with layers of laterial work; near this, close to a garden-house, a vaulted recess, into which we look down from the shelving back that now obstructs the entrance; and further off (in another estate) an edifice, against the hillside, called the "Nymphæum of Alexander Severus," a good deal like that misnamed "Grotto of Egeria" which is such a favourite with tourists and sketchers in spite of all to be said against its pretensions; this building having its lateral walls adorned with niches, no doubt for statuary, and its fountain from a stream of crystal waters still visible in a conduit, with a ruinous opening and vault on the hillside; that fountain no longer gushing into its marble basin, but left to flow in darkness; the vaulted roof no more protecting the desolate hall; the inlaid pavement torn off, weeds and long grass growing in its place, nothing spared by time but what is left, still beautiful in decay, and sufficing to give an idea of the attractiveness of such a retreat on this Colian declivity, whence is enjoyed one of those views never to be forgotten by those who have loved and been familiar with the fascinating scenes of Rome! Still more than at the pretended Egerian Grotto has Nature here fulfilled, by her own reclaiming power, the wish of Juvenal in regard to that haunt of the enamoured goddess:—

"Quanto præstantius esset
Nomen sagæ, viridi at margine clauderet undas
Herba, nec ingratum violenter marmore topium."

The labours still in progress at S. Angelo in Piccaria, the modernised church built under the portico of Octavia, have not only uncovered much that had been hidden of this classic ruin, but also made accessible several remnants, in a cleft, of the Servian structures, not only in different low courses of the usual stonework, but more conspicuous elevations, and beyond the subterranean story of the church, the other within it, under the chancel, and here describing the segment of a wide semicircle; these two more considerable portions of the same walls being on parallel lines at some distance, that may have been connected by some certain of masonry at an angle with both, and suggest the idea of a tower or projecting bastion.

From these grounds we descended to the level of the Appian Way, and, at a point nearly opposite to the Antonino Therma, entered gardens at the southern side of the Colian, below the height crowned by the pleasant Villa Mattei, one of the ascertained directions of the Servian walls, near the Porta Capena, being on this line. No Servian structures are seen here; but such antiquities as we found on these cultivated depositories are indeed curious; and most interesting is it to consider, with Mr. Parker, that a ruin with walls at two sides of an angle, in *opus reticulatum*, thrown up against the hill, may be no other than the Temple of the Gamete, near the Valley and Grotto of Egeria, the real site of which we may confidently place in these low grounds under the Colian, at a short distance from the Capena Gate. Another remarkable structure here, on the same hillside, has been for the first time brought before public notice by Mr. Parker, who identifies it as a portion of the Appian Aqueduct,—an arched conduit, partly excavated, partly built, the masonry of brick and reticulated work mixed, into which we could enter at the cost of not easy scrambling over heaps of soil and debris, and beyond the outer compartment could reach three inner cells, now quite dry, but showing the action of water in petrifications on the vaulted roof.

Much more imposing is another specimen of the Servian walls, accidentally discovered in a vineyard of the Jesuite (now of Prince Torlonia), on the highest level of the Aventine, in 1851. Entering these grounds from a solitary road opposite S. Prisca, we find two elevations of the same massive masonry, in square-hewn stone courses, both of considerable height, and one locked down upon, as if in a wall, from the level of the cultivated soil under which it had been so long buried. At about the centre of the more conspicuous portion is an ample archway of travertine, in front of which advances a curtain of similar masonry, blocking up the egress by what must have been a portal of later addition, and which Mr. Parker assumes may be as ancient as the time of Camillus, about B.C. 360. The other fragment seems to belong to a massive square tower projecting from the cincture. On another part of the Aventine, in the gardens of the S. Sabina Convent, were found, some years ago, not inconsiderable remains of those walls, built up in the chambers of a mansion (probably patrician), which we saw soon after the dis-

covery, but which are now again withdrawn from view, the Dominican friars having wanted means to continue the excavations, and therefore allowed this interesting relic of Rome under her kings to be lost to modern citizens and students.

A stupendous structure of peperino in regularly-hewn blocks, divided by cornices of travertine into three stories, and in its highest part rising 90 ft., in its extent between walls well up, and another still open, but half buried in the ground, called *Arcs de Pontani*, has been hitherto considered nothing else than the massive enclosure to Augustus's Forum, preserved only on this the eastern side, near the base of the Viminal, and the beautiful ruin of a colonnade, which abuts against this building, passes for the Temple of Mars Ultor, the principal edifice in that Forum.* But Mr. Parker maintains that these very imposing walls also belong to the Servian enclosure, and that the half-buried *arcs* is, in fact, one of the city gates; nor, indeed, can it be disputed that the character of fortification manifestly appears in those immense ruins beneath the Viminal. The different dates of their origin must be inferred when we observe one side, at an angle, only seen in a narrow court behind a *caffè*, where the upper part presents a surface so worn by time as to resemble rugged rocks rather than masonry; but the lower, in similar stonework, is compact, smooth, and well-preserved, like a building comparatively modern; thus, we may suppose, being a restoration of the older structure. The same origin is assumed by the learned archaeologist for some other remains, of similar stonework, now built up in two sides of the ponderous brick tower, a huge unsightly pile, that rises in gloomy decay not far from the above-named walls, and which is all left of the once extensive castle of the Conti, built for the family (or, according to some writers, restored from an original of the ninth century) in the latter years of the twelfth century by Innocent III, the most illustrious son of that house. Canina referred those ruins within the Conti tower to the Temple of the Sun and Moon; others to that of Tellus; but, seeing the fortress-like character both of these and the ruins of the Augustan Forum, we must avow a disposition to agree with Mr. Parker in fully endorsing his opinion. A similar structure, referred by German writers to the Forum of Julius Cæsar, forms a curtain-wall behind the half-buried columns and beautifully-sculptured entablature of the Pallas temple in the "Forum Transitorium," begun by Domitian and completed by Nerva, a singular detail being the archway, filled up with corresponding stonework, placed at a point not central between the columns that flank it, and therefore evidently foreign to the plan of the later-raised portico that surrounded Minerva's temple. In this example, also, Mr. Parker points out a recognisable remnant of the Servian structures. Another undoubtedly of the same origin, but much less conspicuous, which we believe Mr. Parker has been the first antiquary to notice, is found near the Tiber bank, at the foot of the Aventine, within enclosed ground between the river and the archway called *Arcs della Salara*, supposed to represent in modern form the Porta Trigemina. Less picturesquely situated, though on the classic ground of the Tarpeian Rock, is another relic of the old king's works for defence, in a few courses of quadrate peperino blocks, now encased in brickwork, on one side of a dark corridor leading to a wash-house off the *Via di Monte Tarpeia*, on the highest level above that now disappointingly insignificant precipice,

"whence the traitor's leap
Cured all ambition."

It may be problematical, but is admitted by authorities, that some buttresses of lithoid tufa beneath an upper story of brickwork against the steep of the Quirinal in the Colonna gardens are also to be referred to Servius; and we cannot doubt that some other similar stone courses laid bare in the recent levelling for the ascent to the Papal palace on that hill, but soon afterwards swept away, were likewise of Servian origin,—their loss, therefore, to be regretted. We have

* We are inclined to agree with Nibby in rejecting this popular notion, and considering those Corinthian columns as the Temple of Nerva, dedicated to his adoptive father by Trajan, the church of S. Martina, near the arch of Septimius Severus, having better title to occupy the site at least of the temple of the Avenging Mars, which is represented on medals as circular. The Roman archaeologist above named is contented to observe the obviously higher antiquity of those contiguous walls, without determining their date.

now completed our survey, in an exploration none can have made without hearing away things to remain in memory, and not only to delight the antiquary, but also the lover of nature—indeed, all who have eyes for admiring so solemnly beautiful scenes of ruin and landscape as the Eternal City abounds in.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS, NEW YORK.

SOME ten or a dozen years ago a charter of incorporation was granted by the legislature of the state of New York for the formation of the "American Society of Civil Engineers." Mr. James G. Laurie, the first president, had the credit of its origination, and many of the most noted engineers in the country were enrolled among its members. Lack of funds, however, prevented the society from establishing permanent head-quarters; and interest in its proceedings gradually failed, until finally the society existed merely in name, and in the memory of its members. Last fall, however, some of the old members revived the old society on a new basis. The first meeting was held last December, and Mr. James P. Kirkwood was elected president, with Col. Julius W. Adams as vice; while Mr. James O. Morse, the original secretary of the old organisation was still kept in office. At this meeting the president dwelt especially upon the importance of professional papers and communications, as being essential to keeping up an interest and life among its members. It is hoped to do much by means of this society towards educating the American public in the idea that engineering is not a trade, but a learned profession, practised by gentlemen. At the January meeting a full attendance showed the interest felt, and a paper was read by Mr. Craven, "On the Breakage of some of the enormous 10-ft. Mains of the Croton Aqueduct." A communication was read by the secretary, Mr. Morse, from Mr. McAlpine, upon the subject of corrosion of cast iron immersed in sea-water. He is of opinion that cast-iron piles are not subject to any corrosion whatever, if the ore from which the iron is made is properly selected.

PARR & STRONG'S CELLULAR FIREPROOF CONSTRUCTION.

We have illustrated in our present issue an entirely new mode of building which has been invented and patented by two architects, Mr. Samuel Parr and Mr. Alfred Strong. Its friends say it is Strong and above Parr; and we hope it will turn out to be so.

In this system of building, short tubes are substituted for bricks,—tubes made of clay, terra-cotta, metal, or any other suitable material. They may be of any shape, but the hexagon shape is best adapted for general use. The tubes are laid transversely in the wall, and the thickness of the wall is made up of tubes all one length. In external walls, the tubes are partially filled at one end with concrete made of Portland cement and ballast; and the concrete may be faced with plain Portland cement or pieces of stone, iron slag, flint, &c.

An ornament of cement, terra-cotta, or metal may be fixed to the end of the tube, and hacked up with concrete if necessary.

The other end of the tube forming the internal surface of the wall is covered with a plain tile of hexagon shape, the same size as the tube, and with a rim fitting the inside; or the internal surface may be formed by fixing a tile inside the tube, and covering it with concrete or plastering, according to the surface intended to be formed.

In all external walls it is intended to leave a cavity or air-cell between the materials forming the internal and external ends. For the internal walls and partitions surfaces may be formed, as above described, for the internal surface, leaving the tube quite hollow, or the tube may be partially filled or the whole tube may be filled with concrete. In the sides of the tubes it is proposed to make holes for the insertion of dowels or rods to unite the tubes vertically, horizontally, or diagonally.

The patentees propose further to construct roofs and floors with tubes, hexagon in shape. The tubes for this purpose are laid with their sides at right angles to the surface of the roof or floor, and are united with cement and dowels where necessary. The surfaces are formed by

covering the tubes with flat or spherical covers united with cement, and the spaces between the covers are filled in with cement; or an entire surface is formed over the whole of the ends of the tubes with concrete.

The patentees point out the value of the cavity or air-cell in the tubes as making the wall weather-proof, and claim, amongst other advantages, that the work, when united with dowels, rods, or tie-holts, is very strong; that the tubes being perfectly dry when built in the work, the walls are dry when finished, so that the joiners' work may be fixed without delay; that the tubes being made of equal lengths and the internal surface true, a thin coat of plastering is all that is required to complete it; that walls can be built very rapidly, and have the same solidity as masonry; that, the joints being all equal, no irregular settlements can take place, and no rubbish can be built in the wall; that hacking to stone walls can be executed without staining the stone, and the internal surface will be dry when the wall is finished; that alterations can be made in the walls and openings formed with safety without shoring or needling; and that arches can be formed with the tubes without cutting or waste.

Where great strength is required, as in the case of warehouse walls, a system of solid piers and arches can be formed in the work by filling the tubes with concrete, and the piers and arches may be further strengthened by the introduction of iron dowels, rods, or bolts. King-and-queen post-trusses can be formed in the walls with cast-iron hexagons and wrought-iron bolts, thus avoiding the necessity for iron girders.

Embankment walls can be built with rapidity, and without injury by the wash of the tide. Vertical bolts being fixed in the walls, the land-ties are concealed and secured from injury.

Saving of space may be effected by the adoption of thin walls.

For half-timbered houses it is proposed to fill the framing with short tubes and line the inside with tiles (flat), leaving a cavity at the back of all timbers to allow for shrinkage, &c.

With reference to cost, it is stated that, taking all things into consideration, this mode of construction is cheaper than brickwork.

The area occupied by each tube inclusive of joint is 1 ft. superficial, thus greatly facilitating the task of calculating the number required for any given wall-surface.

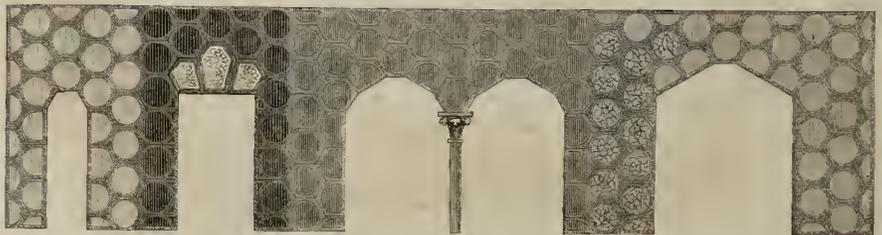

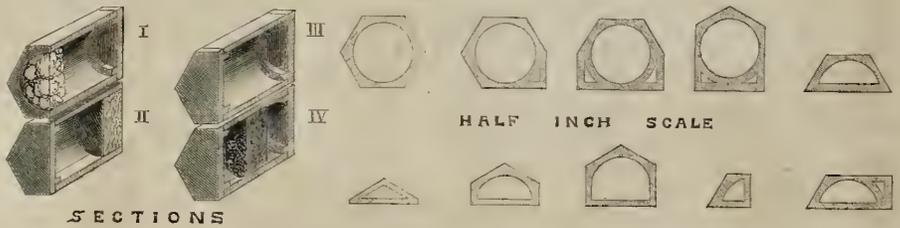

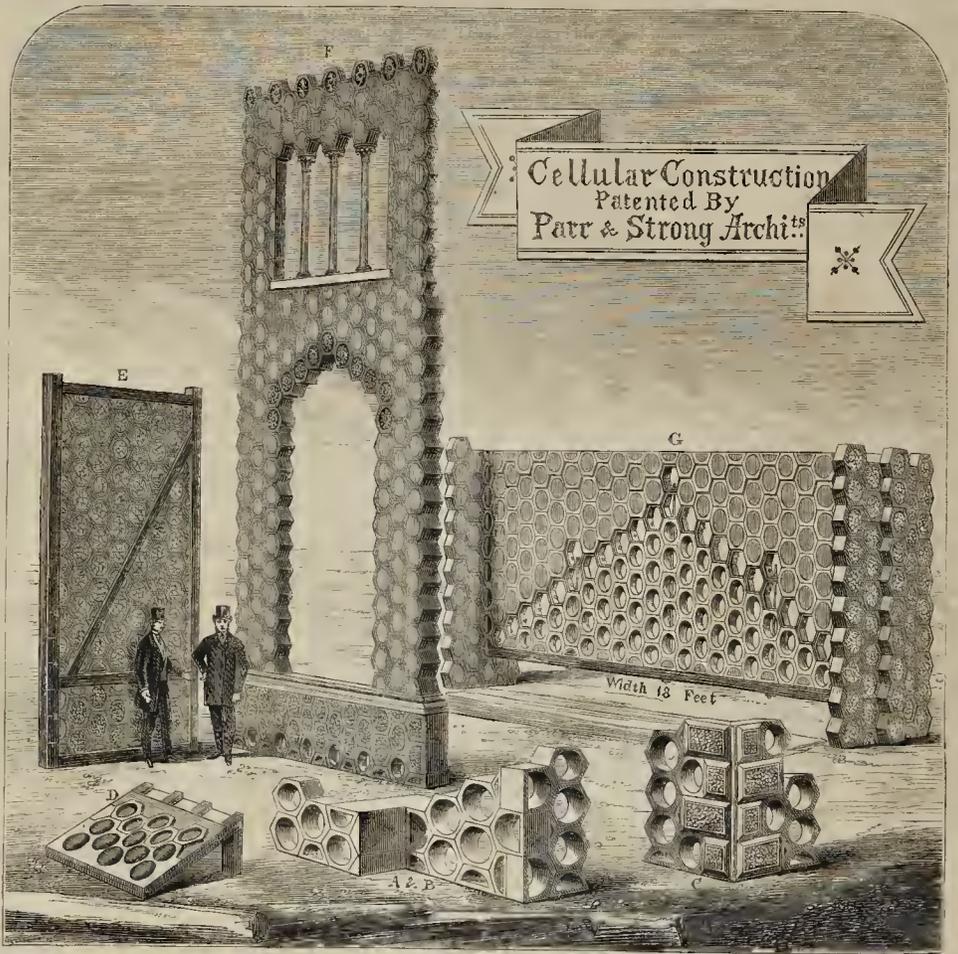

The illustrations show some details of the construction above described. The upper half of the page gives a view of some experimental works in the unfinished hall of the Strand Hotel Company. Figs. A and B show the method of forming breaks and exterior angles where it is not desirable to use brick, stone, or concrete quoins. Fig. C shows an exterior angle of terra-cotta or stone, and the method of uniting them with the hexagonal tubes. Fig. D represents a portion of a roof in its various stages of construction, the rafters, the lathing or rough boarding, the hexagonal tubes, and, lastly, the spherical covers. Fig. E exhibits a portion of half-timbered work, the tubes in the lower panel being filled with flint, those in the upper panels with granite. Fig. F stands 27 ft. high, and is built in three thicknesses. The plinth is 14 in. thick, the piers on either side of the arch are 9 in., and the remainder is of 4-in. tubes. The first row has been left empty, to show the strength of the tubes, whilst the others are filled with about 4 in. of concrete.

Fig. G is a truss with a clear space of 18 ft. between the piers, one of which is 6 in., the other 9 in. thick. These piers were erected (of tubes), by one man, at the rate of 1,700 bricks a day (9-in. work). The truss itself is composed of cast-iron hexagons, bolted together, and the king and queen posts are of wrought-iron, and pass through the ordinary tubes, which are 4 in. thick.

The lower half of our illustrations shows sections of various modes of forming the ends. In figs. 1 and 2, concrete and cap are used; in fig. 3 caps only; and fig. 4 shows two cells, divided by a wall of concrete. The next ten figures exhibit the chief forms necessary in this system of construction, the chief form being of course the hexagon, whilst the others are required only occasionally.

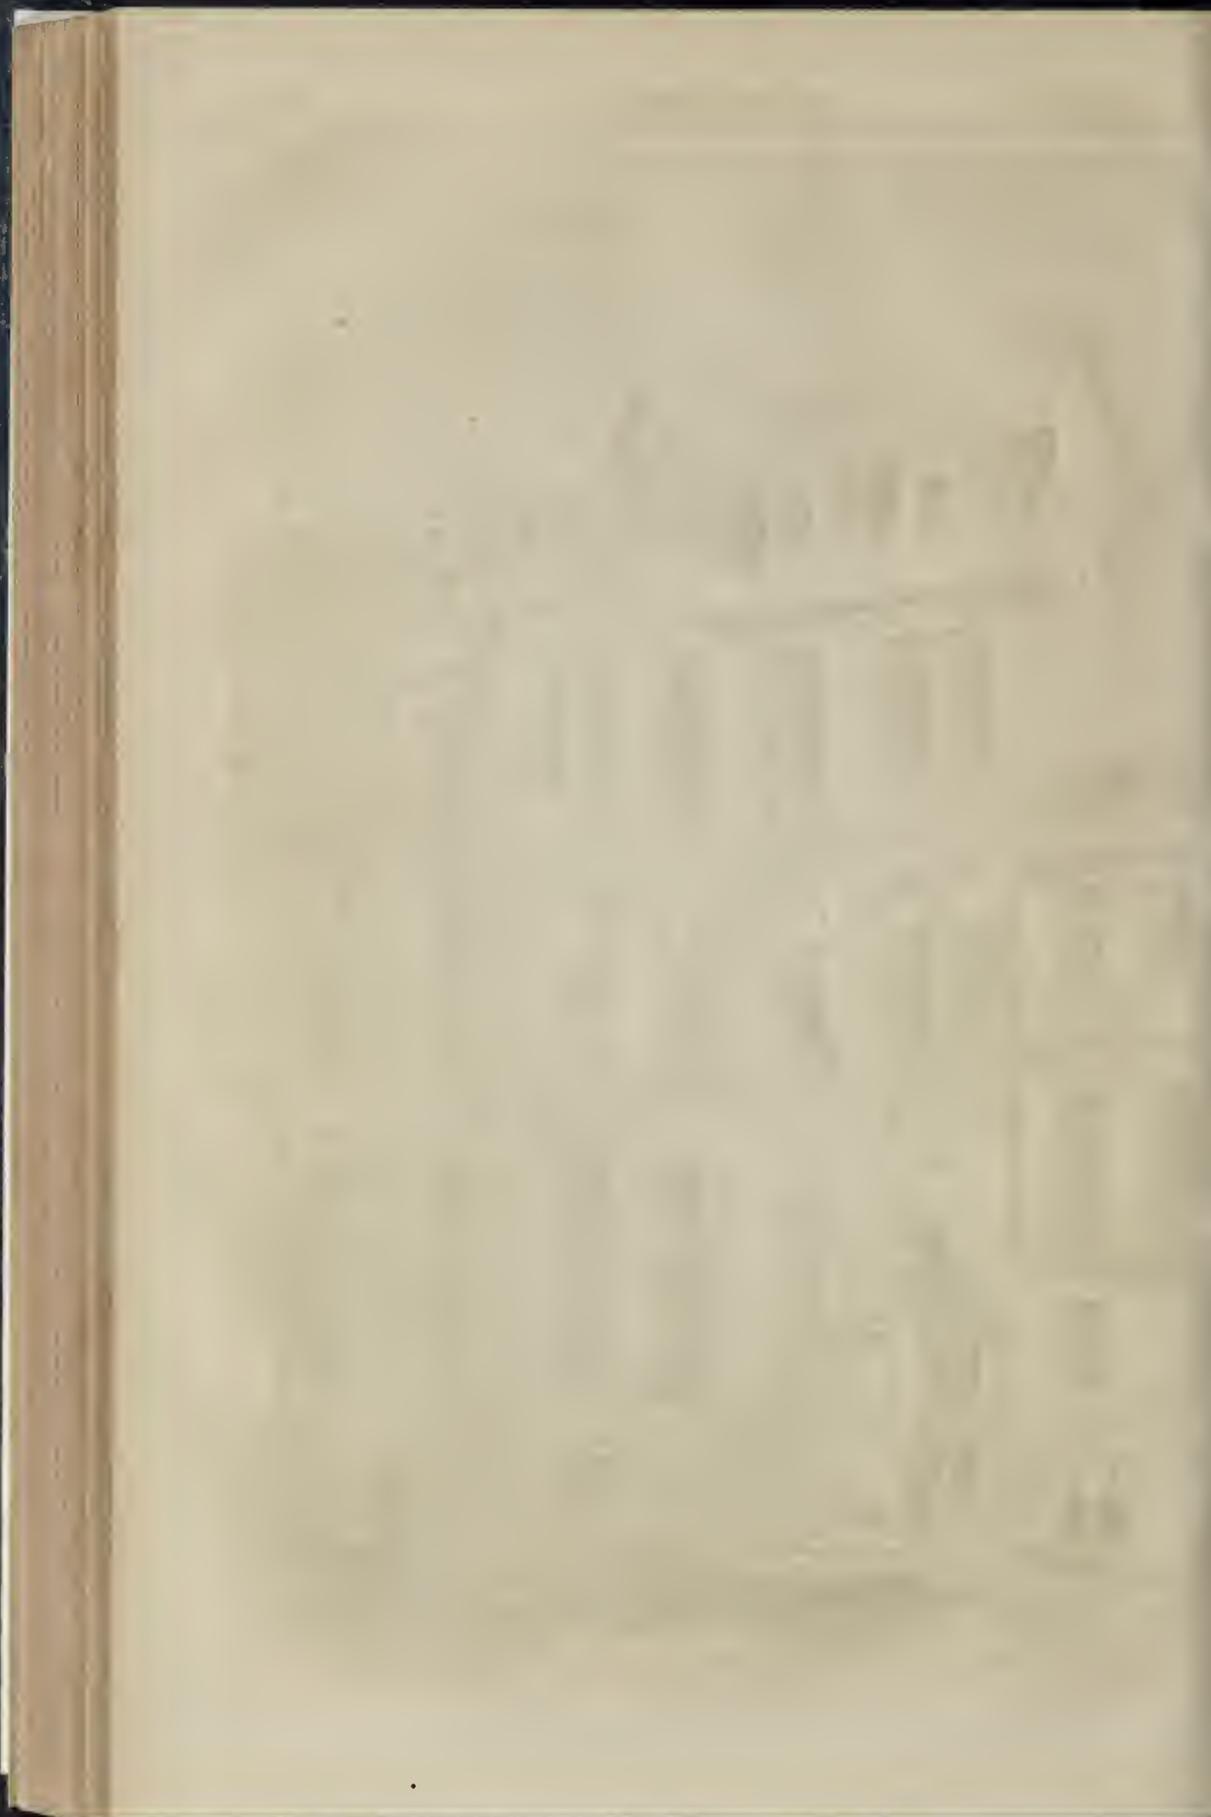

The bottom row of window openings shows the effect of *massing*, the capability for architectural treatment, and the ease with which any required width may be obtained.

A visit to the locality we have indicated will well repay those interested in new methods of construction.

NEW UNIVERSITY CLUB. ST. JAMES'S STREET FRONT.—MR. WATERHOUSE, ARCHITECT.

THE NEW UNIVERSITY CLUB,
LONDON.

The New University Club was founded in the year 1864 by various members of the Universities of Oxford and Cambridge, who, finding at that time it was necessary for a candidate's name to have been from eight to ten years the hooks of the two older University Clubs before he could expect to come on for ballot, thought that the establishment of a new club, which would absorb the numerous members of the two Universities who were then waiting and desirous to get into the older clubs, would meet with success. The result seems to have justified the expectation. The New University Club opened in St. James's-street in May, 1864, with 100 members. This number has now increased to 950. Early in 1865 it was determined to build a new club-house, capable of accommodating 1,000 members, and to that end the leases at the back of the St. James's-street property, having a frontage in Arlington-street, were purchased, and as soon afterwards as practicable the whole site was cleared and the new house commenced. The works are now nearly completed, and it is intended to open the building on the 25th inst.

The St. James's-street front, which we illustrate in our present number, is constructed wholly of Portland stone. Between the double-line courses at the level of the first and second floors shields are carved, bearing the names of all the colleges and halls of both Universities.

The Arlington-street front is built of white Portland stone, and has only a basement entrance for tradesmen.

The principal rooms in the building, looking on to St. James's-street, are the morning-room, somewhat octagonal on plan, about 40 ft. by 30 ft., and 22 ft. high, with a large bay window on the ground floor; the drawing-room, about 32 ft. by 32 ft., having a bay window also, occupying the whole of the frontage on the 1st floor; the smoking-room, over the drawing-room, and about the same size, having an open covered balcony in continuation of the windows of the rooms below.

Looking towards Arlington-street, there are, on the ground floor, two coffee-rooms, the larger 48 ft. by 27 ft., and the smaller 27 ft. by 17 ft.; above the larger coffee-room the library, and above that two billiard-rooms.

The staircase, and the retiring-rooms, lavatories, dressing and bath rooms, serving-rooms (one on each floor), are arranged in the centre of the building; as also the strangers' dining-room, on the ground floor, 27 ft. by 20 ft.; secretary and clerk's office, first floor; and card or committee room, 19 ft. by 15 ft., on the second floor. A well-lighted corridor, 10 ft. wide, on each floor connects the rooms looking into St. James's-street with those fronting Arlington-street.

The attic floor is appropriated for the servants' bedrooms, and the basement for the numerous offices.

The building is "fireproof" throughout, the walls being constructed with Phillips's wrought-iron joists and laths filled in with concrete, and lined up by wrought-iron girders, the soffits of which are visible in the various rooms.

The Portland stone staircase is carried on wrought-iron girders, the whole of which are visible.

The principal rooms are lighted by sun-lights.

The general contractor is Mr. W. Brass. The decoration has been executed by Messrs. Heaton, Butler, & Bayne. Mr. Boyd has carried out a system of iron flue-plate ventilation, and supplied kitchen apparatus and grates generally. The new carving has been done by Messrs. Farmer Brindley. The cost will somewhat exceed £100,000. Mr. Waterhouse is the architect.

SHEFFIELD ARCHITECTURAL SOCIETY. — On Friday last week, the monthly meeting of the members of this society was held at the School of Art, when the Rev. J. Stacey exhibited some ancient celts or rude spear-heads of flint and stone, a bronze javelin-head, a rapier-blade, and sword, and several cells of the same metal. They were all found in Limerick and other parts of Ireland. The rev. gentleman gave a detailed account of the various uses of the several objects. Mr. Fawcett read a paper on "St. Peter of Knaresborough," giving an account of his cell and rock-cut chapel.

THE DISINTEGRATION OF ROCK
FOUNDATIONS.

JERUSALEM.

In the course of the discussion at the Institute of Architects, after the reading of Mr. Grove's paper "On the Exploration of Jerusalem," a question was raised to which increased publicity may be usefully given.

Mr. C. Barry said: Mr. Grove has interested us very much by the details of these explorations which he has brought before us, and I have no doubt the effect of his paper will be to add to the number of subscribers among the members of this Institute, as well as to the interest which he seeks to excite in these proceedings. But in order that it may be done intelligently, I think it would be very desirable that he should give us some of that practical information which we want in dealing with money. He has given us a description of what has been already done, and he has told us the amount of funds he has in hand; he has also intimated that in the course of ten or twelve months that fund will be exhausted; but he has not told us how much the expenditure has been in making the series of discoveries which has been described, nor has he given us any idea of his own and Mr. Warren's anticipations to what extent the present funds will carry them, assuming they go on so satisfactorily as they have begun. It would be interesting to know whether they can form any idea of the amount that may be required, and the time over which the explorations may last if they are carried to a sufficient extent for the perfect elucidation of the Temple area. I think some definite information with regard to the amount which had been spent upon the work, as far as it has yet been carried out, will give some encouragement to the subscriptions, which I hope will receive some additions from the large meeting which we have this evening.

Mr. Grove.—I am much obliged to Mr. Barry for putting this question. The cost of the explorations which I have mentioned to-night, up to this time, has been about 1,700*l.*, including the expenses of sending Lieut. Warren and two assistants to Palestine, and their pay. What further expense may be incurred is a question of how much is to be done. The present expenditure is about 200*l.*, but we might advance from that to 500*l.* per month with great profit and advantage. What I should like to do with regard to this fund would be to rescue it from its present temporary and spasmodic condition, and put it on the footing of regular yearly subscriptions. I am about to propose to the committee of the fund a plan by means of which we may obtain a regular yearly income with which to go on exploring, not only Jerusalem, but other parts of the country also. I do not wish to leave out of sight that there are other departments to be explored besides the architecture and topography of Jerusalem. The geology and natural history are but very imperfectly known, and they are highly interesting and important. All I can say regarding that department which affects the Institute is, that the old city appears to be lying there beneath the modern nearly intact,—only waiting for the removal of the debris which presses it down.

Mr. Seddon referred to the picture painted by his late brother, Thomas Seddon, which was purchased for the nation, and is now exhibited at South Kensington. He said: It happens to represent the very locality which has been mainly referred to in the lecture, and to give the present aspect of the valley with the utmost accuracy. The character and colouring of the vast accumulation of debris which overlies the apparently original slope of the precipice is therein shown as having exactly the aspect of the tips from mines and quarries with which we are familiar in this country. Nevertheless, the depth of the ravine and the steepness of its banks are sufficiently striking, and from it may be gained some idea of the stupendous grandeur which must have characterized the effect, if the Temple walls were ever visible to the full extent of the amazing height which has been described, and the depth of the valley was as great as the section exhibited by Mr. Grove would appear to prove it once to have been.

Mr. Dight Wyatt.—Mr. Grove's passing reference to the fact that the illustration of the ethnology of the country is one amongst the contemplated objects of the society, opens out interesting prospects of what it may be enabled to effect in the future. The most casual observers of museums, and the most superficial students in

archæology, cannot fail to be struck in contrasting the yield of the Holy Land in remains of antiquity with those art-treasures of all kinds which have teemed upon the soil of Egypt, Greece, Nineveh, Rome, and other places. On those historic sites illustrations of the mode of life, of the manners and customs, and of the peculiarities of successive dominant races seem to turn up with every square yard of virgin soil in which excavations are made; while, on the contrary, in the Holy Land, no indication whatever appears to have been as yet discovered in a tangible shape of the nature of the technical arts of the country. Hitherto no success has, it is believed, rewarded research by former explorers in this particular; and I should therefore be glad to hear in detail,—firstly, whether in the investigation of tombs, or in any of their excavations, any fragments illustrating the technical arts of the country have been discovered by the Palestine Exploration Society; and, secondly, whether those who practically conduct the work have the intention to extend their examinations over a considerable area. In going to such a great depth as that in which, judging by the diagrams, the main shafts have as yet been sunk, the sewers, the old water channels, and probably certain subterranean passages connected with the ancient defences of the city may be perfectly well investigated; but it is scarcely to be anticipated that many relics will be discovered which will throw light upon the arts and habits of the people.

Mr. Grove said.—Mr. Wyatt is quite right in his remarks. Not a single weapon, not a coin, not a piece of metal-work of any kind has been discovered. It is almost as if no people of any race or kind had existed in the country. Going down to the great depth which this shaft of 87 ft. indicates, it is natural to expect that at the foot of a wall which must have been tenanted by soldiers and others for many years, some coins or other articles would have been dropped. The only things Mr. Warren has found are some small pottery vessels and two little glass bottles, and those were found, not at the foot of the wall, but in the subterranean passage from the Virgin's Fountain, and they have been pronounced by competent judges to be of a date not later than the fifteenth century.

The Rev. Mr. Smyth inquired whether the filling up of the Kedron Valley was from debris of rock or from natural soil.

Mr. Grove replied that Mr. Warren reported it was all composed of stone chippings. It might be either the fragments from the dressings of the stones of the wall, or the debris which had been tipped over during the many successive demolitions of the place. Looking from the Mount of Olives, the whole of the side of the valley next to and below the wall appeared like one enormous "tip." It had exactly that form, and also was of a grey limy colour, like destroyed masonry.

Professor Ansted said: I should be glad to add to the stock of information on this subject more directly than I am able to do, and there are many points of geology which might have been enlarged upon, but this would not be a fit place to introduce them; but with regard to the extraordinary appearance of the chipping of stone alluded to, from what I have seen in that part of the world—though I have never been at Jerusalem—I can perhaps explain them. Those who have visited Greece, and countries where the rock is chiefly brittle limestone, readily acted upon by the weather, and have noticed the result of time on walls or buildings, will be prepared to recognise a similar result on naked rock. In many places where scarcely any buildings remain, and where there is no evidence of former civilization, one sees heaped together a vast amount of angular stones. The traveller's faucies he sees the ruins of an ancient city which must have existed for centuries; but when he looks with a geological eye, with a view to make out how the result has really been produced, it is clear that all these fragments of rock are nothing but the result of the action of the weather on the great mass of the limestone itself exposed at the surface. A large portion of the buildings of Greece have been built originally of rock brought from no great distance; the old walls and buildings have served afterwards as quarries, and the result is a vast confused heap, partly derived from old buildings and partly from sub-aerial denudation. In the valley near Jerusalem there may have been fragments thrown down, and an enormous extent of artificial as well as natural destruction of this kind; but in the instance before us I think a large pro-

for at the age of twenty he entered a convent, and, except once, for a brief visit to Rome by command of the Pontiff, he never left it till his death. His fervent devotion found utterance in his pencil, and his days were industriously passed in the production of works each of which may be regarded as a superb hymn of praise, conforming in all things to the rule of his order. He received commissions through his superior only, and the proceeds became the property of the convent. It was "the passionate energy" that Masaccio threw into the study of art, and the contempt of all common pleasures and frivolous pursuits that he exhibited, that first drew the notice of Cosmo de' Medici. Benozzo, the favourite pupil of Fra Angelico, was also an excellent man, pious, and a good Christian. Signorelli, we are told, was "a man of great learning and industry, as well as original genius; of irreproachable life and amiable manners; courteous and helpful to those who needed his assistance; to his numerous scholars kind and communicative, as became a great and generous artist."

Domenico Corradi, says Vasari, was the delight of the age in which he lived. Mantegna, one of the hundred and thirty-seven pupils of Squarcione, was another honourable man, and it seems a fitting crown to his just life that he was able to return to Mantua, after he had been employed at Rome, and build himself a magnificent house, which, with his own hand, he embellished with paintings, both on the exterior and in the interior, and in which he ended his praiseworthy days. Il Francia was a man of exemplary morals, amiability, and cheerfulness—so witty, so wise, so agreeable, deposes Vasari, that "the saddest man" would have felt happy in his company; and his family, fellow-citizens, strangers, and princes loved and venerated him. Fra Bartolomeo was enthusiastic, devout, and affectionate: accordingly Mrs. Jameson sees the greatest tenderness and softest regular beauty in his female heads, and a sweet, mild dignity in his suits; for just such qualities as an artist possesses can he depict. Leonardo da Vinci was "the miracle" of the age of miracles in which he lived. "Ardent and versatile as youth; patient and persevering as age; a most profound and original thinker; the greatest mathematician and most ingenious mechanic of his age; architect, chemist, engineer, musician, poet, painter,"—no wonder that in our day Hallam has looked upon his acquirements as revelations calculated "to strike us with something like the awe of preternatural knowledge." Not only men, but "the very brutes," we are told, loved Raffaello. Giulio Romano, too, was a man of generous moods. Tintoretto must have had lovable qualities, for his daughter, whose pictures had won her so much celebrity, that both the Kings of France and Spain invited her to their courts with tempting promises, would never leave him. Paul Veronese lived an amiable, liberal, generous, pious, domestic life, asking but very small prices for his pictures when he painted for churches or convents, and educating his sons and other relatives in his atelier. And of Bassano, whose pictures are compared to handfuls of rubies and emeralds, it is written, "nothing could tempt him from the little native town where he flourished, grew rich, and brought up a numerous family." In fine, all these gifted men were good; it is impossible not to deduct the inference from the evidence placed so lucidly before us that the purer one lives the better our work will be: the hand and brain cannot set forth virtue or truth in glowing colours if the heart be clouded with vice.

The unwary are warned by our authoress that they must not accept as genuine all the paintings referred to the various masters. In some instances two painters have wrought on the same canvas, and it is now impossible to identify their respective styles. We have just cited the case of Titian and his son. The pupil's work is often scarcely distinguishable from that of the master. The brothers Dossi, who unfortunately by no means agreed in their lifetimes, are now inextricably merged in one, all writers finding it scarcely possible to distinguish their works. Not one-third of the pictures attributed to Leonardo da Vinci were the production of his own hand, though it is allowed they may have been executed under his direction and from his cartoons. Of the paintings ascribed to Giorgione especially, few are genuine. The greater number of them were painted by the Venetian, Pietro della Vecchia, a clever imitator of his mode of execution, style of colour, and everything but the feeling that Giorgione threw into his work. Titian's picture of the "Four Ages"

is, however, the only one that should have imposed upon skilled judges. This, painted when he was in daily communion with him, doubtless reflects much that he gained from his companionship. With subtle dexterity does the biographer teach her readers to look below the surface for the full meaning of things. In every respect we consider she accomplished the aim she set before herself, which was to suggest to young students of art comparative and discriminating reflections.

MONUMENTAL.

Statue of Lord Palmerston.—At a recent meeting of the town council of Southampton the mayor announced that he had received a letter from the sculptor of the statue to be erected in the town to the memory of Lord Palmerston, to the effect that it was now on view in the Royal Academy, and would be ready for erection in July. It would be necessary for the council to provide a site for its erection, and to prepare the foundations and erect the pedestal and sub-plinth for it. The statue, they would remember, was raised by public subscription, but all the money had not been promised, and if they were not prepared with a site for its erection it would probably be a long time before they came into possession of it. Some part of what he had asked for would have to be provided by the subscribers, but the foundation certainly would not, and as the corporation had the power under the Marsh and Markets Act to erect statuary and to place other ornaments in the parks, he recommended that the Marsh and Markets Committee be empowered to do the work he had asked, and added that it would be gratifying to reflect that Mr. Sharp, the sculptor, was closely connected with one of the leading families in the town, and that no doubt the work would possess much interest as well as be an ornament to the town. A resolution in accordance with the mayor's suggestion was agreed to; the cost of the foundation, pedestal, and sub-plinth not to exceed 50*l.*

Memorial of the late Earl of Carlisle.—The Carlisle Memorial Chapel, attached to the Castle Howard Reformatory, has been publicly opened for service. The chapel is intended as a place for divine worship during bad weather and the winter months for the inmates of the Reformatory, and is also intended to serve as a school-room. The building has been paid for by subscription of those friends and admirers of the late Earl of Carlisle who, while subscribing to the county memorial, now in course of erection, dissented from the view that a purely ornamental erection should be adopted. The building was designed by Mr. J. L. Pearson, of London, and combines the ecclesiastical with the domestic in style.

THE WESTERN PENNSYLVANIA HOSPITAL.

THE great State hospital of Western Pennsylvania at Dixmont is now far advanced towards completion. The central buildings were completed in 1861. The western wing has since been erected; and now the eastern is in progress. In the last report of the architect, Mr. J. W. Kerr, to the Board of Managers, he gives an account of the whole building, from which we glean the following particulars:—

The main buildings of the hospital will consist—when the eastern extension, now commenced, is completed—of a central building of 61 ft. front by 131 ft. deep, having on each side of a wing of 345 ft. front by a minimum depth of 38 ft., making the whole 751 ft. front, the central part and portions of the wings being four, and the remainder three stories in height. These buildings being arranged in a cluster of connected parts for the purpose of facilitating ventilation, would, if all were placed end to end in a straight line, make a front of 1,150 ft., or about one-fourth of a mile.

The first, second, and third stories are each 12 ft. high in the clear, and the fourth stories 15 ft. high.

The central building contains a chapel 50 ft. by 57 ft. on the floor, and 27 ft. high in the story; three stairways, corridors, or halls, 17 ft. wide; and the offices, parlours, and chambers of the medical superintendent and his assistants;

one kitchen, 19 ft. by 27 ft., and another of 17 ft. by 19 ft.; and pantries, closets, and bath-rooms.

The wings contain 250 private rooms for patients, the smallest room being 8 ft. by 10 ft.; twelve dining-rooms, eight parlours or day-rooms, twelve bath-rooms, and other closets; store and drying rooms; laving halls or corridors 12 ft. wide running through the middle of each wing.

The buildings are lighted with gas made in a detached building, and are warmed throughout by steam from radiators placed in the cellar story, the warmed air being carried to each room and the corridors, through tin-lined flues in the partition walls, and the vitiated air being carried off by other flues leading to the attic, where they connect with ventilators on the roof.

All parts of the buildings are supplied with hot and cold water, conveyed in galvanised iron pipe, and all waste is carried off through ventilated drains of cast-iron pipe.

In the erection of the buildings, including laundry and various other outbuildings, there have been used 8,300 perches of stone, 4,000,000 bricks, 46,000 ft. of roofing, and 52,000 yards of plastering, over ten acres, and the gas, water, and steam pipe used amounts to over nine miles in length. The floor surface of the hospital buildings amounts to three acres in extent.

The whole work has been designed more for utility than show.

ART AND ARCHITECTURE IN ABYSSINIA.

In a recent number of the *Builder* (p. 257) allusion was made to Abyssinian notions of fine art, as they have been described to us by English newspaper correspondents. Some of the letters from the land of the late King Theodore are full of the most curious and interesting information regarding the works of Abyssinian artists, and they also give us an idea of the capabilities of—we suppose we may be allowed to call him so—the ecclesiastical architect of Abyssinia. The efforts of hoth, as might be expected, are of a very rude and crude kind, showing an extremely primitive condition of art. It may, however, be presumed that these native works are an advance on the efforts of many kindred barbarian tribes. One of the camping places of the English expedition was at a place named Antalo or Booyeah. Among Abyssinian towns this is one of the most considerable and important. What may be the number of its inhabitants we are not, however, told. By the way, it would be a rather difficult thing, one would imagine, for a *white registrar* to take the census of a large black population, and to be certain that he had taken it correctly! It could only be effected, we presume, on the instinctive knowledge principle by which shepherds, it is said, are enabled to recognise each individual sheep, not only by its presence, but by its absence from the fold. Antalo, we are told, has at first sight a picturesque effect, being built of red sandstone, which the trees surrounding its three churches relieve. One of these churches is the cathedral which is dedicated to St. George. It stands by the river side, embosomed in a grove of lofty cypress-trees. The cathedral is a circular building one story high, and roofed with thatch. It is built in three concentric circles. The innermost, or most central, is the most holy place where the ark is kept, where priests alone may enter. The second is ornamented with rude frescoes, which cover the whole of the wall space. A large number of wooden doors, and windows having wooden shutters, gives communication between the outer and inner passages.* There are upwards of a hundred pictures; and, as the church is dedicated to St. George, his triumphs have, of course, great prominence in the subjects chosen. Other designs represent the Madonna and Child, the Crucifixion, the Stoning of St. Peter, our Lord walking and St. Peter half-sinking in the sea, with other incidents of New Testament history. Those pictures which it would seem are held in the greatest reverence are the Virgin Mary, which is life-size and encased in metal in Russian style, and a large fresco of St. George on a white horse, killing the dragon. There are also

* These peculiar arrangements of the Abyssinian highlanders are in singular accordance with explanatory suggestions as to the concentric circles and central cups of the rock symbols of the high lands of England, Scotland, and other countries, treated of in a series of articles in the *Builder* some years since.

life-size portraits of the Archangels Michael and Raphael. None of the paintings, according to one correspondent, are executed with the slightest regard to perspective, and all seem to be but rude imitations of the religious paintings of the Early Medieval period. This opinion is borne out by the *fac-simile* of two pages of an Abyssinian Bible published the other week in the *Illustrated London News*. One page represents the Creation of Adam and Eve, and the Crucifixion in another compartment. The other exhibits the figures of St. Theodore and of St. George and the Dragon. Nothing could be more grotesque than these pictures. They resemble the crude pencillings with which an English urchin of about four years of age is in the habit of decorating his slate. This Bible has been forwarded, along with other curiosities, to the British Museum by the representatives of that institution sent out to Abyssinia on a collecting mission.

FROM SCOTLAND.

Fountainbridge (Edinburgh).—At a recent meeting of the Chalmers Working Men's Hall and Institute, Fountainbridge, it was stated that a property had been acquired in Ponton-street as a site for the institute, and, after paying all expenses, there remained a sum of 366l. 9s. 3d. towards the building fund. Mr. Patrick Wilson had examined the site, and had prepared a plan, which the trustees recommended for adoption. The cost would be about 1,000l., and the trustees hoped to raise at least as much money as they had in hand, and they knew where the remainder could be had on loan. It was thought there should be no difficulty in raising that sum. Mr. Wilson submitted the plans he has prepared. The institute is to be a plain building of two stories, with a frontage to Ponton-street. On the ground-floor are two large rooms, 27 ft. by 16 ft., which it is proposed to fit up for games, and also as reading-rooms. On the second floor there is a hall, 57 ft. by 38 ft. It is intended to erect a gallery in one end of the hall, which will then be capable of seating 330 people. Committee-rooms, or rooms where silent games could be carried on, are also provided on this floor. The plan has been prepared with the view of leaving room for further erections, without interfering with the original building. Resolutions approving of the plans for the institute, of the constitution of the association, and of the trustees appointed were thereafter put to the meeting and carried.

THE OTTOMAN RAILWAYS.

LAMARTINE, in his work on the East, says,—“Let us congratulate ourselves on having found a living people among a people supposed to be dead.”

When H. H. Abdul Aziz was invited by the Emperor of the French to the World's Fair, one who, by a happy presage, exhibited his marvellous works at the Champ de Mars, we could foresee the birth of a movement of progress.

Carried away in the whirlwinds of Western civilisation, which annihilate distance, quitting his vast empire, which the difficulty of communication separates from the family of European nations, the first thought of the Sultan was necessarily directed to the miracles of modern ingenuity. Also, he could compare and judge of the degree of advancement of Western nations, the prosperity of which is in a great part due to the magnificent lines of communication established in all directions. Thus, no sooner had the Sultan returned to his states than, convinced of the utility of this means of transport, he conceded to strangers the right, not inscribed in the Koran, to possess landed property in the Ottoman empire, and he granted thus many important concessions.

In fact, by a happy coincidence, for two years already, serious negotiations have been opened with the Divan by four Frenchmen, M. E. G. Piet, Toucas at Constantinople, the Comte Paul de Saint-Alais, Paris, and J. B. Saaron, French vice-consul at Odessa, for the purpose of obtaining the concession of the Ottoman group of railways for large contractors of Brussels, to whom they were formally engaged.

On the departure of the Sultan nothing had been decided, but the line was marked out: as soon as he returned, M. Toucas obtained, on the 1st of October, 1867, the ratification of the bases of the treaty, and, on the 31st of March, 1868, the

firm of C. & L. Van der Elst, Brothers, & Cie., represented by M. Cyrin Van der Elst, received from the Sultan the firmen of the concessions of the following lines of the Ottoman group, going from—

Constantinople to Adrianople,
Adrianople to Tatar-Bazardjik,
Tatar-Bazardjik to the frontier,
Salonica to Uskiap,
Uskiap to Nisch, and
Enos to Adrianople.

THE NUISANCE AT TATTERSALL'S.

STEPS ought to be taken at once, and before it be too late, to mitigate the nuisance and inconvenience caused by the proceedings at Tattersall's in Knightsbridge, chiefly on Mondays. The roadway, there very narrow, is obstructed by the standing of vehicles, and round about the gateways a vast crowd of hicklegs and their victims gather and remain. For a time after the passing of a recent Act the police prevented this to a considerable extent, but matters now go on just as badly as before. On Monday last, in the afternoon, there were from 300 to 400 persons of the disreputable classes alluded to congregated near the entrances. The parish authorities ought to move at once, and nip this monstrous and demoralising nuisance in the bud.

WATER SUPPLY AND FEVER AT BALSALL HEATH, BIRMINGHAM.

At a recent meeting of the Balsall-Heath Local Board some very interesting facts were disclosed by Mr. Scofield as to water supply. This gentleman stated, says the *Birmingham Journal*, that, having procured water from various wells in the district which had been affected by disease, he found that the supply which came from wells serving houses in which fever had raged most severely contained the largest admixture of organic matter, while water from the opposite side of the street, where fever had not prevailed, contained the least proportion of organic pollution. He further stated that the wells from which the greatest amount of organic matter had been derived were more or less surrounded by pigsties, ashpits, or privies. The inference seems perfectly clear: surface drainage has polluted the wells, and polluted wells have given origin to fever. Such being the case, it is very satisfactory to learn that a remedy is being applied. A firm of manufacturers having endeavoured to sink a well in the district, found the attempt frustrated by the falling in of earth. To avoid this difficulty, they determined to make trial of the American tube pump. This has completely answered their purpose, being found to throw up 300 gallons of water per hour. Some others of these tube pumps have since been fixed, at various depths, from 10 ft. to 17 ft., and in almost all cases good water has been obtained. Here, then, is a way out of one part of the trouble. By the use of tube pumps, instead of wells, the freedom of water from surface consumption may be secured, and that alone is a considerable step towards the eradication of the fever.

DURSLEY CHURCH, GLOUCESTERSHIRE.

This fine church was re-opened on the 16th ult., after restoration. It was formerly in a very dilapidated and unsafe condition: the outer walls and the great nave arcades were very much out of the perpendicular, in some places leaning as much as 14 in. The foundations were from the first constructed without footings, and of no great depth; and they had in recent times been undermined by vaults and graves in a way which would have endangered the stability of a far stronger fabric; and the piers and columns had been cut away and hollowed out in many places for the purpose of fixing monuments, and that in a manner seriously to weaken them. Huge galleries encumbered the western end of the nave and aisles, and the floor was covered with high square pews of deal panelling. The chancel was a modern building, small, and of no architectural character. The roofs of the north and south aisles were of chestnut, and very hard-wood, and dated from the fifteenth century.

The work just completed consists in the re-

storation of the body of the church to a sound condition, in the enlargement of the church by a new chancel, vestry, and organ-chamber, and in adding of a clearstory to the nave. In order to bring the fabric into a safe and satisfactory state, it was considered necessary to take down and rebuild both the nave, arcades, and the north aisle. Care has, however, been taken to retain everything of architectural or antiquarian interest that was possible, and so to make the work bear the character rather of restoration than of renovation.

The foundations have been carried down to the solid rock in nearly every case, and in some places have gone nearly 12 ft. deep. The concrete on which the piers are built is in no instance less than 6 ft. thick. The walls of this part of the church are faced with Puff stone, a sort of alatacote found at Dursley, which has a very picturesque effect. The new buildings are of Knackerby stone, with dressings of Bath stone. The vestry is on the south side of the chancel, with an organ-chamber above, opening into the chancel with a wide arch. The old organ is for the present retained, but it is hoped soon to replace it by a larger instrument. The old roofs of the aisles have been restored, and the nave roof has been completed to a similar design internally, but raised to a higher pitch externally. The new clearstory consists of eight three-light windows on each side. The windows, new and old, have been glazed with quarry-lights in lead, re-arranged in geometrical patterns in the beads and tracery. The chancel has been paved with a mixture of plain and encaustic tiles and marble.

The cost of the whole work has been rather more than 5,000l.

Something still remains to be done in the way of substantial repair. The fine groined porch and the south-west angle of the church are in a state which requires serious attention. The carving, tiled floors in nave and aisles, stained glass in east window, &c., also remain for the present incomplete for want of funds.

The architect of the whole work is Mr. T. G. Jackson, M.A., London. Mr. R. Futcher was the contractor for the fabric, Messrs. Whitfield & Sons executed the seats in the body of the church, Messrs. Farmer & Brindley the chancel seats, and Mr. W. Godwin the chancel pavements, the marble being supplied by Messrs. Farmer & Brindley.

THE DESIGNS FOR THE NATIONAL GALLERY AND LAW COURTS.

In the House of Lords, on Tuesday last, in reply to Viscount Hardinge, who asked what steps the Government proposed to take with respect to the preparation of designs and plans for the New National Gallery,—

The Earl of Malmesbury said, on receiving the report of the committee of which the noble viscount was himself the chairman, if his recollection rightly, the Government communicated with the trustees of the National Gallery, and from the trustees, who also furnished a report, the Government received a succinct set of suggestions, giving a complete account of the space required, and giving also some very valuable suggestions. The Government was now waiting in consequence of that report. His noble friend the First Commissioner of Works had not yet decided who the architect should be. The plans were ready to be submitted to the architect as soon as he was selected, but the report sent to the Government by the committee gave rise to the impression that none of the plans suggested were such as ought to be adopted.

The Duke of Rutland hoped that in a short time an architect would be found who would be able to design a satisfactory plan for the new building for the national collection of pictures.

On the same day, in reply to Lord Denman, The Lord Chancellor said as to the Law Courts,—A competition was invited, which was responded to by a certain number of architects—eight or nine—who sent in plans, which were publicly exhibited. Before they were sent in a memorandum was drawn up of the terms on which the exhibition was to be held, and it was, that referees should be appointed by the Treasury, who were to determine to which of the plans exhibited the award of superior execution ought to be given. The referees who were charged with this duty were unable to agree that any one of the plans exhibited in competition was the best, but

they selected two, and made an award that they thought the interior plan of one of the competitors and the exterior plan of another were the best. That award having been made, some of the unsuccessful competitors objected to it as being beyond the power of the referees. They said, "We entered into competition each one against every other, but not into competition with the joint production of two others." In the memorandum of the terms of competition it was stated that any matter in dispute should be referred to the decision of the Attorney-General. That has been done, and I believe the reference is still going on, and until it is concluded it will not be in the power of the commissioners for the erection of the Palace of Justice to take any steps in regard to the selection of any plan. I hope that before long the reference will be terminated, and that the commissioners will then be allowed to proceed with the erection of the building.

"THE ART SEASON."

At a meeting of the Society for the Encouragement of the Fine Arts, on Thursday evening, the 8th inst., Mr. H. Otley delivered a discourse "On the Art Season." The speaker took a rapid survey of the art-history of the year, including points of interest connected with public works, and the products of art as displayed at the exhibitions of the season, and in the print-sellers' windows. Speaking of the 100th exhibition of the Royal Academy, now opened, Mr. Otley said that, whether considered as a whole or in its parts, it did not warrant the title of being "fully up to the average of former years." On the contrary, he considered that it was a bad exhibition, beyond any precedent within his memory, and one discreditable to the arts of the country. He did not think there was a picture in the whole range of it which the country would be prepared to put forward, whether at home or abroad, as fairly representing the status of our art. This was a sad reflection; and on this 100th anniversary of the foundation of the Academy the question thrust itself upon the mind how far that institution would have to be held responsible for the result as it stood before them. The votaries of art amongst the community had increased a thousandfold in number and intensity of appreciative feeling during this eventful century. The artists as a body had also greatly increased in point of numbers during the same period; but had the number of artists of first-rate merit increased amongst us in anything like the same proportion? He thought not. Certainly there were not three artists amongst us at the present day to compare with Reynolds, Gainsborough, and Hogarth—a grand triumvirate of the last century—neither of whom owed anything to academic instruction.

CONNEMARA MARBLE.

Two or three years ago I was applied to, on the part of the Baron de Triqueti, through Mr. Trenham Reeks, for blocks of the above substance, to complete the ornamentation of the Royal Family Memorial in Wolsey's Chapel at Windsor. We had not then entered on the examination of the district containing the stone known as Connemara marble; and, after vain endeavours to induce any of the Dublin stone-masons who had it to part with any of it, I was obliged to cause two large blocks that I heard of as lying in a mason's yard in Galway to be transmitted to Paris, in order that Baron de Triqueti should have the pieces that suited his purpose cut out from them. The old quarry at Ballyhinch being then closed, I was informed that no other quarry was open, but that blocks were got from masses scattered over the surface where the rock lay in the ground.

A year or two ago, when making a preliminary examination of the ground near Westport, Mr. G. H. Kinahan (senior geologist of this Survey) showed me a cutting through this rock in the railroad a mile and a half to the south-east of the town. I subsequently crossed a broad band of it running along the rocky hills to the south of the town; and have just examined, with Mr. R. C. Symes, who is now geologically surveying the district, the northern slope of Croagh Patrick, on which we find two, if not three, broad bands of the stone. It strikes

steadily from east-north-east to west-south-west for about six miles, dipping northerly at a high angle, the widest band being about 300 ft. in width.

In places the stones appear to be beautifully mottled with various shades of green, and occasionally with reddish tints. Large crags occur in it, which are much jointed near the surface, and part of the rock seems very brittle and splintery. It would, however, doubtless be more massive and solid "in depth."

The bands on the northern slope of Croagh Patrick, just south of Murrisk Abbey, are hardly two miles from Westport Bay, with a gentle slope for a tramway the whole distance, and about six miles from the railway station at Westport, to which there is a good road.

Should there be a demand in the architectural world for this ornamental stone sufficient to make it worth any one's while to open a quarry in it, I could hardly conceive a more convenient place for it than that now mentioned; and I therefore, with the sanction of Sir R. I. Murchison, the Director-General of the Survey, beg leave to make its existence known through your columns, should you think this announcement worthy of a place in them. J. BETTE JUKES.

H. M. Geological Survey, Ireland.

P.S.—I have since heard that the old quarry has been re-opened within the last twelve months.

THE ALBERT MEMORIAL MUSEUM, EXETER.

WITH reference to a paragraph noting the opening of the Albert Memorial Museum in Exeter, that appeared in our impression of the 2nd inst., Mr. John Hayward writes,—

"Three-fifths only of the whole design are at present completed, at a cost of about 6,500*l.*, exclusive of the site. A further sum of 3,000*l.* is needed for the erection of the south wing, to complete the design; and it was in aid of the building fund that the recent fancy fair and other festivities have taken place, as well as to celebrate the opening of the building. The result of the enterprise is very satisfactory, inasmuch as 2,700*l.* have been raised, clear of expenses, sufficient, not merely to pay off a heavy debt on the portion of the work at present completed, but also to furnish a handsome sum towards the expense of building the remainder. The design of the building has been considerably altered from that which appeared in your columns, the principal difference being the omission of the central tower, much to the detriment of the building, owing to the strict enforcement of a stipulation imposed on the committee by the gentleman who gave part of the site, that the height should not exceed a certain limit. The plans are substantially the same."

THE ARCHITECTURAL MUSEUM.

ACCORDING to the report laid before the members, nine tenders were sent, in reply to the invitations for building tenders, for the new Museum at Westminster, and the lowest (for 2,970*l.*, by Mr. R. E. Roberts) was accepted. The works have so far progressed that the building will be shortly roofed in. The building fund at the disposal of the council now amounts to about 2,000*l.* A further sum of 1,000*l.*, in addition to the many kind gifts of material, &c., hereafter enumerated, will be wanted to defray the cost of the building alone, exclusive of the legal charges for the lease, and of the many incidental expenses unavoidably incurred from the time of clearing the site to that of the removal of the collection to its new home.

The council therefore appeal with renewed earnestness to all former friends of the Museum, and to all who care for its objects, whether or not previously subscribers, for their kind and prompt co-operation in raising at least a portion of the 1,000*l.* still needed.

The following offers of materials, &c., have been made:—

"Messrs. Clark & Co. have undertaken to fit up the two ground-floor front windows with their patent steel-revolving shutters, and Messrs. Bunnets & Co., in acknowledgment of their employment by most of the chief members of the architectural profession during the last thirty years, volunteered similarly valuable assistance on their hearing of the proposed removal of the collection. The six iron principals for the roof are a gift from Messrs. Kelk & Lucas; Messrs. Bart & Potts promise iron casements for most of the windows; Messrs. Roward contribute the Caen stone required for the interior of the building;

Messrs. Rust & Co. offer glass and mosaic material; Mr. Godwin, of Lingardine, in addition to 20*l.*, will make some ornamental tiles, specially designed for the front of the building; Mr. Fabricotti's promise carved Carrara marble of the value of 60*l.*; Messrs. Strode & Co. add to a donation of ten guineas a present of one of their patent gas sun-brainers, fixed free of charge; Mr. Charles Hudson undertakes some coloured decoration; Mr. Robert Chapman (art-workman) is willing to make a piece of furniture; Mr. E. Whitehead (art-workman) offers to execute some carving; and Mr. N. Thwaites has contributed a model of the Museum front."

On the completion of the building, the valuable collection of about 200 Classical and Mediæval casts, formerly exhibited at the Royal Institute of British Architects, and now transferred to the care of the council of the Architectural Museum, will be displayed.

CHELTEMHAM DRAINAGE.

MANY of the landowners and occupiers who live below the town of Cheltenham have for some time past felt themselves aggrieved, in consequence of the continued flow of the sewage into the river Chelt and Hatherley Brook, which, they allege, so fouls the streams as to create an intolerable nuisance, injurious to property, dangerous to the health of the inhabitants, and hurtful to the cattle pastured in the vicinity. A meeting of the adjacent landowners and occupiers has recently been held, when it was resolved "to take such measures as will compel the Local Board of Health of the borough of Cheltenham to abate the nuisance forthwith." The following resolution was afterwards unanimously adopted by the meeting:—"That should the Local Board determine to abate the nuisance by an irrigation scheme, we, the undersigned, are willing to take the flow of sewage over the number of acres attached to our names, for such time, and on the payment of such reasonable sums to the Local Board as may be agreed upon." (Here follow the names of twenty-nine owners and occupiers of some 2,000 acres of land, all of whom are willing to take the sewage on their land.) Mr. Bateman, C.E., has advised them to discontinue the present treatment of the sewage by deodorisation, in favour of the system of irrigation. The cost of the deodorising agents is some 800*l.* or 1,000*l.* per annum, and yet the plan is said to be so ineffectual that the authorities are in constant dread of being dragged into Chancery at the suit of adjoining landowners.

ART-MASTERS' REPORTS ON THE PARIS EXHIBITION.

SIR,—Some twelvemonth ago the Science and Art Department offered to the masters of schools of art a contribution towards the expenses of their visit to the Paris Exhibition, a further sum if they wrote reports on it if they were published, and three prizes for the three best reports so written. I read in several art and other periodicals some suggestive remarks from art-masters, and have been looking ever since for an award of these prizes. Never seeing anything as to the award either for art or science, I have spoken to a friend of mine who wrote a report upon the Exhibition, and his explanation is rather extraordinary. He says that very valuable reports both for the art and science divisions were written by science and art teachers, and published in the local and other papers, and formally sent in in 1867 for competition. Since then nothing has been heard of them. There were something under twenty reports in each division, and a fair judge could have awarded the prizes in a week, and, as far as reading goes, could have read them in a day, for almost all were short and terse. He says that part of the sum guaranteed towards expenses has been withheld, and that, for anything that can be known, the contract has been broken. Upon inquiring why he did not write to know for certain about this, my friend replied that, since the Parliamentary Commission on Schools of Art, when the authorities were compelled to keep the votes for the Museum at Kensington and the schools distinct, they have lost no opportunity of snubbing the art-masters who caused that commission to be held, and in so doing have produced rather an odd complication. One regulation they started was that art-masters should not be allowed to write to the authorities, or, if they did write, no notice should be taken of any communication they might desire to make; so that my friend re-

marked, "We receive letters from Kensington, and other communications, but can write none to it; we have information in abundance about immaterial matters, but have no means of getting the slightest information on vital points; and if I asked the entity called 'my Lords' why it had failed in its contract to me about these Paris Exhibition reports, the entity would act upon the regulation in the directory, and take no notice of my inquiry; for art-masters have some little spirit left, even after the nation has repudiated all its obligations to them, and will not send letters through the secretaries of their schools, suppressing their own names, which dignified hide-and-seek complication is what the state most recently approves of." I confess to being amused at this perfect development of red tape, and suggested that a letter should be written by my friend to the *Builder*, asking through its pages for some information. "Yes," he answered; "that is the only resource left; but I cannot afford to draw down upon myself a personal grudge. Like the historical eels, though we don't like it, we are getting used to being skinned alive, and have been made dumb beforehand, to smother our cries of complaint."

"Well," I replied, "we live in a free country, and I am at least unconnected with the authorities, and what you say shall be made known to solvent England, who shall be asked by me whether any department of its Government is insolvent to the extent of twenty shillings in the pound." AN AMUSED OUTSIDER.

Berwick-upon-Tweed.

* * * We have reason to believe that the payments are in course of being made.—Ed.

REBUILDING OF HER MAJESTY'S THEATRE.

The following is a list of the tenders, just now received, for rebuilding Her Majesty's Theatre, in the Haymarket. The "quantities" were furnished:—

Smith & Taylor	£35,674 0 0
Cullitt	35,318 0 0
Myers	31,586 0 0
Lanson	29,800 0 0
Piper & Wheeler	29,500 0 0
Holland & Hannen	28,439 0 0
Trollope	27,767 0 0
Foster	26,770 0 0

The above do not include the stage, machinery, fittings, fixtures, gas-fittings, fire-mains, warming, and decorations; but they include all iron-work.

SUGGESTIONS ON THE SUBJECT OF EDUCATION.

Sir,—The question of technical education, in my mind, greatly resolves itself into mechanical education. Inasmuch as Britain's greatest wealth exists in her manufactures, principally constructed of the produce of foreign countries and her colonies, and when we find that foreign countries are making such rapid strides in the march of arts, commerce, and manufactures, it therefore becomes Britain to take immediate action in the education of the mechanical population of the British Isles.

When I look at the wondrous mechanical structures of the First Great Mechanic, especially the construction of the human body, where is there a machine constructed by human ingenuity of such splendid action and durability, although the materials are of so delicate a composition? If the human body had been constructed as the most delicate piece of machinery ever erected by man, how ungraceful would have been the demagogue! But we can extend or contract the muscles, and move many of the joints in various positions, at will. Seeing at a glance the great superiority of the movements of the human body over anything designed by man, what must be the mechanism of the soul, which is infinitely of greater value than the body? I think that ought to be the first and grand centre of attraction in mechanical education.

As it is necessary to adapt the routine mechanical education to the existing laws of the country—as they cannot be set aside nor declared null and void without an Act of Parliament, which cannot be passed without a period of time elapsing—we ought to make the best use of those means that are within our reach that will prove effective agencies when adopted, whatever code of law exists.

The only agencies which, I think, can be of efficacy are silent ones: let them speak for themselves. On entering the class-rooms of our seminaries, and taking a glance at the walls, we find that they are either bare or have a geographical map hanging upon them, which is very appropriate for imparting a knowledge of the earth's surface. Next, the cabinet containing fossil remains, different strata of the earth, &c., are useful for instruction in geology. But as the sons of Britain cannot all be geologists or geographers, nor is it there that the wealth of the British Isles exists, but in her mechanical productions,—as maps are beneficial for instruction in geography, specimens of fossils and dendritic markings for imparting a knowledge of geology,—it therefore follows that drawings and models of mechanical structures exhibited on the walls and convenient spaces would be of great utility for imparting mechanical education.

These might be obtained by application to many of our

copies of Scripture paintings. Many artists, professional and amateur, would gladly hail the opportunity of displaying their productions by donations to the cause. In order to obtain drawings and models of mechanical structures by application to engineers, architects, draughtsmen, artists, and schools of art. I think from these sources there would be obtained by donations more designs than would be requisite for the use of seminaries, &c., for the mechanical population of Great Britain and Ireland. These representations should not be exposed to view at all times, as they would become wearisome to the eyes of the student, by simple mechanical arrangements they might be exposed or concealed from view at the controller's pleasure, who should be a man of disinterested.

ALEX. KAY, Working Man.

VISIT TO THE NEW SMITHFIELD MARKETS.

Sir,—My attention has been called by Mr. Horace Jones to a letter which appears in the *Builder* of last week, signed "Stylus." I much regret that the Association, but more particularly the honorary secretary, should have been the innocent cause of depriving one of the members of an anticipated pleasure, but I am quite unable to reconcile the statements made by "Stylus" with the facts of the case.

Permit me to say that every arrangement was made to direct members to the place of meeting (viz., the model-shed, at the end of the masons' yard), where we remained until twenty minutes past three, Mr. Jones in the meanwhile explaining the general plan and design of the buildings. From this, as our starting point, we perambulated the building internally, and to a great extent externally.

In reply to the queries given, the President and about thirty-five members found out the place of meeting, and under the conduct of the City Architect, inspected every part of the buildings, accompanied by the clerk of the works. I am not surprised that a building of this magnitude it was possible that two or three gentlemen might escape notice; but how they overlooked a body of thirty-five or forty men who remained in the building for upwards of an hour, is a mystery I cannot solve. I have regretted that the ganger referred to, and also the other labourers, had directions from me to send all gentlemen to the place of meeting. J. DOUGLASS MATTHEWS, Hon. Sec.

CASEMENT WINDOWS FOR COTTAGES.

Sir,—It may be interesting to some of your readers to know that I have given the plan of opening sliding casement windows, suggested in my hook on "Cottage Construction and Design," a thorough trial, since that was written, and that I find it to be certainly by far the best manner of fitting sliding casements, and appears to me entirely to get over the few little objections to this form of window, which, even with the defects of the common manner of fitting it, I have always considered to be the best form of window for cottages. The little brass fittings have been made for me, and may be procured from Messrs. Hareourt & Sons, Atlas Works, Moseley-street, Birmingham. C. W. STRICKLAND.

EFFLORESCENCE ON NEW BRICKWORK.

Sir,—Your correspondent "G. E.," in last week's issue, has really not answered the question of "T. U. & J.," of Swansea. The formation of the white frosty-looking growth on new brickwork is very annoying to the owner, architect, and builder, and any method of preventing it would, I believe, be gladly adopted. In London my experience has taught me that bricks from a field where I have inspected their make, and where neither the clay nor sand used in the manufacture has been impregnated with salt, will at times become covered over most hideously with efflorescence when built up. Has the lime in the mortar anything to do with the matter? I have separated the stuff of the new walls and tested it, and cannot detect any saline flavour. I wish some of your chemical readers would gather a quantity, analyse it, and communicate the result. J. KRATZOV.

SPEAKING TUBES.

Will one of your numerous readers give me the size of tube best suited for the conveyance of messages between two offices 100 yards apart, with three or four right angles in the length? T. C.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

Sir,—At the present juncture I wish to draw the attention of the donors and subscribers to our institution, and those of our own class in particular, to the position of the institution, and I trust you will allow me to trespass a few lines upon your valuable space.

It is the wish of the committee of the advertisement on the front page, convening a special meeting of the friends of the institution on Monday evening next, and trust that they will find the subject sufficiently interesting to induce their attendance in large numbers on that occasion. For some time the committee have been empowered to grant temporary relief, but from the absence of claimants such has not been done.

It is the wish of the committee that all subscribers and donors should be aware of this fact; for with the power they desire to find a use, and it is possible that, from ignorance of the fact, they who are not subscribers would be glad of, the assistance may be deterred from applying. The same committee, who for more than two years have given their time and trouble to this good work, solely for the purpose of assisting a helping hand to those of their own class whose necessities demand it, would rejoice to see that they have not laboured in vain.

Some short time since a case was brought before them, a clerk who died suddenly, leaving a widow and large family in adverse circumstances. It is an old, old story, but mournful enough to move the hearts of all

acquainted with the facts. In the present case the committee are most anxious to assist the family, and somewhat alleviate their distress; and the question has arisen, "Can a present use be made of the Orphan Asylum Fund to purchase one or more life presentations in an existing asylum?" The special meeting is convened to decide that question; and I hope I do not appeal to the kind hearts of our friends in vain, to show their appreciation of the objects and labours of the committee, and give them encouragement for the future, by favouring them with their presence and opinion at this coming meeting.

I cannot close this without appealing to those who have not yet given us the powerful assistance of their names, and the encouragement of their subscriptions, to do so at once. F. T. MULLETT, Secretary.

GRINDING MONEY.

Tuckett v. Warskitt.—This was an action, in Whitechapel County Court, brought to recover the sum of eightpence, for "one hour's grinding money," plaintiff being a joiner, formerly employed by defendant, a builder in Cannon-street-road.

It appeared that plaintiff had entered into Mr. Warskitt's employ for the hour, and on a certain day he received an intimation that his services were no longer required, as he was paid for one hour beyond the time of working, as "grinding money." He claimed two hours, which he alleged was the custom of the trade, and rights and equitable.

The defendant denied the custom, which he said he had always set his face against, and he defended the action for this insignificant sum only to protest against what he regarded as an injustice. The facts of the case were admitted on both sides, and, after hearing the arguments,

The Judge said he should require a great deal of evidence to prove the existence of a custom so opposed to what he considered equitable. A man engaged himself by the hour, with the right to cease work at the end of the hour, as one of the conditions of the mode of hiring he consented to; and he had no right to claim two hours' grinding money, when the engagement was terminated on the other side.

Judgment for defendant.

CASES UNDER METROPOLITAN BUILDING ACT.

At the Marylebone Police-court on Friday, Mr. Benjamin Taylor answered a summons taken out against him by Mr. Henry Baker, district surveyor of St. Pancras, for that "he, the said Benjamin Taylor, having recently erected the 'Lichfield Ais Stores,' Frederick-street, Hampstead-road, which was hitherto in but one occupation (viz., that of himself), did divide the same into two or more separate tenements, each having a separate entrance and staircase, or a separate entrance from one entry, contrary to the 27th section of the Metropolitan Building Act.

The District Surveyor presented in person; Mr. Taylor was represented by Mr. Yarde, solicitor, assisted by Mr. W. F. Potter, architect.

Mr. Yarde said this was a case never contemplated by the Act of Parliament, which intended that no building should be divided into separate buildings except by proper party walls. This case more properly came under the second clause of the 27th section as to the separation of a building into "sets of chambers or rooms tenanted by different persons," and, as the building did not exceed 3,600 square feet in area, the Act had not been infringed. Moreover, the building had never been in one occupation, as contemplated by the Act in the 3rd clause of the 27th section, but had always been in the joint occupation of Messrs. Taylor, and Parish, and Arnot, as offices or chambers.

Mr. P. Eyncourt, after a lengthened hearing, dismissed the case.

CHURCH-BUILDING NEWS.

Sutton Veny (South Wilts).—The new church erected here at the cost of Mrs. Everett and family has been consecrated by the Bishop of Sodor and Man, for the Bishop of Salisbury. The new church is dedicated to St. John the Evangelist. It is built in the Geometrical style, and consists of a nave and side aisles, north and south transepts, a tower supporting a spire, which rises from the junction of the cross, an entrance porch on the south side, and a vestry on the north side. The chancel is built of Frome and local stone, with Barb dressings, and the roofs are of Staffordshire tiles, and are terminated with ornamental cresting. The spire, which is 151 ft. 9 in. in height, rises within the parapet of the tower. The tower has on each side two two-light windows, with trifoliate heads, and at the four angles below the battlements are gargoyles with ornamental iron work. At the south-east angle of the tower is a turret containing a staircase, which leads to the ringing and bell chambers. The nave is divided from the side aisles by three arches resting on circular piers, with capitals of Early Decorated architecture, from which spring transverse arches supporting the roof-timbers of the aisles. The roof of the nave is of open timber-work, the beams resting on stone corbels. The west window has five lights, with large open tracery in the head. There are six windows in the north and four in the south side, and there is a window at the west end of each aisle. There is one stained-glass window in the north aisle, which was given by Mrs. Fowle, mother-in-law of Colonel Everett

and two of her daughters. In this window is depicted one of our Lord's miracles, the healing of the sick girl. It is intended to fill all the other windows on the north side of the nave with representations of the miracles of our Saviour. In the south aisle are four windows, three of which are filled with stained glass. In the head of the easternmost window is an angel bearing a scroll, and beneath are two subjects from the parable of the Prodigal Son. The next window also has in the head an angel and scroll, and below are two subjects from the parable of the Good Samaritan. The next window has in the head an angel bearing a scroll, and beneath are two subjects from the parable of the Unjust Steward. The glass in the windows is of cathedral tint, but it is intended ultimately to fill all the windows with stained glass. The church, which is 114 ft. long, will hold about 600 people, and there are at present sittings for over 400. The whole of the internal walls are of Bath stone, and the steps throughout are of Portland stone. The church is heated with a warming apparatus, furnished by Mr. Haden, of Trowbridge. There are six bells in the tower, which were brought from the old church. The architect was Mr. J. L. Pearson, of London, and Messrs. Rogers & Booth, of Gosport, carried out their contract. Mr. A. Harrison, of Wilton, officiated as clerk of the works; and the whole of the windows were supplied by Messrs. Clayton & Bell, of London, who executed the painting of the font, the pulpit, the reredos, and the walls of the chancel. The building has cost upwards of 7,000*l.*, exclusive of the churchyard, which has cost 1,000*l.*

Preston.—The foundation-stone of Emmanuel Church, Preston, has been laid by Sir Thomas G. Fernor Heskeb, bart., M.P. for Preston, in the presence of a numerous company. The proposed edifice will be built of brick interspersed with strings and bands of coloured and moulded brick, with stone weatherings and dressings. The style may be termed Geometrical Gothic, and the building will accommodate 632 on the ground-floor, and 334 in the galleries. At the west end there will be an outside porch, in which will be the steps to the church; also an inner porch or vestibule, close to which is a baptistry. There will be four entrances, exclusive of that to the vestry, which will be on the north side of the chancel. There is to be a gallery on the west end, which will accommodate about 150 persons. At the south-west corner of the church will be the tower, which is to be an approach to the west gallery, and which forms a prominent feature in the design. The tower is intended to be surmounted by four stone pinnacles at the angles, each terminating with a *flèche de lis*. The belfry, which is to be 12 ft. square inside, will contain six bells. The extreme length of the edifice over all is 125 ft.; the extreme breadth over the transepts is 86 ft.; the internal breadth of the nave, 40 ft.; the chancel, 20 ft.; the transepts, 25 ft. 6 in.; the length of the nave, including the vestibule, 86 ft. 6 in.; the chancel, 27 ft.; the organ chamber, 18 ft. by 11 ft.; the height of the tower from the ground level to the top of the spire, 96 ft.—from the foundation, 105 ft. The roof will be an open timber one, boarded diagonally on the spars. The benches will be without doors, with pitch pine ends. The chancel seats are to be of pitch pine, and have a tracery front, the ends of the benches having carved arm-rests. The church will be warmed with hot water, the heating apparatus being in a fire-proof chamber under the vestry. The architects are Messrs. Myers, Vewers, & Myers, of Preston. Mr. Bamber is the builder; and the contract signed by him stipulates that the erection shall be completed by next April. Mr. Pownall has been appointed clerk of the works; and Messrs. Clark & Charney are the iron-founders. The work is let altogether for about 5,200*l.*

Books Received.

"NOTABLE Things of our own Time." By John Timbs, F.S.A., &c. London: Lockwood & Co. There are many notable things in each issue of Mr. Timbs's "Year-Book of Facts;" but in the book under notice he has not restricted to limit himself to the notable things which may turn up in any one year, the only limit being "our own time." This is a supplementary volume to the author's "Things not Generally Known," and it contains many notable and interesting things.—*Fraser's Magazine* for May (Longmans, Green, & Co.) contains a suggestive

paper on Australia, in connexion with which another in it on Political Economy and Emigration may be read by those interested in such subjects. Of the working of the educational system, free from clerical trammels, there is some account in the paper on Australia.—"Thoughts and Suggestions on Mission Chapels, Rooms, &c." By the Rev. J. Brame, M.A., organising secretary of the Additional Curates' Society. London: Skeffington. Notwithstanding the astonishing activity of church building and church restoration, throughout the country, it would appear that "the Church of England is in a missionary position with regard to three-fifths of the population of the towns," so that there is a no less extraordinary want of mission chapels, of a small and inexpensive description, suitable to the poorest localities in towns; and to urge the extension of these, either by the conversion of rooms into chapels or otherwise, is one of the chief purposes of the issue of this pamphlet. The question of cost and working expenses is also treated of.—"Catalogue of the Exhibition of Portraits on Loan in the New Galleries of Art at Glasgow." This is the authenticated catalogue of the exhibition opened under the auspices of the Lord Provost, magistrates, and town council of Glasgow, in the lately-formed galleries in Sauchiehall-street. The collection consists of 392 pictures in oil, 26 in water-colours, 15 in crayons, and 26 busts or medallions. Of these, 250 have been lent by residents in Glasgow, and all the others come from other places in Scotland, except three from London. The artists are chiefly of the Scottish school, but some are English.—"The Accounts of Building Societies: a Letter to Mr. J. Tidd Pratt, F.S.A., Registrar of Friendly Societies." By Astrop Cariss. Kent & Co., Paternoster-row. The author of this pamphlet states, with reference to Liverpool building societies at least, that "under the system in general use any society can effectually conceal its true position." It is well that the particulars should be brought under Mr. Pratt's notice. This was done by Mr. Cariss in the *Leader* of February 1, 1868, and this is a reprint of the article.—The *Church Builder* for April contains accounts of several churches, as usual, with illustrations; an abstract of a paper of ours on the Sculptured Stones of co. Angus, in Scotland; and other matter of interest.—Hardwicke's *Scientific Gossip* for May contains, as usual, much interesting matter, including papers on Vegetable Hairs, Animals that never Die, Reptiles and Fish, Remains from the Coal Measures, Spiders' Webs, &c.

Miscellanea.

CONTRACTS.—Some time ago the road trustees for the county of Berwickshire contracted with Mr. John Dickson, Galashiels, for the building of a new bridge over Bowmont Water, near Yetholm. It was a condition that the contractor was bound to uphold the bridge for one year. When finished, the work was taken off Dickson's hands by the trustees' inspector as finished, in terms of the contract. In a few days afterwards the bridge was carried away by a flood, and the trustees sued the builder for its re-erection. Proof was laid before the sheriff by both parties, and it was contended for the builder that the plan was faulty, and that he was not to blame. The sheriff has given effect to this plea.

CONSTANT WATER SUPPLY WITHOUT WASTE.—An improved system of water supply to the poor of East London has been effected through the instrumentality of the local authorities. Mr. Liddle, medical officer of health for the parishes comprised in the Whitechapel district, has made a report to the local board of works, in which he states that in the poorer parts of the district, where a few years ago there were about seventy courts badly supplied with water on the intermittent system, by means of a stand-tap only, there are at the present time fifty-three courts supplied with water direct from the main, and the inhabitants of these places can have pure water at all times of the day or night. While there is an abundance of water, it is, by the use of "waste preventers," without waste. The New River Company and the East London Water Company have both expressed their desire to extend the system of constant supply on the single condition of provision being made against needless loss by the use of the "waste-preventing apparatus."

A SCHOOL OF ART FOR LEWES.—A Government school of art has been established at Lewes. The classes will be held in the Fitzroy Memorial Library, under the superintendence of a teacher certified by Government. Evening classes will also be held in the building of the West-street Lecture-room.

TENDERS FOR NEW ASSIZE COURTS, BRISTOL.—The tender for building the new Assize Courts, in Small-street, by Messrs. Wilkins & Son, for 11,850*l.*, has been accepted, being the lowest. There were several other tenders, the next nearest being that of Mr. Foster, for 12,463*l.* The others were from 1,000*l.* to 1,200*l.* above the successful tender. The architects are Messrs. Pope & Bindon.

FALL OF A FEUDAL CASTLE.—Thurles Castle walls have suddenly given way, after standing for centuries. Four of the inhabited houses near the west gate were entombed, with all their contents, in the pile of ruins; but it appears that only a horse was killed. One side of the castle is still standing, but there is every reason, according to the *Nenagh Guardian*, to think that it is destined speedily to follow what has already fallen.

INSTITUTION OF MECHANICAL ENGINEERS.—The general meeting of the members of this institution was held on the 30th of April, in the Lecture Theatre of the Midland Institute, Birmingham, Mr. Thomas Hawksley, vice-president, in the chair. An adjourned discussion took place upon a paper read at the previous meeting, "On the Allen Engine and Governor," by Mr. Charles T. Porter, of Manchester. The next paper was a "Description of the American Dovetailing Machine," by Mr. John Robinson, of Rookdale. This machine, the invention of Mr. T. S. Armstrong, of New York, was shown at work at the recent Paris Exhibition; and it is constructed so as to cut out the dovetail joints in woodwork by means of the continuous rotation of compound circular saws of peculiar form, which finish the joints completely, without the use of any chisels or cutters.

ACCIDENTS.—An architect met his death in town recently in a very sudden and shocking manner. Mr. William Barnes, of Doric Lodge, Bromley, was on his way from the Bank by omnibus to Bromley, along with his wife, and got on the top "to oblige a lady." He had complained of giddiness, but was quite sober. He leant over to look at another passenger who was picking up some money he had let fall, and overbalanced himself, came straight down on his head, and was instantly killed by a fearful wound on his left temple, which fractured his skull.—A decorator in the employ of Messrs. Clayton & Bell, last week fell from a height of 50 ft., while doing tracery work in the interior of the dome of the New Foreign Office, Downing-street. He was picked up from the marble pavement and conveyed to the hospital, where he said he had fallen from the top of the scaffold. He expired two hours after his admission. It was found that the skull was fractured at the base from side to side, and there was a second fracture at the anterior part of the skull.

ARTISTS' BENEVOLENT FUND.—The fifty-ninth anniversary dinner of this charity was held on Saturday evening, last week, at the Freemasons' Tavern; Sir Francis Grant, president of the Royal Academy, in the chair. The report of the fund shows that since its establishment the sum of 28,689*l.* has been distributed by it in relieving the widows and orphans of artists. During the past year fifty-two widows received annuities, amounting to 847*l.*, and five orphans were assisted with the sum of 23*l.* Sir Francis Grant (the chairman), in proposing the toast of "The Queen," referred to the fact that her Majesty had from her own private resources given an aggregate of not less than 3,000 guineas to the society. Her Majesty had also still further shown her interest in art by permitting her daughter, the Princess Louise, to send to the Royal Academy a bust of her brother, Prince Arthur, executed by her Royal Highness's own hand. He had no hesitation in saying that, as a work of art, this bust of the prince was beautifully executed, and it was a most admirable likeness of the young prince. The opinion which he had formed respecting this interesting work was shared by all the members of the Royal Academy to whom he had spoken on the subject. A subscription-list, including receipts of 800*l.*, was read in the course of the evening.

CHURCH FOR DEAF AND DUMB.—It has been determined to erect a church in London for the deaf and dumb. The site is intended to be in the western central district.

TRAMWAYS FOR LIVERPOOL.—The select committee of the House of Commons to which the Liverpool Tramway Bill was referred has passed the preamble of the Bill. The line passes from north to south of the borough, and it is to be hoped that the Bill will pass both Houses, so that the experiment of street tramways may be fairly tried.

PAPER BELTING.—The experiment of making belting from paper has proved a success in the hands of Crane & Co., at Dalton, Mass., and the article is now used in all their own mills, and several other manufacturing establishments. The belting resembles the genuine oak-tanned leather, and serves alike well in a dry or damp atmosphere.

TESTIMONIAL TO EMPLOYERS.—On Saturday, at the Carriage Manufactory, Victoria-street, Messrs. Hooper were presented by the artisans in their employ with a vote of thanks for their liberality in sending representatives from each branch of the business to the Paris Universal Exhibition of 1867, and also presenting each person in their employ with a copy of the first published reports of artisans appointed by the council of the Society of Arts. The vote of thanks was engrossed on vellum, and richly illuminated.

RAILWAY SUPERFLUOUS LAND.—Before a railway company can, under the 127th section of the Lands Clauses Consolidation Act, sell superfluous lands, they are bound to offer them to all the owners of adjacent lands, whether owners in fee or merely leasees. The Master of the Rolls thus held, in the case of Coventry v. the London, Brighton, and South Coast Railway Company, which was a suit instituted against the company to restrain them from selling as superfluous lands certain pieces of land taken by the company under their Act, but which were not required for the purposes of their undertaking, without first giving to the plaintiffs the option of exercising the right of pre-emption which they claimed as adjoining owners under the 128th section of the Lands Clauses Consolidation Act, 1865.

OPENING OF DRINKING FOUNTAINS AT BRIERLEY-HILL.—Three drinking fountains have been opened at Brierley-hill. Two of them were raised by subscriptions contributed by the commissioners of the local Board of Health and the ladies of the district; the third was presented by Mr. Frederick Smith, M.A., the Earl of Dudley's principal agent. The first fountain opened stands at the police-station. The base is of Yorkshire stone, the basin of Italian marble. Two columns rise from the latter, and a water-god, adorned with leaves of water plants. The Ladies' Fountain is situated in a wall surrounding the premises of The Laurels. Mr. Smith's fountain is of iron, and of the pillar form. It stands over 7 ft. high, and is surmounted by two dolphins and a trident.

EXHIBITION OF ART IN LANCAIRESHIRE.—The Marquis of Hartington, M.P., has inaugurated an exhibition of works of art and industry that has been for some months in preparation at Over Darwen. The occasion was one of great rejoicing in the neighbourhood. In Darwen the day was a general holiday, all the mills were gaily decorated with flags, and the streets were crowded with operatives in their best attire. The exhibition was opened with considerable ceremony. As many as 2,000 season tickets had been disposed of. The portion of the building allotted to the fine-art department consists of a nave, 170 ft. by 45 ft.; transept, 90 ft. by 50 ft.; four galleries for oil paintings, each 60 ft. by 22 ft.; two galleries for water-colour drawings, each 90 ft. by 22 ft.; two galleries for photographs and chromo-lithographs, each 80 ft. by 22 ft.; and an extensive gallery for engravings, 60 ft. by 45 ft. The private collections of the Duke of Devonshire, Colonel Wilson Patten, M.P., and many local residents have furnished to the exhibition some of its most interesting and valuable features. The arrangements of the exhibition have been carried out by Mr. George Hayes, artist, Manchester. A mechanical department is added to the exhibition, and a refreshment-room. Musical attractions are also provided.

DEATH OF AN ARTIST.—Mr. Meanness Massey O'Keefe, of Cork, has died, at a comparatively early age. In the art of illuminating manuscripts after the manner of the ancient Irish he is said to have excelled. Mr. O'Keefe's productions are described as approaching nearly to the perfection attained by the early ecclesiastics. A few friends, commiserating the helpless condition of his aged mother, now appeal to the public of his native city for contributions, however small; they will be received and acknowledged by Mr. John Mahony, at the School of Art, Cork.

INDEX TO CAMDEN SOCIETY'S VOLUMES.—An Index, of a valuable character, for literary use, is about to be published—an Index to the hundred volumes issued by the Camden Society during the last thirty years. 500l. have been voted for the purpose, and Mr. Henry Cough has been appointed to compile the work. The Indexes to the *Archæologia*, to the *Edinburgh and Quarterly Reviews*, to the *Gentleman's Magazine*, and more recently to the *Scientific Papers* by the Royal Society, with the Index now announced, supply a series of valuable keys to masses of literary and scientific facts.

THE BIRMINGHAM WORKHOUSE SCHOOLS.—In a letter from the Poor Law Board, read at a recent meeting of the local Guardians, the secretary of the Board says,—"With reference to the plans which you state the Guardians are prepared [with?] for the erection of a school for boys ('on the same land [on?] which the schools for children were intended to be erected'), at a cost not exceeding 7,500l., I am directed to state that the Board are not prepared to entertain any proposal for the erection of schools that are not entirely detached from the workhouse, and placed under a separate management." A deputation, according to the local *Gazette*, has been appointed to wait upon the Board with power to "concede" the separation of the new school from the workhouse. We are glad to hear it.

TENDERS.

For a house for Mr. D. T. Morgan, at Walthamstow, Essex. Mr. John T. Bressay, architect:—
 Arber 2,378 0 0
 Rivet 2,298 0 0
 Mundy & Hutchinson 2,268 0 0
 Piper & Wheeler 2,190 0 0
 Perry & Co. 2,135 0 0
 Reed 1,941 0 0

For addition to Southfields-villa, Wandsworth. Mr. G. Low, architect. Quantities not supplied:—
 McKee 4,400 0 0
 Strong (accepted) 395 0 0

For erecting a detached residence near Rhayader, Radnorshire, for the Rev. J. Williams, including stabling and lodge. Mr. E. H. Lingen Barker, architect. Quantities supplied by Mr. W. Paice. The estimates are exclusive of excavation, water supply, and walling stone:—
 Jones 2,288 0 0
 Evans 2,898 10 6
 Morgan 2,837 0 0
 Evans 2,714 5 0
 Roberts & Son (accepted) 2,657 9 0
 Mason 2,355 5 0

For alterations and repairs at No. 15, New-street, Smithfield. Mr. Robert Parris, architect:—
 Dent £392 0 0
 Hemmings 285 0 0
 Sherman 285 0 0
 Miles 283 0 0
 Plicher 260 0 0
 West 259 0 0
 Abraham 250 0 0
 Wretton 238 0 0
 Esleman 235 0 0
 Blackman & Hargy 229 0 0
 Smith 229 0 0
 Burtwell 216 0 0
 White 209 0 0
 Marshall 209 0 0
 Taylor 205 0 0
 Scofield 185 0 0
 Culitt 185 0 0
 Porten 172 0 0
 Mans 165 0 0
 Penny 148 0 0
 Warne 138 0 0

For additions and alterations to house, College-green, Gloucester, for Mrs. Hemp. Mr. H. James, architect:—
 Clutterbuck (accepted) £335 12 0

For alterations to the Devonshire Arms, Kentish Town-road, for Mr. A. Weatherly. Mr. R. Washington Hart, architect:—
 Langnesad & Way £459 0 0
 Lawrence & Bangh 490 0 0
 Kelly, Bros. 467 0 0
 Knight (accepted) 357 0 0

For alterations and additions to the Norfolk Arms, Bethnal-green, for Messrs. Truman, Hanbury, & Co. Mr. R. Washington Hart, architect:—
 Gray £740 0 0
 Marr 739 0 0
 Kelly, Bros. 664 0 0
 Langnesad & Way (accepted) 655 0 0

For House, Putney-hill, for Mr. C. Lee. Messrs. Lee, Bros., & Pain, architects:—
 Atiss & Son (accepted) 22,712 0 0

For alterations and additions to houses on South Parade, Newark, for Mr. W. Wallis. Mr. Charles Baily, architect. Fretwell (accepted) 2210 0 0

For three houses and shops at Forest-hill, Kent. Mr. George Low, architect. Quantities supplied by Mr. F. Johnsons:—
 Beeton 22,777 0 0
 Burchell 2,756 0 0
 Colls & Son (accepted) 2,680 0 0

For the erection of residence on the London-road, Newark, for Mr. Charles Baily, architect:—
 Bricklayers, Masons, Plasterers, &c. Work 3,413 0 0
 Fretwell 1,588 0 0
 Carpenters and Joiners' Work 436 0 0
 Henderson 147 12 0
 Plumbers and Glaziers' Work 147 12 0
 Bousfield 14 0 0
 Painters' Work 14 0 0
 Crossley 14 0 0

For the erection of Yeargare House, at Sutton-upon-Trent, for the Rev. A. C. Graystone. Mr. Charles Baily, architect:—
 Lane 21,845 0 0
 Henderson 1,633 0 0
 Mackenzie 1,698 0 0
 Fretwell 1,598 0 0
 Bennett & Co. (accepted) 1,500 0 0
 Dennett & Co. (accepted) 1,250 0 0

For the erection of a new Station Inn and stable buildings, at Hildenborough, on the New Town direct line, Messrs. Wadmore & Baker, architects. Quantities supplied:—
 Whiltshire 21,760 0 0
 Payne & Balding 1,735 0 0
 Whealey 1,589 0 0
 Dove 1,683 0 0
 Mansfield & Price 1,530 0 0
 Funnell 1,243 0 0

For the erection of Mostyn-road Wesleyan Chapel, Britton. Mr. John Farring, architect:—
 Kirk 29,730 0 0
 Hobson 9,589 17 5
 Browne & Robinson 9,325 0 0
 Hill & Sons 9,175 0 0
 Brascher & Son 9,095 0 0
 Henshaw 8,800 0 0
 Jackson & Shaw 8,965 0 0
 Newman & Mann 8,768 0 0
 Higgs 8,614 0 0
 Thompson 8,465 0 0
 Sandlers 8,400 0 0
 Myers & Son (accepted) 8,263 0 0

For taking down house and the erection of a pair of villas, at Bezenwell, Eritis, for Mr. Creed. Mr. F. Cushing, architect:—
 Thompson 2545 0 0
 Chorhill 447 0 0
 Archibald 398 10 0
 Dowsett 387 10 0

For the erection of four cottages and public-house, at Entford. Mr. Mr. F. Cushing, architect:—
 Holbert (accepted) 2759 0 0

For Sir John Powell's almshouses, Enlham. Mr. J. P. Seddon, architect:—
 Helbach 27,200 0 0
 Hall 5,945 0 0
 Grover 4,350 0 0
 Williams & Co. 4,126 0 0
 Muspratt 3,168 0 0
 Pitts & Son 4,060 0 0
 Avis & Son 3,950 0 0
 Ebdine 3,540 0 0
 Henderson 3,618 0 0
 Wigmore (accepted) 3,368 0 0
 Lacey & Co. 2,490 0 0

TO CORRESPONDENTS.

NOTE.—Architects who are unwilling (as we are) that their names should not accompany lists of tenders with which they are concerned may prevent the omission by sending lists themselves. We cannot repeat lists on the ground of such omission.

We are compelled to decline publishing out books and giving addresses.

At statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

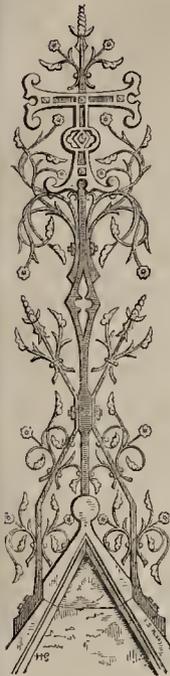

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHURCH, TURRET, AND STABLE CLOCKS.
 J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the Manufactory, Lindgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimate and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 25, Old Bond-street, and 33 & 34, Lindgate-hill, E.C. Established 1749.

The Builder.

VOL. XXVI.—No. 1320.

The Art-Exhibition in Leeds.

HE long-expected and carefully-prepared Exhibition of Works of Fine Art in the new Infirmary, Leeds, was opened by the Prince of Wales on Tuesday last with great éclat, his Royal Highness fulfilling his part of the duty with an ease and earnestness that gratified and delighted all concerned. The day was regarded as a general holiday, crowds filled the streets, and banners waved in all directions. The Infirmary, it will be remembered, has been erected from the designs of Professor G. G. Scott. It is a red brick and stone building, in the style that may be called nineteenth century Anglo-Italian Gothic. Illustrations and descriptive particulars of it will be found in our

volume for 1864.* It is, of course, founded on the pavilion plan, the general adoption of which we take the credit of having materially contributed to bring about. The building is situated between the Town-hall and St. George's Church, and covers an area of 17,300 superficial yards. It is built to accommodate 300 patients, and has cost upwards of 110,000*l.* On March 29th, 1864, Mr. Alderman Kitson, as chairman of the Building Committee, laid the foundation-stone, and, with the exception of a few interruptions consequent on trade disputes, the work continued to progress till the close of last year, when, so far as hospital purposes were concerned, it may be said to have been completed. From south to north the building measures about 390 ft., and from east to west about 240 ft. There are five pavilions, with two wards in each, one over the other. Owing to the nature of the site, there is an extra story in the front portion of the building to what there is at the back, room being only found at the back or northern end for two floors in each pavilion, while at the south the pavilions have three floors, the ground one being used for offices and other purposes. The pavilions are so disposed that three stretch northwards, and two, forming wings as it were to the central building, where is the principal entrance, stretch towards the south. The wards are lighted by double windows on both sides, and are 27 ft. wide, and from 16 ft. to 19 ft. high. The south wards are 122 ft. long; those at the north are 10 ft. shorter.

It is unnecessary now to go into many particulars, nor shall we here inquire into the merits

and demerits of the structure as a hospital, many of the temporary arrangements for the exhibition interfering considerably to prevent a proper judgment in this respect. We may add briefly, that the principal porch is carried out from the main building on either side upon a bold arch, and that it consists of three arches towards the front. The arches rest upon marble shafting, with carved caps, and the spandrels are filled in with Minton's encaustic tiles, the tiles surrounding carved medallions executed in floriated work. A balcony, which is formed by the top of the portico, rests on groining, executed in red and white bricks, with stone ribs, and is ornamented with an open balustrade. The entrance-hall has a panelled ceiling, the beams being supported on carved stone corbels. Three moulded arches, supported on Derbyshire marble columns, form the end of the hall, out of which passage is obtained from the right and left to a number of the apartments necessary to the work of the Infirmary, and from the immediate centre to the corridor leading to the grand staircase. This corridor is 52 ft. long by 14 ft. wide, and is lighted from the roof. The visitor passes into it under a semicircular arch, resting upon marble columns. The roof is here of open timber, and the ribs rest upon marble wall-shafting, with carved brackets and shafts, rich in representations of plants having known medicinal qualities. Another corridor—33 ft. by 22 ft.—is passed before the main staircase is reached. The staircase is lighted by a central three-light window and by small two-lights. The architectural combinations here form several pretty pictures. The staircase leads to a corridor which goes round the interior of the building, and gives access to all the pavilions, as well as to the central hall, and to other parts of the building. The chapel has stained glass in the three two-light windows in the apse, the gift of the mayor and the mayoress, and Dr. Heaton.

The buildings were originally designed around an open court, about 150 ft. long and 65 ft. wide. For the purposes of the exhibition it was at first proposed to cover this temporarily; but, as it was soon seen that such a covered area might be made to serve with good effect as a winter garden and place of general resort for convalescent patients, a more permanent roof of iron and glass was determined on, and has been executed by Messrs. Handyside from a design by Mr. Ordish, at a cost, including flooring and other contingencies, of nearly 4,000*l.*, the Exhibition Committee making themselves liable for half this amount, and the Infirmary Committee for the other half. We may say, *en passant*, that opinions differ in Leeds very considerably as to the wisdom of making the Infirmary so large and costly as it is. The Infirmary Committee, of course, look hopefully to the result of this Exhibition. It is anticipated that the profit will be 20,000*l.* If this be the case it is proposed, we understand, that the sum of 12,000*l.* shall first be paid out of the profits in the name of rent for the use of the Infirmary building, to be divided between the Infirmary and the Mechanics' Institution in the proportions agreed upon, being one-fifth (but not exceeding 2,000*l.* altogether) to the latter, and the rest to the Infirmary. One-half of the remaining profits are to be paid over to the Infirmary, and the other half applied for the establishment of a permanent gallery of art in Leeds.

Passing by, however, the question of finance, it was in this winter garden, filled with handsomely-dressed persons, and adorned with flowers, shrubs, statues, and flags, that the Prince, after some very fair musical performances, received addresses, made replies clearly and genially, and ultimately declared, in the name of her Majesty the Queen, the Exhibition open.

The catalogue has been compiled by Mr. R. N. James, and includes biographical notices of all

the artists whose works are exhibited. The Exhibition may be described as consisting of,—

1. A collection of paintings in oil by the old masters, from the fifteenth to the eighteenth century.
2. A series of works in oil by British artists, down to the present day.
3. A series of paintings by modern foreign artists.
4. A collection of water-colour drawings by British artists, deceased and living.
5. Engravings and etchings.
6. Drawings and sketches by the old masters.
7. A collection of miniatures in the same gallery.
8. A portrait-gallery of Yorkshire worthies, contained in the corridors round the central court.
9. A museum of ornamental art, consisting of works from the earliest period to the present century, arranged in the chapel and adjoining rooms.
- And 10. An Oriental museum.

The works of the old masters have been selected, and the collection formed by the Chief Commissioner (Mr. J. B. Waring), and by Mr. Redford, the Assistant Commissioner, by whom the pictures of the Italian, Spanish, and French Schools have been arranged. The galleries, containing paintings by British artists, have been formed under the superintendence of Mr. R. C. Sanders. The gallery of pictures by modern foreign artists has been formed under the superintendence of Mr. L. Lefèvre. The engravings and etchings have been collected and arranged by the Honorary Superintendent, Mr. W. Smith, F.S.A. The gallery of Yorkshire worthies has been entirely formed by the Honorary Superintendent, Mr. Hailstone. The museum of ornamental art has been collected and classified by the Superintendent of the Museum, Mr. W. Chaffers.

The Indian Museum has been entrusted to Dr. J. Forbes Watson, who seems to have a monopoly in this direction. The very interesting collection of lace and embroidery has been formed by Mrs. Hailstone. For the floral decorations, with the statues and trophies, we will praise Mr. H. C. Brandling, and add a word for Mr. Metcalfe for a well-designed set of pensons.

The following, we are told, gives the number of works in the Exhibition:—

Old Masters (Italian, Spanish, and French) ..	424
(German, Flemish, Dutch, &c.) ..	492
British Deceased Painters in Oil ..	291
British Living Painters in Oil ..	183
Modern Foreign Artists ..	232
British Water Colours ..	363
Drawings by the Old Masters ..	273
Etchings and Engravings ..	187
Museum of Ornamental Art ..	2,900
Miniatures ..	336
The Dudley Gallery ..	28
Yorkshire Worthies ..	273
Indian Museum ..	390
Total ..	5,904

Commencing in Gallery A the visitor may study the infancy of modern art in the religious works of the Florentine painters, and trace it from this beginning in the early part of the fourteenth century as displayed in "the Coronation of the Virgin," by Orcagna, to its culmination in the more perfectly developed Roman school of Raffaele, as seen in his "Holy Family," No. 246, Gallery B. It is interesting to note the general prevalence of religious thought among the early painters, and no better mode of comparing the styles of the several artists, or estimating the progress of art, can be adopted by the general observer, than in noticing the distinct treatments which that subject of so many of the pictures, the Holy Family, has met with. Conventionally treated at first, with purely conventional accessories, such as the gold background, adopted from the more humble department of decorative art, we see these conventionalities gradually disappearing before the

* Vol. xxii., pp. 116-117, 152-153.

matured experience of the later masters, and eventually, as in the marvellous masterpieces of Raffaele, Leonardo, and Lini, becoming all that consummate power in art and the most reverent and cultured imaginations could portray. In these two galleries, containing the Italian, Spanish, and French pictures, which have a definite historical connexion, the student of art will see each great school represented by its greatest of masters—the Italian, with its numerous sub-divisions, of the Florentine, Roman, Venetian, Bolognese, Lombardic, and Neapolitan schools, displaying a constellation of genius so brilliant that no other country may ever hope to rival it, nor the world to see its like again; the Spanish school, with its crowning glories of Murillo and Velasquez; and the French school, whose representatives, such as the Poussins, Claude, Vermet, Watteau, and Greuze, are so distinctly national in type and characteristic in their originality of treatment.

In Gallery C the same historical progress in the works of the German, Flemish, and Dutch masters may be noted. The first picture, No. 501, is a most interesting work on account of its subject and the author of it, "The Installation of Thomas à Becket," by John Van Eyck, the inventor of the process of oil painting, and the founder of the Flemish school. This and the two important pictures by Albert Durer, (505 and 506), will show the cradle of the Flemish and German schools, as the early works in Gallery A indicated the beginning of the Italian. Let the visitor regard well the refinement and delicacy of these early works, comparing them with the productions of the schools founded by these artists. "The Crucifixion," by Albert Durer, No. 505, is a marvellous production.

Mr. Waring says justly, in his introductory notices, that however desirable it might have been, it was not possible to form in the present Exhibition a complete series of works illustrative of the art of oil painting in Europe. "The earlier productions of the great masters in Italy, Germany, and Flanders are well known, and are preserved in certain localities, which the student of art must visit before he can form an adequate idea of their value. In the present instance, we have collected such pictures as will serve to illustrate the rise of oil painting in Europe, and give the visitor an idea of the characters of the various Schools from the fifteenth century onwards. For this purpose a certain degree of chronological arrangement has been kept, but our principal object has been to render the collections attractive and interesting."

The earliest paintings in oil are executed on wood panel, and the use of prepared canvas did not become general till the close of the fifteenth century, but in every instance, until within a comparatively late date, when the making of colours became a separate manufacture, the artist prepared his own colours, or employed an assistant to do so for him, under his own guidance. The purity of the material, and the care taken in the process, led in a great measure to the excellent preservation in which old paintings are generally found, unless roughly treated, whilst many of our modern productions fade away or crack to pieces even during the lifetime of the artist, who, regardless of chemical experience or ignorant of the nature of the material he employs, especially in the unfortunate use of asphaltum, produces very perishable works, to his own vexation and the purchaser's loss.

Various good examples of the three great masters of English art—Hogarth, Reynolds, and Gainsborough—will be noticed in gallery D. George Morland, a purely English painter of great natural ability, is also well illustrated; and the diploma pictures from the Royal Academy, or pictures presented by artists on their election as Royal Academicians, serve to show the progress of art from the early part of the century almost to the present day.

There is much to admire, nevertheless, in the French and Belgian pictures here brought together, and from their novelty to the general public, arising from their difference in subject and feeling from our own pictures, as well as from their variety in technical treatment, we shall expect the Foreign Gallery to become a general favourite with the public. The delicate work and exquisite finish of Edouard Fieé, the refined drawing and elegance of composition of Ary Scheffer, if not representing the power of the French school in historical art, displays most attractively its sentiment; and Rosa Bonheur, in her water-colour drawings of Highland cattle, appeals to us in language such as we are ever ready to hear. The animal pictures of Verboeck-

hoven will be subjects of interest also, from their own intrinsic excellence, and from the fact that the artist is, in his own country, what we Englishmen, with a beautiful mixture of simplicity and patriotism, call the Belgian Landseer; just as, when the brilliant advent of Rosa Bonheur set the British world of art in motion, we showed our great love and appreciation of her productions by immediately calling her the French Landseer.

In the water-colour collection some of our best men are well represented. Hunt shows us the poetry of common nature, just precisely that poetry which we do not look for, and which sweetens existence to those who can see it. With Lewis we visit the East, not as, in our youth, the Arabian Nights led us there, but to see a literal transcript of the life of the people, recorded with such art as only John Van Eyck or Albert Durer could have attempted. Let those who have time stand before the Frank encampment of Lewis, not for a passing moment, but for many moments, regarding it first as a monument of the art of the 19th century, and afterwards inch by inch to see the perfect attainment of art power. Do not neglect to see whatever magnifying help you have at hand, for there is not the surface of a pabbie, the feather of a bird, or an inch of the canvas tent that is not a realisation. Who is there, also, that cannot appreciate, or hesitate to love the works of Birket Foster? Wherever bright-eyed children exist and primroses grow, he will find his appreciators, as he has already found his subjects; and as long as English people love their country and delight in its simple beauties of bedgerow and bank, and seacoast and bright sky, so long will the lovely epics of this artist be most keenly enjoyed.

The collection of engravings is an interesting though not exhaustive one, and Mr. W. Smith has prefaced the list with some pertinent notes on the history of the art. One of the earliest specimens of wood-engraving is the well-known representation of St. Christopher carrying the infant Saviour, the only impression being in Lord Spencer's Collection, which bears the date of 1423. The first productions were rude, ill-drawn, and little more than outline. Towards the end of that century renowned painters, especially Albert Durer and Lucas Cranach, adopted the process, and by their hands, or under their personal direction, were executed those works which still excite universal admiration. In fact, the former artist may be fairly considered the founder of the art as it is now practised.

Scarcely any attempt in line engraving seems to have been made as far as this country is concerned, till about the middle of the sixteenth century, when certain foreigners, chiefly Flemings, obtained employment in London in engraving portraits, frontispieces, and illustrations to books. In the following century, William Faithorne, a native of London (1620—1691), having, from his adherence to the cause of Charles I., been compelled to live for some time in Paris, and having probably worked with some of the great engravers before mentioned, attained remarkable excellence. His plates are executed with consummate skill, and have a brilliant and powerful effect. Several years later, Hogarth (1698—1764) again introduced the practice of the painter engraving his own works; and the English school reached its highest position when Strange, Woollett, and Sharp preceded their well-known works, which, especially in the landscapes engraved by the second, are still unrivalled.

In the present collection etchings have been placed first, on account of their being the nearest approach to original drawings. The increase in the pecuniary value of works of art of this description during the last few years is enormous. An impression of Rembrandt's Christ Healing the Sick in the Temple, called the Hundred Guilder Piece, on account of its being traditionally stated that he once sold an impression for that sum (*little more than eight pounds*), corresponding in every respect with No. 13 in this collection, was sold by auction in London, in 1867, for 1,180*l.* In 1788, one exactly similar sold at the Hague for 84 guineers (*seven pounds*), and there is good reason for believing it to be the one now in this Exhibition.

The Museum of Ornamental Art contains a series of works remarkable for their artistic merit, from the time of the ancient Egyptians, or some thousands of years before the commencement of our era, down to the present century. An extraordinary amount of ingenious

and clever adaptation of natural modes to the purposes of industrial art, and a wonderful power and delicacy of manipulation, are to be remarked in the earliest, equally with the latest, productions of man's hands; and it is a noticeable fact that, for purity and simplicity of style, for a high and keen appreciation of natural beauty, the ancient Greeks have still the advantage over us of the present day. It is hoped that the artisan, especially, will carefully note the more remarkable examples of that class in which he may be personally interested; and carry away with him, not only many valuable ideas, but an increased sense of the estimation in which the best specimens of artistic industry are held by all educated persons, as affording a high idea of the genius of the people who were able to produce them.

We may have an opportunity to go more into detail hereafter, and to say something on the remarkable improvement that is going on in Leeds, one of the most rapidly-growing towns in the country. It has increased from 38,017 houses and 172,258 inhabitants in 1851, to 46,168 houses and 207,138 inhabitants in 1861; while now it is estimated that there are about 55,000 houses and upwards of 240,000 people in the borough. While this has been going on, changes equally noticeable have been taking place in the appearance of the streets and buildings. With very few exceptions, the previous to the erection of the Town Hall, there was scarcely a public building that could lay any claim to architectural beauty. Of the buildings that have been reared my length of time, only two or three had any pretensions to architectural merits, while even their merits were of a very shadowy description. As the inhabitants, however, gradually realised the beauty and symmetry of their hall, they erected the new and handsome buildings which now adorn what was at one time one of the most prosaic and ill-built towns in the country. Not only have the voluntary subscriptions of the public being generously given during the past ten years to provide buildings better adapted to the growing wants of the hospitals, more in accordance with the teaching of science, and calculated, while alleviating suffering and distress, to contribute to the adornment of the town, but they have been as freely extended to agencies whose chief object is the cultivation of man's mental powers. The destroyer of all external beauty in the town is smoke; but as we do not desire to end these remarks with a grumble, we will take some other occasion to issue our counter-blast.

GEDAR AND ITS RELATIONS.

THERE are certain material objects in this world which possess, in our opinion, more inherent interest—more poetry and even philosophy—than can possibly be extracted from the study of numerous families of the human race. A good deal, of course, lies in the association. That metallic substance which we call gold is, for instance, far greater human interest—particularly regarding the subjects with which it may be correlated—than the anthropology of the Zulu Caffres or the dusky natives of the Gold Coast. And we are quite sure that most people would prefer a practical acquaintance with the history of the mineral to that of the men. It is upon this principle that we have chosen this week to give our readers a disquisition upon a well-known tree, rather than excite any discussion, which at one time we felt tempted to do, concerning the aboriginal savages whose skulls are said to be imbedded in the glacial drift.

And the tree which we have chosen for our subject is the Cedar,—the very name of which recalls the most vivid impressions of the grandeur and glory of the chosen people of the Lord. Certainly, the cedar is of all trees the most renowned of Scriptural history. It bears the same relation to Syria and Palestine that the oak does to the British empire. Who has not heard of the cedars of Lebanon? Who does not know of the exquisitely beautiful and solemn passages of Hebrew poetry to which they supply the metaphors? When the sacred historian of the kings of Israel wishes to convey to his readers an adequate impression of the wisdom of Solomon he is not satisfied with the simple assertion that his wisdom excelled that of all the children of Egypt; that he was wiser than all men—than Ethan the Ezrahite, for example, and the sons of Mahol; that he spake three

thousand proverbs and a thousand songs; but he adds, by way of a crowning illustration, that "the spake of trees from the cedar tree that is in Lebanon even unto the byssop that springeth out of the wall."*

Similarly, the Prophet Isaiah, in threatening confusion to the kings and nobles of their backsliding people, does so under the similitude of levelling with the dust the cedar of Lebanon and the oaks of Bashan.† "Behold!" says Ezekiel, in his denunciatory comparison of Pharaoh to the late Assyrian empire; "the Assyrian was a cedar in Lebanon," &c.‡ In short, we may sum up the symbolism of the cedar in the poetry of the Old Testament by saying that it was used in its strength as an emblem of wisdom, power, dominion, and prosperity; in its fall as a fitting illustration of portentous calamity and desolation.

It must not, however, be supposed from what we have written that cedar is the most important tree in Syria in an economical point of view. We must not overlook the olive (*Olea europæa*). The palm and the olive are almost indispensable to the comfort and even the existence of the mass of the community. Bread, oil for cooking, oil for lamps, paper, soap, are the produce of the olive. Indeed, the olive is to the modern Arab what the fish-oil is to the Esquimaux,—it is his all in all. Hence the general lamentation over a failure of the olive harvest; and hence the expression of the prophet who says, "Although the labour of the olive shall fail . . . yet I will rejoice in the Lord" (Hab. iii. 17, 18). Nor should we pass by without a single allusion to the Oriental or Syrian sycamore.§ The Syrian sycamore, indeed, is the true type of the platan, as contrasted with cedar, which is the best type of the mountain trees of Palestine. It is easily propagated. It strikes out roots with great rapidity and to a vast depth. Its ample girth, its wide-spread arms branching off from the parent trunk only a few feet from the ground, and its enormous roots (it has no tendrils) are in every respect suitable to the light, porous, sandy soil, and the variable, often tempestuous climate. The natives say the sycamore bears seven crops of figs in the year. But it varies in this respect. The wood is soft and of little value. This is implied in various passages of Scripture. Thus in Isaiah (ix. 10) it is said, "The sycamores are cut down, but we will change them into cedars;" and in the days of Solomon it is also said, "He made cedars to be in Jerusalem as the sycamores trees that are in the valleys for abundance."¶ It is a tender tree, and flourishes immensely in sandy plains and warm vales; but cannot bear the hard cold mountain. A sharp frost will kill them, which agrees with the fact that they were killed by the frost in Egypt. (Ps. lxxviii. 43-47.) Of these three trees, however,—the olive, the sycamore, and the cedar,—there can be no question but the greatest historical and ecclesiastical interest belongs to the cedar.

The cedars of Lebanon have been celebrated from the very dawn of history for their beauty and magnificence, as well as the excellence and durability of their timber. The dark natural evergreen hue has obviously given rise to the names (*L. Cedrus*; Gr. *Kédros*; Heb., *Kedar*, literally, "to be dark"). Gesenius seems to indicate that the Hebrew root signifies also "coiled," or "compressed," that, in fact, the term is expressive of a mighty and deeply-rooted tree. Both etymologies, it may be conceded, are correct; and its splendid foliage, and the rich perfume of its timber, are the qualities upon which it depends for the universal and long-continued estimation in which it has been held. It belongs to the natural order *Coniferae*, the *Pinus cedrus* of the older botanists, but it is now ranked by modern phytologists in the genus *Abies* (fir); or in the genus *Larix* (larch), by that school, who make *Larix* a distinct genus from *Abies*; or, finally, it is held by some to be the type of a genus *Cedrus*—distinguished from *Larix* by its evergreen leaves and carpsels separating from the axis—which has received the appropriate name of *Cedrus Libani*. Although in foliage, and to some extent in its physiological character, the cedar resembles the common larch, it differs extremely in form and habit. Its stem bears almost in form and habit, where the trunk frequently splits into quarters, irregularly placed branches, often

of prodigious size and expanse, which again divide irregularly into branchlets. The cones are erect, oval, and rounded at both ends in a semicircle, about 4 in. long by 3 in. in diameter, requiring two years to come to maturity; and clinging to the parent tree for years before their scales fall off and the seeds are set free. But we need not pursue the technical description. We shall only add here, that on its native mountains cedar is often found at the base of the highest peaks, at an altitude sometimes of 8,000 ft. above the level of the sea.

It is, indeed, on the loftier ranges of Lebanon, we are told by a recent traveller,* that the true Scriptural cedar flourishes; and he has repeatedly followed the wildest of the routes, with or without a path, clinging to the shelving declivities with a wilderness of rocks and ravines sinking away westward down to the sea. The plateau where the cedars grow is more than 6,000 ft. above the level of the Mediterranean; and above and around are gathered the very loftiest and greyest peaks of the Lebanon mountains. The forest is not large, containing not more than 500 trees, great and small, grouped irregularly on the sides of shallow ravines, which mark the birthplace or fountain of the Kadisha, or the Holy River. But, although the space covered by the trees is not large, yet whenever one gets fairly within the grove, and beneath the giant arms of those old patriarchs of a hundred generations, there comes a solemn hush upon the soul like an enchantment. "Climb into one, and you are delighted with a succession of verdant floors spread around the trunk, and gradually narrowing as you ascend. The beautiful cones seem to stand upon or rise out of this green flooring. I have gathered hundreds of these cones for friends in Europe and America; and you will see them in private cabinets more frequently than any other memento of the Holy Land."

There is much discrepancy in the statements of different authorities with regard to the number, variety, and age of the trees, as well as the extent of ground which the grove embraces. Dr. Thomson, whom we have just quoted, says, about half a dozen acres; others say, three-quarters of a square mile. Again, some travellers suppose that most of the trees in the grove may be 200 years old; several between the ages of 400 and 800 years; and twelve trees in particular, whose age is incalculable; seven standing very near each other; three more a little farther on, merely in a line with them; and two on the northern edge, not observed by any recent travellers, excepting Lord Lindsay, who says these are respectively 63 ft. and 45 ft. in circumference. On this head Dr. Thomson remarks that it is not easy to draw any such line of demarcation. The girth of the largest is more than 41 ft.; the height of the highest may be more than 100 ft. There is, in point of fact, a complete gradation of small and comparatively young trees to the very oldest patriarchs of the forest. "I counted 443, great and small, and this cannot be far from the true number." Even this group, however, is not uniform. Some are struck down by lightning; some are broken by enormous loads of snow; some are torn to fragments by the terrific tempests that sweep over Lebanon like a tornado; and finally, even the sacrilegious axe is often lifted up against them. But, on the other hand, young trees are constantly springing up from the roots of the old ones, and from the seed of ripe cones infant cedars in thousands may be seen springing from the soil. As the grove is wholly unprotected, and greatly frequented both by men and animals, these are, of course, quickly destroyed. But this simple fact demonstrates the possibility of increasing the propagation to any extent, and undoubtedly the whole of the upper terraces of Lebanon might be covered, as of old, with groves of this noble tree; and might again furnish the timber for other temples and other "houses of the forest of Lebanon!"

Upon the whole, then, it may be stated with regard to those celebrated trees which once flourished in the forest of Lebanon, that only a very few now remain. They are also more remarkable for their girth than their stature, and their age cannot be accurately determined. The rules by which botanists determine the age of trees are not applicable to these ancient cedars; for their stems have ceased to grow in regular concentric rings, and they owe their prolonged existence to the superior vitality of a portion of

their bark which has survived the decay of the rest. Russeger, a well-known German botanist, is inclined to suppose that the age of these Scriptural trees may possibly number 2,000 years,—a term, we may add, that would not carry us back even to the era of the last of the Old Testament prophets. As to their dimensions, there are at this moment larger trees every way, and much taller, on the banks of the Ohio; and the loftiest of the present cedars in Lebanon might take shelter under the lowest branches of the Californian pines.

Maundrell, who visited them on Sunday, the 9th of May, 1697, observes in his valuable book, which is too little known by modern commentators,—*

"Despairing of any other opportunity, I made another attempt this day to see the cedars and Caspines. Having gone for three hours across the plain of Tripoli, I arrived at the foot of Libanus, and from thence continually ascending, not without great fatigue, I came in four hours and a half to a small village called Edon, and in two hours and a half more to the cedars. These noble trees grow among the snow near the highest parts of Lebanon, and are remarkable as well for their age and largeness as for those frequent allusions made to them in the Word of God. There are some of them very old, and of a prodigious bulk; and others, younger, of a smaller size. Of the former I could only reckon up sixteen; but the latter are very numerous. I measured one of the largest, and found it 12 yards 6 in. in girth, and yet sound, and 37 yards in the spread of its boughs [diametrically?]. At about five or six yards from the ground it was divided into five limbs, each of which was equal to a great tree."

