1571. "Grief is overcome by patience," wrote G. Gyford on his prison wall in August, 1586, when "Ralph Done, Esqnyer," was rejoicing over the completion of his house at Tarporley, and causing his delight to be engraved on the front of it. Some of the luckless ones learnt wisdom from their confinement, and perpetrated their conclusions on the stones, that so grimly kept them fast. "Wise men ought circumspectly to see what they do, to examine before they speake, to prove before they take in hand, to beware whose company they use, and, above all things, to whom they trust," wrote the young gallant Charles Bailly, who has recorded he was twenty-nine years of age when he arrived in England from Flanders, hearing letters in cipher for Mary, Queen of Scots, advising her of an attempt about to be made in her favour, and was seized on landing at Dover, and committed to the Tower.

"I leve in hope and
I gave credit to my frin
do in time did stand me
moste in bande, so woulde
I never do again excepte
I hade hime sver in bande and
to al men wisho I so vnles ye
evstaine the leke lose as I do."

bemoaned Thomas Clarke, 1576. "As verduc maketh life, so sin causeth death," another unfortunate incised upon the stones. But of all the memorials in this sad chamber, the most touching is the iteration of a woman's name. Graven on the stones, twice repeated, at some distance apart, we seem to have before us all that could be rendered into words of a burst of passionate anguish,—"Jane, Jane!" For this was the prison of Lord Guildford Dudley, the husband of the accomplished, youthful, and amiable Lady Jane Grey. Let us hope their terrible "perilous passge" ended in a "port pleasant."

Except in very occasional instances, we have left off writing upon our houses. We seem to have reserved all writings on stone for perpetuation of the memory of the dead on their tombs. But surely we are suffering a practice to fall into oblivion that has many things to be said in its favour. Especially all restorations of ancient work should be furnished with tablets recording the fact, for the enlightenment of posterity. It is not to be contested that inscriptions of suitable character, sense, situation, and size add an interest to a fabric, especially after the lapse of years. Does not the distich over Lady Lucy Reynall's hospital give us an insight into her pious mind, and makens picture her, as we fear her considerate provision reveals her to have been, a "poore widowe" in weeds and wimple? Do not the quaint Tudor lines of John Waldron, and Richard his wife, of John and Jane Greenway, help us to portray these worthy merchants and their partners as fit members of the class of wealthy, successful merchant-adventurers, or merchant-princes, of which Edward Osborne, Thomas Gresham, and Richard Whittington are world-known examples? They are voices. If we would know a man, let us hear him speak; and these have spoken to us in this fashion.

ANAGNI CATHEDRAL.

AMONG the old towns in the Papal States least frequented, but well worthy to be visited by tourists, Anagni, the Anagnina of the Hernicians, to which Virgil gives the epithet "dives," is picturesquely conspicuous, and, seated on the long ridge of an isolated height amidst the cultivated uplands of the Frosinone province (anciently Latium Novum), looking towards two noble ranges of mountains: the Hernician on the east, the Volscian on the west: this decayed city, chosen residence of so many Mediæval popes, seems from a distance far more imposing and prosperous than it proves to be on nearer view. Among its tortuous, gloomy, and labyrinthine streets, one is often surprised by the relics of past magnificence, in fronts or fragments of fine architecture, porticoes with arcades, arched windows divided by colonnettes, Corinthian capitals and classic frieze; or, it may be, some nondescript animal-head, or other Gothic fantasy cut in marble, set into the rough stonework of modern houses. The Communal Palace, but a remnant of what it was as built in the fourteenth century, stands a heavy pile of sombre and imposing effect, pierced by a broad cavernous archway, with some fine old windows of three lights, under acute arches, divided by

colonnettes, and framed in mouldings; armoial shields in stone emblazoning its dusky fronts, both on the sides of the streets and on that overlooking a court. But our principal business at Anagni is with the cathedral, noticeable on account both of its architecture and its contents, historic through its association with the memory of several pontiffs among the most illustrious of St. Peter's successors—particularly the high-spirited and unfortunate Boniface VIII. Local tradition states that the first bishop of this see was consecrated by St. Peter in person; and it is certain that its prelates may be counted in unbroken succession up to the seventh century. The actual cathedral church had origin in the eleventh century, though, no doubt, much altered in later ages, and in many details, especially those in the interior, indicating the style of the thirteenth and fourteenth centuries; the first historic notice of it importing that the primitive church on this site (referrible to very high antiquity, we may assume) was enlarged and embellished, probably quite renewed, by the Greek Emperor Michael (A.D. 1071-78), in gratitude for his recovery from illness through the prayers and merits, as he believed, of Peter, a canonized bishop of Anagni; but it was not till A.D. 1107 that the renovated edifice was consecrated by Alexander III., a pope who spent several years in this city, and who within this church's walls performed the canonization of St. Bernard; as it was in this same cathedral that St. Clara of Assisi was canonized by Alexander IV., A.D. 1256; that the Emperor Frederick II. was excommunicated by Gregory IX., A.D. 1227. The architecture actually before us presents an example of the transition between the Early Romanesque and the Italian Gothic, the round and the pointed arch being here placed together, though the former predominates both interiorly and exteriorly; instead of the coffered ceiling in flat woodwork, as common in Rome, is the stone vaulting over nave and aisles; and, instead of the classic columns (seen in Rome's basilicas), are heavy built-up stone pillars alternating with quadrate piers. The plain façade terminates in a gable, but the original form is lost owing to the raising of lateral walls above the lean-to roofs of the aisles, still visible under the more modern stonework. At each side of the single round-arched portal on this façade are set into the walls a variety of friezes, classic and barbaric, nondescript animals in rude relief, among other details, pieced together without plan or symmetry. Three apses project from the eastern end, behind the chancel, the central and largest of these with an arcade gallery near to its summit, at the springing of the arches in which gallery fantastic animal-heads alternate with the capitals of columns, neither shafts nor capitals being in those alternate spaces. Near one angle of the façade projects a quadrate structure, on whose outer front we see the outline of a walled-up acute arch, lofty and spacious, sufficing to indicate the former existence of an atrium with Gothic arcades, demolished in all but the portion now converted into a lateral chapel entered from the corresponding aisle. A lofty campanile, with walls that batter (or lean inwards), and stories of arcade-windows divided by colonnettes, stands isolated, at some distance from the façade, a remarkable structure, referred to the eleventh century, and indeed one of the best examples of the Mediæval belfry in these parts, though much maltreated by modern restorers, the ancient arched doorways being walled up, and the arcades, on one side, converted into large windows without any architectonic character. On the northern side of the church, high up near the cornice, is an arched recess with canopy and columns, containing a colossal statue of Boniface VIII., seated on a throne, in full pontificals, with one hand blessing, with the other holding the keys,—a figure rude in execution, but of marked character and dignified individuality, reminding of the recumbent portrait statue on that Pope's tomb at St. Peter's by the Florentine Arnolfo; but as to the authorship of this singular work, placed in so singular a position, on the Anagni Cathedral, we regret our inability to give information. The noticeable details in the interior of this church are,—the rich intarsia pavement of coloured stone; the massiveness of pillars and pilasters that support rounded arches, their capitals of the most rude simplicity, with fantastic animals coarsely sculptured, above the abacms in some instances; the wagon-vault roof of the nave; the elevated choir, and high altar under a graceful white marble canopy, with four

columns supporting architraves, a double story of light colonnettes above, and pyramidal roof, surmounted by a lantern of open work with globe and cross on its apex.

But the most onrions, and no doubt oldest part, is the dim-lit crypt, divided into three aisles by columns, with light abacts and barbaric capitals, dimensions and orders different, the vaulted roof resting on stilted arches, three small apses projecting behind as many altars, and the whole extent of walls and vaulting covered with ancient frescoes, now in great part faded, many groups being totally effaced. These quaint pictures are believed (our authority is an intelligent canon of this cathedral) to be of date within the twelfth century. Among the best preserved are: "Christ Blessing (in the Greek form) with four Apostles beside Him," "Christ amidst the four Emblems of the Evangelists," "The Blessed Virgins amidst female Saints," "The Divine Lamb worshipped by the twenty-four Elders," who all wave censers; "St. Magnus, patron saint of Anagni," a seated figure, in episcopal robes, of some dignity; also groups of apostles, among whom St. John appears most frequently, and in each instance with a scroll in his hand, displaying the words, *In principio erat Verbum*. Not all, apparently, of the same date, these paintings are all characterized by more or less of rudeness and quaintness, the outlines of some figures being about half an inch thick; the expression in others rather pleasing, however childlike the incapacity manifest, and the general style of drawing either absolutely barbaric or giving some faint indication of the dawn of a better day in art-history. It would be interesting to confront these works with the wall-paintings lately discovered in the ancient, and now untenanted, *S. Clemente* at Rome.

In the sacristy of this cathedral is a very rich assortment of sacred objects,—vestments, censers, mitres, &c., no longer used, but now exhibited as curiosities, and all, we are glad to find, photographed for sale, in such copies, at a Roman establishment. Interesting are the numerous vestments, copes, chasubles, and dalmatics that belonged to Boniface VIII., and were all presented to the church by him; their texture of woven gold, covered with figures in needlework, the aggregate forming a most valuable monument of thirteenth-century art,—if we refer them to the last years of Pope Boniface, who died A.D. 1303,—of fourteenth-century art; and, indeed, hearing any comparison to the designs of Giotto, and scarce showing more than ambiguous emancipation from barbarism. The subjects of the groups are Scriptural, legendary, and hagiographic. Among several scenes of martyrdom are the deaths of apostles, the Suffering of St. John in the Caldron of Boiling Oil, St. Denis carrying his severed head in his hands, and (interesting to English eyes) the decapitation of the Saxon king, St. Edward (supposed to death by the Danes A.D. 870), and the murder of St. Thomas à Becket, who is represented kneeling, whilst three armed assassins attack him, and one cleaves his skull with a long sword, opposite being seen the king, standing in a kind of tribune, hung with colored cloth, in the attitude of one who gives orders,—a curious testimony to the idea admitted at the Papal Court as to the degree of King Henry's complicity in the death of the archbishop! Among legendary subjects, most singular are those from the story of St. Nicholas, who, in one group, appears in the act of causing two devils to fall from their pedestals, by virtue of his prayers; in another, discomfiting the demon of the Storm—an ape-like monster—who seems responsible for a tempest on board of a ship out at sea. The Holy Trinity is represented with Father and Son, almost identical in type, age, and attitude, each in the act of blessing, seated beside each other on thrones, with the dove, in an oval nimbus, between. Most complete and best preserved are the Mysteries of the Gospel, from the Annunciation to the Ascension, with the additional legendary subjects of the Transist, the Assumption, and the Coronation of Mary, each group within a circlet on the gold base of a *lumeral*, or veil for enveloping the shoulders at the rite of benediction.* A singular detail in the Annunciation scene, among these groups, is the manner in which the dove approaches close to the ear of Mary, commandingly to the majestic idea respecting the birth of her preternatural conception expressed

in an ancient hymn. But the veritable gem of the set is an altar-pallium, also presented by Pope Boniface, embroidered with figures of groups from designs ascribed to Giotto, and all, we should say, worthy of the great Tuscan master. The subjects range along two files. On the upper, the Virgin, with sweetly serene countenance, seated on a throne, the child on her lap; two archangels and six apostles each standing under a canopy with cusped arch and supporting columns. On the lower file, the martyrdoms of St. Peter, St. Paul, and St. Stephen; also the baptism and restoration to sight of the first-named apostle,—all treated in a manner that seems decidedly "Giottesque." Several vestments that belonged to Innocent III. are of crimson silk, stiff with gold embroidery in perfect preservation, but not artistic, the subjects mostly heraldic, as in the frequently-repeated crowned eagle, other birds, and flowers, suggesting the notion, that seems admissible enough, of the presentation of these gorgeous robes to Pope Innocent by an imperial ally. The many mitres seen here—some embroidered, others quite plain—are chiefly noticeable as proofs how different and much more modest in its low form was the mitre of old, as compared with those, so ponderous and top-heavy looking, now in use. A beautiful censer, one of Pope Boniface's gifts, exemplifies the taste for Gothic design in his day; and other objects in this sacred treasury are remarkable either for richness or on account of the contrasts they suggest.

The general effects of things seen in the cathedral and in the street at Anagni is mournful. Too evident here, as elsewhere, are the cold neglect, the apathetic non-appreciation of the Middle Ages, their genius and creations, in Modern Rome as in the range of territory still under her sway.

LECTURES TO WORKING MEN.

The Council of the Working Men's Club Union are arranging a list of gentlemen willing to give lectures in the different Working Men's Clubs and Institutes connected with the society in London. It is proposed that the lectures shall be delivered at the various club-rooms, which are but small, admitting an audience of about 150 in number. We would suggest, that should some good lecturers be obtained, the provision of a central apartment of larger capacity, which would accommodate the members of, say, four or five of the clubs, might be desirable, as more fully utilising the lecturer's services. Probably, however, the council have learnt that, while the members of a club might be disposed to go to their own room to hear a lecture, only a part of them would take the trouble to walk half a mile out of their way to do so. There is a terrible apathy in all quarters, which has to be overcome.

THE "BUILDER'S" LAW NOTES.

Injury by Fellow-workmen: Liability of Master.
A scaffold was erected for the purpose of sinking a pit and making arrangements underground for opening a new seam in a certain coal-pit in Scotland. The owners had a manager for the pit, and they had also a general manager over all their works. The pit manager had the charge of sinking the pit. Two days after the erection of the scaffold a workman was engaged by the owners to assist in driving the level. While so employed he was killed by an explosion of freedamp, the accumulation of which was caused by the obstruction to the ventilation occasioned by the erection of the scaffold. It was admitted that both the managers were competent persons selected for their duties with proper care. An action was brought by the mother of the deceased for damages in consequence of his death, and the judge told the jury that if they were satisfied that the arrangement or system of the ventilation of the pit at the time of the accident had been designed and completed by the pit manager before the employment of deceased, and if the owners had delegated to such manager all their authority in regard to the matter, that such manager and the deceased did not stand in the relation of fellow workmen engaged in a common employment, and that the owners were not relieved from liability. A verdict was given for the plaintiff. Exceptions were taken to the charge, and one of the exceptions was allowed, and a new trial

granted. The plaintiff appealed to the House of Lords against such allowance, but it was confirmed by that House. The Chancellor said that the liability of a master to his workmen does not depend on the question of the author of the accident being a fellow-workman. The master is not liable to his servant unless there be default on the part of the master in that which he has contracted to do. He does not contract to execute in person the works connected with his business. What he is bound to do in the event of his not personally superintending the work is to select proper and competent persons to do so, and to furnish them with adequate materials and resources for the work. If the persons so selected are guilty of negligence it is not the negligence of the master.—*Wilson v. Merry*.

Clay-pits: Rates.—A person had an exclusive licence to enter upon lands in two parishes and take clay. Under this licence he worked certain clay-pits, and carried on a trade in clay in one parish, but he did not work any clay-pit in another parish, though he had the licence to do so. The surface of the land in the latter parish was let to a farmer; and it was held by the Court of Queen's Bench that the person having the licence was not rateable in the latter parish as an occupier of clay-pits, but only rateable in the parish in which he actually worked clay-pits under the licence.—*The Queen v. Fayle*.

THE NEW SANITARY ACT.

AMONGST the statutes passed in the late session was one (chapter 114) briefly entitled "The Sanitary Act of 1868," having for its object the making of additional provisions for the removal of refuse matter from dwelling-houses. The Act only extends to England. It commences (after some definitions) with reciting the 51st and 54th sections of the "Public Health Act, 1848," which require that every new house and every house pulled down to or below the ground-floor and rebuilt, shall have a sufficient water-closet or privy and ash-pit, and also that the Local Board of Health shall see that drains, water-closets, privies, and ash-pits within their district do not become a nuisance. The new Act then proceeds to extend those sections to the district of every "sewer authority" in which district there is no enactment in any public or private Act of Parliament to the like effect in force. "Sewer authority" in this Act is to have the same meaning that it has in "The Sewage Utilization Act, 1865," and to be construed as if the phrase used were "local board." Any officer appointed by the "sewer authority" to examine any premises shall be deemed to be the "surveyor" within the meaning of the said sections. Where the sewer authority and the nuisance authority of a district are different bodies of men, the jurisdiction of the nuisance authority is to cease within such district in relation to all matters within the purview of the abovementioned sections of the "Public Health Act, 1848;" and any sewer authority to whose district the said sections are extended making default in enforcing their provisions shall be subject to proceedings under the Sanitary Act of 1866 in the same manner as if it had made default in providing its district with sufficient sewers. Each sewer authority shall, within its district, have all the powers vested in a local board by the "Local Government Act of 1858" (as amended by any subsequent Act of Parliament) so far as relates to the removal of house refuse from premises, and the cleansing of privies, ash-pits, and cesspools. Where the sewer authority and the nuisance authority, in any district, are different bodies of men, the jurisdiction of the former in such district shall cease in respect to all matters over which the latter acquires power. The provisions of the "Public Health Act, 1848," relating to private improvement expenses (as amended by any subsequent Act of Parliament), shall be deemed to be incorporated with this Act so far as may be required for carrying it into effect. Any enactment requiring the construction of a water-closet stall, with the approval of the local authority, be satisfied by the construction of an earth-closet, or other place, for the reception and deodorisation of fecal matter, made and used in accordance with any regulation, from time to time, issued by the local authority. That authority may, as respects any houses in which such earth-closets or other places are in use with their approval, dispense with the supply of water re-

* Used also by the deacon, whilst he carries the paten of High Mass; and at benediction by the priest, who carries the ostensorium containing the Holy Sacrament.

quired by any contract or enactment to be furnished to the water-closets in such houses, on such terms as may be agreed upon between such authority and the persons required to provide the supply of water. The local authority may themselves undertake (or contract with any person to undertake) to supply dry earth, or other deodorising substance, to any houses within the district, for the purpose of earth-closets or the places referred to above. The local authority may themselves construct (or require to be constructed) earth-closets in all cases where under any enactment in force they might construct water-closets, or require them to be constructed. No person shall be required to construct an earth-closet instead of a water-closet if he prefer to comply with the Act requiring the construction of a water-closet, and a supply of water for other purposes is furnished to such house. No person is to be put to greater expense in constructing an earth-closet than he would be put to in the construction of a water-closet. After some sections (which we need not set forth) respecting the recovery of expenses and the enforcement of penalties, the Act provides that the sewer authority (or, in the metropolis, the nuisance authority) shall have the same power with reference to the temporary supply of medicine and medical assistance for the poorer inhabitants as it now has to provide hospitals or temporary places for the reception of the sick by the "Sanitary Act of 1866," subject to the previous sanction of Her Majesty's Privy Council.

THE ISLINGTON NEW WORKHOUSE.

THE ARCHITECT, THE CLERK OF THE WORKS, AND THE BOARD OF GUARDIANS.

On the 28th of August the Islington Board of Guardians passed a resolution (on which we commented) that the clerk of the works at the new workhouse at Highgate should send in weekly reports to them—1st, as to work done and number of men employed; 2ndly, whether any stoppage has occurred, and why; 3rdly, as to any inferior material brought on the ground, whether such has been used after being condemned by him, with copies of any communications made either to the architect or builder with respect to the same, with their replies; 4thly, whether such material has been taken out and removed from the ground after complaint, and generally to report anything and everything affecting the stability of the building. Mr. Burden, the architect, complained to the Board of Guardians that it was not the custom that the clerk of the works should report to them; he ought to send in his report to the architect, and it was for the architect to report to the Board. The Board granted Mr. Burden an interview, in order to allow him to explain and support his views before them. Mr. Burden contended that the clerk of the works should be at the disposal of the architect, and every report should come through him and not through the clerk of the works, Mr. Lewis. The Chairman, on behalf of the Guardians, said that they consider the clerk of the works their servant, as they paid him. Mr. Burden said that, although they paid Mr. Lewis, the custom of the profession made him the servant of the architect. It would be very inconvenient for the clerk of the works to turn round upon the architect and say he was independent of him. Mr. Lewis's influence with the contractors would be lessened unless he derived his power directly from the architect. He, moreover, objected to the clerk of the works having power to condemn materials, or to pronounce any judgment on the stability of the building. For the clerk of the works to report at all was a new thing to him. The architect's monthly report was quite sufficient. The Guardians expressed themselves opposed to doing anything that would tend to lower Mr. Burden in his office as architect, but at the same time said they were determined to watch the work most zealously. As nothing could be done without previous notice of motion, the subject was adjourned until the following week.

At the next Board meeting a letter was read from Mr. Lewis, clerk of the works, expressing his surprise that the architect should reserve to himself the power of condemning bad materials. It was important that, when an attempt was made to use bad materials, they should be at once condemned, as, were they left to be worked in, they might deceive the most experienced eye.

He considered it the duty of the clerk of the works to condemn materials in the first instance, and then report to the architect for his final decision. If Mr. Burden reserved the power to himself, the builders would ignore the clerk of the works altogether. Mr. West brought forward his motion that the resolution empowering the clerk of the works to condemn bad material should be rescinded, as being contrary to the contract. Several guardians were of a contrary opinion, when the clerk informed them that the contract said that either the clerk of the works or the architect could "reject" bad materials; but, in the event of any dispute between the builders and superintendents, the decision of the architect alone should be binding. Mr. Cuffin moved an amendment that resolution 3 should be rescinded; but the amendment was lost. Mr. Box then moved that the words "together with copies of any correspondence," in resolution 3, should be rescinded, and the word "rejected" be substituted for "condemned." Mr. Fairbank seconded, remarking that they had had ample proof that the builders had not been working in a very straightforward manner. Mr. Cuffin replied that in the best of works bad materials would be used sometimes without the builder's knowledge. Mr. Box's motion was put and carried. The fourth resolution was entirely rescinded as being superfluous, and thus matters stand for the present between the architect, the clerk of the works, and the Islington Board of Guardians.

NEW THEATRE OF MUSIC AT WEST HARTLEPOOL.

This building, which was opened on Monday, the 21st ult., is capable of accommodating 2,000 persons. The form of the auditorium is three parts of an oval, having its termination at the proscenium, which has an opening of 25 ft., and represents a picture-frame of rather massive character. The gallery front recedes from the box front, and forms an awning. Pains have been bestowed on the stage. With reference to the ventilation, the pure air in a rarefied state is admitted by means of numerous inlets and fines, and the vitiated extracted by means of the air-shaft immediately over the sunlight. Messrs. Thomas Moore & Sons, of Sunderland, were the architects; and Mr. Gibbon, of Hartlepool, was the contractor. The gasfittings were put up by Mr. T. Sherwood.

RESTORATION OF PERIVALE CHURCH.

The most thinly populated parish in the metropolitan county is Perivale, the number of householders being but four. The parish is situated in a fertile and deliciously verdant vale, through which stealthily creeps or tortuously winds one of Father Thames's smallest tributaries, the gravelly Brent. Just where the stream takes a westerly course, upon the north bank, where it is unusually elevated, stands the smallest church in Middlesex,—a pile of chalk reared at least 600 years since. It consists of nave and chancel, with a south door and a west door, each having an arched head, lancet-shaped outside and segment-pointed inside, the walls being 2 ft. in thickness. The roof is high pitched, and was doubtless once open-timbered, with braces, forming a lancet arch, which appear to have been lathed and plastered in the days of the Puritans. Besides the two doorways, there is left of the original edifice an octagonal font and a hole where the east window was. At a much later date the original nave windows appear to have been replaced by some two-light Tudor windows. The benches also appear to have been put up in the fifteenth century, as well as the pulpit and some memorial brasses. Indeed, but for the doors, the east window, the high-pitched roof, and the fact of the walls being of chalk which must have been brought at least eight miles, the church would be taken for a fifteenth-century one. It appears to have suffered considerably at the hands of the Puritans, and again in the Georgian age.

This interesting relic of Medievalism has been restored, evidently by loving hands, and reopened for divine service. The outside remains unaltered, with the exception of the addition of another two-light window in the south wall, a faithful copy of the old one. The inside, however, has suffered a complete metamorphosis. A new

organ-chamber has been built; the pews are gone, the rood-screen is no longer seen, and the heavy classic altar-rail is replaced by one designed in the spirit of the ancient builders. The floors of nave and chancel are relaid. The white-wash enamel is scraped from the timbers, and they are no longer supposed to be marble or slate; but we are sorry that the restorers should want us to think it oak, by graining it. We would suggest the destruction of all the Puritanical and Georgian anomalies, such as the east window, the porch, and the Punch and Judy construction called the tower. Then the restoration will be complete.

The architect who superintended the alterations was Mr. Charles Jones, of Ealing; and the whole of the works have been carried out by Mr. Nye, of Ealing, builder.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

AN APPEAL TO BUILDERS.

SIR,—From the press that has rendered to the above cause such powerful aid, permit me to seek still a little further assistance; it is only through its medium that we can get aid from the rich and willing, or acquaint the deserving destitute of temporary aid or permanent relief. Our first election takes place next Monday evening, at the Institution, when two widows of builders' clerks, late in the employ of leading London firms, will be elected to the pension of 15*l.* per annum. The applicants are thoroughly destitute; one has three children under twelve, the other nine under seventeen years of age.

It is, indeed, a pleasing satisfaction that the committee are enabled at such a juncture of distress as this at once to offer some permanent assistance.

With the knowledge that still more is required, I earnestly appeal for aid; but I more particularly respectfully solicit the profession, merchants, builders, and others, to aid the endeavours being made to secure the election of one of the children of the last case I have mentioned, into the Orphan Working School, at Haverstock-hill. To secure the election the first time, the difficulties are great; the case is a very sad one, and deserves the support of all your readers. Votes will be received by any of the committee of our Institution. The election is sure if our building friends have sympathising and willing hearts to help us. T. P. W.

THE SCIENCE OF COLOUR.

SIR,—If I may add to my former communications on this subject, and to the extracts which appeared in the review of my treatise in your number for 25th July last, a short statement of the principal facts which refute the common theory of colour, and seem to me to establish the amended theory which I have ventured to maintain, it may prevent some misdirected labour and loss of time in such as desire, like Mr. Colling, to investigate the subject for themselves.

1. A mixture of these red, green, and blue rays of the pure spectrum whose colours are best represented in paints by scarlet vermilion, emerald green, and ultramarine or French blue, without any of the other rays, will produce the sensation of white.

2. These three are the deepest, or most powerful in proportion to their brightness, of any three of the prismatic colours which are capable of producing white.

3. All the other prismatic hues may be produced by mixtures of these three, with the same depth as that which they have in the spectrum; namely, orange, yellow, and yellow-green, by mixtures of the red and green, and sea-green and all hues intermediate between it and green or blue, by mixtures of the green and blue; and therefore all possible colours in nature may be produced by mixtures of the prismatic red, green, and blue, in various proportions. But all the prismatic hues cannot be produced, with the depth they possess in the spectrum, by mixtures of any other given prismatic colours besides these three.

4. From these facts, which have been proved by Maxwell's experiments (Phil. Trans. 1860), and are also in accordance with the fact that every eye which has the ordinary capacity for discerning colours, judges these the most striking

colours in the pure spectrum, it is reasonable to conclude that the prismatic red, green, and blue present the nearest approach to three simple sensations of colour, and that all possible colours consist of mixtures of these.

5. Continuous combinations of the prismatic colours, placed in juxtaposition, show that the deepest and brightest blues, best represented in paints by ultramarine and cobalt, are exactly complementary to the clearest and brightest yellows, best represented in paints by lemon yellow and king's yellow.

6. The combination of the best blue and yellow lights, in whatever way effected, produces a neutral gray or white; and though the combination of blues and yellows approaching more or less to sea-green, blue, and yellow green, will produce a pale green; no deep or powerful green (such as that of emerald green) can be so produced.

7. The analysis by the prism of the best natural reds, greens, and blues, shows that they are produced solely by the prismatic rays in which those colours respectively predominate; but the like analysis of the best natural yellows shows that they are produced by all the red and green prismatic rays, as well as by the intermediate yellow rays.

8. From these facts it is evident that if blue is one of three simple sensations of colour, yellow cannot be another of them, but must be a binary compound of the other two; a conclusion which is also confirmed by the ocular modification of white when viewed in conjunction with bright blue or bright yellow, or immediately after the same.

If I have, as I fear, expressed myself in my former communications with a somewhat unbecoming warmth or confidence, I hope I may be excused when I assure your readers that I did not venture to reject any part of the common theory of colour without much research and many experiments. The subject necessarily requires thoughtful and patient investigation; but I am persuaded that the result of arriving at correct conclusions will amply repay the trouble to those who would produce good and varied effects in colour.

W. BENSON.

OUR BLACK DIAMONDS.

COAL is a black opaque mineral substance of vegetable origin. Its specific gravity varies from 1.25 to 1.75. Its chemical constituents are carbon, hydrogen, nitrogen, and oxygen. The chief constituent or basis of coal is carbon; the other substances are volatile. When coal is rich in hydrogen and oxygen, and poor in carbon, it is bituminous; and when it is rich in carbon and poor in hydrogen and oxygen, it is non-bituminous. Coal does not contain any actual bitumen, only the constituents of it. Bitumen is the result of the decomposition of vegetable matter, and may be extracted from coal by distillation. The bituminous varieties of coal are less hard, compact, and lustrous, and more inflammable than the non-bituminous, which are often made into articles of use and ornament, besides being used as fuel.

Carbon in coal and oxygen in air have great affinity for each other. The moment fire is applied to the coal the oxygen rushes to the fire and supports the combustion. The combination of the oxygen with the carbon produces carbonic acid, and with the hydrogen aqueous vapour. The process of oxidation evolves heat, which is increased or diminished by the speed with which the products of oxidation are allowed to escape. When the combustion is perfect the resulting gases are nearly invisible, but when it is imperfect smoke is produced. It is not possible in the ordinary open fire, or to prevent the formation of smoke, or to wholly to consume it; but much may be done by careful firing to prevent it, and to consume it. Those who desire a clean hearth, and a bright cheerful fire, must take pains to manage it. The fire should be fed frequently, with a small quantity of coal each time, between the front bars, and amidst the hot embers at top. If the ashpit be made to close in front, so as to exclude the air from under the fire, there would be great saving of fuel, and the fire would burn steadily. There are nearly one hundred varieties of coal, about seventy of which are imported into London. All of them differ in quality, and also in lighting and heating power; but the difference is many is so slight as to be undistinguishable except to those conversant with them. They may be arranged as anthracite-coal, pit-coal, and brown-coal.

Anthracite-coal is common in South Wales. It is also found in some English, Scotch, and Irish coal fields. Its composition, by weight, is 92.56 per cent. of carbon, 3.33 of hydrogen, 2.53 of nitrogen and oxygen, and 1.58 of ashes. Hence it is exceedingly rich in carbon, poor in volatile substances, and is non-bituminous. Some samples of this coal, of great purity, yield as much as 98 per cent. of carbon. It has an iron or greyish black colour, and a metallic lustre. It is very hard and brittle, ignites with difficulty, but burns steadily with a strong draught. It is nearly smokeless, burns with little or no flame, and gives out an intense heat, sometimes melting the furnace bars. It does not cake in burning, contains little sulphur, and leaves little ash. It is used largely in iron works for manufacturing metals, and in ocean steamers for generating steam. Its calorific effect for these purposes is much greater than Newcastle coal. Owing to its hardness and compactness, its power of conducting heat through itself is very slow. If it be exposed to great heat at first, the outside will expand more than the inside, and break off in small pieces. To obviate this, and to assist the combustion, it requires to be gradually heated.

Pit-coal has many varieties; indeed, they are as numerous as the seams of coal; and sometimes the same seam differs in character and quality at different parts. Some varieties of pit coal have popular and local names; such, for instance, as *furnace-coal*, which is used for smelting, smiths' work, &c.; *gas-coal*, used for manufacturing gas; *steam-coal*, used for generating steam; and *house-coal*, used for burning in stoves and fire-grates. All these varieties, which are more or less bituminous, are classed under four heads:—1. Caking-coal. 2. Splint or hard coal. 3. Cherry or soft coal. 4. Cannel or parrot coal.

1. Caking coal is obtained in great abundance from the coalfields of Northumberland and Durham; also from those of Cumberland, Lancashire, Derbyshire, and other parts. Its constituents by weight, are 75.28 per cent. of carbon; 4.18 of hydrogen; 15.96 of nitrogen; and 4.58 of oxygen. It is velvet black; is middling hard and brittle, breaks easily, and ignites readily. It melts or falls to pieces when heated, makes a bright pleasing fire, with attention burns a long time, and gives out great heat. As, after lighting, the heat increases, the pieces unite or cake (whence its name), and form a solid mass, which requires frequent stirring. Some kinds of this coal burn slowly, cake hard, and send out a strong long-continued heat; while others burn quickly, cake soft, and give a weak, short continued heat. As this coal contains only 1½ per cent. of earthy matter, it leaves but little ash and little cinder. One hushel of it weighs 84 lb. It yields about 40 per cent. of bitumen. This coal is the most useful and economical for household purposes, and is that commonly sold in London as Newcastle or Wallsend coal. It makes the best coke, 1,000 lb. of it yielding 774 lb. when made in an oven. It is also a good steam-coal.

2. Splint or hard coal is obtained from the coal-fields near Glasgow, in Ayrshire, and in England and Wales. Its composition by weight is 75.00 per cent. of carbon, 6.25 of hydrogen, 6.25 of nitrogen, and 12.50 of oxygen. The coal called *culm* is an inferior quality of it. Splint coal is black, with a brown tinge, and splinters when broken, whence its name. It is much harder, breaks less easily, kindles less quickly, requires greater heat to make it burn, burns with less flame, and makes less smoke, than caking coal. As this coal does not cake when heated, it is not so well adapted for small fires as caking coal; but a large body of it makes a strong lasting fire. It is almost non-bituminous. When prepared in a coke-oven, 1,000 lb. of it will afford 647 lb. of coke. It contains 9½ per cent. of earthy matter.

3. Cherry or soft coal is obtained near Glasgow, in Fifeshire, and abundantly in Staffordshire. Its constituents by weight are 74.45 per cent. of carbon, 12.40 of hydrogen, 10.22 of nitrogen, and 2.93 of oxygen. Its colour is velvet black with a grey shade. It has a resinous lustre, breaks easily with a shaly fracture, takes fire readily, burns with a continuous clear flame, gives out much heat, produces little cinder, and leaves a light white ash. As it also does not melt and cake when heated like caking coal, it requires little stirring; but it burns away more rapidly, creates less heat, and is less economical than either caking or splint coal. In an oven 1,000 lb. of it produce 522 lb. of coke; and it contains 10 per cent. of earthy matter.

4. Cannel or parrot coal is obtained from Scotland, Derbyshire, Lancashire, Yorkshire, and other parts. Its composition by weight is 64.72 per cent. of carbon, 21.56 of hydrogen, and 13.72 of nitrogen. It burns readily with a clear flame like a candle, whence its name, but with much smoke. It is compact, fractures sometimes shaly, and varies much in appearance from a dull earthy to a bright shaly lustre. This latter variety burns like wood, leaving little cinder, and a white ash, while the former retains the shape and size of the original lumps. It contains about 20 per cent. of bitumen. It is seldom used, except locally, as a household coal, but it is admirably adapted for, and much used in, the manufacture of gas. Some very hard shaly qualities are made into toys and ornaments and sold as jet. This coal contains 11 per cent. of earthy matter.

Brown coal, known also as lignite, is of recent formation. One kind of it is soft and mellow when first quarried, but becomes hard and brittle by exposure to the air. In this kind the structure of the plants from which it is derived is little altered,—their stems and fibres are seen crossing in all directions. Another kind of this coal appears as a dense stratified mass, nearly black, fracturing easily, and sometimes presenting indications of vegetable structure. This variety, like that of Bovey, in Devonshire, is scarcely distinguishable from ordinary coal.

To those who are not conversant with the particular kinds and properties of coal, these remarks may be of service in enabling them to order, distinguish, and use that coal which is most applicable for the purpose required.

JOHN PHILLIPS.

SOAP AND ALUM FOR KEEPING OUT WET.

SIR,—I am very glad to see that your correspondent, Mr. Arthur Chambers, confirms my experience as to the efficiency of the soap and alum process for rendering the faces of brick walls impervious to wet. Some years since I brought this "dressing" to the notice of the Institute of British Architects, and I believe there are many members who can bear witness to its success, if properly applied. I know a case where a tenant gave notice to leave his house unless it was coated with cement. The landlord refused to have the brickwork disfigured by plaster. The solution of soap and alum was applied, and with complete success. I do not go quite so far as Mr. Chambers, and declare it to be a certain cure. I think it might fail in cases where the brick or stone is very porous; but unquestionably, when applied to a closely-grained material, it will succeed.

In a discussion a few sessions since at the Institute I directed attention to this simple and inexpensive process as applicable to the stonework of the new Houses of Parliament; and I feel confident that it might be very beneficially applied to that building. When properly used it is by no means injurious to the effect of the stone, but, on the contrary, imparts a greyish tone, which is most agreeable to the eye.

BENJN. FERREY.

DESIGN OF LODGES.

If you agree with me on the importance of the subject of this letter, you may think it well to bring it before the public in some suitable form.

I observe, not only in this country, but in others also, a studied misconception of lodges or gate-houses. They are, almost invariably, level with the damp earth, uncellared, with 7 ft. or 8 ft. ceilings, and windows too small for healthful ventilation.

Now, without considering the life, health, or usefulness of the occupants, I ask, Are not such structures miserable frontispieces to a handsome mansion and ornamented grounds? Will not good taste, if not humanity, reform this mistake? A.

AIRING HOUSES.

SIR,—Can any of your country or scientific correspondents kindly say at what point of outside atmospheric humidity it is not beneficial to open the windows of an uninhabited house in the country during winter? and which instrument, if any, is best for determining this humidity? The house is regularly fired, but the house-keeper, a gardener, seems to dread an open window.

COURTNEY HOUSE.

THE ELEVATIONS IN THE REGENT'S PARK.

Sir,—In the leases of the houses in the Regent's Park, the whole of which is Crown property, it is provided that no addition or alteration shall be made to the exterior of the houses; and so important was it considered at the time of laying out the park, that the architectural appearances of the terraces and blocks of buildings should not in any way be impaired, that it is also provided in the leases that the exteriors should all be painted at the same time and at certain periods, and at those times only; yet I perceive in one of the houses in Chester-terrace an extra story has been added, thus disfiguring the frontage of the terrace.

I consider that in making in the original lease the proviso that no additions or alterations should be made to the exteriors of the houses the public were taken into the compact, the park being Crown property; and I would ask, is it right that the appearance and architectural effect should be destroyed to accommodate any individual?

The terraces will soon become as disfigured and spoilt in appearance as Regent-street or Park Crescent; the Circus at Oxford-street may be cited as an effort terribly disfigured by additions,—but these are, I believe, private properties, and not Crown property.

As Parliament is up, there are no means of getting a question put to the "Woods and Forests" on the subject in the House of Commons; I therefore trust, Mr. Editor, you will call attention to it; a word from you will perhaps bring the attention of the authorities to the point, and either have the excrescence removed, or an intimation sent to all house proprietors in the Park that they are at liberty to make any and what additions they like to their properties.

HOTSP. PARSONS.

THE APPROACH STREETS, HOLBORN VIADUCT.

Sir,—“What's in a name?” “A rose with any other name would smell as sweet.” If little in a name, how much in an apology for a name? Does not the naming of these approach streets show a poverty of ideas somewhere? Should not such important thoroughfares be named after the great men of the world? Are there none to mark the era in which they are built? I presume there will be four approaches: why not “Napier,” “Magdala,” “Theodor,” “Abyssinia”? They would then commemorate the heroes of our age in modern history, one that shows that the age of chivalry has not passed. If the approach idea must prevail, why streets? Would not simply approaches be preferable?

ONLY A TAILOR.

BIRMINGHAM NOTES.

ATTEA depression in demand and prices extending over a period of nearly three years, the manufacturers of builders' hardware in Birmingham are beginning to experience a steady return to something like activity. This is just the commencement of the “season” for stove-grates, cooking-ranges, and other descriptions of foundry-ware fixtures, and already the workpeople are having full employment. Ornamental iron gates and palisades are in tolerable request, but Coalbrookdale takes the “cream” of the trade in the Lock department. The hinges, bolts, and latches are in fair demand both in this town and at Wolverhampton and Willenhall, where the ordinary qualities are most largely made. Wrought-iron bridge and girder making is occupying a greater number of hands than reported for two years past. Metal-ware is gradually improving in demand, but prices are remarkably low, and there seems to be no prospect of any immediate movement in this respect. Among the late arrivals in builders' hardware may be mentioned, iron-japaned finger-plates for doors, which are being produced by an enterprising firm in Willenhall at sixpence per pair. There are said to be equal to the china plates for which 1s. 8d. or 2s. per pair is demanded, and of course in point of endurance the latter will bear no comparison. A lock and finger-plate combined was also shown to us the other day, and his “invention” savours more of the curious than the useful. The increased application of machinery to the bolt trade is tending to improve the style and workmanship of those articles, besides facilitating production, and thereby lowering the price. The lock trade, which hitherto has not availed itself of recent scientific invention, is also taking a step in the same direction. Owing to a wages dispute in the “fine-plate” branch at Wolverhampton, some of the makers intend to render themselves less dependent upon the work people by introducing machinery on an extensive scale. This step will likewise benefit the consumer by reducing the cost of the article. The Birmingham people are favoured just now by the South Kensington department of the Civil Service. An extensive load of metal-work (chiefly Medival) has been made at the Free Library, where the collection of articles is now being exhibited. The locks, hinges, and bolts are especially fine, and there are several cabinets, and a *serre de fabrique* of the Middle Ages, which excel in design the elaborated door furniture of Haddon Hall.

NEW RELIEF OFFICES IN ST. PANCRAS.

In the *Builder* of the 15th August, were described the new Relief Offices and Dispensary for the parish of St. Pancras, situated in Compton-place, near Burton-crescent. The second of the series of four Relief Offices, designed for the parish in accordance with the provisions of the Poor Relief Act of 1857, has been completed this week. It is situated in Leighton-road, Kentish Town, occupying the house and grounds hitherto known as Bower Cottage. It differs from that in Compton-place in having no dispensary attached, though provision is made for the addition when required; while the ample site, which comprises an area of nearly half an acre, has afforded space for the construction of extensive labour yards, stone-breaking sheds, and oslum-picking rooms, for the employment of able-bodied paupers.

The old cottage, which is attached to the rear of the chapel buildings has been retained, with only such modifications as were found necessary to connect it with the new buildings associated with it. It is two stories in

height, and on the upper floor are the apartments of the resident superintendent. The committee-room is on the ground floor, and with the store-room adjoining, completes the accommodation provided by the old cottage.

What was formerly a dining-room is now divided longitudinally, forming separate paper entrances and exit passages to and from Leighton-road and the new waiting-room. Between the new waiting-room and the committee-room are situated the new relieving office-room and the bread-room. By the parallel passages or corridors, direct access is gained to the waiting-room, returning past the relieving office, bread-room, and committee-room, each of which communicates with this exit corridor, which is widened opposite the bread-room and committee-room, forming lobbies to the same in the order indicated. The waiting-room has a lofty open roof, lighted by a large lantern skylight. A portion of ground is fenced in to admit of the enlargement of the waiting-room as well as for the erection of surgeons' rooms and dispensary.

The labour-yard is reached by a road on the west side of the chapel, and is an open quadrangular yard, which measures about 125 ft. by 70 ft., and has been paved with Peunmaesur granite cubes by Messrs. Sewell & Son. On three sides of the yard stone-breaking sheds are ranged. These sheds are divided into double boxes by dwarf partitions, and afford space for ninety-four stone breakers. The sheds are tiled with corrugated red and white tiles, and present an effective appearance as they slope from the back boundary walls towards the yard, to which the boxes are open, east-iron pillars supporting the eaves-beams between each division.

The superintendent's office and implement store-room are placed in the centre of the range of boxes on the north side of the yard, immediately opposite the entrance road. On either side of the superintendent's offices are the entrance lobbies to the oslum-picking store-rooms, which are situated behind the boxes, the whole width of the northern side, or 137 ft. in length by 14 ft. wide. Accommodation is provided for all oslum-breakers in two long rooms fitted with tables and benches; between these rooms are the picked and un-picked oslum store-rooms. All these rooms are lighted by skylights, and carefully ventilated by louvre and oslum windows. The rooms are warmed by open fire stoves with warm-air chambers, through which the air from within is passed into the rooms and warmed in its passage.

The architect is Mr. E. G. Robins; and Messrs. Thomas & Son undertook the contract at the sum of 1,735l.

WORCESTER DIOCESAN ARCHITECTURAL SOCIETY.

ON the second and last excursion of this society for the season Alcester, Coughton Court, and the Marquis of Hertford's mansion at Ragley, have been visited. There was a large muster. By permission of Sir W. Throckmorton, bart., the fine old edifice of Coughton Court was first inspected, and the party then proceeded to Coughton Church, where Mr. Walker discoursed on the ancient history of Congiton, and Mr. Tomes criticised the old painted glass. Alcester was next visited. Luncheon had been provided at the Swan Hotel, and was presided over by the Rev. Canon Seymour. The party afterwards proceeded in carriages to Ragley, the neglected seat of the Marquis of Hertford, who has long resided in Paris. The visitors were escorted through the state rooms and library. Arrow church was next examined, and Mr. Walker read a paper detailing the history of the church. Mr. Walker announced that though the rector of Arrow, the Rev. Beauchamp Stannus, was prevented from being at home, yet he had invited the company to partake of tea and coffee at the rectory, and the day being so fine, it had been set out in the gardens. In the advancing evening the carriages were called for Redditch, where, safely arriving, the return was made by rail to Worcester.

AN ATLANTIC TELEGRAPH WITHOUT A CABLE.

OUR readers may recollect of the experiments, some years since, of a Dundee gentleman, now deceased, in course of which he was said to have telegraphed by electricity across Portsmouth Harbour by permission of the Government, and also across the Tay, without any apparatus except galvanic arrangements on shore at right angles to the course of the message. This gentleman (we forget his name) even maintained the possibility of so telegraphing across the Atlantic Ocean, only he stipulated the arrangement of transverse lines, that in Britain running north and south through a great part of the country. The same idea essentially has been taken up by a Mr. J. H. Mower, in America, as a discovery of his own. He is said by the *New York Herald* to have already telegraphed east and west across Lake Ontario—from a point near Toronto, Canada West, to one on the coast of Oswego county, New York—a length of 133 miles, transmitting his message, without a wire, from “submerged machine” at one end of the route to one at the other. The messages and replies were continued for two hours, the average time

of transmission for the 133 miles being a little less than three-eighths of a second. The npsnot of the discovery—on what principle Mr. Mower is not yet prepared to disclose—is, that “electric currents can be transmitted through water, salt or fresh, without deviation vertically, or from the parallel of latitude.” The difficulty from the unequal level of the tidal waves in the two hemispheres will be obviated, it is claimed, by submerging the apparatus at sufficient depth. The inventor is preparing to come to Europe to secure here the patent rights for which the caveats have been filed in the States. At the inconsiderable cost of 10,000 dollars he expects within three months to establish telegraphic communication between Montank Point, the eastern extremity of Long Island, and Spain, the eastern end of the line striking the coast of Portugal at a point near Oporto. The statement is enough to take away one's breath; but, with the history of the telegraph before us, we no more venture to deny than we do to affirm its possibility.

OPENING OF THE MIDLAND TERMINUS AT KING'S CROSS.

THE great terminal station of the Midland Railway in Euston-road, St. Pancras, close to the King's Cross terminus of the Great Northern, has been (somewhat prematurely) opened, although the works are still in a very immature state. The vast arched span of the station area is already roofed, or nearly so, but the frontage is not yet raised much above the hoarding. The whole range of houses eastward to the Great Northern station has been removed, as some time since suggested in the *Builder*.

FROM SCOTLAND.

Dumfries.—The *Dumfries Courier* gives a detailed description of Greyfriars Church, recently completed. The church occupies the site of what for nearly a century and a half was known as the New Church at Dumfries. A row of shabby buildings partially intercepting the view from the High-street has been removed. The style of the church is Second Pointed. The principal or entrance-front faces the High-street, and the central feature in the facade is a tower, surmounted by a spire, the height in all about 180 ft. The main tower is flanked right and left by small circular towers, in which are staircases leading to the galleries. These towers are interspersed with buttresses, surmounted with crocketed pinnacles. Adjoining the staircase towers, rise the angular gables of the aisles. The tower windows are filled with tracery, and the upper portion of these gables is filled with triple windows, the piers of which have pillars with enriched capitals. Between the staircase towers and the aisle gables rise octagonal spirals to the height of 80 ft. The interior is entered through a vestibule about 14 ft. square, with a groined ceiling. The building is seated for about 1,050, but a much larger number could be accommodated. The dimensions are about 70 ft. by 63 ft. The nave and transepts are each about 31 ft. wide, and the aisles 15 ft. wide. The clustered pillars which support the nave walls carry the gallery front. At the southern end of the gallery, and fronting the pulpit, are the magistrates' seats, the orchestra, and the organ-gallery. The large north-west window has been filled with stained glass, the gift of Mr. John Lindsay Scott. The window has six upright compartments, which contain illustrations of leading incidents in the life of our Lord. This work has been executed by Messrs. James Ballantine & Son, of Edinburgh. The whole of the other windows throughout the church are filled with cathedral tinted glass, having stained-glass borders, the latter being executed by the same firm.

Kirkwall Market-Cross.—The Market-Cross of Kirkwall, Orkney, was blown down during a recent gale of wind, leaving only a small stump standing above the steps. The Cross was a freestone erection, of about 6 ft. in height, and bore its date 1521.

The House of Airlie.—The Earl of Airlie intends, it is said, to erect another mansion, contiguous to the site of the famous old castle, “the bonny House of Airlie” of the well-known Scotch ballad. The new edifice will cost from seventy to eighty thousand pounds, and the work has been entrusted to an English architect.

CHURCH-BUILDING NEWS.

Heigham.—A meeting of the inhabitants of the new district parish of St. Philip, Heigham, has been held, for the purpose of considering the present entire want of church accommodation, and to take steps for the erection of a church. The meeting resolved that steps be at once taken to build a church to hold 800, at a cost of 4,000*l.*, and a committee was appointed to carry out the purpose of the meeting.

Rosemarket.—Alterations and improvements have been recently effected in the parish church of Rosemarket, Pembrokeshire, from the designs of Mr. E. H. Lingen Barker, architect, of London and Hereford. The chief additions consist of a western bell-tower and vestry. The execution of the works has been carried out by local tradesmen.

Alford.—The Church of Alford, which is of the time of Edward III, has been restored, and re-opened by the bishop of the diocese. The accommodation was very meagre, and the seats most uncomfortable. The restoration and enlargement, by building a new north aisle, have been carried out by Messrs. Haslip & White, under the superintendence of Mr. Geo. Gilbert Scott. The dimensions of the church are,—nave, 69 ft. by 20 ft., divided into four bays, by arcades of octagonal columns and deeply moulded arches, having north and south aisles, 59 ft. by 19 ft., and a new north aisle, 59 ft. by 16 ft. 6 in. The chancel is 44 ft. deep by 20 ft. wide, and the minister's vestry and organ-chamber are 29 ft. long by 13 ft. wide. The organ-chamber opens out into the chancel with lofty arches. The style adopted is Second Pointed, the windows and other architectural details being as nearly as could be ascertained of the date of the original building. The arches of the nave and chancel are moulded, having foliated capitals and moulded bases. The tower side of the chancel arch seems originally to have contained nine painted colours our Lord and the Twelve Apostles. The lower arch is of great depth. The large east window is of five lights, the upper part of which is filled in with tracery of elongated quatrefoils. On the north and south sides of the nave there are three windows of three lights each, square-headed, with perpendicular tracery. In the new north aisle the east and west windows are of four lights each, appointed, with perpendicular tracery. In the chancel there are one window on the north side, and two on the south side, with a low side window; when and why the latter was introduced is a question. The tracery in the chancel windows is to be filled in with the remnants of the old stained glass. The roofs are open, of high pitch, stained and varnished. The chancel roof is of stained Baltic oak, in the wagon-headed shape, and the principals are moulded and supported by carved figures. The chancel screen is one step, and at the end of the choir there is a rise of the steps, then other two steps for the sacristy, which is separated by carved oak balustrades. The seats are of Baltic oak, and open, with the ends carved, of three different designs, and fixed on a wooden floor. The middle aisle is flagged with ancient tombstones, the other aisles and tower-porch being paved with Godwin's red and black tiles to various patterns. The body of the chancel is also laid with the same class of tiles, and the upper part with Godwin's encaustic tiles. The windows are glazed with pale green cathedral glass, in small diamond lead quarries. The exterior has been eased with dark green sandstone from the Worlaby quarries, with the exception of the north, south, and east sides of the tower, which has been pointed only, to show the fact of the restoration. The roofs are covered with pale Westmoreland slates, having moulded stone ridges, and the gable-ends being surmounted by binnacles and crosses of various designs. The tower doors are of oak, and are hung on wrought-iron hinges from the Medieval metal works of Messrs. Peard & Jackson, of London. The gas standards are from the same works. The church is to be heated by four stoves. A memorial window is likely to be erected at the east end of the south aisle. The chancel stalls and screen are of wainscot. The accommodation in fixed fittings is for about 600, but the church is capable of accommodating about 750 persons. The green sandstone has been presented by Mr. Nelson, the light stone for the angles and windows millions, &c., is from the Ancaster quarries. The new gargoyles and heads on the corbel stones on either side of the doors and windows have been carved by Messrs. Ruddle,

of London, and the tracery under the spire of London, and the tracery under the spire of London, and the tracery under the spire of London.

Hailsham.—A committee has been appointed by the ratepayers to consider as to the dilapidated state of the parish church and its repair. From an estimate prepared by Mr. E. Christian, architect, it seems that about 1,000*l.* or 1,100*l.* will be required as follows:—South aisle, repairing roof, opening out and making good the timbers, and retiling, 165*l.*; repairs of south and west walls of the aisle, which require almost rebuilding, including the renewal of the windows in stone of proper character, 290*l.*; remodelling and repair of south porch, 65*l.*; opening and repairing roof of nave and joining new ceiling between the rafters, 185*l.*; repairs to roof of north aisle, 140*l.*; repairs to walls and restoration of windows, 96*l.*; opening out of the archway of tower, restoring the window, replastering walls, and renewing floor, 95*l.*

Waverley.—The foundation-stone of a new chapel-of-ease to Holy Trinity Church, Waverley, has been laid. It is to be called St. Bridget's. The proposed church will be surrounded on the west, north, and east sides by Bagot-street, Lawrence-street, and Thorneycroft-road respectively. The dimensions of the edifice are,—breadth, 60 ft.; length, 126 ft.; the east end terminating with a semicircular apse or tribune the full width of the nave. The nave will be 93 ft. by 34 ft., and 47 ft. high to the ceiling; will be divided longitudinally into nine bays, and transversely into three bays or divisions; the ceiling being horizontal, and partitioned into twenty-seven sunk and enriched panels, surrounded by a deep cornice. The columns in the nave and at the entrance of the tribune (eighteen in all) will have shafts of Irish red marble. The height from the floor to the springing of the arches above the capitals will be 17 ft. 6 in. in the nave, and 23 ft. at the opening of the tribune. The principal entrance will be in Bagot-street, through an arched opening 11 ft. wide, leading into a vestibule or narthex 37 ft. by 8 ft., which will be vaulted in brick-work and decorated with panelling. A tower to contain a peal of bells is proposed to be built at the north-west corner of the church. The vestries will be placed at the south-east, and separated from the chancel by an arcaded screen. The organ is proposed to be placed in the opposite bay or division, on the north side. The church proper will be lighted by forty-five windows, twenty-one occupying the clearstory, and they will be filled in with coloured glass. Arrangements will also be made for lighting the church at night. There are to be no galleries, but seats provided on the floor for about 800. The choir-stalls, desks, doors, and other joinery will be carried out in Dantzic oak. The characteristic features of St. Bridget's Church are based upon those exemplified in the basilicas at Rome, as affording one of the best means of accommodating a large congregation without interruption to the sight or ear. It is intended, so soon as the requisite funds are provided, to enrich the interior walls and ceiling with coloured decorations, and the architect has prepared a perspective view in water-colours, showing what is proposed to be done. The requisite designs for the building, with the window-glass, furniture, and decorations throughout, are being executed by Mr. Edward A. Heffer, of Liverpool, architect. The contract has been let to Messrs. Nicholson & Ayre, of Liverpool. The brickwork will be carried out by Messrs. Mackinson & Glover; masonry by Mr. J. Grindrod, slating and plastering by Mr. William Callaghan; the marble columns being supplied by Mr. Stubbs. The sum subscribed to carry out the design is 5,200*l.*, leaving about 1,400*l.* to be raised to meet the expense of the work.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Ross.—The school-chapel, at the rear of the Rev. Dr. Marshall's residence at the Crofts, Ross, has been opened for divine worship. The building, which is a very plain one, measures 50 ft. by 22 ft., and will, we understand, accommodate about 200 persons. The interior presents the usual appearance of a Roman Catholic chapel. The sanctuary is divided from the body of the chapel by a step and curtains. The altar is a temporary one, and over it is a life-size crucifix, made of Herefordshire oak, and presented by the Rev. Dr. Vaughan, of Belmont Priory. Mr. F. Vaughan has also presented statues of

the Virgin Mary and St. Joseph. The builder was Mr. William Parry, of Goodrich. The bell was obtained from the establishment of Mr. Smith, ironmonger, Ross.

Ancoats.—The corner stone of a new chapel has been laid on a site in George Leigh-street, Ancoats. The edifice will be a brick one, and the style Early English. The frontage will be in George Leigh-street, from which there will be three entrances, one to the nave and the others to the aisles. Over the centre entrance will be a large three-light window; there will be a two-light window on each side of the centre doorway, and a trefoil window over the aisle doors. A small bell-turret will surmount the western façade. At the east end there will be a three-light window, and also one looking into the Lady Chapel. The edifice will be also additionally provided with dormer lights along the aisle roof, and the clearstory windows will also afford some accommodation in this respect. The nave will be disposed into five bays, with pillars of polished red granite. The total length of the building will be 87 ft. 6 in., and the breadth, 61 ft.; while the height, from floor to top of belfry, will be 71 ft. 6 in. The Lady Chapel will be at the north-east corner, and the vestry at the south-east, and there will be accommodation for about 1,000 persons. The expenditure, exclusive of fittings, will be 2,000*l.*, and the land will cost 1,200*l.* The architect is Mr. W. Nicholson.

STAINED GLASS.

St. Mary's, Bury.—The stained glass with which the west window of the north aisle of this church has been filled is a memorial of the late Misses Harrison. The lights below the transom are occupied by one subject, the Last Supper. The upper lights are filled with representations of the following incidents preceding and commencing the history of our Lord,—namely, the arrival of Mary and Joseph at the inn at Bethlehem, the adoration of the Magi, and the flight into Egypt. In the upper traceries are angels bearing a scroll, and above these other angels holding musical instruments. The symbolical Alpha and Omega also appear, and the emblem of the Holy Spirit in the apex of the window. The window was supplied by Mr. H. Hughes, of London, the donor being Mr. J. Harrison Allan, who inherits the property of the ladies to whose memory it is inserted.

Leeds Parish Church.—A memorial window, of stained glass has been recently placed in the north corner of the west gallery of this church. The subject of the first light is the Good Samaritan; of the centre light, our Lord healing the Lame Man at the Pool of Bethesda; and of the third light, St. Peter raising Dorcas. The ground-work is composed of the passion-flower and leaves, and below is an inscription in memory of Mr. Samuel Smith, well known as an eminent practitioner, and for many years the senior surgeon of the General Infirmary at Leeds, a member of the congregation, and churchwarden of the parish. Messrs. O'Connor, of Berners-street, London, are the artists, and the window is presented by the sons of Mr. Smith.

Miscellaneous.

ACCIDENT WITH A BALCONY.—A Greek gentleman, the other day, was leaning on a balcony at Brighton, when it gave way, and he was precipitated to the pavement.

THE LONDON ARTISANS' CLUB AND TRADES' HALL COMPANY.—A public meeting on this subject has been held at the Cleveland Hall, Fitzroy-square, Mr. McCallagh Torrens, M.P., in the chair. There was a large attendance. The Rev. Henry Solly detailed the objects of the promoters of the company, who were all working men. It was proposed to lease or build a hall in a central part of London, capable of holding at least 1,000 persons seated, with library, reading-rooms, and refreshment-rooms, attached, for the use of trade, benefit, and other societies. The shares were 1*l.* each, payable by instalments of 2s. 6d. per month. Up to the present time 250 shares had been taken up by 140 persons, and as soon as 200 shareholders had been enrolled, a meeting would be held to elect the directors. A resolution approving the scheme, and pledging the meeting to its support, was unanimously agreed to.

THE MONUMENT TO ABRAHAM LINCOLN.—The National Lincoln Monument Association have adopted the design of the American sculptor, Larkin G. Mead.

PHOTOGRAPHS OF EGYPTIAN ANTIQUITIES.—The photographic mission sent by the North German Federation into Upper Egypt, under the direction of Dr. Dümichen, to take photographs of a series of antique monuments and inscriptions, lately left Cairo on board the *Aigle*, which navigated the Nile under the flag of the Confederation.

RE-OPENING OF THE CENTRAL EXCHANGE NEWS-ROOM, NEWCASTLE-UPON-TYNE.—This building has been re-opened on its restoration from the ravages of fire. Only few alterations have been made on it as left by the late Mr. Crainger, its architect. The light is a little stronger, and the room more lively. The massive pillars, formerly painted in granite, now represent marble. In a short time the triangular block of buildings will present its former appearance, and even the dome at the south-eastern extremity will, thanks, chiefly, to Alderman Dodds, be restored. The entire work connected with the restorations has been carried on in accordance with the directions of Mr. Wm. Parnell, the architect, by Mr. Francis Jackson, as contractor.

THE GREAT YARMOUTH SCHOOL OF ART.—The prizes awarded to this school at the annual examination in March last have been presented to the successful students at the Town-hall, by the Mayor. The honorary secretary, Captain Cobitt, said, with regard to the general progress of the schools of art and navigation, that in both a decided progress had been evinced during the last as compared with the previous year, both in the number of pupils and the results as exhibited at the last examination. In the school of art, the number had increased, especially of artisans. This was the more satisfactory to this school, for though used by all classes in the town, it was particularly designed for the improvement and culture of the artisan classes. Hitherto the school had not been used to the extent it was desired by this class, but, thanks to the present excellent master, Mr. Dornay, they had succeeded in attracting a very respectable number.

THE METROPOLITAN ASYLUMS' BOARD.—The board of managers of the metropolitan asylums' district met on Saturday for the first time since the vacation, at the board-room of the Metropolitan Board of Works, Spring-gardens. Dr. Brewer occupied the chair. Letters were received from the Poor-law Board, approving of applications to the Public Works Loan Commissioners for 15,500*l.* for the purchase of the site at Stockwell, and for 128,000*l.* (or 64,000*l.*, a moiety thereof) for the purposes of the Leavesden Asylum. The finance committee reported that having had under their consideration the question of the contribution to be assessed upon the several parishes and unions to meet the demands upon the managers, they recommended the levying of a rate of one-eighth of a penny in the pound, to be payable on the 25th December of the present year. The report was adopted.

GAS HEAT FOR STEAM.—In one of the piles of warehouses belonging to the London and St. Katherine Dock Company, in Cutler-street, steam machinery has been introduced, the different fire offices having approved Jackson's patent, by which the boiler is heated by gas instead of coals. The east area of the dock company's premises will henceforth be worked by the steam lift, without any additional premium being incurred by its adoption. The boiler is placed in a small house built out from the top floor between two warehouses; for there is this stipulation, that even the safe gas-furnace shall not be actually inside the walls, among the merchandise. A considerable length of pipe is therefore necessary through which the steam passes before it can be brought to bear on the engine; but the tube is covered with a coating which is so good a non-conductor that the radiation of heat is very trifling. The circular furnace beneath the boiler contains a series of burners which, when they are all lighted, will raise steam to 50 lb. from cold water in twenty-five minutes. The burners may then be extinguished with the exception of one or two, which are sufficient to keep the pressure-gauge stationary, until power is wanted, when instantaneously the furnace is rekindled, and the engine set in motion. The lift is 55 ft. from the ground below, and more than 500 chests of tea are raised in an hour.

UTILIZATION OF SEWAGE.—Mr. R. B. Grantham, C.E., has been commissioned by the British Association for the Advancement of Science, to draw up annual reports on the treatment and utilization of sewage in connexion with the drainage of towns, in order that such facts and information as may guide future operations may be recorded from time to time. He is requested to include in the details of each report—1. The special circumstances of each case, such as the extent of the district, the population, and the number of houses with or without the benefit of drainage. 2. The character of the sewage and water supply adopted in the district, and the quantity of sewage at disposal. 3. The mode of disposing of the sewage, with description of the works, and their cost. 4. The result pecuniarily to the district, and to those who are selling or applying the sewage to the land or otherwise, in any form whatever. We anticipate much advantage from this undertaking.

THE CONSUMPTION OF SMOKE.—A copy of Mr. Rawlinson's report to the Home Secretary of his recent inquiry as to the alleged neglect of the town council of Hanley to enforce the smoke clauses of the Sanitary Act, 1866, has been received by the town clerk from the Home-office, together with a letter from Mr. T. Taylor, who writes—"I am to request the early consideration of the report by the council, and to state that the clauses for the prevention of smoke, as embodied in the Sanitary Act, 1866, must be duly and properly enforced." Mr. Rawlinson reports that the allegations of the memorialists have been substantiated by the evidence adduced at the inquiry, and that the town council had taken no effective steps to enforce the Act prior to his first visit in July. They had now taken the preliminary steps, and had promised to carry out the Act as far as practicable. Time would be required to make certain structural and other alterations in furnaces and chimneys, and Mr. Rawlinson thinks that a year from the 1st of November next may reasonably be allowed for this purpose. Immediate action should, however, be taken to enforce the law against the worst cases, and this action should be continued. Mr. Rawlinson points out that the consumption of smoke has been proved to be practicable, and says where it is earnestly enforced, as in London and other places, the results are alike beneficial to the manufacturers and the general public. If the towns do not now act for themselves they may expect the interference of other powers.

THE WORKING CLASSES AND TRADES' UNIONS.—The proceedings at the late International Congress of Workmen give interest to an article entitled "*Les Associations Ouvrières en Angleterre*," by Dr. Montucci, which has just appeared in the September number of the *Revue Britannique*. We glean from it the following curious calculation, by which the author endeavours to show what the workman gains by contributing to a trades' union:—Taking the most common case, that of wages ranging between 30*s.* and 40*s.* a week, suppose the workman to pay into the savings bank the 4*s.* a week he now pays into the union; there his money will, at the lowest, produce 3 per cent. interest, payable every six months. As the workman gets nothing in that shape from his union, it is but fair to admit that, in the case under consideration, he leaves his interest to accumulate in the savings bank. Now, calculating the produce of his capital at compound interest, with the regular weekly increase of four shillings, the workman, at the end of twenty years will find himself in possession of a sum of 880*l.* Allowing for illness and other mishaps, let it be 800*l.* Now, it is clear that, with such a capital at command, a shop may be opened, some profitable business or other may be carried on by the wife, while the husband, not older than 50, perhaps, at the time, earns his wages as usual at his master's establishment, with the certainty of having secured comfortable means of living for his old age. Comparing this hypothetical state of things with the real one, the author of the article shows that the workman who contributes to the union fund at the end of the twenty years has nothing; that by belonging to the association he loses not only the 10*l.* a year to which his subscription amounts, but also, on an average, three months' work per annum, in consequence of strikes and other direct or indirect interference with the regular course of business; so that his means are reduced to 72*l.* per annum, instead of 110*l.*, as they would be in the former case.—*Galtgnani.*

THE CLOCK-TOWER, LEICESTER.—The Haymarket Memorial Clock-tower Committee, in closing their labours, have presented a report to their subscribers, congratulating them on the successful attainment of their object. The committee believe that the memorial "will bear favourable comparison with any similar architectural work in the kingdom, and which will thus prove a permanent monument to the honour of the four eminent benefactors represented on the building, as well as to the designer, the executors, the subscribers, and the town at large. The total amount subscribed was 872*l.* 2*s.* 9*d.*

EXPERIMENTS WITH SEWAGE AT WREXHAM.—Lenk's purifying process has been tried at Wrexham. It is one of precipitation, by means of sulphate of alumina with alum and water. The result seems to have been that the most offensive portion of the sewage was precipitated, leaving a milky solution of tolerable purity. This mixture is put to the sewage, one part to 1,000, and the cost is one penny per 1,000 gallons of sewage, which would amount to a considerable sum a year for the deodorization of the Wrexham sewage, towards counterbalancing the proceeds from the sale of the deposit. That, however, is not the chief consideration.

GENERAL UNION OF CARPENTERS AND JOINERS OF GREAT BRITAIN.—The members of the city of Gloucester lodge of this society have held their annual dinner at the Talbot Inn, Gloucester. About thirty members and friends attended. Brother England was called to the chair, and Brother Panter to the vice-chair. The usual toasts were given, and the toast of "Success to the General Union" was drunk with enthusiasm, and responded to by Mr. Robert Last, general secretary of the union. The toast of "Success to the City of Gloucester Lodge" was proposed, and responded to by the lodge secretary, who gave a financial report of the income and expenditure for the year ending July 31st, 1868, and stated that the lodge was making steady progress. "Prosperity to the Master Builders of Gloucester" was given, and honoured.

THE GOVERNMENT AND THE TELEGRAPHS.—At the last weekly meeting of the Metropolitan Board of Works, the clerk to the Board read a letter from Mr. Soudamore, of the General Post-Office, stating that the Postmaster-General (the Duke of Montrose) was now considering the arrangements which would be necessary to construct the system of Post-office telegraph communication contemplated by the Act of last session; and that it was believed that the subways and sewers belonging to the Board could be made use of to a great extent, and required the Board to favour his Grace with a plan showing the direction of any sewer or subway which might appear suitable for the purpose, and any suggestions. Mr. Pollard said that instructions had been given to Mr. Bazalgette to supply the plans asked for. Mr. Cyrus Taylor thought that they should receive in return facilities for communication between the various Fire Brigade stations.

PARIS ART SCHOOLS.—At the distribution of prizes to the pupils of the Municipal School of Drawing and Sculpture, M. Robert Fleury, who presided, said that up to 1830 only one school of art existed for the working classes, and that at the present moment there are fifty evening schools of art in Paris, where more than 4,000 pupils can study; the models chosen, with care, by a commission, are sent to all the schools; rewards are given by the municipal authorities; and the most meritorious pupils receive prizes of honour from the Emperor. The Prefect of the Seine has caused large school-houses to be built to replace those whose accommodation had become insufficient. The school of the Rue des Petits Hôtels, which is one of these, has room for 3,000 pupils. M. Robert Fleury referred to the courses of geometric drawing, sculpture, and elementary anatomy, established by M. Lequin, and said that the education given in these schools answered all the wants of the industrial arts. "Continue, then," said M. Robert Fleury, "to profit by the encouragement which is offered to you; make free use of the advantages which the country and the Government place at your disposal, and all difficulties will give way before your perseverance. Imbibe as much as possible of the spirit of the best models of antiquity and of the Renaissance; exercise yourselves in composition and invention; but remember that, though fancy is admissible in industrial art, it should never overstep the limits of good taste."

The Builder.

VOL. XXVI.—No. 1340.

"Social Science."

THE "Social Science Association" labours under a certain disadvantage. It is one, it may be, of annually decreasing importance, but yet it is not altogether to be overlooked. It is one, moreover,

which it is easier to point out than to remedy. It is the want of a name that should be at once appropriate and distinctive. A certain group of questions, of the utmost social importance, is gradually elucidated by discussion. But we are yet far from arriving at a result worthy of the name of science, and when sanitary organisation, educational organisation, criminal legislation, and the other subjects on which such valuable information is now being collected, shall have attained a development corresponding to that of the physical sciences, the respective students and doctors of these important branches of politics will be even less likely than at present to consent to their amalgamation under an inappropriate title.

In fact, the term "Social Science" has the objectionable character of ambiguity. The subject of the study lies half-way between two widely distant systems of philosophy, to neither of which it properly belongs. It looks backward towards the "politics" of Aristotle, and forward, or at least sideways, towards the "biology," or sixth science, of Comte. But the practical aim of the discussions at Birmingham is as unlike that of the final chapters of the *Physique Sociale*, as it is to the clear synthetic argument of the Stagyrite. Of the two, it holds much closer to the Greek than to the French method. The doctrine of Aristotle as to the State, and the rights and duties of the citizen, is reduced to that clear and systematic form which was proper to a mind that conceived of all exact knowledge under the general term of "mathematics." But while stating and demonstrating his propositions with all the rigidity of Euclid himself, Aristotle does not evolve his political doctrine from his own ideas of primary principles. He travelled much, observed much, and compared and classified all that he saw, before he wrote. He studied the working of the politics of his day before he spoke of the laws which regulated their working. The treatise of Aristotle was founded on the best statistics that he could procure; and that great philosopher adds to his other claims to the primate's throne of human intelligence that of having been the first statistician, as well as, in spite of the ungenerous efforts of Bacon to deprive him of the title, the first inductive discoverer. The main difference between a treatise on political principles written to-day (if by such a pen as that of the Stagyrite) and the Greek acroatic treatises, is to be found in the increase in the number of facts to be mastered. When the number of 50,000 inhabitants was regarded as the limit of a city, even Aristotle himself was unable to exhaust the case of a metropolis containing 3,000,000 of souls. In all that relates to the position of man as the questioner and compeller of nature, the greater part of the civilised

world of the time of Aristotle could be replaced out of the surplus population of our European cities, without the fact becoming known to the basier portion of the population.

England in 1868, then, differs from Athens in the age of Aristotle, to an extent that may be measured by the lapse of so long a chronological period. Where the Attic philosopher thought of thousands, we have to think of hundreds of thousands, if not of millions. But that part of the political science which depends on the stability of human nature remains unchanged. The ethics of the Greek master are as true to the life of to-day as to that of the age of Alexander. True it is, that the ablest writers on political science have dipped their pens in the inexhaustible source of Greek philosophy, and have been for the most part successful in their dealing with the facts of their own day, in proportion to their acquaintance with the course and the records of history.

The great French writer, on the other hand, looks at sociology from an opposite point of view. He will not allow the name of science to a tentative process, such as all our political action must long continue to be. He requires the student to exhaust the knowledge of the phenomena of inorganic existence, before acquiring that of the phenomena of organised bodies. This latter study—organic physics—he divides into the phenomena which concern the individual, or physiology; and those which concern the species, or sociology. At this last of all possible sciences man can only duly and satisfactorily arrive, after passing through the simpler studies. Thus it is only at some long distant and indefinite future that the positive philosopher can hope to arrive at the point where the basis of Social Science can be laid. And if we remember that M. Comte considers the mastery of any science to be unattained until the power of prediction is grasped by the student (as in the case of eclipses in astronomy), we must confess that all the positive writing on sociology intimately partakes of the nature of a shot in the dark.

Now, we hold that the aim and the useful upshot of such associations as that to which other references will be found in our columns, is very opposite to that of the positive philosopher. Nor do they properly include that political science which is historical in its character. An estimate formed, for instance, from an exhaustive view of the history of Spain, as to the course of the present revolution, would be out of place at Birmingham. Yet nothing would come more strictly within the province of the real political student. The part to be played by our Birmingham fellow-labourers is distinct from that of either of the above-named philosophers. We hold that part to be of no inferior importance, and to be especially germane to the genius of the English people. The main point is the collection of facts, the acquirement of knowledge that is positive, not in the sense in which that word is used by a school, but in that of the ordinary vernacular. It is not the object of the Association to support particular theories. We might say that it is not its object to arrive at theories; were it not that the apprehension of that true and ultimate theory which explains the law of facts is a necessary step in the perfection of knowledge.

The object, then, of such association is to curtail the province of opinion. It is to substitute the knowledge of what is known for the knowledge of what is thought or taken for granted. Opinion, after all, is only another name for ignorance. No person has any opinion as to the problems of Euclid. If one were to hear any individual express an opinion unfavorable to the truth of the forty-seventh proposition of the first book, it would not be the intellectual character of Euclid that would be in jeopardy. Now there are many subjects of the utmost import-

ance to our social welfare the leading principles of which are as fixed as the relations of the containing sides and the hypotenuse of a right angle, as to which nine people out of ten have not yet gone beyond the state of opinion. Many people have "opinions" as to inconvertible bank-notes. That is a case in point. It is one on which "opinion" means ignorance. Again, there are many other no less important points on which the most advanced of us are still in a state of "opinion." The vital question of the disposal of the sewage of great cities and towns is one of these. Our positive knowledge of facts is not yet quite such as to allow us to lay down absolutely the general principles on which this problem should be everywhere solved. But, mean time, there is much to be done by way of clearing the ground. In every science, as in every art, the first step to progress is, to know what is known. An immense amount of working power is frittered away from the simple fact that minds naturally fitted to originate, to improve, or to combine, are left in ignorance as to what has already been discovered in the province with which they seek to deal. Biography is full of instances of the kind, such as that of Ferguson, the astronomer. Those conversant with the business of the Patent Office are pretty fully aware how often the same discovery has been made and remade by persons entirely ignorant of the labours of their predecessors. They are also aware how often the same pseudo-discovery has been made,—how often an inventor has devoted years of life and hundreds of pounds to the prosecution of some supposed improvement, the design of which cannot be put on paper without evincing an entire ignorance of mechanical law. In such struggles in the dark the mind of the inventor may indeed acquire a rough and useful schooling, but, had the efforts thus made been preceded by the knowledge of how much was already known on the subject, the results would no longer have been purely subjective. It is society that is the greatest sufferer by the non-education of powerful and original minds.

In meeting that great want of the day, a want more obvious in our own country than in the more systematically educated parts of Europe, the association to which we refer has an important function to fulfil. To bring out clearly and distinctly into the light of day the actual state of the main questions affecting man as a citizen, is a far nobler task than to legislate, as we now do, from hand to mouth. The proudest triumph of a party leader is paltry and contemptible, when compared with the triumph of him who fully, clearly, and irresistibly first demonstrates a new truth. The minister may command his majority, or the opposition leader may overthrow the cabinet, by an effort of what we complacently call Parliamentary eloquence. What is the result? A. draws the quarter's salary which B. would otherwise have received. Ten or twenty years hence who cares which was which? But the man who clearly demonstrates a scientific truth, before unknown, obtains a triumph that endures for ever. True, his name may be forgotten, but his work abides. He has laid down a new stepping-stone for the human mind through the slough of ignorance. He has won a new district, be it large or small, from the cloudy and indistinct regions of opinion, and added it to the *terra firma* of real knowledge. Truth, once grasped by the individual mind, may, indeed, remain uncommunicated, and thus fail to benefit mankind. But truth when not only grasped, but clearly and plainly enounced and co-ordinated with other truths, is a permanent gain to the race.

In no group of social questions is this advance from the state of opinion to that of knowledge more discernible than in those which relate to sanitary regulations. What was the state of public opinion on this subject when the cholera

first visited our shores, some five-and-thirty years ago? What is it now? When we find, as was stated at the meeting, an undrained, unwholesome, uncleanly nook in the midst of a thriving town, and when a visitor calls attention to the fact, how is the announcement met? By the assurance, whether correct or incorrect we will not stop to inquire now, that the subject is on the very point of receiving some attention! How would Birmingham have greeted such an interference from a stranger in 1834? By a recommendation to mind his own business, and by an assertion that the midden-heap was as salubrious as it was convenient and prescriptive. The difference in the mode in which the subject is regarded is simply owing to the dissemination of exact knowledge on the subject. Opinion, indeed, is not yet altogether routed and destroyed. The cesspool and the midden-heap have still their patrons. It is likely to be long before a single abuse or evil that existed when the nineteenth century was young, will fail to find some advocates to palliate or to excuse it. But the majority of reading people have ceased to hold opinions on the subject. They know that the absence of sewerage means the presence of ill-health. They do not discuss; they seek to act. And, although the subject is yet very far from having arrived at a satisfactory state,—although the questions of river pollution, of earth-closets, of defecation of sewage, of surface- or sub-drainage, of rainfall, and the like, yet require much thoughtful study, we are yet gradually disseminating the knowledge of the truth that uncleanliness involves ill-health.

The same rule applies to the discussion of all questions that, to the exclusion of party squabble, are truly political; that is to say, that regard the well-being of man as a member of a community. Their principles are for the most part eminently simple; yet, simple as they are, they are so obscured by the mist of passion or of prejudice, that they have long formed the battleground of opinion. Gradually this must disappear. The first step is the collection of facts; the second is their due co-ordination,—a co-ordination which may be tested by the circumstance that anomalous and long-misunderstood facts find their explanation under the general theory. Then comes the dissemination of truth. Old "opinion" passes into the decrepitude of "old-fashioned prejudice," and the work of amendment becomes complete.

Thus to collect and thus to distribute the knowledge of what is known is the self-imposed task of the members of the Association. They may call themselves students of social science; they are labourers in the great field of political economy, or rather of economical politics, who deserve well of their fellow-citizens for their care of the common weal. But their work deserves to be called economical rather than political, since it regards not the special interest of the individual state so much as the general welfare of the habitable world.

SCIOGRAPHY.

A HUNDRED and fifty years ago the learned few who knew there was such a word as Scio-graphy in the world of words, attached a different meaning to it from that it represents in the present day. It was explained at that time as a profile or platform, or the first rude draught of a thing. It also represented the art of dialling or of showing the time of the day by shadows; and astronomers used it to express the art by which they found out the hour of the day or night by the shadow of the sun, moon, or stars. As far as it concerned architecture it simply meant the profile mentioned above, now called an outline, or a section, then described as "the draught of a building out in its length or breadth, to show the inside of it, as the conveyance of every room, with the thickness of the walls, timber works, floors, vaults, &c." So lately as the period of the compilation of Rees's "Cyclopaedia," scio-graphy and scio-graphy are both explained as "the profile, or section, of a building to show the inside of it." As with many scores of English words, however, we have sifted and shifted the meaning of these kindred terms, and they are not now by any means so interchangeable. Profile, in the architectural world, is extinct, though it still flourishes in the portrait-painter's studio; platforms, too, have vanished from the modern draughtsman's vocabulary, enticed, perhaps, by the high office held out to them at public meetings; and scio-graphy

no longer means the outline of a building, but the outline of the shadows that are cast from that building. As precision of terms is one means of progress, as well as one sign of it, we may congratulate ourselves upon being on the right road.

We have before us a work on this science of the projection of shadows by Dr. Puckett.* He tells us most of his text and many of his diagrams were prepared as blackboard lessons for the students of the Bath School of Art who are under his instruction. No progressive textbook being at hand, he called upon his own resources; and, aided by hints derived from the lectures on perspective at the Royal Academy by the late Professor of Perspective, J. P. Knight, R.A., and by thoughts suggested by Dr. Brooks Taylor's more advanced work upon the same subject, he has endeavoured to fill up this void for other teachers and pupils by placing his lessons in their hands. Before a student is in a position to be benefited by our author's labours he must be familiar with linear perspective; scio-graphy, from its very nature, cannot be more than a supplement to perspective. But to architectural students his work is likely to be of great use, as errors in shadows, their spendthrift profusion, and the idle withholding of them altogether are as pitfalls in their paths, into which they must certainly fall without a sound knowledge of the principles that govern them.

Dr. Puckett lays down the primary laws of shadows in these plain terms:—

"The direct shining of the sun, or other luminous body, is in the form of rays, or thin ethereal lines, each acting independently of the other; no such separation of parts is observable in common circumstances, in consequence of the diffusive properties of the atmosphere."

When the medium in which the rays of light move be of uniform density, they will always spread in straight lines from the luminous body which produces them.

In consequence of this directness, a shadow or darkened spot is observable behind any opaque object presented to the light. During night, we are in the earth's shadow; and this shadow reaches so far beyond us into space, that when the moon plunges into it in her course, she undergoes an eclipse.

In proportion as light advances from its seat of production it diminishes in intensity. The ratio of diminution is agreeable to that which governs physical forces,—i.e., the intensity of the light will diminish as the square of the distance increases, or at the rate of 1, 4, 16, &c. But in proportion as we lose in intensity, we gain in volume; the light is the weaker the further it is from the candle, but it is filling a wider space. This continual receding of the rays of light from each other, as the word implies, forms radii, proceeding from a centre."

Notwithstanding this radiation, the sun's rays, owing to the immensity of space they traverse, are conventionally divested of their almost imperceptible divergence, and considered to be parallel to each other. In accordance with this accepted fiction, the first lesson to be worked out by the student is proof of the fact that when the direction of the sun's rays to the plane of delineation is parallel to that plane, lines that represent rays of light must be drawn parallel to one another." Two corollaries are deduced from the problem in which this statement is proved: first, the shadow on a plane of any point must lie on the intersection with that plane of one containing the ray of light that casts the shadow; and, secondly, shadows thrown by lines upon planes parallel to such lines vanish to the vanishing point of the plane on which the lines lie. From this elementary platform, if we may use the expression, the pupil steps upwards to the consideration of more intricate shadows. Sometimes he is placed with his back to the sun, sometimes with his face to the great luminary, sometimes he is placed immediately under it so that its rays pour down upon his devoted head; and in all these varied circumstances he is instructed to take due note of the immutable mystery and certainty of the projection of shadows. There are twenty lessons in all, leading from shadows from planes, oblique and otherwise, and upon them, to shadows upon and from curvilinear and spherical surfaces. This is the mode in which shadows are thrown upon and from oblique planes. A truncated pyramid placed in perspective, making angles of 45° with the plane of delineation, casts a shadow upon an oblong figure with a gabled apex that is placed at a more acute angle with the plane of delineation, which, in its turn, casts a shadow upon the ground. It is necessary, to delineate the proper projection of these shadows, after determining the azimuth and the altitude of the sun, to find the axis of the pyramid. The student is then directed to draw a line by the vanishing point of the sun's rays upon the ground until it is intersected by

the ray of light from the luminary containing the apex. At its intersection with the vertical plane he is to draw a perpendicular line meeting the ray of light that tips the apex of the pyramid; and then lines drawn by the vanishing point of the sun's rays upon the horizontal plane through the corners of the base of the pyramid, and cutting the vertical face of the block, and carried to that just mentioned, will give the form of shadow. Without the author's diagrams, and his references to them, the process is more difficult to follow than with those aids. We must add, however, the vanishing point for the shadow thrown by the axis of the pyramid upon the oblique plane is obtained by the intersection of a line joining the accidental vanishing point of the oblique plane with V. P. 3, with the vertical trace of the sun's rays upon the plane of delineation. The shadow upon the ground is obtained by lines drawn by the vanishing point of the sun's rays upon the ground, and out by rays through certain points not to be indicated without the diagram.

By the time he has arrived at the seventeenth lesson the pupil is assumed to be proficient enough to understand the mode of finding shadows thrown by artificial light in the interior of rooms. Here we have a diagram showing a chamber, with a hookcase and a box in it, and a square plane suspended from the ceiling, with strong lights and shadows playing upon the whole. Dr. Puckett explains that the shadows cast by an artificial light are governed by the same principle as those that are cast by the sun, viz.: "the union of the luminary, the vanishing point of the plane receiving the shadow, with the trace of plane throwing the shadow." The luminous point, however, is always represented before the spectator. After going through all the shadow lines, and the means by which their exact position is ascertained, the author sums up with a remark to the effect that "the vanishing point for a shadow must be found upon the trace of the plane receiving the shadow; and the intersection upon this trace, obtained by the ray of light passing from the luminary to the vanishing point of line throwing the shadow will be the shadow's vanishing point." The eighteenth lesson brings us to the subject of reflections.

Whilst we are looking through the chapter on reflections, our author permits us to imagine ourselves seated in a boat on a lake, with the glorious hills and sky reflected in the water around us,—a delicious privilege for weary students,—for which they will gratefully thank him. Leaving them to contrast the brown rippled shadow of the boat with the radiant reflections of the light-clouded sky, we will make our more sombre way after Dr. Puckett. This is a sample of the way he treats his subject:—

"While the painter can scarcely be expected always to work out every appearance of nature with mathematical precision, the laws that govern such appearances should at least be thoroughly apprehended by him, that he may more closely imitate nature in all her diversities, and by the application of her laws be able to test the correctness of his work."

Light is diffused around us by the refractive power of the atmosphere, and therefore objects are quite visible though the rays of the sun do not strike directly upon them. The atmosphere being thus a vehicle of light, the rays of the sun must be regarded as travelling through immense regions of darkness before they reach our atmosphere, where they become diffused into that universal soft light which we observe around us. But besides being diffused by a pure atmospheric medium, light is greatly enhanced in brilliancy by reflection. If all the objects on the surface of our planet were to be black, which is the negation of all colour, the sun's light would be absorbed, or at least return no part of the rays which fell upon them, and we should, even while the sun shone, possess much less light than we now enjoy. Nature has avoided this calamity, and by producing all varieties of colours in objects, the sun's rays which fall upon them are less or more reflected or thrown back into the general mass of light. We then understand that any object we see reflects rays of light, and that these rays travel from the object to our eye as soon as we bend our vision upon it. Inasmuch, however, as a thousand or more individuals may see the same object at the same instant of time, it is evident that the rays proceed at all points, and fall upon eyes at every variety of angle."

Thus it will be seen that though it is impossible to say anything entirely new of facts that are, if not as old as Time, at least as old as our terrestrial globe, though only known to man after ages of self-culture, it is possible to state those facts in a plain manner easy to remember and understand, and that the author has done so. The students left in the boat are further told that a ray of light darting downwards in an exactly perpendicular direction to the surface of the lake will be thrown back in the exact path which it traversed in its descent, while another descending in an oblique manner will not return to the place whence it came, but will be reflected at

* Scio-graphy; or, Radial Projection of Shadows. By R. Campbell Puckett, Ph.D., Head Master of the Bath School of Art, London: Chapman & Hall, 1863, price 1s. 6d.

an angle exactly equal to that at which it descended upon it. The first-mentioned ray, or that striking the reflecting surface, is called the incident ray; the last-mentioned, or that which is returned from the reflecting surface is called the reflected ray. Further, the angle made by the incident ray with a perpendicular to the reflecting surface, called the angle of incidence, is equal to the angle made by the reflected ray, with the same perpendicular line, called the angle of reflection; and this fact affords a method of universal application by which, when the angle of incidence is found that of reflection is obtained.

The nineteenth lesson shows the method adopted of finding reflections upon a vertical surface, as a looking-glass. The pupil is required to understand that reflections upon plane surfaces always lie in planes at right angles to such surfaces, and contain the object throwing the reflection. To this end a mirror is drawn and a vase and frame placed sufficiently near it to be reflected upon it. Then follows the lineation which determines the position and extent of the reflections. The twentieth lesson illustrates the principles of reflection upon oblique planes. A lighted candle in a candlestick standing on a couple of books is placed before a swing looking-glass, the mirror of which is in an oblique direction forming an angle with the horizontal plane. The figures are placed at angles of 60° and 30° with the plane of delineation. As reflections always lie in planes perpendicular to the reflecting surface, it is necessary to find a vanishing surface, at right angles to the oblique plane. Our author then draws a line representing the trace of a plane upon the oblique surface of the mirror, which he continues until it cuts the produced axis of the candlestick. Then, he says, as the apparent distance of reflection behind the plane reflecting surface is always equal to the distance of the object from the reflecting surface, an angle must be constructed equal to that produced by the trace and the axis on the other side of the trace, the outermost line of which will give the axis of the object in the reflection. Four corollaries are deduced from the examples illustrating reflections—1. Reflections on horizontal surfaces will have the same vanishing points as the objects reflected; 2. The angle of incidence is always equal to the angle of reflection; 3. Reflections upon plane surfaces always lie in planes at right angles to such surfaces, and contain the object throwing the reflection; and, lastly, reflections upon plane surfaces will always appear to be at every point equi-distant with the objects casting the reflections to the reflecting surfaces.

The author has treated an intricate subject without entanglement, and the progressive manner in which he has arranged his lessons helps to facilitate an exact comprehension of them. Shadows are the inseparable adjuncts of realities; and we endorse his suggestion that sciography, as a means of expression of form, should be comprised in the programme of the studies of art-students.

THE NEW UNIVERSITY FOR GLASGOW.

The University of Glasgow is the second oldest university in Scotland. It was founded by Bishop Turnbull, in 1450-1, in virtue of a Bull obtained from Pope Nicholas V. and a charter granted by James II. For 100 years, however, it had no endowment. Queen Mary, in 1560, gave it a moiety of the consecrated church-property in the city; and subsequent monarchs, as well as the corporation, have increased the endowment. St. Andrews University was in existence forty years previously to that of Glasgow; but all the other Scottish seats of learning came afterwards: King's College, Aberdeen, in 1494; Marischal College, in the same city, in 1593; and the now famous Edinburgh University, in 1617. It was not until after the Reformation that Glasgow became a place of any importance, and its progress was mainly in connection with its church and university. The latter early acquired a reputation nearly equal to that of St. Andrews. Of the original building no traces now remain. The present edifice was erected between the years 1632-62; partly by public subscription, but chiefly through the magnificent benefactions of Zachary Boyd. Of this celebrated and long-winded divine the following story is told. In 1651, Protector Cromwell took up his abode here, and went one Sunday to hear service in the cathedral. Mr. Boyd officiated, and inveighed so uncompro-

misingly against Oliver, that Mr. Secretary Thurlow proposed to have the defiant and fearless minister shot. Cromwell's only answer was, "He's a fool, and you're another. I'll pay him out in his own fashion." So he asked Mr. Boyd to dinner, and concluded the entertainment with a prayer that lasted three hours. Glasgow University is the gloomiest of buildings, situated in the most squalid and unsavoury of streets to be met with from Land's End to John O'Groats'. At one time the favourite place of residence of Scottish nobility, — High-street, — with the once equally aristocratic Salt-market (where lived Bailie Nichol Jarvie), the Gallowgate, Bridgegate, and other contiguous thoroughfares, are now inhabited by a population whose counterpart is to be found in Drury-lane or St. Giles's. The buildings consist of two quadrangles, connected by a not unhandsome clock-tower; and to the north of these is a third, in which are the houses of the different professors. Over the entrance in High-street is a balcony, and the arms of the founder in basso-relievo gilt. The most noticeable feature of the outer court is a massive stone staircase leading to the hall, which is panelled with oak. Over the archway of the inner court is a carved effigy of Zachary Boyd aforesaid.

The general style of the college is a mixture of the Elizabethan with the peculiar architecture which Scotland borrowed from France in the seventeenth century. It has the balconies, the tall rectangular chimney-stacks, corner to corner, and the variously-decorated window tops of the former; while the narrow rocket-topped towers of the latter, polygonal or circular, are conspicuous in the quadrangles. Beyond the buildings comprising the class-rooms, stands the Hunterian Museum, a structure in the Grecian style, and, of course, not at all in keeping with the rest of the college. This museum was founded by the celebrated Dr. William Hunter, of London. It contains a splendid collection of anatomical curiosities, and a good one of coins, books, and paintings—the last including specimens of Rubens, Rembrandt, and Salvator Rosa. Not the least interesting of the objects of the museum is the original steam-engine which James Watt constructed, and by his experiments on which he made his great discoveries. This building was erected after a design by Stark, in the beginning of the present century, an annex having been added in 1838. The college possesses a splendid library of 50,000 volumes, and as a seat of learning it has long maintained a high position. The college green or garden, a large open space behind the museum, was the scene of the conflict in "Rob Roy" between Frank and Raskleigh Oshaldiston. Few cities in the Old World, who may safely he said, have made such rapid strides in physical development and commercial prosperity as Glasgow. In 1556, when the Scottish burghs were taxed by Queen Mary, Glasgow had a population of 4,500, and was only the eleventh city in the kingdom in wealth and population. In 1708 it was estimated at 12,776; in another century it had reached 83,769, and it has rapidly increased ever since. Thus, in 1823, the number of its inhabitants was 147,043; in 1841, 289,682; in 1851, 329,097; in 1861, 394,897; and it is now estimated that the population is half a million. The extension has been mainly westward and southward; and it has long been felt that the college was far removed from the virtual centre of St. Mungo, that its contracted limits were wholly inadequate to modern requirements, and altogether that the grim old pile, so ill-favourably situated, was unworthy of the commercial capital of Scotland. For more than twenty years has local agitation been going on, with a view to the erection of a new and more suitable *Alma Mater* for the city. So long ago as 1816, a Bill for the disposal of the present site and buildings to the Monklands Junction Railway Company, and the removal of the college, received the assent of both Houses of Parliament. Nothing came of the project, however, the railway company having failed to carry out their agreement; and, in consequence of which failure, they had to pay, we believe, some 10,000*l.* as "smart money." At length, in 1864, a sale of the college and grounds was effected with another railway company, the City of Glasgow Union, the price being 100,000*l.* With promised aid from Government, the University authorities found that they had at their disposal the sum of about 139,000*l.*, and they at once set to work to carry out the scheme of removal. The lands of Gilmore-park, an eminence separated from the west-end park by the river Kel-

vin, presented an eligible site, and accordingly these were purchased for 65,000*l.*, and adjoining ground to the westward, and also on the south bank of the Kelvin, for a further sum of 33,000*l.* The first stone of the new buildings was laid in April, 1867. Exclusive of the professors' houses, they will occupy nearly four acres on the summit of the hill. The style of the new university is that of the early part of the fourteenth century, as applied to collegiate structures. The buildings, when completed, will form an oblong rectangular pile, 600 ft. long by 300 ft. broad, divided in the middle by a building which separates two courts or quadrangles, each 180 ft. square, or nearly four times the area of the two original quadrangles of the present university. The edifice will have an imposing effect viewed from the higher portion of the west-end park. The main or south front consists of a centre and two wings, terminating in flanks, which latter project a little, and are elevated a story higher than the rest. A tower rises from the centre to a height of nearly 300 ft. It is 36 ft. square at the bottom, the walls in the lower part being 7 ft. thick. This is reduced to 4½ ft. at the bottom of the spire, which commences at a height of 178 ft. from the ground, and springs up 114 ft. higher. The tower itself is divided into six stories, lighted by arched windows.

Near the foot of the spire there will be a clock, the minute-hand of which will be 7 ft. long, and each of the numerals on the dial 20 in. long. The chief entrance pierces the centre of the tower, leading into the middle of the buildings. The various class-rooms need not be particularly described. We may mention, however, that the lower hall is 120 ft. long by 60 ft. wide, and 22 ft. high. The roof is supported by twelve fluted columns of cast-iron, united at top by ornamented iron girders. Above this is another hall, of similar dimensions, but open above to the arched roof of the building, 52 ft. from the floor. The common hall will occupy the centre building, which divides the two quadrangles, but only in its upper part. The ground-floor is to be fitted throughout its whole extent with arcades, affording communication between the two quadrangles, and also, along with the cloisters, shelter for the students. The grand stair will lead to the hall, the museum, and the library; and in the upper floor these three apartments are so arranged that on fitting occasions they can be thrown into one magnificent suite, capable of receiving several thousand persons. There will be no fewer than ten boilers distributed throughout the University in connexion with heating apparatus, pipes, and tunnels for heating and ventilating, permeating the entire buildings.

They are so far advanced that the workmen have commenced to roof in the east front, and it is expected that the south or main front will be ready for roofing in a month. There are no fewer than 750 men employed daily at the works, and it will be at least a year and a half yet before the university be completed. The stone is chiefly that of Giffnock quarries, in the neighbourhood, and of Dumfries, near Bannockburn; the flagstones for steps being Arbroath pavement. The woodwork is all of Dantzic red timber, and is stained and varnished, but not painted. The architect is Mr. G. Gilbert Scott. The contractor for the stone and wood work is Mr. Thompson, of Peterborough; Messrs. M'Elroy & Sons, of Glasgow, have supplied the ironwork. Messrs. Wallace & Conell are the plumbers, and Mr. Morrison the slater. Mr. Bradford is clerk of the works. The entire cost of the new university is estimated at about 200,000*l.* Such is a brief outline of the important work, the foundation-stone of which was yesterday (Thursday) laid with "all the honours" by his Royal Highness the Prince of Wales." The occasion was observed as a general holiday in Glasgow.

FORTUNATE ESCAPE OF ETON COLLEGE CHAPEL.

—On a recent occasion, when, for the first time under new regulations, divine service was to have commenced at 9.25 at Eton College Chapel, on the entrance of the choir and students it was discovered that the chapel was filled with gas, which had been escaping since the close of the evening service, through some neglect in turning it off. Prompt means were taken to expel the gas, but the morning service was dispensed with. Had the service been arranged to take place as on the previous evening there is every probability that the edifice would have suffered much injury.

THE MIDLAND RAILWAY STATION,
ST. PANCRAS-ROAD, LONDON.

The Midland Station, opened last week, as we then briefly mentioned, is unquestionably, as regards the length, width, and height of the roof, the greatest in the world. The roof is 700 ft. long; the rafters rise from the platform 100 ft., and the roof is 240 ft. in span. In London the only roofs to be compared with that of the Midland Station are those of Charing-cross and Cannon-street Stations, which are each narrower than the one in question. A peculiarity of the Midland Station roof is, that while it is the widest span of any roof in existence, the vast space under the ribs is unbroken by ties or braces, perpendicular, horizontal, or diagonal, common to other roofs. Cannon-street Station roof, which is 60 ft. less in span than that of the Pancras Station, is a segment. The Midland Station roof is Subdued Gothic, with segments meeting at its crown. There are twenty-five principal ribs in the roof, each of which weighs about 50 tons. Between the principals are three intermediates of rolled iron, which are borne upon latticed purlines. The station walls rise behind the spring of the principals, and the space at the top is filled with a sprandrel of open ironwork. The station roof covers an immense area of two floors, the basement being a carriage for storing pale ale and other goods. The floor of the station is supported upon plate girders, which are borne upon 600 strong cast-iron pillars. Under this basement the Midland connexion is carried to the Metropolitan system. Reverting to the station, it should be mentioned, that all the upper structure is borne upon lateral and cross girders, covered with Buckle's patent plates. The platforms and carriage-road are, of course, erected upon this. The platforms have dwarf walls, with sleepers on the top, and are covered with close-jointed red deal planks, with hoop-iron tongues. The edges of the platform are of dressed stone. The carriage-way is constructed of concrete in two arches, the centres shifted as the lengths are finished. The decorations in the station include a fine frieze about 2 ft. deep in Minton's enamelled tiles, and a dado round the base and foot of the principals. Space is provided for thirteen lines of rails, with platform accommodation available for nine lines. For the present the booking office, temporarily provided, is at the parcels office on the Skinner-street side, which has a good carriage-way and a plank footpath with side railing from Euston-road.

One cannot tell what the effect of this great pile will be from its present appearance; the principal front being only just above ground, and the whole of the end and side fronts concealed by hoardings. The hotel does not as yet show to the front. It will have its chief facade to Euston-road, but will have also side fronts to Skinner-street and inwards to the station approach.

THE TEMPORARY EMPLOYMENT OF
OPERATIVES.

The essay on "The best and most feasible plan for the temporary employment of operatives and workmen in casual distress," by Mr. R. Arthur Arnold, to which Mr. W. R. Lloyd's prize of 25*l.* was awarded, was read at the Birmingham Congress. In a discussion of the various plans which have hitherto been or which might be adopted in seasons of distress, Mr. Arnold narrows the subject so as to make it plain,—1st, that in seasons of temporary distress it is unadvisable to promote emigration; 2nd, that the production of saleable commodities cannot be undertaken; 3rd, that in any employment of persons so accidentally reduced to indigence it is absolutely necessary to provide such labour as that at which they can earn wages sufficient for their maintenance; 4th, that no more than the proper value of their labour should be given in payment for the execution of such work; and, 5th, that the labour of indigent persons during periods of temporary distress, employed by the guardians of the poor or any other local and corporate authority, must be confined to works which will come under the denomination of "public utility" or "sanitary improvement." Mr. Arnold's proposal is that a Public Works Act should be passed, applicable to the United Kingdom, limiting to 2,000,000*l.* the annual sum which the Treasury should be empowered to pay to the Public Works Loan Commissioners for the purposes of the Act, the special consent of Parlia-

ment being obtained if any further sum was required in any one year. A minister of public works should be responsible for the reorganised business of the existing Public Works Loan Commission; but so long as that remains without a chief directly subject to Parliamentary control, the advances for the purposes of the Act should be made by the Public Works Loan Commissioners, upon orders bearing the seal of the Poor Law Board and the signature of the president of that Board for the time being. Loans should be made to any local Board acting under the Local Government Act, 1858; to any local authorities invested with powers of town government and rating under any local Act, by whatever name such local authority may be called; to any commissioners or body of persons, or any other authority having power to levy rates for general or special purposes; and to any guardians of the poor who have authority to borrow. No previous limitation of borrowing powers by any local Act should affect the claim of any local authority to borrow, under the Public Works Act, a sum equal to one year's rateable value of the property assessable within the district, or parish, or place in respect to which the loan is applied for. Any local authority, having borrowed to this full amount, might again mortgage their rates and obtain a further loan, an equal amount of the original loan being already repaid. The repayment of the loans under the provisions of the Public Works (Manufacturing Districts) Act, 1863, was by thirty equal instalments of the principal, the annual diminishing interest being added. A better plan would be to calculate principal and interest together, in which case the annual payment for thirty years of about 5 per cent. upon the total amount of the loan would pay off both principal and interest, with the advantage to the local authorities of paying an equal sum every year. The security for the loans would be upon mortgage of the rates, and any property of which the local authority was possessed in the locality in respect of which the loan was applied for. It would be requisite that the works proposed to be undertaken should be of public utility or sanitary improvement; and the expediency of granting loans would be determined by the department charged with the administration of the Act, the minister at the head of such department being responsible for the loans, the grant of which would in every case bear his signature as authority for the advance of money. The loans must be exclusively devoted to the actual works in respect of which such sanction is given. The money would be advanced in such instalments as the Department charged with the administration of the Act thought proper to sanction, and the payment of any instalment might be postponed or withheld on notice being given by the Department to the local authority that the works were not being proceeded with in conformity with the plan proposed. But the Department should have power to sanction alterations of plans on the advice of their inspectors, at the same time having no responsibility in respect to the design and execution of the works, which, together with their superintendence, would be entirely committed to the local authorities and their officers. Having given some further details, Mr. Arnold observed that there is no city, or town, or district in the United Kingdom, in which there is no need for the execution of works of public utility and sanitary improvement. Many are wholly without sewers, or only supplied with old drains, which are nothing better than poisonous cesspools; many have no water supply but from polluted wells; many draw their contaminated supply from brooks full of sewage and other impurities; in many, the old streets are badly paved, and the new or bye streets are impassable in winter, their surfaces covered with putrid filth thrown out from the houses; scarcely a river bed is properly and periodically cleansed of the accumulations brought by storms, which, obstructed by the bridges and buildings of towns, are usually deposited in their neighbourhood. Near every town there are undrained lands injuriously affecting the health of the population, the fertility of which would be greatly increased by drainage. Upon the public highways, there are in every direction hills which might be levelled, and valleys filled up, with great benefit to the public convenience and reduction of the cost of cartage. The permanent works of highway improvement executed in several rural parishes, under the provisions of the Public Works (Manufacturing Districts) Act, 1863, effected a saving of 50 per cent. of the highway rates. The works executed

under such an Act are all of so beneficial a character, that their commencement before the occurrence of distress, or their completion after it has passed away, is thoroughly advantageous and satisfactory.

THE FOUNDATION
OF THE NATIONAL GALLERY, AND
SIR GEORGE BEAUMONT.

The following memoranda, now first printed, will be read with pleasure by all interested in the progress of art. They were written by George Agar Ellis, afterwards Lord Dover, touching Sir George Beaumont and our National Gallery. Lord Dover was a man of great taste, and it was mainly through his exertions and influence that the Angerstein collection was bought by Parliament:—

One of the objects Sir George Beaumont had the most at heart was the establishment of a national gallery for pictures. He was constantly, during the years 1821, 1822, and 1823, talking to me upon the subject, and urging the various reasons which rendered such an institution desirable in this country, in all of which I concurred. He frequently begged me to speak to Lord Liverpool, then Prime Minister, about it, and always assured me that he would give his own pictures to the nation as soon as he saw a place allotted for their reception. In consequence, took several opportunities of mentioning the subject of a national collection of pictures to Lord Liverpool, who always received the suggestion favourably, but generally ended by rather throwing cold water upon the project, on the score of expense. I also frequently urged the same points to Lord Aberdeen and Lord Farnborough, and Sir George did the same; but still nothing was done. At length Mr. Angerstein died, and it was understood that his pictures were on sale. This was in the year 1823, and great fears were entertained that either the King of Bavaria or the Emperor of Russia would buy them, and that thus they would be lost to this country. Upon this Sir George again spoke to me, and we agreed together that now was the moment to press for the gallery. I again urged Lord Liverpool, but nothing was done. At length, towards the end of the session of 1823, I determined, with the concurrence and advice of Sir George, to take some opportunity, as all other means had failed of bringing ministers to a favourable decision, to mention the subject of the National Gallery, and of the purchase of Mr. Angerstein's collection, in the House of Commons, as I thought that if the temper of the House declared itself in favour of the acquisition, ministers could not for very shame avoid making it. I do not mean to say that they were not favourably themselves to the plan, but they were so timid and frightened at France and the economists, that they could not bring themselves to a decision. Accordingly, on the 1st of July, 1823, I took occasion of a vote for money for the new library at the British Museum, to state how anxious I was to see a national gallery of pictures established. I then alluded to Sir George Beaumont's promise of giving his collection to the public, and eulogised his conduct, and afterwards gave some account of the Angerstein collection, and of the danger there was of its being taken out of the country; and finally gave notice that if the ministers did not in the meanwhile purchase it, I would myself make a motion to that effect at the commencement of the next session of Parliament. Mr. Stuart Wortley (now Lord Wharncliffe), Mr. Alexander Baring, Mr. Hudson Gurney, Mr. William Smith, and, I think, one or two others, spoke in favour of my proposition. The feeling of the House was so evidently with me that the point was gained. During the recess the Government bought Mr. Angerstein's pictures, and the National Gallery was established. I have gone into this detail in order to explain Sir George's letters, which were written subsequently to the discussion in the House of Commons, and which show his great anxiety upon the subject. I am, indeed, quite certain that without his persuasions and encouragement, and the permission he gave me to announce formally the donation of his collection to the nation, I should never have had the heart to do what I did, so discouraged was I by the delays and vacillation of the Government. I have been anxious that you should know the part Sir George had in this transaction respecting the National Gallery,—first, because it is

highly honourable to him; and, secondly, because it is something of an event in a life of such amiable and retiring tranquillity as his was. His allusions to the prints of Garrick relate to two engravings of Garrick, which were executed by Reynolds under his inspection and correction, and which he was anxious to have engraved, because he considered them the two best likenesses of that great actor extant. They are after Dance and Zoffani, in the characters of Richard III. and Abel Drugger.

George Howland Beaumont was born November 6th, 1753, and had an only brother Charles, who died an infant. His family, which is very ancient, derives its name from Bohemond, Count of Antioch, and is lineally descended from the royal families of France and England. By the death of his father, when Sir George was still a child, he was left to the care of his mother whose maiden name was Rachel Howland, a woman of extraordinary powers of mind, during the whole of her long life. She died in 1811, at ninety-six. She was ever regarded by her son with the greatest affection. He married, in 1781, Margaret, daughter of — Willes, esq., of Astrop, Northamptonshire, and granddaughter of the Lord Chief Justice Willes. It was during private theatricals at Mr. Bowles's, North Aston, that he first saw her, and was much struck by her great beauty.

As an actor he possessed great talents; and it has been even said in one or two characters nearly equalled Garrick. With this celebrated actor and many others he was intimately acquainted; and King bequeathed to him the Shakspeare cup he had himself received from Garrick.

With most of the artists and wits, and, indeed, distinguished men of all kinds, he was also on friendly terms. Sir Joshua Reynolds, Sir Eyedale Price West, Payne Knight, Colman, &c., may be mentioned.

Sir George's taste for drawing appears to have been first developed in the tour he made to Rome after his marriage. His first drawing-book (at Eton) is hardly so far advanced as usual with boys of that age. At Paris, during some of the early scenes of the Revolution, he had a narrow escape. He was walking with the late Lord Beverley, when they accidentally witnessed the execution of an unfortunate man by the populace *à la lanterne*; their look of horror attracted the attention of the furious people, and they were only saved by a *poissarde*, who, having taken some fancy to them, dexterously fixed the tricolour cockade in their hats and favoured their escape.

Early in this century Sir George determined on rebuilding the house on his estate in Leicestershire, Cole Orton, and employed the talents of Mr. Dance.

The amusement of laying out and beautifying the grounds, and improving the condition of the villagers, afforded him delightful occupation for the remainder of his life. In the country he always devoted the morning to painting, but so diffident was he of his own success that he destroyed many of his pictures, and would have destroyed many more had not Lady Beaumont removed them from his sight. He has left many unfinished from the impossibility of pleasing himself. To others, and to their productions, he was invariably kind and encouraging. Sir George made another excursion to Switzerland in 1819, and again to Rome in 1822. It was then by the assistance of Canova he succeeded in securing the *alto rilievo* of Michelangelo, which he left conditionally to the Royal Academy. His cousin, the present baronet, has since presented it unreservedly to that body.

Many of the earliest pictures of our best artists were purchased by Sir George,—Wilkie's "Blind Fiddler," Haydon's "Machbeth," &c. The paintings he presented two years before his death to the National Gallery were the collection of his life. Of the Narcissus he was so fond that it always travelled with him; indeed his admiration of Claude may almost be termed a passion. In his collection of drawings there are many of Gilpin, Alexander Hearn, Girtin, Dance, Cozens, &c. The beautiful group of Psyche borne by Zephyrus was executed for him by Gibson after his last visit to Rome; but he did not live to see it arrive in England, dying after a few days' illness, occasioned by cold, February 7, 1827, aged seventy-four. His widow survived him two years, dying in July, 1829, at the same age. At his particular desire a simple

tablet was placed in Cole Orton church, where he was buried, with this inscription,—

"Enter not into judgment with thy servant, O Lord."

Many of his paintings are still in the possession of his family; several were presented by his widow to various public galleries; among others, to the Academy at Rome.

His disposition was amiable and kind; his religious feelings were strong; his conversation was peculiarly interesting, possessing much quiet humour, and enlivened by a great fund of anecdote.

He appears to have been indefatigable in the pursuit of the art which was his engrossing passion, and has left an immense variety of sketches. It was with Sir George that the first idea of a public exhibition of Sir Joshua Reynolds's paintings originated, and to his exertions, which were most graciously encouraged by the late king, and kindly aided by Lord Melville, &c., that the public were indebted for the success of that idea.

LIGHT AND COLOUR.

My own hypothetical suggestions, both in the lecture and the several letters which have appeared in the columns of the *Builder* during the last twelve months, have been but mere addenda to their more important objects, and must await experimental proof. These more important objects have been to point out the constant confusion of the Newtonian and "undulatory" hypotheses and the neglect to take into account the physiological considerations necessary to a true comprehension and a putting together of the theory of light and colour by English writers, objections from which I do not consider Mr. Benson's letters and work are exempt. I know the difficulty of framing language strictly in accordance with pure theory; it is not easy to emancipate oneself from the common faulty habit of speech in these matters. I trust, therefore, that my observations will be received as actuated by a fair spirit of criticism, and a desire to attain to a more correct enunciation of the received theory, and not to detract from the object of Mr. Benson's labours, which are in part similar to my own. That Mr. Benson works from sheer devotion to and love of his subject may be gathered from the following passage at page 39 of his work:—"It seems clear that, strictly speaking, there can be no discord in colours," for such a conviction with most men would have deterred further prosecution of the subject.

In treating of so complex a theory, or a theory having so many ramifications as that of light and colour, it is better to keep special phases of it distinct, otherwise discussion is apt to run backwards, forwards, and across in inextricable confusion.

Definitions.

Light is a sensation, supposed by Newton to be caused by atoms projected from the sun* striking upon the retina; colours, sensations produced by the different velocities of these atoms. That every ray or beam producing the sensation of white light is compounded of, some of his expositors say, seven; others, an infinite number of rays of travelling atoms, of various velocities. Wave lengths are no part of this hypothesis. The undulatory or received theory supposes that light is a sensation produced by undulations on the retina; colours, by the different wave lengths and rapidity of those undulations.

Colours, therefore, according to either of these theories, has no objective existence, but is only a form of sensation. If it were objective and inherent in the atoms or the waves, the different velocities of the one and the wave lengths of the other theory would be superfluous assumptions. But Mr. Benson, in common with other authors on the same subject, is constantly giving objectivity to colour; for instance,—"The colours of all natural objects are merely the sensations produced by those of the incident rays,"—"the white light of the sun,"—"is the sum of the colours of all the component lights,"—"Green rays added to the blue." These are only a few out of many which could be enumerated.

Whilst, however, the Newtonian hypothesis has been abandoned in the main, its suppositions

* This definition might, of course, be framed to apply to all illuminating sources.

bundle of an infinite number of rays has been transplanted to the undulatory theory; and if it is cumbersome and improbable in its original domain, it is much more so, it appears to me, in its new soil. What is the diameter of that bundle? What its form of section? What the disposition of its fascioli? These questions lead to very important considerations, having reference to the integrity and truth of the general supposition, and are questions which I have never seen touched upon, much less solved. The Newtonian hypothesis in immediate reference to the prismatic rays is not the great discovery it has been proclaimed; it is a compound of fact and supposition which I, myself, feel convinced will be proved to be one of that intellectual giant's infelicitous conjectures. And as Mr. Benson is so wrapt in this "great discovery," I am not surprised to find him clinging to the ancient, instead of the more advanced physiological explanation of the *ocular spectra*, and this leads me at once to the subject of

Compensation.

To compensate is to make even that which is irregular, to counterbalance. Now the involuntariness of the fascioli, "infinite in number," composing the solar beam, which Mr. Benson so tenaciously clings to, precludes the possibility of any external compensation. The compensation, then, which we talk of in respect to the harmony of colours, is a readjustment in the sentient constitution of the eye itself. And what is our great experience of the nature of the compensation which is constantly going on in our sentient being? It is this. That after it has been moved from its mean or general state in any special direction, it has a reactionary tendency in the opposite direction. Indeed, this is not a tendency peculiar to our own, but to all nature, in confirmation of which a volume of instances might be cited. "Insensibility" is that state of the human system in which reaction is rendered either difficult or impossible. I would therefore venture to suggest the following as a law of compensation in reference to colour, viz.: *That in proportion as the retina experiences a colour of one kind, is its tendency to a sensation of colour of an opposite kind, or one which tends to balance and re-establish the equilibrium of the optic system.*

The "insensibility" of the eye to one colour, according to Mr. Benson, and some former writers upon this subject, is clearly, according to their own showing, a keen sensibility to another. But taking my own statement of the law which I have here ventured to intrude, the old-fashioned explanation of the *ocular spectra* might possibly pass; but unfortunately for the old hypothesis, the compensating spectra appear on closing the eye. The familiar experiment of looking at a window and then closing the eyes, will point the way in which this important fact may be best tested. In this case the reaction is merely from light to dark, and from dark to light, the glazed spaces after a while appearing dark; the frame, the sashes, light. If, however, instead of white glass we substitute coloured glass, the spectra will be coloured and compensating on closing the eye. If the eye be sensitive, the fact of the *ocular spectra* being reactions of the retina may be confirmed by the usual means, and, after intently gazing at the wafers or spots, closing the eye. If further proofs be needed I can give them. These experiments are not only conclusive regarding my statement in my last letter, that *ocular spectra* are due to nervous reaction, but that light and colour are sensations which may exist independently of any direct external excitement whatever.

It is very curious to observe that the involuntariness of the fascioli of the solar beam or ray which Mr. Benson so much insists on, is dead against his other notion of yellow being a secondary sensation, for every colour would then be caused by a particular primary, *inviolable* wave. Marked difference, as a colour, yellow has; it is therefore primary according to Mr. Benson's foundation doctrine, and for the only two reasons it is possible to call a colour "primary." There are two terms to the equation of compensation, and these are mutually compensating. A compensating colour, therefore, is not necessarily a secondary.

Newton's great discovery, says Mr. Benson,—

"Was, that the sun sent out an infinite number of different kinds of light, all differently refrangible, and producing different sensations of colour; and that the peculiar refrangibility, which gives to each kind its peculiar refrangibility, is invariable with the colour sensation which attends it. This is the very foundation of the science of colour."

Ergo, an infinite number of different kinds of light would include a yellow ray, pure, simple, uncompounded. Every ray is a primary.

"The whole essence of the theory is involved in the fact, that every separate wave maintains its own time invariable, and its own proper effect at every point of the ether which it reaches, whether such point is at rest or disturbed by any other wave or waves at the same time."

With this passage compare the following:—

"So that all the colours which lie in the spectrum between the first and second, and second and third of these may be produced by mixtures of these," &c.

In the former paragraph Mr. Benson says the waves preserve themselves invariable: are the waves still invariable when they are mixed, or does he mean that the sensation is mixed? There is such a thing as interference: are the waves invariable at the same point then? There is, too, such a fact as rays diminishing in power in a certain ratio to distance: are the waves of each ray the same at the sun as at the earth? Is it consistent with the simplest principles of dynamics that waves should be propagated through matter unaltered? I think not: there is a decadence in the wave as it progresses in time and space from the originating force, just as the waves of a bell after it has been struck pass in the resonance (I am told) to the third and fifth. The matter of naming a colour primary or secondary is of little consequence, but to have a clear logical exposition of theory is of the utmost importance.

On my own notions respecting the science of light and colour, I have in the main forbore to dilate in this communication; for the further exposition of these, and the details of an important experiment, I must beg Mr. Benson, and the readers of the *Builder*, to wait, on account of full occupation.

W. CAVE THOMAS.

THE ARCHITECTURAL ALLIANCE.

At the last meeting of this association there were present, for the *London Architectural Association*, Messrs. T. Roger Smith, T. M. Rickman (secretary pro tem. of the Alliance), J. Douglass Mathews, and R. Phéu Spiers. From the *Glasgow Architectural Society*, Messrs. Alexander Thomson and John J. Stevenson. The *Liverpool Architectural Society*, Mr. C. E. Grayson. *Manchester Architectural Association*, Messrs. Peter B. Alley, jun., and Alfred Darbyshire. *Northern Architectural Association*, Mr. R. J. Johnson. *Nottingham Architectural Association*, Mr. T. C. Hine (treasurer), and Mr. Kennedy, from Glasgow (not a delegate). Mr. T. R. Smith presided.

A paper by Mr. Hine was considered, proposing that the quantities should form part of the basis of contract, as much as plans and specification, and that the architect should be responsible for them, whether prepared by himself or by his surveyor. After discussion, it was resolved,—

"That inasmuch as the bills of quantities are now generally tacitly received as the basis of builders' contracts in the settlement of their accounts, in the opinion of this meeting it would be more just, both to client and builder, as well as more satisfactory to architects, were the bills of quantities formally recognised as part of the contract."

A deputation from the General Builders' Association were introduced, consisting of Mr. Whiteley, of Leeds; Mr. W. B. Briggs, of Birmingham; Mr. E. Johnson, of Manchester; and Mr. A. Maul, of Birmingham, secretary.

Mr. Maul proposed that their society and the London builders should meet a committee of the Institute and of the Alliance, to draw up a model contract. He also complained that throughout the country building contracts vary in their terms, and he argued that they should be specific in terms to a greater extent; that sometimes drawings offer very indifferent data for contracts, while many contracts are on the theoretical footing, that one party being the proprietor, the other the builder, the architect is independent; whereas they hold that the architect is not independent, but the nominee of one party, and that oftentimes builders are thereby inconvenienced and their interests prejudiced from the fact that the architect thus appointed is sole judge.

They want an ample arbitration clause on all subjects in dispute, but not upon material and workmanship. It was further urged, that there is a want of mutuality shown in the provision for taking the work out of the builder's hands for want of speed, while there is no counter provision as to want of funds.

There are also usually clauses relating to the bankruptcy of the proprietor; nor is there usually any reciprocity in the arrangement as to sureties.

The builders admit that a penalty for time should be part of contract, but they urge that the position of the architect should be more defined as to orders for extras.

In case of sealed contracts, they also urge that powers should be taken for variations, without the use of a sealed instrument.

And also that, as quantities are a definite part of the

contract, either builders should join in appointing the surveyor, or where the quantities are supplied they should form part of the contract, and that as to sums left in hand there should be some recognised limit; also some common understanding as to the ordinary terms and periods of payment.

It was resolved,—
"That the Alliance appoint their office-bearers as a committee to hear the representations of the General Builders' Association, and, in conjunction with any other bodies who may be interested, to endeavour to come to some agreement on the subjects submitted for consideration, and to report to the Alliance at its next meeting, or to the constituent societies at an earlier period."

Mr. Plevin's form of contract was then considered. Mr. Spiers reported a resolution from the Architectural Association against the scheme.

It was ultimately resolved,—
"That, as the whole of the questions covered by Mr. Plevin's form of contract are included in the subjects that will have to be discussed with the General Builders' Association, it will be premature to enter upon them at the present meeting."

As to architectural education, it was resolved,—
"That the secretary be requested to obtain information from the allied societies as to the facilities for architectural education now existing, and to report upon the subject to the next meeting."

MANCHESTER ARCHITECTURAL ASSOCIATION.

The annual meeting of the Students' Class was held on Monday evening, the 28th ult., at the Society's Rooms, Lord's Chambers. There was a good attendance. The secretary and treasurer's reports were passed; the latter showing a balance in favour of the society. Mr. Alley, jun., treasurer, and Mr. W. H. M. Ward, secretary, were re-elected, and Mr. Bedford was made the president in lieu of Mr. Batty, who retired. The society seeks to educate students in architecture in branches not ordinarily learnt in office routine. The construction class is held on Monday evening, under the supervision of Mr. Batty; the freehand drawing class on Friday evening, directed by Mr. Bedford; and the water-colour class on Saturday afternoon, by Mr. Bagot.

ARCHITECTURAL STUDENTS IN PARIS.

At the Palais de Beaux Arts in Paris the designs sent in competition by the architectural students for prizes were publicly exhibited on the 30th ult. The subjects were—1st, a church; 2nd, a hospital; 3rd, Hôtel de Prefecture. For the first subject there were sixty-eight competitors; for the second, twenty-eight; and for the third, eight; making together 104 competitors.

It would appear that the anæsthesia hurled by M. Viollet le Duc against all non-medæval art have had but scant influence on our artistic friends across the Channel, for of the 104 designs three only are in the Pointed style.

The 416 drawings completely fill the great hall of the Palais. Among them there are many good drawings, but only one medal was awarded.

CONSECRATION OF NEW CHURCHES AT WOBURN AND WOBURN SANDS, BEDS.

The new church erected at Woburn by the Duke of Bedford has been consecrated. The site is near the Woburn entrance to the dinal park. The edifice, which has been erected from the designs and under the superintendence of Mr. Clutton, of London, architect, at a cost of some 26,000*l.*, exclusive of the value of the ground, is built in the Gothic style of the thirteenth century, the materials being Clepham stone with dressings of Box Crowned stone for the exterior, and for the interior Cowham stone. The extreme height of the structure is 61 ft., and from the ground level to the top of the parapets the height is 40 ft. Projecting through the parapets are a series of gargoyles discharging upon iron traps beneath. The nave, which is 96 ft. long by 64 ft. in width, is supported by seven duplicate columns, with plain shafts and carved capitals, and is lighted by nine windows, five in one, and four in the other aisle, together with three windows and an oriel at the west end. The vaulted roof is carried level throughout, at an average height of 50 ft. from the pavement, so that by this arrangement there is no rooves. Instead, there is a flight of steps leading to the chancel floor, the level of which is some 3 ft. 6 in. above that of the nave. At the eastern extremity of the chancel another flight, consisting of three steps, leads to the area in which the communion-table is placed, the level of this portion of the chancel being 5 ft.

above that of the floor of the nave. The extreme length of the chancel is 52 ft., and the width 26 ft., the whole of the interior being vaulted with stone. The chancel has at each side three windows, and at the east two lancet windows, surmounted by a central oriel 13 ft. in diameter. In due course all the windows, according to our authority, the *Bedford Times*, will be of stained glass. Beneath the chancel there is a crypt, 72 ft. by 24 ft., vaulted with stone, and supported by two rows of columns. This is to be used as the future burial-place of the Dukes of Bedford. The tower, which is situated at the western end, is 28 ft. square, and, with the spire, reaches to the height of 185 ft. Probably the height to top of the copper cross which crowns the spire may be set down at 200 ft. It contains a new bell, weighing nearly 3 tons, cast (in C) by Messrs. Mears & Co., of London, and has a deep sonorous tone. The fittings are all of oak. At the western extremity of the north aisle, and fronting the font and main entrance, is the organ-gallery, supported on pillars, and ascended by a flight of spiral stone steps. The organ has been built by Mr. T. J. Robson, of London. In the west wall of the church, directly opposite the font, is inserted a slab of polished granite, on which is carved the following simple inscription,—“In the years 1856-56-57-58, William, 8th Duke of Bedford, built this church,”—under which, in small and unpretending characters, is a record of the architect's labours in the sentence,—“Operi et consilio Henrici Clinton, Archt.” The clerk of the works was Mr. J. Young.

The new church at Woburn Sands has also been consecrated. The edifice has been erected at the cost of the late Duke of Bedford. It is erected on the crest of one of the lofty ridges which skirt the main roadway through Woburn Sands, and is called St. Michael's-on-the-Mount. The building is erected in the Gothic style of fifteenth century; the materials employed being Cosgrove stone, with dressings of Box Ground stone for the exterior, and Cowham stone for the interior. The nave is 64 ft. long by 38 ft. in width, and is covered with an open timber roof, and the chancel is 20 ft. by 18 ft. At the west end of the structure a turret rises to the height of about 80 ft. The fittings of the nave are of deal, while those in the chancel are of oak, carved. The edifice has been erected from the designs and under the superintendence of Mr. H. Clinton, London. The cost is roughly estimated at 5,000*l.* The organ, which has been presented to the church by Mr. Steven, of Aspley Guise, was a family heirloom, supposed to have been built 300 years ago, by a German named Snatchel, and the principle on which it is erected is so peculiar that, on the organ being lately remodelled prior to its being set up in the church, it was supposed to be the only one of its kind in this country. The church is capable of accommodating about 500.

THE NEW INDUSTRIAL SCHOOLS AT KIRKDALE.

The additional industrial school buildings at Kirkdale, in connexion with that department of the Liverpool Parochial Vestry, and which have been rendered necessary in consequence of the over-crowded state of the existing schools, have just been completed, and will shortly be opened. The new buildings, which are quite distinct from the old schools, have been erected from designs by Messrs. Pictou & Son, of Liverpool, architects. They stand on high ground, in the immediate vicinity of the county prison. The style adopted is Gothic. The principal elevation, which faces the south, is 357 ft. in length, and 40 ft. in height to the battlements, and consists of three stories. In the centre is a tower, which rises 68 ft. above the battlements. Beneath this, and over the main central entrance, is a large, ornamental, oriel window, below which again there is a prominent three-light window. At each side of the main entrance there are two carved figures in stone, representing Charity and Mercy. At the east and west ends of the building respectively there are pavilion roofs, which rise to a considerable height. The east and west elevations of the building are uniform in design with the south front, the school-rooms, dining and play rooms, having mullion chancel windows. The rear of the building forms a large quadrangle, there being, in addition to the east and west wings, what may be termed a centre wing, containing school rooms, play rooms, and dormitories, uniform with the other portions of the

building. The main south entrance leads to a corridor, 7 ft. in width, which runs the entire length of the building, from which, in the front part, on the ground-floor, are approached the several day-rooms, teachers' rooms, offices, and other rooms in the master's department. From the opposite side of the corridor, in the centre, a play-room is entered, 73 ft. in length by 30 ft. in width, with an additional play-shed beyond it, 73 ft. by 30 ft. The principal school-room is in the east wing of the building, and is 83 ft. long by 30 ft. wide, and 36 ft. in height; whilst the dining-room, which is in the west wing, is 80 ft. long and 30 ft. wide, and uniform in height with the schoolroom. Two staircases, one at the east and the other at the west end, lead from the ground floor to the first floor, along which there is a corridor exactly uniform with that already described. The whole of the first floor is divided into dormitories of uniform size, for the use of the officials of the establishment as well as the inmates. The upper story is approached by a staircase similar in size to the one beneath it, and a uniform corridor leads to three large dormitories similar in size to the large school-room, dining-room, and play-room on the ground floor, in addition to which there are also a number of smaller dormitories. With the view of promoting ventilation there are iron gratings on each side of the entire length of the two upper corridors, by which a constant current of air is kept up from the ground floor, whilst for the entire ventilation and warming of the building throughout apparatus and machinery have been fitted up in the basement, under the immediate superintendence of Mr. Watson, of Halifax. Mr. J. Westmoreland, of Islington, is the sole contractor, and the building has been erected by him, assisted by tradesmen who have taken contracts from him in the several departments. The new premises are calculated to accommodate 700 children, which, with the capacity of the existing building, will contain shelter and education for an aggregate number of about 1,900.

ACCIDENTS.

Two serious accidents have occurred at the new Midland Railway Station, King's-cross. A labourer, employed by the contractors, fell from a high roof and sustained such injuries that he had to be taken to the Royal Free Hospital. Another labourer also fell from a roof, and was taken to the same hospital, suffering from concussion of the brain.

An inquiry has been held at St. Bartholomew's Hospital, touching the death of a workman who was at work on the roof of the new Southfield Market, when he fell, and was dashed to the ground. His skull was fractured by the fall. The jury returned a verdict of "Accidental death."

At the Lord Mayor's Court, before Mr. Sergeant Tindal Atkinson and a common jury, the case of "Vonder Heydo and wife v. Peters" has been tried. It was an action to recover compensation in damages sustained through the alleged negligence of defendant's servants. It appeared that on the 17th of August last a wagon belonging to the defendant, laden with scaffold-poles, turned into Red Cross-street, and the poles projecting behind swept over the pavement and struck plaintiff down. She was much shaken, and was laid up for some time. A City police-constable said the poles ground against the kerbstone for some distance, and then sprung up over the pavement, and struck down the plaintiff. He heard no warning given. It was admitted that the cart was the property of the defendant, but at the time of the accident it had been let to a railway company, and was then in charge of the railway company's servants. It was also mentioned that a proper warning had been given. Witnesses having been called for the defence, the jury found for the plaintiff, with 10*l.* damages. This case lasted over two hours, and the jury receive 2*d.* each for trying it.

While Sir John Trevelyan was addressing a large meeting at Bude the overcrowded platform gave way, and caused a scene of great confusion. Two men who were underneath at the time were injured, one seriously.

Two houses at Low Town, Holly Hall, Dudley, fell recently, and carried with them a nailer's shop and outhouse. The block thus destroyed was situated at the end of a ruinous row of building in what is called Bags Gutter, a part of the town thoroughly undermined by the neigh-

bouring pits. The lower extremities of two women were buried beneath a terrible load of bricks, timber, &c., but their heads and chests were protected by a joist which had fallen, but lay in a slanting direction across them. The poor creatures were released, after half an hour's hard labour. Two bricklayers employed in repairing a portion of the wretched premises were injured, though not in a very serious manner, one being thrown from his ladder, and the other cut and bruised by the falling material. The two houses are a complete wreck.

RAILWAY MATTERS.

The trial of Mr. Charles Kendall's atmospheric break has been in progress on the London, Chatham, and Dover Railway for three years. A novelty in working the apparatus for the instruction and amusement of a party on a trip from London to Margate and back was the placing full command of the break in the hands of the engine-driver. The driver, it is urged, is captain of the train, and should be entrusted with power equal to his responsibility. That he as well as the guard should have the means of checking or bringing to a stop the carriages in the rear of the engine is a condition fulfilled by the atmospheric railway break, which simultaneously blocks the wheels of the whole train, and which may be worked from either end. The first stop was between Sovenoaks and Farningham, on an incline of 1 in 100, the train being checked in a speed of 35 miles, and within a space of 823 yards. His second pull-up was on a level at Sole-street, when the train was going 40 miles an hour, and was stopped in a space of 220 yards. The third stop was, from want of time, not measured, but was judged between 160 and 200 yards, at the utmost, the speed of the train being at the time 55 miles an hour. Three more stops were made before reaching Margate, with increased success. Mr. Kendall's break includes a plan of communication between driver and guard, accessible only to passengers.

An experiment has been tried on the Manchester, South Junction, and Altrincham line, with Kearsley & Holt's railway carriage alarm signal. One of these signals was attached to the top of a first-class carriage. In each of the three compartments there was a light chain, stretching from side to side, attached to the signal. If a passenger wishes to give an alarm whilst the train is in motion, he has only to jump up and give any portion of the chain a pull. The pulling of the chain raises a semaphore on the top of the carriage outside, and uncovers a revolving wind-vane, which is then set in motion by the wind, and rings a large bell, which can be heard distinctly through the whole of the carriages in the train, as well as in deep cuttings and tunnels. The noise of the bell would instantly attract the attention of the guard and driver, the train would be brought to a standstill, and the semaphore which had been raised, and of which the driver could have a good view from the engine, would indicate the carriage from which the alarm had been given, and the reason of the alarm could at once be ascertained. At night the signal carries a white light, which is converted into the red or danger signal when the alarm is given. Tampering with the signal by a passenger when he has once given the alarm is impossible. When he once pulls the chain a small round ball descends from the roof of his compartment, which he cannot put back again, and this shows where the chain has been pulled. Such is the account of this signal, which we condense from a contemporary. Now suppose that one or two of the knocker-wrenching gentry happen to be amongst the occupants of a first-class carriage. The train comes into a tunnel during the day time, when there is no lamp lighted in the carriage. One of them pulls the chain quietly and the train is stopped. We may leave the result to the imagination of our readers. Or even let a nervous old woman, of either sex, conscientiously believe that there is an absolute necessity for stopping the train for some imaginary reason or other, would the punishment of such a person prevent the recurrence of similar *contertemps* in other cases? Communication between passengers and guards is most essential to the public safety, but no such "communication" can be effected in a satisfactory manner so long as the guard is fixed up in a box, or until he be enabled to communicate personally, and see with his own eyes and hear with his own ears, what it is that

requires the stopping of the train *before* it is stopped. The unnecessary and irregular stopping of trains would occasion not only delay but danger itself to the public. All short of this, we fear, is little better than ingenuity thrown away in order to save expense to railway companies.

BAY-WINDOW, RATHHAUS, RATISBON.

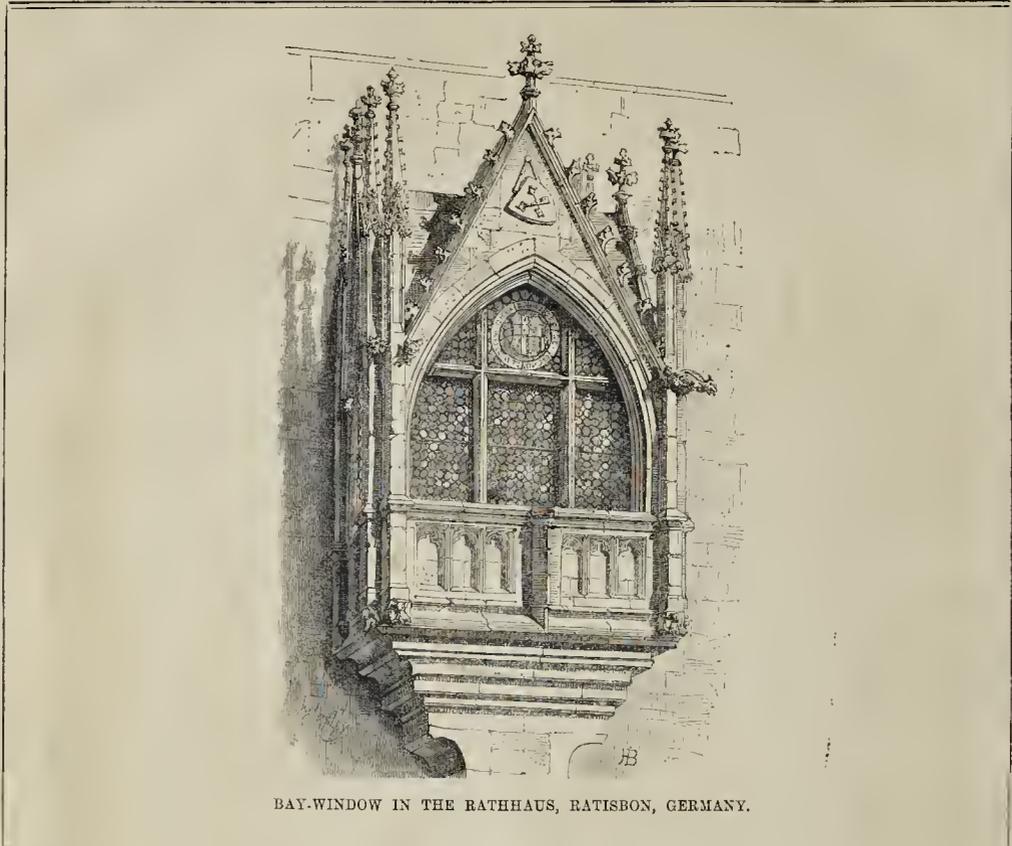

The Rathhaus at Ratisbon is a charming specimen of German Gothic of the end of the fourteenth century. The principal portion of the building consists of a large oblong structure, containing the council-chamber, entrance-hall, chief staircase, and below these a set of most dismal dungeons and a torture-chamber, with all its fearful machinery *in situ*. The most beautiful portions of the building are the porch, which has a very rich doorway; and the bay-window, of which we give a sketch. This bay-window projects from the centre of the east side of the council-chamber, to which it opens by a low arch. There can be little doubt that it originally formed a kind of chapel or oratory, and was separated from the council-chamber by a portable screen. On one side of the window, carried upon a panel, is the date 1400. It is doubtful whether the tracery is of the same date as the other portions of the bay window. It looks very like an alteration of the sixteenth century. It is, however, well moulded and of stone. Attached to the Rathhaus is a lofty square tower, with a clock and bells; and in one of the smaller chambers are some fine old tapestry, and a fifteenth-century "corona" for holding candles.

EASTCHEAP.

WHEN London was at once a fortress and a royal palace, Eastcheap, being the direct thoroughfare into the City, was a fashionable lounge, from the beginning of the thirteenth century down to the time of Henry VII., partaking of the character of the modern Pall-mall and St. James's-street, mixed with a strong flavour of what the Haymarket was a few years back before the night-houses were interfered with. It was here during nearly two centuries that the most fashionable traders displayed their goods; here the cooks and tavern-keepers, the predecessors of the modern club, had their ordinaries, and the ruyterers of the time held their carousals. Lydgate, the poet monk of Bury, and the contemporary and friend of Chaucer, in the preperations of his ideal character of Lackpenny, thus describes it in the reign of Edward III.:

"Then I eyed me into Eastcheap:
One cries rybis of befe and many a pye,
Pewter pottes they clattered on a horpe,
There was harpe, pype, and minstrelsy;
Yen by Cok, may by Cok, some beggers crye,
Some songe of Jenkin and Julian for their mede,
But for lack of money I might not spede."

The genius of Shakspeare has peopled this district with the creatures of his imagination, who are made by his magic to occupy as much of our memories as do the real characters of history, and the ideal characters dispute the places with the men and women who have actually lived and carried on the world's history. We know Falstaff and Poin, Bardolph, mine ancient Pistol, and Dame Quickly, as well as we do our familiar acquaintances; and it is doubtful whether the real characters of the contemporary history are as vividly brought into our minds when we think of the reigns of Henry IV. and Henry V. as the personages which poetry has given character and form to. What Shakspeare had begun, Goldsmith, in his essays, and Washington Irving in his sketches, have continued, and have made the whole of Eastcheap olivaceous ground. Stow, speaking of Eastcheap, mentioned an occurrence which took place here in the year 1410, between the two younger sons of Henry IV., Thomas and John, who had been carousing here "during the small hours of the night," until the morning, and with some of their friends had got into a quarrel, were taken by the City watch before the civic magistrates, and afterwards before Judge Gascoigne, which occurrence most probably, with its traditional festive reputation, has induced Shakspeare to lay his scenes of the revelries of the Mad Prince and his debauched companions at this spot. After the time of the first Tudor (who was the

BAY-WINDOW IN THE RATHHAUS, RATISBON, GERMANY.

last king that made the Tower a place of residence), festivity and fashion went farther west, and the shops of the Royal Exchange, with those of Cheapside and St. Paul's churchyard, became for a time the loadstone of attraction for the court gallants, the rich citizens, and their gayer wives. But what the world turns from, fashion turns to; so in time its votaries were drawn again still farther westward, and commerce filled up the void. Still in the time of Sir William Davenant it continued to be the abode of well-to-do citizens who, in his "London Vacation," narrates in verse the departure of a citizen and family from Eastcheap to Islington, to enjoy the country sports and pleasures. Eastcheap has, however, now entirely lost its ancient residential and minor business character, and as Thompson says,—

"There commerce brought into the public walk,
The busy merchant the big warehouse built;
Raised the strong crane, choked up the crowded street
With foreign plenty."

In fact, it has become one of the great centres of business for the colonial and wine trade. The ghosts of Falstaff and Pistol may still be supposed to haunt the scenes of their former revels. They may, as they were wont of old when out of purse, to only sniff the fumes of the sack as it rises from the cellars which spread everywhere underground, like the roots of the trees in a forest, filling all the spaces below, while the spice and ginger, which "is as hot in the mouth" as heretofore, rest in the warehouses above. But business, instead of pleasure, is everywhere; and the ancient Dogberry's office is now superseded by the City policeman, regulating the traffic during day, instead of quelling the disputes and taking roysterers into custody "during the small hours of night," which is now, by contrast, the only time that the neighbourhood is perfectly quiet and deserted.

The building which forms our illustration has been erected either upon the precise site or close upon that of the old Boar's Head Tavern, before

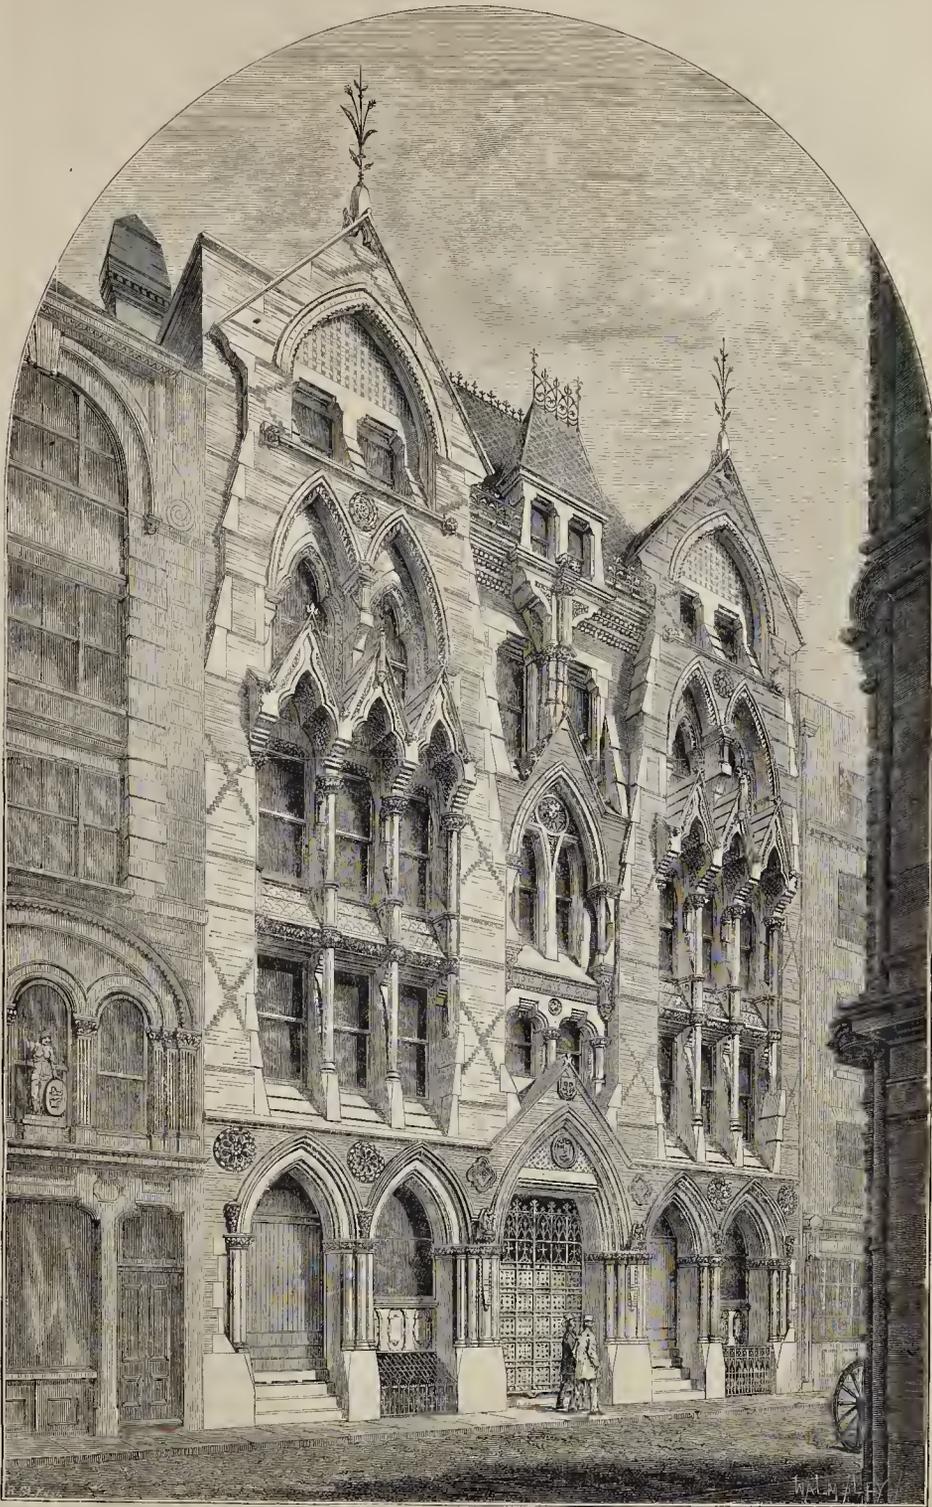

alluded to as mad-cap Henry's place of revel. It has been built by Messrs. Hill, Evans, & Co., British wine and vinegar manufacturers, of Worcester, for their London depot, their present offices and warehouses in Martin-lane, Cannon-street, being required for the extension of the Metropolitan District Railway, which, together with the increase in their business, necessitates their removal from their old premises to new ones.

The general idea which we are apt to entertain of the extent of the manufacturing industry of Great Britain is always a vague and limited one, however enlarged we may think it to be, and it is certain to be very much increased whenever we have an opportunity of being well informed with respect to some special business, however inconsiderable a section it may at first sight appear. The more we go into detail,—the more minute and precise our researches are,—the greater the extent embraced by trade will appear, and it will be only by taking as a datum what we do know of some businesses as an index to what we have not an equal opportunity of examining into that we are able to form an adequate idea of the multifarious ramifications of commerce. With regard to that simple article vinegar, we see it on the table in table-spoonfuls in the cruet-stand, and we know that it is largely used by the pickle manufacturers, and in a smaller way when that manufacture becomes domestic. But we are much surprised when we find that, at the last revenue return of the vinegar duties, just before that duty was repealed (in July, 1844), duty had been paid during that year by the vinegar manufacturers upon 2,828,043 gallons, and that they had at that time in store 3,901,568 gallons which had not paid duty. In looking at these figures the importance of this manufacture is manifest. Since that time it has much increased. The sale of vinegar by Messrs. Hill, Evans, & Co., at that time amounted to 153,375 gallons, and their stock in store to 291,689 gallons; but their manufacture and business has now increased,

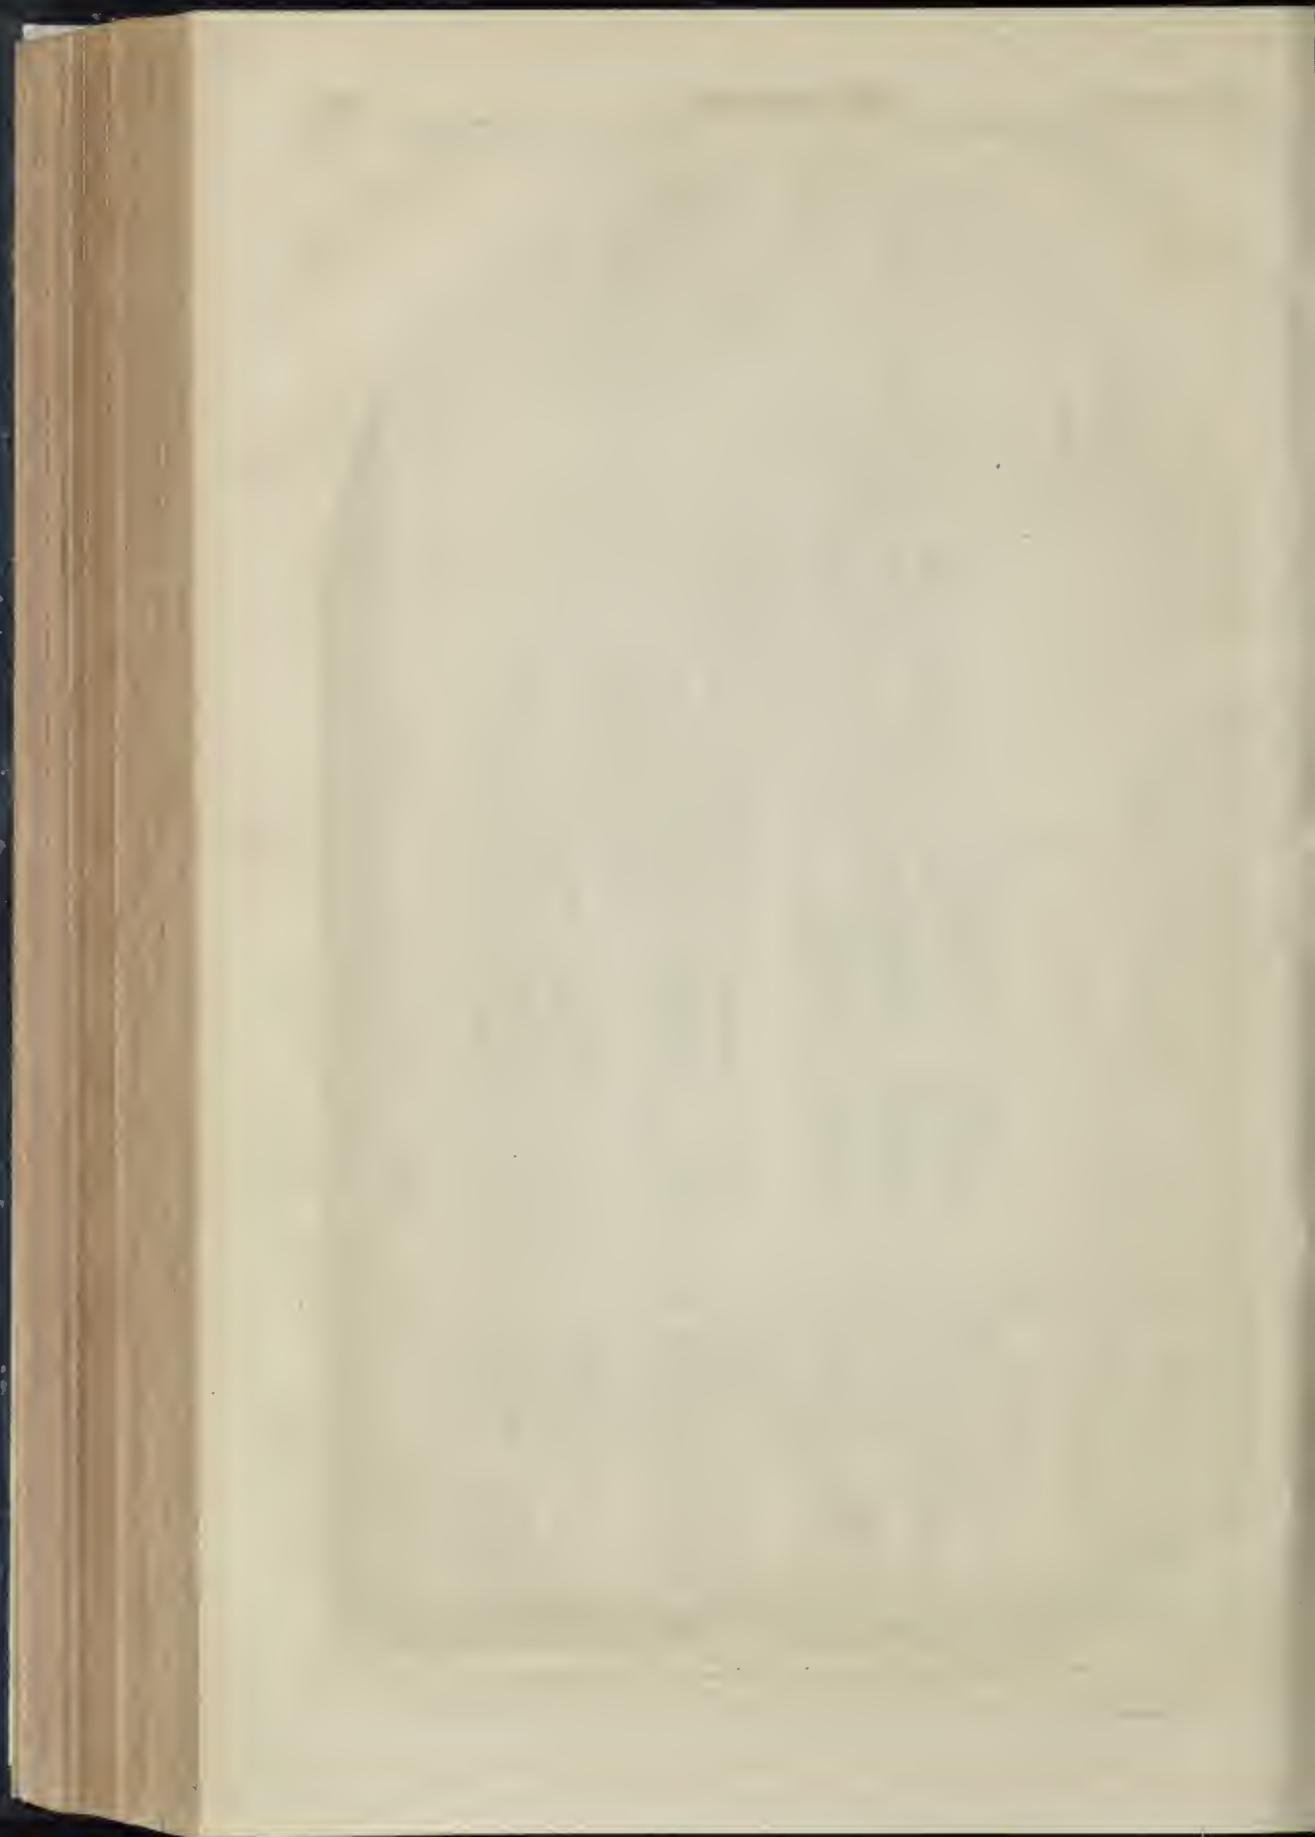

and to carry out the demands upon them they have almost entirely rebuilt their Worcester manufactory, so as to extend it upon a much larger scale, and it now quite rivals in the size of its buildings, vats, and machinery any one of the great London breweries. Their tun-room contains above thirty vats, the five largest of which will each hold 80,000 gallons of vinegar, and their present year's sale will amount to quite 2,000,000 gallons, being equal to considerably more than two-thirds of all the vinegar manufactured in 1844 by the whole of the trade.

Their building in Eastcheap has a frontage of 48 ft. on the street, by a depth of nearly 100 ft. It contains two tiers of cellars below the ground floor, and has four square floors above it, with some rooms in the roof. The style adopted by the architect, Mr. B. L. Roumieu, is the Gothic of the south of France, with a Venetian impress; and the design, if a little overdone, may be considered picturesque and original. As the rooms were intended for offices in a narrow street in a city having a dull atmosphere, large openings for light became a necessity, and have been provided. In this composition a depth of shadow is obtained by the thickness of the walls, and the variety which the contrast of colour here introduced gives it affords all the relief in that respect required. The materials used are red and black brickwork, the arching being moulded bricks; the stone is from Tisbury—the same as that used in Salisbury Cathedral; and the roof is covered with variegated slating.

The contractors are Messrs. Brown & Robinson, who are executing the Smithfield Market Improvements for the City of London Corporation. The carving was done by Messrs. Framp-ton & Williamson, from drawings by the architect, and is executed cleverly. Messrs. Simpson did the external and internal tile work, and Messrs. Peard & Jackson most of the ornamental ironwork, the whole of which was designed by the architect for this building. The amount of the contract was 8,170*l.*

WAREHOUSE, IN EASTCHEAP, LONDON.—MR. ROUMIEU, ARCHITECT.

THE CRAWLEY EXHIBITION OF PICTURES.

THE committee have succeeded in gathering together 136 paintings and drawings in water colour, the majority of them good works. Thirty-two of them are contributed by Mr. George Smith (of Pimlico, and known to many of our readers), from his handsome new residence in Worth, including an early picture by Constable, a "Water-mill" by Müller, a capital drawing by Paul Sandby, "Windsor Castle," and Mr. F. Chester sends a portrait of Mr. Mark Lemon, a clever work, though a little exaggerated. Mr. D'Nie's "Volunteer" is a striking feature; equally so his "Landing of the Princess Alexandra at Gravesend." Works of more or less importance, by Danby, Solomon, Miss Solomon, Miss Nutrie, Millais, Horler, G. Chester, E. W. Cooke, John Phillip, Creswick, F. Stone, Birket Foster, H. Warren, and other well-known artists, cover the walls. The next time an endeavour should be made to obtain a better lighted room for the exhibition.

CONDITION OF BIRMINGHAM.

THE importance of the object aimed at will sufficiently excuse us for reproducing the following articles:—

From the "Birmingham Daily Post."

"The discussion in the Health Department of the Social Science Association, on Thursday, returned upon a subject which has often engaged attention in this place, and as to which we have repeatedly censured the local authorities for want of public spirit. A paper was read 'On the Functions and Authority of Medical Officers of Health,' and its treatment led to the expression of opinions which, considering the sources whence they proceeded, ought to receive serious attention from the people of this town. In Birmingham we have no medical officer of health; and, notwithstanding repeated agitation of the question, the Town Council remain adverse to the creation of such an office. The members of that body—at least the majority of them—take refuge in the fact that the rate of mortality in this borough is moderate when compared with the scale prevailing in other large towns. As Birmingham people die on an average at the rate per annum of about 24 per 1,000, and in many large towns the ratio is higher, our aldermen and councillors appear to think that they stand well in the comparison, and that, therefore, they are not called upon to incur the expense of engaging a special officer to take charge of the health of the people. The mayor, on Thursday, put the case thus:— 'In Birmingham, the governing body paid a strict and critical attention to the demands of the public, and they wanted to be convinced by facts, as well as arguments, that some beneficial results would follow the appointment of such an officer as now recommended.' In order not to find these facts, they turn their faces, when seeking them, only in one direction. They look alone to other great towns, where matters are even worse than here, and find nothing that to be the case, they say Birmingham is already a model town in respect to sanitary condition, and no money ought to be thrown away on the folly of endeavouring to improve it. If they go even further than that, for some of their observations imply that, as people die faster here than in some towns which have a medical officer of health, the influence of such an officer appears to be the reverse of remedial. If, instead of this, they would look to the mortality of the country at large, they would find that the mortality of Birmingham ranged annually at about four per 1,000 above the average,—which signifies that about 1,400 more persons die every year in Birmingham than would die if the same people had not the misfortune to live in an overgrown, overcrowded, and unwholesome neighbourhoods. That Birmingham is as good as the rest of these towns,—or even a little better,—is no answer to the grave charge which these facts sustain. What the corporation should aim at is to make it as healthy as the general average of the country; and if they kept that object in view, they would inevitably be led to see the necessity of appointing to the charge of public health a more competent officer than they now belonging to their inspection staff. Examples of deleterious influences abound in every borough. Two at once present themselves to notice. The filthy stream entitled the river Rea,

and that other abomination, the Hockley Brook, are little better than two sluggish currents of poison. Not only does their quality show itself in the very look, but facts which should be notorious to the public show that their shores are the home and abode of disease. The inspectors of nuisances may answer very well for the purpose of discovering and prosecuting instances of individual neglect in regard to cleanliness, but wholesale propagators of disease, such as these two open drains, are beyond the functions of those persons. What we want is an officer competent and empowered to investigate remote causes of disease, and so to raise the sanitary condition of the place in a sensible manner. Compelling the removal of what are termed nuisances may prevent our getting worse, but in order to get better we must have the services of a man who can look deeper into the matter than a police-constable, and can make suggestions as to the attainment of radical improvements. An illustration of this difference is to be found in what lately occurred just on the outskirts of what is technically called the borough. In a part of the Balsall Heath district the people were found to be dying rapidly of fever, and the attention of the local Board being thus attracted to the spot, it was ascertained that the epidemic arose from the want of wholesome water. People whose business it is to hunt up cases of pig-keeping or ash-pit neglect would never have thought of this neglect had not the prevalence of a destructive malady forced it upon their attention. As a well-qualified officer of health would immediately lay his hand on such a want of sanitary provision, we say without hesitation that many lives have been sacrificed at Balsall Heath to the non-appointment of such an officer; for it must be remembered that the absence of good water had been long prey on the inhabitants before the febrile outbreak which led to its being remedied.

Some examples of the present condition of Birmingham were presented to the Section on Thursday, by one of the members of the Association. Mr. Godwin,—to whom the public are indebted for such useful service,—had personally visited, under the guidance of the chief of police, some of the central parts of Birmingham. The result of his examination is given in the following passage from his observations in the Section:—

'He did not wish to say one word that might be objectionable to the authorities of Birmingham, but he wished to raise his voice in favour of humanity. On the previous day, aided by the Chief of Police in Birmingham, he (Mr. Godwin) visited some of the districts in the centre of the town, which presented conditions that seemed to him most extraordinary, considering the very fair death-rate which Birmingham had been able to boast. In more than three-fourths of the width of the streets in the district he visited he found houses tumbling down, no windows, floors torn up, pavements retaining decaying matter, and of a character always to retain it; an utter want of close accommodation. In Balloon-street he found double houses, the rooms full of people, and the middens all full. In No. 6 Court, Brick-kiln-street, the neighbouring cess-pool of the court was some 3 ft. higher than the pavement, and the consequence was that the filth was constantly oozing through, and spreading over the floor of the court. The first woman he inquired of in one of the courts had three children living, and she said the locality was being very healthy. There she elicited from her that she had five children dead. Next door the woman had no children dead, but her husband, she added, had been invalided for many months. In a court in Stanforth-street, an open cess-pool was to be seen—that is, the closet ran into what was prepared to be a midden, but not being so used, was simply filled with fecal matter. Here again there was the same appearance on the part of the children—pale faces, sunken eyes, women worn and haggard, and throughout the whole of the inquiry he did not meet with a single child who was able to read. Here, then, was what he begged leave to point out to the authorities of Birmingham—an enormous population, living under conditions utterly opposed to anything like health. Whether any attempts were made to remedy this he could not say, but at any rate they must have been very insufficient. He could go through a large number of similar cases, but he did not think it necessary. Here, in these wretched districts, were growing up in ignorance and dirt girls and boys, with no other prospect than the streets for the one and the goal for the other. Where, he asked, had been the ministers of the Church? It was quite possible that he might expose himself to some obloquy for these observations; but the fact remained that there were hundreds of children growing up in a lamentable state of ignorance, and under a condition which ought not to exist.'

Having ourselves been instrumental in collecting and publishing numerous cases of a similar kind, both as to the town and the populous district adjacent to it, and having striven by every means at our command to impress on the local authorities the necessity of taking greater precautions than are possible under present arrangements, we rejoice at receiving this additional testimony from the independent inquiry of a competent visitor. We can only say further that, if the facts stated by Mr. Godwin, and the arguments advanced in the Section, do not obtain serious notice on the part

of our authorities, we trust that they will be well considered by the great mass of the persons by whom local authority is conferred.'

From the "Daily Telegraph."

"Sensational narratives of travel and adventure, such as those which are frequently related at the meetings of the Royal Geographical Society, are scarcely expected at the quieter gatherings of the Social Science Association. No tale of an African or Asiatic wanderer, however, can rival in pathetic interest the recital of certain recent explorations made by Mr. George Godwin, and reported by him to the Health Department of the great Congress now assembled at Birmingham. Mr. Godwin is an old and experienced traveller. Few men are more familiar with what may be called the savagery of civilization; few men have penetrated deeper into those foul regions which still disgrace our large cities; few men have devoted more energy and courage to showing one half of our English world how the other half lives—and dies. It is true that he has visited only Bethnal-green, not Borrioboolagah; true, that he is less familiar with Wbydah than Whitechapel. The 'natives' whom he knows are not black; they would even be white, if they had any water to spare for washing purposes; as it is, they are only dirty and grimy Christians, subjects of her Majesty Queen Victoria. Still, such as they are, they happen to be our fellow-creatures; and it may some day be admitted that they deserve almost as much attention as Sambo himself. To the praise of novelty Mr. Godwin's narrative can hardly lay claim. It is—to the shame of this country be it spoken—exactly like a hundred other reports, made by a hundred other explorers. As we examine its melancholy, squalid, repulsive details, the painful thought arises that we have heard them all before; that a story which ought to shock the conscience and awake the manhood of the whole land is really trite and stale, has been told over and over again, and will yet have to be repeated scores of times before the country is roused to anything like earnest action. Let us accompany Mr. Godwin on his latest excursion; and, revolting as the details may be, we must here use the plainest language, for that alone can convey the full truth. The traveller set out one morning, with a sergeant of police for his escort. Avoiding the main streets, the larger manufactories, and the comfortable hotels, he went into the heart of Timbuctoo—we beg pardon, Birmingham—and diligently examined two districts, about a mile in extent. So far as regards mere distance, therefore, the journey was no very startling feat; and yet the news that the traveller brought back ought to startle us, if it does not. For, in the centre of a thriving and busy town—one of the healthiest, for its extent, in England, and inhabited by a community which is eminently practical and enterprising—he found that the houses were miserably dilapidated, that the pavement was covered with decomposing matter, that the rooms were scandalously overcrowded, and that court after court was unprovided with the ordinary requisites for decent and wholesome living. In one of these places, the soil from an adjoining cess-pool was percolating through the boundary wall, and filling the air with a sickening and deadly stench. Of course, so experienced a traveller found little difficulty in communicating with the natives. The first to whom he spoke was a woman, and her story was as painful as it was significant: she had had eight children; three of them were living—but five were dead. The next had to say that her husband was invalided—and these were but 'samples' of many others. In one court the 'midden' was simply a great open cess-pool; and it is scarcely surprising to be told that the children here 'were pale and wan, with staring eyes'—a touch of reality which should surely bring the picture vividly before us. Do we require to add that these children, one and all, were unable to read? Turning these matters over in his mind, the audacious explorer was absolutely bold enough to say, 'Here, then, hundreds of children are brought up without health, without knowledge of anything but evil; and I feel bound to ask, not merely whether the authorities have exercised the powers they possess, but whether the clergy of the neighbourhood have done their duty.'

The audacious traveller ceased; and a mild, simmering murmur of discussion broke forth. We have said that, to us, the statements of Mr. Godwin are not particularly novel or surprising; but we are bound to admit that there was one

person to whom they seemed altogether fresh; and, strangely enough, the learner was none other than the Mayor of Birmingham himself. One might have thought that he, of all men in the world, should know,—nay, was bound to know,—the sanitary state of that town which he ruled as chief magistrate; and so, indeed, in a certain sense, he did. He knew,—for there were figures to tell him,—that Birmingham, as compared with other great centres of industry, was one of the healthiest places in England; but he did not know,—since something more than statistical tables would have been required to teach him the less paraded fact,—that large districts of Birmingham were still in a sanitary condition which was not merely disgraceful, but dangerous. To our mind, this amiable unconsciousness of the Mayor is the saddest as well as the strangest part of the whole story. Here is a gentleman,—presumably humane and intelligent,—who, from his official position, should know more about Birmingham than all other men; and yet he has to be told, by a stranger coming down from London on an entirely different errand, that all the elements and conditions favourable to pestilence abound in the very heart of the town which he governs. ‘The authorities,’ said the good Mayor, ‘were generally in favour of a recognised officer of health; but they had to economise the rates, and did not wish to adopt a plan on the subject until they were satisfied it would be attended by definite and satisfactory results.’ Is it safe to have a large open cess-pool in the middle of a crowded court? Perhaps not; but ‘we have to economise the rates.’ Is it prudent that we should offer a standing invitation to pestilence, keep typhus constantly among us, and assure cholera of a triumphant career when it arrives? Perhaps not; but then ‘we have to economise the rates.’ The true economy would be to disinfect those places with chloride of lime, to drain them thoroughly, and provide them with the ordinary appliances of decency; but no—the local authorities are saving the article of chloride of lime, and trusting to the chapter of accidents as regards the article of coffins.

We should be sorry to convey the idea that the mayor of Birmingham is one jot worse than his neighbour. In such matters, to quote Hood’s words, ‘Evil is wrought by want of thought, as much as want of heart.’ Apparently, the worthy gentleman had never given serious consideration to the subject; obviously, he was taken aback by Mr. Godwin’s explicit statement. And it is just the same, we are honestly convinced, with the authorities in many other towns. They know the main streets, the houses of the gentry, of the shopkeepers, and the manufacturers; but they far too rarely turn aside

from the chief thoroughfares into the dingy alleys and courts that lie apart. When those magnates are not wilfully obstinate, but merely ignorant, the knowledge that sanitary reform is wanted may lead them to bestir themselves. We are not, however, exceedingly sanguine of that result. In Liverpool, which is now sometimes cited as an example, years were allowed to pass before the authorities could be roused to anything like earnest action. The utiring industry, the indomitable perseverance, the dauntless courage of one man—Mr. Hugh Shimmis—at length bore fruit; but for years his statements were denied, his passionate earnestness was ridiculed, and his motives were malignised. Such is too frequently the reception accorded to the sanitary reformer. He has to brave danger of no light order; he has to undergo toils that are not merely arduous, but noisome; and his rewards are misconception, calumny, and abuse. Much, indeed, has been done of late years in the right direction, but in many cases it has only been done under the influence of alarm; and, as we look mournfully around us, and contemplate the immensity of the work which yet remains to be accomplished, there are moments when we almost apprehend that the only ‘Sanitary Reformer’ to whose teachings men will really listen is one whose visits, when they do occur, are long remembered,—Asiatic Cholera.”

PROVINCIAL NEWS.

Chesterfield.—The Sheffield Banking Company, who have for some time past had a branch bank in Chesterfield, purchased the old Manor-house, in the Market-place, and have rebuilt and remodelled it the better to accommodate their extending business. The architectural style of the old house, erected about the close of the seventeenth century, has been studied in the new building. The exterior is built of Darley Dale stone, the roof being covered with small green Westmoreland slates. The front, with three gables and tall chimney-stacks, has millioned and transomed windows and an arched and panelled doorway, with an oak door, panelled and countersunk. The banking-room is 27 ft. by 18 ft. It has a ribbed ceiling, and is lighted by three windows. There is a fireplace of Derbyshire marble. Adjoining is the manager’s room, with lavatory, fireproof safe, &c., and the house for the resident agent is comprised within the building. The staircase from the hall, leading to the upper floors, is a reproduction of the old one. It is lighted by a tall millioned window, filled with geometrical glazing; and a floor of mosaic tiles, executed by Messrs. Maw, from the

architects’ design, gives a finish to the whole. Mr. John Milner, of Sheffield, has executed the works from the designs and under the superintendence of Messrs. M. E. Hadfield & Son, of Sheffield, the architects; Mr. John Pearson having acted as clerk of the works.

Ipswich.—The new Roman Catholic Convent, dedicated to St. Mary, and situated on the grounds immediately adjoining the Roman Catholic Church of St. Mary, Woodbridge-road, Ipswich, has been opened in the presence of a large congregation, by whom the convent chapel was filled. The structure is about 130 ft. in length by 35 ft. wide, but when completed wings will be added on either side. That portion of the building which was opened, has been in course of construction for a year past. The style of the building is Gothic, treated with much freedom, in order to be adapted to the purposes for which it is intended and the requirements of the time, and there are large arched openings for light and air. The northern side of the building is occupied by wide corridors which run from end to end, and to which the rooms, all of which look to the south, open. At either end is a flight of stairs, whilst in the centre is the principal staircase. The lower corridor is lighted by shafted windows with arched heads and pierced tracery, and there is a large porch surmounted by a cross, and paved with Mosaic tiles. Bands of black bricks give relief to the red, which form the principal material of the building, the springings being of yellow in the cornices and window heads. The principal room on the ground floor is an exhibition-room, 50 ft. in length, and on the first floor are class-room, music-room, and infirmaries, the upper floor being devoted to dormitories, &c. Mr. Goldie, of London, was the architect; and Mr. R. S. Smith, of Ipswich, the contractor.

UNIVERSALITY OF DRAWING IN CONTINENTAL SCHOOLS.

SIR,—At the meeting of the Social Science Association at Birmingham for the present year, the Earl of Carnarvon remarked, in reference to education, that “if there be one branch of instruction more valuable than another to the artisan, it is drawing.” He might have said to all; and yet up to this present time drawing has scarcely been recognised at our public schools, except as engaging an hour on half holidays! I have been at the trouble of ascertaining how much time is given to the various kinds of drawing in some public schools on the Continent, and I send you the results in respect of four of them.

Machine Construction	18

MILFORD HAVEN AND ITS PROSPECTS.

In reading the article in the *Builder* of the 12th inst. respecting the failure in launching the *Bermuda*, I was forcibly struck with the feasible plan you recommended for the future construction of iron monsters, and of the appropriateness of the place you named for the purpose.

With regard to the latter—the place—I now wish to offer a few remarks. The vast water shed of Milford Haven is not only capable of any number of such structures being built in the manner you proposed ("floating on the surface of the water"), and leaving ample room for the whole of the traffic of the kingdom, if needs be, besides, but its banks on either side are filled with creeks, or *pills*, as they are termed in that locality, which are docks that are already formed by nature, from which the water might be excluded at a trifling cost for such purposes, and where the building of gigantic pieces of naval architecture could be carried on without inconvenience on the dry land, whence, after being completed, they could, without blow of hammer or strain of wedge, be floated gently into the bosom of the deep.

The situation of Milford Haven is adapted for each purpose on account of its proximity to the great iron districts of the country. Merthyr Tydvil is within easy distance by rail, and the whole country around it abounds with iron ore of the purest quality, that only wants enterprising capitalists to bring its entire manufacture, for the uses above named, on its very shores.

A few years ago a small iron smelting furnace was built at a place called Stepaside, fifteen miles from the banks of the Haven, where, from a native ore, iron is made that is not surpassed in quality by any in the kingdom. Hundreds of tons of the ore supplied to that furnace cost no further labour to procure than to pick it up from the contiguous beach. In a three-miles' walk along the shore from the beautiful and fashionable watering-place, Tenby, to a village called S Saundersford, which is in the neighbourhood of the Stepaside furnace, the pedestrian can see the sides of the cliffs teeming with iron ore, and under his feet lie thousands of tons smoothed and rounded into the form of pebbles by the motion of the tide. About two miles from Tenby, and nine miles from the Haven, a valuable vein of hematite ore has been discovered, which the proprietor of the Stepaside works has been for some time working. Coal, also, abounds in the neighbourhood, and it is the home of the moun-

tain limestone. All the buildings about that part of the country are constructed of the native limestone, so that the materials are all at hand and only want capital to develop them.

Besides iron, coal, and limestone, the district yields the finest black marble, which is procurable in very large blocks, clays from which very superior fire and common bricks are made, and a sand that has been pronounced excellent for making glass. Wages in that locality are lower than in any part of the country. We believe the highest class workmen in Pembroke Dockyard are not paid more than twenty-six shillings a week.

With all these advantages, and now that it has direct railway communication with all parts of the kingdom and a through narrow-gauge line to the North, Milford Haven must become a place of vast importance, and those who are there first in the race are the more likely to become the most successful men.

ONE WHO KNOWS MILFORD.

RAILWAY STATIONS.

The extension of the railway system has brought the stations so close together, that it becomes necessary, for the despatch of business, that even half-minutes should not be lost. Why should not all the employes at each station wear a band on their caps, with the name of the station legibly worked white upon black, or the reverse; and on long journeys, where intervals of sufficient time exist, why should not the guards, even, change their band, after passing each station, to the name of the next. The unintelligible manner in which the stations are announced in some districts warrants this simple expedient, which, I fear, is so simple that it will not be adopted. If objection be made that the porters are sometimes shifted, a remedy might be adopted in making the band removable, like the armband of the policeman.

Should not the names of all stations be placed at right angles to the road? and when the place is important, should not the name be painted in gigantic letters on each end of the station?

W. H. B.

GENERALISATION IN ARCHITECTURAL EDUCATION.

Sir,—Many thanks for the article on this subject, which I have read carefully, with much mingled pain and pleasure. With pain, because I once more see that others think as I do, viz. that I have been turned out ready to earn a living,—as my friends think,—without having learnt anything, but that I know nothing. With pleasure, because I trust that such articles as this will be the means of preventing others madly following in my steps.

The question which those who have blindly fallen into error want answered is, how are they to obtain the education which they require? Their education is supposed to be over; their friends say, "You must now support yourselves;" but they themselves see and know that they are altogether ignorant. They can copy and trace, and may be able to earn an honest living by hard work as draughtsmen; but they want to do more, they wish to live a pleasurable life: how is this to be done?

If a college were started, they would find it difficult work to persuade their friends to go to the expense of commencing their education again. Their fate is sad one, and they cannot see any helping hand outstretched to assist them. The Royal Academy offers them a studentship and prizes, but here its aid stops; there is no education except in perspective.

Where are they to look for light? If they are to remain in their present darkness, they are of all men the most miserable; but there is one who hopes for light, and believes it will not be long before it shines forth.

ADELPHI.

GOST OF CONCRETE TANKS.

Sir,—Can any of your readers give me an idea of the cost of constructing concrete tanks to hold 100,000 and 250,000 gallons respectively, and to be arched over.

J. A.

BIRMINGHAM NOTES.

THE makers of builders' hardware in Birmingham are receiving orders from the Northern and Eastern Counties, such as indicate a considerable improvement in building operations in those parts of the country. A fair proportion of these are railway and other engineering works, but all the railway-ironwork establishments are not yet employed to their full extent; and, indeed, one of the most extensive in the neighbourhood of Birmingham is only occupying about half its usual complement of hands. Among the recent novelties in the lighter branches of builders' hardware, may be mentioned a new and highly-decorated ceiling rose in stamped metal, introduced by Messrs. Winfield & Co. This artistic production will do much to favour metal roses in preference to those of Roman cement or wood.

The same firm have done much to facilitate the ornamentation of metal tubes, an operation now performed by

machinery by an almost instantaneous process. It is noticeable that Birmingham is making steady progress in the art-workmanship of its iron and metal wares; and although, perhaps, to a somewhat less extent, the same remark will apply to similar productions in the neighbouring district of South Staffordshire. Foreign competition in some branches continues severe, and a reduction in the cost of production has been the natural result. In one branch, for example,—metal cornice-poles,—which are largely made on the Continent, the Birmingham price has fallen 50 per cent. during the past few years.

BRICK-KILNS TO BURN THEIR OWN SMOKE.

At the Bradford Borough Court, the Town Clerk recently appeared in support of an information against Mr. Joseph Wilson (Messrs. J. Wilson & Sons, builders, White Abbey), for causing a nuisance in Carisle-road, Manningham, by the smoke from a brick-kiln. There was no difficulty whatever, he said, in bricks being made without causing the least nuisance if the necessary precautions were taken, and it was a mere matter of expense. An enclosed circular kiln could be formed, and when it was charged and fire applied to the first hatch it was allowed to get to a red heat; the other fires were then lighted, and the smoke passing from the kilns was entirely consumed, so that very little except vapour passed into the tall chimney. There was a kiln of this kind in full operation in the town, and he believed with these facts before their eyes the magistrates would see that the nuisance could be abated. He did not ask for a penalty, but for a prohibitive order, and the bench could fix the date when they chose. Evidence was led to prove that the kiln in question did not consume its own smoke, and that such smoke consumption was quite possible.

The mayor decided that the defendant be allowed to continue his works until the 1st of January, if a promise were given that no more kilns should be built, and the utmost vigilance exercised to render the smoke as light as possible.

It was agreed that this should be done as far as practicable; and an order was then made for abatement on the 1st of January, 1869, the defendant to pay the costs.

FEVER HOSPITAL COMPETITION.

A fever hospital is to be erected at Hampstead for the Metropolitan Asylum District, and a limited number of architects were invited to submit designs, namely, Messrs. F. Gordon Smith & G. A. Dunning, Saxton, Snell, Peckington; Brereton, Son, & Brereton; E. Fowler, and Edmeston. The designs are now before the Board. Other hospitals are about to be erected for the metropolis by the same Board.

PROPOSED NEW PIER AT SCARBOROUGH.

THE Scarborough Harbour Commissioners, in March last, advertised for designs for a new western pier. At a special general meeting last week, the first premium of 50*l.* for the best design was awarded to Mr. Charles W. Whitaker, of 28, Woburn-place, Russell-square; and the second premium, of 30*l.*, to Messrs. Stelford & Robinson, Victoria Chambers, Westminster.

FROM IRELAND.

Dublin.—The Roman Catholic church of Ballybollah, county Dublin, is to be remodelled internally, with alteration of gallery and addition of pews, &c.; also to have a new octagonal tower at south-east angle, surmounted by a timber and slated spire, terminated with ornamental metal vane. Mr. J. J. Lyons is the architect.

Sligo.—Farm buildings are being erected at Heapstown, county Sligo, for Capt. McTernan, according to plans, &c., by same architect.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the friends of this institution was held on Monday, the 5th inst., at the offices, Bedford-row, to evidence its success by the election of the widows of two builders' clerks as pensioners on the relief fund. The chair was taken by Mr. S. J. Thacker (Messrs. Holland & Haumen); and the poll was opened (at 7.30 p.m.), the result of which is shown in the advertisement. It is rather less than two years since we had to record the founding of this institution by the public meeting presided over by Alderman W. Lawrence, M.P., and since then at various times appeals have been made to the trade and public on its behalf in our pages. The necessity that compelled the

committee to make use of the funds at the earliest moment prescribed by the rules shows that the institution has not been established at all too soon. The committee are now canvassing for and will gladly receive proxies for the next election at the Orphan Working School, Haverstock Hill.

CHURCH-BUILDING NEWS.

Crowmarsh Gifford.—The newly-restored church of Crowmarsh Gifford, near Wallingford, has been re-opened. The work of restoration has been carried out by Mr. Moses Winter, of Wallingford, under the direction of Mr. J. H. Hawkeville, of London. The cost of the work is about 600*l.*, and comprises the entire removal of the old roof, restoring the same, and making an open roof to the nave; putting in new lancet windows to correspond with the old Norman style of the building, removal of the gallery, taking out the large old pews, and reseating with benches of stained deal.

Llanbrynmair (Montgomeryshire).—The new church of St. John has been opened for divine service. The architect was Mr. David Walker, of Liverpool. The plan is that of a nave and chancel under one roof, the east end of the chancel terminating in an apse. The internal length, from east to west, is 68 ft., the chancel and sacristy taking up nearly one-half, and the width is 21 ft. 6 in., with a height, from floor to ridge, of 31 ft. There is a vestry on the north side. A dwarf stone screen divides the nave and chancel. The roof of the nave is open-timbered to the ridge, and plastered between the rafters. The chancel roof, which is of a polygonal form, is boarded, the intention being to decorate it in colour, when the funds permit of that being done. The church is fitted up with open benches of varnished deal, and kneeling accommodation is provided for about 230 persons. The central aisle to the nave is paved with 4-in. buff and blue tiles, laid to a design by the architect. The chancel tiles, which were supplied by Mr. Godwin, of Lugwardine, are of a more elaborate kind. The architecture of the external elevation of the church is Twelfth Century Gothic, and has much of the character of Early French work. For the walling, which is of broken coursed work, stone of a deep blue colour, obtained from a quarry in the locality, has chiefly been used, but bands of light blue stone are introduced. The nave windows are copied lancet lights, the heads and sills being of Cefu stone. The east windows, and that on the south side of the chancel, are two-light windows, filled in with plate tracery. The stonework of the west front is carried up above the roof, to a height of about 45 ft., forming a belfry, with space for three bells. Only one bell, however, has yet been provided, and that is of cast steel, from the foundry of Messrs. Vicars & Co., at Sheffield. The roof is covered with Machynlleth slates, ornamented by a red clay crest of peaks, manufactured from the architect's design. The chancel portion is of an enriched character, the apsidal end and the junction with the nave being marked by hip blocks and ornamental wrought-iron crosses. Provision is made for warming the church, in the cold season, by means of underground flues. The windows are glazed with Bowen's patent interlocking glass, in two colours, obtained from Messrs. Forrest & Co., of Liverpool. The church has been built by Mr. J. Harrison, of Newtown, under the superintendence of Mr. Walker, the architect. The cost will be about 850*l.*

Clifton (Bristol).—St. Paul's Church has been reconsecrated and reopened. The west end has been entirely rebuilt. The centre portion has been raised about 15 ft., and the pitch of the roof has been somewhat increased. The aisle roofs remain at the same pitch. Two projecting buttresses, with gabled heads, separate the nave from the aisles, and divide the front into three compartments. The principal feature is the grand-entrance doorway, projecting from the face of the wall, and finished with a gabled roof, surmounted by a carved finial; the jambs have triple shafts of polished granite with carved capitals. The arch is moulded, and has two rows of carved foliage. Above this doorway are two windows of two-lights each, with tracery, and in the gable a circular window containing three trefoils. The ends of the aisles have three-light windows and small trefoil gable lights. A new entrance, enclosed by a gabled porch, has been made at the west end of south aisle, thus giving additional means of ingress and egress.

This porch has been composed out of the old materials of the former porch. Other portions of the old porch have been used inside the building. The disparity in size of the tower and spire is rendered still more apparent by the additional height given to the nave. A new tower and spire, in proportion with the rest of the building, at the south-west corner, are recommended by the architects, and shown in the design first submitted by them to the committee. Beyond building on the old foundations, the interior may be said to be entirely new; all the old windows have been cut out and new tracery inserted; the inside arches of the windows have been changed and made more pointed. The greatest change effected is the raising of the centre roof and the addition of the clearstory windows. The next is the formation of a distinct chancel, separated from the nave and aisles by moulded arches, and furnished with stalls, sedilia, credence, &c. The nave arcade is executed entirely in stone; the shafts of the pillars are circular, of red Mansfield stone, with carved capitals. The chancel arch is carried up as high as, and agreeing with, the arched principals of the nave roof. The transept arches have been raised considerably, and rest in the centre upon a clustered shaft of red Mansfield stone, and at each end in small corbelled shafts of the same kind of stone, the whole having carved capitals. The floor is everywhere filled in above the brick vaults with concrete, and the chancel and passages in nave and aisles are laid with encaustic tiles; those of the chancel are by Messrs. Maw & Co., and the remainder by Mr. Godwin, of Hereford. The roof of the nave is open, having seven arched principals filled in with tracery, the whole being covered with diagonal boarding. The chancel has an arched ceiling of wood, divided into panels by arched mouldings, springing from a carved stone cornice. The aisle roofs are boarded, and have arched principals at every bay. The carving of foliage to capitals, cornices, &c., was executed by Mr. Margetson. The pulpit, font, and reredos, together with the sculptured tympanum of the west door, are the work of Mr. R. Boulton, of Cheltenham. The altar-rails, pulpit-guard, font, cover, &c., are by Messrs. Brawn & Downing, of Birmingham. The gasfittings were supplied by Messrs. Singer, of Frome. The church is heated by hot air, the apparatus being supplied by Messrs. Haden & Son, of Trowbridge, and placed in a vaulted chamber. Care has been taken to guard against a recurrence of the catastrophe which destroyed the church, and the whole area has been arched in with bricks. The architects were Messrs. Hanson & Son; and the contractors Messrs. Wilkins & Sons and Mr. H. Brooks. Mr. T. Lewis was the clerk of the works.

Alford.—St. Wilfrid's Church, Alford, has been re-opened. The sum of 6,205*l.* 2*s.* has been expended on the restoration and enlargement of the church. The work has been done by Messrs. Hasmy & White, of Alford, under the superintendence of Mr. George Gilbert Scott. The plan of the church comprises a nave 59 ft. long by 20 ft. wide, divided into four bays by arcades of octagonal columns and deeply moulded arches, having north and south aisles 9 ft. wide, and a new north aisle 16½ ft. wide. The chancel is 44 ft. deep, by 20 ft. wide. A tower stands at the west end of the nave, and is 17 ft. square within. The entire length of the church is 125 ft. 6 in., and width 62 ft. There is a large porch on the south side, with vestry above for choristers, &c. The style adopted is Second-Pointed; the windows and other architectural details being, as nearly as could be ascertained, of the date of the original church. The arches of the nave and chancel are moulded, having foliated capitals, and moulded bases. The tracery in the chancel windows is to be filled in with the remnants of the old stained glass. The roofs are open, of high pitch, stained and varnished. The chancel roof is of stained oak, in the wagon-head shape. The seats are all open, of pale oak, with the ends carved, of three different designs, and fixed on a wooden floor; the middle aisle is flagged with ancient tombstones. The other aisles are paved with black and red tiles, unglazed, from Godwin's works at Lugwardine, near Hereford, each in different design. The windows are glazed with pale green cathedral glass, in small diamond frames. The roofs are covered with pale Westmoreland slates, having moulded stone ridges, the cable ends being surmounted by pinnacles and crosses, of various designs. The new doors, of pale oak, are hung on wrought-iron hinges, from the Medieval

metal-works of Messrs. Peard & Jackson. The gas standards are also from the same firm. The new organ, by Messrs. Forster & Andrews, of Hull, has been erected in the new organ chapel, at a cost of about 400*l.*; the case is of oak, carved. The church is to be heated by four stoves. The east window in the south aisle is about to be filled with stained glass, by Mr. Lister Wilson. The dark green sandstone used is from the quarries at Worlaby, and has been presented by Mr. A. Nelson. The light stone for the angles, window-mouldings, &c., is from the Ancaster quarries. The new gargoyles, and heads on the corbel stones, on either side of the doors and windows, have been carved by the Messrs. Radlock, of Loudon. The accommodation in fixed sittings is for about 600, but the church is capable of accommodating about 750 persons.

DISSENTING CHURCH-BUILDING NEWS.

Huntingdon.—The site of the old Dolbin-yard, which for many years past had been a disgrace to the town, has now reared upon it a spacious and elaborate Nonconformists' church, known as Trinity Church. The structure is almost completed. The building is situated in about the centre of High-street, and the style is Early Decorated. The tower has four pinnacles and windows, surmounted by a spire, with carved arches, rising above the level of the pavement 190 ft. The contract amounts to 7,817*l.*, exclusive of warming and lighting. Mr. J. Wrighton, Godmanchester, has executed the mason's work. The church is arranged at present for about 720 sittings on the ground-floor.

Gainsborough.—A new chapel in connexion with the United Free Methodists has been opened in Hickman-street. The chapel is partially built of concrete, with brickwork here and there visible. It is 47 ft. long by 33 ft. broad, and will hold about 300 people. It is built from designs of Mr. T. Lister, architect, of this town, and the work has been carried on under his personal superintendence. Its internal fittings are not yet completed.

Mere (Wilts).—The foundation stone of the new Congregational Church, about to be erected by Mr. C. Jupe, as a memorial church, has been laid. The building will be in the late Early English style, and will have nave, north and south transepts, aisles, and polygonal apse at the east end, in which will stand the pulpit and communion-table. Galleries will be carried all round, except in the north transept, where the organ and choir will be placed. The clearstory will be carried on 6-in. iron columns. There will be three entrances, one by the south porch, one on the north side of the west front, and the principal one through a lofty porch, at the south-west angle of the church, so designed that it may be left as a porch, or form a suitable base for a tower and spire, should it ever be decided to build them. There will be accommodation for 350 persons on the ground-floor, and 220 in the galleries. The church will be heated by Messrs. Haden's hot-air apparatus. Mr. W. J. Stent, of Warminster, is the architect.

Devonport.—After undergoing extensive alterations and improvements, Princess-street Chapel has been re-opened. Two small galleries at the extreme end of the building which were almost useless have been removed, the porch has been widened by nearly 6 ft., and two rooms constructed on each side, one being for the minister's use, and the other intended as a class-room, separated from the chapel by a glazed partition. The pulpit has been entirely removed, and in its stead a platform erected, supported by ornamental pillars. The interior has been repainted, and the windows are frosted. The plans were supplied gratuitously by Mr. Andrews, who has also superintended the erection of the work by Messrs. Murch & Son, Stoke.

Hytha.—The new Congregational chapel has been opened for divine service. The amount of the contract was 1,925*l.*, but that sum will be increased by extras. The chief material of the building is rock, and the Gothic style of architecture has been adopted. There are two porches and a lobby at the entrance from High-street, and a dwarf wall, with iron railings and piers, extends along the front. The pulpit is formed by two raised platforms. Over the windows there is some ornamental scullioning. Mr. J. Gardner, of Folkestone, was the architect. Messrs. Gandy & Gibbs, of Croydon, executed the carving.

Willenhall.—The memorial stone of a new

Wesleyan school chapel, to be erected on the Walsall-road, Willenhall, has been laid. The cost of the property, and the erection of this "school chapel," together with boundary walls, &c., will be over 750.; but the building alone, which is to be of brick, and to accommodate about 250 persons, will only cost 300l. The building, as may be supposed from the cost, will be of a very unassuming character, and will be composed entirely of red brick, with facings of coloured brick; the only ornamentation being a front porch facing the road. The plans of the building were prepared by Mr. B. Baker, and the builders are Mr. John Taylor and Mr. Henry Hall.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Market Basen.—The church here has been reopened. The addition and alterations have been such as to have left scarcely any trace of the old building, so that it may be called a new church. The architects were Messrs. Hadfield & Son, of Sheffield. The edifice consists of a nave and north and south aisles. The north aisle and the baptistry at the end were built at the sole expense of Mr. Arthur Young, of Kingerby. The south aisle is terminated by a saddleback tower, and rises to a height of more than 70 ft.; it is crowned by a figure of our Saviour on the cross in stone. The nave is divided from the aisles by pillars of stone with carved capitals. The arches are of brick in alternate bands of white and red. Over the high altar hangs a canopy, and at the back a large crucifix; the sanctuary is laid with encaustic tiles of simple design; the communion-rail is of oak with wrought-iron standards, painted and gilt. The gas standards are of nine lights each. At the east end over the lady altar is a window representing the angel Gabriel appearing to the Virgin Mary. It is from the works of Messrs. Laver, Barrand, & Westlake, of London.

STAINED GLASS.

Haberley Church.—This church has just had erected a new east window, the gift of Mr. F. T. Sparrow. The window is in the Early English style, consisting of three lights of stained glass, by Mr. Preedy, of London, and represents six scenes in the life of Christ, and that of the Virgin Mary. The subjects are as follows:—The Annunciation, the Nativity, the Presentation in the Temple, the Flight into Egypt, the First Miracle at the Marriage in Cana, and the Crucifixion. The stonework, also new, is carried through the thickness of the wall, and has been executed by Mr. R. Smith, of The Clive.

Miscellaneous.

CUMBERLAND AND WESTMORLAND ARCHEOLOGICAL SOCIETY.—A meeting of the members of this society has been held at the Crown Hotel, Penrith. Major Whitwell, of Kendal, occupied the chair. The Rev. J. Simpson read a paper sent by the Rev. John Mangham, on the "Supposed Roman Stations at Kirksteads, Burgh-ton-Sands, and Bowstead Hill." Dr. Michael Taylor then read his paper on "The Vestiges of British Occupation near Ullswater, and on the Discovery of Buried Stone Circles by Eamont side." The company afterwards lunched in another room. Nearly the whole of the ladies and gentlemen present then proceeded in carriages to Dacre Castle, where a descriptive account of the old castle was read by Dr. Taylor. After the reading of this paper, the company dispersed in various directions. The day was very favourable for the excursion, and all seemed to enjoy themselves. On leaving Dacre, the company drove over to Pooley Bridge, and ascended the famous Dunmallet, about which reference was made in Dr. Taylor's paper, and where there is one of those singular entrenchments, with a mound outside the ditch, which have been observed in other parts of the country, as in Cornwall. The Dunmallet earthwork stands on high ground, Dunmallet rising to a considerable height from the margin of a lake, and the ditch and mound occupying the summit. The company returned to Penrith, after spending a very pleasant and agreeable afternoon.

THE LATE SIR CUSACK P. RONEY. — The life of this gentleman was an eventful one, and, properly written, would be instructive. He was born in 1810, was educated at Trinity College, Dublin, and took his B.A. in 1829. He was a member of the College of Surgeons; secretary to the Royal Literary Fund, 1835-37; a clerk in the Admiralty, 1840-45; secretary of the Eastern Counties Railway, 1845-51; secretary of the Grand Trunk Railway of Canada, 1853-60; and was knighted by the Lord-Lieutenant of Ireland (Earl St. Germans), for his able management of the Dublin Exhibition in 1853. His skill as an organizer was great. His genial manners and ready kindness endeared him to a large circle of friends.

BOILER EXPLOSION AT WOLVERHAMPTON. — Inquests have been held on the bodies of six men who were killed at a recent boiler explosion at Moseley Steel and Iron Works, Wolverhampton. The jury returned a verdict of "Accidental death." The foreman of the jury also handed in the following recommendation: "We are of opinion that the explosion was accidental; but we think that if a proper inspection of the boiler had taken place the accident would not have happened. We are of opinion that a boiler of the same make as the one which exploded is not safe with the amount of heat which was worked into it. We think that proper steam gages should be used, and regular inspection of the boiler by a competent person should take place."

THE ATHERSTONE SEWAGE.—The local sewage committee have resolved, "That the tender of Messrs. J. & J. Smith, of Hanley and Newcaste, for contract No. 1, 2, 410l., be accepted, subject to the proper filling in of the schedules, and references proving satisfactory to Mr. Latham, the engineer;" also, "That the tender of Messrs. Skey & Co., of Whitecote, for contract No. 2, 558l. 4s. 11d., be accepted, according to the specification, upon the recommendation of Mr. Latham; and that Messrs. Skey & Co. be called upon to enter into a written contract according to their schedules of prices." It appearing that Owen-street was included in the system of the sewerage, it was resolved that the same be included, and that work be executed by the contractors, under Mr. Latham's direction, upon their schedule of prices.

MONUMENT TO THE LATE GENERAL BRUCE.—A monument to the late General Bruce, governor to the Prince of Wales, and brother of the late Earl of Elgin, who was plenipotentiary to China, is being erected in Dunfermline Abbey. It is an altar tomb, on the panels of which are commemorated, in bas-relief, the chief incidents of the journey to the Holy Land made by the Prince of Wales under the guidance of the deceased. One of the scenes portrays the departure of the pilgrims from home; the next indicates their arrival at Jerusalem; while in the third the Prince is tending the general in his illness while in Palestine. On the top of the tomb lies an effigy of the general, sculptured after the fashion of Mediæval church monuments. The figure of his widow is represented in the attitude of mourning. The Prince of Wales's plume, on the corner of the pillow which supports the head of the general, was suggested by her Majesty, to serve as a memento that the general had breathed his last within the precincts of St. James's.

STEAM FROM THE SUN'S HEAT. — Captain Ericsson undertakes to supply a new source of heat in place of coal, oil, &c. For several years he has been experimenting with the view of collecting and concentrating the radiating heat of the sun, with which, so to speak, to heat his furnace. At length, at the beginning of the present year, he was able, according to his statement, to construct three "solar engines," of which the first was driven by steam formed by the concentration of the heat of the solar rays; and the other two by the expansion of atmospheric air, heated directly by concentrated radiant heat. His experiments show, he asserts, that the concentration of solar heat on 10 ft. square, or 100 square feet of surface, develops a power exceeding one horse's power. We are curious to learn the exact nature of the concentrating mechanism. A Mr. Dellamater declares that the enterprise is already a success, and that, "before the termination of the present season, bread will be prepared from flour ground by the power of the 'solar engine.'" Hitherto, however, Captain Ericsson's ingenious calorific inventions have not been found available on a large scale as practical machines.

RE-OPENING OF THE PARISH CHURCH, TWYNING.—Two years ago the roof of this church was in a dangerous state; the walls were crumbling; the interior was filled with old pews of various sizes, heights, and patterns; the whole was dreary and comfortless; and there were no funds from which to repair it. A sum of 2,300l., however, has now been expended on the structure, which has been formally reopened.

INSCRIPTION ON A SUN-DIAL.—On a silver sundial, in front of Stanwardine Hall, in the parish of Baschurch, Shropshire, is the following inscription:—

"In the hour of death (Dial) For as tyme doth haste
God be merciful to me; (Dial) So lyfe doth waste."
"He that will thrive
Must rise at five;
He that hath thriven
May lie till seven;
He that will never thrive
May lie till eleven.
Anno 1569."

Stanwardine Hall is a remarkable old mansion.

THE PROPOSED MUNICIPAL OFFICES, BRADFORD.—At a discussion in the town council on this subject, wherein motions, amendments, substantive motions, and movements of adjournment, succeeded each other in such perplexing involution that not even the movers seemed to comprehend the actual fate of their own motions, it has been finally resolved,—

"That it is not expedient at present to proceed with the erection of public offices; and further, that it be an instruction to the Street Improvement Committee to offer for public auction, in such lots as they may determine, the land known as the Chapel-lane site, and that the resolution of the 3rd of September, 1867, with reference to such offices, be, and the same is, rescinded accordingly."

When the corporate wisdom had virtually brought the matter to this pass, the mover of the successful resolution rose, and said he should leave the game in the hands of his opponents; and he was on the eve of taking his departure at this point, when, amidst considerable laughter, he was made aware of his mistake. Some one should move a radical "amendment" of the council's mode of voting.

CHURCH WINDOW OPENING. — An apparatus patented by Mr. Beard, of Bury St. Edmund's, has been so fitted to St. Mary's Church in that town, according to the local *Pest*, that a lad or woman can now from the west end of either aisle open simultaneously and without noise ten of the clerestory windows to any extent that may be wished, and with equal ease shut them close and firm. A hollow tube of galvanized iron, about 1 in. in diameter, runs on the outside of the entire length of the clerestory windows along the sills, and is worked longitudinally by an endless screw, small iron roller-wheels being fixed at intervals to facilitate the motion. Upon the tube are affixed small jointed arms, which are attached to the windows, and acted upon with precision by the screw, the motion being conveyed by a weighted pulley and a cord, which passes from the roof to the floor of the church. In the case of St. Mary's, Bury, the length of tube on each side of the church is 130 ft., total 260 ft. The number of windows opened on each side is ten.

DISCOVERY OF ANOTHER ROMAN VILLA, NEAR PALNSWICK.—At a spot known as Highfold Farm (to be found in the Ordnance map), the remains of a villa have accidentally been discovered while ploughing. Mr. Adey, proprietor and occupier, has covered it in and levelled the ground again for the winter crop, purposing next summer to re-open it. A hypocaust was found, with square columns of brick (pilæ), supporting the incumbent floor, fine tiles (umaria), running up the side walls, and a tessellated pavement (tesserales), also roofing-tiles (tegulae), of pointed hexagonal shape of red sandstone. Mr. D. T. Nihlett, F.S.A., in writing as to the hypocaust, &c., discovered, says,—"I strongly suspect that these hollow floors, raised in this way upon piles of bricks, or short columns, and arranged for the circulation of hot-air beneath, were not invariably belonging to the bathing apartments, but, as frequently, to the ordinary day-rooms, or maybe these particular rooms were used for both purposes. Moreover, these hollow floors are the most highly ornamental ones throughout each villa. While on the subject of square flooring bricks (lateres, or laterculi) size, say about 1 ft. square and some 2 in. or 3 in. thick, I would call attention to their occurring in Gloucester Cathedral in several places, set vertically in the Norman work."

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.—The visitors in the week ending Saturday, the 8th inst., numbered, by season tickets, 5,505; by payment, 24,605; total, 30,110.

LAUDY ISLAND.—The granite quarries in Laudy Island are now no longer worked, and the company is being wound up. The works were started in 1863, and 80,000 lb. have been expended upon them.

FEVER IN LIVERPOOL.—A sudden and extensive epidemic fever has broken out in country places near Liverpool, on the north bank of the river. The number of cases has, according to the *Medical Journal*, been very large. The deaths in the affected places, of which Bootle is one, have for the last six or seven weeks been nearly, if not quite, double the average.

PRESENTATION OF A TESTIMONIAL TO THE OXFORD CITY SURVEYOR.—Upon the removal of Mr. T. C. Clarke, C.E., the late assistant borough engineer of Portsmouth, to Oxford, in consequence of his election as the surveyor of that city, it was determined to present him with some suitable recognition of the services rendered to Portsmouth during his residence there. The testimonial, which consisted of a French clock and a purse of fifty guineas, was lately presented, after a dinner at the Bedford Hotel, Landport. The mayor presided. The guest of the evening, Mr. Clarke, occupied a seat on the right of the chairman.

THE LORD MAYOR ELECT.—Many of our readers will hear with great pleasure that Mr. Alderman James Clarke Lawrence will be the next Lord Mayor of London. His brother, Mr. Alderman W. Lawrence, M.P., was Lord Mayor in 1863. Mr. Alderman J. C. Lawrence became alderman of the ward of Walbrook upon the demise of Mr. Alderman Wire in 1860, and filled the office of sheriff two years afterwards. He is a very good speaker and a cultured man, and we have every reason to expect that the duties of his important office will be well and gracefully performed. He has the advantage of coming after a year of great fatness in the Mansion House.

THE ESTIMATE AND TENDERS FOR ST. SWITHIN'S CHURCH, LINCOLN.—The lowest tender having been found to be 1,059l. above the estimate accompanying the selected design of Mr. James Fowler, and above the sum proposed by the committee to be expended, three of the competing architects, Messrs. Goddard & Son, Drury & Mortimer, and Bellamy & Hardy, have written to the committee calling upon them either to return the selected plans to their author and make a new selection from the remainder, according to the instructions, or to permit them to furnish other designs to include the extra sum required to carry out the design selected. The three firms named also state in their letter that they believe their designs could have been carried out in their entirety, including the seats, for the stipulated sum. The tenders given in were as follow:—Patterson, Ruskington, 9,721l.; Wallis, Rason, 9,600l.; Slingsby, Lincoln, 8,600l.; Lovelee, Branston, 8,559l.

THE SCHOOL OF ART, BRADFORD.—The report of the School of Art Committee of the Bradford Mechanics' Institute, with which this school is connected, says,—"In presenting to you a report as to the art classes in connexion with your institution, under the charge of Mr. Sowden, we would first congratulate you on the greatly improved condition of the art education of the pupils as compared with last year. The collection of drawings and models which have been submitted to us is a remarkable proof of this, and not only is the general collection better, but the prize drawings are of a higher character than the prize drawings of last year. The numbers attending in several of the branches competition has been so close that it has been difficult to adjudicate between the productions of the competitors." It was stated at the annual *soirée* by the president, in reference to a project for the erection of a new building for the institute, that the entire estimated cost of the new enterprise was 25,000l. The sale of the old building and ground and other financial arrangements enabled the committee to see how the half of that sum could be covered, and they required 12,000l. or 12,500l. towards which their fellow-townsmen had already contributed 5,000l.

ROYAL HORTICULTURAL SOCIETY.—The Exhibition of edible and poisonous fungi, held on Tuesday last by this society, was most remarkable. Contrary to the expectations of the council, several hundreds of freshly-gathered specimens, in excellent condition, were sent for exhibition, nearly all the wholesome and deleterious kinds finding a place on the tables. Dr. Bull, of Hereford (in the absence of the Rev. M. J. Berkeley), delivered an able address on the subject, passing each species in review, both edible and poisonous, and giving his personal experiences of them. Prizes had been previously offered for the best collections by Lady Dorothy Nevill and Mrs. Lloyd Wynne. The first prize was awarded to Dr. Bull, and the second (that given by Lady Nevill) fell to the share of one of our contributors, Mr. Worthington Smith.

THE LIVERPOOL MASTER BUILDERS' ASSOCIATION.—The second annual meeting of this Association has been held in their rooms, South Crescent-chambers, Lord-street, Liverpool; Mr. Thomas Haigh, the president, in the chair. The report for the year just ended was read and adopted, and the course which the committee had pursued in reference to the late strike of operative bricklayers was approved, the committee being complimented upon the successful issue of a contest of the bricklayers' own seeking. It was stated that the operative bricklayers who are members of the trades union are now anxious to have arbitration, and to be reconciled to the employers, after framing another code of trade rules; but the time for these negotiations, it was conceived, had gone by. They were the terms which the employers offered, and the bricklayers refused last May. Now the masters' workshops are plentifully supplied with men, and if at any time either party desire an alteration of rules, they provide for arbitration. The present number of the members of the Association is 174, and they comprise nearly all the influential employers in the building trade of Liverpool. Mr. John Jones, of the firm of Jones & Son, was unanimously elected president for the ensuing year.

TENDERS.

For alterations and erection of chapel, at North Snarry District Schools, Anesley. Mr. J. Berney, architect:—
Sawyer.....£1,843 0 0
Faulkner.....1,769 0 0
George.....1,750 0 0
Baxter.....1,770 0 0
Crabb & Vaughan (accepted).....1,729 0 0
Housegood.....1,712 0 0
Wills.....1,721 0 0

For pulling down and rebuilding two houses in Dove-wood, Shoreditch. Mr. William Mundy, architect:—
Marr.....£1,266 0 0
Tolley.....1,907 0 0
Langmead.....800 0 0
Christoffer Brothers.....897 0 0
Higgs.....772 0 0

For Christ Church District Schools, Eastbourne:—
Ford & Atwood.....£3,767 0 0
Nightingale.....2,953 0 0
Dabbs.....2,547 0 0
Faller & Longley.....2,450 0 0
Peeries.....2,260 0 0

For new 7-in. water-main, for Chelmsford Board of Health. Mr. C. Pertwee, surveyor:—

	Pipes.	Labour.	Total.
Dence.....	£1,158 0 0
Weston.....	949 0 0
Everett & Son.....	£968 10 0	£249 10 0	619 0 0
Bugbird.....	645 0 0	224 0 0	869 0 0
Tanner.....	655 0 0	210 0 0	865 0 0
Coleman & Co.....	645 0 0	194 0 0	839 0 0
Dennis & Scruby.....	547 10 0	288 0 0	835 0 0
Christy.....	695 2 0	219 0 0	815 2 0
Thornton.....	656 0 0	159 0 0	815 0 0
Stevens.....	627 14 4	173 0 0	800 17 4
Wells, Smith, & Wright.....	673 5 0
Bailey, Pegg, & Co.....	638 15 0
Tice.....	620 15 0
Newton, Chambers, & Co.....	620 15 0
Butterley Iron Company.....	615 10 0
Begg.....	607 12 6
Warner & Co.....	607 12 6
Graham & Son.....	6'3 5 0
Roberts.....	601 1 6
Cockayne, Grove, & Co.....	594 10 0
Reidy & Co.....	590 10 7
Claridge, North, & Co.....	582 2 9
Laidlaw & Son.....	563 0 0
Bower.....	547 0 0
Chandler & Sons.....	...	189 0 0	...
Walker.....	...	185 0 0	...

* Accepted.

For a new Congregational church, at New Brompton Kent, for the Rev. J. Harasant. Messrs. E. Habershon & Brock, architects:—
Hastley & Rogers.....£2,620 0 0
Simpson.....2,523 0 0
Scrivener & White.....2,169 0 0
Taylor.....1,978 0 0
Nightingale.....1,972 0 0
Stamp.....1,950 0 0
Falkner.....1,734 0 0
Wilkins.....1,709 0 0

For the erection of a mortuary, for the guardians of the poor of the parish of St. Pancras:—
Turner (accepted).....£277 0 0

For new Metropolitan Police-court, Lower Kennington-lane. Mr. T. C. Sorby, architect. Quantities by Mr. John Scott:—
Hill, Keddell, & Waldram (accepted) £6,388 0 0

For new premises for Messrs. Negretti & Zambra, at Holborn Viaduct. Mr. F. W. Porter, architect. Quantities by Mr. James Williams:—
Yanson.....£6,635 0 0
Carter & Sons.....9,570 0 0
Mansfield & Co.....9,099 0 0
Farman & Fotheringham.....5,885 0 0
Jackson & Shaw.....8,660 0 0
Conder.....8,599 0 0
Piper & Co.....8,597 0 0
Hill, Keddell, & Waldram.....8,588 0 0
* Accepted.

For building new offices, for Messrs. H. & V. Nicholl, Lewisham. Mr. E. H. Badger, architect:—
Amer.....£685 0 0
Jerrard.....649 0 0
Pain & Baldy.....635 0 0
Beaton.....623 0 0
Penny.....555 0 0

For detached villa residence at Woodford, for Mr. Brascombe. Mr. G. B. Noble, architect. Quantities by Messrs. Linsdell & Giffard:—
Rivett.....£1,798 0 0
Piper.....1,723 0 0
Hedon.....1,680 0 0
Hill, Keddell, & Waldram.....1,637 0 0
Perry (accepted).....1,625 0 0

For repairing and painting the interior of the parish church, St. John of Wapping. Mr. S. M. Pipe, architect:—
H. & J. Johnston.....£298 10 0
Kells.....248 10 0
Jackson.....292 9 6
Thompson (accepted).....230 0 0

For the erection of a new wing and alterations to Park Villa, West Dumpton, Thauet, for Mr. Sinclair. Mr. John R. Collett, architect:—

	New work.	Old work.
Osborne.....	£294 0 0	£197 0 0
Kelson.....	289 11 4	179 0 0
Duckett.....	282 0 0	167 0 0
Wyde.....	212 10 0	117 0 0
Lawson.....	790 0 0	160 0 0
Elgar (accepted).....	744 0 0	150 0 0

For two semi-detached houses, Nottingham-road, East-wood. Mr. J. Zail, architect:—
T. & H. Herlett (accepted).....£320 0 0

For alterations, &c., to the Coopers' Arms, Silver-street, City, for Mr. Doughty. Mr. R. Washington Hart, architect:—
High & Lawrence.....£505 0 0
Kelly Brothers.....496 0 0
Langmead & Way.....458 0 0
Prince (accepted).....445 0 0

For alterations to the George and Dragon, New North-street, W.C., for Mr. Westbury:—
Knight (accepted).....£159 0 0

For additional works at the Norfolk Arms, Hart's-lane, Bethnal-green, for Mr. Keymer:—
Langmead & Way.....£196 0 0
Knight.....125 0 0

For enlarging and restoring Denver Church, Norfolk. Mr. William Smith, architect:—

	Oak Seats.	Deal Seats.
Bennett Bros.....	£1,623 0 0	£1,450 0 0
Brown.....	1,459 0 0	1,348 0 0
C. Bennett.....	1,450 0 0	1,200 0 0
Drake.....	1,395 0 0	1,296 0 0

Accepted for the erection of a Wesleyan chapel and school, at Redcar. Mr. J. Hunter, architect. Quantities supplied:—

	Bricklayer and Plasterer's Work.	Joiner and Carpenter's Work.	Mason's Work.	Slater's Work.	Painter, Glazier, and Gasfitter's Work.	Heating Apparatus, &c.	Painter's and Stainer's Work.
Scott.....	£319 0 0	439 0 0	435 0 0	175 0 0	87 14 0	57 0 0	39 0 0
Watson.....	435 0 0	435 0 0	175 0 0	87 14 0	57 0 0	39 0 0	29 17 0

For building coach-house and stable at Leytonstone Mr. William Mundy, architect:—
Cains.....£265 0 0
Arber (accepted).....244 0 0

For harbour works, Cernarvon:—
Bugbird (accepted).....£244 0 0
The water and drainage works here, at a cost of 22,000l., have just been completed by the same contractor.

The Builder.

VOL. XXVI.—No. 1341.

Birmingham: Art, Health, Education.

WHILE the Social Science Association was in Birmingham a statue of James Watt was set up in the open space between the Town Hall and the Midland Institute; very awkwardly, by the way; for though it is probably the centre of the road if the Institute had a square corner like the Town Hall, it does not look to be so, because the Institute corner is largely rounded off to benefit the traffic. The result is that the statue, which is of Sicilian marble, 8 ft. 3 in. in height, and with its pedestal nearly 20 ft., looks as if it had been popped down temporarily, and was waiting for the carrier to take it

away again. That we may get rid of all our objections at once, let us add that the Darley Dale stone pedestal is of the egg-box family, and very insignificant, the designer having been trammelled probably by want of room. Watt holds in his right hand a pair of compasses, his left rests on the model of a cylinder, and his mind rests too,—rest and calm, indeed, characterise the statue. The attitude is expressive; the face admirable. Birmingham may thank Mr. Alexander Munro for giving them the only good statue yet in their streets. There is a meritorious figure of the Prince Consort boused in the Midland Institute, but this has not yet found a site, or been subjected to the test of an open-air situation. If money and sufficient space can be found, it ought to have a proper canopy. The statue of Atwood in New-street is a poor thing. Close by it a handsome new Bank is approaching completion,—a large stone-fronted building of two lofty stories, the upper one Corinthian. It carries Barry-like chimney-shafts at the angles, and will have an entrance porch or portico with marble columns in New-street when finished. It promises to be a very dignified structure, and very creditable to the architect, Mr. Holmes. The ugly brick flank wall seems to show that another building will butt against it. This is to be regretted: a structure of this kind should stand clear, and be in keeping all around,—a complete building, in fact, and not a couple of fronts. We cannot give Mr. Holmes equal praise for the Masonic Hall he is erecting in the same street. It has a carved stone doorway, not yet finished, but the rest of the two fronts (the Hall, like the Bank, is at the corner of a street, running backward to a considerable extent) is cemented. The details are poor; an ugly sentry-box is stuck over the angle attic window as a turret, and the whole pile can scarcely escape being called vulgar. A range of

shops in progress come very prominently into notice a little nearer the Town-hall. These call Mr. Plevins author; and are of red brick, with freestone dressings, in the mixed style, Italian and Gothic, we of these days know so well. The windows have segmental heads under pointed arches, and the whole is,—well, a trifle *bizarre*.

The Theatre Royal, here at hand, has been newly decorated, and looks very gay—rather too gay, indeed. The prevailing tint is a bright blue complemented with a light French pink, and gods and goddesses, nymphs, and Cupids are lavishly scattered about. The proscenium is most elaborately adorned both as to form and colour, and *per se* the whole has a certain degree of richness. But this strength of colour before the curtain is a mistake. The scene ought always to hold the prominent place, and when the note is struck so high in front to cap it becomes difficult. The form of the auditorium here is much flatter and shallower than is usual in English theatres, where the abominable long horse-shoe generally obtains; and the result in the Birmingham Theatre is that, so far as we could observe, every one seemed to be able to see and hear, though the house was densely crowded to enjoy Miss Bateman's "curse."

Over the way are the rooms of the Royal Birmingham Society of Artists, and the annual exhibition of modern works of art is now open. It is a very agreeable collection, and includes 647 paintings and drawings, and eight pieces of sculpture. Its principal features are, of course, known to London art-lovers,—"Herod's Birthday Feast," by Armitage; "The Sleep of Duncan," by MacIse; "Rent-day in the Wilderness," by Landseer; "The Tuilleries," by Elmore (the best picture he ever painted); "Before Waterloo," by O'Neill, and some others. The committee, by the way, give a good sentence, by Lessing, on their catalogue:—

"Art must paint as plastic nature conceived the picture; without the imperfection which resistant matter renders unavoidable, and without the injury which time works upon it."

Do the good people of Birmingham do as much for art as they should and might? Judging from what we saw and heard during a visit to the School of Art we are disposed to think not. The rooms are in the top floor of the Midland Institute, and it is no reproach to the architect when we say that they are not suitable to the purpose, and do not afford anything like accommodation enough. The gas having been burning for some time, the thermometer marked a temperature of 95°! The students were crowded together, and the classification was not what is desirable. At the present moment there are 750 students on the books, and there might be half as many more if the accommodation were sufficient and good. A large separate well-ventilated and well-lighted building should be provided, and the manufacturers should feel that it is their interest to support the school nobly. The town will reap a hundred-fold for all they sow in this soil. Let us also exhort the young that they avail themselves at once of such facilities as are afforded. The man who wants to learn will triumph over obstacles: will not give in because everything is not exactly as he would wish it. Industrial art offers ample scope for gaining fame as well as money. As Mr. Robert Flenny said the other day to students in Paris,—"Industrial art has the sympathy of all the world—the production of a potter of Athens finds passionate admirers everywhere. Any one may be proud to add his name to the long list of famous art-workmen. Believe me, industry offers a fine field for those who know how to distinguish themselves in it. Work, for labour is honourable; it renders men better, and therefore more capable of fulfilling all the duties of life. Develop your faculties by study, and raise industry to the level of art. Remember that the grand epochs which make the glory of nations

are also those in which art and industry were at their apogee."

We felt it matter for regret that so little was said on the subject of art-industry during the recent Social Science Congress. One of the ladies, however, who so ably took part in the proceedings, made this observation (and it ought not to be quite overlooked in Birmingham), that for want of artistic training women in Paris are now being largely superseded by men in the distinctly feminine employments, such as millinery and the dressing of shop-windows. Through want of artistic training, how many English men are superseded by foreign men! The Congress, we regret to hear, has not been a success, in a pecuniary point of view, though in other respects greatly so. The president and heads of departments made very excellent addresses. The discussions were valuable and well sustained, and much good seed, it may be hoped, has been sown, and will bear fruit in due season; but the population of Birmingham did not flock in to take tickets as they should have done.

The Rev. Dr. Hart Burges, vicar of Bishop Ryder's, Birmingham, has addressed to us a letter, which will be found on another page, commenting on the remarks the conductor of this Journal found himself compelled to make, at the recent Social Science Congress, as to the lamentable state of certain parts of the town. The assertions were, that a large population was living in the heart of the town under conditions inconsistent not only with health but with virtue; that in these wretched districts not one child to whom he had spoken could read; that girls and boys were growing up in ignorance, dirt, and ill health, with no other prospects than the streets for the one and the goal for the other; and he asked, looking at the state of the people as well as of the places, not alone whether the town authorities had used the remedial powers they possessed, but where had been the ministers of the Church,—where had been the clergy generally? The vicar takes no exception to the particulars given of the nunhousesome dens in which masses of his people are living,—if the word may be allowed. On the contrary, he fully admits "the incalculable injury to health and physical well-being" that is thus done; and is fully satisfied "that the generally wretched character of the dwellings of the poor, the absence of refining influences, and the miserable associations of poverty-stricken homes, courts, and streets, tend much to the inhumanising influence which, destroying the finer susceptibilities and blunting the better feelings of the heart, generally results in brutality and crime, a family plague and a social curse." "In the greater portion of Mr. Godwin's statements," says Dr. Burges, "I most thoroughly agree;" but naturally enough he would remove from the ministers of the church any reflection that may seem to have been cast upon them by the inquiry; and this he seeks to do by stating that "the educational necessities of the parish have not been overlooked;" setting forth the number of schoolrooms in the parish, and adding, "so strong is my sense of the deep need of the portion of my parish alluded to by Mr. Godwin, that the erection of a large ragged and infant school will be commenced (D.V.) within ten days." This is good hearing; Dr. Burges's warm interest in the matter is even better; but does it in the slightest degree show the impropriety of the question? We think not. Schools or no schools, here is the fact that hundreds of children in certain districts are growing up in a state of the densest ignorance. The fact is not denied; cannot be denied. In the course of two examinations not a single child spoken to could read. "You need not trouble yourself to ask;" the intelligent police-officer who was with us on the first occasion remarked, "none of them are taught anything but bad; and yet, as

I have often said, this is in England, and we send out people to teach the blacks!" The reverend vicar's statement is no more an answer than is that of the mayor to the objections to the sanitary condition of these parts of the town. The mayor says the town has spent on its present sanitary system within the last twenty-five years no less a sum than 200,000*l.*, and the death-rate is low compared with that of other large towns. It would be satisfactory to know the items of this expenditure. But, supposing the money has been wisely used, the amount is but small comparatively; and if it were five times as much, it would be no excuse for a community allowing in their very midst thousands of their fellow-creatures to be horrid together year after year under conditions which put cleanliness of mind or body out of their reach, and make health and virtue alike impossible. As to the general healthiness of the town, will the mayor tell us the death-rate in the summer months of these particular districts? It would be found frightful. More than one medical resident has told us that in some of the places visited fever has not been absent for years. Are these things to remain unchanged, because less unhealthy parts of the town admit of an average death-rate being stated not immoderate, considered with reference to some other towns, but still very large as compared with really healthy places? As Dr. Farr said, after the Mayor had spoken,—"It is little consolation to persons living in unhealthy parts of the town to know that others residing not far off are enjoying the advantages of salubrity."

While dense masses of people in the midst of wealthy communities are found ignorant and untended, growing up wholly to the bad, and supplying unintermittently the goals and hospitals, the inquiry will still be made, "Where have been the ministers of the Church? where have been the clergy generally? If it be the system that is at fault, not the individuals, they can at least say so, and demand from each pulpit and platform such arrangements as will give to every fresh-born fellow-creature the chance of health and parity.

It will not be supposed that we are speaking of Birmingham as if it stood alone. Other large towns, and our readers know how many we have personally and painfully examined, present the same dreadful condition of things. The right remedy is not merely of local interest; it is an Imperial question of the greatest and gravest importance.

HAMPSTEAD FEVER-HOSPITAL COMPETITION.

The plans of six selected architects mentioned in our last are now before the Metropolitan Asylum Board. A premium of 200*l.* is offered for the best design, 150*l.* for the second best, and the successful competitor if required is to carry out the works for a payment of 750*l.*, less the amount of premium; but he will not be entitled to any premium or payment unless a substantial contractor will undertake the work at a price not more than 10 per cent. above the architect's estimate, which is to be sent in with the plans. This seems to show that the Board contemplate an expenditure of some 15,000*l.*, as we can scarcely suppose that a metropolitan public body would take advantage of their position to assist in lowering the established remuneration of a not too highly-paid profession, especially as four out of the six competitors will get nothing for their labour in preparing designs. This proposed expenditure, however, would seem to be insufficient to supply what is wanted.

The instructions required,—That the building should be on the pavilion principle, with distance of 60 ft. between them, and provide for the accommodation of 104 patients; that no pavilion should have more than two stories; that the buildings should be so arranged as to admit of their future extension, and the ultimate addition of other pavilions; that the axes of the buildings should be north and south, if practicable, so that the windows on either side of the wards should face east and west; and that an adequate site should be left for the erection of a Small-pox Hospital.

The names of the competitors, and the sums at which they severally estimate the cost of carrying out their designs, stand thus,—

Messrs. Pennington & Bridgen	£15,500
Messrs. P. Gordon Smith & G. A. Dunning	19,200
Mr. Saxon Smith	20,000
(For 208 bed)	£27,000.

Mr. F. Fowler	£24,500
Amended to £20,500.	
Mr. Edmeston, No. 1	27,500
No. 2	29,000
Messrs. Beeston, Son, & Breerton	50,228

The reason why the last-named design should cost so much more in execution than the sums named by the other competitors is not obvious. The general arrangement is symmetrical, the material is red brick, and the style Jacobean. The sum stated, however, and the fact that the designers have not fulfilled the proper desire of the Board to place the pavilions north and south, will probably lead the Board to give little consideration to this design. As to the estimates generally, the Board ought to take it for granted that the sums named are simply "opinions." An actual estimate of any one of the designs would cost at least as much as the premium offered, and we suppose the Board do not desire that the sacrifice made by the competitors in their anxiety to get public business should go to that extent.

The section of the ground furnished by the Board shows a rise from east to west of no less than 53 ft., and this has increased the difficulties of the competitors. We may say at once that any attempt to make a long line of building follow this slope would produce a failure. The bad effect of this is shown in Mr. Edmeston's view of No. 1 design. His design No. 2 is much better, and deserves consideration. In this the isolation of all the pavilions by means of curved corridors leading from main corridor, so that the chance may be lessened of infectious atmosphere being generally disseminated about the corridors, is attempted.

Mr. Srell proposes to place the pavilions on different levels, and connect them by corridors sloped according to the natural inclination of the ground, but he does not show the effect of his arrangement in his drawings. This plan represents the building as extended for the reception of 208 patients, and rather mystify in consequence. According to his estimate, it seems that while a hospital with 104 beds costs at the rate of 192*l.* per bed, one for 208 patients costs only 130*l.* per bed. Mr. F. Fowler has evidently bestowed much pains on his design, and sends two arrangements, one of which shows a double corridor, with a view to separation. We should scarcely be disposed to recommend an arrangement by which all the pavilions are made to open into one long closed corridor, as shown in the design submitted by Messrs. Pennington & Bridgen. The closing in of the spaces between the pavilions by means of the projecting closet-buildings at the extremities, is also objectionable. They wisely urge the importance of confining hospitals for very infectious diseases to one story.

The greatest amount of sickness is proffered by Messrs. P. G. Smith & Dunning, who give a number of distinct buildings placed widely apart and *en echelon*, so as, ingeniously, to free them one from another. The covered ways for administrative purposes are on an incline. They divide the difference in the levels at the administrative department in the centre, and so dispense with steps on the lower floor of all the pavilions on each side of it. Although the buildings are necessarily scattered, by terminating the octagonal closet-buildings which are placed on each side of the end of each block with a conical roof, the connexion of the whole is seen, and some architectural effect obtained. We are but glancing at the drawings superficially, and cannot say how other requirements are met; but certainly one great desideratum is supplied by this design.

Many things will have to be considered by the Board before erecting, and in the course of erecting, such an establishment as is proposed,—the home of small-pox, typhus, and scarlet fever,—the disposal of the sewage, for example, will demand serious thought, or dire results may follow in the future. Indeed, a great responsibility rests on the committee who have this matter in hand, and we would strenuously urge them to call in a small mixed committee of architects and medical men who have given attention to the subject, to assist them not merely in selecting the best design from those submitted, but in rendering the design as free from objections as possible compatible with present knowledge. An additional 500*l.* thus used would show wise economy. The amount of good or evil that may be done by the intended hospital is enormous; and it cannot be too strongly impressed on each member of the Board that they have in hand a work that cannot be treated lightly,—a problem before them that cannot be rightly solved without the best knowledge and the deepest consideration.

THE VENGEANCE OF THE THAMES.

We wish to call the attention of those who are interested in the conservation of the public works of London, to one of those indications which it is well never to neglect. We do so neither as wishing to excite alarm, nor as speaking otherwise than hypothetically. Attention will not be thrown away if directed to the subject; and, if it prove that the warning is unnecessary, none will be more rejoiced than ourselves.

Many of our readers are familiar with the aspect of the quay wall of the Thames Embankment as seen from the river, as well as with the various picturesque scenes that open on the eye of the steam-boat passenger, or the pedestrian who passes along the boarded causeway of the Embankment. The northern arch of Waterloo Bridge is entirely occluded by the new roadway, and a pair of granite piers, designed in accordance with the architectural style of that noble structure, serve to unite the pier with the quay. The pier thus brought into line with the wall shows a serious crack, which, as far as we can ascertain, is entirely new. Supported as the work in which the defect occurs is, by the gault masonry on either side, this lateral movement is the more unexpected, not to say alarming. It is a subject to which a process of accurate investigation cannot be too speedily or too carefully directed.

The condition of the whole of the bed of the Thames, as far as it is affected by the tidal scour, has been interfered with by the works of the Embankment. How serious this interference has been, is a question which we should be glad to have elucidated. It is far from being a simple one; it is far from being unimportant. It is one on which we have at present a certain limited amount of information. It is essential to the maintenance of confidence in the Thames bridges that the subject should be thoroughly investigated and understood.

The level of the bed of the Thames may admit of considerable variation, without occasioning any apparent change on the surface of the river, except at very low water. The height of the high-water level depends on the state of the tides, on the winds prevailing, especially in the lower parts of the river, and in the obstacles offered, by bridges or other impediments, to the course of the flow. The effect of the combined ebb tide and current of the river will depend, not only on the actual quantity of water which is poured upwards through the arches of London Bridge by the flow, but also, to a great extent, on the form and character of the banks.

Now, the Thames Embankment, as it stands at present, has reduced the surface area of the river, above Blackfriars Bridge, by a very perceptible proportion. It may be urged that this scour of the downward current is diminished by the contraction of the area, as the water that would have risen over the shelving banks, now displaced by the embankment, is no longer sent there with the flow, to return with the ebb. But it must be remembered that the actual quantity of water thus displaced (if it can be proved to be kept below bridge by the change), is small in proportion to the surface area, as the shore in question was shallow and shelving. On the other hand, the bank of the stream on which the centrifugal, or rather tangential, force of the current and the ebb throws the most stress, is reduced in width; while the smooth, nearly vertical wall, affording much less frictional resistance to the stream than did the old irregular banks, is certain to produce a mining or burrowing action, of more or less intensity, during the ebb, and even, to some extent, during the flow.

Considerable obstruction to the flow is now occasioned by the enormous mass of piling that heaves the site of Blackfriars Bridge. In so far as this tends to retard the incoming tide, this obstruction may be held to diminish the scour. But every other alteration which has taken place between the banks of the river, since the building of the new London Bridge, may be regarded as having a tendency to narrow and deepen the channel, and to increase the force of the scour. The iron cylinders which support the railway bridges have this effect, and the result of the change effected by the completion of the quay wall must be something very serious.

The important requisite is, to ascertain with scientific exactitude what are the actual facts of the case. We should be glad to know what observations have been made as to the effect of these works on the bed of the river. Sections

ought to be on record, taken from time to time, so that the scientific man may know clearly what action has already taken place, and thus may come to some satisfactory conclusion as to the future.

The whole question of the state of the Thames is of the utmost interest to the inhabitants of the metropolis.

As to a large portion of the sum expended in the improvement of the Thames, it is pretty clear that we have not heard the last word. It is not so very long since people began to put the question, how far it was wise, with a view to the purification of the river, to collect all the sewage of the metropolis, in order to pour it into the stream at a fixed point,—far enough, it might seem, below bridge, but still within the neap flow of the tide. Strange and ugly stories were told of the evil that was being silently but swiftly effected at Barking Reach. They were contradicted even more loudly than they were uttered.

We should be glad to believe that the alarm was unfounded. Still the fact stares us in the face that an immense amount of fecal matter is daily poured into the lower portion of the Thames, that the solid portions must be deposited somewhere, and that this deposit, if less serious an obstacle to navigation than an equal quantity of sand or gravel, is of a putrescent or putrescible quality. We must reserve the valuable elements of sewage manure for the purposes of agriculture, and allow nothing but water to return to our river channels, whether it be at Oxford, at Reading, or at Barking Creek. As to this there is but little room for doubt. If so, then our great metropolitan sewage works are but in a provisional and temporary state.

The past summer has afforded an unusual opportunity for gaining information, both as to the state of the bed of the Thames, and as to the minimum quantity of water that flows through the metropolis in a dry season. We should be glad to learn that advantage has been taken of the opportunity to secure this important information. The coming winter may enable us to make corresponding observations as to the maximum flow of the river; and in both cases the action of the scour on the bed of the stream should be accurately noted.

It is well known that the rebuilding of London Bridge had a distinct and appreciable effect on the tidal flow, and that the result of the change has been the deepening, in some places, of the bed of the river, the undermining of Westminster and Blackfriars Bridges, and the final destruction and removal of those structures. The Thames is no longer the noble stream, of which the salmon fishery was granted by the Prince of the Apostles to the mitred Abbots of Westminster, but it is still a river of sufficient volume and velocity to take its own way, which is pretty much the wont of all rivers that are not very tenderly and very skillfully dealt with. The bridges of Rennie have long been the pride of the profession of the Civil engineer, not only for the architectural merit of their elevations, for the boldness of their spans, and for the convenience of their level or easy roadways, but also for the soundness of their foundations, and for the unshaken homogeneity of every part. A crack in a pier of Waterloo Bridge is not, therefore, an unimportant affair. It is a fact which would have caused the builder to shake his head. It can arise from but one cause, namely, an undermining, more or less dangerous, of the foundation. The evidence of such an action at the very edge of the now quay wall, is a circumstance that should call attention to the state of all river foundations,—in fact, of the entire bed of the stream. It is not beyond the bounds of possibility that the question may be raised as to throwing an invert under portions of the Thames.

We desire to speak with all the reserve that becomes public writing. We wish to raise no sensation, to excite no undue alarm. But we cannot refrain from calling attention to an indication, slight as it may be, that the Thames is following the wonted habit of great rivers, when their course is in any way interfered with. They are accustomed to help themselves to an equivalent for that which is taken from them. Narrow their channel, and they will themselves deepen their bed. Such is the very first postulate of hydraulic engineering. Since the ancient bridge that laden with houses, and upborne on piers that must have occupied more than a fourth of the waterway, kept back the flow of the tide from the shores of the Strand and of Lambeth, has been replaced by the present noble structure,

we know that Thames has deepened his bed. More water comes up with the flow, now that the incoming tide is no longer strangled by piers and starlings. More water has to sweep down with the ebb; and in deepening its channel the river has already caused the removal of two bridges. In presence of this known activity of the stream, we have greatly contracted its width, and given it a quay-wall along which the tide and current may rush with the least possible littoral friction. That the result would become apparent *somewhere*, on the bed of the river, any engineer might have foretold. What and where that result will be, is the question that it is now important to solve.