In addition to this, Mr. Hartwell Horne,† tells us, that in the year 1550 the old Scriptural cedars are stated to have been twenty-eight in number; in 1575, twenty-four; in 1600, twenty-three; in 1738, fifteen; in 1810, twelve; and finally, in the year 1818, when they were visited by Mr. Rae Wilson, they were reduced to seven! This traveller described the few which he observed as being about 15 ft. in height, and twisted together; and moreover, that instead of spreading out their branches with a natural irregularity, their outline was confined to one uniform pyramidal cone (p. 88).

Before proceeding to describe the applications of cedar, we may say a few words with regard to the soil and climate of Lebanon. In the first place, the name Lebanon itself signifies white, and was applied either on account of the snow which during a great part of the year covers its whole summit (Tacitus, Hist., v. 6), or on account of the white colour of its limestone cliffs and peaks. It is the "White Mountain," the *Mont Blanc* of Palestine,—an appellation which seems to be given, in one form or another, to the highest mountains in all the countries of the Old World.‡ Such a geological tract of mountainous country has, of course, its corresponding picturesque scenery and variable climate. With regard to the soil, we can only say that, in whatever soils, altitudes, and climates, whether in a natural or cultivated state, the pine tribe, when in luxuriant growth and perfect health, will be found to be indigenous. The soil must be more or less rich in natural humus,—that is, vegetable mould combined with aluvial and rocky debris, which have throughout a series of ages been pulverising, decomposing, and accumulating, and so prepared in nature's laboratory as *pine food*. When found in their greatest beauty it is generally in mountainous countries; but almost any description of soil will suit them, excepting a soft peat or spongy marsh. Such a soil as they require is abundantly supplied by the decomposition of the mountains of Lebanon; and so fertile is this sacred ground in pine food that it produces with equal luxuriance the cedar and the Scotch fir.

All modern travellers in the East, from Lamartine to Lord Lindsay, concur in lamenting the decay of the cedars of Lebanon. We have already pointed out what a source of national income it might prove were the valleys protected and the young trees suffered to arrive at maturity. But unless a wiser and more provident Government control the country, such a result could hardly be realised; and, indeed, the whole forest will gradually die out under the wasteful negligence of the Turk and the Arab. Let us hope that the Sultan will, among other reforms in his interesting dominions, see to the protection of the cedars of Lebanon.

Still, even in the case of their dying out, which we shall never contemplate, the tree will not be lost. It has been propagated by the nut or

seed in many of the noblest parks of Europe. Indeed, there are more cedars within fifty miles of London than there are on the mountains of Syria taken together. The celebrated tree at Sion House is now 8 ft. in diameter above the ground. Even in the Highlands of Invernesshire it succeeds so well that trees planted at Beaufort Castle, the seat of Lord Lovat, in the year 1753, are now 3 ft. or 4 ft. in diameter. We all know how the great Lord Chatham conceived a passion for cedars, and what an expense he was at to gratify it.* Indeed, it must be admitted that there is something singularly attractive in the very name. When Miss Braddon, in her best novel, chooses for her scene of action a villa named "The Cedars," we can all understand the motive which influenced the authoress. The oaks, the lilies, the beech-woods, the laurel-groves, have had their day; but the cedar blooms fresh as a perennial spring flower.

We have thus briefly and imperfectly sketched the outlines of the most interesting portions of the natural history and associations of the cedar. In another article we shall describe some of its leading economical applications.

DOMESTIC ARCHITECTURE OF MEXICO.†

THERE are two or three descriptions of town houses erected in the Mexican cities: there is the town residence or casa grande of the broad-nosed Mexican don, erected of large capacity, with ground-floor and floor above; another house of equal area, of one floor only, used for a similar purpose; and another of similar space, that is converted into one or more residences for a lower class of the population,—clerks, shopmen, and others; and stores, or "tiendas," are sometimes made in the corner rooms or the front rooms of the building.

We will now proceed to describe the latter. The ground plan is generally square or rectangular; the outer part of the area of the plot is built upon, and the inner part is left open for the purposes of a yard. The entrance is through a gateway in the middle of the front, though there are accesses through the store; and the part of the building that is not occupied by the proprietor of the store is divided into a series of apartments that are rented by others; and the one room serves for living-room and bedroom, a cot being fixed in the corner of the room.

These are generally erected of the usual substantial style,—thick rubble walls, covered with an overhanging roof and red tiles; large windows opening down to the ground, protected by iron guards and shutters; and the inside is white-washed, and but rarely ornamented.

The whole aspect of the building is bare and comfortless; but as the Mexican spends little of his time in his casa, that does not disturb his complacency; he can ride out and do a little bridleage, or attend the store, or while away his spare hours in the fascinations of the billiard-room, or at the card-table, and win his pools of dazzling dollars.

There is a kitchen common to all the occupants of the casa, in which their coffee, tortillas, and frijoles may be cooked; but they do not trouble it very frequently, as they breakfast about 10 a.m. and dine late in the evening, and these two meals a day are generally made to suffice for the wants of nature. About middle day cakes and sweetmeats are carried round to the houses, in which the Mexicans freely indulge; and this, we suppose, is intended for their luncheon.

The "casa medio" is a building of somewhat more pretension than the one just described; it is likewise built on a square plan, the outer space being covered and the inner area open to the heavens; the yard is usually approached through a gateway in the centre of the building, closed in with a good substantial gate.

The walls are thick and strong, and roofed in with overhanging eaves, the outer eaves being used to cover the sidepath, and the inner one made wider, supported on pillars, to form a

* He then sold Hayes and took possession of a villa at Hampstead, where he again began to purchase houses to the right and left. In expense, indeed, he vied during this part of his life with the wealthiest of the conquerors of Bengal and Tanjore. At Burton Eyusset he ordered a great extent of ground to be planted with cedars. Cedars enough for the purpose were not to be found in Somersetshire. They were, therefore, collected in London, and sent down by land-carriage. Relays of labourers were hired, and the work went on all night by torchlight.—*Vide Macarty's "Critical and Historical Essays;" "The Earl of Chatham."*

† See pp. 7 and 292, ante.

covered corridor round the inner side of the building, and an approach to the rooms.

The walls are smoothly finished, and coloured in some delicate tint, and the exterior is frequently ornamented with grotesque figures, or figures of animals, painted in prominent places upon them, and also to imitate pilasters, string-courses, cornices, &c.

The principal apartments occupy the front of the buildings, and the wings form the chambers, which are lighted by windows opening into the corridor; the windows in front are large, and open down to the ground, and are protected outside by an iron guard railing, sometimes plain, and at others elaborately ornamented, and the inside is closed in with shutters.

Of course, the shutters being open during the day, the air circulates freely through the apartments. The inside rooms are sometimes white-washed, and sometimes coloured with colours of a delicate tint, and a few of them are occasionally left plain, while others are highly ornamented with wreaths or scrolls of flowers, formed in imitation of the beautiful indigenous flowers, or other designs, which has a very pleasing, chaste, and even elegant appearance, and forms a striking contrast to many of our rudely-designed and roughly-executed paper-hangings, with which we delight to cover the walls of our houses, but even these begin to show symptoms of improvement in that respect. The dexterity of these colourers or plasterers display in the colouring and finishing off an apartment is something to be wondered at, considering the natural indolence of the Mexican. The stencil plates are cleverly and nicely cut out of cardboard, and are well and correctly applied, representing the different colours of flowers, fruits, or animals, with considerable accuracy and artistic effect.

The floors of the houses are usually covered with red quarry tiles, also the corridor, and the yards are generally paved with small boulder paving-stones; but in many instances small gardens are formed in the centre of the open space, planted with the beautiful evergreens and flowers that flourish in the country, and adding a redeeming feature of peculiar interest and delight to the otherwise rather poor and meagre aspect of the place.

The rear part of the block of building is usually occupied as the kitchen, scullery, stables, &c., as previously described in the case of the hacienda.

But the principal buildings of a Mexican city, after the cathedral, churches, and nurseries are described, is undoubtedly the town mansion, or "casa grande," of the Senor Don of Mexico, and there are many of them of considerable extent and pretensions to architectural display.

The ground-floor of these houses are similar to those above described, but there is another story or floor above it; and the approach to the upper floor is effected by means of staircases from the inner corridor of the buildings.

The fronts of these buildings are supported on arches and pillars, which support a gallery or corridor above, and form a covered way beneath similar to the rows in Chester; and these pillars and arches are continued to the story above to support the usual overhanging roof, which in this case is made much wider, and the spaces between the pillars on the ground-floor are left open to the street, but above ornamental balustrades are fixed between the pillars as a protection to the gallery, and for architectural and artistic effect.

There is also some architectural display at their gateways; on each side are ornamental pillars, with suitable bases and capitals, connected together with a well-turned arch, and above the archway is erected a pediment giving a finish and an effect to the whole, and a strong, well-executed gate closes in the main entrance. The window openings are also highly ornamented with well-designed and sometimes rich iron railings, and the windows have usually the luxury of glass, and are closed in with large and massive shutters.

In the interior of the area or courtyard is rather an elaborate and imposing display of pillared and arched arcades, tier upon tier, connected together with tastefully designed and ornamental balustrades to protect the gallery and the openings to the staircases; this elevation is surmounted with an ornamental eave-board.

The pillars of many of the buildings are decorated with well-executed bases and ornamental capitals, and the arches of these arcades on the upper floor are sometimes partially or wholly filled in with trellis work, in which are trained

and entwined the beautiful creeping plants that flourish in that glowing clime: there is suspended in graceful festoons the many coloured convolvulus, the chastely white clematis and jessamine, the bright Virginian creepers, and others of Nature's floral gems that revel in wild luxuriance and magnificence in the recesses of their forests, and are very properly brought forth, and beautifully and usefully applied to minister to the luxury, the refinement, and happiness of man.

The upper floors of these "casa grandes" are used as drawing, dining, and general reception rooms, in the front part; the sides and ends are used as chambers, and the lower apartments are used as domestic offices, servants' apartments, kitchens, stables, coachhouses; in fact, to accommodate the whole of the servants of the establishment.

The open inner area, as in all Mexican houses, is nicely paved over, except the centre part, which is devoted to a pretty and picturesque garden, in which are cultivated all the choice and beautiful flowers and plants of the tropics, and even some of those of European origin, the graceful evergreen trees and endless blooming flowers giving it at all times a bright and pleasing appearance, and forming one of the most delightful and interesting objects connected with the domestic architecture of Mexico.

In the centre of the area that is devoted to the flower-garden is erected a fountain, throwing out cool and refreshing jets of sparkling water; these are conveniently fixed and arranged for watering the plants, to cool the heated atmosphere of the enclosed area, and to afford at all times a supply of water to the house, and also to the horses, mules, and other animals kept at the establishment.

The decoration of the exterior of these buildings is generally of an elaborate and costly character, but of the same style as previously described; and the interiors of the apartments and galleries are also profusely ornamented according to the taste and character of the occupant, and the means he has at his command, which are now in many cases much reduced from the effects of the unsettled state of the country, and the anarchy and commotion that have so long prevailed there; but still, there are isolated cases of better fortune.

In the fronts of those large houses where the pillared and arched plan is not adopted they are frequently architecturally decorated with elaborately designed and tastefully ornamented iron balconies, sometimes extending the whole length of the front of the upper floor, at others made separately for each window, and ornamental iron bronze-work railing is used to protect the lower windows that open down to the ground. These designs are evidently the handiwork of intellectual minds, well skilled in the manipulation of iron and the fine arts, as established and cultivated in Spain, particularly in Biscay, which had a world-wide reputation.

The interiors of some of the Mexican residences are elegantly fitted up and sumptuously furnished, the produce of the skilled hands of the civilized capitals of Europe; and elaborately carved and decorated furniture, *recherche* mirrors and lustres, ormolu, gold, and silver ornaments, and statuary of exquisite design and taste, adorn their saloons and principal apartments. And when this is said it cannot be thought that all the wealth of Mexico had dissolved away, or been entirely dissipated by their intestinal strife and perpetual war, as it is upon record that when one of the Senor Dons of Mexico resident in the capital visited Paris, he was invited with his Signora Donna to one of the Emperor's state halls at the Tuileries; the Signora was most splendidly and elegantly attired in costly Parisian toilet; and her display of diamonds was most gorgeous and profuse, so much so as to be the observed of all observers, and throwing into the shade and eclipsing even the Empress's toilet, and that of her elegantly attired suite, and the other splendidly dressed ladies that usually grace those magnificent assemblies. But we suppose it is in Mexico as in other countries, there are all classes, rich and poor, very rich and very poor, as the poet observes,—

"Some are and must be greater than the rest,
More rich."

And we know in the case alluded to there is great wealth, comprising thousands of broad acres of rich and fertile land, and mines of untold wealth, with many "haciendas," besides sundry "casa grandes" in the cities, and a magnificent one in the city of Mexico, redolent

with wealth, and adorned with every imaginable luxury.

It is not usual in warm and tropical climates to use carpets, as the bare floors are cooler and more agreeable, although tastily designed and well-executed matting is sometimes used; but in some of the Mexican mansions, Turkey and other rich carpets are profusely spread, and, as if wealth could not supply articles rich and costly enough to adorn their apartments and embellish their *casas*, they lavish it away in these all but useless articles.

In the "casa medio" small pieces of carpet are used, and sometimes gay heart-rings are placed on the floors opposite the windows, bounded on each side with a row of rocking or easy chairs, as previously mentioned, where the family and friends assemble in the evening, as round our own firesides, chat over the current subjects of the day; and, as they smoke their much-loved cigars and cigarettes, they swallow the smoke and pass it out through their nostrils, and thus mingle the graceful curls of the fumes as they arise in blissful indolence, so dear to the true Mexican.

It is no uncommon thing in the open inner areas of these *casas grandes* to erect theatres and concert-rooms by throwing a temporary roof or awning over the uncovered space; and very good theatrical performances and concerts take place there, and the performances are sometimes thrown open to the public; but, if the proprietor chooses to provide such an entertainment for his friends, the space is well adapted at a trifling expense to provide the necessary accommodation, and these entertainments are usually given on a Sunday. It strikes an Englishman as remarkable that, after making their marketings in the morning, afterwards attending their religious observances, they wind up the events of the day by attending theatres, concerts, and even billiard-rooms, in the evening.

Truly they must be a happy and self-contented people, that can make their religious duties fit on and chime in so easily with their ordinary worldly affairs, as to traffic in the morning, attend with lowly brow and bended knee their noon-day prayers and evening vespers, and indulge in full-dress costume theatrical and musical performances, and even gambling, in the evening: this is their custom, but it is one more honoured in the breach than in the observance.

The stores or "tiendas" of the city are numerous, and they vie with each other in making a good display of their wares and merchandise; but it is a kind of mongrel trade they carry on: for instance, at a drapery establishment you can purchase ironmongery, cutlery, tools, stationery, shoes, &c.; at a grocery establishment, a similar medley; at a druggist's, all kinds of drugs and oils; and one "Simon Pure" having purchased a quantity of petroleum from the United States, advertised the sale of it as "gas!" brilliant gas! and the poor benighted Mexicans absolutely bought it as the veritable gas, and were much annoyed to find they were deceived.

The butchers' shops are situated in several parts of the city, and are not, in hot climates, very desirable as neighbours; the cattle they kill the previous evening, and cut them up in the night, ready for the early morning's market.

The cattle are caught on the prairie by means of the lasso, and are brought to the place where they are to be slaughtered, and which is set apart for the purpose; and this place may be easily discovered by the villanous-looking and stinking black vultures congregating together in the locality, watching for the opportunity to carry away the offal and filth left by the butchers, and which they do most diligently, and thereby discharge a very urgent and important sanitary duty as effectual scavengers.

In the manipulation of gold and silver ornaments, particularly the latter, required for the saddles and bridles, the Mexicans considerably excel, and the work they turn out is very neatly and skilfully executed, and would bear comparison with that of more highly civilized nations; but the metal they use is not always of the purest character, as they employ a considerable amount of alloy, which does not much affect its appearance, but materially lessens its intrinsic value.

In saddlery and ornamental leather-work they also considerably excel. Their saddlery is highly ornamented and well executed, and other leather work is equally good, cases for boxes, and other articles; but the leather is not very strong or well tanned, and is carried a brown colour.

The fashionable hours of shopping are in the cool shade of evening, when the shops are

brilliantly lighted up with "Mexican gas." At those times you may see the dark-eyed and bewitching signoritas tripping gracefully along, gaily attired in handsome lace or other shawls of thin material, fastened usually to a gold comb at the back of the head, and falling in graceful folds over the figure; and with the handsome and indispensable fan, with which they make a peculiar noise to attract attention, and they flirt it about in the public promenades, the stores, and places of amusement. In the Plaza one of the principal houses was selected by the French army as an hospital, the plan and arrangement of the building being very well adapted for it, and the writer was informed it acted very beneficially in the interest of the army, by quickly restoring the sickly and wounded soldiers to the ranks. The arrangement of the hock of buildings, with windows opened on each side, so as to promote a current of air through them, and approached by the covered corridors on the inner sides with the large open court-yard and the wide gallery in the front on the first floor, served as a place of exercise for the convalescents: the whole building was so well arranged as if it had been absolutely built for such purposes, closely approximating to the pavilion principle, but an improvement upon it, as there is a wider space between the hocks of buildings than is usually adopted on the pavilion plan.

The selection of this building, and other army arrangements, fully convinced the writer that the distinguished men in command of the French army left no arrangement incomplete, no commissariat service neglected, or sanitary regulation unfulfilled, though many valuable lives were sacrificed during the Mexican campaign from the harassing duties they had to undergo, the marches and counter-marches often in the dead of night over very bad roads, the deadly hostility of the inhabitants, and the constant attacks of the guerillas, and the numerous places they had to capture by assault, which produced but little effect upon them, and proved the pluck, gallant bearing, and enduring materials their soldiers are composed of, such as any nation might be justly proud of, and fully sustain the reputation established by their army when, at the terrific slaughter of Waterloo, the old Imperial Guard when conquered, overpowered, and surrounded, cried out, "The Guard dies, but never surrenders."

We venture this passing complimentary allusion to the French army, from whom we received many courtesies, and being in a fortified city we had the opportunity of witnessing the dexterity with which the accomplished sappers of that army constructed their barricades, as one was fixed opposite the writer's casa, for the inner line of defence, and to protect the approach to the Plaza, as the French were much annoyed by attacks of mounted guerilla.

The barricades were placed across the streets, and were made with earthen (clay) works, faced with "fascines" on both sides, formed of the tough wood of the adjoining forests. The height of the barricade was 5 ft. and 6 ft. wide, the inner slope $\frac{1}{2}$ to 1, outer 1 to 1. The works were as closely inspected by the engineer officers as by the writer, who took great interest in the whole operation, although he did not much relish the position they had chosen for their line of defence.

The barricades, we suppose, were a necessity in a military point of view; but they interfered with and incommoded the streets, and were a great nuisance to the inhabitants.

In addition to the many other sanitary advantages enjoyed at an early period by the Mexican people, we must not omit to mention that intramural internment had been abandoned for a long period, much earlier than has been adopted by more highly-civilized nations. About a mile from the city a spacious and well-arranged cemetery was laid out, in which are many interesting monuments erected; but, we fear, none to record the last resting-place of the many French soldiers who were taken to that bourne whence no traveller returns, and whose bones lie rotting in that distant and inhospitable land.

In drawing this article to a conclusion, we believe we have remarked on all the salient features of Mexican architecture, its constructive details, and its sanitary arrangements and appliances, in which we have endeavoured to show most of its relative points of interest and advantages; and as the original design and laying out of these cities possess merits which few of our towns can boast (notwithstanding our vaunted standard of superiority and

the eminence we flatter ourselves we have attained in the constructive arts and sciences), and which we might most advantageously and worthily follow without derogating from our national status or prestige; and we trust we have awakened a feeling of interest and anxiety to know something more of the remarkable works of this far distant country, as soon as the spirits of peace and concord shall have paved the way by shedding their benign influence on the unsettled and predatory race that now holds sway over the extensive territory of one of the richest and most fertile countries in the habitable globe.

THE SCIENCE OF MAN.

Of late years the science of humanity, under the full-sounding designation of anthropology, has been gradually coming to the front. "Men admire the heights of the mountain, the mighty waves of the sea, the high rush of the waters, the extent of the ocean, and the tracks of the stars, and neglect admiring themselves," said St. Augustine, hundreds of years ago; and the same may be said of the great mass of mankind still: nevertheless, there is a section that has taken up the study of man as the grandest, most beautiful and most wonderful in the world; and by its ability and earnestness, a large circle is gradually widening out, in which its investigations, inductions, collections of facts, are viewed with great interest. There is now an Anthropological Society in London, and another in Paris; Frankfort-on-the-Maine has commenced an anthropological journal; and Cologne, Aix-la-Chapelle, Essen, Elberfeld, and Crefeld, have just heard a course of thirty lectures on the newly recognised science. Leipzig, Dresden, Hamburg, Brunswick, Hanover, Berlin, are likewise under instruction. A French savant, M. E. Godard, dying in Jaffa, bequeathed in his will 5,000 francs to the Parisian Society, the interest of which is to constitute a biennial prize for the best memoir on any subject relating to man. An international congress was held at La Spezia in 1865, at Neuchâtel in 1866, and in Paris last year. The most prominent members of the London Society are exerting themselves to have anthropology permanently and duly acknowledged in the British Association for the Advancement of Social Science, contending that a scientific body without this science is, in the apt words of Dr. James Hunt, like an arch without a keystone; more than one elemental work has recently been published on the subject by its ablest exponents, for the information of those who are not already acquainted with its breadth and bearings; in fine, man, in his natural history relations, his physical, intellectual, and moral aspect, is now on the eve of due study by the million.

Anthropology must not be confounded with ethnology. Pervert followers of the former science, indeed, affirm there is no such thing as the latter; though less exclusive zealots agree that it is a branch of the superior study. Ethnology used to be defined as the science of races, and as it is held that there are no such things in nature, from a scientific point of view, as "races," the first deem it is time that the word was obsolete. The term ethnography is considered more fitting to represent descriptions of existing varieties of mankind. This, then, and all its kindred subjects, historical and comparative philology, mythology, &c., are looked upon as branches only of one of the great divisions of anthropology. The origin and destiny of man are the Alpha and Omega of this science. Whence came we, and whither are we going? The latter query is of the most practical importance, but as man's experience shows that he cannot get to the top of any ladder without beginning at the foot of it, we are forced to take the first into our gravest consideration. Between these two questions, however, are numbers of facts bearing upon them from very different directions; great voids that we have yet to fill up, and contradictory evidence that has yet to be reconciled.

People only dreaming of country consins as the kin with whom they may be unacquainted will be surprised at the number of undreamt-of relations the anthropologist will produce for them. Man has zoological, geographical, functional, historical, geological, genetic, and progressive relations, all waiting to be recognised; in other words, man is literally kin to all the world. We are scarcely able, at first, to grasp the comprehensiveness of all this; but by

examining each claim, one by one, we come to a realization, according to our individual gifts, of the scope and sublimity of the science of man. To "ink in" such a vast subject, even in outline, would be to step too far, perhaps, out of the art-world; but a glance at some of the most recent ponderings of scientific men in some of the departments may be suggestive.

A novel question has arisen among anthropologists as to the effect of soil on character. In our own immediate walk we have seen the theory of relationship of man to the soil applied to the solution of the mystery of the limited powers for ill of cholera in some localities in the immediate neighbourhood of districts in which the epidemic was as singularly fatal. We have seen, too, the peculiar nature of Irish soil given as the secret of its capabilities for horse-breeding. Now, the question is asked whether, for example, the character of the Scotch is an expression of the soil of Scotland? Mr. Cleghorn advances an opinion that it is. He finds, that wherever the boulder clay exists in Gathness there are the best men, the best cattle, and the best cereals; and where it is absent these are all of a miserable description. Proceeding to a larger field of observation, he shows that the area of the boulder clay divides Scotland into two well-marked regions, an eastern and a western, the former being that of the desirable soil. The man of eastern Scotland is taller and bigger-headed than the man of the west. The death-rate is lower in the east than in the west, as is the birth-rate, in accordance with the law that gives to poor communities increase, and causes luxury to be barren. Aberdeenshire, our exponent argues, has turned out more senior wranglers than all the west—perhaps all the rest—of Scotland, and the east has three universities for the one in the west. All religious revolutions have arisen in the east, most individualism exists in the east, most men eliminating for themselves their beliefs; whereas, in the west the opinions of their teachers are generally accepted. The contour of the east and west coasts is the result of the action of the prevalent wave-producing wind, which thus determines the soil of the country. He sums up, as his opinion, that the soil has determined the food, the food has made the race, determined its birth-rate, legitimate as well as illegitimate,—its marriage-rate and death-rate, its language and religion; therefore that it must be allowed that the character of the Scotch is the expression of the soil of Scotland.

It has been said, jestingly, "What is mind? No matter. What is matter? Never mind." The anthropologist treats of the first question as one of the most vital importance. Among the ancients, as is well known, the blood and the heart were successively believed to be the presence chamber of the mind or soul. Then Galen adopted the brain as its seat. Eventually, helped by the suggestions of Albrecht, Bishop of Regensburg, Gall and Spurzheim evolved the scheme of craniology known as phrenology. This last tenet is as likely to be discarded in its turn as its predecessors. Mr. W. C. Dendy, at the last meeting of the London Society, cited two cases in which life existed and the mental faculties were present after very severe mutilation of the brain. One patient, whose skull was cracked by a fall on a pier of Waterloo Bridge, lived for several days after the bone was trephined, when a basinful of brain was removed; and another lived for months with his mind in good working order after the total destruction of the left parietal bone and hemispheres. He also instanced cases of deformed skulls in which magnificent minds had worked. Those of Cicero, Bichat, and Curran, for instance, were remarkably different from the lofty fronts of other gifted men; and that of Sir Walter Scott was singularly pyramidal. He infers that the quality of the brain, "its firmness, comparative weight, and the complexity of its convolutions, and their secondary gyri," is of more consequence than the form of the case into which it is packed. Proceeding with his anatomy of the intellect, he thinks the non-correspondence of the two hemispheres likely to be the cause of much of the eccentric mental phenomena that is so puzzling to the physician, judge, and others. The opposition of the two hemispheres to one another may account for indecision of character; for the power some writers have possessed to scribble virtue while they were acting vice; as well as for the degree of rationality some insane persons enjoy.

With regard to the antiquity of man the anthropologist finds traces of his existence and industry, as well as remains of his body, in

geological strata, the age of which is beyond computation. Dr. Bruce, secretary to the Paris society, writes,—"He has lived in epochs when the flora and fauna considerably differed from those at present existing; he was the contemporary of a number of species now only existing in a fossil state; and whatsoever has formed an idea of the slowness of such changes effected on our globe will easily convince himself that six thousand years constitute but a short moment in the life of humanity." So, instead of looking upon man as a being degenerated from some former excellence, he regards him as he is bound to regard the proprietor of the rude tools and weapons we find among his relics. The golden age of mythology tones down before actual facts and finds into the Stone age,—the dark and distant period when man made shift to live without the use of metals. To this succeeded what is now known as the Bronze age, when he had succeeded in making an alloy of copper and tin, which he fashioned into implements; and then he raised himself still higher by the discovery and application of iron—"that hard metal which, in the language of the ancient poets, symbolised human perversity, characteristics, on the contrary, in the eyes of modern science, the third age of industry, security, stability, and true civilization. It was thus by an extremely slow process that man gradually rose from a savage to a barbarous state, from barbarism to civilization." The origin of man is a much more complicated question. Taking the author quoted above as a fitting representative of modern anthropological opinion, we find he considers the investigation of origin beyond science, save by concatenation of idea; "for beyond observed facts and beyond more remote facts discovered by way of induction, and still more remote ones which are only approached by hypothesis, there still remain, and ever will remain, primordial facts in the presence of which hypothesis remains dumb and powerless." Citing the Darwinian hypothesis as the holdest on record, he states that it carries us back only to the spariation of the first Monad: not to his origin. The Monogenists incline to the belief that all human races were derived either from a single couple or a certain number of primitive men resembling each other; the Polygenists aver that, human types being only liable to slight modifications, the diversity actually existing among them must have arisen from the multiplicity of their origin. The modifications to which human types are liable is of itself an important subject, too lengthy to be more than passingly indicated. How far man is altered by centuries of exposure to climate, experience of different modes of life, mechanical mutilation, and deformation, is only to be seen by inspection of an immense amount of evidence. We have, on the part of permanence of type, the Egyptian sculpture showing Negroes, Jews, Greeks, Mongols, and Hindoos with the same characteristics these people present at the present day; and we have the still more astounding evidence of retention of type in the celebrated cranium of New Orleans, identical with that of the present Redskins, found in a bed beneath a series of cypress forests successively submerged by the alluvia of the Mississippi, indicating a period not less removed than 15,000 years; and again we have the case of the Gipsies who, under every condition of climate, preserve their type, presenting the same peculiarities in Persia and other Asiatic climes as they do round the snow-bound foot of Cheviot; as well as that of the Jews. On the other hand, there is the possibility that we ought to count by millions of years; when, perhaps, we might arrive at universal brotherhood. Language has scarcely less permanence of type than physical characters. The information it gives us concerning European races is to the effect that a primitive people prospering in a region to the north of Persia, established colonies and extended branches to the borders of the Ganges on the one side, and the shores of the Atlantic on the other, much in the same way as we have colonised the New World and Australia in these latter days. We quote our Parisian anthropologist:—"At the time when the Indo-European peoples first set foot in Europe, they did not find that region altogether deserted; it had been occupied before their arrival by an autochthonous population. There are still found, at the two extreme ends of Europe, the Basques and the Fins, whose languages are unquestionably derived from these autochthones, but elsewhere there remains, neither in the language nor in the traditions, any trace, any remembrance, of a people prior

to the arrival of the Indo-European, so that the existence of these primitive peoples might be doubted, if their crania had not been discovered in the turf-pits, in the graves of the Stone period, in the ossiferous caves, and in the diluvium. This decisive testimony supplies the silence of history." Hypotheses are often opposed to each other; and facts often accrue that destroy both. It is admitted, for instance, on the one hand, that civilization, with its regular subsistence and abundant alimentation, increases both the height and strength of man; while, on the other, it is contended that civilization, being unnatural, weakens the body, though it may improve the mind, and under its influence man becomes of less stature and diminished physical powers. The Græco-Latin people are shorter than the Germans, Scandinavians, and Slavonians, notwithstanding the latter were civilized long after them; and the Bas-Bretons are shorter than the Belgians, Normans, and Provençals, who were civilized long before them. Thus the variation of stature must be explained from further scrutiny; as, indeed, must that of complexion, cephalic differences, and aptitudes, all facts for which we are able to account but unsatisfactorily at the present time.

As further proof of the increased interest in the study of man, we may mention that anthropological tours are not now uncommon. Word arrives at the London and Parisian centres, frequently of journeys and finds of objects relating to the subject from the uttermost corners of the earth. Thus we hear of a human skull recently found in California, at a depth of 130 ft., in the plicose, that far outreaches the antiquity of the flint-makers of Abbeville and Amiens; of arrow-heads and other primitive weapons found in Peru in such relation to the bone of the mastodon as to imply that the animals had been slain by the hand of man; of rude objects of art, notably a wooden idol, found on the guano islands below the deposits of guano, which was so completely saturated with their salts as to have acquired the specific gravity of marble, &c.; and we are led to expect discoveries of value from the present journeys of well-known anthropologists on the Mosquito Coast and among the races south of the Zambesi.

When we remind our readers that the International Congress of Anthropology and Pre-Historic Archaeology will be held this year in this country, this slight indication of the channels of thought in which some of its members have been recently travelling may be found useful.

THE HONESTY OF MASONRY.

We have paid tribute, recently, to the majesty and magnificence of masonry; we have acknowledged its poetry; we have indicated its occasional association with magic; we now step a few paces nearer to examine its honesty.

On the sandy plains of Egypt we find an example that we will take for our first. In the huge plainness, sameness, and paucity of idea, as to everything except quantity and size, exhibited in the form and manner of the Pyramids, we may see masonry recording the fact that only one man, say, in ten thousand, possessed the power of mental creation when they were built. One mind, they tell us, conceived the idea of a monument for future ages to admire. Contemporary minds, at the rate, we have roughly hazarded, of one in ten thousand, had developed the pre-historic idea of setting up a stone as a testimony, into the obelisk; and the author of the design of the Pyramids, elaborating the idea still further, devised the huge monuments in question, preserving the monolithic sentiment, but bringing his vast resources in the way of labour and material to bear upon its extension. We must observe there was no division of artistic labour possible. The one man with creative faculty could not say to another, "Carve me two winged lions for this entrance," and to another, "Model me an embodiment of the Nile to place in the centre of the court;" he could only say to his ten thousand, literally, draughtmen, "Bring stones here of this size, and pile them up upon one another in this fashion." The masonry thus formed tells us this honestly.

Turn to Greece. Note the brown sward, the wood-clad mountains, the deep rocky gorges, the patches of hline and white water-lilies on the winding waters, the sweet soft breeze, the calm full blue sky, and then look at the monuments of ancient Greece. There they lie on the slopes' on the plains, overturned and neglected it is

true. But what do they not tell us of the incalculable honesty and the cultivated taste of those who built them? The gangs of men who dragged the stones of the Pyramids to their arid places could not have carved you capital, now lying on the ground like a white blossom from an acacia-tree,—could not have dreamt of you crowded frieze,—could not have read your inscription. These fragments of sculptured masonry tell us more, however, than the degree of intelligence and cultivation of those who fashioned them. Among the overturned columns, is there one that is marble without and an inferior stone within? Among the friezes, is there one of plaster when it purports to be stone? Among the inscriptions, is there one that is painted when it purports to be incised? Not one. These builders were honest artists, and dealt honestly with the world. Look at Rome. Look over the wan, fluted, modern bousetops, in the mean streets, at the mighty sky-vaunted Colosseum. Recognise the bold determination of nothing less than the firmament for the crown of the dome of the ringed Pantheon. Compare our puny "pillars" with Trajan's Column, 120 ft. high, composed of thirty-five blocks of marble, sculptured with 2,500 human figures, besides fortresses, bridges, horses, and other objects. Think of the other amphitheatres, temples, and columns, the triumphal arches, the basilicas, the forums, baths, aqueducts, tombs, and columbaria, and decide whether the masonry of ancient Rome does not grandly, unsurpassingly, and honestly represent the vigour, integrity, skill, and wealth of its great people. It gives back that which was given to it,—honesty. If the Romans built as Strawberry-hill was built, or as we are building much of London, their masonry could not have borne this testimony.

One more example of honest evidence in stones before we come to the corresponding necessity of honesty in modern workmanship,—our cathedrals. These tell us of artistic skill cultivated in different branches by great numbers of men. Reversing the position of one man deciding how thousands of men should accomplish his idea, these buildings testify that the principal undertaking them, or superintending them, divided the work into departments and portions, and distributed the latter to men who had especially devoted themselves to the description of labour allotted them. We cannot believe that the same band that formed the bold branching tracery of the windows, chiselled the lace-like canopies over some of the exquisite figures, any more than we can credit that the band that sculptured these transcendent figures was the same that placed the plain ashlar work close by or the paving stones below. It is clear that there were multiplicity and degrees of skill in the masonry work as it is that William the painter was not requested to perform the work of Johannes the smith, nor Gualterus the plumber to execute the task of Thomas the joiner. Thus masonry gives evidence according to the truth, for or against us, as the case may be.

Consider much of our modern masonry. Directly there occurs a gale of wind of extra force down come tumbling many of our chimney-stacks, like home-made aerolites, dealing death and destruction to all and everything sufficiently near to be affected by the catastrophe. Away go our slates, as though they were meant to come on and off as often as our bats. Occasionally, too, down comes a gable-end; and still more occasionally, fortunately, we have to record the fall of a house. Take a walk down a new street and look at the heads of the window-openings and count how many show traces of settlements. In the older of modern streets these cracks are filled up, and are therefore not perceptible, but they are there in far too many cases. A cracked house may be a very good substitute for a whole house; but why should we not have the latter? It was not in this frail manner that our Tudor, Jacobean, and Hanoverian brick mansions were erected; neither was it in this way that castles were built in the days of the Normans and Plantagenets. Here is a bricklayer at work on a piece of walling. Let us watch his mode of operation. He lays a line of bricks at the inner edge of the wall, and another at the outer one. This he repeats till there is a hollow recess some half-dozen bricks deep between the two surfaces of the wall. Into this recess he throws some broken brick-bats, and when these level it up to the outer edges, in a rough kind of way, he throws over all a few courses of really proper solid brickwork. Then he repeats the hollow cavity for a similar height; and finally com-

pletes the wall in these alternate courses. Is this honest? Is he not aiming at making the world believe his wall is solid and strong, when in reality it is hollow and weak? Is not this a deception made with bricks?

Here is a stonemason at work building a wall. Like the bricklayer, he is making his wall all glories without, but hollow within. As he goes on he throws loose rubble into the fissure between his two surfaces, and occasionally he pours a pail of grout into it as well. Where are the bond-stones? Either left out altogether, or put so far apart as to be of very little use. Is this honest? Ought not the rubble to be well packed together, and the grout poured in till it is on a precise level with the edges of the outer surfaces? Every contrivance or omission short of this is therefore dishonesty of workmanship.

All the arguments and ordinances applied to design may, with equal pertinence, be made use of with reference to workmanship. Everything should be what it aims at being thought; that is, nothing should pretend to be what it is not, in the way of workmanship as in design. There are few people now, we may presume, who would contend that it is right to build a cottage to look like a small castle, or a stable to look like a large studio. The same principle applies to the workmanship, which, to be honest, should be what it seems to be. A mason ought to be able to say at every turn of his hand, "I helped to build that piece of masonry, and the children of my great grandfathers will find it as sound as I leave it;" not, "Well, that's the easiest and cheapest way it is possible to do it, and I should think it will last my time, at any rate." We hear sometimes of master builders complaining that they cannot get walling properly executed; that the mason will even set an ordinary stone to stand out as though it was a bonding-stone, rather than lift the real bond into its place. This shows that the mason's apprentice must first be taught to take pride in the bonesty of his work. Then perhaps, as a man, he will practise it from choice. If not, he must be forced to do so by public taste and opinion.

Honest masonry has had its triumphs in the history of the world, as dishonest masonry has had its tragedies. Consider our Medieval remains; how many of them have been "peppered" with cannon-balls, fired, stripped, left open to the weather, cattle, and worse; and yet how few there are but in them some matchless indestructible piece of masonry still stands, as an awakening sample of the whole! If false construction sometimes leads to loss of life, a strong tower has likewise saved life. Masonry has, too, its legends and its literature. A volume would scarcely contain the beautiful things that have been said and written about true masonry,—not of the miserable workmanship we have decreed, but of the sort true men have reared as the best that it was possible for them to do, according to their gifts. The ancient poets, the Medieval poets, the modern poets, have all traced the sweetest pictures about masonry. The "columned town," with

"The high slant street, that lengthen'd on and on,
And up and up, until it touch'd the sun,"

and "the chief relics of almighty Rome" have been painted in cadences, as well as the more variegated graces of Medieval buildings.

"Castles shall be seen afar,
The works of the minds of giants
That are on this earth,"

sang an old Saxon poet, when he wished to prophesy there was a "good time coming," feeling, doubtless, somewhat of the power, endurance, beauty, and honesty of masonry; and there have been but few great poets since his dreamy prophetic eyes closed that have not left us exquisite building pieces. Sir Walter Scott, Byron, and Wordsworth must, however, have especial mention for their unsurpassing "bits" of masonry. They seem to have revelled in stonework. But from the hermitage to the cathedral, with its porch full of kings and saints, from the solitary watch-tower to the strength-proud castle, from the cottage near a wood, or otherwise, to the

"quaint old gable-ended house,
With oriel windows, diamond paned,
And rich oak panelings within,"

masonry has been identified by song. In like manner it has been seized and carressed by pictorial art. What does the most genial and rejoicing of painters make more of than a piece of lichen-kissed walling ripening like corn in the sun? It behoves us, then, to let our work be worthy of the appreciation that has been so bountifully awarded to that of our predecessors,

that, in due time, it may render back testimony of us that will not put us to shame. When King David thought to himself, "Solomon, my son, is young and tender, and the house that is to be builded for the Lord must be exceeding magnificent, of fame and glory throughout all countries, I will therefore now make preparation for it," the first thing he did was to "set masons to hew wrought stones."

HUMIDITY AND DECAY.

THE INSTITUTION OF CIVIL ENGINEERS.

ON May 12, the paper read on "The Durability of Materials," by Mr. Edwin Clark. The author expressed the opinion that a series of papers devoted, not so much to the special application of these philosophical principles which formed the basis of practice, as to the consideration of the principles themselves, would be of great interest; as numerous questions occurred which could be more effectually discussed in their abstract capacity, than in connexion with the practical applications of which they arose. Well-established fundamental principles had been arrived at on many subjects, which it was advisable should be definitely recorded.

The list of materials used by the engineer was small. It included stone and timber among natural productions, and bricks and cement and the metals among artificial products. It was difficult to state, even approximately, the positive life of either of these articles. The durability of any material depended, not only on its own inherent properties, but principally on the agencies to which it was exposed; as, for instance, the effects due to climate.

On examining all the facts, and seeking some common characteristic, it was found that among all the causes of decay, humidity held the first rank. The decaying influence of humidity was evidently dependent on other coincident circumstances. The mere pressure of water, or even of a saturated atmosphere, was not sufficient to induce rapid decay, which appeared to be caused by humidity only under peculiar conditions. One of these conditions was well known by the popular title of dampness. The decay caused by dampness, as in the case of dry-rot, was as effectually prevented by the presence of water as by a constant current of air, whether perfectly dry, or saturated to any degree of humidity. Damp, therefore, was not the mere presence of moisture in the ordinary form in which it was held in solution by the atmosphere. If a hygrometer were placed in a damp situation it would simply indicate perfect saturation; no evaporation took place, but the cotton covering of the wet bulb was speedily covered by a peculiar mould, well known by its fungus-like odour, and in a short time it was converted into an impalpable powder, or ash. Under similar circumstances, timber, leather, paper, and all like materials, underwent the same rapid decomposition; vegetable gums and oils, that were insoluble in water, and even dry hard paints and varnish, became soluble and liquid. Massive timbers were rapidly disintegrated to the core, entirely losing their weight, though still retaining their form; and they were often totally free from apparent moisture, although at times dotted externally by drops of brilliant water. Damp spots were, moreover, peculiarly hygrometric, indicating atmospheric changes with remarkable precision, and temporary desiccation in no way disturbed this process. The peculiar odour which always accompanied this condition was one of the best tests of its existence; and the expression that a room smelt damp was strictly correct. The effects were, within certain limits, intensified by increase of temperature and absence of light, and arrested by poisons destructive to vegetable life. If this phenomenon of decay were more closely examined, the process would be found to resemble, in many respects, a slow combustion. The ultimate results of combustion and decay were strikingly similar: the union with oxygen was slowly effected, and the residue was more or less diluted with foreign substances; but whether the bodies were burnt, or decayed, the remains in the ashes were substantially identical. Decay might thus, to a great extent, be looked upon as a decomposition, resulting from the slow chemical combination of oxygen with the matters decomposed. Now, if slow combustion were the cause of decay, and that particular state called dampness were so

important an accessory, the inquiry naturally suggested itself, what connexion existed between those agencies, or in what way could damp promote the absorption of oxygen? In the case of organic substances, the presence of vegetation in the form of fungus, or mould, was an invariable characteristic of decay, and the decomposing effect of all vegetable growth was beyond question. It might be said that the vegetable growth alluded to was the effect rather than the cause of decay. Doubtless the spores of microscopic fungi followed the law of all other seeds in vegetating only under the peculiar conditions of soil, light, and moisture which were adapted to their growth: dampness and partial darkness, absolute quietude, and even decay, might be essential to their existence; and therefore it was only under such conditions that they appeared at all. But, nevertheless, when they did appear, their presence rapidly accelerated the decay, and they furnished a vital medium, capable of accomplishing the observed effect—combustion, or slow union with oxygen, of the substances on which they thrive. It was probably by some such chemical vital action, the fact could be explained, that even the hardest rocks were rapidly decomposed by the growth of lichens, or that decay should be arrested by poisons which could exert no other influence than the prevention of vegetation. It was equally remarkable, that in the putrefaction, or rapid chemical decomposition, of animal and vegetable substances, the same profusion of the lower forms of animal, as well as vegetable, organisms characterized the phenomenon.

Whatever might be the cause of decay, moisture was an indispensable element. Dry air was incapable of decomposition. Water was a carrier of oxygen in a potent form; and it was only from water, and more especially when in the form of vapour, that the oxygen necessary for decay could be obtained. The durability of tin and iron roofs in Geneva and St. Petersburg was due to the absence of moisture; and the importance of some shelter for timber, and of thorough ventilation wherever it was employed in this moist climaté, was a necessary corollary.

TESSELLATED PAVEMENT, CANTERBURY.

A SHORT time since, in carrying out some extensive drainage works in this city, a fine specimen of Roman tessellated work was found in Burgate-street. It lay about 7 ft. below the surface of the present road; and, from the evidence of burnt materials immediately above it, it probably owed its preservation, through fifteen or sixteen centuries, to the fact that the fire which destroyed the dwelling of the Roman citizen, whether accidental, or designedly occasioned by the hands of barbarian invaders, had, by the falling in of the roof and walls, caused the preservation of the pavement, and secured it from all subsequent injury.

When first opened to view by the labourers' spade, the colours were particularly vivid. The internal and more elaborate portion was bordered by red tessera, within which was a rectangular border about 6 in. wide, having, in red and white, alternate diamond-shaped figures and right-angled designs. Within this was a thin border of black or dark purple layers of tile, about 1 in. wide, forming a second square. To this a smaller circle or border succeeded, the space between the two borders being ornamented with scroll-like designs of small tessera of red, yellow, white, and black. On a white ground, within this, on an oval field about 16 in. in diameter, was designed a two-handled goblet or vase. This object was evidently taken from some silver or metallic type, as it has no resemblance to any glass or earthen vessel of Roman workmanship; indeed, an attempt had evidently been made to show a metallic lustre or reflexion by the artist, in the manner in which he had designed a streak of white tiles on the surface of the goblet.

Its other component parts were red, yellow, and black tessera. The high arched handles were of black; the stand was also composed of black tessera. The square containing the central figure was 2 ft. 8 in. in width.

Stepping off this pavement about a foot lower down, lay a portion of another, of less elaborate design; the tiles being of white and black only, of a kind of lozenge pattern; it might have formed the entrance to a hall or part of the hypocaust of the Roman house. Some time

was spent in making further search, which was, however, much impeded by the neighbourhood of one of the main sewers of the city.

It is intended to restore and preserve this pavement for the Canterbury Museum, being the only relic almost, from the extensive drainage works now nearly completed, which has a chance of being obtained for the city.

Thanks are due to the Mayor of Canterbury for the readiness with which he seconded the exertions made to secure this ancient work, and also to Mr. G. W. Piddick and Mr. John Hall, surveyor of the city, for their personal exertions in rescuing and preserving these interesting remains of the Roman occupation of Canterbury.

JOHN BRENT, F.S.A.

SANITARY MATTERS.

Fever among the Irish in Southwark.—Mr. Edwards, inspector of nuisances to the St. George's District Board of Works, has appeared before the Police Magistrate for an order to remove several poor persons attacked with fever, from their lodgings in Brent's-court, High-street, to the workhouse (*pro forma* on their way to the Fever Hospital). Applicant stated that a few days before fever broke out in Brent's-court, which consists of a number of small houses, densely populated with Irish families, there being as many as six or seven persons in each room. About a week before one of them died in the Fever Hospital, and the relatives had the corpse brought back to No. 19, Brent's-court, for the "wake" to take place. It was kept there some days, and visited by scores of Irish, the result of which was an alarming spread of fever in the locality. Several were in a very bad state, and unless removed at once the calamity would be very serious. The order was granted.

The Epping Drainage Question.—A largely attended meeting of ratepayers interested in the new district, formed for sanitary purposes, has been held at Epping Police Station for the purpose of electing a committee, delegating certain powers to such committee, and electing an officer to act under the direction of the committee. After a long discussion a committee was appointed.

Witham Drainage and Water Supply.—A numerous attended meeting of ratepayers has been held at Witham, for the purpose of meeting Mr. Rawlinson, the Government engineer, who had been sent down by the Home Office to hold a semi-official inquiry on the important subjects of drainage and water supply. The plans of the Local Board had been inspected by Mr. Rawlinson, and reported upon by him to the Home Secretary. Mr. Rawlinson said the two plans under consideration would go before the General Board of Health, who would, probably, send them to him to report upon, and he should then go into the details, and send his report to the Home Secretary, who would, no doubt, forward a copy to Witham.

Malvern Link Sewage.—A report by the committee on this sewage was some time since presented at a public meeting, held in the Link Hotel. It stated that, until the local authority was clearly ascertained, it would be premature to take any action in the matter, and then the cost would come under consideration. The committee advised that prompt measures should be taken to divert the sewage which now flows from the lower sewer into Newland Brook (and which has given rise to Earl Beauchamp's actions), and that every precaution should be taken to prevent the streams from being polluted throughout the district. The committee regretted that Earl Beauchamp had not yet thought fit to accept an invitation of the ratepayers to nominate a gentleman to represent him on this committee. The committee offered the suggestions in their report for the consideration of their neighbours, in order that the question might be fully discussed and any plans fully matured before expenses were incurred, and in the hope that some united action might forthwith be taken, to save the neighbourhood from being involved in litigation with Earl Beauchamp.

Gloucester Waterworks: the New Works at Witcomb.—Minutes presented at a recent meeting of council showed that the waterworks committee had been busy examining and inquiring as to the sixteen tenders received for the construction of the new reservoir and the other works at Wit-

comb. The mayor remarked that they were doing their best to secure a contractor who would perform the work properly, and that he hoped shortly to be able to give some definite information on the point. Mr. Ward complained that people in the street could name the contractors, and knew all about the matter, while the members of the corporation were kept in ignorance. The Mayor answered that he did not know how the people got the names, for that he had given them to nobody; and Ald. Nicks observed, "I've tried everywhere to get the list of names with the amounts, and haven't succeeded till I got into this room this morning." The council then went into committee on the Witcomb matter.

PARIS.

WE mentioned about two years ago that there were, over a doorway in the Rue du Four Saint Germain, No. 63, and at No. 6, Rue aux Fèves, two bas-reliefs of stone of the sixteenth century, representing Susanna at the fountain; the houses have been now cleared away for the Rue de Rennes.

Some of the old sign-boards,—or, rather, engravings,—were very quaint, especially in this quarter; Rue des Canettes, a bas-relief in stone representing "annes" (wild ducks) swimming in a pond. Rue du Cherche-Midi, a person drawing a sun-dial, bas-relief. Rue de la Harpe, corner of the Place Saint Michel, King David singing and accompanying himself on the instrument after which this street was called. In the Rue du Dragon, No. 24, a furnished hotel took for a sign a remarkable dish, by Bernard de Palissy, representing the victory of Samson over the lion. Near there is a dragon sculptured over the entrance to the Passage du Dragon. This passage now leading from the Rue de Rennes to the Rue du Dragon is not doomed to destruction, and seems to date from the seventeenth century. In it is established a colony of blacksmiths and iron founders, particularly of stoves. In passing through we have often remarked park-gates and wrought balcony railings of excellent workmanship and design. Iron bedsteads are also manufactured there in great numbers.

The new Hôtel Dieu is appearing above ground level. Our readers are aware of the depth to which the foundations are carried, so as to insure a firm footing for the masonry, which is of the most massive character and well laid. The Palais de Justice is nearly completed. We have often remarked an excellently well sculptured arch over the Rue de Nazareth, which established a communication between the Hôtel des Comptes and the Gallery of Archives. The arch and the whole soffit rest upon eight consoles, four of which are ornamented with heads of satyrs, and the others with female heads, bearing each a crescent on the forehead. Panels and heads of angels fill up the spaces between the consoles. On the keystones of the arch on each side there are masks and laurel branches; on the spandrels, four small figures, holding palm branches. An attic story, with Ionic pilasters, was erected on this arch in the sixteenth century. A stone, on which is inscribed in Gothic characters, that one of the buildings of the ancient domain was erected in 1486, may be seen embedded in the wall of the grand staircase of the Palais of the Cour des Comptes, where they now reside. This was probably the date of the arch in question.

A very melancholy event took place a few days ago near Nantes. We all remember the little steam pleasure-boat which M. Ariol brought to the Paris Exhibition last year, and the many pleasant trips he gave to his friends between the Pont Royale and the Champ de Mars. The sad occurrence happened as follows. M. du Chalard, engineer-in-chief of the French navy; M. Marin, lieutenant de vaisseau, chief of the traffic of the port; and M. Ariol, were making experiments in the small steam-yacht when the boiler blew up, near Roche-Manrice. M. Du Chalard was killed and thrown into the water. The boat sank at once, leaving MM. Marin and Ariol to swim for their lives; fortunately they gained the river bank. The news spreading at once to Nantes, M. Broca, captain of the port, at once proceeded, with proper apparatus, to the rescue of the party. MM. Marin and Ariol being placed in safety, the boat was raised, also the engine, beside which the body of M. Du Chalard was found.

SCHOOLS OF ART.

The Gloucester and Stroud Schools.—The results of the examinations conducted by the committees of these schools in March last have been communicated to them by the Government Department of Science and Art. They are such as are extremely creditable to the schools. At Gloucester, of forty students who sat for examination thirty-one were successful. In freehand drawing, of twenty-eight who sat, twenty-three were successful; in model drawing, of eight who sat, seven were successful; in geometry, of five who sat, three were successful; but in perspective, of four who sat, only one was successful. At Stroud, of the thirty-five candidates who sat, twenty-two were successful. In freehand drawing, of twenty-five who sat, twenty-two were successful. In model drawing, of seventeen who sat, ten were successful; and in geometry, of five who sat, four were successful.

The Dorchester School.—The results of the first examination of students belonging to this institution, which took place at the Town-hall in December last, simultaneously with the other schools in connexion with the South Kensington Science and Art Department, have just been received by the hon. secretary, the Rev. B. L. Watson. Out of the forty candidates who entered for competition, nineteen have fulfilled the Government requirements in freehand drawing, and are entitled to receive certificates of merit. Of this number the specimens sent up by six of the pupils have been pronounced "excellent," or above par, which entitles the competitors to receive the awards offered in addition to the certificates. In geometrical drawing two have passed, and one in perspective, whilst in drawing from the model five have passed, one of whom, in addition, earns an award. Amongst the successful candidates it is satisfactory to find there are four artisans. The progress which has been made in this first year of the school's existence may be judged from the fact that many who have passed the examination never had a lesson in drawing until they came under Mr. Dewar Campbell's able instruction. At present the pupils are engaged in competing for local prizes, given for painting in water-colours and crayons, for pencil outline and mechanical drawing with instruments; and the prizes and certificates which have been won in connexion with the late general examinations will be distributed at a public meeting, which it is proposed to hold when the school re-opens after the vacation. There is still a deficiency of about 40l. in the amount originally proposed for carrying on the school.

The Oxford School.—The annual general meeting of this school was held in the school at the Randolph Galleries. The meeting was not very numerously attended. The report of the Managing Committee was laid before the meeting, and after some discussion it was adopted. Some of the classes have now as many pupils as can be conveniently accommodated. The committee hope to repeat the exhibition this year as soon after the long vacation as possible, when the results of this year's examination are made known. The balance-sheet presents the least satisfactory portion of the report; but it must be remembered that considerable expense was necessarily incurred in making the change of abode, and this at a time when the number of pupils and the sum paid in fees had from various causes sunk to a very low ebb. In the last quarter there were 197 pupils, and if this attendance can be kept up (and there is every reason to hope it will be increased), the fees paid, helped by a few subscriptions, will very soon be sufficient to clear off the debt.

AUSTRALIAN NEWS.

FROM MELBOURNE, VICTORIA.

The memorial stone of an asylum and school for the blind was laid in St. Kilda-road on the 25th of January. Messrs. Crouch & Wilson are the architects, and Mr. Thomas Newton the builder. The amount of the contract is 4,600l.; but, to complete the whole of the buildings according to the original design, the committee would have to enter into another contract to the extent of 1,500l., making the total cost of the buildings 6,100l. The edifice, which is already partly completed, is in the Italian style, and, when finished, will match with the Deaf and Dumb Asylum, Wesley College only being be-

tween the two institutions. The site comprises three acres granted by Government, and three-quarters of an acre adjoining, which the committee have purchased on account of its giving them a frontage to the St. Kilda-road. It was expected that the Duke of Edinburgh would have laid the memorial stone, but at the last moment it was discovered that he had not time to do so.

The centre of the building will be of three stories, with a tower in the middle rising to the height of 80 ft. The wings on each side of the centre will be two stories high. The frontage occupied will be 96 ft. The design on which it is being built was selected by the committee out of thirteen sent in for competition. The building will be capable of holding 100 pupils, besides furnishing quarters for the officers and teachers. In the centre portion in front will be the offices and committee-room, and behind these a large dining-room, workshops, &c. In each wing on the ground floor there is to be a school-room, 60 ft. long, 22 ft. wide, and 14 ft. high, one of which is intended for boys and the other for girls. The upper stories will be composed of dormitories for the boys and girls, lavatories, &c. The side wings can be extended 50 ft. on either side.

The City Council have adopted plans and specifications for the new cattle markets, and resolved to call for tenders for the execution of the works.

The city surveyor has been instructed to stop or remove all drains communicating with closets and cesspools and the public streets.

Messrs. Hughes & Simot are now erecting a new dock opposite the Australian Wharf. When the works are entirely completed, the dock will be capable of receiving the largest ship which can navigate the river. It will be 230 ft. in length, 44 ft. in width, and 12 ft. 6 in. in depth. When a vessel has been placed in the dock the caissons will be closed, and by a centrifugal pump the water will be pumped back into the river at the rate of between 5,000 and 6,000 gallons per minute. The pump is 20 in. in diameter, and is the largest of the kind ever erected in Australia. It is worked by a high-pressure horizontal engine, with a multitubular boiler.

We are glad to notice that the subject of preserving meat for export to England, of which we not long since spoke, is exciting attention at Melbourne, as well as Sydney. Papers on the subject have been read to an association in Melbourne, who are interesting themselves in the subject; and we observe that among samples of meat preserved in various forms exhibited at their meetings was spiced mutton, which we suggested while writing on the subject, and of which a committee of the association say it is "the safest and cheapest method of sending large quantities of mutton to Europe."

The influence of spices in preserving both animal and vegetable substances, is remarkable, and has not yet been thoroughly investigated. No doubt the ancient Egyptians well knew how to preserve their food as well as their mummies in a spicy form.

Within a day's journey of the metropolis of Victoria there grow the loftiest trees of Australia, and perhaps of the world. In the hick gullies of Dandenong, on the Black Spur, and near the sources of the La Trobe river, as well as in some of the remotest valleys of the Upper Yarra, a kind of eucalyptus, botanically known as *eucalyptus amygdalina*, attains such a marvellous height as to rival, at least in this respect, the Wellingtonia pines of California. The stems rise as straight as masts, but with a height far exceeding the masts of any naval structure. The height of the loftiest ranges from 400 to 500 ft. A fallen tree on the Black Spur measured 480 ft. in length. Another in Dandenong showed a height of 295 ft. to the first branch, the height then extending 70 ft. further in ramifications to the broken top branch, which here still measured 3 ft. across. A still larger tree at Berwick measured 81 ft. in circumference, at a distance of 4 ft. from the ground. The stems, with exception of the base, are beautifully smooth, and of an ashy colour. The wood is excellent for shingles, and splits with facility. Like many other eucalypti, this huge species grows with celerity, far more so than the Californian Wellingtonia, and the minute seeds germinate with the utmost facility. *Eucalyptus amygdalina* is restricted to Victoria, New South Wales, and Tasmania.

FROM LAUNCESTON, TASMANIA.

Although Tasmania, the old Van Diemen's Land, is divided from Australia by a strait of the sea, we may include it here under head of news from Australia.

The new Wesleyan church in Patterson-street, Launceston, of which the *Illustrated Australian News* gives an engraving, has been opened for worship. The site adjoins the old Centenary chapel. Messrs. Crouch & Wilson, of Melbourne, were the architects. The structure is of brick, on a stone foundation, measuring 52 ft. by 90 ft. within the walls, and is capable of seating over 700 persons. There is also a vestry and organ-loft at the rear, and a gallery capable of holding from 250 to 300 children across the front. Ample means of egress has been provided for the congregation by not less than six spacious doors. The lobbies and tower are all paved, and the floor of the church is laid with seasoned Tasmanian hardwood. The height of the walls at eaves is 21 ft. from the floor-line; the height of the mid-ceiling, 40 ft.; the height to the ridge being about 54 ft. from the ground. The roof is framed of Tasmanian blackwood. The covering of roofs is of slates with ornamental bands. The tower at the S. E. angle is 16 ft. square at base, 58 ft. high to the broach, and 132 ft. to the top of vane. The weatherings to buttresses, tracery, &c., of windows and other dressings are either of Hobart Town freestone or pressed cement.

The principal windows, front and rear, are fitted with stained glass, by Messrs. Ferguson & Urie, of Melbourne. It was intended to have framed the pulpit and seats of Tasmanian myrtle, a handsome wood taking a very high polish, but in consequence of difficulties Sydney cedar was used. The total cost of the whole works is nearly 7,000l.

FROM ADELAIDE, SOUTH AUSTRALIA.

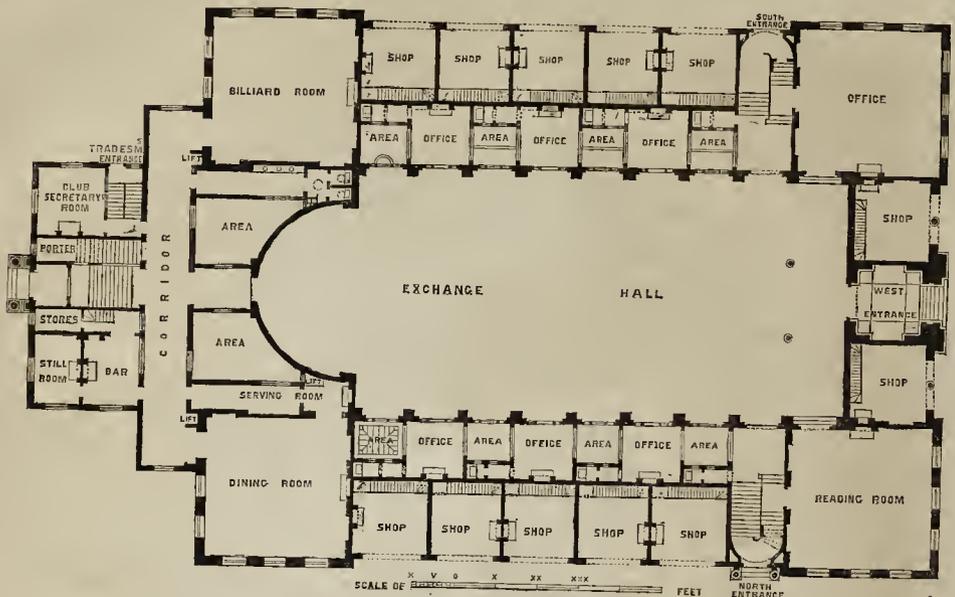

The new General Post-office walls are now some 4 ft. out of the ground, and the works are proceeding rapidly in the hands of the contractors, Messrs. Brown & Thompson. On the completion of the greater portion of the foundations, the superintendance of the works was transferred to the Public Works Office. A fulfilment of the original design was at the same time directed, the clerk's residence and the new telegraph office being left for a future period, and the whole building reduced in height. The Post-office will be one of the handsomest of the public buildings, and the stone-facing used is the finest yet quarried in South Australia. The foundation-stone of the Victoria Tower which forms the south-western corner of the structure was laid by the Duke of Edinburgh.

The new Local and Insolvent Courts, on the south side of Victoria-square are approaching completion, and the east-side fronts are now partially cleared of scaffolding. The style of the building is of Anglo-Italian character, and it has frontages both to Victoria-square and King William-street. The plans were prepared in the Colonial Architect's office, and the works have been so far carried out by Messrs. Brown & Thompson, of this city. The total cost will be about 13,600l.

The adjoining building—the new police-court and station—has been completed for some months, and is in daily use. The court-room is lofty, commodious, and of good acoustic properties. The adjoining offices for the commissioner and the inspector's residence, it is said, meet all that is required. The work has been carried out by Messrs. Crocker & Lawson, the contractors. The requisite cells, &c., have also been added, at a cost of between 700l. and 800l.

The only other Government building of any magnitude completed during the past year is the new Government printing-office, erected under the supervision of the Colonial Architect, Mr. R. G. Thomas. It fronts the road leading to North Adelaide and near the Parliament House. It is a large building of three floors, constructed of Glen Osmond stone, with dressings partly of freestone and partly of cement. The style is Romanesque, and the four elevations are of bold character, presenting a good appearance in the prominent position the structure occupies. The interior is simply a warehouse, and can be fitted up in any manner required for the use of the office. The building was carried out by Messrs. Brown & Thompson for 4,800l.

A new drill-shed and parade-ground have been constructed opposite the police-barracks at North-terrace. The drill-shed is constructed of galvanised iron, and was used temporarily

EXCHANGE AND CLUB BUILDINGS, MIDDLESBROUGH-ON-TEES.—Plan.

as stables for H.R.H. the Duke of Edinburgh's horses during his visit to this province.

The Exhibition building, on the park lands, was much enlarged and raised in height for the purpose of holding the Great Exhibition, opened by the Duke, and forms now about the largest room in the Australian colonies. The works of enlargement were planned and carried out in a month by Messrs. Brown & Thompson, under the direction of the officers of the Colonial Architect's department.

At the Lunatic Asylum the increase of inmates necessitated some additions, pending the completion of the new asylum. Extra men's and women's wards have accordingly been erected.

The east wing to the Adelaide Hospital has just been completed, being a counterpart to that on the west, containing four wards, two on the first and two on the second floor, with a large hall for convalescent patients, besides the requisite surgeons' rooms and other adjuncts. The contractor was Mr. McMullen.

During the past year there has been commenced and completed a building to be used for the purpose of Turkish baths. It is from designs by Mr. James Macgeorge, and is to form part of a general plan, by which it is intended eventually to do away with the old building, at the rear of which it has been erected. The walls are of Glen Osmond stone, blue-pointed, and the quoins and strings are in brick. The entrance door and coupled windows are arched in the Moorish style in ornamental brick, and this being supported by the style of internal decoration reminds the visitor of the Oriental derivation of the bath. The frigidarium, or cooling room, is 30 ft. long, 23 ft. wide, and 21 ft. high, from which there is an entrance to the lavatorium, also provided with a lobby and doors, to exclude draughts of cold air from the penetralia of the bath. This apartment is of the same loftiness as the frigidarium, 28 ft. long and 12 ft. wide, and next to it is the tepidarium, 25 ft. long and 16 ft. wide, adjoining which is the callidarium, the two latter being heated by means of a boiler. The floors of the hot rooms throughout are composed of cement trowelled smooth, and lined into ornamental patterns; the walls are also lined into diamonds, which it is intended to ornament with coloured stencilling, and the Moorish arch is used throughout for internal window and door openings. The builder is Mr. William Pink.

FROM SYDNEY, NEW SOUTH WALES.

Botany Bay was a fitting sphere for the atrocious Fenian who shot Prince Alfred in the back. When insane scoundrels had a penchant for firing at her Majesty, the passing of the Lash Law put a stop to it like magic. An immediate and liberal extension of this law to Fenians would, no doubt, have the same salutary influence as it has already had in that case and on garotters. Mr. Disraeli, inconsiderately we think, placed the Fenian Thugs on a level with the had eminence of the Vengerichters, but the insensate wretches called Fenians have not even the merit of murdering only those who oppose or punish them: the innocent, whether men, women, or children, are their victims, as those of the utterly insane so generally are.

The Sydney people, notwithstanding the few O'Farrells amongst them, were most loyal, and vied with the other Australian colonies in their triumphal arches and other modes of manifesting their good feeling. At the Prince's landing-place, near the Custom House, a triumphal arch was erected under the superintendence of the colonial architect. It consisted of one grand central opening of a depth of 30 ft., and 25 ft. wide, with wing openings 11 ft. wide, capped with three gold-painted domes on pediments, with crown pediments; the central dome rising 79 ft., and the wing domes 40 ft. each, with flagstaffs. The structure was ornamented in various ways, and the central dome, with 12 openings for illuminating the Prince's name, was surmounted by the Royal Standard.

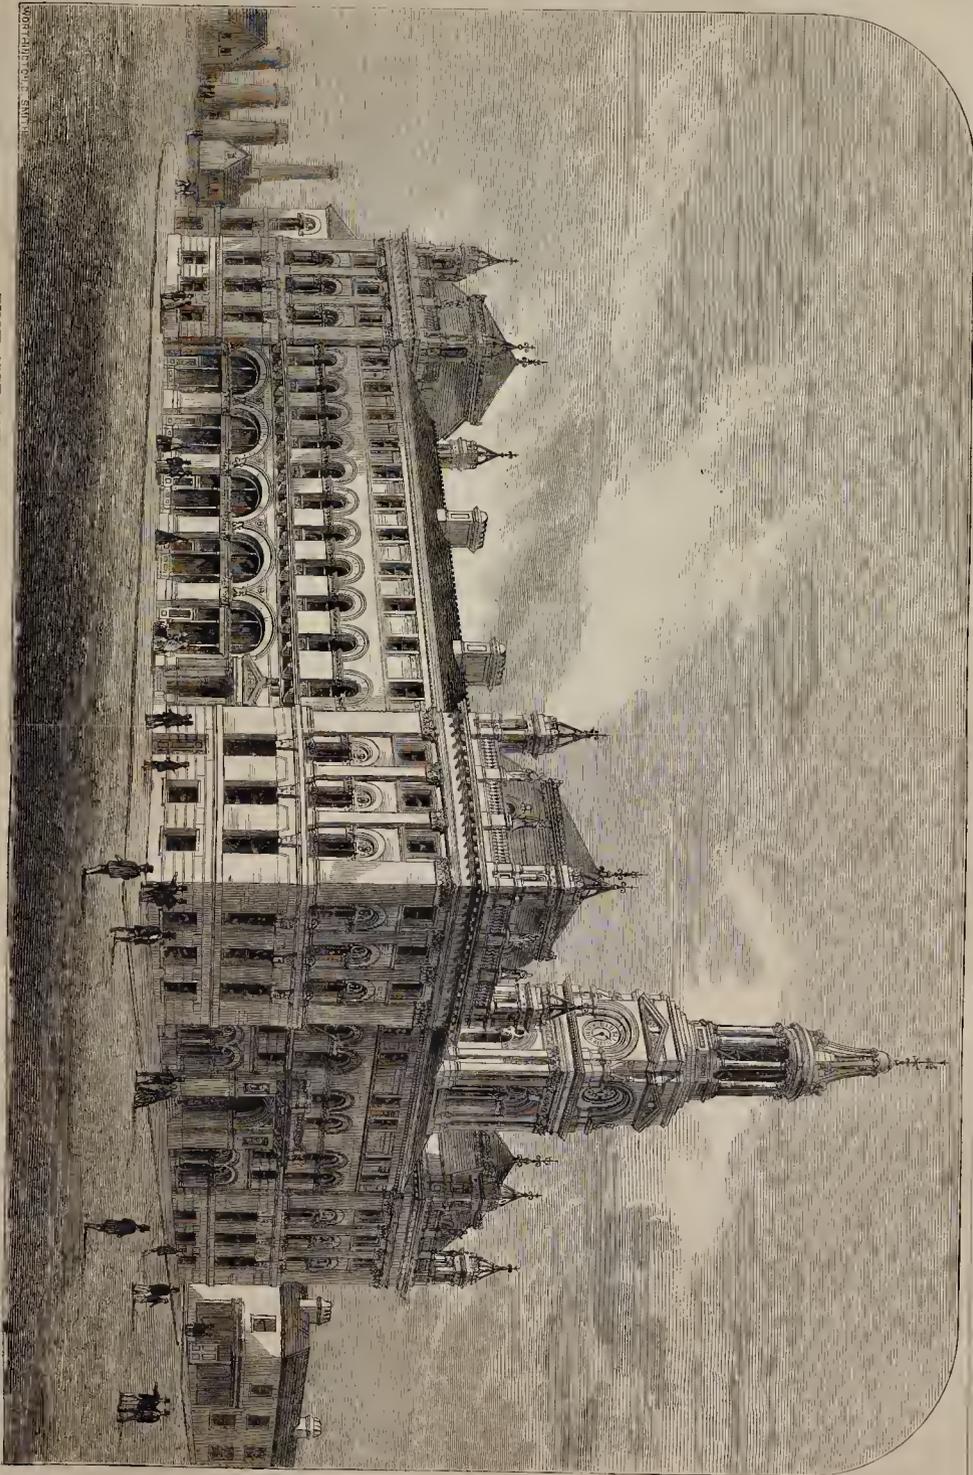

EXCHANGE AND CLUB BUILDINGS, MIDDLESBROUGH.

The new Exchange and Club Buildings at Middlesbrough-on-Tees, of which we give a view and plan, are now fast approaching completion. They are being erected by a limited company upon their freehold land. Mr. Charles J. Adams, of Stockton-on-Tees, is their architect, and Mr. Jones secretary. The site is close to the railway station, and is surrounded by streets. Designs for this building were sent in competition, January, 1865, and those now carried out were selected. The contract for the principal portion of the works was let to Mr. Bellerby, of York; the iron-work to Messrs. Head, Wrightson, & Co., South Stockton.

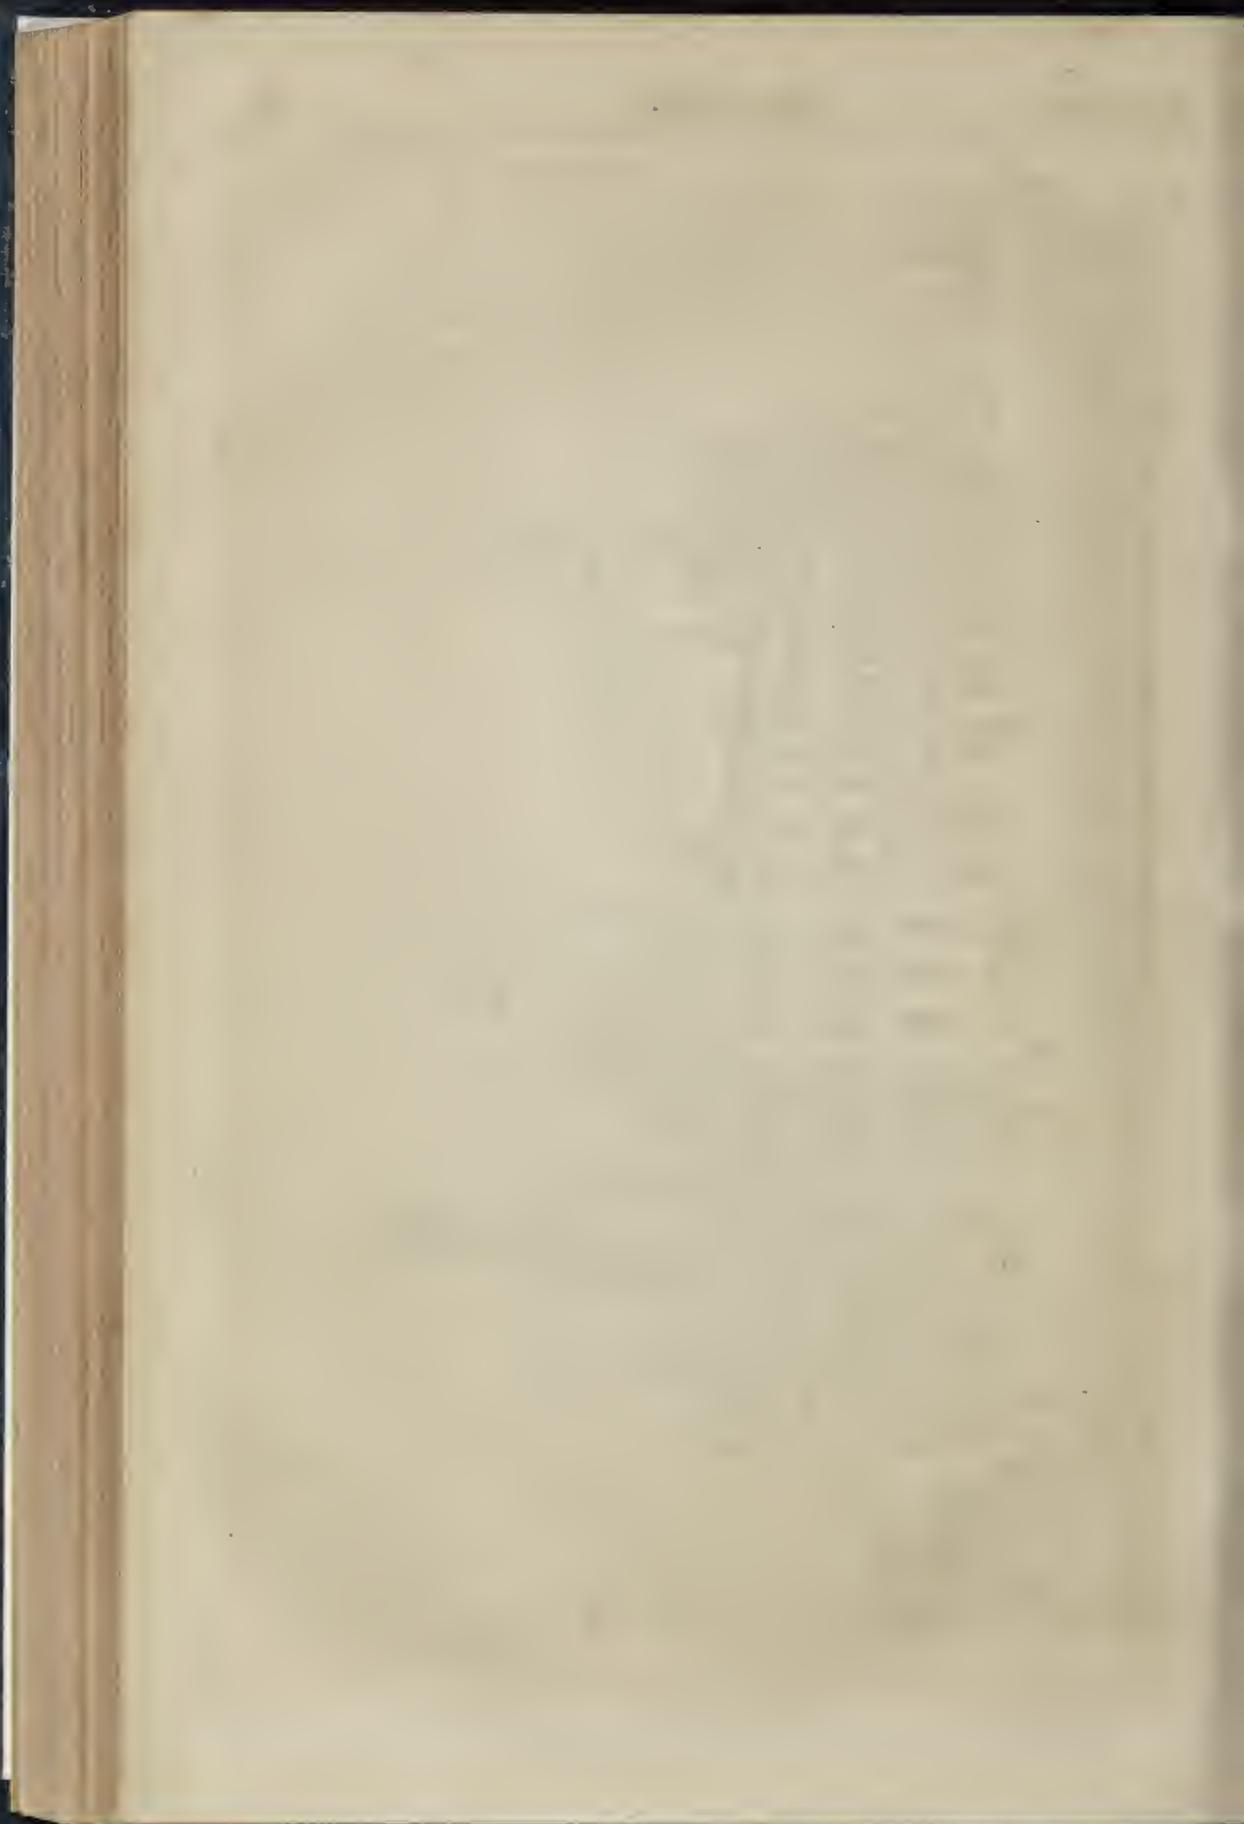

The general arrangement of the buildings comprises in the ground-floor, exchange-hall, about 120 ft. by 60 ft., with a semi-circular end, 20 ft. deep. The hall has offices on each side, and is approached by large entrances from the north and south fronts, and also by west front under tower. On the outside, towards the above street, shops have been constructed, with a mezzanine story above them, to be used as show-rooms. The club buildings are situated at the east end of the building, and comprise the rooms shown upon the plan. The first, second, and third stories are devoted to the purposes of the club. The upper stories over the shops all around the exchange-hall are planned out in offices; the whole of which have been for some time past let at high rentals. It is estimated that the cost of the works will amount to about 30,000l.

The several elevations are being executed in red pressed bricks, stone, and terra cotta, which is being manufactured by Messrs. Blanchard, of London. The buildings will be warmed and ventilated by Lewis & Adams's (air) patent. The carving is being executed by Mr. Borrowdale, of Darlington, under the architect's directions, Mr. Sturday acting as clerk of works. We shall give a view of the interior of the hall on another occasion.

The offices are almost exclusively taken by firms connected with the iron trade of the Cleveland district, and, with one or two exceptions, all the iron-making firms will be represented in the building. It is proposed to connect the Exchange with the several works by private telegraph lines. The iron trade of Cleveland has been vastly increased and developed during the last few years. Last year, 1867, the production of pig-iron was estimated at 1,147,000 tons; or more, we believe, than any iron-producing district in Great Britain. The district also contains extensive rolling-mills for rails, plates, shipbuilding and general merchant iron, foundries, engineering establishments, shipbuilding yards, hot and nat works; and is calculated to become, before long, one of the most important industrial centres in the country. Hence the necessity for such a building as the new Exchange is apparent, and it has been designed on a scale likely to prove suitable to the wants of the locality for a long time to come. The weekly iron market now held in the Middlesbrough town-hall, will be transferred to the Exchange when it is completed.

EXCHANGE AND CLUB BUILDINGS, MIDDLEBOROUGH-ON-TERRIS.—MR. CHARLES J. ADAMS, ARCHITECT.

MR. WHITWORTH'S SCHOLARSHIPS.

A PAPER has been issued containing documents additional to those already published respecting Mr. Whitworth's scholarships for promoting mechanical science. The first is a minute by the Committee of Council on Education, in which reference is made to a letter and memorandum from Mr. Whitworth. Their lordships state that they have great pleasure in acceding to the request made by Mr. Whitworth that the Science and Art Department may conduct the necessary examinations and correspondence. Their lordships will also give every assistance in their power to secure the success of the scheme which Mr. Whitworth supports with such patriotic munificence. The second and third documents are the letter and the memorandum referred to in the minute. There are two important paragraphs in the letter. The first suggests, for the consideration of the Committee of Council on Education, whether honours in the nature of degrees might not be conferred by some competent authority on successful students each year, thus creating a faculty of industry analogous to the existing faculties of Divinity, Law, and Medicine. Mr. Whitworth is of opinion that such honours would be a great incentive to exertion, and would tend in a considerable degree to promote the object he has in view. In the other paragraph referred to, the writer expresses a hope that the Government will provide the necessary funds for endowing a sufficient number of professors of mechanics throughout the United Kingdom. In the memorandum accompanying the letter Mr. Whitworth describes the general arrangements of the first competition for the scholarships, which he proposes should take place in May, 1869. These arrangements have been so devised that, while requiring a practical acquaintance with a few simple tools as a *sine qua non*, they shall render the competition accessible on perfectly equal terms to the student who combines some practice with his theory, and to the artisan who combines some theoretical knowledge with perfection of workmanship. As the scholarships scheme can only come into full operation by degrees, Mr. Whitworth proposes to create at once, from the fund ultimately available for the scheme, sixty exhibitions or premiums, of the value of 25*l.* each, tenable until April, 1869, and to place them at the absolute disposal of the governing bodies of several educational institutions and towns which he names, in order that they may award them to youths under twenty-two years of age, who may be thus aided to qualify themselves, and must undertake to compete for the scholarships of 100*l.* in May, 1869.

Mr. H. Cole, we observe, has written to the local authorities of various towns, inclosing the minute of Council, and announcing the distribution of thirty scholarships at 100*l.* each, and sixty exhibitions of 25*l.* each, to the respective towns.

NORTHERN ARCHITECTURAL ASSOCIATION.

An ordinary meeting of the members of the Northern Architectural Association was held on Wednesday, the 13th inst., at the Old Castle, Newcastle, Mr. R. J. Johnson presiding. The chairman, Mr. T. Oliver, and Mr. F. Charlton, were appointed delegates to the Architectural Alliance Meeting, to be held in London on the 28th inst. Messrs. W. H. Hoskins, Darlington, J. B. Tilby, Sunderland, and George Connell, Newcastle, were elected associates. The secretary drew attention to the question of concrete houses, as a subject that was attracting attention, and a discussion ensued on the aesthetic and constructional qualities of concrete.

BRITISH ARCHAEOLOGICAL ASSOCIATION.

At the annual general meeting on Wednesday, May 13th, Lord Houghton, vice-president, in the chair, the annual report was read, together with the balance-sheet, by which it appeared that on December 31st, 1867, the balance in hand was 367*l.* 15*s.* 10*d.* after paying all liabilities. There were twenty-seven members elected within the year, and twenty had been lost by death and retirement. Of the former, Mr. Nathaniel Gould, F.S.A., was mentioned as having been one of the

original members, and whose loss was deplored by all.

An alteration in the bye-laws was recommended by the Council, and was adopted. Its effect is to place all past presidents *ex officio* in the list of vice-presidents.

The following were elected officers for the ensuing year:—

President: The Earl Bathurst. Vice-presidents: The Earl of Eillingham; Sir J. Gardner Wilkinson, D.C.L., F.R.S.; H. Syer Cuming, F.S.A. Scotland; John Evans, F.R.S., F.S.A.; George Godwin, F.R.S., F.S.A.; Joseph Mayer, F.S.A.; J. R. Planché, *Somerset Herald*; Rev. Prebendary Scarth, M.A.; Rev. W. S. Simpson, M.A.; F.S.A.; Thomas Wright, M.A., F.S.A. Treasurer; Gordon M. Hills. Secretaries: E. Leven, M.A., F.S.A.; E. Roberts, F.S.A. Secretary for Foreign Correspondence: Thomas Wright, M.A., F.S.A. Palmographer; Clarence Hopper. Curator and Librarian: George R. Wright, F.S.A. Draughtsman: G. F. Teniswood. Council: G. G. Adams; G. Ads; W. E. Allen; T. Blashill; H. H. Burrell, F.S.A.; Josiah Cato; J. Copland, M.D., F.R.S.; A. Goldsmid, F.S.A.; J. W. Grover; J. G. Halliwell, F.R.S., F.S.A.; H. P. Holt; G. V. Irving, F.S.A. Scotland; W. C. Marshall, R.A.; Rev. S. M. Mayhew, F.S.A.; R. N. Phillips, F.S.A.; J. W. Previtte; Cecil Brent, F.S.A. Auditors: C. H. Luxmore, F.S.A.; George Patrick.

The Congress is fixed for the first week in August, at Cirencester. Thanks having been given to the officers of the past year, and to the chairman for his conduct in the chair, the meeting adjourned.

MANCHESTER ARCHITECTURAL ASSOCIATION.

The concluding meeting of the session was held on Tuesday evening, May 5th, when the following gentlemen were elected office-bearers for the ensuing year:—

President, Mr. Isaac Blackwell; Vice-President, Charles Clay, M.D.; Hon. Secretary, Alfred Darbyshire; Council, Messrs. Booth, Redford, Battyne, and Ward.

The following gentlemen were elected delegates to the forthcoming Alliance meeting:—

Mr. Booth, Mr. Darbyshire, and Mr. Alley, jun.

A paper, entitled "A Walk through the City of Glasgow," was read by Mr. P. B. Alley, jun., illustrated by numerous sketches. A conversation ensued.

ELY CATHEDRAL.

At a recent meeting of the Cambridge Architectural Society, a communication was read from the Dean of Ely on the "repairs now in progress to the buttresses on the south side of the choir at the cathedral."

About two years ago, his lordship said, cracks were observed in the groining of the choir, and careful examination was made by Mr. Scott and his assistant, Mr. Burlison, as to the cause of the same. The result showed conclusively that the defect was at the foundation, and that some slight settlement of the buttresses had manifested itself in the manner described. It has accordingly been resolved by the Dean and Chapter to make the whole system of buttress support from foundation to roof sound if possible. This involves necessarily two works, first, the underpinning of the buttresses at the foundation; secondly, the restoration of the flying buttresses above, some of which are crippled. We began by an elaborate shoring of the buttresses which most in fault. On examining the foundation we found the wall very defective. The buttress rested indeed upon the solid rock, which was right; but the masonry, if masonry it can be called, between the rock and the ground level, was of the most unsatisfactory kind, consisting of little more than rubble with not very good cement mixed up with it. We have cleared away all the old weak foundation, and have replaced it with large slabs of Yorkshire stone, which take a wider footing upon the rock, and are also incapable of crushing or giving. The first of these operations is nearly accomplished; I mean that one buttress is nearly underpinned. Our next step will be to rebuild the flying buttresses which, as I have stated, are crippled. I think we shall probably introduce some iron ties, and make some other minor improvements. The buttresses of the Early English portion of the choir have evidently been troublesome for centuries. The architect has not made them quite so wide as was desirable, and as I now find he was not sufficiently careful about the strength of his foundations. Alan de Walsingham managed his work better,

and there is no appearance of weakness in his work. The reason why the cracks manifested themselves at the time at which they did so appears to me to be found in the fact of an exceptionally dry summer, which had probably had an injurious effect upon the imperfect foundations of the buttresses.

THE ARCHITECTURAL RELICS OF INDIA.

It has been resolved by the Government of India to require the insertion, in every annual Administration Report, of a separate chapter on the Archaeology of India, under which heading the local Governments and Administration are requested to notice the condition of works of art. Petty repairs and measures for the preservation of structures are also to be dealt with by the local Governments; operations on any large scale to be referred for consideration to the Department of Public Works. Casts and photographs of the most important works of ancient architecture in India are to be taken. Men are to be instructed in the art, or modellers engaged. They will take complete sets of models of large buildings. A party of ten or twelve, for example, may be employed upon such a building as the Sanchi Tope, to make casts of all that it may be deemed desirable to reproduce. Each party will be placed under the immediate superintendence of some intelligent subordinate of the Public Works Department, to be resident on the spot, and seeing to the carrying out of the orders of the superintending officer. The moulds or casts will be transmitted to the headquarters of the general superintendant, and from these the requisite number of casts will be prepared and sent to Europe. The subordinate will also take accurate plans and measurements of buildings, and photographers will take views indicated by the superintending officers. Written descriptions will be obtained from competent persons for publication in England, with illustrations from the plans and photographs of details taken from the casts. One or two of such memoirs for each party during the year, it is thought, will suffice for the present. Four working parties will be appointed, one in Madras, one in Bombay, one for Lower Bengal and Behar, and another for the North-Western and Central Provinces, at a cost for all of Rs. 52,000 per annum.

It is suggested, according to the *Bombay Builder*, that the local Governments might allow the experiment to be carried on at first under the charge of the principals of the schools of art and design at the Presidencies. The name of Lieut. Cole, R.E., is suggested for the North-Western Provinces.

Gypsum or plaster of Paris is said to exist in various parts of India; so that it might not require, as heretofore, to be imported from Europe.

POLLUTION OF RIVERS COMMISSION.

The new Commissioners have met at Liverpool in the Council-chamber of the Town-hall, for the purpose of making arrangements for the preliminary inspection of the basin of the Mersey, which was broken off by the resignation of Mr. Rawlinson. The new commissioners are Sir William Denison, K.C.B., R.E.; Dr. Edward Frankland, F.R.S.; and Mr. John Chalmers Morton; Mr. S. J. Smith being their secretary. The mayor, several members of the council, the medical officer of health, and other officials were present.

Sir W. Denison stated briefly the course the commissioners intended to take. They would prefer, he said, to receive information in writing. They were too apt, if they began to examine a person, to cross-examine him with regard to their own opinions, and to try to draw from him admissions which would serve to support foregone conclusions in the minds of the commissioners. Therefore their object was to get as much written information as they could from persons who were qualified to give it; and then, when they had carefully collated it, they would come down again into the district and examine evidence with reference to those particular matters, and so they proposed to get as clear and definite opinions as possible, not only with reference to the causes of the impurities, but the best mode of getting rid of them and doing as little injury as possible to the industry of the

district, having regard to the character of the evils which arose from the pollution of the water. The new commissioners next inspected the Liverpool sewerage system; and next day, accompanied by the principal officials of the corporation, they inspected the eight sewer outlets into the Mersey. They also inspected the manure wharfs, and some of the most crowded and poorest districts of the town, paying special attention to the water-closet revolution in progress. The commissioners will resume their investigation on an early day. They made, meanwhile, a similar inspection of the sewerage system at Birkenhead. They will next visit Manchester, and then Warrington, and other places.

MONUMENTAL.

A FULL-LENGTH statue of the late Sir Peter Fairbairn, mayor of Leeds in 1857-8, and the father of the present mayor, has been displayed in that town. The statue, which was obtained by a voluntary subscription, is the work of Mr. Nohle, the sculptor. It has been erected on a suitable site in Caledonian-road, not very far from the Town-hall, in a westerly direction. The statue, which is in bronze, mounted on a polished granite pedestal, has cost 1,000l.

A wish having been expressed by several influential persons connected with the Ward of Bishopsgate that some permanent memorial should be raised in that locality to record the general respect and esteem for the late Alderman William Taylor Copeland, it has been suggested that the west window of St. Helen's Church, lately restored—to which the late alderman had recently contributed—should be filled with an appropriate subject in stained glass, to accord with the east window. A committee is being formed in order to take such steps as may be deemed advisable to carry the proposition into effect.

About a year ago the executive committee of the New York Shakspeare Monument Fund selected a design out of several models which had been submitted to them. It was then, however, in an unfinished condition, but is now completed. The statue of Shakspeare is expected to be finished and erected in Central Park (upon the foundation where its corner-stone was laid with appropriate ceremonies four years since), on the 23rd day of April, 1869, which will be the 305th anniversary of Shakspeare's birth.

VOTES IN SUPPLY FOR PUBLIC BUILDINGS.

UPON the vote of 25,000l. being taken for new wings to Burlington House, Mr. Monk asked if the blank wall in front was to be removed; but no direct reply appears to have been given to this question. Mr. C. Bentinck suggested that the architects should be requested to improve the plans for the new buildings, and that the gateway might be preserved and set up elsewhere. Mr. Cowper thought Burlington House should be superseded by a new building altogether, and Mr. Layard and others seemed to be much of the same opinion. Lord J. Manners said in reply that nothing was asked for alterations of Burlington House proper, and that the Royal Academy had already executed their part of the contract. The vote was agreed to.

On the vote of 22,000l. being taken towards the expense of erecting the building for the University of London, Mr. Layard asked if Vigo-street would be opened for carriage traffic, and Lord J. Manners replied that all street improvements had been handed over to the local authorities. Mr. Cowper said Vigo-street was so narrow that its opening was of small importance; and Lord J. Manners said access to the Royal Academy and the learned societies would be obtained from Piccadilly. The London University had made no application for additional means of access.

On the vote of 108,000l. for the purchase of a site for the new Courts of Justice, the Chancellor of the Exchequer said, in reply to questions, that the Treasury had had doubts whether the decision of the judges as to the design that should be selected was to be considered a final award, and the matter was referred to the Attorney-General, before whom all parties had power to appear. The Attorney-General had given his opinion within the last day or two, but he (the Chancellor of the Exchequer) had

not seen it. When it reached him it should be communicated to the House. As to whether a new story was to be added to Burlington House, Lord J. Manners said there had been no alterations in the plans exhibited last year, which included the erection of an additional story.

In a brief discussion previously to the House going into committee, Mr. Alderman Lawrence drew attention to the narrow and insufficient approaches to the site; and Mr. M. Chambers commented severely upon the treatment which the competing architects had received from the commission, and urged that the site was ill-chosen and too limited, and that the new building had better be erected on the Thames Embankment.

On the vote of 44,000l. for the site of the enlargement of the National Gallery, Lord J. Manners said, in reply to questions, that the ground for a portion of the site was not yet in the possession of the Government, and until it was it would not be advisable for the Government to hurry on the selection of an architect, especially after what occurred last year. Two years ago came to an untimely end, and in both cases the Government found themselves in a difficult position. He thought that he would best discharge his duty by giving no positive answer as to the intentions of the Government on the subject.

On the vote of 47,936l. for the new buildings in and about the Houses of Parliament, a desultory and grumbling discussion took place on various subjects connected with the Houses of Parliament, and Mr. B. Osborne said instead of Messrs. Pugin and Barry quarrelling over who was the real architect of the building, the wonder was they did not put the matter aside, or seek to throw upon the ancestor of each other the odium of having constructed a building in which there was not a single useful or comfortable room. The transfer of the stables of kings to Westminster Hall was disapproved of by Sir G. Bowyer as being out of place because they were dressed in the style of the George III. era, and not in the Gothic style; and Mr. Locke retorted that upon that principle the members were out of place till they also were dressed in the style of Richard II.'s reign.

On the vote of 25,000l. purchase of land for the New Palace at Westminster and the embankment of the Thames, Sir C. O'Loughlin said he hoped the noble lord would lose no time in securing the land, as it was at present covered with hay and straw yards, to the great danger (from fire) of the Houses of Parliament. Perhaps St. Margaret's Church, which interfered with the appearance of Westminster Abbey, might be removed there. Lord J. Manners said that a recommendation to that effect had been lodged with the commissioners. The votes were all agreed to.

LAMPLIGHTING BY CLOCKWORK.

AN ingenious apparatus for turning on and off the gas in street or other gas lamps was described by Mr. Stephen Tucker in a paper read at the Society of Arts on the 13th of May. On the various methods of lighting streets by gas, with proposals for the introduction of an improved system." The apparatus, said Mr. Tucker, aims at three objects of improvement—to abolish the genus lamplighter, to simultaneously light and extinguish the lamps, and to economise gas.

The Letters Patent (No. 2,435) of Mr. Walter Thurgar (who is not professionally connected with gas-engineering, but is a surgeon, at Norwich), sealed the 25th of February last, are for "Improvements in Apparatus for Regulating the Supply of Gas to Burners." The basis of this invention is the American clock. The central spindle of an eight-day clock revolves once an hour, and has two arms inserted to gear with 48 teeth on an independent plate, which therefore makes its revolution in 24 hours. Of these 48 teeth half are inserted on the upper and half on the under surface of the plate, and so have more liberty to hear upon the arms of the spindle. This independent plate has 96 cogs in its circumference, and its retrogression is thus prevented every quarter of an hour by a small spring-stop, to avoid strain on the mainspring. In this 96-cogged plate is inserted a spindle, connected with the outer or dial-plate, which has two arms, one fixed, one movable. This movable or adjusting arm is for regulating the

hour at which the gas should be lighted or put out, according to the time of year. The dial-plate, of course, revolves also once in twenty-four hours, and at the proper time the arm presses one side of the double cam fixed to the tap in the vertical gas-pipe. On each side of the tap, a small groove, through which, when the light is turned off, sufficient gas escapes to supply a small blue flame, which continues—though invisible—during the day-time. The cam being pressed turns the tap, and reduces the light to this blue flame; and on the other arm coming round and in contact with the cam, it lowers the guard, turns on the gas at full, and in effect lights the lamp. The guard (the sole object of which is to protect and hide the small daylight flame) has perforations for air at its bottom, and is connected by a tube with the plate on which the loops of the cam act.

One of these patent apparatus has been tried by Lord John Manners's orders in an outer passage of Somerset House; and another by order of the Master of the Mint, Professor Graham, over the porter's lodge at the Mint. These seem to have required amendment, as they were not strictly regular in the time of illumination. Some obvious objections to the practical and dependable use of the invention in street-lighting were started in the discussion which followed the reading of the paper.

"CURIOSITIES OF ART."

SIR,—If you wish another article on this subject, pray note No. 267 (in the Royal Academy Exhibition), "Mater Parisina," and 284, "Mater Dolorosa." The artist has represented them both of about the same age. Nearly twenty-seven years must have elapsed between the two events. They illustrate twenty-seven years from maturity,—make a woman, in Oriental countries, quite old,—indeed, as old as a woman in England would appear at sixty. C. H.

LECTURES ON SCIENCE AND INDUSTRY.

SIR,—The "Workmen's Technical Education Committee," appointed at a conference held at the rooms of the Society of Arts, under the presidency of the Earl of Lichfield, in March last, have made arrangements for the delivery of a course of popular lectures by eminent scientific men, for the purpose of illustrating the connection between progress in scientific knowledge and the prosperity of the national industry. The lectures will take place twice a-week, at the Mechanics' Institute in Southampton Buildings, and will commence with a lecture, on Tuesday evening next, by Professor R. Kerr, on "Technical Education for the Workman from an Architect's Point of View." Dr. W. B. Carpenter, Dr. Lankester, Professor Warrington Smyth, and the other eminent men secured, will give their valuable services gratuitously. There will be two courses of four lectures each; the charge for each course being sixpence, and for admission to a single lecture threepence. As we are most anxious that the London artisans should be made fully aware of these important series of lectures, we shall be greatly obliged by the insertion of this letter.

HODGSON PEARCE, Chairman.
THOMAS PATTERSON, Hon. Sec.

A QUESTION IN RESTORATION.

SIR,—Conservation in architecture is so thoroughly ignored in some instances, and in others carried to such a ridiculous extent, that I should like to elicit a decided expression of opinion upon one point, especially at the present time, for my own guidance; I hope, also, for the guidance of many others who are connected with church restorations.

I will premise that I am employed to restore a church, and that I find the north aisle a perfect specimen of Thirteenth-century Gothic, the windows being rich in geometrical tracery, and the hall tower used profusely as a decoration; but I find two exceptions, the centre and westernmost windows, which, although consisting of the original stones for the jambs and heads (curiously worked in), are Perpendicular, the old stones looking sadly out of place, the springing being

higher than the other windows, additional jamb-stones having been roughly worked, and the old arch stones looking most uncomfortable in their new four-centred resting-place. As these windows are in a tumble-down condition, am I to reproduce the tracery, as well as the jambs and arch, as I find them, copying each stone with its defective arc; or am I, after having reproduced the tracery, to inclose it in jambs and head of Perpendicular character; or am I to put two new windows, such as I have evidence to prove were similar to the rest?

What my own opinion may be is at the present time immaterial. I know two good authorities who differ, and can hardly hope, therefore, for a unanimous verdict; but, for the sake of the younger members of the profession, I dare hope that you may deem this question of sufficient importance for discussion in your valuable paper.

M. UNDERWOOD.

PLAGUE-STONES.—DERBY.

ACCORDING to "Hinton" the town of Derby fell under that severe calamity, the plague, in 1665.

"The town was forsaken; the farmers declared the Market-places; and grass grew upon the spot on which the necessities of life had been sold. To prevent a famine, the inhabitants erected, a little way out of the town, what bore the name of the *Headless Cross*, consisting of about four quadrangular steps, covered in the centre with one large stone; the whole near 5 ft. high.

Hither the market people, having their mouths primed with tobacco as a preservative, brought their provisions, stood at a distance from their property, and at a greater from the townspeople, with whom they were to traffic. The buyer was not suffered to touch any of the articles before purchase; but, when the agreement was finished, he took the goods, and deposited the money in a vessel filled with vinegar, set for that purpose. A confidence, raised by necessity, took place between buyer and seller, which never existed before or since; the first could not examine the value of his purchase, nor the second that of his money."

The Headless Cross has been placed in the Arboretum, and is in an excellent state of preservation.

JAS. J. ROBINSON.

ROYAL ACADEMY EXHIBITION.

SIR,—Would you allow me, while thanking you for your impartial criticism of my drawing at the Royal Academy, to explain that the peculiar form of the roof, of which you speak, arises from peculiar requirements of my client. I venture to ask this because I attach weight to your criticism, and desire to set myself right with your readers; and, doing so, an careless of the venomous remarks with which, for some cause unknown to me, some cowardly slanderer has continuously for years past endeavoured to injure my reputation in another journal.

FREDERICK WALLER.

THE THAMES EMBANKMENT AND THE BOYS.

SIR,—While there is much to admire and commend in the stone (granite) work of the new Thames Embankment, there is one point to which I could have wished some attention had been paid beyond what seems to have been given, viz., the avoidance, as far as could be, of such projections with that tops as give facilities for children to climb up to and rest upon or slide down by. I saw, a few days ago, on going from Westminster Bridge to Lambeth, at least twenty boys and girls climbing up by the moulding on the outside of the dado wall of the steps at Stangate, where the moulding has a flat surface of 4 in.; whereas a weathered top or upper surface would obviate this. I am quite aware the former is the more correct, as well as more elegant shape, but it leads to inconveniences. I saw the same trespass at the steps on the Westminster side, but the parties were less in number.

LONDONIENSIS.

THE TRADES MOVEMENT.

Bradford.—The operative painters some weeks ago struck work for an advance of wages—from 5½d. to 6d. per hour. The masters resisted the application on the ground that it was unreasonable; and the men, who alleged that an implied acquiescence had been previously made, offered to submit the matter to arbitration, but their employers refused. The different masters have now obtained a supply of hands from London. The men who struck work have, consequently, started an industrial society (limited), with, it is said, great promise of success.

Wolverhampton.—A general meeting of the operative carpenters and joiners has been held at the Noah's Ark Inn, for the discussion of several matters of importance relating to the trade, not the least of which was the consideration of the subject mooted by the umpire to the branch, Mr. Rupert Kettle, in the late conference

between the master builders and the men at the Town-hall, viz., setting apart a day on which to celebrate in each year the adoption of the principles of arbitration for settlement of all questions arising between the masters and the men. A unanimous and lively interest was evinced in the matter by the meeting. After much deliberation, the following resolution was adopted:—

"That this meeting of the Operative Carpenters' and Joiners' Branch of the Building Trade views with extreme gratification the existing cordiality between the members thereof and the leading master builders of Wolverhampton; and, in order to strengthen and confirm such compact, by drawing the several elements into closer communication, accepts with confidence the idea of the honoured and respected umpire to the trade, Rupert Kettle, esq., of a 'builders' day,' and that the workmen's arbitrators be appointed a committee to carry out the necessary arrangements in order to give due effect to the same."

The course pursued by the master builders in the late conference was very generally applauded.

A meeting of the operative painters has been held at the Noah's Ark Inn, to consider the desirability of placing the trade on a better footing than it now occupies in respect to the rest of the building trades. With little or no discussion it was resolved,—"That we solicit the masters for the sum of 1s. advance, and a reduction of two hours on the Saturday." It was afterwards determined that a circular was afterwards determined that a circular embodying the resolution should be sent to every employer, based upon a circular issued in May, 1865, when, the chairman remarked, the trade successfully obtained a rise of 2s. a week by one day's strike. The wages which the Wolverhampton painters now receive are 27s. a week. A committee of twelve, composed jointly of society and non-society men, was then formed, to represent the whole body in the negotiations with the masters.

Another Strike of Belgian Workmen.—The stokers of the iron company of Montigny-sur-Sambre, near Charleroi, have struck work in consequence of an intimation of lowering wages. The workmen were offered five francs per day instead of six. They declared they would not work. The next morning a placard posted on the walls of the establishment announced an increase of 5 per cent. on the sum proposed, but work has not been resumed. No disturbances have taken place.

PROVINCIAL NEWS.

Newcastle-upon-Tyne.—The "Bramell Wing" of the Ragged and Industrial Schools has been inaugurated by Sir W. Armstrong, K.C.B. The original building, which has been twice extended, was erected from the designs of the late Mr. Dobson; and the present extension has been designed and carried out by Mr. Thomas Oliver, at a cost of about 2,000l. Mr. Andrews was the clerk of the works; and Mr. W. Gibson, of the Red Barnes, was the sole contractor. The new wing consists of a commodious boys' school-room, with class-room, store-room, and work-rooms on the ground-floor, and a large boys' dormitory and reading-room above. In addition to these extensions, considerable alterations and additions have been made in the old buildings. The dining-room has been enlarged, and the two school-rooms for boys and girls have been thrown into one, to be used for a girls' school only. New class-rooms and lavatories for the girls are also provided. Alterations have been made in the administrative department, and a new sick-ward, with nurse's room adjoining, both of which are cut off from the main premises, and a separate staircase from the outside, have been provided. The new wing corresponds in its style of building with the existing premises. Every care has been taken to make it dry, warm, cleanly, and well-ventilated. The interior walls of the school-room, class-room, dormitory, and reading-rooms are built in the inside of buff-coloured glazed bricks, to a height of 5 ft. from the floor; and above this height they are faced with Parian cement. The ventilation is self-acting, with additional resources when required, and is designed on the "through and through" principle, with openings opposite; the windows also being arranged on the same plan. There is a large cubic quantity of air to each person, and abundance of light. The warming is by open fireplaces, which also assist in ventilating the rooms. New latrines are provided for the boys, and they are ventilated on the same principle as the rooms and dormitories. The increased accommodation which has been provided will admit between 50 and 60 inmates, and about 100 day-scholars in addition.

HER MAJESTY'S THEATRE.

THE foundation stone of her Majesty's Theatre was discovered on Wednesday last, whilst removing the foundations. The stone was raised in the presence of Messrs. Lee & Pain, and in a cavity in the bed of the stone were found a guinea, date 1788; half-guinea, date 1789; a shilling, date 1787; a sixpence, date 1787; a fourpenny-piece, date 1786; a threepenny-piece, date 1772; a twopenny-piece, date 1786; and a silver penny-piece, date 1786.

The position of the stone was in the north wall of the box corridor, on the centre line of the auditorium, under the opening leading from the hall to the pit corridor, at a depth of 2 ft. 3 in. below the paving of the hall. The dimensions of the stone are 2 ft. 1 in. long, 1 ft. 1½ in. wide, and 1 ft. deep. The inscriptions on the stone are as follow:—On the top—"The first stone of this new theatre was laid on the 3rd of April, 1790, in the 30th year of the reign of King George III., by the Right Honourable John Hobart, Earl of Buckingham.—*Auctor pretiosa facit.*" On the front—"The King's Theatre, in the Haymarket, first built in 1703." At right end—"But unfortunately destroyed by fire on the 17th June, 1789." On the back—"Prevalabit justitia."

CHURCH-BUILDING NEWS.

Hollington.—The old church of Hollington, Sussex, having been found inadequate, a new church, to be dedicated to St. John, has been erected, and the edifice has been consecrated by the Bishop of Chichester. In style it is Early English, slightly departed from. There is an absence of ornamentation. The nave is fitted with stained deal open seats, and these will afford accommodation for nearly 500 persons. The church is built with arches in the north wall, so as to be readily capable of enlargement. The font is a present given by the architect of the church, Mr. E. W. Wyon, of London. Mr. Howell, of Hastings, has built the edifice. The cost of the work is said to be about 4,000l.

Gloucester.—The restoration of the tower of St. Michael's Church has been commenced. Mr. Clinterhuck is the contractor, and the present contract includes the renovation of the tower up to the string-course. For this portion of the restoration sufficient money has been promised, but further subscriptions will be needed to carry out the whole of the restoration as designed.

Church Stretton.—About twelve months since it was determined to thoroughly restore this old church, and to add a second transept aisle to the south, opening to the present south transept, as also to the nave by an arcade. It was at first determined to allow a gallery, erected by the late rector, the Rev. R. N. Fomberton, at the west end of the nave, to remain, but as the work progressed it became apparent that it would sadly mar the appearance of the roof, which is a specimen of Norman building, the other parts of the church being mostly Gothic. Mr. Pountney Smith is the architect, and Mr. Pugh, of Hungerford, is the contractor.

Wheatley.—The church here, which was built and consecrated in 1857, has, at an additional cost of 600l., been crowned by a spire.

Caldecote.—All Saints' Church has been consecrated. The plan consists of nave and chancel under one roof (covered with dark red tiles surmounted by a ridge of yellow), intercepted by transepts of slightly lower elevation. The separation of nave and chancel externally is effected by carrying up the wall of partition above the roof and making it support a large bell-cote, capped with stone and finished with a metal cross, pierced for two bells, from Taylor's foundry at Loughborough. The entrances are at the south-west and north-west, the porches being formed within the walls and furnished with double doors. The west end terminates in an apsidal baptistery of semicircular form, lighted by two small windows, painted by Heaton & Butler, of London, one from the contributions of the school children, the other given by the Misses Wilson. The interior length of nave, including the baptistery, is 78 ft., and of the chancel, 32 ft.; width of nave and chancel, 21 ft.; length through the transept, 53 ft.; height from floor to ridge of roof, 33 ft. The east wall is pierced with three round-headed lights, divided internally by stone shafts with carved capitals, surmounted by a circular light, a horizontal band of red, black, and white commencing from

the wall-plate and rising in an arch which spans the entire window. The temporary glazing is of green, yellow, and white. The transepts are lighted in a similar manner, two round-headed windows beneath a circular one. The west gable is also pierced with a round light. The nave-windows are single round-headed lights filled with glass of different tints, arranged in alternate sections of square and diamond panes. The nave and chancel walls, arches, and window-heads are relieved, both within and without, by lines and alternating courses of red, black, and white, the chamfered edges being formed of yellow notched bricks, from Stevenage. The open timber roof of the chancel, though of the same construction as in the nave, is distinguished from it by the addition of colour, the portion above the sanctuary being more elaborately decorated and further enriched with gilding. The chancel walls beneath the windows are plastered and covered with conventional flower-painting in chocolate. The chancel is divided from the nave by a low stone screen, surmounted by light ironwork. The style of the building is described as Pointed with Romanesque modifications, adopted on account of the material employed, which is white brick, with red and black for ornamental purposes. The combination of colour, without being obtrusive, imparts a general warmth throughout. The masonry was executed by Mr. Warren, and the woodwork by Mr. Bates, both of Stevenage; the ironwork by Mr. Shrivell, of London; and all the decoration by Messrs. Heaton & Butler. The contract with Mr. Warren was for 1,700*l.*, and the extra work, including the furniture and gifts, is estimated at 500*l.* The church is built for 275 adults, but admitted on the day of consecration 400 persons. The burial-ground was lowered and levelled almost entirely by the unpaid labour of the men of the hamlet. The architect was Mr. A. W. Blomfield, of London.

Dorking.—St. Martin's Church has been consecrated, on the completion of the chancel, which has been built to replace the old chancel, which, in the general rebuilding, commenced in 1835, and completed in 1837, was left at a level of 7 ft. below the height of the present structure. From this cause, and from the obstruction of the central tower, it was completely cut off from the nave, and was thereby rendered useless. The limited space under the tower has hitherto been used for chancel purposes, for which it was unfit, both from want of size and of light. This inconvenient state of things has now been remedied by the building of a spacious chancel, and by opening out larger arches on the east, west, and north sides of the tower, and giving greater space for the choir and the greatly enlarged organ, which stands in the north transept, having its front in the new north arch. The style chosen for the new work was influenced by that of the old, and is Late Decorative in character. The old east window furnished the type for the new windows generally. The walls are faced with snap flint work, the dressings being of Bath stone. The roof is covered with Westmoreland slates, and the parapets are of pierced work. The carving in the interior is the work of Mr. Nichols, of Lambeth. The chancel windows are filled with stained glass by Mr. Wallis, of Newcastle. The chief or east window represents, in the different compartments, Christ's entry into Jerusalem; the Agony in the Garden; Bearing the Cross; the Betrayal; scene before Pilate; St. John taking the Virgin home; the Resurrection; and the appearance to Mary in the Garden. The south and north chancel side windows contain figures of the twelve Apostles, and there are groups from the Acts as follows:—The election of Matthias, Pentecost, Peter's sermon on the Day of Pentecost, Peter baptising, Peter and John healing the lame man, Barnabas laying the price of his hand at the Apostles' feet, Peter and John delivered from prison, Peter and John before the council, Peter raising Dorcas, Peter's vision, Peter preaching to Cornelius, and the death of James. There are two other windows having special reference to St. Martin, in his military and priestly character. As a soldier, the representative tableaux of St. Martin are—Received as a catechumen; dreams of our Lord appearing to him; joined a cavalry regiment; his baptism; divides his cloak with a herger; offers to meet the enemy armed only with the cross. As a priest, we have where St. Hilary instructs him; converts his mother; elected Bishop of Tours, aged fifty-five; burns down pagan temples and sacred trees; celebrating the Mass; and his death at the age of eighty. The architect from whose

designs and under whose superintendence the additions to the church have been carried out is Mr. Henry Woodley, of Craffham, Guildford. Messrs. Wheeler Brothers, of Reading, are the contractors. There was no clerk of the works. The cost of the building is about 6,000*l.* The windows cost 700*l.* The organ has been restored and rebuilt by Messrs. Walker & Sons, of London, and the expense will be defrayed by subscription. The lamps, brass-work, chalice, candelabra, &c., are provided by Mr. Hardman, of Birmingham.

DISSENTING CHURCH-BUILDING NEWS.

Swindon.—The chief stone of Wesley Chapel has been laid at New Swindon, by Sir F. Lyett, ex-Sheriff of London and Middlesex. Mr. T. S. Lansdown, Swindon, prepared the plans of the building, which is based on the building known as the Barracks. The style of architecture is Decorated Gothic. The principal entrance is on the south side, through three doorways, which open into a vestibule 16 ft. by 13 ft., and on either side of this are two towers, which are 66 ft. in height, and containing the staircases leading to the galleries. The body of the chapel is 69 ft. 6 in. wide, by 88 ft. long. The whole of the seats will be of deal, light-stained and varnished. On the western side of the chapel there are two class-rooms, 19 ft. 6 in. by 19 ft. each; a deacons' vestry, 19 ft. 3 in. by 15 ft. 3 in.; also a kitchen, living-room, pantry, &c., for the chapel-keeper. The entrance in the High-street will remain unaltered, and will be used as one of the principal entrances to the chapel, as well as to reach the school, class-rooms, &c.; this will make eight places of ingress and egress, including the two staircases contained in the towers. The walls are lined with Bath stone on the inside. The height from floor to ceiling will be about 29 ft. Over the class-room is a school-room, 88 ft. 6 in. by 23 ft. 6 in., and about 18 ft. high. There is also one end gallery provided, which is reached by the staircases in the towers. The whole of the windows to the chapel will be remodelled, to give an ecclesiastical appearance. The present accommodation is for 1,062, and the building is so arranged that side galleries can be added when required, which will accommodate about 300 additional persons, making a total of 1,362. The whole building will be well lighted and ventilated. The works are carried out under the superintendence of the architect, and Mr. T. Barrett, of the same place, is the contractor.

Blyth.—The foundation-stone of a new chapel for the use of the Congregationalists of Blyth has been laid. The site is in Carlton-street. The drawings have been prepared by a member of the body, and are being carried out under the superintendence and personal inspection of Mr. James Darling and Mr. John Wood. The total cost of the building, including lighting, warming, and ventilation, but exclusive of ground, will be about 1,600*l.* The contractors for the work are: mason and joiner, Mr. James Nairn, of Blyth, with Mr. Wm. White as sub-contractor for joiner work; slaters' work, Messrs. Dawber & Son; ironfounders' work, Messrs. Walker & Emley, Newcastle; plumbers' work, Messrs. Henderson & Thompson, Blyth; plasterers' work, Mr. Joseph Elliott, North Shields; painters and glaziers' work, Messrs. T. A. Bowman & Son, Morpeth.

Books Received.

A Catalogue of the Books, Manuscripts, Works of Art, Antiquities, and Relics, illustrative of the Life and Works of Shakspeare, and of the History of Stratford-upon-Avon, which are preserved in the Shakspeare Library and Museum. London: printed for the Shakspeare Fund. 1858.

In the few years which have elapsed since the establishment of the Shakspeare Fund, three of the most important of the objects in view have been nearly completed, and amongst them the formation of the valuable library and museum. The permanency of this important collection has been carefully secured. The library and museum have been conveyed to the corporation of Stratford-upon-Avon upon trust. The catalogue has been compiled by Mr. Clarence Hopper. Presents to the museum and library are of course still acceptable, as well as subscriptions

to the fund. Mr. J. O. Halliwell, of Tregunter-road, London, receives these, and also makes purchases of suitable books, &c.

Every Man's Own Lawyer: a Handy-Book of the Principles of Law and Equity. By a Barrister. Sixth edition. London: Lockwood & Co.

It is said that the man who is his own lawyer has a fool for his client; but "Every Man's Own Lawyer" is not every man's own lawyer. This epitome of law and equity must be very useful to the public generally, and may save many a six-and-eightpence, for the price of one; for the price is, appropriately, 6s. 8d. This edition is not only revised, but supplemented by the substance of new Acts.

A Dictionary of Chemistry and the Allied Branches of other Sciences. By HENRY WATTS, B.A., F.R.S., F.C.S., editor of the *Journal of the Chemical Society*, assisted by eminent contributors. Part XLV. Water—Zymurgy (completion). London: Longmans, Green, Reader, & Dyer. 1868.

This valuable and standard work, in five volumes, is now completed. We have so often spoken of it while in course of issue that all we need at present do in the way of recommendation is to announce its completion. We may here, however, quote a brief passage from the concluding number as to a cement of zinc, an incidental glimpse of which, some time since, in course of chemical experiments for a purpose unconnected with cements, led us to think it would be preferable to that of magnesium, recommended by a French chemist, and of which we lately gave some account, partly from experimental inquiry of our own:—

"When zinc-oxide is boiled with a strong solution of zinc-chloride in certain proportions, a plastic mass is obtained, which, after a while, becomes very hard, and may be used for taking casts. A cement, prepared by adding 3 pts. zinc-oxide and 1 pt. glass-powder to 50 pts. of a solution of zinc-chloride of specific gravity 1.6–1.8, with 1 pt. of borax dissolved in the smallest possible quantity of water, is much used in Paris for stopping teeth, and for making artificial teeth (Feichtinger, *Dingl. polyt. j. cl. 78*). An oxychloride of zinc, prepared by a similar process, may also be used as a paint for wood, paper, stone, or metal. It dries quickly, and is quite free from odour. (Sorel.)"

Nine years have elapsed since the Dictionary of Chemistry was begun. It has extended considerably beyond the limits originally contemplated; nevertheless, the limits has still been found too narrow for the treatment, as the editor would have wished, of many important subjects. Some of these, however, are so valuable that they have taken rank as classical treatises in their respective spheres; and, of course, such treatises greatly enhance the merits and the value of the work. So many changes and advances have been made in chemistry within the last nine years, that the editor has found a supplementary requisite to bring up many subjects to their most recent state of development; but this is unavoidable in the publication of any great work requiring time for its completion. The editor states, on the whole undertaking, that he has endeavoured to give some notice of every compound discovered up to the time of publication of each part of the work; and where full description was impossible, reference is given to original sources of information. The work is an important and valuable contribution to chemical science and the allied branches of other sciences of which it treats. The part now issued contains the title page, and an index and preface to the fifth volume.

A School Manual of Health. By EDWIN LANKESTER, M.D., F.R.S. London: Groombridge & Sons, Paternoster-row.

This is an excellent little treatise on the elementary principles of physiology. Its object is to supply the elder scholars in our national and other schools with an elementary treatise on those facts which must be known in order to secure health. It does not enter into minute details of the structure of the human body, but treats of such subjects as digestion and its organs, the nature of the food, and the elementary and organic constitution of the human body, the nature of the blood and its circulatory organs, the function of respiration, and so on, up to the cerebral functions, the two states of waking and sleep, and the spiritual nature of man.

We may quote from what Dr. Lankester says on the subject of respiration, to show how clearly and simply, yet scientifically, he inculcates the

great sanitary truths by whose guidance health may be assured:—

"In order that the function of respiration should be carried on properly, it is of the first importance that the air which is taken into the lungs should be pure. If there is a deficiency of oxygen in the air breathed by a human being, the result is the production of animal poisons, which do not take place, and a corruption of the blood ensues. The air breathed by human beings is constantly liable to a deficiency of oxygen, by its corruption during various causes of combustion. Thus, in a room lighted with gas, the gas will consume so large a quantity of oxygen as to diminish the supply for persons remaining in the room. One of the great drawbacks in the present civilization, is the practice of introducing gas into our sitting-rooms, bed-rooms, workshops, and factories, without making sufficient arrangements for the supply of the oxygen gas consumed by the lights. On the slightest of an ordinary kind consumes during burning as much oxygen as five human beings, and where no provision is made for a supply of fresh oxygen, the air is most injurious to health. In the same way a large number of human beings congregated in a small room, will consume the oxygen and render the air unfit for maintaining healthy life.

Not only do the combustion of gas and candles, and the respiration of human beings, consume the oxygen of the air, but they make it impure by giving off carbonic acid gas. This gas is given off from burning lamps, and from candles, and from the respiration of human beings. It is a most destructive gas. If a jar of carbonic acid is collected from the burning of lights or fires, or the breathing of animals, no light can be burned in it, no animal can live in it. When sent from the lungs of animals, it is instantly a part of it in the operation, and a natural ventilation is established; but when it is confined in rooms, it is breathed again and again, and the most disastrous effects follow. It is not only a poison to the blood, but it prevents those changes taking place which are necessary to health; and a variety of diseases are the result. One of the most common and obvious results of breathing an impure atmosphere is the production of the diseases known as scrofula and consumption. In those districts of London and other large towns of Great Britain and Ireland, where the greatest overcrowding takes place, scrofula and consumption are most prevalent. Not only are these diseases prevalent in such places, but persons exposed to the action of carbonic acid gas are much more liable to fevers and other diseases than those who breathe a pure supply of fresh air. Of so much importance is fresh air to the health of man, that the Government insists that in every family there should be at least a pint of fresh air for each individual.

But the most dangerous contamination of the air is that which arises from the diffusion of it of vegetable and animal poisons. When plants and animals are dying or dead they give off small particles, which, entering the human lungs, pass into the blood and produce disease. These particles though apparently dead, possess the power of producing in living particles the same decomposition as they undergo in themselves. It is thus that the particles rising into the air from drains and dead bodies, may produce in the living body the most fatal and destructive diseases. Many forms of fever are now known to arise from this source alone. Amongst others may be mentioned drain fever, which carries off from fifteen to twenty thousand human persons every year in Great Britain, and which is certainly dependent on the most offensive matter being taken into the human system and carried into the blood. The decaying matter of plants, such as their leaves and stems, in contact with water, gives forth an effluvia, known by the name of malarious, which produces the most violent and terrible fevers. The intermittent fever known by the name of ague is thus produced, and the malarious fevers of sub-tropical and tropical climates are produced in the same manner. The best remedy for these diseases is drainage, all putrefying plants and animals should be got rid of as far from near the houses of human beings. It is the duty of every person to see that all the refuse decomposing animal and vegetable matter is at once removed away, or placed at such a distance from the house that no human being can be injured by its presence. When the refuse is not removed, it should be covered up, and be perfectly covered. There are many things commonly sold in shops for this purpose; amongst them we may mention chloride of lime, carbolic acid, and the permanganate of potash and iodine.

But besides these poisoning particles which are given off from all dead and dying animal and vegetable bodies, there are certain special poisons, which are given off from every animal body which contaminate the air, and against which too active measures can hardly be taken. The human body is subject to certain diseases which, originating in the blood, produce particles in it which, given off from the body, are capable of producing the same disease. Such diseases are known by the name of small-pox, scarlet fever, measles, whooping cough, typhus and typhoid fevers, and cholera. When persons are attacked with these diseases, they are capable of giving off particles into the air which, when taken up by other bodies, will produce the same disease. By proper precautions all these diseases may be prevented from propagating themselves in other persons. With regard to small-pox, it is found that if persons are vaccinated, they are not capable of receiving the disease. Hence the duty of all parents to see that their children are vaccinated, in order to prevent their taking this terrible disease. It is certainly a misconception to suppose that vaccine matter by itself can introduce any other disease than cow-pox into the system. There are, however, a great number of persons who, without their 'catching diseases,' but everybody knows that by proper precaution they may be prevented, and it is now one of the first duties of human beings, one to the other, to take care by no means to let the poison of these diseases be conveyed from them to their neighbors. It is a common practice, much to be reprehended, to send children to school from families where small-pox, measles, or scarlet fever, or whooping cough are prevailing, thus spreading the poison amongst those who have not been previously attacked.

The air being thus easily contaminated and rendered impure, it is of the first importance that it should be secured to secure fresh air, free from carbonic acid gas and organic and poisonous impurities. In every house, sitting-room, bed-room, shop, workshop, school, or public building, the most liberal provision should be made for the free ingress and egress of fresh air from without, and the letting in of fresh air from without. This is done by what is called ventilation. There is a natural tendency of warm air to ascend, and advantage could be taken of this to have ventilators placed at the

top of the room or building, so that the warm impure air may escape. In cold weather fires ventilate rooms, by a current of warm air ascending the chimney, and the cold, fresh air rushes into the room to supply its place. In warm weather rooms should never be shut up. When there is no other means of ventilation, the top sash of the window should be let down, so as to allow of the escape of impure air. All houses should be constructed with holes and valves, to let the impure air of the rooms out into the chimneys or into the open air."

In this useful little manual of health sufficient is said of the structure of the human body to enable every reader to understand the operation of the great laws on which the health and life of human beings depend, and to show that these are God's laws, and that He will not suffer them to be broken with impunity.

Miscellanea.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—The third conversation of the season has been held at the gallery of the Society of British Artists, Mr. Solly, F.R.S., in the chair. After an introductory address, in which the chairman dwelt on the soothing influences of art upon all, and especially upon those engaged in science, musical performances commenced. The company was numerous, and presented a brilliant appearance; music, painting, sculpture,—the marble side by side with the life,—all combined to lend a charm to an entertainment as pleasant to the artist and amateur as encouraging to the higher branches of art.

THE METROPOLITAN DISTRICT RAILWAY AND THE THAMES EMBANKMENT.—At the last meeting of the Metropolitan Board of Works, the Works and General Purposes Committee presented a report on the proposals of the Metropolitan District Railway as to the construction of a solid embankment between the Temple and Blackfriars Bridge. A provisional agreement had been entered into for the construction of a solid embankment, with a 100 ft. roadway thereon, from the Temple Gardens to Blackfriars Bridge, and the company to construct their railway within the Embankment; the railway company to commence their works for the construction of the railway on the Embankment from Westminster Bridge to the Temple on the 1st of July next, and the other works to be carried on simultaneously with the works of the Board; the railway company to deposit 40,000l. on the 1st of July next; the payment of the 200,000l. to be paid to the Board to be spread over three years. The report was adopted.

HALF-TINTS IN PAINTING.—The great difficulty in shading is the management of the half-tints. Any one can make an extreme shade of black; and if the right feeling for half-tints and semitones is not a natural one—something analogous to that of a good ear for music—it can be to a great extent acquired, though in some cases it will demand a much greater amount of practical experience and observation than in others before they begin to perceive the many varieties of tone which are spread upon the surface of an object, especially if it be an irregular one. But when we have to add colour in connexion with light and shade, we go farther into a field of change and variety that is unbounded. And here is the test of the painter. It is the management of the minor tones which makes all the difference between a first-rate artist and a common country sign-painter. The latter may paint a red cow sufficiently well to answer the purpose of giving a title to the village ale-house. We will grant that he has the ability to make a tolerable representation of the animal in outline, but when he attempts to paint it he will do nothing more than fill up the outline with red, and darken the parts in shade with black, because he can see nothing further; but the eye of the true artist would seize upon the innumerable tints spread all over the surface—the various degrees of colour influenced by the position and strength of the light, some parts more brilliant, some more subdued, intermingled with greys of various hues in every portion—added to which are the reflections of colour and of light amongst the shadows, some warm, some cold: in short, to name all the changes and tones that would require his special attention can only be done by him who is able to paint them. Here, then, is the secret why one painter is greater than another; and their comparative excellence is determined by their ability to perceive and represent few or many of the infinite varieties of tones scattered over every object in nature.—Cassell's New Popular Educator.

VALUE OF HOUSE PROPERTY IN NEW YORK.—The rise in the value of real property in the metropolis of America is shown by the following from the *New York Times*:—"The south corner of Broadway and Bond-street has been valued within a life time at 10 dollars: it was sold once for 250 dollars, then offered for 500 dollars, then for 1,800 dollars, and in 1839 was again sold for 18,000 dollars. Recently a sewing-machine company offered 200,000 dollars for it, which being declined they have leased the premises for a long term, and are about to open "the most magnificent sewing-machine establishment in the world." During the past forty years the property has doubled in value every seven years. The whole of New York island was once sold for 10 dollars.

THE INSTITUTION OF CIVIL ENGINEERS.—At the closing business meeting for the present Session, held on Tuesday, the 19th instant, Mr. Charles Hinton Gregory, president, in the chair, nine candidates were balloted for and duly elected. The total number of elections during the Session 1867-68 has been 150, viz.: 45 members, and 105 associates. The register of the institution now contains the names of 16 honorary members, 641 members, 914 associates, and 123 students, in all 1694, as against 1419 of the various classes at the same date last year, including at that time, 20 honorary members, 591 members, 834 associates, and 4 graduates. The class of students has been created during the session just concluded, to take the place of the old Graduate Class, which is now abolished.

THE BISHOP OF LONDON'S CHURCH-BUILDING FUND.—The Bishop of London's proposal to raise a million sterling for church building and other ecclesiastical purposes is not likely, it is said, to be fully accomplished. Five of the ten years which were allowed for raising the fund have passed, and less than a third of the total amount has been contributed. A pastoral by the bishop has been read in all the churches of his diocese, calling for additional subscriptions, and stating the various objects on which the money received has been expended. The sum of 51,500l. has been given as stipends for 113 additional clergymen; 49,000l. have been voted towards building forty-seven new churches; 48,000l. for educational purposes; 54,000l. for church and school sites; and 35,000l. for objects specified by the donors.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.—The fifty-third anniversary of this charity was held on Saturday night, at the Freemasons' Tavern, Mr. John Duke Coleridge, M.P., in the chair. It appears from the report of the operations of the charity for the past year, that the total income was 1,656l., of which 966l. were subscribed at the last anniversary dinner. During the year seventy-six applicants were relieved with the sum of 1,317l. The charity is administered with so much economy that an average of the last six years shows an annual expenditure of not more than 134l. The losses sustained by so many persons in all classes of society by the financial panic of 1866 have for the present prevented the committee from taking any further steps to raise a special sum of money for the endowment of an artists' orphan home, and thus avail themselves of the liberal offer made to the institution in 1866. The company present was about 150 in number. Subscriptions to the amount of nearly 800l. were announced in the course of the evening.

ACCIDENT WITH AN ENCAVATING ENGINE AT KENSINGTON.—A serious accident has occurred at the Gloucester and Cromwell-roads cutting, Kensington, where an extension line of the Metropolitan Railway is in course of construction. It appears that a steam excavating engine, together with the necessary implements and tackle, were fixed at the mouth of a pit, and the process of delving and bringing up the soil to the surface was being carried on, when, from some cause or other, the engine, &c., with its weighty accompaniments, fell over into the pit. There were three men on the engine at the time of its fall, the engineer, the stoker, and an attendant (who were severely injured), and several labourers or miners were at work below. As the engine descended the shorings were torn away, and the whole mass of mould and debris fell to the bottom. Providentially, the men at work below received the alarm by the crashing of the timber shoring, the roaring and hissing of the steam and water, and the sudden blocking out of the light. They all escaped with the exception of one man.

ALARM OF FIRE AT BUCKINGHAM PALACE.—On Friday, in last week, shortly after the arrival of the Prince and Princess of Wales at the State ball given by command of the Queen, and whilst the company was still arriving, and the ball was about to commence, it was found that from the too great heat of the gas the glass of an illuminated window cracked and fell to the floor, and the flame of the gas had commenced to attack the wooden framework. Fortunately the contractor and two men were in attendance, and they at once ran to the main and turned the gas off. The people outside, however, fearing that the palace would be destroyed, had sent off for the engines of the Metropolitan Brigade, and in a very few minutes four or five land-steamers, with a number of manual machines, arrived at the entrance to the palace, but, of course, the services of the firemen were not required.

LIVERPOOL ARCHITECTURAL SOCIETY.—The annual meeting has been held at the Royal Institution, Mr. Kilpin in the chair. The following prizes for designs of churches were presented:—First, Mr. George Smith; and second, Mr. W. J. Casson. The first prize for figure-drawing was awarded to Mr. Thomas Medcalfe, and the second to Mr. H. H. Hermann. The statement of accounts showed that at the end of last year there was a balance in hand of upwards of 10*l.*, and there now remained a balance of 5*l.* 15*s.* 3*d.* The secretary read the report of the council, which showed that the society had continued to increase in numbers, which was a proof that its influence and status in the town had not diminished. On the motion of Mr. Boul, the report was adopted. Mr. J. P. Horner was unanimously elected president of the society for the ensuing year; and Messrs. Haigh and Vale were appointed vice-presidents. The other officers were appointed, after which it was agreed that the annual excursion of the Society should this year be to Gressford and Wrexham. The chairman then read an address, in the course of which he alluded to the importance which ought to be attached to the establishment of labourers' dwellings, and made a complaint as to Liverpool not having a fine-art exhibition, such as Edinburgh and Glasgow had.

THE KIRBY UNDERDALE TUMULUS.—During April the Rev. Canon Greenwell, of Durham, and several local archaeologists, have been engaged in the full examination of the large tumulus on Lord Halifax's estates on the Wold scarp, near Kirby Underdale. The results of the examination just closed are very curious. The mound was circular, but very flat, not being more than 3 ft. high, with a diameter of 94 ft. This was due to cultivation, however. The barrow was both British and Anglo-Saxon, one over the other. The inner British barrow was 70 ft. in diameter, and covered only one burnt interment in a central grave nearly 7 ft. deep. Except in the discovery of parts of a British drinking-cup, a green-stone axe, and a few flints near, on the east, there was no further trace of the Britons. Upon the British mound, however, the Anglo-Saxons had formed a large cemetery, depositing their bodies upon it in rows 3 ft. apart, and the bodies themselves also about 3 ft. apart. These rows all ran east and west, and the burial upon the surface was shown by the elevated heads on the east side, and the heads lowest on the west. The burials exceeded seventy in number. The great bulk of the burials were contracted, many of them very much so, resembling British interments, and in this disagreeing with the almost invariable mode of Anglo-Saxon interment at full length. An immense number of relics have been found with the seventy burials. Of these the chief are five iron swords, forty iron knives (various), some of which have been in contact with cloth, the impression remaining on the oxide; twelve iron spears for sharpening knives, some showing signs of much use; eight necklaces of glass and pot beads, two with gold pendants, one with silver pendants, and an ivory one set in silver; twenty bronze buckles, some of them gilt; thirty iron buckles, four bronze boxes (one full of thread of two kinds), a flint and steel, &c. The special peculiarities of this grand tumulus were—the contracted Anglo-Saxon burials, the absence of creosote fimbria and spears, the frequency of bronze boxes, no coffins, &c., and particularly the finding of skeletons of young men—the aged ones being invariably those of women. This is regarded as an indication of frequent wars having carried off the male population at an early age.

THE SEPTON PARK QUANTITIES.—The members of the Liverpool Town Council who took exception to the quantities taken out by Messrs. Andre & Hornblower, employed Messrs. Mills & Fletcher to check the quantities, and the result is a difference, on an amount of over 70,000*l.*, of only 1*l.* 3*s.* 5*d.* To Messrs. Andre & Hornblower's charge of 1,000*l.* for taking out the quantities, there have now been added 322*l.*, charged by Messrs. Mills & Fletcher for checking these quantities.

PROCESS FOR COVERING IRON AND STEEL WITH COPPER WITHOUT A BATTERY.—This process, due to Herr Graeger, is described in a recent number of Dr. Boettger's *PolYTECHNISCHES NOTIZBLATT*, according to the *Scientific Review* for May. The objects are first well cleaned, and then painted over with a solution of protochloride of tin, and immediately afterwards with an ammoniacal solution of sulphate of copper. The layer of copper thus produced adheres so firmly to the iron or steel that the different objects can be rubbed and polished with fine chalk without injuring the deposit. The tin solution is prepared with one part of crystallised chloride of tin, two parts of water, and two parts of hydrochloric acid; the copper solution with one part sulphate of copper, sixteen parts of water, and ammonia sufficient to re-dissolve the precipitate formed when it is added. Zinc and galvanised iron can be treated, according to Boettger, directly by the copper solution, without using the tin salt. The above process may be found useful by gilders, and for various ornamental purposes.

TENDERS.

For warehouse and stabling, Cross-street, Finsbury. Mr. H. J. Hammond, architect:—
Enor £3,453 0 0
Turner & Sons 3,411 0 0
Macey 3,384 0 0
Bishop 3,362 0 0
Eaton & Chapman 3,165 0 0
Henshaw 3,069 0 0

For dwelling-house, River, Kent, for Mr. Alfred Kingford, Mr. Rowland Rees, jun., architect:—
Fagg £2,283 0 0
Adecock 2,150 0 0
Turnbridge 1,965 0 0

For the erection of gate-ledge, on the Lincoln-road, for Mr. James Thorpe. Mr. Charles Baly, architect:—
Fretwell (accepted) £500 0 0

For the erection of cottage, near Malbushes, Newark, for Mr. William Gilstrap. Mr. Charles Baly, architect:—
Mackenzie & Fretwell (accepted) £204 0 0

For the erection of four warehouses, Monkwell-street, Wood-street, E.C. Mr. Herbert Ford, architect. Quantities supplied by Messrs. Hovenden & Heath:—
Stone Front.
Ashby & Son £10,655 0 0 475 0 0
Conder & Sons 10,632 0 0 75 0 0
Lawrence & Sons 10,532 0 0 150 0 0
Piper & Wheeler 10,500 0 0 70 0 0
Turner & Sons 10,470 0 0 98 0 0
Myer & Sons 10,443 0 0 85 0 0
King & Sons 10,369 0 0 36 0 0
Crabb & Vaughan 10,296 0 0 211 0 0
Mann 10,175 0 0 70 0 0
Pritchard 10,154 0 0 79 0 0
Henshaw 9,855 0 0 84 0 0
Brown & Robinson 9,879 0 0 98 0 0
Brass 9,747 0 0 84 0 0
Webb & Sons 9,684 0 0 69 0 0

For finishing two houses in Granada-road, Southsea. Mr. A. D. Dawney, architect:—
With Pointed Fronts. With Bay Gnt. buildings.
Ward & Son £472 0 0 4632 0 0 457 11 4
Buckhurst 455 0 0 579 0 0 50 0 0
Morey 445 0 0 583 0 0 49 10 0
Barbidge 390 0 0 500 0 0 48 10 0
Blackburn — 540 0 0 30 0 0
Bailey — 410 0 0 —

For new school-rooms, vestries, &c., Commercial-street Chapel, Northampton. Mr. T. Rygate Vernon, architect. Quantities supplied by Messrs. Mann & Sandlars:—
Berrill £1,359 0 0
Redshaw 1,394 0 0
Marsh 1,350 0 0
Watkins 1,200 0 0
Hall 1,129 0 0
Smith, Brothers 1,116 0 0
Clark & Heap 1,090 0 0
Conford & Esery (accepted) 1,080 0 0
Chappel 974 0 0

For the erection of five cottages, near the Cornwall-road, Hammersmith. Mr. John G. Hall, architect. Quantities not supplied:—
Beazley £1,100 0 0
Chamberlain, Bros. 1,965 0 0
J. & F. Bayliss 1,204 10 0

For alterations and repairs at the Prince of Brunswick Inn, Brunnschick-street, Deptford, for Mr. H. G. Stranger. Mr. D. Haydock, architect:—
Mills £246 0 0
Wilterton 545 0 0
Stone 522 0 0
Harrington 516 0 0
Languesd & Way (accepted) 493 0 0

For house and offices at Stoke Newington, for Mr. Gatliff. Messrs. Beck & Lee, architects:—
Woodward £3,007 0 0
Lewis 2,969 0 0
Colls & Son 2,900 0 0
Brown & Robinson 2,894 0 0
Ashby & Son 2,793 0 0
Webb & Sons 2,777 0 0
Colls & Son 2,773 0 0
Foster 2,670 0 0
Conder 2,573 0 0

For new assembly-rooms at Stoke Newington. Messrs. Beck & Lee, architects:—
Colls & Son £2,950 0 0
Woodward 2,739 0 0
Brown & Robinson 2,692 0 0
Hearle 2,637 0 0
Webb & Sons 2,666 0 0
Ashby & Son 2,654 0 0
Conder 2,472 0 0

For building five warehouses in Finsbury-street, E.C. Mr. Wimbie, architect:—
Perry £9,957 0 0
Patman 9,855 0 0
Kelly, Bros. 9,721 0 0
Hart 9,630 0 0
Keable 9,543 0 0
Wells 9,529 0 0
Newman & Mann 9,498 0 0
Gardner 9,469 0 0
Webb & Sons 9,468 0 0
Kilby 9,330 0 0
Abrahams 8,857 0 0
Scriven & White 8,810 0 0
Henshaw 8,660 0 0
Mortier 8,123 0 0

For erecting a Congregational church in the Brixton-road. Mr. J. Phelps, architect:—
Rider £11,670 0 0
Little 11,599 0 0
Downes 11,560 0 0
Webb & Sons 11,468 0 0
Nicholson 11,446 0 0
Brown & Robinson 11,150 0 0
Simpson 10,960 0 0
Gammon 10,877 0 0
Jackson & Shaw 10,850 0 0
Batman Co. 10,800 0 0
Adams 10,850 0 0
Brass 10,349 0 0
Higgs 10,365 0 0
Myers 10,342 0 0

For Kensington sewers. Mr. J. Broadbridge, surveyor:—
Lloyd £1,900 0 0
Crockett 1,817 0 0
Nicholson 1,820 0 0
Bloomfield 1,813 0 0
Goodair 1,802 0 0
Whittek 1,758 0 0
W. Moore (accepted) 1,693 0 0
W. Wright 1,630 0 0
Palmer 1,445 0 0
Lacey & Co. 1,350 0 0

For house at Bound's Green, for Mr. G. P. Francis. Mr. A. Rowland Bratton, architect:—
Messrs. Brown £1,110 0 0
Lizell 995 0 0
Manns, Stringer 965 0 0
Pocock 845 0 0
Survener & Co. 824 0 0

For residence at Shepherd's Bush, for Mr. T. Elborough. Mr. C. Bradley, architect:—
Haward, Brothers £2,215 0 0
Tubb 1,845 0 0
Longmire & Barge (accepted) 1,697 0 0

For alterations to two houses, Inlington, Liverpool, for Mr. John Stoward. Messrs. Pictou, Chambers, & Bradley, architects:—
Hinghes £810 0 0
Calle 508 0 0
Tomkinson (accepted) 490 0 0

For alterations and additions in forming shop and offices in Peasod-street, Windsor, for Mr. R. Little. Mr. W. Simm, architect:—
Atkins £313 10 0
Snowball 615 0 0
Reavell 611 0 0

THE PHYSICAL CONDITION of the LABOURING CLASSES. Resulting from the State of their Dwellings, and the Beneficial Effects of Sanitary Improvements adopted in England. Price 2s.
 Working Drawings, on a large scale, for Labourers' Cottages. Each Design, complete on one sheet, 3s.; Specification for ditto, 1s.; Bills of Quantities, 1s. 6d.
 Published at 51, St. Paul's Church-yard, by
THE GREAT PATENT BOOK OF ORNAMENT and DECORATION.
 By OWEN JONES.
 One Hundred and Twelve Plates.
 One Volume (imp. folio, extra) extra cloth, gilt edges.
 AGENTS WANTED.
 R. QUARTICH, 16, Piccadilly, London.

Now ready, price 1s.
RATING of RAILWAYS.
 By EDWARD RYDER, Surveyor.
 Being No. 1, of Cassell's Practical Reference Books, CASSELL, PETER, & GALPIN, Ludgate-hill, E.C.

SUFFOLK AGRICULTURAL ASSOCIATION.
PRIZE COTTAGE PLANS.—Copies containing Plans of 5 Cottages, with 4 drawings of each, and specifications, may be had on application to the Secretary, ROBERT BOND, 10 Queen-street, Norwich. Price, 4s. each. Free by post.

HAVRE EXHIBITION.—June 1st to October 31st.—A CONSULTING ENGINEER, going over for an English Company who are exhibitors, is now a desideratum for other responsible parties.—Address, HAVRE, care of Dorrell & Son, 15, Charing-cross, S.W.

PERSPECTIVES Drawn and Coloured
 By Mr. GEORGE PATRICKS,
 ARCHITECTURAL ARTIST,
 No. 3, Lansdown Cottage, Leamington-place, South Lambeth.

PLANS PREPARED, Specifications made
 and Quantities carefully Abstracted, Builders' Accounts adjusted, &c.—Address, SURVEYOR, No. 1, Victoria-ville, Albert-road, Croydon, S.

TO CAPITALISTS.—A BUILDER, in want of a good town, within 60 miles of London, is in want of a PARTNER, with about 5,000s. capital, to assist him in carrying on an successful country Building Business. The Partner is required in consequence of the Advertiser's father having retired from the business.—For particulars apply to Mr. HALTIEB, Architect, Southbury, Essex.

TO BUILDERS, DECORATORS, &c.
GILDERS, thoroughly experienced in House Work, may be OBTAINED at the House of Call, Marlborough-lane, Blenheim-steps, Oxford-street.—Address to the Secretary.

TO EMPLOYERS of CARVERS.—Information may be had regarding the trade by applying to the Secretary of the Wood Carvers' Society.—Address, WM. McCALL, 34, Shandon-street, Glasgow.

CORPORATION of FOLKESTONE.—The Corporation of the Borough of Folkestone give notice, that at their meeting to be held on WEDNESDAY, the 19th day of May, 1868, at the Town Hall, at SIX o'clock p.m. they will be prepared to appoint a duly qualified person to act as Local SURVEYOR for the Borough, his engagement to commence on the 1st July, 1868. Such officer will be required to act as "Local Surveyor" and "Inspector of Nuisances;" not to follow any business or other occupation, except account, but to devote his whole attention to the faithful discharge of the duties devolving upon him in his office; to perform all the duties appertaining to those offices under the Municipal Corporation Acts, the Public Health Act, and the several Acts incorporated therewith, and any by-laws, rules, or orders made therewith, and under any other Act or Acts in force within the Borough, and to obey all the orders of the Corporation in connection with or arising out of such several duties; to take the care and management of the Fire Engine and its appurtenances; to prepare all plans, specifications, and estimates; to know the value of labour and materials; to take the charge, superintendence, and management of the Public Lamps; to investigate and report as to the Cocks, Cakes, or Clodds brought into the Borough and liable to the Coal Duty; to prepare the accounts and certify the expenditures for all the Borough's moneys and all bills (that it will form part of the duties to pay the labourers or bills); to take the charge, superintendence, and management of all such works as are now or may hereafter come within the provisions and order of the Corporation, and to perform all duties adding out of such several duties and offices. The Office to be held during the pleasure of the Corporation. Salary 200l. per annum, payable quarterly. The Corporation will provide an Office with coal and gas, stationery, and other articles required for the performance of his duties, but any expenses which may require to be paid at his own expense, in equity to be given for performance of the duties—the Officer himself in 1867, and two surties in 1868, each. Applicants must forward their applications and testimonials addressed to him, at his Office, under seal and marked "Application for Office of Surveyor," at or before FIVE o'clock on THURSDAY, the 14th INSTANT, 1868, accompanied with a letter in their own handwriting, stating their age, and their present or latest employment, and containing the names and addresses of the proposer. The Corporation do not pledge themselves to make any appointment, if the qualifications of the applicants are not approved.—By order of the Corporation,
 RALPH THOMAS BROOKMAN, Town Clerk.
 Folkestone, 18th May, 1868.
 Note.—A person will be added to the salary for care and superintendence of the Town-hall and Offices.

CONSTANT EMPLOYMENT for a good GLAZIER and CUTTER. Good references indispensable.—WILLIAM N. FRODY, estate Merchant, Hammer-smith, London.

JUNIOR CLERK—WANTED, by the Advertiser, aged 19, a RIFTONIAN as above. Highest references.—Address, ALPHA, 11, Tower-road, Hammer-smith.

OXFORD LOCAL BOARD.—The Board at their meeting to be held at the Town-hall, in Oxford, on TUESDAY, the 9th day of JUNE next, at ELEVEN o'clock in the forenoon, will proceed to the APPOINTMENT of a SURVEYOR, who will also be the Inspector of Nuisances, in the room of Mr. J. Galpin, resigned. The Surveyor will have to provide, at his own expense, an assistant inspector subject to the approval of the Board, and such other sufficient staff as shall be required for the efficient performance of the two offices. The salary will be 300l. per. ann. viz. 200s. as surveyor and 100s. as inspector, and an allowance will be made of 50l. a year towards the rent of an office, which must be situate in some central part of the city, to be approved by the Board. The surveyor will be required to devote the whole of his time to the service of the Board, and to fulfil the duties of the two offices as set forth in the Bye-laws of the Board, and to enter into a written agreement that he will on no account whatever undertake any other work. He will also be subject to such further regulations as the Board may from time to time see fit to make. Applications in writing, with testimonials and references, are to be delivered (post-free) at the Office of the Clerk to the Board, No. 14, Slatk Street, Oxford, on or before WEDNESDAY, the 2nd day of JUNE next, enclosed in an Application to the Office of Surveyor.
 By order of the Board,
 FREDERICK J. MORRELL, Clerk to the Board.
 14, Slatk Street, Oxford, May 12, 1868.

REQUIRED, a FOREMAN of WORKS, thoroughly experienced, to go out to Shanghai, Wages 100l. per. month, plus 2s. 6d. per diem. Employment assumed for 2 or 3 years, with free passage out and home. Written applications, with testimonials of service and testimonials in question, to be forwarded to the Surveyor-General of Prisons, 45, Parliament-street, Westminster, S.W.

WANTED.—LIZARD SERPENTINE COMPANY (limited).—SECRETARY WANTED for the London Office. A knowledge of the English trade, and of the Architects and Builders in the metropolis indispensable.—Apply, by letter, with full particulars, and salary required, to the Directors, 24, St. James's-street.

WANTED, a THREE-BRANCH HAND.—Apply to T. BURGESS, 65, Tottenham-avenue, N.W.

TO CARVERS.
WANTED, a good FIGURE CARVER.—Address, R. O. P. Office of "The Builder."

The Builder.

VOL. XXVI.—No. 1321.

Woburn Abbey and Dunstable Church.

VERY Friday, thanks to the consideration of his Grace the Duke of Bedford, the public are admitted to Woburn Abbey, its pictures, its sculptures, and its gardens; and a great privilege this is, full of pleasure for those who know how to see. Dr. Waagen, in his "Treasures of Art in Great Britain," describes his visit to Woburn as "the most uncomfortable" of all that he had had in England, "the very respectable-looking, corpulent woman, who in her black silk gown came rustling in such state" to meet him, driving him on from room to room, and giving him no time to see anything properly, though he bore a letter to her from Dean Hunt. Things are differently managed there now, and the visitor will find the housekeeper intelligent and obliging. The number of fine portraits that are to be seen in England is certainly astounding; the three remarkable exhibitions that have been made in South Kensington are to be noted only as indicating that fact, not as having benefited the store. House after house may be visited in all parts of England full of portraits; some have never reached London; portraits, too, are pictures to be coveted irrespective of person represented. Of how many of the portraits that are being painted to-day will history say that? Hurry-scurry, slap-dash; sentiment, no finish; the head half painted, hands a blotch, and the costume nowhere: these are their characteristics. Some recent portraits at Woburn contrast but badly with the earlier works. We should be glad, for example, to see a better picture there of Earl Russell, our "Red John."

We are not proposing to write a guide to Woburn,—only a memorandum that may lead some of our readers to give themselves a day during the present bright weather. England had an exceptionally fine May, the May of the year. We cannot always speak by Milton

the flowing May, who from her green lap throws
The yellow cowslip and the pale primrose."

l the
"Queensly May,
Showering daisies on her way."

o can recollect of Mays that were brown,
not green; cold, and anything but flowery;
y the May of this year certainly the poets
been justified. Woburn may be reached in a
e of hours from London. The house was
in 1774, on the site of a Cistercian abbey,
ded in the twelfth century. It is a quad-
lar edifice, surrounding an open square,
a front "of the period," having an attached
ment and four three-quarter Ionic columns
a centre. Henry Holland, who designed
on House and old Drury-lane Theatre, was
chitect, if we recollect rightly. A marble

hust of him will be found amongst the sculpture here.

A very scholarly and well-written little "Guide to Woburn Abbey" (by J. D. Parry, M.A.) was published some thirty-six years ago, and now needs some revision to meet the alterations that have been made in the rooms. The writer of it, on entering the picture-gallery, with justice adapts Virgil's words:—

"Here those who suffer'd for their country's good;
Or blameless priests before the altar stood;
In ages past:—here souls whose mighty thrill
Glad Phœbus welcomed on the Acian hill:
Who life with various arts embellish'd then;
And those whose bounty fills the hearts of men."

Here they are set forth in their habits as they lived. After passing through the house, the large features that fix themselves most strongly on the mind are the Vandyckes, the room full of Canalettos (and such Canalettos!), and the collection of portraits of artists mostly painted by themselves.—Ruhens, Murillo, Titian, Rembrandt, Teniers, Tintoretto, Kneller, Paul Veronese, Sir Joshua Reynolds, and many others. A most charming specimen of Sir Joshua's art is that picture of Elizabeth Marchioness of Tavistock, mother of the late Duke, crowning a bust of Hymen with flowers, with a black servant in the background, said to be a portrait of Reynolds's own black page. The series of miniatures in enamel by Borel Rembrandt's "Rabbi," some of Lambert's little-known landscapes; a remarkable view of the Castle of St. Angelo, Rome, by Claude Lorraine; the foreshortened Ahel by Rubens; the "Captain-General of the Spanish Armada," attributed to Valasquez; and Sir Nicholas Bacon, by Zuccheri,—are amongst the other noteworthy items, together with some first-rate specimens of the work of Mytens, Cuyp, Cornelius Jansen, and Gavin Hamilton. Amongst the more modern works in the rooms, Eastlake's "Pilgrims coming in sight of Rome," a fine seapiece by Calcott; "The Crown offered to Lady Jane Grey," by Leslie; and a good likeness of the poet Rogers, by Hayter,—will be remembered. The pictures are in a capital state of preservation; indeed, some few of them of the Kneller and Lely period look very much as if in parts they had been cleaned with fresh paint! This should not be allowed.

We ought not to omit to say, in a notice of Woburn, however brief, that the rooms occupied by her Majesty the Queen and the late Prince Consort on the occasion of their visit to the Abbey in times gone by are maintained precisely in the state they then were. In another part of the Abbey we have the cane used by King Charles II. Posterity would be glad to find in the rooms to which we have referred some personal memento of the "Blameless Prince."

The gallery of marbles includes a number of remarkable antique reliefs and the celebrated Lanti vase, found in Adrian's villa at Tivoli, and purchased of the Lanti family, into whose possession it had come. This vase, of Parian marble, is 6 ft. 3 in. in diameter and 6 ft. in height. Another remarkable antique there, is a large sculptured marble sarcophagus, brought from the ruins of Ephesus, and sculptured with groups setting forth the death of Patroclus, the binding of Hector's body to the chariot of Achilles, and other cognate incidents. Saw in pieces, according to the story, it was built into the wall above the entrance-gates of the modern Ephesus, whence it was obtained, after some difficulties, by a determined Englishman. There is so striking a difference in the work of the two sides, and such discrepancy in the mouldings, that a critical examination is still needed. Near these very interesting remains is a fine mosaic pavement, formed out of the fragments of a larger one discovered in 1823 about a mile from Rome. The design includes a tiger chasing a bull, and some heads, probably intended for those of river

gods. A small draped head of a Roman lady, close to the border, is especially charming. This pavement was put together by the late Sir Richard Westmacott, who has left here many specimens of his tasteful skill. Thorwaldsen, Canova, and Flaxman are also well represented. We may not, however, stop to speak longer, and the gardens, the greenhouses, and the quaint Chinese dairy must be passed without a word. We have already said enough to show how much there is here to justify a visit. The town has also something to interest, if it be but in the fact that some hundreds of cottages of a superior kind have been built about it by the present and preceding Dukes. The aspect of it at night is especially picturesque. Wandering there in the moonlight, one feels the strength and the value of Night,—

"In her starry shade,
Of dim and solitary loveliness,
We learn the language of another world."

The silence, were it not for a nightingale, would be intense;—

"But she supplies the night with mournful strains,
And melancholy music fills the plains."

The market-house was rebuilt in 1830, under Mr. Edward Blore; so, too, was the church mainly.

A visitor to Woburn, making Leighton Buzzard (vice Leighton Beau Desert) his head quarters, would find many pleasant places about to occupy a second day. Leighton itself has an old church and old cross. Stewkley Church is a very interesting, unmix'd Norman building, with good west front of the usual kind. The tower was damaged with cement some years ago. More recently the interior has been repaired and set right with evident care and good feeling. In the chancel, which is vaulted and groined, some little more might have been done, the arch of the east window being much disrupted. In early times, before Britton or Rickman had begun to work, this was one of the churches always termed Saxon, but it does not present any difference from buildings in England known to belong to the Norman era. Wing Church has a Norman arcade, and a polygonal apse, with narrow pilasters on its outside, and is altogether a curious building, worth a visit. There is a large Corinthian monument here, with sarcophagus, in memory of Sir Robert Dormer, dated 1552, rather an early period for such work in England. The roof is flat, with carved figures at feet of principals, and there is a chancel screen. A brass, dated 1648, and inscribed to "Honest Old Thomas Cotes," is curious. Wing is one of the places said to have been forfeited by the Hampdens, in consequence of a blow received by the Black Prince at Great Hampden:—

"Tring, Wing, and Iringhoe,
Hamden did foregoe,
For striking of a blow."

Mentmore, the mansion built by Paxton for Baron Rothschild, and illustrated in these pages at the time, is close by; and so, too, is Eddlesborough Church, with its painted chancel-screen and lofty carved canopy over the pulpit. There is a handsome Decorated east window here, and the spandrels of the nave arcade are painted.

The most important architectural monument, however, to be found in the neighbourhood is Dunstable Priory Church, which has long been in a sad state of decay. Some years ago money was raised, and the south aisle, a fine piece of Norman work, was rebuilt. More recently it was found that the roof threatened a catastrophe, and that, unless efforts were made, the exterior would go to ruin. Subscriptions have been raised, and, under Mr. G. S. Clarke, the works are now being pushed on, but cannot be completed without further assistance. The west front of this church is remarkably picturesque and striking. The main entrance, interlaced arches, and other parts about it are Norman; the rest of the front is Early English, suggesting Salisbury and Wells.

The body of the church, apparently only the nave of the original structure, is Norman, of noble proportions, and much of this is now put into a sound and excellent state. In restoring the clerestory, Perpendicular arches have been placed within the Norman arches, and both being equally new and perfect, the conjunction is not agreeable. The wisdom or otherwise of this step depends on circumstances with which we are not fully acquainted. We find no fault, therefore, but point attention to the matter as one of those points in restoration that demand most careful consideration on the part of the architect before decision. An extension for chancel is needed towards the east, and the opportunity is afforded for making it, if sufficient money can be raised. The whole county ought to feel interested in the preservation of this most interesting structure, and give willing aid to the committee who have taken the matter in hand.

This Dunstable was probably the *Mogio Vinium* of the Romans, and certainly the *Dunstable* of the Saxons. Henry I. chartered it; he commenced the Priory Church in 1131; and it was dedicated in 1213 by Hugh, Bishop of Lincoln. It was in this church that Cranmer read the sentence of divorce against Queen Catherine. One of the earliest theatrical performances, "The Miracles of St. Katherine," took place in this town, in 1110. Kings and Queens have met in it, and great tournaments have been held here. Straw bonnets have kept its name before the world far and wide, and notwithstanding the shrinking of the female head-covering, and the adoption of silk, lace, a rose-leaf or a postage-stamp as the material, here and in many of the towns and villages around, few of the female part of the labouring population are to be seen without a mouthful of straws and their hands hard at work, plaiting.

Going as far to the north of Woburn as Dunstable is to the south, Olney, the home of the Poet Cowper, is found; where he kept his tame horses, and to which he refers so often in his letters. But we might run on and on, or right or left, never stopping for want of objects to interest; for all England is sprinkled over with instructive memories and beautiful memorials.

THE CENTENARY EXHIBITION OF THE ROYAL ACADEMY OF ARTS.

WITH more or less delicacy and accuracy of taste, more or less education in the practice or in the principles of art, or in such a command of technical language as reduces it to the level of slang, and more or less palpable or inexcusable bias, critics and correspondents of every calibre have opened fire upon the Exhibition of the Royal Academy for 1868. It is obviously easy to treat a collection of 1,200 pictures and sculptures in almost any style that may suit the temper of the writer or the taste of the public which he addresses. The old story of the handsome and the deformed leg can never be more applicable than in a case of the kind. In so large a number of new works of art it is almost certain that, wherever the exhibition might be held, the majority would be below mediocrity. Even in the case of great artists and of great works perfection is but rarely attained. Where perfection is absent there is always room for criticism; and not only so, but if actual perfection were attained it would infallibly be assailed by pseudo criticism.

While it is thus easy to increase the inharmonious Babel of sound that is now echoing from the daily and weekly press on the Exhibition of the current year, it may be more useful, as well as more agreeable, to point out some of those features as to which, we venture to think, educated students of art, unbiassed by prejudice or personal motive, cannot very widely differ. Whether the average merit of the Exhibition be higher or lower than in former years, there may be room for an honest difference of opinion. A reliable judgment on the subject can only be arrived at as the result of a careful criticism of every picture. Again, there are paintings in which there may at the same time be much to admire and much to condemn. There may be others which, whatever be their intrinsic merit, strike us chiefly as being either better or worse than was naturally to have been expected from their authors. On all three points there is room for a wide, and yet not uninformed, difference of taste, as well as for the expression of opinions which, if they are honestly formed, are dictated

by anything but cultivated connoisseurship. But there are some points on which agreement must be almost unanimous.

In the selection of his subject the artist, whether he be painter or poet, has to encounter his first and main difficulty. This is also the portion of his task to which, judging from results, he appears ordinarily to have paid the least attention,—to have arrived by haphazard. While a wide difference of style and of subject is open to the painter, there are certain limits which he can never overstep with impunity, but which we find him often overstepping in point of fact. The artist, or the portion of the public for whom the artist labours, may prefer this or that walk of art. He may be accrate, or even ennobling, as a portrait-painter; he may photograph nature with the happy pencil of Linnæus; he may portray domestic life with the painful fidelity of Faed's "Worn Out;" he may attempt historic composition, a style of work almost entirely absent from the walls of the Gallery on the present occasion; or he may take us into the regions of Fancy and of Romance, in which there is nothing to approach the heauty of the "Fairy Changeling" in last year's Exhibition; but, whatever be the power with which he can handle his brush in either of these great departments of his art, his success—his permanent success—will always be dependent on his adherence to certain great canons of his craft which he will not find inscribed on the tablets of the Academy.

Taking that department of painting in which photography, or the actual delineation of nature, has perhaps attained its greatest triumphs, and in which the artist has thus most closely contended with the mechanic, there are two or three pictures now before us which would do credit to any school of painting, at any era in the progress of art. Such is "Christmas Morning, 1866," No. 624, a sea piece, by Brett. It is hard to tell whether most to admire the judgment of the artist in the selection of his scene, or the perfect mastery of his craft by which the aspect of the moment is depicted. There may be many persons who do not much care for landscape, others who do not like sea pieces. Let such persons turn to subjects they prefer; but none the less may it be said without fear of contradiction that of its class this picture is a gem of the first water. A man may have been much at sea without having the opportunity to remark the peculiar swell, and, so to speak, texture, of the wave here seized and represented by the artist. Having once witnessed such a scene, he knows and admires the truth of the reproduction. It is not readily conceivable that, by any artist of any school or age, a real bit of marine scenery could be more faithfully and more successfully represented.

A contrast to the lurid stormy sky, and angry reflecting water of Mr. Brett, is the clear heat of the desert atmosphere given by Mr. Herbert in his "Valley of Moes" (No. 138). The purple shadows thrown on the ground by the advancing men and camels denote the early morning hour at which the landscape is delineated. The great heat of the day has not yet come on; but you see what it will be. The livid outlines of the distant mountains, fanciful as they may seem to those who have never drunk of the water of the Nile, or been wet by the salt spray of the Mediterranean, are such as are only defined by a sub-tropical sunlight. As you gaze quietly, with half-closed eyes, on the canvas, the stillness of the desert life comes upon you. These two pictures give us two aspects of Nature under her almost widely opposed conditions, and each is admirably in its way.

Another very remarkable picture, as to the merit of which there can be no question, is "The Calvary" No. 402, by E. J. Poynter. The red-hot iron head of the missile weapon is a perfect representation of the metal at the moment when the first scald that follows the removal from the furnace is just beginning to form. It is not an easy subject to paint. The success is perfect. The whole picture is full of antiquarian research, no less than of artistic merit; but we point rather to the feature which is unique, and which betrays the patient and careful attention which the artist has devoted to enable him to give the stamp and impress of truth to an imaginative work.

Very different in its mode of handling, but equally remarkable for its truth to nature, is the lantern in the "Pilgrims to St. Paul's" No. 356. The picture itself is a noble one, the expression of the two old shipmates of the great admiral is admirably conceived and adequately rendered.

The one seems to say,—"Ho is gone, his dust is here!" the other,—"All of Nelson cannot die, he yet lives." The gloom of the scene, the play of light on the faces, the general effect of the picture, all happily harmonize, but the flame of the candle, refracted through two of the glass plates of the lantern, inclined to one another, is what we have never before seen thus attempted in painting. Indistinct, it may be called, but you have to shade your eyes to be convinced that it is not actually dancing before you. You do not see the prim, decorous little pyramid of flame, with its black wick and its blue base, and its yellow top, but a confused, hazy, reduplicated image, which has no distinctness except the distinctness of reality. In the scene you trace the element of sentiment,—a sentiment that could not fail to touch the mind even if less artistically rendered. In the lantern there is nothing but a careful study, and scientific reproduction, of a very humble phenomenon. But it is one which more completely impresses on the imagination the idea of motion, and the reality of combustion, than any representation which we can call to mind. Millais has lighted his candle as Poynter has red-heated his iron.

It should be observed that the pictures of Mr. Millais are remarkably dependent not only on the light, but on the distance at which they must be viewed. When seen close they altogether lose their due effect. In the crowded rooms of the Academy this is a great misfortune to an exhibitor. If you attempt to view his productions from the only distance at which they are excellent, so many less careful observers come between you and the wall the you can only catch a glimpse of a portion at a time. Probably there is no artist who suffers so much from having his works exhibited under such circumstances as Mr. Millais.

The human interest which is excited by the reverent sorrow of the pilgrims to Nelson's tomb is turned in another direction by the charming scene of "Sterne and the French Innkeeper's Daughter" (No. 167), W. P. Frith, R.A. The pathos of the two faces is admirable. The half-veiling, half-teasing aspect of the unworshipful sentimentalist—the inquiry of "Have I gone too far, or shall I go on?" which is expressed in his face—the character of the mirth, curved and unknickered, not by the honest laugh of fun, or even the smile of sly badinage, but betraying a sense of impropriety that underlies the effort of wit—is admirably balanced by the patient, weary, enforced attention of his lovely listener,—the tacit rebuke of her countenance, before which the jibe of her tormentor would have shrivelled, had his delicacy been anything but the delicacy of self-love.

Another branch of imaginative portraiture given in the two companion pictures, the "Mater Purissima" and the "Mater Dolorosa," by J. Goodall, R.A. So lovely is the first, so delicate yet majestic in her loveliness, so appropriate the action by which she presses the offering to the Lord to her bosom, so dark is the depth of those eyes which kindled at the Ave of the Angel, that we cannot but regret that the artist should have given his time to the delineation of the companion picture. It is true that the "Mater Dolorosa" is, evidently, the work of a master, but it is, of intention, an unpleasant work. It is one of those subjects the delineation of which can only be excused by the presence of a strong religious sentiment, or rather sentimentality, for which, happily, the air of England is not healthy or encouraging. There are points of great excellence, no doubt, in the picture. The contrast of the hues of the dress and of the flesh, the disarrangement of the latter overlooked in the deep sorrow; even to somewhat too much advanced position of the wrung hands, demand a respectful verdict from the critic. But why present to us so lovely a face, marred and made unlovely by the passion of sorrow? Why spoil the portraiture of the calm and dreaming virgin mother, by teaching us that her beauty could be so withered and destroyed. It has been remarked, and justly, on these pages, that the difference of age between the two epochs selected by the painter has been lost sight of. Thirty-three years elapsed from the Easter of the Nativity to the Easter of the Crucifixion. If the tradition of the Roman Church be adopted so far as to fix the age of the Virgin at the earlier festival at fifteen (and the Mater Purissima must be three or four years older at least), the second scene must be represented by a person of nearly fifty, a period of life when, on the borders of the Mediterranean, a woman looks as old as at sixty-five or more

England. This simple reflexion shows that the artist has erred in attempting to contrast the two phases of one life. In seizing on what is painful, he has lost very much of what is dignified, and has entirely contradicted possibility. His power is so great, that it induces a wish that the second picture had not been exhibited.

If we pass from hagiology to mythology, it is impossible to repress the admiration excited by Leighton's "Nymph of the Shore" (No. 522). Not that this is a picture by any means beyond criticism; but it is one that charms, not as being faultless, but in spite of faults. It shows a great advance in the mastery of his art from the figure, "Unrobing for the Bath," of last year. It is a picture involving contradictions, which, like the charming inconsistencies of the feminine character itself, perhaps heighten our imaginative pleasure. Nude with a boldness rarely ventured on by the painter, it is pure and delicate. Carefully drawn, there is yet an angularity in the position of the hip that wars with the line of beauty. The landscape is the very shore of the Mediterranean, photographed in living colours; but it is enlivened or deformed by imaginary dolphins swimming as never fish—we beg pardon, dolphins are not fish, aquatic mammals—swam, and of the colour of a Rockingham toad. If they are put in for the purpose of heightening the ideal into the impossible, their presence may be accounted for, not justified—otherwise it is inexplicable in a picture which, with all its faults, refuses to depart from the memory, or to cease to delight the imagination.

The Ariadne is open to more discussion. Not in the whole, a pleasing picture, but chiefly so in the ground that death is not a germane subject for the pencil. Study, thought, art-imaginations, are all there. Had she only slept she would have been charming. Dead, there is much that grates on the feelings. Why will artists rush into that awful presence that dwarfs their genius and chills their hues?

Another presence,—not that of death, but of the Destroyer of death,—has been attempted with the invariable failure. In the "Disciples of Emmaus," No. 288, by C. W. Cope, the form and especially the face of Peter are very noble and appropriate. The figure of Peter's Master, modelled on a well-known Medieval model, suggests a rebuke to those who rush in with angels fear to tread,—the rebuke which, where rarely an exception, they have drawn down on their own heads.

There are some pictures which charm the observer rather by the ideas which they suggest to the mind than by the very high merit of their execution. They are the works of men who have taken at least the first step towards the highest excellence,—the selection and appreciation of pictorial incident. Such are the "Empty Sleeve," No. 657, by G. D. Leslie, A., the "Escape of the Countess of Morton to Paris with Henrietta, infant Daughter of Charles I.," E. Hicks, in which the patrician beauty of the countess, the struggle between her offended pride and delicacy and the exigency of the situation, the rude unchecked admiration of the soldiers, the angry glance of the disguised nobleman, the horror of the chaplain, and the unconscious occupation of the party at drill, all the story most forcibly and most happily. No. 672, "The Orphans of Charles I. at Rushbrooke," by J. Hayllar, is another of the same kind. A greater contrast between a sentiment that touches the heart with pathos, and that which only excites a repulsive feeling, is not readily to be found than between this fine group and the next one in the catalogue,—the "Queen Mary, after execution, cast on the ground before the empty throne. Under the C. Calderon." Pictures must be ranked those of passion which they leave on the mind, rather than for delicacy of touch or accuracy of finish, though considerable advance has been made in the artist in these respects. You cannot help hearing the hearty laugh of the lady who dandles the little baby which is to grow up into the "of the hoy's ride, and at the admirable way in which the jester paws in the character of a . . . You want the artist to explain that which he only suggests in "Whither?" But you wish to wish that Mr. Calderon, as well as Mr. . . . were less faithful to their models. To the same face so constantly reappear serious and wearisome. The arch look, the well-lined mouth, showing the shapely teeth, which comes out of all Calderon's pictures, is very

pleasing in itself; but when we see it year after year, in new dress and new scenery, we think that the artist limits his range in an extremely disadvantageous manner. The same may be said of most of the female faces of Millais. Rosalind and Celina, in drawing whom there is room for the most charming contrast, are the same person with different coloured hair. Even in "The Sisters" (No. 6), the same face, rather physiognomically than artistically admirable, again haunts us. If Raffaele had thus drawn all his virgins and saints from a single model, the world would have become extremely tired of the performance. The "Rosalind" is nevertheless a delightful work.

In speaking of truthful delineation of nature we must not omit to mention the "Chevy" of Sir E. Landseer (No. 347), which does everything but bark. In the "Rent Day in the Wilderness"—rather a straggling picture—the dogs are also quite alive. Sant has shown equal mastery of a nobler subject than the dog—his children are almost always charming. We also call attention to No. 188, "Custance sent adrift by the Constable of Alla," by P. F. Poole; No. 236, "Home News," by G. D. Leslie; No. 467, "Sion House, 1553," by Mrs. E. M. Ward; and No. 477, "In the Glen, Rathfarnham Park," a remarkable work by F. Walker, "A Fleet Wedding" (No. 269), by E. Crawford, Fritch's scene from "She Stoops to Conquer" (No. 340), Burgess's "Stolen by Gipsies" (No. 391), Hook's "Are Chimney-sweepers Bisk?" (No. 434), Hodgson's "Chinese Ladies looking at European Curiosities" (No. 453), Marks's "Experimental Gannery in the Middle Ages" (No. 494), Nicol's "Waiting at the Cross Roads" (No. 504), and the same artist's "China Merchant" (No. 531) are very lively and faithful pictures.

After, but not at a very great distance from, the sea swell of Brett, and the desert glow of Herbert, we may mention the "Corinth" of Mr. H. Johnson, in which the gleam of the distant sun on mountain peaks, seen between the columns of the fallen temple, is a real bit of Mediterranean landscape. Linnell's "English Woodlands" (No. 17), Cole's "Sunlight lingering on the Autumnal Woods" (No. 298), Redgrave's "Ancestral Woods" (No. 530), are beautiful bits of English scenery.

"Herod's Birthday Feast," No. 520, by E. Armitage, if not altogether a pleasing is a powerful and able work. The outline of the tyrant's face has probably been taken from the profiles of the Macedonian kings; the air of bloated and relaxed inebriation, though repulsive, is marvellously expressive. So is the eagerness with which every eye is turned upon Salome, evidently from the attitude of the spectators rather than from her own, at a critical moment of her display. The attention excited in the experienced tambourine-player is eminently suggestive of the skill of the dancer. The only two exceptions to the general inteness of gaze directed to the dance are to be found in the evil face of Herodias, who is watching not the performance, but the king, and in the superb contempt with which the fine old Jew behind the throne glances on the tipsy youth who shouts as he claps his hands. The brown complexion of Herodias, which has descended to her daughter, is hardly that of a woman who could have established such an empire over one of the hearty-loving Idumean kings of a land abounding in female beauty.

We have left till the last one of the most remarkable pictures in the exhibition as being one as to which, while criticism may have somewhat to condemn, taste finds much to admire. The wonderful exuberance of detail in "Madeline after Prayer," No. 685, by Maclell, diverts the eye from the beauty of the form and face of the girl herself. Why an artist should crowd his canvas with such innumerable items of millinery and upholstery, exquisitely as they are painted, is only explicable on the idea that he revels in his command of the brush. We have seen apartments nearly as crowded as is the scene in which the girl's bed is made, but it has been only in the houses of extremely wealthy Jews, where, with all that money can command, there usually lingers rather a strong flavour of the commercial genius. Such would not be the scene to tempt the visit of St. Agnes. With a modest protest, therefore, against the wealth of embellishment, first as inappropriate in idea, and then as calling the attention away from the principal figure, we cannot but speak in the highest terms of the finish of the whole painting, as well as of the beauty of the figure. If fair St. Agnes herself had sought a limner, she

could not have been more charmingly drawn. And again, when the eye has become so accustomed to the detail as to take in merely the rich colouring without glancing to the subordinate forms, the mode in which long acquaintance with the subject, no doubt, led the artist himself to regard it, the objection almost entirely disappears.

It cannot be fairly urged that an exhibition including such works as we have named, and many other lovely landscapes and agreeable domestic scenes, is altogether unworthy of marking the centenary of the Royal Academy.

TECHNICAL EDUCATION FOR THE WORKING MAN FROM AN ARCHITECT'S POINT OF VIEW.

UNDER this title the first of a series of lectures illustrative of the value of science to industry (to which reference was made in our last) was delivered by Professor Kerr, of King's College, on Tuesday evening last, in the London Mechanics' Institution, Southampton-buildings, Chancery-lane. The chair was occupied by Mr. Edward Hall, F.S.A.

Professor Kerr said that in standing up to address an assembly of working men on the question of their own education he felt that he was addressing those who were earnest in the cause, and who, without affectation, were bent on something practical; and that, therefore, he should best consult his feelings by proceeding at once to what he proposed to do. In the outset, he proposed to divide his lecture into three parts,—first, to endeavour to describe generally the nature and position of the present movement; secondly, to treat the movement from what he called the architect's point of view with reference to the working man, apart from the architect himself; and, thirdly, to take the architect's own point of view. First, then, with regard to the movement itself, as tending, in this country, in favour of technical education. In his opinion, the movement had its rise, primarily, in political changes in the past year. They had not met to talk politics; but, as a matter of fact, it was to be borne in mind that last year a very important change was made politically in the enfranchisement of the working-classes. This was effected in a very unusual manner in respect of the change in the position of political parties. It became necessary for the party who had been turned out of power to endeavour to regain power by some measure of public importance; and, as it seemed to him, that which was called a "cry" in such circumstances was found to be the question of education. But, as education had already been a cry for many years, it was thought desirable to import into it a little novelty; and, therefore, instead of "education" generally, it was "technical education" that was launched. They had been led to expect that a great deal of legislation would take place in the present session of Parliament respecting that class of men who had been suddenly elevated to political importance. The matter of technical education was taken up by the Government Department of Science and Art, generally identified with the museum at South Kensington, as regards its special function for technical education. Science and art, as a matter for Governmental action, was simply synonymous with technical education, the promotion of which was the very purpose for which the South Kensington Museum existed. The Society of Arts was appealed to, but that Society was now amongst our old-fashioned institutions. It was established originally for broad purposes—for the cultivation of science and art at large; but its original purpose was in a great measure gone, although it was still a very useful society, and, in a case of this kind the proper court to go to. The discussions which took place in the Society of Arts were characterised by a want of practical hearing on the subject in question. The class of persons most prominently represented on the occasion was, perhaps, politicians—noblemen and gentlemen of position, who were present to support the movement from their own point of view, which was a political point of view. They looked upon the people, not as a people to be educated, but as a people to be worked upon for political purposes—purposes, no doubt, entertained with the very best motives, but guided by a peculiar organisation of political life. Therefore, although there was a great deal of common sense in what the Society of Arts did, it failed exactly to hit the

mark. The working classes required that the question should be dealt with more earnestly and practically. Of those who attended the discussions, a portion also were philosophers, some of them men of great name, who made profound and eloquent speeches no doubt, but who were theorists. Their speeches ended in nothing. In the hard sense of practical life they had no proper bearing on the subject under discussion. Another class of persons who took up the subject were philanthropists. Human charity was not to be disparaged; but England had arrived at that stage in the existence of nations when philanthropy with a certain class of persons had become very much a matter of credit; and certainly, in the present instance, the speakers indulged only in vague declamation. Lastly, there was another class of persons who took up the question—those representing the manufacturing interest. Gentlemen had come from the Midland counties to represent the manufacturers of their several localities. They had a much more intelligible tale to tell, and they told it in plain language indeed. They looked upon themselves as employers of what was called labour. They had a variety of goods on hand for the market; they found that foreign dealers in labour were outbidding them in the quality and price of those goods; and, investigating the matter with the view of discovering the reason why they were thus being bid out of the market, they came to the conclusion that their work-tools, so to speak, were not good,—that the tools of the foreign workmen were better. They therefore appealed to somebody to find them better tools, better workmen, and a better class of foremen, who should be equally well qualified with those of their foreign competitors; and they said, "If you will supply us with these tools, then we will restore to England its supremacy in the market." The result was that, in answer to this appeal, only a very vague purpose was expressed,—a purpose of elevating, by some means not clearly defined, the educational character of the English workman generally; and, when it was considered how the funds were to be provided for these measures, the conclusion arrived at was, that these funds were to be provided out of the taxation of the country. The practical result of the conference of the Society of Arts was, that something was to be done which was called the education of the working classes technically, and that this was to be done at the public expense. A committee was appointed, and that committee was about to sit on the basis he had described. It had become obvious that the artisans themselves ought to take the matter into consideration. Seeing that their particular interests had not been fully represented in the discussions that had taken place on the subject, it was proposed that they should enter into discussions of their own. He felt bound to tell them that he had no great expectations of practical result from the discussions of the artisans themselves. Straightforward, honest speaking, he believed, was always the rule in the meetings of the artisan class, and therefore if he should speak at variance with his audience he had no doubt they would forgive him. He did not expect much practical result from the discussions of the workmen themselves on account of various circumstances; although at the same time he was decidedly inclined to support such discussion, believing as he did that it would be earnest and unaffected, and devoid of many distracting elements which were involved in the discussion by others; and if the discussions of the working classes had no direct practical effect, as regarded any public measure, they could do no harm. On the contrary, they must do a great deal of good in the way of prompting and inducements to individual exertion. What, then, was meant by the proposal for technical education? Primarily and properly, it signified that for vocations more or less learned a theoretical training in youth should be provided. However, at the present moment, popularly, the question took four forms, of which that was perhaps only one. First, there was the education afforded in science and art in the universities and public schools of the country. It was said that, although our higher classes were educated well in a particular way, they were not educated well in another particular way—that, whilst on the Continent science and art were included in the ordinary course of education for well-educated men, here, although not positively excluded, they were overlooked; and that therefore we were not on an equal footing with our

Continental rivals. There was a general demand for science and art in the Paris schools. There they said, "Let us not confine the education of the more humble classes to the three R's, good as these are in their way; but give us a little of scientific and artistic knowledge, so that even the common classes of the community may be possessed of that intelligence which arises from some acquaintance with these accomplishments." A third form of the proposed technical education was, that there should be a better training in England for professional men, and in this respect theoretical training was very much behind that on the Continent. Fourthly, and lastly, there was that particular form of technical education more immediately under consideration—technical education for the artisan. What, then, was this technical education for the artisan? It was that elementary education in youth which should be brought to bear upon the artisan's particular trade, so as to make him, intellectually and theoretically, more powerful and accomplished than he was at present. In this respect it was urged that on the Continent, as in France and Germany, the workman acquired a theoretical education, which was not afforded in England; and that if the English workman could be possessed of that theoretical knowledge which his foreign rivals enjoyed, more particularly in art-workmanship, then he would be able to compete with foreign workmen upon their own ground, continuing at the same time to excel on English ground in that peculiar instinct which the English workman possessed, and which the architect's point of view; and first, as to the architect's point of view, the present instance of the architect's point of view, the architect, as chief of the workmen, was not so liable, as in the case of other professions, to lose the sympathies of the class over which he was placed as director. There was something which always bound the architect and the workmen of that profession sincerely and honestly together. The position of the former was always recognised by those who were under him, and there were no disparaging interests between them. That was a very favourable condition of things for the architect in taking his particular point of view with regard to the education of the workman. The architect was better appreciated by the workman than he was by the member of Parliament. The discussions which took place in the House of Commons were very often considerably wide of the mark. Certain gentlemen seemed to make it a matter of great amusement, not only to disparage, but to ridicule the architect, whenever occasion offered; and, to believe those detractors, the architect in England was a mere ignoramus as compared with the foreign architect; whilst the buildings of the former were mere rubbish as compared with those of the latter. There was a reason for this antagonism among certain classes in the Legislature, as there was a reason for such antagonism in most other cases. The architect was possessed of a certain sentiment—sometimes amiable, sometimes not, but always a sentiment working out a very good purpose. There was also a good deal of amateurism; and therefore it was scarcely to be wondered at that the architect should present an object for disparagement to a certain class of minds. The architect was no dealer in the market, no speculator, no politician, no philosopher, no philanthropist, strictly speaking, and he was no manufacturer. He was a mere director of the work, and practical co-operator with the workman, and therefore the sympathies of the two had always been and ever would be preserved. Again, the architect possessed in his own profession a singular combination of characteristics. He was at the same time a man of science, a notary of art, and a man of business,—a combination to be found in no other profession. The architect was quite as much a man of business as the engineer, using bricks and mortar in one way as the engineer did in another, and being associated with him in the Royal Academy of Arts. His art was called "the queen of arts;" and, finally, he was quite as much a man of common sense and shrewdness in business as the builder. Combining these characteristics, then, the architect was peculiarly suitable for looking at the subject in question in a practical point of view. The technical education of the architect himself afforded a very good illustration of the technical education of the working classes. In the existing contest upon the subject there was one class of thinkers in favour of what was called the English system, and there was another in

favour of the Continental system. In the former case, the workman had to spend four or five years in passing his pupillage, in the same way as in passing apprenticeship. The master did not undertake to explain anything to him, but he must have him working upon practical business; and the argument was that if he did not learn to transact business he was a fool. That was the English system, without any hyperbole. The consequence was that when a young man after having served a pupillage in the office of an architect, when he had at last an opportunity of commencing business on his own account, he was chargeable perhaps with being somewhat empirical, although those who accused him of working by the "rule of thumb," might have a good deal to say in his favour. In France, when the pupil left school at Paris, and was destined to be an architect, he went into the workman's room to be under a man who undertook to teach him, and who carried him through a regular course of study from beginning to end, teaching him to draw, to design, and, it might be, also to construct. At the end of this course of study, the young man passed a Government examination; if he did not pass he had to go back and try again; but, having passed, he was furnished with a diploma, which served as a certificate to the public that the man was competent to be entrusted with architectural business. All the while he had done no particular work at all, and when such a man at last got into practice he did so by the aid of the Government, which employed him, and promoted him from one position to another—such being the way in which professional progress was made in France and in Germany. And what was the result? The man was educated—had his mind filled with theory,—but was deficient frequently in practice, and was entirely dependent on Government patronage. These things pointed to a difference of national character as between England on the one side of the Channel, and France on the other—a difference which every Englishman ought to understand. Narrow as the Channel was, it divided two distinct types of human intelligence which it was questionable whether centuries would bring into harmony. The systems which prevailed here and there were radically different. On the one side, there was what was called paternal government; on the other hand, not paternal but fraternal government. Under the paternal government our neighbours had all the advantage to be derived from systematic action in the mass, to whatever purpose the human energy might happen to be turned; but on our side we had everything that was to be derived from individual opinions; and from that personal self-reliance, personal self-confidence, and personal enterprise which carried Englishmen all over the world. The American practice was precisely the same as our own. The Americans had copied the French in many things, but not this. In America everything was fraternal, and a little more so than with ourselves—no superseding us in that system, but only carrying it a little further. With regard to the results of the two different administrations, existing on opposite sides of the Channel, there were provided in France schools more or less free of charge for all work,—men who chose to take advantage of them; and any workman in France might obtain a theoretical education under this paternal system, which made it the duty of the Government to find him in every thing, as opposed to our own system, according to which the individual was expected to find everything for himself. The Continental workman was much more theoretical than the English; his intellect was, perhaps, more keen and facile; but in instinct was not so practical, and was, in point of fact, comparatively feeble. The English workman might be empirical, but he generally managed to make his instinct go further in the end than the foreigner's intellect. With regard to our English Department of Science and Art, the Museum of South Kensington was an institution of which England might justly be most proud; it being, he believed, the best museum in the world. It contained a great deal of surplus matter, but still a great deal of most useful matter not to be found anywhere else; and yet it was very questionable whether the South Kensington system was at all calculated to succeed in England. The system possessed powerful friends, but it also possessed considerable enemies; and the reason of the want of success was to be found in the obvious want of accord with that English sentiment which lay at

root of all our operations in this country. There was a certain paternal character about the Department; and he was not prepared to say that it was easy to suggest a better plan, but, although not able to suggest an improvement, one might perceive a defect; and it appeared to him that the defect consisted in this, that there was a certain kind of what might be called Cesarism, copied from the Continental régime, which was independent of all matters of government as forming the essentials of our system. Therefore it was that the South Kensington Museum, with all its advantages, should be found not to succeed in this country; and if any institution of the kind was devised so as to be perfectly successful in the matter of technical education in England, it would have to be devised so as to fall in with what he had no objection to being called the prejudices to which those principally concerned had been accustomed, and which they were slow to surrender.*

A FRENCH BIOGRAPHY OF CELEBRATED ARCHITECTS.†

The venerable French architect, the late M. Alexandre Du Bois, had commenced the preparation of a monument to the memory of the great, in the form of a grand biographical work, which was to record the labours and occurrences in the lives of French and foreign architects, when his death, in his eighty-first year, put an end to his project. But since that event, which took place in 1866, the materials he had collected have been placed in the hands of M. Charles Lucas for completion and publication. The work will appear in instalments periodically, and the introductory number, completed under these auspices, is now before us. After a modest bow to the public, which, rendered into writing, runs to the effect that, if left to himself, he should not have dared to attempt the accomplishing such a magnificent scheme, mixed with expressions of gratification on being called upon to carry out that which so great a genius had conceived, M. Lucas commences his task with the biography of the founder of the work, for whose memory he entertains the most affectionate reverence. In the ordinary course this would have been deferred till his name occurred alphabetically; but his continuator, who calls himself his disciple, asks sympathy for the feeling of filial piety which compels him to place it before all others.

Alexandre Du Bois was educated first at the Central School, and subsequently at the Polytechnic, in Paris, and at an early age obtained the chair of mathematical professor at École Militaire, which he held for three years. But an intense admiration of architecture led him to place himself with MM. Le Bas and Debret, under whom he studied for some time. He next obtained a Government appointment, which he held till 1815, when, in the storms of that eventful year, he enrolled himself among his former fellow-pupils of the Polytechnic School, as one of the defenders of Paris. On the subsidence of this excitement he returned to his appointment, and superintended the erection of the *abbatoy* of Grenelle, having, previous to the outbreak, directed that of Montmartre. When the Opera-house was entrusted to M. Debret, he appointed Du Bois one of his inspectors, and he seems to have been deputed to arrange the ventilation, heating, and the acoustic and mechanical requisites of the stage. After a visit of inquiry to England, he drew up a long report upon the construction of this work, addressed to the Minister of the Maison du Roi, in which his biographer finds striking proof of his wonderful union of the artistic faculty and scientific exactness. For thirty years after this M. Du Bois filled the post of Commissaire-Voyer of the first class to the Prefecture of Police, in which he exercised beneficial influence upon works relating to the health and salubrity of Paris. From his private works, which were very numerous, M. Lucas selects two for especial mention, the first being the hydraulic problem of the conveyance of water to the summit of the Butte-Montmartre, and the other the construction of the first gasworks, which were intended to light the

Tuileries, the Opera, and some buildings on the civil list. His other works were large factories for different productions, at Batignolles, Passy, Saint-Denis, Belleville, the Faubourgs of Paris, and an industrial city at Gros-Caillois, château, villas, numberless hotels, maisons à loyer, on considerable scales. He is accredited with especial success in monuments to the dead, expressing the idea of death, his biographer relates, in a noble and elevated manner quite opposite to the fantastical style affected by contemporary artists. M. Du Bois left a library of upwards of 20,000 volumes, without counting innumerable pamphlets, gathered together principally to assist him in the literary works he undertook. Before he died he finished a "*Bibliographie des Beaux-Arts et Spécialement de l'Architecture*," in three volumes; a treatise upon "*Stéréométrie*;" a "Dictionary of Architecture," in three volumes; a treatise upon the "*Comptabilité des Bâtimens*," in two volumes; and commenced the biographies of ancient and modern architects now under notice.

M. Lucas adds that it is intended to give only the lives of such architects as have been recognised as eminent either by Government, the public, or the profession; such as the chief architects of the public administration, the laureates of the exhibitions, the *pensionnaires* of the Academies of France and Rome, and the members of the Legion of Honour. The selection of foreign architects will be guided by a similar rule. A photograph of a medalion designed by M. Lucas forms the first of the series of illustrations. On this is represented a tumulus on which are piled wreaths of *immortelles* terminating in a summit formed by a pine-apple. Tradition, carrying a torch in one hand and a wreath in the other, stands on one side of the tumulus, and a branch of laurel balances the composition on the other. Around runs the legend, "*Ad memoriam majorum*." On the reverse are a lamp for tradition, hooks for science, a star for inspiration, a pencil for form, compasses for measurement, a pen for writings, and a palm for recompense, neatly grouped. Portraits of architects, both ancient and modern, are promised. As M. Lucas has enjoyed the assistance and support of several eminent persons, and has been assured of further encouragement as his task proceeds, we doubt not he will realise the idea of M. Du Bois, and make a "golden book" of the glories of the profession of architecture.

THE MYSTERY OF LIFE AND ITS ARTS.

On the 13th inst. Mr. John Ruskin delivered a lecture, under this heading, in the Concert-room of the Exhibition Palace, Dublin. In the course of it he said, ten years in the early period of his life were devoted to endeavouring to show the excellence of the works of a man whom he believed to be the greatest English painter since Reynolds. He had, then, perfect faith in the power of every great truth to prevail ultimately, and to take its right place for usefulness amongst men. Turner, during his lifetime, knew better than he did, and discouraged his views. His books, however, got talked about, and he began to hope for victory. The trustees of the National Gallery commissioned him to arrange 300 examples of the great painter's studies in the Kensington Museum. Accordingly they had been placed there; but they were not exhibited, for the room in which they hung was always empty. That showed him that ten years of his life had been practically lost. For that he did not much care; but what he did care for was to (to him) frightful discovery that the most splendid genius in art might be permitted by Providence to labour and to perish uselessly—that in the very fineness of it there might be something rendering it as invisible to ordinary sight as an Elysian mystery;—that the glory of it was perishable as well as invisible;—that the gift of it might be as snow in summer and rain in harvest. That was the first mystery of life to him. Amongst several personal reasons which caused him to give this prosing lecture in Ireland, one of the chief was, that in reading it he should be near the beautiful building, now their Engineers' School, which was the first realisation he had the joy to see of the principles he had been endeavoring to teach, but which, alas! was now no more than the richly-designed monument of one of the most earnest souls that ever gave itself to the arts—Benjamin Woodward. But it was not in Ireland only that he

received the help of Irish sympathy and Irish genius, for to another friend of his—Sir Thomas Deane,—with Mr. Woodward, was entrusted the building of the Museum at Oxford; and the best details of it were executed by sculptors born and trained here, and the finest window in the façade was carved from his design by an Irishman. The work they did together had, however, been vain. The architects they sought to introduce was inconsistent alike with the reckless luxury, and the deforming mechanism, and the squalid misery of modern cities. He could tell of other failures as years went on; but he would proceed to speak of the result of these discouragements. They were aware that the tendency of the minds of disappointed men was to say that life was a vanity—that its pleasures could be grasped in imagination only. The cloud was but a painted cloud after all. No one had more beautifully expressed that sentiment than Pope—

"Meanwhile, Opinion glides with varying rays,
Those painted clouds that beautify our days;
Each want of happiness by Hope supplied,
And each vacuity of sense by Pride;
These build as fast as knowledge can destroy:
In folly's car still laughs the bubble joy.
One prospect lost, another still we gain,
And not a vanity is given in vain."

But the effect of failure on his own mind had been the reverse of what was described by the poet. The more disappointing his own life had been, the more solemn and wonderful it had become to him. It had become to him no more a painted cloud, but a terrible and impenetrable cloud; not a mirage, which vanished as he approached it, but a pillar of darkness which he was forbidden to draw near; for he saw that both his own failure, and his success in petty things that seemed worse than failure, arose from the want of a sufficiently earnest effort to understand the whole law and meaning of our life, and to bring it to sufficiently noble ends. He saw more clearly every day that every success in arts, as well as in other occupations, had come from the ruling of all lower purposes, not by a conviction of the nothingness, but by a solemn faith in the glory of human nature, and in the promise, however dimly apprehended, that the mortal part of that nature would at last be swallowed up in immortality, and that, indeed, the arts themselves never had reached any vital strength or honour, but in the effort to proclaim that immortality. Nothing that he had ever said was more true, but had been more misunderstood, than that the arts could not be right unless their motive was right. Continually weak painters came to him with their paintings, and the only answer that he could give them was, that if they had expended twenty instead of two years upon their work, they had not mind or hand to succeed. But let the point be tested by men who did know their business, who had the hand and the gift, or might have it, and these should serve their nation faithfully with it; for it was a greater trust than ships or armies. Ships and armies might be replaced if they were lost; but a great intellect once abused was a curse to the earth. But what he meant by saying that the arts should have a noble motive was that they had never prospered but when they were devoted to the proclamation of some divine truth or law. Yet he had seen that they had always failed in these proclamations—that poetry, sculpture, and painting, though only great when they strove to teach us something about the gods, never had taught us anything trustworthy about them, but had always betrayed their trust, and with these powers at the full reach of them, become ministers to party and to passion. He had felt, also, amazement at the incurable apathy that was in us, hearers;—that while the wisdom and rightness of every art and act of life could only be consistent with a right understanding of the end of life, we are all plunged, as it were, in a languid dream, our eyes heavy and our ears closed, lest by chance any inspiration or voice should teach us, and we should understand with our hearts. This intense apathy was the first great mystery of life that stood in the way of every perception of every virtue. They had sent for him to talk to them about art. The one thing he had to tell them was, that art ought not to be talked about. The fact that there was a talk about it signified that it was ill done, or could not be done. The highest works of art were the silent productions of instinct which the possessor of it knew to be incommunicable, and the true critic of it knew to be inexplicable but through a long process of laborious years. They were all of them wild with enthusiasm about the work of Gustave Doré. If he were to

* The remainder in our next.

† *Bibliographie Universelle des Architectes Célèbres*, par Fen Alexandre Du Bois, architecte du gouvernement, membre du Conseil d'Hygiène du Département de la Seine, et Charles Lucas, architecte. Paris, Bureau, Rue Rochechouart, 55. Imprimerie Générale de Ch. Lahure, Rue de la Fosse, 1868.

tell them that that work was wholly bad—had not by failure, but with a dreadful evil, with a harpy power of pollution, and that as long as they looked at such art as that they could have no perception of any pure or beautiful work, would they look at Gnstavo Dore's pictures the less on that account? Rather more, he fancied. On the other hand, he could talk to them about good works of art, but they would be none the wiser for that. Art could not, like science, be communicated in that way. Art was the instructive and necessary result of powers which could only be developed through successive generations, and which only burst to light under social conditions of equally slow growth. Whole eras of history, and the passions of dead millions were summed up in the existence of a noble art. If such a noble art dwelt amongst them they should simply feel it and rejoice in it, and not care to hear lectures about it. Since it was not amongst them they had only to go back to the last place where the root and stock of it was yet alive. If they were to go back for germs of national art that had decayed, they should find a more signal example in Ireland than in any other European country. In the tenth century Ireland possessed a school of illumination which in all essential qualities was wholly unrivalled. He knew none that were equal to it for invention, finish, and refinement. The lecturer, in continuation, said he had seen much of the Irish character, and he thought the form of failure it was most liable to was this, that being generous, and wholly intending to do right, it did not attend to the external laws of right, but thought it must necessarily do right because it meant to do so; and then, when it did wrong without intending to do so, the consequences came upon it, and a sense of innocence and justice led it further astray than anything it would have been capable of doing with a good conscience. Mr. Ruskin concluded his lecture by exhorting his hearers to do useful work as a means of preparing society for the development of art. Let them not strive to feed, to dress, and to lodge all those who required such aid. These were the three first arts. All the fine arts came after them. In respect of dress, he laid down that persons ought to dress so that their rank should be known; and the changes of fashion should be restricted within certain limits. It was not by parliamentary measures that they would reduce the amount of the distress that was multiplying daily; but every one should ask himself this question, "How many persons can I feed, clothe, and put into wholesome rooms?" The elevation of the mind of the masses above that state into which their physical conditions had reduced them was also an essential preliminary to the future superstructure of art.

BUILDING MATERIALS AND THEIR DEFECTS.

In a letter recently published by "A Metropolitan Ratepayer,"* the attention of the Board of Management of the Metropolitan Asylum District was specially invited to the existence of very serious defects in building materials now generally used for the construction of asylums, hospitals, and other large habitations for the accommodation of the poor. The object of this writer, in the first place, was to make those defects obvious, and then to indicate the causes by which they were produced, so as to enable the managers of the Metropolitan Asylum District, in the erection of asylums and hospitals proposed to be built in various parts of the suburbs of London, at the joint expense of the several metropolitan parishes and unions, to avoid the committal of errors similar to those which have been actually productive of very disastrous consequences to the general health of the community, and, in many individual instances, have not only shortened life, but perverted it from continuous health to a period of intense suffering. It was to ameliorate the condition of the lunatic, imbecile, and afflicted poor, under the several forms of parochial management which had obtained legislative sanction, that the Poor Law Act of 1867 was passed, and the special constitution of the Board of managers was so framed as to represent the interests of all who were under legal obligation to provide the money proposed to be thus expended. The statement made by "A Metropolitan Ratepayer" respecting the defects in

building materials, which he described, has not been challenged; in fact, those defects have been virtually admitted by every one practically conversant with the subject. He, therefore, feels it to be his duty further to ventilate the matter, and suggest how, in his opinion, such proper materials as may be required in the formation of the extensive edifices which this Board of managers propose to erect at so large an outlay of public money may be best, easiest, and most cheaply procured.

After much consideration given to this subject, the writer is most decidedly of opinion that a large proportion of the pauper inmates of workhouse infirmaries, schools, and madhouses, and those who are generally termed able-bodied paupers, inasmuch as they are capable of performing the ordinary amount of workhouse labour, are there in consequence of ailments produced by damp or wet brickwork in the habitations they or their parents had previously now reside in are not altogether free. The poor man's house is generally built on low ground, not thoroughly underdrained, and the soil of the foundation being taken out to a depth of 2 ft. or 15 in., makes a lower trench to become a receptacle for such water as may run or leak from waterbutts, sinks, drippings from the roofs, or rainfalls soaking through the ground; water thus deposited under the foundation not only saturates the brickwork underground, but is drawn up in many instances 2 ft. or 3 ft. above the surface of the soil upon which the building rests. Where the gutting of the roof has been imperfectly executed, or has become in any way defective, the walls also become saturated downwards, and thus get soddened and waterbound, so that they are never again perfectly dry. Damp caused in the manner here described may be said to originate in malformation of structure, and not solely from the use of improper or defective materials, such as the mixing of saline particles with the clay of which the bricks are made, or in the mortar used for the purpose of binding them together. There are thus two sources of damp to which the dwellings of the rich as well as those of the poor are too frequently exposed, the latter more especially on the ground of cheapness.

It may be remarked also that the houses of the poor are generally built of inferior bricks. Not that old bricks should be universally condemned as useless, for some of them are much more fit to make a dry building than new bricks manufactured with brackish water, clay mixed with sea sand, or moulded with saline materials dragged from the river channel near to where the new bricks are made, or floating up to London in leaky barges. But bricks taken from the flues, kitchens, old drains, cellars, store-rooms, and places where bams and meat are salted and preserved, cooperies and washhouses, which form a large proportion of the whole, are mixed together with certain kinds of new bricks and worked up into small buildings, at little cost, to let on what may be considered low terms, but taking all consequences into account are really exorbitantly high. Such buildings, in my opinion, never will be perfectly dry; therefore, bricks which have undergone deterioration in the way described should not be used in any building intended for human occupation. Only good, old, dry, and hard bricks, manufactured of the best material, should be so employed. All others should be used to make road bottoms, as they constitute the best material that can be selected for such a purpose. If used in that way, it may be fairly calculated that at the least one-fourth of the outlay now expended on macadamised roads would be saved, for it has been well ascertained that a weak bottom makes the wear of material under the surfaces much greater than is caused by traffic over a sound bottom. A great pecuniary saving to the several parishes of the metropolis would be the direct result.

The first step which ought to be taken in the erection of such extensive buildings as are contemplated by the Asylum Board, is the preparing a good foundation. The proper drainage of the land is an essential point which must in no case be overlooked. Then it would be desirable to put at least 12 in. of clean gravel or flints, brought from inland pits into the excavation, so forming a perfect system of under drainage, and upon that a substantial layer of concrete. The sand for mortar should be brought from inland pits, either carted or by rail. If the sand cannot be found near to or on the land, half the proportion of it required might be substituted for it, clay burned hard and ground with a

proper quantity of stone lime. Such a mixture would form a most excellent mortar. If inland cement cannot be obtained, blue lias lime should be used for the underground courses, and for the parapets. Then use for the superstructure either stone from inland quarries or close-knit burned bricks, sold made or made with inland sand. If the mould used in making the bricks be even dusted with river sand, or with sand coming from pits within a mile of the river, or swam over any portion of salt water, there would be danger in using such bricks. As blue lias lime will ensure greater strength in the walls of the building than ordinary lime, it is desirable that it should be used as a substitute for cement wherever necessary.

The demand for bricks having been gradually increasing during the last fifteen years, and that in the proportion of 10,000,000 to 1,000,000 formerly used, has caused a corresponding increase in the demand for sand for the purpose of manufacture. This material was taken from the sand-hills on the shores of the river, but that operation was found so to weaken the river-wall that, for its protection, the Board of Conservancy found it necessary to interfere and prevent sand being taken above Woolwich, under pain of fine and imprisonment, so driving those getting it below that point, and necessarily into brackish water, rendered much more so by the sewerage of the metropolis. But, even if the Thames Conservancy had not enforced this stringent regulation, it would have been impossible to have obtained a sufficient supply of freshwater sand for brickmaking purposes from that source. Recourse must therefore have been had to other means of obtaining the sand required. As it is always desirable to obtain a nice smooth face to the brick, inland sand ground very fine may be properly used for this purpose. In that part of the process of brickmaking which is called "walk flattening," the table is dusted with sand to "flat" the quantity required in order to fill the mould, and the clay, as it were, lies up the sand, so that it will pass easily through the mould without sticking. To make each brick shift clean, the mould is also dusted with the same sand. If soft Thames sand, "unweathered," be used in both cases, that of itself is sufficient to "pickle" the brick, without the harrow-loader dusting the face of it, as he generally does, with the same material. A uniform effect is produced throughout the whole of the kiln of bricks thus made; and the only way of preventing a deteriorating result is to get inland sand ground in a mill till equally fine as the sand usually employed in making what are termed "grey stocks." In all such places of the superstructure as it may be thought necessary to use cement, it is, as we have said, strongly recommended that blue lias lime be substituted. By only adopting these suggestions a good, sound, substantial building will be produced.

A METROPOLITAN RATEPAYER.

ON MODERN FURNITURE.

THE ARCHITECTURAL ASSOCIATION.

At the ordinary meeting of this society, held on Friday evening, the 22nd, Mr. Charles L. Eastlake read a paper on "Modern Furniture."

It was, he said, a subject of considerable interest, and one in which more than all others the public showed their bad taste. All kinds of household furniture bad of late years greatly deteriorated, both with respect to design and material. This, although it might seem strange, was in a great measure owing to the amount of competition in trade, in consequence of which every upholsterer found it absolutely necessary to be continually introducing new patterns, however hideous. No one dared now-a-days to find fault with a lady's taste; if one did so it was almost an unpardonable offence, and yet it was but too apparent that even in the highest circles there was very little really good taste. Materfamilias furnished her house more after fashion than in accordance with art, and as long as the shopman could persuade her that such or such a material had been supplied shortly before to some noble lord she at once purchased it, and would ever after be blind to its faults. This was much to be regretted; but it was to no small extent the effect of art forming little if any part of a young lady's education. They were supposed by learning music and other accomplishments to become judges of art; whereas it ought to be a study for them to do so. People, were, however, at last beginning to realise that

* See p. 209, ante.

there was such a thing as good taste in upholstery, jewelry, and even in millinery, and that the last fashion was not necessarily the best.

The present style of household furniture was utterly devoid of taste, and as a rule hideous in the extreme. The curves, for instance, in their chairs and sofas, which were the order of the day, what could be more uncomfortable or inconvenient? They were not ornamental, and in many instances made the article almost useless. The process was called "shaping," and a very bad practice it was, and utterly opposed to all principles of taste. The carving, too, which one met with on these pieces of furniture, was very bad, as was also the custom of veneering. A wood carver might be an artist, but a furniture carver was a mere machine, and his productions might be obtained by the yard, or in some instances by the pound. It was lamentable to notice how the turner's art had deteriorated; indeed, the work of a country wheelwright was often more artistic, inasmuch as any ornaments which he added were generally simple, and not devoid of taste. As a rule, the furniture in the hall of a modern house was the best, on account of its simplicity. The table was usually made of oak; and the chairs, since they were not intended to be moved about so much as in a sitting-room, were more acid and presentable.

The furniture, however, in the other rooms was had, no apartments being arranged in a similar style. The dining-room table, which pulled out as a telescope, was insecure, and ought not to be tolerated; while the carpets and paper were invariably ugly, and needed reform. He had seen some chairs which had been made in the early part of the seventeenth century; they were stuffed with feathers, and still retained their original shape in the mill. Furniture now-a-days scarcely lasted a lifetime, and soon became shabby and rickety; and tables, which used to be polished by hand, were now covered with what was called "French polish," in reality a sort of varnish which failed to give the wood that dark and massive appearance which was the characteristic of furniture occasionally met with in some of the country-houses. It was astonishing what an amount of articles were manufactured and sold for old work, often one panel being deemed sufficient ground for the formation of a whole sideboard. But on inspection the difference would be easily perceived. The cracks would be found filled with putty and varnished over; the carving stuck on with glue, and instead of firmly fixed; and in many respects it would be seen that they were greatly inferior to what they were supposed to represent. The curtains of the present day, he considered, were made much too long, so that they might be hitched up on pegs at the sides of the window resembling incipient engine-buffers. The consequence was, the dust accumulated, and the material soon wore out. The poles, too, on which they were hung, or supposed to be hung,—for often they were merely an imaginary ornament,—were much too big, and were finished off with some huge flower, at once inelegant and unnatural. Fringe, as Mr. Pugin had pointed out, was originally the ends of silk, which were tied into a knot to prevent them unravelling; but our modern fringe was twisted in with a number of little pieces of wood, and then attached to some article for which it was entirely unsuited. The carpet, in his opinion ought to be a square one, and not fitted into the corners of the room,—a system which was opposed to all economy, and extremely inconvenient in the case of a removal, while the pattern should be more in the Eastern style, and not in the wearisome regularity of the English productions. There were many matters, too, with respect to our bed-room furniture, which needed reform. There should be nothing there to offend the eye, but everything ought to invite repose. The great "four-poster" bedstead, surrounded by curtains which were drawn round the sleeper, was an absurdity of a past age, and totally at variance with present ideas of health; but there were many things now in use which would seem equally ridiculous to posterity. Among other things to be laughed at was the change of fashion with respect to different woods. At the present time, everything in a drawing-room was made of walnut; a little time since it was all rose-wood, and before that mahogany. It was a mistake to suppose that really good furniture would be more expensive than the present style. It would be in reality cheaper, and in every respect more satisfactory. He was glad to see that some architects had taken the matter in

hand, and he hoped that the public would assist them in the advancement of art.

Mr. Ridge quite agreed with what Mr. Eastlake had said with respect to the want of taste in the public generally; but they (the architects) must endeavour to instil some taste into them, and point out to them the absurdity of following fashion when opposed to art. Such was popular prejudice against the old style of furniture that any one about to be married and wishing to furnish his house with real taste would have to do it before the ceremony, as he would never be allowed to do it afterwards.

In answer to a question, Mr. Eastlake said that he had suggested a table which would do away with the necessity of the telescope one. He proposed to have two bearers, to be pulled out at each end; they would be twice as long inside as out, so that they would be strong enough to bear any strain. He considered that an incised ornament would be the best for wood, but any of a monumental style should be avoided.

HOW WE SET THE STEAM TO WORK.

We have hobb'd the fire, we have kindled the flame,
And lighted the mine so bright;
We have made a prison, the strongest on earth,
To hold in the "water sprite."

For the sprite is lazy, and roams abroad,
In the river, the spring, the sea;
He will sing, and babble, and murmur about,
But never to work will be.

Leave him at large, let him run down-hill,
Let him roam wherever he list,
And he suddenly rushes to and fro,
Or exhales us fog and mist.

But we want him to work wherever we will;
He is strong, and our muscles will save;
So we fasten him up in an iron box,
And force him to be our slave.

And we light the fire, and torture him well,
Till he kicks and screams like mad:
"I will get out of this nasty hole!"
Be quiet; you burst us, lad."

Then out he comes, with a rush and a roar,
In a scalding cataract shower.
"Very well," quoth we, "come out if you will,
Provided you yield us power."

And we guide him, and turn him, and twist him about,
In a narrow and straiten'd road,
And we make him to pull, and struggle, and shout,
Till he moves the heaviest load.

So he turns the mill, and works the mine,
And he takes our ships to sea;
He ploughs the land, and he moves the sand,
And he mows the meadow lea.

We found him cold, we have made him hot;
We make him slow, and weary, and wet;
We move him about from place to place,
And we make him puff and sweat.

Ah! old sprite, we have got you now,
And never will let you loose;
We have you enchain'd, and will manage your powers
By the wheel and the iron nose.

SANITARY DEPUTATION TO GOVERNMENT.

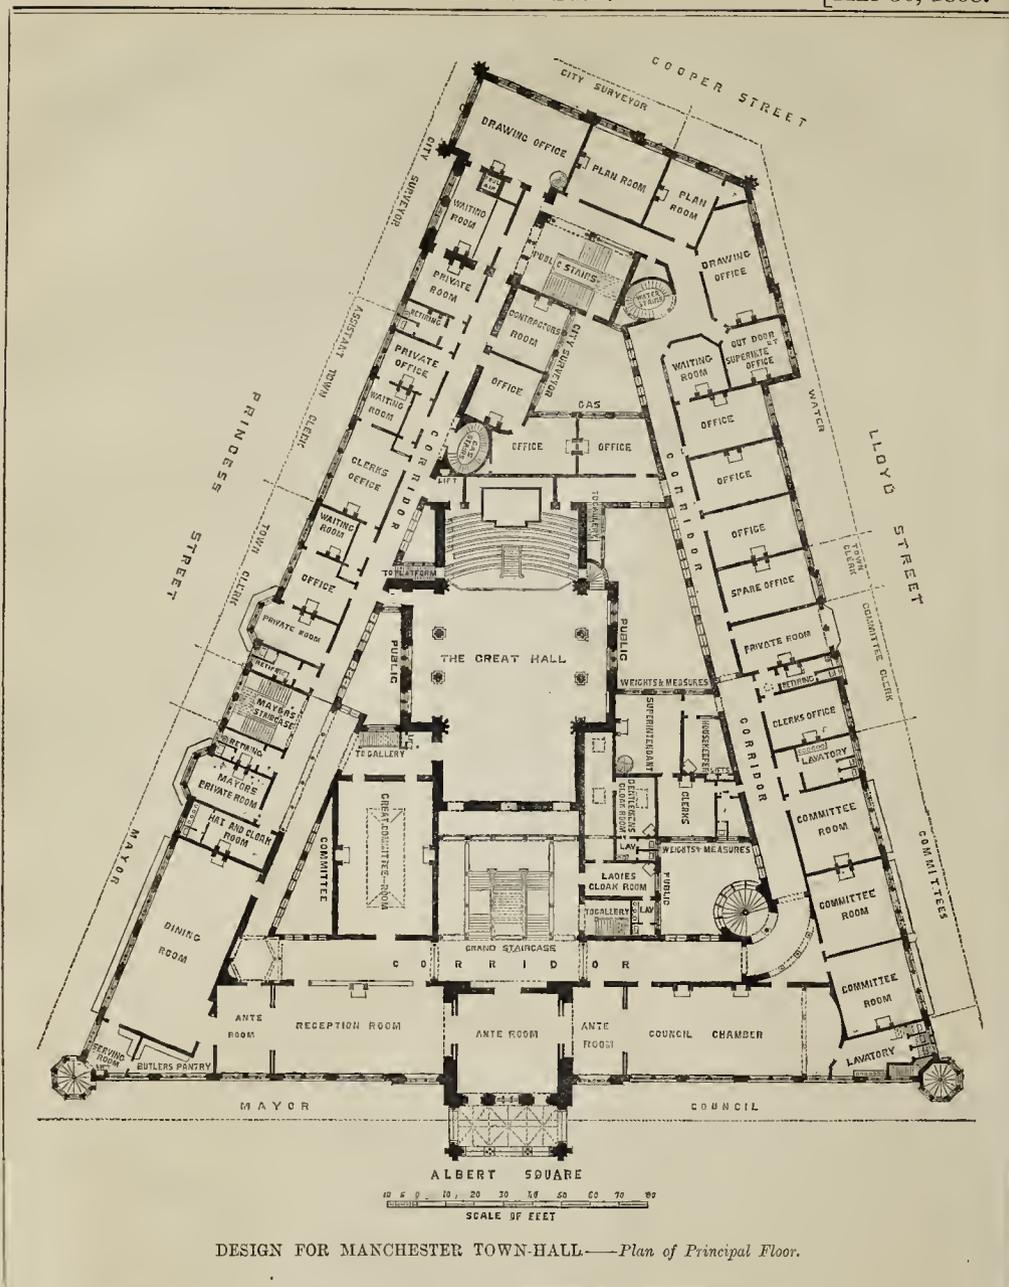

A LARGE deputation has waited upon the Duke of Marlborough, as president of the Privy Council; the Duke of Devonshire, as president of the Poor-law Board; and Mr. Gathorne Hardy, as Home Secretary, to draw attention to important matters connected with the laws of health, and other questions. The deputation was received in the council-chamber of the Privy Council Office, and was introduced by Mr. George Clive, M.P.

The ministers present were addressed at some length by Mr. Clive, Dr. Acland, Mr. Cbadwick, Mr. Acland, Dr. Ramsey, Dr. Symonds, Dr. Simpson, and Dr. Stewart; and by their remarks it was shown that the deputation represented not only the British Medical Association, a body of upwards of 4,000 medical men in all the great cities throughout the country, and the Social Science Association, but well-known gentlemen were also present from different parts of the kingdom, in order to bear testimony to the urgent necessity that exists for the Government at once to take steps to learn the complicated and inharmonious nature of the present sanitary laws, and to provide for their consolidation.

The Duke of Marlborough acknowledged that the subject was one of the greatest importance to the whole country, and said the Government was fully aware of the inconvenience of the present system of things. The Board of Health which previously existed was a movable body, and it having been dislodged in a very unworkmanlike manner, he was obliged to say, its work had been thrown upon the Privy Council. This had already arrested the attention of the Government, whose duty it would no doubt be to consider how a central body could be formed for the administration of the sanitary laws. He agreed that there should be a revision and consolidation of the sanitary laws, having special reference to the increase of the efficiency of their administration, both central and local. Local boards of health did not exist everywhere, and it might be well to make the proper authorities responsible for the administration of the sanitary laws. These ends might be attained by having a complete organisation under one department. The Government would consider these things, and would give their best attention to the whole subject. Perhaps the Government would appoint a royal commission.

THE TRADES MOVEMENT.

Wolverhampton.—The stonemasons, who had not bound themselves by the arbitration agreement, adopted the old plan, and "atruck" for higher wages; and from peculiar circumstances, the masters, finding themselves unable to resist the demand, had to yield to it. Naturally enough, the members of the other branches were anything but delighted at this, and it is quite possible that some of the men who by their own act had deprived themselves of taking advantage of the opportunity, were disposed to cancel their agreement, and follow the example of the stonemasons. Happily, this was not done. The masters were not ill-disposed in the matter, the men waited a little longer, and at length eighteen of the latter and six of the former, with Mr. Kettle as the general umpire, met and amicably discussed the matter. After considerable deliberation, a convention was arrived at, by which the wages will be immediately augmented, and the Saturday half-holiday become the rule; and this agreement is to hold good for three years. As Mr. Kettle remarks, this is "a great triumph for arbitration," which, it is to be hoped, may now be considered to be firmly established as a substitute for strikes and lock-outs so far as the building trade at Wolverhampton is concerned.

DESIGN FOR MANCHESTER TOWN-HALL.—Plan of Principal Floor.

NEW ORGANS.

Malvern.—The inhabitants of the quiet village of Malvern Wells have long coveted an organ for their church, and as long ago as 1865, when Mr. Sims Reeves was staying there for the benefit of his health, he gave a chamber concert, the proceeds of which were devoted as a fund towards the purchase of an organ for St. Peter's Church. The organ, which has been built by Nicholson, of Worcester, has now been opened.

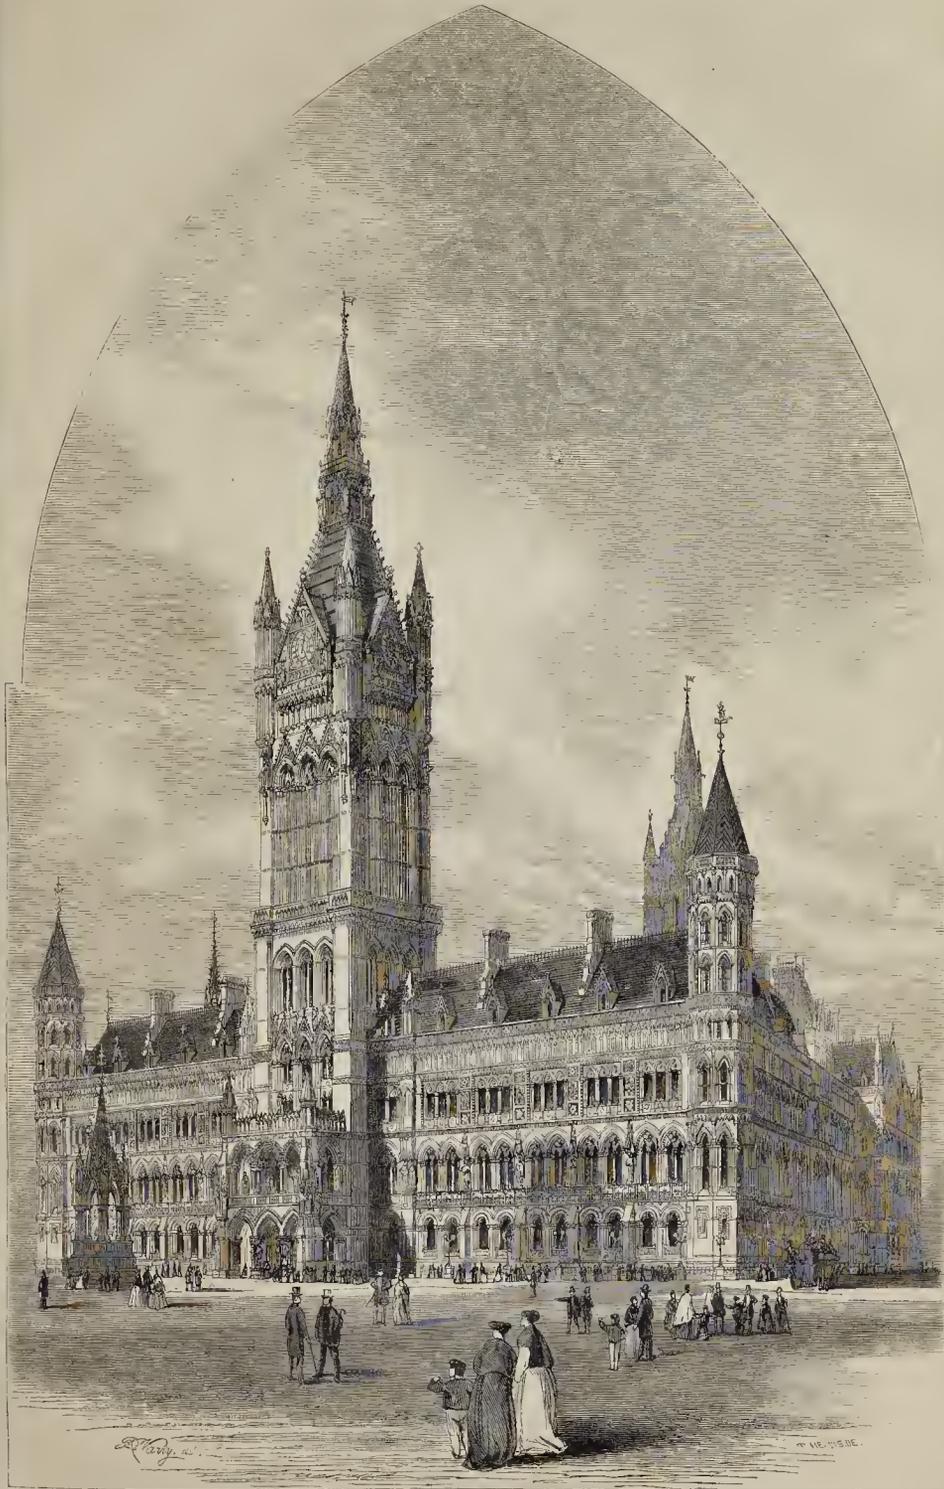

Liverpool.—The new organ in St. Peter's Church, Seel-street, built by Messrs. Conacher & Co., of Huddersfield, has been opened with Mozart's twelfth Mass, sung by an excellent

choir. The swell organ has ten stops; choir organ, seven stops; great organ, nine stops. In the pedal organ there are nine stops. There are five composition pedals to the organ, and the ordinary pedals are radiating. The bellows of the instrument are on the hydraulic principle, the engines used for the purpose being the invention of Mr. Duncan, the water engineer. The new organ is in the main gallery at the west end of the church. The old organ was in the south gallery.

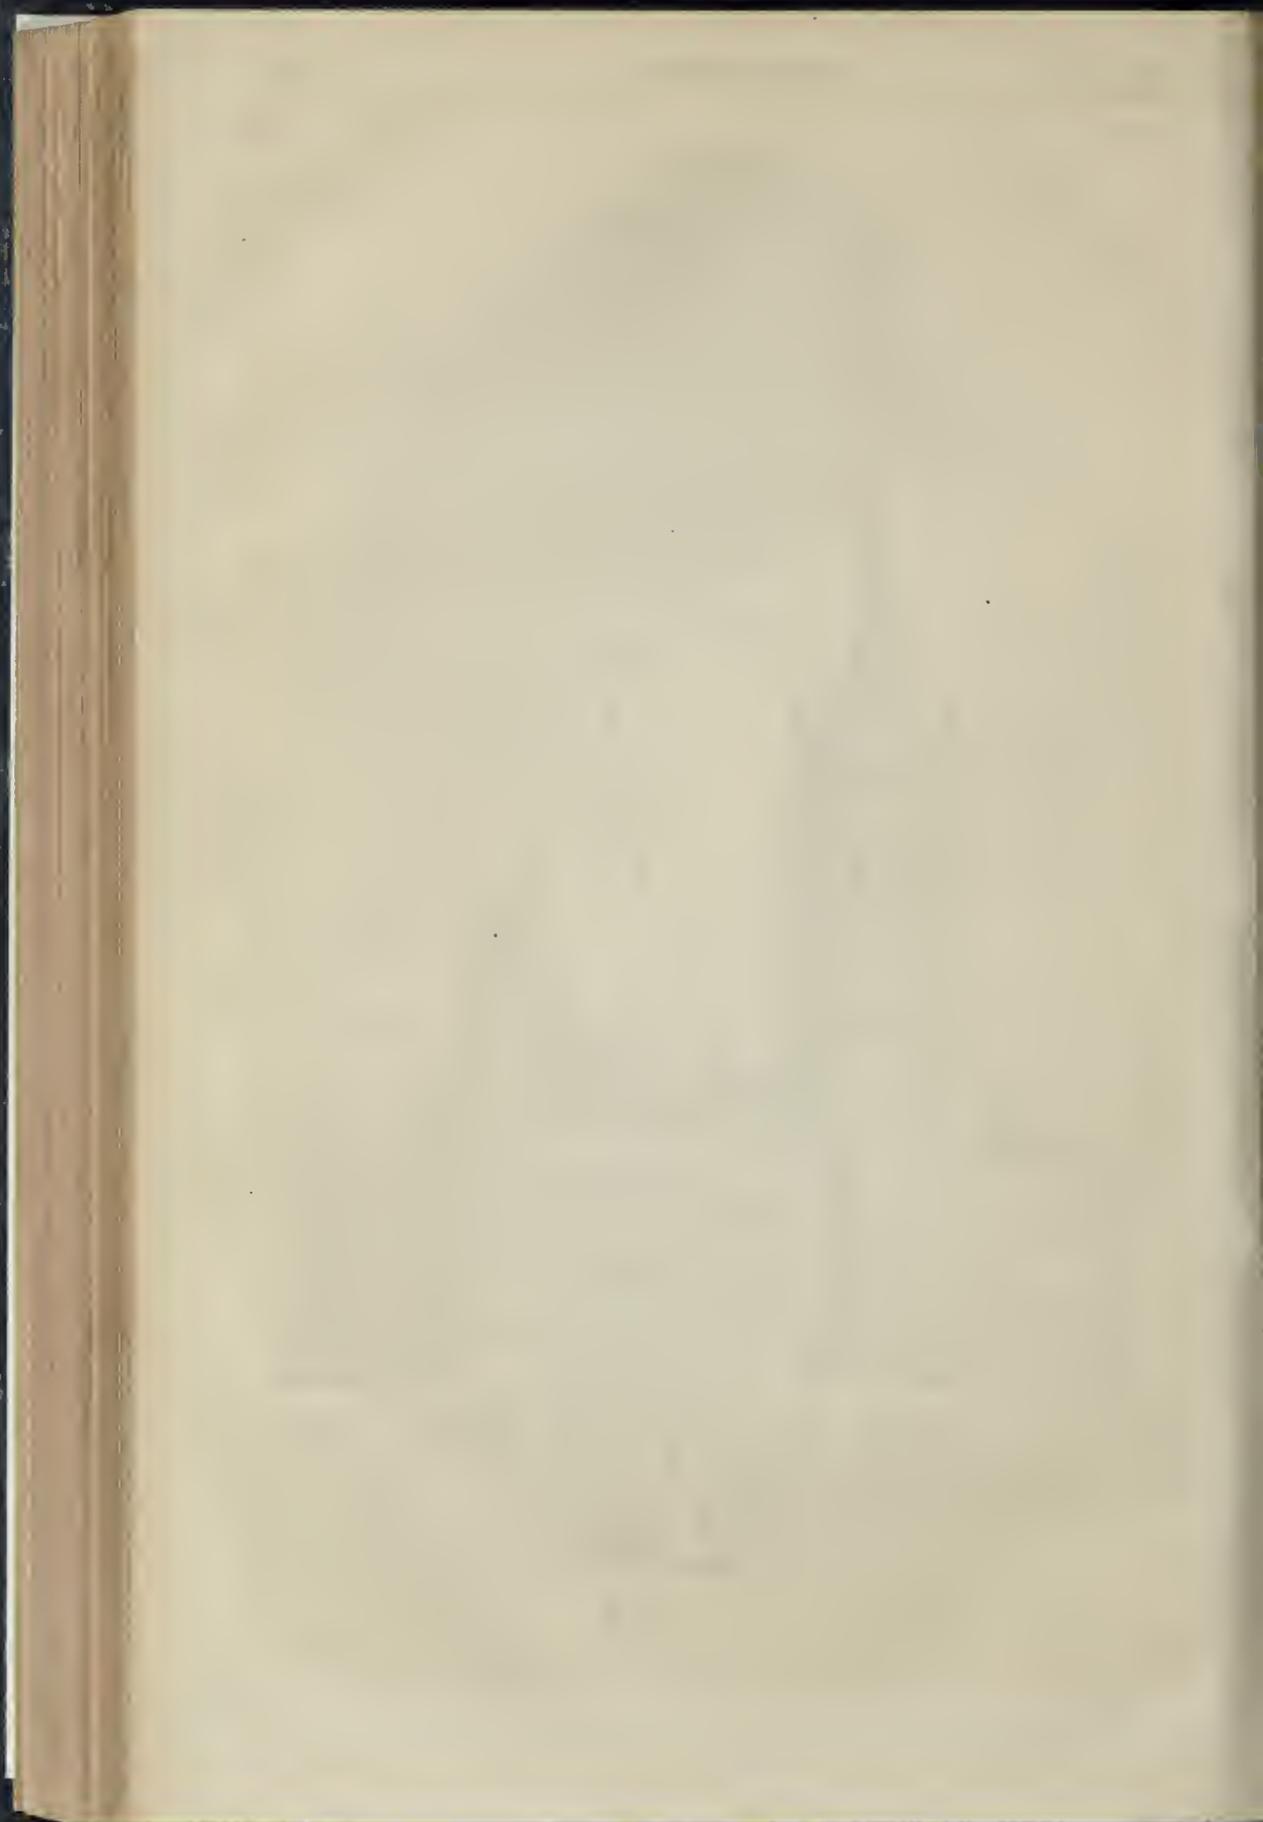

Yarmouth (Isle of Wight).—The opening of the new organ supplied to Brook Church by Messrs. Bevington & Sons, of London, has taken place. There was a grand choral service. The instrument, which was shown in the Paris

Exhibition last year, where Messrs. Bevington & Sons, it is said, gained the only prize for chancel organs, is built in the Gothic style, with illuminated speaking-pipes in front, and containing the following stops:—Bourdon, wood, CCC to CC 16 ft., 13 pipes; open diapason, metal (G), 8 ft., 47 pipes; stop diapason and claribel, wood, CC to F 8 ft., 54 pipes; dulciana, metal, C to F 8 ft., 42 pipes; principal, metal, CC to F 4 ft., 54 pipes; total of pipes, 210; one and half octave of German feet pedals. Its cost was between 80*l.* and 90*l.*

Leconfield.—A new organ has been opened in the parish church. The instrument, which was built by Messrs. Forster & Andrews, of Hull, cost 140*l.*

DESIGN SUBMITTED FOR MANCHESTER TOWN-HALL.—By MR. JOHN O. SCOTT.

MANCHESTER TOWN-HALL.

We illustrate in our present number another of the designs for Manchester Town-hall submitted in the ultimate competition,—that sent in by Mr. John O. Scott. This design was placed by the referees second in architectural merit, and third in point of general merit. We have already reviewed the design, and expressed a strong opinion of the ability displayed in it. In our review we objected to the central arch in the entrance porch being elliptical, and suggested the substitution of a stilted semicircle. Mr. Scott writes that the arch was in reality meant to be a stilted semicircle, and that the appearance alluded to was the effect of indifferent drawing.

The estimated cost of carrying out this design was stated at about 250,000*l.*

DOBROYD CASTLE.

MR. JOHN FIELDEN—as at the laying of the foundation stone of the castle—ordered to be provided, at his expense, a substantial dinner, with beer, &c., to celebrate the rearing of Dobroyd Castle, near Todmorden. The arrangements were made by Mr. W. Glover, clerk of works, at the castle. At the Masons' Arms, Gaxholme, the entertainment was prepared, and it was served up in an empty larder near to the inn. The room was almost draped with evergreens. The company were upwards of 240 in number. At the head of the room was a platform or dais, on which a piano-forte was placed, and a party from among the men at the castle sang various glees to enliven the feast, and a song on the occasion by Mr. Morgan, one of the joiners, was sung by the composer. Mr. A. Stansfield, of the masons, Mr. G. Carpenter, of the carvers; Mr. J. Brunton, clerk to Mr. Davis; and Mr. J. Pickles, mason, were the glee party. Two presentations were made during the evening—one to Mr. W. Glover, clerk of works, and another to Mr. Edwin Long, foreman over the masons. The proceedings were altogether orderly. Mr. W. Glover was in the chair, assisted by Mr. Davis in the vice-chair. Two years have now passed since the first sod of the castle was turned. During that time 35,000 cubic yards of excavation have been completed for the castle and roads connected therewith; upwards of 6,000 ft. of drain-pipes have been laid, and more than 1,000,000 bricks have been made and used. Two quarries have been opened, 120,000 cubic feet of stone have been taken from the beds of these quarries, besides 33,000 ft. for "metallic" roads; 8,000 ft. of timber, 33 tons of iron, and 8,000 ft. of Bath stone, have been used in and upon the castle. No accident of any moment has occurred. The architect of the edifice is Mr. James Gibson.

ACCIDENTS.

At the Prince of Brunswick, Brnmswick-street, Blackfriars-road, an accident has happened from the fall of a wall and a portion of an arch. It appears that builders were engaged in erecting a new cellar at this house, and for that purpose the old arch had to be removed. A portion of it had been left standing, and four men, labourers who were engaged to clean the old bricks, chose to sit under what was left. Without any notice the wall fell and buried the men in the debris. The men were extricated, and found to be severely injured.

A disastrous fire has occurred in Limehouse, on the premises of Messrs. Lloyd & Sons, steam saw-mill proprietors and timber merchants, St. Ann's-row, nearly facing Limehouse Church. The premises were for the most part destroyed, and the timber in the yard severely damaged by fire. Twenty private dwellings were also seriously injured by fire and water. The origin of the fire could not be ascertained. The books, kept in one of the Reliance fireproof safes, were all saved.

In Queen's-road (formerly known as Lamb-lane), about 200 yards from the Miles Platting Railway Station, near Manchester, an accident has happened resulting in the death of three persons, and serious injury of a fourth. Between Jessie-street and Bagulet-street, a block of old houses which stood with their end to the road, was being demolished preparatory to a better

class of houses being raised on their site. The roofs had been removed, and workmen were busily engaged taking down the side walls. For some reason not ascertained, the gable, which was anything but a substantial piece of work, being only one brick thick, and having been weakened by a flow of water, was allowed to stand at nearly its full height. The consequence was, that when the support which the side walls afforded was withdrawn, the gable gave way, and, falling outwards, broke down the boarding which had only been erected a few hours before, and covered the street to the other side. Three little children, who were amusing themselves opposite, were buried in the debris and killed on the spot, while a man who was passing along the street was knocked down and one of his legs injured, besides sustaining other injuries.

THE ARTISANS AND LABOURERS' DWELLINGS BILL.

It will not be this Session that an Artisans' and Labourers' Dwellings Act will be passed, urgent though the occasion be, as the Bill has been referred by the House of Lords to a select committee, notwithstanding the strenuous endeavours made by Lord Chelmsford, who introduced the measure to the House, to obviate this delay. The ground upon which the decision was based is that the Bill is crude and unworkable. Yet it passed through the House of Commons, and its principles have been approved of by a select committee of that House already.

Previously to the vote in the House of Lords, a numerous deputation, composed of representatives of the various local bodies of the metropolis, waited upon the Duke of Marlborough, at the Privy Council Office, to urge upon the Government the increase of taxation which the Bill will entail upon the metropolitan ratepayers, and its injustice upon the inhabitants generally. The minister in reply said, that since he had received a deputation on this subject some time ago, several facts had been brought under his notice and that of others, with more prominent light. He was bound to say that some of the sanitary provisions of the Bill were, in his opinion, of considerable importance. At the same time, facts had been laid before the Government of equal importance requiring deep consideration. Those brought before him to-day were not less so. The change of the local authority from the vestries and district Boards to the Metropolitan Board was one open to very grave question. He could not conceive, so long as rates were locally levied, that there was any advantage in spreading their expenditure over larger areas. Another fact that struck him as important was the burden of additional rates which this Bill imposed on the poorer classes. It had become now the custom to impose rates for all manner of purposes, until they had a number of people reduced thereby and constantly on the verge of pauperism,—on a precipice, as it were, ready to be toppled over. He was doubtful whether, considering this subject as a matter of political economy, it was good to allow Boards to build, and not leave it to the ordinary laws of supply and demand. He thought that, in a select committee, whatever was good would be retained, and an opportunity would be given the deputation to show what was needless or impracticable in their opinion.

THE AGRICULTURAL LABOURER.

A PAPER on the condition of the agricultural labourer has been read before the Society of Arts, by Mr. J. Bailey Denton, who stated, in the outset, that he thought it possible that a few words from a member of the Society who for many years had directed the operation of a large number of agricultural labourers, and who necessarily felt a great interest in their welfare, might have some influence upon those who are giving their attention to the means by which their condition may be improved. He then endeavoured to show that the position of the agricultural labourer was not so bad as many represented it to be, though no one could say that it was quite satisfactory; but with the profits of farming so low and uncertain as they were, it would be acknowledged, he thought, that the only way to justify an increase of labourers' wages would be by rendering the value of the labour given greater than it now was. Active hands, directed

by superior intelligence, already obtained wages above the mean, which he made out to be 16*s.*; and as there was greater scope in agriculture for the exercise of judgment than perhaps in any other trade or pursuit in which physical labour formed so great an element, owing to the diversity of its objects and the casualties which might affect them, there was no reason, he conceived, to doubt but that with an increase of knowledge on those points which alone could enhance the value of labour, the earnings of the whole class might be increased.

On the subject—the notorious subject, we may say,—of the Dorsetshire labourer, his hire, and his beer, Mr. Denton stated a case which his experience, in which Dorsetshire men were made to compete with Yorkshire and Northumberland men. He brought higher priced and competent men from Northumberland into Dorset, guaranteeing them 18*s.* a week instead of 7*s.* to 9*s.*, which their fellow labourers of Dorset were earning.

"As soon as the Dorsetshire men knew what the north-country men were getting, and saw the character of the work executed by them, they applied all their energies in imitation. At first they drank more beer, thinking that by such means they could do more work. They soon saw their error; and it was both amusing and instructive at the same time, to see how astrict they were when they found that the northern men had for their dinners good meat and bread, while they were living on bread, tobacco, and miserable beer or cider. It was by very slow degrees that the Dorsetshire men realised the truth that butchers' meat was more strengthening than bad beer. Eventually, by the example afforded them, the 'technical education' given them by the Northumberland men, and by the effect of improved food, the despised Dorsetshire men were enabled to earn as much as their teachers, and it was not long before I actually removed them into the North of England, to compete with Yorkshire men in the work they had learned; and the first place at which they were engaged was Swine, in Holderness, where there did not exist a public-house or a beer-shop in the village!"

THE BELLS OF THE CHURCH OF ST. MARY-LE-BOW.

THE well-known tower of Bow Church, in Cheapside—"the most splendid of all Wren's steeple compositions,"—contains a celebrated peal of ten bells, the weight of the tenor being 53 cwt. 22 lb., and its note C.

It appears that when Sir Christopher designed and built the present church he prepared the tower for the reception of twelve bells, but only eight were placed. At length "these got out of order; and in 1758 the citizens petitioned the vestry: the tenor bell being 'the completest in Europe,' and the other seven very inferior, they requested to be allowed, at their own expenso, to recast the seven smaller bells, and to add two trebles." This was permitted, after two celebrated architects had reported that "neither such additional weight, nor any weight that can be put upon the steeple, will have any greater effect than the bells now placed there." Accordingly the peal of ten bells was completed, and first rung on the 4th of June, 1762, the anniversary of the birth-day of King George III.

Having recently surveyed the bells, I give their several notes, weights, and inscriptions:—

No.	Note.	Weight.	No.	Note.	Weight.
		cwt. gr. lb.			cwt. gr. lb.
1	...	8 3 7	6	...	17 0 11
2	...	9 0 2	7	...	20 2 26
3	...	10 1 4	8	...	24 2 5
4	...	12 0 7	9	...	34 2 6
5	...	13 0 24	10	...	53 0 22

The first, second, third, fourth, fifth, sixth, and seventh of the peal bear the subjoined inscription, or some variety of it:—

"Lester and Pack, of London, fecit. William Gibson and James Pierrepont, Churchwardens, 1762."

On the eighth bell is:—

"The Rt. Rev. Dr. Thomas Newton, Rector. William Gibson and James Pierrepont, Churchwardens of Bow; Thos. and Jno. Stevenson, Churchwardens of St. Pancras Super Lane. Lester and Pack of London, fecit. 1762."

On the ninth we find,—

"Lester & Pack, of London, fecit. 1762. Wm. Gibson and Jan. Pierrepont, Churchwardens of Bow. Samuel Blackwell, Esq. gave 50*l.*"

The tenor is inscribed:—

"Samuel Lisle, D.D., Rector. Robert Green, Wm Cannel, Thomas Paris, Jno. Waldron, John Rufford, Churchwardens.

Bow Bell, 1699.
Re-cast 1738. Richard Phelps, Thomas Lester, Londoni fecit.

Wt. 53 : 0 : 22."

The tenor, or heaviest bell, like the tenor of Westminster Abbey, was made during the year 1738, in which Richard Phelps, the master founder, died. Thomas Lester then succeeded

to the business, and subsequently he took Thomas Pack into partnership: so that all the bells were cast at the Whitechapel foundry.

It will be observed that the tenor, being named after one of its predecessors, has "Bow Bell" inscribed upon it; and I may take occasion to remark that, "in the year 1463, it was ordained by a Common Council that the Bow bell should be rung nightly at nine of the clock,"—a vestige of the Norman *couvre-feu*, or curfew; and at length it was looked for anxiously by "the young men" pretensions and others in Cheape," as the signal for closing the shops; but the bell being usually rung somewhat late, as it seemed to them, "they made and set up a rhyme against the clerk," whose office was to ring it, as follows:—

"Clarke of the Bow-bell with the yellow locks,
For thy late ringing thy head shall have knocks."

Whereunto the clerk replying, wrote,—

"Children of Cheape, hold you all still,
For you shall have the Bow-bell rung at your will."

But, returning to the peal of bells now in the tower, I may state that a band of ringers, consisting of respectable members of the Society of College Youths, attended by the faithful steple-keeper, ascend the tower and give a performance every monthly Thursday evening. They also ring on certain festival and joyous occasions; and so skilfully are the bells hung, that even the extremely heavy tenor, when raised, is generally rung by one man, who, in common with other able ringers, stands as upright as a drill-sergeant.

Everybody has heard of Bow Bells, and many have well said that the present peal is the finest, or one of the finest, in Great Britain. I will, therefore, merely add that, although it can never be heard with due effect during the busy time of the day, the tenor alone is worth going many miles to hear. It is a magnificent bell, the grandeur and richness of its tone being truly chaurd.

THOMAS WALESBY.

MUNIFICENCE IN SHEFFIELD.

The erection of a block of buildings will forthwith be commenced at Hanging Water, which is at the end of the new road through Endcliffe Wood, for the accommodation of forty-eight poor people. The buildings will consist of thirty-six almshouses, the cost of which, about 24,000*l.*, will be borne by Mr. Mark Firth, the Master Cutler. Mr. Firth will provide for the allowance of 7*s.* a week each to the single and 10*s.* a week to the married occupants. The site will cover two acres of land. The charity will be open to the poor of all religious denominations. The plans for the building have been prepared by Mr. Hill, of Leeds, now of the firm of Hill & Swann, Sheffield. The design is Gothic, in the form of a double quadrangle, and the material rock-faced Green Moor stone, with dressed dormers and quoins. The houses in the centre wing stand back to back; those in the return wings are single. The middle of the centre wing is occupied by a small chapel for the use of the inmates, from which rises an ornamental tower. Adjoining the chapel is a house for the governor. The building is two stories high, and each house contains a living-room 12 ft. square, a bedroom of the same size, and a cellar, fitted for pantry and coals. Gas and water will be laid on to every house. Standing in a beautiful neighbourhood, the building will enjoy a warm, sheltered, sunny aspect, well suited to the residence of the aged and infirm.