We are not speaking from hearsay or from gossip, but from actual observation. Two gentlemen long familiar with the locality, one an engineer and the other an architect, observed the black gaps in the courses of the pier, in which the ebbing tide left a slimy deposit only a day or two since. "Do you observe that mark?" said one. "I was just looking at it," said the other. "I never saw it before: did you?" "It seems quite new," was the reply. "It must have appeared since we passed under the bridge a month or two ago. It is impossible we could have overlooked it." "It must be a settlement," said the engineer. "It is only the other day that attention was called to the fact of the perfect freedom of Rennie's bridges from cracks or settlement. The apparent support given to the pier by the granite masonry of the quay-wall on either side, makes the movement that has taken place more conspicuous." The steamer went on with a rush, and turned out its passengers to change boats,—a proceeding which the steam-boat managers seem to have adopted in the direct interest of the railway and omnibus companies. It is not any very precise information that can be gleaned on such a transient glance; but the indication, however slight, is positive.

We cannot, therefore, hesitate to form the opinion that it has become a matter of importance to ascertain the nature of the change which has taken place, and is taking place, in the channel of the Thames, in consequence of the recent structural modifications of its course. It must be borne in mind that when the thousand and one piles, and props, and struts that make the site of Blackfriars Bridge look like an immense workshop, erected in and over the river, are removed (which we hope will be the case before the close of the present century), the self-adjusting action of the river is likely to be intensified. At very low tides, years ago, it was apparent that two or three channels towards the centre of the stream took the main scour. Where that scour now lies,—whether in the old channel or alongside of the quay-wall, it is essential to ascertain. Great depth of piling appears to have been employed for the foundation of the embankment wall itself, but then it must be remembered that the foundation of Waterloo Bridge has long been considered *à fabricis* of any possible action on the bed of the river. If a pier of this structure is now on the move, the whole system of our river foundations must require reconsideration.

Nor is the question confined to bridges and quay walls alone. St. Paul's is said to be built on the gravel, and its foundations are on a level considerably above that of the Thames. In all cases where a drain or outlet is cut lower, the filtration and drainage from a pervious bed, if such a stratum is passed through, has a tendency to produce surface movement. The finer particles are gradually washed away by the action of the deepened outlet; the coarser follow, and subsidence may eventually succeed. It may seem, for the moment, wild, to speak of a possible movement in the dome of St. Paul's Cathedral as a sequel to a trifling displacement in a pier of Waterloo Bridge. We rejoice to believe that such a probability is, to say the least, extremely remote. But we are speaking not of inference or of opinion, but of the action of known mechanical law. The burrowing power of water respects no architectural beauties. This action, in the case of the Thames, has taken place, is taking place, and ought to be prevented; but precaution must be taken in time.

There can be no doubt that the action of the river is, at the present moment, perfectly within the control of the engineer. But to be so controlled, it must be foreseen and provided for. If we allow one engineer to build a bridge, another to raise a wall, and another to plant the water-way with a forest of timber,—in short, if we allow each man to do what in itself may be

well advised, but what, as part of the *ensemble* may prove formidable, the Thames will give us trouble. It is only by an exhaustive method of dealing with all the requirements of this portion of our river system, that our results will be either satisfactory or permanent. On such considerations it will depend, whether the Thames shall prove the greatest ornament and advantage of that picturesque line of buildings, almost daily increasing in beauty, which stretches from the Cathedral Church of St. Paul to the Abbey Church of St. Peter; or whether, neglected and ill-treated, the angry river shall prove the most relentless foe to the architectural excellence of London. It will be an evil day for the metropolis if we provoke the vengeance of the Thames.

ART-NOTES IN MANCHESTER.

The New Exchange in Manchester has not yet risen above the ground; and the only indications of its progress at present consisting in the large deposits of brick walling which form the basement. The site of the other great building in contemplation, the Town Hall, is cleared of houses, and exhibits at present a waste of land varied with heaps of debris. A definite commencement, in the shape of laying a foundation-stone, will be made before long. Some of the first competitors who may not have seen the site would, perhaps, be surprised, could they see the narrow and mean-looking street (Princess-street) towards which they proposed to erect such splendid and ornate flank elevations. As the land is at present, the front towards Alhott-square will be the only one that will be properly seen from a sufficient distance to take in the general effect of the design. The two large buildings being in this initial state, we are free to turn our attention to what architectural developments we may find, on a smaller scale, scattered up and down the streets of Manchester.

These are not at present very numerous, nor on the whole of very much interest, though there are two or three which are worth a pane to look at. Of these the most important, and one of the largest, is the new warehouse in Portland-street, now in course of erection from the designs of Mr. Waterhouse. This is one of those large buildings, almost peculiar to Manchester, which the necessity for the storage of valuable goods in great quantities has called into existence. It is in a round-arched Gothic style, the doors and windows on the ground story forming a series of semicircular-headed openings, with flat soffits having a bold roll-moulding at the angle, stopping on a square impost supported by a shaft; the actual window-opening being formed by an inner recessed jamb, with a second roll-moulding continued down to the sill without any break. When the impost, now in the rough, are carved, this ground-story will present a very good effect of combined richness and sobriety, quite in keeping with the object of the building; though, owing to the fact that the crown and springing of the arches have been kept at the same height throughout, while the openings are of varying width, the narrower arches are necessarily silted to a degree not at all agreeable to the eye. Above this the majority of the openings are of that square-headed form, with angle-shafts on the chamfer-plane of the jamb, which Mr. Waterhouse is so fond of using, and which is indeed to be found in nearly all his latter designs. At each end of the front is a projecting angle bay, carried on a heavy stone corbel. Except at the back, the building is entirely faced with ashlar work of, apparently, a Yorkshire stone; a rusticated basement being formed of stone of a greyer tint; and internally the whole bearing of the floors will be on a system of cast-iron beams and columns; but what is to be the construction of the floors themselves does not yet appear. So far as the building has progressed (it is up to the level of third floor) it is a design very well adapted to its purpose; solid and durable, and not incongruously overlaid with ornament. Are the small panels over first-floor windows to be carved in the centre? At present they have a rather hard and bald appearance. A little way off, in the same street, is another still larger block of building, recently finished, of brick with stone dressings, which we shall perhaps not be wrong in ascribing to Mr. Salomons, partly because it resembles nothing else, and this gentleman seems to go in for a new style in every building he erects. There is an angle porch, internally circular on plan, flanked at the entrance by octagonal columns of

a most indescribable design, with very novel and not ineffective capitals, but too much bedizened with ornament about the base. The general design may be described as clever, but wanting in breadth of general effect and in refinement of detail,—too much cut up into little bits, and too full of conceits and oddities; in these qualities contrasting unfavourably with Mr. Waterhouse's simple and unobtrusive building just mentioned. The hands of incised stone ornament over first-floor windows are very pretty and effective, in that flat style which Mr. J. K. Colling has set the example of. Opposite this large building is a small "front," just finished, of detestable design, with stone piers between the windows of about the tenacity that would befit a design in cast-iron. Possibly they are strengthened by iron in the rear; if not, the stability of the structure is doubtful.

Opposite the Free Trade Hall is a large square block of Classically just completed, with a ground story of rusticated masonry, forming a series of circular-headed openings, which has a solid, sensible look enough, but would have been better with a deeper reveal, to give more look of weight and strength, considering the size of the superstructure. Above the first-floor string there is nothing to praise. There are three stories of windows of the most common and conventional Classic type, a string course of the same section (and a very weak and ineffective section) forming a continuous sill to each range of windows, though the design of these latter is different in each story. The neglect of the point and expression which may be given to a building by a judicious contrast in the size and profile of the string-courses speaks only too surely of the absence of true feeling for architectural design. If Messrs. Grey & Knowles, to whom persons wishing to rent these offices are referred, were the architects thereof, we cannot congratulate them. Close to this is another block, of brick with stone dressings, less pretensions and a little mere architectural in the treatment of the windows, but still very commonplace. As a curious contrast to these we may mention the large block of shops and offices just completed in John Dalton-street, for the perpetration of which, we believe, Messrs. Speckman & Charlesworth must be answerable. Many of the Manchester architects seem to know no medium between dry Classicity and the wildest vagaries of Gothic out-Gothicised. We are always glad to see attempts to do something with brick in an artistic manner; but it is quite another thing to see a building covered over with large panels in recessed and projecting brickwork; and, as in the second story of this building, a ragged mass of double-recessed brick arches over the windows, the outer arch segmental, the inner circular, all springing from a stone shaft of disproportionate lightness. The application of panelling to the main piers of brick, which run up nearly the whole height of the building between the groups of windows, is most unhappy, since it gives an appearance of lightness and weakness to the very part which is constructively most important, and which ought consequently to appear heaviest; but as one of these main piers comes right over the crown of the semi-circular-arched doorway, it may be as well that it has been made to look a little less crushing than it otherwise would have done.

There is also an angle doorway, with two shafts supporting immense chimney-looking corbels projecting towards each other at right angles, the under side of each forming a segment of a circle; while above they support an oblique lintel, forming the head of the entrance. The under side of each corbel is covered with a sort of pie-crust foliage, quite out of place in a situation where every line ought to indicate strength and bearing capability; in short, taken as a whole, this doorway is one of the worst architectural features we have seen for a long time. There is a small shop, however, erecting in Princess-street, for Messrs. Palmer & Howe, which within a small space is even more extravagant than the last-named building, and may be called Manchester Gothic run mad. The whole principle of architectural design is inverted here; there is a very heavy corbelled brick cornice at the top; then thin brick pilasters, carrying pointed arches run through two stories, and resting upon a mass of horizontal stonework at the level of the first floor, under which a sham stone corbel and short shaft, supporting nothing, lead the eye down to a thin spiral shaft, forming the outer edge of an iron standard, which shaft, so far as the design is concerned, carries

the whole superstructure of stone and brick. Of course, it is common enough to see a shop-front standing upon nothing apparently but plate-glass, and bad enough it is; but here the matter is made worse by the jugglery of the apparent corbel-shaft brought down upon the iron one, to cheat one into the belief that the support is in front and visible—a sort of prevarication, which is worse than the downright lie of the plate-glass. Of a very different class to the two last is the building in Cross-street, called Commercial Chambers, and which contains the new Stock Exchange. This is carried on solid piers from the ground; the ground-story pier being made, we suppose, as wide as the demands for shop-light will allow them to be, but not as wide as they ought to be to give the proper stability of appearance to the design. The building is in a round-arched style, the leading lines horizontal, and some details, as the archivolts mouldings of the windows, partaking of the Classic type, while the carving of the caps, and the proportion of shafts and caps to each other, are decidedly of Gothic character. On the whole, the elevation is a very successful specimen of general Classic form, or, we should prefer to say, horizontal form, with details of that boldness and depth of shadow which characterise the best Gothic work. The front is in two differently coloured stones, harmonizing very well now while they are new, but we should fear not sufficiently strong in contrast to retain their effect for long in smoky and rainy Manchester. One defect in the design is that the doorway is badly placed, not being centrally under any other feature; and a pier on the first floor comes just over the haunch of the arch, which, of course, is bad both constructively and artistically. But this is the only positive fault we should find with the building. Internally, there is a good and well-lighted staircase; and, as a whole, this building is a credit to its architect, whose name we did not learn.

To turn from one art to another, we must confess that the Manchester Picture Exhibition this year, though a large one numerically, is not in point of quality so good as might be; not so good certainly as one or two that we have chanced to see there before. There seems to be a pretty large proportion of paintings by local artists, some of no small merit, and two or three of the best pictures from the Royal Academy we noticed during a hasty survey. Following "the line" round the room, it would be difficult to conjecture upon what principle pictures have been selected for the post of honour, save on that of giving an equal representation to all schools and styles.

Before quitting our subject, we are tempted to ask, when do the good folk of Manchester mean to do anything to render their principal and busiest thoroughfares, Market-street, less architecturally uninteresting? Half the rebuilding seems to go on in back streets; and here in the main street of the city is all the ugliness of the most debased period of jerry building. There will be the New Exchange presently, certainly, but can no enterprising person start a better and more artistic class of buildings for shops in that locality? But let it be noted that when we say "artistic," we do not include under that term any of those fire-work designs in brick for which some Manchester architects have shown such a predilection; more particularly do we denounce these when they come out in parti-coloured brickwork, giving the idea of having been copied from Manchester coloured prints. Whenever any part of Market-street may be rebuilt, let those who do it choose a sober, well-considered, architectural style of treating the buildings, as they value their commercial prosperity; for a whole street built of shops, like the one we mentioned in Princess-street, would be enough to frighten away all "buyers" from the city of cotton and calicoes.

PORTSLADE-BY-SEA, BRIGHTON.—A deputation of the members of the late Brighton Mechanics' Institution, with their secretary, attended, by invitation of Mr. Henry Scrase, one of their former colleagues, at the recent opening of an assembly-room, which that gentleman has built at Portslade-by-Sea, for the purpose of holding meetings, lectures, concerts, readings, and for religious worship, as well as for the establishment of a reading-room and library for the inhabitants of that thriving suburb.

AT THE SOCIAL SCIENCE CONGRESS.

As president of the Health Section, Dr. Ramsey delivered, during the recent meeting in Birmingham, an able address. We print one portion of it touching

The Air of Towns.

Although much has been learnt from the study of death-rates, I have for some time past scrupled to quote them in support of sanitary dicta. With all respect for the Registrar-General, and for my learned and distinguished friend, Dr. Farr, I find these statistics full of fallacies, especially in crowded towns, where the figures give by far too favourable an estimate of that mortality which is strictly due to town life. I need hardly say that the death-roll does not reveal the actual loss of health among town masses, nor does it record the multitudes disabled by a host of diseases and casualties which may not at once destroy life, though they ravage the territory of labour and duty, and levy a heavy tribute upon produce and property. For this we need an official registration of sickness attended at the public cost. Professor Haughton has shown that, on very simple mathematical principles, the density of a population would be a factor determining the ascent of the curve of increase of an epidemic. This would apply to the case of the distribution of poison by a water company. "I believe," adds Dr. Morris, in his very remarkable essay on germinal matter, "that bad sanitary state of any kind would be equivalent to greater proximity." All other sanitary appliances and reforms being equally adopted or equally neglected, it is certain that close proximity of dwellings over an extensive area is *per se* a cause of unhealthiness and deterioration of race. It is not fair to compare a well-regulated town population, having, perhaps, only eight square yards for each person to live upon, with an ill-conditioned dirty population in the open country. For all this vitiation of air caused by town life there appear to be three natural remedies of different values in different cases,—motion of air, diffusion of gases by natural law, the presence or introduction of active oxygen. Now (1) the mere motion of air, if it be natural motion, *i. e.* wind, is occasional and variable, while the generation of morbid causes is constant, the remedy cannot be relied on, for the air is often stagnant in circumstances of the greatest danger. The motion of air in towns is impeded by the proximity and height of buildings probably as much as by insufficient openings in rooms. Nor do we know that, without the admixture of pure air, foul air can purify itself by simple motion. If the motion be artificial, it may be excessive or ill-timed, but of this again. 2. The diffusion of gases is necessarily limited by space, and mainly by superficial space; for their diffusion in a vertical direction, *i. e.*, into the upper regions of the atmosphere, we know little, and that little (depending partly on diminution of temperature according to height of aerial column, and partly on the relative specific gravity of gases) does not favour the hypothesis of an effectual change. Gaseous diffusion is also impeded by the very circumstances which impede aerial motion. And these circumstances are most potential in towns. 3. But the presence of active oxygen in sufficient quantity—and sufficiency here means abundance—were that possible in dense populations, would be the real remedy. Oxygen I take to be the burning and purifying principle of nature, represented by the elemental fire of the ancients. For flame is but luminous combustion. Professor Tyndall has shown by his curious candle-burning experiments in the Vale of Chamounix and on the summit of Mont Blanc, that the quickness and intensity of combustion, such as takes place in vigorous oxidation, is, in general, incompatible with that brightness of flame which depends on the presence of carbon or other inflammable matter. The purer the fire, the more invisible is the fire, yet the more effectual the burning. The proportion, chemically determined, of oxygen in air may not be much altered in towns, though it is sometimes found to be less; but recent discoveries tend to prove that its energy depends on the conversion of a portion of itself into another form, which, when obtained artificially, we call ozone. Since the most delicate tests fail to detect anything like ozone in the air of our crowded towns, we infer that in these places our great benefactor is "used up;" and that without his presence and aid, oxygen itself fails to purify. Practically, then, the most essential measure of sanitary legislation and ad-

ministration would be, not merely to purify as far as possible the air of towns, but also to provide better air than towns supply to the people. These objects may be accomplished by three methods:—(1) speedily removing all the débris of animal life, and everything which by decomposition can corrupt the air; (2) promoting the free circulation of air into every quarter, through every court and alley, into every house, every room, in the inhabited area,—in a word, ventilation; (3) enabling every person to breathe a sufficient quantity of good air, i.e. air having the properties of ozone. Our sanitary laws, if properly carried into effect, which they are not at present, may exceed the first object. The second is a very vexed question. What is sufficient ventilation; and how is it to be obtained? The verdict in each case must depend on circumstances which in different cases are most diverse and complicated; for, on the particular temperature of the climate, the season, the house, the workshop, the chamber, depends the demand for the more or less rapid circulation of air. In winter, or at night (exhalations being more readily condensed in cold air), several persons might remain not seriously injured in a room, the atmosphere of which would be dangerously vitiated by one person in a hot summer, or within the tropics, when and where the exhaled organic matter is volatilized and thus prepared for quick re-admission into the living body. The question of temperature is so intimately connected with that of air-circulation, that a long and complete series of scientific observations, in a great variety of places, would seem to be necessary to frame even elementary formulæ of ventilation. If old-fashioned people are more anxious to warm their houses and rooms than to secure purity of air, advanced sanitarians are, perhaps, sometimes too eager to ventilate without sufficient attention to warmth. Both extremes may be avoided. An authorised allowance of cubic space might be insufficient for healthy existence without the introduction of currents of air so swift as to injure the weaker inmates of the house. Women, children, and the sick especially, would then be the chief sufferers. But, in crowded cities, the free circulation of pure air is simply impossible. The air outside the house—i.e. the air to be admitted for ventilation—is often, as we have seen, only a few degrees less vitiated than the air to be expelled. The air which sustains the life of 200 or 300 persons on every acre of a large district (including, for instance, more than a square mile), can never act properly upon effete organic matters; while invading currents of air from the open suburbs very rapidly lose their power to oxidise. Existing legal provisions against overcrowding in single houses and rooms—good as they are, and better as they might be—only touch the surface of this tremendous question.

Masters and Men.

Mr. A. J. Mundella read a paper, in which he traced the history of labour in this country to the period when masters and workmen were free to combine for their own benefit, and wages became a matter of bargain and sale between them. He then referred to trades' unions, which, he said, numbered no less than 700,000 members, who, with their families, represented about 3,500,000 of the industrial classes. The objects of these unions was to adjust the rates of wages, to aid members when out of work or in sickness, and to help in burying the dead, and they must exercise great influence upon society for good or for evil. The question now was, were they a blessing or a curse? He thought that, notwithstanding many faults, they had proved beneficial both to the working classes and the nation. There could not be the slightest doubt that the condition of the mechanics, who formed the staple of the members of the unions, was infinitely better than that of agricultural labourers. It was not to legislation, but to the good sense and good feeling of employers and workmen, that they must look for an effectual remedy for strikes. He had no faith in any arbitration, by persons who were unacquainted with and not interested in the trade in which the dispute arose. Arbitration, to be effectual, must be the result of a system of open and friendly bargain between masters and men meeting together, and talking over their common affairs in an amicable manner. Mr. Mundella gave an interesting sketch of the Board of Arbitration and Conciliation of the hosiery and glove trade at Nottingham, which consisted of an equal number of manufacturers and operatives, and, with its branches, governed 140,000

persons. He showed that the board had always been successful in settling disputes and preventing strikes, and said that the result of his experience, as president for eight years, was the conviction that nothing could be more conducive to the benefit of any trade, or to the growth of a kindly feeling between all engaged in it, as the existence of such a representative and legislative body.

Mr. W. Gilliver, on behalf of the Birmingham tradea council, composed entirely of working men, read a paper on the same subject. He said there was often a difficulty in getting employers to discuss, with the representatives of a union, a trade dispute in a friendly way, and he suggested the appointment of a board or council of conciliation, composed of an equal number of members of the chamber of commerce and the trades' council in a town.

Mr. Kettle gave an account of the court of arbitration at Wolverhampton, which had succeeded in putting a stop to disputes and strikes in the building trades in that town, and the principles of which had been adopted by the same trades in Manchester and Salford. The difference between the Nottingham board and this court was that the awards of the latter could be legally enforced, the workmen agreeing to work upon the terms adopted. It was a matter for discussion whether that plan was the best, or whether the Court of Arbitration should rely solely upon the influence of public feeling for the carrying out of its judgments.

Mr. Samuel Morley, as a manufacturer, gave his entire adherence to the Nottingham system, which he said had been a great success, and presented a solution of one of the most important questions of the day. That system was entirely a voluntary one, and he thought that if the law or force of any kind were introduced, it would collapse. He admitted the perfect right of working men to combine for the purpose of getting the highest price for their labour, but he denied their right to coerce their fellow-labourers, and trusted the Legislature would take most determined measures to punish such tyranny.

Mr. Alfred Hill, chairman of the Birmingham Chamber of Commerce, said that in the case of the Birmingham stonemasons an attempt last summer at conciliation had failed. The men objected to piecework, to the subletting of contracts, to wrought stone being brought into the quarry (they wanted the stone to be brought in a rough state from the quarry), and to arbitration. A committee, composed of three members of the Chamber of Commerce, three members of the trades' council, three operative masons, and three master builders, was appointed to settle the dispute; but after meeting three or four times they separated without coming to an agreement.

Mr. Jesse Collings read a paper

On "The State of Education in Birmingham."

He said the Birmingham Education Society—originated by Mr. George Dixon, M.P., in March, 1867,—had ascertained the educational condition of the manual labour and the poorer classes in Birmingham with an exactitude which had never been equalled in any other town in England. House-to-house visits were made in 754 streets out of the 1,027 in the town. The remaining 273 streets were of a class that did not require visiting. The total number of children visited was 52,573. Of these 7,517 were under three years of age. Of the remaining 45,056, those who had been at school at some period of their lives numbered 32,997, and 12,059 had never been to school. This was stating the case in the most favourable light possible, because the number of children which had been at school included those which had attended for any space of time, however short, and to any school, including dame schools. The average time of each child at school was consequently very short, and altogether useless for the purpose of education, being for boys a year and three-quarters, and for girls two years and a quarter each. The actual number of children at school at the time of the inquiry was,—boys, 8,587; girls, 8,436; total, 17,023; or a little less than two-fifths of the whole number of children over three years of age. The educational state of the 45,056 children was as follows—13,380 could read and write; 5,482 could read only, leaving 26,194, or more than one-half, who could neither read nor write. This was stating the case far too favourably; because a large number of those who were said to be able to read and write did so in such an imperfect manner that the

acquisition would be of little or no practical value to them in after life. Many children between the ages of nine and fifteen, who were stated to be able to read and write well, were found on examination hardly able to write an easy paragraph in legible hand, or to read the same without spelling several words. Of the children actually at school, by far the larger portion were very young. Of the whole number, 10,890 were between the ages of three and nine, while only 6,128 were between the ages of nine and fifteen. There were 1,136 between three and four. The largest number (2,220) were between seven and eight, after which age they gradually fell off, till between eleven and twelve there were only 1,148, and between twelve and thirteen only 715. These tables showed at what a very early age the children left school. It would be a mistake to suppose that the children not at school were at work, because as a matter of fact only 6,337 were at work, thus showing to a certainty that 21,696 children out of 45,056, between the ages of three and fifteen, were neither at school nor at work. Of the 6,337 children who were at work, 2,044, or not 35 per cent., could read and write, while 926, or about 16 per cent., had never been inside a school. These tables indicated so clearly a lamentably low state of education among the grown-up persons of the working classes, that the committee resolved to test, by individual examination, the state of education of the young persons between thirteen and twenty-one, employed in the various factories in the town. The test used was the Fourth Standard of the Committee of Council on Education, which consists of reading an easy paragraph, writing the same, and doing the simplest sum in arithmetic, in which money was used. This standard was so low that its attainment was scarcely worthy the name of instruction; yet only 41 out of 908 young persons, or about 4½ per cent., could pass. Many of these young persons had been to school a considerable time; nearly half of them for a period of more than three years. The total amount of school accommodation in Birmingham (excluding private schools and the Free Grammar School) was for 29,275 children. The average attendance was 18,531, leaving vacancies for 10,742. The whole accommodation, even if properly distributed, would leave 15,781 children unprovided for. But it was very unequally distributed, varying from one in seven of the population in St. Mary's Ward to one in twenty-eight in St. Paul's. Duddleston, for example, containing about 48,000 inhabitants, had only school accommodation for about one in seventeen of the population. There were in Birmingham sixty-three schools under Government inspection and receiving Government grants, with an average attendance of 15,276 children. The children's school fees amounted at these schools to 7,035l. 15s.; subscriptiona came to 2,868l., and the Government grants amounted to 6,144l. 12s.; total, 16,048l. 17s. There were twenty-seven schools not receiving Government grants. The children's fees in these cases amounted to 743l. 2s.; subscriptions at least, 632l.; total, 1,375l. 2s. The number of children on the books of night schools in November last was 2,679; but the average attendance was only 1,640. Fees in night schools, 307l. 17s.; subscriptions, 90l. 12s.; Government grants, 210l. 17s.; total, 608l. 10s. Total from all sources spent on the schools in Birmingham, 18,033l. The Free Grammar School had very little influence in the education of the poorer classes in Birmingham. The New-street school had been used principally by the children of the middle and upper classes, and even the elementary schools belonging to the charity had been for the most part filled with the children of small tradesmen, foremen, and the better class of artisans. Those who had most need, the poor children, who could not, through poverty, be sent to school, had not any share in that wealthy institution, the Free Grammar School. A study of the evidence given before the Royal Commissioners led to the conclusion that education in Birmingham would have been as good if the Grammar School had never existed. Mr. J. S. Wright said, in his evidence, that "the effect of this school has been to destroy nearly all the private schools in Birmingham. My own feeling is that if there had been no charity of this kind the people of Birmingham would not have been worse educated." The head-master himself said:—"The system of admission by nomination, and that of gratuitous education, have been most injurious to the cause of education in the town.

I believe that together they have acted as a positive blight upon the preliminary education of the children of nearly 300,000 people." Nearly all the children in the school belonged to parents who were able and would be willing, in the absence of the Free Grammar School, to pay for the education of their children; and these parents, waiting year after year for a nomination to the Free School, too often neglected the education of their children. Mr. Collings considered that there was little hope of education advancing satisfactorily under the present system. He advocated an insectarian system, with compulsory attendance, and under local management and Government inspection.

Dwellings of the Labouring Poor in Birmingham.

The Rev. Micaiah Hill read a paper on this subject. He said they were better than in most other large towns and cities. There were no inhabited cellars. Nevertheless, excluding three or four principal streets, there was not one without courts on the right and left, where pure air could not possibly circulate; and in summer the inhabitants were seen coming to the main street to catch a breath of air. The practice of taking in lodgers led to overcrowding; the rooms were very small, and the habits, prejudices, and ignorance of the inhabitants rendered ventilation impossible. The uncleanness of the poor was due rather to poverty than indifference. Scrubbing, brushes, towels, and soap were luxuries which the poor could not always afford. The fact that sitting, sleeping, cooking, washing, drying, and nursing had all to be done in one room accounted for much untidiness and much mismanagement and unthrift at home, and for habits of intemperance on the part of the husband, soon followed by the withdrawal of the children from school. Should the husband be taken ill, his wages ceased with his labour. Furniture, clothing, even bedding, then went to the pawnshop. Murmuring, strife, and violence followed. The house agent or rent collector then came with the bailiff to take anything that remained, and the wretched family, stripped of everything, might soon afterwards be traced to a low part of the town, occupying a dilapidated house, without an article of furniture—husband, wife, and children huddled together in a little straw on the floor. Refinement, sensibility, modesty, could not be expected to flourish in that atmosphere. The wife, perhaps, sank into an untimely grave, and was succeeded by an unmarried person. The children were driven from home by cruelty to lead a life, the chief events of which might be learned at the workhouse, the police court, and the gaol. He would be a sanitary enthusiast who should affirm that good drainage and ventilation, and interior structural arrangements, could have prevented these evils. He would be an educational fanatic who should maintain that compulsory education would render such a career impossible. He would be a religious bigot who could maintain that tracts and Bibles, Bible women, missionaries, and Scripture readers would have proved an antidote to the sanitary, social, and moral disadvantages to which the family were exposed. To no one of many causes could the downward career be traced of those who gravitated towards the lowest sub-stratum of society; and yet he knew little of human nature, and less of the temptations of the working man, who could hesitate to attribute the physical distress, social degradation, and moral ruin of multitudes in a great city to a combination of the influences described. The progress of improvement in the town was letting in light and air to quarters which had been the hotbeds of disease and crime; but the classes were not improved—they were merely displaced, to crowd localities which had hitherto enjoyed a more healthy reputation. To receive these persons long ranges and blocks of building had been put up, in the south-west, on the very boundary of the borough, between two great thoroughfares, dotted all along with villas and commodious shops and dwelling-houses. Drainage, water supply, and other sanitary wants, were unprovided for. Not less than 1,000 houses were erected within the borough of Birmingham annually—not a few for immediate sale—and the health and morals of the public were not items which entered into the calculation of profits. Houses let for immoral purposes constituted a better pecuniary speculation than any other, except public-houses. Hence, the man who consults public health and morals must sacrifice personal gain, and where personal gain was the sole motive, accommodation should be provided for drunkenness and

prostitution. The labouring poor were utterly helpless to avoid localities where fever was chronic, and poverty and squalor indigenous, and where immorality saturated the social atmosphere. Even superior workmen could not always avoid these localities. Not able to build their own houses, they took them as provided by men who thought only of their own interests, and spent more upon an attractive exterior than upon substantial means of comfort. Houses were crowded together in blocks that defied light and ventilation; and almost every new street continued for months, sometimes for years, unpaired and undrained. Greater earnestness on the part of the authorities to interfere with what were assumed to be the rights of property, and more extended powers to insist on the observance of the approved principles of construction and of sanitary arrangements, would go far towards correcting some of the evils affecting Birmingham in common with all great seats of industry. There was a district on the confines of this borough where the water was intolerably bad, where fever had been domiciled, and where the inhabitants were idle, squalid, and intemperate. Three consecutive rainy days reduced them to the greatest straits, and three weeks of snow to the pawnshop, the workhouse, and the cemetery.

The Industrial Progress of the Black Country

was treated of by Mr. J. C. Tildesley. Having traced the history of mining in South Staffordshire from remote times until the invention of the steam-engine by James Watt, Mr. Tildesley proceeded:—At the dawn of the present century the number of collieries in the district was 160, and the average yield of coal 500,000 tons per annum. In 1815 the collieries had increased to 200, and the annual yield to 800,000 tons. At present there are 540 collieries, yielding annually 10,206,000 tons, and employing 26,620 persons. This enormous supply is, however, in proportion to the number of collieries, lower than that of other English coalfields, owing partly to the intermixture of ironstone in the coal-beds of South Staffordshire, worked by the same shafts, and partly to the great number of small collieries, locally known as "Jackey Pits," worked on the old-fashioned whimsical principle. It is estimated by Mr. Hill that the ungotton coal in this district exceeds 950,000,000 tons, which, at the present state of working, will require 200 years to consume. The iron trade of South Staffordshire, from its commencement in the reign of Edward VI., when blast furnaces were invented through its successive changes under the enterprise of Lord Dudley, Abraham Darby, Cort, and Foley, was next reviewed. In the year 1796 there were only 14 blast furnaces in the district. In 1806 the number had increased to 42, and in 1829 to 123. There are now 167 furnaces, of which only 80 are in operation. The present production of pig-iron in this district is 10,000 tons weekly, of which about one-half is made from native ores. It is, however, in the production of finished iron that South Staffordshire excels. There are in the district 102 forges, containing 2,100 puddling furnaces, and producing annually 855,000 tons of finished iron. It is estimated that the Black Country contributes half the entire production of finished iron in Great Britain. The district has, however, recently lost ground in the race of competition, the modern and improved scientific arrangement of the works in the Cleveland district and in Belgium having placed the South Staffordshire ironmasters, with their old-fashioned works and appliances, at some disadvantage. South Staffordshire will do well to confine its energies more to the quality than to the quantity or cheapness of its finished iron. There are in the aggregate 20,000 persons employed in the iron trade of the Black Country, the number being more than doubled since A. D. 1800; but there has been no increase during the past ten years. In the hardware produce of the district is exemplified to a remarkable degree the principle of the "location of trade." Every town and village has its own particular department of smallware, with which its neighbouring town, though baply divided only by a scoria mound and a couple of "swags," does not presume to interfere. In Elizabeth's time the district could boast craftsmen of considerable skill,—worthy descendants of Tubal Cain, "the inspired artificer in brass and iron." Some of the earlier crafts are now obsolete. Sword-hills and chains, curiously carved, which would have done credit to Andrew Ferrara, were made two centuries ago at Wolverhampton. Silver buckles were made at Walsall until the

invasion of "Wellingtons and Blachors" revolutionized the livery of the country squires. Other branches, like the pottery trade of Wednesbury, have been transferred to other districts. The production of locks and keys at Wolverhampton and Willenhall has increased fourfold since the commencement of the century. The present weekly production of these articles exceeds 400,000, and the number of workpeople is 5,000. Chain-cable and anchor making around Dudley commenced in the year 1824. Over 60,000 tons of chains and 5,000 tons of anchors are annually produced by 4,500 workpeople. Saddlery and harness making has been the staple craft of Walsall from time immemorial. The rate of production has doubled since 1849. The aggregate number of workpeople, of whom a large proportion are females, is 4,200. Japanned and tin ware making in Wolverhampton and Bilston employs 2,000 workpeople, the number having increased by one-third during the last twenty years. Wrought nail making in East Worcestershire is, owing to the introduction of machines-madonnals, doomed and decaying industry. In 1830 the craft employed not less than 50,000 workpeople. Now there are only 20,000, and the number is fast decreasing. Glass-making is an important branch of local industry. There are three large plate-glass factories—two at Smethwick, and one at Stourbridge. The reduction of the duty in 1845 increased the production of glass-plate in England from 7,000 ft. to 140,000 ft. per week, a progress in which the Black Country has largely participated. The annual production of plate, sheet, and crown glass in this district is 17,000 tons, and the number of workpeople employed 2,500. There are also thirteen works in the neighbourhood of Stourbridge for the manufacture of flint and bottle-glass, employing 1,500 workpeople. The production of iron-foundry, boiler-plates, edge-tools, galvanised iron, tubes, railway and engineering work has increased during the last twenty years at rates varying from 50 to 70 per cent. The total number of workpeople engaged in the fabrication of hardware in the Black Country is estimated at 80,000, being an increase of 30,000 since the Great Exhibition of 1851. Foreign competition is severe. America excels by an extensive application of machinery; Germany, by the cheapness of labour. In facilities of production the Black Country is making little progress. The recent encroachment about "Technical education" was, so far as the art-workmen of this district were concerned, a false alarm. In the more intricate departments of hardware the Black Country workpeople are able, for ingenuity and chasteness of design and execution, to hold their own against all comers. It is only when a profusion of gaud and glitter is required for the palaces of imperialism that they can be at all outvied by French and German workmen. Our local artisans chiefly require their efforts to be supplemented by mechanical appliances, to reduce the mere drudgery of their toil, and leave them free to exert their ingenuity in the higher and more inventive branches of handicraft. Mr. Tildesley, after referring to the improved social condition of the workpeople, concluded his paper by severely condemning the injustice of the Factory Acts in their present partial application to this district.

NEW PAINTED WINDOW IN THE PARLIAMENT HOUSE, EDINBURGH.

The only part of the old Parliament House in Edinburgh which escaped the destructive fire of 1824, which consumed the square in which the building was situated, as well as great part of the High-street, consists of a hall 122 ft. in length by 40 ft. in breadth. This apartment is used as an ambulatory in connexion with the Courts of Law, and is one of the objects of attraction in the northern metropolis. It is spanned by a heavy oak roof, having large gill pendants, and is lighted on the west side and south end by elliptical arched windows fitted with perpendicular tracery. Statues and busts of eminent judges and lawyers are ranged around the floor, which is of inlaid oak, and the walls are adorned with portraits.

The exterior of this edifice, which was erected in 1632, was a picturesque and richly-decorated example of Late Scottish architecture; but after the fire it was replaced by a classic façade entirely out of keeping with the interior as well as with the exterior surroundings.

The great south window, which is of five lights, was filled with a representation of Justice, surrounded by masses of murky clouds, and was, as a work of art, thoroughly contemptible. This glass has been replaced by an expensive specimen of the art of glass-painting from the celebrated manufactory at Munich, designed by Herr von Kaulbach, to whom drawings were furnished from the office of her Majesty's Works.

The upper part of the window is sub-divided in the usual perpendicular manner, and is filled with armorial bearings, upon an enamelled groundwork of foliage, and the under part of each light has a square panel similarly treated. The great central part between these is occupied by a large painting, which stretches from side to side, without regard to the four mullions which intersect it, although the design has been adjusted, so that they interfere as little as possible with the composition.

The subject represented is the inauguration of the College of Justice, by James V., in 1532. In the centre of the picture the young king is seated on his throne, and in galleries to the right and left are the ladies of the court, while in front of the throne are grouped ecclesiastics, nobles, and judges in their robes of state. The moment chosen for representation is that when the president of the court has received from his sovereign the royal sign manual, and the archbishop is in the act of giving his benediction, while the spectators look on with intense interest. The whole picture has somewhat of a melodramatic effect, the action of the archbishop being particularly so, but, as a picture, the grouping is artistic and the drawing excellent. As a stained-glass window, however, it is not to our liking; the treatment is not architectonic, and it has none of the brilliancy and sparkle found in the best examples of the art. But even as a picture, it has the defect of having no middle tints. The figures in the galleries are about one-fourth the size of those in the foreground, and yet have the appearance of being close beside them. Indeed, we doubt if it is possible to overcome this defect in pictures of the kind, and it is one of the chief objections to this manner of treating subjects in glass. Much enamelling has been used in order to tone down the accessories, so as they may be subordinate to the main incident, but there are rich masses of colour in the robes of the principal figures. It appears to us that the result aimed at would have been more successfully attained in a mural painting. It is, however, the finest thing of the kind in this country that has come under our notice. Herr von Kaulbach has only used the drawings sent him as suggestions, and the whole design bears the impress of having been the work of a foreign artist. The window was fitted up under the superintendence of Mr. Charles Heath Wilson, of Glasgow, whose connexion with the windows in the cathedral in that city is well known to our readers; and that gentleman made the arrangements with the authorities at Munich for carrying out the design.

The cost has somewhat exceeded 2,000*l.*, which sum has been voted by Parliament on account of this service.

NEWS FROM ABROAD.

Berlin.—Those of our readers who have visited Berlin will remember the Brandenburg Gate. Its general character, the style, and the situation (at the end of the Linden and leading to the Park), all helped, in all probability, to remind him of the Arc de Triomphe at Paris, whilst the Quadriga on the top is further associated with that city as having been carried thither by its Napoleon, but brought back and restored to its original position after the peace. To this gate colonnades are now being added, flanking it on either side. The designs are by Professor Strack, and the works will be finished before the winter. Forty-four designs have been received for the cathedral to be built here, and these will be publicly exhibited as soon as the Annual Autumn Exhibition of the Royal Prussian Academy is closed. The plans include several from English and French architects (two from Toulouse), and seventeen from Berlin.

The New Polytechnic School at Munich, for the building of which one million florins, about 55,000*l.*, were voted by the Bavarian Parliament some years ago, was to be formally opened on the

15th instant. It stands opposite to the well-known Pinskiötheke.

In Vienna, as in London, the reform of the Patent Laws is being agitated. Whilst some are, of course, for the preservation of the existing laws, others are for mere registration; a third party is for the American and Prussian system (examination of patent claimed by a committee or council); whilst a fourth party would see the entire system abolished.

Cavaliere Canzio, professor of the fine arts at Florence, died in that city on the 3rd September last, at the age of 84. His best known work of art is the statue of Columbus on the Piazza dell' Acquaverde, at Genoa. "Villa Vermont," the house in which the Grand Duke Nicholas died at Nice, was bought by the Emperor of Russia immediately after his death, and was cleared away for the purpose of erecting a chapel upon the site. The chapel is in the Byzantine style, of polygonal shape in plan, and about 90 ft. high. A handsome portico of Carrara marble, surmounted by a fine mosaic from Rome, representing St. Nicholas, leads to the interior, which is lighted by ten round-arch windows, filled in with red glass and yellow rings. The walls are built of dark red stone, with banks of a paler tint, whilst the interior is lined with white marble. The centre of that part of the chapel to which the congregation are admitted, is occupied by a black marble slab, about 8 in. high, of the exact size, and on the exact site, of the bed on which the Grand Duke died. The rest of the floor is laid in mosaics, of various coloured marbles, and the walls around are further decorated with niches, containing twenty-four pictures of saints, with the background always in gold. The pomegranate trees which surrounded the house, have been removed, and turf and evergreen shrubs help to set off this very handsome little chapel. More frescoes have again been discovered at Pompeii. Two of these are remarkable as being the first discovered which were evidently intended as portraits. They are those of a man in the senatorial toga, and of a woman holding a pencil in one hand and tablets in the other.

THE FAIRFORD WINDOWS.

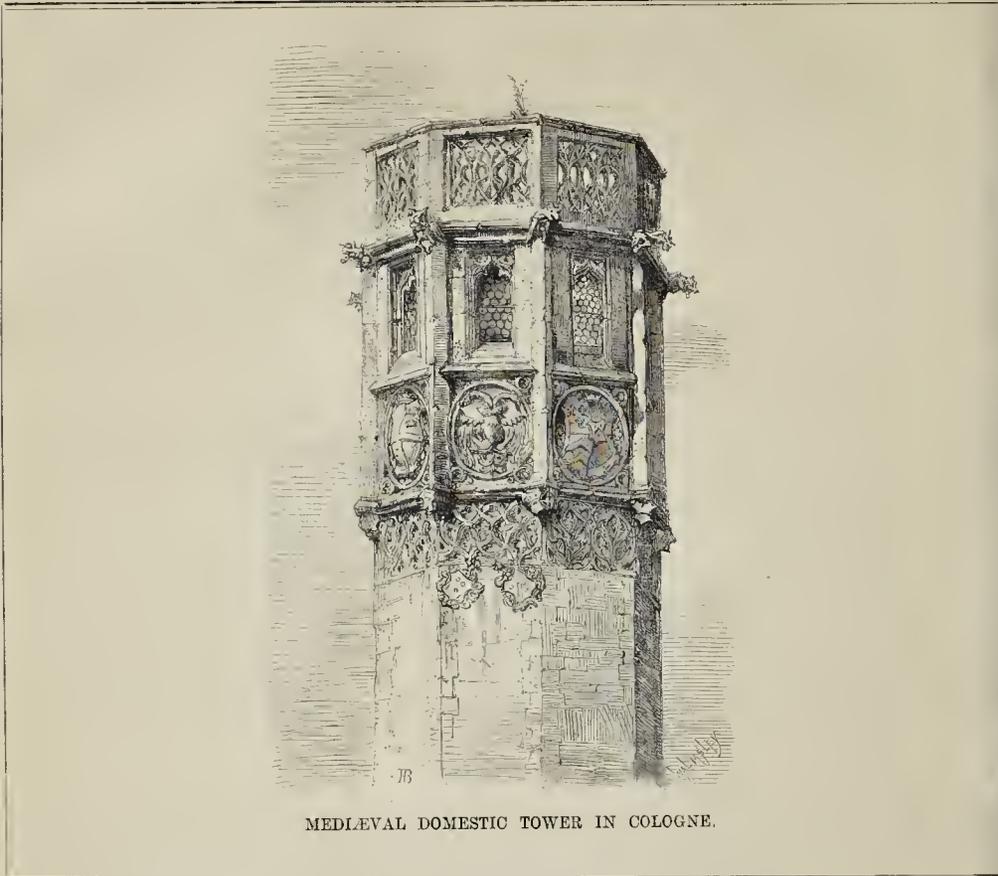

HAVING recently visited Fairford Church, and put the windows to the test of an immediate comparison with the known works of Albert Dürer, I beg to submit to your readers the result; for it is only by such a test that the debated question can be decided. On entering the church and giving the subjects a superficial glance, I must confess to my disappointment on not detecting a single trace of the special style of Albert Dürer as known to us by his numerous engravings. I should have rejoiced to have been able to acknowledge that we had such a glorious treasure in England; but I had brought with me a number of the wood-engravings known as the "small Passion," works executed in the purest manner of the master, and I proceeded to compare them one with another. If I had had even a lingering doubt before, it would now have been dissipated. Over and over again did I make the comparison, with this inevitable conclusion, that if one was by Albert Dürer the other was not. But as general terms do not carry weight, I will proceed to analyse and compare the two, and will begin with the east window.

Now, had we only this remaining, it would have been impossible for any one, however hindered by his enthusiasm, to have ascribed it to that great man's hand. First, the subject of Christ entering into Jerusalem. The engraving shows as a simple, but beautiful, composition: the figure of Christ, in ample drapery, finely arranged, the hair falling in ringlets over the shoulders,—a very constant habit with the master,—the ass upon which he is riding well drawn after nature, and the whole composition free from ancient conventions. In the window the subject is treated according to early conventions: the figure is draped in a very simple manner, almost to poverty; the hair is lank and ungraceful, and the ass a very ill-drawn, wooden representation. "The Agony in the Garden" in the engraving is one of the most beautiful and touching of Albert Dürer's designs; indeed, I do not know of any master who has thrown more feeling into this subject. The window is utterly unlike it in character and treatment, and still more unlike the larger engraving on this subject. I pass by the other subjects of this window, as not calling for particular

notice, to "The Crucifixion." Here the first thing to be noticed is the very bad and wooden drawing of the horses, utterly irreconcilable with anything of Albert Dürer, and the composition, from beginning to end, has not a single trace of the master's style. Carrying on my comparison, I take the subject of "The Annunciation," and will point out the figure of the angel as being especially unlike what we know of Albert Dürer: and here let me observe, this is a strong point, for figures of angels abound in his works, all having a general agreement in style, but totally differing in every respect from that in the window. I point out also "The Harrowing of Hell," "The Incredulity of St. Thomas," "Christ in the Garden," "The Adoration of the Shepherds," "Pilate washing his Hands," "The Supper at Emmaus," "The Last Supper," "The Resurrection," "The Entombment," and "The Pentecost," with other examples, to the number of twenty, of the small Passion, in which not a single trace whatever in style, composition, or costume agrees with the same subjects in the windows. On the other hand, these quite agree in all these particulars with the larger work of A. Dürer on the same subject. One of the most important facts, however, which ought at once to settle the question in dispute is the drawing of the nude. I take the whole of the figures, without any exception, which display anything of the made, beginning with the large figure of Christ in the "Doom," and will also add the extremities, particularly the feet, in all the subjects from beginning to end. The figures are ill drawn, the anatomy imperfectly understood, especially the articulation of the joints; and the feet are large, ugly, the toes without form, and weak. This, of itself, would dispose of the question of these windows being executed from Albert Dürer's drawings; for these very points are characteristics of another school; and it would be an insult to the great master's memory to attribute to him works which contain these imperfections. The large figures of apostles and prophets which fill the windows of the two aisles, fine figures as they are, may also be criticised for weaknesses in drawing of the hands, though in general we have here the best work. But it is remarkable that four of these figures, side by side, are studied closely from the same model. I should lay no stress upon this point alone, but Albert Dürer is remarkable for his luxuriant variety, and I believe his judgment, as a great artist, would have taught him to avoid this monotony.

There is a fine and interesting set of figures in the north chancel, interesting, especially, on account of the rarity of the subject, viz., "The Persecutors of the Church." I challenge any one to produce a parallel from the works of Albert Dürer which assimilates to any one of them. They mark a distinct school, which school is manifest throughout the whole series of subjects. I now draw attention to the architectural details, especially to the canopies of the large figures. Here we should certainly expect to see a decidedly German type in works attributed to Albert Dürer; the more especially as he indulges in a very free use of the florid crocket-work that marks the school, whenever he deals with Pointed architecture. Now, there is nothing whatever of this, but the style is altogether that which marks the Flemish school, and it is to that school, so unmistakably indicated in the general character of the work, that these windows belong. In the details of costume, the angular drapery, the faulty drawing of the nude, and the observance of ecclesiastical traditions, we recognise the early Flemish school, and had these works been assigned to any follower of the school of Van Eyck, the disproof would be exceedingly difficult.

Some, who have written upon this subject, appear to be entirely ignorant of that traditional mode of representation which was a law in ecclesiastical art. Hence they have ascribed to an individual the treatment of a subject that not only did not belong to him, but not even to his school, but which was generally obeyed by all the artists of the Middle Ages. The great artists of the sixteenth century broke from the trammels, in a more or less degree, and Albert Dürer among them. He rarely uses the *nimbus* in his compositions, and disregards, whenever it suits him, all conventional treatment. His luxuriant fancy made him impatient of restraint; hence he is the most picturesque of designers. He never repeats himself, but his style is so strongly defined, that there ought not to be a moment's question as to whether the Fairford windows should be or not attributed to his hand. These

MEDIÆVAL DOMESTIC TOWER IN COLOGNE.

who will have it so, do it at their peril. They must credit Albert Dürer with imperfections which his known works never exhibit. Among the many details that have been appealed to to prove these works to be by A. Dürer are the scroll inscriptions and a monogram. As regards the first, we are told they exactly coincide with the alphabet called A. Dürer's. I plead to an ignorance of this special alphabet; but having had thirty years' experience of Mediæval alphabets, and possessing a collection of inscriptions from the thirteenth to the seventeenth century, I failed to see any speciality whatever beyond that perfectly familiar to me. As regards the last, I admit it was a very great discovery. It was not, indeed, our familiar friend A. D., but A. T. Nevertheless, with wondrous learning and research, we are told that Dürer was Thürer, and that he might spell his name with a T, just as the respected Weller, sen., spelt his name indifferently with a *vee*. How can we withstand such learning and research? Surely this ought to clench the whole affair, and loud praises of triumph ought to have been awarded the discoverer, only he had been beforehand with us, and sounded them himself. One trifling fact, however, is wanting, not perhaps important, but some people will cavil,—viz., that there is no A. T., but simple, modest, unpretending letter A. This letter is on the sword-hilt of the executioner of St. John the Baptist, close against the hilt. It is, therefore, more likely to be a final than an initial letter; and as the colour is gone beneath it (a defect seen in many of these windows), it is probably only a part of some inscription. Of all places, it is the most unlikely one for an artist's monogram to be placed; for swords are often inscribed, and this may be merely the final letter of an appropriate legend, such as "IRA," or "LUXURIA," most likely the latter, in allusion to the immediate cause of the death of

the saint. But whatever this may be, the only true signature of an artist's work is in itself. To appeal to petty details to decide the artist's hand when such abundant materials exist, savours somewhat of impotence. And as to the traditions, one and all, let them be dismissed to the land of dreams whence they came, and to which they appropriately belong. In conclusion, I must state that, although the Fairford windows are not quite up to the standard of Albert Dürer's genius, they are, nevertheless, fine works of art, and their completeness is such as should make it a matter of national importance to insure their due preservation.

J. G. WALLER.

DOMESTIC TOWER, COLOGNE.

IN the Middle Ages, Cologne was celebrated for the number and beauty of its towers. So striking was the effect of this city that the Pope, Æneas Silvius, is said to have declared it to be the most striking in Christendom. And notwithstanding the destruction of more than fifty of its churches at the revolution, and modern "improvements," few cities have a more picturesque "sky-line." It is probable that originally most of the larger and more important houses (as well as the churches and public buildings) of this city were furnished with one or more towers. Eight or ten of these towers still exist in various parts of the town. They are all of a similar character, and consist of a lofty octagonal shaft, perfectly plain from the base to the height of the roof of the house, and crowned with a very elaborate top story and open parapet. The best examples are near St. Mauritius Church (of which we give a sketch), in the Neü Strasse, Neü Markt, and Jesuiten Gasse.

FROM MELBOURNE.

A STAINED-GLASS window has been ordered by the Rev. Mr. Parle for the chancel of St. Patrick's (R.C.) Church, Belfast, from Messrs. Ferguson, Urie, & Lyon, of Melbourne. The design for the four lower or principal openings consists of the Nativity, Baptism, Death, and Resurrection of our Saviour. In the large circular opening in the upper portion of the tracery the Ascension is the subject; and in the intermediate openings other scenes in the life of our Saviour are represented. The upper portion is complete, but temporary windows of plain cathedral glass will be inserted in the lower portions. The cost of the window when completed will be 250*l*.

Collingwood.—The new Foresters' Hall in Smith-street, Collingwood, has been opened with a *conversazione*, attended by about 200 of the members of the order and their friends. The ground cost 602*l*. 10*s*., and the building 2,500*l*. The whole work has been done at the cost of the Court Perseverance 2,727, a sum of 1,000*l*, having been appropriated from the court funds, and the remainder of the amount was borrowed on mortgage. Two shops form the front part of the premises. The architect of the building was Mr. F. H. Thomas, and the contractor Mr. Edward Galbraith. The gas-fittings were by Mr. Stieh, with whose patent reflectors the hall is lighted. An excellent piano, of colonial manufacture, has been supplied by Mr. Blazey, of Richmond. The hall, including a gallery at the west end, will seat about 400 persons.

Ballaarat.—There is to be a public park for Ballaarat East. The council having decided to ask for the reservation of Mount Xavier, a picturesque spot situated between the Melbourne-road and Eureka-street, this will be the site of the park if it be obtained.

THE NEW TOWN-HALL, MELBOURNE.—MESSRS. REED & BARNES, ARCHITECTS.

THE NEW TOWN HALL, MELBOURNE.

The foundation-stone of this handsome structure was laid on the 29th of November, 1867, by His Royal Highness the Duke of Edinburgh. At about four o'clock His Royal Highness, accompanied by the Governor, Viscount Newry, and Lieutenant Haig, arrived in a carriage and four, with outriders and postillions, escorted by a great number of troops. In a second carriage were Miss Manners-Sutton, Miss M. Manners-Sutton, Mr. Brierley, and Mr. Manners-Sutton; and in a third were Lieutenant Rothwell and two younger sons of his excellency. His Royal Highness was received by the mayor, the aldermen, and councillors, at the threshold of the temporary building, and conducted to the council-chamber, thence to the platform, where the ceremony was performed. Messrs. Reed & Barnes are the architects; Messrs. Lawrence & Cain being the builders. The trowel used was of solid gold. The building is progressing rapidly, and when finished will be one of the principal features in Melbourne.

GLOUCESTER CATHEDRAL.

The restorations on the southern side of this cathedral are making progress, and the exterior of the south transept is complete, except a few finishing touches. The open parapet which had been removed from the sill of the great south window has been replaced, and a panelling beneath has been recovered. Below this a small niche has been discovered. As the back and sides are each painted with a black St. Andrew's cross on a red ground, it is probable it contained a figure of that saint, and this supports the opinion that the south transept was originally called St. Andrew's aisle. The window is temporarily closed, but will be filled with painted glass, the gift of Mr. T. Marling, of Stroud. The restoration of the south porch is the next work on hand. It had originally been intended to do this with Anston stone, the same as that used for the Houses of Parliament; but, after having been quarried some time, it was found difficult to work, and Bath stone is to be substituted. An addition has just been made to the painted glass in the cloisters. Over the lavatory are ten two-light windows, with traceried heads, one window at each end, and eight in front. These have just been filled with painted glass by Hardman, of Birmingham, the gift of Mr. G. Bonnor, of Kensington. Of course the subjects are all Scriptural, and include a representation of the miracle of turning water into wine, Christ walking on the sea, the miraculous draught of fishes, Christ washing the feet of his disciples, the division of the waters, Christ and the woman of Samaria at the well, the cure at the pool of Bethesda, Christ teaching from St. Peter's ship, &c.

THE NEW LONDON MEAT AND POULTRY MARKET.

Mr. H. LOWMAN TAYLOR, chairman of the Markets Improvement Committee, has brought up a report to the Court of Common Council of proceedings relative to the construction of the Metropolitan Meat and Poultry Market, and recommending that the Coal, Corn, and Finance Committee be authorised to negotiate for a loan of 85,000*l.* to meet the necessary expenses in connexion therewith. Mr. Taylor said the court would remember that, as far back as December, 1865, authority was given to the committee to obtain estimates for the erection of the market upon designs which had been furnished by the architect. The committee wrote to a number of first-class builders, and the lowest tender received was from Messrs. Browne & Robinson, a very respectable firm, who agreed to do the work for 134,400*l.* The highest tender was from an equally respectable firm, Messrs. Ashby & Sons, and the sum they asked was 170,000*l.* Messrs. Browne & Robinson's offer was accepted, and the works were now being carried out by them in a way that would do credit to the corporation, and there was every reason to suppose that the market would very soon be completed. The architect's estimate of the cost of erecting the market was 200,820*l.* The works, however, would be carried out at something like 12,000*l.* or 13,000*l.* below that estimate. They had had authority from Parliament to raise 200,000*l.*, and they had raised that sum, but they should

only spend 188,000*l.*, and it was thought advisable to reserve the balance to meet the interest on the loan of 200,000*l.*, already amounting to 5,888*l.*, and other incidental charges. The contract with Messrs. Browne & Robinson was signed on the 22nd of December, 1866, and at that time these gentlemen ought to have had possession of the site, but they did not get possession till some time afterwards, and the last portion was not given up to them until the 26th of March, 1868. They were thus put to great inconvenience, and could not complete their works within eighteen months as they had contracted; and as, in accordance with the provisions of the agreement, they could not be called upon to have the market ready for some considerable time, and as the committee were desirous of having the building finished as early as possible, they had come to an equitable arrangement with Messrs. Browne & Robinson to add the sum of 4,200*l.* to their contract, on condition of their completing the works, and giving possession of the market, by the 14th of November next, and also as some compensation for the increased expense incurred by them from the delay in obtaining the site. The court would see that it was a matter of pecuniary importance to have the market completed as soon as possible.

It was originally contemplated to have cast-iron columns and girders and brick piers; but it was subsequently considered advisable to have the whole of wrought-iron, and no amount of money could be thrown away in a matter of this sort to give strength to the building. To erect a market above a railway station was a thing unprecedented and not to be carried out without great care and consideration; and, as the architect and engineer recommended the alteration, the committee were most anxious to give effect to it. Anticipating the opening of the market in November, the committee thought the ceremony should take place in the most public manner possible; and they were anxious to obtain some person of considerable note to open the market, knowing that when the Cattle Market was opened they had the lamented Prince Consort, who kindly attended on that occasion. Therefore, if the court would leave this matter in the hands of the committee, they would bring up a recommendation which he believed would be acceptable to the members. The report also recommended that the committee should have authority for dismarketing Newgate Market. It was very gratifying that the new market every shop and available space was disposed of and allotted; and they had been obliged to refuse further allotments. At each of the corners there was an elegant refreshment-house for the accommodation and convenience of people frequenting the market, and these also had been let, one at a rental of 470*l.* and the other three at 500*l.* each. The market revenue would be upwards of 40,000*l.* In conclusion, Mr. Taylor moved that the court agree with the committee in their report.

The report of the committee was agreed to.

WORCESTER GAOL ENLARGEMENT.

THE works consequent on the amalgamation of the county and city prisons have been commenced, and will occupy twelve months in the completion. Mr. Rowe's estimate of the entire cost, including purchase of cottages and land in Easy-row, was 10,000*l.* The six cottages to be removed at the north-west angle of the row cost about 1,400*l.*, and Messrs. Wood & Sons' estimate for their portion of the new works was some 5,000*l.* in round numbers. To set against this expenditure, there is the sum received for the site of the old city gaol, so that the total outlay will be under 8,000*l.* The new works will be a continuation and extension of the north-west radiating wing of the old county gaol, and the new boundary wall will extend to the high-way in Easy-row, in length enclosing the space occupied by the six cottages and their gardens. This wall will be of brick, and is to be 23 ft. high, having on its top two courses of loose brick, surmounted by a stone coping. At its north-west end will be an entrance doorway, under a pointed arch, of sufficient width and height to admit of the prison van being driven in and out, for the removal of prisoners without exposure to spectators. The space enclosed by this outer range of buildings forms a large airing ground, in the centre of which will be erected the new block of prisoners' cells. This new block

will consist of a basement and three tiers of cells above, the cells being forty-eight in number. In the basement will be the warming and ventilating apparatus (by Haden, of Trowbridge), also baths, washing places, and store-rooms. The first tier of cells is approached from a central corridor, and the other two tiers by galleries; each cell to be separately supplied with water, gas, means of ventilation, water-closet, and all the other appliances, to correspond with the most modern arranged cells in the old building. The corridor of the new building, being in a straight line with that of the old, will be under the same inspection and control of the officers.

A NEW SYNAGOGUE, ROCHESTER.

THE foundation stone of a new and handsome Jewish Synagogue, which is about to be built and endowed by Mr. Simon Magnus, merchant, Chatham, was laid by that gentleman on Monday, the 5th of October, at Rochester, Kent, in the presence of the mayor, and a large number of spectators. The building and house adjacent for the residence of the Rabbi form an extensive frontage in the High street. The site was purchased from the governors of St. Bartholomew's Hospital, for the sum of 1,500*l.* The new synagogue will be built from the drawings of Mr. H. H. Collins, under whose superintendance the buildings are now in course of construction by Mr. J. G. Naylor, builder, Rochester, and with the sum appropriated for endowment will cost 7,000*l.*, the whole of which will be defrayed by Mr. Magnus.

SEWAGE EXPERIMENTS IN ESSEX.

THE report of the experiments with sewage irrigation made at the Lodge Farm, Barking, by the Metropolitan Sewage and Essex Reclamation Company, for the year ending on August 31, has been presented to the directors by the manager, the Hon. H. W. Petre.

He commences by stating that one-fourth of the Lodge Farm has been during the last two years devoted to the growing of Italian ryegrass. This has been attended with a somewhat less favourable result than last year, as regards the weight of the crop. Whilst, however, the area of grass cut this season was five acres less than last year, and the quantity of sewage applied to the whole farm up to the 20th June this season was 204,000 tons, producing 892 tons of grass, in addition to other produce, the 273,000 tons applied to grass alone last year yielded up to the same date 769 tons only. The value of sewage-grown grass is beginning to be appreciated, and the demand for it now exceeds the supply. In addition to feeding from fifty to sixty milking cows entirely on sewage-grown grass with most satisfactory results, two young steers had been fed exclusively on that grass from 18th May. On 7th August their respective live weights had risen from 7½ cwt. to 9½ cwt., and from 6 cwt. to 7½ cwt. The results of some interesting and successful experiments with wheat, oats, rye, cabbage, and mangold are given in the report. Some experiments on a smaller scale are then given with canary seed, linseed, parsnips, potatoes, sugar-beet, red cabbage, onions, &c., and with great success in all cases, especially with cabbages. Perhaps the most satisfactory result is that with the mangold wurtzel, though quite expected, from the experience of the crop of last year on a smaller scale.

The report contains an account of the cultivation of the rest of the farm, consisting of about 100 acres. On this the only manure applied is salt and the sawdust litter used in the cow-houses and stables. Mr. Petre then institutes a comparison between the sewage and other manures. No amount of ordinary manure, he remarks, could produce six or seven crops of grass in a season, weighing from six to twelve tons each. In the case of mangold, also, the knowledge that two dressings or floodings of sewage, consisting of 200 or 300 tons per acre each, is capable of producing a crop of from 50 to 60 tons per acre, enables a comparison to be drawn with the ordinary crop of 20 to 25 tons produced with a good dressing of farmyard dung. The crop of wheat grown last year without any manure was about 3½ qrs. to the acre; this year the yield with sewage was 5½ qrs. The land is a poor gravel. In conclusion, Mr. Petre says:—"Although, per-

haps, a larger return might be obtained by cultivating only the most profitable crops, it must be remembered that this farm was established with a view of testing the real practical value of town sewage in ordinary agriculture and exhibiting the results, more especially to the farmers of South Essex, the company's future customers for the whole of the sewage of North London, not more than a 350th part of which is used on Lodge Farm in a year."

THE ARCHITECTURAL MUSEUM.

The Council announce the near completion of the premises in Bowling-street, Westminster, and are inviting the subscribers to call and inspect the new home for the collection about to be removed from South Kensington. Much has yet to be done, but they say that nearly the whole of the decorations have been promised by various workers in the architectural arts, who have generously come forward with offerings. It is proposed to open early in 1869. The fund subscribed is now exhausted, and 1,000*l.* more are required to pay the balance due to the contractor.

THE TRADES MOVEMENT.

The whole of the masons in Aberdeen have struck work on account of the masters refusing to continue payment at the rate of 5*d.* per hour. Some time ago the masters, in agreeing to an advance on the then rate, did so on the ground that when the trade got dull the wages would be lowered. Now, when that arrangement was to be put in force, the men would not submit, and consequently struck work. Several masters agreed to the terms sought by the men, and it is believed the strike will not be of long duration.

The Congress of the German working men has taken place at Berlin. Dr. Schweitzer presided, and made a long speech in favour of establishing trade unions throughout the country. He is of opinion that strikes alone will not greatly improve the position of the working men, but that they are useful sometimes, and that the fear of strikes, when once vast combinations have made them dangerous to the masters, will often make the actual strike unnecessary. A violent quarrel arose at one of the meetings, which led to the accession of a large minority. Since then, the latter party has also been holding a series of meetings, and a great part of the time of the rival parties has been taken up with defending themselves and abusing each other. It, therefore, seems not improbable that the result will be the establishment of two opposition central associations, of which the one will adopt Schweitzer, and the other Schulte-Delisch, or at least his principles, for their guidance.

TESTIMONIAL TO A GOOD STEWARD.

Mr. LEWIS KENNEDY having been upwards of fifty years factor upon the estates of Perth, a desire was entertained by the tenantry to express their respect for him in his official capacity and as a private gentleman. That desire took action, and not long ago a meeting was held in Crieff, when the necessary arrangements were made to give the proposal a definite shape. In such cases there is usually a good deal of trouble connected with such a matter, but on this occasion the duties have been comparatively light. The proposal was entered into enthusiastically; the money came in in a stream; and in a marvellously short time the committee had the handsome sum of nearly 300*l.* at their disposal. It was decided that the sum collected should be expended in procuring three fine silver vases; and Mr. G. P. Kennedy, architect, Glasgow,—one of Mr. Kennedy's sons,—prepared by request of the committee of management appropriate designs, which were executed by Messrs. D. C. Rait & Sons, jewellers to the Queen, Glasgow. The presentation took place last week at Crieff.

The chairman of the meeting, in handing the vases to Mr. Kennedy, said, "Mr. Kennedy, some fifty-two years ago, came to this part of the country for the purpose of laying out the far-famed Drummond Gardens. These gardens are the pride of our parish, for they have gone far to

make Crieff a favourite resort for health and pleasure-seekers; they have feasted the eyes of many a visitor, from many a country, and of all ranks, from our beloved Sovereign downwards. With regard to the tenants, Mr. Kennedy was always their true friend, ready to mix mercy with justice. He could not be expected to give the tenants all they wanted, but was ready to give them what was just. So far back as I can remember, in drinking his health on a rent-day, the remark was always made, 'He is a very honest man,' and we all know what Robert Burns says of such a man." Mr. G. P. Kennedy also came in afterwards for a share of praise.

LORD MAYOR'S SHOW.

A CORRESPONDENT, "P. E. M.," writes,— "Considering how very rarely we have anything like a public show or ceremony, I, for one, shall be very sorry for the time-honoured Lord Mayor's Show to lapse into desuetude. The innocent enjoyment of the common people ought, I think, to be considered by those in authority, a little. The great objection made to the usual procession is the stoppage of street traffic. But now that the Thames Embankment is open, affording accommodation for many thousands, why not reintroduce water processions, which would not be open to the objection named? Such might be made eminently showy and graceful, and interesting even to people of refined taste. I hope the Lord Mayor elect will look round on his architectural acquaintance, and see if he cannot find a worthy successor to Inigo Jones in the designing and getting up of a fitting and appropriate water pageant for the approaching Lord Mayor's Day, something which shall be had in remembrance in years to come. I hope the matter, Sir, will have the aid of your advocacy!"

The retention of the show has always had the aid of our advocacy. The abandonment would be a matter for great regret. Some years ago, when Alderman, afterwards Sir John, Muggrove had been elected to fill the office, we published some suggestions for the improvement of the Show, which had a wide currency at the time. We hope Alderman James Lawrence will not aid in diminishing the ceremonial. It has its value even beyond affording amusement and matter of interest to many thousands of persons not too constantly supplied with it,—not a trifling thing itself.

SIR DAVID WILKIE'S LETTERS.

SIR,—My attention has been called to the *Builder* of August 15th, in which are published some letters from Sir David Wilkie to my father. I beg leave to correct a statement which is not exact. The portrait was not "painted unknown to him."

I well remember going over many times with my father to Phillimore-place for the sittings, at which I was present. It was never quite completed, the hands not having been finished.

I have no doubt that the letters came into your possession in a legitimate manner; but some one, through whose hands they have passed, has obtained them surreptitiously.

The letter dated January 10, 1826, in particular, was not to be found, though anxiously sought for after my father's death, when I printed his "Autobiography," for private circulation. I thought it had undergone the fate of many valued papers, and had been used by the cook to light her fires. It seems it had a different fate. M. T. S. RAINBACH.

THE ESSAYS ON THE TEMPORARY EMPLOYMENT OF OPERATIVES.

SIR,—Although I believe most people will agree that competition is the most efficacious way to bring out latent talent and encourage advancement by the offer of money,—that passport by which man calls his fellow-creatures to his assistance,—yet I cannot but think that the benefit which may be derived from it is only felt when aided by the press.

Reading from time to time in the *Builder* your description and criticism on the merits and demerits of the various plans submitted in any important competition, I have observed how many you favour with your notice,

although only one perhaps can gain a prize; thus extracting and bringing to light for the benefit of all whatever is meritorious and ingenious in the labours of those gentlemen who had devoted their time and thoughts in endeavouring to obtain excellence in what they had undertaken; and nothing, Sir, can be more certain than that your criticisms are most beneficial to those who compete, and are highly valued by all.

There has just been competition upon a most important subject at the Social Science Congress, viz., "Employment during Casual Distress." I understand nearly eighty competed, and circumstances lead me to believe that some of the papers were by men occupying such a social position that some bright thought or useful piece of information would be sure to be gleaned from them. But, as in a written paper only the one gaining the prize is made public, would it not be well to invite those gentlemen to publish together their papers, that no useful thought or calculation once conceived should be lost to the science of economy? And I must say I consider that the Government should become fully acquainted with every circumstance which could be brought to bear on the subject of unemployed labour, that they might take the initiative in whatever is done.

I understand that the competitors have had their papers returned, and therefore this course would not interfere with the rules of the association. R. F. D. C.

THE CONDITION OF BIRMINGHAM.

SIR,—My attention has been called to a statement made by Mr. Godwin in the Health Department of the Social Science Congress. The statement alluded to was to this effect: That aided by the police, he (Mr. Godwin) had visited a certain district, including certain streets mentioned by name, situated in the centre of Birmingham. The state of the district he thus sums up:—

"In more than three-fourths of the whole of the streets in the district he visited he found houses tumbling down, no floors, no windows; floors torn up, pavements retaining decaying matter, and of a character always retaining; an utter want of closest accommodation. In Balloon-street he found back-to-back houses, the rooms full of people, and the middens all full. In No. 6 Court, Brick-kiln-street, the neighbouring cesspool of the court was some 3*ft.* higher than the pavement of the court; and the consequence was that the filth was constantly oozing through, and spreading over the floor of the court. The first woman he inquired of in one of the courts had three children living, and she praised the locality as being very healthy. Then he elicited from her that she had five children dead. Next door the woman had no children dead, but her husband, she added, had been invalid for many months. In a court in Blauforth-street, an open cesspool was to be seen—that is, the closet ran into what was prepared to be a midden, but, being never so used, was simply filled with fecal matter. Here, again, there was the same appearance on the part of the children—pale faces, sunken eyes, women worn and haggard, and throughout the whole of the inquiry he did not meet with a single child who was able to read. Here, then, was what he brings before you, point out to the authorities of Birmingham—an enormous population, living under conditions utterly opposed to anything like health. Whether any attempts were made to remedy this he could not say, but, as any rate, they must have been very insufficient. He could go through a large number of similar cases, but he did not think it necessary. Here, in these wretched districts, were growing up, in ignorance and dirt, girls and boys, with no other prospect than the streets for the one and the goal for the other. Where, he asked, had been the ministers of the Church? Where had been the clergy?"

As the above statement refers chiefly to my parish, in which the streets named are situated, I trust to your courtesy to allow me a word in reply. In the greater portion of Mr. Godwin's statements I most thoroughly agree. The state of Balloon-street, Brick-kiln-street, Hen-street, and a portion of St. Andrew-street is truly wretched, and many of the houses almost unfit for human habitation. But Mr. Godwin asks, "Where have been the ministers of the Church?" "Where have been the clergy?" I am afraid the poor clergy have sometimes rather a hard card to play. If they do not interfere, for instance, in sanitary matters,—more properly the business of the lay authorities,—they are brought to book. If they do interfere, they are going out of their province, and had far better confine themselves to spiritual matters, and leave all secular work (education, perhaps, included) to the laity. However, as I look upon education as an integral portion of a clergyman's work, and consider the preservation of its religious character indispensable, I will venture so far to inform Mr. Godwin that the educational necessities of the parish have not been overlooked. In addition to the ordinary school departments, there has been in

existence since 1861 a ragged school, twice enlarged to meet the exigencies of the case. There are four large principal school-rooms and five class-rooms, and there were present in the day and night schools, in July last, at H.M.'s Inspector's examination, 1778 children. This is, of course, independent of the Sunday day and Sunday night schools; and I may further say, so strong is my sense of the deep need of that portion of my parish alluded to by Mr. Godwin, that having at length secured the old police station in Staniforth-street, the erection of a large new ragged and infant school will be commenced (D.V.) within ten days, although after troublesome bargaining, I still require over 700*l.* of the estimated sum for the purchase of the site and erection of the school. I may honestly say, I do not think, considering the wretched poverty of the parish, and the difficulty of obtaining money, more could have been done than has already been effected in an educational point of view.

I trust to be able to open the new school (D.V.) in the first week of January next.

With regard to the sanitary aspect: It has long been my wish to erect a row of model labourers' dwellings, and lodging-houses, both in the neighbourhood of Balloon-street, and also in Old Cross-street and Vauxhall-street. I have mentioned the matter frequently to several laymen in the town; but the great impediment—money—still stops the way. However, I do not despair. Of one thing I am satisfied, from a long service in poor parishes, that the generally wretched character of the dwellings of the poor, the absence of refining influences, and the miserable associations of poverty-stricken homes, courts, and streets, tend much to the inhumanising influence which, destroying the finer susceptibilities and blunting the better feelings of the heart, generally results in brutality and crime, a family plague, and a social curse. Of the incalculable injury to health and physical well-being it is, perhaps, not my province to speak.

May I also add, in reply to Mr. Godwin's question, "Where are the clergy?" one word on their behalf. The statistics of the educational bazaar will abundantly show that, in spite of many difficulties, the clergy have steadily pushed forward in the great educational work of the country. Conscious of its necessity, they have spared neither labour, anxiety, nor money in its prosecution, and they alone who have been engaged in the work can form any adequate conception of the difficulties which attend it. I am sure Mr. Godwin, when the facts of the case come under his notice, will kindly withdraw the reflection he has hastily cast upon me, and believe not only of me, but of my brethren the clergy of Birmingham, that we are, one and all, most anxious and earnest in our efforts to provide a good, sound, and cheap education for the working classes of the town.

J. HART BURGESS, D.D.,
Vicar of Bishop Ryders.

CONCRETE BUILDING.

SIR,—In the *Builder*, page 699, *ante*, a notice is given of certain patented improvements in concrete building; and, in justice to the building public, as well as to the patentees, I am desirous of pointing out that in each of the sections described as "first," "secondly," "fourthly," and "lastly," there is no novelty, nor anything that has not been in use previously to the date of the patent. Therefore, it is needless to attempt to claim a patent for them. From July to December, 1867, being at the time manager to Mr. Tall, I made a great many specimens of concrete, to show to persons interested in the matter what it was possible to do in concrete building. Some of these specimens had the fine concrete face cast on; some had the triangular and other shaped recesses; and some the ornament in relief. Several of the specimens were exhibited at the Architectural Association, December 6, 1867, and are mentioned in a printed paper. The casting of concrete cornices, caps, string-courses, cills, &c., in place, is notoriously old. As the son of a builder who was very partial to the use of concrete floors, skirtings and hearths, chimney-pieces, and cills, they are among my first recollections. Indented string-courses were designed by Mr. T. Hayter Lewis for some cottages now building at Staplehurst; and string-courses, cornices, &c., indented and in relief, were designed by Mr. G. Woodhouse, architect, of Bolton, for a large school now building with my patent apparatus. The

use of T-iron for concrete chamber floors and roofs is also old.

As to section "thirdly," there is nothing in the notice to enable me to judge of its merits. However, if the patentees will take the trouble to make inquiries, they will find that my statement as to the other sections is accurate.

CHAS. DRAKE.

SIR,—I beg to bring to your notice the partial (I am afraid it will turn out to be total), destruction of a large house building in the above material, at St. Margaret's, Twickenham (see *Builder*, 19th September last, page 639). The walls, 12 in. thick, have been carried up to a height of about 35 ft. The whole of the front wall of one wing from top to bottom, with all its window and door frames, and a portion of the side wall, have fallen down, and are now a heap of ruins, with dangerous cracks in other portions of the building. There has been much talk lately about this kind of work, and I trust that the cause of this failure in a material of which we were beginning to have some faith, will be fully explained.

WILL WATCH.

SIR,—I write you a few facts respecting my block concrete system. I have erected at West Bank, New Hampton, Middlesex, a pair of houses. I claim,—first, my walls are totally free from moisture; secondly, my blocks will stand the fire, which may be seen of the house that has been burnt out at Northfleet, leaving all the walls and chimney now standing which I built some time ago; thirdly, I will guarantee to build and complete a pair of houses, that is to say, if all my blocks be ready before I begin laying them, with two layers, and complete the whole then.—Build all walls, slating, plastering, stoves, copper, fit for habitation within one month with ease. In my block system the walls contain nothing but gravel and cement, showing in blocks on the face of the work the natural material itself, saving the cost of and requiring no plastering ever afterwards. Some have said that the block system is as dear as brickwork. I differ in opinion, as the following item will prove to you of one day's practical test:—

Thus, in casting my blocks of September 12th,—

	£	s.	d.
One man preparing gravel	0	3	6
Two men making blocks	0	7	0
One man laying down moulds ready to fill up	0	3	6
One cast of Robins's Portland cement	0	7	0
Total cost	£1	1	6

Number of blocks made, 424 in nine hours, being equal in bulk to 3,392 stock bricks. Compare the cost for bricks and my blocks, which proves its economy to you at once. I am using Hobias & Company's Portland cement for making my blocks, and I advise your readers, if they think of employing concrete, to use it. First, you can depend on its durability; secondly, it will set like a mass of rock in a very short time.

W. MAX, JUN.

GLAZING.

SIR,—I have an iron skylight glazed with glass, 1 in. thick, 63 in. by 23 in., the squares of which are all broken by the contraction and expansion of the metal. They were bedded in putty, and the skylight had an iron capping fitting on the rebates, but not touching the glass, the space between being filled up with putty. I should be obliged if some of your readers who have experience in the matter, would suggest a plan by which the leakage may be prevented. Would a thin layer of wood or cork prevent the damage?

B. P.

WASH THE HOUSES.

SIR,—You have frequently drawn attention in your columns to the neglect of sanitary matters by the St. Pancras authorities, and you should let your readers know that during the late hot weather, a suggestion made in your columns, viz., washing the exterior of the houses in the many courts and alleys, by means of stand-posts with a hose attached, was carried out. In the East, or Somers-town district, alone, fifty-six confined and densely populated courts have been repeatedly flushed, much to the comfort of the poor inhabitants, and amongst the number—

A WORKING MAN.

LIABILITY OF SUB-CONTRACTORS FOR WAGES.

AT Worship-street Police-court, Messrs. Browne & Robinson, builders, of Worship-street, were summoned by James Vesoh, a bricklayer, for the sum of 1*l.* 13*s.*, wages due for work and labour done for them. The complainant stated that he was engaged by a man named Elliot, who was pointed out to him as being the foreman of some works being carried on in St. John-street-road, Clerkenwell, and to whom he had applied for work, as a bricklayer, at 8*d.* an hour, to help to run up a brick wall. On Saturday, the 10th, there was owing to him 1*l.* 17*s.* 6*d.*, of which he received 1*l.* from Elliot, who stated that he could not get him more, as the firm (Browne & Robinson) had not sent him enough money. He went to Messrs. Browne & Robinson, and was informed that Elliot was a sub-contractor, and therefore liable. In answer, it was contended that the contractors were not liable, inasmuch as they had underlet their contract for this particular work to Mr. Joseph Elliot, who had

failed to carry on the work, and had overdrawn his accounts. A stamped agreement between Elliot and Browne was handed up to the magistrate.

Joseph Elliot, builder, Merton, Surrey, was produced, and he swore to the agreement. As a sub-contractor he had engaged the complainant, gave him directions, and set him to work. He was not able to pay the men on the 26th, as Messrs. Browne had only sent him 10*l.*, with which to pay 2*l.*

Mr. Newton said that being so he had no course left but to dismiss the summons.

PAINTING HOT-WATER PIPES.

SIR,—Some few months ago I read in the *Builder* (I think), of a material for colouring or painting iron stoves and hot-water pipes, that would stand the heat, and would not throw off the disagreeable effluvia arising from ordinary oil paint, Brunswick black, or Japan varnish. It was, if I recollect right, composed of water-glass, mixed with lamp black, or other colouring matter. Can any of your correspondents inform me what the materials are, how and in what proportions they should be used, and where they are to be obtained?

A SUBSCRIBER.

RESPIRATION.

ACCORDING to the most reliable experiments, a man makes sixteen respirations per minute, and he draws into and expels from his lungs 30.51 cubic inches of air at each respiration, consequently the quantity of air that he respire per minute is equal to 488.16 cubic inches. The expired air contains 4.6 per cent. of carbonic acid; and, as the atmosphere consists of one-fifth by volume of oxygen, four-fifths of nitrogen, and .04 per cent. of carbonic acid, the quantity of the different gases that a man inhales and exhales per minute, is exhibited in the following table:—

A Man inhales per Minute		A Man exhales per Minute	
Gases.	Cubic Inches.	Gases.	Cubic Inches.
Oxygen	97.5020	Oxygen	77.1852
Nitrogen	393.3728	Nitrogen	393.3728
Carbonic acid ...	0.1952	Carbonic acid ...	20.5929
	493.1600		488.1600

JOHN PHILLIPS.

PROVINCIAL NEWS.

Kettering.—The contract for the erection of a new banking-house and manager's residence for the National Provincial Banking Company, to be built on the site of the late Three Crows Hotel, in Granby-street and Horsehair-street, from a design and plans by Messrs. Mallicott & Smith, of this town, architects, has been taken by Messrs. Osborne, Brothers, masons, &c., of Leicester. The style of architecture adopted is a mixture of Classic and Elizabethan.

CHURCH-BUILDING NEWS.

Churchill.—A new church, built on the site of the old parish church of Churchill, has been consecrated by the Bishop of Worcester, and opened for divine worship. Mr. W. J. Hopkins prepared the plans, and the work has been executed by Mr. Warner, of Malvern. The edifice is in the Early Decorated style, and is built of dark red sandstone, obtained from a quarry on Lord Lytton's estate. It consists of chancel, nave, and tower, the latter of which it is hoped at some period to add a spire. There are tracery windows to the chancel and nave, and on the one side they are of varying sizes. The chancel roof is panelled, and the nave has an open-timbered roof. There are sittings for about 120 persons in the church. The cost is 1,800*l.* The length of the church is 73 ft., and the breadth 22 ft.

Hednesford.—A new church has been consecrated here. The building is of stone. It is in the Early English style, is plain, in parts almost to baldness; but the design is only partially carried out, provision being made for a tower at the west end, and the pillars and arches for a north aisle have been built and enclosed with a thin wall, which, on the addition being made at any future time, may be readily removed. The chancel has a semicircular termination. There is a south transept for the children, and the building will seat 500 persons. The inside of the walls as well as the outside is of smoothed

stone. The cost of the structure (exclusive of the site, which is given by the Marquis of Anglesea) will be about 3,000. The architect was Mr. W. Rushworth, of London; and the builder Mr. M. Anderson, of Cannock.

Boughton.—The new church and the addition to the graveyard have been consecrated by the Bishop of Lincoln. The new church is built of Steely stone, with ashlar of Ancaster stone. The interior is faced with red brick, handed at intervals with stone and black bricks. The style of architecture is Early Geometrical. The builder was Mr. Hopkinson, of Retford. The church will seat 200. The architect was Mr. Fowler, of Louth.

Hyde.—St. Thomas's Church, Hyde, has been consecrated by the Bishop of Chester. It is very simple, both in general arrangement of plan and in details. There is accommodation for 600 people, on the ground-floor and in a small west-end gallery, for the sum of about 2,300. The walls are built and faced with rubble stone of the place, pointed on the outside. The coigns, cornices, strings, and more ornamental parts are of red stock-bricks, the colour of which contrasts with that of the rubble walling. A little ashlar stone is used where constructionally needed. The principal entrance is through the west door. There is a wooden porch, the inner doors of which open into the central passage of the nave. The nave is 72 ft. by 43 ft., divided into five bays by timber-framed principals: it is 40 ft. high. The chancel is 26 ft. by 20 ft., and not quite as high as the nave. The north chancel aisle opens by wide arches into chancel and nave, and will contain the organ. The western bay of the nave is galleried. The gallery-stairs are on the south, and the font on the north side of the west porch. The seats are low open benches. The chancel has longitudinal stall-like benches. The glass is arranged in different forms and devices. The east window has a floral ornament and a little colour. The whole of the walls are covered with a warm tint. The windows, arches, &c., are also brought out in different tints from that of the wall. The east wall of the chancel is decorated in colours and gold, by Mr. R. Park, in devices designed by the architects. The belfry, which surmounts the west gable, is of moulded brick and stone. The bell, cast by Mears, has the motto "*Cum voco venite.*" The churchyard is surrounded with a wall of brick and stone. The builders were Messrs. J. Robinson, of Hyde; and the architects Messrs. J. Medland Taylor & Henry Taylor, of Manchester.

Cornforth (Durham).—A new church, dedicated to the Holy Trinity, has been consecrated at Cornforth, near Durham. The edifice is built from plans by Mr. Pritchett, of Darlington, the estimated cost being about 2,000. It holds about 300 persons.

Manchester.—The additions to St. Oswald's Church comprise a tower and spire, which has just been completed. The tower is divided into four stages, with buttresses at each angle, with canopied heads. The tower is faced with Yorkshire parapets with ashlar dressings. The spire is of dressed ashlar with gurgoyles at the springing of broaches, with ornate lucarnes, and relieved with bands of Runcorn stone, terminated with gilt vane, rising to the height of 150 ft. The outlay is 1,300. Messrs. Ellis & Hinchcliffe, of Manchester, were the contractors, and Mr. J. Lowe, Manchester, the architect.

Patricroft (Manchester).—Christ Church, patricroft, has been consecrated. It is in the Early English style, and comprises nave, 82 ft. by 30 ft., with north and south aisles; chancel, 30 ft. by 20 ft., with stalls for the choir, with vestry and organ-chamber adjoining. The chancel is laid with encaustic tiles. The principal entrances are at the west end. The nave has an arcade of six arches of moulded bricks of varied colours, with pillars of Mansfield stone and carved caps of Bath stone, which support the lofty clearstory. The roof has open-framed principals of high pitch. The west elevation is pierced with a large circular window, and from the gable springs a lofty belfry, terminated with a gilt cross. The pulpit is of Caen stone at the north-west angle of nave. The font is near the west entrance. All the seats are open stained and varnished. The church is faced externally with Yorkshire masonry, relieved with bands, &c., of different colours. Accommodation is provided for 600 persons, of which 318 are free. The works have been executed by Mr. Southern, of Salford, at an outlay of 3,900, under the direction of Mr. J. Lowe, architect, Manchester.

Exeter.—The Church of St. Michael and All Angels, which has been erected at a cost of 20,000, and is the gift of Mr. W. Gibbs, of Tyntesfield, Somerset, formerly of Blamhead, has been opened. In addition to this gift, and an endowment of 80*l.* a year, Mr. Gibbs has built a school-room, near the Church of St. Michael's, for the boys of the parish, and also a vicarage-house; he has also built a chapel of ease at Cowley Bridge. The new edifice is in the Gothic style of the Early period. It will accommodate 650. The east window cost 650*l.* The organ cost 800*l.* The church is built of Westleigh stone, with Hamhill dressings. The spire overtops everything of the sort in the city or neighbourhood; the entire height is 233 ft. It is a pretty close imitation in style of the spire of Salisbury Cathedral. It has a hell weighing over a ton.

Bedale.—Several improvements have recently been made in the interior of Crakehall Church. It was formerly, in many respects, one of the most mean and squalid churches in the diocese. The chancel and sacristy are laid with encaustic tiles, and the latter guarded by a rail. There are a new prayer-desk and pulpit, lectern, and choir seats. The woodwork is light and open, and has been well carved by Mr. C. Palliser, of Northallerton. The lectern and communion rails are by Jones & Willis, of Birmingham. The altar furniture, hangings, &c., are by Browne, of Manchester. The architect employed was Mr. G. T. Jones, of York.

Norton.—The foundation-stone of the new chapel about to be erected in the parish cemetery at Norton has been laid. The plot of ground secured is 6*l.* acres in extent, and cost 2,000*l.* It is situated on an elevation in Derbyshire-lane. It is intended to consecrate only about two acres at present. Messrs. Flockton & Abbott, of Sheffield, are the architects of the chapel, and the builder is Mr. John Camm, of Norton. The chapel, which will be Gothic in style, is to be built of stone from the neighbourhood, faced with Burbage and Grenoside stone. It will be 30 yards by 20 inside.

Bewdley.—The church of St. Leonard, Ribbesford, has been re-opened after some considerable repairs and partial restoration. It is well known to archaeologists as presenting an open arcade of timber work in pillars and arches in the nave; but several discoveries have been made: for instance, the flat framing stones in the lintels of two windows (having been denuded like the rest of the building of a coating of rough cast and whitewash, and restored to the original pale cream of red sandstone), prove to be carved in an original pattern; the door of the roof-turret, marked by a buttress, and its newel staircase, the base of the roof-loft, and two niches in the east wall of the south aisle have been found. The latter are deeply recessed: one probably held the death-light for the cemetery, like one in a somewhat similar position at Ashford: the other may have been used for a similar purpose. It retains red colouring in distemper powdered with crayons of five points, like those worn by saints in Mediaeval illuminations, and on one side a fragment of the upper lid of a diminutive coffin of the fourteenth century date, with the words "*Ben Henri*," in Lombardic letters, and a flowing ornament, has been built into the south jamb. The trefoiled waterdrain of the lady chapel, at the east end of the north aisle, has been laid open, and like the two canopied niches, supporting like corbels, the wall plate of the roof coloured in distemper. Several texts of the early part of the seventeenth century have been retouched. The pulpit has been lowered, the "three-decker" replaced by an open reading-stall. The whitewashed ceiling has given place to open woodwork. The sanctuary has been lined with old carved oak, and the Jacobean credence-table is once more, after long disuse, placed on the north side. The "horse boxes" and "pens" in the nave are abolished, and additional room obtained for the congregation. Mr. Baker, of Kidderminster, was the architect employed. The Rev. Mackenzie Walcott (cousin of the rector) is, we are informed, the gentleman to whom the restoration is due.

Hanford (Staffordshire).—The old church at Hanford has been reopened for divine service. The old edifice having for some time been in a dilapidated condition, and quite inadequate to accommodate the increasing congregation, was pulled down last year, with the exception of the chancel, which had been rebuilt and enlarged. The rest of the church has now been entirely rebuilt, and the number of sittings increased from 200 to 450. Its plan comprises a nave

67 ft. by 21 ft. 4 in.; north aisle 67 ft. by 8 ft. 8 in.; south aisle, 61 ft. by 8 ft. 8 in.; a south porch, a gallery at the western end of the nave capable of holding seventy children, a vestry to the north side of the chancel, and a bell-turret at the north-west corner of the south aisle. The nave is of five bays, and has a clearstory. The whole of the building is of the most simple character. The walls are of plain red bricks, faced with the same, both externally and internally, stone-work only being employed sparingly, as a frame for the glazing of the windows. The constructive timbers of the roof are all exposed to view internally, and the ceilings are formed between the rafters. The arcades of the nave have cylindrical piers with stone caps and bases very plainly moulded, and blue brick shafts. These bricks are made for the purpose and set in cement. The arches are of brick, chamfered on the outer edges, and have keystones. The passages in the floor are paved with Minton & Co.'s plain square tiles, and the spaces where the benches are placed are boarded. The glazing throughout is fixed in lead lights, in varied patterns, and is of crown glass, slightly relieved by the introduction of green-tinted patterns. The nave is fitted with new open benches, and the aisles with the benches of the former church. The gallery has new seats for children, and the chancel new stalls for the choir. The pulpit has been refixed on the south side of the nave, and the prayer-desk on the north side, and a new lectern has been provided. The font is the gift of the architect, and is constructed of blue and red bricks put together with cement, the bowl being lined with lead. The amount of the contract was 900*l.*, exclusive of the benches, gasfittings, and heating apparatus. Mr. Alfred Barlow, of Stoke, was the builder; and Mr. Charles Lynam, also of Stoke, the architect employed.

DISSENTING CHURCH-BUILDING NEWS.

Derby.—The memorial stone of the United Presbyterian Church at Derby has been laid. The building occupies a site at the junction of Green-lane and Gower-street. The plan is arranged to accommodate about 500, with minister's vestry and session-room, heating chambers, and other offices in the rear of the church. The style of architecture adopted is English Gothic of the thirteenth century, and the material for the walling externally is white Coxhean stone, the window tracery being of fine Hollington stone. The principal front towards Green-lane has a high pitched gable, containing a five-light window, with tracery geometrical in design, and is flanked on either side by the entrance porches. The doorways to these have moulded arches supported on shafts, with moulded caps and bases. Between the centre gable and the north porch an ornamental spire rises to a height of 70 ft. The front next Gower-street is divided into five bays, the easternmost bay projecting as a transept, and containing a two-light traceried window. Each bay in the body of the church contains a couplet of cusped-headed lancet windows. Internally the church is divided into nave and side aisles by two rows of light iron columns supporting the arched ribs of the roof. The ceiling of the roof is divided into panels by timber ribs, stained and varnished. The contract for the building has been taken by Messrs. T. & H. Herbert, of Leicester, at the sum of 2,150*l.*, and the works are being proceeded with. The architect is Mr. J. Tait, of Leicester.

Bristol.—The chapel which has been erected by members of the Baptist persuasion, just beyond the site of the old White Ladies' turnpike, has been dedicated to public worship. The building is from the plans of the late Mr. S. Hancorn, of Bristol and Newport, architect. The design is in the Decorated style of Gothic, and includes the chapel, with transepts; vestibule, with two lobbies; open porch; chancel, with baptistry underneath, and organ recess on one side of the same; minister's and deacons' vestries and private entrance; ladies' vestry, with private entrance. An end gallery is erected over the vestibule and lobbies, with stone staircases. A tower is included in the design, but it has as yet only been carried high enough to receive the stairway therein. The chapel is lighted with five three and two light traceried windows, of cathedral glass, in two tints. The walls of the chapel, internally, are stuccoed, and the elevations are faced with Pennant stone in random

ranged courses, knick pointed. The floors of the vestibules and lobbies are paved with encaustic tiles. The chapel is heated and ventilated by Messrs. Haden, of Trowbridge. The work has been done by Messrs. Marquis & Munroe, general contractors; Mr. Tuckey, plumber; Mr. Gay, glazier; Mr. Leman, smith and gasfitter; Mr. Rice, staining and varnishing; Mr. Marjotson, stone carving; and Mr. Houghton, wood carving. The expense incurred has been about 7,500l.

Books Received.

A Manual of Practical Assaying. By JOHN MITCHELL, F.C.S. Third Edition: Edited by WILLIAM CROOKES, F.R.S., &c. London: Longmans, Green, & Co. 1868.

The first edition of this almost standard work was extensively sold, and a second edition followed. The rapid progress of science soon renders a metallurgical work antiquated, and it therefore became necessary to rewrite some parts of the work and modify others. This has been done by a highly competent and able editor, Mr. Crookes, who in this third edition has incorporated all the late important discoveries in assaying made in this country and abroad. Most of the chapters are entirely rewritten. The old equivalents, however, are retained, as they are more generally understood by students of science who do not make chemistry their chief study. Special care has been devoted to the blowpipe assays, as well as to the important volumetric and colorimetric assays; but the chapter on crystallography is left out altogether, as a subject only remotely bearing on assaying. The work may well be said to be far better than ever it was.

Miscellaneous.

OLD PAVING.—A contract has been entered into with the city of Paris to buy up all the old paving stones for the purpose of shipping them across the Atlantic, where they are to be used to pave the principal thoroughfares of Buenos Ayres and Monte Video.

FATAL FALL FROM A HEIGHT.—A labourer of Bradford, employed at Heaton, in a stone quarry, was engaged wheeling a loaded barrow along a plank, which spanned a deep chasm of the delph, when he lost his presence of mind, became dizzy, and fell off the plank, the barrow falling on one side and he on the other. He alighted on his head, which was fractured, the depth of his fall being 24 ft., and was killed on the spot. The coroner's jury gave a verdict of "Accidental death."

COMPLETION OF THE GREAT RAILWAY BRIDGE ACROSS THE MERSEY.—The deviation line from Ditton, in Lancashire, to Dutton, in Cheshire, on the London and North-Western system, is seven miles and a half long, and has been in course of construction since 1863. In this length is included the stupendous iron girder bridge across the river Mersey at Runcorn. It consists of three spans of 305 ft. each, besides four arches, which rise out of the bed of the river on the Lancashire side. The bottom of the bridge is 75 ft. above high-water mark, and in order to attain this elevation, which was necessary to keep unimpeded the navigation of the river, viaducts have had to be erected on both sides, and in these are no less than ninety-four arches. The whole line has cost 250,000l. Messrs. Cochrane, Grove, & Co., of Dudley, are the sub-contractors for the bridge, under Messrs. Brassey & Ogilvie, who accepted the contract for the whole line. A footway runs alongside the bridge, supported on cantilevers, and this has been opened so that the many inconveniences of the old ferry are done away with. The line itself will, it is expected, be opened for traffic early in December. It will save between nine and ten miles in the journey between Liverpool and London, which it is intended to accomplish in a little over four hours. The carriages for this special service will be built somewhat upon the American principle, for which we have so long contended while trying communication between guards and passengers, through a passage up the centre, and they will be provided with retiring-rooms for passengers. Arrangements, we are informed, will also be made for the supply of refreshments during the journey.

LIVERPOOL ARCHITECTURAL SOCIETY.—The members of this society held their first sessional meeting of the year at the Royal Institution, Colquhoun-street, on Wednesday night, the 7th inst. The opening address was delivered by Mr. Francis Horner, the president, who referred to some of the most important questions occupying public attention in reference to science and the fine arts.

THE TIMBER TRADE.—Messrs. Barnes & Sons' circular says:—"Our market continues to improve in tone, and there is not that entire stagnation we had to report a few months since. The importation compared with the corresponding month last year is 6,074 tons register less, and for the year to this date 6,681 tons less. This deficiency is on the following descriptions, viz., Quebec about 4,000 tons, St. John's and New Brunswick 6,800 tons. But the increase on Baltic goods and United States timber is sufficient to reduce the total falling off in importation for the year to 6,681 tons. Canadian woods: The demand for pine timber is dull. Baltic goods: There is a good supply of Memel timber, but the stock of Swedish is light. Pitch pine timber, &c. The stock is large, the demand continues dull. Mahogany: the supply is equal to the demand."

TELEGRAPHS IN THE SUBWAYS AND SEWERS.—At the last meeting of the Metropolitan Board of Works it was stated that, in reply to a communication from the Postmaster-General with reference to the Board's subways and sewers being used for receiving the wires of the Post-office telegraphs proposed to be constructed, the Works Committee submitted a letter stating that it would afford them great pleasure to assist the Postmaster-General in any way, and with that view had prepared a plan of the Board's subways and sewers. Mr. Collinson moved that the letter be approved. He considered that it would be a great convenience to have the telegraph wires in the subways, as it would greatly facilitate the transmission of messages to and from the Fire Brigade stations, and would get rid of the telegraph wires which London was now disfigured. The motion was unanimously carried.

THE TENDERING SYSTEM.—At a recent meeting of the Metropolitan Board of Works reference was made to the proceedings of contractors. At the previous meeting of the Board tenders were opened for the construction of a sewer in the Belvedere-road, Lameth, and one of them being lower by 20,000l. than some of the other tenders sent in, it was accepted, subject to the usual inquiries. The surveyor now reported that the gentleman whose tender had been accepted at the previous meeting had since withdrawn. The next lowest tender was that of Mr. Pearson, which amounted to 26,900l. A lively discussion took place respecting the contracts of the Board, in the course of which the conduct of the contractor who sent in a tender 20,000l. less than one of the others, and afterwards withdrew without explanation, was remarked upon. The result of the discussion was the formal approval and acceptance of Mr. T. Pearson's tender.

THE NEW NORTH STAFFORDSHIRE INFIRMARY.—This building, which has been erected at Harts-hill, near Stoke-on-Trent, and the foundation-stone of which was laid by the Prince of Wales, in June, 1866, was informally opened on the 6th inst. The total cost of the new infirmary, including site, &c., is 33,704l., and towards this sum 23,951l. have been already obtained, and there are assets estimated at 5,573l., leaving a deficit of 4,180l. The removal of the infirmary has been caused by the deterioration of the present building through undermining, and the injurious effects of ironworks and ironstone calcination in the immediate vicinity upon the patients, rather than by the want of a larger establishment, although more room was required, and has been for a long time. It has been built, at a cost of 27,000l., by Mr. Alfred Barlow, of Stoke-on-Trent, from the combined designs of Mr. C. Lynam, of Stoke-on-Trent, and Mr. Nicholls, of West Bromwich. The pavilion principle is adopted by the architects, and the main building will afford room for 167 beds, 1,500 cubic feet of air being allowed for each patient in the ordinary wards, and 1,875 cubic feet in the "special cases" wards, and in the fever hospital, which forms a detached block. Another separate building is an asylum for incurables, founded by Mr. Smith Child, at a cost of 1,000l.

ARCHITECTURAL ASSOCIATION.—The opening conversations will be held at the House in Conduit-street, on Friday evening, the 30th inst.

NEW TOWN-HALL, MANCHESTER.—The first stone of the proposed new building is to be laid by the mayor, Mr. Robert Neill, on Monday, the 26th inst.

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.—The visitors during the week ending Saturday, the 10th day of October, numbered, by season tickets, 5,296; by payment, 21,563, making a total of 26,859. Very little time now remains for those who would visit this important collection of works of art.

OPEN SPACES IN LONDON.—Mr. J. Runtz, a member of the Metropolitan Board for the Hackney district, stated last week, at the meeting of the Hackney district board, that the committee of the central board, to whom the matter of the preservation of open spaces in and around London had been referred, had prepared a scheme for the enclosure of Blackheath, and were giving every attention to the general subject. He counselled the committee of the Hackney district board, to whom had been referred the question of the preservation of London-fields, Hackney Downs, Hackney Common, &c., to arrive at some early conclusion as to the course they would wish to be adopted, and then to press upon the Metropolitan Board the bringing in of a scheme founded thereon. The committee, it was stated, would shortly commence active steps with this view.

THE SHEFFIELD WATER SUPPLY.—Extensive operations are being carried on in the neighbourhood of Bradfield, where four great reservoirs are in various stages of completion. The reservoirs are the Agden, the Strines, the Dale Dyke, and the Dam Flask, all made on the streams which converge in the Loxley, and all constructed on the principle of blocking up a valley by a great embankment. The Agden is on the point of completion. At Strines, it is expected that the works will be completed in a year or eighteen months. At Dale Dyke a great chasm has been dug in search of suitable foundation for the erection of a new embankment, in place of that which gave way on the 12th of March, 1864. The Dam Flask works can hardly be said to have commenced. The whole of these works have to be completed by the year 1873.

THE NEW VIADUCT ON THE MIDLAND EXTENSION TO BARNSELY.—The new viaduct at Barnsley crosses the valley of the Dearno. At the lowest part, where the new line from Cudworth to Barnsley crosses the turnpike, the viaduct is 1,087 ft. long. It is composed of three stone piers—two 40 ft., one 41 ft., and another 10 ft. long, which form the end supports of the girders. The space from one abutment to another is supported by fourteen iron piers, which are bolted together, and, although light in appearance, seem to form a safe and firm structure. The contract for the masonry work was taken in March, 1864, by Messrs. Nicholson & Son, of Leeds. The iron-work has been executed by Messrs. Butler & Pitt, of Stanningley, near Leeds. Mr. John Sidney, of Crossley, is the engineer to the line, which is nearly finished, with the exception of the station. The work has, it is estimated, cost over 30,000l.

THE GAS QUESTION AND THE METROPOLITAN BOARD OF WORKS.—Messrs. Newton & Richardson have given notice of motion, "That in the opinion of the Board it is expedient that the manufacture of gas should, as far as practicable, be removed from the populous districts of the metropolis; that the Board should promote a Bill, empowering them to supply gas to the metropolis; that if it be desirable to take the existing gas companies, they should be compensated, the terms of such compensation to be, if possible, agreed on between the Board and the companies; and that the matter be referred to the Special Gas Committee, with authority to obtain the useful advice and take the necessary steps for the preparation of Parliamentary notices and of a Bill to be introduced into Parliament during the next Session; these powers, however, not to be sought if the companies will agree on such a price and such regulations as to the supply of gas as shall be satisfactory to Parliament." Mr. Evans gave notice that he would move as an amendment, "That in the opinion of the Board it is not advisable to take measures to promote a Bill in relation to gas supply during the ensuing Session of Parliament."

THE MEYRICK COLLECTION OF ARMOUR AND ARMS.—This unique collection, we are happy to hear, is being brought from Goodrich Court to the South Kensington Museum, as a loan. It will be set up, we believe, in the gallery adjoining the Horticultural Gardens, which lately contained the Portrait Exhibition.

NEW LETTER-STAMPING MACHINE.—Mr. Pearson Hill, a son of Sir A. Rowland Hill, has invented a machine for facilitating the stamping of letters in post-offices. It is self-inking, and impresses the two requisite stamps at once, to obliterate the postage-stamp and give the time and place of stamping. As many as 218 letters have been single stamped, and 180 double stamped, by help of this machine, in one minute, test time.

PROPOSED BOTANICAL GARDENS FOR PLYMOUTH. A scheme is in progress for the establishment of Botanical Gardens for the three towns—Plymouth, Devonport, and Stonehouse,—similar to those at Bath and other large places. A piece of ground, planted with trees, situated between Argyll and Collingwood Villas, Stoke, has been selected. Most of the land in the vicinity of Plymouth being intended for building purposes, could not be obtained without giving the building lot prices, and Stonehouse was so confined that there was no available place to be found there. The Steward of the Lord of the Manor of Devonport has met the views of the committee. The cost of fencing the ground is roughly estimated to be 200l. The committee would erect a building with wood, having a slated roof and glass sides, which would cost 400l. With cost of planting, &c., 1,200l. to start with would be required. A committee has been chosen to further inquire into the matter.

NEW MODE OF VENTILATING MINES.—The Incorporated Association of Mine Agents of South Staffordshire recently made an excursion to Homer Hill Colliery, near Cradley, in order to inspect and test one of Guibal's new patent fans for ventilating mines. The fan is 16 ft. 8 in. diameter, 5 ft. wide, enclosed in a brickwork casing, and connected to the top of the upcast shaft by a tunnel of 35½ square feet sectional area. It is driven by a small ten-horse power high-pressure horizontal engine, connected with the winding-engine boilers, and the whole, when once started, requires little or no attention for days together. The air is drawn from the mine up the upcast shaft, and driven by the fan up a short chimney, much wider at the top than the base. Near the bottom of this chimney is fixed a sort of Venetian shutter, for the purpose of regulating the quantity of air. At an experimental trial, the engine making sixty-five strokes per minute, the fan changed 37,500 cubic feet of air per minute. When at its greatest speed it was scarcely possible for the party to stand upon their feet. It was clearly shown that it only took about twenty seconds to increase the ventilation from a state of stagnation to that of 50,000 cubic feet per minute. The total cost of engine and fan complete has been about 500l.

THE PROPOSED NEW BUILDING FOR THE BRADFORD MECHANICS INSTITUTE AND SCHOOL OF ART. At a meeting of the committee of the Institute, the designs for the new building, prepared by Messrs. Andrews, Son, & Pepper, of Bradford, architects, have been finally approved, and instructions given to them to proceed with the necessary works forthwith. The advantages of the proposed edifice over the present will chiefly consist in a larger lecture-hall, in the number and size of the class-rooms, and the addition of galleries for exhibiting drawings, casts, and other works of art. The site is bounded on three sides by main thoroughfares. The principal front being towards the Bowling-green, and the flanks to New Market and Tyrel streets, each of these fronts will have a spacious entrance and staircase. On the first, or principal floor, below which will be shops, will be the reading and news room and library, about 85 ft. by 40 ft., in the rear of which will be placed the lecture-hall. This room, about 80 ft. by 50 ft., and 30 ft. high, will, with its galleries, comfortably seat upwards of 1,000 persons, and extends through the first and second floors. The front part of the second floor will be occupied by the principal class-rooms, and the whole of the third floor, which is concealed by the parapet, will consist of class-rooms and the galleries before mentioned, all lighted from the roof. The style of the building will be modern Italian. The cost will be 12,000l.

THE PROPOSED AQUARIUM AT BRIGHTON.—The Brighton Town Council have sanctioned plans for a large salt-water aquarium at Brighton, and have agreed to contribute 7,000l. towards the cost of a projecting sea wall that is to be built.

HENLEY-ON-THAMES.—Mr. Ferrey, having been called in by the churchwardens of the parish church of Henley-on-Thames to report upon the damage done by lightning to the building during the storm of the 20th inst., reports that beyond the destruction of the south-east turret and injuries to the roofing, &c., caused by the fall of the stonework, the tower has sustained no other fracture or settlement, and that the necessary repairs can be made at a comparatively moderate outlay. Such was the force of the lightning that it scattered the stonework far and wide, some fragments falling on the roof of the Red Lion Hotel, and portions even, it is said, into the Thames.

THE METROPOLITAN CATTLE MARKETS BILL. The report of the Markets Committee, with reference to the proceedings in Parliament in relation to this Bill, has been again brought up for consideration in the Court of Common Council. The committee recommended that they should be authorised to inquire into the whole subject, and report to the court the best course to be pursued in order to meet the requirements of the cattle and meat trades, and prevent, as far as might be practicable, the introduction of the cattle plague, and, whilst protecting the fair and proper interests of the corporation, to promote the advantage of the public. The committee also asked for authority to confer upon the subject with her Majesty's Government, and such other parties as they might consider advisable. The adoption of the report was finally agreed to in the face of an amendment to the contrary.

FURNACES FOR SMELTING GLASS.—An improvement in the method of creating draughts in glass furnaces has been patented by Mr. James Davison, of Bishop Wearmouth. At present, long caves are placed under glass furnaces, and large cones of brickwork above them, in order to get the sufficient amount of heat requisite for the perfect fusion of the materials used in glass-making. Mr. Davison's invention does away with these expensive and inconvenient draught creators. He employs steam, which is generated in any suitable boiler, and which is injected into small flues, chimneys, or chimneys by steam-pipes or jets. In each flue or chimney the steam pipes or jets may be either fixed or portable; they are provided with stop-cocks, so as to regulate the supply of steam, and in this manner a draught is created and the heat of the furnace increased and regulated at pleasure. The flues may also be so arranged as to consume the smoke from the fuel.

TENDERS.

For new wing to the Norfolk County Asylum, near Norwich. Mr. R. M. Phipson, F.S.A., architect:—	
Nightingale	£4,689 0 0
Sabberton	4,180 0 0
Nelson	4,062 11 0
Balls	3,983 0 0
Gibbons	3,948 0 0
Newell	3,822 6 0
Downing & Hood	3,640 0 0
Youngs	3,605 0 0

For drainage works at Horley, for the Local Board, Reigate. Mr. J. F. Matthews, architect:—

<i>For Materials and Labour.</i>	
Symonds	£925 0 0
Woodman	890 0 0
Ayers	749 17 0
Pitt (accepted)	743 0 0

<i>For Labour only.</i>	
Woodman	£490 0 0
Keward	415 0 0
Collips	192 10 0

For tavern at Southend, for The Commonwealth Land, Building, and Investment Society. Mr. Iron, architect:—

Jobston	£1,485 0 0
Gann	1,475 0 0
Lark	1,410 0 0
Wood	1,363 0 0
Kilby	1,353 0 0
Hearle	1,325 0 0
Crabb & Vaughan	1,295 0 0
Wicks, Baugh, & Co.	1,250 0 0
A. & J. Smith	1,247 0 0
Hubers	1,235 0 0

For alterations Nos. 27 & 25, Oxford-street. Mr. S. C. Capes, architect:—

Mann	£628 0 0
Manley & Rogers	607 0 0
Kelly, Brothers	558 0 0
Scrivenor & White	559 0 0

For rebuilding the Bramley Arms, Notting-hill, for Mr. J. Empson. Mr. Alfred Stoner, jun., architect. Quantities supplied:—

Bishop, Ashford, & Co.	£1,587 10 0
Patrick	1,490 0 0
Gammou & Sons	1,368 0 0
Aspin	1,350 0 0
Wheeler	1,300 0 0
Langmead & Way (accepted) ..	1,250 0 0

For building two ale stores at the Ransgate Brewery, for Messrs. Tomson & Wotton. Mr. B. Adkins, architect:—

Goodchild	£1,977 0 0
Crockett	1,693 0 0
Belsey	1,638 0 0
Wilson	1,493 0 0
Epps	1,183 0 0
Sollitt (accepted)	1,187 0 0

For a villa residence, London-road, Enfield, for Mr. T. F. Clunie. Mr. F. Cushing, architect:—

Holbard	£978 0 0
Patman	944 0 0
Bayes	930 0 0
Brown & Son	883 0 0
Fairhead	870 0 0

For a dwelling-house, Sidney-road, Enfield, for Mr. S. Hatland. Mr. F. Cushing, architect:—

Bayes (accepted)	£285 0 0
------------------------	----------

For three cottages, Medcalf-road, Enfield, for Mr. Turner. Mr. F. Cushing, architect:—

Bayes	£398 0 0
Ranson	342 10 0
Holbard	315 0 0

For four cottages, Putney-road, Enfield, for Mr. Brown. Mr. F. Cushing, architect:—

Ranson	£300 0 0
Holbard	500 0 0

For parsonage-house, St. Mary Cray, Kent:—

Hollis	£1,575 0 0
Hill, Clunie, & Co.	1,779 8 0
Wright	1,745 0 0
Keys	1,700 0 0
Vanhan	1,474 0 0
Francis (accepted)	1,375 0 0
.....	1,125 0 0

For church restoration, Barrow-upon-Sea. Messrs. Stevens & Robinson, architects. Quantities supplied:—

<i>Tower.</i>	
Past	£438 12 0
Elliott	378 7 0
Moss	489 0 0
Firn	404 0 0
Roberts	319 18 10

For alterations to 32, Gough-street, Gray's-inn-road (beer-house), for Mr. Tomkins. Mr. C. F. Crapp, architect:—

Terry	£399 0 0
Langmead & Way	517 0 0
Hughes	549 0 0
Colen	484 0 0
King	379 0 0

For the erection and completion of a villa residence in Withshire-road, Angel-town, Brighton, for Mr. Thomas Sbw. Mr. Charles Bows, architect:—

Lathey, Brothers (accepted)	£545 0 0
-----------------------------------	----------

For building new school and master's house, St. Saviour's Church, Horse Hill-road, Brighton. Mr. W. Trickett, architect. Quantities supplied by Messrs. Batstone & Hunt:—

Lathey, Brothers (accepted)	£1,493 0 0
-----------------------------------	------------

For finishing two villa residences, West-hill, Sydenham. Mr. William Mundy, architect:—

Webb	£1,735 0 0
Lark	1,390 0 0
Lark (accepted)	1,347 0 0

For alterations to two houses in Gil-street and Red Cow-yard. For Mr. W. William Smith, architect:—

Nash	£745 0 0
Cole	730 0 0
Mann	594 0 0
Sharpe	584 0 0
Clark	581 0 0
Fletcher & Caghey	540 0 0
Goodman	487 17 0
Staines & Sons	488 0 0
Crabb & Vaughan	489 10 0
Blackmore & Morley	430 0 0
Waters (accepted)	445 0 0

For the erection of a stable in the Seven Sisters'-road. Mr. William Smith, architect:—

Bradley	£337 0 0
Fletcher & Caghey	396 0 0
Crabb & Vaughan	408 0 0
Briley	344 13 0

For residence at Chertsey, for Mr. J. Madocks. Mr. T. Wonnacott, architect:—

Britton & May	£2,208 0 0
Foster	2,116 0 0
Duke	2,109 0 0
Knight & Sons	2,081 0 0
Simpson	1,800 0 0
Miles	1,815 0 0
Harris	1,887 0 0
Turner	1,787 0 0
Nightingale	1,777 0 0

For House at Wood-green. Mr. F. A. Klein, architect:—

<i>Deduction.</i>	
Bayes	£2,687 0 0
Axford	2,985 0 0
Charlton	2,809 0 0

Baker	2,190 0 0

The Builder.

VOL. XXVI.—No. 1342.

Architecture and the Tenure of Land.

T occurs at times to the technical, or to the scientific, writer that a subject foreign to his usual studies forces itself suddenly on his contemplation. Politics may be forbidden ground, and yet some great political change may take place, which altogether disturbs the course of business. Or some popular mania may arise, some period of unhealthy and gambling activity, or of unreasonable despondency, the cause of which is matter of no slight moment to all who live by the clink of the trowel.

It is thus that matters which are, strictly speaking, non-architectural, may at times assume considerable prominence in an architectural and social journal. The relations of the architect are so numerous that it is hard to draw the line, and to tell him with what subjects he is unfitted professionally to deal. Few kinds of study, for example, can be more distinctly separated than are architecture and physiology. Yet the laws of health require to be studiously studied by the architect. The ventilation and warming of buildings, the construction of hospitals, the eradication of fever-heds and pest-plots in crowded cities, bring the builder into intimate relation with the physician.

Again, the subject of finance is one which comes home to every one. Want of money has been called, with much justice, the only engineering difficulty. The nobler labours of the architect are eminently expensive. Private opulence may at times seek to build for itself an appropriate home; but public buildings,—ecclesiastical, forensic, municipal, regal,—are those which demand the chief attention, and require the most cultivated skill of the designer. It is thus that the builder comes in contact with the stock-broker, and that the course of the speculative fury of the day, the fall of banks, or the nursing into life of credit companies, has direct relation to industrial progress.

One of these occasions has lately arisen. The subject may at first seem non-technical; but it can only be so regarded on the view, that it is purely visionary. If we were to consider it, as many will do, as not entitled to receive serious consideration, we could find no room for its discussion in our columns. But the names of some of those who, with grave faces, and the formulae of reason, urge the most novel argument against civilization, are too well known, and, we may add, are some of them too much respected, to allow us to pass by their views in silence, on the sheer ground of inherent self-contradiction. We allude to the theory that land cannot rightly be held as private property.

Were it possible for the hypothesis to which we refer, to take actual, practical form, it would be an evil day for the craft of the builder. Architecture would founder, like a stricken vessel in a storm, beneath this heavy blow of the political economist. For the first requisite of the architect is the land on which to build. A firm hold on the soil is essential to the builder. Ownership, property,—call it by what name we like,—the old phrase, *cujus est solum est usque ad cælum*, is as sacred to the man who would build a house, as it used to be to every man who regarded the freedom of his native land, and the unshaken stability of her institutions.

It is always a suspicious circumstance when a bald and imperative logic is brought to bear on an ancient opinion. The process of the logic may be unexceptionable, but fallacy usually lurks in the premises. The great probability has in the first instance to be dealt with, that the habits and customs of our ancestors, as far back as we can distinctly trace them, are more true to the wants of our common human nature, than is the assumption, that all these habits are wrong, and that their origin is false and unnatural.

Instinct, in this matter, is at one with history. Nor is the instinct merely human,—it is common to all the higher forms of animal life, to most beasts, to many birds, even to some fishes. The instinct which leads the eagle to retain and to defend its eyrie, or the fox its den, is, of course, widely different in its development from that in accordance with which man, emerging from barbarism, throws the shelter of law around his home; but the wide and imperative rule of the instinct cannot be disregarded by those who ask, "what is the teaching of nature?"

To occupy a portion of the earth's surface, to the exclusion of all other occupants, is the first step towards civilization. Nomadic tribes exist which have never struck root in the earth, but which, nevertheless, guard their hunting-grounds, or fishing waters, or pasturages, with jealous care. The Scythians are reported by Herodotus to have made their homes in wagons, so that they could be shifted at the desire of the occupant. The historian goes on to add, that the idea of the family, among these cryptogamic people, was as undeveloped and as uncomfortable as the idea of a home. The very act of sowing the ground implies the expectation of retaining its possession till the harvest.

The advocates of radical change in this matter reply, that the land is the property—not of the individual, but of the nation. Propose to them the historic investigation of a rather unintelligible claim, and they decline to meet you on that ground. They are not concerned, they will tell you, with what is, or what has been, but with what ought to be—at which they arrive by logic.

This, then, is the argument. The only ground of claim to private property in anything is, that it has been produced by labour. No man has made the land: therefore it is no man's private property.

Two methods exist of dealing with a theory. One is to examine its origin, the other is to trace its consequences. If the latter involve the impossible, either the reasoning or the premises must be false.

Now to refer the origin of private property to labour, is, at all events, to beg the question. It cannot be proved that such was ever historically the case. The assumption is contrary to much that we know of human habit and of animal instinct. The proposition, then, can only be supported by some proof of its innate truth.

The idea of ownership is only a part, or a case, of a more general idea, that of right. Ownership of land means a right to its occupation and enjoyment, to the exclusion of every one else. Now, to say that all rights are created by labour alone, is pure nonsense. No one could gravely sup-

port such a thesis. The basis of right, in many, if not in most, cases, is contract, more or less explicit. Such, to say nothing of a higher sanction, is the marriage contract. The mutual right of husband and wife to the mutual enjoyment of each other's intimate society and fellowship, holds good against all the world. Is this a right created by labour?

As with the hed, so with the hearth. The first requisite for the establishment of the family is the roof-tree,—the spot on which the settler may rear his hut, if it be only one of logs. When the settler ceases to be solitary, he adds to the need of shelter, that of a temple for his faith, and a spot sacred to the repose of his dead. He acquires this by the same simple methods to which he has recourse for the supply of his other instinctive wants. In that primary state of society which always reappears where the proportion of inhabitants to soil is that of the unit to the million, man takes possession of a homestead by discovery, by occupancy, by enclosure, or by cultivation. Prescriptive right is of rapid growth in lands in which all that is not the scene of private cultivation is the hunting-ground of the wild beast; and prescriptive right to territory once created, its demise from occupant to occupant, or its transfer from owner to owner, is simple matter of contract. We may at this moment see, in the vast western wilds of America, how landed property originates.

All cases of oppression and injustice on the part of the owners of this description of property come under the same law with those of the abuse of wealth or power of any kind. The rich man owes an exact account of his stewardship, a more exact one than any earthly tribunal can demand. Whether he own acres, or ships, or mines, or gold, the principle is the same. The exactments of conscience are stern; but to carry them out, is beyond the power of the execution that issues from any human court. The interference of the State must, at all times, stop far short of the full demand of right. While property exists, bad men, as well as good men, will do as they like with their own; nor is the tenure of property likely to be destroyed because such is the case.

As, then, the tenure of land is, in its origin, like that of many other descriptions of property; and as it is, in its present state, dependent, like all other property, on the sanctity of contract; the only ground on which society can be asked to interfere with the law of so ancient a tenure is the public welfare. If the advocates of any agrarian redistribution (a word which recalls the Roman troubles in the time of the Gracchi, just 2,000 years ago), call upon the Legislature for aid, it can only be by showing, at the same time, the practicability and the necessity of the reform which they propose, or the certain and absolute amount of good, to the whole community, that will follow on the interference with the prescriptive rights of a portion of it. *A priori* right to interfere, there is none. The historic title of the landowner, his contract right to his land, the instinctive force with which man has ever clung to the soil, the fact that civilisation (as its name imports) is the work of the builder, and that the work of the builder depends on the tenure of the soil,—all these things are against the innovation. The would-be reformer has no shadow of an argument to adduce, if he be not the *Salus populi suprema lex*.

What, then, is the practical nature of the demand? What will the claimant have, if he obtain all he asks? Re-distribution, pure and simple; confiscation, with or without compensation, of the property of the present landowners, for the advantage of some undetermined future landowner. "The State is to be the owner," says the agrarian reformer. How will the action of the State take effect?

Let us confine ourselves, in the first instance,

to the subject of land used for building, or in immediate connexion with residential purposes. What induces a man to build? The desire for a home for himself or for others. The purchase of land means, that the house which the purchaser builds on it shall be his castle. If his hold be for such a limited term as that of three generations, a ninety-nine years' lease, the mode in which the builder sets to work is feeble and unsatisfactory. Compare the stucco villas run up on property of this description with the houses that a man builds for himself. What sort of cathedral, or palace, or court of justice, or gallery of art, or market, or school, or hospital, or important building of any kind, can be secured without a firmer hold on the ground than that of such a lease? How, moreover, is the State—the proposed universal landowner—to secure the builder? It will give him a lease. What are to be the terms of that lease? To ensure building of an architectural character, it must be a perpetual lease. How is the State to be remunerated? Is it by a yearly payment? Suppose the tenant to be a permanent defaulter, is the State to have the power of ejection? If so, who would build? If not, who is the proprietor? Possession, in such a case, would be not only nice, but ten, points of the law.

Say that the State is to be secured by the payment, in the first instance, of a sum adequate to the redemption of a perpetual ground-rent. What is this but purchase of land? The State will have been made to intervene as the seller, and a new property will have been created for a new set of owners. That is all the difference. The builder must have a *HOY STO*—with no land, no building, no ownership of land, there will be no building beyond the shanties of squatters.

It is perfectly true that instances may be pointed out in which the competition for a special site, for residential or for business building, is so keen, that large sums of money may be expended in the erection of houses subject to a heavy ground-rent; but the risk in these cases is considerable. The constant ebb and flow of fashion or of business may convert the Belgrave-square of to-day into the Leicester-square of 1888. No description of property, forty years ago, would have been thought safer than a good roadside inn on one of the great lines of metropolitan communication. What is such property worth now? The piercing of a new street, the adoption of an improved mode of travelling, the mere unchecked expansion of a great capital, may at any moment, and probably will, sooner or later, so change the residential, or raise the business, value of certain localities, that the householder will be unable to find a tenant at the mere rate of ground-rent and taxes.

Nor, were the risk less, and were the exception to prove the rule, can it be shown that any advantage would accrue to any one from the fact that the State was ground-landlord. Most tenants would think the reverse would be the case. As a source of public income, ground-rents would be expensive in collection, troublesome, and hazardous; in short, a bad form of tax. As respects the occupier, the only benefit he would derive from paying rent to the State instead of to an individual, would be the chance of being less strictly looked after.

The erection of houses is only a portion of the labour expended upon land, which will be ill, or not at all, attempted, without the existence of a firm, definite, sacred, tenure of the soil. Great works of all kinds,—docks, harbours, canals, roads, railways,—require to strike a root as deep as the very basis of society itself. Drainage and irrigation demand permanence of tenure for their execution. The application of steam to agriculture has led us to turn over a new page in the true book of political economy. The workmen who met at Brussels the other day were by no means blind to the fact that the peasant proprietor is anything but a national benefactor. The perpetual *amortissement* of land, which Napoleon pointed out to Eugene as a sure method of reducing the mass of the country population to political subservience, is inconsistent with the use of the steam-plough. High farming, it is now fully admitted, can only be applied to large farms. A certain amount of agglomeration of land is necessary for every kind of culture, except that of the spade; and for the engineering of culture,—for all comprehensive and efficient draining, irrigating, sewage manuring, and thorough application of the steam cultivator, to answer, the size of a farm must be considerable. Then, again,

it may be readily shown, that no legislative interference on the part of the State can actually amount to anything, except confiscation and resale. Landowners may be extinguished; hut, if so, it can be only to reappear; unless cities and towns, public buildings and private enterprises, the routes of inland commerce, and the improvements of modern agriculture, are all to disappear with them.

When, then, a writer on political economy, even if he be one who is justly regarded as entitled to respectful attention, permits himself to say that the appropriation of land "is at the first aspect a usurpation on the rights of other people," and when he adduces as reasons for such a dictum the statement that land is "a thing which no man made, which exists in limited quantity, which was the original inheritance of all mankind, and which whoever appropriates keeps others out of its possession," he not only argues with equal fairness against anything like a sacred tenure of most sorts of property, but, as far as he has any influence, strives to stop the progress of the builder. The objections are not special to land. "No man made" coal, though man wins it by labour. "No man made" timber, though man grows it on his land by care and patience. "No man made" the water-fall, which has been appropriated to drive a mill; and whoever appropriates the return of the seed which he has himself sown "keeps others out of its possession." Wild and sweeping statements, put forth with the assumption of logical exactness, that involve self-contradictions of this kind, bring contempt on the study of political economy, or at least on some of its students.

For all great works of modern civilisation, tenure of the soil is the *sine quâ non* condition. For all domestic architecture, for all attempts at climatic improvement, by action on rivers, fens, forests, lakes, and the like, the case is the same. For all farming worthy of the name, not only the definite tenure of property, but the tenure of property to a considerable amount by the same holder, is requisite. It will hardly, we suppose, be argued, that our present cities, towns, and detached dwelling-houses, are numerous and durable enough to serve the needs of our descendants for all time. Yet the opponents of landed property, if they had their way, would go far to make their renewal difficult, and their increase impossible. To the fancied syllogism, "no man can own anything that he has not made; no one made land; *ergo*, no one can own land," must be added the corollary, "But no one can build without owning land; therefore no one must build." The same result will follow from the other clauses of the argument. For as "no one made" timber, and therefore as no one can own timber, no one can have a right to huy or sell timber, and therefore no timber is to be forthcoming for the builder. And as no one can appropriate even the manufactured article of brick, without keeping some one else out of possession, it is evident that we shall be reduced to living in tents, if our friend whom we have quoted has his way.

It is a painful and humiliating reflection that public speakers and public writers should gravely bring before the minds of the less instructed masses of society fallacies so transparent. From the very strength of the instinct with which man clings to the soil, any theory that appears to promise land for the million will be sure to stir very deeply the minds of the poorer and more dependent. We have, as we before hinted, two thousand years of experience on this head. But for men to make speeches in Parliament, and to write pamphlets and articles in newspapers, assuming, with all the forms of reasoning, the truth of statements that are not only unproved but incapable of proof,—not only unproven but false,—is an evidence of the extremely fragmentary and imperfect character of the education of some of our educated men. When a man feels impelled to ejaculate,—

"The world is out of joint. Oh, cursed spite,
That ever I was born to set it right!"

he should, in the first instance, be very careful to take nothing for granted; and, above all, not to beg the principal question on which he founds his views. The lucid clearness of the first great English writer on the sources of national wealth was present in his thoughts, and, therefore, was evident in his style. Men have found it far easier to imitate, to some extent, the trenchant language of Adam Smith, than to emulate his patient and modest labour; but when such pseudo-logical statements encounter the calm

good sense of the practised man of business, they find their natural level. He may be unable to expose their logical inaccuracy, but he is aware of their practical absurdity. Tell the man who is about to build a mansion that he can have no property in the land on which he is about to erect it, and he will desire his architect to seek another locality. The architect requires his *HOY STO* as implicitly as does the geometriician. Tell him he shall not have the land, and he will reply that those who deny it to him oppose the very basis of civilisation, and would push back the European citizen to the wigwam of the Indian, the tent of the Arab, or the wagon of the Scythic nomad.

SKETCHES ON THE TWEED: KELSO.

The traveller who penetrates into the old Scottish Borderland by the North-Eastern Railway via Berwick-upon-Tweed, will traverse a tract of country rich, indeed, in natural beauty, but richer still in its historical monuments and battle-fields, with all their teeming elements of romance and all their stirring incidents of legendary lore. For some miles the railway route runs on the south bank or English side of the noble river, and here we pass, first of all, the ancient and ruined castle of Norham, its soft red freestone gradually crumbling into dust, but still standing boldly out and in high relief against the horizon of the Cheviot hills. A few miles further on, close under the magnificent site of Twizell Castle, the ancient bridge across the Till (which here falls into the Tweed) is still seen standing, by which the English army, under the Earl of Surrey, crossed to the battle of Flodden Field. Then we come on the northern bank to the pretty village of Goldstream (with its splendid stone bridge), suggestive of the name of a well-known regiment of Guards which General Monck raised here some 200 years ago. Between Carham and the Tweed, again, on the English side, stands Wark Castle, now the seat of Lady Waterford, one of the strongest and most celebrated of the Border fortresses.*

But, leaving these memorials of bygone ages behind, the traveller will, in process of time, arrive at the little Border town of Kelso, five-and-twenty miles or so from Berwick,—a town which is better known in English history than many a manufacturing burgh ten times its size and importance in the present day. Lying out of the ordinary track of the traveller and the tourist, Kelso is not so much known or visited, we think, as it deserves to be; for it is unquestionably an interesting town,—both from its historical relations and its present condition. One of the gravest faults we shall have to find with it we may as well dispose of at once. The railway station is miserably inadequate. This may be owing most probably to the fact that it is the common terminus of two companies—the North British on the north, and the North-Eastern on the south. But surely some extra provision in such a case ought to be made. It appeared to us that there were not sufficient shuntings for the separate trains coming, stopping, changing carriages, and returning; and it does seem strange, surely that no provision is made on an important line like this for a thorough system of traffic. We suppose these things will be adjusted some day or another by the companies who are interested; although it may not be, perhaps, until two rival directors come into fatal collision, and are killed on the spot. But to proceed.

The first and most conspicuous object which meets the eye after crossing the magnificent bridge over the Tweed and entering the town, is the ruin—now, alas! sadly diminished and broken down—of the ancient abbey which gives the name to Kelso.† This celebrated monastery was founded by King David I. in 1128, and it

* Wark Castle was given by Edward III. as a marriage present to the Earl of Salisbury; and was defended by his handsome countess against King David II. Edward arrived to relieve it after the Scots had raised the siege; and fell in love with its beautiful defender. The story is told at some length by Froissart.—*Murray's Handbook for Scotland*, p. 27.

† The etymology of the name is somewhat obscure. The accurate author of the *Caledonia* derives Kelso, originally from *Calico*, *i.e.*, a sandhill; in the Celtic language.—(*Chalmers's Caled.*, p. 211.) In the celebrated letter of the Community of Scotland to Edward I., taken from Rymer (*Fodera*, vol. ii., p. 371, New Ed.), the abbots of Kelso and Melrose spell their names in the Welshish Latin of the period, De Kelgou and De Meurois.—See Tytler's "History," vol. i., p. 354 (Edin. Nimmo, Edinburgh; 1864), where the letter is printed.

was so far completed as to receive the tomb of the founder's son, Earl Henry of Northumberland, who died in 1152. The monks were of a reformed class of the Benedictines originally established at Tiron in the south of France; hence they were commonly styled Tironenses. Fifteen years before this foundation, King David, while still the Earl of Huntingdon, had imported these Tironian monks into Scotland, and had settled them near his castle in Selkirk. But the principal residence of the Scottish kings at this period was the castle of Roxburgh; and accordingly when David succeeded to the crown, on the death of his brother in 1124, he soon removed the convent from Selkirk to its present site at Kelso, on the banks of the Tweed, and within a how-shot of his royal castle. In consequence of its vicinity to the English border, Kelso suffered severely during the wars of the Succession; and it was reduced to its present, or rather its more recent, yet less ruinous, condition by the English troops under the Earl of Hertford in 1545. Although the Abbey was never of any great size, the abbots of Kelso long asserted and claimed the precedence in the hierarchy of Scotland, and even contended for superiority, as we learn from an able writer,* with the parent house of Tiron, to which this northern daughter had given more than one ruler. But we need not pursue its history. We have only to add, that after the Reformation, it came into the family of the Kers of Roxburgh. A low gloomy vault was thrown over the remains, after the fashion of the period, into a presbyterian church. But owing to the ominous fall of a piece of plaster from the roof, and to the existence of an old prophecy of Thomas the Rhymer, that the kirk should fall when it was full of people, the congregation deserted it in the year 1771. Afterwards it was converted for some time into a joiner's shop. Eventually the ruins were disencumbered of the rude modern masonry by the good taste of William, fifth Duke of Roxburgh. In 1823 the decayed parts were strengthened and repaired by subscription, and finally, about two years ago, the present duke had the ruins thoroughly repaired; and the tower which showed signs of decay over the principal archway, was strapped with strong iron rods.

The style of Kelso is that which it seems was usually adopted by David II., a mixture of Norman and Early Pointed. The church originally consisted of chancel, with aisles 60 ft. long; a nave about 30 ft., transepts, and central tower, about 90 ft. high. There are at this moment left only two arches of the south side of the chancel, the walls of the nave, with part of the west entrance. The main feature is the central tower, which was supported by four magnificent arches of Early Pointed age, two of which are still standing entire, and are at least 40 ft. high. The rest of the architecture is Norman; and the building is one of the few, we are informed by Mr. Billing,† in which the head of the cross lies to the west. One of the most remarkable features is the entrance to the north transept, which has a porch containing a small room, and this porch was the principal entrance to the parish church when the chancel was roofed in. Above the arch, which is deeply recessed and exquisitely moulded, there is a row of interlacing arcades, surmounted by a tympanum, of which the face is intersected in lozenge shapes.

Upon the whole, however, we must say that the architectural student will probably be disappointed in the study of what is left of the ruins; which, notwithstanding the efforts to preserve them, are gradually crumbling into dust. "Kelso Abbey," says the editor of its chartulary, "stands alone like some antique Titan predominating over the dwarfs of a later world." If simplicity of style and construction be any proof of this Titanic character, the learned editor may be correct, for in our opinion it is certainly the least crutide, if not the rudest, specimen of ancient ecclesiastical architecture we have seen in the whole Borders

* *Vide the Quarterly Review*, vol. LXXV., see also, "The Monastic Annals of Teviotdale," by Rev. Jas. Morton. This well-known author, although one of the prebendaries of Lincoln, was a native of Kelso. Compare Haig's "History of Kelso," and the able article, "Kelso," in the "Edin. Encyc.," by Sir D. Brewster, who was a native of Jedburgh.

† In his "Ecclesiastical and Baronial Remains of Scotland." The dimensions and description are quoted at greater length than we have done in Mr. Murray's excellent "Handbook of Scotland," which we can cordially recommend. It is proper to mention that we have also derived some assistance from Black's "Picturesque Guide."

with the exception of Jedburgh. But "the churches of Jedburgh and Kelso as we now find them," says Mr. Fergusson, "belong either to the very end of the twelfth or to the beginning of the thirteenth century. They display all the rude magnificence of the Norman period—used in these instances not experimentally, as was too often the case in England, but as a well understood style, the features of which were fully perfected. The whole features were used with a Doric simplicity and boldness which is very remarkable; although it must be confessed that this independence of constraint was sometimes carried a little too far, as in the pier arches at Jedburgh where these are thrown across between the circular pillars without any subordinate shaft or apparent support. This was," he adds, "a favourite trick of the later Gothic architects of Germany, though seldom found at this early period. Here, however, the excessive strength of the arch in a great measure redeems its want of perpendicular shafts." We cannot, at present, dwell longer on the ancient abey; we must proceed to say something about the town itself.

The town of Kelso is charmingly situated on the north bank of the Tweed, nearly opposite, or rather just below, the point of its confluence with the river Teviot. It lies, in fact, in the central plateau of a richly-wooded amphitheatre. It consists of four principal streets, and an open square or market-place in which are situated the Town-hall and the principal buildings. Like most towns which lie on the banks of a winding river, its thoroughfares are tortuous and irregular. But the principal square of the town is one of the finest and most spacious market-places we have seen in Scotland. The shops are also very good; and the houses throughout the town are generally built of the light pink-coloured sandstones of the district, and roofed with blue slate, imparting to its aspect, on the whole, a certain degree of architectural elegance and superiority, which vindicates its title to be regarded as a "pretty market-town"—a character which was ascribed to Kelso by Patten so long ago as temp. Edward II.* This character it still supports by a weekly corn-market, a cattle-market, and a wool-market, and four annual fairs. Indeed, it is a rather celebrated emporium for agricultural produce.

Kelso seems to occupy the site of what had been originally an inconsiderable village, a kind of suburb—as Gattonside is at this moment to Melrose—to the once important burgh of Roxburgh, which then lay on the opposite bank of the Tweed. It began to acquire more importance after the foundation of the abbey. During the reign of Robert I. it had increased so much as to consist of two parts, Easter and Wester Kelso; and on the final destruction of Roxburgh by James II., it naturally took the place and assumed the prominence of that celebrated burgh. The connexion of the town with the abbey necessarily made it a sharer in the fortunes of that ill-fated monastery; and, in fact, its history from the fifteenth century down to the era of the Reformation consists of nothing more than a detail of successive sieges and conflagrations. Whenever the abbey was assailed the town was attacked; whenever the former was set on fire the latter was sure to be burnt. Nor is there anything in Border history more remarkable than the manner in which its buildings (no doubt constructed chiefly of timber) were continually repaired and restored, so as to constitute the materials of so many and so closely consecutive conflagrations. Better days, however, dawned for Kelso. A new source of prosperity was opened up, and a new element of security obtained in the fostering care of the family of Roxburgh, who succeeded not only to the revenues of the abbey, but also to the seigniorial jurisdiction of the abbots. All the benefits of a princely expenditure; all the advantages of a steady and impartial administration of justice, speedily followed. By the time of the Revolution Kelso had become the principal market-town of the south of Scotland, the chief resort of the neighbouring gentry, the seat of an eminent grammar-school, and a place of reputation as a seat of learning. It is now a rather busy, improving, and wital genteel country town, totally destitute of manufactures, yet ambitious of distinction; and not so notorious for ecclesiastical history as some of the towns we could mention of equal size and importance in the northern part of Scotland. Indeed, the Kelso people, for what reason we cannot tell, unless it be due to their

* See "The New Statistical Account of Scotland," vol. III., p. 239.

Border history and connexions, have always had a greater reputation for business than devotion. Thus Sir Walter Scott says of them on one memorable occasion:—

"The Kelso men all slunk away;
They liked not much to hymn and pray,
Nor like they'st much unto this day!"

On the other hand, it must never be forgotten, that Kelso can boast of being the first provincial town in Scotland to adopt the printing press; and that it was here where John Ballantyne printed "sixty years since" the first edition of the celebrated "Border Minstrelsy," then unobtrusively announced "with notes and illustrations" by Walter Scott, esq. "How strange and unfortunate that a connexion so proper in itself and so romantic in its nature should have at length terminated so disastrously for them both!

We have already mentioned in terms of approbation the celebrated bridge which Sir John Rennie built across the Tweed at Kelso. There can be no doubt that it is one of the very best of our modern bridges in point of design; and had it been constructed of granite, or even of the hard Whinstone rocks of the district, it would doubtless have proved more lasting than the material, a soft and rather friable sandstone, which was actually employed, and which, we regret to record, even now shows evident symptoms of decay.

The view from this bridge is singularly beautiful. The junction of the Tweed and the Teviot on the left lends an imposing character to the broad and stately flow of the river, which is at this point 300 ft. in breadth; the lovely foliage of Sir George Douglas's seat of Springwood Park; the romantic old-fashioned town on the right, with the picturesque mansion of Ednam facing the bridge; and, lastly, the splendid architectural object of Floors Castle in the distance, surrounded with its towering trees and closely-shaven lawn, sloping to the very edge of the river,—all this constitutes a picture for which poor Leyden could find a parallel alone in that classic vale of Thessaly which the ancient poets have agreed in describing as the most delightful spot on earth:—

"Green swarded plains to dimpling lawns succeed,
And Temples rise on the banks of Tweed,
Blue o'er the river Kelso's shadow lies,
And copse-clad isles amid the waters rise."

Close to the bridge on the left is a massive gateway in the form of a triumphal arch, imitated, we suspect from the Marble Arch at Hyde Park, which guards the approach and avenue to Springwood Park. It is chiefly noticeable as a piece of masons' work; and it was executed, we understand, by the Messrs. Waddell, who are, or were at one time, great builders in these parts. A little higher up we observe a group of very tasteful cottages, with heavy triangular Gothic timbered roofs and finials on the gables. The walls are constructed in the old-fashioned method of timber-framings, in squares of about 4 ft., filled in with random rubble, partly-coloured and elaborately pointed. This, we observe is a growing taste on the part of cottage builders in Scotland. These are very nice examples of suburban cottages, and are obviously of English design,—at least, we never happened to see such designs proceed from a Scottish architect. But, after all, on this point we may remark that Kelso is much more like an English town, as far as its buildings are concerned, than a Scotch one. Whether this be due to the peaceful progress of "Anglo-Saxon civilization," which Mr. Matthew Arnold loves so well, we will not pretend to say. A more proximate cause, perhaps, resides in the inevitable results of the long centuries of Border warfare; but, at any rate, it is curious that there are no flats or common stairs in Kelso. Even in the poorest districts of the town, such as the Coal-square, the old houses appear to be constructed after the well-known English model, although we are afraid that more than a single family inhabit a single house. The ordinary plan of houses in the Market-square and Roxburgh-street is also that with which we are familiar in England,—a shop on the basement, cellars beneath, drawing-room on first floor, and bed-rooms above.

The modern churches of Kelso are either beyond or beneath criticism. The parish church, for example, is a hideous pentagon of some sort, covered with a circular roof like a Chinese pagoda. Compare this with Mr. Pilkington's ambitious effort in the Free Church, with its tall spire, its licentious treatment, and its elaborate naturalistic ornament, and one cannot resist

* "Scenes of Infancy," p. 172.

the conclusion that with all their genius and resources the Scottish Presbyterians have sought for true architecture in their temples, but they have not yet found it.

The only public building worthy of notice in Kelso is the Court House and Exchange, which occupies the northern side of the Market Square. To the right of this building runs a street called the Horse Market; and on the left a parallel street called the Hay Market. From the Market Square runs a long straggling street called Roxburgh-street, almost equal in length to the celebrated long town of Kirkcaldy, where Adam Smith was born. Passing up this street, close to the Free Church we come upon a most intolerable stench, proceeding, as we were told, from a "skimery," whatever that may mean—certainly it has no connexion with a tan work, we should imagine. In this same quarter we also observed the ruins of the reservoir—a large cast-iron tank, which burst and did great damage some time ago. We were surprised to see it still unrepared. Several narrow dingley alleys lead out of Roxburgh-street to the banks of the river; but near its western extremity we come suddenly upon the old-fashioned yet stately gates, the pillars surmounted with the ducal coronet, which guard the noble avenue to Floors Castle.

The day was far spent ere we could tear ourselves from that splendid mansion and those beautiful gardens. On returning to the railway station we took a last look over Kelso Bridge, and a passing glance at the massive archway of Sir George Douglas. Here we paused for a moment to observe the sculptured arms in the centre; two winged horses—the Pegasus—supporting the escutcheon of the well-known bloody heart; and the grim motto, "DIE or DIE," reminded us that we had been travelling with much pleasure in peace and security through a district of country where this was at one time impossible.

STRATHEDEN HOUSE, KNIGHTSBRIDGE.

THOSE who recollect Stratheden House, when "plain John Campbell" lived in it, would scarcely recognise the interior now that it has become the residence of Mr. Mitchell Henry, the well-known wealthy and discriminating lover of the fine arts. Under the direction of Mr. Thomas H. Wyatt, as architect, and Mr. Frederick Sang, as artistic decorator, the rooms have been fitted up and furnished very elaborately, and, we may add, magnificently. In the Hall, which is still, unfortunately, low, the ceiling and frieze are appropriately embellished in encaustic colour, and a handsome tile pavement has been laid by Maw. A dual head, Diogenes and Socrates, a fine antique bust of Agrippa, and the Florentine Dogs, in Serpentine, are amongst the works of art it contains; while the walls of the staircase are hung with pictures, some of them originals and others copies of paintings by good masters. In the Dining-room the walls are covered with silk brocade; a lofty chimney-piece, of carved oak, in the style of the sixteenth century, has been built up, including some beautiful carving of the period. The ceiling, modelled in the same style, is embellished with allegories, Raffaellesques, and gilding. The woodwork of the Library is chomized, with gold mouldings and ornaments. The ceiling, cornice and frieze, Venetian *Cinque-cento* in style, are partly on gold, partly on turquoise-blue ground. The penciled compartments contain arabesques in the borders and portraits of philosophers and poets. The walls are hung with heavy green silk from Lyons, as are those of the drawing-room. For the latter, the furniture, tables, chairs, consoles, and frames were modelled and finished in Rome and Florence after originals in the Palazzo Pitti and in the Vatican. The walls of the Billiard-room are pale sea-green in colour, the woodwork being dark green with gilding. The ceiling, cove, and cornice are very elaborately embellished, Italian *Cinque-cento* in style. There is a remarkable carved settee in this room that once adorned a ducal mansion in Florence. The design of part of it is ascribed to Giulio Romano. A recess of this room, between marble columns, the back-ground of which is a positive Pompeian red, contains a statue of a flower-girl, by Wolf, of Rome. Other statues by the same sculptor, and a "Puck" by Lough, will be found elsewhere. As among the heat things in the rooms we note a remarkably fine tea service of Sevres china, painted with portraits, and originally a present from Louis XIV. to a member

of the Visconti family. It is an exquisite result of the union of Art and Industry.

The principal addition to the house is in honour of sculpture,—a temple-like apartment or shrine, formed to receive Melly's noted group, "The Pompeian Mother," which was for some time one of the lions of modern Rome. The statue represents a woman who, unclotched, with the exception of some wind-pressed drapery behind, and holding her child in her arms, strives to escape the horrors of the destruction of Pompeii by Vesuvius. Her figure recalls Rubens rather than Raffaello,—power rather than refinement; but any objection to this being yielded, the work must command great admiration. Rumour gives 8,000 guineas as its cost.

This temple and its approaches have been painted in the Pompeian style. The greater part of the back-ground is red and black, with animals, birds, scrolls, a rich frieze, a gilt dome, and a mosaic pavement by Minton. It is scarcely necessary for us to add that a very large sum has been expended on the works in Stratheden House.

POPLAR AND STEPNEY SICK ASYLUM COMPETITION.

THE Poplar and Stepney Sick Asylum is to be built in Bromley, Middlesex, just opposite the Stepney Union Workhouse, a commodious structure, erected not long ago from the designs of Mr. Henry Jarvis. The Board of Management having invited a certain number of architects to compete, eleven have sent in designs for the proposed hospital, and the drawings are all very fairly hung in a room at the workhouse. The instructions required accommodation for 255 men and 345 women, on the pavilion principle; fifteen of the women being lying-in cases, and fifty of each sex being Foul cases. The instructions were in accordance with modern hospital principles, but the competitors were to suggest anything they thought desirable. The chief premium offered was 100*l.*, to merge into the commission, if the design he carried out, with 80*l.* to author of second best design, and 40*l.* to each of the other competitors. If we understand rightly, a reduced commission is offered to the architect who may be engaged, but of this we are not certain. We will hope we are misinformed. The site is a long narrow awkward piece of land, bounded by the Tilbury Railway on one long side, and by houses of very poor character on the other; and this, doubtless, increased the difficulties of the architects. The following is a list of the competitors, with the sum they put down as the estimated cost of their design:—

Messrs. Hills & Fletcher.....	£ 39,000
Messrs. Giles & Biven	34,000
Mr. Wilson, Design A.....	35,000
" Design B.....	50,000
Mr. Bressy.....	50,000
Mr. Worthington.....	50,000
Mr. Scott, jun.....	50,500
(Add 1,500 <i>l.</i> for Parian cement, deduct	
500 <i>l.</i> if floor in pine instead of oak)	
Mr. T. Blashill.....	50,000
(Including machinery and lifts)	
Messrs. Hammack & Lambert	56,500
Mr. Morris.....	57,952
Messrs. Harston.....	68,000
Mr. Bracebridge.....	72,000
(Exclusive of engineering works,	
fitting up laundry and washhouse,	
hydraulic lifts and fittings, laying	
out garden, &c.)	

Examiners of the drawings would fail to find the reason why the last-named design should cost more than double the sum put down for some of them at the top of the list, or why it should cost even one-third more than most of the other designs. The fact is, however, as we said in our last, speaking of a similar competition, these amounts are simply opinions founded on more or less previous experience.

The designs from which the managers will probably select the first two are those by Messrs. Harston, Messrs. Hammack & Lambert, and Mr. Wilson, (B.) Mr. Wilson's plan, at the closet end, is somewhat close and confined. Messrs. Hammack's elevation is poor. Messrs. Harston's is superior in this respect, as in some others, and if the apparent difference in price be reconciled may come out first, a result we should scarcely feel disposed to term erroneous, so far as we may depend on a superficial examination.

Mr. Thos. Blashill has sent two designs, on which he has evidently bestowed much thought. The plan is very good in several respects.

Mr. Worthington, by placing main corridor in

centre, renders his wards too small for economical working. His elevation is agreeable. Mr. Bressy in designing a long ward, for bedridden patients, without a day-room, throws a doubt on his knowledge of the actual requirements of such an establishment as this.

Mr. Scott, jun., has given his buildings such an ugly aspect that his plan was probably less looked at than it might otherwise have been. Messrs. Giles & Biven, who have the whole matter at their fingers' ends, are less happy here than in some of their other designs. By placing the day-room at the side of the ward, and separating it from the latter only by a low partition, they not only take away a window from some of the beds, but give the same atmosphere in the day-room as in the ward. Mr. Wilson also in his general plan shows the day-room at side of ward, but a large alternative sheet with referenceto this arrangement probably saved him from objection on that score.

ON MEGALITHIC MONUMENTS.

AT the annual meeting of the Northampton Architectural Society, held recently, Sir Henry Dryden made some *vivâ voce* observations on

The Megalithic Monuments of Brittany.

The province of Brittany, he said, consisted of five departments, and if they looked at the map of France they would see that it constituted the great western promontory of France; and it was no doubt owing to its particularly promontorial position that so many of these ancient monuments had been preserved, for the arts of civilisation had not so readily obtained a position there, and therefore could not work in so destructive a spirit as in other parts of France. Of these departments Finisterre and Quiberon were the most rich in these monuments, although they existed in the other departments. The part in which he had been at work with Mr. Lukis was in Quiberon. The province of Brittany contained a large number of these megalithic remains. There were four kinds of megalithic monuments; first, *Menhirs*, which meant tall stones or pillar stones, of the tallest of which yet found he exhibited a drawing. The second kind were the *Dolmens*, which were chamber tombs, of which he only exhibited a drawing of one specimen. Thirdly, there were the *Circles*, of which there were several. He exhibited plans of the three principal—the circle of *Ménec*, the circle of *Kairverin*, and the circle of *Kerlescant*. There were a few more, but not many of them—perhaps one or two more; but he supposed there were not a dozen circles altogether in Brittany. Then there were the monumental lines of Erdeven, the principal part of which was near Carnac. The lines of *Ménec* were eleven in number, the lines of *Kairverin* ten, and the lines of *Kerlescant* thirteen. Now there was a very important point in the nomenclature of these things, which was very bothering. If they had to do with French antiquaries and their works they would find this difficulty. What we call a *cromlech*, the French call a *dolmen*; and what we call a *circle*, the French call a *cromlech*. These monumental remains had never been planned to any extent, and never been properly described. The number of people who had visited them was extraordinary, and therefore it was the more surprising that so little had been done to make them understood. He believed he had seen everything that had been written on the subject, and there was not a single thing to be relied on. His friend, Mr. Lukis, had seen more of the remains than he had. A strong reason why they should be planned was, that they were being destroyed as fast as they could be. He was in the district in September, 1867, and when he went again this year he found that many of them had been destroyed, and one of the most curious *dolmens* was being carted away. They were breaking up some of the others whilst he was there. As the plans he had taken were accurate, they would be of great use eventually. Very few of these remains were marked on the French ordnance maps, and not nearly so much interest had been taken in them by the French engineers as was the case in England. He should not say anything about the *dolmens*, for his friend, Mr. Lukis, had written a good many things about them, which would ultimately be published. They were chamber-tombs, and were all inclosed in immense mounds of earth first of all. There were lines and circles in other parts of Brittany,

but he should only describe those about Carnac. He had only planned part of these, for it would take two or three lives to measure and plan many of them. Some of these sets of lines had circles at the head, whilst others had not; but he could not say that there had not been circles at the head of the others. For instance, *Kerlesant* had one which was not placed symmetrically with regard to the other; and then *Kairverin* had no circle, and he did not think it ever had, because in the other cases the circles were on the highest ground, but in this case the lines went up to the point, and the ground began to sink directly after. Therefore he considered it never had any circle, as did Mr. Lankis also. As for the *Kerlesant*, the enlightened owner was carrying it away as fast as he could; and since he had planned it much of it had gone. A good deal was carried away in the interval between his two recent visits. *Ménez* consisted of eleven lines, and no doubt never had more than eleven. *Erdevén*, he should think, consisted of eleven lines. The drawing which he exhibited represented the circle of St. Pierre. The distance between the circle and the corner of the lines was 290 ft., and the diameter of the circle was 180 ft. *Ménez* was very nearly a mile long, but *Kairverin* was the longest of them all. St. Barbe was about 900 ft. only in length, but they did not know exactly whether that was the complete length. They believed, however, that it was, and up at the top of it there was no circle now, but there were three enormous blocks which stood up at the head. Whether they were part of a circle, or whether they were only three blocks put at the top, one could not determine, but there was nothing like a circle. Neither was there anything like a circle at *Erdevén*, but there the circle, if one ever existed, might have been destroyed, because in making the Imperial road some of the end blocks had been mutilated, so there was great confusion; but still he thought there never was a circle. Some of the end stones of the circle of St. Pierre had been eaten away by the sea, for they had found some of the fragments on the beach. The circle of Ile Lanic was on a small island about a quarter of a mile from the coast, the whole of which was covered with Roman pottery. All along the little cliff which was only some 4 ft. or 5 ft. in height, there were numerous specimens of Roman pottery, and other similar antiquities. Flint heads and arrow heads, and many such things, had been found, and no doubt others would be found also. The sea had encroached very much there. Mr. Lankis said it was very odd how so much pottery should have accumulated on a small island, and he raised the question, why did the people go there? He supposed it was likely it was once part of the mainland, and especially when they found, on sounding, that the channel between the island and the mainland was quite shallow. It appeared, therefore, highly probable that the sea had burst over the land, made the projection an island, and washed the circle away. It was not very different in diameter from the circle of St. Pierre, it being some 165 ft. All the writers who had made mention of those lines had treated them as if they were so many parallels, and Dean, in his "Serpent-worship," wanted to make out that all these lines favoured the hypothesis that they were temples for serpent-worship; but that argument would not hold water. In the case of every set of lines, the head was wide and the tail small. They began with big stones, and tailed down to little ones. The stones began by being some 8 ft., 9 ft., or 10 ft., in diameter; and towards the end they gradually became smaller, till the diameter, perhaps, was not more than 4 ft.; the spaces between the stones and the lines remaining but slightly different. None of them were set out with mathematical regularity, but they were very wavy. The circle-stones in all these cases were smaller than the line stones. Mr. Lankis wanted to know which were first erected,—the lines or the circles; whether the circles were added to the lines or the lines to the circles. They first of all thought that the circles, being the smallest, were first erected, and that the lines were afterwards added; but against that supposition was the significant fact, particularly in the case of the *Kerlesant*, that the circle—which, by the bye, he should have explained, was a horse-shoe shape,—was flattened to receive the head of the lines. That was conclusive against the circle being made perfect at first, and the lines being tacked on to it. It was much more likely the circle was tacked on to the lines, although the stones were much smaller. The Great Menhir, Locmariaquer,

was 67 ft. 5 in. in diameter by 13 ft. 6 in. wide. This was the largest in Brittany, and he supposed in France. The oddity of it was that, when it broke, the two fragments fell in opposite directions, as represented in the diagram. In one *dolmen* a gold collar had been found; and that single fact had done more harm to antiquities, and had resulted in greater destruction to the monuments, than the ravages of 200 years. Various questions were put to Sir Henry, and in answering them he stated that the celts he had produced were undoubtedly later than the *dolmens* in which they were found. In many of the *dolmens*, Roman statuettes, coins, and other antiquities had been found. He further stated that in Constantia, Algiers, there were thousands of these *dolmens* only a few feet high. Some of them were 8 ft. high, 17 ft. wide, and 65 ft. long.

Monument in Scotland.

Mr. Samuel Sharpe described a *cromlech* or *dolmen*, which had been recently discovered in Scotland, and which he had visited, and sectional drawings of which were exhibited. He was visiting at a place in Airlry, Forfarshire, where in the course of some agricultural operations a slash was turned up, which led to an opening with steps, which led down some 10 ft. beneath the surface. Immediately at the foot of those steps the passage curved and widened out, and extended to a distance of about 50 ft. or 60 ft. beneath the crown of the hill. They penetrated to the end, and in the course of conversation in which he inquired whether any inscriptions had been found in the *cromlech*, he was informed there had been none found. The extremity of the place was perfectly dark and dripping with water. It was almost like the dripping well at Knaresborough. But before they got out a stone was discovered. He should say that the width of the cavity ranged from 5 ft. to 8 ft. or 9 ft. The stone he had mentioned was about 8 ft. in length and 5 ft. in the other direction. Figures appeared on the stone. There was a large-sized serpent and a smaller one at right angles with that, and then there were several lines and the figure of a rudely-marked letter F, with other characters which were undecipherable. On the wall beneath this stone was a smaller one, upon which was the figure of a circle between two lines, and other lines similar to those which occurred in the *cromlechs* of Brittany, in greater or less number. On the floor were the remains of charcoal or other burnt material. It was stated that the *cromlech* had been discovered some hundred years previously. He should suppose that at that time it was closed up and covered with earth, and lost sight of altogether. It was known to be somewhere in that locality; and, from the description of the old and the character of the newly-discovered *cromlech*, he should think the two were identical. Near the entrance and on either side was a fireplace, with a chimney from 15 in. to 18 in. high. The stones were more clumsy than represented in the diagram, and had two uprights with a passage traceable from the bottom to the top into the open air. In the course of looking about he discovered a fragment of a quern, or hand-mill to grind corn, an illustration of the passage in Scripture, "Two women shall be grinding at the mill," &c. The suggestion which offered itself as to the reason of those remains of domestic habitation was this. The object of the *cromlech* in the first instance was a sepulchral one, and after being used by those who built it for that purpose it was doubtless discovered by other people and utilised by them so far as to make it a habitation; and hence the fireplaces, and the domestic utensil, the corn-mill. With respect to the lines, he regarded them as an evidence of the extension into Scotland of serpent-worship, as carried out on the greater part of the continents of Asia and Europe. With regard to the other characters, nothing was known except that, perhaps, they were intended to indicate the number of the members of a family that were deposited in the urn or burial-place. Possibly the F might be an indication of the family, but that was merely conjecture, and the same remark applied to the diagram of the other stone.

KITCHEN BOILERS.—By the explosion of a boiler in the kitchen of the United Hotel, Charles-street, St. James's, five female servants were seriously injured, and great damage was done to the premises. We postpone observations, in the hope of an official inquiry.

NEW BUILDINGS IN EDINBURGH.

It is a somewhat singular fact that amongst the numerous Gothic churches erected in Edinburgh within the last quarter of a century, there are only two possessed of really good Gothic character; and these two were designed by non-resident architects. This peculiarity may be accounted for from the circumstance that the local architects who have acquired a position, and to whom, as a matter of course, works of importance are entrusted, have been educated in the Classical school, which obtained a firmer footing in the "modern Athens" than in any other city in the empire. The Gothic revival has never been heartily acquiesced in by these men; it is as a new language to them, the grammar of which they have not mastered.

West Coates Church, Roseburn.

We some time ago gave a description of a Free church erected in the newly-created western suburb, called Roseburn; and our attention is now directed to another church in course of erection there in connexion with the Establishment. It is situated immediately to the east of the grounds of Donaldson's Hospital, and consists of a nave and transeps, with a spire in the centre of the nave gable, which faces the south. At the angles formed by the junction of the spire and nave and the nave and transeps, are octagonal turrets, which lead to galleries. The tower and spire will be 130 ft. high, and pierced by a three-light traceried window immediately above the doorway, and in the upper part by triplet lancet-windows. The spire is pierced by two tiers of gables, and surmounted by a large finial and vane. The nave is lighted by double lancets, and in the north elevation is a rose-window of plate tracery, beneath which is the vestry; and on either side are two light traceried windows, and at the angles are massive buttresses, corbelling, and other features peculiar to Scottish Gothic are introduced.

The general arrangement and distribution of the parts show that a picturesque and grandiose effect has been aimed at; but the result is not quite satisfactory; the outline is rigid in parts, and the detail a mixture of various periods not happily combined. The church will accommodate 900 sitters, and the cost is about 8,000l. Mr. David Bryce is the architect.

Free St. George's Church.

That Mr. Bryce is more at home in the Classical than in the Gothic style, is shown by Free St. George's, which is situated within ten minutes' walk of the church above described; here all the details are thoroughly correct, although there is little originality in their application; and the faults are those inherent to the extreme Pallasian. The site is at the angle of Stafford-street and Shadwick-place; the main entrance, which faces the south, being from the latter; the north elevation abuts upon a stable lane, and the east one is not visible from the street: the latter have not therefore been treated architecturally. The whole of the site has been built upon, and measures 78 ft. from east to west, and 125 from north to south. The principal entrance is flanked by coupled attached Ionic columns surmounted by a broken pediment, from the centre of which a great sprawling device crops out; above this is a range of arched windows with projecting keystones. On the side is a slightly projecting wing with a three-light square-headed window on the ground floor, and an arched window in the upper story; massive Corinthian attached columns rise from the basement story to the architrave, which, with the dentilled cornice, breaks over them. The wall head is finished with a balustrade, having pedestals at intervals to sustain vases. The tower is placed at the south-west angle, and is divided into four stages. The basement stage is 25 ft. in diameter, is rusticated at the angles, and rises to the main cornice, where it terminates in semicircular pediments embracing clock dials, which are ornamented with festoons of fruit and flowers, and a vase is placed at each angle. The next two stages consist of open arches supported by Corinthian columns and pilasters surmounted by enriched cornices; from the upper of these springs a pyramidal spire pierced with circular openings, and at the springing of the spire vases are again introduced. The west elevation consists of a centre having two ranges of rusticated windows, flanked by wings having attached Corinthian columns surmounted by triangular pediments, the outer mouldings of which are broken off before reaching the apex.

The interior contains, besides the church, committee and waiting rooms, and in the basement is a residence for the head, &c. The church proper is divided into a centre and aisles by iron Corinthian columns, supporting a series of arches upholding an elliptical ceiling, divided into square panels, with bosses at the intersections. There are galleries in the aisles, and at the south end opposite the pulpit. The ceiling over the galleries is divided into a series of domes.

The preaching platform occupies a small apse at the north end, and in the apse are three windows to be filled with painted glass. The roof of the apse, which is a semi-dome, is supported by granite pilasters, with foliated caps. Accommodation is provided for a congregation of 1,800, and the entire cost, including 13,000*l.* for the site, is about 30,000*l.*

The original Free St. George's, which was displaced by the operations of the Caledonian Railway Company, has been rebuilt at Stockbridge, with the addition of a tower, having a high-pitched slated roof. With this addition, and in its present situation, with meager surroundings, the building has a much better effect than it had on its former site in the Lothian-road.

Bank of Scotland.

The scaffolding has now been removed from the Bank of Scotland, presenting the whole facade to the spectator. The transformation is complete; the once clumsy, badly proportioned building is now one of the most picturesque and imposing in the city. With its broken skyline of domes and groups of statuary, and standing as it does on neutral ground, between the old and new towns, it forms a link between the modern and formal architecture of the one, and the more irregular and ancient style of the other. The sculpture is not at all to our mind, and is much inferior to that on the Bank of the British Linen Company, which was designed by the same architect, Mr. David Bryce.

Castle Terrace.

The first instalment of the new buildings designed by Mr. James Gowan, in his own peculiar style, is now completed, so far as the elevations are concerned. The peculiarity of the style consists in the ignoring of every known detail and the application of mouldings more suited for execution in wood than in stone, the profile only of which is generally presented to the spectator. Much of the construction is false,—e. g., arches are cut out of the solid and provided with stone tie-beams, where there is ample abutment. The general effect produced by the number of gables, moulded chimneys, and statues breaking the skyline, is striking and picturesque. Mr. Gowan, who is both architect and proprietor, deserves to be complimented on his pluck. He is feeling his way, and may improve as he proceeds.

Fruit and Vegetable Markets.

The new markets at Princes-street are progressing. Whatever objection may be made to the propriety of establishing markets on so fine a site, it is already evident that the rescuing it from the state of chaos it has presented for many years will be an improvement.

BRICKMAKING, AND DESIRED IMPROVEMENTS.

The committee of the "Manchester Society of Architects" has just now made a report on this subject, which, though to some extent local in its interest, has much in it that will be found generally useful, and is, therefore, placed before our readers.

The report was produced in consequence of the Master Builders' Association having requested the Society's opinion as to the desirability of introducing brickmaking machinery into Manchester, or rather machinery of a certain description; and it is signed for the committee by Mr. W. R. Corson, president, and Mr. J. Murgatroyd, hon. secretary.

The committee appointed on the 13th April, 1868, to consider and report on the methods of brickmaking in this neighbourhood, and to make suggestions with the view of obtaining better bricks than those generally in use, beg to submit the following report:—

They have examined and tested bricks from various crofts near Manchester, and several

machine-made bricks, including those presented to them by the Master Builders' Association. They have also visited works at Bradford near Manchester, where one of Bradley & Craven's machines is making bricks from coal shale; and also the works of Messrs. Platt, Brothers, at Oldham. They have had interviews with a deputation from the Master Brickmakers' Association, and with one from the Operative Brickmakers' Union.

Their inquiries led them to investigate particularly the following points in connexion with bricks and brickmaking:—

1. Regularity of shape.
2. Uniformity of size.
3. The size to be recommended as a standard.
4. Uniformity of material.
5. Density.
6. Power of absorbing water.
7. Ditto of retaining it.
8. Methods of manufacture.
9. Price.

Your committee has not thought it necessary to make experiments on the weight required to crush any of the bricks they have examined, such experiments on individual bricks giving no reliable data for calculating the weight that would crush a mass of brickwork.

Your committee may observe that the best stock bricks made in this neighbourhood seem nearly all that can be desired as to colour, regularity of shape, and quality, though the subsequent remarks will apply to them also, under the heads 2 and 9; and they have, therefore, more particularly directed their attention to the improvements necessary to produce the best common bricks for general use.

In the whole of the experiments your committee has used bricks of good, though not specially selected quality.

TABLE I.—Showing average Size and Weight of Bricks, with Quantity of Water absorbed. The results are the averages of several specimens of each kind by total immersion.

Description of Brick.	Contents in Cubic Inches.		Weight in Pounds.		Water Absorbed by Total Immersion.		Per Centage of Water absorbed to the Volume of the Brick.
	lb.	oz.	lb.	oz.	cu. in.	Per Cent.	
Common hand-made, ten samples from various crofts near Manchester	103.5	8 2.25	109.75	11.8	20.75	19.8	
Builders' Association, machine-made	149.12	8 12.5	119.6	19.7	34.9	24.29	
Platt's machine-made	116.04	8 4.5	123.39	12.5	21.6	18.6	
Hutchinson's machine-made	114.85	7 15.5	129.60	9.575	17.0	15.0	

1. *Regularity of Shape.*—This is a most important point when, irrespective of appearance, the greater liability to fracture is considered, when the points of contact in built work are few. In this respect the machine-made bricks alone can be said to combine the qualities of true and parallel surfaces and general rectangularity, though they seldom maintain a good arris. The hand-made bricks are almost all defective in the above requirement, a large proportion being warped, bulged, rough-faced, and with very irregular arrises, proceeding partly from indifferent tempering of the clay, neglecting to pick out stones, the use of so soft a material in moulding that it becomes distorted in handling, the rough surface of the drying-ground, want of protection in drying, and the haphazard modes of burning.

2. *Uniformity of Size.*—This has an important bearing on the cost of brickwork, the number of yards of work set by 1,000 bricks being much less with bricks made from a stiff clay (which, from the quantity of water used in the manufacture, shrink in drying to a small size) than with those made from a more sandy clay, and when no difference in price is made on account of the increased or decreased size. Much difficulty and annoyance are also caused when calculations on bonding-faced work and ashlar dressings, that have been based on one size of brick, become nugatory on account of that size being used up, and when bricks from another kiln, and therefore probably of other dimensions, are brought to the building.

The method of manufacture is entirely to blame for this fault. From want of protection in drying, some bricks are partly washed away by the rain, often unequally so, or more on one edge than the other. It is also obvious that different-sized moulds should be used for different kinds of clay, so as to produce bricks, when burned, of uniform size with others. This matter appears to be entirely under the control of the master brickmakers; for, although the operatives have, very properly, a standard maximum size, beyond which they will not mould bricks (10 in. by 5 in. by 3 in.), they have no objections to use smaller moulds; and, if their maximum

size be used for stiff clays, others smaller should be used for more open ones. There is, however, a strong temptation not to do so, as full-sized moulds will produce a large brick from open clays that will be preferred by certain classes of builders. The introduction of machinery, without graduating the sizes of the moulds, would therefore not obviate this objection; and to introduce larger moulds than the maximum standard in one locality would only lead to their being used elsewhere, and thus the spirit of competition would unceasingly increase the size of bricks till they became too unwieldy for bricksetters to handle. It is a question for consideration whether stiff clays might not be rendered more open by an analogous mode to that followed in the Midland Counties and London, by mixing a more loamy clay, or breeze, or sand with them.

It is also well known that different-sized bricks can be made even from the same clay, under different conditions of tempering.

3. *The Size to be recommended for the bricks when burnt, so that all shall be uniform, from wherever procured, should be one that would not be too large nor too heavy for a bricksetter of average strength to handle, and such that two brick breadths should, with the mortar joint, equal one brick length, and three thicknesses, with the joints, equal to the same dimension; and taking into consideration the size that can be procured from stiff clay, it would appear that 9 in. by 4½ in. by 2½ in., or 110 cubic inches, would be the best for general use, and such bricks would set, exclusive of waste, exactly 11 yards of 9-in. work per 1,000. Some bricks, made from stiff clay, are a little less than this; but a proper amount of attention in tempering the clay stiffer would no doubt bring it up to the size required, if so managed that the freshly moulded brick should contain about 27 per cent.*

of water instead of 33, which it often does now. We may here mention that the cubic contents of the bricks made in the neighbourhood of Manchester range from 94 in. to 115 in., averaging about 104 in.; that Messrs. Platt Brothers' bricks average 116 in.; the sample bricks submitted by the Master Builders' Association, 140 in.; and Mr. Hutchinson's, 115 in.

4. *Uniformity of Material.*—Want of attention to this requirement is the cause of many of the faults alluded to under No. 1. We find stones not properly picked out of the clay, and bricks hurst or halged in consequence. There is also frequently an incomplete mixture of clays of different strata, with bands of sand or other foreign materials in them, and consequently a varied mechanical and chemical composition of different portions of the same brick. A more effectual sorting of stones, &c., out of the clay, and more careful casting and tempering, whether by means of a pug-mill or otherwise, are absolutely indispensable to achieve improvement in this respect, whether the bricks be intended to be made by hand or by machinery. Grading the clay by means of rollers would not seem to be desirable where limestone is present; to crush up which amongst the material would only be to more thoroughly disseminate centres of destructive force, ready to hurst the bricks on the admission of moisture.

5. *Density.*—While on the one hand it is desirable that appreciable hollows should not exist in the texture of a good brick, neither on the other is it desirable to so compress the material as to totally exclude air, and thereby not only render its proper burning difficult, but also make it so heavy in proportion to its cubical capacity as to be tiring to handle, expensive in carriage, and the cause of increased outlay where structures are to be carried on iron beams, or for arching, &c. The bricks submitted by the Builders' Association compare well in this respect, the weight of a cubic foot being 110½ lb., while the average of hand-made bricks is 109½ lb.; of Messrs. Platt's, 123½ lb.; and Mr. Hutchinson's brick, 120 lb.

Hardness is not necessarily commensurate

with density. The Builders' Association brick, though little removed in density from the hand-made one, is very considerably harder, while the most dense of other machine-made bricks appear rather wanting in toughness. It appears, indeed, to your committee, that the more the tempering and kneading manipulations of the clay are dispensed with, the less probability is there of a tough homogeneous brick being produced.

the desirableness of applying pressure, in moulding, in a different direction to that in which it is generally done. In testing the facility of parting with water, the bricks, after being saturated, were left to dry at a natural temperature. Messrs. Platt's and the Collyhurst bricks lost in the four hours and a quarter only about half of what the others had done; in four days they were all nearly on an equality, and after that time the Builders' Association brick and Messrs.

with layers of fuel, appears particularly objectionable and wasteful, giving uncertain and incommensurable results for the fuel used, besides certain distortion and inequality of colour.

The systems of burning at Messrs. Platt's and at Messrs. Livesey & Johnson's, at Bradford, by kilns built in compartments, the latter being "Hoffman's" method, and the former an approximation to it, so that the waste heat from one division may be turned into the adjoining ones before commencing to apply them with fuel, both point to drying or completing the drying of the bricks by means of waste heat, and both seem to be economical and satisfactory in results. Your committee is well aware that either system is beyond the means of most brick-makers, and would only be remunerative where a very considerable quantity of clay is at hand. But it seems a question for fair consideration, whether bricks should necessarily be made and burned in immediate proximity to the spot where the clay is obtained.

It is not at all improbable that the additional care and attention shown to be requisite can be carried out without enhancing the price of hand-made bricks. They are at present sufficiently dear; and if machinery could produce an article superior in the most important requirements, and but little inferior in others, at a much lower price, its introduction would no doubt be welcomed by all engaged in building operations, to whom a reduction in the price of material would be some compensation for the constantly-increasing cost of labour. It must, not however, be forgotten that the increased care recommended would diminish the enormous waste and the difference in number between the quantity of bricks actually moulded during a season, and the number that are ultimately delivered to the consumer fit for putting into a building, and would thereby bring a proportionately greater profit and reduction in price at the same time.

Bricks of good quality should be of a uniform size, say 9 in. by 4½ in. by 2½ in., and should weigh at the rate of about 110 lb. per cubic foot, or about 7 lb. each.

They should be rectangular, with true faces, and only the sides and ends need be smooth; the arrises should be sharp and straight.

No print sinking on either face. They should not absorb, when saturated, above 20 per cent. of their bulk of water, and should absorb it reluctantly, and part with it with facility at ordinary temperatures.

They should be uniformly burned, and have a metallic clang when struck together.

They should be tough and "pasty" in texture, and not granular, so as to require repeated blows to break them, rather than one single hard blow. Superiority in this respect will cause the bricks to retain their entirety and sharpness of their arrises in carting and handling.

The hand-made bricks cannot, as at present made, be relied on for complying with the above requirements, though some closely approach the standard of size, weight, powers of absorption, and toughness; but they are unequal even when from the same ground, and very much so when those from one ground are compared with another; in the other requirements they are generally very deficient.

With regard to the machine-made bricks, Messrs. Platt's process would not appear to be practically introducible in the neighbourhood of Manchester for they might be produced by it at a low price and of generally uniform quality, yet its merit consists as much in the preparatory processes as in the moulding machine; and the immense extent and cost of providing for these, places it beyond the reach of any but those possessed of considerable capital; and it might be necessary, where the beds of clay are thin, to bring the material to the manufactory from a considerable range of ground.

The bricks presented by the Master Builders' Association comply with the majority of the qualifications, and in most respects are superior to the bulk of hand-made ones; but they should be made smaller, to comply with the standard size, and their somewhat granular texture, as well as the friability of the arrises, and immense absorptive powers, point to the necessity of some method of improving the tempering of the clay.

The bricks made by Mr. Hutchinson's process seem, in many respects, the best your committee has had the opportunity of examining. They are sound, homogeneous, not granular, and possess a surface well adapted for making a good mortar joint; their low absorptive power is also

6 and 7. Power of Absorbing and Retaining Water.—The annexed table will show the relative values of different bricks in this respect. For the purpose of securing dryness of dwellings, &c., the brick which imbibes the least moisture, and that the most slowly, and which parts with it most rapidly, is the most desirable: not only will there be less probability of driving rain penetrating walls under such circumstances, but the action of frost must be less injurious than when it attacks a material whose pores are filled with moisture. It will be observed from the experiments with bricks laid on their edge in water, that all kinds except Mr. Hutchinson's will become saturated for all practical purposes within fourteen hours—Messrs. Platt's, indeed, and one from Collyhurst, in two hours and a half,—that the quantity of water absorbed is not, as might have been expected, in inverse ratio to density; Messrs. Platt's, the most dense, absorbing 18.6 per cent. of their bulk of water; Mr. Hutchinson's 15 per cent.; the Builders' Association brick 24½ per cent., and the hand-made bricks varying much, but averaging 19.38 per cent. The rapidity with which the water was absorbed was most contradictory; the Builders' Association brick, which in the first quarter of an hour had absorbed 30 per cent. of its total quantity, as against 47 per cent. of that of the Hulme brick, had at the end of two hours and a half surpassed the latter in the ratio of 85 per cent. to 68½, though even then far behind Messrs. Platt's, which had absorbed 98 per cent., being nearly saturated. It will be observed from the tables 2 and 3, that some bricks, though they absorbed in a given time a larger proportion of their total capacity than others, yet where that capacity was small the actual quantity taken up might be less, and as the penetrating effect of damp must be gauged by the latter characteristic, it will be seen that the position of the different bricks as to quantity absorbed in a quarter of an hour, one hour, two hours and a half, and fourteen hours, was pretty uniformly thus—1st. Mr. Hutchinson's (least); 2nd and 3rd. Hulme and Bradford; 4th. Messrs. Platt's; 5th. Collyhurst; 6th. Builders' Association (most). The majority of the bricks, when immersed, absorbed the water more rapidly at their sides and ends than at the top and bottom beds, as shown by the air-bubbles: this would seem to point to

Platt's surpassed the others in rapidity of drying.

In the earlier stages of the drying process, the order in regard to rapidity is—Hutchinson's, Bradford, Platt's, Association, Collyhurst; and in the latter stages—Association, Collyhurst, Platt's, Bradford, Hutchinson's. Thus the bricks which parted most eagerly with their moisture at first, were the longest in drying, and vice versa. At the end of eleven days none were perfectly dry, from ½ oz. to 1½ oz. water being retained.

8 and 9. Method of Manufacture.—Price.—From the foregoing remarks, it appears that the following points require attention to improve the character of the common brick:—

- Greater care in cleaning the clay, and in thoroughly tempering it.
- Variation in the size of moulds, so as to produce uniform-sized bricks from various clays.
- Moulding the bricks with material of anob consistency that it may not become misshapen by the effects of its own gravity.
- Greater regularity of surface of the drying-ground.
- Protection from extreme variations of temperature and rain in drying.
- Less frequent and more careful handling in the process of drying, so as to preserve the edges.
- A means of burning whereby the amount of firing shall be under control.

On points e and g, it would appear that wherever onlay has been made by brickmakers towards this end, whether by covering the "walled" bricks in drying by boarded copings, roofing over the clamps to protect them from rain, or shielding them from the action of the wind, a proportionate improvement in quality of the bricks, and a diminution of waste, has followed. Attention should, however, be directed to still greater protection during the earlier stages of drying, and to some method of burning in properly-constructed kilns, where the amount of firing shall be under control, and the "live holes," or firing-up apertures, so shielded from the wind that the heat may not be driven here and there uncontrollably by it. The present system of burning common bricks by so-called "close fires," where the bricks are interspersed

a recommendation, and they present a good surface when cut and rubbed, and we understand that they can be produced at a reasonable price. They are somewhat heavy, and would, we think, when required for fire-proof floors or walls supported on iron beams, be improved by any treatment tending to lighten them. The process also requires improvement to secure greater regularity and uniformity of burning.

Your committee might have extended this report by giving various details of the different modes of manufacture, but they are of opinion that the immediate object of their appointment will be secured by the particulars they have given. It now rests with the manufacturers to determine in what manner effect may be given to these recommendations, bearing in mind, however, that though lowness of price is an important consideration in itself, yet that equality of size of bricks and reliable excellence of material are of much greater importance to architects.

THE "BUILDER'S" LAW NOTES.

Alteration of Drains.—In a case where the vestry or district board of a parish or district, under the powers conferred on them by the Metropolis Local Management Act, substitute a new sewer in a course different from that of an old one, and think proper to divert house-drainage (not in itself deficient or insufficient) from the old sewer to the new one, they are bound to provide new drains for the old ones so diverted, and are not entitled to call upon the owners of the premises to pay the expense of such new drains.—*Vivet v. Vestry of Marylebone.*

Repair of Sewers.—The local authorities of a district are bound to lay down a sewer in such a district when necessary, and to keep the same in good and serviceable repair. It has been decided that the expression "repair" does not mean the reconstruction of a sewer which has been originally defectively made, but the keeping of the original sewer in proper repair. When, therefore, the Court of Queen's Bench issued a mandamus requiring certain guardians to put a sewer within their district in good and serviceable repair, it was held to be a sufficient answer that the sewer which had originally been constructed by another board had been defectively made; that it was, and that in consequence of its defective structure it could not be put into good and serviceable repair.—*The Queen v. The Guardians of the Epsom Union.*

Taking Possession of Houses.—The Commissioners of Sewers cannot take compulsorily the whole of a house unless they have first in due form adjudged that possession of the whole house is necessary for the purpose of executing their powers in the best manner.—*Thomas v. Dav.*

Public Health.—A mandamus directed to a local board of health stating that a sewer is in such a state as to be a nuisance, and commands the local board to cleanse it, cannot be enforced, as it does not show, according to the "Public Health Act, 1848," that the person causing the nuisance, or the owner or occupier of the premises where it exists, has failed to comply with notice to remove it.—*The Queen v. Godmanchester Board.*

LIGHT AND COLOUR.

I SHALL willingly wait for Mr. Thomas's exposition of the views he entertains on light and colour; and would he among the first to congratulate him if his promised experiments add anything to the discoveries of previous observers. At the same time I do most sincerely entreat him to make himself more fully cognizant of the truths which are known respecting light and colour, or (if he prefers the expression) of the principles of the undulatory theory. It surely must be worth while for any one who proposes to publish his own thoughts on such a difficult subject, to know accurately those conclusions at which the best philosophers of the present century have arrived, especially when we know that the most brilliant discoveries of the age have arisen, directly or indirectly, out of that theory, which now seems to promise more than was ever before hoped from it. Who does not admire the new and refined method of chemical analysis, by examining the powers which different substances possess of destroying waves of light of particular periods faster than others, as indi-

cated by the absorption-hands in the spectrum of the light they transmit? Who would have supposed, a few years ago, that the nature of many of the constituents of the sun, and even of the distant stars and nebulae, would have been revealed by the mere fact that their light is deficient in waves of certain periods? Or that whether a comet or other heavenly body shines by its own or by reflected light, should be seen in the directions of the vibrations of which its light consists? Yet the truth of these and many more such results depends entirely on every separate wave being preserved—doctrines which Mr. Thomas seems unwilling to admit, though their rejection would make as great a muddle of the whole science of light as he seems to suppose the various distinct vibrations to compound in the pure ethereal firmament.

When one of the scientific observers now so ardently engaged in following up the clue lately given by the science of light to find out some of the mysteries of the universe, receives through a narrow slit a beam of light from a distant nebula, causes it to pass through a train of prisms till, as he supposes, its various component rays of different wave periods are widely but variously bent from their initial direction, and diverge from each other sufficiently to allow of the accurate determination of their positions in the spectrum; and when viewing their spectrum through a telescope, he finds that these rays are (for example) precisely the same as the peculiar rays emitted by incandescent hydrogen and nitrogen gas, and thereupon announces that the said nebula consists of such incandescent gases; or finds that its several rays are each slightly more refrangible, or less refrangible than certain corresponding rays emitted by the same gases, and therefore calculates, that if the nebula consists of those gases, we are approaching to, or receding from, it at a certain rate; always relying implicitly on the doctrine that the rays he operates upon have retained their wave-periods invariable ever since the waves first started on their marvellous journey of perhaps a thousand years;—may we believe him? Or must we think, with Mr. Thomas, in his last letter (October 10), that the supposed great discovery of Newton about the prismatic rays is but one of his "infelicitous conjectures," and prefer with the same writer in his former letter (September 19), to believe that not separate vibrations issue from the luminous body, but only "a general vibratory motion of the elastic medium, which modified by the prism or other means produces in us all the varieties of light and colour?"

I can hardly believe, however, that one who shows such a liking to science as Mr. Thomas does should really mean to dispute any of its great fundamental principles, though his language implies as much. How could he hope to explain the magical influence by which, for instance, one and the same prism could modify any single kind of general tremor in so many ways, and cause it to produce in us such various sensations of colour, with such wonderful constancy, when we examine with it the light that proceeds from different bodies? What would be the use of so Quixotic an enterprise as to attempt the overthrow of a science built up by such slow degrees, with painful labour of thought and patient observation, by the masterminds of the last two centuries? Would it in the least forward any theory of numerical proportion being at the root of chromatic harmony? Would it not rather take away the only means of proving the existence of such a proportion? It seems more likely that the difficulty felt in accepting this part of the undulatory theory arises from an imperfect acquaintance with it; and the manner in which Mr. Thomas writes again in his last letter about rays, asserting that

* The demonstration of this, on dynamical principles, in respect of waves in general, was first given by Newton, who also showed that their velocity in any medium depended on the ratio of its elasticity to its density, and that their intensity diminishes as the square of their distance from their origin increases. Unfortunately, perhaps actuated by some jealousy, for he was not exempt from human weakness, Newton too hastily refused to admit the possible application of the undulatory hypothesis to light when suggested in an imperfect form by Huyghens; though in his most ingenious endeavours to apply a corpuscular hypothesis (always treating it as an hypothesis only), he was forced to call in the aid of ethereal vibrations, to account for effects now known to arise from the interferences of waves.

Newton's "supposititious bundle of an infinite number of rays has been transplanted to the undulatory theory," where it appears to him much more "cumbersome and improbable" than in its original domain; and asking, "What is the diameter of that handle? What is the form of section? What the disposition of its fasciculi?" shows that he has no accurate conception of what is intended by those terms, especially as he adds, "These arc questions which I have never seen touched upon, much less solved." Let me then again state that rays, in the undulatory theory, are nothing but imaginary lines, everywhere perpendicular to the advancing surface of the wave; and as every wave, so long as the medium through which it travels is of uniform density and elasticity, must spread with equal velocity in every direction from its origin, and therefore preserves a spherical form, these rays must also so long continue to radiate in straight lines from their source. But if part of a wave enters a medium which it cannot traverse with the same velocity, its surface is necessarily broken, and loses the spherical form, and the rays are bent accordingly from their original direction according to the law of refraction; and a reflected wave is also sent from the second medium back again into the first, causing rays to return according to the law of reflection.

Having acquired the idea of a single ray of light as the line perpendicular to the surface of the wave at a certain point, and indicating the direction in which the disturbance which constitutes the wave at that point is propagated, it is not difficult to explain what is intended by a beam or pencil of rays, simple or complex:—

First, suppose a single wave, or a succession of hundreds of waves, all of the same period, given out by a single shaken or vibrating atom, in the luminous body, just as a struck nail, or ball, may send out a single wave or a succession of waves of sound through the air.* The lines drawn from this atom to all points on the surface of the pupil of the eye, or in the orifice of an opening through which the light emitted by the atom shines, will be a bundle or pencil of homogeneous rays, which if the atom is distant may be regarded as parallel.

Next, suppose the same effect to take place in a great multitude of similar atoms, near together. The pencil of nearly parallel rays will now be composed of a number of subordinate handles or "fasciculi," each proceeding from its own distinct origin. It will, however, still be a pencil of homogeneous light.

Thirdly, suppose that these several atoms do not all vibrate with equal rapidity, but at two, three, or any number of different rates. Our complex pencil of rays will now be heterogeneous, composed of a number of subordinate handles, each of which separately would excite the sensation proper to its wave-period, but which altogether excite the sensation, either of whiteness or of some other colour, in which all the sensations proper to the separate handles of rays do in fact co-exist. When such a complex beam traverses the prism, the several subordinate handles of rays of which it consists, being differently refrangible, diverge at different angles from their original direction, and give us the spectrum proper to the peculiar light emitted by the congeries of atoms from which it proceeds.

Lastly, suppose a constant succession of shocks agitating the same set of atoms or other sets which come (one after another) into nearly the same positions, without which our light would be like that of a lightning flash, which does not continue for the hundredth part of a second, though the sensations it excites continue much longer. We have then exactly the case which is commonly presented to us in nature. Take a portion of the flame of a burning candle. A stream of atoms of incandescent gases sends out waves of some particular periods, which excite the sensation of blueness perceived in looking at the lower part of the candle-flame, and give a spectrum consisting of a few bright lines, separated by dark spaces; but the myriads of incandescent particles of carbon, like those of other solids, send out waves of all periods, and the more intense the heat of the flame the greater is the proportion of the shorter waves, as Professor Tyndall has lately so clearly pointed out. Hence the part of the flame where they abound gives a continuous spectrum, in which

* Mr. Airy, in his treatise on the undulatory theory, supposes that there are always a succession of some hundreds at least from each centre of disturbance.

(as might be supposed from the colour of the flame) the rays which produce the sensation of red are most intense or numerous, and the more refrangible rays occur in proportions far less than in the Hime light, the magnesium light, or the solar light.

None have yet attempted to number the colours of the waves, or successions of waves, of light that may originate in ever so small a portion of a luminous body in a second of time; but the period of the longest of them is known to be so short that they may be thousands of billions, without even two starting together; yet suppose as many as we please to be contemporaneous, however they might interfere with each other, the very manner of their interference ensures that in the whole there can be no loss of force in any wave, and therefore no loss of light. At particular points interference may destroy light, but then it will increase the intensity fourfold at other points, the whole effect remaining constant.

Perhaps the above slight attempt to explain a matter which is not in general very clearly stated in popular works, may lead some to regard with more respect a science which displays such marvellous perfection in the works of the Great Creator, and leads to such sublime considerations; a science whose evidences none can understand without a thorough conviction that every attempt to overthrow them must be futile.

With regard to the physiological considerations to which Mr. Thomas refers, I will only say that if Newton has satisfactorily shown that all the colours in nature are but compounds of the colours of the prismatic rays, and if Maxwell has satisfactorily shown that these prismatic colours are identical with the colours that may be produced by combinations of three of the prismatic rays, namely, those which excite the deepest sensations of red, green, and blue, then there is satisfactory reason to consider the sensations excited by those three rays as the nearest possible approach to three simple or elementary colour sensations, of which all possible colours are compounded. And if, according to modern custom, we use the term *primary colours* to mean simple or elementary colour sensations (in which sense it was used first, I believe, by the German astronomer Mayer, a century after Newton used it to denote the prismatic colours), then these three colours have a claim to be so called in preference to any other. To inquire in what manner those sensations are produced by the action of the various rays, may be interesting and useful, but is no more essential to the theory of colour, strictly so called, than is the inquiry into the nature of light. I myself incline to think that the optic nerve is so framed as to admit of three, and only three kinds of vibrations, and that these are severally excited with greater force by rays which more nearly accord with their several periods than by others. Some homogeneous rays, for instance, excite the sensation of red most powerfully, others that of green; while a third kind, of intermediate wave-period, excites both of these sensations equally at once, and thus produce the sensation of yellow.

This is no suggestion of mine, though the particular analogy, the possibility of which I have suggested in my book may be new. Aristotle himself, the first and best of the ancient observers of nature, whose writing have come down to us, had a similar idea about the relations of the principal colours; and Newton himself (whose most infelicitous conjectures are well worth our study, makes the following queries in his *Optics* (book iii.) :—

“Do not the rays of light in falling upon the bottom of the eye, excite vibration in the *tunica retina* which vibrations, being propagated along the solid fibres of the optic nerves into the brain, cause the sense of seeing

“Do not several sorts of rays make vibrations of several bignesses, which, according to their bignesses, excite sensations of several colours, much after the manner that the vibrations of air according to their several bignesses excite sensations of several sounds? And particularly do not the most refrangible and especially the shortest vibrations for making a sensation of deep violet, the least refrangible the largest for making a sensation of deep red, and of several intermediate sorts of rays, vibrations of several intermediate bignesses to make sensations of the several intermediate colours?”

“May not the harmony and discord of colours arise from the proportions of the vibrations propagated through the fibres of the optic nerves into the brain, as the harmony and discord of

sounds arise from the proportions of the vibrations of the air? For some colours, when they be viewed together, are agreeable to one another, as those of gold and indigo, and others disagree.”

Young, in his *Lectures on Natural Philosophy*, seems to have been the first to apply the notion to the theory of three simple sensations. I cannot but remark that had Newton's and Young's suggestions on this point been considered as they deserved on this, we should probably never have had so many fanciful and groundless analogies proposed between colours and musical notes, as may be met with in subsequent works.

With respect to regular spectra, I hope Mr. Thomas will carefully reconsider what I have written in the chapter on the optical modifications of colour, and try the simple experiments there mentioned, without any undue excitement of the eye, and with strict adherence to the cautions mentioned. I shall be disappointed if he does not find out that the doctrine I have laid down is correct. Having examined many memoirs on the subject, I am surprised that he considers it not in accordance with the “more advanced physiological explanations,” and should be glad to be informed where these may be found. But he misunderstands my doctrine when he says “the insensibility of the eye to one colour, according to Mr. Benson and some former writers upon this subject, is clearly, according to their own showing, a keen sensibility to another.” I only show that the excitement of any one of the simple colour-sensations tends to deaden for a time the sensibility of the eye for the same, leaving its sensibility for the others unimpaired.

Before concluding this already too long a reply, I must gently protest against what seems (but I am sure is not intended to be) a somewhat disingenuous attempt to fasten upon me the absurd notion that colour has objective existence, though my treatise begins by declaring “Colours are merely sensations produced by the action of light on the nervous tissue of the retina.” When I say (in a sentence imperfectly quoted by Mr. Thomas) “The colours of all natural objects are merely the sensations produced by those of the incident rays which they send to the eye,” my expression certainly admits of improvement, but their sense is obvious,—produced by such of the incident rays as the object sends to the eye; and not, produced by the colours of the incident rays. To find fault with such terms as “white light,” “colours of lights,” seems rather hypercritical when the meaning is plain, and both whiteness and all other colours are treated throughout as sensations alone. I thought I had said enough on this point in my letter of September 26th. We cannot always use an awkward periphrasis, such as “light exciting the sensation of white,” or “a green-producing ray.” But Mr. Thomas, I think, commits a much more serious fault when he defines light as a sensation only, ignoring the universal and principal use of the term to express that which proceeds from the luminous object and produces the sensation; and especially when he words his definition so as to make a distinction between light as a sensation and the sensation of colours, as if there could possibly be any sensation of colours which is not light. For in this sense “light” is a mere generic term, including all possible sensations of colours.

W. BENSON.

ON WRITING-DESKS.

THERE is a piece of furniture which is gradually becoming extinct; and which may be looked for in vain at Mech's, Parkin & Gatto's, or any other fashionable purveyors of writing materials; it is the large, plain, heavy, old-fashioned writing-desk, at which our grand-parents used to sit, with a business-like, and often gloomy countenance, so inexplicable to the young, whose cheerfulness seemed to receive a sudden check from the time that desk was opened, till the sound of the little click announced the key at length turned upon its mysterious contents!

What could those odious desks contain to occasion such long and serious faces? the deep thought, the frequent writing, the search amongst letters and memorandum-books—old, old papers—little packets unfolded, and again carefully replaced.

It makes one shudder to recall those times, which passed as a cloud, more or less dense, over the sunny brow of hopeful youth! Years have, however, revealed to us the secret, and we find ourselves growing old, with

writing-desks, which, notwithstanding their pearl, brass, or ivory dressings, wring from us every sentiment of pleasure and pain to which the heart of man is heir! Yes; we, too, now have desks, and will speak out that they inclose, and hold in a solid form, each transient joy and poignant grief of our lives, of which the outward world has, in comparison, witnessed but the passing shadow. In them lie concealed—yet ready to be brought before us at any moment—all the emotions that over disturbed the heart or pleased the imagination. Treasured up within their narrow limits, hallowed reminiscences are packed side by side with angry words, cold rebukes, claims of money, sympathy, or love! What a medley! Truly, O Desk, thou remindest one of the human heart itself! To ransack thy stores is to lay open the secret recesses of that vital spring, whereby we may trace the character and past life of thy owner! No wonder thou art kept locked! No one likes his inward soul to be invaded, the sanctified precincts of thought, words, and works to be entered by other than one's own self! The older we become the more tenuous are we of such infringements, and the more have we to stow away in those silent nooks.

But although the desks of our forefathers are gradually passing away, come to lumber-rooms, others to second-hand furniture shops, and the like, their descendants are numerous, elegant, and often costly in appearance; one can scarcely believe they contain aught but the most charming subjects for contemplation.

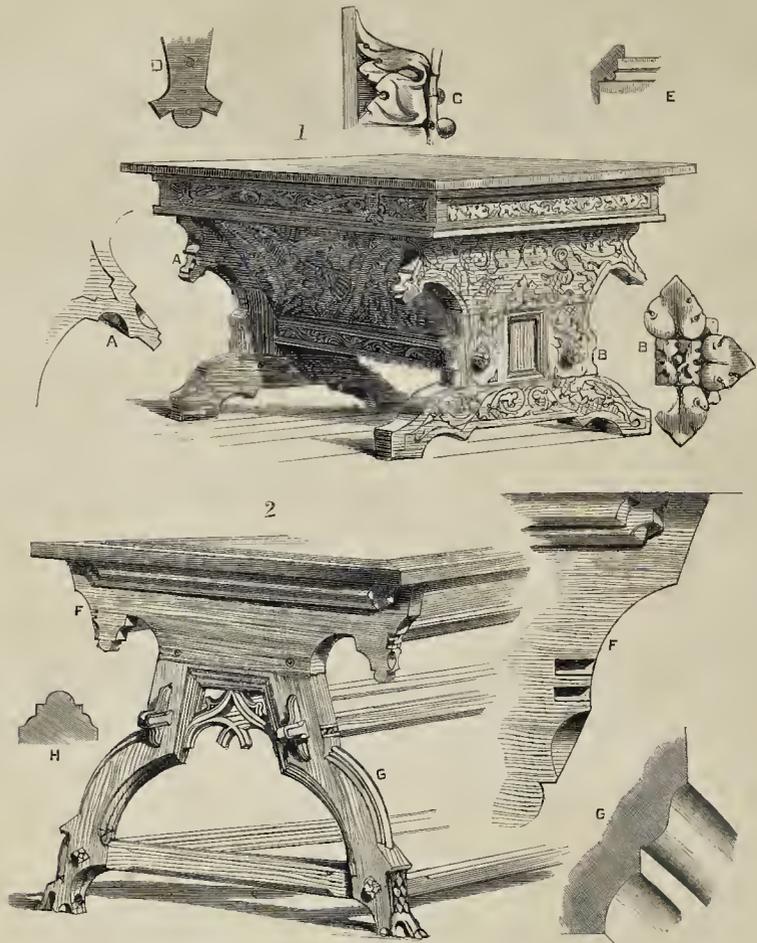

Children, too, in these days have their desks, and how simple and childlike are the contents! Their pure and unsophisticated minds are surely reflected in their little desks, the interior of which, in the genuineness of their nature, they display with such delightful frankness. Smooth and spotless as the bordered white paper they hand you to admire, is the dawn of those impressions which, coming in contact with this frail world, need so much skillful guiding,—bright and sweet as the little gilded scent-packets which accompanies the paper, imparting its fragrance to all around, are the hope and its fragrance which pervade that developing mind! In one corner may be seen the silkworm's golden skein, occupying a place that in after years we find devoted to some loved lock! An intricate puzzle net turns up! To us does it not portend difficulties to be encountered? While the paper-flower, concealing riddles within each leaf, speaks of hidden problems yet to be unraveled, the gay pen-wiper with its coronet of beads, almost too smart for use, dare it but admonish, would say,—“Use me'er the pen has defaced the fair sheet with discord, and remember that kind words echo kind feelings.”

All these, and many more, simple, yet to the contemplative mind, soul-stirring objects, are to be found in the child's desk; objects in which young eyes merely see an outward beauty, but into which the thoughtful penetrate, and behold the shadowy future.

The age of “toens” has, generally speaking, no desk; its substitute is the gay paper-case, iridescent with flowers of mother-of-pearl: if there be an unsettled and doubtful period of our lives, it is surely during those years from twelve to twenty, though it is then one looks around and beholds nothing but varying colours of brightness, warmed with life's meridian sun, our real mission lying in the grey undiscernible distance. True to the age is this gay, and in some measure, useful receptacle,—the paper-case. Open it, and the interior corresponds. What have we? Various coloured papers; scraps of poetry in German, French, and English; half-finished notes (of course we will not read them); “card of dances” at last ball; concert programmes: not that the owner is without many little treasure besides, but those are scattered in jewel-cases, glove-boxes, drawers. None, however, are in the paper-case. No concentration of feeling has yet taken place; time and circumstance alone bring that; and in doing so impart accordingly, strength and firmness to the character.

It is after twenty that the first firms of thought gather; these become united by thread-like intersections, which afterwards swell into channels through which a more or less healthy circulation deposits, as it flows, those useful resources which constitute the marked difference observable between one individual and another.

From that time those various accumulations unite, by slow degrees, till at length they swarm, and become, by some means or other, *used*, in that presence-chamber of our souls,—the desk! And

ANCIENT TABLES IN THE RATHHAUS, OCHSENFURTH, BAVARIA.

who can look over its contents free from excitement? Who can repress the strong feelings which rise or fall with the touch of every fresh packet? The vilest heart occasionally shudders at what it there encounters; for the writing-desk, though it be the hiding-place of many foul deeds, keeps no secrets when opened. The hese transactions of the swindler stare him in the face, and sinners look up therein traces of their own guilt! But, let us leave the contemplation of human nature in this its worst form; many a sweet souvenir draws us, like an overpowering magnet, into communion with our own desks; and although, while diving into the past, we may inadvertently open a partially-healed wound, close by will be found that remedial balm, the solace of friends, which, in their own handwriting, assures us of their sympathy and love! Not far from this source of comfort lie the rich anburn—the black—ah! and the grey curl—all that remains of dear ones that are gone! On these we like occasionally to look; and, allowing our thoughts full freedom, they fly swiftly over years that are past; halting only here and there at those prominent events which must for ever stand out in hold relief upon the chequered pages of our lives!

It is to the writing-desk that we consign our first small earnings, until necessity, or a more profitable investment calls them forth. In that desk, too, will be found our last wishes, when we have no longer breath to give them utter-

ance. At her writing-desk the careful housewife sits, pondering how to make "hoh ends meet;" and often by the midnight lamp may be found the speculative man, leaning over his, and reckoning profits which are, perhaps, at that very moment wrecked at sea. Who will, after such considerations, look with indifference on writing-desks? Those we have noted, and many other examples of feeling, varied as individuals' minds, find a resting-place in those lone receptacles of the heart. Whenever we are called away, survivors! respect their contents, for they represent the spiritual part of our nature, which too frequently passes through this life misjudged and misunderstood. Touch the long-treasured relics they contain with reverence, and on committing them to the flames, which must, sooner or later, be done, let it be with solemn thoughts and careful hands, for perhaps the spirit of the departed hovers over them! ANCIENT FURNITURE IN THE RATHHAUS, OCHSENFURTH.

SOME short time ago we gave a view and details of an interesting earthenware stove in the Rathhaus at Ochsenfurth, near Wurzburg.* Our present illustrations represent two very

curious old tables in the council chamber of the same building. No. 1 is made to open, and the upper portion forms a receptacle for documents. This table has been barbarously "grained" in imitation of oak; the wood of which it is constructed is a very fine pine.

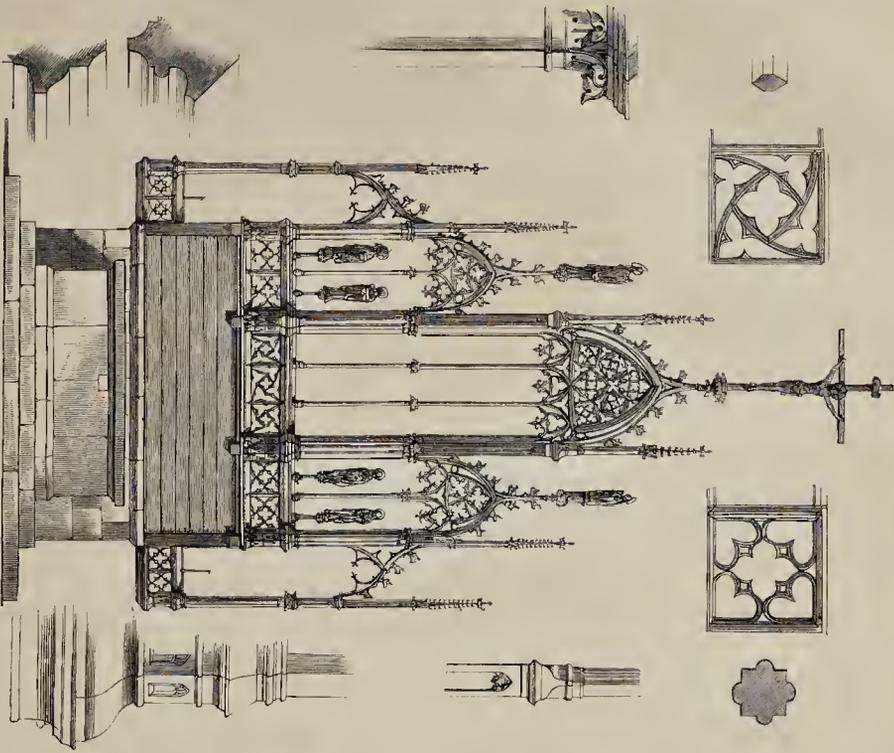

No. 2 is a still more remarkable example: like the former, it is of pine, but retains its old colour and decoration. The hollows are painted crimson with black spots. The chamfers are gilded. The slab of this table is ornamented with a "zigzag" pattern forming a border of inlaid wood. There are no less than eight other ancient tables in the same building, but the two we have illustrated are the most noticeable. The date of these interesting examples of ancient furniture is unknown, but from the style of the carving and mouldings there can be little doubt that they are works of the latter part of the fifteenth century.

MEDIEVAL BRONZE ALTAR AND CHANDELER IN AUGSBURG CATHEDRAL.

Chandlery, A.D. 1321.

**BRONZE ALTAR AND CHANDELIER
IN AUGSBURG CATHEDRAL.**

AUGSBURG CATHEDRAL, although by no means a magnificent or grand building, is exceedingly interesting on account of the singularity of its plan, the great antiquity of portions of the structure, and the very beautiful ancient furniture which it contains.

The cathedral consists of a large, lofty eastern choir, with apse, chancel, and surrounding chapels, all fourteenth-century work. The aisles of this choir are entered at the sides by two splendid doorways of the same date. Were the other portions of the church built upon a similar scale, with their choir and aisles, it would be one of the finest cathedrals in Germany; and it is highly probable that those who designed this choir contemplated the rebuilding of the whole church upon a scale of equal magnificence. The architect may regret that this scheme was never carried out, but the antiquary will be most thankful for its failure. West of the choir are two square Romanesque towers of moderate height, crowned with tall lead spires. These towers are placed so wide apart that the nave and aisles intervene between them. The effect of this arrangement is singularly ugly, and is not improved by the roof of the choir being higher than the towers themselves. The nave is very early Romanesque work, with double aisles of the fourteenth century. It is so low that the chancel arch is only as high as the aisles of the choir. The vaulting is fifteenth-century work, but very bold and good. Westward of the nave and aisles are two transepts, the same height as the nave, and these are crowned by a western choir, terminating in an apse. Internally this choir is raised about 12 ft. or 15 ft. higher than the floor of the nave, and beneath it is a very early Romanesque crypt. On the south side of the nave is a Romanesque chapel, dedicated to St. Blaise. The cloisters on the south side are late fourteenth-century work.

The bronze altar, of which we give an illustration, stands in the western choir in such a way that the priest, when celebrating mass, stands with his face to the people. The reposes is entirely in bronze; the constructive portions appear to be cast, and the ornamental ones beaten. The height to the top of the crucifix is about 35 ft. It is probable that the space now boarded up immediately above the altar was occupied by a retablo of costly metal work. The three centre spaces do not appear ever to have been occupied by statues, but the two outer ones were certainly filled up with some kind of ornament, as the rivets into which it was fastened are still visible. The four lower statues are of wood, gilt, and are probably not the original ones. The date of this most interesting work of art is 1346. This altar is about to be restored, and the portions which are wanting will be replaced.

In the apse, immediately to the west of this altar, is the ancient episcopal throne. It is a stone seat supported, upon the backs of two rudely-carved lions. It is evidently a work of very early date, and the little ornament used is quite classical in character. It is far older than any portion of the existing cathedral, and may have belonged to some earlier church. Against the wall, to the north of this altar, is another bishop's throne. It is of Early Romanesque work, and has a curious canopy over it supported upon pillars with ornamented shafts. Its date is 994. Westward of this altar and throne are a fine double set of stalls, richly carved, in deal. They are the work of the fifteenth century, and their good state of preservation is a strong proof of the durability of this wood for internal work. At the east end of this choir is a low metal screen. It is the work of the sixteenth century. Against the pillars of the nave are eight altars, the reposes of which are new, but contain most remarkable ancient pictures; four of these are by Zeitbloom, and the other four by the elder Holbein.

Hanging from the vaulting in the centre of the nave is the superb bronze chandelier, of which we give an illustration. The date of this fine work is 1321; and it is in a perfect state of preservation. The bronze doors to the porch on the north side of the nave date from the year 994, and are very remarkable (we have given a description of them in another number). Six of the windows of the nave contain stained glass, which is probably coeval with the building A.D. 990. They represent very rude figures, which, in drawing, strongly remind one of the Bayeux tapestry. They are probably the very earliest stained glass in existence.

The eastern choir contains a double set of stalls and stone sedilia, of the fifteenth century, the backs of which are hung with stamped leather, which has a very agreeable effect; and a modern Gothic high altar, of poor design. The chapels round the apse contain ancient altars, with beautiful sixteenth-century pictures, by Zeitbloom and Hans Burknaier, and some interesting monuments of bishops of the cathedral. Two of these are large tablets, carved in red marble, and show how this description of monument can be made ornamental, instead of disfiguring a building. The screens to these chapels are good specimens of late sixteenth-century metal-work. In the Lady Chapel is a good Early fourteenth-century stained-glass window. The whole church has been well restored. There is a little modern stained glass, but it is far from meritorious.

EXPLORATION OF PALESTINE.

WILSON'S ARCH is on the west side of the "Haram" area, near the Jews' Walling-place. Hero Lieutenant Warron sank a shaft last November, "to see what the wall was like" at that place. He found the rock, and the base course of the Haram wall let into the rock at a depth of 50 ft.; he discovered, also, a stream of water running "through the land," down this Tyropsean valley. Later, on January 22nd of this year, he wrote,—"We have made a great discovery this week, viz., a system of tanks, vaults, and aqueducts, in connexion with, and to the west of, Wilson's Arch: they are, apparently, of similar age and construction, and are likely to throw considerable light on Jerusalem topography. In fact, it appears to me that this system of vaults is the key to underground Jerusalem; and we may reasonably hope to have a good knowledge of the great embankment which runs across the Tyropsean valley." We have before us, just now received, a plan of these vaults, as far as they have been explored. In one row, the vaults are each 12 ft. square, and about 18 ft. high. It is evident, from the passages broken off and unexplored, that a great deal yet remains to be investigated here before the question can be answered,—What was the use of these vaults? The passage, which is 12 ft. wide and 14 ft. high, was probably used as a secret passage connecting the Jaffa Gate with the Haram area. By this, in case of a tumult, troops could be brought quickly and unperceivedly. It has been followed to a distance of 250 ft. from the wall.

We would remind our readers that the fund is wholly supported by subscriptions; that money is wanted; and that the society's office is at 9, Pall-mall East.

THE NEW BANKRUPTCY ACT.

THE Act passed last session to amend the Bankruptcy Act of 1861, came into force on the 11th instant, and as it is an Act of considerable importance to all men of business, the following abstract in popular language will no doubt be acceptable to our readers.

The Act provides that no deed between a debtor and his creditors, or any of them, relating to his debts and his release therefrom, or to the distribution, inspection, management, and winding up of his estate, shall be as binding on all the creditors as if they were parties thereto, unless, in addition to conditions hitherto observed, the following be also complied with—1. Together with the deed there is to be delivered to the registrar a list of the debts and liabilities of such debtor, stating the times when incurred, the consideration for same; the names, residences, and occupations of creditors, the respective amounts due to them, the securities held by them, and the estimated value of such securities. 2. There is also to be handed in a statement, setting forth the amount of the debtor's property and credits, and the estimated value thereof. This statement may be, from time to time, by leave of the court, amended, the amendment, as well as the original statement, to be on oath; and in the case of an amendment, the affidavit is to state the reason of the amendment being made, and why it was not in the original statement. Notice of the handing in of such lists is to be given in the *Gazette*, or in a daily paper, circulating where the debtor resides or carries on business, within such time as the general orders made by the Lord Chancellor and

two commissioners shall direct. Any person stating himself in writing to be a creditor, may personally or by agent, inspect the statement and amendments, and (on application in such manner as general orders shall direct) obtain a copy or extracts. Creditors assenting to the composition deed must prove their debt in the manner prescribed by the General Orders. In the computation of the requisite value, the amount due to each creditor, after deducting the value of the securities held by him on the debtor's property, shall alone be reckoned. The time for the production and leaving such deed at the office of the registrar, is to be twenty-eight days from the day of execution by the debtor, or such further time as the court may allow. Proofs by creditors are to be filed, and any person stating himself in writing to be a creditor, may inspect all the office documents in the case, personally or by attorney, and have copies, in manner directed by General Orders. The Act contains provisions respecting the examination of the debtor, and of any creditor, or alleged creditor, and others possessed of information; and also respecting the payment of the costs of such examination. The application for the examination must be by a creditor whose debt exceeds 10*l.* In case of a "deed of arrangement," creditors, in order to be reckoned in computation of majority, must prove their debts in the manner set forth in General Orders. The other portions of the Act are of a technical nature, referring to the jurisdiction of the respective Bankruptcy Courts, and to other strictly legal matters. The Act does not extend to Scotland or Ireland.

THE TRADES MOVEMENT.

A REPRESENTATIVE meeting of the trade societies of the metropolis has been held at the Bell Inn, Old Bailey, for the purpose of adopting such measures and taking such action as may secure the passing of a Bill which will place trade societies on a footing of social equality with other associated bodies. The circular calling the meeting stated that this had become necessary "by reason of the insecure position in which the recent conflicting decisions of judges have placed trade societies." A large number of trades were represented at the meeting. The chair was taken by Mr. Spelling, of the Velum Binders' Society. Among those present were Professor Besley, Mr. Lloyd Jones, Mr. Crompton (barrister), &c. Mr. Guile (Ironfounders' Society), moved the first resolution,—

"That this meeting, composed of representatives of various societies in the metropolis, having fully considered the Bill which has been prepared for the purpose of obtaining legal protection for the funds of trade societies, and which was brought before Parliament by Sir Edward Burton, is of opinion that it is sufficient for every legitimate purpose, and should receive the support of every well-meaning member of the House of Commons."

Mr. W. Allen (Engineers' Society), seconded the resolution, which was spoken to by Mr. Applegarth (Carpenters' Society), and Mr. George Potter (Joiners' Society). Mr. Lloyd Jones and Professor Besley also took part in the long discussion which followed. Mr. Odger suggested that the meeting should be adjourned, that the Bill should be improved if possible, but not abandoned. The consideration of the question was then adjourned.

A court of arbitration and conciliation has been formed in Manchester. The first step was taken by the local Chamber of Commerce, which invited a conference on the subject with the trades' council. Deputations from the two bodies accordingly met, and formally agreed that a court of arbitration should be established. One of the rules provides that the objects of the court shall be to arbitrate on any question relating to wages or other matters that may, by mutual agreement, be referred to it from time to time by the employers and operatives, and, by conciliatory means, to interpose its influence to put an end to any disputes that may arise. The court is to be appealed to only when the employers and employed have failed to effect an amicable settlement of any dispute by other means. The court is to consist of a chairman and sixteen members, eight of whom shall be selected by the Chamber of Commerce, and eight by the trades' council.

An adjourned annual meeting of the General Builders' Association has been held, at the offices of the Liverpool Master Builders' Association, South Crescent-chambers, Lord-street, Liverpool, Mr. Baker, of Bristol, presiding. There

was a large attendance of members from Birmingham, Manchester, Stockport, Chester, Bath, Coventry, Leeds, Bradford, and about twenty other of the principal towns in the Kingdom. Some routine business having been transacted, a long discussion took place on a resolution, that notice be given to the operatives that the following rules will come into operation on the 1st of May next:—"That wages in all branches of the building trade be paid by the hour;" "That all rules restricting machine or quarry worked stone be rescinded in all towns where they are now in force;" "That all disputes respecting wages or working rules be settled by arbitration." An amendment, that the debate be postponed for twelve months was proposed, but it was subsequently withdrawn, and the resolution was carried unanimously.

A very full meeting of the Bristol operative carpenters and joiners has been held, to consider their hours of work and wages. The first resolution adopted declared that the trade had long felt the necessity of having a legitimate half-holiday on Saturday, by leaving at twelve instead of two o'clock, and pledged the meeting to do all they could to secure so desirable an end. A second resolution contained a respectful request to the employers to make an advance of a halfpenny per hour on the present rate of wages (6d.), in order to bring the week's wages as near as possible to the present amount. It was decided to give the masters notice that the men would expect the increase to come into operation the first Saturday in May next. The chief reasons urged for the demand thus resolved on, according to the local *Times*, are that the members of the same trades in other towns, where the rent is cheaper and provisions are not dearer, get more money and work fewer hours than those in Bristol.

BUILDING OPERATIONS AND SANITARY IMPROVEMENTS IN BARNSELY AND THE DISTRICT.

The improved appearance of the town of Barnsley within the last few years, where perhaps building operations have been carried on as extensively as in almost any West Riding town, is very marked indeed. The numerous new collieries and iron works in the district have caused the building trade to be brisk, whilst the new Midland Extension from Cudworth to Barnsley has found ready work for a large number of hands. Barnsley possesses few good public buildings; but this will, no doubt, be altered, should a charter of incorporation, for which it is seeking, be granted. The want of builders has chiefly been in the erection of cottage property, for which there is yet great demand. The number of houses in the town in 1860 was 2,889; whilst in 1861 it was 3,368, being an increase of 679. Since that time new streets almost without number have been erected both at the west and south ends of the town. The operations are being further extended. At the last monthly meeting of the Board of Health, which is the governing body, upwards of thirty building plans were presented to the Board for approval, whilst at the previous meeting of the same body not fewer than fifty plans were approved. With regard to the sanitary improvement of the town, something has been done. A new sewerage scheme has been provided and carried out to a great extent. The Board of Health are, however, still wishful to provide for the wants of the public, and at their last monthly meeting they signed and sealed a contract for a new sewer on the Cockerham-road, which is about to be constructed by Mr. Henry Carter, of Barnsley. It may also be mentioned that something approaching 70,000l. has been spent in providing a supply of water from a scheme propounded by Mr. Hawksley, from the Yorkshire moors. At Ingbirchworth, a place about seven miles from the town, the works are scarcely yet completed; but the water has been supplied to the inhabitants for a few months, and, during the past trying season, has not been found to be wanting. In addition to these improvements, which have provided much labour for those connected with the building trade, there are several rather important enlargements about to be made. Plans have been prepared by Mr. Wade, and are now before the Poor-law Board in London, for the erection of two additional wings to the workhouse, which was erected in 1851 from designs prepared by Messrs. Lockwood & Mawson, of Bradford, at a

cost of 5,000l. A new wing is also about to be added to the present Beckett Dispensary, which has been built and presented for the benefit of the town by Mr. F. J. Beckett, of Torquay. The new addition is to provide an infirmary or accident ward for the reception of the numerous accidents which are constantly occurring in the district collieries and works. The changes brought about by the extension of the new line into the town will necessitate the erection of a new county court, the present one being required in the extension, so that there is every prospect that builders will find plenty of employment in the town and district for some time to come.

THE HOUSES OF THE POOR AT THE WEST END.

THE thirty-fifth section of the Sanitary Act of 1866 having, with the sanction of the Secretary of State for the Home Department, been adopted in the parish of St. James, Westminster, for the purpose of regulating houses let in lodgings, Dr. Lankester, medical officer of health, proceeded to ascertain the number of notices to be served on persons for lightening the pressure of the population on the existing lodging space. He commenced with twenty-five houses in Heddon-street (Regent-street), Rupert-atreet, and Tyler's-court. In these twenty-five houses he found 549 persons living; whereas under the regulations of the Act the houses would only accommodate 198 persons, showing that 350 persons would be turned into the streets. Carrying his investigations further, he estimates that there are 500 other houses in the parish equally overcrowded, and that at least 7,000 persons must be removed from their homes to carry out the regulations. If these 7,000 persons had been for the sake of their health compelled to get rooms somewhere else they would have been obliged to leave the parish and go to the surrounding parishes, or to the suburban districts, where it would have been impossible for them to carry on their occupations. Dr. Lankester states that he sees no remedy for this state of things but the erection of dwelling-places, adapted for the working-classes to live in, in the districts where labour is required. There are many spots in the parish where such lodging-houses might be slightly built. Nearly every court in the parish is overcrowded, and a gigantic nuisance, injurious to health. In the construction of such lodging-houses, the wretched domiciles which now minister to the poor, the indolent, the vicious, and the criminal classes, would be abolished.

OPENING OF TURKISH BATHS IN BRIGHTON.

The directors of the Brighton Turkish Bath Company (Limited) have opened their new building in West-street. The foundation-stone of the building was laid on the 2nd of last March. The contractors were Messrs. Cheeman & Freeman, of Brighton. The architects were Messrs. Goult & Gibbins. The style is of an Oriental or Moresque character, even on the exterior. The height of the building is 56 ft., and it has 50 ft. of frontage. Its depth from front to back is 120 ft. The gentlemen's bath is entered from the upper, or north, side of the frontage, through a waiting-room, 13 ft. by 21 ft., and an ante-chamber. The "cool-room is a large, nearly square, Alhambraic hall, 47 ft. long and 45 ft. high. There is a miniature fountain close to the entrance. A polished and deeply-attained flooring skirting the apartment and enclosing shining and rich coloured tiles for the inner part. A marble bath, 35 ft. long, 5 ft. wide, and 5 ft. deep, bordered with exotic plants, leads up to a Moresque triple arch, one section of which is closed by lace curtains and the side arches by heavy red curtains. There are "divans" round the room, curtained and cushioned and pillowed in damask and silk of varied hues. In a gallery above, similar drapery and curtains show "divans" there also. The high and steep-pitched roof overhead has beams, rafters, and pillars of Moorish design.

The triple arch leads into the "hot room." This chamber, about 30 ft. in diameter, is floored entirely with white veined marble. There are four recesses of the room; two of which are used as hot rooms in aid of the central chamber;

the other two being used respectively as a lavatory and a douche room. The large hot room is kept at a temperature of from 115 to 120 degrees; one of the recesses is at about 150 degrees; the other can be heated to 180 degrees. The recesses are fitted with marble slabs, by way of couches, covered with felt and having pillows and cushions. The hot air comes in from the furnaces under the building through perforated zinc.

In the gallery (13 ft. in height to the roof) are three private baths with divans and hot rooms. The Ladies' Baths are on the first floor, and are approached by a separate entrance on the south side of the frontage. There are four hot-rooms, each 9 ft. by 10 ft. 6 in.; two cool-rooms, about the same size, and one large cool-room, 27 ft. 6 in., by 14 ft. 5 in. The waiting-room for the ladies' bath is on the ground-floor. In the back part of the upper story of the building is a laundry, with drying-rooms, &c., attached. There are also rooms for the shampooers and attendants. The cool-rooms were decorated by Mr. T. Dury, who has furnished the stained glass and will complete the decorations. The heating was executed by Messrs. Joakes & Co., of London. Mr. Parker has acted as clerk of the works during the construction of the building.

CHURCH OF ALL SAINTS, LITTLE MUNDEN, HERTS.

On Thursday, the 8th inst., the parish church of All Saints, Little Munden, was re-opened for public worship after being repaired and renovated. The manor, of which this is the parish church, is very ancient. Domesday Book mentions the name of a vassal of Earl Harold, to whom it belonged in Saxon times; and how William the Conqueror afterwards disposed of it. The church belongs chiefly to the beginning of the fifteenth century. It contains some remarkable canopied monuments with sculptured effigies. In July of last year a circular was issued by the rector, the Rev. F. A. L. Foster, in which the state of the church was described in the following words:—"The whole of the fabric has fallen into a bad state; the walls require re-facing; the stonework generally needs repair or restoration; the woodwork of the roofs has been disfigured by alterations, and is much decayed; drainage and paving must be attended to; there should be new seating throughout, and means must be provided to warm the church, at present so damp and cold as to be scarcely endurable in winter." Through the strenuous exertions of the rector and parishioners, the programme of restoration, as traced in the circular quoted, has been carried out. The church consists of a west tower, nave, north aisle, a north chapel, and chancel; but there was doubtless a much earlier church on the same spot. Some vestiges of this are observably at the north-west corner of the building, and have been carefully preserved. The walls, which are of flint, with freestone dressings, have been refaced; and the windows restored.

The coarse modern porches have been removed, and two new ones erected at the north and south entrances, constructed of the same materials as the main body of the building, and in accordance with its style of architecture. A stone groined vault, of which only indications remained, has been put in at the western entrance through the tower. This ought really to be the chief entrance to the church; but it is at present obstructed by a large raised pavement, resembling an organ-loft, just over the door. This is private property, but it is to be hoped that its owner will be persuaded to consent to the removal of so unsightly an obstruction. The interior of the church and the porches has been paved with tiles. New open seats, of stained deal, have been substituted for the old pews, except in the north chapel and the chancel, where such of the old seats as could be used have been worked in. The pulpit and reading-desk are carved in oak. There is to be a new reredos. The roof of the nave (one of the Hertfordshire king-post kind) is open, showing the rafters. The drainage has been attended to, and the interior is warmed by hot-water pipes. At the south-east angle of the church a vestry has been erected, the want of which has caused some inconvenience hitherto. The path through the churchyard leading to the north entrance, which was five steps above the floor of the church, has been lowered and levelled. The architects of the works were Messrs. G. & H. Godwin, of Brompton. Mr.

Ginn, of Puckeridge, was the builder; and Mr. Leigh clerk of the works.

The tower had been left undone for want of funds; but on the occasion of the opening, the lay-patron, Lieut. Colonel Loyd, who had already subscribed handsomely to the works, undertook the cost of bringing the tower into the same sound condition as the church.

REEREDOS, HEMPTON, DIOCESE OF NORWICH.

A new reeredos has just been completed in Trinity Church, in this parish, and dedicated to the glory of God, in memory of deceased communicants. It occupies the entire east end of the chancel, from north to south, and is divided into three compartments, the central part higher than the two sides, and rising up to a point. The central space is occupied by a cross, in green and red marbles, on alabaster, executed by Messrs. Field & Co., of Westminster, and it is flanked by two panels in Minton's majolica tiles, embodying the passion-flower and the Agnus Dei. The whole of this part rests on a retablo of stone, inscribed, "By Thy cross and passion, good Lord, deliver us," whilst the monumental inscription is placed behind the altar. The whole has been executed from the designs of Mr. C. J. Moxon, architect, London.

BIRMINGHAM NOTES.

The London builders are sending fair orders into this district for tools and material. Mr. Milward, successor to Allarton & Powell, the well-known awl-blade makers of Birmingham, is cautioning the public against an improper use which is being made of the name of the firm by a late manager in their employ. The inquiries for stove-grates and register-grates are steadily maintained, and door-knockers command a considerable request. The difficulty among builders and ironmongers often experienced in regard to the "band" of locks required for doors, is being effectually remedied by Messrs. Carpenter & Co., of Wilkenhall, who have recently introduced a number of new patterns of their double-banded rim and mortise locks, adapted for doors opening either to the right or left. The wrought-iron makers in East Worcestershire have a better demand in the leading branches, and the men are getting better wages for their work. The awl-blade makers at Bloxwich are better employed both for home and export. In the bolt trade, the manufacturers in South Staffordshire are introducing machinery on a more extensive scale, and thereby reducing the cost of production. The price both of "towel" and "barrel" bolts is proportionately lower. The Brassmasters' Association, at the recent quarterly meeting, decided that the price of brass should remain unaltered during the next three months. English tin is higher. Ornamental fences, gates, and balustrades, both in wrought and cast iron, are in more request for home and Continental trade.

THE ATLANTIC CABLES.

The manufacture of a new Atlantic telegraph, which is to be submerged between Brest, on the French coast, and a suitable terminus on the shores of the State of New York, is progressing satisfactorily. The new cable is almost identical in construction with those which were completed in 1856, the only difference being that the diameter of the conducting copper core is slightly greater, and the outside wires are of homogeneous Bessemer steel, galvanized, having a breaking strain of about 1,000 lb., while the wires outside the existing Atlantic lines have a breaking strain of only about 800 lb. The new cable will be laid in two lengths,—one from Brest to St. Pierre, off the south coast of Newfoundland, of 2,225 miles in length, not including slack; and the other from St. Pierre to the terminus, of 22 miles in length, not including slack. The water section will be similar to the Persin Gulf cable, as it will have to be laid in comparatively shallow water, and its exterior wires will be protected with Bright & Clark's patent silicious compound, which consists principally of powdered flint and pitch. The construction of the shore ends will be similar to that of the existing Atlantic lines, and will gradually become thinner

until they assume the deep-sea dimensions. During the summer Her Majesty's ship *Gannet* took soundings along the proposed route. In order to avoid the dangers of injury from rocks and icebergs, the new line will be laid to the south of the present cables, below the southern edge of the Great Bank, so that it be in deep water. Sir James Anderson will command the *Great Eastern* during the expedition organized for the submergence of the line. The breaking strain of the new steel cable will be 7½ tons, and the strain required for submergence need not be more than 14 cwt. Even if at any time it be necessary to haul up any portion of it already laid, the strain need not exceed a ton and a half in the deepest water. The weight of copper forming the conductor of the existing Atlantic cables is 300 lb. per knot; in the new cable it will be about 400 lb. The *Great Eastern* has arrived at Sheerness, whence she will proceed with the cable probably in the end of next June.

We are glad to state that the Atlantic cable of 1866, which sustained some damage two or three months ago, has been repaired, and is again in working order.

THE DUBLIN WATER SUPPLY.

FOUL RESERVOIR BOTTOMS.

The water supplied at great outlay to Dublin from the Roundwood reservoir is pronounced undrinkable by the consumers. The Roundwood reservoir lies in a valley, one end of which is closed by an embankment, while the Vartry—a sufficiently pellucid stream—enters at the other. The bottom of the reservoir is composed in part of peat-hog, and hence, it is said, the impurity of the water. In process of time, no doubt, the peat in the Roundwood reservoir will either be washed thoroughly or rotted away, and then the water will become pure, but the process must be tedious, and for years the water supply of Dublin may be defective. Unfortunately, in the case of the Dublin Waterworks, washing cannot be effected. The Roundwood reservoir takes two years in filling, and to empty it now would be tantamount to postponing the supply of water to Dublin from the Vartry for at least a year. It is not easy to suggest any remedy other than the emptying and refilling of the reservoir. Water stained by percolation through peat cannot be purified by any filtering power which a great water company can be expected to employ. It is somewhat remarkable that engineers seldom pay the smallest attention to the character of the soil on which they propose to store up water, except in so far as its peculiarities are likely to affect the permanence of the storage embankment.

A physician, writing to one of the Dublin papers, suggests a reason for the impurity of the new supply which deserves attention here. He asserts that the valley of the Vartry was for many years thickly populated, and that the soil has been greatly contaminated by excreta and sewage matters which, now being dissolved out, render the water bad.

GENERALISATION IN ARCHITECTURAL EDUCATION.

The article under this heading, in a recent number of our Journal, has called forth a rather melancholy and desponding letter from a correspondent who signs himself "Adelphi," a letter which, however, we have no doubt expresses very much the feeling of many who have been decoyed into the profession by premium-hunting architects, and find, after the best years of their youth have been spent, that they have learned nothing satisfactorily, or that they do not possess the special talents which they discover, when too late, to be absolutely necessary for success in the profession. Many can sympathise with "Adelphi." Even those who were fortunate enough to be placed under a member of the profession who conscientiously endeavoured to do his best in instructing his pupils, must remember their own feelings of helplessness when, at the expiration of the articles, they began to consider what they really knew, and what capability they possessed for carrying out works on their own account. The answer to "Adelphi's" question, "Where are we to get the education we require?" we believe can only be, for the present, that a man must teach himself, as well

as he can. Details of construction may be learned during studentship, but all that appertains to the history and the principles of architecture, as an art, must be obtained for themselves from the study of published works, attendance at societies, and from thinking out the subject themselves.

There is one means, however, whereby the present apprenticeship system might be made to bring forth much better fruits than it does, or has hitherto done, viz., the more conscientious recognition by architects of their responsibility for the proper training of a pupil for whose education they have received a premium, and a greater degree of care and caution on the part of those who advise or induce a young man to commit himself to the study of so arduous and exacting a profession. What becomes of all the young men who go through their term of apprenticeship in architects' offices, and are then never heard of again? In nine cases out of ten, they have very likely been carelessly bound over by friends to a master who receives them as carelessly, without the slightest effort being made to explain to them the real bearings of the profession they are to undertake, or to ascertain whether they possess in any degree the natural ability for it, without which genuine success is out of the question. On this latter point, the architect who takes the pupil is the man most able, generally, to form a judgment; and it is not too much to say that any architect who, knowing what the profession requires, accepts as a pupil one who he is aware has no capability for it, without giving him or his parents a word of advice or caution on the subject, but quietly pocketing a premium and letting a lad's youth run to waste in copying drawings, such a man is guilty of a moral delinquency; he is carelessly permitting a fellow-creature to take a false step in life, which perhaps can never be wholly retrieved. This is surely an evil case; yet how common it is it would perhaps be well not to inquire too closely. If the remarks on architectural education, which occasioned the letter of "Adelphi," should have had the slightest influence in awakening to a more serious view of the subject either any who are entering the profession, or any of those who are undertaking the responsibility of acting as their professed and premediated teachers, they will have done good.

MASBRO' CEMETERY COMPETITION.

There were twelve competitors, and some of them sent in two or three designs each. The number was, according to pre-arrangement, first reduced to five, and then to three. The final choice fell upon the plans of Messrs. Blackmoor & Mitchell-Withers, of Rotherham and Sheffield. Next came those of Messrs. Swann & Hill, of Sheffield and Leeds, and those of Mr. Thomas Dobb, of Rotherham. It was accordingly unanimously resolved that the plans of Messrs. Blackmoor & Mitchell-Withers be adopted, and the work no doubt will be proceeded with. The two chapels,—the one for the use of the members of the Established Church, and the other for the use of Dissenters,—will be Early English in style. They will form separate buildings, as it is understood that the Archbishop of York objects to consecrate buildings of this character that are erected together with and, as it were, under the same roof as chapels for the use of other denominations.

THEATRES.

The Haymarket.—During the recess, Mr. Buckstone's popular theatre has been very agreeably decorated. Fresh painting and gilding to the public box-fronts, and hangings of green and gold to the private boxes, produce a bright and elegant effect. Above the proscenium is an allegorical group by Mr. E. C. Barnes. We happened to be ill-placed to judge of its merits, and may find another opportunity to do so more fairly. A new drop-scene, representing Tasso reciting his poems in Venice, has been painted by Messrs. Tebbin. It displays their usual skill, but is over-red in colour, and might be improved by a little additional work in the right place. The re-appearance of Miss Bateman, in "Leah," seems likely to prove a great success, notwithstanding the length of time during which the piece was played in London some four years ago, an evidence of the number of audiences to be

found in the metropolis for any perfect work of its kind. The actress each night, in the special points of her performance, excites the spectators to the loudest demonstrations of satisfaction. A sister of Miss Bateman, under the name of Francis, made a pleasant impression, as she had previously done in Birmingham.

Royal Alfred Theatre.—Evidence was afforded on the opening night of this theatre in support of what we have before now said, that no quiet enjoyment can be expected in a house where any number of the audience are unable to see. This was the case in the gallery of the newly arranged theatre in Marylebone (we suppose it is by this time altered), and the result was a constant hubbub and the imminent risk of a serious accident. We do not hear of any architect having been consulted. The whole of the interior is new. Mr. S. Simpson was the builder employed. The ceiling, proscenium, and balcony front have been executed by Messrs. White & Co. in *carton pierre* and *papier mâché*. The coloured decorations have been carried out, discreetly, by Messrs. Green & King, and the general effect is light and elegant. The drop-scene, which represents the *Galatée* as she anchored in Port Jackson Harbour, is hard and heavy. On the other hand, some of the scenery in the Indian piece, with which the house opened, is creditable to Mr. Arthur Henderson. Miss Amy Sedgwick has the direction.

India.—It is stated that the Punjabees are going in with spirit for the erection of a theatre and concert-house at Anarkullee by a limited liability company with 100rs. shares. Eighteen shares have been already subscribed, and operations are to be commenced directly other eighteen shares are taken up.

THE GLASGOW INSTITUTE OF ARCHITECTS (INCORPORATED).

The first general meeting of the Glasgow Institute of Architects, which was incorporated on the 18th ult., under "The Companies Act, 1862," and "The Companies Act, 1867," was held in the Religious Institution Rooms, St. George's place. Mr. James Salmon occupied the chair. After some preliminary business was transacted, the Council of Management for this year was chosen, consisting of Messrs. James Salmon, Alexander Thomson, John Burnet, George Bell, John Baird, James Boucher, John Carrick, Campbell Douglas, John Honeyman, junr., William Spence. It was unanimously agreed to recommend that the members of the Institute should use the initials I.A. after their signatures to documents connected with their profession, meaning thereby Incorporated Architect or Incorporation of Architects, to indicate membership.

A meeting of the Council of Management took place immediately after the general meeting of the Institute, at which Mr. James Salmon was elected president; Mr. John Burnet, vice-president; Mr. Wm. MacLean, writer, secretary; and Mr. Alexander Thomson, treasurer. A committee was appointed to frame a table of fees to regulate the charges for professional work done by the members, and by-laws and rules for the purpose of regulating and conducting the examination into the professional attainments and qualifications of entrants.

GAS.

At the usual meeting of the Metropolitan Board of Works Mr. Newton moved the following resolution:—

"That in the opinion of the Board it is expedient that the manufacture of gas should, as far as practicable, be removed from the populous districts of the metropolis; that the Board should promote a bill empowering them to supply gas to the metropolis; that if it be desirable to take the existing gas companies they should be compensated, the terms of such compensation to be, if possible, agreed on between the Board and the companies; and that the matter be referred to the special gas committee, with instructions to obtain the needful advice and take the necessary steps for the preparation of Parliamentary notices and of a bill to be introduced into Parliament during the next session; these powers, however, not to be sought if the companies will agree on such a price and such regulations as to the supply of gas as shall be satisfactory to Parliament."

Mr. Evans moved an amendment,—

"That in the opinion of the Board it is not advisable to take measures to promote a bill in Parliament in relation to gas supply during the ensuing session of Parliament."

After a long discussion the amendment of Mr. Evans was carried upon a division.

The Sheffield Gas Company have declared a dividend at the rate of ten per cent. for the last year at their annual meeting.

Bombay Cathedral is now lighted with gas. The sparrows that frequent the place found the burners very convenient to build their nests in, and when on the first two Sundays the gas was fully turned on, the materials composing these nests ignited, and there were, for a few minutes, three or four small conflagrations, that for a time looked dangerous, more especially as several sparks fell into the pews immediately under the burners.

At the half-yearly meeting of the shareholders of the Geelong Gas Company a dividend of 10 per cent. per annum was declared. The consulting engineer's report enumerated considerable improvements in plant and erection of masonry, and stated that the works were in a complete state of repair.

UTILIZATION OF WASTE STEAM IN WARMING BUILDINGS.

The steam from high-pressure engines is led into a self-acting apparatus, patented by Messrs. Herring & Co., of Chertsey, and is there condensed and utilised in warming the buildings, after which it is returned to the boiler still hot, and so pure, from its previous distillation into steam, that it can produce no incrustation in the boiler. Not only are the buildings connected with the steam power thus warmed, but 95 per cent. of the water is thus economised in its re-use, and fuel saved by the re-entrance of the water while still hot into the boiler. By this apparatus 20,000 cubic feet of mill or manufactory per horse-power, it is said, can be warmed, and six gallons of water per horse-power per hour saved, the water, as we have indicated, giving a hot feed, and without deposit; and all this continues to be done absolutely without any cost, the only outlay being the first cost of the apparatus, which seems to be safe as well as economical. The using up of waste heat has for many years received our attention, and we do not recollect of a finer example of such utilisation than this at least, in theory; and as for the practice, it seems that this invention has been tested, with great success, by the experience of the last two winter seasons.

UNDERGROUND ROOMS.

SIR,—Will you allow a plain country parson to enter his solemn protest against the cruelty of builders? Wherever I go I see great deep holes being dug, in which many of our poor unfortunate countrywomen are to be buried alive. Now, sir, it will be quite time enough to put us underground when we are dead; until then, pray let us do what we can to keep above ground. It may be difficult to do so in every case, but surely in the suburbs of London, and many other parts, there is no imperative necessity for sinking kitchens in the earth instead of placing them on the earth. Sunken kitchens are so prejudicial to health that few of us would think of placing a valuable horse in one of them. Ought we, then, to deem them antiseptic for our own species? But further, they entail a serious additional expense. The extra work occasioned by kitchen stairs is almost equal to half a servant. Without these stairs a servant could well-nigh do double the work. Then, again, the inconvenience and discomfort to the mistress of the house are great, and it is a terrible tax to her if she has to run up and down stairs every time she may wish to superintend some little matter in her kitchen. Health, economy, and comfort are all in favour of houses with kitchens at the back, on the same floor with the sitting-rooms. How houses constructed upon this plan are valued, appears from the fact that they are no sooner built than they are immediately taken; while those built upon the old-fashioned plan remain vacant for months, and in many instances for years. I have myself for some time been looking out for a small villa in the suburbs of London, with the kitchen at the back; but house-agents tell me that this style of house is rarely ever vacant,—that they could let any number of them if builders understood their own interests and would erect them. Yet the great majority of builders seem to persist in multiplying houses with the terrible drawback of a sunken kitchen; but I am persuaded that as the question of comfort and health is

considered, so will sunken kitchens be avoided. I for one will never take a house so constructed, and I think that underground servants should strike and go in for double wages. Builders will do well to turn their attention to this important matter. There is another point which I should like to bring under the notice of architects and builders, and that is the erection of handsome blocks, capable of division and subdivision, combining economy and security;—each suite of rooms to comprise all offices and appliances necessary to constitute a complete and distinct residence; in fact, something after the Scotch fashion, and that which obtains in some parts of Italy. Many families would prefer such an arrangement to the expense and responsibility of a separate house; and many who now take lodgings would be glad to take a block suite. If well planned and on eligible sites near London, the speculation would be a great success, and supply a great desideratum of the present day.

WILLIAM WRIGHT, late Vicar of Harbury.

CONCRETE HOUSES.

SIR,—In common with most members of the architectural profession, I take great interest in the question of cement concrete for walls; and noticing that a failure had occurred in the construction of a house at Twickenham, I visited the spot. On inquiry, I found that the work had been superintended by Mr. Tall, and that his apparatus was used for the formation of the walls. It appears the walls were carried up in his usual way of 18 inches at a time, between 30 ft. and 40 ft. high, the ordinary door and window openings being left where required. Nothing unusual occurred to cause apprehension of a failure, when suddenly one evening, fortunately after all the men had left off work, a large portion of the walls fell in. The exact cause of the accident I could not gather from the men upon the work. The concrete had been carefully mixed in the proportion of eight to one in measured quantities of Thames ballast and Portland cement. I noticed that the work had broken up in straight courses, evidently at the level at which the machine had been shifted, showing imperfect adhesion at this point. This is undoubtedly a grave defect, and is caused by the wall being formed in layers, or courses, 18 in. in height, and the concrete of one layer setting before the next is added. How far the bolt-holes which are left in the walls for the purpose of fixing the machine may have contributed to this failure, is difficult to say; but, from appearances, it seemed to me that they would considerably help to increase or extend a fracture already begun in the work. Being somewhat puzzled to account for the original defect, I was led to examine the boundary-walls, which are constructed in precisely the same manner; and upon a close inspection I noticed minute cracks occurring at certain intervals, and extending from the top to the bottom of the wall. Now, it appears to me that these cracks must be due to the contraction of the material in the process of drying; and it is just possible that one of these cracks, occurring between a series of openings in the wall, caused its destruction.*

ARTIFEX.

THE FAIRFORD WINDOWS.

SIR,—Your correspondent, Mr. J. G. Waller, has written a very long letter to prove that he is not of Mr. Holt's opinion respecting the Fairford windows,—for that is all he does prove,—and I have no doubt that Mr. Holt will cheerfully allow him to enjoy the conviction he entertains as long as he pleases. Who Mr. J. G. Waller may be does not appear from his letter, but from his initials he is probably the engraver of a creditable work on Sepulchral Brasses, which was published some years ago. His authority, however, as an art-critic has yet to be recognised, and his lucubrations may be safely left to the tender mercies of Mr. Tom Taylor, whose authority in such matters is recognised, and who has more than once publicly expressed his opinion that the hand of Albert Dürer is visible throughout the work. I am not going to follow Mr. Waller's example, and inflict my opinion upon you, though it might not weigh less with the public; but he has indulged in

* We have received some other letters on this subject, too late for consideration.

expressions which, while they do not advance his argument, deprive him of the right to complain should he be accused of "impertinence" in return. He is exceedingly facetious and satirical respecting the discovery of the letter A upon the sword of an executioner, in one of the windows—a discovery which was not made by Mr. Holt, or considered by him of great importance, though it certainly does not militate against his theory. The last paragraph of Mr. Holt's "exhaustive paper" (I use the words of an antagonist), at Cirencester, are, "To me that monogram needs not to be inscribed anywhere on that noble range of windows in Fairford Church; the painter has left on them the more conclusive mark of his great mind and master hand." If Mr. Waller has read that paper, "the savor of impertinence" attaches to his own remarks. Let me, however, do him justice. He has himself made "a great discovery." He has discovered that Herod not only commanded the execution of St. John the Baptist, but actually presided at it, on his throne, in his royal robes! "How can we withstand such learning and research?" If Mr. Waller has studied the works of Albert Dürer as deeply as he appears to have studied the Scriptures, there is an end to the controversy. It is consolatory, however, to know, that although Mr. Waller has not been able to "detect a single trace of the special style of Albert Dürer" in the windows, he thinks "they are fine works of art, and their completeness is such as should make it a matter of importance to insure their due preservation." I trust, therefore, that he will forward his subscription to the fund opened for that purpose: it will, I have no doubt, be received by the treasurer or either of the secretaries of the British Archaeological Association, to which Mr. Waller, if he be the engraver, formerly belonged, without any reference being made to his secession from that society, a calamity which it has providentially survived. B. A. A.

—the old Failers' Earth pits, mentioned by Pennant, but of late (I think) perhaps scarcely much less used. A retired Quaker Meeting-house is said to be as old as their founder, George Fox. The "purchase" of a "common right" of the poor by a nobleman some seventy years ago, which certainly cannot be considered ungenerous, may interest now, when we read of encroachments with no wish for compensation. Francis, Duke of Bedford (the friend of Fox, &c.), having covenanted, for himself and heirs, to give to the poor of Wavendon, in lieu of their right to "dig turf," &c., a head of land, worth, a hundred tons of coal yearly, at a time when the price, with carriage, and before even "Grand Junction Canal" was, was doubtless much higher than at the present day. Whether the quantity has been (liberally) increased with that of population, &c., is not known to the writer.*

STROUD NEW RESERVOIR.

Sir,—Can you inform me to whom the Local Board have awarded their premium for the above competition, as there is evidently a great want of courtesy on the part of their officers, who (upon application) do not care to afford the necessary information upon the subject? The Board seem to have been determined not to afford any assistance to competitors, for they did not provide even a plan of the site, and those wanting information had to obtain it the best way they could. A COMPETITOR.

DAMAGES FOR BESPATTERING CLOTHES WITH LIME.

Mr. J. PITT TAYLOR, the judge at the Greenwich County Court, gave judgment the other day in a singular case. A young lady residing at Greenwich was passing some buildings in the course of erection at New-cross, when a liquid containing lime fell upon her bonnet and velvet mantle, doing damage to the extent of £4. The land upon which the houses are being erected had been taken on a lease by a Mr. Turner, a builder, and against this person an action had been brought to recover the amount of damage stated. The defendant contended he was not liable, on the ground that another person had agreed with him to do the brickwork of the buildings at so much per rod, and that, in law, such person was a contractor, and would alone be liable. The Judge ruled that this person was, in the eye of the law, the servant of the defendant, and an order was made for the full amount claimed, with costs.

AN ARCHITECT'S BILL.

Jones v. Knight.—This was an adjourned case (Hyde County Court), in which defendant, an inhabitant of Hyde, disputed the balance of a bill of 132. 3s., for drawings, surveyings, &c., as an overcharge, 10% having been put into contract. Mr. Bull appeared for plaintiff, and Mr. Hooper for defendant. It was agreed that the issues of the case should depend upon an item of 52. 6s.

Plaintiff examined, said the item in dispute included two sets of drawings of the premises in the Arcade, which he had been ordered by Mr. Urry, defendant's solicitor, to prepare for him. He followed his instructions implicitly, and on sending him the drawings he said they were useless, and he prepared others, which answered the purpose desired. He had, of course, charged him for the first set, which was included in the item of 52. 6s.

Defendant examined, said he had not given orders for the plans to be prepared; the first he heard of it was when he received them from his solicitor, Mr. Urry, saying they were useless.

His Honour said, if he employed a solicitor, it was at his discretion to act and order were necessary.

Mr. Urry examined, said he never gave orders for particular plans. He gave Mr. Jones instructions to prepare three plans of the three changes the premises had undergone. The plans were for the purpose of illustrating a case to the counsel in a cause now pending between Mr. Knight and Mr. Hughes. The plans first sent to him were not what he wanted, and he told plaintiff they were not, saying at the same time that they were rubbish. The plans he afterwards received were what he wanted.

Mr. Hooper submitted that if plaintiff did not properly prepare the drawings he was not entitled to charge for them; but his Honour thought it would depend upon from what cause they were useless whether he ought to charge or not; and a Mr. Bink, surveyor, of London, having given evidence as to the charge being moderate for the work done, he gave judgment for plaintiff.

HAMPSTEAD FEVER-HOSPITAL COMPETITION.

WE understand that the recommendation of the committee of the Metropolitan Asylum Board is favourable to the design of Messrs. Pennington & Bridgen for the first, and that of Mr. F. Fowler for the second premium. The Board at their meeting on the 10th instant decided not to adopt this recommendation of the committee until they had all had an opportunity of examining the designs, and the matter is therefore adjourned until, this, Saturday. In the meantime permission has been given to the various competitors to send any further printed particulars of their designs for the information of the Board.

* At the neighbouring Woburn (town) Consecration something it seems was done for the poor. A recommendation of "Benefactions" to the poor on consecration or re-opening of churches, "a kind if not useful mode of making them remember it," appeared in the Gentleman's Magazine about six years ago.

Acting upon this permission, one of the competitors, Mr. Snell, has sent in a protest which deserves the consideration of the Board. In the course of it he says:—

"The 'Instructions' issued by you to the six competing architects, stipulated that the designs should surmount the following difficulties, viz. —

1. That the buildings now to be erected for the accommodation of 104 patients, should be so arranged as to admit of their future extension, and the ultimate addition of other pavilions.
2. That the area of the pavilions should be (if practicable) north and south.
3. That an adequate site should be left for the erection of a small-pox hospital."

The design submitted by Messrs. Pennington & Bridgen, which I am informed you recommend for the first prize, will not admit of extension or the addition of other pavilions. There is no room without encroaching on the small-pox site for the required additional pavilions, and the ventilation of the one-story buildings being through the roofs, it is not possible to extend the accommodation by building another floor over; and further, provided this objection did not exist, there are no provisional spaces for staircases to the upper stories.

The axes of the pavilions, instead of being north and south (as desired by you) are nearly due north-west and south-east, and consequently the windows of the wards face north-east and south-west, the coldest and dampest points of the compass. If by this design be made capable of extension, the piece of ground left will, as I have pointed out, be too small for the erection of a small-pox hospital. Consequently none of the above 'instructions' have been complied with by Messrs. Pennington & Bridgen. . . .

FROM SCOTLAND.

Thurso.—The foundation-stone of the new town-hall of Thurso has been laid with Masonic honours. The whole cost is to be about 2,500! Of this sum nearly the whole has been subscribed, a legacy of 1,000!, left by the late Mr. Alexander Henderson, being the "nest-egg" around which the sum accumulated. The building is to contain, besides the town-hall and public rooms, a library and museum. The following are the contractors for the work:—Mason work, Mr. George Manson, Murkle; joiner work, Mr. J. Gauvie, Aberdeen; plaster work, Mr. A. Smith, Thurso; slater work, Mr. Donald Ross, Thurso; plumber work, Messrs. Johnston & Son, Wick; painting and glazing, Messrs. J. & S. Fife, Aberdeen. The architect is Mr. Mackenzie, Aberdeen.

CHURCH-BUILDING NEWS.

Leaden-Road.—The church of this village has been re-opened. The whole structure has been renovated and restored, commencing with the porch, which has been rebuilt in oak in the old Norman style. The plaster walls have been replaced by rubble, with south stone dressings; while the chancel has also been rebuilt throughout in the same material. The floor has been repaved with Staffordshire tiles, a new open oak roof built, the font restored, and the church re-seated throughout with oak benches. The spire, which was formerly in a dilapidated and unseemly condition, has been restored, and a new bell added, the church possessing three bells. New buttresses have also been added throughout to the exterior of the building, and it is proposed hereafter to complete the restorations by adding a new vestry and introducing other minor improvements. The old pulpit has been restored under the direction of Mr. Dowsett.

Wadworth.—St. Mary's Church, Wadworth, after having been internally renovated and restored, has been re-opened for divine worship by the Archbishop of York. The chancel was restored about three years ago, and this year it was resolved to complete the work, which had indeed become a very necessary one. The interior of the church, like the one recently restored at Tickhill, had become thickly coated with dirt and whitewash, and the carved stonework had fallen into a dilapidated state, which was not improved in appearance by the contrast with the renovated chancel. Something like 400l. is the cost of the restoration. The work was entrusted to Mr. Athorn, of Doncaster, who also carried out the restoring of the chancel. The whole of the stonework in the nave and aisles has been scraped, cleaned, and stuccoed, and the carving where demolished or disfigured restored, and the floor also levelled and relaid. Open stalls throughout the church have been put in by Messrs. Green & Snowden, of Wadworth. The organ has also, under Mr. Meacock, of Doncaster, partaken of the general overhauling.

Bridelick.—The foundation-stone of a new church has been laid here. The plans were prepared by Messrs. Cory & Ferguson, of Carlisle.

ROAD-MAKING.

Sir,—The practice now of repairing highways is by laying on a thick bed of stones, say 4 in. or 5 in. in thickness, covered with road scrapings in a semi-fluid state; then rolled with an iron roller some tons in weight till a surface is obtained resembling the one on roads which have been repaired and used weeks subsequently. The old system recommended by Telford and others has been to lay on a thin bed of clean, equal-broken material, and when rats began to appear, the material was raked into them, so the surface being kept even, and the traffic as equally distributed over the surface, by means of road-guards, as possible. If from the quantity of traffic one bed was insufficient, others followed as soon as the other material had got wound together, till the strength of the road was made equal to its traffic.

Now, if any of your scientific readers or practical road surveyors can give any evidence as to which system makes the best roads at the least expense, I am sure it will give great satisfaction to members of corporations and local boards, and to none more than your humble servant, X. Y. Z.

"WOBURN SANDS."

Sir.—The origin of the church here is due to the late Rev. J. V. Moore, rector of Aspley, and a gentleman of some family property. Feeling, as all must long have done, the great church deficiency there (beyond, I believe, any school-room service instituted by the present rector of Wavendon), he offered to "meet" the late Duke of Bedford by completely "endowing" a church on condition that the Duke, &c., being erected. This seems to have been carried out with schools, &c., by the present Duke. Mr. Moore having bequeathed (I am locally informed) 5,000l. upwards, for the other object. The gift of a "clock" by a surviving state was a grateful though minor tribute; but the very "rare" tri-centenary organ may, doubtless, cause distant musical visits.

A chapel-of-ease to Wavendon, to which the greater population—then much smaller—belonged at that time, was recommended in accordance with the aspirations of the incumbent, Mr. Fisher, as early as Parry's "History of Woburn," 1831. Woburn "Sands" though not in that parish, the "Station" being over two miles from the town, were once well known on that line of road. There exists a very rare semi-humorous engraving by Bunbury, representing the "Passing of the Coach,"—a small antique one with the "basket," and a sturdy, blunderbussed "guard" trudging along, nearly knee-deep in sand by the side. This, however, has long been remedied by a deepening hill-cutting (70 ft.), with some raising of good road below the tall cliffs on the cliffs having an extremely interesting effect. To this locality also belong—though attributed to Aspley

The estimated cost is about 3,100l. It is to be built of yellow freestone, and cruciform in structure, consisting of a chancel and nave, with a square tower rising upon pillars, and about 61 ft. in height, resting between the chancel and the nave. The interior of the nave is to be 39 ft. 8 in. by 22 ft.; the exterior, 46 ft. 7 in. by 27 ft. The interior of the chancel will be 29 ft. by 18 ft., and the east end of the church circular, while outside the building there are to be two transepts, each 19 ft. 9 in. by 19 ft. The contractors are, for the masonry, Mr. Henry Graves, of Aspatria; the joiners' work, Mr. Henry Dent, Cockermouth; and the plumbers' work, Mr. Thompson, of Carlisle. The site of the new church is on a portion of the glebe land of the parish close to the present edifice, which is now being pulled down. Towards the cost of the new edifice the sum of 2,400l. has already been contributed.

Stimping Thorne.—The parish church of St. George, which has been under restoration for more than twelve months, has been completed, and the services are now performed in the church. In the late restoration cathedral glass has been used for the chancel windows, except the east, and the old stained glass canopies have been replaced by Messrs. Bailie & Mayer, of London. The floor has been paved with Minton and Hollins' tiles. There are new altar-rails and stalls for the choir, of oak. The chancel restorations were carried out by Mr. J. Maxey, of Louth, from designs by Mr. Fowler, architect, of the same place. The repairs of the rest of the edifice have been much more extensive; new roofs have been added to the nave and aisle, all the chancel arch and much of the adjacent wall of the nave, and all one side of the tower, have been rebuilt, and the whole of the exterior pointed out. The tower arch has been opened out, and a new window of stained glass inserted by the rector, the subjects represented being our Saviour's Transfiguration and Ascension. In the place of the north door a new window has been made, which has thus restored some of the light excluded by the abolition of the modern clear-story windows. The furniture of the nave and aisle is of oak, and the sittings have ends of carved panel-work. The panels of the pulpit, together with the cornice, are the work of a lady, Mrs. Tyrwhitt Drake, of the Thorne.

Windsor.—We learn from an appeal which the vicar and churchwardens have laid before the parishioners that steps have been taken with a view to the re-seating and restoration of the parish church. The estimate is as follows:—1. Reseating of area, alteration of gallery-seats, reconstruction and decoration of other parts of interior, 1,540l.; 2. Erecting a chancel, vestry, organ-chamber, and new Royal pew, with the necessary decorations, 2,150l.; 3. Entire reconstruction of windows; addition of a large western porch, with circular cloisters right and left, to communicate with the street; new parapets, alteration of tower, &c. (according to plans), 3,650l.; giving a total of 7,340l. It is not proposed, however, at present, to take any step beyond the exhibition of the plans, which will remain on view at Mr. Griffin's, in the High-street. Three sums of 250l., 150l., and 100l., besides a thank-offering of 25l. and a donation of 20l., have been promised, whenever the work shall be commenced. Should these be followed by others of sufficient magnitude to justify an expectation that, with the help of the Church Building Societies, the sum of 3,690l. might be speedily raised, steps would be taken to bring the plans in proper form before the parishioners at large, for their approval or rejection.

Fylkingates.—The corner-stone of the new church for this parish has been laid. The object is to provide the parishioners with a place of worship in closer proximity with the largest part of the population than the old one is; the latter being in such an exposed and inconvenient place, that in winter only a small portion of the congregation can attend the services regularly. The church will be built from the designs of Mr. Street, architect.

Buckland Monachorum, Devon.—The parish church is now undergoing restoration and repair, under the direction of Mr. H. Elliott, of Plymouth. The works are being executed by local tradesmen, Mr. P. Blowey being the principal contractor. The building is an interesting specimen of ecclesiastical architecture, and was erected during the reign of Henry VII. by the members of the neighbouring Cistercian abbey, from whom the parish derives its name. The church is interesting from the fact of having formerly numbered amongst its worshippers the

great Admiral Sir Francis Drake. An elaborate monument by the elder Bacon, erected in the church to the memory of General Elliott, afterwards Lord Heathfield, the defender of Gibraltar during the siege in 1782, bears silent witness to the fame of another illustrious parishioner. The works now undertaken will comprise the cleaning and repair of the existing oak roofs (now partially covered by plastering), new slating to roofs, removal of the high deal pews and huge western gallery, repair of the ancient carved oak bench ends and renewal of the seating throughout in oak, carved so as to harmonize with the ancient work; new tiled flooring in passages, plastering to walls, glazing to windows, and various other works that may be required to restore the ancient features of the church, as far as possible, to their original appearance. About 1,200l. are proposed to be spent on the works, part of which sum is raised by a parish rate, and the remainder by voluntary subscription.

Sopley (near Ringwood, Hants).—St. Michael's Church, after having undergone restoration, was reopened for divine service on Michaelmas-day. It is a cruciform building of Early English date, to which alterations were made in the Perpendicular period. The chancel has been repaired. The original lancets and the lopers' window, which had been blocked up, have been opened out. The modern segmental plaster ceiling to the nave has been removed, and has disclosed to view a fine Tudor tie-beam roof, with tracery in the upper part, and elbow-pieces supported by figures of angels holding various kinds of musical instruments. The walls, pillars, and arches have been cleansed from many years' accumulation of whitewash. Open deal benches, stained and varnished, supply the place of the high old square pews throughout. It is much to be regretted that the funds in hand did not permit of the restoration of the tower (at the west end), and of the noble arches opening into it from the nave and aisles, which are at present blocked up by temporary wood and brick-work. Were this removed, and the deeply-recessed and moulded arches properly repaired, the effect would be remarkably good. The works have been superintended by Mr. Ferrey, and carried out by Mr. J. Tanner, of Sopley, builder.

Houghton-Conquest (Bedfordshire).—The fine old church in this parish is about to undergo restoration. Mr. G. G. Scott, R.A., is the architect, under whose instructions the work will be carried out, by Mr. John East, of Melton-Mowbray.

DISSENTING CHURCH-BUILDING NEWS.

Devesbury.—The foundation-stone of a Congregational church has been laid here. The site of the building is at the junction of the Bradford and Halifax roads. When erected, the edifice will be used in place of the building now known as the Public Hall. The basement floor will contain the school-room, 50 ft. by 44½ ft.; lecture-room, 30 ft. by 22 ft.; infants' class-room, 24 ft. by 14 ft.; and four smaller class-rooms and kitchen. There will be separate yards on each side of the building for boys and girls. These will be approached from the Halifax-road by a flight of stone steps, and from Wellington-road by a side street inclined to the required level of the yard. There will be four separate outer entrances to this floor, two being provided through side lobbies to the school-room. The remaining two will be for the class and lecture rooms. There will also be two separate communications by staircases to the ground floor and gallery, and a minister's staircase to the vestries. The ground floor will consist of large vestry, 29 ft. by 14½ ft. and a minister's vestry, 14½ ft. by 11 ft., with lavatories, &c.; also the main body of church, which will be 87 ft. by 50 ft., with the two side wings containing the entrance vestibules and staircases to galleries and schools. The approaches to this floor will be three in number, the two principal entrances being from the Wellington-road by flights of stone steps to the vestibules. The remaining entrance will be from Halifax-road by level landing to the vestries. A gallery will be continued round the entire chapel, supported on ornamental cast-iron columns. The gallery front will be moulded, divided into compartments by pilasters, and filled in with perforated ironwork on a scarlet ground. The body of the church and the gallery will seat 500 persons each, making the entire seating accommodation

of the church at least 1,000 persons. The whole of the seating will have shaped stall ends, low doors, and leaning backs, and the whole of this and other woodwork in the church will be of red deal, stained and varnished. The ceiling of the church will form an ellipse, and will be 37 ft. from the floor in the centre. The style of the architecture will be Italian. The principal front will be towards the Wellington-road, the central portion of which will project from the main wall and will be surrounded by a pedimental cornice. The main feature in this portion will be a triple-light window, divided by Corinthian columns, supporting the arched and canopied head of the centre light, which will be 25 ft. high and 8 ft. in width. The two side lights will be square-headed, and the space below the eills will be filled in with ornamental balustrading. On each side of this central portion, and recessed from it, will be two other windows of similar proportions. The whole of this front and the wings will be constructed of toolled ashlar, from the neighbourhood of Huddersfield; and the remaining external portions of the building will be faced with pitched Elland Edge wallstones, with dressings of Huddersfield stone. The cost of the entire building will be about 7,500l. Messrs. John Kirk & Sons, of Huddersfield and Dewsbury, are the architects. The contractors for the various works are as follow:—Mr. G. W. Fox, of Ossett, mason; Messrs. Monson & Hollings, of Bradford, joiners; Mr. George Shaw, of Mirfield, plasterer; Mr. Thomas Yeoman, of Dewsbury, plumber and glazier; Mr. John Brook, of Huddersfield, painter; and Messrs. T. A. Heaps & Co., of Huddersfield, ironfounders and smiths.

STAINED GLASS.

St. Michael's, Alnwick.—Three stained glass windows, in memory of the late Algernon, Duke of Northumberland, are about to be placed in this church.

Ashtford Church.—A memorial window has been placed in the south chancel of this church, to the memory of Richard Greenhill. The window is by Mr. Wailes, of Newcastle.

Tallard Royal Church.—A painted window has been placed in the east end of the north aisle of this church, to the memory of the Hon. Alice Arbutnot, who was killed by lightning on her wedding tour while ascending the Schelhorn, in Switzerland. The window has three compartments. In the centre one at the top is a half-length representation of the Saviour blessing little children. Below these is a full-length female figure, with upturned face, the arms extended and raised, as if in the act of ascension. The north compartment contains two figures, representing the wise and foolish virgins. In the south light are two figures, representing orphan children, one holding an infant in its arms, while a third figure represents Charity. The stained glass is protected by plate glass outside, the size of each compartment, as well as by a wire guard. The window was painted by Bertini, of Milan.

Town Church, Guernsey.—A memorial window, lately set up in this church, and completing the stained glass of the whole east end, has been placed by Mr. Emamy Dobrée, of London, to the memory of his father and his son. The design is founded upon the subject of the nativity of our Lord and His manifestation to the Gentiles. The window consists of three main openings, of considerable dimensions, and a flowing tracery of Flamboyant character, having nine openings. In the lower portion of the centre the infant Jesus is shown lying in a crib in the manger, the Virgin Mary being immediately behind him kneeling and in the attitude of prayer. Joseph stands by, bearing his staff, as having been journeying. In the background are the ox and the ass, and ruined buildings which formed the stable. The compartment on the dexter side of this contains figures of the three wise men or Magi. On the sinister side is a group of worshipping shepherds. Above all these groups, and extending through the three main lights, and also through the eight opea of the tracery, the entire is filled with the Heavenly Host, the angels in the centres bearing a scroll with the sentence, "Glory to God in the Highest," the other angels bearing and playing upon musical instruments, the topmost opening in the tracery having the Star of Bethlehem. The three main lights are enclosed within a border, which forms a framework to the whole picture, composed of the vine

foliage and fruit. This is upon a ruby ground. The artists were Messrs. O'Connor, of London, who had previously placed three other large memorial windows in this church.

St. Nicholas's Church, Newcastle.—A memorial window, of large dimensions, has been erected in this church, at the cost of Major Spoor. The window is one of a series at the north side of the church, and consists of four lights with Decorated tracery. The first compartment contains "The Agony in the Garden," the next is filled with "Our Lord hearing the Cross," in the third opening is "The Entombment of Our Lord by Joseph of Arimathea." Next follows a scene after the resurrection, "The Marys at the Tomb." The tracery is filled with an angel, and the monograms of the family are surrounded by foliage. The window is the work of Mr. Baguley, of Newcastle-upon-Tyne.

SCHOOL-BUILDING NEWS.

Kerry (Montgomery).—The Kerry new schools have been erected from the designs of Mr. David Walker, of Liverpool, and are built upon a site presented by the Rev. W. Morgan, B.D., vicar of Kerry. The front view of the schools is towards the road leading from the Sarn, the building being placed upon the same frontage as the Reading-rooms, erected some years ago by Mr. Naylor, which form a group. The new building is designed for National Schools. The plan consists of two separate rooms, each 40 ft. long by 18 ft. wide, with class-rooms attached to each about 14 ft. to 17 ft. The height of the wall-plate is 13 ft., and about 28 ft. to the ridge. The roofs internally are open, timbered with curved braces of pitch-pine varnished, the open spaces between the spars being plastered. The floors are laid with selected pitch-pine, the walls being coloured with a warm salmon tint upon the brickwork, a skirting of about 4 ft. high being carried round the walls in oil paint of a dark chocolate colour, and capped with an ornamental stencilled border. The boys' school is entered from the east, or principal front, the girls' entrance being on the west front, and leads from their enclosed playground. Both of these entrances are laid with tiles from a design of the architect. The building has a tower, with slated spire and ornamental iron finial, rising to a height of 45 ft. over the boys' entrance, and fitted up with a cast-steel bell by Vicars & Co., of Sheffield. The tower is broken up by openings, filled in with ornamental projecting louver boards. The chimney-shafts spring from the square into the circle. The walls externally are constructed of Bower's light yellow Raabon bricks, and are laid in Flemish bond with a wide mortar-joint, which is ruled in a headed form. The roofs are slated with Bangor slates, the ridge crests of red clay being manufactured from the architect's design by Mr. Peake, of Tinstall. The glass used in the windows is of Harley's ribbed manufacture. Accommodation is provided for 130 boys or girls. The ironwork was supplied by Messrs. Smith, of Birmingham. The works, from the plans of Mr. Walker, were carried out under the superintendence of Mr. James Martin, by the staff of workmen on Mr. Naylor's Kerry estate, the dressed stonework being supplied by Mr. James Porteous, of Welshpool.

PATENTS CONNECTED WITH BUILDING.

APPARATUS FOR WARMING BUILDINGS, &c.—*W. A. Herriny.* Dated 4th December, 1867.—Here the patentee causes the exhaust steam from the engine to pass a coil of pipe of such diameter that the back pressure on the engine may be insignificant. This coil he encloses in a cistern or close tank with which pipes for warming the building are connected. The outlet pipe passes away from the top of the cistern or tank, then circulates through the rooms or holdings to be warmed, in the ordinary way of a hot-water apparatus, and afterwards the pipe returns the same water in a comparatively cold state to the bottom of the cistern or tank. This water remains in the cistern or tank until it again becomes hot, and then it again circulates through the pipes of the hot-water apparatus. In this way the rooms or holdings are warmed without other fuel than that necessary to keep the high pressure steam-engine at work, and at the same time an economy of water is effected, which sometimes is of importance, the exhaust steam

from the engine being condensed into a pure water, which is returned into the boiler.

BRICKS, &c.—*T. W. Walker.* Dated February 5th, 1868.—The patentee claims, first, the general construction, arrangement, and combination of machinery or apparatus for the manufacture of bricks, tiles, slabs, and other like articles, as described and illustrated by the drawings; secondly, the combination with the pistons or plungers of machines for compressing bricks, tiles, slabs, and other like articles of a self-acting expanding packing, arranged and operating substantially as described; thirdly, the moulding and compressing of bricks, tiles, slabs, and other like articles on a bed-plate or table, by the aid of a mould-box or frame and piston or plunger, substantially as described; fourthly, the peculiar composition or compound for the manufacture of plain or ornamental tiles and slabs, as described; fifthly, the production or manufacture of ornamental tiles by punching or perforating holes or openings through such tiles according to any desired pattern, and filling in such perforations at the time of laying the said tiles with mosaic work, or with other tiles of a more or less ornamental character, as described.

HEATING BUILDINGS, &c.—*W. Gram.* Dated January 23, 1868.—These improvements consist in taking or receiving the steam from the boiler or steam generator into the first length of pipe, and continuing such piping to any required length throughout the building, and returning the steam to the boiler by introducing the last length or other extremity into the boiler below the water-line. A tap or valve is applied at the entrance-pipe to control the admission of steam, and another is provided at the termination or exit, near where the pipe enters the boiler, by which tap water is withdrawn from the heating-pipes, and by such combined means the constant circulation of the steam is effected, and an increased heat obtained from the pipes.

DOORS, SHUTTERS, AND BELL-KNOBS.—*J. C. Sanders.* Dated 23rd January, 1868.—A mould of metal or other suitable material is prepared of the shape or form which it is desired the exterior of the knob or other articles shall possess, and glass, either coloured or colourless, is poured therein in a molten state. Any desired pattern is then impressed upon the upper surface of the molten glass whilst the latter is in the mould by means of suitable stamps or dies. When cold and hard the glass is removed from the mould, the edges trimmed, and such portions of the impressed pattern as it is desired shall be of a different colour or colour from the rest of the glass are painted. The glass is then placed in a metallic mounting in the manner well understood by persons connected with the manufacture of such articles, the effect of brilliancy being given to the pattern by placing metallic foil or other suitable varnished or polished material of any desired colour or colours between the glass and the metallic hack or mounting.

Books Received.

Geological Table of the British Fossiliferous Strata. Compiled by Sapper WILLIAM PARSONS, R.E.

THIS seems to be a well-arranged and useful table, compiled from the works of Lyell, Murchison, Tennant, and others. It gives a compendious list of fossils characteristic of the various strata, which are arranged in the order of superposition. In the column for "Remarks" there is one which might have been usefully extended to other instances besides the one in point. The remark is in reference to Portland stone. A table of great use to architects and builders might be compiled in a similar form to this one, but containing many such remarks. In reference to the lowest "Typical Group of Rock," the Laurentian, which is stated to be "devoid of fossils," it must be remembered that this is a table of British fossiliferous strata, and hence does not include the Transatlantic Laurentian rocks.

VARIORUM.

THE *Quarterly Review* for October is a specially good number. Amongst the more interesting papers are the leader on the Great Railway Monopoly, and one on Lake Dwellings. The leading paper advocates the transfer of the railways to one consolidated management, under Government auspices, and we are of opinion

that this is really desirable. As an example of what may be anticipated under such an arrangement we may quote what is said on the Belgian system:—

"Let us now glance at the results of the bold policy adopted by King Leopold in providing for his kingdom,—then the youngest member of the family of European nations,—a system of railways at the public cost, at a time when other nations were indifferent, if not actually hostile to their formation. At the beginning of the enterprise the prophets of evil were in the ascendant. They were able to point to the constantly increasing annual deficit on the working of the lines. Excepting in the year 1836, when there was a gain of 37,000 francs, the loss went on increasing until it amounted to 39,000,000 of francs yearly. This loss was, however, more apparent than real, being principally occasioned by the payment of interest on unproductive capital while the lines were still under construction. But by the end of 1852 the State railways were nearly all made and at work, and then the tide began to turn. Year by year the apparent loss was reduced, until at length not only was the interest on the borrowed money all paid, but a substantial profit was shown on each year's working. In 1858 the net profits, after providing for all interest and outgoings, was 5½ per cent. on the capital expended; in 1860 it was 6½ per cent.; and now it is 7 per cent. The principal of the debt incurred in constructing the lines is in course of annual reduction, and if the revenue continues to increase as heretofore, not only will all the Belgian railways become the unburdened property of the State, but they will contribute in no small degree to the reduction of the ordinary taxation of the country."

Some interesting statistics in reference to our own railway system are given. One of the most startling facts brought to light by the railway traffic returns annually published by the Board of Trade is the comparatively small average number of passengers carried per train. Every one must have been struck with the frequent long and empty trains travelling on railways, but few, we dare say, would be prepared even from these for such a result, in illustration, as this, that to accommodate 4,482 passengers 13,512 seats should be given, or 1,274 to accommodate 179! This, of course, is done under the mistaken idea that it is for the public accommodation all this absurd waste is incurred; but how can the public be accommodated in such a way as this? It goes towards accounting for low dividends and high fares, but there is something radically wrong in the management which renders it possible. In respect to Irish railways the whole system, it appears, might be purchased at present, for 22,000,000*l.*, or less than one year's expenditure on our army and navy. There are 333 Irish railway directors, 70 auditors, 35 secretaries, and 13 general managers, all of whose functions would be much more satisfactorily performed by one efficient executive sitting in Dublin. Let us hope that "Her Majesty's highways," which have for long been superseded, will soon be replaced by "Her Majesty's railways."—*"A Treatise on Optics; or Light and Sight theoretically and practically treated; with the Application to Fine Art and Industrial Pursuits.* By E. NGENT, C.E., of New York. London: Virtue & Co." This is an American offering to those interested in technical instruction amongst the industrial classes. The author has steered pretty clear of abstruse mathematical investigation and formulae, and yet his book is capable of giving an accurate enough knowledge of one of the most interesting and useful branches of science. The treatise seems to be one capable of being made useful not only to artists, but to mechanics and artisans generally, and as a text-book for schools and colleges for both sexes. The style is clear, and the instruction plain and intelligible. The author has had specially in view its utility to the house decorator and painter, the builder, architect, draughtsman, engineer, and others connected with the building trades, as well as those engaged in various other branches of industry.

Miscellaneous.

FALL OF THREE HOUSES AT HOLLOWAY.—On Sunday morning, about eight o'clock, three houses that had lately been erected in the Holloway-road, adjoining the Tottenham and Hampstead Junction Railway, fell with a great crash. Fortunately no one was in the houses, or passing at the time. The cause of the houses falling ought to be ascertained.

THE PARKIN JEFFCOCK MEMORIAL FUND.—A meeting of the friends of the late Mr. Parkin Jeffcock was held in Sheffield last week, when it was decided to proceed at once in the erection of a memorial church, in sympathy with the Oaks Colliery calamity of 1866, at Mortomley, to accommodate about 260 persons. A design by Mr. Butterfield was approved by the committee.

TECHNICAL EDUCATION.—On Saturday, October 10th, classes in connexion with the Science and Art Department were opened at the Slough Mechanics' Institution for the study of practical plane and descriptive geometry, mechanical and machine drawing, building construction, and architectural drawing. About twenty-five students have already joined, and the classes (which are under the direction of the Messrs. Dorrell) promise to be successful.

SOUTH STAFFORDSHIRE INDUSTRIAL AND FINE ARTS EXHIBITION, 1869.—The Guarantee Fund, which the committee determined should be fixed at a minimum of 2,000*l.*, to be limited to 10*l.* each guarantor, is now complete, and the list of 200 names includes very many of the wealthiest and most respected names of the whole district, names which guarantee not only a much larger sum than 2,000*l.*, if it should be necessary, but also the thoroughness of the scheme, and, as far as they possibly can, the prospect of its entire practical success. Mollinex House and grounds are also now taken for the purpose of the exhibition.

GAS REGULATION.—An account is given in the *American Gaslight Journal* for the 2nd of October of an invention patented by Mr. E. Beggs, of San Francisco, for the regulation of gas burners. By means of a small apparatus containing levers, valve, &c., applied to the gas-pipe supplying the burners from the meter, or to the burners themselves, the amount of pressure is equalized, so that whether a smaller or a larger number of burners are used, or whether the gas be at high pressure or low, no gas shall be wasted by undue pressure. The invention is said to be in operation at the office of the journal in Fine-street, New York.

ENCOURAGEMENT FOR OTHERS.—On Thursday evening, the 15th instant, the vestrymen and members of the Board of Guardians for the district of Chelsea, which Mr. Tite, M.P., has long represented in the Metropolitan Board of Works, entertained him at dinner, in testimony of the services he had rendered in Parliament in the passing of the Act authorizing the construction of the Thames Embankment at Chelsea. The entertainment was given in the Vestry-hall, King's-road, Chelsea, and about 200 of the principal inhabitants took part in it. Sir Charles Wentworth Dilke, M.P., presided; and Sir John Thwaites, chairman of the Metropolitan Board of Works, with several of the members of that body, and the Rev. Mr. Burgess, incumbent of Trinity Church, Sloane-street, occupied seats on his right and left.

RAILWAY GARDENS.—A company has been formed to rent, for sixty years, from the various railway companies having lines through the east, middle, and south of France, the right to plant and cultivate fruit-trees on whatever portion of the sides of the line is found suitable. The trees will be trained on metal espaliers, and those kinds planted according to the situation. Gooseberry and currant bushes are to be made to flourish in the least favourable spots, but pears will form the staple crops. The first five years no rent is to be demanded. The idea is not new, as those who have travelled on the German lines can recall the thrift displayed in cultivating these waste spots, in Luxembourg particularly. It is to be hoped, however, that the company will be restricted from obstructing the views of the country with their trees.

SUSSEX ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society has taken place at Lewes, where Mr. M. A. Lower, as usual, became Coryphæus, the Rev. Edward Turner, V.P., being at his post. The Hon. Secretary, Mr. Francis Barchard, the Rev. William Powell, and several of the leading clergy and gentry of the district, were present. In the course of the day the objects visited were Kingston Church and Manor House, Iford Church, Rodmell Church, and the site of a British cemetery on the Rodmell Downs, where excavators were employed to dig into some of the twenty-six barrows which indicate the site of the cemetery, and where human remains were found. Mr. Lower explained the churches of Kingston and Iford. The Rev. P. de Patron did the same for Rodmell, and also read a paper on *barrows*, by Mr. Joseph Cooper, F.S.A.; Mrs. Rosseter, Iford Manor House; and the Rev. P. de Patron. A luncheon took place at Rodmell, and the party, numbering upwards of fifty, enjoyed one of the most pleasant "outings" that the society has ever had.

MARPLE CHURCH.—NARROW ESCAPE.—On Sunday before last, before the congregation had all left the church in the morning, a large portion of the cornice which encircles the chancel-arch and gaslights fell from the ceiling into the middle aisle of the church. Fortunately no person sustained any injury.

ANCIENT REMAINS IN FRANCE.—The *Journal des Landes* mentions discoveries that have been made at St. Cricq, near Ville-Neuve-de-Marsan. These remains consist of antique walls of great thickness, of rooms adorned with mosaics, and in good preservation. In the River Sèvre, also, sunk beneath the bottom, have been found the remains of a boat, which probably belonged to the Normans.

LOUGHBOROUGH PARK VILLAGE.—The works on this estate, which have become the property of the Sutherland Village and General Dwellings Company, have been commenced. It is proposed to erect on this estate about 650 houses, each to have a garden. Plans have been prepared. The houses are to be in price from 200*l.* upwards, payment to be made in the shape of rents, extending over fourteen years.

LIVERPOOL.—Although the Liverpool corporation has long been considered one of the wealthiest in the kingdom, the inhabitants are now complaining bitterly of the pressure of local taxation. At a recent meeting of the town council, Alderman Dover pointed out that the local taxation has risen since 1858 from 5*s.* 1*d.* in the pound to 7*s.* 4*d.* In addition to this, the corporate debt is now 5,000,000*l.*; and recently no less than 21,000*l.* had been spent in obtaining thirty-four bills, which involved an expenditure of 1,000,000*l.* Another speaker complained that the original estimate for the Sefton Park had risen from 85,000*l.* to about 250,000*l.*

A NEW STEAM-ENGINE.—An extremely simple steam-engine, in which piston, crank, steam-chest, &c., are dispensed with, has, it is said, been invented by Mr. Benjamin Franklin, of Westmoreland, Penn., U.S. It depends entirely upon centrifugal force; friction is almost entirely overcome; and it will produce 1,500 revolutions per minute with one-fourth the steam usually required, although the same amount of horse-power is developed. This centrifugal steam-engine condenses almost all its steam (which in itself is a great saving), whilst from its simplicity it can be constructed at one-fourth the ordinary cost, and is not liable to get out of order.

OBTAINING WATER AT ANY DEPTH.—Experiments have been made, on the grounds of Richmond Villa, with Messrs. Watson & Baker's newly-patented invention for obtaining water. The Hon. Edward Erskine, accompanied by several scientific gentlemen connected with her Majesty's Government, were conducted by the patentees to the spot, and two gentlemen representing the Russian Government, and others from the East-India service, attended, all of whom expressed themselves gratified at the result, water being obtained in less than an hour. The water so obtained, it is said, can be pumped up from any depth, and conveyed into the top rooms of the highest house.

A HINT TO LECTURERS.—Many lecturers have felt how unsatisfactory it is to write or draw, or in any manner attempt to illustrate their ideas in a large room. Professor Albert R. Leeds, of Haverford College, Pa., suggests that this difficulty may be overcome thus:—A plate of glass is placed in the lime-light or magnesium lantern, and an inverting prism is put in the forward part of the draw-tube of the objective. If, now, while lecturing, writing is done with an ordinary pen and Indian-ink upon the glass plate, proceeding from left to right upon the plate, it will advance correspondingly upon the screen, and will be read in greatly enlarged characters by those present. The square prism inverts with respect to bottom, and the writing being actually reversed by the writer in reference to the other direction in which the lantern is pointing, the crossing of the rays produced by the lens becomes in this case an advantage, and corrects the letters upon the screen. A collodion film, blackened by exposure to the sun's rays, may be substituted for a naked glass plate with great advantage. On such a film chemical and mathematical formulae, drawings of apparatus, machinery, and so on, may be cut with delicacy, and appear as intensely bright white lines on a black ground, and with something of the appearance of an immense copper-plate engraving.

"ASSOCIATED ARTS INSTITUTE."—The opening *conversazione* will be held on next Sturday evening, the 31st inst., when the president, Professor Westmacott, R.A., will make an address. A remarkable collection of drawings (never before exhibited) by the late Sir J. Westmacott, R.A., will be on view. For ensuing meetings a number of papers are promised by Mr. Soda Smith, Mr. R. Radgrave, R.A., Mr. Ellis Woolbridge, Mr. Bateman, Mr. Cave Thomas, Mr. A. Hart, R.A., and others.

THE ARUNDEL SOCIETY'S PUBLICATIONS.—The Council announces "An illustrated description of the Arundel Society's publications during a period of twenty years." The whole of the publications, including the ivory carvings, will be photographed one-fifth the size of the originals, and arranged chronologically according to the years in which they were issued, whether as annual or occasional publications. The letter-press will give a full description of the works, arranged in a similar manner.

MANCHESTER JEWS' SCHOOL.—The foundation-stone has been laid of a building about to be erected from designs of Mr. E. Salomons, in Derby-street, Chetham-hill-road, as a school-house for Jewish children. Mr. Edward Nathan, the president of the institution, laid the stone in the presence of a considerable number of the members of the Jewish congregation. A dinner in celebration of the event was given by Mr. Nathan, at the Queen's Hotel, and amongst the company were Mr. Thomas Bazley, M.P., and Mr. Jacob Bright, M.P.

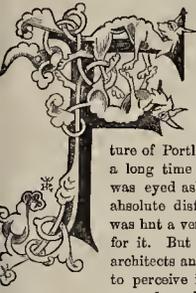

MEANS OF MAKING PAINT ADHERE TO ZINC.—It is a difficult matter to get a coat of paint to adhere well to zinc, which rapidly oxidises when exposed to air and moisture; and, as most engineers know, galvanised iron goes very quickly when once the covering of zinc has decayed. Many means have been tried to obtain the firm and close adherence of paint to zinc. The last we have met with is due to Dr. Botiger, who professes to have completely succeeded. He makes a solution of one part of chloride of copper, one part of nitrate of copper, and one part of chloride of ammonium in sixty-four parts of water and one part of commercial hydrochloric acid. This solution acts as a sort of mordant. It is paid with a wide brush over the zinc, which immediately becomes a deep black colour, forming, according to the Doctor, a basic chloride of zinc, and what he calls an emorphous brass. The black colour changes in the course of twelve or twenty-four hours to a gray, and upon this gray surface any oil paint will dry, and give a firmly-adhering coat. Summer heat and winter rain will have no effect in disturbing this covering, which affords complete protection to the zinc.

FINSBURY PARK.—On Monday night a public meeting was held in Myddelton Hall, Islington, for the purpose of protesting against the proposed building on Finsbury Park by the Metropolitan Board of Works. Mr. W. T. M. Torrens, M.P., presided. Mr. Alderman Lusk, the other member for Finsbury, was also present. The following resolutions were passed:—"That this meeting views with great surprise and regret the course contemplated by the Metropolitan Board of Works to dispose of a large portion of the ground already purchased, and positively required, for the purposes of the Finsbury Park; and feels certain that, if the intention of the Board be carried out, the object of the Legislature will be frustrated, a great injustice will be inflicted upon the inhabitants of the borough, and the usefulness and beauty of the park as a place of public resort will be materially and permanently injured." "That a memorial be signed by the chairman on behalf of the meeting, and presented to the Metropolitan Board of Works by a deputation to be headed by the chairman." "That, failing to obtain a satisfactory reply from the Metropolitan Board of Works, a Bill be prepared to amend the Finsbury Park Act of 1857, having for its object the preservation for the use of the public of the whole of the 131 acres purchased; that the borough members be requested to carry such into the House of Commons; and that they, together with the county members, give the said Bill their utmost support. Further, that the assistance of the Government and the Open Spaces Association be respectfully solicited." Among the speakers were Alderman Lusk, M.P., the Rev. R. Maokenzie, Dr. Harvey, Messrs. C. H. Eli, A. Walker, E. W. Phillips, E. S. Conlin, and J. Vincent.

The Builder.

VOL. XXVI.—No. 1343.

Portland Cement.

PORTLAND CEMENT. For a long time the new material was eyed askance, if not with absolute disfavour, and there was but a very limited demand for it. But gradually foreign architects and engineers began to perceive its merits, and become large customers for it,

using it in vast quantities in the construction of harbours, docks, and fortifications; and within the last fifteen years English engineers have dismissed their prejudices against its capabilities; and its manufacture is now conducted on a gigantic scale on the banks of the Thames, as well as on those of the Humber, Tyne, and Medway. Meanwhile Germany has commenced to make Portland cement. Hitherto Germany and France have been our chief customers: consequently, had it not been for the general acceptance of the cement in our own country, this innovation would have seriously affected the trade. As it is, the increased demand at home is more than compensated for the loss of this outlet. Nevertheless, it will, doubtless, be useful to examine into the mode of cement manufacture in Germany, the more especially as a claim for superiority has been set up for the Continental method. Such a scrutiny has been made by Mr. Reid, who, in a work setting forth the history, properties, and purposes of cement, has given a translation of a German pamphlet by M. Lipowitz, who is the inventor of a mode of manufacture stated to be an improvement upon our own, in which his particular process is fully detailed.* The production of Portland cement in Germany commenced sixteen years ago: there are now twenty-five manufactories established; and we read of a German prince giving the subject his especial attention; contributing, indeed, a paper entitled "The Theory of Portland Cement" to a periodical devoted to mines and manufactures, in which there is evidence that he has made a great number of experiments to ascertain which are the best clays for cements. Being the importance that is attached to the subject abroad, we feel Mr. Reid has been well advised when he resolved to place the information in his possession before the public. Before opening the German branch of the question our author describes the English mode of manufacture; states the combination of advantages that should rule the selection of a site for a manufactory; gives the nature of the raw materials; describes the various kinds of kilns and machines in use; indicates the methods of grinding the burnt cement, and testing it before using it; and, finally, shows the manner of its application in marine architecture, in the building of houses, and formation of roads. This part of his work is of considerable interest. It

seems cement manufacturers are under great obligations to French engineers and architects, whose rigid tests of their material and peremptory rejection of all not coming up to a certain standard led to the strict attention being paid to the various processes, which resulted in the ultimate excellence of the article. Subsequently, the equally severe tests instituted by the engineers of the Metropolitan Board of Works, previously to its use in the formation of the Thames Embankment, have had a similarly beneficial effect in raising and maintaining the quality of the cement. Formerly, the simplicity of the materials, and the comparative ease with which they were manufactured, led to the impression that all care in their manipulation could be dispensed with, which carelessness allowed the article to deteriorate to an often worthless quality, and permitted its export in sacks, instead of casks, whereby it became damaged. One of the charges brought by the Germans against English cement is its inferiority from this last cause. They say it used to arrive in sacks which had lain in the holds of ships exposed to damp and even water; and when landed, instead of the spoil being separated from that which was unruined, both were pounded together, and sometimes adulterated with powdered ashes, metal dross, and sand. Under these circumstances it is scarcely to be wondered at that rivals possessed of facilities equal to our own entered the field.

Portland cement being a mixture of chalk and alluvial clay, the first condition in the selection of a site for its manufacture is that it should possess an abundant supply of these materials. It would be unwise, our author warns, to commence operations on a site where there is not material enough to last for at least twenty years. The next point is accessibility and cheapness of transit. Much of the success of the principal London manufacturers is due, he affirms, to their excellent situation in commanding water-carriage to their principal points of consumption or shipment, at a cost of about 1s. 6d. per ton, combined with their contiguity to the port of London, which facilitates their shipping to foreign ports at low rates. Another item to be considered is the price of fuel. London is provided with a cheap fuel, in the shape of coals, from the gasworks. Owing to this advantage which cheap fuel confers, Newcastle-upon-Tyne is able to compete with London in the production of cement for foreign markets, although it possesses no chalk, and relies for its supply of that essential upon the coal-vessels, which bring it back from the Thames as ballast. The theory of Prince Schönau-Carolath, mentioned above, is that the clays best suited for cements are those which contain iron up to 10 or 15 per cent. in the form of iron oxydide, and that this qualification is possessed in the most eminent degree by the clay of the Medway, a superiority only shared by the clays of Wildau and Kieferstädtel, near Gliewitz. After the choice of a site with the necessary materials at hand comes the selection of the means by which their due and accurate manipulation is accomplished. The first process of washing or mixing is performed either with edge-runners, harrows, or knives; but beyond these, in point of efficacy, Mr. Reid places a wash-mill of a certain construction, which he describes, furnished with two sets of revolving knives. This mill requires a power of eight horses to work it, and costs, with boiler, engine, and machinery, from 300l. to 400l. The proportions of the chalk and clay are, of course, a matter of judgment. Mr. Reid furnishes two tables of analyses of various limestones to assist the manufacturer in forming a conclusion. If the materials be the simple chalks and clays of the rivers Thames and Medway he recommends four parts of chalk from the Medway (which is of a grey colour), or three parts of that from the Thames (which is white), with one

of clay, subject to modification according to the state of both. The next process should always be sampling, that is, a sample of the mixtures overflowing from the wash-mill should be taken and dried on hot plates, and then burnt, with a view to ascertain the correctness of the proportions. Our author directs that the sample should be moderately well burnt, and when quite cool pounded in a mortar, from which it should be sifted in a fine-meshed sieve of about 2,000 meshes to the square inch. He says:—

"Make a sample from the powder with the least possible quantity of water, which divide into two circular pats three or four inches in diameter, and half an inch thick. Place one of these, when sufficiently set, into a basin of water, leaving the other in a dry place; the first with the object of proving the hydraulicity of the mixture, and the other the colour. After an interval of twenty-four hours the samples should be carefully examined in a good light, and if the water-sample is free from cracks or fissures it may be passed as sound, or at least may be considered safely mixed with the proper proportion of carbonate of lime. If on examination the air or dry pat appears of a blue-grey colour, without any stains or brown specks, you may safely continue the proportions of chalk and clay represented by the duplicate samples. But if, on the contrary, the water-sample gives way, cracking and flying, as it is technically called, no time must be lost in reducing your measure of chalk or increasing the quantity of clay. Again, should the water-sample continue sound in appearance after twenty-four hours' immersion, having set quickly when being worked up into the pat, and the air-sample of a brown colour, you may consider the mixture over-clayed, and instant steps must be taken to alter the proportions."

This system is called the wet method. The German system is called the dry method. Instead of mixing his materials in a mill, M. Lipowitz dries his chalks and marks by heating them to 100° centigrade in a square building constructed of fire-bricks for the purpose. The dry chalk is then mixed with this other materials in a dried form, in certain ascertained proportions, and then ground. Mr. Reid compares the two systems very fairly. As far as the cost is concerned in the preparation of the cement to this stage the balance is in favour of the English method, but, taking other considerations into account, he candidly states that the German plan has the advantage. He estimates that the expense of mixing and reducing the raw materials according to M. Lipowitz's method could not be less than 3s. per ton, or three times the cost of the washing operation. On the other hand, the English mode requires more space and more time, consequently the use of a larger capital. To illustrate the comparative merits of the two systems, he states the conditions with which 100 casks per day, or 20 tons, are manufactured by both. By calcination, or the dry method, 240 tons of raw materials would be required to furnish 100 casks per day for a week, allowing for the waste or loss of moisture by heat between the raw materials put into the kiln and the result in manufactured cement obtained at the spots of the horizontal millstones; while by the wet method at least 400 tons of washed material would be required to furnish the same amount of finished cement. To deal with the amount of material, a space of at least an acre must be provided; and two months must elapse before it has settled and dried sufficiently to be turned to proper account. Mr. Reid sums up the respective merits thus:—

"The space, therefore, under the conditions named in the above description, for the reception of one week's washing is an acre, with the weight to be dealt with 400 tons; whereas by the dry method an insignificant amount of room only is required, and the weight but 240 tons, in obtaining equivalent results. The necessity of delay in allowing the raw materials to settle and dry entails the great cost of space, and in like manner adds to the weight. . . . While, therefore, by one method, the material washed is not available for further operation until an interval of two months has elapsed, by the other method, when ground dry, the further process may be continued and even perfected on the same day, obviously great and important advantages, preventing thereby the necessity of locking up an amount of capital represented by the value of two months' washed materials; so that, notwithstanding the extra cost of grinding over that of washing, there are other considerations on the question which, when duly estimated, may leave the balance in favour of the German system."

From the wash-mill, English Portland cement proceeds, by gravitation, by descending drains or channels, to a series of reservoirs, called hacks, provided with sluices to assist in the passage of superfluous water from the mixture

* A Practical Treatise on the Manufacture of Portland Cement, by Henry Reid, C.E., to which is added a translation of M. A. Lipowitz's work, describing a new method adopted in Germany of manufacturing that cement, by F. Reid. London: E. & F. N. Spon, 48, Chancery-lane, 1868.

where it lies till it is sufficiently consolidated to be wheeled in barrows to drying-plates, placed conveniently between the hacks and the kilns, so as to economize the waste heat from the ovens used for coking the coals required for the kilns. After this desiccating process has continued for about twenty-four hours, the material is burnt in the kiln. When cool it is drawn from the kiln, and sent on barrows or trucks to the grinding-mill, where it is either stored or hoisted into the hoppers of the millstones, to be pulverized at once. In considering all these processes, and the appliances required for them, Mr. Reid sees preferable advantages in the German plan. This we will proceed to notice more fully.

A leading feature in the method invented by M. Lepowitz is the use of a kiln he describes as "endless." He has applied the principle of this endless kiln to a sample kiln, in order that his samples may be burnt under the same circumstances as the great hulk of the cement. It is oblong in form, and may be described, so as to give some idea of it, as divided into three parts, two gratings to hold the fuel, an oven to hold the bricks and cement, and a ventilator; and it is so contrived that the whole heat from the fire must pass through the oven to get to the ventilator. A sheet of mica is introduced in one side of the oven, through which the condition of the contents of it may be observed. These are the advantages claimed for the sample kiln of this construction:—

1. The value of different fuels may be accurately determined. It is only necessary to introduce between the kiln and the ventilator a serpentine tube or pipe, immersed in water. The heat engendered in the kiln and the temperature of the water represent the worth of the fuel.
2. The adaptability of all kinds of fuel for the purposes of burning cement, chalks, bricks, &c., can be ascertained.
3. The amount of heat may be regulated to any degree, by the quicker or slower rotation of the ventilator (from 600 to 2,600 revolutions per minute).
4. The proper degree of heat can be accurately determined by the colour of the material while burning, and the time required to burn it.
5. The space required to burn certain quantities of cement or chalk can be with accuracy determined.

Another structure required is the fire-brick building, in which the chalk is dried. This is composed of four walls, enclosing a quadrangular space, which may be either arched over or left open at the top, though if the latter alternative be adopted a slate roof at some height above it is recommended as necessary. In the centre of one side of the square is a small door, through which the chalk is introduced, and another side is occupied with low arched holes for the fires. The chalk is piled up within so lightly that there are plenty of interstices through which, when the fires are lighted, the hot air can rise and dry it. While the drying process is going on the door is kept closed, and is plastered up with clay; and when it is complete the door is opened and the chalk taken out. Besides these kilns, factory buildings, sheds, &c., there are several machines used for special purposes, such as a stone-breaking machine, vertical mills, and horizontal mills. Each mill is provided with covered shoots to endless worms, which carry the material on to pits, whence elevators raise it to cylindrical sieves, through which it again descends through inclined shoots. M. Lipowitz gives a detailed estimate of the cost of machinery and iron for a manufactory capable of producing 30,000 casks per annum, which amounts to 4,682*l.*, exclusive of the cost of buildings. This is subject to the degree of accessibility and neighbourhood of iron-works of the proposed manufactory, the author giving the maximum price of each article. This he supplements with a statement of the yearly cost of raw materials and working expenses in producing 30,000 casks per annum. Including, what appears to be every possible charge besides the raw materials, such as labour, coal, casks, repairs, oil and lighting, carriage, travellers' expenses, 5 per cent. on the outlay for the works estimated in round figures at 9,000*l.*, and 10 per cent. as a redemption fund for the outlay, the cost comes to 9,780*l.* Setting the sale of the 30,000 casks at 9*s.* each against this, there is an income of 13,500*l.*, or a net profit of more than 40 per cent. on the outlay. With these figures before us the interest taken in the subject in the Fatherland is not extraordinary.

Besides describing the process very minutely and systematically, M. Lipowitz gives a plan of a model cement manufactory. Here we may see the shed in which the raw materials are placed, the fire-brick building close by where

the chalk is dried, the positions of the stone-breaker, the edge-runners, and the horizontal mills, by means of which the raw materials are successively ground to powder, the place into which the sifted powder falls, close to the machine which forms it into bricks or briquettes, the drying channels along which it is propelled on wagons by woman, on tramways, to the endless kiln; the return roads that bring it all back again to another series of grinding-machines; and the room where, finally pulverized, it is stored till the casks are ready for it to be packed in. All are arranged with a view to saving of space and labour. There is no passing and repassing. The raw materials are received at one end of the works, and thence in a well-considered circuit, all the necessary processes are effected till it returns to the same extremity of the works, which is probably in proximity to the wharf or other means of transit, perfected and packed ready for export. The employment of women in the transport of the bricks is a feature not common to us. The wagons are, however, small and light. They are composed of six stages, on each of which are laid three drying-plates, holding twenty-seven bricks. Each wagon therefore carries 162 bricks. Our author, speaking of his system of drying, says:—

"When the bricks are dried they shrink to about one-half of their original size, and then weigh about 4 lb. each, so that the channel, when full, contains more than 2,000 bricks, weighing 4 tons. From the mouth of the channel a tramway leads to the endless kiln. Another return-channel declines from the kiln to the forming machine, down which descends the empty wagons, to be used again. This method of drying is one great advantage of my method of manufacture. Other works have extensive drying-houses, built at great cost, requiring a large outlay of labour and time to do an equal amount of work, besides the loss sustained by breakage of the bricks. Other works, again, have extensive covered drying-plates, return-channels leading from the kiln to the forming machine, and other a chimney-shaft, from 100 ft. to 125 ft. high, in order to cause a draught through the numerous flues. My system utilizes the heat, which in other manufactories escapes through the chimneys, I can dry equally fast in winter as in summer, and am therefore independent of the seasons and temperature, as well as the dry or wet state of the atmosphere."

The endless kiln is by no means in general use in Germany. The old-fashioned high cylindrical kilns, 50 ft. high and 10 ft. in diameter, are in vogue there still. It was the knowledge of the time and labour wasted in filling these high kilns and the loss of fuel in heating them every time they were used, that led M. Lepowitz to consider whether the ring-kiln could not be adapted to the same purpose; and the result of his experiments and deliberations is the endless kiln, built, however, not ring-formed, but oblong. Exact particulars of its construction, as well as a plan and section, are given by the author, to which we must refer our readers. Its inventor caudally allows that English cement is better than French cement; but he contends that cement made by his method is better than either. Moreover, his endless kiln is equally advantageous to the brick and lime manufacturer.

Mr. Reid's details of the tests applied to cement afford valuable information. Some people are of opinion that cement requires an addition of sand to give it strength; but this is not so. In proportion as sand is added its strength is taken away. Thus, neat cement gauged by Mr. Grant at different periods in twelve months, to ascertain its strength, yielded the following results:—

	lb.
1 week	445
1 month	449.9
3 months	877.9
6 "	878.7
9 "	935.9
12 "	1,075.7

That is to say, it more than doubled in strength in the twelve months; while, mixed with equal proportions of clean, sharp Thames sand, a considerably lower strength resulted, although a progressive rate, developed by time, was also shown:—

	lb.	Per cent. of the Strength of neat Cement.
1 week	379.9	= 21.8
1 month	399.3	= 44.3
3 months	367.0	= 41.8
6 "	549.8	= 55.9
9 "	607.8	= 61.3
12 "	700.3	= 65.1

The nature of the tests, too, are curious. French architects have given the most attention to this subject, and it is their tests that are the most rigid. In one case Mr. Reid relates that the form of test prescribed by the French authorities for a quantity of cement, ordered for a French Government contract, involved an expense that was out of proportion to the terms;

and that to curtail the cost, he invented a machine for pressing the sample briquettes, instead of cutting them, now in general use. One test consists of the penetration of a needle into the cement. This was invented to measure the relative hardness of several mixtures of pure mortar and cement without sand. A steel conical needle, protruding from a socket on the lower extremity of a vertical rod or spindle, is impelled into the cement by a hollow metal cylinder, weighing about a pound. Another test is a breaking weight of 480 lb., applied after fourteen days' immersion in the sea. Then there are the comparative, hydraulic, and frigorific tests; and the age test, which later Mr. Reid somewhat scornfully couples with fortune-telling. Mr. Grant instituted a triple test. He first required that the cement should weigh 110 lb. to the struck bushel; next that it should remain under water for six days before being submitted to the tensile and third test, which should yield a value equal to 400 lb. on an area of 24 square inches. After reviewing the results of a large number of tests, Mr. Reid draws attention to the fact that Portland cement bricks, even at nine months old, exceed in value or resistance to compression some of the best natural and artificial building materials in the country.

The purposes to which cement may be applied occupy a large share in the thoughts of both the English and German writers. They both speak highly of its applicability to domestic architecture. The use of Portland cement, instead of lime-mortar, would be a cure for at least half the dust in our houses from which we now suffer, according to Mr. Reid. He would have the cement and sand accurately mixed in the required proportions supplied to the builders, so as to only require the addition of water to render it ready for use. For cottages and farm buildings, and barracks and cottages for soldiers, Portland cement is recommended as possessing many advantages. The whole roofs, walls, ceilings, and floors of cottages, with the addition of a small quantity of iron, could be built with this material, and great stability and comfort ensured. M. Lipowitz specially advocates its adaptation to roofing. He says a firm in Silesia has produced a black pitchy substance, called Häsler's wood-cement, which has been used with much success for covering roofs. It is as cheap as felt, much more durable, and is not cracked by the sun's rays. Roofs covered with it are cool in summer, warm in winter, cannot catch fire from the outside, and may be covered with earth, and used as gardens. It has been tested for upwards of twenty years, and no repairs needed. The enterprising German advises all cement-makers to make it, and tells how it is made. From 160 lb. to 190 lb. of cement are mixed with 100 lb. of coal tar in a large iron boiler with a flat bottom. The tar is put in first, then the cement is gradually stirred in, and to every hundred-weight of cement a pound of powdered sulphur is added. When the mixture becomes too thick to flow, it is drawn off through a pipe fixed in the side of the boiler and packed in casks. Before covering a roof with this material, a coating of sand is spread over it, then a covering of strong brown paper. Upon this the molten mixture is spread with a tar-brush, another layer of paper is then added, and the process repeated till the coating is four layers strong. A dressing of sifted ashes is strewn over it; and when all is finished, including the zinc borders recommended to secure chimneys, a depth of an inch or inch and a half of gravel is laid on, properly levelled with rakes and scrapers. The necessary framework should consist of rafters or joists placed not more than 2 ft. 3 in. apart, with boards an inch or an inch and a half thick nailed on to them and dovetailed; and it should have an inclination of half to three-quarters of an inch per foot. The cost of a square foot of this roofing, guaranteed not to require repair, is about 1*l.* 4*s.* in Germany. Mr. Reid would extend the use of Portland cement to roads, the walks in our public parks, and places of amusement. He gives full particulars of the trials that have been made in this direction already, including the failure in St. James's Park. Mr. Mitchell's Scottish successes are also quoted. Diminished wear and tear, superior cleanliness, and diminished cost and annoyance from repairs are urged in the favour of cement concrete roads. Where a square yard of concrete road has cost 6*s.* 8*d.*, a similar measure of a paved road has cost 17*s.* On the other hand, when the concrete road is required to be taken up, for the purpose

of attending to gas or water pipes, the strength of it is a disadvantage. To obviate this Mr. Reid recommends the use of blocks of convenient sizes, that have acquired the requisite degree of hardness. In the certainty of the feasibility of this mode of using concrete for roads, he says he would not reckon the engineer a visionary who would undertake to relay the whole extent of London Bridge with blocks of concrete in this manner in fourteen days; and he seems disposed to back the road so made as likely to be superior to the present one in every way.

Mr. Reid also gives a short account of the experiment made for the Metropolitan Board of Works to ascertain the virtues of the "Béton Aggloméré Système Coignet," under the superintendence of M. Coignet, by a staff of French workmen, in the construction of several arches under the stair approach from Westminster Bridge to the Southern Embankment of the Thames; he fully endorses the excellence of the French article, the more unreservedly, perhaps, because its high price puts it out of competition with ordinary Portland cement concrete. The latter cost, on these works, from eleven to thirteen shillings per cubic yard, while the Bêton Aggloméré's came to more than double that sum. About twenty miles of the Parisian sewers were laid down by M. Coignet of this material, when it was considered, and certified, that a saving of 20 per cent. upon the cost of masonry was effected by its use. Without its large proportion of Portland cement, however, our author doubts whether it would retain its applicability to building purposes.

The conclusions to which our authors would conduct us are that Portland cement is on the eve of a greatly-extended use; that it fully merits the good opinion engineers now form of its qualities; that the opinion can only be maintained by due attention to its manufacture; and that the best and most remunerative mode of manufacturing it is by the process invented and perfected by M. Lipowitz. Some of our own manufacturers had better take heed. Sad stuff is occasionally sold and used.

THE BISHOPRIC OF RAMSBURY.

ENGLAND without railways has become a scene altogether unfamiliar to the literature of the day. Steam locomotion has entered the minds of the present generation as an established means of travel. A novelist who sends his hero on the stage by the only conveyances known to the first quarter of the present century is now looked upon as an antiquarian writer,—a feeble imitator of the Great Wizard of the North. The change effected on the face of the country, on the manners, habits, and appearance of the country folk, is in accordance with this great revolution of thought. Facility of locomotion, and that facility on a very liberally used, has given an impulse to the national life that is everywhere apparent in the great sign of vitality,—steady and continued transformation.

While the England of 1868 is so different in all, except its most marked physical features from the England of 1828, we must remember that the country is not yet absolutely reduced to the dead level of homogeneity. Strong as is the influence of modern travel in destroying local and provincial peculiarities, the effect is, like that of the force of gravitation itself, eminently modified by the distance at which it acts. Find a nook of the country that is deprived of ready communication with the great railway network, and you meet with lingering features of pre-railway England, and the quiet of these little country nooks, the tranquil content with which the village shopkeeper will confess herself "out" of the article you require, but expectant of a stock of it next month, or the indifference with which the postmaster will tell you that between 6 p.m. on Friday night and the same hour on the following Monday the only mail-bag made up is despatched at eleven a.m. on Sunday, is no doubt the very height of an enviable philosophy, although the jaded inhabitant of a great city, surprised at the unthought disregard of quarters of an hour, unwarily denounces it as "stupid." It takes some time to realise the felicity of being safe from the post-man for twenty-four hours,—safe from a telegram, unless it is brought by a steadily-trotting horseman whom you may recognise a mile off at the very entrance of the long and shady avenue.

At a moment when the attention is called to

questions of ecclesiastical history, to the habits of the early Anglican clergy, and to the "Use of Sarum," it cannot fail to be of interest to detect in one of these quiet and forgotten nooks of an agricultural county the remains of a cathedral and See of greater antiquity than Old Sarum itself. In the year 635, we are told by the Sarum Almanack, when Severinus was Bishop of Rome, twenty-eight years after the mission of Augustine to Britain, Cynegils, King of Wessex, abjured heathenism, and was baptised at Dorchester by Birinus, on which occasion the seat of the hishoprie of Wessex was established in that city, Dorchester, in Oxfordshire. In 683, Bishop Hæddæ removed the see to Winchester. In 705 the diocese was subdivided, the country to the east of the Forest of Selwood remaining as the diocese of Winchester, and all to the west of Selwood being formed into a new diocese, the see of which was fixed at Sherborne, and first filled by Althelm, a kinsman of King Ina.

In the year 906, a fresh division was effected, and a see was created at Ramsbury, comprising Berks and Wilts. The names of the hishops of Sherborne and of Ramsbury are still preserved, and the latter are often termed Episcopi Wiltunnenses, or Bishops of Wiltshire; and also Episcopi Sunnungenses, from their residence at Sunning, in Berks. In 1045, Herman, one of the chaplains to King Edward the Confessor, was made Bishop of Ramsbury. He attempted to remove the see to Malmshury, but the abbot of that famous monastery, supported by Earl Godwin, successfully opposed the effort. Herman retired in disappointment to the monastery of St. Bertin, in France; but on the death of Alfræod, 1058, he was made Bishop of Sherborne, and administered the two dioceses of Sherborne and Ramsbury from the former see.

In 1075, in consequence of the decision of a council, held under Archbishop Lanfranc, in 1072, to the effect that the episcopal sees which were established in obscure villages should be removed to considerable towns, Herman changed his residence to Old Sarum. Osmond, the successor of Herman, commenced the erection of the Cathedral of Sarum in 1092. Four of the successors of Osmond sat in this church, the founder and endower of which established the famous "Use of Sarum," which regulated, for many centuries, the form of the Anglican worship, and to which attention has so recently been called by the proceedings of the Ritual Commission. The exposed situation of the cathedral, and the turbulence of the garrison of the castle, caused the removal of the see, and in 1220 Bishop Richard Poor laid the foundation of the new church in the "Fair Mead," two miles distant from the former site. The present Bishop of Salisbury is the sixty-second in succession from Bishop Richard Pauper, or Poor.

The Bath road of the great coaching era, which crosses a branch of the Great Western Railway at Hungerford, leaves at that town the valley of the Kennet, and runs through pleasant chalk hills, and under the shade of trees of a yet surviving actual forest, to Marlborough. But the river Kennet, running along the arc of a bow of which the coach-road forms the chord, flows through a country unweaved by traffic, and dotted with fine old mansions seated in those green and well-timbered parks so dear to the lovers of the picturesque, and of the old country life of England, and so grievous in the eyes of a certain school of improvers. About four miles west of Hungerford, half way between the two stately parks of Littlecote and of Ramsbury, is the site of the episcopal see which, in A.D. 909, comprised the counties of Berks and Wilts. Little remains in the quiet and tidy village to tell of its former ecclesiastical importance. The unusually large buttresses which form part of the low along tower of the church seem to tell of a former and forgotten spire. The roof of the nave is an ancient piece of oak-work, recalling, at an humble distance, the ceiling of St. David's Cathedral. The most curious and unaccountable architectural feature that distinguishes the building is the eccentricity of the chancel. The handsome five-light Gothic window at the east end of the building is some 3 ft. or 4 ft. nearer to the southern than to the northern wall. Within, this peculiarity fails to strike the eye at once; but on the exterior it has the disagreeable consequence, that the ridge of the roof is not perpendicular to the point of the window. The hand of the restorer may, indeed, be detected; and on the tower are to be seen marks of a roof of much higher pitch than that which now covers the nave. At the east gable the abomination of rough cast disguises some

repairs or alterations in the wall above the window; but a piece of ancient work, which looks as if it were *in situ*, and which encloses in a trefoil light two scutcheons, of which the bearings are now entirely obliterated by weather, is in the vertical line of the ridge, and thus unsymmetric with the eastern window below it. The whole of the southern wall of the church has moved decidedly outward, and is held from further mischief by iron rods.

A very fine, though very neglected, canopied tomb of the twelfth or thirteenth century, and an episcopal grave-stone in the floor before the altar, from which the brass has been stripped, are all within the church to tell of its former rank, excepting the appropriate offerings of some feminine hand which adorn the backs of the communion-table chairs, on one of which is embrodered the arms of the present see of Salisbury, and on the other, on an azure scutcheon, a silver archiepiscopal pall, charged with five sable crozettes, under a silver cross pattée, which, from the antique shape of the mitre above, seems to denote the ancient see.

The Church of Ramsbury is not, however, without memorials of much interest in an historical, if not in an ecclesiastical sense. On the wall of the chancel hangs a hatchment which, by its fine old bearing of two bars or, on an azure field (the same charge which is borne on a gules field, by the House of Harcourt, which traces an unbroken descent to the times of the Carolingian dynasty), recalls the name of one who was in his time, not only the most famous haronet, but also the most popular man in England, the Sir Francis Burdett, who stood siege in his house in London, against the military power of the House of Commons, represented by the Sergeant-at-Arms. No sculptured memorial to this distinguished lord of Ramsbury Manor appeals to the eye in this church. There are tombs to his predecessors in the property, the Jones family, from whom Ramsbury, falling to the spindle, came to the Burdetts,—one, the last male of his line, in the tight two-eared wig, of the time of George III., a young man of whom two portraits of singular beauty exist in the manor-house; the other that of the first proprietor of the name, "*ayres curatus*" and "*atomatus generosus*," in the time of Charles II., who acquired Ramsbury by marriage, and who looks in a half-remicent attitude from his monument, adorned by a full and flowing perwig, with a physiognomy that is so characteristic that it can hardly fail to be a truthful portrait. One hatchment of the Jones family, whose arms are party per pale azure and gules, three lions rampant argent, blazons what the French heralds would call a pennon, being enriched with fourteen quarterings, with a scutcheon of pretence of five more. Those silver lions have ramped out of the country, and are now only to be seen on the shield over the entrance to the manor-house, and sculptured as large as life, and with particularly malignant and human visages, on the piers of the great gateway of the park.

The most interesting feature, however, of this ancient church is one which will escape the notice of the casual visitor unless he take the trouble to walk round the exterior of the edifice. North of the chancel, and in continuation of the north aisle of the nave, from which, however, it is now entirely separated, is a mortuary chapel bearing signs of very costly and tasteful labour, which is known by the name of Darrell's aisle. It is a building distinct in date and design from the church, into which it formerly opened, and contains an altar of its own. In the centre stands a fine tomb, somewhat recalling that of King Henry III. in Westminster, the sides of which were once of polished granite, while the brass which has been ruthlessly torn from the slab seems to have presented the effigies of a knight and of two ladies—the last Darrell and his two sisters. The chapel is in the most discreditable state of neglect, a fact which does small honour to the family which, under circumstances long recorded in ballad, succeeded to the Littlecote property—a family commemorated in the distich,—

"Popham, Horner, Trute, and Thynne,
When the monks went out, they went in."

The story of the extinction of the proud line of the Darealls is so frequently met with, under one legendary form or another, that it is interesting to trace it to its very scene. Littlecote Hall, a fine old Elizabethan mansion, which, though girt with a semicircle of noble timber, and looking on a well-wooded and undulating deer park, containing a crested hill, from the summit

of which radiate nine noble avenues, lies low by the swampy course of the Kennet. The story goes—we cannot make room for the seventy-five verses of the ballad—that a midwife was summoned by night by a masked visitor, was placed in a carriage, and closely blindfolded. The direction and duration of her rapid journey she had no means of ascertaining, but she was led at its close up six stone steps, across a hall measuring twenty paces, and then up thirty-one polished stairs. She was freed from her bandage in a noble chamber, lighted by a single taper, held by an old woman, where lay her patient in a stately bed. Her function was safely and successfully performed; but the fine boy whom she introduced into the world was seized by her masked conductor, dashed against the mantel-piece of the antechamber, and consumed in a large fire piled on the hearth. The nurse, in terror and perplexity, secretly cut a piece off the hangings of the bed, and with this in her pocket was reconducted, with the same precaution which attended her arrival, to her own home, and dismissed with a purse of gold, a recommendation to silence, and a threat of death if she broke the injunction. She kept her bed for three days; on the fourth she heard the sound of a passing bell from Littlecote, and repaired to a neighbouring magistrate, to whom she stated what had taken place. The sister of Darrel had just died, it was said, of a sudden attack of fever, and the details of the information so exactly pointed to Littlecote Hall as the scene of the infanticide, that Darrel was at once arrested. As the trial was proceeding, it is said that Popham, the presiding judge, received a letter, to the effect, that if the prisoner was acquitted, the judge should be his heir. By an interference with the course of justice by no means incredible under the Stuart kings, the judge twice made the jury reconsider the verdict of guilty, and thus saved the murderer. Darrel returned to celebrate his triumph by a great banquet at Littlecote, but his slumbers on the following night were driven away by the appearance of the ghost of his sister, bearing a child of fire in her arms. He started in the morning on a great stag-hunt, and by a stile, which is now reduced to a single aged oak stump, beheld the same apparition, at which his horse shrank in terror. In fury he spurred the animal at the stile to clear it, shutting his own eyes to avoid the reproachful glance of the spectre; the horse again refused to leap, and Darrel was thrown headlong and broke his neck in the fall. Popham, in virtue of the iniquitous bargain which failed to lengthen the murderer's life, succeeded to Littlecote, but a curse, such as is said in several cases to linger in the blood of some old families (like the curse of Jeanne D'Arc on the house of Talbot, and the curse of the Grand Master of the Templars on the house of Capet), attended the heritage. This portion of the legend is not given in the ballad; but the whole history of the descent of the property is said to be in accordance with the tradition, and the gloomy and neglected condition of the noble park,—and the yet more melancholy condition of its present owner,—go far to excuse the superstition, if such it be.

The manor-house of Ramsbury, on the west of the village, though now for many years untenanted, presents a strong contrast to its more ancient and gloomy neighbours. Not devoid of a certain sort of tastefulness, the impression which this mansion produces on the mind is that the *attornatus generalis* and his heirs contrived to make themselves eminently comfortable on the estate of the Bernards. Unstudied, provident, elegant comfort, is the character of the house, now some two centuries old. You enter a noble hall, containing a billiard-table and some fine family portraits, directly leading to a wainscoted drawing-room, 27 ft. by 36 ft., or thereabouts, with moulded ceiling, very fine marble mantelpiece, adorned by wood carving, that suggests the chisel of Gibbons, and full of Indian and Chinese furniture and of old china,—a room, in fact, which once entered you regret to leave. The remainder of the house is *en suite*, the dining-room, which corresponds to a library on the opposite side of the hall, being, however, hardly large enough for the remainder of the building. The fine oak panelling of this room, moreover, has been barbarously painted over. Some of the family pictures are very noticeable. There is a very good full-length of his most sacred Majesty King Charles II., which seems to fix the date of the building as the work of the *æques auratus*.

Here is a portrait of the heiress, through

whose alliance Ramsbury came to the Jones family, a lady every inch a great heiress; handsome, portly, jolly, and authoritative. There are two portraits of the last Jones, a singularly handsome young man, in the gay and picturesque costume of a time when the great schism in dress had not arisen, and when we did not see the men attired like grooms or poachers, and the women like draggled-tailed and disreputable persons. You leave Ramsbury Manor-house with a feeling of great regret, that the sixteen fires which are kept alight during the winter, should not cast a glow on merry faces, and that the noble hall should be silent to the echoes of children's feet and voices.

There is one point in the arrangement of the park which is worthy the attention of those who lay out ornamental grounds. A branch is led off from the Kennet to form and freshen an artificial lake, which, although sadly requiring cleaning out, abounds in fine trout. Near the house, one of the occupation roads crosses this lake, or rather river. A bridge would have been a considerable expense, if at all in keeping with the character of the place. The difficulty is met in this ingenious manner. An artificial ford has been made, and well metalled, like a turnpike road. Three culverts, running in the direction of the stream, are adequate to convey the water under this ford. When, therefore, the flood-gates that draw up the lower portion of the lake are open, the road is dry. When these are closed, and the lake is full of water, the river ripples over the ford, which is then perfectly safe and practicable in either case. The sly-looking, well-fed trout, that haunt the spot, let you come close to their lurking-places, or hunt the smaller fry out of the water, under your very nose, as if they, too, were fully aware that Sir Robert had not been near the park since the funeral of his father, Sir Francis, and that no one can get leave to fish.

THE DOGE'S PALACE.

The imposing effect of the Doge's Palace in Venice is approved by admiration so general and so unaffectedly genuine as to place it above all question, all cavil. We may criticise it at extended leisure; but the first impression must be that we are in the presence of a majestic architectural enunciation. We may criticise ourselves into disquiet, but it will be apt to be less with what appear to be its faults, than with our own inability to justify the leniency with which we cannot help regarding them. The more serious the objections that gain hearing after the first enthusiasm has had time to cool, the more perplexing is it to render an account to ourselves of the principles on which enthusiasm inevitably revives,—re-establishes itself. While cavils, then, must have fair play, to strangle them in their birth were to do injustice to the artistic value of the expression that can countervail them: it is of more importance to save first the accurate recognition of this better expression, and to analyze—if so we may—its causes.

The position of the palace is most happy, yet only happy in the last degree, because the erection is worthy of it. Two equal fronts at a right angle, face—who needs to be told it?—one towards the broad quay of the lagoon, the other to the piazzetta. The chief of the republic's government—seems housed at the very margin of the element where its power was most conspicuous, so placed for the reception of earliest tidings from remote possessions, for most immediate despatch of commands, for readiest communication with dock and arsenal, for promptest action. Where more fitly could be placed the chamber for those councils of which Shakspeare has epitomised the characteristics in a single scene of *Othello*;—the midnight summons,—the progress from conflicting to consenting opinion in sober respect for reason and for ever-accruing evidence, the justification of sagacity by confirming news, and the energetic policy at last enforced with "Haste, post haste, despatch!" So the palace of the Doges faces towards the line of the Adriatic, and then towards the opening by which the Grand Canal broadens out into the lagoon. The city is close behind and at either side of it, accessible in every direction by canals and bridges; and opening immediately out of its piazzetta is the largest open space upon its groups of islands, the piazzetta, that bears the name, and is fronted by the cathedral, the original ducal chapel, of St. Mark.

Significant as the site and aspect of the palace may be, it is not inconceivable that their advantages might have been seriously damaged, not to say forfeited, if original design or later modifications had been subject to inferior architectural inspiration. The grandeur of the building depends on simplicity of distribution of parts in elevation and outline, on a certain nobleness of proportion and harmony with the form and dimensions of the piazzetta, and on magnificence of general mass, combined with an effect of magnitude even in details.

The building consists,—who does not know, and yet it needs must be repeated,—of an open arcade on a level with the piazzetta, with broad pointed arches and bold cylindrical pillars: each name seems most appropriate to supports that, sooth to say, have no title to the more finished style of "column." A string course conducing with the extrados moulding of the arches, carries a frieze of small rosettes, and above these is a loggia, a second open gallery, with smaller and closer shafts and intermediate balustrade. The pointed arches, with imperforate cusps, rise with returned curve between the heavily moulded circles that fill the spandrels,—quatrefoil circles with a red marble ball at each blunt cusp. These two orders of arcades are of stone, and above the horizontal string-course that crowns the upper, is superposed the grand story of the palace; it rises with flush surface, built of reddish and yellowish marble, diapered on a large design, with lozenges of hreath just so far exceeding height as to harmonize in an expression of recumbency with the broad proportion of the facade. There is no projection above the upper line of the wall that can be dignified as a cornice; but it is surmounted by a series of alternate small obelisks and somewhat fantastic pointed and pierced turrets that at least recall to a certain extent the open forms of the arcades, and are of sufficient magnitude to assert themselves as constituting a concluding member. The marble ashlar of the upper story is divided into lateral halves by the stone dressings and accompaniments of a stately central window; the balcony of this rests on the cornice of the loggia, and represents, in fact, the *vinghiera* of the proper Italian loggia or townhall, the feature whence etymologists derive our English word *harangue*. The pointed opening is flanked and surmounted by architectural and sculptural enrichments; niched statues are on either side in double tiers; above is the large tablet for the gospel-guarding lion of St. Mark, and higher still, and raised above the pierced parapet, is the statue of personified Venice, between the loftier obelisks that terminate the enclosing pilasters on either side. On the front, towards the lagoon, there is a corresponding central balcony and window, and surmounting and flanking sculpture,—corresponding in position and effect but not in detail. Details and treatment in both cases declare these central features to be works of the period of the Renaissance—documentary proofs were not wanting,—yet they are far more in harmony than could be with the more original details of this most prominent civic example of Venetian Gothic, and are, indeed, to a great extent the saving of it. The more advantage to unity that is gained by the principle of organic as distinct from simple perforate arcuation being thus carried up unbroken from the truly masculine arcades, through the weaker ashlar, and to the very summit of the building, is invaluable; and invaluable also is the expression of centre which is thus obtained on either face for a structure which otherwise must have looked rather like a fragment than a composition.

There are nineteen of the large stumpy pillars of the lower arcade towards the piazzetta, and consequently eighteen pointed arches; over the apex of each of these comes a smaller pillar of the upper arcade, and one intermediate ranging with a pillar below,—thirty-seven pillars, therefore, and thirty-six arches. There are thirty-five circles between the extrados mouldings of these upper arches, and at the conclusion of the series at each angle a half circle, or, if we please, a complete one bent upon the angle.

The lower range of the sea front has one pillar less, with consequent differences above. These lower arcades exhibit no accentuating mark of centre, and their terminations present quite as much a simple breach of continuity as an emphasized architectural pause. The lower pillars at the angles are no doubt visibly more stout and solid, and they have larger and deeper capitals, and a projecting super-capital with a subject elaborately sculptured, but in such a

manner as in no degree to reinforce—indeed to weaken—the expression of solidity intended by the substantial support below. It were a serial to ingenuity,—to say nothing of ingenuousness and candour,—to have to hold ourselves bound to dissent enthusiastically on the excellence and dignity of these sculptures, either as sculpture or in their architectural application; there is considerable beauty of parts, of feature sometimes, of foliage more generally, but, as Horace knew,—

"The meanest sculptor of the Æmilian square
Can imitate in brass the nails and hair."

but still remain in no high sense a sculptor. At each of the three exposed angles of the building the figures of the group are on adjacent fronts, and their action is distributed on either side of an intermediate tree: a vine separates Noah from his sons; a fig-tree marks the temptation of Adam and Eve with an arrangement of amusing, were it not of grotesquely absurd, quaintness; and, again, a tree interposes in the apparently later scene of the Judgment of Solomon, where, sooth to say, there seems little indeed to choose between the dead child and that which the point of the anecdote obliges us to consider as alive. The deeply-cut sculpture, then, weakens the angle; and when again the angle pillar of the upper arcade is seen also to have extra thickness, the advantage is again forfeited by the ill-closed diameter of the open semicircle above it. The necessary interruption of a series at such a point is precisely one of the emergencies to which the inventiveness of Gothic architects usually responded with promptest alacrity, but there was none forthcoming here. The angular solidities below are still farther disowned and falsified by the slightness of the spiral mouldings that run up the angles of the aërial to support small canopied shrines rising at the top, above the level of the turrets. The great plain campanile of the piazza has its angles strengthened with simpler, but still the best appropriate ones. In the library of Sansovino, opposite the palace, and much smaller, a lapse in constructive feeling at the same point has been carefully—it may be even through reaction somewhat too emphatically—avoided.

It is in spite and not in consequence of such derelictions that the Doge's Palace remains, nevertheless, so impressive. We might ascribe them to a later architect than he who built the arcades, if we could accept the suggestion of Fergusson, that these were originally intended to be in advance of the upper story; but this seems scarcely clear,—the presumptions, indeed, seem clearly the other way. The seventh column from the sea in the piazzetta is an unusually stout one, and the pillar in the loggia above it is compound, having attached shafts, and bears a stronger unperforated circle with sculpture in relief, differences all admitting—announcing—a responsibility to the hearing of the party-wall of the northern division of the palace. By a difference having no relation to construction, and as little to any obvious principle of selection, the ninth and tenth pillars from north in the upper gallery are not white like the rest, but of red marble,—the position, it is said, from which sentences of death were proclaimed.

Of the large lower pillars one alone,—the northernmost,—has a base, and this is so fitted, not beneath, but round it, as to be manifestly new; the others pierce the pavement, and it is just possible that a base moulding may be hidden below, although no argument is to be derived from comparison of the present level of St. Mark's, and levels do not alter easily in the dustless city of Venice. Nothing would be more easy, of course, than to indulge in all manner of lazy imaginations and all kinds of subtle reasons to more than vindicate the omission; the eloquent have filled pages of declamation, delightful to read, from many a more barren brief. The pillars emergent directly from the earth may be interpreted, if we please, as symbolical annunciations of the very principle of existence of the pile-built city, and so forth; it is, however, probable enough that the wharf on the sea-front was originally much less broad, and the steps down to the water much closer, or probably quite close to the palace. So would an expression have been given originally of that indispensable ground-line,—the basis of support, that can never be slurred with impunity,—that resposion of horizontal solidity to vertical pressure that is wanting so unfortunately to the front towards the piazzetta, but is supplied in some degree to the eastern aspect by the quay as seen from seawards.

What may have been the original treatment of the central places of the two façades seems now beyond discovery; to the uniting effect of the feature supplied in their present form by architects of the Renaissance, is due the realization of the sentiment of a dignified composition. By no less decisive interference could the long-drawn regularity of the arcades be reconciled with the gross disregard of symmetry in the division of the structure above them. The stone construction and ornaments of the central window carry up, in a certain sense, the stone construction of the lower stories to the top of the building, and make them, above all, dependent on its centre; and, even yet more important, the aërial of the upper story is thus fairly cut in two, and so is reduced on the one hand to due subordination to the arcades; on the other hand, has on either façade a more symmetrically-disposed half, divided from a more unsymmetrical, to the manifest reduction of disturbance from the irregularity.

On each façade there are three large windows on either side of the central window and balcony; but in each case the three large windows to the left of the balcony have smaller windows and perforations above them irregularly interspersed, and are even themselves of varying proportions and at various levels. On the sea-front this difference is connected with an interior distribution, to which is further due the original closing of the five lower arches next to the Bridge della Paglia. The disturbing effect of such vagaries is contravened perhaps, but we are not therefore authorized to construct a theory to prove them beautiful; nor, fortunately indeed, bound to trouble ourselves to controvert those who care for such theories. There is a difference in the pillar of the loggia that bounds the division answering to the blind arches below; it may be remarked also that the balcony and its window centre accurately with arches of the loggia, but not so with any of the larger below,—spanning them indeed from a spandrel to an apex.

The modified asymmetry, moderate or excessive, of one side of an otherwise symmetrical composition touches a question of theory of great interest and speculative curiosity. It is here that the genius of an architect may rise to assert its freedom at the very point where it seems under compulsion to admit its limitations. Absolute symmetry is liable to degenerate into absolute hardness; it seems to be naturally a type of subjection to inflexible legality rather than the exponent of conscientious law-abiding principle,—of solitary self-sufficiency and jealous independence rather than of that nobler self-dependence that can venture to recognise and respond to an exterior circle of influences, and is not above allowing some stem of attachment to a grander whole,—displaying some sensitiveness to an unusually forcible proximity. Architecture triumphs no doubt in the reduction to well-balanced order of varied and competing claims to accommodation, and the symmetry of a public building becomes then the best expression of the concentration of purpose that governs the association of the functions it is provided for,—enhancing their efficiency by discipline; of what can utter irregularity without being typical bit of disorder within, of disastrous conflict, or at least of incapacity for measured co-operation? But, on the other hand, it would seem that absolutely scrupulous adherence to minute symmetry in an extensive design declares by as necessary an implication an undue tightening of mechanical discipline that derogates from the honour of vitality,—a negation of sympathetic movement so complete as to involve an apprehension of anaesthesia,—of paralysis.

An argument of this kind, however, requires to be carefully watched lest it degenerate into that fanatical habit of justifying an admired work at all risks and against all conscience,—the sycophantic assentation that will slavishly,

Exalt each whimsy, every vice adore;

so should we be drawn into citing carelessness, caprices, and even vilest tastes as illustrative of truly refined,—subtle it would be styled,—and deliberate art. Hence we give up, as vindications of permissible licence, the cases of grossly ill-matched western towers that are due to the disregard one Gothic architect was ever wont to display for the design of his predecessors. In every large design it is certain that, however absolutely it must be left to inspiration of the architect to adopt place and degree of licence, the licence must ever be manifestly well under subjection; regularity, of which grand symmetry

is the highest expression, must ever be manifestly predominant. Among the greatest classical works we observe,—as in the case of the Parthenon,—that the strictness of symmetry in the building was tempered by a managed approach from the angle,—by oblique presentation. This resource was not available for the Propylæa arrived at by a broad direct ascent of steps; but so far as the best critical examination of the ruin yet applied can be relied on, it seems impossible that the two wings of this imposing structure can have been completed in exact correspondence, while it is no less certain that whatever difference were admitted could have told for nothing as against the general agreement in respect of mass and the predominance of the central portico.

The value of the expression of centre by the high-canopied window of the Doge's palace, supereminence with pinnacles and high central statue, is well seen by comparison of the building opposite, the celebrated Libreria Vecchia, of Sansovino. The effect of this, as compared with the palace, and even relatively to what should have been expected from its sameness of art and execution, is wanting in point, vigour, and concentration. There was, it may be, no obligation to treat the long elevation towards the piazzetta as a proper front rather than as a flank dependent on the shorter return towards the lagoon and quay; but when the alternative was adopted, it seems weak to have relied for expression of centre not on an enhancing addition, but on an omission—on breaking the line of statues above the balustraded attic, and leaving the two midmost pedestals vacant. This is much like leaving out the front teeth, in order to mark decisively the centre of the range. Of the intention there can be no doubt, for in the division of the arcade immediately below, the chief entrance is made elaborate, and was at least intended to be ennobled, by a pair of colossal Atlantes. In the range of buildings that close the piazza opposite to St. Mark's, there is much the same reliance on much the same expedient: here the surrounding range of statues is hacked by a wall, and their ranks are interrupted in the centre, to display a section of it in more exposed exposure; this is enriched, no doubt, by bas-reliefs; yet even these are without a conspicuous central subject, and, in any case, of a dignity inadequate to compete with the distinction of statues in the round.

A line of gratitude, however, is ever due to Sansovino,—of admiration if he acted of deliberate purpose,—that he did not raise the Libreria Vecchia by still another order. He thus left the superior height and western exposure of the palace free in all its dignity, and spared to reduce the supereminence of the glorious campanile, or the freedom of distribution of uncrowded space, where cathedral, palace, campanile, and library all approach most nearly, and all lend, each to each, enhancement of effect.

To architecture proper, as imposing the gradations of the upper and lower portions of the palace, and its symmetrical division,—to architecture, as lord of proportion in general magnitude, outline, and relation to heights and open space adjacent, must be assigned the main glory of the magnificent whole that reconciles us to overlooking such considerable anomalies. Pictoresqueness, however,—another,—an alien, and sometimes an interfering influence, contributes something, indeed no little, to our readiness to be so satisfied; the associations of history, of poetry, the prestige of antiquity, and the apologetic allowance conceded among the generous to some obviousness, some ungainliness, some lapses of accuracy in pronunciation, and even syntax, on the part of the aged, must account for the rest. But quaintness and incongruity are not art in themselves, and live only parasitic lives,—are tolerated impatiently as encumbrances and rent-charges upon it.

Some vague notes may be worth recording vaguely. The transverse arch of the lower arcade at the north angle meets a stout attached pillar, but all the others descend on poor pilasters with weak angle mouldings. This arcade is groin vaulted. The loggia above has a ceiling of horizontal beams, and shows no trace that any other more legitimate Gothic construction was intended,—an anomaly again.

All the great arches from the north-west angle as far as the eleventh have but three vousoirs on either side, and an undivided key-stone; the spandrels are also built of large stones, but the seven spandrels south are built up of more numerous courses, and we miss the masonic marks

that—sometimes complicated enough—occur regularly on almost all the first thirteen.

Only one of the southern spandrels on this side now retains remainder of an inland circle and incrustation of coloured marble, but there is every appearance in grooves upon extrados moulding of the others, that the embellishment was once, or was intended to be, general.

Quaintness abounds, again, and is too often so rampant as to predominate, in the elaborate subjects introduced in the capitals of these lower pillars. The sculptor must answer for his vagaries to the architect, who will be better satisfied with the natural, with the truly artistic, grace of his foliage,—the extreme, yet, as their preservation shows, not rash thinness to which he wrought the several leaves, and the ingenuity of his stratagems for strengthening and attaching them.

More distinctly architectural still is the consideration of the propriety in ordination of the leafage as compared with the original Classical type, and its numerous and noble Gothic variations. In the Corinthian capital the stem of the leaf rises erect, and takes its greatest curve forward and at the top. In these examples the middle of the leaf quits the root of the capital with an outward bulge, as the thickened calyx of a flower starts from the corolla—in fact, with the proper cymatium curve.

The subjects intermingled with foliage above the lower range and just below the shacrus are quaint and amusing enough, and so varied that no doubt a poet or a philosopher may surfeit in admiration and wisdom from them, like *Amiens* or *Jaques* from *Tonchstone*, and yet will he not be justified in asserting for them a claim to any particular enthusiasm. Latin inscriptions help the interpretation of more of the subjects than require them. In the capital below the subject of the Judgment of Solomon, Moses is receiving the law on one side, and Aristotle is expounding philosophical jurisprudence to his pupils on the other. Between them the anecdote that justifies Dante in placing the heathen *Trajan* in Paradise,—his justice to a widow,—is represented. The suppliant kneels on the ground before the war-horse, but, even so, her head is well on a level with that of the mounted emperor, whom she is conjuring with hands lifted between its ears. One capital has simply a series of baskets of fruits, well imitated, but still with names inscribed.

On another the various industries are represented that are connected with building. Masons, sculptors, and polishers are at work, the marble under their hands being sometimes inserted pieces of coloured material,—serpentine or verde antique. Here we find the stages and epochs of domestic happiness embodied in detail, and consecutive and enlivening scenes from the commencement of courtship forwards; and there, below the edges of an octagonal shacrus, are the seven ages of the living man; and, finally, the outstretched, aged corpse. As a last note, he it added, that Bellini's picture in the *Accademia* shows *trascry* in the now plain west windows of the *Palace*.

THE COURTS, ALLEYS, AND COUNCIL OF BIRMINGHAM.

At a recent meeting of the Birmingham Town Council, after hearing a report from the Borough Inspection Committee, Mr. Alderman Brinsley said he was amazed at the nonsense which was spoken at the Social Science meeting in reference to the condition of cottage property in Birmingham. He begged to say that in no town in the kingdom was small property in better sanitary condition, better drained, or better arranged than in Birmingham, and in no town was it to be let so cheap. The fact was this, that those gentlemen who had abused them at the Social Science meeting, went to a policeman, and said to him, "Show us the worst part of Birmingham!" Then, having seen the worst part of the town, they went and retailed what they had seen, and held up Birmingham as the most unhealthy borough in the country. But was that fair? He maintained that it was not.

Alderman Sadler, commencing with a rudeness for which he was called to order by Alderman Ryland (who has a proper regard for the dignity of the council of which he is an eminent member), said he must express his opinion that the frightful picture of the sanitary condition of Birmingham drawn by Mr. Godwin, at the Social Science Congress, was greatly exaggerated; and he feared that the remarks of that gentleman

were made solely with the view of creating a sensation which should lead, whether wisely or unwisely, to the appointment of an officer of health. Again, Mr. Godwin, instead of making inquiries of the Public Works Committee as to the number of holes emptied, had thought fit to accept the statement of some old lady, who told him that they were never cleared out except on application. The whole aim of the speakers at the Social Science Congress was, he argued, to enforce the appointment of an officer of health—to do that which was already done efficiently by inspectors.

Mr. Guest said—Was it not too bad that a parcel of scientific gentlemen should meet in conclave in Birmingham, and abuse the council, and use hard names—too hard to repeat?

One thing, at any rate, is very much too bad, and that is, that these complaining gentlemen did not keep a little close to the truth. Who abused them and called names? Mr. Godwin, in making his statement, expressly said he desired particularly to avoid uttering a single word against the authorities of Birmingham, and the utmost that he asked in the course of his remarks was, if the authorities had exercised all the powers they possessed to remedy the evils complained of. Again, it was never said, as asserted by Mr. Brinsley, that Birmingham was the most unhealthy borough in the country. So far from it, constant reference was made to the fact that the average death-rate was not a high one comparatively; but it was properly asserted that that should not be accepted as an excuse for allowing parts of the town to remain in a frightfully unhealthy condition. The hardihood exhibited by Alderman Sadler in asserting that Mr. Godwin's statements were greatly exaggerated, and were made solely with the view of creating a sensation which should lead to the appointment of an officer of health, might have done him credit in a better cause, but it cannot be said to do so now. The statement was true to a letter, understated rather than over, and was confirmed in every respect by others. At a meeting which followed that at which the first remarks were made, Dr. A. P. Stewart said, that coming down from London, he read the observations of the mayor in the papers, and the same afternoon he made a tour of inspection with an old friend. They visited a number of courts, and he must say, though he had seen many very bad cases, he had seldom seen any courts so filthy and abominable a state. Leeds was formerly considered one of the very worst in the kingdom; but there had been a great improvement there, especially in regard to the state of the ash-pits and privies; but here, going from court to court, every one was worse than another. Some of these receptacles of filth had been emptied that morning, immediately after the discussion which had taken place in that section. They had been expressly informed of that fact. But the mischief was, they were only half emptied. They were emptied only three times a year; and in the immediate vicinity of these horrible accumulations of refuse were the public wells, from which the population derived a large portion of their water supply.—Mr. Clayton entirely corroborated the statement of Dr. Stewart as to the disgraceful state of the courts, and from his own practice in Birmingham he could say that one-half of the diseases there were preventible.

At the very same meeting of the Town Council at which Alderman Sadler's remarks were made, Alderman J. H. Cutler demonstrated, by a fact which he could within his own knowledge, the absolute necessity for a more vigilant inspection and supervision of lodging-houses; and Mr. Brooke Smith directed the attention of the Inspection Committee to the nuisances to health arising from uncovered ashpits and from cesspools in the courts of Birmingham, and said he believed a great portion of the sickness which had taken place during the summer months had been occasioned by the exhalations from the pits.

The Rev. Dr. Hart Burges, vicar of his parish containing many of the miserable holes pointed to, took exception to the particulars given of the unwholesome dens in which masses of his people were living. On the contrary, he fully admitted "the incalculable injury to health and physical well-being" that is thus done; and said he was satisfied "that the generally wretched character of the dwellings of the poor, the absence of refining influences, and the miserable associations of poverty-stricken homes, courts, and streets, tends much to the inhumanizing influence which, destroying the finer susceptibility,

ties, and blunting the better feelings of the heart, generally results in brutality and crime, a family plague, and a social curse." "In the greater portion of Mr. Godwin's statements," added Dr. Burges, "I most thoroughly agree."

The *Birmingham Journal*, commenting on this discussion, says, sensibly, after referring to statistics of sanitary work done in the town that were brought forward,—

"There is no question about the accuracy of the fact thus stated, nor, we imagine, is there as to those adduced by Mr. Godwin. Birmingham, therefore, presents two sets of sanitary statistics. On the one hand it possesses a naturally healthy soil and site, a vigilant Inspection Committee, under whose auspices ash-pits are emptied by increasing thousands per annum; healthy embarks, the death-rate of which is exceedingly low; and an exceptionally large area per head of its inhabitants, which tends to render deleterious influences less active than they would be elsewhere. On the other hand, it contains courts and alleys unfit for the habitation of human beings, and districts of so pestilential a character that disease is one of their permanent occupants. The balance of the two phases is, that the annual death-rate of the whole borough is lower than that in other large populations, and it is much higher than that which prevails in really wholesome places, but the average of the borough is made up of a very low rate in certain parts, counteracting the high rates which exist in others. The sanitary question consequently offers a compound puzzle, and one which can only be dealt with by taking the several localities separately. Mr. Godwin, in his observations, pointed out the parts which he had seen, and the Town Councilors are equally accurate in their representation of the whole. The difference between the two may be best shown by a comparison. Mr. Godwin treats the town as a phylax, and looks at the community. He gives his attention only to the parts which are diseased. The Council argue as if medicine were unknown, and the sick and the healthy were to be bundled together in one general average, and left alike to the powers of nature. If Messrs. Brinsley, Sadler, and Orest will regard the question in this light, we have no doubt that they will see the necessity of more diligent watching and perishing for the want of assistance such as they have the power to render, though there are others where the death-rate would not be affected if such a thing as an Inspection Committee were unknown."

We will add an incident of the examination made by Mr. Godwin not before narrated. In No. 5 Court, Old Cross-street, there are a dozen houses, containing, shall we say, eighty or ninety people; and for these there is but one privy, and at the time of the visit it had no seat. Twelve or fourteen women, the majority with children in arms, came round the visitors when they had been in the court a few minutes, and spoke, unasked, of the miserable condition in which they were. One of the most respectable in appearance and manners pointed to the shonimhole pit in the centre of the court, and merely said, "Sir, there is no possibility for a decent female to remain decent." What an amount of teaching there is in that one sentence! Will Mr. Alderman Sadler have the audacity to say that such a state of things as this should be allowed to prevail? Or, again, let him look at what is called the Back of the Gullet,—where he will also see ten or twelve houses with one most filthy "convenience" indescribable, and at the time of the visit mendicant; yet there are rooms over it, and people living in them!—and answer the same question.

The whole local press has supported the views we take in the frankest and most comprehensive spirit. "We have much to answer for," says the *Daily Gazette* (in addition to those journals we have already quoted),—

"Contented with, and even proud of, the fact shown by statistics, that our town is one of the healthiest in the kingdom, we have never seriously inquired into its condition in detail; nor have we been roused to greater curiosity by the significant circumstances that, while other towns have improved in salubrity, Birmingham has stood still, and even in some degree deteriorated. An alarm of cholera sometimes galvanizes us into a brief and factitious fit of sanitary zeal; but the great danger passes by, and the silent, steady mischief continues as before. It is not till an inquisitive stranger makes it his business to inspect for himself some of the poorest quarters of the town, that we learn,—what we ought to have found out long ago,—that if we leave Edgbaston and some other of our suburbs out of the calculation, the official death returns prove that, instead of comparing favourably with other large centres of population, Birmingham shows a greater mortality than those of the naturally less favoured towns in the surrounding 'Black Country,' and is entitled to a much lower place in the national list than has hitherto been claimed by and assigned to her. We are indebted to the recent visit of the Social Science Association for having this matter brought before us in a way that precludes on any longer pleading ignorance of the miserable condition under which some thousands of our poorer brethren live, move, and have their being."

And again:—

"Till the whole question be taken up in earnest, and treated solely with reference to the public welfare, irrespective of private interest, we shall not only live in almost constant danger of an outbreak of epidemic, but we must expect, even if that do not happen, our death-rate to increase rather than diminish; and with the example of Bristol and other places before our eyes, our 'sanitary' arrangements will continue to be a disgrace to a civilized community, as we have been frankly told they are. How the necessary change in the views of our local rulers is to be brought about, we do not at present clearly see, but we apprehend that failing the undesirable visitation of a scourge which would produce conviction by decimating

Edgaston, Small Heath, Moseley, and the rest of our aristocratic suburbs, we shall have to wait for the pressure which will in a few years inevitably be brought to bear on the authorities by that great body of the burghers whose health and whose lives are now being needlessly sacrificed to ignorance and prejudice. Thirty thousand and upwards of these had no voice in the election of representatives to the Town Council until the abolition of compounding. Let us hope that they will now at least look after their own dearest interest in this "Bio-health."

We earnestly entreat the Town Council to put aside the notion that anything like dictation is being attempted. Let them consider the matter calmly, like men of business, men of intelligence, men of humanity, as they mostly are, and they will see it is not consistent with their credit or the credit of their town, to allow things to remain as they are; they will see that steps should be taken immediately to remedy evils that cry aloud.

SUBTERRANEAN APARTMENTS IN BRISTOL.

THE daily papers have mentioned briefly the discovery of an extensive system of subterranean passages and caverns in the neighbourhood of Redcliff Hill, Bristol, and some of our readers may be glad to have fuller particulars. It is not altogether a discovery: the existence of passages of the kind has been known for some time, and four or five years ago circumstances and impressions, to which we will not now further allude, induced gentlemen connected with the works at Redcliff Church to enter them with the view of discovering in what direction they led. After a time, however, they were brought to a stop by an immense pile of stones reaching to the ceiling of a cave, and did not prosecute the inquiry further.

The present examination was brought about by the excavations which are now going on behind Redcliff Hill, for the branch line of railway from the terminus to the floating-harbour. In the deep cutting at the back of Guinea-street, one of these passages was accidentally cut through. The aperture on the left-hand side is blocked up with *debris*, but the other, which is immediately underneath Jubilee-place, is open, and is opening to a considerable extent with huge rocks of sandstone. On Monday evening in last week a party, consisting of Mr. J. H. F. Roberts, C.E., Mr. W. Rice, and several gentlemen residing in the parish, explored a portion of the passages. Each member of the party carried a lighted candle or a torch, and before entering, care was taken to secure the end of a line to one of the supports, so that the explorers would be in no danger of losing their way in the subterranean labyrinth. Getting through a small opening, 20 ft. to 30 ft. below the level of the roadway, one by one, the party proceeded cautiously along a sort of low corridor, cut in the solid rock. After about twenty yards the road widened, and the party halted opposite a row of three arches, each leading in a different direction. The one to the right, however, was impassable on account of a large quantity of *debris* having been piled up there. Selecting the central roadway, the pioneer of the party, Mr. Roberts, moved on, the rest following on hands and knees under the arch, which was of an immense thickness, and supported by roughly-hewn columns, every thing being hewn out of the rock. On the other side of the arch a short, narrow passage opened into a commodious cavern, and here a brief pause was made. Leaving this apartment behind, the explorers were again brought on their hands and knees, and toiled up the cold, heavy sandstone. The shadow of the torchlight fell on what at first appeared to be a great fissure in the right-hand side of the rock, and beyond a large sheet of water, some 20 ft. or 30 ft. from where they were resting. The extent of it could not be ascertained, but several pieces of loose rock were thrown into it, and from the sound it was judged to be of a considerable depth. Further examination showed that the material on which they were resting was not the original bottom of the passage, inasmuch as there were traces of archways and columns to be seen on each side. Other circumstances tended to show that this branch had been partially filled up at some period or other. Still bearing to the left, a little more toiled brought the explorers into a cavern of larger dimensions than any yet entered. It was lofty, and the roof preserved a pretty good shape, although several falls of rock had taken place from it. Two or three wider branches were explored a short distance, but the whole of the line

having been paid out it was found necessary to act with increased caution, for the passages were of such a circuitous character that the correct path, once lost, could only be recovered with the greatest difficulty. After the pioneer had gone some distance farther on, he led his followers into another large apartment, in front of which were two or three openings in different directions. Selecting that which appeared to be the best, the party again went on "all fours" to get underneath the ponderous arch. On the other side, a short but disagreeable walk in a stooping position, brought them into the largest and by far the most singular apartment, or rather cavern, they had yet visited. In form it is octagonal, being some 60 ft. or 80 ft. in diameter, and from 6 ft. to 8 ft. high. The vaulted roof, hewn out of the solid rock, is supported on eight very large columns, and one fixed under the centre. At some period or other a well has been sunk from the property above, and the boring passes right through the centre column, taking away a portion of one side of it. In the aperture thus caused a lighted torch was placed, and by its aid the water at the bottom of the well could be distinctly seen. From the bottom of the cavern to the bottom of the well the distance appeared to be about 40 ft., but all attempts to learn the height failed. The well is walled round pretty neatly, and the pillars of sandstone are dressed up to a form with a small pick, and have a tolerably fair face. The spaces between the columns were walled in, with only two exceptions, viz., the passage through which the explorers had entered, and a similar one immediately in front of it. This was the first masonry that had been seen, everything up to this point having been cut out of the rock. Returning, the corridor on the other side was the most regularly formed that had yet been entered. As with the apartment just left, the roof was arched, the whole superstructure resting on columns, the spaces between them being built up. The corridor itself was also walled up at a distance of about 20 yards, and further progress in this direction was thus put an end to.

In all directions, in fact, passages were found walled up, so as to prevent further progress. The path by which they entered was kept to as much as possible, and the party emerged from the cave in a little more than two hours after they entered it. In a map of Bristol, dated 1250, published by Barratt, this spot is marked as the hermitage of St. John, and it appeared then to be a place well known. Whether the subterranean passages have or had any connexion with this hermitage it is difficult to say. It is well known that some extensive caves are used by Messrs. King as store-rooms, and there is little doubt that the passages above indicated communicate with them in some manner. One thing is quite certain, that some of the passages have been formed by the removal of sand for the purposes of the neighbouring lead-works, but this would not serve to account for the whole of the excavations. It is intended, if possible, to explore the passages on the other side of the railway cutting, and which appear to lead towards Bedminster Bridge.

THE LIVERPOOL SEWAGE WORKS.

THE Liverpool Sewage Utilization Company, which obtained an Act of Incorporation during the last session of Parliament, and in which the town-council are largely interested as shareholders, are now actively proceeding with the works. Parliamentary powers have been obtained for carrying the sewage of the town, by means of pipes, as far as the neighbourhood of Southport, extending to about twenty miles in length; but the works now in progress are limited to the laying of the pipe-line from Commercial-road, near the Sandhills Railway-station, to Ince Blundell, a distance of about nine miles, and when this portion of the works is completed, the distribution of the sewage around the land in the neighbourhood of Ince Blundell will, in the first instance, be commenced, after which the works will be continued to Southport. Already the pipes have been laid down to the extent of between three and four miles, and are carried beyond the township of Linacre. They are 9 in. in diameter, and are laid, on an average, about 3 ft. below the surface of the road. Mr. W. Barrows is the contractor for this department of the undertaking. The deposit-well at Sand-

hills, which is ten yards deep, has already been sunk, and the pumping-station immediately above it is in progress. The engine, which is capable of being worked up to sixty-horse power, is being manufactured by Messrs. R. Dalglish & Co., of the St. Helens Foundry, and is nearly ready. The deposit-well will be connected with the main sewer near Sandhills, from which the sewage will be received into the well, and from thence pumped out and forced along the pipes to the point of distribution. This portion of the works is being executed under the direct superintendence of Mr. Duncan and Mr. Newlands, the water and borough engineers. The engineering details at the pumping-station will be so carried out that the sewage can be thrown back into the main sewer by means of valves, when pumping from the well into the pipes is not going forward.

The company have purchased fifty acres of land at Ince Blundell, for the application of the sewage, and beyond this a considerable number of the tenants of the Earl of Sifton and Mr. Blundell have already arranged for the laying down of branch pipes to their respective farms, in order to enable them to put the sewage upon the land. The company expect that the whole of the works to Ince Blundell, including the pumping-station and connecting sewer at Sandhills, will be completed, so as to enable them to commence the distribution about Christmas next.

THE BLOMFIELD MEMORIAL IN ST. PAUL'S CATHEDRAL.

BISHOP BLOMFIELD'S monument has been set up in one of the window-recesses in the south aisle of the choir, and the whole recess has been made to form part of the memorial, the panels on each side being filled in with coloured marbles, and the window containing the arms of the deceased prelate in stained glass, with inscription referring to the monument below, and being formed into patterns with pieces of blue and green glass. This conjunction, however agreeable in masses such as blue skies and green fields afford, is not so heroic. The window, moreover, being chiefly of white glass, with ugly bars, the effect is poor and cold. It would be better even to paint the surface of the glass some warm, harmonious, and harmonizing tint. The monument proper is a low altar tomb of Caen stone, relieved with insertions of coloured marbles and mosaics. Thereon is placed a bed of polished marble, and a raised pillow diapered; and on it rests the full-length figure of the bishop in full episcopal habit, the right hand lying across the breast, and the other at his side on a book, and by its side a crozier. The effigy is the work of Mr. G. Richmond, R.A., better known as a painter than a sculptor. It must be pronounced a meritorious production, and a good likeness.

HOUSELESS POOR, OVERCROWDING, AND CRIME.

AN elaborate report in reference to the houseless poor in the City of London has been issued by the out-relief committee of the Board of Guardians of the City Union, in anticipation of the coming winter. It appears that the adoption of the plan by that Board of supplying warm broth, coffee, and soup in the daytime to wanderers had the effect of vastly increasing the number of that class applying for relief in the union. In a corresponding month in the present and past year there had been 8,101 and 6,101 cases respectively; whilst in 1866, before that plan was put in operation, there were but 1,513 cases. The Board have just erected premises for the distribution of relief to casuals, in Northumberland-alley, Fenchurch-street, at a cost of 3,000*l.*, exclusive of the land. The accommodation is, however, very limited; and it will be necessary, as before, to send all except sick cases and very urgent ones to the work-house at Bow every night, a distance of about three miles, to sleep. The City Union, though occupying a space of about a square mile only, has a yearly expenditure of from 48,000*l.* to 50,000*l.*, for its ninety-eight parishes. One parish that contributes for its quota about 1,100*l.* yearly has but one solitary pauper chargeable to it.

The demolition of dwellings without any compensatory erections will have to bear a heavy share of the blame if the overcrowding lead to

some terrible pestilence, as it is but too likely to do. And to blame such a cause is to blame the legislature which has not provided against it while authorizing such demolitions.

The directors of convict prisons in England report a great increase in recent years in the proportion of convicts who are of a weakly and diseased constitution. Of 6,552 male convicts in confinement on the 7th of April, 1868, no less than 1,981 were either confirmed invalids or fit only for light labour. Of 1,237 convicts disposed of from Millbank prison in the year 1867, only 688, or 55 per cent., were removed to the public works prisons as fit for hard labour, and 136 to public works for light labour; the remainder being sent to the invalid prisons. The great majority of these prisoners are either men of originally feeble constitutions or the subjects of diseases or infirmities which they have contracted through circumstances over which they have had no control.

The number of depredators, offenders, and suspected persons at large in England and Wales last year was 112,403, against 113,566 in the preceding year. All persons who have been living honestly for one year at least subsequently to their discharge after any conviction, are not included in the above numbers. The returns for 1866-7, lately issued, show that, of 22,889 known thieves and depredators, 3,944 were under 16 years of age; of 2,959 receivers of stolen goods, 31 were under 16 years of age; of 23,378 suspected persons, 4,086 had not reached their 16th year of age; and of 32,558 vagrants and tramps, 5,709 were under 16 years of age. The total number of these classes at large in 1866-7 shows a decrease of 3,243, or 2·8 per cent., compared with the average number in the three years 1864-6. In the number of known thieves and depredators there is an increase, as compared with the preceding year, of 83, but a decrease of 70 as compared with the average. The following are the proportional numbers of the criminal classes in the different groups of towns which have been classed together for comparison in former years:—In the metropolis the proportional number in 1866-7 was 1 in 220 of the population, against 1 in 222 in the preceding year, showing an increase of 1 per cent.; in the pleasure towns, such as Bath, Brighton, Dover, Ramsgate, &c., the proportion was 1 in 89 against 1 in 79 in 1865-6, or a decrease of 11·2 per cent.

ACCIDENTS.

A FEARFUL accident has happened at the immense building which was being raised to the ground to make an entrance to the new street from Blackfriars Bridge to the Mansion House. Great blocks of stone had to be removed from the coping, and whilst a man was in the act of rolling one of these blocks over a couple of rafters, one, having a knot in it, suddenly snapped asunder, and caused the unfortunate man and the stone to fall into the basement. The stone struck another block, which canted over, and drove the poor fellow with great force against the wall, breaking his arms and legs, fracturing his ribs, and otherwise fearfully injuring him. He was extricated as soon as possible, and removed to St. Bartholomew's Hospital.

The district of Halifax has been visited by a strong storm of wind and rain, and at Bolton Brow, Sowerby Bridge, a horse fell, killing a woman and her infant. The house, we understand, has been in a dilapidated state for some time, but there were no immediate signs of its fall.

A fatal accident is reported from Bolton. Two men were engaged building a lofty chimney-shaft attached to the works of Messrs. Little & Smith, cotton spinners, when the scaffolding gave way, and one of the men was precipitated a distance of 36 yards. He was, of course, instantaneously killed.

The inquest on the bodies of the eight men who were killed by the fall of the building at Hull, on the 26th ult., is being held. The evidence went in a great measure to show that the floors had been overlaid with seed. The chief foreman, however, who had had several years' experience in seed warehouses, considered the building to be perfectly safe, and so constructed as to be capable of bearing almost any weight. The accident was, in the opinion of the warehouseman, due to the filling of the stores, which drove the walls outwards. The deceased were warned of their danger fully fifteen minutes before the catastrophe occurred; but thinking

there was nothing wrong, they did not heed the warning.

On Wednesday night the deputy-coroner for Westminster investigated the circumstances attending the death of Henry Ellis Hill, aged fifty-four, who lost his life by falling from the roof of Her Majesty's Theatre, now in course of construction. Mr. Henry Ellis Hill said that he was a draughtsman, and the deceased was his father. He saw him after the occurrence, but he was unable to tell him how it happened. Charles Clott stated that the deceased was a carpenter, and employed in rebuilding her Majesty's Theatre. On Wednesday last week he was at work on the roof of the theatre, and witness was about 8 ft. from him. They were talking, and he was collecting the joints for some loop cords. All of a sudden the deceased stepped on a piece of deal hoard in order to come to him, when one end sprang up and shot the deceased below. He fell upon a heavy iron shoe, put there to receive an iron girder. The distance he fell was about 13 ft. The jury returned a verdict of accidental death, but added that greater care ought in future to be taken in not leaving pieces of timber about, as they were calculated to mislead persons employed on the works.

PHOTOGRAPHS IN PRINTERS' INK.

THE permanency of printers' ink has now been fairly and fully realized in photography. The carbon photographs of Mr. Pouncy, of Dorchester, in which we early saw the realization of this great desideratum, have been submitted to tests of the most trying nature, by Mr. George Dawson, of King's College, M.A., and lecturer on photography. They have been tortured by oven heat, and by boiling water, and have withstood the ordeal in the most triumphant manner. Mr. Dawson, in one of his experiments, soaked a Pouncy photograph, which was snn-printed on canvas and printers' ink, for six days in cold water, and then boiled it for six hours in water, without any change whatever being apparent except a little in the colour of the canvas! He kept paper Pouncy photographs in water till the paper rotted, but there was no fading, no failure of the photographs! He hung up slices of Pouncy pictures in a gas oven, and roasted them for six days in a heat of 300 deg. to 400 deg. Fahrenheit, and "on matching the cuttings with prints from which they were severed, no change whatever could be discovered!" There need be no more lamentation over fading photographs.

JUNIOR UNITED SERVICE CLUB.

ALTERATIONS have been carried out during the recess for the improvement of the ventilation of the Junior United Service Club, by Mr. Wilson W. Phipson, C.E. A fan worked by a small gas-engine now supplies the fresh air to the building; a new fresh-air supply erected near Waterloo-place; and an entire rearrangement of the old air-pipes and main channels to the different rooms, constitute the most important features of the new arrangement; besides which a more direct use of the existing extracting-shaft has been effected, so that it is hoped the coffee-room will especially derive great advantage from the adoption of this plan. We shall be glad to hear of the result.

THE TRADES MOVEMENT.

AN adjourned delegate meeting of trade societies of the metropolis has been held at the Bell, Old Bailey, for the purpose of adopting such measures and taking such action as may secure the passing of a Bill which will place trade societies on a footing of social equality with other associated bodies. The following societies, among others, were represented:—Engineers, ironfounders, carpenters, joiners, plasterers, bookbinders, tailors, deal cabinet makers, ropemakers, bricklayers, painters, zinc-workers, gliders, stonemasons, glassworkers, coopers, and shoemakers. The chair was again taken by Mr. J. Spelling, vellum binder, who was supported by Professor Beesly, Mr. Lloyd Jones, Mr. Crompton (harrister), &c.

Mr. Burgess (joiner) resumed the discussion upon a resolution proposed at the last meeting,

to the effect that the delegates approved the Trades' Unions Bill brought into the House of Commons last session by Sir Fowell Buxton. He defended the 3rd clause of the Bill, which provided that any workman using a threat of violence should be subject to three months' imprisonment, because trades unionists did not want their societies to exist on a basis of violence or intimidation. He also defended the Bill generally, because it legalised trades' unions, and simplified and defined the law of conspiracy.

Mr. Nisbett (mason) said his society, consisting of 20,000 men, were opposed to certain words in the said clause referring to threats of violence, because a wink or a shake of the head might be construed into a threat of violence. He objected to exceptional legislation for trades' unionists. He moved that the words relating to threats be omitted.

Mr. Broadhurst (not Broadhead) seconded the amendment.

Mr. Crompton (harrister) said the amendment would virtually strike out the third clause. Under the law of assault a man may get twelve months' imprisonment, but by the third clause of this Act the punishment was limited to three months' imprisonment. The general law of conspiracy was what unionists had to dread.

Mr. Lloyd Jones advised the delegates to retain the clause, and thus challenge the law, and say, "Punish us if we deserve it."

Mr. G. Potter suggested the appointment of a committee to reconstruct the third clause—having first conferred with Professor Beesly and Mr. Crompton.

The discussion was carried on by various others, and ultimately the Bill was sent to a committee to reconstruct the third clause, and the proceedings closed.

CHURCH BUILDING IN WALES.

THE churches of Llanfihangel Bryn Pabuan and Llanfhechan have been re-opened after restoration. The church of Llanfihangel, dedicated to St. Michael, is situated on a hill on the roadside leading from Llanfawr to the picturesque village of Newbridge-on-Wye. It has been supposed that it is called "St. Michael Pope John," because it was built in the time of a pope of that name, but the proper derivation of the name is Llanfihangel Bryn Ty Ienan, St. Michael-on-the-hill in St. Avau or Ienan. Ienan is another name for Afan. It seems that some of the early Welsh churches were called Tai, "houses;" St. David's is called to this day "Ty Ddewi," St. David's House. The old church of Llanfihangel has witnessed many changes. In the time of Cromwell it was converted into a stable, and the font removed from the church to a farm-house, where it was used as a pig-trough. The ordained minister was expelled from his living; and a mason of the name of Evan Bowen, an ignorant fanatic, was appointed in his place. The vicar was, however, ultimately restored to his living. Tradition says that when he was expelled all the jackdaws left the church steeple!

Llanfhechan Church, which, like Llanfihangel, is annexed to the vicarage of Llanfawr, is situated on the banks of the river Iro, about four miles from Bulth. It is dedicated to St. Afan, to whom, also, the mother church of Llanfawr is dedicated. The present vicar, from the dilapidated state of the edifices, which were not equal to the meanest hovels in his parish, appealed for help far and wide; issued no less than 10,000 circulars; and, besides being able to renovate the two churches, he has collected 550l. to erect a school and master's house, which are now nearly finished. The churches are in the Early English style, and were designed by Mr. Backridge, of Oxford. The builders were Mr. Pryce, of Bulth, and Mr. Evans, of Talgarth.

IMPROVEMENTS AT ASCOT RACE-COURSE.—A new building for the transactions of all official business during the Ascot race-meetings is in course of erection in the adjoining enclosure. The new building, which is designed by Messrs. Clark & Holland, of Newmarket, will contain weighing-offices for the jockeys, rooms for Messrs. Weatherly (stakeholders and secretaries), Mr. Manning (clerk of the course), Mr. Oxley (printer), and for the representatives of the press. Outside there will be an erection from which the officials may see the running.

THE AFFIX "MASTER OF ARTS."

"FELIX SUMMERLY" did good service the other day by directing attention through the medium of the columns of the *Builder* to the greater consideration given and larger share of time devoted to the study of art in the Continental colleges and schools, than in England. This opens a question of great moment, and a subject which must be actively agitated and well ventilated. Is not the affix "Master of Arts" a delusive sign of a complete education, being earned as it may be, and commonly is, by men entirely ignorant of the principles of the two great arts of painting and music? The classics, it is true, were for many centuries the only studies having the spirit of art in them, and this long prescriptive right has doubtless fostered a prejudice, and a jealous antipathy against permitting new-fangled studies in the *curricula* of our ancient seats of learning. There are signs, however, of a better temper, and of a yielding to a more advanced idea even there; but our more modern collegiate institutions offer every facility for the complete study, not only of the classics and the mathematics, but of the natural sciences, and even medicine. For the thorough study, however, of the two great civilizing arts of painting and music, there is still small if any provision, and notwithstanding it has been admitted on all hands that Art is a national necessity, that it promises a greater mercantile prosperity, a plethora in the British pocket, British prejudice remains proof even against the proffered bribe of wealth. This insensibility and immobility to common sense I believe could exist nowhere but in England.

While the School Commission was pursuing its useful course in 1865, I took advantage of a professional position to call one of its members' attention to the disadvantages under which the study of art commonly labours in colleges and schools, and when urging the importance of the study, and the necessity for some reform in this direction, I stated that—"The study of art was not merely important as the means of educating men to appreciate the beautiful, but in its direct utilitarian bearings; for that when drawing is properly taught it is a most potent agent in perfecting the faculty of observation, as people are then taught to see, to observe correctly. How inaccurately people do commonly observe what is before or going on around them is only fully known to art-teachers and Queen's counsel. And this must continue to be so till the importance of training the senses be thoroughly recognised. It is not, therefore, an indifferent matter," I urged, "how drawing is taught in public and private schools, whether it be condemned to *make-shifts* for times and places of study, whether it be pinched between hours devoted to Greek or Latin, and driven to the worst lighted and most inconvenient classrooms; then and there to be limited, as it too often is, to crude water-colour blotching. For to fulfil its proper educational function, the study of art should beget a habit of exact comparison, and this can only be effected by experienced teachers, conversant with the thorough means of training used in art schools, the student commencing his studies from the simple lines of fruit and flowers, and gradually rising to grapple with the greater subtlety of the human form."

One hindrance to the introduction of a better system of drawing in schools is, doubtless, the ignorant satisfaction at flimsy "accomplishments" in their children, which too many parents exhibit. Thus landscape drawings, composed of impossible rustic figures and dwellings, surrounded with a brilliant and almost tropical array of foliage, are preferred from pupils, to the dry, imperfect, less showy but more useful attempts under a good teacher.

But in retarding to the subject of "the footing" which art ought to hold in our great seminaries of learning, I would ask why it should not be the same as that of the most favoured subjects? I think I have shown there is every good reason why art should be so placed. A student of painting, sculpture, or architecture, ought to have it in his power to carry on other studies simultaneously, and to take the general degrees of B.A. and M.A. The question, then, arises, as to the re-organization of our educational system must soon become a leading question, whether it would not be preferable to found colleges with a leading speciality, though embracing also the general branches of study, — thus, the Royal Academy, or Royal College of Arts, the College of Medicine, the College of Engineering, &c., in which the general

degree of M.A. could be matriculated for, as well as the special one of R.A., M.D., or C.E. The plan would have this advantage, that the greatest talent in each speciality could be then concentrated, while rising talent would be enlisted in other colleges where art, medicine, and engineering would only take their positions as branches of general education. This would appear to me, too, to be the best mode of combining special with general education; and one which would not disturb existing elements, or rend our present educational framework to any great extent. Oxford could keep to its classics, Cambridge its mathematics, raising at the same time other subjects of general study to their fair proportions. The Royal Academy could easily be converted into a College of Arts; the College of Physicians or Surgeons into a great School of Medicine, and so on. Having thus briefly set forth my notions on the affix M.A., I leave a siller pen to extend and support them if they be of any value. W. CAVE THOMAS.

WEST INDIA PACKET SERVICE.

In a former number of our journal, we called attention to the "R. M. Steam-ship" service connected with the Island of St. Thomas and the West Indies, and pointed out the serious consequences of persisting in using that island and the neighbouring islands as the central depot for that important service, in consequence of the dangers arising from hurricanes, yellow fever, &c. We observe by the last report of that company that they are unable to pay any dividend for the last half-year in consequence of the serious falling-off in the traffic; and that falling off has not only affected that once powerful company, but it has also extended its ill-luck to another company, the "Panama and Australian R. M. Co.," who are now in financial difficulties; and so impressed is the latter company with the importance of abandoning the present route, that they suggest an alliance with another company who will run their steamers direct to Colon, abandoning the pestiferous districts of the Virgin Islands, and thereby saving, it is said, a distance of 1,800 miles in the sea voyage; and what is most important, shortening most materially the time of transit between Great Britain and the Australian colonies. It is much to be regretted that the former company did not attend to our warning remarks or appreciate our observations, particularly as they were induced by the most humane considerations and friendly spirit towards that particular company, as these excellent auxiliaries of our civilization,—the sea-going steam-ship companies,—are worthy of all aid from the press of the country, and deservedly merit a substantial reward in the shape of good dividends.

Who are to blame for this state of things we do not know. It is evident a serious loss in a pecuniary point of view has resulted from the arrangement, and we fear both the Government and the companies have lost confidence and prestige by it.

THE WEDGWOOD MEMORIAL INSTITUTE AT BURSELEM.

At a meeting on the 23rd instant, in connexion with this structure, Mr. Hope described the new building,—the first in England in the construction of which ceramic enter largely,—as a remarkably successful experiment in ceramic architecture. Mr. Melly presided over the evening meeting, and much of his opening address was devoted to technical education, which he said was now a vital necessity to England if she was to retain any of her superiority in trade. Technical education had become one of the cries of the day. Suddenly it was found that hundreds of thousands of window-frames, door-frames, and doors had arrived from Sweden and Norway, followed a few days after by twelve locomotive steam-engines from Belgium; and forthwith everybody rushed to the conclusion that our carpenters and joiners, and our workers in iron and brass, had had their education neglected, and that we were being rivalled and outdone by foreign nations. This, of course, led to questions in the House of Commons, and equally, of course, to the issue of a commission of inquiry; and he found from the ponderous Blue-book which resulted from that commission that we were behind one or two nations in Europe in the matter of schools of science and

art. Comparing England with countries he had named, they were bound to admit that, though in the matter of art England lagged not far behind, in respect of technical education we were a long way behind other nations. Still, he was not going to say that because some hundred thousand door and window frames, and a dozen steam-engines had been imported into England, the sun of England's commercial and manufacturing prosperity was setting. On the contrary, he hailed with satisfaction everything that tended to the commercial intercourse of nations, believing that to be one of the surest means of securing peace, increasing the comforts of mankind, and bringing about the brotherhood of nations. The memorial building is to be formally opened next Easter with an art exhibition. Its erection will cost upwards of 9,000*l.*

SIR DAVID WILKIE'S LETTERS.

It did not seem to us necessary to make any observation on Mr. Raimbach's letter which we printed recently (p. 768), nor does it now. But more than one esteemed correspondent thinking otherwise, we give a line or two of information. Mr. Raimbach says he has no doubt the letters came into our possession in a legitimate manner; but that some one through whose hands they had passed had obtained them surreptitiously. He adds, that one of them in particular had been looked for on a special occasion, but could not be found, and that he "thought it had undergone the fate of many valued papers, and had been used by the cook to light her fires. It seems it had a different fate." A strange probability surely,—that of the cook, in a well-ordered household; but still not at all interfered with by our recent publication; for the letters we made public were not printed from the originals, but from copies kept by the great painter's brother, Thomas Wilkie, since dead. There is no surreptitious dealing in the case at all therefore, and the cook must still rest under Mr. Raimbach's suspicion.

ST. CHAD'S SCHOOL, DENSTONE.

On Thursday, the 22nd inst., the first stone of these buildings was laid by the son of the late Bishop of Lichfield, the Rev. Canon Lonsdale, in the unexpected absence of the Marquis of Salisbury, who was detained through illness.

This school is a branch of the parent college of St. Nicolas Lancing, and is the first of three which are to be established in the Midland Counties, after the models of Lancing, Hurstpierpoint, and Ardingly schools in Sussex. St. Chad's School is for the middle class, as is the Hurstpierpoint School, and will be built for 400 boys, who will be educated and boarded at a cost of little more than 30*l.* a year.

The site is on a low range of hills between the town of Uttoxeter and Alton Towers, and the North Stafford Railway has a station at Rooster on their Manchester line which is about a mile from the college. The school will thus be in the centre of the great towns of Derby, Nottingham, Manchester, and Leicester. The ground on which the school stands is given by Sir Percival Heywood, bart., and is in the parish of Denstone, on the borders of Staffordshire.

The buildings are being erected from the designs of the college architects, Mr. W. Slater and Mr. R. Herbert Carpenter, by Mr. Bromwich, of Rugby. The plan follows in its general outline the letter H; that is to say, there are two quadrangles, the one opening to the east, and the other to the west, divided by a central block. The western quadrangle is 200 ft. long and 160 ft. wide; the eastern is about 160 ft. square. In the central building is the great school-room, 100 ft. by 35 ft., with a lofty open timber roof, 62 ft. to the floor from the ridge, and lighted by two-light tracery windows, running up into the roof with gables over them. Under this room are day-rooms for boys, porter's, and visitors' rooms. The great staircase to the school-room is at its northern end.

The chief entrance to the buildings is in the centre under the school-room. Over the doorway opening into the east or "Chapel Quadrangle" will be a figure of St. Chad, and over the doorway into the western quadrangle a figure of Bishop Lonsdale, whose memory will be preserved by this quadrangle being called the "Lonsdale Quadrangle." The two wings of this quadrangle are 210 ft. long and 40 ft. wide, in three stories. The two

ANCIENT BRONZE MEASURE AT OCHSENFURTH.

upper stories in both will have each two dormitories for fifty boys, with lavatories and junior master's rooms attached. In the ground-floor of the northern wing are class-rooms, and in the southern wing a gymnasium, 125 ft. by 17 ft., a series of rooms for the master's training-school, a boys' library and a master's library, and the chaplain's rooms. The second master's house is at the west end of this wing, and the head master's house occupies a corresponding position in the north wing. At each of the inner angles of the quadrangle, where the wings join the central building, is a lofty and massive tower for the water-tanks, and supply for the whole building, so placed as to preclude the possibility of any fire spreading. The chapel will be of lofty proportions, apsidal with a campanile on the north side of the apse, and an ante-chapel communicating with the cloister, which runs through the entire ground-floor of the building. The dining-hall will be 100 ft. by 35 ft., opposite the chapel. These two are not yet begun, but the foundations will be put in during the next spring. The kitchen and offices form a small separate quadrangle north of the buildings, and will include engine-house, gas-works, and workshops.

The present contract (with the foundations) for the Lonsdale quad. is about 20,000*l.* The ultimate cost will be about 50,000*l.* The style is Early English, treated with a certain amount of severity. The material for the external thickness of the walls is grey Alton stone in coursed work, with hands of red Alton stone.

ANCIENT METAL FURNITURE.

BRONZE MEASURE AT OCHSENFURTH, BAVARIA.

The accompanying engraving represents the "Eimer" Measure still used in the town-hall at Ochsenfurth. It is cast in bronze. On the rim is the date "Anno domini M^o CCCC und III^o" 1403. The mixture of German and Latin in the inscription is singular. The subjects represented in low relief are the "Crucifixion," in the first and third compartment, and "St. Michael and St. Lawrence" in the second and

fourth. The handles are curious, but very convenient. The following are the dimensions of this peculiar relic of antiquity:—

Height	29 in.
Diameter	22 in. at rim.
Figures	6 in. high.
Thickness at rim ..	2 in.

This measure is preserved in the council chamber of the town-hall.* In our last we gave drawings of some remarkable specimens of ancient furniture in the same room.

The details of the Measure show section of the lip, section of rib on face of the Measure, one of the handles, and the rosette at end of handle.

THE CHÂTEAU CARADOC, BAYONNE, FRANCE.

BAYONNE, it may be remembered, is near the south-western extremity of France, in the department of the Basses-Pyrénées; it has a cathedral, docks, and a vast military hospital, capable of containing 1,700 patients; and gave its name to a weapon first produced there, which the English took to using with some effect. It is one of the prettiest of French fortified towns, and its suburbs are delightful. Few who visit it fail to ascend the high ground of St. Etienne, where the view, extending to the summit of the Pyrenees, and brightened by the river Adour, is superb. Here, during some years past, a chateau of large size and costly appointments has been in course of erection, from the designs of Mr. B. Albano, for an English nobleman, Lord Howden, whose father, the first baron, was Lieut.-general Caradoc. The chateau is now completed, or nearly so, and we publish in our present number a general view of it from the south. Mr. Albano, who is best known as the architect of the interior of the Royal Italian Opera House, Covent Garden, built in 1847, and which was burnt

* These particulars were erroneously attached to a view of a bronze font in Würzburg Cathedral, in our last volume (xxv), p. 829, as was explained at the time; see p. 834 of same volume, where also some particulars of metal fonts will be found. View of a bronze font at Ochsenfurth is given in our present volume, p. 28, ante.

down in 1856, has devoted himself entirely to the work in question, which includes not merely the chateau as seen in our view, but a graceful water-tower, terraces, winter gardens, enclosures, and garden buildings.

The residence forms three sides of a quadrangle, open to the south, and from which side long flights of steps overcome the declivity of the grounds. On the north front is a carriage-porch, the servants' entrance, and staircase being in the lofty tower seen to the right, the conical roof of which (as of the others), is covered with cut slates. The walls, we need scarcely say, are of stone. The pavilion seen on the left, is covered with a domo, groined within and without, and surmounted with a lantern formed of eight Ionic columns, wholly of Crazeanne stone. The cornices and mouldings in this, as they are indeed throughout, are very carefully worked. The same stone in the dome forms the two faces, internal and external. The diameter of this pavilion is about 19 ft., and its height about 40 ft. The prevailing effect of the exterior of this building is one of great dignity. Within, every part is fitted up with care and skill: the chapel is Gothic in style, and includes marhle mosaics and carvings; the library and other rooms display excellent woodwork. In the *salle à manger* the panels of the doors are painted in oil with views of the principal Spanish cities, and the parquetry-floor is especially noticeable.

A Frsnoh visitor, warmed into enthusiasm by an examination of the chateau, writes,—"In this well-ordered dwelling the domestic duties will be accomplished with ease. The daily duty of each, from the master in his cabinet to the *cordon-bleu* in his kitchen, is facilitated in the most complete manner; consequently and evidently good-humour will be preserved, the discretion of the interior life will be respected, each will be free in his own domain, and the exterior relations of friendship and society exercised with dignity and order. This picture of material and moral comfort is but the expression of what is due to the architect of the *Casa Caradoc*."

We may take an opportunity to illustrate this work more fully.

CASA-CARADOC, ST. ETIENNE DE BAYONNE, FRANCE: THE SEAT OF LORD HOWDEN. — MR. B. ALVARO, ARCHITECT.

SALARIES OF BOROUGH SURVEYORS.

In a report made by a committee appointed by the Huddersfield Town Council, to inquire as to the appointment of a borough surveyor, they give particulars with reference to the following twenty towns where the salaries were as follows, viz. :—

	£.	Area.	Mileage of Roads.
Birmingham	600	8,420	136½
Sheffield	400	22,370	160
Leeds	300	21,672	149
Newcastle-on-Tyne	600	5,325	74
Bradford	700	6,500	50
Leicester	600	3,760	60
Bolton	250	1,550	no return
Birkenhead	500	1,700	60
Salford	350	1,320	45
Preston	400	2,900	57
Oldham	300	4,685	45
Norwich	400	6,630	43
Halifax	400	3,788	42
Wolverhampton	550	3,410	37
York	300	2,720	24
Gateshead	400	5,134	13
Derby	350	1,829	30
Blackburn	250	3,681	30
Oxford	320	5,000	no return
Ashton	200	1,591	31
Average	400	6,582	64
Huddersfield	10,438	50

In eighteen of these places no private practice is allowed: the two exceptions are Sheffield and Derby. The average allowed for clerks' salaries, &c., in addition to the salaries named in the whole of the twenty towns, is about 212l. In the cases of Bradford, Preston, and Halifax, the duties of waterworks manager are combined with those of surveyor, and in the case of Oxford the borough surveyor is also the nuisance inspector.

THE PHYSICAL COMMOTIONS THROUGHOUT THE GLOBE.

THESE commotions unfortunately are not yet at an end. The rendings of the earth's crust south of the equator have only partially relieved the internal pressure, and now they have extended into the northern hemisphere, and California has been seriously shaken, so that San Francisco has had many buildings thrown down and several villages have been reduced to heaps of ruins. The island of Hawaii in the Pacific ocean, opposite these coasts, is slowly sinking into the ocean, on the western and southern shores, which are now several feet lower than they were in April last when the terrible volcanic eruption took place there. Since the first attack, a second earthquake, but much less violent, has occurred at San Francisco. The disturbance of the Pacific ocean has been of an extraordinary nature in connexion with these commotions,—at least, with those of August; and considering that the bed of the Pacific is like a sunken continent whose mountain tops alone appear in the form of its innumerable islands, there seems to be little doubt that the crust of the earth is thinner there than on the continents above water. This fact seems to corroborate the idea that the cause of all these commotions is really chemical, or underlies the whole crust of the sphere, and hence operates chiefly where the crust is thinnest; and that it is such as Hopkins, of Cambridge, represented the cause of old crust fractures to be—an expansive force, or force operating outwards from within the earth's crust. Moreover, if it be such a force, it will tend to relieve itself chiefly by *rendings north and south*, if it be connected, as we have suggested, with the earth's rotary and centrifugal force, and especially in regions more or less extending from the equatorial. Thus, too, the idea prevalent amongst geologists that the earth is still essentially a fluid or molten though encrusted sphere,—and indeed, *a fortiori*, it must be admitted that a spherical form indicates a fluid substance,—is one which is much more capable of explaining the geological phenomena than that of a solid sphere, particularly if, as we have suggested, the admitted or recognised tendency to expansion is derived from the rotation of the sphere.

The problem of the influence of a varying rotation on a molten and encrusted sphere (though there is no actual evidence of the earth's rotation being at present either on the increase or the decrease) is one of peculiar interest and importance, and is capable of affording curious explanations of the present states of other planets as well as our own. For example, the greater the rapidity of rotation, the lighter in specific gravity *ought* the fluid and encrusted

sphere to be, as well as the more expanded in dimensions; and the less the rapidity of the rotation, the denser and the less expanded ought they to be. Now, it is evident that on a general view this is the fact,—namely, that it is precisely those planets which rotate with the greatest rapidity that are the lightest in specific gravity, as well as the most enormous in circumference; and it is not difficult to explain what may not at first sight seem so evident. Jupiter rotates once every nine hours; and hence it is, probably, that his great molten mass is so levitated, expanded, and centrifugalized by this tremendous rapidity of rotation that the specific gravity of his vast sphere is reduced to something like that of water, although, for all that, he may thus be an encrusted sphere. Saturn, with his centrifugal rings, his magnificent dimensions, and his specific gravity like that of cork, also rotates with immense velocity. On the contrary, Mars, Venus, the Earth, and Mercury,—all small in dimensions,—are comparatively dense in substance: hence, as the earth is least dense, they probably all rotate comparatively slowly. There is no great planet of anything like the density of the smaller ones.

SANITARY STATE OF THE NAVY.

THE sanitary report of the Royal Navy shows that the total force employed for the year 1866-67 was, in round numbers, 50,000, and that of these about 500, or one in every hundred, died in the twelve months. But at least one-fifth of these deaths were accidental, leaving 400 due to the effects of disease. The year 1866 was marked by a visitation of epidemics. At home, in the Mediterranean, and on the south-east coast of America, cholera was prevalent; in China and Japan small-pox raged with great severity; and on the East Indian and Pacific stations the ships were visited with serious outbreaks of remittent fever. Thus, though the period was exceptionally unhealthy, the mortality in the navy, and not the mortality alone, but the sickness and invaliding, were less than had been known for years.

It is also satisfactory to note, as we may here do, that the General Sanitary Convention at Berne have agreed to specific articles as regards the neutrality of those engaged in the management of the sick and wounded in war and all that relates to such management, whether in maritime warfare or warfare on land.

THE PROPOSED NEW ROUTE BETWEEN ISLINGTON AND THE CITY.

PROGRESS is being made, although slowly, towards the opening of a direct route from the Branch Post-office, Essex-road, Islington, through Packington-street, Shepherdess-walk, Bath-street, Bunhill-row, Type-street, Moor-lane, Cripplegate, and the centre of the grand termini of the Metropolitan, Great Northern, Midland, Great Western, London, Chatham, and Dover, Western and South Metropolitan districts, and St. John's Wood Railways, to the centre of the City. At a recent meeting of the Board of Guardians of the parish of St. Luke, the clerk reported that Mr. Vulliamy, the arbitrator appointed by the Metropolitan Board of Works, and Mr. Clutton, on behalf of the parish of St. Luke, to whom reference was made in order to ascertain and determine the value of the land belonging to St. Luke's Workhouse required to be given up for the widening of Shepherdess-walk, had selected Mr. John Shaw, of Christ's Hospital, as umpire between them, and that the question was in a fair way of being speedily and equitably settled. The Board of Works have agreed to widen Shepherdess-walk at its own cost, and the Asylum wall in Bath-street has been already set back to a line, ranging with Alleyn's Almshouses. Two portions, and these the most difficult, of the direct route from Islington to the City, have thus been won, and the whole length of thoroughfare will soon be opened for public use and vehicular traffic.

It has been determined that the forecourts of Lady Lumley's Almshouses shall be thrown into the thoroughfare as soon as the arrangements for opening Shepherdess-walk, widening the canal-bridge, and removing the workhouse wall have been completed. It is likewise in contemplation, according to the *Clerkenwell News*, to remove the almshouses altogether from their present site to one more suburban.

WORKS DONE IN THE METROPOLITAN DISTRICTS.

THE Superintending Architect of the Metropolitan Board of Works (Mr. G. Vulliamy) has just now published his annual report on the monthly returns of district surveyors. It shows that the total of the gross fees received for the year is 36,674. 6s., in respect of 21,303 works, of which more than two-thirds were done within the year.

The gross fees received in thirty-two districts vary from 24l. to 450l., five being under 200l., twelve under 300l., six under 400l., and nine under 500l. In the others the incomes vary from 500l. to 1,644l.

The expenses of district offices are 65,691. 17s. 3d. The fees remaining due for all arrears are 27,592l., but probably mostly of little value. The sums abated or lost are 1,509l. Compared with the results of former years the present abstract shows still a considerable increase.

	Works.	Fees received.
In 1856	14,654	210,904 11 11

ROTHERHITHE SICK ASYLUM COMPETITION.

THE Board of Managers invited eight architects to furnish plans for the Pauper Hospital for the parishes of Bermondsey, Rotherhithe, and St. Olave, to be erected on a limited site adjoining the Rotherhithe Workhouse and the new Southwark Park.

The principal conditions were,—

Each architect to receive 40l., except the successful competitor. The successful competitor, if required, is to carry out the works for a payment of 500l.; but he will not be entitled to any payment unless a substantial contractor will undertake the work at a price not being more than 10 per cent. above the estimate. An estimate is to be sent with each design. The payment of the sum of 500l. is to include all travelling expenses and attendances, and the supply of all plans, working drawings, &c. &c., that may be required. All drawings are to be to a scale of one-twentieth of an inch to the foot. Accommodation is to be provided for 600 patients—about 200 males and 300 females; and the buildings are to be so arranged as to be easily capable of extension if required, so that easy access may be had to all parts. Buildings to be constructed on the pavilion principle.

The competitors were—

	Estimate.
Mr. George Legg	£35,000 0 0
Mr. Elkington	32,000 0 0
Mr. Ernest Turner	29,000 0 0
Mr. C. H. Cooke	29,000 0 0
Messrs. Giles & Biven	27,500 0 0

Dr. Markham and Mr. Corbett, inspectors of the Poor-law Board, attended the meeting of the managers, to give their opinions on the designs; and recommended those by Messrs. Giles & Biven, and Mr. Ernest Turner. Ultimately that by Mr. Turner was selected.

ROADS.

THE present practice of repairing roads is certainly open to improvement, and we have now no eminent living authority to advise and direct us as formerly in the execution of such works.

Your correspondent "X. Y. Z." seeks information on the subject; and I shall be glad, as an old practitioner, to offer my mite of knowledge derived from the late Telford's practice. In one of his specifications he speaks of 6 in. of broken stone being applied—4 in. to be first laid on and worked in by carriages and horses, care being taken to rake in the ruts until the surface becomes firm and consolidated, after which the remaining 2 in. are to be put on.

The whole of the stone is to be broken as nearly cubical as possible, so as to pass through a 24-in. ring inside diameter, and the whole of

the material to be covered with a "binding" of 1½ in. of good gravel, free from earth or clay.

In another of his late works at Coventry, what he generally considered one of his most perfect works, the pitching is to be covered with a layer of Nuneaton stones, to be laid on 6 in. thick, the stone to be broken as heforesaid, cubically, and to pass through the gauge. The Nuneaton stone is to be covered with 1½ in. in depth of good binding, evenly and regularly laid on, and well raked, so as to prevent it getting into ruts.

In my own practice on suburban roads, I should lay on the 6-in. coat at two different times, 3 in. each time, and let the first coat become nearly consolidated before I applied the second, at the same time paying strict attention to the shape of the cross section, and to secure a smooth surface when set and consolidated.

On town roads, if 6 in. in thickness be required in one coat, I should lay it on at one time; then clean gravel, or screenings of metalline; and if this be properly put on, and the stone well and regularly broken, and afterwards rolled with a steam roller, the metal cannot fail to become soon consolidated. Of course, in towns, if macadamized roads are indispensable—of which I have grave doubts—the mode of repairing should be such a one as to effect the object in the shortest space of time, so that the inhabitants and the traffic may suffer the least possible inconvenience, while the street is undergoing repair; but the system of rolling to consolidate macadamized roads adds very materially to the cost of them, and makes the difference in the first cost and repair very much more in favour of a well-executed pavement.

The metropolitan roads need the application of those excellent axioms laid down by the late eminent Telford, derived from his extensive practice and experience; and until these are followed out and adopted more generally, I shall expect to hear at the approach of winter ominous sounds of grumbling, not only loud, but deep, in the pages of the metropolitan press.

B. BAYLIS.

THE NUMBERING OF HOUSES.

A CORRESPONDENT, "C. B. H.," writes,—“An improvement in the numbering of streets is called for. I would suggest that the number of each house be painted on a piece of ground-glass, and inserted in a small aperture in the street-door, where, by the aid of the hall lamp it would be easily seen outside. On an evening there is a difficulty to find in any strange neighborhood the particular house for which we may be searching, especially if it be situated in a badly-lighted thoroughfare, or if it stand back a little distance from the road.”

The suggestion has been made before in our pages, but will bear repeating.

GENERALISATION IN ARCHITECTURAL EDUCATION.

The observations and advice in the *Builder* of last week in answer to poor "Adelphi" are both kind and good, but I cannot but think if farther advice were given in regard to a useful and plain course of study, and reading, it would be a considerable aid to "Adelphi" in enabling him to fetch up some of the leeway in his neglected course of architectural education. I am fully aware that a course of reading has already been recommended in the *Builder*, but I think some of your correspondents might advise a simple and useful course of works for his study on the following heads, viz:—

- On the general rules and principles of Architecture from Palladio, &c.
- On General Construction, Geometry, &c., &c.
- On the Principles of Design.
- On the Principles of Taste.
- On Estimating, Specifications, &c.
- On Colour, Light and Shade.

No doubt much might be gained from the programmes of King's College and the London University, supposing that a young man when out of his time could not afford to attend the classes. Many of your correspondents are both competent and capable of giving sound advice to "Adelphi," as well as others who have fallen in their time into the same dilemma, after expend-

ing five or six years in an architect's office, leave it without one single word of advice or teaching during that period, and who ought really to have the interest of the premium presented to them on leaving as some atonement for neglect.

A SUBSCRIBER.

PAINTING HOT-WATER PIPES.

A CORRESPONDENT from Sussex writes:—In answer to "A Subscriber" in your impression under date October 17th (p. 769) allow me to say the paragraph to which he refers occurred in the *Illustrated London News* of June 20th, 1868. He will there read, "In Germany . . .

a suggestion has been made to do away with the black lead, and paint the stoves and ovens. Oil paint, of course, cannot be employed, but water glass (silicate of potash), coloured with pigment to match the paint of the apartment, is the material recommended. Before this is applied, the iron must be thoroughly cleansed from grease, and all rust spots must be rubbed off with a scratch brush. Two or three coats of the paint may then be put on and allowed to dry, after which the fire may be lighted without any fear to the colour, which may, indeed, be heated to redness. It may be kept clean by washing with soap and water; spots of milk and grease have no effect upon it. Dutch ovens and like utensils may also be coated with the same materials, and the labour spent in polishing be saved. A good coating of the paint, the author says, will last a year or two."

GLAZING IN IRON.

In reply to "R. P." respecting glazing Iron skylights, I have to inform him I have used putty made with lamp oil instead of linseed. This putty remains soft, and prevents the breakage complained of. I have used it on several occasions with great success.

CHARLES CLARE.

HERTFORD COTTAGE COMPETITION.

SIR,—Can any of your readers oblige me by affording information concerning the award of the premium in the above competition? I had my drawings set back, with a letter accompanying them, thanking me for the kind assistance I had afforded, but not containing any information concerning the "successful competitor," or whether the premium was awarded or not.

COMPETITOR.

POPULAR AND STEPNEY ASYLUM COMPETITION.

SIR,—If you saw the drawings you could have had little difficulty in judging whose estimate was really to be depended upon as founded on actual knowledge and experience in the value of such works; but to show you how little value can be placed on such estimates, I beg to forward you the estimated value of the works required to carry out the three selected designs, as ascertained by surveyors appointed by the Board of Managers of the asylum. They are as follow:—

	Original Estimate.
Mr. A. Wilson	£54,700
.....	£35,000
Messrs. Hammett & Lambere ..	34,000
.....	65,500
Messrs. Harston	62,900
.....	58,000

In one case, Mr. A. Wilson's, the difference is only 20,700!! Still, I fear you will hardly credit it, the real contest has been between him and Messrs. Harston; and I believe Messrs. Harston are No. 1 by 6 votes to 5. This is hearsey.

I have no hesitation in asserting that, if all the designs had been cubed up and valued at one and the same price per foot cube, it would have been found that my estimate was not too high. I mean for good sound and lasting work. I believe that the estimates, even as obtained by the Board, would be found 15 or 20 per cent. too low for first-class work, such as there ought to be in public buildings.

My estimate was based on 6½d. per foot cube average. Can you get work well done for less?

The absurd estimates sent in by some of the competitors need no comment. I was always taught in early days that estimates ought to be founded on a certain basis. Is that the case now?

E. L. BRACEBRIDGE.

SIR,—We observe that in your notice of the designs submitted in competition for the proposed "Popular and Stepney Sick Asylum," you have not placed any estimate in connexion with our names. As this may give rise to erroneous impressions as to our assumed unwillingness to do so, we beg to state that an estimate of 55,000l. was given by us; but being embodied in the specification, and not in our general description, it may probably have thereby escaped recognition.

HILLS & FLETCHER.

THE FAIRFOLD WINDOWS.

SIR,—Your correspondent "B. A. A." has written to you apparently with little other purpose than to assure you that I am to be handed over to the tender mercies of Mr. Tom Taylor, whose authority "is recognised, and who has more than once publicly expressed his opinion that the hand of Albert Dürer is visible throughout the work." Very well, this shall be the test of Mr. Tom Taylor's claim as an art-critic and of mine. I have no fear for the issue. If these words are by Albert Dürer, those known to us by his signature are not. This is the issue I put, and it is a matter easily decided. I remind "B. A. A." that I mentioned no names in my letter; and he had been wise, as he conceals his own, to have followed my example.

I thank him for showing me my error in appropriating the so-called signature to the wrong subject. My argument is not touched thereby, and as this was the only instance of my omitting to make a note on the spot, it was an error of memory. But I do not excuse it; let my opponent make the most of it.

As regards every other point in which "B. A. A." makes free with my name, I do not think it necessary to trouble your columns. He is probably but a young member of the Archaeological Association; for an old one would have known my claims to enter into this dispute. He would also have known that on my retirement from active participation in their proceedings, I received a very cordial vote of thanks for my services.

I must apologise for troubling you, even to this extent, in reply to a writer who can only refer me to others. I write only in the interest of truth; and it is to elicit truth that I have applied to this question the result of a study occupying upwards of thirty years of my life.

J. G. WALLER.

WANTS IN JERSEY.

SIR,—Will you allow me to mention two things that struck me during a fortnight's stay in the island of Jersey? Thousands of pounds are being spent in making the vast quarries available for road purposes; but although the island is overrun with visitors and tourists, the authorities grudge a few shillings for half a dozen finger-posts. In the remoter parts of the Isle they are specially wanted.

During a few visits to the police-court at St. Helier's, I was much struck with the fact that nearly all the cases that were brought before the magistrate had their origin in intemperance; nevertheless, all the pumps I saw in the island were deficient of their laces or drinking-cups.

VERBON SAR.

UNDERGROUND ROOMS.

SIR,—Your correspondent, "A Plain Country Parson," is labouring under a very great mistake, when he says that houses built all above-ground are rarely vacant. I have recently completed the erection of about sixty houses, on an estate considered one of the most healthy parts of London, very open, with gravel soil, adjacent to a park. Twelve out of the above number are built all above-ground, with every convenience: it is true six of them are let or sold; the rest I seldom have an application for.

Now, sir, all the rest are what is termed half-story, or by some under-ground, and not one of them is vacant, but were bought up immediately.

I can, therefore, at once accommodate your correspondent with the sort of house he requires; rent, 45l. Not a villa, true, but one of a block.

M.

BUILDINGS IN MANCHESTER.

SIR,—We beg to inform you that we were the architects of the Commercial Chambers and Stock Exchange, mentioned in your Art Notes in Manchester; also of the warehouse in Peter-street.

WALLERS, BAKER, & ELLIS.

PROVINCIAL NEWS.

Cheshunt.—The building known as St. Mary's Hall has been pulled down, and the foundations of a new hall to be erected on the same site have been dug out. The contractor is Mr. F. Sanders, of Cheshunt, and the cost of the erection will be between 1,000l. and 1,100l. The building is expected to be finished in about six months.

Bodala.—The foundation-stone of a new Drill-hall has been laid here for the local Volunteers. The hall is to be 70 ft. long and 30 ft. wide.

Lincoln.—In obedience to the instructions of the committee appointed at a recent meeting of the Town Council, Mr. Wheeler, C.E., has prepared a plan and scheme for converting the land adjacent to the Bath-gardens into a public park or recreation ground. The land in question is already the property of the Corporation, and is 33½ acres in extent. It is proposed to enclose with a light fence about seven acres, lying between Mr. Joyce's garden and the Mill Hill, and by filling in the ditches and levelling the ground make it available as a play-ground and for fives and parades. The entrance, provided the scheme be carried out, will be through a pair of iron gates fixed in the line of the fence of Mr. Joyce's garden, where an ornamental cottage for the park-keeper's residence is to be erected.

FROM IRELAND.

Ballycastle.—The foundation-stone of five houses and a tower has been laid at Ballycastle, for the Coast-guard buildings, where the Government has obtained a site and two statute acres of land on the Boyd estate, adjoining the Coast-guard-station. The site is on an eminence, commanding an extensive view of Rathlin Island, the hills of Scotland, Fairhead, Glenshenke, and Knocklady Hill. The contractor is Mr. Mathew McClelland, of Derry.

POPULAR BOARD OF WORKS NEW BOARD ROOM AND OFFICES.

The Popular Board of Works at a recent meeting entrusted the erection of their proposed new offices to the joint firms Messrs. Hills & Fletcher and Messrs. A. & C. Harston, who, it will be remembered, gained the first and second prize respectively in the competition decided in June, 1867.

PUBLIC WORKS IN INDIA.

The following gentlemen have recently been selected from among 250 candidates for temporary service in the Public Works Department in India in the unmentioned grades:—

Executive Engineers, Fourth Grade.—Mr. C. C. Adley, Mr. W. J. B. Clerke, Mr. T. P. S. Crosthwait, Mr. W. J. W. Heath, Mr. W. Henderson, Mr. G. F. J. Hood, Mr. G. H. Jones, Mr. H. M. Mathews, Mr. R. Reynolds, and Mr. T. T. Ryan.

Assistant-Engineers, First Grade.—Mr. J. P. Bell, Mr. J. A. Coghlan, Mr. H. W. Cliff, Mr. C. H. Oudnes, Mr. R. Foley, Mr. A. D. Fox, Mr. C. E. Guel, Mr. H. S. Hallett, Mr. R. M. Henderson, Mr. E. J. Jones, Mr. G. N. R. Lambert, Mr. J. C. Ledger, Mr. G. W. Macdonald, Mr. T. P. Morris, Mr. J. Ramsay, Mr. S. A. Reade, Mr. H. S. Ridings, Mr. H. T. Tanner, Mr. W. B. Taylor, Mr. R. H. Winder.

Assistant-Engineers, Second Grade.—Mr. G. C. E. Barnard, Mr. J. W. Brasington, Mr. F. Bullock, Mr. F. B. Cunningham, Mr. R. H. Denny, Mr. R. Fogarty, Mr. A. B. George, Mr. W. C. Hoaking, Mr. J. E. Hilton, Mr. R. B. Joyner, Mr. T. W. Miles, Mr. R. D. Morgan, Mr. E. B. Oliver, Mr. W. G. Owen, Mr. P. Reynolds, Mr. W. P. Richardson, Mr. H. Riggie, Mr. F. Robertson, Mr. C. B. Target, Mr. A. Valentine.

CHURCH-BUILDING NEWS.

East Barwick.—The parish church, which is dedicated to St. Mary Virgin, has been re-opened after restoration and addition of a north aisle. The nave and south aisle also have been restored, and the chancel, which was built about twenty years ago, refitted. The seats, which are all free, and subject only to the allotment of the churchwardens, are of pitch pine, the pulpit of the same material. The floor tiles are by Messrs. Minton. The stained-glass memorial east window, in three compartments, is the work of Messrs. Lavers, Barrand, & Westlake. The subjects are the bearing of the cross, the crucifixion, and the interment. The reredos was done by Messrs. Bell & Co., of London, and contains a statutory marble cross, enriched with gold, with angels painted in the side panels, and with moldings decorated with mosaics. The chancel works were done by Mr. Withers, of London. The architect of the nave was Mr. Atkinson, of York. The carving of the stone corbels which support the principals of the roof represent the Christian course (the infant children blessed by the Saviour, guided by the guardian angel, the cross held out by the angel as the race goes on followed by the crown as the reward, ending in prayer and praise in heaven) was the work, as was that of the chancel, of Mr. Earp, of London. The builders employed were Messrs. Pattinson, of Ruskington, near Sleaford. Considerable portions of the ancient structure still remain. The old tower, the porch, with St. Mary holding the infant Jesus in her arms, the arcade of the south aisle, and the ancient font, with the emblems of the Passion on the panels, are almost untouched. There is also a narrow lancet window at the west end of the south aisle, showing that some parts of the church date from the beginning of the thirteenth century. It had been closed up with bricks, and on these being cleared away it was observed by the workmen that there were marks of there having once been a shutter with a bolt, &c. In the restoration this window had to be in great measure pulled down, but it was rebuilt, under the rector's orders, with its large internal splay, &c., precisely as before. The day after the re-opening

of the parishioners, men, women, and children, and their friends, to the number of about 400, were feasted by the rector and chief parishioners.

Helmsey.—The ancient church of Helmsey, in the North Riding of Yorkshire, has been restored at the cost of the late and the present Lord Feversham, and re-opened by the Archbishop of York. The restoration (almost the rebuilding) has occupied nearly two years. The work was commenced in 1866, by the late lord, under the advice of Messrs. Banks & Barry, of London, architects. At his death during last year the work was far advanced, and it has now been completed by his eldest son and successor. In the course of the works of restoration, it has been found impossible to retain much more than the south wall of the nave, the arcade between the nave and north aisle, the old arch into the chancel, and the lower part of the tower. It was found that alterations and repairs had been going on in the chancel and transepts, which had so shaken and loosened their walls that rebuilding was imperative, but the examination of them revealed the positions and sizes of the old windows which had been walled up, and enabled the architects to reproduce, in all essential features, Helmsey church as it existed in the eleventh century. The old pitch of the gables and of the roofs has been restored, and the late windows have been replaced by the original deeply-recessed round and lancet openings. The west gallery has been removed, and the tower, with its arch, thrown open to the church. The old chancel arch and that to the south door have been preserved and their mutilations repaired. The whole of the internal seating is renewed in oak, while externally a new south porch has been built, the incongruous upper part of the tower renewed and replaced by a belfry stage and pinnacles of early character, and a lych-gate of the old familiar type has been inserted in the south wall of the burial-ground, immediately opposite the south entrance. The whole of these works have been carried out by Messrs. Barton & Smith, of Helmsey. The chancel windows and some in the transepts have been filled with stained glass by Messrs. Hardman, of Birmingham. The treatment of the eastern triplet being illustrative of the dedication of the church to All Saints; the centre light contains the Saviour in a sitting attitude, of heroic size, in the act of receiving and blessing the bands of saints, prophets, martyrs, and confessors, groups of whom fill the lights on each side, while four single-light windows in the sides of the chancel contain figures of the Evangelists. Messrs. Brown & Downing, of Birmingham, have supplied the metal work in the gas standards, gates, &c., and the pavement of the chancel is designed in encaustic tiles manufactured by Messrs. Maw & Co., the nave and transept floors having tiles of plain character made by Messrs. Watkin, of Burslem. An organ has been given by the Earl of Feversham. It is from Messrs. Walker & Son, London. The instrument is erected on the north side of the nave, and its front pipes are gilded and illuminated. A new clock by Messrs. Moor, of Clerkenwell, with musical chimes at every quarter of the hours, has been provided, and the old peal of bells has been examined and rebung by Messrs. Mears, of Whitechapel, the largest of them (found cracked) having been recast. The entire expense has been upwards of 10,000l.

Rickingham Superior.—The parish church has been restored and re-opened. The restorations recently effected have brought to a completion a work inaugurated a year or two ago by the restoration of the chancel. The floor of the nave (formerly on a level with the chancel) has been lowered 30 in., and paved with red and buff tiles; those with which the chancel is paved are red and black. The decayed roof of the nave, which was of oak, has been replaced by one of stained Memel deal, of the same pattern as the old one, with traceried spandrels, circular ribs, and moulded principals, supported on stone corbels. The inside walls have been stripped of the old plaster and fresh stuccoed, and the whole of the stone-work has been freed from accumulated coatings of whitewash, and repaired. A gallery at the tower end of the church has been taken down, and the tower-arch thrown open to the church; a two-light window in the tower has been restored and filled with cathedral glass. All the windows in the nave have also been repaired and glazed with cathedral glass, with a white margin, and a few fragments of stained glass have been collected and placed in the windows on the north side of the nave. A chief feature of the recent altera-

tions is the removal of the high old-fashioned pews, which have given place to oaken benches, rather too close together. Over the south porch there is a chamber, or parvise, reached by a stone staircase. This, until recently, was used as a lumber-room, but it has been thoroughly cleaned, and is now fitted up as a vestry. The staircase to what was formerly the roof-loft was until the recent alterations filled with brick-work, done by a churchwarden of past time, who was a maker of bricks, of which some 2,000 were thus disposed of. On removing the pews on the south side of the nave a piscina was brought to light. The north door of the church has been re-opened, after being closed for thirty years. The church doors have been newly constructed of oak, with ornamental hinges, &c., of wrought iron. The roof of the nave has been covered with slate. The exterior walls of the church (which are mainly of flint) are in good repair, but Macfarlane's gutter has been affixed to the eaves. In the chancel is an organ of seven stops, by Mr. Conacher, of Huddersfield, which was opened at Easter last, and has been purchased by subscription. The whole of the recent work (which has occupied about five months) was undertaken by Mr. Chas. Bishop, of Diss, and has been executed by him under the supervision of the architect, Mr. Fawcett, of Cambridge. The glazing was done, under Mr. Bishop's directions, by Mr. Herbert Osbourne, of Stowmarket. The total outlay will amount to between 800l. and 1,000l.

Paddington.—A new church has been opened at Paddington, near the north end of Westbourne-road. At the ceremony a large number of clergymen vested in their cassocks and stoles attended, and the lady from St. Alban's, All Saints', Margaret-street, and other churches were present at the services. The new church is dedicated to St. Mary Magdalene. At present the chancel and nave alone are completed, there being but a temporary roof. Mr. Street is the architect.

Millwall.—The foundation-stone has been laid of the new church of St. Luke at Millwall, in place of the temporary iron building erected in a great measure by the liberality of the Bishop of London's Fund some few years since. The church will be built of Kentish ragstone, with Bath facings, and the ground on which it will stand has been granted by Lady Margaret Charteris. The site is at the end of Stratford-street. The architect is Mr. E. L. Blackburne; and the builder Mr. Howard.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Gloucester.—A new church on the old site in Northgate-street was opened in March, 1860. That church was designed by Mr. Gilbert Blom, of London, architect, and was in the Gothic style of the second period of the pointed arch. The parts of the building completed at the opening were the chancel, the lady chapel, the sacristy, and about two-thirds of the nave and the aisles, and the cost was 2,500l. In 1864, new schools were built, at a cost of about 600l. In August, 1867, the works needed to complete the original design were begun, and now they have been well-nigh finished, at a cost of about 5,000l. The original design was that the total internal length should be 101 ft., the width 39 ft. 6 in., and the height 41 ft. The chief part of the new work is the addition of a tower and spire. The total height is about 180 ft. The style is the Decorated of the fourteenth century. Above the tower is an open lantern with double windows on either side, having marble shafts: rising from that is the broached spire, crocketed to the first hand, canopied, ornamented, sculptured near the finial, containing four two-light windows, and surmounted by a metal weather-vane cross. Gargoyles spring from the tower, and in it has been placed a clock, which was purchased at a cost of about 100l. by Mr. W. Ellis, solicitor. There is a ringing-loft, and provision is made for bells. The lady-chapel has been rebuilt; the chancel roof has been altered; and the walls have been rebuilt, hollow, so as to prevent dampness, and hereafter to admit of fresco painting. As now completed, therefore, the building consists of nave, north and south aisle, baptistery, chancel, lady-chapel, cloister leading to robing-room, and organ-gallery at the west end. The columns of the gallery front are of Devonshire marble. The arcades of the nave consist of six columns on each side,—those of the chancel of four columns on each side; the latter are of Devonshire

marble. The floor of the chancel has been re-laid with Minton's encaustic tiles, and the Forest stone steps have been altered. The moulded ceiling is new, and has groined arches with carved terminations. All the windows are now filled with tinted cathedral glass; but it is hoped that this will be replaced throughout with painted glass. The work has been carried out by Messrs. Wingate, builders, of Gloucester; the clerk of the works was Mr. Reynolds. Messrs. Hardman & Co., of Birmingham, supplied all the metal work—the vase, six or seven crosses, the chancel gates, and so on. The new organ, supplied by Mr. Williams, of Cheltenham, is the largest instrument in Gloucester, next to those at the Cathedral and the Shirehall: the cost was between 400l. and 500l.

Windsor.—On the octave of the Feast of St. Edward the Confessor, once King of England, the new church, dedicated to his name, and erected in the Alma-road at Windsor, was opened with a grand Pontifical High Mass. The portion of the church already completed comprises the nave, 80 ft. in length and 51 ft. in width, with north and south aisles: to the latter of these is appended the Lady Chapel, or Riley Chantry, and a south porch. The style is English, of the latter part of the thirteenth century. The edifice is built of Kentish rag, with quoins and dressings of freestone. The church is fully open to view on all sides. A niche in the gable over the west window contains a seated figure of Edward the Confessor. The chancel and the proposed north-west tower and spire are still wanting to complete the outline of the architectural group and the symmetry of the interior. There are five arches on each side of the nave, with clustered columns and moulded capitals. The clearstory windows are arched and cusped, surmounted by a roof of open timber-work supported on slender shafts. The temporary high altar at the east end of the nave is raised beneath a moulded arch, with clustered and banded columns, and destined to open into the future sanctuary. The east end of the south aisle communicates with the Riley Chantry, a transeptal chapel, with arched and panelled roof. The rose window over the lady altar is embellished with stained glass by Messrs. Hardman & Co. The principal light is admitted by two traceried windows towards the south, prepared for figures of patron saints. The floor and steps are laid with Minton's encaustic tiles of ornamental patterns, colours, and borders. The blank arches towards the north are intended to open from the chantry to the chancel, and to correspond with other two, on the opposite side, for the tribune. The works have been carried out by the contractor, Mr. E. W. Kelly, of Windsor, from the designs and under the supervision of Mr. C. A. Buckler, of London, architect. The cost of the church is upwards of 4,000l., raised by voluntary contributions. The stone pulpit is the gift of Mr. Kelly, the builder; and the font is given by Mr. T. Kelly. The organ was built by the Messrs. Bevington & Sons.

STAINED GLASS.

Kington Church (Grantham).—Memorial windows of the late Duke and Duchess of Rutland have been erected in this church. That to the memory of the duke is fixed in the east end of the north transept. It consists of three lights, the middle one containing the Raising of Lazarus, the dexter the Good Samaritan, and the sinister Abraham offering his son Isaac, illustrative of the Christian graces of hope, charity, and faith. Below the central light are the arms of the Duke and Duchess of Rutland. The memorial window to the duchess, which is fixed in the south side of the nave, contains two lights, representing the Raising of Barabas. An inscription at the bottom of each window records that they were erected in memory of the duke and duchess by the villagers of Kington.

Books Received.

Letters on Natural Magic, addressed to Sir Walter Scott, by Sir David Brewster, F.R.S. New edition. London: William Tegg. 1868.

This edition of Sir David Brewster's charming and well-known letters on natural magic is prefaced with a somewhat elaborate paper "On the Being and Faculties of Man," by Mr. J. A. Smith, and has at the end an account of additional

phenomena of natural magic, including particulars of some of the Polytechnic inventions.

Transactions of the London and Middlesex Archaeological Society. Vol. III., Part IX. J. PARKER, Strand.

The new Part of the "London Archaeological Society's Transactions" is very interesting and readable. It includes the paper by Mr. W. P. Griffith, F.S.A., on St. John's Priory, Clerkenwell; notes of various Roman remains recently discovered in London and Middlesex; and an account of the church of St. Mary Somerset, Upper Thames-street (about to be pulled down with the exception of the tower), written by Mr. Milbourn, architect. "Grub-street," by Mr. Campkin, F.S.A., should also be mentioned.

Miscellaneous.

THE MANCHESTER TOWN HALL.—On Monday last the foundation-stone of the Manchester town-hall was laid by the mayor of Manchester, Mr. Robert Neill. A procession, consisting of most of the city dignitaries, military and civil authorities, left the town-hall at 12.30, and proceeded to the site in Albert-square, where the stone was laid with the ordinary formalities. Mr. Bazley, M.P.; Mr. Jacob Bright, M.P.; Mr. Cheetham, M.P.; Mr. R. N. Phillips, M.P.; and Mr. Fildes, M.P., were present. A public banquet took place afterwards in the town-hall. We have given a view of the proposed building.

FETE IN HONOUR OF A VILLAGE PUMP.—There was a well dressing at Pilsley, not long since, according to the *Derbyshire Advertiser*. During the summer the whole of the inhabitants had been supplied with water from the village pump, and people from Tibshelf, Morton, North Wingfield, and other places, had been largely dependent upon it for supplies. Notwithstanding it has been such a remarkable season the well has never been exhausted. The grateful inhabitants consequently determined to do honour to the pump, and it was gaily decorated with flags, evergreens, &c. About 400 people sat down to tea in the large room at the Horse Shoes Inn. Towards the expenses 14l. had been subscribed, and the women and children were allowed tea free. A musical band was in attendance.

ROMAN REMAINS AT COWES.—Having obtained permission to excavate the garden at the extreme point of Gurnard Bay, the Rev. E. Kell has, during the last few weeks, uncovered two rooms and the wall of a third room of the Roman building discovered on this spot in 1864. The garden formed the site of Gurnard fort, which, so late as 1635, was in a state of defence, though now no trace of it remains. The Roman building, the entire of which has now been uncovered, was about 70 ft. in length by 13 ft. 6 in. in breadth, and consisted of five rooms in a line. The two rooms at the west end had tessellated pavements of a common kind, made from tiles. The building had been consumed by fire. Among articles found were a large quantity of hexagonal stone roofing-tiles, fragments of a mortarium, a Roman fibula, and a lady's bracelet. This Roman building stood at the termination of Rue-street, which is considered the point at which the Isle of Wight was united to the main-land of Hants.

THE NEW STREET FROM BLACKFRIARS TO THE MANSION HOUSE.—The Metropolitan Board of Works, deeming it desirable that their works along the new street from Blackfriars to the Mansion House should be carried on under the same management as that of the railway as far as possible, with a view to expedition and economy, have made arrangements with the Metropolitan District Railway Company whereby the company have undertaken the formation of the sewer and subway at the same time as their railway, up to the point where the railway and street will diverge, for the sum of 22,000l. The portion to be constructed by the railway company is that east of St. Andrew's-hill, while that portion west of Chatham-place is included in the Thames Embankment contract, No. 3; but there remained an intermediate space of about 700 ft., and a short length of vaults, the execution of which has been given to Mr. Webster at the rates of payment specified in the schedule of prices attached to his contract for the portion of the embankment from the Temple to Blackfriars Bridge, the estimated cost being 10,000l.

SOCIETY OF ENGINEERS.—At the next meeting, Monday evening, 2nd November, a paper will be read on "Modern Gas Works at Home and Abroad," by Mr. Henry Gore.

ARCHITECTURE AT THE ROYAL ACADEMY.—A course of lectures on architecture will be delivered by Mr. G. G. Scott, R.A., professor of architecture, at the Royal Academy, on the 4th, 11th, 18th, and 25th of March.

ENGLISH CHURCH IN CONSTANTINOPLE.—The English memorial church at Constantinople has been consecrated. On the occasion, the Greek Patriarch paid the unprecedented compliment of sending his vicar and a bishop to be present.

STABLE FITTINGS.—The well-known proprietors of the Ann-street Iron Works, Belfast, Messrs. Musgrave, Brothers, have issued a new and varied illustrated catalogue of stable, cowhouse, piggyery, and kennel fittings, stoves, and drainage and flooring materials, park-gates and fencing, cast-iron bridges, &c. Much practical information is conveyed in this catalogue, which seems to have been carefully prepared, and at considerable cost. Messrs. Musgrave's fittings have an excellent character.

THE BALANCE-CONE CHIMNEY GUARD.—This invention consists in the construction of a hollow cone, in three parts, held together by three outside partitions or fans, attached edgewise at equal distances. The fans hold the pieces of the cone sufficiently apart to allow a current of air to pass through in an upward direction, which ventilates the cone, with the view of causing an increase of the up-draught in the chimney. The cone is balanced with nicety on a universal joint, and at such a height with relation to its centre of gravity that it can be easily moved by the wind, which causes it to shield the windward side of the chimney or shaft, while the smoke escapes to leeward beneath and between the divisions of the cone. The idea is very ingenious; and the invention, we should think, is one that will work well, if the joint do not get corroded and stiff. It seems well worth a trial.

THE SINGAPORE GAS COMPANY, LIMITED.—From the directors' report for the half-year ending 30th of June, 1868, presented to the shareholders at the extraordinary general meeting, on the 27th of October, it appears that the profits on this undertaking for the half-year are 1,000l. 4s., which, together with 45l. 16s. 4d., the unappropriated profit of the preceding half-year, makes the available balance 1,067l. 0s. 4d. Out of this sum the directors recommend the declaration of a dividend at the rate of 7½ per cent. per annum, less income-tax, on the preference capital; and a dividend at the rate of 4 per cent. per annum on the amounts paid up on the original capital, free from income-tax. The coal question is still causing some anxiety, rates of freight ruling high from Australia. A cargo of coals which arrived from Australia in May last, fully answered expectation; they produced 9,200 cubic feet of gas per ton, of 13½ candles illuminating power, and 40 bushels of good hard coke.

DOCK ACCOMMODATION AT CARDIFF.—The new dock works on the estate of the Marquis of Bute at Cardiff are being executed with great rapidity. The powers conferred by Parliament on the trustees of a low-water pier and a basin of construction so large that it will present the appearance of a dock rather than a basin. What looked like a few piles at the commencement of early summer is now a pier extending out to the mouth of the river Taff, with a tramway laid upon it the entire distance; whilst at the head the arrangements, by means of a pontoon and a lift worked by hydraulic arrangements for the landing of passengers, and the loading and unloading of goods, are of the most complete description. The pier forms a breakwater for the approaches to the docks. The basin that is to be rapidly assuming shape, so far as the work of excavating goes, and the masonry has been formally commenced. The weekly estimate of money paid in wages and materials is from 10,000l. to 12,000l. Even the Bridgewater canal sinks into insignificance when compared with the outlay on the Bute Dock works, the rapidity of their execution, and their influence upon the development of the trade of a district. A scheme is said to be under consideration for having rapid saloon steamers between the Bute pier and that of Portishead, by which the distance from Cardiff to Bristol will be accomplished in an hour and a half.

THE NEWARK HOSPITAL.—It is in contemplation to make extensive alterations in the Newark Town and District Hospital, with a view of rendering it more efficient than its present limited space enables the governors to make it. The building was not erected for the purposes of an hospital; and the space and accommodation do not amount to half of what is necessary. It is intended to make application to the Town Council to appropriate the whole of the site of the present buildings.

LARGE RIDING SCHOOL IN AMERICA.—A fine riding school has just been erected at Poughkeepsie, a place already well known for its educational institutions, and especially for those of the more practical sort, such as Eastman's Business College, and the Vassar Female College. The new institution is for the especial benefit of the latter. In point of size, it is second only to the Riding Gallery of the Military Academy at West Point. The building is 156 ft. long by 130 ft. wide. It was designed by Mr. J. A. Wood, of that place, architect, and is built of brick, ornamented. It contains a gymnasium, 81 ft. long, with a width of 30 ft., and a height of 23 ft., a billiard-room, 30 ft. by 52 ft., a bowling-alley, 30 ft. by 82 ft., a number of dressing-rooms, and stalls for twenty-three horses. The cost may be put at 56,000 dollars.

IMPORTANT DISCOVERY IN THE MANUFACTURE OF STEEL.—The *Times's* City article says:—Great interest is stated to attach to the successful operation of a process patented by Mr. Heaton, of the Langley Mill, in the Erowash Valley, by which inferior iron is made into first-class steel, thus utilising for the higher purposes of manufacture vast deposits of ore hitherto condemned to the lowest rank. The process is chemical and not mechanical, and a great economy of time and labour appears thus to be secured. Nitrate of soda is the agent employed, and the personal investigations of Professor Miller, of King's College, vice-president of the Royal Society, and Mr. Robert Mallet, F.R.S., together with the results of experiments by Mr. D. Kirkaldy as to the tensile and resisting strength of the steel manufactured by this method, appear to be conclusive as to its efficiency, placing the steel upon an equality with Low Moor and Bowling. The saving in cost of production is said to be several pounds a ton.

PROPOSED ASSEMBLY-ROOMS, RAMSGATE.—A scheme is now on hand for the erection of Assembly-rooms in this town. It is proposed to erect a building for this purpose in High-street and George-street. Plans and specifications of the proposed building have already been drawn up by Mr. Bridge, architect, and the ground has been purchased. The idea at present is that the capital should be 10,000*l.*, a large portion of which has been subscribed. The entrance will be from the High-street, and the grand hall will be in dimensions about 120 ft. long by 55 ft. wide. Entrance to the hall will be obtained by a grand staircase. The decorations of the room itself will be in the Italian style. In case of fire there will be four ways of escape. The roof immediately above the orchestra will be devised as a shell, and the ceiling will be elliptical. Ventilation will be obtained from the roof, and an apparatus will be constructed for the admission of cool air, but without forming a draught. It is contemplated to build a colonnade of shops on the ground-floor.

PROPOSED INFIRMARY FOR OLDHAM.—At a meeting recently held for the purpose of considering the propriety of erecting an infirmary at Oldham, with the 1,000*l.* granted from the Lancashire Relief Fund, a committee was appointed to make the necessary inquiries and report. A meeting has just been held at the Town-hall for the purpose of considering the report and taking proceedings thereon. The report recommended—first, a dispensary with the necessary apartments and offices for the resident staff and servants, and, if possible, two or three rooms for special cases where quiet and isolation were necessary; second, an infirmary containing separate rooms for male and female patients, arranged so as to afford about 1,500 cubic ft. of air to each bed, of which it was proposed to begin with twenty. The committee were of opinion that the proposed buildings would cost at least 6,000*l.*; and, in addition to this, 4,000*l.* should be added for purchase of site, furniture, &c.; and they therefore recommended that a sum of 10,000*l.* be raised. The entire amount subscribed by the meeting was 2,655*l.*

AN ART-FUND MEMORIAL.—An art fund for the benefit of Irish artists is to be established as a memorial of the late Judge Berwick, of the Dublin Bankruptcy Court, who was killed by the Abergelle accident.

AN ORCHARD-HOUSE.—Under the title of "Orchard-houses in the Midland Counties," a correspondent of the *Notts Guardian* thus describes an orchard-house, in which peaches, apricots, nectarines, plums, cherries, mulberries, pears, and apples, are grown, as well as grapes, interspersed with flowers, such as camellias, and with herbs. The house is 80 ft. long, 30 ft. wide, and 7 ft. high at the sides; the walks are paved with black and red tiles, in a diamond pattern, and beneath the flooring at the south end is a large cistern, which collects the whole of the rain-water which falls from the roof. Its aspect is north and south, thus enabling the sun's rays to travel over the house, and avoiding the excessive heat at mid-day, when they fall direct upon a slanting roof: the position in which an orchard-house is placed contributes materially to its success. The house was erected about four years ago, somewhat after the model of the houses belonging to Mr. Pearson, of Chilwell: it is glazed at the ends and sides with 16-oz. glass, and the roof with 20-oz. glass: the roof is also made in separate lights, and, if occasion require, the whole structure can be removed without breaking a pane of glass. The building, complete, was erected for less than 200*l.* There are about seven peaches and nectarines, fifty plums, forty pears, ten apples, thirty cherries, twenty apricots, and twenty vines: the whole stock cost about 40*l.* The orchard-house is pleasant at all times of the year, in winter as well as summer. On each side are the trees, packed together as closely as possible, the pots imbedded in litter: thus is frost prevented from attacking the roots, and the little of it which gets into the house does good rather than harm. About Christmas last year the house presented the appearance of a winter garden.

LIABILITY OF EMPLOYERS.—The case, as between master and servant, is another in which actions for negligence are very commonly brought. A careful perusal of the Lord Chancellor's judgment in the late case of *Wilson v. Merry*, in the House of Lords (see 12 Sol. Jour., 858), will perhaps throw more light than anything else on the true principles which govern this case. The question is, whether there has been negligence on the part of the master in anything which he undertakes, as between himself and his servant, to do. He does not undertake personally to superintend the work; but, if he does not do so, he undertakes to employ reasonably competent persons for the purpose. He does not, however, warrant the competency of these or of any other of his servants, but is only bound to select such as, so far as his means of knowledge go, he has reason to believe competent. If he does personally superintend the work, he undertakes, doubtless, to bring to bear upon it a reasonable and ordinary amount of skill and of care. He also undertakes to provide proper and efficient materials and plant for the work; but here, again, he does not warrant the efficiency, but need only do his best to furnish what is required. And this duty of seeing to the materials, &c., is not one which he is bound to attend to personally, but he may employ another presumably competent person to do that, as well as the rest of the work, and he will not be liable for that person's default: see *Feltham v. England*, 15 W. R. 151, L. R. 2 Q. B. 33. We believe that the above is substantially a correct summary of the effect of the very numerous cases which have recently been decided on this branch of our subject, and it will furnish a solution of all master and servant cases. Possibly, however, we ought to add that the master does undertake, as regards his servants, that he will perform any statutory duty imposed on him with respect to the manner in which his business should be carried on; for instance, with respect to the fencing of machinery, the ventilation of a mine, and so on. We have, however, already remarked on this subject in our last article. It remains only to add that of course even where there is a breach of the duty above defined on the part of the master, the doctrine of contributory negligence of the plaintiff applies as in other cases. So that a servant who works with materials or implements which he knows to be unsafe, cannot recover against his master, nor can he if he has equal means of knowledge of their condition with his master.—*Solicitor's Journal*.

NEW BLACKFRIARS BRIDGE.—The capitals for the columns have been modelled by Mr. J. Birnie Philip, and will be executed in Portland stone.

HIDDERSFIELD BOROUGH SURVEYOR.—The town council have appointed Mr. Abbey, borough surveyor, at a salary of 350*l.*, Mr. Abbey providing the necessary clerks, and not giving up his private practice. Offices are to be provided by the town.

BAD WORK IN ISLINGTON.—At a meeting of the Islington Board of Guardians last week, Mr. Fairbank, in the course of the business, said, two stone buildings which had been raised in the parish had lately been found to be sinking. Mr. Higgins, the surveyor, had visited them, and had found that instead of concrete being laid as a foundation, ballast only had been used, and the consequence was that there would be an expense of 200*l.* to make them good. Clerks of the works were employed when these places were built, and yet these things had been overlooked.

OPENING OF THE NEW MARKET, SMITHFIELD.—At the last Court of Common Council, Mr. H. L. Taylor announced that the formal opening of the new market would, in all probability, take place on the 14th of November, and that an application had been made to the Prince of Wales to be present and perform the ceremony. His Royal Highness, in reply, however, had expressed his regret that he was unable to do so, having made all his arrangements for leaving England previous to that date. The mayor, Mr. Taylor added, would therefore be left in the hands of the Lord Mayor for the time being and the corporation.

LECTURE ON VENTILATION OF SCHOOLS, &c.—The last lecture of a course has been given in the Bedford Rooms, by Mr. K. T. Craig, of Oxford. The subject of ventilation of dwellings, school-rooms, and public buildings was shown to have an important relation to health. Mr. Craig directed attention to the utter neglect of proper means of ventilation in dwelling-houses, and the great mortality from consumption and preventable causes of disease. He also made some practical suggestions on the ventilation of bed-rooms and school-rooms. Resolutions in accordance with the lecturer's ideas were proposed by the chairman and carried unanimously.

THE CUMBERLAND NEW GAOL.—At the last Quarter Sessions for the county of Cumberland, the county surveyor stated that if he had gone down to a solid foundation for the new prison it would have put the county to 5,000*l.* additional expense, and as they were about to commence another part of the building he wished to know whether the county would rather have that portion erected in the same manner as the other portion, with a liability to crack, or they would go down to a solid foundation, with a certain cost of 1,700*l.* additional. Mr. Spedding said he had understood from Mr. Reddin that one reason why the building had cracked was that the concrete had not had time to harden. The county surveyor said that was so; they had been obliged to build within a few days of the concrete being laid. Mr. Spedding suggested that arrangements should be made to give the concrete time to harden. The chairman said the gaol committee would see to it.

THE BIRMINGHAM SCHOOL OF ART.—The *Birmingham Journal*, reprinting and commenting on our recent mention of the School of Art in that important town, says:—"We quite agree with the writer of these remarks, and we may add that other considerations make the suggested improvement still more desirable. The School of Art occupies part of the Midland Institute building, and the Institute is so much in want of room that it is becoming absolutely necessary to take into its own use the space now occupied by the School of Art. But this cannot be done until other accommodation is provided for the school. The subject has been very often pressed upon the attention of the Institute Council, and it is to be hoped that something practical may soon be attempted. Both institutions would benefit by the change. The School of Art would get more suitable accommodation, and the Institute would obtain the room now so urgently wanted for its increasing classes. At present both the School of Art and the Institute are prevented from expanding, the space at their disposal being so comparatively limited and so fully occupied that not another student can be crammed into it."

LIBRARY FOR STAFFORDSHIRE.—The widow of the late Mr. William Salt, a Staffordshire gentleman, has given to that county a library valued at 8,000l.

THE FRENCH GALLERY.—The usual Winter Exhibition of Cabinet Pictures by British and foreign artists in the French Gallery will be open to the public next Monday.

ECCLESHELL CHURCH SERIOUSLY INJURED BY FIRE.—Eccleshell parish church has been on fire. The north aisle, the lower end, and the vestry were gutted, and the wood-work of the roof was destroyed. The north wall, supporting the clearstory, was so greatly weakened as to endanger the safety of the building, and men were set to work to prop it up. The fire began in a beam built into a chimney of the new warming apparatus. The damage, it is said, cannot be less than 1,000l. or 2,000l. There was unfortunately no insurance on the building.

THE YORKSHIRE WOLD TUMULI.—The researches of the Rev. Canon Greenwell, of Durham, among the graves of the Britons on the Potter Brompton Wolds, near Scarborough, are being continued. Several archaeologists have accompanied the reverend explorer, and results of an interesting nature have been brought out, particularly in a narrow 54 ft. diameter and 1 ft. high. This had a trench cut round it being 23 ft. in the inner diameter, and varying from 14 ft. to 24 ft. in width, and being cut 24 ft. deep into the chalk. The circle was incomplete, having at the south-east and south side a space of 8 ft. not excavated. In this trench, on the east and south side in a slight oval hollow in the bottom, was the body of a man doubled up. At the centre of the barrow, on the natural surface, was the body of a young person, of about sixteen years, doubled up. In the grave below were the remains of at least two persons, one old, one young, disturbed. About 6 in. from the south side of the grave, and 14 in. below the natural surface, was a burnt body, and near it a red deer's antler. The grave was oval, 8½ ft. by 6½ ft. and 3½ ft. deep. In it was the body of a young man. There were also several portions of a "drinking-cup," and a flint knife, 3 in. long, beautifully chipped on both sides. The knife and cup probably belonged to the disturbed bodies. The incomplete circular trench accords with the circle of stones which, whether with or without a tumulus is always incomplete, as witness the so-called burial-places called "Druid's circles." Other barrows have been opened. The whole of the unburnt burials were of the round-headed (*brachycephalic*) people. About five more openings will complete the investigations on the north range of the wolds.

KITCHEN BOILERS.—Mr. Hiller, chief engineer of the National Boiler Insurance Company, Manchester, writes as follows:—The recent explosion of a kitchen boiler at the United Hotel suggests to me several points which are frequently overlooked in the original construction of such boilers. They are generally made and set up by men who know nothing of steam pressure, and are unable to calculate the strength of such vessels. The feed is generally by a column of water from a cistern placed in a convenient position at or near the upper part of the building. Where the top of this inlet pipe is at a high level above the boiler, the pressure will be proportionately great, and, I believe, in many cases reaches from 15 lb. to 20 lb. per square inch in boilers not suitable for half that pressure. The open escape-pipe is supposed to be an outlet for any steam pressure which may be generated, and thus a safety-valve is believed—erroneously—to be unnecessary. Such boilers ought always to be made very strong, and to be provided with safety-valves and suitable test-taps, which could be tested without inconvenience. The height of the outlet-pipe should also be limited according to the strength of the boiler. I would suggest the following to the attention of all who use or may require such boilers:—Their construction should be intrusted to none but those who possess the requisite engineering knowledge to insure the boilers being suitable for the purpose required. They should be provided with a safety-valve and with taps so fixed that the flow of the feed-water, &c., may be tested. The boiler and all its connections should be regularly tested and examined by a competent person. Were these precautions taken, the risk of working such boilers would be very much reduced.

CHRISTIAN MORTAR.—In New York, a maiden lady has left all her property for the purpose of building a church, on condition that her body and bones shall be made into mortar in which to lay the corner stone. What could have been the leading motive for such a stipulation? Was it that she was determined to guard against the possibility of being buried alive, or that she desired, with her own body and bones, to help to consolidate the church?

THE SUEZ CANAL.—The directors of the Maritime Canal of Suez have published a table, showing the general situation of the works on September 30. In the narrow channel and basin of Port-Said, and along the canal to Suez, the total to be extracted was 74,112,130 mètres cube; between August 15 and September 15, 2,081,367 were taken out; the total up to the present time being 49,309,522. There remain to be removed 24,802,608. Fifty-eight dredging-machines are at work, and two more are in preparation. The number of labourers is 14,853.

LICHFIELD CATHEDRAL.—Improvements have recently been made in the lighting of the nave. Mr. Atterton has accomplished the desired end by fixing round the heads of the columns of the nave sixteen jets. The result is a uniform body of light, which, from its elevated position, is singularly pleasant. This same workman is now fitting four rays in the choir, with grilles of ornamental ironwork. They are of a geometrical pattern, from designs by Mr. G. G. Scott. Mr. Atterton has also been engaged in lighting the new church of St. Augustine, Edgbaston.

CANYONE SOCIETY, BRISTOL.—The anniversary of the Canyone Society was held on Thursday, the 22nd, commencing with divine service in Redcliff Church. A very eloquent sermon was preached by the Dean of Chichester (Dr. Hook), at the conclusion of which a collection was made in aid of the restoration fund. This annual dinner took place at the College-green Hotel, when upwards of one hundred ladies and gentlemen sat down to a repast, the mayor presiding. The annual report showed the steady progress of the restoration, though it also stated that the funds were very low; and that, unless a vigorous effort were made, the work would have to be suspended. Several admirable speeches were delivered, among others by Archdeacon Denison, Mr. R. P. King, and the Rev. H. G. Randall, after which the chairman announced that the collection for the day amounted to about one hundred guineas.

MISERABLE LEADENHALL-STREET.—At the meeting of the City Court of Sewers on Tuesday, the 20th instant, Mr. Deputy de Jersey in the chair, the principal clerk, Mr. Davy, read a report from the Finance and Improvement Committee, in reference to the plan for improving Leadenhall-street and Fenchurch-street, at the eastern angle. The committee recommended that no further proceedings should be taken on account of the many pressing financial obligations of the commission to the improvements at present in hand. The plan originally framed for making the improvement was now recommended to be entirely given up. The Chairman observed that the subject was one of considerable importance, and perhaps the better course would be, that the consideration of the report should be adjourned until the next meeting of the commission. Mr. Whiteside agreed that that was the best course that could be pursued, and the suggestion was adopted.

SCIENCE TEACHING IN SOUTHAMPTON.—Dr. Bond, the principal of the Hartley Institution, has been delivering a course of lectures on "Experimental Physics" adapted for young persons, the greater part of the audience on the occasion consisting of about 200 boys, who had been selected from the national and other similar schools in the neighbourhood, and who, with their teachers, were admitted gratuitously to the course. The object which Dr. Bond has had in view in making this experiment, which has grown out of a conference with the teachers held a short time ago in the institution, was twofold: firstly, to prepare a certain number of the boys for the examinations of the Department of Science and Art, and for competition for the Local Science Exhibition, which has lately been founded by the council of the institution, in conjunction with the Lords of the Privy Council, for artisans in Southampton; and, secondly, to lay the foundation of a regular system of science teaching in the national schools of this neighbourhood.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The opening meeting will be held on Monday next, the 2nd of November; when Mr. Tite, M.P., President, will deliver an Opening Address. Several papers of architectural and archaeological interest have been promised for the evening meetings, which will take place once a fortnight, as usual.

CANAL ACROSS THE PANAMA Isthmus.—The company which has been for some time endeavouring to arrange for the construction of a canal across the Isthmus of Darien, or Panama, to unite the Atlantic and Pacific Oceans, has at length, it is stated, been definitely formed. President Johnson and Mr. Seward are both favourable to the plan.

BATH HEATING.—This discussion on this subject in the *Builder* has led Mr. C. R. Havell to invent and patent a stove for submergence in the bath water to be heated by it. This new stove can either be used with gas or with spirit. The stove has holes for circulating the water through it, and an air-shaft as well as a chimney; and the gas can be supplied to it by an india-rubber pipe descending the air-shaft, or spirit can be used by simply pouring it down the air-shaft. The stove is lighted by putting a lighted taper down through an opened cap in the chimney. It will heat sufficient water for a full-sized bath, it is said, in from twenty-five to thirty minutes, by gas, at a cost of 1½d.; or in thirty to forty-five minutes by spirits, though, doubtless, not at so small a cost. Stopping added to the chimney leads the products of combustion either into the fire-place or through a window.

THE DELUGES IN SWITZERLAND.—A letter from Berne gives some details concerning the late torrents. The waters have now subsided, and the roads and defiles across the Alps are again open to commerce, so that the authorities are able to ascertain the extent of the damage done. There had already been two great deluges in Switzerland since the commencement of the present century—once in 1817 and the other in 1834; but that of 1868 has been of wider extent and more destructive than either. In the Ticino, the river of that name swelled by the mountain torrents, submerged all the valley above Locarno for an extent of more than twenty-five miles. At that town the water reached the windows of the first story of the houses and destroyed a large quantity of merchandise: the apartments on the ground-floor are still filled with mud. Lake Maggiore rose more than 7 ft. At Palmengo a mass of stones 500 ft. broad rises before the village, which is totally destroyed. Near Faido, Chioggiogna, Crovareggio, Lavorgno, and Chironico, various bridges were destroyed, the road washed away, the houses filled with water, and the fields devastated. At Giornico four dwellings were thrown down, fourteen inundated and devastated to the first floor, and two mills and twenty-five cow-houses were carried away. At Badio seventeen persons perished. Aquila, Torre, Lottigna, Grumo, Agnarossa, Maralta, Dangio, Malvoglia, and Semaine were all inundated, the houses and fields filled with sand and stones several feet deep, and the cattle drowned. At Chiniasca, a hamlet of the commune of Corzonese, not a stone remained standing; eighteen persons were drowned; also five at Semaine, and as many at Malvoglia. At Blegno alone the loss is estimated at 1,200,000 fr. In the Valais, the Visp inundated Truttman, Echolz, Leuchern, Batscheld, Raron, Oberwald, Lauche, Martigny, &c. for a distance of twenty kilometres. The dykes are destroyed, and all the villages more or less devastated. The loss in 1834 was estimated at 10,000,000 francs, a sum which the late loss will probably far exceed. The country will do what it can in the circumstances, but other countries should extend a helping hand to the Swiss, whom all respect. We are glad to hear that, in addition to the subscriptions which have been organised in France and Switzerland for the relief of those who have suffered from the floods, a subscription for the same end has been started in London. The distress which has been occasioned by this fearful disaster is widespread, and we feel sure that Swiss residents and our countrymen generally will sympathise deeply with the unfortunate sufferers, and subscribe generously towards their relief. Information will be gladly afforded by Mr. Carlo Gatti, of Villiers-street, Strand, who is a member of the Swiss Parliament, and was in Switzerland during the rains.

TENDERS.

For erecting Victoria Hotel, Peckham Rye. Drawings supplied by Mr. Pierce Arthur:—
Loveloy £1,540 0 0

For alterations and additions to the Manor House, Osterham, Surrey, for Mr. G. Parbury, Mr. Richard Martin, architect. Quantities not supplied.—
Gross, Old Materials, Not Amount.
Blyth £2,375 £95 £2,280
Ward 2,368 150 2,218
Regis (accepted) 2,220 130 2,090

For erection of shop and alterations to premises, Walworth-road, for Mr. Edward Belcher. Mr. P. Arthur, architect:—
Langdale £500 0 0
Day 750 0 0
Tabel 712 0 0
Henson 680 0 0
Brett 630 0 0
Davis (accepted) 610 0 0
Lanc 605 0 0

For building nine mechanics' cottages in Newbury, for Mr. W. H. Care, including old materials, Mr. J. H. Money, architect:—
Sargent £1,393 10 0
Elliot 895 0 0
Whiter 115 0 0

For repairs to the Tiger Inn, Newbury, for the Trustees of St. Bartholomew's Charity. Mr. J. H. Money, architect:—
Elliot £1,128 10 0
Whiter 115 0 0

For building a dwelling-house at Marine-terrace, Horne Bay, for Mr. S. Dorrige, Mr. B. Adkins, architect:—
Shrubsole £1,245 0 0

AS PLUMBER, Painter, Glazier, &c. Wanted by a respectable Young Man. Has served seven years' apprenticeship in the above. Can graft and gassing with confidence. Will not touch an object as a contractor, with a chance of improvement.—Address, **C. C. 10, Gough-street, Gough-street, Blackfriars-road, S.**

A GOOD PLUMBER, or PLUMBER and GAS-FITTER, WANTS a JOB or a **SITUATION** as **THREE BRANCH HAND.**—Address, **A. Z. 2, Black-terrace, Lower Deptford, Peckham, S.E.**

A GOOD BRICKLAYER WANTS EMPLOYMENT. Would take charge of brickwork, or take brickwork piece work, labour only. Good references.—Address, **S. H. Post-office, Peckham, S.E.**

A FOREMAN of BRICKLAYERS WANTS EMPLOYMENT. He is desirous of being recommended to an employer on heavy jobs. Good references.—Address, **A. Post-office, 105, High-street, Peckham, S.E.**

TO MASTER BUILDERS.
An experienced BUILDER'S FOREMAN, having completed his apprenticeship, has just opened to an employer in town or country. Good references.—Address, **1,005, Office of "The Builder."**

TO ARCHITECTS and ENGINEERS.
A CLERK of the WORKS is desirous of obtaining a **RE-ENGAGEMENT.** Well up in church work, restorations, quantities, measuring up, &c. Age 35. Copies of testimonials for wanted on application.—Address, **A. Z. 2, Mr. St. Leonard's, Kinsbury, S.W.**

TO ENGINEERS, SURVEYORS, and CONTRACTORS.
A COMPETENT MAN, aged 31, WANTS EMPLOYMENT as **ASSISTANT, CLERK of WORKS, or a Builder's Office.** Good surveyor and accountant. Has had management of large drainage and building works. Salary moderate. Security if required.—Address, **1,005, Office of "The Builder."**

TO BUILDERS, CONTRACTORS, and OTHERS.
RE-ENGAGEMENT WANTED, by a Young Man, at present engaged in the office of an Engineer. No objection to the country.—Address, **974, Office of "The Builder."**

TO ARCHITECTS.
A GOOD DRAUGHTSMAN and experienced General ASSISTANT is **DISENGAGED.** Is thoroughly conversant with the routine of the office of a first-class draughtsman and draughtsman. Land surveying and levelling, and fully qualified to act as a good general Assistant. References.—Address, **Y. C. B. Cheshill, Bowdass & Son, 12, Bell-yard, Temp'-bar.**

AGENCIES WANTED, for the South of Ireland, to do the Surveying would be willing to do the work of a few FIRST-CLASS AGENCIES (on commission or otherwise) in the South of Ireland, where there is a great want of such services in the building trade. Unexceptionable references and security by any amount if required.—Address, **AGENTS, Office of "The Builder."**

TO BUILDERS.
AS SHOP FOREMAN or SUPERINTENDENT of WORKS, a thoroughly competent and experienced Man required. Can give good references to last employers as to sobriety, fidelity, and ability.—Address, **J. C. L. 3, Russell-road, Rye-lane, Peckham.**

TO ARCHITECTS and ENGINEERS.
An experienced ASSISTANT requires an RE-ENGAGEMENT. Is well acquainted with the various styles of architectural detail, and general routine of office. First-class draughtsman and draughtsman. Land surveying and levelling, and fully qualified to act as a good general Assistant. References.—Address, **Y. C. B. Cheshill, Bowdass & Son, 12, Bell-yard, Temp'-bar.**

The Builder.

VOL. XXVI.—No. 1344.

Foreign Improvements carried on by English Enterprise.

PART of the question of individual rectitude of character, there is much matter of importance involved in the subject of the recent trial at Brussels with reference to the

execution of a certain foreign enterprise by English capital. Every professional man, engineer or architect, who has or who seeks for foreign practice; every builder or contractor who is disposed to turn his attention to Continental work; every investor of money who thinks 6 per cent. abroad better than 3 per cent. at home, has a direct personal interest in questions that involve the relations of English speculators or capitalists to foreign officials and to Continental Governments and tribunals.

Our own practice and habits as Englishmen differ so widely from those of the countries regulated by the *Code Napoléon*, that statements often come from the foreign journals that may produce an altogether erroneous impression on the English mind; and while we may find that, in the real principles of business, which are, in fact, the principles of human nature, there is little actual difference in different localities, we shall yet be made aware that, in the formal or conventional mode of the application of those principles, differences of the widest nature occur. It is important to look a little into this part of the subject.

We must not, for instance, assume the identity of a court of law and a tribunal of justice. We intend no backhanded blow at the morality of our neighbours; but we refer to what is palpable fact. The celerity and rigour, for example, with which judgment by default is sometimes rendered and executed under the *Code*, has no reference to the true equity of the case. Advantage can be taken of the absent, and at times is cruelly and most unjustly taken. Thus the personal character, enmity or friendship, political colour, or temper, of the judge, has a far more direct influence on the sentence of many foreign tribunals than an Englishman can well conceive to be possible. Above all, it must be borne in mind that the grand principle at once of English law and of English liberty, viz., that a man must be presumed to be innocent until he is proved to be guilty, appears to be incomprehensible to the foreign judge. Everywhere it is a misfortune to be accused, but on the Continent generally, accusation means not only inquiry into fact, but presumption of guilt. The accused is put on his defence, in a manner entirely contrary to our ideas of fair play. It is not the accuser who is called on to make out a definite case, on the failure or breaking down of which the trial is at an end: it is the defendant who is called on for explanations, and out of his very explanations the matter most damaging to himself is frequently extracted. The public prosecutor seeks, one is almost bound to believe, conviction rather than justice; and the judge but too often seems to think it his duty in every way to aid the public prosecutor. Such, indeed,

was the habit of the English Bench under the Stuart kings.

Another point important to bear in mind is, the opposite manner in which an Englishman is viewed, and, for the most part, is treated, abroad, under different phases of his engagements. No one who has experience in this matter will hesitate to endorse this statement. An English capitalist, engineer, or architect, is, in the first instance, only applied to in cases of magnitude, of risk, or of difficulty. His aid is sought, in fact, for something a little beyond the power of the man who invites him. For anything within their means foreigners, of course, seek no English aid. Great inducements are therefore held out, and courtesy of every kind is extended to the insular stranger. Doors fly open at his approach, difficulties disappear at his suggestion, and even the law of the place assumes, or is made to appear to assume, a strange pliability to his will. If this occurs to a man but imperfectly acquainted with the language in which his new business is conducted, and if, moreover (as is pretty sure in that case to be the fact), he is somewhat dazzled by his sudden accession to an apparent influence and power which he could have never hoped to attain at home, it is not in human nature that all error should be avoided.

Let the enterprise, however, be set afloat; let the skill or the money of the Englishman supply the missing link; that which was admirable, even when only on paper, then assumes a more tangible form. The promised benefits appear, by onward and visible signs, to be at hand. Then comes the second phase. The patriotism, or the self-love, or the greediness of the inviters wakes up. What! is all the fruit of their enterprise to be reaped by the stranger? Against such a consummation the Continental habit of thought revolts. The case must be reconsidered, and hard will be the fight and long the odds but that some act or some omission of the Englishman, committed in sheer ignorance, or under assurance that it is unimportant or advantageous to his interest, will be unearthed, and he will find his own importance far less, and his friends' powers of taking care of themselves far greater, than he imagined in the first instance.

In the case of the Belgian Public Works Company it is clear that, whatever the amount of blame that may attach to any individual, a course of proceeding from which the English capitalist has too often had to suffer, has been resorted to in Brussels. It is admitted on all hands that a concession was made to two Englishmen, for certain works for the improvement of that capital. The Belgian Public Works Company (limited) was formed by the *cessionnaires* to carry out this concession. A sub-contract was made by the *cessionnaires* to carry out a portion of their concession with Belgian contractors for an amount of 598,000*l.*, and this sum was made to cover the payment to the *cessionnaires* of 100,000*l.* It further appears, that this contract was accepted by the Belgian Public Works Company as an element of its constitution. A resolution of the directors is also published, which implicitly covers the arrangement between the *cessionnaires* and the sub-contractors; but, although this is the case, it does not appear that any one except the parties to that agreement was at that time aware of the nature, or, at all events, of the amount, of the payment thus stipulated to be made.

Now, as to such an arrangement, we conceive that the English shareholders of the Belgian Public Works Company,—a company constituted in London,—have the right to expect full information. It is a matter affecting the character of the directors, and one quite proper to be cleared up as between these gentlemen, in their quality as trustees, and their constituents. But what the *Bourgmestre* and *Échevins* of Brussels

have to do with the arrangement (fair or unfair, honest or dishonest, as it may be) we altogether fail to perceive; and it will take something of a very different character from the attempt to rip up the private character and habits of the English *cessionnaires*, to which the President of the Tribunal Correctionnel of Brussels so freely lent himself, to convince the English public that the inquiry originates in any other source than the wish to get a possibly excellent contract out of the hands of the foreigners, who have given it a tangible value.

Let us hope that we are wrong. Let us trust that long and consistent experience has made us, for once, uncharitable. None the less do we advise our English friends to remember to what that experience points, and to be very sure of their exact *status* before investing labour, or time, or money in the numerous list of grand Continental improvements.

A point arises in this case which is of far more importance than the case itself. It is the question of the remuneration of the *cessionnaire*, or promoter, or founder, of a foreign enterprise. On this subject it is highly important that there should be no mistake. It is one on which our habits are so different from those of our French, and Belgian, and Italian neighbours, that misapprehensions are very likely to occur. We manage these things in a different way at home. It may be, perhaps, a wiser or an honest way; it is certainly a more cumbersome and expensive one. In a matter like the improvement of Brussels, one or two individuals obtain a concession or grant of an exclusive right under certain conditions. It is, in fact, a regularly articulated contract. The one in point was entered into by the Corporation of Brussels, and approved by the King. The men who have given the time, and undergone the expense necessary for procuring this concession, naturally seek to be reimbursed, and generally to be somewhat more than reimbursed, for their trouble. They constitute or deal with a company, and in their arrangements with this company, to which they make over their concession, they provide for their own compensation.

So far so good. But the gist of the matter lies here. Does the incoming company know what it is paying for the purchase? This is a question of which the morality concerns both parties. Those who buy should settle it with their consciences no less than those who sell. Frequently, we fear, there is that hinking of the question on both sides which plain-dealing honesty must condemn. The subscriber is eager to gain a share in a lucrative enterprise, and does not stop to inquire whether the men who enable him to do so are properly remunerated for their labour. It is a short-sighted greediness. The seller is not only apt to take care of himself, but is, for the most part, too ready to do so in that silent and subterranean way which covers a more ample payment than he could venture distinctly to ask. In any case in which a concession is made over to a public company, the distinct arrangement of an adequate and defined remuneration to the *cessionnaires* should be brought prominently and intelligibly forward. If this is not the case, it is because there is something to conceal.

Two principles should be borne in mind, in the regulation of such compensation. Payments actually made should be fairly refunded. Further compensation to the promoters should be contingent on the prosperity of the undertaking. The mode in which this should be secured is matter of detail, but the general idea is clear. It is nothing but what justice demands. The allotment of a certain number of shares in the enterprise to the founders, is a usual mode of attempting this object; but it is one liable to abuse. What is required is, to ensure identity of interest between promoters and shareholders; or to make the remuneration of the former

depend on the prosperity of the latter. This is not ensured by delivery to the former of a set of obligations or securities which they can carry into the market, and which they may be induced or driven to dispose of on terms that are injurious to the *bona fide* shareholder. The reservation of a *tantième* on the dividend would appear to be a more rational and satisfactory arrangement.

Let the English subscriber to a company formed for foreign objects, then, first be sure that he has to deal with no vague indefinite claims, and that he is not, apparently, about to receive some unthought benefit. Let him remember that projectors are but human, and that any apparent disinterestedness on their part is dangerous in proportion to its magnanimity. Then let him look to the faith of the guaranteeing Government. Let him remember that he has no help from the English law, or English justice, or English diplomacy. He must be dealt with by the *lex loci* administered by the local judge. In no case of wrong can he hope for any ministerial or diplomatic support from his own Government, unless the foreign Government, or municipality, *break their own laws*,—a proceeding which involves a degree of clumsiness which he must not anticipate. He may rely on finding quite difficultly enough, when divergence of interest arises, without the other parties to the contract getting outside their legal rights. In this respect the conduct of every foreign Government to their English employes or creditors deserves attentive notice. The black book has a good many pages. Repudiation, in one form or another, is the law in a good many ministerial palaces. The Englishman who lets his money go to aid the schemes of those who have robbed his countrymen, deserves, in our opinion, to lose it. At all events, deserve it or not, he is pretty certain to do so.

Let us remember, too, when we are tempted to express a virtuous horror of a *pot de vin*, how we manage matters at home. What is the amount of secret service money, with the payment of which the capital account of most of our own public works has been hounded? Bribery! How shocking it is, especially when found out! But compensation to landowners, consideration for opposing companies, regard for vested interests, Parliamentary charges, legal charges, financial charges—for how many millions do they figure?

Parliament has just linked this question. In the Act passed in July, 1868, for the future regulation of railways, it only needed one or two intelligible words to secure an answer to it. We can conceive that it was not altogether without purpose that these words were omitted. Could such a body as Parliament be conceived of as having a conscience, or were the consciences of the individual members liable to any qualms of remorse as to the action of each in their collective capacity, we can well understand why the Act of 1868 should have omitted to ask for a return of Parliamentary and legal expenses incurred in legislating our ill-considered and ill-distributed net of railways.

It is tolerably clear, however, that our Belgian neighbors are now disposed to strain hard at a gnat, very diminutive in its size as compared to the camels which we so easily gulp down at Westminster. The gnat must, we fear, have been a mosquito, and the venom of its sting must have been derived from its English origin. Take matters at the very worst, a sum of 100,000L. has been spent, or has been demanded, to cover the design, the legalisation, and the efficient organisation, of an enterprise involving a capital of 2,000,000L. We do not say that all has been quite fairly managed; we reserve our opinion on this score. But we intend no innuendo when we say that it would have been a fortunate thing for great Britain if our railway schemes had been legalised at so small a proportionate cost. The nominal value of the B shares, however, which has also to be taken into account, has not come out in the course of the proceedings. But the morality which st once reprobates the *pot de vin* to a foreign promoter, and winks at bribes on all sides to men at home to make the way smooth, does not very strongly commend itself to our respect.

KENSINGTON GARDENS.—The well-known fosse separating Kensington Gardens from Hyde Park, near the bridge over the Serpentine, has been filled up at the southern end, and the site added to the roadway, an iron railing marking the line of division.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS: OPENING NIGHT.

The opening meeting of the session of this Institute was held on Monday evening last at the House, in Conduit-street, when Mr. W. Tite, M.P., the President for the ensuing year, delivered an opening address. There was a large attendance of members and associates.

The President said the growing success of the Institute was manifest from the large increase in the number of its members, and the consequent increase in its finances. All the topics in connexion with it were those of congratulation. The total number of associates, fellows, &c., in May of this year, was 623. In the year 1858 (ten years ago) the number of fellows was only 146: at the present time they amounted to 262. He apprehended there were very few architects in London who had not joined the Institute and endeavoured to further its objects. Having spoken of the large additions made to the Library, he remarked that the papers read during the past session had not been very many, but they had been of very great interest. Prominent amongst these was a paper by Professor Ansted, "On the Relations of Geology with Architecture," and the discussions which followed the reading of that paper showed how important the one science is in relation to the other. A paper of great importance followed, by Mr. Digby Wyatt, who had gone to Paris on a mission of the Government connected with art. That paper was a very important one, and led to frequent discussions. It also improved their acquaintance with much that might be said to be novel in architecture. The last communication to which he would allude was that by Mr. Charles Barry, which treated of the improvement of structural architecture; and he showed how he had in the case of a large building with which he (the President) was connected as a governor,—Dulwich College,—introduced very successfully the use of terra-cotta instead of the more costly material of stone. He showed its cost, the nature of the material, and the incidents which led him to use it. Having, however, some experience himself in that material, he would caution those who might view these results in too sanguine a light as to its use. He had been told that the ante-fixe of St. Pancras Church, which were composed of terra-cotta, had failed; and they knew that the statue of the Prince of Wales at Brighton, composed of the same material, dropped to pieces,—first an arm, and then a leg, and then became a complete wreck. To young architects, he would say they should be careful that the material was well and homogeneously burnt, and that they ought not to be too ready to adopt that with which they had not an entire acquaintance. He then referred, in passing, to a promise made by Mr. Beresford Hope to bring before the House of Commons the question of the conservation of ancient buildings and archaeological remains. He trusted that his excellent friend would have an opportunity afforded him of redeeming that pledge in the next Parliament.

Up to this point, the President continued, he had adverted to subjects of unmixed satisfaction, but he now thought it his duty to refer to one which, with every possible respect for the persons most concerned in it, he felt to be one of considerable difficulty; nevertheless, he was called upon to notice it. The incidents to which he would refer were of great importance in their general bearing on the position of architects. It seemed to be the universal fashion that architects were to be ever exposed to competition in all directions. He had no reason to quarrel personally with competition, for he had been as unsuccessful as most men, and as successful. He, however, thought that all matters relative to the late great competitions should be thoroughly understood by those whom he addressed, because they had an important reference to, and bearing upon, their position as architects in general. The matter to which he specially referred was that in connection with the competitions for the New National Gallery and the Law Courts. By the assistance of a kind friend he had obtained the details of every step taken in both these matters. First, then, with regard to the National Gallery. The invitation to compete was issued on the 15th of February, 1866, to E. M. Barry, Banks & Barry, D. Wyatt, Street, and Scott, afterwards increased to eleven by the addition of G. S. Clarke, O. Jones, Penrose, Cookerell, and J. Murray. Mr. Scott ultimately withdrew, leaving ten competitors. Designs were sent in by ten competitors on January 1st,

1867. Judges of designs were appointed in January, 1867; viz., Viscount Hardinge, Lord Elcho, Mr. A. J. Beresford-Hope, Mr. W. Bosall, Mr. D. Brandon, Mr. R. Redgrave, Mr. W. Russell, Mr. T. Gambier Parr, and Mr. W. Tite. Letter by competing architects to Lord J. Manners, First Commissioner of Works, pointing out that it would be a breach of faith with them if one of them were not selected for employment: 16th February, 1867. Judges reported, 28th February, 1867, that they were "not prepared to recommend any one individual design for adoption," but that the design of Mr. E. M. Barry "for a new gallery," and that of Mr. Murray for the adaptation of the present building, exhibited the greatest amount of architectural merit. Appointment of Mr. E. M. Barry as architect of a new National Gallery, 16th June, 1868. There the matter rested, and for a considerable period of time nothing more was done in it. It might be that it was sufficiently embarrassing to the Government. The next communication to which he would advert was that with reference to the new Law Courts. In that case the arrangements were very different, and the complications which ensued were very great. Those arrangements were as follows:—February, 1866.—Five judges were appointed by the Treasury.—Mr. Cowper (chairman), Mr. Gladstone, Sir W. Stirling Maxwell; by the commission.—Sir A. Cockburn and Sir E. Palmer. December 23rd, 1865.—Treasury minute, that the committee of judges shall issue the invitations to compete, and their award shall be final. Determination to limit the number of competitors to six, and letter of invitation (enclosing printed instructions, which contained no promise to employ the successful architect) to Mr. Barry, to be one of the six. Negotiations, in the course of which the Treasury undertakes to employ the successful architect, but introduce a condition forbidding him to undertake new work for three years after his appointment. March 21st, 1866.—Withdrawal of Mr. Scott and Mr. Barry from the competition, in consequence of this condition. April 20th, 1866.—Condition withdrawn, the number of competitors increased to twelve; Mr. Scott and Mr. Barry re-invited by letter of invitation, containing printed conditions, finally revised and signed by Lord Chancellor Cranworth. January 15th, 1867.—Designs sent in by eleven competitors, one having resigned. June 8th, 1867.—Messrs. Shaw and Pownall appointed judges of designs, at the unanimous request of the competitors, increasing the number of judges to seven. July 30th, 1867.—First award of the seven judges, to the effect that they considered Mr. Barry's design the best for plan and distribution of interior, and Mr. Street's the best as an architectural composition; recommendation, therefore, that those two gentlemen should be jointly employed in the respective departments named. Return of award to the judges by the Treasury, with the request that the judges would select one architect. November 25th, 1867.—Reconsideration of award by the judges, and statement by them that, having come to the conclusion that the design of Mr. Barry is the best in regard to plan, and the design of Mr. Street in regard to elevation, and having recommended the joint employment of those two architects, they could do no more. Reference of case to Attorney-General. Opinion of the Attorney-General that the award was invalid, and the Government free to make any appointment they thought proper. May 30th, 1868.—Appointment of Mr. Street. June 8th, 1868.—Letter of protest to Treasury by Mr. Barry, followed by others, to none of which any answer has been returned. Now, in Mr. Hope's inaugural address, in the year preceding his (the President's) nomination, he made the following remarks:—

"I was just observing that there were certain complications attaching to the competition for the New Law Courts. These were of an administrative character, and owed their origin to the fact that the Government had handed over no considerable portion of the contract which, in the case of most public buildings, would have been shared between the Treasury and the Board of Works, to a special commission created by an Act of Parliament, and comprising a large infusion of the legal element. These gentlemen set to work with a very sound principle strongly before them; and as was not unnatural, rode that principle a little hard. They assumed that the successful architect (or architects) ought to have made himself practically acquainted with the working of the different courts of law; and the inference which they drew from this undeniable proposition was, that it was needful for them to be excessively restrictive in the number of competitors chosen, in order to prevent the business of the courts from being interrupted by the frequent visits of curious investigators; and so they drew the line at six. This was palpably, in the eyes of all men, except the commissioners themselves, an extravagant application for their principle. Not to allude to any other objection, this prin-

eriction manifested considerable confusion as to the architect's obligation, contracted with the national honor, to produce the best obtainable building. However, it required a vote of the House of Commons to overcome the reluctance of this most respectable Junta.*

What Mr. Hope then predicted followed; but the result was not, perhaps, on the whole, unsatisfactory. The calling in of two professional judges—men of great eminence and practical skill—was no doubt the proper course to take to remedy the difficulty; and he believed the appointment of Messrs. Pownall and Shaw was satisfactory to all parties concerned. The result was equally satisfactory. The plan of Mr. Barry and the elevation of Mr. Street were severally declared to be the best. These two gentlemen, putting their heads together to erect these buildings, would have been satisfactory to the nation and to the profession generally. There was, moreover, precedent for this course of proceeding. In his (the President's) early days, Mr. Wilkins and Mr. Gandy had built one of the great club-houses as joint architects; and in his own case, Mr. Cockerell and himself acted as joint architects in the building of the London and Westminster Bank in the City, and in each case everything went on agreeably and conveniently. But in the matter of the New Law Courts discussion was indulged in to a large extent, and it ended in Mr. Barry being awarded the building of the National Gallery, and Mr. Street the New Law Courts; a result, however, which did not appear very much to please anybody, and which was a difficult question to determine, because each gentleman had equal merits; and the solution which he ventured at the time to suggest in the House of Commons appeared to him a reasonable one. The suggestion he made was this—that inasmuch as it was perfectly well known that the Law Courts, as designed, would occupy much more space than had been accorded them, the Chancery and Common Law Courts should be divided—one to be placed on the Thames Embankment, and the other in Lincoln's-inn; and that one should be entrusted to Mr. Street and the other to Mr. Barry. This suggestion met with no favour in the House, and thus the matter ended in a somewhat unsatisfactory manner. He would not pursue this subject further than to say, that they must all feel in these competitions that if the strictest adherence was not kept to the conditions put forth, it could not be expected that men of honour and talent would join in such competitions. The result might, he said, be satisfactory in the present instance. No man respected more than he did, and than all of them did, both the gentlemen referred to, for either one or the other would be sure to erect a creditable building. At the same time, if there was no disappointment on the one hand, or inconvenience on the other, he should still regret that some more satisfactory result had not been obtained. He would only add on this subject, that if competition were to be indulged in, it could only be done successfully, usefully, and wisely by the strictest obedience to the original agreement under which gentlemen went into these competitions. The President concluded his remarks on this topic by quoting an article from the *Builder*, of June 13th, 1868, which he said he thought very fairly expressed the whole extent of the difficulty, and the position in which they were at present placed. He then proceeded to remark that the general consideration of the position of architecture induced him to believe that they were held in higher estimation as a body than was formerly the case. In his address to the Institute in 1862 he remarked,—

"I cannot but express my hope that the profession I am attached to, and that I have followed for more than forty years, may receive from me, in a kindly spirit, a few words of caution, that we ought not to forget that the great principles of art demand something more than a mere patient reproduction of forms eliminated in and appropriate to other times, without sufficient reference to the great power given to us by new materials, demanding different treatment, and a new exertion of the imaginative faculty."