NEW BUILDINGS ON PUBLIC THOROUGHFARES.

On the road forming the outer circle of Regent's Park, one of the most beautiful drives of the metropolis, about half-way between St. John's-wood Chapel and Primrose-hill, a new block of solid brickwork has been erected, which covers a space of 24 ft. by 10 ft.; it encroaches upon the driveway 8 ft., and upon the park side footway 2 ft.; at present it is carried up to a height of 8 ft., and is divided into three small rooms with separate entrances, having a fireplace and window to each. It is reported that a new main sewer is to be made on the line from Avenue-road to near Baker-street, and that these little chambers are intended for the use of inspectors and pay clerks whilst the works are

in progress; but the obtention of solid brick structures upon this favoured and well inhabited locality startles the residents, as the permanence of the structure would seem to portend a long continued nuisance and deformity to the drive. The driveway is of a nearly equable width of 40 ft., besides a footway on the side next the open Park, and also next the five terrace rangos round the circle.

In great public works, such as sewers and railways, much inconvenience must be suffered where demolition and subversions are actually necessary; but where only a new sewer of about half a mile in length is needed in a wide and fashionable thoroughfare, surely there is no necessity to erect three little offices in solid brickwork, when in the immediate vicinity much better and more suitable apartments might be had at 10*s.* a week.

Is there no parish surveyor for this locality? or has he no jurisdiction in a case where the Commissioners of Sewers are omnipotent—if in reality they are so? No such solid buildings have hitherto been imposed upon the Queen's highway; and as there is no occasion for the imposition or nuisance, the influence of the *Builder* is sought to shield the public against the innovation, as also to protect owners of property who have a stake in the neighbourhood like—

QUERRENS.

SPEAKING TUBES.

Sir,—In reply to "T. C.," speaking tubes according to his description might be of tin, zinc, copper, or iron; and if for vertical runs should be 1 1/2 in., or if for horizontal runs should be 1 1/4 in. diameter.

J. J. P.

GRINDING MONEY.

Sir,—It appears that county court judges decide cases without reference to rule or precedent; what is right according to one judge is wrong when brought before another. In the county courts, as in all other law courts, there is no code or system, and the English people have still to ask, without receiving a satisfactory answer, What is law? The question of grinding money has been many times decided in favour of the workmen. The remarks of the judge in the case reported in the last issue of the *Builder*, shows a manifest unfairness towards the plaintiff, and an ignorance of the methods of working in the building trades. In the first place, there is not a man in the trade that engages himself to work only for a single hour. It is well known that the introduction of what is called the hour system made no difference in the method of payment. When a man engages himself to an employer, he expects to stop till the job is finished; and there are few employers who would think of discharging a workman in the middle of the day. Were it otherwise, the building business would be in confusion.

The joiner, in relation to the other parts of the building trade, is in an exceptional position. He is required to carry a large number of tools to his work, which must be in working order. To keep them at their proper pitch, both time and labour are necessary, and therefore it is the rule of the trade that he should be allowed two hours' rest, or else the pay, when his services are no longer required; and it is for the interest of both parties that the rule should be maintained. It would be most unjust to keep a joiner at work till the last minute, when perhaps he had been working up old material, and every tool out of order.

A JOINER.

RAILWAY AUDITS.

Sir,—When one reads in the columns of the *Builder* of the sad *exposé* of the London, Chatham, and Dover Railway one feels disposed to ask whether it is not time for the protection of the public from fraud and deception that the affairs now of railway companies should be submitted to higher tribunals for auditing their accounts, when those who are interested with such matters in the railway companies lend themselves to every species of dishonesty, in order to hoodwink the public, who have been so unmercifully defrauded, and to check the system of railway contractors living like princes and building palaces at the expense of shareholders.

A SUBSCRIBER.

HERNE BAY PIER.

Sir,—Some time since hopes were thrown out that this pier was likely to be restored and opened to the public. I regret to hear that the efforts which were being made have been completely frustrated, and that there are now less hopes than ever of the pier being made what it ought to be,—an ornament to the town, instead of a disgrace. What is the reason? The proprietors are all very wealthy men, I believe; if so, why are they afraid to spend a few thousands? and why do they refuse to allow the townspeople to subscribe towards its restoration? If the pier is really to be left in its present disgraceful state, it is to be hoped that the merchants will carry it wholly away one of these nights, and rid the town of so unsightly and useless a structure, and leave us the neat beach of old times. Would the townspeople and visitors support or assist in starting a company to purchase the pier for constructing a new pier,—say, one of iron? There is no reason why it would not pay if properly managed. For one would find a helping hand and a few others to help as well. OBS. OF THE DISAPPOINTED.

WIDE TENDERING.

The following were sent in for new roads and sewers on the Brockley-lane estate, Forest-hill under Mr. Robert Walker:—

Hammerton	£10,434	8	10
Oliver & Rowland	6,000	0	0
Bilamy	5,560	0	0
King	5,484	14	0
Lean	5,233	10	10
Moxon	5,160	0	0
Porter	5,148	0	0
Blackmore	4,950	0	0
Fisher	4,946	0	0
Harris	4,680	0	0
Adamson & Paylor	4,660	0	0
Clarke	4,587	0	0
Morris	4,598	0	0
Strickson	4,500	0	0
Hanbard	4,345	10	0
Bloomfield	4,389	0	0
Ruff	4,318	4	10
Tinsley	4,220	0	0
Pizzey	4,200	0	0
Ossington	4,025	0	0
Turner	3,998	0	0
Brewer & Co.	3,555	0	0
Wainwright	3,510	0	0
Jackson	3,250	0	0
.....	3,200	0	0

It will scarcely be believed that these tenders were all made on the same "quantities!"

Sir,—Pray publish the following list of tenders sent in for the first portion of the restoration of St. Peter's Church, Great Berkhampstead. Mr. Butterfield, architect:—

Cook	£1,170	0	0
Harris	850	0	0
Nash & Matthews (accepted) ...	380	0	0

I think it my duty to inform you that the architect stated to the committee that the last tender but one was a fair one, but they accepted the lowest. Will some one explain how these frightful differences occur? A. B. C.

Sir,—Here are the extraordinary tenders sent in for the external painting, and the carpenters' work, in repairing and re-changing sashes, &c., at the Mile-end Old Town Workhouse. Mr. W. Dobson, architect. The quantities were not supplied:—

	Carpenters' Work.	Painting.	
Kelloway	£81	12	0
Walls, Gordon, & Co.	322	0	0
Patten	260	0	0
King	35	0	0
Leveston	13	0	0
Prescott	2	0	0
Hemby & Mann	38	0	0
Nor	25	0	0
Derby	21	0	0
Britton	10	0	0
Brown (accepted)	10	0	0
Mistry	70	0	0

A. Z.

Sir,—Will you insert the following specimen of wide tendering in the iron trade?—

For hot water pipes, and fittings for the heating of the Basingstoke Swimming Bath up to 80 degrees—	Mr. J. Curtis, Mr. G. B. Musselwhite, architect:—		
Ridd's boiler	£425	0	0
Temple	129	0	0
Hobbs, with Marriott's boiler (accepted)	125	0	0
Soper	32	12	0

TERMS OF CONTRACT.

VIGORS & PEO.

THIS was an action (Court of Queen's Bench) against Sir Morton Peto by a contractor who had contracted to carry away the materials extracted in making the excavations for the Metropolitan Railway Company; and the question was as to the construction of the contract, which was that the plaintiff should be paid at the rate of 1*s.* 4*d.* per cubic yard for the materials cut and carried away. The point was as to the meaning of the words "per cubic" yard—whether that meant the yard *in situ* (i.e., as the soil lay in the earth or the yard) as it was measured after excavation, when the materials were loose. The difference would be enormous—a matter of some thousands of pounds. At the trial, however, the plaintiff failed, the construction put upon the contract being adverse to him, evidence being adduced on the part of the defendant (which was objected to on behalf of the plaintiff, but received) to show that the phrase was understood by contractors in the sense opposite to that for which the plaintiff contended—viz., in the sense that a cubic yard means a yard of earth as it lies *in situ*. Upon this construction the plaintiff would already have been paid; on the contrary view, he would be entitled to recover some thousands more. The question was whether the evidence was admissible, and whether the plaintiff's view of the contract was the right one—that the cubic yard meant the yard of earth as it lay loose after excavation. The Lord Chief Justice pronounced the judgment of the Court in favour of the defendant. Taking the words as they stood, it might be that the plaintiff's view would be right; but taking them in the sense in which they were understood in the business, according to the finding of the jury (and the evidence the Court deemed admissible), the defendant's view was the right one—that "per cubic yard" meant the earth as it stood before excavation. The other learned judges concurred.—Judgment for the defendant.

mahe, M.P., will, with other noblemen and gentlemen, take part in the proceedings.

Hollington Church.—The font was given by Mr. E. W. Wyon, as stated in our last; but the architect is his son, Mr. E. Alexander Wyon.

DISSENTING CHURCH-BUILDING NEWS.

North Shields.—The chief stons of a new Lutheran Church has been laid here on the east side of the Borough-road, and not far from the quay. The building will consist of nave, 40 ft. long and 26 ft. wide; chancel, 15 ft. wide; small west gallery with external stone stair turret, west porch and large sacristy, communicating both with street and church. In general arrangements it resembles an English church,—chancel at the east end, with holy table raised on steps; priest's seat in north wall; stone arch between nave and chancel, and the pulpit placed on the south side of it, &c. The building is to be entirely of stone, and will externally present a west gable to Borough-road. The porch, projecting about 6 ft., occupies the lower part of the gable, and above this rises the stair-turret, to be finished with an ornamental gilded iron finial. On the north side of the porch are windows lighting the lower part of the church, and over these two lancet lights connected together by label moulds. Over these, in the upper part of the gable, is a circular sexfoiled window of large diameter. The south wall has buttresses with lancet windows between them. Internally the church is divided by roof principals into four bays or divisions, having moulded collars, rafters, &c., and ceiled with wood boarding laid to a trefoiled outline. The height from floor to wall-plate is 16 ft. 6 in. The chancel arch is of stone, resting on corbels with carved caps, &c., the font being built into the north jam. The east end of the chancel has a window of three lancet lights, which it is hoped at some time to fill with stained glass. The passages between pews and the chancel floor are to be laid with encaustic tiles. The seats will be of pine timber simply varnished, and in some places slightly stained. Provision is made for artificial lighting, ventilation, heating, &c. The church will seat 230 adults, and the entire cost of building, land, professional expenses, &c., will be about 1,350l. The contract for masons', plasterers', and joiners' works has been let to Messrs. Campbell & Goulson; for plumbing, to Messrs. Twizell; for slating, to Mr. Place; and for ironfoundry work, to Messrs. W. H. Walker & Son, of Newcastle. The church has been designed by Mr. F. R. N. Haswell, of North Shields, architect, under whose superintendence it will be erected.

Sunderland.—A new United Presbyterian Church is about to be erected in Toward-road, immediately adjoining the new park, Sunderland, from the designs and under the superintendence of Mr. Thomas Oliver, of Newcastle-upon-Tyne, architect. It will be in the Gothic style of architecture, with walling of local limestone and sandstone dressings.

STAINED GLASS.

Wellington Church.—Two stained glass windows have been put up in the chancel of the parish church, in memory of the late Mr. W. O'Connor, of London, were the artists. The windows are of the same style as the Oliver memorial window in the east part of the chancel, and fill the spaces formerly occupied by the doors of the north and south aisles. That in the north aisle contains a full-length figure of St. John the Baptist, and that in the south aisle a similar figure of St. John the Evangelist. Both windows have a border composed of the chain of office worn by the deceased as an officer of the Grand Masonic Lodge of Shropshire and North Wales, and at the upper corners of each window are the insignia of the rank held by the deceased in Freemasonry. Mr. J. Davies, architect, rendered service to the committee by undertaking to fix the windows, and that, although a subscriber to the fund, without charge. In addition to the windows, the committee have also presented a massive gold medal to the Wellington Rifle Corps, of which deceased was Lieutenant. This medal is to be competed for twice a year, and is to be called "The Anslow Memorial Medal."

Memorial Window to Sir James Graham.—The design of Messrs. John Scott & Son, of Ricker-gate, Carlisle, has been selected for the stained glass window to be erected in Arthuret Church to the memory of the late Sir James Graham. Various designs were submitted by stained glass artists in London and Newcastle. The window is divided into twelve principal compartments, and these will be filled with large figures of the Apostles attired in robes of contrasted colours. In the traceries are to be figures of angels playing on harps and other musical instruments, and in suitable positions in the design will be introduced emblems of the Brangellias. The ground-work of the design will be blue, which will be the prevailing colour, but a golden transparent canopy will give it a light and sparkling appearance, while the colours of the large figures will give variety of hue. The cost of the window will be between 200l. and 300l.

St. David's.—A chancel window has just been erected in this church. In the centre of the window is placed David, King of Israel, to whom the church is dedicated; on his right are Moses and Aaron, and on his left Elijah and John the Baptist, representatives of the Law and Prophecy. The figures are placed under canopies on a ground of geometrical tracery, enriched by a golden stain and bands and losses of colour. This window was presented by Mr. John Nicholls, the patron of St. David's, and was executed by Mr. T. W. Camm, of Smethwick.

SCHOOL-BUILDING NEWS.

Dunmow.—The new national school building has been publicly opened by the Bishop of Rochester. It stands on a rood of ground on the Dunmow Downs, the gift of the late Viscount Maynard. The materials are red brick with stone dressings, and the general style Decorated Gothic of a late date. The principal entrance-door, facing the east, is somewhat of Tudor character, with windows on the same front in keeping. The entrance, facing south, is a Perpendicular Gothic door, and the large windows facing south and east are Decorated Gothic. The ground plan is in the form of a T, the upper compartment running east and west, in length 62 ft., and that from south to north 56 ft., each being 21 ft. wide and 11 ft. high to the wall plate. The area in superficial feet is 2,457, exclusive of a class-room and lobby, with cellars underneath. The longest compartment will be the girls' and infants' school, and the other for the boys, with a movable partition separating the two. The architect is Mr. Gilbert G. Scott, jun. The contract was undertaken by Mr. William Franklin, builder, Dunmow; and the masonry was erected by Mr. A. Haselgrove, the brickwork by Mr. S. Johnson, the glazing and plumbing by Mr. J. Young, and the gas-fittings by Mr. Edwin Taylor, all of Dunmow. The freestone came from the quarries of Mr. Octavius M. Simpson, Great Casterton, Stamford.

Wilmslow.—The foundation stone of the new national schools at Wilmslow has been laid by the Bishop of Chester. These schools, the design of which has been approved by the Education Committee of the Privy Council, will comprise all that is required in a national day-school, with facilities and capabilities for parish or local meetings, lectures, &c. The boys' school-room, 42 ft. long by 20 ft. wide, is separated from the girls', which is 34 ft. long by 20 ft. wide, by folding doors, thus making one large room capable of holding 300 persons. Both of these rooms have class-rooms adjoining. The infant school is 35 ft. long by 30 ft. wide, and is entered by the same porch as the girls' school, on the north side of the building. The boys' porch is on the south side. At the east end of the building is the master's house. The site is a piece of glebe land sloping towards the south, and near to the church, with which old building, lately restored, in the Perpendicular style, the new schools have been designed to harmonize. They are to be built of grey brick, relieved by slight touches of red, in arches, band, string courses, &c. There will be accommodation according to the Government regulations for 120 boys, 100 girls, and 130 infants; 350 in all. The architects are Messrs. J. Medland Taylor & Henry Taylor, of Manchester. The cost of the schools and master's house, including value of site given by the incumbent (the Rev. F. H. Cope) is estimated at 2,500l.

Books Received.

Report to the Walton Local Board, on the Sewerage of the District, and Disposal of the Sewage of Walton and West Derby, by Irrigation. By GEO. WM. GOODISON, C.E. With an Appendix on Facts in Sewerage Farming. By READ & GOODISON, C.E. Ordered to be printed by the Walton Local Board, Liverpool.

The most generally important part of this report is the Appendix, in which an account is given of the public experience in sewage farming, and the principles of the utilization and purification of town sewage by irrigation. This is a subject we have frequently treated of, and at some length—even quite recently. Messrs. Read & Goodison give an interesting review of what has been done in this respect, even from old times, and in other countries besides England. Among the places referred to are Barking, Croydon, Chelmsford, Norwood, Bryn St. Edmunds, Edinhrgh, Carlisle, Rugby, Mansfield, Watford, Worthing, &c. The general subject of sewage treatment, with a view to the realization of an agricultural profit, is also considered. To take an illustration where, from the character both of the neighbourhood and the soil—the one covered with good houses and the other a stiff soil—the difficulties may be supposed to have been the greatest, South Norwood is an example of great success, the tenant of the land being so gratified with his farm, that he has offered to repay the Board the whole expense of the work on the condition of their granting him a long lease. The farm is 33 acres in extent. It receives the sewage of about 10,000 persons, and the purification seems all that is requisite. Forty to fifty, and even sixty tons of grass per acre are grown—15 ft. 7 in. in year, six cuttings being taken. The underdrainage originally carried out is now disposed with, and the water, after enriching the land, flows immediately into a water-course; and at the junction the stream from the farm was, say the reporters, when they saw it, much cleaner and purer to the eye than that flowing down the brook. The Norwood example—no longer an experiment—may very well be quoted as an encouragement to the authorities of inland towns who are in difficulties in connexion with this subject; and it is so quoted in Messrs. Read & Goodison's pamphlet, which ought to be well studied by borough engineers, town surveyors, and suburban farmers.

The Story of a Blind Inventor, Dr. James Gale, M.A., F.G.S., F.C.S. By JOHN PLUMMER, London: Tweedie, Strand. 1868.

Dr. GALE is the inventor of the non-explosive gunpowder process which we early brought under the notice of our readers. He has been blind since boyhood. He is fortunate in having an able biographer, although he is still in life. Mr. Plummer's object is to adduce an encouraging example of the power and value of self-help, to those engaged in the pursuit of knowledge under difficulties, by showing how perseverance and energy can vanquish the most formidable obstacles, converting impediments into so many stepping-stones towards success. The biography is written in an interesting way; and it gives an account of Dr. Gale's various inventions, especially his method of keeping gunpowder safely by temporary mixture with fine ground glass, for the prevention of explosion.

VARIORUM.

"THE Decked-well Fishing Boat, and Fisheries and Fish-market Reform." By Henry Dempster. London: Simpkin, Marshall, & Co. The improvement of fish supply to the metropolis and the country at large, as our readers know, has for years engaged our occasional attention. Mr. Dempster has done much to promote this very desirable object; and, notwithstanding the not very attractive form, of dialogue between himself and others, in which he has written his book, it contains much useful suggestion, especially as regards the enlargement and improvement generally of fishing vessels, and fish-market reform. The oyster question is also treated of.—"A Glimpse at the Social Condition of the Working Classes, during the early Part of the present Century; Trade Strikes; and Trade Unions." By the Author of the Autobiography of a Beggar.

boy. London: Heywood & Co." One object of this author is, speaking from long experience, to point out why strikes have in nine cases out of ten been failures, from serious errors in their management. Another object is to show that no combination of men can keep up the value of labour beyond its power to remunerate the capitalist; and that a high standard of labour may become in itself a tax upon the working classes by forcing up the price of all the common necessities of life. This we have often pointed out, and that it can only be during the transition from low prices to high in all branches of industry that some few can benefit at the expense of others. The unhealthy competition between reckless masters who have no respect either for the claims of their workpeople or for the rules which regulate the conduct of fair traders, and the reaction of such competition on the labour market, are also considered. The chief purpose of the author is to give advice to the working classes.

Miscellaneous.

THE NEW LAW COURTS.—In the Commons, Mr. Pease inquired whether the opinion of her Majesty's Attorney-General had been received on the legality of the award of the judges of designs for the law courts; and what was the nature of that opinion, if delivered to the Treasury.—Mr. Solator-Booth, in reply, said the award had been received, and the Government felt themselves at liberty to make any appointment they thought proper.

SEWAGE NUISANCE AT BARKING.—A memorial, signed by the vicar, the churchwardens, the medical men, and most of the inhabitants of Barking, has been prepared for presentation to the Home Secretary, setting forth the "grievous nuisance and injury" inflicted on the inhabitants of all the towns below London by the Metropolitan Main Drainage, and praying for an injunction against the Metropolitan Board of Works to restrain that body from discharging the sewage of London into the river Thames.

ALUMINIUM.—It would seem [as we asserted long ago] that so valuable a metal as aluminium, distributed (in the form of an oxide) more generally and plentifully over the globe than iron is, might be procured with no greater expenditure of labour, time, and money than iron. To be sure, we cannot apply the same crude means to the reduction of aluminium from its base, mother clay, that we can use in the reduction of iron; and this is just where scientific knowledge and practical talent are needed. We want the metal; the exigencies of the times demand its general use. It will readily combine with other metals, as copper, iron, gold, &c., and with them forms very valuable alloys. Some of its qualities seem to recommend the metal or its alloys as a material for minting, and others stamp it as of vast value in the arts. What we now need is its production in sufficient quantities and cheap enough to be employed in the arts.—*Scientific American.*

THE ENGLISH CHURCH ABROAD.—A year since the foundation of St. Andrew's Church at Compiegne was laid, owing its origin to an English lady, the Hon. Mrs. Russell Barrington. Its dedication to divine service took place lately in presence of a large crowd. St. Andrew's Church is built in a situation where, fifteen years ago, there was not a single house, but which is now dotted with picturesque villas, and the church adds to the attractiveness of the beautiful avenue on the borders of which it stands.—The vast influx of English visitors during the last few years to the various towns on the Mediterranean shores of France and Northern Italy has called for a large increase in church accommodation. There are two English churches at Nice, two at Cannes, and two at Mentone; one is about to be erected at Hyères and one at St. Remo. The church in the western bay of Mentone was opened during the past season, and a gratifying proof of the feelings of the English visitors towards the architect, Mr. William Barber, of Leicester, son of the officiating clergyman, has just been shown in the presentation to him of a testimonial with a suitable inscription. The testimonial consisted of a handsome clock, representing an ecclesiastical building in the Early Lombard style, and a pair of candelabra to match. Mr. Barber has since been appointed architect of the two projected churches referred to at Hyères and San Remo.

LADY DE ROTHSCHILD'S INDUSTRIAL EXHIBITION. The arrangements for the inauguration, by the Premier, on Whit-Monday, of the industrial exhibition to be held under the auspices of Lady de Rothschild, in the grounds of Hulton Manor House, near Aylesbury, are now complete. The prize medals offered to successful exhibitors are valued at 500*l.*

A PANIC IN THE DOME ASSEMBLY ROOM, BRIGHTON.—On Sunday evening before last, a congregation which assembled in the Pavilion Dome for short evening services, was thrown into a state of great alarm, and exposed to some danger, by a panic originating in the following cause:—The large centre chandelier had, it appeared, been undergoing the process of cleaning during the week, and the work not being quite finished, some of the strings of lustres were temporarily fastened in their proper position for the evening in question. These lustres are glass drops, strung together like heads; and in the course of the service one of the strings came unfastened, and the lustre descended in a shower upon the heads of those who were kneeling beneath the chandelier, and who, greatly alarmed by the falling drops and the rattling of other pendants, screamed and rushed in terror towards the doors. Fear spread throughout the congregation, numbering about 2,000 people, who were moving simultaneously with a view to escape, when Alderman Martin, seeing the cause of the alarm, called upon them to resume their seats, and having explained the trivial character of the accident, order was restored. Only one entrance to the room was open, the others being locked; and the crush at this point was very great.

A NEW BRANCH OF INDUSTRY.—Sheep draw from the land on which they graze a considerable quantity of potash, much of which is ultimately excreted from the skin with the sweat. It was pointed out by Chevreul that this peculiar potash compound ("suint") forms no less than one-third of the weight of raw merino wool; while, of ordinary wools, it constitutes about 15 per cent. of the weight of the fresh fleece. As the "suint" may be extracted by mere immersion in cold water it is easy for the wool manufacturers to produce more or less concentrated solutions from which the potash may be recovered by appropriate treatment. The development of this new branch of industry is principally due to M. Maumené and Rogelet, and their process is probably in operation at most of the great seats of wool manufacture in France. The wool manufacturers of Rheims, Elboeuf, and Formies annually wash the fleeces of 6,750,000 sheep, and the amount of potash, reckoned as carbonate, which these fleeces would yield, if all subjected to the new process, represents a value of 80,000*l.* But M. Maumené and Rogelet calculate that there are seven times as many sheep in France as are included in this estimate. The practical and very obvious moral supplied by these facts (says the *Quarterly*) does not yet appear to have penetrated the mind of the British farmer.

THE NOTTINGHAM PATENT BRICK COMPANY (LIMITED).—The new works of this company have been formally opened in presence of a considerable number of influential men of business and other gentlemen. The works are situated about a mile and a half from the central part of Nottingham, and in a declivity on the left-hand side of the Carlton-road, where there is plenty of working material within an easy distance, and a large quantity on the spot itself. The kiln, which is a very large one, has been built according to the designs of Messrs. Hoffmann & Leight, of Berlin, who have patented them. The new company have also availed themselves of the "Wakefield Grinding Pan" (as it is called) and the "Dry Brick Machine and Disintegrator," and the "Dry Brick Machine and Disintegrator," of Platt, Brother, & Co., of Oldham. As regards the machinery, which is upon a large scale, the managers have adopted the latest improvements. The estimated daily production of bricks will very shortly be 20,000. Upon the new plan the clay is at once dug out of the bank, put into trucks, thence into the grinding-pan, and, in an almost incredibly short space of time, it is reproduced as dry bricks, which are ready for being wheeled into the kiln, where they may be burned the same day, instead of after a delay of a month from the winning of the clay. There is also an immense saving in the expense of fuel. The spectators at the opening seemed greatly surprised at the expedition with which the raw and unprepared clay was converted into complete and well-shaped bricks.

THE METROPOLITAN BUILDINGS AND MANAGEMENT BILL.—There is not the slightest probability that this Bill will be brought into the House of Commons during the present session. We should have expressed our opinion of it before now if there had been.

DUKE OF BUCCLEUCH'S COMPENSATION.—Judgment has been given for the Duke of Buccleuch in his case against the Board of Works. The duke will therefore be entitled to the $\$325*l.*$ awarded him by Mr. Pollock as compensation for the injury done to the dual mansion by the building of the Thames Embankment, as well as to 20*l.* for interest and the costs of the preceding trial.

NEW PEALS OF BELLS.—A peal of six bells (tenor about 11 cwt.) has just been completed at Clifton, near York. They were made at the foundry of Messrs. John Warner & Son. Three bells recently erected for Sir T. Brown at his new church, Sheffield, were made by them also; and it is intended to increase the number to eight bells at a future time. Messrs. Warner's men are now employed erecting a peal of bells (tenor about 10½ cwt.) at Hunsingore; Messrs. Kirk & Parry, Sleaford, architects.

ROYAL HORTICULTURAL SOCIETY.—The great rhododendron tent in the gardens of the Royal Horticultural Society at South Kensington was opened to the public on Wednesday, and, notwithstanding the fact of its being the Derby day, attracted a large attendance of visitors. The plants this year are supplied, as usual, by Messrs. Waterer & Godfrey, and the ground under the great tent has been entirely re-arranged, under the superintendence of Mr. John Gibson, of Battersea Park, and Mr. Eyles, superintendent of the South Kensington Gardens.

MR. HENRY LESLIE'S CHOIR.—The present season of this choir was brought to a close on Wednesday night by a concert at St. James's Hall, which fully sustained the high and continually-advancing reputation and standing it has obtained in the musical world. It may safely be said that no finer concerted or choral singing, unaccompanied by instruments of any kind, can be found in the metropolis than that of the "Leslie Choir." The indefatigable efforts and thoroughly artistic abilities of the conductor have been well responded to by the members of the choir.

THE WYRE-HILL HOME MISSION SCHOOLS, BEWDLEY.—Old Bewdley, or the "Bewdley St. Giles's," being greatly in want of religious ministrations, about eight years ago a Miss Pountney conceived the idea of devoting her time and energies to the amelioration of her poor neighbours. Mr. Ryland (his present poor neighbour) came a few years since to reside in Bewdley, and one night, taking a walk up the steep and rugged cartway, once the main thoroughfare from Wales, was surprised to hear the sounds of divine service issuing from an old dilapidated building. He gently opened the door, and was astonished to see a young woman, surrounded by a number of navvies and smock-frocked labourers on their knees fervently engaged in prayer. He closed the door, and, as he walked away, resolved that if ever he was in a position to call upon the public for aid to erect a more suitable room for Miss Pountney's use, he would take the first opportunity of doing so. As soon as Mr. Ryland was appointed mayor he mentioned the subject of erecting a more suitable building for Miss Pountney's use to the Rector of Ribbesford and Mr. Thomas Bangh, J.P. These three gentlemen at once formed themselves into a committee for the purpose of carrying out Mr. Ryland's idea, the mayor being appointed chairman, the rector secretary, and Mr. Bangh treasurer. The result of their appeal to the public was most encouraging: from the humble almshouse-women, who subscribed their pence, to her Majesty the Queen, who subscribed 30 guineas, they appealed to none in vain. Mr. Thos. Lloyd Roberts, of Crofton Manor-house, gave the ground for the site of the building, and Miss Pountney has just had the pleasure of laying the corner-stone of a building that will long perpetuate the memory of her labours. The mayor handed to Miss Pountney an elegant silver trowel, bearing the following inscription: "Presented to Miss Pountney, on laying the corner-stone of Wyre-hill Home Mission Schools, Bewdley, 18th May, 1868. W. H. Ryland, esq., mayor." The trowel was the gift of Mr. T. F. Parry, of Birmingham, the architect for the schools.

The Builder.

VOL. XXVI.—No. 1322.

Gleanings from French Gardens.

It is not in the sunny, mellow, musky gardens attached to the grand old French châteaux that we must look for improved modes of gardening. It is where gardening comes within the range of commerce, where fruit and vegetables are grown to be sold, and a fortune made out of the process, that French gardeners have made strides, especially in rapid rotations of crops and in economy of space, that we ought to examine to see if the same management will benefit us. In January, 1867, Mr. Robinson visited France, to study its horticulture for this purpose. He found, as we have stated above, that large private gardens, as a rule, were not so well kept or productive as those in our

country; but that where a supply for the markets was cultivated we were left far behind. In city gardening, too, the French take the lead of us; and also in the decoration of apartments with plants. He has now published his observations in an illustrated volume, in which he details the various processes that have brought about the remunerative state of things in operation.* We purpose glancing at a few of these in which constructive works are called for, leaving the details of culture to be found on reference to Mr. Robinson's very useful, careful, and timely work.

First, as to fruit. Why are our peaches and pears so inferior to those grown for us in France? Not because there is a slight difference in the climate, but because every good French fruit-cultivator does not rely entirely upon this advantage, but takes every means to equalize the sap, and keeps every tree under control. Moreover, observes Mr. Robinson, "there is not a good fruit-garden in the neighbourhood of Paris but has its walls protected by a wide temporary coping, while in numerous cases with us there is no protection at all, or but a very imperfect one. This fact speaks for itself." We think it does. If peaches and pears require this protection in the more genial climate across the Channel, how can gardeners hope to grow them in equal perfection here without it? With similar care paid to the fruit many parts of England and Ireland could grow as fine peaches as ever were grown in Montreuil, says our

author emphatically. The construction required for the cordon system is of the most inexpensive kind. It is minutely illustrated in the volume before us. A simple galvanized wire, not thicker than strong twine, is extended at a height of a foot from the ground, and supported there by oak or iron uprights. To this wire the fruit is trained. By this means in France the apple is grown as an edging to the quarters in kitchen and fruit gardens. The term *cordons* is explained by a quotation from a letter from M. du Brossil, who claims to be the inventor of the mode of training in question. It is derived, he says, from the word "cord," and was applied by him to trees pruned to consist of a single branch, bearing fruit spurs only; this necessarily has much the appearance of a cord or rope of fruit. He regretted the long period that must elapse before a wall could be profitably covered by the larger form of trees, and invented this mode as a means of securing a more rapid and early return. The bilateral cordon or tree on which two branches are allowed to grow upon the stem, and departing from it in opposite directions, our author recommends as a means of covering the bottoms of walls, bare spaces between fruit-trees, or in front of pits, or other spots generally seen wasted in our gardens. The fine dessert apple, the Colville Blanche, most suitable for such positions, sells in Covent-garden for half-a-crown, and sometimes three shillings for each fruit. At Versailles a border of cordons has been tried; that is, three graduated heights of wire have been raised on the border before a wall covered with fruit, that nearest the wall being about 3 ft. high, the intermediate one 2 ft., and the lowest and farthest from the wall 1 ft.; but the shade given to the fruit on the wall by the highest cordon Mr. Robinson considers a disadvantage, and recommends that the three lines of cordons should be all 1 ft. from the ground. The wires for cordons are tightened, and thereby straightened, by a little contrivance, scarcely to be accounted a "machine," as it is called in the text, known as a *raidisseur*. It is a small oblong galvanized iron frame, about 3 in. long, through which passes an axle with a hole in it, and the wire is passed through a hole in the frame and then through that in the axle, when it is wound up and tightened just as a guitar string is wound round its peg,—only, instead of turning the axle with the finger and thumb, a key is used. Mr. Robinson strongly advocates the French mode of wiring all walls destined to grow fruit, as much neater, cheaper as far as labour is concerned, and much more durable than our mode of nailing with shreds of cloth; and as the French fruit-growers are supplied by the wire from this country, we may conclude that it would be even cheaper to us than it is to them. A row of strong iron spikes, at equal distances one above another, driven into the right angle formed by two walls, is all that is required to fasten on the wire, and all that is wanted for its support is that it should be threaded through iron hooks, which should also be galvanized, placed at regular intervals in straight lines. By this plan there are no holes made in the walls for insects to harbour in, and our author estimates that a man may do as much work along a wall thus wired as he could in six with the old nail and shred plan.

We perceive Mr. Robinson advocates "a new and cheap method of making garden walls." This is the concrete walling. Like the galvanized wire, our author found it first in use in Paris, but on inquiry learned that it was of English origin. The concrete is placed in position by the use of two frameworks of boards set up to the size of the wall required. When ready, the concrete is thrown into the space between the two surfaces of boards, and in twenty-four hours is hardened sufficiently to admit of their removal, when the framework is readjusted to form a further length. In some districts where there are great masses

of clinkers thrown out from furnaces this kind of wall could, doubtless, be run up at a very small expense. Our author considers that fruit-trees could not be in a more excellent position than upon a wall of this description, smoothly plastered, and wired as above. "The temporary coping taken off after all danger from frost was past, every leaf would be under the refreshing influence of the summer rains, all the advantages of walls as regards heat would be obtained, the syringing engine would not be counteracted by countless dens offering dry beds and comfortable breeding-places to the enemies of the gardener and the fruit-tree, while the appearance of the wall would be all that could be desired." The temporary coping alluded to should be formed of narrow lengths of tarpanin nailed on cheap frames from 6 ft. to 8 ft. long, and about 13 in. wide. "The use of such," continues the author, "on the walls devoted to the culture of choice pears, peaches, &c., would result in a marked improvement. The temporary coping has a great advantage in being removable, so that the trees may get the full benefit of the summer rains when all danger is past, and not suffer from want of light near the top of the wall, as they would if such a wide protecting coping were permanent." The netting and canvas protections in use in some English gardens is not, he considers, to be compared to this. A suggestion is made that there should be a smaller permanent coping of slate slabs or concrete strengthened with flat iron bars running across it; but neither of these copings, as shown, would bear a ladder against it. Nor should we like to guarantee the stability of concrete walls, of the dimensions mentioned, 9 in., 7 in., and even 6 in. thick, and 9 ft. and 12 ft. high, in a gale of wind without buttress supports at intervals.

There is a French mode of glazing iron greenhouses specially commended. Instead of overlapping the panes they are made to meet evenly, any little interstice there may be being filled with a particle of putty; and on the outside strips of thin lead-paper are laid over the junctions. The strip of "lead-paper," which is probably thin lead, is said to have a silvery appearance, and to have the effect of sealing the houses almost hermetically. We are told, too, of improved fruit-shelves:—

"Instead of being confined to wide shelves or benches all round, as is usually the case, there were several sets of shelves arranged along the room—rather narrow, sloping oak shelves—supported by oak uprights. These shelves are wide enough for five rows of pears on each side, and on such a slope that the pears rise gradually, like after line, so that the eye could see each fruit with ease, without bending or distorting any, and of course this was a great gain. But the careful constructor had gone further, by making the slight concavity upon which each line of pears rested of two laths, so that the air could flow up between them. No single fruit was allowed to touch its fellow, and thus they were in a very much better condition than in the British fruit-room, where all are frequently packed tight together, and the good ones often liable to get tainted by the bad. This was in the pear-room at Baron Rothschild's, and a more pleasing sight could not be presented to the lover of a garden—the successive shelves of splendid fruit being so arranged that every individual pear could be examined without touching one."

The French have already made an experiment in planting railway banks with fruit-trees. Mr. Robinson went to see eight leagues so planted along the line from Gretz to Colomniers, on the Chemin de Fer de l'Est. The fences of galvanized wire is in operation here, and pear-trees are trained on it so that their branches cross each other as in trellis-work. In some parts the fence is of wood, the planters reckoning that before it decays the trees will be so firmly intertwined as to support themselves. But only a single line on each side of the railway was planted, leaving a large amount of waste space still, which the author would have occupied by dwarf trees. He quotes M. Ballet: "It is quite possible and very advantageous to establish neat hedges of pear-trees more or less regularly trained. By planting them rather close together a quick result is obtained. At first it would be desirable to train the trees, as shown in the cut (exactly like trellis-work), so as to secure a dwarf-spreading tendency, but

* "Gleanings from French Gardens, comprising an Account of such Features of French Horticulture as are most worthy of Adoption in British Gardens." By W. Robinson, F.L.S. London: Frederick Warne & Co. 1868.

after a time they might be allowed to grow like any common hedge, and even clipped with a shears. They should be planted at about 4 ft. apart." This eminent French authority recommends this arrangement for railway banks as it will resist the strongest winds. Mr. Robinson suggests that we should grow figs on the sunny banks in our southern counties; and that, instead of planting one continuous fence of fruit-trees without reference to the soil or situation, as the French have done in their experiments, we should consider both and take only the more desirable spots along the lines at first.

Not only are our sunny railway banks wasted, except by enterprising railway porters at rural stations, in tiny plots, but we throw away our available spaces as though our "right little island" was the vast continent of America. Not only miles of garden-walls are left bare, the lower exterior walls of hot-houses left bare, and great blank spaces left bare, where there are fruit-trees grown at distant intervals, whereas the most skillful cultivators in "La helle Franco" arrange their branches alternately, and their trees so closely, that the branches of one run in between those of another, making the wall as green as a meadow; but we throw away other opportunities. It seems any one who has a cave or cellar, old box, tub, or tea-chest, can cultivate mushrooms if he will. Any one with the smallest garden can have salad all through the winter, by the use of the same means French growers take, which is simply to cover their salads with bell-shaped glasses, beneath which the lettuce or other salad flourishes in frost or otherwise, as in a Wardian case. Any one, as we have seen, may greatly increase the productiveness of his fruit-garden if he choose to take the same means French fruit-growers take, and the same means. In fine, we might very materially improve our condition in this respect if we thought well to set about doing so. There is no reason why peaches should not be sold about London streets for the same price as oranges, or for a halfpenny a-piece, as in Paris. The peaches sold in Paris are grown on walls in the neighbourhood; only every foot of the wall is utilised, and care is taken, by the protection described above, that the crop is not blighted every other season, or more frequently still, by frost.

The sum and substance of Mr. Robinson's book is a reiteration of our lost opportunities, our wilful waste of wall-spaces, our bungling, expensive, extravagant ways of gardening, all tending to make fruit a luxury for the wealthy only,—for those who can drive to Covent-garden and select it at a cost as high as though it had been "guarded by dragons to brighten the gardens of kings." When he has made our errors patent, he shows us how fruit-culture is managed in France by those who have attained the most success in it; and shows also how profitable it is to them, and how laudible it is for the public. But he also draws attention to the superior appearance of the French public gardens and the details that have conducted to it. And here, again, the French have naturalised a production of Great Britain, and shown that they can appreciate it, if we cannot. This is the common Irish ivy. The borders in the private garden of the Emperor at the Tuileries, as well as the more public part of the grounds, are all edged with beautiful dark green glossy bands of the Irish ivy. It may be seen again in the gardens of the Louvre, and in the Luxembourg Gardens, where it is trained to fall in wreaths from tree to tree in the avenue bordering the long basin of the fountain built by Catherine de Medicis. The municipality of Paris begrudge no expense in the purchase of trees and plants, nor in floral decoration. Mr. Robinson says one ball at the Hôtel de Ville, in the festivities of the past year, cost considerably over 30,000*l.* Ten thousand plants are sometimes taken there for one evening, in vases furnished with stoves and flat hot-water pipes. "As soon as a new road or boulevard is made in Paris, in go the trees, and every one of the millions is as carefully trained and protected as a pet tree in an English nobleman's park." Each tree is protected with a cast-iron grating, to keep the ground from becoming hard. The kinds chosen are the plane, chestnut, large-leaved elm, the Robinia, Alantus, and *Paulownia imperialis*. Of course the author seizes the opportunity to press that the Thames Embankment should be endowed with these most agreeable ornaments. The nurseries in which the plants, trees, and shrubs are reared for the principal gardens and streets, their boulevards, their river-banks, and radiating avenues, are immense

establishments, with every possible appliance. There is one for tender plants at Passy, another for trees and shrubs in the Bois de Boulogne, and a third for herbaceous plants in the Bois de Vincennes. The gardens of the State grow their own supplies. About 3,000,000 of plants are annually furnished by the first-mentioned propagating establishment for the embellishment of Paris. Everything is on a large scale. Sixty men can work at the hench in the potting-shed. Eighteen iron and glass-house buildings have just been completed, and sixty more are ordered. Then there are numbers of houses 80 ft. and 100 ft. long, filled with one variety of plant, 30,000 being the "opening quantity" for any novelty. 50,000 cuttings of one kind of fuchsia are inserted at a time. And besides the wholesale numbers of plants grown above ground under the gardens. Wherever stone is taken out of the ground for building purposes, a rough prop is left here and there sufficiently strong to support the superincumbent soil, and the quarry thus becomes a large cavern, which affords protection for the storing of choice plants. The Parisian gardener's varieties of hardy outdoor plants is much larger than ours. We do but little with palms, for instance, though there are kinds that are quite hardy enough for our climate: nothing with bamboos and bamboo-like plants, though many spots in the south of England and Ireland could grow them well: very little with the Yucca, or Adam's Needle; very little with several fern-like plants that are hardy and yet ornamental; in fine, it is clear that the list of hardy herbaceous, as well as annual plants, suitable for our public gardens, may be materially extended. While our enterprising and tasteful neighbours have the keenest appreciation of the beauties of numerous plants unacknowledged by us, they have but one idea about the floral decoration of cemeteries. That one idea is the wreath of everlasting. Faded, worn, wan, often wet, and rotten, these memorials, hanging, or lying, or fixed, on every tomb, have a most miserable and depressing effect. We respectfully suggest to M. Haussmann that he should take these places in hand, and not leave Death to be associated with such ghastly, dreary, harrowing associations. Mr. Robinson's eyes are not so dazzled by the remarkable productiveness of French gardens, nor by the glories of the public pleasure-grounds, nor by the tastes displayed in private establishments, but that he can see the wretched aspect of the cemeteries. Indeed, his work is written in a fair spirit, and his strong desire to bring the superior fruits of the earth within the means of the million, combined with the pains he has taken to show how this may be done, entitles it to our hearty recommendation.

A LIMIT TO THE ARCHITECTURAL DEVELOPMENT OF CAPITALS.

THERE is a question which not unfrequently intrudes itself on the reflection of the architect, and which, repeatedly cast aside for the consideration of more practical demands on his attention, is apt often to recur, despite of its vague and shadowy nature. It is a question of which the solution is at present impossible, in default of sufficient data on which to base the inquiry. And yet it is one that is not without influence on the whole course of structural progress and of architectural development, for it involves the elements of durability and of adaptability, two of the chief considerations in design. The question is that of the natural or possible limit to the growth of our great cities. For how long can they continue to double their area within forty years? By what agencies can such a rate of progress be arrested? And what would be the state of stagnation or of decay that would ensue on the arrest of growth?

The question is forced on our consideration at the present moment by echoes of discontent and disquiet from the banks of the Seine. Over the mathematically-drawn streets and wide and stately boulevards that own M. Haussmann as their creator there flits a shadow that seems to tell of an approaching storm. A shadow of the same tint, and direction, and origin, is to be traced in almost every part of the map of Europe. Indeed, the gloom is very rapidly closing in; the bright points are hourly diminishing in number, in size, and in illumination; and the gay streets of the capital of modern civilization seem already to be thrilled by that often

remarked shudder that is the usual precursor of a gust of tempest.

The exact form of this menacing shadow, and the relation which it bears to the question of the present size and the future extension of the French capital, and which thus throws incidental light on the probable history of our own, is this:—How soon will it be too expensive to live in Paris? How soon will the increasing pressure of rent and municipal impositions force the poor man, or the man of moderate income, outside of the *enceinte*, and beyond the limits of the ever-extracting *octroi*?

It appears that the *Crédit Foncier* (an institution which differs from the unfortunate *Crédit Mobilier* and other enterprises formed for the purpose of supplying an artificial maternity to wealthy speculations, inasmuch as it is supposed to attach the roots of its prosperity to the very soil of France) has entered into treaty with the city of Paris to supply funds for the building operations of the next decade. The amount thus to be furnished is differently stated by different authorities, all, it would seem to a foreigner, equally worthy of respect. The Minister who is regarded as the *porte-voix* of the personal Government spoke of 15,500,000*l.* (of course we reckon in sterling).

A member of the Municipal Administration, in a report at the close of 1867, arrived at 18,000,000*l.* A later authority, a councillor of State and Government commissioner, rather exceeded 18,500,000*l.* But, apart from estimate, and at the commencement of the decennial period over which it was proposed to distribute that expenditure, it seems that the *Crédit Foncier* has already discounted, or advanced money, to the amount of nearly 16,000,000*l.* sterling on the hills, *titres*, or *bons de délégation* drawn on this account on the municipal treasury. In addition to this, upwards of 2,000,000*l.* sterling have been advanced on similar security by the *Société Générale*, the *Crédit Lyonnais*, and the public.

To repay the advances of the *Crédit Foncier*, which, according to the principles of that institution, were regarded as a loan—that is to say, as a sum lent, and to be repaid in its integrity at a fixed date (this differing from that national, never-to-be-repaid subscription, which is also sarcastically termed a loan,) a charge of 2,000,000*l.* sterling *per annum* now weighs on the city of Paris. This, of course, is only an item in the account which will some day have to be summed up of the expenditure of the present enterprising Prefect of the Seine. Besides the *bons de délégation*, we find ranking against the ratepayers of the French capital, bonds of the famous year 1852 for 2,000,000*l.* sterling; from 1855 to 1860, for 8,750,000*l.* sterling; for 1865, for 12,000,000*l.* sterling; and the bonds of the "Fund of Public Works, Paris," for 4,800,000*l.* These sums form part of the 80,000,000*l.* sterling which have been raised and, as it is called, borrowed, by the towns, departments, and communes of France, during the sixteen years' life of the Second Empire. It is, therefore, not surprising to find that the annual charge of the *délégation* bonds presses somewhat uneasily on the good city, and that there is a proposition now under consideration to extend the time for the repayment of this considerable sum over a period of sixty years, instead of the ten years stipulated for in the existing and, as it should seem, somewhat irregular, treaties. The immediate inducement for this alteration in the character of the responsibility is not slight, being no less than the saving of an annual sum of 29,000,000 francs, which has to be defrayed out of the heavy *octroi* duties of Paris. But the shape of the change proposed has been defined, in a line thus:—That the population of Paris, instead of paying 20,000,000*l.* sterling within ten years, shall pay nearly 52,000,000*l.* sterling in extinction of the same debt within sixty years. This may be called paying for a long day with a vengeance.

It may be as well to point out that under the French laws there does not exist that happy immunity for the escape from pecuniary inconvenience that prevails under our own more liberal institutions. We have seen within the last week or two the account of the manner in which the directors of a certain famous undertaking horrified 533,000*l.* from the public in direct defiance of the law, and in the absence of any property, of any description whatever, on which the so-called loan could be legally based. Had this taken place in Paris, instead of London, the parties to the transaction would before this time have been condemned to the repayment,

from their own private resources, of the entire principal and interest of which the public had been thus irregularly eased, and would probably have been sentenced, into the bargain, to some such short term of imprisonment as the French judges are accustomed to add, by way of salt, to sentences of pecuniary mulct.

The very *idé mères* or nursing mother of all credit and finance companies, the child and sister of the lower Empire, the *Crédit Mobilier* itself, is even now affording an example of this wholesome vigour of the French laws. In the flush and glow of a prosperity too rapid, too vast, and too dazzling to be thought capable of reverse, the directors of this great financial association, with some slight irregularity of procedure, doubled their capital.

While Fortune smiled, and the run of luck held good, the fortunate possessors of the new (and irregular) shares were only too thankful to lay hold of them. When the aspect of things changed, and the fairy gold returned to its original form of withered, or even of poisonous, leaves, they thought it well to make inquiries, to take that legal counsel which would have been spruned in the palmy times of premin. The consolation and advice given by the men of law, if we may be allowed to condense them into four words of vernacular English, were simply, "Go at the directors." At the directors accordingly the discontented shareholders went, and the result has been the condemnation of those once famous capitalists to refund, out of their own resources, the money paid for these new and irregular shares. The judgment actually given by the tribunal at Amiens only covers the sum of some 2,000*l.* for which the action which it decided was brought, but the decision applies in principle to the whole sixty millions of francs of the new issue. The verdict will not be allowed to take effect without appeal, but the only form in which we have as yet seen any attempt to set aside the decision has been somewhat in the form of an appeal *ad misericordiam*; those directors who acted rather as sleeping partners in the concern representing that they should not be visited with the same rigorous measure of retribution as those who were the guiding spirits and active managers of the whole enterprise, such as the Messrs. Percire and M. le Duc de Galliera. To this it is rejoined that the public know nothing of the distinction between acting and ornamental directors, that the appearance of such a name as that of M. Chevalier was a point that commanded public confidence in the management, and that there can be no excuse from liability merely on the ground of misfortune.

The law thus laid down, and as yet uncontradicted, by the Tribunal of Commerce at Amiens, stringent as it is in its operation, is not more so than our own. To say that the Bench of this country is as fearless and upright in the discharge of the judicial functions as is that of France would be a very mild way of stating an uncontradicted truth. It shows, therefore, a remarkable difference in the tone and the temper of French and of English shareholders that the formidable weapons provided by our own legislature against defaulting or fraudulent directors should have been allowed hitherto to rust in desuetude. By the Consolidated Statute Law of Larceny and other similar offences, any director, manager, or public officer of any body corporate or public company guilty of making, circulating, or publishing any written statement or account which he shall know to be false in any material particular, with intent to deceive or defraud any member, shareholder, or creditor, or to induce any person to become a shareholder in the company in question, or to advance money to the same, is made subject to the penalties of misdemeanor, and to penal servitude for from three to seven years, or imprisonment, with or without hard labour and solitary confinement, for two years. If, therefore, it should continue to be the case that the directors of the *Crédit Mobilier* are the only irregularly-acting trustees who are called to give a legal account of their stewardship, there are many men in this country who will have great reason to felicitate themselves that their recommendation to the debtor of two hundred talents to take his bill and sit down quickly and write fourscore has been rather commended for its acumen, than rightly rewarded for its dishonesty, by the great master, the Public.

It is pretty clear from this example of the operation of French law, that the bonds, or *bons*, or *titres*, or obligations under whatever name that the last sixteen years have been tied round

the neck of the unfortunate residents, who can obtain no article of household consumption that has not to pay the charges of the *octroi* of the city of Paris, have been tightly tied, and that nothing but a revolution, of a much more sweeping and convulsive nature than the mere fall of a dynasty, or exchange of republican for monarchical or other form of government, can apply the sponge to such liabilities. If the present harden be so great that a delay of fifty years in the repayment of a portion of the loan absorbed by the operations of M. Haussmann must be secured at an ultimate cost of thirty-two millions sterling,—for such is the result of the statements on the subject which have been published in this country,—what must be the intensity of the present! The great advantages of residing in a capital, viewed as a centre of business, are capable of pecuniary evaluation. Against these are often to be set others which money cannot readily purchase, especially the greater health and vigour attainable by sleeping in pure country air. The railways, while hitherto they have tended to augment the population of our great centres of industry by the enormous stimulus which they have afforded to business of all kinds, may yet evince a compensating power. As residence becomes rindly and intolerably expensive, travelling will come in aid, and country residence, with railway transit to and from a mere city office, will seriously interfere with the increase or even the maintenance of the number of city residents. To some extent this influence may even be made the subject of calculation and of prediction. The area available for residence increases as the squares of distance from the central point, the rates of fare are fixed and readily ascertainable, and the probability is that the ample returns which have been found to attend extremely low fares, coupled with proper accommodation for travellers, will tend to a general increase of cheapness in travelling on all lines that carry a heavy freight of men going daily to and from their business avocations in our cities. On the other hand, the pressure per head of loans and treaties, such as those to which we have been referring, and of large and increasing expenditure, such as that of our own Board of Works, is capable of pretty accurate estimate. So long as the additional cost of the railway journey approaches the difference in rent, or in tangible and easily distinguished imposts, in the cost of the city over the country residence, there will probably be a sufficient inducement in the feeling which men have of liking to be on the spot where they conduct their business at their usual place of abode. But so soon as the balance turns in the other direction, and the domestic economist finds that he is an actual gainer in pocket by sleeping in country air, the natural advantage of the latter mode of life will tell as rapidly as they become familiar. Thus it is far from improbable that we may even now be at no very great distance from a natural limit to the increase of Paris, if not of London. Centralisation may still go on, until it becomes so impracticable, from the sheer impossibility of discharging all the business that seeks the capital within any tolerable time, as to enforce the distribution of different branches or grades of work to different provincial centres, a mode of action of which our county courts and revising barristers' courts afford examples. But, if our views are correct, the centralisation of dense, unbroken lines of street and masses of building is likely, sooner or later, to meet with a pecuniary check. The first substitute would be the dotting of a large area of country thickly over with houses, yet not so thickly as to form streets or towns. Something of this sort is now to be seen in the neighbourhood of Sydenham, where a large district is being covered by villa or cottage residences, each within its own inclosure of garden or close.

Building in this manner resembles a return to the arrangement of the great cities of antiquity, to the Babylon or Nineveh that could afford to shut its gates and await within its lofty and unassailable walls the raising of the siege from the sheer distress of the assailant, and could do so because within that formidable barrier there was cultivated land adequate to supply the food of the beleaguered inhabitants. In English walled cities, such as York and Chester, the ecclesiastical intramural precincts still present the same feature. A city was not, in earlier times, a mere mass of houses. It is only by slow degrees that the cities of our time have assumed that most unnatural and unhealthy development. So long as the financial reason operates in that

direction, a reason the force of which may be gathered from the fact that, while population in cities has been shown to double in forty years, the money value of land in cities has been found to double in seven years, or even with greater rapidity, the increase of hlook cities may be counted on. So soon as the rapidly increasing weight of municipal imposts, under whatever name they may be known, becomes so heavy that the safety-valve afforded by railway travelling comes palpably into play, the increase in the property value will receive a decided check, and the increase in residential population will probably be turned into a decrease. The example of Paris in this respect is thus of the utmost interest to all who hold, or who have to do with, house property in London. The great and pressing want of the metropolis is that unity of rule and administration of which Paris seems to have enough and to spare. But with that consolidation and simplification which a few years more or less cannot fail to introduce, consolidation of jurisdiction, of municipal management, of gas supply, of water supply, and of what may yet remain to be done as to sewage, the features of a gigantic metropolitan expenditure cannot fail to become more marked and appreciable. Palaces and halls, on which it may now seem as though the architect had free encouragement to lay out what he would, may then stand empty and untenanted. It is not croaking to say this, for a more general distribution of the increase of population and the pursuit of the arts of the builder over the whole country would be a greater good, as far as the health, the morals, or the happiness of the people at large are concerned, than the continued growth of our enormous capitals. It is chiefly, however, by financial reasons that this change is likely to be determined.

JOHN BURNET.

JOHN BURNET, the line engraver, whose skill in using the burin has not been surpassed, died on the 29th of April last, aged 84. He was married twice, but no other occasion was he happy in his selection. His second wife, by whom he had no children, was a sad invalid. She died before him.

Our great engraver was the son of George Burnet, general surveyor of excise in Scotland, a man of probity and talent, and Anne Cruikshank, his wife, sister to the eminent anatomist, the friend and associate of John Hunter. The family came originally from Aberdeen. John Burnet was born in Edinburgh on the 20th March, 1784. His associates at the Trustees' Academy for Design were Sir David Wilkie and Sir William Allan.

Burnet was the author of the following works:—

- A TREATISE ON PAINTING. In Four Parts, Illustrated by 130 Engravings, from Celebrated Pictures. 4to, price 4*l.* 10*s.*
 - 1. ON THE EDUCATION OF THE EYE. 1*l.* 6*s.*
 - 2. ON COMPOSITION. Seventh Edition. 1*l.* 2*s.*
 - 3. ON LIGHT AND SHADE. Sixth Edition. 1*l.* 2*s.*
 - 4. ON COLOUR. Fifth Edition. 1*l.* 11*s.* 6*d.*
- In royal 4to, with Proof Impressions of the Plates on India Paper, and a portrait of the Author. Price 5*l.* 5*s.* half-bound morocco, gilt tops.
- THE PROGRESS OF A PAINTER, dedicated to his then young friend, P. Cunningham.
- A 4to Edition of SIR JOSHUA REYNOLDS'S DIS COURSES.
- ILLUSTRATIONS OF THE WORKS OF J. M. W. TURNER, R.A.

One of his best works is his noble engraving from Wilkie's "Chelsea Pensioners hearing the Gazette read of the Victory won by Wellington at Waterloo." Some of his clever sketches in oil from the heads of Greenwich pensioners,—old Trafalgar men,—narrowly escaped the recent fire at the Opera House. The best-preserved are in the collection of Colonel Francis Cunningham, who fought under Sir Robert Sale at the terrible and determined defence of Jellalabad.

The last life which Allan Cunningham wrote in his "Lives of British Painters, Sculptors, and Architects," was that of James Burnet. James was four years younger than John, and was only twenty-eight when he died.

Another principal engraving from the burin of John Burnet is "The Blind Fiddler." We saw in one of Mr. Burnet's portfolios Wilkie's drawing for the fiddler's hands; the fingers were imitable in expression and in feeling.

The engraving after Wilkie which Burnet thought was the best example of his skill with the graver was "The Letter of Introduction.

The expression in the action and inquisitiveness of the dog is inimitable.

The following are some remarks by John Burnet with reference to his brother James:—

Distances.

Extreme distance ought generally to be of the same tint as the sky with which it unites, and as it approaches the middle ground the tints appear interspersed with touches of light and dark, such as the lights upon the tops of the houses, and their shadows. Be particular in marking the buildings with a firmer line than the trees; never admit colour into your distance when in the direction of the light; scumble a little with purple and grey at the bottom of your objects, losing their forms at the base. In a side light the objects are coloured where the light shines upon them, while the shadows are all of one tint; even red is grey in the shadow; but when the light is behind you every object is made out with its proper colour.

Water.

To paint water the artist must truly have the liquid pencil of Cypri. It ought, if possible, to be painted at once with a full pencil and a quantity of vehicle. The colour reflected in the water appears interspersed with their possessing a rich pulpy substance, and also from their sweetly melting into each other. In painting water particular attention should be paid to the place and distance, as it alters much according to the situation. Objects near the foreground have their reflections strong when they touch the object, and often less when they come to the bottom of the picture; while, on the contrary, objects in the distance have their reflections stronger as they approach towards you. This arises from the waves conveying the reflection being larger, and less under the influence of perspective than where they touch the distant object.

Keep your reflections as flat as possible, as nothing gives greater firmness to the object, handling it only on the edges; keep lights flat, and your shadows smooth, with the space between them touchy, so as to unite them both. These observations will be sufficient to show you his strict observance of the objects in nature, and his reasoning upon them. When viewing collections of pictures it was also his practice to note down any remarks made upon them at the time. For example, he says, under a note dated May, 1814, on viewing the pictures of Richard Wilson at the British Institution,—"I observed some pictures more pleasing than others. Those which seemed most so were light pictures, with warm foregrounds falling into a cool sky and distance, the middle-ground mostly in shadow of a purple grey, with yellow and green touches through it. A piece of blue drapery in the foreground gives great value. Of all things, he seems careful to keep a proper balance of hot and cold colour, and of light and shade, with very little positive colour, and little of black and white, but always some of each."

I find many of the remarks are too disjointed to be worked up into anything like a regular series of notes, they being for the most part observations for the guidance of his own practice in painting. However, what I have given here may be sufficient to give an idea of his mode of study, as it is not necessary to give a complete treatise on the art of painting.

I forget whether I mentioned that he was buried in Lewisham churchyard. He was anxious to be interred in the village church of Lee, which forms the background of many of his studies; but, not being a parishioner, it was not compatible with their rules; and, as he died in Blackheath, where he was removed for change of air, we buried him in the adjoining parish.

J. BURNET.

January 1844, 1853.

Here is an agreement with Burnet for the copyright of two pictures by Sir Edwin Landseer:—

"In consideration of the sum of one hundred and fifty guineas, paid to me according to agreement, I give and make over the copyrights of two pictures painted by me, namely, 'The Lassie and Sheep,' and 'The Widow Duck,' together with all profit and emolument arising from the same, to Mr. John Burnet, his heirs, assigns, and for ever.

E. LANDSEER.

March 14th, 1841.

Witness, JACOB BALL.

There is a capital portrait of Burnet by the late Stephen Poyntz Dunning, keeper of the Bourgeois Collection of Pictures at Dulwich. It is admirably engraved by Charles Fox. Mr. Burnet's great friends were the Robisons of Leytonstone, in Essex. He died at Stoke Newington.

A HALT AT DIJON.

WITH Italy in memory, and Italy again within the scope of designs at starting, it is not easy even for the idle to linger along the route that leads to the open transit over Mont Cenis. A sense of shame at passing by whole provinces of antique interest without attention is, however, not to be suppressed, and perhaps has quite as much to do as disposition to, of course it is believed, well-earned self-indulgence, in declaring a halt at Dijon, where, with but cavalier consideration for a contemporary artist, we are told in our red guide, "in spite of modern improvements, there remains a good deal within the town worthy of notice." So at the ancient capital of the Dnkes of Burgundy we pause, and open wide eyes at daybreak for reception of impressions from the seat of potentates, of whom, somehow, the relaxing historical memory of busy life finds it a little difficult to think definitely. In the style and colour of their associations they will persist in blending oddly with the characteristics of their beverage that survives them,

Charles the Bold and Philippe, and Jean-sans-Peur, all are tinged in the thoughts of a well-girt traveller, without even a Mandler in his portfolio, with some hues of pretentious self-announcement a little in excess of performance that are reflected from the wine, that has merit enough of its own no doubt, but still can scarcely shake off the imputation that it would be port if it could.

There is a fine Burgundian tone, much in harmony with these quite uncritical associations, about the two magnificent tombs—dating quite at the beginning of the fifteenth century—of the two last-named worthies. They are set up in the museum, in no doubt more than their original freshness and completeness; but, glazing as they are with hyper-restoration, there is so much that is fine about them, and so much that is interesting, and so utterly impossible has it now become to determine the claims of fifteenth as against nineteenth century, that it is best to admire the admirable, give up the reins of our imagination into the hands of the restorer or author, he pleased we know not by which, and are only concerned to analyse the wherefore.

Each duke lies recumbent, with consort beside him; all are represented in the manner that was satisfactory in the Middle Ages and has in truth a certain justification in sentiment, neither distinctly dead nor living, sleeping or awake; all retain their best good looks, as they appear in their finest apparel and most dignified array; still the interest they excite speedily declines before the attractive enrichments of the details that surround them, and the liveliness of the subsidiary figures, that, disengaged of dignity, seem not even struggling against the pre-occupations of common existence and every-day nature.

The deeply-recessed arcades along the sides of the altar tombs are occupied by a large number of very elaborate statues of friars, sculptured in the round out of alabaster, each in his niche, the friars, no doubt, of the Chartrouse of Dijon, founded by Philippe, and endowed by him, providently acting in accordance with the maxim of Hamlet, that it behoved a potentate who would not be forgotten after his death to build chapels during his lifetime. These little figures are of the greatest variety and difference of expression and physiognomy, and, if the heads are original, may more easily have been portraits than inventions. As mourners they can scarcely be said to declare themselves, and are really for the most part as widely remote from the solemn as from the grotesque in that interval so much more roomy that divides the sublime from the ridiculous. The variety of pose and gesture is only equalled by the diversity communicated by invention of folds and monuments, to the simple cowl and single robe of the friar. They are ascribed to one Claus Sluter, a Dutchman. As accessories to an almost royal tomb they are out of harmony, at least according to conventional proprieties of loyalty within a half-century of the country's bereavement; otherwise—must we say?—as sideboard or chimney-piece ornaments, and as welcome subjects individually for the photographer, they are works that would not easily in their kind be matched.

For proper architectural interest Dijon is well known as preserving various specimens of a provincialism in Gothic that has been compared to the relaxations of the style, as it diverged or declined into Indorism. Such specimens and their features are unengaging enough, and undecided enough, and, indeed, chiefly on that account unengaging. They seem akin rather to the clumsiness of expression and lapses in syntax that declare the hopeless ignorance of a base patois, rather than the vigorous irregularities of strong thought which disdain restraint and will one day dignify itself as an accepted language of art. We look in here and there at interiors that invite but little stay in other respects, and certainly none by an incongruous admixture of depressed round arches with pointed, and alternation of depressed pointed arches with round. The examples may be passed over here, relegated to the collections that the history of every art is bound to undertake, of styles abortive, and styles artificially or accidentally suspended in development, or distorted after it.

The one chief architectural interest at Dijon, so far as an idler on another errand can venture to claim acceptance for his recommendation, is the earlier and purer church of Notre Dame. This is now undergoing repair to an extent that is very little short indeed of re-construction, at least of the interior, and the exterior must be

taken in hand, and doubtless will be so thereafter. The church deserves the most reverential conservation, and that little less could be undertaken in this way than is now in progress seems pretty clear from the abundant shavings that are sustaining, no hour too soon, the tower and various walls that as yet have been scarcely interfered with. The nave is what we have called before now Colonnar—that is to say, columns, in this case round, are in the place of piers simple or compound; the capitals are not good, true, or beautiful particularly; and the stiff, horned foliage rises to the angles of an octagonal abacus. This octagon is not regular; it shelves forward peculiarly in front, and on this projection, as on a corbel, are accommodated the bases of three shafts, that spread above into the diagonal and transverse ribs of the quadripartite vaulting. The choir, or rather apse, which is dated 1229, is very shallow, and here the vaulting is supported by shafts that rise, not from columns, but from the ground, and are superposed. The triforium passage has a lightly-shafted opening to the church, but is lighted by a circular window from without immediately behind it.

The western front has been compared to Ely; above the deep triple portals rises the flat wall, that is relieved above, or differentiated at least, by two ranges of very tall pillar-erected arcades. Of these the lower has at least the excuse of an opening through the pierced wall, as if for entrance from the building into the gallery, shallow as it may be. The upper pillarless, no less, stand free of the wall, not returning round the angle, as neither do those below; and here, to all appearance, they are not sufficiently advanced to permit of standing-room behind, even if the space allowed were accessible, which to all appearance it is not. The most plausible defender of the fairness of constructed decoration, who may so often fairly have the best of the argument, will be at fault here. In such a glaring case of misapplied casual elaboration as a means of escaping from the misery of an unornamented blank wall, the lamp of sacrifice is lighted in vain; it is little more than a guttering candle burning daylight to disgrace and wastefulness, and we shall damage better causes by holding by the palpable abuse. The true glory of the facade is in the originally designed and beautiful porch below. A very spacious central arch and two considerable side arches admit (when they shall no longer be looked upon by shoring timbers) to a porch of two bays in depth, two compound shafts in front of door-jambes of the main entrance supporting the elegant vaulting. The doors are recessed in several orders, with light shafts of coloured marble and tabernacled capitals of peculiarly early character. The capitals retain much ancient colour, and indications of very decided coloured patterns remain with and without, on walls, shafts, architrave of door and its soffit, but, on the whole, not very successful in intention. It may, perhaps, be a fact explained by or illustrating much in the story of the manifold religious troubles of Burgundy that, while the sculptures of the tympanum and archivolts have been carefully and thoroughly defaced, the Virgin and Child upon the central door-post, and manifestly coeval with the rest, are absolutely uninjured.

It is impossible to witness reparations so capital as here proceeding without some qualms as to the chances of lapse in conscientiousness of adherence to the ancient model. On the conscience of our neighbours let the responsibility lie. For ourselves, well pleased with the prospect that a noble church will be saved from ruin, and seeing enough to assure us that the effect of the restored work will be consistent and expressive, we really at the present time cannot charge ourselves with the burden of what may be needless apprehensions. We willingly have faith that all the details that were of merely historical importance, and that may now disappear, have been duly recorded for the advantage of history, while art may be heard upon its own merits, and replace what was had (and such things were even in the glorious thirteenth century) with what is truly and consistently in harmony with whatever the structure contains of the better and the best. Ughness must, it may be feared, sometimes be consecrated by historical associations—may we be visited lightly in this way at home in England!—and when the consecration can scarcely be made out let us have the grace to cut boldly, out deeply, and give both to Nature and Art a fair chance of rejuvenescence and their right fair play. At Dijon at the present moment, as we have said, our frame of

mind will really not admit even of liability to lapse into captiousness: we see how much that is done is being admirably executed, and promises a truly fine effect, and cannot bring ourselves to inquire, or to feel ourselves entitled to inquire, any more how much mischief goes with it than to trouble ourselves about how the whole is to be paid for.

THE FACULTY OF INDUSTRY.

ON more than one occasion we have congratulated the nation on the acquisition of an extraordinary benefaction, and now the particulars of the Whitworth Scholarships for Mechanical Science are fully made known by a memorandum signed by the generous donor himself (an epitome of which we gave in a recent impression) it will not be inopportune to add a few words as to the use to be made of this noble foundation.

We may premise that, as was to be expected, the memorandum is directed to the arrangements for the proper use of the funds, and in a few pithy sentences shows just such wide sympathies and broad views as one would suppose ruling in the breast of the man who could devote such a considerable portion of his fortune to such an object. For instance, not only are all universities and colleges in England, Scotland, and Ireland mentioned by name, and all the more important public schools, as well as the Society of Arts, and the Department of Science and Art at South Kensington; but especial provision is made for the artisan class in the various towns and cities where mechanical industry is chiefly required; curiously enough, omitting Manchester itself, though noting Birmingham, Bristol, Swansea and Cardiff, Halifax and Huddersfield, Leeds, Northampton, and Sheffield.

In fact, as if especially to mark the unsectarian nature of the gift, Manchester, "the seat of our workshops," is provided for by having eight Exhibitions devoted to the use of Owen College, and two exhibitions devoted to its grammar-school, with no special appropriation of any of the Scholarships, to be given in 1869, or subsequently.

The broad basis of the whole scheme is only limited by the phrase "her Majesty's subjects," and so it is open to every one in any part of her Majesty's dominions to compete for these rewards, whether he reside in the farthest part of India or the most distant colony.*

How well this contrasts with the too often close and narrow schemes of former times, when some limitation to the founder's kin, or to residents in his native town, some reservation as to a particular name, a preference for some form of education, or even directions as to some particular dress or manner of living, have gone far to neutralise the value of a great and substantial donation, and even at last called for the positive interference of the Legislature to prevent the waste and corruption engendered by such mistaken limitations! Although we are admirors of old customs and forms which may not be altogether consistent with present usages, we never see the yellow-stocking and capless youths of Christ's Hospital without regret that the spirit rather than the letter of the founder's will should be adhered to, and wishing that the boys might pursue their studies or enjoy their pastimes without being obliged to wear the absurd costume prescribed for them at a time when it was only the customary dress. We cannot but believe that the large heart which originated such a noble charity would be pained at the narrow rendering of his meaning which, with mistaken respect for his memory, modern generations of governors have given to his words.

* General Particulars as to Scholarships.

"II. That the thirty scholarships of 100*l.* each should be open to all of her Majesty's subjects, whether of the United Kingdom, India, or the colonies, who do not exceed the age of twenty-six years, and be held either for two or three years, as experience may prove to be desirable; that ten scholarships should be competed for and awarded in May, 1869, at the annual national examinations in science, provided that a sufficient number of candidates prove themselves to be competent."

General Particulars as to Exhibitions.

"VII. As the scholarships scheme can only come into full operation by degrees, I propose from the fund ultimately available for the scheme at once to create sixty exhibitions or premiums of the value of 25*l.* each, tenable until April, 1869, and to place them at the absolute disposal of the governing bodies of the following educational institutions and towns, in order that they may award them to youths under twenty-two years of age, who may thus be aided to qualify themselves, and must undertake to compete for the scholarships of 100*l.* in May, 1869."

Mr. Whitworth has had the foresight to prevent his name being ultimately made liable to ridicule by unthinking men, in not clogging his gift with absurd conditions; and in placing it in the hands of the Committee of Council on Education he has obtained the highest guarantee that his scheme will be administered with due regard to the interests of the nation, as well as to his own individual wishes, and has proved that his object is the disinterested good of others rather than the vanity of making a name, or even the noble desire of "keeping his memory green" in future generations.

Another great feature in Mr. Whitworth's arrangements is its immediate effect. This is no deferred gift, to be made use of when not wanted for other purposes; but it is now, at a time when there is great demand for such mechanical teaching, that it is offered. The suggestion of the Exhibitions to be given this year is, in fact, making use of existing organisations, developing present resources, calling forth real, though latent powers, in order to arrange and encourage them for another effort, at a period not too remote to seem hopeless, nor too near to prevent any likely candidate from competing.

In fact, the announcement of the ten scholarships for May, 1869, of 100*l.* each, tenable for two or three years, would probably be practically useless in the majority of cases, were not provision made for these sixty Exhibitions this year (of 25*l.* each), in order to form a body of disciplined and worthy competitors.*

Every one, except those specially endowed with a love of study above the ordinary standard, requires an object to aim at and a stimulus to exertion, as well as some information as to his progress, in order to keep up the spirit necessary for sustained study, and often something more substantial to encourage, at least, if not to assist him on the road to the prize of ultimate success which he has in view.

As one of the proposals embodied in the memorandum referred to (and it is not the least advantage of this scheme that, like all that is really good, it seeks to engage others in the same good work), it is modestly submitted, as a suggestion, that "honours in the nature of degrees should be conferred by some competent authority on successful students each year, thus creating a Faculty of Industry analogous to the existing faculties of divinity, law, and medicine." We are inclined to be of Mr. Whitworth's opinion, "that such honours would be a great incentive to exertion, and would tend greatly to promote the object in view;" and it is not without some longing for a similar Faculty of Fine Art, actually suggested at University College not very long ago, that we read further of the hope that Government will provide "the necessary funds for endowing a sufficient number of professors of mechanics throughout the United Kingdom."

How much it is now to be regretted that the architectural voluntary examinations and the scheme of education supposed to have been fairly started a short time ago have both fallen through! For such organisations were of the very character likely to give vitality and reality to such a suggestion, and make use of the impetus of any forward movement which ought to be experienced by all "the Arts" alike, though in various degrees. An important arrangement for those who have obtained the scholarships is that as much latitude as possible is to be granted in the subsequent plan of study proposed by them. If the student wish to complete his general education instead of continuing his scientific study he may be permitted to do so. He may go to the universities or colleges affording scientific or technical instruction, or he may travel abroad. "The successful artisan should be encouraged to study theory, and the successful competitor in theory aided in getting admission to machine shops and other practical establishments."

A more admirable paragraph than the foregoing could hardly be penned; but this intention is further explained in the following additional memorandum:—

"My object in devising the foregoing scheme has been, while requiring a practical acquaintance with a few simple tools as a *sine quâ non*, to render the competition accessible on fairly equal terms to the student who combines some practice with his theory, and to the artisan who

combines some theoretical knowledge with perfection of workmanship."

With regard to certain special exhibitions offered this year to artisans—already mentioned—it is pointed out that by connecting them with the Science and Art Department under the minute of the 21st of December, 1867, the value of each might be doubled. This in itself shows a careful consideration of the interests of the working classes, which it would be well for those to remember who are always quarrelling with capital, and who so falsely imagine that the interests of the one are antagonistic to those of the other class.

Looking, then, to the details of the scheme as sketched out by Mr. Whitworth's own hand, we are impelled, as artists ourselves, claiming a thorough alliance with the constructive and mechanical arts, to ask if it be not possible to introduce, say, even the smallest element of artistic excellence to the consideration of the founder. We strongly hold that as in former times artistic and mechanical excellence were not only closely allied in the execution of ordinary or extraordinary work, but often united in the same individual (thus often going hand-in-hand as brother and sister, the one contributing grace, delicacy, and truth to the strength and manliness of the other), so ought it to be now. We seem to see some signs of an attempted union, where perhaps least expected—say in certain improved artistic forms given to simple engineering works, following closely after some of the most uncouth productions of modern times. And, if it *ought* so to be, would it not be well to acknowledge the fact in some substantial manner, and in a way to be now decided—perhaps, say, by devoting three exhibitions this year, viz., the one given to King's College and the one to University College, with one of the three devoted to the Science and Art Department (to be followed by the offer of one of the ten scholarships next year), to the producer of such special additional proof of artistic excellence in any of the various branches of mechanical science chosen as may be decided upon?

Perhaps we are looking at this matter from too professional a point of view, from too limited an area, and may be liable to the charge of a selfish attempt to secure for Architecture a share of the prize. Be it so. To the generous founder it cannot be a source of regret to find his efforts appreciated, and his sanction and encouragement desired for the advancement of art allied with his special object—mechanical skill.

We are aware that we may be treading on delicate ground, and that the "arts cognate" to architecture may be considered by some as an intrusion and an impertinence; but in reality it is far otherwise, and Architecture, which is so dependent upon and so connected with mechanical science as it is, cannot afford, if she would, to stand aside while the latter is progressing, and then quietly bring up the rear. On the contrary, she ought to take the lead, and, from higher and more dignified position, point to objects capable of being reached and aims worthy of being attempted by the most mechanical genius. For as far as the devotion of man's efforts to the noblest aim of improving and elevating his fellow man exceeds in value the application of them to his physical destruction (or to the means by which this may be accomplished), so far does the artistic elevation of science, which includes also all its practical application to the amelioration of the condition of man's daily life, exceed the application of science in all its precision and exactitude to any of the ordinary branches of mechanical art.

At the same time, we are free to admit that the proportion of those whom it is desirable to encourage in this speciality is small, as is the number of those endowed with artistic powers small compared with those capable of exercising or of cultivating in others the exercise of pure mechanical science.

What we desire to see, then, is an authoritative recognition of the power of art to elevate, refine, even improve and instruct, the practical and scientific mind and guide the strong hand of the mechanic.

As the department charged with the execution of a portion of the plan is that of Science and Art at South Kensington; and, moreover, as the Society of Arts has a share in the matter, we think it is not too much to ask that they at least should make the attempt and consider the desirability of the course we recommend. Very properly, we think, neither the Institution of

* One of these Exhibitions of 25*l.* each has been placed at the disposal of the Principal of Liverpool College, and that gentleman has thrown it open to public competition, under conditions named in the advertisement which appeared in our last number.

Engineers nor the Royal Institute of British Architects, as not being educational establishments, has been referred to; so that, as far as we see, nothing professional in either case can stand in the way of the due appropriation as may be deemed fit of certain Exhibitions which may be unapplied.*

The disposition of a certain number is specially indicated in the memorandum; but it is provided that any not so applied may be given by the Science and Art Department to any other scholastic institution which makes satisfactory arrangements for affording instruction in (amongst other things) "free-hand and mechanical drawing."

Thus seems distinctly recognised the special power of representation which an artist or designer possesses and exercises, while there is no reason why such an artist should not be as good a hand at the use of mechanical tools, and as good at geometry and physics, as one who cannot perceive the beauty of line or appreciate the excellence of one style of work to another. When all other circumstances and conditions are satisfied, let us hope that an opening will be made for the speciality of the artistic metal-workers, for instance, say at Hardman's (Birmingham), Skidmore's (Coventry), or Hart's and others (of London), who, as mechanics, are at least worthy to stand beside engine-makers and others, who do not profess to add taste to the various excellencies of finished mechanical art. Let these lead the way for many other similar classes of workmen who can combine the theories of art and science and the best workmanship in both.

SAINT PANCRAS NEW PUBLIC BATHS AND WASH-HOUSES.

THESE baths and wash-houses have been formally opened. They are situated in King-street, Camden-town. The superintendent's residence is over the entrance. There are two tepid swimming-baths, each 56 ft. by 22 ft. 6 in., with sixty dressing-boxes, fitted with dwarf doors and York stone platforms. The baths are lined with glazed tiles, and have glazed brick hot-tubs, the latter on a pattern made by the use of Staffordshire bricks in hands, &c. There are ornamental tile borders to the first-class baths representing a series of dolphins. A glazed dome skylight surmounts the swimming-baths, and there are three gas star-lights over each bath. Showers run all round under the platforms.

Of private bath rooms on the upper story there are—

	1st Class.	2nd Class.
Men's	28	58
Women's	8	10
	34	68

The baths are Finch's porcelain throughout, with Busby's patent valves.

The entrance in King's-mews leads to the public wash-houses. Here are the boiler-house and engineer's residence. The public wash-house is 54 ft. by 27 ft. There are sixty-three washing compartments of galvanized iron, with cast-iron tubs for washing and boiling. Hot and cold water and steam are laid on to each. There is a hot-air drying-closet, with a separate galvanized-iron horse for each washer suspended on wheels and iron runners: these were made by Messrs. J. & F. May, of High Holborn.

There are three wringing-machines, by Manlon & Allcott. The engineer's apartments are over the washhouse, entrance, with tank over for 26,000 gallons of water.

The architects were Messrs. Messenger & Gundry; the general contractors Messrs. Manley & Rogers. The boilers, pipes, &c., were supplied by the St. Pancras Iron Company, and the iron work was constructed by Messrs. Head, Wrightson, & Co.

THE NEW LAW COURTS.

WE have reason to believe that the Government have appointed Mr. G. E. Street, A.R.A., to be the architect of the new Courts.

* This is supposing that certain offers of Exhibitions are declined or cannot be acted of this year. The number of exhibitions to be provided as stated is sixty, while there are sixty-six disposed of in various ways; therefore it must be expected that a considerable number are not likely to be made use of this year, or these additional appropriations would not have been made in the memorandum, nor any further remarks as to others still likely to be "unapplied."

BEARWOOD.

A VERY interesting event came off on Saturday last. At Bearwood, in Berkshire, on the charming site of the old house formerly there, a fine mansion is being erected, from the designs of Professor Kerr, for Mr. John Walter, late member for the county, and again, we are glad to see, announcing his intention to stand at the ensuing election. The building being finished externally, or nearly so, Mr. Walter on that day entertained at dinner the whole of the workmen who are engaged upon it, some 380 in number, as he had previously done on laying the corner-stone. Besides Mr. and Mrs. Walter, there were present Mr. John Delane, Mr. Kerr, Captain Walter, and several other friends; and the meeting passed off in a singularly agreeable and admirable manner; workmen, architect, and employer being apparently equally pleased with each other. Mr. Walter made some felicitous addresses, in the course of which he expressed with emphasis the hope that the home there being formed would never become the seat of merely selfish enjoyment, but would be and long remain a centre of kindly hospitality and social sympathy. The health of Mr. Kerr was drunk with great warmth, as was that of the manager of the works, Mr. Deacon.

In proposing the health of the architect, Mr. Walter said that it was from the perusal of Mr. Kerr's book, "The Gentleman's Homes," he had been led to seek that gentleman's assistance. Mr. John Walter, jun., called on to reply for "Posterity," did so in a capital speech.

The house is of considerable size and great commodiousness, and includes a central picture-gallery, round which the other apartments are disposed, the windows of the chamber-story opening above its roof. When we mention that the picture gallery is 70 ft. by 24 ft., the dining-room 40 ft. by 24 ft., and the drawing-rooms 96 ft. by 26 ft., the scale of the house will be understood. The style adopted is a free version of that of the sixteenth century, the materials being red brick, of peculiarly good colour, and Mansfield stone. A more admirable piece of brickwork we have seldom seen. The slating is Westmoreland, of excellent colour. A tower, some 30 ft. square at the base, serves as the staircase. Other towers of smaller size assist the skyline, and the gables contain sculptured shields and foliage. At the garden entrance, of which a view may be found in the present exhibition of the Royal Academy, two figures of considerable beauty, Night and Morning, modelled, but not yet put into stone, will form a portion of the doorway.

It was a worthy act on the part of the owner of a building which, adorned with the fine collection of pictures he is known to possess, is destined to become one of the notable Homes of England, to let the first exercise of hospitality within its walls be in favour of those who have laboured upon it. The spirit shown on all sides was excellent, and we heartily congratulate those who are concerned in the undertaking.

At Ascot, on the road to Bearwood, a gabled house that has been built for Mr. Delane, under the direction of the same architect, was pointed out to us. This, also, is of red brick with stone dressings, and looks very well, from the railway. The planning is somewhat peculiar, to meet a special requirement; and we shall take an opportunity to make it better known to our readers.

THE LATE MR. PRITCHETT, ARCHITECT.

ON the 23rd ult. departed this life Mr. Pritchett, of York, architect, probably one of the oldest members of the profession in the country, being in his 80th year, and having been in actual practice on his own account for the long term of 55 years.

Mr. Pritchett was born October 14th, 1788, at St. Peter's, near Pemroke, of which parish his father was the clergyman. He served his articles with Mr. Medland, of Southwark, and was afterwards two years in the office of Mr. Alexander, at that time architect to several public works. He was subsequently a short time in the "Bar-rack Office" under Government, and commenced practice for himself in London in 1812. After executing two or three commissions he removed to York in 1813 to join in partnership Mr. Watson, who was the successor of Carr, the

original Yorkshire architect, and continued to practise in York up to within a few months of his death.

In those days architects were few and far between, and he and his partner had a wide range of practice in the northern counties, being out sometimes for weeks together visiting their works on horseback or driving. In the city of York his works were the deanery, some restorations at the master St. Peter's School, now the School of Art, the Savings Bank, new front to Lord Burlington's Assembly Rooms, Lady Henley's Hospital, Lendal and Salem Chapels, and many private works. In the county his works included Wakefield Asylum, one of the largest built at that time, Beverley Court-houses, and Gaol, numerous churches, chapels, schools, parsonages, and gentlemen's houses. He was architect and surveyor to the Earls Fitzwilliam during three generations, visiting their seat and estate at Wentworth on an average once a month for more than 50 years; and in addition to enlargements and improvements in the house, he erected many churches, parsonages, schools, and lodges on the estate. Among his pupils now in practice may be named Messrs. Dancks, of Whitehall-place; Blackett, of Furnival's-inn; Medland, of Gloucester; Middleton, of Cheltenham; Gilbert, of Nottingham; and his sons, of Walton-under-Edge and Darlington.

FROM SCOTLAND.

Leith.—The new Town-hall has been formally opened by the magistrates. The edifice is in Charlotte-street. The new offices have been constructed from plans prepared by Mr. Simpson, burgh assessor. On the basement floor are placed the detention-rooms, and rooms for the accommodation of the detectives and officers of the police force. The first floor is occupied by the collector's offices, burgh officers' room, and a room in which are preserved the burgh records. The provost's and town clerk's rooms are placed on the second floor, from which there is a passage leading to the old building. In the old building accommodation is provided for the registrar and sheriff-clerks. The entire cost of the new building is estimated at 1,600.—The foundation-stone of the first of a block of houses about to be erected at Hermitage-place, adjoining the Links, by the Industrial Co-operative Building Society, has been laid by Provost Watt. Eight acres of ground have been acquired, upon which it is intended to erect a number of working-men's houses. According to the plans, the houses will be of a uniform height of two stories, and so arranged internally as to conduce to the comfort and convenience of their occupants. Each house will have a plot of ground attached to it; and the working men, guarding against the error of their forefathers in building their domiciles so closely together, intend to make the roadway between the rows of houses fully 60 ft. in width. The occupant of each house, by the payment of an entrance-fee and of a small sum at stated intervals, will, in a brief period, become his own landlord.

Stirling.—Arrangements are nearly completed for the thorough restoration of the choir and chancel of the high church. It is intended to restore the whole fabric according to the style and character of the restorations effected in the cases of Glasgow Cathedral and Paisley Abbey. The improvements connected with the East Church are calculated to cost upwards of 2,000. There have already been 1,670l. subscribed. Of this latter sum the town council have subscribed 200l.; and Mr. John King, of Levernholm, has given 500l., 350l. of which are to be expended in the erection of a memorial window. It is anticipated that the Gullery Incorporation are also to erect a similar window to the memory of John Cowane, founder of Cowane's Hospital. The restoration of the transept is in the hands of a committee of some of the most influential inhabitants, and for which a sufficient sum of money has been raised, and the work is now being proceeded with. The whole work of restoration is expected to be completed in the course of the year.

Paisley.—The Fountain Gardens, a gift of Mr. Thomas Coats, of Ferguslie, to the townspeople, have been inaugurated. The grounds extend to six acres. In the centre of the park or garden is a fountain with circular basin 58 ft. in diameter. At the entrance to the grounds are two cottages, one for the superintendent and the other for ladies.

OF SOUTHBEND; SANITARY AND ARCHITECTURAL.

"The laws of health should be taught to every child, from the ragged-school upwards, and followed; and if we had preventive physicians—physicians who would keep us from getting ill, as well as cure us when we are ill—we should be a healthier, better, and happier people. The spread of knowledge on the subject is of the greatest importance; to that we must look for the desired result."*

THE recent visit of Prince Arthur to Southend has somewhat increased the public interest in this part of Essex. In 1804 it was visited by Queen Caroline and the Princess Charlotte, and by several distinguished families.

Southend consists of an old town and a new town, and there can be but one opinion as to which is the healthiest, and most convenient for a temporary habitation. The old town formerly consisted of one long irregular street (and its additions are quite as irregular), facing the sea. The new town, called Cliff Town, stands westward; the houses are attached in rows, and are of three classes. The first-class face the sea, and consist of basement, ground, one and two pair stories. The other classes form diverging lines, so as to have a view of the sea. The houses are all similar, plain, and neat, with bow windows, surmounted by balconies.

The architectural student will not find much worthy of notice in Southend. The houses in Cliff Town, although neat and convenient, present the appearance of a barrack town, more than anything else. The Congregational church is an exception, it is Early Decorated, and consists of a nave, south aisle, and a small octagonal broach spire on an octagonal tower, rising from a square base. Circular columns separate nave from aisle with foliated capitals. Roofs are high pitched and truncated. The church is in all respects similar to our parish churches, except a peculiarity at the east end; in this is an oblong space boxed in for the minister, and over this is a polygonal recess for the choir.

The hotels and houses in the old town are mere brick boxes, with holes cut for windows, so that at present we have but little architecture at Southend. The modern church in the old town, built in 1840, is proposed to be enlarged, with a tower, &c. A Wesleyan box-chapel exists already in the Old Town, and a piece of ground has been taken for a new Wesleyan chapel in Cliff Town. There is, also, to be a Catholic church erected here; and among other buildings an asylum for the Trinity brethren is talked of.

Prettlewell Church, a well-known sea-mark for navigators, "the largest and the fairest in the Rochford hundred," is a mile and a-half from Southend. Rickman says that it "is a handsome church, with a fine perpendicular tower, having good buttresses, pinnacled battlements, and four rich pinnacles." The church consists of a nave, south aisle, a large south porch, chancel and south aisle, and a tower at the west end containing six bells. The ceiling of the west end of the nave is flat, the original roof and western arch being ceiled. There are two columns and two responds between nave and aisle, which are older than the rest of the church; they are octagonal, with moulded capitals. The columns in the east part of the nave are octagonal and concave; the roof open, of low span, with moulded tie-beams. Some portions of the old benches, worm-eaten, remain in the south aisle. The pulpit stands on the north side by the chancel. The font is original, and has octagonal concave sides, with sculptures,—the crucifixion, roses, heart, &c.: it stands at the west end by the column, with christomary in a niche in the column. The windows are four centred, in three five-foiled lights.

In a north window of the nave, by the chancel, are remains of the entrance to the roof-loft. A staircase on the east side of the porch-door leads to a room over the porch. The chancel is separated from the nave by a fine moulded pointed arch, springing from semi-octagonal responds. The east window is blocked up, with an elaborate modern Gothic altar-piece, containing the Decalogue, erected in front of it. In the chancel floor is a brass, date 1612, in memory of Richard Cocks and his wife. There is a low window by the chancel-arch. Several slabs are in the floor, dates 1737, 1751, 1810, &c. The pews are similar to horse-boxes, and there are a few mural monuments, mostly modern. In the vestry is an oak chest, elaborately carved and of an early date.

The tower can be seen for miles, and will be recollecting by many visitors. It is a fine lofty

Perpendicular tower, embattled and surmounted by octagonal embattled turrets, with octagonal crocketed pinnacles, and stone staircase in south west angle. Square chequered flintwork may be seen on the tower and parapets of the body of the church.

The church has not yet fallen into the hands of the restorer, consequently is more interesting to the architect and antiquary. If the edifice be restored, the mode of treating the two heavy columns and responds of an earlier date, between the nave and aisle at the west end, will be a question. The door in the south doorway of the church is of oak, and elaborately carved. Foundations of a former north aisle are visible.

Southchurch, a mile from Southend, consists of a nave, chancel, south porch, and a tower with one bell, and a spire. The tower is Norman, and possesses north and south doorways, plain, with zigzag mouldings. On the north side of the nave is a small Norman window by the chancel arch, and a stone staircase to the roof-loft. An Early English window on the south side by the chancel arch contains a double piscina in the window seat, similar to two cushion capitals hollowed out. The roof of the nave is a span truncated, with tie-beams, and octagonal king-posts, with moulded caps and bases. The seats are modern. The font is octagonal, modern, of good proportion, with water drain.

There are many old churches within walking distance, for those who prefer something to think about, instead of wasting their time in novel reading, and dreaming at the sea-side. The churches of Rochford, Rayleigh, Eastwood, Shoebury (north and south), Wakering (north and south), Leigh, Hadleigh (and castle), Benfleet, and Thundersley, contain interesting points.

The Southend Local Board is of recent formation, and has much to do; it meets for two hours once a week. It has already effected good, and it is a question whether it would not be well to borrow money, and deal effectually with the drainage of the old town; at present the sewage empties itself on to the beach. In Cliff Town the sewer is carried a mile and a quarter into the sea; and the cost has been put upon the rents of the houses. Of course, the tenants demur; they will, however, find in the end it is cheaper to cheat the doctor and the undertaker than to have to pay them for sickness and death derived from offensive open ditches and fragrant bouquets in the public tea garden resorts. At low water the sea recedes a great distance, and leaves many acres of ground in a maddy and uninteresting condition. If a sea wall were constructed towards the end of the pier (in front of the whole of Southend), a vast quantity of ground would be recovered, and Southend much improved. If similar places were treated in this manner, the quantity of land re-secured would be enormous, and the drainage permanently improved. The present sea-wall at the bottom of the Cliff affords an agreeable promenade *when the tide is up!* One great inconvenience in Cliff Town is the absence of shady walks; in sunny weather it is rather more than warm.

The sea, and the proximity to London, are not the only attractions connected with Southend; the walks inland are pleasant, and the country wooded and rural: the botanist will find much to repay his search among the wild flowers.

The architect is more concerned with sanitary matters than he supposes; the fact is that, in my opinion, he has really more to do with these inquiries than those appointed to carry them out. Data as to deaths are quoted from the Registrar General's report: light, air, ventilation, and drainage, are better understood by the architect than the medical man; and when the latter does interfere, he usually does more harm than good. Again, as to the analysis of the water: this may be obtained from the Board of Health, or the analytical chemist. Few medical men can accomplish this, and if they could they have not the time. And, again, who knows so well of the construction of dwellings as the architect? If architects omit to make themselves thoroughly acquainted with sanitary requirements, they must not complain if they are not consulted. At present the architect is looked upon as the man "who washes the ceiling."

Regulations for guiding the cubical contents of rooms are not much respected in sea-side residences. I suppose that keeping the windows open day and night compensates for small rooms over-crowded.

Dr. Granville, in 1841, on the Spas of England, notices a new mineral spring at Hockley, about seven miles from Southend, and gives an analysis

of the water, by Richard Phillips, F.R.S., who states that one pint of the water yields,—

	Grains,—
Common salt	11.96
Carbonate of lime	5.93
Anhydrous sulphate of magnesia	20.13
Sulphate of lime	1.82
	39.84*

This spa was spoken of very highly at the time. A large Classic halling was erected for it, and it is still standing, although used for a different purpose.

The water at Southend is considered good for some complaints; it is supplied by the local waterworks, and derived from springs. It probably would be improved if all housekeepers were induced to use filters.

The soil is of a gravelly nature, consequently very dry.

In conclusion, Southend, at present, is only an idea. That the place in time will be much resorted to, there is no doubt; but, before that can be expected, the Local Board has much to do. In the main street there are about forty houses, and not any sewer, and in a street adjacent there are nearly as many cesspools as there are houses. The night-soil generally percolates the gravel. It would be very important if the Local Board could push matters forward instead of waiting for a fever; and, as regards public buildings, and other works, we can for the time being only imagine what they will be in years to come, provided that exertions be made to keep and render the place worthy of public esteem.

W. P. GRIFFITH.

TECHNICAL EDUCATION FOR THE WORKING MAN FROM AN ARCHITECT'S POINT OF VIEW.†

REFERRING next to technical education from the artisan's own point of view, Professor Kerr said he did not think the workman was more selfish than any other class of the community; but there could be no hesitation in saying that the first question the workman put to himself when a scheme of technical education was proposed for adoption in this country, was—"What advantage is this scheme to bring to the workman himself?" It was all very well to talk of creating a new class of foremen, but what advantage was the workman himself likely to derive from such a scheme? Was it to advance his craft as a matter of merit? Every workman was naturally proud of his craft, and every honest man ought to stand by his craft. Although no other advantages were shown to be obtainable, if it was shown that the trade of the craftsman would be advanced in merit, that itself would be a considerable gain. The object of the movement certainly was to advance the craft; by the improvement of the workmen and foremen, through the medium of a practical technical education. The proposal was not to educate them so as to make them masters; the purpose of the present movement was, to keep the workman as such, but to raise him as regards the merit of his workmanship; and that was the purpose the men from Manchester had in view when they came up to advocate technical education. As to the question of common primary education, he himself had found that foremen in a good position, and even masters who had been workmen, were deficient in primary education. There was not that efficiency there ought to be even with regard to the three R's. They could read, of course, but not so as to employ themselves in that continual reading which alone was of any use to the mind. They could write, but not so as to be able to express their thoughts with that precision which was worth anything. They could reckon up their wages per diem at so much an hour, but in more extended calculations they were devoid of that certainty of being right which they ought to possess. It might, no doubt, be urged that the long hours and the fatigues of labour left but little time or disposition for cultivating the refinements of education. In this argument there was a good deal of weight, coming from the average class of workmen, or from those under the average whom Providence might not have favoured with anything in the shape of particular cleverness; but at the same time there could be no doubt that even a stupid man was not justified in resting all his life in primitive ignorance; and those who called them-

* Error in excess of about one-third of a grain.

† See p. 387, ante.

* "Another Blow for Life," 1864.

self the advocates of technical education ought distinctly to understand that the technical education must have a primary basis of common education upon which to rest; and every encouragement ought to be given to the working class kindly, handsomely, and liberally, in every way, to acquire those simple elements of knowledge they required. Passing from the question of the three R's, the lecturer proceeded to speak of technical education itself, and, referring to the British Museum and other aids to technical education, he said he thought it would be wise policy if the advantages which these institutions presented were made more generally and easily available than they were. It was proposed to distribute the Kensington Museum more over the metropolis, and to have branch museums in the country. He thought it must be admitted that this was a wise measure, and especially in view of the peculiarly practical character of the English mind. Then, if the lectures which were given in these museums, and the public libraries were thrown open a little more, great good might result to the public. It was the misfortune with regard to all libraries that those in charge of them seemed to look upon the books as so many curiosities not to be touched. These, if they were only more widely thrown open, would be most important agents in the promotion of practical education in this country. Next, a word as to what was called popular science, in which the recondite or difficult matter was brought down to the meanest capacity. Among the speeches delivered at the Society of Arts conference, one was made by a learned professor which was rather staggering. Popular science, according to that speech, was "the mere skimmings of the scientific pot." Well, assuming this to be true, if men of science in its higher sense had the general contents of the pot, the humble votaries of popular science need not be grudging the skimmings. He (Professor Kerr) held in his hand one of old John Weale's rudimentary series of educational works, and a more useful set of books was never published in this country. Weale was dead and gone; and when he started that series of books probably his first object was but a bookseller's—to make profit—but at the same time he was a shrewd man, and it was to be supposed his business motive was to cater for such as the working classes. If so, he had most admirably succeeded, and it would have been difficult to start a scheme of more value than this series of educational books—albeit "skimmings of the pot of science." Every such effort as this having for its object the improvement of the people, ought to have the most kindly encouragement, and, if he who made two blades of grass grow where only one grew before, was a benefactor, much more were the promoters of popular education. As to the question of mutual instruction, he (Professor Kerr) was not there to speak of his own antecedents; but, he was free to confess that when he was sixteen years of age, he was a member of the mutual instruction class in a Mechanics' Institution, and he knew of no project yet devised which was more reliable, practically, in this country at least, as a means of education, than mutual instruction. Workmen meeting for mutual instruction were hnt doing what was done in higher walks; for what did scientific men of the highest rank meet for in the Royal Society, but for mutual instruction? From the highest to the lowest level there was something in the freedom of mutual discussion which could not be had under more formal auspices. He was proud to say that one of the most effectual agencies they possessed in regard to architectural education was a mutual instruction society amongst young men. With regard to drawing, that was an essential branch of technical education in all art-workmanship, the very language in which alone one's ideas in respect of form could be expressed. One of the great advantages of the Continental system over ours was in the fact that, in so far as the State could accomplish it, schoolboys were taught drawing; and he would impress upon all practical men the necessity of acquiring that accomplishment at any expense. Without that no art-workman was properly qualified for his work. Drawing schools, he thought, were not sufficiently open in the evenings to workmen; if they were so, they could not fail to be of the greatest advantage. Having spoken of the necessity of learning to draw, and of the advantage of studying popular science, of conducting mutual instruction classes, and so forth, he would now inquire how all this was to be accomplished. The promoters of this scheme of technical education said it was to be

done at school. He would remind the meeting of the old guilds. These were based upon this very question of technical education. They provided a definite mode of instruction for the young men of the craft; and a young man having been so instructed, was protected from the competition of another young man who did not choose to go through the proper course. Let it not be supposed that he (the lecturer) was trading on delicate ground when he asked his audience whether or not their trades unions could be made to serve the purpose of promoting the education of young men? As to the internal organisation of these institutions he did not know anything, and did not want to know. A great deal had been said about them lately, and a good deal to their prejudice; but if this matter of technical education could be taken up by the trades, something might be accomplished which would cover a multitude of sins. Another point was the question of State aid. It was to be observed that the conference of the Society of Arts came to a conclusion in favour of State aid, or of providing the funds by means of rates. Such, however absurd, was the result arrived at. Now, he had spoken in vain that night if he had not exhibited his sympathy with the peculiar character of the English system of learning business, and with the peculiar system of English government. He had shown, he thought, his perfect sympathy with the independence of the English workman as opposed to the dependence on Government by the foreigner; and he believed and maintained that the great secret of the Anglo-Saxon ascendancy, as it existed all over the world, was this encouragement of self-reliance and personal independence and enterprise. When the question therefore was put, how far they ought to depend on State aid for technical education, he replied: not at all. They thanked Government for their museums, but believed at the same time that if even these museums, in respect of Government aid were done away with, private societies would supply their place. They thanked the Government for the Department of Science and Art; but until it was brought into more perfect harmony with the prejudices of the Englishman, that department would be in vain. Then, if not upon State aid, upon what would he have them to rely? On self-education. There was no education like self-education—that they learnt at school was but the basis for self-education. If they left off education when they left school, how little would they be benefited; they built upon their school education as a basis the structure might attain to any height or expansiveness. Ask the Lord Chancellor, the hishop, the philosopher, and others who had attained to elevated positions, how they got there, and the answer would be, "By self-education." The man who was determined to be educated would be educated. That was the only way in which real intellectual eminence had ever been attained, whether in exalted or in humble life. Some complained that they had not the heart to study, that they had not the time, and so forth. He knew a man, a fellow member with himself in that same mutual instruction class in a mechanics' institution, who was a common weaver, who worked hard, reading all the while a book slung upon the loom, and he was now one of the most distinguished philosophers in England. Such instances, more or less prominent, might be quoted literally by the hundred. Let this be remembered of what he (the lecturer) had said to his audience that night, that for self-education they could neither be too stupid nor too clever. He would conclude by quoting a maxim in point—"Heaven helps those who help themselves."

Mr. Thomas Paterson, in moving a vote of thanks to Professor Kerr for his lecture, concurred with him in thinking, whatever might be said of State aid, properly so-called, that they were at least entitled to have greater facilities afforded them for the acquirement of knowledge in respect of technical education by having more easy access to museums, libraries, and the like, which were the means by which, in a great measure their education was to be acquired. For his own part, he thought, but if he was so large as to demand every energy on their own part, and on the part of their societies, and at the same time every effort that could be made for their advantage on the part of the State.

Mr. J. F. Dexter, in seconding the vote of thanks, also expressed his concurrence as to the desirability of greater facilities being afforded for the acquirement of knowledge, and said, with regard to the museums and libraries, that he did not see why other districts of London should not be as well provided as the district of South Kensington. He thought it would be well if the ratayers themselves would secure that the libraries, when once started, should have a fair attendance and be fairly used. In conclusion, he thought if the practical suggestions thrown out by Professor Kerr were carried into effect, English workmen would not be behind their rivals of France or Germany, or any other country whatever.

The Chairman (Mr. E. Hall) in conveying to Professor Kerr the thanks of the meeting, said, it might be interesting to state, upon information in his possession, that the movement on the part of the leading trade societies in respect of technical education was, perhaps, nearer to accomplishment than was generally supposed. He held in his hand one of the reports of the Amalgamated Societies, in which there was a letter from Professor Jenkins, of University College, expressing the opinion that any seeming deficiency in intelligence on the part of the English workman compared with some of his Continental rivals was really due, not to inferior intelligence, but to the want of the means of technical education; and urging that unless the men took the work in hand themselves, there was little hope of their improvement. In reply to this, it was stated, on behalf of the Amalgamated Societies, that the subject would receive the serious consideration which its importance demanded; and matters were looking hopeful, some progress having already been made towards the realisation of those things to which Professor Kerr had alluded.

THE CHURCH OF NOTRE DAME DE FRANCE, LEICESTER SQUARE.

WITHIN the well-known walls, in Leicester-square, where "Burford's Panoramas" were exhibited for years, a French Catholic Church (l'Eglise de Notre Dame de France) has been constructed, in accordance with the system introduced by M. Boileau, architect, and under his direction. We have already spoken of this system of construction for vaulted churches, with ribs of cast and wrought iron, as applied in the Church Engine (Paris), that of Vesinet (Seine et Oise), and of Montignac (Allier). Its application in Leicester-square is singular, a cross church being there formed within the existing walls of the rotunda, galleries supported on cast-iron ribs occupy the exterior angles of the nave. In this building the iron groins have been made to carry the roof of the rotunda so as to admit of the removal of the large central pillar of wood formerly there. The spaces between the ribs are filled in with brickwork cemented. Other properties surrounding the building, it has been found impossible to open more than two small rose-windows in the walls (which are filled with stained glass), and the lighting is chiefly obtained by openings in the roof. A basement story admits of arrangements for warming and ventilating the church. The entrance is by a porch in Leicester-place.

The church now finished, and which is due to the initiation of M. Faure, French missionary, will be formally inaugurated on Wednesday, the 10th of June next. Messrs. Wood were the builders, and the cost has been about 2,000l.

The high-altar, we may add, is a handsome specimen of terra-cotta work, by Vireux, of Toulon.

NEW CORN WAREHOUSES AT LIVERPOOL AND BIRKENHEAD.

NEW warehouses, built by the Mersey Docks and Harbour Board at Liverpool and Birkenhead for the accommodation of the corn trade of the Mersey, are nearly completed, and when finished and at work will, according to our authority, the *Liverpool Journal*, be the most perfect buildings of the kind in the world. On the Liverpool side the new warehouses, which are fireproof throughout, have been built on the site of the old Waterloo Dock, and comprise three blocks, forming a quadrangle, within the margin of which is the corn warehouse dock. The total length of the buildings is 1,485 ft. by 70 ft. in width. Besides the quay floor there are five stores available for storage, and a sixth, which is appropriated as a machinery floor. The aggregate clear internal area, including the quay floor, is 113 acres. The height of the building from the quay to the top of the cornice is 82 ft. The stores, with the exception of the quay floor, which is 15 ft. 3 in. high, are 9 ft. 3 in. from the surface to the underside of girder above. Every attention has been paid to the relative strength of each part of the structure, the breaking strain of the beams and girders being three times the load they are intended to carry. The total weight of grain upon the floors when fully loaded will amount to no less than 77,660 tons. The clear aggregate storage area of all the floors, exclusive of the quay and other spaces, is 48,918 square yards, affording storage capacity for

* Other lectures have since been delivered. The first of the second course, "Iron and Wood," by Professor F. C. Gilchrist, will be given on Tuesday evening next, in Southampton-buildings. The charge is but nominal. Working men who are willing to do something more than talk and complain should attend.

196,000 quarters of grain. Rails are laid within the warehouses, forming a communication with the main dock line.

Throughout the building the machinery for hoisting and distributing the grain is worked by hydraulic power. There are five self-acting traversing rocking cranes for raising the grain in tubs from the hold of the ship. Each crane is capable of raising a ton of grain at a time at the rate of 50 tons per hour, through an extreme distance of 136 ft. Having brought the grain to the machinery floor at the top of the warehouses the cranes discharge it into hoppers, from which, after being freed from dust, it is weighed by a single operator in 1-ton lots, and then transmitted by an ingenious arrangement to any part of the warehouses. This work of transmission is effected by means of endless bands, of which there are two running the entire length of the three stacks of warehouses. This system, it is said, has never before been introduced into England. The bands are of vulcanised indiarubber, 18 in. wide, and traverse at a speed of about 500 ft. per minute. They are capable of transmitting grain from end to end of the warehouses at the rate of 50 tons per hour. There are chutes for passing grain from one floor to another, into the holds of vessels, or into wagons beneath. Besides the cranes there are eleven hoists for barrels and sacks, and twenty jiggers for lowering purposes. The machinery has been supplied by Sir William Armstrong. Mr. G. F. Lyster, the engineer to the Mersey Docks and Harbour Board, has designed and superintended the erection of the whole of the building and appliances.

The Birkenhead warehouses are in many respects similar to those on the Liverpool side of the water, and are fitted up in the same manner. Their storage capacity is 212,800 qrs. of grain. They are not fireproof. Like the Liverpool warehouses, they have been designed by Mr. Lyster.

THE FEMALE SCHOOL OF ART.

A FINAL appeal is being made to the friends of the Female School of Art, to raise the sum of 1,500l., in aid of the Building Fund of the School, and to found two scholarships. If this be done, the maintenance of the school will be assured without further help from friends. A *fete* and fancy fair will be held in the gardens of the Royal Botanic Society, Regent's Park, on the 25th, 26th, and 27th of June. In reply to a petition to the Royal Academy of Arts for aid towards defraying the debt incurred by purchase of freehold property and enlargement of school, Mr. J. P. Knight writes to the superintendent, "I have the pleasure to inform you, that the Council, fully sympathising in the labours of the Female School of Art, unanimously voted the sum of 50l. towards the purpose stated in the said petition."

A petition for aid will shortly be presented to several of the City companies, by whom we trust the strong claims of the school will be favourably considered.

BRICK SMOKE.

THERE are some common brick-kilns at Swansea which cause much nuisance. Mr. R. Rawlinson, C.E., and the borough engineer, Mr. E. Cousins, at the request of the Local Board, have just now made a report on the subject, which, as it will probably interest many of our readers, we print:—

"Having been requested to report on the best known means of consuming smoke, &c., in the burning of bricks, we visited Messrs. Doulton's pottery kilns, at Lambeth, and Messrs. Hoffman's patent brick-kilns, situate at West Brompton. Ordinary kilns were at first erected at the West Brompton Metropolitan Railway Works, but they were violently objected to by the inhabitants in the neighbourhood. This patent was then adopted. The clay used is that known as 'London clay,' brought to the works from parts of the line of railway adjoining. It is a very heavy clay, and alone is too strong for brick-making; it is, therefore, mixed with sandy loam, from one to four or one to five parts, one part sandy loam to four parts clay.

The clay is not tempered, but is merely cut down and turned over; it is neither ground nor sorted. The clay, mixed with loam, is filled into barrows, each barrow containing materials

for fifty bricks, and weighing about 450 lb.; it is then passed into a pug-mill which is in connexion with the dies: by a recent arrangement these dies are lubricated with grease extracted from soap waste of the woollen manufactories of Yorkshire. During winter the moulded bricks are aired under a shed-roof formed over the kilns, so that bricks are made all the year round irrespective of weather. The bricks are sound-looking, and are very heavy in proportion to their size: this is in consequence of the character of the clay.

Hoffman's patent kiln is built in the form of a large arched passage of a circular form on plan, within which the burning of the bricks is carried on round its circumference. There are twenty-four entrance doorways, admitting of being closed with temporarily-built bricks and clay, so as to retain heat and exclude all entrance of air by the doorways so built up; the circular chamber consisting of twenty-four compartments, or spaces, with one of these doorways to each. In the centre of the ring a chimney is erected about 150 ft. in height, measuring at the base about 16 ft. square, and from each of the twenty-four compartments of the annular chamber an underground flue leads into the chimney; each flue has a valve by which its communication with the chimney can be cut off, arrangements are made by which a damper, or portcullis, can be inserted, so as to cut off all communication between any of the twenty-four compartments of the ring kiln and the next one.

After the kiln has been lighted the fire is never extinguished, but the burning of new bricks and the removal of the finished produce are carried on by a continuous and regular process from day to day. Two of the compartments on each side of the kiln have their entrance doors open, all the rest being closed. By an arrangement of valves (or dampers) in the branch flues, and the larger damper or portcullis in the main flues, air is admitted by the open doors, and has to go round the whole circuit of the kiln in order to reach the chimney. From one of the two open compartments on each side of the kiln men are taking out finished bricks, and in the other they are building unburnt bricks which are not yet quite dry.

Air entering by these compartments passes first among bricks almost cold, and then goes forward to warmer bricks, and so on to hotter and hotter, carrying the heat of the cooling bricks forward with it until it reaches half-way round one-half of the kiln, at which place there is a final accession of heat from the burning of a very small quantity of coal-dust, which is from time to time dropped in through properly-arranged flues from the top of the kiln among the bricks by numerous small openings, furnished with moveable heads. The hot air, including the products of combustion, then passes forward to the bricks, which, by its continuous current, are being dried and heated, passing on among them from hot bricks to those that are less and less so, heating them as it goes on to those which are still damp, drying them, and then passing to the chimney with moisture in the form of steam or vapour taken from the damp bricks. Each day a portcullis is shifted forward one compartment, and a corresponding change is made as to the flue which is to communicate with the chimney and the air at the end of its circuit in the annular chamber. The places where coal-dust is thrown in are also advanced one compartment, and so the whole process goes on.

In the burning of this kiln there is an absence of all smoke containing sooty particles; arising from the perfect combustion of the fuel. That which is discharged from the chimney is steam or vapour from the drying bricks, mixed with gases from burning the clay. These gases are discharged into the air at about 150 ft. Since the erection of these kilns no complaints have been made by the inhabitants of the neighbourhood.

Conclusions:—An examination of Messrs. Hoffman's patent brick-kilns has convinced us that bricks may be moulded, dried, and burned all the year round, and with great economy, as also without sending into the atmosphere black smoke. The patented process economises heat to a very great extent, and thereby saves fuel. The mode of feeding the kilns ensures a combustion of the carbon of the coal; and as very much less coal is required than in the rude method of open kiln firing, local nuisance is in a corresponding degree lessened, and the gases and vapours produced

are delivered into the surrounding atmosphere at the elevation of any chimney provided for such purpose. At Brompton this elevation is about 150 ft.

ROBERT RAWLINSON.
EDWARD COUSINS.

P.S.—The patented method as described is necessarily costly to establish, and can, we think, only be recommended where long continued use is contemplated. For short periods of time the great cost of the patented kiln must prevent their adoption. The nuisance from ordinary brick-kilns consists of dense smoke and vapour at the first lighting, and heated gases and vapour being given off into the surrounding atmosphere at low elevations 10 ft. or 15 ft. above the surface.

There are coke-kilns in use where flues of fire-bricks set dry are formed on the top of such kilns to connect all the vents with a chimney. The bricks in these flues become sufficiently heated to burn all black smoke before it can reach the chimney, and so prevent this form of nuisance, as in the patented kilns. The open beds and joints amongst the heated fire-bricks allows of a due admixture of oxygen with the carbon, and a transparent gas is the result. We are not prepared absolutely to recommend this method, but only suggest it as a cheaper expedient than the more costly but perfect mode by patent."

HALTON INDUSTRIAL EXHIBITION.

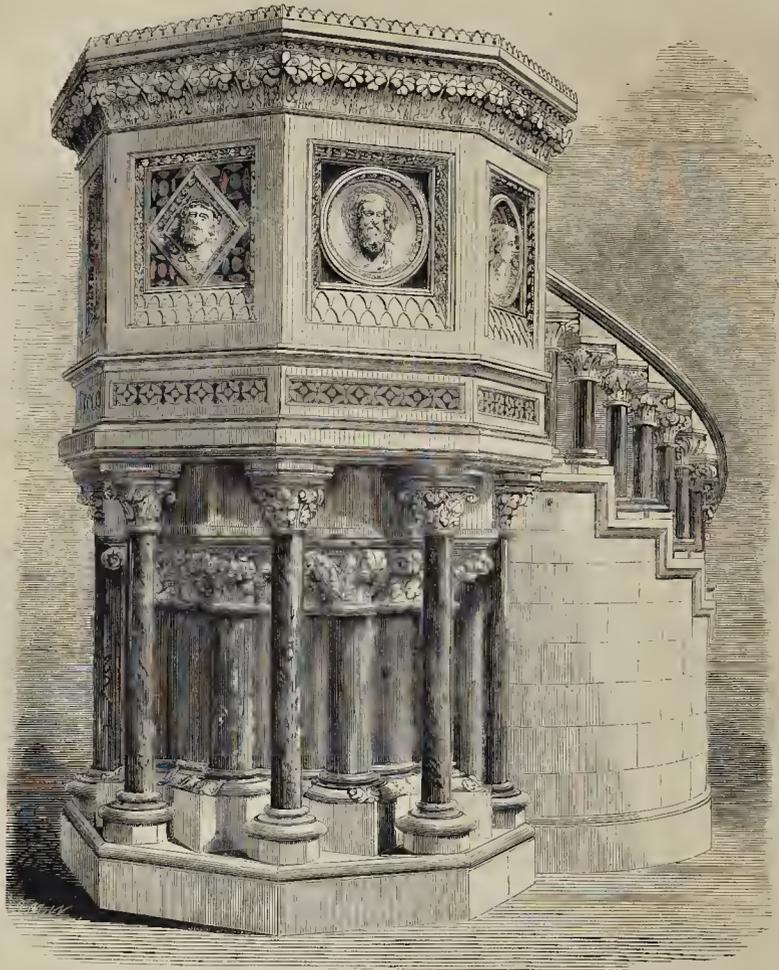

This Exhibition has been opened by the Right Hon. B. Disraeli, M.P. A large and fashionable assemblage was present, including the Premier and Mrs. Disraeli, the Bishop of Oxford, Miss Burdett Coutts, Baron Meyer de Rothschild, Sir Anthony de Rothschild, Mr. N. M. de Rothschild, M.P., the Ladies Rothschild, and Miss de Rothschild, Mr. Julian Goldsmid, M.P., and a large number of the clergy and gentry of the neighbourhood.

The children of the schools of Halton and Aston Clinton, which are supported by the Lady de Rothschild, sang, accompanied by the band of the Grenadier Guards, conducted by Mr. Daniel Godfrey, "A Song of Joyous Greeting," a chorus specially composed for the opening of this Exhibition. After the chorus had been sung, Mr. Disraeli made a short address from the steps of the Halton mansion.

"They had collected together," he said, "an exhibition of the products and manufactures of the district which would well bear comparison with others of greater pretensions. Of the lace manufacture of the county, which in later years had vied with that of the Low Countries, he had seen specimens exhibited at public exhibitions which rivalled the productions of Mechlin and Valenciennes. There was also one part of the county where the manufacture of furniture was carried on successfully; and in working up the beech woods of the district they carried on a trade which sent its products not only throughout England, but to the colonies as well. The embroidery which they would see in the Exhibition was of great merit; and there were many departments of industry which they were about to visit which could prefer claims to public approbation. There was one thing in this county which had made great progress within the past few years—the improvement of the dwellings of the working classes. The silk manufacture was carried on and was flourishing in the county town of Aylesbury. The silk which they produced was able to compete successfully with that of French manufacture; and they not only supplied themselves, but sent a great deal over to France, which got made up, and was sent back and exhibited in the shops of Regent-street as the productions of the French looms. The manufacture was steadily increasing. He had been told that nearly 200 medals would be distributed that day."

PULPIT, CHURCH OF ST. MATTHIAS, STOKES NEWINGTON.

The accompanying engraving represents the pulpit that has been set up in the Church of St. Matthias, Stoke Newington. It is of stone, with marble adjuncts, and was designed by Professor G. G. Scott. Mr. Farmer executed the work.

STONE PULPIT; CHURCH OF ST. MATTHIAS, STOKE NEWINGTON.—PROFESSOR G. G. SCOTT, ARCHITECT.

ABERDEEN PUBLIC AND MUNICIPAL BUILDINGS.

THE accommodation in the County Courts at Aberdeen having become very defective, it was found necessary to provide additional accommodation, and accordingly in the year 1861 it was resolved to erect a new Court House. Designs for this building were obtained from three architects in competition. Some time having elapsed, and there being no proper municipal and county buildings in Aberdeen, it was proposed to take advantage of the opportunity which the building of a new Court House would afford, for the erection of municipal county buildings also; and a scheme was mooted by which it was proposed to erect one large building, combining Court House, municipal and county buildings in one. This scheme it was ultimately resolved to carry out, and for this purpose a site was obtained at the west end of Union-street, the principal street of the city, and in the very centre of public business. The site is an irregular one, having frontage both to Union-street and to Broad-street—a street of secondary importance—the back of the buildings looking to the prisons, and to property of an inferior description. Plans for this enlarged

building were accordingly procured and are now being carried out.

In the building, as arranged, the right-hand portion to Union-street is to be appropriated for the use of the Court House and county officials; the left-hand portion is to be occupied by the town's officials and police commissioners. Part of the accommodation in the town's portion of the buildings is to be let as chambers for business purposes. The centre of the ground-floor of the building is occupied by the entrance to the court-rooms. The entrance is through a corridor, 60 ft. long by 16 ft. in breadth and 24 ft. high. The walls of the corridor are of freestone, having a groined roof of the same material. At the end of the corridor is a broad staircase, the first flight of which leads to the court-rooms at the back of the building. From the landing of this flight double flights of stairs, one on either hand, lead to a large hall, occupying the centre part of the building in the upper floors, the joint property of the town and county.