He strongly recommended young architects not to confine themselves to one style of architecture alone. It was no use being merely a Gothic architect or merely a Classic architect; they must try, as far as they could, to understand both, and not be led away by the mere fashion of the day. At the present time everything must be Gothic. It was excellent when well applied, but far from agreeable when not well applied. This style was carried a little too far in the present day. His friend Mr. Beresford-Hope, he knew, would join issue with him on this point, and would give them a design for a Gothic theatre; but he (the President)

confessed he thought the Classic style better adapted for that class of buildings. He had done as much, perhaps, as most men in the Gothic way, and was one of the first to attempt a railway station in that style. Whether he had succeeded must be decidedly a visit to Carlisle station; but he had adopted other styles in France, particularly at Ronen, which perhaps on the whole were more satisfactory. Having congratulated Mr. Scott upon his success in connexion with the St. Pancras Station of the Midland Railway, the President passed on to notice the necrology of the Institute during the past recess, and referred more particularly to the death of Mr. Allason, whose father was an eminent and popular architect, and Mr. G. R. Burnell, the latter gentleman having been a most liberal contributor to the library of the Institute. In a passing allusion to the great public works in course of construction, he remarked that the Thames Embankment was worthy of the encomium that was passed upon it by his friend Mr. Beresford-Hope in his inaugural address. That work had been carried out so far in a comparatively small space of time. Whether they regarded the heany of the material employed, or the excellence of the workmanship, or the usefulness of the work itself, the Thames Embankment stood forth as one of the greatest features of our age, and when completed to the extent contemplated on both banks of the river, it would mark an epoch in the history of architectural skill, besides being a work of the greatest possible convenience; and the Thames, which had been so long the great disfigurement of the metropolis, would be one of its greatest ornaments. He expressed his gratification at the satisfactory progress which was being made with the new St. Thomas's Hospital facing the House of Commons. It was being carried out by Mr. Curry, and was founded on the principle of the Lariboisiere and other great French hospitals, and when completed would afford accommodation to 600 sick and wounded persons, and as a piece of architecture would be as creditable as it would be as a work of humanity. A great deal had been done during the last few years in respect of the architecture of the city of London. The great hotels especially were magnificent pieces of ornamentation, as well as being useful, and admirably adapted to the purposes for which they were built. They were based upon the best architectural principles, and were elegant and excellent in themselves. Evelyn had recorded in his works that, in passing through London he thought it "the ugliest city in all Europe for its bigness." He hoped they were now redeeming that great blot on their national taste and national means, and that London soon would be worthy of the great people and nation of which it is the capital. He could not say so much for the bridges, which now spanned the Thames in all directions. Old Blackfriars Bridge, which was a structure of surpassing beauty, and which was admired throughout Europe, had ceased to exist, and he thought, to the structure which was now taking its place, he might apply the words of Evelyn and say, "It would be the ugliest bridge in all Europe for its bigness." At the same time it would bring increased convenience and add to the comfort of the inhabitants, and no doubt it would carry them safely over the river for a very long time to come.

Mr. Beresford-Hope, in proposing a vote of thanks to the President for his address, said, while declining to follow his hon. friend in what he had remarked on the question of the two late great competitions, he would venture briefly to put the general question of competition in another shape. If it were not for competition, he asked, how could the young members of the profession make their merits and genius known? Architecture, after all, resolved itself into the simple question of *E. S. D.*, and those who decided competition should at least be able to bring some other plan forward by which the interests and the talents of all might be considered. As regarded the measure which he was to have brought before the House, he could only say that he had not done so for two reasons. The first was the extreme pressure of other business (having also been absolved of his pledge for that session by his friend Mr. Donaldson); and the second was, that he hoped to introduce the question as a branch of one more comprehensive; viz.—the necessity of having a great Minister of Art, Architecture, and Science. That minister should absorb the first Commissioner of Works, and some other offices, and should be an efficient public servant in that department, and upon whom,

when elected, the eyes of Parliament and the country should rest. He (Mr. Hope) would like very much to see a Gothic theatre, and did not agree with the President in all he had said in regard to that particular, but fully concurred in the opinion that it was the duty of architects to study all styles of the art.

Mr. G. G. Scott had great pleasure in seconding the resolution which had been proposed, and in doing so would say that he hardly knew of anything in which he differed from the President in the remarks he had made in his excellent opening address. He was well satisfied, so far as he was personally concerned, with the results of the competition referred to, though perhaps the logical part of the question would not be so easily followed out. He concluded by thanking the President especially for his valuable gifts to the library of the Institute.

Mr. George Godwin, in supporting the resolution, said that the energy of the President was equalled only by his liberality. He would let the results of hygone competitions be regarded as hygone. He could not, however, help remarking that there were a great number of new competitions which appeared to be managed in a peculiar manner. He alluded to those for erecting asylums for the sick and imbecile poor. He would like to know who it was that named the six or twelve gentlemen who were selected to compete in each of these cases. It was a fact well known that in one or two of the cases at least all that could be said of the young men brought into these competitions was that they were untrammelled by anything like former work or former connexions, and would make their first appearance as architects of those asylums. Doubtless many of them would gain distinction, but he did not think that the men who had won their spurs should be passed over.

Mr. Charles Barry said that doubtless the architects for the asylums referred to were selected by the local authorities from motives of economy. The terms of the competitions were such that he did not wonder Mr. Godwin failed to recognise the names of those who had acceded to them. The subject had already attracted the attention of the council, and would be further considered by them during the present session.

Mr. A. H. Layard, M.P., though only an honorary member of the Institute, wished to call the attention of those present to the fact that the Government was about to erect the largest series of buildings that had ever been undertaken at one time. These comprised the New Law Courts, the National Gallery, the larger part of the Public Offices; and, besides, there would soon be commenced a building somewhere in the vicinity of South Kensington, for a collection of Natural History, partly taken from the British Museum. He would offer no opinion upon these buildings as to whether the style adopted should be Gothic or Classic, but he did wish that those words were forgotten, and that attention was turned more to the cultivation of a true English style. It was a question of national honour. They had got a magnificent site on the Thames Embankment, and they had now the opportunity afforded them of erecting a series of buildings which might, perhaps, exceed in grandeur those of any other country. He trusted that they might not fall into errors in the erection of these buildings. He was desirous that the Institute should direct public attention to this matter, and to commence doing so at once, as little time was to be lost. He was afraid that the decision in some respects of the House of Commons in the matter of the National Gallery had not been satisfactory, but it would be useless to attempt to get them to alter it.

The vote of thanks to the President was carried by acclamation.

THE LAW AS TO APPRENTICES.—James Pond, aged twenty-one, who had been an apprentice at Messrs. Doulton's pottery works, was on Thursday brought up at the Lambeth police-court, charged with having left several months before his term had expired. As similar cases had previously been allowed to pass with impunity, the young man's employers determined to make an example, and having obtained a warrant, he was captured at Glasgow. He said he had gone away because he could not earn sufficient money to provide for himself properly. The magistrate inflicted a penalty of 6l. for the loss of service, and 10l. costs, or in default of payment a month's imprisonment.

A WORD OR TWO ON "FALSE ECONOMY."

THE contract for altering and enlarging the County Gaol at Carmarthen has just been accepted. The contractor is Mr. George Thomas, of Pembroke, and the amount of his tender 12,972*l.* Some of the tenders, we hear on good authority, were as high as 18,000*l.*, and Mr. Thomas's was the lowest. It is far from our intention on the present occasion to find fault with the Carmarthenshire magistrates, or indeed to say one word derogatory to the claims of Mr. George Thomas. On the other hand, we say most unhesitatingly that Mr. Thomas has performed some Government works which have given the greatest satisfaction, and he is at present making good progress with the fortifications at Tenby. But this reflection naturally thrusts itself upon us: that where a few men tendering for the same work,—by no means a large undertaking,—vary in their tenders from 12,972*l.* to 18,000*l.*, there must be a great blunder somewhere. In a discussion on this subject at the recent Carmarthenshire Quarter Sessions, the Earl of Cawdor alluded to the experience which the counties of Carmarthen, Cardigan, and Pembroke had so dearly purchased in the erection of the Joint Counties Asylum, a large building erected at Carmarthen some six or seven years since. Some of the readers of the *Builder* may recollect that, at the time the tender for the asylum was accepted, we called attention to the alarming difference in the amounts of the various tenders. We believe the lowest was about 24,500*l.*, and the highest about 42,000*l.* Well, the lowest tender but one was accepted, and the committee were justified in accepting it, inasmuch as the contractors were highly recommended. Now, what was the result of this? The sequel will show that the building is at present a monument to "False Economy." We are anxious to be as honest as possible in our statements, and we therefore only say what was publicly stated at the recent Pembrokeshire Quarter Sessions. It was there said that the work at the asylum was "very badly done." The committee "did all in their power to put matters right," but the work at last was so badly done that they "found it impossible to make them do it properly." The contractors used iron instead of copper nails to a large extent,—a number of the nails were smaller than the size agreed upon, and as a consequence, the committee has since been obliged to take a great portion of the roof off. The contractors placed a tank under the closets to receive the sewage. Of course this was a great nuisance, and it had to be removed. The cost of all this, including a new roofing to the building, was something considerable, and we are not surprised that some of the magistrates wished to know whether something could not be done in the matter, especially as the report of the Commissioners in Lunacy showed that a great deal of work was still undone. When a contract is accepted, and an architect is paid for certifying that the work is properly done, the public have a right to expect that the work is satisfactorily executed. The architect was well paid for his duties in the instance, if one of the magistrates was correct in stating that the remuneration amounted to nearly 2,000*l.* It was stated by the chairman that the committee were at present taking counsel's opinion as to whether they cannot recover from the architect the amount of any expense they may be put to in consequence of his neglect in not insisting upon proper work being done. Of course the committee are not to blame. Once they received the architect's certificate, it was simply their duty to order the payment of certain sums of money. At the same time some one must be to blame, and who that "some one" is, we suppose we shall shortly know, as it was stated that the committee were determined not to "let the fellows escape," but to take legal proceedings if the counsel's opinion warranted them in doing so. One of the speakers, who appeared a little anxious to smother the matter, could not but admit that some of the work had not been properly done, but added that it was done at a very low price and remarked that, as to Government inspectors, they did not want to quarrel with them, but they well knew that those gentlemen must complain: they were paid for doing so. Possibly there may be something in this, but it has little weight in the particular case under consideration.

However, our object is not to discuss the merits or demerits of this question: our object

is simply to draw attention to this case, as a warning to the public in general, and public bodies in particular, against always accepting low tenders. It is a policy which often becomes very costly in the end.

RESEARCHES IN ROME.

FUNDS are needed to enable the British Archaeological Society of Rome to continue their investigations. Some of our readers, when they see what has already been done, may feel induced to aid. Here is a list of the excavations and researches made to the end of July, 1868.

1. The line of the wall of the kings round the city of Rome, and the sites of the gates of Servius Tullius, fixed by the nature of the ground and the existing remains.
2. The principal chambers of the Mamertine prison discovered (the two small rooms usually shown are the *vestibule only*).
3. The sites of the Porta Capena and of the Piscina Publica fixed, by finding remains of the arcade of the Aqua Appia, where it crossed the Via Appia, passing over that gate from a reservoir at the foot of the Coelian to the Piscina Publica.
4. Another Castellum Aquæ, or reservoir, of the time of Trajan, found on the cliff of the Coelian, near the Porta Capena, with a series of five brick chambers of that period, and the *spectus* of an aqueduct passing through it.
5. Remains of another important building in the same valley, part of which is of the time of Sylla, and part of the time of Nero, supposed to be the *Ædes Camænarum*.
6. The month of the Aqua Appia, on the bank of the Tiber shown. The course of the *spectus* of this aqueduct traced through a subterranean stone quarry in the Aventine.
7. The source of the Aqua Appia found in another very ancient stone quarry of the time of the kings, 7 miles from Rome.
8. The site of some important *Thermae* found in the large vineyard to the north of the Porta Maggiore, and the building called the temple of *Minerva Medica*, shown to be a *Nymphæum*. Reservoirs and branches of several aqueducts found in the same vineyard.
9. Other reservoirs of the aqueducts found on the south side of the Porta Maggiore, near the Sessorium (now the monastery of S. Croce, in Gerasalemme); and the *Speens Vetus*, of Frontinus, found upon an old *agger* leading to the Coelian, and along the Coelian to the great antlerman reservoir at the arch of Dolabella.
10. The site of the Porta Trigemina, and of the Sublician (or wooden) bridge fixed, by finding remains of the gate and one of the piers of the bridge in the present *Salaria* or aal-wharf.

RAINFALL AND TEMPERATURE.

THESE two subjects are supposed to be very simple matters, and by many it is tacitly assumed that all is known that is worthy of examination. With the superficiality which is too frequently a characteristic of the present day, there are not a few men who say—"Oh! rain, yes: get a rain-gauge, put it in a tolerably clear space, and then you'll soon find out what the fall is."

During many years (see especially *Builder*, March 31, 1860), we have maintained and urged the paramount necessity of systematic regularity in, and increased attention to, the observation of rainfall. It is, therefore, with great pleasure that we draw attention to some most exhaustive experiments designed by Mr. G. Symons, carried on for some time by Col. Ward, at Calne, in Wiltshire, and now in an extended form continued by the Rev. C. H. Griffith, at Strathfield Targis, Reading.

Prior to 1863 there was no publication which gave any trustworthy information as to the relative amount indicated by large and small gauges respectively, and consequently gauges differed almost infinitely in size and pattern. In Scotland, owing to the influence of Professor Fleming and Mr. Stratton, the prevailing size was only 2½ in. in diameter, while English and Scottish engineers mostly employed gauges 1 ft. in diameter. Mr. Glaisher recommended 8 in., and Luke Howard, with many others, had used a 5-in. diameter. Hence it was imperatively necessary to ascertain if size influenced the returns.

Again. There having been no bond of union

nor standard authority in rainfall matters, the exact nature of the funnels above the ground was even more variable than their size, the heights varying from nothing up to 30 ft. or 40 ft. Some experiments had been made on Westminster Abbey, York Minster, and some other places, to test the law of decrease in relation to the elevation above the ground; but the data were neither sufficient nor in a serviceable form for practical men. Hence it was necessary to ascertain the ratio of decrease due to the elevation above the ground.

Passing over the preliminary stages, we propose to describe, as succinctly as possible, the exact nature of the experiments now in progress, before which we must preface one word as to their *locality*—a point of the first importance. Strathfield Targis Rectory is square-built, with a few trees near, and the whole of the grounds, 30 acres, perfectly level and clear of trees. It is therefore as eligible a site as can be conceived.

In one part of the ground there are a set of gauges of the following diameters:—1, 2, 3, 4, 5, 6, 8, 12, 24 in., and also two square ones of 25 in. and 100 in. area respectively. The whole of these are similar in material, construction, mounting, and height above ground; therefore any variation between their indications is due to size alone.

In other parts there are four other sets; one for the purpose of determining the influence of elevation above ground irrespective of buildings, the gauges being mounted on lofty poles. Another set are perched in all sorts of positions on the roof of the rectory and out-buildings, in order to obtain the effect of such positions, and therefrom approximate corrections to be applied to the many observations previously made in various parts of the country in analogous (unsuitable) positions.

The third series consists of different patterns, funnels with the rims sloping at different angles, and variations of that kind; and the fourth and last are identical in all respects except the material of the receiving surface, among which are pot, glass, copper, japan, paint, and shonite,—the last being apparently the best; but at present all are *sub judice*, and therefore we give no results.

We think the above will convince our readers that the questions we mentioned are now in a fair way to solution. Mr. Griffith is, however, by no means satisfied with doing what was never done before, and undertaking the arduous task of registering all these (42) rain gauges; and he has therapeutically work of the highest importance simultaneously in progress.

Almost every year, sometimes oftener, there crops up in the daily papers a discussion, more or less prolonged, as to "What is shade?" It generally arises in this way. A very hot day occurs. Forthwith sundry letters appear, giving temperatures varying, perhaps, 20°, and some of them hotter in the shade than others, possibly in the same town, are in the sun. Then some of those who have returned the lower numbers complain of the others, and it comes out that A had his thermometer on a post facing north, and forgot that the post got hot through and warmed the thermometer; that B was in a narrow space surrounded by houses,—in fact, might just as suitably have been in a well; that C's was outside a window, the glass of which reflected the heat on to the bulb; and so on. Now it is obvious that none of these positions is proper, and none comparable with any of the others; hence, many years ago thermometer stands were designed and they have since been adopted by all who have any claim to be considered observers of meteorological changes. Most unfortunately there have been several forms of stand adopted, differing as widely as a sentry-box and a meat-stand,—in fact, possessing no bond of similarity. Two years ago Mr. Symons drew attention to this anarchy in the *Times*, and expressed the hope that some person with leisure, and a clear open space, would take up the question, compare the various forms of stand, and determine their effect on the temperature and humidity recorded. Mr. Griffith having volunteered the space, and the time and trouble of observing, Mr. Symons has had stands made of the patterns suggested by Messrs. Lawson, Glaisher, Stow, Martin, Stevenson, Pastorelli, Morris, and Col. Sir H. James. Mr. Casella has provided the requisite number of thermometers (32). They have all been verified at the Kew Observatory of the British Association before commencing, and will be reverified at the close of the experiments.

We therefore conclude that meteorologists will

soon have the data for determining the relative influence of the various patterns of stand, and we hope they will agree to work uniformly in future; and in meteorology more than in any other science, uniformity of observation, of instruments, and of reduction, is all-important.

ON COLOUR IN CHURCHES.*

THE question, "What are we to do in the way of colour?" is very often asked in these days of church restoration, and it is with a view of doing something towards finding an answer to this question that I venture to bring these remarks under your notice. Almost every one admires colour, but most people dread using it, partly from a notion of its great expense, and still more from fear of failure. Of course, by the employment of celebrated artists, the cost of picture decoration may be swelled to any extent; and it is very desirable, where cheapness is not an object, that the best art should be employed in our churches; but, under ordinary circumstances, very good effects may be produced with a limited number of colours, and at a comparatively trifling cost. In most instances more money is expended, and more time lost, in experiments than in executing the actual decoration itself, when the style and arrangement have been determined on. The best way to prevent this needless waste of time is to make the necessary experiments with paper patterns, fixed up on the walls of the church, so that the effect of the proposed ornaments at a distance may be judged of. If this is done, the work will commence with a much better chance of success, and almost always a great deal of disappointment will be saved, for a painter is then able to set about his work with tolerable certainty as to the result. It is, of course, impossible to lay down any special canons for the guidance of any one wishing to decorate a building, as circumstances will determine many points better than the most elaborate rules. For instance, a dark interior will bear an amount of brilliant colour and high tones which would be intolerable in a more fully lighted building; and, on the other hand, the faint colours, and delicate whites, greys, and blues, which form such a beautiful harmony in an ordinary interior, would look poor and feeble in a gloomy little Norman church. Commonly, however (as far as we can judge from the specimens of colouring which keep turning up day after day in the progress of church restoration), there were but few colours employed in ordinary church-work in Mediaeval times, and the more elaborate decorations, and richer colours, were reserved for the most prominent situations in a church, as a retable on an altar, or the roof of a side chapel. As time went on, the church furniture itself seems to have been chiefly depended on for richness of effect; and the magnificent screen-work of later days was made to stand out by its brilliancy in an otherwise quietly-coloured interior. The choir sittings, also, sometimes came in for their share of the general splendour, as we see (if I remember rightly) at Walpole St. Peter's, Norfolk, where the fronts of the book-boards (if I remember rightly) are decorated with very good pictures of saints under canopies. Indeed, this plan was carried so far that the bench-ends themselves were sometimes coloured with stonil patterns, as at Brington Church, near here, though, as far as I know, this is a very unusual instance. The use of colour as a means of increasing the effect of the architecture never appears to have entirely died out. Up to the end of the fifteenth century it was, of course, common enough; and though the rise of the Renaissance style probably changed people's ideas a good deal, yet the old method of ornamentation was still adhered to, though the details were changed. To prove this I have only to refer to the exquisitely delicate colouring in Bishop West's chapel, in Ely Cathedral, finished early in the next century, and to the richly-decorated tombs at Brington and other churches. The church of St. Margaret, at Ipswich, has a very remarkable roof, apparently of the sixteenth century, though late in the style. The north transept roof in Empingham Church, Rutland, is another very good specimen, executed probably about the same date; and the restoration of South Kilworth Church now in progress, has brought to light considerable remains of wall decorations of this period. In

the seventeenth century we have the chapels of Lincoln and Jesus Colleges at Oxford; while the paintings of Thornhill, at St. Paul's Cathedral, and other places, and the pictured ceilings of St. Peter's at Arches, Lincoln, and St. Mary Le Wigford, in the same town, bring the art of permanent church decoration through the eighteenth century down almost to our own, when ornamentation of this kind certainly seems to have slumbered for a while, but only to be awakened with increased strength and power in the glorious Gothic revival of our own times. Perhaps I shall be doing the most service, and make myself best understood, if I describe the decorations of an imaginary church. Let us begin with the walls, and in doing so let us suppose that the common mistake of painting the interior has been avoided, and that the walls have been carefully plastered, so as to receive the decorations. The whole will then be coloured, with a general ground-work, in which pale bluff had, perhaps, hetero-predominate. Upon this ground bands of colour should be placed, the widths of which will be ruled by the architecture of the building. For instance, a kind of dado should be painted under the windows, reaching from the floor-line to the string-course, if there is one, and where no string exists, to give a finish a hand of colour might be used instead, to sever the pattern, below the line of the window sills, from the decorations above. This coloured string-course would look very well if designed with a fawn-coloured pattern, on a chocolate ground, or vice versa, as at Timworth Church. Above this, up to the height of the springing-line of the window-heads, some diaper or masonry pattern (as it is called) would fill up the space very well, upon the fawn-coloured ground, the divisions being marked out with red, black, or chocolate colour, and a small flower introduced into each square, in yellow or red, as at St. Alban's Abbey Church, and numberless other places; indeed, this masonry pattern is the commonest method of ornamentation which was used on the walls of churches. A second band of colour, repeating or counter-changing the tones mentioned before, might divide this pattern work from the upper part of the wall, where a less elaborate treatment might be used with effect (say a powdering of red roses or stars), till stopped by a third band of ornament immediately under the wall-plate. The eastern end of a church should be made to harmonise in point of tone of colour with the side-walls, of course, but would bear a richer and more ornate treatment.

The chancel of Ashley Church, in this county, has been coloured very carefully, lately, and the effect is in many respects highly satisfactory. Its arrangement will be found to agree pretty much with the plan of ornament which has been suggested, save that there is a band of canopies, running round the whole chancel, containing figures of prophets and apostles, painted with great care and very delicately coloured. The east end of Ashley Church is coloured in the same way as the side walls as far as the springing line of the east window, above which is a painting of our Lord in glory, surrounded by angels. This picture is rich in gold and colour, and adds very much to the effect of the interior.

The chancel of the church at Weston-by-Welland has also been entirely decorated very lately, and the general effect is harmonious and complete.

Holdenby Church has begun to put on its dress of many colours, but calls loudly for still further ornament.

The same may be said of Theddington Church, and Market Harborough Church was partially coloured some years ago; so you see we have not been altogether idle in this neighbourhood.

During the restoration of the little village church of Timworth, near Bury St. Edmund's, a most curious and valuable specimen of mural painting was laid bare, and it was especially interesting as showing the plan upon which the ornamentation of an entire chancel was arranged. It also followed in its general outlines the plan I have suggested. The lower part, or dado, was composed of a drapery pattern, in broad chocolate lines, at the top of which, just under the windows, ran a wide chocolate-coloured pattern, on a buff ground, of very bold and effective character. Above this was painted a series of wide architectural canopies, containing Scriptural subjects, among which "The Annunciation," "The Meetings of Saints Mary and Elizabeth," and "The Nativity," were tolerably perfect. The drawing was rough, but not bad,

and the whole, when fresh and sharp, must have looked very well.

I am sorry to be obliged to speak of these curious paintings as things of the past. They have been totally destroyed, and a rough sketch of my own is probably the only memorial that remains of what was certainly a very interesting discovery. The paintings at Timworth had been so much injured and hacked about, in the fifteenth century (to make room for another system of colouring), that it was impossible to preserve them as decorations for the restored church; but every one who saw them must regret that photographs were not taken before the walls were replastered. The painting was of the thirteenth century.

Another very remarkable specimen of wall-colouring has been discovered lately in the parish church of Easby, near Richmond, in Yorkshire. Situated under the shadow of Easby Abbey, no doubt unusual care was taken with the decoration of this church, and the painting seems to be very good. The subjects are arranged in square panels, and there are large figures painted within the arches of the sedilia. It is to be hoped that these very valuable models for church decoration will be found to be in a sufficiently good state of preservation to make it desirable to retain them.

St. Alban's Abbey Church, which is a perfect storehouse of beautiful architecture and quaint things, has many very good specimens of mural decorations, but they are so much like the general run of such ornament, that it is needless to describe them here. One of the best examples near at home is to be found in Lutterworth Church, which is being repaired under the able guidance of Mr. Scott, and this wall-painting is to be restored. The masonry pattern is of unusual excellence, and I am glad to have it in my power to show you a drawing of it, very carefully prepared by Mr. Lea, of Lutterworth. The painting appears to be of the end of the thirteenth century.

The pillars and arches of our ideal church must claim our attention next. They should be decorated much in the same style as the walls, and in old days were very frequently divided into a masonry pattern, running with the actual stories, though this was not always the case.

At Lutterworth, both the pillars and arches retain a good deal of their original decoration. In the arches the chief interest is given by graceful running patterns, in chocolate colour, following the lines of the arches. Specimens of this kind of ornament are to be found also at Ketton Church, Rutland, and in still greater quantity at Uppingham Church. A small portion of a more highly-coloured example of arch decoration is to be seen on one of the arches of the south side of the choir at Rothwell Church. It has a very good effect. The next specimen is later in style, and formed part of the second system of colouring employed at Timworth Church, Suffolk. It is taken from an archway which had long been blocked up, and the painting was very fresh in consequence. I am afraid I must admit that in this instance the general ground-work was whitewash, in addition to which there was another circumstance connected with it which rather jars against our notions of the truthfulness which is such a just boast of Gothic work. The spaces were covered with a rough red mottling, on a yellow ground, which must have been intended for sham marble. The idea is not pleasant, but it certainly looked very well. There is also some marbling of the same kind at Ketton. This need not be copied, however, as a plain surface of colour, not too evenly spread, would look equally effective, in all probability. With regard to the pillars, a chevron, or some other hold pattern, was often adopted, as at Lutterworth and Hunstanton, in Norfolk. But one cannot help thinking that a good strong stone column does not want much to recommend it, and that it might generally be left pretty much to itself; its fine natural colour would, in most cases, add to rather than detract from the effect of the interior by contrast.

The subject of roofs is one which deserves great attention, but there will only be time just to allude to a few existing specimens. The roofs of churches being almost inaccessible to the destroyer, and only get-at-able with considerable difficulty, by that still more fearful person, "the climber up" of later days, they have been suffered to retain their original colouring more than other parts of our churches; indeed, there is scarcely an old building where more or less of this roof decoration does not exist, and the style of all the periods of Gothic

* A paper by the Rev. F. Sutton, Rector of Theddington.

may be made out pretty clearly. The roof of Lincoln Cathedral, though at present covered with white and yellow wash, was once carefully painted, and bits of ornament peep out here and there, to tell us how to restore it, when the day of restoration arrives. The whole of the roof of that vast church, St. Alban's Abbey, is coloured! The nave and transepts have flat ceilings, which seem to have been coloured in imitation of older work; but the choir was a beautiful fourteenth century vault in wood, covered with very good painting, quite worthy of being visited by any one interested in such matters. It appears to be the second decoration which the ceiling has had. There is at Chichester Cathedral, on the roof of the vestibule, to the present library some very telling painting of later character, which might be imitated with great success on a vaulted roof.

Ely and Winchester cathedrals also give us examples of colour on stone-vaulted roofs of different periods. It was, however, with the open timber roofs of the fourteenth and fifteenth centuries that the full glory of coloured ceilings came in. In these, carving and colour vied with each other for the mastery, and the combination must have been sumptuous and stately in the extreme.

Norfolk and Suffolk give us the best examples, perhaps, but there are very good specimens scattered all over England. The church at Brant Broughton, in Lincolnshire, has a pine roof of the Perpendicular period, most effectively coloured. It is in very fair preservation. The plaster ceiling of the neighbouring church at Welbourn, in the same county, is said to conceal another of like character; and at Christ Church, in Hampshire, a fine wooden roof (still retaining its original painting), is hidden by a sham stone vaulting. Almost endless instances, indeed, might be referred to, but time would fail, and patience, no doubt, wear out too; so it will be best to conclude at once, with a hope that what we find in the way of painting we may preserve carefully, and that new work, founded on the excellent old models which we have, may rise up on every side round about us, so that one by one our churches may regain that quiet beauty and refined delicacy of coloring which so many of them once possessed.

THE FAIRFORD WINDOWS.

WILL you allow me, as one who has studied closely the early schools of Germany and Flanders, and for many years in companionship with my friend Mr. Alfred Bell (practised glass-painting as a profession, to express my entire agreement with your able correspondent on the subject of the Fairford glass, Mr. J. G. Waller, than whom none has fairer warrant for making his opinions public? I will further give the favour of a little more space in which briefly to note how Mr. Tom Taylor (to whose "tender mercies" Mr. Waller is consigned by "B. A. A.") practically expresses his concurrence too, by his direction of what I cannot help considering the heaviest blow that has been inflicted on the hypothesis he writes* to support,—viz., Dürer's authorship in the Fairford glass.

Beyond all doubt, the crucial test—the proof of proofs, one upon which Mr. Tom Taylor well insists, as bearing with most cogent force on the origin of the glass in question—lies, not in appeal to the confessedly dubious evidence of the "Biblia Pauperum," "Block Books," &c., whose own authorship is a matter of dispute, but in the striking identity between the west window at Fairford and the celebrated triptych of the same subject at Dantzig.

The complete coincidence, patent between the picture and the window could not possibly have been accidental; for a description of one is virtually a description of the other.

That the artists of these works were followers of one school,—that the author of the glass was familiar with the picture, and borrowed largely therefrom,—is beyond the limits of reasonable question.

Mr. Tom Taylor ventures, indeed, more than this. He says,—“It is difficult to believe that the designer of the Fairford window and the designer of the Dantzig picture were not one and the same.”

A claim of such personal identity of authorship as this must be received with reserve; but to all who have regarded the subject with an

artist's eye, the magnificent composition at Dantzig and the Fairford window reveal, in every characteristic, the unmistakable signature of their common school. In the Dantzig picture the general scheme of arrangement, the graceful delicacy of form, the long-drawn attenuated and peculiar modelling of the nude, and the characteristic type of the faces, proclaim a completely representative example of the art of Memling and Van Eyck.

Dr. Waagen, speaking of Flemish pictures, and especially of that at Dantzig, declares that "this is not only the most important by Memling that has descended to us, but one of the *chefs d'œuvre* of the school."

It is difficult to comprehend by what unusual oversight Mr. Tom Taylor confounds a work so distinctly Flemish with the name of Dürer, to whose more robust style it bears no real affinity. On the other hand, it is as easy to understand how he was struck by the obvious, though unnecessary, clue which the picture affords to the origin of the window.

But Mr. Taylor seems much more certain that the window is referable to the Dantzig picture, than that the picture is referable to Dürer; for he says, "It is quite possible that the picture may be Dürer's, if [I], as I believe, the Fairford windows are his."

With the same probability the converse might be stated, viz.,—It is possible the windows may be Dürer's, if the Dantzig picture is by him. Reasoning of this kind is really all that has been brought forward on behalf of Dürer's claim from first to last.

I would refer to one other point, which is significantly passed over in silence by the advocates of the Dürer theory, to which it is a fatal difficulty. I allude to the canopies of the Fairford aisle windows. These canopies are as Flemish beyond question as is the Dantzig picture; which, thus corroborated, carries, I submit, the whole question of the school whence the windows issued. That, in the absence of documentary or historical evidence, the actual artist of the glass can ever be known, I do not believe, though an enthusiast might easily make much of a theory favouring Memling. The gentle gradations of style resulting from the influence of schools in ancient works where an artist's characteristics are distinguishable, less by divergence of manner than degree of power, present difficulties in the ascription of individual authorship to apocryphal works, that in face of them artists are slow to pronounce. To establish the plausibility of a surmise that a work of ancient art of unknown authorship may, by possibility, be by a given artist, settles no doubts, and is but a tantalizing way of showing, what is never doubtful in such cases, that it is of a certain school and a particular date.

But, sir, next to an auctioneer there is no one like your non-professional enthusiast for vaulting over obstacles of this kind. In riding his hobby he has no faint-heartedness. He fears no stumble. His foregone conclusions absorb his heart and soul, and difficulties but intensify his purpose. Where the artist fears to tread he rushes in and cuts the knot in triumph. In this way all obstructions vanish; and many are the works of art that have been baptised thus with names that would make their owners' hair stand erect were they with us to claim their own again.

JOHN R. CLAYTON.

** The artist of the celebrated picture in the Church of Sainte Marie, Dantzig, mentioned above, is now understood to be Derrick Stuerhout, better known as Dirk Van Haerlem, from the place of his birth, and the earliest distinguished painter of Holland. Mr. Weale, long settled in Bruges, and whose name as an antiquary is well known by many of our readers, has recently met with a document, we are told, in which Stuerhout engages to paint the picture for a Milanese nobleman. Stuerhout was born in the year 1391, according to Mr. Crowe, and died at the age of eighty-seven, or in the year 1478; so that if this identification be certain, and we have no doubt about it ourselves, the Dantzig picture would seem to have been painted before Albert Dürer was born.—Ed.

MANCHESTER.—A site in Oxford-street has been chosen for the new buildings of Owen's College, plans for which are under consideration. The site will cost 29,000*l.* if the whole of a plot of building land containing 19,164 yards be secured; or 12,000*l.* if a plot of only 8,963 yards be taken.

THE WINTER EXHIBITION, FRENCH GALLERY.

THE collection here of cabinet pictures by British and (a few) foreign artists, 200 in number, is well selected and particularly interesting. Moreover, upstairs may be seen, without extra charge, Linnell's fine picture, "The Dusty Road." Foremost in the collection proper stands Mr. E. Long's "Christmas Charities in Seville" (165), hrimful of interest, both for the artist and the ordinary sight-seer. It shows us a well-dressed lady distributing alms to a group of beggars in one of the cathedrals. A sombre priest looks on approvingly, while the crowd is kept in order by a soldier who, under ordinary circumstances, would be the least interesting figure in the work, but who compels one to look twice at his bright uniform, and his whiskerless, mustached, amiable face, if only to see what the men are like who make the revolutions in Spain. The beggars are the most rugged, pictureque creatures in the world. The subject is well chosen, and admits of all that variety of character and beauty of colour in the rich-dyed and picturesque dresses, which have such charm for artists eyes, and in the fresh daylight effect of the lighting from the open door. As a composition, too, the picture is exceedingly well conceived. "The Twins" (69), by M. Bongueran, is distinguished by great excellence of painting; it represents an infant boy and girl lying asleep upon some downy cushions and rich quilt, the curtains parted letting in a ray of bright silvery light which just strikes upon the pretty form of the one twin, and leaves the group in shadow. The subtle modelling of the soft little limbs and velvety skin is wonderfully true, and the colouring of the flesh is perfection.

In No. (50), "The Favourite Padre," by J. B. Burgess, a lean padre is set off by the plump form of his unctuous brother. The favourite padre gives his hand to be kissed by one of a group of girls, while a boy oings on his arm, and looks up at him with a face bursting with fun. Mr. Dicksee is more than usually strong. "The Sick Chamber" (86), W. Q. Orchardson, although mannered, lays hold of the spectator, and keeps his place in the memory. (22) "The Morning Meal," by L. Perrault; (34) "A Highland Loch," B. W. Leader; (61) "Prayer," Eng. Fines; (173) "Fancy Free;" and Mr. Archer's touching picture, "Desolate" (186), all deserve special notice.

PARTIAL DESTRUCTION OF THE RESTORED CHURCH OF ECCLESHALL BY FIRE.

THE parish church of Eccleshall has narrowly escaped being burned entirely down. On the morning of Sunday in last week the north aisle was found to be in flames. Engines soon got to work, but at length the roof of that portion of the building fell in, and shortly afterwards the roof of the nave was discovered to be on fire. In a little time, however, the flames in that part of the building were subdued.

The damage done is very considerable, but not so great as might have been expected. 600*l.* it is said, will cover the whole, but there are 300*l.* or 400*l.* still unpaid for the restorations recently done. The whole of the north aisle is destroyed, and also a portion of the nave. Only the walls of the north aisle are left standing. The south aisle is uninjured. The chancel, with its rich oak carving, is safe, though the walls and roof are much discoloured by the smoke. The north aisle, in which the organ is placed, has received no material injury. The organ itself is a good deal damaged.

The conflagration, it is said, has been traced to one of the principal beams of the north aisle roof having been left into the side of the chimney of the warming apparatus. This apparatus, which supplies the building with hot air, had been lighted for the first time, as far as the services in the church were concerned. The beam appears to have taken fire, and the flames were communicated thence to the roof. The church was not insured.

The building had been re-opened for service on the 29th of April last, after a thorough restoration, which cost between 7,000*l.* and 8,000*l.* The general feeling among the people of Eccleshall is a determination to get the church restored, if possible, with the same beauty and proportions which it displayed before the fire. This is the result of a meeting convened by the

* In the *Gentleman's Magazine* for October.

Rev. C. P. Good, the vicar, and the churchwardens, in the Town Hall, to consider the steps to be taken respecting the damage done. More than half the 600l. required was at once subscribed. The Vicar presided, and, in a few opening remarks, explained the probable origin of the fire. He would not, he said, pretend to say who was to blame, or whether any one at all was to blame. Mr. Street, the architect, had written to express regret at not being able to attend, but Mr. George Wood, his chief clerk, was present at the meeting. Mr. Wood was asked as to the cause of the fire, and he said he had carefully examined the heating apparatus and the floors above it on the back of the arches, and also the flue leading to the chimney-stack, and he was of opinion that the fire originated in the stack on the level of the north aisle wall. One of the principal beams was set by the side of the flue at this point, and was protected by a fire-clay lump-lining 3 in. thick, supported at an inclination of about 40 degrees by an iron bar, so forming a bend in the flue. The actual face of the beam appeared to have had a clear space between it and the fire-clay lump of 3 in., which was, in his opinion, sufficient for the safety of the building. No doubt it would have been safer if the beam had been kept at a distance of 12 in. instead of 6 in., and this could have been done by the clerk of the works. In answer to a question, Mr. Wood said he, of course, considered the clerk of the works was the servant of the Restoration Committee, acting under the order of the architect, and he (Mr. Wood) had no doubt that had the clerk of the works reported the fact of the beam being so near the flue, and asked for special instructions, he would have been told to keep it at a greater distance. Mr. Wood, in conclusion, said that he had heard that the flue was used by the builder during the progress of the work to dry some timber. He believed the flue became filled with soot at the bend formed by the fire-clay lump, and when the fire was lighted it became red hot and communicated the heat through the fire-clay to the beam. Mr. Barker, who represented Messrs. Stuart & Smith, of Sheffield, who provided the heating apparatus, was present, and expressed an opinion that the fire must have arisen from the beam communicating with the chimney. Mr. E. Lyon, one of the churchwardens, said he felt very acutely that no insurance had been effected upon the church. He did not attempt to excuse himself for neglecting so important a matter, but any parishioner might have proposed to do so at the vestry meeting. The fire arose from a piece of carelessness. He considered that it was very important that the matter should be fully investigated.

ACCIDENTS.

A WAREHOUSE in Rigby-street, Liverpool, used for storing linseed and the like, seven stories high, has fallen in. On the fifth story about 50 tons of linseed were stored in a heap. Some men observed that the centre heap of linseed in bulk was subsiding; but they believed that this was caused by the "sliding" away of the outer ridge of the bulk. Both the upper and lower floors were deserted by the workmen because they "felt there was something coming;" but the machinery was working the press-room, and everything else was going on as usual, when a fearful crash was heard. The floor of the fifth story of the building had given way, the joists having apparently broken in the centre, and 50 or 60 tons of linseed in bulk falling on the fourth floor, on which there was a similar quantity of produce stored, broke that down, and, again descending on to the third and second stories, fell into the machine-room, where a number of pressmen, grinders, and others were employed. The falling of the floors was so sudden that not one of those engaged in the machine-room escaped, while several of the workmen employed in proximity to the scene of the disaster sustained severe injuries about the head and arms. All the centre timbers of the different floors appeared to have parted, leaving the flooring joists projecting from the opposite sides of the warehouse. Efforts were at once made to rescue the workmen inside the building; but after an immense quantity of *débris* had been removed, they found the bodies of four men amongst some broken rafters and ceiling-planks. None of the bodies were disfigured, and it appeared that the unfortunate men had been suffocated by the immense quantity of grain falling on them.

A new chapel has been blown down and four persons killed at Bill Quay, Shields. The chapel was in course of erection for the Wesleyans, in Swinburne-terrace, at the high part of the village, on a slight slope. During a strong gale of wind from the north-west the roof of the chapel came down, bringing with it nearly the whole of the south gable and a large portion of the north gable. The south gable fell bodily upon an adjoining house, a two-story one, crushing in the roof and the floors of the upper rooms, and completely burying the whole of the occupants in the ruins. Besides the four killed, others were more or less seriously injured.

Inflax has been also visited by a strong storm of wind and rain; and at Bolton Brow, Sowerby Bridge, a horse fell, killing a woman and her infant. Both were shockingly crushed. The house has been in a dilapidated state for some time, but there was no immediate sign of its fall.

THE EARTHQUAKES.

THESE commotions are still reported from one end of the world to the other; and now we have a slight indication of them in our own favoured land. On Friday in last week, between ten and eleven at night, the west of England was shaken by earthquake. There has also been an earthquake in Ireland. All these were comparatively very slight however; but it is said that the Baltic has been agitated to an extraordinary degree, subsiding 3 ft. and upwards below the usual average, and then rising a foot above that average. Nearly all the steamers plying between Cromstadt and St. Petersburg went aground, a circumstance unprecedented.

From north to south of New Zealand a curious tidal phenomenon was observed on the 15th August. The sea rushed out and in with extraordinary violence, and in some places in the South Island great damage was done from the sea going far over the usual high-water mark. On the 17th shocks of earthquake were felt over a larger portion of New Zealand than is usually subject to them. The Chatham Islands have been visited by three tidal waves, causing great loss of life and property. The settlement of Tupunga, on the north side of the island, felt the greatest force. It was entirely destroyed, no mark being left to tell where it stood. The ground was completely covered with sand and seaweed. The inhabitants barely escaped with their lives. The sea went inland about 4 miles. The settlement of Waitangi sustained great loss. Houses were shifted, and carried out to sea. There have been great floods in Chili, and many persons drowned. Doubtless these floods, as well as those of Switzerland, and also the previous drought, have all had something to do with the other phenomena.

OPENING OF YORK CORN EXCHANGE.

THIS building, which has just been completed, and is situated in King-street, has been formally opened. The erection has been carried into effect through the medium of a limited liability company.

The building is 7½ ft. long, 63 ft. wide, and from the floor to the apex of the lantern light about 54 ft. in height. The roof, which is an open timber one, is partially supported by two rows of iron columns, which are fixed about 11 ft. 6 in. from the side walls, from which spring semicircular laminated ribs spanning over about 38 ft., which forms the central portion of the Exchange. These ribs form part of the truss of the roof. Along the whole length of the building is a raised lantern roof, the whole of which is glazed, and gives an ample supply of light, and the side lights of lantern are made to open. It is also heated with two of Gurney's patent stoves.

In addition to the large room there is a settling-room about 38 ft. long and 21 ft. wide, and in the front there is a pile of warehouses, comprising several floors in height. The entrance to the Exchange is through a portion of the warehouses, and is 10 ft. wide. There is also an orchestra in the large room, and the interior is finished in an ornamental style.

The architect was Mr. G. A. Dean, of London and York; and the contractors were Messrs. Weatherly & Rymer, of this city. The clerk of the works was Mr. Vicars, who is also the archi-

tect's principal clerk. The total cost of the premises, including corn-stands and fittings, and alterations to the warehouse, will be about 3,000l.

The sub-contractors for the work were Messrs. Close, Ayre, & Nicholson, for the iron work; Mr. Rawlings, the plasterer; Mr. Pearson, for the painting and decorating; Messrs. Hodgson, the plumbers; and Mr. T. Wood, the slater.

THE ASYLUM AT LEAVESDEN.

WE learn from the daily papers that the foundation-stone of the first asylum for the imbecile poor of the metropolis, to be established under the provisions of the Metropolitan Poor Act of 1867, was laid at Leavesden, Woodside, about four miles from Watford, on Saturday last. The Metropolitan Poor Act of 1867, introduced by Mr. Gathorne Hardy, constituted what is termed the Board of Management of the Metropolitan Asylum District, consisting of sixty members, three-fourths elected from the thirty-nine parishes and unions comprised in the metropolitan area, and one-fourth nominated by the Poor-law Board. The Board are to provide asylums for imbecile poor, and hospitals for the reception of the poor who are afflicted with fever and small-pox. Two asylums, each to contain 1,600 patients, are now being erected, one at Leavesden for the north side of the river, and one at Caterham, near Croydon, for the south side. The Leavesden site contains 76 acres, and cost 100k. an acre—7,600k.; Caterham site contains 72 acres, and cost 80k. an acre—5,760k. There is to be accommodation in each of these asylums for 860 females, in six separate blocks, and for 700 males in five separate blocks. The estimated cost of the building, furniture, clothing, &c., for the Leavesden Asylum is 128,000k., and 129,000k. for the Caterham Asylum. The Board have obtained sites for fever and small-pox hospitals, as follows:—for north-west district, at Haverstock-hill, Hampstead, about 8 acres, cost 15,544k.; for north-west district at Homerton, about 8 acres, cost 11,812k. 10s.; for southern district, at Stockwell, about 7½ acres, cost 15,075k. The Board have approved the design for the fever hospital at Hampstead, for 10½ patients, submitted in competition from six architects, by Messrs. Pennington & Bridgen, of Manchester. The designs for hospitals at Homerton, to receive 184 fever and 102 small-pox patients, and at Stockwell for 150 fever and 102 small-pox patients, are to be ready soon. Up to the present time the Board have made a call of one-eighth of a penny in the pound on the rateable value of property in the unions and parishes of the districts (about 16,000,000k.) for defraying the expenses of the Board for the years 1867-8, and further call of a similar rate payable 31st December next. The funds required for the erection of the asylums and hospitals are raised by loans on the rates, repayable with interest by equal annual instalments in twenty or thirty years, as the provisions of the Act direct.

We have already given a general view and plan of the asylum at Leavesden.

THE MONMOUTH WORKMEN'S INSTITUTE.

THE opening of this Institute took place on the 15th ult. The site is in Monk-street. It has been founded by Mrs. Jones, of Ancre Hill. The plan of the building is a parallelogram, 52 ft. 6 in. by 32 ft. 6 in., with a transverse wing 28 ft. by 15 ft. on the south side, and it stands detached in its own ground, so that the front and two sides may be seen from the street. It has two stories. The ground floor, 12 ft. high, comprises a spacious entrance vestibule and hall with mosaic floor, from which an inner vestibule is entered through an ornamental glazed wooden screen, with self-acting folding doors. From the inner vestibule the following rooms are entered: the reading and news room, 32 ft. by 16 ft., lighted in front by a coupled window, and in the side by two windows of a similar character; the library, 20 ft. by 13 ft. 6 in., fitted with ranges of book-shelves, book-case and cupboard; between this room and the former is an arched opening, fitted with a counter and glazed sliding screen from which books, &c., may be issued by the librarian; a committee-room, 14 ft. by 12 ft., which can also be entered from the reading-room. From the outer vestibule a stone stair,

6 ft. wide, with an ornamental balustrade of hammered wrought-iron leads to the lecture-hall 48 ft. by 28 ft. and 20 ft. high. This hall is fitted throughout with movable seats, and has at the east end a raised semicircular platform; midway on the south side, and above the doorway is a pointed arcade of two openings to a gallery over the landing and staircase. This arcade is divided by a circular column, with an enriched and foliated capital, and the front of the gallery is of ornamental hammered iron works. The gallery is approached by a circular stair from a cloak-room, forming a mezzanine story on the first landing of stairs. Beneath this mezzanine, and approached downwards by a few steps from the outer vestibule, are a lavatory room and other conveniences, and in the basement, are a boiler-room for tea purposes, cellars for coals, stores, &c., a pump, and other appliances. All the interior is lighted with gas, the lecture-hall having a large gilt starlight pendant. The whole of the woodwork and fittings are stained light oak and varnished.

The general style of the edifice is of Italian Gothic character; the exterior is constructed with polished red sandstone walls, and Bath stone dressings and strings, interspersed with blue forest stone bands; the shafts of the columns of entrance doorway and windows also being of blue forest stone polished. The roof is of Carnarvon countess slate, in bands of purple and grey; the whole forming a contrast of colour. The noticeable features are the gable front. 54 ft. high, surmounted by a banneret of hammered iron, coloured and gilt, with crystal points. In the middle of the gable is the large pointed window of the lecture-hall. This window is subnarcated as a triplet on circular columns with foliated capitals, and the spandrel is filled in with the arms of the foundress surrounded by foliations on a diaper of conventional character. Between the lower windows is a circular tablet of polished royal marble, upon which in Lombardic letters is the following inscription:—

"This Free Institute
for Working Men
Was founded and endowed by
MRS. MATELA JONES,
of Ancre Hill,
A.D. 1868."

The entrance doorway, flanked with moulded jambs and disengaged columns, with foliated capitals and moulded bases, is finished above with a bold octagonal balcony carried on moulded brackets and corbels, with pierced spandrels. The site is enclosed with a low wall and coping, carrying ornamental baunmered-iron railings; and the entrance-gates are supported by circular pillars of red stone, with moulded bases and pyramidal, polygonal caps enriched with carving.

The contractors were Mr. C. Lawrence, jun., Mr. George Webb, and Mr. H. Elias. The cast-iron work was supplied by Macfarlane, of Glasgow; the wrought-iron work by Cormell, of Cheltenham; and the carving by Mr. J. Willis. Mr. Benjamin Lawrence was the architect.

WARMING AND VENTILATING BUILDINGS.

By the process of respiration a man absorbs 20-30 cubic inches of oxygen, and produces the same quantity of carbonic acid per minute. The absorption of oxygen represents the preservation, and the production of carbonic acid the waste, going on in his body from birth to death. Nitrogen is inactive, or rather serves by diluting the oxygen to moderate its energy, and diminish the violence with which burning would otherwise go on. Without oxygen a man could not exist, nor could a fire be kindled; and no more nor less than the normal amount of oxygen in the atmosphere is essential to existence and well-being. If a man breathes air diluted with carbonic acid for any length of time it produces headache, lassitude of mind and body, sickness and death. To do so, in fact, is a process of slow poisoning. The temperature of the air that he expires is always the same as that of his body,—namely, 98°; and, as it is warmer and lighter than the surrounding atmosphere, it ascends during the pauses between exhalation and inhalation above his head. In the open air, which is always in motion, it ascends at once and is dispersed and diffused never to return, and his lungs take in fresh air at each inhalation. In a room, however, it rises to the ceiling, where, if no aperture exist for its escape, it remains

until it becomes cool and loses its levity, or is displaced by other ascending currents, when it descends, diffuses uniformly throughout the air in the room, and the occupant breathes it over again.

The air in rooms is also further deteriorated by the aqueous vapour continually emanating from the lungs and skins of the occupants; and also by the products of combustion from gas, oil, and candles burnt therein. A man exhales from his lungs and skin 720 grains, or 13 ounces of aqueous vapour per hour. When the temperature of the air is high and the dew-point is low his lungs exhale an increased amount of vapour, while the quantity exhaled from the skin decreases. On the other hand, when the dew-point is high the air is less absorbent of moisture, and the amount of vapour increases from his skin and decreases from his lungs. Excessive heat, moisture, or dryness of the air render it insalubrious, and injurious to health. When air contains but little moisture its dryness rapidly absorbs vapour from the skin and lungs, contracts the blood-vessels at the surface, and surcharges others. Hence a due amount of water should always be present in the air to render it fit for respiration. Air is saturated with moisture when a cubic foot at 56° contains five grains, and at 66° seven grains of water. The quantity of moisture that should be present in air to enable it to absorb the vapour given off by the lungs and skin is when a cubic foot at 56° contains 3.4 grains, and at 66° 4.7 grains,—that is, when at 56° it is 1.6 grains, and at 66° 2.3 grains short of saturation. The 720 grains of aqueous vapour per hour exhaled by the body will then saturate 450 cubic feet of air per hour at 56°, and 330 cubic feet at 66°. An agreeable air exists in a room for respiration when the dry-bulb thermometer reads 50°, 63°, and 70°, and the wet-bulb reads at the same time about 45°, 54°, and 63°, giving dew-points of 40°, 49°, and 58°, successively; or when humidity is 66, complete saturation being represented by 100.

It is remarkable that, although the nature of the atmosphere, and the evil effects arising from breathing respired air have been known for nearly a century, houses are still built without any provision for bringing fresh air into the rooms and for taking vitiated air out of them, other than what comes in and goes out by doors, windows, and fireplaces. When the doors and windows are closed, air can only enter the rooms through the crevices around them; and the fire, together with the huge smoke-openings above them, devour the air, and cause strong cold draughts to rush through the crevices and across the rooms in the direction of the fireplaces, driving back the radiant heat and preventing it from warming the apartments. The object of the fire-grate should be, besides the cheerful glow of the fire, to warm the air and walls remote therefrom as much, and to use the fire-place for ventilation as little as possible. The combination of warming and ventilating by the fire-place alone has always ended in failure, and always will. A separate supply of air should be brought by a tube direct from the outer air under the floor to the sides of the fire-place, to feed the fire. The fire would then act almost independently of the air supplied to the room for ventilation. The area of the tube, and also of the chimney throughout, should be from 30 to 40 square inches, and the orifices of both should be provided with sliding regulators to contract and enlarge them at pleasure, and to close them in summer when fires are not required. This arrangement would check the cold draughts of air across the rooms from the doors and windows, and cause the floors to be warmer. Rooms, however, should not be dependent for the supply of air upon the chance ingress of it through the door and window crevices, but should be provided with sufficient tubes and apertures for its admission and distribution near the floors, either directly from the open air or indirectly from the staircase; and such tubes should be subservient to the admission of moderately warm air in winter and cool air in summer. Neither should rooms be dependent for the discharge of vitiated air wholly upon the fire-place, but should be provided with sufficient apertures in or near the ceilings, communicating with heated tubes, or with the smoke-flues, rising through the roof into the open air. Fresh air would then readily make its way into, through, and out of the rooms, partly by the fire-places, and chiefly by the openings above. This would render the rooms comfortable and salubrious. The currents should be gentle and under control, and sufficient to perform the office of purification.

Good ventilation is not less important than good drainage. In the eye of the law houses are not considered habitable unless they are properly drained. Neither should they be considered fit for occupation unless every room is properly ventilated also. In a sanitary point of view the one is as necessary as the other. Men and women who dwell in crowded towns, and work and sleep all their lives in close rooms without ventilation, and so continually breathe air contaminated with the waste of their bodies, go down to their graves seventeen years earlier than the men and women who dwell in the country, and work in the green fields, and breathe the fresh air. As the poor toilors for bread in pestiferous houses and workshops in towns are shut out from the balmy breeze and the glorious sunshine; from the sight of the prime rose, and the smell of the lawthorn; from the wild birds' songs in the hedgerows, and the lark's merry trill in the clear blue sky; the least those who live upon their toil can do for them is to make their homes and surroundings decent and habitable. There always have been, and always will be, poorer classes; that is inevitable; but there is no reason why, added to their poverty, the poor should be poisoned with foul air. It is sickening to enter some of the sties called houses in which thousands upon thousands of human beings eke out their miserable existence. The Hottentot and the Esquimaux are better housed in their mud-and-snow huts. It is marvellous that such barbarism and refined civilization should co-exist to the extent they do in our cities and towns.

When we enter unventilated rooms, especially bedrooms, that have been occupied for some hours, we immediately feel an unpleasant closeness and odour, and resort to the expedient of opening the doors and windows in order to pass currents of fresh air through the rooms. This in summer is not objectionable; but in winter, or in damp or chilly weather, it is not only inconvenient, but sometimes dangerous, to those who are exposed to such draughts. In crowded assembly and hall rooms, unprovided with adequate ventilation, the opening of doors and windows is particularly objectionable for the same reason. Now, in order to preserve the body from the pernicious gases which continually emanate from the lungs and skin, it is absolutely necessary that every room in which we live, and work, and sleep, should be provided with means for conveying away the vitiated air engendered therein as fast as it is produced, and for replacing it with pure air. The public generally have no voice in the construction of houses, but are obliged to take what is provided for them. The proper ventilation of houses does not receive that attention which its importance demands. If architects and builders would only think how much the health and comfort of those who are to inhabit the houses they design and build depend upon good ventilation, they would not hesitate to make special provision for it in every room. In future Building and Sanitary Acts clauses should be inserted compelling adequate provision for ventilating dwelling-houses, under proper supervision, other than by doors, windows, and fire-places. As the editor of the *Builder* truly observes, in reference to a kindred subject, "it is an imperial question of the greatest and gravest importance."

When air within and without a vertical tube, open at both ends, is of the same temperature, the weight of the internal and external columns is equal, and no motion ensues; but immediately heat is applied inside, the air therein expands, a portion overflows, and the remainder, being specifically lighter than the air outside, is forced upwards by the preponderating pressure. In this way an ascending current is produced through the tube; and as long as the internal air is warmer and lighter than the external air there will be an inflow at bottom and an outflow at top, and the velocity of the current will be in proportion to the difference between the temperature of the two columns.

Air expands, becomes light, and ascends by heat; and contracts, becomes heavy, and descends by cold. The ventilation of rooms and buildings, is dependent upon currents produced in the air by difference of temperature, whatever expedients may be adopted to cause it. Air expands $\frac{1}{100}$ of its bulk for every degree that its heat is raised; that is, 490 cubic inches at 32° become 491 cubic inches at 33°, and so on, increasing 1 cubic inch for every additional degree of heat. Hence, if the air inside a ventilating tube or a chimney be 127° and that

outside be 65°, the expansion inside will be $\frac{1}{80}$, equal to one-eighth nearly, or its weight will be one-eighth less than the external air. If the tube or the chimney be 50 ft. in height, the pressure causing the draught will be equal to $62 \times .002408 \times 50 = 6.92$ ft.; that is, 43.68 ft. in height of air at 65° will balance 50 ft. in height at 127°. Now, according to the law of gravitation, the velocity of the current through the tube or the chimney in feet per second will be equal to eight times the square root of the difference in height of the two columns; that is, equal to $\sqrt{632} = 8 \times 2.5 = 20$ ft. per second; and if the area of the tube or the chimney be 15 square inches, the discharge of air will be equal to $15 \times 20 = 300$ cubic inches per second, or equal to $300 \times 60 = 18,000$ cubic inches per minute. As, however, friction reduces the velocity about one-tenth, the actual discharge will be about 16,200 cubic inches per minute. From this example the flow of air into and out of rooms through ventilating pipes or chimneys may be easily calculated.

The system of warming rooms by hot water circulating through lengths and coils of iron pipes placed in the rooms has been successfully practised since 1816, when the Marquis de Chabannes first introduced it into this country. The principle upon which this system acts is that of convection, which consists in the particles of water at the bottom of a boiler, heated from below, gradually expanding and ascending through the colder particles above, which sink down by their gravity to be heated and expanded and to ascend in their turn, until the whole of the water in the boiler is raised to the boiling temperature, namely, 212°. If the boiler be closed at top, and a pipe filled with water be continued thence to any required height, then laterally to any reasonable distance, and finally down into the boiler near the bottom, the hot water in the boiler will rise through and displace the cold water in the ascending pipe until all the water therein also boils, or nearly so. Then, as the weight of the cold water in the descending-pipe will be greater than the weight of the hot water in the ascending pipe, motion will necessarily set in towards the boiler; and thus complete circulation will be established, which will continue so long as the descending-pipe parts with heat, which it does by radiation and conduction, and the water in the boiler receives additional heat from the fire.

This system has been aptly compared to the circulation of the blood. The heart is the boiler, from the left side of which oxygenized or bright scarlet blood is driven through every part of the body. In its course it loses its scarlet colour by parting with the oxygen, and becomes of a dark purple colour by taking up carbonic acid instead. It finally enters the right side of the heart, and is strained through the lungs, where exposed to the action of the air by respiration, it parts with the carbonic acid and takes up oxygen, which changes the colour again to bright scarlet. It then proceeds once more on its journey ended with life and nourishment to preserve and sustain the body.

Great heat is evolved from hot water circulating in iron pipes; and air heated from this source is much purer and healthier than air heated by any other artificial means. The hot-water pipes usually carried from the kitchen boiler to the roof and back again, for supplying a bath, or the upper part of a building, with hot water, are also capable of heating currents of air, which would not only warm the various rooms, but thoroughly ventilate them as well. These objects could be accomplished far more efficiently and economically than have hitherto been done, by carrying the hot-water pipes up and down in air tubes, communicating with the external air and with the rooms, and constructed within the thickness of the partitions which divide the rooms from one another, as shown by the following diagram.

From the top of the boiler, *a*, at the back of the kitchen fire, a pipe, *b c d e*, ascends in an air tube, *A*, fixed in the partitions dividing the rooms, to a closed cistern, *f*, placed in the roof. From the bottom of this cistern a pipe, *g h i k l m*, descends in another air-tube, *B*, built in the partitions, and returns to the boiler near its lower extremity at *n*. Two other pipes, *g d n l* and *h o k*, branching out of the last-mentioned pipe at *g* and *h* at top, also descend in air-tubes *C* and *D*, concealed within the partitions, and join the return-pipe at *k* and *l* at bottom. Now, as the water in the boiler becomes heated by the kitchen fire it expands and ascends in the pipe *b c d e* to the cistern *f*, and as the pressure

of the colder and heavier column in the pipes *g h i k l m*, *g d n l*, and *h o k*, is greater than that of the warmer and lighter columns in the pipe *b c d e*, movement takes place through the former pipes towards the boiler. Hence circulation is established from the boiler upwards through the pipe *b c d e* to the cistern *f*, and downwards through the ranges of pipes *g h i k l m*, *g d n l*, and *h o k* to the boiler, the velocity of which will depend upon the difference between the temperature and weight of the water in the ascending and descending pipes. The hot-water cistern *f*, the pipes, and the boiler, are supplied with water from a small cistern (not shown in the engraving) fed from the water-closets, and is placed a little above the other, and is of sufficient capacity to supply a bath, the water-closets, and the bed-rooms with cold water. The bath and bed-rooms would also be supplied with hot water from the hot-water cistern *f*, in the usual manner. A pipe, *t*, rises from the hot-water cistern out through the roof for discharging steam and air rising from the water in the pipes. The water will continue to circulate in the pipes and give out heat, after the fire is extinguished, so long as the temperature is higher than the surrounding air.

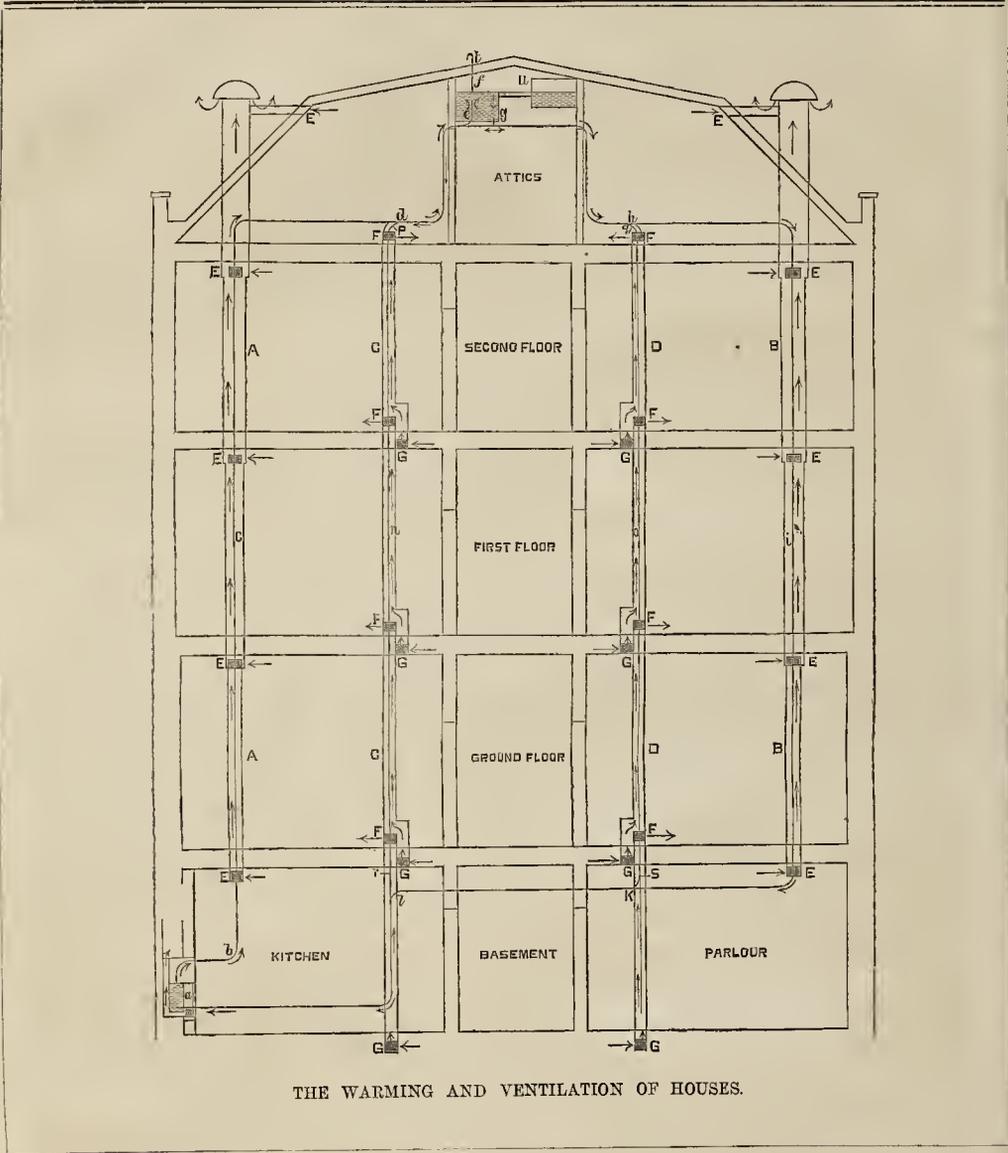

Now it is evident that by enclosing hot-water pipes in columns of tubing placed in the partitions or other walls of houses, in the manner shown by the diagram, considerable heat and velocity would be imparted to currents of air admitted into the tubes at any points. If, therefore, the tubes *A* and *B* be carried out through the roof into the open air, and openings are formed into them at *E* near the ceilings of the rooms on both sides of the partitions, the heat continually evolving from the hot-water pipes would expand the air within the tubes so as to produce strong upward currents therein, which would effectually ventilate all the rooms opening into and communicating with these heated tubes. Also if pipes are introduced between the joists of each story through the external walls to inlets at *G*, so as to conduct the external atmosphere into the air-tubes *C* and *D* surrounding the hot-water pipes *d n l* and *h o k*; and if openings are made in the tubes and skirtings at *F* near the floors, on both sides of the partitions, currents of fresh air, entering the several inlets at *G*, would, as they rise up the tubes *C* and *D* to the next floors above, be heated by the hot-water pipes therein, and the air so tempered would be delivered into the rooms through the inlets at *F*. The air-tubes *C* and *D* are stopped off by diaphragms just above the inlets at *F*, so as to turn the warm air rising up the tubes below into the rooms. Smaller horizontal air-tubes, with smaller hot-water pipes therein, arranged so as to form plinths to the skirtings, could be laid, when desired, from the vertical air-tubes and hot-water pipes for distributing the warm air to other parts of the rooms; or pipes could be laid from the air-tubes to the angles or sides of the rooms for this purpose. Pipes would also be carried from the centre of the ceilings to convey away the products of combustion from gas-burners, oil lamps, &c., into the air-tubes *A* and *B*.

In summer, when cold air only would be required to circulate within the rooms, the warm-air inlet-tubes *C* and *D* could be converted into cold-air tubes by turning off the hot water circulating in the pipes within them by stop-cocks placed at *p* and *q* at top and at *r* and *s* at bottom. This arrangement would tend to increase the ventilating power of the tubes *A* and *B* at such times by the increased heat which would be given off by the hot-water pipes therein. Additional cold-air tubes, of small size, could be laid from the external air alongside the tubes leading to the inlets at *G* for supplying cold as well as warm air to the rooms through the inlets at *F* for regulating the temperature when desired. Screens of perforated zinc, or wire gauze, of different degrees of fineness, would be introduced in the inlets of the tubes which convey fresh air from the external atmosphere to the tubes *C* and *D*, for filtering the air of blacks, dust, and other impurities; and the bottom of these inlets would slope upwards and inwards in the thickness of the walls for discharging the filtered impurities outside the walls. The openings at *E* and *F* would be arranged so that a brush could be introduced and worked up and down in the tubes to remove dust, and thus keep them clean. Long diaphragms would also be fixed opposite the openings at *E* and *F*, to prevent the transmission of sound or communica-

tion from one room to another. The hot-water pipes would be of strong wrought iron with screw joints. These joints would be placed opposite the openings at *E* and *F*, so that they could be examined or unscrewed, and the pipes removed, when required. The air-tubes would be of cast or wrought iron, or stoneware, with sockets, or with flanges bolted together, so as to make the joints water and air tight. The warm-air tubes would be of the same size throughout; but the vitiated air-tubes would increase in size upwards in proportion to the additional quantity of air admitted into them from each floor. The warm air would pass into the rooms at *F* through perforated zinc or wire gauze, with slides for enlarging or contracting the openings at pleasure. The outlets for the vitiated air at *E* would be fitted with sliding ornamental gratings. The draught up the columns of tubing *A* and *B* would be so strong, by the heat given off by the hot-water pipes therein, that it would be scarcely possible for a down-draught to occur. But in order to prevent eddies heating down the tubes, they would be fitted at top with turn-cups, or surrounded with projecting hollow truncated cones or pyramids. Eddies striking against their oblique surfaces would be reflected upwards, instead of blowing down the tubes.

The boiler in the basement and the cistern in the roof could be connected by an ascending pipe, with separate air-passages, formed and holed on each side of it,—one serving to admit fresh warm air into the rooms, and the other to convey the vitiated air out of them, as previously described. The hot-water pipe would have sealed wings or diaphragms between the two air passages, so as to effectually cut off communication between them; and heat would be transmitted to each passage from the opposite sides of the hot-water pipe. With this combination of a hot-water pipe with air-tubes in one column, passing up through the staircase, or at any other convenient place, all the rooms of the house could be supplied with warm air, and thoroughly ventilated, by carrying pipes from the outer air into the warm-air passages, and thence into the rooms near the floors; and by leading other pipes from near the ceilings into the vitiated-air chamber, which would pass out through the roof into the open air.

In comparatively small dwelling-houses having only front and back rooms on each story, the rooms could be warmed and ventilated by two columns of tubing, similar to *A* and *C* in the diagram, placed in the dividing partitions, one for giving warm air to, and the other for taking vitiated air from, the rooms, and carrying a hot-water pipe direct from the top of the boiler up the vitiated-air tube *A*, to a cistern in the roof, and back again down the tube *C* to the boiler near the bottom. In large houses and mansions, with rooms surrounding a central staircase, two, three, four, or more pairs of columns of air-tubing could be built in the partitions or other walls dividing the rooms, and also in the walls at the sides and ends of large rooms, with hot-water pipes carried up and down within the tubing from the kitchen boiler, or from a separate boiler specially arranged for the purpose in the basement, to a cistern and cold-water supply arranged in the roof. Houses already built could be warmed and ventilated by this system, by fixing columns of air-tubing, shaped like pilasters, and occupying but little space in the angles or other parts of the rooms, and making good the cornices and skirtings round them. Hospital wards, infirmaries, barracks, and workhouses could also be agreeably warmed, and effectually ventilated by this system. Gentle currents of fresh warm and cold air could be brought into the sleeping and sick wards between the beds near the floors, and vitiated air discharged at the ceilings; and, in addition to this, hoods, with pipes leading from them into the vitiated-air tubes, could be placed over the patients, so that the exhalations from their lungs and skin would rise at once into the hoods, and pass away without being diffused through the air in the wards. However perfect the construction of water-closet apparatus may be, foul air escapes from them into the closets when the valves are opened, and also at other times. It is extremely desirable therefore that water-closets, especially stacks of them in hospitals, barracks, &c., should be well ventilated. This may be easily done by carrying a small column of tubing, with a hot-water pipe in it, up in the partitions or walls of the closets, with openings into it from under the seats, and at the ceilings. In this way the foul air would be effectually drawn off into the upper at-

THE WARMING AND VENTILATION OF HOUSES.

sphere. The drains could be ventilated by the same means.

The volume of air necessary to be passed through rooms, in order to thoroughly ventilate them, should not be less than 15 cubic feet per minute for each occupant. In ordinary dwelling-houses it would suffice to pass 45 cubic feet per minute through the rooms in the basement, 60 cubic feet through the dining and drawing-rooms, and 30 cubic feet through each bed-room. The air should move through the rooms to the discharging orifices in or near the ceilings with a velocity of 2½ feet per second, or 150 feet per minute. At this speed the movement would be gentle and almost imperceptible; and the rooms would be found after-occupation for any length of time as agreeable and salubrious as if they had not been occupied at all. The free areas of the orifices of supply to, and discharge from, the basements, to produce these results, would be in the basement rooms $\frac{1}{16}$ of a square foot; in the dining and drawing-rooms $\frac{1}{16}$ of a square foot; and in the bed-rooms $\frac{1}{16}$ of a square foot. It should be understood that complete interchange of air in rooms, to the above extent,

cannot be produced by *natural ventilation*; that is, by the small difference subsisting between the temperature of the air inside and outside of the house when no fires or lights are burning in the rooms. It can only be obtained by some *artificial power*, either for forcing fresh air in or drawing the vitiated air out; and no better, cheaper, and safer method can be adopted than that of hot-water pipes placed in air tubes carried up in the partition walls of buildings, as previously described. The vitiated air upon entering the columns of tubing is immediately warmed and expanded; and, in consequence, it acquires an ascensional power which is proportional to the height of the tubing and the difference of temperature between the air inside and the atmosphere outside. The areas of the tubes for discharging the air could be calculated from these differences of temperature.

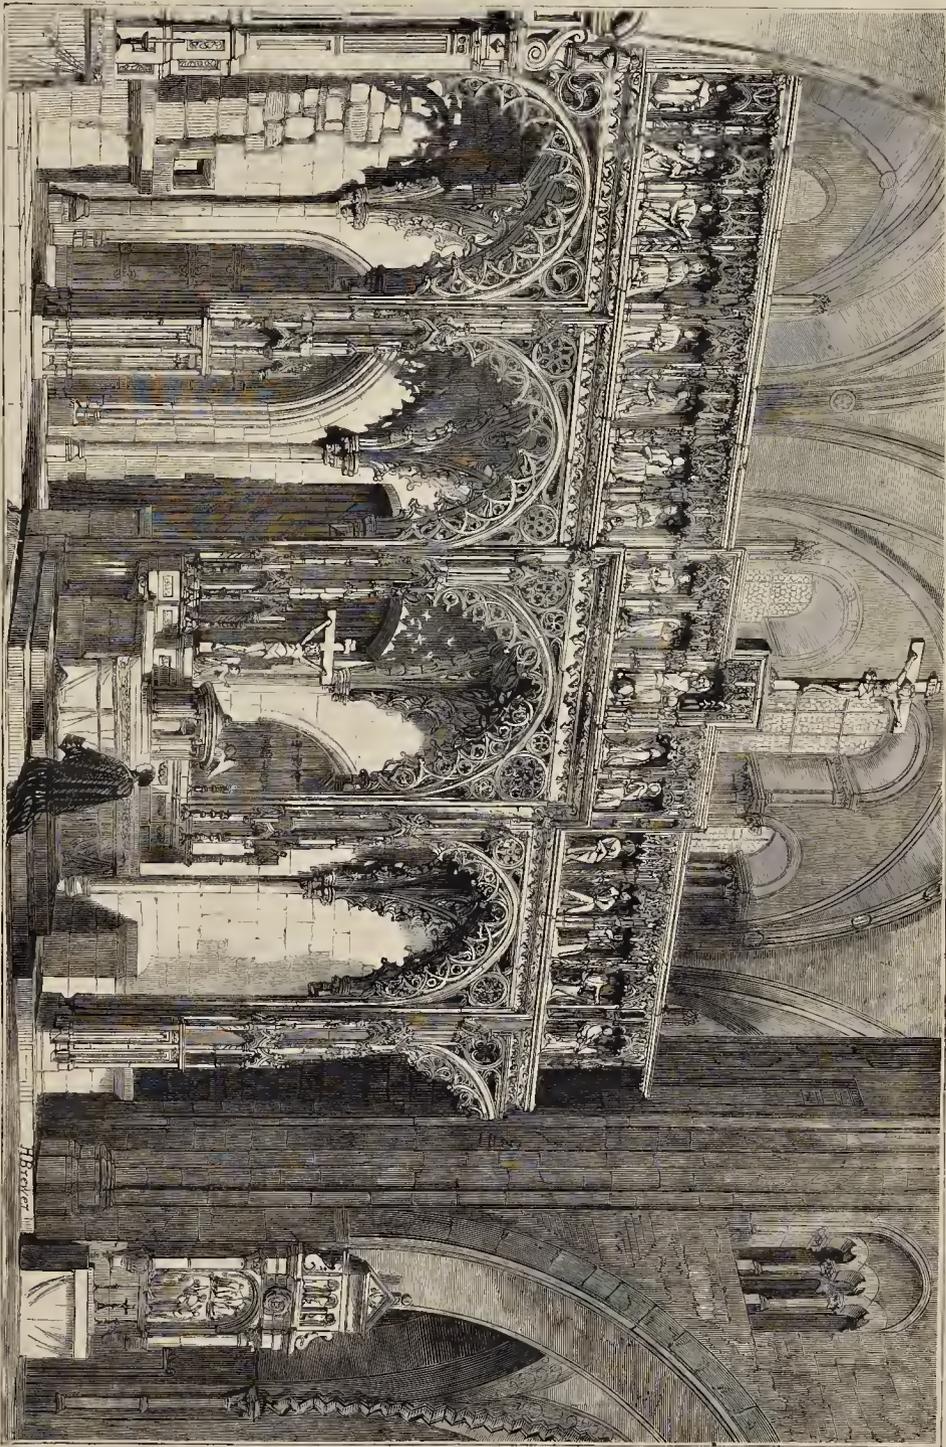

This system of warming and ventilating buildings is eminently practicable, and is adapted to every class of house, from the smallest to the largest. It is free from complication, easily put together, safe and certain in action, very economical, and not liable to get out of order

when properly arranged and constructed. As the hot-water pipes and the air-tubes would be contained within the thickness of the partitions, they would not be seen, and would occupy no space in the rooms. By this system, while fresh warm or cold air would be flowing into the rooms near the floors, vitiated air would be flowing out at the ceilings, and thus a constant interchange of air would be going on in the rooms, rendering them comfortable and salubrious.

CHOIR SCREEN IN MUNSIEKER CATHEDRAL, WESTPHALIA.

ROOD-SCREEN AT MÜNSTER.

A short time ago we published a letter from Münster, in Westphalia, calling attention to the fact that the elaborate rood-screen in the cathedral of that town was doomed to destruction, and begging us to bring the matter before the public in order to see if anything could be done to save it. From inquiries we have since made, and information recently received, we fear that the removal of this ancient monument is decided upon. As it seems useless to attempt to prevent this act of destruction, all we can do is to present our readers with a careful drawing of it in its present condition.

It is sad to think that this rood-screen should have escaped the Iconoclastic spirit of the sixteenth century, the mad rage of the Anabaptists, the scarcely less destructive Italianization of the seventeenth and eighteenth centuries, only to be destroyed in our own day, when works of Medieval art are prized and cared for. And what makes the matter more astonishing is the fact that the very people who have conceived this act of barbarity have shown themselves most enthusiastic church restorers. Witness the very judicious restoration of the cathedral itself, where the whitewash has been carefully removed from the walls, bringing to light many most interesting remains of ancient painting; the removal of the hideous and incongruous organ-gallery, the opening out of the exquisite arcades surrounding the western choir, and the destruction of the walls which built out the lower stories of the western towers. Nor has this zeal for the good cause confined itself to the cathedral alone; for the restoration of the Church of St. Moritz is one of the most costly and beautiful that has been yet attempted in Germany. The churches of St. Martin, St. Ludgeri, and St. Mary have also been restored, furnished, and decorated, in a satisfactory manner; and even the hideous seventeenth-century church of St. Giles has been beautified (as much as such a building could be), by the superb frescoes of Steinle. The new Capucine church and convent form a most picturesque and spirited little group of Gothic buildings; and, although the new Jesuit Church fails in detail, it is solemn in effect and well planned.

The only reason given for the proposed destruction of this rood-screen is the fact that it shuts out the view of the high-altar from the nave; and it seems to us that this might be very easily remedied by pulling down the solid wall which forms the back of the screen, and substituting in its place open arches (which has been done at Louvain, where there is a very similar screen), or piercing the wall with open tracery panels, and removing the three altars which occupy the centre and side compartments. We feel sure that, if this alteration were made, no great cause for complaint would remain, as what would be left of the screen would form no real obstacle to a view of the choir and high-altar.

We will now give a short description of this rood-screen as it at present exists. It is (as will be seen from our engraving) a rich specimen of the latest German Gothic, and was erected in the year 1490. It consists of a solid wall pierced with two doorways, in front of which stands an open arcade of five semicircular arches with open buttresses between them, and a series of richly canopied niches above them, twenty-one in number, and each containing a statue. The centre one represents "Our Lord in Judgment," and the twelve nearest the Apostles, from which this screen is called "Apostelgang." The vaulting which connects the wall with the open arcade is very irregular in construction: it is, in fact, a "skeleton vault," consisting of ribs only. Each rib is connected with the wall, from which it springs, by open tracery, so as to form a kind of bracket, and these brackets support a flat roof, composed of slabs of stone: a roof of the same construction exists over the baldachino in the Theysen Church at Prague. On the top of the screen is a gallery or passage about 8 ft. wide, which is approached by two "newel" staircases, contained in circular turrets, which are pierced with flamboyant tracery. These staircases are at the back of the solid wall of the screen, and are entered from the choir. This screen stands under the western arch of the "crux," so that the intersection-space is included in the choir.

In addition to this screen the Cathedral of Münster contains many other ancient articles of church furniture; for instance, a fine set of double stalls, early sixteenth-century work, two

noble stone tabernacles of the same date, a very ancient clock, a bronze font, a credence-table, and a number of reliquaries of the twelfth, thirteenth, and fourteenth centuries.

Our engraving is from a sketch made for us on the spot by Mr. Brewer.

THE ARCHITECTURAL ASSOCIATION.

The annual *conversazione* of the Architectural Association was held on Friday evening, the 30th ult., at the Rooms, in Conduit-street, when the chair was taken by Mr. W. White, who distributed the various prizes. The first on the list was for the best essay on the Effect of Literature on Architecture, awarded to Mr. L. F. Day; and the second to a gentleman who answered to his motto, "Buildings, not Books," and received his prize. Mr. Walter Ewll gained first prize for the best series of sketches in the class of Design, the second being awarded to Mr. W. L. Spiers. The prize for the best summary of subjects in the class of Construction and Practice, was adjudged to Mr. Bell, and for the best figure drawings to Mr. Lewis. Mr. W. Henman gained a prize for the best measured drawings of existing buildings in England; and two prizes for designs for a town church were awarded—the first to Mr. W. L. Spiers and the second to Mr. A. Hill.

A testimonial was then presented to Mr. D. Mathews, in acknowledgment of his services as hon. secretary.

The Chairman, in his address, dwelt at some length upon the necessity for a liberal education as a sound basis for the reception of art training, and went on to say that the converse of this proposition had begun to be also recognised, namely, the importance of art training as a portion of a liberal education. The late Sir Frederick Slade had left 45,000*l.* for the purpose of promoting this object, and a plan was likely to be now adopted by University College, which was to receive a large share of the means, for carrying out a comprehensive course of art study.

The address was much too long for the occasion, and had the effect of dissipating the meeting.

After the address, Professor Kerr made a few observations, and some music concluded the evening.

THE ARCHITECTURAL ASSOCIATION CONVERSAZIONE.

SIR.—There is one feature of this *conversazione* which I wish to bring prominently before the members; and that is, that Mr. Carne's drawings for the Royal Academy studentship were upon the walls. There were other members who went in for the studentship with Mr. Carne, and I was among the number,—but our drawings were not there because we did not think of sending them. I have a suggestion to make to the committee, which I want to reach the eyes of all members, and that is, that a certain portion of the walls of the gallery be allotted for the hanging of Royal Academy probationship and studentship drawings by members; and that a bill be fixed over these drawings to announce the fact that they are members' probationship and studentship drawings. This would show a little of what members do out of the Association; and I trust that all members will aid in the carrying out of this scheme. A MEMBER.

THE ARCHITECTURAL MUSEUM.

The following gifts of materials and decorative work have been received or promised. The donors well deserve the publicity we can give them. The Caen stone for the interior of the building by M. Foucard. A figure of St. George, carved in Sicilian marble, by Sig. Fabbricotti, from a design given by Mr. Redfern.

Terra-cotta busts for the front of the building by Mr. Blashfield; subjects being William of Wykeham and Sir C. Wren.

Red granite shafts for windows by McDonald Field, & Co., and Fraser & Son, of Aberdeen.

Patent steel sashers by Clark & Co. (a similar offer from Bunnett & Co. came too late).

Tiles for the front by Codwin, of Legwardine, from a design by Lord Alwyne Compton, and for the floor by Minton, Maw, Codwin, Oppenheimer, Rust, and Malkin. Patent painted tiles, representing two processions, for front of building, by Harland & Fisher.

Stained glass for windows by Clayton & Bell, Lavers & Barrand, and O'Connor.

Iron-work for screen by Hardman, Peard & Jackson, Brown & Downing, Hart & Son, and Richardson, Slade, & Ellison.

Window casements by Burt & Potts.

A large patent stove by the London Warming and Ventilating Company.

A sun-burner by Strode & Co.

Mosaic-work by the Salvati Company, from design by Clayton & Bell; also mosaics given by Rust & Co.

Marble mosaic by Harland & Fisher.

Coloured decoration by Mr. Charles Hudson.

Carvings by Messrs. Poole & Son, being the seal of the A. M. and the heads of the architects of the Parthenon, and of St. Sophia and of William of Sens; and by Messrs. Rattee & Kell and Mr. Whitehead.

Two large figures, representing Architecture and Sculpture, by Mr. Earp and Messrs. Farmer & Brindley.

Furniture by Cox & Son and Mr. Chapman (an art-workman).

Tracery over door and door-frame in oak by Rogers & Booth, of Gosport.

Six iron principals for roof by Kalk & Lucas. Lamps for entrance, and patent springs for screen, by Hart & Son.

Washing convenience by Jennings.

Stain and varnish by Mr. Swinburn.

The Council expect to move the collection from South Kensington in January, 1869, when it will be at once enriched by fine specimens taken from various cathedrals by Mr. Octavius Hudson, some from Westminster Abbey and other places by Mr. Scott and Messrs. Poole & Son, and a complete set of figures from Henry VII.'s chapel, presented by Mr. Brucciani.

The present income from annual subscriptions will be utterly inadequate for the maintenance of the Museum in its independent existence, and ought to be at once increased by 200*l.* or 300*l.* a year.

A committee for considering the best means of ensuring practical teaching by the collection has been formed, and with such a collection the Council look to the architectural world for substantial support in carrying out their various aims.

AGRICULTURAL LABOURERS' COTTAGES.

THESE have been recently erected at Down Hall, in Essex, by Mr. Selwin Ebbatson, M.P., several cottages for agricultural labourers, each cottage containing a living-room, scullery, and three bed-rooms, with an equipment of offices and fittings, including hard and soft water supply. Some of the cottages have all their sleeping-rooms on the chamber-floor, while others are arranged with one of the bed-rooms on the ground-floor. The cottages have been built with Cambridge perforated bricks, relieved with hands of Staffordshire red and black bricks. The roofs are covered with Huntingdonshire tiles of an ornamental character, having projecting eaves, gables, and porches. The works have been carried out by Messrs. Bell & Son, of Cambridge and Safron Walden.

Similar cottages have also been erected on the estates of Mr. R. P. Long, M.P., near Chippenham, in Wiltshire, built of dark-red bricks and covered with Bridgewater tiles. The works have been carried out by Mr. George Bezzant, of Chippenham. Similar cottages have likewise been erected near Wallingford, Berks, for Mr. N. Humphrey, and in Cheshire for Mr. W. Wright. The several works have been carried out from the designs and under the directions of Mr. John Birch, whose plans have also been adopted by the Duke of Rutland.

HUDDERSFIELD CONVALESCENT HOME.

MR. CHARLES BROOK, JUN., J.P., a member of the firm of Brook Brothers, thread manufacturers, of Meltham Mills, near Huddersfield, having given the munificent sum of 30,000*l.*, to form a convalescent home at Huddersfield, the foundation-stone of this edifice has just been laid, with Masonic honours.

The Home is to stand on the summit of Meal-hill. The site is a portion of fifteen acres, and the prospect it commands is charming. Meal-hill is approached by a road branching from the Holbarn and Holmfirth turnpike road.

The style of architecture adopted for this hospital is of the domestic Gothic character, with a few modern developments. The main

ront will face north-east, and be about 190 ft. long. The centre part of this will project a little, and be devoted to the administrative department, and will contain, on the ground floor, a central entrance, with matron's parlour, surgeons' consulting-room, and patients' waiting-room. The wards branch out right and left, for each sex, and consist, on the ground floor, of capacious staircases and corridors, which, being on the south side of the building, will be agreeable for the invalids in bad weather, leading to the convalescent day-rooms and night-wards for the infirm. The patients' entrances from the recreation-grounds will be to the main staircases, under covered glass porticoes. Extending further south-west is a dining-hall, with the kitchens, pantries, and store-rooms beyond. On the first floor, the central part contains the matron's and nurses' lodgings, and store-rooms for bedding and linen. There are two night-wards for each sex, which are divided by low partitions, 8 ft. high, for privacy, each apartment accommodating two beds. There are lavatories and bath-rooms, furnished with hot and cold water. There will be accommodation for thirty males and thirty females, and the hospital will be so arranged as to be capable of enlargement. The apartments for the domestics will be over the kitchens. The buildings are to be constructed of Yorkshire stone, from designs prepared by Mr. Edward Birchall, architect, Leeds, and will be carried out under the superintendence of Messrs. Kirk & Sons, architects, Huddersfield.

BRADFORD HOUSE OF RECOVERY COMPETITION.

THE designs for this building have been on view. The instructions issued to the architects were that the general arrangement of the hospital should be on the pavilion system.

Messrs. Lockwood & Mawson present two designs, the one Gothic and the other Italian. Their designs illustrate the pavilion principle, developed in two modes of arrangement, both with the pavilions on lines from north to south, and therefore with east and west aspects to the wards. The buildings are two stories in height. Each ward, to contain twelve beds, would be 60 ft. long, 25 ft. wide, and 16 ft. high, with 24,000 ft. cubical contents, allowing 2,000 ft. to each patient, and also a private ward, containing nearly 3,000 cubic feet. The architects state their "opinion that 100l. per bed is sufficient for the cost of the sixty patients provided for in the design, or the sum of 6,000l." for the structure, and the separate building, for twenty patients, they estimate at 50l. each, making an extra sum of 1,000l.

Mr. E. Birchall's design is Gothic, two stories in height, with the administrative department in the centre, and the wards at either side, connected with the central building by corridors. He gives accommodation for fifty-two patients, the wards on either side in each story for twelve patients, who have each rather more than 2,000 cubic ft. of air, and a small ward is shown, capable of accommodating one patient. The wards run nearly north and south. Mr. Birchall considers that it could and ought to be built at a cost of 100l. per bed, but thinks that the sum might advantageously be raised to 150l. per bed.

The selected design, by Messrs. Andrews, Son, & Pepper, is treated in a different manner from the others. Their first design shows a two-story building, but in their second the wards are only one story. In the centre of the front pile of two stories, which partakes somewhat of the Gothic style, is the administrative department, where apartments for the board-room, the waiting-room, the surgeon, the matron, and other officials are located. The front faces to the north. The convalescent wards are placed right and left of the centre. The acute, or fever hospital wards, four in number—two for males and two for females—are in the rear, and on the south side of the administration, each ward having a south, east, or west aspect, and shut out from the north. The wards are each 60 ft. long, 25 ft. wide, and 16 ft. in height, lighted by five windows on either side, the space between each ward being three times their height, and they will each accommodate twelve patients. The wards will be warmed by Pierce's stoves, Sheringham's ventilators and other means being used to secure a proper supply of fresh air, and the top of each window fitted with fixed open panes of glass. The wards are attached by closed corridors of wood and glass, roofed with

slate, and another corridor leads from the administration. Each patient will have more than 2,000 cubic feet of air space, and the walls of the ward will be covered with cement, and the floors be of oak, the roof and window-frames of iron. Sixteen patients can be accommodated in the convalescent and fifty-two in the acute wards, and the cost of the building will be about 110l. a bed, or 8,000l.

NORWICH LUNATIC ASYLUM COMPETITION.

SOME months ago the corporation of Norwich invited Mr. Brown, of that city, and Mr. R. M. Phipson, to submit designs for the proposed New Lunatic Asylum, and those gentlemen accordingly did so. After some discussion, the council referred the plans to Dr. Robertson, of the Sussex, and Dr. Campbell, of the Essex Lunatic Asylum, in the state in which they were received by the committee, and each of these gentlemen was asked to give his independent opinion as to which set of plans would be the best calculated to meet the views which the council had in erecting the Borough Asylum of this city. Both these gentlemen reported strongly in favour of Mr. Phipson's plans, and at a meeting held on the 31st ult., the town-council adopted them.

The reasons given by Dr. Robertson as those on which he grounds his preference are suggestive, and may be useful to other designers:—

"1st. Mr. Phipson's plan in its general features and design is original in conception, and an advance on the present standard of asylum architecture in the direction in which the medical superintendents of asylums have long pointed, viz.—

- The means of classification and distribution of the patients is complete.
- The day rooms are all on the ground floor; it greatly facilitates the working of the house.
- There are no complicated dark corridors to intercept ventilation.
- The access to the wards from the centre block is simple and ready.
- The thorough ventilation of the wards by natural means is insured.
- The arrangements for the wards, offices, w.-o.s., &c. are of the best construction.

2nd. The general distribution of the buildings specially commends itself to my approval, and stands in marked contrast to the ill-designed crowding of the different buildings in Mr. Brown's plans.

The division into administration block, wards, dining-hall, laundry, workshops (with accommodation at the two latter for working-patients) is very complete, and a clever application of the pavilion system to the works of an asylum.

3. Above all, these arrangements of Mr. Phipson's commend themselves by the great facility which they offer for convenient and economical extension of the building, should such want arise (as in all asylums it has done)."

HERTFORD LABOURERS' COTTAGE COMPETITION.

STR.—In reply to your correspondent "Competitor" on this subject, I had my drawings returned safely (two sets), with letter, stating that the premium was awarded on the day of the Agricultural Show to Mr. W. H. Scriven, of Leamington. COMPETITOR 80 and 81.

CONCRETE HOUSES.

STR.—Referring to a letter by "Artifex" in your journal, page 788, relative to the fall of a concrete house at Twickenham, I beg to forward you plans of the building, so that you may form your own opinion; and I challenge "Artifex" to erect a house with 14-inch walls in ordinary brickwork built at the same rate per day that this concrete house was, without the same result, i.e., the penalty of falling down by the time his walls are 38 ft. high. First, "Artifex" informs you he found on inquiry the work had been superintended by me. This statement is entirely false: I saw the building once only before I was informed that part of the front wall had fallen. At the time I saw the building the walls were 9 ft. high only, and ready for the joists. The first defect in construction I complained of was the large recesses at each quoin of the building as shown on plans, and informed the clerk of works it was an absurdity to nearly sever the walls in such a manner, especially where the strength was so very essential. I was informed the space was left for a 5-inch water-pipe. I requested him, before proceeding further, to obtain the pipe and put them in with neat Portland cement without delay, but, instead of doing so, the building was

carried up 38 ft. without joists or any tie whatever; and, to make matters still worse, all the quoins were chamfered off to one-third the thickness of the wall for an ornamental water-spout. I beg to call your attention to the back front, 40 ft. by 38 ft. high, with its large openings, and without any cross wall, joist, or tie of any description. Further, I must ask you to notice the long party wall, and ask if it is practical building to construct this main stay recessed in the manner as shown for cupboards, &c., leaving only 4½ in. of concrete work at the back.

The clerk of the works informed me that the part in front which first gave way stood on the most treacherous foundation, indeed it was a complete quicksand. I must also mention, that although the gravel was some of the finest I ever saw, being clean and sharp, the proportion of sand was far too great. Had I superintended the construction I should have passed the gravel through a ½ screen: see my pamphlet.

Last, but not least, the quality of the cement was of the very worst description. There are a number of good cement manufacturers who supply cement of a quality to be depended upon. If builders will go to dealers (who must have profits), and not to manufacturers, what result can they expect? I should certainly recommend intending builders in concrete for the future to buy of the makers, and I shall at all times be ready to give them names of those I can confidently recommend; also to give advice as to the mixing of gravel concrete, which requires different treatment to burnt hallast or other material.

I attribute this failure to the defects in the construction, each sufficient of itself to cause such an unfortunate result to the proprietor.

And now, sir, in fairness and justice to myself, permit me (if I am not trespassing too much on your valuable space) to say "Artifex" is either prejudiced against Portland cement concrete or ignorant of its adhesive strength, or he would have been more candid in his communication, and mentioned that the walls were carried up 38 ft. without joists or ties of any description, and the four large chases for rain-water pipes could not possibly have escaped his notice. He then states, "I noticed that the work had broken in straight courses evidently at the level at which the machine had been shifted, showing imperfect adhesion at this point. This is, undoubtedly, a grave defect, caused by the wall being formed in layers or courses of 18 in. in height, and one layer setting before the next was added."

If, at any time the work has been standing still for a month, all that is required is to well moisten the top of the wall or mix the first 3 in. or 4 in. of concrete with more water, or a little thin grout; but this operation is not at all necessary where the work is green,—as it must be, if carried on every day. Again, concrete is always left rough at the top of the mould, and (not like smooth brick) giving a sufficient key for the next layer.

To prove the adhesive qualities of Portland cement concrete, I can show at my factory (built between two party walls of 12 ft. span) a beam, 2 ft. 3 in. deep and 6 in. thick, packed full of rough Kentish rag, large chippings from flint runs, Yorkshire stone, and brick-bats, which can be seen on the face, which beam will carry 12 tons (if the walls which form the abutments do not give way).

Lastly, I will forfeit to "Artifex" 50l. if I do not break an opening in any ordinary brickwork (not hie lias lime) in any warehouse in New-street, Southwark, in one-fourth the time "Artifex" can in the concrete warehouse now building in Great Guildford-street, Southwark, he being liable to me for the same amount if I am successful. J. TALL.

THE following letter, which we received last week from the owner of the house, puts a different face on part of the transaction as between himself and the patentee:—

"Sir,—Considerable notice having been lately taken in your columns of the accident to my house, I send you its history.

A few months ago, I was induced (from a perusal of Tall's pamphlet on his new patent machine, &c.) to erect a four-storied house in concrete. I therefore purchased the machine, at a cost of nearly 130l.; engaged a "clerk of works" a man from Tall's office, and solely on his strong recommendation (a man, it was said, next to the method and material); and in all details followed the instructions given in the pamphlet.

As to materials, I used Thames gravel and Little's cement, both of which received continual praise; and the walls, when at the third story, were visited by the patentee, and pronounced to be "very good." Nevertheless, one wall suddenly collapsed, and the remainder

proved so un sound that the whole had to be pulled down. The rains throughout showed no "blocks" of concrete, but simply wore as rubble out of a gravel-pit. In addition, the patentee, who covenants in his pamphlet, said on his bill of sale, to take back the machine (when a house is built) at half-price, takes advantage of the accident, and leaves it on my hands.

I tell the tale that others may profit thereby, and be doubly cautious—as the invention is still in its infancy—in their choice of machines, agents, and materials.

Twickenham.
Geo. LARSEN, D.C.L.

We cannot meddle with any personal differences, but we have no hesitation in saying that the unlucky accident at Twickenham tends in no way to disprove the belief that concrete, properly compounded and properly applied, will make sound, strong, and enduring walls. Our knowledge of concrete, and faith in it, date from many years ago, and we are perfectly assured that in many situations it may be most economically and satisfactorily employed.

The warehouse in Great Guildford-street, Southwark, is 70 ft. one way, 50 ft. the other, and is to be 60 ft. in height. The concrete there is compounded of crushed slag, gravel, burnt clay, and Portland cement, in the proportion of one of cement to six of the other mixture. We saw a piece cut out of the lower story, and found it as hard and as solid as stone. Where it is intended to make the walls lofty the work ought not to be hurried.

THE NUMBERING OF HOUSES.

Sir,—In reference to this subject mentioned in your last issue, will you allow me to suggest to a few enterprising fellows how they might promote the convenience of the public, and at the same time benefit themselves? Miles of houses in London and its suburbs are fitted with fanlights over the door which are illuminated by the hall gas at night. Let a man call with the requisite materials—say moveable figures, with cement for fixing them—at every house, and I believe a very large proportion of occupants would be only too glad to have the work done at once. The cost could not be great.

NUMBER FOUR.

POPULAR AND STEPNEY SICK ASYLUM.

Sir,—In your list of the estimates submitted by the architects competing for this work, you quote only one of my estimates, and that the highest.

I submitted two estimates, the lower sum being 47,000*l.* There are thus but two architects whose estimates are lower than mine. The sums named by these gentlemen are about 12,000*l.* below me, and 15,000*l.* below any of the other competitors.

Such extreme variation in the estimated cost of designs, which provide, of necessity, much the same clinical content, shows how essential it is to a just decision that all the competing designs should be submitted for valuation to the same surveyor.

You consider my elevation ugly. You have a right to your own opinion. It is, however, fair to mention that the first of the instructions to competitors directed that the building should have "no architectural pretensions whatever." I have endeavored to carry out this instruction.

G. GILBERT SCOTT, Jun.

FALL OF HOUSES, HOLLOWAY.

Sir,—Seeing in your paper of the 24th ult. a notice of the fall of three houses in the Holloway-road, Upper Holloway, and being interested in similar buildings adjoining, I must ask you to give the names of the builders of the said houses, viz., Messrs. W. & R. Carter, as it is very detrimental to the letting or selling of property adjoining to leave this in doubt.

A LOVER OF FAIR PLAY.

METROPOLITAN BOARD OF WORKS.

Finsbury Park.—A deputation appointed at a public meeting in Finsbury attended the Board at its last meeting to present a memorial in reference to the proposed buildings to be erected in Finsbury Park. The deputation was a numerous one, and was introduced by Messrs. Savage and Eli.

The memorial stated that the memorialists had heard with great surprise and regret that the Board had resolved to purchase 131 acres of land only for the purposes of Finsbury Park, instead of 250 acres, as authorized by the Act of 1857, and that 20 acres were to be appropriated to building purposes.

The Chairman said that there was a clause in the Bill enabling the Board to reduce the area sought to be obtained, and they adopted that course rather than abandon the Bill; but the circumstances were altogether changed, as the

park had to be formed entirely at the expense of the ratepayers.

After some discussion, and several motions, the Board finally resolved, by a majority of 15 to 12,

"That no reason whatever had been shown that the usual course should be departed from, and that the memorial be referred to the Works and General Purposes Committee for consideration and report."

Illegal Practices by Scavengers.—A report was brought up from the Works and General Purposes Committee, recommending

"That the Board do offer a reward of 2*l.* 2*s.* to any party or parties giving such evidence as shall lead to the conviction of scavengers and others detected in sweeping refuse into the gullies, shafts, and other works connected with sewers, and that the several vestries and district Boards be requested to co-operate with the Board by prosecuting the parties charged with reference to their sewers."

Mr. Thompson said that this practice in the parish of Clerkenwell, which he represented, cost them thousands of pounds, and he trusted that a clause would be inserted in some Bill they might promote in the coming session of Parliament empowering them to prosecute the employers of these men.

The recommendation was put and agreed to.

THE TRADES MOVEMENT.

A CIRCULAR has been sent by the secretary of the General Builders' Association to all their local branches, inclosing this form of address to be sent to operatives:—

"Name of town.....
Date.....
To the operative..... of.....

We, the master builders employing operative..... do hereby give you notice that we require the following alterations in the trade rules now in force in this district:—

I. The rules relating to the reckoning of time and quarter time, and the payment of wages, are to be altered and rescinded, and in lieu thereof the following is to be the rule:—

Rates of Wages.

That the following shall be the ordinary rates of wages for skilled operatives. Superior and inferior workmen to be rated by special agreement.

The men who have hitherto been paid..... per week, shall be paid..... per hour.

II. Any rule or custom forbidding or interfering with the employment or use of machinery or machine-worked materials is to be abrogated and entirely done away with.

III. Any rule or custom forbidding or interfering with the introduction or use of stone worked at the quarry, or anywhere else than the place where it is to be used, is to be abolished and done away with.

IV. That all trade rules, disputes, demands, and differences shall be settled for the future by conciliation or arbitration, and proper courts shall be constituted for the purpose.

And we hereby further give you notice that we are prepared at any time, upon six days' notice from you, to meet you, and publicly severally appoint our arbitrators, and mutually agree to construct the said floor as directed, and leave to the decision of the arbitration court thus appointed not only all future settlement of trade rules and disputes, demanding any assistance, but also the settlement of all matters contained in this notice and in the notice received from you.

And we hereby further give you notice that we require the alterations contained in this notice to be carried out on the 1st of May, 1869, or on such other day as is mentioned in the existing rules as the day upon which new or altered rules shall come into force.

Signed, on behalf of the master builders."

PUBLIC BUILDINGS AND THE BUILDING ACT.

ROYAL ALFRED THEATRE.

On the 27th of August last, a summons was heard at the Marylebone Police-court, and which was reported in our columns, in which Mr. Peebles, district surveyor of North Marylebone, charged Mr. Simpson, builder of the Royal Alfred Theatre, with constructing the floors of the corridors leading to the boxes upon the first gallery, and also the floor at the back of the said gallery, with combustible materials, contrary to the Metropolitan Building Act; and with omitting to construct the said floor with stone or other fireproof material, and carried by supports of a fireproof material, as required by the said Act. After a lengthened investigation, Mr. D'Eyncourt ordered that the works considered necessary by the district surveyor should be carried out by Mr. Simpson, and the necessary order was signed.

On the 27th ult. the district surveyor attended before the magistrate, to press for penalties against Mr. Simpson, for refusing to obey the magistrate's order. Having been sworn, Mr. Peebles said that defendant told him he had obtained counsel's opinion that Mr. D'Eyncourt's decision was wrong, and he should proceed with the building without carrying out the order. His (the surveyor's) clerk wrote to the defendant, asking that plans should be sent, as required by the 38th section of the Building Act, and also suggesting an appointment; but defendant took no notice of it. He was not even in court that day. The theatre was not open, with the regulations imposed by law were set at defiance.

A legal gentleman applied for a fortnight's delay on behalf of defendant, and promised that the order would be carried out by the defendant. Mr. D'Eyncourt reluctantly consented, but said if the Act of Parliament was not bona fide complied with by defendant without delay, the whole fines imposed for each day's non-compliance would be resolutely enforced.

SURVEYOR FOR METROPOLITAN POLICE.

Mr. T. C. SORBY, on account of the increase of other duties, has resigned his appointment as Surveyor to the Metropolitan Police and Police Courts; and Mr. Caiger, the Deputy Surveyor, has been appointed by the Secretary of State to the vacancy.

The principal buildings erected, and erecting from the designs of Mr. Sorby, are the Lambeth Police Court, Police Stations at King's-cross-road, Vine-street, Wapping (High-street), Blackman-street, Hammersmith, Rochester-row, Lea-bridge, Bedford, Richmond, and Ealing.

WASHABLE INDIAN INK.

ARCHITECTS and draughtsmen generally know the difficulty—in fact, impossibility—of obtaining Indian ink that will not run when coloured over. Mr. Stanley, of Great Turnstile, Holborn, has produced an ink which he describes as being simply a solution of redissolved Chinese ink, to which is added a chemical mullage that renders the ink insoluble after it has dried upon the paper. We have practically tried this with the most severe test—namely, on tracing cloth. When the usual Indian ink is used on this material draughtsmen know the result, if any attempt be made to colour over it: consequently the colour has to be applied to the back of the drawing. The new ink will neither wash up nor blur. We have tested it also on parchment, with the same satisfactory result.

As to the intimate action or effect of the chemical mullage employed, we know nothing; but the truth of the statement made by Mr. Stanley—that it will not wash up or blur, we can from practice safely substantiate; and we make this clear expression of our opinion because we believe the ink will be a boon to the architectural and mechanical draughtsman. In other words, this really is an invention that "will wash."

CHURCH-BUILDING NEWS.

Windhill (Bradford).—The memorial stone of Christ Church, Windhill, the erection of which was begun last spring, and which is now rapidly approaching completion, has been laid by the Bishop of Ripon. There has long been an increasing demand for church accommodation in Windhill. Mr. F. S. Powell, M.P., Mr. M. W. Thompson, M.P., and Mr. Benjamin Wood have contributed 250*l.* each; Mr. W. R. C. Stansfield, Mr. Edward Salt, Mr. G. Hargreaves, and Mr. Joseph Wood, 100*l.* each. A grant of 500*l.* has been made by the Ripon Diocesan Church Building Society, and of 120*l.* by the Incorporated Church Building Society. The total amount of the contributions from all sources was 3,200*l.*; and the cost of the new church, including the site, will be about 4,200*l.* The sum of 4,200*l.* does not include the cost of the spire (700*l.*), which will be erected when the funds permit. The site is on the south side of the turnpike-road leading to Idle. The body of the church is 75 ft. long and 56 ft. wide, and is divided into a nave and side aisles by circular stone shafts, having carved capitals supporting pointed arches in stone. Above, four circular windows on either side in each clerestory admit light into the nave; and the aisles have painted windows arranged in couples. The chancel, 35 ft. long by 23 ft. wide, opens from the nave by an arch the full width of the chancel. At the east end of the north aisle provision has been made for a tower, in the lower part of which the vestry is placed, separated from the chancel by an arched screen. Above is the organ-chamber, and a corresponding extension of the south aisle contains seats for the school children, with a chamber underneath for the reception of the beating apparatus, by Hayden, of Trowbridge. The end of the chancel is semi-circular, and will be lighted by seven long lancet windows. The roofs of the nave and aisle will be formed of framed timbers, supported upon stone corbels, and the spars will be visible. The roof of the chancel will be divided by moulded ribs and panels, plastered and prepared for colour. The seats will be open, and all the internal wood-work stained and varnished. Messrs. Andrews, Son, & Pepper, of Bradford, are the architects.

North Otterington.—The new parish church for North Otterington has been consecrated by

the Archbishop of York. The old parish church is situated at the extremity of the parish, nearly three miles distant from the bulk of the population, who reside in the township of Thornton-le-Moor. In consequence of that it was decided to build a new church in that village. Here was an old parochial chapel, supposed to have been built in the thirteenth century, but in the year 1811 divine service ceased to be performed in it, and the building, lost to the church, was used as a school-room and cottages for poor families, the chamber-flooring of the cottages being formed of the old pews. The eastern part of the building was the school-room, and remained in charge of the schoolmaster till 1837. Shortly after this the dissenters, having got possession, used it as a place of worship. The late vicar (the Rev. F. Starkey), supported by Sir Samuel Crompton, endeavoured to recover the building, but failed. Upon the appointment of the present vicar (the Rev. F. Seale) legal measures were taken for the recovery of the building, and this was accomplished. The old chapel was pulled down, and the new parish church (the foundation-stone of which was laid by Lord Greenock last autumn) was erected on the site. The designs for the building were supplied by Messrs. Atkinson, architects, York. It consists of a nave, chancel, and vestry at the north-east, porch at the south-west end, and bell-turret at the west end. The style is Early English. The east window is a reproduction of the east window in the old chapel. The outer walls of the church are rough Bradford sets, with Osmotherly stone facings; the inner walls are lined with pressed red bricks, varied with courses of black brick. The church is fitted with stalls of stained deal; the nave with open benches; the floors and pews are laid with encaustic tiles. The cost of the building has been £1,500, exclusive of the old material.

Tintagel (Cornwall).—It is proposed to restore part of Tintagel Church as a memorial of the late Mr. Douglas Cook, of the *Saturday Review*.

Camplen (Gloucestershire).—The Gainsborough Memorial Chapel of St. Michael's, Broad Campden, has been opened by special service. The church, which has been built after the design of Mr. John Fritchard, diocesan architect of Llandaff, consists of a nave and small apsidal chancel, with a bell-turret.

Harmston (Lincolnshire).—All Saints' Church, Harmston, has been re-opened. The restoration, or rather the reconstruction of this church, consists in new roofs to nave, aisles, and chancel, new windows throughout the whole fabric, glazed with cathedral glass of green and gold; new open seats, the raising of the chancel floor, the erection of a screen and a pulpit of Ancaster stone and Welch marble shafts. A reredos has been placed in the chancel, with white marble cross, the stonework illuminated by Messrs. Beh & Redfern. The work has been carried out from designs of Mr. R. J. Withers, architect.

Preston (Suffolk).—St. Mary's Church, the tower of which fell in 1863, has been partly rebuilt and re-opened for divine service. The church overlooks the valley of the Brett. It is of mixed architecture, principally Decorated, with Perpendicular windows, &c., inserted. There is a nave, with aisles and clearstory, west tower, north porch, and vestry. The church is built of flint and stone, with flush panelling. There are clustered piers in the nave, the shafts pear-shaped and filleted, with moulded bases and capitals. There were formerly a number of coats of arms, in stained-glass, in the east window, which were removed, and are now inserted in the clearstory window. The east window is in three lights, of geometrical tracery, and of stained glass, with Christ, as the Good Shepherd, in the centre, and the Sower and Reaper on either side. The side windows are Decorated two-light ones, with angels in the centre bearing labels. In the tracery of the side windows, and those at the east end of the aisles, are angels with extended wings, holding scrolls. The west or tower window is Perpendicular, also of stained glass, with Christ, in the attitude of blessing, in the centre, supported by Moses and Aaron, thus representing the Law, the Priesthood, and the Gospel. These windows are the work of Messrs. Ward & Hughes. The staircase to the roof-loft is blocked up, possibly done in the first instance, like that in the church of Rickinghall Superior, by a churchwarden in the brick trade. The restorations effected have been extensive, almost amounting to a rebuilding of the church. The greater portion of the tower is entirely new, and part of the walls of the aisles; and there is a new vestry on the northern side. The roofs

are also new; those of the nave and aisles nearly flat, with moulded timbers and carved bosses and corncices. The chancel-roof is wagon-shape, fourteenth-century style. All the internal stonework has been cleaned and restored, and the walls replastered. The floors are paved with Minton's tiles. The church is heated by hot-water apparatus. On the side walls are quaint paintings that doubtless were considered, when executed, very fine and appropriate. One contains the Royal arms, with many quarterings, of "Good Queen Bess," with the inscription beneath, "Elizabetha Magna, Regina Anglia." The works were carried out by Mr. Tooley, of Bury St. Edmund's, under the superintendence of Mr. A. Blomfield, architect.

Brixton.—The new church of St. Jude, recently built in Brookwell Park, Water-lane, Brixton, and which has already been illustrated by engravings in the *Builder*, has now been consecrated by the Bishop of Manritius, who officiated for the Bishop of Winchester. The new edifice is built of stone. It affords accommodation for the sitting of 1,000 persons, and one-third of the sittings are free. The cost of the building has been 6,000*l.*, raised by subscription in the neighbourhood. In addition to the information already given, we may here note that Mr. Plows sculptured the pulpit and reading-desk, and the font, from detailed drawings by the architect, Mr. Robins; and that Caen stone, red and green Irish marble, alabaster, and red Mansfield stone, are the materials employed in them, with polished oak door and book-boards, &c. Messrs. Maw & Co.'s tiles are used for the reredos throughout. The tablets are built up of tiles, the lettering being burnt in, so that the reredos is as permanent as the tile paving of the chancel, the walls of which the architect hopes some day to colour in devotions in a similar manner to those recently completed at Christ Church, Battersea.

Books Received.

Rudimentary Treatise on the Manufacture of Bricks and Tiles, containing an Outline of the Principles of Brickmaking. By EDWARD DONSON. Fourth Edition. London: Virtue & Co., Ivy-lane. 1868.

This work, originally useful, has been made more valuable, first by the revision of Mr. C. Tomlinson, F.R.S., and now by the additions of Mr. Robert Mallet, F.R.S., who has given some particulars of the greatest invention yet made in respect of the Drying and Burning of Bricks, viz., Hoffmann's kiln. It is the best handbook on the subject at present available; but a better may be made by-and-by, by bringing together the information on various heads, which in the volume as it now stands is scattered. Additional information also is needed as to moulded bricks, coloured and enamelled bricks, and the mode of cheapening them; also as to the value of covered works, and the improvements that are needed in the manufacture of bricks generally. Brick-making is not by any means in the position amongst us in which it should be. Good bricks at a much less cost than is now enforced ought to be obtainable.

We can safely recommend the little book before us as a good investment for 3*s.*, and we advise our young readers, who are constantly writing to us for the titles of cheap books that would be useful to them, to get Messrs. Virtue's list of their "Rudimentary Series," wherein they will see the titles of many works they ought to have.

VARIORUM.

A PAPER "On Mechanical Saws," read before the Society of Engineers. By S. W. Worsam, jun. There is much practical information in this paper as to saws, files, filing machines, saw frames, &c.; and the paper is illustrated by numerous engravings.—"The Increase of Material Prosperity and of Moral Agens, compared with the State of Crime and Pauperism." By J. H. Elliott. This is a reprint from the *Journal of the Statistical Society of London*, September, 1868. The paper is thoughtful and suggestive,—all the more suggestive perhaps that one cannot agree with all the author's opinions. We should not like, for example, to see people going about the streets armed for self-defence against thieves: it is easy to foresee what that would lead to: street brawls are bad enough at any

time without deadly weapons to aid and provoke them into fatal results. The author treats of various important subjects, such as the poor-law, education, wages, emigration, crime, charity, &c. He is of opinion that in England there ought to be but one charity in the whole land, that is, the national poor-law. On the subject of wages, he deprecates the pretence of mental improvement as an excuse for shortening the hours of labour, as a short sham. "Advance wages," he says, "and shorten labour if you will, but do not believe that much use will be made thereof for mental improvement." As regards the expenditure of wages, some sad facts are referred to. He speaks of "men engaged in the City who have wages of from 1*5s.* to 1*6s.* a week, but make with fees 4*0s.* to 4*5s.* weekly. If they take home 1*5s.* for the wife out of 1*6s.*, keeping one for themselves, they think they make fair contribution: they say nothing of the 2*4s.* to 3*0s.* extra. Men who two years ago employed six days in the week at 4*0s.* to 5*0s.* gave the *smallest* sum to their family on which they could drag on, and now that they get work only four or five days in the week, their families are no worse off, for they always did and do get only the minimum: the man himself has less drink."—"County Court Reform." By G. M. Wetherfield, solicitor. London: E. Wilson, Royal Exchange. Why the County Courts are a failure, and do not pay their own expenses by more than a quarter of a million, is the chief subject to which, and to its remedies, this pamphlet relates. Its special purposes are:

"To prove that the main cause of failure is in the high rate of court fees; to show that the system of procedure, as other tribunals, is its own enemy; to point out the great inconvenience of a compulsory trial in all cases; and to suggest two simple remedies by which the County Courts can be placed upon the same footing, in these respects, as other tribunals. The first is, that every case insured in a like success. These two suggestions are:—1st. To reduce the fee on a plaint to a maximum of 6*s.* for 5*l.* and upwards; the same for a consent judgment, with 1*0s.* in the case of a hearing about judgment cases above 2*0s.*, and those sent from the Superior Courts, might fairly be charged more, say 2*0s.* each. 2nd. To extend the benefit of Sec. 2 of the County Courts Act to all suitors alike, and let them have judgment without hearing twelve days after personal service of the summons where no notice of defence is given; also to extend the new scale of attorney's costs provided in the above Act, to all cases between 2*0s.* and 2*0*l.**, instead of such being limited as now to actions for goods wholly or in part sold for trading purposes."

Messrs. De la Rue & Co. have issued their "Indelible Diary and Memorandum-Book" in numerous shapes, edited by Mr. Claisner, F.R.S. and Mr. Thelwall, M.A. The illustration represents the wonderful Nebula in the sword-belt of Orion, concerning which Mr. Warren De la Rue, F.R.S., contributes an interesting article. He considers that the phenomena there going on present "a picture of the formation of new worlds in space far greater than that comprised within the limits of our own solar system." We cannot avoid observing that these excellent little books would be much more legible if they were printed in black instead of blue. Indeed, considering the class to whom they are addressed, the fancy colours seem out of place.—Part II. of vol. VIII. of the "Transactions of the Civil Engineers of Ireland," contains some valuable papers on Construction in India.—*Cassell's Magazine* gives this remarkable view of the possessions and powers of the Earl of Dudley:—

"His territorial possessions and country seats in Staffordshire and Worcestershire, his shooting grounds in Scotland and the East of England, his mansion and picture-gallery in London, his winter palace at Rome, even his valuable mineral estate in Merionethshire, fade into insignificance when compared with his mines, and collieries, and ironworks in and around the Midland town from which he takes his title. This latter estate—honeycombed by industry beneath, blackened by industry on the surface—covers an area of ten square miles. It furnishes employment for 9,000 workpeople; and reckoning in their families, wholly supported, at a moderate computation, something like 27,000 human beings—a population equal to that of the city of Oxford at the last census. It is intersected by two private canals, and traversed by forty miles of railroad. The horses employed upon these numerous canals to supply a cavalry regiment, the canal boats to furnish a fleet. The steam power used upon it is simply inextinguishable—it is so dispersed. Eight locomotives ply upon its railways; there are forty boilers in one of its works, and twenty in another; every pit and every furnace over and under the whole ten miles has its accompanying steam-engine. This vast estate yields 70,000 tons of coal and nearly 1,000 tons of pig-iron per week, to say nothing of the limestone used for flux; and it sends manufactured iron into all the markets of the world. Nearly 100 heads of departments are engaged in managing it, and it takes over three hundred clerks to keep the accounts. The annual outlay in wages does not fall far short of half a million of money."

We have lately heard of the possessions of the Marquis of Bute, and the time may be named when a future Marquis of Westminster will have an income of a million a year. There is snrely matter for thought here: perhaps for action too.

—“Greater Britain.” By Mr. C. W. Dilke, Mr. C. Wentworth Dilke, the author of “Greater Britain,” a record of travel in English-speaking countries, which will be published in two volumes, by Messrs. Macmillan & Co., this week, is the eldest son of Sir C. W. Dilke, bart., M.P., and grandson of Mr. Dilke, whose name is well remembered in the literary world as the editor, and, indeed, the actual founder, of the *Athenæum*. The author of “Greater Britain” travelled during a portion of his journey with Mr. H. Worth Dixon, who was at that time in the United States gathering materials for his “New America.” Mr. Dilke accompanied Mr. Dixon as far as Salt Lake City. Thence he travelled alone in New Zealand, Australia, and India—chiefly, we believe, with a view to observe the working of political systems in the countries which he visited. Mr. Dilke is now a candidate for a seat in Parliament as representative of the new borough of Chelsea, and very likely to be elected.

Miscellaneous.

JOINT-STOCK BUILDING, BRICK, TILE, AND OTHER COMPANIES.—From the returns of Joint Stock Companies in England and Wales, which have just been issued, we learn that there are 393 societies which have been registered between the 1st day of June, 1867, and the 31st day of May, 1868. Of this number thirty-five have been called into existence to erect houses, hotels, deal in land, and promote in other ways the building operations of the country. These societies are accredited with a nominal capital of 7,612,900*l.* In addition to these are eleven societies which have been registered for the purpose of manufacturing bricks, tiles, the getting of lime, slate, and other articles connected with the building trade. The nominal capital owned by the societies is set down at 315,000*l.*, making, with the capital sunk in building, &c., 7,927,900*l.*

IMPROVED ACCOMMODATION FOR THE WORKING CLASSES.—The *Public Health* says, “The leaseholder of a large disused warehouse, in Little Grove-street, Lisson-grove, Marylebone, conceived the idea of converting the same into a convenient, airy, and capacious lodging-house. By forming a company, and issuing shares, he raised the necessary capital, and set about the work, which is now on the point of completion. The building is laid out in dormitories, comprising 130 single iron bedsteads; the floors are covered with cocoa-nut fibre matting, and the rooms are lighted with gas and well ventilated. There is a large kitchen, and lavatories and baths, on the most approved principles. The spirited proprietor even promises a library, to relieve theedium of the winter months. The Medical Officer of Health for Marylebone has given his unqualified approval of the sanitary arrangements adopted in the establishment. We heartily wish success to this company, and as many others as shall devote their energies and their substance to the amelioration of the condition and elevating the *morale* of the working classes.

ASSOCIATED ARTS INSTITUTE.—Last Saturday evening the session of 1868-69 of this institute was opened by a *conversations* at the House in Conduit-street. In addition to the usual display of works of art by the members of the institute, the sketches of the late Sir Richard Westmacott, of which we spoke previously, were exhibited on screens in the centre of the principal room. This being the first time that those sketches have been shown in public they were the subject of much interest and scrutiny. An address was made by the president of the institute, Professor Westmacott, R.A. In the course of it Mr. Westmacott pointed out the importance of students practising the separate branches of art, so as to arrive at a state of the utmost perfection, not for their own sakes alone, but with a view of realising a great whole. He also drew attention to the facts that the object of the Associated Arts Institute is to get artists together for the encouragement of mutual intercourse, and the discussion of those subjects in which they are interested, at times when they are not engaged in more practical work. Mr. Westmacott gave some particulars respecting the progress that the institute has made and its present position, foremost among them being that it is five years old, and that it commenced with five members, and it now can boast of 144. A concert followed the president's address.

THE HAVRE EXHIBITION.—From an examination of the list of awards made at the Havre Exhibition to British exhibitors it appears that the British have reason to be satisfied with the success they have achieved.

WAREHOUSES, MANCHESTER.—A correspondent writes, “It may be as well you should say, with reference to the warehouses in Portland-street, from the designs of Mr. Waterhouse, to which you alluded lately, that the beams for the floors are not of cast iron, but of *rolled iron*,—an unusual feature of such dimensions in warehouses erected in Manchester.

A BAIT.—Sir: What do you think of the following:—

“**SERVEYOR WANTED.** For a first-class established permanent building society. Must take paid-up shares in the society (6 per cent. dividend), and be prepared to introduce members and depositors from his own connection.—Apply, stating sum to be invested, and probable amount of business that can be introduced, to—”

A SUB.

CONSERVATIVE CLUB HOUSE, ST. JAMES'S.—This building, erected in 1845, has recently undergone entire renovation. The decorations of the halls (upper and lower), vestibule, and groined ceilings, have been revived; Mr. Sapwell was the contractor and Mr. Robert Yarrow the artist employed. The right person to be called in in such a case would seem to be the original artist. This is the second renovation since the foundation of the club twenty-three years ago.

COKE.—The directors of the Watton Gas and Coke Company have just issued a notice to the effect that “from and after the 10th of November next the price of gas to the consumers will be reduced one-fourth,” that is, to 7s. 6d. per 1,000 ft. For many years the directors were not able, of course, with such absurd prices as theirs, to pay any dividend. The only wonder is that it is said they are now paying a fair one.

—New gas works, erected at Langley Mill, adjoining the railway station, by the Langley Mill and Heanor Gaslight Company (Limited), for the supply of gas to Langley Mill and Heanor, have been opened. The works have been designed and carried out under the superintendence of Mr. Thomas Crump, gas engineer, of Derby. The contractor for the building was Mr. Samuel Hunt, of Long Eaton. The Batterley Company supplied the castings and main pipes.

VALUE OF PROPERTY IN ST. PAUL'S CHURCH-YARD.—At the Auction Mart, Tokenhouse-yard, Lothbury, Messrs. Dehenham & Co., auctioneers, offered to public competition the freehold warehouse, No. 27, St. Paul's Church-yard, let on lease for an unexpired term of nineteen years at 1,000*l.* per annum, and now in the occupation of Government as the Post-office Savings Bank, the property occupying an area of 1,479 square feet. The highest bid was 20,000*l.*, and it was bought in at 22,500*l.* The two adjoining warehouses, Nos. 28 and 29, held for an unexpired term of sixty-six years at a ground-rent of 750*l.* a year, and let for twenty-one years at 1,300*l.* per annum, were bought in at 8,000*l.* The corner warehouse adjoining, held for an unexpired term of sixty-six years at a ground-rent of 350*l.* a year, and let at —, for the first seven years and 650*l.* for the next seven years, sold for 3,200*l.*

MONUMENTAL.—In the Chapel Royal, Savoy, there is a monument to the memory of Richard Lander, the distinguished African discoverer. A member of the Royal Geographical Society has bequeathed a small sum of money towards the restoration of the monument, and the Rev. Henry White, of King's College, London, the chaplain of the Savoy, has invited such as are disposed to add their subscriptions, so that the restoration may be carried out.—In a letter recently received from the west coast of South America, the writer mentions that Commodore Powell, and the officers on board *H.M.S. Topaz*, are to erect in the island of Juan Fernandez a tablet to the memory of Alexander Selkirk, whose history is popularly believed to have afforded De Foë the materials of his attractive story of Robinson Crusoe. The tablet is to be placed near a break in the high mountain ridge which rises from the bay at the northern part of the island. It is said that to that high pass Selkirk used daily to climb, in the hope of seeing some friendly sail that might convey him from his drear solitude. The tablet will be of iron. Whilst seeking for some one to do the lettering on the tablet, a man offered himself who rather claimed the job, on the ground that he had created the tablet to Captain Cook's memory at the Sandwich Islands.

THE RESTORATION OF CHESTER CATHEDRAL.—Dean Howson writes:—“Our appeal for funds in aid of our works of restoration began last spring. The architect's estimate for the whole amounts to about 55,000*l.* Towards this we have now about 28,000*l.* promised, the Ecclesiastical Commissioners contributing 10,000*l.* of this sum. The process of restoration began during the summer, attention being first given to a part of the fabric which was in imminent danger.”

ALBION ASSEMBLY ROOMS, NORTH SHIELDS.—The proprietors of these rooms have determined upon making such additions to them as will not only greatly increase their own accommodation, but will also improve the frontage of Norfolk-street, by taking in the whole of the property between them and the Masonic Hall, and adding a new building, nearly 50 ft. in height, to contain a gallery; second and third class refreshment rooms, 37 ft. by 22 ft.; and, on the ground-floor, shops, &c. The architect is Mr. J. P. Spencer.

BOILER EXPLOSIONS.—A terrible explosion has occurred at Mr. Norris's steam saw-mills, Baron's-place, Waterloo-road, Lambeth, injuring ten men and setting fire to the mills, which have been destroyed in consequence. One of the men injured has since died, and the others are in a precarious state. Surely there ought to be some Government inquiry into the subject of steam-boiler explosions, or some legislation with a view to the proper supervision of boilers. There is an association at Manchester for self-protection from boiler explosions, and the result to them is that scarcely a single explosion takes place in those supervised by the officers of the association.—The sufferers by the late kitchen-boiler explosion in the Haymarket are all doing well. One who was not expected to survive is now progressing favourably.

CLOSING OF THE NATIONAL FINE ARTS EXHIBITION AT LEEDS.—This exhibition, which was opened by the Prince of Wales, on May 19, was finally closed to the public on Saturday. During the 143 days it has been on view, the number of visitors has reached 570,000, and of that number 450,000 paid for admission at the doors, the remainder obtaining entrance by season tickets. The largest attendance was on Thursday, October 23, when no fewer than 13,231 persons entered the building. The highest weekly attendance was reached on the week ending October 16, when it amounted to upwards of 46,000 persons. On the proposition of Mr. W. Becket Denison, chairman of the executive committee, a vote of thanks was passed to the contributors. He especially referred to the warm interest taken in the exhibition by the Earl of Dudley and Lord Houghton. Both these noble lords having delivered brief addresses, special votes of thanks were awarded to heads of departments for their untiring zeal in the collection and arrangement of the art treasures; three cheers were given for the Queen; the band played the National Anthem, and the building was then slowly cleared of visitors.

SUPPLY OF ICED WATER TO PARIS AND LONDON. Every one who has visited the *cafés* of Paris must have observed the *carafes frappées*, that is to say, water-bottles with a great block of ice, often very curiously crystallised inside. The production of those frozen decanters has become a very important operation, which is carried on at ice-houses situated in the Boulevard Lannes, on the Passy side of the Bois de Boulogne. The establishment, according to the “*Journal of the Society of Arts*,” consists of ten great underground ice-vaunts, protected from the action of the sun by buildings raised over them, and covered with straw. Each of the ice-vaunts is nearly 500 ft. long, and about 36 ft. high, and the ten are capable of holding 10,000 tons of ice. The department in which the water-bottles are frozen is a curiosity. These decanters are two-thirds filled with filtered water in the receptacles of the freezing machine, and the freezing is produced by means of salt water and vapourised ether, with the help of a steam-engine of sixteen-horse power. When the water within the decanters is reduced below freezing-point, it is rapidly stirred with a stick, when the freezing takes place as if by magic. More than 6,000 of these frozen *carafes* are sent out daily in hot weather, at a very trifling charge, and each being filled up with fresh water as often as required will serve during a long summer day, and cool ten gallons of water. Why should not London and other large towns have their frozen water-bottles in summer as well as Paris?

ST. GEORGE'S HOSPITAL SURVEYORSHIP.—Mr. Stephen Salter has been elected surveyor to St. George's Hospital. Mr. Thomas H. Watson was second on the list.

SERGEANTS' INN.—The ancient state hall of Sergeants' Inn, Chancery-lane, under the auspices of the present treasurer, Mr. Serjeant Balm, has been redecorated and renovated.

WATERLOO BRIDGE.—We have received a letter from Mr. W. C. Clarke, Chief Clerk to the Waterloo Bridge Company, stating that the pier of the bridge, to which reference was made recently in our pages, has been in the state it now is for many years.

THE FALLING-IN OF THE FOOTWAY IN DOWNING-STREET, WESTMINSTER.—On the 30th ult., between seven and eight o'clock, nearly the whole of the public footway and hoarding which extends from King-street to the new Foreign Office, fell in with a crash. Fortunately no one was passing at the time, and the large number of workmen employed were all absent from the works.

ITALIAN OPERA, COVENT GARDEN.—Some good operas, by good performers, at this season of the year, are a boon to lovers of music, compelled for their sins to remain in London; and this Mr. Mapleson is affording, through the accommodating disposition of Mr. Gye, at Covent Garden. Beyond stock enjoyments he has made known to London a young singer from America, Miss Minnie Hauck, who in the "Sonnambula" produced a very satisfactory impression. Miss Hauck is very young, and if she fulfil her present promise will be a fresh delight for Europe. Signor Mongini sang admirably with her.

THE SMOKE NUISANCE.—At the Clerkenwell Police-court on Saturday a manufacturer was charged with using furnaces which did not consume their own smoke; and it was even alleged that they were constructed as if on purpose not to do so. The Government officer stated that this problem has now been most thoroughly and completely solved; and he mentioned a hewery which he inspected last week, in which were nineteen furnaces in full operation, consuming from 8,000 to 9,000 tons of coal, and from 700 to 800 tons of spent hops annually, and yet there was not a particle of smoke emitted. He also cited other similar cases. It thus appears that by a strict administration of the law the smoke nuisance may be got rid of entirely without hardship to those who require furnaces. The defendant was fined 3l. and costs.

TENDERS.

Country newspapers should be marked. We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read in public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

ADVERTISEMENTS.

KELLY'S PRACTICAL BUILDERS'
PRICE-BOOK, &c. A Guide to the Valuation of all kinds of Artificers' Work; with the Modern Practice of Measuring, and an Abstract of the New Building Acts for Regulating the Height of Buildings. Revised and Corrected by New Calculations upon the present Value of Materials and Labor. Arranged by an Architect of eminence, assisted by experienced, Accurate Surveyors. Illustrated and exemplified by Steel Engravings and numerous Woodcuts.
Royal Soc. price 5s. newly bound.
London: Published by J. KELLY, Paternoster row; SIMPKIN & MARSHALL; and may be had of all Booksellers.
Of which may be had, new and second-hand, of the following Practical Architectural Works:

1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET MAKING. Revised by TREGOLD: being a new and complete System of Plans, for the Use of Workmen, containing the Art and Mystery of the Trade. 4s. 6d. in boards, 30s.; containing upwards of 120 Steel Plates, and numerous Woodcut Diagrams.
2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, and PLASTERING (REVISED BY TREGOLD) both plain and ornamental; containing a new and complete System of Lines for Stone-cutting; for the Use of Workmen; the Formation of Mortar, Cement, and Plaster, to which is added a variety of new Designs for Rural Tablets, Tombs, Gravestones, &c. &c. with a Description of the various Materials employed. Ten Parts at 3s. or in boards, 30s.; containing upwards of Ninety Steel Plates, and numerous Woodcut Diagrams.
3. TREGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE; containing plain and simple Plans, and Elevation and Section of the Orders, with the most approved Rules for the Use of Workmen; the Formation of Mortar, Cement, and Plaster, to which is added a variety of new Designs for Rural Tablets, Tombs, Gravestones, &c. &c. with a Description of the various Materials employed. Ten Parts at 3s. or in boards, 30s.
4. DESIGNS for COTTAGE and VILLA ARCHITECTURE, and enlarged Edition, comprising the Practical Illustrations of the Machinery and Processes employed in every Description of Manufacture of the British Empire. Illustrated by the most approved Engravers. By JOHN HERRICK, Civil Engineer, &c. The rapid progress of Mechanical Science has developed many new and useful Inventions, the publication of which in the Encyclopedia. The Inventions and discoveries recently made have engaged the solution of the Editor; for the value of each was tested by experiment, a description was accordingly prepared. By the selection of new articles, and care in the revision of the old, the Encyclopedia has been rendered more useful and complete than it may be received as fully and faithfully preserving the existing state of the art, and being distinguished from the works of "Scientific Men." In two large 8vo. vols. cloth, illustrated, price 30s.

A CLERK of WORKS, of great experience, is open to an ENGAGEMENT. References of the highest class given. Mr. THOMAS, care of Mr. Bickler, Plumber, 123, Long-acre, London.

TO ARCHITECTS, SURVEYORS, &c.
A GENERAL ASSISTANT is open to an immediate ENGAGEMENT, temporary or otherwise. Is a good and well-drawn draughtsman, and is well acquainted with the building trade, superintendence of works, &c. Aged 30. Terms moderate.—Address, D. S. Bell's Library, Alexander-street, W.

A THOROUGHLY qualified ESTIMATING and MEASURING CLERK, well versed in builders' and contractors' accounts, requires an ENGAGEMENT. First-class references and testimonials.—Address, R. C. care of Davies & Co. Ayrer-bridge Agents, Fish-lane, Cornhill.

AN EARTHQUAKE IN ENGLAND.—New Lectures, by J. L. King, Esq. daily at TWO, and Monday, Wednesday, and Saturday Evenings at Half-past Seven, "On Earthquakes and Volcanos," with magnificent pictorial illustrations; and the New Electric Organ, by Herr Schalkowsky.—"La Nature," a new and interesting "Journal of Science and Nature," by Mr. and Mrs. Robert Coote.—Professor Fepper's New Lectures on "The Last Royal Politician"—An old German Story, of allured Spiritual "The Blue and Barber," with marvellous effects. At the ROYAL POLYTECHNIC.

TARPAULINS on HIRE, 2s. 6d. per week. Tarpaulins (now, to be purchased from 1s. 6d. per square yard. Any size, any colour. Samples on application.

PIGGOTT, BROTHERS, No. 59, Bishopsgate Without, London, E.

SLATE FACIAS, NAME-PLATES, and SHOP FRONTS. The only place for these beautiful, attractive, and durable Articles. **MAGNUS, FIMLICO SLATE WORKS.**

TO BUILDERS, CONTRACTORS, &c.—HOARDINGS for ADVERTISING PURPOSES, in good condition, erected Free of Expense.—Apply to WILLING & CO., 38, Gray's-inn-road, W.C.

GOLD MOULDINGS. Gold Mouldings of the best quality Manufactured and kept in Stock by **GEORGE JACKSON & SONS,** No. 45, RATHBONE PLACE, W. Sections of Mouldings and List of Prices can be had on application.

THE INVENTOR'S PATENTRIGHT ASSOCIATION, LIMITED (R. HANSEN LATHAM, Esq. Chairman), solicits applications for the grant of Letters Patent, and advice on Inventions. Handbook gratis.—ALEX. F. WRIGHT, Secretary, 21, Cockspur-street, Charing-cross, London.

IMPERIAL FIRE INSURANCE COMPANY. Established 1850. The security of a subscribed capital of £70,000, and an Assurance Fund amounting to more than seven years' purchase of the total Annual Income. Eighty per cent. of the profits arising from the Assured every Fifth year.

Advantages granted at very low rates of premium for the first Five Years. The most liberal conditions in respect of Foreign Residence and Travel. Receipts of Receipts, Policies, and Receipts valid in all parts of the World. Licenses free of charge, when the circumstances are favourable.

Advantages for Children. Annulment—Immediate, Deferred, or Retrospective. Notice of Assignment registered and acknowledged without fee. The revised Prospectus, with full Particulars and Tables, to be obtained at the Company's Office in London, 1, Old Broad-street, E.C. and 16, Pall Mall, S.W.; and of the Agents throughout the Kingdom. **ANDREW BADEN, Actuary.**

IMPERIAL FIRE INSURANCE COMPANY. 1, OLD BROAD STREET, and 16, 17, PALL MALL, S.W. Established 1850. Subscribed and Invested Capital, £1,000,000. Losses paid, £2,000,000. Fire Insurances granted on every description of property, at home and abroad, at moderate rates. Claims liberally and promptly settled. **JAMES HOLLAND, Superintendent.**

SUBURBAN VILLAGE and GENERAL DWELLINGS COMPANY (LIMITED). Capital £100,000, in 100,000 shares of 10s. each. **CHAIRMAN—WILLIAM G. GILBERT, HARBINGTON, Esq. F.R.S.A. M.A.S.**

SECRETARY—WILLIAM JONES, Esq. This Company has been re-organized and entirely fresh Directors, is formed for the benefit of the working class, to provide those who have no means of saving, with a secure and profitable investment, and open a source of safe and profitable investment for all parties. Nothing superior in its kind, and is a security offered in its nature completely improve. A valuable estate has been secured, and a good dividend is thereby assured.—Full information at the Office, 15, York-lane, Adolph.

SIX POUNDS per WEEK while LAID OFF by INJURY, AND LOSS OF EARNINGS CAUSED BY ACCIDENT of ANY KIND, may be secured by the annual payment of 1s. 6d. from **RAILWAY PASSENGERS ASSURANCE COMPANY.** For particulars apply to the Clerks at the Railway Stations; or the Local Agents; or at the Office, 54, Cornhill, and 10, Beckett-street. **W. J. VIVIAN, Secretary.**

ALLIANCE LIFE and FIRE ASSURANCE COMPANY. Established 1814. Capital £500,000. Chief Office, Bartholomew-lane, London. **BOARD OF DIRECTORS.** James Alexander, Esq. Sir Moses Montefiore, Bart. E. S. President. Charles G. Barron, Esq. George Henry Barrett, Esq. Right Hon. George Robinson, M.P. William Gladstone, Esq. Samuel Curney, Esq. M.P. James Holton, Esq. Sir George Murray, Bart. Samuel Lewis, Esq. Sir Charles Murray, Bart. Thomas Mesterman, Esq. J. M. Montefiore, Esq. Anthony de Rothschild, Bart. Baron L. S. de Rothschild, M.P. Thomas Charles Smith, Esq.

AUDITORS. Sir T. Powell Buxton, Bart. M.P. Lord Richard Grosvenor, Bart. Hugh Collin Smith, Esq. Home property of every description, insured at moderate rates of premium. Life and annuities in various forms offered on favourable terms. Liberal commission given to architects, builders, surveyors, &c. becoming agents for the Company. Prospectuses and all information may be obtained by application to **ROBERT LEWIS, Esq. Life Insurance, Examinations, and Freehold Property.**

UNIVERSAL LIFE ASSURANCE COMPANY (established 1834), 1, King William-street, London, E.C. with branches in Calcutta, Bombay, and Benares. **THIRTY-FOURTH ANNUAL MEETING, 31st MAY, 1868.** The following is a summary of the results of the meeting for the six years. Policies, English or Indian, on which the premium was originally 100l., which he charged only 50l. for the year, MAY 1868:—

New policies issued in 1867 for 468,232l., at an annual premium of 105,124l. Policies in force, 1,857,077. Accumulated funds, 83,882l. Annual Income, 143,000l. **FREDK. HENDRICKS, Actuary.**

The Builder.

VOL. XXVI.—No. 1345.

The Management of Heat.

T this season of the year, when winter is waiting ready crowned and robed, doubtless, in some arctic region, for the day of his reign to begin, the subject of artificial heat must be one to which most of our readers will turn with hearty approval. What ice is to us in the height of summer, so is heat in the depth of winter. By the use of both we can mitigate the effects of the extremes of the opposite seasons. But summer, with her train of honey-suckles and roses, not to say watering-carts, having turned her back upon us for the present year, there is no probability of our attention being distracted from the heat means of modifying the severities of winter. We are glad, therefore, to notice a practical treatise by Mr. Box, in which he has aimed to apply the laws of heat to the useful arts. Among the latter he has very properly included the art of heating and ventilating churches, chapels, all public buildings, and houses.*

Beginning with an explanation of the general principles and facts touching heat, Mr. Box proceeds to treat, successively, of combustion, steam-boilers, the efflux of air, chimneys, vapours, evaporation, distillation, drying, heating liquids, heating air, the transmission of heat, and laws of cooling, leaving ventilation and heating of buildings, and the effects of wind on ventilation, to the last. Reversing this order, in the interest of our readers, we will give some account of our author's theory of heating and ventilation first.

Before reckoning how much heat is required for a building there are several things we must know. One is, how much is expended. Our author divides the heat lost by buildings into four portions; or that lost by the floor, the ceiling, the walls, and the windows. The heat lost by the floor is not considerable, because the earth, at a depth of 20 ft., has the same temperature as that of the yearly mean of the air at any place; nor is the loss by the ceiling great if it is an ordinary lath-and-plaster ceiling protected by the further overing of the roof from cooling influences, though, if the roof is an open-timbered one, without a ceiling, the loss must be great. The walls are a more serious item of consideration. He states the case of a room with brick walls and no windows exposed on every side to cooling influences, with an internal temperature of 60°, while that of the external air is 30°, and goes through an intricate calculation to arrive at the temperature of the surfaces

of the walls and the quantity of heat transmitted from one to the other, in three formulae. Should any one want to know the loss of heat sustained by the wall of a furnace with the fire on one side of it and a low external temperature on the other, he would have to seek the solution of the difficulty by similar means. Then, again, Mr. Box gives the case of a room forming part of a large building in which only one side of it is exposed to the external air and radiant objects, and the formula for working out the amount of loss. The loss of heat in units per square foot per hour by brick and stone walls, 40 ft. high, in buildings where only one face is exposed, and for 1° difference of internal and external temperature, is shown by him in this manner:—

Brickwork.			Stone.		
Thickness.	U.		Thickness.	U.	
Brick.	Inches.		Inches.		
1 1/2	= 9	.371	12	= 453	
1 1/4	= 9	.275	12	= 379	
1 1/2	= 14	.213	18	= 324	
2	= 18	.182	24	= 284	
3	= 36	.136	30	= 257	
4	= 36	.108	36	= 238	

The loss of heat by glass in windows requires further calculation. As a specimen of the system pursued by Mr. Box, we will quote the case he gives of a window in which the interior walls and internal air in contact with the glass have one and the same temperature of 60°, and the external air and radiant objects one of 30°.

"The glass being heated on one side and cooled on the other by similar influences, will have a temperature in the centre of its thickness a mean between the two, or in our case $\frac{60 + 30}{2} = 45^\circ$, and with this glass we may assume that it has this temperature throughout. We may calculate the amount of heat received from within and dissipated without by the Rule $U = Q \times (T - t)$. For glass the value of R is, by Table 71, .948, and the value of A by Table 74, for a window, say 6 ft. high, is .4655; therefore $Q = .9484 \times .4655 = 1.463$, and in our case the loss is $1.463 \times (60 - 45) = 15.9$ units per square foot per hour for 30° difference of internal and external temperature, or $15.9 = 53$ units for 1°, by a window 5 ft. high; for 10 ft. and 20 ft. the losses are .515 and .594 respectively."

Besides having to make up for the heat lost in absorption and radiation, before being in a position to calculate the degree of artificial heating required for a building to be pleasant and healthy, we must consider the heat evolved by respiration of the occupants, among other matters. It is agreed that an ordinary man gives out .022 lb. of carbon per hour, which develops a heat of 12906 \times .022 = 284 units per hour. Some portion of this heat, however, is absorbed by the vapour formed during respiration, and some is dissipated by radiation to the surrounding objects, and by the contact of cold air; otherwise this amount of heat would be sufficient to set ventilation in motion. The quantity of air required by an ordinary man for his twenty respirations per minute, which are reckoned at 40 cubic inches each, is $\frac{20 \times 40 \times 60}{1728}$

= 28 cubic feet per hour. Taking into consideration the vapour emitted by him, which would saturate a small allowance of air with too much moisture to be healthy, he requires per hour the capacity of a cube 6 \times 6 \times 6 ft. For prisons, workhouses, &c., Mr. Box adds, it should not be less than 350 cubic feet, and for hospitals 1,000 cubic feet, per hour per head. This necessity involves a constant change of air to form part of all schemes of artificial heating. Our author is scarcely aware of the continuous efforts of the more advanced sanitary reformers among architects to ensure due provision for ventilation and heating in buildings, for he writes,—"The acknowledged difficulties of accomplishing effective ventilation have led to the whole question being virtually abandoned by architects and others designing our public and private buildings." Practising a little more perseverance himself—at least in theory—he gives three or four schemes for ventilating rooms, none of which have any great novelty,

but all of which are marked by a minute attention to the workings of natural laws. Upwards of a hundred little careful diagrams illustrate his statements. We will follow him through three cases he describes at length to exhibit three different plans. The first is a school for 100 boys warmed and ventilated by a certain stove; the second a chapel heated by hot-water pipes and ventilated by a compressing-fan, driven by a weight wound up by manual labour during the preceding week; and the third is a hospital, heated by hot air pipes and ventilated by a draught-chimney, in which a fire is maintained all the year round.

We must premise that the first of these schemes is ascribed to Pécelet, to whose work, "Traité de la Chaleur," our author frequently refers. The stove is placed at one end of the school-room and the chimney at the other; and both the stove and the long pipe, which extends from one to the other, are constructed with a double case, the inner space containing the fire and smoke and the outer one heated air. This case is furnished with openings, through which the highly-heated air from within is forced into the room. If there were openings at the top of the room this heat would pass through them and be wasted: so to prevent this the openings for ventilation are made about 18 in. or 2 ft. from the ground, to which level the warm air descends. Mr. Box contends that the air is distributed by these means all over the room in horizontal layers, which become cooler as they descend to give out heat to the walls. In the summer, when the stove is not heated, the ventilation is accomplished by means of a small special fire at the base of the chimney and a large register opening high above the heads of the scholars. In the winter, the stove should be lighted an hour or two before the boys assemble, because, although, as our author says, each individual emits heat enough to furnish that required for ventilation, the walls and air require warming. To give a specimen of the author's minute calculations we quote his measurement of the heat dissipated by the walls:—

"The building exposes an area of 210 square feet in windows, and 1,390 square feet of 14-in. walls: assuming for the air an internal temperature of 60° and external 30°, the loss by the windows will be 12.3 units per square foot, and in our case $12.3 \times 210 = 2583$ units per hour, and the walls (Table 78) will lose $1340 \times 109 \times 30^\circ = 6490$ units, giving a total of 8983 units per hour lost by the building after it has been heated to the standard temperature. But a great amount of heat must be absorbed by the walls before they can be brought up to that standard; by (282) and Fig. 80, we see that with 14-in. walls, and air at 60° and 30°, the mean temperature of the wall is $\frac{60 + 30 + 34.2^\circ}{2} = 41.1^\circ$, or say 41°; they have therefore to be heated in the morning from 30° to 41°, or 11°; and as they contain about 1570 cubic feet, weighing by Table 86 = 115 lb. per cubic foot, and the specific heat of brickwork (harrt clay) being .185 by Table 1, they will require $1570 \times 11 \times .185 = 327,420$ units of heat to raise their temperature from 30° to 41°. In our case they will receive it from two sources, from the heated air in the room and by direct radiation from the stove and stove-pipe. The amount that can be received by contact of air is at first, when the walls are cold, or at 30°, by (272) and Table 74 = $435 \times 30 = 13,050$ units per square foot; but at the end of the operations, when the walls are heated to their standard internal temperature of 48° we have only $435 \times (60 - 48) = 5,220$ units; the mean is $\frac{13,050 + 5,220}{2} = 9,135$ units per square foot per hour."

We must explain that the tables referred to form an important feature in the work, and present in a cut-and-dried form the result of many a careful and lengthy experiment. Our author next calculates the time required to heat the walls and cool down the building, the area of inlet and outlet openings, the quantity of fuel required, &c. We must pass on, however, to notice the more general features of the next scheme. This is the case of the chapel, which is destined to accommodate 400 persons on one day in the week, and to be abandoned to cooling influences for the other six. The first thing required of the hot-water heating apparatus is that it should heat the walls before the building is occupied, and the next, that it should heat the requisite amount of air for the congregation during the hours of worship. The size of the apparatus should be

* A Practical Treatise on Heat, as applied to the Useful Arts, for the use of Engineers, Architects, &c. By Thomas Box. London: E. & F. N. Spon, 48, Charing-cross, 1868.

determined by the greater of these two conditions. Mr. Box goes into a calculation which gives 47,816 units of heat as the amount required for heating 220 cubic feet of air per hour per unit, and 46,938, as the amount of units of heat absorbed by the walls, and then he settles the dimensions of an enclosed pipe, 3 in. in diameter, according to a table furnished by him. Some 214 ft. of pipes are carried by rollers, supported on cross-beams, built into the brick side-walls of channels, and a boiler of the common horseshoe form is placed below the level of the chapel floor. To yield the required amount of heat, 12 lb. of coal per hour must be furnished. After calculating the time required for heating the apparatus and the walls, and the time consumed in reducing these to the external temperature, Mr. Box advances a recommendation that will be echoed by most persons having authority in the matter of church-heating. He draws attention to the division of the 168 hours of the week. Fifty are spent in getting up the temperature, 14 in maintaining it during the hours of worship, and 104 in cooling down again. The weekly consumption of coals by this method would be 6 cwt. A small increase upon this would maintain the temperature throughout the week. This latter management is that recommended by Mr. Box. He says that the economy of regular and slow firing would be so considerable that the consumption of coal for the whole week would be not more than $7\frac{1}{2}$ cwt., or $1\frac{1}{2}$ cwt. more than the quantity used for the intermittent firing; and to set off against this small extra outlay would be the accommodation of finding the chapel always ready for any occasional or periodical service in the course of the week. He gives diagrams of the fan used for ventilation, with its gearing and framing. To this fan he allows a velocity of 5 ft. per second. As an ordinary man can raise 3,000 foot-pounds per minute by a wind, he calculates that the necessary weight of 18 cwt. could be raised in 13 minutes. To this plan there is the objection of the periodical winding up of the fan required, should the continuous firing be preferred to the intermittent. The destination of the air moved by the fan is a space below the floor of the boiler-house, whence, branching right and left, it enters and proceeds along the channels in which the hot-water pipes are laid, from which branch channels conduct it under the pew-seats, where it is discharged through apertures made for the purpose. A wooden casing must cover the hot-water pipes, recommends our author, and the total area of the 1 $\frac{1}{2}$ -in. diameter holes by which the air is admitted must be equal to the area of the two main channels, or 5 square feet. With his ordinary minuteness, he lays down that, with 8 for coefficient of contraction, the area of 1 $\frac{1}{2}$ is $1.22 \times .8 = .976$; and we should require $\frac{730}{.976} = 740$ holes, which, distributed on a length of 214 ft., or 2,568 in., would be $\frac{740}{214} = 3\frac{1}{2}$ in., centre to centre.

We turn now to Mr. Box's scheme for heating and ventilating hospitals. He justly observes that the ventilation of a hospital should be more perfect, powerful, and uniform than that of any other building, on account of the diseased condition of the inmates. A first necessity is that the walls should be warm. He gives a plan and longitudinal section of a small hospital or quadrangular wing of a large one, three stories high. This is heated by a coker or hot-air stove placed at one end of it, and ventilated by a draught chimney. The hot-air apparatus consists of a collection of pipes, open at both ends, and built into the side walls, and retained in position by clamp-plates and bolts. A furnace at one angle causes fire to circulate among the pipes on its road to the chimney at its most distant angle. The external air enters the pipes heated in this manner, and leaves them in a chamber inside the wall, from which it proceeds down two channels which extend the length of the building. The upper stories are heated by other channels in the walls up which the hot-air passes and descends again to the basement, warming the walls in its progress. From these perpendicular channels branch pipes are laid on each floor, which discharge the hot-air into additional channels furnished with openings into the rooms under each bed. Funnel-channels, into which orifices open near the ceiling, carry off the vitiated atmosphere and conduct it to the end of the building occupied by the apparatus, where it enters descending shafts communicating with the chimney. It must be understood that the air entering the walls must be of a much higher temperature than that required for the

rooms, otherwise when the walls have absorbed their portion of the heat it will be insufficient for the purpose of heating the room. The loss of heat by the walls, windows, &c., is duly calculated in this as in the other instances.

Allowing 1,000 cubic feet of air per hour per room, and that we have $69 \times 3 = 150$ inmates, we shall require 150,000 cubic feet of air at 60° , or $.76 \times 150,000 = 114,000$ lb. of air per hour. If we assume that the interior surface of the walls is at 60° , with a thickness of 2 ft. 3 in., we shall have by the following formula—

$$U = \frac{Q \times (t - T)}{1 + Q \cdot G}, \text{ or in our case } \frac{1.134 \times (60 - 30)}{1 + (1.134) \cdot \frac{27}{4.83}} = 4.63$$

units per square foot per hour, and as we have 11,790 square feet of wall surface (windows excepted), the heat dissipated by them will be $11,790 \times 4.63 = 54,567$ units of heat per hour. This heat has to be supplied by the 11,400 lb. of air entering the building; and to do that it must be cooled $\frac{54,567}{11,400 \times 238} = .20^\circ$, and as it leaves the walls to enter the rooms at 60° , it must enter them at 59° . The mean temperature of the air in the walls is thus $59.2 = 70^\circ$, and the internal surface would be rather more than 60° , as we assumed. The windows contain 1,449 square feet of surface, and will dissipate $1,449 \times .53 \times 30^\circ = 23,586$ units per hour, the greater part of which will have to be supplied by the air in the rooms.

The number of units of heat required to be furnished by the coker or air stove is 135,660, to produce which 23 lb. of coal per hour are consumed. In summer a fire must be maintained for the especial purpose of the ventilating apparatus in a furnace at the base of the chimney, which is so contrived as to feed upon the foul air entering the chimney. In winter the waste heat from the coker is used, and consequently no additional coal incurred.

Mr. Box gives some French examples of heating and ventilation, and states the relative expense of the mechanical and heated chimney plans. The great Prison Mazas, in Paris, is one of the examples chosen; the Prison of Provins another; and the Church of St. Roch a third. We cannot do better than refer our readers to his work for the numerous and precise particulars noted. Another point of value discussed by our author is the influence of the wind upon ventilation. He gives a table of the force and velocity of the wind, showing the amount of pressure per square foot, according to the character of the wind, and another showing the relative power of wind-vanes with single and double blades. He calculates the force necessary to overturn a chimney 80 ft. high, taking into account the two forces that resist the wind, the weight of the mass, and the cohesion of the mortar. The process is as simple as possible, and yet it is one that would not occur to every one. The brickwork is measured to contain 1,747 cubic feet, and then weighed according to a table which gives 115 lb. per foot, when a weight of 200,000 lb. is ascertained. The cohesion of good mortar fourteen years old is set down at 60 lb. per square inch, or 5,265 \times 60 = 315,900 lb., or a total weight of the chimney of 200,000 + 315,900 = 515,900 lb. To overturn this mass a force of 110 lb. per square foot would be required, a pressure of wind that is happily not generally known in this country. Mr. Box explains:—

"If the materials were incapable of crushing, the chimney would turn on that edge of its base remote from the wind, but in truth that point would be somewhere between the centre and the edge, and the chimney would resist fracture, partly by the crushing strain and partly by the cohesion assisted by the weight. By analogy with other materials broken transversely, we know that the result is very nearly the same as if the neutral axis coincided with the edge, and the force of cohesion only came into play. Admitting this, the force of 315,900 lb. acts with a leverage equal to half the diameter of the base, or 49.5 in. The centre of effort of the wind is at the centre of gravity of the surface exposed to it. The easiest way of finding the centre of gravity in our case is by cutting out an outline of the chimney on drawing paper, &c., of equal thickness, and balancing it on the point of a needle. We thus find the centre of effort in our case to be 36 ft., or 432 in. above the base, and the surface area of one side of the chimney being 449 square feet, the force of the wind that would overturn it would be $\frac{515,900 \times 49.5}{432 \times 449} = 110$ lb."

Many writers have treated of the laws of heat, but few have so uniformly applied them to the purposes of the useful arts. All the observations and calculations of Mr. Box have a practical aim. Unlike the ignorant stoker he describes, who delights in a roaring fire and sharp draught, unconscious of the loss of fuel, he is always striving after the utilization of our resources. A quiet personal of his work will help to unravel many knotty points in the minds of those who are thinking over schemes of heating and ventilation. All owners, besides tenders, of furnaces, steam-boilers, and stoves used in the different arts, will

find, too, matter of moment in his pages. For instance, he states we may obtain nearly the whole of the heat which any fuel contains by having a long flue, or pipe conveying the products of combustion from a stove to the outer air, subject to the length of the pipe, and the material of which it is composed; whereas from an open fire in a room only the radiant heat is used, the rest being wasted in passing off up the chimney; and he gives the kinds of materials proper for the pipes, and the amount of heat dissipated. One of his tablets gives the radiating and absorbing power of many bodies, such as different metals, woods, stones, saw-dust, paper, oil, calico, woollen stuffs, &c. He recommends that all pipes to steam-engines should be covered, as the loss of heat by naked pipes is very considerable. A saving of 84-horse power in a 4-in. pipe, 100 ft. long, may be effected by casing it in woollen felt, or any other bad conductor. Such scientific economy as this is well worth study. As warning, we must point out that a casing made of a good conductor, will only increase the loss. Some people think that whitewashing pipes reduces the loss; but this is not so, except to an inconsiderable degree; although the use of tinned iron, or common tin plate, is found to reduce the loss to one half.

We have already said our author devotes a chapter to chimneys. Round chimneys and square chimneys are both discussed, and their respective merits stated. The velocity of discharge is the same with both, he concludes, but the horse-power of the latter is the greater in the simple proportion of the areas of a square to the circle. A chimney 60 ft. high and 2 ft. 9 in. square, with a flue 100 ft. long, is equal to 100 horse-power, he tells us; and if we would increase its power we must decrease the length of the flue, for to double the length of it would be to reduce its power one-half. In the construction of such chimneys hoop-iron should be built into the ordinary stock brickwork at every few courses to form a bond; while in chimneys of reverberatory furnaces, in which the air rises to a temperature of 2,250°, there should be a lining of fire-brick, and wrought-iron bands placed at regular intervals outside. Tables of the draught power of chimneys under different circumstances complete the measure of information on this subject. There are few engaged in manufactures or the arts of construction on whom Mr. Box's work is not likely to confer a wrinkle. To the general student it will prove a valuable assistant.

PUBLIC HEALTH DURING THE LATE SUMMER.

As surely as the frost and cold winds of winter cause an excess of death through the fatality of affections of the lungs, so does the heat of summer produce the same effect through annual visitations of diarrhoea, with mild forms of cholera and dysentery, the mortality from which, in tropical and hot half-cultivated countries, assumes such terrible proportions. The deaths from those diseases which are in a great measure incidental to variations in climate and temperature occur in much higher proportions in towns than in rural districts, and their greatest fatality is confined to the laboring classes, whose poverty, ignorance, and habitual carelessness of the simplest precautions, render them liable to any almost invite, attack. Mortality from disease is but one of the evil consequences of the condition in which millions of our poorer fellow-creatures exist, a condition which it is the object of social science to ameliorate.

The unusual heat of last summer produced, as we are all now pretty well aware, a mortality considerably in excess of the average of summer seasons. The Registrar-General, in his quarterly return for the three months ending 30th September last, tells us that the annual death-rate in England and Wales in the quarter was 23.9 per 1,000 persons living, which was 3.7 per 1,000 in excess of the average rate in the corresponding quarters of the ten years 1858-67. This average rate is 20.2, and, if it had not been exceeded, 20,958 persons would have survived, who fell victims to the excessive death-rate. The highest rate in those ten years was 21.8 in 1866, when cholera was in some places epidemic, and we must turn back as far as 1854 before we find a rate so high as that which prevailed last quarter; the rate in the third quarter of 1854 was 24.3,

caused by the deaths from cholera, which was then merely epidemic.

In town districts the average annual summer death-rate is 22 per 1,000, while in rural districts it does not exceed 17; last quarter it was 26.5 in the towns, and 20.4 in the country. The greatest excess of deaths was shown in some of the largest towns, the death-rate exceeding 35 per 1,000 in Manchester and Salford, Walsall, and Wigan, while in very many of them it ranged between 30 and 35. In the fourteen large towns of the United Kingdom furnishing weekly returns, the death-rate in the thirteen weeks ending the 26th of September last was 27.6 per 1,000, against 29.2 and 23.7 in the corresponding thirteen weeks of 1866 and 1867. Ranged in order from the lowest, the rates of mortality prevailing during last quarter in each of these towns were:—Bristol, 21.8; Dublin, 23.4; London, 24.6; Edinburgh, 26.3; Newcastle-upon-Tyne, 27.4; Glasgow, 29.1; Birmingham, 29.8; Hull, 30.0; Bradford, 30.8; Liverpool, 32.2; Sheffield, 32.5; Leeds, 33.5; Salford, 36.0; and the highest, 37.8 in Manchester. The excess of deaths in the eleven English towns, over those which would have occurred if the average summer town death-rate, 22.5, had not been exceeded, make up a large proportion of the 21,000 excess in the whole of England and Wales.

We have at present no means of ascertaining the total loss of life from diarrhoea throughout the country during the past summer quarter,—we can only roughly estimate it between 15,000 and 20,000. In the eleven large English towns above mentioned the deaths from this cause were no less than 7,656, whereas in 1866 the total deaths in the whole of England and Wales from this disease in the three months was only 9,570, which number was considerably above the average of summer quarters. In very many of the other large English towns the mortality from diarrhoea was fully as great as in these eleven, and from the notes appended to their returns by the local registrars this loss of life was not confined to the large towns, but also occurred to a great extent in small towns and villages, and even in completely rural districts. The mortality from diarrhoea varied very considerably in the different towns, ruled, as it would appear, in a great measure by the general sanitary condition of the populations; it was at the annual rate of 4 per 1,000 in Bristol, Newcastle, and London; 6 in Bradford; 7 in Liverpool, Sheffield, and Hull; 9 in Leeds and Birmingham; and 10 in Manchester and Salford. Facts for the calculation of the rates in other towns are not yet available, but from the registrars' notes it is evident that in very many of them these rates have been equalled, and even exceeded. In Leicester, for instance, out of 785 deaths, no less than 320 were fatal cases of diarrhoea, showing an annual rate of 14.5 per 1,000 from this cause alone.

The mortality from diarrhoea in its summer epidemic form, arises principally from two sources; air-poisoning and water-poisoning. It is impossible to say to which the greatest share of the evil is to be attributed. Fortunately both are almost equally within the influence of sanitary science. The annual heat and drought of last summer, combined to fill the air with exhalations of putrescent matter, animal and vegetable, which need not poison our large towns, and at the same time so shortened the store of water in many of our large towns, that both the quantity and quality of the supply was much impaired. Manchester and Salford, on the whole, suffered more severely last quarter than any of the other large towns, as in addition to the highest mortality from diarrhoea, scarlatina and different forms of typhus and typhoid fever were also severely epidemic. The water-supply of this city is beyond suspicion, but it is only necessary to read the reports of the medical officers of those towns to be convinced that there are other causes in abundance, causes well within human control, to account for this excessive mortality. We need not, however follow the recent reasoning of the *Saturday Review*, and assert that because the high death-rate from diarrhoea in Manchester cannot be attributed to a faulty supply of water, the high rates of mortality in many other towns cannot, to some extent, arise from this cause. We entertain, indeed, an entirely different opinion on this point.

Fortunately the first two quarters of this year were unusually favourable to the public health, so that the death-rate for the nine months ending September is still rather below the average, in spite of the excess which prevailed during last quarter.

THE RIVER AND WATERLOO BRIDGE.

WE mentioned in our last number that we had received a letter from the Clerk of the Waterloo Bridge Company, assuring us that the pier to which we referred on the 17th of October has "been in the state it now is for many years."

We have great pleasure in receiving any assurance of the yet unshaken stability of one of the chief architectural ornaments of the metropolis. It would have been still more gratifying if the courtesy of the Clerk had enabled us to add, as we now do from other and direct testimony, that the course suggested by the *Builder* has been promptly and wisely followed by the proprietors of the bridge, or, at all events, by the proper parties. The stones, between which the black openings mentioned in our columns made their appearance, have been cut out, and are either replaced, or in course of replacement, with new material. The imperfections which arrested the eye of the steamboat passenger are thus removed, and, which is of more importance, it will now at once become apparent, to those who watch the repaired portion of the work, whether there is any tendency to further movement.

The explanation which has been given to us by apparently impartial and well-informed testimony, although not exactly tallying with the statement that the condition of the bridge had been unchanged for many years, is this:—When the piling was being driven for the embankment, we are told that it was found difficult to drive the piles properly under the arch in question, from want of a headway for the fall of the monkey. Lewis-holes were therefore cut in the face of the bridge, in order to form points of attachment for steadying the heads of the piles. It was merely the local defacement caused by this process, it is said, that arrested the attention of our informants. If this be really the case, the black deposit in the opening, which must have formed since the removal of the piling, will have denoted no structural injury, but merely have been a local disfigurement. This view is happily in accordance with an affirmative reply to the main question on which we wanted to be re-assured,—the stability of the bridge.

It will be obvious to our habitual readers that remarks, such as we felt called on to make on this occasion, should rather be welcomed by those who are interested, than regarded with any degree of displeasure. The function of a public writer differs essentially from that of the engineer, or other responsible officer, of any great work. It is the duty of the latter to watch carefully the safety of the works under his charge, and, on the indication of the slightest danger, to satisfy himself fully as to the exact nature of the facts before calling public attention to them in any way. With the writer the case is altogether different. The open-eyed watchfulness of the press is one of the great safeguards of society in the present stage of our civilisation. It is the duty of the public writer to raise no undue alarm, to mention no fact on vague hearsay, and to exaggerate nothing. But it is not his duty either to test the causes of the phenomena to which his attention may be called, or to suppress any intelligence he may receive because it is of a nature to claim inquiry. Such testing he expects to be, as in the present instance it very properly has been, carried out in consequence of his comments. And as in almost all cases of structural dilapidation or decay, the first external indications are usually very slight, it may often happen not only that a warning is timely, but that, happily, no real danger exists. We had, on the other hand, a very ugly instance of what neglect of slight indications of movement, in an apparently very solid wall, may occasion, in the case of the fall of part of the Monte di Dio, at Naples, described in our columns.

The best and most satisfactory reply that can be given to a question as to stability is, that the soundness of the work has been tested, and is perfect. The next best is, that the inquiry has been made in time, and that the proper steps have been taken. In the present instance the second reply has been practically and most commendably given by the proper persons. It will only add to our satisfaction should it prove that the disturbance indicated was strictly local.

In any case of new and unpleasant intelligence it frequently occurs that three answers are successively made by those who consider themselves in any way injured, or reflected on, by the statement. First, it is replied, it is not true. Secondly, it is not new—it is an old story. Thirdly, it is of no importance. We congratulate the proprietors of Waterloo Bridge that

their representatives, instead of satisfying themselves with this method of reply, to a hint that has never previously been given by ourselves, nor, as far as we are aware, by any portion of the press, have resorted to the forcible logic of fact. They have not despised warning, but they have taken the proper steps to test, and if necessary to prevent, danger. The most practical and most satisfactory reply to a word of inquiry is that which is given, as in the present case, not by the pen of the advocate, but by the hammer and chisel of the mason.

POSITION OF ARCHITECTURE AND ITS PROGRESS.

MR. FRANCIS TONNER, in the course of his address as President of the Liverpool Architectural Society, said,—Among the works exhibited at Leeds are some of special interest to the architect, the catalogue containing such names as Holbein, Canaletto, Pannini, Guardi, and among modern architectural artists those of Turner, David Roberts, Prout, &c. One picture by Pannini, of the interior of "The Church of St. Paolo Fuori le Mura Rome," belonging to Mr. J. Heywood Hawkins, particularly struck me as a most splendid specimen of the master, being an exceedingly fine specimen of architectural drawing and perspective, and excellent in colour. The subject is a very fine basilica, no doubt familiar to many. It is a picture on a large scale, and in very good preservation. While another, by the same artist, and the property of the same gentleman, of "The Interior of the Pantheon, Rome," displays great power of drawing, and boldness in the treatment of light and shadow, without losing the architectural detail, or yet verging on the other extreme of hardness.

Canaletto and Guardi are also exceedingly well represented, there being two charming companion pictures by the latter (views in Venice) belonging to Mr. John Samuel, excellent in drawing, full of atmosphere, and pleasing in tone, and entitled to take high rank as specimens of architectural landscape.

Perhaps, however, one of the most minute relics of quasi-architectural draughtsmanship which is to be found in the exhibition is a beautiful drawing in pen and water-colour, being a classical design for a cup by Hans Holbein, and which, it is said, was actually executed in silver for Anne Boleyn about 1534. This work, which formerly belonged to Horacio Walpole, and is now sent for exhibition by the Bodleian Library, seems a well-authenticated production of this artist. It is difficult to know whether to admire this work most as a specimen of correct and minute, yet spirited, drawing, or as exemplifying about as beautiful a style of design for this particular class of the manufacture in silver as it is possible to imagine, so perfectly it is adapted in all its forms and details to the material it was intended to be executed in. Truly our modern professors of ornamental design might often profit by a study of the classic and elegant conceptions of this master of his craft.

One is tempted to expatiate somewhat largely over a field so rich in subjects as the Leeds Exhibition undoubtedly is. The works, however, of our great modern architectural artists are too well known and too fully appreciated by architects to require any panegyrist.

A comparison of the productions of our British school of art, up to the early part of the present century, with the Continental works of the same date is exceedingly interesting, and as afforded at this exhibition will not, I think, in the eyes of an unprejudiced judge, prove, on the whole, disadvantageous to the former.

Among the French and other Continental schools we very generally meet with correct drawing (I am now more especially referring to the human figure); but in conjunction with this, in the same picture, if a delinquent is perceptible, it will be on the score of imagination, and a certain monotony of tone and colour. In the works of our own school, on the other hand, the reverse of all this may frequently be found; for in pictures exhibiting high powers of imaginative conception, fine in composition, and rich and true in colour, we may sometimes detect a certain evenness of drawing which does not occur even among the inferior of the French works.

These peculiarities, I think, very much illustrate the mode of artistic training pursued in the respective countries. On the Continent

much greater attention is paid to the inculcation of correct drawing than with us, and thus diligently-taught pupils of moderate talent accomplish more almost than could be expected from them; but the wearisomeness of over-labour on technical detail is very apt to cramp the mind, and to stunt the growth of the inventive faculties. The young English artist, if his studies as a draughtsman are somewhat too slender, has the greater opportunity of early cultivating whatever original talent he may possess.

One regrets to see the band of genius compromised by a lack of technical instruction; but still more unfortunate is it when the mental powers are, by an overstrained mechanical education, made subservient to the merely material section of an essentially imaginative art.

Might not a modification of the system of instruction pursued in each instance lead to advantageous results? The exercise of the inventive faculties should ever be allowed to relieve the drudgery of the mechanical lessons of art; and this observation, I submit, must apply as fully to the case of architectural study as to any other of its branches.

These galleries, however, both British and foreign, alike contain pictures of great excellence and beauty; and what I have just said must be understood as having reference only to what I conceive to be the respective results of the varying systems of art-education in different countries, and is far from being intended as depreciatory of any portion of this fine collection.

Upon such a historical picture as "The Last Sleep of Argyle," by Ward, an Englishman may be excused for looking with pride; nor does the name of Ary Scheffer reflect less honour on his country. While the goodly array of works in one branch of British art form the most striking refutation of the theory published by Winckelmann about one hundred years ago, when he declared that the English people must be naturally incapacitated by their climate from attaining any eminence in the exercise of the Fine Arts; for here we have ocular proof of the existence of a school of landscape art among us, both in oil and water colour, such, perhaps, as no other country ever possessed, and to the full development of which our humid climate itself, affording as it does a constant play of light and shadow and great varieties of aerial effect,—a climate which, according to this philosopher, was to be fatal to all our efforts, has doubtless very materially contributed.

Those of you gentlemen who have not visited the Leeds Exhibition I can only advise to do so, before the 26th of the present month, when it closes. Those who have already been there, like myself, doubtless, "still would go," to take a final leave of a collection of works of art, which our late respected president, Mr. Kilpin, whom I had the pleasure of meeting there in the summer, observed to me we should in all probability never see the like of again in our generation.

Another year has passed in which the Liverpool Academy have failed to support an exhibition! This unpalatable subject has on former occasions been so fully enlarged upon that I shall not trouble you with any further observations upon it, but simply state the fact. It is idle to expect that the public will accept, in lieu of the legitimate annual display they formerly enjoyed, any chance collection of a picture-dealer, however good, which may be brought here for sale, even when a charge is made for admission, and a catalogue provided. The Manchester Academy continue regularly to maintain their annual exhibition on a creditable scale.

Amid the strife of conflicting opinions as to the proper adaptation of styles to our modern uses, no work has, perhaps, proceeded more steadily nor stands out in brighter relief in the annals of really artistic architectural practice among us, than the restoration of our grand old cathedrals, which is everywhere to be met with in the country.

The hypercriticism of certain reviewers calling in question the propriety of every step taken, and unscrupulously laughing to scorn, with more zeal than modesty, the efforts of architects of the first eminence in their profession, is singular. While they are ready enough in manufacturing difficulties, they are wonderfully shy in committing themselves by suggestions for the practical solution of any; and if the dictum of the writer of one article in particular which I lately met with is to be followed, it is our bounden duty to allow our cathedrals to fall to ruin and come about our ears, rather than

presume to disturb their archaeological associations by attempting their repair!

In most cases, however, the question really is, which conduces most to the antiquarian and archaeological interest of the building, the hod and trowel of the mason and plasterer, and the brush of the whitewasher of the last century or two (whose incrustations upon the stone and marble shafts, and enrichments of all sorts, the architect of the nineteenth century pretty universally finds it to be his first duty to endeavour to scrape away), or the substantial recovery of the original material, and the restoration of the whole, as far as possible, to their pristine beauty?

Questions, of course, may arise as to the desirability of certain details in what as a whole we must approve. Sometimes we may be inclined to doubt whether too much latitude may not have been taken by a restorer in some particulars, as in the insertion of windows of his own design, in the place of others which we have been accustomed to regard as integral parts of a great design, and similar cases.

Such an instance occurs to me in the restoration of Worcester Cathedral by Scott, where at the west end a well-known window of Perpendicular date has been replaced by one of Geometric Decorated.

Yet an accomplished artist must be allowed a certain amount of discretion in dealing with a style of which he is master; and if the member removed, as this window, for instance, may have been deemed by him, from surrounding mouldings and details, to have been itself an interpolation, the step is a legitimate one, in the attempt to restore the supposed original unity of the design.

Take the cathedral in question as an illustration of the mode in which these restorations are executed, and I say it is an honour to our age! In point of intrinsic beauty there can be no doubt that the west end is greatly benefited by the alteration; for it can now boast, perhaps, one of the finest windows, of the best date of Gothic art, to be found in the country.

As to the general effect of the restoration, taken as a whole, no man of any pretension to taste can have seen, as I did, this noble building twenty years ago, with its columns, mouldings, bosses, and enrichments of all sorts, smothered up in yellow wash, and interpolations of all styles and no styles, and dates, disfiguring it in every corner; and now visit it with its marble shafts again brought to light, its groining, and ornamental work and tracered windows really restored, and the whole of the friggible lumber which the dark ages of Gothic (the seventeenth and eighteenth centuries) had accumulated within and around it removed, without feeling that it has indeed risen from the dust and put on its beautiful garments!

Chester Cathedral, too, through the indefatigable zeal of Dean Howson, is at length to be rescued from its present state of utter dilapidation. Nor need we, I think, keep over the removal of each decayed stone, whose only interest in general consists in the almost preternatural state of pulverization to which they have been reduced without the whole coming to the ground. A few remnants of the panelling of the upper stages of the tower alone remain to attest the original richness of its design, the character of which, it is to be hoped, will be carefully preserved in its resurrection.

I have referred to the strife which exists in the architectural world with respect to the course necessary to ensure the true progress of the art; and the difficulty of the case is no doubt very complex, arising as it does, not from the lack of material on which to work, but from its very redundancy.

It is often charged upon the architecture of our own day that it is effete, and that as an art it has absolutely ceased to exist. Now, may we not trace some parallel between the present state of the architectural art and the language which we speak, more especially in respect of their derivative character?

If our architecture is a compound of Greek and Roman, of Italian and French Renaissance, and Gothic, is not our language equally compounded of and derived from all these sources? To the Greek, the Latin, and the Teutonic races, and even to modern France, how much are we indebted for its richness, its fulness, and perspicuity?

The comparatively contracted mental development of the rude Anglo-Saxon required, no doubt, a very simple form of speech wherewith to express any ideas he might wish to clothe in

words; but, as civilization advanced, the science of language naturally became more complicated, and we find ourselves now supplied with an ample vocabulary, borrowed from all the foregoing sources, wherewith to give utterance to our thoughts. If in some particulars this fusion of tongues and dialects may lack the grandeur of simplicity which some original languages possess, it at least affords other advantages,—of being full almost to redundancy, and of forming a very perfect channel for the expression of intricate ideas. We do not, because we possess such a multitude of derivative words, therefore declare the English language to be effete; but, on the contrary, accepting its mixed character as an almost necessary result of the passage of time and our knowledge of the past, we admit at once that it is admirably suited for our state of high intellectual culture.

So with our architecture, accumulated as its knowledge has been from the lights of past ages. The researches of the archaeologist and our intercourse with foreign countries have legitimately placed this acquired experience of generations within the grasp of the practitioner of the nineteenth century, to be interpreted and adapted freely by him, and, with the additional resources which a man of talent ever has at his command, from the exercise of his own individual invention, to be used for the purpose of meeting the complex circumstances and requirements of a refined age; and thus treated as an art, it is still a living and progressive one.

Many and great, however, as are the facilities and appliances which attend a state of high civilization in the culture of science and taste, it may well be doubted whether, in respect of the latter at least, these acquisitions are unmixt benefits. May we not, on the contrary, often find in the works of our forefathers much of simplicity, of unity, of repose, and association, which our modern designs frequently lack, but which, after all, are very important elements of power.

One of the characteristics of our own day, no doubt, is that scientific knowledge and mechanical skill have advanced in a much greater ratio, even within our own recollection, than artistic feeling or taste; and there seems to be some danger of the spirit of the latter being almost merged in the general utilitarian tendency of the age. It behoves us, then, to combine in keeping alive some spark of regard for the poetic, by every means in our power; and I cannot think that for the attainment of this object, it is wise with regard to any art, not even of the art architectural, constantly to crave after some new thing.

Architecture, like its sister arts, has a noble history to look back upon; and her development has been as gradual as the lapse of years, upon whose centuries it is written in living stone.

The growth of the architecture of Greece was the work of hundreds of years; and it slowly arrived at its perfection by the patient and careful study of harmony of proportion and beauty of form; and the same truth is to be learnt from the history of the rise and progress of Gothic art.

No real advance in art was ever attained by the ignoring of any one of the elements of beauty; and beauty, we are taught by nature herself, is an essential element in all that can delight.

"Beauty," says a writer in *Frazer's Magazine*, "is everywhere, unnecessary, useless beauty, throughout earth, water, air, and the infinite of space; and everywhere developed, in metre, in balance, in rhythm, in symmetry; the grand original Poësis."

There is a great truth in this quotation; but such words as "unnecessary" and "useless" can never, in their ordinary acceptation, be applied to any works of nature.

That elements of beauty everywhere exist in nature, supplying no physical want, and ministering to no material necessity, is, I think, the most striking argument which can be adduced in proof of the vast importance of the place assigned it in the economy of creation, as a moral and intellectual agent for the mental use of man; and thus viewed, every trait of beauty to be found in the universe is in the highest sense both necessary and useful.

Founded on an innate love of the beautiful, that subtle and delicate mental gift called "feeling," is in fine art the key to truth; and all that is lofty, refined, and consistent is perceived through this faculty. To him who possesses it not, I fear it can never be supplied by reason or philosophy.

There are men to be found moulded much upon the model of our iron age, who seem ever desirous of dragging down the standard of taste to a level with their own perceptions; possessed of no sensibility themselves, they ridicule its presumed assumption by those who do possess it; ignoring the probability that the deficiency may reside in their own prosaic and matter-of-fact brain, and not in any affectation of the poetic mind of the artist. To such spurious connoisseurs as these we may reasonably assume the Poet Laureate to have addressed his objurgation:—

"Vex not thou the poet's mind
With thy shallow wit;
Vex not thou the poet's mind,
For thou canst not fathom it."

The well-informed art critic who is philosophical in thought, and moderate and judicious in the statement of his opinions, is entitled to our respect, and is often a very valuable coadjutor to the man of genius in the attempt to forward their common cause, and to raise the tone of the public mind to something like an appreciation of questions of taste. But it behoves these gentlemen to be careful that, even when perfectly honest and unbiassed in the treatment of their subject, they do not fall into the error of conventionalism, both in idea and expression; an offence which they are wont to visit somewhat heavily upon the heads of any whom they may deem amenable to it.

Among the stereotyped phases of modern criticism, intended generally to express a high meed of praise, none is more common than that of referring to certain artists as "conscientious."

Now when we happen to have had our attention called to the productions of these "conscientious artists" it has proved that this commendation is, as a general rule, bestowed on works conspicuous only for want of hearty, originality, and imagination, laborious though they might be; and our memories may recur to a particular class of pictorial works to which this epithet need to be so overwhelmingly applied that the only inference to be drawn was, that if these were indeed so conscientious, the endeavour to delineate ideal beauty must be highly "unconscientious," and therefore a moral delinquency.

Now I conscientiously believe that this term is, in the literary world of art, greatly misapplied, and has become an apology for a species of imitative pedantry, at the expense of the legitimate end and aim of fine art.

My understanding of a "conscientious artist" is one who exercises his imaginative faculties, in conjunction with his manual ability, to the utmost of his power, and thus emulates the examples of his great predecessors, under the guidance of whose genius all art has been gradually huilt up, and has culminated in every worthy school which the world has ever produced.

The opportunities which the modern architect enjoys of exercising his talents upon works of national importance or of great magnitude are, I fear, few and far between. But if this he denied him, yet many occasions must occur in the course of the practice of a lifetime which shall enable him to illustrate the true principles of his profession, and leave enduring monuments of his skill, which shall influence the future development of his country's architecture in long years to come.

But never let us assume that high ends in art can be lightly attained. To the sublime, the beautiful, the true in nature, the professor must appeal for inspiration. But his efforts will still be vain unless with this he united, in a greater or less degree, that magic talent which seems almost, as it were, a reflex of the mind of the Supreme Being, and a delegation of one of the Divine attributes to the use of man—the gift of creative power.

MIDDLE-CLASS SCHOOLS.—Among the many conversions and improvements of property in recent completion or in progress about the City, there is one which commands the deepest interest, indicating (as we believe it does), moral no less than material progress. The corporation for middle-class day-school education in London has purchased, at a cost of 29,000*l.*, a site of an acre and a quarter on the Finsbury estate, belonging to the Ecclesiastical Commissioners, and is already busily engaged in clearing it, and erecting school buildings for 1,000 boys.

THE INSTITUTION OF SURVEYORS.

INAUGURAL ADDRESS.

THE first opening meeting of this Institution was held on Monday last at No. 12, Great George-street, Westminster. In spite of the rival attraction at the Guildhall, the room was full to overflowing, and many of the well-known surveyors both in town and country attended. The president,

Mr. John Clutton, delivered an opening address. He said—it becomes my duty and pleasure, as your first president, to address a few observations to you on the nature and objects of this Institution. I shall endeavour to compress them into as few words as possible, as it must be sufficiently apparent that the success of the Institution will rest upon the practical efforts and unceasing perseverance of its members, and not upon any efforts of mine, beyond a few simple words by way of introduction, in these the earliest days of the infancy, of what I have no doubt, with the good-will and energy of its members, will become a most valuable Institution. But, before I proceed, I must state with what great diffidence I appear before you as your first president. I cannot but feel wholly inadequate to the task of properly supporting the position in which I am placed by the unanimous vote of the members who first took upon themselves the somewhat arduous and responsible duty of selecting the executive for this Institution. This, however, I may be permitted to say, that though there are very many amongst you much my superiors in intellect and skill in our common profession, there are none who feel a more lively interest in its well-being, or who have more persistently endeavoured, throughout a busy professional career, to maintain our calling in a position which many of us must have felt has not heretofore been recognized by the public. Many causes have combined to produce this result, but the principal one has been the absence of a common centre of association, to which the public might look as some guarantee of the trustworthiness of its members. Every other profession or body of men, having a common occupation, has long since perceived the necessity of association, and found the great benefits that have arisen to the members forming such associations. I can only account for the fact that surveyors have so long remained isolated, without any such common centre, into which individual experiences may flow to be discussed and matured, by the recollection that they have hitherto lived and laboured in local centres, distant from each other, formed and maintained by individual energy, but wanting a common bond of cohesion; and it is superfluous to say how much each one so labouring must have felt the need of an institution "established to secure the advancement and facilitate the acquisition of that knowledge, which constitutes the profession of a surveyor." Even the man in the largest local practice must acknowledge the necessity of that finish (so to speak), which can be alone obtained by the friction of mind with mind among professional brethren.

In speaking of local centres, I allude not only to those large country districts, in which many of our members have taken a prominent and distinguished part; but I include even this large metropolis, in which there are many local centres; and it cannot, I think, be doubted that we shall all greatly benefit by the interchange and expression of thoughts and opinions, many of which can be improved, corrected, and made more useful by discussion and intercourse. The probable reason why such an Association has only partially been attempted, was the difficulty in olden days of travelling to coaches and slow conveyances, and of inducing individuals to expend so large an amount of time as would have been necessary to attend the meetings of a society in any central district.

The advent of railways, however, effected a revolution in locomotion; and none have benefited more largely, in every way, than the surveyor, not only from a pecuniary point of view, but as enabling him to associate more freely with other members of his own profession.

The first society of which I have any knowledge was formed in 1834, and was called "The Land Surveyors' Club." It was in the early days of railways and of other great changes tending to emancipate land and trade from trammels which had, until then, retarded their development and improvement.

It became apparent to the surveyors in and around this great city that changes were in pro-

gress which would vastly affect the value of land,—the staple article with which they had to deal. In addition to the general introduction of railways, other most important legislative enactments were passed affecting land and consequently the surveyor. Of these I may enumerate, "The Commutation of Tithes Act," "The New Poor Law Act," the Acts withdrawing generally restrictions on trade, "The General Inclosure of Waste Lands Act," and "The Copyhold Enfranchisement Act," and other similar Acts, all tending to increase the demand for land. Six members of our profession, feeling the need of a common centre for mutual support, and for facilitating the discussion of subjects brought before them by the new legislative enactments, started the club; but this society was limited, as its name implied, to land surveyors only.

The Land Surveyors' Club eventually became, what its name implied, almost exclusively a dining club, and, as it was found difficult to dine in large numbers, was limited to forty members; but even the meeting for the purpose of dining was found so greatly to benefit the members in the discharge of their business transactions that as the numbers of that club could not be largely increased, others were established both in London and in other large centres of industry, taking into their society not only the land surveyor, but also the huddling and mineral surveyor. These, also, were essentially dining societies; but they all were evidence of the desire for co-operation, and to this end the gentlemen who formed this institution, and amongst whom will be found representatives of every class of surveyor, commenced their work to combine in one institution all the surveyors of Great Britain.

It may now, perhaps, be well that I should shortly state the steps taken to bring about the desired object.

On the 23rd of March last a meeting was held, at the Westminster Palace Hotel, of those persons who had given some indication of their desire to see a combination of the various branches of the profession. At this meeting the following resolutions were passed, viz:—

"1. That it is expedient that an association be formed, to be called 'The Institution of Surveyors.'

"2. That the undermentioned gentlemen do, with this object, form themselves provisionally into such association, and take the requisite preliminary measures for organizing the institution."

The following were the gentlemen who, by this resolution, formed the Provisional Association.—Messrs. Chas. F. Adams, Virgoe Buckland, W. J. Beadell, F. J. Clark, Edward N. Clifton, John Clutton, Henry Crawford, J. B. Denton, R. C. Driver, Richard Hall, Thos. Horsey, H. A. Hunt, Thos. Huskinson, Jeremiah Mathews, John Oakley, Edw. Ryde, E. J. Smith, W. Sturge, George Trist, and Francis Vigers.

At the same meeting, a resolution was carried to the following effect:—"That the undermentioned gentlemen, viz., Messrs. Hunt, Clark, Denton, Vigers, Driver, Ryde, Clutton, and Trist, be appointed a committee to prepare and submit a report to the Association." Here I am pleased to record the fact that we are indebted to our learned associate, Mr. John Horatio Lloyd, for being good enough to aid us in the preparation of the above resolutions; and that we have, throughout our labours, been much assisted by his kind and very able counsel and advice. The committee above mentioned met, and, with the very valuable co-operation of our honorary secretary, prepared the bye-laws and regulations, which were duly reported to a general meeting of the Association, then enlarged to about fifty members, and by that meeting, held on the 15th of June last, were made and established. At this meeting, also, the seventeen gentlemen whose names appear as the first council were elected by ballot; and they afterwards selected from among themselves the president and four vice-presidents. At a subsequent meeting, the council had the great pleasure of electing the two associates, Mr. Lloyd and Mr. Bramwell, who now aid us with their counsel and advice. Thus, gentlemen, this Institution first came into existence.

I need scarcely say that, in common with all things human, the early promoters of the movement met with many difficulties and some disappointments, and I regret that a few of the most eminent and respected of our brethren are not found in our list of members. As the council is from necessity limited in number, it was most

difficult to make a selection of representative men at the Board; but I can conscientiously assert that it was the object of all concerned to extend it as far as possible, so as to embrace gentlemen representing the various branches of our profession. Fortunately for the members generally, they can at the end of the first year reform (if reform is needed) the present council, which has undertaken the somewhat arduous duty of bringing the first year's operations to a successful issue.

So far as we have gone I think I may congratulate the members of the Institution upon the success which has attended our work. We have now enrolled amongst us 131 members and nine associates, and I am sure that as the Society becomes better known its members will largely increase. It cannot, I think, be doubted, that great benefit will be derived from frequent intercourse; and that the public at large will benefit by the more wholesome practice which must follow from such intercourse: for I cannot conceal from myself the fact that, as individuals, we have sometimes forgotten our true and legitimate position as surveyors and valuers, and have allowed ourselves to become partisans and advocates; and that, under the guise of giving opinions, we have allowed our zeal or our imagination to lead us somewhat astray. The business of the surveyor, I hold to be to give an unbiassed opinion upon the subject placed before him, and not to become, in any sense, the advocate. As it was once said by a respected surveyor, upon being asked if he was "concerned" for some one, he replied, "I am employed by him; but not 'concerned' for him." If we could only keep this in view, such startling differences as have been found amongst surveyors will seldom be met with; for it can scarcely be possible that such differences can properly exist between respectable men, having, as we ought to have, a proper regard for our profession, and the Society to which we belong.

This Institution has, in truth, like other similar institutions in this great country, arisen from the wants of society, and being the natural result of its present state, promises, I think, to be both useful and lasting.

Law, physic, and divinity, have long had their several internal regulations. The City trades were formed into companies so long since, that in some cases the original foundation is lost. The lovers of wisdom originated the Philosophical Society two hundred years ago, and in no part of the intervening period has that society failed in its transactions; the Royal Academy of Painting has celebrated its centenary; the Society of Arts has continued with more or less success for 115 years; and many kindred societies have subsequently been formed, and have worked great good, both to their members and to the public. One is worthy of special mention—the Institution of Civil Engineers. It appears from their records, that a society, or rather a club, was formed in 1771, mainly by the efforts of Smeaton; but the members were few, and it was most difficult to get together more than four or five members at a meeting.

This date takes us back to the time when Brindley and Smeaton were required to form canals to convey the enormous increase in manufactured goods, which ensued on Watt's improvement of the steam-engine, the foundation of the subsequent eminence of the country. The recovery of coal at a reduced cost gave the country that power of cheap production which ultimately so burdened the canals, that goods waited for weeks at Manchester for their turns of transit, and yet the canals carry to-day, between that place and Liverpool, more goods than they did before the railways were made. Canals, bridges, roads, harbours, and railways have in succession developed the latent powers of the engineers, and their institution originated when their works became of importance.

It was not until 1817 that the present Institution was established, and it is recorded, "that a few gentlemen, impressed with the difficulties young men had to contend against in gaining the knowledge requisite for the diversified practice of engineering, resolved to form themselves into a society for promoting a regular intercourse between the persons engaged in its various branches, and thereby mutually benefiting by the interchange of individual observation and experience."

How well does this describe our own position, and what we must all have many times felt.

Now, what has been the result of the establishment of the Institution of Civil Engineers, both upon its members and the public at large?

It numbers now about 1,500 members of all classes. Meetings are held weekly during the session, at which the average attendance is nearly 250 persons; and surely it cannot be doubted that the mighty results brought about by the labours of the civil engineer could never have been accomplished if the individual members had not been able to secure the aid and support of the important body to which they belong. Thus will it be with this, our Institution, if the members are only true to themselves and the society; for the surveyor's practice, like that of the engineer, is greatly diversified; and it is scarcely possible that any body of men can have to deal with more important and more constantly varying and increasing interests than the surveyor.

The Royal Institute of British Architects is also of a kindred character, but confined almost exclusively to architects in practice. It was formed in 1834, and now numbers upwards of 600 members of all classes. The Architectural Association, which consists chiefly of students and the younger members of the profession, may also be mentioned. This was established in 1842, and has now upwards of 400 members. The Mining Engineers' Society, of Newcastle, was started in 1852, with eighty members, and now comprises 320 members, publishing monthly a most valuable series of transactions. This society admits coal-owners, as having a material interest in the success of the institution, and any literary, scientific, or practical members of other professions, whose labours, talents, or professional experiences can aid its labours.

Although the Institution of Civil Engineers may be the society to which we are most nearly allied, there are many other societies to whom we are indebted for much knowledge that is essential to the surveyor. For instance, the Geological, the Botanical, and many others, which aid in the formation of that judgment required successfully to deal with land under its different circumstances of soil, locality, and climate.

The founder of geology was a surveyor who travelled more than once over the whole of England, before he made sections from side to side, and delineated with an accuracy which has well stood the test of time, the order in which the several strata, from primary to tertiary, rise successively to the surface, between the Welsh hills and the eastern coast; and to him, as a geologist, the country is indebted for the opinion that the Durham coal-field underlay the magnesian limestone. This opinion was the basis of expenditures varying from 100,000L. to 300,000L., to pierce through that limestone to the coal at a depth of 1,500 ft., expenditures most profitable, and adding nearly one-third to the area of the Durham coal-field. Now what would that man have given for the support of an institution which could have endorsed his facts twenty years earlier than he could himself force them upon an ignorant and, to a certain extent, unwilling public?

In a great and free country, where land is constantly being converted to more valuable purposes, and where the value may vary from a few shillings to a million pounds per acre, it must be apparent that the surveyor, through whose hands all these transactions pass, and by whose skill and experience the face of the country is changed from barren wastes to fertile fields, and prosperous thriving towns, with their docks, railways, and every variety of commercial and manufacturing premises, must, to discharge his duties effectually, be a person of enlarged and cultivated knowledge; and it is evident that the surveyor has not generally held his proper position amongst the professional men of Great Britain. There can be no doubt that the duties of a surveyor have increased to an extent and importance which demand the establishment of an institution; and I am proud to be one of those met together, this day, at the commencement of a new life for a profession to which many of us owe so much, and to which we are all attached.

I endeavoured just now to shadow forth some of the reasons that tended to depreciate our position in the public opinion, but there are others. A considerable number of the men in country districts called "land agents" are, in fact, not surveyors at all. Many most respectable gentlemen are entrusted with the management of land, whose education and early pursuits were directed to entirely different objects. Gentlemen learned in the law and physic, officers of the army and navy, and members of other classes of professional men, think themselves competent to manage and deal with land.

How strange would these gentlemen think it if the surveyor advised on abstract questions of law, or ventured upon a surgical operation, or undertook to manœuvre a regiment of soldiers, or to navigate the Channel fleet; yet officers of these services undertake the management of land, than which nothing requires a larger amount of professional knowledge and experience to manage properly and successfully.

I have time left only to indicate briefly some of the various duties of the surveyor, commencing with the ancient forest.

In years gone by the planting and management of the oak forests would have been one of the duties of a surveyor; but the days of oak forests are numbered, and iron supersedes wood in the walls of old England. At present, the surveyor's attention is chiefly directed to plantations for ornament and shelter, but there is room for clothing many bleak sides of bills with trees, to the profit of the owner and the advantage of the country.

The surveyor now has to devise the most expensive and ingenious ways of rooting up the remains of the forest and converting the soil into productive land, and the clearing, road-making, fencing, and draining; the erection of farm premises, and the finding suitable tenants; with the framing of leases for the due cultivation of the land, holding an even balance between the lord of the soil and his tenants. All the above are works requiring great knowledge and experience. At another period the surveyor has to convert and utilise land for building, to lay out and make roads and sewers, and in fact prepare the land for the builder. So again with docks and railways. The surveyor not only measures and maps the ground to be converted to commercial purposes, but his skill and experience are again brought to bear upon the sale and purchase of the land before the engineer can commence his operations. The surveyor's services are again required in the measuring of holdings and estimates of their value, and also in the estimate and sale of wharfs, docks, and other commercial property; and last, though not least, the services of the mineral surveyor are necessary in the management and exploration of our mines. These all afford vast fields and scope for the skill and experience of the regularly-educated surveyor, and it is evident that miserable failures must be made by men who assume to be surveyors, but who have had no proper education to enable them to carry out the important works briefly enumerated above.

There are one or two subjects which must shortly more engage the attention of the surveyor. To mention one only, and that, perhaps, the most important, viz., the utilization of the refuse and sewage arising from our population. Hitherto the object appears to have been to get rid of all such matter, at a great cost, into the nearest stream or water-course, thereby transferring to other localities the nuisance and evils arising in our towns. Scarcely any attempt has been made to convert the most valuable manuring matter to any useful purpose. It is for the surveyor to aid in the application of this matter, so as to render our fields more productive, and to convert a substance which, misapplied, is so destructive of life, to the support of life, and the increase of the nation's wealth and happiness.

I will not here enter upon the large question which are now ripe for discussion, viz., whether the dry earth system is the better method of conveying away the more valuable manures contained in sewage; or, whether we must continue to use the present expensive mode of getting rid of it by sewers which, have not only to be made large enough as at present usually constructed for sewage proper, but for the rain-fall also. The question to be discussed in this room was, whether the manuring value of this refuse is better and more economically applied in a fluid or dry state? and I hope soon that some one of our members will prepare a paper, and so lead to a full discussion upon this most important subject.

It now remains for me to indicate the line of action which this Institution is likely to take. Offices and a convenient room for our meetings have been secured, to which is attached a reading-room and library, open at all times to members of the Institution. The room will be supplied with papers, &c., for the convenience of members.

General meetings, it is at present proposed, shall be held in this room on alternate Mondays, at eight p.m., in the seven months beginning in November and ending in May. At these meet-

ings papers will be read upon subjects interesting to the surveyor, and discussion will afterwards be open to the persons present. It is proposed to print and distribute the papers, with a short statement of the discussion which may have taken place.

The bye-laws and regulations have been prepared with great care, and I hope they will be found sufficiently matured to be a basis upon which to rear an important structure. But, however sound the foundation, the ultimate completion of the Institution, its future prosperity and usefulness, and, indeed, its very existence must depend entirely on the good sense, the personal conduct, and the individual exertion of every member; and I feel assured it will be enough only to mention this circumstance to command the best efforts of the members, always bearing in mind that talent combined with respectability are preferable to mere numbers; and that, from too easy and promiscuous admission, unavoidable, and not infrequently incurable, inconveniences perplex and sometimes destroy societies.

The council hope that the members will bear in mind that it is important to have a good library, and that books and maps should be presented at an early period. It will also be of great value to have plans and reports of works executed or designed, with the result of their cost, &c.; and it is hoped in course of time to make the Institution a centre for the accumulation and diffusion of all information and matter of interest to the profession.

Our very able honorary secretary has kindly, for the present, undertaken to carry on the business of the society with the aid of an assistant secretary. The Institution, thus fairly started, must run a successful course, if the members are only true to themselves, and it will prove of great advantage both to the members and the public.

Mr. J. H. Lloyd (associate) in an eloquent speech moved a vote of thanks to the president, and, as an outsider who took a great interest in the profession, begged permission to add a few words of kindly advice and encouragement. He had seen and talked to some of the eminent gentlemen whom he believed the president alluded to with regret as not having joined the Institution. They had doubted its success, and wisely shaken their heads, but head-shaking was very easy; and he never yet knew anything worth the doing accomplished by doubters. Would Columbus have discovered the continent of America, or would those wondrous cables have been laid to connect his new world with the old if courageous minds had been dissuaded from the attempt by shaking of heads? He advised the members to discard all doubts of success; to fail in a great end was nobler far than not to endeavour. It was well not to promise or to anticipate too much, but he thought they might calculate on the attainment of three objects—intellectual advancement, social elevation, and moral improvement. As judges, as arbitrators, witnesses, or advisers both in public and private capacities, a general as well as a special knowledge was most important. Social elevation and moral improvement would go hand-in-hand, and, though it might ill become him to say to those present that any of the latter was needed, he would take this opportunity, while they were talking as friends, boldly and frankly to mention a subject that was often in his mind. He believed that as judges, arbitrators, or advisers there was no body of men more upright and responsible, and more anxious to do what was right at any cost than the surveyors of Great Britain, but he was bound to say, from a somewhat large experience, that as witnesses he had sometimes observed a zeal which must put a strain upon the conscience. No client had a right to ask a surveyor for more than an unprejudiced opinion, or get him to pander to his stupidity for his own gain; let there be less of that overweening confidence of statement, which not only does more harm than good to the client, but lowers the surveyor in the estimation of all right thinking men. The institution could only be a success by constant and combined efforts, and he specially urged on the younger members the necessity of attending the meetings, and taking part in the papers and discussions.

Mr. Richard Hall briefly seconded the motion, which was carried by acclamation.

Mr. F. J. Clark then moved a vote of thanks to Mr. Lloyd, who was always ready to assist surveyors with his purse, or with his counsel, and had so eloquently reminded them of their

duties that evening. This was seconded by Mr. Huskinson, and carried amidst great applause.

Thanks were also accorded to the honorary secretary (Mr. J. W. Penfold), and a most successful meeting terminated with the announcement that a paper would be read on Monday evening, November 23rd, entitled "Historical Notes," by Mr. Edmund James Smith.

GUILDHALL: LORD MAYOR'S DAY.

EVERYTHING passed off most satisfactorily in the City on the 9th of November. The arrangements at the Guildhall, and the hall itself, now completed, were most creditable to Mr. Horace Jones, the City architect. The lobbies were decorated with sculpture from the studios of Mr. Durham and Mr. Theed, and in the Alderman's Court-room was set up an effective scenic picture, by Mr. Frederick Fenton, representing the Attack on Magdala by the British Army. The stained-glass windows in the ball were illuminated from behind. The great Lancashire memorial window at the east end came out beautifully. A handsome carved oak screen, or rather reared, has been set up under it, at the hack of the dais. Some of the other windows were but dimly seen, probably because of the blaze of light in front of them. The scene, as a whole, was as grand a sight of its kind as ever looked upon. A little less trumpeting—two blasts, for example, to each toast instead of four,—and fewer repetitions by the toast-master, of "May it please your Royal Highness," would have left cynical visitors without a ground for grumble. The Lord Mayor, Jas. Clarke Lawrence, pleasantly indicated the wise spirit that will influence him during his mayoralty when he said, in one of the many excellent speeches made by him during the dinner, "I do sincerely hope that during my year of office the Mansion House may be regarded as the proper centre and home of all who are eminent in art, science, and the civilization of our time."

KENSINGTON SICK ASYLUM COMPETITION.

THE Asylum Board have purchased six acres of land at North End, from Captain Cunter,—a plot in between the West London Railway and Beaufort House; and here it is proposed to build an asylum for 600 patients. Six sets of designs have been sent in by the following architects. We add the amount of the estimate in each case where it is attached to the drawings:—

Messrs. Hunt & Steward.....	£55,000
Mr. Allmon.....	50,000
Mr. Williams.....	45,000
Messrs. Nesfield & Shaw.....	45,000
Mr. F. H. Pownall.....	39,800
Messrs. Giles & Bree.....	36,700

The design by Messrs. Nesfield & Shaw has been selected, subject, we suppose, to the verification of the estimate. Of this, however, there is probably not very much doubt, provided any of the other estimates be correct! It is very plain externally, and peculiar. The walls are of brick, the roofs of tiles, and in parts the walls of the upper story are faced with weather tiles. When we add that there are tall brick chimneys, and that the windows are filled with thick wooden sashes and small panes of glass, it will be seen that it presents a rural and almshouse-like aspect, such as belongs to some buildings of the seventeenth century. We have no doubt that it will produce a very agreeable effect. The plan, too, appears to have been carefully studied. The wards are to be warmed by earthenware stoves in the middle of the floor, the flues from which pass up through the other floors. The position of the W.C.s seems open to question.

DUMFRIES INFIRMARY COMPETITION.

THE conditions issued by the governors contain a very objectionable clause. After announcing that, "though they will consider favourably the claims of the architect who obtains the premium, [they] will not be bound to employ him to carry out the work," they continue,—

"It is proposed to expend the sum of 10,000*l.* upon the buildings, which sum shall include the architect's fee and the salary of the clerk of the works, the amount of which fee and salary shall be stated by each architect in a stamp sum."

The architect whose plans may be selected as the best shall not be entitled to payment of the premium unless and until the committee and governors are satisfied that the works can be contracted for at or within the said sum of 10,000*l.*, including as aforesaid."

In other words, as will be seen, the governors, in a by sort of way, invite a competition for terms amongst architects, tempting competitors to name a low sum for remuneration as a means of increasing their chance of being selected. Architects will do well to reflect before they respond to this condition. The profession is being dragged into the dirt.

The premium really offered to the successful competitor is 50*l.* A correct estimate of the cost of carrying out his design would itself cost more than double this amount.

THE INSTITUTION OF CIVIL ENGINEERS.

THE Council have issued a list of subjects upon which, among others, communications are invited for reading at the meetings of the Institution. For those approved premiums will be awarded. Amongst the subjects given are the following:—

On the present state of knowledge as to the strength of materials.

On the theory and details of construction of metal and timber arches.

On land-ships, with the best means of preventing or arresting them, with examples.

On the principles to be observed in laying out lines of railway through mountainous countries.

On the most suitable materials for, and the best mode of formation of, the surfaces of the streets of large towns.

On the construction of catch-water reservoirs in mountain districts, for the supply of towns, for irrigation, or for manufacturing purposes.

Accounts of existing water-works.

On the drainage of towns, and the ultimate disposal of town refuse.

On the employment of steam power in agriculture.

On the ventilation and warming of public buildings.

On the design and construction of gas-works, with a view to the manufacture of gas of high illuminating power; and on the most economical system of distribution of gas, and the best modes of illumination in streets and buildings.

The first meeting of the Institution for the ensuing session, to be held on Tuesday, the 17th inst., will take place in new premises erected during the recess on the old site in Great George-street.

PROPOSED SANITARIUM AT WESTON-SUPER-MARE.

A SITE having been purchased for the Sanitarium, having a house upon it capable of accommodating twenty patients, plans were prepared by Mr. Spencer, architect, Tannton, in order to show how much building may be added to, and the site utilised. The cottage system has been adopted, on account of its elasticity. What has been aimed at has been to obtain facilities of communication; but at the same time (as on the pavilion principle in hospitals) to isolate each building as much as possible for the sake of the thorough circulation of the atmosphere and complete natural ventilation. The present site will be sufficient for eight blocks, or cottages, without crowding, all connected by corridors. All the apartments used by the patients are on the ground floor, and on the same level, thus the fatigue of making use of stairs is entirely avoided.

The apartments for women are on one side, and the men's apartments on the other. They consist of bedrooms, a day and dining room for each six, with rooms for the master and matron, the kitchen and offices, common to all, being in the rear. In the rear of the sick-wards for cases of relapse, and all the usual and necessary offices adjoining. Each bedroom for convalescents is calculated to hold five beds, thus giving 1,000 cubic feet to each; but in the sick-wards 1,500 cubic feet have been allowed to each patient.

A conservatory and the corridors would serve as places of exercise in inclement weather; while, as the former leads directly on to the beach, bathing-machines could be brought up to the door and be entered by patients under cover.

A tower serves as a distinguishing mark to the group of unpretending buildings. The tower staircase leads also to the tops of the corridors, which have flat roofs, and are useful ambulatories. Numerous points of access are provided from the corridors to different plots of garden-ground.

METROPOLITAN BOARD OF WORKS.

Dangerous Structures.—At the meeting on the 6th inst. the clerk read a letter from Sir M. E. Hicks Beach, bart., Home Office, inquiring whether the Board would have any objection to undertake the duties, imposed by the Building Act, with regard to dangerous structures in the metropolis, now performed by the commissioner of police. The matter was referred to the Committee of Works.

Improvement of Park Lane.—At the same meeting, the Works and General Purposes Committee brought up a report recommending that an improvement should be made in Park-lane by purchasing the two northernmost houses on the east side of Hamilton-place, to pull down the fronts and widen the roadway to 40 ft., and that the road should be carried northwards, in a straight line with Hamilton-place, into Park-lane, and that the solicitor to the Board (Mr. Smith) should issue the necessary notice for an Act in the ensuing session of Parliament. This was embodied in a motion, put, and agreed to. It has yet to be seen, however, if the Commissioners of Woods and Forests will assent to the plan.

THE SEWAGE FOR THE SOIL.

The Leamington Local Board of Health have at length become convinced that the attempt to deodorise the town sewage is a failure, and they have unanimously resolved to adopt irrigation. At a meeting of a committee of the whole Board, a sub-committee has been appointed to look out for land suitable for irrigation. The question, however, whether the sewage should be pumped on to the land direct from the sewers, or shall first have some solid matter extracted, was left open for future consideration.

The Leicester sewage question seems to be approaching the same solution. The local *Advertiser* says:—

"The official report of the analytical investigation of the merits of the two systems of treating town sewage, namely, that of deodorising it by means of lime, and Mr. Sillar's method of treating it, will be read with considerable interest by most of our readers. They will see that no very brilliant result has been arrived at by the latter process. In the former, that of deodorising it by means of lime, much of the fertilising properties of the sewage was, as is well known, lost. Mr. Sillar's process is an improvement in this respect, but still it must be pronounced as very far from being satisfactory. By neither of the processes can the liquid be so far purified as to be fit to be permitted to enter a running stream. Science, hitherto, is at fault in this respect; no chemical means having yet been discovered that can thus far effectively purify sewage.

One strange discrepancy is apparent in this report between the calculation of chemists as to the value of deodorised manure as a fertilizer, and the price it fetches in the market. While they estimate it as worth between 13s. and 14s. per ton, experience teaches that, in the market, but 1s. per ton can be obtained for it. Farmers may, perhaps, deem it worth while to test this matter. Either the chemists must have strangely miscalculated, or else here is a manure selling at less than one-thirtieth of its intrinsic value. As a manufacture of solid manure Sillar's process is reported as being 'much superior to the treatment by lime, although it fails to extract more than a very small portion of its valuable constituents.' The report states that 'no chemical process is known which even remotely approaches irrigation in its efficiency as a purifier of sewage.'

SANITARY MATTERS.

Falmouth.—The sanitary condition of Falmouth, at the present moment, seems to be as bad as it could have been had there been no local board of health in existence. The very best parts of the town are hotbeds of fever. Woodlane-terrace, Florence-terrace, and the neighbourhood, whose proximity to the sea and great elevation would be supposed to render them peculiarly free from zymotic diseases, are declared to be the most infected parts of the town. One medical gentleman in the town has no fewer than forty cases of fever under his own care, the majority of which are situated in this district; and the other medical men, says our authority, are, to use an expressive phrase, "run off their legs;" so that the extent to which fever has laid hold of the town is

something alarming. In front of almost every house is a cesspool, the only receptacle for the whole drainage of the house, and from which noxious vapours are continually arising and poisoning the neighbourhood; whereas, in the lower part of the town, a large portion of the sewage matter is conveyed at once into the harbour.

North Shields.—An epidemic which recently broke out in North Shields continues to run its course, no abatement in its severity being yet visible. Mr. George Bell, at the Tynemouth Town Council's last meeting, said that there were from 700 to 800 cases of fever in the town. The entire prostration of those suffering under the attack has been pitiable. Fortunately, the mortality is not proportionate to the intensely violent character of the fever. The disease has been extremely severe in all the principal streets and squares occupied by the respectable classes in North Shields, and in some of the best portions of Tynemouth; and there is the same disproportion in the number of cases in the higher as compared with the lower parts of the town as was seen during the cholera visitation, the humbler classes by the river side being again come off comparatively unscathed. This is a remarkable circumstance, and narrows the search after the cause of the alarming outbreak to very small proportions. The Falmouth case might usefully be considered in connexion with it. The origin of the disorder is believed to be found, however, in some sort of water pollution, and not in atmospheric conditions. The Public Health Committee have instructed Mr. Hawksley, C.E., to make a complete inspection of the water-supply of North Shields.

THE ANCIENT MANOR-HOUSE OF SOUTH WINGFIELD, DERBYSHIRE.

In your recent review of "Guide-books to Derbyshire" no mention is made of one of the most interesting and extensive ruins in that county. I allude to the Manor House of South Wingfield (or Winfield), three miles distant from Alfreton and about eight from Matlock Bath. Allow me, then, to add to what you have said a few remarks on this charming old mansion, which, independently of its architectural features, possesses some historical interest as the place where the ill-fated Mary, Queen of Scots, was imprisoned for several years. To the traveller on the line between the Amborgate Junction and Chesterfield the ancient Manor House forms a striking object, standing out majestically amid a fine grove of trees, which almost embosom it, and surrounded on nearly every side by a deep valley. It is not exactly a castellated structure, but a specimen of a manor-house erected during the reign of Henry VI. (of the very early Perpendicular period; in fact, almost Decorated in parts), and fortified to some extent.

According to Camden, it was built by Ralph, Lord Cromwell, Lord Treasurer of England, and this statement is somewhat corroborated by the fact of carved bags or purses being introduced in the arms over the principal entrance gateway. The plan of the Manor House consists of two quadrangles, the northern of which comprises the more important rooms, the southern court having evidently been used for the inferior buildings. In the north wing of the former quadrangle are situated the banquetting-hall* (with a fine crypt, the use of which seems uncertain), having the usual arrangements of an entrance-porch with chamber over, and a bay-window of elegant design. Adjoining the hall to the west is a large room, probably the state apartments or refectory, beyond which are the buttery-hatch, kitchen, and other rooms, to which no name can with certainty be given. In the west wing, it is said, were the suite of apartments in which Mary Queen of Scots was confined. This is popularly believed to have been the most magnificent part of the building. The foundations of two bold semi-octagonal projections and portions of the walls still remain on the inner side of this wing. These are traditionally said to have been bay-windows, but the foundation is solid, and from an excavation I made some time since, resulting in the discovery of the jambs of

an archway at the side of one of these projections, they appear much more probably to have been lofty *turrets*. At the south-west angle stands what is now termed the high tower. There are some persons still living who remember the fall of a tower of similar dimensions at the opposite (south-east) angle. On the south side of the north quadrangle (which forms the north side of the south court), are the porter's lodge, entrance gateway, and a modern farmhouse, stable, &c., formed within the walls of the original structure. There are no remains beyond a portion of a wall, of the building which formed the east wing of the north quadrangle, but beyond to the east are the ruins of what was probably the chapel.

The south court was evidently used for offices. Its east wing consists principally of two large halls, which were probably barrack-rooms. At the south end of this side is an arched gateway; on the south is a barn, the greater portion of which is clearly part of the original design, and fragments of walling remain, sufficient to show that buildings extended along the whole length of this side of the quadrangle. On the west side the greater portion of the outer wall exists, and there are indications here of another external gateway. Till within about the last twenty years, the original well in the centre of the court was in use, but one night it suddenly fell in with a loud crash.

Nearly all the work is in capital preservation—some portions of the window tracery, door-jambs, &c., look as if only just from the mason's hands, so sharp and well defined are the arrises and moldings. The more important part of the building is faced with ashlar, which I am told, on tolerably good authority, was quarried on Ashover Moor, about four miles distant from the Manor House: it is a crystalline millstone grit. The material for the rougher walling was obviously obtained on the spot, as the greater part of the south quadrangle is built on the solid rock (which is a formation of the old red sandstone). Blore, in his history of South Wingfield Manor (published in the last century), remarks: "Some assaults during the civil wars between Charles I. and the Parliament, and the more deliberate attacks of its subsequent owners, have brought it into a state of irreparable ruin." However, the present possessor of this property, the Rev. Immanuel Hailton most fully appreciates the ancient building, and in a conservative spirit adopts every means to preserve and to strengthen it where necessary." E. B. F.

BUILDERS' HARDWARE.

MR. RUPERT KETTLE (County Court Judge), who, it will be remembered, was the chosen arbitrator of the Wolverhampton builders in the recent wages dispute, which he brought to a successful termination, has just been addressing the working people of Willenball on the "Ornamentation of Flat Surfaces," with especial reference to the manufactures of the district. Mr. Kettle, after an elaborate criticism of modern house decoration, particularly cornices and wall papers, referred at some length to the design and ornament of builders' hardware. "Hinges," he said, "thanks to the design of ecclesiastical builders, had been more elaborated recently; but locks and keys, bolts, and window fastenings, still retain the utilitarian character of former times." He suggested that brass ornaments in the shape of corner-pieces on ordinary door-locks, would be simple and inexpensive decorations, and would greatly improve the appearance of those articles. One eminent firm in South Staffordshire (Messrs. Carpenter & Co.), have already begun to act on the suggestion, and are preparing for the London market a series of cheap yet ornamental rim and dead locks. The Wolverhampton co-operative locksmiths, who have quarrelled with their former employers, have applied to Professor Fawcett for assistance and advice, and that gentleman, in conjunction with other well-known advocates of co-operative industry, has expressed his desire, under certain conditions, to render the applicants "permanent aid." The demand for builders' hardware in Birmingham is improved further, and the work-people are steadily employed. Builders' tools are especially in more buoyant demand.*

* In 1678, this portion of the Manor-house was altered and adapted into a dwelling-house, the remains of which still exist.

* I must express my obligations for some of these data to Mr. John Capitt, of Wingfield Manor, who has resided there for some years, and takes the greatest interest in its antiquities.

PROPOSED FISH MARKET IN THE FARRINGTON ROAD.

ACTING on the facts that upwards of 70 per cent. of the total supply of fish is now conveyed by railway, and that Billingsgate market cannot be made to meet all requirements, the Smithfield Market Appropriation Committee, entertaining strong convictions of the appropriateness of the land lying between the New Meat Market and Farringdon-road for the purposes of a fish market, have availed themselves of the professional services of Mr. Lewis H. Isaacs, architect, and have issued a plan showing the situation of the proposed market, and a view of the intended structure as seen from the Farringdon-road. The ground proposed to be utilized is a parallelogram, bounded on the north by the new road leading to the Charter-house; on the south by an intended new street in continuation of Longlane; on the east by the new street now formed at the end of the meat market, and on the west by the Farringdon-road. In the design no attempt at originality in the external appearance of the building has been sought after; and, as far as it is practicable, the fish-market has been made to appear an addendum to the meat and poultry market. The cost of the building is estimated at 150,000*l.*, exclusive of the value of the land, which is the property of the corporation. The committee in their prospectus take credit for availing themselves of a fall in the land by forming a shell-fish market below, besides the basement below that again; but the result is to render flights of steps necessary to reach the market proper, which we are disposed to think would be found objectionable. However there are more vital questions to be disposed of before this need be discussed.

RE-OPENING OF PORTSMOUTH GARRISON CHURCH.

This event took place on Friday, the 30th ult., and was conducted with considerable ceremony.

The restoration of this ancient structure has been one of some difficulty. The found the old buildings in a wretched state, windows blocked up, doors also, members concealed or fractured, the tie-beams of the roof hanging by iron straps to the outer walls, rendering it quite a matter of wonder they had not dropped from their places long before. We read that the building was the only remains of "Domus Dei," or God's house, a kind of hospital originally for poor monks; and since then the place of marriage between Charles II. and the Infanta of Portugal, &c., to celebrate which, it is supposed, the monarch presented the altar-cloth in the possession of the church, and embellished with a view of Lisbon and the Royal arms of Portugal.

According to Matthew Paris, 1238, Peter de la Roche or de Rupibus was the founder of the Hospital of Portsmouth, in the W.S.W. portion of the town, about 1205. In Slight's History of Portsmouth, we find that on the authority of Dugdale, "Peter de Rupibus, Bishop of Winchester, founded at Portsmouth a house called God's House," which was dedicated to St. John the Baptist and Nicholas." Camden and Speed are agreed on this point.

In the 20th, 37th, and 52nd years of Henry III., disputes were settled as regarded certain possessions. After several grants in 1272 and 1276, the two brothers of William of Wykeham were wardens successively. In the fourteenth century William of Wykeham himself bequeathed "a suit of vestments and a chalice."

In digging down, a broken column and portions of an archway were discovered, which proved that the proposed extension (which has been carried out) of the western end would terminate the actual original length of the building. 20 ft. have been added, making the dimensions as follows:—Nave, length, 110 ft.; width 45 ft.; height from floor to springing of roof, 32 ft. Chancel, including choir,—length, 55 ft.; width, 22 ft.; height from floor to springing of groined arches, 25 ft. The new transept on the north side of the chancel is in length 18 ft.; width, 12 ft.; and height, from level of floor to apex of roof, 30 ft. The roof, which is open-timbered and tile-covered, forms as nearly as possible an equilateral triangle, king-truss for nave and queen-truss for chancel. Vanings lying concealed beneath by the deposits of centuries have been filled in, and a substantial

hed of concrete, 6 in. thick, over-spread by a layer of cement, 3 in. thick, which will, in time, be covered by Minton's tiles, makes a dry and serviceable floor. Chairs, 750 in number, are placed in the nave. The nave, from east to west, is divided into bays, consisting of pointed arches, springing from freestone columns, and is lighted by twelve two-light windows, independently of the stained windows, which we shall describe further on. The chancel-floor is composed of encaustic tiling (Godwin's) interlaid with old white-veined marble, which formed part of the old structure, laid diagonally, and connected by hands of polished green tiling. In the chancel the old credence and sedilia have been restored, the millions of windows partially so. The stained windows above the altar are three in number, and placed there in honour of Sir Charles Napier, of Indian fame, Lord Raglan, and Lord Clyde. The large window at the west end, over the main entrance doorway, is illustrative of Christ sitting in judgment at the last day, and is placed there in honour of the officers, &c., of the 43rd Regiment, killed in the New Zealand campaign. East of the south aisle is a small one-light window, placed there by Archdeacon Wright, one of the chaplains to the forces at Portsmouth, in memory of his brothers, hearing upon it full-length pictures of David with the head of Goliath, and Jonathan in battle array. South-east of the south aisle,—a small window, containing the figure of "Sanctus Georgius," in full armour, presented by Mr. A. Smith, the contractor for the building. On the north side of the chancel proper a two-light window represents the baptism and preaching of Christ, and is to the memory of Col. Willis. In the north-east corner of the nave is a three-light window exemplifying the child-life of our Saviour, comprising the offering of the Magi, &c., and erected to the memory of Capt. Molesworth, R.E. On the north side of the choir is a window to the memory of the officers, &c., of the 67th regiment. All these stained windows are by Messrs. Clayton & Bell, of London. The church is warmed by a central pipe running down the centre of the nave below the flooring, and terminating in branches to two Gill's stoves, situated respectively at the east and west ends of the north side of the building. The gaslight arrangements are effected by fourteen ornamental Medieval iron standards rising from the floor, and carrying a total of 108 lights. These were all from the manufactory of Messrs. Hart & Son, of London. Mr. Street was the architect, and Mr. A. Smith, of Portsea (late Simms & Marlen), the contractor.

MONUMENTAL.

A MONUMENT to the late Admiral Sir Charles Napier is at last in existence, but not so much on the part of the country, as it ought to have been, as on that of private friends and admirers of the bluff old admiral. The ceremony of unveiling this monument, which is one in relief, and fills a niche in St. Paul's Cathedral, near the north entrance, has just been performed. Among the company present were the following:—Major-general Napier, C.B.; Major-general W. Napier; Admiral Sir Michael Seymour, G.C.B.; Colonel Hamley, C.B.; Captain W. Napier; Captain W. Morris, R.N.; Captain Ingledew, Captain Norton Taylor, Captain Poulter, &c. The expense of this monument was defrayed by a few friends and companions in arms of the late admiral. It is of white marble, and upon flags are the names of most of his battles. In the centre is the head in bold relief, surrounded by a wreath of laurel and oak; in the background is the ship *Wellington*, gunboats, and a fortress blown up; beneath is the simple inscription, "Charles Napier, M.P., Admiral, Count Napier St. Vincent, born 1786, died 1860." The work was designed and executed by George G. Adams, sculptor, who has now five monuments in the cathedral, two being colossal statues of the admiral's cousins, Generals Sir Charles J. and Sir William Napier.

A memorial brass, in the Medieval style, sunk in a black slab of Irish marble, has just been executed by Messrs. Hart & Son, of Brook-street, Hanover-square. This tablet is to the memory of the late and sixth Earl of Harrington, and is now being erected in Etravston Church, near Derby. The slab is 8 ft. 6 in. by nearly 4 ft. The inlaid brass is delicately worked, the enamelled portions being effective, and the colours harmonising with the general design.

The whole is bordered by texts and symbols. Under the canopy is a full-length portrait of the earl in collegiate attire. This memorial is being erected by Elizabeth, Countess of Harrington, mother of the deceased youthful earl, who died in 1866, before attaining his majority.

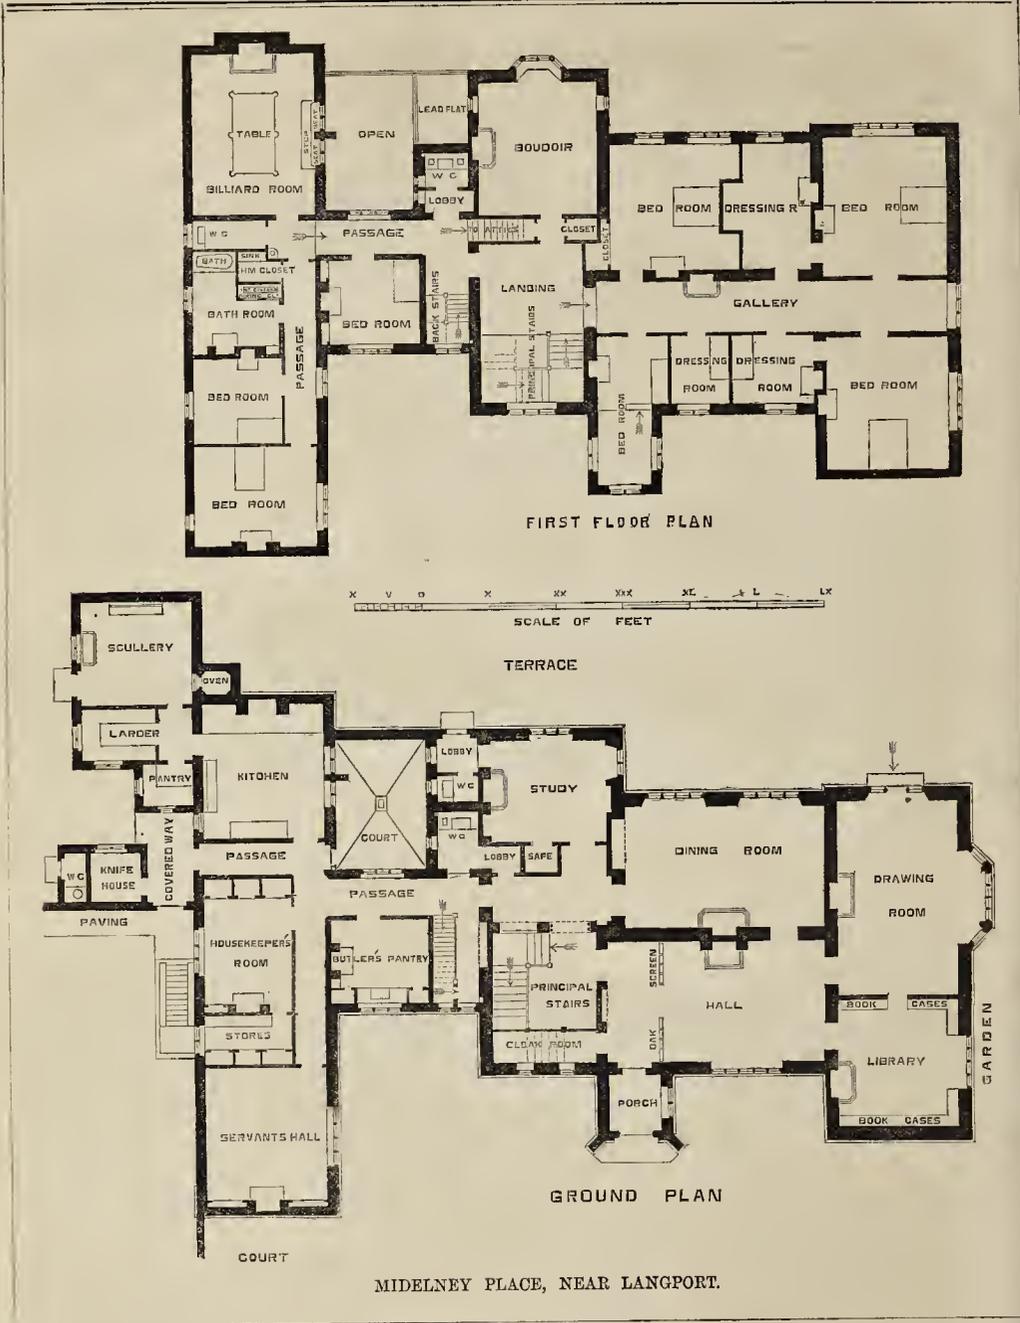

THE TRADES MOVEMENT.

Leeds.—The master builders of Leeds have given notice of their intention, in accordance doubtless with the resolutions of the general association, to adopt, on the 1st of May next, very extensive and important alterations in the rules of the various trades. Instead of 30*s.* per week, they propose to pay ordinary skilled workmen amongst masons 7*d.* per hour; plasterers, instead of 30*s.* per week, 6*d.* per hour; plasterers' labourers, instead of 22*s.* per week, 4*d.* per hour; and plumbers, instead of 26*s.* per week, 5*d.* per hour; superior or inferior workmen in each trade to be paid by special agreement. They also require the abolition of the rule or custom in the Masons' Society for bidding or interfering with the introduction or use of stone worked at the quarry, or anywhere else than the place where it is to be used. Any rule or custom forbidding piecework or sub-letting amongst masons and plasterers they also require to be abolished. With respect to the bricklayers, bricklayers' labourers, masons, masons' labourers, plasterers, plasterers' labourers, and the plumbers, the masters require that in future all trade rules, disputes, demands, and differences shall be settled by conciliation and arbitration [to "require" all differences to be settled by conciliation, we fear, is not the best way to effect such a settlement], and that proper courts shall be constituted for that purpose. They further state that they are prepared at any time, upon six days' notice from the men, to meet them to appoint arbitrators and select an umpire, and that they are willing to leave to the decision of the arbitration court, thus appointed, not only all future settlement of trade rules, demands, and differences, but also the settlement of all matters contained in the notice they have just given.

Liverpool.—A general meeting of the operative bricklayers, who are at present on strike, was held the other evening in Stanley Hall, Richmond-row, for the purpose of taking into consideration the correspondence which had taken place with the master builders with regard to the proposed board of arbitration. Mr. Bromlow, chairman of the Bricklayers' Society, presided, and Messrs. Bolt and J. Samuelson were also present on the platform. There was a large attendance of the men interested in the proposal. It was resolved,—

"That the communication of the master builders, in reply to the friendly overtures of this society, be received in an entire spirit of reconciliation; and this meeting expresses every desire to meet the wishes of the master builders and renew friendly relations with them. But, inasmuch as it would be a serious injury to the operatives, as well as contrary to public policy, that the strike should terminate before a court of arbitration has been formed, and during the present depressed state of the building trade, this society again respectfully asks the master builders to reconsider their determination, and at their convenience appoint their referees to act with those selected by the operatives; meanwhile, the members of the society are recommended to cultivate friendly relations with their employers."

An Imperial Building Society.—The *Courrier de Bayonne*, speaking of the buildings for workmen which the Emperor has decided on having erected in that town, says,—"It is on the same ground on which three specimen-houses have already been erected that the new constructions are to be built. They will be smaller than the preceding, and are intended for only one family. The Emperor, in order to design purchasing all the lots composing the block on which the first three habitations have been constructed, and to pay the price which would serve as the estimate for putting it up to auction. Each dwelling is expected to cost 4,500 francs; the tenant is to pay 300 francs a year, out of which sum 100 francs will be set aside as a sinking-fund for the capital employed. His Majesty will give the property, it is said, to the Society of the Prince Imperial, which will select the occupants and collect the rents. At the end of fifteen years the inhabitant will become the owner. If, by any unforeseen event, he cannot pay the stipulated annual sum (which may be acquitted by monthly instalments), he will be reimbursed the 100 francs a year he has accumulated towards the redemption of his house, with the addition of 3 per cent. interest."

MIDLNEY PLACE, NEAR LANGPORT, SOMERSET.

This house, which is of moderate size, has been built for a gentleman in Somersetshire. It stands on a gentle slope to the south-east, and this is the aspect of the principal rooms.

The porch, by which the house is entered, is at the back, and fronts a courtyard enclosed on the three other sides by walls, the direction of which is indicated on the ground plan, and by the stables. The approach is by an archway in the north-east wall of this courtyard.

The house is built of the white lias of the neighbourhood, with dressings of Ham Hill stone, the distant quarries of which can be seen from

the windows. The roof is tiled. The style has been followed, though scarcely hoping to attain their grace, of the numerous remains of Medieval Domestic architecture with which the district is adorned.