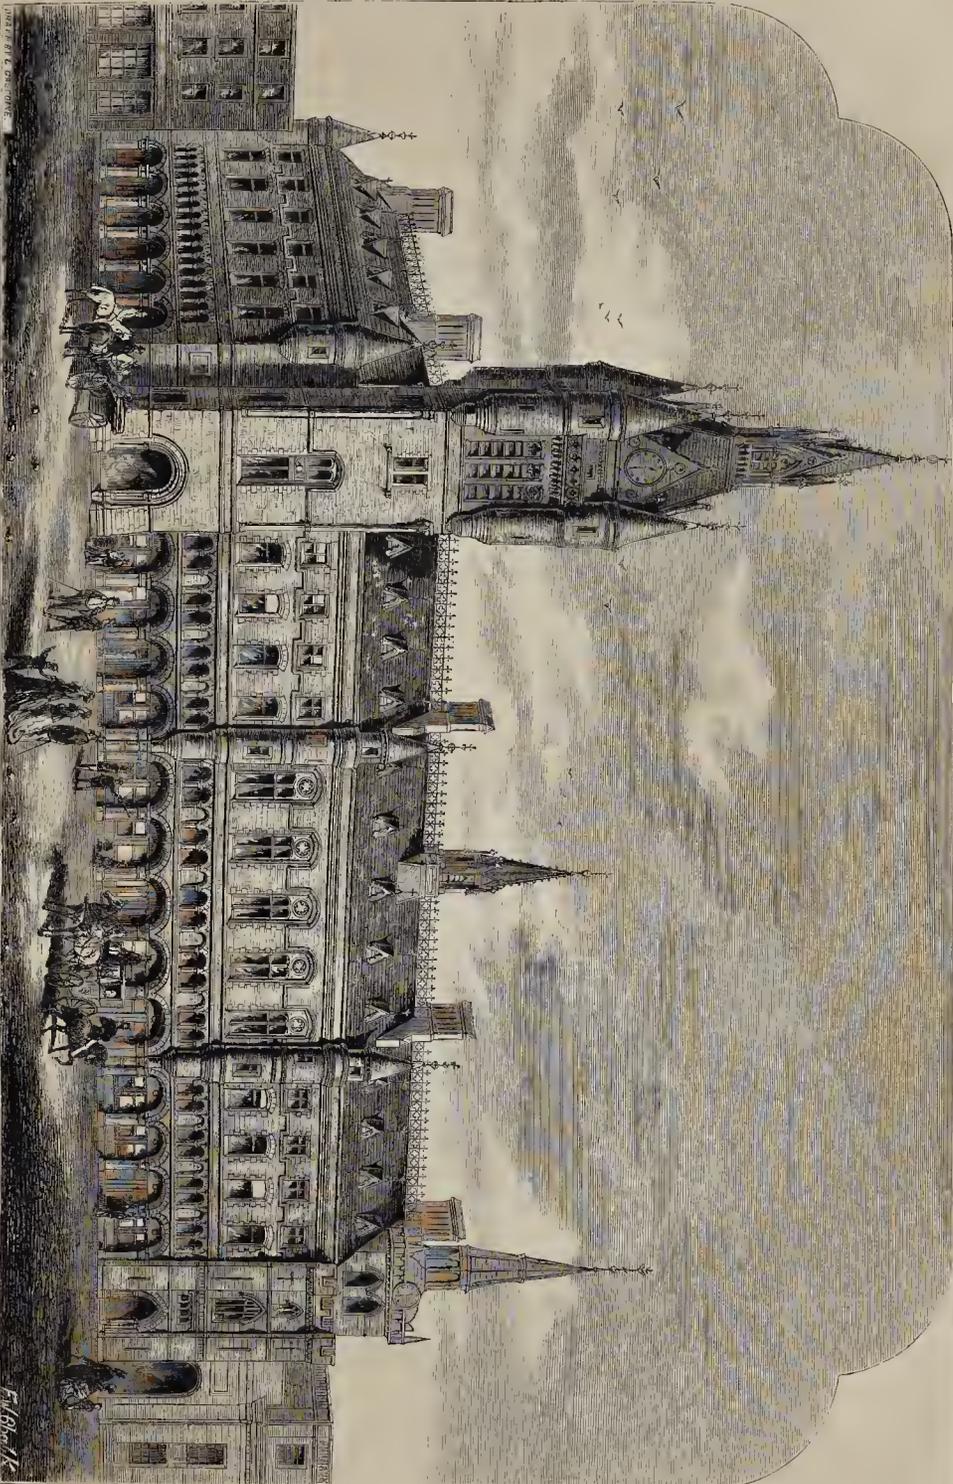

The back portion of the buildings consists only of two stories; whereas the front, as will be seen from the elevation, is four stories in height.

The style adopted in the building is a variety

of the Scottish architecture of the sixteenth century. The material used in the erection is the Aberdeen grey granite.

The tower at the right extremity of the building is an old structure, faced up about the beginning of this century in the style of Gothic then in vogue, and with which the architects have not been allowed to interfere. The principal feature of the edifice,—the great tower to the left, at the corner of Union-street and Broad-street, rises to a height of 185 ft.; and through it is the entrance to the portion of the building occupied by the municipal authorities. The height of the two principal fronts, to the parapet, is 64 ft.

The total cost of the building, when completed, is estimated at from 45,000*l.* to 50,000*l.* The contractors for the various departments are:—For the mason's work, Mr. George Donaldson, Aberdeen; for the wright's work, Mr. James Coutts, Aberdeen; for the plumber's work, Messrs. Charles Middleton & Son, Montrose; for the plasterer's work, Mr. Robert Henderson, Aberdeen; and for the slater's work, Mr. Alexander Adam, Aberdeen; and the work is being carried out under the inspection of Mr. Thomas Sidey, clerk of the works. Messrs. Paddie & Kinnear are the architects.

ABERDEEN PUBLIC AND MUNICIPAL BUILDINGS.—MESSRS. PENDER & KINNEAR, ARCHITECTS.

CONVERSAZIONE, INSTITUTION OF CIVIL ENGINEERS.

At this *conversazione*, held on the 26th ult., a diamond rock boring machine was exhibited by Mr. Appleby, which appears to be more simple in arrangement than that exhibited at the Paris Exhibition of 1867, although it bores a hole at the same speed and of the same diameter and depth. The boring head consists of a number of diamonds set in a ring, cutting a chaos of about $\frac{3}{8}$ in., and it takes out a solid core of about $\frac{1}{8}$ in. diameter, the finished size of the hole being therefore about $1\frac{1}{2}$ in. diameter, which is put down at a speed of about $1\frac{1}{2}$ in. to 2 in. per minute.

Amongst numerous other improvements and inventions, Messrs. R. Moreland & Son, of Old-street, exhibited an improved method of constructing floors for buildings. This system of flooring consists in fixing wrought-iron girders at given distances apart on the walls of buildings, and then placing between them on their lower flanges a number of wrought iron bow and string lattice girders; and on the upper or curved surface of these laying corrugated iron throughout the floor. Concrete or other material is then laid on the corrugated iron to the desired form and thickness, and sleepers, joists, and floor-boards may then be laid on the concrete in the ordinary manner. The ceiling joists are notched or otherwise, fixed on the lower part of the lattice girder, and are lathed and plastered in the usual way. The advantages claimed for this system of flooring are the adaptability of it to all spans and positions required in ordinary buildings, particularly in large spans; and it is more economical and much more rigid than floors constructed with rolled girders: large spans may be constructed by this system without the intervention of main girders, as the wrought-iron girders are made of the greatest depth possible, being kept close to both floor boards and ceiling, thereby ensuring the greatest amount of rigidity and strength, with the least possible quantity of material.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of members was held at the House in Conduit-street, on Friday, the 5th ult., of which we have not yet given a notice.

Mr. Rickman, one of the delegates appointed to represent the Society at the meeting of the Architectural Alliance, read his report, by which it appeared that there had been really no meeting at all, an insufficient number being present to constitute a quorum. In consequence of this fact, he had no special report to make on the subject, but he read a letter from Mr. Chamberlain, pointing out that the Alliance had at their former meetings effected some good, and had transacted some important business. Among other things, they had adopted the scale of charges drawn up by the Institute of British Architects, which had proved an advantage to the profession generally. In conclusion, he asked their opinion as to the best method of securing its future success.

In answer to a question, Mr. Rickman said that nine or ten delegates were present last year ready to take part in the proceedings, but from some accident or other (in consequence, he believed, of a train not keeping its time) the remainder did not arrive until it was too late to transact any business. He hoped, however, that four or five other societies would send delegates this year, and, if so, the meeting might be a success.

Mr. Ridge was very much inclined to question the advisability of sending any one to represent them at the meetings of the Alliance for the future. As, however, Mr. Rickman had expressed such a strong opinion in their favour, he should not take any steps in the matter at present, unless it was the evident wish of the meeting that he should do so.

Mr. Roger Smith always had a good opinion of the object the Alliance was intended to serve. With regard to the special points raised as to a scale of charges, there were various opinions on the subject, but it was caused by the fact that different changes were made in different parts of the country. He argued that the Alliance had done well in adopting the scale of charges drawn up by the Institute of Architects, and thought that it ought to be supported, as there were many other subjects which required the deliberation of its members. He believed that

it would be a mistake to withdraw from it because the meeting last year had been unsuccessful. All members who attended it should look to the advantage of their profession; for they must remember that by raising their profession they raised themselves.

After a short discussion, it was resolved that Messrs. Roger Smith, Rickman, Matthews, and the President should attend as representatives of the Association at the next meeting of the Architectural Alliance.

The Chairman read a letter received by the committee from the Master Builders' Association, requesting them to allow a deputation from that society to wait upon them. He stated that an answer had been returned declining the request, on the ground that it would be putting the Builders' Association to considerable expense for no purpose, as many of its members of the Architectural Association were students, and others belonged to the Institute of Architects, where they would have an opportunity of hearing anything which might be advanced by the deputation which was to attend that body.

Mr. Roger Smith brought up the report of the committee appointed by the association to attend to the department in this Paris Exhibition allotted to architectural drawings. He expressed himself rather disappointed with the result, and said that the committee had guaranteed a certain sum in case of emergency, and they had been drawn upon to the extent of 3l. 8s. a piece. The exhibition of the drawings included many objects of merit, but he did not consider that it in any way adequately represented English architectural art at the present day. The success of this collection, such as it was, was mainly owing to the exertions of the committee.

Mr. Matthews then drew attention to a plan for utilising superfluous heat from ordinary fires, which elicited a short discussion.

THE NUT FOR PROFESSIONS TO CRACK.

III. PAYMENT OF OPERATIVES (AND INCIDENTALLY OF DOCTORS).

THE *Builder* is a journal "for the architect, engineer, operative, and artist," and having now, by your courtesy, had space to consider the "Nut" proposed with regard to the two former, I come to the operative, which has been well said to be absurdly called a "class," being merely the body of society—its body, as distinct from limbs, special organs, tumours, ulcers, clothes, armour, and other excrescences and appendages.

By "operatives" we understand all those necessary to a nation's manual work: consequently all of both the owners (or holders) and the users (if these be different) of the tools or capital employed in each work—all who claim such names as builder, brewer, printer, &c. Now, the first thing operatives seem to need telling is, that their only right or normal condition is where the possessors and users of this capital are entirely the same, none either working with what is not his own, or owning what another is controlling and using; and that, though this state of things may no more exist anywhere, or be ever expected to exist rigorously, than a community without sick people, orphans, or debts, yet it is the state of equilibrium towards or from which every society is moving; and if moving towards it, but from however great a distance, is healthy; but if travelling from it, then, however little removed therefrom, is in course of dissolution and destruction.

The following, then, will have no reference to a dissolving community, which no truth-telling can benefit; but will apply only to operatives who are tending towards, or resolutely intend, this their normal state. Any who, or rather any which, are not only toiling on contentedly (?) upon another's capital, but increasing and multiplying on what he may happen to find it expedient or necessary to pay them, and so regarding this as the proper, intended condition of themselves, or their children, or somebody,— "the state of life into which it hath pleased God to call" somebody,—these I do not include in the term "operatives." For how can they be called so that neither profess nor mean, nor are meant, ever to supply what is necessary to a single piece of work—the capital and labour? In fact, our language commonly does not call them either workmen or even men or women, but "hands," by an idiom as yet confined, I believe, to English—a phenomenon, by the way,

that those who speculate on the significance of changes of language in rotten old races would find worth looking at.

We are to show, then, how any community not merely dissolving and decaying must needs be approaching the state of having no mere "hands," but all operatives, in the strict sense of supplying both the requisite of work. It were easy to show how this process must constantly go on, and the number of mere "hands" grow less and less, in a people holding, believing, or worshipping what Englishmen profess to hold, believe, or worship. But the difficulty is to get any English reader to remember, or bear in mind for one minute, what things he most loudly and constantly professes. Most strangers would take for granted, as to any nation they visit, that no public words, neither their laws nor their popular songs, were more intended than what they utter to their deities in their temples. This is the kind of material by which Dean Stanley judges the Russian Dissenters called *Staroverists*, or "Old-faith-men" (professedly adhering to the primitive Christianity, or that of the first fifteen centuries, prior to all so-called reforms). That singular people seem of such literal, dull, and prosaic minds as to suppose, for instance, when they address their Deity in church (like the Englishman, once a month) in these terms,— "Lord, who shall dwell in Thy tabernacle, or who shall rest upon Thy holy hill? He that walketh uprightly, and worketh justice; . . . in whose eyes a vile person is contemned; . . . he that putteth not out his money to usury," &c.,—that literal material money (such is the gross materialism of their minds) has to do with getting to heaven!— that so spiritual a thing as religion is concerned with their daily use of such things as rouble and kopecks! * * *

For every trade or craft there is a certain quote of capital (measurable in money) necessary to each man's effective employment. It is not always to be found from what a single or even ten isolated operatives require; but if you take a hundredth of what just employs 100, or a thousandth of what employs 1,000 and no more, you have in each case the same quote. This sum, which none can ascertain better than a "hand" of that craft, must be fixedly known by the whole craft, and it must be settled among them that whoever has not this *head-money* (as the word "capital" rightly means) is no right workman, but only a "hand," and that to get this is so essentially a hand's first duty that, till it be gotten, no deed not contributing thereto is even *harmless*. For every hand which, while without this quote of wealth, is making any profit not to itself, but to another, is so far destructively working against its owner, craft, and nation.

Now, in a trade that knew their *head-money*, suppose 100 men working together. Consequently there must be among them the capital that I call 100 *head-moneys*. But suppose this very unequally shared, and, for simplicity's sake, thus: fifty have none of it, but are mere "hands;" forty-five more have just what would employ forty-five, but no more. The remaining five must, therefore, have invested fifty-five *head-moneys*, and, say, in this proportion: twenty, fifteen, ten, eight, and two.

First, you have to learn that, as long as this is so, the entire control and command of the hundred's labour must belong to these five. No others can have any voice; but what relative voice must each of these have? If you say their votes must tell as the above numbers, though you are very near right (in figures), you are wrong enough to ensure your infallible ruin. They must tell as 19, 14, 9, 7, and 1; for they rule, observe, not by virtue of their whole capital, but only of their *supererogatory* capital; otherwise the 45 common workmen would have each a vote; but they are entitled to no voice at all, as long as none of their capital helps to employ others. It is absurd to suppose the personal capital needed by a man's self can give any ruling power. *Personal* capital gives him the privileges of workmanhood, as distinguished from mere handhood, but not a penny of ought but his *supererogatory* capital (which we may call *super-capital*) can give him any rule over others.

Co-operators must not suppose they can afford, in any the smallest particular, to adopt the rough and ready shifts of common thriving companies (limited), which let a large and small shareholder's vote count alike, being too busy with outsiders' pockets to care for more than the vaguest shadow of justice among themselves. Co-operators have a job like the sub-

marine cable covering, where any single pin-hole destroys, and cannot be so small as not to entail entire ruin. I read lately of some poor Lancashire ones elaborating wondrous riles, whereby a holder of 100 shares was to find the last ten had only the voting power of the first two, or somewhat of the sort. Vildest and most suicidal ochlocracy a mob ever devised! For what end do these wise men of the North suppose any man will put capital to another's labour but either to direct that labour or to rob him? Then, if the last shares in the hundred are not to have the full directing effect of the first ones, to whom do they think, except a swindler for some thieving purpose, will it be worth while to invest those last? There are but two possible motives; and to say you will have any penny of supererogatory capital not ruling you, is to say it shall only come to rob you! So every society that do not allow each penny of super-capital (and of none but super-capital) its full and entire ruling power may be sure their sin will very soon find them out.

Now, of course all co-operators understand by this time that an operative can never receive his just due hut in two parts—one a regulated daily allowance that should always be less than the current employers' wages, and, indeed, unless the latter be grossly and unusually curtailed, must needs be less, and ought never to be called by the same odious name; the other part uncertain, though always making with the former more than the current wages, and receivable only when it is ascertained, by the periodical balancing of books, at the end of each quarter, or longer interval. This portion has been hadly and confusingly called "profits," and harshly "bonuses;" but I will call it the *dividends*. It is not the only just way, but a just one and the simplest, to divide these in the proportions of each man's receipts of allowance since the last division, but of course only of allowance for labour, not sick allowance. Hence, whatever ratios have been established between the daily allowance of different classes, the same will be the ratios between their whole earnings, when working equal times. And observe that the ruler and manager is entitled both to double an ordinary allowance, and a double share in the division. This has been settled last by an Apostle—"Let the elders that rule well be counted worthy of double honour," which might equally have been translated "a double honorarium," and applies, observe, to worldly business; for he adds next, "especially they who labour in the word and doctrine;" especially implying that it also applies to those labouring in other things. Moreover, that the words "double honour" chiefly involve double pay, you may know from what our Lord said of the son whose Corban was an excuse to "honour not his father or his mother," where unless "honour" included hard cash there would be no meaning at all. And, in case you should fancy this proportion a matter on which Divine views may vary, like human, with the age, please to observe, while you nowhere find any other, this one was exactly the same for the patriarchs. Among them an eldest son, as inheriting the rule of his father's clan, was to have the ruler's double share in all things; and this was too settled a point, before Moses's time, for him to be ordered even to state it, but only to forbid any father to alter it for private affection!

The Divine right, then, you see, of the manager, as long as you, by keeping him so, imply that he rules well, is to double emoluments. You may vote him anything more, but not less; and to subordinate rulers or foremen, what excess you please.

But you ask, perhaps, what is the difference, in this division, between the man who have their head-money and the "hands" that have it not? Simply, that the former can take their share, while the latter can only have theirs credited to them in the books as so much capital: they can touch nothing but their allowance till their personal head-money shall be thus made up.

But a "hand" wants to leave, to emigrate, or dies; or a workman with just his head-money or with any super-capital does so: what is each entitled to take away, or his heir to have? Take, first, the case of one having his exact head-money, and dwelling still at hand. He can require, on the day he leaves you, only the capital he brought at his entry. In the week after leaving, or in the next, or the tenth, or the hundredth week, he can remove whatever he brought in or earned in the first, or second, or tenth, or hundredth week after entering. For

the society is entitled to the use of each penny of his personal capital for as many days as it gave him membership. But all super-capital he takes away on the day of leaving, because he has exercised the ruling power that each penny thereof gave, for just as long as that penny has been invested. You see, then, that, whether he has super-capital or not, it will generally happen, unless he brought in his full head-money at entering, that different sums become due to him only at various times after leaving: yet you need never make more than one payment. You will find in all school arithmetics *above a century old* (that is, all that were written before the extinction of the worship of the true God in commercial England) a rule called "Equation of Payments," which is not printed now, because thieves have no use for it. That rule shows you on what day to pay any of these sums in a lump, whether the whole of them, or only those not removable when the member left.

For example, suppose the head-money fixed at 25*l.*, and that a "hand," at his entry, brought only 15*l.*. After six weeks there was a quarterly division, and he was credited 2*l.* 10*s.* 3*d.*; again, at the next quarter, 6*l.* 11*s.* 7*d.*; at the next, 5*l.* 14*s.* 4*d.*; making, beyond his head-money, 4*l.* 16*s.* 2*d.*, but of which he only leaves for super-capital 2*l.*. At the next audit his dividend is 7*l.* 0*d.*, of which he removes all but 1*l.*, and after three weeks he leaves.

Now, at leaving he is entitled to the 15*l.* wherewith he entered, and the 2*l.* and 1*l.* super-capital:—

In all.....	£18 0 0
Six weeks later.....	2 10 3
Thirteen weeks after that.....	6 11 7
Thirteen weeks after that, the rest of his head money, or.....	0 18 2
	£28 0 0

Now, to find at what time he may receive the whole 28*l.*, the old arithmetics tell you rightly to multiply each debt by the time (from any fixed date before or after) to its becoming due, and divide the sum of these products by the sum of debts, thus—

Weeks after notice to leave.....	£18 0 0	which × 1 =	£18 0 0
7.....	2 10 3	× 7 =	17 11 9
20.....	6 11 7	× 20 =	131 11 8
33.....	0 18 2	× 33 =	28 19 6
Divide by sum of debts.....	£28 0 0	£28 0 0	2 11 10

So that nine weeks four days after leaving is the time to pay the whole, if he claims none earlier.

I will now take the case of a mere "hand" leaving without having made up the head-money. Suppose it 60*l.*, and that he entered with 10*l.*, and was successively credited the following dividends, but leaves or dies without having attained full membership.

He entered with.....	£10 0 0
7 weeks later was credited.....	5 2 3
13 weeks after that.....	9 16 10
13 weeks after that.....	10 5 4
13 weeks after that.....	4 18 1
49 weeks (and leaves).....	£40 1 6

Now, if he had made 60*l.*, you would have been entitled to use each part thereof forty-six weeks. But the use of 60*l.* for forty-six weeks is plainly the same as using 40*l.* for sixty-nine weeks (because 60 × 46 = 40 × 69). Therefore he can only receive the first 10*l.* after twenty-three weeks from leaving, and each sum sixty-nine weeks after it was earned. Each is to be reckoned as earned from the middle (or thereabouts) of the time in which he was earning it. Thus:—

Weeks after leaving.....	£10 0 0	which × 23 =	£230 0 0
23.....	5 2 3	× 27 =	138 9 9
37.....	9 16 10	× 37 =	354 2 10
50.....	10 5 4	× 60 =	613 6 8
63.....	4 18 1	× 63 =	308 19 3
Divide by sum of debts... £10 1 6	£21,554 9 6		

Therefore thirty-eight weeks six days after leaving he may receive the whole.

Necessarily every co-operative body must have a doctor to tell them who is sick, and who entitled to sick allowance, and how much. Now, in order that he may find it worth while to attend to these things thoroughly, there is only one possible mode of paying him, and it is the simplest possible. He must take nothing for any visit or any medicine to the members themselves (I am not speaking of their families),

and he must undertake all this for a fixed unalterable rate of percentage on the company's whole earnings. You must deal with no doctor who suggests any other base, and the rate per cent. once fixed must never vary, be the company large or small, growing or dwindling, rich or poor, healthy or sickly.

Another learned officer has to be paid similarly, only a far less percentage, because he may serve as many as 100 or perhaps 1,000 doctors could physic. This is the actuary, who settles what is just and safe in all the non-operative money matters, as superannuation, widowhood, &c. If you had only to do with my present subject, payment of operatives, he would not be needed; for trade has reference only to pure justice, and a schoolboy can keep your books as here shown, and any system that gave a farthing to one man which this gives to another is mere theft. Questions of degree come only in the provident or non-trade affairs. And for these matters a company, which is one simple body for work and trade, will yet have to be divided into several, somewhat thus:—

A.....	Bachelors.
B.....	Married, without children.
C.....	Having 1 or 2 children.
D.....	Having 3, 4, or 5 children.
E.....	Having 6, 7, 8, or 9 children.
F.....	Having more than 9 children.

Each of these ought to be so far an independent body as to have separate right to fix their head-money, and he completely separate in their provident funds. Hence, if the birth of a child removes the father out of grade C, and he has not paid up the additional capital that D have fixed for their membership, he must be allowed to draw no dividends till they shall have made up that addition.

In fixing all such points they require the actuary, who must be, like the doctor, their percentage partner, at an invariable rate.

E. L. GARRETT.

PLAGUE STONES.

I BEG to supply you with some further information with reference to plague stones. During the years 1665 and 1666, the little village of Eyam, in North Derbyshire, was visited by the plague. To prevent the spread of the disease, it was agreed by the inhabitants, at the suggestion of the rector, Mr. Monpesson, that none of the villagers should pass certain boundaries. At points on the "cordon sanitaire" were placed troughs, containing water, in which the villagers placed money, which was exchanged on the following day by the people of the surrounding district for bread and other necessaries.

One of these troughs existed within my recollection; it was hewn out of a piece of rough sandstone, and measured about 2 ft. 6 in. each. It was broken up some years ago. A well, called Monpesson's well, that was used for the same purpose, still remains, and is an object of great interest to persons visiting the neighbourhood. For further particulars, see "Wood's History of Eyam." T. G.

"A QUESTION IN RESTORATION."

STR,—I am glad to see the question on this subject started by Mr. Underwood (p. 378, ante), because it is very important that some definite rule should be laid down for the guidance of all engaged in the important work of church restoration.

My maxim in all cases is "conservation, not destruction," being of opinion that every feature of an ancient building tending to show its history should be carefully preserved.

Such a rule being admitted, as I believe it will be by all archaeologists, to be the correct one, it follows in the case under consideration that if Mr. Underwood "puts in two new windows such as" he "has evidence to prove were similar to the rest" he will completely blot out the page in the history of the church which reads that two of the thirteenth century windows were in the fifteenth reconstructed. If, on the other hand, "he, having reproduced the tracery, encloses it in jaumbs and head of Perpendicular character," he destroys all record of the interesting fact that the thirteenth century jaumbs and arch were re-used with the new tracery in the fifteenth. If, again, he "reproduces the tracery, as well as jaumbs and arch, as he finds them, copying each stone with its defective arc,"

he completely destroys the old work, and the "sermon in stones" cannot be read without a verbal exposition.

I should say, neither "make new" nor reproduce, but carefully reset every stone of the old work that is not utterly perished; and if any are so much perished that they cannot be reset as they are, cut out and replace the smallest possible pieces that will suffice to make the work fit again; if, however, the work is so utterly gone that it cannot be reset, re-use at least one or two of the best pieces of each section, no matter how decayed, to perpetuate the history, and to show that you have read it aright, and reproduce the rest stone for stone, "defective arc" and all.

By adopting this course you not only preserve the history of the windows, but escape the horns of a dilemma, and the work will possess a value in the eyes of all true archaeologists (the only persons whose opinion is worth consulting) which no new work or total reproduction, however careful, could command. By them the "defective arc" (if proved to be historical by a presence of only two or three old stones), like the "defective arc" of a leg broken in battle, will be valued for the history it carries with it.

If the rule I have thus endeavoured to lay down were universally adopted we should not have archaeologists detesting the sight of a "restored," which often means a "destroyed," church, and our country would abound with the records of its own history.

J. P. FRICHELLT.

SIR,—I have always felt that, to find a proper solution to such questions in restoration as that proposed by Mr. Underwood in your issue of May 23rd, some reconciliation must necessarily be effected between the views of the mere antiquary and those of the art-architect. The antiquary says to the restorer, "You have no right to take away from me what I consider my birthright,—the power of examining the history of the works of our forefathers through their structures,"—a most admirable principle to lay down, but one that may be easily carried too far. To give an example,—perhaps an excessive one, but the excess will only make plainer what I mean.—The whole of the interior wall-surfaces and groining of Salisbury Cathedral are coated with whitewash, which was most probably first applied to them in the early Puritan days. Through this whitewash it may be discerned that the whole of the walls and groinings were painted in a very exquisite manner, the paintings apparently remaining perfect. Now the antiquary, to be consistent, must leave the whitewash still remaining, for the whitewash as much represents a part of the history of the building as the lovely colours which it hides. Yet, surely no antiquary would wish the lazy, fanatic whitewash to remain, and the diligent, pains-showing work done by God-fearing men for the glory of Christ's Church to be obscured? Taking this for granted, where will the antiquary draw his line, dividing what is to be preserved from what may be destroyed? I think the decision cannot be left with him alone, who only too often interprets Mr. Ruskin's golden rule for restorers, "Better a crutch than a lost limb," as forbidding the excoision of a hideous tumeur.

Now for the other side of the question. As in the supposed case given by Mr. Underwood, the architect says, "Such and such a part of the building is in a dilapidated state. The part is evidently a late insertion, and a careless one too, and, to my mind, forms an eyesore in the building. How am I to restore it? There are the three usual courses open to me:—1. To make good and sound the existing features with new work similar to the old, so far as may be necessary for stability; 2. To rebuild it in accordance with what was evidently the original design; or, 3. To design something of my own harmonizing with the original work, as far as may be, but efficiently differing from the original to mark it the work of the nineteenth century. Which shall I adopt? If I adopt the first course, I shall be accused of perpetrating a lie in every new stone I insert. If I adopt the second method, it will be soundly rated for having destroyed "the most interesting feature in the building," by robbing the antiquary of the power of reading the history of the edifice in its structure. Or, if I am bold enough to use the third course, my presumption in having dared to think that anything that I could design was fit company for the "glorious

work of our forefathers," will meet with all due condemnation."—Happy architect!

With all deference to more learned opinions than my own, I cannot but think that, in any case similar to the one mentioned by Mr. Underwood, a little consideration will show us that at any rate the first of the above methods of "restoration" ought not to be adopted, for it is very evident that the specimen he cites possesses no value except antiquarian value, and is in fact a blot on the architecture of the building; therefore, to put in new work similar to the existing features, is making a sham antiquity, which, having no value as a thing of beauty, has consequently no value whatever, and is merely the perpetration of an eyesore. I would then submit that the architect, having been loyal and conservative towards the building under his hands as far as possible, should at such points become radical, and boldly cut away the decayed eyesore, heedless of the wails of antiquaries and the carpings of critics, who can easily find fault, but cannot quite so easily advise what can be done better; taking for his motto an extension of Mr. Ruskin's surgical simile—better a newly healed scar than an eye-burning tumeur.

Which of the two remaining systems of restoration should now be carried out I must leave for further consideration.

CHARLES NOEL ARMPFIELD.

JOHN SPILLER.

SIR,—In the year 1794 died John Spiller, a pupil of Bacon, the sculptor, a distinguished student of the Royal Academy, and a sculptor of great promise. He was only thirty-one years of age, having been born in 1763. His wife—said to have been very beautiful—died of the same disease, consumption, a few months after him. What a pathetic story have we here! What is known of this young and now forgotten genius? All that I know from reading is, that the statue of Charles, which occupied the centre of the piazza of the Royal Exchange, was the work of Spiller. The enthusiasm of the young artist was so great, we are told, that, though consumption was doing its fatal work, he persisted in labouring at this statue, in spite of earnest advice to the contrary. He was, he said, to die at the foot of the statue. It was completed, and raised to its destined site. The young martyr returned home, and soon was known no more. The statue escaped at the fire which occurred on the 10th of January, 1838. In speaking of this gifted sculptor, the elder D'Israeli says,—"The energy of his labour and the strong excitement of his feelings had already made fatal inroads on his constitution." No mention is made of Spiller in Allan Canningham's "Lives of Painters and Sculptors." If any of the readers of the Builder are in possession of any particulars regarding John Spiller's life and labours, and will communicate them, it would oblige your correspondent, and might be not without interest to your readers.

S. M. P.

DISPOSAL OF SNOW IN THE CITY.

SIR,—On 4th, the practical testing of the different plans is to be hoped no further delay will take place, for if put off until winter the carrying out of the successful competition will be parallel with ordering a new fire-engine when the house is already in flames. Can you inform me what is the cause of delay? Is it really a business? A COMPETITOR.

DRAINAGE OUTSIDE METROPOLITAN AREA.

IMPORTANT TO SUBURBAN BUILDERS.

At the Marylebone Police-court, on Monday last, a case was decided by the magistrate which is of importance to builders of houses outside the metropolitan area under the jurisdiction of the Metropolitan Board of Works, and is also of interest to intending occupants of such dwellings. By the 25th & 26th Vic., c. 102, sec. 61, it is enacted, amongst other things, "that no person shall make or branch any sewer or drain, or make any opening into any sewer vested in the Metropolitan Board of Works," without the previous consent in writing of that Board; and "every person so offending shall for every such offence forfeit a sum not exceeding 50*l.*, and the Board may cut off the connection between such drain and the sewer," &c. The defendants in this case were Messrs. Midson & Dale, of 12, Princes-terrace, Upton-road, St. John's Wood, builders, and they were summoned by the Metropolitan Board for having made a sewer from certain houses erected

by them in the parish of Willesden into the main Banelagh sewer, in Paddington parish, in contravention of the statute.

The case for the Metropolitan Board was based as follows:—Their engineer reported that the parish of Willesden, although formerly within the limits of the Metropolitan Commission of Sewers, and draining naturally into the main sewer in question, was excluded from the jurisdiction of the Board of Works by the Metropolitan Local Management Act, 1856, and permission to drain property into the sewer from the Willesden side has been invariably refused by the Board. In the present case part of some of the houses is in the parish of Paddington, and within the Board's jurisdiction, and a part, in some instances the whole house, is in the parish of Willesden, and beyond the Board's jurisdiction; but the entire block forms one compact property. The question as a whole appeared to the engineer to come under the general one of the admission of the sewage of outlying districts into the Metropolitan main drainage system.

The solicitor for the Metropolitan Board, referring to the houses outside the Board's jurisdiction, remarked, that "it would seem a lamentable defect if nine or ten houses out of a block of seventeen or eighteen could be drained that the other seven or eight are not to be."

At a previous hearing of this case defendants admitted that they had made the sewer connecting the Willesden houses with the main sewer, but that it was done in ignorance; whereupon the magistrate adjourned the matter, the defendants in the meanwhile to conform with the Metropolitan Board.

On Monday, Mr. Fry, for the Board of Works, said that no difficulty was raised as to the drainage of the houses within the Paddington boundary into the main sewer, but the Board had "no power" to allow defendants to drain the houses in Willesden into the main sewer, although they were only a few feet beyond the parish boundary. In this case the Board asked that a penalty might be inflicted, as a caution to other builders.

Mr. D'Eyncourt, remarked, that outside the area of the Board of Works' jurisdiction houses were being built so rapidly that the outlying suburbs would soon become large towns. Were they to have no drainage?

Mr. Lovick, assistant engineer to the Board of Works, said that was a question for the inhabitants of those districts. The Board had nothing to do with their drainage.

Mr. D'Eyncourt then asked what would be the result if the builders in suburban places connected the drainage of the houses with the Metropolitan main drainage system.

Mr. Lovick said the Board would summon them all, and press for penalties in every case.

Mr. D'Eyncourt said it was a hard case for the inhabitants of Willesden; but their remedy would be to get an Act of Parliament if they wished to get their drainage removed by the main sewers vested in the Board of Works. Defendants had contravened the statute, and he would inflict the mitigated penalty of 5*l.*

HERNE BAY PIER.

SIR,—It would be desirable to have a printed list of the directors, or sub-directors, of this undertaking, and to determine as to their "legal liability" to keep the pier in proper repair.

Is the Board of Admiralty or Trinity Board charged with looking after such structures and exercising a proper surveillance? Surely a notice to repair should have emanated from one of those bodies; and the directors should not have been permitted to board in and shut up this pier to the inhabitants of Herne Bay and the public in general, as they have done for many years past, to the infinite loss of both.

PALATIN.

ARCHITECTURAL PUBLICATION SOCIETY.

The annual general meeting of the subscribers of this society was held at the House in Conduit-street on the 27th ult., Mr. Horace Jones in the chair.

Mr. Arthur Cates, the honorary secretary, read the following report:—

The past year has been devoted by the committee to the completion of the issue for the 17th year, 1868, and the second part for that year is now in course of distribution to the subscribers. This part continues the Text of the Dictionary as far as the article "Load," the letter K being therein completed, and much progress made with the letter L,—a further considerable portion of which letter is now in type. On examination of this part, it will be observed that many of the articles have extended to a considerable length, arising either from the importance of the subject, or from the experience and knowledge of the writer having enabled him to give fuller development than had at first been considered necessary. As expressed in a paragraph of a former report, "it is this freshness of information which has placed the Dictionary in its high position, and precludes all opportunity for any one to assert that the text is a mere compilation from preceding works of a similar nature."

In confirmation of the position which the committee again with pleasure confidently assert to have been attained by the work they refer with satisfaction to letters lately received from M. Cesar Daly, the learned editor of the *Revue Générale de l'Architecture*, and from M. Ernest Vinet, the librarian of the "Ecole Impériale des Beaux Arts," at Paris, which satisfy them that although the number of foreign subscribers is but few, those copies which have reached Paris ha a attracted well-merited attention, and that the work has made for itself a reputation in highly informed and very critical circles. M. Daly announces his intention of noticing "The Dictionary." In the *Revue*,—"Avec tous les éloges que mérite un ouvrage aussi intéressant que bien fait," while M. Vinet says:—

"Le tien essentiellement à enrichir une collection que j'ai formée des plus beaux ouvrages qui se publient à l'étranger, et le Dictionnaire des Architectes anglais est du nombre. Acquiescer ce remarquable ouvrage est difficile; il n'est pas dans le commerce, et quand il se vend c'est à un prix très élevé."

It had been the intention of the committee to have during the year issued a part of illustrations with text,

but various obstacles prevented the realization of this wish; not the least has been the difficulty which exists in procuring suitable drawings and sketches to form illustrations. This may arise from the fact of the student now relying much on the subjects produced by photography rather than on the work of his own pencil, and that many of the best collections of sketches are now reserved for reproduction in the illustrated sketch-books of architectural societies. This difficulty, and the pressing engagements of the publisher of the illustrations, have prevented the issue of the plates; but a series is now in preparation which will, it is hoped, shortly be ready for issue. The completion of the letter L will enable the committee to issue a title-page and table of contents for the binding of volume IV, of "The Dictionary," comprising the letters H, I, J, K, and L, and thus place that portion of the work in a more available form.

The committee much regret that the munificent offer of Mr. T. H. Wyatt, made in 1868, to contribute 100*l.* towards the funds of the society, has not led to the example being followed; but however desirable it may be thus to obtain funds to hasten the progress of "The Dictionary," the committee would prefer to rely on the individual exertions of the subscribers to extend the list of members, and thus increase the income at the disposal of the executive. The expense of management are nearly the same for a small or a large income; and the addition of a number of subscribers would enable the committee to increase the quantity of matter issued in each part, and thus expedite the work.

The assistance received from the general body of subscribers (with some remarkable exceptions) does not encourage the committee to anticipate much aid in this direction, but they would observe that a proposal is now under consideration, by which it is suggested that by an active and simultaneous exertion on the part of the present subscribers, which would result in the addition of one half to their number, it would be possible so to arrange the funds which would thus be placed at the disposal of the committee as to secure the completion of the text without further call on the subscribers, whose payments for past years would probably cover all future expenses, or nearly so.

Considering the prosperous state of the architectural profession, and the considerable increase made in its numbers during the last few years, this addition to the numbers of the subscribers ought to be readily obtained, and is encouraged to do so by the support of the general body of subscribers, the committee will endeavour to mature the scheme, and submit it for consideration.

The audited balance-sheets show a total receipt for the seventeenth year, 1866, of 432*l.* 0*s.* 10*d.*, and a total expenditure of 388*l.* 7*s.* 8*d.*, leaving a balance in hand of 33*l.* 13*s.* 2*d.*, to be appropriated to the most outstanding liabilities for that year, while for the eighteenth year, 1867, 178*l.* 10*s.* has been received, and 62*l.* 2*s.* 10*d.* has been expended, the balance, 126*l.* 7*s.* 2*d.* being available towards the cost of the publications for that year now in hand.

In the discussion which followed, the accounts and balance-sheets were subjected to close scrutiny, and the explanations afforded by the secretary having evidenced the satisfactory financial position of the Society, the progress of the "Dictionary" and probability of its early completion were discussed, the chairman, Professor Donaldson, Messrs. C. C. Nelson, O. Hansard, T. M. Rickman, and others, taking part. The statement made by the secretary, in reply to the inquiries addressed to him, showed that the only element required to ensure the speedy completion of the "Dictionary," was the immediate accession of a sufficient number of new subscribers to place an ample capital at the disposal of the committee. The individual interest of each subscriber was shown to be the introduction of new members, to meet whose demands the committee had available a stock of the publications of the past years sufficient, if all disposed of, to supply nearly all the capital needed for the completion of the "Dictionary of Architecture."

The report being thereon adopted, it was moved and carried, that in order to economise the funds, the printing and circulation of the report and accounts be discontinued.

Votes of thanks to the officers and chairman closed the proceedings.

ARCHITECTURAL SOCIETIES.

The Sheffield Architectural and Archaeological Society.—A number of members of this society, together with several ladies, have made an agreeable excursion into Derbyshire. Starting from the Sheffield School of Art, they drove to Padley Wood, near Grindleford-bridge, where the whole party alighted, and crossed the fields to the site of the ancient Manor House of the Padleys, Eyses, and Fitzherberts. The chapel, now the only part remaining of this once stately mansion, was inspected, and a paper on it was read by the Rev. John Stacey, M.A. The visitors next crossed Burbage Brook by a rustic bridge, and after a scramble over the rugged moorland, came by way of Booth's edge to "Higgaw Tor," which was scaled, even by the ladies. Descending on the south side, the famous "Caerswark" or "Carlswork," was next visited, and here, surrounded by the natural and artificial fortifications of this singular stronghold of the Ancient Britons, the party again listened to Mr. Stacey's notes; after which they adjourned to Fox House.

Leicester Architectural and Archaeological Society.—At a meeting of this Society, held in the Town Library, Guildhall, Leicester, the Rev. J. H. Hill in the chair, a paper, contributed by Mr. Vincent Wing, on Buckminster Church, was read; after which Mr. James Thompson (local secretary for the Society of Antiquaries for Leicestershire) read an account of a recent visit to Silchester.

Durham and Northumberland Architectural and Archaeological Society.—The first general meeting of the members of this society was held on the 18th ult. at Chester-le-Street and Lumley Castle. The party started from Durham about ten o'clock in the morning in conveyances for Chester-le-Street, where they arrived about eleven o'clock. After inspecting the parish church at Chester-le-Street, the company assembled in the churchyard, when the Rev. W. Featherstonehaugh read a paper on Romsay Chester-le-Street. In the discussion which followed, the Rev. Mr. Greenwell expressed his regret that in the restoration of Chester-le-Street old church so little regard had been paid to retain many of the ancient architectural features of the venerable church. Lumley Castle was afterwards visited, when a paper was read by Mr. Longstaffe, "On the Lords of Lumley."

Oxford Architectural and Historical Society.—A meeting of this society was held in the Taylor Building on May 20. A lecture on "Monasticism" was given by Mr. Charles Appleton, M.A., who traced its history and described the various forms which it had assumed at different ages, and discussed the views which had been held by recent historical writers and philosophers on the subject. The lecture was followed by some remarks on "The Recent Discovery of Wall-paintings on the Apsos of Checkendon Church," by Mr. E. G. Bruton. The church is one of those rare examples of an original apsidal eastern end, and it was probably built early in the twelfth century. Mr. Bruton described the steps by which the paintings were discovered, and his reasons for thinking they were painted shortly after the erection of the church. When complete they consisted of the twelve Apostles, equally divided, and ranged on either side of the walls, north and south of the east window; but the southern half had been reduced to three or part of four figures in the fifteenth century, by the insertion of a window. Some parts of the figures of our Saviour, seated on a throne, were discovered on the vault, immediately over the east window. The figures of St. Peter and St. Paul were arranged north and south of the east window, and were distinguished by being placed in panels or niches, while the others were not so separated; and to these saints the church is dedicated.

DAMAGE DURING THE THUNDERSTORM.

THE recent lightning caused great damage to house property in the metropolis, and affected the telegraph wires to a remarkable extent.

The Victoria Tower of the Houses of Parliament was struck by lightning. The House of Lords was sitting at the time for the purpose of hearing appeals. It was ascertained, however, that no material damage had been sustained.

At Brompton, Little Chelsea, and between the Fulham-road and South Kensington, at which places deep cuttings have been made for the works of the Metropolitan Railway Extension and new branch lines, the torrents of rain that fell inundated the works to the depth of 10 ft., notwithstanding that the contractors had wooden shoots to convey water across the cuttings and out of the tunnels. It is feared that some of the new brickwork, which is scarcely dry, will require to be rebuilt.

It is said that during the storm there was a fall of meteoric stones.

A frightful explosion took place at a fog-signal manufactory in Cherry-lane, Bordesley-green, Birmingham. The result was the almost entire destruction of the place in which the works were carried on, and two young women employed there were burnt to death, and four others so severely injured that several, if not all of them, have since died. The damage to the works is estimated at nearly 1,000*l.*

Morville Church, in Shropshire, was struck by lightning during the storm, and sustained considerable damage. The electric force first struck the south-west pinnacle of the tower, breaking it in pieces, and scattering the fragments of

stone in all directions. One piece, weighing 20 lb., was hurled the full length of the church, and fell upon the roof at the end of the nave, breaking the tiles.

A school was struck by lightning at Furze-hill, Brighton. The building is detached, and has two chimney stacks on the western side. Upon one of these is a lightning conductor, and that one escaped, but the lightning struck the other stack, a few feet off. It carried away four long and heavy zinc flues from the top of the stack, and tore off the slates in two places on the roof. Descending one of the flues, it tore out a register stove and displaced a mantel-piece in an upper room. It went as far as the drawing-room grate, where it put the fender on one side, and threw the fire-irons out on to the floor. The clerks in the telegraph office at the Brighton railway station were compelled to leave the place. One of the metropolitan police ventured to enter the office, but was met by a flash of electricity passing from one instrument to another. He was partially stunned and temporarily blinded, and did not recover for a considerable time.

Illinois papers have accounts of great devastation, with less of life, occasioned by a recent storm there. At Shanghai a church was destroyed by lightning during divine service. The hail and wind had broken in the window lights, and torn out the windows, sashes and all. Two persons who had succeeded in getting out were instantly killed. The building reeled like a drunken man, but no one else could get out. Despair was depicted upon every countenance. Suddenly the crash came, and with a deafening sound mingled with the shrieks of the pent-up people; timbers, scanting and all, came down with a sudden crash upon the heads of the congregation. Some had skulls broken; others, arms; others received internal injuries from which they can never recover. Nearly all were more or less injured. A tornado has also occurred in another part of North America, and a severe hurricane in the Sandwich Islands.

DEBATE AS TO SITE OF THE NEW LAW COURTS.

ON a motion for the adjournment of the House of Commons, Mr. B. Cochrane called attention to the site of the New Law Courts, and observed that the subject was one of great importance, involving as it did an outlay of between two and three millions of money. The frontage to the Strand was only 700 ft., and the depth did not exceed 550 ft. An additional frontage of 100 ft. was required. The site was unroaded by most miserable streets, and proper approaches could not be made for less than 1,000,000*l.*, in addition to the estimated cost of 2,000,000*l.* for the buildings. Now, what was the case with respect to the Thames Embankment? Between King's College, adjoining Somerset House, and the Temple, a river frontage might be obtained of 1,000 ft. with a depth of 700 ft. That site, which was perhaps unsurpassed in Europe, would afford sufficient space to accommodate the courts most advantageously. The purchase of that site might be effected for 1,000,000*l.*, and the approaches to it were already made.

Mr. M. Chambers said he had received information from a man of great experience that the approach to the Courts would cost half as much as the sum expended for the acquisition of the site. Further, the buildings on the west and the north, which were of the worst possible description, would have to be cleared away; for, if allowed to remain, they would be a disgrace to the new courts. The buildings on the east, from Bollyard to Chancery-lane, would also have to be removed, otherwise they would not be able to get to the Courts from Holborn. In the plans proposed to be adopted,—the internal by one architect and the external by another,—he found in the former that their lordships the judges, the counsel, suitors, jurors, and witnesses, would have to ascend to the courts, which would be placed as high as the House of Commons; but how they would be able to mount so high he did not know, except they adopted those things called "lifts." It was desirable, before they proceeded further, to obtain from the authorities information of the cost of the present site, and how much it would sell for if thrown into the market next year, or in the next two or three years. He quite agreed that they might dispose of the present site for at least the amount they had given for

it; but they might, in a few years, when they had constructed the Courts on the Embankment, obtain a much larger price for it.

Mr. Cowper said the Embankment site might be a better one on purely æsthetic grounds, but upon those of economy and convenience the present site would be far preferable. The present site was equidistant from both Lincoln's Inn and the Temple. The proposed site on the Embankment would cost at least twice as much as the site purchased, for the houses in Norfolk and Arundel streets would have to be bought, and, being of a better description, a large sum would have to be paid for them. He knew that some architects had stated that the space on the Strand site would not be sufficient; but that point would be determined when they knew how much room the Government would require for the accommodation to be afforded. He believed the space would be found to be amply sufficient, and, therefore, no time should be lost in appointing an architect, and commencing the works.

Sir G. Bowyer thought it wrong to proceed with the new building until they had the report of the Judicature Commission, and knew what courts would require accommodation.

Lord J. Manners said that the question of site had been settled years since, and that not by one but by repeated Acts of Parliament. The purchase of the land was virtually completed, and, therefore, he could not agree in raising the whole question of site again. The total cost of the ground would be 896,000*l.*; but to fix what it might be worth in ten years would be to make the wildest of estimates. It had been said that inconvenience would arise from the difference of level between Carey-street and the Strand; but, if he was not mistaken, there would be a much greater difference of level between the Strand and the Embankment. Carey-street would be most convenient to suitors, and, besides, was close to the Record Office, which had been built, at an expense of 200,000*l.*, at the back of Chancery-lane. The land purchased amounted to seven acres,—quite sufficient, in his judgment, for the erection of all our law courts.

SURVEYORSHIP OF GRAY'S INN.

The Benchers of the Honourable Society of Gray's Inn have elected as their Surveyor Mr. Lewis H. Isaacs, of 3, Verulam-buildings. Mr. Isaacs is Surveyor to the Holborn District Board of Works. There were fourteen candidates for the appointment.

COMPETITIONS.

Monmouth.—The Monmouth Board of Guardians, at an adjourned meeting on the 16th ult., selected a design the joint production of Mr. G. C. Haddon, of Hereford, and Mr. F. B. Payton, of Bradford, Yorkshire, submitted in competition, along with fifteen others, for their proposed new workhouse. The site is in the Old Hereford-road, and is described as highly suitable for the purpose to which it is to be devoted. The estimated cost of the new buildings is stated at 6,000*l.*

CHURCH-BUILDING NEWS.

Snetton (Nottingham).—The new church of St. Matthias, in the rapidly-grown district of Snetton, has been consecrated. The edifice is erected on land, the gift of Earl Manvers, situated on the left of Carleton-road, on the rise of the Mapperley-hills. The architects were Messrs. Hine & Evans; and the builder Mr. J. E. Hall. It is now more than ten years since plans were prepared for a building with tower and other accessories. After these plans had been approved by the Incorporated Society, it was discovered that the committee were more than 1,000*l.* short of the sum required to carry them out, and it then became a question whether the work should be further delayed, or whether the architect (Mr. Hine) should be requested to furnish plans by which the requisite number of sittings (700) could be obtained at a cost of 3,000*l.* The latter course was adopted. Externally the building presents nothing very remarkable. The edifice consists of a nave, 67 ft. long and 48 ft. wide, with open-timbered roof, the ridge of which is nearly 50 ft. from the floor;

a chancel, with circular apse of equal height, 32 ft. long and 20 ft. wide; and chancel aisles on either side, out of which a vestry and organ-chamber are partitioned off with open screens; and a south porch. The division between the nave and the chancel, and the chancel and the chancel aisles, is effected by a triple arcade, with two stone columns, in one of which the ceremonial stone forms the base. A fourth arch, rising to a height of 35 ft., divides the chancel from the apse. The walls throughout are built of Balwell stone and lined with red brick, interspersed with black brick bands and panellings. The building will provide for upwards of 700 on the floor, and the total cost, including fences, fittings, and architect's expenses, is about 3,000*l.* In addition to lancet windows at either end, the light is admitted through a range of openings formed in the roof. The gas-fittings have been executed by Mr. Rhodes.

Reading.—The restoration of St. Lawrence's Church has been completed, and the edifice reopened. The roofs have been repaired, the whitewash coatings of centuries removed, all the interior stone-work restored, and the plastering redone. The nave roof has been opened and stained, and the panelling of the aisle ceiling restored. The old flat ceiling of St. Jehn's Chapel has given way to a wagon-headed roof, to admit of the organ being placed in that part of the church. The benches, screens, and other joiner's works have been executed in oak, and the aisles are paved with Peak's tiles in simple geometric patterns. One of the south windows has been filled with stained glass by Messrs. O'Connor, of London. The subject is "The Resurrection of the Just." Various other improvements have been effected. The contract for the restoration works was taken by Mr. Henry Lovatt, of Wolverhampton, and carried out under his foreman, Mr. Henry Charlton. The works have cost about 4,000*l.* Mr. Joseph Morris was the architect employed.—The vestry of St. Mary's parish have resolved to repair the roof of the nave of St. Mary's Church, on a report by Messrs. J. B. Clacy & Son, at a cost of 400*l.*, to be raised by voluntary subscriptions.

Aylesbury.—From a statement issued by Archdeacon Bickersteth and the churchwardens of St. Mary's parish church it appears that 1,950*l.* have been expended on the restorations at the present time, and that a sum of 400*l.* requires to be raised for further works, exclusive of the chancel. The cost of restoring the tower and spire was 1,029*l.*, in place of 750*l.*, the timbers having been more seriously decayed than was anticipated.

Moulton.—The parish church at Moulton, in the county of Lincoln, has just been reopened by the Lord Bishop of the diocese, after having undergone considerable repairs and restoration. It is one of those large churches for which the county is famous, and consists of an Early pointed nave, with north and south aisles, 92 ft. by 51 ft., a perpendicular chancel, 48 ft. by 20 ft., and western tower and spire, about 170 ft. in height. A new south porch takes the place of a comparatively modern one of poor design, and a vestry and organ-chamber have been added at the east end of the north aisle. The new seats and doors are of English oak; the walls and windows have been restored, and the roofs repaired and recovered with lead. The cost of the work has been upwards of 3,000*l.*, and to meet this outlay the parish have agreed to borrow 2,000*l.*, the remainder being raised by subscriptions. The whole of the works have been executed by Mr. W. Brown, of Lynn, under the direction of the architect, Mr. William Smith, of John-street, Adelphi.

Withersfield (Suffolk).—The church here has been re-opened after restoration. It was decided to rebuild the chancel at a cost of 500*l.*, and enlarge the church by an additional aisle on the south side, and plans and specifications having been prepared by Messrs. Clark & Holland, of Newmarket, architects, the works were undertaken by Messrs. Mason & Green, of Haverhill, builders, and the whole of the repairs have been carried out. The chancel is entirely new, and built with flint. The windows are fitted with coloured glass. The roof is built of open timber work, stained and varnished. The quoins, windows, and dressings are of Bath stone, and the floor is paved with Maw's encaustic tiles, in black, red, and buff. Additional sittings are also created. The additions to the church consist of a south aisle and porch, agreeing in style with the north aisle, and built with flint, to correspond

with the exterior of the chancel. There is additional accommodation of upwards of 100 free sittings. The piers and arches to the nave are made of Bath stone, and the new aisle windows are filled with cathedral green tinted glass. All the old walls and stonework have been cleared of their old dressings and replastered, and the whole cost of the work is upwards of 1,200*l.*

Cramlington.—The new church of St. Nicholas has been consecrated. The style of architecture adopted by the architects, Messrs. Anstin & Johnson, is a severe type of Early Pointed, the details partaking much of the French character. The church consists of a chancel, 29 ft. by 29 ft.; nave, 63 ft. by 22 ft. 6 in.; north and south aisles, porch, vestry, and organ chamber; and a western tower, 72 ft. high. The church will seat 412 persons. The chancel has a three-light window, placed high up in the east wall, and filled with stained glass (by Wailes) representing the Crucifixion, the Resurrection, and the Ascension. Underneath this, there is a reredos, carved, with a central cross, surrounded by the Evangelistic symbols. The church is built entirely of finished stone internally, no plaster being used on the walls. There are oak stalls and sedilia in the chancel, which is paved with encaustic tiles. On each side of the nave there is a clearstory of sixfolded circles. One of these is filled with stained glass, representing the Prophet Jeremiah. The window is the work of Mr. Cottier, of Glasgow. The roofs are of open timber, and the seats are low and open, and darkly stained. Besides the east window, the two side windows of the chancel and a number of the lancet windows of the aisles have been filled by Mr. Wailes; the two western windows of the aisles by Messrs. Clayton & Bell; and two lancets in the south aisle by Mr. Cottier. The last represent the parable of the Wise and Foolish Virgins. Externally, the church derives dignity from the tower, which rises considerably above the nave roof. This is of low pitch, forming a contrast with the more acutely pointed chancel roof. The general contractors for the work were Messrs. Waterson & Stafford, of Morpeth. Messrs. Walker & Emley, of Newcastle, furnished the iron railing; Mr. Gibson has done the painting, and Mr. Bailoy, of Newcastle, the plumbing. The total cost of the structure has been about 3,000*l.*

DISSENTING CHURCH-BUILDING NEWS.

Manchester.—The foundation-stone of a new Wesleyan chapel has been laid in Sussex-street, Broughton-road. The edifice is built in the Italian style of architecture, the exterior being pressed bricks, with facing of Yorkshire stone. The length is 79 ft., and the breadth 52 ft. 6 in. In the rear of the building are two class-rooms and the minister's vestry. The chapel will be heated with hot water. The pews will be made with inclined backs. The windows will be finished internally with moulded archivolt impost. The front will consist of coupled doorcases, with pilasters and centro column, having carved spandrels and ornamental keys. The entablature will be surmounted by panelled pedestals, supporting the pilasters and columns of the gallery windows, which will have Corinthian capitals. The staircases and side windows are of a plainer description. The angles of the chapel have French rusticated pilasters. The front will be crowned by a pediment, with cornice, containing a ventilator and the inscription stone. The chapel will seat 800 persons, and cost about 5,000*l.* Mr. William Waddington, of Padiham, Burnley, is the architect; and Mr. Mark Foggett, of Cheetam, contractor.

Bloxham.—The new Wesleyan chapel here has been opened. It is a small Gothic edifice, built of brick, with bands of Bath stone running along the walls. The window dressings are also of Bath stone, and the gables are finished with copings of the same material. The chapel is entered by a porch, the floor of which is laid with Staffordshire pavement. The roof is an open one, supported by curved ribs and stained wood-work. At the right-hand side of a separate floor. Under the gallery is the school-room, capable of accommodating 100 scholars. There are three arches, composed of Parian cement, in the interior of the chapel—one over the front of the gallery, and one over each of the two large windows,—the pines of which are of ground glass. The building will accommodate 300 people, and was designed by Mr. Thomas

Garrett, the town surveyor of Banbury, who, with his brother, Mr. William Garrett, of Bloxham, made a gift of the site to the congregation. The entire work in connexion with the chapel has been executed by Messrs. Orchard, of Banbury. The cost, exclusive of the site, will be about 600l.

Stockport.—New Mount Tabor (Methodist) Chapel, Wellington-road South, has been opened. The Classic style has been adopted in the designs. The building is of brick, with stone dressings; the whole front elevation, however, is faced with Darley Dale stone. A Corinthian portico of four columns, approached by a flight of steps, extending the whole width of the building, forms the chief feature of the design. Within the portico are three principal entrances to the chapel. On each side of the portico are two tiers of windows, affording light to the staircase, and enriched with carved and moulded impostes. The length of the building, internally, is 73 ft., and the breadth 50 ft. A vestibule, entered from the portico, extends the whole width of the front, on ground-floor, having at the ends staircases to the gallery. The vestibule communicates with two inner lobbies, and from thence to the aisles on the ground-floor. At the rear of the building, on the ground-floor, two large vestries, minister's vestry, and a staircase for the children, communicating with basement, are arranged. The gallery is the whole length of the chapel, each side, extending over the vestibule in front, and the vestries at the back. The entire height of the chapel, from the ground-floor to the ceiling, is 34 ft. The accommodation is for about 900 persons. Beneath the chapel, on the basement, there is a school-room, 50 ft. by 44 ft., and 14 ft. high. A kitchen, store-rooms, rooms for warming apparatus, &c., are also provided on the basement. Messrs. Longson, builders, of this town, were the contractors for the whole of the works; and Mr. William Hill, of Leeds, was the architect. The lighting and ventilation have been executed by Mr. Harlow, Heaton Norris, under the instructions of Mr. Jacques, the gas-engineer, in this borough. The painting, staining, and varnishing have been done by Mr. Robert Chetham.

STAINED GLASS.

St. Mary's, Ealing.—The series of apse windows begun in 1865 by Mr. Boddington, who designed and presented them, is now completed, and they are just put up in the chancel of this church. They do not all appear from the body of the church, it being necessary to stand in the chancel to see the whole at once. The mosaic principle, in contradistinction to the mode of treatment of glass-painting of the Munich school, has been adhered to by Mr. Boddington. By the absence of all ornamentation he wishes to give all the importance to the subject, and by the pictorial representation of different events in the life of our Lord to address no many lessons to the hearts of the beholders. The subjects are selected so as to lead through a succession of scenes, from the annunciation of the birth of Christ to the Ascension, ending with the death of the first martyr, St. Stephen, and the signal conversion of St. Paul. These windows have been presented to the church by Mr. Boddington, we hear, as a thank offering for the success attending the reconstruction of St. Mary's. The other windows, now in progress by Mr. Boddington, it is hoped will ere long be completed: one of David, over the organ arch, and the other John the Baptist, over the entrance to the baptistery, are already announced. Two new windows have recently been put up in the church—the parable of the Good Samaritan, presented by Mrs. Atkinson, and four subjects from the Old Testament placed in the ambulatory by Miss Belton, by Messrs. Clayton & Bell. All Mr. Boddington's designs are executed by Messrs. Heaton, Butler, & Bayne. The apse windows represent the Annunciation, the Visitation, the Birth, the Presentation, the Flight into Egypt, the Return to Nazareth, the Baptism, the Temptation, the Call of Peter and Andrew, the Well of Samaria, the Entry into Jerusalem, the Last Supper, the Agony in the Garden, the Betrayal by Judas, the Foot of the Cross, the Descent from the Cross, the Three Marys, the Sepulchre, the Angel at the Sepulchre, Christ appearing to Mary Magdalene, Christ joining the Disciples going to Emmaus, Christ appearing to the Holy Women, Christ appearing to St. Thomas, Christ's Charge to Peter, the Ascension, the Apostles'

return to Jerusalem, Matthias chosen to replace Judas, the Holy Ghost descending at Pentecost, the Stoning of St. Stephen, the Conversion of St. Paul; in the traceries above, Angel in Adoration, the Virgin Mary, Christ Bisen, St. John the Evangelist, Angel in Adoration.

All Saints' Church, Chichester.—The east window of this church, which is composed of three lancets, has just been filled with stained glass in memory of the late Alderman Gruggen, of Chichester, banker. The subjects are the Agony in the Garden, the Betrayal, Scourging, Bearing the Cross, Crucifixion, Entombment, Resurrection, Incredulity of St. Thomas, and the Ascension. The arrangement of the window is chiefly medallions on a grisaille background: the subject of the Crucifixion occupies a prominent part of the centre opening. At the top of each lancet is an angel bearing a scroll with a text. The window was designed and executed by Mr. Bagley, of Newcastle-upon-Tyne, at the cost of 100l.

Stretford Church.—A stained-glass window has been placed in this church, in memory of the late rector, the Rev. W. E. Brendon. The subject picture is the Resurrection of our Lord, framed by canopy work and foliated ornament, composed of coloured glass, worked in the manner prevailing in the Early Gothic style. The window and brass are from the establishment of Messrs. R. B. Edmundson & Son, of Manchester.

PATENTS CONNECTED WITH BUILDING.

WATER-CLOSETS AND SINKS.—*J. G. Jennings.* Dated May 14, 1867.—According to this invention the patentee arranges water-closets in such manner that, whilst the excrementitious matters which the basin may receive, together with the small quantity of water which the basin holds, are discharged into a receiver, so as to be applicable for use as a manure, the comparatively large quantities of water which are used to scour the basin are kept out of this receiver and directed away into a sewer or otherwise, as may be desired, but without mixing with and diluting the excrementitious matter, which is consequently discharged almost in an undiluted state into the receiver, whatever be the quantity of water used to cleanse the pan. For this purpose the patentee employs a pan with a valve at the bottom, and when this valve is opened the matters in the pan press into the manure receiver. The same act of opening the valve of the pan also in the usual way opens a valve for the supply of the scouring water, and this water-supply valve is so arranged, as is well understood, as to remain open for a regulated time. The scouring water is, however, prevented from passing into the pan so long as the valve of the pan is closed. The scouring water is admitted and the excess passes away by a side opening from the pan, leaving therein only a small quantity of water, say a depth of half an inch, but more or less as may be desired, and sufficient to prevent the adhesion of soil.

PIPES FOR VENTILATING, HEATING, AND VAPORISING HOTHOUSES, &c.—*W. Taylor.* Dated July 20, 1867.—The patentee claims, first, the application of chambers or passages to pipes for receiving hot water, &c., so that such chamber or passage may receive water or other liquid to be evaporated whilst they at the same time act as conduits for the passage of air for ventilation, and thereby moisten as well as heat the air so supplied for ventilation, whereby hothouses, malshouses, and other buildings or residences, may be ventilated, heated, and vaporized, as described. Secondly, the method of forming the joints of pipes used in heating hothouses, malshouses, and other buildings and residences, as described.

VENTILATORS.—*J. Hooper.* Dated July 20, 1867.—The patentee claims constructing and arranging or combining the parts of a ventilator, substantially as described and illustrated, whereby a series of flaps or doors covering a corresponding number of openings in the body of the ventilator may be simultaneously raised or simultaneously lowered, so as to open or close to the required degree the said openings in the ventilator.

CONSTRUCTION OF THE ROOFS OF HORTICULTURAL AND OTHER BUILDINGS AND STRUCTURES. *W. Simpson & W. Howitt.* Dated July 21, 1867. The patentees claim constructing the principals of the roofs of horticultural and other buildings and structures hollow instead of solid, and of tubes, or pipes and sockets, either separately or

in combination, with longitudinal pipes, rods, &c., as described.

MOULDING CLAY FOR MAKING BRICKS, TILE &c.—*C. H. Murray.* Dated July 25, 1867.—The invention consists in constructing the dies or apertures in brickmaking machines through which the plastic material is delivered with movable hollow boxes or vessels provided with perforated sides, and supplied with any suitable lubricant, which, by extending through the perforations in the boxes, will lubricate the desired parts.

Miscellaneous.

HARVESTING OF CORN IN WET WEATHER.—The Council of the Society of Arts having offered the gold medal of the Society and a prize of fifty guineas, for the best essay on the harvesting of corn in wet seasons, received twenty essays, and the gentlemen acting as judges have unanimously recommended the Council to award the prize to Mr. W. A. Gibbs, of Gillwell-park, Essex. This award has accordingly been made.

NEW WORKHOUSE FOR CLERKENWELL UNION.—The local Guardians have resolved that a workhouse, capable of holding at least 500 persons, be constructed on the Guardians' Freehold estate at Highgate, and that a committee of seven guardians be appointed to visit the modern built workhouses of the metropolis with a view to the adoption of the most recent improvements in the construction of the Clerkenwell workhouse.

ITALIAN OPERA, COVENT GARDEN.—*Mlle. Pauline Lucca* and *Mdlle. Patti* continue to reign here by turns, and with undeviating success, *Signor Mario* assisting each in turn. In "Les Huguenots," which will be presented again on Monday evening next, *Mlle. Lucca* particularly distinguished herself last week; and the opera, as a whole, was given with remarkable vigor and perfectness. We know of no other work of the lyric stage that so completely fills the mind of the spectator and listener.

WAGES AND LABOUR.—The executive committee of the Social Science Association have resolved to invite the association to appoint a general committee for the purpose of spreading information as to the natural laws regulating the rate of wages and the supply and demand for labour. Mr. Overend, Q.C., has stated to the executive committee that, in his opinion, "almost all the crimes in trade matters originate in ignorance." It is this ignorance, wherever existing, which the committee are desirous to remove. The main object in forming the proposed general committee is to present to employers, to the working classes, and to the country generally, a list of names calculated to inspire confidence in the disinterestedness of the promoters of the object in view, and in their ability to carry on the work wisely and efficiently; but the general committee will not be called upon for more than superintendence, since, for active exertion, it is intended to have an executive committee. Upwards of forty gentlemen have already expressed their willingness to serve on the general committee.

APPOINTMENT OF ADDITIONAL PATENT LAW COMMISSIONERS.—A meeting of the Delegates' Invention Right Committee, consisting of delegates from the Inventors' Institute; the Working Men's Technical Education Committee; the Workmen's International Exhibition Committee; the Foremen Engineers' Association; the Metropolitan Working Men's Clubs' and Institutes' Union; and the Public Museums' and Free Libraries' Association, representing in the aggregate upwards of 200,000 persons, has been held at the Offices of the *Scientific Review*, Cockspur-street, to consider the determination recently arrived at by the Commissioners of Patents to appoint three additional commissioners. Much dissatisfaction was expressed at the constitution of the existing commission, to the inefficient action of which body the chief evils of the present objectionable Patent Law system were ascribed. The course adopted by the existing commissioners, in now seeking to appoint three additional commissioners, was strongly condemned by the speakers, as being objectionable and inopportune, especially when it was considered that the whole Patent Law question must shortly be dealt with by Parliament. A resolution to that effect was unanimously passed, and a copy of it was ordered to be forwarded to the commission.

SOCIETY OF ARTS.—On Wednesday evening a *conversazione* was given by this Society at the South Kensington Museum, and Mr. Hawes, the president for the year, and Lord Henry Lennox received a large and fashionable company, amongst whom were many persons eminent in politics, art, and science.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.—The anniversary dinner on behalf of the funds of this Institution, will take place at the Freemasons' Tavern, on Wednesday, June 10th next, when Professor G. G. Scott, will take the chair, and a goodly muster of friends is hoped for.

PARK-LANE.—The committee appointed to consider and report on the crowded condition of Park-lane have agreed to a special report, to the effect that in their opinion the inconvenience at present experienced from the overcrowded state of the traffic would be best obviated by opening up Hamilton-place as a thoroughfare for public traffic, with a width of not less than 60 ft. roadway, to be obtained by removing the houses and other buildings on the eastern side.

A MILL-STONE DRESSING MACHINE.—A trial of a new patent mill-stone-dressing machine has been made at Stowmarket. Mr. Jacobsen, a wealthy merchant, introduced the invention into this country. While at the last Paris Exhibition, he entered into a negotiation with the patentee, which ended in Mr. Jacobsen and two Edinburgh gentlemen obtaining the use of the patent in Great Britain and Ireland. The invention is simple. It consists of a "black diamond," similar to a glazier's diamond, fixed in a spindle, with a small wheel, about 1 in. in diameter, connected with a frame. The millstone to be operated on is laid on its side, and by means of a small belt or cord, adjusted to a shaft of the mill machinery, a rapid revolving motion is given to the diamond-set spindle, which, with its frame, is placed on the stone. A man attends the sharpening machine, and by the hand directs the longitudinal and lateral movements of the diamond in its operations. The fine lines it cuts, it is said, far more expeditiously and better secured than could be accomplished by the ordinary sharpening by picks, and after a few passes sharpening, the stone is brought to a perfectly level face, which is maintained without any trouble, as long as this machine is used. The manual labour connected with the sharpening of the stones is reduced from 8 hours to 2 hours per stone, and the saving effected, or profit secured, is stated at upwards of 3*l.* 10*s.* per week, in every pair of stones, or 182*l.* per annum.

THE NEW RACECOURSE, MANCHESTER.—The case of the old course at Castle Irwell, which has so long been used as the Manchester racecourse, having expired, its renewal was refused, and a new course was obtained on the left, coming from Manchester, of Regent-road, Salter's-lane, and Howard-street, Eccles New-road, and they admit the visitor to a spot at the rear of the grand stand. The extent of the ground above 100 acres, being 40 acres more than the course previously occupied by the Manchester race committee. The architects of the Grand Stand are Messrs. Bird & Son, of Manchester. The buildings are in the form of a quadrangle, and close an area of about an acre, the entrances being from the rear. The principal entrance is a double porch, from which stairs both on the right and left lead to the spectators' gallery, and there are corridors leading to the paddock, dining and refreshment rooms and the offices for stewards and other functionaries, rooms for jockeys for dressing and weighing, also adjoining corridors. The gallery of the stand will conveniently accommodate from 2,500 to 2,700 persons, all of whom will be under cover, the whole building being roofed; and there are arrangements for enclosing the front with galleries when the stand is not in use. There will be a stone gallery rising directly from the paddock, which will accommodate 400 spectators. Provision is also made for a second-class stand, which it is calculated will accommodate 4,500 spectators. Beneath the stands are booths, to let to publicans and vendors of refreshments. There is stabling convenience for eighty horses, horse boxes and two-stalled stables. The cost of the whole of the works, including the grand stand, is estimated at 40,000*l.* The ground has been laid out by Mr. Downing, C.E., Manchester; and the work carried out by Mr. Edward Rothwell, of Warrington.

METROPOLIS STREWAYS BILL.—This Bill has passed through committee in the House of Lords.

FEVER IN PRUSSIA.—In East Prussia typhus has been so destructive that no fewer than twenty physicians have died in attending on patients. The number of other victims is very variously given, and, it seems, will never be correctly ascertained.

MONUMENTAL.—A Poughkeepsie paper, called the *Eagle*, wants the Hudson river lined with colossal statues. It proposes a statue of Hudson at the entrance of the highlands, one of Liberty at Grape Island, one of Washington at West Point, and one of Fulton at Pollipel's Island!

TRIBUTE TO A FOREMAN.—On Saturday last a meeting of the workmen in the employ of Mr. J. H. Parsons, numbering upwards of 150, was held in Castle-street, Leicester-square, to present to W. Wilkins, their late foreman, on his leaving, a testimonial, accompanied with a purse of twenty guineas, as a mark of their esteem for his impartial conduct towards them during a service of nine years.

THE IMPROVEMENTS IN GUILDHALL.—Mr. Kelday, the chairman of the Guildhall Improvements Committee, mentioned at a recent Court of Common Council that the window in the Guildhall, to be presented by the Lancashire committee, would be completed by June 13th, and that arrangements had been made with the Earl of Derby to come and present the window in a formal way to the corporation.

GAS.—The Uckfield Gas Company have declared a dividend of 10 per cent., with a balance of 11*l.* to their reserve fund.—The Lewes Gas Company have agreed to borrow 2,000*l.* for a new gas-holder. A sum of 2,000*l.* has already been expended in the extension of their works. The company divide 10 per cent. dividend, and Mr. R. Crosskey at their meeting said they looked forward to the time when they could reduce the price of gas and yet pay a good dividend.

THE NEW BUILDINGS AT THE CLERKENWELL HOUSE OF DETENTION.—At the Middlesex County Sessions it has been agreed that the sum of 20,000*l.* be granted by the Court, to be raised in the usual manner, towards the cost of erecting the new buildings at the House of Correction at Coldbath-fields, according to the plans sanctioned by the Court at the November Session, 1865, in addition to the sum of 65,000*l.* already granted by the Court for that purpose.

A SILVER COFFIN—GEORGE I.—The *Universal Magazine*, about the best, except the *Gentleman's*, of the last century, in a visit to Hanover, with its " Windsor " Herenbansen, had the following passage:—"The body of George I., who died here, is interred in a silver" (doubtless meaning "onion") coffin, of admirable workmanship. What may be known now of this coffin? In the same it is stated that the number of houses then in Hanover was 1,200; but I am informed by a recent visiting friend, that the population now is above 20,000.—D.

LONDON OMNIBUSES: THREATENED WITH DRAWAL OF THE LARGER ONES.—The public complaints against the chief omnibus company of the metropolis for their bad omnibuses are notorious. With few exceptions the accommodation is so stunted as to be really indecent; and the vehicles are either close and stuffy on the one hand, or on the other are ventilated from wide and gaping apertures behind the horses and drivers, sweeping the foul air from without through the omnibuses like wind through a funnel along the heads of the passengers, and causing neuralgic attacks, more especially amongst elderly people, from which they may suffer for weeks from a single exposure to such stupid and ignorant arrangements. There are a few exceptions; some of the omnibuses being large and roomy, as well as more sensibly arranged as to ventilation. The company now threaten to withdraw these few larger buses on pretence that the public avoid them, a very unlikely thing, unless there be some special reason, such as a preference for other companies who have not given cause of offence to the public. The fact of three horses being required for these omnibuses, while the stuffy little herring boxes of the old sort require only two, though carrying not far short of the same number of passengers, seems to be a much more probable explanation of the threatened withdrawal of the only few decent vehicles than the actual avoidance of these latter by the London public.

ROYAL ACADEMY.—At a meeting of Academicians, held on Tuesday evening last, Mr. Henry Weekes, R.A., was elected Professor of Sculpture. At the same time Professor Partridge was re-elected to the Chair of Anatomy.

ARTISANS' AND LABOURERS' DWELLINGS BILL.—The following peers were named as the select committee on this Bill:—The Earl of Malmesbury, the Duke of Somerset, the Duke of Beaufort, the Earl of Derby, the Earl of Shaftesbury, the Earl of Carnarvon, the Earl Cardigan, the Earl of Kimberley, the Bishop of London, the Duke of Argyll, Lord Foley, Lord Portman, Lord Chelmsford, Lord Westbury, Lord Abingdon, and Lord Penrhyn.

STEAM ROLLERS.—The steam roller made by Messrs. Moreland & Son, for use in Hyde Park, has been at work consolidating the new roadway along Park-lane. A top dressing of gravel and sand, or hogging, to bind the broken granite, having been laid, the steam roller went ahead, and did more and better work in half an hour than the two four-horse rollers had done during a whole week. The machine weighs 27 tons, is easily guided, and makes little noise when at work.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—At the meeting of the British Archaeological Association on Wednesday evening, the 27th ult., some drawings by Mr. Wadding from the screens of Suffolk churches, were exhibited. Mr. Greenshield sent a very fine ball of Pope Nicholas V., found near Glasgow Cathedral. The Rev. J. G. Cumming produced a cast taken from the head of the Bethnal-green bundle's staff and bearing a representation of the Blind Beggar. Mr. Bailey showed a very interesting head of a pastoral staff, found lately in Smithfield; this is most probably of the twelfth century. Mr. Gordon Hills produced the money-box and account-book of the Company of Stationers of Ludlow. The book commenced in 1669, and from the entries and references to a former book, and other matters, it seemed that the Company, which was in fact a trades union, had been incorporated under an Act of the 19th Henry VII., and it was probable the box was as old as this period. Mr. E. Roberts produced a deed of surrender of the time of Charles I., which the jurors of the court had signed by marks similar to masons' marks. Mr. S. Holt exhibited some ear-rings and other matters, taken by himself from a Roman coffin found at Arles. The inscription on the coffin showed that it contained the body of a certain Faustina, who had died on her twentieth birthday, it being also the day of her marriage. One pair of gold ear-rings were of an Etruscan type. Mr. Irving read a paper on the death of the Red Comyn, which led to discussion.

TECHNICAL EDUCATION FOR ENGINEERS.—A paper upon Engineering Education was read by Mr. G. Lauder at a recent meeting of the Liverpool Polytechnic Society. He limited engineering education to that knowledge necessary for a young man to acquire that he may become a skilled engineer, and pointed out the importance of a proper elementary education being enforced before a technical education is commenced, deprecating the introduction of the latter into common schools as a course which would strike at the root of all true education, as it might raise a wonderful superstructure, while it would cause a life-long regret for the want of a proper foundation. Having referred to the importance of the present movement for promoting technical education in this country, and premised that a general education and a workshop education must be the first steps in that direction, the author of the paper proceeded to enumerate the scientific subjects to which a young man destined to become an engineer should direct his attention. A thorough grounding in mathematics was indispensable. He regarded pure mechanism as a connecting link between the geometry of the schoolboy and the mechanics of the man. He considered the manner in which the mechanical sciences are taught in most of our colleges, and then useless in the education of the engineer; and says that until Rankine's " Applied Mechanics " was published, in 1858, there was not a book that could be said to be adapted to the requirements of engineers. In conclusion, he referred to the establishment of the Chair of Engineering in Owen's College, Manchester, and to the munificence of Joseph Whitworth in donating 100,000*l.* to the provision of thirty scholarships.

THE ROYAL HORTICULTURAL SOCIETY.—The great annual flower-show was opened on Tuesday at the Society's grounds, in South Kensington. The display of flowers was remarkably fine.

THE RAILWAY VIADUCT AT RUNCORN.—The girder bridge constructed by the London and North-Western Railway Company across the Mersey, at Runcorn, in order to shorten the route from London to Liverpool, is now near completion. The bridge is built on four buttresses, 167 ft. in height from their foundation, and has three central spans of 305 ft. each. At high-water the space from the water level to the bridge is 75 ft., and at low water 95 ft. Some minor works on the new junction line still remain to be finished.

THE THAMES EMBANKMENT.—In reference to the report that it was not intended to have chains or other means provided for the rescue of persons who might be in danger of drowning along the embankment wall, Mr. Raphael Brandon urges that, if chains were suspended from one ring to the next all along the wall, with a fall that would leave them in reach of a person in, say, three or four feet depth of water, they would at all times of the tide prove a valuable source of safety, and one which it is earnestly to be hoped the Board of Works will supply.

ROSHERVILLE PIER ON FIRE.—Some commotion has been created in Gravesend in consequence of Rosherville Pier suddenly braving into flames. A lighted fusee is supposed to have been thrown down on the pier, and falling through a crevice in the timbers, set them on fire. The timbers, which were exceedingly dry, and coated with pitch and tar, blazed furiously. Seen from Tilbury half the pier seemed in flames. The pier sustained much damage before the fire was extinguished. Strange to say it is the fourth time this pier has been on fire, the previous fires also all occurring at Whitsuntide.

TUBE CONSTRUCTION.—In reply to some inquiries we are enabled by Messrs. Parr & Strong to say that, in addition to the experiments made in the great hall of the Strand Hotel Company, of which we gave a view, a house, composed of granite-faced tubes, is now being erected under their direction at Bickley (near the station), and the clerk of works has instructions to give access and to supply all information upon the production of private card. The external walls of the ground-floor are composed in this case of tubes, 12 in. long, whilst those of the first-floor are constructed with 9-in. tubes. As a specimen of wharf-walling, we may mention one at Millwall, opposite the Commercial Dock Steam-boat Pier. Here the tubes are also granite-faced.

HANDEL FESTIVAL AT THE CRYSTAL PALACE.—The preparations for this great celebration may now be said to be complete in all respects. The chorus will number in all little short of 3,500. The entire orchestra will consist of 4,000 performers. The preparations for rendering the Great Transept of the Crystal Palace acoustically perfect have been in active progress for many months. The appliances by which this will be accomplished are ready to be fixed in their respective places immediately, and in this respect it may be fairly asserted that a surprise is in store. The Great Transept, the width of which is double the diameter of the dome of St. Paul's, will be converted into one vast concert-hall, enclosed on every side, its enormous arched roof being screened from the sun by several cloth coverings. This great experiment was first suggested in the *Builder* some years ago.

VELOCEPÈDES.—The Londoners have not yet adopted our suggestion to make use of self-acting vehicles, but the velocipede, according to the *Pall Mall Gazette*, is becoming a formidable rival to the horse in Paris. One velocipedist (it has been found necessary to invent the word) rolled down the Champs Elysées the other day in an "Américaine," drawn by two velocipedes, on which were mounted two postillions, or jockies. M. de Visin, a distinguished equestrian who rode over the steeple chase course of the Bois de Boulogne a fortnight ago without touching his horse's bridle, has made a match with Prince Achille Murat, in which M. de Visin on a velocipede backs himself against the Prince on horseback. M. de Visin, a few weeks ago, undertook to travel on a velocipede from Angers to Paris, and actually went as far as Tours, a distance of about fifty-four miles, when the machine broke.

THE ENCLOSURE OF TOOTING COMMON.—A meeting has been held at Tooting, "to assert and protect the rights of the commoners and parishioners over the common, and to ascertain if the recent inclosure by the lord of the manor can be justified." The rector of the parish, the Rev. Mr. Congreve, presided, and there was a very large attendance. Resolutions were passed in accordance with the objects of the meeting, and a committee was appointed to carry them out.

ROMAN REMAINS AT PAPA CASTLE.—During the last six months Papcastle has been the scene of a considerable amount of excavations, done for the sewerage and waterworks, in the course of which very numerous relics of the Roman period have turned up, many of the smaller and more interesting of which were purchased and preserved by Mr. Henry T. Wake, of Cockermouth. Among these were a quantity of leather, chiefly parts of shoes, one of which was a sole covered with very large-headed nails; fragments of glass; a steel awl; a steel punch, &c. A great quantity of oak timber was met with, in beams and boards.

FIREPROOF CONSTRUCTION AT COMPTON HOUSE, LIVERPOOL.—This large building is divided into five fireproof compartments. The brick walls forming each division are pierced with windows, for the purpose of lighting the bedrooms, and those windows are provided with Clark's steel shutters; so that if a fire were to break out in any one division the adjoining divisions would be safe, in consequence of the protection of the shutters. The ceilings of the shop are also fireproof, so that the domestic part of the premises, which is above, together with the shop which is below, are considered safe from fires which may happen in either place. The beams that sustain the flooring are of iron, and also the joists, which are placed 2 ft. apart, and filled in with concrete to the depth of the joists, 9 in., on Fox & Barrett's principle. In the event of a fire occurring in the shop security is given for the safe exit of every resident to the staircases, of which there are three, all of stone. In each staircase there is a hydrant, and upon each floor a hose, the length of each of which would be about 200 ft. There is now forming a fire brigade of 200 young men employed on the premises.

FALL OF HOUSES.—At Manchester some time ago a fire occurred on premises adjoining the Millstone Inn, Thomas-street, which caused their being pulled down. While excavating for a foundation, in order to erect a new building, one of the end walls of the inn was so much undermined as to cause it to become unsafe, though evidently unknown to the occupier; and while some fifty or sixty people were in the concert-room, a waiter gave warning that the wall was giving way, and, on examination, it was found that a portion of the cellar wall had fallen. Mr. Lyne, the city surveyor, was sent for, and pronounced the building unsafe for occupation—a fortunate circumstance, as the whole gale fell at twenty minutes after midnight, destroying a considerable quantity of the furniture and stock-in-trade. No personal injury whatever occurred.

—A somewhat singular disaster has occurred at Whitehaven. A short while ago the trustees purchased and removed some dwellings in West Strand, in order to erect apparatus for the sewerage works on the site; and in making the change they seem to have disturbed the foundations of three dwellings, which have since fallen down the embankment. In falling they struck other three houses, which were reduced to a wreck almost as complete as that to which the tumble-down dwellings were in an instant levelled. The wonder is that none of the tenants were killed, because the occurrence was sudden, if not altogether unlooked for. The furniture of the poor people, however, has been destroyed. Men were set to work to prop up other houses that are also endangered.

TENDERS.

For rebuilding foundry, Nos. 195 and 196, Brick-lane, for Messrs. Noakes & Son. Messrs. Tolley & Dale, architects:—

Peters	£200 0 0
Kiddle	300 0 0
Pritchard	855 0 0
Langmead	795 0 0
Marr	680 0 0

For the erection and completion of a row of four cottages, Walthamstow, Essex, for Mrs. Newman. Mr. George F. Payne, architect:—

Vickers & Harding (accepted)	£200 0 0
------------------------------	----------

For alterations to The Fitzroy, Charlotte-street, Fitzroy-square, for Mr. Chamen. Mr. A. E. Gough, architect:—

Keble	£500 0 0
Perkins	498 0 0

For erecting four dwelling-houses and shops in the Wanstead-road, Essex. Mr. F. G. Widdows, architect:—

Daye	£4,241 0 0
Painar	4,545 0 0
Ennor	4,363 0 0
Tully	4,945 0 0
Murray & Hatchinson	4,150 0 0
Chesson	4,980 0 0
Ward	3,806 0 0
Perry (accepted)	3,671 0 0

Alterations to the Marlborough Arms, Chelsea, for Mr. Wykes. Mr. R. W. Hart, architect:—

Day	£777 0 0
Lawrence & Bough	670 0 0
Turner & Son	670 0 0
Whittaker	670 0 0
Langford & Way	683 0 0
Kelley	613 0 0

For the new Infirmary, Hastings Union. Quantities supplied. Mr. Thomas Elworthy, architect:—

Parks	£2,694 0 0
Geary	2,632 0 0
Bourne	2,537 0 0
Hughes	4,838 0 0
Jones	2,476 0 0
Korda	2,438 0 0
Howell	2,385 0 0
Wignall	2,380 0 0
Yilder, jun. (accepted)	2,349 0 0

For roads and sewers on an estate at Penze, for London and Suburban Land Company. Messrs. Hammar & Lambert, architects:—

Reddin	£3,540 0 0
Valwright	7,300 0 0
Bentley	7,234 0 0
Ostington	7,110 0 0
Crookett	7,100 0 0
Nicholson	7,080 0 0
Mayo	7,051 0 0
Bish	7,050 0 0
Pizzey	7,035 0 0
Lawrence	6,450 0 0
Foyard	6,450 0 0
Clark	6,389 0 0
Bloomfield	6,243 0 0
Habbarth (accepted)	5,930 0 0

For repairs, papering, &c., to 31, Finsbury-square, London, for Royal Maternity Charity. Messrs. Goult & Gibbins, architects:—

Wood	£298 0 0
Nightingale	288 0 0
Barton & Moreland	288 0 0
Greaves	235 0 0

Revised Tenders from two last Builders.

Burton & Moreland	£272 0 0
Geddes	270 0 0

For four detached dwelling-houses at Malden, Surrey, Mr. Charles Blake. Mr. Henry Peak, architect. Quantities by Messrs. Rake & Ranwell:—

With 28 oz. Breech.		
Hill, Claxton, & Hobbs	£9,234 10 4	With Plin.
Loe	8,020 0 0	£8,210 0 0
Parker	7,991 5 6	8,137 5 6
Ray	7,998 0 0	8,062 0 0
Jones	7,750 0 0	7,750 0 0
Hall, Bull, & Co.	6,926 0 0	7,211 14 6
Todd & Saunders	7,000 0 0	7,000 0 0
Newman & Mann	6,850 0 0	7,030 0 0
Nightingale	6,700 0 0	6,850 0 0
Weir	6,593 9 2	6,591 9 9
Heggs	6,214 0 0	6,214 0 0
Golling	6,225 0 0	6,683 12 6
Jarret (accepted)	6,330 0 0	6,445 0 0

For house, Coldharbour-road, Dorking, for Mr. J. Abel. Mr. T. J. Dibble, architect:—

Lynn & Dudley	£269 0 0
Hamblin	635 0 0
Ingham	3,023 14 7
Taylor	479 0 0
Putney	460 0 0

For houses at Westcott, for Mr. Thos. Paine. Mr. J. Dibble, architect:—

Putney	£3,050 0 0
Hedges	2,927 0 0
Lynn & Dudley	2,800 0 0

For erecting fire-station at Fulham, for the Metropolitan Board of Works:—

Wittick (accepted)	£280 0 0
--------------------	----------

For painters' work at the East London Union Workhouse, Homerton, Middlesex. Messrs. Jarvis & Sons, architects:—

King & Son	£204 0 0
Mason	253 0 0
Gordon	253 0 0
Pickering & Son	240 0 0
Keeps & Son	173 10 0

For alterations to Stone Hall, Otford, Surrey, for G. Barker. Messrs. Tolley & Dale, architects:—

Kesterton & Head	£375 0 0
Wright	350 0 0
Coleman	275 0 0
Galley & Moon	260 0 0
Wallis	25 15 0

For rebuilding two houses with shops at Port West Ham, for Mr. T. Hearn. Messrs. Tolley & Dale, architects:—

Hedges	£260 0 0
Ennor	664 0 0
Rivett	623 0 0
Smith	627 0 0
Cook	563 0 0
Hunt & Elkington	489 0 0

great value, and so will be the series of photographs. Unceasingly you find the mind to bear in this direction. The idea of art has insensibly disappeared; you have subsided into the task of reading a mere catalogue of names, with most, though not with all, of which you have some previous acquaintance, when, on a sudden, you meet something strange. You start as if you had a slap in the face. What is it? You find you are looking at a PICTURE. Dreary square yards of more or less accurate sign-board painting are suddenly succeeded by the works of real artists.

You look to the Catalogue for explanation. You see the words "Haus Holbein," "Vandyck," "Supplementary Collection." A greater surprise, or a more marked contrast, it was not in the power of human managers to present.

We have represented simple fact,—have put the case actually as it occurred. It is possible that part of the inferiority of the portraits from artists later than Gainsborough arises from ohemical reasons. In the works of Reynolds this is unquestionably the case. Yet few artists have given more time, or devoted more expense, to the chemical portion of their art than did Sir Joshua. His pictures, as a rule, have so much grace and truth that their sadly faded state is the more to be lamented. His blues were once as bright as those of Cornelius Jansen, yet after the lapse of two hundred and thirty years the dress of Bridget Cromwell and the scarf of her sister Mary are as fresh as the colours of Perugino himself, while the tints of the President are the mere ghosts of departed colours. In the work of Sir Thomas Lawrence the injury caused by time is less discernible; but the paintings, in spite of the grandeur of air in some—(see especially his own unfinished head),—are cold and poor when compared to those of the supplementary collection.

In comparing and criticising the works of modern artists, there may be room occasionally for difference of opinion among impartial and educated judges of painting. There is certain to be the eager contradiction of party fight. Do we see any particularly obnoxious aberration from the right path, such as the incredible "Symphony in white" of last year, we are sure to find some equally aberrant critic to hold it up as an example, not to avoid, but to follow. A certain allowance must be made for the imperfection of human nature, and, allowances or not, the disputes are sure to wax so high that the artist will, in nine cases out of ten, fail to derive the benefit which he would obtain from true and enlightened criticism.

The present instance, then, is as happy as it is unusual. If the artist, who does not shrink to paint a lady who does not object to be painted embracing a dog, may rely on the sweet voices of his friends when you ask why he does not use the brush of the painter of the Eve of St. Agnes, and reply that he prefers his own, he cannot make the same answer when you point to the real, enduring work of Holbein or of Vandyck. The instances are rare in which a modern style, which it would be altogether unwise to call mediocrity, is exhibited in such close proximity to works of undeniably excellent execution. If the contrast presented on the walls of South Kensington do not teach our portrait-painters to reconsider their ways, nothing will. The case is hopeless. They will implicitly reply,—“We do not care for fame, we paint for money.”

Tonching the catalogue, of course there are differences of opinion. The little scraps of information appear to be rather inserted with a view of identifying than of explaining the portraits. Thus in No. 1 (the Prince of Wales, afterwards George IV.), we find the note “scarlet uniform;” in No. 332 (the Prince Consort), “dark uniform.” This is not information. Any one who looks at the pictures is struck, in the very first instance, by the colour of the uniform. That which we want to know, and that which it would greatly enhance not only the interest but the historic value of the catalogue to have included, is, *what* uniform is represented in each instance.

We have named these two pictures as instances of the highest merit of the Exhibition. The interest is at once moral, historical, and artistic. No greater contrast has been presented by any person in modern history than by these successive occupants, not of the Crown, but of the Castle of Windsor. They are two very beautiful paintings. The horse in the first may too much distract the attention from the Prince; but the latter is a noble and a charming figure, and the face presents such indications both of delicate and refined taste, and of intelligence, as to teach

a memorable lesson of the ill effects of unchecked power, unbalanced station, and unmeasured flattery. In the second, Winterhalter's portrait of Albert Francis Augustus Charles Emmanuel, Prince Consort of England, we have one of the best paintings of the more recent part of the Exhibition. If it is compared with the two other pictures by the same artist, it will be seen to be immeasurably superior, not only as a happy inspiration, but as a painting. The tender grace, the modest yet manly pose, the pictorial beauty of both feature and expression, both face and form, represent the happy development of that most charming infant head an engraving of which is prefixed to her Majesty's memorials of the Prince Consort.

Again, we are disposed to think, if the principle of grouping had been that of the character of the subjects, we should have had much to interest and to instruct the mind brought before the ordinary visitor, for which we now have to search the catalogue, and to visit and re-visit the Gallery. Take the painters, for instance. If a bay had been devoted to them how many persons would have lingered there. It would have been well to compare the fine portrait of West, whom we can hardly regard otherwise than as a champion of decadence in art, by Lawrence (No. 17), with that by himself (No. 945), and again with the noble unfinished head, or rather head of the unfinished autograph picture, of Sir Thomas himself. Again, the contrast between the marked and somewhat picturesque features of Joseph Mallord William Turner, R.A., by himself (No. 912), and the dreary smudge of the same by the same (No. 94), requires explanation. The dates of the two ought to be, at least approximately, given.

Another group of great interest would have been composed of architects and engineers. We have some of them in proximity,—a very fair likeness of Brunel, hanging under a not good representation of Robert Stephenson, and near a very rampant idealisation of rough old George. We have Sir Charles Barry looking as if with prophetic uneasiness across another hay at a plain but powerful portrait of A. W. Pugin, in a bedizen frame,—an encasing of the artist in heraldic emblems which his own taste would have repudiated for his own picture-frame. Cookerell, and Wyatt, and other artists in stone and in brick, would have formed a most interesting group.

Another group might have been thrown together of those fair, fatally fair, faces, the history of whose owners forms no inconsiderable part of political biography, if not even of political history. Here, indeed, the exquisite charm of Lely's "Nell Gwynne" throws other royal favourites into shade; but there is a small group of very memorable beauties. The two famous Miss Gunnings must not be included in the group to which we refer. For the *furor* which they caused, their portraits do not enable us to account. Their chief charm must have been that of vivacity of manner; for we would undertake to produce a pair of milkmaids who should fully rival, both in features and in complexion, the very pleasant pictures of these celebrated beauties now at Kensington. An expedition to Langham, near Milford, the birthplace of "Mistress Gwynn," would be likely to enrich the portfolio of the artist. Whether it be the air, or the wit, or the water which is so favourable to female beauty, may be matter of doubt, but this little nook of "England beyond Wales," certainly produces forms and faces that show that, if portraiture is in its decadence among us, it is not for want of lovely women to paint.

Among the famous "difficulties" of the Georgian era we have Dorothy Bland, Mrs. Jordan, as a brilliant Irish girl, and again in maturer life; Mary Darby, afterwards Mrs. Robinson, the "Perdita" to whom the Prince of Wales played "Florizel," by Gainsborough, by Reynolds twice, and by Romney; Emma Hart, Lady Hamilton, the evil genius of Nelson, twice by Romney, once ironically placed in the posture of Guido's Magdalen. Even by the poor work of the painter the idea of a very beautiful woman is only partially obscured. Queen of this aphroditocracy ranks Maria Anna Smythe, wife of Edward Weld, of Lutworth Castle; then of Thomas Fitzherbert, of Swinerton; then, in 1785, of George Prince of Wales, who risked his revolutionary crown by his private marriage, afterwards denied, with a Roman Catholic. The present portrait is by Gainsborough, that of a woman of queenly beauty.

The portraits of men of fame and note will be

selected by each visitor rather from personal than from artistic reasons. There are finer portraits of Wellington and of Nelson than those now exhibited. The rueful and dreary aspect of the reverend father of the latter bore suggests the idea that the boy must have been truly happy to find himself at sea at twelve years old. The face of Erskine is one of those that most command attention, and it is curious to trace how much younger Gainsborough's powdered portrait looks than the later dark-haired likeness by Lawrence. Lord Eldon, at forty-seven, by Sir Thomas Lawrence, is a very fine face, and his portrait, in his robes as chancellor, has a most imposing air of superhuman wisdom. Spencer Perceval's posthumous portrait is remarkable. There is much intelligence in the face,—no bad feeling, and yet it is repulsive. It reminds one of a glorified frog. In his "Sir John Moore," Sir Thomas Lawrence makes perhaps his nearest approach to the style of Gainsborough. Porson's deep brow resembles that of Brnel.

The most valuable picture in the Exhibition (to which we referred in our first article*) is also the oldest. It is called in the catalogue a contemporary representation of King Richard II., a note which dates it before the close of the fourteenth century. It has been cleaned with complete success by Mr. Richmond, among whose numerous crayon drawings will be found some of the best of the modern portraits. The face has an air of dignified repose, and the hands, though very ill drawn, are evidently portraits, as faithfully given as the painter's power would allow. Those who are aware of the remarkable indication which is given of the feeble or the over-streained state of the brain, the approach towards idiocy on the one hand, or mania on the other, by the articulation of the joints, will look with great interest at an illustration of this physiological remark in a painting more than 450 years old.

In ending these remarks we have only to repeat the expression of satisfaction that such a collection of portraits has been brought together. For the purposes of the historian and of the physiognomist, this opportunity of securing the represented features of so many historical characters is a boon of great value. We wonder if M. Froude would have written his estimate of King Henry VIII. if he had been familiar with the numerous portraits of the monarch, especially if he had seen them in a group. And if a deeper and more wholesome lesson to living painters than the collectors of the Gallery thought to impart has been extracted from the result of their labours, we trust that this also may not be without golden fruit.

DOINGS IN GERMANY.

At Vienna, the new opera-house, begun under the superintendence of the architect Vau der Null, is now rapidly progressing towards completion. Professor von Siccardsburg has been nominated architect to the building in the room of the former gentleman, whose untimely death was a loss felt by all lovers of art in the Austrian capital.

At Pesth, the committee appointed to report upon the safety of the central dome on the cathedral came to the conclusion that the work was perfectly safe, and that the substructure was well qualified to carry its intended weight of about 2,000 tons. Scarcely a fortnight after, the whole dome came down "with a run," and work which cost more than 25,000, is now a worthless heap of rubbish.

At Frankfurt, three leading architects of Germany, Messrs. Douzinger, of Ulm; Schmidt, of Vienna; and Voigtel, of Cologne; having been called upon to report as to the best means of restoring the cathedral, partially destroyed by fire on the 15th of August last, are unanimously of opinion that all the work up to the crown of the upper windows of the tower is safe, that all above that should be taken down and rebuilt, and that the tower should be *finished*, neither with dome (as before) nor spire, but according to the original design, with a crown representing that of Imperial Germany. They further advise that the damaged roofs should be reconstructed of iron covered with slate, that the site round the cathedral should be cleared of the houses now built against it, and that the cloisters shown on the original plan should be executed.

Cologne.—The old gilt on the tower, so well

* See p. 273, ante.

known to all travellers, and the feature of all views of the cathedral—*vide* even any Eau-de-Cologne bottle—has now disappeared. It was erected shortly before 1524, in which year the works were discontinued owing to the Protestant tendency of the then Archbishop Hermann V. Connt of Wied. From that time to this it was only used once, namely, on the 4th September, 1842, the date on which the works were again resumed. On that occasion the ancient gib was used to raise a mighty block of stone, to symbolise the energetic vigour with which it was now intended to finish this grand old church. Professor Blaser has been commissioned with the execution of a statue of the late King Frederick William. The figure (on horseback) will be 21 ft. high, the pedestal 20 ft. making a total of 41 ft. The king is represented in his coronation robes, and bare-headed.

At Dresden an English church is being erected from the plans of Mr. St. Aubyn. The costs are chiefly, if not entirely borne by Mrs. Göschen, mother of the present member for the City of London.

ON THE FOREIGN ARTISTS EMPLOYED IN ENGLAND DURING THE SIXTEENTH CENTURY, AND THEIR INFLUENCE ON BRITISH ART.*

DURING the first few years of the sixteenth century, the influence of the great Italian school of art manifested itself strongly in Germany, in the persons of men such as Albert Durer, Peter Vischer, and Jean de Mabuse; but in England scarcely at all, excepting by transmission through the entry of the last-named into the service of Henry VII.

Mr. Wortum, who has made it a labour of love to test the correctness of all the usually received dates which serve as landmarks in the chronology of art-history, has stated it as his opinion that this fine artist, indifferently known as Jan de M'Abuse, Jan Gessart, and Johannes Malodius, was born about 1470—visited this country in 1498 or 1499, and died in 1532. To him we shall return almost immediately. I have already alluded to the fusion of the practice of various branches of fine arts by the leading foreign artists of the close of the fifteenth and commencement of the sixteenth centuries, and I would now especially point attention to it as the transcendent quality which fitted the pioneers of the revival of art for the task of reformers. In two notable cases this quality extended itself into the form of all but universality. In the persons of Leonardo da Vinci and Albert Durer, the same habits of profound philosophic inquiry, combined with the utmost appreciation of mechanical dexterity, existed, and induced their record of studies in every direction. In the notebooks of the former, preserved at Paris and Milan, and in those of the latter in the British Museum, ample evidence is preserved of the parallel ardour with which these master-minds devoted themselves to the study of geometry; engineering, both civil and military; practical architecture (Albert Durer's studies of wooden roofs are peculiarly interesting); human and comparative anatomy, physiology, and the science of the laws of proportion, balance and movement in all things capable either of setting themselves in motion, or of being set in motion by others. Not only their private note-books, but their published works tell the same tale. To the attention of the architectural student I would especially commend Albert Durer's "Ueber-richtung der messung mit dem Zirckel und Reyschecht" (Nurem., 1525), and his "Eidliche Underricht zu Befestigung der stet, Schloss und flecken," a very important essay on fortification, containing, amongst other matters, a lively prototype of the circular system which has been so warmly advocated by our distinguished fellow, Mr. Ferguson. It is by no means foreign to our special subject to observe the skill attained by such great artists in the science of attack and defence, as expounded in the admirably illustrated works of Valerius and Vegetius, the text-books of the great Condottieri of the sixteenth century; since we shall find that one of the most skillful Italian painters who ever worked in this country died in the service of Henry VIII., in the exercise of his duties as "magister tormentorum," or divisor of implements of war. Vasari's pleasant chapter on the

"diversi artefici Fiamminghi," traces the spread of Italian art in Flanders, and commemorates the leaders of that school, specimens of which were early brought into this country by means of the renowned Corporation of the Merchants of the Stalhof or Steleyard, to whom such important privileges were granted by Henry VII.; and who were as ready to protect and support Flemish artists visiting England, as the Pelaviana Bards and other great Lombard merchants settled in London were to assist and introduce Italians of adequate ability.

Having now traced, firstly, England's need of skilled artists and artisans at the close of the fifteenth century, and secondly, the abundance of contemporary art-talent in Italy, Germany, and Flanders, we proceed to trace the mission-aria who were induced to visit us, and propagate the doctrines and practice of the art of the Renaissance, destined to supersede the waning traditions of our once admirable school of Medieval art.

Walpole, in his anecdotes, assures us that two painters only are mentioned in the reign of Henry VII. A bald statement is preserved in the registrar's office at Wells, that one, Holbein, lived and died here in the reign of Henry VII. He was probably a hinner, and can scarcely have been a relative of the great Holbein of the succeeding reign. The other painter was the Jean Gossart, born at Maubeuge in Hainault, and hence known as Maubeugius, or Mabusius, or Mabuse, to whom allusion has been already made. By education and talent he was well fitted to set a new fashion in England, since Vasari tells us that "Giovanni di Mabuse fu quasi il primo che portasse d'Italia in Flandria il vero modo di fare storie piene di figure grandi e di poesie." His talents and industry were great, in spite of his dissipated habits. The anecdote is told of him that when given a suit of damask by the Marquis de Veron, in which to appear before Charles V., he sold the cloth, and made himself a suit of paper, which passed muster even with the emperor for the genuine article. He painted the celebrated Adam and Eve, which being hung at Whitehall, gave its name to the gallery. In Walpole's time this picture was in the king's antechamber at St. James's, and subsequently at Windsor. Walpole has engraved an interior of a church with some figures he regards as intended to represent the king's children, Henry and Elizabeth.

The well-known picture of three children, generally supposed to portray the family of Henry VII. in the royal collection at Windsor, of which replicas, attributed to Holbein, exist in the Wilton and other collections, has been lately identified on good grounds by Mr. G. Scharf* as the original picture referred to in Henry VIII.'s catalogue as "item a table, with the pictures of the three children of the Kynde of Denmarke, with a curtayne of white and yellow sarsenet pased together," and in that of King Charles I. as "item a Whitehall piece, curiously painted by Mabusius, wherein two men-children and one woman-child playing with some oranges in their hands, by a green table; little half-length figures upon a board in a wooden frame."

The best evidence, however, that we possess in this country of the rare talents of Mabuse, consists in the grand picture at Castle Howard, which some of my hearers may remember to have seen when exhibited in London at the British Institution. This is certainly one of the most masterly pictures of the early Netherlandish school in existence. It was originally painted for the Abbey of Grammont, and represents the worship of the Magi. It is rich in ornamental and quasi-architectural accessories, and although painted apparently before the visit to Italy, which made him what Vasari and Sandrart have described him, the artist had evidently emancipated himself from Gothic trammels, and had begun to emulate the change of manner effected by his honoured friends and rivals, Lucas Van Leyden and Albert Durer. Van Mander, who is the best authority, as the earliest biographer of Flemish artists, records only the fact of Mabuse's visit to this country, and we are left altogether in the dark as to the duration of his visit, and the extent of influence exercised by him upon English art. All we can do is to esteem him as the precursor of the im-

pending change, which only assumed a definite shape in the early years of the reign of Henry VIII., which I need scarcely remind you commenced in the year 1509, at which date the handsome and accomplished heir to Henry VII.'s vast accumulated wealth had only attained his eighteenth year.

The proficiency of Henry VIII. at the period of his accession to the throne, in both reading, writing, and speaking Latin, French, and Italian, is testified by the foreign ambassadors who then visited at his court; and for a measure at least of this proficiency he was obviously indebted to the learned Frenchman Giles du Vadia or "Egidius Dewes," who was employed as Royal librarian by Henry VIII., as he had been in his youth by his father. Dewes died in 1535, having instructed all the Royal Family in his native language. At Henry's command he wrote "An Introductorie for to learn to rede, to pronounce, and to speak French truly, compiled for the Princess Mary." Thus was Henry specially qualified to hold personal intercourse with the foreigners in whose society he rejoiced to exhibit his magnificence and rare personal accomplishments. The king and his first great minister met as upon common ground in their love of display, no less than in their love of learning, and in their desire to raise Englishmen to at least a level with the natives of those countries, with whose advanced civilization and cultivation of the arts of luxury and delight of every kind they actively sympathised. They vied as it were in giving encouragement alike to literature and art. To induce the most learned professors to visit this country for the purpose of raising the standard of classical education, or to take into their service foreign artists capable of recreating the outward forms of classical art, were to both objects of almost equal emulation.

The following, in addition to Mabuse, appear to have been, as far as I have been able to trace them, the principal foreign artists and artificers employed in England during the sixteenth century, in an approximation to chronological sequence, and in the order in which I propose now to, far too briefly, notice their lives and works; dwelling (as is fitting to such a architectural audience) upon those who exercised a direct influence upon architecture, and passing rapidly over those who practised as painters only.

1. Torrigiano.
2. John Maynard, or Meiner.
3. Benedetto da Rovenzano.
4. Antonio Cavallari.
5. Vincent, or Vincenzo, Volpe.
6. Anthony, or Antonio, toto dell Nunciata.
7. Barthelomew, or Bartolomeo Penne.
8. Lucas Carnefi.
9. Nicholas Modena, or Nicola da Modena.
10. Ambrose, painter to the Queen of Navarre.
11. Theodora Bernardi.
12. Antony Bernardi.
13. Lambert Bernardi.
14. Ellis, or Alice Carmillon, "millyner," otherwise, probably Eliza Carmillon, Milanese.
15. Cirolamo da Trevizi.
16. Gerard Horneband.
17. Luke Horneband.
18. Susanna Horneband.
19. Lavinia Termick.
20. Katharine Maynor, of Antwerp.
21. Harry Mayner, painter, one of the witnesses to Holbein's will, 1543.
22. Hans Holbein.
23. Anthony Suecher, armourer.
24. John of Antwerp, or Antwerp, goldsmith.
25. Jan Mustyan, born at Enghien, arms maker.
26. John de Mayne, seal engraver.
27. Richard Atayll, stone engraver.
28. John of Padua.
29. Johannes Corvus Flandrus.
30. Gervas Flic, Gerberius Flecus, Flicus, or Fliccius "Germanus."
31. Guillim Strates.
32. Sir Antonio Moore.
33. Joost van Cleef (Zotte).
34. Nicholas Lyzarde, or Nicolo Lizardi, d. 1570.
35. Lucas de Heere, b. 1534, d. 1581.
36. Frederico Zuechero, b. 1543, d. 1609.
37. Cornelius Kettel, b. 1548, d. 1604.
38. Mark Garard, b. 1581, d. 1635.
39. Henry Cornelius From, b. 1565, d. 1640.
40. Petrucio Ubal dini, worked in London, 1565.
41. George Hoefnagel.

It appears that Henry VIII. basied himself in the first year of his reign with the collection of information as to the probable cost of the Royal monument projected by his father, and as to the most fitting persons to execute it. A memorandum of this nature, docketed in the King's own hand, exists in the Record Office, and has been printed in Mr. Brewer's most interesting "Calendar." It contains various estimates made by different artificers, all apparently Englishmen, excepting John Maynard, the painter, whose real name seems to have been Hans Meiner. Most of the persons whose names are mentioned in this memorandum were subsequently employed, with the notable addition of the eminent foreigner to

* From a paper by Mr. M. Digby Wyatt, read at the ordinary general meeting of the Royal Institute of British Architects, held on Monday, the 18th of May.

* See his "Remarks on some Portraits from Windsor Castle, Hampton Court, and Wilton House."—Archæologia, vol. xxxix. p. 245.
 † Sandrart follows Vasari's very words in declaring that Mabuse was one of the first "Historien voll neckender Bilder zu machen, und allerley Postereyen darin zu setzen."

whom we shall presently refer, and to whom probably the design of the whole is due, as well as the execution of the really artistic portions. Meritorious in their way as several of these English art-workmen may have been, it was but natural that the king should seek to employ for the effigy, at least, of his father some one of the great artists of Italy, whose fame had spread throughout Europe; and samples of whose rare talents had been no doubt brought to this country by the rich Lombard merchants, and by the Venetians, whose interest it was at the commencement of his reign to conciliate the king's favour, which they could do in no more graceful way than by anticipating his artistic necessities. I have already alluded to Henry's accomplishments as a linguist, which no doubt facilitated his acquisition of foreign tastes—another of his natural endowments, his love of and ear for music—should also be noted as a special bond of sympathy between himself and his cultivated Italian contemporaries.

The king's early marriage with Catherine of Aragon may be regarded as another predisposing cause tending to induce Henry to look abroad for the highest class of artistic talent. That he was fortunate in the first great master upon whom he lighted is proved by the rare merits of the works of Pietro Torrigiano, which we are still fortunate enough to reckon amongst our national art-treasures.

This distinguished artist, who was born at Florence in 1470, was taken whilst a youth into the academy founded by Lorenzo di Medici the elder, and directed by Bertholdo, a pupil of Donatello. Amongst the students were Buonarroti, Rustici, Granacci, Niccolò di Domenico Sazzi, Lorenzo da Credi, and Giuliano Bugiardini, all Florentines; and Baccio da Monte Lupo, Andrea Contucci, of Monte San-Sovino, and other strangers. It was whilst they were fellow students here that Torrigiano broke Buonarroti's nose with a stone. Torrigiano described to Cellini how it happened; and we are told in the autobiography of the latter that Torrigiano and Michelangelo were copying Masaccio's frescoes at the Church of the Carmine together, and that the latter so bantered and tormented the former that, unable to endure it, he gave him a violent blow on the nose, which he would hear the mark of to the day of his death. Vasari says, however, that Torrigiano hated Michelangelo, and was constantly seeking to injure him because Michelangelo was superior to him. Whether that was the case or not, Lorenzo di Medici was so incensed against Torrigiano that, if he had not fled from Florence, he would have been heavily punished. The Pope Alexander VI. employed him, on his arrival in Rome, on the stucco-work of that part of the Vatican called the Torre Borgia; but, being attracted by the pay and spoil of the soldiers under the Duke of Valentino (the Pope's son), then in the Romagna, Torrigiano gave up his work, joined the army, and comported himself bravely.

He then followed Paolo Vitelli in the war against Pisa, and was with Piero di Medici at the action on the Garigliano, where he obtained a pair of colours and the reputation of a brave ensign. Disappointed, however, in obtaining the grade of captain, he returned to his art, and prepared various small figures in bronze and marble, which he sold to Florentine merchants, together with numerous drawings, all of which Vasari praises for "good manner" and great boldness of execution. The merchants above-mentioned invited Torrigiano to proceed to England, where, Vasari tells us, and we shall presently see, that he executed many works. "And now," says his biographer, "did Torrigiano receive so many rewards and was so largely remunerated that, had he not been a most violent, reckless, and ill-conducted person, he might there have lived a life of ease, and brought his days to a quiet close." We have no knowledge of his reckless or violent conduct in England, nor in Art is it probable that he had a rival; still he left England for Spain, after having executed the monument to Henry VII. In Spain he executed various works, and gained great reputation; but, quarrelling with the Duke d'Arcos, to whom he had sold a statue of the Virgin, he broke it to pieces with a hammer. This want of reverence, either for what was "*sin pecado concebida*," or, for what was almost equally venerated in Spain, a "grande," and perhaps his long stay in apostate England, induced the Inquisition to arrest and imprison him; in the prisons of which anti-reforming institution, at Seville, through indignation and grief, he is averred to have starved himself to

death, in 1522, but in which it is more probable he suffered that fate which the nature of his accusers would indicate as probable. Over the door of the Sala Capitular, Granada, is a "Charity," by Torrigiano, executed as a sample of his talent, when he was at Granada, competing for "The Sepulchre of the Catholic Sovereigns," which was finally executed by Peralta, of Genoa.

I have not interrupted this hasty narrative of Torrigiano's chequered life by dwelling specially upon the circumstances of his engagements and works in this country, but as that is what primarily interests us, I proceed to allude to them now. Vasari tells us that Pietro made little figures of marble and bronze for certain Florentine merchants, by whom it is highly probable that some specimens of his handicraft were forwarded to the branches of their firm settled at London. Amongst such merchants the great firm of the "Bardi" stands conspicuous; and the entry found by Vertue amongst the records of the Court of Requests, of a cause tried in 1518 before the Council at the Palace of Greenwich, and in which the great sculptor appeared as one of the witnesses, is interesting as identifying the connexion which existed between him and Pietro di Bardi and Bernardo Cavalcanti, between whom rested the cause of strife. Vasari's words as to the fact that Torrigiano was not only invited, but brought (*condotto*) to this country by the Florentine merchants for whom he had worked at Florence, are precise; nor can we doubt that he was hired for the express object of executing works for the king, since he began to work for him immediately upon his arrival in this country (in 1515 probably), and one work only of his is extant in this country which was not executed, either directly or indirectly, for the Crown. Where, alas! are the "*infinite cose di marmo, di bronzo, e di legno*," which Vasari tells us he wrought while in the service of "that king," in competition with natives of this country, "to all of whom he was superior"?

The original agreement into which he entered for the execution of the monument to King Henry VII. and his queen with the executors of that monarch, is given at full length in Ackermann's "Westminster Abbey" (vol. ii. pp. 140 to 143). It bears date A.D. 1516, and is a most interesting document. He must have worked with rare diligence, for Stowe tells us that the tomb was finished in 1519. To describe such a monument here would of course be superfluous. All must alike have recognised how entirely unlike it must have been to anything done in this country before its erection. It struck, as it were, a key-note of an absolutely fresh pitch, and produced a "great sensation" far and wide upon all who saw or heard of its grandeur. I am happy to have been able to procure an excellent cast from it for the Crystal Palace, in which, from the models having been gilt, as the original was, and from its being freed from the fine Gothic screen which surrounds the original, the merits of Torrigiano's work may perhaps be even better studied than in the original. To bring the details as to architectural style under the reader's notice, I reproduce Cottingham's view of one end of this monument. His success in this work led to the same artist's employment to execute the monument to Margaret Countess of Richmond, the mother of Henry VII., the great fondness of, and honest actress to, several of our collegiate institutions. To me, I must confess, this effigy in bronze has always appeared superior to those of either Henry VII. or Elizabeth of York. I am obliged, therefore, to differ altogether from Dr. Waagen, who, strangely enough, remarks that it is "so far of inferior merit as that the head and hands were merely casts from moulds taken from nature." That the artist may have been assisted by such casts is possible, but, to those who know well what post-mortem casts look like, the difference between the heavenly resignation and sentiment of the Countess's head and hands and the rigidity of expression never wanting in casts taken from corpses must be at once apparent. The very perfection of style with which the bronze is wrought, its surface, and the beautiful modelling of the drapery might, I think, have redeemed Torrigiano from such an insinuation.

The one other monument we still possess, either from the hand of Torrigiano or from that of Benedetto de Rovizzano, but most likely the former, too little known for its rare merit, is in terra-cotta, coloured most tastefully and skillfully. It is in the chapel of the Rolls Court in Chancery-lane, and commemorates Dr. John

Young, Master of the Rolls in the reign of Henry VIII. He lies, supine, with crossed hands, and wears a most dignified expression on his countenance, which is modelled in masterly style. In a recess above his effigy is a head of Christ, in the centre, and on each side an angel's head, in high relief. Even in Italy I know no finer coloured terra-cotta head than that of the Christ. The architectural members of the monument are of the purest cinque-cento, and, on the whole, the monument to Dr. John Young is one of the finest objects of Renaissance art in the world. Would it were more seen. I naturally endeavoured to get casts, so as to reproduce it in *fac-simile* at Sydenham, but an honour which the reasonableness of the plea upon which the then Master of the Rolls rested his unwillingness to grant my prayer. At Strawberry Hill was a model in stone of the head of Henry VII. in the agony of death. It is in the great style of Raffiello and Michelangelo, and worthy of either. It may fairly be assumed to have been a study executed by Torrigiano to show his capacity for executing the work—his trial-piece, in fact. It is engraved in Carter's "Ancient Painting and Sculpture." The question has occasionally been asked whether Torrigiano had anything to do with the stone statues in Henry VII.'s Chapel at Westminster. No one can, I think, believe that he had. We are, indeed, told that Robert Verbe, Robert Jennings, and John Lebons were the master masons, and they were very probably some of those *maestri di quel paese*, alluded to by Vasari, to whom Torrigiano "showed himself so superior."

That the king was pleased with Torrigiano's work is proved by the fact of his going so far as to sanction the preparation of a draft agreement with Torsyans, as he is called, for the erection of a monument to himself and Queen Catherine, at a cost of 2,000*l.* This draft agreement, dated in 1518, was found in the Chapter-house at Westminster, amongst the papers of Cardinal Wolsey, and has been printed in the "Archæologia" (vol. xvi. p. 84). Why this agreement was never carried out does not appear; but, since both Vasari and Cellini agree in describing Torrigiano as a proud, passionate, intractable, and foolish man, as well as a capital artist, it is probable that the fault was his own, and that he quarrelled with those "*bestie di quelli Inglesti*," as he never wearied of describing our countrymen to Cellini. Torrigiano visited Florence just about the date of this draft, for the purpose of engaging assistance for this very work; for Benvenuto, in his Life, says that Torrigiano expressly told him that he had to execute a great work, *al mio Re*, consisting of, or at any rate involving, *grand opere di bronzo*. Cellini did not like Torrigiano's manners, and declined to go to England with him, which perhaps helped to disgust the former with his commission: anyhow, the affair went off.

The only foreigner who appears to have worked with Torrigiano was the painter, John Maynard, or Meinert, of whom little is known save that he was so employed, and that he was probably a relative of a certain Harry Mayner, painter, "of Antwerp," who appears as one of the witnesses to Holbein's will.

This, however, was but an accidental circumstance, for Henry's taste for foreign fashions was carried into every branch of his establishment, from his serjeant-painters, architects, sculptors, and masters of engineering and music, to his cooks and grooms.

The patronage thus afforded to foreigners of all kinds, did not fail to excite bitter jealousy and enmity on the part of the city of London; and ultimately, on the "evil May-day" of 1517, the rising took place which had for its object to cut to pieces all the strangers in London, in number from 6,000 to 7,000. There seems little doubt, indeed, that several of the celebrated seventy-eight "faulds and abusses of religion" complained of in the protestation of the clergy of the Lower House, presented to Henry in 1536, derived particular "gravamen" andunction from jealousy of foreign practice. The musical novelties sanctioned by the King in his private chapel gave great offence in the Church; and but for his protection of Italian, versus English, composers and organ-players, he might never have been told by his clergy that, "syrning and saying of mass mattins or evensongs, is but roryng, howling, whistelyng, mummyng, conyuring, and joggyn; and the playing at the organs a foolish vanity."

Warned, perhaps, by the temper shown on "evil May-day," Wolsey seems to have hesitated about entrusting the design of his palaces at

Hampton Court and York-place to foreigners; and, as far as internal evidence may be trusted, these buildings would appear to have been based altogether on English models. Hangings and furniture he purchased largely on the Continent, and thereby tended to introduce new types of ornament and art-manufactures into this country, which of course re-acted upon the style of national architecture. The only decided evidence of Italian art of the sixteenth century Hampton Court still shows, consists in the terracotta roundels, with busts of Hadrian and Trajan built into the towers of the eastern gateway of Wolsey's first Court, and others of the same kind in the adjoining Court. These have been attributed to Lino della Robbia, and are said by Mr. Cole (Felix Sumnerley) to have been given to the Cardinal by Leo X. As they are by no means like della Robbia's work, I don't feel the first assertion, and I am inclined to doubt the second, partly because Leo X. was no great patron of della Robbia's, partly because as gifts they would be scarcely valuable enough, and partly because other similar roundels and terra cottas exist in contemporary buildings in this country, as, notably, in the courtyard of St. Donat's Castle, Glamorganshire, one of which I engrave. Of those which once abounded in this country in Henry VIII.'s possession, and have perished, we are fortunately provided with sufficiently detailed descriptions to enable us to form a good idea of their general character.

We are indebted to Mr. Wornum for having printed, in the Appendix to his excellent "account of the life and works of Hans Holbein," copious extracts from the inventory of art "properties" preserved in the Palace of Whitehall, in the year 1547. Other extracts had been printed previously by Mr. Cole, Mr. Waring, &c. Amongst those entries are many which illustrate the general state of such contemporary art—as that patronised by the Cardinal at Hampton Court and elsewhere—very curiously. In the first place, there is to be noted the fact that what are called "pictures" appear to be bas-reliefs coloured, and more or less gilt, and made either of "erthe," i.e., majolica (as the roundels), or of black "towche," or touch stone. In the second place, what we now call pictures are all called "tablets;" and this title is adopted whether the "table" be an ordinary painting on wood or canvas, an alto relievo in alabaster or wood, a hanging in needlework, a plaque in enamel, a slab of marguerite, or a specimen of glass-painting. The subjects of the "tablets" are, with few exceptions, either portraits or ecclesiastical and devotional themes. In one or two instances only do "histories," taken from Ovid and other authors so popular with the masters of the early Italian Renaissance, make their appearance; and even in those rare instances they seem scarcely yet naturalised and at their ease, as witness the "stained cloth with Phoebus riding in his cart in the air with th' history of him." Some of the pictures "made of erthe," may very probably have been the productions of Italians either in the king's or in his minister's employ, as they certainly executed such works in their own country, and there is no reason why they should not have done so here also.

It was in his noble palaces of York-place and Hampton Court, furnished with all the sumptuous hangings and adornments which he never seemed tired of seeking for abroad, that the great cardinal kept his high state and magnificence described by Cavendish, which was admired of all foreigners, and was even more royal than that maintained by his proud master. Thus sings old Skelton:

"The Kynges Courte
Should have the excellence;
But Hampton Court
Hath the pre-eminence:
And Yorke's Place,
With my Lord's grace,
To whose magnificence
Is all the confidence."

Probably Benedetto da Roverezano and other Italians in Wolsey's service contributed to produce this stately "magnificence," which was so well understood and methodised in Italy through men like Bernardo Castiglione, author of the "Cortigiano," and was maintained with great punctilio in the Court of Rome; which was, no doubt, the great model followed by one, the "ultima Thule," of whose ambition was to occupy the chair of St. Peter.

In the pages of Vasari it is to be found the biography of the eminent artist last mentioned, and it is unnecessary, therefore, to do more here than note that Roverezano's works at

Florence, executed before he was tempted to enter the Cardinal's service, had earned for him a first-rate reputation. Those works combined architecture and sculpture; and prominently amongst them are to be remembered the chapel and shrine for the relics of San Giovanni Cualberto, proposed to be attached to the Church of Santa Trinita at Florence. The chapel which was added to St. George's Chapel at Windsor by the Cardinal, I need scarcely remind you, was intended to contain his tomb and monument, and it was to execute this work that Benedetto da Roverezano was specially retained. He was assisted by Antonio Cavallari, and probably other foreigners; and worked, as we are told by Lord Herbert, from about 1524 to 1529. "The design whereof (he adds) was so glorious that it exceeded far that of Henry VII." After spending 4,250 ducats upon it, the Cardinal fell under the displeasure of the King, who, seizing upon his subject's palaces and other property, left him not even the poor "simlacra" he had destined to commemorate his unprecedented grandeur.

After the Cardinal's fall, he wrote from York, asking the King to let him have his own figure for his tomb at York, with "such parts of his tomb as shall please the King." He also beseeched the King to send Anthony Cavallari, the glider of the tomb, back to Antwerp, and to permit "Benedict, the carver," to return to Italy. The King did neither, but used up the materials for his own tomb.

The services of Roverezano were transferred from the Cardinal to the King, who endeavoured to adapt much of the work which had been done for Wolsey for his own monument. This, according to Nicholas Charles (Lancaster Herald), who left behind him the manuscript description of "The manner of the Tombe to be made for the King's Grace at Windsor," printed in Speed's "History of Britain" (p. 1083), was to be mainly of copper gilt. Upon two separate altars, or table-tombs of touchstone, the figures of Henry VIII. and his Queen, Jane Seymour, were intended to lie recumbent in their Royal habits, "not as death, but as sleeping," and of the size of a man and woman, with two angels at the head of each. "Upon a high basement between them, upon which shall be the history of St. George embossed, shall stand the King on horseback in full armor, of the stature of a goodly man, and a large horse. Over all, the Image of God the Father, holding the King's soul in His left hand, and His right hand extended in the act of benediction. Thirteen prophets and four saints, all 5 ft. high, and between each pillars of serpentine marble. The amount of the carvings—133 statues, and 44 stories, or has-reliefs." Dallaway observes that: "In Henry VIII.'s will (dated 1546) this tomb is specified as 'an honourable tomb for our bones to rest in, which is well onward, and almost made therefore already.'" Had but the King's successors completed what was "so well onward," England might have now to boast a Royal monument, before which those of the Abbaye of St. Denis might "pale their inefficual fires." The bulk of what was done must have been very great, since the metal melted down and sold by the Parliament Commissioners fetched 620*l*. I am inclined to fancy it possible that the beautiful statuette of St. George and the Dragon belonging to Mr. Louis Huth, which I have engraved, may have been a study for an equestrian group for this monument, superseded by the equestrian statue of Henry, above described.

Poor Benedetto's eyes were injured by working in the King's foundry, and he at length returned home rich; but doomed speedily to lose vision altogether (in 1550), and to die shortly afterwards. Of his fellow workman, Cavallari, we lose sight after the period of Wolsey's disgrace.

For a notice of the next artist upon our list, Vincent or Vincenzo Volpe, I am indebted to Mr. Congh Nicholl's admirable essay "On the Contemporaries and Successors of Holbein," printed in the 39th volume of the "Archæologia." After giving extracts from records proving Volpe's employment by the King in various branches of decorative painting, from 1514 to 1530, Mr. Nicholl adds: "I think it by no means improbable that Vincent Volpe may have been the painter of some of those curious military pictures, something between plans and bird's-eye views, that are still to be seen on the walls of Hampton Court. That he was an eminent artist is proved by the fact of his receiving wages equal to two-thirds of those paid to Holbein. Volpe is one of the very few eminent foreigners of this period who seem to

have escaped the notice of Virtue, Walpole, and Dallaway, to whom Englishmen have ransou to feel deeply indebted for the preservation of so much relating to the history of art in this country, in every way worthy to be had in remembrance.*

GHOSTS IN PICCADILLY.

"To be sold, the handsome Entrance Gateway and admired Stone Erection for the Colonnades at Burlington House."—*Adv't.*

"CARRMAN, leave me here a little, while as yet 'tis early morn,
At this mansion old and famous, I will rest and view the form.
'Tis this place, and all around it, as of old, the shadows fall
Upon colonnade and mansion with a smoke-begrimed wall."

"Stalwart porter, looking gloomy, reclining at the gate,
Doth muse upon the old time, or the future contem-plate."

"I for olden times care little, and at trifles am not daunted;
The source of all my misery 'a to guard a house that's haunted
By the ghosts of the departed, who at eve when I'm a napping,
At my door and at my casement continually are rapping.
Jostling, pushing, quick they enter, for they're all in wondrous haste,
To revisit scenes so pleasant, where they met the 'Man of Taste.'

With swords, gold lace, and ruffles, and their coats of brilliant hue,
They lounge about the courtyard—a strange and motley crew.
There's Pope, the Waap of Twickenham, with Arbutnot and Gay,
Bygone times and scenes recalling as arm-in-arm they stray.

"Handel—mighty master—of his sad and solemn strain,
Elysian transport to their souls—it thrill'd through every vein,
Of 'Burlington's fair palace,' and its famed 'delicious meal.'

Of balls and routs and junkettings, fond memories o'er them stem
Hornes Walpole, smiling blandly, vows 'The colonnade, so bright,
Was the handiwork of fairies, and they built it in a night.'

Swift, who's rather airy, says, 'Mannars put it up for sale,
Till Hope† came to the rescue, and told a flattering tale—
Of its graceful form and beauty, and declared 'twould be a scandal
To destroy of Art a monument—he'd believe it of a Vandal.'

So gravely walking, softly talking, every topic they recall
That reminds them of the mansion with a smoke-begrimed wall.
Until Chanticleer, he crows, they vanish somewhat flutter'd.

And round about the gateway a chorus loud in utter'd:
O Sydney Smirke and Barry! O Banks and Penne-thorne!
A worthy task's before ye, to excel its present form." X‡

ON TRAPS FOR HOUSE-DRAINS AND GULLIES.

THE object of trapping house-drains and gullies is to prevent the foul air engendered in the sewers and drains from escaping into the houses and streets. The traps used for this purpose are of two kinds—namely, flap-traps and syphon-traps. The original flap-trap was similar to the old sluice-valve, and consisted of a door of wood or iron, fitted into a rabbeted frame, and hinged at top. The original syphon-trap consisted of a square brick box, with a stone placed on edge across the centre, and dipping 2 in. or 3 in. below the bottom of the drain. This was called the "bricklayers' trap." The flap-traps and syphon-traps so made were formerly used, either separately or in combination, for trapping the house-drains. The flaps were hung sometimes under the inlets, but chiefly on the outlets; while the syphons were placed under the inlets, and on the line of the drains, with flaps in addition at the outlets. The gullies were trapped by fixing flaps only on the ends of the drains in the sewers. The traps now employed for trapping house-drains and gullies are made on the principle of the old wood flap, on that of the old brick box with a dipstone, and by a combination of both; and the practice is to place the syphons under the inlets, and to hang the flaps on the outlets as heretofore.

* To be continued. † A. J. Beresford Hope, M.P.
‡ This is stolen very freely, you will perceive, from Tennyson, Pope, and Gay; so, although I sign myself very respectfully yours, you will at once recognise in me
A PLAGIARY.

The flap-trap now in use consists of a galvanised iron disc, hung by shackles at top, and covering a round hole in a block of stoneware. This is known as the "lock-flap." The same flap is also similarly hung on the end of a short length of stoneware pipe. There is a raised rim round the face of the block, and also round the end of the pipe, with a corresponding rim round the back of the flap. In the best made traps these rims are ground so as to form air-tight seats for the flaps. Many traps, however, are made with the rims unground. The action of this trap is very unsatisfactory. It is operative only while the flap is closed on its seat, and inoperative each time the flap is forced open by the drainage behind it endeavouring to escape. Its action, therefore, is intermittent. Moreover, while the flap is closed it not only checks the flow of the drainage, but the obstruction it presents often causes the drain to choke. Frequently hits of stick and rags get between the flap and its seat, and block it open permanently; and some of the flaps become furred and eaten through, or stick fast, by oxidation. While, therefore, the flap is thus kept open, and each time that it is opened by the pressure of the drainage behind it, the sewer-air rushes up the drain and escapes into the house. How often have sickness and death resulted from this cause? The flap-trap, therefore, whether used separately, or in combination with the syphon, is not only worse than useless, but positively mischievous, and should be abolished. This was pointed out by the writer, in the *Builder*, many years ago. It, however, is almost as great as ever. There are also a vast number of drains the outlets of which are not trapped at all, and up which the sewer-air is continually escaping into the houses. These drains are, of course, as bad or worse, in this respect, than those which are supposed to be trapped.

The syphon-trap now in use consists of a stoneware pipe bent longitudinally. The upper part of the bend in the centre dips one or two inches below a straight line drawn from the bottom of the pipe at the ends, or below the outlet. The water occupying the cavity formed by the bend, together with the part of the pipe dipping below the surface of the water, produces the trap. While, therefore, the water in the bend prevents the sewer-air from escaping into the drain, and thence into the external atmosphere, it permits the free discharge of the drainage through it at all times without unseating the trap. The trap is stagnant only for a short time, because the drainage coming down the drain displaces that in the trap. This trap is always in operation, both as a trap and a drain; and therefore it only should be used for trapping house-drains and gullies. The common "bell-traps," and all other traps in which there are partitions dipping into water in bends below the outlets of the traps, are only varied forms of what is called the "syphon-trap."

The question has often been asked whether house-drains should be trapped at the outlets in the sewers as well as at the inlets in the houses. To this it may be replied that, inasmuch as the sewers are partly ventilated by the house-drains, there can be no doubt that, for the sake of health and comfort, air communication between the sewers and the houses should be cut off as effectually as possible. It has also been remarked that "if the drains are trapped at the outlets as well as at the inlets, how is the foul air engendered in the drains themselves to be got rid of, seeing that when the closets are opened, or water is poured down the inlets, the drain-air would escape into the houses at those points the same as at present?" To this it may also be replied that the remedy is both easy and simple; thus, let it be insisted on as part of the construction of the drain that a ventilating-pipe shall be carried from or near to the highest part of the drain to the top of the house, and there communicate with the atmosphere. The air passing through the closets and inlets, each time water is poured down them, would expel the drain-air, which would escape by the ventilating-pipe. In the event of the draught being the reverse way, which doubtless would be the case in some instances, it would be considerably less objectionable to receive atmospheric air into the house by this means than sewer-air as at present. The closet soil-pipe, and also the rain-pipe, afford a ready means of accomplishing this very necessary improvement in house-drainage. The soil and rain pipes should be untrapped at bottom, continued to the tops of the houses, and covered with gratings. The joints of the rain-

pipes should be filled with cement, so that air may not escape at those places. The writer has adopted this plan in many instances, with successful and beneficial results. He would therefore recommend that all house-drains should be effectually trapped, by syphon-traps or otherwise, at the outlets of the drains in the sewers, or as near to the sewers as is practicable; and that from or near to the highest point of the drain a ventilating pipe should be carried to the top of the house, so as to discharge the drain-air at the least objectionable point. The Metropolitan Board, and the local Boards and vestries, have the power to order this improvement to be carried out.

Formerly the sewers, after they were cleaned by hand labour and cartage, accumulated deposit until it was necessary to repeat the process again and again. Cleansing the sewers by flushing is a similar palliative. The truth is, that resorting to flushing for keeping the sewers clean is a proof that the channels are too large and too wide, and that such sewers are little better than common cesspools. The motion of a stream is produced by one end of its bed or its surface being lower than the other, that is, by the force of gravity; and the velocity varies with the difference in the forms and areas of the transverse sections, it being least where the sections are shallow and wide, and greatest where they are deep and narrow. The discharges are equal through the various sections. From this it will be seen that the utmost impelling power is produced in a deep narrow section where the velocity is quickest. When, therefore, it is considered that the removal of decomposing matter from houses and towns is dependent on the water discharged with the matter into the drains and sewers, it is evident that the channels should be made narrow and smooth in order that the impelling power of the water may not be lost. That portion of the matter which is of less specific gravity than the water will float, and be carried away by the current, however sluggish it may be; while that portion which is heavier will deposit, if the force of the current be insufficient to urge it forward. The maintaining power is proportional to the fall, but the impeding influence depends on the extent of the bed in contact with the current compared with its volume. In wide-bottomed sewers, therefore, the impulsion of the flow is weakened to such an extent that the heavier matter always deposits, but by narrowing the channels to a minimum the flow is augmented sufficiently to prevent deposit. The writer found, from observation and experiment in the sewers, that when the currents glided from 13 to 2 miles per hour, the velocity was ample to cut through and remove deposit, and also to carry away coarse sand and gravel. He is confident, therefore, that if the drains from the houses were to be collected into narrow and smooth channels, the currents would be sufficiently powerful to keep the greater number of the sewers in the metropolis free from decomposing deposit without flushing. Had the money, which has been expended in flushing, been judiciously applied in rectifying the channels, the sewers would now be self-cleansing. Going on, therefore, with the method of flushing is merely wasting the ratepayers' money. All that is necessary to be done to make those sewers self-cleansing which are now obliged to be flushed is "to hed stoneware channel tiles along the inverts, and to fill up the sides with concrete," also sloping to the channels, and to continue the outlets of the house-drains and gullies into them with stoneware pipes and syphon-traps. This simple plan was proposed by the writer twenty-one years ago, and is to be seen in his evidence before the Metropolitan Sanitary Commission, 1847. Here is the germ or origin of the "concrete sewer." Large-sized "cement concrete pipes" were also made and laid, under the direction of the writer, in the open sewers in the Surrey and Kent district in 1848 or 1849. In some of the old flat-bottomed sewers, and in others where the levels are defective, the inverts should be taken out and new ones formed, to improved levels, with stoneware blocks and Portland cement concrete, or brickwork in cement, underpinning the side walls. Either of the suggested plans would almost supersede flushing, and be found cheap and efficient.

Some years ago it was considered that, if the sewers could be kept free from decaying matter by flushing or otherwise, no foul air would be engendered within them, and no special means would be required for ventilating them. Dr. Arnott, however, said, what is the fact, that "nothing can prevent the sewers from being

filled with offensive effluvia, even if there be a good declivity and a rapid current. Flushing might lessen the quantity of impure air, but would not free the town from the amount." The truth is, that sewage matter, while it is passing along the sewers, continually evolves hydrogen and carbonic acid gases. Hence the necessity for an effectual system of ventilation. The sewers are now ventilated partly by the house-drains, partly by the gullies, and partly by the air-shafts in the middle of the streets. To allow the house-drains, or even the gullies, near to the houses, to be used for this purpose is a palpable mistake. Every house-drain and street-gully in the metropolis should be effectually trapped by syphon traps, both at the outlets in the sewers and at the inlets in the houses and streets. The sewers might be ventilated by one or all of the following processes:—By air-shafts in the middle of the streets, as at present; by jets of water falling down the air-shafts; by jets of gas in the air-shafts continually burning over or under gratings or candle-pipes containing dry chemical compounds; by pipes connected with the crowns of the sewers and carried up the sides of public buildings or the flank walls of houses; by lofty chimneys, or posts in the centre of public urinals, into which the impure air might be drawn by fires or fans, and there heated and burned. A reduction in the death-rate of the metropolis would result from the adoption of the above suggestions.

The most practical and efficient method of ventilation would appear to be that by distinct systems of downcast and upcast shafts. Bridging the metropolis into certain ventilating areas or districts, the existing air-shafts in each district would serve as downcast shafts; and, at a suitable situation on the line of a sewer in the district, a pair of air-ducts should be formed leading upwards from the crown of the sewer to the surface, and then bending over and downwards through a fire-chamber placed under the junction of the air-ducts, with a horizontal passage leading from the ash-hole to the upcast shaft. By this method air near the surface of the streets would be drawn down the air-shafts; and, with the foul air engendered in the sewers, would be drawn out of them and pass through the furnace downwards. Thus the sewer-air and the fuel-smoke would be burnt or consumed by the fire; the sewer-air, with the products of combustion, would together pass into the atmosphere at a high level almost clear and invisible; and the air-passage between the fire and the upcast shaft, and the upcast shaft itself, would never become coated with soot. The supply of fuel to the furnace, and the discharge of ashes from the ash-hole, would be by self-acting appliances. All the sewers in each ventilating district, which do not now communicate with each other, should be made to do so; then the foul air in all the sewers would be drawn off and burnt.

JOHN PHILLIPS.

WHERE ARE WE GOING TO?

SUCH is the title of a popular religious tract: the intention of its author has evidently been to arouse serious reflection as to what sort of life we are leading, and where it will probably land us. I wish some able hand would write a "Where are we going to?" in the matter of our commercial interests. It is a very serious question, and there are very many reflecting minds struck with the idea that we are going anywhere but to prosperity and settled commercial progress—in fact, that we are going to—the dogs. Not to allow this much, we may at the same time admit that there are serious signs of the times not to be mistaken. Note the state of public credit as represented by the various financial or speculative companies; mark the low ebb of morality to which trading is reduced; observe the shameless impudence of fraudulent bankrupts, and the almost universal corruption and misrepresentation (may we say fraud) connected with the reports and accounts of many of the recently-started limited companies. Worse, far worse, than all, see the deep-seated principle of antagonism which exists betwixt the vital elements of all national prosperity, namely, capital and labour. Crimes of the most revolting and inhuman character have been committed and approved by British workmen in the interests and by the instigation of their trade unions. Where are we going to? What mania is it that has seized the minds of our operatives, and is ever urging them to demand more pay and less work,

and to enforce these demands by tyrannical and unjust regulations (called club rules), and by inhuman cruelties towards their fellow-men?"

That the workman should receive fair remuneration for his labour, and that the duration of it should not extend beyond such reasonable limits as will allow him time for rest and recreation, mental and physical, is most proper, and every right-minded man will assist in bringing about such a consummation; but when the demands for pay are out of proportion to the work done, and to the masters' legitimate and reasonable profit thereon, when the fictitious advances so enforced are swallowed up in the increased price of all necessities, created by this very means of everybody "asking for more"—then there is at the root of the whole matter a principle unsound and dangerous, and which may fairly lead to the question, "Where are we going to?"

Reader, come with me a little while, and I will show you where we are going. It is a bright spring morning; the air is sweet and pure, and it seems as if the restored strength and renewed activity of nature imparted some of its elasticity to us, as we feel eager for our appointed tasks, professional or otherwise. We see before us a hard day's work, and we rejoice in it, as we feel the active pulses beat, and as we breathe the soft, pure, cool air. It is ten o'clock. Here, in a dingy back street, I take you past the "Jolly Waggoners" around the doors of which are grouped men of all ages, wearing the well-known dress of English mechanics. They seem listless and weary; not a few are under the influence of "beer and baccy." Some of them, as they idly lean against the door-post of the rendezvous seem, one could suppose, ashamed of their position. From the open window of the "front parlour" there arises a din of voices engaged in controversy, and a stream of tobacco-smoke issues in graceful curls into the street. These, dear reader, are the noble British workmen, and at the Jolly Waggoners is their club-room; here they have come day by day for weeks past to idle away their time in talk and drink, or to receive the miserable weekly dole which the club provides for them, for they are on strike. They are here to vindicate the liberty of the British workman to do as he likes, and to compel his fellow-workmen to do as he does. There is one young man here; he looks as though he had been educated for better purposes, and had dreamed of a more noble destiny than to stand one of an idle group before a tavern door for days and weeks; but he is in the club—he must be in the club or there is no work for him—and being in it he must do as the club does; he must parade at the Jolly Waggoners; he must smoke and drink and "keep his heart up." Instead of fair pay, which he could have (and would if he dared), he must hold out his hand and receive from the secretary 8s. a week instead of 36s.; he must drink a part of this, because the Jolly Waggoners expect it. Poor lad, he took the drawing prize at the mechanics' institution three years ago; he married a wife much younger than himself; he has two little ones, and he sees before him moral degradation by forced contact at the alehouse with the roughest in the shop, and at home he meets a wife dejected and heart-sick at the long strike, which the men are so "nobly" continuing against their employers.

The other day I visited the home of a striker. In a small back court, approached from the main street by an inclined passage 3 ft. wide, I found two dwellings. Into one of these I entered. A cellar-room about 10 ft. square formed the habitable part, and into this eating, drinking, and sleeping were all compressed. The air was stifling, the bed close to the fire, the small cupboard, with eatables, was in a corner closely adjoining a slop- or sink-stone, which was full of foul water, for which there was no escape, the outlet being choked up. Greasy rags and crockery, with other odd things, littered the floor, and at a small fire sat a woman, with an infant at her breast. I have made minute inspections of the poorest districts in largely-populated towns, but no pen-and-ink description can convey an adequate impression of the sickening details of these human (let us rather say inhuman) dens. I never shall forget that woman's face. It was young and fair and clean,—more, it was trustful and truthful. It was an honest face; and as the infant nestled to its mother's breast she answered my inquiries with a simplicity most touching. Why did her husband allow her and her infant to live in such a place? Why did he not take her to a proper dwelling, where she could breathe; why leave

her here in this fever prison? "Does he drink?" I asked.—"No." "Is he idle?"—"No." "Is he cruel?"—"No; but," said she, with upturned eyes and a sort of heroic suffering smile, "he is on strike."

Poor innocent sufferers! you may thank the Trades Union for that idea of liberty which deuces to your bread-winning the right to labour where, and how, and for how much be pleases; which places his impulsive industry on a level with the sluggish drone; which silks all his desires to ruse, and keeps him weighted down to the club-level; which checks and finally destroys every aspiration after preferment; which keeps him, against his better nature and his free will, one of a dissipated gang, at enmity with his employers; which robs his wife and child of their needful support and their wonted cottage comforts; and which may, and often does, lead a man to confirmed habits of indifference, and finally of dissipation.

Meanwhile, the world wags on somehow or other, and does not sink under its sense of the want of the *confères* at the Jolly Waggoners. The master contends and struggles on as well as he can against his two enemies,—his own workpeople and competition; and whilst our hero is leaning idly against the well-greased door-jamb of the Jolly Waggoners, ship-loads of rolled iron, and ready-made joiners' work, and other like things, come rolling in from abroad, and he sees his bread taken from him and his, and given to strangers; until at last, reduced to want and driven to desperation, he and some few others like him begin to think, become mutinous, and the strike is ended just where it began; the men go back to work loaded with debt, encumbered with loose and idle habits, ashamed of their defeat, and unable to look their employers fairly in the face. The secretary of the club flourishes on until another strike brews up, upon some trifling difference, and he is once again in his glory, feeding upon the misfortune and the folly of his fellow-men, and they cannot see it; for, heedless as the thrice-burned moth, they will be led again and again into the flame.

Where are we going to? There is a complaint of bad trade, and well there may be. I know of many thousands of pounds ready to be invested in the building branches; but the bidders are unwilling to encounter the annoyances and hindrances met with from workmen and their union system, and the difficulty there is in getting work done at all; for it is a fact that, for six days' time, there is not four days' real work, with wages 20 per cent. higher than they were four years ago. To complain is to be insulted; to persist is to cause a strike. What I have herein stated is simple truth, and I commend it to thoughtful perusal; and let every man who feels an interest in his country's future welfare seriously ask himself, "Where are we going to?"

J. B.

SEWERAGE AND OTHER SANITARY MATTERS.

Teddington.—At a recent special meeting of the Local Board, the subject of drainage was especially considered. Some conversation took place about the schemes proposed by the neighbouring towns, Kingston and Surbiton. Several gentlemen of the Board thought it would prove injurious to the neighbourhood if Kingston were allowed to take its sewage to Ham fields, especially when the wind set in the direction of Teddington. Others did not think it would prove in the least injurious to them, but they did think that if Kingston tried to get Ham fields for sewage purposes, there was no reason why they, who were situated nearer Ham fields than Kingston, should not also carry their sewage to that spot. In answer to a question from one of the members, as to what course Hampton Wick was likely to take, it was said that very probably it would oppose the Kingston scheme, unless Kingston consented to take Hampton Wick with them. Upon this, another gentleman remarked that Teddington ought to go where Hampton Wick and Kingston went. The Clerk said he saw by the report of the Hanwell Lunatic Asylum that they disposed of all their sewage on seven acres of land. The inmates numbered 2,000, and 500 officers, which was more than the present population of Teddington. The Surveyor said he found that they were living on a natural filter bed, composed of sand and gravel, and if they determined to make use of the advantages they possessed they would find that in filtering their sewage they

would save a deal of money. Acting on this principle he had drawn up a scheme, which he read, and wherein he advocated that all water-closets and sink drainage should be taken into cesspools,—a very doubtful scheme. A communication was received from Messrs. Grover & Wragge, of London, engineers, suggesting a plan of drainage, with two sets of pipes in the same excavation, one for rainfall and the other for sewage. Ultimately, a committee was appointed to consider the whole subject of drainage for the district.

Northwich.—The Rivers Pollution Commission have visited Northwich, and were about to proceed to Congleton, after making preliminary inquiries. In course of a conversation with the local authorities, Mr. Williams made a curious statement, that Northwich was fast going down; and if the streets sunk at their present rate by Mr. Harrison's old shop, in less than five years the town would be under the level of the Weaver.

Leamington.—The Local Board of Health have held a special meeting, with closed doors, to discuss a communication received from Mr. Thomas Heath, of Myton Grange, the plaintiff in the recent Chancery proceedings. It will be recollected that the sewage of Leamington is decolourised by the lime process, and the effluent water is discharged into the River Leam, a short distance above its confluence with the Avon. Mr. Heath resides on the banks of the Avon, and about four years ago instituted proceedings in Chancery against the Leamington Local Board for polluting that river and the Leam with the town sewage. A long and costly course of litigation ensued. The Board was to be restrained from discharging any water polluted with sewage into the River Leam, unless and until certain additional works had been executed, including the cleansing of the bed of the River Leam from the sewage outfall to its confluence with the Avon. There was delay in carrying out these works, and Vice-Chancellor Wood held that the Board had been guilty of contempt of Court. A sequestration of the town property was accordingly granted, and it was put in force in August last. Then an application was made to Vice-Chancellor Mallins, the vacation Vice-Chancellor, for an extension of the time for the execution of the works, which was granted. The local Board then completed the whole of the additional works directed by the Court, paid the plaintiff's costs, and hoped the difficulty had been surmounted. Complaints, however, have since been made from time to time of the failure of decolourising works, and even members of the Board have called attention to the amount of filth that was being discharged into the River Leam. Matters have again come to a crisis, and it will depend upon the action taken by the local Board whether the town will be again involved in litigation. The substance of Mr. Heath's letter is understood to be—that he affirms the pollution of the river still continues, and he repeats that nothing will ever be satisfactory to him but the entire removal of the sewage outfall from the river, and the adoption of irrigation. The Board were allowed fourteen days to decide what they would do; but in the event of their determining to adhere to the present unsatisfactory system of decolourisation, Mr. Heath intimates that he shall again institute proceedings in Chancery against them for polluting the Rivers Leam and Avon with the town sewage.

Whitehaven.—The sewerage works have been completed and opened. A sort of temporary dam had been erected near the mouth of the main sewer, thereby impounding the sewage. After the tunnel and pumping works had been inspected by Mr. Charles Hawkesley, C.E., accompanied by Mr. Thompson, Mr. Doover (the contractor), Mr. Anderson (the clerk of the works), Mr. Bowman, and others. Mr. Thompson, the only town trustee present, entered the sewer, and, removing some of the stones by which the sewage had been impounded, he declared the works opened. The sewerage tunnel is 554 yards in length, or, speaking roundly, about one-third of a mile. It is egg-shaped, and is about 6 ft. 6 in. in height. Flood-gates shut out the sea at high water. The tunnel is, for the most part, formed of a double row of bricks. A considerable portion towards the centre is through solid rock, and here the brickwork is only to the height of three or four feet. Connected with the sewerage are centrifugal pumps, capable of raising 1,000 cubic feet per minute, and worked by two engines of 25-horse power each. Under ordinary circumstances these pumps will not be required, except perhaps two or three days, or, at most, two or three weeks in

the year. A great portion of the town lies at so low a level that in the case of a very high tide or heavy rains there would be a danger of flooding the lower tenements of the houses. It is to prevent a casualty like this that it has been found necessary to incur the cost of constructing the pumps, which are so placed that, instead of passing into the tunnel, the sewage may be pumped into the harbor.

Sheffield.—Small-pox is very prevalent in Sheffield. A letter on the subject from Dr. Skinner, one of the medical officers of the union, was recently read at a meeting of the local guardians. The disease, he says, is fast spreading. He had himself alone nineteen cases in hand, in only two of which there had been previous vaccination. We may here incidentally mention that the writer of this notice happened lately to have a letter from Manchester, in which it was stated that the writer of the letter and his wife, while resident at a hotel in Sheffield for a few weeks, had both been seized with small-pox, of which, however, they had recovered, and they were glad to get out of the town.

WOBURN, DUNSTABLE, AND VICINITIES.

St.—Perhaps you will permit one who must at least have known an interesting district as well as most living, to offer some experience.

In my humble publication of 1831 (over 300 pages), which you kindly complimented, as reviewer at that time, was, as you have seen, considerably more than a mere "guide to the Abbey?"—some history and description of the "Monastery" town, and neighbourhood, and Russell family.

You have heard, Sir, something of the great misfortunes and low estate, for many a year, of the writer, but may not so well know that it has been mainly owing to unhappy failures of kind memorialising friends living and dead, including Mr. Britton, &c., to obtain a pension from the high local quarter. The writer's father (v. a monument from the destroyed church), having been parish priest for twenty-three years, and part of that time "domestic chaplain." And himself, besides the above and a 4to on Bedfordshire (very much borrowed from), having published a small work (140 pages) on Woburn, &c., kindly noticed by reviewers fifty years ago, at what may be well conceded as not a frequent age for this kind of effort—"eighteen."

Of the present attractions no doubt one of the principal will be the "Sculpture Gallery" (130 ft. long): altered from a "greenhouse" by a "good" duke (ob. 1839), still respected and regretted by the inhabitants. The first introductions were eight central marble shafts (with capitals added in London), from excavations in, or near, Rome; and bold *bassi-reliefs*, especially the "Hunt of the Caledonian Boar." There are now many classic, sepulchral, and votive inscriptions, torii, tazze, candelabra, &c. Of modern sculptures, are a very elegant "Cupid and Psyche," and "Hero and Leander" (rescued from the waves), both by Westmacott.

In the picture-gallery (111 ft. long, but narrow) is a small portrait of Surrey's "Fair Geraldine," pronounced by Pennant *not very fair*. There are many family and other portraits in other parts of the house. In the saloon,—a finely-proportioned room, 27 ft. high, with carved blue and gold ceiling,—is (or was) a beautiful "Christ appearing to Mary," by Annibale Carracci (though with scarcely as pretty a landscape as *Meng's*, at All Souls), and the celebrated "Baker's Dream." Hayter's "Trial of Lord William Russell," with careful portraits of the day (several times engraved), was a "commission" of 1,500*l.*—liberal, but certainly excellently earned. A feature just worth mentioning in this house is some bold sculptured statuary marble chimney-pieces.

Fliccroft (though "Holland" was employed otherwise) was the architect of the Quadrangle, which is spacious. He was complimented by Horace Walpole for his "St. Giles's" Church, in very similar, and "St. Olave's, Southwark," not dissimilar, style.

Lying in four or five parishes, the Park has the unusual extent of 3,500 acres, with usually about 1,000 head of deer, good hill and dale scenery, some fine trees, including isolated beech, and sufficient water. Some of the neighbouring villages are also picturesque, the principal object being Hanslope spire (on high ground), 15 miles distant.

Amphill, 6 miles distant, is an "historical"

and pleasing little town (population about 2,000), whilom celebrated for its "castle," above of two Catharines, at the time of the pronouncement of divorce,* its site still marked by an inscription of Horace Walpole's, an Earl of Upper Ossory; for its picturesque old oak-abounding park and extensive neighbouring ruins of Houghton House, built almost certainly by Inigo Jones for the celebrated Countess of Pembroke. There was a late rumour that the popular Prince of Teck, with his amiable consort, were likely to rent the domain of Amphill.

Dunstable Church is still the most "cathedral"-like, except St. Alban's Abbey, in this part of England, its remaining north-west tower indicating to less appreciative visitors a corresponding "twin" one. As the writer stated in the *Gentleman's Magazine* long ago, no efforts are known to have been made to trace the original "foundations" (here not disturbing churchyard). With the present 120 ft., it was perhaps not far from 300ft. long; but there are no certain signs of transepts. It is, of course, occasionally mentioned in the famous "Chronicle." Here are many fine modern monuments, similar to one of a great benefactor here in Bow Church, and a very lofty "Last Supper," gift of two sisters, and painted (500*l.*) by Sir James Thornhill.†

Houghton Regis, one mile north-east, derived its name from a palace. The neighbouring "Chilterns" are above 200 ft. high, and Bedford, 20 miles distant, can be seen. Dunstable is famous for educational and almshouse foundations, contrasting happily in the latter with the exceedingly poor ones—1*s.* a week each—at Woburn, which have been before mentioned in one or two quarters. If some generous and humane distant benefactor and visitor would augment these, he might, doubtless, leave a "fragrant" memory (though acting from higher motives) in that small town.

J. D. PARRY.

TRADES' UNION CONGRESS AT MANCHESTER.

A CONGRESS of trades' councils, federations of trades, and trade societies generally, assembled at the Mechanic's Institute, David street, Portland street, Manchester, on Tuesday in last week, to consider various subjects of interest to the working classes and trade societies at the present time. Mr. W. H. Wood, secretary of the Manchester and Salford Trades' Council, which called the congress, presided, and Mr. Shorrocks acted as secretary. It was announced that there were thirty-four delegates present, representing 118,367 trades' unionists of all the large interests of the country.

A paper by Mr. G. Potter, of London, on the necessity for Trades' Unions, was read. This paper had been read at Preston, and adopted by the Preston Trades' Council in preference to two other papers which had been drawn up. It was regarded by the conference as the best defence of Trades' Unions that had yet been given.

On Wednesday the conference reassembled. Mr. Wood, the Chairman, read a paper to show further the necessity for Trades' Unions. Mr. Dewhirst (Bradford Trades' Council) read one on "Regulation of the Hours of Labour." These and other papers were followed by discussions on the respective subjects of the papers. Mr. Booker (Amalgamated Carpenters) then read a paper on "Technical Education," which was partly discussed when the conference adjourned.

On Thursday the adjourned discussion on technical education was resumed. The meeting ultimately gave a vote, which was presumed to be in favour of the principle of technical education,

* Shakespeare, who probably never saw this spot, though he must have passed through Dunstable, makes a great mistake in speaking of—

"—Dunstable, six miles from Amphill."

By the nearest cross route it is about double. It seems to have been much overlooked that Henry VIII. certainly desired to make this church a Cathedral after the Reformation (some apparent confirmation of great size). On a change of purpose, however, the rest of the priory church was demolished, leaving the nave for the parishioners; "a clock above the pulpit" (probably here) had been mentioned in the "Chronicle" about 1400, or earlier. Mr. Steele (about 120 years ago) described "five large bells; and the same number occurs in Willis & Coles' (Little-known County and "Deacons' Lists. Four of these old, and the tenor a "noble" modern one, 38 cwt., recast near the end of the last century into eight, tenor 21 cwt. The former small organ was the second or third in date (i. e., of the eighteenth century) in the county.

but the sentiment of the meeting was not embodied in any definite form.

A paper was expected to be read on "The present Royal Commission on Trade Unions; how far worthy of the confidence of the trade union interest," but a debate on the subject took place without any paper having been read.

Mr. Potter read a resolution, which he wished to have an opinion on from the meeting:—

"That after a full and deliberate discussion on the Royal Commission's appointment to inquire into the operations of trades' unions, the delegates assembled in this Congress are of opinion that the Commission is looked upon up to the present time with suspicion and disfavour by a majority of the trades of England, both in regard to its unfair composition, and to its one-sided and to a great extent secret proceedings."

He could not consent, he said, to wholesale condemnation.

Ultimately this resolution was adopted, 25 voting for it, and 6 against it.

The Chairman, Mr. W. H. Wood, read a paper to prove that the limitation of apprentices was a necessity. Mr. Potter expressed himself opposed to the principle. Ultimately the resolution was unanimously passed:—"That we urgently recommend all trades to adopt the apprenticeship system, and in all cases to limit the number of apprentices if found desirable to protect the interest of any trade or trades."

On Friday Mr. Davies (masons) read a paper on the subject of legalisation of trade societies. The Chairman (Mr. W. H. Wood) then read another paper on the same subject, written by Mr. J. Keegan, cabinet makers' secretary, Dublin, and another by Mr. Hutchinson (United Boiler-makers).

The following resolution was then unanimously carried:—

"Resolved, that this Congress pledges itself in the name of the respective societies represented, to aid and assist the London Committee of Amalgamated Trades in their laudable efforts to secure the legalisation and protection of trade funds, and hereby declares its firm determination to continue the agitation, and to make the support of this measure a condition for candidates for Parliamentary honours before giving any pledge or vote at the ensuing election."

Mr. Kane (malleable ironworkers) opened a debate upon the effect of trades' unions on foreign competition. The meeting, after the debate, adopted the principles of Mr. Kane's opening address by special vote. Mr. Bronfield (Sheffield) read a paper on "Trades' Unions and Political Economy."

Mr. C. Barker (letter-press printers) then read a paper on "The Factory Acts Extension Bill, 1867; the necessity of compulsory inspection, and its application to all places where women and children are employed." After the reading of this paper the Congress adjourned.

ARTISTS AND ARABS.*

FROM Marseilles to Algiers is but a forty-eight-hour's journey by steamboat. You step on board in the late autumn, say, and every hour's run brings you nearer to a new summer. When the voyage is only half accomplished, the sea that has been wintry sparkles and flashes with a smooth hosom; the sun that has been veiled and distant peers into everything and plays upon everything with an intense radiance; and by the time the famed "City of Pirates" is in sight, the genial atmosphere is sending a thrill of satisfaction through every vein. No wonder, then, that Algiers is spoken of with ecstasy by most who know its charms. The sunrises are scented as with mingled odours from orange-trees and violets; the sunsets seem to fill the earth with adoration; and the Moorish noon is a long, silent, solemn rapture of sunshine, coffee, and tobacco. Next to seeing the fair city the French call "*la ville du corsair*" for ourselves, we must account it a pleasure to view it through a painter's eyes. The *Hispaneur* is likely to give us his personal impressions; but the painter describes with the same simple desire to depict that he feels when he takes pencil in hand, subject to no more idiosyncrasy than his style renders inevitable. What we lose in word-power we gain in bare pictorial facts when an artist takes the trouble to tell us what he has seen. Mr. Henry Blackburn has been at these parts, and has shown us Algiers in much the same picturesque manner as in former times he showed us artistic "bits" of Spain.

* Artists and Arabs; or, Sketching in Sunshine. By Henry Blackburn. With numerous illustrations. London: Sampson Low, Son, & Marston, 1868.

After a summer's sketching campaign in the beautiful chestnut-wooded Val d'Aosta and a supplementary loiter on the north shore of Lago Maggiore, Mr. Blackburn and his friends—two or three,—tossed up to settle where they would winter; whether it should be in Spain again, or a Rome, or in Trebizond, Cairo, Tunis, or Algiers. The lot fell upon Algiers, and the next morning the party set out on its route. His account of the sea-voyage between Marseilles and Algiers brings vividly before us the effects of the change of climate upon all on board as the vessel neared the African shore. Bundles of old clothing that had lain about the deck, scarcely noticed, unwound themselves, and basked in the generous sun, goodly specimens of Oriental humanity; dark visages crept out from under tarpaulins, from behind boxes, and from other out-of-the-way places; till at least double the number of passengers that were visible on starting could be counted on board. The first view of Algiers that greets the straining eyes of the voyagers, is a low, dark line of coast, with a background of mountains. This shady, wavy line gradually turns to a golden shore in the twilight, with a single bright sparkle upon it; upon to "a little white pyramid or triangle of chalk, on a green shore, shelving to the sea; next, into an irregular mass of houses, with flat roofs, and mosques with ornamented towers and minarets, surrounded and surmounted by grim fortifications, which are not Moorish;" and then the French aspect comes into view, with its harbour, lighthouse, hotels, and Place. But Mr. Blackburn's business is with the Moorish or picturesque aspect of the place. After one afternoon passed in the Place Royale listening, in company with groups of French officers and their wives, Arabs and Moors, to the band of the Chasseurs d'Afrique, noting the arcades and shops around in Parisian models,—Orientalized, however, here and there, with such names as Mustapha over the doors,—taking count of the intrusion of the "Hausmann" style of architecture, and French names of the streets departing east and west of the Place, the mingling of the fashions of *le Follet* with the costumes of Arab women and children, the Caliph-like dress of the Moors, the flowing robes of the Marabouts and further distinctions peculiar to the Jews, and others again to the Kabyles, we are shown little more of the French. He takes up his abode in Moorish quarters, and sees more of the mosques and their frequenters than he does of the congregations of the Roman Catholic churches. These Moorish quarters are in the upper part of the town approached by narrow, climbing, slippery, crooked streets, and here there are "mysterious-looking old houses that meet overhead and shut out the sky;" open shops, in front of which are seated embroiderers at work surrounded by heaps of rich stuffs, or old merchant traders, cross-legged, calmly smoking; others full of festoons of dried fruits, red morocco slippers, or earthenware vessels of quaint forms; Moorish *cafés* which you may enter without question; an old Moorish hat of curious design, innumerable carved lattices, low doorways studded with massive bosses or nails, narrow windows with grilles, steps in the steep pavements; and ever and anon you encounter large soft masses of white gauze in these narrow streets, which are no less than veiled Moorish ladies taking the air. Among the curious scents of this densely-packed quarter, Mr. Blackburn mentions one that he and his friends were unable to account for. It was that made by a Moor in branding his donkeys, hehdominally, with his monogram. We give a sample of the colours with which our author paints this part of Algiers. Everything we purchase is odd and quaint, irregular or ornious in some way. Every piece of embroidery, every remnant of old carpet, differs from another in pattern as the leaves on the trees. There is no repetition, and herein lies its charm and true value to us. Every fabric differs either in patterns or combination of colours. It is something, as we said, unique,—something to treasure, something that will not remind us of the mill." The Arab quarter has its distinct features, too, and is rich in wares for sale that are artistically valuable, such as weapons with ornamented hilts, horse-gear of rondrous workmanship, women's trinkets, and algeero anklets, beads, corals, and piles of similar characteristic objects.

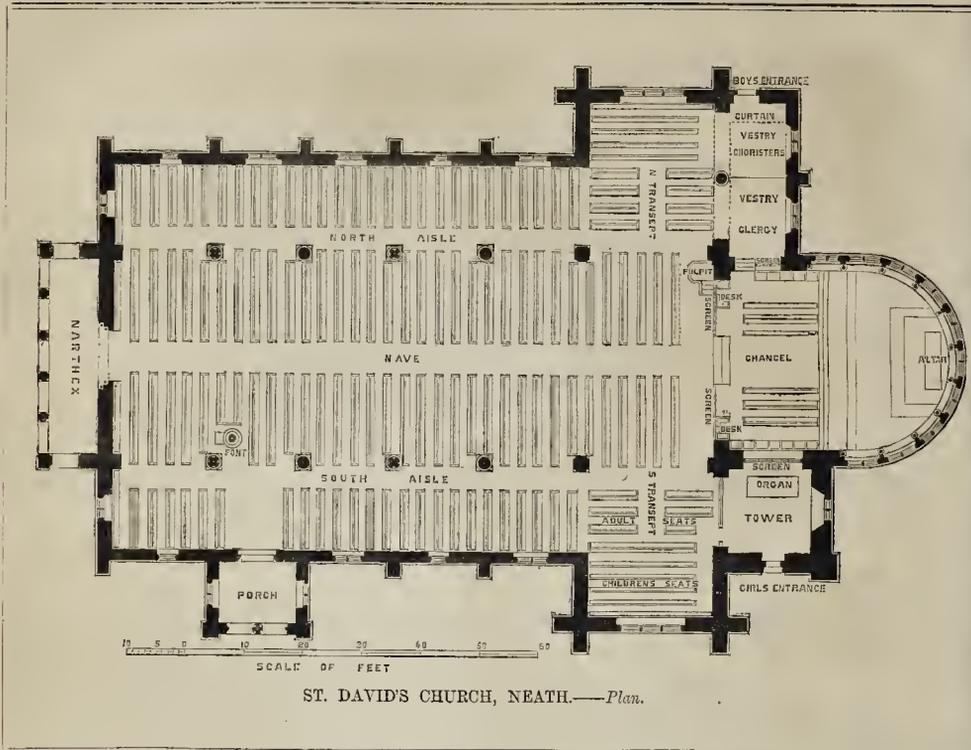

There is some little difficulty in getting models, especially females. Our author tells us that it was some days before he could hear of any one willing to sit for double the usual remuneration. At last he agrees with the father of a

Fatima for two francs an hour, which the hour considered poor pay. She is a little, fat, married woman, of thirteen years of age, with small hands and feet, and large rolling eyes, made to look larger still by the aid of henna, phlegmatic, yet restless, from an artist's point of view. Here is her portrait. "Her costume, when she throws off her baik (and with it a tradition of the Mahomedan faith, that forbids her to show her face to an unbeliever), is a rich loose crimson jacket, embroidered with gold, a thin white bodice, loose silk trowsers reaching to the knee and fastened round the waist by a magnificent sash of various colours, red morocco slippers, a profusion of rings on her little fingers, and bracelets and anklets of gold filagree work. Through her waving black hair are twined strings of coins and the folds of a silk handkerchief, the hair falling at the back in plaits below the waist." For all this splendour she is not beautiful, nor scarcely interesting; for an expression of "utter boredom" is the only one seen on her countenance. Our author apparently got on better with a Moorish Jewess, who presented herself one morning accompanied by her mother, whose disorderly appearance, dirty shawl, discoloured black hair, and bare feet, formed an extraordinary contrast to the queenly picture she presented when her toilet was completed. Her dress was more European in its shape than that of Fatima, having a flowing skirt and square-cut bodice without sleeves, but it resembled hers in the profusion of brocades, gold ornaments, armlets, necklaces, and rings. On her head was a tiara of gold and jewels, and on her feet tiny velvet embroidered slippers. She was more tractable than the other lady, but still unmanageable with regard to regular attendance. As sitters, our author speaks with more satisfaction of the camels than of either Jewesses or Moors. These creatures, if fed first, and the flies kept off them, will "sit" almost immovably through the live-long day, breaking its monotony only, occasionally, by a croak. "We should like to see," says Mr. Blackburn, "one or two of our popular artists, who persist in painting camels and desert scenes without ever having been to the East, just sit down here quietly for one day and paint a camel's head; not flinching from the work, but mastering the wonderful texture and alaginess of his thick coat or mane, its massive beauty, and its infinite gradations of colour. Such a sitter no portrait-painter ever had in England." Always on the look-out for pictorial effects, our author sees them where others would not. He says that colour and contrast seem to be felt everywhere to such an extent that no two Orientals will walk down a street side-by-side unless the colours of their costumes harmonize or blend together. This is, perhaps, saying too much. We can believe in rich colourings seen in the streets such as those afforded by a Negress selling oranges or citrons; an Arab boy with red fez or white turban carrying purple fruit in a basket of leaves, though we cannot follow our author so far as to allow that these occupations are chosen from a feeling for colour, as he would assert.

A blemish in the book is the fact that there is no date to it. We are quite in the dark as to how many years ago this winter was spent in Algiers. That it was not a very recent sojourn we find both in notes and in the text; but on this point there should have been more definite information. It detracts from the sense of freshness in the narrative to come upon passages such as "Years elapsed between our first and last visit to our favourite street, yet there they were (a row of eighteen Moorish gentlemen smoking before a *café*) when we came again still doing nothing in a row; and opposite to them the merchants who do no trade, also sitting in their accustomed places, surrounded by the same old wares." When the lapse of years is mentioned only a few pages from an allusion to a picture exhibited in the Royal Academy in 1867, which must have been seen to have furnished the illustration it afforded, some confusion is created, which is intensified when we come, further on, to a note bearing date 1857. Another blemish is the choice of subjects for the engravings. Of the models alluded to the author gives a camel's head and a negro, while the characters he describes more fully he omits. We must submit that a sketch of Fatima, for instance, would have been more interesting than that of a bride of whom we are told nothing, that is furnished by a French artist. There are groups of aloes and specimens of palms, besides a storm out among the tombs and palms and aloes; but not

many specimens of the workmanship of Moorish or Arab hands, save patterns of embroidery reproduced as vignettes. The great mosque rising almost out of the Mediterranean, and an interior view of the house occupied by the artists, are the best samples of Algerine architecture. This house is in a narrow street, the white walls of which nearly meet overhead. A low dark door, with a heavy handle and latch, gives admission to the open courtyard in the centre; and a narrow staircase in one corner of this furnishes access to the first or principal floor, which is furnished with an open gallery on its four sides, from which you can look down upon the courtyard below or up to the blue sky above. And there is an upper terrace or house-top from which the whole town is visible. This is what Mr. Blackburn says of the accommodation:—"The arrangement of the rooms round the courtyard, all opening inwards, is excellent. They are cool in summer, and warm even on the coldest nights; and, although we are in a noisy and thickly-populated part of the town, we are ignorant of what goes on outside, the massive walls keeping out nearly all sound. The floors and walls are tiled, so that they can be cleaned and cooled by water being thrown over them. The carpets and cushions spread about invite one to the most luxurious repose. Tables and chairs are unknown. There is nothing to offend the eye in shape or form; nothing to offend the ear, not even a door to slam. . . . Here we work with the greatest freedom and comfort, without interruption or any drawbacks that we can think of. The climate is so equal, warm, and pleasant, even in December and January, that by preference we generally sit on the upper terrace, where we have the perfection of light, and are at the same time sufficiently protected from sun and wind. At night we sleep almost in the open air, and need scarcely drop the curtains at the arched doorways of our rooms. There are no mosquitoes to trouble us, and there is certainly no fear of intrusion." By way of contrast to this sunny state of things the author glances to the condition of a friend in Gower-street at the same season of the year, with the depressing street, dreary with damp mud and dotted with gaunt lamp-posts, stretching to the right and left of him, and sums up with an invitation to all who would study comfortably to come to Algiers. A large number of French artists seem to have preceded Mr. Blackburn. We know, of course, that it was here Horace Vernet tarried; and learn that other artists of distinction annually study here. With but a few notable exceptions these French artists, however, remain closely closeted, "copying and re-copying fanciful desert scenes, such as camels dying on sandy plains, under a sky of the heaviest opaque blue, and with cold grey shadows upon the ground; drawing imaginary mausoleums on impossible house-tops; and, in short, working more from fancy than from facts;" doing, in fine, as flourishing an export trade as the photographers. Our author does not begrudge them their pecuniary success, and speaks very kindly of numberless civilities received from them; but, as his own sympathies are with open-air studies from the life, camping out on mountain tops for the sake of the knowledge of a mountain side, and spending days in half-deserted cemeteries for the sake of the aloes, palms, cacti, shrubs, flowers, and palm-trees, he looks with some slight upon their "hot-bolling" proceedings.

The book gives a clear notion of Algiers. Not because of any great literary skill, to which there is no pretence, but by virtue of the artist's knack of depicting things as he sees them, combined with the author's acceptance of the superiority of out-door sketching from life, carried out in his text. His prominent idea is that we may, if we like, realize much of our ideal of beauty and happiness in this world, and that the place to do it in is Algiers. The "City of Pirates," or as the French call it, the "Diamond set in Emeralds," he declares, is perfect as a residence for artists; cheap, without many taxes, cares, or "distractions;" and with splendid opportunities for study of nature, character, the civilization of the East, as well as of the West, varied costumes, and a grand architecture. But it is the solitary country in the neighbourhood of Algiers that he most strongly recommends. In one excursion he spent some time in a tent pitched nearly 3,000 ft. above the level of the sea, in the mountain scenery around Medeah. And he made another sketching excursion among the Djurura

ST. DAVID'S CHURCH, NEATH.—Plan.

mountains, where, about sixty miles from Algiers, at a similar altitude, the French were building a fortress to protect their colonists, and keep the Kabyles in check. Some of the Kabyle villages were still smouldering when his tent was pitched upon the heights of Beni-Raten. Here the Mediterranean was visible, apparently above the purple hills, and higher than all around, save a few snowy peaks, conveying a wonderful sense of height and distance. In Algiers, there is, perhaps, a temptation to too much luxury, to too much dreaming away of time on Turkey carpets, on terrasses: too much scent of henna, too, he speaks of, and of too strong a flavour of coffee and tobacco. But a few months spent among the mountains braco frame, eye, and mind alike. The longest journey that he would suggest to an artist to make in one winter, however, is to the cedar forests of Tomet-el-Hâd, because too much travelling is incompatible with work. These cedars, supposed to be "the wildest, and most wonderful to be met with in any part of the world," have hitherto only been sketched by our own countrymen and countrywomen, for French artists have not as yet tired of the luxuries of Algiers. We reiterate that those who cannot visit this famous city may make themselves familiar with its aspect by means of Mr. Blackburn's volume.

ST. DAVID'S CHURCH, NEATH, WALES.

THE town of Neath, containing a population exceeding 8,000, has been, till recently, sadly deficient in the matter of church accommodation. The old parish church, supposed to be the ancient garrison or castle chapel, was so small and inferior a structure, that but a small proportion of the mixed population could avail themselves of the privilege of church services, and this evil was still further increased by the existence of faculty pews.

During the years 1866-7, a noble effort was made by the inhabitants to meet the growing requirements of a rapidly increasing population. A central site was given by Mr. Howell Gwyn, M.P., of Dyffryn, a liberal contributor to the new church. The Rev. John Griffiths,

whose energy is known throughout the principality, supported by a committee of the principal inhabitants, has succeeded in completing the new church of St. David, with the sole exception of the upper portion of the tower and spire. A fund to complete this feature, has been raised, headed by a donation of 500*l.* from Mr. Nash Vaughan, a liberal churchman, who has largely contributed to this work, in addition to the erection of a church on his own estate.

The population of Neath being bi-lingual, the rector has determined to devote this as a free church, open alike to rich and poor, who prefer the English service, the old church being devoted to Welsh services.

The church has been recently consecrated, and comprises a nave with aisles, north and south transepts, the former with an eastern aisle; chancel with circular apse, and a tower on the south side of chancel. A narthex at the west end extends the entire width of nave, and there is a porch to the south. The nave is 100 ft. long by 32 ft. wide, and 39 ft. high to the plate, and 62 ft. to ridge, and consists of six bays in length: the easternmost arches, being wider and higher than the rest, form the crossing of the transepts.

The arches are formed of concentric rims of stone and brick, supported alternately by circular and clustered columns, with moulded bases and foliated capitals, of an early French type, under square abaci. The nave is lighted by lofty clearstory comlet windows. The west window is formed of four lights, with geometrical circles in the head, and is moulded internally and externally.

The aisles have lean-to roofs, and are supported by stone and brick arches, forming flying buttresses to the external walls. Each aisle is 13 ft. wide, and 13 ft. high at plate. The bays are marked by projecting buttresses, carried up through panelled parapet, and are surmounted by octagonal pinnacles.

The transepts are 21 ft. wide, and project 10 ft. from the nave, and are 47 ft. high to the ridge. In the gables are lofty three-light geometrical windows. An arcade filled in with screenwork, separates the north transept from its aisle, forming vestries for the clergy and choris-

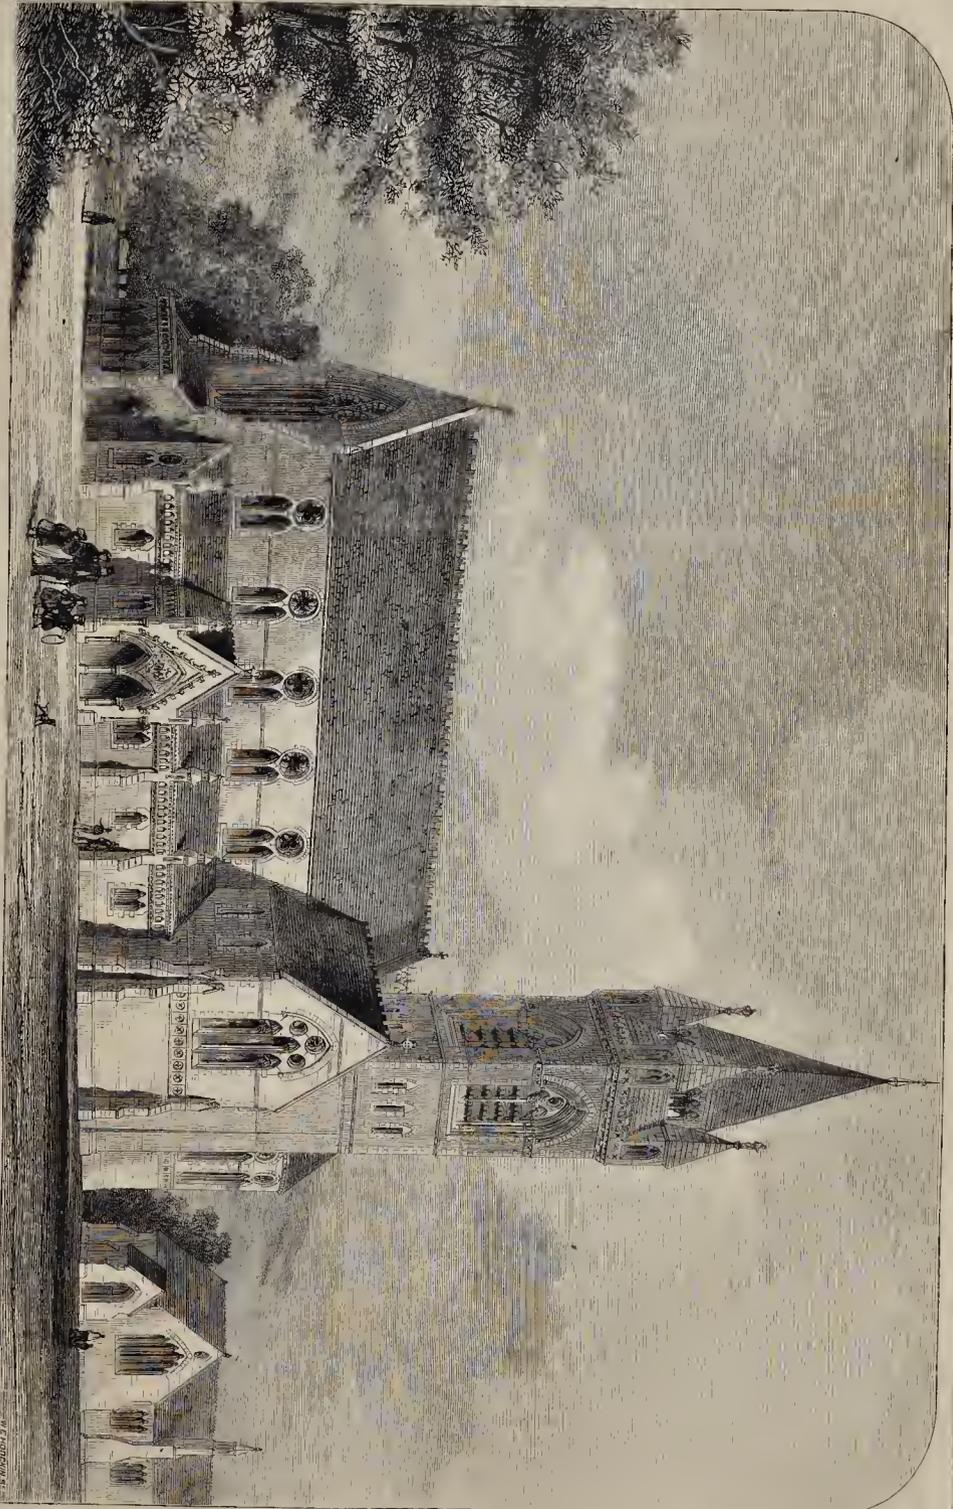

ters. The tower, which opens into the chancel and south transept, forms the organ chamber. The chancel is 40 ft. long, 29 ft. wide, and 48 ft. to panelled roof. It is raised three steps above the nave, and separated therefrom by a low stone screen, under a chancel arch, 41 ft. high, formed of rims of richly moulded stone and brickwork. The apse is further raised by seven steps, and is lighted by ten comlet windows, with traceried heads, which form a continuous arcade round the apse. A carved stone reredos fills the space between the altar and the apse windows.

The two chief entrances are at the west, by means of an open arcaded narthex, 9 ft. wide, and the south porch fills the second bay from the west, and is entered through a lofty arch, subdivided into two openings. The spanrel contains a large vesica, in which is carved a representation of the preaching of St. David. The tower forms a handsome feature, connecting the apse with the south transept, and is 20 ft. square, and is carried up without buttresses to a height of 95 ft., where it terminates in a bartlemated parapet, with angle tourelles, the spires of which terminate with statues of the Evangelists. The lower part of the spire forms an irregular octagon, supporting a stone arcade, which carries the spire, formed of timber, and covered with Staffordshire tiles.

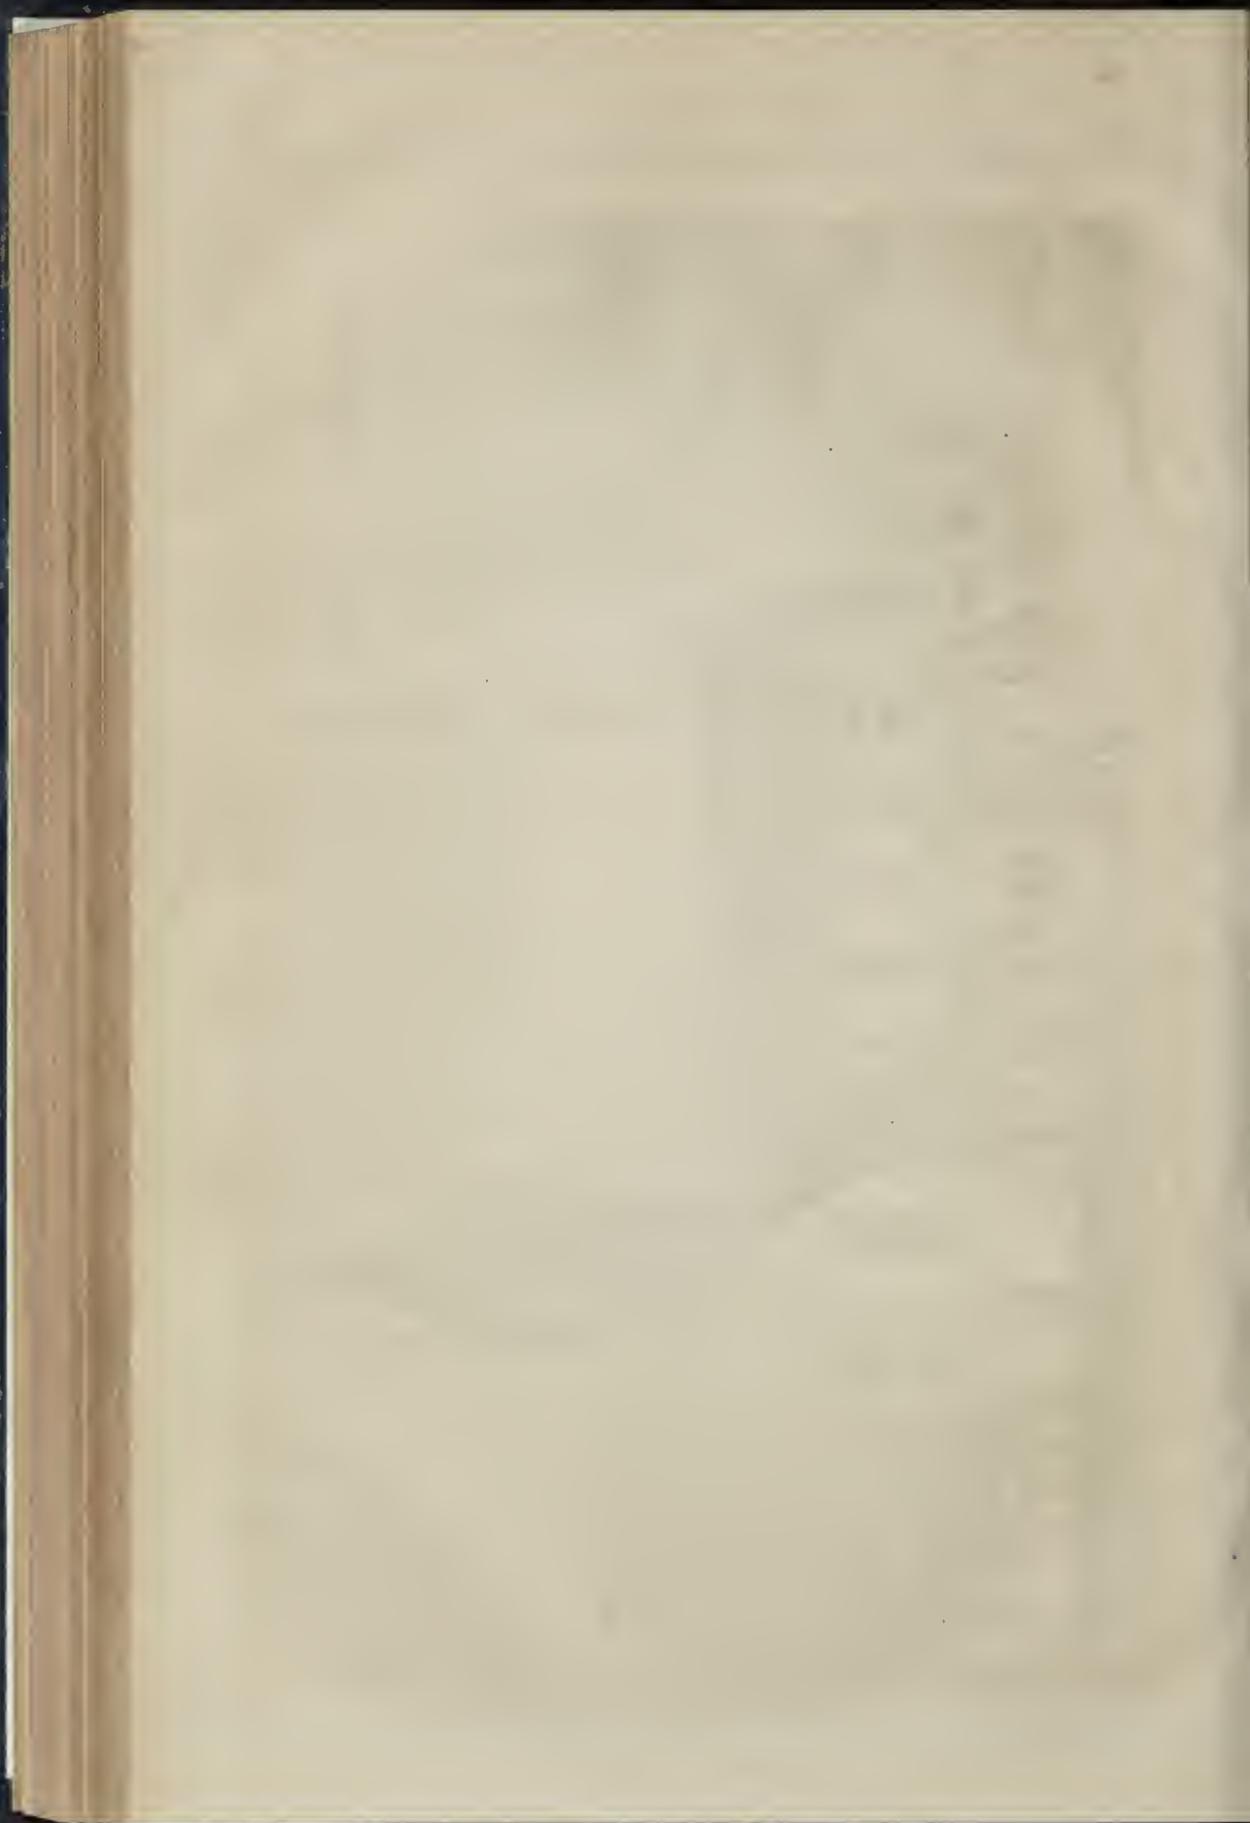

The stone employed in the erection of the church is from the Kidcoed quarry, with bands of red sandstone, and the dressings throughout are of Bath stone. The roofs are of fir, covered with Broseley tiles. Internally the church is lined with local red bricks, varied with Staffordshire blue bricks. The whole area, internally, is floored with tiles. Open benches provide accommodation for 1,200 worshippers. Messrs. Hall, of Bristol, furnished the gasfittings, the nave being lighted by wrought-iron corona, suspended from the arched principals of the roof, the chancel, by a large corona and standards rising from the stone screen.

Haden's system has been adopted for warming. Messrs. Gray & Davison have supplied a powerful organ, at a cost of 400*l.*

The general contractors were Messrs. Jones & Sons, of Gloucester. The architect was Mr. John Norton. The cost was 7,000*l.*

ST. DAVIDS CHURCH, NEATH, WALES.—MR. JOHN NORTON, ARCHITECT

COMPETITIONS.

Slough Church.—The competitive designs for the new parish church of St. Lawrence, to be erected at Slough, have for some days been on view in the High-street. There are eleven sets of plans, some of which possess considerable merit. A design which has for a motto an open book with compass and square has been well spoken of. So has one marked "In Cruce spes." The third favourite is marked with a double triangle in a circle. The sum to be expended is 10,000*l.* The committee have called in Mr. Christian to aid them in the decision.

Alston Parish Church.—The first premium for improving the parish church of Alston, Cumberland, has been awarded to design by Mr. T. Oliver, architect, Newcastle; the second to Mr. T. C. Ebdy, architect, Durham. The drawings are to be submitted to the "Incorporated Church Building Society" for final decision.

ROMFORD DRAINAGE COMPETITION.

The award on the competitive plans for these works has been given in favour of Messrs. Russ & Minns, Parliament-street, Westminster, and their plans are about to be carried out under their directions.

The sewage is to be carried by gravitation on to land, nearly three miles from the town, and employed in irrigation. Mr. Beardmore was employed by the Board as consulting engineer, and the decision arrived at is in accordance with his report and recommendation.

SCHOOLS OF ART.

The Nottingham School.—A public meeting for the distribution of prizes has been held in the hall of this school. The chairman read the following—

Comparative Statement of the Result of the Government Examinations of 1867 and 1868.

Subject.	1867	1868	Increase for 1868
Freehand drawing—			
Number passed.....	18	14	36
Number of prizes for excel- lence.....	11	24	13
Practical Geometry—			
Number passed.....	30	43	13
Number of prizes for excel- lence.....	14	18	4
Perspective—			
Number passed.....	18	21	3
Number of prizes for excel- lence.....	7	13	6
Model drawing—			
Number passed.....	34	44	10
Number of prizes for excel- lence.....	6	14	8
Mechanical drawing—			
Number passed.....	4	5	1
Number of prizes for excel- lence.....	nil	2	2
Full certificates for having passed in the first four sub- jects.....	9	19	10
Total number of papers passed..	144	207	63
Total number of prizes for excel- lence.....	38	71	33
Total number of students examined.....	300	366	66
Total number of successful artisan students.....	132	178	46
Amount of Government Grant on artisans for examinations only	206	289	223

Mr. Rawle, the head-master, addressed the meeting, or rather the students, encouraging those who had not won prizes and congratulating those who had. He called attention to the vacation prizes offered for competition, the number of which was greater than last year's and of more value. In all there were twenty-nine prizes, some of 5*l.* 5*s.* There was also a special list of prizes for ladies, who last year, he said, had worked very pluckily. The subject of technical instruction concluded the address.

The Birkenhead School.—The annual meeting of the subscribers and friends of this school has been held at the Institution, Hamilton-street. Mr. James Taylor presided, and there was only a very small attendance. Mr. Hinde, the secretary, read the annual report, which stated that, in 1865, the Birkenhead School of Art was established, and, although worked under many disadvantages, it had been eminently successful, and had fully contributed its quota to art-education. The best answer to a statement publicly made that the school was used by a

class for whom it never was intended, was the fact that, of the students attending evening classes of the school since its establishment in 1862, 259 were workers in iron, 109 workers in wood, 77 bricklayers, plasterers, and masons; 44 house painters and plumbers; 52 architects' apprentices, school-masters, and governesses; 41 sundry trades; and 53 school boys and girls; making a total of 659. There had thus been benefited thirty different branches of trade, and no fewer than 415 prizes of different grades, including five Queen's prizes and 105 medals from the Science and Art Department, had been received by the pupils. The committee were desirous of erecting a better and more suitable building for the purposes of the school, and hoped that in time this might be accomplished. The report concluded by tendering the thanks of the committee to Mr. Bentley, the master of the school, for the attention he had manifested. Since 1861 the number of students was 6,034, of whom 223 (attending the morning classes) had paid 701*l.* for instruction, or about 3*l.* 8*s.* each; and 832 attending the evening classes had paid 449*l.*, or 13*s.* 2*d.* each. The chairman remarked that he had been informed by Mr. Bentley that upwards of 400 drawings, the works of the students, had been sent up to London; and he hoped that many prizes would be awarded to the Birkenhead competitors.

PROPOSED PORTRAIT OF MR. TITE, M.P.

At the meeting of the Institute on Monday evening last, a letter was read from Mr. Tite, the President, discouraging (in very handsome terms) a proposal which had been made for the presentation to him of a testimonial volume, in acknowledgment of his recent donation of 500*l.* to the library. Mr. Kerr remarked that, to put the matter plainly, it was the feeling of members that Mr. Tite's portrait, like the late Mr. Cockerell's, ought to be placed in the rooms. Mr. Marrable supported the proposal, and it was received with universal approbation as a recommendation to the Council. Not only the liberality of the honorable gentleman to the library, but his readiness to aid the Institute and the profession in every way, as well as the high public position which he so worthily occupies, as the reward, we may say, of professional eminence, will, we doubt not, make this a very popular proposal, and we hope it will be well carried out.

PRIZES TO ART-MASTERS.

We are informed that the Lords of the Committee of Council on Education have awarded to Mr. W. G. Muckley, head master of the Manchester School of Art, the first prize for the best report referring to instruction in art, as suggested by the industrial arts of the Paris Exhibition last year.

FURTHER ACCOUNTS OF DAMAGE BY THE LATE THUNDER-STORM.

The steeple of St. Stephen's Church, South-wark, was struck by lightning. The top of the steeple is covered with tiles, which were stripped off, but no further damage was done.

The lightning struck the premises of a linen-draper, in Church-street, Dalston-lane. The electric current first caught the chimney-stack, and running down the wall passed through the conservatory, completely shattering the roof.

During the storm a wooden house in East-street, Bromley, was struck. In the upper part of the house one of the weather-boards was thrown to a considerable distance; the lightning then entered the upper room, where it did some damage to the fireplace. It then passed to a lower apartment and through the wall, tearing off another of the weather-boards. About the same time the house of a brazier was struck; part of the wooden framework over the window was destroyed, and many panes of glass broken.

The temporary Congregational Church at Buckhurst-hill, near Woodford, was struck. It was instantly in a blaze at the apex of the roof. Some workmen brought ladders at once and extinguished it with water. Three or four houses on the hill were also struck.

The lightning struck the gable end of a new house in Gladstone-street, Chesterfield. The bricks were hurled from their places, and the roof was

completely lifted up. It passed through the ceilings of both back and front bed-rooms, stripping the plaster off the walls on the staircase, and afterwards went through the huck window. There were nine persons in the house at the time, but fortunately they were down-stairs and received no injury. At about the same time a large oak tree, a short distance off, was split.

Two seamen belonging to a hulk lying off Rotherhithe were struck by the lightning. One of the men, who was clasping an iron bar, is dreadfully injured, having nearly the whole of one side scorched from head to foot. The other man remained totally blind for several hours. A man was killed in the east of London while combing his hair before a looking-glass.

At Doncaster, a gardener, who was in the open air, was struck by the lightning, and only slightly hurt, but the windows of a cottage near him were broken.

As to the fall of supposed meteoric stones in Birmingham before alluded to, it appears that there was an immense number of these stones, all of very small dimensions, the largest being 3/4 in. in length. They are said to resemble fragments of Rowley ragstone. The most singular thing connected with them, were they really meteoric, is the fact that in June, 1858, the very same thing happened in the same town, also during a thunderstorm. May they not have been carried up by an electric whirlwind from some local ragstone quarry, and showered into the town on both occasions? It is scarcely credible that such an occurrence could in both cases have taken place in one and the same town had the fragments been meteoric.

That electric disturbances are more active and powerful than usual, not only in England but in various parts of the world, seems evident from the events both of last year and this year.

VENTILATION.

The ventilation of the Old Men's Dormitory in the Truro Union workhouse, Cornwall, is described to us as being very satisfactory. It is at any rate very simple. The dormitory, containing forty beds, is one wing of the house, and has two external walls. Three perforated zinc tubes, about 3 in. in diameter, open at each end to the atmosphere, placed at equal distances, pass across from side to side nearly close up to the ceiling, and thus constant circulation is kept up, without, as we are told, any perceptible draught in any part of the room. The master of the workhouse says the result is excellent:—"No foul air is to be found in the dormitory at any time."

PROPOSED NEW CHURCH IN PARISH OF ST. PANCRAS, LONDON.

A NEW church of a large size is about to be commenced forthwith in Kentish Town, on an elevated and excellent site presented by Christ Church College, Oxford. Independently of the site being gratuitous, funds are already provided,—it is said, about 15,000*l.*—for the erection of an edifice which would do honour to the parish. The money has been obtained from the Midland Railway Company in compensation for the church in the Euston-road, of which the Rev. Mr. Andrews was incumbent. This church was pulled down in order to form part of the new station now in progress, and Mr. Andrews will be the incumbent of the new district in Kentish Town.

It is essential, however, that more light be thrown upon a part of the subject which interests both architects, builders, and parishioners; for it is stated that the vicar has appointed his own son to be the architect, who is about to undertake this work as his "first job," and intends to provide a builder from Cardiff to execute it without competition.

Nothing is implied against the young architect, simply because nothing is known about him, except that he is wholly inexperienced; and in such an important matter the vicar should surely even now put him into double harness, to prevent the possibility of a mess. The late vicar, Canon Dale, would have appointed Mr. Johnson, who was the architect of the church pulled down, and also of the churches in Oakley-square and Camden-square; but some say it would have been but an appropriate return for the gift of the site if the vicar had appointed the surveyors of the College Estate, who by education and

experience are well qualified to carry out the work with credit. They say "a man never sees clearly when he has got the sun in his eyes," and it is feared that the worthy vicar's vision has been somewhat dazed in this way.

Then, again, are there no builders worthy of this work in great St. Pancras? Have the Cnabits, the Mansfields, and many others, shunt up their shops? The appointment of a Welsh builder seems a questionable act. Tenders should be invited in the usual method. The parishioners have clearly a right to a voice in this matter, for it was by their subscriptions that Mr. Andrews's church was built, and this one is to be erected identically with the same funds, returned and increased by the railway company.

THE PURIFICATION OF RIVERS.

Huddersfield.

The Borough Engineer to the Improvement Commissioners of Huddersfield, writing to Mr. Rawlinson, says,—

"I thought it might be interesting to you to know that this river, which, up to the time of the inquiry held by your commission in Huddersfield, was in so dreadfully polluted a state that nothing could live in it, is now so much improved that large quantities of young fish have been seen in it within the last few days, and I have myself seen scores of boys fishing at the weir near to the brewery in Lockwood no later than Saturday last. From inquiries I have made I understand that large quantities of young trout have been seen, as well as numbers of eels. This, I think, proves that the inquiry has done some good in inducing, without compulsion, parties to keep their refuse out of the streams."

A useful lesson may be learned from this example, namely, that to keep solid refuse out of rivers, will immediately improve the condition of the river's bed, and also of the water. The solids of sewage,—or rather solids washed from sewers, it is evident, produce a large proportion of the mischief. At Birmingham the depositing tanks intercept some 30,000 tons of refuse annually. The Metropolitan Board of Works pass into the river Thames from their new intercepting sewers (if at a similar rate to Birmingham in proportion to area and population) not less than 300,000 tons of solid matter per annum. No wonder that the river is shoaling at, below, and above Barking Creek, and also fouling under the effects of such masses of refuse washed from the metropolitan streets and roads. It will be better and cheaper to prevent this vast mass of refuse entering the river, than to suffer from the effects of pollution and pay for dredging.

THE BELLS OF THE CHURCH OF ST. SAVIOUR, SOUTHWARK.

NEAR the south foot of London Bridge stands the noble and very interesting Church of St. Saviour—formerly the priory of St. Mary Overy—which ranks first in magnitude among the parish churches of the metropolis. Its massive tower contains a grand peal of twelve bells, the weight of the tenor being 5½ cwt., and its note B.

The following are the respective notes and weights of the bells:—

No.	Note.	Weight, cwt. qr. lb.	No.	Note.	Weight, cwt. qr. lb.
1	F sharp	7 1 20	7	G sharp	13 2 4
2	B	7 3 20	8	F sharp	17 1 21
3	D sharp	7 3 0	9	E	19 0 21
4	C sharp	9 0 10	10	D sharp	25 3 21
5	B	10 0 14	11	C sharp	34 1 2
6	A sharp	11 0 16	12	B	51 2 0

This church formerly possessed a peal of eight bells; weight of tenor, 46 cwt. 3 qr. 21 lb.; but in 1735 these were re-cast, with additional metal, by — Knight, of Winchester-yard, near the edifice, and made a peal of twelve, which was first rung by the College Youths, on Saturday evening, the 2nd of August, in the same year.

The tenth and eleventh of this peal were re-cast by Messrs. Mears—the former in 1844, weight 24 cwt. 3 qr. 7 lb.; the latter in 1820, weight 32 cwt. 0 qr. 24 lb.; and Messrs. Warner have lately repaired the gear of some of the bells.

It should be mentioned that the College Youths have rung many remarkable peals on these bells, some of which are recorded on the tablets placed in the hofry; and that certain members of that respectable society still ring here on special and joyous occasions.

A band of ringers also meet in the belfry for practice on alternate Tuesday evenings.

THOMAS WALESBY.

PANIC IN BUILDINGS.

I SAW a notice in the *Builder* of what threatened to be a serious disaster at Brighton, from a panic-struck congregation rushing to the only door left unlocked, to escape from what they supposed to be a falling building. Though fatal accidents from falling buildings are rare, panics from those supposed to be falling are not, and the danger from them is greatly increased by the obstinate stupidity so often shown of providing insufficient channels of egress, or, as in this case, locking all the doors but one. A very common fault is having the doors made to open inwards only; so if there be a rush to escape, the door may easily be held fast by those striving to get out. Nothing can well be easier for architects with brains than to have doors free from this most dangerous defect at all places liable to be crowded, such as churches, theatres, and meeting-halls; and it would not be very difficult, and would be convenient always and of vital importance in emergencies, if as many doors opening outwards were provided as there is room for through the outer walls, by which the crowds could always quickly depart, while the risk of a dangerous rush would be almost entirely prevented. It would be easy to fasten such doors so as to prevent their being opened from without, but very easily opened from within, so that a crowd frantic from fright could always escape.

P. H. HOLLAND.

SPREAD OF FIRE.

WILL you allow me space in your columns to invoke, if I may have that good fortune, the more earnest attention of your many professional readers to the losses which take place in this country by fires of valuable and interesting property (relics of the past) owing in great measure to the nature of our buildings. It seems strange that whilst men's minds are so largely devoted to improvements and inventions, very little—if any—attempts has been made to improve on the principle on which houses are built as to confine fire to the particular region in which it originates, or even to arrest fire and bring it under better control. It occurs to me that the present mode of battening is the most destructive that could be adopted, the spaces between the battens constituting a series of flues as well as conductors around each room, carrying fire with fearful rapidity to the room above, and thence to the roof. Could not walls be equally well battened by placing the battens horizontally instead of perpendicularly and thus checking, if not absolutely stopping the progress of fire? Sufficient open spaces might be left for ventilation; improvements might also, I should think, be made in the framework of partitions.

The burning of large mansions with their valuable collections was occupying my mind, but street architecture is also of the greatest importance, and for the latter no such opportunity ever existed in this country (notwithstanding the early visit paid us by the Romans) as the present, when any inexpensive modes of preventing or checking fire which can be suggested might be incorporated in the code of rules established by Local Boards and made compulsory.

EDILIS BRITANNICUS.

POSTAL DESPATCH.

THE conveniences and comforts of life are made up in a great degree of trifles; so, also, it is by the careful attention that is now-a-days given to matters of minute detail that the immense and increasing business of this great country is kept in motion with such surprising regularity. No department of the public service is perhaps more important, relatively, than the postal; and it is here that I would suggest an improvement.

Observe the thousands of letters delivered daily in every large city and town. Notice in all weathers,—in blinding snow or driving sleet, in wind and rain, by night and day,—the patient and ever-civil and cheerful postman (our modern Mercury) standing at the doors of dwellings with no response to his knock or ring. The servant is up-stairs or in the cellar, or the inmates are from home, and the postman waits. Legislation has touched the naming of streets and the numbering of our doors. Why should not touch the postal system, and, by securing

more despatch in the delivery of letters, save many an anxious waiting, many an unfulfilled engagement or missed train, because our Mercury has been "kept out in the cold" by our thoughtless neighbours? To save trouble in head-quarters, I beg to present a draft of my little bill; and, if the Postmaster-General will get it put into due form, and also into practice, he will deserve still further our thanks:—

"Whereas much unnecessary delay occurs in the delivery of letters, and thereby is incurred by her Majesty's subjects much inconvenience, annoyance, and loss; now therefore be enacted that on or before the first day of November next, every inhabitant householder occupying any dwelling or other premises of the annual rateable value of 10l. and upwards, shall, in the door of such dwelling or premises, or near thereto, or in some equally convenient place, provide, fix, and maintain a suitable receptacle for letters; and every person making default herein shall, upon information of any postmaster, and proof and conviction before any magistrate, be liable to a penalty of five shillings per day for every day during which such default shall continue. *Vivat Regina*, also the Postmaster-General."

JOSEPH BRIERLEY.

MÜNSTER, WESTPHALIA.

As your valuable paper has often been the means of preventing the destruction of works of art, I write to inform you of an act of barbarity about to be perpetrated in this ancient and interesting city. The magnificent rood-screen which adorns the cathedral here is, I regret to state, about to be demolished,—in fact, a portion of it has already been removed. This is more surprising, as the people of Münster have shown a laudable zeal and great taste in the restoration of many of their churches, and I cannot but fear that this contemplated destruction is the result of a false idea that a late Gothic screen is out of place in a Romanesque church. I will make further inquiries, and let you know the whole history of the matter, should you consider it of sufficient importance for publication.

H. W. BREWER.

P.S.—I have made a careful drawing of the screen in its present condition.

A QUESTION OF MEASUREMENT.

SIR,—Will one of your correspondents point out a good method of finding the content of a conical heap of ballast. I have already tried Peddie's and Nashitt's systems, finding some difference in the results?

	Dimensions of Ballast Heap.	f. in.
Girt at base	133 0
Girt at top	88 0
Height	9 6
A WORKING MAT.		

A QUESTION CONCERNING SINK TRAPS.

SIR,—I believe that my difficulty, which I request you to solve, is shared by most householders, and that the information which I ask through your columns may be useful to many persons who, knowingly or not, are subjected to great inconvenience and risk through the neglect or obtuseness of servants with regard to the management of the scullery sink-drain.

This "bell-trap" was invented for the purpose of preventing the effluvia escaping from the drain into the house, but in consequence of the stupidity or stupidity of servants the grating in the sink is removed, and the "bell-trap" gets clogged up; that necessitates its removal, and the escape of noxious gases takes place. This doubtless is the cause of the unpleasant smells which are often noticed coming from the basement, but for which annoyance the servants always have a ready excuse in order to hide the true cause.

Now some bell-traps are fixed immediately under the grating in the sink, and that is the reason given for not having the grating fastened down, as the trap gets quickly filled with sand, &c., and requires constantly clearing. Would not that difficulty be obviated if the bell-trap were to be fixed under the bricks or stones just level with the flooring? It may be useful to call attention to the defect at this season, as many householders exercise no control or supervision over their servants in these matters; and the health and even the life of many individuals may be jeopardized through their neglect in such simple, salutary matters as their upon which I now ask an opinion.

M. A. B.

WASTE LAND.

SIR,—I wish to be informed whether a local Board has power to take all waste land in front of property. A member of our board says that all waste land in front of property once dedicated to the public becomes public property for ever. As this is causing a deal of trouble here, I wish you to explain the matter.

A BUILDER.

High Crompton, near Oldham.
* * * Look to the Act of Parliament.

THE BUILDERS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the friends and subscribers to this charitable institution was held at Willis's Rooms, King-street, St. James's, on Thursday, the 28th ult., for the purpose of electing two pensioners on the fund, — one male and one female, — from a list of nine candidates. Mr. W. R. Rogers (president) occupied the chair, and expressed his regret that they were not then able to elect a greater number, but hoped that the funds would allow another election in the present year. The amount of stock is 11,200*l.* 15*s.* 3*d.* for the Relief Fund, and 2,920*l.* 4*s.* 6*d.* for the Building Fund, making a total of 14,120*l.* 19*s.* 9*d.*

At the close of the poll the following were declared to be the successful candidates: —
G. H. Michelmore, 74, St. Peter's-street, Islington, aged 75; and Maria Curwin, 4, Eden-terrace, Bridge-road, Battersea, aged 67, widow of a builder.

NATIONAL COTTAGE HOSPITAL FOR CONSUMPTIVE PATIENTS.

THE inaugural dinner of a benevolent society, founded for the reception of consumptive patients from all parts of the kingdom, on the separate or cottage principle, has been held at the City Terminus Hotel, Cannon-street. The chair was occupied by Sir Lawrence Peel. The company present numbered about 100. The patients will be scattered through a series of cottages, or villas, situated near Ventnor, in the Isle of Wight, in a locality well sheltered from the prevailing winds. They will be of an ornamental character, designed in harmony with the surrounding scenery, constructed upon the most approved sanitary principles, and surrounded by gardens. The erection of sixteen cottages is contemplated; each cottage to furnish hospital accommodation for six persons; and the cost of building will be about 600*l.* A piece of land, of over six acres in extent, has been secured, commanding a fine view of both land and sea. It is intended, after the pattern of the Bournemouth Sanatorium, that this National Cottage Hospital for Consumption and Diseases of the Chest shall be in part self-supporting. The Ventnor Hospital, as it will be called, though situated in the Isle of Wight, will be by no means a local institution, it being designed for the admission and relief of patients from all parts, and of all denominations; and the pecuniary support obtained being derived from the whole kingdom, the hospital will be entitled to be regarded as a national institution. The plans for four "cottage hospitals" have been accepted, and their construction is to be immediately commenced. At the meeting the subscription list was read: the amount subscribed amounted to over 2,500*l.*

NOTES IN THE HOUSE OF COMMONS.

MR. B. HOPE called attention to an advertisement of the sale by auction of the colonnade, frieze, &c., of Burlington House. He contended that the Government ought to re-erect the colonnade and the archway in some of the public parks. Lord J. Manners said if the hon. gentleman would communicate with him privately he would attend to his views. Mr. D. Griffith thought a more serious answer should have been given. Since then the colonnade has been withdrawn from the sale.

The Thames Embankment (Chelsea) Bill has been read a third time. Mr. Tite stated that the Metropolitan Board of Works expected to raise 260,000*l.* on the further continuance of the coal and fire duties for six or seven years; and if the Government would consent to a small enlargement of the guarantee it had already given, there would be no difficulty about the finance of the work.

A desultory and grumbling discussion took place in committee of supply, on the vote of 141,690*l.*, to complete the sum necessary for salaries and expenses of the Department of Science and Art, and the establishments connected therewith. Lord R. Montagu explained that there was a total reduction in the vote for the present year of 20,000*l.* Mr. B. Hope said that doubtless the expenditure of this money was necessary for the existence of the provincial schools of art as well as the department at South Kensington, and whatever might be its faults, he could not help bearing testimony to the great energy and zeal displayed by all connected with the department. What he should like to see was one central administration, embracing the British Museum, the Science and Art Department, and

the Board of Works. Colonel Sykes said that 7,132,000 persons had visited the Museum since it was opened, and he believed that by supporting an institution of that character they were doing more for the instruction of the people than all the elementary schools in the country. Lord R. Montagu, in reference to objections made as to the publication of the art catalogue, said that the total cost of it would be 8,000*l.*, and the House had not objected to its publication in connexion with *Notes and Queries*. As to the South Kensington Museum, it must not be regarded as a local but a national institution. The plans of the Museum had been laid on the table. The buildings had cost 195,000*l.*, and he knew of no other building being in contemplation. He did not believe any one would begrudge Mr. Cole an addition of 300*l.* a year, which was proposed. The vote was agreed to, as were also 6,063*l.* (to complete 9,063*l.*) for the University of London, and 10,992*l.* (to complete 15,992*l.*) for the National Gallery.

FATAL FALL OF A CORNICE IN SHEFFIELD.

A HEAVY cornice in High-street, Sheffield, nearly opposite the Post-office, has suddenly fallen, without any previous appearance of instability, killing one person, and severely, if not fatally, injuring others. The cornice belonged to a block of three houses, erected twenty-seven years ago, and which had not shown any signs of insecurity or weakness, although a plate-glass shop-window had been unaccountably broken, so as to lead to fear of a settlement of the front wall, but an architect could discover no signs of anything wrong. On examination, it is said, of the cornice, it was found that the masonry had had but a narrow resting-place. There are two accounts given of the stonework of the coping, one of which is, that it was 24 in. wide, the wall itself being only 9 in., the difference—15 in.—overhanging the street; and the other representing the wall to be 8 in. thick, and the stonework 16 in., 8 in. of which overhung the street.

SEWERAGE AND IRRIGATION AT HARROGATE.

At a recent meeting of the Harrogate Improvement Commission the surveyor's plans and sections of the new sewerage of the town were considered. The report of the surveyor, Mr. J. Richardson, embraced a system of sewerage for the town, together with a scheme for disposing of the sewage by irrigation. The improvement district contains 790 acres, of which 264 acres are already built upon, or likely to be built upon, and the whole district is well situated for obtaining an efficient system of drainage. The report recommends that four of the five outfalls should be abandoned, and the whole of the sewage collected to one outfall, that of the Coppice, north of the Cheltenham grounds, and be conveyed thence by a sewer through private land, across Ripon Road, into land belonging to the Duchy of Lancaster, which the Board have arranged to take under lease from the present lessee for a term of twenty years. It was unanimously resolved that the plan be at once submitted to the consulting engineer to report thereon. It was stated that although the estimated cost of the sewerage and irrigation scheme will be 7,000*l.*, the repayment of the capital borrowed may be extended over thirty years; and, allowing a very moderate rent for the land irrigated, the sewerage rate will not exceed threepence in the pound.

FROM SCOTLAND.

Partick (near Glasgow).—The foundation-stone of the free high church has been laid. The church is situated at the west end of Hamilton-crescent, Partick. The ground slopes rapidly towards the south, where the principal entrance is placed in the haesment, and the floor of the church is approached by two spacious stairs in the aisles encircling this end of the building, which is apsidal in form. Immediately above this aisle are three large windows, filled with geometrical tracery, lighting the church. The style of architecture is early geometrical Gothic. There will be no galleries, but provision is made

for their erection hereafter if required. Mean-time fitting accommodation will be provided for about 720. The space under the south end of the church is made available for a prayer meeting hall, and at either side there is a session house and ladies' room. The cost of the building will be about 4,600*l.* The architect is Mr. John Honeyman, Junr., of Glasgow. The mason is Mr. A. Coghill; and the joiners are Messrs. William McCall & Son. The clerk of works is Mr. Wm. Kent.

Breckin.—One of those curious subterranean buildings, named Picts' houses, has been discovered at Fithie, in the parish of Farnell. The building is curvilinear, about 12 ft. long, 5 ft. wide, and sloping from 4 ft. to 6 ft. deep, on a floor of red sandstone rock. The side walls are built of a rude masonry, laid in clay, and there was a layer of worked (milled) clay on the floor. The chamber was covered by three boulders, one of gneiss, about 8 to 9 ft. long and 3 to 4 ft. broad, weighing nearly two tons; one about 7 to 4 ft. long by 3 ft. broad, of limestone; and one about 5 ft. long by 3 ft. broad, of freestone. These boulders were laid crosswise. About half a mile distant are the remains of a large kitchen-midden. This circumstance has led to the belief that the neighbourhood had been the seat of a considerable population in early times. On excavating the chamber, several remarkable discoveries were made. The floor, laid with clay, seemed to be strewn with small pieces of charcoal. Laid on the floor, immediately under the middle of the central or largest boulder, were the remains, strange to say, of a classical urn or vase, ornamented on the outside with a beautiful pattern. The urn was in fragments when found, but as many have been preserved as will show its character and the great beauty of the ornamental designs which adorn it. From the appearance of the fractures the vase seems to have been crushed long ago by the soil which had dropped in the course of ages through between the boulders and gradually at last almost filled up the chamber with a mass of soft earth.

CHURCH-BUILDING NEWS.

Tibberton.—The new church here is nearly ready for consecration. Mr. Hopkins is the architect, and Mr. Warner, of Malvern, the builder, at an estimated cost of 1,040*l.* As before, it only consists of chancel and nave, with south porch, and wooden bell-turret with spiret at the west end, sloping into the nave roof. Blue lias stone from Broughton Hackett has been used for the walls externally, and Bath stone facings; plain Broseley tiles, without bands or ornamental ridge tiles, on the steep-pitched roof. The walls are lined with red brick and bands of blue-and-white ditto; and red and black tiles cover the floor. Early English was the style adopted, and the windows are all lancet lights—single, double, treble, and quadruple, with stone moulded rosette arches above them. The east window is a copy of the old one, being a three-light; while that at the west end has four lights and a circular window above, being all under one arch. There is but little carving in the church, and that has been done by Mr. Boulton, of Cheltenham. Rimmington's hot-air apparatus will give warmth to the building. Two bells have been re-cast into one, with the addition of more metal, and the new bell weighs 3½ cwt. This was the work of Messrs. Taylor & Co., of Loughborough. The chirolyard has been lowered and the base of the wall well drained.

Nottingham.—St. Matthias's Church, Carlton-road, has been consecrated. The edifice consists of a lofty nave 67 ft. long and 48 ft. wide, with open timbered roof, the ridge of which is nearly 50 ft. from the floor; a chancel with circular apse of equal height 32 ft. long and 20 ft. wide, and chancel aisles on either side, out of which a vestry and organ chamber are partitioned off with open screens and a south porch. The division between the nave and the chancel and the chancel aisles is effected by a triple arcade with two stone columns, in one of which the ceremonial stone forms the base. A fourth arch, rising to a height of 35 ft. divides the chancel from the apse. The walls throughout are built of Bulwell stone, and lined with red brick interspersed with black brick bands and panellings. The building will provide for upwards of 700 on the floor, and the total cost including fences, fittings, and architect's expenses, is about 3,000*l.* In addition to Lancet windows at either end, the light is admitted through a range of openings

formed in the roof. The works have been executed by Mr. J. E. Hall, of Nottingham; the gas fittings by Mr. Rhodes, and the decorations by Mr. J. Marshall. The architect was Mr. Hine.

Arlingham (Gloucestershire).—The church has been re-opened for divine service, after an internal restoration. The works were carried out by Mr. J. Meredith, builder, Gloucester, under the direction of Mr. H. James, architect, Gloucester. The whole cost of the restoration was 600l.

Thornton-Hough (Cheshire).—The new church of All Saints here has been consecrated. The edifice, with its schools and parsonage, has been built from designs prepared by Messrs. John Kirk & Sons, of Huddersfield and Dewbury, architects, and under their superintendance. The style of architecture adopted is Gothic of the thirteenth century. The plan of the church is cruciform, having a tower and spire at the south-west corner about 120 ft. high, with a warming apparatus under the same. In the upper part of the tower there is a bell-chamber, and clook with four dials. At the north-west corner there is a porch and staircase to the west gallery for children. The general plan of the church consists of a nave, transept, organ-chamber, vestry, chancel, tower, and west porch. The nave is divided from the chancel and transepts by five arches, supported by circular columns and corbels surmounted by octagonal abaci, having the bell portions filled in with conventional carving. All the windows have tracery heads; that in the west gable has five lights, those in the chancel and transepts have each three lights, and all the remainder have two lights. The window in the chancel is of stained glass, representing the Crucifixion, and has been supplied by Messrs. Clayton & Bell, of London: all the remaining windows are of cathedral tinted rolled plate, with stained margins. All the masonry is of stone, from the immediate neighbourhood; the wall stones are of red sandstone, and the dressings are of white ashlar, from Storton quarries. The spire is surmounted by a wrought-iron vane, and each gable has a wrought-iron finial, all painted and gilded. The roof is constructed on the open principle. Sittings are provided for 460 persons—viz., 264 in the nave, 76 in the transepts, 20 in the choir, and 100 in the gallery. The warming is by hot water. Near the church, the schools, parsonage, and teachers' residence have been erected, in the same style of architecture as the church, and of the same class of materials, all of which are inclosed by walls and entrance gateways, surmounted by ornamental wrought arches and finials, with lamps suspended therefrom. The church and schools are fitted up with cornice and brackets for gas, finished line and gold, and have been supplied by Messrs. Lidster & Armitage, of Huddersfield. The cost of the entire erections has been about 8,500l., exclusive of the ground and endowment.

SCHOOL-BUILDING NEWS.

Arnold.—A new school, for the education of the children of the working classes, has been opened at Arnold. The building is plain and unpretending. In the front it is ornamented with white brick quoins. The doors and windows are arched in red and white brick, which affords some relief to the general sameness of its appearance. It is in the T shape, and, with the aid of folding doors, can be readily converted into three separate rooms. Its dimensions are,—height 15 ft., length 38 ft., width 14 ft.; the large class-room, height 10 ft., length 15 ft., width 12 ft.; while the smaller class-room is half the size of the one just described. The school has been erected, from plans supplied by Mr. W. Jackson, architect, Nottingham, by Mr. Worrall, builder, Arnold, at a cost (including land and fixtures) of 620l. Its space will accommodate 195 children, according to the Government requirements. The site is in the centre of the village.

Saltire.—Recently a large number of new erections have been going on at Saltire, consisting of private dwellings, a number of almshouses, and public buildings, some of which are now completed, and one of them, a large and elaborate school-room, has just been opened. The building is situated in the centre of the Victoria or main road to Saltire, and is set back from the road 60 ft. The plan is based upon the system of instruction recommended by the Committee of Council on Education, and provides accommodation for 750 children. The boys and girls' school-rooms are placed at opposite ends of the

building. Each room is 80 ft. long and 20 ft. 3 in. wide. Between the wings on the front is a double colonnade, and in the centre, projecting forward, is the infants' school-room, 54 ft. by 24 ft. To each school-room are attached class-rooms, cloak-rooms with Jennings's patent tip-up lavatories, and every convenience. Separate entrances to the front are formed under each colonnade. To the back are placed extensive play-grounds, laid with asphalt, for each division of the scholars, and large covered play-grounds are also provided for the children in wet weather. The boys' play-ground has the addition of complete gymnastic appliances. The interior of the school-room is lofty and well lighted and ventilated; lined with pressed brickwork 3 ft. 6 in. high, and the windows finished inside with brick. The whole of the building throughout is heated with hot water, and is lighted in the evening by gas pendants from the ribs of the ceiling. The style adopted is Italian in its character. The wings of the building are terminated by pediments, the tympana of which are filled by sculptured ornament; under these are three-light Venetian windows, supported by columns. The sculpture in the pediments has been executed by Mr. Milnes, of London. Over the centre compartment of the front is a bell turret with figures of children holding instruments of instruction over the centre arch. The sides of the schools are relieved by large two-light windows, supported by consoles and with shafts, and carved capitals and pediments over. The base of the building is in hoisted and channelled ashlar; and the cornices and window dressings throughout in hoisted ashlar, with the walls in pitched-faced work. The architects are Messrs. Lockwood & Mawson, of Bradford and London.

Books Received.

The Architect's, Engineer's, and Building Trades' Directory; a Business Book of Reference for the various Industries connected with the Arts of Construction throughout England, Scotland, and Wales. London: Wyman & Sons, Great Queen-street, W.C.: Wyman, Bros., Calcutta and Allahabad. 1868.

We have here a very remarkable work, and one that can scarcely fail to prove greatly useful, not merely to individuals, but to the professions to which it relates. As the publishers said in their first prospectus:—

"Class literature being now a recognised necessity and a prominent fact of the age, little apology is required in presenting the prospectus of a work intended to supply an admitted want, viz., a Business Directory for the especial use of the various and important professions and trades identified with the arts of construction in this country. Unlike the clerical, legal, and medical professions, each of which has at least one annual record of its members, the architects and engineers of England possess no general list of their members or record of their professional achievements. This single fact seems to indicate how greatly such a work as the present is required; it will therefore, in addition to the usual directory matter, seek to give in a form at once very brief and very complete,—the salient facts in the professional history of every architect and engineer throughout England, Scotland, and Wales."

"The publishers hope to furnish a work which shall not only be invaluable to all concerned as a mere useful directory, but shall shortly become a literary monument of modern times in the domain of art and science as applied to construction. Such being their aim, the publishers cannot believe that the architects and engineers of the present day—unrecorded and almost unrecorded as they are without some such register—will fail to perceive the professional value, or to co-operate in the production, of a work having regard to the promotion of their own importance and status."

The work consists of five divisions.—1. Institutions, Societies, and Charities. Under this head is given a list of the principal institutions, societies, and charities connected with architecture, engineering, the arts and sciences, and the building trades, including an account of the objects contemplated by them, and lists of officers and members from official sources. Large and interesting as this list is, it may be properly increased in the next edition, some of the provincial architectural societies being omitted. 2. Architects, Engineers, Surveyors, Sculptors, &c. This comprises, in an alphabetical classification, under proper heads, lists of architects, engineers, surveyors, sculptors, and others prominently identified with architecture and engineering throughout nine hundred cities, towns, and principal places in England, Scotland, and Wales; and, in most cases, in addition to the name and address, is presented a concise record of the salient facts in the professional career of living architects and engineers. There are lacunæ here to be filled up, and the whole should be revised hereafter

by a competent hand, so as to preserve a balance in the accounts. 3. Building-trades' Directory; which comprehends in an alphabetical classification of trades the names and addresses of contractors, builders, engineers, granite, stone, glass, slat, brick, iron, and timber merchants, iron and brass founders, stone and metal workers, ship-builders, and, in short, the various industries connected with the arts of construction. 4. Towns and Official Directory. Preceding each local directory throughout the work will be found information as to all the various offices, boards, and public offices connected with engineering and building, sanitary matters, and gas and water supply, the members of Parliament, together with an approximate estimate of the population. The arrangement of this division will enable persons desirous of communicating with architects, engineers, and the building trades in any particular town, to find at a glance the name and address they seek. It furnishes a classified local building-trades' directory for each name and trade referred to elsewhere in the work, and is of great value. And 5. Notes of Patents likely to prove of special interest taken out in the course of the past year; the name and address of the person or persons taking out each patent; together with its date and number on the books at the Office of the Commissioners of Patents. In addition there is a Trade Appendix, furnishing a useful collection of trade lists and business announcements pertinent to the subject-matter of the work.

An examination of the book shows that no fewer than 3,500 persons are referred to in the professional division; namely, architects, civil engineers, surveyors, and sculptors; and that the trade list contains the addresses of 7,000 holders; the total number of names in the book is nearly 50,000. About 900 towns are referred to, and the number of trades included in the work is about 200.

The publishers may fairly congratulate themselves upon the success which has thus far attended their enterprise; for, whatever its shortcomings, the volume undoubtedly contains a mass of special information exclusively relating to architecture and engineering, which fully justified its production. Only those who have ever essayed the compilation of facts to be gathered from thousands of people located in hundreds of places, can form any adequate conception of the enormous task comprised within the limits of this volume; and we hear with surprise that the work has been scarcely five months in process of compilation from the commencement to the end.

The binding is artistic and quaint, but as the architects named in the book are not Medieval and do not wear coifs, and the builders are not Egyptians, we do not see any reason why they should be so represented on the cover.

The Architect's, Engineer's, and Building Trades' Directory has nothing to do with the Pharos; it is a book of to-day, eminently and entirely so, and as such we warmly recommend it to the public in general, and to the readers of the *Builder* in particular.

Reports of the (United States) Commissioner of Patents for the years 1863 and 1864. Arts and Manufactures. 4 vols. Washington: Government Printing-office, 1866. Steven's American Library and Literary Agency, 17, Henrietta-street, Covent Garden, London.

It is said that the well-condensed and valuable abstracts of patents issued by the United States Government are so profusely circulated, that there is a joke, in the Yankee style, current in the States, that the hackwoodmen build book-huts with them instead of log-huts. The intention of the Government is liberal and excellent, and it ought to benefit inventors, and promote invention throughout the States. Each year's reports are given in two portly volumes, one entirely of illustrations, and the whole forms an extensive and important record. The letter-press volume for 1863 consists of 895 pages octavo; and that for 1864 of no less than 1073. Each volume contains an index of subjects, and a separate index of names, besides a condensed abstract of all the patents taken out for the year indicated. Thus the volume for 1864 begins with No. 41,047, and ends with No. 45,684; and there are besides abstracts of re-issues running from No. 1,596 to 1,843; a list of designs, and also one of extensions.

The number of applications for patents in 1864 was 6,972, and the number granted, in-

cluding re-issues and designs, 5,020. The number of expired patents was 1,034, and the number extended 48. Of the patents granted, there were 4,862 to citizens of the United States; 89 to subjects of Great Britain; 38 to Frenchmen; and 31 to other foreigners. The money received on applications for patents, re-issues, &c., was 220,864.76 dols., and for copies and recording assignments, 20,055.22 dols. The expenditure for salaries, &c., was 229,868.00 dols. The business of the office had increased during the twenty-eight years ending 31st December, 1863, from 765 applications filed to 6,972, and from 29,289.08 dols. to 240,919.98 dols. received; and from 33,506.98 dols. to 229,868.00 dols. expended.

Miscellaneous.

THE SUPERVISION OF ASYLUMS FOR THE INSANE. We have received from an architect a melancholy statement of the circumstances under which he (being, as he states, perfectly sane), was confined in an asylum, by means of false certificates, and half starved. It is not a matter that we can investigate, however much we may commiserate; and we advise our correspondent to state his case to one of the medical journals.

THE ARUNDEL SOCIETY.—The annual meeting of this Society was held on Tuesday, the 9th instant, under the presidency of Mr. Austen Layard, M.P., who made an interesting address. Mr. Norton, hon. secretary, read the nineteenth annual report of the council, which showed that the Society was in a very satisfactory financial condition. Several members addressed the meeting; and a suggestion that the council should now look to Spain, as well as Italy, for subjects, was received with favour.

TOTNESS CHURCH RESTORATION.—At a recent meeting of the Committee, the Secretary stated that he had received about 100l. since the last issue of circulars, making about 1,040l. available for the first section. The secretary was directed to write to Mr. Gilbert Scott for specifications in order that advertisements for contracts might be at once issued. 150l. only are now required to complete the first section of the work. It is to be hoped that care will be taken not to over-restore the very fine stone screen existing in this church, of which two valuable illustrations were given in the Architectural Publication Society's Dictionary, January, 1866. The screen is on the whole in very good repair, showing some traces of colour. Even the original doors remain, and are still in use. The tower of this church is also one of the best proportioned in Devonshire.

WORKING MEN'S CLUB AND INSTITUTE UNION.—The sixth annual meeting of this institution was held on Monday last, at Exeter Hall, under the presidency of the Earl of Carnarvon. The report stated that the number of working men's clubs and institutes, of the existence of which the council are at present aware, is 312. According to returns received from eighty-five clubs the average number of members amounts to 128 to each club. Of the eighty-five clubs sending returns, fifty-four report themselves as self-supporting, or very nearly so; and of these forty are entirely self-supporting. In these eighty-five clubs sending returns, there have been 103 educational classes in operation during the past winter. Twenty-eight clubs report that provident societies of various kinds have either been formed by their members or hold meetings at the club. Nearly all state that they have had various lectures and entertainments during the six winter months, amounting to 239 lectures and 4548 entertainments for the eighty-five clubs. The chairman remarked that one of the great benefits conferred by working men's clubs lay in the fact that they stood out as the alternative, so to speak, and the rivals of the public-house and public-house influence. The adoption of the report was moved and spoken to by Lords Lyttelton and Lichfield. The Rev. Mr. Solly took the opportunity of explaining that his retirement from the position of honorary secretary was solely owing to the fact that his views with regard to the working of the institution were so opposed to those entertained by others officially connected with it, that it was undesirable that he should hold office any longer. Various gentlemen delivered addresses advocating the claims of the institution. On Tuesday a conference was held, at the Society of Arts, Adelphi, under the presidency of the Earl of Lichfield. Several papers were read, and questions were discussed.

COLLIERY EXPLOSIONS.—Having seen in your paper of the 23rd ult. a correspondent's idea of preventing colliery explosions; I beg to suggest that a large "air-pump worked by steam power" would, by suction and evacuation, I think, be sufficient to prevent these great calamities.—H. E. G.

RAILWAY STATISTICS.—The *Statistical Abstract* for the United Kingdom, just published, shows that at the end of 1866, 13,854 miles of lines were open to the public throughout the kingdom, 9,701 of which were in England and Wales, 2,244 in Scotland, and 1,909 in Ireland, representing a total paid-up capital of 481,872,184l. sterling. During the year 238,214,329 passengers (including season-ticket holders) were conveyed on railways in England and Wales, 23,102,936 in Scotland, and 13,066,630 in Ireland. The total of traffic receipts in England and Wales was 32,274,869l.; in Scotland, 4,127,131l.; and in Ireland, 1,762,354l., which for the United Kingdom amounts to 2,754l. per mile of railway. The total of working expenses for the United Kingdom amounted to 18,811,673l., and the net receipts to 19,352,681l., or an increase of more than a million and a half sterling as to the former, and of more than half a million sterling as to the latter, in comparison with the previous year.

POLEGATE; A NEW TOWN COMMENCED.—A fête recently took place at Polegate, mainly to commemorate the completion of the first score of houses erected on the estate of Mr. Owen Fuller Meyrick, and situated near the railway station. This estate comprises about 90 acres of land, adapted for building purposes; and from its close contiguity to the Polegate station and its nearness to the favourite watering-places of Hastings and Eastbourne, there is thought to be every probability that ere long the site will be studded with villas and the better class of houses. The property is marked out in lots, many of which have already found purchasers. Roads have been formed by Mr. W. Beeny, the contractor; numerous trees, plants, and flowers have been planted by Mr. Thomas Larkin, nurseryman; and the drainage and water-supply have been ensured. A spot has been chosen for a church. The finishing of the first row of houses on the estate was considered an "event," and hence the rural fête.

YORKSHIRE UNION OF MECHANICS' INSTITUTES. The thirty-first annual meeting of delegates from the different institutes in connexion with the Yorkshire Union has been held in York. The president, Mr. Edward Baines, M.P., opened the proceedings by an address, congratulatory on the flourishing condition of the union. The annual report entered somewhat largely into the question of scientific instruction, and expressed the opinion that mechanics' institutions may be made the medium for imparting the special or technical education now demanded. The report stated that an association in Paris, similar in its objects to these institutes, employs more than 150 teachers. A presentation was made to Mr. James Hole, one of the secretaries of the Union, in recognition of his services during twenty years, consisting of a gold watch and chain, a purse containing one hundred and five pounds, together with an illuminated testimonial on vellum in carved oak frame. Other testimonials were afterwards presented to Mr. Hole. In the evening a public meeting was held, presided over by the Archbishop of York.

IRON STOVES AND FEVER.—At the last sitting of the Academy of Science at Paris, Dr. Decaisne sent in a paper on "The Heating of Rooms by Cast-iron Stoves," which, in his opinion, predisposes to typhus fever. He states that forty-two cases of that malady which he has observed in the course of the last ten years in various communes of the Oise, may be divided into three classes:—1. The patients who were in the habit of using cast-iron stoves with scarcely any ventilation; 2. Those who used the same with imperfect ventilation; and 3. Those who heated their dwellings by other means. Between the two former categories the differences were very slight, the advantages being on the side of ventilation; but generally all the patients belonging to these classes experienced stupor, twitching of the tendons, delirium, and especially nasal and intestinal hæmorrhagia, while the duration of the disorder itself and the convalescence lasted much longer than in the case of those who did not warm their rooms with cast-iron stoves, and who generally suffered infinitely less from these symptoms.

ROYAL ACADEMY TRAVELLING STUDENTSHIP.—Mr. John Humphrey Spanton, to whom the gold medal was awarded by the Royal Academy in December last, has been elected travelling student in architecture for two years.

WHITEHALL.—The intention has been mentioned lately of concentrating the Public Offices at Whitehall: would it not be wise to look to the plan of Inigo Jones, which, it was mentioned some time ago in the *Builder*, exists in the British Museum?—E.

THE CHURCH "NOTRE DAME DE FRANCE."—We are informed that the sum expended is 4,000l. instead of 2,000l. as stated. The architect wishes it understood (and we do not wonder that he should so wish) that he had nothing to do with the design of the entrance-doors.

THE BATH AND WEST OF ENGLAND AGRICULTURAL AND ART EXHIBITION.—The Falmouth Exhibition of the Bath and West of England Agricultural Society has been opened. Besides the usual agricultural and horticultural display there is an exhibition of the works of local artists and of art manufactures, as well as a South Kensington collection. The local artists are well represented, and there is a varied display of articles of taste and utility in the building devoted to art manufactures.

ELECTRIC ORNAMENTS.—Electro-magnetism, it is said, is now employed to make small butterflies flutter their wings on ball head-dresses, in Paris. Within the chignon are concealed a small battery and a minute Ruhmkorff coil. On the bosom may be a brooch, with a head upon it, the eyes of which turn in all directions. This, too, is accomplished by the use of a battery and coil so minute as to be concealed within the brooch itself. Could not a battery be applied to make larger butterfly fans?

AN ALFRED MEMORIAL HOSPITAL FOR SYDNEY. At a meeting in London of an English committee for the erection of this hospital, Sir John Young, bart., in the chair, it was resolved to invite subscriptions and co-operation from every colonist in England, and from all connected with the Australian colonies. A sub-committee was appointed, consisting of Mr. Moses Joseph, Mr. William Mort, and Captain Mayne, to conduct the correspondence, and to receive subscriptions, &c. A list was opened, and eighteen gentlemen at once subscribed about 700l.

RATTENING.—An ingenious correspondent of *Notes and Queries* says, "This word is not in Hunter's *Hallamshire Glossary*; it appears to be old Norse—"Ridding, disciplina, flagellatio," which expresses precisely the correction which the saw-grinders' union administers to refractory brethren." This, however, is quite a mistake; in the first place rattening is not corporal punishment of any kind; it is simply the destruction or the theft of machine hands, tools, &c.; and this was sardoniously attributed to rats; hence, rattening, and not from old Norse.

FRESH MEAT FROM AUSTRALIA.—Great interest is, we learn, being taken now in Sydney in a process for preserving fresh meat known as Mort's freezing process, the cold being obtained by the liquefaction of ammonia. A public meeting has subscribed 3,000l. towards sending to England a shipload of 260 tons of fresh meat, which may be expected to arrive this autumn. It is to consist of choice meat, and to be sold at sixpence and sound at fourpence per stone, preserved for eleven months by this refrigerating process, is said to have been perfectly fresh when eaten two or three days after being thawed. It is well known that flesh of the Mammoth, preserved in Siberian ice for many thousands of years, was eaten and relished by dogs in our day.

MANUFACTURE OF STEEL.—A process, which it is asserted will prove even more important than that of Mr. Bessemer, inasmuch as it is hoped that it will be free from the objection that the worn metal cannot be economically re-melted, is now about to be introduced. The invention consists in the use of machinery by which pig-iron is ground to powder by a very rapidly-moving cutter. The extreme friction produces a heat so intense that the iron is set on fire, and, after scintillating, falls down a reddish-brown dust. The combustion causes the superfluous carbon to be got rid of; the dust is then put into a crucible, melted, and when cooled, is found to be ingots of very good steel. This process was explained at the recent *conferenza* of the Institution of Civil Engineers.

THE PRINTERS' PENSION CORPORATION.—The Very Reverend Dr. A. P. Stanley, Dean of Westminster, has kindly consented to preside at the anniversary festival of that thriving institution, the Printers' Pension, Almshouse, and Orphan Asylum Corporation, to be held early in July.

INDUSTRIAL EXHIBITION IN HANTS.—An industrial exhibition, recently held at Abbots Anne, near Andover, Hants, was opened by the Earl of Portsmouth. The exhibition, which remained open a week, occupied the whole of the large school-rooms, the reading rooms and mechanics' institute, and two large tents. There were over 1,000 exhibitors.

THE NEW ACT ON LONDON IMPROVEMENTS.—The new Act to further continue the statutes on the London coal and wine duties has just been printed. The Acts are continued till the year 1872. The proceeds of 4d., part of 12d. duty, are to be applied to complete the Holborn Valley and other improvements, and afterwards to improvements "in or adjacent to the City of London," as sanctioned by Parliament.

BAILEY HILL (MOLD) EXPLORATIONS.—Subscription-lists have been exhibited at Messrs. Pring & Price's and Mr. Thomas E. Birch's establishments, Mold, containing a list of gentlemen who have formed themselves into a committee for the purpose of raising funds to explore the far-famed "Bailey Hill," in that town. In May last a circular wall, from 3½ yards to 4 yards in thickness, surrounding the top of the mound, was discovered by Mr. Cain Parry; and it is believed that there still exist further remains of the old castle, which is supposed to have stood there during the Norman period, and been demolished in 1260.

IMPROVED PARAFFIN, OR PETROLEUM LAMPS.—A New York firm of Patentes, Messrs. Ives & Co., according to the *Mining and Petroleum Standard*, are selling lamps with considerable improvements. They are of various forms, as for hanging, bracketing, or standing. The chimney and shade of the standing or table lamp, move to the side on a hinge, so as to allow the lamp to be lighted, or replenished, without separation of the parts, and not even the burner requires to be unscrewed, the oil being inserted from the filler through a long and slender spout. The bracket lamp moves aside by a spring, and is lighted or replenished in a similar way. The hanging lamp is a balance one, and can readily be drawn down for lighting or replenishment.

CHARGES OF CONSPIRACY AGAINST UNIONIST WORKMEN.—At the Police-court, Liverpool, Andrew Colleen, T. Williams, John Murphy and James Ball, bricklayers, were brought up under warrant, charged with conspiring by unlawful means to impoverish Archibald Parker in his trade or business, and to restrain the freedom of trade. The case arose out of the strike of bricklayers in the town, which had put a stop to the progress of several extensive buildings. A large edifice is in course of erection at Lime-street Railway Station, and in consequence of the turnout of the bricklayers employed there a number of non-union men were brought down from London to take their places. The society men put into operation the picketing system at Lime-street, and this led to the apprehension of the prisoners. Mr. Parkinson said he was glad to state that an interview had been held with the unionist committee, and it had been promised that the picketing system should be abandoned, and that the non-society men should be allowed to work unmolested. Under these circumstances he consented to the prisoners being liberated upon entering into their own recognizances to appear that day month. These terms being accepted by the solicitor for the defence, Mr. Raffles, the stipendiary, discharged the prisoners. Since then, however, Mr. Parkinson has again applied for warrants against certain operative bricklayers for picketing. He said that notwithstanding the promise given that the system should be discontinued, it was still being exercised in gross violation of good faith, and amounting to nearly contempt of court. After some witnesses had been examined the magistrates were granted.—Nine members of the masons' union at Sheffield have been committed for trial at the local assizes on the charge of conspiracy to prevent Mr. Powell, a builder, from carrying on his business, by using threats and intimidation to those who were willing to enter his employ. The dispute was about dressing stone at a quarry "in defiance of one of the Society's rules."

No Gas.—The now somewhat singular event of a large town being lighted with oil has just occurred at Cambridge. A new gas company being started, the Improvement Commissioners granted it a three years' contract to light the public streets. An attempt was subsequently made to buy off this threatened competition, and the new company suspended its operations for nearly a month, and at the last moment the old company became inexorable. It being impossible to get the works ready by the 12th June, the period when the contract was to commence, oil lamps have been resorted to for the present.

REPERDS FOR CIRENCESTER CHURCH.—A sculptured stone reredos has been put up in Cirencester church. It consists of three large panels, sculptured in *alto relievo*, representing the Crucifixion, the Agony in the Garden of Gethsemane, and the Resurrection; and four niches containing figures of the four Evangelists. In the centre panel, which contains a representation of the Crucifixion, there are eight figures. The panel on the left shows the Agony of our Saviour in the Garden. The right hand panel contains a representation of the Resurrection of our Saviour. The four niches containing figures of the four Evangelists, St. Matthew, St. Mark, St. Luke, and St. John, intersect and form a border to the panels. The canopies are carved, and are surmounted by finials. A diaper and a molding with carved oak foliage terminates the reredos proper on either side. Receding panels of a smaller description are attached to each side. That on the left contains St. John the Baptist preaching in the wilderness, and the Annunciation of the Virgin Mary. On the right are representations of the Nativity and Baptism of our Saviour. These panels contain a number of objects. A cornice, on the top of which is a battlement, surmounts the whole. The architectural portion of the work was designed by Mr. Scott, jun. The sculpture was designed, and the work executed, by Mr. E. E. Geffulowski, of London.

TENDERS.

For restoring and enlarging Doughty's Hospital, Norwich, for the charity trustees, Mr. James S. Bonest, city surveyor, architect. Quantities supplied.—
 Mitchell & Walker £2,408 13 0
 Wright 1,810 0 0

The Builder.

VOL. XXVI.—No. 1324.

A Word of Counsel to the Explorers of Palestine.

I have a word or two of friendly advice to offer to our friends the Palestine Exploration Society.