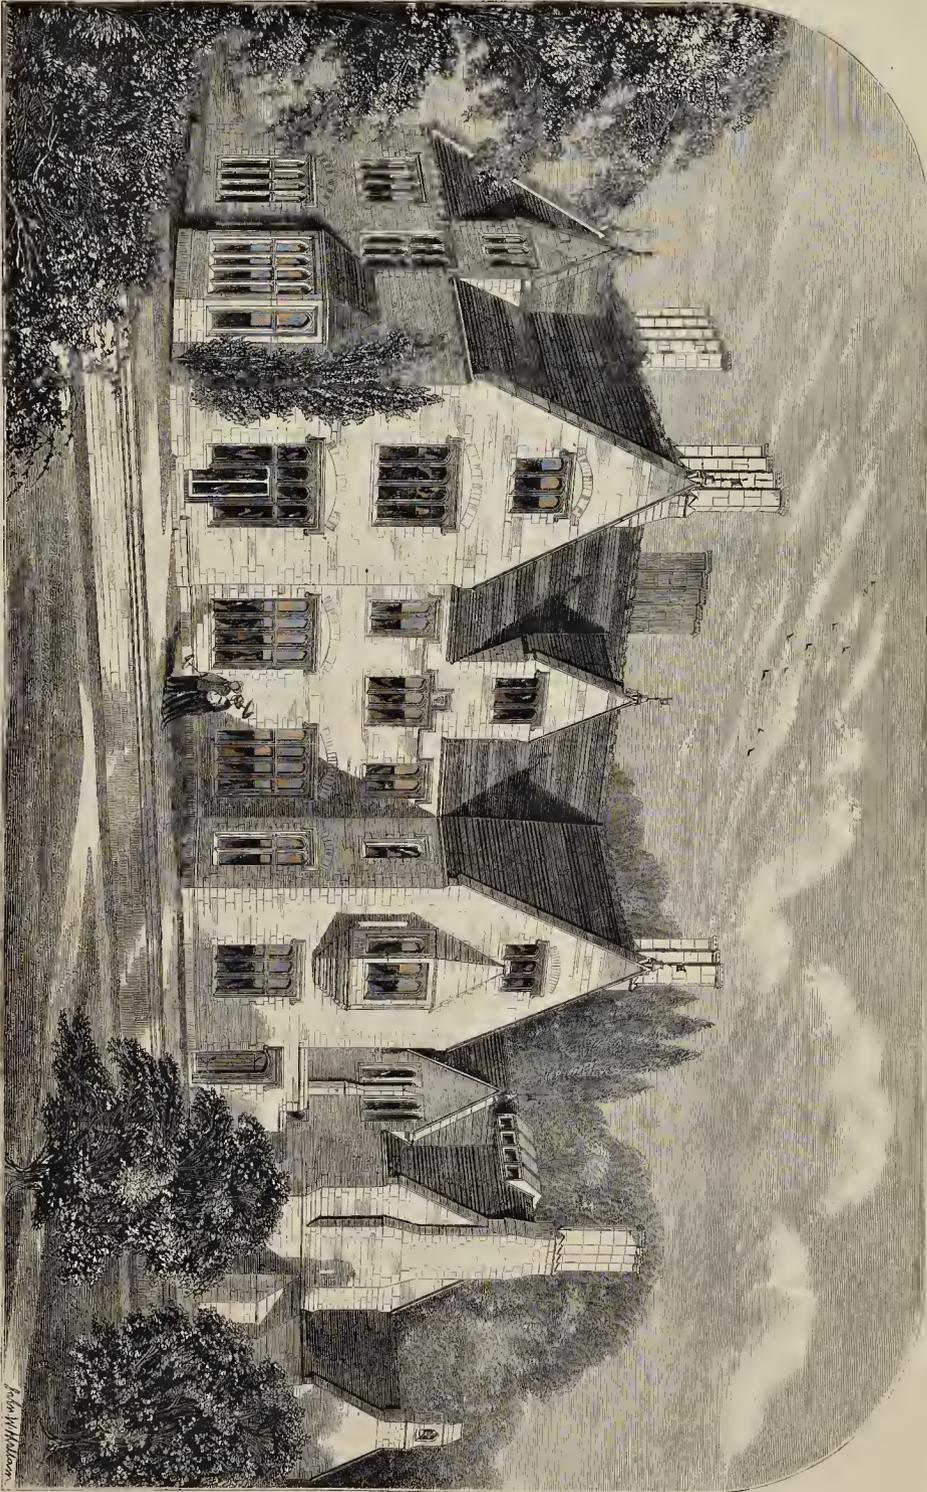

The greater part of the hall is secured against the draught from the front door by an oak screen, 8 ft. high; and as the window faces the north-west the apartment thus formed makes an agreeable summer sitting-room. It is altogether 32 ft. in length, and, as also are the three principal rooms opening out of it, is 12 ft. high, and 15 ft. broad; the dining and drawing rooms are 29 ft. long each.

On the first floor, a handsome corridor, ending in a large western window, leads to the principal

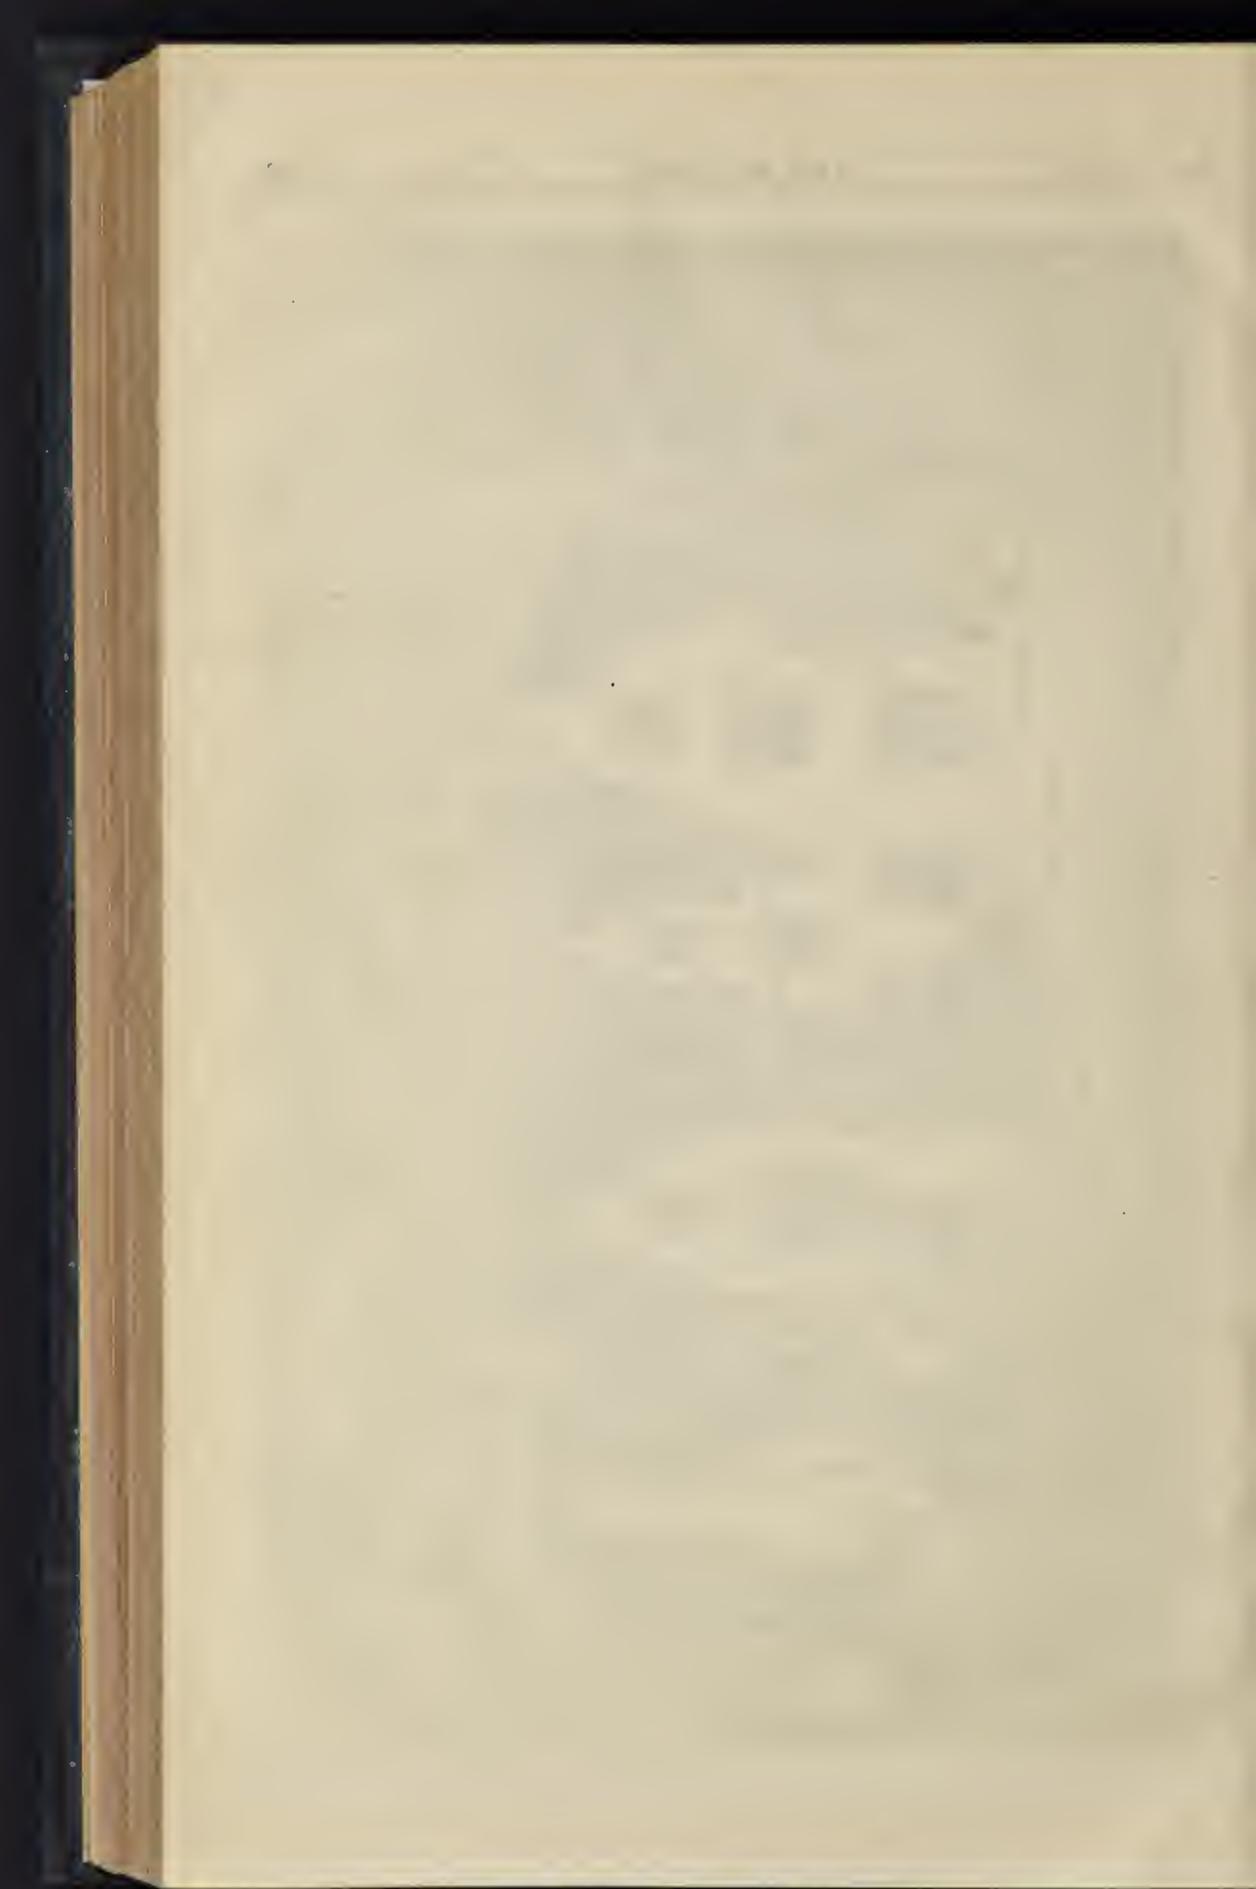

bedrooms; their height is 10 ft. Above, by spanning the valley between the two central ridges with a flat lead roof, spaciousness has been obtained in the attics. These rooms are all 9 ft. high. A billiard-room, over the kitchen, is lighted by a lantern in an arched timber roof.

The builder was Mr. M. Davis, of Langport; and Mr. J. P. St. Anghyn was the architect.

The tender for the house was 5,330l., but by additions and variations the owner increased the amount to about 5,832l. The whole of the stone for the building was dug in the adjoining field. This and other advantageous circumstances materially lessened the cost. The cost of the house, if erected in the neighbourhood of London, has been estimated at more than 8,000l.

MIDDELEY PLACE, NEAR LANGFORD, SOMERSETSHIRE.—MR. ST. ALDEN, ARCHITECT.

WESTMINSTER ABBEY.

"I see the old Abhey, both turret and tower."

It was with thoughts of the past that I rambled around the noble pile of buildings which is the glory of the metropolis and of our land, and I longed for a Hansmann's power to remove the modern buildings by which it is hemmed in, in Dean's-yard and Poet's-corner, so that the abbey might be seen in all its grandeur. The chapter-house is being restored, but its beauty is hidden by the houses that stand between it and the Houses of Parliament. While examining the abbey, I came on to an ugly hoarding adjoining Henry VII.'s Chapel and the northern transept, used as a stonemason's yard (and it has been so for several years): and to my horror I heard a steam-engine puffing away as if it wanted to damage the abbey. The steam-engine appears to be close to the buttress of the northern transept. Surely it ought not to remain for a single day, for it has been publicly stated that with the extraordinary changes in the pressure of the atmosphere there is very great danger to steam-boilers, and the slightest carelessness of an attendant might cause much mischief.

I ask you to raise a warning note in the *Builder* ere it be too late. Surely the hoarding might be removed, and a stonemason's yard obtained very near, where the steam-engine might do its work without danger to any surrounding building.

E. O. S.

THE FAIRFORD WINDOWS.

SIR,—I venture to send you some remarks suggested by Mr. Clayton's letter on this subject in the last number of the *Builder*, not with any intention of discussing the possible connexion of the Dantzig triptych and the west window at Fairford, or the authorship of the former, but with reference to Mr. Clayton's observation that the canopies of the Fairford windows are distinctively Flemish in style.

I have the greatest respect for Mr. Clayton's authority on any point in connexion with glass-painting, and it is with an honest and unaffected sense of his knowledge and my ignorance on the subject, that I ask him in what particular the canopy-work of the Fairford windows is distinguishable from Nuremberg canopy-work of or about the same date? I would also ask Mr. Clayton if he has compared the figures in the Fairford windows with those in the windows of Cologne Cathedral ascribed to Albert Dürer; and if he has minutely examined the tower architecture in many of the backgrounds of the Fairford windows? My own impression from such examination was, that much of these details was actually taken from the walls, gates, and towers of Nuremberg itself. I do not say positively that this is so; but I mention my impression, because it strikes me that careful examination of the architectural details of these backgrounds might be useful as throwing light on the origin of the windows. I have been out of town, and so have had no opportunity of seeing the letter of Mr. Waller to the *Builder*, referred to by Mr. Clayton.

TOM TAYLOR.

* * * Having enabled Mr. Clayton to see the foregoing, that gentleman writes hastily:—
"Canopy-work of Düreresque treatment can be best and abundantly seen in Dürer's authenticated works, where the contrast with that of Fairford will be at once apparent. The difference will be seen in the great exuberance of curvilinear forms and foliated detail of the former, as against the verticity and comparative simplicity of the latter."

At the meeting of the Archaeological Association, on Friday, the 6th, when the Rev. Father Russell read his paper against Dürer's authorship at Fairford, such good judges as Mr. Waller and Mr. Oldfield spoke in favour of the possibility of some of the canopies being English! so little of Nuremberg character did they see in them.

No institution of comparison between the figures at Cologne and Fairford would evidence anything in the question, unless it be first proved that the Cologne figures are by Dürer! Are not these, too, of doubtful authorship? When this matter is settled the Fairford glass may be considered in that connexion.

The architectural backgrounds might probably resemble the towers of Nuremberg, more or less, as they do those of any old city full of gables

and sharp high-pitched roofs, towers, &c. If Mr. Taylor can say distinctly that Nuremberg in particular is so represented in the Fairford backgrounds the point would be interesting, but, even then, not conclusive in favour of Dürer or any German origin, as it would be easier to suppose a reminiscence of the city on the part of a Flemish artist than that a German designed all the rest of the work in a Flemish manner."

CONCRETE HOUSES.

SIR,—Those who may adopt this method of building should be careful to procure good and sound Portland cement, and to put in sufficient to bind the rubble or ballast together. To insure this the quantity used must be regulated by the strength of the cement.

In this the secret of success, I believe, entirely depends. I have already built six cottages one story high with concrete, and I have been so satisfied with the result that I have now commenced to build a dwelling-house with the same material. The walls of the cottages are only 9 in. thick, but are I believe stronger and drier than if they had been 14-in. brick walls. The Portland cement has, however, been used in sufficient quantity, and has been good.

I have not employed Tall's or any other patent apparatus, but merely boards. My reason for doing so was simply that I considered the cost of the patent apparatus excessive.

As to the strength and stability of concrete as a building material there can be no question. General Gillmore, in his work on "Limes and Cements," says, in regard to it (para. 447), that "It is superior to brickwork in strength, durability, and economy; and in some exceptional cases it is considered a reliable substitute for the best stone, while it is always preferable to the poorer varieties." And the late Mr. Robert Stephenson, in his evidence before the Committee of the House of Commons on Westminster Bridge (18th July, 1856), stated that he had examined the concrete of which the foundations of the new bridge were made, and "that it was a great deal harder than the stone of the old bridge, or than it ever was," and added "there is no chance of any decay taking place there."

Some of the old churches in Kent, I have been informed, are built of concrete, and are in excellent preservation to this day; but to give more recent instances of its use, and which many of your readers can examine for themselves, I may mention that part of the retaining walls of the Metropolitan Railway (between the Aldersgate and Moorfields-street Stations) are made of concrete, as also near the Baker-street Station on the St. John's Wood line; and, lastly, there is a concrete bridge across the District line near the junction at the Gloucester-road Station. It would be both interesting and instructive if the engineer by whom this bridge was built would give an account of it in your paper.

W.

SIR,—The liability of concrete to crack and disintegrate, evidently increases in an enormous ratio to the size and dimensions of the wall, and the error of all its advocates lies in the supposition that, because it might answer well enough for a low wall, it will answer equally well for those of a lofty building. There is another point respecting concrete walls that has to be carefully attended to. In a word, when you want good concrete, to use a common phrase, "see that you get it." There is good concrete, and there is bad, the latter being nothing better than so much dirt, the employment of which will end in the collapse of the whole concern. We know that it is impossible to obtain in the mass those qualities that can be ensured in a smaller amount of the same material. Cast iron is an instance of my meaning. Moderate-sized castings can be turned out of the foundry in a perfectly sound and reliable condition, but these conditions cannot be guaranteed when the mass of metal passes certain dimensions. So it is with concrete, the proper duty of which is to act under pressure, as in foundations, where its sphere has been one of great utility and value. I do not mean to assert that concrete may not be applied to the building of walls, but I contend that, until some method is introduced which shall impart to it the qualities in which it is at present deficient, it will prove a failure in all instances where it is adopted upon a scale of comparative magnitude. I have used it myself as an adjunct to brickwork in retaining

walls, where it answered perfectly well, but I should hesitate to build a large retaining-wall altogether of concrete. THOMAS CARGILL.

I HAVE, amongst many others, been watching closely the progress of concrete as material for building, and was much pleased with the article in your pages on Portland Cement. I lately heard, accidentally, that at Gibraltar the Royal Engineers engaged some Moors to assist them in mixing concrete, from whom they learned the proportion of sand or other material, and other information, by which remarkable consistency was given to the mixture. Perhaps some of your readers may be able to furnish us with information on the matter. INQUIRER.

CONCRETE HOUSE AT TWICKENHAM.

SIR,—I wish to notice one paragraph of Mr. Tall's letter in your paper of last week.

He states that the cement applied to Dr. Larden, at Twickenham, was of the "very worst description." This I must distinctly deny, and, fortunately for me, who supplied it, the garden walls, which are now standing, show the falseness of his statement, and will prove to any one who sees them that no cement could be better. There is also the fact of the concrete holding together in large blocks after it had fallen from a great height, which it would not do if the cement were bad.

I think the fault in building concrete houses is in expecting the cement to go further than it safely will do.

In Dr. Larden's house, the proportion of cement to ballast was about 1 in 14, which is certainly not sufficient to be depended upon; in addition to this, there was the deficient construction of the walls, the total absence of bond or tie, the bad foundation, and the running up the building in too short a time to allow the work to set properly (and all good Portland cements are very slow in setting), which I think fully account for the falling of part of the house.

I may add that the house at Ealing, which has stood well, was constructed with my cement; and that the clerk of the works of both this and Twickenham is still being supplied by me. ASHBY, LITTLE.

TO PRESERVE A SCALING OR CRACKED PAINTING.

SIR,—I understand that Mr. Holman Hunt has written a letter from Florence on the present condition of the renowned picture known as "Titian's Venus," and that he states "it is free from the sacrifice of 'retouching,' except near the frame, where the flakes of colour which have fallen off have been replaced as well as possible. But the whole picture is covered with cracks, radiating like cobwebs from various points, and circulating all over the canvass. The entire surface of colour hangs therefore in little scales, which are in danger of being shaken off or chipped by even the most careful moving or brushing." I have no doubt that there are many preservers who well know to those engaged in the art and science of restoring paintings; but having myself discovered a simple preparation which possesses the property of fixing the colours of pictures when they are in a state to chip or scale off from the canvas, as pointed out by Mr. Holman Hunt, I think it may be worth publicity. The preparation is a mixture of equal parts of linseed oil and methylated chloroform. It is to be poured over the painting if the colours are too brittle to bear the friction of a soft brush. After remaining on the surface of the painting for a day or two, the excess of oil may then be removed by means of a piece of cotton-wool, or a soft brush, and a fresh portion of the preservative applied, and the excess removed as before. The process must be repeated from time to time until the colours are firmly fixed, when the painting will bear friction, and may be submitted to the cleaning process or varnished. It is advisable, however, to remove as much of the dirt as possible from the picture, by careful washing with soft water, previously to the application of the fixing agent.

In order to illustrate the value of the preparation I experimented, some years since, on an old oil painting, and accidentally removed the oil and turpentine with which the colours were originally mixed by the artist, thus causing the colours to crack all over, and to fall off in minute pieces when the painting was raised on its side. To prevent further destruction I flooded the painting with the oil and chloroform, and soon found the colours firmly fixed to the canvas, and presenting the appearance of being varnished, owing to the action of the atmosphere and the combination of some of the old varnish embedded in the painting. I sometimes use a mixture of one part of methylated chloro-

form and two of linseed oil for reviving the colours of paintings. A small portion is rubbed over the pictures, after washing, with cotton-wool, and on the following day the painting is wiped over with a soft silk handkerchief. I have found the oil and chloroform, when used in the proportion which I have given, to possess the property of restoring the faded colours of paintings, and I have succeeded in developing colours which had perished, to the eye, by age. It is said that peroxide of hydrogen possesses this property; but I found it to fail when the oil and chloroform succeeded.

In conclusion, I would mention that the methylated chloroform which I have used is the English manufactured article, which differs in some respects from that of the French, though the latter may answer the purpose equally well, but care must be taken in regulating the quantity of oil required for dilution. I believe it would not be safe to use more than equal proportions, even of the English methylated, as there would be some risk of starting the colours or causing diffusion. Lastly, I would suggest that linseed oil and chloroform might be advantageously used by artists for mixing the colours for painting instead of oil and turpentine or varnish.

I wish it to be understood that the fixing agent will not restore the cracks in a painting, but simply fixes the colours, and renders the painting, I have sometimes found, as elastic as the oil-cloth table coverings.

I have now tested the process over a period of three years or more, but my opportunities have been very limited; nevertheless, I think the preparation may be worth the attention of your readers.

HENRY OSBORN, M.R.C.P., &c.

PAINT FOR HOT METAL.

Sir,—Having seen the answer your correspondent from "Sussex" gives to a "Subscriber's" question regarding a paint for hot-water pipes, I beg to inform you that the waterglass paint to which he refers may be obtained from Messrs. Keilan & Gummi, at Nussdorf, Vienna, Austria. About ten months ago I saw at Vienna a sheet-iron stove, which had been continually at a red heat during the cold season, and the waterglass paint, with which it had been covered for a period of more than twelve months, had preserved its colour unfaded, in spite of this severe test. Allow me further to state, that the waterglass paint has been, to my own knowledge, successfully used at Vienna, in places where no description of paint could have withstood the effect of the weather.

The various paints may be had at the above-named place, at prices ranging, according to colour, from 1l. to 6l. per owt.

H. WINKLER.

THE ARMOUR AT SOUTH KENSINGTON.

Sir,—It was with a great deal of pleasure that I saw the announcement in your publication that Meyrick's beautiful collection of armour is to be exhibited, on loan, at South Kensington. Now, I think, a happy time has arrived, and that with the kind help of collectors, such as the Marquis of Westminster, Lord Londeshborough, Lord De Lyle, Mr. Maniac, and others, together with the assistance of the Government from the Tower, and the crown from Windsor Castle, a few lines from your able pen, and the aid of Mr. Planche and Mr. S. Pratt to arrange it, a more perfectly historical and chronological exhibition of armour than was ever seen before could be made. I do sincerely hope the good chance so very interesting an exhibition may not be lost.

H. W. TUCKER.

THE COSMICAL DISTURBANCES OF THE EARTH'S CRUST.

Sir,—I have read with great interest your remarks upon the above subject, it being one upon which science has little condescended, as yet, to enlighten the vulgar mind. Scientific investigation is, unhappily, at variance with theological exegesis with regard to various portions of the revealed Word which are supposed to embody secular facts: the reconciliation of these may be critically dependent upon the question of the permanent or varying dimensions of the earth's diameter. The theory of the gradual expansion of the earth has been more than once brought forward, but always to be overborne by the weight of astronomical assumptions.

Yet, more than one astronomical and geodesical difficulty remains, from which this theory affords apparently a means of escape.

There is a singular absence of data from which to deduce conclusions respecting the direction and extent of primary disturbances, which can only be supplied by sections, through large areas of the globe, showing the profile of the sabbatic formation as it at present exists. These, accompanied by borings in those portions of the formation which are sufficiently exposed, and by careful thermometrical observations, would probably lead to a closer acquaintance with the processes by which the different strata were arranged, and with the mode in which they have been made to regulate the effects of internal forces. We might then, perhaps, arrive at satisfactory conclusions respecting these forces themselves.

F. H.

A PLEA FOR THE TOWN CHILD.*

CHILD of the Town! for thee I sigh;
A sombre roof's thy golden sky,
Thy fragrant air is thick with smoke,
It is thy shroud and mourning cloak,
Alas! poor child, thou art confined,
At once from sun, and light, and wind.

Child of the Town!—'tis sad to sing
Of such a rank and noisome thing
Thy home is foul, thy air is fair,
Sweet life and joy are unknown there.
Alas! poor child, thou art confined,
At once from all that's pure and kind.

Child of the Town! thy danger's great
When thou attempt'st to cross the street.
Thy groves and hills are thine no more,
And rough's thy path for miles and miles.
Poor child! they should ram ground and stone
By steam, and not by man who groan.

Child of the town! for thee, alas!
The *Boards* won't plant nor trees nor grass;
Nor jolly sun, nor cloaking awe,
Will they prevent, or try to cure.
Alas! poor child;—care for his health!
It is his all—his strength, and wealth.

LOCAL BOARDS AND OTHERS v. PRIVATE PRACTICE.

Sir,—I beg to inclose herewith an advertisement, cut out of a Yorkshire newspaper, inviting engineers and architects to offer themselves as candidates for the office of surveyor of bridges to the North Riding of the county of York. You will see, sir, that the salary offered is 300*l.* a year, and no expenses whatever are allowed. The duties are various, and their name is legion; also that the officer appointed is to give the order, in his time, and is debarr'd from any private practice whatever. Seeing in the *Builder* of last week a list of the salaries of twenty borough surveyors, and that only *two* out of the *twenty* are permitted to *have private practice*, I beg to offer a few remarks upon that system. I trust I shall not be considered to be encroaching too much on your space with a subject which is of such importance to so many gentlemen of the architectural and engineering professions.

I need not say that the above is quite a munificent salary compared with many others, and under similar restrictions; but, sir, why should a county or borough surveyor be hampered in this manner? Surely the employers have their remedy if the employed should neglect his business, by their intimating to him that, if he continues his neglect, he must give up his berth; and if it be worth his while to accept an appointment of this kind, it is worth his while to keep it, and not to neglect its duties. But, certainly, if he can determine to resign or superintend other work in the neighborhood, I say it is very unjust and illiberal policy to prevent him.

I know a gentleman who was a county bridge-surveyor for over twenty years, with more than 300 bridges to visit twice a year, with frequent additional visits, and meetings of magistrates to attend, in a large county. The magistrates of that county were more liberal, and allowed him to do other work, thereby enabling him to make a living by combining his bridge-surveying with the superintendence of other local work he may have had in hand, as it was impossible otherwise to make both ends meet with the small salary (50*l.* a year, including all expenses) and excessive travelling expenses. This gentleman held also an appointment as a city surveyor, and likewise designed and carried out many engineering works in that part of England during a period of more than thirty years, and neither his employers in the county nor the city had ever cause to regret their liberality, and on his retirement a few years since no one could say that he ever neglected the duties of the one appointment for the other, or either for his private practice. Now, what kind of a county surveyor do they expect to get for North Yorkshire? Certainly one who has no other business. If a gentleman accept such a post. Perhaps the "justices" do not wish to have a man with any opinion of his abilities, but would prefer a gentleman with no opinion, who would defer entirely to the justices' abilities. If a gentleman, under these restrictions, there are many clever engineers (considering in what a stagnant state the profession now is) in North Yorkshire, I have no doubt, and many of Yorkshire, who would be glad to offer their services, and even reside "within three miles of the Court-house at Northallerton," if they saw any chance of rising in their profession by constructing other works. It may be said that in many of these appointments to the higher or surveyor shows that he can do other work without interfering with his duties, after a time he is often allowed to take private practice. It may be so; but still I present many young men of ability, from offering themselves for these berths, and is, I consider, a great stumbling-block in the way of young men by whom I should like to see these offices held, being positions with a certain income while they were engaged in the higher or branches of the profession. This may be said to be a very Quixotic view of the matter. However, I think that engineers and architects will agree with me in wishing that a

* See Allan Cunningham's poem of "The Town Child and the Country Child."

state of things existed different from that which I have depreated, and also in believing that were it so more competent men would often hold these minor appointments.

It may be objected that the heads of the professions would go in for these berths, and that the youngsters would stand no chance against them; but the former would soon find out that they were no *careers*, and that they would not pay them for the keeping. I have alluded here only to the North York county surveyorship, but the same remarks will apply equally to any of the many appointments as surveyor to local boards, highways, &c., which we see advertised.

Of course, in the case of the more important appointments, and where in such cases as Halifax, Bradford, &c., waterworks and gas are included in the surveyor's duties, it would not be possible for the engineer to devote any of his energies or time to private practice, as he would be entirely occupied with his duties. But where the salary is insignificant, as in small towns and districts, or such appointments as county bridge surveyorship, I do say that it is a bad policy to restrict a man from accepting private practice.

CIVIL ENGINEER.

GENERALISATION IN ARCHITECTURAL EDUCATION.

Sir,—My letter seems to have stirred up a very muddy pool, and I have to thank you for having exposed the filth more fully and in better language than I could possibly have done. I was sorry you thought my letter so unbecomingly and unbecomingly. I am I feel sure that there are many poor fellows who have not had the good fortune to be articled to as good a master as mine was. It is the rottenness of the system of pupillage, and of the system so common among us, of sending a certain class of architects, of making pupils do the work of assistants, that I complain. Every one who desires the welfare of the profession is striving for something better; and, as long as that, some one else, and lead a grand charge of noble men against the mass of ignorance which lurks beneath the name of architect.

We see "our Continental neighbours" systematically educating young architects; and are we, without a desperate struggle, to allow them to ride over our heads? I trust that this matter of education will never be allowed to rest until something really permanent is done. A great deal has been said, but where are its fruits? Some young men have been awakened, perhaps, but we want more; we want to see them clamour for reform, and we want to see a body of the ruling spirits of the profession put themselves into such an attitude that they may be able to reform it coming.

The present system has worked enough harm; it has wasted enough precious time, and turned out enough useless men. Reform is in the hands of the sufferers, and I trust they will fearlessly strive for it, if it comes. We, like certain reformers of the present day, cry for disestablishment, but must look to older men for a new and enlightened system, believing that their love for that profession to which they have bound their lives will carry them through all difficulties.

But let all young men remember what Mr. Spiers said in his presidential address at the Association, about the little use made of the present means of education; and let us with the means we have; for until we do this we cannot expect better things. If anything I do me success will depend upon the amount of patronage it receives, and if this its failure will not be brought about for want of this.

I have to thank "A Subscriber" for his letter last week, and trust that all correspondents will be so generous, come forward and help us.

ABERDEEN.

MAGNESIUM LIGHT.

Sir,—Is there any person who undertakes to light public buildings by means of magnesium? A. M. M.

RATING THE STANDARD THEATRE.

Douglas v. St. Leonard, Shore-ditch.—This was an appeal at the Middlesex Sessions, November 9th, by the proprietor of the Standard Theatre against three rates made by the vestry of St. Leonard, Shore-ditch, in January, April, and July of the present year, on the ground that he was unfairly assessed to a larger amount than the real net value of the premises. Mr. Douglas has been for a long time a successful theatrical manager, and when his theatre was destroyed by fire in 1866 he rebuilt it on a much larger scale. He purchased two houses in George-street and three houses in Holywell-lane, besides enlarging the superficial area by other arrangements, and when the new theatre was opened in November, 1867, it was found to be the largest and most commodious in London. The vestry assessed it at 1,200*l.* net annual value, exclusive of the five houses; and upon Mr. Douglas making complaint, it was arranged that Mr. Castle, a surveyor, should estimate the value and should carefully consider the facts and state the amount to be assessed. Accordingly, in the July rate the net annual value was entered at 800*l.*; but Mr. Douglas refused to be bound by the understanding referred to, and hence these appeals.

There were technical difficulties in the way of the appellant getting his case heard at all, and it was arranged by counsel that the vestry should reduce the rates to a uniform sum for theatre and houses—viz., 800*l.*—and that Mr. Douglas should bear the costs of the appeals.

FALL OF HOUSE AT DEVONPORT.—Part of a house building at Morice-town, Devonport, fell suddenly a few days ago. Several persons were near the spot at the time, and eleven were buried in the ruins. Mr. Oliver, a master builder, was killed, and six others were injured.

CHURCH-BUILDING NEWS.

Church Stretton.—The church of St. Lawrence has been restored and reopened. The new works completed consist of additions to the north and south transepts, both as side aisles opening by arcades into the transepts and nave, the clearing out, concreting, and ceiling of the area, removing the plastered ceilings and wall coating, cleaning and pointing the walls and masonry, recovering the roof, building parapets to the four old gables, re-flooring, and effecting general repair and cleaning. The additional buildings are wholly of masonry, the walling dressed on both sides. The roofs, of selected pitch pine and English oak. The fittings in the church and chancel are of English quarter oak. The floor tiles are 4-in. encaustic in patterns; the chancel and altar space of figured tiles. The style adopted in the additions is varied to suit their relative requirements and surroundings. Thus the low lean-to of the north aisle is thirteenth, and the south aisle, which is gabled, follows the fourteenth to the fifteenth century work. The old roof of the nave, dating back to the thirteenth century, is particularly fine; the "comple" unusually massive, each rafter being 9 in. by 8 in., and set at 9 in. apart upon wall plates. The roofs of the north transept and chancel are also on the framed couple principle, but less massive than the nave. The work has been effected from the designs and under the superintendence of Mr. Pontauy Smith, of Shrewsbury. The contractor is Mr. Pugh, of Hungerford, Much Wenlock. The total cost of the work is about 1,500l.

Hempstead.—Alterations have lately been carried out in the church here by which its interior arrangements have been completely renovated. The old high pews have been replaced by open fittings. The pulpit, reading-desk, and clerk's seat—which rose tier upon tier, in the old three-decker style, completely enclosing the chancel from the view of those sitting on the north side of the church—have been removed, the prayers and lessons being now read from desks at the end of the chancel seats, and a simple open pulpit having been fixed against one of the pillars which support the central tower. The chancel has been paved with encaustic tiles of a quiet pattern, and raised by two broad steps of Forest stone. The heavy wooden railing which enclosed the communion-table has given way to a single rail of polished oak, supported by iron standards. The cost of the alterations has been defrayed, and a harmonium provided, by the subscriptions of the rector and inhabitants. The alterations were effected without closing the church for more than three Sundays, during which the necessary painting and graining were completed. The carpenters' work was entirely executed by a mechanic (Charles Wilson), living in the village. The paving, masons' work, and altar rail were provided by Messrs. Wingate. There are in this church several monuments to the Lysons family, to which a large part of the parish belongs. Closely adjoining the churchyard is the site of an early Roman camp, of which traces are clearly visible, and "Our Lady's Well"—a spring covered by a porch, on which is sculptured a rude image of the Virgin. The parish boasts of a very ancient stone cross, the upper part of which was recovered some years ago from the bottom of the Severn, to which some zealous iconoclasts of former years had consigned it.

Rawmarsh (Yorkshire).—There is a movement for the restoration of Rawmarsh Church. With a view of carrying out the main object, that of rebuilding the tower, a voluntary church-rate of 6d. in the pound has been laid at a vestry meeting, and it is anticipated that sufficient money will be raised towards carrying out the desired object. The architects appointed to prepare the necessary plans are Messrs. Blackmore & Mitchell-Withers, and under their inspection the demolition of the tower, which has recently shown further symptoms of instability, will shortly commence. Such is the insecure condition of the tower that for some time past it has been considered unsafe to ring the bells in the usual way. Along with the rebuilding of the tower will be carried out the work of restoring the interior of the church, the cost of which has already to some extent been provided.

Bingley.—The newly-erected church of Holy Trinity has been consecrated by the Bishop of Ripon. The site is at Duhb, on the high ground between the canal and the railway; and the parish assigned to the new church divides Bingley in two. The church has been built from

the designs of Mr. Richard Norman Shaw, of the firm of Nesselife & Shaw, London. The style of architecture adopted is very Early English, with some traces of Norman. The cost has been 5,000l., exclusive of a tower and spire, which will at some future time be built over the chancel. Mr. Forster, of Bingley, was the contractor for the works.

Sutton-in-Ashfield (Notts).—The parish of St. Mary's Church, of Sutton, has been restored, and re-opened, so as to accommodate a greater number of people. The church, which, in its late form, was probably erected about the end of the fourteenth century, had arrived at such a state of decay and disrepairment as to be not only unfit, but absolutely unsafe for public worship. The plans for the restoration contemplated the removal of the chancel eastward, so as to increase the length of the nave and aisles; also the erection of an organ-chamber and vestry on the north side of the chancel. This extension had to be abandoned for want of funds. The tower and spire, the latter seriously damaged by lightning last year, still remain to be restored. The whole of the galleries have been removed, and increased space has been obtained by widening the aisles and extending them westward on each side of the tower. Abundant traces of a much earlier structure were found in pulling down the walls of the aisles, and some interesting but mutilated drawings and inscriptions in distemper were discovered under the numerous coats of whitewash on the old walls. The defaced and dilapidated portions of the bases, shafts, and capitals of the columns have been exactly restored, and the whole of the colourwash from the ashlar-work has been chiselled off. The open roof and also the new benches throughout the nave, aisles, and chancel are of deal, stained and varnished. The windows are glazed with cathedral glass. The pulpit, a gift of the parishioners in memory of the Rev. W. B. Stevens, the late incumbent, is of stone. The cost of the restoration was about 1,600l. Messrs. Fisher & Sons, of Mansfield, were the contractors for the builders' work; Messrs. Haden, of Manchester, for the heating; and Mr. Rhodes, of Nottingham, for the gasfittings. The whole of the works have been completed from the designs and under the direction of Mr. C. J. Neale, of High Oakham. This restoration, commenced in February last, is mainly due to the energy and zeal of the Rev. Charles Bellairs, the present incumbent, who, by himself and his relatives and personal friends, has contributed a very large proportion of the funds.

Hessle.—A formal commencement of the work of restoring and enlarging the parish church of All Saints, at Hessle, has been made by the laying of the corner stone by Lieutenant-Colonel Pease. The contractors are Messrs. Simpson & Malone, and their contract for the whole work required to be done, including the erection of the chancel, is 5,543l.; contract for work at present in hand, 3,430l. 2s. The estimated cost of the north and south aisles is 1,058l. 19s. respectively. It has been proposed to take down the chancel, with its aisles, and the chancel arch and east end of nave, and rebuild them 25 ft. 6 in. further eastward, lengthening the nave to that extent by building two new arches on each side of the nave arcade, and by taking down the north and south aisle walls and widening the aisles, the present aisles being only 7 ft. wide. The alterations contracted for at present embrace the removal and rebuilding of the chancel and its aisles, and the lengthening the nave as at first proposed, and the building (to the extent of the addition) the aisles to the width originally intended, so that at any time, should the committee be provided with funds, the continuations of the aisles can be carried out. The work at present contracted for will give an additional area to the church of 1,785 ft. The restoration and enlargement are being carried out under the superintendence of Mr. R. G. Smith, of Hull, architect. During the removal of portions of the fabric several relics of Norman work have been discovered, also a corbel with a representation of Sagittarius carved thereon, and suggesting the existence of a former church, probably erected in Stephen's reign.

Moreton.—The restoration of the chancel of the church is now finished. In 1855 Mr. Chancellor, of Chelmsford, substituted open seats in the place of pews, and put down new ties, &c. A window which had been covered up for many years was restored at the east end. Under a thick coat of whitewash the remains of mural paintings were discovered, probably of the same date as the church itself, viz., Early English,

A.D. 1189, 1272, Richard I., John I., and Henry III. A copy of this painting was preserved for future restoration, but this could not be done until the walls were perfectly dry. The work has been done by Mr. Lea, of Lutterworth.

Leamington.—The new public cemetery in the Whitnash-road is now completed. It comprises fourteen acres of land; and two chapels, in the Norman style of architecture, have been erected, one for Episcopalians and the other for Nonconformists. The chapels were designed by Mr. G. W. Candall, of Birmingham, and have been erected by G. W. Green, of Leamington. The total cost of the land and building will be about 8,000l., which have been borrowed on security of the poor-rates of the parish.

Heanor.—The church in this place is rapidly progressing towards completion. The whole of the church has been rebuilt, but the old tower has been untouched. The edifice has very little ornament, excepting some stone-carving on the corbels in the chancel and round the spring of the arches. The old monuments have been restored. A memorial window, which was in the former building, has been placed in the north aisle, and another has just been put in the chancel by Mrs. Ray, of Heanor Hall, to the memory of her son and daughter. For the warming of the church an apparatus has been presented by Mr. F. Wright, of Osmaston Manor, the patron of the living.

Pleshey.—The church here has been re-opened. In designing the restoration it was determined to adhere as closely as possible to the architecture of the original church, built by Thomas of Woodstock, Duke of Gloucester. Such portions, therefore, of the original edifice as were sound, and which were principally confined to the lower arches, the ringing-chamber of the tower, and portions of the transept, were repaired and restored, the roof being renewed and the external walls stripped of plastering and the pebble facing repaired. The nave and aisle walls were refaced with pebble work, and new open timbered roofs added, and the upper part of the tower was taken down and rebuilt in character with the lower part, with parapet and lead flat roof. The original ascent to the bell-chamber being by a series of hngo ladders fixed in the north transept, and consequently very unsightly and very much in the way, it was determined to construct a staircase turret at the north-east angle of the tower. Two-light windows have been introduced on either side of the nave, with a three-light west window, and a four-light window has been put in the chancel. The north wing of the nave is protected by an oak porch, and a vestry has been added to the south side of chancel. In consequence of the tombs to the Tufnell family which are put up in the chancel no side windows are there introduced. The whole of the external walls are faced with the pebble-work of the original church, which was found in excavating the nave and transept; the windows, doors, copings, &c., being executed in Bath stone. As regards the internal arrangements the nave is fitted with open benches, with paved gangway. The organ is set up in the south transept with the children's seats surrounding it. The north transept is left without benches, and both transepts are paved throughout. The font is new, with red Mansfield stone shafts and white stone base and top. The east window is filled with painted glass to the memory of the late Mr. John Jolliffe Tufnell, and the west window is filled with painted glass to the memory of the late incumbent, the Rev. James Hutchinson. The south window of the transept is filled with painted glass, the other windows throughout being glazed with tinted cathedral glass in patterns. Rimmington's heating apparatus has been adopted. The restoration has been carried out under the superintendence of Mr. Chancelor, architect, by Mr. James Brown, of Chelmsford and Bocking, builder.

Bradwell.—The new church, dedicated to St. Barnabas, in this village, has been consecrated. The edifice is built after the designs of Mr. C. C. Townsend, of London.

New Shildon.—The Bishop of Durham has consecrated a new church, dedicated to All Saints, and also a burial-ground, at New Shildon. The church stands on high ground, about a quarter of a mile south of Shildon, adjoining the Redworth turnpike road, on a site of an acre of ground given by the Earl of Eldon, who has also granted a similar quantity adjoining for a parsonage house. The building is designed in the Early Decorated style of architecture, with a good deal of the Early French character about it.

In the clock chamber will be placed a clock with illuminated dial, and machinery for striking the hours and quarters on bells in the belfry. The clock and bells are promised by Mr. Pease, of Darlington. The seats, which provide accommodation for 400 adults, are all open, with low standing backs and moulded standards. The churchyard is surrounded by walls and railing, and is laid out with paths to afford easy access to the graves. The whole of the works have been designed by Mr. J. P. Fritchard, of Darlington, who has also superintended the works.

Tamworth.—The parish church of Crossall, near Tamworth, which has been closed for some months for alterations and improvements, has been re-opened for divine service. The old square pews have been replaced by oak benches, carved. A new pulpit, of Mansfield stone, has been placed in the north-east corner, near the chancel arch. The organ has been removed from the west end of the church to a recess specially built for it on the north side of the chancel. Here also are two rows of stalls. A new warming apparatus has been laid by Mr. Mellard, of Rugeley. The other works have been done by Mr. Lilly, of Measham, from plans drawn by Mr. Street, architect, at a cost of about 500l.

Kettering.—A new church is being built in the small market-town of Kettering, and the foundation stone has just been laid. The new church will be made to accommodate about 550 persons, and the sittings will be all free and unappropriated. The architect is Mr. Street, and the builders are Messrs. Butlin & Barlow, of Rothwell. The rector gave the site on which the church is to be erected. It will be dedicated to St. Andrew the Apostle.

Welford.—The chancel of this church has been re-opened, after very considerable restoration, and the erection of a window in memory of the late Mr. E. Cox, surgeon, Welford. At the bottom of this window are three subjects,—the raising of the son of the widow of Sarepta, by Elijah, the raising of Tabitha, by St. Peter, and, between them, the raising of the widow's son at Nain by our Saviour. Above is the crucifixion, between the entombment and the resurrection. The architect employed in the restoration was Mr. Law, and the builder Mr. Gee, of Daventry. The window was by Mr. Usher, of London.

Broadwindsor.—The parish church has been re-opened by the bishop of the diocese. It had been rebuilt by Mr. Charles Hamilton Malan, major in the 75th Regiment, as a memorial of his wife. The restoration has been effected so as to perpetuate the style of the old building. On one side of the church the pillars were Norman, marking the original structure as having been erected about the time of William the Conqueror. On the other side the pillars were Early English. This has been carried out in the restoration. The nave has been lengthened 10 ft., and, with the chancel, has been entirely rebuilt. A heating apparatus has been built beneath the vestry, and the drainage around the church renewed. The north aisle has been enlarged. The west window has been opened up by the insertion of a western arch. The porch of the south entrance has been rebuilt. Mr. John Mountford Allen, of Crewkerne, was the architect of the new building, and the contracts for the masonry and woodwork were undertaken by Mr. Davis, of Langport, and Mr. Charles Trask, of Ham. A new organ by Walker, value 200l., has been obtained by subscription, principally by the efforts of Mrs. Joseph Stedley.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Cotton.—The chapel at Cotton, near Oakmoor, has been re-opened, after having been closed upwards of ten years. The church was built from the designs of the late Mr. Pugin, by the last Roman Catholic Earl of Shrewsbury.

Swinerton.—The foundation-stone of a new church has been laid at Swinerton, near Stone. It will be built from the designs of Mr. Gilbert Blount, of London, and its cost will exceed 4,000l., which will be defrayed by members of the Fitzherbert family. The style will be that of the transition between Early English and Decorated. It will consist of chancel, with aisle, trifune for the family at the hall, sacristies, porch, and belfry. The erection of the building has been undertaken by Mr. Heveningham, of Wolverhampton, builder. The site is close to the hall, and within a stone's throw of the ancient parish church of Swinerton.

Whitehaven.—The new church of St. Bees, which has been erected on a site near to the coach-road, Whitehaven, has been opened for divine service. The new church has been built from designs by Mr. Wolby Pugin, architect, and is a Gothic building of the Decorated period. The whole of the work in connexion with the structure was undertaken by Mr. Cousins of Whitehaven. The church consists of a nave and two aisles, and has a clearstory lighted by eighteen oriel windows. The architect has preserved the ecclesiastical separations, consisting of an apsidal chancel and two lateral chapels, and the whole is so arranged that the altar can as easily be seen from the aisles as from a nave. The east end aisle is terminated by a chapel on the south side, to be dedicated to "Our Blessed Lady," and on the north side by another, to be dedicated to "The Blessed Sacrament." Adjoining the latter there is a vestry, which measures 30 ft. by 20 ft. The church measures 124 ft. long by 61 ft. wide, and is 64 ft. high, or 61 ft. from the level of the floor to the top of the ridge. The exterior is built of white stone walling, with red stone dressings, the former having been obtained from the Walk Mill quarries, and the latter from Mr. Cousins's quarries at Brigham. The pillars and arches in the interior are built of red and white stone, from the same quarries, and the entrance-doorways are lined with alabaster. The roof of the nave and aisles is formed of open-timber work; those of the chancel and side chapels are divided by wooden ribs into panels. Each bay of the nave measures 18 ft. from centre to centre, and is divided by quatrefoil and octagonal columns, formed of varied coloured polished stones. Each division of the aisle is almost entirely filled with one window. The west end measures 108 ft. from the bottom of the steps to the top of the cross of the belfry, which is flanked by two buttresses 56 ft. high. The main gable is filled with three lancet windows, below which is the principal entrance. The roof is covered with pale green and dark blue slates, the former obtained from the slate quarries at Batemere, and the latter from Wales. Toward the east of erecting the new church of St. Bees, the first contributor was Mr. Francis Charlton, county surveyor of Northumberland, and the descendant of an old Catholic family, who gave the donation of 1,000l. Mr. Dees has provided two windows of stained glass at the east end of the church. The total cost of the structure will be a little over 5,000l., and more than 1,000l. yet remain to be given before it is entirely free from encumbrance. It is proposed to convert the old church of St. Joseph—which closely adjoins the new building—into a school to be taught by nuns, for whom a convent near at hand is to be prepared; and to the new church is to be attached a priory for the use of the priesthood.

SCHOOL-BUILDING NEWS.

Salburn-by-the-Sea.—The foundation-stone of new British schools has been laid at Salburn, by the Earl of Zetland. The new buildings, when complete, will occupy three sides of a quadrangle, and comprise three school-rooms, with class-rooms attached, affording accommodation for 600 children, and dwelling-houses for the teachers. The style adopted is Gothic. The materials used are red bricks, relieved with white bands and stone dressings. The walls of the school and class-rooms will be lined up to a height of 4 ft. with white glazed tiles, resting on a stone plinth, and finished with an ornamental border and stone capping. Care has been bestowed in the arrangements for heating and ventilation to render them thoroughly efficient. The estimated cost of the buildings is 2,500l.; and the works have been let to Messrs. Shaftoe & Barry, of Salburn. The architect is Mr. John Ross, of Darlington.

Fownhope.—New schools have been opened here. They have been erected through the liberality of Mr. Gwatkin, of Gore House, Twickenham (who, however, does not possess any land in the parish). The master's house has been built by subscription. The structure, which is in the Gothic style, and is built of red sandstone, with Bath stone dressings, has been erected by Mr. William Ford, of Fownhope, from the design of Mr. Nicholson, the diocesan architect. The glazing and painting have been performed by Mr. W. Evans, also of Fownhope.

Great Horton.—The school-rooms, which are being erected in connexion with the Congregational Chapel at Great Horton, and of which the

foundation was laid in June last, are now rapidly approaching completion. The contractors are Messrs. B. Illingworth & Son, of Bradford. The school covers an area of 550 superficial yards, and its dimensions are 120 ft. by 41 ft.: the height from the floor of the lower story to the ridge of the roof is 52 ft. The structure is three stories in height on the north-east side, but only two on the front and on the side facing the chapel. The building of the tower with which the school is to be ornamented, has not yet been commenced. The accommodation includes an assembly-room capable of seating 600 people, above which there are sixteen class-rooms; there is also a large lecture-room. The undertaking will cost upwards of 5,000l.

Reading, Berks.—It is proposed by the vicar and churchwardens of the parish church of St. Lawrence, Reading, to erect a new infant school, on a plot of ground given by Mr. J. H. Blagrove, of Calcot Park, for that purpose. The cost of the school will be about 700l. Messrs. W. & J. T. Brown, of Reading, are the architects, and Mr. Sheppard the builder.

Abingdon.—The foundation-stone of the new Abingdon Free Grammar-school has been laid. The spot which has been selected forms a portion of the ground adjoining Albert Park, an open, dry, and salubrious situation, immediately contiguous to the town. It is near to eligible building-ground, on which residences are already springing up. The school, when built, will be capable of holding forty or fifty boarders, and will be large enough to accommodate one hundred day scholars.

Books Received.

Illustrated Books for Children and Young People. Annet Mavor's Toy Books,—"The Little Hunchback," "The Enraged Miller," &c. (Routledge); "Puss in Boots" (Routledge); "Every Boy's Annual," "Jack the Conqueror" (Partridge & Co., Paternoster-row); "The Broadway Annual" (Routledge).

When the history of art in connexion with the periodical literature of England comes to be written with that attention to truthful detail which the subject demands, the names of men like Catnach, Hodgson, and several others whose reputation does not at the present time stand high, either in the world of art or letters, must not be forgotten. In their generations, when the days of art were dark in comparison with the present, they did useful service amongst multitudes, and paved the way to those improved conditions which in so many instances afford the means of recreation to large masses of persons.

General education is advancing in Great Britain; but it is unfortunately the case amongst the millions in this country,—and, to a considerable extent, the same may be said of other communities,—that the instructor, which the pencil, aided by the graver and printing-press, can convey, has not been rightly brought into use and made available for a numerous and comparatively uneducated class,—we mean that important portion of our community who are in the impressive years, when all matters of guidance in good or evil are so marvellous in their effect.

The age of childhood is most important, whether it is in connexion with taste, the practice of art, or those principles which in more matured life lead men and women to be a means of affording pleasure and comfort to those who have reared them, and to others with whom they may have become associated while fighting the battle of life; but it is only those who have taken a deep interest in this most important subject, and watched with care the sure result of right or wrong infant teaching, that can form a just estimate of the consequence of early home and general education.

In many ways there is much to be regretted in the general plans of childhood tuition; but in what is connected with taste and art, the state of affairs is most deplorable. This is to be attributed to various causes, but certainly the want of demand for children's books, particularly those which have a pictorial character, cannot be named as one; for it is probable that in no department of literature has there been such an extensive production of books as in that which caters for the amusement and guidance of very young England. Nor should we complain that there has been altogether a want of contempo-

DEPUTY SURVEYOR TO THE POLICE.—We mentioned last week the appointment of Mr. Oaiger (late deputy surveyor) to the surveyorship of the metropolitan police. We have to add that Mr. John Entler has been promoted to be deputy surveyor.

WATER FOR EDINBURGH.—Edinburgh is about to rival Glasgow in the attainment of a good water supply. The town council has decided upon taking measures for the construction of works for conveying water to the city from St. Mary's Loch, a source believed to equal in some respects the famed Loch Katrine.

BADGERS AND DRAINS.—At Penquite House St. Blazey (Cornwall), some radical defects in the drainage were satisfactorily ascertained to be due to the digging of badgers. Three of these animals were captured, although two showed fight, and were only "dug out" after a severe contest with some dogs, who were pressed into the service.

THE LATE FALL OF WAREHOUSES AT HULL.—The inquiry into the fall of the old sugar-house at Hull, when several persons lost their lives, has been terminated. The jury have returned a verdict of "Accidental death," at the same time recommending that legislative measures should be passed for the supervision of old buildings used as warehouses.

HYDRAULIC JACK.—Mr. T. Armstrong, an ingenious mechanic, has invented a hydraulic jack, which, from experiment, it is said, promises to be of great advantage both on the score of efficiency and economy. By the old system it would require ten men to sling a wagon, &c., weighing 12½ tons, but by means of this invention two can lift a wagon of the same weight, or a 23-ton gun, with the greatest ease.

PRINTERS' ALMSHOUSES.—At the last council meeting of this corporation a letter was read from the treasurer, announcing that the late Mr. Henry Wright, of Kingston, had bequeathed 2,000*l.* to build the second wing of the above most worthy institution. The collector was requested to endeavour to obtain the remainder of the 1,000 guineas (now being collected) required for erecting the first wing, so that the bequest of the liberal donor may become available for the completion of the almshouses.

THE BURSTING OF WATER-PIPES.—Does water expand on becoming ice? *Scientific Opinion* asks this question, and says.—When a bottle of water is frozen, the bottle is usually burst. Hitherto this has been explained by the assertion that the water on solidifying suddenly expands. M. Barthélemy, one of the professors in the Lyceum of Pan, denies this explanation. In a memoir which he has written on the crystallization of water, he alleges that bursting of the bottle is caused by the disengagement of a large quantity of gas—hitherto in solution—by the water at the moment of its solidification. It is alleged, in support of this, that if a bottle of water be placed outside a window in frosty weather, it will be observed that the rupture takes place at the bottom side, viz., that next the window. Some of our correspondents may have made experiments on this point, and we shall be glad to hear what they have to say to this opinion.

DESTRUCTION OF FIRE-DAMP IN MINES.—Our readers will recollect the suggestion in our pages some time since with the view of destroying fire-damp in mines. We are curious to know whether the following originated in these suggestions; for it is rather remarkable how often some Frenchman discovers an invention after it has been suggested in the *Builder*, another instance of which we shall have occasion shortly to particularize. A new invention, it is said, by M. Delannier, of Paris, for destroying fire-damp in mines, has been lately laid before the Academy of Sciences. It consists of a copper conductor, broken at intervals, but joined by very fine gold wire soldered to the copper; the gold wire being surrounded by flowers of sulphur, which ignite easily. By passing strong currents of electricity through the copper wire, the gold wire becomes red hot, and thus ignites the sulphur, which burns any noxious gases which may be present. It will, of course, be understood that the electric current is made to pass through the apparatus before the descent of the miners into the mine. The Academy of Sciences have, it is stated, reported very favourably on M. Delannier's invention.

HOUSE BUILDING IN BELFAST.—During the past month the plans of upwards of 300 new houses were passed by the surveyor and the improvement committee of the town council. This is the largest number of houses approved of in any month in many years, and it is at the rate of 3,600 new houses in the year.

EXPLOSION AT THE ROCHDALE GAS WORKS.—A workman cautioned another that there was a "back pressure" on a new meter in course of fixture in a part of the works recently built to increase the supply, and the hole was plugged up with a wooden plug. Either forgetting or neglecting the caution, the workman pulled out the plug at the back of the meter, and the gas then passed without obstruction from the gas holder into the purifier, and thus into the building, where a number of workmen, employees of Mr. Charles Bigmore, of Stockton, were engaged in painting the purifier. The gas ignited, and a terrible explosion took place. The inside of the building was one volume of flame, and the workmen with difficulty managed to get out alive. Some of them were frightfully burnt. As the building and roof were both fireproof, the flames gradually died out, and the works and the building sustained but little damage.

A PAINTER AND A PICTURE.—Rare works of art have been picked up for a few pounds, worth as many hundreds; but these incidents of picture-dealing rarely come within one's own personal experience. A startling case of good fortune is (says the *Worcester Journal*) a topic of conversation in Worcester. A few weeks ago J. L. Albert, a working painter, residing in the Trinity, saw at a broker's, we believe, a picture, of which he formed a very high opinion. He bought it for five or six pounds, carried it home, cleaned it, and began to persuade himself that he had come into possession of a valuable work. He invited several gentlemen to see it, and his opinion was endorsed by some who are looked upon as judges. By-and-by Mr. Albert had successive offers of 50*l.*, 100*l.*, and 250*l.* for his purchase. He rejected, however, all these overtures of purchase. People from all parts came to see the picture, and he was offered 500*l.* for it. This, too, he rejected. This would have turned the head of some men. The picture is a representation of Christ bearing the cross, and is without doubt very beautifully painted. The figure of one who is scourging our Saviour is a marvellous study, and the work bears strong marks of originality. For Albert's sake, we are glad to learn, says our authority, that he has sold it for 700 guineas. We shall be glad to hear more of this work of art. Who bought it? If the story be true, Albert's canvas has proved even more satisfactory than that of some of our electrotyping friends.

NEW MACHINERY FOR CHARGING AND DRAWING GAS RETORTS.—An interesting and successful trial of Messrs. Holden & Best's patent gas retort charging and drawing machine has taken place, at Messrs. Handyside's, Britannia Foundry, Derby. The machine travels on rails from one end of the retort-house to the other, immediately in front of the benches of retorts, and consists of three long wrought-iron rakes, mounted one above another on a moveable carriage; also three long scoops mounted on a similar carriage, and in the same relative position as rakes. These carriages travel on a strong wrought-iron cradle. This cradle also carries the engines and boiler that actuate the machine and propel it along the rails. The action, as described, is exceedingly simple, most of the motions are self-acting, and so precise and regular that one might almost fancy the machine was endowed with intelligence. The usual average time for drawing and charging a bench of nine retorts by manual labour is forty-five minutes; this machine accomplishes the same amount of work leisurely in ten minutes, and has drawn and charged that number in six minutes. In labour the machine dispenses with fifty-four men out of seventy-two. The reduced time necessary to keep open the retort-doors effects a very considerable saving. In dispensing with so many men, the experience of the Alliance Gas Company, Dublin, is said to prove that the machine does its work for something under 9*d.* per ton, whereas, by manual labour, it used to cost them about 2*s.* per ton. In a gas work carbonising 1,000 tons per week, at 2*s.* per ton, this would cost 100*l.*, while with the machine, at 9*d.* per ton, the cost, it is said, only amounts to 37*l.* 10*s.*, thus saving 62*l.* 10*s.* per week.

THE ARCHITECTURAL ASSOCIATION CONVENTION.—"A Member" requests us to say to the gentleman's name whose drawings he mentioned is CAME, not CARNE, as misprinted.

TENDERS.

For rebuilding a warehouse, No. 15, Watling-street City. Mr. Herbert Ford, architect. Quantities supplied:—

Lawrence & Sons	£2,587 0 0
Meyers & Sons	2,409 0 0

Clark & Co.	28 9 0

TO BUILDERS, PLUMBERS, &c.
WANTED, by a first-class PLUMBER, a
 PERMANENT or JOB, all branches, from service, also
 work, gaffing, &c. Has no objection to fill up time with painting,
 if required.—Address, E. C. Plumb, 25, Henry-street, New
 Bromley, Kent.

TO BUILDERS AND OTHERS.
 The Advertiser is open to an ENGAGE-
 MENT as GENERAL MANAGER, can work Jointed Clerks,
 Lar Saw, Moulding Machine, or a General Joiner. A good reference
 will be given.—Address, H. B. S., Beechenden-street, Lancaster-road,
 Nottingham, W.

TO ARCHITECTS.
 THE Advertiser, being disengaged in the
 evening, would be happy to RENDER ASSISTANCE to an
 Architect or Surveyor. Terms moderate.—Address, A. S. 66, Man-
 nings-road, Haverstock Park, N.W.

TO ARCHITECTS, SURVEYORS, AND BUILDERS.
 THE Advertiser wishes for EMPLOY-
 MENT, either at Home or in an Office. Many years' experience,
 and terms moderate.—Address, Z. Mr. Vedy's, Stationer, Battersea-
 square.

**TO DECORATORS, ESTATE AND HOUSE AGENTS,
 SURVEYORS, &c.**
 THE Advertiser, aged 28, thoroughly
 versed in every branch of the above and the building trade,
 desires an ENGAGEMENT. Good accountant and draughtsman,
 writes neatly, and possesses excellent references.—Address, No. 220,
 Office of "The Builder."

TO LAND AND ESTATE AGENTS.
 THE Advertiser wishes for a SITUATION
 in an Office of the above. Has a fair knowledge of surveying
 and levelling, and is a good draftsman. Salary not so much as
 object as p. active.—Address, J. D. Fulbeck Cottage, Pond-street,
 Hammersmith.

TO ARCHITECTS, BUILDERS, AND ESTATE AGENTS.
 THE Advertiser requires a RE-ENGAGE-
 MENT as GENERAL FOREMAN or CLERK of WORKS,
 having just completed his engagement with one of the largest
 firms in London. First-class foreman, Joiner or Trade. April 23,
 Address, 35, care of Mr. Palmer, 23, Harrison-street, Gray's-lan-
 road, W.C.

TO CIVIL ENGINEERS, ARCHITECTS, AND SURVEYORS.
 THE Advertiser desires an ENGAGE-
 MENT. Eight years an Office Assistant and Clerk of Works
 on water and sewage works, and two years in an architect's office.
 Refer to articles in "The B. & C." in London.—Address, EYFION,
 Office of "The Builder."

TO ARCHITECTS AND BUILDERS.
 SITUATION WANTED, by a Young Man,
 who has worked at the bench had charge of work, is a fair
 draughtsman, and can assist with measuring and estimating.
 Address, G. G. Ashburnham-terrace, Strand Green-lane, Holywell, N.

TO BUILDERS AND CONTRACTORS.
 PLASTERING WANTED, by a thoroughly
 practical Man. Labour only.—Address, 225, Office of "The
 Builder."

CLERK.—A Young Man, of unexceptionable
 character and testimonials, requires a SITUATION. Ac-
 counted to Government works. Can take charge of an office, do
 prime cost, or take charge of a set of books.—Address, ALPHA,
 100, Great Portland-street, London, W.

TO ARCHITECTS, &c.
 A FIRST-CLASS DESIGNER, PER-
 SPECTIVE DRAWING, AND COLOURIST, will sell up
 details and working drawings, is open to an ENGAGEMENT, in
 Town, temporary or otherwise.—Address, ARCHITECT, 11, Duke-
 street, Ad-194.

TO ARCHITECTS, &c.
 AN efficient GEOMETRICAL and PER-
 SPECTIVE DRAUGHTSMAN requires a RE-ENGAGEMENT.
 Address, 104, Office of "The Builder."

TO ARCHITECTS.
 AN efficient ASSISTANT desires a RE-
 ENGAGEMENT. Has good designs, and is an able
 calculator. Flat-class references.—Address, No. 119, Office of "The
 Builder."

TO BUILDERS, DECORATORS, AND UPHOLSTERERS.
 A GENTLEMAN, with good business
 abilities, is open to an ENGAGEMENT in the above trade.
 Competent to undertake the management of the painting and
 decorating department of a firm or branch establishment. Reference,
 with receipts, if required.—Address, G. G. Ashburnham-terrace,
 Portland-place, W.

A CLERK of WORKS, with references and
 testimonials of the highest class, wishes for an ENGAGE-
 MENT.—Address, R. X. care of Mr. Holland, 20, Southampton-row,
 Bloomsbury-square, W.C.

TO ARCHITECTS.
 AN ASSISTANT DESIRES AN ENGAGE-
 MENT. Perspective, detail, and working drawings.—Address,
 G. care of Straker & Sons, 26, Leadenhall-street.

TO BUILDERS AND OTHERS.
 A YOUNG MAN, aged 20, who has been
 brought up to the bench, wishes for EMPLOYMENT as IM-
 PROVER or Carpenter and Joiner.—Address, R. BEGGS, 21, Bed-
 borough-street, Easton-road, N.W.

TO BUILDERS, DECORATORS, AND IRONMONGERS.
 GOOD PRACTICAL PLUMBER and
 HOOD-WATER MAN (in iron pipe) is open to a RE-ENGAGE-
 MENT. Unexceptionable references.—Address, 5, & 7, Finsbury Coffee
 House, 9, King's-road, Chelsea.

TO ARCHITECTS.
 A GOOD DRAUGHTSMAN and expedi-
 tion General Assistant at present DISENGAGED. Is a fair
 colourist and perspective draughtsman. Thoroughly versed in
 the various duties of the profession.—Address, G. C. J. & G., Edward-
 street, Bath.

TO CIVIL ENGINEERS, ARCHITECTS, AND BUILDERS.
 A YOUNG MAN, capable of making neat
 A. Tracings and Writings, desires a RE-ENGAGEMENT at a
 moderate salary. Conversant with architectural drawing and design,
 and quantities.—Address, H. B. G. Grov-r-road, Upper Holloway, N.

AN ARCHITECT and SURVEYOR, of
 established practice, whose offices are in a well-ventilated
 is willing to receive a suitably educated Youth, of Christian
 principles, as OUT-DOOR PURVE. Premium required. A vacancy
 also for an 181 BOND.—Address, F. Child's Library, Archway
 place, Bayswater.

TO ARCHITECTS AND SURVEYORS.
 A SITUATION in an Office is required by
 one experienced in the PREPARATION of DRAWINGS, in
 DETAIL of otherwise, and taking out quantities.—Address, R. V. E.
 124, Leadenhall-street, London.

TO ARCHITECTS.
 AN experienced ASSISTANT WANTS
 EMPLOYMENT. Moderate terms accepted.—Address, A. B.
 Post office, Knightbridge.

A COMPETENT FOREMAN WANTED,
 to SUPERINTEND the ERECTION of NEW BUILDINGS,
 make working drawings, keep accounts, and pay men. Salary 45s.
 Apply to F. B. DONNELLY, 10, St. Mary's-buildings, Strand; or to
 Alderley, 10, White-church-lane, Fackham.—No written application attended to unless
 stamps enclosed.

AN experienced ESTIMATING and
 MEASURING CLERK (apples to an ENGAGEMENT. Well
 acquainted with office work, billiards, and Contractors' accounts, &c.
 References and testimonials unexceptionable.—Address, Mr. D.
 Deacon's News Rooms, 151, Leadenhall-street.

 thousands, equally secured to pay a fair rate of interest. Address full
 particulars, with price referred to Messrs. DOWSETT & GHAFFNEY,
 28, Lincoln's-inn-fields, W.C.

**TO SPECULATORS, BUILDERS,
 CAPITALISTS, and OTHERS.—TO BE SOLD, reasonably,**
 close to the Waterloo-bridge Station, the remaining portion of a
 FREEHOLD BUILDING ESTATE, consisting of about 1200 ft.
 frontage. Gas, water, and sewage are laid on the estate, and new
 houses can be built. Full particulars of the premises, and of the
 mortgage if required.—Apply to G. H. HOLLEGGIE, Westwood
 House, Belmarsh, South Norwood.

**TO BUILDERS, CAPITALISTS, and
 SPECULATORS.—TO BE SOLD, very cheap, the LEASE-
 HOLD INTEREST, for Ninety-eight Years, in Thirty Acres of Land
 close to the City of London, and near the City of London, and
 readily let to builders to produce 1000l. a year profit in improved
 ground-rent.—Apply to T. ROBERTS, Esq. 23, Southampton-build-
 ings, Chancery-lane.**

A BUILDING SITE, near to the City
 suitable for one or two Warehouses, TO BE LET on a long
 lease.—Apply to Mr. J. BLAND SMITH, Colman-street, Bunnell
 row.

ASHFORD PARK ESTATE, near
 STAINES.—PLOTS of various sizes on this beautifully sit-
 uated PROPERTY TO BE LET on Building Leases. Soil fertile. Most
 advanced.—For plans and particulars apply to Mr. FREDK. PAG
 WALTERS, Architect, 11, Bond-street, Wallbrook, E.C.

**TO SPECULATIVE BUILDERS and
 OTHERS.—TO BE LET, at the corner of two important roads**
 with frontages to each road, is a valuable four-mile route to the
 north of the Bank, about 11 acres of valuable BUILDING LAND.
 Particulars and plans, detailing area and dimensions, to be sent to
 the undersigned, on or before the 20th NOVEMBER, instant.
 For further particulars apply to Mr. F. H. EASON, Architect, 3,
 Regent-street, S.

WANTED, WHARF on the River Thames
 The Commissioners of Sewers of the City of London are
 desirous of obtaining a WHARF having a good frontage to the River
 Thames, and situate within, or contiguous to, the City of London.
 Particulars and plans, detailing area and dimensions, to be sent to
 the undersigned, on or before the 20th NOVEMBER, instant.
 JOSEPH DAW, Principal Clerk,
 Sewers Office, Guildhall, 9th November, 1868.

The Builder.

VOL. XXVI.—No. 1346.

Taste in the Household.

NOTWITHSTANDING all that has been said and done to improve the public taste, much more must be written and told, retold and reiterated, before those working in any department of this reformation may dream of ceasing from their labours. One hook, one lecture or series of lectures, one exhibition devised for the purpose of elevating public taste, in the matter of articles of household furniture, for example, is but as the oft-mentioned drop in the ocean. It is the untiring repetition of a text that calls attention to it and causes it to strike the imagination, dwell in the heart, or fasten upon the memory. We

must have piles of books, scores of lectures, repeated exhibitions of worthy art-work, before we can expect to see an appreciable difference in the taste of the great bulk of our fellow-subjects. It is now upwards of thirty years since Pugin first brought before the public, in a practical form, the possibility of making the interiors of our homes as picturesque as the ancient mansions of our forefathers, without detracting from their comfort, by attention to beauty of form in domestic furniture. He not only pointed out what we should aim at having and the principles that should lead us to the selection he recommended, but he showed what should be avoided. In our own columns, through the intervening years, the subject has been treated over and over again. Then we must not forget the chamber of horrors at Marlborough House, before it was a royal residence, where articles of bad taste were gathered together and exposed to scorn; nor the continuity of instruction in truer taste provided, by the same teachers, at the South Kensington Museum. The praiseworthy dictionary of M. Viollet-le-Duc, copiously illustrating the domestic furniture of the thirteenth, fourteenth, and fifteenth centuries, from a foot-stool to a canopied seat, a cradle to a state-bed, a *dressoir* to the jewelled and enamelled *dragoirs* displayed upon it, and so on through every apartment in a French chateau, with like comprehensiveness, proved another notable accession to our stores of information and instruction. But all these must be looked upon as only initiatory steps in the grand march of progress. They form but a faint trackway, through a region beset with

monstrosities. This trackway has yet to be beaten into a fair, broad path; and the monstrosities have to be driven into the background, if not into a bonfire.

It is then with a conviction that, although much has been said of the nonsense, vulgarity, and want of thought displayed in the matter of household furniture by the public, and the desirability of fostering an appreciation of beauty combined with fitness, it is not too late to say a great deal more, that we turn over the pages of a work on "Household Taste," by Mr. Eastlake.* His treatment of the subject differs from that of some previous writers in this particular: instead of contenting himself with ancient examples, or selections of these contrasted with modern mistakes, he aims rather at pointing out from the actual stocks of leading firms in different branches of the furnishing trades, such materials, designs, and objects as are not flagrant violations of good taste. This has the drawback of conferring upon his work somewhat of the character of a trade circular; but it is advantageous so far as it brings the practicability of procuring inoffensive articles before the reader's eyes. One closes M. Viollet-le-Duc's fascinating pages with a sigh of regret that all poetry, beauty, and artistic feeling have departed from our houses for ever, for the exquisite objects he delineates as being household realities in former times are no longer to be sought for love or money. But if Mr. Eastlake's volume falls short of awakening such an ecstasy of admiration, it has a homely usefulness in directing attention to reforms that can be carried out, and purchases that can be made, any day in the week, that would invest homes with somewhat of the old interest and comeliness. We will not, however, unreservedly endorse all his suggestions. For instance, he would do away with castors to tables. He says, "Such an appliance is by no means necessary or desirable. A dining-table rarely requires to be moved from its ordinary position. It should stand firmly on its legs at each corner. When it is fitted with castors, servants are perpetually pushing it away." Now, round the legs of a table without castors in everyday use there would inevitably come to be a halo of dirt, because no sweeping or scouring brush in the hand of a housemaid would be able to thoroughly cleanse the floor close up to each leg. Again, when a change in the position of the table was required for any special purpose, if there were no stout serving-men at hand to lift it, the carpets would get dragged and torn by its being shuffled about. In some minor matters of this kind we disagree with Mr. Eastlake.

After a preliminary chapter on street architecture, illustrated by a street in Nuremberg, more *cherry-riquettesque* than picturesque, our author begins a tour through the principal apartments of a modern house at the entrance-hall. Here he recommends the use of staining fluid for the woodwork instead of paint. But if the latter must be used because it has been already applied, then he prefers a flat tint of dark green or chocolate, instead of graining in imitation of oak. He regrets the disappearance of the old-fashioned brass knocker, whose bright spottiness gave such an air of industrious cleanliness to the threshold of a house; and considers its present cast-iron substitute a "frightful invention." Three illustrations of wrought-iron knockers, two antique and one modern, kept in stock by a well-known metal-worker, show how we can best meet this requirement. Door-mats and rugs are not overlooked, and our author fails not to deprecate the use of those "silly lumps of hinc, or manvo-stained wool, called drawing-room door-rugs;" also made in white, and which are out of all correspondence with their purpose. He gives, too, a series of patterns of encaustic

* "Hints on Household Taste in Furniture, Upholstery, and other Details." By Charles L. Eastlake, London: Longmans, Green, & Co. 1868.

tiles and tiled borders out of a trade catalogue suitable for the floor, and suggests what should be done with the walls. He approves either a sort of dado of encaustic tiles, 3 ft. or 4 ft. high, with the wall painted, or the plaster washed with flatted colour above, or distemper painting. For colours, where there is but little light, he suggests pale green or drab; and the Pompeian and Egyptian red for halls that are well lighted. He gives a design for a hall table, which differs from those in present use by the addition of a raised dorsal furnished with a narrow shelf. For hall chairs he makes no recommendation, but gives a sketch of one at Cotehele, a Tudor Cornish mansion, as an illustration of what they used to be before the present decadence of taste set in.

In the dining-room there is not only more to find fault with, but more to commend in modern manufactures, in our author's estimation. Beginning with the table, he says:—"It is generally made of planks of polished oak or mahogany laid upon an insecure framework of the same material, and supported by four gouty legs, ornamented by the turner with mouldings which look like inverted cups and saucers piled upon an attic baluster." A sketch of an end of one of these graceless uninviting modern tables is supplemented with one of a handsome Jacobean make, a design in which the strength and form of the latter is combined with the telescopic capacity of the former, and two illustrations of old German tables. With reference to the sideboard, he urges, as we have often urged, the reinstatement in the dining-room of the ancient *dressoir*, now only known in the kitchen as the dresser. The modern sideboard is but the torso of this noble piece of furniture. We have, indeed, the wide board, useful in the service of the dinner; but where are the shelves upon which treasures in ceramic ware and metal-work can be suitably displayed? Mr. Eastlake gives a design for a sideboard based upon the ancient form, not quite so graceful as some of the old models, but still a great improvement upon the present dwarfed fashion. For dining-room chairs he gives examples from Earl de la Warr's seat at Knowle, belonging to Stuart times; and from modern manufacturers' stocks selects those known as the Cromwell chairs as the least objectionable. Following others he inveighs against the modern upholsterer's method of hanging window curtains. But he goes further. We must admit he is a brave man; for time after time he attacks the taste of the ladies—we must add, the young ladies particularly; and in this apartment he takes them to task about their "lace trimmings and edgings used for 'antimacassors,' and similar articles of household use." After exhorting them all to inspect the specimens of ancient lace in the South Kensington Museum to improve their taste in designs for this class of work, he saves his credit by gallantly making an exception in favour of the productions of one fair lady—sly Mr. Eastlake!—and gives an illustration of her hand-made lace, the design of which he contents is "exactly in accordance with the spirit of old and sound principles of manufacture." Of stuffs for window-curtains he enumerates several kinds:—

"In the early part of this century window-curtains were only made of silk or damask. The material known as 'rep' was next introduced, and was in many respects superior to what had been used before. But the Germans have invented a still better stuff, a mixture of silk, wool, and cotton, called *coteline* in the shops, which is often worked in diaper patterns of excellent design. It is one of the most artistic examples of modern textile fabric which I know. To the French we are indebted for a heavy ribbed material, decorated with broad bands or stripes of colour running transversely to its length, and resembling the pattern of a Roman scarf. This stuff has been much in vogue of late years, particularly among artists and people of good independent taste. Another French material called 'algerine' appeared for a short while in the London shops. It was made chiefly of cotton, and was also designed with horizontal stripes of colour on an unbleached white ground. In effect it was all that could be wished, and it had, moreover, the additional advantage of being washable; but, of course, because it was cheap and about the best thing of the kind which had appeared for many years, it found few admirers and but little demand."

This is not quite complete; for, besides the silk and damask, there was a stout stiff woollen material, called "moreen," in very general use from forty to twenty years ago. We know artists are subject to strange enthusiasms, else how could we account for an incongruous mixture of alternate strips of velvet and common horse-girths for curtains, mentioned by our author as the device of artistically-trained minds? We must pass on, however. Before entering the library, the writer lingers to make a chapterful of observations on floors and walls. In the matter of carpets he altogether parts company with English manufacturers. He prefers the "humblest type of Turkey carpet or cheapest hearth-rug from Scinde," to anything they can show. Their wreaths of roses, their malachite marble patterns, their crimson moire antique, with borders of vine-leaves, he consigns to Madame Tessand's extra-sensational chamber; but when he touches upon paperhangings, he makes them some amends. These mural decorations have been as execrably bad as English carpets could possibly have been at their worst; but there are now exceptions to be found that should infuse courage into the carpet trade. Although, from the improvements in this manufacture, it would appear not to be so much a matter of necessity, our author gives a series of patterns for wall-papers, modified by himself, from diapers shown by some of the old Italian masters.

In modern library furniture there is less to find fault with than in that of other apartments. Contrary to the dictates of the principle that requires that everything should appear to be what it really is, Mr. Eastlake suggests the staining of unpolished mahogany with black for book-shelves. This imitation ebony, he says, looks well when covered with a thin varnish and contrasted with white metal for hinges and escutcheons. He gives a design for a bookcase in which the most novel feature is a sloping roof instead of the usual flat top finished with a cornice. For access to the space in this new top he has devised a trap-door in the centre of it, which has a miniature gablet projecting from it. This sloping top is introduced also in a design for a cabinet. But for the super-imposed pigeon-hole it would have the merit of not harbouring dust. A second utilization of space is more effective. This is the addition of upper shelves to the ordinary single shelf over the fireplace. When there is no *dressoir* in the dining-room, the library becomes the best place in which to place any specimens of art-manufacture that are worth looking at. "Few men care for a mirror in such a room; but if it is indispensable to the mantelpiece, let it be a long low strip of glass, stretching across the width of the chimney breast, about 18 in. in height, and divided into panels. Over this may be raised a capital set of narrow shelves,—say 6 in. wide and 12 in. apart,—for specimens of old china, &c. The plates should be placed upright on their edges, and may be easily prevented from slipping off by a shallow groove sunk in the thickness of each shelf. A little masonry may thus be formed, and remain a source of lasting pleasure to its possessors, seeing that 'a thing of beauty is a joy for ever.' In his own sketch of this arrangement he shows but two shelves over the usual mantel-shelf, the lower one decked with tall handsome vases, and the upper one with circular dishes. The effect is good. He properly bestows upon the work of the smith as much care as upon that of the cabinetmaker. The miserable designs of the cast-iron ornaments, set like braids of patryness upon modern stores and fenders, deserve all the blame they receive at his hands. A fender should be a *fender*, a protector, and to this end he recommends a form for it that should fulfil that condition. A library fender shown consists of four rods following the contour of three sides of an octagon, supported, at even distances apart, by four uprights, up to about half-way the height of the opening of the fireplace, the space between the two lowermost being filled in with sheet iron or brass, perforated with a slightly pattern. The library fender curiously suggests the breakfast urn, upon which our author falls with all the severity it deserves, as "the most contemptible instance of perverted taste" known to him; and, with more connected sequence, modern gaseliers and moderator lamps. Some examples of ancient German and Swiss metal-work, supplemented by drawings of samples of the modern candlesticks and vases kept in stock by leading firms close the inspection of the library.

The young ladies and the upholsterers are both rated soundly by Mr. Eastlake when he uncovers the shortcomings of taste in the drawing-room. It is to be hoped they will be improved by his Spartan asperities. He seems to think, if it were not for the young ladies' preference for the attributes of millinery in the aspect of everything, however unsuitable for that frail description of feminine decoration, the upholsterers would cease to manufacture the absurdities they now launch upon society; and if it were not that the latter debased the young ladies' taste by the tempting exhibition of such frivolities, they would know better. Especially, if upholsterers were to wear themselves from the production of meaningless curves at every turn they would be wisor men. On this subject he remarks,—

"The tendency of the present age of upholstery is to run into curves. Chairs are invariably curved in such a manner as to ensure the greatest amount of ugliness with the least possible comfort. The backs of sideboards are curved in the most senseless and extravagant manner; the legs of cabinets are curved, and become in consequence constructively weak; drawing-room tables are curved in every direction—perpendicularly and horizontally—and are, therefore, inconvenient to sit at, and always rickety. In marble washstands the useful shelf, which should run the whole length of the rear, is frequently omitted in order to ensure a curve. This detestable system of ornamentation is called 'shaping.' It always involves additional expense in manufacture, and therefore, by avoiding 'shaped' articles of furniture, the public will not only gain in an artistic point of view, but save their pockets."

Influenced by these sentiments, there are no handy-legged drawing-room chairs either in our author's sketches from ancient examples or in his own designs. He gives a settee, a sofa, a chair, and an arm-chair of the date of 1620, from a set preserved at Knowle, which are interesting. As an improvement upon the modern round table resting on its hollow cylinder and three claws, he suggests that the central stem should be made solid and have a substantial base, and that four struts should stretch diagonally from the stem to support the table-top. For chairs, tables, and couches he prefers marquetry to carving, which he would leave for cabinets, coffers, and sideboards, where hard projections are not likely to be so much in the way. The garish looking-glass frame of the present day he would have banished to give place for real carved work, or, as a substitute for this, plain solid frames of wood, either enriched with suitable mouldings or incised ornament. Common woods ebonyised, and set off with narrow gold stripes, form another alternative. For pictures he recommends classification. Thus the dining-room should enjoy the undisputed possession of family portraits; while in the drawing-room should be placed more miscellaneous works. Oil and water colours should not be contrasted with one another, nor placed in juxtaposition with engravings and photographs. One row only should be placed in a room, and that should be hung at a height of 5 ft. 6 in., measuring from the floor to the centre of the picture. This arrangement he says happily, would make a sort of coloured zone round the room, especially pleasing if varied by the introduction of small ornamental mirrors, sconces, brackets supporting statuettes, vases, &c. No picture should be suspended by less than two nails at the triangles outlined by the cord; when one only is used it is always at variance with the horizontal and vertical lines of a room.

But if our author is unhappy in the drawing-room, he has, and finds, good reason for being inconsolable in the bedroom. The gaudy chintzes, the flapping wall-papers, the bewildering carpets, the unbrushing French-polish, the distorted landscapes depicted on the chamber-ware, would be enough to make any reformer consider the case hopeless; but when these are supplemented by a veiled dressing-table, all ribands and muslin, that looks very much like a lady dressing for a ball without her head and shoulders,—nothing but retreat seems open for the bravest. For this last-mentioned item of bad taste our author has suggested an exchange to a low straight chest of drawers, covered with a fair cloth with fringed ends; but this is not likely to be accepted by those whose delicate health, or fatigue attendant upon a fanastically got-up headgear, requires the accommodation of a chair while making this part of their toilet. A table made open under the centre, with the drawers on both sides of this space, would be preferable in most cases.

He gives a design for a wash-stand, made in accordance with his horror of curves, which is a sensible and substantial piece of furniture, suitable for its purpose. Among

other matters discussed, the bed, of course, comes in for stricture. He says,—

"The design of metal bedsteads is generally very poor, especially where anything in the shape of decoration is introduced. For instance, it is usual to connect the joint which occurs where the tie-rods intersect each other with a small boss. A circular rosette would be obviously the most appropriate feature to introduce at this joint, whether in wrought or cast metal. But instead of this, the iron-bedstead maker (*elegantia gratia*, as the grammarians say) insists on inventing a little lumpy bit of ornament, which possibly intended to represent a cluster of golden slugs, and this abomination is repeated not only a dozen times in one bedstead, but on some thousands the same pattern."

Against this he sets a design which, so far as the suspension of its canopy from the ceiling is concerned, is a modernization of an ancient French bedstead given by M. Viollet-le-Duc. The transverse stripes on the curtains, the horizontal stripes on the trim box-plated valances round the head, the open metal-work footboard, group together exceedingly well, and confirm the impression that a very little alteration in some of the designs of our most common commodities would bring them within the pale of propriety.

The latter portion of this volume is devoted to crockery, table-glass, dress and jewelry, and plate and millinery. In all these matters the superiority of the labour of the art-workman's hand over the machine is advocated. If the forms of plates, dishes, and saltcellars, for instance, are less rigidly symmetrical, if the glaze is unequally distributed, if the colour is fainter on some parts than others when made by hand, there is a power of attraction in them for the educated eye that no machine-made pottery can have; and there is life in them, and man's mind and skill. Like as he prefers the Oriental carpet to the mock gaudous of our manufacturers, and for the same reasons, so an Indian preserve-jar or a Moorish plate is beyond any of the spiritless and loveless productions of most of our potteries. A point of departure in the minds of the Oriental potter and the English designer is the separation of the pictorial idea from the decorative. The former conventionalises the objects he depicts on his ware for its adornment; the latter aims at the most realistic representation of a landscape, or perhaps sea-view, as though its fidelity and minuteness of detail were of the first consequence, and the general effect of the piece of ware of none whatever. Again, ancient glass is infinitely preferable to modern, because in its manufacture its natural properties were considered; whereas at the present day they are nearly forgotten in the desire to produce vessels that are accurately symmetrical, colourless, and flawless. "To the eye of the artist," says our author, "the delicate gradations of natural colour, the slight imperfections and streakiness of old glass, render it infinitely more attractive than a purity of texture, which has nothing but its clearness to recommend it, and which can only be acquired by a sacrifice of more precious qualities. For the simple transmission of light through the best piece of flint glass that could be manufactured, is of small value compared with the mellow and often jewel-like effect produced in the design of a Venetian beaker." And in accordance with the scheme of his task, he points out where glass, approximating as near as may be to the ancient perfection, can be obtained. For all such information, however, we must refer the reader to the work. We have only to show, in the present case, the mode in which our author has carried out his aim to improve the taste of the general public. The only reform in the department of costume that he ventures to advocate, is the adoption of knickerbockers, though hats, hoops, boots, and coats all come under his lash.

Mr. Eastlake is not correct in attributing the "moustache movement" to the visit of foreigners in 1851. It was commenced and carried on persistently by the *Builder*, at first specially with reference to sanitary considerations for workmen, and was continued by writers and lecturers admittedly prompted to action by our pages.

The young ladies escape censure as to dress, for the simple reason that while he writes the details of colour and form in their costumes will change so considerably, that his words will no longer apply by the time he comes to the end of his remarks. But their jewelry, being a little less evanescent than their millinery, is open to more serious criticism. Too often, he fears, it is valued more for the money it cost, or would sell for, than for its intrinsic beauty, either in material, design, or workmanship. He thinks if diamonds were cheap and common, no one would wear them.

"They would be at once and for ever banished from the necks and heads and stomachs of every court belle in Christendom." As it is, he finds fault with the way they are worn, grouped together, in some instances, in quantities sufficient to make a blaze of light, instead of being isolated like the stars above us; and the cutting and paring of them down to obtain lustre, as in the case of the Koh-i-noor, he considers of questionable propriety. But this is not worse than the taste for strings of large single diamonds, devoid of all artistic accessories. Less expensive jewelry, particularly that which is either directly copied or adapted from antique precedent, is often in better taste. But the best specimens are those of other countries and other ages. The rudely-made trinkets the Russian peasants treasure, the still more myrtle-looking manufactures from Central India, as well as the ancient work of the earliest of Rhenish Byzantine artists, are all preferable to the commonplace thoughts expressed in modern English goldsmith's work. Those who would know what really good jewelry is like, must search the cases of the South Kensington Museums from time to time when ancient specimens are displayed. Coming down to plate, he misses the spirit that designed the apostle spoons of old. "Take," he cries, "the ordinary 'fiddle pattern' fork: can anything be more senseless than the way in which modifications of that form are decorated,—now with a raised moulding at its edge, now with an outline of heads, now with what is called 'a shell,' but what is really a bad copy of the Greek honeysuckle ornament, at the end of its handle, now with a Rococo scroll or a representation of natural flowers in low relief on its surface?" If Dame Quickly had placed one of these novelties before her guests it would have taken the favour out of their sack. Sweet Anne Page would have scoured such a spoon. But if the merry wives of old would have disdained our prosaic spoons and forks, with what discontent would they have regarded our tasteless turcons, side-dishes, crust-stands, salvers, and card-tables? Surely nothing quaint, they would argue, could come out of such fumbling, feeble pretences. For guidance, our author says, "Round silver dishes and salvers are preferable to those of an oval or square shape, for many reasons, and especially on account of the mode in which such articles are manufactured. Richly-moulded edges are, for a like reason, inappropriate; moreover, in precious metal they necessarily increase the cost, and in plated goods they are liable to be rubbed and look shabby." The loss of the old appreciation of an artist's work is remarkably noticeable in our modern cutlery. The machine only is recognised in this department of the world's industry. We are not surprised to find the richly-carved and gently-curved knife-handle of the past contrasted with the plain, smooth, small bone or ivory parallelogram of the present day, in the pages before us. Staining bone-handles is recommended as a substitute for the shagreen that once was so effective, and studding dark wooden handles with flat steel ornaments is indicated as a fashion that might be revived. Mother-of-pearl handles are preferred for desert knives and forks, as more agreeable in touch and appearance than silver or plated goods. Whilst the silversmith's and cutler's arts remain at their present stage there would be less vexation of spirit, our author infers, if an intending purchaser make his selection from the stock of some of the old jewelry shops in Hanway-street or Wardour-street; against which last-mentioned place, by the way, as the head-quarters of sham ancient cabinet-work, the unwary are especially warned in a former part of the work. There are many metal-workers who have aimed at reviving the ancient taste and dignity of the silversmith's art, but then they charge for their goods treble the price of similar articles of the ordinary makes, and while they cannot see that a good design should not cost more than a bad one, because it need not involve more labour in execution, there is no immediate prospect of any appreciable reform in this department. If manufacturers do not assist in educating the public taste by the production of goods suited to everyday life that are designed upon true principles, the unaided influence of our museums will make but slow way. As appealing from purchaser to producer, bestirring first the one to create a demand and the other to supply it, and vice versa, pitting them against each other as it were, Mr. Eastlake's work will help on the issue.

COSMOPOLITAN BRITAIN.

THE Grecian colonists, who pushed adventurously across the Adriatic, and founded the cities of South-Eastern Italy, and the yet erect temples of Paestum, gave the name of *Magna Grecia* to their new country. They were the missionaries of a civilisation which has outlived the political term of the republics of peninsular and insular Greece, as well as that of the stern iron empire which absorbed the Italian Crocks. Greek letters, and Greek science, resting from an Eastern exile, gave a tone to the civilisation of Europe, being adopted by the students of that graver Roman law which would otherwise have yet more profoundly modified our manners and our faith. The colonising impetus, stimulated by the discovery of a new world, sent the most restless of our own race on a new mission in the Tudor times. "The development of the England of Elizabeth," we have here a traveller who tells us, "is to be found not in the Britain of Victoria, but in half the habitable globe. If two small islands are by courtesy styled 'Great,' America, Australia, India, must form a Greater Britain."

Greater, there is no doubt, in territory and in population. And yet there is a sense in which the term may be taken, and will, perhaps, be taken too, by the enemies of England herself, which might make the author wish he had sought some other appellation for our giant offspring. Some may even think at first, as they accompany Mr. Dilke through the lands where the shadow of a terrible and relentless war is cast over his brilliant pages, that some such covert satire was intended by his title. But amid the invigorating breezes of New Zealand the shade disappears. The gloom with which he so often speaks of the inhabitants of one set of free states as "rebels" against the inhabitants of another set, is charmed away by the soft cadence of the Maori song. The second part of the first volume of "Greater Britain," containing the chapters which treat of Polynesia, we have read with unmingled pleasure. There is much in them that is novel,—much that ought to be known. The picturesque description of scenery and inhabitants enables us to glance over the traveller's shoulder, or at least to see through the clear vision of his memory. The peculiarity of the climate is reflected no less in the unusual character of the vegetation, than in the strange features of social life.

The highway of 170 miles in length, which, crossing the New Zealand Alps, connects Canterbury with Christchurch, is "corduroyed" with the trunks of the tree fern; and in the swamps these trunks have again taken root, and shot forth fronds, forming a grove that rises out of the very bones of the road. The semi-tropical vegetation grows up to the very limit of the eternal snows, and the most graceful form of all flowerless plants, the natural production of the botanical belt that immediately succeeds the equatorial growth of palms and bananas, is found on the very edge of a glacier. As to this, too, Mr. Dilke tells us that the glaciers of Mount Cook are the longest in the world, except those at the source of the Indus.

The political importance of the labours of the engineer receives ample illustration in New Zealand. The settlements in this island are historically distinct, and, in the original absence of roads, were totally separated from each other by impenetrable bush. Hence resulted the establishment of no less than ten cabinets and ten legislatures, for a population of 200,000 souls. Thus it came to pass that the taxation of the inhabitants of New Zealand is nine times as heavy as that of those of Canada.

Landing in Virginia in June, 1866, Mr. Dilke's rapid line of travel runs on through New York, across Canada, over the never-ending sweep of the Great Plains, to the Mormon State, and to the "Golden City." He steamed along the shores of Lower California to Mexico, and sailed from Panama for Wellington in New Zealand, the longest steam voyage in the world. Thus the first part of the book is entitled "America," the second, "Polynesia." Australia forms the third portion, containing chapters on Sydney, Victoria, Tasmania, and Adelaide. The fourth part is devoted to India; Ceylon, Benares, Simla, Umritsar, Lahore, and Bombay, being the local headings of chapters. In this division of the work the chapters on overland routes, and on

France in the East, will prove especially interesting to our readers.

On the former of these points, Mr. Dilke is of opinion that the Brindisi route from Alexandria, by which he returned to England, is the proper line for our Indian mails to take until the Euphrates road is made. It is more than twelve years since we became convinced of the truth of this opinion. The completion of a line of railway, running by Constantinople, bestriding the Bosphorus, and striking on the head of the Persian Gulf, would only leave the distance from Bassora to Kurrachee to be performed by water. We cordially agree with Mr. Dilke "that the direct route to India is one of the most pressing of the questions of the day."

In the chapter "France in the East" Mr. Dilke gives less distinct information, as to the actual condition of the Suez Canal, than we have already laid before the readers of the *Builder*. He has rather addressed himself to the political side of the question, his views differing from those which we have expressed rather in unvarnished plainness of speech than in principle. His remarks, without however citing any authority, that the difficulty of keeping clear the channel at Port Said, at the Mediterranean end of the canal, is well known to the Pacha and his engineers. He adds that it is not difficult to get through the bar, but that such cutting must be continually renewed, as the effect of the great piers will be to push the Nile deposit seawards; and that new bars will certainly form in front of the canal. Something similar to this was the opinion of Mr. Stephenson. The statement is denied by M. de Lesseps and his friends. As the opening of the canal is advertised for October, 1869, we shall probably have more distinct knowledge on this subject long before the completion of the Mont Cenis tunnel places us in unbroken railway connexion with the port of Brindisi,—unbroken, that is to say, from Calais. "I shall not rest," said King Ferdinand II. to an English engineer, "till you can enter a railway carriage at Brindisi and not step out of it till you reach Calais."

The feature of "Greater Britain" which, while exciting unqualified admiration in some readers, will cause pain in others, is the thorough-going partisanship with which it espouses the views of the dominant majority of the American Congress. It is hard for an Englishman to form an absolutely reliable judgment on the most disastrous event of modern civilization. It is impossible for any man yet to tell what will be the result of that sanguinary and stubbornly contested war. And although we hold and always did hold that the North was in the right and the South was in the wrong, it may be well to suspend judgment as to some of the results. The broad and sound philosophy of which we welcome so many indications; the admission of the essential importance of the ethnological element, in all questions of politics, properly so called; the clear perception and honest admission that economics are not politics, and that what may be economically wrong may yet be, for a time, politically right; the kindly human feeling, that yet warns to the Teutonic rather than in the Latin blood, and craves even a tinge of old English prejudice against our French neighbours—all these are too closely related to the principles which we have not infrequently advocated in the pages of this journal to need any more formal expression of adhesion on our part. We may mark, in passing, the firm and level pace of the diction of at least the greater portion of the book, and the hearty appreciation of all that is good and noteworthy. There is a genuine sense of humour and love of fun, too, displayed in not a few of the pages. The list of the "titles" which the Americans "invented for their children" when the Scripture vocabulary was exhausted, is worthy of permanent commemoration, and the apothegm, "Let every man skin his own skunk" is worthy to rank among the raciest and most pointed proverbs of the older world.

The great ethnological question, Mr. Dilke agrees with us, underlies not only the form of political institutions, but that of civilisation itself. To inquire as to community of origin, science as yet can give only vague and tentative replies; replies, however, which comparative philology is yearly making more articulate. But, come whence they may, the present distinctive features of race seem now to be only eradicable with the race itself. Among these features one of the most marked is that of adaptability to climate. Three centuries have not acclimatised the Teutonic blood in Hindo.

* "Greater Britain: a Record of Travel in English-speaking Countries during 1868 and 1867." By Charles Wentworth Dilke. In two volumes, with Maps and Illustrations. London: 1868. Miscellaneous & Co. Pp. 434, 428.

stau. Draw the line where you may, a zone, lying somewhere about the fortieth parallel of north latitude, divides the natural home of the white and the black races, speaking in the widest acceptation of the terms. Mr. Dilke has pointed out with truth that races, or families, that *whiten* by removal to hotter climates (as English children do in the South of Europe), cannot take root there. Labour, with the thermometer above 80 deg., is unendurable, permanently, by the Saxon races. It looks as if intellectual labour became impossible to the brain somewhere about that temperature. Where the natural tillers of the earth, and working pioneers of humanity, cannot live their natural life, Nature exacts no toll from her dusky children. The fig, the cocot-nut, the banana,—fruits innumerable,—require only the simple toil of plucking them. In the damp seaboard air, which is fatal to English life, through the long gloom of the tropical night, the races whose skin has a peculiar provision for resisting heat, dance and sing and chat after the unlabouring day.

It is with the utmost pleasure that we have accompanied our author in his scamper round the world. In such a fight he can but have given a glance here and heard a whisper there; but his reproduction of the impressions made on his own mind is clear and vivid. We believe it to be, for the most part, impartial and truthful. There is a great advantage in the perusal of a series of notes separated at once by so small an interval of time, and by so large intervals of distance. The contemporary life of the English-speaking races comes thus before us with greater reality than is the case when we read more patiently compiled descriptions. We fly with the author round the world, putting on the magic girdle, not in forty minutes, but in the time which it may take us to read, and at times to re-read, 800 pages of well-printed letterpress. Sometimes the glance has been, as is natural, a little too rapid, the whisper too partial. Thus Mr. Dilke expresses a wish for the destruction of the fort at Bombay; while the fact is, not only that the fort was destroyed before the end of 1864, but that it was the proceeds of the sale of the ground on which it formerly stood that had furnished the funds for the erection of the detached forts, the absence of which Mr. Dilke notes, and was intended, further, to provide means for filling the city with large public buildings,—a scheme which collapsed in the panic.

"Greater Britain" will be read with pleasure and with profit in, we doubt not, repeated editions. We are not yet sufficiently cosmopolitan to recognise, or to wish to recognise, a greater Britain. But we give our hearty good wishes to the book so called, no less than to that younger Britain at which it affords us so brilliant a glance. Such a journey was an admirable preparative for public life, and Mr. Dilke, who is now the Parliamentary Representative of the new Borough of Chelsea, will find the advantage of it throughout the career which lies before him.

THE MANUFACTURE AND USE OF TERRA-COTTA.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary meeting of the Institute, held on Monday evening last, a letter from Mr. Sydney Suirke was read, which stated that the new exhibition-rooms of the Royal Academy will be completed and opened for the reception of works next March, and it was a great satisfaction to him to be able to assure the members of the profession that their works will no longer be condemned to be crowded into a mere passage-room, as hitherto. There are (wrote Mr. Smirke) altogether fourteen galleries, none of which are less than 41 ft. by 31 ft., and not one of them is inferior to the rest in light or position, so that architects may now rely on justice being done to their productions. He expressed an earnest hope that architecture would be well represented on the occasion of the opening of the new Royal Academy, and that she would vindicate her position as one of the Three Sisters.

The subject fixed for this evening, was the discussion of Mr. Charles Barry's paper "On Terra Cotta," read in the previous session.

The discussion was opened by some supplementary remarks by Mr. Barry, who said it was

commonly assumed that terra-cotta is nothing more than baked clay, or baked clay and sand, and a large proportion of the terra-cotta made use of in buildings recently erected, and now in progress, is of no other character. He did not consider that to be a worthy material for architectural purposes, and it was certainly very inferior to the ware used by him at Dulwich College. Terra-cotta, he said, to endure the severities of change in these northern latitudes, should be a hard vitreous body of a peculiar character. To compound such a body for cream-coloured ware, we must use Cornish, Devon, or Dorset clays, with ground flint, Cornish granite, sand, and old potsherds composed of like materials. If the colour is required to be of a warm stone hue, clay or marl from the colts beds in coal measures are used to brighten the mixture; also sands containing protoxide of iron. Glazes are prepared from frits composed of Cornish granite, flint, red lead, soda, and borax. To these frits, after grinding, is added white or red lead, flint glass, and Cornish granite. The proportions in which these materials are used is the secret of the manufacturer, and the goodness of the ware will differ according to his scientific knowledge. Pecuniary considerations sometimes induce manufacturers to omit these materials, and a terra-cotta may be manufactured that is nearly equal, when new, in appearance to the best "body," but which is liable after a few years to disintegrate or flake on the surface. A perfect equality or homogeneity of the body of clay used throughout the mass of blocks of considerable size is almost essential to durability. When this is not done the effect is to cause a cracking of the surface, which may probably end in the decay of the whole. After some further remarks on the composition and manipulation of the best qualities of terra-cotta, Mr. Barry observed, that one fruitful source of bad work in terra-cotta is the want of sufficient time being given for the air-drying, but it is so essential to the durability of the future work that it cannot be passed over negligently. If a piece of terra-cotta either bad in material, or imperfectly dried and burnt throughout, he soaked for four or five hours in equal parts of sulphuric acid and water it will lose in weight, and, when dried, will show efflorescence over its surface, and the liquid will be found to be charged with sulphate of alumina, or alum. As to the heat and weight of fuel required for burning in the kilns, to burn duly a body of such materials as he had described will require an equal amount of coal to the weight of the ware. As to the heat required there is difference of opinion, it having been stated by some at 3,000° Fahrenheit and upwards. One good test of a heat necessary to fire terra-cotta that shall be really durable, is to put it at the heat at which soft iron readily melts when introduced into the kiln. As to absorption of rain-water by terra-cotta in the building, Mr. Barry remarked that it was a pretty well established fact that the durability of stone and other materials for building is almost directly in proportion to their non-porosity. Since his paper was read he had had some experiments made on this point: pieces of terra-cotta, Portland stone, Bath stone, and Ketton stone of equal bulk, viz. 12 in. square and 2 in. thick, were thoroughly dried in a moderately-heated oven, carefully weighed, and then plunged into water, and left there for thirteen days. At the expiration of that time they were again carefully weighed, with the following results:—

Portland, dry, weighed, 22 lb. 10 oz.; wet, 23 lb. 6½ oz. Increase of weight, 1 lb. 6½ oz.
Bath, dry, weighed, 21 lb. 14 oz.; wet, 23 lb. 15 oz. Increase of weight, 2 lb. 1 oz.
Ketton, dry, weighed, 21 lb. 11 oz.; wet, 23 lb. 8 oz. Increase of weight, 1 lb. 13 oz.
Terra-cotta, dry, weighed, 20 lb. 9 oz.; wet, 21 lb. 8½ oz. Increase of weight, 15½ oz.

With these remarks he left the subject for discussion.

Mr. Blashfield, of Stamford (manufacturer of the terra-cotta used at Dulwich College), narrated the history of his connexion with pottery works applicable to architectural purposes, which, he said, arose in the first instance from his intimacy with the late Mr. Herbert Minton at the time that gentleman introduced tesserae to public notice. About the year 1850 he (Mr. Blashfield) first began to make terra-cotta, the composition of which, and the method of manipulation adopted by him, were described in considerable detail. He urged the

great importance of employing proper fluxes, which in the burning of the ware should become infused throughout the whole mass, by which alone durability of the material could be obtained.

Mr. Redgrave, jun., brought under the notice of the meeting some specimens of the terra-cotta used in the new buildings in progress at South Kensington, which, he said, differed entirely from the material employed by Mr. Barry at Dulwich. The question, he said, was not so much which particular clay was the best as a building material. In the matter of clays he avowed himself a latitudinarian. The clay of which the terra-cotta used in the Albert Hall and the buildings at South Kensington was made was obtained from the coal measures commonly known as fire-clay, and which produced a material of the hardness and durability of which, he said, there could be no question; whilst elaborately prepared clay on which manufacturers had expended a vast amount of trouble had come to grief a few years after it had been put up in London. The terra-cotta at South Kensington was simply a fire-clay—almost a pure clay, which, after being ground fine, was mixed with a proportion of what is technically called "grog," or clay which had already stood the highest heat of the furnace, and is used to prevent shrinkage, which would destroy the straightness and beauty of the work. It therefore became a question whether a mixed material or a pure material best fulfilled all the requirements of the architect. He submitted that a great advantage in the use of a pure body was a uniform rate of shrinkage, which he said was of great importance when the material was used in lengths of several hundred feet in mouldings, &c. The superior capabilities of terra-cotta such as he had described to sustain weight as compared with ordinary bricks had been fully demonstrated; the crushing-weight in the former case being 100 tons, and in the latter 15 tons only. Directing attention to the specimens brought from South Kensington, he said they had in them an imperishable vitreous material, impervious to heat and moisture, and to all the influences of London atmosphere. He especially referred to the glazing and colouring, which, he said, were produced at very little cost, and only needed a second firing. Valuable as this material undoubtedly was, it was not a rival to stone or brick. For beauty of line stone would always maintain its supremacy; but in the use of terra-cotta they obtained a beautiful surface, and a variety of colouring, which could be obtained in no other known material.

Mr. Medlock made some observations upon cements in general; and pointed out the effects of the introduction of various silicates into the composition. With regard to the constituents of terra-cotta he submitted it was a subject which called for strict scientific experiment, in order to ascertain the proper proportions of the various ingredients employed, which he said was at the present time regulated by the rule of thumb, and not upon any fixed principles.

Mr. Canning (manufacturer of the terra-cotta of the Albert Hall and South Kensington Museum) said his friend Mr. Redgrave had entered so fully into the description of the material used by that gentleman in the structures to which he referred that Little was left for him to add. He complimented Mr. Blashfield upon the great excellence of the ware exhibited by him, which he regarded as a very successful result of the rule of thumb described by the preceding speaker, considering, as was alleged, that manufacturers knew little or nothing of the components of the material with which they had to deal. As far as he (Mr. Canning) was concerned, he had only to deal with a very simple pure clay, as compounded by nature, and which had only to be dug out of the bowels of the earth, and moulded into shapes which architects directed. This, he said, was done without addition, excepting a little of the same material burnt and mixed with it, which they called "grog." That was all the mystery in the manufacture of terra-cotta, so far as he was personally concerned, for the last twenty years, and he was not aware of any failures having occurred. Having directed attention to his specimens of glazing and colouring, he expressed his readiness at all times to compare notes with his fellow manufacturers, and to cultivate a spirit of emulation among them which would benefit the trade at large, and tend to the more extended application of this material.

Mr. Etheridge spoke on the subject of the

valuable deposit of clay lately discovered at Watcombe, in Devonshire, which he said was between 30 ft. and 100 ft. in depth, and extended over a very considerable acreage. This clay, being in his opinion adapted for the finest class of pottery works, he regarded as one of the most important discoveries of the age. Mr. Morrell, who had made experiments with this clay, pronounced that all could be done with it that was done with the clay of the ancient Roman and Greek times, and the most beautiful objects of art had been manufactured from it. The shrinkage of the Watcombe clay was stated to be very small indeed.

Mr. Blanchard expressed a very high opinion of the clay spoken of, and with respect to terra cotta in general, it had been so fully treated of in Mr. Barry's paper, and the subsequent discussion upon it, that he felt he could not profitably occupy the meeting by any observations of his own.

Mr. Henry Doulton considered great credit was due to Mr. Blashfield for the high standard to which he had brought his terra-cotta. Special attention had not been paid to that material at the Lambeth Works, but lately some little effort had been made in that direction. The best test of the durability of terra cotta was that of a sharp-pointed steel instrument. If it made an incision in the terra-cotta, the tooth of time would attack it; but if it turned the sharp point of the steel they might be sure it would be imperishable. The other test was that of acid, which in a short space of time would affect the material in a manner that it would take years of time to produce. He did not agree that fire-clays had any great advantage over other kinds if they required to be fired at excessive heat to make them imperishable.

Mr. Page, C.E., remarked that he had taken great interest in the development of the manufacture of terra-cotta, and was much gratified with what had been done by Mr. Barry at Dulwich College. He looked upon the revival of this material in that instance as an era in art, and he trusted it would be extensively introduced in all future buildings. Terra-cotta, he said, was a material with which even granite could not compare for durability. As one who had paid some attention to art, and who hoped to see the day when there would be no engineering work which was not also an artistic work, he begged to thank Mr. Barry and the other architects who had done so much to revive the employment of a very beautiful material in buildings of the present day.

Mr. C. F. Hayward mentioned the satisfactory results which had attended the use by him of terra-cotta supplied by Mr. Blashfield in a building he had erected in the vicinity of Plymouth. Speaking of the economy of the material as compared with stone, he stated that the cost of the triple-light windows with all the parts complete, and containing ninety pieces, was 6l. 11s. each, or 19l. 13s. for the three, and that of single windows 4l. 11s. each. The columns cost a little over 20s. each, and hollow blocks to carry weight, filled in by the contractor, cost 10s. each. The manner in which Mr. Blashfield and his principal workmen devoted themselves to the carrying out of his designs had given him the greatest satisfaction. He mentioned that in the progress of the works a strike of masons was threatened, and he believed the arrival of the terra-cotta had a very beneficial effect upon the men, and induced them to alter their mind, lest they might be deprived of the stone-work which remained to be executed by the substitution of a greater amount of terra-cotta than was originally contemplated.

Professor Kerr, in proposing a vote of thanks to Mr. Barry and to the visitors who had taken part in the discussion, remarked that the subject was one of great interest, introducing as it had done two separate schools in reference to this material of terra cotta. Mr. Redgrave, as representing the operations at South Kensington, started a different idea from that which Mr. Barry and Mr. Blashfield had laid before them as regards the practical use of terra-cotta. Mr. Redgrave raised the question whether the material should be composed of natural clay or clay artificially compounded. He thought the argument in favour of the natural clay was scarcely borne out by the facts. The specimens of the South Kensington material, he believed, were from the natural clay, untouched by the tool before burning; whilst those exhibited by Mr. Blashfield had been tooled carefully before being placed in the kiln. Mr. Blashfield said, in effect, "Look at the fine arras and the smooth

and perfect lines, and the refinement and finish of these specimens." South Kensington said, "We would rather have less refinement and more artistic 'touch.' On the other hand, Mr. Blashfield was content to sacrifice artistic touch for the sake of refinement; and he (Prof. Kerr) thought the English mind in the present Gothic day would prefer the latter. These were the chief points of difference between the two schools which remained to be determined in the future. The speaker having expressed an opinion unfavourable to the specimens of colouring exhibited, and a hope that it would never be employed for the beautifying of London, included in the vote of thanks the practical gentlemen who had taken part in the discussion.

Mr. Barry briefly replied upon the discussion, and the resolution having been passed, the meeting adjourned.

THE PROPOSED NEW BRIGHTON RAILWAY.

A PREGNANT comment on our remarks as to the suicidal policy of the Brighton and South-Eastern Railway directors, has been given by the Parliamentary notices just deposited. A new direct line, from the Dulwich station of the London, Chatham, and Dover Railway to Brighton, will be applied for in the ensuing session. The novel and commendable plan of issuing 1l. shares, for the purposes of survey, deposit, and Parliamentary expenses, has been adopted; the holders to have the prior right to the subsequently issued definitive shares, if the Act of Parliament be obtained.

With the whole country seething and foaming in the turmoil of the most heatedly contested election that has taken place for the third of a century, it is impossible even to give a guess as to the manner in which the new Parliament will regard the rights and interests of the travelling, or indeed of any portion of the public. If the new House of Commons prove to be so far an improvement on its predecessors as to have a definite, intelligible, and honest policy—we speak with reference to railways, he it understood,—the most probable event will be, that the existing companies will again bid for legislative protection, by proposing to bind themselves to a more equitable treatment of their customers. For all parties this would seem to be more desirable than the construction of a new duplicate line.

The daily journal which in very many quarters is looked up to as the most consistent authority on subjects similar to that of which we speak, has taken a tone with reference to the present application with which we do not altogether agree. The *Times* sees many and great advantages to be expected from the consolidation of railway management and the distribution of dividend over as wide a system of returns as possible. So do we. But we do not hold that, until this consummation is attained, the Brighton directors have no option but to adhere to the recent augmentation in their fares. We may yet have some time to wait before we are in a position to define exactly how much the net returns have been improved, or how much deteriorated, by a policy which has been so generally condemned; but it is our belief that the most fertile source of income is to be found in giving the utmost facilities to the travelling public. On no other view is the erection of enormous structures, like the Cannon-street and London Bridge stations, and the Thames bridges, to be for a moment justified. It is because we hold the recent action of the Brighton and their associated directors to be, not conservative, but retrograde, that we are of opinion that it is an unwise policy for the shareholders, as well as an aggressive policy as regards all those locally interested in the rate of fare. It is by good service, cheap service, and punctual service, that the utmost returns on the expended capital are, if we do not grossly err, to be obtained. The mere fact that the deposit for an opposition line has been provided shows, more distinctly than any words can do, the feeling with which the present management of the Kent and Sussex system of lines is regarded by the public. It speaks well for public spirit, under all the depression of the long financial stagnation, that proof should be given that the travellers who now reluctantly use the Brighton Railway will not fail to resist monopoly, unless monopoly shows some convenience. It is also highly encouraging to see so novel and so sound an application of the over-

wrought principle of "limited liability" brought into practice. Either as affording the basis for an equitable arrangement, or, failing that, as an act of self-defence against monopoly, we look with pleasure on the project of the new Brighton Railway. What we most desire, however, is that the present company should render a new one unnecessary.

DECORATION OF ST. MICHAEL'S, CORNHILL.

CONSIDERABLE alterations, it will be remembered, were made at St. Michael's Church, Cornhill, between the years 1858 and 1860, including a new doorway next Cornhill, designed by Mr. Scott, and an elaborate series of carved benches by Mr. W. G. Rogers. The interior was partly decorated also, and the windows were filled with stained glass by Messrs. Clayton & Bell, much of it very effective. Quite recently some considerable additional works have been done. Amongst other things, the reveals and columns of the aisle windows have been richly decorated with colour, and a scroll enrichment has been painted on the shafts of the main columns forming the aisles. A pavement of encaustic tiles by Minton has been laid. The north porch, next Cornhill, has been elaborately decorated, we might say over elaborately, and includes a biblical subject, creditably painted in oil by Mr. Brophy, in the head of the doorway opening into the church. A new cloister, leading from St. Michael's-alley to the churchyard, has been formed in Portland and Caen stone, with red Mansfield stone shafts and carved caps, executed by Bevers. For this part Messrs. Barnsley were the contractors. The decorative work has been done by Messrs. Trollope, under the direction of Mr. Herbert Williams, the architect to the parish, and his son, the assistant architect. The organ has been restored by Messrs. Bryceson, and an electrical arrangement is applied to enable the organist to play from one side of the chancel to the other. In the whole some 3,000l. have been spent. The church is well worth a visit.

SEWER VENTILATION.

ALTHOUGH the question of sewer ventilation has of late years engaged the attention of many thoughtful men, its importance has not been generally appreciated. The efforts of sanitary reformers to impress upon Boards of Health the necessity of sewer ventilation have been but partially successful. The reason of this may in a measure be owing to the fact that no satisfactory method of grappling with the difficulty has yet been discovered. Every engineer may have given the subject more or less consideration, but professional men have never discussed the question in a comprehensive manner. We are daily reminded of the importance of trapping the drains to prevent mephitic gases from entering human habitations, but seldom are we told that, under certain circumstances, sewer gases will find their way into dwellings notwithstanding traps and other ordinary precautions now in use.*

Gas evolved by decomposing organic matter is always dangerous to health. In small quantities it poisons the blood, and produces typhoid and those other diseases commonly termed zymotic. In a perfectly undiluted state the gas would cause instant death. Sewage should have sufficient velocity to prevent accumulation and deposit, but this degree of perfection has seldom been obtained. In well-regulated towns much is done by means of constant flushing to keep sewers comparatively wholesome; but, owing to the surface configuration in many districts, sewers are necessarily constructed with flat gradients, and, the velocity of the sewage being insufficient to keep the solid particles in a state of motion, a deposit is formed. It is well known that these deposits rapidly putrefy and evolve most dangerous gases.

In his evidence before the Select Committee on the Sewage of Towns, Dr. R. A. Smith states that sewage is oxidised even before it leaves the town, and that poisonous gases (especially carbonic acid gas) are evolved in large quantities. Whenever the temperature rises to about 54°, oxidation is intensely rapid. The gases will, of

* This has been often urged in our pages.—Ed.

course, vary slightly, according to the nature of the sewage, but are generally as follows:—

Carbonic acid	95.0
Nitrogen	2.6
Sulphuretted hydrogen	2.0
Carbonic oxide, hydrogen, and carburetted hydrogen	0.4
	100.0

The temperature in sewers being never less than 54° these gases are produced in prodigious quantities. The motion of the liquids constantly exposes fresh matter to the influence of the air, and the solid matter deposited in the sewers or adhering to the sides being in an advanced state of decomposition the exhalations are of the most deadly character.

We naturally ask, What becomes of these gases? It has been supposed by some that the carbonic acid gas being heavier than air (its specific gravity being 1.529) finds its way to the outfall and is dissipated in the air: this is clearly an error; the law of gaseous diffusion, and the well-known habit of all gases to mix and diffuse themselves without reference to the force of gravity, militate against this theory. The constantly accumulating gas is soon rendered highly concentrated by the temperature in the sewers, and as soon as the pressure of this exceeds the hydrostatic pressure of the water in the traps it escapes. The bubbling noise not uncommonly heard in water-closets and sink-traps is caused by gas escaping in this way; moreover, sewer gases are extremely soluble: water readily absorbs more than its own volume of carbonic acid gas, consequently the water in the traps rapidly becomes highly charged with sewer emanations, which cause it to putrefy and evolve most dangerous gases into the apartment.

Carbonic acid gas is non-inflammable, and is incapable of supporting animal respiration; it does not simply cause death by excluding oxygen as some other gases do, but is positively poisonous. It will cause death by its presence even if otherwise there be sufficient oxygen to support life. This fact cannot be too strongly impressed on the memory, that although a candle will not burn where there is less oxygen than will support life, it may burn where carbonic acid is present in sufficient quantities to destroy life: accidents have frequently occurred to persons ignorant of this important law, in sewers and in brewing-vats where fermentation is carried on.

The system of ventilation adopted in London and Paris is simply to insert an iron grate over the manhole, and allow the gases to escape into the streets, without passing through any process of deodorisation. The advocates of this method have received encouragement from Mr. R. Rawlinson, who has omitted no opportunity to bring the matter under the notice of municipal authorities. Some years since, before water-closets came into general use, street gullies were left untrapped, and no inconvenience was experienced; but after water-closets became common the sewers were made receptacles for everything foul and unwholesome. The nuisance soon became intolerable, and the cry was raised, "Trap the gullies!" The gullies were trapped accordingly; but it was quickly found, that instead of the streets, the houses received the contaminated vapours. We have now to consider what we are to do next: shall we adopt some means of ventilation not hitherto tried, or shall we revert to the old system of untrapped gullies?

To allow foul gases to escape into the streets will cause a nuisance in proportion to the necessity for ventilation. The gases will come up under our very noses, and will be received into our lungs before any very extensive mixture with the atmosphere can possibly take place. Those who advocate the open grate system frequently quote the death-rate of London and Paris as convincing proofs of the correctness of their arguments; but they forget to consider the peculiarities of those cities, which make them quite exceptional, and their example of no practical value to towns differently situated.

The bill of mortality does not give a correct history of the sanitary condition of any place. For instance, a healthy and salubrious neighbourhood may show a higher death-rate than a dirty and notoriously unhealthy place; and for this reason, that invalids congregate there in large numbers, many of whom do not recover, and their deaths go to swell the average of a small population. The converse holds equally good. Large and wealthy cities are centres to which men of means are attracted. These live in comfortable and healthy dwellings, in clean and aristocratic districts, and of course live longer than their less favoured neighbours.

Again, although London is not blessed with a constant water supply, the dilution of the sewage is much greater than in any other considerable town in England. The sewer gases are, therefore, less noxious, as the excessive quantity of water tends to keep the sewers wholesome. The same applies in Paris, where there is no attempt at trapping, and no need for it, as the "soil" is collected in cesspools, and does not pass into the sewers. The streets are also washed with vast quantities of water, and the sewers are flushed every day.

The open-grate system is so barbarous that we dismiss it from further consideration. It may continue in use for a short time, but like other expedients it must soon be abandoned, and something more worthy of this progressive and scientific age be introduced.

No plan of sewer ventilation ought to be entertained which is not perfectly self-acting, and in which the first cost does not cover the whole expense likely to be incurred, as it is well known that municipal authorities in their zeal to cut down expenses have sometimes fallen into the grievous error of neglecting preventive measures as soon as all fear of an immediate epidemic outbreak has passed.

To disinfect sewer gases before they can reach the street, vegetable charcoal spread lightly on a perforated tray or basket has been fixed in connexion with the manholes or the gullies. When dry it effectually purifies the gases, but as it absorbs water rapidly it requires to be renewed frequently. The steam and damp vapours from the sewers will in a short time render it useless. Elaborate and expensive ventilating chambers have been erected in West Ham and some other places, the object being to purify the gases by means of charcoal before they escape. This process is theoretically correct, but its practical value is very doubtful, owing to the charcoal absorbing damp and becoming impervious.

It has been proposed to connect the sewers with factory or other chimneys, so that the gases may either be consumed in the furnace or be discharged into the air at a great elevation. I have tried this method, and have reason to believe that with care it may be made perfectly successful. The expense of building special chimneys and keeping up a furnace would be too great to be entertained, unless all other reasonable schemes result in failure; but if a factory chimney exists near the summit of a sewer a connexion can be made with very little expense. An enthusiast once proposed to ventilate all the sewers of Manchester by means of one immense chimney and furnace, to be erected in some central situation: fortunately this proposal did not meet with much favour. If a central chimney and furnace should be constructed so as to extract air from the sewers, no benefit would be felt more than a certain distance from the furnace; as the air would be drawn with the force of a hurricane into the sewer, through the gullies and traps in the neighbourhood; while the sewers at a distance would not be affected in the slightest degree. We see no chance of successful ventilation other than by establishing outlets at frequent intervals.

Rain-water spouts have been used in some instances; but the objections to this system are numerous. During heavy storms, when the sewers are being rapidly filled with water and when some outlet is specially required, the spouts are required for their legitimate function; besides which, leaves and birds' nests cause frequent obstruction and stoppage. The gases would, moreover, be discharged into the immediate neighbourhood of bedroom-windows, an objection which cannot be overlooked or excused.

The corporation of Liverpool has recently incurred great expense in the endeavour to solve this all-important mystery. Until last year there was no attempt at ventilation, and the sewers were in a most unwholesome condition; but after some discussion it was decided to ventilate freely, and during that year 1,000 ventilators were constructed. The sewers are now comparatively wholesome. Iron shafts or chimneys, about 8 in. in diameter, with revolving tops, in connexion with which is an archimedean screw, to cause a constant upward draught, have been fixed in corners or recesses. These shafts are joined to the sewers in convenient places, and are also carried far above any windows, so that there is no danger of particles of poisonous gases finding their way into human habitations. These shafts have been found to answer their purpose admirably. A great reduction in the rate of mortality has

taken place since their adoption. This fact alone speaks volumes in their favour, besides which they are not very expensive, require no attention, and do not cause inconvenience or annoyance to any one.

There is probably no subject of every-day interest so little understood or regarded as this now under consideration. In almost every house complaints are made of "bad smells" arising in the neighbourhood of the sink-stone, but a kind of intuitive horror of trouble prevents the householder from taking steps to protect himself and family from the evil effects of vitiated atmosphere. Generally sink-stones are fitted with what are called "bell-traps." These are supposed to keep down all bad smells, and at the same time allow water to flow away freely. In practice, however, the water does not get away fast enough, and the traps are removed. The course is thus left quite open for the escape of gases, which quickly penetrate into every room, filling the house with a deadly poison, which destroys the stamina of our town populations, and lays the foundation of many of the diseases from which humanity is doomed by its own ignorance or carelessness to suffer. V.

TECHNICAL INSTRUCTION.

This subject appears to be making satisfactory progress and creating a good deal of interest. During the past few weeks the provincial papers have reported meetings which have been well attended by a good proportion of the working classes, who do not as a rule give much attention to educational questions. The meeting at Huddersfield was presided over by the new mayor, the place having recently become a corporate town, and men of all shades of political and religious opinion took part in the proceedings. At Sheffield the Rev. Canon Sale presided; at Newark, the mayor; at Burslem, the Right Hon. C. B. Adderley, M.P. At the latter meeting Mr. Baresford Hope, M.P., Mr. Melley, M.P., Mr. Roden, and Mr. Buckmaster, from the Science and Art Department, delivered instructive and appropriate speeches. The importance of scientific instruction is making steady progress, and in many places evening classes are now in operation for instruction in science.

Classes are about to be established in Liverpool for imparting practical and theoretical instruction in the mechanical arts and sciences, and to afford opportunities to the working classes of competing for the prizes and medals of the Science and Art Department, as well as for the Whitworth scholarships. A sub-committee of the School of Science, aided by one or two large employers of mechanics, have met to carry out the scheme. A suitable teacher will shortly be appointed (the committee having already one in view), who will be remunerated partly by the School of Science, and also by students' fees (which will, however, be very low), and by the grants given by the State. It is considered highly desirable that a chair of engineering science should be endowed, and, as the books required are expensive, it is hoped that liberal donations will be forthcoming to aid these desirable objects.

A public meeting has been held in St. Mary's National School, Lewisham, for the purpose of organising classes for instruction in geometrical, mechanical, and architectural drawing, under a science teacher, certificated by the Department of Science and Art. Mr. Buckmaster attended from the Science and Art Department, and delivered an address, in which he encouraged the young men to earnest work, and said that success in life depended more on continued effort than extraordinary natural gifts. The classes will commence at once.

A public meeting has been held in the Grammar School, Daventry, for the purpose of inaugurating a class for instruction in magnetism and electricity, which will be conducted by Mr. Righy, a certified science teacher. The mayor, Mr. W. Line, presided, and briefly introduced Mr. Buckmaster, who delivered an appropriate address, which was well received.

A large meeting has been held in the County Hall, Abingdon, on the occasion of the second annual distribution of the "Queen's" and local prizes. The mayor occupied the chair. The secretary reported the excellent success that has attended the labours of the master (Mr. E. J. Gubb) and crowned the commendable application of the pupils to their study in the past session.

The first annual meeting for the distribution of prizes to the students in the Science and Art Classes, at Northampton, gained in the recent examination, has been held in the Town-hall, Earl Spencer presided. The science classes have not been established more than six months, and the late examination was the first, therefore, that had been held. The result is regarded as very encouraging. The classes are already equal in number and success to those in the largest towns in the kingdom, and the Inspector of Science Schools for the Midland District (Mr. G. C. Bartley) speaks of them in high terms. In the fifteenth annual report of the Science and Art Department, Mr. G. C. Bartley says,—"The science classes in the Midland districts are in a flourishing condition, particularly the one held at the Guildhall, Northampton." These classes were established in October last, and in five months after their establishment the students were examined in free-hand drawing, in geometry, in perspective, and in model drawing. Sixteen students were successful in free-hand drawing, six of them taking prizes; ten students were successful in geometry, one taking a prize; four students were successful in perspective, two taking prizes; and nine students were successful in model drawing, one gaining a prize. There were other successes among the students.

open to science-trained men, there need be still less fear for the education of the middle and upper classes. Teachers and schools of science would soon spring up if the people found that science would 'pay.' The demand having once been created, it is against all the experience of commerce if the supply does not keep pace with it."

SCHOOLS OF ART.

The Oxford School.—The annual meeting for the distribution of the awards to the successful students of this school, took place in the Town-hall, when a very large and influential audience attended. The Lord President of the Council of Education (the Duke of Marlborough) occupied the chair. His Grace opened the proceedings in an able address. In it was considered the bearing of art upon the prosperity and commercial institutions of the country, the growth of it since the Great Exhibition of 1851, and the position which it occupies in England at the present time. The Rev. E. L. Wignifield read the Government report, which was very satisfactory, and the list of those pupils who had obtained Government prizes and certificates. The chairman said it was a gratification for him to know that Mr. Macdonald, the master of the Oxford School of Art, had been awarded a honours of 10l. during the past year. The Department was anxious to do what it could to increase the number and efficiency of these schools, and he trusted the public would give them credit for the exertions they were making in order that the money which was freely given by the public might not be bestowed in vain. In conclusion he signified his intention to give a donation of 10l. annually to the funds of the school.

The Bristol School.—The prizes have been distributed to the successful pupils of this school at the recent Government examination. The Mayor occupied the chair. The report stated that the school is in a satisfactory position so far as the success of its students can be a test; nevertheless, the debt of 655l., and the decrease of annual subscribers, continue seriously to fetter the expansion of the school.

The Ipswich School.—The public distribution of the prizes awarded by the Government Inspector at the last examination, took place in the School of Art, Northgate-street. There was a large and interested audience. The Rev. C. H. Gave, rector of St. Matthew's, presided. Three pupils have won for themselves free studentships. Mr. W. T. Griffiths, the master, said this school almost stood alone in one respect—it had no subscriptions. In other towns they would generally find a long subscription list. They had been established ten years, and had not come upon the inhabitants for one farthing, excepting for such expenses as were connected with the fitting out of the room at the outset. It had been supported entirely by the fees of the students. Those fees were drawn up so as to meet all classes, and the teaching was of an essentially practical character.

The Coventry School.—The annual meeting of this school has been held in St. Mary's Hall. Mr. James Darlington presided, and there was a numerous and influential attendance. The annual report says—

"The friends of the Coventry School of Art may fairly look upon the past year as the most successful of its existence. The South Kensington Department of Science and Art has this year awarded to it one silver and three bronze medals, an increased number of book-prizes, an increased number of successful examination papers, one national scholarship, seven free studentships, and a bonus of 20l. to the master in recognition of his success.

The total number of students who have attended the school during the year has been 183, and although the hot summer caused a temporary falling off, the attendance has been very regular.

The Department of Science and Art has this year awarded eight book prizes for drawings in elementary stages, against five last year; one also secured honour, able mention. Twenty-one works were selected for national competition, against sixteen last year; to one of these a silver medal was awarded, three had bronze medals, and one a book prize. Last year, one bronze medal and three book prizes were obtained.

The examination in free-hand, model, geometrical, perspective, and mechanical drawing, held in March last, were conducted under the superintendence of the local committee. The number of students who passed is 135, against 27 last year. The number of successful papers 50, against 36 last year.

Seven scholars have had free stewardships granted to them for one year by the Department of Science and Art, and Mr. John Frost has succeeded in obtaining a national scholarship, with an allowance of 1l. per week, for one year. These scholarships are now given to a limited number of the best students who are, or intend to become, professional designers for manufacturers, or art workmen.

Bonuses, consisting of one sum of 50l.; three of 40l.; five of 30l.; ten of 20l.; and twenty of 10l., were this year awarded to the head masters of schools in which the results of instruction, as tested by the examinations of the department, were the most satisfactory. Of these Mr. Anderson obtained 27l., this school being the fifteenth on the list, which comprises altogether 102 schools."

The Taunton School.—The annual meeting for the purpose of distributing the prizes awarded to this school by the Department of Science and Art has been held at the school. There was a good attendance. The company first examined the works of art executed by the master (Mr. John Rowe) and the pupils during the past year. The drawings and sketches by the students numbered 141, embracing all the stages of instruction; and were supplemented by thirty-one studies in oil, water-colour, chalk, and pencil by Mr. Rowe, all from nature, with the exception of a copy of Titian's Ignatius Loyola. The productions of the students were executed in the morning and evening classes of the school. Six of the students' works were selected by the Department for national competition, and of these Mrs. Malet's gained the distinction of Queen's prize. The Rev. W. Arthur Jones (honorary secretary) read the report, which said—

"The committee have the satisfaction of congratulating its friends and supporters on its continued efficiency and on the success with which, under the able direction of the head-master, Mr. Rowe, the pupils of the school have pursued their studies during the past year. The payments on results received from Government this year have been more than double the amount received from the same source last year. This circumstance is especially encouraging, because it is a sure and undoubted proof of increased diligence and activity on the part both of pupils and master."

A stirring address to the students was given by the head-master, and the meeting was also addressed by Mr. Malet, the chairman, and the hon. secretary.

The Newcastle-under-Lyme School.—The annual meeting of this school has been held in the town-hall. It was well attended by the pupils and their friends, a large proportion being of the working classes. Mr. W. S. Allen occupied the chair. The report of Mr. Bacon, now head-master of the Stoke schools, was read. The reporter said—

"I am glad to state that sixty-eight students have availed themselves of the instruction offered in the classes. Sixty-one students attended in the evening and seven attended the private classes which met in the morning.

In March an examination, conducted by members of the committee in accordance with the Science and Art department's regulations, took place. Sixteen students presented themselves and were examined. Of these, ten passed and three obtained prizes.

The drawings which were finished in the school during the previous twelve months were sent to London in April to be examined. The works of ten students were satisfactory, three obtained prizes, and one honourable mention. At the national competition, at which about 100 schools compete for ten gold, twenty silver, and fifty bronze medals, one bronze medal was awarded to this school. Two of the students, viz, W. P. Rhodes and E. J. Watkin, have been appointed free students, the Science and Art Department paying their fees for twelve months."

The meeting pledged itself to give support to the school, fully recognising the importance and advantages which such an institution offered to the locality.

A Sherborne School.—It has been resolved at a public meeting that a local school of science and art, in connexion with the Department of Science and Art, shall be established with as little delay as possible. A committee and secretaries were named, and it was stated that Mr. Fraser, who is conducting the school of art at Salisbury, will probably undertake the duties of conductor of the Sherborne school, assisted (*pro tem.*) by Mr. Stephens, the master of the Sherborne National Schools.

ST. SAVIOUR'S CHURCH, PRESTON, LANCASHIRE.

This church was consecrated on the 29th ult. by the bishop of the diocese. It consists of a broad nave and north aisle, the latter sufficiently wide and lofty to receive a spacious gallery without extending up to the arcade dividing the two.

The east window has detached shafts, carved capitals, with moulded archivolts, interceded, and plate-tracery of a simple and early type. The communion-rail and standards are wrought in iron, decorated with colour and gilding.

The chancel and footpace are paved with Godwin's tiles. The chancel-stalls have open fronts, and the bench ends are decorated with the symbol of the Christian faith, and an ancient monogram expressing the name of Christ in Greek, by the use of the first letters of that name combined. The pulpit is the gift of Mrs. Newsham. It is of oak, with polished stone substructure and steps.

TECHNICAL INSTRUCTION FOR THE BUILDING TRADES.

A MEETING on this subject has been held at Bradford in connexion with the building trades. Its purpose was the inauguration of classes for the operatives and apprentices employed in the Bradford building trades. In connexion with the trade of the joiners there has been formed a board of conciliation and arbitration, which it is hoped will extend to the whole of the building trades. The early workings of this Board are hopeful for the future. The proposed schools originate with this board of arbitration, and though the joiners have the honour of their foundation, it is hoped that all the building trades will share in their advantages. The objects sought were stated by Mr. A. Neill, the umpire. The meeting was enthusiastic in character, and the speeches of the several gentlemen who addressed it were loudly cheered. The proceedings were commenced with tea, and about 800 persons sat down. The classes have commenced, and are to meet twice a week in the Unitarian school-room, the services of an efficient and practical teacher having been secured.

THE TECHNICAL INSTRUCTION MOVEMENT IN SCOTLAND.

The President of the Royal Scottish Society of Arts, Mr. George Robertson, C.E., in an able address to the Society on the 9th inst., treated chiefly on the subject of science education. In the course of his address he said—

"The question as to the exact character of the schools, graded or otherwise, it would be desirable to establish, on the large scale of a purely technical nature, such as those on the Continent, I do not think (and I say it with deference) can be settled just at once. In the present state of matters the country is hardly ripe even for immediate, certainly not for hasty action in this respect. Full use is not made of the technical institutions now in existence, such as the School of Mines; and a healthy and not spasmodic demand must first set in before any purely scientific establishment on a large scale would be quite free from the risk of failure."

"Professor Huxley says that this want of success is because the great mass of the manufacturing interest do not, even at the present moment, understand that such instruction in the groundwork of technical education is what they want to prevent their manufactures going to ruin."

"After all, perhaps, the most valuable and practical way of promoting scientific education is to rouse up interest and convince the employers of labour of its value. Were the manufacturers all over the country thoroughly convinced of this, and determined to show that they appreciated it, by promoting and giving higher wages to those workmen who were technically trained, they would rouse up such a demand as would satisfy the most ardent well-wishers of the cause. It is the employers of labour who may be said to have the great prizes of life to give away, in comparison with which all the medals and certificates a department can grant are only the means towards an end. If the artisans who are employed in engineers' shops find that they get on because they know the principles of mechanics; if those who are engaged in dyeworks, glass-works, and the like, find that they advance because they know something about the science of chemistry; if the stonemason finds himself promoted because he is acquainted with descriptive geometry and drawing; if the miller finds himself the captain of a mine because he understands geology,—then, there will be no fear for the technical education of either the present or the future race of artisans. And if the results of life, whether at college or in professions, be in like manner thrown more

ST. JAMES'S CHURCH KIDBROOKE.—CARVED CAPITALS: GAS FITTINGS.

The organ remains to be added, together with the prayer-desk, the present one being temporary. The lectern is an eagle, of very old oak.

The roof-ridge of the chancel and nave is continuous, but the point of separation is marked by greater richness and size of the principals, the carved rafters of which are decorated with various devices of a symbolic character, as the cross and the emblem of the Trinity. At the apex is a conspicuous emblem of the Holy Ghost as a descending dove.

The wall principals at the east end are similarly decorated, and the emblem at the apex, directly over the communion-table, where the sacrifice is commemorated, is the Lamb of God. The roof principals over the sacarium are decorated with conventional representations of the vine and the passion flower. The stone carvings also symbolic in many instances. The two corbels to the chancel principals represent angels.

The gas-standards are Skidmore's work. The gallery ceilings are divided into bays by the supporting timbers, decoratively treated, and each bay is further ornamented with coloured stencil bordering. The space below the west gallery is immediately near the principal entrance, and being partly screened off from the open nave, forms a quasi narthex or vestibule. Here the font will be placed, the present one being only temporary. The sacarium window is filled with Powell's stamped quarries, and represents the sacramental elements in the forms of wheat and vine. The east end is about to receive a large memorial window, the gift of Mr. Edward Swainson, by Ch&ell, of Paris, the subjects being figures of Christ and the four Evangelists. Messrs. Hardman, of Birmingham,

are also commissioned by the widow and family of the late Mr. John Smith and the architect with two memorial windows for the west end, of their best workmanship, the subjects being respectively "Christ Blessing Little Children" and "The Harvest of the World, and the Putting in of the Sickle."

The completion of the exterior requires the tower in its upper stages, the enclosure of the site, and the removal of the cottages in Queen-street. The principal entrance under the tower is surmounted by a medallion of the head of Christ. The west windows of the nave and aisle have tracery of an early character. Stone crosses surmount the east and west gables of the nave, and over the aisle gable is a crown of thorns in wrought-iron work.

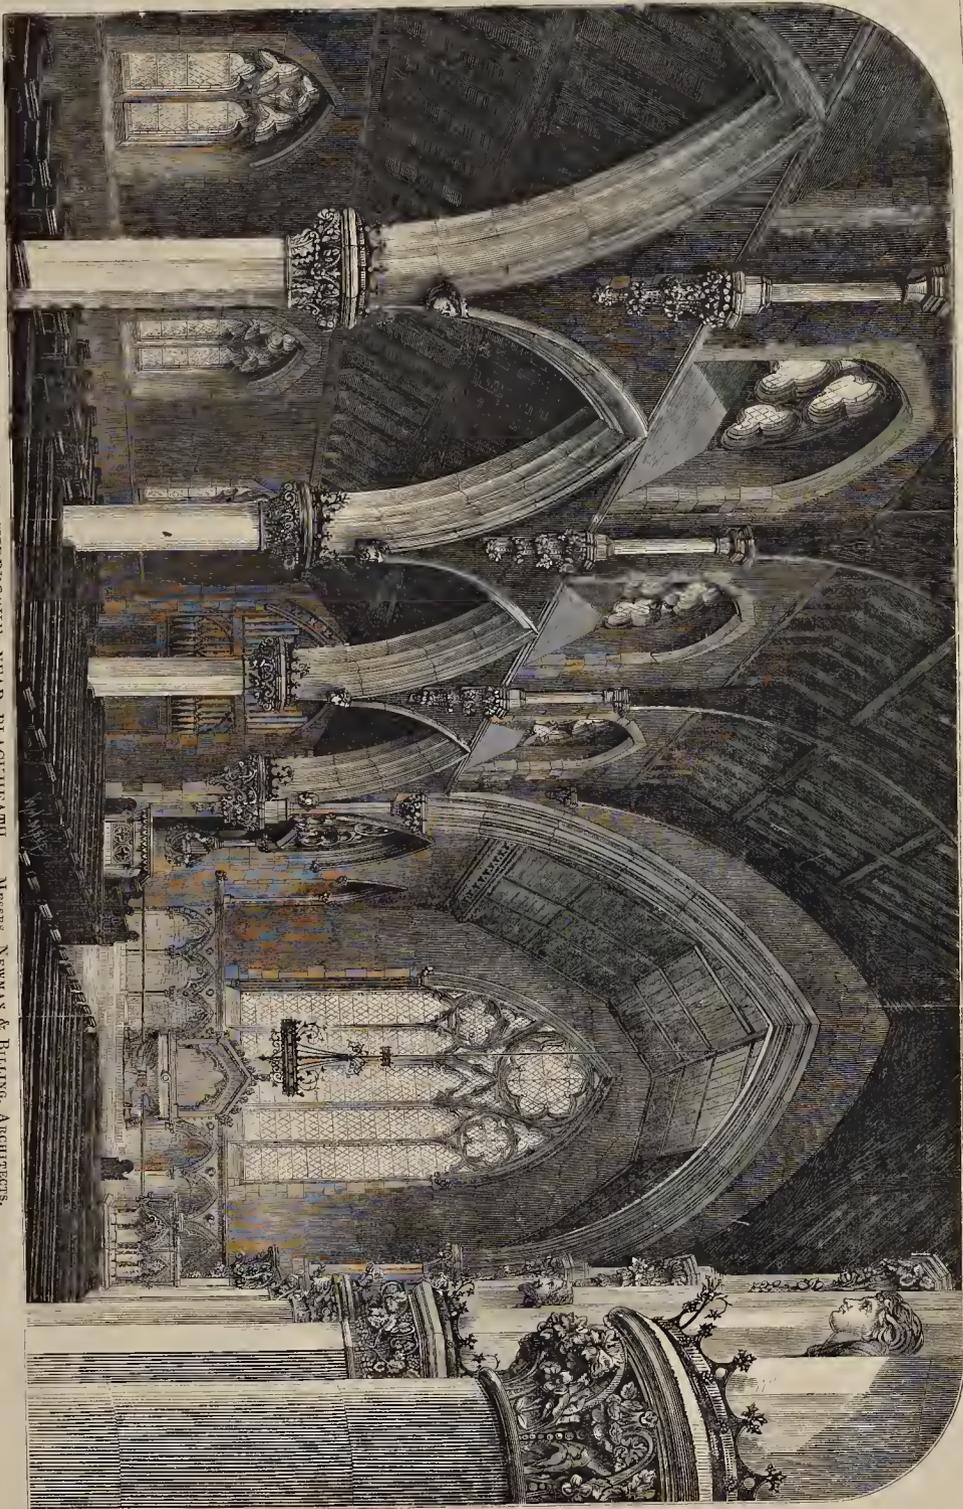

The architect was Mr. Hibbert. The whole of the carving and parts of the decorations have been contributed by various persons interested in the church, without trenching upon the general building fund.

THE EDUCATIONAL PRIZES AT THE POLYTECHNIC INSTITUTION.—The prizes and certificates from the Society of Arts, the Science and Art Department, City of London College, and Royal Polytechnic have been distributed to the successful candidates of the evening classes at the Polytechnic. The gold medal of the Science and Art Department was gained by Mr. W. J. Wilson, engineer's clerk, and the silver medal by Mr. Robert Wilkins, clerk, both for animal physiology. Besides three bronze medals, various books, money prizes, and certificates were distributed.

SAINT JAMES'S CHURCH, KIDBROOKE.

IN consequence of the rapidly increasing demand for residences near Blackheath, the land adjoining became eligible for building purposes. The freeholder of a large estate at Kidbrooke, Earl St. Germans, having offered a site for a church and rectory, steps were taken in 1866 to build the former, which resulted in the erection of the church of St. James, Kidbrooke, and a parish was accordingly formed. The church was consecrated by the Bishop of Rochester in July, 1867. It contains accommodation for 1,000 persons, and cost, exclusive of the organ, reredos, pulpit, fenees, lighting, &c., about 7,000l. The plan consists of nave, aisles, and chancel, with a tower and spire 160 ft. high at the east end of the north aisle, and a vestry on the opposite side. The organ-chamber is formed on the ground-floor of the tower.

The reredos, pulpit, reading-desk, and font, which are wrought in Caen stone, with alabaster and marble columns introduced, as well as the carving generally, were executed by Mr. Seale, of Walworth, from the designs of the architects. The church is built of brick with Kentish rag-stone facings, and Bath-stone dressings. The pewing and stalls are of deal, stained and varnished. The aisle passages are paved with red and black tiles, and the chancel is laid with eucastic tiles. The whole of the windows are filled with geometric tracery. The east window, which has five lights, will shortly be filled with stained glass by Messrs. Ward & Hughes, at the expense of a lady in the congregation. The organ is by Robson. The architects employed were Messrs. Newman & Billing; and the builders Messrs. Dove, Brothers.

ST. JAMES'S CHURCH, KIDBROOKE, NEAR BLACKHEATH.—MESSRS. NEWMAN & BELLING, ARCHITECTS.

THE LATE MR. EDWARD WELCH,
ARCHITECT.

We regret to hear of the death of Mr. Welch. He was born at Overton, in Flintshire, in 1806, and died at his house in Southampton-row, Bloomsbury, on the 3rd of August. In former years he was in partnership with Mr. Hensom, and the Birmingham Town-hall was built by them conjointly, the firm being "Hansom & Welch." They also built St. John's Church, Toxteth Park, Liverpool; the Beaumaris County Gaol; the Terrace and the Balkeley Arms Hotel, Beaumaris; a church in Hull; the Dispensary, York; King William's College, Isle of Man; and several churches there. The firm suffered greatly through the building of the Birmingham Town-hall, and their sureties, or rather the sureties of the builders, Kendall & Thomas, lost all the money they had advanced to assist the building, amounting, we believe, to something like 4,000l. or 5,000l.; but Mr. Welch's father, as one of the sureties, was compelled to pay a further sum of 1,000l. to get rid of his responsibility. This loss to the sureties was a great grief to Mr. Welch for many years, and he did all he could to repair the damage, but the hard world said a contract was a contract; and though subscriptions were raised to indemnify the sureties, the amount collected was but very trifling.

Mr. Welch, alone, was the architect of the Northern Hospital, Liverpool, and several churches in and around that town; the Monk's Ferry Hotel, Birkenhead, &c. Of late years he had devoted his attention to the ventilation and heating of houses by means of a hot-air chamber behind the ordinary fire-grate, and lately had succeeded well in the application of the principle, especially on a patent taken out in 1865. The St. Pancras Relief Office, designed by Mr. Robins, was recently provided with Welch's stoves; and the same architect, with one of these stoves, has since arranged the warming and ventilation of three apartments,—the ball and a room besides that containing the stove,—in a residence at Godstone.

Mr. Welch was highly esteemed by all who knew him intimately. He was a man of liberal and expansive ideas, and generously open to the merits and abilities of others, while modestly undervaluing his own.

THE DRAINAGE OF OXFORD, ETON,
WINDSOR, AND ABINGDON.

A REPORT on this subject by Colonel Ewart, of the Royal Engineers, commanding in the London district, has been made to the Home Secretary, and printed by his order. The reporter recommends the separate system as explained in the treatise on "Sanitary Management and Utilization of Sewage," by Mr. W. Menzies, Deputy Surveyor of Windsor Forest and Parks. At the conclusion of his report the reporter says—

- 1. That the 'separate system,' of drainage as above described, is the proper principle of drainage to be adopted in the towns of Oxford, Windsor, Eton, and Abingdon.
- 2. That a complete system of sewers should be laid out in the above-mentioned towns, to receive all the sewage matter of the towns; and that such sewers, so far from being of such a size as to enable a man to work in them, should be of such dimensions only as may be sufficient to afford a passage to the sewage matter.
- 3. That the rainfall should not be allowed to enter into the foul sewers, but should either be stored in tanks for domestic use, or be allowed to flow into its natural channels, care being taken, in the event of its running into a river, that it is freed from noxious impurities by careful scavenging of the streets, or, if necessary, by passing it into settling beds before allowing it to enter the stream.
- 4. That, as soon as possible, a complete system of water supply should be provided where it does not already exist, and arrangements should be made for enabling such supply to be used for flushing the sewers.
- 5. That the water and sewage works of each town should, if possible, be under the control of the same local authority.
- 6. That all drains communicating with the foul sewers should be trapped where in connexion with the houses, and elsewhere when necessary; the traps to be beyond the control of the inhabitants; bell-traps to be considered inadmissible.
- 7. That stables or cow-houses should have surface drainage carried through the walls into trapped cesspits, clear of the walls, and thence enter the foul sewers. Examples of which may be found in recently constructed Cavalry and Artillery stables.
- 8. That refuse from gas and other factories, when injurious to vegetation, should be collected into a tank at each establishment previous to the drains from it entering the public sewer, and the noxious constituents be separated by precipitation and filtration; the deposited matters to be frequently removed at the cost of the manufacturer.
- 9. That proper ventilation be provided for all the foul

sewers. Ventilating shafts should be carried above the level of the highest windows of the houses, and to such a height as to prevent the noxious gases being blown down the chimneys; the shafts to be connected to the crowns of the sewers by air pipes, and ventilation in no case to be effected by rain-water pipes.

10. That a sufficient area of land be selected and purchased, or leased, for the purpose of being laid out for irrigation; and that the sewage be conducted over or through that land in such manner as not to create a nuisance, and to entirely disinfest the sewage matter. The 'carrars' should be covered.

11. That the total quantity of land required will depend upon the nature of the soil; but as a maximum, two-thirds of an acre per 100 of the population will suffice, although it would be better to provide one acre per 100, in order to admit of farming the lands subject to the judicious rotation of crops."

The true method of dealing with the subsoil water in the valley of Thames, the reporter adds, must depend on an efficient method being devised of bringing the river under control.

An appendix to the report contains memoranda, after inspection, as to the Bedford sanitary improvements.

FROM IRELAND.

Lurgan.—A new town-hall has been opened here with Masonic ceremonial. The building, which was commenced early in the summer, is modern in style. It is three stories high, and the interior consists of two large rooms and a basement story. The dimensions of the building are,—length, 105 ft.; breadth, 36 ft.; and height, 64 ft. The basement story, which is intended to be used as a poor-law dispensary and butter market, measures 101 ft. by 22 ft. The second floor, which is almost on a level with the street, is intended to be used as a town-hall and assembly-rooms. Its length is 86 ft., and width 36 ft., and at the north end of the hall there is an orchestral gallery capable of accommodating sixty persons. The body of the hall, it may be stated, would seat 500 persons comfortably. The upper room, which is lighted by thirty-two arched windows, will, when completed, be used as town commissioners' board-room, town clerk's office, and for other town purposes. The estimated cost of the entire building is about 2,000l. The architects were Messrs. Young & McKenzie, of Belfast; and the builder Mr. John Archer, of Lurgan. The new hall, which is almost completed, is built on the vacant space between the police barrack and the Mechanics' Institute, in Union-street, and is connected with the latter building. The gasfittings for the hall were put up by Mr. Stewart, of Belfast, assisted by Mr. John Long, of Lurgan.

FROM SCOTLAND.

In Dunfermline there have been a considerable number of erections of different kinds during the last two years. Three large power-loom factories, besides extensive additions to a number of others, a new foundry, and a number of dwelling-houses have been put up. At the present time the burgh intend erecting new public slaughter premises. They are shown on the plans to cover three-quarters of an acre. The extended burgh boundaries are intended to be drained, and the streets properly repaired. Fees at Comely Park are rapidly being taken off for building purposes. There are two villa residences at the above place, nearly completed. Mr. Maccallum is the architect.

PROVINCIAL NEWS.

South Shields.—Messrs. Wright's new premises in Dean-street consist of one large shop for general business, a suite of private offices, entered from Dean-street and Ferry-street, a bond store of three stories, with the ground-work laid for another bond, both in Ferry-street. There is also in Dean-street a preparation for shop extension, with a large suite of offices on two floors above. The character of the building is Byzantine, worked out in plain red and white bricks. The windows are relieved with double reveals, stopped by quarter rounds, and splayed on different outlines. The front is broken by corbelled pillars and strings, worked into dentil blocked head moldings, and terminated by a cornice, also having a dentil blocked cornice, relieved with white brick recesses. The whole is slated and finished with a ridge cresting. The shop will be lighted by two gaseliers,

instead of the ordinary burners. The size of the shop is 34 ft. long, 24 ft. wide, 19 ft. high, and fitted with British plate-glass of very large size. The architect was Mr. Martin Greener, of Sunderland and South Shields. Messrs. Wright & Son have just given a dinner to a number of friends and the workmen who had been employed in the construction of their new premises. The party numbered about 100.

Upwell.—The new Public Hall has been opened by a conversation. Upwell contains a gas company and erected gas-works; this year they formed another company, and so raised funds for building the public hall, with the idea that by supplying it with books and newspapers, the delivery of scientific and moral lectures, the young men might be kept out of the public-houses, and their minds instructed by rational amusement; it is also designed to impart sociability among the upper and middle classes, too little known to each other by reason of the scattered nature of the ten farms and the indifferent roads. Concerts, balls, tea-parties, &c., in the Public Hall will bring together the persons now isolated; angularities will thus get rubbed off, and friendships be formed for the general benefit of all. Mr. C. V. Townley presented the site, which is near the church. The new building has been erected by Mr. William Elworthy, of Upwell, from the design of Mr. R. Reynolds Rowe, F.S.A., of Cambridge, the Isle surveyor. The style is Italian; the walls are of the local bricks, with dressings and arcading in red and black bricks. The hall is 60 ft. long by 30 ft. wide in the interior, and is covered with an open-timbered roof. Arrangements are made for the erection of a gallery opposite the platform, when needed. There are retiring and cloak-rooms; and the rooms are all lighted with gas.

ROAD-MAKING.

Sir.—As a Road Surveyor, horn and bred in it, my father having been one of M'Adam's pupils, I have again and again noticed the extraordinary ways surveyors, and especially the surveyors in London, have of making and repairing roads. I can account for it in no other way but that commissioners appoint men not really qualified to undertake the duties of their office, and, in fact, whether they be town commissioners or highway boards, the appointment is gained, for the most part, by local influence, and not by the personal qualifications of the candidate. There seems to be however, generally speaking, better management not only in the election of surveyors, but in every other matter, by turnpike trustees, whose offices are now being so rapidly abolished, they being better educated, and filling superior positions in life.

I think it is wrong to place a thick metalling on roads, for these reasons:—It is far more expensive than a thin coat, as more stone is required. People are too fond of applying the epithet "good" to a thick coat of stones. A thick coat will take longer to settle than a thin; each separate stone forming "the coat," requires a matrix before it can settle; if therefore stones are spread thickly, they have no matrix whatever, and before they can settle, they must wait until a large portion of the coat is pulverised, which pulverised matter then acts as the matrix for the stones. A thin coat, on the contrary, being spread on the soft road, at once finds its matrix by the mud of the road, or by the pliability of the road itself; the individual stones in a thick coat will by attrition rub themselves nearly round,—at any rate, lose all the sharp angles caused by the fracture, thus adding to the length of time the coat will take to settle, as a sharp angular stone will find a bed for itself quicker than a round or rounded stone. A thick coat will not wear in evenly; it will wear "pitty" or "bunchy" because it cannot be kept raked properly: it is more expensive to keep raked, for the longer it takes to settle, the more attention it requires. Then a thick coat does not last as long as a thin coat; for in a thin coat each individual stone sinks at once into its matrix, and one of its faces only is exposed to friction of traffic, while in a thick coat much is wasted in attrition; it settles, and then, after all, it does not settle so "sweetly" as a thin coat. The sooner a coat of stone is settled, the longer it will last, and of course the less expensive will it be; for that reason alone, a thin coat is preferable.

Another objection to thick coats is, that laying periodically an embankment on roads of 6 in. of metalling soon makes the road higher than the trottoirs.

I consider that a coat of stones is of sufficient thickness if one stone touches the other with an extra scatter in the centre of the road to bring it up to the proper convex form.

Regarding the letter to you signed "B. Baylis," I challenge the writer to point to a single spot, either on "town roads" or "suburban roads," in which 6 in. of metalling are required. It is downright cruelty to put on such a coat, whether in once or twice,—cruelty to the ratepayers, cruelty to the owners of carriages and horses, and cruelty to the poor horses themselves.

Mr. Baylis advises the coat to be covered "with a good [] coat of binding material, clean gravel, or screenings of metalling," that implies the metalling he uses is screened. What is the use, where is the advantage, of screening the metalling, and then putting the screenings back again amongst the stones when they are spread?

He has "grave doubts" as to whether macadamized roads are indispensable: I entreat him to get up by the side of the driver of the first bus he sees, and ask him which he likes best to drive over,—a steined road, or a paved road; and which his horses like best. Nay! I entreat him to watch for himself, and he will see horses on a paved road stepping with short, timid steps, slipping about (falling down perhaps), and profusely sweating; and on a metalled road he will see the same horses stepping out fearlessly, tossing their heads, masters of their work.

The difference in expense, too, is immensely in favour of a metalled road. I say nothing as regards the difference of comfort to the inhabitants of the street in less noise.

Raking the coat is very important, only skilful men should be employed; for if a coat of stones be not kept with as level a surface as possible, how is it possible to have a level face when it has settled? But before the coat of stone is put on, there is first a considerable outlay generally incurred by "lifting," why I cannot see. Mr. Adam introduced "lifting" because, before he began with the roads it was the practice to repair a road with stones broken as big as a man's two fists, and not to pay any further attention to the coat after it was on. "Well," Mr. Adam said, "there is such an immense depth of stones, that I can repair these roads and make them smooth and well-shaped simply by lifting" them, breaking the "lifted" matter so that it shall go through a 2½ in. ring, and then re-coating the road with it, taking care to keep it raked well." And he did what he said he could do; on the strength of that, and because the roads under Mr. Adam's care got so much improved, surveyors went on lifting, lifting, lifting,—they are lifting now,—and, upon my soul! I believe they will go on lifting when you and I, sir, are not. What their reason is for this expensive process I have again and again asked, but I have obtained no other answer than "Oh! it is all very fine for you not to do it, but it has always been done here, and I shouldn't fancy a coat without." My father stopped lifting after his roads got into shape. He never lifts now (unless, of course, the road is out of form); and I never lift, except when it is to form a road made by surveyors who thought big stones, and plenty of them, necessary to make good roads. If the road is left until the winter comes in, frost, rain, and snow will lift it without costing a penny-piece, and far more effectually than any artificial means can do it. By lifting a road, a thicker stratum of stones requiring to be settled is added to the coat; the old coat, already weakened by friction, attrition, by the natural effects of its porosity, and all the rest of it, is ground to mud, or ground so small that it is comparatively of no use to the road, so the road is positively weakened by "lifting."

As to breaking, which I ought to have written of first to be in the natural sequence of things; in no case, unless of the most extraordinary character, are large broken stones admissible for road repairing. A coat of stones ought to be broken so that each separate stone can be passed through a 2-in. ring. In breaking the stones smaller, there is too large a proportion of gravel (stones broken to gravel) in the heap; breaking them larger is a waste of material; for a cubic yard of stone broken 2-in. ring size will cover more space than a cubic yard broken 4-in. ring size, a coat of large broken stone (I mean stone broken larger than 2-in. ring size) will not settle as soon as a coat of properly-

broken stone. Each stone requires a larger matrix for itself. It has, therefore, to displace a greater portion of the road's surface, and yet it has but the same force exerted on it to drive it into its place as a 2-in. stone; and as I have already implied, the longer a stone is "up" the more unfit does it become for its place, its angles will wear off, and with that its power of becoming really settled in its place. And too, a greater extent of wearing surface is presented; so unless the stone settles well it will "tip" with passing carriages, wear a too large hole for itself, and then there are mud, holes, loose stones, and all the other unpleasantnesses of a bad road. There is not either such a chance for the road settling, or "running" smoothly, as in the case of a coat of well-broken stone. It is impossible to find a quarry in which the stones are all precisely alike in the quality of durability. Then it is still more important that the stones should be broken small, for in a coat of stone in which each stone is subject to the same wearing influences, if one stone is softer than the other, the softer stone will wear first. Thus the surface of the road in this way becomes "pitted" or nodulous. And, too, in a coat of large stones, there must need be larger interstices than in a coat of small stones. In this therefore, the coat of large stones is inferior.

Another needless expense, is sifting the broken stone. I should like to ascertain why surveyors insist upon having the broken stones supplied on their roads sifted. If a road is in good order, it has but little dirt on it, even when it requires stoning: what then can more rapidly and more naturally be the means of uniting a coat of stones than the gravel found in a heap of broken stones, as the breaker leaves the heap? The gravel in the heap acts as a sort of concrete for uniting the stones. Brush a road after wet weather that has been made of large sifted stones, and you will find you can push the blade of your knife into the interstices. Mr. Hickey, the well-known surveyor of Truro, in Cornwall, not only puts on the stones he uses unsifted, but in addition, when the coat is partially settled, he scatters small broken grey granite over it, the granite being easily broken by a passing wheel, crushes into gravel, and acts as an additional means of getting the coat rapidly settled; and, what is very valuable, he finds that a coat so metalled will not "break up" in the summer. Pro.

Sir,—In answer to "Z. Y. Z.," upon road-making or repairing, I partially agree with Telford's system. There can be no possible doubt that the laying on of equal-sized stones, free from extraneous matter, is correct, as whatever is of a softer material naturally works up to the surface. My experience is, never allow your road to be so far neglected as to form ruts, but the loose stones carefully drawn to the crown of road, and this done by an experienced man, if you want a smooth surface instead of a patchy one. I also find placing layer upon layer does not answer, for the simple reason, if you allow the surface of road to be worn partially smooth before laying the required extra coat or covering, the stones are not thoroughly bonded together. My practice is, never allow your road to get into that state of neglect as to require 4 in. or 5 in. to be laid on at one time, as a stitch in time, &c.; but lay them on at the proper road-repairing time, keeping the centre well up, so that the road may drain itself dry, the channels open, and the water got rid of as quickly as possible. If these simple matters were attended to, a great saving of labour and materials would be the result.

JOHN MCLINNAM,
Surveyor to Parish Board of Health.

HAVING devoted much attention to the subject of making and repairing roads, I consider the system introduced by Mr. Adam very much superior to that practised by Telford, both as regards durability and economy in their construction and maintenance.

In making roads according to Mr. Adam's system, no pitching or rough set pavement for a foundation is necessary, as an average depth of from 9 in. to 10 in. of broken stones is sufficient for any road. All the stones should be broken sufficiently small to pass through a ring 2 in. in diameter.

In my practice I have the formation properly drained and well rolled before laying on the material, which consists of broken stones 10 in. deep in the middle and 8 in. deep at the sides, the surface of the road being segmental in form,

with an inclination of half an inch to a foot from the crown of the road to the side channels. The broken stones are laid on in three separate coats, each coat being well raked, watered, and rolled until it has become consolidated.

On roads where there is but little traffic, a sprinkling of finely-sifted road-scrappings may be used to facilitate the setting of the stones; but this can be better effected by constant watering and rolling for a short period.

It is a matter of great importance for the stability of the road that it should be impermeable. This is difficult to accomplish when stones of irregular sizes are used, and can only be secured when the broken stones are as nearly as possible of one size, forming a compact and solid mass.

I do not agree with the practice of using gravel "binding" as mentioned in Mr. Baylis's letter in the *Builder*, as I find the smaller stones have a tendency to work downwards, and in so doing displace the larger stones.

I consider the subject of the efficient maintenance and economising materials in the making and repairing of roads is one deserving of more careful consideration than is generally given to it.

A. MORGAN, C.E.

LIGHT RAILWAYS.

MANCHESTER INSTITUTION OF ENGINEERS.

At the first meeting for the Session of the Manchester Institution of Engineers, the president, Mr. W. W. Hulse, read an address "On Light Railways," in which he considered what would be the best system for suburban traffic. This he concluded would be a 3½ ft. gauge line, unless where intended to interchange with the usual 4 ft. 8½ in. or the 7 ft. The 3½ ft., he urged, could be constructed and equipped for less than two-thirds the cost, and he maintained and worked at a corresponding reduction of expense, by comparison with the 4 ft. 8½ in. system. The 3½ ft. system is already largely adopted in Queensland, Ceylon, Norway, Belgium, and other places, and with complete success.

In designing the carriages for the local line, the 3½-ft. gauge is found to give ample accommodation. The carriage which promises to be most suitable is what may be termed of the omnibus type, with seats arranged on each side, and a longitudinal passage, say 30 in. to 36 in. wide, down the middle, with doors opening inward at the ends. The leading dimensions are 20 ft. long, 6 ft. wide, and 6½ ft. high inside. Carriages of this size would accommodate twenty-four passengers, twelve on a side, and give over 30 cubic feet of space to each. The floors of the carriages would be on a level with the platforms, and this, with the wide passage, would give the requisite facility of ingress and egress, which is one of the essentials of a local traffic, where there is a great frequency of trains. In speaking of light railways it is not intended to convey the idea that the works or rolling stock for such a system would be in any respect less substantial and durable than on the heavy 4 ft. 8½ in. system, but rather that the works, engines, and carriages would be, though lighter, sufficiently strong and durable in proportion to the reduced loads and speed of the trains, and that a closer approximation of the paying to the non-paying load would be effected.

ARCHITECTURAL EDUCATION.

ALTHOUGH I have read with great interest the various letters from "Adelphi" and others, which have appeared on the above subject in your journal, I have hitherto refrained from entering into the correspondence, in the hope that the Architectural Association would take up the subject on a more extensive scale than could be done by individual members writing to your journal. These hopes are now about to be realized, and the report of the delegates of the Architectural Association to the Architectural Alliance, which will be submitted on Friday, the 27th of this month, at the meeting of the first-named society, will contain much of the information which "Adelphi" has been in search of, and will also suggest a scheme of education for young architects, which I hope will be taken up seriously, and brought to some definite issue. I take the opportunity of calling the attention of all those who are

interested in the matter to this meeting of the 27th, in the hope that they will attend and bring forward their quotas of suggestions and information.

R. PHÉNÉ SPIERS.

P.S.—I would further add, that in future, at the ordinary meetings of the Association, frames will be hung up containing prospectuses of the various colleges and schools where lectures are given or instruction afforded of direct use to the architectural student, and also the particulars of all the honorary prizes offered by the Academy, Institute, and Association.

DANGER IN THE CEILING.

ALLOW me to call attention to a matter which I consider to be of great importance, inasmuch as it affects not only the comfort and convenience but the safety of ourselves and families.

Within a short space of time, nine instances of the plaster of the ceiling falling from the laths have come under my notice, two of which occurred to the house in which I reside. In one instance the plaster which fell was about 2 in. in thickness, and the quantity more than 1 cwlb., the ceiling being very lofty. Nobody at the time was in the room, but it is needless to say that it might have resulted in a fatal accident. As the falling in of ceilings may be occasioned by a variety of circumstances not necessarily consequent upon their being badly put up or on indifferent materials being used, I think the following or some such method might be adopted to prevent the possibility of their falling (at any rate, in very large pieces). If eyes were fixed in the wall on all sides, and strong copper wire taken across the ceiling embedded in the plaster, and here and there fastened to the joists above by staples, there would be little chance of a ceiling (unless very rotten or shaken by an earthquake) coming to the ground. F. T. ARNOLD.

GALVANIZED IRON CISTERNS AND PIPES.

SIR,—I am building a house in a provincial town, and have specified galvanized iron cisterns and pipes to be used throughout for the water service. However, the secretary of the local water company has been at the building, and said that he should recommend and prefer lead pipes being used, as their water was so very soft. The company obtain their water from the river which runs through the town, and which may receive the sewage of two small villages some distance higher up, and might therefore have a slight taint of sewage.

I have a horror of lead pipes and cisterns, and believe that galvanized iron is the most wholesome and durable material that can be used. I should be much obliged if some of your correspondents would state their experience as to the employment of galvanized iron, and whether soft water, or water with a slight taint of sewage, can have any prejudicial effect upon it.

A NATIVE OF ESSEX.

MAGNESIUM LIGHT.

SIR,—There is no difficulty in lighting a public building with magnesium if expense be no consideration. Mr. Henry Larkin, of 6, Portico-cottages, Kentish-town, N.W., lighted up a large pavilion for two nights at the meeting of the British Association at Nottingham, in 1866, and the same at the Guildhall, London, on the evening of Lord Mayor's Day the same year; and Mr. Larkin would be ready to do the same again if required. There is now a fair prospect of a reduction in the price of magnesium through some recent improvements in its manufacture, and it is probable that in the course of next year we shall see the metal retailed at or under 1s. per ounce.

W. W. E.

FORM OF FLUES.

SIR,—I shall be much obliged if any of your correspondents will give me information about the form of oval flues or chimneys. I see them recommended in various books on buildings, but can meet with no one who has any practical knowledge as to their advantages or otherwise. I am building a house in London, and shall be very glad of any early information on the subject.

STAT. VERITAS.

CASES UNDER METROPOLITAN BUILDING ACT.

At the Clerkenwell Police Court, before Mr. Ellison, Mr. William Thomas Parkins, of Belle-Vue-villas, Seven-Sisters-road, was summoned by Mr. John Turner, the district surveyor of the eastern division of Islington, for having erected a building at the rear of No. 40, Grafton-road, after the same house had been built, with walls only 4½ in. thick, the door-frame flush with the face of the brickwork, and the roof covered with boarding, contrary to the rules of the Metropolitan Building Act. Mr. Parkins not being in attendance at the time mentioned in the summons, the magistrate, after deferring the hearing until the other summonses were disposed of, then considered the case, when Mr. Turner stated the building was erected at the end of the main building of the house, between it and the dust-bin; that it was about 6 ft. in length and 4 ft. wide, and about 4 ft. 8 in. high; and that there were eleven other buildings exactly of the same construction situate at the rear of the other houses erected by Mr. Parkins in the course of the Act, when, upon his referring to the statute, he decided it to be so, and ordered that the building be amended as required by the district surveyor, or removed within the period of one month, and that 12s. 6d. costs be paid.

A second summons for a similar building at the rear of No. 2, Gloucester-road was then gone into, when Mr. Turner explained that the building in this case was larger than the former; and there were eight others similar in construction at the rear of the houses erected by Mr. Parkins in the Gloucester-road. The magistrate made a similar order and award of costs as in the preceding case.

THE FALL OF A WAREHOUSE IN LIVERPOOL.

THE inquest on the bodies of the four men who were unfortunately killed by the fall of a warehouse to Rigby-street has been closed. In the course of the inquiry Mr. Nowlands, the borough engineer and surveyor, was examined. He said the promises in question were built before he was appointed borough surveyor. The Act of 1812 would be the only authority under which the then building surveyor would be called upon to interfere in the construction of these premises. Since the accident he had carefully surveyed the building, and found it in conformity with schedule B of the Act referred to. He submitted a report upon the construction of the building, its present condition, and the probable cause of the accident. In reply to the Coroner, he said: "The condition of the girder was such as to lead him to the opinion that it had been injured before the accident. The fibre of the beam had been injured by a cross cutting and a screw bolt. There was a natural defect in the beam, but an ordinary examination of it before it was used would not have indicated its actual internal condition as now seen. The ordinary

warehouse beams were generally of much greater strength than this, and of somewhat less bearing. They were generally 14 in. by 14 in. Wooden girders,—or, indeed, girders of any kind—if constantly overworked, would gradually deteriorate, so as to become unsafe. He considered that practical good would come out of this investigation, if, as he had no doubt he would, the coroner called attention to the fact that the limit of safety on the floor in question would have been a 3-ft. load. He would suggest that those places which, like this one, were not built originally for the express purpose of warehouses should be inspected by professional architects, so as to ascertain whether they were in the limits of safety.

The jury gave the following verdict:—

"That the deceased were accidentally killed, owing to the floors Nos. 3, 4, and 5, falling in upon them whilst at work on No. 2 floor, such floors falling in consequence of a wooden girder in the 15th floor being latently faulty and defective, and so giving way under the weight of hoisted stored upon it."

Accompanying the verdict was the following presentment:—

"The jury beg to express their entire concurrence in the suggestion made by Mr. Nowlands, that warehouses, which have not been originally constructed as such, should, as a matter of safety, be inspected by a competent person; and they entirely acquit the Messrs. Wallace of all blame."

PILES IN A PEAT-BED AT TROWSE.

At the last monthly meeting of the Norwich Geological Society the principal subject of the evening was a paper read by Mr. J. E. Taylor, honorary secretary of the society, "On the Occurrence of Piles in a Peat Bed at Trowse." Some oaken piles, one of which was exhibited, have been found during excavations at Trowse for sewage purposes. Mr. Morant, the Board of Health surveyor, had written to Mr. Taylor concerning them, and both these gentlemen had investigated the subject. In their opinion there was no doubt that here were indisputable evidences of ancient "lake dwellings," or "crannoges." The excavation in question was a large deep trench, 5 ft. in diameter and 8 ft. in depth, which had been cut across a meadow at Trowse, in order to lay the pipes for conveying the sewage to Crown Point. In the space of twenty or thirty yards no fewer than thirty piles had been found, all standing erect. Each was rudely cut and pointed, and had been driven into a hard layer of gravel. Resting on this gravel was a bed of peat, 3 ft. or 4 ft. in thickness, which surrounded the piles, and contained great quantities of fresh-water shells similar to those now living in the neighbouring rivers, as well as bones of deer, horse, ox, sheep, hare, &c. The tops of not one of the piles passed vertically above the peat. Overlying both peat and piles was a bed of yellow sand and loamy clay, 4 ft. in thickness, and which was thoroughly undisturbed. The antiquity of the piles, therefore, is indicated by the fact that over 3 ft. of peat had accumulated around them, whilst the whole of the overlying sand and clay had been deposited since they were broken off or decomposed to their present level. In about 9 in. of "made" earth or surface soil, too, there were found the small roots of very large ash and willow trees, which were themselves at least 200 years old. Similar evidences of "pile buildings" were discovered in the same county, when the late Mr. Birch drained the West Mere, at Wretham, in 1851, and the Great Mere, in the same locality, in 1853, in depths varying from 8 ft. to 20 ft.

CHURCH-BUILDING NEWS.

Chaltenham.—All Saints' Church has been consecrated. The edifice has been erected from the designs of Mr. J. Middleton, of Chaltenham. It is built of Cleveo Hill stone, with Bath stone dressings. The interior is lined entirely in Bath stone, with bands of blue Forest stone. The style is Early French. The shape is apsidal, and the plan comprises chancel, chancel aisles, nave, north and south transepts, and north and south aisles, with porches to each, and a massive tower at the south-west angle. The length of the chancel is 45 ft.; the width 25 ft.; the nave is 93 ft. long and 28 ft. wide, with side aisles, that on the north side 70 ft. long and 14 ft. wide; the south aisle is made rather shorter than the other by a portion of the tower projecting into it. The chancel is approached from the nave through a lofty arch. The chancel has a

SEFTON HIGHWAY DISTRICT—WANTED, A SURVEYOR!

SIR,—I was very much gratified by the perusal of your account of the proposed doing of the Institution of Surveyors, and trust that the society will have for its main object the raising of the standards of the orthodox surveyor. This gratification, I regret to add, was sensibly increased by an advertisement in the same issue from the Board of the Sefton Highway District, setting forth their wants of a surveyor. Knowing as I do some of the gentlemen forming the provisional committee of the Surveyors' Institution, I can well imagine they, with myself, must feel ashamed at the estimate surveyors are held in by the above board.

Only to bid adieu to the profession in the summer of 1868, and to devote the whole of his time to the supervision of seventy miles of highway, for the magnificent sum of 100 guineas per annum! Surely, sir, it would be but charitable to conclude that such a man would transmute these amounts; that the 300l. should take the place of the 100 guineas, the latter sum being the surety required; otherwise my knowledge of the profession over twenty-five years assures me that the legitimate surveyor will not apply to the honourable acquaintance of Sefton Highway District Board; their choice must necessarily rest with some whose fitness to discharge the duties of the office satisfactory will be on a par with the competency thus publicly proclaimed by this board to reasonably appreciate the services of a duly qualified surveyor by their liberal offer.

The calve of this board would appear to be no better than the great Telford described to the legislature the condition and components of highway boards generally years ago. No wonder, then, at the wretched attempts at road-making and repairing so recently alluded to in your publication, when the ability to execute such works properly is held at so unreasonably low a figure as by the worthies of the Sefton Highway District Board.

REDUCED LEVEL.

PRACTICAL AID.

SIR,—I thank you for noticing my endeavours to give instruction to workmen in the building trades; but allow me to say I do not claim the professional title of an "architect." I am a builder, and though I was able to give a little instruction to young men—journeymen and apprentices, in many things that would be useful to them, and create a desire to study for themselves.

Since the greater number (?) than I had first fixed my limit at, and have had to refuse recent applications for want of room. I am pleased with my beginning, and will let you know in two or three months' time how we go on.

JOSEF B. BOWENKAMP.

* The following is the hand-bill:—"Technical Education. Mr. John D. Botwright, builder, Bangay, is desirous of giving free instruction during the winter months, every Wednesday evening, from seven to nine o'clock, at his house, to a limited number of youths and young men—journeymen, apprentices, and workers in the building trades, viz., bricklayers, carpenters and joiners, and stone-masons. The instruction will consist of the study and illustration of some of the elements of practical geometry, useful to artisans in the above trades; preparing and explaining detail and working drawings; the principles of construction, &c., &c."

semicircular apsidal termination, and is lighted by five two-light windows with carved caps, and arranged for four marble shafts to each window. These windows, it is hoped, will soon be filled with stained glass. Two have already been given by Mrs. Dobson, in memory of her late husband, for many years Principal of Cheltenham College. The roof of the chancel will be formed of wood groining, springing from marble shafts. The sanctuary arch will be placed at a point where the circular end commences, and will be supported on each side by two marble shafts. The roof of the chancel, as well as those to the other portions of the building, are intended to be decorated with colour. The reredos is designed to be of great beauty and richness, formed by an arcade of fifteen arches of alabaster marble, the effect of the three behind the altar being further heightened by filling in the spaces within the arches with glass mosaic. The chancel aisles are separated from the chancel by two arches on each side, supported by granite pillars in the centre, and respond pillars of Devonshire marble. The nave produces an effect from its height, 55 ft. The arches between the nave and aisles are supported on highly-polished red granite shafts, and at the responds, with short marble shafts, resting on corbels. The transept arches are similarly supported. The clearstory windows are large three-light windows. The west end is lighted by a large circular window and two two-light windows under it. The transepts are similarly lighted. The aisles are lighted by two two-light windows; the one at the west end of the north aisle has been completed with its marble shafts and stained glass, the gifts of a lady. This glass is by Hardman, and consists of full-length figures of Edward the Confessor and St. Alban. The roofs are supported by a series of stone arches. The architect has availed himself very largely of the blue stone found in the Forest of Dean. The arches, including those to the windows, are composed of this and Bath stone alternately, while bands of it on the plain walling relieve the whiteness of the Bath stone and make it harmonise with the richer colours of the granite and marble. The roofs are high pitched throughout, and are covered with Broseley tiles. The tower has only been built to the height of 45 ft., but is intended, with its spire, to be more than 200 ft. high. The church will seat nearly 1,000 persons. The works generally have been executed by Mr. Thomas Darby.

Accrington.—The new church of St. John here has been opened by licence for divine service. This church was originally planned to occupy the south-west corner of the plot upon which it now stands, leaving space on the side next the railway for the erection of a school at a future time; but in consequence of another plot being promised for the schools by Mr. Peel, the church was placed in the centre of the plot, and the late Rev. G. Garbett and the committee approving of the arrangement of the plan as then designed, little or no alterations were made. It consists of a nave 92 ft. in length, and 40 ft. wide in one span, the object being to avoid the obstruction of columns as much as possible, and the usual objection to a wide single span roof: a simple arrangement of the roof timbers admits of lightness in appearance, combined with strength. The wood is stained and varnished, and the space between the spans coloured blue. There are two transepts, each 26 ft. wide and 21 ft. deep, separated from the nave by stone arches in a single span, springing from the caps of half circular columns on each side. On the north side of the nave is a porch, and at the south-west corner is a baptistery in the lower part of the tower, and having arched openings into both the nave and side aisle. There is one side-aisle occupying the space between the tower and south transept, 39 ft. 4 in. long by 12 ft. in width, and separated from the nave by an arcade of three equilateral arches. The chancel, which is approached in the centre by two steps from the nave, is 29 ft. long by 19 ft. wide, having on the north side the vestry, and on the south the organ chamber, which is open by arches both to the nave and chancel. The lower portion of the reredos has four buttresses, having the three spaces between filled with moulded stone panels, laid with encaustic tiles, and the upper part is divided into three arched panels (intended by the architect to be filled with marble mosaic) by green marble short columns, having carved caps and moulded bases, with bands of white marble, the whole supporting a moulded cornice at the level of the window sill, and having the spandrels of panels filled with tiles. The east window has

three lights, with cusped opening in the head above, enclosed within an arch, over which, in illuminated letters, on a coloured band, is the text, "Holy, holy, holy, Lord God of Hosts." The window is a memorial one, in stained glass, to the late Rev. G. Garbett, the centre light having, under an ornamental canopy, a figure of Christ, and under similar canopies on one side are figures of the Virgin Mary and St. Peter, and on the other St. John the Evangelist and St. Joseph, with the emblems of each underneath. Externally, the church is of plain and simple detail, nearly all label moulds and other moulded work having been objected to at the commencement of the work, as likely to add unnecessarily to the expense. The general architectural effect of the building was therefore sought to be obtained from the arrangement of the plan, so that the church, approached from Burnley-road or from Dowry-street, should present a well-grouped effect, and give a broken and picturesque outline. The lofty has coupled arches on all sides, filled in with slate louver, ornamentally cut on the outer edges. Above this the tower has a cornice, surmounted at the angles with pinnacles, taking the form in the lower part of circular stone columns, with caps and bases. From here the spire rises in an octagon form, having plain hands of stone at intervals; this method of breaking up the plain surfaces of walling being adopted throughout the exterior, together with the arches over the windows, &c., being composed of alternate plain and pick-faced stones. The roof is covered with alternate bands of cut and plain slating, in two colours. The ordinary leaded windows with small panes are superadded in this church, by the architect having introduced zinc frames, forming a network of geometrical tracery, the bars being nearly as light in appearance as lead-lights, but much stronger, and requiring no saddle-bars to interfere with the design, and having the further advantage of being able to be glazed like an ordinary window-frame. The whole are glazed with $\frac{1}{2}$ -in. plain rolled plate,—transparent, but not transparent. The whole of the internal fittings are of varnished pitched pine, from the architect's designs. The heating is by water circulating in square pipes, which run round and are level with the raised floors of the open benches; the boiler, &c., being placed under the floor of the baptistery, with an approach from the outside. The lighting of the nave and transepts is by brass standards of nine burners each, the chancel by two corona standards and two brackets, and the side aisle and remainder of the interior by wall brackets. The masons' work was executed by Mr. John Riley; the joiners' work by Mr. William Roberts; the slating and tiling by Mr. Richard Holden. Mr. Henry Macanlay, of Accrington, was the architect.

Sheffield.—The foundation-stone of St. Mark's Church has been laid. The architect is Mr. Crossland. The site has been given by Mr. William Butcher, and lies immediately behind the present temporary iron structure.

Bolton.—Holy Trinity Church, Bolton-le-Moors, has been re-opened after an interval of several weeks, during which extensive alterations have been effected. The old pews have been replaced by others, but they do not extend so far eastward as the old ones. In the two eastern bays of the nave is a chancel-like arrangement. The floor is raised three steps, and laid with Maw's ornamental tiles. The chancel-fittings are of pitch pine. No part of the main fabric of the church has been touched. New gas organs, with a few brackets and standards, take the place of the old and shabby gas-fittings. The church has received some coloured decoration. The ceilings are a soft blue, and in the centre of each of the fourteen nave panels is an ornamental medallion, two devices being placed alternately. The walls are of a cream colour, and the mouldings, cornices, and other parts are slightly touched and relieved with different colours. The baptistery has somewhat more ornament and colour. The fittings were all prepared before the workmen entered the church. Mr. W. Clark, of Manchester, was the joiner employed. The tiling was done by Messrs. T. Dale & Son, and the painting and decoration by Mr. B. Park, of Preston. The architects, from whose designs and under whose superintendence the whole work has been executed, are Messrs. J. Medland Taylor & Henry Taylor, of Manchester.

Ryton.—Mr. J. Walford, J.P., of Trengo Castle, Ross (and the largest landowner in Ryton), gave the money for executing the work in

a new font for the church; and the architect, Mr. H. Percival, gave the design and the working drawings, and saw it erected. The font was executed by Mr. Bonebill, of Manchester, carver, &c.; it is done in Bath stone and marble shafts, on York stone base.

Bicester.—Ambrosden Church, which has been undergoing a repair, has been re-opened. The restoration has been superintended by Mr. C. N. Beazley, of London, and the work has been executed by Mr. Lewis, of Bicester. The cost of the restoration is 1,400l.

DISSENTING CHURCH-BUILDING NEWS.

Market Weighton.—A Wesleyan new chapel has been opened here. It occupies a site near to the old chapel, having a frontage to the principal street. The building is designed in the Italian style by Mr. Wm. Botterill, of Hull, architect, and externally it is executed in white stock bricks, with dressings of stone from the Harehill quarries. The principal elevation exhibits three compartments (in which are placed the doorway and window openings), divided by pilasters with moulded bases and carved capitals. The central arch connecting the pilasters rises into the gable, which is finished with a modillion cornice and ornamental apex. The side elevations are also divided by pilasters and arches, with two tiers of windows, the one below and the other above the galleries. There is a low flight of steps to the entrances in front of the chapel, with vestibules to communicate with the aisles on the ground-floor, and staircases to the galleries, which are on three sides of the building. Internally, the dimensions are,—length 51 ft., width 34 ft., and height from the floor to the ceiling 30 ft. At the further extremity of the chapel is a back entrance, with ministers' vestry, and staircase communicating with an organ chamber or recess above the same. The pews and other internal fittings generally are of red deal slightly stained and varnished. The ceiling of the chapel is divided into moulded panels, with ornaments in the centre, and surrounded with a denticular cornice. The lighting is by gas pendants from the ceiling, and the warming by hot-water apparatus. The accommodation provided is for nearly 400 persons, and the cost will be about 1,600l. The bricklayers', masons', and plasterers' work has been executed by Mr. R. Pape, of Beverley; the carpenters' and joiners' work by Mr. James Jackson, of Hull; the plumbing and glazing by Mr. H. H. Law; and the painting and varnishing by Mr. James Richardson, both of Market Weighton; the slaters' work by Messrs. T. Smith & Co., the gasfitting by Messrs. Stones, Suttle, & Wilkinson, of Hull; and the heating apparatus by Messrs. A. M. Perkins & Son, of London.

St. Dominic (Cornwall).—The opening of a new Wesleyan chapel at St. Dominic, took place on the 22nd ult. The building is a simple Gothic structure, suited to the locality in which it is placed. The materials used in its construction are local stone, with granite quoins and Polyphant stone for columns of main entrance, &c. The chapel will accommodate about 200 persons, and has been erected at a cost of 500l. A schoolroom and other buildings will be eventually added. Particular attention has been paid to the ventilation of the chapel. The contractors for the work were, Messrs. Consens (carpenters) and Pood (mason), of St. Dominic; and Mr. Henry Pearse, of Stonehouse, was the architect.

Ollerton.—We understand the deposit money has been paid for ground for a new Primitive Methodist Chapel at Ollerton. The site is in a desirable situation, being in the principal street in the town, and consists of the butcher's shop formerly in the occupation of the late Mr. Henry Turner, and the house adjacent. The building will be about twelve yards long by eight yards wide, and is to be built close alongside of the cottage occupied by Miss Elizabeth Ward: the work to commence in the spring. It is intended, when the edifice is completed, to have a resident minister at Ollerton, for whom, if possible, a house will be provided near the chapel. The chapel about to be built will make the fifth erected in twenty years.

Godalming.—The new Congregational church has been opened for divine service. There was a difficulty in regard to the foundation of the building; 2 ft. below the surface the contractors came upon a quicksand, and were obliged to concrete the bottom to keep out the damp. This

operation had entailed an expense of 80*l.* or 90*l.* beyond what was anticipated. The following details of expenditure have been given:—Purchase of land, 300*l.*; building of chapel, 1,712*l.*; tower, 200*l.*; stained glass, 78*l.* 15*s.*; railings, &c., 104*l.*; organ, 120*l.*; heating apparatus, 45*l.* 10*s.* The total cost was 2,600*l.* 5*s.*; the expense of schools bringing that sum up to 3,600*l.*

SCHOOL-BUILDING NEWS.

Earl's Barton.—The new British school at Earl's Barton has been opened. It has been built by Mr. Renshaw, from plans and under the direction of Mr. Sharman, of Wellingborough. The site of the school, with the adjoining yards, consists of 1,200 square yards, and the building has been erected in accordance with the rules of the Committee of Council on Education, by whom the plans and specifications were approved. The building is of a semi-Gothic character, and consists of one large room, an infant school, and a class-room. The school-room is 71 ft. by 18 ft., the room not being in one length, but one part of it at right angles to the other. The school is a mixed one for boys and girls, who are taught in the same room, but there are two distinct playgrounds, with swings, &c., and distinct lavatories. The cost of the site was 90*l.*, and the lowest tender was 974*l.*, the whole cost of the building, including the expense of conveyance, of architect's charges, of school fittings, &c., being 1,364*l.* 11*s.* 11*d.*

Slough.—The plan of Mr. Edgington for the boys' school and teacher's house of the proposed National School was returned with the request that a reduction might be effected so as to bring the estimate for both within 1,000*l.* This has been done, and the Messrs. Passidge, of Exbridge, will at once commence the work. Mr. Edgington's plan for the infants' school has also been adopted, and will be carried out by the Messrs. Passidge at the same rate of cost as the boys' school. The infants' school will be built adjoining the present school in Herschel-street, the latter being converted into a girls' school. The buildings in question will be made to contain,—boys' school, 140; girls' school, 100; infants' school, 80. The boys' school and teacher's house will stand on the piece of ground which lies at the junction of Hencroft and Osborne streets. The National Society have made a grant of 160*l.* towards the new schools and teachers' houses at Slough and Chalvey, and the Government Council of Education have made a grant of 205*l.* to the building fund for the Chalvey schools and teacher's house.

Elmley Castle.—The foundation-stone of new schools at Elmley Castle has been laid by Lady Pakington, who for many years past has done much to promote education in this village, where she possesses considerable property. Mr. Rowley, of Walsall, architect, furnished plans, which were accepted. The site upon which the building will be erected is an eligible one, at the entrance to the village, and within a few minutes' walk of the church. It is intended that the structure shall be a blending of the domestic Gothic and Tudor in style, and of brick with stone facings, and oak ornamentation. It will consist of school, classrooms, and mistress's dwelling, on the Government plan, together with garden and playground. Lady Pakington has given 500*l.* to rear the edifice, and promises 50*l.* more if required.

Books Received.

Macdonald's History of Dumfries.

THIS is a useful and carefully-written, although somewhat over-voluminous, account of the ancient and royal Border burgh, together with its surrounding relations. There is, however, no doubt of the general attractiveness of the subject. Our readers will, perhaps, remember that we printed some articles on Dumfries and the neighbouring district of Annandale in the *Builder* two or three years ago; and those who are interested in the subject, and care to pursue it, will find some very good material in the present volume. The only quotation we can find room for is one which gives us an account of the Domestic Architecture of Dumfries during the period of King Robert the Bruce:—

"All the houses in town or country, except those occupied by barons, were built of wood or clay, roofed with straw or heather. 'Generally,' says Tytler, 'we connect the ideas of poverty, privation, and discomfort with a

manion constructed of such a material [as timber]; but the idea is a modern error. At this day (1829) the mansion which Bernadotte occupied as his palace when he was crowned at Drontheim,—a building of noble proportions, and containing very splendid apartments,—is wholly built of wood, like all the houses in Norway; and, from the opinion of the Scottish burghers and merchants during the reigns of Alexander III. and David II., there seems good reason to believe that their mansions were not destitute either of the comforts or what were then termed the elegancies of life.' For ages afterwards this perishable material continued to be put to the same use. Streets so formed could easily be destroyed by an enemy; but then they could be restored at a much less expenditure of time and labour than if stone had been employed. The Dummies of Bruce's day was a town of timber. The freestones quarries of Castle-tykes and Locherbriggs had been partially drawn upon, but only for building the castle, the bridge, and the few ecclesiastical structures of which the burgh could boast; and stone tenements for any but the middle and upper classes were rare within it till the reign of James III. About that time houses began to be erected with a ground story of stone, and a projecting upper one of wood,—a style which continued long in favour with the burghers."

We may add that Mr. Macdonald has devoted considerable space to the subject of the old bridge across the Nith,—the pious gift of the devout Devorgilla (the foundress of Balliol College, Oxford), whose biography also constitutes one of the most interesting episodes in the History.

Historical and Architectural Notes on the Parish Churches in and around Peterborough. By the Rev. W. D. SWEETING, M.A. London: Whit-taker & Co. 1868.

This volume consists of a valuable series of notes and extracts, from registers and other documents, relating to the various churches and parishes in and around Peterborough, and is illustrated with thirty photographs of the buildings. These are rather too small for the practical architect, still with a glass even the details can be made out. But for the doubt that still remains as to the long endurance of ordinary photographs, no equally good mode of illustration could be employed. Several of the churches will, doubtless, become better known through Mr. Sweeting's very useful labours than they have hitherto been.

Architectural Foliage, adapted from Nature. By JOSEPH BARLOW ROBINSON, Sculptor.

A Series of Designs for Carved Panels, suitable for Headstones, &c. By J. B. ROBINSON. London: Bemrose & Sons, Paternoster-row.

The examples of "Architectural Foliage, adapted from Nature," in six parts, are intended for the enrichment and decoration of buildings, monuments, furniture, and other ornamental works. They include a series of designs for capitals, bosses, crockets, finials, diapers, and corbels, and show a considerable amount of taste and skill.

The designs for Carved Panels are in two parts. The designs are adapted from natural foliage, with scrolls and monograms, and will afford many serviceable hints to cemetery sculptors. Mr. Robinson has also published a cheap book of headstones and crosses, some of them meritorious.

The Feudal Barons of Powys. By MORRIS C. JONES. London: Smith, Soho-square. 1868.

POWYS, or Powis, was the ancient British name of an eastern principality of Wales, of which what is now called Montgomeryshire formed a part. The archaeology and history of this district form the chief subjects of interest to the Powys-land club, of which Mr. Morris Jones, of Welshpool, an energetic archaeologist, is one of the honorary secretaries, and the Earl of Powis, of Powis Castle, is the president. The members of the club, which is a new one, are limited to 100, and they already number eighty-seven, although the association has only been formed since the end of last year. The sale of the volume under notice is itself limited to 100, and the net proceeds (if any) will be devoted to an "Illustration Fund" which it is wished to establish in connexion with the club. The work contains an account of the Lords of Powis and the abeyant Barony; and in an appendix are the proposals, laws and list of members of the Powys-land club.

VARIORUM.

We have received No. 3 of "Sloan's Architectural Review and Builders' Journal," published monthly in Philadelphia, U.S. It contains a considerable amount of readable and instructive matter, and a number of very well executed illustrations.—The *Dombay Builder* for October, includes a view of the "Poona Engineering

College," which originated with Mr. Cowasjee Jehangoor Ready-money, who gave 50,000 rupees (justifying his name) towards the erection of the building. A number of small domed turrets and the stone cresting on the parapets, give an Eastern character to the building, securely agreeing with the roofed tower. The *Dombay Builder* says,—"The design is attributed to Mr. Trubshaw, formerly architect to Government. We say attributed, because we have been given to understand that Messrs. Paris & Molecy, who were the assistants to Mr. Trubshaw, are the real designers."

Miscellanea.

BUILDERS' BENEVOLENT INSTITUTION.—The annual dinner of this Institution, which is entitled to the support of our readers, will take place on Thursday, the 26th inst. Mr. G. F. Trollope will preside.

THE ARTISANS' DWELLINGS ACT.—The Poplar District Board of Works have taken action under Mr. Torrens's Act. Two houses in Barr's-alley, Robin Hood-lane, were reported by the medical officer as being unfit for human habitation. The Board passed a resolution ordering the landlord to demolish the houses within a period of three months.

TRADES UNIONS AND ARBITRATION.—A crowded meeting of delegates from most of the metropolitan trade societies was held at the Bell Inn, Old Bailey, on Saturday night, to consider what steps should be taken to forward the adoption of arbitration in trade disputes. It was resolved:

"That this meeting of trade societies' representatives approves of the principle of arbitration, in the belief that it is the best method of settling disputes between employers and the employed; and recommends that trades committees in their various localities seek to bring about meetings of masters and men, with the view of establishing boards of conciliation and arbitration; and this meeting feels deeply indebted to Mr. Mundella for the successful efforts he has made to establish such boards."

HORTICULTURAL BUILDINGS AND APPLIANCES.—The trade-book of Horticultural Buildings, hot-water, and hydraulic appliances, issued by Mr. T. G. Messenger (of Loughborough), will be found useful and suggestive. Mr. Messenger has some special arrangements of his own, of which he gives the following outline:—

"Upon a sill of wood, iron, or stone, as may be preferred, but usually of wood, cast-iron muntins, with bracket-heads to receive rafters, are erected. Upon these muntins rests a light plate to receive sash-bars, and carry girders. The rafters are of wood of very small scantling, so as to offer the minimum obstruction to the admission of sun-light and heat; but as any one acquainted with the strengths of timber will be well aware, such scantlings, when placed as is usual at distances of 4 ft. or more apart, are themselves inadequate to bear either the stress of snow, workmen climbing upon them for painting, &c., or even of a heavy crop of fruit. In order to obtain the required strength without increasing the scantling of the timber, these rafters are trussed with iron tension rods, which are secured to the iron muntins at foot of rafter, and to an iron saddle at the ridge, giving to these light rafters as much strength as was formerly obtained by the use of rafters 9 in. or 10 in. deep. The iron saddle, besides being available for securing tension rods, effectually connects the rafters and the ridge."

PICTURES FOR SALFORD, LANCASHIRE.—At a recent meeting of the town council of Salford, the ex-mayor read a communication from Mr. Alderman Agnew, containing the following passage:—"In taking leave of my friends I must avail myself of this opportunity of expressing my cordial thanks to them. For many years past I have occupied myself in the collection of pictures, and especially of portraits of eminent Lancashire men, with a view to bequeath them to an institution in which from its establishment I have felt the highest interest. I refer to the Royal Museum and Library in Peel Park. I ask you, my dear Mr. Mayor, to make known my desire to present this collection to the corporation at the present time for the use of the Museum. I enclose a list of the pictures herewith. If upon the occasion of my retirement from public duty the gift of this collection gives increased interest to or promotes the usefulness of the Museum, I shall see no cause of regret in the necessity there exists of my severance from my respected friends in the corporation." A resolution was passed expressing regret at the retirement from the council of Mr. Alderman Agnew, tendering him the best thanks of the council for his valuable gift, and expressing a hope that he may be long spared to witness the growth and extension of those educational and benevolent institutions and objects of which he has during a long life been a warm supporter.

ENGLISH CHURCH NEAR SMYRNA.—On the 4th of November the Bishop of Gibraltar consecrated a new church at Bordjaj, near Smyrna. On that occasion there was a repetition of the same fraternal courtesy on the part of the Archbishop of Smyrna as has been exhibited by the Patriarch of Constantinople on another occasion.

METROPOLITAN TRAMWAYS.—Notice has been given of application to Parliament for power to form tramways to run from Archway Tavern, Highgate, and Seven Sisters-road, along the Holloway-road and High-street, Islington, to the Angel, and thence through the City-road to Finchbury, Whitechapel, &c., and as far as Stratford.

BRITISH MUSEUM.—The mighty series of glass sheds, built up between the columns in front of this noble building some ten or twelve years ago, is now in course of demolition. It is not easy to say why these sheds were allowed to disfigure the building for so long a period, especially as it was generally understood there was sufficient room in the museum itself for the marbles there stowed away.

MEMORIAL WINDOW, CAMBRIDGE.—It has been resolved to obtain subscriptions in order to fill the east window of St. Michael's Church, Cambridge, with stained glass, as a memorial of the Rev. W. J. Beant, vicar of St. Michael's. Whatever surplus may remain is to be spent in establishing prizes of books, to be given to promising students at the Cambridge School of Art, to be called the Beant prizes.

THE "POLLRAD DOG."—Mr. F. T. Pollard has recently secured by patent an ingenious form of "Dog," mounted in a slide, and adjusted upwards or downwards by simply turning a hand-wheel under the bench. The hand-wheel is connected to chuck or plate, in the face of which a volute groove is cut, and a pin projecting from the "Dog" into this groove receives vertical movement from the rotation of the volute. The whole apparatus is mounted on a bracket, which is screwed to the underside of the bench. The "Dog" can be raised or lowered from the side, or from the end of the bench, and the whole is constructed so as to move quickly, and be easily adjusted to its work.

THE TOWER SUBWAY COMPANY.—The first ordinary meeting of this company, which is proposed to make a new tunnel under the Thames from Tower-hill to Southwark, for the conveyance of passengers and goods, has been held at the Guildhall Coffee-house. It was stated in the prospectus that it is intended to run a steam omnibus on a steel railway through the tunnel, to be brought to the surface by hydraulic lifts, the time of the journey to be three minutes. The tunnel is expected to be finished in eight months, and the cost is not expected to exceed 16,000. Mr. P. W. Barlow, F.R.S., one of the directors of the company, took the chair. The report having been read, the chairman stated that the prospectus of the company were excellent, and that the remuneration of the enterprise would be on a scale not generally imagined. The report was unanimously adopted.

THE VELOCIPÈDE MOVEMENT.—The French have taken up this subject in earnest, and if any one could now apply some simple and easily-obtainable motive power to velocipedes he would be certain to profit largely by it. The *Salut Public* of Lyons informs us, that in certain departments, and especially in the Aube, even the rural postman may now be seen riding on three-wheeled velocipedes, behind which is fixed a box for holding small parcels which they undertake to deliver. The men not only perform their service in three hours less time than on foot, but are able in a few months to get back the cost of their vehicle by their earnings from the increased commissions they are able to execute. In this country, too, an interest in the subject seems to be increasing. A velocipède journey lately took place, in which a person, who resides fifteen miles north of Bristol, drove and rode a velocipède, which he built himself, from thence to London, a distance of 135 miles. He left home at four p.m., and reached Reading the same night. Next morning he left for London, arriving at ten a.m., scarcely at all fatigued by his long journey. Residents in suburban and out-of-the-way places near London, who have daily business in town, might have healthful exercise and be independent of railways were they to use velocipedes. The vehicle would soon repay its own cost.

WEST LONDON DISTRICT SCHOOLS.—The second premium has been awarded to the design submitted, in competition, for these proposed schools at Ashford, Middlesex, by Mr. R. H. Burden.

FEVER IN BELFAST.—During the month of October, eighty-seven cases of fever in Belfast were reported to the Sanitary Committee. This is a slight increase, but the health of the town generally is said to be good.

ANOTHER EXPEDITION TO THE NORTH POLE.—Doctor Petermann has received official information from the Geographical Society of New York that the United States intend to send another exploring expedition to the North Pole. England ought not to give up.

COMMERCIAL TRAVELLERS' SCHOOLS.—Two new wings, at a cost of about 6,000*l.*, have been added to the Commercial Travellers' Schools at Pinner. At a luncheon, which subsequently took place in the dining-hall of the institution, it was announced that the day's subscriptions, with 1,200*l.* previously received, amounted to 5,000*l.*

DEATH OF MR. WM. THOMAS.—We hear with regret of the sudden death of Mr. Wm. Thomas (successor to the late Mr. C. H. Smith). Mr. Thomas was well known for his practical experience in all matters connected with stone. He was intrusted by her Majesty with the superintending of the Prince Consort's Mausoleum at Windsor, now in course of completion under Mr. A. J. Humbert. The consideration of the Queen was marked by the attendance at the funeral of one of her Majesty's private secretaries.

WEST SURREY WATER-SUPPLY.—Notice has been given of an intention to apply to Parliament for the incorporation of a company for supplying with water the towns of Walton, Weybridge, Chertsey, Byfleet, Cobham, and Shepperton, in Surrey; Walton and Shepperton, in Middlesex; and the districts and places adjacent to these towns, and for other purposes. The water is to be taken from the Thames and from various springs and brooks, and led into reservoirs, whence it is to be taken by conduits or lines of pipes to the respective places to be supplied.

IMPROVED GOVERNMENT FOR THE METROPOLIS. With the view of early action in the new Parliament, on the now most urgent question of the government of the metropolis, the Metropolitan Municipal Association have given the requisite Parliamentary notices for their bills to establish municipalities and a corporation for London, with the intention of proceeding, at the earliest opportunity the forms of Parliament will permit, in their discussion. It is anticipated other schemes will be proposed, and that the Corporation of London will have taken preliminary evidence by the committee of the Corporation appointed by the Court of Common Council, with a view to a definite policy on their part, and in view of the imminence of some decided action on this all-important question.

OPENING OF A CORNISH BARROW.—A barrow on Tredinney-hill, six miles west of Penzance, has been opened. The barrow is nearly a complete circle, with a diameter of 38 ft., enclosed by an outer circle of large granite slabs set on edge. A trench having been sunk in the middle of the mound, to a depth of about 18 in., the explorers came to a large pile of granite rocks, heaped together promiscuously. The course of one of these, which sloped in an easterly direction, at a distance of 7 ft., was followed, and led to a flat stone, 3 ft. by 2 ft. On raising this stone the rim of an urn was seen, filled with fine dark earth, and further exploration proved that this was one of the ancient Celtic kists, and one which has turned out to be unique in the district. Instead of being formed in the usual way, of four stones set on edge, it was constructed of two stones to each wall, the upper one slightly overlapping the other in such a manner that the urn, which was placed mouth downwards, was tightly wedged in. The only other kist of this description ever discovered in Cornwall was at Gwiltian, in 1741. The urn is ornamented round the upper part by three hands of rude irregular indentations, which extend over four knobs or handles protruding from the sides. The style of pottery is rude, and the vessel is not well baked. It was filled with human bones, very much less burnt than those found on previous occasions, and identified as those of a woman.

FIRST STONE LAYING.—On the occasion of laying the first stone of a residence in the Finchley-road, the owner, Mr. A. J. Woodhouse gave a dinner last week to the *employés*, sixty or seventy in number, of Messrs. Mather & Read, by whom the house is to be built, Mr. Mather presiding. In the course of the evening attention was called to the gradual prevalence of a better feeling between employers and employed than did exist, and to the growing conviction that a mutually conciliatory policy was the best adapted to the interests of both.

TENDERS.

For building chapel-of-ease, Hollybush Castle, Morton, Worcestershire (portion of materials given). Mr. Fredk. Freedy, architect:—

Inghes	4738 0 0
Wall & Hook	652 0 0
Garbutt	632 10 0
Ivwood	597 0 0
Griffiths	583 0 0
Smart	583 10 0

For rebuilding north aisle and restoring part of Yellin Church, Huntingdon. Mr. Fredk. Freedy, architect:—

Thackray (accepted)	£613 0 0
---------------------	----------

For putting new roofs and attics to Slubbing House, Maidenhead, for Mr. H. D. Skrine. Mr. Fredk. Freedy, architect:—

Silver (accepted)	£1,180 0 0
-------------------	------------

For pipe-drainage at Greenford, for the Board of Guardians of the Brentford Union. Mr. J. Figg, surveyor:—

Floy	£135 0 0
Bell	129 0 0
Batley	119 0 0
Brandsen (accepted)	113 0 0

For brick-drain, &c., at Honslow, for the Board of Guardians of the Brentford Union. Mr. J. Figg, surveyor:—

Hirons & Porter	£250 0 0
Nias	150 0 0
Burchett	115 0 0
Brandsen (accepted)	113 0 0

For building a dwelling-house on the British Estate, Horsaey, for Mr. W. Chapman. Mr. C. W. Horne, architect. Quantities not supplied:—

Tull	£465 0 0
Storer	395 0 0
Taylor	365 10 0

For the erection of a public-house, stabling, &c., Acton-lane, Acton, W., for Mr. Wm. Williams. Mr. Edward Monson, jun., architect. Quantities supplied by Mr. D. W. Young:—

Harding	£1,585 0 0
Messrs. Chamberlain	1,339 0 0
Adamson & Sons	1,328 0 0
Wright (accepted)	1,200 0 0
Welch	1,195 0 0

For model dwellings, Grosvenor-mews, Bond-street, for the St. George's Parochial Association. Mr. R. H. Burden, architect. Quantities supplied:—

Morris	£445 0 0
Patman & Fotheringham	2,875 0 0
Fish	2,690 0 0
Gammam & Son	2,685 0 0
Longmire & Burgess	2,643 0 0
Stoner (accepted)	2,615 0 0
Keyes & Head, too late.	

For alterations and additions to the parish church of Raibon, North Wales. Mr. B. Ferrey, architect. Quantities supplied:—

General Works.	Porches.
Black & Readie	£3,300 0 0
Higham	3,150 0 0
Yates	2,891 0 0
Dove, Bros.	2,795 0 0
Chester	2,593 0 0
Potter	2,430 0 0
Williams	2,218 0 0

For new baths, Cowes, Isle of Wight. Mr. James Woodman, architect. Quantities supplied:—

Chinnock	£4,965 0 0
Nightingale	4,567 0 0
Winchell	4,450 0 0
Stephens	4,100 0 0
Thomas	3,903 0 0

For alterations and additions to No. 15, Hereford-road, Bayswater. Mr. Wilson, architect:—

Blease (accepted)	£248 0 0
-------------------	----------

TO CORRESPONDENTS.

Engineer Competitors for India.—A rejected candidate requests us to insert copy of a letter addressed by him to the Secretary of State for India. Were we to do so it would simply cease to justify the position.

July's Window.—Next week.

F. A.—J. P. St. A.—W. B. S.—H. L.—W. W.—J. G.—H. E.—Amateur.—M. T.—D. W.—G. M.—A. S.—A. B.—W. H. L.—C.—J. F.—P. W.—A. H.—W. G. S.—E. M.—F. S.—R. H. R.—J. P.—W. F. N.—J. T.—W. T.—P. H.—E. B.—J. S. (what is the object of the company, and how has the profit been made?)—Q. E. D. (ought certainly to be allowed to omit date his work by adding the gages' hat, of course, has no power to control his employer's will.—M. B. K. (nearly excavated first).—W. M. Jan. (letter is an advertisement).—J. G. W. (next week).

Country newspapers should be marked.

We are compelled to decline pointing out books and giving addresses.

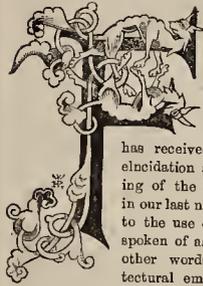

All statements of facts, lists of Tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

The Builder.

VOL. XXVI.—No. 1347.

Moulded Brickwork, or Terra-Cotta.

EV subjects can offer more intrinsic interest to the architects of Great Britain than that which

has received such interesting elucidation at the recent meeting of the Institute, reported in our last number. We allude to the use of what was there spoken of as *terra-cotta*, or, in other words, to the architectural employment of clay, moulded by pressure, or by the hand, into artistic forms, and then hardened by fire. We wish to avoid, in the first instance, the exclusive adoption of a name which is not ordinarily applied to a structural material, because the most correct method of dealing with the subject is, to regard it as merely a late improvement (carried to a high state of perfection, four centuries ago, in Italy) of the most ancient artificial material of the builder. The moulding of clay, and the application of the heat of the sun to harden the object moulded, was almost the earliest art of which we have any record or relic. The separation of this art into two branches, that of the potter and that of the builder, is as yet among the undated inventions of a very remote antiquity.

So late as in an Egyptian tomb of the eighteenth dynasty, we find representations of the fabrication of vases without the use of the wheel. Thus the application of this simple implement, the use of which gave a distinct artistic position to the manufacture of utensils, as separated from the manufacture of bricks, can hardly be carried back with certainty to a date much more remote than 3,000 years.

In a monument erected during the reign of the same eighteenth Egyptian dynasty, we find a representation of the whole process of brick-making. It was carried on almost precisely in the same manner as it is with us in the present day, with the sole exception of firing. The mixing of the clay, the fetching water in a bucket from a pond, the moulding in a wooden mould (with a fixed head, wider than the mould itself, instead of our present strike-stick), the carrying of the bricks suspended to a sort of yoke, and the setting them in order to dry,—all these things were done in Egypt 3,000 years ago, with a precision of which we have distinct contemporary testimony.

The step in the manufacture of brick which first converted a temporary into a permanent building material, was the substitution of kiln-drying for sun-drying. Exact date may here again fall on us, yet we are not without some chronological information on the subject. The brick-kilns near Pharaoh's palace at Tahpenes are mentioned in the book of Jeremiah. The Egyptian monarch referred to was Ouaphris, the Apries of Herodotus, and the Pharaoh Hophra of Scripture, who reigned at Sais from 588 to 569 B.C.

Again, there is such a reference to a furnace in the Book of Daniel as to lead to the impression that bricks were burned at Babylon in the reign of Nebuchadnezzar, which was partially contemporary with that of Apries.

The bondage of the Israelites in Egypt is spoken of as passing through the "iron furnace." Here, again, it is rather inference than direct proof which points to the use of the kiln.

But in the British Museum we have the actual bricks of Nebuchadnezzar, Nabonadins, and other Chaldean and Assyrian kings, fired to a hardness that has resisted the tooth of time for twenty-six centuries, and stamped with the names of the great kings in whose works they were employed. These Assyrian bricks were, more properly speaking, tiles, varying in square dimensions from 15 in. or 16 in. downwards, and running about, or under, an inch in thickness. The most ancient monarch whose name has yet been deciphered on the Asiatic bricks is that of Uruck, whom few will doubt to be that same Aricoh, king of Ellasar, who was contemporary with Abraham. Thus we have in our museum a signed piece of *terra-cotta* (baked earth) more than 4,000 years old.

The next ancient form of brick with which we are familiar, not only from the study of foreign architecture but from that of Roman work in this country, is only a reduction of the Assyrian brick or tile, of which, indeed, the later specimens are smaller than the earlier. The Roman brick was a thin tile, laid generally in three courses, in excellent lime cement, as a bond in honeycomb (*opus reticulatum*), rubble, or other work. The Italian building brick of the present day is very similar to the ancient Roman form; and in those parts of Italy where tufa forms a cheap and readily-available building material, *maltona*, or brick, is considered as the nobler substance, as being less liable to injury from weather. Little, if any, progress has been made in Italian brickwork since the times of the earliest specimens.

Of the English brick,—its price, its hardness, its ugliness, its durability,—it is unnecessary here to speak. With the exception of certain kinds of fire-brick and face-brick, the present form, colour, and workmanship of our bricks are such as to justify the language of the architects who speak of brick as "a low material." The elevation of this form of material, by the application of careful manipulation and of artistic form, is the object of what may almost be called the *terra-cotta* movement.

The object, then, of architects and of manufacturers is, to produce that union between the structural and the decorative treatment of burnt clay, in order to its use as a building material, which will result from the combination of the work of the potter with that of the brickmaker. That the plain portions of a building should be constructed of square and simply-moulded bricks, relieved in proper proportion by more elaborately wrought work, of similar, but more carefully prepared material, is a proposition so simple and natural that our only wonder on the subject must be that it has been so long unrecognised as an object to be constantly sought by the builder.

When the important question of durability is raised, the first consideration to bear in mind is, that of the known antiquity of brickwork. Further, we are aware that, of all human work, that which is apparently the most indestructible, except by violence, is the rudest form of earthenware. The lamps, the vases, the pitchers, of the earliest Italian tombs, are instances of this durability. In the debris of ancient ruins, amid the 70 ft. of fragments that hury the base of the Haram walls, at the bottom of Swiss lakes, deep in the alluvial deposit of the Nile mud, discoverers are continually stumbling on pieces of ancient earthenware. If an urn can be made to last for four or five thousand years, why should not a cornice or a column?

In fact, so far from there being any cause to fear for the durability of clay mouldings, when properly mixed, tempered, and fired, there can be no doubt that such a material is far more

enduring than almost any natural substance. Mr. Page called the attention of the Institute to the weathering of Waterloo Bridge; and, on a recent examination of that graceful structure, we made a similar remark. The slow decomposition of the felspar, has given a granulated face to the wrought granite. In the present stage of decay, the appearance is highly picturesque. But it is clear that granite will not be eternal in the atmosphere of London. Marble is more rapid in its disintegration. Bronze itself is not able absolutely to resist the tooth of time; and, in all these materials, *ce n'est que la premier pas qui coûte*. It takes far less time to convert a slightly decayed surface into a deeply decayed surface, than it does to effect the first lodgement for the process of dilapidation. What is the ultimate result of the process may be seen on the sides of Vesuvius. The lava which, as we write, is pouring in a fiery river from the cone of the volcano, solidifies into a stone, which is harder than granite. Blocks of this stone may be seen at any time in process of being quarried from the site of ancient lava streams. The streets of Naples are paved with this material. So were the streets of Pompeii two thousand years ago. But many parts of the side of Vesuvius are covered with vegetation; and the soil which now supports the vine or the fig-tree, is nothing but lava disintegrated by time.

For this important question, therefore, of durability, the only thing that remains uncertain is, the best selection or admixture of material. On this point the main difference of opinion lies between the use of a mixed substance, one of the constituent parts of which should, when the whole is fired, act as a flux; and the employment of a simple fire-clay, or the protection of the surface of a homogeneous clay by a glaze, applied by means of a second firing. In addition to these two principal types of work, our readers may have observed, a fine, pure, red clay from South Devon was shown to possess very high qualities as a plastic material. As to its durability no evidence was given.

The point, however, which, as it appeared to us, was left out of sight was this. What is the exact chemical constitution of the most indestructible *terra-cotta*? The most successful modern manufacturers rely upon "rule of thumb." The scientific speakers dwell on the advisability of well-directed experiment. But to take a rude Etruscan vase, of the coarsest description, and to ascertain by exact analysis of what it actually consists, seems to us to be the first desideratum.

In all descriptions of pottery, except in such as consist of pure homogeneous clay, fragments of older material of the same nature (burnt, of course), crushed to powder, form an important element. The process of haking has produced an ascertainable chemical effect. It is important to know what that effect is. When we know exactly what old stoneware chemically is, we shall be in a position to ascertain what part its fragments play in the paste we are to-day mixing. When we know what we have, we shall know what we want. We shall then, there can be little doubt, be able to attain this in the most direct and simple method. Let it be known what is the constitution and what are the conditions of indestructible pottery, and we shall be able, with little question, to produce indestructible *terra-cotta*.

Of the architectural value of this knowledge it is almost unnecessary to speak. When we remember how the great desiderata of cheapness of original material, of durability (without which there is no real cheapness), and of ready facility for receiving any requisite form, are combined, or, at all events, may be combined, in *terra-cotta*, there can be no room to doubt that an immense impulse will be given to decorative architecture by its employment.

Nor are we entitled to speak of this employ-

ment as novel, or as of altogether our own invention. There is, indeed, much that is new, as well as much that is beautiful, in the specimens that adorn the elevation of the new "God's Gift" college, as well as in the floors, and walls, and columns of the Kensington Museum. But let the architect recall the noble moulded brick chimney-stacks of some of our Elizabethan mansions. Let the decorator remember those ancient and honoured "Dutch tiles," from which so many, besides Dr. Doddridge, were taught Scripture history by the lips of a mother. Let us glance at the enormous *glazie*, containing the arms, and mottoes, and badges of the good King René, blazoned in their appropriate colours, which is to be seen at Kensington, as fresh as when it was moulded and fired some four centuries ago. Let the visitor to Cintra recall that fantastic apartment, floored and walled with tiles, in which converging streams of water are suddenly directed on the unwary guest. In those climates where the free sprinkling of water, whether by hand or by the jets of a fountain, is the most grateful luxury of the hot summer weather, the employment of glazed earthenware for structural and for decorative purposes has long played a most important part among the materials selected by the architect.

We do not altogether sympathise with those who expect that London is to be made "beautiful for ever" by the introduction of the glazed, polychrome, moulded, china-work, of the manufacture of which the artists at South Kensington are attaining such facile mastery. It is a very great question how far such a style of decoration is suited either to the grey tints of our climate or to the sober tastes of our people. In many cases the power to command a cheap, imperishable, obedient material, easily and indelibly stamped, at the will of the artist, not only with a certain sharpness of outline, but with a distinct variety of colour, may be of extreme value. But for long lines of street architecture, the paler tints of *terra-cotta* will no doubt be generally preferred. Nor do we think that, if durability can be secured without it, as there is every reason to expect, a high glaze is to be chosen, excepting in the case of fountains, or of work unusually exposed to the action of water. Yet in obtaining a full knowledge, and an absolute command, of a material of such wide and varied applicability, the architects of the present day are making a great stride in advance. We hope that the well-earned reward of full pecuniary success will attend the exertions of the several manufacturers who have so worthily emulated each other. There is room for them all. There will be more room, and more custom, when they have replaced the "rule of thumb" by the exact knowledge of the chemist. It is all very well for them to ask Government to aid them in this respect, but are they not competent to set their own shoulders to the wheel? However rapid may be the future progress of this latest development of one of the most ancient methods of manufacturing a structural material, the gratitude of all those who take interest in the progress of architecture is due to the men who have, whether professionally or commercially, done so much to shed on this important subject the light of practical and successful experiment.

NOTES ON ARCHITECTURAL DETAIL.*

ALL great works of art, whether in poetry, painting, music, or architecture, depend upon the elegance and proper application of detail for the realization of the effect aimed at. There is, however, in the case of architecture, this difference, that its products being utilitarian as well as ornamental, the detail must be subservient to the purpose for which the building is erected, for wherever the property of usefulness is lessened by the ornamentation there the ornament is had. An architectural work is not produced to insure a mere transitory sensation of pleasure; it is a lasting monument of the ability or incapacity of the designer, and must be treated in a serious and conscientious manner. Mere whims and vagaries may be allowed in ephemeral works of poetry and music created to please the passing hour, and even in the more perishable and less obtrusive art of painting; but in architecture they should be altogether eschewed as inapplicable to

so serious and substantial a thing as a building. Like the work of the historian, it may have the grace of style and a certain play of the imagination, but these should be strictly confined within the bounds of truthfulness and reality. This appears all the more evident when we keep in view that the works of the architect, although first produced on paper, are intended to be reproduced in the most substantial and least perishable materials, and that they cannot be pushed out of sight or destroyed without much labour, cost, and inconvenience.

The first attempts at art by a nation emerging from barbarism are invariably characterised by magnitude and rudeness of construction; but as a feeling for art grows, less attention is paid to mere bulk, and greater care is evinced in the preparation of the materials and in the endeavour to produce good proportion and elegant detail.

The architecture of Nineveh and Egypt commands our admiration for its massiveness, and consequent grandeur, more than for its beauty: it is not high art, in the truest sense of the term. There is much good art shown in parts, but the waste of labour and material is enormous, and, indeed, that it would be impossible to command in modern times, were we disposed to imitate it: we shall, therefore, pass at once to the architecture of the Greeks, whose works of art have never been surpassed by those of any other nation, whether as regards beauty of detail or elegance of proportion. And, first, I would observe, that the finest sculpture will not compensate for had proportion and inelegance of outline; accordingly we find that the Greek architect bestowed the utmost care upon the attainment of this essential of good architecture. Unity, rather than multiplicity of effect, was his constant endeavour, and every detail was subordinated to the general effect and outline of the structure; but at the same time the element of variety was called into play in the adjustment of the various parts. Thus, in the columns and the frieze, the detail is repeated, while in the pediments and metopes it is varied; in the latter the leading lines are diagonal, in the former they are vertical. Another thing to be observed is, that the hearing members do not show high relief in the ornamental detail,—that is only found in the pediment and such parts upon which the eye can rest, and where depth of shadow is obtained by the enrichments.

It is instructive to observe that the Gothic architects acted upon an entirely different principle, producing an entirely different result. Classic architecture produces the impression of repose, Gothic of unrest; the one clings to the earth, the other soars heavenwards; the one is the product of intellectual culture, the other of a spiritual faith. The Classic sculpture, although exhibiting more action than the Gothic, is characterised by greater repose. The Greek architect concentrated his forces; the Mediaevalist dispersed his; while, luxuriating in an endless variety of detail, the Gothicist gives a monotony of attitude to his sculpture, whereas the Classicist, while repeating his detail, varies the attitude of his figures; and yet the eye dwells upon the group in the pediment, and it wanders from figure to figure on the Gothic façade. Then, again, there is this marked difference between the two styles: in the Classic temple the human element is prominent, in the cathedral it is subordinated; the figures in the pediment are visible at a great distance, the saints in their niches require to be sought out; and, to complete the catalogue of contrasts, the sculptures in the Greek pediment and frieze were less conventional than those placed amongst the Gothic fretwork; whereas the foliated enrichments of the Classicist were more conventional than those of the Gothicist. Is further proof necessary of the truth that no definite rules can be made to apply to works of architecture? for it cannot be denied that the two great styles are each of them possessed of peculiar beauties, although these are obtained by diverse methods.

The detail of Greek architecture is so perfect of its kind, that there is nothing in it to censure or avoid, unless, indeed, it be the spiritless copying and misapplication of it.

Beautiful, wonderfully beautiful, as is most of the Gothic detail, there is much of it that should be avoided in our modern practice.

The architects of the Renaissance, in their endeavour to be original, abused the beautiful features of the style they professed to admire in the most senseless manner. The pediment, the crowning beauty of the Greek temple,—with its group of statuary sheltered within the triangle,—

they broke at the apex, producing one of the greatest abortions in architectural practice. I had thought that its deformity was so manifest to every one having a due appreciation of the beautiful in art that it would not have been repeated in these days of enlightenment; but it has, as you have doubtless all of you observed, recently cropped up in this city.

The complete triangular pediment, again, is sometimes used over an arch, and it only requires a glance at our Tron church to perceive how incongruous is the association. A love for littleness and friter of detail is shown also in the breaking up of the frieze into small parts, whereby all repose is lost, and a feeling of discord between that feature and the column is produced. When this practice is followed, each pillar seems isolated, and to have no other duty to perform than to air itself in front of the structure it professes to strengthen. Perhaps it supports a vase or a statue; but that only renders the absurdity more apparent: it always brings to my recollection a figure in bronze I once saw representing Atlas, who seemed to be straining every nerve to support a glass globe between his shoulders, which a Cupid could have balanced between his fingers and thumb.

There is another practice to which I cannot reconcile myself, the use of half or three-quarter columns. A column, I conceive to be a structural feature required to support a weight; and it appears to me to be misapplied when used to strengthen a wall surface. Where that is necessary, a well-developed pilaster seems more appropriate, as it is a mere thickening of the wall surface. The engaged column, again, has a disagreeably sack-on look; and this peculiarity is still more apparent when it runs up two stories of the façade. This remark does not apply to slender shafts, which are not, and do not present the appearance of, structural features.

Rustication applied to a wall surface or angle is useful where emphasis is required, by giving an impression of strength; but the reverse effect is produced when it is used in a column. It has in that position the additional fault of disturbing the harmony of the lines, and producing a feeling as if the work were unfinished. A lintel formed of one stone, and cut into to appear as if built in several pieces, is one of the most absurd shams extant; it not only weakens the lintel in reality, but has the appearance of weakness. In a *bona fide* arch the case is quite different. Rustication should, I think, be confined to the under story of a building, and never be used above a plain wall surface. In short, as I before stated, its use is to give emphasis and an effect of weight or strength, and it should, as a rule, be sparingly applied, unless there is a considerable surface of unpierced wall.

When you see a door-knocker in the shape of a leg, a bell-pull in that of a hand, a foot-scraper on which you have to clean your boots upon dragon's wings, a column surmounted by a vase doing duty as a chimney, and such like, it is a sure sign of the weakness of the inventive faculty of the inventor. And such is still the case when inverted consoles are used as buttresses, and where buttresses in miniature are carved on bench ends, and even when buttresses of any size are used where not required as a structural necessity.

Excessive relief in carving is one of the exaggerations adopted by the architects of the Renaissance,—a practice which they carried to the excess of attempting to produce perspective in bas-reliefs,—an attempt which has ever resulted in failure, and which is often productive of the most comical effects,—effects never intended by the designer.

All ornament that has the appearance of being stuck on to the wall-surface should be avoided; and such is the impression produced by festoons of fruit and flowers, which look as if hung on nails inserted in the wall, and in late Gothic a like effect is provided where shields are made to appear as if suspended in ribbons. Still more should any detail be avoided that appears ready to fall off. Some of the finest Gothic doorways have this defect. Statues are tortured into the form of the arch, and seem ready to topple from under their canopies upon those who enter or leave the sacred edifice. There is another mode of using details to which I would call your attention,—viz., the reducing of important features to infinitesimal proportions, and the opposite practice of magnifying small members into undue proportions.

I have a lively recollection of my first visit to the British Museum, seventeen years ago, when

* By Mr. W. G. Shiels. Read at the meeting of the Edinburgh Architectural Association, on November 16, 1868.

I stumbled upon an example of the former practice. I had spent some time in the narrow cell which contains the Elgin marbles, examining with a feeling of awe what I hardly comprehended. I then threaded my way amongst specimens of Egyptian art, and found myself in a corridor with a flight of steps at one end of it, the stoue parapet of which was wrought into the form of *Doric columns*, of about 2 ft. in height, surmounted by an entablature. Of all features the Doric column, with its simple dignity and massiveness of proportion, is the least suited for such a purpose. I have read somewhere that "the baluster is the most successful invention of the moderns;" and certainly no more appropriate feature can be found as a boundary to a balcony or terrace, but it should be of such a height as to be easily seen over. I once crossed a railway bridge, intended to be ornamental, as it led into the grounds attached to a mansion-house. The parapets were formed of balusters nearly 6 ft. in height, and anything more hideously ugly I have seldom beheld.

The spiral form is only assumed by those plants which require support, as in the tendrils of the vine and the branches of the honeysuckle; it is never found where there is a weight to support; and a column, when convoluted, has a weak and bizarre effect, but slender shafts and mouldings, when so treated, are appropriate and beautiful.

Breadth and simplicity may be obtained by extent of wall-surface, and by giving depth of relief to the openings; but this effect is destroyed if ornament is scattered in patches over a wide surface; it fatigues the eye, and produces a sensation of restlessness and disgust. The eye should rather be encouraged to dwell upon what is beautiful, and be drawn by a well-regulated gradation from one point to another. The distance of the ornamentation from the point of sight should also be carefully considered. The figure of a man, or of one of the lower animals, correctly proportioned, will not appear so when placed on a height, and the individual features will be indistinguishable at a certain distance; a conventional treatment and exaggeration of parts is therefore required to produce a good effect. The posture of the figure and the flow of drapery must also be restrained, especially when the statue or group is detached from the wall-surface, or appears against the sky-line. The object sought after must not be the display of the sculptor's art, but the proper adornment of the building. This does not imply that the sculpture should be of inferior design, but that it be treated in an architectonic manner.

In the sculptures of the temples and palaces of Nineveh and Egypt, we are presented with representations of the daily life and customs of the people, so that we can form a pretty accurate idea of the social position of peoples who flourished 4,000 years ago; and so has it ever been when a true and living art was practised. We, on the other hand, think it a requisite of good taste to copy not only the general form of buildings designed ages ago, but to represent scenes and incidents in which we take so little interest that we hardly trouble ourselves to decipher their meaning. Why do we decorate our Gothic mansions with men in armour and crossbowmen in trunk-hose? Is it impossible to find good models amongst our dragoons and artillerymen? Would it not be more to the purpose to give a representation of a Lord Mayor's Show upon a City Hall, than a copy of a frieze from the Parthenon? A corporation banner might be made as jolly a sight in stone, and to afford as much pleasure to many as the reality.

I doubt not that some centuries hence our dress and customs will appear as quaint to those who then strut upon this world's stage as do those of the Middle Ages to us. A true and living art can only be obtained by delineating the social characteristics of the times, and the adoption of this course will be the necessary concomitant of a new style.

In this architecture of the future, I believe that colour will form an important element, and the proper application of it is well worthy of consideration and study. It appears to me to be a mistake to introduce different materials in the construction of a wall in order to produce variety of coloured surface. This is better effected by means of inlays of marbles or encaustic tiles, and the most appropriate positions for such enrichments are the wall surface between windows, and in string courses and friezes. A moulding, either plain or enriched, and of small pro-

jection, would be an appropriate framework for these inlays. Detached shafts and columns are also very effective when executed in a rich and durable material; but in this and every other application of colour, care should be taken to avoid harsh contrasts, and a meretricious glitter or spottiness of effect.

My remarks have been somewhat disjointed and fragmentary; the subject is a wide one and would need more time and knowledge than I can command to do it justice. It is easier to advise as to what should be avoided than what to follow; each must be left to choose a path for himself, and you will allow me to conclude by throwing out a hint that it will be more to your profit if you employ the time often spent in searching out tit-bits from the works of others in designing details of your own. Study the details of every style, but copy none; a comparatively poor original is of more value than a copy of a superior work; it is only the unsuccessful artist who takes to copying; he may make a livelihood by that means, but his name will die with him. An architect whose ambition is limited to mere money-making would be better employed in a more mechanical pursuit; and I cannot help thinking that many good hutchers and bakers, shoemakers and tailors, have been spoiled to make most miserable architects. I hope better things from those I have been addressing.

SURVEYS OF SYRIA AND ARABIA.

Our readers will remember the hearty support which, on several occasions, we have given to the appeals of the Palestine Exploration Fund. While we are given to understand that this undertaking is still asking for aid, we are called on to help the promoters of a supplemental or complementary scheme for the survey of the peninsula of Sinai.

The object, no doubt, is one of importance, as well as of deep interest in many points of view. The names of some of the supporters of the undertaking, and especially of the Engineer officers who take charge of the survey, are such as to guarantee proper application of the funds which may be raised, and to promise reliable results. We do not know that the earlier explorers, our Palestine friends, claim, or wish to claim, a monopoly of the public support. Still we cannot help thinking that it would have been better to avoid such a duplication of machinery for objects so similar. There is no such immediate hurry. The accurate survey of Palestine would naturally be extended, in process of time, to the whole district covered by the description given in the Pentateuch. The wilderness of Sinai is but a portion of the land which must be delineated for our future Scripture maps. Palestine, the site or the vicinity of "Shur, that is before Egypt," Gerar, between Kadesh and Shur, the seat of Abimelech, who may, very probably, have been one of the Hyksos kings of the fourteenth dynasty; Goshen, the pastoral district, "in the best of the land, the land of Rameses;" Talpahas, where stood the palace of Ouphris, or Apries, the seventh king of the twenty-sixth dynasty; are as intimately connected with the early Hebrew history, and as much demand the careful investigation of the practised surveyor, as does any portion of the Sinaiic peninsula. What is required is, first a clear and distinct programme of the work to be done, and then, a patient, well-ordered scheme for the application of the funds, which may be forthcoming, to the orderly prosecution of the details of the enterprise.

If we have a lit here, and a scrap there,—in one case the photographer left out for want of funds, in another the naturalist omitted,—in short, if enthusiasm directs the undertaking, instead of wisar forethought, we shall fritter away our means, and disgust the public by repeated and ill-considered applications, before the real object of pursuit is attained. The field is wide and rich. Those of our readers who are acquainted with the exquisite engravings of "Forty Days in the Desert" can form some idea of what photography may do for the cave temples and ruined cities of Edom. There seems ample ground to conclude that the ruins of Repphidim, where Amalek fought with Israel, are to be traced near Wadi Feiran. Of the "eleven days' journey from Horeb by the way of Mount Seir unto Kadesh Barnes," the spot where Jordan, before the great geological convulsion that depressed the central part of its course, and formed the evaporating surface of the lake Asphaltites, fell

into the Red Sea, there seems every reason to suppose that we shall be able to recover every detail. But we think it is taking a very narrow view of the question to assume that the thirty-eight years which intervened between the "turning" of the Israelites at Kadesh, and their crossing the brook Zered, were spent in the small peninsula of Sinai. They took their "journey into the wilderness by way of the Red Sea." That this was the retracing of their steps towards Egypt, seems to be inconsistent with more than one passage of the Sacred Record. Of the eighteen stations mentioned by name as resting-places, between the time when the spies returned to the wilderness of Paran, and the encampment at Ezion Gobar, or Akaba, not a single name is that of either of the former halting-places, a fact discordant with the idea of so limited an area, for the nomadic period of the Exodus, as that which is usually assigned to it. To fix these stations, it is therefore probable that a survey and exploration, on a far more extended scale than that which is now proposed, will be necessary.

We have on more than one occasion expressed our own views as to the principles which ought to regulate the proceedings of the explorers of Palestine. While the value of such a survey as our own Royal Engineers are in the habit of executing, is very great, still, at least from one point of view, the architectural information which may be gleaned by a methodical investigation is the most important object of research. Amid the desert intervening between inhabited Egypt and the Holy Land proper, there is much of a structural character to delineate and to investigate. In Palestine itself, as we have so fully urged, the important task of identifying the exact localities of the Holy City, by the systematic tracing of the foundations of those enormous walls which yet await the persevering investigator, seems yet to be unattempted. What the case really demands, then, is not dispersion, but concentration, of effort, not multiplication of enterprises, but more systematic pursuit of the investigation for which funds have been actually collected. We wish good speed to the explorers who have already sailed for the survey of the peninsula, as well as to those who may yet be sinking shafts and running galleries among the *débris* accumulated in the valley of Kedron, or in that of the Tyropoeon. But to all those who, in the quiet of English parsonages or country houses, devote their leisure hours, and their spare guineas, to the search of local knowledge illustrative of the scenery and of the language of the Greek and Hebrew Scriptures, we would recommend combination of effort and well-directed unity of aim. The explorers of Palestine and of Sinai seem to be sadly in want of an engineer-in-chief.

NOTES FROM ABROAD.

Brunswick.—A second and exact copy of the celebrated Quadriga, in bronze, that crowned the chief front of the palace which was destroyed a few years ago by fire, is now being erected upon the former site, the entire building having been restored to its previous glory. The palace has always struck us, like that which was begun at Cassel, but was never continued beyond some 10 ft. from the ground, as much too large for the requirements of a third or fourth rate German court, and the rebuilding of this Brunswick palace would seem to indicate a greater reliance on Prussian non-annexation than we should have.

Berlin.—The municipality have determined to do away, as much as possible, with the system of the nightily and unduly open markets at present held in the principal squares of this city. A large market-hall is forthwith to be erected upon the Dönhofs Platz, and a second upon the Gendarmen Markt.—Another free hospital has been determined upon, and the plans have received the sanction of the "director of charities," Councillor Dr. Von Esse.

Hamburg.—An International Floral Exhibition is to be held here in September next. The programme just published contains a section for "Garden Architecture," to which will be admitted ornamental green-houses, conservatories, summer-houses, park-lodges, small rustic bridges, entrance-gates, park-palings, iron railings, and other objects of landscape gardening. A committee has been formed under very high local patronage, and a guarantee fund of about 10,000*l.* will be formed, the greater part of this

sum being already subscribed.—The Church of St. Nicholas, by Professor G. G. Scott, contains a number of external niches, and these are gradually being filled with statues, thanks to the liberality of the citizens, thus adding materially to the finished beauty of the whole edifice. Thus there are now in their respective places: the four Evangelists on the tower; St. Ansharius (by Professor Siegel, of Athens), Luther, and Melancthon, at the south porch; Erwin von Steinhilber, Peter Vischer, and Albert Dürer on the south aisle; St. Nicholas (an old statue, restored by the Society of Christian Arts), Ziegenhagen, and Winkler at the north porch; Gutenberg, Handel, and Schieermacher on the north transept; besides eight angels, four of which are on the gable of the south transept, and the other four on the tower, at a height of 200 ft. from the ground.—A very interesting exhibition of photographs by German artists is open here, and contains some perfect triumphs both as to clearness and colour, as also in regard to verticality of lines. A very pretty wooden building has been erected on some waste land near the Exchange for this purpose, by Herr F. George Stammann, architect.

Prague.—Some months ago a building society was formed here, for the purpose of erecting houses for the working classes on a very extensive scale. It seems to have answered so well, even in this short time, that several other towns of Bohemia are now following the example set in the capital.

Trieste.—A very large fish-market, to be supplied by the Adriatic, is about to be erected here. Twelve designs were received, in answer to public advertisement, six being from local architects, and the committee is now deciding upon their various merits.

ON THE ANTI-PATHIES OF ARCHITECTURAL GRAMMAR.

GLASGOW ARCHITECTURAL SOCIETY.

At the last meeting of this society, a paper was read, by Mr. Horatio K. Bromhead, "On the Antipathies of Architectural Grammar," being a consideration of how architectural ornament ought and ought not to be combined. He said:—

Before more definitely pointing out the precise section intended it were well to express that the absence of a predecessor's footsteps must be the apology for any incomplete and crude treatment of the subject; the "Grammar of Ornament," by Owen Jones, being the only work known to me as approaching it. But that magnificent work does so, as it were, from the opposite side from that selected for this paper. The "Grammar of Ornament," as understood by me, principally tends to show the inevitable and grand principles that must exist in architectural aesthetics; whereas it is now attempted to take the negative view, and consider as much as possible what may be argued as not allowable, by indicating for consideration adverse or restrictive principles, founded upon those great and glorious relics which our noble art has bequeathed to us.

In art generally, the restrictive principles are so simple, and the issue is so evident, that they have not required much study. This clearness is, perhaps, largely owing to the plain and facile verdict which so inevitably follows any violation of aesthetics. If we for a moment imagine the production of a piece of ideal painting or sculpture with an error destroying its general harmony, we at once think with satisfaction of the unremunerative limbo to which it would be consigned. Fortunate it is for the world that artists and sculptors are able to see their own works first themselves, and rectify errors then apparent; and further fortunate for them that many causes irresistibly lead to the formation and activity of a tribe of critics whose volubility is so irrepressible, that the recipient can silently take advantage of the one good point, while deriding the empty garbularity accompanying it. But it is well carefully to bear in mind that it can be said we are not blessed with an architectural limbo. We are enabled to see in the works of architects how admirably some are able to preconcite and avoid errors, and the want of this power in others, as evinced in the painful monumental proofs which they set up, and are unable to destroy. This may appear to be wandering from the end in view, but a careful consideration will make apparent that we are at the very foundations, for how can we study architecture to the advancement of art, if we accept every existing

erection as beautiful and perfect, without measure or qualification? at the same time overlooking the possibility that some of the architects, after they had seen the completion of their works, would gladly and publicly have repented in sackcloth and ashes, if they could only have thereby been enabled to remove some of the accomplished errors then for the first time detected.

It has been most generously asserted by some of our esteemed art-brothers, the artists and sculptors, that architecture is entitled to a first rank among arts on account of its universal need. I do not enter into the question further than to suggest that, if architecture be entitled to such an important position, its first claim would probably be founded on the necessary absence of experiment with regard to the production of its great works. We cannot point out what we do not like, and designing our model, full size, in soft clay, is equally impossible. With this argument I to some extent account for much that is had. Looking through works, one cannot help thinking that some are prominently good in planning arrangements, or aesthetics, or acoustics, or engineering construction, or carpentry, or masonry, or painting, &c., to the injury of other important requirements. Here I am not aiming at men who were trained as engineers, carpenters, masons, &c., and afterwards became architects; for most men, after so changing, could earnestly work through a great quantity of the remaining architectural knowledge in a few years, overcome the bias of the first education, and perhaps equal the average number of those who have been properly-trained architects for the same length of time; but am pointing out that some works indicate an unbalanced, biased, or lamentably deficient education by an error in some one, or more, essential yet neglected item; and also a tendency to give objectionable prominence to one section of architectural knowledge or building material. This, as I term it, negative way of looking upon art, appears to me very much neglected by the present generation of architects. The greater number of people are quite alive to the fact that the disagreeable man seldom says more than one offensive thing in an interview. The most notorious liar earns his reputation as easily; yet an architect who is quite aware of this and regulates his conduct with the utmost propriety, will sometimes be found, apparently without the least care or thought, blindly setting up buildings with at least one grave error; and when he has erected sufficient to stamp his character, feels particularly aggrieved that the public look upon the good points of his works as nothing but what was his duty to do; and, seeing the faults, set him down as of no great ability, and try the next new man in the hope of something better. I believe that an unduly large proportion of important buildings erected during the last few years could be identified by the mention of the worst architectural feature in each, and that the farther back the time under consideration is extended, the smaller the proportion will be; and, if so, there is cause for plain speaking and serious consideration. Taking the matter, however, at its smallest, it is assumed that all will admit the existence of errors in some of the architecture now existing; and, therefore, the difficulty lies in defining what is erroneous, and more particularly in endeavouring to lay down some propositions which, though they may require to be maintained with sufficient leniency for exceptions, may yet be considered generally good and sound. The following propositions have been hastily made out with a view to affording some definite ground on which the discussion to follow this paper may be continued, and the more easily become interesting and valuable:—

Proposition 1.—The origin, continued existence, and increasing isolation of the various styles of architecture indicate the opinion of many ages as most remarkably decided in asserting that there are sympathies and antipathies among architectural forms and colours that a correct taste cannot ignore, and that there are varied wants and requirements that have demanded and maintained a variety of style.

Proposition 2.—An architectural work should not have a single detail of form or colour that is not in harmony with every other detail, and with the use and situation of the work, but should be treated as a harmonious whole.

Proposition 3.—A new discovery, feature of design, method of construction or coloring,

material for execution, or locality for erection, has often caused a transition time of modification, finally resulting in the rejection of a previous feature and the production of a different style of architecture that avoids the discord occasioned by the novelty. Transition styles are, therefore, of confused and imperfectly developed grammar; and a combination of styles containing unmodified parts of two or more distinct styles is flatly discordant and ungrammatical, and much to be condemned as a violation of aesthetics.

Proposition 4.—Architectural features, when used in several styles, though retaining the same name and skeleton, should not be so used without being modified in detail and outward form so as to possess a sympathetic character for each style. The principles and methods of coloring should also be subject to this proposition.

Proposition 5.—If a well-known feature or detail that is to be found in many buildings is very seldom to be found in the same building with another well-known style, feature, or detail, without modification, the combination, without the customary modification, is a discord that requires marked and careful sympathetic modification to become grammatical.

I cannot hope to exhaust the subject in the necessary limits before me, so will only attempt a single illustration—that of the column. In the great works of all ages we find each particular style of architecture a carefully-modified base, shaft, and capital to its columns. First, confining the argument to any one style of one age, we find the detail so completely corresponding in sympathy that the designs of one building can generally be interchanged with those of another without any violation of grammar. Second, extending the argument to every age of one style, we find the sympathy fluctuating, being advanced, refined, and headily clear when architectural art was prosperous, and debased and partly lost when art was neglected. Third, still further extending the argument to be without limit, we strike, as it were, the very key-note. Where is the style without its columns? Consider them regardless of style. We may say that no good column exists without being clearly marked out as possessing base, shaft, and capital—ever the same names, ever the same triplet representation of honest strength. Consider them with reference to style. It is impossible to marshal forth in memory the different modifications of columns to be found in the different styles without being convincingly struck with the remarkable facility with which their sympathetic modification of detail enables every style to be distinguished. They may, indeed, be described as the very landmarks of style, endlessly varied, yet always a triplet "thing of beauty and a joy for ever."

HER MAJESTY'S THEATRE, HAYMARKET.

A REPORT has been circulated to the effect that the money provided for rebuilding Her Majesty's Theatre was exhausted, the structure being simply in carcass, and that the works would be stopped unless other persons came forward to provide funds. We are enabled to say, not merely that this is incorrect, but that there are not the slightest grounds for the assertion.

The theatre is in course of erection, our readers may remember, from the designs of Mr. Charles Lee, assisted by his sons and partner (Messrs. Lee, Brothers, & Pain). A considerable amount of work has been done, considering the limited time which has elapsed since their commencement, by Messrs. Geo. Trollope & Sons, the contractors. The building is now roofed in, and the greater part of the ironwork and the stone stairs are fixed; and there appears little doubt, judging from the forward state of the building, as to the theatre being completed by the end of next March, according to contract. Scenery and properties would have to be provided, but that, of course, is a separate question.

The late theatre was burnt down on the evening of December 6th, 1867, and steps were at once taken to clear the site; but, for various reasons, the owner, the Earl of Dudley, did not finally arrange to rebuild until early in March this year, and on the 29th of May the works were commenced. We will before long give plans showing the old and new theatres.

In rebuilding, care has been taken to provide

the additional stage accommodation, before so much required, without materially encroaching upon the area of the auditorium; also to improve the entrances and exits; and the staircases have been arranged so that no part of the theatre will be without two, at least, staircases or passages of communication. There will be three saloons exclusively for ladies (the late house had no such accommodation); the boxes have been increased in height, and they will consist of four tiers and a half. No use will be made of the roof over the auditorium or stage, and the roof being of iron, the risk of fire will thereby be reduced; the carpenters' shops and painting-rooms, before in the roof, have been placed next the Haymarket, on the east side of the stage; the properties and stores have been provided for on the basement.

The stage is separated from the auditorium by a thick wall, continued through the roof, without openings, except for the stage; the floors of all the saloons, dressing-rooms, passages, and landings will be formed with Dennett's oement arches, and all the staircases will be of stone, inclosed with brick walls.

THE GRAVE OF ROBERT HOOKE.

NEAR to the site of old Gresham College, in the ancient church of St. Helen, Bishopsgate, lie buried, without a memorial stone to mark their last resting-place, the remains of an eminent philosopher and marvellous mechanic, Robert Hooke. Whether the fault rests with those who inherited his great wealth, or whether a tomb was erected and has since fallen to decay, I cannot ascertain; but at present he lies in an unhonoured grave in the midst of a city which has largely profited by the results of his earnest labour. The variety and extent of Hooke's inventions and discoveries are scarcely so well known as they deserve to be, and while drawing attention to his neglected grave it may prove useful to give a short account of the most important. The following, chiefly derived from a highly appreciative exposition of his mechanical inventions, by Bryson,* will, I think, prove that Hooke is justly entitled to a grateful remembrance.

Hooke in early life was delicate, so that his parents had small hopes of rearing him; but after his seventh year his constitution seemed to gain strength. His mechanical genius, the strongest intimation of his nature, was first developed. In a short extract from his diary, Waller,† his biographer, says: "Being subject to headache, which hindered his learning, his father laid aside all thought of breeding him a scholar, and finding himself also grow very infirm through age and sickness, wholly neglected his further education, who, being thus left to himself, spent his time in making little mechanical toys, in which he was very successful. His father, observing by these indications his great inclination to mechanics, thought to put him apprentice to some easy trade (as a watchmaker or limner), he showing most inclination to those or the like mechanical performances." His taste for the fine arts seems to have recommended him to the notice of Sir Peter Lely, with whom he served but a short time, as the odours from the oil colours produced aggravation of his headache, which, beginning in his earliest years, continued to afflict him through life. This was, perhaps, for his fame and for science a fortunate adversity. In the year 1653 Hooke, then in his eighteenth year, went to Oxford, and by his mechanical genius soon gained the notice of the Hon. Robert Boyle. Here he seems to have found more employment suited to his tastes from meeting Wren, Wilkins, and other eminent philosophers, who shortly afterwards founded the Royal Society of London. It was while residing at Oxford that he contrived for Boyle the first really efficient air-pump, and applied the balance or pendulum spring to a watch, by which and his subsequent discovery of its isochronal properties, he converted the machine which he found but a rude toy, into an almost perfect measurer of time. From a suggestion of Wren's, he made a series of observations of the barometer for the purpose of testing the truth of the hypothesis of Des Cartes, that the tides resulted from the pressure of the moon upon the air in

its passage by the meridian. Hooke found that the oscillations of the mercurial column did not comport themselves according to the moon's motion, but were due to the varying density of the air. Thus the barometer became, in the hands of Hooke, not merely the Torricellian tube, but a weather-glass, or as he quaintly calls it, the "weather wiser." To him we are also indebted for the double barometer, the four-legged barometer, the wheel barometer, the diagonal barometer, and the marine barometer. About 1690 he invented what he calls his circular pendulum, it has, however, been termed a conical pendulum, being continuous in its motion. It was applied by Hooke to a telescope mounted equatorially, so as to keep the instrument always coincident with the star's motion, both in right ascension and in azimuth. This invention is more familiar under the name of Watt's governor or the steam-engine. Watt most ably applied it, but (with very few know) Hooke was the inventor. In the year 1662 Hooke was appointed orator of the Royal Society; and, in April of the succeeding year, he read before them an account of his discovery of the rising of fluids in capillary tubes. He also discovered that mercury was not subject to the same law, but was depressed in tubes in the ratio of their diameters. He also here hinted, what was afterwards discovered, that mercury in tubes made of different kinds of glass has a different ratio of depression. He also proposed a system of telegraphy by connecting between distant stations a wire, acted on by a series of vibrations or musical notes, and thus communicating almost instantaneous intelligence. In 1663 he invented the watch wheel-cutting machine, and in the following year a method of grinding spectacle lenses, by means of which more than 100 could be ground at once to the same focal power. This ingenious contrivance is daily used in our manufactories at Sheffield, but few know the name of its inventor. On the banks of the Avon you may be asked the question, Who was William Shakspeare? and in the workshop of the optician, Who was Robert Hooke? In the same year he invented an instrument to determine the refractive index of fluids. His life, indeed, at this time must have been a busy one. Macaulay eloquently tells us "how necessary it was for the fine gentlemen of the court of Charles II., when science had become the fashion, to have something to say about telescopes and air-pumps; and even fine ladies now and then thought it becoming to affect a taste for science, went in coaches and six to visit the Gresham curiosities, and broke forth into cries of delight at finding that a magnet really attracted a needle, and that a microscope really made a fly look as large as a sparrow."

In 1664 Sir John Cutler having founded a lectureship in connexion with the Royal Society, Hooke was appointed to the office at an annual stipend of 50*l*. Although science has, perhaps, gained by the publication of his Cutlerian lectures, to Hooke it proved a source of great trouble; as, through some misunderstanding, he became involved in a long and vexatious lawsuit for the recovery of his annual allowance, which appears to have soured his disposition for the remainder of his life. In the same year he was appointed professor of geometry in Gresham College, and continued for some time to read general astronomical lectures, showing a wonderful fertility of invention in devising instruments for astronomical purposes; describing a plan for a weather-clock, a quadrant, and erecting the first transit instrument. As this is intended more as a catalogue than a description of his earnest labour in the pursuit of scientific truth, I can only enumerate the subjects to which Hooke devoted his mind during his long and useful life.

In the year 1666, the Great Fire of London, though it disturbed the labours of the Royal Society, increased those of Hooke. On the 19th of September, we find him presenting before the Society a model for the rebuilding of the city. "What this model was," says Waller, "I cannot well determine; but I have heard that it was designed in it to have all the chief streets, as from Leadenhall to Newgate, and the like, to lie in an exact line, and all the other streets turning out of them at right angles; all the churches, public buildings, market places, and the like in proper and convenient places." This plan was not accepted, but it led to his appointment as surveyor by the City magistrates. In this situation he laid out the ground to the several proprietors for rebuilding the City, and acquired most of his

wealth; none of which, it is believed, he ever used, as it was found in a chest after his decease.

The invention of the reflecting telescope has been awarded to Newton, to Gregory, and Hooke: the share which he had in the invention was in perforating the larger speculum, thus enabling an observer to view the object directly. In one of his discourses he clearly indicates the stethoscope. He invented the spring balance, now known as Salter's spring balance. To him we also owe the steelyard: although unknown to Hooke, it had long been used as the standard instrument for determining weight in China. He proposed the catenarian curve as the best form of arch; employed a heavy weight moving in a short arc for the pendulum, from which its sole advantage is derived. He had the earliest suspicion of what keeps the planets in their orbits, discovered that the density of the air in a diving-bell is doubled at the depth of 34 ft., invented a water-pump having an elliptical rotary motion acted on by a spring, and discovered the various forms which sand assumes when placed on a vibrating plane. He attributed the revolutions of the planets to the combination of a projectile motion with a centripetal force. Had his mathematical powers equalled his practical sagacity, he might have obtained the laurel which Newton so soon afterwards bore away. He discovered that Jupiter revolved in about eight hours. That he possessed the secret of the steam-engine is undoubted; he, however, hid it in the form of an anagram, which Waller thus translates,—"The air presses with force the vacuum left after the use of fire." As an astronomer he did much; as a geologist his views were in advance of his age. Speaking of fossil remains, he says that they belonged to extinct species, and even suggested that they may have disappeared in consequence of earthquakes in former ages, to which he attributes the elevation from the sea of the strata containing marine remains. In conclusion, Bryson remarks that, "Had Hooke been born fifty years after Newton, Newton would not have been less. Had he been born fifty years before the great philosopher, Hooke would have been more exalted." II.

PLANS OF PARIS.

A LIST was given in these pages* of the most ancient plans of London and Westminster known to be in existence: to this list, which must be of the greatest interest and assistance to all who are addicted to antiquarian or historical researches, as well as those who desire exact knowledge of the locality of facts connected with general literature, we are enabled to add a similar inventory of the plans of the City of Paris, from the last issue of the *Chronique des Arts*.

A collection will be made of all the plans of Paris that can be obtained, which will be placed in the Historical Museum of the City of Paris as soon as the alterations to the Hôtel Carnavalet, the former residence of Madame de Sévigné, in which the Museum is to be formed, have been completed. In point of number the ancient plans of Paris are inferior to those we possess of London, but they are sufficient to enable us to trace the progress of the city during the last four centuries, and if they could all be collected under one roof their usefulness would be greatly increased.

The following is a list of the most ancient plans extant:—

1. A manuscript plan found in the Abbey of Saint-Victor representing Paris about the year 1400. This plan was engraved by Dhuelland in 1756.
2. Another manuscript plan, constructed from a tapestry of about the same period. There are no illustrations of Paris of a date anterior to, or contemporary with, these plans, with the exception of some views of public buildings on the margin of an illuminated manuscript of the fifteenth century, formerly belonging to the Duke of Bedford, and purchased by the city of Paris from M. Firmin Didot.
3. The plan of 1560, executed in the reign of Henri IV., and now in the Imperial Library.
4. An Italian plan dated 1565.
5. Quésnel's plan in twelve sheets, dated 1609 (reign of Henri IV.).
6. The plan of 1615 engraved at Amsterdam by Witt.

* Vol. xv. p. 642.

* Edin. New. Phil. Mag., 1858.

† "Posthumous Works of Robert Hooke." London, 1765.

7. Another plan engraved in Holland in 1620.
8. The plan of 1651, which only shows the streets.
9. The plan by Boisseau, 1652, and another by Gomboust, of the same date.
10. Cochin's plan, 1669, in three sheets.
11. Defer's plan, 1692.
12. Jouvin de Rochefort's plan, 1697.

From the beginning of the eighteenth century to the present time, the plans may be counted by hundreds. The principal are those by Félibien, 1725; the plan of the great Turgot, 1739; the curious plan by Bonamy, in 1740, in which year Paris was visited by a severe inundation; and the plan of Verniquet, in 1789.

A plan of Paris, on a large scale, showing the recent alterations, is in course of preparation by Baron Haussmann.

THE INSTITUTION OF CIVIL ENGINEERS.

GLASS FOR LIGHTHOUSES.

The first meeting of the present session was held November 17th (Mr. C. Hutton Gregory, president, in the chair), in the new building erected during the recess, and upon the completion of which, according to the promise made by the council, the president congratulated the members; taking occasion to remark, that the council had placed upon their private minutes a unanimous vote of thanks to the architect, Mr. T. H. Wyatt. The president observed that the contractors, Messrs. Holland & Hannen, were also entitled to commendation, for the manner in which they had carried out the works within the time specified in the contract—a result to which the personal care of the secretaries had largely contributed.

The paper read was "On Lighthouse Apparatus and Lanterns," by Mr. David M. Henderson. It was stated that the glass used in lighthouse apparatus was nearly all made at Saint-Gobain or Birmingham, and was of the kind known by the name of crown glass. Different mixtures had been employed for the purpose; but M. Reynaud, the director of the French lighthouse service, now gave the composition as—

Silica	72.1
Soda	12.2
Lime	15.7
Alumina and Oxide of Iron }	traces.
100.0	

At Birmingham various mixtures had been tried, of which several examples were given, the following being about an average:—

	wt. qr. lb.
French Sand	5 0 0
Carbonate of Soda	1 3 7
Lime	0 2 7
Nitrate of Soda	0 1 0
Arsenic	0 0 3

English glass was supposed to be of the refractive index of 1.51. That produced at Saint-Gobain had formerly an index of refraction as low as 1.50, but now it was 1.54, and frequent experiments were made to ascertain that the standard was maintained.

The furnace for melting glass was generally rectangular in plan, and was constructed of the most refractory materials; and the sides were arranged so as to allow of the easy withdrawal of the pots. Six, and sometimes eight, pots were placed in the furnace, arranged in pairs with a firegate at each end. The flame filled the whole interior of the furnace, and, after circulating round the pots, which were covered to prevent the colour of the glass being injured by dust, or impurities in the coal, found its exit by flues. Great care was necessary in the preparation of the pots, which were made of about one-half new fire-clay, and one-half old potsberds, finely ground. The length of time a pot would last depended upon (1) the quality of its manufacture; (2) its being slowly and thoroughly dried,—a process occupying about six months; and (3) the care bestowed upon it in the furnace, and whilst withdrawn for casting. The average number of castings from each pot was about twenty; and the time the pot was out of the furnace at each casting was about three minutes. It was mentioned that Mr. Siemen's regenerative furnaces were now in use for the manufacture of lighthouse glass with perfect success. When the metal was ready for casting, each pot was lifted from its seat, with-

drawn from the furnace, and carried to the foot of a crane, the lifting chain of which had attached to its end a clip to embrace the pot. A mouth-piece of wrought-iron was fitted to the pot before casting, to facilitate the pouring, and the workmen tipped over the pot by means of long handles.

The casting-table was circular, and was mounted on a frame, so that by means of a handle it could be turned round, and each part of its outer circumference brought consecutively under the pot of molten metal. The moulds into which the glass was to be cast were arranged round the outside of this table, and were caused to revolve slowly under the continuous stream of liquid glass flowing from the melting pot, so that each mould was filled in succession, thereby enabling the immediate return of the empty pot to the furnace. The moulds were of cast-iron, of a uniform thickness of $\frac{1}{2}$ -inch, and were supported on feet cast on, the size being such as to allow $\frac{1}{2}$ -inch thickness of glass all round for the grinding process. The small lens-rings and prisms were cast in one piece, but the larger ones were cast in segments. The large bells, or central lenses for fixed lights, were generally cast flat, and were afterwards bent on a saddle to the required curve in a kiln.

Sand, emery, rouge, and water were the four necessities for glass grinding and polishing. The sand had to be applied, with abundance of water, until it lost its cutting qualities. The emery, after being ground to a fine powder, was agitated in water, and the mixture was passed through a series of vats or tubs, so that the emery was divided into as many qualities as there were tubs, the coarsest being deposited in the first tub, the finest in that furthest from the supply. The rouge, which was an oxide of iron, was prepared from the sulphate, and was separated into qualities by means of water-tubs, as in the case of the emery. The glass of optical apparatus was ground on horizontal circular tables, securely fastened to the tops of wrought-iron vertical spindles, which received motion from the main shafting in various ways. The surfaces of these tables were divided out, like the face-plate of a lathe, to receive of cast-different sizes of "carriers," or supports of cast-iron, which were bolted to them, and were arranged to hold the lenses or prisms to be ground. Plaster of Paris was then laid on the "carriers" in hands, the hands being reduced to the exact size by turning the table round under a gauge secured to the framing of the machine. The glass was laid on these strips, and was secured in place by means of pitch, care being taken in the larger sizes, which were ground in segments, to place a thickness of pitch between each joint, so that glass did not touch glass.

ENGINEERING ARCHITECTURE.

In the course of the address delivered to the "Civil and Mechanical Engineers' Society," by Mr. B. Haughton, the president, the speaker said:—The last discussion was, perhaps, the very best of the season, prompted by joint papers on "Engineering Architecture," by two of our oldest and most valued members. The meeting discussed the question with a spirit worthy of the combatants in the battle of the styles, even the visitors warmly assisting. This is a subject on which there is a great deal more to be said, and we will look forward to further consideration of it. It is one which the Society would do well to keep continually before it, because it is a line in which we can see our way, and in which every one admits there is room for improvement. It is, indeed, humiliating to think of the vast sums that have been spent in England on grand engineering works with an utter disregard of appearances, and where a modicum of æsthetic skill would have given us so much effect and beauty. It will be said that nobility, and not beauty, should be the cry of the engineer; but this is, after all, only the twaddle of incompetency, for it is well known to those who have given attention to art that it costs no more to arrange materials in effective and pleasing forms than to pile them in the shapeless masses that attract the eye.

We must at once dismiss the assertion that beauty is costly; it is not meretricious ornament that is advocated, such as may be seen in at least one of the latest engineering works, and which is a reactionary effort, worthy of praise, as showing a step in the right direction, but still

unworthy as having overshot the mark, and having given us, as it were, "a jewel of gold in a swine's snout." I allude to the Abbey Mills Sewage Pumping Station, the design for which is the more remarkable, seeing that it has come from the hand of the engineer who has shown so much artistic excellence in the severe lines in which the Thames Embankment is conceived.

What I ask you to aspire after in those engineering works upon which you are, and shall be in the future, engaged, is form in the æsthetic sense, in place of that deformity which is so often broadcast around us, in which the British engineer has hitherto gloried himself, and in which he would seem to wish to idealize and deify sheer strength, which in his simplicity he sees to be incompatible with beauty of outline. How, then, is this desideratum to be attained? The British engineer in his efforts to redeem engineering architecture must look to himself, and to himself alone; and the present recess is perhaps an opportunity given him for this very purpose, and to enable him to direct his mind to a subject which demands his closest attention. He will again, notwithstanding our prophets of evil, be called upon to construct works on English soil equal to, if not surpassing in magnitude, those of to-day. Let him endeavour in them to improve on those of a bygone generation, and to hand down to posterity a legacy of beauty in connexion with such works, as he has received from the past its legacy of strength and endurance.

Let him above all things refuse to entertain the thought that veneration for the beautiful is beneath him as a man, or derogatory to the dignity and character of his race; for during all time those races which made themselves famous for their prowess and their majesty, their power alike over matter and mind, were equally renowned for the beauty and for the magnificence of their public works—those monuments of glory by which, history apart, we can now alone judge of their aristocracy of race. If Egypt has had her Pharaohs of the camp and the battle-field, she has also had the Pharaohs of the Pyramids, of Thebes, and Phyle; if Greece has given to the world an Epaminondas and an Alexander, who has left his traces visible to this day upon the banks of the Siltledge, the Dethum, and the Indus, she has also given it a Phidias, an Apelles, and a Praxiteles, who live at this moment in the columns, entablatures, and friezes of the Acropolis, in the inimitable statue of the Venus, and in the thousands of miracles of art which have made their countrymen as a race nigh upon earth; if Rome has had her Romulus, her Pompey, and her conquering Julius, who has left his stamp upon these banks of Thames, she has also had her Augustus and her engineers and architects by the score, beneath the walls of those grand buildings the Englishman loves to wander during the period of his own dark winter; and if Carthage has had her Hannibal, she was also one of the most exquisite of cities. These facts should at once disabuse us of any idea that being possessed of an eye to admire, a head to conceive, and a hand to construct what is beautiful, is incompatible with those qualities of *physique* and of *morale*, and of general manhood on which we as a nation rely and pride ourselves; on the contrary, history tells us that the very highest types of the human race are those in which all these qualities have been combined, and, further, that wanting in any of them, we cannot claim to rank as equals, but only as degenerate and effete imitators of the mastering races named, sent into the world by the King of Kings and great Engineer of Engineers for the guidance and instruction of the 1,200,000,000 of his creatures who incessantly inhabit it, and whose instruction and example they stupidly reject and ignore.

Let us then look for better days for engineering art, and if we shall succeed in our aspirations and efforts to restors and to perfect it, when the time comes that we are to be conquered as a people—it may be by the Cossack, it may be by the Western Vandal—as conquered we shall be, if history is to repeat itself, we shall have that glorious consolation, which Horace describes as having remained to Greece after her conquest by Rome—"Captive Greece took captive her fierce conqueror and introduced her arts amongst the rude Latins. Thus, their rough Saturnian manners became polished, and delicacy expelled rank virulence; though for a long time remained, and this day remain, the traces of rusticity."

SCIENTIFIC INSTRUCTION.

The annual distribution of prizes has been made to the pupils of the Lower Islington Public School Science Classes in connexion with the Science and Art Department. The room was crowded by the boys and young men, with their friends, who were gratified at the success that has attended the instruction given students by Mr. John Howard and his assistants. Professor Heeslow, Mr. Edgar, of the School of Mines, Mr. Howard, and other gentlemen addressed the meeting. The Professor pointed out that in the hands of an able teacher the driest scientific subject might become wondrously interesting, and made the means of developing to the fullest extent latent mental powers.

Some inquiries have lately been instituted in Yorkshire respecting the means available for scientific instruction. Nothing effectual, it is thought, can be accomplished until there is a good supply of teachers, and it will, of course, be for the direct interests of the masters if they can earn further grants from the Government. To qualify them for scientific teaching the Yorkshire Board of Education is organizing special classes, and in Leeds thirty-five schoolmasters have already joined these classes. Altogether, no less than 100 schoolmasters in Yorkshire are now busy qualifying themselves for the Government certificate. When this is attained, the boys in 100 common schools will be able to learn the elements of science as a part of their ordinary education. The Board is endeavouring to supply the link which will be necessary to connect this elementary education with the higher grades of instruction. They propose to establish professional lectures for the elder pupils of primary schools, which will supplement the lessons of the masters. The boys will assemble weekly for this purpose in convenient centres, and it is hoped that a basis may thus be afforded for trade-schools in our chief manufacturing towns. One of the wishes Mr. Whitworth expressed was that the Government would assist in providing professors of mechanical science throughout the country; and, if this design could be carried into execution, it would exactly fall in with the plan proposed in Yorkshire. If the scheme thus sketched be completed, it is evident that a complete and graduated course of scientific instruction will be established; and it will have been provided in the only satisfactory way,—by local efforts, supplemented and guided by the Government.

PUBLIC IMPROVEMENTS IN OXFORD

From the annual *resumé* of improvements in the University and City of Oxford, in the local *Journal*, we give an abstract:—

Christ Church.—The window on the north side of Christ Church Hall has been filled with lights, commemorating the visit of the Princess of Wales and Denmark last year. The work has been executed at the cost of the Ven. Archdeacon Clerke, sub-dean of the college. A new road, 600 yards in length, is being formed across the Meadow, from that part of the Broad Walk facing the new buildings to the path opposite the boats. It will be lined, when completed, with an avenue of elms. Christ Church is further carrying out its excellent design for the improvement of the parish of St. Thomas. The notorious "Hamel" will soon be a thing of the past. In addition to the thirty tenements known as the "Model Dwellings," which have been built within the last two years, there are now in course of erection, and nearly finished, nine other new and commodious dwellings for the poorer classes. Two facing the High-street are for shops, seven front the old street or alley known as the Hamel, now widened to 30 ft.,—a good open airy street. These houses are solidly built, well designed, and fitted up with all necessary conveniences for the family of a working man. Each house has a sitting-room, wash-house or kitchen, and three bed-rooms, good drainage and water supply, and separate walled garden. They are being built by Messrs. Jos. Castle & Co., under the direction of Mr. Branton, the surveyor of the College. The object sought in the improvement of the dwellings in flats and the cottages, is to provide for the accommodation of all grades of the working classes. The contrast between these cottages and those just pulled down or about to be removed, is very striking.

Exeter College.—The glass mosaic by Salvatii,

at present confined to that part of the chapel beneath the east window, is intended to be continued throughout the arcade of the apse.

Queen's College.—The east pediment of this college was found to be out of the perpendicular, and as Mr. Wilkinson deemed it unsafe, it was taken down immediately the long vacation commenced, and was soon rebuilt. The carving in the tympanum was also restored.

Merion College.—The ante-chapel of this college, which had become much decayed, is being thoroughly restored by Mr. J. Fisher, under the direction of Mr. Backeridge, architect. The stonework of the windows, columns, and other parts of the structure is being renewed.

New Inn Hall.—A small chapel has been added to New Inn Hall, consisting of brick, with stone windows. The builder is Mr. Guise, of this city.

The New Museum.—New buildings are being erected on the north-west of the Museum, in connexion with the department of Experimental Philosophy. They will comprise lecture-theatre, students' and private laboratories, workshops for turning, photographic room, and examination room for Professor Clifton. These additions are being made out of a fund given to the University by the Clarendon Trustees. In general appearance, design, and material of construction, they will resemble the Museum itself. The architect is the same, Mr. T. N. Deane, of Dublin; and Mr. Symm, of this city, is the builder. The north front is to present a handsome elevation of nearly 100 ft. in width; the west of 51 ft. in width. The new additions, which will be connected with the Museum by a corridor, and will have a central court, are to be completed about May, 1870. The contract is for 10,255*l.*

London and County Bank.—The new premises for the London and County Bank, just completed, occupy a commanding position in the High-street, at the corner of Alfred-street. The style adopted is Tudor or Collegiate. The materials used have been the best white bricks of the neighbourhood for the several fronts, with Bath stone for all the stone details. The exterior is relieved by buttresses, projecting chimneys, and windows of varied design, and the angle is further diversified by an octagonal projecting window, which rises to the summit of the building and terminates in a turret with coped top, and iron terminal. The public room measures 43 ft. by 34 ft., and 16 ft. high, with boarded and panelled ceiling, with carved corbels and pateras. The gas-fittings are by Hart & Co., Strand. The whole of the works, including the adjoining premises, will cost about 4,000*l.*; they have been executed by Messrs. Jones, from the designs of the architects, Messrs. Francis, of London.

St. Barnabas Church.—The Church of St. Barnabas is the title of the new edifice now rapidly approaching completion in the district of Jericho. The plan is of the Basilica type, and is a long parallel building with an apsidal termination at each end, that at the east for the altar, and that at the west for the baptistery. The choir place is at the east end of the nave, and will be marked off by a low railing. The clearstory is remarkable for its height, which gives to the nave a fine lofty effect. The aisles are divided off by arcades in the usual way, but the arch opening the baptistery to the nave, and the fine round arch and ceiling over the sanctuary are not common features. The roof, which is not of a sharp pitch, is of simple but effective construction, and boarded on the inside, the timbers being all exposed. The walls are constructed with rough wall stones of the district, put together with ground Haslams and Thames sand, and covered on the outside by a rough coating of Portland cement and sand. The window cills and heads, and those portions usually constructed of wrought masonry (except the columns and their capitals and bases, which are of Bath stone), are built with a concrete of cement, gravel, and other hard materials, made and cast in moulds of the requisite shape. The church will seat about 1,000 persons; and, it is said, will cost, owing to its peculiar method of construction, not much beyond half the sum usually required for churches of that magnitude. The architect is Mr. A. W. Blomfield, of London; and the builders are Messrs. Castle, of Oxford.

St. John's Mission House.—This is the name given to an Ecclesiastical and Collegiate establishment in Marston-street, in the newly-made Ecclesiastical district-parish of Cowley St. John, the new suburb on the east side of the city. It has been built by Messrs. Joseph Castle & Co. for the Rev. E. M. Benson, the incumbent of the parish. It has spacious offices and refectory in

the basement, and the upper stories contain, besides a large "parish room," a common room, library, with conversation room adjoining, principal's room, and twenty-six rooms for men, each room fitted and furnished for separate occupation. On the top of all is a large, convenient, and well-designed chapel, fitted with stalls for over fifty persons, and capable of holding a good many more. The house is heated throughout by a system of hot-water apparatus, thereby saving trouble and inconvenience from separate fireplaces. The rooms, as well as the passages and corridors, are lighted with gas, and great care has been taken to give good and manageable ventilation. No attempt has been made at architectural display.

New Schools, Gloucester-green.—A Gothic structure has been erected on Gloucester-green for day schools in connexion with the Independent Chapel, George-street, but in which an unsectarian education is given. There are large class-rooms on the ground-floor, with entrances from Gloucester-green and George-street. Mr. Codd was the architect, and Mr. J. Hall, of Walton-street, has carried the work out.

Chapel school, Hythe-Bridge-street.—At the corner of Hythe-Bridge-street, a Chapel-school for the boatmen and their children has been erected. The architect is Mr. Branton; and the builders are Messrs. Jones & Sons. The new structure will cost about 350*l.*

COMPRESSED AIR FOR PROPELLING VEHICLES.

We have often suggested the desirability of applying compressed air, or some such power, to the propulsion of street vehicles, whether coaches, omnibuses, cabs, or velocipedes. If what we now learn from America be correct, this desideratum has at length been realized.

Mr. Waylis, of New Orleans, has recently invented a locomotive car, which is said to have proved a complete success. In the car station there is an ordinary steam-engine, of about sixty-six horse-power, for compressing air into reservoirs, and two of these reservoirs are placed on the top of each car. On the car there is a small engine, operated by the air supplied from the reservoir in the same manner as by steam, and giving the exact amount of power that was required to compress the air. The engine is not difficult to run, and the cars can be stopped much more readily than when horses are used. Each car will have 300 pounds of compressed air to start with, which will be sufficient to run it nine or ten miles.

NEW TRAMWAY, RAILWAY, AND OTHER PROJECTS.

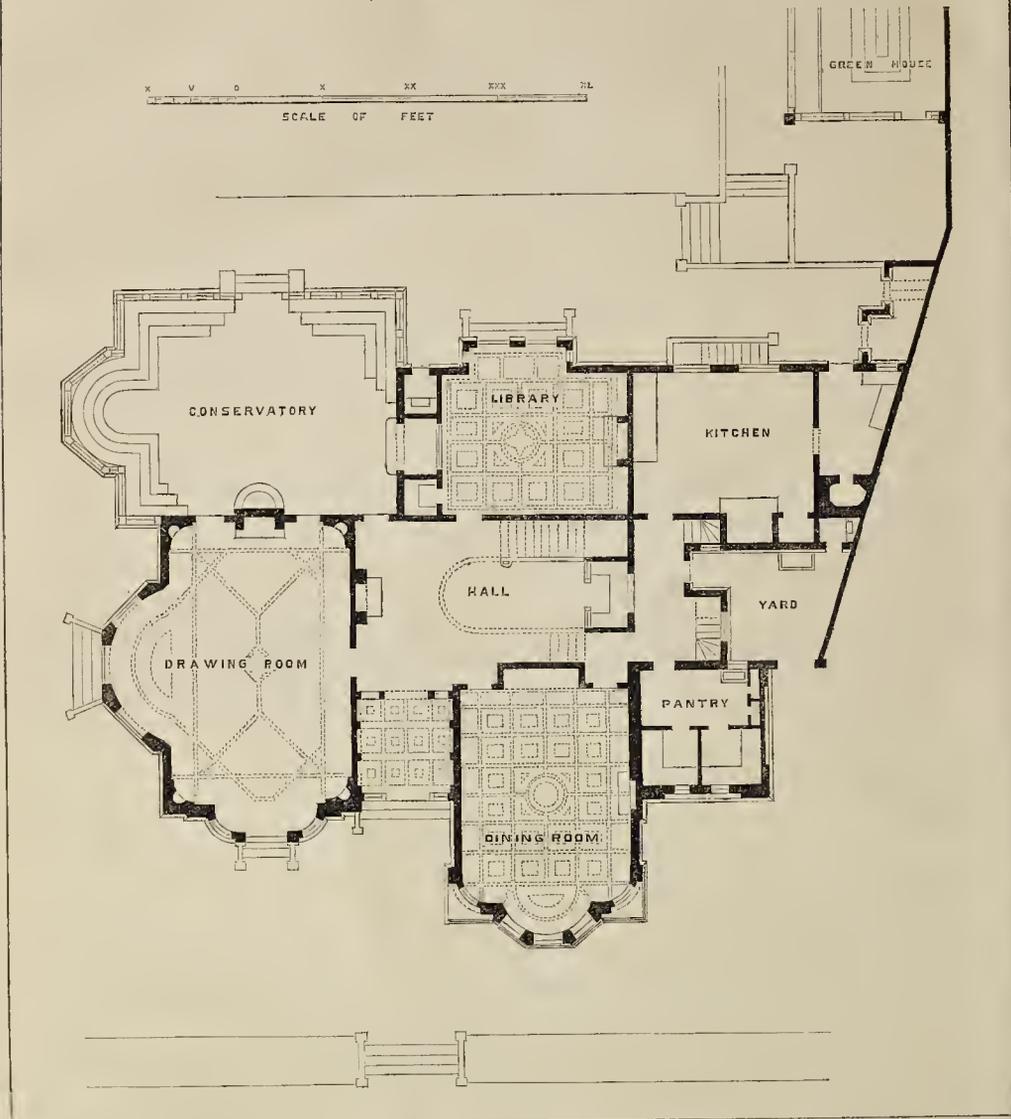

AMONG the notices of proposed applications to Parliament are the following:—

Incorporation of company for making tramways from Kensington to Hounslow, Hammersmith to Uxbridge, Paddington to Harrow and Edgware, Islington to Barnet, Newington to Charlton near Woolwich, Lambeth to Croydon and to Richmond.

Incorporation of company: construction of railway from near the west end of Oxford-street to Cheapside, in the City of London (to be called the Hyde Park and City Railway, and running as follows): commencing in the parish of St. George, Hanover-square, in the county of Middlesex, near the west end of Oxford-street, and thirty-three yards or thereabouts westward of the Marble Arch, and terminating in the parish of St. Michael at Bladun, otherwise St. Michael-Querne, in the City of London, near the western end of Cheapside, and at or near the junction of Foster-lane with Cheapside, to make and maintain the said railway, wholly or partly, as an underground railway, and to pass through and under the following, or some of the following, among other roads and streets, that is to say,—Uxbridge-road, Baywater-road, Oxford-street, Duke-street, Regent-street, New Oxford-street, High Holborn, Iloiborn, Holborn-hill, Holborn Viaduct, Victoria-street, Farringdon-street, Skinner-street, the Old Bailey, Giltspur-street, Newgate-street, St. Martin's-le-Grand, and Cheapside, or some of them.

Incorporation of a company to make and maintain a railway from Colchrooke-row, Islington, to New Union-street, in the City of London. Railways [Metropolitan (Southern District)

"THE LOGS," HAMPSTEAD.—Plan of Ground Floor.

Railway] from Elephant and Castle to Waterloo and Whitehall Railway, and from that railway to the Thames Embankment (north) and to Scotland-yard. Incorporation of company, powers as to Waterloo and Whitehall Railway, &c.

Kew and other bridges: to confer upon the Mayor, Aldermen, and Commons of the City of London, and the Metropolitan Board of Works, certain powers with respect to freeing from toll the bridges named in the 5th section of "The London Coal and Wine Duties Continuance Act, 1868," such bridges being Kew, Kingston-upon-Thames, Hampton Court, Walton-upon-Thames, and Staines, over the river Thames, and Chingford and Tottenham Mills, over the river Lee.

Landowners' Association, for the construction of branch railways and other works. Incorporation of company: powers to purchase and hold lands; to construct, work, and manage railways and other works; to levy tolls to raise capital; special provisions for acquisition of lands—powers to landowners and other persons having limited interests in lands to subscribe and hold shares, and to guarantee interest; and to charge

the inheritance with subscriptions and guarantees as a prior charge—provisions for compelling such persons to guarantee interest and to charge the inheritance with guarantee as a prior charge;—powers to persons guaranteeing to participate in profits of company, &c. This seems a very broad measure.

"THE LOGS," HAMPSTEAD.

The house we illustrate in our present number is faced with double-pressed Burham bricks (the stables and offices with wire-cut Burham bricks), and has Portland stone dressings. Red bricks are sparingly used in panels, under the eaves and strings. The eaves project considerably from the face of the wall, and have a panelled soffit of Portland stone, supported on carved cantilevers. Polished granite and red Mansfield stone are used externally, and serpentine and Plymouth rock internally, in decoration. The roofs are covered with the Broomhall

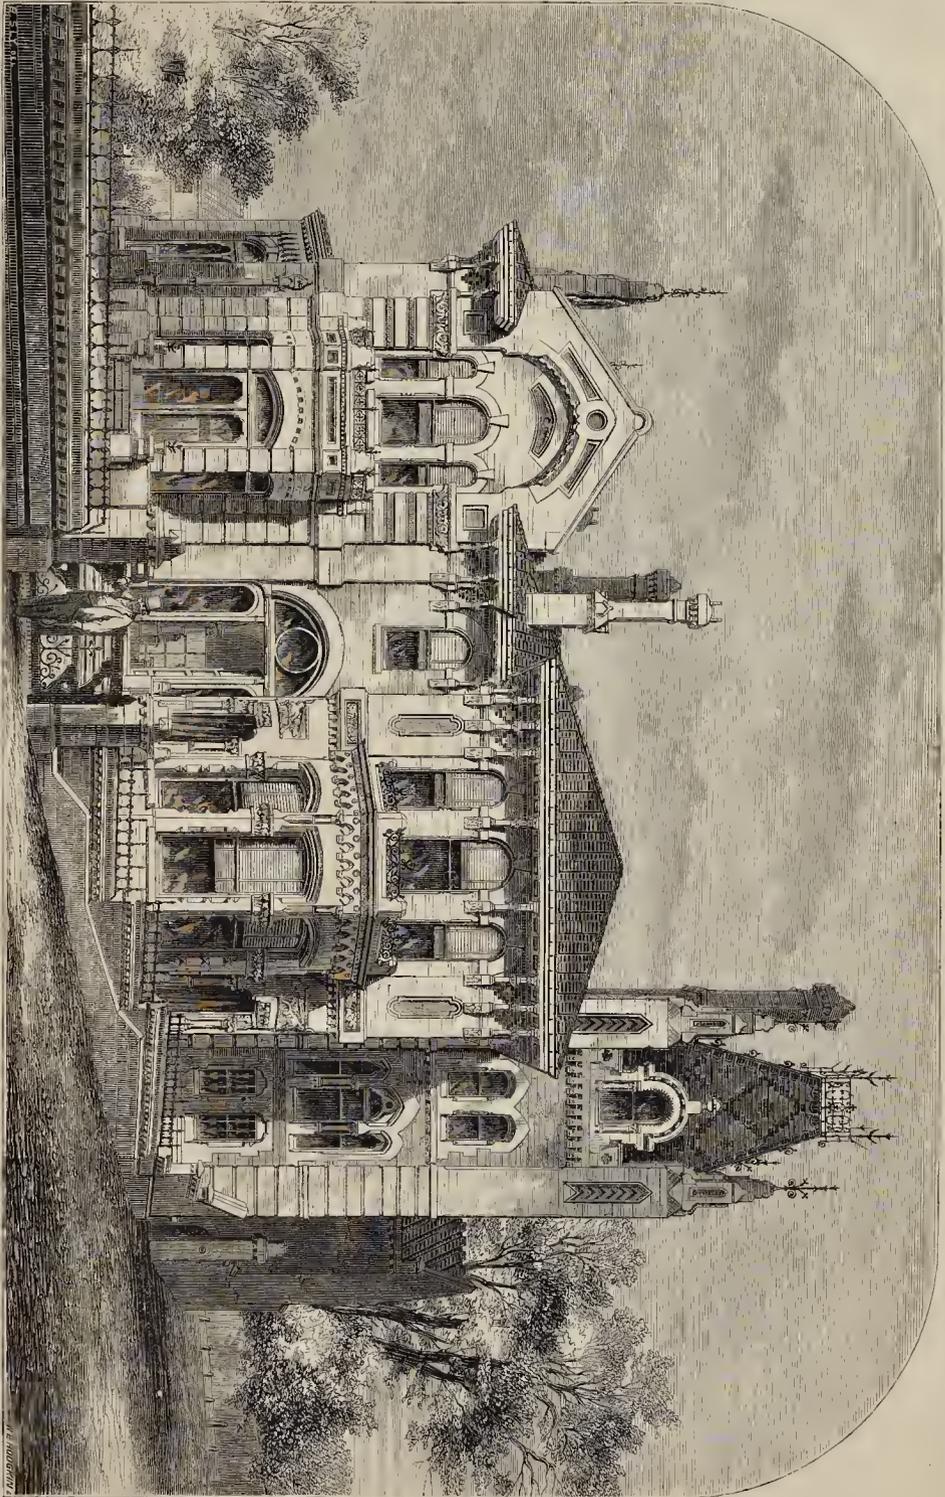

Company's patent tiles. Portland stone has been used internally for principal staircase, hall window, and screen between hall and vestibule. The hall, vestibule, and conservatory are paved with Minton's tiles.

There are open stained deal roofs over the hall and billiard-room. The joiner's work generally is of pitch pine, and carved work is introduced in the doors and other parts of ground floor. The drawing-room and dining-room ceilings have pitch pine ribs and cornices, and the library ceiling is wholly of pitch pine. Arrowsmith's parquet has been used for the floors of the principal rooms. The furniture was made from special designs. Parts of the house are heated by hot water.

Mr. J. S. Nightingale, of Westminster, was the architect.

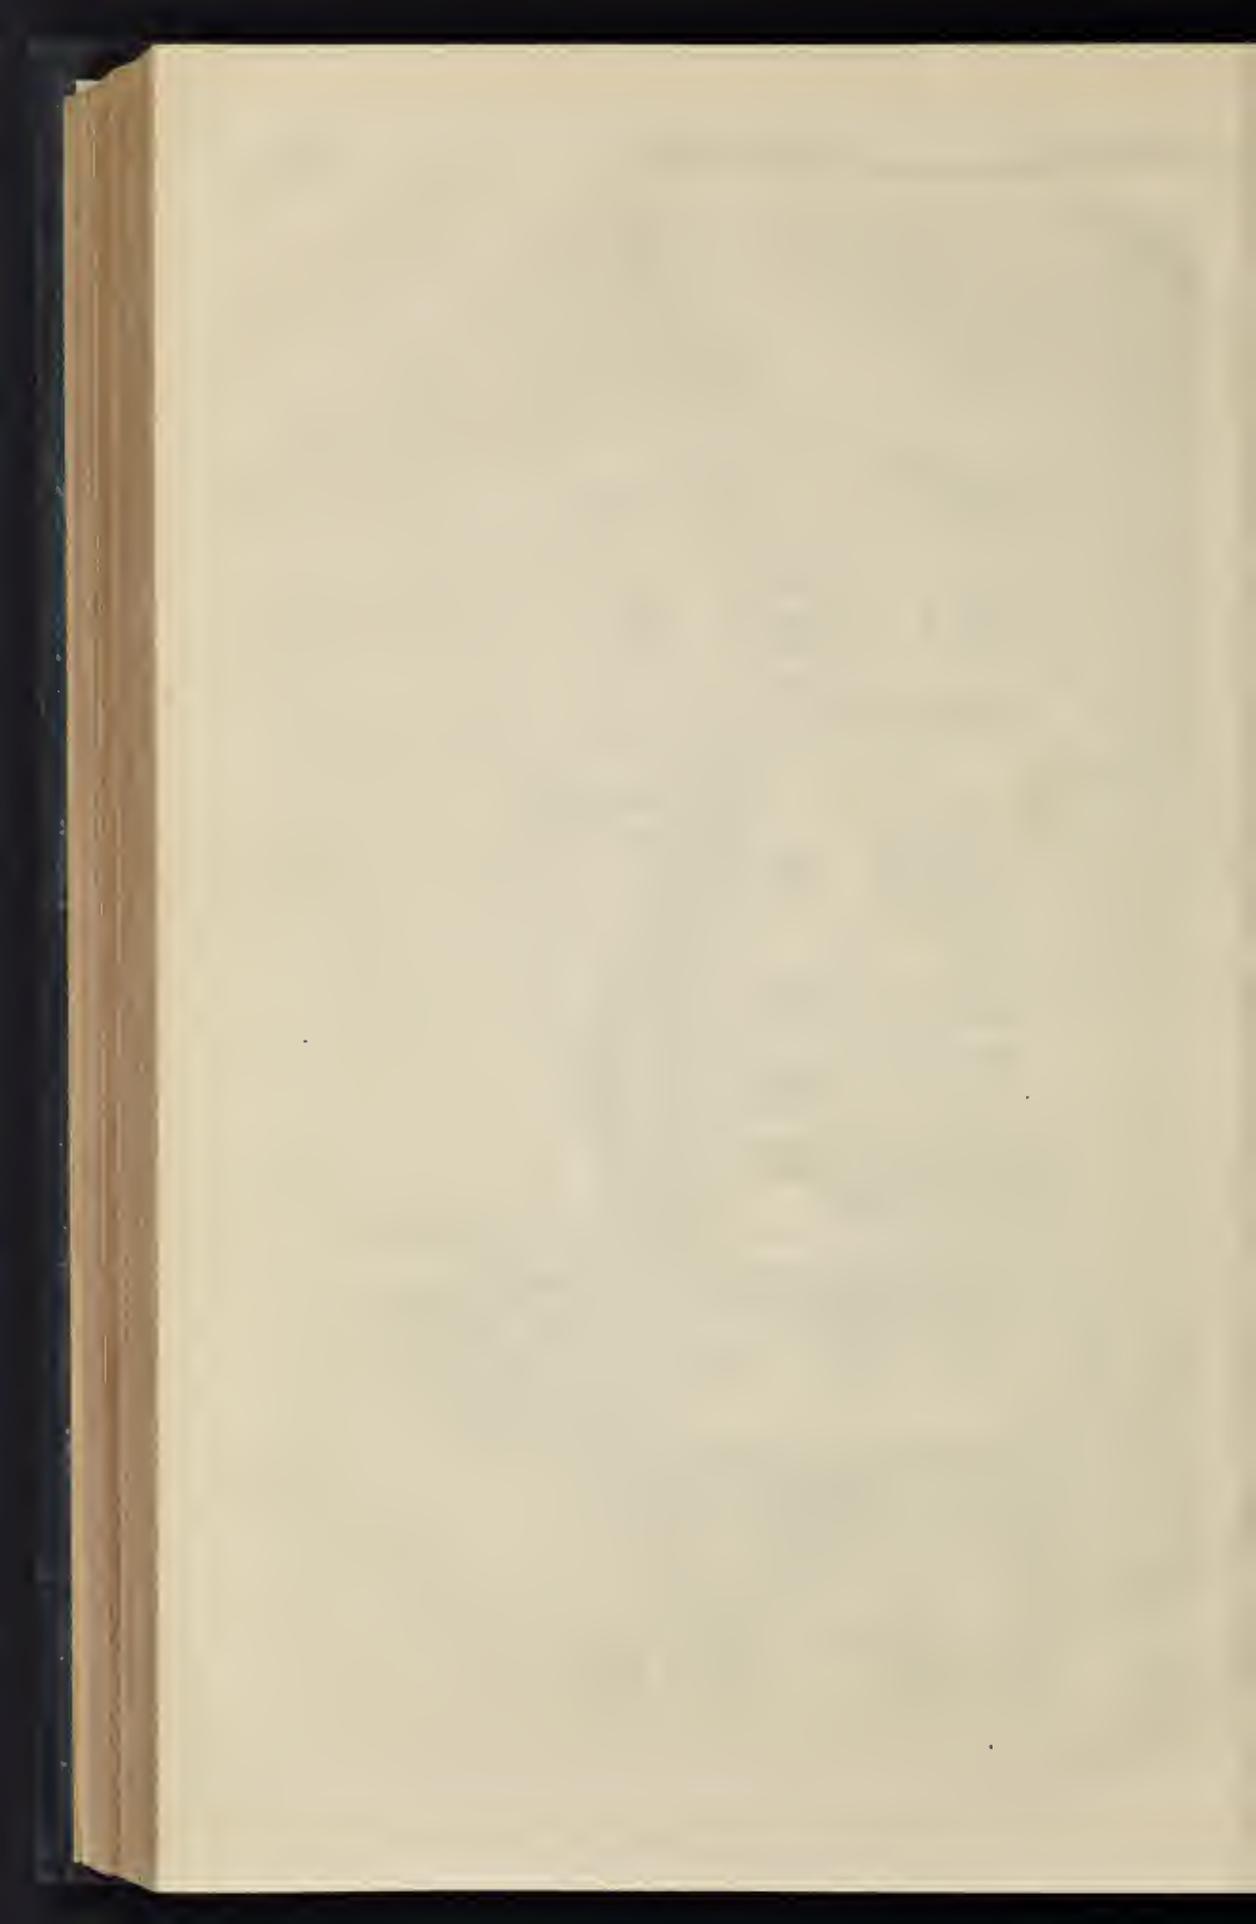

The chimney-pieces were made by Mr. Mitchell, of Brompton-road, from designs furnished. Mr. Shrivell supplied the ironwork; and the contractor for the general works was Mr. Charles Till, of Hampstead.

The cost of the house was about 9,000*l.*

“THE LOGS,” HAMSTEAD.—MR. J. S. NORMINGALE, ARCHITECT.

J. H. BURNETT

THE TRIANGULAR LODGE, RUSHTON HALL.

Long ago we illustrated this singular building, and we have since, at different times, given other particulars of it. Mr. Thomas Powell, who has been examining it, writes,—"I have also had an opportunity of examining those very interesting papers and documents which, some thirty years ago, were brought to light by the pulling down of a wall at the hall. I have not been able to do more than turn my attention to the 'building accounts,' which form a portion of those very curious manuscripts, but I have been able to ascertain from them a few distinct facts, of which the following are some:—

The beautiful fabric at Liveden was commenced, and nearly finished, before the 'Triangle,' and the parties who constructed it were two named 'Gronbolds.' The Triangle was not finished in 1595, as is sometimes conjectured, from these figures, with the letters T, T, which are placed on the outside. The work was in progress in 1596.

The general stone material was raised at the white stone and red stone 'pittes,' at 'Hawke fields.' The skunchions' (shields?) were from Pipwell.

Ordinary masons did the plain work, including the ashlar; but Freemasons executed all the symbolic matter. The names of both sets of workmen, together with those of the parties who did the windows, are given.

The Triangular Lodge has been mistaken for 'Wadener's Lodge;' they were entirely distinct fabrics, as appears from the building accounts; but of the latter there are, I believe, no remains.

During a great part of the time that both the fabric at Liveden and the Triangle were in course of construction, Thomas Tresame was in prison at Elis (Ely). To meet the cost of building, he sold, at intervals, lands at Clipston.

The 'spirit-rapping' did not occur in the Triangle. The building is simply the gratification of an exquisite taste in architecture, subverted by a deep religious trine enthusiasm.

The term 'triangle' is applied to the building by Tresame himself. I think an explanation of all the symbols might be found in the 'accounts.'

We should be glad to have the exact words in which the distinction between the ordinary masons and "freemasons" is made.

HARVESTING IN WET SEASONS.

THE prize essay on this subject, by Mr. W. A. Gibbs, of Gillwell Park, Essex, has been printed in the Journal of the Society of Arts, which Society awarded the prize. We have already given an account of Mr. Gibbs's method of drying wheat, hay, &c., by means of the hot-blast, &c., and his own account is so lengthy and diffuse that our limits do not allow us to give any intelligible quotation from the essay; but we may give an account of his wheat-drier as constructed for the Duke of Sutherland, after remarking generally that the essay first of all gives particulars as to various modes of harvesting crops in wet weather in different countries. As to a mode recommended in our column to be used at a pinch, and where elaborate and costly "wheat-driers" with their engines, fans, furnaces, wheat-hoses, hot blasts, elevators, &c., were not to be thought of or attained, even had they been then invented, Mr. Gibbs speaks of it as "an absurdity," although he acknowledges that it was "the old Roman plan," and that it has been "partially revived in Australia," and is "the last resource of a forlorn hope"—where, of course his "wheat-driers" are not even to be hoped for. To us it seems to be a still greater absurdity for Mr. Gibbs to present the country with such a system as his, by way of a solution of the problem how (short of at least half a century's progress amongst farmers in general) to harvest crops in wet seasons. The original suggestion in the *Builder*, by the way, was not the old Roman plan referred to by Mr. Gibbs, of beheading the corn "as it stands" in the fields, but after it has been cut and handed, and has stood waiting favorable weather which has never come. Then it is that the beheading process might perhaps best be done with sickle or with chopper, leaving the straw ready cut and standing as before, in the best possible position in the field for its preservation till drier weather should come. This original suggestion was certainly so far modified in our subsequent remarks

as to recommend, in very wet seasons—where it was desirable even to harvest the crop before the cutting of the straw—to save the heads at least, by at once reaping them where covered accommodation for drying straw and all was out of the question. Either of these modes, we will venture to say, will be adopted in nineteen out of every twenty cases, were one alone on Mr. Gibbs's system will; and for this plain and obvious reason, that out of every twenty farmers, either in this country, in Australia, or in any other country, for the next half-century, not more than that one is likely to be either able or willing to provide himself with Mr. Gibbs's "wheat-driers," on the chance of needing them for wet seasons. While describing his system, therefore, we venture to say that the grand problem of saving the crops of a country in wet seasons has not been solved by him, at least.

The "wheat-drier" referred to comprises a steam-engine, with cold and hot air flasks, a furnace, and a wheat-hose, covered and fitted with perforated cones on which the wheat is temporarily stacked, while the blast of hot air enters through the perforations and dries the bundles. The wheat is then taken to an elevator provided with a blast fan, also worked by the steam-engine, and which blast fan propels each bundle through a long and wide table or atmospheric hoist to the top of the stack where it is to be stored when thus dried.

By a modification of his process, rather confusedly and wordily described, Mr. Gibbs mentions that 45 lb. of "grass saturated with the heavy morning dew was dried into 9 lb. of bright green fragrant hay in fifteen minutes, by maintaining a steady temperature of 320° for the ingoing air. This [he adds] was my first experiment with steam-power in lieu of hand labour; but I have since, with my smallest model, succeeded several times in drying grass in a similar condition into perfect hay in six minutes, using a temperature of 380° and a velocity of 1,650 revolutions per minute."

In conclusion, the author says:—

"If it be remembered that this new adjunct of the steam-engine begins its work with the first crop of hay, can next be applied to wheat, oats, barley, and the whole range of cereals, is then at hand to finish the second crop of hay, and enables us to dry the artificial grasses at any season of the year, it would seem as if it were destined, perhaps at no very distant period, to complete that perfect circle of systematic husbandry which now begins with the steam-plough and ends with the threshing-machine.

When continuous employment can once be found for the 'iron horses,' we may hope to see them on every considerable farm in the kingdom, first breaking up and cultivating the soil, next mowing, reaping, and gathering the produce; and, finally, passing from field to field and from farm to farm, saving, drying, and bearing home the harvest."

Meantime, and till this good time has come (and no doubt it is coming), the world still wants some rough and ready means of harvesting crops in wet seasons.

THE INQUIRY AS TO THE FAIRFORD WINDOWS.

Sir,—In my former letter I alluded to certain specific differences that existed between the works of Albert Dürer and the Fairford windows. I shall now endeavour to show that the motives, the sentiment, and the principles under which both artists worked, were no less at variance. The artist of the windows was altogether an artist of the Middle Ages. He obeys the traditions, and confines himself entirely to the conventions of ecclesiastical art. His thoughts never stray out of their beaten path. His beauties and his defects are those of his school. The uncouth drawing that appears in the nude and lower extremities is not the result of youthful imperfection, but of the settled conviction of one who has not recognised scientific drawing as an artistic necessity. It is conventional, as is also his treatment of his subjects, and can be paralleled in abundant instances in the works of the Flemish school, in sculpture as well as in painting. The positive, quaint, almost melancholy air of the single figure of the prophet and apostles, pleasing as it is, is somewhat monotonous; no great distinction of character is attempted, by which the personality of the artist could be made known from amongst his contemporaries. Now in Albert Dürer we have quite a different man. He belongs to the *cinque-cento* school of art, rather than to that of the Middle Ages. Educated, as he must have been, with all the traditions of ecclesiastical art around him, he obeys them or neglects them at his pleasure. His ardent—nay his devoted—study of nature

appears in all his works, small or great. He is no conventional draughtsman, but one who has studied from the living model with a thorough knowledge of its anatomical construction. The splayed foot of the Flemish school, as in the Fairford windows, is impossible to Albert Dürer, and is not found in a single example known to be by his hand. It is equally impossible that so great a student of nature, animate and inanimate, could have drawn the ass and horses in the east window of the above-named church. His licence in the use of costume is like the freedom from restraint that marks him in every particular. He composes a costume for his Roman soldiers which is neither Medieval nor antique, nor of his own time, but made up of all sorts of elements; so also of other figures. Energy and power are his chief attributes: he shrinks from no difficulty, but grapples with it, where others have avoided the contingency. Let us examine, as an illustration, his treatment of the subject of the "Agony in the Garden," as expressed in the "Small Passion." And here let me observe that, in alluding to this series, I do so on account of its being favourable for such examination. If the Fairford windows cannot bear this test, they have but small chance with the larger and more important works. Most artists, in the treatment of this subject, have declined to represent the anguish of that terrible hour. The figure of our Lord is usually shown merely as praying with the sleeping disciples about him. But here, the almost convulsively-clasped hands and bowed head speak with bitter truthfulness of the mental agony of the moment, expressed in the words, "Father, if it be possible let this cup pass from me." The pathos of this little composition finds no parallel at Fairford, and in his larger composition of the same subject A. Dürer again differs from himself and the ordinary treatment, whilst the artist of the windows keeps to the old path trodden before him. The architectural background must also be contrasted with those of the two works on "The Passion," because the difference between them shows that the minds of the two artists ran in diverse directions. At Fairford all the backgrounds are Medieval; in A. Dürer's, Classic, or quasi-Classic. The distinction is important, as it shows that, whilst the one extended his thoughts beyond his own time, the other was content to represent his subject, in true Medieval conventionalism, as if the occurrences were of his own day.

Whilst upon this subject, I may allude to Mr. Taylor's inquiry of Mr. Clayton respecting identity of background at Fairford with Nuremberg details.* The towers, &c., in the window may easily be illustrated in old towns on even the Lower Rhine, as at Andernach, as well as in the old Belgic towns. But a glance at Braun's views published in the sixteenth century will show that it is not necessary to travel much beyond the German Ocean to illustrate the scenic backgrounds at Fairford. Of the style of the canopies, I stated at the meeting of the Architectural Institute on the 6th inst. that not a single example of Nuremberg detail was visible there,—indeed, I exhibited a tracing from German glass in my possession, showing the distinction. I also stated my opinion that the canopies were distinctly Flemish.

Having thus stated what, in my opinion, are distinctive differences fatal to the attribution of the windows to the hand of A. Dürer, with whose special style I find no agreement, it may be interesting to point out other works of the same age in our churches, having a close analogy with them. In the north transept of the Abbey Church of St. Alban is a representation of the "Incredulity of St. Thomas," in mode of treatment and character similar to that at Fairford. Among the very pretty examples at West Wickham, Kent, perhaps a few years earlier in date, we find details similar to some in the windows under consideration. Such, for instance, as the sword in the hand of St. Catherine, crown, &c., and the head of St. Christopher will certainly compare with the best of those at Fairford. But the very curious series of wall-paintings in the Lady Chapel at Winchester Cathedral, though almost effaced, of great merit as designs, contain many indications of being executed by one of the same school and period. The urban worn by some female figures in the windows, as also the executioner in the "Judgment of Solomon"—a remarkable and very distinct costume,—the ample skirts of the females generally, the broad-toed shoes, all ap-

* See p. 845, ante.

pear in the paintings. Now, these are valuable for comparison in one point at least,—viz., they furnish a date. The paintings were executed by Prior Silkeste in 1489. Now, I utterly throw from this inquiry all tradition. I place no trust in it. But working from independent sources, comparisons of costume and the like, I should certainly place the date of the Fairford windows in the fifteenth rather than in the sixteenth century. In fact, every bit of evidence, given out by themselves, points to that conclusion. There is another very interesting work for comparison that is Flemish, having close analogies with the costume in the Winchester and the Fairford works. I allude to that magnificent volume of the "Roman de la Rose," Harl. MSS. 425, in the British Museum. It is many years since I have examined it, but I have memoranda which certainly refer to it, with the above, to a common school of art. This work dates about 1480. I much regret that when at Fairford I neglected to note particularly the details of the kneeling figure in armour in the west window of the south aisle, because here we should certainly find data which would solve this interesting point to at least within a year or two. As it is, looking upon the subject in a purely archaeological point of view, the date of the windows must not trespass much beyond the boundary of the fifteenth century. The Dantesque picture, whose identity with the windows Mr. Taylor could perceive, yet singularly enough not how much it diverges from the style of A. Dürer, now takes its place as a witness for the attribution of them to the Flemish school (*vide Builder*, 7th instant), and also bears upon the question of date as the artist, Dierick Stuerhout, died in 1478, close upon the time in which the above referred to works were executed.

Supposing that we admit Mr. Holt's postulate that A. Dürer was engaged at one period of his life in designing for painted glass, which is probable enough, yet this is as far as ever from proof that the Fairford windows are by his hand. Many others were working in the same direction, and our task is to decide by the *only* certain means left us, viz., comparison of styles, whether they are by the hand of Dürer or from one of another school. No amount of personal history, short of direct proof, can stand in the way of this test. To sum up in brief, my objections are:—1. That the mind of the artist of the windows and that of A. Dürer, as shown in the treatment of the same subject, differs materially. 2. That he is inferior in artistic ability and knowledge. 3. That the details of his work, costume, architecture, &c. do not coincide with those shown in A. Dürer's compositions.

J. G. WALLER.

DANGER IN THE CEILING.

YOUR correspondent very properly calls attention to the accidents from the fall of plaster ceilings. I think, however, that these mishaps sometimes take place not through any scamping in the work, but owing to the plasterers fixing the laths so close that no proper key can be formed behind; hence, either vibration or a sudden jar will detach considerable portions. Sometimes, also, floors are constructed with a slight camber, and the plasterers in their endeavours to make the ceilings under them perfectly level increase the thickness towards the centre, so that the additional weight alone breaks the key and brings down the plaster.

While on the subject of ceilings, however, I have a caution to give. Possibly some of your readers may know a small covered way called Trinity-place, next to Stanford's, the publisher's, at Charing Cross, leading to official chambers in the court at the rear of Northumberland House. This passage is 6 ft. wide and 35 ft. long. The ceiling consists of eight iron joists, with Yorkshire rag stones bearing upon them. Passers-by supposed this to be mere fireproof construction. Not so, however; for it seems the party-walls between the houses facing Charing-cross rested on the centre of these cast-iron joists, which were put in about thirty-five years ago. On the night of Saturday, the 14th inst., loud reports were heard; and on Sunday morning, by a timely discovery, it was found that seven of the cast-iron joists had snapped in the centre, and it was a providential circumstance that a great catastrophe did not take place. Fortunately labourers were at hand; the front wall was shored up, and stout timbers wedged up under the cast-iron joists, sufficient to prevent further

mischiefs. A more striking instance could hardly be found to show the great danger of using cast-iron in such positions. It was suggested that the wires of the Electric Telegraph Company, which touched the iron, might have had some effect upon it; but being sheathed with india-rubber, they could have had no injurious influence upon the metal. B. F.

SIR,—The suggestion of your correspondent, of straining wires across bad ceilings to prevent their falling, is very good in its way, but will only apply in cases where the surface of plaster is sufficiently hard to resist the cutting of the wire; besides, the process of fixing will be attended with considerably difficulty. My remedy for old cracked or dangerous ceilings is papering. The strength and durability of paper in this respect is almost incredible, and very little known. Ceilings with a very threatening aspect, and appearing in a very bad way, have, to my knowledge, been sustained twenty years or more by two or three coats of paper. In extreme cases, brown paper, well lapped previously to the white or lining paper being laid on, is necessary.

I can say, after many years' experience in this branch of the building trade, I have never known it to fail, and can recommend it both as a remedy and a preventive.

THOMAS DAWSON.

THE SPIRE OF SALISBURY CATHEDRAL.

A CORRESPONDENT writes thus:—"Some weeks ago, being in Salisbury, I was assured by a gentleman who resides in the Close, and is connected with the cathedral, that the beautiful spire was not constructed of stone, but of some composition of lime or cement, resembling concrete. He said also that our forefathers had a knowledge of such mixtures, which has been lost. This was a new idea to me; but having read several of your recent articles and letters on the subject of cement or concrete structures, I see no reason to doubt the accuracy of my informant's statement. If you will be good enough to allow this to appear in the *Builder*, it may elicit interesting information as to the real material of which the Salisbury spire is made from any one who may have examined its nature."

This notion seems to be somewhat extensively entertained, for within three weeks we have received the inquiry from three different quarters. It may be as well, therefore, to set it at rest definitely, and this we are able to do with the authority of Mr. T. H. Wyatt, and Mr. Fisher, the clerk of the works at the cathedral. The latter gentleman, we may say, and his father before him, have had charge of it for about 100 years, and he knows every stone in it. The statement, then, is incorrect. The spire is built of Chilmark or Tishny freestone ashlering, solid. The tower is built of the same material, but is not solid, being filled in with a very hard material, similar to concrete of the present day: this filling has hitherto been found to be very firm, and some statement with regard to it has probably led to the misapprehension as to the material of the spire.

ROAD-MAKING.

THE paragraph of "X. Y. Z." on roads seems to have attracted attention, and my endeavour to enlighten his darkness by quoting from some of Telford's specimens has aroused a host of writers anxious to question the enlarged knowledge and experience of the great leviathan of road-makers.

I am not disposed, even if you would afford space, to nearnith the subject of Telford v. M'Adam roads, as that subject was thoroughly investigated and sifted by the last generation of engineers, and all the scientific men of that day acknowledged the superiority in every respect of the system of constructing roads as laid down by Telford over those constructed by M'Adam. It was scientific and more durable, and therefore cheaper; it lessened the tractive power of moving bodies as established by many experiments, and therefore lessened the labour of horses, and promoted economy of transit,—important points in these days, and don't so in those of inefficient communications. Your correspondent "Pro" takes exception to the laying on of 6 in. of metal at one time.

That was part of Telford's practice in making new roads: it has been found to answer in numerous cases, and I have known 12 in. put on in one coat in the iron districts of Staffordshire and South Wales without any great inconvenience, as the covering of fine cluders or "binding" soon formed a smooth surface for the feet of horses and the wheels of carriages.

And, if your correspondent has not tried the effect of the steam-roller on newly-laid metal 6 in. or more in thickness, with just sufficient "binding" to fill up the interstices of the stones in forming and consolidating a roadway, I would recommend him to try the experiment, and let us have the advantage of the result.

As to the assertion that M'Adam roads are cheaper in town than pavements, "Pro" cannot be aware of the numerous experiments that have been made and data derived from investigating this subject in London, Liverpool, and other places; and I dare say if he could procure the trustworthy reports of Messrs. Haywood, Newland, and others on this matter, he would rather modify his opinions.

If you take the first cost of a well-constructed pavement, and the annual wear and tear, and compare it with a macadamized road under similar circumstances, you will find the advantages are materially in favour of a pavement, which was candidly admitted by Sir James M'Adam in his evidence given before Parliament on this subject. There are other questions to be considered besides the mere comfort of horses travelling over roads; the best surfaces for them to travel swiftly over are not always the best for moving heavy weights. We have to consider the relative power required to move a given weight, and that surface that will economize the labour of draught to the utmost degree is the best adapted for the streets of towns.

Paved surfaces are not always slippery; there are millstone grits, syenites, some granites and other stones that are not slippery, and, if well laid on a good foundation, with open joints crammed with fine gravel or stone chips, they will make a fine foothold for horses.

Mr. Morgan appears to be also a disciple of M'Adam, and takes exception to a foundation for a roadway; while I consider, with Telford, that it is a *sine qua non*. We do not want an elastic surface that would obstruct heavy weights at every foot as they advance, but one that would carry and support weights unyieldingly as on our railways. I have travelled on railways with a yielding roadway, but it is not pleasant; it forcibly reminds me of being afloat in a small boat on a short and chopping sea, and must involve a great sacrifice of moving powers.

I think a solid foundation for a roadway, of concrete or otherwise, as essential as one for a house, a castle, or a bridge; it is the neglect of this that renders the streets of many of our towns so very unsatisfactory.

Again, he objects to the "binding" as applied in Telford's practices; but that serves to fill the interstices of the stones, and to cement them together, and forms a smooth surface for horses' feet and the wheels of carriages; but the system of applying scrapings or street sweepings, as adopted by the late Pigott Smith in Birmingham, made their streets more like ploughed fields when applied, very heavy for the traffic while consolidating, and an intolerable nuisance to the inhabitants. In reconstructing a roadway I should pursue the course I have indicated above, and as I have carried out on hundreds of miles of road in this country and abroad; but in ordinary and casual repairs I should pursue the system of coating and patching, of just sufficient thickness to maintain a good surface and a correct cross section. No precise or exact thickness of coat will apply in all cases.

I should "lift" if necessary, and the road was strong and would bear it, but "lifting" weakens the foundation of a road, and, I believe, has been carried sadly too far in this country, as road trustees and bondholders know to their cost.

The use of water to roads in the winter months is unnecessary and injurious, as we have frequent showers of rain quite sufficient to assist in the setting of the metal, if all the other matters are properly prepared and arranged, as it is only during the winter months (October to March) that the principal repair of roads and streets should take place.

As to the policy of laying on metal on dirty surfaces, such as are some of the metropolitan roads during the winter, ankle-deep in mud, without any previous preparation, this would be absurd; a thin coat, or sprinkling of stones, as

suggested, would be lost: they are obliged to apply a thick coat that would lead the traffic clear of the seaway of thick, liquid, floating mud.

The object of screening metal is to take out a part of the dirt that collects in the course of quarrying, carting, and breaking the metal, as the proportion is usually too great to fill up the interstices of the stones, and soon appears on the surface in the shape of mud: the application of binding on the surface of sufficient quantity to work in and fill up the interstices, is found in practice the better plan, as it works down the more readily, and sets more expeditiously. I think I have noticed the principal objections of your correspondents, which I did not originally intend, but the importance of the subject unwittingly drew me on. B. BAYLIS.

HYDE PARK.

MAY I be permitted to point out in your columns to the authority to whom we are indebted for the present beauty of Hyde Park, an improvement which may appear trivial until the result has been shown?

The Achilles statue, which would be seen to stand out with great effect on entering the gates at Hyde Park Corner, is now completely shrouded from view by the trees in front of it. If two or three of these were removed to the back of it, and a bed for flowers sunk in the slope leading up to it, this place, which is so much frequented during the season, would then possess all the beauty which can be given to it. A. P.

CONDITION OF FARNCOMB, SURREY.

LOCAL BOARDS OF HEALTH.

I LEARNT from your paper some time ago that a sanitary deputation waited upon the Duke of Marlborough to represent the defects of the present sanitary laws.

The organization of a central governing power has now become a necessity of the time. Members of local Boards of Health in many instances are quite incompetent, thereby saddling the ratepayers with unnecessary expenditure. It is not much to be surprised at. How can it be expected that the class of tradesmen and farmers who generally compose a country local Board of Health can have any idea as to the best plan of obtaining a water supply to a town, or the best means of sewerage and disposing of the sewage, and many other questions connected with sanitary engineering? And as they have their daily business to attend to, I consider it is hardly fair to expect more of them than they do at present. I consider the wholesome sanitary affairs of England ought to be in the hands of the Government, as towns or districts could then be grouped to advantage.

The present Boards of Health, I will admit, are adepts at contention, and waste much of their time thereby, and often create a party spirit in the district, which is much to be regretted, to say nothing of little jobbery affairs that the surveyor has generally to take upon his shoulders.

From recent statements as to the water supply to Guildford, it is seen that after laying out a great deal of money upon old waterworks the water is not fit to drink, thereby raising doubt in the minds of the inhabitants whether the bad quality of the water was not the cause of the outbreak of fever there this last summer.

I observed in the *Surrey Gazette* of the 7th of November that a letter was sent from the municipal department of the Privy Council to the authorities of the next town of Godalming respecting their water supply and drainage.

I have not heard of the fever reaching Godalming yet, but I hear it has got to the adjoining village of Farncomb, where, I am informed, the sanitary arrangements are miserably defective. The water from the sinks runs through a hole in the cottage walls to soak away in the ground. The privies in many cases are within a few feet of the wells. In thunder-storms, the cesspools sometimes overflow, and run down the streets of the village; and open ditches, full of black sewage, were covered in places with a green scum, when I was there in the summer.

What a wonder they should have fever come amongst them! Several gentlemen tried to bring about the draining of the village, but they

met with so much opposition and illwill from small freeholders owning cottage property, that the project fell through. Amongst other things, tenants occupying cottages at a rental of 2s. 6d. to 3s. per week, were told, if the draining of the village were carried out, the tenants would have their rents raised 6d. per week per cottage.

What course has been taken since the outbreak of fever in the village I do not know; but if remedial measures have not been taken, it is time something should be done.

LOOKER ON.

THE THAMES EMBANKMENT.

SIR,—This noble work stands some chance of becoming an eyesore very soon; and, as the remedy is at hand, no reason exists why every nook and corner should be considered an improvised "stopping-place." The stains are painfully visible, and certainly are becoming detrimental to the appearance of the place. The distance is great from end to end, and there is ample space within the hoarding for any amount of conveniences to be erected. The stairs leading to the embankment at Waterloo Bridge are also filthy; and, although lamps have recently been placed there, they alone will not abate the nuisance. The light of the *Builder* must shine on it. J. G.

AS TO GALVANIZED IRON FOR PRESERVING OR CONDUCTING WATER.

SIR,—A correspondent in your last week's journal inquires whether "galvanized iron" can be used for water-cisterns with safety.

In reply, I beg to state that I have turned my attention to the action of water on lead and zinc for a period of thirty years, and regret to say that "galvanized iron" (sincd iron) is nearly as injurious as lead for receiving or transmitting water intended for domestic purposes. If water is capable of acting upon lead, it will also act upon galvanized iron, and I would recommend your correspondent to substitute *slate* for the above metals,—*i.e.*, slate cisterns.

For transmitting water the pure tin pipes, or enamelled iron pipes, are preferable to any other with which I am acquainted; but the former are more expensive than the latter, though the enamelled iron are sometimes liable to impart a little ferruginous taste to the water.

HENRY OSBORN, M.R.O.P., Lon.

REPORTS ON THE PARIS EXHIBITION.

SIR,—Having unintentionally attributed, in a report I wrote on Class XVI. of the Paris Exhibition for our Government, the credit of having executed a very satisfactory reproduction of a picture of "Pride's" by Mr. Poynter to Mr. Powell, of Whitefriars, instead of to Messrs. Harland & Fisher, of Southampton-street, Strand, I desire to make any reparation I can to them for this slip of my pen.

I shall esteem it a personal favour if you will allow these few lines to appear in the next number of your Journal. M. DIGNY WYATT.

ROUNDBABOUT WAYS.

SIR,—I take the liberty of enclosing some advertisements which seem curious in their way.

The East-Indian Railway Company require tenders for 800 tons of coal and 200 tons of coke, to be made by one of three firms named. As the firms by whom the tenders are to be made are all named, what on earth is the use of advertising for them? Ordinary intellects would suppose that it would be sufficient to write to the three firms, and ask their price. There may be some wise purposes in this, but it is inscrutable.

From the other two advertisements we learn that the Admiralty wish to send six officers and 154 soldiers from Leith to Dover, and eight officers and 174 soldiers from Milford to Portsmouth. Common people might rashly suppose that with hundreds of steamers at the disposal of the Government, the way to get this service effected would be to put the soldiers, &c., in question on board one of them at one port and take them to the other; but no, tenders are required for the service, to be made on "printed forms," to be supplied by the Admiralty, and

"The bundle is in the pointing of the advertisement, which stands thus:—

"EAST INDIAN RAILWAY COMPANY. The East Indian Railway Company is prepared to receive TENDERS for the supply of, 800 Tons of best Sulphur Coal; also 200 Tons of the best Foundry Coke.

To be made by one of the following firms, viz., Messrs., &c., &c., and to be delivered at Calcutta," &c. It is not the "tenders" that are to be "made," one of the firms named, but the "coke" and the makers of coke would not necessarily tender for the transmission.—Ed.

sent in "in sealed envelopes," and no doubt, though this is not specified, to be tied with red tape. I am told there is a tradition current in Government offices that some important province or island was once given up uselessly by this country, because the "official personage" who conducted the negotiation had got the least idea where it was, and did not choose to confess his geographical ignorance. It is possible that Leith and Milford represented some far-off unknown localities, instead of places twenty-four hours apart by sea, or twelve by rail? or are these curious advertisements simply examples of the mighty power of routine? CENSOR.

RESPONSIBILITY FOR DEATH FROM DEFECTIVE PLANS.

IN the Court of Exchequer on Saturday last (Sittings in Banco, before the Lord Chief Baron and Barons Chanell, Pigott, and Cleasby), the case Moore v. Denton and Shipway was decided. This was an action under Lord Campbell's Act, by the widow of a bricklayer, in behalf of herself and children, to recover compensation in damages for the loss of her husband. It appeared that the defendant shipway, a publican, employed the other defendant, Denton, who was a builder, to construct a public-house in the neighbourhood of Finchley. Shipway also employed a man named Thomas to prepare the plans and superintend the works. In consequence of an admitted defect in the plans and the structure, a wall fell and killed the husband. It was sought to make both the defendants liable, on the ground that they must have known that Thomas was incompetent to prepare the plans and to superintend the building. The evidence went to show that he was a carpenter by trade, and had acted as foreman of carpenters and as general manager to a builder. The trial took place before Mr. Baron Pigott, in Middlesex, and resulted in a verdict for the plaintiff—damages, 600*l.* It transpired that the plaintiff was not likely to realise the fruits of her judgment against Denton. During the present term a rule was obtained on the part of Shipway to set aside the verdict for the plaintiff as regarded him, and enter a non-suit, or for new trial.

Mr. M. Chambers, Q.C. (with whom was Mr. J. Bridge), had the honour to address the Court. He contended that there was evidence to show that Thomas's incompetency must have been known to Shipway.

The Court (without calling upon counsel to support the rule) said the rule must be made absolute to set aside the verdict against Shipway, and enter a verdict in his favour. They did not think the evidence proved that Thomas's incompetency was known to Shipway. A foreman of carpenters and a manager to a builder might be perfectly competent to do the work which shipway employed Thomas to perform; and it was clearly Shipway's interest to entrust the work to a competent person, as he was laying out a large sum of money upon the building. Under these circumstances their judgment would be in favour of Shipway.

CASES UNDER METROPOLITAN BUILDING ACT.

ALTERATIONS.

At Marlborough-street, Mr. Edwin Bull, architect, Holes-street, was summoned before the magistrate by Mr. Jennings, district surveyor, South Marylebone, for certain fees alleged to be due for alterations to a house, No. 9, Duke-street, Portland-square.

It appeared that the house had been rebuilt, and a claim for district surveyor's fees made in due course, one fee being "for inspecting arches under public ways, &c.," which was objected to by the defendant, on the ground that the arches had not been touched. On this objection being made Mr. Jennings withdrew his claim, substituting a tender of 7*s.* 6*d.* for alterations made to buildings the roof had been covered in, such alteration having reference to the cellar in front of the house, and being explained by the surveyor to mean the taking down of a portion of the area wall on which the area railing stood. This alteration the surveyor contended entitled him to half the fee charged on a new building.

The defendant denied his liability, contending that what had been done was by way of necessary repair; and further, that vaults and cellars under public way could not be deemed "buildings" under the Act.

The magistrate was of opinion that a cellar was a building, and that taking down a portion of the area wall was the same as dealing with the external wall, entitling the surveyor to his fee, and made an order accordingly. He thought it, however, a hard case.

SANITARY MATTERS.

At the Clerkenwell Police Court, James Clark, of Union-square, Islington, was summoned before Mr. Cooke, at the instance of the authorities of the parish of St. Mary, Islington, for having a workshop so crowded, while work was carried on, as to be dangerous or prejudicial to the health of those employed therein. Mr. Robert Dunham, one of the sanitary inspectors, said he visited the premises in question on the 30th of October, and found in one room thirteen persons employed in the manufacture of artificial flowers. The length of the room was 18 ft., breadth, 13 ft., and height 10 ft.,—2,340 cubic feet, giving to each person employed 180 cubic feet. The superficial feet of flooring was 234, giving to each person 18 ft. Dr. Ballard said the cubic feet of air allowed to each person was not enough. There was a partition in the room which did not reach the ceiling by 4 ft., and, perhaps, if that were taken down, the room would be sufficient for the purposes of the parties employed. After a long discussion between the magistrate, Dr. Ballard, and Mr. Ricketts

for defendant, it was agreed to remove the partition; and, if that answered the purpose intended, all proceedings would be stopped.

A correspondence has taken place between the new Archbishop of Canterbury (Dr. Tait, late Bishop of London) and Mr. R. Arthur Arnold, respecting recreation-grounds for the poor in Lambeth, the latter suggesting that a portion of the lands attached to Lambeth Palace might be advantageously devoted to this purpose. In reply to a communication to this effect, a letter has been sent informing Mr. Arnold that "his letter shall receive full consideration," but that the new prelate "is not at present in a position to enter upon the subject of it." Mr. Arnold is also reminded that "the late archbishop allowed the use of the Lambeth Palace grounds to the cricket clubs at Lambeth."

There is typhoid fever in Keswick, where a man has just died of the disease, which, it is said, was solely occasioned by the exhalations of decomposing matter in a loathsome pit, over which it was his misfortune to lodge.

MANAGEMENT.

The part of the approach to the New Meat-market east of Farringdon-road was opened for carriages on Tuesday morning. One of the water companies took the opportunity of opening the roadway of the section west of Farringdon-street (leaving room for one line of vehicles to pass) on the same morning, having neglected availing themselves of the six weeks' time they had to effect their purposes.

SOCIETY OF PAINTERS IN WATER COLOURS.

The seventh winter exhibition of so-called Sketches and Studies (427 in number), by the members of this society, includes many charming works, but differs very little, as we have had occasion to say of their winter exhibition before, from the ordinary spring show. It seems to us it might be as well for the Society to recognise this fact, and to lessen the inducement that may thus be given for hasty and incomplete work, that they should to a certain extent limit the number of members, and limit to a certain extent the right to exhibit. We throw out this hint as one worth consideration, previously to March next, when Associates are to be elected. If the Society in return should desire us to select for ourselves six or eight pictures as a present out of the present collection, we should presently present a list with a strong presentiment, that in our presentment we were naming the artists to whom the exhibition is the most indebted, and it would run thus:—Mr. Gilbert's "City of Worcester" (92); Mr. Lundgren's "Spanish Gipsy" (98); Mr. Lamont's "Illustrations of Bonny Kilmory" (133); Mr. Burne Jones's "Head" (160); Mr. J. D. Watson's "Waiting for the Boats" (186); Mr. Birket Foster's "Sea" (191); Mr. G. H. Andrews's "Ebb Tide" (273); and Mr. F. Walker's "Lilies" (367). There are some others as good, but we are not avaricious.

METROPOLITAN BOARD OF WORKS.

At a meeting of the Board last week, the first business was to receive tenders for new sewers and filling up the open ditches in Wood-lane and Lawn-place, Shepherd's-bush. There were seventeen competitors, the highest tender being 12,200*l.* and the lowest (of Messrs. J. & S. Williams) 6,500*l.*, and the latter was, on the motion of Mr. Freeman, seconded by Mr. Layman, accepted.

Mr. Silas Taylor moved, "That the Board do limit the amount to be paid in one year for local improvements to a sum not exceeding one halfpenny in the pound upon the rateable value of property chargeable for that purpose." He did not consider it fair that the ratepayers living in remote districts should be called upon to pay for City improvements.

Mr. Healey seconded the resolution, believing it was necessary to limit the amount of expenditure.

A long discussion ensued, during which it was urged that the Government should aid the Board in making improvements such as the Thames Embankment, which was a national improve-

ment. It was suggested that a small tax in the shape of a halfpenny or a farthing stamp should be charged on metropolitan railway tickets, the revenue to be expended on metropolitan improvements. It was further argued that the great improvements benefited the community, for which all should contribute. Finally, it was agreed to refer the question to a committee.

FROM SCOTLAND.

Edinburgh.—The offer of an ornamental fountain for the adornment of the city having been received, says the *Scotsman*, with objection and opposition in almost every quarter, rather than with encouragement or thanks in any, is now likely to be withdrawn. The suspension of the Caledonian Railway Company's station works at the west end of Princess-street has indefinitely postponed the prospect of a site being found for the Ross fountain in that quarter; and the only place now open appears to be that originally proposed in the terrace of East Princess-street-gardens. If that site is generally considered to be eligible, no time should be lost by parties who desire to secure the gift of the fountain in taking action in the matter; for the intending donor is so wearied by delays that he is now resolved to bring the matter summarily to a close.

CHURCH-BUILDING NEWS.

Ewyas Harold.—The church here, which had been in a state of decay for many years past, has now been restored. The work of restoration has been to take down a portion of the tower, which was very much shattered, and rebuild the same, replacing stone for stone wherever possible, and adding new stonework of its original form. The white-washed ceilings have been removed in every instance, and have opened to view an oak-framed roof, which has been renovated and re-covered with local stone tiles and ornamental cresting; the timbers have been oiled. New one-light and two-light windows have been inserted alternately in the nave, and a new three-light window in the east end of the chancel. An archway has been opened out between the nave and the tower, giving increased accommodation for sittings. A new vestry has been erected on the north side of the chancel, and at the south doorway a new oak porch has been built. A heating apparatus of simple construction warms the edifice. The passages are paved with Godwin's tiles. The tower has been underpinned at the north-east corner, the sinking of which had caused a large rent, and the north wall of the nave, which bulged out badly and had recently been propped by modern buttresses, has been rebuilt. The windows throughout are filled with cathedral tinted quarry glazing. The pulpit, the open seating, and the stalls (the original worked in) are wholly of oak, and are made up principally of specimens of sixteenth-century carved panelling, the retables in particular. The doors, lectern, and altar-rail are of oak, the latter being supported on ornamental iron standards of a foliated design. The bells were originally five in number, but some of them were cracked. They have since been recast by Stainbank, of London, and one added. They were hung by Messrs. Alfred White & Sons, of Besselsleigh, Oxfordshire, bell-hangers for Mears & Stainbank, and who, with other members of the same family, constitute the set of Appleton chango-ringers. The bells, in addition to the name of the founder, bear the following inscriptions:—"Treble, 'S. Ethelbert—Blessing;" second, "S. Mary—Glory;" third, "S. Peter—Thanksgiving;" fourth, "S. David—Honour;" fifth, "S. Nicholas—Power;" tenor, "S. Michael—Be unto our God for ever and ever. Amen. W. Jones and T. D. Kedward, Wardens." In the chancelryard is a restored cross, a small part only of which belonged to the original. The whole work has been executed by local contractors, Messrs. Edwin and James Giles, of Ewyas Harold, from the design and under the direction of Mr. G. C. Haddon, of Hereford and Great Malvern, architect.

Folkstone.—The report of Mr. Christian, the architect appointed to make an estimate of the probable cost of thoroughly repairing the parish church, has been presented to a meeting of the committee, the Rev. M. Woodward in the chair.

The several items and the expense of each were as follows:—In south transept—rebuiding the wall, raising the gable, alteration of the windows, roofing, re-arrangement of tower-stairs, removing the south gallery, and preparing the floor for the reception of the organ, 237*l.*; in the south aisle of the chancel—rebuiding the wall, inserting new windows, and a new roof, 165*l.*; in the north aisle of the chancel—new windows, new doors, and thoroughly repairing 186*l.*; repairing and cleaning the stonework of the tower, 55*l.*; refitting the nave seats, 104*l.*; new choir-stalls and re-arrangement of corporation seats under the tower, 135*l.*; colouring the ceilings, &c., 90*l.*; heating the church with hot-water pipes, 250*l.*; making the gas-standards uniform throughout the church, 100*l.* Ten per cent. might be added for contingent expenses. It was announced that about 400*l.* had already been promised. After some little consideration, it was resolved to proceed at once with the south transept, the north aisle of the chancel, the cleaning of the stonework under the tower, the organ, and the new choir-stalls, as it was not thought possible to get the heating apparatus ready for this winter. It was also decided that a complete canvass of the town should be made.

Burwell.—The chancel of Burwell Church has been re-opened for divine worship. The chancel has been erected at a cost of upwards of 1,300*l.* All the ancient carved panel work, the decorated screen, and carved oak roof have been restored. The roof has been re-leaded, the plaster removed from the outer walls, the windows renewed, and filled with tinted glass,—the carved niches restored; oak stalls and seats erected in the place of the square pews, and the floor laid with encaustic tiles. The eastern wall is faced with plaster, and it is hoped a suitable retable will soon occupy the place of this unsightly wall.

Eltham.—The Bishop of Rochester has laid the first stone of the new church, to be called the Church of the Holy Trinity, at Eltham, and also opened the new national school-rooms. The church is being erected by public subscription, on a site granted by her Majesty. Mr. Street is the architect. The schools, with the master and mistress's houses, have been erected partly by means of funds belonging to the school, but principally by the subscriptions of the inhabitants. They are large enough to accommodate 400 children. Mr. Tasker is the architect. Mr. Naylor, of Rochester, is the builder of the church and schools.

Upton-on-Swern.—It has been resolved to take steps to promote the building of a chapel of ease capable of containing 150 persons, on a site in a central position, adjoining the Hook-road, offered by Major Martin. For this purpose a committee has been appointed, and Mr. G. Row Clarke chosen to be the architect.

DISSENTING CHURCH-BUILDING NEWS.

Keighley.—The United Methodist Free Church at Keighley has been opened for divine service. The foundation stones of the new buildings for chapel and school were laid a year ago last Shrove Tuesday. The buildings are in the Gothic style. The general plan consists of a parallelogram, 86 ft. long, and 48 ft. wide within the walls, exclusive of an apsidal projection 20 ft. deep at the rear for orchestra. The interior is divided into nave and aisles, by a series of ornamental iron columns, from which springs an arcade of seven arches on each side, which supports open hammer-beam trusses across the nave; these, and corresponding trusses over the aisles, have curved ribs or braces on the underside. A gallery runs round three sides of the chapel, three seats deep below the aisles on the side, and nine deep on the front end. All the seats are open and uniform. On the ground floor there is a clear width of about 3 ft. between the seat backs. A raised platform, in panelled compartments divided by buttresses, and with an ornamental iron balustrade on the top, occupies the place of the usual pulpit. A similar balustrade is carried round the communion. The exterior shows the triple arrangement of nave and aisles, with coupled doorways in the centre of end, opening into a corridor 8 ft. wide, laid with encaustic tiles, and extending between the gallery staircases, which are of stone, on each side. The staircases on the left of the entrance corridor is carried up in a square tower, surmounted by an octagonal lantern and spire, the height of tower and spire together being 125 ft.:

the space is used as a ventilator to the buildings. Over the coupled entrance doorways is a five-light window, filled with tracery in the head. The sides of the building are divided into seven bays, each by deeply projecting buttresses; each bay with two heights of two-light windows, with tracery heads. The upper lights are alternately circular and gabled, the latter running into and intersecting the aisle roofs, and terminated by iron finials. The large end window, the circular side windows, and the tracery of all the windows, are filled with stained glass, and the remainder have stained ornamental margins round, all executed by Edmundson & Son, of Manchester. The floor of the chapel is raised about 6 ft. above the street level, and in the basement under the chapel, and the same size as the chapel, is a school-room, lighted on the sides by a two-light window in each bay. The principal entrance to the schools is at the rear of the chapel, but communication is also provided by a staircase in the tower, under the gallery stairs, so that the scholars can pass from the school-room into the gallery of the chapel without going outside the building for the purpose. On the level of the schools are class-rooms, store-room, stoker for heating apparatus, arrangements for heating water for tea meetings, and other conveniences. At the rear of the chapel, on the ground level, are two large class-rooms, and vestry, lavatory, water-closet, &c. The chapel is lighted by star lights suspended from the arches of the arcades, with brackets under the galleries. The premises will be surrounded by a suitable iron railing, with iron gates and stone piers at the entrance, the piers surmounted by a couple of globe lamps. The whole of the wood-work is stained and varnished, and the iron-work painted in colours and part gilded, under the architect's direction. The different divisions of the building are warmed by the warm-air system of Messrs. Haden & Sons, of Trowbridge. The excavator, bricklayer, and stonemason's works have been executed by Mr. John Smith; the plumber and glazier's works by Mr. James Harrison; the plasterer's work by Messrs. Wilson & Ackroyd; and the painter's work by Mr. G. Lonsdale, all of Keighley; and the carpenter and joiner's works, by Mr. Thomas Smith, of Harden, near Keighley. The total outlay is about 5,000l. Mr. William Sugden, of Leek, Staffordshire, is the architect.

Walsley (Derbyshire).—A new Wesleyan chapel has been opened for divine service here. The edifice is built of the pressed bricks of the neighbourhood, with stone dressings from Woolley Moor, and consists of a chapel 54 ft. long, 23 ft. wide inside, with a porch at one end, and two entrances from the same to the aisles; also two school-rooms for girls and boys, attached to the chapel as transepts, shut off by sliding doors, which are opened during service, and obviate the confusion of bringing the children into the chapel. A vault is provided underneath the school-room to receive the warming apparatus, and for other general purposes. The style of architecture is Gothic, of the early part of the fourteenth century. It is fitted up with open benches of deal, slightly stained, as well as the main timbers of the roof. The windows are glazed with quarry plate-glass, with iron casements. The works have been erected by Mr. George Heath, of Chesterfield, builder, from the designs of Mr. S. Rollinson, architect, Chesterfield. The cost is 750l., exclusive of any cartage or fence walls.

Books Received.

Illustrated Books from Messrs. Routledge.

"Pictures from Nature," by Mary Howitt, is a charming little volume. To twelve illustrations of the Months, printed in colours, Mrs. Howitt has written with graphic truthfulness and feeling twelve descriptive papers, which bring the events and belongings of the various seasons forcibly and usefully to the mind. We transplant a couple of her paragraphs from the end of "October," relating to an application of science to the labours of the husbandman:—

"The thrashing-machine has given a new feature and a new voice to the country. Our fathers knew it not, and poets have as yet let it untraced in their descriptions of rural life. Listen! There it is humming and booming over stubble-field and wood, like a gigantic bee, or the hive of a whole district united in one great apian chorus. It is the great bee of science sipping at its work; tripping in its newly-created power of absorbing whole harvests, of separating straw, and grain, and chaff; by a speedy analysis of inessate energy, that laughs to scorn

the flail and the winnowing-fan of all the ages and nations of the past.

Wonder on, old Jonas, at what will come next. But of this be sure, that before many generations are past, the flail will be a piece of antiquity, known only as resounding through the pages of the old poets, chiming in with the ring of the blacksmith's hammer, through the dark winter mornings of their forefathers. The grim Frankenstein of science, the great humming-bee of innovating times, the strong, snorting mastodon of machinery, is, if not in the next lane, at least in the next season, and will henceforth be as much a feature of October as the stubble-field and the many-coloured woods."

Some of the illustrations are better than others, but the majority well fulfil their purpose. Examined with a glass, they show more expressive drawing than the after-printings have left visible.

To the illustrations in "The Language of Flowers, or Floral Emblems of Thoughts, Feelings, and Sentiments," by Robert Tyas, M.A., we will offer no objection. These also, twelve in number, are printed in colours. They consist of groups of flowers, and are presented with delicacy and skill. Take for examples the first two we open upon, the group of Honeysuckle, White Heath, and Scarlet Ipomoea, and that of Lilac, Spiderwort, and Marvel of Peru. A few years ago these alone would have been cheap at the cost of the book. The volume is handsomely bound, and will please the young ladies.

The same publishers have issued a fourth and prettily edition of Mrs. Jameson's "Memoirs of Celebrated Female Sovereigns," commencing with Semiramis, the first female sovereign upon record who ever held undivided empire, and ending with that fascinating tigress, Catherine II. of Russia.

VARIORUM.

Messrs. Moxon & Co. have published the last volume of a new edition of "The Poetical Works of H. Wadsworth Longfellow," and the last volume of "The Complete Correspondence and Works of Charles Lamb." The former is edited and prefaced by Mr. Robert Buchanan, himself a true poet, and will have the advantage over previous editions of containing the complete works, divided, for the first time, into two artistic portions, the impersonal and narrative, and the personal and lyrical. The volume of Lamb's delightful Correspondence commences with an Essay on his Life and Genius, by Mr. George Augustus Sala, displaying all the vivacity, skill, extent of reading, and knowledge of persons, that distinguish this most prolific and remarkable writer.—"Everybody's Year-Book" for 1869 is an improvement on its predecessor. It contains a large amount of useful and entertaining matter, and is certainly a good "sixpen'orth."

Miscellanea.

NEW TUBE WELL.—The New South Wales correspondent of the *Times*, dating from Sydney, speaks of a tube well, which he considers superior to the "Alyssinian." The tube to be sunk, instead of being shod with a steel point and pierced with holes, is quite open at the bottom, and possesses a free cutting circumference in contact with the ground. It may be sunk through the solid rock. When this is encountered a jumper is used inside the first tube, and this having pretty free motion within the tube makes a way of larger circumference. For quitting the rubbish a tubular jumper is used, which, when filled with material, is withdrawn and emptied.

POISONING BY GAS.—One life has been sacrificed and another imperilled by a new process recently introduced at the Gloucester Gas-works, in the manufacture of gas. The new process liberates sulphate of ammonia, and it is said that means can be adopted for preventing mischievous results; but in the instance referred to there can be no doubt about the cause and effect. It appears that two workmen, named William Hale and Henry Baker, were employed at the gasworks at Gloucester, and while at work at the blacksmith's shop, seeing steam (ammonia of gas) issuing from a valve of the boiler, they tried to prevent the escape by pressing down the valve. The ammonia, however, took such an effect upon them that they both staggered and fell. They were immediately conveyed in an insensible state to the Gloucester Infirmary, where Hale died in a few minutes. Baker has since recovered.

ARCHITECTURAL UNION COMPANY.—The annual meeting is fixed to take place on Wednesday next, at the House in Conduit-street. The directors are able again to report an increase from the rentals of the several rooms and galleries during the past year, and they recommend the payment of the usual dividend of 5 per cent., which will leave something handsome in hand to meet contingencies.

A FLOUGH FOR FEES.—Last Saturday night a prisoner, by a desperate leap, escaped from the custody of a police-officer at the Forest Hill station of the London and Brighton Railway. Bugden and Smith, two warrant-officers of the Lambeth Police Court, arrested James Quinn, of Bell Green, a master builder, under an order of the Court for non-payment of certain fees to a surveyor. While Smith was procuring tickets at the Forest Hill station the prisoner made a dash from the platform. Bugden seized him by the coat, which, however, gave way, and the prisoner leaped from the platform just as a train was coming in, and escaped. Bugden was caught by the huffer of the engine and thrown down, sustaining serious injuries.

FALL OF A ROOF.—At Liverpool a sad accident has occurred in connexion with the new works now in progress for the enlargement of the Adelphi Hotel, Ranelagh-place, which has resulted in very serious injuries to one man and the narrow escape of four other workmen and a boy. The only portion of the old hotel, standing between Brownlow-hill and Copperas-hill, is the hall-room, situated over what was formerly used as the hotel kitchen, and this the men were proceeding to take down when the accident happened. Five men and a boy were upon the roof, and were about to take out the principals, and for this purpose they had knocked the king-post away, when, without a moment's warning, the whole roof gave way and fell into the room below, carrying all the men and boy with it. The roof, which was 30 ft. in length by 20 ft. broad, fell in a mass.

DESTRUCTION OF MESSRS. GRIEVE & Co.'s SCENE-PAINTING ESTABLISHMENT.—A fire broke out on Monday morning last on the premises of Messrs. Grieve & Co., the well-known scene-painters, in Charles-street, Drury-lane. The building was at least 100 ft. deep, about 50 ft. wide, and three floors high, and ran as far back as the houses in what is termed the Coal-yard. The lower part of the premises was used as stables, and at the time of the disaster several horses were there. The whole of the upper floors were used as carpenters' shops, painting-rooms, and varnish stores. A number of elaborate scenes for the Christmas pantomimes were being prepared, all of which have been destroyed. We knew the place well, and had a sort of affection for it. It was here that many of the scenes for the Revivals of the late Mr. Charles Kean were executed, in connexion with which we spent many hours in those odd yet commodious painting-rooms.

THE LONDON HOUSE PAINTERS.—On the 18th instant a lecture was delivered by Mr. Dicky Wyatt, on "The History of Decoration by Means of Colour," to the members of the West London House Painters' and Decorators' Mutual Improvement Association, at the St. John's Schools, in Kirkman's-place, Tottenham-court-road. Suspended on the walls were numerous drawings of buildings in Italy, and details of decoration, as well as specimens of textile manufactures exemplifying Persian, Chinese, and other methods of ornamentation. The lecture, besides treating of the Eastern, Egyptian, Greek, Roman and later Italian, and the French styles, explained the principles of conventionalism and imitation in decoration, the latter of which was characterised as dangerous, albeit it embodied the perfection to be attained; whilst the former had the attribute of propriety, and, being more easy of attainment, had come first in the progress of art, and even now was in vogue in some countries. The value of attention to style was also shown. One characteristic of each style was the harmony that it had in itself, and this harmony should not be omitted as a feature when new productions were required. The audience were afterwards addressed by Mr. Grace and others, who urged the importance of establishing classes for instruction in drawing, and other requisites of the house-painter's craft, and who also adverted to the necessity for securing greater durability in painters' work, especially where costly decoration was attempted.

THE METROPOLITAN MEAT MARKET.—The new market in Smithfield was publicly opened on Tuesday last. Illustrations of the building will be found in our volumes for 1866 and 1867.*

THE INTERNATIONAL EXHIBITION.—Mr. Gladstone has accepted the presidency of the Workmen's International Exhibition, 1869. The requisition, we are told, was seventy yards in length, and was signed by workmen only.

BRONZE STATUE OF NAPOLEON III.—An equestrian statue of the present Emperor of the French has just been fixed over the new gateways that lead beneath the great gallery of the Louvre into the Place du Carrousel. It is executed in half relief, in bronze, and is of great size, measuring about 14 ft. each way, and weighing nearly a ton. It is being fixed to the stonework by means of bronze bolts, screwed into sockets in the marble.

CAMBRIDGE ANTIQUARIAN SOCIETY.—At a meeting on November 16th, the president exhibited a series of plans and other documents from the Treasury of St. John's College, relating to the building of the second court. Among these were the ground, first, and second floor plans of that court, the statement of moneys expended, deeds signed by the architects, &c.; also a proposed plan for the third court, according to suggestions by Sir Christopher Wren.

UNITED STATES PATENT OFFICE AND ENGLISH TRADE BOOKS.—The U. S. Patent Office is seeking to obtain for its library copies of all illustrated catalogues, price-lists, and circulars. In many cases, where no illustrations are given, such lists and catalogues are of great service in determining the meaning of words used in the arts, and for other purposes. It is sought to make the Library of the Patent Office a place of deposit for the unrecorded literature of the arts, which would otherwise, in a few years, be entirely lost. Three copies are asked for, one for permanent deposit in the library, and two or more for the use of the examiners. Messrs. Stevens, Brothers, of 17, Henrietta-street, Covent Garden, London, will take charge and forward any that may be sent to them.

ACTION OF WATER ON LEAD.—Professor Parkes, F.R.S., of Netley, calls attention to the fact that it has always been seen that the action or non-action of water on lead could not be entirely accounted for by the usual statements on the subject; and lately Dr. Frankland has made a curious observation, which may throw light on it. He found that water which acted on lead lost this power after passing through a filter of animal charcoal. He discovered this to be owing to a minute quantity of phosphate of lime passing into the water from the charcoal. On comparing two natural waters,—that of the river Kent, which acts violently on lead, and that of the river Tyrrwy, which, though very soft, has no action on lead,—he found that the latter water contained an appreciable amount of phosphate of lime, while none could be detected in the Kent water. This observation may probably explain much of the discrepancy of evidence in respect of the action of soft water on lead.

SANITARY COMMISSION.—The London Gazette announces that the Queen has been pleased to appoint Lord Northbrook, the Earl of Romney, Lord Elcho, the Right Hon. C. B. Adderley, the Right Hon. H. A. Bruce, Sir T. Watson, bart., M.D., Sir C. Lanyon, kt., Lieut. Colonel C. B. Ewart, R.E., Mr. J. R. McClean, C.E., Mr. G. Clive, Mr. F. S. Powell, Mr. A. S. Ayrton, Mr. R. S. Aytoun, Mr. B. Shaw, Mr. J. Lambert, Mr. J. P. Eslet, F.R.C.S., Mr. H. W. Ramsey, M.D., Mr. H. W. Acland, M.D., Mr. R. Christian, M.D., Mr. W. Stokes, M.D., and Mr. S. H. Clerk, M.D., to be her Majesty's commissioners to inquire into and report on the operations of the sanitary laws for towns, villages, and rural districts in Great Britain and Ireland, so far as these laws apply to sewerage, drainage, water-supply, removal of refuse, prevention of over-crowding, and other conditions conducive to the public health; also to report upon the operation of the laws for preventing the introduction and spreading of contagious and infectious diseases and of epidemics injurious to the public health; upon the local administration of the aforesaid sanitary laws; and upon the operation of that part of the registration system which relates to certificates of causes of death.

* Vol. xxix., pp. 955, 967; and vol. xxx., pp. 261, 263.

ROYSTON HALL ESTATE, KILBURN.—This freehold estate, having a frontage to the Edgware-road, and adjoining the station of the North London Railway, has been purchased by the United Land Company (Limited) co-operating with the Conservative Land Society.

RESERVOIR OF MONTROUGE, PARIS.—Another great reservoir for the supply of water to Paris, and similar to that at Ménilmontant, is being constructed to receive the waters of the Yvanne, which are being brought to Paris by means of aqueducts. The new reservoir is situated close to the new park of Montsouris, not far from the railway-station of the Seineux line. This reservoir will contain more than 67,000,000 gallons, for the supply of the left bank of the Seine, and such portions of the city on the other side as are not supplied from other sources. The object of the reservoir being built in two stories is to obtain a pressure sufficient to supply the houses in the highest parts of the town.

SOCIETY OF ARTS.—On Monday evening last, the first meeting of the 115th session of the Society for the Encouragement of Arts, Manufactures, and Commerce, was held in the Society's Rooms, John-street, Adelphi, when Lord Henry G. Lennox, M.P., as chairman of the council, delivered an address. Mr. W. A. Gibbs was then called forward, and received the gold medal of the Society, and fifty guineas for his excellent invention for harvesting corn in wet weather. Mr. Robert Cresser, Kingston, received a certificate and twenty-five guineas for having obtained the greatest number of first-class certificates at the examinations of the Society. Mr. Le Neve Foster then produced the Albert gold medal, which had been awarded to Mr. Whitworth, who was not present. Mr. Foster was directed to forward it to Mr. Whitworth.

DOES WATER EXPAND ON BEING CONVERTED INTO ICE?—Two or three correspondents write to us to deny, "as practical men," M. Barthélemy's assertion that vessels are broken in the act of the freezing of their contents, through gas being given off freely at that moment. Their mere assertion, however, is worth nothing. A correspondent of *Scientific Opinion*, dating from St. Thomas's Hospital, writes more to the purpose. He says:—"This assertion is not true, for I have used water from which the gas has been withdrawn by boiling and exhaustion under the air-pump, and even then an iron bottle, 1/2 in. thick, and having a bore of 1/2 in. diameter, was broken into pieces. If our worthy friend makes into consideration the fact that ice is lighter than water, he must admit that it expands; and this admission will disprove his argument." Even this, however, does not quite settle the question.

MODEL TENEMENT HOUSES FOR BROOKLYN, NEW YORK.—A block of model tenement houses has been built at Brooklyn, on a plan prepared by Mr. J. A. Wood, architect. The cost of the buildings will be about 100,000 dollars. They comprise three buildings, and are located in Stanton-street. One, of 130 ft. fronts in Stanton-street, and there are two in the rear, running at right angles with the front one, back 55 ft., and closing a court 65 ft. square, which is entered through a covered way. The front building is relieved by variety in outline, so as to obviate anything like barrack form. The tenements are divided into suites of rooms, with halls or lobbies, and each contains its own kitchen and other conveniences, complete in itself. Admittance is had from external corridors to which staircases lead. They are not intended for the poorest classes, but for persons of moderate income.

TENDERS.

For completion of Nos. 5 and 6, Collingwood-terrace, Plough-lane, Battersea. Mr. Octavius Symons, surveyor:—	
Whittick	£429 0 0
Leader	385 0 0
Shillito (accepted)	375 0 0
For constructing a sewer in Arthur-street, for the Vestry of St. Luke, Chelsea. Mr. Joseph Pattinson, surveyor:—	
Wignmore	£595 0 0
Fusell	593 0 0
Porter	578 0 0
Crockett	570 0 0
Hubbard	579 0 0
Bloomfield	519 0 0
Brass	511 0 0
Hollingback & Badley	510 0 0
Whittick	497 0 0
Nesve	485 0 0
Young (accepted)	451 10 0

For a dwelling-house and shop, to be erected on the Godstone-road, Caterham, Surrey. Mr. George Robson, architect:—	
Ellis	£379 10 0
Galt	678 0 0
Francis (accepted)	650 0 0
Elliff	643 0 0

For erection of cisterns and water-pipes at St. Marybone schools, Southall. Mr. H. Saxon Snell, architect:—	
Dennis & Scruby	£195 0 0
Penham & Sons	450 0 0
Jennings	143 0 0
Jeakes & Co.	398 7 0
Potter & Sons	375 0 0

For sewers and shading tank for the Wimbledon Local Board. Mr. Charles Bird, surveyor to the Board:—	
Kent	£1,699 0 0
Brewer & Steggle	1,474 0 0
Tyler	1,434 0 0
Pizzey	1,400 0 0
Marshall	1,394 0 0
Morton & Acomb	1,375 0 0
King	1,368 0 0
Wignmore	1,350 0 0
Dickenson & Oliver	1,340 0 0
Brown & Co.	1,339 0 0
Hollins	1,320 0 0
Harris	1,296 0 0
Pearson	1,269 0 0
Dover & Co.	1,258 0 0
Nicholson	1,250 0 0
Chapel & Holden	1,233 0 0
Killingback & Radley	1,230 0 0
Hayward	1,245 0 0
Chandler & Jarvis	1,235 0 0
Frayne	1,233 0 0
Kelly	1,213 0 0
Robinson, Brothers	1,207 0 0
Tosell	1,193 0 0
Young	1,185 0 0
Falkner & Cowley	1,185 0 0
Partridge	1,171 0 0
Gardner	1,152 0 0
Bloomfield	1,149 0 0
Carter	1,129 0 0
Reed	1,097 0 0
Moxon	1,055 0 0
Floyd	1,076 0 0
Tinsley (accepted)	1,060 0 0
Barnes, Hasel, & Co.	876 0 0

For rebuilding No. 23, Villiers-street, Strand, for Messrs. Stevens & Sons. Mr. W. H. Sanders, architect:—	
Quantities supplied by Messrs. Raik & Russell:—	
Carter & Son	£1,367 0 0
Baguley	1,211 0 0
Downs	1,127 0 0
Macey	1,098 0 0
Clemence	1,099 0 0
Read	854 0 0

For the erection of a villa residence on lots 5, 6, and 7, the Ellington Estate, Ramsgate, for Mr. Cooper. Mr. John R. Collett, architect:—	
Yade	£1,095 10 0
Forsyth	995 11 0
Osborne	988 0 0
Duckett	978 0 0
Ilgar	915 0 0

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than **THREE o'clock, p.m., on THURSDAY.**

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES only should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and not to the "Publisher."

The Builder.

VOL. XXVI.—No. 1348.

The Globe Theatre, London.

N part of the site of Lyon's Inn, between Holywell-street and Wych-street, with a narrow frontage in Newcastle-street, a Theatre has been built, and, under the title of The Globe, was opened for public performances on Saturday evening, the 28th ult. In Lyon's Inn (formerly a hostelry, with the sign of the Lion, purchased by professors of the law in the reign of Henry VIII., and made an inn of Chancery), the Architectural Association, as many of our readers know, had its first home. The site was then taken by the luckless Strand Hotel Company, part of whose ruins, at the end of Newcastle-street, still disfigure the Strand.

The site having been excavated very considerably for the proposed hotel, the floor of the pit has been made many feet below the street-level, and is approached by a steep flight of steps from Wych-street, the pay-place being at the bottom,—a very undesirable, not to say dangerous, arrangement. A sad disaster at the Haymarket Theatre, some years ago, where a similar, but now improved, arrangement exists, will long be remembered, though the warning, it would seem, has had little effect. In Wych-street, also, are the entrance to the gallery-stairs, and that to the royal box. The ordinary boxes are entered from Newcastle-street, and are on a level with the street, so that stairs are avoided; here, too, enter the occupants of the stalls. The box-circle has five rows of seats, part being regarded as the dress-circle (at 4s. each seat), and the remainder as ordinary box seats, at 2s. 6d. The admission-money to the pit is 1s. fid. Above the boxes is a large gallery, the front row of seats in it being treated as amphitheatre stalls. The front line of the boxes forms nearly a circle, cut off at about two-thirds of its extent by the proscenium. The ceiling is domical, with a sun-light in the centre. The seats are all fairly commodious, and there would seem to be very few places in the house where what is passing on the stage cannot be seen and heard. The draught is disagreeable in some of the back seats of the boxes, and the want of a centre passage through the pit seats is obvious. The draughts in many of our theatres keep away hundreds who would otherwise be visitors.

The Globe has been built from the instructions of Mr. Sefton Parry, the proprietor, by Mr. Samuel Simpson, of Tottenham-court-road, who built the Holborn Theatre, the Queen's, the Royal Alfred, and is now engaged on the Gaiety, in the Strand. It will seat 1,500 persons, exclusive of the eight private boxes. Mr. W. Brown was the clerk of the works.

The whole of the interior decorations in relief,

comprising the dome and perforated rib round it, the proscenium, and the gallery and box fronts, were designed and executed by Messrs. White & Co., of Great Marylebone-street, in their *papier mâché* and *carton pierre*. The view we give* shows the character of the ornaments, and we may say that they are well drawn, and produced with sharpness and precision. The material offers great facilities for rapid work: thus the ceiling here was executed in the shops, and screwed up in compartments complete.

White with gold is the prevailing colour, if colour it may be called, a little blue being introduced around the anthemion, along the bottom of the box-fronts. The crimson curtains of the private boxes, with gilded frames, are effective. The appearance of the whole, indeed, now the work is new, is bright and "smiling."

An act-drop representing Stratford-on-Avon, the birth-place of Shakspeare, was painted by the Messrs. Telbin, and is spoken of as having been one of the most successful results of their skill. Unfortunately, however, it was consumed by the fire that destroyed the painting-rooms in Charles-street, Drury-lane, mentioned in our last. Mr. Buckstone immediately offered Mr. Parry one that he had in store at the Haymarket, but Mr. Telbin and his son, with a numerous staff of assistants, went to work, and produced in time for the opening, an effective view of Ann Hathaway's Cottage, at Sbottery; with two figures, doubtless intended to suggest the poet and his future wife. The scene shows Telbin "hath a way" as well as a representation of Ann.

The stage appears to possess all the necessary appliances for rapid and effective representation, so far as we have yet gone in that direction, but we cannot speak well of the accommodation behind. The dressing-rooms are insufficient in number, and not what they ought to be in arrangement; and, strange to say, there is no green-room, with a view, as we have been told, to avoid "noise." The performers engaged are, therefore, driven to the dressing-rooms, or to holes and corners, when not on the stage. A more certain way to degrade the profession than by inattention to the dignity, comfort, and requirements of its professors behind the scenes, we do not know.

The play with which the house opened, "Cyril's Success," by Mr. Byron, is itself a great success. It is exceedingly well written and admirably acted. Slight though the plot may be, the interest is unflinchingly maintained, and, as a literary production, it is entitled to very high praise. The third act especially is a masterly piece of construction. It falls especially within our province to note that all the troubles of the hero, Cyril, very well played by a new man, Mr. Vernon, result from his attending a supper given to present a testimonial to one *Lincher*, who has submitted a design for baths and washhouses, and failed to convince the committee that his design ought to be accepted. "Why are you giving him a testimonial?" replies *Matthew Pincher*, a literary hack, capably presented by Mr. John Clarke; "why, because he has done nothing to deserve it." Mr. David Fisher, Mrs. Stephens, and Miss Henrade are other known performers who have parts, and contribute to the unmistakable success of the piece. Amongst those not known before is Miss Maggie Brennan, the representative of the *Hon. Fred. Titebo*y, a youngster of fashion, with more heart than head. The self-possession without impudence, the naturalness without mawkishness, and the humour without vulgarity displayed by this young lady won for her a reputation in a night. But why Maggie? The designations now assumed by our young actresses are one of the bad signs of the times. We have Miss Milly this, Miss Polly that, Miss Nolly one thing and Miss Patty the other. Those of them who wish to maintain the

dignity of their art and their own self-respect will give up this slang and endeavour to stand before the public like ladies.

As we are talking of things theatrical, we may add one or two notes which serve to show the movement just now going on in that direction. The Gaiety, on the site of the Strand Music Hall, is being proceeded with rapidly, and will be opened some time in the present month. Looking at the present bare walls, this would seem scarcely possible to those not used to theatre-building. The fact is, however, that the whole of the interior is in course of completion elsewhere, and will be at once put into its place when the shell is ready to receive it. This theatre will have the peculiarity of being Gothic in style! The St. James's Theatre, we understand, has been bought by Mrs. Wood, the American actress, and will be pulled down, together with some of the houses in the adjoining court, with a view to entire reconstruction and improvement. This, however, will not be done yet, a French lady having taken the theatre for the next eight months, intending to produce drama and extravaganza. Moreover, Brompton, rumour says, is to have a theatre. The story is, and we have reason to believe it correct, that a popular novelist, who has taught the public it is never too late to mend, has purchased two of the houses in Brompton-row, not far from Brompton-square, and on the site, which extends backwards considerably, intends to build a playhouse at the end of next year.

THE REGULATION OF RAILWAYS ACT, 1868.

AMID the din of that personal squabble which we call Parliamentary legislation, and encouraged by our contempt for the old maxim "*Notamus leges Angliæ mutari*," measures of great importance will at times elude the exigencies of faction, and the comments of the daily press, and to the surprise of every one, become law. It is probable that the most valuable of our legislative improvements are those which thus slip through Parliament, since any perceptible degree of homogeneity in a Bill is pretty certain to be destroyed by the process of lengthened debate. In fact, when a new statute issues from the senatorial mint, its value is, for the most part, altogether uncertain, until it has received the stamp of judicial exposition. Very frequently the ablest lawyers profess themselves unable to state what will be the effect of a new Act of Parliament, until a case arising under its provisions has been tried before a court of justice.

We have a striking instance of the manner in which laws may sneak into existence, in the Act of Parliament 31 & 32 Victoria, cap. cix., called "An Act to amend the Law relating to Railways," which commences by enacting that "This Act may be cited as the Regulation of Railways Act, 1868." It received the royal assent on the 31st of July last, but we are not aware that public attention has hitherto been at all adequately directed to its important provisions. It will be seen that they are well worthy of that attention.

Commencing with the preliminary establishment of the "short title" above quoted, by which the Act may be cited, the new enactment goes on to fix, on the broadest and most comprehensive scale, the interpretation of the terms "railway," "company," and "person." It does not seem possible that any of the difficulties, lately discovered to attend the use of the latter word, can crop up in legal proceedings under the Regulation of Railways Act.

The new law then confronts the important question of accounts. It does so in a fearless and determined spirit, and, it must be admitted, with the promise of working an important and much-needed reform. Fifteen blank forms of account, and two forms of certificate, are included in the first schedule annexed to the Act; and every incorporated company is enjoined to prepare and print a statement of accounts and balance-sheet, together with the other statements and certificates required by the schedule, in correspondence to these forms, every half-

* See p. 595.

year. A penalty not exceeding five pounds per day is declared in case of default.

The enforcement of a uniform method of stating capital and revenue accounts is, in itself, an important step in the right direction. It will be a boon of no slight value to the *bond fide* investor; and will, to an equal extent, be a blow and discouragement to the share gambler.

The form of the accounts, moreover, is to a certain extent clear and lucid; but the schedule appears to have been drawn up without consulting an engineer, or some much-needed improvements would have been made in it. Thus in Form No. 5, "Details of Capital Expenditure for Half-year ending —," the item of "Works" is omitted from what purports to be an exhaustive distribution of the expenditure of capital. The aim and intent of the form is clear, and the draughtsman no doubt thought that the expression "construction of way and stations" was calculated to elicit full information. If the accountants of the several companies desire to keep back any information which is not explicitly required, or even if they are officially exact, or nervously anxious to keep to the very letter of their newly-prescribed duty, this want of proper professional phraseology will give room for much regret. The miserable economy that saved a fee, which should have been given to some eminent engineer for revising the schedules, is likely to cost the country at least the expense of an amended or explanatory Act of Parliament, to say nothing of loss of time. The expenditure out of capital for the half-year is directed to be given, as showing, "under separate heads, amount paid for land (purchase and compensation); construction of way and stations, including rails, chairs, sleepers, &c.; engineering and surveying; law charges; Parliamentary expenses; interest, commission, &c." No such details are, however, insisted on in Form No. 4, "Receipts and Expenditure on Capital Account," so that the value of the detailed information demanded by the Act, even independently of the failure of the draughtsman to define properly what the framers of the schedule really wished to know, is reduced to a minimum.

To insure uniform, intelligible, and reliable accounts, that would be of real value at once to the profession and to the purchaser of railway stock, a very little enlightened care would have sufficed. An exactly similar demand for detailed account should have been inserted both in Form No. 4 and in Form No. 5. It should have been something to the following effect,— "Showing, under separate heads, the amounts actually paid for,—(1) parliamentary expenses; (2) purchase of land; (3) compensation to landowners and occupiers; (4) works, distinguishing earth-work, masonry, tunnels, and heavy viaducts; (5) permanent-way materials, distinguishing cost of (a) rails, (b) chairs, (c) bolts and fittings, (d) sleepers or timbers; (6) laying of permanent way; (7) stations, distinguishing passenger and goods; (8) law charges; (9) engineering and surveying; (10) finance charges; (11) any expenditure not included in the above."

Subject to that more matured consideration which should always precede, not follow, legislation, the adoption of some such form as that above sketched would have enabled any man familiar with railway construction to form a very accurate notion of the financial position of every company, on the face of each half-yearly account. Again, with regard to the working expenses. A little more precision would have had the same happy result. In the abstract of the cost of maintenance of way, there is a statement of "miles maintained, double—single." How much of this length is due to actual running distance, how much to sidings and station yards, is left out of sight. The actual running length of line should be clearly stated. If to this a table of gradients had been added, or at least a summary of such a table, and the tonnage of the coal and coke consumed had been stated, as well as the cost of those stores, the information would have been so complete as to be of extreme value. To know the sum spent in fuel, while remaining in ignorance either of the cost per ton, of the running lengths and gradients of the line, or of the mileage actually made by the trains, is to have the materials, indeed, for a partial and hasty comparison, but not those for a searching and useful criticism.

It is a matter much to be regretted that so well-intended an effort should have fallen so short of what might have been easily attained. Legislation has taken its course. Steps which we have ourselves pointed out as essential to the re-habilitation of railway property have been

boldly taken, and yet the full amount of satisfaction that might have been readily obtained has been missed, for the mere reason that competent professional advice has not been taken as to the engineering details of the forms now made imperative by law.

The Act goes on to enforce the signing of the accounts of the company by the chairman or deputy-chairman, and by the accountant; and to provide penalties for the falsification of accounts. It gives power to the Board of Trade to appoint inspectors, to examine into the affairs of any company under certain conditions, or auditors to examine the accounts. Then follows the clause as to which a public dispute arose between Lord Redesdale and Sir E. Watkin as to the issue of preferred and deferred stock, a clause as to the admissibility of which there is much to be said on both sides. The liability of companies (including canal companies) as carriers is then defined. A legible table of fares is ordered to be exposed at every station; and certain provisions are made with the intent of securing fair treatment for steamboat passengers, and for the consignees of goods.

A clause as to proceedings in case of non-consumption of smoke is worded in a curiously unsatisfactory manner. It is intended, apparently, as a mere supplement to the provisions on this subject in the Railways Clauses Consolidation Act of 1845; but a clear and distinct enactment would have been preferable to a patch on the former law. The clause is to the effect that, where proceedings are taken against a company for failing to consume the smoke of the locomotives, the justices before whom the complaint is heard are to decide whether "the engine is constructed on the principle of consuming its own smoke, but that it failed to consume its own smoke as far as practicable at the time charged in the complaint through the default of the company or of any servant in the employment of the company." The clause does not provide for any professional assistance to their worship, the justices, in case of any complaint involving so nice a mechanical question; and a finer sample of legal engineering, or of the failure of legal draughtsmanship in an attempt to grapple with a practical mechanical question, it would not be easy to find.

The provision of smoking compartments in every passenger train where there are more carriages than one of each class, is made imperative after the 1st day of October, 1868. But no penalty is provided for the infraction of the provision, any more than for the failure to post a legible table of fares, or to furnish, on demand, particulars of charges for goods. A penalty of from 250l. to 500l. is declared in case of any special accommodation being given for prize fights. The difference between the reality of the legislation on a point that so rarely can arise, by the declaration of a large penalty, and the vague uncertainty in which the clauses affecting the comfort of so many passengers in the matter of fares, of goods, and charges, are left by the omission of any fine for the neglect of the new law, is worthy of comment.

The long-versed question of a communication between passengers and the company's servants is set at rest, as far as enactment goes, by imposing a penalty of 10l. for each case of default in providing such a communication, after the 1st day of April, 1869. Five pounds fine is imposable on any passenger who makes use of such means of communication without reasonable and sufficient cause. There is not even an exception in favour of the day on which the new provision is to come into vigour—a very suggestive date.

Two very good clauses provide for punishment of trespassers, and for the removal of trees that may be in danger of obstructing the traffic.

The question of compensation for accidents is treated in a singularly inefficient manner. The Board of Trade is authorised to appoint an arbitrator to determine the amount of compensation, on a joint application from the company and the claimant. Where parties are so far agreed as to take such a step as this, it is easy to appoint an arbitrator without any further intervention. It is also provided that a judge may order examination of an injured claimant, by a medical man; but no such provision is made, as would have been consistent, in the case of the proposed arbitrator.

We have already spoken at such length on the subject of railway compensation, pointing out that the only satisfactory course is the adoption of a definite system of insurance by the companies, that we need merely now call attention to the inutility of the above-named clauses.

The fifth portion of the Act is, we cannot doubt, by far the most valuable and important. It provides, in three simple clauses, 27, 28, and 29, for the traffic of the future. On this point, also, our readers will be fully prepared for our opinion. The stats of the law, up to the passing of this Act, has acted as a direct bar to the due and legitimate extension of the railway system of this country, by rendering it imperative that branch lines, even to the remotest country districts, should be adequate to the full strain that is thrown on the main trunk.

In the clauses authorising light railways may be traced the workmanship of a far more skillful hand than that which has allowed such lamentable slips as to statement of accounts and enforcement of penalties. The one necessary step has, in this instance, been taken; and no more. The barrier has been knocked down; and that with so well-proportioned a blow, that no casual reader of the Act of Parliament would be aware of the revolution which it is calculated to effect. It is simply enacted that "the Board of Trade may by licence authorise a company applying for it to construct and work, or to work, as a light railway, the whole or any part of a railway which the company has power to construct or work." Notice of such application is to be given, and objections are to be inquired into by the Board of Trade. The conditions and regulations subject to which the "light railway" shall be worked, are remitted to the wisdom of the Board of Trade; the two cardinal provisions being alone insisted on,—first, that no greater weight than eight tons shall be brought on the rails by any one pair of wheels; and secondly, that the speed shall in no case exceed twenty-five miles an hour.

This simple enactment removes the obstruction which the—we can hardly give any other word than—stupidity of Parliament has hitherto opposed to the due extension of the railway system of this country. In a recent number* we made some remarks on this important subject. While the public highways of Great Britain, as is the case in every other part of the civilized world, have been fairly proportioned to the amount and character of the traffic which they were destined to serve, the railway engineer has hitherto been directly prevented by the Legislature from exercising the same wise economy. For city thoroughfares the roadway has required, and has received, a very different amount of care from that given in the case of a long line of mail-coach road. For the country lanes and by-ways, again, far less expenditure has been incurred than for the mail-coach lines. And thus has expenditure gradually been economised, down to the farmer's occupation road, or the grassy drive through the nobleman's park. But for railways, hitherto, the same outlay per mile has been legislatively imposed for the branch in a country district that may require a couple of trains per diem, and for the main trunk over which whirl the mail and express trains that connect London with the great centres of population at home and abroad. Single or double lines the Hobson's choice which we have hitherto had.

It is, happily, unnecessary now to argue as to the injurious stupidity of this legislation. But it is well to point out to all those interested in the industrial development of the country, or in the welfare of railway property, the great importance of the revolution which the Act of 1868 has so silently authorised. Our system of railways, costing, as we have before shown, nearly 35,000l. per mile for 14,000 miles which have been constructed in the United Kingdom, (the 9,634 miles in England alone having cost 42,000l. per mile), can now be completed by branches and feeders, constructed in accordance with the requirements of the districts, at a cost not exceeding a tenth part of the present extravagant outlay. That this low cost will in all cases be attained; that the reign of a wise economy will at once set in; that all idle waste will be benefited carefully eschewed; in fact, that human nature will be favourably modified by Act of Parliament,—we are not so sanguine as to expect. But it is much, that waste should no longer be enforced by statute or by standing orders. It is much, that the "wisdom of the Legislature" has at length permitted engineers to apply the principles of economy and of common sense to their work. And we cannot doubt that all the industrial classes will have reason, before long, to rejoice in the permission thus snatched from the House of Commons.

The remainder of the forty-seven numbered paragraphs of the Act provide for arbitration in

* See p. 640, ante.

certain cases of dispute, for information as to shareholders' addresses, and for some other special details of little general interest. With all its faults, especially those of want of courage in dealing with the great sore of Parliamentary outlay, and want of professional acumen and experience in the draughting of portions of the Act and schedules, as before mentioned, the Regulation of Railways Act, 1868, is a boon to the people of England.

THE PROPOSED PUBLIC OFFICES.

PUBLIC OFFICES CONCENTRATION.

THE most important of the plans deposited at the private bill-office of the House of Commons up to Monday last, the last day for receiving plans in connexion with bills to be dealt with in the next session of Parliament, was probably that which embraces the property in Westminster to be appropriated by Government for the new Public Offices. There may have been notices given of hills involving more important engineering works, but no other coming bill gives promise of equally imposing architectural results; and, although some of the other proposed bills may affect, more or less, a large number of valuable properties, no other comes with such a full swoop upon a large and definite area, proposed to be entirely cleared away. The plan referred to embraces the three blocks of building which have the common boundaries of Charles-street and Great George-street, and the outer boundaries of Parliament-street and St. James's Park, with King-street, Duke-street, and Delahay-street intersecting. The appropriation of this property seems to indicate that the public offices are designed to occupy two immense quadrangular blocks, extending from Parliament-street to the Park in one direction, and from Downing-street and the end of Whitehall to Great George-street in the other; Charles-street, running between Parliament-street and the Park, will be the inner boundary of each of the two quadrangles, and will exhibit the splendour of their side fronts. The partial breaking up of the head-quarters of the engineering profession in Great George-street, and the dispersion of the Parliamentary agents in Parliament-street may cause regret, but the clearance of such other buildings as occupy the ground, and the substitution of the palatial structures destined to rise upon the site, can only be cause for public satisfaction. The fragmentary portion of the northern quadrangle now in progress will include the Home and the Colonial Offices, in addition to the India and the Foreign Office, already occupied. The new quadrangle to the south will be required for the War Office, the Admiralty, and various other departments. It may be mentioned that the Bill authorising these great works is of a hybrid character; in so far as private property has to be appropriated, the Bill has to be dealt with as other private bills; but inasmuch as this bill is for State works, at the public cost, the Public Offices Concentration Bill will be dealt with as a public bill.

MOSAIC DECORATION.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary general meeting of the Institute held on Monday evening last, Mr. Charles Barry, V.P., in the chair, an interesting paper was read by Mr. A. H. Layard, M.P. (Honorary Fellow), "On Mosaic Decoration."

Mr. Layard said,—I desire to call your attention this evening to a subject of some interest both to the architect and the public—Mosaic Decoration. It has already been treated, and very ably treated, as everything he takes up is very certain to be, by my friend Mr. Digby Wyatt, in a paper read before this Institute on the 17th of March, 1862. He dealt with the subject as a member of the profession. I can only do so as an amateur without much practical experience; but since he read his paper, much has been done in mosaic, and in the direction which he then pointed out. I trust, therefore, I may add a little to the information furnished to the Institute by him.

I have long turned my attention to the subject of architectural decoration, external and internal. It has been connected in my mind with two great objects—public instruction and public enjoyment. In public instruction I would include all that is calculated to raise the character, cultivate the understanding, and refine

the taste, as well as to impart actual knowledge. By public enjoyment, I mean that exquisite sensation of delight and satisfaction which arises from the contemplation of the beautiful, and that pleasurable effect which, although difficult to define, and very often almost imperceptible, is produced by beauty of form, proportion, and colour upon most men.

With a desire, then, to ascertain how these two objects could be best promoted in this country, I have studied, as well as my opportunities would permit me, the architectural decoration, external and internal, as employed by the ancients and the moderns in different parts of the world, in the West and in the East, but especially in Italy, which now affords us the best school for the investigation of this subject; but to go into the general question at any length, would be to occupy your time far beyond the usual limits. I shall, therefore, confine myself to only one branch of it, viz., the decoration of public buildings, religious and secular, in this country, and the materials which may be best employed for such decoration.

It has always seemed to me that the numerous public buildings which have been erected during the last few years, and which are now in course of erection, or in contemplation, in England, and especially in the metropolis, would afford an unexampled opportunity for educating the public mind, and improving and elevating the public taste, through the means of mural decoration.

Mr. Ruskin, with his usual eloquence, and just appreciation of the real value of art, has observed that the Church of St. Mark, at Venice, was "to be regarded less as a temple wherein to pray, than as itself a Book of Common Prayers, a vast illuminated missal, written, within and without, in letters of enamel and gold. The common people were taught their Scripture history by means of the mosaics, more impressively perhaps, though far less fully than ours are now by Scripture reading. The walls of this church became the poor man's Bible, and a picture more easily read upon the walls than a chapter." "Never," he exclaims, "had a city a more glorious Bible!" and at every hour of the day, he might have added, the book is open. Our own churches might afford, and, perhaps, once did afford, public instruction of a similar kind, and at the same time become beautiful and solemn monuments like St. Mark's. Our public buildings might do for our history, political and intellectual, what our churches might do for our religion. There have hitherto been two difficulties in the way—English prejudice and English climate: the first chiefly affects our churches, the other both our churches and public buildings. As regards English prejudice, there is much yet to get over, although a great deal has been effected in the right direction. I do not intend to enter into the reasons for this prejudice, or to seek to combat it. Suffice it to say, that the strong reactionary feeling against the influence of the church of Rome, which set in at the time of the Reformation, and which received additional impetus during the Commonwealth, is yet powerful among us; and that church decoration is still connected, in the imagination of a vast number of people, with the tenets of the Roman Catholic faith. But I will presume that this prejudice has now greatly subsided, and that we are at liberty to decorate our churches to our heart's content, so long as we do not introduce into them any figures or symbols which may scare good Protestants, without our orthodoxy being called into question.

With respect to our public buildings, there is no such prejudice existing, although there is still floating about, even amongst educated people, who ought to know better, that strange notion that decoration is un-English, unsuited to our climate, and vulgar. A step in the right direction, though, unfortunately, owing to various circumstances, not a very auspicious one, has been made in the ornamentation of the Houses of Parliament. Had that attempt been more successful, the example would, I doubt not, have been more extensively followed in this country than it has been.

The climate difficulty is really the one which stands in our way, and which we must seek to get over. Owing to it, the attempt made on the Houses of Parliament has been unfortunately arrested, and a great work which might have added to our national glory, has been left unfinished. If the difficulty can be removed, I believe that, with the general improvement in public taste, and with the desire for educating the

people, which now prevails, we may see our churches and our national edifices covered with mural decoration, which would serve to cultivate, refine, and instruct the masses.

For some years I entertained a hope that wall-painting, either buon-fresco, fresco-secco, or water-glass, might be adopted in this country. I had carefully examined, and, indeed, partly traced, almost every wall-painting in Italy. I had convinced myself that, except, perhaps, at Venice, fresco would resist the effects of climate and of time, when only protected against them with moderate care. The frescoes of Giotto in the Arena chapel and at Assisi, in fresco-secco, be it remembered, are almost as fresh and transparent as when he painted them, except where exposed to wilful injury, or, as I regret to say they still are, to the grossest neglect. The frescoes of Ghirlandajo and the great masters of his time, are only blackened by the smoke of candles and incense, or by dust and dirt never removed. The beautiful decorations of the library of the Cathedral of Siena are as bright as the day on which Pinturicchio finished them. The frescoes of Perdoneuse in the church of St. Maria della Campagna at Piacenza have almost acquired the consistency of enamel, and would seem to be indestructible. In Venice only, owing, it is alleged, to the extreme moisture and saltness of the sea air, wall-painting seems to have partly failed. Of the great works of Giorgione, Titian, and other masters of the Venetian school, which once embellished the palaces of that city, and of those of Perdoneuse which adorned the cloisters of St. Stefano, only fragments now remain. But these frescoes, if must be observed, were on the exterior of buildings, and therefore completely exposed to the effect of the atmosphere. Tiopoli's frescoes, in the Lohbia Palace, and in some churches, do not appear to have yet withered; but still it would seem that the Venetians distrust the durability of fresco, and never employed it on a large scale, even for internal decoration, when it was being so used in almost every other city in Italy.

With the examples of fresco painting which I have mentioned, and with my desire that mural decoration on a large scale should be introduced into this country, I was rejoiced to see that which was being done under the direction of the Fine-Art Commission, of which the Prince Consort was president. I lost no opportunity of advocating, publicly and privately, fresco decoration. Amongst those who took the same view of the subject as myself was my distinguished friend, Mr. Watts; but he did more than I could ever hope to do in the cause; and with a devotion to his art and the public spirit, which are the best accompaniments of genius, he undertook to execute, without remuneration, a vast fresco on the walls of the hall of Lincoln's Inn. That work, criticise it as you like, is the greatest of its class on this side of the Alps; and I cannot believe that any man of feeling can be insensible to its grand and solemn character, or any man of taste to the additional value and majesty it gives to the architecture. Unfortunately, Mr. Watts has never completed the decoration of the hall; all the empty spaces in which should be treated in connexion with the fresco forming the principal feature in it. I do not think that we are yet sufficiently impressed with the fact, that in decoration completeness and general harmony are essential; and that, without these, the true and full effect of a great fresco, or any other similar work, can never be properly appreciated.

My hopes with regard to fresco were doomed to disappointment. I have no reason to believe that any serious deterioration is taking place in Mr. Watts's fresco at Lincoln's Inn; but in the Houses of Parliament, some of the frescoes had scarcely been painted before decay commenced, and many of them are even already almost gone. The same thing has taken place with the late Mr. Dyce's frescoes in All Souls' Church, in St. Margaret-street, which, I am informed, have required almost entire repainting. I was at one time inclined to assign this rapid decay to some defects in the materials employed, either in the pigments or in the intonaco, or lime, especially as the same deterioration had occurred in some of the frescoes at Munich, though by no means in all; it will appear where, at least, the fault could not be laid upon the English climate. The Germans, however, attributed it to the effects of the atmosphere acting upon the exterior surface of the painting, and to prevent this they adopted the method of covering the fresco with a solution of silicate called water-glass, which was supposed

to be impervious to the air. The great frescoes of Kanlbach at Berlin have been painted in this material; and Mr. Maclise and Mr. Herberth have adopted the process in their most recent works in the Houses of Parliament. It is, perhaps, too early to pronounce decidedly upon the durability of the waterglass, but there are grounds for fearing that it will not resist the insidious attacks of our London smoke. Dr. Percy, after a very careful scientific examination and analysis, carried on under official instruction, has come to the conclusion that no such painting, whether executed in buon-fresco or fresco-secco, can resist the atmosphere impregnated as that of London is with the chemical substances evolved from the consumption of coal. He doubts even the efficacy of waterglass, and gives it as his opinion that Mr. Herberth's well-known fresco will not be safe except under glass. The scientific investigations of Dr. Percy have, unfortunately, been confirmed by the practical experience of Mr. Digby Wyatt.

I confess to great disappointment at this unexpected result of the attempt to introduce fresco painting into England. It is a noble art, the one declared by Michelangelo to be best fitted to show the genius of a man; the one which gives the really great painter the widest influence over, and can bring him into the closest communion with, the great mass of his fellow men. It can raise the great painter to the level of the great poet. Think one moment of the fame which Leonardo da Vinci, Michelangelo, and Raffaelle have achieved through their wall paintings. Leonardo's "Last Supper" is more widely known than any poem that was ever written, not excepting the "Iliad." Throughout the whole civilised world some kind of copy of this immortal wall painting may be found in the palace and the cottage. But after what has occurred I am afraid that we must give up the hope of seeing fresco painting introduced on any considerable scale into England.

Thus disappointed, I turned my attention to mosaic as a means of supplying the place of fresco. With this object in view, I have carefully studied most of the finest examples of mosaic decoration in Italy. It is unnecessary for me to enter into the history of mosaic: that has been done already by Mr. Digby Wyatt in his paper to which I have already referred. It is sufficient now to say that the art of putting together small cubes or tesserae, as they are technically called, of different substances, so as to form patterns and figures either in monochrome or in various colours, is one of very ancient date, and was known even to the earliest civilized nations,—such as the Egyptians, Assyrians, and Babylonians. Mosaic was applied to the decoration of walls and pavements, and was extensively used, especially for the latter purpose, by the Greeks and Romans in their public and private buildings. Owing to the durability of the materials generally employed,—such as hard marbles and porphyries, enamels, or glass and terra-cotta,—mosaic has defied the ravages of time probably more effectively than any other architectural decoration. To this day the remains of mosaic pavements are the most usual indications of Roman sites in England and in many countries of Europe, as well as in parts of Asia and Africa. But pictorial mosaic on a really large scale was first used for the decoration of public buildings during the later days of the Roman empire, and during the supremacy of Byzantium, and in those countries which derived their civilization and arts from Rome and her Eastern successor. It took its chief development after the spread of Christianity, and in the decoration of Christian edifices, so that we may call it essentially a Christian art. The most magnificent examples of ancient times were to be found in the churches of Christian Rome, Constantinople, and Ravenna. It is to this Christian mosaic that I wish now to draw your attention.

The chief features, then, of this Christian mosaic are the vast extent of wall-surface to which it was applied; its most frequent use on domes, apses, and curved surfaces; and the representation of figures and ornaments on a gold ground, although a gold ground was not always used, as in the early mosaics in St. Prudenzianna and St. Prassedo, and in the baptistery of St. Giovanni Laterano, in Rome. In Italy to this mosaic the epithet Byzantine is indiscriminately though wrongly applied. It is true that the art flourished in the East when it had almost died away in the West, and that Italy owes to a great extent to Byzantine artists its revival; but a direct Roman influence, as

Mr. Digby Wyatt has well pointed out, may be traced in Italian mosaics up to the eighth and even ninth century. The art, however, flourished contemporaneously in the eastern and the western parts of the empire.

The extreme richness of their mode of decoration and, at the same time, its grand and solemn character when used in large masses, made it especially applicable to religious purposes; and it appears to have been generally used for the embellishment of churches, although there are several recorded instances of royal palaces having been very profusely adorned with it. A vast mass of ancient mosaic work has perished: no small amount in the East is still covered with whitewash and plaster. There scarcely seems to have been a church or baptistery of any importance built within the precincts of the Byzantine empire that had not more or less mosaic decoration. The fashion spread across the Alps, and we find Charlemagne decorating his basilicas and palaces with mosaic.

This general use of mosaic led to improvements in the materials employed. Marbles and porphyries could no longer be exclusively used, and earthenware did not promise the required durability. Enamels or vitreous substances, which the Italians call "smalti," and which had not been unknown in earlier times, were mixed with them. The art, too, of enclosing gold-leaf within layers of glass, a very difficult one, was also discovered (there is no evidence, I believe, that it was known in Classic times); and thus the gold ground, one of the peculiar features of this mosaic, could be effectively executed. Of these early mosaics, the most remarkable now preserved are those of St. Sophia, a church at Salonica, the baptistery of Constantine, or St. Costanza, at Rome, which show a curious mixture of Pagan and Christian figures and symbols, and the style of which almost approaches that of the painted ornaments in the Baths of Titus; of the apse of St. Prudenzianna, also of the fourth century; of the monumental chapel of Galla Placidia, and of the baptistery of Ravenna, and of St. Maria Maggiore at Rome, of the fifth century; and those of St. Vitale, of St. Apollonaris in Clesse, and of St. Apollon Novvo in Navarre, of the sixth century. Unfortunately few of the early mosaics at Rome and even Ravenna are free from considerable restoration, and their original character is in many instances much destroyed: frequently these restorations are even made with coloured plaster.

I will now direct your attention to those edifices which furnish the best examples of mosaic decoration and are most deserving of study, with a view to the use of mosaic in this country. I exclude St. Sophia because the mosaics on its walls are for the most part concealed by plaster. In its original state it must have been, as far as the interior is concerned, one of the most glorious buildings that the world ever saw. In no other, probably, were such vast spaces covered with the richest mosaic decoration; and every part that was not so covered seems to have been panelled with the rarest and most beautiful marbles. I had the good fortune to see St. Sophia when under repair, and when the plaster had been removed, under the direction of an Italian architect, Sig. Fossati. The effect of this partial revival was truly magnificent. Some idea of the vastness and richness of the details may be obtained from Salzenberg's work, which is in your library. I would particularly dwell upon the extraordinary preservation of these mosaics. They had been covered since the Turkish conquest, and probably had not undergone much restoration in previous times. The examples, therefore, of mosaic, which I would most particularly point out for imitation, if the time should ever come, as I hope it will, when people in this country will be only impressed with the value of internal decoration, are St. Mark's, Venice; Monreale and the Capella Reale, at Palermo; and the basilicas of Ravenna. I do not place these buildings in order of date, but according to importance as illustrating mosaic decoration.

St. Mark's, taken as a whole, is the most perfect example of internal decoration in the world. In other edifices you probably find instances of details and detached mosaics more beautiful than any in St. Mark's; but you will nowhere find an example of one grand and noble conception so thoroughly and completely carried out. It furnishes, too, the richest and most valuable chapter in the history of mosaic, for in this one building we have specimens of mosaics extending over a period between the

eleventh, or certainly the beginning of the twelfth, and the end of the thirteenth century, and, consequently, comprising a variety of styles and showing many different modes of employing mosaic. Every square foot of the church, the baptistery and the vestibule, domes, apses, sides, and pavement, is covered with mosaic work, except where the richest marbles panel the lower parts of the walls. There is no uncovered or naked space. The eye, I may say the mind, is completely satisfied. Nothing looks as if it were unfinished, or as if there yet remained anything to be done. I cannot imagine any one to enter this glorious edifice without being deeply impressed with the solemnity and majesty, and, at the same time, with the exquisite beauty and harmony of all around him; without feeling that, if we are to have decorations in our sacred edifices on a large scale, and so as to add to their religious character, and at the same time to produce a sense of enjoyment of the purest description, mosaic is the most appropriate of all decoration.

The lustrous surface of the enamels, the large masses of gold ground, the richness of the colour, produce an infinite variety of the most beautiful effects, ever changing as the sun changes its place. St. Mark's is never the same. Enter at any hour of the day, in summer or in winter, and whether the sky be clear or overcast, and you will ever be surprised and delighted by some new unexpected effect. In the morning, the recesses of the nave-end, the grand solitary figures of Christ, the Virgin, and the Evangelists, will be revealed to you. At midday, when the full light of a southern sky is equally diffused over the interior, the many domes and vaults are so illuminated that every detail in that vast maze of figures and ornament can be plainly detected. And when the rays of the setting sun stream through the western window upon the grand apse above the high altar the majestic form of the enthroned Saviour seems to float in a sea of burnished gold. Even when the shades of night are fast gathering over the lower parts of the building a mysterious and solemn light lingers for a time on the golden domes and vaults of the upper, like the bright clouds which float in the sky after a Venetian sunset.

The singular harmony, notwithstanding the abundant richness of the gold grounds, which prevails throughout the decoration of St. Mark's, is owing to its completeness. Any whitewash or plaster, or blank unredeemed space, such as one sees in our churches, would have been an eyesore, and would have marred the marvellous beauty of the whole. Decoration, when thus complete, whatever may be the wealth of gold and colour lavished upon it, is never vulgar or tawdry; but, on the contrary, when a just balance is preserved in them, it is sober and harmonious, and can be made eminently subservient to religious purposes. It is only when decoration is introduced as if it were something not forming an essential part of the building itself, but only put there for show, and as if too precious except to be doled out with a niggard hand, that it does become vulgar and tawdry, and appear inconsistent with the objects of a sacred edifice.

St. Mark's teaches us that it is especially necessary to avoid white spaces, and particularly plaster, where materials so rich as mosaics are employed. We see this well established in the sacristy. Its vaulted ceiling, lunettes, and spandrels furnish one of the most exquisite examples of cinque-cento mosaic work with which I am acquainted; but the effect of the whole chamber is greatly impaired, and an appearance of weakness and want of finish is given to it by a panelling of white marble, which runs completely round it, between the mosaic decoration and a skirting and benches of dark walnut wood below.

In St. Mark's we can study and satisfy ourselves as to the best mode of employing mosaics, and the style best suited to our churches, should mosaics be introduced into England. We have in this very museum of mosaic decoration specimens of all styles and manner of work. The most ancient are simple figures on a gold ground, probably the work of Greek artists; or if not, certainly copied from them, and properly termed Byzantine—such as the colossal figure of Christ seated on a throne, in the apse over the high altar; the figures of patriarchs, saints, and apostles in the domes, or the side walls of the nave, and on the pendentives; and the group of Christ, the Virgin, and St. John over the principal entrance. So, also, are some of the figures, arranged in processional order in various parts of the church, a tradition of the Classic period

of mosaic, as seen in the basilicas of St. Vitale and St. Apollinaire Nuovo at Ravenna. In the baptistry and vestibule, and in the semi-domed recess over the most northern entrance in the exterior, we have examples of the work and design of the thirteenth and fourteenth centuries. A more complete grouping of figures is attempted, and more variety in the tints. The tesserae in some instances are very minute. The general design and arrangement of the figures are all strictly architectural. In the chapel of the Mascoli, one of the most beautiful portions of the church, in the wagon-shaped ceiling, decorated by Gianhono, towards the end of the fifteenth century, we see how the growing feeling for Classic ornament had modified the old manner, and had produced a style very appropriate to architectural decoration in mosaic. In the sacristy, in the works of Rizzo and Guccati, we have the graceful and flowing ornamentation, and the broad treatment of the draperies which mark the cinque-cento period; still, however, made subservient to the architecture, and forming part of it. Lastly, in the upper part of the walls to the left of the high altar, in the vaulting over the western end of the nave, and in the lunettes over the exterior entrances, and over the central entrance in the vestibule, the mosaics, having been executed from cartoons by Titian, Tintoretto, Salviati, and other great masters of the sixteenth and seventeenth centuries, we see how the mosaicist vied with the painter in producing pictures not only without reference to the architecture, but altogether independent of it. I will point out hereafter which of these different modes of treatment I consider best adapted to our modern buildings, and most consistent with the legitimate use of mosaic.

Perhaps the most perfect specimen of mosaic decoration after St. Mark's with which I am acquainted is that of the Capella Reale, or, as it is frequently called, the Capella Palatina, in Palermo. The chapel was built in 1132, and the mosaics were finished in 1143, or soon after. Consequently, they are all of the same period, although the original character of many of them has been somewhat altered by modern restorations. I place this interior next in order after St. Mark's, because, although much inferior in size to other buildings similarly decorated, the decoration is complete, leaving nothing to be desired. It forms one beautiful and harmonious whole, without a spot upon which the eye can dwell with regret. It also possesses that solemn, religious character, and shows that infinite variety of effects which form the glory of the Venetian temple. The cupola, the sanctuary, the walls, and the aisles and nave are covered with mosaics, in which the figures of Christ and the apostles, and scenes from the lives of St. Peter and St. Paul, form the principal subjects. Beneath the mosaics is a skirting of rare marble. The pavement is of mosaic work (*opus Alexandrinum*) of serpentine porphyry and hard marbles.*

HISTORICAL NOTES ON THE CULTIVATION AND TENURE OF LAND.

THE INSTITUTION OF SURVEYORS.

At the ordinary general meeting held on Monday, the 23rd ult., the president, Mr. John Clifton, in the chair, several new members were proposed for ballot. Various donations of books and subscriptions to the library fund, amounting to about 115*l.*, were announced.

An interesting paper, entitled "Historical Notes," was read by Mr. Edmund James Smith, member, in which he noticed many of the scattered details relative to agriculture and transactions with property which present themselves in ancient history and in England prior to the commencement of the era of modern cultivation. He said the characteristic of the present system is the cultivation of the land by freeholders or by tenant farmers with free labourers, while that of the period prior to Henry VII. was that field work was the task of slaves or serfs. The oldest form of civilization was in Egypt, and its characteristic was repose. Corn was grown in Egypt as far back as history or tradition can carry us. The fecundity of the land was renewed yearly by inundations of the Nile, and the land was irrigated much in the same way as our water meadows. The art of mensuration must have been one of the earliest arts, as the boundaries were sometimes washed away, and required

annual resettlement. He described the ancient mode of cultivation in Egypt, which was carried on with little valuation to the present day. The cultivation of corn in India more resembled that of the open field land system of England. In Egypt no manure was wanted; in India none was available, as all animal excrement was required for fuel. The later Greeks never cared for farming, but their pastures were excellent and their honey famous, and they were great bee-masters. The Romans in early days were fond of agricultural pursuits, but, as their power increased, they depended on Sicily, Egypt, and Africa for their corn, and there was always a large quantity stored at home to provide against the contingency of unfavourable winds stopping the importation. Three Greek and three Roman agriculturists have left precise accounts of farming. The alternate fallow, the insufficient working of the land, the few cattle kept, and the practice of burning the straw, show that the produce of a given area must have been insignificant, and demonstrate the great inferiority of ancient farming.

The notices of the value of property throughout this period are rare. The transfer of one parcel of land 4,000 years since proves that some land was then private property. He referred to the purchase by Abraham of the field and cave of Macpelah; and it was worth while to note the manner in which this ancient purchase was effected. The purchaser desired to buy a cave: the vendor begs he will accept it as a gift, but intimates that a price may be named. The vendor names the price (about 50*l.*), and the offer is accepted by Abraham like a price without discussion. The plot was probably about an acre of land, with olive trees some half a mile from Hebron; but we have no measure of the relative value of silver at that date. He knew of no other detail of the value of land in Judea until the grandsons of St. Jude were charged with treason before the Roman Pretor. They appeal to their horny hands, hardened with the cultivation of 24 acres of freehold on which they lived, and this is valued in the Roman census at 300*l.* of our money. Crassus, the wealthiest Roman, derived his riches from land immediately around the old city, the value of which will be apparent to surveyors from the fact that the emperors repeatedly enacted that no private house should be erected more than 70 ft. in height; and that when Rome reached its maximum it contained only 50,000 houses, but a population of 1,000,000, or twenty to each house, there being in our own most densely populated parishes only twelve persons to each house.

The residence of Crassus sold, after his death, for 30,000*l.*; another house sold for 130,000*l.*; and another, with its furniture and ornaments, being burnt, the loss was estimated at 800,000*l.* Marius gave 2,500*l.* for the site on which he built his villa at Misenum; and it was sold, after his death, for 80,000*l.*, his villa being built, probably, meanwhile.

The Roman census was much more complete than ours, and gave detailed particulars of all the property, as well as the names of all persons in the family. It was the duty of the College of Agrimensores (or Institution of Roman Surveyors) to measure and value every estate, so that it might be fairly charged with the public impost. Their mode of surveying was primitive; they ran a line due south from a given point, and then ran another east and west perpendicular to it, and by a system of squares ascertained the relative position of fences and the area.

The College of Agrimensores no doubt originated in the same necessity which has induced us to form the Institution—the necessity for a more systematic practice on our part, and for some security to the State on its part, that business of the magnitude and of the confidential character entrusted to the Agrimensores should be properly transacted. We find corn was cultivated in this island before Caesar's first invasion; and when Caesar landed on the 25th of August, the corn was just beginning to be cut; but before he sailed away, on the 12th of September, the harvest was secured and the ships re-victualled. And at a subsequent period 600 Roman or Gallic ships, carried from England some 126,000 quarters of corn, at a time of dearth in Gaul: this quantity could hardly have been raised from less than 60,000 acres.

In the succeeding 450 years the Roman modes of agricultural cultivation, as well as Roman

civilisation, overspread the whole country; for the Romans followed here their general practice of imposing on the natives of each district an annual tribute of corn to be paid in kind. This tribute in kind at once provided for the food of their soldiers, and gave some security for the natives' good behaviour: the first sign of an impending insurrection was that the natives neglected to prepare the land for the next year's corn.

The withdrawal of the Romans 450 years after the landing of Caesar, was the commencement of a period of relapse into barbarism, so complete, that the light of Christianity was totally extinguished south of the Humber, and only rekindled from Rome after a period of 200 years. The laws of the Anglo-Saxons regulate the prices of all kinds of cattle, and are nearly silent with respect to arable cultivation. The lord's mansion and demesne were under the care of the hallif and domestic slaves, and the rest was held by bondsmen at rents fixed by law, but burdened with oppressive services to the lord.

There must have been some approximation to a survey of the Saxon kingdom about the year 1,000, nearly 100 years before "Doomsday Book" for the Danegeld, a tax of 1*s.* on each hide of land, was then imposed, and the "Doomsday Book" throughout compares the valuation and number of hides charged in the time of Edward the Confessor with the valuation and number then accounted for, and with the rents then actually paid for them.

The Anglo-Saxon transactions furnish us also with glimpses of prices. Thus, a hen was 1*l.*, a sheep (of which the value of the fleece was two-fifths) was worth 1*s.*, a cow was worth four sheep, and an ox worth six sheep; a horse worth about five oxen, and a mare about three oxen. One hide of land was sold, the price of which is recorded at 11*s.* It is impossible to avoid perceiving that the gradual restoration of peace in England was mainly due to the monks and churchmen, whose monasteries and churches contained the only civilized men in the whole kingdom. Neither security nor knowledge was to be found elsewhere. The monks reclaimed the wastes, tilled the land, preserved libraries, taught the people, and inculcated Christianity.

The exertions of the monks were repaid by grants of land; and, as the boundaries of the townships and parishes had been by that time settled, there is little difficulty in identifying these several donations, except where they became lay property at the Reformation. The possessions of the ecclesiastical corporations and of the universities being the most ancient in the kingdom, and having been held uninterruptedly for eight centuries, afford the best chance of tracing the gradual increase of rents and change in the value of money consecutively through the whole period. It is remarkable that there is no notice of tithes in Doomsday Book, while the landed possessions of the bishops and abbots are carefully enumerated.

Doomsday Book was formed after the Norman Conquest, from evidence given to five justices in each county.

The county reports give the names of the landowners, and the extent, with more or less detail, of their lands. The landowners' names are frequently arranged in the order of their rank, but in some cases the return is arranged in the order of the parishes.

It would be supposed that from such a survey, so well preserved to us, a tolerably accurate account of the state of the country might be prepared; but to the present time no one has been able to deduce from it any practical results, except as regards population. The leading feature is the enumeration in each manor of the number of hides in some counties, of carucates in all counties; but what is a hide and what is a carucate is not settled.

Admirable facsimiles of the Doomsday Book of each county have recently been photozincographed and published at a nominal cost, but the letterpress prefixed to them is very unsatisfactory.

The hide has been variously estimated as 120 acres, as 24 carucates, as 14½ carucates, as 12 carucates, and as 6 carucates. In Herefordshire each possession is stated in hides and virgates. The latter has been variously estimated at 30, 24, and 15 acres. The carucate appears in nearly all the surveys, as does occasionally the organ as a portion of the carucate.

Remembering that different justices took the evidence in each county, that the evidence was that of the grieve and tenants, and that these men spoke according to their local usage, no com-

* To be continued.

parison between different counties seems to be possible. We are all aware that to this day the Irish acre, the Cheshire acre, the Lancashire acre, and the forest acre perplex our minds; and it is only reasonable to suppose that different standards of measure obtained in different counties; but within each county it might be possible to arrive at some nearly approximate standard, and he recommended the subject to the notice of the members. With respect to value, the same want of uniformity between the several parts appears; as, for instance, taking three estates following each other consecutively. In one 20l., in King Edward's time, had decreased to 14l. at the time of the survey; in another the value was unaltered; and in the third 16s. had decreased to 5s., about the time of the Conquest, and again risen to 10s. The one thing in which the Domesday Book is probably to be depended upon, is in the number of men in each manor. The king would care more for this part of the account than even for increased taxation; and there would be more danger and difficulty in giving false information on this point than in diminishing the extent and the value of the lands in the manor.

The Domesday Book did not extend to the county of Durlam; but about 100 years later, an account of the lands within that county palace was taken, but excluding the estates of the free tenants of the county. It relates the state of each parish, and is much more precise than Domesday Book. Taking Bolton parish for an example, there were 22 villans, holding one with another 2 oxgangs of 15 acres each, or 650 acres together, each villan paying a rent of 2s. 6d. yearly, and 16d. in another form, and half a husband of oats, and 5 cartloads of wood, and 2 fowls, and 10 eggs; and they gave 3 days' work in each week to the lord, all the year round, except Easter and Whitsun week, and for two weeks at Christmas, besides other heavy duties. And the 12 cottagers, each of whom held 12 acres, or 164 acres together, gave 2 days in the week work to the lord, all the year round, except at the festival weeks, and paid 12 fowls and 60 eggs each.

About 200 years after this survey another was made, including the estates omitted in the Boldon Book, and this giving a complete view at that date. The free tenants had 266 acres, and were 27 in number; one who received the bishop's rents in Weremouth, and was in fact his local agent, and had 36 acres without charge, and 26 who paid 3s. 8d. for each 10 acres, or about 3s. 6d. an acre. The 32 bond tenants now paid for 22 houses, and 46 oxgangs, with the mill and common rights, 44l. The day work appears to have closed, and the rent gone up to about 20s. an oxgang of 15 acres. It is not unlikely that the survey marks the time of the substitution of rent for servile work, which first took place on church lands.

In these two hundred years a considerable proportion of the demesne lands, and probably of the other lands, were gradually converted into arable land; and there is every reason to believe that the numbers of the population had largely increased. From the accession of Edward I., in 1272, to the death of Henry V., in 1422, a period of one hundred and fifty years, there had been continued internal peace and security; and he believed that a close investigation would prove that the cultivation was as far advanced and the population at least as large, if not larger, at that date than it was at the accession of Henry VII., more than sixty years later; for, in the meantime, the wars of the Roses destroyed nearly all the ancient nobility, and the peace and security of nearly every laided estate in the kingdom. The landholders having led their followers into the field, the numbers that returned were so diminished that the demesne lands were for the most part laid down in pasturage,—and, probably, much of the other land,—and, as the surrounding lands were arable, pasturage now involved the inclosure of the pasture closes. From the reign of Henry VII., the commencement of free labour generally, any connected account of English agriculture should begin. To that date the accounts of the operations of husbandry, and even the farming accounts, were written in Latin; but, from the beginning of the reign of Henry VIII., there are a series of regular treatises, written for the most part by persons actually experienced in the subject they describe.

It would appear that, from Cassar's first expedition to the present time, a period of 1,900 years, one-fourth passed in comparative peace under the Roman dominion; one-fourth, reaching nearly to the Conquest, was marked by

constant internal war and rapine; one-fourth, after the Conquest, was freed from external attack, but was frequently disturbed by internal strife; and that the last fourth alone is a continual and uninterrupted progress in civilization. No taxation can possibly bear comparison with the cost of internal disturbance, as regards agriculture,—to say nothing of trade, manufactures, and commerce.

At the reign of Henry VII., therefore, where modern history begins, he concluded, hoping that his curiosity would induce others to continue the subject, and occupy the attention of members with papers of a more practical character.

A discussion ensued, in which Messrs. Haskinson, Clark, Vigers, Woolley, Buckland, and others, took part, and it was thought that the line of inquiry opened up by Mr. Smith was of great interest and usefulness, especially at the present time, when the tenure of land both by owners and occupiers, and the adjustment of their respective rights had become an important question in Ireland, and in England some modification of existing law and custom would doubtless be necessary; and it was suggested that by discussion among surveyors, who were so well acquainted with the several usages and varieties of tenure, and their effect on the value and disposition of property, some plan might be sketched out for assimilating custom and more strictly defining the interests of owners and occupiers, and so he of great assistance to the Legislature in maturing any scheme which it might be thought desirable to bring forward for that purpose.

Mr. F. J. Clark, who had visited Egypt, pointed out several peculiarities in the cultivation of that country which had struck him, and promised, if possible, to relate his experiences more at large in a paper on a future occasion.

The president mentioned several curious customs which had come within his own experience,—among others, that which obtains to the present day in the Isle of Portland of taking a conveyance of land by paying over the money at the church-door, and of keeping the account of the Queen's Manor rents there on a stick with a series of notches. All custom was antiquated, and should be abolished. Every agreement should be expressed in writing; and he hoped the country members would take up the subject and bring it before the Institution for regular discussion.

A vote of thanks was given to Mr. Smith, and the meeting then adjourned to Monday, December 7th, when a paper will be read, entitled, "The Education of the Surveyor," by Mr. William Sturge.

OF SOME WELL-BUILT MONUMENTS.

The *Builder* often treats of monuments, either because of some going to decay before the fame of the things we mean them to commemorate, or of others puzzling us by surviving all memory of what on earth they meant,—for architects have not exactly hit the mark of making both monument and meaning endure as long as they are wanted.

Now the last year or two has uncovered a marvellous monument, so contrived by a consummate architect as to defy probable human power to destroy, deface, or make illegible, for as long as he meant the memory of what it celebrates to endure.

Most have heard of, and many (luckier than the present writer) saw the "meteor-stream" of the 14th of November, 1866; and that an American professor, Newton, predicted it, by deducing from numerous records, Chinese, Arab, and monkish, of star-showers in the last 900 years, that after every 33 years, two or three may be expected at intervals of 365 days 6½ hours (that is, a sidereal year and 21 minutes, or a tropical year and 41 minutes), or when we pass a certain point of the earth's path, but a point shifting onward so as to be reached nearly 24 hours later in each 33 years. Some may have tuned a globe to see how the visibility of the shower in any land depends on its arrival between that country's midnight and sunrise; for we and they meet almost directly, as opposite trains, and before midnight we are always on our planet's sheltered back. Only from midnight to noon are we on her front, where their impact is possible, and most so at sunrise; near which hour only can a place meet them (as some in America did in 1833) like a rain, slanting but moderately from the south, owing to the perspective radiant point,—which keeps

its place among the stars of Leo,—being only then on the meridian.

Now as to their orbit, each meteor might either to the place or "node" of our encounter come 67 times in the 33 years period, or 65, or 34, or 32 times, or only once: these were the five possible theories. In the two small orbits that would bring them round every 180 or 186 days, we should meet them at their farthest from the sun, therefore lowest speed, which, though added to our own (of 18 miles per second the opposite way) would scarce account for half the observed rate of meeting between our air and them. They would also be as frequently met in the 17th year as in the year or two after the 33rd. The two nearly circular orbits (of a 33rd less and a 33rd more than a year) would give them only our speed, for we should meet only at about 35 miles a second, instead of nearly 50, as we do. And our great discoverer of Neptune has found, by immense labour, that the action of the planets would not shift the node, in any of these four orbits, by the minutes that give the delay of three days per century. This can only be in the immense orbit that carries them out on a 33 years' journey, or beyond far-wandering dim Uranus; and only in this, which brings them to us at their nearest to the sun, and swiftest, is our enormous rate of encounter explained.

This rate is 100 times that of the best rifle-shot. Were it only 10 times, they would be a murderous hail; but because it is 100 times, they fail to reach us! None, seemingly, have mass enough to stand the air's friction three seconds, but are dissipated into flame and vapour. Each pebble cleaves the thin fluid, from 70 miles down to 40 miles above us, dragging after it a vacuous globe, as big perhaps as a house, filmed over with intense fire; but into this and the smoke-train, the whole solid, if he sail or adamant, has been resolved ere it can, in the slant direction they commonly arrive, be retarded enough to drop perceptibly from the straight line!

Now the last-found marvellous property of light came just in time to reveal something of their materials. With the spectroscopic, Mr. Browning caught the rays of some in the 1863 display, and found diversely proportioned mixtures of light from solid and from gaseous matter, but in all a dominant yellow, as of a soda-salt vaporized, except in two that gave green rays, apparently maguesian.

Next came Schiaparelli's discovery, from the table of comets, that this and the other known meteor-streams are following in the exact wake of every little comet known to have crossed our annual path in space. For the orbits of many,—though only telescopic ones,—do actually cut or touch that of our earth. The small comet which heads this November train had been only observed by Europeans within the same year. In January, 1866, this Tempel's comet passed, with the very direction and speed of the meteors, the point that we pass on November the 14th. Ten months after him, we arrived there, and found his retinue still passing, in thousands per minute; and after another year, and even another, up to this third November, their procession has not entirely passed!

It is not in the power of observers, from the mere ellipticity of so much of a comet's orbit as it traverses in one appearance, to approximate more than vaguely the period of its revolution. The calculator of this one's elements, however, Dr. Oppolzer, actually fixed as the likeliest period, a fraction over 33 years. His finding thus any length between 30 and 40 would have been remarkable. The comet has since been identified with one observed by the Chinese, passing its descending node, in August, 1366 (but two months before one of the chief recorded meteor showers), and whose Chinese observations had been reduced to elements twenty years ago. There is no manner of doubt that between the Chinese date and the visit in 1866, this cometic made 15 exact nodal revolutions. Thus, then, by most rare coincidence, we are supplied, at this "nick of time," with an accurate mean period for the comet and his suite, 33.292 years, instead of the 33 and a quarter, the nearest guess that could be made from the meteor-showers. I will presently show how exactly every one of those on record followed on one or other of the comet's unseen passages thus reckoned, and the most noted displays within the fewest months after him. We have, then, no experience or record (unless one presently to be added) of what might happen did the comet's body

ever pass the node (say, but a day or less before the earth. But this we know, that should there, even then, he no meteors heavy enough to penetrate to the ground unaccommodated, at the slant angles nearly all places met them, yet if any could reach the ground, it would be in the district (perhaps very small), that met them most perpendicularly, or with the "radiant" in its zenith. And this, we have seen, could only happen to a place having sunrise at the time; but, further, of all the places then having sunrise, it must be that one whose latitude corresponds to the radiant's declination. (Remember that celestial latitude and longitude are not, like terrestrial, measured from and along the equator, but the ecliptic; and distance from the equator is called declination.) If we are in latitude 51°, no stars can pass overhead but those whose declination is 51°.

Now, it has been guessed, because all other known meteor-streams are rather annual than periodic,—that is, met nearly alike every time we cross their line, as if distributed round their comet's whole path, while this one is met but at two or three crossings of 33,—that this might be a new comet, not yet travelled round enough among us to get so distributed. Hence Le Verrier's great calculation that, taking the meteor's period at 33 2/5 years, they may have almost touched Uranus (the only planet besides ours that their present orbit could) in A.D. 126, and so got turned from an unknowable orbit into this one. But any correction of the above-assumed period, even to 33 2/9, changes all that; and neither the Italian, English, nor American astronomers admit this approach to have happened. Moreover, as there were anniversary displays three years apart, even in 931—934, the train was hardly shorter then than now; and, if a fresh arrival in our system, it must yet, you see, have been introduced far more than twice these nine centuries back.

Now, take 93 times this 33-2/9 from 1366, and you find there was a node passage in B.C. 1897 (remember, that from B.C. 1 to A.D. 1 is but a year, and from B.C. 100 to A.D. 100 only 199). Next find the declination of the "radiant" at that time. Sir J. Herschel makes its present latitude 9° N. and longitude 142°. This longitude is counted along the ecliptic, eastward, from that circle's intersection with the equator, a point that is always shifting westward (by the earth's top-like movement, called precession) a degree in about seventy-two years, at which rate, therefore, every fixed point's celestial longitude goes on increasing. Making this allowance, then, for thirty-seven centuries, you find what was then the longitude of a point that is now in 142°. The figure will happen to be the only one that saves you all trouble with its declination. Knowing the ecliptic's ninetieth degree to be always its northernmost, or in its declination above 23°, the "radiant," if in its present latitude of 9°, was simply 9° north of that, or in declination 32° N. So our meteors could only impinge vertically on a place in the parallel of 32° N.; and of all such places, that only which was then on the sunrise line.

Well, now let me transcribe from a record professedly of occurrences in the latitude 32° N., and the year B.C. 1897,—“And Abraham was ninety-nine years old.* . . . [Gen. xvii. 24]. And the Lord appeared unto him in the plains of Mamre; and he sat in the tent door in the heat of the day [xviii. 1]. . . . And the men turned their faces from thence, and went toward Sodom [22]. . . . And there came two angels to Sodom at even [xix. 1]. . . . And when the morning arose, then the angels hastened Lot [15]. . . . The sun was risen upon the earth when Lot entered into Zoar. Then the Lord rained upon Sodom and upon Gomorrah burning stone and fire from the Lord, out of the heavens. [Heb.] And he overthrew those cities, and all the plain, and all the inhabitants of the cities, and that which grew upon the ground. But his wife looked back from behind him, and she was made [Heb.] a pillar of salt” (23-26).

Of these meteors, then (following a node passage of the same little comet as ours, in the same direction, and from the same radiant), the only one particularised, because it hurried a person, made her (or was) a pillar of salt. And pillars of salt—of soda salts and magnesian salts—(the same chief and the same second ingredient that seem, according to Mr. Browning, to characterise the November meteors) are the matters that, dissolved in the lake, or

heaped in forms unknown to geology on its borders, are found to blight and mark off that locality from the whole globe. Another thing indeed it has unaccountable, and contrary to all other earthly phenomena; its depression to furlongs below the sea-level, and this by downward bending of the whole strata. It is now, in no sense, “the plain” that Genesis calls its former state; but is the only district on earth like nothing but a bruise of her plump skin, a contusion or indent, as by direct impact of a foreign body. And agreeably with this, we find volcanic outbreaks on the extreme verge of the depressed area; but none within that area. The non-biblical accounts, too, of the event either called it simply a great earthquake, or made that its chief element.

Tradition has poetically but ignorantly derived the country's asphalt and sulphur from the catastrophe, though Genesis distinctly says the former distinguished it before (xiv. 10), and the sulphur veins have lately proved to be part of its deluge-drift or older strata. But neither of these minerals would make the soil barren. The only things that do this are the salts, that geology finds unaccountable intruders.

I must now apologize for one omission made to simplify the above reckoning, and which may seem to have made it look a little stronger than it is. We supposed the “radiant” at its present place among the stars of Leo, but the permanence of the phenomenon shows it to move eastward about equally with the node; and a Chinese account, nine centuries old, confirms this by placing it then in Cancer. In Abraham's time it was in Gemini, and instead of longitude 90°, was as far west of 90° as it is now east thereof. If in its present latitude, its declination was the same as now, or about 23°; but its latitude is certainly decreasing, and may, for aught we know, have been then several degrees higher, and S° would give it the declination we assumed above. The exact fact then is this:—That it was within a very few degrees of the zenith of Sodom, or the fall as vertical as any rain, is certain; and mathematically exact verities (which is nowise required) was quite possible, but is not, as the above made it seem, ascertainable.

Now observe that none of these calculations would be easy, or perhaps possible, had the comet's elements been slightly different, the stream not encountering us so directly at our sunrise line, or not having its perihelion and node within a few degrees of being identical; had it, in short, resembled the August meteors' orbit, or any other known, these would have made the problem one for astronomers, if not almost as insoluble as had the Chinese account of the comet in 1366 not existed. But as surely as the spectroscope came just in time (this comet the very first to be examined by it), so are these numerical data just such as would be chosen if one wanted to make the calculations and argument plain, yes, ridiculously easy, to a school-boy. This applies even to the comet's period, so near a third of a century, that we may reckon 24 in 799 years. Thus, then, I find an event singularly well monumented. Lot's wife's pillar served in its day; but a far more durable, and how carefully and consummately contrived a monument is this flying through the sky! that non-travellers can examine, and so arranged as to be visible in general once every generation from any single spot on earth,—from some occasionally twice.

I will now tabulate the list of its recorded visits, as the American professor traces them, but connected with the notable one twenty-eight centuries before his first. The times of the comet's passage, except the two in 1366 and 1866, must be taken as what they would have been undisturbed. The period found from fifteen revolutions will apply better in calculating many revolutions than a few; for you must observe that planetary perturbations may have lengthened or shortened any single revolution by as much as a year, and even accumulated similar effects for two or three revolutions together. Therefore, we know not whether the showers of A.D. 931, 1399, or 1698 preceded the comet, for it may have been many months earlier than the dates here set down for 933, 1399, and 1699. But we do know from the slight display in 1855, which certainly preceded the comet's passage two months, that he has some vanguard of meteors, though the mass of the procession follows him.

TEMPEL'S COMET (1. 1866) AND ITS ATTENDANT METEOR STREAM.

No. of Visit.	COMET.		METEORS.		Place and Remarks.	By whom observed.

* This year was 1867, even according to the popular margin, if you compare it with that given for Abraham's journey out of Haran (Gen. xii. 4).

ORNAMENTAL ART WITH RELATION TO ETHNOLOGY.

At the Associated Arts Institute Mr. R. H. Soden Smith, M.A., read a paper on "Some Phases of Ornamental Art, considered in Relation to Ethnology."

In introducing his subject, Mr. Soden Smith alluded to a paper read during the last session of the Arts Institute, in which he had stated the theory respecting the classification of art that he had been led to adopt,—namely, the division of all Fine Art into Instinctive, Intellectual, and Moral or Spiritual Art. He then proposed to take one of these classes or divisions,—viz., Instinctive Art,—as his present theme, and proceeded to point out, 1st, its nature and limits, its excellences and defects; 2nd, its development among certain nations.

Some exception may be taken, he said, to the term "instinctive," which cannot with exactness be applied to any operation of the human mind resulting in artistic effort, however humble; but, on the whole, it most nearly expressed the thought he desired to convey. The aim of instinctive art is not high. It occupies itself with surface decoration, and with this, not as subordinate to architecture, &c., but as the only art known, and therefore, primary, instead of, as it should be, secondary. It also, in objects surrounding daily life, shows its influence on form, and, among certain races, with excellent results. In its own sphere it approaches perfection,—a perfection more easily attainable than that of intellectual or moral art, as it seems to be free from the hesitation that belongs to reflection. It is not symbolic, nor truly æsthetic, but makes its appeal to man's sensuous nature. It is limited, therefore, to conventional ornament and forms, whether in the round or the flat, the ornament and forms employed being the result of general rather than particular impressions. When it strives after direct imitation it passes its limits, and fails; thus the efforts to represent the human form that occasionally intrude themselves into works of instinctive art are hopeless failures.

The development of instinctive art among certain races of mankind was then alluded to. First among certain oceanic groups of the Malayan type and amongst Papuans. The objects of daily use, the dresses, and weapons of these races were quoted as admirable examples of instinctive art. Reference was made to a collection of tissues brought from the South Sea Islands in one of Capt. Cook's voyages, and which now belong to the South Kensington Museum. These are decorated by means of the simplest forms and few colors, and are examples of the complete attainment of the object in view. The art of the Mongolian race was next spoken of, Chinese surface-decoration being dwelt upon, and their skilful treatment of colour pointed out. The probability was suggested that the forms which they occasionally use, and often mar in the use, originally were derived from a race of another ethnological type. Vases, for example, of excellent outline have their forms strangely altered by handles or projecting monsters of shapes out of harmony with the rest of the work. Yet the instinct of the Chinese artist enables him at times to redress the balance wonderfully, and for this reason,—the carved wooden stands should not be removed from the vases, incense-burners, &c., to which they belong. They are necessary to complete the conceptions of form, often *bizarre*, which was in the mind of the artist.

Lastly, the instinctive art of races belonging to the Caucasian race, using that title in its wide sense, was treated of, and the surface-decoration of the Celtic nations, especially the British Keltic, was dwelt upon, their skill in the ornament in metal-work being mentioned at some length, and examples of cast, of chased, and of filigree ornament being quoted, and its characteristics pointed out, the peculiarity of certain curves, and especially of the spirals and their distinction from other allied phases of decoration, being indicated. The MSS. illumination of the British and Irish Keltic people was next mentioned for its extraordinary excellence as an example of surface-decoration, its complexity of design and faultless accuracy of execution being illustrated by reference to the "Book of Kells," which dates from the seventh century, and to other examples of nearly contemporary work.

The speaker concluded by observing that, although he might seem to invite attention to a very humble field of art, yet that the subject

was not without importance; for if we could aid in any degree in surrounding the daily life of the millions of our countrymen with objects enriched by such art as that on which he had commented, so fit in design, so subtle in conception, so rich in colour, sometimes so marvellous in execution, we might be conscious that we were assisting to raise those around us in the scale of intellectual civilization, and to enable them at length to appreciate the efforts of those nobler arts which shed an immortal light on the fortunate lands where they take root and flourish.

THE SOCIETY OF ARTS.

An able and interesting review of the past history of this society, with suggestions for its future expansion, has been given by Mr. S. T. Davenport, financial officer of the society, in a paper titled "A Glance at the Past and Present of the Society of Arts, with some Suggestions as to the Future." The past was divided into two periods, one extending from the foundation of the society in 1754, by William Shipley, landscape-painter, to what may be called its winding-up, about a quarter of a century ago, and the other extending from that time till now. Mr. Davenport has been connected with the society during the whole of this last period. For the future, he said,—

"I would venture to suggest, in the first instance, some such division as the following, each group being placed under the special care of an expert:—

Chemistry in its relation to manufactures and the arts.

Manufacturing machines and tools.

Trade and commerce, especially including colonial produce.

Education, domestic, social, and economic appliances.

Under some such divisions (he continued) an expansion of our present action might be begun; an expansion which could be elaborated from time to time as additional funds were provided; and under these divisions I believe members would naturally group themselves, and papers might be read periodically in each section.

With industry, according to a list formerly prepared for the society, applied to nearly 1,000 trades, and the discoveries of science daily brought to bear more and more upon them, how is it possible, under our present system, to watch and record progress in this country alone?

I think, also, that it would be a good and profitable investment of money to appoint gentlemen to watch and report on the progress of science and industry abroad, and to translate the records of the published discoveries made in foreign countries for the society's *Journal* and the information of its members."

"The society should watch for and record the wants of industry and art, and offer such honorary rewards for them as their importance demands. Are there no wants in the present day not yet supplied? Do we know all there is to know about metals? Can we puddle iron without a large amount of manual labour? Have we succeeded in constructing a locomotive fit to be worked, and capable of being used in underground railways without creating a nuisance or injury to health? Have we yet ascertained how to bring the surplus food supply of other countries to our own shores? Have chemists exhausted all the sources from which motive power may be supplied, without nuisance, and in so safe and portable a form that horses might be dispensed with on our streets and roads, thereby adding an enormous food-producing area for the benefit of the people of this country? Have manufacturers combined with electricians to apply electricity as it is capable of being applied to increase and extend the artistic powers of the loom? Are there no new oils, gums, fibres, and splices, &c., in India, Africa, and throughout Australia? Do we know how to use petrolæum as it is capable of being used? Surely with experts in charge of sections, wants such as these and many others I could name might be recorded and put forward for solution; and though we may not live to see them all realised, still when our successors shall come before the members of the Society of Arts 115 years hence, they may then have to record of them as we do now, that the reaping-machine asked for 100 years ago has been obtained and is regularly at

work, and that the hay and the corn that used to be spoiled in wet seasons are now capable of being preserved and harvested for the use of man."

"We started our present society twenty-five years ago, with 300 members. We had to borrow money to pay debts, and members subscribed funds for special purposes. We did work which was appreciated by the public; the public supported us; and we are now a body of 3,000. Let us still endeavour to extend our influence; and I have no doubt that, as, in times past, the seed which was sown in good ground took root, and has brought forth tenfold, those who are spared, if they work vigorously, will, in years to come, be able to say it has brought forth an hundred-fold."

In the discussion which followed the reading of Mr. Davenport's paper, very high encomiums were passed on both the review and the suggestions, and the thanks of the Society were unanimously accorded to him at the close.

THE TRADES MOVEMENT.

Manchester Court of Arbitration.—A meeting of the representatives of employers and employed interested in the formation of this Court has been held at the Manchester Chamber of Commerce, and, as their first business, proceeded to the election of a president. It was found that the representatives on both sides had independently selected Mr. Edwd. Owens, judge of the County Court, as a gentleman specially qualified for the appointment. It was therefore arranged that the presidents of the Chamber of Commerce and Trades Council should wait upon Mr. Owens to ask his acceptance of the office. Mr. Owens has accepted the invitation, and at a court held when he was present, he was duly appointed president. Those present at the meeting first mentioned were Mr. Edwd. Owens (chairman), Mr. J. M. Bennett, Mr. Fereday Smith, Mr. Richard Johnson, Mr. J. Slagg, jun., Mr. H. J. Leppoc, and (representing the Trades Council) Mr. W. H. Wood, Mr. George Jones, Mr. P. Clark, Mr. P. Shorrocks, Mr. G. Townley, Mr. C. Swain, and Mr. A. Ridge. The reconsideration of a code of by-laws and standing orders occupied nearly the entire sitting of the court. These rules will shortly be completed and made public. Mr. Browning, secretary of the Chamber of Commerce, volunteered to undertake the duties of secretary in an honorary capacity for the next six months.

ST. PATRICK'S (R.C.) CATHEDRAL, MELBOURNE.

This important edifice was commenced in the year 1858. The plan of the cathedral comprises nave, transepts, and choir, with aisles to each on both sides. The choir has an apsidal end, and five chapels open out from the aisle which surrounds it. There are two towers with spires, each 220 ft. in height, at the south-west end of the nave, and a lantern tower and spire 330 ft. high at the intersection of the nave and transepts. The extreme length of the church interior is 345 ft. The width inside the nave and aisles is 76 ft. The interior length of transepts is 160 ft.; and the height to the ridge of the roof is 92 ft.

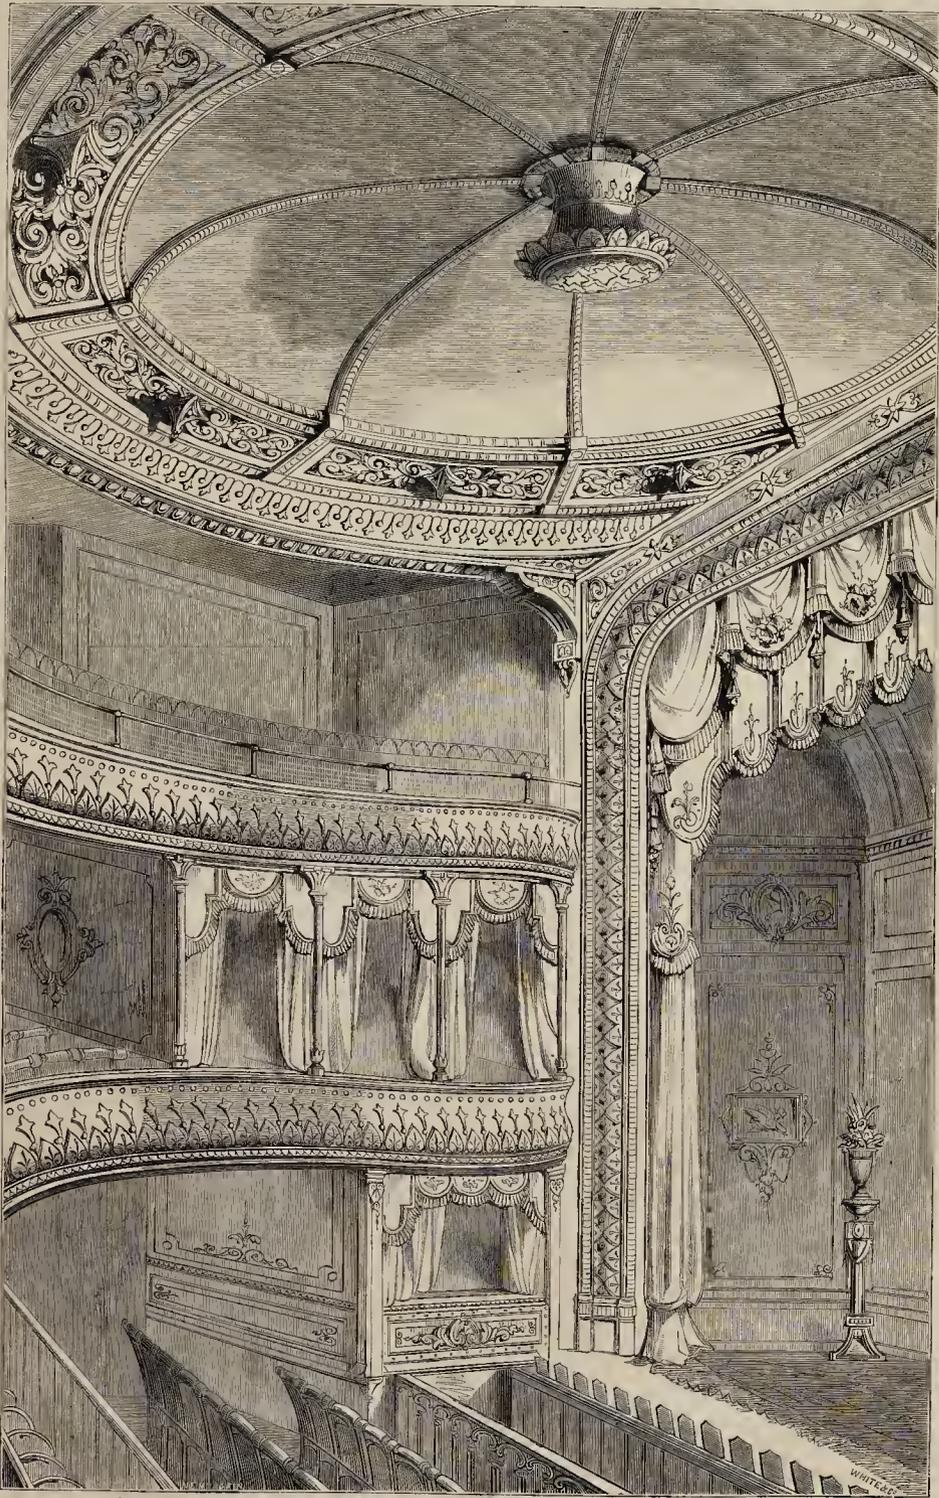

The nave and aisles and two western towers have been commenced; the nave and one aisle are roofed in and nearly completed, and the stone vaulting of the second aisle is making rapid progress. The fittings are at present all temporary. One of the towers is up, ready to receive the spire; the other being complete to the floor of the upper belfry, a portion of the bells have been hung in the western tower. They were cast by Mr. Sheridan, of Dublin. The stained glass is by Hardman, of Birmingham. The principal window in the nave, having for subject the Ascension of our Lord, is well spoken of.

The works are being carried out under the superintendence of Mr. Denny, by Mr. Young, the contractor. Messrs. Wardell & Co. are the architects.

It is proposed to remodel the present house for the bishop, to form part of the grammar school buildings, and the proposition includes a plan for a new house for the bishop, with chapter-house, sacristies, cloisters, &c.

ST. PATRICK'S (R. C.) CATHEDRAL, MELBOURNE.—MESSRS. WARDELL & CO., ARCHITECTS.

IRON AND STEEL SHIPS.*

No one who reads his newspaper can be ignorant of the name and note of Mr. Reed, our navy constructor. This work of his is so replete with practical and detailed instructions to qualify it for its destiny as the base of future examinations in practical iron shipbuilding in the national dockyards, that it is not a hook well suited, and especially on such a subject as ship-building, to be used freely as a gleaner's field for our columns; defective, as it is acknowledged to be, in what relates to the history and theory of ship-building. We shall endeavour, however, to give an idea of the author's manner of treating his subject as regards armour-plates and steel in ship-building, premising that the hook is divided into chapters on the strength of iron ships; on keels, keelsons, and garboard strakes; on stems; on stern-posts; systems of framing, in various chapters; deck stringers and plating; bulk-heads; topsides; rudders; iron-masts; steel-plates for ship-building; rivets; testing iron and steel; Lloyd's and rules for ship-building; armour-plates, &c.

Steel is now regarded by the shipbuilder as a material which may with care be made to possess greater ductility, both hot and cold, than the best wrought iron, in combination with a tensile strength 50 per cent. greater than that of iron. It has on this account come to be largely used by shipbuilders, instead of iron, for plates and angles, and to a great extent for rivets also. There is but little room for doubt that it is destined to a far more extended use than it now has for these purposes; and it is possible that it may ultimately displace iron for such uses. But, in the present state of the manufacture, steel ship-plates, our author thinks, possess some very dangerous peculiarities. There is ample experience, he says, to prove that ships built of steel may be weaker, both structurally and locally, than ships built of iron of the same scantlings, and with precisely similar arrangements of framing and fastenings. It may be said, indeed, with truth, he remarks, that if steel supplied by first-class makers is treated in the same manner as iron in working it into a ship, it will require to be of the same thickness as the best iron, in order to obtain the same strength; and that, as the practice has been to reduce the thickness in nearly inverse proportion to the tensile strength of the perfect plate, steel ships so built are by so much inferior in this respect to ships built of iron of unreddened thickness.

Several kinds of steel have been used in ship-building in the form of plates and angles, but there are only two which have had any extensive use, viz., Puddled and Bessemer steels. These two materials differ widely from each other, not only in the mode of manufacture, but in their qualities. Puddled steel plates and bars, like iron, are made from a pile of small pieces, welded together under the hammer, and between the rolls, and are subject to those well-known and troublesome defects produced in these processes, to a greater extent even than iron. Each Bessemer steel plate or bar is, on the contrary, made from a single ingot, and is therefore free from these defects.

Large plates can thus be made by the latter process with the same precision, and almost with the same ease as small ones, but in puddled steel this is not so. It also appears to be more difficult to obtain uniformity of temper in a batch of puddled steel plates than in Bessemer steel, probably because of the extreme care required in selecting the puddled bars of which each pile is made, as these bars differ greatly from each other in temper, and the selection is made from observation of the nature of the fracture when they are broken. In the manufacture of Bessemer steel, the selection which requires to be made is dependent on precise chemical analysis, which is part of the daily operation of the mills, and is altogether independent of the workmen. Puddled steel is not necessarily inferior in strength to Bessemer steel, but that made in England is generally of lower tensile strength, as well as less uniform in strength.

An important metallurgical discovery, we may here observe, has been recently made, which will have great influence on the manufacture of steel, and how far that may affect the use of it for ships remains to be seen. Bessemer's process is ingenious, and successful with the best kinds of iron, although it is inapplicable to the inferior kinds produced in North-east Yorkshire and in Northamptonshire. Even Bessemer, however, is now beaten by Heaton, a manufacturer in the Erwash valley, for he can take common "pig," and turn it into steel, and by a very simple process. He covers the bottom of a cupola with

nitre, pours thereon the molten metal which he

desires to convert, and chemistry does the rest. At the end of two or three minutes, a fierce flame bursts from the top of the cupola. Presently all is quiet; the nitre, by the action of the intense heat, is converted into phosphate of soda, and the iron into steel. That is the whole process; and, on opening the cupola, there is a solid mass of steel, weighing from 12 cwt. to a ton, ready for the hammer, and to be wrought into any of the forms in which steel is sent into the market.

As if to be ready for this new steel, too, a "deadstroke hammer" has been recently invented by Messrs. Shaw & Justice, of Philadelphia, which is to excel the ordinary steam hammer of Nasmyth by simplicity and ease of working, as well as economy of steam. Three of these hammers, it is said, can be kept going with the steam required for one ordinary steam hammer, and "any boy in a smithy" may manage one.

In armour-plating iron ships, the practice of Government service is to make a set of moulds representing sections of the outside of the ship, and to fix them in their proper relative positions, so as to obtain an accurate representation of the ship's side in wako of the plating to be taken account of. The slight expense of materials and workmanship thus involved is found to be more than compensated in the accuracy with which the plates can be specified for. Drawings of the various plates are prepared, showing their forms and having the figured dimensions, thickness, and estimated weighing marked on them, together with the distinguishing letter and number by which each plate is known. These drawings are forwarded to the manufacturers, and accompanied by printed forms, on which are given the numbers and particulars of the plates ordered. In preparing the specification for armour-plates at the extremities of a ship it is usual to allow a margin of about 2 in. on each edge and butt above the net dimensions; but for the plates amidships the allowance made is not so great, as they have only a moderate amount of curvature and twist. The ordinary dimensions of the plates used are a length of from 15 ft. to 16 ft., and a breadth of from 3 ft. to 4 ft., but the dimensions of many of the plates necessarily vary greatly from these.

A ship's side has to resist both shot and shell; and one of the most important things to guard against is, the explosion of a shell within the wako hacking.

"When the *Warrior* was designed [says Mr. Reed] it was very probable that any shell would pass completely through the 4-in. armour and explode there, and therefore a great depth of wako hacking was unobjectionable on this ground; but as Mr. Whitworth, Sir William Armstrong, and others improved their shells, this contingency became probable, and hence it appeared to me most important so to adjust the thicknesses of the backing and armour, that a shell, which was large and powerful enough to pass through the armour, should be too large to bury itself within the backing, and explode there. If it were not regarded, it is obvious that a single shell might strip several armour plates from a ship's side, and expose her to speedy destruction. In the *Hellfire* target this was carefully regarded, as it is not to be expected that a shell large enough to break through a 6-in. armour-plate would be less in length than the thickness of the backing, viz., 10 in.; and the importance of the precaution was signally illustrated, for the shell that did penetrate the plate was stopped by the stout iron skin before it got within the armour, and consequently exploded harmlessly backward through the hole which it had made. By placing the extra iron plate of the *Lord Warden* upon the frames of the ship, the same object is accomplished there also, so that a shell piercing the 4-in. plate may encounter the 11-in. plate before it has space to bury itself.

In the *Hercules* target the same principle of construction has been carried out. In the *Hercules* herself, provision has been made for 9-in. armour at the water-line, and for wako backing, varying from 10 in. to 12 in. It was considered that in this case, also, it was out of the question to suppose that a shell which could penetrate a 9-in. plate would be less than 12 in. in length, and consequently, in this case also, it was presumed that the armour-plate, the backing, and the skin of the ship must all three be pierced, before a shell could do any serious injury to the structure."

We learn, by the way, that Messrs. Napier, of Glasgow, have received orders from the Admiralty to construct the *Hotspar*, a steam ram which bears no resemblance to anything in our navy at present. She is neither a broad-side ship nor a monitor. Like the *Beller*, this vessel is intended to fight end-on. The armour belt at the water-line consists of two strakes of plating, the upper one being 11 in. thick, and the lower one 8 in. She has a formidable ram. On the main-deck is an armour-plated breastwork extending about one-third the length of the ship, similar to that which has been adopted in the new monitors. From the bow aft to the breastwork the main-deck is plated with 3-in. armour; and at the forepart of this breastwork a pear-shaped battery, covered with 8-in. armour, is brought above the upper deck. This battery is

pierced with several ports, and contains a turntable carrying an 18-ton gun, the whole being trained, &c., by suitable machinery situated on the main-deck. The only other gun to be carried by the *Hotspar* is a 40-pound Armstrong; this will be placed aft.

The book is valuable.

SCHOOLS OF ART.

The York School.—The annual meeting of the friends and supporters of this school has been held in the school, but there was only a thin attendance. The report stated that the condition of the school was satisfactory in respect to the number of pupils as well as their works. The number of pupils in attendance on the various classes during the past year had been 67, that of the preceding year being 51; their attendance had been more regular; they had displayed a greater amount of diligence, and their success had consequently been greater, a statement corroborated by the number who had passed the Government examination and had obtained prizes. Eleven in the second grade, and five in the third grade, had obtained prizes; while thirty-eight had passed in the second grade, four with full certificates; one had been made a free student, and one a pupil teacher with 15l.

The Cambridge School.—The annual meeting in connexion with this school for the distribution of prizes, &c., has been held in the large assembly room, Guildhall, the Rev. the Master of St. John's College presiding. A large number of ladies were present, and on the platform to support the chairman were Professor Kingsley (who read a paper on the "Morality of Art"), Mr. Hattersley, the master of the school of art, and others.

The chairman congratulated those present on the success of the school, its progress during the past year being of an encouraging character. He regretted the severe loss the school had sustained in the death of Mr. Beaumont. The committee reported an increase in the total number attending the school, but they regretted that there was a diminution in the attendance at the gentlemen's advanced class. The number of prizes and rewards obtained by the students from the Government, either in the local examinations or for works done during the year, was much greater than last year. Thirteen were this year selected for national competition at South Kensington, against six of last year.

THE TECHNICAL INSTRUCTION MOVEMENT.

Newcastle-upon-Tyne.—Mr. J. C. Buckmaster has delivered a lecture, in the lecture-room of the Literary and Philosophical Society, on "The Facilities and Grants of Money now offered by Government for Scientific Education." The lecture was well attended. After Mr. Buckmaster's address, practical observations were made by various speakers, and it was resolved "That a committee [named] be appointed to assist the two gentlemen sent down here to promote the formation of classes, for the purpose of making representations of the defects in the present arrangements, and to lay before the Government those little difficulties which fall in the way of the inauguration of these classes."

Blyth.—A public meeting has been held in the lecture-room of the Mechanics' Institution, Blyth, for the purpose of increasing the interest in evening classes for instruction in geometrical drawing, machine drawing, building, construction, &c. The Rev. W. Greenwell, vicar of Horton, presided. Mr. W. T. Rowden, associate of the Royal School of Mines, London, was in attendance, and explained the advantages and objects of such classes, and showed how they could be wrought in connexion with the Government Department of Science and Art. The meeting was also addressed by the Rev. W. Dromgoole (Roman Catholic), the Rev. T. Clifton (Congregational), and Mr. G. B. Forster. The committee of the Blyth Mechanics' Institution inaugurated two successful classes last winter—one on marine architecture, the other on geometrical, free-hand, and perspective drawing, conducted by Mr. Wallace, National School teacher. Several pupils obtained certificates at the last March examination.

Banbury.—The annual meeting of the Committee of Management for the Banbury Science

* Ship-building in Iron and Steel; a Practical Treatise. By E. J. Reed, C.B., Chief Constructor of the Navy, &c. London: Murray, 1869.

School has been held in the Council Chamber, Town-hall. Mr. B. Samuelson, M.P., the president, occupied the chair. The annual report was adopted. It was reported that efforts had been made in the neighbourhood to establish classes for science instruction, and that in one case (Deddington), these efforts were likely to receive encouragement, as classes were now being conducted in Elementary Mathematics and Physical Geography. Classes for Banbury were arranged for the next session, on Animal Physiology, by Mr. J. H. Beale; Elementary Mathematics and Physical Geography, by Mr. A. Owen. The chairman was requested to obtain the assistance of Sir H. Verney, M.P., in the formation of classes at Buckingham. Mr. Samuelson expressed a hope that as the Banbury Science School was one of the first established in connexion with the Government Department of Science and Art, every effort would be made to secure permanent successful working for the various classes in the town and neighbourhood. He called attention to the efforts that were being made in the North of England; where through the agency of schoolmasters' classes, science instruction was being pushed with marked success. He especially called the attention of the committee to the minute of the department which allows grants for building purposes to committees of science classes, and expressed a hope that advantage may be taken of the same. The minute is as follows:—

"A grant in aid of a new building, or for the adaptation of an existing building for a School of Science, may be made at a rate not exceeding 2s. 6d. per square foot of internal area, up to a maximum of 500l. for any one school, provided that the school

(a) be built under the Public Libraries Act, or

(b) be built in connexion with a School of Art aided by a department building grant.

And provided that there is a population in the neighbourhood which requires a school of science; that it is likely to be maintained in a state of efficiency; and that the site, plans, estimates, specifications, title and trust deeds are satisfactory."

COMPETITIONS.

New Church, Brownswood Park, South Hornsey.
In a private competition for this new church, four designs were sent in, by Messrs. Wallen, Joseph James, Theodore Green, and Bacon & Bell. The design of the first-named gentlemen has been selected for erection.

THE NORTHERN ARCHITECTURAL ASSOCIATION.

The quarterly meeting of this body was held on the 26th ult. in the Old Castle, Newcastle-on-Tyne; Mr. J. Watson in the chair. The secretary announced that he had been in communication with the Architects' Benevolent Society; and they had advanced 10l. to the widow of one of the late members of this Association. The Association (added the secretary) subscribed annually; and this was the third time that help had been received. It was resolved, on the motion of Mr. R. J. Johnson, seconded by Mr. Frank Charlton, that a letter of condolence be sent to Mrs. Green, on the death of her husband, Mr. John Green, the late president of the Association. The report of the Architectural Alliance was read; and Mr. R. J. Johnson announced that he had attended the annual meeting in London, on behalf of this Association. The secretary called attention to a very important matter in the last paragraph of the report, referring to the facilities for architectural education in the neighbourhood; and also read a letter from the Alliance on the subject. Mr. Fowler moved, and Mr. Oliver seconded, that the report and letter be referred to a special meeting. The secretary received instructions to write to the secretary of the Glasgow Architectural Association to inquire what steps had been taken by that society for the purpose of registration, and under what Act of Parliament. The Society then proceeded to elect the officers for the year, as follows:—President, Mr. J. Watson; vice-president, Mr. R. J. Johnson; hon. treasurer, Mr. F. Charlton; hon. secretary, Mr. Thomas Oliver; hon. solicitor, Mr. G. W. Hodge; committee, Mr. Hogg, Mr. Fowler, Mr. Thompson, Mr. Parnell, and Mr. John Johnstone. The president returned thanks for the honour they had done him. He felt the honour the more from his being the successor of his late lamented friend, Mr. Green.

SANITARY MATTERS.

Typhoid at North Shields.—Last week, says the *Lancet*, we informed our readers that fifty-six deaths have lately occurred from fever in North Shields; and, from the various accounts we have published of the disease, it is very moderate to compute that 1,000 people have been ill, out of a population of about 35,000. There has been no coroner's inquest over any one of the fifty-six deaths, and the illness of a thousand does not seem to have occasioned much anxiety. It would take an alderman's death, or town clerk's, to startle the authorities into an inquiry worthy of the occasion. There has been no investigation by the Privy Council, so far as we know, though the outbreak is far more serious than the one at Guildford. We have no reason to doubt that Mr. Simon would find the North Shields outbreak as "instructive" as the Guildford one, and (as valuable an illustration of "excremental poisoning." It is high time the Sanitary Commission which has just been appointed should begin its inquiries. It cannot have a better subject to start with than this outbreak of typhoid at North Shields, and the slight attention excited by it.

On the Use of Sewage at Parsloes (Barking).—We have the summer's history before us in a report on certain half-acre beds of land near Barking; and it throws considerable light upon the sewage question. A nine-acre field, of a fair loamy soil, lying a mile beyond the utmost point to which the Metropolis Sewage Company then sent their North London sewage, was during the month of May, ploughed and reploughed and thrown up into ridges 18 yards wide and nearly a yard high. Meanwhile, a line of troughing which should command this field was erected on posts some 12 ft. high at the sewage end—landing their contents, however, in a stream just above the level of the furrows along the ridge-lines of these beds. Mangold plants, says the report, were transplanted into the blanks from a seed-bed, sown so late as June 9th; and by-and-by the sewage was available, and the appearance of everything soon changed, almost as by magic. And now the straw of the Indian corn, the crop having been long since gathered, is standing 6 ft. or 7 ft. high; the mangold ridges, not altogether evenly covered, for some of them had been transplants and others had been seedlings, are covered with a heavy crop, probably nearly 40 tons per acre, many of them heavy, handsome roots; the cabbages have been sold after the rate of 30l. per acre; the kohl rabi, not so good a crop as the others, yet promises a very fair return; and some of the remaining ridges are covered with a very vigorous and bushy crop of late-sown turnips. The detailed history of the field is one of the most surprising testimonies to the fertilising power of London sewage that has yet been borne.

Sanitary State of the Army in India.—The report of the sanitary commissioner for 1866-7 shows that the death-rate of the European army was 30.95 per 1,000 men. This was more than half as high again as in the previous year, much higher than any year since 1861, when it was 45.93 per 1,000. The rate of 1861 was the highest on record, and of 1866 the lowest. 1,071 deaths from all causes occurred, and of these 471 arose from cholera. The per-centage of deaths from cholera per 1,000 was 13.81. Next to cholera, the largest number of deaths was due to fever.

THE SANITARY STATE OF SHOREDITCH, AND THE DWELLINGS IMPROVEMENT ACT.

The vestry of Shoreditch are considering several important matters relating to the sanitary condition of the parish. A meeting was recently convened by requisition, for the special purpose of considering a report from Mr. Sutton, the medical officer of health, suggesting the expediency of carrying out the provisions of the Act 31st and 32nd Victoria, cap. 120, entitled "An Act for providing better Dwellings for Artisans and Labourers."

The report stated that during the two weeks ending with the month of October last, there had been nineteen deaths from contagious diseases registered in the parish; that there had been an outbreak of typhus fever in the Holywell district; that eleven persons had suffered from typhus in Bath-place, Curtain-road, all of whom had been removed to the Fever Hos-

pital; and that isolated cases had occurred in Willow-gardens, Garden-row, Eleanor-place, Chapel-street, Royal Oak-walk, Pitfield-street, and the neighbourhood of Hoxton Market. Notices had been served on the owners of the houses in which these cases had occurred to cleanse and disinfect the same, and the beds and clothes were ordered to be destroyed. In several instances notices had been served on owners to close the houses, as being unfit for human habitation, and the medical officer recommended that the vestry surveyor be requested to report upon certain houses in Charlotte-court, Charlotte-street, Curtain-road, as to whether they can be rendered fit for human habitation by alteration, or it is necessary that they should be rebuilt. The medical officer strongly urged the vestry to carry out these recommendations, on the ground that the house property around Garden-walk, Ingram's-buildings, Charlotte-court, Dennis-place, and that district, is in a very bad state, the houses being in such bad structural condition that it is almost impossible to keep them in a good sanitary condition. The result, he states, is, that these houses are frequently the dens of fever, and if fever break out in one house, it generally spreads to several others. More- over, he continues, now that the owners of this property are beginning to recognise the necessity for pulling down such houses, it is very important for the health of the artisans and the labouring classes of the parish that the owners of such bad property should know that the vestry have the power to compel them either to greatly improve or to rebuild these houses. It is not intended, he observes, that a number of these houses should be closed at once, but that measures should be taken to compel the owners to improve and reconstruct such houses by degrees.

A discussion followed the reading of the report, when very different opinions of the propriety of interfering were expressed, and ultimately the meeting was adjourned till the second Tuesday in January, the clerk meantime to furnish each vestryman with a copy of the Act.

RAILWAY MATTERS.

City Railways.—A new method of applying steam for locomotive purposes on street railways, so as to avoid the use of fire in the engine while running on the streets, has been exhibited at Philadelphia on a temporary track. In this engine the necessity for a fire-box, smoke-stack, &c., is done away with by substituting a tank or reservoir for holding water previously heated to a high temperature in a stationary boiler. The water is forced into the locomotive tank, and is said to be capable of giving off an amount of working steam for a considerable length of time sufficient to drive the engine and draw one or more carriages. The new locomotive weighs about five tons when fully supplied with the requisite storage of heated water. At the trial it ran forty-five minutes, making 125 stoppages and reducing the steam pressure from 80 lb. at starting to 20 lb. when the trial ceased. The temperature of the water is kept up by a non-conducting jacket 3 in. thick around the tank.

Communication between Guards and Passengers.—A series of experiments have been made on the North-Eastern Railway system, with a view of testing various methods of communication between passengers, guards, and drivers, which have been devised in April next, when a provision of the kind becomes compulsory on railway companies. Four experimental trains were run, and the general managers and other officials of the Great Northern, South-Eastern, Manchester, Sheffield, and Lincolnshire, Midland, London and North-Western, North-Eastern, and other companies were present, and travelled in the trains. The results will lead to a conference with the different managers, and form the basis of a suggestion to the Board of Trade for a uniform system of signalling in passenger trains.

A Railway Train Smashed by Indians.—A freight train on the Union Pacific Railroad has been captured by Indians, about a mile west of Alkali Station. The Indians effected the capture of the train by cutting the ties in the centre, and thus spreading the rails, so that when the train came along, about two o'clock in the morning of the day stated, it was piled up together, and made a wreck. In the smash the fire-

man was killed. All the men of the train fled when the disaster occurred, to escape from the Indians, except the engineer, who remained with his dying freman. The Indians burned the railway-bridge near by, for the apparent purpose of destroying a passenger train that was soon to follow the freight train already destroyed; but the division superintendent immediately telegraphed west to the coming passenger train, and stopped it. He also telegraphed to Fort Sedgwick for troops; but when they arrived the hostile Indians were all gone. When he arrived at the scene of the disaster there were about 100 Indians congregated on an adjacent hill around a bonfire. Very quickly after he saw similar bonfires lighted successively, as signal lights, on the distant hills, around each of which he could see bands of Indians. He calculates that their whole force amounted to 1,000 warriors. These Indians were Sioux and Cheyennes. Railway travelling in the Far West must be rather exciting.

THE RESTORATION OF ST. NICHOLAS'S STEEPLE, NEWCASTLE-UPON-TYNE.

At a meeting of St. Nicholas's Steeple Restoration Committee, the Secretary read a report, which said,—

"In obedience with the resolution passed at the last meeting of the Committee of Management, application was made to the town council to levy a voluntary rate of 3s. in the pound upon the rated inhabitants of the borough, for the purpose of raising the necessary funds to complete the restoration of St. Nicholas's steeple, in conformity with the plans and specifications of Mr. Gilbert Scott. The town council have the satisfaction to report that the said committee very promptly acceded to their request. It is estimated that it will require about 7,000*l.* to perfect the restoration, against which 2,922*l.* 13s. 7d. have been paid, and some of the largest subscribers to the fund, or promised. Some of the largest subscribers to the fund, before contributing, stipulated that there should be no partial measure, but that the work be thoroughly and effectually done. The committee having secured from a first-class builder a contract undertaking to do the whole of the restoration as recommended by Mr. Gilbert Scott, at 1,223*l.* below the average of other eight tenders which were sent in to the committee, it is extremely desirable that so favourable a contract should not be lost; they have therefore to express the earnest hope that the public will liberally respond to the voluntary rate, and thus enable them to reap the full advantage of the tender made by Mr. Walter Scott, and also keep faith with those contributors who only subscribed upon the understanding that the work should be carried out in its entirety."

It was resolved that the report be received and printed.

The Secretary gave the following financial statement:—Subscriptions promised, 2,943*l.* 13s. 7d.; unpaid, 292*l.* 2s.; total received, 2,650*l.* 11s. 7d. Disbursements—Contractor, on account, 2,100*l.*; architect, 100*l.*; clerk of works, 303*l.* 9s. 11d.; advertising, &c., 38*l.* 6s. 6d.; total, 2,886*l.* 14s. 10d., leaving an available balance of 63*l.* 16s. 9d. The amount for which they were now liable to the contractor was 1,400*l.* on the second division of the contract. The secretary added that Messrs. Robert Stephenson & Co., although they gave 100*l.* had now paid the voluntary rate amounting to nearly 30*l.*; and Mr. Budden, their chief manager, had gone over the work, and expressed the greatest satisfaction with it.

It was resolved that notice be given to the contractor to proceed with the third division of the work.

MIRFIELD TOWN-HALL.

MIRFIELD, near Huddersfield, has provided itself with a town-hall, and it was opened on the 25th ult. The building has been erected from the designs of Messrs. John Kirk & Sons, architects, of Huddersfield and Dewsbury, and is situate in Easthorse, abutting on the turnpike-road. The structure comprises, on the ground-floor, a hall, 90 ft. long by 40 ft. wide, having seating accommodation for 900 persons, with an orchestra of 600 performers, also side and end galleries of extent sufficient to accommodate 300 persons, making the total sitting accommodation of the hall for 1,000 persons. There are five entrances to the hall and three to the galleries, the principal one being from the main road, and two others from the side street, all of which have vestibules, and contain ticket offices, and staircases to the galleries. Under the orchestra in the hall are two private entrances, and ante-rooms suitable for the use of committees, &c., and beneath these, on the basement floor, are the cooking kitchen and warming apparatus for warming the building. In front, and abutting on the main road, are four look-out shops with cellaring. Above these, and ap-

proached from the main road by the gallery staircase are suites of offices and a reading-room, 95 ft. by 20 ft., with lavatories. The roof of the great hall is formed with nine principals, composed of rafters and collar-beams, the principal portion of the lateral pressure being sustained by a moulded circular fitch rib in three thicknesses, bolted together; the spandrels are filled in with ornamental cast-iron work, which serves to bolt the whole together as well as to enhance the general appearance. These principals are dressed and partially exposed, and divide the roof into ten compartments; they are stained and varnished, and supported at the walls upon projecting moulded corbels. The ceiling is 40 ft. from the floor, and the hall is lighted by means of skylights in the roof. Externally the principal features of the building are the south front, consisting of a central projecting clock-tower, and containing the principal entrance, flanked on each side by the shops. The style of the architecture is Italian, freely treated. The stone has been obtained from the local quarries, and the cost of the entire building has been about 4,000*l.*

LIGHTHOUSE BUILDING.

THE INSTITUTION OF CIVIL ENGINEERS.

On November 24th, the paper read was on the "Roman Rock Lighthouse, Simon's Bay, Cape of Good Hope," by Mr. John Frederick Bourne.

The object of this communication was to point out the causes of failure of the original structure, and to give an account of the mode of securing the tower against further injury.

The late Mr. Alexander Gordon was intrusted with the design, and with the superintendence of the construction of the iron-work and lantern in England. The design was for a circular tower, 15 ft. in diameter and 48 ft. in height, of cast-iron plates, with a central column, 16 in. in diameter, as a well for the weight of the revolving machinery. There were eight plates in the circumference of the tower, and six plates, each 8 ft. long, in the height. But to admit of the horizontal joints of each vertical set of plates breaking joint with those of the contiguous vertical sets, there were four plates of 4 ft. high each and four of 8 ft. each in the first and last sets of plates. The door- sill and level of the first floor were 24 ft. from the foundation; the whole interior up to that level being intended to be filled in with concrete. If the building, as designed, had been skillfully and carefully erected, and filled in with good material, there was no reason to doubt that it would have answered the required purpose, and have stood well. But it failed, and was condemned as being dangerous.

The first cause of trouble, and which led to immense additional expenditure of time and money, arose from the lowest portion of the rock being chosen for the site, on account of its being more level. The next error was cutting the foundation pits too deep into the rock. For the purpose of getting as much solid rock as possible for the inside of the tower. In order to give a core of 6 in. at the lowest spot, it was necessary to leave it 2 ft. 9 in. high at the highest point; and as the groove was formed by blasting, for the sake of saving labour and time, the rock was much injured. Every sea of course filled the annular foundation pit, rendering it difficult to work. Two channels were therefore made, by blasting, one on each side, to allow the water to run off; and these channels were very annoying at a later period. It was found impossible to cut the foundation pit true and level, or so difficult that the attempt was abandoned; and the holding-down bolts were so imperfectly secured that some of them drew when screwed up. Nor was the circle true in plan. Not only had the bottom flanges of the plates to rest upon uneven bearings, being wedged up in some places with blocks of oak, but they were forced, when screwed together, to take a form to which they were not cast. When the plates were tightly bolted together, and the concrete was filled in to its full height of 24 ft., the plates began to crack vertically in six different places, one crack extending 28 ft. high; so that it became necessary to hoop the tower with wrought-iron hoops. In this condition the lighthouse was completed, and was used for some time. The erection occupied five years, and the cost was stated to have been about 17,000*l.* The lighthouse was built by the Imperial Government, and the arrangement was that when completed to the satisfaction of the Colo-

nial Government, it was to be maintained and lighted by the colony. Owing to its patched-up state the colony refused to undertake its maintenance, and consequently a long correspondence ensued, when a proposal, made by the author, was eventually adopted by the Board of Trade, that the tower, as it stood, should be surrounded to the level of the first floor, a height of 24 ft., by a concentric ring-wall of granite, 4 ft. thick, with a backing between the wall and the iron plates of about 8 in. of cement concrete.

The arrangements for conveying the stones to the rock, for landing them there, and for setting them by means of a traveller running on a circle of fished railway bars fixed round the tower, were described. Copious extracts from the resident engineer's journal of operations were also given, from which it appeared that the foundation pit was cut by drilling holes, 1½ in. in diameter, in concentric and radial lines, to the required depth, and breaking the pieces out with ping and feather. The bed was then dressed until it was perfectly true. The whole foundation was put out in two levels, the lower one not being so deep as the old foundation pit, or as the channels previously referred to. The journal shows that in 269 days after the work was commenced, in 1864, there were 102 days on which it was possible to do something on the rock, in 356½ working hours, whilst in the same number of days in the year 1865, there were only 42 days when the work could be proceeded with, for 126½ working hours. But the year 1865 was exceptionally bad. The number of hands employed, all told, was generally nineteen. The four masons and two smiths received 6s. 6d. a day each, and the labourers who were employed in drilling, quarrying, and rough-dressing, and in pulling out, and back from, and working on, the rock, received 4s. 6d. a day each. It was satisfactory to be able to record that the whole work was completed without any serious accident to the men. No difficulty was experienced in filling in the old pit and gullies in favourable weather, with Portland cement mixed with very little sea-water and chips of granite from the quarry. A temporary protection for each short length of pit, as it was about to be filled, was made with gunny bags, filled some with sand and some with clay. As the still cement and flakes of granite were laid, they were covered with tarpanin and bags. Some time elapsed, owing to adverse weather, before the courses of stones could be laid. The work was commenced on the lee side of the tower, and carried round to windward on both sides for the first three courses, after which each course was commenced to windward, as, being 6 ft. high, it was not so much exposed to the force of the sea, and it was more convenient in bringing round the stones. By the end of 1866 the work was at its proper height for putting on the coping. This was completed early in the following year, when the lighthouse was taken over by the Colonial Government.

BUILDERS' BENEVOLENT INSTITUTION.

The twenty-first anniversary festival of this Institution was celebrated on Thursday evening (26th ult.), at the Freemasons' Tavern, Great Queen-street, Lincoln's-inn-fields, Mr. George F. Trollope (president) in the chair. The entire number of friends and subscribers who attended amounted to 250.

On the removal of the cloth, the usual loyal toasts were given, and duly honoured.

The Chairman next proposed "The Army, Navy, and Volunteers," to which Lieut.-Colonel Thorpe briefly but very suitably responded.

The Chairman, in proposing the toast of the evening, "The Builders' Benevolent Institution," referred to the foundation of so valuable an Institution, which for twenty years had been pushing onward in the work of doing good. He contrasted it with the Society of Painters, to which he had the honour to belong, and showed the advanced growth of the Builders' Benevolent Institution, as to its giving relief to decayed members of every branch of the building trade, as also to their widows; the male pensioners receiving 2*l.*, and the women 20*l.* per annum. This might not appear much, but to the poor it was a great deal. In some cases the recipients lived with their friends in the country; and when the time came round for the payment of their money, it was received with joy and gratitude. In other cases, it materially assisted in keeping them out of the workhouse. Under all circumstances, the Institution was progressing,

and very deservedly so; and be hoped that all the friends and subscribers would continue and further their support and interest, as there was yet much to be done to meet the requirements of the Builders' Benevolent Institution.

Mr. W. B. Rogers, in support of the toast, strongly showed the necessity for builders aiding the Institution, which had now attained its majority. He said that with builders, in the undertakings they had frequently in hand, there was no doubt a vast degree of talent and assiduity required to carry on the works successfully. But notwithstanding that talent and assiduity, they all knew that obstinate adversity had appeared, and the heretofore wealthy man had irrevocably fallen. It might be said that he had done that which he ought not to have done; that he had entered into speculations which he ought not to have entered into. But enterprise and speculation were one; for without the combination enterprise would be constrained. Enterprise, in fact, was speculation. The small sum of 24l. per annum had been alluded to, but as a charitable grant, he was of opinion that it was very acceptable in old age. In August last, the number of pensioners on the funds was forty-eight, and he thought they ought not to scruple at having one hundred on the books. There were numbers of gentlemen who were all in some way connected with the building trade, and to these he would suggest that they should give a hearty and continuous support to this very praiseworthy undertaking.

The toast was drunk with great enthusiasm.

Mr. Geo. Plucknett proposed "The health of the Chairman and President." He was fully aware, in introducing that toast, it would be satisfactory and cordially received. That gentleman (the chairman) being largely connected as he was with a great business, had the opportunity of giving up a portion of his time to works of charity. In that spirit of philanthropy he felt that in bestowing his attention on the Builders' Benevolent Institution he would thus promote good objects.

The Chairman briefly returned thanks. He said he was fearful that his efforts to promote the interests of the Institution would not be adequate to his wishes. He, however, trusted to extended assistance, for there were many anxiously waiting to become recipients of the funds.

Mr. R. Crockett proposed "The Patrons, Vice-Presidents, and Trustees," and associated with that toast the name of Mr. Thomas Cozens, the founder of the Institution, through whose zeal and untiring energy the Institute had breathed difficulties until it had attained its present strength. He much regretted that Mr. Cozens was prevented from being then present among them as he was suffering from illness. There was, however, another gentleman among them who had also been a hard-working promoter of the interests of the charity. He meant Mr. John Thorn, who had devoted much time to the Institution's well doing. He repeated the toast with the above names conjointly added.

Mr. J. Thom, in reply, also regretted the absence of his friend and colleague, Mr. Cozens, with whom he had worked hand-in-hand both as committeeman and otherwise for many years. For his own part, and also on that of Mr. Cozens, he could say, that as long as they had the power and ability they should devote themselves to the welfare of the Institution, with a hope and trust that the ultimate wish of the founder may be realised.

The Chairman then proposed "The Health of the Treasurer," whose name it was not necessary to mention.

Mr. George Plucknett sincerely thanked the meeting for the kindly manner in which they had drunk his health, and congratulated the committee on the result of their more than night usual, making altogether nearly 500l., and he hoped that each succeeding year they might realise as much. It would not all be spent, but carefully watched and appropriated as deemed most advisable. The funded stock now amounted to about 15,000l., and he trusted, therefore, that in a few years the pension would be increased from 24l. to 30l. per annum.

The "Architects and Surveyors" was the next toast, on which the Chairman referred to the feeling of respect and hearty co-operation which existed between them and the builders.

Mr. Franklin responded. The Chairman then gave the last toast, "The Directors and Stewards."

Mr. Wilfred Nicholson (a director) returned thanks, and spoke of the anxious desire he and his brother directors had to support creditably and permanently the establishment in which they all had so great an interest. At the fall of the present year they had not their usual election, simply because it was deemed prudent not to throw another pensioner on the list. They would wish to take in all, but at present they were unable to do so. The builders were a class different from others, and when a brother met with vicissitudes, little or no sympathy was obtained. How necessary was it, then, to extend as much as possible the usefulness of the Builders' Institution, so that by and by they might show a very large success and a very worthy treasury. A few friends might do a very large amount of work. They might enter the whole metropolitan area, and by the obtaining of new subscribers greatly enhance and the income. Referring to the vicissitudes by which men of their class were stricken down, he said many who had held high positions, — not by any fault of their own, had fallen: one, a former member of the board of management of that Institution, at that time was a grateful recipient on the funds. They required a large amount to help all who were in need, and, therefore, the more benefactors they had the better. The trade did not consist alone of those connected with bricks and mortar.