The *Builder* was the first journal to set the example of doing more in the way of calling the attention of the public to the subject of the survey of Palestine than is involved in the mere insertion of letters received from the officials. We have done this as feeling a deep and permanent interest in a subject so especially cognate to those which we habitually bring before our readers. Even architecture proper may gain valuable illustration from

the investigation of such buildings as the Golden Gate, and of the characteristic earmarks that betoken the masonry of Herod and of Solomon. Archaeological questions of extreme interest are also involved, and, above all, the topography of the spot which, of all on the surface of our planet, is marked by the most venerable sanctity, appeared likely to be redeemed from a condition of hopeless confusion. It would not have been either ungraceful or undeserved if our labours to promote the worthy object of the society,—labours which to no inconsiderable extent have awakened echoes in the columns of several of our contemporaries,—had been referred to with some expression of gratitude by those interested in the exploration.

Stimulated by the successive appeals which have been made for its aid, the public has come forward to such an extent as to obviate the need, which appeared at one time to be pressing, for the arrest of the works conducted by Lieut. Warren. As each new appeal has been made for contributions, detailed acknowledgements of the sums received have been published, in such a manner as to be satisfactory to each individual subscriber; but neither from these successive lists, nor from the statement made, according to the newspaper reports, at the public meeting, that the treasurer had something under 2,000l. in hand, do the actual balance-sheet of the society, and *procès* of the operations, past and projected, of the conductors of the enterprise, come clearly and fully before the public. The whole matter is somewhat *en l'air*. Country subscribers have been hoping to receive more systematic information in return for their subscriptions, and all the interesting speeches of the patrons of the enterprise,—of such men as Sir Henry Rawlinson, Mr. Layard, and the Dean of Westminster, fail to supply that definite programme which it is desirable to have brought before those interested in the support of the undertaking.

It would be well that all the subscribers should be provided with a block plan of the

localities investigated and to be investigated by the officers of the survey, together with the reports which have been printed from time to time. These, moreover, should be serially numbered, and all details of work should be so described as to admit of immediate reference to the key-plan, so that all persons in any way accustomed to the use of maps should be enabled readily to comprehend what has been and still may be done.

The attention which has been given to a subject of minor interest, that of the "complicated network of drains and reservoirs," which indeed has been brought before the public in a separate and entire work, might have been, we venture to think, better bestowed on those topographical questions to which all others are subordinate, and the determination of which is the most important result to be expected from the labours of the explorers. We do not undervalue the importance of the determination of the depth of the south wall of the Haram beneath the present surface of the rubbish which encumbers the site, or of the course and mode of junction of the wall of Ophel to that of the Haram. The latter are the principal discoveries of value as yet made with reference to the main object of the search, the identification of the features existing before the Christian era. Monkish Jerusalem is comparatively uninteresting, our first aim must be the determination of Scriptural localities.

We cannot, therefore, but think that Lieut. Warren undervalued the results of his actual discoveries, when he spoke at the meeting of the area of the Haram as containing room for much more than the site of the Temple and the Tower of Antonia. "Space for three such sites" as that of the Temple, are the words of the report.

The first point to decide as to this part of the investigation, a point which to a certain extent Lieut. Warren has elucidated, was the true character of the masonry surrounding the altar-shaped hill on which the Temple unquestionably stood. Was it the date of the Crusaders? in which case its position would have told no little. Was it built by Herod? Did it contain any of the work of Solomon? For, if this superb *encinte* could be identified with the work of the builder of the third, still more with that of the first, Temple, it follows that we have in its actual dimensions the measurement of the "Stadium" of Josephus, and that the grand double square, six stadia in circuit, half of which contained the Temple, and the other half the fortress, accurately coincide with this gigantic walled platform of some 1,800 ft. long by 900 ft. wide.

The shafts and galleries of Lieut. Warren, in enabling him to ascertain the depth at which the southern and the eastern walls of this quadrangle sprang from the living rock, have verified the large dimensions used by Josephus. The investigation of the masonry, and the comparison of its characteristics with those of certain well-known buildings, leave no room to doubt the presence in these walls of the work both of Herod and of Solomon himself; and certitude is thus attained that the altar mountain is not, in its present dimensions, the work of some unrecorded builder at some unknown date, but the repaired remains of the original circumvallation raised by the two great Temple-building kings. The topographical importance of this fact is primary, and this is the first definite result of the survey.

The next point, important in itself, and important as being that on which all other topographical questions must more or less directly hinge, is to determine the course of the three walls of Josephus. There can be no doubt of the prime importance of this desideratum. We have already pointed out that, before gunpowder was available for military demolition, it

was impossible that such buildings as the walls of ancient Jerusalem should have been destroyed to below the level of the ground, or even to below the level of the debris caused by the overthrow of the upper part of the walls themselves. These foundations, then, are *in esse*: to trace them is the first duty of the topographer. That once done, there are many questions that will settle themselves. It is not, for instance, conceivable that when this first step to a restored topography of the city besieged by Titus shall have been taken, we shall find writers continuing to start with the assumption that a certain tower is the "Hippicene" of Josephus. This identification appears to have been arrived at by the following syllogism:—Josephus says there was a tower called Hippicus. Here is a tower. Ergo, here is Hippicus. Unfortunately for this sort of logic, which people rarely apply to any subjects but those which are in some way connected with Scripture, the dimensions, no less than the position of the tower in question, are entirely irreconcilable with the description given by the great Jewish historian of Hippicene.

The verification of the site of the Holy Sepulchre is another of the points closely dependent on the determination of the course of the wall. We do not say that positive determination is thus immediately attainable, but negative is. If the Church of the Holy Sepulchre, venerated as such by unbroken tradition from the date of the appropriately styled "invention" of the cross by the Empress Helena, be without the wall of the city,—the wall described by Josephus,—it does not necessarily follow that the site is the true one. But if it be within the wall, it is certain that such will not be the case. This, then, will be one of the first results of this much-needed first part of the survey.

The essential condition of the most successful amount of the exploration is, to bear in mind what may and what may not be fairly expected from its prosecution. It is only by an organized direction of all efforts to attain these primary ends that waste of time, of money, and of energy will be avoided. Research at Jerusalem will have a totally different result from research at Thebes, at Nimrod, or at Pompeii. We shall find no historic sculptures, no palaces buried under their own ruins, no indications of the daily life of a population suddenly overwhelmed by the volcanic agency of nature. A few scraps of pottery, a few bronze nails, an engraved ring, a Hebrew coin or two, glass fragments of the third or fourth century of the Christian era,—such are the results that, in the excavation of Jerusalem, replace the papyri of the Theban tombs, the glass, and ivory, and clay, and metal, of the Assyrian drinking-vessels, and ornaments, and domestic utensils, and the clay tablets of their imperishable, though quaint and humble, domestic records. For the restoration of the house of Paneas, or for the reopening of the amphitheatre, we have to be content with the piercing of long-closed galleries under the courts of the Temple, and the opening to the light of day of enormous stones, which seem to have been re-cut in the time of Solomon. The severe style of ornamentation adopted by a people who were forbidden to reproduce animal forms, may occasionally make its appearance among the ruins. There may possibly occur some memorial of the fifty-six years of Assyrian rule. Sir Henry Rawlinson entertained a hope of the disinterment of some Babylonian cylinder or obelisk containing Nebuchadnezzar's own account of his conquest. There is a more historically-founded hope of the intact preservation of the places of sepulture of eleven of the kings of the House of David in the bowels of Mount Zion; but it is not in archaeological results that the survey can be expected to be fruitful.

On the other hand, in the books of Kings, Chronicles, Ezra, and Nehemiah, we have nume-

rous details as to the topographical features of Jerusalem, that it will be of the utmost interest fully to explain. Fewer, but even more interesting allusions, occur in the first five books of the New Testament. In the "Antiquities," and in the

"Wars" of Josephus, we have the fullest details preserved in any ancient history of any ancient city. In the Talmud we have a counterpart of the Holy City itself—a mass of recoverable details hidden under the accumulated rubbish of centuries. The pick and shovel of the excavator are the instruments of a new and an indispensable exegesis applicable to these important tests. But the application must be systematic. It is not by a shaft here and a gallery there,—the measurement of a reservoir, or the opening of an arch, that the light of day will be thrown on the subject. Isolated and minor discoveries of this nature are like the feeble ray of light which is thrown from the cauld of a solitary visitor on the roof or sides of some gigantic cavern, the shimmer of a torch on the stalactites of "Peveril's Hole" in the Peak. We want the full illumination of the blue lights. We want such a combined and organised effort to solve the topographical questions, as shall at once give us the true plan of the city described by Josephus, and taken by Titus. When these historic walls are once dotted in, not as a guess, but as a continuous certainty, on the excellent ordnance survey, each minor detail will find its proper place, and assume its due relative importance. The completion of the thorough investigation of the Haram area,—of its northern and its western wall, as well as of its honeycomb substructure, and the tracing of the walls of Herod, and of Nehemiah, are the objects to which all others should be made subservient.

It is very well to urge the public to support the work. We have been glad to lend our own voice to swell the cry for help. We have been glad to point out in what widely different portions of the public addressed by the newspaper press are to be found groups of different character, each of which claims a peculiar and a special interest in the exploration of the ancient city. To that venerable fellowship—perhaps the most ancient in the world—wider than either of the forms of monotheistic faith—practical in its aims and conduct, and bound, by a tie never to be forgotten, to venerate the site of the house reared without sound of "hammer, or axe, or any tool of iron"—we were the first to indicate the propriety of an appeal which is now beginning to be productive, but which ought to be, not dimly indicated, but distinctly and specially made. To the archaeologist and the architect we have pointed out that if the discoveries probable in their departments of art are likely to be few, they would be at once venerable from antiquity and certain in the indications which they will give.

The clergy of the Church of England have not been slow to perceive what volumes of vapid and erroneous comment may be superseded by a few well-chosen photographs. The members of the Dissenting churches, accustomed to find money to carry out what they consider to be the true interpretation of the New Testament, only require to have the nature of the explorations made satisfactorily clear to their minds, in order to make sure that it shall not fail for want of voluntary aid. But though this urgency is a very good thing in its way, people are apt to become tired of its repetition. They want to be satisfied, not only as to the good faith, but as to the good sense, with which these contributions are laid out. They do not so much care to know that this shaft is 35 ft. deep, and that 46 ft., as to understand what is the course definitely proposed by the person responsible for the direction of the exploration,—how the monthly progress carries out that comprehensive and well-digested design; and, above all how the main requisite of the certain restoration of the block plan of the Jerusalem of the Gospel era—the triple-walled city of the great Jewish historian—is steadily advancing. Whatever additional information may have been gathered by those subscribers who had the advantage of hearing the address of Lieut. Warren, on the occasion of the meeting at Willis's Rooms, we have reason to know that sentiments such as we have expressed are entertained, and we think reasonably entertained, by country subscribers. Much has been done—money has been forthcoming in good faith—disinterested energy has been devoted to a worthy end—personal labour has not been shunned by those of our countrymen who have been exposed to all the trials of the climate of Palestine, and all the toil of labour in the East. What we are anxious

to see is, that all the efforts made and yet to be made for the exploration of the Holy Land should be so directed by competent and practised intelligence, and so subordinated to the requirements of well-organised method, that we shall, by the return of the hot weather of 1869, be able to point out, fully and distinctly, how much more we know of ancient Jerusalem than we knew in the spring of 1868.

"I hoped," wrote a country clergyman, who had sent his contribution to the exploration fund in consequence of the statements made in the *Builder*, "that on subscribing my guinea I might receive any further accounts. It would, I should think, be worth while to send the letterpress, if not the etchings also, to subscribers. If I know the secretary I should also suggest whether it would not be worth while to get fifteen or twenty copies of photographs boldly printed in colours" (meaning copies of fifteen or twenty photographs) "on calico, like those which Elliot Stock lends out (a great many sets on different subjects) for popular lectures. The size of these is 4 ft. by 3 ft. I should be very willing to give a popular lecture on the subject, and no doubt many would do the same, and popular interest would thus be awakened."

There is always a delicacy felt in speaking of "honorary" services in any terms than those of unqualified gratitude. This is one of the great evils of such a method of conducting any important undertaking. For the want of the voice of friendly criticism much is often left undone that might be done with advantage. We are so fully of opinion that a debt of gratitude is due to the energetic man who may be regarded as the father of this enterprise, that we wish distinctly to state that any remarks we have made have been suggested by the wish to strengthen his hands. We do not see how any competent person can be expected to devote gratuitously to such a purpose the time, and thought, and uninterrupted attention that are necessary to the adequate organisation of the enterprise. A certain degree of vagueness of object is sure thus to supervene. This becomes quite evident from the speech of Lieut. Warren. "The explorers must be content, he feared," said that officer, "to be baffled and perplexed for a long time to come before they could bring out Jerusalem as it was; for, starting as it might appear, they had not yet a single fixed point from which to commence."

Considering the great mass of writing,—we can hardly call it literature,—existing on the subject of Jerusalem, the wild guesses, and the impossible assumptions that have what is called "authority" to support them, the perplexity of Lieut. Warren is most natural. At the same time it is an unanswerable proof of the importance of the line of conduct which we suggest. A distinct plan of operations should be sketched out and communicated to the subscribers; estimates should be attached to the programme, as in all cases of serious engineering undertakings; and it should be understood that the first point to be carried out is the identification and the survey of the foundations of the ancient walls, and the consequent delineation of the ground-plan of the Holy City, as it existed when its streets were trodden by—

"Those blessed feet
Which, eighteen hundred years ago, were nailed,
For our salvation, to the bitter cross."

LIFE RISKS IN EDINBURGH.

EDINBURGH is just now in a vortex of "movements" of one description or another. Not to speak of political movements, with which we are not conversant, there are, to begin, the well-known annual games, high-jinks or *saturnalities* which spring from the decayed embers of the annuity-tax (church-rate) agitations, and which this year seem to have exploded with uncommon violence in crushing the laudable attempt to establish a free public library. In the second place, there is a great social and sanitary movement set a-going for the purpose of eradicating poverty and extinguishing crime, on the principles of voluntary association. In the third place, there is a noble and magnificent effort being made to reconstruct, at the cost of 100,000*l.*, the ancient and celebrated Medical Hospital, which has been so long and so honorably identified with the Edinburgh Medical School. We purpose devoting some space to the discussion of these two latter subjects; but before doing so we wish to clear away some rubbish, so to speak, which has been accumu-

lating on our hands, and at this moment encumbering our pathway.

How does it occur that Edinburgh should be the scene of so many extraordinary and fatal accidents? * Now it is an ancient tenement filled with inhabitants toppling over in the High-street. Then a fire breaks out at the basement of a long stair in the Canongate; and the poor inmates, deprived of all egress, precipitate themselves and their children from the seventh story windows. Again, the chimney-stalk of a comparatively new tenement in Duke-street is blown over, and crashes through the roof, and all the joisting and flooring of several stories, destroying the lives of four or five people in its fatal descent. No doubt this accident occurred during a storm; and by certain authorities it may be assigned to that category of casualties which are comprehended under a visitation of Providence! It is just possible that the same excuse will be made for the loss of life arising from the fall of enormous masses of rock which are every now and then detached from the cliffs with which Edinburgh is surrounded. But we must confess that, in our opinion, such an excuse is alike insufficient and unwarrantable. We have on former occasions been compelled to animadvert on the negligence and want of foresight on the part of the Edinburgh local authorities;—particularly, we may state, in regard to the fall of that ancient tenement in the High-street which had been undermined in the course of alterations; and the destruction by fire of the Theatre Royal, at which the Dean of Guild, Mr. Lorimer, was killed. We are afraid that we must continue to hold them responsible in certain other cases which we now proceed to particularise.

We shall begin with the storm. Our readers will remember that on the 24th day of January a fearful storm raged over a great part of Scotland, as well as England, which resulted in grievous loss of life, in many painful accidents, and in no small destruction of property. The fall of the barometer during the previous night gave warning of some atmospheric change at hand: the sky had become by ten o'clock overcast and lowering; and by twelve o'clock the tempest had set in. It grew in fury till about one o'clock, when there occurred in Edinburgh the saddest of all the incidents of the storm. A tall chimney-stalk at the back of the residence of Mr. John Keegan, S.S.C., in Duke-street, was blown down, and, tumbling through the roof, it threw down the whole of the back wall of the house, five stories in height, hurrying six inmates in the ruins. It was found, after digging through the *debris*, that four persons had been killed. In the upper part of the house a servant had been killed and another severely injured; further down, Miss Keegan had been killed; and of three clerks at the house in the lowest apartment, two were killed and one narrowly escaped, although he was extricated almost unscathed. Several other accidents also occurred in Edinburgh, but fortunately in none of them were lives lost. Many narrow escapes, however, took place from falling chimney-stalks, cans, and bricks; and all the streets were strewn with fragments of masonry, slates, tiles, and loose mortar.

It was pointed out in our columns at the time, and we desire to reproduce the argument, that although this gale, or rather storm, was more than commonly severe, the accidents with which it has been accompanied are by no means uncommon. Indeed, they are the very reverse. Every year numerous accidents occur from chimney-pots and decaying roofs in Edinburgh, both in the Old and the New Town; and we do not need to inform our Edinburgh readers that it does not always require a terrific storm to produce the fall of a lofty tenement and a destruction of human life. It is not easy to account in a single word for this condition of things; but one defect in the Edinburgh municipal administration is very conspicuous—there is no Building Act in Edinburgh. There seems to be no proper supervision, inspection, or regulation with regard to buildings in force in the city. We cannot better describe the *Deau of Guild Court*, which is popularly supposed to be entrusted with these important duties, than by comparing it to the Court of Border Wardens, or the man-at-arms in the Lord Mayor's Show. It is an institution that has long survived its usefulness, and ought to be abandoned. There are, we are aware, a city architect in Edinburgh (Mr. Cousin), a borough engineer (Mr. Macpher-

* See on this head "A Chapter of Accidents" in our volume for 1860.

son), and last, though not least, a medical officer of health (Dr. Littlejohn), all men of standing and experience in their respective professions. There could hardly an occasion arise, we should imagine, in which an official report from either or all of these burgh officials would have been of greater value. Yet it is a most extraordinary thing that no such report ever appeared; or, if it did, it never reached the public through the ordinary channels of information, or in the reports of the town council proceedings. Indeed, so far from "improving on the occasion," as the fashion is in certain other matters across the Tweed, there was a studious, and, as we think, culpable desire on the part of the authorities to hush the matter up altogether. The only professional, if not authoritative, deliverance the emergency called forth, as far as we could discover, was a sort of semi-official article in the *Scotsman*, which was partly transferred to our columns at the time, in which the whole theory of official responsibility was completely repudiated. At the same time the doctrine was laid down that the common law of property on the part of the landlord, and the *instinct of self-preservation* on the part of the occupier, comprehended all the principles necessary to foresee and provide against such extraordinary and fatal calamities. We will not stay to point out the preposterous character of such a defence, and we have already shown that the highly unwarrantable statement with regard to the duties of the burgh engineer was not in accordance with the local Acts of Parliament, even as compiled by the very highest local authority on such matters in Edinburgh,—*videlicet*, the town clerk.* This curious dogma of the instinct of self-preservation will, we suspect, be equally at fault in another class of accidents to which we must now refer. Edinburgh, we need scarcely say, is a city of comparative altitudes. Like ancient Rome in this respect, it is built on hills, although we do not know as to seven hills. At all events there are plenty of precipitous cliffs and jutting rocks overhanging the principal thoroughfares, chiefly composed of a porphyritic greenstone, sometimes basaltic, as at Samson's Ribs, but more commonly conglomerate, as we see them on the cuttings of the Calton Hill and Salisbury Craigs. The Castle itself is built on a bluff intrusive igneous rock having a sheer perpendicular fall on its western shoulder of 200 ft. to the lower plateau of Prince's-street. Prince's-street, again, is 200 ft. feet above the level of the sea, while the valley of the Water of Leith at Dean Bridge is about 120 ft. lower than this. Just at this point an accident occurred the other day of which we happen to have mislaid the account; but it was of this nature. At Randolph Cliff a portion of rock, estimated at 100 tons weight, fell one evening about seven o'clock into the pathway below, causing much anxiety and consternation in the neighbourhood. Fortunately, no one was passing at the time, so that no accidents occurred, and no lives were lost. A detachment of policemen were sent to guard the spot until the fallen *débris* was cleared away by the authorities.

We particularly wish to state that this is not an isolated nor an unrequent occurrence. Not long ago a huge piece of rock became detached at Salisbury Craigs, which overlooks the beautiful valley of the Queen's Park, from a height of 400 ft. Down it came, thundering and crashing into the valley, and alighted among a group of innocent schoolboys, one of whom was fearfully injured, and who afterwards, we believe, died in one of the surgical wards of the Royal Infirmary. Just suppose this accident to have happened during a gala day when the park was crowded, or at a volunteer review! On another occasion, we remember, a mass of rock, weighing 50 tons, became detached from the cliffs under the south wall of Edinburgh Castle, and fell into the roadway of Johnstone-terrace, during the night, with a noise like thunder. It was fortunate indeed that this fall did occur during the night, for had it occurred during the day the loss of life might have been appalling. Once more: there is a

brewery, situated under the cliffs of the Calton Hill, which was severely damaged the other day by a similar accident; indeed it may, for anything we know to the contrary, be at this moment as liable to extinction as the ancient villa of Lucullus (Castel dell' Novo), which was buried not long ago under the precipitous cliffs of Pizzofalcone, near Naples. Now, in the case of a dreadful catastrophe like this occurring in Edinburgh, we should like to know who is to blame. Such a thing may occur it will be admitted.

"The oaks of the mountains fall;
The mountains themselves decay with years."

It has been wisely ordained that rocks of every description shall slowly disintegrate and subside into soils; and this process of weathering is always most apparent after a severe winter, or rather after a succession of severe frosts. It may be safely affirmed that there are no special circumstances which render Edinburgh free of the operation of such natural laws, or which absolve her rulers from the guilt of neglecting them. Naples, it will be allowed, is as beautiful, and we have no doubt, as well governed a city as Edinburgh; and at Naples there were seventy lives lost. What security, we again ask, has Edinburgh against such a dreadful catastrophe? We are sorry to answer the question—there is absolutely none. It is only after the fatal event has occurred that the activities of the Edinburgh authorities come into play. In such a possible calamity we can imagine the Lord Provost and the Lord Dean of Guild actively engaged in digging up the mutilated corpses of the citizens; and an able report on the expense incurred in the operation presented to the next meeting of the Town Council by the burgh engineer. It is also possible that a day of fasting and humiliation might be ordained by the United Presbyterian churches; and most probable that a Bill would be brought into Parliament by the senior member for Edinburgh to prohibit entirely the sale of spirituous liquors in Scotland! And so would the municipal conscience be satisfied, and once more go to sleep!

Seriously speaking, this is a subject which should at once be seen to. No city in the empire, if we except the metropolis itself, can boast of so many and such eminent scientific men as Edinburgh; and this is a matter which scientific men alone can dispose of. It is needless to expect much knowledge, or even much foresight or discrimination, at the hands of a corporation which is composed, as we understand, chiefly of respectable tradesmen. The Lord Provost Chambers, one might suppose, would constitute an honourable exception; but then his lordship is often in a minority upon public questions—as, for example, on a recent occasion when the offer of the North British Railway was refused; and Prince's-street, one of the most beautiful esplanades in Europe, was selected for the site of a vegetable market.

We shall now say a few words about the fires. Towards the close of last year Edinburgh was the scene of two or three most disastrous and calamitous fires; in fact, they are more properly described as conflagrations. It is hardly necessary to say that there was great destruction of property; we must also tell there were some severe and more than usually harrowing cases of the loss of life. The circumstances under which these fatal occurrences originated show very little grounds for believing in the wisdom or public spirit of the Edinburgh local government. But our readers shall judge. On the 9th day of September, 1867, there was an explosion, and consequently a fire, on the premises of a firework manufacturer in the Canongate, which eventually turned out to be the most shocking disaster which it had been our lot for several years to record. The results were the death of five persons, and dangerous injuries to at least nine others. However alarming this dreadful explosion was in front, it was in the rear of the tenement that its terrible effects began soonest to appear.

Chessel's-court, notwithstanding its worn and dilapidated appearance, is still the most spacious court in the Canongate; and the stair leading to the floors of the tall tenement entered from the court. By this solitary stair it is possible, we believe, that such a number as 120 human beings had ingress and egress to their separate domiciles; and this egress was barred by a terrific flame from the firework-maker's back door. No sooner were the inhabitants of the floors above aware that they were imprisoned than a scene of terrible agony occurred. The women were

to be seen at the windows shrieking madly for help, and wringing their hands with indescribable anguish and bitterness. It is horrible to tell, but it is true, that the wretched and maddened mothers at length began to throw their children over the windows; yet up to this moment there was absolutely no appearance of the fire-brigade. To collect the fire-brigade in Edinburgh is a task of some difficulty and research, as the firemen do not attend at the stations, and are in general occupied with other professions. It is melancholy to add that there was no fire-escape. Such an invention at that time had not penetrated into Scotland, and so the process of pitching over the children proceeded. At length help of a better kind began to arrive. A soldier, a private dragoon of the Scotch Greys, took command of the crowd. Mr. R. M. Ballantyne was seen to rush through the flames. Mr. Slater brought a long ladder from his yard, and with much exertion and after some unsuccessful efforts it was raised against the wall. A sailor immediately climbed up and began to rescue the terrified inmates. But the ladder was too short. One good-looking married woman, named Ferguson, about thirty years of age, in a paroxysm of frenzy and despair, leaped from the window to the ground; and her body, horribly fractured and mangled, was in a few moments afterwards transported through the crowd to the Royal Infirmary. Other poor women were seen aloft clinging to the wall, and holding on to the lintels and the burning window-sills, terrified at the prospect of the fatal leap. Several of the inmates were unaccounted for; and some, it was found, were suffocated or burning inside the walls. But we will not prolong the agonizing scene. At length the fire-engines did arrive, but of course there was no water. There is very little of that commodity to spare in the old town of Edinburgh, as we have often pointed out; the manufactories for which the supply is chiefly reserved, lie for the most part at the outskirts of the city. A feeble pressure, however, was somehow got, and the engines when once under play did excellent work. We shall venture to pass by the valorous exploits of the civic authorities,—the lord provost, the magistrates, the town councillors, the town clerk, the lord dean of guild, the burgh engineers, the superintendent of police,—who all arrived in due course, and are honourably distinguished in the newspaper reports. Nevertheless, great complaints were heard, we understand, at the Cross of Edinburgh about this period of the harassing nature of official life. For it must be recorded that on the following evening the terrified authorities were again started in their sleep and aroused from their slumbers by another fire of still greater magnitude,—also arising from the combustible materials of another dangerous trade, which had been long and successfully carried on by a distinguished councillor now retired from office,—and occurring in another poor and densely-populated locality. On this occasion, although many severe accidents happened, fortunately no lives were lost; for the fire-engines were early on the spot, and there was a copious supply of water. It is proper to add that not long afterwards a fire-escape was procured for the city of Edinburgh—not without considerable opposition in the town council by certain wise and honourable members, who still persisted in maintaining that the best fire-escape and the highest security that Edinburgh possessed was the long staircase of stone!

ON THE FOREIGN ARTISTS EMPLOYED IN ENGLAND DURING THE SIXTEENTH CENTURY, AND THEIR INFLUENCE ON BRITISH ART.*

WE now come to an artist of much greater importance than Volpe, the excellent Florentine painter and architect, Anthonio, or Toto, dell' Nunziata, in his youth a pupil of Ghirlandajo's, and a formidable rival ("*uno sprone del del continuo lo pugnava*") to the all-accomplished Perino dell' Vaga. In him we at length meet with an artist gifted with special talent for architecture. He, like Torrigiano, and probably most of the other Italians who entered the service of the king, "was taken [*condotto*]" to England by some of the Florentine merchants. There (says Vasari, in his "Life of Perino dell' Vaga") Toto executed all his works, "and by the king of that province for whom he wrought

* Comp. "A Voice from Edinburgh after the Storm," p. 112, *ante*, and "The Duties of the Burgh Engineer," p. 215. In this last article a reference is given to the sections of the local Acts regulating the engineer's duties, which certainly do not coincide with the *Scotsman's* statement "that he has other and quite different duties to perform."—*Vide the Scotsman*, February, 1868. Indeed, it would be very curious if he had. But we must own that the duties of the burgh engineer of Edinburgh seem to be of rather a complicated character, if we may judge from the following advertisement which appeared in the same newspaper:—"King's Stables.—Lots to Let. Occupied by Messrs. McLean & Hope, Rent, 28s.—Apply at Burgh Engineer's Office, Police-chambers."

* By Mr. M. D. Wyatt. See p. 423, *ante*.

in architecture (as well as in sculpture and painting), and for whom he built his principal palace, was most handsomely rewarded." The credit is due to my friend the late Mr. Carpenter, of the British Museum, of having been the first to notice this passage, and identify Toto with the design of Nonesuch. Not only was Nonesuch the principal palace built by Henry, but it was the only one he can be really said to have built; and it was, moreover, 'so different from all other palaces, in England at least, as to have fairly earned its cognomen. Toto's earliest education had specially fitted him for dealing with such an infinity of allegorical and quasi-pictorial sculpture as that with which we shall find Nonesuch to have been adorned; since his father, in whose "hottegh" he was first brought up, obtained his nickname of "Nanzata" from his annually furnishing all the quantity of imagery with which the Feast of the Annunciation was wont to be set forth in a tangible shape at Florence. From Mr. Gough Nicholls, who wrote a capital notice of Nonesuch in the *Gentleman's Magazine* in August, 1837, I borrow the following notice of the edifice:—

"The original and principal structure was of two stories, the lower being of substantial and well-wrought freestone, and the upper of wood, richly adorned and set forth, and garnished with a variety of statues, pictures (i. e., coloured figures in relief), and other artistic forms of excellent art and workmanship, and of no small cost.* Its roof was covered with blue slate. In the centre, over the gatehouse to the inner court, was a clock-turret, and at either end of the structure, east and west, was a large tower of five stories high, commanding an extensive prospect. This singular building remained in good condition for more than a century; for it is noticed both by Evelyn and Peeps, in their diaries in the year 1665, when it was temporarily occupied by the office of the Exchequer during the prevalence of the plague in London. 'I took (says Evelyn) an exact view of the plaster statues and bas-reliefs inserted 'twixt the timbers and panchions of the outside walls of the court, which must needs have been the work of some celebrated Italian. I much admired how it lasted so well and entire since the time of Henry VIII., exposed as they are to the air, and pity it is they are not taken out and preserved in some dry place: a gallery would become them. There are some mezzo-reliefs as big as the life. The story is of the heathen gods, emblems, compartments, &c. The palace consists of two courts, of which the first is of stone, castle-like (built in the reign of Elizabeth), by the Lord Lumley; the other of timber, a Gothic fabric, but these walls incomparably beautified. I observed that the appearing-timber panchions, entrelaces, &c., were all so covered with scales of slate, that it seemed carved in the wood and painted, the slate fastened on the timbers in pretty figures, that has, like a coat of armour, preserved it from rotting. There stand in the garden two handsome stone pyramids.' Peeps describes the same features as 'figures of stories and good painting of Rubens's or Holbein's doing; and one great thing is, that most of the house is covered,—I mean the posts and quarters in the walls,—with lead, and gilded.'

"In the earliest description of Nonesuch, that published in Brann's 'Civitates,' 1532, it is stated that Henry VIII. 'procured many excellent artificers, architectes, sculptors, and statuaries, as well Italians, French, and Dutch as natives, who all applied to the ornament of this mansion the finest and most curious skill they possessed in their several arts, embellishing it within and without with magnificent statues, some of which vividly represent the antiquities of Rome, and some surpass them'—terms which are echoed by Camden in his 'Britannia,' who declares that Nonesuch was 'built with so much splendor and elegance that it stands a monument of art, and you would think the whole science of architecture exhausted on this one building. It has such a profusion of animated statues and finished pieces of art, rivaling the monuments of ancient Rome itself, that it justly receives and maintains its name from them.'

Henry VIII. did not commence the erection of Nonesuch before 1538, for it was in that year that he acquired the site, previously called Cuddington. It was still unfinished at his death, and remained so during the reign of Edward VI., but in that of Mary it was completed by the Earl of Arundel, 'after the first intent and meaning of the said king his old maister,' and

the front quadrangle was afterwards added by the Earl's son-in-law, Lord Lumley, from whose hands it reverted to the Crown in 1591 by exchange for other property."

Fortunately, we may form a good idea of the aspect of Nonesuch from early prints, the most important illustration being the view taken by George Hoefnagel in 1582, an impression of which is amongst the choice engravings shown in the King's Library of the British Museum. In whatever capacity Toto may have worked for the king, in the records he is always described as "paynter," and he ultimately held the appointment of "serjeant paynter." In the accounts he is always associated with "Bartilmew Penne" (Bartolomeo Penni), another Florentine, with whom, no doubt, he generally worked. Much discussion has taken place amongst the learned as to the identity of this Bartolomeo Penni with the Luca Penni, brother-in-law to Ferruccio Vaga, mentioned by Vasari as having entered the service of Henry VIII. In spite of Vasari, I am inclined to believe that they were two individuals of the same family, Luca being in the service of Francis I., and Bartolomeo in that of Henry VIII. Like Inigo Jones subsequently, Toto was an ingenious designer of "masques and entries," as his father had been before him.

If Bartolomeo even were Luca, neither is it to be confounded with another Luca, a painter of Leyden, who came over here with a large family, tempted by the reports of Henry's magnificence. At least so says Walpole, whose error in confusing this Lucas with Cornelius Hayes, whose name occurs in a list of new year's gifts for the thirtieth year of Henry's reign, in which mention is made of a silver cup given to Hans Holbein, made by "Corneli," has been pointed out by Mr. Franks in the "Archæologia," vol. xxxix., page 8.

We now come to an artist whose ability must have been first-rate—Nicholas of Modena, generally described in the accounts as "kerver." He appears to have entered the king's service in 1537, and to have continued attached to the Court at any rate as late as the fifth of Edward VI. (1552). He made the royal effigy (the "picture," as Machyn calls it) which surmounted the king's coffin at his death; and Mr. Nicholls has unearthed, *inter alia*, a curious description of a contemporary work of art as "hy Modeno a feire picture" (no doubt carving, the term "picture" being constantly used to describe basso and alto reliefs), "paynted the Freche King his boole personage, sett in a frame of woide." This entry has assisted Mr. Scharf in identifying as by Modeno the beautiful little figure of Henry VIII. standing on the capital of an Ionic column, exquisitely carved in bone stone in very high relief, which formed one of the greatest of the Strawberry-hill treasures. It is now in the possession of Mr. Dent, of Sudley Castle. In spite of its diminutive size, Mr. Scharf recognizes it as one of "the noblest representations of King Henry in existence." It once belonged to the Arundel collection, and afterwards to Lady Betty Germaine; it bears, therefore, a good pedigree. From identity of style Mr. Scharf also attributes to Modeno, a fine circular medallion of stone in high relief in the Long Gallery at Hampton Court, which has been hitherto associated with the name of Torrigiano. I cannot help thinking that the beautiful statuette of St. George and the Dragon standing on a fine cinque-cento pedestal, carved in wood and gilt and painted, in the collection of Mr. Louis Huth, is by the same hand, if not by Rovezzano (see *ante*, page 425) or Torrigiano.

Of Ambrose, "paynter to the Queen of Navarre," I have been able only to find that on the 13th of June, 1532, he received some twenty crowns "for bringing of a picture to the King's Grace to Eltham." It is not probable that such an artist would have visited this country without desiring and receiving some employment from so liberal a patron as Henry VIII. bore the reputation of being throughout Europe; but of what nature any such employment he may have obtained was, or what status Ambrose himself occupied as an artist, I have been unable to discover.

Of not much greater note appear to have been the three Bernardi,—viz., Theodore the father, and Antony and Lambert his two sons. They were all brought to England in 1519 by Bishop Sherburne, and employed by him on several pictures illustrating the history of the diocese of Chichester, which in a sadly repainted and mutilated form have descended to our days. Dallaway considers that the chambers in Conday

Honse were also painted by them; and they were probably amongst the earliest of the decorative painters whose peculiar arabesque work adorned the architecture of the Renaissance in England, and set the fashion of the rich coloured decoration subsequently followed in the great Elizabethan houses. Purity of style, however, of painted arabesque never seems to have obtained to any great extent in England. The King's notion of decorative painting seems to have been divided between heraldic insignia and fantastic "imprese" or emblems. He was particularly fond of ordering the introduction of the "Kynghes hestes," and the King's or the Queen's "wordes" with "knotys" and "badgys"; and the royal vagaries in this way frequently go far to spoil the designs even of the accomplished Holbein. He appears, nevertheless, to have kept some skilful Italian decorative painters about him; and no doubt the miniaturist Ellis, Alice, or Alys Carmillyon Millyner, otherwise Elia Carmillione Milanesa, who was in his service from 1523 to 1548, was well versed in the fine decorative style of Northern Italy and the school of Leonardo and Luini.

Girolamo da Treviso, by whom the fine altarpiece representing "the Madonna and Child enthroned with Saints and Angels," in our National Gallery, was painted, and who stands next upon our list, was born at Treviso, in 1497. Having failed, as it is related by Vasari, in a competition at Genoa with Porcio del Vaga, about 1530, he quitted his native country and entered the service of "hief Harry," as a "magister tormentorum," or engineer. He was killed by a cannon-ball in the year 1544, at the siege of Bologna. Henry having failed in inducing Raffaele to visit England, had to content himself with Trevisano, who was one of the closest imitators of the great Urbinese, not in his painting only but in his architectural and decorative studies as well. His knowledge of engineering was, however, his special recommendation to the king, and led to his employment at a large salary and to his most honourable entertainment by his master, whom he delighted with "alcune prove d'edifitii ingegnosi cavati da altri in Toscana e per Italia."

But for his inopportune and early death at the age of thirty-seven only, Girolamo would probably have done more for architecture in England than any of his contemporaries who practised in this country. With him closes the list of Italians, predecessors, contemporaries, and rivals of Holbein in England; and it remains for us now to trace rapidly natives of other countries who fall into the same general category. I cannot, however, but preface my notes on this portion of my theme by drawing attention to the notable deficiency of the supply of artists or art-workmen from France. One can only attribute this to the combination of several accidents—1st, the greater fame of the Italian schools; 2nd, the influence of the Italian merchants resident in London; 3rd, the old tendency of Flemings to suck the golden eggs of Britain; 4th, the rivalry of the merchants of the Steyerland with those from Italy; and 5th, the King's jealousy of Francis I. and the French.

When Holbein visited England, bringing with him his letter of introduction from Erasmus to Sir Thomas More, in probably the year 1526, he was himself but thirty-two years of age, King Henry VIII. being four years his senior, and having occupied the throne since 1509. At the date of his arrival, although one John Browne held the office of serjeant painter to his Majesty, the really ablest artist resident in this country appears to have been Luke Hornebolt of Ghent.* This clever painter's father, Gerard, and his sister Susanna, were both residents in England before the year 1523, and such was the talent of the lady especially, that Albert Durer records in his diary, that when he visited her father in Antwerp in 1521:—"Item. Master Gerard, the illuminator, has a little daughter about eighteen years old, named Susanna, who has illuminated a little leaf, a Saviour, for which I have given a florin. It is a great wonder that a woman can do so much." Guicciardini is scarcely less emphatic when he declares "that so excellent was she in illumination, that the great King Henry VIII., with noble gifts and abundant provisions, enticed her to England, where she lived many years in great favour and estimation with all the Court; and there, finally, she died

* Specimens of Hornebolt's ability may be examined in the shape of twenty-one drawings of allegorical subjects added to the collection of the British Museum during last year.

† Descrizione di tutti i paesi Bassi.

* Survey of the Parliamentary Commissioners in 1650.

rich and honoured." Susanna's great rival as a miniature painter, in addition to Eliza Carnillione, already noticed, was Lavinia Teerlinck, daughter of Simon Benninck, of Antwerp, best known as Simon of Bruges. Mr. J. G. Nicholls, in his admirable essay in the "Archæologia," "On the Contemporaries and Successors of Holbein," has given many interesting particulars touching this lady, and her ultimately great popularity with Queen Elizabeth, whom she painted many times, and from whom she received in return many valuable presents of gilt plate. She also was one of Henry VIII.'s importations. We hear further of a very clever female artist in the same style, one Katherine Maynor, of Antwerp. She was, no doubt, thoroughly imbued with Holbeinism, as her brother Harry was one of his most intimate friends.

The extension of the arts of printing and engraving diverted these able female artists from their original vocation, the embellishment of manuscripts for royal libraries, and no doubt induced them to turn their attention to the delightful practice of miniature portrait painting. So transcendent is the merit of the finest miniatures of Henry VIII.'s time, that writers of art have, until quite recently, been willing to attribute them to no other hand than that of the immortal Holbein himself. The important discovery in February, 1861, of that artist's will by Mr. W. H. Black,* and the fixture thereby of the date of his death in 1543,—eleven years earlier than the date at which it had been previously believed to have taken place,—have imposed upon cognoscenti the burden of discovering by whom the works were done, which, clearly referable to the eleven years in question, had been previously hesitatingly ascribed to Holbein. Among these are many miniatures of the highest excellence, the merit of the execution of which must now be restored to their rightful owners above enumerated—clever descendants of the great misal painters of Italy and Burgundy. The conclusion is then forced upon us, that the same hands which painted the miniatures of these eleven years must have done those which exactly correspond with them, and which must have been completed before Holbein's death. Away, then, melts the tradition, which was never very satisfactory, although universally accepted, that Holbein was the great founder of our national school of miniature painting, ultimately made so illustrious by the Hilliards, Oliver, and Coopers. Fortunately his reputation needs no hurried plume, and there is quite enough left to prove his just title to the admiration and estimation in which he ever has been, and must always be, revered as one of the ablest artists who ever lived. The artistic quality he possessed in the highest degree was, I consider, the intensity with which he realised "form." Able master as he was of delineation, what gives the stamp of enduring truth to his work is the feeling of assurance his delineation conveys to the mind of the spectator, that what he has drawn from life was the "very effigies" of what he saw; that what he designed could never be executed with equal propriety in any other way than as his drawing defined it. There is never any uncertainty as to his intention or meaning. What he says was, what he says should be, should he. In this precise conception of pure form, and power of conveying his own sense of it to others, he stood upon the same platform as the great men to whose universal genius I have already alluded—Albert Dürer and Leonardo da Vinci. The artist who possesses in a high degree any such power as that I have attempted to define, must of necessity have the requisite aptitude for success in either painting architecture, or sculpture, or all three; since the power in question lies at the root of and is indispensable to the satisfactory practice of either or all. Architects will do well to look earnestly at each relic as time has spared of the genius of Dürer, Da Vinci, and especially of Hans Holbein, since, so far as I know, they were the best makers of working drawings who ever lived. Of whatever they drew they gave every characteristic, and their slightest sketches never fail to mark essentials and to omit secondaries of form and expression. How often in architects', painters', and sculptors' studios is the reverse the case.

Happily there is no need now to dwell upon Holbein's career as a painter, for the excellence

of recent memoirs of him, published both at home and abroad, leave little or nothing unillustrated on that head. His peculiar interest to us is his genius as a designer, and the impetus given by his example and practice in substituting fresh models of beautiful form for the feeble mannerisms into which Gothic art had sunk at the date of his arrival in this country. This took place in the year 1526, Holbein being at that time in his twenty-eighth year. He came to us from Basle, where he had been practising designing in all its branches for about ten years. The existence of many works at Basle referable to this period induced, until comparatively recently, the not unnatural supposition that Hans Holbein was a native of that city. The only difficulty which this theory presented was the very great one of discovering from whom he could, if reared at Basle, have received the peculiar education in art which made him a great master at so early an age as from eighteen to twenty. That term may rarely be applied to one who united at so early an age, in such a place as Basle, and at almost the beginning of the sixteenth century, the following qualities:—a competent knowledge of the theory and practice of drawing and painting; an unerring eye and thoroughly-trained hand; a mastery over the rules of composition and design on the best Italian traditions; an acquaintance with the forms and proportions of classical architecture and ornament; a thorough technical facility in applying art to industries demanding specific design, and a pliant facility which enabled him to lend himself to each conventional form of design, as though that particular form had been his individual speciality. Happily the demonstration by Dr. Pesevaux, in 1846, that Holbein had been reared in Augsburg, from whence, at the age of about eighteen, he removed with his father to Basle, "came to the front" to solve the mystery of much which appeared inscrutable, and to account for Holbein's having acquired in early youth that universality of practice which distinguished his maturity, and which specially brings him within our notice this evening. I need scarcely remind you, that as one of the most considerable of the old imperial free cities of Germany, Augsburg shared with Nuremberg the first extension of commercial and manufacturing energy from Italy Northwards and towards the West. The princely mercantile houses of the Fuggers and the Welsers rivalled the Bardi and the Medicis in the vastness of their operations, and in the encouragement they gave to art and artists. They brought to Augsburg the handicrafts as well as the products of Milan, Florence, Venice, and Genoa, and preceded the rest of Europe in disseminating the principles of the application of the types of Renaissance form to architecture and industrial art. This was the hot-bed in which the budding genius of Hans Holbein was forced, and here it was that he learnt, like the most famous contemporary Italians, how to apply his dexterity and readiness in design to every possible theme. In fresco, oil, stained-glass painting, designing for the early printers, Froben and Bebelius of Basle, Trechsel of Lyons, and at a later date probably, Pynson in England, wood-blocks, title-pages, borders and alphabets, making working drawings for jewellers, metal workers, weavers, tapestry workers, wood and stone carvings, and even for masons and carpenters, he exercised himself freely during his residence at Basle, and so much to the delight of the citizens, that great efforts were made to recall him even after he had taken root in this country.

It would be beside my present object to dwell upon the circumstances of his life, his friendship with Erasmus, by whom he was introduced to Sir Thomas More—his employment by Henry VIII.—and the portraits and pictures he executed for the king and others. My aim is to recall to you the evidences we are fortunate enough to still possess of his admirable talents as a designer. First and foremost amongst such evidences, as exhibiting the widest range of his powers, must be placed the invaluable small octavo volume of designs, principally for jewellers' and cutlers' work, which is preserved amongst the Sloane MSS. in the British Museum. This precious little book contains as many as 182 subjects, mounted upon twenty-nine pieces of card-board. The designs are for the most part drawn with a pen with black ink, and then some slight touches of brown have been put on for the shadows.

Most of the designs have the ground blackened, the ornaments being left in white. Some of the jewels are entirely coloured, and are

often touched up with gold; several of them are designed for enamelling in high relief.

It ought to be remarked that there are certain circlets with groups of figures in them "or *impresa*," and jewels introduced; these might possibly be intended for "enseigns," to be worn in the hat. No one can fail to be struck in looking over this book with the great use evidently intended to be made of niello, or black inlay, an art then exceedingly popular in Italy, through Maso Finiguerra, Peregrino da Cesena, &c.; in fact, it is used in nearly every one of the designs. This, no doubt, was an Augsburg novelty, borrowed from Italy, and popularised by Holbein and others; indeed much jewelry of the age shows this peculiarity. Another most noticeable point in these designs is their entire and absolute freedom from any trace of Gothic manner. Holbein no doubt derived great advantage from the works carried on around him by the various admirable Italian masters of ornament, by whom, as we have seen, Henry had surrounded himself. Many of the objects, designs for which are contained in the volume under discussion, were no doubt intended for the new year's gifts, with which kings, nobles, and commoners annually reciprocated expressions of good-will, and with the particulars of which the Royal and other accounts of the period are teeming.

In all these beautiful designs, and indeed in all the accessories introduced in his pictures, the artist has proved his clear practical acquaintance with the technical processes by which he contemplated the realisation of the effect he aimed at. Nothing is left vague; and the artisan is, as it were, taken by the hand and aided by the designer, instead of feeling himself hampered (as is too often the case in modern designs) by the impracticability of successfully rendering the effect of the working drawing by any process known to either the workman or the draughtsman.

While rendering all due tribute to the masterly power of the inventor, justice should also be done to the executants, who met, for the fitting elaboration of such complex and ambitious designs, involving the combination of ornament both superficial and chased in the round, with the human figure nude, and in vigorous action, have been craftsmen of no mean skill. Let us now endeavour to see who some of these were. The King's leading goldsmith, by whom, no doubt, Holbein's splendid designs for plate were chiefly executed, was "John Anwarpe," or John of Antwerp, who was one of the witnesses to his will, and to whom he died indebted in the sum of six pounds, no small amount in those days and in comparison with his own yearly salary from the King of thirty pounds only. Some of his other designs for precious arms, &c., may probably have been wrought by another witness to his will, Anthony Sneider, "a farmer," who is considered by Mr. Franks* to have been one of the "Almayne" or German art-workmen employed at the King's palace at Greenwich. Others of this band, probably Augsburgers, as Holbein himself was, since they were the best of all German armourers, whose names have been lost to us, may have executed such objects as the daggers, &c., I have attempted to describe. Of other foreigners whose names are recorded in the traditions of other branches of production, and who may have worked for the King from Holbein's designs, the most worthy mentioned were Jan Mustyan, a native of Enghien, Henry VIII.'s arras maker, John de Mayns, his engraver, and Richard Atsyll, his precious stone and cameo cutter.

It is curious that the high estimate of the technical powers of Holbein in every department, his universal practical aptitude, in fact, which the scanty relics of his working drawings, preserved here and at Basle, vindicate on all occasions, is corroborated by the epithet applied to him in an interesting letter from Erasmus introducing him to Peter Agidius, wherein he describes him simply as an "insignis artifex," i.e. not painter, nor architect, nor sculptor, but simple workman—master of all crafts, the true magister "artium," answering to "the maker" of the Greeks.

In architecture I would not wish to detract from Holbein's merit; but we have seen, from the number of different able Italians employed by Henry VIII. before the date of Holbein's arrival in this country, how much reason there is to doubt Walpole's assertion that "the beginning of reformation in building seems owing to

* See the "Archæologia," vol. xxxix., in which the text of the will, and Mr. Black's, Mr. Nicholls's, Mr. Franks's, and Mr. Schatz's comments on the altered aspect thrown by it upon contemporary art history are printed *in extenso*.

* Discovery of the will of Hans Holbein.

Holbein." Of his work, so far as I know, one specimen only remains, viz., the porch or "loggia" at Wilton. I cannot admit this, nor indeed has it ever been so considered, as beautiful, but it is at any rate free from any admixture of Gothic detail. Of the two gates he designed for the king at Whitehall, now removed, plates are given in the "Vetusta Monimenta." One of the Whitehall gates was built in glazed bricks, in different colours, and was decorated with four large circular medallions of huts in terracotta, possibly the work of Rovezzano, or one of the other Italians skilled in the processes of Northern Italy. I have already alluded to the existence of medallions of a somewhat similar kind at Hampton Court and St. Donat's Castle, Glamorganshire, as well as in great quantities in the king's private collection.

One can feel but little surprised at the redundancy of these "tables in earth," since not only were many doubtless brought to this country from Italy, where, at the beginning of the sixteenth century, the productions of Luca della Robbia and his successors, as well as those of the ordinary majolica manufacturers, enjoyed the highest vogue; but it has been recorded that many Italians, skilled in all the contemporary ceramic processes of their country, quitted it to practise their art in other parts of Europe. Thus we know that one of the "Castel Durante" artists, Guido di Savino, and his two sons, made majolica at Antwerp during the earliest years of the century.

What further architectural works Holbein may have done can now scarcely be traced. There is, however, one very important one, which has not hitherto, so far as I am aware, been ascribed to him, but which, from internal evidence, I cannot hesitate to believe must have been executed from his designs. I refer to the splendid woodwork of King's College Chapel, Cambridge. In its way, it is a model of Renaissance wood-carving, revealing in every arabesque, and especially in the ornaments of the imbrices, the peculiarities of classical form as they were first, if I hear the Italian into German by Albert Durer, Aldorffer, Peter Vischer, and others, including Holbein. A comparison of this work with the detail shown upon his admirable design for a richly and highly-elaborated chimney-piece, having on it the arms, &c., of Henry VIII., probably executed for one of his palaces, drawn with the pen, and washed with Indian ink and colour—from the collections of Richardson and Horace Walpole—now in the print-room of the British Museum, will at once, I think, serve to establish the identity between the designers of one and the other monument.

In judging of the influence exercised on architecture and the industrial arts, of which architecture must ever have been and he the foster-mother, by such men as Holbein and the Italians, of whom mention has been made, it should ever be remembered that our impressions are derived, not from all they did, but from the "disjecta membra" alone of their greatness which time and tradition have spared to us.

With Holbein's death, now clearly ascertained to have taken place in 1543, perished the last of the great artists whose talents were trained on the old Italian system of art-education to fructify in every field, and to yield fruit of every variety. From that time forwards, in this country at least, painters were painters, sculptors sculptors, and architects architects; but the great masters of arts, to whom form was everything, and the medium by which it was to be expressed a matter of comparative indifference, fade from the range of historic vision.

No research has yet clearly made out who "Johannes de Padua," the celebrated architect who mainly took the place of Holbein as Henry VIII.'s chief engineer, really was. The earliest document referring to him appears to be the patent which appointed him "Devizor of his Majesty's Buildings," in 1541—the year after Holbein's death. Mr. Worman, in a note, supplementary to one by Dallaway on the subject, states the fact that it was in this same year that Girolamo da Trevisi, the former official architect to the king, met his death. He hence infers that Giovanni succeeded to Girolamo. Dallaway observes that in the above year Henry had completed his palaces, and "little more could have been done before his death in 1547." I think it would be altogether wrong to assume from this that John of Padua did nothing for the king before the date of his appointment by patent, since he would scarcely have obtained his formal

nomination unless he had already proved his capabilities to that potent monarch's satisfaction. This view is supported by the terms in which the king granted him in the same year a special fee of 2s. per diem. He gives it of his "assured knowledge," as well as "mere motion," and further, "in considerations boni et fidelis serviti quod dilectus servicus noster Johannes de Padua nobis in architectura, ac alias in re musica inventis impendit se impendere intendit." We thus find that he had won upon the king's good graces by his musical, no less than by his architectural skill. Moreover, the works at Nonsuch were far from being complete at that date. After the king's death, Giovanni probably entered the service of the Protector Somerset, for whom he carried out the magnificent palace in the Strand, which was left in a very incomplete state when the once all-powerful noble met his untimely end upon the scaffold.

Beyond his work at Somerset House, which appears to be well authenticated, I must confess that much which has been attributed to John of Padua appears to me apocryphal, and Longlet, especially, scarcely answers to one's expectation of what a regularly-educated Italian architect's work was likely to have been. The necessity for such education began to be seriously felt in England even before the supposed date of the commencement of Longlet (1567), since as early as 1550 John Shute was sent to Italy expressly to study architecture, by John Dudley Duke of Northumberland. As Dallaway remarks, John Shute, on his return in 1563, published the first scientific book on architecture which appeared in our language. His principal foreign rival was apparently Theodore Have of Cleves. He is honourably mentioned in the annals of Caine College, Cambridge, as the author of the pillar and stone erected in Dr. Caine Court ("*hæca constructio toto solaris decoratum*"), of exquisite and wonderful workmanship, bearing sixty dials (*horologia*). He is further on stated to have been "an excellent artist and celebrated professor of architecture," and he is supposed (on, I think, good grounds) to have been "the architect" to whom Dr. Caine had in his lifetime prescribed "the exact model and pattern" to which his celebrated Gate of Honour (completed in 1574, after the doctor's death) was "enviously worked" in "squared and hard stone." I need scarcely recall to my readers the strict and pure classicism of this interesting specimen of pedantry. It is a singular illustration of the *multum in parvo* system which may frequently be found in Flemish work, and is strictly and perfectly monumental in every respect except size.

With Have's work and Caine's death, with Shute's return from Italy and the speedy dissemination in England of the general treatises upon architecture which began to be multiplied on the Continent after the middle of the sixteenth century, the necessity for the employment of foreigners in this country as architects and designers no longer existed, and in their place there grew up the native school which, headed by John Thorpe, soon increased: so that before the end of the century, numerous as the foreigners may have been who were employed as painters and in some other branches of art, none of any great importance beyond those already alluded to seem to have practised as general designers or architects. Still, although not so practising, many foreigners helped to maintain the "prestige" which all the forms of Renaissance art popular in the other countries of Europe had come to be regarded in England. A brief allusion to the principal amongst the great family may, therefore, suffice for our immediate purposes. Those who wish for full details may be referred to the pages of Walpole and Dallaway, with the admirable corrections of Messrs. Franks, Gough Nicholls, and Scharf in a recent volume (the thirty-ninth) of the "Archæologia." The leading foreign painters to whom the portraits supposed to have been painted by Holbein between the year 1543, in which he has recently been proved to have died, and the year 1554, in which until recently he had been supposed to have died, were the three following: Johannes Corvus of Flanders, Gherardus Plecoens—or, as he is occasionally called, Gervas Flicx, Flicens, or Flicious—of Germany, and Guillim Stretes, a very able artist, whose principal works may be referred to the reign of Henry's successor. From the great care and accuracy with which personal jewelry, the patterns of dress and embroideries, and even architectural backgrounds of Renaissance character, were painted by these artists, there can

be no doubt that they were well acquainted with ornament and decoration; but we remain without evidence of their having ever practised design, or influenced contemporary architecture otherwise than as skilful draughtsmen cannot at any time avoid doing. Their main efforts were certainly devoted to portraiture, and there was unquestionably a falling away from the grand activity in monumental art which distinguished the whole reign of Henry VIII. Even decorative painting flourished but little under the auspices of Edward VI.

In Queen Mary's reign we come to Sir Antonio More, who was a native of Utrecht and scholar of Jan Schorel. Originally in the service of Philip II. of Spain, he was sent to England to draw Queen Mary's portrait, which he did in a very courtier-like manner. At the end of her reign he followed Philip to Spain, whence ultimately, getting into disgrace, he returned to the Netherlands, under the patronage of the Duke of Alva. He is believed to have died in 1573. He painted in Holbein's manner, but often neglected to put his name to his performances. They are consequently difficult to recognize. He principally painted portraits, but also executed some few historical pictures.

In Queen Mary's reign we had another excellent foreign artist here for a short time, who was by many of his contemporaries regarded as rivaling Titian, even as a colourist, in spite of the strange extravagancies of disposition and manner which gained him the cognomen of "zotte," or fool. Our hero, Justus van Cleef, Mr. Worman believes to have died in 1556, and not in 1536, as has been usually supposed. Van Mander's story of the artist's insanity having been occasioned by his disappointment at the failure of his introduction by Antonio More to Philip II. of Spain when he came to England to marry Queen Mary, and which event took place in 1554, furnishes a strong corroboration of the probability that his death did not occur until the later of the two above-mentioned dates. Don't has arisen as to the nationality of a contemporary of Van Cleef's, the Nicholas Lyzarde (probably Lizardi), who was a leading court painter from 1547 till his death in 1571.

Lucas de Heere, whose allegorical picture of Queen Elizabeth at Hampton Court with the date of 1569, will no doubt be remembered by my readers, was born in 1534. His father was a good sculptor and architect, and ultimately placed his son under Franz Floris. He became a good designer, and worked for the tapestry weavers and glass-painters. I cannot find, however, that he did anything but paint portraits in this country.

Although after Lucas de Heere many distinguished foreign artists worked in England up to the end of the century—such as Frederigo Zuechero, a decorative painter of great facility; Cornelius Ketel, who painted in public with his feet; and Mark Gerrard, a clever general designer, whose portraits of Queen Elizabeth will be in your memory; Henry Cornelius Vroom, who made the cartoons for the Spanish Armada tapestries burnt in the fire of the Houses of Parliament; Petruccio Ubaldini, the last of the illuminators attached to the Court, &c.—it would profit us little to dwell upon their works or merits. It is enough for us, as architects, to note their residence amongst us. Happily, the rapid formation of the great English school of architects, to whom we are indebted for the creation of so many of those heartily picturesque old buildings which we generally call Elizabethan, and which Mrs. Hemans had no doubt in her "mind's eye" when she so well apostrophized—

"The stately homes of England,
How beautiful they stand,
Amidst their tall ancestral trees,
O'er all the pleasant land,"—

released us from dependence upon foreign aid, and kept alive the flame of that lamp of symmetry and comeliness in structure which ultimately, through Jones and Wren, shed its rays far and wide; not through England only, but to every land and clime in which such noble and right royal architecture as theirs will and must be cherished as long as arts may flourish and mankind endure.

In conclusion, pardon me if I have dwelt at too great length upon my theme. You will certainly do so if I may have succeeded in imparting to you a tittle only of the interest and enjoyment with which I have tried to live again through memory with the pioneers who cleared the way for the onward march of the revival of Classical architecture in this our native land.

THE SANITARY HISTORY OF CROYDON.*

The sanitary measures to which the inhabitants of Croydon were driven in past years, by ill health and great mortality, complemented, as they were, by the legal compulsion under which they were obliged to act in cleansing the local stream, which their sanitary measures had fouled, afford altogether a most instructive sanitary history, to which we have often adverted, and which is likely to form the key to the deadlock into which the sanitary question has got, so far as regards the disposal of Sewage. Mr. Latham, the engineer to the Croydon Board of Health, has given, in his report, recently issued, a concise sanitary history of Croydon; and although this history is nothing new to our readers, it may be worth while to condense the particulars by way of refresher to the memory from Mr. Latham's report.

The average mortality of Croydon for the seven years prior to the construction of works of sewage and water-supply was 23.66 per thousand; but, in 1848, the year previous to the adoption of the Public Health Act there, the mortality had risen to 28.16 per thousand. In 1848 the population of Croydon was 19,880; in 1851, 20,855; in 1851, 30,240; and in 1857, 50,755. The rate of mortality for the last thirteen years (viz., since the works have been completed and in successful operation, in 1855) has been only 18.64 per thousand; and the mortality for the past year (1867) only 16.6 per thousand; and without the Union-house, which contains the aged and infirm from thirteen parishes, it has been only 14.73 per thousand! The birth-rate has increased from 29.1 per thousand before the construction of sanitary works, to 31.4 per thousand, on the average of years since; but during the last year it was 34.0 per thousand. Thus the birth-rate by its increase, and the death-rate by its decrease, show, beyond dispute, the great value of sanitary works. Between the years 1855 and 1867 there has been a mean population of 37,375 persons living in Croydon, and the mean saving of life has been a reduction from 23.66 per thousand to 18.64 per thousand in thirteen years, or a reduction in the death rate of 5.02 for every thousand people of the mean population, which, in the thirteen years, equals 2,439 lives saved.

The benefits that were first conferred by the execution of sanitary works in Croydon were purchased at the expense of fouling the river Wandie, and other streams. The evils arising from the practice of turning the sewage into the river, and the serious effect of nine actions or injunctions, either restraining the Board from following the practice, or obliging them to make satisfaction for the damage caused, had the effect of hastening a remedy which has been found in the application of procuring suitable land for the purpose have been very great; but, on two occasions an opportunity offered, and about 130 acres of freehold land have been bought for the purpose of securing an outfall in the natural drainage valley of the district. Other land has been taken on lease; and the sewage is now constantly applied both at Beddington and South Norwood. By a process, therefore, perfectly natural, the foul contents of the sewers, instead of polluting the rivers and streams, the soil and the wells, are adding vitality and richness to vegetation, and, at no distant day, will add materially to the wealth and prosperity of the parish.

The results of the application of the sewage to the soil are extraordinary. Large and luxuriant crops are grown, while the foul streams are converted into comparatively pure water. The following analysis by Dr. Odling, of the effluent water after purification by irrigation on the land, will show the result. It is an analysis of samples taken every quarter of an hour by the doctor's assistants on the 23rd and 24th November, 1867; and this was not a very favourable period of the year for demonstrating the success of the system.

The sewage at the time was flowing over 30 acres of land, on which it had been continuously flowing for about two days; the volume of sewage passed on to the area in the twenty-four hours, was 3,274,300 gallons, and the effluent water, flowing off after purification, was 2,245,200; so that 31½ per cent. of the whole

volume was lost by evaporation and absorption. As the land was completely saturated prior to the experiments, it may fairly be taken that 15.75 per cent., or one-half the entire loss, is due to evaporation through the plant and from the water surface. This would tend to condense any impurities that remain in the effluent water in the proportion of the reduction of volume. In the analysis given, the result that would be obtained by condensing the water-supply, is shown in the second column:—

	Sewage of Croydon after purification by irrigation. Nov. 24, 1867. Grains per gall.	Water supply of Croydon, condensed to same extent as sewage. Grains per gall.
Total solid residue	26.180	25.233
Mineral matter	25.025	24.877
Volatile matter	1.155	.422
Chloride of Sodium	3.400	1.081
Ammonia012	.037
Nitrogen as ammonia033	.039
" oxides413	.281
" organic matter144	.0023

A comparison between the two columns will show how nearly the sewage has returned to the state of the pure water as supplied to the town. It may be observed, that the total amount of organic and volatile matter contained in the effluent water after passing over the land, is less than the average amount contained in the water supplied by any one of the existing London water companies; and, therefore, it may safely be laid down that sewage, after such purification, is fit to be turned into any stream or river.

Some doubts have arisen as to the probable effect of spreading large volumes of sewage over areas in the immediate vicinity of populous places; but the result, in a sanitary point of view, of the application of sewage to land, is equally assuring; for we find, upon examination, that Norwood, with its irrigation area close to the inhabited district, during the three years that the system has been applied to the land, has had a mortality of 18.17 per thousand in 1855, 15.13 in 1856, and 14.21 in 1857; while the same area, but inclusive of more distant localities, has had, during the same period, the respective mortalities of 21.26, 20.04, and 16.60; so it appears that, in the rapid growth of the plant, the assimilation of nitrogenous and carbonaceous matter, and the elimination of large volumes of oxygen by the plant, we have the antidote for what might have been thought to prove harmful in its effects.

How much society loses annually by preventable diseases it is impossible fully to estimate, as health is so essentially connected with the labours and duties of every-day life. We know full well that the power of physical ability forms the basis of every description of labour, whether bodily or mental, and that the full value of work cannot be obtained from a sickly, and, therefore, a feeble population. Those communities, therefore, that are in a bad sanitary condition are great losers. The national prosperity of the country is impeded by any undue amount of sickness or loss of human life. If there were no higher motives, it would be true economy to spend some of our earnings on sanitary works. Some estimate of the probable result of the value of sanitary works can be formed in the following manner:—1st. The saving in the cost of funerals, inclusive of mourning and fees, which may safely be set down at 5*l.* each. 2nd. The saving by the escape from sickness, with its cost, and its loss of labour; and it may safely be taken that, for every life saved by sanitary works, twenty-five persons escape sickness, and that 1*l.* per case would represent a moderate value of the result. 3rd. The value of the labour saved to the country by prevention of premature death. For every adult female, 5*s.* per week, and for every adult male, 10*s.* per week, or a mean of 7*s.* 6*d.* per week, may be taken as the value of labour over and above the cost of maintenance.

Comparing such savings in Croydon with the expenditure that has achieved them, we shall see at a glance the pecuniary benefit resulting from sanitary operations. The total expenditure, as set forth in the schedules accompanying the report, for the purchase of freehold lands, public baths, construction of water-works, sewers, sewer irrigation works, shafts, and general improvements of all kinds, has been 196,135*l.* 6*s.* 5*d.* But, though outlay of this kind is generally called "expenditure," as if, like personal expenses, it were spent and gone, leaving nothing in hand in lieu; yet, for the above-

mentioned outlay, the more proper name for it would be "investment," as I shall show hereafter that the parish has in hand permanent improvements and possessions of a larger amount of value than the total sum thus expended. But had the money been all spent without the acquisition thereby of permanent possessions in water-works, land, baths, slaughter-houses, sewers, kerbing, &c., still there would have been a sufficient *quid pro quo*, an acquisition of advantages, or, in other words, a saving from losses of greater amount of value than the outlay. It has been shown that 2,439 lives have been saved. Of this number six-tenths, or 1,463, would be adults, or persons above the age of twenty years, and probably one-tenth of these would be infirm from age. By making this deduction we have still 1,317 lives, in the full vigour of life, saved. By using the figures before quoted in connexion with the lives saved, we shall get the money value of the benefits conferred by the works:—

2,439 funerals less, at 5 <i>l.</i> each	£12,195 0 0
2,439 × 25 = 60,975 cases of sickness prevented, at 1 <i>l.</i> each	60,975 0 0
1,317 value of labour, at 10 <i>s.</i> 10 <i>d.</i>	166,828 5 0
for 13 years	£239,998 5 0

In the short space, therefore, of thirteen years, a saving in money and labour, exceeding in value by 25 per cent. the total expenditure for all purposes, has resulted from the outlay on sanitary works. And although it has been here attempted to put a money value on the expenses and labour lost by the loss of life, yet this is exclusive of the value of life itself. But who shall value the lives? or who can estimate even the improved health, in point of enjoyment, of the living? These 2,439 persons, saved from the jaws of death in this parish, are living testimonies of the great value of the sanitary works that have been carried out.

It should not be forgotten, too, that the cost of the various works has principally been spent in the parish, and additional employment has thus been given to a large number of parishioners. The money has been circulated, both directly and indirectly, among those who will have to pay the cost of the works. In the winter of 1856, employment was found for some hundreds of men out of employ, in pushing on the new public works; and thus a number of men were employed for the good of the parish, who would otherwise have been a burden to the ratepayers.

Much misunderstanding exists with regard to the supposed increase of the rates of the parish, occasioned by the permanent works. The local Board's rates are made twice a year; and, if we assume that all the monies now secured on both special and district rates, were to be levied as a separate rate, the two half-yearly rates of 7*½d.* each would pay off the interest and principal in thirty years. At the end of thirty years from this time, by the payment half-yearly of 7*½d.* in the pound on the rates, the water-works, freehold lands, public baths, shafts, and every other property or work of the Board will be free of any charge.

NOW AND THEN.

ANY person who is addicted to the harmless practice of "moralising" may find food for reflection in the gradual disappearance which is now taking place of the most ancient portions of the metropolis. So imperative are the requirements of commerce that all other considerations have to give way; indeed, if we continue pulling down at our present rate for a few years longer, there will not be a carved doorway or oriel window within the hills of mortality. Londoners will have little left to them but the Tower and Westminster Abbey as connecting-links between the present and the past.

I am induced to make this remark by the metamorphosis of a favourite old street of mine in the heart of the City,—a street savouring somehow of South Sea bubbles and kindred associations,—I mean Winchester-street, the thoroughfare conducting from Broad-street to London-wall. That part of my street dehonouring into London-wall had a certain historic interest, for it was one of the spots which escaped the Great Fire, and was an admirable specimen of Tudor street architecture. There is not much of it left. A tall, staring, prosaic, though no doubt useful structure, containing a range of offices, has taken the place of the tenements where tradesmen cried, "What d'ye lack?" and there Dick Whittington rose to be Lord Mayor of London. Other and scarcely less

* Report on the Permanent Sanitary Works and their Cost, executed in the Parish of Croydon, under the authority of the Local Board of Health, by Baldwin Latham, C.E., Engineer to the Board. Printed by F. Baldwin, Croydon, 1868.

ancient buildings here are coming down apace; burgher houses of the good old times when "country residences" were unthought of. These, also, will soon be probably replaced by gigantic combinations of iron and stone, to be filled presently from roof to basement with the busy sons of commerce; but if, dear reader, as you watch the progress of reconstruction, you should detect a faint murmuring sound, put it down as the groan of an amateur archaeologist sighing for the days that are gone.

But happily there are not many ancient quarters where utilitarianism has not found it necessary to intrude. Which shall we select for a visit? From Sir Paul Pindar's in Bishopsgate-street, to the craziest old tumble-down in Westminster, the mine is rich and varied. Take, for instance, the Strand, as the most conspicuous thoroughfare in which to look for examples of "Now and Then." There you shall see splendid modern shops surmounted by venerable old-world houses, of various styles and dates, the conjunction presenting, in the majority of cases, the most incongruous appearance, such as diamond panes versus plate-glass, or slender iron pillars substituted for the huge wooden beams which sustained the structure in former times. On nearing Charing-cross the buildings become more modern. The town residences and grounds of the nobility being in this direction, the "building mania" was held in check for a while; but the mightiest magnate must eventually give way before the popular need, so pleasure and earthiness had to make place for shop and printing-office, till the eloping banks of the river were covered with streets, marking by their names the situation of the former domains. As an instance of this, there are (or were) the four thoroughfares perpetuating the memory of John Villiers, Duke of Buckingham. Other streets remind us of the Dukes of Norfolk, and the Earls of Arundel, and so on.

One of the quaintest old corners in London, and appearing quaint still by comparison with its modern neighbour, Victoria-street, is Queen's-square, Westminster, where the wood-carving on the doorways is a sight for the curious. Indeed, in all parts of the metropolis having the least pretension to age this art is both abundantly and beautifully exhibited. You may spend a week in inspecting the doorway of the eighteenth century, and then you will have to begin again to arrive at a true comprehension of the different styles; for the earlier the date the more elaborate the carving. Speaking generally, there are three separate varieties, viz., the angular, the arched, and the flat surface supported by ornamental brackets. These are exclusive of those many specimens in which the doorway is flush with the wall of the house. So unmeritorious, however, are the modes of treatment that this classification only gives an idea of the outlines employed; the details are multifarious in the extreme. Among these a very common, though very singular, conception for such a purpose is a Gorgon's head surrounded by the traditional vipers. Faces of all sorts are very prevalent, and sometimes there occur series of figures joined together by festoons of flowers—a beautiful device. Sometimes figures are altogether dispensed with, and the entire affair takes the form of a sort of fluted radius, as in the well-known house in Sherborne-lane. I do not remember any of these designs depicting mythological subjects, probably from the smallness of the field at command.

If any one will take the trouble to compare this durable woodwork with the feeble etrusco which modern builders dash on our dwelling-houses, he cannot help awarding the palm to the designers of old. There is no "peeling" here. These old doorways seem unaffected by the acids of our London atmosphere; every line and curve remain as perfect as the day they were traced, in many cases nearly two hundred years ago. Is there any reason why we should not have carved wooden doorways now? The ductibility of the material is greatly in its favour, and enables the workman to arrive at beautiful results. Of course, if a gentleman can afford polished granite for his vestibule, by all means let him have it; but the next best substitute is wood, in which the orders of architecture can be easily and lastingly imitated. I am not a timber-merchant, though my observations may seem to indicate that there is "nothing like wood."

In the matter of churches our ancestors displayed great piety and liberality; though it is happily out of any one's power to make unfavorable comparisons between "now and then" in this respect. Yet it would be unjust

not to admire the strong religious feeling which in those days did duty for church holding societies and modern organization. The gifts, it is true, were in many instances of a decorative character—such as altar-pieces, stained glass windows, or rood-screens; still I think that the many charities and schools connected with our ancient churches attest that at the bottom of it all there was a spirit of true practical Christianity. There is an irresistible romance, too, about the history of those self-made men in the olden time. Of course, I am not going to deny that in our own day there are many poor boys who come to London with three halfpence in their pockets and begin by sweeping warehouses and end by becoming heads of firms; but in the former case there was more elbow-room; the battle of life was less feverish, and coolity was less artificial. Hence people had more time to be good. If this proposition be disputed, I can only ascribe my preference to the halo of distance. Most of the City churches, as successors of former edifices, date, as every one knows, from the Great Fire, which, among other things, made the reputation of that very hard-working man, Sir Christopher Wren.

Speaking of the public spirit of merchants and others in former times, it must not be omitted to be pointed out that our own age has been splendidly vindicated from the imputation of selfishness. A single leading example will occur to every one's mind.

Bridging over only from the seventeenth to the nineteenth century, vast is the difference between the London of now and the London of then. An ancient prophecy foretold its increase till a period when Highgate-hill should form its centre. Whether this prediction will ever be verified is of small moment to the Londoners of to-day, who have ample matter for study in the comparison of the present and the past of their huge metropolis.

If many a beautiful legend of our childhood, crushed by the stern heel of truth, has altered its character as much as the antipastoral thoroughfare of Drury-lane, let us still be thankful that there is before every one of us an extensive sphere of Christian work and usefulness.

FRANCIS ALLEN.

SANITARY MATTERS.

The Application of Town Sewage.—At a recent meeting of the Maidstone Farmers' Club, Mr. Thomas Cargill, C.E., delivered a lecture on "The application of town sewage to general farm crops." Messrs. Bridgland, J. Payne, Wm. Payne, Stonham, Plomley, Ely, Chittenden, Waterman, Day, Wyles, Thos. Reeves, jun., Jesse Killick, Punnett, Austin, Killick, Hodgson, Berling, Foster, Else, Still, Harris, Allfree, G. Chambers, Wm. Reeves, Thos. Hayes, Bridgland, jun., Marley, and Fauchon, were present. Mr. Cargill said in the outset that to the question, "What is to be done with our sewage?" there was but one answer, "Apply it to the land," but to the question, "How to apply it?" or rather, "How to apply it in the most economical and remunerative manner," the answer was not so simple, owing to the fact that it had not received that thorough investigation which it demanded, and which must be accorded to it. Sewage had always been considered by us as a nuisance, and as a thing to be got rid of somehow and somewhere at any price, and men continued to shun and avoid the evil instead of grappling with it, until it assumed a character so alarming and proportions so gigantic that at last self-defence urged them to adopt measures calculated to mitigate what was fast becoming a national scourge. Even at the present time this was the view entertained most unfortunately by the majority of Local Boards and Corporate authorities, who, as a rule, have accomplished little or nothing regarding the disposal of their town sewage. Sewage must be taken as it came from the sewers to impart the greatest benefit to crops. At Tottenham, Leicester, Birmingham, and Manchester, various disinfecting and decolorising schemes had been tried, which had all resulted in complete failure. At one place 4s. per ton were barely obtained for that which was expected to realize 4l., while at Birmingham scarcely 6d. per ton could be got for the solid residue left after decolorisation and evaporation. It must not, however, be understood that in some instances, as at Beddington, abundance tanks could be altogether dispensed with. From the facts laid before the meeting, the lecturer said,

in conclusion, it is manifest that the future system of sewage farming will be a combined one, and will consist in so proportioning the relative amounts of grass and arable land as to dispose of the sewage in the most effectual manner.

"The Utilization of Sewage Irrigation."—A letter on this subject has been addressed to the town council of Doncaster, by Mr. J. Hindle, of that town. In extracting so much matter as he has done from the elaborate papers "On the Utilization of Sewage by Irrigation" in late numbers of the *Builder*, Mr. J. Hindle might have made some reference to the papers to which he was indebted.

LAYING CHIEF STONE OF GATESHEAD TOWN-HALL, AND SERIOUS ACCIDENT.

The foundation-stone of the new Town-hall for Gateshead has been laid. The style of architecture will be Italian, treated with some freedom in the details. The architect is Mr. John Johnston, of Newcastle-upon-Tyne; the contractor, Mr. Hulman, of Hexham; and the clerk of the works, Mr. W. Burnip, of Gateshead. The building, when completed, will afford accommodation for the mayor and town council, and for the whole of the municipal officials, including the police, besides a court-room for the transaction of police and county court business, and a music-hall for the public. There will be three distinct entrances from Swinburne-place, and the numerous entrances throughout the structure have enabled the architect to completely classify and isolate the various departments of the corporate business. The principal front of the building will stand back from West-street some 30 ft. or 40 ft. The main floor of the building may be described as consisting of a centre and wings, each having its distinct entrance from the front, but communicating internally by means of spacious and well-lighted corridors. The cost of the edifice will be about 12,000l.

At the laying of the foundation-stone, according to the local *Observer*, from whose report we quote, there was an extensive platform erected for the accommodation of about 500 persons parallel with Swinburne-place; and at a right angle with it, backing West-street, was a second wooden gallery for the accommodation of ladies, of whom there was a fashionable assemblage, numbering not less than 250. At the north-west corner, at the angle of the two platforms, the stone was laid. Near the apparatus were a number of stone buttresses and walls newly built, and from one of those points of supposed advantage, immediately adjoining the scene of action, deal planks were placed flatly across at a height of about 7 ft., so as to connect the general platform, which was supported by 2½ in. deals, driven at intervals of about 6 ft. or 7 ft. into the ground. Across the uprights were placed planks, chiefly with their edges turned up, to impart additional strength, and from the main points of the foundation of the fabric thus reared timber stays were inserted obliquely from the front to the rear elevation. The space underneath was partially filled up with props, at distances of 6 ft. or 7 ft. square.

In the midst of the proceedings a loud creaking noise became audible from Swinburne-place, and the general platform was noticed to be slightly swaying, and in a moment a terrific crash was heard,—the platform had given way at the top and centre, and its occupants were thrown into a confused heap below. The pressure on the platform had forced the screws out behind, and there being only a few deals underneath, the forward pressure had had such an effect that the timber after twisting and wrenching had been forced to snap, and the structure in the centre gave way. Happily, the ends of the platform remained firm, otherwise the result would have been much worse. A part of the platform remained standing, and this is accounted for by the fact that it was impossible for it to give way in front, as it rested altogether against the stonework of the building, and the occupants of this portion, perhaps fearing that they might share the fate of their unfortunate brethren, quickly got down to the ground. On making an examination of the place after the accident, it was at once evident that the pressure on the platform must have been very great, for the wall of the hall against which the part of the platform which gave way rested, is broken away. Several of the 3-inch deals, of which the stand was formed, were snapped in the centre; and the deal which sup-

ported the front of the platform, was not only broken, but forced out, showing that the pressure must have come from the back, which was but natural, as all the people would press forward in their desire to hear the various speakers. On the platform giving way the centre ends of the deals fell to the ground, and the other ends remained firm, thus forming, as it were, a hollow in the shape of the letter V; and to this is attributed the fact that no lives were lost. Those who were in the middle of the platform fell down heavily, a depth of about a dozen feet, but those at the sides had their falls broken. Altogether about 500 persons fell down. The people were all thrown in a heap, and those who were uppermost being uninjured soon succeeded in getting up and arriving safely on to the ground. Those who were at the bottom were found generally to be more or less injured, and had to be assisted.

The other platform, for the ladies and the corporation, was erected from a plan by Mr. Johnstone, architect, and when finished was carefully examined by the mayor and the townhall committee, who also would have examined the other platform had it been completed in time.

Certain superstitious individuals attributed the accident to the fact that three of the banners were hoisted in the reverse manner, thus signifying distress, amongst which was the British Ensign!

Somebody is, without doubt, to blame for the platform not being substantial enough for the purpose for which it was intended. "We are given to understand," says our authority, "that Mr. John Johnstone, the architect, is entirely free from blame, an assertion which we hope may be correct. The structure of the stand was most inadequate to the pressure which was universally expected, a fact which any competent builder ought to have been aware of. We understand that a special meeting of the council will be held on Monday, when the matter will be thoroughly investigated."

This case just affords another proof of what we have so often urged, that no such platform ought to be allowed to be erected or used except under competent supervision and certificate of sufficiency.

THE INSTITUTION OF SURVEYORS.

The first preliminary meeting of this Institution was held on Monday last, at the Westminster Palace Hotel: Mr. John Clifton, in the chair. Among the London surveyors were present,—Messrs. T. Horsey, T. Chafield Clarke, F. & E. Vigers, E. Ryde, R. A. Withall, D. Watney, F. Chinnock, H. Clutton, J. R. Bonny, J. Bailey Denton. Of the country surveyors, were Messrs. C. M. Bidwell, Ely; T. Huskinson, Epperstone, Notts; T. S. Woolley, Newark; T. Statter, Knowsley; &c.

The chairman, after recapitulating the proceedings already taken, in the formation of a Provisional Association, shortly stated the objects of the Institution, which were,—1st. To secure the advancement, and facilitate the acquisition of that knowledge which constitutes the profession of a surveyor; 2nd. To promote the general interests of the profession and attend its usefulness for the public advantage. He said the proposal to establish this institution had met with very considerable support, and that if all devoted their best energies to the work they could not fail to raise the status of the profession and ensure its advance in the public estimation.

It was then resolved, "that the institution be forthwith organized and placed in a position to commence operations."

The following gentlemen were chosen by ballot to be members of the council for the first year, viz. :—

Messrs. W. J. Beadell, E. N. Clifton, Henry Crawford, R. C. Driver, H. A. Evans, E. Ryde, W. Sturge, F. Vigers, F. J. Clark, J. Clutton, J. B. Deuton, R. Hall, T. Huskinson, J. Oakley, E. J. Smith, G. Trist.

The honorary secretary, Mr. J. W. Penfold, read the heads of the bye-laws, which provided that the institution should consist of three classes, viz.—Members, Associates, and Honorary Members, with a class of Students attached. Members to be more than twenty-five years of age, and in practice on their own account for more than five years, or members of a firm established upwards of ten years. Associates to be more than twenty-one years of age, not necessarily surveyors by profession, but their pursuits to be such as to

qualify them to concur with surveyors in the advancement of professional knowledge.

Honorary members to be persons who, by reason either of their position or eminence in science and experience, may be enabled to render assistance in promoting the objects of the institution.

The various regulations for election of members and officers, the constitution and government of the institution, the conduct of meetings, &c., were fully set out. These bye-laws were adopted; and, after a vote of thanks to the chairman and honorary secretary, the meeting separated.

THE TRADES MOVEMENT.

Birmingham.—In compliance with the invitation of the council of the local Chamber of Commerce, representatives of the Builders' Association, and of the Stonemasons' Union, met in the Exchange buildings, New-street, to endeavour to promote an amicable settlement of the strike. Messrs. Briggs, Creswell, and Hardwicke represented the employers; Messrs. Harding, Hatch, and Bradley, the operative masons. The principal points in dispute were discussed in a tone which encouraged the deputies on both sides to hope that an agreement may be arrived at. The meeting was adjourned for further conference. The masters have been endeavouring to introduce non-union labour; and it is said that, within two or three days they succeeded in engaging twenty men, who are carefully guarded from any approach on the part of the masons on strike.

Huddersfield.—The local Chamber of Commerce are taking steps with a view of founding a court for the settlement of trade disputes. A meeting of trades' delegates held recently in the town, passed a resolution in favour of the establishment of a court of arbitration, and the Chamber of Commerce appointed a sub-committee to bring about a meeting of representatives of employers and employed, with a view of giving effect to wishes which seem to be entertained on both sides.

PARIS NEWS.

The buildings on the Champ de Mars have nearly all disappeared, and the ground is being levelled; the only structures upright being the Commissariat offices, the Creusot shed, the International Club, in course of demolition, and one of the Eastern kiosks. All the ground between the Military School and the Palace is to be completely levelled by the 15th of August next.

The demolitions in the Faubourg Saint-Marcel for the boulevard of the same name have brought to light innumerable remains of old Paris, portions of the collegiate church of St. Marcel and the parish church of St. Martin, and an immense quantity of human remains. St. Marcel died in 436, and was buried in a place called Mont Cetary (*Mons Cetaryus*), corrupted since into Moutfard, and a chapel was built over his tomb. Sacked and pillaged by the Normans, it was rebuilt and enlarged in the eleventh century, and it was not finally demolished till 1806. The Abbé Lebeuf was of opinion that the crypt of St. Marcel dated from the ninth or tenth century, and the upper church, in its most ancient part, from the first half of the eleventh century. The tower had been built about A.D. 1040. Nothing remains of this but a Gallo-Roman hull, a bas-relief on one of the quoins, now to be seen in the Museum of Cluny. At the Ecole des Beaux Arts may be seen some of the capitals of the choir. The portion recently laid bare appears to be the extremity of one of the transepts; it was covered with flag stones, in the midst of which we observed some small trees. There is some talk of preserving this relic by putting a garden round it, bordering on the boulevard Arago.

At Montrouge the new chroch of Saint Pierre is almost terminated, and is shortly expected to be opened for public service. The tower, of cut stone from its base to the summit, commands a magnificent view of all Paris. The last finishing touch is being given to the ornamentation of the edifice, and, at the same time, the decoration of the choir is being terminated.

In the 20th arrondissement, at the south side of the Place Ménilmontant, the church of Notre Dame de la Croix, commenced three years ago, and destined to replace the chapel of the ancient village of Ménilmontant, has its rough masonry

completed. It consists of a grand nave, a vast transept, side aisles resting on columns and lateral chapels, and covers an area of 37,000 square feet. The steeple, placed over the porch, is 137 ft. high, and the porch will be approached by a monumental flight of steps.

One of the most interesting churches of old Paris, that of Saint-Merry, founded in the ninth century, and reconstructed under François I., is being restored. Commenced in 1520 to 1530, it was not terminated till 1612. The successive architects seem to have adhered to the original plan, as we remark none of those out-of-the-way changes so commonly seen in buildings for a long series of years under construction. The rich ornamentation of the western façade is well known to all lovers of architecture. The venerable crypt, in which the body of Saint-Merry, who died in A.D. 700, was deposited, has been restored.

BOATS FOR RAISING SUNKEN VESSELS.

Two new boats for raising sunken vessels have just been launched,—the *Persévérant* and the *Bon-Espoir*,—at the Quai de la Marne, La Villette, Paris. They have been both designed and constructed by M. Casimir Deschamps. They are 59 ft. long, 9 ft. 10 in. broad, and 10 ft. 6 in. deep, the burden of each being 250 tons. Commenced on the 1st of October, 1867, they were launched on the 25th of May, 1868, completely finished, masted, and rigged. What is most extraordinary is that these vessels of timber, strengthened by iron ribs, covered externally with iron plates, riveted together, and coated with Norway tar, were put together without the aid of any naval or mechanical engineer. M. Deschamps made his drawings on the spot, and executed them himself, aided by simple Parisian workmen,—carpenters, joiners, and smiths. The whole work cost 4,800*l.*, whereas in the ports of Havre, Cherbourg, and Nantes they asked him 6,000*l.* to 6,400*l.*

These boats are constructed on a new principle. Their rounded forms, which give them volume and stability, call to mind those of the steamers which ply directly between London and Paris. The hull is divided longitudinally into two parts, containing each thirteen strong iron plate-lined compartments, which can be filled with either water or air. Absolutely air and water tight, even under a pressure of five atmospheres, they remain separated or can be made to communicate according as is desired. Two series of tubes, furnished in front of each chamber, are laid down along the centre line of the deck, and place each chamber in communication with the pumps, either for removing the water or for driving in compressed air. Each chamber has, moreover, openings, through which the floor can be seen or a boy can descend. In the interval between the two rows of chambers, at certain distances, watertight pits or tubes descend from the deck to the sea, and serve for the passage of chains to be passed under the sunken vessel to be raised. The ends of the chains are to be wound round the very massive drum of a hoisting engine, worked either by manual or steam power, and capable of exerting a power of 25 tons. The interior working portions and accommodations are admirably arranged. At the fore is the captain's cabin, 13 ft. square; in the middle, the watertight air and water compartments; at the aft we have the boilers, engines, of 15-horse power, with Giffard's injector, &c., and an American motor of 10-horse power.

The life of M. Deschamps is a very eventful one. He was bred up as a sculptor, but his ruling passion was the raising of sunken vessels; for this he succeeded in creating a small fleet of lifting-barges; but they became the prey of a storm, and he lost all. Not discouraged, he became a simple bargeman, and up to his waist in water, axe or boat-hook in hand, he worked as a labourer. Still he thought on his invention. Friends and capitalists having come forward, he has now succeeded in constructing these vessels.

SOUTHWARK BRIDGE.—The Corporation of London have paid for rent of the Bridge, during about three years and a half, 18,868*l.*; and now pay for purchase of the Bridge, 200,000*l.*; making a total of 218,868*l.* The chamberlain has given cheques to the comptroller for the completion of this purchase, and the Bridge is now handed over for the public use.

MIDDLESBROUGH EXCHANGE: INTERIOR OF HALL.—MR. C. J. ADAMS, ARCHITECT.

EXCHANGE AND CLUB BUILDINGS,
MIDDLESBROUGH.

IN connexion with the illustrations of these buildings already given,* we add a view of the interior of the Hall. This apartment is about 120 ft. long, and 60 ft. wide, with a semicircular end 20 ft. deep. On each side of it are offices. The hall is partly lighted by openings in the roof, which are not quite so obvious in the view as might be desired.

REPORTS ON PARIS EXHIBITION BY
MASTERS OF SCHOOLS OF ART.

WE mentioned in our last that the first prize offered by the Committee of Council on Education for Reports by Art-Masters or Mistresses on the Paris Exhibition had been awarded to the Head-master of the Manchester School. We have now to add that the second has been awarded to Mr. Walter Smith, head-master of the Leeds School of Art (whose report appeared in our pages), and the third to Mr. Dewar Campbell, master of the Bridport and Dorchester Schools of Art. The International Exhibition was visited by 101 art-teachers, of whom twenty-eight made reports approved by their lordships.

* See pp. 374, 375, ante.

ANCIENT EARTHENWARE STOVE IN THE
RATHHAUS, OCHSENFURTH.

WE have several times mentioned in these pages the very remarkable and interesting Rathhaus existing at Ochsenfurth, near Würzburg. We must remind our readers that this is a building of the latter part of the fifteenth century, and is of the greatest value to the historian of ancient civil architecture on account of its having entirely escaped modernization; in fact, both internally and externally it remains much in the same condition as it was left by its fifteenth century builders. But what is still more remarkable most of the ancient fittings and furniture remain.

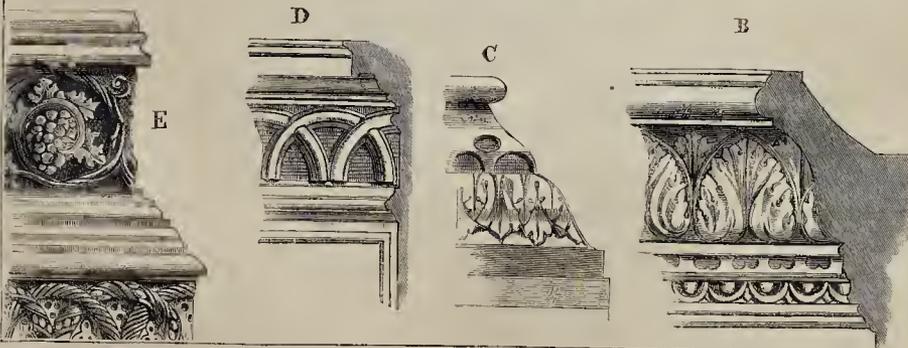

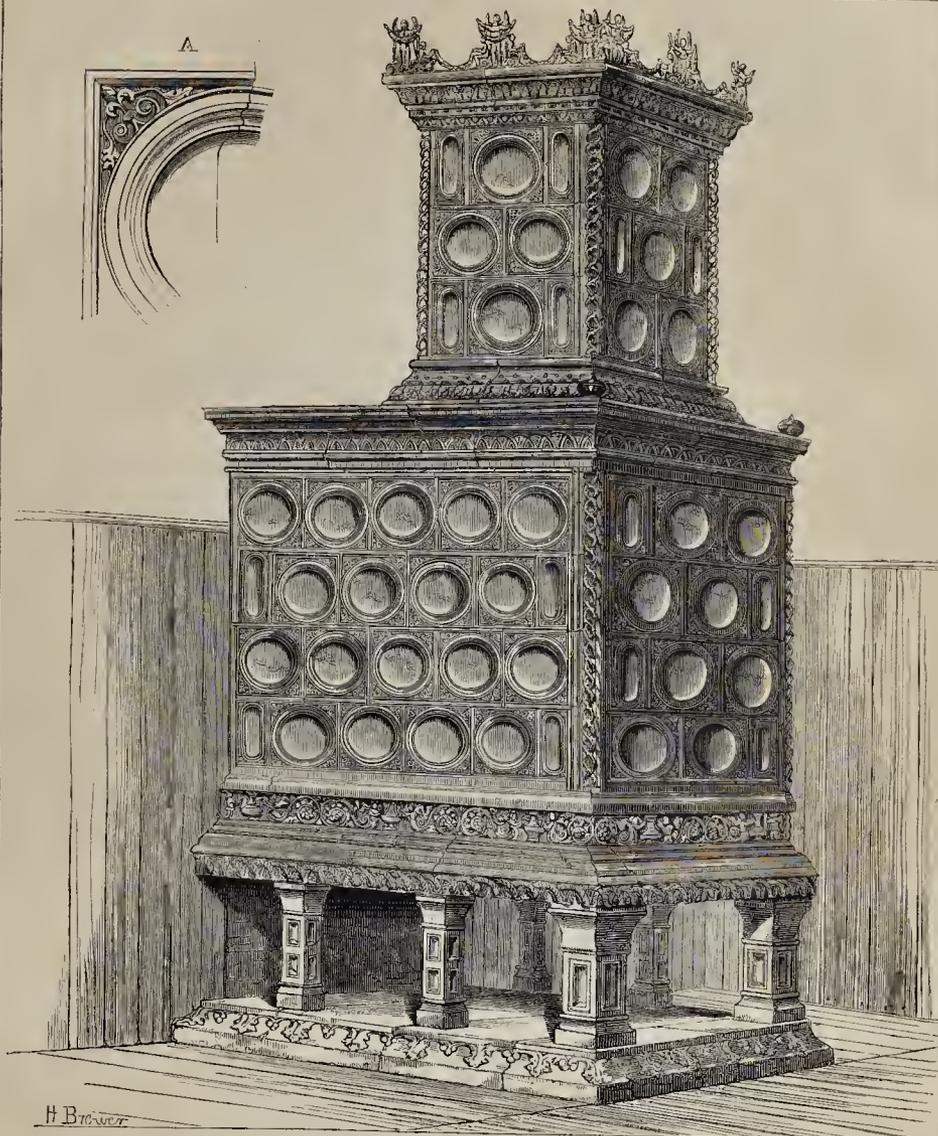

Our present illustration represents a large stove standing in a room in the upper story of the Rathhaus. This stove is of large dimensions, its entire height being not less than 9 ft.; it is placed near to the angle of the room, and the fuel is supplied to it through an opening in the wall from a passage at the back of the room. The materials made use of in its construction are green tiles and brown porcelain, both highly glazed, the plinth upon which it stands is stone. It is probable that this stove is coeval with the building, which was finished in the year 1499, or, at any rate, very little later. It is in a very perfect condition. All the details are beautifully modelled, and are singularly original in design. The curious mixture of Italian and Gothic ornaments is very noticeable; they are, however, all

used with such judgment and taste that there is not the least effect of incongruity. Portions of the cornice D, and the lower part of the base E, bear a remarkable resemblance to our English Norman work. The stone plinth has the regular "Tudor flower" so conspicuous in Henry VIII's Chapel, King's College Chapel, Cambridge, and other late Perpendicular buildings. The cornice and base, B and C, are nearly Classical; and the tile A is like a piece of Italian Cinque Cento work. On the whole, it would be difficult to find such a jumble of styles in one object anywhere else; and what seems singular is the fact that there is nothing crude or inharmonious in the design. The lamentable failures we usually make when we attempt any mixture of the kind shows that we are ignorant of the principles on which the old artists worked. In the Castle of "Transnichts," at Landslut, are several stoves of a very similar description to the one at Ochsenfurth, and they are probably of the same date.

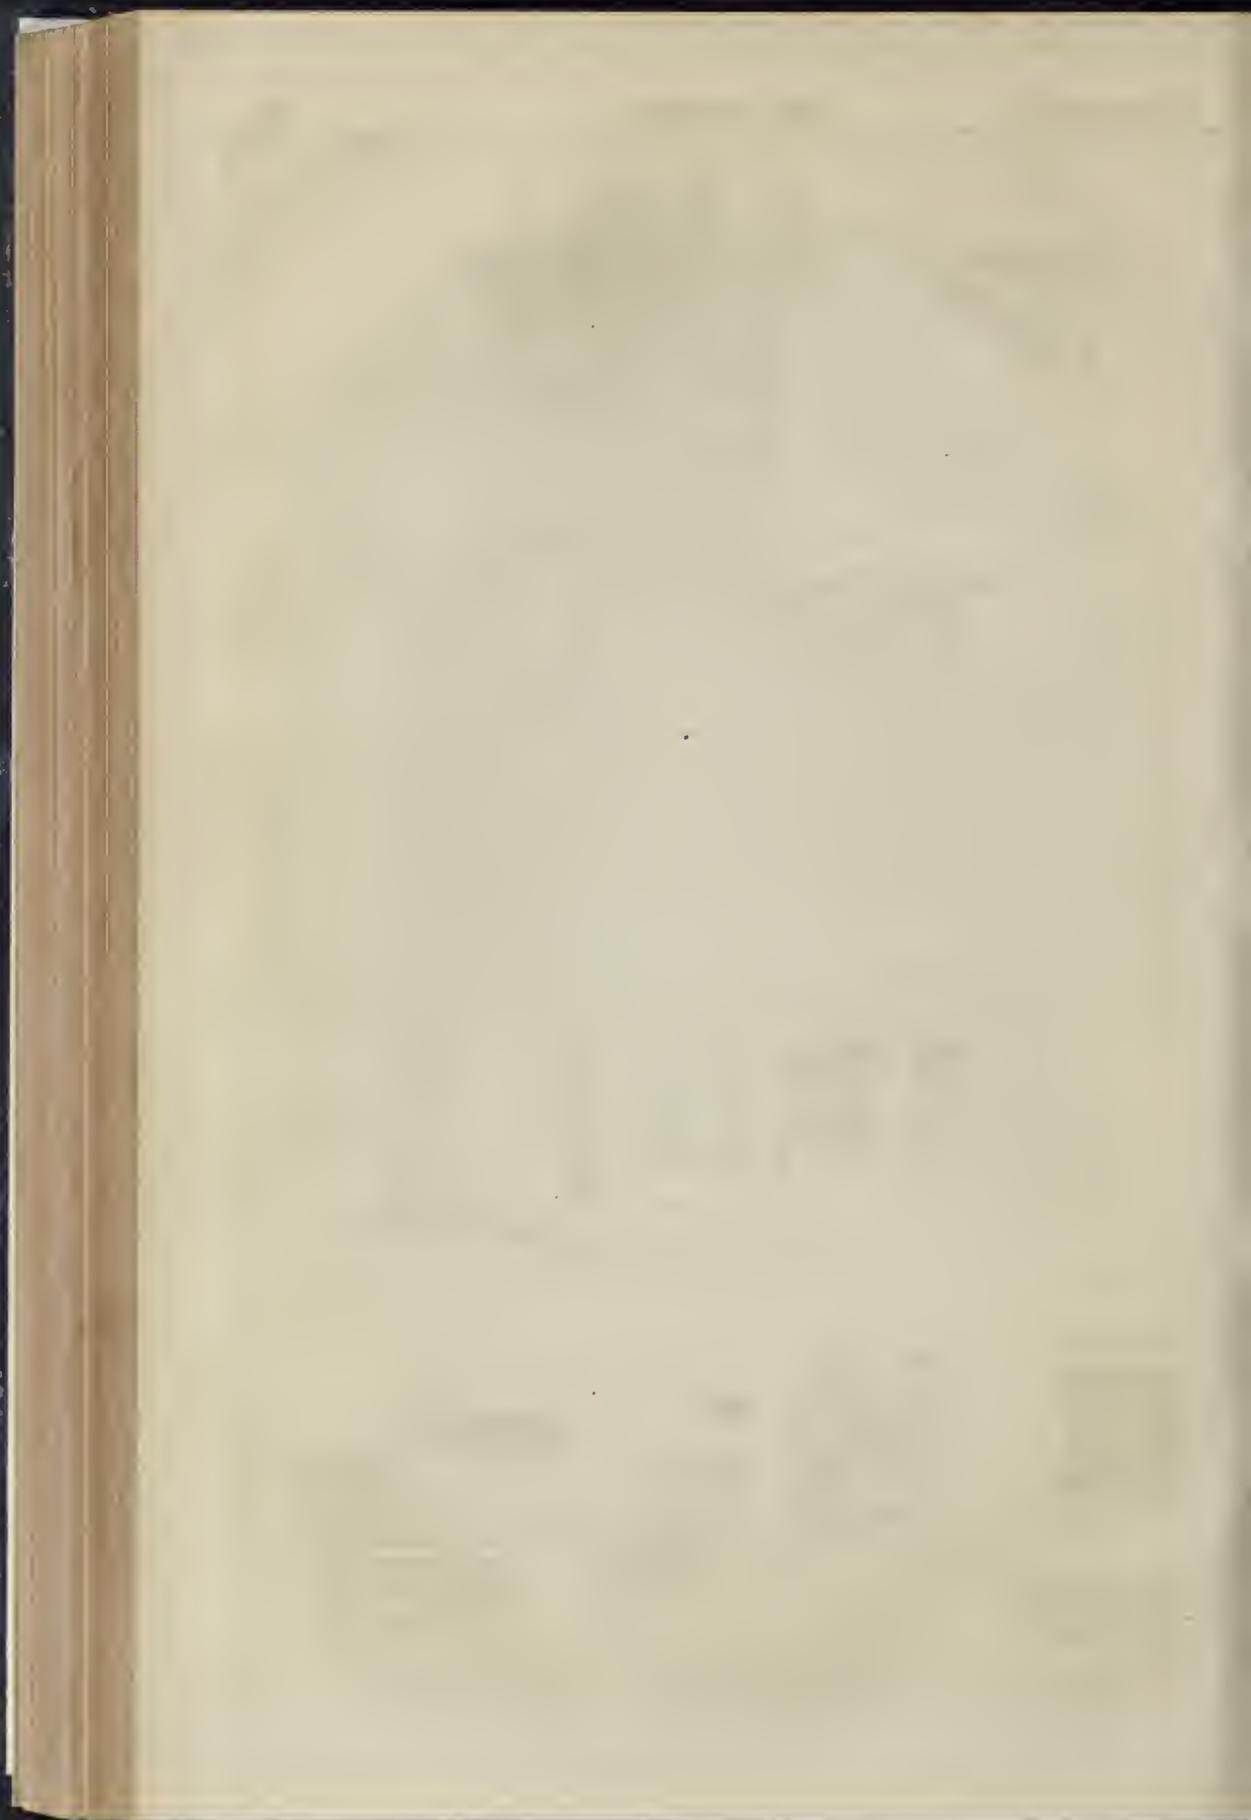

On another occasion we shall give illustrations of the ancient tables and other furniture remaining in the Rathhaus of Ochsenfurth.

ANCIENT EARTHENWARE STOVE IN THE RATHHAUS, OCHSENFURTH, GERMANY.

EARLY BRICKWORK.

ARCHITECTURAL ASSOCIATION.

At a meeting of this Society, held on Friday, the 6th inst., the Rev. E. L. Cutts, made some observations on the subject of "Early Brickwork." He said Mr. Gladstone had once remarked, that the three great inventors were those who discovered the ear, the wheel, and the plough; but he (the lecturer) hoped he might be allowed to add to these the name of the man who invented the brick. He was not going into the whole subject of brickwork, but intended to confine himself to England. Now, Britain was a Roman province for a long time. Many of the houses were then composed of brick; and as villas built in this way were very numerous, the country must have presented a very civilized aspect. Then came the Saxon invasion, and all those villas which had been erected were swept away. Some Roman remains, however, still remained, and perhaps the best specimens were to be found at Colchester. There was, he thought, very little doubt that much of the earlier Saxon and Norman brickwork was nothing more than the remains of the Roman bricks. Some parts of the monastery of St. Alban's had doubtless been erected in this way, the old brick having been utilised with good taste and effect. At Brodwell there was a church made out of these remains,—at least, he thought so,—although some of them might think it was of Roman origin, in which case it would be a most interesting structure. At Coggeshall Abbey there was to be found some moulded brickwork. It did not appear that it was looked down upon as an inferior material, because effect in the arrangement was a good deal studied. At Hull there was a good deal of brickwork, executed during the sixteenth century. In the time of Edward III. bricks were 6s. a thousand, and in the time of Richard II. they were 6s. 8d. for the same number. In the sixteenth century it became fashionable to use brick, and many important buildings were to be found made of that material. Sometimes the brickwork was found covered over with plaster to imitate stone. He thought it was a great mistake to use brick in such a building as St. James's Palace, and Queen's College, Cambridge. Stone ought to be employed where it was possible. But how was it that houses built of brick in old times looked better than those of the present day composed of the same material? He thought it was owing, in some respect to the difference in the shape of the bricks, and also of their colour. A brick house, if relieved by trees, generally looked well. Could they not, by studying effect, render a common brick wall of the present day more presentable? Moulding in this material should be of the simplest possible kind; it should be merely geometrical, and very plain in character. He protested against the introduction of coloured bricks into the façades of their street architecture; he was afraid, however, such a protest would bring him into disgrace, as the custom was very general. They were gradually turning London into a really beautiful city, and thus were beginning to use brick artistically; for instance, All Saints', Margaret-street, amongst others, showed it might be employed with advantage. But the common buildings ought to be more looked after, and by studying effect they ought to be able to make a common brick house not altogether, as it was now, an ugly object.

Mr. Edis did not agree with Mr. Cutts in his theory that the Saxon and Norman brickwork as handed down to us was made out of the ashes of the Roman remains. He thought it had an originality of its own. Modern brickwork had a tendency to get dreadfully dirty in cities; and whether or no it was that, like the Romans, we were becoming very rich, architects found it very difficult to persuade their clients to use brickwork, because a good many of the houses, and especially those intended for business, were built for the sake of show. The shapes and sizes of the bricks, too, were very bad, and capable of much improvement. If, however, members of their profession could only obtain good brickwork at reasonable prices, they would endeavour to make more use of it.

Mr. Blashill thought that economy was studied in the olden times, and that brickwork was used when stone could not be procured, for it must be recollected that most of the brickwork was found in the eastern part of England, where stone was very scarce. He did not approve of red brick and Bath stone being used together, as the contrast was very great, and a very crude

effect was thereby produced. He thought that the present size of brick was the correct one, and that any departure from it would increase the expense.

Mr. G. R. Redgrave differed in opinion from Mr. Cutts as to the superiority in the colour of the Roman bricks: he considered they were too light a shade. He had examined the chimneys of Hampton Court, and he believed they were not moulded, as the brick bore evident traces of having been out. With reference to the ancient bricks which were from time to time discovered, he believed they were Roman, and that the Saxons and Normans had adopted them. He came to the conclusion from the fact that the names of Roman makers had actually been discovered on some of the existing specimens.

Mr. Edis thought the chimneys at Hampton Court Palace had been originally moulded, but had been renewed by cutting.

After some remarks from Mr. Ridge and Mr. Birch,

Mr. Mathews said he believed that it was owing to the narrow frontages allotted to houses in cities of the present day that architects were unable to produce so good an effect in brickwork as was to be found in old houses built of the same material.

Architect-Volunteers.

Before the commencement of the business, it was stated that it had been proposed to form a volunteer company composed of members of this Association, in conjunction with the corps of the Artists' College. Moreover, that the proposal had now become *un fait accompli*, about seventy having been enrolled. The matter was brought under notice with the view of inducing others to join: the only expense attendant on their doing so would be an annual subscription of one guinea.

STEAM HOUSE-FACADE WASHING ENGINE.

We learn with reference to this process that, though it has been patented by a Frenchman, the priority and the merit of the invention are due to one of our countrymen, employed for upwards of thirty years on the Eastern Railway of France. His first experiments were made upon stones and pieces of sculpture, which were perfectly cleaned, on being simply exposed for a few seconds, to a stream of mingled steam and water from the water-level cock of his locomotive. He afterwards, by means of Giffard's injector attached to his engine, cleaned the arch of a bridge, at Longueville, on the Eastern Railway. These experiments took place in the year 1862, four years previous to the date of the French patent, as is testified by a stamped document, signed by fourteen *employés* of the Eastern Railway, who were all eye-witnesses of the fact. We learn that the inventor, who is a poor man, has gained the friendly support of wealthier persons. By their aid he is commencing a suit to settle the question.

THE NEW DOCK AT NEWPORT.

The ceremony of cutting the first sod of the new dock at Newport, to be called the Alexandra Dock, has been performed by Lady Tredegar, in the presence of a great concourse of people. The original estimated cost of the scheme, according to our authority, the *Bristol Times*, was about 600,000*l.* The cost of the moiety of the works commenced will be 240,000*l.*, of which about 150,000*l.* have been subscribed. The company's engineer is Mr. James Ahernethy. Vessels will pass from the tideway into the dock by a "trumpet-mouthed" entrance, the dimensions of which will be 350 ft. width between the pier-heads, and 300 ft. between the line of the river-front and the outer gates, with a depth of 37 ft. of water on average spring tides, or 27 ft. neap. The length of the outer lock between the gates is 350 ft., breadth 65 ft., divided by a pair of intermediate gates, so as to form two locks, or one great lock. The sills will be laid 4 ft. 9 in. below those of the old dock, by which vessels of all classes will be worked in and out at a much easier stage of the tide. Provision is made to receive the largest class of vessels and steamers afloat. Vessels of 1,800 tons, or steamers of 2,500 tons, drawing 23 ft. of water, will be enabled to enter or leave these docks over an average period of three hours on every tide throughout the year. The outer dock is

proposed to be 350 ft. in length and 550 ft. in width, having an area of 8½ acres. The depth of water over the sills will be 35 ft. average spring tides, and 25 ft. neap tides. The inner lock, communicating between the outer and inner dock, is to be 350 ft. in length between gates, and 65 ft. in width, also divided by an intermediate pair of gates. The inner dock is to be 2,150 ft. in length and 550 ft. in width, giving an area of 27 acres, and having a working depth of 27 ft. of water over sills. The graving dock is 350 ft. long and 65 ft. wide, communicating with outer dock. On the north side will be erected warehouses for bonding import cargoes. On the west side and north end of the inner dock will be erected ten staiths for shipment of coal, all on the high level. Lines of railways will also be constructed all around the quays, on the low level.

DRAINS, SINKS, AND TRAPS.

ONE-HALF of our annoyances through life spring from petty causes; at least, they appear petty on the instant; but many of them, when rigidly examined, are found to be the reverse. So it is with the annoyance experienced by "M. A. B.," whose servant, by negligently removing the bell-trap grating in the sootley sink, allowed the noxious gases in the drain to escape into the house. This matter looks somewhat petty, but disease and death have often resulted from this cause. Let me try to mention a remedy for the evil.

The decomposing matters continually discharged into the sewers by the house-drains, as continually generate carbonic acid and sulphuretted hydrogen gases. The former, from being heavier than common air, accumulates along the bottoms of the sewers; while much of the latter, from being considerably lighter than atmospheric air, enters the untrapped drains, and rises to the highest levels, under the sinks and closets; so that when the sink-gratings are removed, or the closet-handles are lifted, the noxious gases escape into the houses and contaminate or poison the air therein. Thus, the drains act like the necks of retorts, and serve to convey the deadly gases engendered in the sewers into the dwellings. Many poor little children, and other near and dear ones, have been and are being sacrificed by typhoid and scarlet fevers, and other zymotic diseases, from inhaling the virulent gases brought into the houses in the manner I have pointed out. For the negligence of servants in not replacing the bell-trap gratings after clearing the stoppage in the traps, there is no excuse, except ignorance of the insidious enemy they unconsciously permit to invade the premises. But as all unpleasant smell points to disease, that monitor should induce all persons to be on the alert against the common enemy.

These traps, however, should not be placed in the sinks at all, but under the paving beneath them, or under the paving outside the walls in the area and yards, where the inlets and traps generally should be placed if possible, and pipes should be laid direct from the sinks into the traps, with fixed gratings in the sinks. But the best remedy would be to cut off the air-connection between the sewers and the houses. This could be done by placing syphon traps at the outlets of the drains in the side walls of the sewers, and ventilating pipes should be carried from the highest points of the drains to the tops of the houses, so as to conduct the drain-air to the upper atmosphere, and the several inlets and closets should be trapped with syphon traps. Too much attention cannot be given to the arrangement and construction of the drains of houses, so as to make the fall regular, and the joints of the pipes water-tight; and if the inlets be properly trapped, and ventilating pipes carried from the drains to the tops of the houses, there would be little or no escape of noxious gases from them into the dwellings.

Under existing arrangements, however, the root of the evil is in the sewers. There an effectual remedy could and should be applied. It is lamentable to think that the sewers of the metropolis are in no better condition, in regard to provisions for cleansing, trapping, and ventilating, than they were twenty years ago. This arises from divided authority; from ignorance or passiveness on the part of those whose duty it is to study and bring forward improvements; or from the want of a properly-qualified visitor, or superintending inspector, to advise and plan

the requisite improvements in a scientific, systematic, and economic manner.

The main-drainage of the metropolis, which consists merely in preventing the sewage from falling into the tidal Thames opposite London, and pouring it into the estuary below Barking, and "out-of-the-frying-pan-into-the-fire" process,—has nothing whatever to do with this question. In fact, the main drainage is insignificant compared to the influence the "small details" I insist upon have on the health and comfort of a congregation of 3½ millions of human beings,—the population of London.

JOHN PHILLIPS.

LET "M. A. B." do as I have just done—without one. I put a grating to the sink soldered down; below sink in scullery-floor I put a square lead trough without any trap or grating, the waste from sink above and from cistern emptying into this trough, and from which I take a 4-in. drain-pipe outside the wall, and then empty into a brick 12-in. square trough, lined with asphalt, and having at the bottom a 12-in. grating, with the usual square trap, dip-stone, &c., to prevent smell rising from the drains. At the end of my pipe, which empties into this trough, I put a hinged flap to prevent the cold air ascending to scullery. It will thus be seen that the scullery sink is not connected with the drains at all, and that, therefore, it is impossible to get any smell into the house, as that which is forced through the drains passes into the open air at once; neither does any smell come up the waste of cistern, which is often the case.

I believe my plan will answer admirably; and now, if some one can hit upon a similar plan to prevent our closets being connected with the drains, although emptying into them, he will do a deal of good.

G. T.

Messrs. Gallichan & Co. advertise "Cottam's patent Effluvia-intercepting Stoneware Trap," which has been illustrated in our pages, as effecting the object required; and Mr. Honeyman, architect, Glasgow, has invented what is called "The Somerset Trap," for the same purpose. The subject has been treated of in *The Builder* before now, by Mr. Rawlinson and others.

SIR.—The London sewage has become an intolerable nuisance to the inhabitants lower down the Thames, and "Veto!" is the cry. All floating substances are easily intercepted and sedimentary particles are quickly precipitated, but the noxious sulphuretted hydrogen baffles our best men.

Allow me to suggest a remedy to meet the great requirement. Powerful and continuous electricity from a few of Cruikshank's coil apparatus would liberate all the hydrogen, which, evolving into a dome, could be burnt through a tube.

This process is termed *recomposition of water*. Thus the vast volume of water would be discharged comparatively innocuous.

R. T.

THE MACHINE CALLED "LEWIS."

A DISCUSSION on the machine called "the Lewis," used for lifting large stones, appeared in your pages in 1862 (vol. xx, pp. 67, 96, 160, and 278). It noticed the generally received tradition that the form at present in use was revived by a workman in the reign of Louis XIV., who occupied the throne of France from 1643 to 1715, and that the machine derived its name from that monarch. It has also been stated that the name is derived from the French *Levis*, as in *pont levis*, a drawbridge.

The present form was, however, in use as early as 1567 and 1588, being represented in the woodcuts to Barbaro's edition of "Vitruvius," of the first date; and in Ramelli's work, as quoted in your previous pages, of the second date. Hudson Turner's work on "Domestic Architecture," 1851, p. 32, states that this machine is called in the early accounts a "lowes," and that it was well known in the thirteenth century. He does not give any reference; but upon looking into the "Fabric Rolls of York Cathedral," published by the Surtees Society in 1859, there appear in pages 12, 27, and 100, under the dates of 1371, 1404, and 1525, the passages "In xviii lowers emptis pro fabrica," "In cordis emptis pro loners, 10d.," and "Pro viii les loveres, 4s.," all

of which terms more probably refer to the "Lewis" than to a *louvre* or lantern-light, as suggested in the *Glossary* at the end of the volume.

The "Dictionnaire d'Architecture" of Roland le Virloze, published in Paris, 1770, p. 14 shows several forms of instruments for a similar use; and in the description of the Lewis are given the technical terms for the middle limb and the side ones, namely, "lonve" for the former, and "louveteau" for the latter. It is curious that the former is also the French word for a she-wolf, and the latter for a wolf's cub, and these might have been applied to the machine in token of the grip, taken by the parts, being similarly efficacious to that of the beasts in question.

Could our workmen have taken the term Lewis from the plural of the French "lonve," through the three loaves, so to Lewis for a plainer sound? or does it come down to us from the terms used in the earlier centuries?

WYATT PAPWORTH.

TO DETECT THE BED-WAY OF GRANITE.

SIR.—In your impression of April 4th there is a short article on the bed of building stone, in which the writer says that he does not know the natural bed of stone when taken from the quarry; and further, that he never met with a working mason that could tell more than the vertical and horizontal bed. Being a granite mason, I would beg to offer my opinion on the natural bed of granite. In the first place, I may state that I believe granite has been formed by the action of running water, viz., that the different substances composing granite have been brought together by the action of water.

You will observe in examining granite minutely that the particles of mica are all standing in one direction, viz., vertically before the granite is quarried; and the natural bed of it in the rock runs horizontally, and the natural bed of our Aberdeenshire granites is the way that it cuts or splits best,—that is across the vertical bed or the way the mica lies; and the reason of this is that in a running stream the particles that are being carried along with the current are carried on their edges, and not on the flat side, so that particles such as mica, drifting in the current would come to be deposited exactly as we find them in the granite, viz., in a vertical position, and the natural bed is consequently at right angles to the mica. I have no doubt but this theory will account for the beds of other stone than granites.

GEORGE GELLIE, Mason.

DUST-BINS AND DISEASE.

You kindly inserted a few lines for me last week on the subject of "Suck-traps." I have now to offer a suggestion respecting "Dust-bins," a matter of equal importance as regards the health of households, and, indeed, of the public generally. If individuals only suffered from the effects of their own neglect, they might be left to pay the penalty in their own case, and that, perhaps, would be the readiest remedy; but it cannot be permitted that those persons who neglect the observance of the laws of health in their own dwellings should subject their neighbours to the risk of infection and disease from a contaminated atmosphere. I do think it would be well if it could be made one of the duties of the sanitary inspector in each locality to visit the basement of every dwelling-house occasionally, for the purpose of ascertaining the condition of the dust-bins, drain-pipes, and other matters, which are so generally neglected, even in the houses situated in the best localities.

But my special suggestion with regard to dust-bins is intended to prevent the admixture of vegetable and animal matter with the cinde-ash, a very prolific source of fever and diarrhoea at this season of the year. My plan is, for an iron grating to be made to fit the top of the dust-bin. It should be affixed as a lid, and have a padlock, to prevent servants from removing it, excepting at stated times, for the dust to be taken away by the carts. This would be found by householders to promote both health and economy, and the grating being small, or, rather, fine enough to allow the dust only to pass through, the cinders would remain on the top, and could be collected and replaced in the cinder-scuttle for household purposes; thus, the

lazy, extravagant habit of servants, who rarely sift cinders, would be obviated.

Dr. Aldis last year suggested the plan of portable boxes for holding and removing the cinde-ash: that would certainly be an improvement upon the ordinary mode of keeping the dust, which is generally so impregnated with decaying matter that the dust-bin is a complete fever-nest to the dwellers and passers-by.

Perhaps the public may not be generally aware that much of the evil as regards dust-bins is kept up through the understanding between the dustmen and domestic servants; the dust-hole is a ready receptacle for all kinds of refuse and for heterogeneous commodities of more value; the dustmen are fed by the servants for the removal of what they are too lazy to dispose of in a legitimate manner, and their employers of course are taxed accordingly. On the other hand, the dustmen can well afford an occasional gratuity to the servants who "make the dust good," not only by neglecting to sift the cinders but by dropping into the dust-place sundry large pieces of coal and various other articles for which the collectors find use or seek customers on the way to the yard.

Thus, from our ignorance of what is going on in our own households, we are often contributing, unknowingly, to great social abuses. It is time that we stirred ourselves to look after our own affairs in such matters; for by our vigilance and determined action in those things which concern the health of the home, we are performing, at one and the same time, a duty to ourselves and our neighbours, and are thereby contributing what we can as good citizens to the maintenance of public health.

M. A. B.

A QUESTION IN RESTORATION.

AFTER reading Mr. Pritchett's and Mr. Armfield's answers to my queries, I deemed the points I had raised were as undecided as ever, so completely had Mr. Armfield combated Mr. Pritchett's arguments. It was with every feeling of reverence for those edifices which have been left to us by God-fearing, art-loving, and practising men, that I proposed the questions I did. I know how dangerous it is to encourage restoration through destruction, and am painfully impressed, upon looking at some so-called restorations, with the fact that many pages of history, as written in our buildings, have been wiped out for ever. I am, therefore, thoroughly convinced that "conservation, not destruction" must not only be the motto of the archaeologist, but also of the architect; but, as Mr. Armfield very forcibly puts it, some line must be drawn, some clear definition given of what conservation means. Putting all questions of art and archaeology on one side, it seems a safe doctrine to follow that every ancient building should be left by us in as sound a state as we found it, without alteration of any kind; but where rebuilding portions or the whole is absolutely necessary, something more than cutting out or patching is required. I cannot find that Mr. Pritchett has by any means disposed of the one matter under consideration. He says, "If I reproduce the tracery as well as jambs, as I find them, copying each stone with its defective arc, I shall completely destroy the old work." He then says, "If, however, the work is so utterly gone that it cannot be reset, reuse at least one or two of the best pieces of each section, no matter how decayed, to perpetuate the history, and to show that you have read it aright, and reproduce the rest, stone for stone, 'defective' arc and all." I have italicised a portion of the above, because it appears to me to shelve the question, and to be a complete contradiction of the former passage quoted; for supposing not one stone or portion of a stone can be reused, I must certainly fall back upon the first but condemned method of reproducing everything in new work as I found it, by which means I shall, he says, "completely destroy the old work, and the sermon in stones cannot be read without a verbal exposition." Again, by building in a decayed stone, how do I perpetuate an historical fact? Is it not natural to suppose such decayed stone will soon drop out, and be entirely lost hundreds of years before the new portions? Then what a "sham antiquity" will be left, which "having no value as a thing of beauty has consequently no value whatever." Thus truly says Mr. Armfield.

I ask, therefore, if under these circumstances the most correct reading of conservation would not be to perpetuate a work of pure art and a

noble piece of architecture; for should I not he as completely blotting out the interesting fact that such a building was ever completed, as that it was defaced in the fifteenth century? An architect cannot add to his reputation by either course--he is not called upon to create: personal feeling, apart from his love of the beautiful and venerable, does not enter into the matter; but were any cases, and the one under consideration I think will be admitted to be one, where artists are much entitled to reverence as the fact that a work of art was partly defaced in the fifteenth century.

Unless a building is in a dangerous condition it ought not to be taken down, but the decayed parts carefully cut out and new inserted, "similar to the old," so as to prevent the whole from falling. No scraping or chiselling of the old portions should be permitted--simply a breathing of new life into the edifice. And this course now is generally followed. But where men begin to talk of history and archaeology, seemingly forgetting that a thing of to-day may be historical to-morrow, and in due time have its archaeological interest, it is but right that they should be asked to "draw a line" somewhere.