Mr. J. Bird said there were 16,000 persons associated with the building trade, and he had no doubt that a great number who had not before subscribed could be prevailed upon to do so, and then, instead of only electing one or two of their poor brethren, they might be enabled to elect all and support them ultimately without touching the material funds of the Institution.

DRINKING FOUNTAIN, SHEPTON MALLET.

A DRINKING-FOUNTAIN has been erected and opened at Shepton Mallet. The base stone is of Cornish silver-grey granite, furnished by the Messrs. Clemens, of Truro. Partly in relief, and partly sunk in the stone, are two dog's troughs. Around the base stone is placed a step of Pennant stone. The spur stones are of Cornish silver-grey granite. After a block of freestone laid on the granite base stone, there is a block of polished mountain limestone, each face having pattern carved in high relief. The stone was obtained from Waterlip quarry. The bowl is of highly polished red and green Cornish serpentine, furnished by the Lizard Serpentine Company. Fern-leaves are carved on it in relief. The carving was done at the company's works at Caerleon Cove. It is made always to contain water, to prevent the splashing that would otherwise arise if the steam of water fell directly on the stone. The stream is incessant, and flows from a brass spout. From the level of the bottom of the bowl springs at each angle of the structure a polished serpentine shaft (blood red and black, black and green, &c.; also furnished by the Lizard Serpentine Company), which sustains the angles of the canopied arch that terminates the structure. The bowl is set in diaper work. The capitals, instead of acanthus, are roses, wheat, and geraniums. The under faces of the canopy are carved in strong relief, each side different, passion flowers, roses, German ivy, common ivy, convolvulus, bramble, &c., are severally introduced; the apex finished with a finial, each of different pattern. From the valleys of the roof spring at each angle a crocketed pinnacle, carried on a short shaft. The roof is carved with a fish-tail tile pattern. The centre of the roof carries a lamp-pillar, cast by Messrs. Turner & Allen, of Loddon. The lamp, which was also furnished by them, is one of Forrest & Co.'s patent cylinder lamps. The lamp and pillar are painted maroon, relieved with gold, by Mr. Smith, of the Market-place, who also fixed and provided all the pipes, &c., required throughout the structure free of charge. The carving was done by Mr. William Halliday, of Wells. The builder was Mr. Emery, of Town-lane, who not only carried out the work without profit, but subscribed towards it. The entire work was carried out under the personal superintendence of the architect, Mr. T. J. Hicks. The freestones is from Doulting. The cup is of silver-plated nickel, and was the gift of Mr. Cuzner. The whole work has been treated with a solution of soap and alum as a preventive against decay and parasitical growth.

SOCIETY OF ENGINEERS.

SIR,—I trust you will allow me, through the medium of your paper, to call the attention of the members of the Society of Engineers to the halloing list of proposed new members of council for the ensuing year.

There are seventeen candidates, and twelve only can be elected. The outgoing council have as usual nominated themselves with one or two exceptions, and will, no doubt, vote for each other and get their friends to help them to get returned.

I beg to suggest that, following up the Conservative tactics, the members should plump for eight candidates, including the five new candidates not in the outgoing council's list. This will ensure the return of the new candidates, and infuse new blood into the council, which, I need hardly say, is much required.

A MEMBER OF MANY YEARS' STANDING.

THE NUMBERING OF STREETS.

SIR,—I noticed in your paper recently a suggestion as to the "numbering of streets," and no doubt improvement is required there. The proposition, however, would not meet all the difficulties. The principle of numbering streets by putting all the even numbers on one side, and the odd numbers on the other, answers remarkably well. The difficulty now to be got over is, how to see the numbers at night, or with gas-light. As a step in the direction of overcoming this question, I would advance, that on two sides of every gaslamp in the public streets the number

of the house immediately opposite it be printed on transparent paper, gummed or pasted on the inside of the glass. This plan would confine the search for a number to be betwixt the lamps; and these catch numbers would be illuminated free of cost, and be discernible so long as the street lamps were lighted; and when these lamps were put out, parties at a loss for their house numbers could just take the hint, that the public authorities did not intend to encourage late walkings. But in addition to this, I would have the "name of the street" put on each lamp in the same manner. I have seen the names of streets done in this way; the light is imperceptibly affected, and the advantage, especially to strangers, is very great. In fact, in any large town the introduction of the above would prove of great public convenience.

Dundee. THE TOWN SURVEYOR.

VENTILATION OF SOIL PIPES.

SIR,—Perhaps you will allow a mechanic a word or two on "sewer ventilation." I quite agree with your correspondent "F." in stating "that the pressure of the gas in sewers often exceeds the hydrostatic pressure of the water in the traps;" but I will go further, and state that the handle of most water-closets cannot be raised without a certain amount of foul air passing into the apartment. And why? Because while the water is rushing through the closet the water in the trap fluctuates and allows the compressed gas to pass. My suggestion would be to have an earthenware trap at the bottom of each stack of soil-pipe, thereby taking the pressure from off the top one, and a 1½ in. or 1 in. pipe attached to the top part of the column, and carried to the highest part of the building, with a return head to prevent it from being choked up; and, further, this escape-pipe would prevent the lead soil-pipe from so readily decaying.

Bell-traps are not only a nuisance, but an imposition on the public, and inspectors of nuisances would do well to condemn such sanitary holes in the improving laws of health. II.

Windsor.

THE CITY MEAT MARKET.

SIR,—I am much amazed that the new Meat Market should be called by the repulsive name of "Dead Meat Market." Surely there cannot be any reason for the word "dead." It appears to me there would be as much propriety in saying "a dead corpse" as "dead meat." T. H.

* * * We urged the objections to this unpleasant pleasure some time ago, and, to a certain extent, with good result; but stupidity is always hard to conquer.

BRICK ARCHES ON CIRCULAR FACE.

SIR,—Would some of your subscribers kindly inform me how they would construct a 14-in. brick covering arch on 18-in. walls over windows in semicircular end of a room? The question is, bond; and how the thrust (horizontal) is to be counteracted. Any information on this unusual form of arch in light walls will oblige.

A CONSTANT SUBSCRIBER.

CHANGE OF COLOUR.

SIR,—Can any of your readers inform me of the cause of green marble paper, after being hung and varnished, turning red or fusty? J. F. S.

REMOVAL OF SNOW.

SIR,—Can any of your readers inform me if anything has yet been done in reference to the award of premiums offered by the City Commissioners of Sewers for suggestions for the removal of snow from the streets? COMPETITOR.

RATING OF PUMPING STATION, OUTFALL SEWER, &c., TO GREENWICH PARISH.

In the Court of Queen's Bench (sittings in Banco, before Justices Lush and Hayes), Mr. Justice Lush, in the case of The Queen v. The Metropolitan Board of Works, read the judgment of the court, which raised a question as to the liability of the Metropolitan Board of Works to be rated for certain portions of their outfall sewer, pumping station, and other works in the parish of Greenwich. He said there was nothing in the statutes under which the defendants were constituted, or the public sewers constructed or maintained, to exempt them from liability in respect of any rateable property they occupied, nor was there anything which prohibited the application of money in their hands to the payment of parochial rates. The only question, then, was whether the property referred to was rateable. As regarded the sewers, they were o

opinion that they were not rateable, on the simple ground that they were not the subject of beneficial occupation. No profit was derived from them by the Board. With respect, however, to the other property, they were of opinion that the rates were properly imposed. The water, engine-houses, pumping station, tramways, and appurtenances had an occupation value. The Board must have rented such property if they had not possessed it, and the Board wished to let it if they could easily have found a tenant. The order of sessions would be confirmed as to this property, and quashed as to the sewers.

CASES UNDER METROPOLITAN BUILDING ACT.

HAD BUILDING: A WARNING.

At Marlborough-street, Mr. John Ashley, builder, of Grafton-street, Fitzroy-square, appeared to answer two summonses taken out against him by Mr. Baker, district surveyor; first, for neglecting to give notice of works; and, secondly, for constructing the front wall with broken bricks and rubbish, put together with inferior mortar, and not properly bonded.

Mr. Baker stated that, on receiving information that a new room was being built in rear of defendant's house, he immediately went there, and found the wall in question already raised 3 ft. or 4 ft., built entirely of brick-bats and what he should call mud, not mortar or cement. He desired the bricklayer to stop the work, and the next morning he served the usual notice to amend. Instead of complying with this the defendant hurried on the work, and at the expiration of forty-eight hours, when the surveyor went again, he found the wall not only completed, but, wet and unset as it must be, it was plastered inside and out, so that no one could then see the materials of which it was composed.

Mr. Venn appeared on behalf of the defendant, and admitted the neglect of notice, but pleaded that it was accidental. With regard to the work, he produced a sample brick of the finest quality, and then called Mr. Potter, a surveyor, who stated that he had seen the wall, and that it was a very good one, fit to carry another story if required; but, upon cross-examination, he admitted that he had only seen it since it was plastered, and knew nothing of the materials with which it was built.

After some further evidence, the magistrate, Mr. D'Eyncourt, suggested that another surveyor should be appointed, with power to strip the plastering and give an independent opinion, to which both parties agreed, and Mr. Caiger, surveyor to the police, was nominated. That gentleman attended the adjourned summons, and was sworn, when he fully corroborated the evidence of the district surveyor; and added that, in case of a frost, he thought the wall might burst and become unsafe.

Mr. D'Eyncourt thereupon ordered the defendant to pull down and amend the work within fourteen days; and in consideration of his heavy expenses of solicitor, two surveyors, and witnesses, he was fined in the nominal penalty of 1s. only, in addition to the other costs, namely, Mr. Caiger, 2l. 2s.; Mr. Baker, 2l. 2s.; summonses, 4s.; total, 4l. 9s.

Defendant paid the money; and the magistrate congratulated him that the district surveyor had not employed a solicitor.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Cloyne.—The corner-stone of St. Colman's new Catholic cathedral, diocese of Cloyne, was laid at Queenstown on the 30th of September, by Dr. Keane, bishop of the diocese. Messrs. Pugin & Ashlin are the architects. The style is Gothic, of a Continental type. The plan includes a nave, with north and south aisles, and transepts; baptistery, side chapels, chancel, pews, towers and sacristies. The length is 80 ft. in the clear, and the width across the transepts 106 ft. in the clear. The nave is 34 ft. wide, and the aisles 15 ft. each, including the thickness of the nave walls. The main tower and spire will be erected at the north-west corner, and will reach a height of 100 ft. There will be six turrets, 120 ft. high, each, containing stairs to the triforium and organ-gallery. The architects are putting in the foundations, as the depths to which excavations had to be made were so variable as to form an impediment in letting to a contractor. Mr. G. Doran is the clerk of works.

Uxbridge.—Dr. Manning has laid the founda-

tion-stone of a new church at West Drayton. The dimensions of the intended building are 77 ft. by 44 ft.: its design is English Gothic of the fourteenth century. When completed it will be fitted to accommodate 500 persons. The architects are Messrs. Wilson & Nicholl, of Marylebone; and the builders, Messrs. Fassnidge, of Uxbridge. The site of the building adjoins the residence of the local priest, the Rev. Michael Wren.

Ongar.—The chief stone of a new church has been laid here by Canon Last, of Ingatstone. In the course of his address he said the church would be dedicated under the invocation of St. Helen, an Essex saint, born at or near Colchester. She was the daughter of Coel, and mother of Constantine the Great, the first Christian emperor. The church is from the designs of Mr. Cabitt Nicholl, architect to Lord Petre, and will be built of brick with Bath stone dressings. It will be in the Early English style, and so formed as to constitute the chancel of a future church, should its enlargement become necessary. The builder is Mr. Joseph Bostock, of Brentwood.

CHURCH-BUILDING NEWS.

Tilley, Herefordshire.—The first stone of the new church was laid on the 30th ult. It will replace an edifice erected 100 years ago, and consist of nave, north aisle, south porch, chancel, organ chamber, and vestry. It is intended to retain the present tower. The fittings are to be of oak, and the church will accommodate 220 persons in open seats. Penrhos stone is being used for the walling, blue Pennant for the arcade shafts, and Bath for the dressings. The walls will not be plastered internally. The style of the church is Early Decorated, and the cost is estimated at 1,600l. The work is being carried out by Messrs. Lewis & Day, of Hereford, under the direction of the architect, Mr. E. Haycock, jun., of Shrewsbury.

Books Received.

Haydn's Book of Dates, relating to all Ages and Nations: for Universal Reference. Thirtieth edition—corrected to June, 1868. By BENJN. VINCENT. London: Edward Moxon & Co. 1868.

HAYDN'S "Book of Dates" has become a standard work of reference, and nothing more is needed on the appearance of a new edition than to let intending purchasers know that it can be had. Mr. Vincent became connected with the work in the preparation of the seventh edition, and from that time to this, when he issues the thirteenth edition, has gone on gathering, and condensing, and wedging in fresh facts. Haydn's original design was to give the greatest body of compressed information that had ever appeared in a single volume, and we are much disposed to say that this intention has been fulfilled. The number of facts and dates in the twelfth edition was certified by actuaries to be 34,563, and this number is now increased. The new edition must be regarded as a writing-table necessity.

Mr. Haydn left amongst his papers a plan for a Dictionary of Biography, as a companion to his Dictionary of Dates. This has been carried out under the care of Mr. J. Bernard Payne, and will be published shortly by Messrs. Moxon & Co.

The Art of Garntishing Churches at Christmas and other Festivals. By EDWARD YOUNG COX. London: Cox & Son, Southampton-street, Strand.

THIS book comes opportunely, and will be welcomed in many parishes, notwithstanding that other books on the same subject are available. Mr. E. Y. Cox, the author of this "Art of Garntishing Churches," is a member of a firm of church furniture manufacturers and ecclesiastical decorators, and it has been his aim to make his volume thoroughly practical, in which he has very well succeeded. Descriptions are given of the ornaments suitable for the different parts of the church and the necessary directions for making devices, banners, and inscriptions. Numerous lithographs and engravings, illustrating the designs of various architects, accompany the work, and also three or four photographs, representing the style of decoration recommended. The festoons across arches shown are a mistake.

The firm have since published an Illustrated Catalogue of shapes, cut to serve as groundwork for devices and other decorations, so that the whole affair is now brought down to the compass of the meanest capacity.

Miscellanea.

THEATRES IN RUSSIA.—The *St. Petersburg Gazette* reports that the erection of no fewer than ten theatres for the people, all to be situated in the workmen's quarters of the city, are to be begun forthwith, the plans having been approved of by the Minister of the Interior, under whose supervision they are to be placed.

BIG BLOCKS.—The Luxulyan Granite Company have just shipped at Charlestown, for the Hampton Waterworks, near London, some huge blocks of dressed granite, weighing from 8 tons to 11 tons and upwards. Two stones in particular, which have been prepared for cylinder beds, measure 10 ft. by 10 ft. 6 in., by 2 ft. deep, containing 210 cubic feet, and weighing over 14 tons each.

EXTENSION OF THE GENERAL POST-OFFICE.—The long line of houses opposite to the General Post-office, in St. Martin's-le-Grand, will shortly be removed, the whole of the property having been purchased for the Government. On the site occupied by the houses, buildings will be erected for post-office purposes, the increase of business having rendered more extended accommodation absolutely necessary.

NEW INFIRMARY FOR OLDHAM.—The Mansion-house Committee, out of the surplus fund, subscribed some years ago for the relief of the operatives during the cotton famine, have apportioned to Oldham, under an order of Chancery, 1,000l. towards the erection of a new infirmary, to cost 10,000l., at that place, which hitherto has possessed no medical institution of its own, though its inhabitants number 90,000.

CHESTER CATHEDRAL.—The chief stone of the restoration works at this cathedral has been laid at the base of the north-east buttress of the Lady Chapel. In the evening the workmen engaged in the work of restoration, to the number of fifty, dined at the Blossoms Hotel, where, through the kindness of the Dean and Chapter, an excellent repast was provided. The Dean was present for a short time, and offered a few remarks upon the occasion on which they had met, and afterwards, Mr. Frater, taking the chair, the proceedings were of a thoroughly convivial character.

OIL PAINTING UPON ZINC.—Every painter is aware of the difficulty experienced in making oil colours adhere to articles of sheet zinc. Professor Beutger, however, has recently published a process by which, it is stated, that the desired result can be accomplished, this process consisting in the previous application, by means of a hard brush, of a mordant, composed of one part of chloride of copper, one part of nitrate of copper, one part of sal ammoniac, and sixty-four parts of water, to which is afterwards added one part of hydrochloric acid. The zinc turns of a deep black immediately after the application, changing after drying (twelve to twenty-four hours) to a dirty black, greyish-white shade, upon which any oil colour, once applied, will adhere with the greatest tenacity.

CLEVELAND INSTITUTE OF ENGINEERS.—From the annual report of this institution, read at the last general meeting, it appears that the most satisfactory progress has been made during the past year. In respect alike of funds and members, the society stands well; and the greatest interest was felt in, and impetus given to, the meetings of last year, in connexion with the valuable discussions which took place on the subject of the manufacture of steel from Cleveland iron. It is intended, if found practicable, to renew the discussion of this subject during the present session; and there can be little doubt but that it will be found productive of valuable results to the cause of Cleveland industry. The annual meeting of the institute was recently held, when the office-bearers for the ensuing year were elected. Mr. David Joy was appointed president, and Messrs. T. Wrightson and G. Whitwell hon. secs. A paper was, at the same time, read by Mr. Theodore West, of Darlington, on the "Wearside and Sildon Waterworks," which elicited a lively discussion.

"EXECUTED IN TERRA-COTTA."—Talking of the education question, a traveller observed that as he was walking on one occasion under the arcade of the horticultural garden, looking at the works of art displayed there, he came upon two well-dressed ladies examining a statuette of Andromeda, labelled "Executed in terra-cotta." "Executed in terra-cotta," says one; "where is that?" "I am sure I don't know," returned the other; "but I pity the poor girl, wherever it was."

THE DRAINAGE OF THE PROPOSED ASYLUMS.—We are told that it is definitely decided that Moul's dry-earth closets shall be introduced into the new asylums for lunatic paupers which are to be built, under Mr. Gathorne Hardy's Act, in the neighbourhood of London. If this be so, we are disposed to fear that a great mistake has been made. We trust that, at all events, the necessary arrangements for water-closets, drains, soil-pipes, and so on, will be made during the building of the asylums, or the result will probably be that costly alteration will be required hereafter.

INVENTORS' INSTITUTE.—The first meeting of the eighth annual session of this association was held at the offices, St. Martin's-place, on Monday evening, when Lord Richard Grosvenor, M.P., the president (elected in the place of the late Sir David Brewster), took the chair for the first time. Mr. Home Williams delivered the inaugural address. A discussion followed, in which Mr. Savage; Mr. Paterson, of the Working Men's Club and Inmate Union; Captain Selwyn, R.N.; Mr. C. W. Siemens, F.R.S.; Mr. Thomas Webster, Q.C.; Mr. F. W. Campin; and the president took part.

THE "TIDY BOX."—So Messrs. Jenner & Knowlton call a despatch-box they have patented, and so it is, for it enables the owner to put by letters, or bills, or other papers, under alphabetical arrangement. The box, of which the front as well as the top opens, contains a tray, in which are twenty-four upright movable divisions, lettered at the top, and which run on a wire at each side, and between these papers may be put away under the different letterings. The patentees consider with Pope, that "Order is Heaven's first law," and, doubtless, think the best sort of order an order for their despatch-box.

INCREASE OF FEVER IN LONDON.—Dr. Buchanan, medical officer of health for St. Giles's district, in consequence of the great increase of fever in the metropolis, has urged upon the local board of works the necessity of establishing a public disinfecting chamber for the purpose of purifying infected clothing, bedding, &c., pursuant to the Sanitary Act, 1866, sec. 23; and as a preliminary step the Board have invited the local boards of adjoining parishes to join with them in providing such an establishment. This is a measure which the medical officers of the metropolis have long urged upon their respective Boards, but without success in even a single instance.

THE LATE MR. G. R. HARTSHORNE.—We spare a corner of our paper to record the early death, from consumption, of Mr. G. R. Hartshorne, for twelve years one of the designers employed by Messrs. Hart & Son, the metal workers. He was first engaged by this firm in 1856, and placed under the instruction of Mr. W. G. Smith. He was a clever draughtsman and designer, and several times exhibited designs for iron and brass work at the Architectural Exhibition. Only a few days previously, another young but very clever draughtsman and designer, Mr. Fitch, originally apprenticed to the same firm as a pattern-maker, but of late employed as designer by Messrs. Benham, died at an early age of brain-fever.

FALL OF A MALT MILL IN STOCKPORT.—About three o'clock on Friday, the 27th ult., the newly-erected malt-mill of Messrs. Yates & Son, High-street, Stockport, fell in, from the roof down to the ground-floor, nearly burying alive two of the malsters—William Evans and William Pugh—who were engaged in the second and third rooms. The accident happened through an imperfection in one of the cross-beams in the upper rooms, which beam had given way under the weight of the malt upon it. For some time Evans could not be extricated from the debris, which had driven him against the wall; but fortunately he was dug out in time to save his life. No bones were broken. The damage to the property is estimated at about 200l.

ENGLISH CHURCH, CEYLON.—The foundation stone of a new English Protestant church was laid at Point de Galle, Ceylon, on the 30th of October, by the Lord Bishop of Colombo. Mr. James G. Smith is the architect.

BOLTON FINE ARTS AND INDUSTRIAL EXHIBITION.—An exhibition of paintings and other works of art, machinery in motion, and models, is to be opened in the New Mechanics' Institution, Bolton, by Mr. Anthony Trollope, on Monday next.

THE TELEGRAPHS AND THE GENERAL POST-OFFICE.—The arrangements for the purchase of the telegraphs by the Government are being actively carried on, and a commission appointed by the Accountant-general has nearly concluded the inquiry into what the net profits of the companies really are.

SHEFFIELD ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY.—The annual general meeting of this society was held on Thursday last week, at the School of Art. Mr. E. S. Howard occupied the chair. Mr. Fawcett, one of the secretaries, read the annual report, and Mr. J. D. Leader, the treasurer, presented a statement of accounts which showed that the year's income had just balanced the year's expenditure.

THE ROYAL SOCIETY.—The annual meeting of the members of the Royal Society took place on Monday, the festival of St. Andrew. Lieutenant-General Sabine, the president, delivered the address, in which he reviewed the principal scientific events of the past year. He was re-elected president. Dr. W. A. Miller, of King's College, was elected treasurer; and Mr. G. G. Stokes, M.A., of Pembroke College, Leonaasia Professor of Mathematics in the University of Cambridge, and Dr. W. Sharpey, secretaries. Mr. W. H. Miller was elected foreign secretary. The following gentlemen were placed on the council:—Mr. John Hawkshaw, Lieut.-Colonel Alexander Strange, Sir William Ferguson, bart., Mr. F. A. Abel, Captain G. H. Richards, Captain Douglas Galton, Mr. John Marshall, Mr. Archibald Smith, Sir Benjamin Brodie, bart., Dr. W. B. Carpenter, Mr. J. Lockhart Clarke, Mr. Frederick Currey, Mr. W. H. Flower, Mr. Warren de la Rue, Mr. J. P. Gassiot, and Mr. Joseph Prestwich.

PROTECTION OF LARGE BUILDINGS FROM LIGHTNING.—This subject was laid before the Paris Academy of Sciences, and M. Pouillet, since deceased, was entrusted to report fully upon it. This report was the other day laid before the Academy, and approved by that body. The Engineer gives a lengthened account of it. The first thing to be done is to establish a conductor, formed of square iron measuring 4.5ths in, on the side, which shall pass without interruption over every portion of the building to be protected: when the line is broken by towers, pavilions, or other erections, the conductor must pass up and down each, so as not to interrupt its course. This main conductor, of course, is modelled, as it were, to the form of the building, and often consists of several branches, particularly in the case of edifices, like the Louvre, where there are several blocks of buildings perpendicular and parallel to each other: it will also have many minor branches, for it must be placed in good communication with all the gutters, leads, and other large metallic surfaces on the roof. This great conductor or circuit must be placed in direct communication with a body of water which is never wanting. Ten or a dozen wells might be dug to receive each a conductor leading from the main circuit. Each lightning-rod must be placed in perfect communication with the main circuit.

TENDERS.

For new workhouse buildings, and out-offices, &c. in Valley, for the Holyhead Union. Mr. R. G. Thomas, architect:—

Williams	£3,595 0 0

GEORGE'S ROAD, REGENT'S PARK, LONDON.

TESTIMONIALS. "I have tried your system of bookkeeping, and like it very much."—G. D. "My system seems thoroughly to meet our requirements."—J. A. M. H. "I have your system in very much, and shall adopt it."—W. W. "Having adopted your system of bookkeeping, I can recommend it to the builders generally. Having had it in use over twelve months, we find it takes much less time to keep the accounts than formerly."—R. & M. "I received orders in the course. They appear to show an excellent system of bookkeeping. Your directions are most explicit, and understood clearly and easily."—G. C. "Messrs. R. & S. have examined your system, and consider it simple, clear, and very satisfactory."

"I greatly appreciate your plan and system of keeping, and consider it a real boon, and I consider that it has only to be made known to be generally adopted."—T. H. "Last June, we had your improved system of bookkeeping. Since then we have been keeping the accounts according to it. I consider it the best system. It meets the requirements of contract work perfectly."—T. B. H. "I received your models. They fully meet my expectations."—A. R. "Your system of bookkeeping appears to me to be excellent."—G. G. "The model form of books you sent me is very good."—G. C. "Your plan of bookkeeping has given me many good ideas."—J. H. C.

THE PRACTICAL BUILDERS' PRICE-BOOK.

Safe Guide to the Valuation of all kinds of Artificers' Work, with the Modern Practice of Measuring, and an Abstract of the New Regulations for Contracting the Construction of Buildings. Has a fair knowledge of surveying and levelling, and is a good draughtsman. Salary not so much an object as position.—Address, J. D. Falkenberg, Pond-street, Hampstead.

WANTED, TO APPRENTICE a Youth, aged about 16, to a CARPENTER. A small premium will be given.—Address, stating particulars, to A. B. care of S. Reid, 101, Oxford-street. The country preferred.

WANTED, as SHOP and MILL FOREMAN, a RE-ENGAGEMENT. Has a capital system of working the two in the saving of time and materials; quick at detail drawing, setting out work, and has a practical knowledge of joinery machinery.—Address, COMO, 10, Vernon-street, Hammanville-gate, London, S. W.

TO BUILDERS AND OTHERS. WANTED, EMPLOYMENT, by a good JOBBING BRICKLAYER. Wages 7s. per hour.—Address, E. D. 6, Devonshire-street, Finsbury, London.

TO MASTER PLUMBERS. WANTED, by a Youth, aged 17, EMPLOYMENT as an IMPROVER (having been apprenticed to a City master, now dead). Town or country no object.—Address, H. E. 3, Chancery-street, Bridgewater-square, Barbican, City.

TO BUILDERS. WANTED, by the Advertiser, a RE-ENGAGEMENT as FOREMAN of BRICK LAYERS. Brick work by the Piece, or to Take Charge of a Job. First-class references.—Address, A. B. 46, Park-street, Dorset-square.

TO CONTRACTORS, BUILDERS, SURVEYORS, AND OTHERS. WANTED, by a Young Man, Carpenter by trade, and has been Assistant to a Surveyor, a SITUATION as YARD FOREMAN, Clerk, or Timekeeper. Wages moderate. First-class references.—Address, No. 465, Office of "The Builder."

TO PLUMBERS AND BUILDERS. WANTED, a SITUATION or JOB, by an experienced plumber.—Address, 470, Office of "The Builder."

TO BUILDERS, PLUMBERS, &c. WANTED, by a Young Man, aged 18, a SITUATION as IMPROVER to the PLUMBING, &c. Four years' experience. Willing to make himself generally useful.—Address, W. H. 3, Old Conception-street, Bobo, W.

WANTED, EMPLOYMENT, by a thoroughly practical and energetic Builder's ESTIMATOR and GENERAL CLERK. Experiences as Foreman. Well up in prime cost and double entry. Particular employment not objected to salary moderate.—First-class references.—Address, Z. 12, Great Cornhill-street, W. C.

TO ARCHITECTS. WANTED, by a DRAUGHTSMAN of four years' experience, lately returned from an engagement abroad, a SITUATION in an office. Salary not so much an object as employment and further improvement. To obtain a desirable situation would pay a premium.—Address, W. F. 15, Mayfield-road, Dalston, N.E.

WANTED, EMPLOYMENT, by a respectable Young Man, who is a PLUMBER, PAINTER, OLIVER, and PLAIN ZINC WORKER. Will be able to make himself generally useful in anything required. Principally at jobbing work of any sort. Wages, 6s. per hour, or take it by the job, &c. otherwise.—Address, H. H. 40, Boston-place, Duncannon-quays, Marylebone, N.W.

WANTED, a SITUATION, as WORKING SHOP FOREMAN or JOINER, or to take charge of a Job, by a practical, steady, energetic Man. Quick at setting out work, drawing plans, elevations, &c.—Address, A. B. 5, Nottingham-terrace, Nottingham-road, Wandsworth.

TO BUILDERS, ARCHITECTS, SURVEYORS, AND OTHERS. WANTED, by a respectable Young Man, a SITUATION as an office. Town or country. Has a good practical knowledge of tracing, measuring, tin-keeping, &c. Salary moderate.—Address, A. B. 2, Red Cross-square, Cripplegate, E. C.

WANTED, by a Young Man, aged 34, married, a SITUATION in a Warehouse, or as a Gentleman's Estate as Carpenter, and to make himself generally useful. Wages not so much an object as a permanent situation. References given.—Address, W. W. T. 208, East-street, Old Kent-road, S. E.

WANTED, an immediate RE-ENGAGEMENT, by an efficient general and practical DRAUGHTSMAN, as ASSISTANT. Has had considerable experience in ecclesiastical and domestic architecture in the different ages in London and provincial offices; is well acquainted with detail, having a good knowledge of perspective, levelling, &c. Terms strictly moderate. Most commendable testimonials and references.—Address, T. H. 2, 46, Manchester-road, Barmley, Lancashire.

TO ARCHITECTS. WANTED, a RE-ENGAGEMENT by a well-qualified ASSISTANT and QUANTITY CLERK. Town or country.—Address, O. P. 35, Adam-street, Cardiff.

TO ARCHITECTS, SURVEYORS, AND BUILDERS. WANTED, an ENGAGEMENT, by an experienced ASSISTANT, to prepare working, detail, and finished drawings, specifications, take off and prepare bills of quantities, or as measuring up and estimating clerk.—Address, A. B. care of Mr. Dove, Plumber, 12, New Park-street, Southey, S. W.

TO ARCHITECTS. WANTED, a RE-ENGAGEMENT, as SHOP or WALKING FOREMAN, Estimating Clerk, or as Take Charge of a Business. Town or country. First-class draughtsman. Active and energetic. The highest reference as to character and ability.—Address, W. B. Deacon's, Leadenhall-street.

TO PARENTS AND GUARDIANS. WANTED, as APPRENTICE (in or out-door) to a first-class firm of Imitators of Woods and Marbles. Also an improver for same.—Duties to commence on January 1st, 1869.—Address, W. MACINTOSH & NICOL, 38, Latham-street, London, W.

TO ENGINEERS, ARCHITECTS, AND CONTRACTORS. WANTED, a RE-ENGAGEMENT, either as CLERK of WORKS or GENERAL FOREMAN, having class testimonials and references. Has just completed a two-year contract. Aged 28. Country not objected to.—Address, H. R. 33, Adelphi-terrace, Old Kent-road, Victoria Park, Middlesex, N. E.

TO BUILDERS, PLUMBERS, &c. WANTED, by a good PLUMBER, a SITUATION or JOB, piecework or otherwise, or as Thresh-branch Hand. Good reference if required.—Address, A. S. Z. 35, Bedford-street, Walworth, S. E.

WANTED, by the Advertiser, aged 32, a SITUATION as SHOP or GENERAL FOREMAN, or as Take Charge of a Job. Town or country. Good reference. Wages moderate.—Address, A. E. J. 17, Avery Farm-road, Commercial-road, Finsbury.

TO ARCHITECTS. WANTED, by the Advertiser, a RE-ENGAGEMENT in a London Office. Classic. Salary moderate.—Address, J. H. 53, Upper Berkeley-street, Portman-square, W.

TO PARENTS AND GUARDIANS. WANTED, by a Civil Engineer and Surveyor, holding a public appointment and extensive practice, a well-educated YOUTH, as OUTDOOR ARTICLED PUPIL.—Apply, by letter, A. L. Tower-hall, Grosvenor, S. W.

TO CIVIL ENGINEERS AND SURVEYORS. WANTED, a SITUATION, as ASSISTANT, to take charge of works, surveying, levelling, and a good draughtsman. Aged 25. No objection to go abroad. Address, J. E. T. 9, Norfolk-villas, Hilly-road, Oxford.

TO BUILDERS AND CONTRACTORS. WANTED, by an experienced, practical Man, a RE-ENGAGEMENT as FOREMAN of MASONS, or would take work, labour only, to any amount. First-class references as to ability and integrity.—Address, Z. Y. 6, Sutton-road, North, Boro.

TO ARCHITECTS. WANTED, by a DRAUGHTSMAN, aged 21, a temporary or permanent SITUATION. First-class testimonials. Terms very moderate.—Apply, W. E. 37, Grosvenor-near-nation, Westminister.

TO PLUMBERS, BUILDERS, AND ENGINEERS. WANTED, by the Advertiser, who is a first-class Plumber, a SITUATION or JOB, as PLUMBER. Town or country. First-class references. If required.—Address, J. W. 2, Green's-row, High-street, Cannon-row.

TO IRONMONGERS AND BUILDERS. THE Advertiser WANTS a SITUATION as BATH, GAS, STEAM, and HOT-WATER HAND. Is well up in close firework, &c. Good references from London. Iron.—Address, J. J. 125, Great Cambridge-street, Hackney.

TO TIMBER and MAHOGANY MERCHANTS. THE Advertiser, who has been in the above trade, is desirous to obtain a SITUATION as TRAVELLER, or in any other capacity in which he can make himself useful.—Address, K. P. Deacon's Newsrooms, Leadenhall-street, E. C.

TO ARCHITECTS AND OTHERS. THE Advertiser is desirous of PLACING his SON in an OFFICE in the COUNTY, where he can be bound with the principal in list of salary. Has been in a London Architect's office for the last eighteen months.—Address, A. No. 219, King's-cross-road, W. C.

TO CONTRACTORS, BUILDERS, BRICK MANUFACTURERS, BARR OWNERS, COLLIERY PROPRIETORS, AND OTHERS. THE Advertiser, aged 33, proffers his services in either of the above businesses. Has a thorough knowledge of brickmaking, sand and way work. A fluent French linguist, an arithmetician, and land surveyor. Securely to any amount. Has occupied two positions of trust during the last twenty years.—Address, MAHE CUTLER, 20, Woodstock-road, Shepherd's-bush, Hammer-smith, W.

TO ARCHITECTS AND BUILDERS. THE Advertiser is DISENGAGED Two days a week. Has first-class quality, estimator, estimator, and accountants' references of the highest respectability. Address, pre-paid, to Y. Z. 48, Liverpool-road, Rich-park-street, City.

THE Advertiser is desirous of a RE-ENGAGEMENT in an Architect's Office. Can make finished, working and detail drawings, draw perspective, and is accustomed to the general routine of a first-class London office.—Address, Z. H. 11, Post-office, Great-street, Suburb-street, W.

THE Advertiser, who has served his articles with an architect as an ARCHITECT and SURVEYOR. Temporary ENGAGEMENT in an Architect's Office. Good references.—Address, or otherwise.—Address, DORIC, care of Mr. Brown, 209, Kensington Park-road, Notting-ham, W.

TO ARCHITECTS OR CIVIL ENGINEERS. THE Advertiser, who is a first-class general Draughtsman and very quick, desires EMPLOYMENT. Permanent preferred. Salary low.—Address, A. F. R. 70, Oxford-road, Barnsbury, N.

TO BUILDERS AND CONTRACTORS. PLASTERING WANTED, by a thoroughly practical Man. Labour only.—Address, 225, Office of "The Builder."

TO ARCHITECTS, BUILDERS, &c. A GENTLEMAN WANTS EMPLOYMENT. Fair draughtsman. Draft specifications. Get out details and drawings, and well acquainted with office work in general in an office. First-class references. Terms, 2s.—Address, ALPHA, 55, Grove-place, Brompton-road.

TO ARCHITECTS, &c. A FIRST-CLASS DESIGNER, PERSPECTIVE DRAUGHTSMAN, and COLOURIST, well up in details and working drawings, desirous of an ENGAGEMENT, in a firm, temporary or otherwise.—Address, ARCHITECT, 11, Duke-street, Adelphi, S. W.

TO ARCHITECTS. AN ENGAGEMENT WANTED, by a CLERK of an office, well acquainted with his duties. References and testimonials for the highest class.—Address, TAV, 140, York-road, Lambeth, S.

AN ARCHITECT'S ASSISTANT is in WANT of a RE-ENGAGEMENT. Can give first-class references.—Address, H. GAYE, 25, Colehill-street, Eaton-square, London.

AN ARCHITECT and SURVEYOR'S ASSISTANT, fully qualified, possessing a thorough experience in construction, surveying, quantities, specifications, superintending of works, &c. and a good draughtsman, is open to an ENGAGEMENT. Temporary or otherwise. First-class references.—Address, 150, Office of "The Builder."

TO PAINTERS, BUILDERS, &c. A GOOD WRITER and GRAINER wishes FOR EMPLOYMENT. Would fill up time at painting, glazing, or paperhanging. Is a good painter, and has acquired an extensive knowledge of the use of machinery, systematic tendencies of work, &c. and a good draughtsman, is open to an ENGAGEMENT. Temporary or otherwise. First-class references.—Address, 351, Office of "The Builder."

AS CLERK, WANTED EMPLOYMENT, by a Gentleman, who has been Articled to an Architect, Surveyor, Auctioneer, and Estate Agent.—Address, G. H. L. The Mount, Thurloe Park-road, Chelsea.

TO BUILDERS, &c. A GENERAL FOREMAN will be DISENGAGED at the end of the month. Can prepare detail and working drawings, quick at setting out work, experienced in the use of machinery, systematic tendencies of work, &c. and a good draughtsman, is open to an ENGAGEMENT. Temporary or otherwise. First-class references.—Address, 115, Office of "The Builder."

TO ARCHITECTS AND SURVEYORS. A YOUNG GENTLEMAN desires an ENGAGEMENT. Aged 25, and has been nine years in the profession. Terms moderate.—Address, A. E. 25, St. Aubury-road, Upper New-road, S. E.

AN experienced DRAUGHTSMAN desires a RE-ENGAGEMENT in an Architect's Office. Having a small independence, permanent engagement will be considered before salary.—Address, W. 4, Waterloo-place, York-road, Montpelier, Bristol.

TO BUILDERS AND OTHERS. A YOUNG MAN is open to a RE-ENGAGEMENT as GENERAL FOREMAN, or Clerk of Works, Carpenter and Joiner by trade. Good references.—Address, A. Y. Park, Kensington, Portobello-road, Kensington Park.

TO BUILDERS. A YOUTH, aged 17, residing with his friends, is desirous of obtaining a SITUATION as JUNIOR CLERK in a Builder's Office. Has a good knowledge of the trade.—Address, A. B. Stephenson & MASER, Abino-street, King's Cross, N.

A GOOD PLUMBER is in WANT of a SITUATION. Well experienced in new work or jobbing. Could fill up time if not necessary, at painting, glazing, gas fitting, &c.—Address, F. M. 123, Belgrave-street South, Finsbury, S. W.

AN ARCHITECT'S ASSISTANT desires a RE-ENGAGEMENT. Qualifications, working drawings, details, perspective, &c. Salary 30s. per week. Highest references.—Address, J. G. R. Bradford, Dorset.

A GENTLEMAN who, during ten years' experience in London, has had several respectable situations as architect, correspondent, &c. in desire of a RE-ENGAGEMENT. Well qualified to undertake the entire management of an office in any business connected with the building trade.—Address, H. G. Office of "The Builder."

TO ARCHITECTS. AN ASSISTANT wishes for a RE-ENGAGEMENT. Is a rapid draughtsman, can prepare finished drawings and perspectives from rough sketches. References and testimonials.—Address, No. 430, Office of "The Builder."

AN experienced FOREMAN of BRICK LAYERS is in WANT of a SITUATION, or to take Work, in London or country; or to take the General Management of an OFFICE.—Address, W. B. at Mr. Bidwell's, Bullock, Brighthelm, Kent, S. E.

AN efficient BUILDER'S CLERK, of considerable practical experience, well up in estimating and measuring, making out accounts, &c. desirous to take large jobs, to give an ENGAGEMENT. First-class testimonials and references.—Address, 518, Office of "The Builder."

AN Architect and Surveyor's ASSISTANT, of eight years' standing, possessing a thorough experience in construction, surveying, quantities, &c. and a good draughtsman and colourist, is open to a permanent ENGAGEMENT in the country or abroad. Efficient French schoolmaster.—Address, No. 500, Office of "The Builder."

TO MASTER CARPENTERS AND JOINERS. A YOUNG MAN, having acquired a plain knowledge of the trade, is open to EMPLOYMENT as IMPROVER.—Address, T. W. 15, Dutton Cottages, St. John's Wood.

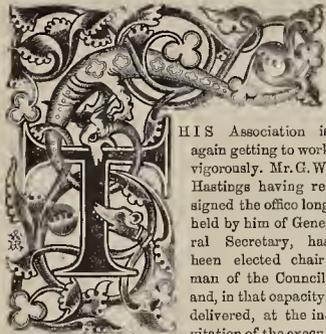

AS MANAGER, FOREMAN, or SUPERINTENDENT in ENGINEERING WORKS, MILLS, or on an EXPERIENCED, WANTED, a SITUATION as above, by a competent, salary 70s. per week. First-class testimonials.—C. T. C. No. 5, John-street, Pentonville-hill, N.

IMPERIAL LIFE INSURANCE Co. Incorporated 1850. The security of a subscribed capital of 750,000, and an Assurance and annuity to more than seven times purchase of the total Annual Income. Eighty per cent. of the profits divided among the Assured every Five Years. Assurances of all kinds, without profit, at considerably reduced rates. Policies granted at very low rates of premium for the first Five Years. The most liberal conditions in respect of Foreign Residence and Travel, Revival of Expired Policies, and Surrender Values. A Liberal and Generous Allowance free of charge, when the circumstances are favourable for Children. Return of Premiums, Deferred, or Reversionary. Assured—Immediate, Deferred, or Reversionary. Notices of Assignment registered and acknowledged without fee. The revised Prospectus, with full Particulars and Tables, to be obtained at the Company's Offices in London, 1, Old Broad-street, E. C. and 16, Pall Mall, S. W.; and of the Agents throughout the Kingdom. ANDREW BROWN, Secretary.

The Builder.

VOL. XXVI.—No. 1349.

The Social Science Association.

THIS Association is again getting to work vigorously. Mr. G. W. Hastings having resigned the office long held by him of General Secretary, has been elected chairman of the Council, and, in that capacity, delivered, at the invitation of the executive committee, the opening address of the new session, in which he referred not to one section specially, but to all; carrying out the idea on which the Association was founded, that Social Science is a unit; that, while its component branches may be separately treated (and with advantage) as to details, they cannot be discovered in principle. Nor is it only that the several sciences concerning the well-being of a community form a common philosophy which must be dealt with as a whole; it is also that the practical work which the study of these sciences evokes requires a reciprocity of labour. The workers in these various fields are in want of each other. The lawyer needs the economist, and has often grievously erred for lack of him. The political economist needs the sanitarian to teach him how much of the productive energy of a nation depends upon a due observance of the laws of life. The sanitarian on his part has need of the jurist that he may learn into what mould the new energies of hygienic government can best be cast. All have sore need of the educationist, to warn them how futile is every effort for national improvement which does not carry with it the assent and purpose of an understanding people. Nothing, then, said the speaker, can be amiss which impresses on our members the unity of our science and the reciprocity of the objects which we pursue. We cannot work at everything; some of us can spare time, and that with difficulty, for no more than a single section; but we all can and ought to be interested in the whole, and be ready to exchange advice and help with each other.

Speaking of the subject which underlies all the problems of Social Science, national education, he maintained that without the solution of this question none other can be followed up to a good result. It is true much has been done during the last thirty years; but after all the efforts made, after all that has been effected by private exertion and by the application of the Privy Council system, there remains in the country a large residuum,—to use a word which has been brought politically into vogue during the last two years,—who have not been as yet subjected to the civilising and refining influences of any education whatever. When the Association held its meeting in Manchester, the fact was brought out by the Manchester Education Society that there are 50,000 children there attending no school. Some months before the London Diocesan Board of Education had pub-

lished a statement that, in London alone, there were about 150,000 children so situated; so that, if these figures are to be taken as accurate, there are in London and Manchester together about 200,000 children who have not been touched by all the educational efforts made by the Government and by private individuals. This residuum, it was his belief, as it is ours, never can be dealt with unless some obligatory system of education be established. In a rural parish in Worcestershire, the children of every single family in the parish except one had been gathered into a school. The half-dozen children of that family were running about ragged, dirty, uncare for, perfectly ignorant, and growing up, no doubt, to be in the end, vagrants or criminals. Any one would naturally suppose that the parents were too poor to pay the 2d. per week which was required for each child, or that they had some religious objection. So far from that being the case, they were a great deal more able to pay than a large number of those who regularly sent their children to school. They had no objection to allege against the school or the teaching; they simply ignored the benefits of education, and steadily refused, in spite of all that could be said, to avail themselves of the advantages placed within their reach. How is a case of this sort to be dealt with except by some obligatory system? Surely, it cannot be alleged that parents have any right to deprive their children of education. What right have they as against the children? What right have they as against the community? For the children, ignorance means mental incapacity, moral degradation, future disadvantage for competition in the labour market, deprivation, poverty, and wretchedness. For the community it means an enlargement of our prisons and workhouses, with the consequent burdens on the rates. For out of this residuum of neglected children is hatched the spawn of our criminal, vagrant, and pauper classes. It may be said,—apply the Industrial Schools Act to cure the evil. But to do so is to ignore the principle on which the Act was passed. That principle was the sound idea of prevention, so fruitful of good in many branches of social science. Within all our memories it was the custom to send criminal children to prison, to be made worse instead of better. A few wise persons, persevering through countless defeats, at length persuaded the Legislature to sanction the establishment of reformatory schools, where young criminals might be taught habits of morality, and thus be prevented from becoming the inmates of prisons. Some time after it was found advisable to establish industrial schools by another Act, thus creating a cheaper machinery to deal with still younger children, beggars and vagrants, and prevent them from growing into the subjects for reformatories. Surely, it is only logical and politic to push the principle one step further, to make your net still closer to catch the smaller fishes, and to provide that obligatory education which shall prevent the children whose parents neglect their best interests from idling into vagrancy and vice.

We have a right to compel every child to be vaccinated, because if unvaccinated it may give small-pox to others; we have a right to compel every householder to drain, lest he breed fever among his neighbours; and *pari ratione* we have a right to require that no child shall be left in the darkness of ignorance, to grow up a pest and burden to the community.

This is the great educational question of the hour, the one which most demands attention, because it is the one most urgently requiring help. The speaker was more hopeful that the well-to-do artisans will obtain as much technical education as they care to have, and in the way they want it, than we are. Something must be done to lead them to care more for it than the majority do. Still we fully agree with him, as our readers may know, that primary education for all

is the great requirement. Unfortunately, the most potent of all obstructions, sectarian differences and religious prejudices, stand in the way of their salvation. Mr. Hastings quoted a remarkable utterance by Lord Brougham, many years ago, on this subject. When speaking of the sectarian opposition to national education he exclaimed, that the contempt cast by history on that Council of Constantinople which disputed on a text while the Turkoman, the enemy of all their texts, was thundering at the gate, would be but as a murmur of dissent compared with the loud shout of universal scorn which all mankind in all ages would send up against us if, on the flimsy pretext of theological differences, we left to destruction the helpless children of our poor. Surely it is time that those who appreciate the importance of this question, who know the facts, and who believe that national retribution waits on national neglect, should make one vigorous effort more to ensure the elements of education to every child in the community.

Coming then to the section of health, the speaker urged the importance of the great science of State medicine. State medicine means simply the care of State health, as opposed to that of private health. A physician in private practice looks after the health of individuals; a physician in what may be termed public practice looks after the health of the community. Physicians, no doubt, so long addicted themselves solely to the cure of maladies, that they neglected the still nobler art of preventing disease; but the medical profession has now, for some time past, understood its wider destinies, and yearly sends forth a large number of highly-educated men impressed with the supreme importance of sanitary functions, and qualified for their discharge. What is now needed above all is a better organization. In the first place, the statute law on the subject is chaotic and contradictory. The different Acts still conflict in their provisions, and in many cases it is hard to know to whom recourse is to be had for the removal of nuisances, or the improvement of sanitary arrangements. The real remedy is the thorough revision of the whole law relating to public health, and its condensation into a single statute. In the next place, we must have a better sanitary administration. We want not only a consolidated Act, but a trained and organized staff in town and country to carry out its provisions. Every considerable town should have its own medical officer of health. Many already possess that advantage. The City of London long ago set an excellent example; Liverpool and Glasgow have followed in its steps; Manchester, influenced by the representations made when the Association met there, has recently had the wisdom to adopt the same course; and it is to be hoped that Birmingham will not long be behind. Small towns may be joined by rural districts around, or several towns may unite in paying the necessary salary. We trust with Mr. Hastings that the joint committee now sitting will continue to press, both upon Parliament and upon the Ministers of the Crown, the necessity of an improved organization of State medicine. Let them also keep a vigilant eye on the commission, and take care that it is fully supplied with information, and that its inquiries are directed to the proper points.

In the department of Economy two subjects were particularly observed on: the Poor Law and trade unions. As to the latter, he did not believe it to be true that trade unions had always, or nearly always, done mischief. So far from unions having, on the whole, encouraged strikes, he was convinced that, on the whole, they had tended to diminish those calamities, though there was no question that when they have organised a strike they have naturally made it much more formidable than it would otherwise have been. It was certain that the outrages which have disgraced

some trade unions were condemned by the largest proportion of the working men who belonged to societies of that kind throughout the country. But, on the other hand, he was astonished at the views expressed, and the strength of the language used, at the meeting held by the Association when Mr. Gisdstone presided; not so much, indeed, if at all, by the working men, as by some of their zealous friends. There seemed to be a lunatic idea that some malice against working men was involved in any criticism of trade unions. Now, if it be the case, as he believed it to be, that trade unions are capable, when wisely managed, of doing a considerable amount of good (though no one can suppose them to be more than stepping-stones to higher things, a necessary defence against other evils, temporary alleviations of mischief in the body politic, and which, therefore, will gradually pass as our civilization expands into higher organizations of social life)—if trade unions have good in them, surely it follows that the more you eradicate anything that may be evil in them the more you will confer a benefit on those bodies, and the class who support them. The man who points out any errors in trade unions, or helps to expose any abuses that may have been perpetrated in their name, is surely the best friend they have; and the working-men can surely follow no course better adapted to their interests, than that of joining in the most vigorous exertions to put down any mischiefs that may have arisen anywhere out of these societies, and to bring to justice all who have abused, for their own criminal purposes, the lawful power of combination. He did not conceal his opinion that by far the most useful function of the Association would be to spread a knowledge of the principles and mechanism of those industrial partnerships which, by identifying the interests of employers and employed, absolutely preclude their quarrelling. Only second to that is the task of diffusing information, as was done the other day by the discussion in Birmingham, as to those means of conciliation which have been so successfully adopted in some trades and districts, so that when the conflicting claims of capital and labour do unhappily produce differences, those differences may be prevented from assuming the calamitous form of a lockout or strike.

The speaker then approached the subject of Jurisprudence, on which he spoke at some length, but we may not follow him further in his comprehensive address than to say he rightly dwelt on the necessity that exists for the revision and condensation of the whole body of our English law. Such a work would not only be an immense boon to the public in itself, but it would also be productive of great advantages indirectly, through the improvements which it would compel the Legislature to make in the actual substance of the law. It lies at the root of the amendment of the law, precisely as national primary education, and as the organization of State medicine, lie at the root, respectively, of educational and sanitary improvements.

At a seasonal meeting after the opening night, a paper "On the Fundamental Reform of the English Poor-law," by Dr. W. B. Richardson, was read, and provoked a lively discussion. It will be seen, from what we have said, that the Association has commenced the session with spirit, and some of our readers learning it is not alone when the Social Science Association goes out of town that its labours, may be led to find their way to Adam-street, Adelphi, and lead their aid in a good and pressing work.

Advertisements have been recently issued, announcing the intention of the Association to elect a secretary: a barrister, or gentleman studying for the bar, it was stated, would be preferred. Some twenty-five candidates sent in testimonials. In the course of two lengthened sittings, the executive committee reduced this number to six, whom they afterwards saw personally. The list was then reduced to two, Mr. Alsager Hay Hill, and Mr. Edwin Pears, of whom the latter was ultimately elected to the office, subject to the approval of the council.

THE HILLFIELD ESTATE, GLOUCESTER.—The first portion of a terrace, consisting of seven houses (ultimately to be increased to twenty-six), has been commenced on this estate. It is in contemplation to continue the terrace early in the spring, and also to erect a number of semi-detached villas. The architect is Mr. Maberly, of Gloucester, and the builder is Mr. Arthur Parker, of London.

MR. LAYARD ON MOSAIC DECORATION.*

The basilica of Monreale, near Palermo, magnificent as it undoubtedly is, and superabundantly rich in mosaics, which cover, according to the Duke of Serra di Falco, no less than 97,973 Sicilian palms (rather less than a foot each) of enamel mosaic (*opus Aleandrinum*) and 13,041 of pietra dura mosaic, and which required for their execution the continuous labour of 150 mosaicists for three years, does not produce the same impression as St. Mark's. This arises from the roof being in timber, from the absence of those numberless curved surfaces which distinguish the Venetian church and which are especially suited to mosaic, and from the greater diffusion of light. The effects are less solemn and religious than those of St. Mark's. Still, however, it is a glorious building, and furnishes to the architect an invaluable collection of beautiful ornaments of a particular period and style, the church having been entirely built and decorated towards the end of the twelfth century. It affords, too, an important example of the use of mosaics for pictorial purposes on side walls, which at Monreale are covered with stories from the Old and New Testaments. The colossal form of the Saviour on a gold ground, in the semi-dome over the central apse, has also a grand and imposing effect, and is a fine example of the manner in which this architectural feature in a church can be appropriately decorated with a single figure. The lower parts of the interior walls are panelled with marble slabs, divided by bands of mosaic in endless variety of designs. Unfortunately, the ancient basilicas of Ravenna have either been allowed to fall into decay, or have been so much changed by modern restorations and alterations, that we can no longer judge of the effect which the mosaics they contain must have produced when the whole ornamentation of the interior was in complete harmony with them. What is called the Jesuit architecture of Italy,—that vulgar renaissance which is so offensive to good taste, and so utterly opposed to all solemnity and true religious feeling,—introduced the fashion of breaking up the interiors of ancient churches by the introduction of side chapels, and of vast altars composed of columns, cornices, and pediments of marbles of every hue, piled up without any reference whatever to the surrounding architecture, or without any pity for the frescoes and ornament which may have adorned the walls.

The original simplicity and symmetry of almost every sacred building of any antiquity in Italy has thus been destroyed. Most fortunately St. Mark's, for various reasons,—amongst them, perhaps, the jealousy with which the clergy has preserved its antique church ritual,—has been spared, and remains, both in form and ornamentation, nearly as it was intended to be by its builders.

In the basilicas of Ravenna we can only judge of each mosaic as an individual example with reference to the actual work and the capabilities of the material: we can form no adequate conception of the general effect which it was calculated to produce as a portion of the general decoration. The richness and harmony of colour are neutralized by the vast spaces of plaster and naked walls by which in most instances these mosaics are surrounded, with the exception, however, of the tomb of the Empress Galla Placidia, which still maintains as a whole much of its ancient character and beauty. But in themselves they are deserving of the most careful study as belonging to the best period of early Christian mosaic art. They are especially valuable to the architect as affording some of the finest examples of the treatment of pictorial mosaic, and of the technical qualities of the material. For beauty and purity of design, which nearly approaches that of the Classic times, and for exquisite harmony of colour, the mosaic of the "Good Shepherd," in the tomb of Galla Placidia, is one of the most perfect specimens of the art that can be found. For the processional treatment of subjects, and for ancient costume and architecture, the basilicas of Ravenna furnish most excellent examples, especially the Church of St. Apollinare Nuovo. Indeed, at no period were the use and capabilities of mosaic so thoroughly well understood as in the fourth and fifth and early part of the sixth centuries.

* See p. 897, ante. In the previous notice, the Church of St. Apollinare in Classe and that of St. Apollinare Nuovo are stated in one part to be in Navarre. They are in Ravenna.

Before concluding this branch of the subject, I would mention, as an example of exterior decoration in mosaic, the cathedral of Orvieto. To judge of the full effect of the mosaic pictures which adorn its richly-decorated facade, it must be seen from a distance. Its position, standing majestically on a platform supported by precipitous cliffs rising out of a wide valley, is admirably suited to the display of its richly-ornamented facade. The mosaics, which are modern, are not of the best style, and are too pictorial for the architecture, unless seen from afar; but the effect is undoubtedly very gorgeous, especially on a bright day, when the facade glows in the sunlight with all the hues of the rainbow. I should hesitate, however, to recommend similar decoration for imitation in this country.

No one acquainted with the magnificent examples of mosaic decoration which I have described, will probably be inclined to doubt its great value, at least for the ornamentation of sacred edifices; and I think that those who have no prejudices and preconceptions on the subject, will be equally disposed to agree with me that, if mosaic can be used effectively and advantageously in sacred edifices, there is no reason why it should not, with equal propriety, be employed in secular buildings. All that is required for this purpose is a knowledge of the principles which regulate its proper application, and of the capability of the material.

In many respects mosaic is undoubtedly preferable to fresco for decoration, especially in our climate, even without reference to the atmospheric influences upon wall-painting. It is more durable; it is more lustrous; it is more effective when employed at a considerable distance from the eye; it is far richer and more brilliant, especially when gold grounds are extensively used, in this shaded and frequently insufficient light of our climate; and, lastly, in case of injury or deterioration from dirt, or other causes, it can be restored and cleaned without any detriment or loss of character to the original work. However, when making the observation, I would add that fresco painting and mosaic have distinct and separate attributes and capabilities, and that, when both can be employed under equally favourable conditions, as in Italy, they need not interfere with one another; and this reflection leads me to endeavour to point out what the proper attributes and capabilities of mosaic decoration really are.

Let me remind you, in the first instance, that I am not dealing with that minute and elaborate mosaic work chiefly practised at Rome, which is intended rather for the reproduction of easel pictures and altar-pieces than for architectural decoration. These are things to be avoided,—not to be imitated,—and with which the architect has nothing to do.

Legitimate mosaic decoration, like all true architectural decoration, should, in the very first place, be made subservient to the architecture, or, rather, it should be made essentially part and parcel of the architecture. The truly great architect will devise and superintend the decoration of his own building, even, if possible, to the minutest details; for there is nothing which adds more to the effect of an architectural monument, and to its grandeur and nobility of character, than the feeling that one clear, well-defined, and lofty conception pervades the whole of it. When this identity of conception is apparent in a building, however inferior it may be in certain details to another edifice in which this homogeneity is wanting, it will always be far superior to it in the general effect that it will produce. In order, then, to make mosaic decoration harmonize with architectural line and forms, all the best designers for mosaic have sought to give their cartoons a certain conventional and architectural character, and have avoided any attempt to make the mosaic look like pictures in oil. As, from the nature of mosaic, tesserae placed together with more or less precision, it is best seen at a distance; it should be used, especially when pictorial, at a certain height from the spectator. There are no mosaics in St. Mark's less, I should think, than 10 ft. from the pavement, and the greater number are at a very considerable elevation. Consequently, distinctness of outline, not only in the figures themselves, but in their extremities and parts, so that they be not lost in the mass, is required. When grouped, each figure should stand out boldly, and not interfere with any other figure. For this reason, the mosaicists of the best periods of the art generally preferred the processional treatment of their figures. Any

attempt to produce different planes of distance which require, to be properly defined, all the subtle tints of the painter's palette, should be avoided. The outlines should be distinct, well-defined, and marked, somewhat heavily; their darkness and thickness being regulated according to the elevation of the mosaic. This rule applies to both pictorial and purely decorative work. Reference should be specially had to the style of architecture of the building; always, however, bearing in mind, that although the general arrangement of lines and treatment of the subject may be varied to suit it, yet that, whether mosaic be introduced into a Classic, Gothic, or Renaissance edifice, the general laws which regulate its use are the same.

I may cite as an example in illustration of what I have said, the semi-dome over the most northern, and the lunette over the adjoining exterior entrance to St. Mark's Church. In the first instance, the original mosaic of the thirteenth or fourteenth century (its precise date is doubtful), represents a procession of figures bearing the body of St. Mark to the church, a view of which, as it appeared when the work was executed, is seen in the background. The subject, simply and somewhat rudely treated, harmonises perfectly with the surrounding architecture. The mosaic of the adjoining lunette represents the Doge and Venetian magistrates venerating the body of St. Mark. It was executed from a cartoon by Rizzi, and is probably one of the finest known examples of enamel mosaic, both as regards execution and the wonderful beauty and richness of the colours, especially the blues, purples, and golds. But this mosaic, however admirable in design and in execution, does not combine or harmonise with the architecture. It looks like a fine picture suspended on the façade, and which might have been hung anywhere else; consequently its effect is infinitely less pleasing than that of the earlier, simpler, and ruder mosaic. What the effect must have been before the original mosaics were removed to recede, the later, may to some extent be judged of by Gentil Bellini's great picture in the Accademia, in which the façade of St. Mark's is represented with almost photographic minuteness, as it appeared in the fifteenth century. No one will doubt that it was superior to that produced by the modern imitators. I may add that, in order to increase its effect, almost all good pictorial mosaic with which I am acquainted is surrounded by a band of appropriate ornament, the width of which depends upon the elevation and position of the mosaic picture.

It may be said that these considerations as to the designs for mosaics should be addressed to the painter rather than to the architect; but I contend that the design for mosaic, whether pictorial or simply decorative, is essentially the business of the architect, and that unless he attends to it and makes it himself, or causes it to be executed under his own immediate direction, he will never produce a really great architectural monument, if mosaic decoration is to be a prominent feature in it. As I have ventured to remind you on a previous occasion, architecture is the noblest of all arts; for when rightly understood, sculpture and painting become her handmaidens. When they were so, the most beautiful and perfect edifices were produced, whether in Greece or Rome, in Italy or more northern climes. It is the architect who, taking this lofty view of his profession, and educating himself to carry it out, will erect the greatest monuments and earn the highest fame.

Although the chief merit of the mosaic must depend upon the designer of the cartoon, much is left to the skill and judgment of the mosaicist who executes it. It is surprising how much effect may be produced by a judicious selection of tesserae of different sizes for different parts, by the mixture of tints in large masses of one colour, such as a gold ground, so as to avoid monotony of tone, and by the dexterity with which the arrangement of the tesserae is made to follow leading lines and the undulations of flesh or drapery. The interval between the tesserae must be regulated according to the distance, and can also be made to contribute to the general effect. These things and the proper selection and matching of the tints form the duty of the mosaicist.

Having thus endeavoured to place before you the nature and capabilities of mosaic, I would invite your attention to the main objects of this paper, which are two. First, to ascertain whether this mode of decoration can be advantageously introduced into this country; and secondly, if

so, whether there be the means of employing it on an adequate scale.

With regard to the first point, I have already expressed my opinion on the subject of the decoration of our public monuments, as well as our churches. Not only am I convinced that pictorial decoration might be introduced into such edifices much more extensively than it has hitherto been, but that it could be so introduced very much to the public advantage, both as regards public enjoyment and public instruction. But, unfortunately, the apparent failure of fresco and other such painting has discouraged the public, the architect, and those who have the superintendence of our national monuments. It is a matter for regret that mosaic was not more generally known, and had not been introduced into England when the decoration of the Houses of Parliament was commenced. I hope that it is not yet too late to introduce it into a building which is eminently calculated, especially in its halls and passages, dimly lighted through stained glass, for this mode of decoration. It was truly a noble idea to make the walls of the great palace of the representatives of the nation the record of her history, and we must deplore that it has not been fully carried out, principally owing to the failure of the materials employed. It will be a national loss if the fine wall pictures of Mr. Macleise should perish, whether we regard them as monuments of the genius of the painter or as most careful representations, in every detail of costume, of great events which have occurred almost within his time. Had they been executed in mosaic, we should no doubt have missed the skillful touch of the master, but we should have preserved designs worthy of him, and he would have been enabled to employ the years that have been consumed in the actual manual labour required to execute such vast works in preparing other cartoons for the completion of the decoration of the wall, in two panels alone of which the battles of Trafalgar and Waterloo are now represented.

The works of some of the principal painters of our time, executed at no small cost to the nation, will perish in all probability within a few years, and our only chance of preserving any memorial of them is by reproducing a portion of them at least in mosaic.

Besides the Houses of Parliament, we have rising up around us museums, picture galleries, public offices, courts of law, town-halls, railway stations, and other edifices. Each of such buildings might, like the Houses of Parliament, be made to contribute something towards the instruction of the public and towards the elevation of the public taste by appropriate pictorial decoration in mosaic. They have blank spaces which need to be filled up, and which the architect would, perhaps, gladly fill up; but he hesitates to do so now with wall-painting, because he cannot satisfy himself that it will resist the effects of our climate, and the smoke and dirt of our principal cities. If a suitable and durable material were at hand, in which such pictorial decoration could be executed at a reasonable cost, he would probably avail himself of it. Judging from the manner in which mosaic in Italy and in the East, when used externally, as well as internally, has defied the ravages of time and weather, we may infer that mosaic, if of good quality, is precisely the material which would suit our climate and atmosphere. I cannot conceive anything more instructing and interesting to the great masses of the people than pictorial decoration carried out in a comprehensive and intelligent manner in our great public buildings. Millions have yearly to while away some spare minutes in railway stations, town-halls, and courts of law. We might make such places, as the Greeks and Romans did their public edifices, a means of teaching and amusing the people, and, at the same time, add much to their beauty and interest by representing on their walls great national events, or recording important scientific discoveries which have increased the prosperity and power of the country, or have contributed to our civilization and our intellectual development. As a familiar illustration of what I mean, I may mention that I learnt more of the different forms and employments of locomotive-engines than I had ever known before, when spending a quarter of an hour a few weeks ago in the railway-station of a small Italian town, round the principal hall of which were very artistically painted in lunettes every variety of engines for railways and the mode of their use.

In our museums and picture-galleries, with

the exception of the South Kensington Museum, where a most praiseworthy and, on the whole, successful attempt has been made to introduce ornamentation on a large and complete scale, we have hitherto been sadly deficient in rich and appropriate decoration; and yet the value of a work of art, and the impression it is calculated to convey, are very much enhanced, as far as the general public are concerned, by the beauty or magnificence of the building which contains it, like a panel which gains by a rich and appropriate setting. Our National Gallery, for instance, is a disgrace to a great and civilised people. Its dirty floor of common boards, its coarsely-papered walls, its undecorated ceilings, its mean internal approach, have unquestionably a tendency to depreciate in public estimation the value of the treasures which it contains. Our pictures, crowded on the walls of such apartments, look as if they were hung there for an approaching sale in an auction-room. Thousands who visit the National Gallery, and for whose instruction and elevation its contents are partly intended, leave it without any adequate notion of the worth and beauty of what they have seen, more because they cannot believe that things of real value can be so poorly cared for. There is something elevating and refining in rich and beautiful ornament when introduced into a public building, and depend upon it the working classes feel the influence of it.

Mosaic decoration is particularly fitted for our churches on account of the grand and solemn effect which, when employed in large masses, it is calculated to produce. It is especially suited to curved surfaces, such as domes, vaults, and apses, because, when thus applied, it produces an infinite variety of effects of light and shade, especially when gold ground is extensively used. These effects are constantly changing throughout all hours of the day. We may imagine what the dome of St. Paul's would have been had Wren's original idea of covering it with mosaics been carried out. Even the gloom of the dull and murky atmosphere of the City would have been conquered by the bright and luminous enamel, and those who have seen St. Mark's at night can picture to themselves the effect of an evening surface at St. Paul's when the golden ground of the overhanging dome would reflect the thousand lights beneath.

In connexion with exterior decoration, which has of late years become better understood and valued in this country, I would point out the use of gold mosaic as a ground to bas-reliefs, whether figures or ornament, in white marble and other materials. The Byzantines and Venetians were well aware of its worth for this purpose, and of the singular beauty and delicacy of its effect. There are some charming examples in the façade of St. Mark's.

In the best period of Italian art the sculptor was well aware of the beautiful effect of sculpture in white marble relieved by a gold ground, and the niches which received the statues on the exterior of the church of San Michele at Florence were for the most part lined with gold mosaic. An important consideration in the use of mosaics in England, and especially in London, is the facility with which dirt and the discoloration produced by smoke and soot can be removed from its surface either by simple washing or by the employment of an acid without the least detriment to its brilliancy. I understand that recently some of the most ancient mosaics at Ravenna, dating from the fifth century, have been cleaned, and that they are as bright in colour as when first executed.

Let me now, in conclusion, ask your attention for a few minutes to my second point, viz.—Have we the means of using mosaics for decorative purposes in this country?

In England we have never had a school of mosaicists. The few specimens of ancient mosaics that we possess, such as those in Westminster Abbey, were executed by Italians. An attempt was made four or five years ago by Mr. Cole, with his usual zeal for the promotion of applied art in this country, to found a school of workers in mosaic who were to employ tesserae of terra-cotta, or, as they are technically called, "ceramic tesserae," instead of enamel, for figures and ornaments. Some very creditable specimens were produced, principally by Messrs. Dinton & Co. and Messrs. Simpson & Co., but the attempt does not appear to have been altogether successful. For certain purposes these terra-cotta or ceramic tesserae are sufficiently effective, but they lack the richness, brilliancy, and luminous quality of enamel, and certain colours such as reds and purples cannot be pro-

done, and they can never equal the effect of the gold of the Byzantine mosaics. Moreover, the gold being applied externally, and not protected by a film of glass, is liable to tarnish and to injury. As regards the durability of ceramic mosaics, I hesitate to give an opinion after the solemn warning of our president in his opening address of the session, against the indiscriminate use of terra-cotta, at least for external decoration. I will only mention this fact, that in repairing the mosaics of St. Mark's, it has been found that whilst the ancient tesserae in enamel are perfectly preserved, those in terra-cotta and other materials (for such were mixed with the enamel) have either perished or have greatly suffered. But mosaics in enamel have been executed with considerable success by several eminent firms in this country. I may particularly mention some of the full-length figures in the principal hall of the museum at South Kensington, by Messrs. Rust & Co. and by Messrs. Harlow, Fisher, & Co. Some of the enamels used were, I am informed, produced in England, by Messrs. Powell, of Whitefriars; but the greater part were, I believe, obtained from abroad, mostly from St. Petersburg, where, as is well known, a manufactory of mosaic, which has produced some remarkable works, was founded by the Imperial Government, under the direction of Sig. Bonafede, a distinguished Roman mosaicist, who is only recently dead.

In Italy the traditions of the workers in mosaics have been handed down through centuries, and, although at times the art has been very low, and indeed was scarcely practised at all, yet it has never altogether died out in the Peninsula. At Monreale certain families of mosaicists have been employed from generation to generation in keeping up and repairing the mosaics of the cathedral. At Rome, owing to the demand for elaborate mosaic in the reproduction of pictures, and for furniture and personal ornaments, the skill of the mosaicist was almost exclusively directed to those objects; but still the ancient traditions were not lost, and workmen were without difficulty found to execute the series of mosaics which adorn the walls of the new basilica of St. Paola. At Venice the old secrets were still preserved in the island of Murano, which had been celebrated since the twelfth and thirteenth centuries for the beauty of its manufactures in glass and for its enamels; but the sad condition to which the mosaic art had been reduced may be judged of by the restorations and renovations which during the last century and the early part of the present were executed in St. Mark's. A few years ago a poor glass-blower of Murano, named Lorenzo Radi, applied himself with that singular intelligence and perseverance which are not uncommon among Italian artists, to the improvement of the manufacture of enamel mosaics, and to the application of some of those secrets which were traditionally preserved in the island. He particularly turned his attention to the manufacture of gold mosaic. The success which attended his experiments attracted the attention of Dr. Salviati, a lawyer of Venice, and a gentleman of much ability and ingenuity, who perceived the value of his discoveries, and foresaw that they might be applied to the revival of mosaic decoration. He accordingly entered into an arrangement with Radi, and opened an establishment at Venice for mosaic work, and obtaining artists from Rome to instruct Venetian youths in this art. In former times mosaic work, having to be executed on the walls, required considerable time and labour, and was consequently very expensive. The mosaicist had to copy the cartoon on the wall itself, fixing the tesserae one by one in the cement prepared to receive them. Dr. Salviati succeeded in avoiding the necessity of working on the spot by an ingenious process, which, however, is only applicable to decorative mosaic, and cannot be used where much delicacy of work and extreme nicety in the gradation of tints are required. He taught the workmen to execute the cartoon on the reverse side, the face of the mosaic being downwards. The tesserae are fastened with common paste to sheets of coarse brown paper, on which the cartoon is traced. When the work is finished, it has only to be fixed with cement upon the wall destined to receive it, and the brown paper is then removed from the face of it. This process requires considerable skill and practice, especially when figures have to be executed, but is perfectly successful. Thus the decoration of many hundred square feet of surface can be forwarded from Venice to any part of the world—to America or

to India, with safety and at little cost. Having thus found the means of executing mosaics in the establishment at Venice, and having trained a number of young Venetians to the art, and much improved the quality of his enamels, he endeavoured to introduce this mode of decoration into foreign countries. It was chiefly in England that he met with success. The increased feeling for colour and decoration, and the gradual improvement in the public taste which had taken place in this country, chiefly through the enlightened influence of the Prince Consort, were very favourable to his attempt. It was principally through the knowledge of art and the well-known taste of the Queen that Dr. Salviati obtained his first important commission,—the decoration of the Wolsey Chapel at Windsor, and that of the Albert Memorial in Hyde-park. The mosaics of the latter monument are now complete, and cover above 1,000 square feet. In the Wolsey Chapel very little now remains to be done. The general designs for the reproduction of mosaic decoration in both these monuments were by our distinguished fellow, Mr. Gilbert Scott, and were carried out under his directions from the cartoons of Mr. Clayton, of the firm of Clayton & Bell.

The Albert Memorial and Wolsey Chapel furnish excellent examples of mosaic used both for external and internal decoration. In the Albert Memorial mosaics adorn a pediment and two spandrels on each face, and the vaulting above the statue of the Prince. The four pediments are occupied by allegorical female figures on a gold ground, representing poetry, architecture, sculpture, and painting. Beneath each pediment, on two spandrels, are figures also on a gold ground, illustrating the application of the art typified in the figure above. The vaulting is blue, set with gold stars, and adorned with emblazoned coats of arms. The general effect of the mosaics, as far as one can judge, in the present unfinished state of the monument, is rich and harmonious. Mr. Clayton has designed his cartoon with a thorough knowledge of the capabilities of mosaic, and of the requirements of architectural decoration. The figures are distinctly and clearly defined on gold ground, and can consequently be seen from a considerable distance. Except on the cathedral at Orvieto, there is no similar instance of the employment of mosaic on so large a scale for external decoration. The mosaics of the Albert Memorial, exposed to the full influence of our climate and atmosphere, and facing the four quarters of the heavens, will furnish the best test of the durability of the material when used in this country on the exterior of monuments.

If I am not much mistaken, the Wolsey Chapel, when completed, will prove the most gorgeous and perfect specimen of modern decoration in Europe. The intervals between the ribs of the groined roof, including an area of about 2,100 superficial feet, are adorned with angels, heraldic devices, and various ornaments in mosaic on a gold ground. The soffits of the twelve side windows are similarly ornamented, and the twenty-eight panels of the great blank west window are occupied by full-length figures of historic persons who have been connected with the erection of Windsor Castle, also in mosaic on a gold ground. The windows are filled with the richest stained glass by Messrs. Clayton & Bell. The walls of the chapel are panelled with a series of Scripture subjects in marble tarsi, each framed in bands of ornament formed by white marble reliefs inlaid in marbles of various colours, the whole executed by the Baron de Triqueti. The tarsi of coloured marbles and engraved outlines and shading filled with mastic is a revival and improvement by the Baron de Triqueti of an art practised during the Italian cinque-cento, and carried to its highest perfection at that time on the pavement of the *duomo* of Siena. Above each panel are introduced medallion busts of the Queen and members of the Royal Family by Miss Durant, a pupil of the Baron de Triqueti. As the decoration of this chapel is not yet finished, the time is perhaps not come to pronounce a fixed opinion upon it; but I cannot refrain from saying how much impressed I have been with the exquisite and refined beauty, and at the same time with the exceeding richness of the general effect. I especially rejoice to see an example of interior decoration thoroughly carried out, and I cannot but believe that it will lead to still greater works of the same nature.

Besides the decoration of those monuments which I have described, Dr. Salviati has obtained

other commissions for public buildings in England. In the Museum of South Kensington, he has executed several full-length figures of celebrated painters, sculptors, and other artists after cartoons by some of our most eminent painters. I may particularly mention the figures of Nicolas Pisano, by Mr. Leighton, and of Apelles, by Mr. Poynter. In Westminster Abbey, "The Last Supper," over the communion-table, is by him, after a design by Mr. Clayton. For St. Paul's he has executed the mosaics of two pendentives of the dome, one from a cartoon by Mr. Watts, the other from a cartoon by Mr. Rivers; and he has a contract for the decoration of the remaining pendentives. I trust that the day may come when the whole of the dome may be similarly decorated as the dome of St. Peter's at Rome is. The architect of the noble edifice, Mr. Penrose, has not, I hope, relinquished the idea of carrying out Sir Christopher Wren's original design. In addition to these great commissions, Dr. Salviati has executed several restorations for churches in England, into which they have been introduced with excellent effect.

Above the principal commission obtained by Dr. Salviati is that for the complete restoration of the mosaics on the walls and in the pavement of St. Mark's at Venice, for which a contract has been entered into extending over fifteen years. Many of the cartoons of such designs as have fallen away from the cracking of the walls, owing to the subsidence of the foundations, have been preserved, and I trust that the restorations will be executed with such care,—indeed, with such reverential feeling,—that this grand and unique monument may in no wise lose its original character.

From what I have said there cannot, I think, be a doubt that mosaic, both pictorial and simply decorative, not only can be, but ought to be, employed in this country. I have shown that when protected from the effects of the atmosphere in the interior of buildings its durability can scarcely be questioned. With regard to exterior use, it may yet have to be tested; although I see no reason why it should not be proof against our climate, if proper precautions are taken in fixing it. These precautions consist mainly in the selection of the cement which binds the tesserae together and fixes the mosaic to the wall. That used by Dr. Salviati has been subjected, I believe, to adequate tests by Mr. Gilbert Scott and other eminent architects who have employed mosaic, and has been found of excellent quality. The architects of St. Mark's appear at one time to have used as an additional precaution in fixing mosaics, especially on walls and ceilings, large nails with heads in the form of a star, and, as it were, split at the end, in which a wedge was inserted which opened up the nail as it was driven into the wall; but such precautions appear to be scarcely necessary when perforated bricks are employed for the reception of mosaic, and they do not appear to have been used by the most ancient mosaicists.

There is still another point of a practical nature upon which the architect and the public also will naturally require some information: I mean the question of cost. Upon this subject Mr. Digby Wyatt made some statements in his paper; but since then, owing to the greater facility of execution, and of producing certain enamels, the scale of prices has somewhat altered. The cost of mosaic depends principally upon the following considerations,—the quality of the work, the distance from the eye at which it is to be placed, the predominance of figures, ornament, or simple ground, and the prevalence of certain tints.

On the walls and on the table are various specimens of Venetian mosaic, which will afford some idea of the relative quality of work used for architectural decoration.*

The most elaborate, well-executed mosaic, for decoration in England, are the figures at South Kensington Museum. It would be difficult to find finer specimens of this branch of the art, but they are, of course, the most expensive, requiring very skilful artists, who receive very high pay. I doubt whether mosaic of this nature can ever be introduced very largely for purely decorative purposes. The great monuments of Italy and of the East contain no work so elaborate and highly finished.

* The illustrations referred to consisted of a mosaic picture representing a full-length figure of our Lord, from designs by Mr. Gambier Parry, exhibited at the Bathin Exhibition; a mosaic picture representing Henry III., duplicate of one of the twenty-eight figures in the east window of the Wolsey Chapel at Windsor, by Salviati; a ditto of Henry VII.; and a mosaic picture representing Our Saviour at Supper with the Disciples at Emmaus.

The pictorial mosaics of the Albert Memorial and of the Wolsey Chapel are purely decorative, and are meant to be seen from a distance. In order to be effective, they are not too fine in the workmanship or too elaborate in the gradations of tints. These figures are excellent examples of what mosaic for internal decoration should be; but they are more elaborate in execution and in gradation of colour than most of the decorative mosaics of the early Italian and Byzantine churches; although there are specimens in St. Mark's, as in the semi-dome over the exterior northern entrance in the Mascoli Chapel and in the sacristy, which exceed it in the fineness of the work and the smoothness and exact fitting of the tesserae. The figure of Christ in the act of blessing, from a cartoon by my friend Mr. Gambier Parry, an eminent amateur artist, is a good example of the two qualities of work united. The head having been executed by a skilful artist, according to the usual process, that is to say, not on the reverse; the drapery, by less skilful hands, on the reverse. Still coarser work even than my specimen exhibited here is well suited for simple architectural decoration and even for figures, producing an excellent effect when far removed from the eye,—a better effect, indeed, than more finely-executed work.

Of course, figures require, under all circumstances, more careful execution and more skilful workmen than mere ornament. As regards the relative cost of tints, the reds and purples are the most expensive, on account of the materials used in them, and of the difficulty of producing them. The gold mosaic, but especially the silver, which is more difficult to obtain than the gold, is more costly than common tints. To show the requirements of a mosaic establishment, I may mention, that in order to execute in a satisfactory manner the cartoons which have hitherto been confided to Dr. Salvati, a stock of nearly 1,500 tints has been brought together, for the most part produced on the company's premises at Murano. I may point out that any quality or tint of gold may be obtained by darkening or lightening the colour of the glass upon which the gold-leaf is laid, or by using a film of coloured instead of transparent glass over it; or the brightness of the gold may be denuded by roughing the surface of the outer film of glass with the wheel. The architect or painter can consequently choose the quality of gold which best suits his work or his taste.

Taking, the various qualities of mosaic which may be fitly used for decorative purposes, the price would vary from about 30s. the square foot to 4l. or, at the utmost, 6l. for the finest. This includes the fixing, but not, of course, the price of the cartoon. When these prices are compared with what an artist of eminence, and fully employed, would receive for the execution of a great fresco, or any elaborate mural decoration; in fact, with what the artists engaged on the wall-paintings in the Houses of Parliament have received, they will be found, I think, very moderate. Of course, we must take the cost of a cartoon into consideration; but even if this be added to the cost of the mosaic, supposing the cartoon to be executed by an artist of high reputation, the whole expense of the mosaic would be far less than that needed for the execution of an elaborate fresco by the same artist. It must be borne in mind that all great fresco-painters have, before commencing their work on the wall, executed most careful cartoons for it,—cartoons, indeed, which would be more than sufficient for the skilful mosaicist.

As regards simple decoration,—when the durability of the material, the facility with which it is cleaned and restored, and the admirable effect that it is calculated to produce, are taken into consideration, the price of mosaic is certainly not an obstacle in the way of its use on a large scale in our great public and even private buildings. In conclusion, I would venture to express a hope that the subject which I have brought before you this evening is one not unworthy of the attention of English architects, and that by the aid of mosaic we shall see erected public buildings which, in their internal decoration, as well as in their exterior architectural features, may be worthy of the wealth and greatness of the country.

LONDON OVER THE WATER.—There is scarcely a street in the district of St. Olave's, Southwark, where fever, in some form or other, is not raging, according to the *South London Press*.

ON THE DRYING PROPERTIES OF VARIOUS KINDS OF HOUSE PAINT.*

The question we have to consider is, "Why does paint dry?"

The difficulties of this question presented themselves to me on the occasion of some house-painting during the last summer. "Capital weather for drying, sir," was the remark of the painter. "Why does paint dry?" was the question of a child.

I have great love and respect for children. I love them because they think what they say, and say what they think. I respect them because they are good observers, and continue to be so until they go to school and learn how not to observe. Philosophers are children whose powers of observation have been cultivated. Children left to themselves are philosophers: what a pity they should cease to be so.

But why does paint dry? When a shower of rain wets the pavement and the sun shines out and the wet disappears, we know that a certain amount of heat-force has converted the water into invisible vapour, and we call this process of drying evaporation. So, also, when we boil a kettle of water, there is a change of state, of water into steam, and a process of evaporation is going on, only in this case it is more rapid than in the other; and evaporation is not superficial merely, but from every part of the liquid, more or less. Continue the process, and the water dries up by this rapid evaporation. Again, if we apply heat to oil of turpentine contained in a retort, it will boil a little over 300° Fahr., and the vapour may be collected and condensed in a cooled receiver; but, if we try to boil linseed oil, for example, it will not only not distil over, but it will blacken and decompose instead of boil. If we moderate the heat so as not to carbonise it, then it will lose about one-sixth of its weight and become thick, tenacious, and viscid; forming what is called printer's varnish. Raise the temperature above 600°, and if air be present the oil will take fire and burn quietly without further external heating, until nothing but tar or charcoal is left. If, however, the burning be interrupted by closing the vessel, a brown viscid substance will be left, known as bird-lime.

There must be something, then, very different in the constitution of these two oils, turpentine and linseed, since they behave so differently under the influence of heat. Such is the case. Turpentine belongs to a class of oils known as *volatile*; that is, they can be raised into vapour by means of heat, and under certain conditions, will evaporate or dry up in the sense that the wet on the pavement dries up after a shower of rain. Linseed oil, on the other hand, which cannot be boiled or distilled, belongs to a class of oils called *fixed*.

Some one now steps in with an objection. Painters not only boil their linseed oil, but the very process gives the name of *boiled oil* to the product.

What painters really do is this: they gradually raise the oil to about 600°, when it begins to give off acrid vapours and a little above 600° the oil itself begins to decompose with the escape of gaseous hydro-carbons, which, swelling up in bubbles, give the oil the appearance of boiling. Continue the process out of the reach of air, and the oil would be entirely broken up, past recall, into a mixture of solid and liquid hydro-carbons, and various fatty acids, with a very irritating body, known as *acrolein*, from its distressing action on the mucous membrane of the eyes and organs of respiration. It is quite clear, then, that the linseed or nut oil used as the liquid vehicle of paint does not dry by the ordinary process of evaporation. I put the question, "Why does paint dry?" to an intelligent painter, and the answer was, "Because we mix *dryers* with the paint." These dryers, as they are called, consist of litharge, oxide of manganese, and sugar of lead. Linseed oil is heated with about one-twentieth of its weight of litharge, which the oil completely dissolves, and is then used as a dryer. A similar heating with manganese or sugar of lead also improves the so-called drying properties of the oil.

But what would be the effect of omitting the dryers altogether in the composition of the paint? I have no doubt most painters would say that the paint would never dry. Let us see the result of a careful experiment performed by

Chevrel some years ago. Of course, you are aware that house paint, omitting the colouring matters or stainers, consists of three ingredients: 1st, white lead or white zinc; 2nd, a fixed oil, such as linseed, or nut, used for the purpose of reducing the white to a soft paste, to which is afterwards added variable proportions of linseed or other oil for thinning the paint; 3rd, the drying material or dryer which we now propose to omit.

Four oak strips were painted, each on one side, with a paint composed of white lead and linseed oil, and the other side with a paint composed of white zinc and linseed oil. The strip No. 1 was exposed to the air to dry; No. 2 was put into a hottle of the capacity of two litres (3-52 pints) and closed; No. 3 was put into a similar hottle, containing dry oxygen gas; No. 4 was put into a similar hottle, containing dry carbonic acid gas. The results as to drying were examined after twenty-four hours, and again after seventy-two hours:—

After twenty-four hours.

No. 1. The lead paint was almost dry; the zinc paint had set, but was not dry. No. 2. The lead paint was almost dry; the zinc paint had set, but was not dry. No. 3. Both the lead and the zinc paints were perfectly dry. No. 4. Both paints were still wet and fresh, and had undergone no change.

After seventy-two hours.

Nos. 1 and 2. Both paints were perfectly dry. No. 4. The lead paint had almost set, but it had no adhesion to the wood, and could be easily removed by friction; the zinc paint had undergone no change, but stuck to the finger like fresh paint.

Now, how remarkable are these results. Paint, containing no so-called dryer, dries rapidly and completely in oxygen gas, within twenty-four hours, and does not dry at all in dry carbonic acid gas. It dries more slowly in the air, whether exposed or confined, and in another experiment it was shown that in drying in a confined volume of atmospheric air, the paint had absorbed all the oxygen, and left nothing but pure nitrogen in the hottle.

We can now answer the question, "Why does paint dry?" in a scientific, that is, in a satisfactory manner. Paint dries, not because it loses anything, as in the case of ordinary drying by evaporation, but because it absorbs oxygen from the air, and solidifies in combining with it. The drying of paint is not, therefore, a physical effect, as in the case of evaporation, but a chemical one, in which there is a change of properties attending a change of state from liquid or viscid to solid.

In the above experiments we omitted the dryers; what would be the effect if we left out the white lead or the white zinc, and exposed pure linseed oil to the air?

Linseed oil exposed to the air in thin layers dries up into the form of a resinous, transparent, moderately elastic mass resembling caoutchouc. This property of absorbing oxygen and gradually becoming solid, also applies to walnut, hemp, poppy, rapeseed, safflower, and some other oils, and hence such oils are termed drying oils. In undergoing this change these oils undergo slow combustion, and give off carbonic acid. Under certain conditions the drying oils absorb oxygen so quickly as to take fire, as when the cotton-wool, tow, &c., used in cleaning machinery is thrown aside, and has thus led to conflagrations.

The non-drying oils, as those that do not absorb oxygen, are rape, colza, olive, almond, and many animal oils. By exposure to air they become gradually changed, but in a different manner as compared with drying oils. They become rancid from the fermentation of the cellular substances of the plant or animal from which the oil was obtained. They lose their colour, and, to a certain extent, their fluidity, and acquire an acrid, disagreeable taste. Such oils are, of course, quite unfit for the purposes of the painter, although there is ground for suspicion that linseed oil is sometimes adulterated with a cheap fish oil, the result of which in the paint is to produce a disagreeable kind of stickiness which is all but permanent. While studying the cohesion figures of liquids some years ago I was anxious to procure a specimen of pure linseed oil. The specimens procured from oil warehouses gave different figures; but in the International Exhibition of 1862 there was a linseed-oil press at work. Here, I thought, is a splendid opportunity for getting a

* By Charles Tomlinson, F.R.S., read at the Society of Arts on Wednesday, December 9th.

specimen of pure linseed oil. "It must be pure," said the man, "for we make it before your face." He gave me a bottle of oil, and generously volunteered to give also a sample of the seed. To my surprise, on examining the linseed, I found it mixed with various other seeds to the extent of at least one-sixth. What hope, then, is there of obtaining pure linseed oil, and, consequently, good drying paint, if not only the oil is liable to adulteration, but the source of the oil itself is impure?

The distinguished chemist who does us the honour of taking the chair to-night, has been good enough to place at my disposal some recent results obtained by the Dutch chemist, Mulder, who drew some of the oil experimented on from good fresh seed in his own laboratory. According to Mulder, the difference between non-drying and drying oils arises from the presence of oleic acid in the latter. He compares drying oils to blood; they absorb oxygen and give off carbonic anhydride. To prove this in the case of linseed oil, fragments of pumice-stone were ignited, left to cool, and then put into a bottle, and the pumice was moistened with boiled linseed oil, the effect of boiling being to raise the oil into a state of greater activity. Air, previously deprived of carbonic anhydride, was next passed over the pumice, and then into a vessel containing baryta water, which, in a few minutes became turbid from the presence of carbonic acid, due to the slow combustion of the oil.

A pure linseed oil, drawn in the laboratory, was represented by the formula C 768 H 112 O 12. When made colourless by being passed through animal charcoal, its composition was not altered. Poppy oil, nut and hemp seed oil, were found to be similar in composition. The chief component of these oils, and probably of all drying oils, is a neutral fat known as linoleine. Linseed oil also contains the fatty bodies known as elaine, palmitine, and myristine. Poppy oil contains elaine, myristine, and laurine. Walnut the same, but rather less laurine. The mucilaginous matter said to exist in these oils, and to act as a ferment, was not found.

The ash of good linseed oil contained only one per cent. by weight.

In the so-called dry distillation of linseed oil, when carefully conducted, decomposition begins at 250° C (482° Fabr.); it yields acroleine, which, by partial oxidation, forms a certain quantity of acrylic acid, sebacylic acid, palmitic acid, and myristic acid, while the great bulk of the oil left in the retort is the anhydride of linoleic acid not unlike birdlime, or fused india-rubber. It is insoluble in ether. It is dark-coloured in the mass, but of a straw-yellow in thin layers, and very elastic. This is the basis of our printing inks. In preparing it, in practice, there is usually a great loss, from the application of too strong a heat, so that volatile hydro-carbons and even oil-gas are produced.

Linseed oil, by saponification, yields glycerine, linoleic acid, elaine acid, palmitic acid, and myristic acid.

100 parts, by weight, of several drying oils, yielded by saponification from 87.7° to 95.4° of fatty acids, dried at 100° C. Fresh linseed oil 95.4°, old walnut oils 87.7°.

Linoleine is readily saponified by means of a solution of basic acetate of lead, the effect being the same as boiling the oil with litharge, or red lead.

Pure linoleine is not disposed to become rancid. The drying oils become slowly rancid by changes produced in the other fatty bodies present, especially in the elaine.

Poppy and nut oils become much sooner rancid than linseed-oil, but in general, the drying oils become less rapidly rancid than the non-drying.

The acid compound of linoleine is linoleic acid. This is a colourless compound when pure, and it is very fluid at 14° C., and is not solidified at 18° C. Its specific gravity is 0.9206. It reddens litmus, and is soluble in alcohol and ether. When exposed to air in thin layers linoleic acid absorbs oxygen and turns red. This change is greatly promoted by the presence of bases. The lime and baryta salts of linoleic acid are soluble in boiling alcohol. The lime, zinc, copper, and lead salts are soluble in ether. The acid readily oxidises, yielding iodic acid, a substance something like Venice turpentine; it is colourless, but becomes blood red by being exposed to the heat of boiling water, as also by contact with strong caustic alkalis and acids. The alkaline carbonates do not affect this acid in the same way. The change in colour is not accompanied by change in composition.

In the change produced by the exposure of linoleic acid to the air, a body known as linoxine is first formed, and some months elapse before the peculiar stickiness of the Venice turpentine-like body is formed. With raw linseed oil, however, the change takes place in about two weeks, with boiled oil in a few days. Linoxine is formed by the loss of one equivalent of the elements of water from linoleic acid. Linoxine is an important body, it being the chief compound resulting from the application of oil colours and paints. It is amorphous and somewhat elastic, like leather or gutta-percha. It is not hygroscopic. It is heavier than water, and is not soluble in water, alcohol, ether; it swells up in chloroform and bisulphide of carbon. It is not affected by acetic acid or by dilute mineral acids. Caustic alkalis dissolve it and turn it red, and it is precipitated from those solutions without change. The best solvent for linoxine is a mixture of chloroform and strong spirits of wine, aided by a moderate heat. Oil of turpentine renders it gelatinous, but does not dissolve it. It is not affected by being raised to 100° C., only it gets a little darker. It cannot be fused without decomposition. Such are Mulder's results, very briefly stated. They ought to have a marked effect not only on the practice of the house-painter, but also on that of the printers' ink maker. Chevreul's details also are full of practical instruction, and we now proceed to lay them before you.

Roughly speaking, the setting of paint is due to the absorption of oxygen; hence we can understand why the painters, in order to prevent their brushes from getting hard, put them into water when they leave off work; and also cover a painted surface with water when they want to keep the paint from setting.

We have spoken of white lead, or white zinc, as the basis of paint; white antimony has also been proposed. In order to determine the relative merits of the three, M. Chevreul instituted an experiment, in which 10 grammes (154 grains) of pure linseed oil were mixed up with sufficient quantities of the three solids without the addition of any dryer. It was found that the zinc paint covered a less surface than the lead, but more than the antimony paint. The drying of the different coats of the three paints required very different times, as will be seen in the following table:—

Coats.	Lead	Zinc	Antimony
	Paint.	Paint.	Paint.
	Days.	Days.	Days.
First	4	18	50
Second	3½	15	28
Third	3	5	27
Total	10½	38	105

Hence it appears that lead paint dries much more quickly than zinc or antimony paint. Indeed, unless it were possible to hasten the drying of zinc paint by the addition of a dryer, zinc paint would be of very little use in industry, since the practice of house painting requires that not more than two or three days shall elapse between the application of the first coat and that of the second.

Antimony paint is also too slow in drying to be used. A tin paint was also tried, but the oxide of tin was found to delay the drying of the oil. Pure linseed oil dries more quickly on glass than when mixed with oxide of antimony, so that this oxide is actually anti-siccative relatively to glass.*

THE VALUE OF ASPHALTE.

THE newspapers have quoted very extensively—and as if an entirely new thought—a recommendation by Professor Rolleston, of Oxford, to the effect that the entire area occupied by a house should be covered with "the same layer of impervious material which is put into the walls as the so-called 'damp course.'" Such a superficial stratum may be cheaply made," the writer continued, "by a mixture of gravel and gas tar. It would effectually prevent that rising of watery vapour out of the soil which the 'aspiring' effect of a warm house does much to intensify over the area it covers." The suggestion, as many of our readers must know, is by no means new. Such a precaution, especially on clayey and otherwise damp soils, we have ourselves often adopted. For years past, in damp situations, all the areas of gunpowder magazines

* The conclusion in our next.

have been covered with Pyramont asphalt, for the suppression of moisture. As long ago as 1853, Mr. William Rutson, of Newby Wiske, erected infant schools upon his estate, the entire site of which, with a view to sanitary benefits, was covered in the same manner; and over which the wooden floor was placed. In 1856, the whole of the foundations of the Enfield small arms factory and engine-houses, situated alongside the River Lea, had all their foundations encased with asphalt, by which means this portion of the building, though surrounded at all times by 3 ft. of water, has been ever since proof from damp; so, also, the superintendent's house and offices at Pyramont-wharf, Cubitt Town, by the recommendation of Messrs. Tilott & Chamberlain, architects, was thus prepared for. At Dr. Swabey's mansion, at Langley Marsh, near Slough, the area was thus covered under the direction of Mr. Hardwick. Again, in 1867, from 4 ft. to 5 ft. of water were kept out in the cellars and basement of Mr. Angell's, Lubenham, near Market Harborough, by the application of this same asphalt, under the direction of Messrs. Cubitt & Co. This same firm, during the erection of the new tobacco stores, in Victoria Docks, situated some 15 ft. or more below the basin of it, encased the dock front of the building with asphalt to the extent of 12,000 ft., continued it through the walls (7 ft. at ground line), and over the entire area of the floor to the further extent of 82,000 ft. Still it is so important that the worth of an impervious layer over the site of a building should be kept in view, that we are thankful to the professor for giving increased publicity to it. He was led to do so, it seems, by the assertion by Professor L. Pfeiffer, "that the interposition of a layer of impervious substance, of whatever kind so that it be impervious, between the level of the ground-water in the soil and the floor of a house built upon it, confers upon such house an immunity in cholera epidemics. Barracks and hospitals lying low, and on superficially plain strata of clay, have been remarked to remain free from attacks of this disease, whilst houses placed on elevated and sandy soils, and more favourably conditioned thus, probably, as to bronchitis and rheumatism, have enjoyed no such freedom."

The Seyssel asphalt is a much better material for the purpose than gas-tar. It is a bituminous limestone from the Lower Jura, brought by beat and an addition of its own tar, to a state of mastic, in which condition it can be applied from ½ in. to ½ in. in thickness, to the area of the site selected for building upon. It is perfectly inodorous and indestructible in such a situation. On the contrary, a mastic composed of gas-tar would, for a considerable time, throw off an offensive odour, and when this odour ceases to be noticed, then the material becomes soft and brittle, and cracks.

Several applications of this valuable material have lately come under our special notice. Thus, at Warrnam, near Horsham, the residence of Mr. Charles Innes, the well-known builder, where a very complete rafter-cone has been formed, the floor is laid with it. And in the New Meat Market, Smithfield, Pyramont Seyssel asphalt forms the wide margins to all the shops, and immediately beneath what are technically called the "butchers' hangings." It is uniform and neat in appearance, and seems to answer its purpose well.

THE CHAUCER WINDOW, WESTMINSTER ABBEY.

A MEMORIAL of Chaucer has been set up in Poets' Corner, immediately over his tomb. The design is intended to embody his intellectual labours and his position amongst his contemporaries. At the base are the Canterbury Pilgrims, showing the setting out from London and the arrival at Canterbury. The medallions above represent Chaucer receiving a commission, with others, in 1372, from King Edward III. to the Pope of Cenoa, and his reception by the latter. At the top the subjects are taken from the poem entitled "The Flour and the Leaf." On the dexter side, dressed in white, are the Lady of the Leaf, and attendants; on the sinister side is the Lady of the Flour, dressed in green. In the tracery above, the portrait of Chaucer occupies the centre, between that of Edward III. and Philippa his wife; below them, Gower and John of Gaunt; and above are Wickliffe and Strode, his contemporaries. In the borders are disposed arms. At the base of the window is

the name Geoffrey Chaucer, died A.D. 1400, and four lines selected from the poem entitled "Balade of Gede Counsaile" :—

"Rise from the pees, and dwell with soft-fastness,
Suffice unto thy good though it be small,"
"That thee is sent reeve in buxomness;
The wrestling for this world asketh a fall."

This window was designed by Mr. J. G. Waller, and executed by Messrs. Thomas Baillie and George Mayer. It is a brilliant piece of colour, and an interesting addition to the attractions of the Abbey. This and the Brunel window deserve the attention of students of modern stained glass. Chaucer's tomb should now be cleared of some of the disfigurements around it.

THE LATE MR. JOHN BURLISON.

ON Tuesday last were interred, in Hampstead Churchyard, the remains of Mr. John Burlison, who has for the last quarter of a century been the confidential and highly-valued practical assistant of Mr. Geo. Gilbert Scott, R.A.

Mr. Burlison was a man of very remarkable talents, and of extensive practical and scientific acquirements, uniting in an eminent degree the classes of skill and knowledge which belong more especially to the practical builder and surveyor, with the constructive science of the engineer, and the antiquarian knowledge and acumen which are so necessary to the investigation of the architectural history of ancient structures, and to a sound judgment in their restoration. His knowledge of our own architectural antiquities, and those of Germany, where he frequently travelled, was very extensive.

He was a mathematician of a high and thoroughly practical order, and was well versed in scientific and antiquarian works in French and German, as well as in our own language. Mr. Burlison's sound judgment and unflinching integrity acquired for him the confidence and respect not only of clients, but of those whose work he had to superintend, and whose charges it was his duty to scrutinize. Among his many important qualifications may be mentioned a remarkable perception, while dealing with ancient structures,—of the means of saving them from ruin, and preserving their identity even under circumstances apparently hopeless; and he may fairly lay claim, like the well-known antiquary, John Carter, who lies buried in the same churchyard, to having given substantial aid in saving many ancient monuments from destruction.

Mr. Burlison died, after only four days' illness, in the fifty-eighth year of his age. He was for some time of the city of Durham, where he was for some time in the office of Mr. Bonomi. His loss will be felt by Mr. Scott, not only as having been a most able and valued coadjutor, but as one for whom he entertained the highest esteem and respect; and the same feelings will be largely and extensively shared by those who knew his talents and his personal worth.

URBAN AND SUBURBAN RAILWAYS AND STREET TRAFFIC.

New remedies of various kinds are again proposed, by private Bills to be petitioned for in next session, for the greivling, in the metropolis especially, of a street traffic in excess of the capabilities of the channels in which it has to be conducted. The remedies are of two classes.

One class of remedy applies to the regulation of the traffic, and to expedients for getting more work more quickly and safely out of the existing means of communication between one locality and another, by guiding the streams of traffic in accordance with understood municipal regulations enforced by law. Much has been well done by the police authorities in this respect, of which no better illustration can be given, perhaps, than the enormously-increased capabilities of London Bridge by the simple expedient of enforcing a quick and a slow stream of vehicular traffic in each direction,—a regulation that almost entirely obliterated the numerous distressing and costly "blocks" that were of daily occurrence.

Another proposed remedy belonging to this class is the adoption of street tramways, by which a larger number of passengers could be carried at greater speed and in a

smaller number of vehicles than by the ordinary street carriages in use. For tramways in the heart of London the public are not prepared as yet, and no projector is held enough to propose their adoption for the City proper, the Strand, Oxford-street, or others of the main traffic arteries; but their use as suburban means of communication would, it may reasonably be expected, prove of public advantage in various respects,—in the increased celerity, smoothness, and comfort of this mode of locomotion as compared with the ordinary street omnibus, and especially in their operation as a check upon the railway companies in their dealings with suburban season ticket-holders. Aots for tramway systems have already been passed by Parliament for Liverpool and Dublin, the Liverpool ways to be carried into the very heart of the town and its best streets. The promoters of the Liverpool and Dublin Tramways Bills have petitioned for several sessions for the conversion of their "Metropolitan Tramways" Bill into an Act, but hitherto they have petitioned without success. This year they come forward again, with a somewhat smaller scheme than those of former years. They ask for less aggregate mileage, and propose to commence at points further from the more crowded thoroughfares or in near the heart of the City. Their proposed lines are to the north, two lines by leading thoroughfares; and to Stratford and Bow in the east, by White-chapel and Mile-end. Other two Bills are to be brought forward for very large tramway schemes in various suburban localities.

The other class of remedies for the overgrown and ever-growing street traffic is by attempting its depletion or diversion into additional and new channels. To this end underground and overground railways are proposed, which often, in the first instance by breaking up the streets and interrupting existing traffic, aggravate to an almost intolerable extent the evils they are intended ultimately to abate. Some of the new schemes proposed for railways in London are but little obnoxious to this objection. One of these is a tunnel line, nearly four miles in length, proposed to be constructed between London Bridge and Clapham-common. This line, it is proposed, shall be under the highway between one terminus and the other, and will be strictly underground all the way. It can be made, it is alleged, without tearing up the road, or disturbing the ordinary traffic, excepting at the points where the shafts necessary for ventilation will be placed. The line will be practically straight and level nearly throughout. Whether with one aboveground line from London Bridge to Clapham, and another between the Borough-road and the Elephant and Castle and Clapham, a third and underground line will pay, is a question for speculators and investors to consider. Another line, under covered way, is proposed, which seems calculated to relieve the pressure upon the streets in a quarter—Billingsgate—which greatly needs relief. This is a line projected from Tower Hill, and along the north bank of the river to Blackfriars Bridge. An extension to Smithfield is also included in the plan, which embraces, moreover, the widening of Lower Thames-street, and the construction of a new road between London Bridge and Billingsgate Market. It is suggested that this line may be a good substitute for this portion of the Metropolitan District Railway, part of the inner circle, between Tower Hill and Blackfriars, and it is further suggested that the low-level main sewer may be carried along in the proposed embankment at a saving of 100,000*l.* as compared with the more inland course. The adoption of this suggestion would also avoid the necessity for breaking up the streets. Another very important underground line,—the Mid-London,—involving enormous cost, is proposed again,—its course to be from the Marble Arch under Oxford-street and Holborn to Newgate-street and Cheapside. Two lines are proposed to Islington,—the one an underground line from the Metropolitan line near Granville-square, Clerkenwell; the other an overground line, on viaduct all the way, as already mentioned by us, from Finsbury to the Agricultural Hall. The viaduct line, it is proposed, shall be on a 3-ft. gauge. Amongst the other lines affecting London and its suburbs is the Metropolitan Southern District, from the Elephant and Castle to Scotland-yard. This project, if the Bill passes, will absorb the Waterloo and Whitehall, and in the communication between the banks of the Thames the works of that company, in so far as they are available, will be taken advantage of.

FREE LIBRARIES.*

The chief librarian of the Manchester Free Libraries, Dr. Crestadoro, has prepared his annual report for the library committee, who have presented it to the City Council. From this report it appears that the aggregate issues have been 807,664, against 673,432 in the preceding year, being an increase of 136,232. Out of this number, 262,446 volumes were issued in the reading-room of the Reference Library; 94,602 volumes in the reading-rooms attached to the branch libraries; and the remaining 452,616 volumes were lent to borrowers. The number of borrowers has amounted to 32,106. The number of books lost or damaged has fallen from 87 to 81, all replaced or paid for principally by borrowers, the guarantor's responsibility having been taxed in but few cases. The new regulation allows books to be taken out on the signature of one guarantor only. With reference to the borrowers' occupations and descriptions, 117 are clergymen, ministers, and missionaries; 1,066 represent literary men, architects, surgeons, solicitors, sculptors, artists, civil engineers, and other liberal professions; 462 are schoolmasters and schoolmistresses; 3,575 school boys and school girls; 3,443 merchants, traders, and agents; 229 employers of manufacturing, agricultural, and other industrial labour; 10,850 artisans, mechanics, working men, and laborers; 5,245 engaged in various public and private situations; and 3,250 ladies.

The Bobington Free Library was established on January 1st, 1866, by Mr. Joseph Mayer, of Liverpool. The number of books issued from it in 1866 was 12,199, to 700 readers. The number of books issued in 1867 was 25,993 to 1,350 readers. From January to April, 1868, the number of books issued was 7,032 to 1,473 readers. The number of volumes in the library was 11,703.

HER MAJESTY'S THEATRE, LONDON.

WITH the assistance of the architect, Mr. Lee, we publish the plan of the new Opera House, and by the side of it a plan of the old one, showing, amongst other things, that a considerable addition has been made to the stage and its surroundings. The following references show the appropriation of the various parts:—

THE LATE THEATRE.

- A. Dressing-rooms.
- B. Gallery entrance, &c., stairs to amphitheatre, &c., amphitheatre stalls.
- C. Stage entrance.
- D. Housekeeper.
- E. Treasury.
- F. Manager's room.
- G. Box office.
- H. Royal entrance.
- I. Committee-room.
- J. Entrance to stage.
- K. Omnibus boxes.
- L. Stairs to flies.

THE NEW THEATRE.

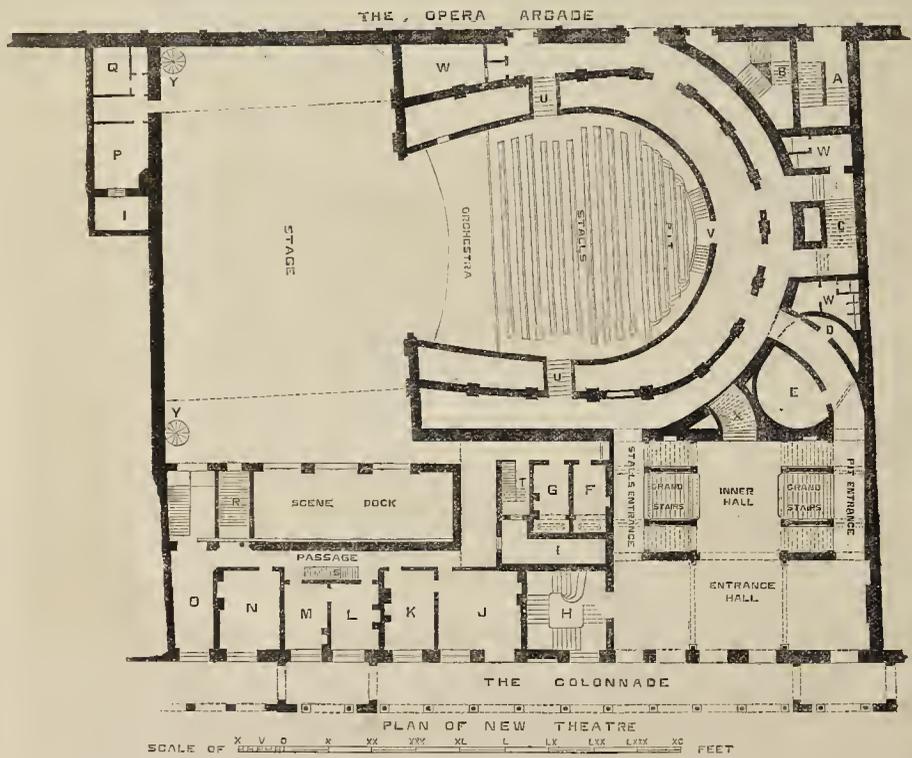

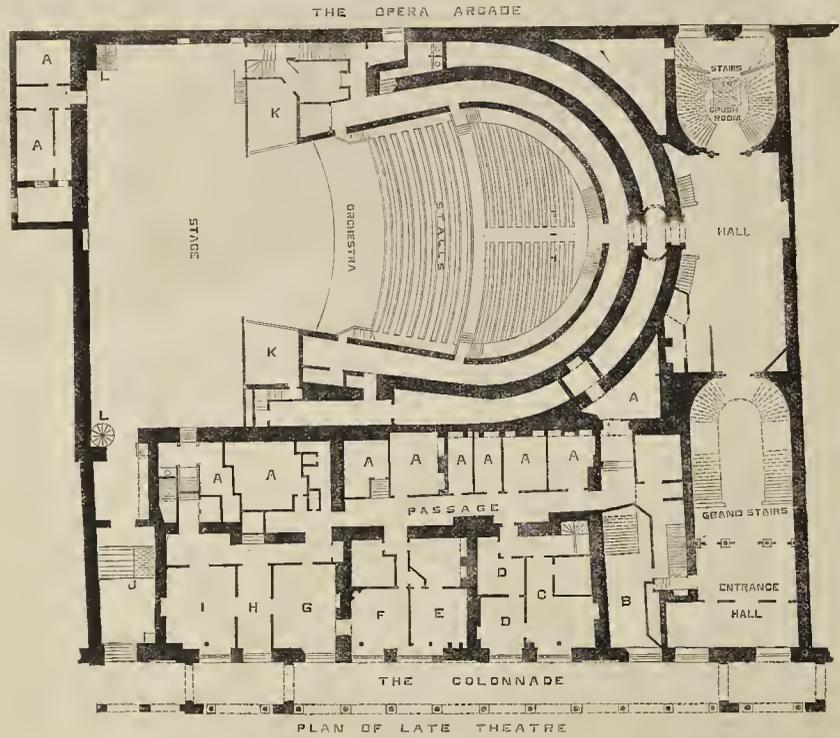

- A. Stairs to amphitheatre.
- B. Stairs to amphitheatre stalls.
- C. Stairs of communication between tiers of boxes.
- D. Cheque-taker.
- E. Soldiers' room.
- F. Acting manager's room.
- G. Conductor's room.
- H. Royal entrance and stairs.
- I. Open areas.
- J. Box office.
- K. Manager's room.
- L. Treasury.
- M. Waiting-room.
- N. Stage entrance.
- O. Scenery entrance.
- P. Green-room.
- Q. Dressing-room.
- R. Stairs to stage.
- S. Stairs to dressing-rooms and carpenter's shop.
- T. Ditto.
- U. Stairs to stalls.
- V. Stairs to pit.
- W. Waterclosets, &c.
- X. Stairs to pit tier of boxes.
- Y. Stairs to flies.

The dimensions of the new house run thus:—

	ft. in.
Height from pit-floor to the ceiling in the centre.....	63 0
Height from the stage to the roof over it.....	70 0
Height of basement under the stage.....	21 0
Length from back of stage to curtain.....	52 3
Length from curtain to the front of the boxes in centre.....	70 0
Diameter of curve of boxes on pit tier.....	43 0

The proscenium when finished will be 40 ft. in width, by 36 ft. in height.

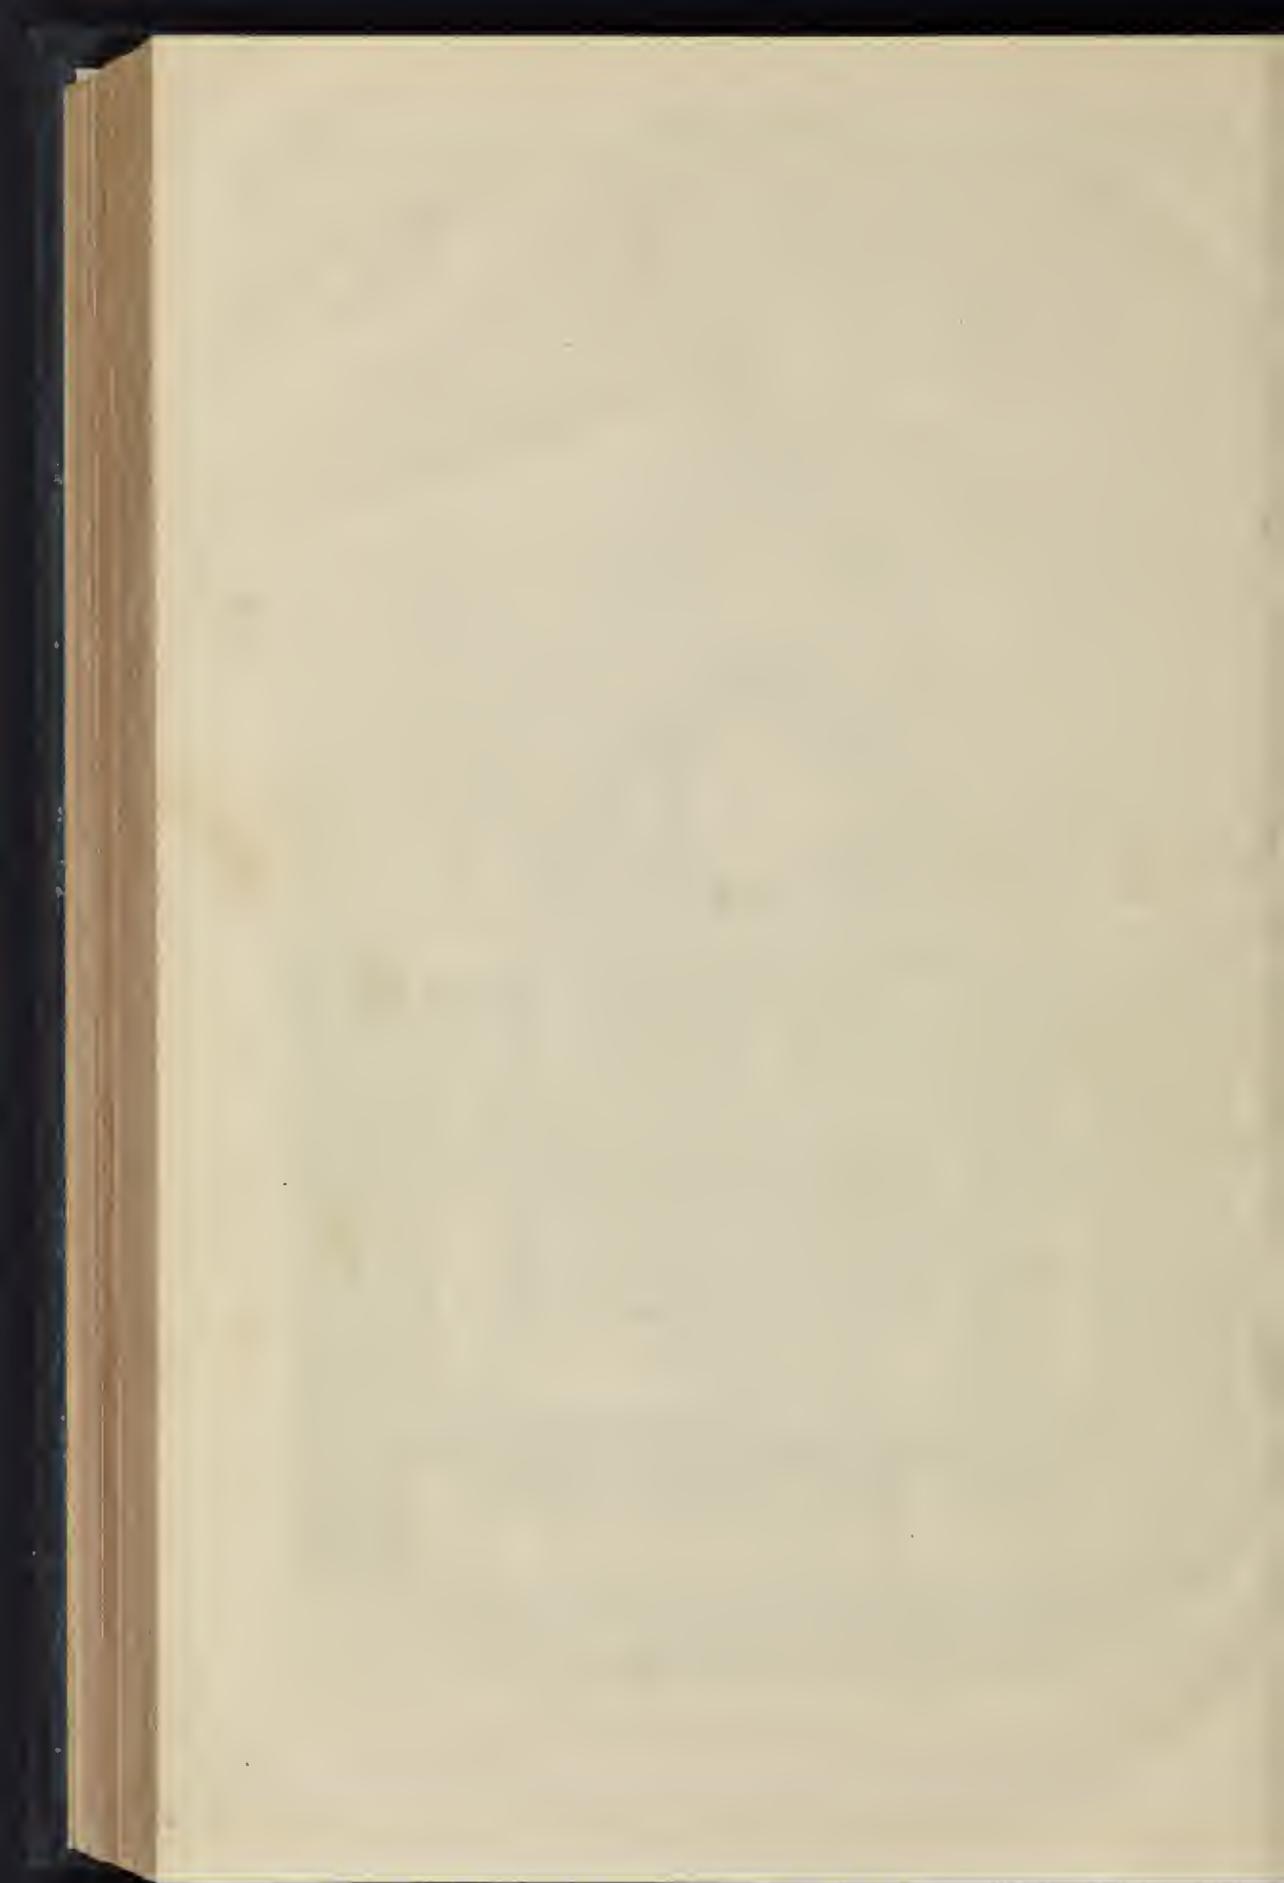

* Sixteenth Annual Report to the Council of the City of Manchester on the Working of the Public Free Libraries, 1867-68, Bobington Free Library.

HER MAJESTY'S THEATRE, LONDON.

MONUMENT TO THE LATE EARL OF ELGIN, CALCUTTA.
PROFESSOR G. G. SCOTT, ARCHITECT. MR. J. BIRNIE PHILLIP, SCULPTOR.

MONUMENT TO THE LATE LORD ELGIN.

The monument of which we here give an illustration is destined for the cathedral of Calcutta, and has been executed at the expense of the Government, in memory of the services of the Earl of Elgin and Kincardine. The design is by Professor G. G. Scott, R.A., and the monument has been executed by Mr. J. Birnie Philip, of Hans-place, in a manner quite worthy of that gentleman's distinguished reputation. To describe the work somewhat in detail: it is a mural monument, Italian Gothic in style, raised upon a table, or rather semi-table. The general form or body is a pedimented parallelogram. On each side is a panelled buttress with crocketed pinnacle, the pediment being richly crocketed also, and terminating with a finial. The centre of the whole is divided into four by broad bands, the upper two divisions being trefoiled. Above these panels is a circular frame in dark marble, in which is an alto-relievo portrait of Lord Elgin, in pure white marble. The four panels each contain a subject in bronze, depicting some prominent event in the diplomatic career of the late earl in the four countries where he had served. The bands which divide these panels are dove-coloured Derbyshire marble, enriched with incised gilded scroll-work, and at intervals studded with jewels, as they are termed. Eight bosses of rich-coloured marble occur at the intersections of the bands and tops of the arches. Over the panels and within the pediment is a trefoiled pointed arch, sculptured with small figures, portraying the virtues of a good governor, and springing from a marble column on each side. The spandrels formed by the trefoil, and which enclose the portrait, are filled with highly-wrought foliage; indeed, the whole is worked as if in ivory rather than stone. A dark serpentine slah covers the table, and the same material forms the base. The front of the table contains the inscription, and has two panels decorated with foliage somewhat too purely Italian in design. The body of the monument is of Mansfield Woodhouse stone. The columns on each side are of greenish-coloured marble. As a whole the monument may be said to harmonise well in tint, with the exception of the marble portrait relieve, which is at present over-white.

The inscription runs thus:—
 "In Memory of the Right Honble. JAMES BARRON, Earl of Elgin and Kincardine, K.T., G.M.S.I., G.C.B., Viceroy and Governor-General of India, who Died, in the execution of his office, at Dharmasala, in Northern India, there lies Buried, This Monument erected by the Government of Her Majesty Great Britain.
 In recognition of the many eminent Services rendered by him to his Country in Jamaica, Canada, China, and India. Born July 26th, 1811. Died November 20th, 1863."

This inscription is in incised lettering, gilded. The cost of the monument, we understand, will be about 800*l*.

CAMBRIDGE ARCHITECTURAL SOCIETY.

At the second meeting of the Society for the Michaelmas Term, held on the 19th of November, the Rev. G. Williams gave an account of "Certain Churches in Egypt and Syria," with the ground plans of which he had been furnished by the Hon. Arthur Gordon, Trinity College, and Governor of Trinidad, by whom they had been carefully measured and plotted when on a tour in the East some years ago. He first spoke of the church of St. Barbara, near Old Cairo, where they say the head of the saint is preserved with some other relics. Most of the churches have more ancient ones below them, and in this case the lower one was dedicated to St. Sergius, and the Holy Family are supposed to have rested on the spot during their sojourn in Egypt. The church, which is 66 ft. long and 48 ft. wide, consists of nave and two aisles, with galleries over the aisles supported by pillars, and adorned with columns in front, which support the roof. The nave terminates at the east end in an apse separated from the church by a screen, but the aisles have square terminations.

He next spoke of St. John's Church near Antinoe, on the Nile. It is higher up the Nile than Antinoe, a town built by the Emperor Adrian in honour of Antinous, who was drowned there. The church, which is 72 ft. long and 34 ft. wide, has a curiously-formed apse, much elongated, so as almost to form a chancel. The prothesis on the south side is ruined, and the nave is curiously divided in the middle. The

narthex, also, is peculiar, in being more open to the church than is usual.

The Great White Monastery near Souhaj (Egypt), to the east of the Nile, was described. Mr. Williams quoted at length from Curzon's "Monasteries of the Levant," with reference to this church. It consists of a long and spacious nave with north and south aisles, divided from the nave by colonnades; the apse is peculiar in being formed in three recesses, one to the east, one north, and another south, and around each are niches formed on a trefoiled plan. Another peculiarity about this church is the long chamber parallel to the south aisle. This chamber is supposed to have formed by a main portion of the monastery. Pocock mentions that he noticed the eagle with a cross and also with crown carved, and conjectured that St. Helena must have been connected with the building of it, which conjecture is strengthened by an ancient tradition mentioned by Curzon that such was the case.

REPORT ON STEAM CULTIVATION.

The following summary of the Report of the Judges on Steam Cultivation at the Leicester meeting of the Royal Agricultural Society has been furnished us:—

"The society offered at Leicester a first prize of 100*l*., and a second of 50*l*., for 'the best application of steam-power for the cultivation of the soil' and in adjudicating upon the same 'Class I,' the judges lay down a most important principle.
 'The prizes in this class,' they say, 'being offered for the best application of steam-power to the cultivation of the soil, without regard to the extent of the occupation, we had no hesitation in restricting the entries to such systems as worked on the direct principle, believing that on large areas steam could be more economically and efficiently employed in this way than on the roundabout system. Having come to this conclusion, it was apparent that Fowler & Co. were alone in the field; and the only point to determine was, which of their systems was most meritorious. The absence of Messrs. Howard's double engine was a source of much regret to those who visited the trial-field, anticipating a keen struggle between the celebrated firms of Fowler and Howard.'

Unfortunately the public thus had no opportunity of seeing the Bedford direct tackle compete with the Leeds direct tackle in any quality of performance, in cost of work, and in other points of comparison; but we have here an official and authoritative adoption of direct-acting in preference to stationary engine apparatus, as the most economical and efficient, excepting in special cases provided for in 'Class II.' Is this decision of the judges borne out by the experiments made?

No roundabout or stationary-engine machinery was tried against the single and double engine direct-acting sets in Class I. But in that class the first prize went to a double-engine apparatus, and the second prize to a single-engine apparatus, direct-acting, and in both this was also another direct-acting tackle was tried in Class II, against the roundabout sets.

The trial [in Class I.] completely proved that for economy and speed of performance the roundabout is decidedly inferior to the direct-acting machinery, and could have stood no chance whatever if it had entered into competition in Class I.

In Class II, the society offered a 1st prize of 50*l*., and a 2nd prize of 25*l*., for the best application of steam-power (we suppose for cultivation) adapted for occupations of a moderate size. If either Fowler's direct-acting sets did more and cheaper work, and lost less time and engaged less labour in travelling between one field and another, how was it that Howard's roundabout tackle, nevertheless, won the 1st prize in this class, and that Fowler's sets were considered ineligible altogether? It was simply a question of the prime-cost of the machinery.

There was not (say the judges) exhibited at Leicester any direct system made up of a travelling anchor and a travelling winch, driven by an ordinary portable or traction engine. In the absence of any such arrangement, and considering all the points we have above alluded to, we are driven to the conclusion that the roundabout system, which can be worked by an ordinary portable engine, is the only one exhibited at Leicester which fulfils the conditions under which the prizes in Class II. are offered by the society. . . . Bearing in mind the conditions as to the cost of the apparatus, which, in our reading, exceeds Nos. 4 and 6 (Fowler's direct-acting sets) from being fit for 'occupations of moderate size,' we were unanimous in awarding the 1st prize of 50*l*., to No. 2, Messrs. J. & F. Howard, of Bedford."

CHURCH OF ST. JOHN THE BAPTIST, LEYTONSTONE.

This church was built by the magnificence of Mr. Cotton in the Early English style of thirty years ago, and has been transformed from looking cold and dingy to warmth and brightness. The old organ, one of the kind which emitted melody by a skillful player turning a handle, has been removed from the gallery, and a new organ has been erected by Gray & Davison on the south side of the chancel. The choir seats have been rearranged.

The floor of the chancel has been laid with Minton's tiles; the stone font altered and inscribed with "Suffer little children to come unto me." The pulpit has been placed on the gospel side; the desk and fittings, the kneeling-

rail, and gas standards are of Hardman's manufacture. The altar-cloth, the offering of one of the congregation, and the kneeling-cushion, the work of the ladies, are richly embroidered.

The flat bays of the ceiling and the shelving sides of the roof are coloured light, with red and black ornaments running next the mouldings; a broad border is painted over the cornice in brown and grey, with a blue seaxill and gold fleur-de-lis in the centre of each length.

The principals, girders, and supports of the roof, with the queen-posts, are painted light grey, alternately ornamented with green, maroon, and brown, slightly relieved with black and gold; the corbel brackets supporting the roof are white, brown, and gold. The upper part of the walls are a warm tint of grey, the lower part maroon; the window mullions and linings are white, with ornaments and lines in a dark red.

The roof of the chancel is light blue, sprinkled with stars, the groins have a warm tint, relieved with maroon; the walls a deep grey, with a wide border on a gold ground, in green and brown, under cornice mouldings. The Decalogue, Lord's Prayer, and Creed are painted on the north and south walls, and the sides are powdered with grey and red. The lower part of the walls, about 5 ft. high, is light olive, with horizontal borders, in rich colours and gold, except the recess for the altar-table, which is arched, with gold panels, upon which are painted, in encaustic colours, the sacred monogram and symbols. The wall-spaces between the three lancet windows are diapered with a rich flowing pattern to harmonize with the stained glass.

The arch mouldings are powdered with black and gold; and on the label is written, "Lord, I have loved the habitation of Thy House," over the side arch, "Let Thy priests be clothed with righteousness," on the organ, the opening sentence of the "Te Deum" over the gallery, "All Thy works shall praise Thee, O God," in the porch, "Be ye all of one mind, having compassion one of another." The designs are by Mr. W. Pitman, and the decoration by Messrs. Hayward & Pitman, of Newgate-street. The building, having been closed a few weeks for general repairs by Mr. Cairns, builder, Leytonstone, and for the execution of the above works, was opened on Sunday, the 29th ult.

STATE OF ST. MARGARET'S CHURCH, LOWESTOFT.

The churchwardens and committee appointed to assist them in carrying out the repairs of the parish church have reported—that, in pursuance of the resolution of the vestry meeting of the 23rd June last, they proceeded to obtain the required assent of the diocesan and the archdeacon to the plan proposed for rebuilding the south aisle, and then entered into a contract with Mr. C. Godbolt, of Harleston, and his associates for the proper carrying out of the same. These preliminary steps being effected, the contractor immediately commenced pulling down the south aisle; and the outer wall had been nearly removed, when it was discovered that the south arcade wall of the nave had for some time partaken of the outward inclination of the aisle wall, an inclination that threatened to increase with a rapidity which might have suddenly put a stop to all further proceedings, had not prompt measures been instantly resorted to to retain the wall in its then position. Mr. Clemence, the architect, having pointed out the serious consequences likely to arise from the dangerous state of things, he was directed to examine the entire fabric, and to make a report on its present state.

Mr. Clemence, having given the result of his examination, said there was no immediate danger, it being well shored up, but his deliberate opinion was that the sooner the wall be taken down and rebuilt the better. The north wall of the nave was secure; the south-east angle of the tower above the leads of the nave roof requires rebuilding. Estimated cost, with new lead gutter to the nave, 650*l*.

On the receipt of this report, the committee consulted with Mr. Clemence. The committee expressed its confidence in Mr. Clemence, but in view of the diversity of opinion prevailing out of doors it was considered desirable, both by the committee and Mr. Clemence, that the opinion of another architect from a distance should be taken, and it was determined to request Mr. Tenlon to visit the church, and report to the committee. Mr. Tenlon accordingly re-

ported upon the subject. The report contained various suggestions, and Mr. Teulon stated that he did not feel able to certify the church perfectly safe in its present state. At the request of the committee, Mr. Clemence gave a more detailed report upon the plan he had proposed for rebuilding the south arcade wall, and he estimates the cost of the works and putting in new gutter boards and bearers to the nave roof at 700*l*. A vestry meeting has been called to consider this subject.

EUSTON SQUARE AND STATION.

Few, if any, architectural works worthy of notice are promised by any of the private bills which are to be brought forward in the next session of Parliament; but it is satisfactory to observe, in the very lengthy *Gazette* notice of a bill to be brought in by the London and North Western Railway Company, a short paragraph that gives promise of an important neo-architectural effort from an existing building—the dropping of the canvas, the presentation to the public in an æsthetic sense, “after all these years,” of the propyleum which furnishes the grand entrance to the Euston Station. The Company give notice, in their New Works and Additional Powers Bill, that they will apply *inter alia* for power, which it is to be hoped will be granted, to make and maintain, in the parish of St. Pancras, an approach-road to their Euston Station, commencing from and out of the Euston-road, at a point nearly equidistant from “the eastern and western ends of Euston-square, thence proceeding in a direct line to, and terminating at, the principal entrance to the Euston Station in Drummond-street; and to provide for the removal of the gates, bare, or railings now erected and standing on or across the site of the proposed approach-road, and for the extinction of any rights or privileges that may interfere with those objects.” The directors may be congratulated on their having arrived at the resolution to carry out, although somewhat tardily, what must have been the intentions of the architect, and of their predecessors in office, in the inception and execution of this design. It may seem paradoxical to say that a structure which dwarfs everything in its vicinity has not hitherto been seen; but this is in a sense true, and it is satisfactory to have the expectation that a point of sight worthy of the work is at last to be provided.

A SHAKY WALL.

Sir,—A passage leading to King-street, St. James's-square, until recently enjoying no very delicate fame, and now known as “Pall Mall-place,” consists, on the west side, of a most unsightly structure, which bulges out at the centre with a truly despicable and dangerous aspect. The other side is a row of shops of the first class, and how the shopkeepers and their customers are affected by the menacing indications over the way, I know not; but assuredly, until the state of things is pronounced, on authority, to be safe, I shall pass another way. Would you have the goodness to take a momentary “survey” of the place, and let the public know whether so unusual a curve in a rather long line of building, is compatible with stability. M.A.

** The appearance of the wall in question is certainly not quite satisfactory, especially at the northern end.

A SCALE FOR DRAWINGS IN PERSPECTIVE.

Sir,—In the “Life of Sonnia,” an architect, who flourished in Northern Germany from the middle to the end of the last century, I find a passage which I should be glad to have explained. Sonnia was commissioned to make a perspective drawing of a garden belonging to a certain Count von Ahlefeldt; he did so, but “die Zeichnung bat das Besondere, dass man vermittelst einer am Rande angebrachten Scala der Längen und Breiten die Grösse eines jeden Gegenstandes auf der Zeichnung anmessen kann.” This I would English thus:—“There is this peculiarity about the drawing, that the size,—in height or in length,—of every object may be measured off from a scale attached to the margin of the picture.”

Can any of your readers oblige me with

information as to this “scale?” If a scale can be attached to the side of any perspective, whereby dimensions, not only of height, but of width, can be measured, this would be of the greatest possible use in the case of photographs taken from nature. ALFRED STRONG.

THE DUTY OF MEMBERS OF A BOARD OF WORKS.

Sir,—Knowing your valuable paper stands pre-eminent as an authority, will you favour me by stating in your next impression whether you deem it a dereliction of duty, and altogether inconsistent or otherwise, with the position of a member of a Board of Works, to undertake to do and make out the accounts of a contractor, who is executing works under the Board, with which (the member) has been and is still connected? A CONSTANT READER.

** A member of a Board so acting professionally for a contractor, would incapacitate himself for rightly discharging his duty to the ratepayers, whom he is supposed to represent.

CEILING AND PARTITIONS.

Sir,—I am glad to find attention drawn to the material of which ordinary ceilings are composed, as it seems strange that materials so opposite in their natures as timber and plaster should so long have been used in such close connexion and with such numerous failures.

I quite agree with your correspondent “B. F.” that it is often attributable to the laths being fixed too close together to allow of a good key, but believe it more often arises from the sagging and shrinkage of the joists where there is no counter ceiling, which is, of course, increased when furniture is placed in the room above, and the constant vibration, caused by motion, is confined to a portion of the room chiefly near the centre. While the timber yields, the plaster, being a rigid material, must crack, and it is only a question whether the whole falls or only the floating and finishing coats, which is often the case on account of the defective key formed by the pricking up coat.

It appears to me that a material is required something of the nature of felt, which may be nailed to the underside of the joists, with a surface similar to drawing paper to allow of distemper; the edge may be luted and bidden by a small moulding, or by stiles to form panels. The material must be unflammable, as there is probably no better fire-resister in houses than the plaster; the cost must also be considered, as it is in smaller buildings that its use would be of more value than in larger ones.

If some such material could be invented also for quarter partitions, instead of lath and plaster, it might prevent the annoyance of ugly cracks occasioned by the before-mentioned causes, and which few architects have been free from during the last trying summer. J. D. M.

Sir,—I have no doubt there will be many persons act on the recommendation in your pages, and paper their cracked and dangerous-looking ceilings.

They will very much strengthen them by twice or thrice without the paint depart, till the zinc breaks. So far as I know this paint resists heat and cold, air and moisture. I beg to enclose a small piece of zinc, painted, as sample. With the same results of firmly adhering, this paint may be used for iron, wood, stone, terra-cotta, &c., in every color, without light and temperature altering the same, and better protecting the painted object than usual linseed paint. The paint alluded to can be applied easier and quicker than linseed paint.

I do not know if it is known in England; in any case, it is not generally known. If this communication be of some utility to you, I will be glad to consider this as a small tribute of gratitude which I feel indebted to your excellent paper, the *Builder*, which has procured me for several years many an agreeable and useful hour, and of much assistance in the beginning of my career. With much regard, I remain, D. JEAN DEW DIXIE.

Rotterdam.

** The specimens sent are entirely satisfactory. We shall be glad to know the nature of the paint or process.

CHIMNEYS.

Sir,—In reply to your correspondent “Stat Veritas,” in your publication of November 21st, I beg to say that circular or oval flues or chimneys will do equally well for conveying smoke; but the determining points which secure an upward draught or a down blast of smoke may be had with either; and if he had the most correct information as to what would make a good draught, he might still be defeated in getting it carried out by the workmen, who, to secure a good regular outside appearance, often make the inside work, especially in chimneys, to suit their own convenience instead of the conveyance of smoke. The only sure way I can find to meet such difficulties is to get flue linings made at the pottery from tested models, the exact form and dimensions to suit the different sizes of chimneys. I quite agree with your correspondent as to the almost total want of practical knowledge to be found everywhere on this subject. It is much to be lamented that in matters so deeply affecting the health and comfort of all, as good draughts in chimneys, good ventilation in dwellings and in the streets and sewers of towns and cities, there should be so much ignorance in those having the management, and so much thwarting of such improvements through the avarice or indifference of those having the control. Were those connected with house-building to study more accurately the laws by which the elements are governed and their power bounded, both separately and in their compounds, and employ these natural laws in their construction, to aid them in carrying out their plans for health and comfort in the dwellings they build, there would be a very remarkable improvement. N.

LINE OF FRONT: METROPOLITAN DISTRICTS.

THE WANDSWORTH BOARD OF WORKS (APPELLANTS) v. HALL (RESPONDENT).

The respondent in this case (Court of Common Pleas) had been summoned by the Board of Works on the ground that he had built in front of Fairlow Cottage, Wandsworth-road, beyond the general line of building frontage. It happened that, at the time the respondent built, the architect of the Board had not actually laid down any building line at the spot in question; and the magistrate held that under these circumstances he had no power to interfere and order the demolition of the respondent's building, and he dismissed the complaint. The question for the court was, whether the magistrate had power to make the order for demolition.

Mr. Francis appeared for the appellants, and Mr. Wharton for the respondent. The court held that if a man built beyond the proper building line, and the line was afterwards fixed by the architect of the Board, the magistrate had power, notwithstanding the line was not laid down until after the building was erected, to order the demolition of the building. Judgment for the appellants.

A WATER SUPPLY REGULATOR.

MR. CHARLES GEOGHEGAN, architect (of Dublin), has just perfected a very useful invention. The pressure at which the Varty water will be delivered in the houses of Dublin will not be strictly constant, and may be expected to cause occasional accidents by the bursting of weak or otherwise defective pipes. To obviate this inconvenience, various contrivances have been devised; but Mr. Geoghegan's possesses, as far as we can judge, important advantages over those of his competitors. It is self-acting; it costs but 2*l*. or 2*s*. 10*s*., according to size; and, being of very simple construction, it is not likely, when once set up, to get out of order.

The principle of the invention, so far as we understand it, is as follows:—The supply-pipe from the main leads into a closed cistern. When the water in this cistern rises to the maximum height which is compatible with the perfect safety of the house-pipes, the air which occupies the upper part of the closed cistern is pressed through a connecting-pipe into a rectangular vessel, called the regulator, one compartment of which is divided by a vertical partition into two compartments, each of which is half filled with water, and which communicate with each other at the bottom. The air which enters at the top of one of the compartments depresses the water therein, and by doing so raises the level of the water in the other. This water in the other compartment contains a float, which, of course, rises with the water, and, by means of a projecting stem, turns a cock in the supply-pipe, and thereby cuts off all further supply and pressure. On the other hand, when the level of the water in the cistern sinks, the compressed air above it expands, and losing a portion of its elastic force, permits the air which is in the upper part of the first compartment of the regulator, and which is in free communication with it by means of the connecting-pipe, to yield to the hydrostatic pressure produced by the head of water in the second compartment. The level of the water in the latter sinks, therefore, and by doing so brings down with it the float, and thereby opens the cock in the supply-pipe. Thus the required supply, and no more than the required supply of water, is maintained without

the necessity of any interference by the proprietor or his servants. The apparatus has been exhibited in action in the Corporation-yard, Wine-tavern-street. The manufacturers of the instrument are Messrs. Ross & Murray, of Middle Abbey-street, Dublin.

SCHOOLS OF ART.

The Gloucester School.—The Tolsey was crowded by the School of Art pupils and their friends, at the annual distribution of prizes. The mayor presided, and many of the leading supporters of the school were present.

Mr. J. D. T. Niblett, secretary of the school, read the report of the committee. It said:—

"We have the pleasure to report that the Gloucester School of Art has gained this year a greater number of successes in the various examinations established by the Department of Science and Art than in any previous year of its existence. In the National Competition it has gained three successes, viz. two national bronze medals, and one Queen's prize of books. The works of eleven of its students were chosen to enter into this competition. Three students have been nominated by the department to prize studentships, by which they are entitled to gratuitous instruction at the School of Art."

Mr. Gambier Parry, the president of the school, addressed the meeting and distributed the prizes.

The Carlisle School.—The annual meeting of the friends of this school has been held, in the school-room, Finkle-street. The mayor (Mr. A. Davidson) presided. In opening the proceedings, the chairman said he was glad to be able to congratulate the friends of the school on its healthy and prosperous condition. There was not much to boast of, because it unfortunately happened that few students came forward to take advantage of the opportunities given to them, than might be expected in a large population like that of Carlisle. However, the school was making progress. It had been in existence for fourteen years, and during the greater part of that period it had had to undergo many vicissitudes. Happily, three years ago, it had got quit of the debt which had been pressing it down, and he believed it was now in a better condition than it had ever been before. The number of students who had passed their examination had increased over the number of last year, and a corresponding increase had taken place in the number of certificates. Another very pleasing circumstance was, that the treasurer had a balance in hand.

CHURCH-BUILDING NEWS.

Rockingham.—The church here has been reopened, after the restoration of the chancel. In the spring of the present year, the roof of the chancel was found to be in such a dilapidated condition, that it was determined to replace it by a new one, of high pitch, and of a better character than the existing one. At the same time it was thought a good opportunity by the patron, Mr. G. L. Watson, to add a chapel, on the south side of the chancel, to receive the greater portion of the monuments belonging to his family, which had previously been in the chancel, and prevented its being rendered available for the choral services of the church. By the removal of a large monument on the north side, the aisle was opened out by the insertion of two arches and piers, the mouldings of which were taken from the fragments already alluded to. At the same time the east window was removed to the new chapel, together with a memorial window, erected in 1853, to the memory of the late Hon. Richard Watson. The subject is "The Ascension." This window has been replaced by one of larger dimensions, and of an earlier date, which is filled with stained glass, executed by Messrs. Heaton, Butler, & Bayne, under the superintendence of the Rev. P. H. Sutton, the gift of Mr. Thomas Watson. The subject in the centre is "The Crucifixion," and on either side are, "The Agony," and "The Resurrection." Beneath are smaller subjects, "The Nativity," "The Baptism," and "The first Miracle of our Lord." The reredos is the work of Mrs. Bigge. The chancel has been restored by the rector. A memorial stained glass window, by O'Connor, has been placed in the west wall, just over the door, by Mrs. Gunning Sutton, and north of this another window is about to be placed by the rector, who has not yet decided on the subject of the illustration. The wall decorations were done by Mr. Hobbs. The restoration has been carried out by Messrs.

Law & Son, of Lutterworth, from plans designed by Mr. E. Browning, of Stamford, architect. The interior is not quite complete, the chancel seats, pavement, &c., having still to be put in. An effect has been produced in the colour of the chancel walls, by the addition of some Indian red in the last coat of plaster. This contrasts with the white marble of the monuments. The family vault is under the north side of the chancel, and is now approached from the outside, the entrance from the chancel having been closed.

West Somerton.—At a meeting of the Norfolk Archaeological Society in this town and neighbourhood last year, the fresco paintings on the walls of St. Mary's Church were examined with interest, and it was resolved to have them illustrated in the society's publications. These paintings had then been recently uncovered, through the exertions of Mr. J. T. Botle, architect; and this gentleman has now been instructed to prepare designs for a complete restoration of the fabric. It is believed, from various indications, that further paintings exist on other portions of the walls under the incrustations of whitewash, &c., and every exertion will be made to discover these, and preserve them. An appeal will probably be made for funds to carry out the proposed works of restoration.

Nottingham.—St. Stephen's Church has been consecrated. The building was the late Trinity Free Church, used as a Chapel-of-Ease. The church is situated on Bunker's-hill, off Lower Parliament-street, in the midst of the class whom it was originally intended to benefit. It contained 550 sittings, but owing to the success which had attended the efforts put forth, the accommodation had become inadequate to the increasing requirements of the parishioners, and it was resolved to enlarge the chapel. This has now been effected by a partial rebuilding of the old edifice, and the new district of St. Stephen's is assigned to it. The main front of the building has been brought forward several feet towards Bunker's-hill, and the space intervening between the chapel and the boys' school at the sides has been covered over. This arrangement gives to the new church an area of 102 ft. in length by 42 ft. in width. To avoid losing the advantage of the school windows, a roof in the form of a lean-to has been thrown over the space, supported by columns occupying the place of the former side-wall. These columns, in conjunction with the support given to the curved ribs of the main roof, without causing any serious obstruction to the view, tend to conceal what would otherwise be the irregular appearance which the room presented. The whole of the walls have been strengthened in accordance with the requirements of the Ecclesiastical Commissioners in regard to all similar enlargements of churches, and they are lined with a red brick facing, varied by blue brick courses in the form of panels. A space has been set apart for a larger chancel, and also for a porch. The architect was Mr. T. C. Hine, and the builder Mr. J. White.

East Barnet, Herts.—The church of St. Mary the Virgin was re-opened on Saturday, the 28th of November, having been closed during the summer months for restoration and enlargement. The church is one of some interest, having been erected in the early part of the twelfth century, by an Abbot of St. Alban's, for the spiritual benefit of the poor inhabitants of that locality engaged in the wood-cutting in the then surrounding forest, and a considerable portion of the ancient fabric still remains. The additions consist of a new south aisle, built in the Early English style of architecture, with walls faced with Kentish rag stone, and windows and dressings of Bath stone. The roof, framed with open timbers, is covered with Staffordshire tiles. The arcade opening from the ancient nave is of two arches, supported by a polished marble shaft, with richly carved capital. The church throughout is fitted with open seats of deal, stained and varnished, and capable of accommodating 420. The passages and communion space are paved with Minton's tiles, that in the latter being of rich encaustic patterns. The east wall of the chancel has been enriched by the artistic writing of the Commandments, executed by Mr. West. The whole of the works have been carried out under the superintendence of Mr. A. R. Barker, the contractors being Messrs. Dove, Brothers.

Whitby.—The ancient church of St. Hilda, at Epton, near Whitby, has fallen into a state of decay and complete dilapidation. During 700 years it has been uninterruptedly used for divine worship, but its condition is now so unsafe that

at any moment it may fall into a mere ruin. The Roman Catholics have recently erected a large chapel, and great exertions are being made to extend Roman Catholic interests among the people. The newly-appointed vicar (the Rev. I. Fish, many years the chaplain and superintendent of the Castle Howard Reformatory) is anxious to set up schools and rebuild the church. The parishioners are nearly all poor persons, and the peculiar circumstances under which the land is held, most of it being in Chancery, and the remainder in the hands of Roman Catholic owners, make it impossible to hope for aid from the proprietors. A subscription list has, therefore, been opened.

DISSENTING CHURCH-BUILDING NEWS.

Bristol.—Clifton-down Congregational Church, just erected at the foot of Clifton-down, from the designs of Messrs. Hansom & Son, of this city, architects, for the congregation formerly worshipping in Bridge-street chapel, has been opened for divine worship. The church consists of nave, chancel, north and south transepts, with vestries and lecture-room beyond. The principal front faces the Down. The centre portion will be occupied by a tower. At the west end is an open porch of three arches, moulded and carved in stone, and groined. On the right side of the tower it is intended to erect a house for the minister. The sides of the building are ornamented with a parapet and pinnacles surmounting a range of traceroed windows; and at each end of the transept is a rose window. The building, as at present, with the land, has cost about 10,000*l.*, and all but 400*l.* or 500*l.* of that amount has been raised. The tower and minister's house are for the present deferred.

Redcar.—The foundation stone of a new Wesleyan Chapel, Sunday school, and classrooms, has been laid here. The cost will be about 1,650*l.* The chapel is in the Early Decorated style of Gothic architecture. The front elevation will be faced with red pressed bricks, Castleton stone dressings, and ornamental bands in white bricks. The building has been let to the contractors for 1,381*l.* 9*s.* Bricklayer, Mr. Scott, Middlesbrough; mason, Mr. Lord, Middlesbrough; joiner, Mr. T. Watson, Redcar; painter, Mr. T. D. Guy, Redcar; plumber and glazier, Mr. Kershaw. The heating apparatus was supplied by Messrs. Cunningham & Wain, Middlesbrough.

Books Received.

"The Ecclesiologist." Masters: London. 1868.

THE December number of *The Ecclesiologist* contains the announcement that this periodical will not again appear. The first number was published in November, 1841. According to the editor's address to his readers its continuance has been a struggle from the first. "The stress and obligation," he writes, "of other—though not alien—occupations, have overmastered our bark." The number includes an article on the Fairford Windows adverse to the ascription of them to Albert Durer.

The Spectator: a new edition. With Introduction, Notes, and Index, by HENRY MORLEY. London: George Routledge & Sons.

WE have here the *Spectator* complete, reproducing the original text, in one compact volume, a charming edition of a work that will be prized so long as the English language is studied. Professor Morley's Introduction is sound and sensible, and the same may be said of his notes.

Cassell's Technical Manuals: Linear Drawing. By ELLIS A. DAVIDSON. Cassell, Petter, & Galpin, London and New York.

THIS little work is intended as a text-book for teachers in schools of art and science, training colleges, national and other schools; and also as a manual for self-instruction for artisans and the public generally. It shows the application of practical geometry to trade and manufactures. The author is a lecturer on science and art in the City of London Middle-class Schools. In addition to illustrations connected with the lessons, six pages of the application of geometrical drawing to iron and wood work, masonry, mechanism, and design, are appended.

The Mechanic and Student's Guide in the Designing and Construction of general Machine Gearing. Edited by F. H. JOYNSON. Edinburgh: Nimmo.

This is a practical treatise on the designing and construction of eccentrics, screws, toothed wheels, &c., and the drawing of rectilinear and curved surfaces, with practical rules and details. Mr. Joynton is the author of a work on "The Metals used in Construction," and the work under notice seems well adapted for the practical instruction of mechanics and students.

Address to the Members of the Historic Society of Lancashire and Cheshire. By JOSEPH MAYER, F.S.A., &c., President. Liverpool: Printed by Thomas Brakell, Cook-street.

On the Preparations of the County of Kent to Resist the Spanish Armada. By JOSEPH MAYER. Printed by Brakell, Liverpool.

The first of these was read on November 5th, 1868. In course of it Mr. Mayer makes interesting remarks on American archaeology. He speaks of Mr. Blackmore, of Liverpool, purchase of the celebrated museum of American antiquities collected by Messrs. Squier & Davis from the western "mounds." That purchase now forms the nucleus of a collection from "all the four continents," and which Mr. Mayer characterizes as not only the most perfect in the world, as illustrating the age of stone, but the only collection in which it has been hitherto attempted to grasp the whole subject in that detail which the student must require. "At the close of the address, Mr. Mayer says, as to museum rooms,—

"With singular care the documents are preserved which relate to the mere events of to-day, the profit of the family; but for those dim parchment and ancient volumes, which are the title-deeds of its rank in honour, the record of its worth or its usefulness for that high station which England gave, and has often snatched away, what place is devoted for them? Too often a distant and dismal chamber, where rats grow, rain beats in, mice and worms burrow and build. I am not speaking without feeling; and it would even be well if the culpable carelessness of owners stopped at this point; for in too many instances the museum-room is abandoned without thought to the tender mercies of children and housemaids. Every day manuscripts of the deepest importance to the nation are torn up for nursery toys, are cut to pieces for silk-winders, are absolutely burnt in grates and garden-furnaces. One feels a positive thrill of indignation in recalling some stories of this sort which rest upon authority incontrovertible. Such irreparable waste of the national property, for national it is, cannot be allowed longer to continue. I should suggest that the heads of the South Kensington Museum, or other officers of departments where there is room to spare, should issue an invitation to all persons having such documents in their possession, should by that means collect these treasures together, and there and then examine and report upon them. Some such course must be followed. It would be preferable that the owners should solicit the attendance of some skilful person from the British Museum to examine their muniments,—and such requests are rarely refused, I may add,—but even if this be done, as in a very recent instance, the confusion is often found to be so utter and complete that half a lifetime might almost be spent in restoring order, and in properly examining the deeds. I take it this is one of the foremost questions now demanding the attention of archaeologists. It must be solved. One-half the controversies which occupy the time and study of leading men in our science might, I feel sure, be very speedily set at rest if all the private collections of England were thrown open."

The second paper by Mr. Mayer was read on April 2nd, 1868. It contains many curious and interesting quotations from the MS. papers of Roger Twisden, J.P., and Captain of the Light Horse of the Laths of Aylesford, A.D. 1585-1596.

DIARIES.

THE No. 8 "Diary" published by Letts & Co. gives a whole page to each day, and is well suited both for business and literary users. This firm have sent us a packet of their various diaries and pocket-books of last year, which have been duly committed to the waste-paper basket.

The "City Diary," issued from the City Press Office (seven days on each page), contains a considerable amount of information chiefly respecting the Corporation and the City generally.—Blackwood's "Desk Diary, No. 4," contains seven days on each page, and includes postal maps. The "Shilling Scribbling Diary," issued by the same firm, gives more room for each day's entry, and is interleaved with blotting-paper; altogether a useful book.

VARIORUM.

As if in response to our desired geological chart for architects and builders, as well as for geological students generally, a new edition of Professor Morris of University College's Geological Chart has been issued by Reynolds, 174, Strand. This

chart contains a considerable amount of information as to building stones, slates, flags, limes, &c., to be found in the various strata, collected in a separate column under the title of "Uses in the Arts, &c."—Transactions of the Institution of Engineers in Scotland, with which is incorporated the Scottish Shipbuilders' Association: Twelfth Session, 1868-9. This issue contains an Introductory address by Mr. James M. Gale, the president, read October 28th, 1868; a paper on "ships' lights," by Mr. James R. Napier, F.R.S., read October 28th, 1868; experiments on the delivery of domestic cranes, by Mr. Thomas Hoey; report of the council, &c. The president in his address speaks of the Glasgow Sewage Irrigation scheme recently proposed by Mr. Bateman and Mr. Bazalgette. The scheme is estimated by them to cost, including cost of works and pumping, 4d. per ton of sewage distributed, and if only 3d. per ton is realized from it, there will be an annual profit of 58,000l. after paying all expenses. The proposed outfall on the Ayrshire coast is at a considerable distance from any habitation, and is surrounded by a dreary waste of sand; but is separated from Glasgow by sixteen miles of country of an average height of 120 ft. above the sea, and the cost of pumping the whole or any considerable part of the sewage of Glasgow over this elevation was a serious obstacle to the adoption of this outfall, till it was suggested that the whole distance might be tunneled.

"This," said the president, "at once placed the Ayrshire outfall in the same position as the river outfall, as regards the annual expense of pumping and the height to which it would be necessary to raise the sewage of the low-lying parts of the town, or at least to reduce the whole difference between them to the difference in the length of conduit, which cannot be put at more than four or five miles. This small extra outlay for an unobjectionable outfall, and a tract of sandy land to take up surplus sewage, is Messrs. Bateman and Bazalgette to adopt the Ayrshire outfall."

Messrs. Bateman and Bazalgette propose three lines of intercepting sewers on the north side of the river, and two on the south, with one pumping station at the Saltmarket, and another at Pollokshields, at the commencement of the main conduit to Ayrshire, the average height of lift for the whole sewage being 32 ft. The sewage when so lifted will command for irrigation about 8,000 acres of very suitable land, lying between Paisley and Bischopton, by gravitation, but an additional lift will be necessary for that part proposed to be utilized on the Ayrshire coast. The estimate for the whole work is about 1,250,000l., but it does not include the branch conduits over the large areas of ground proposed to be irrigated, the pumping in Ayrshire, nor the cost of preparing the land to receive the sewage water; neither do they in their estimate of the assessment necessary to carry out the works take credit for the very large return which must in time accrue from the use of the sewage-water. Mr. Gale is of opinion that this is the only project that can be devised for the thorough purification of the River Clyde, and he hoped that the next ten years will see it accomplished.

"A Synopsis of the Patent Laws of various Countries." By A. Tolhausen, Ph.D. London: Trübner. Dr. Tolhausen is a translator at the Patent Museum. This synopsis is a second edition, revised, and enlarged. The first edition was published in 1857, and is out of print. The present abstract of patent laws relates to thirty-three different countries, and is very comprehensive and methodical, and must be very useful to inventors and manufacturers, as well as to legislators on any question in Parliament relating to the patent laws.—"Essay on Indian Agriculture." By Lalal Luchmi Narain, Banker and Municipal Commissioner, of Bareilly. Calcutta: printed by Hay & Co. This very interesting pamphlet contains an English translation, by the author himself, of a paper in Hindi, read by him to natives of India at the Rohildund Exhibition, Bareilly, in December, 1866. The English, though not quite according to rule, is better than that of many a translator, and the substance is excellent. The author urges more attention to agriculture, on the part both of the Government and the people of India; points out the hindrances, and expatiates on the advantages. It is an able essay, and, but for a few very slight defects in the English, might have been written by one of our own agricultural writers. We give a specimen:—

"It is worthy of consideration that the productive power of land in India is in no way inferior to that of America, and India is governed for 110 years by the same race of men. Why should the cultivation in this country have been carried on according to the old methods, while America has made such rapid advances in that way? The answer is simple. No endeavour has been made in this country towards instructing natives in this branch of

knowledge, while in America agriculture is carried on according to scientific principles best adapted for that purpose.

The assertion, if made, that the people of India are not capable of receiving such instruction, it cannot be supported, inasmuch as no trial has ever been made, nor can it fairly be made, by the Government, having taken no steps on this behalf. Experience shows that we have made, and are making, great improvements in other branches of knowledge which Government has been pleased to teach us. The science of mathematics is the most difficult and dry science; and if we have improved in it why should we not be able to advance in agriculture, which is not so difficult? The development of the resources of the country depends on the instruction of the people in agriculture. It is essential that the Government should take the subject into favourable consideration. A number of students and cultivators should be selected for the purpose of acquiring such knowledge, and this can be done in no better way than by establishing agricultural schools, such as are established in France, England, and other countries of Europe. Should the Government be pleased to make agriculture a branch of education in its public schools, for the maintenance of which it expends thousands of rupees, the measure will lead to manifold good results. Hundreds and thousands of beggars of land, covered with forest and lakes, would be brought under the plough.

This system may be introduced experimentally, as it was done in France, in 1810, or in the village schools were first established by the late Mr. Thomson in eight districts of the north-western provinces, as a probationary measure. If the experiment realizes the expectations, which certainly must, the system may then be extended to all districts. Exhibitions have been set up by order of Government in the several districts, with a view to the advancement of the agricultural products of the country, and improvement of the breed of cattle; but I am of opinion that the subject in view will not be gained unless agricultural instruction is first of all introduced in our schools; for until the people are trained in the principles of agriculture, both as an art and science, they cannot reasonably be expected to make any improvement in the quality of the produce which their lands yield. They can bring forth only such products as can be raised on the old principles."

—*Fraser's Magazine* for December contains an interesting paper by the Rev. B. Girdlestone, vicar of Halberton, and canon of Bristol, on Landowners, Land, and those who till it. This reverend gentleman is well known for the interest he takes in the physical and moral improvement of the agricultural labourer. He has been the means of increasing the wages, and ameliorating the treatment of these poor serfs in his own district, by obtaining the removal of no less than 100 of them, many with wives and families, to other localities where their wages have been often doubled, as well they might be, from the miserable pittance of 7s. or 8s. a week, which till lately were the regular wages; and even still they are only 9s. Mr. Girdlestone has, of course, been annoyed and insulted by the farmer class of his district in consequence of his kindly exertions on behalf of their labourers. Church-rates have been refused, and he has been dragged into law courts; but for all this petty spite he seems to have been quite prepared, and he still pursues his philanthropic course, for which, we feel assured, he has the heartfelt thanks and the high respect of the public. Here are specimens of the gentry he has to deal with, although there are, be any, exceptions of a very different character. He speaks from his own knowledge:—

"A shepherd, an old and faithful servant of a man who farmed upwards of 800 acres, had several of his ribs broken by one of his master's horses. He was confined to his bed for several days. Not only did he require no wages or any other sort of assistance from his master during the whole of the time he was disabled, but the rent of his house, which as a shepherd he had free, was deducted from his son's wages as long as he was unable to look after the sheep. Another man, a carter, also in the service of a well-to-do farmer, saved a valuable team of horses and a wagon from being dashed to pieces, but in doing so was severely injured. In this case great interest was made with the farmer, but in vain, to give if only a little milk for the wife and family. This description of the condition of agricultural labourers in North Devon is not based upon information obtained from interested parties or at second or third rate, or upon a hasty personal visit. It is the result of the experience of a six years' residence in a parish of 7,000 acres and 1,400 people, in every farmhouse and cottage of which the author has been many times a year at almost every hour of the day, and with the habits and circumstances of whose inmates he is as fully acquainted as those of his own household, and which it is notorious that this is a fair average of the whole district. Can any one in such a condition be said to live?"

The bones of their oppressors deserve to be broken.—*The Journal of the Franklin Institute, Philadelphia*, vol. 56, No. 514: third series, vol. 56, October, 1868. No. 4, Philadelphia: published by the Franklin Institute at their Hall. The issue under notice contains various interesting papers;—on the influence of artificial illumination on the quality of the air in dwelling-houses, translated from the German of a paper by Dr. Gorp-Besanez, and read before the Polytechnic Association of New York, December, 1867, by Dr. Adolph Ott; on proposed method of sinking the piers for the St. Louis Bridge, by James B. Eades, C.E.; on the economical construction of beam trusses, by G. S. Morison, C.E.; editorial items and novelties, and corre-

spondence on fire-proof buildings; lecture notes on physics by Professor A. M. Mayer, Ph. D.; and other matter connected with science and the mechanical arts.—Amongst cheap issues may be mentioned an edition of "The Percy Anecdotes" in sixpenny volumes, published by Berger. The first volume includes "Humanity" and "Beneficence."

Miscellaneous.

TERRA COTTA AT SOUTH KENSINGTON.—With reference to the discussion on the subject of terra cotta, reported in our number for November 21st, when one of the speakers was described as the manufacturer of terra cotta used at the South Kensington Museum, Messrs. Alexander Wilson & Son ask us to say that they have completed two contracts, and have three others now in hand for that building.

PENZANCE WATER SUPPLY.—At a recent meeting of the Town Council, the Sanitary Committee reported that they had given the subject of a larger reservoir their best consideration, and were of opinion that the plans of Mr. Matthews were sufficiently comprehensive. Mr. Matthews said the reservoir would drain a watershed of 300 acres. Two-fifths of the estimated rain-fall, calculated on 300 acres, would give 17,424,000 cubic feet annually. This would give 10,000 inhabitants 4 cubic feet, or 25 gallons of water, a day. The reservoir would cover 11 acres, and be 25 ft. deep at the lower end, or have an average depth of 12 ft. It would hold 5,749,920 cubic feet of water, or 40,000 cubic feet a day for 143 days. The present storage was 1,183,000 gallons, or 40 gallons a day for 23 days, so that 172 days' supply would be provided for without any reliance upon any other source. This he considered ample for many a year. But some additions to the same reservoir would cause it hereafter, if occasion arose, to hold 10,820,480 cubic feet. Simply by raising the embankment 2 ft. or 3 ft., one-third more water would be stored. Looking to these facts, he thought the size of the reservoir ample. Mr. Downing said he still thought the larger scheme would be the best and the most economical in the long run. The available watershed was 600 or 700 acres for a weirhead constructed further down towards the first pond at Treagwaiton. This might cost something more.

MONUMENTAL SCULPTURE BY MR. JOHN STEELL, R.S.A.E.—Mr. Steell is just completing two pieces of monumental sculpture, which the *Scottsman* describes. One is designed to commemorate the officers and men of the 42nd or Royal Highland Regiment who fell during the Crimean war, or in the suppression of the Indian mutiny, and is being got up at the expense of the surviving members of the regiment. The monument is to be a mural one in the Gothic style, and will be placed in Dunkeld Cathedral. The chief feature of the monument will be a large pointed panel, surrounded by a richly-moulded and lofty framework, and filled with an alto-relievo in white marble. It is with the latter that Mr. Steell is engaged. The subject is taken from the lines in "The Black Mosquetaire," in the "Ingoldby Legends," beginning with,—

"But a sombre sight is a battlefield,
To the sad survivor's sorrowing eye."

The central position is occupied by the supposed survivor, who has gone to the battlefield in search of a missing comrade. This is a life-size figure of a soldier of the 42nd Regiment. A slab underneath the sculpture will bear a suitable inscription. The second monument is a mural tablet, which is to be fixed on one of the walls of the ruins of the old church at Blair Athole, to mark the burial-place of the late Duke of Athole. The tablet will occupy a position immediately over the vault which contains the remains of the duke, and also those of C. Claverhouse. It is 7 ft. in height, and bears an allegorical design in high relief, representing one of the duke's Highlanders, standing in a sorrowful mood, with his cheek resting on the butt of his reversed musket, beside the stump of an oak-tree, which, while yet green and flourishing, had been broken by a tempest. One branch of the oak-tree remains attached to the stump, and on that the mantle of the deceased duke hangs. Mr. Steell has been commissioned to execute a monument of the late Earl of Shrewsbury. The monument is to be in the form of an effigy tomb.

THE PEABODY FUND INCREASED.—Mr. Peabody, not satisfied, it appears, with what he has already done in the establishment of this fund, but entirely satisfied with the way in which it is managed, has just given notice of an addition of 100,000*l.*, thus making a total of 350,000*l.*

DESICCATION AS APPLIED TO THE INDUSTRIAL ARTS.—A business pamphlet on this subject, with reference to the use of "Davison's Patent Thermation, or Hot-air Fan System" has been printed at Edinburgh, by E. Ravenscroft. It treats at some length on the seasoning and preservation of timber, the drying of corn, malt, hops, paper, silk, yarns, &c., and on the warming and ventilation of buildings and ships. It is a useful pamphlet irrespective of the merits of Davison's hot-air fan apparatus, which seems to be an efficient desiccator, as well as a ventilator of large buildings and ships. The use of it in drying corn, &c., takes anything like novelty out of Mr. Gibbs's scheme. The chapters on ventilation, and on the desiccation of timber and of corn, are interesting.

THE NEW FONT IN DUDLEY CHURCH.—The font given by the Earl of Dudley has just been formally used for the first time. It was designed by Mr. Forsyth, sculptor, who designed the Dudley Fountain, of which we gave a view in March last. The font is in all 11 ft. high, and of Caen stone. The style is that of the fifteenth century. The plan is an irregular octagon, and the Scriptural subjects used to illustrate the work, are "The Baptism of our Lord," "The Baptism of the Eunuch," "Suffer Little Children to Come unto Me," and "The Presentation in the Temple." These are sculptured on the four larger sides of the font, the smaller sides forming canopies to the statues of the four evangelists underneath, who, with four figures of angels in groined arches, appear to form and support the base of the font. The cover is of oak, carved. It rises tapering, pinnace above pinnace, until the whole culminates in the figure of an angel, and is suspended by two ornamental wrought-iron brackets, with compensatory weights. Mr. Bellamy, a townsman, executed this font from designs by Mr. Forsyth.

RESTORATION OF GLOUCESTER CATHEDRAL.—The restoration of the south porch has now been taken in hand. This effected, there will remain only the restoration of the buttresses on the south side to complete the external work of the chief portion of the fabric. At a recent meeting of the Dean and Chapter, Mr. Scott produced his design for the restoration of the choir. His plans received the unanimous approval of the dean and canons, and instructions were given that the work should be taken in hand without delay. The restoration of the choir will of necessity occupy at least two years, and during that time service will be held in the nave. The work is intended to be composed of stone and mosaic work; it will extend nearly the whole width of the screen; it will be surmounted with tabernacle work, and canopied; the centre panel will contain a carved representation of the crucifixion of our Lord; and other appropriate subjects will be represented in the side panels. Mr. Scott's original estimate for all the work required was 45,000*l.* Already about 10,000*l.* have been spent. The restoration of the choir will involve an outlay of at least 13,000*l.*

THE ISLINGTON AND CITY RAILWAY.—The line of railway already noticed by us as one of the projects before Parliament is to be a light railway of narrower gauge than the country railways. The gauge will be 3 ft., and the line will form a continuous bridge or viaduct. The average gradient is under 1 in 255, and the greatest is 1 in 86, extending over a distance of 270 yards. The average height of the line above the ground is 18 ft. "The perfect safety and economy of a gauge less than that ordinarily adopted," says the prospectus, "have been already proved by the experience of years both at home and abroad. The Festiniog Railway (gauge only 2 ft.) has, during the year, carried 120,000 passengers and 125,000 tons of goods, and there has not been a single accident during the four years since locomotive power has been placed on the line. It has been most favourably reported on by Captain Tyler, R.E., the Government inspector." The proposed line will run from the Angel pretty nearly in the route of the projected new road to the city. It will end at the Moorgate-street station of the Metropolitan. The engineers are Messrs. Robert Richardson, C.E., and John Inrany, C.E. An immense traffic is anticipated.

WATER CISTERNS.—With reference to the recent recommendation of slate cisterns, a manufacturer wishes us to mention that cisterns made of glazed "terra-cotta" are equally as good and much cheaper than slate, and are rapidly coming into use.

THE MARKET HALL, KIDDERMINSTER.—A meeting of the building committee was held at the Guildhall last week, in reference to the rebuilding of the Market Hall. The mayor (Mr. W. Cowen) presided. Plans were produced by Mr. Baker, the borough architect, and approved of, and tenders will shortly be advertised for.

ROBERT HOOKE.—Sir: From the interesting enumeration of the achievements of this great philosopher, furnished by your correspondent "H." in a recent number, is omitted the most important of them all, viz., the origin of the undulatory theory of light. Dr. Whewell considered that he had anticipated, also, the principle of interference. (See "Hist. of Inductive Phil.," vol. ii., p. 391.)—M.

A STEAM-ROLLER.—The Liverpool corporation recently purchased a steam-roller for levelling and smoothing newly-made and mended roads. In that capacity the monster, locally known as "The demon crusher," has been a great success; but it has, unfortunately, so injured the network of gas and water pipes in the streets in which it has been used, that the corporate authorities find that they must either greatly decrease its weight or cease using it altogether in certain parts of the town.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. Francis Horner presided over the fifth meeting of this society, for the twenty-first session, held last week. Mr. Wm. Esch, photographer, of Hardman-street, exhibited a number of permanent fac-similes of the drawings in the Louvre Museum, reproduced by M. Braun, of Dornach, the copies of the engravings having been made by the process invented by the Autotype Printing and Publishing Company. The paper for the evening was read by Mr. H. H. Vale, the subject being "A Trip to Staffa and Iona."

OXFORD ARCHITECTURAL SOCIETY.—A meeting was held on the 2nd inst., at which the secretary of the society, Mr. James Parker, gave an account of the Roman occupation of Dorchester in this county. He described the march of Aulus Plautina, and the difficulties which had to be met with in reconciling the short record preserved by Dion Cassius, with existing remains and the general aspect of the country. He considered that the Roman general passed along the south side of the Thames, and formed a camp at Cirencester, and that he then returned along the north side till, arriving at Dorchester, he had to pass across the river. In order to effect this *Sinodum Hill*, the British fortress, had to be taken, and here was the chief battle of the campaign. He also made some remarks upon the numerous discoveries of Roman remains in Dorchester, which city had sprung up in consequence of the neighbouring camp. The Rev. W. Jackson made some remarks upon the question of the Isæ, the origin of the Isis; and after a paper on "Apsidal Churches," by Mr. E. C. Bruton, the meeting separated.

CONCRETE BUILDING.—A patent has been granted to C. Drake, Kemington, for "Construction of concrete buildings." The patentee claims, first, the construction and use of, in erecting concrete buildings, apparatus consisting of flanged iron plates, supported by iron uprights secured against the face of the wall, such plates being capable of being shifted upwards step by step upon the uprights, and of being locked to them in the several positions by bolts or pins passing through holes in the uprights, and in the flanges of the plates. He also claims the construction and use of angled plates to form the angles or corners of walls, as described. He also claims the use to connect the front and back plates and uprights, of metal straps with pinholes in them at various distances, so that the length may be adjusted to the thickness of the wall required, such straps passing through holes prepared for them in the uprights and plates, as described. He also claims the combining scaffold brackets with the uprights, as described. He also claims the construction and use, in erecting concrete buildings, of apparatus consisting of frames connected or bolted directly the one to the other, and tied together by straps passing through the wall, such frames being capable of being shifted upwards step by step upon the straps which are built into the wall.

VELOCIPEDS.—Several correspondents wish to know where good velocipedes can be bought. We must leave advertisers to answer this inquiry.

THE NATIONAL COTTAGE HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST.—Owing to the liberal response of the benevolent public to the appeals made by the general committee on behalf of this charity, the erection of the first pair of buildings is already far advanced, in Ventnor, in the Isle of Wight. Upwards of 2,000 shrubs for the grounds of the hospital have been presented.

MEDICAL OFFICER, ST. PANCRAS.—The vestry of St. Pancras, being about to appoint a medical officer of health, in the place of the late Dr. Hillier, has resolved to increase the salary from 250l. to 300l. a year, and to require that the officer shall reside in the parish on entering upon his duties. It was stated by several vestrymen that a number of medical men of the highest attainments and position had canvassed for their support.

INAUGURATION OF BELLRINGERS AT TIVERTON. The inaugural festival of the St. Peter's Society of Change Ringers has been held. They procured the services of the St. Stephen's Society of Change Ringers, Bristol, who enlivened the town for two days by their well-known skill in bell-ringing. The Rev. H. T. Ellacombe also delivered a lecture on bells on the occasion. The Tiverton Society have advertised their charges for ringing: a full peal for a day costs 3l.; for half a day, 2l.; for an hour, 1l.; a muffled peal for an hour, 3l.

ACCIDENTS.—At Hastings a bricklayer met with an accident while at work at a house which is being erected near Warrior-square. He was ascending a ladder, and a fellow-workman who was above him accidentally dropped a coil of rope, which knocked him off the ladder to the ground, a distance of about 30 ft. Fortunately no bones were broken, but he sustained a severe sprain of the ankle.—As a labourer was employed at a house in course of erection in Richmond-terrace, Edinburgh, a portion of the scaffolding gave way and precipitated him to the ground, a distance of nearly 25 ft. His wrist was fractured, and his head and body were much cut and bruised.—The new tower of the parish church of Moirans (Isère) has fallen to the ground, doing considerable damage to the roof and nave. The cause of the disaster was the elevation of the structure without means being taken to strengthen the base, which at last gave way beneath the additional weight. Only a few hours before, the church was filled with people.

THE LATE MR. THOMAS DUNCAN, C.E.—Mr. Duncan, the water engineer to the Liverpool corporation, has recently died. He belonged to Perth, and was selected by Mr. James Walker, civil engineer, to execute his plans for the construction of the lighthouse on Fern Island. This lighthouse was the first step made by Mr. Duncan towards that eminence which he subsequently attained as an engineer. His reputation in carrying out submarine works was confirmed by the skill with which he executed other commissions entrusted to him by Mr. Walker. His introduction to Liverpool was as early as the year 1843, when he accepted the position, under Mr. James Simpson, C.E., of assistant engineer to the Liverpool and Harrington Waterworks Company, before the corporation had taken the waterworks into their own hands. Mr. Duncan soon after coming to Liverpool, was appointed assistant to Mr. Newlands, the borough engineer, and he had continued in the service of the corporation from that time down to the day of his death. When the waterworks were purchased by the corporation Mr. Duncan was placed in sole charge of them, and he had become recognised as the Liverpool water engineer when the Rivington Pkcs scheme of Mr. Thomas Hawksley, C.E., of Nottingham, was broached. In addition to the five lakes or reservoirs designed by Mr. Hawksley,—the Upper and Lower Rivington, the Anglezark, the Rakebrook, and the Lower Roddlesworth,—two subsidiary reservoirs, one at Roddlesworth and one at Prescott, had been since designed and completed by Mr. Duncan, besides improvements which he has made in the other works at Rivington, and the preparation and execution of the plans and designs for the various receiving reservoirs at Liverpool. He has left a widow in adverse circumstances, arising from heavy losses, which had swept away the investments of years.

TENDERS.

For the erection of premises, 46, Strand, Mr. T. C. Clarke, architect. Quantities supplied by Mr. Mark W. King:—

Table with 2 columns: Name and Amount. Includes Henshaw, Wheeler & Co., Clements, Kelley, Bro., Kelly, Brass, King & Sons, Scrivener & White, Abraham.

For completion of villa residence, No. 5, Brokes, Reigate, for Mr. G. E. Morrison. Mr. J. F. Matthews, architect:—

Table with 2 columns: Name and Amount. Includes Barnes, Nightingale Brothers, B. E. Nightingale, Gage, Cook, Bacon, Holdsworth.

For new infirmary, &c., Godstone Union, Mr. A. R. Stearns, architect:—

Table with 2 columns: Name and Amount. Includes Knight, Morris, Worsell, Cooper, Galyer & Moore, Sherwood, Cook, Grover, Barnes, Kesterton & Head, Smart, Webb & Sons, Dannel, Henshaw, TIL, Macey, Colls & Sons, Byles, Nightingale, Knight, Regis, Johnson (too late), Woodward (accepted), Constable & Baley, Gage.

For sewage utilization works for the Romford Local Board of Health. Amended plan. Messrs. Russ & Minns, engineers:—

Table with 2 columns: Name and Amount. Includes Contract No. 1. Sewer and Buildings, F. & J. Wood, Mercant, King, Crane, Neave & Fry, Bloomfield, Hubbard, Young, Porter.

Contract No. 2. Engines, &c.

Table with 2 columns: Name and Amount. Includes Campbell, Johnstone, & Co., Barrows & Stewart, Kirrihan, E. & J. Wood, Bower, Bells, Goodman, & Co., Whieldon, Lecky, & Lucas, Wilkins, Williams, E. R. & F. Turner, Burton, Sons, & Walker, Laidlaw & Co., Prothero & Bastin, Perkins, Brothers, Farnell, Chigley & Co., Whitmore & Benyon, Rogers, Bevington, Courland, & Baker, Davey, Gimson & Co.

For erecting a warehouse in Ropemaker-street, Finsbury, for Messrs. G. Bartholomew & Co. Mr. F. G. Widdows, architect:—

Table with 2 columns: Name and Amount. Includes Webb & Sons, Ennor, Chestum, Colls & Son, Newman & Mann, Pritchard, Bishop, Brass, Henshaw, Browne & Robinson, Killy, Hill, Keddell, & Waldram.

For erecting forty-four almshouses, chapel, and lodge, with boundary walls, drains, &c. for the Worshipful Company of Drapers, at Elmale, Tottenham, Middlesex. Mr. Herbert Williams, architect. Quantities supplied by Mr. Charles Reilly:—

Table with 2 columns: Name and Amount. Includes Trollope & Sons, Brass, Piper & Co., Conder, Barclay & Sons, Ashby & Sons.

For repairs, pulling down, rebuilding, and building new workshops in the rear of five houses in James-street, Goswell-street, for Mr. D. Donovan. Mr. Hammond, of Finsbury-square, surveyor:—

Table with 2 columns: Name and Amount. Includes Lewis, Follett, Starkey, Peely, Stockwell, Wilson.

For six houses at Lewisham. Mr. Banks, architect:—

Table with 2 columns: Name and Amount. Includes Belham, Smith, Staines & Son, Bennett, Jackson, Hanks, Wevell, Reilly, Turner, Harrison & Edwards, Dixon, King & Sons, J. & W. Hobern, Walker, Blackmore & Morley, Leild, Williams, Wise, Felchick, Huphedon, Bridel, Heyrman.

For alterations to the Berley Mow Tavern, Smithfield. Messrs. Haywood, Blashill, architects:—

Table with 2 columns: Name and Amount. Includes Mather & Read, Lagmead & Way, Tully, Nind.

For house, Cheyne-row, Chelsea. Mr. P. Webb, architect:—

Table with 2 columns: Name and Amount. Includes Thorne & Co., Howard & Son, Lathley, Brothers, Ashby & Sons, Brass, Adamson & Sons, Foster, Cherrington & Cole.

For pier, &c. at Mousehole Harbour, near Penzance. Quantities supplied by Mr. Joseph Simmons. Mr. Douglas, engineer, Trinity Works, Penzance:—

Table with 2 columns: Name and Amount. Includes Robbins, Flavin, Freeman & Son, Sharpe, Brothers, Hubbard & Long, Moore, Keswick.

For restoration of Kelshall Church. Messrs. Nash & Son, Royston, architects:—

Table with 2 columns: Name and Amount. Includes Memel roof, Pitch pine, Fittings, Gibbin, Gibbons, Brown, Richards, King & Sons.

For sewers at Kensington Park, for Mr. Stephen Marten. Mr. R. Whitechurch, surveyor:—

Table with 2 columns: Name and Amount. Includes Wigmore, Hollins, Bercham, Parker, Killingback & Bradley, Williams, Nicholson, Crockett, Hubbard, Young, Potter, Bloomfield, Osenton & Carter, Tossell (accepted).

TO CORRESPONDENTS.

C. F. (happy to receive particulars).—Penzance Quæritio (consult the schedule of charges issued by the Institute of Architects).—J. S. (recovery would be very doubtful).—R. E. N. J. N. J. M. L. T. W. F. H. W. G. G. S. J. H. E. H. B. A. F. F. G. A. G. C. S. B. J. O. W. C. R. W. H. F. G. W. W. S. F. H. K. G. H. H. S. M. N. M. U. R. H. G. N. H. J. W. J. F. T. W. R. G. T. R. N. & Son. A. H. E. Anti-Siam (next week). A. M. (next week). A. S. (next week). J. D. M. (next week). J. F. (next week). We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of Tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHRISTMAS WEEK. "The Builder" for the week ending DECEMBER 26th will be published on THURSDAY, 24th inst., at the usual hour.

ADVERTISEMENTS for insertion in that issue must therefore reach the Office before THREE O'CLOCK p.m., on WEDNESDAY, 23rd inst.

ADVERTISEMENTS.

Will shortly be ready. Price 4s bound in cloth. LAXTON'S BUILDERS' PRICE BOOK, for Architects, Engineers, Builders, Contractors, Surveyors, and all the Building Trades.—2nd issue—contains more than 30,000 prices, embracing all the various trades connected with the operations of the Architect, Engineer, Builder, Contractor, and Surveyor; together with 10,000 useful and important notices relating to the same. MORGAN & CHASE, 28, Ludgate-hill, London, E.C., and may be ordered of any bookseller in Town and Country.

The Builder.

VOL. XXVI.—No. 1350.

Our Railways and their Makers.

LOOKING without previous knowledge at the Railways of Great Britain and the Railways of the world, which have followed them, it would scarcely be believed that these enormous works had been conceived and perfected within a third of a century, and that men still in the prime of life were workers at their inception, and remember, as if it were but yesterday, the press and fight of those early days, the growth of great reputations and fortunes in connexion with them, on one side, and total collapse and disappearance for ever on another. Under the title of "Personal Recollections of English En-

gineers,"* the author of "The Trinity of Italy," reviewed some time ago in our pages,—himself an engineer, sketches with a vigorous pen the incidents that attended the introduction of the railway system and the doings of the men by whom it was brought about; more especially, of course, Robert Stephenson and I. K. Brunel. He depicts to the life the hurry of those times; the way in which engineers were created, or created themselves; the ignorance that wasted shareholders' money; the genius and perseverance that nevertheless made the whole a success, although modified. We shall avail ourselves of his pages, and transfer a few of his views, which will be found not very unlike some that have been often expressed in these columns.

Those early times did, indeed, produce strange things. Railways were the cry of the hour, and engineers were the want of the day. If they were not to be found ready made, they had to be extemporised: and so they accordingly were. Long before the school, in course of formation on the works actually in progress, could turn out men able to appear in public as authorities on expenditure, and construction, engineers-in-chief were required by many a group of projectors. So came to the front, military men, accustomed, perhaps, to sketching of country, able with the theodolite, but unacquainted with other requisites of their improvised profession; cautious martinets, formed in the old school of the Royal Engineers, at the time when the Duke of Wellington, as Commander-in-Chief, found such difficulty in making use of these dependents on the collateral authority of the Master-general of the Ordnance, that he took the step of forming the Royal Staff Corps, to have engineers of his own; mining surveyors,

* Personal Recollections of English Engineers, and of the Introduction of the Railway System into the United Kingdom. By a Civil Engineer, Author of the "Trinity of Italy." London: Hodder & Stoughton, 27, Paternoster-row, 1868.

accustomed to the use of the dial; mathematical engineers, good, no doubt, to direct the smithy and the lathe, but unaccustomed to works of magnitude; architects who generally limited their claims to the construction of stations, and who were snubbed on every possible occasion by all who, on any of the above grounds, called themselves engineers. So holdly did these new commanders take up their position in Parliamentary warfare, that many of them established themselves in lucrative herths; engineers by divine inspiration. At a time when the profession of civil engineering is suffering from a cernel sort of "lock-out," it is tantalising to remind them of the golden showers that watered the early growth of the various grades of railway constructors. The Ordnance map was the great guide of the projector of those days; but few, even of those who called themselves engineers, seemed then to be fully aware of the immense advantage to be drawn from the careful study of this admirable chart. Surveys were made at large expense, which were, if not absolutely worthless, quite unnecessary.

As competent engineers-in-chief were at a premium, so also were all the elements of an efficient engineering staff. Young men who could handle the level and the chain suddenly found themselves persons of importance. Engineering, as carried on in those days, involved both hard work and good fellowship. As the period for depositing the plans required by the Standing Orders approached, the offices of the busily-occupied leaders of the profession became scenes of toil or of scramble. Night was economised as the days grow short. An impulse was given to posting, and chaises-and-pair and chaises-and-four were to be seen at not uninfrequent intervals galloping east and west and north, at a speed rarely to be witnessed. "Now, boys," cried the chief of such an office, coming one day into the thick of the work, and springing at a bound on to the mantel-piece, "hurr your night-caps, for the angel a one of them you'll see till after the 30th. Then you shall have a week to lie in bed." Accordingly, for some ten days, the labour of plotting sections, copying plans, numbering and copying references, and the like, went on almost without intermission. At nine in the evening would appear mighty howls of oysters, gallons of ale, and other materials of a rade but hearty repast. A respite of some three-quarters of an hour would be filled up by uproarious hilarity, and then a fierce objurgation from the chief, the moment before the chief reveller, for so scandalous a manner of wasting the company's time, would set all briskly to work again. The quality of the work thus performed was not altogether equal to that which a more sluggish rate of proceeding might turn out. If you prick through a dozen sheets of drawing-paper at once, a very slight deviation from the perpendicular in the needle is enough to make the twelfth plan very different from the first. But this we may pass by.

The men long active in the service of their fellows, as regards the development of the means of intercourse, are now folding their arms in enforced inactivity. The 600 millions which we have spent on our own railways have been lavishly and inconsiderately spent. If the fourth part of that sum, which we may reckon, without exaggeration, as having been made into ducks and drakes, were now forthcoming for the necessary development of the feeders and ramifications of the great trunk and branch lines, an immense impulse to our national prosperity would ensue. There is wisdom in looking back to inquire how the chief industry of the last thirty years came to start in a wrong groove;—how it was that the service of the public was injured for the benefit of private individuals, and that a false direction was given to an industrial development of such unparalleled

importance. The most sanguine ideas of the most sanguine speculators never contemplated the enormous traffic developed and created by the railway system. This gigantic and unexpected excess over the estimated traffic has been claimed by the projectors of railways as a set-off against the enormous excess over the estimates of their construction. The balance has been fortunate, and, of course, to some extent unexpected traffic has caused unexpected outlay. But those familiar with the subject know that comparatively little of the actual waste is thus to be justified. Had the capital of railways been spent by men taking an enlightened interest in its application, and controlling that application with the simple aim of profitable investment, our position at the present moment would have been something very far different from the actual fact.

It has been a happy thing for the credit of the engineers of Great Britain, our author urges, that they were, as a rule, paid by salaries, and not by commission. Had the latter mode of payment, he says, which in many instances has much to recommend it, been sanctioned or insisted on by Mr. Stephenson and his earliest colleagues and pupils, no integrity of private character would have been enough respected to avoid the reproach of outlay without other motives than that of earning large commissions. But was this mode of payment always avoided? We have reason to doubt it. However, the labour was immense, and deserved high pay. The havoc that death has made in the ranks of a profession which might expect to be distinguished by unusual longevity, is most remarkable. Brunel, in the judgment of those who remember the iron energy of his youth, should now be a man in the prime of intellectual vigour. Robert Stephenson might naturally have looked forward to many more years of quiet authority. Locke, Rendel, Moorsom,—how many are the names which a greater reticence of labour and more attention to the requirements of health, might have kept for many years from the obituary! Working by day, and travelling by night, make a constant and unrepaid demand on the vital energy of the brain. The cost of English railways includes the lives of many eminent men.

Stephenson is our author's hero: he knew more of him than of Brunel, his rival. He urges that Stephenson's knowledge of actual work of all kinds gave him the advantage of his great rival, who, possessed alike of hereditary constructive genius, of hold and courageous originality, and of the results of the most scientific training then attainable, had in some measure to make his acquaintance with the practical details of actual work, and with the best method of dealing with master workmen, at the cost of his supporters.

A little incident is given to show the pleasant relations of the two men with each other. The three were travelling together in a railway carriage; Stephenson wrapped in a dark plaid, on the exact disposition of the folds of which he somewhat prided himself. He saw Brunel regarding him with curious eye. "You are looking at my plaid," said he. "I'll bet you ten pounds that you cannot put it on properly the first time." "Very well," said the other; "I have no objection to bet ten pounds. But I won't take your money. I bet ten pounds against the plaid. If I put it on right when we get out on the first platform, it is mine. If I miss, I pay you ten pounds." "Done," said Stephenson, and resumed conversation with Locke, who was also in the carriage. But Brunel sat in a brown study, and said not a word till they arrived at the next station. "Now, then, Stephenson, give me the plaid to try," said he, as he stepped on the platform. Robert Stephenson slowly unwound the garment. Brunel promptly wound it around his own shoulders, with as much composure as if he

had pulled on a great coat. "It is a first attempt," said he, "but I think the plaid is mine." For many a day did he rejoice in its comfort. "But had you never tried before?" said a friend. "No," said Brunel; "but, when Stephenson challenged me, I was not going to give up; so I began immediately to study the folds, and to make out how he had put it on. I got the thing pretty clear in my head before we reached the station, and when I saw him get out of it I knew that I was right: so I put it on at once."

Our author gives his experiences of some of the early contractors. When it was first decided that the most feasible method of executing the heavy works necessary for the construction of locomotive lines was by contract, a school or group of contractors had to be formed in almost the same impromptu manner as a school of engineers. There were materials ready to hand. Special education,—at least the education given by the schoolmaster,—was less requisite in the case of those who thus represented the hand, than in that of those who might be regarded as the head, destined to create the new enterprises. The sturdy self-reliance of the English character, its practical, hand-to-mouth mode of meeting difficulties, a keen eye to the main chance, and a readiness to carry a small amount of available experience to the best market, were the main qualifications that went to form a contractor for public works. Accordingly, the list of competitors was daily lengthened. London builders,—keen, quick men, who had reduced their own branch of business to system; men, very often, brought up to the joiner's bench (by no means a contemptible school of handicrafts),—men who were familiar with the finance of the pay-table, who knew how far bankers would, or would not consent to provide for the recurrent wants of the Saturday night,—men who knew what could be done with bricks and mortar, who were well up in the matter of stone quarries, learned in lime and cement, ingenious in scaffolding,—above all, able to put on the appearance of thorough mastery of the art of building, took the first rank. Nor were these men metropolitan alone; Yorkshire masons, Birmingham bricklayers, miners, lime-burners, and quarry owners, often united the business of a builder with their own. Then there were the relics of the "navigators," who had dug our canals, who had gained experience in the construction of docks,—the road surveyors and contractors called into existence by Macadam and by Telford. Sometimes a land surveyor would quit land-chain and Jacobstaff, to take charge of a body of workmen. Later in the day a civil engineer would prefer the profit to be secured by a good contract, to the smaller certainty of salary or of fee.

It was not until the engineer became practically acquainted with the actual cost of the execution of works on a large scale, whether by the failure of the original contractors, which often threw the execution of every detail of work on the officers of the companies, or by stepping in to undertake the entire responsibility of large contracts, when contractors did not happen to be forthcoming, that the estimates which he formed could become precise. Over and above the prices to be collected from the cost of small works, or from the price-lists of various trades, a considerable amount had to be allowed for contingencies. Five per cent. was usually set down under this head. Thus, although the original estimates, according to which the Parliamentary capitals of the various lines were computed, proved, as a general rule, altogether inadequate, it was not always because the prices were too low, nor was it because the designers wilfully shut their eyes to that which lay before them; but experience was defective. The contracts were generally let below the engineer's estimates; but then came in the question of extras. The astute experience of the old "navvy" would often swell the list of these items, much to the amazement of the engineer. "I will tell you a secret worth knowing," said one of the old Telford school of road-makers to a young sub; "we've a maxim as puts a deal of money in our pockets,—'The more you dissect it the better it cuts up.'" The principle of lump contracts was intended to check this constant "dissection" of work, and consequent multiplication of extras to the benefit of the contractor; and the thirty years of contest between Macintosh and the Great Western Railway is the most striking instance of the difference between the statement of a final account drawn up by the engineer and that claimed by the contractor.

Of the five hundred millions which have been expended on the railways of the United Kingdom since 1830, more than the half, our author thinks, must have passed through the hands of contractors for construction. If, therefore, we allow that a profit of from twenty to thirty millions must have been cleared, by a body of men who have come into recognised existence within little more than the third of a century, we shall be within the mark. If to the actual benefits secured (however they may afterwards have been wasted) we add the power and influence natural to those who had the almost uncontrolled expenditure (so far as the pay-table and the bill-book go) of three hundred millions sterling, it will not be matter of surprise that lordly estates should have been purchased, and noble palaces erected, by men who had known what it was to have to work very hard to make both ends meet. In dealing with contractors, our author says exaggerated severity does not always answer, and that an attempt to enforce an altogether unusual degree of strictness, in the execution of large undertakings, offers great temptations to bribery. The contractor, who sees that more is continually demanded of him than he ever contemplated, and more than he believes to be of any practical advantage, is induced to wink at methods of removing a source of costly and unreasonable vexation, as it appears to him, by incurring an expense which is, no doubt, unjustifiable, but which he may be easily led to regard as the only way of avoiding ruin. Over-strictness is sometimes as demoralising as over-laxity. No small proportion of the heavy cost of the works executed by Mr. Brunel has been owing to the fears entertained by contractors of the power entrusted to the inspectors to render the work ruinously expensive.

While great attention was given from the very first, to the specifications of Mr. Brunel's contracts, there was a marked indisposition, by no means peculiar to this engineer, to supply to the contractors that detailed scientific information, at which they have so much less facility of arriving by their own calculations, than has the designer of the works to be let.

The manner in which the attention of Mr. Brunel's staff was concentrated on the technical maintenance of the specification, and the unexampled finish of the work, produced an undesirable effect on the estimates. Very many of the details of the work were left to the discretion of the engineer, and thus came under the schedule of prices for extra work. The constant care of Mr. Brunel was given for many years to the perfection of the contract specifications. The result of each successive new edition of the printed form was to place the contractor more and more at the absolute mercy of the engineer. Bilateral rights were, as far as careful language could go, extinguished. The right to be paid, at a certain stipulated rate, for work ordered by the engineer, was all that these documents were intended to leave to the contractor. If the former ordered nine-tenths of the work to be abandoned, the latter, who had prepared for the execution of the whole, had no redress. It was provided,—and it was a wise and economical provision,—that the contractor should be paid forthwith, on the measurement of the engineer, from 80 to 90 per cent. of the schedule value of the work executed. But even for this payment, on the regularity of which all his arrangements would depend, the contractor had no legal security. It was stated to be the intention of the engineer to recommend a payment, instead of its being acknowledged to be his duty to certify the execution of a certain amount of work. So "right" did these specifications ultimately become, that nothing but implicit personal confidence in Mr. Brunel, on the one hand, or the belief that the Court of Chancery would set aside any unfair provisions, in case of dispute, on the other, could justify any thoughtful man in entering into a Great Western or a South Wales contract.

An instance of the manner in which the tables were turned on an engineer who, either from inexperience or from ill-feeling, had cruelly outperformed his contractors, is given. The work in question was a bridge, a portion of which was supported on heavy piles. The specification provided for a price per foot to cover all expenses of pile-driving up to, let us say, 50 ft.,—a 10-ft. pile being at so much per foot, a 20-ft. at so much, and so on. At from 40 ft. to 50 ft. a solid bed of gravel was attained, the superincumbent material being soft alluvial soil, so that, by the entrance of the pile-shoe to

its own depth into this solid stratum, which rested in its turn on bog, the greatest possible amount of stability was attained. But the engineer in question was not contented with this result. He had got into very hot water with the contractors and their agents, and he insisted on the use of 60-ft. piles, which could be provided only at a very great expense; and he ordered these piles to be driven 10 ft. into the ground. The result was that many of the piles were shivered in driving, and had to be withdrawn, and that those which were sent through the gravel offered less resistance than would have been the case if they had only entered it. Months were consumed instead of days, the work was, at least, far less satisfactory than might have been the case, and the certificate of the engineer was for an amount less than a fourth of the total cost.

The contractors, annoyed at such a proceeding, and injured by a permanent weekly expenditure without return, consulted an engineer familiar with contract accounts. He visited the spot, and carefully examined the contract. Then he called for the whole of the accounts from the commencement of the work. Observing that the schedule only gave a price per foot for piles driven up to 50 ft., and that it also included prices for timber and for day labour, he charged for the whole of the 60-ft. piling as timber and as daywork,—a mode of drawing up the account which was in exact accordance with the schedule, and which added 3,000l. in one item to the contractor's bill. The right to make this charge in this form was indisputable, for it was the only way in which 60-ft. piles could be carried to account in the exact terms of the schedule. The engineer of the bridge had outwitted himself, and his employers had to pay handsomely for his caprice.

There can be no doubt of the enormous waste which has been incurred in the construction of the English railways. For much of the outlay, the engineers are scarcely responsible. For much they are. Parliamentary and legal expenses represent a price per mile quite adequate to the construction of those light railways of which we are now so much in want. Landowners have thriven largely at the cost of shareholders, first by exacting high prices and enormous residential and occupational damages, and then by funding the value of their whole property so much increased, that in most instances it would have paid them well to make a gratuitous cession of the land required, as an inducement to the engineers to lay out the works through their property. Duplicates and opposition lines have been another source of prodigal outlay. Mr. H. E. Bird, in a careful tabulated statement of the expenditure on 253 railways, up to the close of June, 1867, gives a total of 487,905,167l. expended on 14,000 miles of line. It is highly instructive to remark the different prices of English, Scotch, and Irish railways as set forth in this statement: 9,634 miles in England have cost 405,331,055l., or 42,000l. per mile,—very nearly the price of the London and Birmingham Railway,—notwithstanding the immense experience; miles introduced by subsequent experience; 2,486 miles in Scotland have cost 55,921,649l., or 22,700l. per mile; 1,898 miles in Ireland have cost 26,652,463l., or 14,000l. per mile. To say nothing of the low cost of the railways in the United States, which are far less solidly constructed than our own, but which have served for the development of a large and increasing traffic, at an aggregate cost, at the close of 1867, of 1,654,050,739 dol., for 38,605 completed miles out of a total of 51,325 miles undertaken, it is evident, from the comparison of work and cost in England and in Ireland, that our own waste has been enormous. Had the English railways been kept down to the cost of twice the Irish lines, a condition of which the neglect is due principally or even exclusively to Parliament, our 9,634 miles, at a cost of 270,000,000l., would be earning a gross revenue of 33,000,000l. per annum, yielding a net return of from 6 to 7 per cent. on the capital. To speak of the difference of 135,000,000l. as sheer waste will appear, to persons familiar with the subject, as an understatement.

That wasted outlay would have sufficed to supplement our 9,634 miles of principal line with 45,000 miles of light branch railway. Much of the evil from which we are now suffering results from the weakness that has characterised our railway legislation. It is hard to point to the name of a single member of either House, with the exception of that of Lord Redesdale, who has appeared to watch the national in-

terest. That interest is, in the long run, identical with the welfare of the shareholders; but it is in the long run alone. The present state of the railway share-market shows to what misfortune the unchecked competition of rival companies may drive their proprietors.

Legislation was necessary for the introduction of the new mode of travelling. So much being admitted, the first thing that any statesman would have thought necessary was, to lay down the principles of that legislation. But this was not done. It was thought fit to deal with each case on its merits; that is to say, to open the door as wide as possible to every description of intrigue, of rivalry, and of juggle. The result is to be seen in the present price of what might have been, by this time, a national property of the utmost value. And certainly, whoever else may be to blame, the chief responsibility for profligacy of expenditure rests on the Legislature, which not only sanctioned, but encouraged, a frantic and unmeasured rivalry. We willingly repeat that the Railway Regulation Act of 1868, which comes into full operation on the 1st of April, 1869, empowers the Board of Trade to authorise the construction of light railways, on the two sole conditions that the maximum weight to be borne on a pair of wheels shall be eight tons and the maximum speed twenty-five miles per hour. But this provision, unless attended by a change in Standing Orders, does not authorise the application to Parliament for power to construct a railway originally intended to be "light." It is a boon to existing companies, but it is only an admission of the fact that such a boon ought to be extended to the public.

Bad as the present position of the engineering profession is, our author goes with us in looking hopefully to its future. Certain great questions, which have been neglected until their neglect involves not only cruel waste, but imminent peril, are now demanding solution. The increasing pressure of a population that doubles itself in a century, the increasing difficulty of maintaining health, or even life, in cities that double their population within forty years, calls for the thorough organisation of that service which may be compared to the circulating and the digestive systems of animal life. The water-supply of cities and towns, pure, ample, and efficient in case of fire; the removal and disposition of sewage; the redemption of our rivers and brooks from a neglect that is rapidly converting them into pestilent sewers; the application to agriculture of that mass of chemical fertilising power with which we now poison rivers and estuaries; the drainage of land; the storing-up of that water, of which we are either anxious hastily to get rid, or helplessly destitute; and the production of fertile and certain crops by irrigation; all these are but so many features of one department of the duty of the engineer,—the proper distribution and utilisation of the rainfall. The steam plough has already established its claim to rank as the best servant of the farmer. Portable and convenient steam-engines are fast superseding the more costly labour both of man and of beast. But the farmer is still, to a most unnecessary extent, dependent on the chances of a very variable climate. The engineer is aware that this is entirely unnecessary. He can readily find the means, if consulted, of gathering crops, independently of the weather, and of drying hay and corn independently of the sun. Surely, then, there is a busy and a useful future for the engineer who takes this view of his duties, and who finds himself engaged by those who do the same.

The book which we have thus condensed will be found amusing, as well as instructive reading. Engineers and contractors will recognise in it many portraits, though the name be not written beneath the picture; and legislators will discover hints here and there deserving their attention.

A BURNED CITY OF GEORGIA, IN WESTERN ASIA.—In certain excavations, says a journal of Tiflis, lately made on the banks of the Koura, at about half a mile from its confluence with the Arago, the remains of an ancient city have been discovered. The tops of the houses are covered with a thick layer of earth. The supposition is that the catastrophe by which the place was engulfed occurred 2,000 years ago. A subterranean passage has also been found under the river. The workmen have collected several coins and earthen vases.

THE RISE AND PROGRESS OF ART.*

If we would trace art to its source we must be prepared to take a very long journey into the realms of the past. The designation of the "cradle of the arts" has been properly, perhaps, conferred upon Egypt; but the actual birth or budding forth of the power in man to use his intellect in the creation of forms must be sought for in an antiquity greater even than that of the people of that garish land. We must find our way back, indeed, into those old times when man moved about the surface of the earth in families or tribes, rare and mere specks among the gigantic vegetation of the virgin soil; for when we come upon the caves that bear witness they have temporarily sheltered such nomades, we find the testimony expressed in rude sculptures on the walls and crude ornamentation implements, which, but for this manifestation of an art-power, would be scarcely distinguishable from natural productions. The first bud of art, therefore, must have been in the brain of some young hunter, or, more probably still, in the heart of the woman who loved him, in those hoary times; and even as the lichen covers the stone, the seaweed the rock, and the heather the mountain, this creative faculty has spread and spread among mankind, till it has become the glorious incrustation upon civilization we delight to speak of as though it was a better world or quondam, overlaying the grovelling among common things. Art, art-power, and the art-world are a set of words, watch-words, belonging to a strife, or strain, there has always been in the best minds, since the most primitive of times, to beautify, purify, and exalt our earthly life. Whether born, as we have ventured to surmise, of the most divine of our sympathies, human love, or not, art has adapted itself to all the vicissitudes of man. It has survived dynasties and desolation, neglect and misunderstanding, changes of circumstance, climate and faith; it has bided its time and it has stood forth, according to what was required of it; and after thousands of years of solace and incentive to our race it cheers us still, and ennobles everything within its influence. We are justified in looking upon art as a mistress whose charms will endure beyond the noon-day of the earth, even to its last and most refulgent sunset.

In Germany, where men seem to have a greater capacity for loving and proving all things than elsewhere, some such comprehensive view of the attributes of art has been taken by several writers. Instead of frigidly rejecting as spurious all art previous to Hellenic perfection, they have opened the fold and admitted within its pale, absolutely, all material expression of the ideal ever made by man. They recognize the whole length of the silver cord,—its entire continuity; the whole breadth and depth of the golden bowl,—its ring of true metal that fracture would destroy; and do not capriciously snap either asunder and make selection of fragments as alone worth having. Among these writers we must class Dr. Lübke, whose work entitled "The History of Art" we are about to introduce to the notice of our readers. It has been translated by Mr. F. E. Bunnett, who will be praised or blamed, according to people's predilections, for having retained somewhat of the author's German style; and the broad grasp taken of the subject is enlivened by 400 illustrations, from which completeness it will be seen that this history of art-power has not been undertaken in a fantastic mood, nor completed in a day; although more details in the modern section of the work would be an improvement, as we shall elsewhere show. The author explains that his object was to help the cultivated reader to a proper understanding of art and its productions by showing him its development and historical progress, its unchangeable laws, its principal phases of essential and grand features, rather than by dwelling on intermediate stages and preparations, which could be studied afterwards in still more comprehensive works. We quote his words in continuation of this explanation:—"But my aim especially was to show the inner spiritual connexion in the artistic creations of the various epochs, from the time of the Egyptian pyramids up to our own day, and to discover in them the grand ideas of the advance of the human race in civilization." Dr. Lübke succeeds in doing much of what he undertakes, for when we close his two substantial volumes we find we have traversed the whole wide field

* The History of Art. By Dr. Wilhelm Lübke. Translated by F. E. Bunnett. London: Smith, Elder, & Co. 1868.

of art beginning with the earliest years of mankind, and coming down, by a chronological and geographical sequence of his own arrangement, to the present day.

Our author says of the origin of art that the period of it is as uncertain as the place. "One nation dates the birth of its art a thousand years ago; another is looking for it still to come. Only so much is certain, that in the first stirrings of an impulse to art, under all zones and at all times, there is a remarkable harmony to be observed. It is the original universal language of mankind, the traces of which meet us in the islands of the Southern Ocean, as on the shores of the Mississippi, among the old Celts and Scandinavians, as among the heroes of Homer and in the interior of Asia." Just as we find the bow and arrow in the hands of men all over the globe, so do we find, it seems, a riband-like twist used as an ornamentation everywhere. The first illustration of early art is a Celtic monument; the second, the interior of a Greek grave, showing the recumbent skeleton of a man, surrounded by the arms he wore, the implements he used before he laid down his life, and the various vessels those who mourned him buried with him. From a consideration of these and similar relics, Dr. Lübke passes rapidly on to the art of the Aztecs in Mexico and Central America, and in all sees ideas of an artistic kind. He considers the earliest step taken "by the awakening impulse to art" to be the erection of a hillock over the tomb of a hero; and another, the raising of mighty hooks in combinations that leave a spiritual impression as of awe upon the mind. After this he finds the next weak efforts at artistic creations taking the form of aspirations to erect monuments, with which to connect the adoration of Deity. At first satisfied with the rude monumental column, the mighty form of which was to his yearning mind a symbol of the Supreme Being, man gradually sought to invest such masses with a definite image of Deity, for which purpose he seems to have distorted his own features, as in the colossal head of Tiguamaco, at Lake Titicaca, in Peru. And from these manifestations of the artistic thriving of all nations, the author proceeds to note how mental capacity, individual character, outward circumstances, and the nature and government of countries, have combined to develop art to its glorious prime. Successive chapters on the ancient art of the East, the art of Central Asia, of Western Asia, of Eastern Asia, India, China, and Japan, Greek art, Etruscan art, Roman art, bring us to the art of the Middle ages, with its researches into early Christian art, the art of Islam and the Romanesque and Gothic styles; and thence to the architecture and plastic arts of modern times in the different European countries. A comprehensive survey, surely.

Our author makes a great point of the connexion of artistic creations with the innermost life of nations. Standing upon the banks of the Nile, and looking upon the so-called cradle of the arts, "old Egypt," he points out it was the wonderful stream; its regular, annual rise and subsidence, compelling the inhabitants of the rich valley watered by it to build protecting dykes and embankments, and suggesting to them the formation of canals, that first gave an impetus to science, and raised the people of the Pharaohs above surrounding nations; and to the same extent it was the despotic form of government that fixed the forms that art first assumed, and rendered them unchanging in the lapse of three thousand years. He gives, however, two reasons for this arrest of development:—

"Whatever finer distinctions in the conception of forms, the ingenuity of more modern research may have discovered, the indwelling idea, the range of view, the proportion of plastic industry—ay, even the types and subjects of representation—ever remain the same, thousands of years, fixed and unchangeable as the nature of the Nile valley. The ground for this remarkable fact can only be traced in the position which the plastic art occupied among the Egyptians. This position may thus be briefly designated, that sculpture and painting, whether used in decorating the immense walls and columns and ceilings, with figures and reliefs, or whether they reared their colossal forms in front of the entrance, against the pillars of the forecourts, or in the interior of the sanctuary, in every case they stood exclusively in the service of architecture. It is true that in all places this has been among the primary conditions of the plastic arts; and even among the Greeks sculpture had at first to conform to the laws of architecture. Still, wherever a free development of the individual mind made its way among the people, and the plastic arts began to be inspired by their songs and odes, the chains were soon burst asunder, and the works of sculpture, resting on their own strength, stood apart from the creations of architecture in a beauty of their own. That this spirit of the free development of the individual was lacking among the Egyptians, that, in the true Oriental subjection they blindly followed one despotic will, is the deeper reason why the plastic art

could not rise in this people from its dependent position. By this the boundary is defined which characterises the Oriental turn of mind in general, which fetters all their artistic productions to the inexorable laws of architecture, and stifles in the germ all individual intellectual life. In the same manner, although with national modifications, we shall find this the case with all the other races of the East."

The Euphrates, "the river whose source is in Paradise," and the Tigris were to the inhabitants of Central Asia what the Nile was to the Egyptians, and what the Ganges was to Eastern Asia. In each case the rising of the waters called out man's resources to enable him to maintain his position on the fertile soils that owed so much to this periodical circumstance. The mighty ruins of both banks of the Euphrates are still the marvel of the world. Traces of palace after palace, rising terrace upon terrace, temples and tombs of colossal dimensions, vie with the ten miles of ruins on the Tigris, that proclaim the site of Nineveh, in evoking our astonished admiration. In the sculpture of the Assyrians, however, there is no effort to express thought or feeling; we find in it no aim beyond representing actual existence, reality; and it remains apparently unchanged either in the sphere of representation or mode of treatment from the beginning to the end of their days. The Medes and Persians came under the same influences. First subjugated by the Assyrians, and then conquering them, they intermingled with them too much for their artistic creations to exhibit any remarkably distinctive character. Moreover, the plastic arts were still subservient to architecture: bound hand and foot. In the Ganges district, we find new moulds and grooves of thought emanating from the adoption of Buddhism by the Hindoo people. Instead of the tame repetition of the same ideas over and over again, there is a more spiritual, speculative, self-conscious development apparent in the art-work, as well as an enthusiastic admiration of the beauties of nature. But this is to a great extent over-riden by the bewildering effect of the fanciful creations relating to the polytheism of Brahminism; and it requires a special talent to pick out the graceful tender poetic ideas that sprang out of high conceptions of the dignity and destiny of man, from the luxuriant and motley confusion of more untridled fancies. But on leaving the vast sultry regions of the East, we come upon a people in the south of Europe, in whose hands the plastic arts reached a height of cultivation that has not since been surpassed. Here, again, Dr. Lübke would account for the chief distinctions in the mental conditions of the Greeks by the nature of their country. Spring from the great Asiatic family from which the Indians and Persians were descended, speaking the same language, and having the same manners and religion, he considers that nothing but the peculiarities, the natural wealth and variety of the land, with its "blue-sea floors," of which they took possession, could account for the marvellous strides made by them. Instead of tropical superabundance, the Greeks enjoyed a climate that, though mild, was moderated by sea and mountain air,—a country that, though small, was intersected and ramified by mountain ranges which divided it naturally into a number of small territories, and a soil that, though fruitful, required labour. It would be difficult, he advances, to find conditions more likely to generate mental independence, or an art-power of a purer, nobler type. Then the habits that allowed the un fettered development of the body, and the gymnastics that cultivated power and dexterity, and with these grace, helped in the course of generations to make this people more beautiful, manly, and noble than any other; and their scant though elegant drapery left the harmonious proportions and movements of their limbs ever before the artist as a constant study. Not individual characteristics nor casual forms, however, were sought by Greek artists for portrayal; but out of their wide observation they realised a general type of excellence that, with slight modifications to express such differences as sex, youth, maturity, and age, served their every purpose. We see the fine oval of the face, the low and narrow brow passing almost in continuation into the nose without indentation on the profile, the large straight-cut eye in its broad, deep socket, the full lips and projecting chin in the whole circle of characters they represented. Dr. Lübke, noticing this rejection of individual traits by Greek art, says,—

"It is satisfied with the expression of the highest sovereign will and sovereign mind in Jupiter; with that of lofty womanly dignity in Hera; of heroic manly power in Hercules; and of youthful beauty, either of a relaxed or luxu-

rious character, in Apollo and Bacchus; of perfect grace in Aphrodite; of noble just wisdom in Pallas Athene; of maiden-like vigour in Artemis; of manly adroitness and cunning in Hermes; and other similar creations, in whom the round of human characters and qualities is typically established in broad lineaments, and serve as a general standard. Whatever lay beyond this passed also beyond the power of Hellenic perception; and it would have been perfectly incompatible with the Greek nature to represent individual character in its modern sense."

In the Greek temple plastic art became free of the restraints by which the architecture of the East enchained it. Over and above the sculpture that formed the ornamentation of the fabric, and which was obliged to adapt itself to certain given outlines, there was the personation of the god or goddess within upon which the artist could lavish his unfettered powers. Perhaps from the vagueness or the ideality of the subject, or, perhaps, from the different aspects and attractions it presents at different times according to the state of the mind, or, perhaps, from the actual want of clear notions, many writers upon art express themselves often mistily, moodily, and in a roundabout way, saying and unsaying things, and affecting a sort of dreamy rapture which they express in an inarticulate jargon of what may be called artistic cant.

Somewhat of these complications, and of this veiled style of expression is used by Dr. Lübke in his enthusiastic contemplation of Greek art. Thus on one page he attributes the superiority of the Greek to a personal inner development and the unfolding of a national life with free consciousness; and on another he says no one was allowed to develop his power either for his own personal enjoyment or for the adornment of his own existence, which appears scarcely compatible with the "free consciousness" quoted. In a third it is the contrast between the Ionians and the Dorians, "so radically diverse though dwelling on a common national soil, that invests Greek life with its wonderful depth, its rich value, and its stamp of perfection," and in a fourth, it is the breaking up of the fellowship among the individual states, after the Peloponnesian war, that enabled the individual subject to extricate himself into a freer position, develop his powers with less restraint, and his rich talents with greater versatility; and in a fifth, it was the portrayal of the gods as a glorification of human beauty that gave the Greek artist his magic power. In the same half-contradictory way, though he rejoices over the emancipation of plastic art from the thralldom of architecture, nearly all his illustrations represent Caryatides, and bas-reliefs from friezes and figures from pediments; proving, indeed, that sculpture was never so beautiful as when she was the handmaid of architecture, and never so much her handmaid as in the days of the Greeks.

The chapter upon the art of that wonderful people who appeared upon the face of Central Italy as mysteriously as they faded from it, the Etruscians, is, however, as clear, consecutive, and precise as we could wish. It was they who left the world the legacy of the arch, which, in the hands of their conquerors, the Romans, became the means of a further long stride in the history of architecture. The author gives us examples of their tombs, their *reliefs*, wall-painting, and mirrors, and passes on to the art of the great realistic people who conquered them and the world. It was the Etruscan legacy that enabled the Romans to erect buildings on a larger scale than those of Greece, he points out. "So long as the covering of a stone building could only be effected by mighty horizontal beams, as was the case in the East and among the Greeks, architectural work was limited in its scope, and was dependent on the natural conditions of the stone, which afforded horizontal beams only to a small extent; but after the combination of wedged-shape stones had been devised, which, by the tendency of their various parts to their centre of gravity was kept in a firm span, the art of building was in a great measure freed from natural hinderances, and the courts could be formed with much more size and variety, and the ground-plan with greater freedom than before."

But though the Romans adapted Etruscan discoveries, and invited Greek artists to their capital, he considers art never enjoyed the hearty delight of the people, but remained always a luxury belonging to the rich and powerful. With some obscurity he intimates that architecture was employed to adorn life, ennoble power, and attract the people, "without standing in closer affinity to the Roman character by its application to the practical necessities of life." How this statement corresponds with the tendency to realism in sculpture for architectural purposes, which marked the distinctive peculiarities of in-

dividuals so strongly as to constitute portraiture, we do not see. But Dr. Lübke atones for the insufficiency of some of his general views, and the contradictions into which this shortcoming betrays him, by his true admiration of all noble works when he comes to details. As he paces the sites of the temples, or gazes upon the ruins of the triumphal gates, baths, or amphitheatres, he is as much a Roman as he was a Greek when dwelling upon the matchless conceptions of Hellenic art.

In early Christian art our author no longer sees the influence of geographical conditions at work, but the promptings of a spirit resolved to realise new truths regardless of antique traditions. Thus the Christian artist, in his need for materials with which to embellish his basilica, took all that was costly and possible from the remains of fallen temples, careless of old laws of proportion or arrangement, and placed his gleanings in new combinations that harmonized in his mind with the requirements of the new faith. "The remains of the columns of old temples and courts, most heterogeneous in size, material, beauty, and execution, were placed in the same arcade of the new Christian church. Shafts too long were cut short, and those too short were heightened by higher bases or capitals; among the capitals themselves in the same colonnade, all conceivable shades of Corinthian, Composite, and Ionic forms would alternate, so that ancient architecture appeared chaotically let loose in its fundamental elements." Painting was seized as a facile means of expressing the new ideas, and acquired great prominence in those times; while plastic art, especially in relief upon sarcophagi, represented scenes from the Old and New Testaments with much of the same feeling with which it had illustrated the old mythology. Mosaics and ivory carving were the vehicles, too, of many noble inspirations at a very early period. But, with the removal of the seat of government from the banks of the Tiber to the shores of the Bosphorus, came new expressions in Christian art. All traces of antique traditions were effaced by the adoption of Byzantine principles. The rectangular basilica was supplanted by a polygonal pillared structure with mighty arches, upon which rose a central dome, which grand feature, however, by the addition of a choir for the exigencies of the service, was not always maintained as a centre. This "non-centralising element" of the choir at the east end Dr. Lübke considers "an irrefutable testimony to the disunion between ritualistic object and architectural design." Byzantine forms had but little of his sympathies, but he admires the rich splendour of decorations blazoning with gold-coloured marbles and mosaics, with which the interiors of its domes and niches and internal wall surfaces were adorned, the abundance of which was one of the peculiarities of the style; and gives very interesting details of some of the principal buildings of this period.

The art of Islam is described as being as largely affected by the nature of the land as it was by the teachings of Mahomet, who forbade all figurative representations. The roving life of the Arabians, the boundless wilderness of the desert, the expanse of sky in which glittered the stars of the northern and southern hemisphere, gave birth, the author considers, to a frame of mind as much inclined to fantastic extravagance as to keen, one-sided speculation; and, because there was no distinct horizon line, no variety in the forms of nature on which his eye could rest, the imagination of the son of the desert revelled in the formless, and passed from one idea to another without repose. When this impassioned race began to overrun the world in their fervour of religious ecstasy, they had, then, no national art; and when they did not adapt Christian churches to their own mode of worship, they obtained Christian architects from the Byzantine court to build their mosques. But as time passed, we find they introduced in the halls and arcades of their buildings the pointed arch, the horse-shoe arch, and the keel arch; a vaulting peculiar to themselves, consisting of separate niche-like vaulted calottes projecting over each other, sometimes likened in its effect to that of stalactite caves; and that rich wall decoration composed of the mingling of animal and vegetable forms, with entwining geometric figures that we call Arabesque; the brilliant whole forming an architectural style as distinct as any other, and infinitely more fanciful. The author whose steps we are now following, thus paradoxically speaks of it:—"It lacked that

definite stamp which only appears when the imagination, restrained by reflection, produces pure creations. Instead of this, the architecture of the Arabians presents the same combination of striking contrasts as clings to their whole mental nature; a bold, cold exterior, with a fantastically decorated interior; monstrous confused masses, and a magic complexity of ornament; death-like stiffness and inexpressible rich life." If we were disposed to be captious, we might ask whether the last two conditions can be reconciled in this manner.

The Romanesque style was the result of the remains of antique culture acting upon the minds of the Germanic races endeavouring to express Christianity. They accepted the Basilica, but altered its proportions to such an extent as to give it a new character. The nave was divided from the choir by transepts, which gave the ground-plan the figure of the Cross; and the choir was extended to seat the large number of monks requiring accommodation. In some churches the ritual requirements called for a second choir, and occasionally a second transept; and in others provision was made for nuns by the erection of galleries at the western part of the nave. Two towers formed the leading feature of the western portal.

Many ground-plans, illustrations of bases of columns, capitals from Gurk, Horpitz, and Heiligen Kreuz; friezes from Wiener-Nustadt, and Schwarz-Rheindorf; views of the cathedrals of Worms, Treves, Spire, and Limburg; Palermo, S. Marco Venice, Modena, Peking, and numerous monastery churches; fragments of faultless cloisters, marvels of portals, towers, snatches of other details of beauty, place this style before our eyes. Again, sculpture and painting became altogether subordinate to architecture, and if we may believe the wall-paintings at S. Savin, Schwarz-Rheindorf, St. Michael at Hildesheim, and Siena, the relief from Aquila and Pisa lost none of their power in so doing. The assimilation of antique traditions with Christian necessities being perfected, the Germanic mind began to make progress in new directions. Chivalry, a freedom of inquiry in religious matters, attended by a deeper devotion, a feeling of reverence for the female sex, the revival of the nation's poetry, all helped to bring about an entirely new spirit, "a presentiment of a fresh spring," which architecture expressed by the free, bold, graceful forms which we call Gothic, but which in Central Europe has been called "German," and "old German," although it was France, moved by the mighty social revolution of the Crusades, that first worked them out. Now, the pointed arch, before used superficially, became part of the construction of all edifices. The cathedrals of Rheims, Beauvais, and S. Maclou, Rouen, in France; the exquisite townhalls of Ypres, and Oudekerke in the Netherlands; a selection of German churches, a dazzling gable from S. Stephen's, Vienna, Münster townhall, and the hall of the Artushof, Dantzic, in Germany; glimpses of the cathedrals of York, Worcester, Salisbury; details from Exeter, Wells, and Westminster, in England; the cathedral of Drontheim, in Norway; the cathedrals of Siena, and the churches of Certosa and S. Petronio, Bologna, with a bit of the sweet Palazzo Buonaparte, Siena, in Italy; and the cathedrals of Burgos and Toledo, in Spain, are given as illustrations of this period of art. Dr. Lübke dwells long and luminously upon the plastic productions of this age, which kept pace in their development with the national mind. He says of them,—

"An animated striving, similar to that which we have seen in our considerations upon architecture, long laboured at the remodeling of the old forms; and about the middle of the thirteenth century, a new style had resulted, which was indeed in every respect different from that which Romanesque art could have produced. Scarcely, however, had this form reached its perfection, than it spread as rapidly and uncontrollably as Gothic architecture had done over the whole Christian world of the West, and was adopted with one accord by all; thus affording testimony of how completely it expressed the feeling of the age. The whole of the fourteenth century adheres resolutely to the new style of art, which on this very account soon became conventional, and often degenerated into external mannerism, just as the tender homage of the Minnesingers was speedily transformed into courtly etiquette."

Much as we should like to tell our readers of the sumptuous sculpture, the wall paintings, the altar pictures, the rich glass-painting, the miniatures, the illuminations, given as samples of the art of those times, we must pass on, as we wish to notice the scantiness with which the creations of the moderns have been mentioned. Our regret is lessened, however, by the conviction that the indication we have given of the con-

tents of the work will induce those interested in art to read it. We turn over the teeming pages devoted to the Cinque-cento period and its palaces, its marvellous sculptures and thrilling paintings, the German wood-carving of the fifteenth and sixteenth centuries, magic work in bronze, feeling as we gaze upon so much of man's industry and intellect, as though we were in one of the treasure-houses of the world till our attention is arrested by the German estimate of our own position among art-wealth producers. England, in the nineteenth century, it sets forth, has no great importance in the artistic cultivation of architecture. Smirke's Covent-garden Theatre and Barry's Houses of Parliament are the only two buildings whose fame has reached the historian of art. "The most original and valuable of the later productions of English architecture," he says, "are the numerous large and small country residences in which a free picturesque element is successfully introduced." Three English architects only out of our present list are mentioned, and these are not associated by the faintest allusion with their works. Again, we are accredited with only three sculptors worthy of note, besides Gilson; and in a short catalogue of our recent painters, about a dozen in number including several who have laid down the brush for ever, we miss some of our chief artists. This shows us it is easier to take a comprehensive view of the past than of the present: the latter is too vast, too full, too varied for measurement by mortal man. While acknowledging the difficulty, Dr. Lübke generalizes in this way:—

"The interest which different nations take in the development of the art of the present day is of characteristic importance. Foremost stands Germany, from whence the recognition of art, rich as it is in future promise, emanated. . . . Next to the Germans, the French grasped the antique with similar enthusiasm, in order again to bring back art to seriousness and depth, to moderation, and to beauty. . . . Since the liberation war there has been again in Germany, as in France, a national art which conceives and fashions its special tasks in its own distinct style. Belgium and Holland have also possessed since that period a revised culture of national art, and England has displayed, more than in former centuries, the stirrings of an independent artistic power, which has arrived at able results in many branches of art. The South, on the other hand, is strikingly behind other lands in artistic production. Neither in the Pyrenean peninsula nor in the Italian have any important works been recently produced."

When we have had shown us, in this compact manner, so much of what man has essayed to do and succeeded in doing in all ages and in all places, and we look upon the brilliant mass of brainwork, impressed with its earnest striving, its gradual attainment of eminence, and its still ripening power, we feel a conviction that if this were taught in our schools, if the young, let them be ever so rough and rude, were shown this mighty panorama of man's endeavour and success, their lives would take more elevated tones. In all probability some aspiration would shape itself and fill many a breast otherwise callous. No one could sit down content with dirt, disorder, idleness, or grovelling, who knew of all this industry, this beauty, and poetry achieved by other men. Surely every one would long to add a link to the glorious chain, and so he lifted up out of their unsavouriness, unstrained, laziness, or sordidness, as the case might be. We cordially commend Dr. Lübke's comprehensive work, not the less because we find in it the basis for such a popularization of the history of art.

THE ARMOUR AT SOUTH KENSINGTON.

THE MEYRICK collection of armour and arms is now set up in the long gallery bounding the gardens of the Horticultural Society. The armouries were called in Mr. J. R. Planché, Somerset Herald, and under his careful direction the whole has been set up chronologically; Mr. C. Pierce and Mr. C. C. Black having been his chief assistants. Each reign is marked out by banners of the livery colours of the Royal Houses, separated by a slight fence formed with weapons of the period,—a capital idea, as thus, while mistake is prevented, the *coup d'œil* is not interfered with. The general effect is very fine; the collection, indeed, has never been seen properly before, and an artist may go into each bay, and for the first time, so far as we know, feel certain that everything around him belongs to the period concerning which he is in search of information. Many lessons are quietly taught by this arrangement, and if it do not lead to the reform we have long called for in the national collection in

the Tower of London, we shall be as much surprised as we are that the jumble there has been allowed to exist so long as it has been. As an example of the sort of lesson to which we refer, look at the breastplates. Arranged, as they are, chronologically, the gradual alteration in the form which took place, serving to mark the exact date of a specimen, is at once observable. In the first instance they are globular, afterwards somewhat flatter, and then they are seen to have a line running down the centre. In a succeeding reign, this front line becomes pointed close up to the neck; gradually the point comes lower, until, in the time of Elizabeth, it is seen only in the shape of a recession of the breastplate at the waist. With the pistols, again, by keeping those of each reign together, any distinctive peculiarity is at once obvious; thus, while in a previous reign all the handles are seen to have a globular termination; in the reign of Charles II. the globe is elongated.

To go a little into detail: the first bay is appropriated to works of early art, some of them unmatchable; the other bays range from Henry VII. to William III. Foremost in the first bay will be observed the gilt bronze coating of a shield, made by the Britons (or, as we would rather say, the Gauls), in imitation of the Roman scutum. This priceless and beautiful work was found in the bed of the River Witham, Lincolnshire, with several broken swords and spear-heads of bronze, and presented to Sir S. Meyrick by the Rev. H. W. Sillithorp. The umbo, or boss, is studded with pieces of red cornelian. "The ornament," Sir Samuel remarks, "is just such an attempt to rival Roman art as would be made by a less civilised nation." During the recent examinations the fact has been arrived at that the rude figure of a lion was originally pinned on to the face of the shield: the pin-holes are visible, but it requires a peculiar position to detect the form. Above the shield is a British or Gaulish helmet matching it remarkably. A few corroded sword-blades, hoses of shields, and a spur or two, form the total of the military remains as yet discovered of the Saxons, the Danes, and the Normans. Of their personal ornaments, there exist ample and rich collections, but from the perishable nature of their body armour, which was principally composed of rings or small plates, of various forms, stitched upon leather or linen, no authentic specimen has descended to us. Within the last ten years, four or five helmets of the twelfth and thirteenth centuries have been discovered; but previously to the death of Sir Samuel Meyrick in 1848, no armour was known to exist in England of a date earlier than that of the helmet and gambutes of Edward the Black Prince, preserved by good fortune rather than good guardianship in Canterbury Cathedral. Amongst the head-pieces exhibited, is the jousting helmet of Sir Richard Poynter, who died in 1375, and which was formerly suspended over his tomb in Hereford Cathedral. It was presented to Sir Samuel by the dean and chapter! A masked horguinet, with a vizor made to represent a human face, with formidable monstaches, is curious. This species of helmet, taking altogether more the shape of a human head, had its name from its being of Burgundian origin.

In this same compartment is the beautiful ivory saddle, engraved all over with love verses in old German, and with the figures of the two personages whose sentiments they express carved in high relief and in the costume of the time.

The collection includes twelve mounted figures in full panoply; some of them as in the act of tilting.

The earliest complete suit in the Meyrick collection, the first mounted figure in the gallery, dates from about 1445, the reign of Henry VI. Although the era of complete plate is assigned with good reason to the previous reign of Henry V., and the armour of that time possessed characteristics which could not easily be mistaken, it is a singular fact that in no public or private collection in England, France, or Germany, we know of, nor in the works that have been published illustrating the armouries of Russia, Spain, and Sardinia, is there to be found a suit which could be confidently ascribed to an earlier date than 1425. The tilting helmet, saddle, and shield of Henry V. are almost out of sight, over his tomb in Westminster Abbey, and helmets and spurs of that period are to be met with occasionally. Some basinetts will be found in the present collection, but not a fragment of the long steel coats that were worn at Harfleur or Agincourt has been as yet identified. In the Tower of London, in the Amhras Collection at Vienna, and elsewhere, the earliest suits present

the same features as those to be observed in this mounted knight. The headpiece is the salade—so called from the Italian *salada*—introduced to England apparently in the reign of Henry VI., though the basinet continued to be worn with and without the vizor. The peculiarity of the salade consists in its covering only the upper half of the face, a horizontal aperture being made for the sight, as in the earlier tilting helmets, and projecting considerably behind, where it terminates in a peak like the Knight's chapeau, which was usually worn over it. The lower portion of the visage is guarded by a piece called the hanse col, rising above the chin, and almost meeting the rim of the salade. The breast and backplates are of exquisite form and workmanship, and are fluted in the most tasteful manner, imitating the gatherings of some textile fabric. The sollerets, or steel shoes, are sharply pointed, a distinguishing characteristic of this epoch, and the outlines of all the pieces extremely elegant. It is of German manufacture. On the left arm is a fine shield, also German; the notch on the side was called the *bouche*, and was made for the passage of the lance. It does not appear before the reign of Henry IV. in England. The bright suit, stamped with the Nuremberg arms, denoting the place of its manufacture, was brought from Vienna by the French General Amielle, and is assigned by tradition to Maximilian king of the Romans. The black and gold one is said to have belonged to an Elector of Bavaria. We must not attempt, however, a complete account; that will, doubtless, be given by our contemporaries of the daily press at the proper time. But we must briefly point out the fluted suit, date about 1495; the singular puffed and slashed suit, in imitation of the dress of the day, A.D. 1510; and another, with cuisses, ribbed and engraved with a masterly freedom, in the very best style of the German school; the black armour of a Knight of St. George of Havana, A.D. 1525; and the suit of Genoese armour, with raised white ornament on a black ground, the prototype of the embossed armour, which indicated the rapidly approaching confession of its intility as a personal defence by the elaborate art lavished on its decoration.

We repeat the expression of our desire that artists will make good use of the opportunity now open to them. In an account that was written of the armour exhibited amongst the Art-Treasures at Manchester in 1857, Mr. Planché tells a story which is not without its lesson. Sir David Wilkie consulted him respecting the now well-known picture of John Knox preaching the Reformation. He was desirous, he said, of being very correct in the costume he had introduced, and requested a candid opinion upon it; the picture being then finished, and ready for removal to the Royal Academy, for the purpose of exhibition. On its being pointed out to him that he had introduced in the gallery of the church, military personages wearing the barred helmets of the time of Charles I. in the reign of Mary Stuart, he replied that his reason for so doing was, that these persons were to be supposed as having visited the church with a desire to be unknown; and yet he had actually selected the open headpiece of the seventeenth century, through the bars of which the face was distinctly visible, in preference to the helmet of the sixteenth, the closed vizor of which would have defied scrutiny! The glaring absurdity of this anachronism was, notwithstanding, allowed by the painter to remain, and to be disseminated by the burin of the engraver, although it might have been remedied in half an hour, with as much advantage to the effect of the picture as to its historical accuracy. This reminds us of one more creditable to the taste of another Royal Academician. Mr. A. Cooper, while at work on the "battle of Bosworth," consulted Meyrick as to how King Richard III.'s horse should be caparisoned. "In silk housings, embroidered with the royal arms," was the answer, "covering the steed from his ears to his hoofs." "Oh!" exclaimed the mortified artist, "that will never do for me: my principal object is to paint White Surrey, and if I cover him from head to foot, as you describe, I may as well not paint him at all." "But," rejoined the antiquary, "you tell me the moment you have chosen is that in which Richard made his last desperate charge. Now, as this was at the close of the battle, the caparisons of the horse would probably by that time have been cut and torn to shreds, and the colour and anatomy of the horse in that case might be rendered sufficiently visible for your purpose." Cooper jumped at the sug-

gestion, and what was the result?—the silken housings rent to ribbons, streaming in the wind, and adding to the horse, tell of the fury of the fight, and satisfy the archaeologist, while they display the peculiar genius of the painter, and give additional effect to the picture.

Amongst the fire-arms at South Kensington, dating from the commencement of the sixteenth to the close of the seventeenth century, will be found the dragon, so called from the head represented at the muzzle, and from the use of which the troops now known as dragoons derived their name; a hand-mortar of the time of Elizabeth, for throwing grenades; a snaphance, a blunderbuss, wheel-lock pistols, and dags of various dates. Here is also a matchless cross-bow of ivory, of the time of Henry VI., carved with figures in the military and civil costume of the period, and shields of arms, amidst which that of Bavaria is conspicuous; and, as a curiosity, notice the bâton of the renowned Duke of Alva, presented to him by Philip II. of Spain. It is of steel, hollow, to contain the muster-roll of the army, and covered outside with Arabic numerals in gold, with divisions of silver on a russet ground. These are the results of calculations, according to the system of warfare in the sixteenth century, by which the general is apprised what number of men would occupy any given space.

Two of the chief treasures in this collection are the targets of the Emperor Charles V., and of Francis I., King of France, with which we must end our notice of this part of the collection. The first is the work of Hieronymo Spacini, a Milanese artist, whose name is engraved in the centre, around the spike underneath the two gilt cinquefoils. It is of steel, and ornamented with forty-eight gilt engravings, on a groundwork of niello, arranged in four concentric circles. The innermost represents the twelve signs of the Zodiac; the next, twelve subjects from classical mythology; the third, twelve incidents in the life of the Emperor; and the fourth, as many illustrations of Holy Writ. As the latest historical event represented on it is the submission of the Landgrave of Hesse, which took place in 1547, it is presumed that it was made about 1550. The companion to this valuable relic, the target of Charles's great contemporary Francis I., was exhumed in France, and has suffered greatly from the pickaxe, which was struck through it. The design is attributed to Giulio Romano, or his contemporary Primaticcio.

Half a dozen lines and then, with renewed congratulations to all concerned in giving the public this exhibition, we close our account. A second gallery contains a number of examples of Eastern arms and armour, some very fine ivories, a case or two of miscellaneous antiquities, and a few pictures. A small frame amongst the latter may or may not attract attention; it contains two miniatures by Holbein,—one, King Henry VIII.; the other, Anne of Cleves. Without information they would be looked at with careless eyes. We have seen a good many portraits of these individuals, some of them better than these. With what different feeling, however, must they be regarded when it is known that by these portraits were brought about their marriage. It was at sight of this very miniature, in 1540, that the king fell in love with the lady whom he designated, when he saw her herself, a Flanders mare, and put away from him a few months afterwards!

SEMAPHORE STREET SIGNALS.

The semaphore signal-post, that has been erected by Messrs. Saxby & Farmer, railway-signal engineers, to the order of Sir Richard Mayne, with the authority and sanction of the late Secretary for the Home Department, at the south end of Parliament-street, Westminster, has excited some attention. The signal-pillar is of cast-iron and hollow; the rods and cranks by which the signals are worked, and the gas-pipe by which the lights are supplied, being adjusted and carried up in the inside of the pillar. It is 24 ft. high from the level of the street refuge upon which it stands. The base of the pillar is octagonal in form, and about 20 in. in diameter at the bottom. It tapers upwards, and has projecting mouldings returned round the top of each of the sections from which it contracts. The upper portion of the shaft is round, and has a spiral head, from about half height to the neck. At the top there is a box, from which lights issue, corresponding, as regards the colours shown by them, with the

position of the semaphore arms, displayed immediately below them: red for stop, and green for caution or walking pace, for vehicles or horses while passing over the crossing. The stop position of the semaphore arm is the horizontal, and the caution position the angle of 45° at its junction with the pillar. The mode of working will be the same by day and night: the same action will turn on a green light and drop the arm, or will show a red light and raise the arm to the horizontal position. The arms are 4 ft. long, 12 in. broad at the outer ends, and 8 in. broad at the necks. The complete apparatus should show four arms, and four lights to correspond with them; but in this experimental pillar, it has not been considered necessary to take power to stop the traffic in one of the four intersecting streets. There are accordingly three semaphore arms, and three magnifying discs of 6 in. diameter, which will each show red or green lights at night, in accordance with the position of the arms. The intended action of the apparatus is this:—When the signals are in their normal condition, that is, the semaphore arm dropped or a green light displayed, all vehicles and horses will be required to pass at a slow pace over the crossing. When the three arms are raised to the horizontal position, and red lights are displayed, the traffic, as regards vehicles and horses will be stopped across the end of Parliament-street, and between Parliament-street and Bridge-street, in each direction, in both cases. The traffic from Great George-street, to the right or left of the crossing, and on the west side of it, will not be interfered with. The signals are seen from the entrance to Birdcage-walk, from Westminster-bridge, from the end of Whitehall, and from Old Palace-yard, which is a great advantage as contrasted with the uplifted hand of the policeman, not seen until the crossing is reached. The arms are 18 ft., and the lights 20 ft. above the ground level. The pillar is about five tons in weight, and is set down about 4 ft. below the surface. Its foundation is a bed of concrete 6 ft. square, and a stone of about 4 ft. square, and 14 in. thick.

The whole of the apparatus for working the signals, including the arrangement for changing the colours of the lights, is concealed, excepting a horizontal bar about 9 in. long, which is pulled out from the side when the signals are set to "stop." The idea of applying the semaphore and colored light system of signalling, as commonly employed on railways, to the regulation of street traffic, originated with Mr. Knight, superintendent of the South-Eastern Railway, who made the recommendation to a select committee of the House of Commons, in 1866. He recommended it for the protection of authorized foot crossings; for narrow side-streets to stop the traffic in one of the directions; and for streets wholly or partially closed for repair, and the adjoining streets to which the traffic may be diverted.

DEATH OF THE REV. J. L. PETIT.

It is with deep regret that we announce the death of the Rev. John Lewis Petit, B.A., the well-known archaeologist and artist. His writings, his lectures at the Architectural Exhibition, and his bold and effective architectural sketches, in colours and pen-and-ink, are familiar to most of our readers. Some of his papers and a *fac-simile* of one of his pen-and-ink sketches will be found in earlier volumes of the *Builder*. Mr. Petit's death, ten days ago, was most unexpected, and, comparatively, sudden. A week or two since he visited London, and on his return to Lichfield, whilst engaged in his favourite pursuit of sketching, caught a slight cold in the neck. This speedily took a dangerous form, from which he never recovered.

He was born at the commencement of the present century, and was nephew of Louis Hayes Petit, M.P. Studying at Trinity College, Cambridge, he took his B.A. degree in 1823. He was a frequent contributor of papers on architecture and archaeology to various journals, and at the time of his death was engaged upon an illustrated description of Howden Church. Amongst his published works we may mention "Illustrations of Church Architecture," in 1841; "Remarks on Architectural Character, and on the Principles of Gothic Architecture as applied to ordinary Parish Churches," in 1846; "A Description of the Abbey Church, Tewkesbury," in 1848; "Lectures on Architectural Principles," and "Lectures on Architectural Studies," in 1854.

ARCHITECTS' CHARGES IN GERMANY.

On a former occasion, in giving an account of the biennial meeting of German architects held at Hamburg in September last, we briefly referred to this subject, promising to return to it so soon as the particulars should reach us. We are indebted to the courtesy of an occasional correspondent residing abroad, for a copy of a journal which enables us to elicit the subjoined information.

It appears that previous to the year 1855, the charges for professional labours were so arbitrary and various all over Germany, that the Architectural Society of Hanover determined to attempt the task of fixing those charges, and in issuing them obtained the adherence of all its members to the new rules; but their exertions did not rest here. Thanks to the insertion of the charges in various architectural publications, and in sundry professional pocket-books and almanacs, they obtained more and more voluntary adherents, until, in the year 1864, a second scale was issued at Stuttgart, for the use of those practising in Southern Germany. This was followed in the year 1867 by a third scale, issued by the Society of Architects and Engineers of Prague. But the Stuttgart rule found most favour for the time being, it being understood that the whole subject should come on for general discussion at the Hamburg meeting last autumn. Three distinct propositions, based on different principles, were accordingly brought up at the meeting, to be discussed and framed into one law, which should be binding throughout Germany. They came from Hanover, from Stuttgart, and from Berlin, although all three were founded upon the basis originally propounded by the former of those cities, namely, a general per-centage of four and a half, with modifications.

- I. According to the greater or lesser amount of artistic execution.
- II. According to the amount of the contract; and
- III. According to the greater or lesser amount of time and labour which may devolve upon the architect in superintending.

Hanover divided the former of these modifications into three heads, namely,—

1. Plain country-houses.
2. Middle-class town-houses; and
3. Costly private residences, public buildings, &c. &c.

Berlin made a similar division; whilst Stuttgart submitted five heads, namely,—

1. Town and country houses of a plain character.
2. Ordinary town-houses, and the plainer class of public buildings.
3. Houses of a better class, and somewhat larger public buildings.
4. Edifices of monumental character, mansions, &c.
5. Decoration and monuments.

The second modification, namely, that of varying the per-centage according to the amount, was also variously advocated. Hanover submitted eight scales of charges, as proper remuneration for works ranging from 75*l.* up to 150,000*l.*; Stuttgart had also a graduated scale for works from 600*l.* to 120,000*l.* in value; whilst Berlin, agreeing in the main to the Hanover scale, suggested that the highest charge should be on sums under 450*l.*, and the lowest on sums over 30,000*l.*

The third modification was that according to the time and labour expended. All three proposals agreed in holding that the charges should vary according to the phases through which a building, or a proposed building, had passed, although they differed in the classification of those phases. Hanover divided them thus:—

1. Sketches and rough estimates.
2. Working drawings and exact estimates, together with the necessary details, supervision, &c.

Stuttgart had three divisions:—

1. Sketches, plans, and estimates.
2. Details.
3. Supervision, and settling accounts of extras and omissions.

Whilst Berlin divided "time and labour" into no less than six heads.

We will not trouble the reader with the details of the discussions which these propositions called forth; he will probably be sufficiently contented to know the results, which were these:—

With regard to the classification of buildings, the Stuttgart division, which we have given above, was adopted. Coming to the second

head, that of a sliding scale, decreasing in proportion to the amount of contract, the meeting adopted the Hanoverian tables; whilst the third question, that of time and labour, was passed in favour of the Berlin proposals. But the question of four and a half per cent. on the costs, as basis to the modifications above given, did not finally pass without a very animated discussion. As a starting-point, it was agreed to suppose the erection of a town-house of the value of 30,000 thalers (about 4,500*l.*), and the amount of time and labour devolving upon an architect in such a case, was carefully gone into. Stuttgart demanded a remuneration of 1,936, Hanover 1,359, and Berlin only 1,200 thalers, being 6, 4, and 4 per cent. respectively; and it was only after a lengthened discussion that Stuttgart was outvoted, and the Hanoverian scale of 4½ per cent. was adopted,—a measure which Berlin was of course not unwilling to consent to.

THE TECHNICAL INSTRUCTION MOVEMENT.

A LECTURE on technical instruction has been delivered by Mr. John Plummer at the Bedford Institute, Bethnal-green. The Rev. Septimus Hansard, rector of Bethnal-green, presided. The lecturer described the condition of technical education on the Continent, and the advantages gained by Continental industry thereby. His thought primary education was the great want of this country. Let that be looked after, and scientific education would take care of itself. He recommended the study of mathematics, and explained the working of the Government Science and Art Classes, the Royal School of Mines, Whitworth Scholarships, &c. In responding to the customary vote of thanks, Mr. Plummer gave a short account of his career as a prize student of the Spitalfields School of Design, and was followed by the Rev. Chairman, who described the success of the Bethnal-green science classes, and the probable popularity and usefulness of the museum now erecting in Bethnal-green.

A public meeting has also been held in Poplar, at the All Saints National Schools for the purpose of inaugurating evening science classes for instruction in practical geometry and mechanical and architectural drawing, under the regulations of the Science and Art Department. Mr. Swiss, a first-class certificated science teacher, will conduct the classes, and an influential local committee has been formed to carry out the object. The Rev. T. W. Nowell, the rector, occupied the chair; and after a few introductory remarks, introduced Mr. Backmaster, who referred to the educational objects of the Department and the importance of scientific knowledge in developing the industrial resources of the country. He asked for earnest co-operation and sympathy in the work which had been commenced in that district. After speeches from some of the working men present, the meeting separated.

MIDDLE-CLASS SCHOOL, LONDON.

On Tuesday last, the Lord Mayor laid the chief stone of the new school about to be erected in Cowper-street, City-road. The superficial areas of the whole site is about an acre and a third. The buildings will be constructed of white Suffolk bricks and relieved by stone cornices. The architect is Mr. E. N. Clifton, and it is expected that the portion of the school already begun will be finished by August next. This block will form a rectangle of about 114 ft. by 60 ft., fronting Cowper-street, and it will consist of class-rooms and dining-room; in fact, of the rooms absolutely essential to the conduct of a school attended by 1,000 scholars. At a subsequent period, when the funds have been raised, it is proposed to continue the Cowper-street elevation by building a large and lofty room in which all the scholars may be brought together simultaneously. The buildings will leave a very large area available as a playground. The estimated cost of the block already begun is 16,000*l.* The addition of the large hall will make the cost as much again. This is independent of the cost of the land, part of the Finsbury estate of the Ecclesiastical Commissioners, and purchased from them for about 30,000*l.*, including two houses let on lease, from which a rental will be derived. The basement of the first block will contain a dining-

room for 400 or 500 scholars, living too far off to go home to dinner, and for whom a dinner will be provided at a cost of 6*l.* per head, and adjacent to the dining-room will be the necessary kitchens and cooking apparatus. On the ground floor five long rooms will be set apart for hats and cloaks. The remaining rooms on this and the two upper floors will be class-rooms, of which there will be seventeen, varying in size, but on the average large enough for a class of sixty boys. To facilitate marching out of the playground into the school, an inclined plane is substituted for steps; and to prevent serious accidents on the staircase, it is to be a square one, with flights of eight steps on each side, and a large corner landing between each flight; so that it will be all put impossible for a boy to fall down more than eight steps. Mr. Tite, M.P., had a prominent part in the ceremony. A site has been purchased in Southwark, upon which it is proposed to erect a branch school for the south side of London.

ACCIDENTS.

At Leominster Waterworks the arch of the newly-constructed reservoir, near the Newlands, has given way, in consequence, it is stated, of the large quantity of soil placed upon it, and the arch not having been built sufficiently strong. The cost of rebuilding it is estimated at about 300*l.*

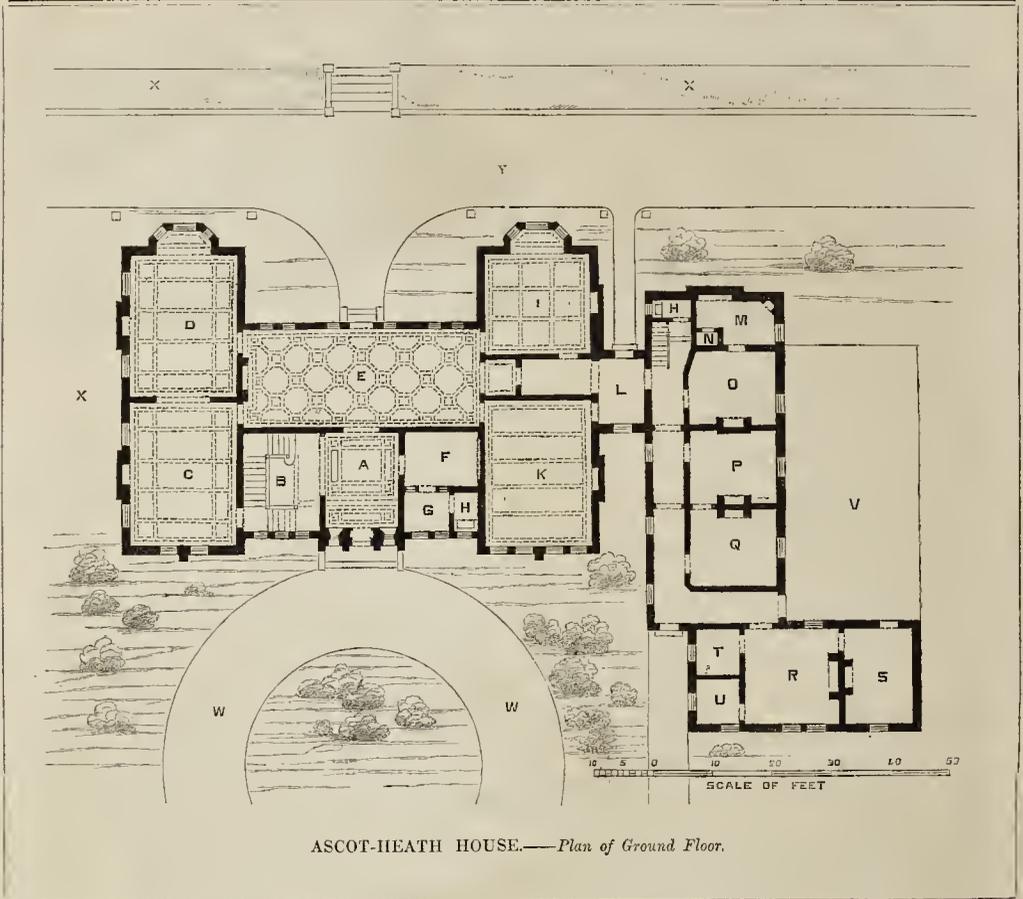

At Ileanor Church the wall opposite the chancel window has fallen, a great quantity of earth falling with it, as well as some grave-stones. To an onlooker the church appears to be in a dangerous position, being little more than a yard from what is now the edge of the bank; but it is said to be built on a good and sure foundation.

At the Killing Shambles, Sheffield, about 12 yards of a high brick wall, opeed with stone, the boundary towards Chandler's-row of the works of Messrs. Charles Chambers & Co., Castle-hill, has fallen, hocking up Chandler's-row with earth, bricks, and stone, to a height of 20 ft. or more. The outside of the wall, towards the "clammings-houses" and the killing shambles, is perhaps 40 ft. in height; but inside it is much less, owing to the higher level of the ground. For a long time past the wall has given signs of insecurity. The wall has cracked and bulged in several places. From the height of the ground inside the pressure on the wall must have been very great, and the bricks have also been considerably loosened by the percolation of the surface drainage water.

At Above Eign, Hereford, a house near the Ox-farm, and in the occupation of a working man, has fallen. The cottage in question was one of a couple standing alone and facing the trumpet ring; and it appears that a cutting had been dug alongside of it by some men in the employment of Mr. Inghes, builder, for the purpose of taking the pipes necessary for conveying the city water to the back of the premises; and it is to this circumstance that the disaster is attributable. The two houses were erected about fifty years ago. They were built without foundations to them, and the cutting mentioned scarcely exceeded 18 in. in depth.

SERIOUS ACCIDENT AT THE THAMES EMBANKMENT.

ABOUT twelve o'clock on Friday night an accident occurred at the portion of the works of the Thames Embankment between the Temple Gardens and Blackfriars Bridge. This portion is technically known as No. 3 Contract. The whole length of the contract had been piled and made watertight, and 100 men were at work within the wooden wall. The night men were just resuming work when the accident happened. A very strong wind had brought up an immense tide, and the roll of the waves was such as to shake the stant piles and bend them like reeds. An alarm was given. The night men hastily scrambled out, and at the same moment the water broke through the piles, which snapped asunder with a loud report. In an instant the whole trench was filled throughout its entire length, and an immense amount of damage done to the works. All the floating stagings were destroyed, and also a wooden bridge used for the purpose of filling the large barges of the scavenging contractors.

One of the engines used in the driving of the piles was thrown down and sank.

The work of removing the floating timber, the piles, and such portions of the puddling as were not destroyed by the water, has given employment to a large number of men. Many of the piles are broken short off at a considerable depth below the head of the river, and the work of extracting these stumps will be a slow process; and, until they are removed, no progress can be made with the resumption of the works. The cause of the accident was, primarily, an unusually high tide and heavy wind, which the hacking and struts are said to have been by no means sufficient to resist. The embanking of the section near the Temple Gardens and the approach to Blackfriars was so far complete as to have entirely excluded the water within the area between the piling and the land. Now, however, the whole of the area is covered at high tide just as before a single pile had been driven.

THE EASTBOURNE GAS-WORKS.

The new works commenced in May were formally opened on Saturday, the 5th of December. The coals are brought on to the works by the railway siding, and unloaded into smaller trucks, which are then raised by a hydraulic lift, and conveyed on an elevated tramway into every part of the coal-stores, which are situated on each side of the retort-house. The retort-house is built for eighty-four clay retorts, each 10 ft. long. The works are also provided with,—an annular condenser; two engines, which work the two exhausters, as well as the water, tar, and liquor pumps, and the hydraulic lift; a scrubber, 10 ft. diameter, by 20 ft. high; two purifiers, 12 ft. square, by 5 ft. deep (the two purifiers from the old works will be used in addition to

these); a brick gas-holder-tank, containing a holder 100 ft. diameter, by 24 ft. deep; a station meter; a governor; tar and water tanks, &c.; and a manager's house and offices.

The works were constructed under the superintendence of Mr. A. Williams, of Bankside, London, the company's engineer.

ASCOT HEATH HOUSE, BERKSHIRE.

This house, recently finished, occupies a pleasing and well-elevated site, near the race-course, and overlooking, at some distance, the railway, from which it is accordingly seen to great advantage on the south or garden front. The view we have selected for illustration is, however, the north or entrance front. The building is of red brick, relieved by Bath stone dressings and white brick string-courses, and the interior finishing is of simple, comfortable character, without display. The ceiling panelling, we may observe, is formed by nothing more elaborate than moulded deal ribs, put on after the plaster-work, and fixed through to the joists; and the effect is satisfactory, while the cost is insignificant. The ground-floor plan, which we are enabled to give, will explain itself sufficiently as regards detail; but a few notes on the general motive may be of interest.

The entrance being northward, and the garden southward, according to rule, there is an old lawn eastward, on which the side windows look from the drawing-rooms. Westward stand the offices, with access from the same approach as the house, and no outlook upon the garden. The central feature of plan is a gallery, 40 ft. by 16½ ft., one side of which faces the garden, with an extensive landscape beyond. A small entrance-hall opens upon the middle of the gallery, on the opposite side, affording space towards the north

front for the staircase on the one hand, and the cloak-room and gentlemen's lavatory on the other. Both staircase and cloak-room are attached to the entrance-hall, and not to the gallery. The usual family rooms are then disposed at the ends of the gallery, the doors of the dining-room and library opening from one end, and those of the drawing-room and morning-room from the other, the dining-room and library being placed, of course, towards the offices. These four apartments, therefore, can at pleasure be thrown open to the gallery, to form one extensive suite; it having been an essential part of the programme to provide for occasional receptions of a special character, without any sacrifice of the domestic simplicity and convenience of the dwelling for every-day uses. The communication with the gallery from the offices, in pursuance of this idea, is by a door in a recess, itself ornamental, and intended to be partially closed in by curtains. As the result of this leading principle of disposition, although the rooms, individually, are in every respect of the usual proportions and forms for family use, the aggregate suite for receptions attains the extent of nearly 150 ft. of available length, with the ordinary breadth of a room throughout. The upper floors contain the usual bedrooms. The workmanship is said to reflect credit on the builders, Messrs. Longmire & Brnge of London. The architect is Professor Kerr.

Spangell.

THE NEW BILLS IN PARLIAMENT.

THE time prescribed by standing orders for depositing plans and sections has expired. The total number of private bills lodged was 130, against 124 last year, and 179 in 1867. This number is not an indication of the number of bills that may be petitioned for, inasmuch as a large number of private bills, such as abandonment and finance bills, do not involve the purchase of property or the execution of works requiring plans and drawings.

The plans for the Metropolitan Tramways Bill, which Messrs. John Noble & Co. have brought forward for several years in succession, are, as already noted, again lodged, and now with a hotter hope of a successful result. The same promoters have in former sessions succeeded in obtaining their bills for Dublin and Liverpool. Another bill will be brought in for street tramways from Picnic to Lambeth, by Vauxhall Bridge, and from Lambeth to Peckham and Greenwich. It is now certain that gas and water hills, affecting the metropolitan supply of these important necessities, will be brought in of such a nature as to fully reopen these questions. As regards gas, indeed, it is known that the Board of Trade will either promote a bill directly, or through the Metropolitan Board of Works, the object of which will be to secure to metropolitan consumers, generally, such advantages as were secured to the consumers in the City of London by the bill of last session. By the Metropolitan Improved Water Supply Bill, for which plans have been lodged, the water question may be expected to be again fully discussed. The objects of this Bill are the storage and purification of the waters of the Thames above Medmenham, and the construction of the necessary reservoirs and works for bringing the water to the metropolis. The plans have also been deposited for a West Surrey Water Bill, and for Water Bills for Edinburgh, Greenock, Manchester, Keighley, Oldham, and various other towns.

There are comparatively few bills to be introduced by what are called the great railway companies, that involve new works of importance.

Plans have been sent in for works for Belgrave and Chelsea, and for Westbourne Park. One of the most important drawings lodged is that which schedules the property in Westminster to be taken for the Government offices, to which we have drawn attention.

RAILWAY MATTERS.

FROM the return, recently issued, of the number of accidents and injuries to life and limb which have been reported to the Board of Trade as having occurred on all the railways open for traffic in England and Wales, Scotland, and Ireland respectively, during the year 1867, we take the total of the United Kingdom:—

Passengers killed or injured—	Killed.	Injured.
From causes beyond their own control	19	639
From their own misconduct or want of caution	17	8
Servants of companies or of contractors killed or injured—		
From causes beyond their own control	15	62
From their own misconduct or want of caution	99	23
Persons killed or injured whilst crossing at level crossings	10	2
Trespassers	57	5
Miscellaneous	1	1
Total	299	795

The total number of passengers conveyed in the year, in the three kingdoms, exclusive of season-ticket holders, amounted to 237,633,113.

The miles of railway open at the end of the year were 14,247, being an increase of 393 on the mileage of 1866.

The number of miles open in 1852 was 7,336, or about half the mileage of 1867.

The number of passengers conveyed in 1852 was 89,102,765.

The Doncaster and Hull railway, now in an advanced state towards completion, will shorten the route to London from the north. The line starts from a point near the Staddlethorpe Station on the North-Eastern, or the Old Hull and Selby line, and branches into the South Yorkshire line near to the Thorne Station. The new branch, which is about fifteen miles in length, effects a considerable saving in the distance which has at present to be travelled by those desiring to reach Hull and Goole from Doncaster, Sheffield, London, and the south. According to the present route,

passengers from Hull to London have to go *via* Selby, Milford Junction, Knottingley, and thence by the Great Northern, or by Boston, Louth, Grimsby, New Holland, and there cross the river. It will also open up a vast agricultural district, famed for potatoes and other produce, and place it within reach of the London and country markets. The engineer is Mr. Harrison, of Newcastle. The contractors for the bridges, &c., are Messrs. Butler & Pitt, of Stanningley, near Leeds; those for the line being Messrs. Brassey & Field.

ROADMAKING.

Sir,—Mr. Morgan, in his letter to you, says,—“I have the formation properly drained and well rolled before laying on the material, which consists of broken stone, 10 in. deep in the middle, and 8 in. deep at the sides (width of road not specified). . . . the broken stones laid on in three separate coats, each coat being well raked, watered, and rolled until it has become consolidated.”

The foundation of a new road ought most certainly to be well drained, but *not* well rolled before the metalling is laid on.

In making a new road, regard must be paid to the sort of subsoil on which it has to be made; and this must be borne as a motto,—a dry foundation; a smooth, impervious surface.

Nothing serves better for a foundation than slag, cinders, or other hard foundry refuse, 6 in. or 8 in. deep. Such stuff will not rot, but it will always remain a disintegrated body. Then it therefore acts as a natural drain.

Lacking the cinders, the next best foundation is a coat of 3-in. stones, from 6 in. to 8 in. in depth, not rolled; for unrolled they will act as key, or bond, for the metalling of 2-in. stones, which is to form the surface.

Rolling the foundation coat will destroy this key or bond for the subsequent coats, and will, in a degree, fill up all the interstices, which prevents the foundations serving as an auxiliary or natural drain.

Broken stone ought not to be laid either 10 in. or 8 in. in depth on the foundation layer, for the reasons given in my former letter. From 2 in. to 3 in. are quite sufficient, laid on in one coat. (I am advising as to *making* a road.) If Mr. Morgan would try the non-yielding power of a crust of consolidated metalling of 3 in. depth, he would agree with me. After the foundation of cinders or slag, 2 in. or 3 in. of metalling then should be laid on (the depth in the centre of the road should not exceed 3 in.), and the road brought up to a neat convex surface.

Now, coal-tar is an antiseptic or preservative; it is also a liquid cement; it is also impervious to moisture; it is, comparatively speaking, cheap. Then I should specify that hot coal-tar (for applying cold tar would be like attempting to spread frozen butter on new bread,—it could not be evenly distributed) should be spread over the road's surface. The tar should not be heated where everybody could be choked with the smell and smoke, but in some suitable place. To destroy as much as possible what is to some the unpleasant smell of the boiling tar, and to add to its binding qualities, distilled pitch, at about the rate of 2 lb. to 30 gallons of tar, should be boiled with it.

There can be no rule as to the quantity of pitch, as the quality of tar varies so much; in some places it is very thick, in other places it is very thin; perhaps owing to the more or less quantity of ammonia. I am writing now of tar, which at a temperature of 45° will weigh 12-16½ lb. per gallon, or 78-81½ lb. per cubic foot. To dry the tar as soon as possible, there should also be mixed with it about 3 lb. of sulphur to 30 gallons of tar. The tar might then be placed in an old water-cart, the distributor of which should hang very low, almost touching the road's surface, that the tar might not splash about; and if the road were dry, and there was a prospect of dry weather for forty-eight hours, the hot tar so prepared should be laid on in a moderate quantity, and then the road should be well rolled. Now, sir, I am neither a disciple of Mr. Adam (or Middleton) nor Telford. By both systems England's roads have been improved; neither system should therefore now be abused, and yet neither system will do now; any more than the musket by which she,—dear Old England,—has obtained such a *prestige* amongst the nations, and which, please God, shall never be made less. It, together with pipe-clay, pig-tail, hair-powder, and cross-straps, has given way to

the smart rifle, close-cut hair, and the waist-belt.

Telford's system of making a road was cumbersome, expensive as to time, and expensive as to money.

Mr. Adam's, or rather Middleton's (for he adopted and carried out Middleton's system admirably served its purpose; yet “lifting,” which was its novel feature, will not do now, as I have already pointed out.

A road's surface, however well formed, unless treated with tar as I have specified, must be pervious to moisture; then the moisture, penetrating the metalling, would lodge on the foundation specified by Telford; and, acted upon by frost, would “blow” the road, while in my plan it would drain off.

I specify a loose and yet a firm foundation to carry off any water that might per chance penetrate the road's surface, and also to act as an auxiliary drain for land-springs; and a water-proof surface, made waterproof by a cheap material—coal tar.

In the case of roads already made, and which therefore would receive their coat of metalling in the winter, when coal tar could not be used; the roads in the spring or summer, when there is a prospect of dry weather for a couple of days, should be swept clean of all dust (for that would absorb the tar), and then the tar applied, as already described.

The metalling would last longer, the road could be kept cleaner, and for a considerably less sum of money than now: there would be better roads. Tar, treated as I have specified, is far superior to asphalt; it is cheaper, and it is not affected by heat.

“A sprinkling of finely-sifted road-scrappings may be used to facilitate the setting of the stones.” I disagree with Mr. Morgan. Why should mud be scraped off a road, finely sifted, and then put back again? Mud on a road, finely sifted or not, is “matter in the wrong place.”

And now for Mr. Baylis's letter in your last issue.

Mr. Baylis says that “the last generation of engineers” acknowledged the superiority of Telford's roads. Yes; but that is no reason why the present race of engineers should acknowledge the superiority of the system, or the present race of ratepayers either.

He also says that I—“Pro”—take exception “to the laying on of 6 in. of metal at one time. That was part of Telford's practice in making new roads.” As Mr. Baylis appeals unto Telford, by Telford shall he be judged. Telford's specifications are for *making* a road. Now, between *repairing* a road and *making* a road there is as much difference as between repairing a suit of clothes and making a suit of clothes. The London roads have been already made (after a fashion); they want now to be repaired,—in some cases, it is true, almost remade,—yet the term *making*, as Telford used it, cannot now be applied to them; for he made roads where before there were none, and therefore, regarding the London roads or any other existing roads, his advice as to *making* a road cannot be followed.

Mr. Baylis has “known 12 in. of metalling put on in one coat.” I have no doubt Mr. Baylis has known people out their throats, yet that is no reason Mr. Baylis should cut his throat.

I have given reasons why a coat of stone should only be a stone thick; yet Mr. Baylis does not question those reasons, but merely reiterates his advice to put on a 6-in. coat. I challenge him to give his reasons for putting on the thicker coat, and to name the places in town or country where such a coat is required.

“If you take the first coat of a well-constructed pavement, and the annual wear and tear, and compare it with a Macadamised road under similar circumstances, you will find the advantages are materially in favour of a pavement.” If Mr. Baylis's advice as to road-making and repairing he followed, I have no earthly doubt that the road will be cheaper, if it is at once paved with blocks of copper. I wonder if it is possible to ascertain the annual cost of the London roads at per mile.

Of course “paved surfaces are not always slippery”—who said they were?—but of whatever material they are constituted, if they are at all wet, they are slippery, and they are wet at least nine months out of twelve.

And again, who said that “we want an elastic surface that will obstruct heavy weights at every foot as they advance,” that Mr. Baylis should be led to remark that we do not want such a surface?

He agrees with me that “lifting weakens the

foundation of a road," yet he says, "I should lift if necessary, and the road was strong and would bear it." I should be glad to see the two sentences reconciled.

I did not recommend coating a road while it is "ankle-deep in mud." Of course, the mud should first be removed, of whatever depth it might be.

Calling the advice of laying on a thin coat of stone "absurd," is very easy to do; but that is not reasoning. Let the *reductio ad absurdum* argument be used first, if you please.

If the quarry in which the stones are quarried is at all fit for its object, no dirt whatever is collected in the course of quarrying them, carting them, or breaking them. How can there be when every stone has to be handled by the quarryman as he flings it into the cart? If they are then placed in a suitable depot for breaking, they certainly cannot get dirty by their being broken, and they certainly cannot get dirty by their being shovelled into the carts that they may be taken to the place where they are to be spread.

It must be patent to all that my system—this system I recommend—is infinitely cheaper than any other existing system. I have given my reasons for asserting that it is infinitely better. For many years one system has been alone tried; it has been proved, to every one's dissatisfaction, that it is bad; then, let the system I now lay before you be tried.—Let it be fairly and properly tried; and, sir, both you and I will live to be earnestly thanked for its publication. But before it can be properly tried, the managerial part of the present system must be altered; that is as bad as the state of the roads. Why should bodies of illiterate, unbusiness-like men, of no social standing, have the unlimited, irresponsible control of large sums of money taken from the rate-payers for the repair of roads; while the same men, or men superior to them, acting as boards of guardians, have a central board of control to direct, limit, and guide their powers? Ought there not to be, both for town and country, a similar board of control for roads? Turnpikes are being rapidly abolished and the roads hung on highway boards, which are notoriously incapable of managing the work they have already (I speak generally).

We should find it curiously interesting if we had a return from the recently constituted country highway districts, of the position or situation held by the different surveyors before they held their present appointments.

If London had one recognised Chief Surveyor of Roads (a Sir Richard Mayne or a Mr. Bazalgette amongst the road-makers), and London were divided into suitable districts, each district possessing a surveyor under the chief surveyor, I think Londoners would not only have better roads, but cheaper roads.

And if, regarding the country, there was either a Government Board of Control with a chief surveyor, who should also act as auditor of accounts for one, two, or three counties; or lacking that, a County Board of Control, with a chief surveyor, acting also as auditor, there would be better roads, and cheaper roads; and in both cases there would be order where now is chaos. Pro.

HOW TO KEEP OUT THE WET.

Sir,—I shall be glad of advice from any of your practical readers on the following subject.

I have built a house of slaty rubble, with an outer casing of brick, well bonded. The brick is a fire brick, exceedingly hard, of a light colour, which on being broken has the appearance of being composed of a kind of granite sand. The walls are 2 ft. thick, and are all built with Abergawne lime. The house is in a very exposed position; and in the first hard rain, the front of the house exposed to the weather became apparently saturated with wet, and has let in streams of water.

Since then I have had that side of the house pointed with Portland cement between the bricks; but even this does not keep out the wet, which finds its way through the walls nearly as badly as ever.

Is Ransome's Patent a cure for this? Or is there anything that can be put on over the brick facing which will keep out the wet except paint?

The windows of my house are of Bath stone or Portland stone, and these are found to be utterly inadequate to keep out the wet; the

Bath stone especially letting in the rain as if it were a drip stone.

Is there anything fit to build with in this climate except stucco or cement painted?

ANTI-SHAM.

From all parts of the country such inquiries as this reach us, and to a much greater extent than was the case a dozen years ago. Why is this? In reply to "Anti-Sham" we may repeat what we have often said before, that in some cases, where properly applied, the soap and alum process has had excellent effect on brick walls.

SOUTH KENSINGTON MUSEUM.

WHENEVER I am tired with every-day life, I find nothing brightens me up like a little dose of art: so to-day, being in the frame of mind referred to, I spent a couple of hours in the South Kensington Museum, my constant refuge in such cases. There I found, as usual, much that is fresh; notably, electrotype reproductions of the silver tables, one dating from 1680, the other from 1700, and of the gold-plate, lent recently by her Majesty the Queen, and which have been made under the direction of Mr. Geo. Wallis. For all artistic purposes, they are equal to the originals. The earlier table, which has twisted columns for legs, very much larger at the bottom than the top, oddly enough had these legs the wrong way up, I hear, when they came to the Museum, the capitals being viewed as bases. I was delighted with the terra-cotta life-size coloured bust of Dante. It is called Modern Florence work, I think. It has all the appearance of being a Medieval work, with the stains and damages of apparent age upon it. I was perfectly mystified for a minute, till I remembered the clever young sculptor who had misled the wise men of Paris and elsewhere, and, looking behind, I found this Dante was Bastianini; he died, just lately, and very sorry I was to read of his death; it seemed so sad to quench so much talent. This bust in the Museum stands in the left-hand or lean side of the first grand hall, in one of the openings to the side aisle, and just beyond those antique terra-cotta amphoræ encrusted with marine shells. What a singular effect this encrustation has. It gives the appearance of unfinished Dresden or Palissy work. In the corner of a glass case close by, on the right, there is a most carefully-worked jug in brown earthenware, inscribed "John Samuel Clach, born Jan. 16, 1781." Farther on is a case of Copeland porcelain. How fine it is! how delicate the rose-ground jewelled tazza! An adjoining case shows the work of Binns, of Worcester, and very capital most of it is. The Art-Union of London, by their "Norman Conquest," has supplied the subject with which one of the vases is decorated. E. W. Cooke's Venetian glass is a rich collection. What a delicate creation is the tall white spirally lined goblet and cover. The modern Venetian close by looks to me very coarse by comparison,—even that opal bowl which is turned up for admiration. Straight on, in a case against the wall, is a charming "child's head carved in wood by Mark Rogers." Coming out into the hall again, but quite close, in a glass case, the Staffordshire earthenware small host of Handel is clever; and this double pair of cream-white Leeds earthenware, 1770, are admirable. The Bow jug, in corner of case, is of wonderful fin, and semi-transparent, porcelain.

More in the middle of the same side, the two large Majolica vases seeming to be made of out and folded coloured paper, are worth looking at for their oddity. It is horrible taste, but the work is so well done: they are of the sixteenth century. Going into the second hall, where the large plaster casts are, the first thing that attracts the eye is the Abyssinian collection still there. These things make me wretched. The poverty of the articles in the farther case; the beggarly "tippets"; the poor sword with its uncomfortable handle, notched and rusted blade, worn-out scabbard and wretched band, and such a buckle! the poor priest's dreadful dinner-knife too: what could a people who knew nothing better than these things do against English civilization! And then Theodor's intended present to the Queen. I suppose it was proprietary, and therefore was the best he had to give; but what wretched rubbish it is. The one grand robe, worn on the 8th of April only, and "probably to encourage his troops," was got up in a grand hurry, evidently, for in many places

the "tacking-threads" have never been taken out.

The bequest from Mrs. Louisa Plumley to the S. K. M. did not entrance me much. It is wrong to look at gift-horse, &c.; but surely the collection is not strong in respect of art. There are certainly two Pasticci and one Cosway, but I think very inferior to what I have seen; and, as to the Essex enamels, I care but little for any of them, excepting the Gervartins after Vandyc, which, in my humble opinion, is a gem, and worth all the others put together. The "Ecco Homo," however, must not be overlooked. The wrought-iron gates by Barnard, Bishop, & Barnard, of Norwich, from Paris Exhibition on loan, disappoint me notwithstanding your good words concerning them. The work is rough and unfinished, and the long bas-relief panels are stiff and ugly. Turning to the Prussian gates beside them, oh! what a humiliating contrast (excuse the spleen). And, as I am grumbling, I think S. K. M., which sets up to teach the whole world, should do something better than this sentences (in the description of that beautiful Turkish pulpit from a mosque recently pulled down): "Many traces . . . are still traceable upon the woodwork; but so disfigured by the coarse work of later ages." . . . How cleverly done are the plaster casts of the "eleventh or twelfth century" Norwegian doorways. But for their being darker in colour than the original, it would be impossible to distinguish them as imitations, were they not labelled. The very veins in the wood, at the edges where the softer part had worn away, are given; and small holes looking as if worm-eaten.

By the way, what a nice, honest, semi-English letter that is from D. Juan den Brink, of Rotterdam, in your last, anent painting on zinc. Surely an editor's must be a pleasant occupation when it brings such gratifying little bits of recognition and appreciation even from distant lands.

ART-LOVER.

BOSTON CHURCH BELLS AND CHIMES.

The famous tower of St. Botolph's Church, Boston, is now furnished with a *carillon*, or a set of chimes, on a very extensive scale, of which I give a short descriptive account.

The set of chimes consists of the old peal of eight bells, in the key of E flat, the weight of the tenor as recast with additional metal being 27½ cwt.; a new series of thirty-six smaller bells tuned to the chromatic scale, and an assemblage of mechanism. The tower also contains a clock, which strikes the quarters,—à la St. Mary's, Cambridge,—on two of the larger bells of the new series, G and F, and the first and fourth of the old peal, E flat and B flat, the hour being struck upon the tenor.

The new series of bells, thirty-six in number, were made by H. Van Aerschoot, of Louvain, who recast the tenor of the old peal, in 1867-8; while Messrs. Gillett & Bland, of Croydon, constructed the chime mechanism during the same period.

A fund for defraying the expense of the undertaking was raised partly by public subscription, commenced by Mr. William Simonds, Mayor, A.D. 1865, and partly by a bazaar held in 1868.

Several conflicting and absurd statements respecting the bells and chimes having appeared in certain public journals, I will now add two or three remarks.

The bells forming the new series are well cast, and, generally speaking, in tune one with another, and also with those constituting the old peal. But the quality of tone of the former is not truly homogeneous with that of the latter. This is attributable to many of the bells in the new series, especially those in the lower part of the scale, being made rather too small and too thin for their respective notes. Hence the comparative weakness and peculiar character of the sounds produced.

With regard to the machinery, I may observe that, instead of a wooden barrel, the pins of which are fixtures, the finest *carillons* in Europe have each a hollow metallic cylinder, which is so constructed, as I stated long ago, that any appropriate tune or tunes can easily be set upon it by any intelligent musician. And as the pins of the cylinder are movable, by merely turning the nuts of the screws, new tunes can be substituted for the old ones on the same cylinder as often as you please. The machinery of the chimes at Boston, however, has a mahogany barrel, so that whenever a new tune is required, it will be necessary to send to London for some one to "prick the

barrel," that is, to insert new pins into certain points of its circumference at measured intervals.

Here, however, it is but fair to note that Messrs. Gillett & Bland have carried out the work according to their designs and specifications, and to the satisfaction of the committee. Moreover, the same may be said of M. Van Aerschoot.

The chimes committee and others are entitled to much praise for the time and attention which they have devoted to the undertaking; and it is to be hoped that, in the course of a few weeks, the inhabitants of Boston may have cause to say,—

"Soon your sweet chimed the appointed hour will tell, For here to music Time moves merrily."

I should state that the cost of the undertaking will be about 1,300l. THOMAS WALESBY.

THE NICOLSON PAVEMENT.

SIR,—I am neither a bricklayer nor a road-maker, neither a carpenter nor a bricklayer, yet your journal is duly read by me every week; and it is my wish that the greater interest were felt, generally, among non-professional readers, in the many subjects of public utility that are treated of in the Builder. When in America I read, for the first time, in some of the Western cities, for the Nicolson pavement. Many a ten minutes or a quarter of an hour have I stood to witness the beating down and evening of the street beds, the stepping of the small oblong wooden blocks; and, finally, the pouring over them a composition of what kind I know not. Compliments began to be made before I left as to the greater cost of the Nicolson pavement above other kinds; and many a warm and angry controversy has taken place in municipal councils on that subject. The newspapers have recently stated that it does not last more than half a dozen years.

SHEARON.

A SCALE FOR DRAWINGS IN PERSPECTIVE.

IN answer to Mr. Strong's inquiry, it will be well first to review the principles on which perspective drawings are made. To make a geometrical drawing of a building of say 60 ft. in height, we should require a surface of 60 ft. multiplied by the width of such building, but such would be a waste of space; we therefore find it to be expedient to make a drawing of perhaps 1/2 of the full size, and which is, in fact, a drawing of an imaginary model made to the scale of the drawing.

In perspective we are compelled in like manner to draw a representation of an imaginary model made to a scale to suit the size of our paper. If a model were made, and if we conceive an imaginary transparent substance, through which we can pass threads at pleasure, and which we shall consider to be our paper, and designate "The Picture Plane" and if the picture-plane be erected near to or touching one corner of the model, and a point in space, and on the opposite side of the picture-plane be made to represent the eye of the spectator, and designate the point of sight, and to be sufficiently distant from the picture-plane to prevent the vanishing lines from decreasing their ordinates too rapidly; then if we were to strain a thread from each point in the model to the point of sight, the intersection of such threads with the picture-plane would be points in the picture; and if we could by some means change our transparent picture-plane into paper, we could complete the picture by drawing lines connecting the points we had already obtained.

All straight lines which in the model are horizontal and parallel with the picture-plane are vanishing lines; and if we take two such which are perpendicular co-incident, and which on the model are so many feet (taken from the scale that the model was made from) apart, then such lines produced till they touch the picture-plane will at such place be the same number of feet apart, and which will be the scale of the perspective; if the next point of the wall containing the two lines touch the picture-plane, then the picture will be the same scale as the model, if it come within, the perspective will be on a smaller scale; if without, on a larger.

Having a perspective and the scale given to us, we can ascertain as before, any heights we may wish for; but for horizontal distances we shall first require the height of the "horizontal line," which will be at the height that the two horizontal lines appear, which are of the same height but divergent on plan, and a straight line in our picture; we next require the distance of this point of sight from the picture, which should have been stated by the artist on his scale, and its relative distance from right to left; we next require to draw a plan, and by producing the vanishing lines on the picture till they cut the horizontal line we obtain the vanishing points, which will enable us to draw the vanishing lines on our plan; we can then in the picture drop perpendiculars from each point to a strip of paper and transfer such to the plan of the picture-plane, and the intersection of lines from the point of sight through the points transferred, and produced to cut their respective vanishing lines, will enable us to re-draw the plan, the scale to which will, as before, be determined by its position regarding the plan of the picture plane. HENRY AMBROSE.

SIR,—Your correspondent of December 13th asks if there are any means by which we can make a scale to measure perspective drawings, which could also be applied to measure perspective from nature. I am afraid the problem is as difficult to solve as the squaring of the circle. A drawing which is perspective properly speaking, has as its lines and planes undergoing such great varieties of foreshortenings that the difficulties in the way of a scale seem insurmountable.

I strongly suspect that the drawing alluded to was not a perspective view, but an isometrical projection instead. It is unfortunate that the mistake is often made in using the term "perspective" for an isometrical drawing,—a thorough misnomer,—and yet frequently met with in old books, and in some modern ones. Isometrical, as its derivation implies, signifies "equal measurement." An isometrical projection, sometimes incorrectly called "a bird's-eye view," can be measured by a scale attached to the drawing, because the foreshortenings are uniform, which makes this mode of projection so extremely useful in certain cases to both the architect and engineer, especially for small detail drawings. J. S. R.

A CAUTION.

SIR,—Allow me, through your columns, to caution others against undesirable visitors. The name of Rogers having been brought up to me this evening, I directed my servant to enquire his business. He applied for the address of the secretary of the Architects' Beneficial Society. I directed my servant to look after my coats, &c., in the hall, but before she could descend the visitor had hastily decamped. Having received several of these visits, I wish to caution others, that they, too, may be on the alert. THOS. CHAS. SORBY.

THE DUTY OF MEMBERS OF A BOARD OF WORKS.

SIR,—Referring to page 918 of your last number, any member of a Board of Works having a pecuniary interest in any contract executing under the Board of Works of which he is a member, forfeits his seat, and subjects himself to heavy penalties should he vote on any question before the Board; and which the latter would, no doubt, enforce on receiving information and proof. J. C.

A BLACK STAIRCASE?

SIR,—I should feel much obliged to any of your readers if they could inform me, through the medium of your journal, of any modern staircase, erected in either a small or large house, of slaty or ebonyed wood, the place and date of erection: if also they could refer me to any staircase of black marble entirely erected in any mansion. I am quite aware of oak, mahogany, ash, stained deal, stone, white marble, various coloured marbles, gilt iron, and bronze staircases; but an ebony or entirely black marble staircase I do not know. The effect of either, contrasted with gold and colour in the ceiling and walls, must produce that feeling of repose, richness, and solidity which satisfies the best taste. K. K.

WATERING STREETS.

SIR,—Will some of your readers be kind enough to state their experience as to the best mode of watering the streets of towns, and as to the practicability or otherwise of the hose and jet system? A SCRIBER.

THE MACCLESFIELD SCHOOL OF ART.

The anniversary general meeting of this school has been held in the Town-hall, which was crowded by its members and friends. Upon the platform and on the sides of the hall were hung numerous specimens of drawing, the work of the pupils of the school. Many of these were marked by a high degree of artistic merit, proving the excellence of the instruction given, and the amount of progress made. The most interesting features of this display were the designs for textile fabrics, applicable especially to the silk trade. It was admitted that in this specifically useful department the school had made, within the last two or three years, great advance, an advance calculated to exert much beneficial influence upon the local manufactures of Macclesfield. Mr. Henry Brocklehurst presided. The report of Mr. Ford, the master of the school, to the committee, &c., on the condition of the school, for the year ending November 30th, 1868, said,—

"During this period the artistic progress and designing capacity of the school have been very encouraging and gratifying. For the last six months the school has gradually enlarged the sphere of its operations, endeavouring to fulfil the hope expressed in last year's report, that we may expect that ere long the designs of the students may be produced in the fabric." We have tried hard to accomplish this, both by technical study in the history and designing practice, and the culminating point of our success for the year is the novelty of announcing that no less than the large number of sixty sketches or designs produced in the school have been purchased by a few of the leading firms of the town. This number cannot be compared with any previous year, inasmuch as it is the first in which the students' works have been sold and manufactured.

"This year, in March last, seventy-three students presented themselves for examination in 167 subjects, in which fifty-nine students were successful in seventy subjects; twenty being distinguished by the mark 'excellent,' and gaining boxes of colours, boxes of instruments, and scientific books; and the remaining fifty-eight gained certificates.

Comparison of results for the last three years,—1866,

16 successful and 3 prizes; 1867, 50 successful, and 15 prizes; 1868, 70 successful, and 20 prizes."

"To provide the staple branch of the silk industry and other industries of the town with efficient power and skilled designers, who would work with taste and practical knowledge, the school must be considerably enlarged, and possess suitable apparatus. To enlarge the school the Government would grant 2s. 6d. per superficial foot, or about 300l., and the approved plans have been estimated at 1,200l."

A testimonial, in the form of a good sum of money, was presented to the master at the meeting.

The committee of the school are shortly to bring forward the question of rating the town, in order to carry out technical instruction in connexion with the present school. The master has already studied the practical part of the silk business, and the success of the designs that are being manufactured is attributed to this fact.

ROYAL ACADEMY OF ARTS.

On Thursday, the 10th inst., being the 100th anniversary of the foundation of the Royal Academy, at a general assembly of the Academicians the following awards were made:—

- To Frank Holl, the two years' travelling studentship in painting.
To Herbert M. Marshall, the one year's travelling studentship in architecture.
Silver Medals were awarded
To Arthur Stokes, for the best painting for the life.
To Miss Kate Aldham, for the best copy made in the School of Painting.
To Edward T. Haynes, for the best drawing from the life.
To John T. Carter, for the best model from the life.
To Thos. Brock, for the best restoration of a portion of the frieze of the Parthenon.
To William E. F. Britten, for the best drawing from the antique.
To Thomas Brock, for the best model from the antique.
To Edward Locke, for the best specimen of perspective and sepiography.
To Philip Westlake, the 10l. premium for a drawing made in the Antique School.

After the presentation of the medals, the members and associates of the Academy met at Willis's Rooms, King-street, to celebrate its centenary of existence. The Royal Academy was founded on December 10th, 1768. We believe that in the course of the ensuing year the new rooms at Burlington House will be open to the public for an exhibition of the works of all Academicians and associates from 1768 to 1868.

THE PAYMENT OF ARCHITECTS.

It having been brought under the notice of the Council of the Institute of Architects that many public bodies, interested to carry out important works in the metropolis and elsewhere have lately endeavoured to arrange for the payment of the architects to be employed on such works by a fixed sum in each case, which sum has been less than the usual rate of remuneration recognised by the Institute, the Council have communicated to the members of the Institute the following resolution passed on Monday, the 30th of November, 1868:—

"That it is the opinion of the Council that the remuneration of architects by a payment of 5 per cent., with the modifications pointed out in the rules for professional practice and charges of architects, drawn up by this Institute in January, 1862,—is doubtless the law on the subject, and is the general practice throughout Europe and America. That it is, therefore, most desirable that these charges should be adhered to as far as possible, and that as little deviation should be permitted therein as the circumstances of any individual case will allow."

A LABEL ON THE PROFESSION.

At least we hope it is. Competition designs for a town-hall for Sydney have been submitted, and the Corporation having made their selection and awarded the three premiums offered, assertions are publicly thrown about that some of the architects besides those named, the Sydney French, besides some rhymes, conveying this charge, gives a full-page cartoon, headed "Rewarding the Prizes; or, Municipal Fiddle-winking" (whatever that may mean), wherein two architects are shown pointing out the merits of their respective designs to a fine fat, stupid old fellow, and at the same time putting into his hands, placed conveniently behind his back, one a bag marked 100l., the other a bag marked 150l. Is this a joke? If so, it is a bad one. Anyhow, the sooner the architects of Sydney put the matter correctly before the public the better.

THE TOWN HOUSE OF LORD SALISBURY.

The old town mansion of the Marquis of Salisbury, in Arlington-street, Piccadilly, is now being pulled down, and the site will be entirely cleared. Early in next year a new mansion will be commenced from the designs of Mr. Slater and Mr. Carpenter. One of the fronts will be in the Green Park, the other in Arlington-street. The block of buildings next the Park will be a private residence for the family. The main block will include grand reception-rooms, dining-room, and hall. Messrs. Lucas, Bros., are the contractors.

THE ARCHITECTURAL REMAINS OF INDIA.

It is satisfactory to hear that the proposal of Government to preserve records of the architectural remains in India is in course of being carried out. The *Bombay Builder* reports the proceedings at a meeting, held on the 3rd of November, to decide on a suitable object for the first efforts of the moulding, drawing, and painting party, which have been under training for this purpose for about six months. Dr. Wilson suggested Mount Aboo, and the ruins and remains in its neighbourhood, as possessing much artistic and antiquarian interest; Mr. Burgess, who exhibited a beautiful set of photographs recently taken at Palitana by Messrs. Sykes and Dwyer, was of opinion that this strange and wonderful city of temples should be first explored and copied. Dr. Bhuu Dajee offered some interesting and valuable suggestions. But, in consideration of the difficulty of getting to these places, it was finally agreed that the first attempt, which will necessarily be of an experimental nature, should be made at the temple of Ambernath, near Callian. This is of itself an interesting specimen of architecture, and its proximity to the School of Art here, the headquarters of the expedition, makes it desirable as a training-ground. The architectural draughtsmen who have been trained for this purpose by Mr. Molecey, the decorative painters from the atelier of Mr. Griffiths, and the moulders and modellers from that of Mr. Kipling, will accordingly proceed thither. Signor Domenico Mattei, an Italian formator who has had great experience in moulding large architectural works, will be the chief moulder for the present; while Mr. G. W. Terry takes the general supervision of the first essay, from which we confidently expect most interesting results. In process of time, as the staff gets to be thoroughly organised, it will be sent further afield, and the remains suggested at the meeting will be taken in hand.

IMPROVEMENT IN RAILWAY JOINTS.

MESSRS. JAMES ECKERSLEY AND DAVID MARTIN, two mechanical engineers, at present residing in Edinburgh, have invented and patented a new form of cast-iron chair, which bids fair to introduce a new element of strength and stability into the present mode of constructing railway joints. Their improvement consists in the first place of inserting, in a peculiarly constructed joint-chair, two cast-iron keys or wedges, which are driven home from opposite directions against the rail, and which are tied together with a single bolt and nut in a direction parallel to the rail; and, secondly, of casting on the inner surface of one side of this chair two projecting pins, which pass into elliptical orifices at the extremity of each rail opposed to the plane of the wedges, thus giving the necessary and secure provision for the expansion and contraction of the metals. The leading idea of the invention would, therefore, appear to be a combination of the chair with the fish-joint. It has long been a problem with railway engineers to discover some method of jointing more secure and economical than the present unsatisfactory process of "fishing" the rails; in fact, it is well known that a large proportion of the accidents which occur is due to the rupture of the rails at the suspended fish-joints. This problem the patentees profess to have solved, not only by reducing the risk of rupture to its lowest possible quantity, but at the same time by effecting a great saving in the cost of construction, and of maintenance in the permanent way. It can be applied without any difficulty to our present lines of rail; it has, we believe, successfully stood a comparative test on

the line of the North British Railway, near Portobello, for the last four or five months; and, also, it has been introduced by Mr. Cadell Bruce, G.E., on the railway at present constructing between Ballater and Braemar.

WORTH CHURCH, SUSSEX.

At the last meeting of the Royal Institute of British Architects, Mr. M. D. Wyatt stated that he had received a communication from Mr. Nisbett, well known as an antiquary, stating that the old church at Worth, in Sussex, was threatened with "restoration," and soliciting the intervention of the Institute to preserve this most interesting specimen of a purely Saxon church. The speaker expressed a hope that the subject would receive the attention of the Committee for the preservation of ancient remains in this country. Professor G. G. Scott and Professor Lewis bore testimony to the extremely interesting character of that church. The former gentleman stating that although there were two or three unfortunate cracks in the structure, he believed it would stand for 500 years longer without anything being done to it. The subject was referred to the Committee for the Conservation of Monuments. Attention was drawn in our pages some months ago to the proposed works at the church.

SCHOOL-BUILDING NEWS.

Malvern.—Madresfield School has been formally opened. The school is a plain Gothic red brick building, situated on the western side of the village church. It consists of a school-room, 18 ft. by 48 ft., and 25 ft. in height, and the schoolmaster's house. Mr. F. Preedy, of London, was the architect; and Mr. T. Garbutt, of Malvern Link, the builder. Mr. G. Streeter was clerk of the works. On the northern side of the church a house for the sexton of the parish has also been erected.

Great Horton.—The Schools belonging to the Primitive Methodists have been reopened, after having been enlarged. The schools, as they now stand, with the addition which has just been made to them, are on the plan of the letter T, the vertical line showing the building of 1860, which is one story high, and the horizontal line showing the recent addition, which is two stories high, 86 ft. by 22 ft. The lower story is joined to the large room of 1860 by an ornamental arch springing from coupled columns, and together they form a room having an area of 3,026 superficial feet, and 17 ft. high, the upper floor being divided into thirteen class-rooms. The left-hand corner of the T is filled by the two-story building of 1863, and the right-hand corner by a new building corresponding with it, 26 ft. by 16 ft. two stories high. These are also intended for class-rooms. The building is ventilated, and is heated partly by hot water and open fire. The architecture is Tudor. The architect was Mr. J. C. Hope, of Bradford, under whose superintendence the different works have been carried out by Messrs. T. Fearnley & Sons, masons, and Messrs. Ansley & Nowell, joiners; the executors of the late Mr. Mitchell, plumbers, Messrs. Cordingley & Sons, plasterers, and Mr. David Smithies, slater; and the cost of the whole, exclusive of the land and the previous erections and enlargements, is about 1,100*l.*

Plympton (Devon).—A National School building for about 100 children is in course of erection in this village, from a design by Mr. James Hine, architect, Plymouth. The site, on the south side of the ancient castle, and immediately adjoining the village-green, was given by the Earl of Morley. The style of the building is Early Pointed. The materials of the walls are local stone, freestone, and Lee Moor brick. Mr. Verren is the builder.

Ellenhall (Staffordshire).—A new schoolroom has been erected and opened at Ellenhall, for the education of the children of agricultural labourers. The schoolroom has an open timber roof, stained and varnished, and the exterior is built of pressed white bricks, with blue brick bands.

Gaddeley.—The new school has been opened here: it is of pressed red brick, with Bath stone windows and doorways. There is a clock-room attached, over which is the bell-turret; a traceried window in the north end adds very

much to the appearance. The interior of the room is lined with pressed bricks, tuck-pointed; the roof is open-timbered, and the woodwork is stained and varnished. The contract has been carried out by Messrs. Herbert, of Leicester, builders, under the superintendence of Mr. R. W. Johnson, of Melton and Leicester, architect.

Grimston.—The new parish school was opened a few days since. It is of brick, with stone dressings, and occupies a good situation facing the village green, from which it is divided by a cast-iron palisade fence. A bell-gable, on the west side, has one of Naylor & Vickers's cast-steel bells; and a large porch at the south end forms a cloak-room. The site was given by the Earl of Aylsford, and the building has been erected by subscription. Mr. R. W. Johnson, of Melton and Leicester, was the architect employed; and the contract was taken by Messrs. Whit & Woodford.

Books Received.

"PIECES of Pleasantry for Private Performance." By J. R. Planché. T. H. Lacy, Strand. We have had occasion on another page to speak of Mr. Planché's doings as an antiquary amongst the armour; here we find him as the genial writer of three elegant little pleasantries for drawing-room use during the Christmas holidays, on Christmas Eve, New Year's Eve, and Twelfth Night. They are titled respectively, "Stirring the Padding," "The Compliments of the Season," and "The King of the 'Bean,'" the latter being the most elaborate, but all within the capabilities of a "Limited Company." They are written with grace and wit, without a questionable word or thought, and will serve to make some merry evenings in many houses. They are appropriately dedicated to his friend of many years, Lady Molesworth, "one of the most genial geniuses of the Drawing-room."—Miss Mary Eliza Rogers is contributing to the *Art-Journal* a valuable set of papers on "Jewelry and Goldsmith's Work in Syria and Palestine," profusely illustrated with drawings by this very clever young lady herself. Her book, "Domestic Life in Palestine," is probably known to many of our readers. The article in the current number of the *Art-Journal* is particularly interesting, and includes an account of the Syrian mode of making the well-known filigree scroll-work. Her concluding observation is, that "the individuality of Oriental work is quite refreshing to one accustomed to see the ornaments which are manufactured by the gross, and by machinery, in Western Europe."

Miscellaneous.

SUICIDE OF AN ARCHITECT IN THE RIVER LEA.—Mr. Richards, deputy coroner, held an inquest last week, in Hackney, respecting the death of Mr. William Tabert Spring, aged nineteen years. Mr. Frederick Marrable, Whitehall-place, said that he was an architect. The deceased was related to him by marriage. He resided at 10, Camden-road, and was the son of the garrison chaplain at Bombay. He was an architect, and he had been articled to witness. His articles would have been completed on the 28th of December, 1869. For some time past he had been very desponding and strange in his manner. He was not in love. He was always sober and steady. The jury returned a verdict of suicide while of unsound mind.

OXFORD ARCHITECTURAL SOCIETY.—At the meeting of this Society, which was held on the 9th inst., Professor Westwood exhibited an Anglo-Saxon manuscript of the Four Gospels, of a date not later than the tenth century. Bound with the volume was a Lectiory, also in a fine state of preservation, and at the end, in a somewhat later hand-writing (about the year 1000), a copy of the letter from Fulco, Archbishop of Rheims, in which reference is made to Grynabald, whom tradition has associated with Oxford. There was good evidence to show that the book was probably written for the rich Abbey of Hyde, near Winchester. A lecture was delivered by Mr. E. J. Payne upon the Romans in Spain, in which he showed how much of the Roman customs and language had been preserved; and at the same time many other works, especially some fine aqueducts.

CRYSTAL PALACE.—The Christmas pantomime this year will be produced on Monday, the 21st of December, the Monday before Christmas Day, to afford the 25,000 season-ticket holders and schools and young persons home for the holidays the opportunity of witnessing it before the influx of visitors always drawn to the Palace during the first few days of the holidays. The pantomime this year has been undertaken by Mr. E. T. Smith, assisted by Mr. P. E. Hopkins. The scenery has been painted by Mr. Fenton and assistants. The scenes are more numerous and varied than have hitherto been undertaken at the Palace. The usual Fancy Fair will extend the entire length of the two naves.

DISCOVERY OF SUBTERRANEAN GALLERIES IN LIVERPOOL.—A good many generations ago the then Earl of Derby obtained leave from his sovereign to build a castle in Liverpool. On more occasions than one subterranean means of communication between the castle and different points of the river beach have been discovered, none of these, however, surpassing in interest one which has been brought to light in the area of the Exchange buildings. Here a deep excavation is being made for the cellars. In the course of this excavation, which is all through rock, a well-marked gallery has been opened up. It is cut in the solid rock, is fully 6 ft. in height by 3 ft. in width, and its crown is about 6 ft. below the surface of the natural ground. It runs almost directly north from the site of the castle, from which the Exchange is distant about 200 yards or more.

NEW HARBOUR WORKS AT CARNARVON.—The first stone of the proposed new harbour works at Carnarvon has been laid by the mayor, Mr. Llewelyn Turner. The proposed new harbour is on the north side of the town, near to the station of the London and North-Western Railway Company. It is not intended to supersede the accommodation already afforded, but will be an addition to it. At the same time the improvement of the present harbour is also contemplated. The estimated cost of the portion of the plan now about to be carried out is 24,000*l.*, which will be obtained from the Public Works Loan Commissioners under the Passing Tolls Act. The estimated cost of the entire works is 50,000*l.* Mr. Frederick Jackson, C.E., supplied the plans; and the contractors are Messrs. Bagbird & Jones; and the works are to be completed in about two years.

RESTORATION OF WORCESTER CATHEDRAL.—At a recent sitting of the chapter, the dean, at the request of the bishop, laid on the table a design for a new episcopal throne, prepared by Mr. Gilbert Scott, which throne he requested to have placed in the rearranged choir, as a memorial of his connexion with the diocese. Mr. A. H. Reynolds, provincial grand master of the Freemasons of Worcestershire, attended on the same occasion, and presented a design for a new stained-glass window, to be placed in the north side of the west transept, as a contribution towards the restoration of the cathedral from the Masonic body of the county. At the same time also a box, containing eight bags for the collection of alms, supposed to be the work of ladies of the congregation, was presented through the secret, the Rev. W. Rayson. In the great east window the inferior glass of four of the bottom lights has been replaced with new stained-glass. The restoration is, though gradually, yet steadily advancing.

THE LIVERPOOL PLUMBERS' ASSOCIATION.—The annual *soirée* and ball of the Liverpool Plumbers' Association has taken place in the large concert-room, at St. George's Hall. There were between 500 and 600 persons present, and the chair was occupied by Mr. S. R. Graves, M.P. There were also at the principal table.—Mr. W. Rathbone, M.P., Mr. James Samuelson, and the following master plumbers:—Messrs. Radcliff, Gardner, Merrick, Jackson, Casement, Dutton, Anderson, and Rogers. Shortly before eight o'clock, tea and other light refreshments were served up. The tables having been cleared, Mr. John Fairclough, secretary of the association, gave a short explanation of the objects of the gathering. He said that there was a benevolent fund in connexion with the association, and that owing to the stoppage of Barned's Bank they were left without resources to meet the calls made upon them by widows and orphans. The members of the association hoped that an appeal to the public would not be in vain, and that the ball would result in an increase to the means of the benevolent fund.

SOUTH WALES INSTITUTE OF ENGINEERS.—The general annual meeting of members was held at the Drill-hall, Merthyr, on Thursday, the 10th. The chair was taken by Mr. Beddington; and, after some preliminary business, the discussions on the paper read at the last meeting by Mr. Cope Pearce, on "Mechanical Ventilation," was resumed, and continued at considerable length. The discussion on the "Patent Fuel" paper, by Mr. Bassett, was also continued, and on "Over-winding," this latter subject formed the great feature of the day.

GAS MADE BY THE AIR-PUMP.—Atmospheric air charged with vapour from petroleum refuse, a kind of "gas" not unknown in this country, but now tried in America, and, of course, claimed as an American discovery, has been brought into use in Canada. An air-pump sends a stream of air through a cask of petroleum or paraffine refuse, and the "gas" thus made goes at once to a gasometer and fills it ready for use. The gas is said to be so pure and inodorous that it gives no warning of leakage, and it burns brilliantly. Private dwellings are provided with the apparatus, and make their own gas, as, perhaps, they draw their own water, by a little pumping!

PORTRAIT PAINTING.—Mr. Charles Mercier has just now completed, for the Junior Carlton Club, a whole-length portrait of Lord Napier of Magdala, which is calculated to advance the artist's reputation. The General is represented as giving orders in the field, the battle going on in the background. The head is very forcibly painted, and is understood to be a good likeness. Mr. Mercier will be remembered as the painter of the portrait of the King of the Belgians, presented to his majesty in commemoration of the reception given in Brussels to English Volunteers. This portrait has been engraved, and it is intended, by the sale of proofs and impressions, the artist having given the copyright to the committee, to raise a fund for prizes to be shot for alternately in Belgium and England. Amongst Mr. Mercier's works, a picture of the Rev. Thomas Wright (the prison philanthropist), in the "Condemned Cell," stands prominent.

MINCHESTERHAMPTON COMMON: A RIVAL TO MALVERN.—A limited building company is being got up for the erection of a hotel and villas on Minchinhampton Common, which is said by many of the medical faculty of Gloucester, and the West of England generally, to be an exceedingly healthy locality. The project is not one of money so much as of sanitary profit. The projectors are said to have no pecuniary interests at stake; and even the architect, Mr. Maberly, and the solicitor, decline all preliminary compensation for work done, or to be done, before the company are fairly at work. The site of proposed buildings has been secured for 500*l.*; and the buildings will cost 6,000*l.* in their complete form, according to the architect's plans, but it is proposed only to begin with one half of the sum. On the other hand, 12,000*l.* may be expended on the site taken, if the project be successful. Mr. A. Booth, of Gloucester, timber merchant, having by medical advice gone to Minchinhampton Common, and thereby, as he conceives, saved his life, has been the prime mover in the matter.

ELECTRIC TELEGRAPHS.—A Parliamentary paper with this heading has just appeared, and gives the Board of Trade returns concerning the names of all railway companies in the United Kingdom which construct or use electric telegraphs as part of their undertaking. These returns show that there are in England and Wales 904 telegraph stations or places from which messages are sent used for the public, or the public and the purposes of the railway jointly, and that 717 stations are used for the purposes of the railway only. The plant for these telegraph-grounds lines for the use of the public, or of the public and railways jointly, and 1514 miles of the same used for the purposes of the railway only. There are 7,353 miles of wire for the former, and 4,279 miles for the latter purposes. The total figures for the United Kingdom show 3,381 stations or places from which messages are sent open for the use of the public, or for the public and the railways conjointly; 738 stations used for the purposes of the railway only, the former class having 21,761 miles of posts and underground lines, and 90,668 miles of wire; and the latter 285 miles of posts, &c., and 4,969 miles of wire, the submarine cables representing a total length of 4,695 miles, with 8,146 miles of wire.

THE FINANCIAL POSITION OF THE UNDERGROUND RAILWAY.—The directors of the Metropolitan Railway Company have issued a circular to the shareholders in consequence of various statements in relation to the affairs of the company, and of various letters from the proprietors requesting information. The directors state that the company are in a position to maintain, if not to increase, the dividends which have heretofore been declared.

THE UTRECHT INDUSTRIAL EXHIBITION.—A meeting has been held in the Manchester Town-hall,—the mayor in the chair,—for the purpose of discussing the questions connected with the Industrial Exhibition proposed to be held in Utrecht next year. Baron Mackay, a Dutch nobleman, described the facilities afforded by the Dutch Government to intended exhibitors, by allowing the importation of articles free of duty, &c. He also dwelt upon the importance of the Exhibition both in a social and commercial sense. Mr. Strass, the vice-consul of the Netherlands, the Rev. S. A. Steinthal, and Mr. J. Maclure gave similar information to the meeting, and urged similar arguments upon it, the latter two gentlemen respectively moving and seconding the appointment of a local committee to co-operate with the Dutch association, which was carried unanimously.

METROPOLITAN IMPROVEMENTS.—At the meeting of the Metropolitan Board of Works on Friday, the 11th, it was decided that the Board contribute one-half of the cost of improvements to be effected by widening a portion of Narrow-street, Limehouse, at an estimated cost of 3,500*l.*, and by providing a new line of communication with Threes-Cott-street, at an estimated cost of 11,000*l.*, such contribution not to exceed 7,250*l.* The Board also contributed 4,007*l.* 10*s.*, half the cost of an improvement to be effected by the Commissioners of Sewers of the City, by setting back Nos. 66, 74, and 75, Newgate-street.—Mr. Shaw opposed all grants for improvements in the metropolis. The Board had not money to pay for improvements, and the burden of local taxation had increased to an extent beyond which the bulk of the ratepayers were able to contribute. He thought the Government should contribute towards public improvements, particularly as the Board owed the sum of 7,000,000*l.*—Mr. Collinson said the interest of 4,000,000*l.* was secured on the main drainage rate, and the remainder on the coal duties.—The solicitor reported that the Board had arranged for a loan of 50,000*l.*, for contributions to improvement. The costs attending the loan amounted to 119*l.*

ARMY FILTER-VAN FOR INDIA.—How to supply pure water to an army, whether in camp or on the march, in hot climates, is a question which has never been solved until the present time. Messrs. E. H. Bayley & Co., of the Steam Wheel Works, Newington Causeway, however, are producing an apparatus which seems to meet the desideratum. Their filter-van, which is specially designed for our army in India, holds 250 gallons of unfiltered water in a tank, enclosed in a wood casing, by which the water is kept cool in the hottest weather. The water is drawn in through suction hose, screwed on. A well-cistern is attached beneath the tank, through which the water passes to the filters. At the bottom of the well is a sediment trap, in which mechanical impurities settle, and whence they are drawn off by a cock at the bottom; in the same way also are impurities collected and drawn off from the filters. The filters are composed of a layer of sand, a body of charcoal, and another layer of sand. They are cleaned by attaching an air-pump to the sediment cocks, and sending a stream of atmospheric air through them. The water passes to the filters through sponges, and thence upward through the filtering material, flowing over into a receiver, from which it is drawn off pure by cocks at the tail of the van. The tanks and filters can be examined through man-holes. By employing the ascension principle of filtration, a much better result is believed to be obtained than by the downward system. Each of the two receivers will hold 25 gallons, which ensures a constant supply of 50 gallons of pure water. If the water be very bad it can be passed from one filter to another; the filters are also so arranged that they can be used singly or together. We understand that our military authorities are investigating the merits of Messrs. Bayley's filter-van, and that the Commander-in-Chief has himself inspected them with much interest, accompanied by a party of distinguished officers.

BLASTING GRANITE.—In one of the granite quarries, near Penryn, worked by Mr. W. Hosken, a large mass of good sound granite, after being carefully cleared of all obstructions, has just been moved from its natural bed some inches, by 50 lb. of blasting powder, confined in a bole 12 ft. deep and 61 in. in diameter, bored in the rock. The stone measures, at least, 40 ft. by 40 ft. by 12 ft., which equals 19,200 cubic feet, or 1,280 tons, taking 15 ft. cube as equal to one ton.

ROYAL GALLERY OF ILLUSTRATION.—Mr. and Mrs. German Reed's entertainment will again be presented on December 23, when Mr. Burdand's clever production, "Inquire Within," will be given. During the absence of Mr. John Parry, Mr. Frank Matthews will take his character, and a *debutante* of much promise, Madlle. Rosa D'Erina, will appear, not only in "Inquire Within," but as the heroine of a new musical extravaganza, which will be brought out under the title of "The Last of the Paladins."

THE ROYAL MAUSOLEUM, FROGMORE.—The Royal Mausoleum at Frogmore is now completed—the granite sarcophagus being placed in the centre of the floor of the building, with the marble recumbent statue of his Royal Highness the Prince Consort, by the late Baron Marochetti, resting on its cover. The sarcophagus, which is of Scotch grey granite, stands upon a black marble plinth, with four ironze angels—also the work of Baron Marochetti—at each angle. The black marble is from Belgium, and is a gift of the late and the present King of the Belgians. All that now remains to complete the decoration of the building is to place three more pictures and three more statues in the vacant niches.

PREVENTION OF SMOKE IN THE POTTERIES.—A conference of delegates from the various governing bodies of the Potteries and Newcastle, has been held at the North Staffordshire Hotel, Stoke, for deliberation on the best mode of carrying out the Smoke Prevention clause of the Sanitary Act. After some discussion, resolutions were agreed to, to the effect, that it is desirable that the different local authorities of the Potteries and Newcastle under-Lyme districts agree upon one uniform mode of procedure in carrying out the law in relation to the consumption of smoke; and that it be a suggestion that for the present, after allowing a reasonable period, to be hereafter decided, for getting up heat, emissions of black smoke from chimneys of furnaces attached to steam-boilers, bakers' ovens, and smiths' fires, exceeding three minutes continuously, or an aggregate of ten minutes in any one hour, be proceeded against. A resolution was also passed as to the mode of procedure recommended to be taken by the local authorities in all cases of complaint.

PRESERVATION OF WOOD.—Many attempts have been made to increase the durability of wood by the injection of certain solutions, especially that of sulphate of copper. On this subject the Academy of Sciences has received an interesting paper by M. Maurice Boucherie. He states that, when properly effected, the injection of the above-mentioned solution is always beneficial; and that the best way to perform it is by displacing the sap and then letting the wood dry in the air. To prove this assertion, M. Boucherie sent in with his paper a few samples of railway sleepers laid down in 1847, after being prepared in the way mentioned. They had been taken up but a short time ago, and in excellent preservation. They were found to be harder to saw than any common dry wood; their resistance was equal to that of green wood, and their elasticity had been preserved unimpaired. Our author contends, however, that it is not the excess of sulphate of copper to which they owe their excellence, but to the combination of oxide of copper with the cellulose of the wood. To show the truth of this, he remarks, that if the latter material, or linen or cotton cloth, be impregnated with cupric solutions, and afterwards washed in much water until none of the metal salt be left, it will nevertheless be found that such substances will remain unimpaired, however long they may be buried in the earth; and that if they be afterwards treated with ammonia, oxide of copper will be obtained from them. It is well known that the continual contact of the iron chair with the sleepers is injurious to the wood, and yet in the present case it has not been so, the wood having been used when perfectly dry, after being saturated with the copper solution. The latter is rarely absorbed if the wood contain more than 6 per cent. of sulphate of iron.—*Gaitgnani.*

THE LIVERPOOL INDUSTRIAL BUILDING COMPANY (LIMITED).—The first ordinary meeting of the shareholders of this company has been held in the Odd Fellows Hall, St. Anne-street, Liverpool; Mr. James Samuelson, hon. arbitrator, in the chair. The report of the provisional directors was read, and passed unanimously. It states that, "so far a nominal capital has sufficed to carry on the company's affairs; but it is in contemplation to purchase land, and erect a few well-built villa residences for workmen, for which customers can be found, who will, however, only be able to pay for them by annual instalments." The balance-sheet shows a net profit to date (November 2), of 259*l.* 7*s.* This has been derived from *bona fide* work done to order. The company consists of working men, along with a few gentlemen who are anxious to aid them in their efforts to elevate their position, and try their fortune as master builders. From the balance-sheet it appears that, up to the present time, 584 shares have been taken up, and the deposit of 5*s.* per share paid upon them. The shares are 1*l.* each, and the nominal capital of the company is 5,000*l.*: and there are about sixty shareholders. The provisional directors are all working men, and six working men,—a bricklayer, a plumber, a painter, a plasterer, a mason, and a joiner,—along with a managing director, have been elected as directors for the coming year.

CONCRETE HOUSES.—Much has been said and written of late as to the advantage of using Portland cement concrete as a substitute for brick and stone in the erection of various kinds of buildings. We believe the Duke of Northumberland has been the first to practically test this mode of construction in the North, by ordering the erection of a cottage of three rooms, scullery, and other conveniences, at Church Bank, Alnmouth. The site is on a sand-hank close to the seashore, and contiguous to an old cemetery once connected with the main land, but now, at certain times of the tide, an island. The necessity for the erection of the cottage has arisen from the intention of the inhabitants of Alnmouth to use the cemetery again (after many years of disuse) for the purposes of sepulture. The Duke has inclosed the ground, and is building the cottage at his own expense, and a small oratory is to be built at the expense of the inhabitants of Alnmouth. The material used in the construction of the cottage is Portland cement and gravel from the seashore. The foundation is on the sand, 6 in. thick and 18 in. wide. On this there is a base course, and above the walls are 9 in. in thickness. Part of the erection is two stories in height. The roofs are all flat, and are constructed entirely of concrete and old wire rope. The ceilings are divided into panels by ribs at right angles, and require no plastering. A wall on the upper floor is supported on a concrete beam, 13 ft. span; a large cistern is formed under the roof of the pantry for rainwater. The sides of the cistern being the walls of the bed-room will severely test the imperviousness of the material. The building is nearly complete. No wood is used except for doors, and no iron, except about five shillingsworth of old wire-rope.

TENDERS.

For erecting house and office on St. Helen's Park Estate, at Ore, near Hastings, for Mr. Joshua Williams. Messrs. Habershon, Brock, & Webb, architects:—

Mansley & Rogers.....	£3,150 0 0
Simpson.....	4,430 0 0
Scrivenor & White.....	3,174 0 0
Patman & Fotheringham.....	2,985 0 0
Longmire & Burge.....	1,807 0 0
Nightingale.....	2,860 0 0
Longhurst.....	2,625 0 0
Hughes.....	2,580 0 0
Howell.....	2,560 0 0

For rebuilding machine-rooms, &c., at the clothing factory of Messrs. Hyde & Co., clothiers, Oxford. Mr. Codd, architect:—

Baker.....	£3,920 0 0
Dover.....	3,780 0 0
Jones & Co.....	3,775 0 0
Cable & Co.....	3,592 0 0
Hall.....	3,570 0 0
Cowley (accepted).....	3,220 0 0

For the erection of a portion of the church of Our Lady and St. Helen, Southend, Essex. Mr. T. Goodman, architect. Quantities supplied:—

Brown & Robinson.....	£2,157 0 0
Axford.....	2,125 0 0
Deacon.....	2,100 0 0
Wicks, Bangs, & Co.....	1,790 0 0
Wheeler.....	1,770 0 0
Patman & Fotheringham.....	1,754 0 0
Wilkins & Son.....	1,700 0 0

For alterations in forming class-rooms for the boys and girls, at the Whitechapel Society's Schools. Mr. G. H. Simmonds, architect:—

Hicks & Son.....	£318 0 0
Outwater & Son.....	310 0 0
Little.....	286 0 0
Jacobs.....	293 0 0
Reed & Son.....	286 0 0

For house, corner of lower plot, Nightingale-lane, for Mr. J. K. Farlow. Mr. R. P. Noddy, architect:—

Woodward.....	£3,320 0 0
Webb & Sons.....	3,279 0 0
Newman & Maslin.....	3,128 0 0
Lathey, Brothers.....	2,973 0 0
Adamson & Sons (too late).....	2,859 0 0
Myers & Keddell.....	2,845 0 0
Turner & Sons.....	2,807 0 0
McLacklan.....	2,870 0 0
Morter.....	2,843 0 0
Brown & Robinson.....	2,820 0 0
Colls & Son (accepted).....	1,837 0 0
Thompson.....	2,780 0 0

* Withdrawn in favour of Colls & Son.

For house at Chislehurst, for Mr. F. W. Freese, Messrs. Parr & Strong, architects. Quantities supplied by Mr. Joseph Fox. Messrs. Sheard & Hanstock's patent combination:—

Price.....	£2,120 0 0
Brown & Robinson.....	2,100 0 0
Robinson.....	2,093 0 0
Hill & Keddell.....	2,040 0 0
Longmire & Burge.....	1,995 0 0
King & Son.....	1,988 0 0
Arnand.....	1,921 0 0
Foster.....	1,837 0 0
Rose.....	1,753 0 0

For Montgomery County Gaol extensions. Quantities supplied by Mr. Joseph Simmonds:—

Yard.....	£3,384 0 0
Treasure & Son.....	2,491 13 6
Yates.....	2,459 9 7

Accepted, for the erection of a warehouse, Branch-road Batley, for Mr. Joseph Fox. Messrs. Sheard & Hanstock, architects:—

Mason's Work.....	£158 0 0
Cordingley.....	161 5 0
Brooke.....	8 12 9
Senior.....	21 16 0
Thompson.....	21 16 0

Accepted, for the erection of a warehouse and houses, in Station-road, Southill, for Mr. Isaac Colbeck. Messrs. Sheard & Hanstock, architects:—

Mallinson.....	£740 0 0
Fetty & North.....	439 0 0
Thornton.....	50 0 0
Senior.....	39 10 0
Hey.....	50 0 0

Accepted, for the erection of a power-loom shed at Brookroyd Hill, Batley, for Messrs. Parr & Ramsden, Messrs. Sheard & Hanstock, architects:—

Willans.....	£780 0 0
Sykes.....	199 0 0
Lobley.....	31 5 0
Bagsbaw.....	86 5 0

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. *Note.*—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHRISTMAS WEEK.—"The Builder" for the week ending DECEMBER 26th will be published on THURSDAY, 24th inst., at the usual hour.

ADVERTISEMENTS for insertion in that issue must therefore reach the Office before THREE O'CLOCK p.m. on WEDNESDAY, 23rd inst.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

The Builder.

VOL. XXVI.—No. 1351.

Architecture and Earthquakes.

HE appalling accounts of physical convulsion that have, within the past few months, succeeded each other with such unwonted frequency, have a special importance to the architect.

The long line of upheaval, in which the volcanoes of the Andes afford so many vents for the subterranean fire, may be considered as in movement. The waters of the Baltic have given an unusual indication of sympathy with some geological change, to which we called attention in No. 1,344 of the *Builder*.^{*} Vesuvius has been pouring forth ashes and lava with an intensity of action without parallel since the earthquake of 1853, not excepting the long eruption which succeeded that terrible shock. And even in England, so long considered to be beyond the region of earthquakes, symptoms of that mighty terror have been felt, from Millford to Blackheath. A second shock has been, yet more recently, reported. However slight the movement (and to those familiar with the more frequent and more violent phenomena common in the South of Europe it has seemed but a very feeble echo of alarm), it has yet given a distinct note of warning. To say nothing of the 300 earthquakes, some reference to which has been discovered in the annals and chronicles of this country, we have positive evidence, from geology, of the former intensity of the subterranean force in our island. Dykes of trap, columnar ranges of basalt, mountain upheavals of igneous rock, are familiar to all geological students. And of the seventeen distinct systems of mountain upheaval traced by the French geologists, from that of *La Vendée* to that of *Tenarus*, the one which has given the present superficial form to South Wales is that which is most strongly characterised by the destructive energy of often-repeated shocks. It is peculiar to this system of upheaval, wherever it has been traced, that no stone can be quarried from its rocks of sufficient size for building, except in the form of the most paltry rubble. The vibrations which raised the mountain chains of this system have been such as to disintegrate the strata, and to rive every bed of stone into a thousand seams.

While thus, in the very slight movements which have recently been observed in this country, we see no cause for unreasonable alarm or for idle panic, there can be no doubt that we have indications of the possible recurrence of a period of geological movement in the district of the British Isles. There is no sound reason for supposing that the internal source of activity has become feebler of late years. Long periods of rest have often intervened between outbursts of volcanic activity. When the fearful eruptions of Vesuvius, which overwhelmed the Campanian cities in A.D. 79 (recorded in the memorable words of Pliny), broke forth, the mountain had been, as far as historic memory could reach back, as tranquil as the craters of Auvergne, or the trap hills of Cardiganshire and of Pembrokeshire, are now. The

upheaval of the Pyrenees took place after the deposit of the upper chalk, which underlies the clays and sands of Hampshire, Kent, Essex, and Middlesex; and four distinct mountain systems are of date posterior to the Pyrenees. The rise of the Tuscan mountains is later than the formation of the Pleistocene geological deposits,—an event, so to speak, of yesterday. The depression of a portion of the shore of the Tagus, 113 years ago, was an event that brought modern Europe face to face with an intense and acute throch of the irresistible and mysterious power of earthquake.

The practical hearing of these considerations is this. How far is the style of building now prevalent in Great Britain fitted to resist shocks of earthquake, if such should become more frequent? To some extent, of course, this is a question of degree and of detail; and, so far, incapable of any exact solution. But it is, nevertheless, the duty of every architect who regards his own fame to look the question in the face, and to consider whether any precautions, hitherto not regarded as necessary, should be taken in his future work, due regard being had to the suggested contingency of earthquake.

Against the danger in its most acute form, it need hardly be pointed out, no architectural or engineering skill can for a moment avail. When the earth becomes like a storm-tossed sea, or when unfathomable gulfs suddenly open beneath the feet, whether by the riving asunder of a line of ravine, or by the yet more awful downward movement of a larger or smaller area of land, man feels his utter helplessness. In all the grandest movements of nature, when nature may be said to be angry, the force of human resistance is inappreciable. The fury of the cyclone overthrows buildings that are well able to resist the ordinary outbursts of tropical storms. The thunderbolt is as irresistible as it is sudden. The surge of the sea, driven by submarine shock on the shore, finds before it a city, and leaves behind it a mass of indistinguishable wreck. "Temple and tower went down" in a few seconds before the shock of the Calabrian earthquake in 1858, and 30,000 human beings are said to have perished in their ruins.

But apart from the consideration of these rare and awful catastrophes, against which no human skill or precaution can avail, the question of providing against what may be called ordinary terrene disturbance deserves attentive consideration. A certain amount of prudence, for instance, might make all the difference between the infliction of a slight damage on a city of the magnitude of London, by a moderate shock of earthquake, such as is almost of monthly occurrence in some of the Creek islands, and its reduction to a mass of ruins.

Man hocomes emboldened, by habit, to look almost any danger in the face. In situations where he is exposed to that peril which, of nil, most powerfully affects the human imagination, he has learned so to build as to run the least possible risk when his house is shaken over his head. The best form of shelter for countries subject to earthquakes, no doubt, is the simple protection of a tent. On a dwelling supported on poles, and tied to the soil by cords and stakes, the earthquake has less power than the wind, when the latter rises to a storm. In antiquity, and even to the present day, the countries, with which we are most familiar, that are most subject to earthquakes, are those in which the climate most freely permits of habitual abode under canvas, or rather under goats' hair. An earthquake, of the same degree of intensity, would be a very different calamity, if it occurred in a Bedouen camp, from that which it would be if it took place in Whitechapel.

Races that have felt the need of a more permanent home than the tent of the Arab, or the wattled, thatched, or paper-roofed houses of some of the Malay tribes, have sought to pro-

tect their dwellings from sudden overthrow by the art of the joiner. There can be no doubt that a most important structural principle is involved in this method of construction. A well-framed box will bear an amount of knocking about, without injury, that would not only overthrow a pile of bricks or stones dependent on weight and on friction for its stability, but shake to pieces any ordinary masonry. Even an ill-framed, and carelessly-constructed box, would resist an enormous amount of vibratory force. Framed wooden houses, therefore, have been naturally, and very successfully, adopted by the inhabitants of districts subject to earthquakes. With our cooler blood, and more practical views of comfort, we are inclined to wonder how any men can make, or even keep, their dwelling-place where the earth rocks beneath them at almost every change of the moon. Still, if they will live there, we cannot deny that their wisest plan is to make their houses as much as possible on the principle of great wooden boxes, pinned and pegged together, so as to endure a large amount of shaking, in any direction, without actually coming to pieces.

The next step in the attempt to produce architectural works that shall be capable of resisting ordinary shocks of earthquake is, the introduction of timber into masonry. This is a style of construction that was formerly prevalent in our own country. Each year, alas! witnesses the destruction of one or more relics of ancient, timber-trussed London. In Gloucestershire, in Devonshire, in many a far country district, are to be found noble relics of this durable style of building. The blackened oak-hemms, contrasting sharply with the whitewashed walls which they aided to support, are among the most picturesque features of some of our old country-houses. So much strength, or we might more properly say so much tenacity, was given to the walls of a house by the free use of strong and sound hard timbers, that our old architects were wont to amuse their opportunities, more especially where ground was of value. Old, timber-hill, London presented a series of gabled ends of houses to the street, story overhanging story, so that the foot-passenger walked almost as much under shelter as he can do in the "rows" of Chester at the present day. Fancy the dismay of a modern contractor on being ordered to make the floor of his drawing-room hang, unsupported by pillars, over the kitchen area, and the floor of the bedroom above to project over the width of the pavement!

Whatever was the original cause of the introduction of this method of building into England, there can be but little doubt that the use of solid hard-timbers was, in other countries, resorted to with the express purpose of resisting earthquakes. On no other principle can we account for the introduction of the comparatively perishable material of cedar into the marble walls of Solomon. "The great court round about was with three rows of hewed stones, and a row of cedar beams, both for the inner court of the House of the Lord, and for the porch of the house."^{*} Thus, when we read of the occurrence of an earthquake that rent the altar itself, we hear of no damage being suffered by the well-banded Temple wall.

One very evident danger, it is true, attended on the profuse introduction of bond timber into houses. It was the same danger that has driven our architects to replace the immemorial covering of thatch, precious as are its qualities of securing coolness in summer and warmth in winter, for the more rapidly-conducting, but fire-proof, roof of slate. The danger of fire is considerably increased by the external use of wood. This material has, therefore, gradually disappeared from our external architecture, and the security which bond timber would afford in the

* See *Builder* for November 7th, 1868, p. 810.

* III, Reg. vii, 12.

case of any moderate shock of earthquake has been to a great extent abandoned.

Another change, consequent on the gradual increase of personal security that has accompanied the growth of modern civilization, has rendered the work of the English architect less able to resist a casual shock than that of his remoter predecessor. When the founders of noble families began, in the tenth and eleventh centuries, to build houses for themselves and for their descendants, they took care to make them strong. For a man's house to be his castle, it would then have been quite idle to depend on the protection of public law. Thick walls were required to keep out unwelcome visitors. The sudden raid of a jealous neighbour, the simple process of ejection which some competing claimant might at any time find means to serve, the surprise of the brigand, of any rank and with or without any pretext, had to be guarded against by means of that prevention which is better than cure. Thus we find that solid and lofty keeps arose, like that of the Papal Palace of Avignon. Thus we find that the Irish chiefs, at a time when all Celtic buildings were circular in plan, ran up their places of shelter into towers, and multiplied those remarkable structures which, notwithstanding the unquestionable Christian emblems carved on many of them, have caused such great, and such unnecessary, puzzle to the antiquary.

Men who have seen emblems of Pagan worship, or of what they call "Arkie" significance, in these simple fortresses of the Celtic chiefs, can hardly have been aware how Pisa, Lucca, Bologna, and other Italian cities, during the stormy Middle Ages, were mere groups of lofty turrets—round and square.

Again, in larger and more important buildings of somewhat later date, such, for instance, as Bandon Castle, we find the walls to be as much as 9 ft. thick. In a palace once belonging to the Spanish viceroy of Naples, which is now converted into an hotel, the walls of the lower story, on a level with the shore of the Mediterranean, are 15 ft. or 16 ft. thick. When men were obliged to build with reference to military defence, they piled together such masses of masonry as were adequate to resist, not only the battering-ram, but the more energetic force of earthquake. Few buildings of any magnitude are to be found in Southern Italy which do not present, in some part or other,—in the level roof if not in the walls,—a system of cracks, which for the most part are repaired by some bituminous cement. These black and shapeless scrawls are the handwriting of the earthquake. They are evidence at once of the repeated onrush of the hidden telluric force, and of the power of good masonry, strong walls, and well-set lime, to resist this force, in such a manner as to suffer the minimum degree of damage.

Now, in the greater number of our modern buildings, in our engineering works as well as in our palatial structures, we have fallen into the habit of regarding merely statical equilibrium. We have left out of sight everything like dynamical stability. We have not needed castles. Knowing that no structure, except such as is specially designed for military purposes, can resist the force of gunpowder, and looking to the law and to the police for the maintenance of the public peace, we have filled the fronts of our shops with plate glass, and have pierced the slight walls of our houses for lights that may obliterate the memory of the iniquitous and pestilent window-tax. We have felt that if a house were strong enough to bear the strain of a quadrille in the drawing-room, it was adequate for all the purposes of our law-abiding and non-volcanic habits.

While comfort, space, light, and ventilation have thus been the objects sought by the architects of our bettermost sort of houses, to the exclusion of any military strength, or capability of resisting any sudden violence (such, for instance, as the shock caused by the explosion of a powder-mill, or by the inflammation of an escaped quantity of gas), the security of the humbler dwellings has been equally diminished. Visit what part of England you may, you find that the low, small, thatched cottages which were so numerous, and so picturesque, as well as so uncomfortable, at the commencement of the century, are disappearing. For the most part they are replaced by dwelling-places which, in their sanitary qualities, are as much superior to their predecessors as they are inferior to them in their artistic merit as points in a picture. They are also far safer as regards fire. On the other hand, the destruction that

would be caused in streets and rows of such small, tidy, slate-roofed, well-ventilated, and nterly ugly and tasteless houses, as grow up around all our centres of manufacturing industry, would be terrible, in case of any serious shock of earthquake, as compared with that which would be endured by the small, poking, pictorial, wood-boned old cottages. Where cheapness is the first consideration, one cannot have everything. As to the picturesque, we must not grumble at its sacrifice if the result be, as it is in the cases to which we refer, the improvement of the public health. But if the case should occur, which we have had several hints may occur, we shall find that our structural economy has cost us very dear indeed.

If London were visited by such a shock of earthquake as that which alarmed Naples in 1858, what would be the result? It is easy to reply. In the southern city a great terror seized the population. Hardly any one remained beneath a roof for three successive nights. Delicate women slept in the streets in their carriages; and, close by them, slept the *lazzaroni*, coiled up in their baskets,—the large flat panniers in which they carry fruit, or vegetables, or fish. The barbers made a good time of it, for every one rushed to be bled—the first medical remedy, in the Italian practice, for sudden fright. But no lives were lost; no appreciable damage was done. Further south, as before mentioned, the results were fatal and terrible; but at Naples the shock was just intense enough to frighten any one out of his senses, to re-open a few old cracks, and to form a certain number of new ones, in houses of a certain magnitude, and to do but little further harm. We may take this, then, as an illustration of such an earthquake as is seriously alarming, without being fatally destructive. Now, if a shock or two (there is always a *replica*, which is more dreaded than the first shock) of this intensity were suddenly to visit London, what would be the condition of the metropolis within four-and-twenty hours? St. Paul's would, we firmly believe, be left standing. The great masses of masonry would still appear its dome. The river bridges would probably have been little, or even not appreciably, injured. Some other large buildings might have resisted the shock—Somerset House, Westminster Palace, other important structures in which the walls had not been pressed down to egg-shells,—perhaps a few private dwellings, if any such were to be found, in which the main object of the builder had not been to use only as little material as could possibly hold together, when assailed by no violence greater than that of a moderate gale or the passage of a brewer's dray. For the rest,—it would have been *Londonum fulv*.

That such a trial awaits our modern architecture no one can predict. That it may not, we must all pray. But that it is probable, no one can deny. Is it not, therefore, the duty of all architects, and of all builders, taking a wise precaution for the future, to consider whether they should not, either by the introduction of a well-devised system of bonding, or by a careful and liberal calculation of the strength of their walls, provide for the stability of our habitations, in case the hints, of which we have already had more than one, should prove to be the precursors of a somewhat more serious shock?

The ink was wet on the preceding page, when the announcement of the outburst of a "colossal eruption" from the summit of Etna was flashed through the telegraphic wires. The simultaneous activity of Etna and of Vesuvius is a rare occurrence. Signs of internal movement continue to be reported from every part of the world. The terrible earthquake of San Francisco was felt in Iceland. The shocks experienced in this country lead us to wait with interest for the next intelligence from Iceland, as Scaptar Jokul is our nearest volcanic neighbour. The early set ice on the Neva was broken up, a few days since, by a tidal wave for which there was no wind to account. The waters of Lake Ontario have shown a disturbance similar to that observed in the Baltic. A period of activity in snhtranean energy, hitherto unknown to the present generation, appears to have commenced, and the upheaval of new craters of elevation, such as those which took place comparatively recently in the case of Montt Jurillo, in Mexico, and of Monte Nuovo, in Naples, is far from improbable. The attention of geologists has been long turned to certain phenomena of depression and of elevation on the coasts of the Baltic. It is not without a strange feeling of awe that we note the multiplying rumours of "earthquakes in divers places."

THE EDUCATION OF THE SURVEYOR. THE INSTITUTION OF SURVEYORS.

An ordinary general meeting of this Institution was held on the 7th of December; the President (Mr. John Clutton) in the chair.

Mr. William Sturge, of Bristol, read a paper entitled "The Education of the Surveyor." He said—

The subject of the paper I propose to read to the Institution this evening is one which appears to me to be much in accordance with the principal object of the Institution,—that of promoting the interests and raising the character and position of the profession.

I would state at the outset that I propose to treat principally of the education requisite for my own branch of the profession,—that of the land surveyor. The practice of the building surveyor is of so much importance and so distinct as to require a different education, and I trust that some member of that branch may be disposed to read a paper upon it on a future occasion.

The present state of education for the profession of a surveyor cannot, I think, be considered satisfactory, or adequate to its requirements, especially when we consider the diversity of knowledge required for competent practice in its various branches, the extensive range of subjects it embraces, and the magnitude and importance of the interests committed to its care. In many cases surveyors have had no special education whatever; and, at most, the run of a surveyor's office as a pupil for three or four years, with the addition, in some cases, of a year or two spent with a practical farmer, has hitherto formed the staple of the surveyor's special education. But valuable, and indeed indispensable, as are these advantages, and successful as they have proved in the example of many eminent members of the profession, I cannot think that they are sufficient to enable the surveyor to keep pace with the advancing knowledge and the more exacting requirements of the present day, but that some special course of study is desirable to qualify him for the multifarious duties which will devolve upon him in the course of an extensive modern practice. I propose in this paper to indicate how it appears to me the special education of the surveyor can be improved, and to consider whether any particular course of study is advisable for the attainment of this end.

The only point I would remark on, in reference to the scholastic education of the youth intended for a surveyor is, that special pains should be taken to well ground him in mathematics, not so much in the higher branches—though these will be in his, as in other cases, be useful as a mental training—as in those which will be of the greatest service in the practice of his future profession. Among these I would mention Euclid, which will not only tend to give him mathematical precision, but to strengthen his reasoning powers; algebra, to enable him to understand those mathematical formulæ in which are expressed the laws of so many branches of science; mensuration, both of superficies and solids; and trigonometry.

As soon as the youth leaves school, whether public or private, his special education for his profession should commence in earnest; and the question at once arises, in what that special education should consist, and what are the means most likely to conduce to the greatest proficiency.

And, first, I would discuss the expediency of completing the education of the youthful surveyor at one of the Universities, Oxford or Cambridge. I am aware that it is increasingly the practice of professional men to give their sons a University education; and in some, though probably not in many instances, the practice has obtained amongst surveyors. No doubt it has its advantages. The habits, manners, and associations are formed amongst gentlemen, many of them of the landed interest, whose acquaintance may be professionally useful in after-life. The surveyor's son may be a reading man, and may pass with honours the examinations for his degree,—a distinction which will give him a position in after-life. But, on the other hand, the practice has its disadvantages. Several of the most precious years of the young man's life are spent in an education by no means specially adapted to his future profession,—years which he can ill spare, even for University advantages and honours. If he acquire the manners and tastes of gentlemen, he may also acquire the desultory and expensive habits, if

not the vices, of too many of his associates; and, instead of reading, he may waste his time in frivolity and dissipation. Even if he avoid these evils, the taste and habits he will form will probably render the drudgery of a surveyor's office peculiarly distasteful to him. On the whole, then, I arrive at the conclusion that the balance is against a university education for the surveyor. I think, however, that the quality of his education should be put to a thorough test; and with this view I would recommend that, on leaving school, he should pass the matriculation examination of the London University, which is of a severe and searching character, and is resorted to by young men from the best schools in England,—even by many who intend to pursue their studies at Oxford or Cambridge. Having thus matriculated, the young man need not as a matter of course continue his studies at the London University, though he can afterwards proceed to take his degree if he be so inclined. As an institution especially adapted for the education of surveyors, I may mention the Royal Agricultural College at Cirencester, where a good rudimentary knowledge of geology, agricultural chemistry, and other kindred subjects may be obtained, which cannot fail to be a useful foundation for professional knowledge. The entire course of lectures at this institution occupies, I believe, about two years.

Let us now suppose the young man, of eighteen or nineteen years of age, about to enter on the task of acquiring a practical knowledge of the profession of a surveyor. I would mention, as a preliminary of more importance than is often attached to it, that of obtaining a good practical knowledge of accounts. This branch of a commercial education is wholly neglected in our classical and mathematical schools; and many boys enter upon their professional studies who scarcely understand an ordinary cash account, much less the mysteries of double entry, or the somewhat complicated bookkeeping of the firm or the estate. Yet a practical knowledge of accounts is as necessary to the land agent or farmer as to the merchant or tradesman. Without it, the land agent cannot present his annual accounts of a large estate to his employer, with that clear statement and analysis of receipts and expenditure which will exhibit the general result at a glance, whilst it will account for every item in detail. Without this knowledge, too, the land agent must rely entirely upon his accountant; and, honest as it is hoped and believed are the great majority of this class of persons, yet instances of dishonesty not infrequently occur; and it is obvious that they are far more likely to occur when the accountant knows that his principal is ignorant of accounts, than in cases where he knows that his books will be periodically and strictly audited. This knowledge is also of great use to the land agent, who has to keep the accounts of a home farm and to present a clear and detailed account of receipts and expenditure, and of profit and loss. I believe that a few months spent in an accountant's office is the best mode of acquiring a sufficient knowledge of accounts for these purposes, as well as those habits of neatness in handwriting and figures which we all like to see in our account-books, but which are not often learnt at school. If these objects can be thus obtained, I do not think the time thrown away.

I will now suppose the young surveyor, article as a pupil in one of our leading offices in town or country. On the one that he makes of the next few years will mainly depend his chances of success in his profession. He is pretty much his own master; and whether he acquires much knowledge or little will depend mainly upon himself. He will find the partners of the firm too much occupied in business and too much from home to be able to devote to him much personal attention. How, then, is he to acquire the theory and the practice of his profession? As for the theory, the surveyor's library is but scant, and there are no courses of lectures on professional subjects, as there are for the student of law or medicine; yet there are works which may be read with advantage, and as the time for reading after office hours is but limited, the pupil should devote himself to such a course of reading as bears directly upon his profession. Amongst these I may mention treatises on geology, botany, agricultural chemistry, agriculture, estate management, life leases, reversions, &c. I treat that one object to be kept in view by this Institution will be the formation and selection of a professional library for the

benefit of members and students of the profession.

But it is on the practical knowledge to be obtained, by having what is sometimes called the run of the office, that the pupil must in great measure rely; and here I cannot too strongly impress upon him the fact that much will depend upon himself. If he performs the duties assigned to him in a listless, perfunctory manner, as a mere machine, not throwing his mind into his work, he will soon find that his employer will take little interest in him, that he will not communicate his knowledge, and the pupil will at length leave the office without having acquired one-half the knowledge that he might have done; but, if, on the other hand, he throws his mind into his work, and makes himself as useful as he possibly can, he will soon find that his employer will take especial interest in him, that he will be glad to have his company on his journeys, when valuable opportunities will arise of acquiring knowledge of the business in hand. The pupil may thus become the confidential assistant, who may be trusted with the conduct of important details, and thus he may early acquire a practical knowledge and a confidence in himself to be obtained in no other way.

The pupil will find the profession of which he has to make himself master divided into several branches, all more or less connected but diverse in character. These may be arranged under the following heads, viz. :—

1. Chain surveying, mapping, and levelling.
2. The valuation of land and other property.
3. The management of landed estates.
4. The improvement of landed estates, including land drainage, the erection of farm-houses and cottages, and the laying out and disposal of building land.

And, 1st, as to chain surveying, mapping, &c. In the days of my pupillage, thirty years ago, this formed a large branch of business, to which the time of pupils was principally devoted. The surveys for the Tithe Commutation, then in progress, afforded full scope for employment in this important department, and the opportunity of acquiring, by practice, quickness and accuracy in the field. The completion of the tithe maps, as the standard of measurement, have so far reduced the extent of this branch of business, that, except in offices that specially devote themselves to it, the pupil has now little opportunity for the study and practice of the art. To acquire accuracy and speed, requires several years' practice, and it is a question whether the pupil's time may not be better employed. Yet a knowledge of field work is very useful in after-life, as it enables the surveyor to test the quality of the surveys made for him by those whom he may employ; and if the pupil have time and opportunity, he will do well to acquire it. A practical knowledge of levelling is absolutely necessary for the purposes of land drainage and irrigation, and should on no account be neglected.

I now come to the second head,—the Valuation of Land and other Property. To acquire an accurate knowledge of the value of land is, perhaps, the most important part of the surveyor's education, that in which he will find the greatest difficulty, and to which he must devote the most patient attention. During his pupillage he must expect to do little more than lay the foundation of that knowledge which only long practice and experience can so far mature as to entitle him to the confidence of the public. But it is of the greatest importance that the foundation thus laid should be sound. Suppose the pupil placed in the office of an eminent judge of land. Let him embrace every opportunity of accompanying him in his valuations. Let him not rest satisfied with recording the field values, but let him inquire into the indications on which the judgment has been formed, and the reasons for the conclusions arrived at. Let him not, however, be a mere copyist, even of the most eminent master. Let him study the elements on which the value of land depends; let him classify the various descriptions of soils, according to the amount and description of produce, the course of husbandry, the expense of cultivation. Let him learn to assign the maximum and minimum values to each class of land, and to understand the reasons why these values are applicable. Let him minutely study the indications, both general and special, of fertility and barrenness in soils. On this subject I may mention, by the way, he will find an admirable paper by Mr. Bravender, in the *Journal of the*

Royal Agricultural Society (vol. v.), entitled "On the Indications of Barrenness and Fertility in Soils." Let him study the quality and description of herbage on grass land (here a knowledge of botany will be found very useful), and the depth and texture of the soil and sub-soil of arable land. After all his pains he cannot reduce the science to a certainty, he must be content with an approximation. He will make mistakes. Happy is the surveyor who can say, that in the course of a large practice he has made but few!

The next branch of the profession to which I have to refer, is the management of landed estates. Were one to judge of the management of landed property by the description of persons to whom it is to a large extent entrusted, one would be led to suppose that it requires no special training or qualifications whatever. By far the greater part, probably, of the landed property of England is under the management of solicitors, who are usually little more than receivers, without much knowledge of the details of management. The stewardship is often given to a relation or personal friend of the landowner, not on account of the acquaintance with his duties, but as a means of affording him a livelihood. Military men are great favourites, though in what respect their previous habits have fitted them for estate management it is hard to understand. The fact is, the effects of good or bad management upon an estate are not all at once developed, and, therefore, good management is not always appreciated. But let not the young land agent think that he has nothing to learn. The more the details of estate management are examined, the more attention and skill will they be found to require. The fair rental of farms, the necessary amount of capital, the choice of tenants, the covenants of leases, are all matters needing much judgment and knowledge. The oversight of the tenantry, too, as regards the management of their farms, and the fulfilment of their covenants, requires considerable tact, in order to exercise a firm authority, and to command the respect and good feeling of the tenants, without descending to a system of espionage or becoming too familiar with them. The oversight and management of repairs will be found to require much practical experience, and more study than is often devoted to it. The surveyor should require some knowledge of building and of measuring work, the quality and use of different kinds of materials, and the most economical mode of executing work. A large estate requires considerable administrative talent in the arrangement and superintendence of the duties of subordinates and workmen. The care of woods and plantations also calls for much skill and attention to develop the growth and to increase the annual produce. In fine, he may be described as a model land agent, who knows how to make the most of an estate without racking the rental, how to select and encourage good tenants, how to combine improvement with economy, and how to promote that mutual confidence between landlord and tenant which ought ever to exist on every well-managed estate.

My fourth head, the Improvement of Landed Estates, is yearly becoming of more importance, owing to the increasing spirit of improvement which prevails. It is, therefore, worthy of the special attention of the young surveyor. It is, however, a question for consideration how far this branch of the profession can be combined with general practice. Every surveyor ought to be well versed in the homestead requirements of farms of various extent and description, so as at least to be able to sketch the general plan of a homestead. But the detailed plans, working drawings, specifications, and estimates require the knowledge of an architect,—a knowledge which needs as much time and attention to acquire as the general practice of the surveyor. Few can devote sufficient time to obtain a practical knowledge of both professions; and I am, therefore, inclined to the opinion that the erection of farm-houses must be regarded as a specialty, requiring a particular education distinct from that of the land-agent and valuer. The same remark applies to the art of scientific land drainage, which in its highest sense requires special study, and is, perhaps, best carried on as a distinct practice.

I will now suppose the young surveyor to have spent three or four years as a pupil in an office of extensive practice; that he has made the most of his time and advantages, and has acquired a fair knowledge of his profession. He should now make himself acquainted with the practical details of farming; and, with this view, he should

spend at least two years under the tuition of a first-class farmer, partly, perhaps, on a heavy and partly on a light soil. The knowledge thus acquired will be found of great value in after-life. Without it, indeed, the surveyor, however competent in other respects, will find himself at a disadvantage, especially in his oversight of the farming of the tenantry on estates under his care, and in settling and dispensing the covenants of leases.

Let not the surveyor, who has gone through the whole of the training indicated in this paper, and is now about to enter into practice, think that his education is complete. Perhaps there is no profession that depends so much upon a long course of practical experience for the attainment of a matured skill and judgment. The education of the surveyor must be lifelong. He must never be too old to learn, and to be conscious that he is liable to error. He who is most awake to the mistakes he has made will be most likely to avoid them in future, whilst he who will never admit that he is wrong will probably repeat his mistakes to the end of the chapter.

A mere knowledge, however, of the profession will not suffice to command success, unless accompanied by habits of business, knowledge of men, and tact and address in his intercourse with others. In these respects the surveyor must educate himself; without these qualifications a man of sound and varied knowledge may be beaten in the race by another of inferior acquirements who possesses them. If the surveyor would be a man of business, he must learn the art of executing whatever he has in hand with skill, decision, and despatch. Let him avoid those dilatory habits which have been the bane of some able men in the profession, and let him act upon the maxim, never to put off till to-morrow what can be done to-day. He should also endeavour to acquire that business tact with which some men are naturally more gifted than others, and which mainly consists in a knowledge of men, and of the mode of laying your views before them so as to command their assent; or, in short, of saying the right thing, in the right way, and at the right time. The talent of administration is another point of great importance; without it, indeed, no large business can be properly carried on. It may be defined as the talent of so arranging the duties of the office as to get through the greatest amount of business with the least waste of power, and of so classifying the various departments under responsible heads, as to avoid confusion, and to relieve the principal officers of detail. With some men this talent is a natural gift, and has contributed largely to their success in life: other men of undoubted talent and unwearied industry find that for want of it their business is always a burden, and always in arrear. If, therefore, the young surveyor have not the natural gift, let him spare no pains in its acquirement.

I will now add a few words on the moral principles which should regulate the young surveyor's professional character. Let him be sure that in his profession, as well as in all others, "honesty is the best policy" let all his transactions be marked by candour and straightforwardness; let not advantage in negotiation tempt him to swerve from the strict truth, and no zeal for the interest of his client induce him to descend to meanness or trickery in order to attain his end. In a word, let him never depart from that course of unimpeachable integrity without which even the highest talent and attainments will fail to command respect, or to place him in the first rank of the profession.

I append a few remarks as to the extent to which this institution may render aid in promoting the education of the surveyor. The profession cannot expect, in the present day, to obtain from the Legislature any charter or peculiar privileges, such as those enjoyed by the professions of law and medicine. It will always remain open to all comers; and it will always be competent for any person to call himself a surveyor, whether educated for the profession or not, if he can only induce the public to place confidence in him. The policy of the institution should, therefore, be to require a high standard of education, both general and special, as a qualification for membership, in order that the fact of being a member may be an earnest of superior competence and skill, as well as of good character. There will always be, as there are at present, especially in the country, men who, from long experience as practical farmers, have attained to a fair knowledge of the value of

land—more particularly in their own localities—and the regularly trained surveyor must always expect to encounter competition from men of this class. Whilst it cannot be denied that amongst them are to be found some men of superior ability, yet, as a rule, they are deficient in general knowledge of the profession. The aim of the Institution should be to maintain a standard of membership sufficiently high to ensure an average superiority of its members over other practitioners. In short, membership should be considered a distinction, not only by the profession, but by the public at large.

The test of fitness for membership must, however, be practical, and not theoretical. I do not see it possible to institute an examination in professional knowledge, however desirable it may be thought by some. The only men in the profession capable of conducting an examination are too much occupied to undertake so arduous a duty; and unless it were well done it were better not to make the attempt. The test of fitness for membership must therefore be found in evidence of practical competence and skill.

Although I do not think an examination practicable, yet I believe this Institution may in various ways, indirectly, promote the education of the surveyor. The establishment of a professional library would be a boon to students of the profession. The reading of papers on professional subjects, and the free discussion of them at the ordinary general meetings, would tend to throw new light on many subjects now but imperfectly understood. To make these papers and discussions as generally useful as possible, both to town and country members, a journal might be published and circulated containing the various papers, with condensed reports of the discussions thereon. This journal might be made a useful medium of correspondence on the topics thus introduced, and as a channel for advertising estates. Widely circulating among the profession, it might be made self-supporting.

I have endeavoured in this paper to indicate, I fear but imperfectly, the course of training which appears to me to be the best calculated to fit the surveyor for his important duties, and the mode and extent to which this Institution can aid in promoting this object. If my remarks should prove of any value in improving the education of our sons and of our pupils, I shall feel that I have contributed some trifles towards one of the objects of this Institution,—that of promoting the interests and raising the tone of the profession.*

A GREAT BUILDING CASE IN IRELAND.

Doolin v. Dixon.

A REMARKABLE action brought to recover the sum of 11,500*l.* alleged to be due for building work executed at St. Peter's Roms Catholic Church, Phibsborough, Dublin, has just been concluded, without a conclusion.

The plaintiffs are Mr. Walter Doolin, of Westland-row, builder, and Mr. William Doolin, of Great Brunswick-street, building surveyor. The defendants are the Rev. James Dixon, and the other members of the community of Vincentian Fathers at Phibsborough and Castleknock. A contract was entered into in the year 1857 with the plaintiffs, who were then in partnership as builders, to carry on the work of the new church commenced by the Rev. T. McNamara, then head of the Order in Ireland, under the superintendence of Messrs. Hadfield & Goldie, then the architects. The contract was based on a schedule of prices, no specific sum being contracted for; and it was stipulated that the works were to be measured from time to time under the direction of the architects, whose decision was to be final.

It was admitted that 14,000*l.* had been paid on account of the work; and the defences were twofold, viz.,—that the contract was not entered into by defendant, nor was he bound by it; and that so far from there being just cause of action, the sum paid was in excess of the value of the work done.

The architect, Mr. Goldie, had given a certificate for 3,997*l.*, as against their claim of 11,000*l.* odd, but even this the defendants refused to pay. It was alleged that the tower had sunk and was

* A discussion followed, in which Mr. P. D. Tuckett (a former pupil of Mr. Sturge), Mr. J. H. Lloyd, Mr. Huxkinson, Mr. Eves, and others, took part; and was summed up by the President, who related the experiences of his own education. The meeting was then adjourned to Monday, January 11th, when a paper by Mr. R. B. Grantham, G.E., will be read, entitled "Arterial and Agricultural District Drainage, and the Laws connected therewith."

dangerous. In opposition to this, evidence was given by Mr. Goldie, Mr. J. H. Owen, Mr. T. N. Deane, and others, that the subsidence was an almost unavoidable consequence of a central tower, carried up in connexion with lower and lighter structures; great difference of opinion existed as to the fact of the subsidence being equal on each of the four piers, or partial as regards two of them. Evidence was given on this point as to the plumbing of the lower walls, the four piers, and the levelling of the bases, as not showing any absolute deflexion either from the horizontal line of the bases or the perpendicular line of the shafts. As to the exact amount of subsidence, no definite evidence was given, but from 1 in. to 1½ in. seems to be generally assumed by the witnesses for the plaintiffs' rebutting case: the actual fact of subsidence is evidenced by the fracture or deflection of the clearest string-course in the transepts and apse.

After a hearing of thirty-four days, and the expenditure of an enormous sum of money, the jury found themselves unable to agree on the question of the liability of the defendant, and were discharged. The denial of liability on the part of the Community, because the particular brother who gave the original order had been removed to another country, seems to us scarcely creditable. It is a matter of serious importance to builders and others having dealings with religious communities.

As an instance of the expenditure that has been made, the investigation of one item of 3*l.* 10*s.* cost at least 300*l.*

A sum little less than 5,000*l.* was included in the plaintiffs' demand, for "beds and joints," and resisted by the defendant on the ground that it was not customary to charge for them, and that the schedule of prices did not contain such an item.

The messengers on either side differed on the whole to the extent of 6,000*l.**

SKETCHES AND STUDIES.—INSTITUTE OF PAINTERS IN WATER COLOURS.

It is well understood that the general function of what is called a hanging committee is to disappoint most of those who are dealt with by these much-abused officials. Do the artists, or do the public, ever consider that a great part of the want of success which is annually lamented in this respect, is due to the conflict of discordant conditions which press upon the mind at the same time? Not only does each picture demand a place where it can be seen, and seen in the proper light, and without inconvenience of posture in the observer; but further, each picture objects to be "killed" by its neighbour. Thus arrangement on definite rule becomes as perplexing, and finally as impossible, as the attempt to carry out systematically any inflexible scheme of botanical or zoological classification has hitherto proved itself to be.

Something of the same difficulty attends the toil of the critic, who would give a conscientious account of such an exhibition. He seeks to compare, to classify, to link together in his mind, the various branches of art illustrated by the works before him. He will look at one time at heads or larger figures; then perhaps at the smaller and more stirring groups. Here the landscapes will form a gallery apart, and even among these, sea-pieces, mountain scenery, architectural pictures, and rural scenes, will each demand a separate rank. Cattle stand apart, so do flowers and fruit pieces. And then, when all is done, when the gallery has been paced over and over, and reduced to intelligible order in the mind of the critic, the reader has to pull all this carefully constructed guide-book to pieces; he will object to run, in the present collection, for example, from 1 to 230, because these are two pictures by Mr. Lucas; or even to turn from the gen of the Exhibition (No. 339), the "Interior of a Coffee-house at Cairo: Arah Mnsio;" to the equally well painted, though not equally pleasing, picture (255), "Horse Fair at Damascus, Mount Lebanon in the Distance" in order to compare two pictures which are in some sort pendants to one another, from the delicate and unwearied pencil of Carl Wrenner.

The least troublesome mode, after all, appears to be the most practical; and to stroll along the well-covered walls, noting the pictures as they strike the eye, as it is the proceeding which is

* Full reports of this trial will be found in the *Irish Builder*, November and December.

most natural to nine visitors out of ten, will indicate the order which it is most convenient to describe. The exhibition may be said to hold together rather more than is usually the case. If there are few of those pieces which it is impossible to forget, because they arrest the gaze of the passer-by with an imperative claim, there are, on the other hand, fewer than is usually the case below a fair mediocrity. The general idea, too, of water-colour sketches, appears to have been more distinctly grasped by most of the artists, in the present instance, than has been the case in some exhibitions to which we have called attention in former years. There is, indeed, a wide stretch from the exquisitely finished work to which we have already alluded, which it is pure misnomer to call a "sketch" or a "study," to the characteristic charcoal sketch, No. 181, by W. Bennett, in which is jotted down, in language intelligible to the artist or to the seaman, but hardly to the landsman who is neither one nor the other, the very rush and tumble of the Channel billows hurried by the wind. Yet within these extremes, each marked by its own excellence, lies more promise of the formation, one of these days, of a recognised school of water-colour painting than some recent efforts might have led us to anticipate.

Strolling, then, through the room, Mr. Thos. S. Boys arrests the eye by a bright bit of colour, the brick gables of the old house over which impends the turreted tower at the Hôtel de Ville, at Bergues (No. 22). Mr. Augustus Bonvier will claim a longer pause before his "Shopping at Cattaro" (No. 26). Under the unsuggestive title "An Interior" (in No. 35), Mr. Harrison Weir has given us a bright hay horse, with black, sleek, glossy legs, only a little too hollow in the back; a pony which is a real pony; a semi-dismounted, cat; and ducks that do all but quack. Let the visitor who admires animal painting of this high order neglect his ease, and step across the room to No. 297, by the same artist, which bears the quaint, but not inappropriate name, "About Supper-time." The venerable and white-whiskered felon who watches the rabbits in the distance looks as if he had long enjoyed the benefit of that widespread English superstition which extends the protection of the Sixth Commandment to the fox. Then let him pass on to 310, "The Early Bird," who has happily escaped the compromising attentions of Reynard.

Mr. J. G. Philip's (No. 37) is hard to name, but not hard to admire. The dancing path made by the sunbeams over the water, and the red tints reflected from the ferruginous limestone rock, form a charming bit of nature, though it is named "Tolpead." The next number, "Torno, Lake of Como," by Charles Vacher, is at once a companion and a contrast to the English scene. Close by, "The Ambassador's Dressing-room, Knole," by D. H. McKewen, presents as happy an example of the normal application of water colours as is to be found in the gallery. Closely viewed, this picture is a rough sketch. Observed from the proper distance, it gives drapery and furniture all the aspect of reality. Glancing at the name of this artist on the title-page, we observe that he has contributed no fewer than twelve pictures. Following the numbers in the catalogue itself, we find nearly every one of them to be soored with a mark of admiration. We note (65), "A Trout Stream, North Devon;" (81) "The Venetian Bedroom, Knole;" (90) "The Moine Mountains, Co. Down;" (102) "Stepping-stones on the Lligwy;" (369) "A Salmon Stream, N. Wales;" and (375) "Evening on the Lligwy."

Though thus led away, we must return to praise Mr. Edmund Warren's most charming work (34), "Avenue at Wootton, Surrey." If he had never painted an avenue with similar effects before, this picture would be talked about.

(No. 66), Mr. W. L. Leitch's "Ben Chnlich," in Perthshire, is remarkable for the glow of the heather bloom, when seen from the right distance. "The Church" (No. 67), by Andrew Gow, leads one to look again for the name of the artist, and to note the promise of his No. 270, called "Gallants," where the strained politeness of the how of the hean, and the demure glance of the pretty girl at the window, are very natural and nice. There is a charming bit of Gothic work, overgrown with ivy, to be seen in Mr. B. R. Green's No. 69, "The Baptistery, Canterbury Cathedral." From this we naturally turn to the interior (No. 75), by Mr. Skinner Prout,—

"Midst the forms, in pale proud slumber carved,
Of warriors on their tombs,"

where the crimson cushion on the pulpit lights up the scene. The study for the cartoon, "The Triumph of Justice," by the late E. H. Welner, has the post of honour on this side of the gallery. Mr. Welner, untimely cut off, scarcely realized in his later works, the promise of his early days.

Mr. Whymper's "Old Barn" (No. 89), Mr. Mogford's "Embayed on the Cornish Coast" (No. 92), Mr. Penley's "On the Capel Corig Route to Snowdon" (No. 93), and Mr. L. J. Wood's "Part of Whitby Abbey" (No. 94), close neighbours as they are in position, and widely different in subject and in treatment, are each pleasing. From the sweet peasant face of "Phoebe" by Mr. Henry Tidey, lingering for a moment to watch the attention of the robin in the "Writing Lesson," given by Mr. Kilburne (No. 95), we look on to the expressive glance of "Haidee" (No. 113), and then pass on to two highly characteristic portraits by Guido Bach—a "Rhine Peasant Girl" (No. 178), with blue, dreamy eyes, and "A Sclavonian," whose eyes, also blue, twinkle keenly with that life of which the experience is yet unknown to the maiden.

We have also to note the tottering old *canonico* and the brisk artisan in (103) "Doorway of the Cathedral at Assisi," by W. W. Deane; "The Cloud and Mist Sweeping over the Lake of Lucerne" (108), by the same artist; the frightened peasant woman in (116) Mr. E. H. Gordon's "Fall of James II. of Scotland;" Mr. J. Skerim's "Catching the Moth" (No. 132); Mr. Whymper's "On the Thames" (No. 146); Mr. Mopstone's Welsh scene" (284), with mist clearing off the mountains; Mr. Bennett's "Devonshire Mill" (No. 303); "Now Jump!" a clever contrast of character, by V. W. Bromley (No. 363); Mr. Beaver's "Rough Cattle" (No. 391); Mr. Weigall's "Old Pilot" (No. 412); Mr. Cattermole's "Reading the Fathers" (422); "The Study of an Old Woman" (No. 453), by the late E. H. Welner; and some capital drawings by Mr. James Paley, the excellent secretary of the Institution. Time and space alone prevent a longer list, or a more minute detail, of the many noteworthy items of this interesting exhibition.

THE GAIETY THEATRE, STRAND.

THIS new theatre, which has been built under the superintendence of Mr. C. J. Phipps, architect, on the site of the Strand Music Hall, and of some adjoining properties, which give it a frontage, more or less extensive, on the Strand, Exeter-street, Catherine-street, and Wellington-street, was successfully opened on Monday evening last. The front of the Music Hall remains almost as formerly; a few modifications, however, have necessarily been made on the ground-story, by the formation of the approach to the stalls and boxes of the theatre. The rooms over this entrance, and the new building extending along the Strand and Catherine-street, as far as the Owl office, will form a restaurant, entirely distinct from the theatre, but with a corridor of access from every tier of the theatre. This arrangement, which is on the model of some of the Continental theatres, will be found convenient by many, although, for our own part, we see no reason for connecting theatrical amusements with eating and drinking. The entrance in the Strand leads by a few steps to the level of the stalls, and by a spacious staircase to the balcony or grand tier, and the upper boxes. Another entrance, also on this level, is in Exeter-street, on the other side of the stalls, which, though designed specially as a private entrance for the Royal Family, is available as an exit-way in case of sudden panic, there being a stone staircase from the entrance to the highest floor of the theatre, with communication on every level. There is also a corridor running under the back of the pit, solely for the use of the stalls' occupants, so as to get from side to side without crossing the audience. The entrances to pit and gallery are in Catherine-street, and the stage entrance is in Wellington-street. The auditorium includes a balcony, the front forming a semicircle of 24 ft., opening out by arms of a contrary flexure a width of 43 ft. to the proscenium column. Behind this is a tier of private boxes, as at the Adelphi, upper boxes, and a gallery above. The columns supporting the various tiers are carried up to a sufficient height above the gallery, and from the cap spring a series of pointed arches, supporting cornice and ceiling.

These arches, which at first sight suggest the Leicester-square Alhambra, give great completeness to the design, but on occasions when the house is very full will be found in the way by those of the audience who are at the back of the gallery. While on this point we may suggest that some alteration is needed in the upper boxes on each side nearest the proscenium, as the stage is not visible there from a certain number of the seats. As, however, the house is calculated to seat 2,000 persons, this may not often be of consequence.

The proscenium pillars are all of stone. The dimensions of the auditorium are as follows:—

	ft. in.
From curtain to balcony tier	38 6
Ditto upper circle	45 0
Ditto gallery	47 6
Width of proscenium	30 0
Height of ditto	29 0
Height from centre of pit to ceiling	54 0
Depth of stage from curtain	41 0
Width between walls of stage	61 0

The staircases are of stone. The floors of the boxes and corridors are formed of iron joists and concrete, faced with cement. The floor of corridor of the upper boxes, by the way, whence a view of the stage is obtained, should be covered, as the material is cold. The ironwork necessary for this construction has been manufactured by Messrs. W. & T. Phillips, of the Coal Exchange, at their works in Belgium, and constructed by them at the theatre. The box-fronts, together with the arches and cornices, are executed in patent plaster on canvas, and fixed, by Messrs. George Jackson & Sons, of Rathbone-place, from the architect's designs. The iron balcony front was executed by Messrs. Hart, of Wych-street. The lighting of the auditorium is by a sun-burner, manufactured by Messrs. Strode & Co., who have also executed the float-lights. These consist of a series of argand burners reversed, and burning downwards, the products of the combustion being taken away in an iron cylinder, running parallel with the front of the stage, and carried up inside the brickwork behind the proscenium columns. By a contrivance, should a glass break, that particular burner falls down and shuts off the gas. The coloured glasses, called medians, are worked on levers in front of the lights, on the same principle as the switch-lights on railways. In every division of the audience refreshment-rooms and resting and cloak rooms, for both ladies and gentlemen, are provided. The stage has been constructed by Mr. G. E. Tasker, the clerk of the works. There is a depth of some 20 ft. under it, for sinking large scenes, and a height above of 50 ft. All the departments of the stage are very complete. There is a convenient green-room, and the dressing-rooms appear to be sufficiently numerous.

The whole of the coloured decoration of the auditorium and the lobbies has been executed by Mr. George Gordon. The same gentleman has also painted the act-drop, which is a framed view of a palace on the Grand Canal, Venice. A very noticeable feature of the decoration is the frieze over the proscenium, designed and cleverly painted by Mr. H. S. Marks, 30 ft. long by 4 ft. 6 in. deep. It represents a king and queen of Mediaeval times, with surrounding courtiers, watching a mask which is being performed before them. On each side of this frieze, over the proscenium boxes, are lunettes in the arches,—the one on the left represents lyric, and the other epic poetry,—designed by the same artist. These pictures are works of art. The general builder's work has been done by Mr. Simpson; and the gaswork (except as mentioned above) by Messrs. J. Jones & Son, of Bow street. The capitals of the columns, the cornice, and much of the ornamentation are Early Gothic in character; the coloured ornaments are flat, without shadow; and the result is a very handsome interior. The bottom part of the main columns which carry the series of arches already mentioned, and the ceiling, is hidden by the private boxes at the back of the balcony, a defect to logical eyes; nevertheless, we must congratulate the architect on the production of a very handsome theatre. The traditional green curtain, it should be noticed, has given place to one of maroon colour.

The principal piece produced—a comedy drama from the French, entitled "On the Cards,"—enables Mr. Alfred Wigan to display some most admirable acting. The piece, however, in its present shape is not a good one,—a matter for regret. For the Operetta, with which the evening opens, "The Two Harlequins,"

and the extravaganza, "Robert the Devil," with which it closes, Messrs. T. Grieve & Son have painted some exquisite scenery. For fifty years, as Mr. Hollingshead, the lessee, mentioned in the course of a brief address to the house, Mr. Thomas Grieve has painted scenery for the London stage. How great is the debt the play-goer owes him.

CHARING CROSS RAILWAY.—NEW STATION.

FEW public works are ever conducted in the sight of so many thousands of daily spectators, or make such rapid and palpable progress, as has been the case with those which have been for a few months past in course of progress near the Waterloo junction of the Charing Cross Railway. The daily traffic has continued uninterrupted during the construction of three of the longest platforms, partly covered, connected with any railway station in or near the metropolis, exclusive of the terminal stations. The difficulty and danger incidental to the completion of one of these platforms have been enhanced by the circumstance that it is between the lines, and has been prosecuted during the passage of hundreds of trains in each direction daily. The Waterloo junction station, to which we are referring, for the accommodation of the passengers by the South-Western Railway, and for the more convenient interchange of traffic between the South-Western and South-Eastern Companies, is now happily near completion, and will be opened in the course of next week.

The new station has no architectural pretensions. The waiting-rooms, booking-offices, and other conveniences, are provided in the basement of a viaduct running through house property of a mean character, and over narrow back and side streets. The platforms are raised on the top of the viaduct, on which space could not be provided for waiting-rooms or other accommodation admitting of architectural effect. The north side of the viaduct was widened for the length of the platform which has been provided upon that side. It is 532 ft. long, by 18 ft. wide. A line of rails divides it from the middle platform, which is 435 ft. long and of the same width, the middle platform being double, and serving at its two sides trains passing in each direction. There are covered lengths upon each of these platforms, of 200 ft. and 204 ft. each, the whole width. The third platform, on the south side, commences near the west ends of the two others, which are opposite each other, and extends round a curve to the end of the Waterloo platform. This platform is 337 ft. long and about 15 ft. wide. A booking-office is provided upon the platform for the passengers from Waterloo Station, who, passing to the junction end of the platform, descend by an inclined plane to a passage under the Charing Cross line, and to the stairs conducting to the north and middle platforms. The general booking-offices and waiting-rooms, which are compact and well arranged, are on the ground level. The present Blackfriars Station will be abolished on the opening of the Waterloo Junction Station. The coverings of the platforms are very neat, but will necessarily be cold, from the exposure, being open at the ends. The roofs are flat, and about 11 ft. in height from the platform to what is usually the eaves, but is in this case the highest part of the roof, the dip being in the middle platform inwards to a longitudinal gutter, and of the side platforms towards the outer or back edge. The roofs are carried upon ranges of neat cast-iron columns, with handsome openwork cantilevers on each side, supporting the main cross bearers, which carry pultrines that are boarded and covered with No. 14 gauge zinc; and the under edges of the pultrines are covered with match-headed boarding, which constitutes the ceilings. The platforms are of earthwork, faced with brick walls; they are 3 ft. above the rails, and an easy step down from the floors of the carriages. The columns stand upon brickwork pillars, about 2 ft. square, carried up to within about 18 in. of the ground level. The engineer has done well in having substituted iron for timber for the columns; and the Blackfriars Station, which is now being dismantled, furnishing a remarkable illustration of the perishable nature of such timber as has been used in that particular structure, when placed underground. The station was only erected about five years ago, but this has sufficed for the portions of the

pillars supporting the roof and the struts underground to have decayed so much as to have pulverized, almost to the heart in many instances, upon their exposure to the air. These rotten timbers are of about 8 in. scantling.

A single line of rails furnishes an actual junction between the South Western and the Charing Cross lines; but this will not be need for ordinary traffic, and all passengers interchanging from one line to the other will require to change carriages at the junction.

The work has been designed and executed under the direction of Mr. Peter Ashcroft, the company's engineer. The interlocking switches and signals are upon the system patented by Mr. F. Brady, of the South Eastern, and now in course of adoption by the South Eastern Company. The block system of signalling is invariably in operation on the line. The whole of the work has been executed by the company's own working staff.

ON THE DRYING PROPERTIES OF VARIOUS KINDS OF HOUSE PAINT.*

WE now come to the dryers, such as litharge, manganese, &c., and their action is very remarkable in causing the paint to absorb oxygen quickly and decidedly. For example—two cubic centimetres of linseed oil absorbed, in 30 days, 2.45c.c. of oxygen; but the same quantity of manganese dryer absorbed 21.45c.c. of oxygen; while a mixture of the two, consisting of 1.56c.c. of linseed and 0.44 of the dryer, absorbed 30.826c.c. of oxygen. That is, the absorptive, or, as a painter would say, the drying power of the mixture is far greater than the sum of the powers of the two oils, since 1.56c.c. of linseed oil absorbs of itself 1.985c.c. of oxygen, and 0.44 of the manganese dryer 4.719c.c. of oxygen in 30 days, the sum of the two absorptions being 6.714c.c. But the mixture really absorbed 30.826c.c., or more than 4½ times as much as the same fluids absorbed when exposed separately.

Experiments, scientifically conducted, have also shown, that, in preparing his dryers, the painter wastes both good materials, fuel, and time. He boils his oil too long, and maintains the temperature too high.

The usual mode of preparing dryers is to heat the linseed oil in an iron pot until it appears to boil. The surface is skimmed from time to time, and after from three to six hours, about one-tenth, by weight, of litharge is added, and the heat is maintained five or six hours longer; or 100 parts of very old linseed oil is heated about six hours, when six parts of litharge and about three of burnt umber are added. The heat is continued six hours longer, when the liquid, after being left quietly to cool, is decanted. For the manganese dryer, the oil is heated at the so-called boiling point during five hours; peroxide of manganese is thrown in, and the boiling continued for eight hours. We have already seen that the boiling is not the formation of vapour, but the escape of gas-bubbles due to decomposition.

Chevreul's experiments prove that pure linseed oil is more siccativous after three hours' boiling than if not boiled at all; but is less siccativous after five hours' boiling than after three. The oil boiled during three hours with one-tenth of litharge is much more siccativous than if heated without the addition of this oxide: so that the drying property is not conferred on the oil by the action of heat, as some have supposed, but it is by the mutual action of the oxide and of the oil, assisted by a high temperature, that the drying properties are developed. Litharge is more siccativous than manganese; and what is very curious is, that litharge, heated once with oil, is more active than fresh litharge. It is still more curious, that manganese that has been heated several times with the oil is more active than fresh manganese. But this excess of activity in the oxides is no longer exerted on oil that has already been boiled five hours. All the experiments proved that the drying property of linseed was injured by a prolonged heating at high temperatures; and the remarkable and unexpected result came out, that linseed, exposed to the temperature of from 100° to 175° Fab. during six hours in contact with 10 per cent. of manganese, can be used immediately in painting without the addition of any other dryer. Linseed oil alone, exposed to a similar moderate

temperature, improves in its siccativous property, but not sufficiently so to dispense with the manganese. A very energetic dryer is obtained by boiling the oil for three hours only in contact with 15 per cent. of the metallic oxide.

Every one knows what is expected of good paint. In the first place, it should be sufficiently liquid to spread under the brush, and sufficiently viscous to adhere to the surface, even though it be vertical, without running, or becoming unequally thick in different places. In the second place, it should become solid within a reasonable time after being applied. Thirdly, the solid should adhere strongly to the surface.

We have seen that lead and zinc paints become solid by the absorption of atmospheric oxygen. But as pure linseed oil also becomes solid by exposure to the air, the drying of the paint is not due to the presence of a dryer, or of the oxide of lead or of zinc. It is true that the dryer acts by increasing the absorptive power of the oil for oxygen gas. The lead and zinc oxides have also drying properties, and we must not neglect the influence of the surfaces that are to be painted. Paint dries at different rates on glass, wood, and metal; it dries better on some kinds of wood or of metal than on others, of course under similar conditions of experiment.

Take glass, for example. Surfaces of glass were coated with linseed oil, also with the oil containing a little white antimony, and with the same compound with the addition of a little litharge. The linseed dried quickly, the antimony compound not so quickly, while in the third compound the presence of the litharge seemed to neutralise the retarding effect of the antimony. The following table shows the results:—

	Linseed oil.	Linseed oil and oxide antimony.	Linseed oil and litharge dryer and oxide antimony.
	Days.	Days.	Days.
First coat dried in	17	26	21
Second " " "	17	8	9
Third " " "	9	0	2
Total	43	43	32

It appears from this table—1. That a glass surface does not allow the paints to solidify so readily as a surface formed of the solid oil or paint. 2. That the antimony oxide is anti-siccativous, which effect is corrected by the litharge. 3. That in the second coat the glass seems to be still exerting a retarding action on the oil, but this is not so evident in the antimony paint. 4. That the influence of the litharge dryer is evident in reducing the time required for the drying of the third coat. This influence seems to depend not only on the presence of the litharge dryer in the viscid paint, but also on its presence in the solid surface on which the fresh paint is laid.

The influence of the kind of surface employed on the drying of paint is well shown in the case of oak. On oak surfaces stained brown, three coats of linseed oil took forty-six days to dry, oil with a litharge dryer seven days, oil with a manganese dryer still less time. It was also found that linseed oil and white lead and linseed oil and white zinc dried more quickly with a manganese dryer than with a litharge dryer. On a surface of clean oak the first coat of oil took a very long time in drying. On the twenty-second day it was soft and pasty beneath the surface; the oil had sunk into the pores of the wood, and thus prevented it from absorbing the oxygen required for its solidification. This explains why oil dries more quickly on a painted wooden surface than on a porous one. On a porous surface the dryers seem to act with great effect, probably from covering the wood and preventing the oil from sinking into the pores. Their influence is shown in the following table:—

	Linseed oil and white zinc.	Linseed oil and litharge dryer and white zinc.	Linseed oil and manganese dryer and white zinc.
	Days.	Days.	Days.
First coat dried in	66	6	5
Second " " "	6	5	3
Third " " "	6	5	3
Total	78	16	11

This also shows that a surface of linseed and white zinc allows the paint to dry much more rapidly than a surface of porous wood does. A

* By Mr. Charles Tomlinson, F.R.S. See page 909, ante.

similar effect is produced when the paint is laid on an old surface of paint. The paint itself also becomes more siccative under the influence of time and atmospheric exposure.

It appears from experiment that paint dries more quickly on poplar than on oak, and more quickly on pine than on poplar. In the experiments on metallic surfaces the most remarkable results were obtained on lead. The first coat of linned oil dried very quickly on this, as also the first coats of lead paint and of zinc paint. The zinc paint dried first, then the linned oil, and lastly the lead paint. The zinc paint, however, tended to retard the drying of the subsequent coats. A newly scraped surface of lead acted more energetically than one that had been tarished by exposure to the air, but the lead covered with one coat lost its influence in hastening the drying of the subsequent coats. The first coat of oil on bright lead was only ten hours in drying. In short, we get this remarkable result, that lead is siccative with reference to pure linned oil, while white lead itself, a siccative body, is anti-siccative with respect to linned on metallic lead. The influence of various metallic, vitreous, and wooden surfaces is thus summed up by M. Chevroul:—

FIRST COAT.

On Copper.—Oil dried more slowly than both oil and white lead, and oil and white zinc.

On Brass Wire and Zinc.—Oil dried as rapidly as oil and white lead, but more rapidly than oil and white zinc; but on the brass wire the drying was more rapid than on zinc.

On Iron.—Same results as on zinc; but oil and white zinc dried more quickly on iron than on zinc. This is analogous to the fact noticed with lead. The oil and white lead dried more slowly on lead than did the oil and white zinc.

On Porcelain and Glass.—Oil dried a little more quickly than oil and white zinc, and oil and white lead a little more quickly still.

On Plaster.—The oil and white zinc paint dried in about equal times.

On Poplar and Mountain Ash.—Oil dried more slowly than oil and white lead, and also than oil and white zinc.

THREE COATINGS.

On Copper, Brass Wire, Zinc, Iron, Lead.—Oil and white lead dried more quickly than oil and white zinc. This was also the case on porcelain, glass, plaster, poplar, and mountain ash. In the case of the woods, linned oil was found to dry more quickly on ash than on poplar, and more quickly on poplar than on oak.

Some of these surfaces may, however, be regarded as indifferent, as respects their influence in quickening or retarding the drying of paint; but the temperature and other circumstances modify any general conclusions that may be drawn on the subject. Paint dries more quickly at from 77° to 82° Fah., than from 59° to 64° Fah., other things being equal. This explains why, in practice, the proportion of dryer varies with the temperature. In winter it is customary to add from three to nine, and even ten per cent. of dryer to the linned; in summer not more than half, one and a half, or two per cent., and it may even be left out altogether in the last coat. The drying property of linned oil is nearly always increased by the addition of white lead, and in most cases by that of white zinc. If the compound be not sufficiently siccative, it can be made so by the addition of a dryer, whether of litharge or of manganese, due respect being paid to the varying conditions of the surface, number of the coats, whether first, second, or third, temperature of the air, and the amount of natural light present.

But the influence of the lead or manganese dryer, as will be gathered from the foregoing details, is not so important as is generally imagined. It can be dispensed with in the second and third coats, and even in the first if the temperature of the air be favourable. Linned oil by exposure to light and air loses its yellow colour and becomes siccative, so that it can be employed alone with white lead or white zinc without detriment to their purity. If white zinc be associated with the sub-carbonate of zinc, the dryer may be dispensed with altogether.

Paint owes its lustre and smoothness to the oil alone. If oleic acid were mixed with metallic oxides in such proportions as to form solid chemical compounds, and the acid were to pass quickly from the liquid to the solid state, the result would not be a smooth, uniform oleate; but

when the drying oil passes slowly into the solid state, in consequence of the gradual absorption of oxygen, and the changes pointed out by Malder, the very slowness of the process allows the oily molecules to arrange themselves into a symmetrical compound, which would be transparent were it not for the opaque particles of the white lead incorporated in the compound. If these opaque particles are not in excess, the molecular arrangement is such that the paint dries into a surface that is lustrous, and even brilliant, in consequence of the mirror-like reflexion of the solidified oil.

No notice has yet been taken of the action of the turpentine, which is added by painters, in order to diminish the viscosity of the paint, and to allow it to spread more easily under the brush. If the surface is to be polished, a large proportion of turpentine is used; if it is to be varnished, as much turpentine is added as will render the paint very fluid, but not too fluid to work with; if the paint is to be very durable, and is to be neither polished nor varnished, only a small proportion of turpentine is to be added. As turpentine dries to a great extent by evaporation, one of its chief uses is to hasten the drying of paint. Thus, three layers of linned oil on glass dried in twenty-five days; but when about 30 per cent. of turpentine was added to the oil, the mixture dried in twenty days. This drying effect is promoted by a previous exposure of the turpentine to the air. When both oil and turpentine have been previously exposed, the drying takes place still more quickly. Exposure to air has a similar influence on the other ingredients of paint, even on the white zinc.

This exposure in the case of turpentine favours the combination with atmospheric oxygen and the consequent resinification of the liquid. Exposure in the case of a porous body like white zinc may also lead to the physical absorption of oxygen, and thus hasten the drying. If this physical effect were really obtained in the case of white zinc and white lead, Chevroul thought it likely that the presence of other solid bodies in the paint might have a similar effect. But before putting them into the paint, their influence as surfaces was tested. When linned oil was laid on white lead three coats dried in seven days; but on sulphate of zinc they occupied eighteen days in drying, twelve being required for the first coat and two for the second; white lead is therefore more siccative than the zinc-sulphate. In both cases the first coat acted as a dryer to the second. When a mixture of sulphate of lead and white lead was used as the surface, the oil dried almost as quickly as on white lead alone. It has already been shown that the addition of the litharge and manganese dryers made the linned oil dry more quickly; that is, it became more capable of absorbing oxygen from the air. It is remarkable that this absorptive power is increased by the addition of solid bodies such as sand. Linned oil mixed with white lead dries more quickly than the oil alone, so that white lead is a dryer or siccative. Oil mixed with sulphate of lead dries very slowly; but a mixture of oil, sulphate of lead and white lead, dries as quickly as oil mixed with white lead only. Hence the presence of white lead confers extra drying power on sulphate of lead. Carbonate of zinc acts as a dryer, when added to oil or white zinc; and the mixture dries more quickly than oil mixed with white zinc only. Oil mixed with zinc carbonate sets more rapidly than with zinc white; but it forms a semi-transparent, not an opaque paint. As zinc carbonate renders oil and white zinc more siccative, it might be substituted for the manganese dryer, which has the disadvantage of imparting colour to zinc white. Two paints were prepared, one consisting of 100 lb. of linned oil, 75 lb. of zinc white, and 25 lb. of zinc carbonate; the other of 98 lb. of oil, 2 lb. of manganese dryer, and 100 lb. of white zinc. With each of these paints a door was painted. Four hours after they had been applied both paints appeared to be equally set; but the surface coated with the first paint was whiter than that coated by the second; the whiter paint was, however, the less adherent.

In conclusion, I venture to think that the question, "Why does paint dry?" has been fully answered, and that the intelligent house-painter will find, in the details thus brought together, some material for the improvement of his useful art. The only object of science is the discovery of truth; but the truths of science form a rich resource for the technologist. He finds in them the only proper basis for real improvement; and the Society of Arts is, I think, never better employed than when it brings the

man of scientific theory into direct contact with the intelligent man of practice. The time is happily passed away for ever when the so-called practical man boasted of his independence of all theory. He now knows that, by such a self-imposed blindness, he placed himself at least half a century behind the intellect of his age. Every art that depends on chemistry seeks the aid of science; and, in working out technical results on a large scale, scientific truth is often assisted; just as, by the same righteous law of reflex action, the results produced on a small scale in the laboratory, apparently for the benefit of science alone, are often reproduced on a large scale in the factory to the advantage and profit of the whole community. I repeat that the Society of Arts can never be better employed than in acting as the medium of communication between the man of theory and the man of practice.

THE INSTITUTION OF CIVIL ENGINEERS.

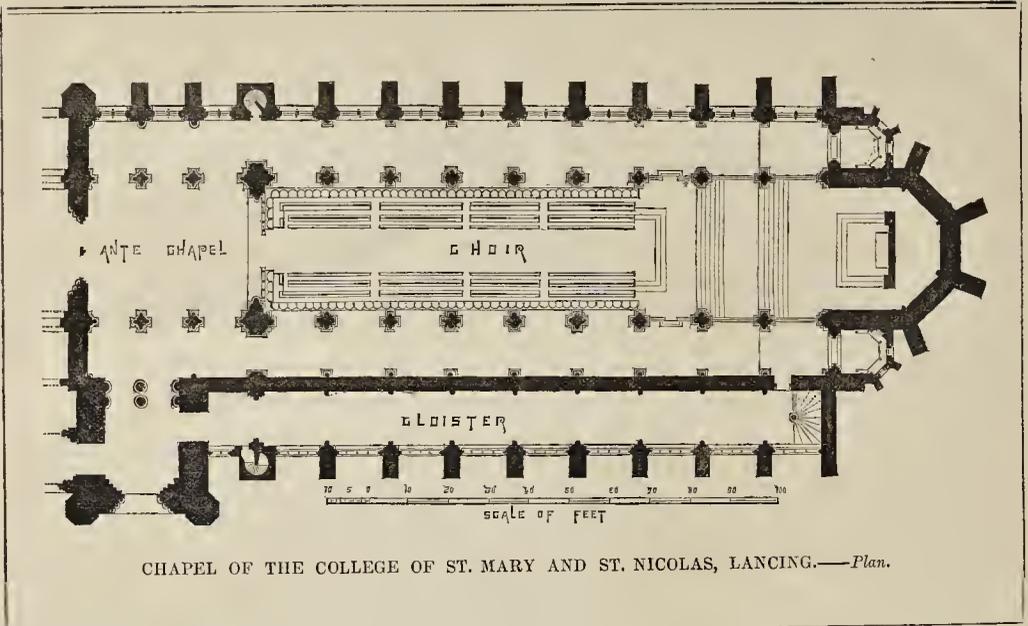

At the meeting, December 1st, Mr. C. Hutton Gregory, president, in the chair, the paper read was "Description of the River Witham and its Estuary, and of the various Works carried out in connexion therewith, for the Drainage of the Fens, and the Improvement of the Navigation," by Mr. W. H. Wheeler. It was stated that the Witham was originally a tidal river, navigable by ships of considerable size as far as Lincoln, a distance of nearly forty miles from the estuary. It was this portion of its course, from Lincoln to the outlet, flowing through a low fertile tract of land, and on which the skill of the engineer had been employed to make it subservient to the purposes of drainage, that formed the subject of this communication.

Reference was made to the works carried out in the year 1825, under the advice of Sir John Rennie, at a cost of about 40,000l., by which the channel between Skirbeck Church and Hob-hole Sluice had been straightened, and the course of the river had been contracted. Thirty years after the commencement of this work, 300 acre of the reclaimed land had been sold for 10,000l., and been embanked by the purchaser; while a few years ago, two other marshes had been embanked by the Commissioners, and had been let on lease at a rental of 310l. per annum, the area, including foreshore and bank, being about 160 acres.

The system of parallel training walls, constructed of faggots, clay, and chalk, had been adopted to a great extent for the Fen rivers, and had been found to answer better than any other plan. The manner in which these training walls had been carried out, on the rivers Welland and Witham, was then described.

In conclusion, the general results of the enclosure of the Fens were briefly reviewed; and it was observed, that the appearance and prosperity of this large tract of land, equal in extent to many counties, when contrasted with what it was a century ago, was a striking proof of the ingenuity and industry of man, and reflected the highest credit on the skill of the engineer, and the enterprise of the people.

On the 15th instant the paper read was "On Machines employed in Working and Breaking-down Coal, so as to avoid the Use of Gunpowder," by Mr. S. P. Bidder, jun. It was stated that the object of this communication was to direct attention to the "winning" of coal by mechanical appliances, with the view of obviating the loss in production and the danger to the colliers which were incidental to the use of gunpowder. Several inventions for this purpose were described; and it was remarked that the great defect in all these machines was their limited expansive power. Machines for cutting grooves or slots in the coal had also been tried, but it was said only with partial success. After considering these systems, the author had, in conjunction with Mr. John Jones, devised a machine which had been submitted to actual trial on a working scale at the Ilarecote Colliery, where the results were so satisfactory, it was said, as to induce the proprietors to make arrangements for its immediate adoption. The machine consisted of a small hydraulic press of 12 tons power, to which was attached a pair of tension-bars, bent in the form of a connecting-rod or hinge-strap. These were placed one over the other in the bore-hole, and between them, at the extreme end, there were a clearance-box and two metal pressing-hocks, between which was

forced, by the action of the hydraulic press, a split wedge 15 in. long, causing a lateral expansion of 3 in. The ram was then withdrawn, and a second wedge was inserted between the two parts of the first wedge, and was forced up until sufficient expansion was obtained to break the coal. It was found that the press could be applied and the blocks brought down in less time than was consumed by firing and waiting for the smoke clearing.

THE STUDY OF ART.

In a recent address to the Female School of Art, Mr. A. H. Layard, M.P., said to those students who intended to follow art as a profession to gain their living, or to help others to do so, "Let me urge on you the extreme necessity of doing thorough good work, of doing nothing carelessly, and going thoroughly through these schools." Unless thoroughly grounded they would never do good work. Young people had a tendency to fancy they could do more than they really could, to imagine themselves artists as soon as they could draw passably, or put in a bit of colour. A lady, who was then a distinguished amateur, came to him some years back to ask advice on her course of study. She followed it, and went to South Kensington, but came back to him complaining that the teachers had set her to draw straight lines for two or three days. He told her the story of how Giotto, the great Italian master, when asked by the Pope's Nuncio for an ensample of his skill, simply struck a circle on paper with one vigorous sweep of his pencil; and so pacified her. Some months after she came to him again, and acknowledged the benefit of the course of thorough training. That eminent sculptor, Mr. Gibson, told him that one day he went into his study, and there found an American physician with his daughter, who, the father said, used to be continually getting hands and feet from his dissecting-room and modelling them, and at last insisted on going to Rome, and studying under Mr. Gibson. Now that gentleman did not take pupils, for he found they generally came to teach him, instead of learning from him; but he told the lady to call next day, when he set her to model in clay a bust of Medusa. Next day he went and found an uncommonly good copy; but he thought, "If I tell her it is 'an excellent copy, I shall turn her head.'" So he said, "Not bad, but you can do better; try again," and defaced the copy. Next day she did better, and the advice and defacing were repeated. The third day he really was surprised to see what she had done, and took

her as a pupil, on account of her spirit of perseverance and willingness to be thorough. She was now a most distinguished sculptress—Miss Hooper—and stood a high chance in the competition for the design of the national monument to the late President Lincoln. After his hearers had mastered first principles, he would urge on them to turn to the cast, and particularly to the study of the human figure. Once mastering that the eye could never go wrong. The better they drew from the cast, the better designers they would be. History showed that the very greatest designers of ornament were very great painters—Raffaello and Benvenuto Cellini. But even when they could draw from the cast, they must not throw off selections, and plunge into picture-galleries to select for themselves; for instead of doing good, our museums and picture-galleries were really likely to do harm to pupils' tastes. Unless a museum was correctly and scientifically arranged, it did not point out what was really good and useful in art, and what was only curious and interesting on account of the epoch in which it was produced. In the British Museum statues and basso-reliefs were mixed up without much discrimination; a little was done, but even the most practised observer, not an intelligent connoisseur, would get misled. The same thing existed in the National Gallery when works were arranged chronologically; a chapter of the history of the human mind, of civilisation, of progress, was presented to the eye; but it did not follow that what was merely curious was admirable as a copy. He would further advise them not to begin art as a trade too soon; to pursue art, even when at the head of domestic establishments, to hold together and help others taught in the same institution, and let the school form a nucleus around which mutual interests should be developed. He was glad to see the attention they were giving to designs for manufacturing purposes. Mr. Samuelson had stated, in a recent work on technical education, that, in consequence of the influence of the town were not only equal to, but superior in design over, those of all Europe. He was sorry to hear that the study of wood-engraving had ceased in the institution, for he believed it would furnish an important branch in art for the exercise of female talent. Some of the past engraving produced in the school need not fear competition, and literary men especially might be of service to those who took up that branch of labour. He cautioned them against a false tendency to heaviness in shadows very much encouraged of late by certain works from the other side of the Channel, which, though "taking," was not good art. He urged them, as much as

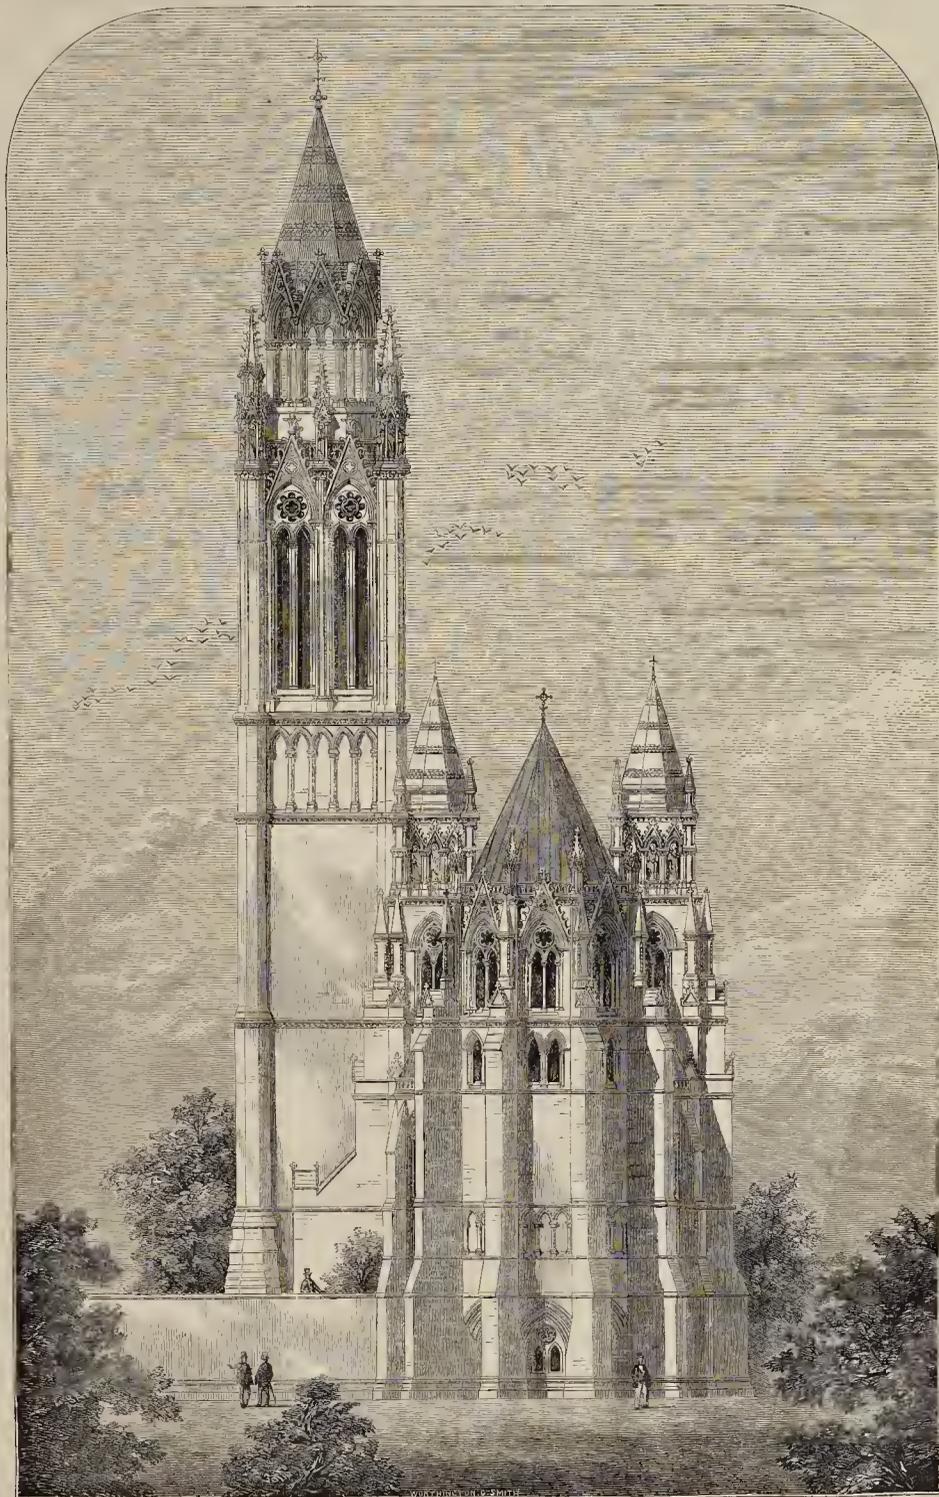

possible, to study from nature, and to study also modelling, which would teach them an accurate knowledge of form. He wished that they had better models, and that the patrons of the institution would lend, whilst they were out of town, pictures of value to serve as copies to the students. To amateurs he pointed out that art taken up for pleasure might be made to turn to a thousand beneficial purposes; that it meant usefulness, and, to the enjoyment of that, happiness—the enjoyment of the beautiful—the greatest and purest of all enjoyments. It would furnish constant modes of pleasant occupation, fresh sources of happiness to oneself and to others. He instanced the success of an author's work through the designs made by his wife, the illustration of sketch-books, which, unlike the gushing passages in private journals, might be kept and shown. He spoke of the use that a smattering of drawing had been to him at Nineveh, of the household elegancies that could be contrived at small cost, of the influence of the Beautiful on childhood, and, finally, of the service done to a country by the diffusion of taste.

THE CHAPEL OF THE COLLEGE OF ST. MARY AND ST. NICOLAS, LANCING, SUSSEX.

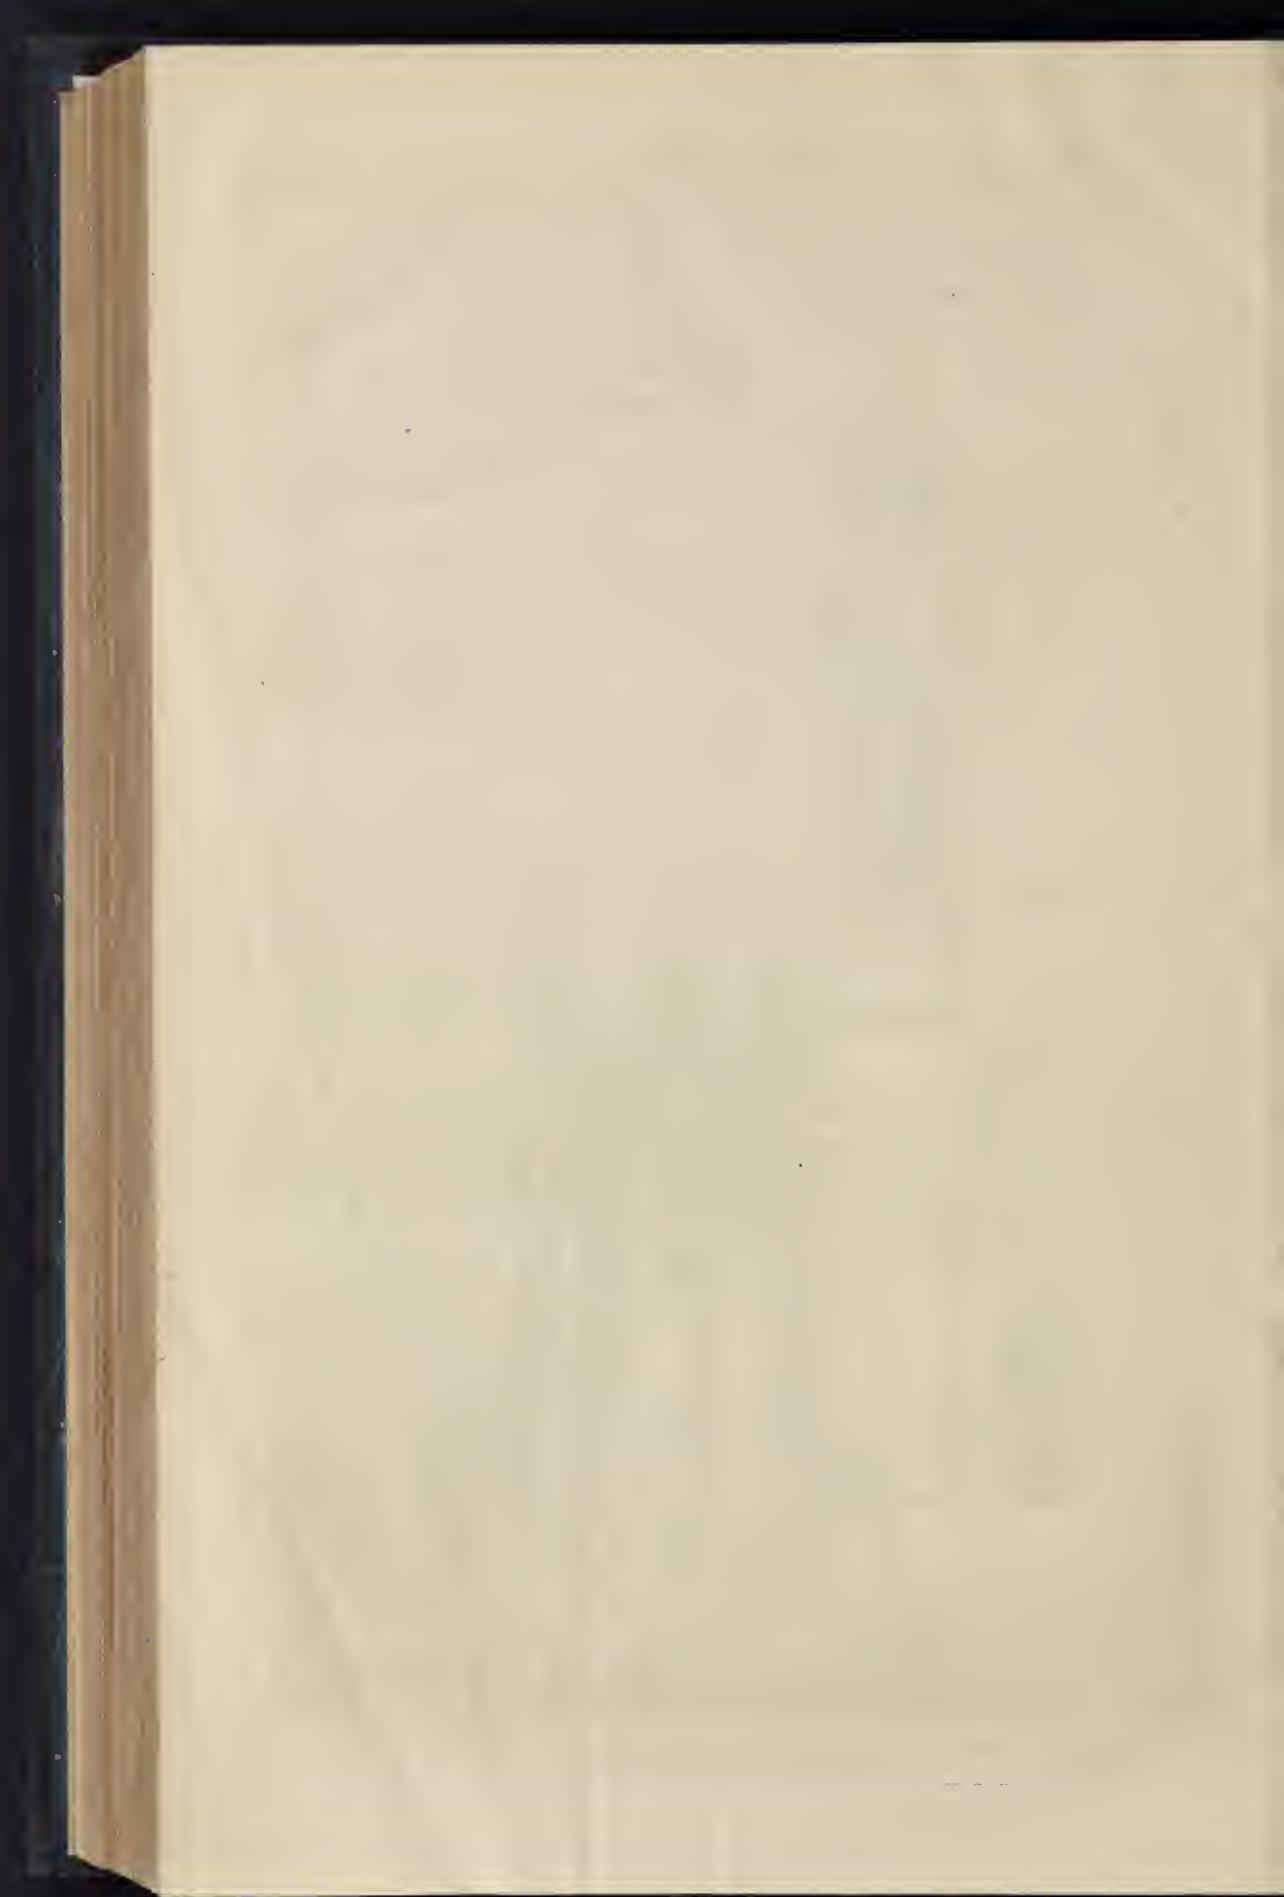

A FEW months ago we mentioned that the first stone of the chapel for this college, where some 300,000l. are to be spent, had been laid, and we fully described the design.* We now give a view of the intended chapel and the plan of it, and briefly recapitulate a few particulars. The chapel, it will be seen, is on a large scale, and will probably be as long time in erection. It is to be carried up as the funds come in, without, if possible, stopping the works at all. The chapel consists of an apsidal choir 170 ft. long, inside, and 30 ft. wide, with an ante-chapel of the same width and 45 ft. long, north and south aisles, north-western and north-eastern towers, and a great campanile at the south-west angle about 350 ft. high. The height from the choir floor to the underside of the groining will be 87 ft. The ground falls greatly from west to east, and the total height of the apex to the ridge of the roof will be about 150 ft. Beneath the chapel there will be a crypt, 20 ft. in height in part, and 30 ft. at the east end.

The chapel is intended to serve as a place of worship for the three great Sussex schools on occasion of grand gatherings of the college. Mr. Slater and Mr. Carpenter are the architects.

* See p. 692, ante.

CHAPEL OF THE COLLEGE OF ST. MARY AND ST. NICOLAS, LANCING, SUSSEX.
MESSRS. SLATER & CARPENTER, ARCHITECTS.

THE TECHNICAL INSTRUCTION
MOVEMENT.

Nottingham.—The mayor has distributed the prizes gained by the students of the Government Science Classes in this town, at the Mechanics' Institution, Lincoln-street. There was not a large attendance. Mr. R. Enfield said he did not think the classes were doing all the good that they ought to do in the town. The subjects that were treated of had a direct bearing on the local trade, and he felt sure that many a man in Nottingham would do his work a great deal better if he only knew exactly the sense of the subject he was dealing with. He had very often regretted that the extraordinary, he would almost say the unparalleled skill of the mechanics in Nottingham, should have so little guidance by scientific knowledge in making them produce the best possible results, and in making the best use of the talents they possessed. He had not the least doubt but that a great number of their talented mechanics were wasting hours, and ruining their health, in struggling after matters which other people had solved before them. It was a great thing to know, in the first place, the principles on which they were working, but it was important also in the second to be acquainted with what other men had done before them. These things they learned from the sort of teaching they received at those classes.

London.—Mr. Buckmaster has delivered a public address in the Subscription-rooms here. He spoke strongly of the indifference of the labouring classes to all questions of social culture, especially those which required any intellectual effort. There was also, he said, "a great want of sympathy and hearty belief in education on the part of employers, and the estrangement and separation of classes was becoming wider and deeper every day. It is useless, he said, to throw all the blame on this class or that class. Every class was responsible for a state of things which, if not checked by a deeper and broader Christian philanthropy and a higher cultivation and refinement of feeling, will ultimately shake the foundations of society. My hope of the future, he added, is in social reforms, in the promotion of education, of temperance, and co-operation, among those whose lot it is to live by manual labour." A committee to consider how the scheme could be best carried out was appointed. Captain W. C. Copperthwaite, steward to Earl Fitzwilliam, occupied the chair.

Oldbury.—Mr. A. M. Chance has distributed prizes and certificates at the National Schools, Oldbury, to competitors in connexion with the Science and Art Department. A number of the certificates were for animal physiology and others for drawing. Mr. Chance strongly urged the necessity of improving the education of working men, and he quoted Switzerland as an example of a continental country where great efforts were made for the education of the humbler classes. Had Switzerland one-fifth of the resources they in England had, it would occupy a far higher position in the industrial world. In some Continental nations education was made compulsory, but he doubted whether Englishmen would consent to be driven.

THE MARQUIS OF BUTE ON SCIENCE
AND ART.

This young and powerful nobleman, who only the other day came of age, has fairly taken the public by surprise by the sensible and excellent speech on art and science which he delivered at the annual distribution of prizes to the students of the Cardiff Schools of Science and Art, in connexion with the free library there. The Marquis was in the chair. In the course of his very able speech he said:—

"What we contend for is, that the use of art is to make people better,—to make them better by setting before their eyes material objects formed in beauty and in truth,—to take the senses, those gates of death, and to make them channels for communicating the comprehension of the beautiful and the true. It is impossible to deny, and to attempt to deny it would be untrue, that upon the average man the ever beautiful phenomena of nature have a great effect. When the Psalmist gazed in admiration upon nature, and the feelings which rose within him made him exclaim, 'How wondrous are Thy works, O Lord,—in wisdom hast Thou made them all.' His was but a creature of the experience of nearly all humanity. There are, indeed, few, if any, upon whose souls the magnificent and lovely spectacle of nature has not an effect to elevate, to purify, to secretly, almost unconsciously, to persuade towards good."

"Art is at present mostly,—I fear I must say almost always,—employed for ecclesiastical purposes. There is

hardly a building erected for worship nowadays in which there is not some attempt made at art. The apostles of art will endeavour to carry out its principles in their dwellings, and in the articles of their daily use. The architecture of houses, particularly of the humbler kind, is quite deplorable. As for the furniture, crockery ware, or plate, it is almost impossible to get it good. A rich man may get a bedstead, or a washstand, or a chest of drawers in good deal, but only by having it specially designed. There are few even then who can do the design, and then there are hardly any workmen, even in London, capable of carrying it out nicely. The most lamentable want of taste is, perhaps, to be seen in jewellers' and silversmiths' ware, and there seems to be most hope about the glass and china. This state of things is one against which the lovers of art must struggle, by endeavouring as much as possible to encourage only the good, or, where that is not possible, the least bad.

I would now wish to speak of the state of art in Cardiff. The immense and sudden increase of the town's material property has been but slightly accompanied by any development of taste for, and encouragement of, art. I am, personally, painfully alive to the fact that the estate is very far indeed from setting anything like an example of art. All I can say is, that that is a defect which I hope to see remedied in time. The establishment of these schools shows, I faintly hope, the desiring of a better way. It is a day which all who love art will do their best to hasten. There is hardly any one who has not got it in his power to assist in some way in the great apostrophe of art. Every one who builds a house, by endeavouring to keep the plain principles of art; every one who keeps a shop, by the manner of its decoration, by the arrangement of his goods, by the character and taste of the wares he transacts; every one who lays down a carpet, or paper a room, or furnishes it, or decorates it—nearly all have it in their power to labour in some way or other, however humbly, for the extension of art, if they have the power to affect it in any way."

COMPETITIONS.

Melbourne Chapel, Derbyshire.—The trustees, after consideration, have finally decided upon the selection of the design tendered in competition by Messrs. Wilson & Wilcox, of Bath, architects. There were eighty competitors. The works are to be commenced immediately.

Kennington School District.—The parishes of Kennington and Westminster jointly are about to erect new schools at Asford, Middlesex, for their pauper children. The following gentlemen have been invited to send designs: Mr. Thomas Ailton, Mr. Burden, Mr. H. H. Collins, Mr. E. Fowler, Mr. Williams, and Mr. H. Saxon Snell. Each competitor is to receive 50l., the one chosen being employed to carry out the works.

THE SUBURBAN VILLAGE AND GENERAL
DWELLING COMPANY.

The works upon the Longborough Park village, under the new management, are said to be favourably progressing, giving promise of a speedy commencement of building operations. The roads have been marked out, and contracts for their construction, with sewers, are being invited by the directors. The proposal is to establish, on completion, a village capable of containing 7,000 inhabitants, who will have dwellings constructed to secure domestic comfort and sanitary requirements. The efforts of the company are directed towards providing for the working classes a house of their own, upon better terms than the ordinary building societies. The scale of repayments extending to twenty-one years, gives the opportunity of doing so at a smaller payment than is generally asked for rent in the crowded localities of London. A selection of plots and class of house was made on the 10th inst., on which occasion all who had paid their calls or instalments, according to priority had a choice. Above 100 were chosen, and will be taken possession of upon completion.

THE SHEFFIELD CORPORATION BATHS.

A CONTRACT has been entered into by the Sheffield Corporation with Mr. Sparrow, builder, Astercliffe, at 1,250l., for the erection of public baths. These baths, says the local *Independent*, are to be near the Borough Bridge, on land the property of the Corporation, situated between the river and the projected new street, which is to be called New Mowbray-street. The new building, when completed, will comprise, on the ground-floor, a waiting-room and ticket and towel office, and a plunge-bath 55 ft. long by 35 ft. broad, or about twice as big as the one at Glossop-road Baths. It will be lined with pressed glazed bricks, giving the appearance of porcelain. The water will gradually increase in depth from 4 ft. at one end to 6 ft. at the other, and will be all the time passing away at the surface through a

slance valve tap, with wheel. The water will be renewed twice a week, the waste water being turned into the sewer. The contents of this bath, when full, will be about 57,000 gallons, and the annual consumption will be about 73 million gallons. At the sides of the bath there will be thirty-two dressing-boxes. In the upper story there will be a living-room and two bedrooms for the attendants, and twenty-four slipper baths, supplied with hot and cold water. A gallery on this story will run round the area of the plunge bath below. In the roof there will be two tanks, each 48 ft. 6 in. long, by 5 ft. 6 in. in width, and 3 ft. 6 in. high, and containing about 6,000 gallons of water. The roof will be slated, except over the plunge-bath, where it will be of glass, supported on wrought-iron pillars. In the cellar there will be a room to wash towels, and a boiler for the supply of hot water.

The frontage of the building will be in the Italian style of architecture, with arched windows, and doors, and will be built of ornamental uncoloured bricks, with projecting pillars. The height, from the ground to the parapet, will be 24 ft.

The contract for the mason's, joiner's, and slater's work is let to Mr. Wm. Sparrow; the contract for the ironwork (boiler, tanks, and columns), to Messrs. Newton, Chambers, & Co., Thorncliffe Ironworks; and the contract for the plumbing department to Mr. Wm. Bissett. The whole of the contracts amount to about 2,050l.

The plans have been drawn up by Mr. S. F. Holmes, the borough surveyor; and Mr. H. Mannmann, of Mr. Holmes's office, officiates as clerk of the works.

BATLEY GAS WORKS.

The district supplied by the Dewsbury and Batley Gas Company comprises the boroughs of Dewsbury and Batley, and the townships of Southill Upper, Southill Nether, and Thornhill, and contains a great number of woollen factories. The almost unparalleled increase of Dewsbury and Batley during the last ten years has compelled the Gas Company to enlarge their works by establishing branch works near Batley, and they have further increased them this year by the addition of a telescope gas-holder, 120 ft. diameter and 64 ft. high. The tank is constructed of asphal, and puddled; and the work has been executed by Mr. Brier, of Dewsbury. The gas-holder is supported by twelve massive cast-iron columns, tied together at the top by wrought-iron lattice girders; the gas-holder is from the works of Mr. Benjamin Whitehouse, West Bromwich. A tar and ammoniacal liquor tank, 52 ft. diameter and 20 ft. deep, has also been added. The whole of the works have been erected and constructed from designs prepared by and under the superintendence of Michael Sheard, of Batley, C.E., at a cost of nearly 13,000l.

RAILWAY MATTERS.

For several years past there has been a project of bridging the Mersey in the neighbourhood of Runcorn, and by so doing reducing the distance from Liverpool to London to about four hours. The site selected for the proposed bridges was that narrow neck of water which separates Runcorn from Widnes, and now that the enormous span of arches which connect both the Lancashire and Cheshire sides of the Mersey has been completed, and, in fact, nearly ready for traffic, a sad mishap has overtaken the exertions of the London and North-Western Railway Company, by which a long delay will be necessary, before the "short run" between Liverpool and London can take place. It appears that for some time past the parties who were constructing the bridges over the Mersey were of opinion that there was a shelving bottom, and that in order to support the masonry an embankment of earth, well pressed, was necessary. This was done, but a few days since the embankment supporting the Widnes side of the bridge gave way. The embankment was made up of a good deal of clay with an admixture of light soil. The late heavy rains had, no doubt, washed away the greater portion of the light soil, and the clay being thus divided into fissures, gradually gave way, and while nearly all the labourers were at dinner, came down with a low rumbling sound. A singular feature in connexion with this accident is, that one of her

Majesty's inspectors of railways had just inspected this portion of the bridge, fourteen engines having been brought down from Crewe for the purpose of testing the firmness of the bridges. The inspector pronounced everything in proper condition.

The first trial arising out of the Abergele railway catastrophe has just taken place at the Manchester Assize. The action was brought on behalf of the three children of Wm. Townend Lund, a Blackburn manufacturer, who lost his life on that melancholy occasion. The liability was not denied, and the jury assessed the compensation at 1,450*l.* for each of the three children of deceased, making a total of 4,350*l.*

The traffic receipts of railways in the United Kingdom for the week ending December 6th, amounted, on 13,355 miles, to 719,698*l.*, and for the corresponding week in 1867, on 13,039 miles, to 689,975*l.*, showing an increase of 316 miles and of 29,723*l.*

CONCRETE BRIDGES.

In a description given in the *Builder* about three months since, of the works on the Metropolitan Extension Railway between Paddington and Brompton, an allusion was made, in passing, to an interesting experiment in progress across a wide cutting upon the Metropolitan District line, near Brompton Station. We are now able to report the results of the experiment, which was to test the tensile power of concrete. They are such as seem calculated to lead to the more extensive use of this description of building material. The structure to which the test was applied is an arch formed entirely of concrete, of 75 ft. span, and only 7 ft. 6 in. rise. It was 3 ft. 6 in. deep at the crown, and of a uniform width of 12 ft. The materials and proportions employed were 6 of gravel to 1 of Portland cement, and dependence for cohesion was placed rather upon thorough mixing of the materials than ramming. The tests successfully borne by this erection were 170 tons, distributed equally over the top, and a train of seven trucks, weighing 50 tons, passed over it. There was practically no deflection under these weights.

ST. MARTIN'S SCHOOL OF ART.

The annual distribution of the prizes to the students of St. Martin's School of Art, took place on the 15th inst., at the school, Castle-street, Endell-street, Long-acre. It seems that, at the examination held in March by the Science and Art Department, eighty-five students presented themselves, and worked out seventy-nine papers successfully in geometry, perspective, free-hand, and model drawing, for which certificates and twenty-seven prizes were granted. The works of forty-three students, advanced and elementary, executed during the year, have been marked satisfactory. Seven free studentships have been awarded for the most satisfactory works sent up during the year. Mr. E. F. Clarke has been awarded the gold medal for architectural design for a cathedral, with dome, in the Mediaeval style (the gold medal is one of ten offered by the Department of Science and Art, to be competed for by all the art schools in Great Britain and Ireland); the second prize, 5*l.*, offered by the Plasterers' Company, was gained by George Jepp, for a design for an ornamental panel.

Lord Houghton, who presided, presented these and various other prizes to the successful candidates, and then addressed the meeting on the faculty of imagination:—

"What were the elements of art" (he asked, in the course of his observations); "the foundation and meaning of it? It was the use of the imagination of mankind. This was not specially confined to any high or gifted class. Sometimes it was to be found among the very lowest class, who were largely endowed with the faculty of imagination. There were nations which might be called imaginative nations as compared with others, and amongst the efforts and products of that imagination had been the desire growing up in the human mind to represent, by means of drawing and of, he might say, manual exercises, to represent in the outward world processes which were going on in the mind and imagination of the individual. There was no doubt that the very highest faculty of this kind, in which the most beautiful thoughts were transmuted into the most beautiful forms, was given by Providence to very few. It had perhaps in the history career been given nationally only to one people—to the inhabitants of those small peninsulas stretching out from Europe into the Mediterranean, and which now formed the Hellenic kingdom: that wonderful people, so small as almost to be politically overlooked—in the general history of the world almost insignificant, yet, nevertheless, by the omission of

the artistic spirit within them, had rendered themselves the immortal founders of the greatest artistic truth amongst mankind. It was that little Greek people whose spirit they saw represented, imitated, followed, taking all kinds of casual forms, through the whole history of the modern world."

Mr. Digby Wyatt, Mr. O'Neill, and Mr. W. Lloyd also addressed the meeting, and thanks were voted to Mr. W. L. Casey, the head master, and to the Rev. R. G. Maul, the hon. secretary.

A CHRISTMAS CAROL.

HAIL, gracious Morn! Hail, Day of days!

Whereon the Lord of Righteousness,
Compassionating human woe,
And ignorance, and wickedness;

Descended from His "high estate,"

And came, "as man with men to dwell,"
Upon this earth He form'd so fair,
But which their passions made a hell.

And having taught, and toil'd, and striven,
To give His people nobler aims

Than self-aggrandisement,—self-love,
With all its gross, debasing claims;—

And having shown, by His own life,
The beauty of sweet love and ruth,
He meekly seal'd with His heart's blood,
His gentle Gospels high-soul'd truth.

Evil and Sin, indignant, rose,

And strove to quench this too pure light;
Which shone contrasted with their deeds,
Like clear noonday 'gainst blackest night.

And as, in ages past, they honed

And crucified Truth's outer shrine,
So now, with thick perverting clouds,
They seek to hide its light divine.

All useless their Satanic wiles!

They with themselves shall pass away;
But God's pure Word of Truth shall shine
"More brightly to the perfect Day."

And while we celebrate the eve,

That brought th' Incarnate Word on earth,
We'll strive to spread abroad the gifts
Bestow'd by this mysterious birth:

By generous heart and open hand;

By sympathy with suffering men;
By sorrowing words for his misdoers;
But ne'er contempt: for, say who can,

Had he been tempted in like way,

He had pass'd scathless through the fire?

Yet, while we palliate his faults,

Plant on our own virtue-standard higher;

Remembering that our Master taught

Each blessing brings a duty, too;

And every talent we receive

Entails a work for us to do.

And if remembrance grow to deed,

With earnest striving to fulfil

His blest commands, then, as in heaven,
So upon earth, is done His will.

Thus may we hope to swell the strain

Of "Glory be to God on high!"

While "Peace on earth, Goodwill toward

men,"

Angels re-echo through the sky!

R. F. H.

NEW METROPOLITAN MARKETS.

SIR,—Agreeing in the observations which have appeared at different times in your paper on the all-important subject of market supply and accommodation of the metropolis, I crave your permission to add a brief suggestion or two for the benefit of the promoters of such useful undertakings, the railway companies, and the public generally, which, I venture to think, will not be deemed unimportant. The light-traffic passengers would be stopped by the obstruction of the goods heavy traffic, which not only would cause great confusion and mischief to the railway, but prove a great nuisance to the neighbourhood of the station, in conveying the goods from the terminus to the market-place.

An underground branch is the imperative remedy; but, to obtain such an expensive accommodation, the market site must be central, to command the supply from the United Kingdom and abroad; if not, the movement in favour of new metropolitan markets will not come within the fair scope of commercial enterprise, because it appears to be lost sight of by the

general promoters of the movement to create markets in London, that the command of the supply must necessarily be the principal object to look to, on the evident principle of no supply no market. In a word, to command unlimited supply, you must have corresponding convenience and attraction. The markets proposed to be erected in different quarters of gigantic and every-day increasing London, should command the most open, commodious, and central situations in their respective localities; and they should have underground branch railways attached to them to carry into these their enormous consignments from all quarters of the interior of the kingdom and the sea-coast, without a moment's delay or interference with the passenger traffic of the various metropolitan railways.

Any market proposed to be erected without realizing these two leading principles,—the one to command supply, the other to make the heavy traffic disappear from the surface, with the assistance of underground branches,—will prove, not a public boon, but a great nuisance, and, judging from recent experience, a frightful danger, and should be strenuously opposed by the London metropolitan railway companies, by the Legislature, by the vestries, and by the public in general. We must look to the press to direct the movement in the right way.

In conclusion, all future markets must have a branch underground railway; and the first market to be erected ought to be a great general market for flowers, fruits, vegetables, meat, fish, game, and poultry. With such a market, provided with all the new requirements of civilization, aided by telegraph and railways, an enormous importation into England would take place of all the richest vegetable products from the South of Europe, Algeria, &c., which are now unknown to the generality of the inhabitants of this wealthy country.

I need scarcely add, that such a change would operate beneficially in a moral, as well as a physical sense, in the sumptuous habits of our middle and working classes. As Brillat-Savarin has truly said,—"*Dis-moi ce que tu manges, je te dirai qui tu es.*" BELGRIAN.

SKUNCHIONS.

MR. POWELL, in his observations on the Triangular Lodge, Rushton, says (p. 879, ante),—"The skunchions (shields?) were from Pipwell." The word skunchion, sconcheon, or scuntion, is in daily use among masons in some parts at least of Scotland, and is applied to the internal jambs of openings in outside walls, and to the jambs of openings in inside walls. In the "Imperial Dictionary" it is thus given:—"Sconcheon. (Fr. *Sconsoin*.) In architecture a term probably originally applied to the angle formed by the meeting of the planes of the window-jamb, and wall of a room; but now used to denote the whole side of any aperture, formed of roughly-dressed stones."

"Sconsoin," used to designate the internal arch of a window, is evidently the same word.

In rubble walling the scunchions are looked upon as most important members of the structure,—specified to be out and in bond,—and unless closely bedded, so as to correspond in solidity with the external "rybets," or jamb-stones, the wall is likely to settle more on the inner face than the outer, and, consequently, hinge outward.

From the above you will see that the word has nothing to do with escutcheons, and the guesses of your correspondent, and of Parker's "Glossary of Terms," and Elmes's "Dictionary," are equally at fault. W. R. CONSON.

A BLACK STAIRCASE.

SIR,—In reply to your correspondent "K. K." he can see such a staircase as he mentions at the Duke of Hamilton's Palace, at Hamilton, in Lanarkshire. The staircase allude to is a large one, and is built entirely of black marble, highly polished. The effect is very solemn and imposing, although, perhaps, somewhat funereal. This staircase is not the principal one in the palace, and it was erected by the late duke—at a very great cost (my guide mentioned 40,000*l.*); the expense having been much greater than was expected owing to the difficulty in cutting and polishing the marble,—the same person telling

no that the polishing of each baluster alone cost 27l. I cannot vouch for the accuracy of these statements, but such were the sums mentioned to me.

The staircase is one of the great sights in the palace, and is certainly worth seeing, as well as the glorious art-collections, brought together chiefly by the late duke, and embracing many fine "old masters" and a large collection of objects of *virtu*, &c.,—an assemblage of art treasures that would go a great way to make another South Kensington Museum.

J. S. R.

In reply to "K. K.," at the Star Hotel, Lewes, there is a staircase brought from Slough—place of oak, but as black as ebony. "K. K." might find the staircase worth seeing. London, Brighton, and South Coast railway. N.

DISTRICT SURVEYORS' DISTRICTS.

Sir,—It has often occurred to me that if a map of London were published showing the fifty-eight districts, and numbered thereon to correspond with the surveyor's list, it would be found very useful to the building trade. The many new districts created of late years, coupled with the vague information to be obtained from price-books as to the boundaries of each surveyor's district, render it questionable at times to whom "notice of commencement of works" should be sent. A map of this kind might very well be attached to all future price-books.

J. B. COLWELL.

ARCHITECTS' FEES.

In the case of *Widdows v. Fuller* in the Court of Exchequer, on December 11th, Mr. Granton appeared for the plaintiff, and Mr. H. James for the defendant. This was an action brought by an architect to recover the sum of 40l. 12s. 2d., being the amount of his charges for drawing plans and specifications and making out bills of quantities for a house proposed to be built by the defendant upon some land he had recently purchased at Sparesbrook, in Essex. The defendant denied that he had ever given the plaintiff any instructions to draw out the plans, but paid 5l. into court in satisfaction of the plaintiff's claim. The jury returned a verdict for the plaintiff for 19l. 15s. beyond the sum paid into court.

THE ROMFORD SEWAGE CASE.

THE Bill, before Vice-Chancellor Sir J. Street, December 10th, was filed to restrain the Local Board of Romford from conveying the sewage of the town and district into the river Rom, to the damage or annoyance of the plaintiff (Master) and other residents. The case has been on several occasions before the Vice-Chancellor and the Master of the Rolls, as *Vacatice* Judge, and the former had in May last granted an injunction restraining the Local Board from conveying the sewage into the river unless the same was sufficiently deodorised. The plaintiff during the Long Vacation, considering that the Local Board were not deodorising the sewage sufficiently, applied to the Master of the Rolls for a sequestration, and his Lordship made the order, but suspended its enforcement to give the Local Board a further opportunity of removing the nuisance. The plaintiff, in Michaelmas Term, applied to the Vice-Chancellor for leave to enforce the sequestration, but the application has stood over from time to time, with a view to an arrangement, the Local Board stating that they were endeavouring to obtain land at some considerable distance from Romford on which to establish and carry on permanent works for the purpose of getting rid of the sewage by irrigation. The plaintiff now moved again for a sequestration; but an arrangement was entered into, with the sanction of the Vice-Chancellor, by which it was agreed that the cause should be set down for hearing, *pro forma*, on the 1st of April, and that a decree should then be taken for a perpetual injunction restraining the Local Board from carrying the sewage into the river, the Local Board having liberty to apply at Chambers for extension of time, and undertaking, in the meanwhile, to use proper means for deodorisation, at a cost not exceeding 15l. a week, if the plaintiff should require it, to employ his nominees to effect the deodorisation, and to pay the plaintiff his costs of the suit.

ST. JOHN'S, DUMFRIES.

This new church has been consecrated. It was erected from the designs of Mr. W. Slater and Mr. R. Herbert Carpenter; and one of the chief contributors to the building fund is the Duke of Buccleuch. The plan consists of a wide nave, with lofty clearstory, and narrow side aisles, square-headed chancel, and a tower and spire on the north-west angle. It seats about 700 persons. The nave has five bays; the arcades are (and, in fact, the whole church is) exceedingly simple in character; they have two orders, in Dumfries and Prudham stone, resting on cylindrical shafts of Prudham stone, with carved capitals. The chancel arch has richer arch-mouldings, resting on three attached shafts. Each bay of the clearstory has three lancet lights. The west wall has a great triplet,

with traceried rose window over. The roof of the nave has moulded tie-beams and king-posts, with curved moulded braces and wind-braces: the total height being 65 ft. The chancel roof has curved and moulded braces. At the east end of the chancel is a triplet of broad and lofty lancets, with an arcaded recesses below. The whole is built and faced, inside and outside, with Dumfries stone, and bands of Prudham stone at the opening of windows, &c. The paving is of Caithness stone, and the roof-covering of green Silbichwaite slates. The tower and spire are 120 ft. high and 18 ft. square. The lower stage forms the north porch, and has deeply-recessed and moulded doorways, with curved tympana. Above are the ringing-floors, &c. The tower batters slightly, and rises without buttresses to the doubly-corbelled cornice under the spire. The lofty-stage has two simple recessed lancets on each face. The spire has cusped arches, with arched and moulded canopies over them, forming, as it were, a crown round the spire. Many of the windows are filled with stained glass, by Clayton & Bell, the principal ones being the east lancets of the chancel and the west lancets and rose of the nave. The whole of the works have been executed by Messrs. Crackstone, of Dumfries, Mr. Paffrey being the clerk of the works.

THE NEW PUBLIC HALL IN IPSWICH.

The New Public Hall, the principal entrance to which is from Westgate-street, is now completed and opened. The site was extensive, and the frontage on Westgate-street has been utilised by building houses and shops fronting the street, whilst the hall has been set back completely away from the noise of the street traffic. Mr. Frederick Barnes, of Ipswich, architect, was employed to make the designs for the buildings, and in accordance with his plans the Public Hall and other buildings have been erected.

The main entrance to the hall consists of an arcade, 15 ft. wide and 16 ft. high, with a stained wood ceiling, and it is closed at the street by iron gates. On either side is a polished granite column, rising from a stone base and ending in a stone scroll,—placed there, we presume, for ornament, for they make no pretence whatever of supporting anything, not even the balcony of a club reading-room above. The hall has sitting accommodation for 1,500.

In determining upon the proportions and general characteristics of the hall, the architect studied those of St. James's Hall, London. The height from floor to ceiling is about equal to the width, whilst the length is, within a foot or two, double the width, the actual figures being,—width, 50 ft. in the clear; length, on the floor, 95 ft., or from the back of the orchestra recess to the back of the gallery 126 ft. The hall is divided longitudinally into seven bays by pilasters, which project 4 in. from the walls and are 30 ft. high from the floor, with enriched capitals, above which are an entablature and ornamental cornice corresponding in style with the capitals of the pilasters. From the cornice springs the ceiling, on the arrangement and decoration of which some care has been bestowed. The ceiling springing from the cornice spans the width of the hall in the form of an ellipse, divided by enriched ribs, corresponding with the pilasters, into seven bays. Running down the length of the ceiling are two enriched bands, the ornamentation of which, of course, is entirely in character with that of the other decorations of the ceiling: these intersect the ribs which span the width of the hall; and in each of the seven centre divisions thus formed is an elliptical dome 13 ft. by 10 ft., and 5 ft. high; and from the centre of each dome is suspended a glass gasolier with sixteen jets. The hall is lighted in the daytime by seven semicircular-headed windows on each side above the cornice, the ceiling being formed in arches above them, these arches being groined into the main elliptical arch, ornamental perforations being made in the groins to assist in the ventilation, for which further provision is made in the centre flowers of the domes of the ceiling. The walls are of a pale pink tint, and are relieved by white pilasters. All round the hall is a panelled wainscoting of pine, 6 ft. high from the floor, having an ornamental capping and base, and this wainscoting is varnished. The cornice is white, and its members are picked out with vermilion and ultra-marine, whilst the ceiling is a pale buff or dark cream colour, slightly ornamented with scrolls and honey-

suckles in claret colour. The colouring was done by Messrs. Stearn & Son, of Ipswich.

The orchestra is at the lower end of the hall, and is in the form of a niche, 32 ft. wide, 42 ft. high, and 16 ft. deep, and the platform projects 10 ft. into the hall, so that from the back of the recess to the front of the platform is 26 ft. It is arranged with tiers of seats rising one above another, with desks, which are fixtures. At the opposite end of the hall is the gallery, which extends back over the main entrance lobby, and the stalls in this gallery form some of the best places in the hall. The front of the gallery is serpentine in form, and is divided into panels filled with ornamental ironwork.

For heating the hall two of Garney's stoves are placed below the floor close by the orchestra, and in the ante-room at the other end are two other stoves, all supplied by Mr. C. J. Meadows, of Ipswich. There are also means for warming the ante-rooms.

The total cost of the buildings, including the hall, has been about 14,000l. The contract for the ball was 4,700l., but extras have brought the amount up to about 6,000l. exclusive of the furniture. Mr. E. Gibbons, of Ipswich, was the contractor.

CHURCH-BUILDING NEWS.

Halesworth.—In the course of the last ten years, Halesworth Church has several times been restored and enlarged, and the last restoration having been completed, the church has been formally re-opened. The enlargement, we have now to notice consists of an addition to the south aisle, and a new south porch, which have been erected in accordance with the prevailing style of the building. The walls are faced with flint, with stone dressings. The interior is filled with uniform open benches. The nave is narrow, and is divided into four bays, in the clearstory being three-light windows, which admit plenty of light, but are wide for their height. Some attention should be paid to the clearstory (which, by the way, extends to the east end of the chancel), and to the roof of the nave, which is now plastered. The two aisles on the north of the nave have timber roofs. The windows in the north aisle have three lights, and are filled with cathedral glass, with a narrow edging of clear glass, and those of the new south aisle exactly correspond. Mr. Francis, of London, was the architect for the newly completed enlargement of the south aisle (which gives considerable additional sitting accommodation); the carpenter's work was performed by Mr. James Smith, the masonry, &c., by Mr. R. Balls; and the glazing, &c., by Mr. John Owles, all of Halesworth. The churchyard, in which there have been no fresh interments since the opening of the cemetery, is being planted out at the expense of Mr. John Read.

Huddersfield.—A new church, at Septon, near Huddersfield, has been consecrated. The site on which the church is erected is Septon Cross, and has been given by Mr. A. F. Beaumont, M.P., together with a plot of land for a parsonage-house, and a sum of 300l. towards the investment fund. The style of architecture is the Early English. The accommodation in the edifice is, for adults, 328, and children, 144. The cost is estimated at 3,800l., and there are 300l. to be raised.

Batley.—A new church has been consecrated here by the Bishop of Ripon. It stands on an elevated site not far from the Baths, Batley. It is dedicated to St. Thomas, and has cost about 6,000l. The structure consists of nave, side aisles, chancel, tower and spire, is an example of the Geometric Decorated Gothic, and has been erected from the designs of Mr. Sheard, of Batley, architect. The nave is 52 ft. high, 75 ft. long, and 23 ft. wide, and the chancel 33 ft. long by 20 ft. in width, the former being divided into five bays. The tower is 20 ft. square, at the south-west corner of the nave, and 150 ft. high to the top of the vane. On the north side of the chancel is the organ-chamber and vestry. The material used in the construction of the building is deep stone from the local quarries for the walls, and Finsdale stone for the dressings. Internally the woodwork is of deal, stained, and varnished, the roof open-timbered, and the seating accommodation is in open stalls. The capitals of the columns of the nave, supporting the clearstory, are carved. The cost of the structure and fittings is some 6,000l., part of which amount has still to be raised. The con-

tractors for the various works required in the erection of the church were Messrs. Copley & Co., masonry; Joah Willans, joinery; J. Hey, plastering; Thornton & Thompson, slating; and J. H. Senior, plumbing, &c. A feature of the church is the painted east window, of five lights, presented by Mr. Michael Sheard, the architect, in memory of his daughter Gertrude. The artists were Messrs. A. & W. H. O'Connor, of London.

Sheffield.—The work of restoring Beighton Church commenced about fourteen months ago, and so little remains except the tower of the original structure that it may almost be said to have been rebuilt. The gallery at the west end has been removed, and the western arch thrown open. The high-backed pews have been replaced by open benches of pitch-pine stained. Nearly the whole of the interior fitting of the church has been renewed. The floor of the chancel, which has been raised, is laid with Minton's tiles. The ancient entrance to the "Rood Loft," which was discovered when the plaster was being removed, has been restored. A Norman arch over the pointed arch separating the nave from the chancel was discovered, and has been rebuilt after the style of the original, except that the mouldings are of a richer character. The screen between the north aisle and the vestry, which is made of the old oak taken from the roof of the church, is carved. At the west end of the south aisle a stained glass window has been placed by a parishioner. The peal of six bells has been re-bung, as it was found the woodwork was much decayed. The Tudor roof has been replaced by one raised to the original pitch, and the north door, which has been closed more than half a century, has been thrown open. The architect was Mr. Rollinson, of Chesterfield, and the contractors for the whole of the work were Messrs. Ash & Clayton, of Sheffield.

Swansea.—The Seamen's Church has been opened for divine service. The new building, which is of Norman style, was designed by Mr. B. Bucknall, architect. It is a plain building. The church will accommodate about 300 people, and the entire cost of erection, including internal fittings, is about 925*l*. The work was commenced last April, the Messrs. Bucknall being the builders.

Dulwich.—Since 1858, when Dulwich College came under a new régime, much of the land belonging to it at South Dulwich has been built upon. The old chapel has been found to offer insufficient church accommodation for the increasing population, and the governors of the college, therefore, gave a site for, and 1,500*l*. towards, a new church and parsonage. The residents contributed liberally, and Mr. Tite, M.P., gave 1,000*l*. The new church, Gothic, of the thirteenth century, designed by Mr. Barry, of the firm of Banks & Barry, and built by Messrs. Perry & Co., of Stratford, is dedicated to St. Stephen, contains 550 sittings, and may be enlarged to hold 180 more persons. It has been consecrated by the Bishop of Manritius, acting for the Bishop of Winchester. The church has cost 7,930*l*., and the debt before consecration was 2,570*l*.

Bradford.—A meeting of the Bradford Church Building Society has been held for the purpose of taking steps for completing the fund for the erection of another new church in this town. Mr. H. W. Ripley, M.P., has presented a site of ground for a new church at Ripleyville, a suburb of the town, and the society intend to erect thereon a new church in memory of the late Mr. Charles Hardy, brother of the late Home Secretary. The sum of 2,500*l*. had been already offered in donations, and a sub-committee was appointed to collect a similar sum in other donations. The society has already been instrumental in erecting eight churches in the town in as many years, and it is intended to complete the original scheme of ten churches.

Shottisham.—The work of restoring the parish church has this year been carried a step further. The tower has now been restored from top to bottom, a new string-course parapet and coping being added, and a new west window, together with four belfry windows, inserted. The old porch on the south side has been pulled down, and a new one substituted. The south wall, nave, and chancel have been refaced; four new windows (in the Early English and Early Decorated styles), have been put in—three in the nave and one in the chancel; and new plain oak doors have been placed in the nave and chancel. The work done to the church during something like a year and a half has cost about 1,200*l*., and the expense will be defrayed chiefly through the liberality of the rector, by whom a

new commodious school-room is now being built. The whole of the new work was executed by Mr. Henry Luff, of Ipswich, builder, under the supervision of Mr. Edward Hakewell.

Kilminster.—The parish church of St. Mary, after having undergone extensive enlargement and repairs, has been re-opened for public worship. A north aisle, opening into the nave by means of four arches on octagonal pillars, has been added. Old pews, with high straight backs, have been supplanted by benches of stained deal, and a new roof of open woodwork has been placed over the entire building. The flooring has been entirely renewed, the aisles being paved with encaustic tiles supplied by the Poole Pottery Company. A heating apparatus, by Haden, has been placed under the floor of the central aisle, near the west end. The organ and choir occupy the south transept. The tower is separated from the nave by a new screen of pitch pine, and a new pulpit of carved oak has been placed on the north side of the chancel arch. The works have been carried out by Messrs. Clark, of Bruton, under the directions of the architect, Mr. St. Aubyn, of London. The estimated cost is 1,200*l*.

DISSENTING CHURCH-BUILDING NEWS.

Birkenhead.—The Hamilton Presbyterian Church, situated in Laird-street, Birkenhead, has been opened for divine service. The site, at the junction of Laird-street with the Upton-road, prevented the use of side windows, there being sufficient land only for the erection of the building itself. The architect was consequently obliged to adopt the mode of lighting from the roof by means of clearstory windows. These run throughout the entire length, supported upon the principals. The roof is in one span, without columns or supports. In addition to the clearstory lights there are windows at each end of the building. The church is 68 ft. long by 42 ft. wide, and 40 ft. high to the ceiling. The floor space, together with a gallery at one end, gives sitting accommodation for 620 persons. The gallery is approached by two staircases from Laird-street, and the principal entrance and vestibules are also from that street. The style is Late Geometric Gothic. The principal elevation to Laird-street is entirely of the stone of the neighbourhood, with a little red stone, in bands and arches, introduced to give effect. The sides, which may ultimately be built against, are of plain brick. There is a temporary vestry at the back, where it is contemplated at some future time to erect a lecture-hall and keeper's house, land having been left for that purpose. The heating has been effected by a hot-water apparatus supplied by Mr. Clarke, and the contract for all the other works has been carried out by Messrs. R. Anderson & Sons, under the superintendance of Mr. James N. Crofts, architect. Mr. Turnbull was the clerk of works. The site is the gift of Mr. John Laird, M.P.; and the cost of the building and other expenses (about 2,500*l*.) have been nearly all provided by contributions from friends to church extension of all denominations.

Macclesfield.—The Park Green Chapel has been re-opened, after cleaning and repair, with alterations to accommodate an increased number of Sunday scholars. The chapel is lighted with Kidd's patent hydro-carbon light, furnished by Messrs. Rigby & Son, of Manchester. The old burners have been removed, and it is found that, with a considerably less number, a much better light is obtained by the new process, which is a simple and inexpensive one. Each light is supplied with a carburettor charged with an explosive carburetted fluid, the heated vapour from which mixes with the gas, increasing the light whilst greatly reducing the consumption and cost of gas.

Callercroats.—The foundation-stone of a Primitive Methodist chapel and school-rooms at Callercroats has been laid. The present building, which projects considerably into the road, having been found to be too small, the Duke of Northumberland placed a suitable site at the disposal of the trustees, on the understanding that the present structure would be removed after the erection of the new premises. The new building is to be entirely of stone, and in the Gothic style. Accommodation will be provided for nearly 400 persons. The whole of the seats will be open, and a convenient platform will be affixed at the west end. The school-room will accommodate from 300 to 400 children. Mr. Thomas

Oliver, of Newcastle, is the architect, under whose superintendance the work will be carried out. Mr. Henry Andrews is the clerk of the works, and Mr. Thomas Turnbull, of Birtley, is the sole contractor.

Stockton.—A new Methodist Connexion Chapel in Norton-road has been opened for divine worship. The new chapel measures 41 ft. by 35 ft. It is to accommodate 500 sitters, and has school and class rooms attached which will further accommodate 300. The whole cost of the premises will be 1,500*l*.

STAINED GLASS.

St. Mary's, Collaton (Torquay).—The church of St. Mary the Virgin, Collaton, near Paignton, has recently had an east window, placed in memory of the Rev. J. B. Hogg, the founder of the church, by his widow. In the three principal lights of this window are represented,—1. Our Lord bearing the Cross; 2. The Crucifixion; and 3. St. John leading away the Virgin Mother to his own Home. In the central compartment is also introduced the figure of St. Mary Magdalene, huddled low at the foot of the cross; and in the first compartment those of the other two Maries. The two quatrefoils above are filled with representations of angels; and the highest quatrefoil with the emblem of the Lamb of God. A small separate light near the roof contains the emblem of the Virgin. In the first compartment the palm-tree appears, and in the last the sycamore. The work was designed and executed by Messrs. Ward & Hughes, of Loudon.

St. George's, Ramsgate.—A stained-glass window has been placed recently in the north side of this church, in memory of the late Mr. M. A. Daniel, eldest son of Mr. M. F. Daniel, and late midshipman on board Her Majesty's ship *Shannon*. The window was prepared by Messrs. Warrington, of Loudon, and is executed in the architectural style of the fifteenth century. The canopy consists of the passion-flower, the blossoms being blended with leaves. The subject of the drawing is taken from 1 Samuel i. On one side the scene delineated is the death of Jonathan, while upon the other side a messenger from the battle-field is represented as showing to King Saul the crown lately worn by his royal son, the sight of which causes him to weep. The inscription (in Elizabethan characters) at the foot of the memorial, is written in steel grey, with initials in gold.

Knaresborough Church.—A window has been placed in the south aisle of the parish church of Knaresborough, in memory of the late Mr. and Mrs. Powell. The subjects represented are the six works of mercy mentioned in Matthew xvi. 37, 38, 39, 40.—Feeding the hungry, giving drink to the thirsty, receiving the stranger, clothing the naked, visiting the sick, and the prisoner. The window has been designed and executed by Messrs. O'Connor.

St. Cuthbert's, Carlisle.—A stained-glass window has been presented to this church by Mr. Ferguson, of Carlisle. It has been executed by Messrs. Ward & Hughes, of Loudon, under the superintendance of Messrs. Cory & Ferguson, of Carlisle. The window consists of three panels, or compartments, surrounded by a gilded border. In the lowest of the panels is a representation of the Stoning of St. Stephen; the middle one is devoted to the subject of the Conversion of St. Paul, after Day's picture; while in the top compartment is the figure of St. Paul, preaching from the Areopagus at Athens. The circular bead, surmounting the whole, is of pattern glass, to accord with the pictures, the prevailing tone of which has been made somewhat dark in consequence of the proximity of buildings outside, but the sombre hues are frequently relieved by the brighter tints of ruby and blue.

Walker Church, Newcastle-upon-Tyne.—This church has just been enriched by the insertion of two memorial windows of stained glass, from Mr. Baguley, of Newcastle. They are Early Pointed in character. One contains the "Parable of the Good Samaritan," the other, "Our Saviour Blessing Little Children," with an angel beneath. Both subjects are surmounted by canopies of foliage. The windows are erected at the west end of the church, which has just been enlarged and re-opened.

Banbury Church.—A memorial window, designed by Messrs. Heaton, Butler, & Bayne, of Loudon, has lately been placed in this church, in memory of the late Mr. Eugene Spinney, Mns.

Bac. Oxon, organist of the church. This window is set up by the choir, with the help of friends and pupils.

St. Patrick's, Hove (Brighton).—A large memorial window has just been placed in this church. It is from designs by Mr. Butterfield, of London. The subject is suggested by the words—"For they drank of the rock that followed them, and that Rock was Christ," which appear below. In the centre (the window is one of three lights) stands the figure of Moses in the act of striking the rock, from which is flowing water, with which the surrounding figures are quenching their thirst. The tracery of the window is filled only with geometrical designs: the absence of subject in the upper part serving to bring the main subject more prominently forward.

Ripon Cathedral.—It is intended to erect a stained-glass window in Ripon Cathedral, as a tribute of esteem and veneration to the late Archbishop of Canterbury. Upwards of 1000 were subscribed at the meeting towards the cost of the window. The deceased prelate was the first Bishop of Ripon.

Books Received.

British Almanac and Companion, 1869.

CHARLES KNIGHT'S little volume still stands at the head of the almanacs. It is as full of information "as an egg is full of meat." "Companion" includes good papers on "Free Public Libraries of Great Britain," by W. E. Axon; "The Exhibition of National Portraits, 1868," by James Thorne; "Technical Education at Home and on the Continent," by John Plummer; and the usual account of "Architecture and Public Improvements." We take a passage from the paper on technical education:

"Even with our present defective system, a good scientific education is not beyond the reach of the workman who, possessing a fair amount of primary knowledge, perseveres in his attempts to reach the higher branches. At the present time, in Bostallack Mine, near the Lead's End, is a young working miner who recently carried off the gold medal in Mineralogy in the examination of the gold medal in Science and Art. It is such men whom employers naturally select for the post of foremen. They might not always be so fortunate, but they would always stand in the estimation of the artisan community. Mr. Kitson, describing an ironworks manager, proceeds by him from France, said that the man in question was a good mathematician and a good chemist. He understood the theory of mechanics, as well as the practice of it; he was also a thorough draughtsman. As a metallurgist, and in his knowledge of chemistry, he was superior to all the other managers. The value of such men in our industrial processes is incalculable. It has been stated by a competent authority, that it would be worth the while of the Birmingham jewelry trade to give 2,000*l.* per annum to a man like Dr. Percy, for the purpose of inducing him to reside in that town. A more scientific manner of conducting the various processes in the jewelry manufacture would lead to greater economy and cheapness of production. One instance, for example, of an improved scientific method of filtration, the water formerly thrown away, after being used for gold-washing purposes, has been made to save the expense to those who have acquired a knowledge of the new process. Another instance, even more suggestive, is furnished by Dr. Percy. He states that one of the most interesting, difficult, important, and novel processes in metallurgy, the Birmingham about the year 1849; and that the Swedes and Germans thought they had that process entirely to themselves, but it was taken up by a friend of his, who laid the foundation of the system now generally employed in the town."

We have the same quarrel with the review of architectural progress as on some former occasions for the absence of the slightest acknowledgment of great indebtedness (almost necessarily) to our own columns.

VARIORUM.

The yearly part of "The British Workman," for 1868, includes a number of large and remarkable wood-engravings; as good, indeed, as anything of the kind that is to be had, and at a cost almost nominal. The coloured print of an Indian Prince that forms the cover is an excellent work. The publishers of the "British Workman" (Seely & Co., and Partridge) also issue "The Band of Hope Review," "The Infant's Magazine," "The Children's Friend," and some other similar publications, all noticeable for the very good wood-cuts, in their several degrees, with which they are illustrated.—Foremost amongst the numerous books for children, old and young, that have been published this year by Messrs. Routledge & Sons, must be placed "Pictures of English History," ranging from the earliest times to the present period, and comprising no fewer than ninety-three pictures, four on a quarto page, printed in colours by Kronheim, and accompanied with a familiar description. These

pictures, though not beyond criticism, are well calculated to impress on young minds the leading incidents in the history of the country.—"The Child's Picture Book of Wild Animals" (Routledge) is another set of prints, in colour, by Kronheim, each with a simply-written (but long words divided) and amusing account. The pictures are open to the objection that each animal being drawn to fill a page, the wolf is made to look as big as the elephant, the leopard as large as the tiger. A few words, however, to the young recipients of the book will set this matter right.—Still turning over the products of the Broadway, Ludgate, we pick out "The Doctor's Ward," by the author of the "Four Sisters," as an amusing tale for girls; and "The Boy Foresters," as calculated innocently to amuse their brothers. Nor will we omit to mention "The Child's Illustrated Poetry Book" (well-known simple rhymes), and the "Adventures of Joshua Hawseppe, Master Mariner."—"Merry Tales for Little Folk" (Lockwood & Co.), is a pretty little volume of well-known tales, such as the White Gas, Tom Thumb, and the Fair One with the Golden Locks, edited by Madame de Chatelein, and illustrated with some 200 little woodcuts.—"Mary's Every-day Book of Useful and Miscellaneous Knowledge," by Frances E. Burbury (Longmans, Green, & Co.), has instruction for its chief object, but the matter is so put together and mixed up with illustrative stories, as to be amusing reading for the children for whom it is intended. A little book of "Questions on Mary's Every-day Book," is published separately, and will be found useful by instructors.—"The Mark" is the title of the Christmas number of *The Quiver*, published by Cassell & Co., and contains some interesting stories with illustrations.—The Christmas number of "London Society," too, will amuse the readers for whom it is intended. The older folks find the type a *little* small.

Miscellaneous.

NEW BUILDING ACT.—The Metropolitan Board of Works has approved of the action taken by the Building Act Committee in having prepared and inserted in the proposed draft Bill for the Amendment of the Building Act, certain clauses relative to the inspection and supervision of public buildings, the flagging of streets less than 40 ft. wide, and the inspection of the formation of new streets.

ACCIDENTS.—While a plumber was looking after his tools at the vitrol works, Cattedown, Plymouth, he fell into a pan of boiling oil of vitrol, and was so dreadfully burnt that he shortly afterwards died. The boilers were not protected by rails.—While a slater was walking on the roof of a house in Oswaldtwistle, Blackburn, his foot slipped and he fell headlong to the ground, a depth of 30 ft. to 40 ft. He was terribly mutilated, and death ensued in a very short time. Deceased was not accustomed to slating work, but was anxious to teach his son the trade, and was engaged in doing so when he fell.

THE DELAY IN THE COMPLETION OF THE HOLBORN VIADUCT.—There are still great complaints on this subject. At a meeting of the Court of Common Council, Mr. Deputy Fry made a statement which was not satisfactory to those by whom the complaints had been originated. Mr. Henry Potter, of Farringdon-street, on behalf of the aggrieved parties, writes: "Our complaint was,—1st. That many months have elapsed without anything comparatively being done to complete the viaduct. The piers for the bridge across Farringdon-street were finished more than twelve months ago, yet to this day there is no appearance of the bridge. So with other portions of the work. "2nd. That no adequate provision had been made for the public during the progress of the works. Because many months ago they might have opened the footway on the south side of the viaduct, east and west of Farringdon-street, by erecting, at a small expense, temporary staircases to each side of Farringdon-street, and thus have enabled the public to avoid the danger of passing amongst the vehicles where now they have twice in the length of 100 ft. to do so. And in a street which will be 80 ft. wide when finished, all the passengers have to get through openings 3 ft. 2 in. wide as best they can, making it so bad for trade in the immediate neighbourhood as almost to ruin all retail businesses."

GAS.—The Bath Gas Company have decided to reduce the price of their gas 6*d.* per 1,000 ft., viz., from 9*s.* 6*d.* to 3*s.* The company have also agreed to reduce the charge for the public lamps 5*s.* for each lamp per annum.—The inauguration of the new gasworks at Brandon, which have just been completed, was celebrated by a public dinner at the Chequers Inn. The works have been erected under the personal direction and superintendence of Mr. Wilton, late chief gas engineer to the Continental Union Gas Company, who happened to come to reside at Brandon for the benefit of his health, just at the time of the formation of the Gas Company, and who offered his services as engineer gratuitously.

NEW PROPPELLING POWER FOR STREET RAILWAY CARS.—A Detroit gentleman, named Wilder, has recently invented a new propelling power for street-cars, concerning which the *Detroit Free Press* says—"Mr. Wilder's invention is destined to revolutionise the whole system of street-railroad appliances for attaching a locomotive engine to the forward car in such a manner that neither steam, smoke, nor cinders can escape; and the noise made by the machinery is not so great as that produced by this working of a Wheeler & Wilson's sewing-machine. The boiler is located upon the platform, and occupies a space of 20 in. in diameter, with an altitude of 3 ft., while the engine is completely hidden under the body of the car, and protected from dust, frost, snow, &c., by a casing of wood and galvanized iron. All four of the wheels of each car are driving-wheels. The engine has a capacity of 6-horse power; and, as the shaft makes two and a half revolutions to one revolution of the wheels, the latter will reach 15-horse power. This increase of force is calculated to be of great advantage in starting the car and in turning corners. The economy of working, by comparison with horse-cars, is said to be great.

OPENING OF NEW CO-OPERATIVE BUILDINGS.—

At Allerton, the co-operative principle, which was introduced into the village of Allerton little more than a year ago, is evidently making progress. A provision-shop was at first opened upon a small scale, and now, upwards of 400 shares at 1*l.* each having been taken up, the business has increased to such an extent that their receipts will amount to at least 50*l.* a week. The society, finding that they required more accommodation, decided upon the erection of new premises in which to carry on their business, and those buildings are now completed and opened. The site is in the centre of a rapidly increasing population. There is a spacious room on the ground floor, 24 ft. 6 in. by 31 ft. 6 in., which will be used as a store-room. The next floor, which is of the same dimensions, is what will be the sales-shop. There is also a large room, which is intended for public meetings, lectures, concerts, &c. In the rear of these premises, and in connexion therewith, there are three cottages. The architect was Mr. James Bairrow; and the following were the contractors:—Messrs. Jewett & Jackson, masons; Mr. Thomas Lund, joiner; Mr. J. Firth, plumber; Mr. John Hill, slater; Messrs. J. Noble & Co., painters; Mr. J. Atkinson, plasterer. The total cost of this erection is 1,000*l.*—A large building, called a Co-operative Hall, has been opened at Cleckheaton. It is the property of the Cleckheaton Industrial Self-Help Society, and is situated in the most central part of this thriving little town. The building has a frontage to the street of 58 ft. in length, and its height is 48 ft., there being four stories, including the cellaring, which will be used for the warehousing of goods. On the next floor there are four shops for the four branches of business carried on, namely, one for the shoemaker, another for the butcher, another for the draper, and another for the grocer. The third floor consists of large show-rooms, and the top story is one spacious room, which will be used for public meetings, concerts, lectures, &c. This room is capable of accommodating 600 people, and will supply a desideratum which has long been felt. It is lighted by gas, four chandeliers being suspended from the ceiling, and is ascended by a wide staircase, the entrance being in the front. All the rooms are heated by hot air. The building is erected in a mixed style of architecture. Mr. S. Overend, of Dewsbury and Cleckheaton, was the architect. The contractors were Messrs. Drake & Hartshill, masons; Mr. Jonathan Allott, Cleckheaton, joiner; Mr. Joseph Morton, Cleckheaton, plasterer; and Mr. Wm. Ratcliffe, Cleckheaton, plumber.

THE ARMOUR AT SOUTH KENSINGTON.—The Meyrick collection, of which we gave an account in our last, will be open to the public on this, Saturday, the 26th inst.

SANITARY COMMISSION OF FALMOUTH.—An inquiry instituted by the Government has been held during the last few days. After hearing evidence, Mr. Taylor, the inspector proposed that the town and parish boards should amalgamate for the purpose of sewerage, and then they could work without the loss of time entailed by a divided jurisdiction. He further advised the local authorities to drain without delay, and to avoid draining into the harbour if possible, adopting in preference a system of irrigation by pumping up the sewage for that purpose.

SIAM.—The acting British Consul at Bangkok, Mr. Alabaster, reporting to the Foreign-office on Siam in 1867, says,—"There must have been a very considerable importation of British machinery, but the greater part of it was not reported for duty, being for the Government and ministers. A large sugar-mill and distillery, a saw-mill, British ship-yard, and dry dock have been in operation throughout the year. Iron bridges have been erected over some of the creeks. Gasworks have been constructed in the palaces of the king and prime minister. A new steam rice-cleaning mill has been added to the four large mills already existing.

MR. M. DIGBY WYATT.—Mr. Digby Wyatt is not yet knighted, but is about to be so, probably at the next Privy Council. In reply to some inquirers, the immediate ground for the bestowal of this honour is the work done in buying, selling, negotiating, building, &c., during his tenure of office (to the extent of considerably beyond a million sterling in amount), for his India Office masters; but no one will doubt that what he did for the 1851 Exhibition, and his other labours towards spreading abroad a knowledge of art, assisted in causing the proposition to be well received at Court. We cordially congratulate Mr. Wyatt on this well-deserved recognition of abilities, and continuous efforts in a right direction.

TWENTY-SIX PERSONS KILLED IN A CHURCH.—A violent storm broke over Belgium a few days back, and committed great ravages in almost all the towns in the kingdom. At Tournai the roof of the townhall was partly carried away; at Namur some lives are said to have been lost; at Mons chimneys were blown down and houses damaged, and several booths from the fair field were carried away; at Bruges the church, the hospital, and the theatre, in addition to some factories and private dwellings, suffered considerably. Also at Fritzlur, near Cologne, the tower of the church was blown down during mass, and several persons hurried under the ruins. Sixteen corpses had already been got out, but ten more were known to be still there.

LEAD.—The quantity of lead ore raised and sold in the United Kingdom last year was 93,432 tons, of the value of 1,158,066l.; the quantity of lead produced was 68,441 tons, of the value of 1,337,509l.; and the quantity of silver obtained was 805,394 oz., of the value of 215,400l. About two-thirds of the production of lead are obtained in England, about a fourth in Wales, and the remainder in Scotland, Ireland, and the Isle of Man. The mean price of lead ore at the Holywell sales in 1867 (rejecting a few low-priced parcels) was 12l. 17s. 6d. a ton. The average price in the Loudon market of English pig and sheet lead was as follows:—For English pig, 19l. 11s.; English sheet, 20l. 12s.; English pig (W. B.), 22l. 1s.; all three lower than in 1866.

MEDICAL OFFICER OF HEALTH FOR ST. PANCRAS.—A special and very fully attended meeting of the vestry of St. Pancras was held for the purpose of examining and making a selection of three candidates to go to a final ballot for the appointment of medical officer of health and examiner of gas, in the place of the late Dr. Hillier, who had held it since the adoption of the Metropolitan Local Management Act. The salary has been reduced from 400l. to 300l. a year, and the officer is to reside in the parish. There were fourteen candidates, some of them of high standing in the profession, but who declined to pledge themselves to reside in the parish. The gentlemen selected to go to the ballot for final election were:—Thomas Stephenson, M.D., M.B., &c.; W. J. Smith, M.B., M.R.C.S., &c.; and J. T. Dickson, M.B., M.R.C.P., &c. Ultimately Dr. Stephenson was elected.

NEW DISCOVERY IN GUN-COTTON.—It has been discovered, in the course of some experiments at the War-office Chemical Establishment, Woolwich, that gun-cotton fired by concussion exerts a force equal to that of nitro-glycerine, or nearly ten times that of gunpowder. Thus, whereas gun-cotton fired by simple ignition, puffs off harmlessly when unconfined, exerting no destructive force whatever upon the body upon which it may be resting, the same quantity of gun-cotton exploded by concussion will shatter blocks of granite, break up thick iron plates, and blow down or destroy any body in contact with it.

WELLS CATHEDRAL.—After the fall of two niches or canopies in the west front, which took place in the early part of this year, Mr. Ferrey, the diocesan architect, was requested to make a careful survey of that portion of the building. His report states that, owing to decay, naturally resulting from the lapse of six centuries, together with the imperfect repairs in times past, this marvellous work of architectural and sculptural art is in imminent peril. It is difficult to form an exact estimate of the cost of restoration, but it is calculated that from 5,000l. to 6,000l. will be required properly to repair (without replacing statues) the characteristic features of this "grand screen." We believe that the Dean and Chapter are also very desirous to make a fitting restoration of the Chapter-room.

TOTAL IMMERSION OF THE CELEBRATED SALMINE OF WIELICZKA.—The famous sal-mine of Wieliczka, ten miles from Cracow, which has hitherto brought a net revenue to the Austrian Government of upwards of 6,000,000 florins (600,000l.), is threatened with total destruction by a stream of water. The mine contains a subterranean village of about 1,000 inhabitants. The water flowed at the rate of 120 cubic feet a minute, and had already almost filled the lower passages, rapidly dissolving the salt. These passages contain extensive stables and provision magazines, decorated with statues of salt, which used to be illuminated on festive occasions. The latest accounts, according to the *Poll-Mall Gazette*, state that the wells which were to have prevented the further inroads of the water were nearly finished when it was suddenly observed that rills already worked their way right round the height of 70 ft., and about 40 ft. more, which by this time, no doubt, have long been filled up, were all that were required to complete the total immersion.

THE RESTORATION OF BATH ABBEY.—The Duke of Cleveland presided over a meeting of the citizens of Bath, held recently, at the Guildhall, for the purpose of promoting this object. After an address from the Chairman, the Rev. Prebendary Kemble, the rector, read a report, which states that,—

"The substitution of a stone groining in the nave and its aides for the plaster ceilings of Bishop Montague is now very nearly completed, and adds a noble feature to the church. The funds required to pay for this portion of the work have not yet been raised. There is a deficiency of about 1,100l., which the committee are very anxious to receive before Lady Day. The past year has not been solely devoted to this work. The ceilings in the transepts have been perfected. The organ has been built in the place originally proposed for it by Mr. Scott, and a faculty has been obtained for the alteration in the internal arrangements, in accordance with his recommendations. The lighting and heating of the church have also been taken into consideration under Mr. Scott's advice. It has now become necessary to determine upon the future fittings of the church, and to raise the funds needed for this third and final portion of the undertaking. Three windows have been filled with stained glass during the past year, and the committee are now able to report that friends have given, or promised to give, stained glass for all the windows in the aisles of the nave, one in the south transept, and three in the choir, making a total of seven. No further progress has been made in filling the compartments of the west window. Once more the committee appeal to the public for renewed contributions."

From a statement made by the Treasurer it appears that the cost of the first portion of the work, 5,346l. 15s., has been wholly provided for, but that a further sum of 350l. is required to meet necessary but unforeseen expenditure. The second portion is estimated to cost 5,500l., and of this 945l. remain to be raised. The third portion of the work, which will most likely be commenced in the ensuing year, will cost about 5,000l., and of course this remains to be provided. Since the last meeting about 1,400l. had been raised, and the Treasurer hopes to be able to pay the cost of the second portion of the work by March next, until which time the contractor has promised to wait for his money. The report was adopted, and a resolution passed pledging the meeting to renewed efforts to proceed with the remaining part of the work.

PUNISHMENT FOR EMBEZZLEMENT OF TRADE UNION FUNDS.—At the Central Criminal Court, a bricklayer, of the name of William Blackburn, has been sentenced, under the new Act, to six months' imprisonment, with hard labour, for embezzling the funds of the Operative Bricklayers' Society, of which he was treasurer. The prisoner had absconded on the day after the passing of the Act of last session, leaving a deficiency of 17l., part of which he admitted he had appropriated to his own purposes, and the remainder, he said, he had lost.

A CHAPEL BLOWN DOWN.—During a strong gale recently, the new Wesleyan chapel, just erected (but not quite finished), at Littlemoor, Pudsey, was blown down. The roof, which was covered with blue slates, was first blown down, carrying with it the side walls and the floors. The end walls were left standing, but one of them was considered so dangerous that steps were taken immediately for removing it, by order of the architect, Mr. C. E. Taylor. The foundation stone was laid on the 2nd of May. The damage is roughly estimated at 400l. to 500l.

LESSONS FROM GRAVESTONES.—Few botanists have paid any attention to our rock-loving lichens, consequently the literature of the subject in this country is at a very low ebb. This is greatly to be regretted, for the beautiful party-coloured films and patches of vegetation so common on architectural remains and exposed rocks are well worthy of close study. Lichens are known to be amongst the first objects which disintegrate rocks and stones, but the time required for their germination and growth has long been a vexed point. Recently an English botanist has hit upon the idea of noting the growth of lichens upon the dated monuments and gravestones of country cemeteries, and has found that it requires a period of twenty years for a lichen to acquire a moderate or adult size on a squared stone; the growth of these pretty rosettes of gray and yellow colour, so ornamental to our architectural remains, is, as might have been expected, excessively slow.

OPENING OF BARROWS NEAR BRIDLINGTON.—The open weather has permitted the Rev. Canon Greenwell, of Durham, and others, to carry out a full examination of two of those rare "long-harrow" which are now generally regarded as being the places of sepulture of the earliest (or long-headed) race of Britons of which traces have hitherto been found. The first barrow, which was upon the Dotteril Park, on the estate of Lord Londesborough at Rudston, near Bridlington, yielded but one long-headed burial, and that at the east end. The harrow, however, had been used by a later round-headed race for burial. With one body was a very peculiarly formed (howl-shaped) urn, but the harrow yielded very little pottery, and but few flints. The second harrow was upon the estate of Mr. Creyke (of Rawcliffe), near Rudston. It contained many broken-up bodies, of which it was impossible to form any other opinion than that the disjuncting had taken place at the time of death, and (as in the cases of the other long-harrow) pointed to the practice of cannibalism. The skulls were markedly dolichocephalic,—the supposed true type of the long-harrow burials.

THE BURNING OF A LUNATIC ASYLUM.—At the destruction by fire of the Ohio Lunatic Asylum, Columbus, six lives were lost. The fire was first discovered in one of the rooms at the north-east corner of the east wing of the building. The east wing was devoted entirely to the use of the female patients, and the ward or section where the fire originated contained some fifty of them. In the ward where the fire originated were some of the most mischievous, and some sick ones. All efforts to induce these to leave their rooms were unavailing, and the few citizens who had reached the place, and the attendants, were obliged, at the risk of their own lives, to rush in and drag them from the horrible fate that awaited them. The roar of the flames, the rolling clouds of smoke, the cries, screams, shouts, laughter, and dancing of the demented women, whose madness seemed increased by the wild and exciting scenes around them, made up a picture terrible to look upon. Six of the female patients died of suffocation and inhalation of the flames, and there were rumours of many more having lost their lives. One of the patients, in a spirit of mischief, lighted a bit of paper, it is said, at the gas-burner in the hall, just after the attendant had passed through, and set fire to her bed, so originating the fire.