If art be admitted into the question, short work can be made of it; for, taking any masterpiece, either in architecture, painting, or sculpture, that has been defaced by additions or restorations, the course of action seems clear. For instance, if an architect were called on to restore one of the temples of Greece, and that in an Ionic portico he find several Corinthian capitals surmounting the columns, the columns having been shortened and adapted, should he leave them there as an interesting historical fact? I do not think any Classic architect would say yes. But the Greeks were not such Goths as to do a thing so entirely adverse to all notions of art propriety. Again, a sculptor, upon examining a statue of Apollo, finds that it has been "mended" with a leg, without anatomy; if called upon to restore (if such thing can be possible in sculpture) such statue, would he preserve the leg in question as his interesting historical fact? I do not think he would; and few archaeologists would be bold enough to advise such a course, however old such leg might be proved to be. How, therefore, shall the line be drawn, and where?

M. UNDERWOOD.

HYDE PARK.

THE Hyde Park banks of the Serpentine are disfigured by numerous dilapidated boards, with notices thereon, in more or less ungrammatical English, signed by one George Ranger. Could not these notices be codified,--expressed in terse, good Anglo-Saxon, and fixed to one or more trees where necessary? The foot entrance to the gardens, opposite Westbourne-street, is disgracefully shabby.

P. H. B.

NEW ROAD FROM BAYSWATER TO KENSINGTON.

As some change is now being made in the Park drive between the Prince's and Queen's Gates, opposite the new Hall of Science and Arts, and a more direct issue is about to be given by the Exhibition-road, it is happily opened to the public across the Park, it may not be inappropriate to suggest, through the Builder, the expediency of making the road for public traffic shorter, and at the same time of improving this portion of the Park, which alone has been hitherto neglected.

A new road, from the Park, from Victoria Gate, Bayswater, to the Exhibition-road, would be but half a mile and 100 yards; whereas by the present road, which diverges south-westward along Kensington Gardens lower, it would be nearly one mile.

The whole range of Park and gardens, from the Marble Arch to the extreme end of Kensington Palace gardens, is two miles, the distance being the same on the southern side of the Exhibition-road, so that a road cut direct from Victoria Gate, opposite Westbourne-terrace, to the Exhibition-road, would bisect the Park and gardens in two nearly equal parts, thus opening to the public the best route of communication between Paddington and Bayswater on one side, and Brompton, Chelsea, and South Kensington on the other.

With reference to the two points of junction, it is obvious that the two great boulevards of Westbourne-terrace (120 ft. wide) and of the Grand Junction-road (100 ft. wide) are of the same width, and that the Exhibition-road leads into the Cromwell-road, now extended half a mile westward, and to be opened as a boulevard, or rather, to Belgrave.

It would be requisite to shift the Victoria Gate from the west to the east side of the lodge, in order to make the way straight and continuous from Westbourne-terrace and thence to strike direct for the broad promenade and the bridge across the Serpentine; and thus which there can be no more beautiful or picturesque drive; the deviations from the level being scarcely perceptible, and from the straight line only sufficient to assume the pleasing effect

of slight curvatures, without adding fifty yards to the extent; whilst it would secure, in its passage through grown forest timber, what gardeners term the line of beauty.

The proposed road would first strike over an angle of the park for about 250 yards, crossing the fosse or ha-ha at the second semicircular projection, or mimic fortillage, and then be formed continuous along the elevated and open promenade, and so onward over the bridge, clear of the magazine. At this point South of the Serpentine it would cross direct, or nearly so, by the line already staked out and called off, to Prince's Gate, at the top of Exhibition-road. By this arrangement the dusty road along the lower walk might be abated, and added to the acute angle of the park, as far as Queen's Gate, the present iron railing being removed, to establish a fence between park and gardens, and the beautiful Albert Gates re-erected at a suitable point for access to the memorial monument, and to hortian grounds, which might be made ornate and suitable to their position.

In return for the use of the road and bridge within the gardens, a good scope of land, of say, at least, 12 acres, might be added to the gardens, and to those grounds now so tastefully planted, which were not long since an unsightly barrack.

For the completion of this great public benefit it would not be necessary to remove more than three old pollard trees (one of them decayed), and all decently, but I should recommend the removal of the iron railings which divide the bridge longitudinally, and the laying down of a paved canopy, 10 ft. wide, on either side, to afford a clear promenade and carriage drive, commanding homely views rarely equalled in any city.

The present temporary public thoroughfare, while it is tedious, also interferes with the inner circle of Park-drive; it descends the hill to nearly water level, and sweeps round the magazine, reascending to the bridge by a soft, sandy, and dusty width of waste.

As to the unsightly fosse, its abatement, or the treatment of its rugged precincts, although I might give a professional opinion, I leave it to the management which has shown so much skill and taste in adorning the borders of Park-lane, and the fairy wilderness between Anley House and the Serpentine.

JOSEPH NAYLOR.

THE LECTURES FOR WORKING MEN.

Sir,--I attended a lecture delivered at the Mechanics' Institute, Southampton-buildings, by Professor Calvert on Iron,--though not employed in any of the metal trades, and consequently shall not in my work require so constant an application of the knowledge I may have gained. Thinking it may help to induce others like myself, for whose benefit the lectures were designed, to attend others, I beg leave, through your columns, to express my hearty thanks for it, and to echo a sentiment expressed by a speaker that it was one of the most interesting lectures he had heard; (for myself not altogether for the scientific truths to be learnt, but for the genuine love the lecturer seemed to have for his subject, and the delight he evidently felt in imparting his knowledge to others. It would be well if we could say that of all the teachers in other walks of life. What we have so often heard lately was repeated, that we, as a nation, are behind others in the requisite scientific knowledge bearing upon our different callings that prevents us from competing with them in the market. If this is true, to look at the audience and see the small responses they were to the committee's invitation was rather disheartening. It must never be lost sight of by us that we, the so-called working portion of the community, living from hand to mouth, are more immediately affected by the prosperity or the reverse of our country than any other, so that our interest should impel us to make an effort to acquire the knowledge we are in need of, and encourage by our presence gentlemen like Mr. Calvert and others (who, I believe, give their services gratuitously) for their generous efforts to do good.

S. C.

We have received comments on another of the lectures (Mr. Reed's), not so flattering, but do not think it necessary to print them.

(Late). Chapter-house c. 1232
West Porch of South Transept c. 1230
Crossing and Central Tower (lower part) c. 1235
Two West Doorways of Choir Aisles c. 1240
GEOMETRICAL PERIOD. A.D. 1245--A.D. 1315.
(Early). Retrochoir, with South Porch c. 1258
North, South, and East Screens of Choir c. 1280
West Towers c. 1280
Cloisters and Passage c. 1285
Central Tower (upper part) c. 1307
CURVILINEAR [DECORATED] PERIOD. A.D. 1315--A.D. 1380.

Chantry Chapel on South side of Retrochoir of Bishop Russell c. 1480
Chantry Chapel on South side of Retrochoir of Bishop Longland c. 1521

It will thus be seen that every portion of the history of English architecture is illustrated in this remarkable building, but more especially that part which belongs to the Lancet and Geometrical periods.

THE ARCHITECTURAL ALLIANCE.

THE seventh annual meeting of this association is to be held on Thursday, July 2nd, at No. 8, Montague-street, Russell-square, London. The following delegates are appointed to attend:--

- 1. London Architectural Association--T. Roger Smith, F.R.S.A.; Thos. M. Rickman, F.S.A., A.I.B.A. (Secretary pro tem. of the Alliance); J. Douglass Mathews, A.I.B.A.; H. Flind Spiers, A.I.B.A.
2. Architectural Institute of Scotland--J. D. Peddie.
3. Birmingham Architectural Association--J. H. Chamberlain, F.I.B.A. (president of the Alliance); T. Plevins, W. Harris.
4. Glasgow Architectural Society--Alexander Thomson, John J. Stevenson.
5. Liverpool Architectural Society--G. E. Grayson, H. H. Statham, Jun.
6. Manchester Architectural Association--Lawrence Booth, A.I.B.A.; Peter B. Alley, Jun.; Alfred Darbyshire, A.I.B.A.
7. Northern Architectural Association--R. J. Johnson, F.I.B.A.; Thomas Oliver, F.I.B.A.; Francis Charlton, C.E.
8. Nottingham Architectural Association--T. C. Hines (treasurer of the Alliance); Frederick Jackson.

PROTECTION OF WORKWOMEN.

We are glad to see the Workshops Act in force in favour of workwomen. At Marlborough street Mr. Studer, milliner and dress-maker, of No. 9, Bruton-street, has been summoned before Mr. Knox, by Dr. Aldis, the medical officer of health for St. George's, Hanover-square,--first, for an infringement of the Workshops Act, by employing certain young women after half-past four o'clock on Saturday; and next (a second summons under the Nuisances Removal Act) for having his house so crowded as to be prejudicial to the health of the inhabitants.

Mr. Edward Lewis appeared for the defendant, and stated that with reference to the first charge his client wished to plead "Guilty." Dr. Aldis said he had to complain of the defendant employing his young women on Saturdays beyond the lawful hour, and on other days with only fifty minutes for meals instead of an hour and a half. The defendant was convicted on the 27th ult., and there was a repetition of the offence on the 30th. Mr. Lewis said that during the season a vast amount of work was required to be done, but customers failed to show a proper amount of consideration towards those who were required to perform it. Mr. Studer had not yet been able to perfect certain arrangements which would prevent him from infringing the law. Mr. Knox said the Act came into operation on the 1st of January last. He would make the penalty 40s., with an intimation that it would be 3l. in future. The second summons was then gone into. Mr. Grant, inspector of nuisances for St. George's, said on the 20th ult. he visited the defendant's house, and, on the basement, he found a small cellar, part of the area, without any fireplace in it. There was a window about 18 in. square, opening into the

THE STYLES IN LINCOLN CATHEDRAL.

FOR the members of the Lincoln Architectural Society, who met on Wednesday the 17th, in the cathedral, to hear papers read by Precentor Venables, "On the Tombs," and by Mr. Edmund Sharpe, on the building, the latter gentleman prepared a Guide, in brief, to the cathedral, which may be useful to others besides those who were present.

The principal works of the cathedral may be classed under the following heads:--

NORMAN PERIOD. A.D. 1066--A.D. 1145.
(Early). West Front (central part) c. 1075
Font c. 1140
(Late). West Front, Circular Arcade c. 1140
" Lower part of two West-towers c. 1140
" Central Doorway c. 1143
TRANSITIONAL PERIOD. A.D. 1145--A.D. 1190.
(Early). West Front, North and South Doorways c. 1148
LANCET PERIOD [EARLY ENGLISH]. A.D. 1190--1245.
(Early). Eastern Transept c. 1190
" Choir c. 1200
" Central Transept (east side) c. 1200
" Central Transept (west side) c. 1215
" Nave, with North and South Chapels c. 1220
" West Front, upper part, and North and South Wings c. 1225

* We are asked to mention that on Tuesday next a lecture on Mechanical Drawing, showing the methods of projecting plans and elevations, and the application of geometrical drawing to the work of masons, carpenters, engineers, metal plate workers, &c., will be given by Mr. Ellis A. Davidson, master of one of the science classes in the City.

area, where there was a most offensive dust-bin, which tainted the air coming into this cellar-room, in which was a bed (where two women sleep). The room was 74 ft. long, by 8 ft. wide and 8 ft. high. He cautioned Madame Studere at the time as to this place. Mr. Aldis said the place was too small for two persons to sleep in, and it was underground. There was only a cubical capacity of 240 ft., whereas, considering the situation, there ought to be 500 ft. He considered that persons sleeping in such a place were poisoning each other. Mr. Knox said on the assurance that the matter should be remedied he would not inflict a fine, and only required payment of costs.

THE HANDEL FESTIVAL AT THE CRYSTAL PALACE.

THE Handel Festival of 1868 is proceeding with the greatest satisfaction. All things go so smoothly that the difficulties overcome are not thought of. Yet every undertaking holds failure within it, and who shall tell of the pains taken and skill shown by Mr. Bowley, by Mr. Grove, by Mr. Costa, by the Directors generally, to keep this down and develop success. When the enormous building has been fitted for the transmission of pure sound, when some 4,000 executants have been drilled and put quietly and quickly into their places in the orchestra, when the solo performers—all great people—are brought together, and 22,000 listeners have been induced to spend their money, conveyed without inconvenience, and seated without squabble, everything seems so easy that the resultant success appears a matter of course.

The vast screens which, as suggested by the *Builder* some years ago, have been placed at the junction with the nave, on each side of the transept, from the crown of the roof down to within about 20 ft. of the floor, have greatly improved the acoustic qualities of this mighty concert-room, and every word uttered by, say, Madlle. Nilsson, who on Friday astonished and delighted every one, was heard with distinctness, by all within the enclosure. The effect of the choruses, too (the true speciality of the Crystal Palace) was immensely increased.*

The chorus from "Saul," "Every eldest-born of hell!" and the first half (only) of the double chorus from "Deborah" were never before sung with equal effect. "O ruddier than the cherry!" by Mr. Santley; "Sweet bird, that shunneth the noise of folly," by Mad. Lemmens-Sherrington, Mr. Radcliffe playing the flute accompaniment; and "Sound an alarm," by Mr. Sims Reeves, were other great successes. The performance, as a whole, will long live in the memory of those who had the good fortune to hear it. On this Friday, the 19th, "Israel in Egypt" will be given, and we advise all lovers of music and grand effects who may happen to see these words in time, to go if they can.

THE STATE OF THE ARMORY IN THE TOWER.

ON Saturday last Mr. Planché, Somerset Herald, met the members of the Architectural Association, by invitation, at the Tower of London, with the view of giving them some account of the national armory. Before going round with them Mr. Planché described briefly the first attempt at scientific arrangement of the armour in the Tower by Sir Samuel Meyrick, who transformed the chaos into something like order, but was compelled by the persons in authority to compromise with a system which should have been utterly destroyed, and which still existed, and could not be too strongly protested against in the name of good taste and the interests of archaeology. The collection was entrusted entirely to the control of the chief store-keeper for the time being, who, however equal to the regular official duties of his department, was not expected to know anything about ancient arms and armour, and was consequently at the mercy of dishonest dealers and casual advisers. In 1858, at the express desire of the late Lord Herbert of Lea (at that time the Right Honourable Sidney Herbert, Secretary of State for War), he (Mr. Planché) drew up a statement of the errors and confusion existing in the

armory; and pointed out that it was the only collection of objects of art and antiquity in England at the head of which there was neither an artist nor an antiquary! That forgeries and modern imitations had been purchased at large prices, and were still exhibited to the public at sixpence per head, while the most rare and valuable articles were lightly rejected, and allowed to leave the country. The death of Lord Herbert had prevented the steps being taken which that eminent and amiable nobleman had owned were necessary to be taken; and the same system was allowed to exist to the injury of the public, who paid annually thousands of pounds for admission, to the confusion of the student and the ridicule of the antiquary.

Mr. Planché then walked through the armory, describing its most interesting objects, pointing out various forgeries and imitations, the absence of classification, Waterloo cruises being crowded into glass cases with fine examples of the armour of the 15th century, and ended with observing that in the very entrance-porch two fine suits, one of the time of Henry VI. and another of the reign of Henry VII., had been placed upon pedestals bearing precisely contrary inscriptions!

We have before now, on several occasions, commented in strong terms on the unsatisfactory state of the collection at the Tower, and insisted on the necessity for the appointment of a duly qualified person to superintend it. If this visit of the Architectural Association should serve to draw public attention to the subject, and lead the Government to apply to Mr. Planché himself (a member of the College of Arms, and, so far as we know, the fittest man in England for the post), it will have effected great good.

THE LAW COURTS COMPETITION.

IN the House of Commons on Monday last Mr. Waldegrave-Leslie, pursuant to notice, asked the First Commissioner of Works whether the statement in the *Builder* of the 13th of June, "that Mr. E. M. Barry, A.R.A., has protested against the appointment of Mr. Street as architect of the new Law Courts, on the ground that such appointment is at variance with the letter and spirit of the conditions of the competition entered into by the architects, be a correct statement; and whether such protest was made before or after Mr. Street's appointment; and whether the plans of the buildings as they are to be erected by Mr. Street will be exhibited in the library of the House of Commons." The reply as to the correctness of our statement was, of course, in the affirmative. Further, it was answered that the plans would not be exhibited again, as they were not likely to be carried out; and that the protest was made after the appointment.

We are not surprised to hear that Mr. E. M. Barry has petitioned Parliament for the appointment of a select committee to inquire into the case.

We have received letters from several correspondents impressed with our own conviction that the reversal of the shameful injustice threatened is not so important even as a personal matter as it is in the broader interests of the public and the profession.

PROVINCIAL NEWS.

Sunderland.—The foundation-stone of a new workmen's hall has been laid in Monkwearmouth, by Sir H. Williamson, bart., M.P. The present Workmen's Hall has been found too small, and a new building has been determined on, a site being presented by Sir H. Williamson. A stone building, designed by Messrs. Potts & Son, architects, will be erected, at an estimated cost of 1,600l. On the basement story will be reading, smoke, game, and club rooms; and in the upper part a lecture-hall, to hold 600 persons, well lighted, and 26 ft. in height.

Great Yarmouth.—The new buildings erecting at the south end of the town (near the fish wharf), for the Trinity Corporation, are now rapidly approaching completion. The total cost will be from 6,000l. to 7,000l. The buildings comprise a store, 100 ft. in length, by 50 ft. in width, and 35 ft. in height, in which will be placed the huys belonging to the Trinity Brethren, and suitable machinery for lifting

these sea marks, each of which weighs at least 10 tons. A tramway leads from the stores on to the Trinity wharf. Springing from the roof of the stores is an octagonal tower or observatory. This "look-out" is 75 ft. above the level of the road, and the ascent is made by means of a spiral staircase. The tower, which weighs about 7 tons, has been raised to its position. Adjoining the stores are a smithy, cooperage, &c. Commodious offices are also built for the use of the various officers attached to the establishment; and a house has been erected for the superintendent. Close to the quay a powerful crane is in course of erection. The foundations for this machine are formed of blocks of Yorkshire stone, varying in weight from 4 to 5 tons each. The Trinity quay has also been extended 33 ft. Mr. J. J. Bennett, of London, is the contractor.

East Retford.—The new markets, Corn Exchange, &c., at Retford, have been formally thrown open to the public. The frontage shops have let at high rents, and the stalls and shops inside have let well. The Court-house, in which the Quarter Session and County Court will be held, and magisterial business conducted, is commodious. Under the townhall is a poultry market, with stands for 200 persons. There is also an open space for a cattle market.

OPENING OF THE NEW DOCK AT SUNDERLAND.

THE Hendon Dock, eleven acres in extent, formed by the River Wear Commissioners, in addition to the previous dock accommodation, has been opened. The dock has cost about 110,000l. It was originally designed to be six acres in extent, and when the tenders were sent in the lowest of these was found to be double the estimate of the engineers, an enormous sum having been added for sea risk. Mr. Meik, the engineer to the Commissioners, advised that he would undertake the work themselves. This was done, and it being subsequently determined to enlarge the dock to eleven acres, this was accomplished at the cost of the lowest offer for the six-acre dock. The Commissioners have a total of 75 acres of dock and harbour, and 90 acres of land, all of which have been forced out of the sea. The great advantage of the dock is that vessels may leave their loading berths and in seven minutes be off to sea, having no long river channel with the difficulties of river navigation to encounter. The new dock is of an irregular square shape, 830 ft. in length from north to south, and an average of 600 ft. in width from east to west.

ALTERATIONS AT THE INSTITUTION OF CIVIL ENGINEERS.

THE contract for the additions to and alterations at the Institution of Civil Engineers, has been let to Messrs. Holland and Hannen. They have undertaken to complete and deliver the whole of the buildings in five months, so as to be ready for the next session, which will commence in November. In the meanwhile the temporary offices of the institution are at No. 1, Great George-street, Westminster, S.W.

INSTITUTION FOR THE BLIND, BRADFORD.

THE inauguration of this new building took place on the 3rd inst. It has been erected at the corner of North Parade and Cambridge-street, and is intended for the employment and instruction of blind work-people. The style of architecture is plain Gothic, from the designs of Messrs. Knowles & Wilcock, of Bradford, architects. The building is four stories in height, and has a frontage of 60 ft. to North Parade, and 136 ft. to Cambridge-street. The premises include a series of large work-rooms for the blind of both sexes, who are employed in knitting, brush, basket, and skep making, &c. On the ground-floor there are parlour, kitchen, and scullery, with four bedrooms over the same, for the accommodation of the resident matron. The upper rooms are approached by open and separate staircases, which are of stone. The ground-floor also contains a library, with shops and offices for the sale of articles they manufacture. The following are the several contractors:—Messrs.

* These screens, which include 2,000 yards of canvas, were put up by Messrs. Unite, of the Edgeware-road.

J. Burnley & Son, masons' and bricklayers' work; Garforth & Walsmsley, carpenters' and joiners' work; John Schofield, plumbers' and glaziers' work; Michael Nelson, slaters' work; Thos. Cordingley & Sons, plasterers' work; and Lishman Lupton, painters' work. Mr. Alner Rhodes was clerk of the works. The total cost of the building, which has been raised by subscription, is 6,533l.

CHURCH-BUILDING NEWS.

Melton.—The new parish church has been consecrated. The site is close by the Horse and Groom Inn. The architect was Mr. F. Barnes, of Ipswich, and the contractor Mr. H. Luff, of Ipswich, whose tender amounted to 2,700l., but the total amount was increased by raising the tower and spire, and other extras. Mr. Callington, of Woodbridge, acted as clerk of the works. The style is Early Decorated, and the material is Kentish rag with Bath stone dressings. The site is surrounded by a battlemented wall of the same material, a pair of iron entrance-gates being placed opposite the south porch. The church consists of nave, north aisle, and chancel, with a tower and a spire of Bath stone, about 100 ft. high, whilst the organ chapel to the north and the vestry to the south of the chancel give the appearance of a transept. The tower forms the south porch. The original design contemplated both a north and a south aisle, that the nave should be higher, and that there should be a clearstory; from motives of economy, however, the south aisle was done away with, and also the clearstory, and the roof of the nave is continued, at a more gradual slope, as the roof of the north aisle. This renders the north side of the church less attractive than would have been the case had the original plan been carried out. The wall of the aisle being necessarily very low, light is admitted by small circular windows, with foliated stone work, similar to those at first designed for the clearstory. The roof is slated, and surmounted by an ornamental ridge, with stone crosses at the ends.

Conewry.—The chief stones of two churches have been laid here on the same day, with masonic ceremonial. The edifices are to be similar, and to accommodate the same number of persons at the same cost. The architects for both are Messrs. H. J. Paul & C. T. Robinson, and the contractor for both is Mr. H. Lovatt, of Wolverhampton. The one is to be called All Saints', and the other St. Mark's. The total length of each is about 110 ft., and their internal breadth about 46 ft., and each will accommodate 346 persons. Both are in the Geometrical Early Decorated style, and built with the local stone, having their internal dressings of Bath stone. They consist of nave, aisles, and chancel, each about 32 ft. long and 20 ft. wide. Here, however, the similarity ceases, for the one in Far Gosford-street, which is All Saints', has gabled aisles, each pierced with a simple single-light window, separated by complex buttress, and surmounted by a simple clearstory. The south side has a porch, crowned by a bell gable; and the west end consists of a complex doorway, having a large rose-window over it. The other church, opposite the new hospital, that is, St. Mark's, has a more advantageous site. This church has aisles divided into bays, by large buttresses, entered by two-light traceried windows. Both are extremely simple, as the object has been to obtain the largest amount of accommodation of the best kind, without trenching too far on the extremely limited funds of the committee.

Stockton-on-Tees.—St. James's Church has been consecrated. The church occupies a site on the north side of Portrack-lane, opposite the union workhouse, and adjacent to the cricket-ground. The building is designed in the Early Decorated style of Medieval architecture, consisting of nave, north and south aisles, chancel, vestry, organ-chamber, with tower and spire, at the south-west angle of the nave. The extreme external measurements are—nave and aisles, 73 ft. by 47 ft.; chancel, 25 ft. by 20 ft. There is no gallery, but accommodation is provided for about 550 persons. The building has been so designed and constructed as to afford provision for future enlargement by the addition of north and south transepts, making it of a cruciform shape, and an extension of the nave; thus giving, if necessary, at least 180 additional fittings at a comparatively slight cost and but little inconvenience. Externally, the design presents, on the south side parallel to Portrack-

lane, at the west corner, a square tower rising 50 ft., surmounted by an octagonal lantern rising 30 ft. more, and finished with a spire rising to the total height of 130 ft. from the ground to the top of the vane. The churchyard is fenced by a low stone wall, surmounted by an ornamental railing. The whole has been designed by Mr. J. P. Pritchett, of Darlington, and carried out under his superintendence, assisted by Mr. Law, as resident clerk of the works. The contract for the building has been executed by Messrs. J. Simpson & Co., for the sum of 3,648l. The carving is by Burstall & Taylor, of Leeds; the ironwork by Messrs. Thomason, of Birmingham; the brasswork by Messrs. Brown & Downing, of Birmingham; and the cost, including lighting, warming, fencing, draining, gasfittings, carving, furnishing, professional charges, clerk of the works, and all other expenses, about 4,800l., exclusive of site.

Willesborough.—The parish church has been re-opened, after having undergone a restoration and considerable enlargement, from designs by Mr. I. Pearson. It is enriched with several stained-glass windows. The east window, by Messrs. Clayton & Bell, is the gift of Mrs. Gregory.

Holdenby.—The parish church of Holdenby, popularly known as Holmby, has been re-opened. The church has been undergoing restoration for the last twelve or fourteen months, under the superintendence of Mr. G. G. Scott. It has been entirely re-roofed, and new open seats of plain, unvarnished oak had been put in. The nave and aisles of the church have been floored with tessellated pavement, red and yellow tiles being placed alternately. The chancel has been inlaid with Minton's unglazed tiles, under the superintendence of the Rev. Lord Alwyne Compton. The floor within the altar-rails has been inlaid with glazed tiles. The church has been generally renovated. The coloring on the chancel-walls was done by Mr. Lee, of Lutterworth, under the superintendence of the Rev. Mr. Sutton, rector of Theddingworth. Mr. Thompson, of Peterborough, was the builder employed for the restoration.

Eye.—The proposed restoration of the church here has been divided into two portions—the repairs to the roof (the expense of which has been estimated at about 759l.), and the substitution of more comfortable and sightly seats for the existing plain pews, and various other matters of restoration, the estimated cost being 1,183l. 4s., making the total sum to be provided 1,942l. 4s. Mr. Colling, of London, is the architect. Tenders have been received, and the work will shortly be commenced.

Haregrave.—The Early English church of this village is now undergoing a restoration, under the hands of Mr. W. L. Baker, C.E., and architect, of London. Owing to the extremely dilapidated condition of the fabric, much new work throughout the whole building has been found absolutely necessary, including the rebuilding of the tower and spire, these latter, however, being replaced stone for stone. The plans are said to have passed the friendly criticism of Mr. Butterfield, and have likewise been formally approved of by a committee of the Northamptonshire Architectural Society. The contract for the restoration has been taken by Mr. Henson, of Finedon, builder. The foundation stone of the new tower has been laid.

Hereford.—The chief stone of St. James's Church for St. Owen's parish, has been laid. In plan the church is cruciform, consisting of nave, north and south aisles, transepts, chancel, chancel aisles, vestry, with warming crypt under, and south porch forming the substructure of a future tower and spire. The total length of the church over all, is 120 ft.; the total width, 80 ft.; the height of the nave, 45 ft.; and of the tower and spire, 140 ft. The style of architecture adopted is the Early Geometrical. The nave is divided from the aisles by arcades of four arches on each side, the arches before the transepts being 20 ft. wide. The chancel arch is 17 ft. wide and 30 ft. high. The transepts are filled with four-light windows, the east and west ends with three-light windows, the aisles with two-light windows, and the clearstory is pierced with eight foliated sexfoils. The walls are being built with native stone, and faced internally with squared and axed masonry, random jointed, and relieved with blue stone bands, voussoirs, &c. The roofs are to be constructed with pitch pine, intended to be left its natural colour. They will be boarded, covered with felt, and slated with green Pembrokeshire slates. The seats, which are arranged for 600

adults, are also out of pitch pine, varnished over. The church is being carried out from the designs and under the superintendence of Mr. Thomas Nicholson, of this city, the diocesan architect, and Mr. Gongb, of Bishop's Castle, is the contractor. The walls have already been considerably advanced. The estimated cost of the edifice, exclusive of the tower and spire, is 3,500l.

Newtown, Wem.—The foundation-stone of the new church was laid on the 22nd ult. The building will be in the Early English style, and consist of nave, chancel, vestry, and south porch. There will be a bell-turret at the west end. The material used for the walls and dressings is Grinton stone. The roofs will be covered with Staffordshire tile. The cost, including warming apparatus and all fittings, is estimated at 1,170l. Accommodation will be provided for 220 persons. Mr. E. Haycock, jun., of Shrewsbury, is the architect, and the contractors are Messrs. Nevett, of Ironbridge.

Chester.—A meeting has been held to promote a movement for the restoration of the cathedral. It was stated that the Ecclesiastical Commissioners had offered to give 10,000l. for the purpose; that another 10,000l. had been promised in response to circulars; and that the Dean and Chapter would devote 2,000l. to the object. At the meeting Mr. Antrabus, high-sheriff of the county, presided, and Mr. W. H. Gladstone, M.P., Lord Egerton of Tatton, Earl Grosvenor, and other gentlemen, were present. About 600l. were promised in letters read.

SCHOOL-BUILDING NEWS.

Morrison (Swansea).—New schools have been erected and opened here for the district. Mr. H. H. Vivian, M.P., contributed 1,000l. towards the building. Mr. John Humphrey, of Morrison, was the architect, and the total cost has been about 3,800l. The schools are capable of accommodating from 1,000 to 1,200 children; whilst adjacent are extensive playgrounds and dwelling-houses for the master and mistress and the principal teachers. There has been no attempt at architectural display or ornamentation; but the whole buildings are lofty and of good general exterior, the school-rooms being well ventilated. The whole of the buildings have been erected with plain native stone, with appropriate dressings. The roofs, which are high-pitched, are relieved by a number of gables, and the windows are of Gothic head ones. Lantern lights are fixed in each school, and these, as well as the windows, are made to open for ventilation.

Acton, near Wrexham.—An infant-school, with mistress's residence, has recently been built at this place. The dimensions of the schools are 33 ft. 6 in. by 17 ft., with a porch of suitable size. The mistress's house comprises a bay-windowed parlour, a kitchen, and two bedrooms, with the usual appearances. The walls are almost entirely built with the red bricks made in the locality, with a few Ruabon stone dressings. Courses of blue Staffordshire bricks are sparingly introduced. The roofs are covered with Broseley tiles, banded with some of a darker shade. There is a bell-turret, covered with oak shingle, which surmounts the school roof. The expenses incurred in these buildings have been defrayed by the family of Sir Robert Cunliffe, bart., of Acton Park. Mr. Ferrey was the architect employed, and the contractor was Mr. Richard Yates, of Shiffnall.

Great Horton.—The memorial stone of new congregational schools has been laid here. Messrs. Paull & Robinson, of Manchester, are the architects. The area to be covered is about 550 superficial yards, and the dimensions of the buildings will be about 120 ft. by 41 ft., the height from the floor of the lower story to the roof ridge being 52 feet. The structure will be three stories in height on the north-east side, but only two at the front and on the side facing the chapel. A feature of the design is a tower, 80 feet high to the top of the vane. Internally, on the ground floor, there will be an assembly-room, 65 ft. by 38 ft., and 16 ft. high, capable of seating 600 adults, and adapted for concerts, public meetings, lectures, &c.; and in the rear a lecture-room, 36 ft. by 26 ft., to seat 230 adults, of the same height as the assembly-room. Above will be the class-rooms, sixteen in number, averaging 180 superficial feet, and 12 ft. high, and a room for the superintendent. The principle of separate class-rooms has been chosen in view of the results which have attended the

adoption of that system elsewhere. On the lower ground floor, and underneath the lecture-room, will be a class-room, 25 ft. by 20 ft., and 14 ft. high, containing a raised gallery for infants, while on the same level are two class-rooms for adults, specially arranged, with fire-places, &c., for week evening purposes, but available for the Sunday school. Externally the building will have dressed wall-stones in regular course, and the architectural features will be of hewn or ashlar stone. The works have been let by contract for 3,000*l.*, in addition to which 150*l.* to 200*l.* will be required for warming apparatus. Add to this the architects' commission, furnishing, &c., and over 5,000*l.* will be needed to complete the undertaking.

STAINED GLASS.

St. George's, Newport.—The memorial window to the late Bishop of Lichfield, in *St. George's Church*, near Wellington, has been formally opened. The window is the production of the Messrs. O'Connor, of London. It is the east window in the church. The subjects treated are as follow:—In the lancets, the Agony, Christ hearing His Cross, the Crucifixion, the Descent, and the Entombment; in the circular lights, Christ the Lord of all, the Good Shepherd, and giving His commission to St. Peter, "Feed my sheep."

St. Giles's, Northampton.—A memorial window has been erected in the south chancel aisle of this church, by Mr. C. Britten, in memory of a son, who died in February, 1854. The window is the work of Messrs. Powell, of Whitefriars, London. The first compartment contains a representation of Christ raising to life the dead and only son of the widow of Nain, the part of the scene depicted by the artist being that described in Luke vii. 15.—"And he that was dead sat up and began to speak. And he delivered him to his mother." The second compartment contains a representation of Christ admonishing the youth who said he had observed all the commandments, in the words of St. Mark, x. 21.

Bishop's Castle Church.—A stained-glass memorial window has been executed by Messrs. Done & Davies, of Shrewsbury, for this church. It consists of two openings with tracery. In the upper part of the openings are the figures of St. Matthew and St. Mark, with their emblems, the Angel and the Lion, each inclosed in a trofoil, which forms part of a decorated canopy under which they stand. Beneath them are St. Luke and St. John, also under canopies, displaying their emblems, the Bull and the Eagle, which form pedestals for the figures above. The window is surrounded with a narrow border. The large quatrefoil in the tracery is filled with the arms and crest of the donor, surrounded with foliated ornaments.

Books Received.

Photographic Illustrations to accompany the Architectural History of Canterbury Cathedral. By the Rev. R. WILLIS, M.A. Selected and arranged by J. H. PARKER, F.S.A. Printed by Jas. Parker & Co. Oxford. For private circulation only.

MR. PARKER is making good use of the facilities afforded by photography for complete archaeological illustration,—such illustration indeed as no pencil can afford. The great value of Professor Willis's "History of Canterbury Cathedral," founded as it is on the minute account left by Gervase of the changes made in the building, is universally admitted: such a series of accurate representations of the various parts as these photographs give were alone wanting to make it complete. The difference between the older parts and the alterations or additions is shown very strikingly.

Although the complete work as now before us is marked "for private circulation only," we trust the set of photographs is obtainable by those who possess the work as originally issued.

Photographs Illustrative of the Archaeology of Rome. Oxford.

WE may mention, in connexion with the above, that Mr. Parker has issued privately a catalogue of the long series of photographs illustrative of the Archaeology of Rome that has been prepared

under his direction. A fund is being formed to pursue important excavations in Rome, the British Archaeological Society of Rome having undertaken to act as trustees and apply it, with the consent and approbation of the Government.

The Great Architect: His Plan of Salvation in the Temple of Dead Stones and Living Stones, God and Man. London: Longman & Co. 1868.

THE "master builders" to whom this work on "The Great Architect" is dedicated, are no doubt the clergy—not of the Roman Catholic persuasion, nor of ritualistic tendencies, who are denounced in no very measured terms. Much of the volume, however, relates to the question of official arrangements in churches; and, if we mistake not, the author, before the publication of it, broached the subject in the *Builder*, in the end of 1863. His idea is that the primitive Christians cast aside all ancient temple arrangements, and simply adopted the hædæan form of edifice as a meeting-house, with cancelli or low railings along the edge of a platform, whence the speakers were to address the meeting. He therefore finds the origin of the chancel, not in the vailed holiest place or penetralia of the temple, but in the screened platform of the Roman judges; and the symbolism which reconverted the chancel into the penetralia of the temple he regards as a subsequent retrogression to Pagan ideas.

VARIORUM.

"On Social Life among the Teutonic Races in Early Times." By J. A. PICTON, F.S.A. Mr. PICTON here appears to have been expending a portion of his learned leisure in an analytical inquiry into the primitive elements of our modern civilization. The subject is a curious one, and Mr. PICTON has made an interesting paper of it, which was read before the Liverpool Literary and Philosophical Society in January last. We give a slight specimen of his mode of dealing with the subject, from what he says of the ancient Franks and Alemanni:—

"By the Alemannic code it was not lawful to erect a building more than three stories high without the consent of the *Lantfrater*, or magistrate of the district. A wall might be built round the court, but not of greater height than could be reached by a man sitting on a horse; nor was it allowed to have the wall crowned with a battlement or parapet."

Even at this early period the vexed question of injury to light by adjoining buildings was the subject of legislation.

"Und zimmert ein man ein haus, so soll er ein nachbar sein haus in ein zimern, so solerz in der hehe ritten das ein licht nicht verzimern werde."

"If a man builds a house, and his neighbour builds another adjoining, the latter shall so carry it up that the light of the first be not injured."

Then follow directions as to procuring satisfaction. Connected with this is rather a quaint, but effective law. "If any one shall build a boat or anything else with another man's timber, the boat shall belong to the man whose timber has been used."

The king's highway (*kunigaz straz*) was to be 10 ft. wide, for the alleged reason that two vehicles might pass each other. The bridges were so narrow that it was necessary to enact a law that the first comer, whether loaded or unloaded, should have the right of way.*

—The Seventeenth Annual Report of the Amalgamated Society of Engineers, Smiths, &c." Printed by Kenny, Camden-road. This report contains the transactions of the society from December, 1866, to December, 1867.

At the date to which the report comes down, the society consisted of 33,325 members, who were divided into 313 branches, of which 240 were in England and Wales, 34 in Scotland, 11 in Ireland, 14 in the British Colonies, 12 in the United States, 1 in Constantinople, and 1 in Croix, in the north of France. The entrance fee to the society ranges from 1*5s.* to 2*l.* 10*s.*, according to the age of the candidate, and the subscription is 1*s.* per week so long as members are in employment. The total income for the year amounted to 86,225*l.* 2*s.* 7*d.*; but, owing to the unparalleled depression of trade that prevailed throughout the year, even this large sum was not sufficient to meet the expenditure, which came to a grand total of 99,105*l.* 5*s.* 8*d.* The 12,000*l.* odd in excess of income required to make up this sum was drawn from the reserve fund, which at the end of the year still showed a balance of 125,263*l.* 2*s.* 7*d.* The out-of-work donations show a total of 58,243*l.* 0*s.* 8*d.*, distributed under a rule which provides that any member who shall be thrown out of work under circumstances satisfactory to the branch to which he belongs, shall receive 10*s.* per week

for fourteen weeks, 7*s.* per week for thirty weeks, and 6*s.* per week for whatever further period he may be out of employment. Of this large sum, it is stated, only 7,000*l.* were expended in supporting members out of employment through trade disputes. The sick benefit, which allows 10*s.* per week for twenty-six weeks, and 5*s.* per week for any greater length of time that he may be ill, to any member who, through sickness or accident, is unable to follow his ordinary occupation, came to a total of 15,577*l.* 18*s.* 0*d.* The superannuation benefit of from 7*s.* to 9*s.* per week, paid to members of upwards of fifty years, who through old age or infirmity are unable to obtain the ordinary wages of the trade, and who have been in the society for eighteen or more years, amounted to 5,982*l.* 13*s.* 10*d.* The funeral benefit, under which the representatives of a deceased member are entitled to 12*l.*, was 5,282*l.* 14*s.* 0*d.*; and ten grants of 100*l.* were, in accordance with one of the rules of the society, paid to members who were by accident or disease permanently incapacitated from working at their trade. Apart from the general fund there is a benevolent fund, which is replenished from time to time,—generally about once a year,—by a small levy. From this fund exceptional cases of distress are relieved upon the recommendation of the branch to which the distressed member belongs. During the year there were 500 grants from it, ranging from 7*l.* to 2*l.* each, and coming to a total of 2,249*l.*—"Report on the Sanitary Condition of the Parish of St. Mary, Islington, 1867." By Edward Ballard, M.D., Medical Officer of Health. The year, according to Dr. Ballard, has been a comparatively healthy one for Islington. The population was estimated at 200,541 in 1867, and the death-rate was 199.9 per 10,000 living; that of London generally being 229.8,—a lower rate than during the five previous years. A small-pox, however, has been gradually on the increase. Dr. Ballard appends to his report the results of personal researches as to the influence of the weather on health, in which, on some points, he differs from the Registrar. He finds it to be an error to suppose that sudden changes in temperature, as a rule, are damaging to public health,—at least, a sudden change from hot to cold. An increase of atmospheric temperature he finds normally associated with an increase of general sickness, and a decrease with its diminution. A fall of rain, especially in summer, lessens sickness generally, and sometimes immediately, while drought augments it. Weather, however, which lessens sickness amongst the healthy, tends, Mr. Ballard says, to hasten the death of those who are sick, and vice versa.

Miscellaneous.

MANCHESTER ROYAL EXCHANGE.—The foundations for this building, consisting of two stories of arched and fireproof ceiling, have been for some time in active progress, and are now nearly brought up to the street level. Messrs. Neill & Sons have executed the work at a schedule of prices. The contract for the main portion of the building above the street, but exclusive of internal finishing, &c., has just been let in a limited competition to Messrs. Parker & Son, of Liverpool, whose tender was the lowest. Messrs. Mills & Murgatroyd are the architects.

BRIGHTON GRAMMAR SCHOOL.—The new building just opened, which is to be called "The Proprietary Grammar School, Buckingham-road," was designed by Mr. Nunn, architect, and it has been erected by Mr. Chappell, of Steyning, whose tender (the lowest) amounted to 2,430*l.* The directors dispensed with the services of a clerk of the works. On the basement is the porter's living-room and bed-room; heating apparatus; open play-ground, 30 ft. by 28 ft.; covered play-grounds, 56 ft. by 24 ft. There are stone staircases throughout the building, with wrought-iron handrail and balusters. On the second floor is the entrance-hall and reception-room, corridor, 35 ft. by 6 ft.; schoolroom, 56 ft. by 24 ft., 14 ft. high. Upper floor, corridor; schoolroom, 56 ft. by 24 ft., 18 ft. high; class-room, 25 ft. by 12 ft. Both schoolrooms, corridor, and class-room will be warmed by hot water. The whole is well lighted and ventilated. A large piece of ground to the south has not yet been appropriated, but will be used if the school should so increase as to render it necessary, of which there appears to be very little doubt, to build a new wing for school purposes.

* Jus. Aleman, c. 132.

GAS.—The Woodbridge Gas Company's shareholders are to receive 8 per cent. upon their shares, but the profits of the year would afford 5 per cent., leaving 7 per cent. undivided. This may be very satisfactory to those interested in the dividends, but not to the consumers, and we understand unless the company reduce their present price it is the determination of several of their customers to discontinue the use of gas, and to substitute for it paraffin and other lights, the same as the Beccles people did, and which had the effect of causing a considerable reduction.

SOCIETY OF ARTS' PRIZES.—The Prince Consort's prize of twenty-five guineas has been awarded to Robert Creaser Kingston, aged twenty-one, of the Royal Polytechnic Institution, gardener, who, in this and the three preceding years, has obtained the following first-class certificates:—1865. Arithmetic—first-class certificate; 1867. Botany—first-class certificate, with first prize, and the Royal Horticultural Society's prize of 5*l.*; floriculture—first-class certificate, with first prize, and the Royal Horticultural Society's prize of 5*l.*; 1868. Chemistry—first-class certificate, with first prize, and vegetable culture—first-class certificate, with first prize, and the Royal Horticultural Society's prize of 5*l.* (together with a second-class in mensuration) the *Gardener's Chronicle's* prize of 3*l.* This is a gardener who has cultivated more than his garden.

TENDERS FOR THE SUPPLY OF WATER PIPES.—At the meeting of the Hereford Improvement Committee, the tenders for supplying 1-inch and 8-inch iron pipes and bends for the intended extension of the water supply were opened. There were seven tenders, *viz.*—Mr. Spittle (Newport), pipes, 5*l.* 10*s.* 6*d.*; Messrs. Cockrane & Co. (Woodsale, Walsley), pipes, 5*l.* 7*s.* 6*d.*; bends, 8*l.* 10*s.* Mr. Leybourne (Newport), pipes, 5*l.* 7*s.* 6*d.*; bends, 7*l.* 7*s.* 6*d.*; Mr. Jordan (Newport), pipes, 5*l.* 5*s.*; bends, 7*l.* 1*s.* Mr. Meredith (Kington), pipes, 5*l.* 5*s.*; bends, 6*l.* Mr. Abell (Worcester), pipes, 5*l.* 1*s.* Messrs. J. & S. Roberts (Westonchurch), pipes, 4*l.* 1*s.* 6*d.*; bends, 7*l.* 10*s.* The tender of Messrs. Roberts was accepted. In laying the pipes, the tender of Mr. Welsh, Hereford, was accepted, the pipes being 4-inch, 8-inch pipes, 2*l.* 4*d.*; 7-inch, 2*l.* 1*s.* 8*d.*; 3-inch, 1*s.*

A NEW LONDON MARKET.—In a few weeks the King's-cross Market will be opened to the public, and the populous districts of west, north-west, and north London will thence receive supplies of fish, meat, poultry, vegetables, and fruit. The King's-cross market covers more than a square mile of ground, and comprises the following:—1. A wholesale fish market; 2. A wholesale meat market; 3. A wholesale poultry market; 4. A wholesale provision market; 5. A wholesale fruit and vegetable market; 6. A spacious covered retail market containing about sixty stalls. As the new market is in close connexion with the Great Northern Railway, and in the immediate vicinity of the Midland, Metropolitan, and Great Western, the Metropolitan communication with the Great Western, and London and North Western stations, fish and poultry, the produce of the great food-producing districts of the north, fruit and poultry from the continent, and Irish eggs and butter, will reach the dealers and consumers three or four hours earlier than they do at the present time.

PROPOSED TUBULAR WAY ACROSS HYDE PARK.—A new scheme for a pneumatic tubular way has been submitted to the Metropolitan Board of Works by Mr. Rammall, C.E., who asked permission to convert for that purpose a disused tunnel, conduit belonging to the Board, formerly known as the Bayswater tunnel. The conduit crosses the park in a nearly straight course from Albion-street, in the Uxbridge-road, to Albert Gate, Knightsbridge; and to effect its conversion it will be necessary to open and under-set the side walls, and put in a new invert, rendering the greater part of the interior in Portland cement, by which a substantial and durable way would be formed; the height being 8 ft. 9 in., and the width 5 ft. 5 in. The increased gage of the tube thus proposed would be both high and wide enough to carry more roomy than the ordinary omnibus. The road would be lighted with gas, and have a clear gangway through from one end of the tunnel. The carriages would support a pair of light steel rails of 3 ft. 6 in. gauge, to be laid on wooden sleepers embedded in the invert.

COMPETITION DRAWINGS FOR THE ART-UNION OF LONDON.—With the permission of the Committee of Privy Council for Education the various sets of drawings submitted to the Council of the Art-Union of London in reply to their offered premium, are hung for exhibition in the South Kensington Museum. They will be found in the narrow gallery to the left of the entrance. The award is not yet made.

HAYMARKET MEMORIAL TOWER, LEICESTER.—A dinner in celebration of the completion of the Haymarket Memorial Tower, Leicester, has taken place at the George Hotel. The whole of the workmen employed were invited; and among the company present were Mr. W. Kempson (in the chair), Mr. J. Allen (in the vice-chair), Mr. Joseph Goddard (the architect), Mr. Barfield (the contractor), &c. A glee party was present, and added materially to the enjoyment of the evening.

ANTIQUITIES IN DORSET.—Interesting ancient British remains have just been discovered at Maiden Castle. Whilst some men were excavating on the summit of the mound, for the purpose of forming a pond for sheep, they came suddenly upon several large pits, regularly constructed, from 4 ft. to 10 ft. in depth, and on removing the loose soil fragments of coarse pottery, a pair of urns, a rude copper ring, several hoars' snags, sling-stones, and several carved bone spear heads were discovered.

VENTILATION OF SEWERS.—At the meeting to be held this Friday, the 19th inst., the Metropolitan Board of Works will consider notice of motion given by Mr. Cook:—

"That the question of the ventilation of the sewers belonging to this Board be referred to a special committee for consideration, especially to advise the Board as to the desirability of offering a premium (by public advertisement) for the best practicable plan by which the escape of injurious gases from the sewers shall be prevented, and at the same time the safety of those who work in them be preserved."

OPENING OF THE PALACE HOTEL, BUXTON.—The Palace Hotel in Buxton has been formally "opened." It is situated on an elevation near to the railway stations, within easy distance of the baths, gardens, &c., and stands within its own private grounds. The architect was Mr. Henry Curvey, of London. The dining and coffee rooms are each 52 ft. by 30 ft.; drawing and reading rooms each 45 ft. by 21 ft. There are also smoking and billiard rooms. "The Palace" and its detached offices,—kitchens, larders, pantries, &c., &c.,—stand on nearly 4,000 square yards of land.

SCIENTIFIC INSTRUCTION IN FOREIGN COUNTRIES.—In the Commons, Mr. Samuelson asked the Vice-President of the Committee of Council on Education what was the cause of the continued delay in the production of the information received from our legations abroad on scientific instruction in foreign countries. Lord R. Montagu said the delay complained of was not on the part of the translator, but arose rather from the immense mass of matter to be translated. As soon as the translations were prepared they were forwarded to the Foreign Office, in which department the responsibility of printing the papers rested. Lord Stanley said he believed a large portion of these papers were already in print. Lord R. Montagu said the reports received from the secretaries of legation would be laid on the table at once, leaving the other documents to follow as soon as ready. He believed that 260 pages had already been printed.

THE THAMES EMBANKMENT PAVING, LIGHTING, &c.—At a recent meeting of the Metropolitan Board of Works, the Works Committee reported that they had considered the matter as to the lighting, paving, &c., of the Thames Embankment by the several parishes coming into the line of the embankment, and recommended that it is not expedient for the Board to undertake the same, but that the duty should devolve on the vestries and local Boards before mentioned. Mr. Phillips moved an amendment to the contrary effect. The amendment was negatived by a large majority, and the recommendation of the committee agreed to. Mr. Newton moved,—

"That on the expiration of twelve months from the completion of the Thames Embankment roadway, during which time the contractors will have to maintain it as a macadamised road, the Board will (after that period of experience) again consider the question of how the roadway should be formed before being handed over to the commissioners, district boards, and vestries, who will have hereafter to maintain it."

The resolution was agreed to.

CONVERSAZIONE OF THE INSTITUTE OF ARCHITECTS.—The President and Council of the Institute of British Architects have issued invitations to a *conversazione*, to be held on the 1st of July.

OPENING OF THE ABBEY MILLS PUMPING-STATION.—At the last meeting of the Metropolitan Board of Works, a report was brought up from the Works and General Purposes Committee, recommending that the works at the Abbey Mills pumping-station be publicly opened on or about the 23rd of July next; and that his Royal Highness the Duke of Edinburgh be invited to perform the ceremony. The report was agreed to.

OPENING OF THE WESTERN ENTRANCE TO MANCHESTER CATHEDRAL.—The new tower of this cathedral is now completed, and formally opened. The tower on its eastern side opens to the nave, forming the vestibule, or principal entrance to the church. Above the western door is a painted memorial-window to the late Mr. J. C. Harter, of five lights, divided by a transom. A band of ornate mouldings runs underneath the window and is continued along the two sides, dividing the open portion of the tower into two stages. The interior of the tower is of stone, and is completely covered with panel-work tracery, carved. The tracery of the second stage on the north and south sides of the tower is made to assume the form of a pointed perpendicular window similar to that in the western face; and from the spandrels rises the fan tracery of the vaulting, the centre of the vault being filled with a large circle, within which are smaller circles filled with tracery, except the centre one of all, on which there is a heraldic device.

THE FALL OF "METEORIC STONES" IN BIRMINGHAM.—Some of the stones collected from the great thunderstorm on the 29th ult. were sent to the borough analyst for examination. Dr. Hill, in his report, says,—“They possess the character, colour, fracture, hardness, specific gravity (about 3), and the property of being feebly attracted by the magnet, of basaltic rock, and are similar to, if not identical with, the well-known Rowley rag stone. . . . The proximity of the Rowley rag to us, and the fact that our streets are made of and mended with it, add probability to the hypothesis that they have been carried up from the surface of the earth by a cyclone, to be showered down at a distance from the spot where they were raised. This is not only plausible, but probable; but the hypothesis must not be accepted without reserve, for the reason that cases are on record, and apparently well authenticated, of the fall of innumerable fragments at different times, possessing, as far as I can learn, exactly the characters of those which have been submitted to me, and which are believed by high scientific authority to be aerolites or asteroids.” The occurrence, as we remarked, of such a fall upon two similar occasions, if not often, in one and the same town, and in a locality near to a quarry where such stones exist, is almost conclusive as to their origin.

THE ENGLISH CHURCH OF ST. ANDREW, COMPIÈGNE.—The designs for this lately consecrated edifice were prepared by Mr. Thornton Shields, of Edinburgh, and the execution of the work was seen to by M. Louis Culla, of Paris, architect. The church is of Early English character. The steeple rises at the side of the church. The nave is of a simple character, and capable of containing about 200 persons. All the woodwork of the building is open, and is of red deal, varnished like the benches and wainscot of the nave. At the right hand of the choir is the vestry, also wainscoted and furnished to harmonize with the style of the church. The windows are decorated with the armorial bearings of the foundress, Mrs. Russell Barrington, and of St Andrew on the left—the place appointed for the organ and the singers. The whole interior is in the English Gothic style. The tower is octagonal, and terminates by a St. Andrew's Cross, with a weathercock of gilt bronze, bearing in the carving the Royal Lion of Scotland. A spiral staircase conducts to the clock and the belfry. The church stands back a few feet from the avenue, and an iron gate or railing encloses the space. This gate is ornamented with four pillars, the two centre ones being surmounted by lions, holding shields with the emblems of St. Andrew. In the garden are placed benches of varnished oak of an original design.

THE ARCHEOLOGY OF FREEMASONRY.—We are told that a Masonic Archeological Society has been established, in order to elucidate and popularise the antiquities and history of Freemasonry. If taken up by proper hands, advantage could not fail to result.

SAFETY IN THE MINE.—One of your correspondents suggests that steam power be adopted to ventilate coal mines. The extensive and intricate labyrinths, sidings, cuttings, drifts, and cavities in the roofs, where the dangerous gas accumulates, there being no through draught, would render his plan ineffectual. The gas could be easily drawn off if cupola-formed, or like nuto the Thames Tunnel; but a mine is a very different place. My plan of igniting it by the electric spark every moment is the only effectual method to secure safety in the mine. I should like to fix the wires in any mine in the kingdom that is considered the most "fiery," for I feel confident that explosions will be events of the past.—R. T.

MONUMENT.—Some time since a proposal was made to place a marble statue of the ex-Chancellor of the Exchequer, Mr. Gladstone, in St. George's Hall, Liverpool, and a considerable sum of money having been raised, the commission was given to Mr. G. G. Adams, sculptor. The statue, the execution of which has been delayed owing to the indisposition of Mr. Adams, is now near completion.—Digging operations have been commenced in front of the Midland Station, at Bradford, for the proposed monument to Richard Ostler, "The Factory King." Upon observing this fact a correspondent of the local Observer says:—"The site is the finest in all the borough, if not in Yorkshire; and, if it must be occupied by a statue, it is worthy of a noble subject,—a man whom the nation honours. Such a man was Cobden, a world-wide patriot. Such a man was not Ostler, a narrow, blatant reviler. He was the opposite of Cobden—the opponent of free-trade and all reform in legislation on civil and religious matters. Surely, Ostler is not the man whom Bradford most delighted to honour."

VALUE OF LAND IN LIVERPOOL.—An inquiry was held before Mr. Aston and a special jury, for the purpose of assessing the compensation to be paid by the Corporation for a property in Jordan-street, belonging to Mr. Wilson, and required for the purpose of making a new street from Parliament-street to Wapping, under the Act of 1855. Mr. Samuell, barrister (instructed by Messrs. Norris & Sons), appeared for the claimant; the town clerk for the corporation. The property consists of about 720 square yards of freehold land, with workshops, sheds, &c., upon it, now used as a boat-building yard, and a portion suited as a smithy. For the claimant, Mr. Wordley, architect, was called, who valued the property at 3,600*l.*, and the usual 10 per cent. for the property being taken compulsorily. Mr. Hornblower and Mr. Wylie agreed. For the corporation, Mr. Culshaw's valuation was 2,792*l.*, Mr. James Holme's 2,834*l.*, and Mr. Scott's 2,430*l.*, all adding 10 per cent. for compulsory taking. Mr. Samuell and the town clerk addressed the jury. The assessor summed up, the jury retired, and, on returning, gave a verdict for 3,700*l.*

THE NEW CHURCH IN POST VALE, HERTFORD. The chief-stone of this edifice has been laid. It is intended for the convenience of the inhabitants of the parish of Bengoe in the district of Post Vale. The new church, which is to be erected in the Early Decorated style, will contain sittings for 400 persons, and the contract for building it has been taken at 3,200*l.* It is to be built of Kentish rag, with dressings of Bath stone. The plan is cruciform, with nave and one aisle, and when the population has increased and more room is required, it is contemplated erecting a second aisle, corresponding with the first. The chancel has an apse, which will be lighted with three single light windows, with an additional window on the south side. The west window is formed with four-lights, with trefoil heads and trefoil intersections, with a rose window finishing the top. The spandrels are enriched with carvings. Near the apex, or gable, there will be a circular window, with three quatrefoil lights, each within a circle. The roof is an open timbered one. At the north-west angle are two large ornamental buttresses, with three columns at the angle, which will carry the corbels, supporting a turret of stone, terminating with a spire, the entire height being about 70 ft. The seats will be open.

TENDERS.

Table listing tenders for various construction projects including Union Chapel, Wilton Parish Schools, alterations to parish schools, and rebuilding premises. Includes names of architects and contractors like Mr. John Birch, Messrs. Webb & Sons, and others, with associated costs.

Table listing tenders for workshops, alterations to the Duke of Sussex, rebuilding Deepish Cottage, and other projects. Includes names of contractors like Messrs. Turner & Sons, Messrs. Messer, Scoble & Son, and others, with associated costs.

TO CORRESPONDENTS.

Church Clerk (cont. from p. 459) or better still, thin slate slab, we remedy the evil.—A Country Gentleman (we have a good set of the tube-pumps from some who have used them, where water is near the surface, and the soil gravelly. In the London the result is not so good)—Fenshawe (Herron is not required making out artificers' bills. As to joining Institute, address the hon. secretary, J. D. M. (too late).—E. B. F. (in 1864).—A. L. J. (too late).—S. W. A. (we have not seen the paper referred to).—M. F. (Mr. R. D. W. F. H. F. C. W. H. A. B. T. N. J. J. Messrs. O. J. F. Mr. W. L. J. J. F. J. W. H. J. O. M. T. R. G. S. O. B. & Co. T. H. H. J. H. P. T. W. S. & R. B. J. J. W. W. F. D. P. H. W. A. R. W. L. W. L. J. W. H. P. J. M. W. P. R. & Son. R. L. S. R. T. B. J. J. J. E. H. C. W. A. B. E. J. L. R. L. C. H. & Co. J. H. L. F. We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily publication. Note.—The responsibility of signed articles, and papers read public meetings, rests, of course, with the authors.

The Builder.

VOL. XXVI.—No. 1325.

Sacred
Archæology.

WHEN we consult a dictionary, the first thing we require in it is method; the second, correctness; and the third, fulness. If we cannot find the word we seek, the fact that it is correctly given, and the explanation full, is of no use to us. And supposing that we can find the required word easily, and its definition is sufficiently full, neither circumstance is of much value if we cannot rely upon the minute accuracy of the explanation: hence, the requisites for a work of a lexicographical character must always be arranged in the order in which we have set them down. Most especially, however, do we require order, exactness, and amplitude in works intended for the assistance of advanced scholars. These three points are not wanting in the Dictionary of Sacred Archæology we are about to notice,* although a little elaboration of each of them in a future edition would be an improvement, as we will presently show. The author is known as a writer on archæological subjects. In the prosecution of his numerous works he occasionally met with difficulties which he never passed over without solving; and the notes made on these occasions, combined with selections from the stores of facts and illustrations that accrued in the prosecution of his studies, form the basis of his volume. He takes an early opportunity to remark,—“Those who are experienced in literary labour will know that this volume is no mere compilation of fragmentary and disjointed extracts, but has been slowly and with critical effort, constructed out of a mass of conflicting evidence, and has been elaborated as much amid historic monuments and the archæological wealth of museums as under the shadow of bookshelves” which, perhaps, pardonable, though somewhat vainglorious, boast, has the effect of raising our expectations beyond patient tolerance of contradictions, repetitions, mistakes, and misplacings, when they occur. But it is a world of change. “Once,” said St. Bonifacio, “golden priests used wooden chalice; now, on the contrary, wooden priests use golden chalices.” It remains to be ascertained whether the peripatetic mode of compiling a dictionary is superior to that formerly practised. In the present instance, it has certainly produced a valuable work.

But before we proceed to give our readers a general idea of the nature of the contents of the

dictionary, we will take leave to suggest some improvements in its arrangement. Look at the word “Church.” Under this heading we are told of the blending of the Greek *kyriake* and Latin *dominicium* in the German *dom kirche* and Lancastrian *church-kirk*; of the earliest mention of church property; the form of the original Christian churches; the neglect of church repairs and cessation of church building about the year 1000, when the millennium was supposed to be at hand; the restoration of confidence in the eleventh century, and renewal of church building; of the correspondence in the form of churches, with their nave, choir, and sanctuary, to the arrangement of the temple with its court of the Gentiles, worldly sanctuary, and Holy of Holies; and finally there occurs the following paragraph:—“Churches are distinguished into various grades—the patriarchal, primatial, and metropolitan, according to the rank of their presidents: cathedral, as containing a bishop’s cathedra or see; collegiate, which are composed of a chapter and dean; conventional, if belonging to a religious community; abbeys, those under an abbot, or priories, if governed by a prior; ministers, when attached to a monastery, or of imposing size; parochial, if furnished with a font.” By and by as page after page flutters over, we come unexpectedly upon “round churches,” further on to “double churches,” in another place to “fortified churches,” in a fourth to “parish churches.” We suggest that a reference should be made to these divisions of the subject under the first heading. Concerning fortified churches there is an error we may correct here. Mr. Walcott says, “In Northumberland, churches in the vicinity of a castle were seldom permitted a tower, lest it should be occupied by the troublesome moss-troopers; and pele towers were built along the coast, at the cost of Furness Abbey.” The reverse of this is the case in Northumberland. The church nearest to Danstanborough Castle, Embleton, has a fine open parapetted Edwardian tower, and there was, and is now, a second square strong pele tower close to the church for the vicar; Bamborough Church, within bow shot of the stupendous castle, has a strong tower; Edlingham Church, situated not further from Edlingham Castle, has another sturdy tower; Warkworth Church has another. Alnwick Church has not only a strong tower, at the west end, but a curious look-out turret, at the south-east angle. Ancroft church has an Edwardian pele tower, superimposed upon the original Norman fabric, as we illustrated in a former number of the *Builder*; and reference to our columns, where we have treated at length of Northumbrian castles and peles, would have shown that the ohrebes were part of the great Edwardian, and post-Reformation system of fortification, against the Scotch and the moss-troopers for the whole of the county. To return to the arrangement of the work, we will take the word “hell.” The information here, again, must be sought under numerous headings, which are all independent of one another, and unfurnished with references. The sacring hell is in one place; the passing hell in another; the pardon bell in a third; and so on with many other subjects. It is, however, still more inconvenient to have to seek information upon a subject under a heading ostensibly devoted to something else; as, for instance, the presence of candlesticks upon the altar, of which we find an account under the word “Gradin,” as well as in their more legitimate connexion with caudles in their proper sequence; or the occurrence of two churches in one church-yard enumerated in the paragraph on cemeteries. This is not so bad, though, as finding a statement on one page that is contradicted on the next, because though this arrangement may leave us only half-informed, it does not set us wondering to the exclusion of power to progress with the subject in hand. Yet such contradictions have

crept in. Among the really plentiful account of guest-houses, for instance, our author says, “The Benedictine abbot received at his own table the guests of superior degree; the Cistercian abbot modestly dined with them in the hostel, whilst the Clugniac abbot took no notice of their reception.” On the next page he says, “The Clugniac abbot dined with guests in hall.” In a third place, he says it was the custom of the Clugniac abbots “to dine always with the brethren;” and in a fourth, “the abbot entertained his guests, and any monks whom he invited, in the hall.” Again, he says, p. 165, the dress of the Clugniacs “was a black frock, a pelisse, a hood of lamb’s wool, red hose, a white woollen tunic, and black scapular; and in choir, copes of linen; in cloister and refectory, a white pall; and in times of labour a white scapular.” And, p. 166, he says, “The Clugniacs wore a pelisse, a frock, and a cowl of scarlet cloth, to show their readiness to shed their blood for the sake of Christ.” Another form of inaccuracy occurs in the mention of wayside chapels, which, by the bye, is separated from the heading “chapel” by two-thirds of the book. After stating that these structures were commonly attached to bridges at the entrance of towns as at Rochester, Stamford, Elvet, Durham, Exeter, Newcastle, and London, Mr. Walcott says, “two still exist at Castle Barnard and Wakefield, the latter being of the fourteenth century; it has a remarkable carving of the Resurrection.” In the first place, the ancient piece of sculpture thus indicated, with the whole of the west front on which it appeared, was taken down twenty years ago, when the chapel was renewed, and rebuilt on the margin of a lake in the grounds of Kettlethorpe Hall, near Wakefield, where it now forms part of a summer-house, or boat-house; and, in the second place, it was not a carving of the Resurrection, but a series of five alto-reliefs placed in niches beneath canopies. These are, doubtless, like clerical errors, of which there are also specimens, trifling matters; but we prefer to point them out rather than gloss them over, hoping that by doing so we may conduce to the exactness of a future edition of what appears likely to be, saving these and similar drawbacks, a very useful work.

The subjects treated as sacred archæology belong to two distinct classes. All religious buildings and their respective parts and ornamentation, including sculpture, paintings, carvings, stained glass, sacred vessels, effigies, gems, tombs; all the furniture, plate, vestments, hangings, and ornaments of the altar, or everything, in fine, upon which the resources of art have been lavished for the embellishment of divine service, are mentioned; to those are added a mass of particulars concerning practices, ritual, tradition, and customs; and lest these may be undervalued, we enumerate the distinctions as given:—The orders of the sacred ministry, and the office of minor clerks; ecclesiastical dignities, offices, and ministries in the service of the church; religious communities, rules, and conventual arrangement of buildings; distinctions of the faithful, catechumens, and penitents; divine service, sacraments, rites and ceremonies in all their details, their administration and accessories; discipline and ordinances; Sundays, festivals, and fasts; usages and institutions. In most instances, however, the two classes of facts are inextricably interwoven. As every one is a “parishioner” we select that word as one of general interest that illustrates this tendency.

* Parishioners, in 1250, 1281, and 1305, were required to find in every church a chalice, principal vestment, a silk cope for principal festivals, two others for rectors of the choir on those days; a processional cross, a cross carried before the dead, a bier, a holy-water vessel, with salt and bread; osculatory, paschal candlestick, censor, lantern, and little hand-bell (for preceding the viaticum); two candlesticks for acolytes before the gospel; a legendary, antiphoner, grail, psalter, tropar, ordinal, missal, and manual; high-altar frontal, three surplices, a pyx, rogation banners, bells and ropes, a font with lock and key, christomatory images, the image of the patron saint, the church light (before the altar), the repairs of the nave

* “Sacred Archæology: a Popular Dictionary of Ecclesiastical Art and Institutions, from Primitive to Modern Times.” By Mackenzie E. C. Walcott, B.D. London: L. Reeve & Co, 5, Henrietta-street, Covent-garden. 1868.

and tower, glass windows, aisles, and churchyard fence. In 1014, prisoners were called the priest's hymen, or hymen. In 994, the only church furniture expressly required comprised holy books, house, vessels, and mass vestments. The sovereign is the prisoner of the Archbishop of Canterbury.

In the personal of this specimen of the dictionary a conviction will be felt of the advantage a work of the kind promises to be. We could have wished that the authority for the statement was given, and that it was expressed with a little more precision, so that we might be informed whether these requirements from prisoners were local or general; but our author has omitted references, except to Holy Scripture, he says, for the sake of conciseness and with extreme reluctance. As some amends for this short-coming, he gives a list of "general authorities," which is a catalogue of archaeological works, belonging to several centuries and countries, that is formidable enough.

King Richard I. said he would bequeath to the Black Monks his luxury; to the Grey his avarice; and to the Templars his pride. Interesting accounts are given in the volume before us of these logeates and their architectural possessions. The first-mentioned "held all the cathedrals of the new foundation in England except Carlisle. The magnificent churches of Tewkesbury, Battle, Pershore, Glastonbury, Tynemouth, Selby, Sherborne, Milton, St. Mary's (York), Crowland, Ramsay, also belonged to them." Of the buildings of the Cistercians, or grey monks, only one abbey-church, that of Scarborough, remains in use; all the others, among them Buildwas, Jorvaulx, Melrose, Byland, Biewaulx, Ford, Merevale, Boyle, Tintern, Littlehull, Kirkstall, and Netley, are in ruins. These brethren, says our author, "erected their abbeys in lovely places, usually well-wooded and watered valleys, far away from human habitation, and were principally noted by their success as graziers, shepherds, and farmers. The short choir, the transeptal side, divided into certain chapels, the low central tower, the grisaille glass in the windows, the solitary bell, the absence of tessellated pavements, pictures, mural colour and many lights in their churches, the almost invariable arrangement of the conventual buildings, with the dormitory at the eastern side of the cloister, communicating with the transept by a flight of stairs; the refectory set at right angles to the cloister; the chapter-house divided into aisles, except at Margam in Wales, are un-failing notes of the houses of the order." The absence of an eastern lady-chapel is also pointed out as observable in the churches of these brethren; the edifice was dedicated to St. Mary; no chapel was, hence, required for her especial service. Of the remains of the buildings of the brotherhood, to whom King Richard declared he would bequeath his pride, there is not so much account. Sir Walter Scott, whom we may credit with having searched every kind of memorial of this order with great industry and acumen, seeing the large part the brotherhood played upon his marvellous canvas, says the establishments of the Knight Templars were called Preceptories, and the title of those who presided in the order was Preceptor; as the principal Knights of St. John were termed Commanders, and their houses Commanderies, although the terms were sometimes used interchangeably. Mr. Walcott, however, alludes to no such distinction:—

"Commandery (*comenda*, a benefice), or preceptory (*precepto*, a first share). A cell of the Templars and Hospitaliers for collecting demesne-rents, and a home for veteran members of those orders; the president paid himself first his own pension, and then accounted for the residue. These houses remain at Swinfield, Clibbourn (or Chibbourn?), and Worcester."

The strong point of the book is that which is built upon the author's acquaintance with the writings of the early fathers of the church. It is the learning of the library rather than a knowledge of practical construction, that we may call his shield and his defence. His histories of the litantes, the liturgies, the kyrie elson, the mass, the martyrologies, all customs in connexion with the services, feasts, fasts, the use of insignia and articles of costume are admirable. It is pleasant to see renewed upon a modern page the pithy, incisive, and decisive wisdom of men whose impressions upon their fellow-men are felt nearly a thousand years after the conclusion of their labours. Hear King Edward: "Ceremonies be no workers nor works of salvation, but only outward signs and tokens, to put us in remembrance of things of higher perfection." Hear, also, what the faithful said of images: "Eusebius mentions a statue of our Lord erected by the woman who was healed (St.

Matt. ix. 20). Tertullian speaks of etchings of the Good Shepherd on glasses, such as are preserved still in the Vatican; and St. Gregory, of Nazianzum, Pope Damasus, and St. Augustine, frequently allude to paintings and sculptures as common in their time. St. Basil says that by 'the beauty of the image the eyes are raised to the fairer vision of the archetype' and St. Gregory of Nyssa declared that he never passed the inscriptions of images without tears, and regarded them as efficacious in stirring the heart and elevating it to virtue; whilst Bede calls them 'the living history of divine history' and Belet, 'the literature of the laity.'" But although these pure souls could see only the means of attracting attention to the highest things in these representations, there have been from the earliest times those who have dissented from their use. We read that Epiphanius, seeing a church at Anshathla lighted up, approached it and was about to enter, when he found a "curtain-veil," painted with the image of Christ or of a saint, drawn before the doors, whereupon he desired the churchwardens to remove it on the ground that it represented the human form, and gave them another veil. As aids to the dissemination of information concerning Scriptural facts, "images," in their broadest sense, have been considered useful by the most pious and simple of teachers. "In paintings on walls," says Gregory, "they who cannot read books can read that which in books they are unable." Mr. Walcott pursues this subject through its labyrinth with much research. He gives, too, an interesting account of emblems. We quote part of his notice of the transitions in the representation of the Lamb:—

"In very old sepulchres the lamb stands on a hill, amid the four rivers of Paradise, or on the Baptist's hand. It sometimes carries a milk-pail and crook, to represent the Good Shepherd. In the fifteenth century it is mimbed. In the fourteenth century its head is crowned with the cross and monogram. In the sixteenth century it bears a spear, the emblem of wisdom, ending in a cross; or appears, bleeding from five wounds, in a chalice. At last it is grided with a gold zone of power and justice (Is. xl. 6), bears the banner-cross of the Resurrection, or treads upon a serpent (Rev. xviii. 14). At length, in the eighth and ninth centuries, it lies on a throne amid angels and saints, as in the Apocalyptic vision. When fixed to a cross it formed the crucifix of the Primitive Church, and, therefore, was afterwards added as the reverse of an actual crucifix, as on the stationer's cross of Valerius. In 692, the Council in Trullo ordered the image of the Saviour to be substituted for the lamb."

Another feature of interest is the notice of the behaviour of congregations during the performance of divine worship. Mr. Walcott reminds us that "murmuring" was once a common mode of expressing approval or displeasure in the course of the service. Bishop Burnet and Bishop Spratt were both murmured at when preaching at St. Margaret's, Westminster, to the delight of the first, who sat down and enjoyed the manifestation, rubbing his face with his handkerchief the while; and to the annoyance of the latter. At Hereford, every person arriving late in choir was thus hummed at. This was, doubtless, the last vestige of the primitive custom of applauding and clapping hands deprecated by St. Chrysostom and St. Jerome. The former of these commentaries says the custom took the place of the Greek acclamation of the orator by his audience. The latter says,—"In church, at the tombs of the martyrs, the amen, like the heavenly thunder, hooms again." St. Justin tells us the people cried out amen after the Holy Communion; and other early authorities frequently refer to this custom. By the reign of Queen Anne, the practice of expressing sentiments by murmuring was not quite obsolete. A witty preacher, at St. Mary's, Cambridge, addressed his congregation as "*Hum et hissimi auditores.*" Elsewhere, in Mr. Walcott's work, we read people need to cross their legs when the Gospel from the first chapter of St. John was read; and to rise when the Lord's Prayer was read in the second lesson. As early as the sixth century, the congregation stood while the Epistle was read, as well as during the reading of the Gospel. All who value precedent will be gratified with a perusal of Mr. Walcott's work. Ancient usage, with regard to candlesticks on altars, floral decorations, banners, and all proceedings and circumstances connected with church arrangements, will be found treated at large. The Pope, who directed the Cistercian abbots to buy up every specimen of English embroidery they could obtain, said, "England is our garden of pleasure and delight; its treasure is inexhaustible, where much is, thence much may be taken." In the same way we feel there is so much in this dictionary of sacred archaeology that much can be taken from it by most students with great advantage to themselves. Take the floral decora-

tion of churches at Christmas, Easter, and Whitsuntide as a sample. This class of embellishment, if undertaken without proper guidance and due feeling, is often ill-done. Mr. Walcott gives early precedents, and a list of the sacred flora suited for this purpose:—

"George Herbert had his church, on festivals, 'strewed and stuck with boughs,' and perfumed with incense; flowers and ivy, on Whit Sunday, adorn St. Mary's Redcliffe, which is strewn with rushes, like the cathedral on Mayor's day. At Christmas, Easter, and Whitsuntide churches were always decked with evergreens (Is. ix. 13; St. Matt. xxi. 8); box, holly, ivy, and rushes, no doubt in memory of the Gardener of the Resurrection (St. John xx. 15), the second Adam, who keeps the paradise of the departed, and also in anticipation of the renewal of all things (Solomon's Song ii. 11-13); birch and broom were used on St. John the Baptist's day. St. Jerome says that Nephtalia shadowed the hassies and martyrdoms with divers flowers, foliage, and tendrils of the vines. St. Severus decked the church walls with lilies; and Fortunatus speaks of crowns and pendant garlands. St. Paulinus alludes to the same custom; and Frutkinus, who also describes the lamps hanging by ropes, and their quivering, glittering light cast on the ceilings, says, picturesquely:—

"With flowers the pavement strewn,
The doors with garlands wreathed;
Before its day the year shall bloom anew;
And purple spring in winter breathe."

The list of sacred flowers is a curiosity. We can, however, only refer our readers to it. We pass on to mention what appears to be a little confusion of terms on our author's part. He does not seem to be clear as to the distinctions between a reredos, retable, frontal, and super-frontal. Thus, he speaks of the celebrated Westminster retable as a frontal, saying, at the same time, it was more correctly described as a tabula picture or table. "The true frontal, like the modern antepane, or antependium, and the ancient pall, was a hanging of embroidery,—a drapery of the colour of the festival. . . . The super-frontal, called the reredos, at Durham (1081), and the super-altar, by Matthew Paris, hung at the back of the altar as a dorsal. . . . The frontal was the fringed upper covering, or parafront, hanging over the frontal or surfont of an altar." The earliest retable he describes as moveable, and set on the altar, to contain relics at certain times; and when, at the beginning of the twelfth century, it became a fixed appendage, he speaks of it as a mere upright slab of stone, masking a little shrine behind it. M. Viollet-le-Duc, however, specially cites the Westminster retable as one not worthy of mention by the side of the famous *pala d'oro* of the church of St. Mark, Venice. Mr. Walcott says, before the thirteenth century no candles or crosses were permitted to be permanently set on altars, but were invariably brought in by two acolyths when mass was to be said, and that the next step was to bring in, in the same way, portable retables or diptychs; "and then, in the fifteenth century, the contratable appeared, a wainscoted decoration above an altar, designed to receive the altar-piece or retable." We do not see why the Westminster retable should be given as an example of a frontal.

Next to close a book with blame when there is much to admire, we turn to the author's account of the diptychs mentioned above. Long before the name was given to a painting or carving that folded together it represented two tablets joined together, on which were inscribed the names of benefactors and worthies of the church, the living on one tablet, the dead on the other. When from the accumulation of names, which eventually included those of the magistracy, clergy, saints, martyrs, confessors, and the faithful dead, more leaves were added, they were enclosed in two ivory tablets as a cover. These lists were "read out by the deacon during the Holy Communion from the fourth century, until the names became too numerous for recital, and only a general commemoration by St. Angustin was made. The use of the diptych, if not of apostolical date, is to be traced to the second century. St. Cyprian alludes to it in the third. The practice was continued until the twelfth century in the Western church, and until the fifteenth in the Greek. It is clear, however, that a Book of Life stood on the altar of Durham and St. Alban's until the Reformation; and even in the seventeenth century, at Chichester, SS. Wilfred and Richard were commemorated, and a list of benefactors set up in a public place in the cathedral." The reading of these names of the dead must have been a solemn scene, as the deacon stood at the foot of the altar and the celebrant cried, "O Lord and Master, our God, grant these souls rest in Thy holy tabernacles," in the hushed assembly. The author adds, "Sometimes names were erased, and heretics in this way retorted on Catholics. So

Theodoret attributes the reconciliation of the churches to the restoration of St. Chrysostom's name upon the diptychs of Constantinople thirty-five years after his death." With this sample of the class of information in the work we must content ourselves. Mr. Walcott estimates his undertaking in Lord Bacon's words as "a thing of exceeding great weight, not to be compassed without vast labour" and this valuation we will not attempt to controvert.

OPENING OF THE NEW CONGREGATIONAL COLLEGE, NOTTINGHAM.

THE New Congregational College or Institute, just completed on the Forest-road, has been formally opened. The college has been erected for the purpose of training young men as clergymen of the Independent denomination. The style of the structure is Gothic of the fourteenth century, and the materials are red bricks with stone dressings. The inside of the building contains on the ground-floor a large entrance-hall, staircase, reception-room, a large class-room, and library. The second story is occupied by the lecture-hall, which is 60 ft. by 30 ft., with open-timbered roof. The houses of the tutors are situated at either end of the building. The front of the erection has been "broken up," and the Gothic windows are doubly recessed. Bands of black bricks are carried at intervals along the brickwork. A porch stands out at the entrance to the main building, and on the other side there are traceried windows, above which runs a band of ornamental brickwork, and above all are formed five upper windows. The centre of these is a large three-light traceried window, running into a gable, which forms the central feature of the building. The high-pitched roof is surmounted by a bell-turret of ornamental design. The structure is situated on an eminence. The architect was Mr. R. C. Sutton, of Bromley House, whose design was selected by the committee out of a large number sent in for competition. The builders were Messrs. Bell & Wood, and the contract for the woodwork was executed by Messrs. Stevenson & Weston. The total cost of the building, without the land, has amounted, including extras and furnishing, to 5,400l.

SOMETHING OF SUSA.

Few are the travellers who linger at Susa, unless to sleep through the interval between the arrival of train and departure of diligence for the Mont Cenis pass, or to sit, sally or sorrowful, through the hours of half-light darkness before the train that was missed by the late diligence has its work taken up by a successor next in order. Post-bags and travellers have alike to wait, and anxious correspondents, and all may freely indulge in the ill-conditioned *salomon miseris* of having companions in discomfort. Until the mountain is pierced by the tunnel, or the post-bags assert their consequence more importantly, such contingencies must occur upon the Turin line. Not even the high summit railway can be expected to be absolutely punctual,—may its arrival at all be in every case a certainty! The works go on with a resolution that declares that success is intended and positively counted on; and now pushes on rapidly with ordinary appliances of the steam-horse, and now betakes itself again to its higher central third, to grapple with seemingly impossible gradients. Shielding arches of massive work show where encumbering, not to say demolishing, avalanches are provided against; and long after the ascending diligence may flatter itself that it has shaken off its presumptuous rival, it is found dogging it pertinaciously again, like "the hound of spring upon winter's traces," and only nightfall makes it uncertain whether the new power has yet attacked the last steep height, which alone, after we have been climbing for half a day, is dignified by the muleteers with the title of "the mountain." In the mean time a single perverse rut in the icy road makes all the difference in effective punctuality of arrival, though not much in the interest or pleasantness of the journey. With the happy unconsciousness of travellers who have never met with an accident, and who regard such events unconsciously with the feeling avowed by the philosopher who noticed that fatal accidents always had a way of befalling somebody else,—

we looked down all the afternoon from coupé, and even from hanquette, at the most desperate precipices. Quite at ease in our wraps, and comforted with a carpeted foot-warmer, a certain sense occurred sometimes of the riskiness of a railway that, always running on the outer side of the road, would afford its travellers a sheer look over. None of us disturbed ourselves at the lurching of the cambrous vehicle, nor even at the excited exclamations and instructions of the guard, who, sitting just behind the driver, was as peremptory in his constant interferences as a Channel pilot might be with the captain on the bridge of a steamer. Picturageness, therefore, and not peril, colours the scene, when, at a turn in the road, where a welcome chance is given to the foremost travellers of looking back at the long train of sledges behind, it becomes apparent that, for ten minutes, all the noise and cracking of whips expired upon fourteen mules has only given the ponderous box a twist, sometimes one way sometimes another, upon an axial point, but never moved it an inch in advance. Of course power is brought up from behind, and of course we go on again all right; but we come to the place where baggage and bags and travellers have again to be transferred to the diligences, full one hour late. This is done at last in the midst of a wilderness of moon-lit snow, over a road of ice, cracking, if not tripping up, at every step. The rapid descent undoes in minutes the ascent of hours, but travellers uneasy about further progress are by this time resigned to the necessity of interrupting the journey from Liverpool to Palermo by a regular night's rest; and guards, who fretted before at every instant of delay, seem restored to a happy frame of mind now that the race is fairly lost.

Happier, as well as luckier, for the moment, are they who have predetermined to make a pause at Susa, and wiser also, it may be, if their errand does not make any lingering an idleness, are they to take a day or two to survey the scenery by which the steeper Italian side of the Alps breaks up and interposes some ranges and slopes of intermediate horror and loveliness before consenting to be lost entirely in the level plain of Lombardy. It is well worth while to familiarize the mind with the characteristics of both slopes of the great mountain barrier before pressing hurriedly on. Even if such impressions could be realized in a moment, and after a single excursion at a single glance, they will either prove but transitory or will interfere and intrude upon the next series of interesting impressions too suddenly succeeding them. Is this the self-deceiving argument of an idler? The truth will be found on trial of Hosioid's maxim, and appreciated no less by the artistic than by his exemplar of

"The sordid soul,
How much the half is greater than the whole."

Doubtless all this is more easily said by one who is not unfamiliar with much of Italy already,—not so easily adopted on a first visit,—with the whole peninsula stretching out in all novelty, and attracting most forcibly to its more interesting points. The suggestion of the interest of suspended travel at Susa may, then, be left to take its chance with those who are returning, and who may think it not time thrown away to explore its beauties and its monuments while awaiting the chance of making up a party and superseding diligences by a vettura.

The characteristics of the scenery may be sought on the walls of water-colour exhibitions, or at the Academy, more fitly than in this place, which has more claim to monumental notices. The cathedral of San Cinsto, and the wonderfully preserved Roman arch, are the principal, it may be said only, monuments of interest, but both worthy of considerable attention. The cathedral and its bell-tower are in true Lombard style. What we should call its west front—though here, in fact, its northern, for ecclesiastical Orientation is but lightly regarded in Italy, is strangely made continuous with the Medieval city wall, built apparently on earlier foundations. The city gate abuts upon it on the other side, flanked by towers, now dilapidated; and the road which leaves the city through it, and skirts the flank of the church in passing to it, is the same that once led direct to the steep ascent still spanned at a little distance by the Roman arch. Road and arch are now within an enclosure, but the keys are at hand, according to a conspicuous notice, and the *custode* is obliging and indulgent. The, so to speak, western entrance of the cathedral is now built up—has long been— and the front has been brought flush with the city-wall by the demoli-

tion of an advanced porch usual in the style, of which the ruined attachments are still unobliterated. The church is not remarkable among Lombard churches; and still, it is impossible to visit it without interest here, on the threshold of Lombardy, or to dwell on it without pleasure. There is a certain simplicity and sobriety about the design of these architects that is very engaging, rescued, as it is, by a sufficient indication of originality and inventive resource from taxation for meagre poverty. The exterior cornice has the usual enrichment of interlacing arcades in relief, very neatly finished in brick, and under the raking cornice. At the end the straightening lines of the arches are at right angles to the slope, but kept well to the vertical, and with excellent effect. Within the openings from nave to aisles are round arcades, of good proportions, inclining to the tall, through the wall that is pierced above with the small windows that suffice for illumination in Italy. These openings have an arch of second order, and a slight shaft rising in the centre of each pier. The vaulting is quadripartite; but only the piers at the extremities of the nave, west and east, have shafts on their face rising to the spring of the arch. This arch by the crossing is pointed, and harmonizes with the converging archivolts of the apse.

The first conclusion is, that this eastern arch and the apse are of later date than the general round-arched nave. It may be so; yet the details scarcely declare decisively, or even equivocally, for such a view; and if it be correct, they must have been inserted within the original shell of the primary structure, which declares itself from without as homogeneous from foundation to cornice, and from one end to the other. There is a difference of the same kind in the same position in a church of considerable elegance at Arona, and of the same apparent uniformity in general design. The question—unless it has been critically settled already—may stand over for illustration by more accessible examples.

At Susa, structural inquiry in the interior has been rendered difficult by the painting in distemper of every portion. Every surface at least has been covered with patterns, and in great variety; yet even when baffled by them as archaeologists, we may give a word of caudid praise to the artist. The shafts, with well-judged effect, have been left plain, and the tone of the whole is sober, for all its lavish diversity, harmonious in itself, and harmonizing with the purpose and dignity of the occasion.

Enough has been said, perhaps, to attract some other visitor to further scrutiny than even an idler had time for, with the Roman arch still to be examined. One other notice each successor may be thankful for. On the side doors by which the church is at present entered are two bronze perforated plates of Medieval execution—of neo-Medieval. They seem once to have been fitted with rings; as present, on the modernized doors, they are high up, and attached as ornaments. The diameter of each is about 11 in. The centre of one is a bull's head, with distinct teeth, perforated eyes, and one of single large head is continued on each side to two small bodies curled round, with complete legs and entwined tail. He would be rash who would say whether the head on the other is wolf or mere chinera, and whether the more freely executed little animals on either side are cubs or tiger-cubs, or what not. The central heads each protrude to form a boss in the centre of a foliated border, excellent subjects for photography, an art not flourishing as yet at Susa. It is curious to see in these grotesquely-treated heads a revival of the very same conventionalities in the expression of the curls on a bull's forehead or the mane of a lioness that meet us on early Greek coins and busts, on the lions of the Lycian room at the British Museum, and on the bas-reliefs of Assyria.

The campanile has the same general character that pervades so many examples in Italy of every degree of the secondary enrichments that culminate in the colossal mosaic of Giotto's tower at Florence. Fergusson has remarked on the propriety with which the openings advance arithmetically, sometimes from one to four in regular order, from below upwards. The success of this depends on a management that is not always forthcoming. Where the outlines of the structure are kept, as they usually are, to the true vertical, these ever-widening openings have an inevitable tendency to an appearance of a fan-like spreading that conflicts with the impression of verticality. Where walls so lofty have no inward incline, not only is this un-

pleasing conflict uncompensated, but the expression of lightning of load towards the summit lacks the confirmation that would be given by the implied reduction of the thickness of the walls towards the top. The beautiful structure of Giotto does not vindicate itself thoroughly against this criticism. What will be the result in case—as those who have lived to see the progress of Cologne Cathedral may well anticipate—it should ever be completed according to traditional design it is not easy to conjecture. Robert Browning, *vates sacer*, has predicted that it will still spring up its—

"full fifty braccia,
Completing Florence, as Florence Italy."

Meantime, we are sensible of a certain tendency to incongruous embossness above the highest and most open light, and a certain excess of unaccounted-for dead solidity in the unpierced height between the top of so generous a window and that of the cornice. The spires and spirals that now cover the tower of San Giuseto at Susa are, of course, modern in design as in execution. "In one of the chapels," says our guide book,—an old companion, doubtless, dated 1858,—"is a curious Medieval bronze group of our Lady of Rocca Melone, with St. George and Bonifacio Rotari, a Crusader of the twelfth century." This is, in fact, an engraved brass, of very perfect preservation; but that it has been thought worth the trouble to scrape off the armorial bearings from the shields, and of fine execution and florid design. It is of a size to be lifted in the hands, and of a style altogether to rouse painful regrets for the absence of tracing-paper and hellhal.

Reversing the order of chronology as it appears in the books, but following that by which we most advantageously quit our own standing-place in history to mount upwards to the past, we quit the monuments of feudalism, and of that well-knit ecclesiastical system that, dating earlier, had contests and compromises so remarkable with the feudal instincts, we turn our backs upon the Porta di San Giuseto to visit the slope to the celebrated, but too little visited Roman Arch of Susa. "From the Marble Arch to the Marble Arch," we exclaim, as we approach it, so similar is it in general aspect to our neighbour in Hyde Park, and so well preserved,—time only having conferred on the material that rich golden hue that never can be hoped for as a glory to be given by the atmosphere of London. The finest view of the arch is from the road above it when the campanile of San Giuseto is seen to the right, and beyond, for back-ground, the glorious distances of mountain slopes,—not too lofty to be dotted with villages, and flushing into the tender greens of an Italian spring. It is difficult to think that the gate was ever used for common passage and entrance into the city, so sharp are the angles of the lower haemese stones. Some traces of Roman construction behind intimate that it was rather erected in the dignified position which its English antetype held and has lost, of connexion with a residence on the same site where later stood the palace of the Countess Adelaide.

Antiquaries have recovered the inscription on the Attic sufficiently to establish that it was erected about B.C. 8, in honour of Augustus, by one of the chiefs of those Alpine tribes whom it was one of his latest personal military occupations to subjugate or pacificate. Julius Cotinus, son of Donnus, who called himself a king, succeeds as prefect, and by his erection acknowledges his gratitude to the irresistible power that deigned to make use of him in his reduced condition,—a condition, after all, that must have been of no slight importance to admit of the execution of such a work. The funds being given, there is little to astonish us in a monument so comparatively pure in taste having been erected by such a personage on the eastern foot of the Alps, when we remember how thoroughly classical in style and meritorious in execution is the coinage of our own Cunoehelin, a contemporary. "The general proportions," said Woods, "are not unpleasing;" but this praise is scarcely positive enough for proportions that are indeed particularly pleasing,—the general proportions, that is, of the structure with reference to void opening, solid supports, depth, mass, and general outline. By rough measurements under difficulties, the depth of the single passage (6.48 metres) seems to be somewhat less than the open width (5.80 metres) as that again is still more in excess of the joint width of the supports on either side (2.58 metres each). The effect is

given very decidedly of a passage much wider than deep, and well in excess of the supporting jambs.

The structure rests upon two oblong bases of rougher material, but very massive blocks that project some foot all round, within archway as without, beyond the proper plinth and base mouldings. Extending from front to back at outer sides of these bases extends on either side a long and high (6.43 by 1.23 dia.) pedestal with base moulding of Roman type, but well and holdly drawn and preserved by having been long covered with earth. The better cornice of this pedestal is less well preserved, but quite recoverable. These long pedestals project beyond the face of the structure at each end, and show as the proper pedestals of four fluted Corinthian columns engaged one at each angle; the bases of the columns are on plinths that are retained along the outside, but finish against the front. To the four columns thus engaged is given their proper entablature, with sculptured frieze running all round, and above the cornice is an oblong attic of corresponding plan, and about equal height, in three courses of which the two upper here the inscription: no trace of a superior cornice, which must have existed, as proved by the preservation of the inscription, now remains.

The architrave of the order has its projection necessarily governed by the degree of engagement of the capitals, and advances not only beyond the face of the wall, but beyond the hand of the archivolt of the arch, which is just in contact with it at the centre.

The fascias of the archivolt descend directly upon the very thin and curved abacus of an angle, pilasters of which the base moulding is very simple, both faces plain and unfuted, and the flat honeysuckle enrichment of the capital very fairly elegant. The level of this abacus is about the middle of the exalted engaged columns; there are no mouldings under the archway, but the lower vousoirs project about an inch from the plane wall, and thus mark the line of spring.

The solidity of the structure is complete, palpable, and very wonderful; it need not be said that no mortar is employed, and the joints are very fine. These have, as usual, been attacked at the points of bond for the sake of metal cramps, but without affecting the general pertinacious cohesion of the mass. There is not a trace of an open joint discoverable either from settlement, failure of materials, or shift from earthquakes. Some semblance of openings along the entablature are seen to be clearly due to constant percolation of water in places where the cornice has been violently damaged.

This permanence is readily accounted for by the serious simplicity of the construction. The marble employed is very hard, and in very large blocks; the masonry work is perfect in its order and execution. Up as high as to the third vousoir the courses of masonry ran through with continuous horizontal joints. Thus, of the plain wall of the interior of the arch, the four lowest courses correspond in height with, and are continued round into the course comprising both plinth and base moulding, the two courses of the ditto, the course of the cornice of pedestal. Above these the base and lowest drum of the column are carved out of a block that is continued in the ashlar, at a height that runs through and so upwards. The capital of the pilaster, again, is part of a course that becomes at the angle a drum of the column, and a joint runs even through the Corinthian capitals at mid height. The two lower vousoirs, of which the joints have but moderate inclination, are part of stones of the horizontal course,—those above become distinct. The central vousoirs of the vault from front to back are three only, the next line on each side has four, and then come, as it seems, three again.

The predominant effect of the Roman arch at Susa, then,—probably the best preserved Roman work in the entire peninsula,—is satisfactoriness in respect of general proportion and of conspicuous solidity, especially when seen from the angle, so that the bond of the continuous flank pedestal can be appreciated. Its points of weakness are,—First, a want of proper architectural expression of the articulation that should unite the system of columns and entablature with the plaster-borne arch; its walls and spandrels seem rather housed within it than rather its true core or outgrowth. The columns assert themselves as independent of the general supports in determining the projection of the architrave, but the architrave is dependent for sup-

port on the archivolt and ashlar below, manifestly, but with suppressed acknowledgment. True, that the continuosness of horizontal joints corrects the sense of primary disjunction to some extent, but covertly; and if recognised, only to protest against a neglect that it insufficiently makes up for.

The architrave by its projection—see it at what time of day we will—throws a dark shadow that interferes with the lines of the archivolt, while the contrast of the uncompensated curves of this inevitably cause the horizontal lines to appear to sag.

Various differences occur in the details and style of execution of the several capitals, and the lower torus of one of the bases is exceptionally as freely relieved from the plinth as those at Tivoli.

The sculptured scorifies on the frieze are rude enough. An enormous bull, as high as the priests who lead it to sacrifice, is even less remarkable than a sow that follows of equal height, and which an acolyte has to strain himself painfully to grasp by the ear with one hand, by the tail with the other. On the other hand, the cavalry-men and horses have the proportions of veritable pigmies; and yet the general scheme, sequence, and distribution, are really very fair. And so enough of Susa,—the Segesium of the ancients.

MAIDSTONE MUSEUM.

THE county town of Kent, nestling snugly in its verdant valley, with the winding Medway watering its skirts, and margined by gently-sloping and luxuriantly-clad hills, presents a very pleasant picture.

"Around the nurturing dale, embosom'd deep,
Contrasted hills extend their circling sweep;
Like battlements appear'd, on every side,
To screen its crops, and fence its lowly pride."

A notable place in its way is Maidstone. Few towns not metropolitan, have so varied a history. It fills a prominent page, not only in the chronicles of Kent, but in the annals of England. It was at Maidstone that the disaffected Sir Thomas Wyatt hatched his memorable insurrection in 1554, which threatened such dire disaster to the British crown, had it succeeded. For this daring escapade Wyatt was executed in London, while three of his followers, Sir Henry Isley, Thomas Isley his brother, and Walter Mantle, squire, met with a like fate at Maidstone. Mary showed her displeasure with the conduct of the inhabitants at that occasion by disfranchising them. The picturesque ruins of Allington Castle, the ancestral seat of the Wyatts, stands on the bank of the Medway, about two miles from Maidstone, and not far from the famous Kit's Coty House—hardest of antiquarian nuts, that nobody yet has been able to crack. In 1613 the town was stormed by the Parliamentarians, under Fairfax, who certainly did not show much mercy to the unlicky inhabitants. They have been peaceful and patriotic ever since. In ancient times the city of the Medway was a place of great ecclesiastical importance. As early as the reign of King John the Archbishop of Canterbury had a palace here, rebuilt in 1350 by Archbishop Ufford. There is an old palace here now, red-roofed and ivy-covered, an object of interest to antiquaries. The church of All Saints, known as "The Pilgrims' Chapel," is close by, and for centuries its pulpit was occupied by the most celebrated pulpit orators of their day from far and near. Indeed, to have preached at Maidstone at one time conferred a distinction, of which divines so honoured were not a little proud, and those less fortunate were not a little jealous. All Saints' was rebuilt in Richard II.'s time, and is one of the largest parochial edifices in the kingdom. It is 227 ft. in length and 91 ft. wide. Its steeple was destroyed by lightning in 1730. Ultimately the place settled down into an ordinary country town, easy-going, and quietly prosperous. At the beginning of the century, the population was about 6,000, it is now about 23,000, which is satisfactory for a special gin, which it brews, and for its manufacture of paper. The latter was begun in 1808. We also hear of the town periodically in connexion with the assizes, and the "good old institution of hanging" (the county jail erected in 1818, at a cost of nearly 200,000*l.* is a model prison); but it is chiefly known to us, of course, for its hops. The first English hops were raised here in the time of Henry VIII., and Maidstone is

now the first hop-market in the kingdom. It is the Maidstone of the past, however, that will afford most interest to the antiquary. The remains and traces are plentiful. The quaint, fantastically carved, gable-fronted timber houses, one meets with all along the High-street, and Stone-street, in Week-street, and St. Faith's-green, recall the old days very vividly. There are one or two long-roomed, wide-windowed, low-roofed, quadrangular inns built of wood, looking like miniature Tabard inns. And doubtless they, too, have had their local Chaucers, and their Canterbury tales, "told in the twilight" over beakers of ale at the hostelry's comfortable board. It is a pity that no really good local guide-book exists to tell us something of the history of the antique houses in Maidstone—numerous enough even now to cast an air of two centuries ago over the place. Not often do we see so many bits of old domestic architecture as one finds here. We wish to say a few words about one of these picturesque structures which has been converted into a library and museum of antiquities. It is something unique in its way, and merits a word of description.

Adjoining St. Faith's-green already alluded to, and in the street of that name, stands the Manor House of Chillington, anciently part of the possessions of the well-known family of Cobham, of Cobham, of Kent. John de Cobham, as we read, procured a charter of free warren for the manor, in the seventeenth year of the reign of Edward III. The present house is a large, irregularly built mansion, dating from about the time of Elizabeth, though some portions may be older, and others more recent. Similar family residences are to be met with throughout the country.

"The oaken wainscot richly graced
With gay festoons of mimic flowers;
The armorial bearings, now defaced;
All speak of proud and long-past hours.
The ceiling, quaintly carved and groined,
With pendant pediments reversed,
A bygone age recalls to mind
Whose glories song hath oft rehearsed."

There is the courtyard in front, and the terraced garden grounds behind. After passing through many hands, and experiencing a variety of vicissitudes, the building, about half a century ago, became the property of Mr. William Charles, of Maidstone, who occupied part of it as a residence, and carried on a felt manufactory, as we understand, in another part. It descended to this gentleman's son, Thomas Charles, a physician and enthusiastic antiquary. By his will, dated 1855, he bequeathed a valuable collection of books and antiquities upon trust for permanent preservation in his native town. At his death the Corporation purchased the mansion, and thus was founded "The Charles Museum." The collection has been largely added to since, chiefly through the liberality of Mr. Randall, a local banker, and executor of the donor, and Mr. Edward Pretty, F.R.S., the first appointed curator of the museum. It is well displayed, and carefully arranged in four rooms. No handbook of the museum has as yet been prepared. In the absence of such help, all we can pretend to do is to note some of the leading features of the collection gathered during a brief visit. On the ground-floor is the library, consisting of upwards of 4,000 volumes, with tables and chairs for the accommodation of readers. It is rich in works of local history, topography, and antiquities, as a country library should be. We also observed a complete set of the *Gentleman's Magazine*, and in a glass case are exhibited several manuscript works and specimens of early printing. Among these may be mentioned an illuminated miniature of St. Martin dividing his cloak with the beggar, from a grand choral book, date about 1300; a MS. illuminated Bible (the Vulgate), written about 1216, with very ancient binding; a MS. Book of Prayers of the latter part of the thirteenth century; and a good copy of "The Ship of Fools," printed at Friburg in 1498. There is a German Lutheran Bible, with engravings, by Godfrey Leigel (Wittenberg, 1551), and original binding; the Bishops' Bible, having Cramer's prologue, 1672; and a Geneva or Breches Bible—a copy of the edition printed in London in 1603. The furniture of the library is appropriate, high-backed baronial-looking old oak chairs, carved, and tables to match; also a beautifully-carved charter-chest of the same material. These ancient relics, we believe, formerly belonged to different families in the county. Their presence here is an acquisition. A plaster statue of her Majesty, and a portrait

in oil, by Mr. E. Pretty, of the Founder, are among the other objects which adorn this room. In another apartment we noticed a bust of the late Prince Consort, and a large equestrian statue (plaster) of Lady Godiva, by Thomas, the latter presented by the sculptor's widow. This statue occupies one end of what we may term the picture-gallery, a long, narrow corridor, on the second floor. The pictures include oil paintings, water-colour drawings, and engravings. As works of art many of them are really interesting. We can only catalogue a very few. A small oil painting of the Dutch fleet coming up the Medway in 1667, is curious. The name of the artist we failed to learn. There is a painting by Scott, of "Old London Bridge previous to the Removal of the Buildings in 1762," and showing the Traitor's Gate and Nonsuch House; another represents "The Morning after the Siege of Gibraltar." The artist is James Jeffreys, jun. "A Drowsy Sol," is a clever characteristic sketch by Rowlandson. One or two landscapes bear the names of Fred. Lee and Shelders, evidently early specimens of those artists; and there are some good portraits by S. Drummond, A.R.A. To come across here a copy of one of Schalken's works, by W. Shipley, the founder of the Society of Arts, was an agreeable surprise. The fact is interesting and the picture worth noting. "Maidstone Market, 1623," and "The Fish Market, Maidstone, 1780" are valuable as local sketches. We may state that the old cross, an octagonal structure, removed about fifty years ago, was latterly used as a fish market. Formerly it was called the Corn Cross, but ceased to be the corn market after the year 1609. Among the portraits is a noteworthy one of Dean Piers, Bishop of Peterborough, afterwards of Wells. It is dated 1623, but the artist's name is unknown. There is a lady by Sir Joshua, and a series of portraits of William Woollett, the eminent engraver. Specially interesting is one engraved by Sherwin. Woollett was a native of Maidstone, where he was born 27th August, 1735. He died in Mey, 1785. A series of plates, framed and glazed, of Hogarth's "Marriage à la Mode," and "Idleness and Industry," also hang on the walls. In the various cases distributed over the rooms, we found a good display of geological specimens, fossil flora, Roman remains and Saxon antiquities discovered in different parts of the country; a lot of glass articles found in earthenware vessels at the Roman Cemetery, at Lockham Wood; specimens of Samian pottery, of old china, and of majolica of Genoa manufacture, 1750. The museum contains besides a very large number of curiosities of a miscellaneous kind. Let us give a few specimen bricks. Here we have a mummy in a wonderful state of preservation. We joyfully asked our kind cicerone,—"Who's your *thin* friend?" He could only reply,—

"Perchance that very hand, now pinion'd flat,
Has hob-a-nobbed with Pharaoh, glass to glass;
Or dropp'd a hapenny in Homer's hat,
Or doff'd thine own to let Queen Bido pass,
Or held, by Solomon's own invitation,
A torch at the great Temple's dedication."

We passed on (strange and suggestive transition) to a cane-bottomed chair which was occupied daily by Napoleon in his prison home at St. Helena. This relic was bought at the sale of the great captain's effects by Sir Hudson Lowe's chaplain. It was presented to the museum by the benevolent banker aforesaid. Then we come to a lock of Napoleon's hair, which, be it remarked, is of a light colour, and duly authenticated; a copy of the *Maidstone Mercury* of 27th May, 1725, being the 25th issue of that print; an old sedan chair; bits of old oak carving, and blocks of old stone carving; an ancient cedar chest of the seventeenth century; a Chinese razor; a piece of lava from Mount Vesuvius; an oval metal watch, by Monk, two centuries old; a silver cross taken at the Battle of the Alma; a relic of the *Royal George*; and a model of Nelson's coffin. Unconsidered trifles these, and yet how full of interest to the dwellers in a country town! We mention one more object, and end this broker's catalogue. An old fly-leaf gives "a short but concise account of Eliza and Mary Chulchrest, who were born, joined together by the hips and shoulders, in the year of our Lord, 1100, at Biddenden, in the county of Kent, commonly called the "Biddenden Maids." There is a woodcut of Eliza and Mary, who lived in this bond of union for thirty-four years, "when one of them fell ill and died. The surviving one was advised to be separated

from the body of her deceased sister by dissection, but she absolutely refused the separation, by saying these words,—"As we came together, we will also go together," and in the space of almost six hours after her sister's decease, she was taken ill and died." This case of *ibusis natura* is well known to medical men. The great importance of local museums for the purposes of art-education, and industrial training, is now generally acknowledged, provided always that the objects collected are capable of imparting instruction,—and instruction too of a recreative kind, as they are in this instance. The many objects of interest in the Maidstone Museum, we are glad to bear, attract large numbers of visitors from the surrounding country; and although the institution is as yet only in its infancy, there can be no doubt that it will exercise an important influence on the future history of the town. What is wanted to make this a model country museum, is an intelligent curator, who has information and enthusiasm enough to appreciate the object for which it was founded.

OLD ST. PAUL'S CATHEDRAL, LONDON.

A FEW condensed notes concerning our former magnificent Gothic cathedral, St. Paul's, may not prove uninteresting to some of your readers, if only as a reminder. The first church dedicated in London to St. Paul was built in the time of Bishop Mellitus, by Ethelbert, King of Kent, A.D. 603, on the former site, in all probability, of a heathen temple, dedicated to Diana. In A.D. 625, Erkenwald, the fourth Bishop of London (who was afterwards canonized, and had a glorious shrine erected to his memory), expended large sums on this church, and procured many privileges for it. Our Saxon kings, Athelstan, Edgar, and Edward the Confessor, were all benefactors to the fabric in various ways. Our trustworthy authority, Dugdale, the chief historian of old St. Paul's, mentions that in the year 1075 the cathedral was held in great esteem, Maurice then holding the see of London. But during the Conqueror's reign a terrific fire occurred in the City, and the ancient edifice was burnt down. In 1083, however, measures were taken to raise the cathedral out of its ashes, and Bishop Maurice began (to use the words of Dugdale) "the foundations of a most magnificent pile, namely, all the body of the church, with the N. and S. cross aisles. So stately and beautiful was it, that it was worthily numbered among the most famous buildings, the vaults or undercroft being of such extent, and the upper structure so large, that it was sufficient to contain a great number of people." Richard de Beaumeis succeeded Maurice in the episcopate, and was so very zealous in his work of love that he voluntarily bestowed all his revenue on the new cathedral, and managed to support himself and his family by other means. Robert de Sigillo was the next bishop, and it seems by this time "the body of the church and the cross aisles were finished."

The choir, however, after its completion, was not thought sufficiently beautiful, and was accordingly pulled down, as also was the steeple, according to Dugdale. The rebuilding of the latter was completed in 1221, and the former in 1240. It seems very probable that an Early English clearstory and vault were added to the nave in 1255, as Dugdale mentions that the roof of the structure was then "made new or substantially repaired." The choir was lengthened out eight bays, and the Church of St. Faith constructed under this new part in the year 1256. The principal portions of the work would appear to have been completed in 1283. Among the numerous benefactors to the cathedral during all these years may be mentioned Henry Lecy, Earl of Lincoln; Bishop Baldo; Roger de Wulham, a canon of the cathedral; Sir John Putney; and many others. In 1332 the cloisters and chapter-house were commenced. At the east end of the churchyard stood a detached bell-tower, to which reference is first made in Henry I.'s reign, and which held four immense bells. St. Paul's Cross appears to have been built, A.D. 1370, by Godric, Abbot of Peterborough. Shiryngton's Chapel and the charnel-house were detached buildings in the churchyard, but were pulled down in the first year of Edward I.'s reign.

Pardon Church-hangh consisted of a chapel with a large and fine cloister, situated on the north side of the cathedral; but this also was unfortunately destroyed in the year 1549. The

spire (of timber, covered with lead) was nearly destroyed by fire, and the roofs of the church entirely burnt, in 1444. The latter were all repaired by the year 1556; but nothing was done to replace the steeple until 1620, when an attempt to procure funds for that work was set on foot; but not till 1683 was the rebuilding really commenced, under the direction of Inigo Jones, who also, as is well known, constructed the western portico of the nave, much admired at the time. But everything came to a standstill in 1642, when the Commonwealth was established, and the whole cathedral was suffered to lapse into a deplorable state of decay and neglect. At the Restoration, however, in 1663, the repairs of the church were begun again in good earnest; but the Great Fire of London put a stop to everything by destroying the cathedral; and though an attempt was afterwards made to patch up and restore it, this was of no avail, as the building was found to be in so weakened and ruinous a condition as to be quite unfit for proper repair. It was then determined to build a new cathedral.

Such is a brief outline of some of the principal points in the history of Old St. Paul's. I will now proceed to review some of its striking features. One of the most conspicuous of these was its immense length, about 596 ft. (these dimensions include the end walls), that is 66 ft. longer than Winchester Cathedral. The length, 630 ft., given in Dugdale's History (p. 17), together with other measurements of the heights, &c., appears to be incorrect in comparison with Hollar's Plates.

I believe the fine characteristic of twelve bays to both nave and choir to be unique, as far as regards English cathedrals: the perspective effect must in consequence have been grand. According to Timbs (see his recent work "London and Westminster, &c., vol. i, p. 261), there was at any rate one western tower; "the southern tower at the west end of Old St. Paul's, called the Lollards' Tower, was used as the bishop's prison for heretics, and was the scene of at least one foul and midnight murder, perpetrated in the month of December, 1514, on a respectable citizen, &c." Now, curiously enough, Dugdale nowhere mentions this in his history, as one would expect, supposing that such a tower or towers ever existed. The two-storied cloisters, enclosing the Chapter-house, which is octagonal externally but circular within (very similar, therefore, in plan to that at Worcester, but of later date), are remarkable, and, I believe, unique. There was a crypt under the Chapter-house as at Wells and Westminster.

Mr. Scott, in his recent Academy lectures, alludes to the circular triforium windows shown in Hollar's views, about which he is in doubt whether they were originally designed or not; but similar examples are to be found in the nave of Waltham Abbey Church. With regard to the vaulting of the cathedral, some believe that it was originally executed in wood, and it would appear to be represented so in Hollar's views. Many of your readers are, no doubt, acquainted with the curious painting of Old St. Paul's, in the possession of the Society of Antiquaries, of the time of James I., and therefore anterior to Hollar's engravings. It seems to be executed on a wood panel, and is a kind of bird's-eye view of the cathedral, but differs in a few points from the plates published by Hollar. For instance, in this painting Early English or Decorated pinnacles and flying buttresses are shown to the nave, which did not exist when Dugdale published his book. The span (about 38 ft.) of the nave must have been wider than that of any of our existing Norman cathedrals. The central tower was clearly never used for bells, as there was a detached clocher in the churchyard, as previously mentioned. The Norman transept appears not to have been entirely rebuilt in the Early English style, but to have been partially preserved. Although all Hollar's external views show the cathedral of the same height throughout; yet a careful examination of the internal views leads me to be tolerably certain that the choir was loftier than the nave.

One reason for this may have been the height to which the floor of the choir was raised above that of the body of the church. This would most probably necessitate the former being heightened to give it proper importance. The magnificent feature, the eastern elaborately-traceried rose-window is unusual for an English cathedral (Durham, I believe, possessing the only example of such). It does not seem clear whether the spandrels formed between the exterior of the circle and the enclosing square

were pierced and glazed or were merely stone panels. It is true they are perforated in the case of the transeptal rose-windows in Westminster Abbey; but then these were altered in the fifteenth century.

"St. Paul's," quaintly observes Fuller, "may be called the mother-church indeed, having one babe in her body (St. Faith's) and another in her arms (St. Gregory)." The latter was situated on the south side of the nave at the western end of the cathedral. Another striking feature in Old St. Paul's must not be forgotten,—the pinnacles and flying buttresses attached to the lower part of the tower. I cannot help fancying those were not parts of the original design, but were added during the progress of the building to strengthen the tower walls. The flying buttresses passing through the clearstories at Gloucester and Salisbury are contrivances of a like purpose; but at Old St. Paul's they are very much more accentuated. The piers, according to Hollar's views, are certainly small, considering the internal diameter of the tower, which was about 44 ft.

As Mr. Beresford Hope, referring to our subject, has said,—"Its noble length, the solemn Norman of its nave, the developed and rich Gothic of its choir, the majesty of proportion with which the English system of a square east end was carried out, must have made it more like Ely Cathedral than any other of our known great churches." E. B. F.

THE INSTITUTION OF SURVEYORS.

This institution, of which we spoke in our last, is established—

"1. To secure the advancement and facilitate the acquisition of that knowledge which constitutes the profession of a surveyor, viz., the art of determining the value of all descriptions of landed and house property, and of the various interests therein; the practice of managing and developing estates; and the science of measuring and delineating the physical features of the earth. And, 2. To promote the general interests of the profession, and to maintain and extend its usefulness for the public advantage."

The institution consists of three classes, viz.,—members, associates, and honorary members, with a class of students attached.

A member must be more than twenty-five years of age, and have acquired a practical knowledge of surveying in one or other of its branches as above defined, and so practised on his own account for more than five years; or be a member of a firm of surveyors established upwards of ten years.

An associate must be more than twenty-one years of age, not necessarily a surveyor by profession, but his pursuits must be such as to qualify him to concur with surveyors in the advancement of professional knowledge.

With the view of forming a library and collection, all members and associates are expected, within twelve months after their election, to deliver to the council an original paper on some subject connected with the profession, or to make a donation to the library or collection. At the ordinary general meetings original communications are read on some professional subject, and their merits fully and freely discussed.

LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.

The annual meeting of this society took place at Lincoln, on Wednesday and Thursday last week; and, although the architectural features of the cathedral have been described, again and again, by the numerous authors on the subject; interesting, and, in some respects, original descriptions of the building and its accessories were given by the gentlemen who took an active part in the society's proceedings. The programme commenced with divine service in the cathedral, immediately after which the Rev. Precentor Venables lectured on "The Tombs in the Church."

The attendance of members of the society and their friends was large.

The party then proceeded to the County Assembly-rooms, where Mr. Edmund Sharpe delivered a preliminary lecture on "The Architectural Features of the Cathedral."

In the afternoon, a large number of the members of the society visited the following places of interest in the city, their architectural features being explained by the Ven. Archdeacon Trollope:—The churches of St. Peter-at-Corsets, St.

Mary-le-Wigford, St. Benedict, and St. Peter-at-Arobes, St. Mary's Conduit, and the High Bridge.

The evening meeting was held in the County Assembly-rooms, under the presidency of the Bishop of the diocese. There was a large attendance of members and friends.

The chairman opened the proceedings with a speech, and then called upon Archdeacon Trollope to read his paper on "The Ermine-street."

Mr. Gambier Parry then read a paper on "Polychromy."

On Thursday morning an excursion was made to Stow, the church at which place was described; and in the afternoon such places of interest in the city as were omitted on the previous day were visited. The public dinner took place in the County Assembly-rooms, and this was followed by the evening meeting, when a paper on "King Stephen's Battle of Lincoln" was read by the Rev. J. Green.

DINNER OF THE PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.

The members and friends of this Institution celebrated their twenty-sixth anniversary, by a public dinner, at the Freemasons' Tavern, on Wednesday, June 10th. Professor G. G. Scott, R.A., presided, and was supported by Mr. Digby Wyatt, Mr. W. J. Gardiner, Mr. John S. Lee, Governor Mr. G. Pincknett, Mr. W. T. Robinson, Mr. W. Macey, Mr. Earle, Messrs. Jackson & Shaw, and others.

The Chairman gave the usual loyal toasts, which were enthusiastically responded to, followed by that of the Army, Navy, and Volunteers; Capt. Gardiner responding on behalf of the Volunteers.

The Chairman, in proposing the toast of the evening, "Success to the Provident Institution of Builders' Foremen and Clerks of Works," directed attention to the necessity of all eligible men supporting such an institution while youth and prosperity were theirs, so preparing for the possible hour of adversity, accident, or infirmity, that all are able to, particularly the class belonging to this Institution, who, to use his own words, "carry their lives in their hands." The Chairman also spoke to the general ability, zeal, and fidelity which the clerks of works and builders' foremen brought to the assistance of architects and engineers in the superintendence and execution of their buildings, and strongly recommended the objects of the Institution as worthy of support.

The governor, Mr. Pincknett, replied on behalf of the Institution.

The secretary, Mr. J. Lucea, read the list of donations, headed by one from the chairman for twenty-five guineas, and amounting in all to over 200l.

Mr. Wyatt replied for the architects and engineers; Mr. Macey for the builders; and after some appropriate remarks from other gentlemen, and Mr. Kay's reply for the stewards, the chairman left the room, and the company dispersed.

NEW KNITTING WORSTED WORKS AT WAKEFIELD.

SEVERAL of the Wakefield manufacturers have just completed, or are in process of completing, new business premises. Messrs. Marriott have extensive premises. Messrs. Lee have also just completed new works. The same may be said of Messrs. Barker & Co., of Thornes, and of Messrs. Goldthorp, who, like Messrs. Lee, are located at the bottom of Westgate. The works of both are on the south side of Westgate, the Chald, or Ings Beck, honnds one side of Messrs. Lee's premises on the side next Halliley's yard. Part of their business is, indeed, conducted on the opposite side of the beck in Chald mill; but it is in the manufactory on the east side of the beck that the new buildings have been erected, though these, indeed, are only partially finished. There are yet to be a new chimney and warehouses, but the manufactory as it stands is complete in all its parts. The new buildings at present consist of an immense shed and a dyehouse, which abuts on the Ings-road. The shed and engine-house are built from the designs of Messrs. Lockwood & Mawson, of Bradford; and the dyehouse from the designs of Mr. Hamerton, of Wakefield, architect. The masonry in the shed has been executed by Mr. Binns, of Wakefield; the iron and millwright

work by Messrs. Teall; the carpenters' work by Mr. Beeth Illingworth; of Bradford; the plumbing by Mr. Keighley, of Bradford; the slating by Mr. Hill, of Bradford; and the painting by Mr. Briggs, of Bradford. In the dye-works the masonry was done by Messrs. Flower, and the carpentry by Messrs. Squire. The new shed (that part of it where the preparing and spinning is carried on) covers an area of about 4,500 square yards, and where the washing and blending is done, of about 1,500 square feet. The engine-house is in the Italian style. The approach from the outside is by a flight of steps, with ornamental palisades. The engine-house is lighted by large windows, and the walls and roof panelled in wood, and painted. The floor is in ornamental tiles; and out of this the engines, which are architectural in design and proportions, rise.

Messrs. Goldthorp's premises are extensive, and the mill which they have recently built greatly extends their power of production. It is four stories in height. The architect is Mr. Watson, of Wakefield; the masonry was done by Mr. Samuel Green; the joiners' work by Mr. J. Goldthorp; Messrs. Teall have furnished the ironwork; and Mr. T. Howden the new engines. The new buildings were chiefly in the shed form; and in the older parts of the manufactory, as well as in the new, there is that consecutiveness of arrangement in the fixing of the machinery which is a noticeable feature at Messrs. Lee's. On the engine-room of these works, like that already noticed, some cost has been lavished. The roof is panelled, and (as at Messrs. Lee's) immense iron bars run across immediately under the roof and rest on the walls, and, when the engine requires repairing, these bars are ready to help in slinging up the parts which have to be lifted. The new shed for drawing, preparing, and spinning is a large room. It is lofty, and the roof is in the shed form, in ridges, and the light is admitted from a northern aspect. The roof is delicately painted in light colours. There is to be a dining-room for the workpeople. In external appearance, Mr. Barker has made of Holmefield a mansion, architecturally considered, and it is the same with the new shed at Thornes. It is of brick, showing a series of windows; and the red brickwork is contrasted with bricks of other colours. The shed is flanked by low towers. On the Denby Dale road front there is ornamental palisading, in accordance with the general style of the building. On the river side the building accords with the decorated architecture of the railway bridge over the Calder. The architects are Messrs. Lockwood & Mawson, of Bradford. The masonry has been done by Messrs. Latham & Son, of Wakefield; the carpentry by Mr. John Jubb, of Thornes; the plumbing by Miss Drake, of Wakefield; the slating by Mr. Hill, of Wakefield; the painting by Messrs. Briggs & Mensforth, of Bradford; the plastering by Mr. Tattersall, of Wakefield; and the ironwork by Messrs. Bradley & Craven, of Wakefield.

VALUATION OF ST. GEORGE'S, HANOVER SQUARE.

The vestry of this parish has at length determined to have a revaluation of the whole of the property in the parish made for the purpose of the poor-rate, and in accordance with the Act 6 & 7 William IV., cap. 96, and Mr. Charles Lee has been appointed to make the same in time for the next rate. The parish has not been valued throughout for many years.

THE LIBRARY AND MUSEUM OF THE COMMISSIONERS OF PATENTS.

ATTENTION is directed by the Council of the Public Museums and Free Libraries Association to the want of proper accommodation for the museum and the public library of the Commissioners of Patents. A question has been asked with respect to these institutions by Mr. Layard, M.P., in the House of Commons; and the attention of Lord John Manners, M.P., has been called to the serious inaccuracy of the reply on the part of the Government. It is proposed, however, not to limit the action of the council to the little that may or may not be done or said in Parliament, but to convene, by circular, a meeting of those professional and working men who are warmly

interested in an immediate settlement of the Patent Museum and Library upon a satisfactory basis. The report to Parliament for 1865 very distinctly points out that the building at present devoted to the purposes of the Patent Office, is not new, nor can it ever be made to be, suitable for the requirements of the office. The new library rooms, opened April, 1867, though they are as spacious as it was possible to make them in so small a building, are already completely filled with books. Those making use of the two collections have also reason to complain of their separation—the one being within the city of London and the other at South Kensington. The appeals which have been made for the erection of suitable buildings have always kept in view the desirability, not to say the necessity, of placing the library and the museum under one roof. This is not a case where want of funds can be pleaded as an excuse. The surplus income of the Patent Office for 1866 was no less than 45,000*l.*

THE MARGATE DEATH-RATE.

A PAMPHLET by Mr. E. Mottley has been published by Mr. T. H. Kable, at Margate, titled "Statistical Examination of the Margate Death-rate for the five years 1863-1867, by order of the Council of the Borough." In this report the author says at the outset, "The heavy and continually increasing death-rate of the Isle of Thanet having caused the Registrar-General to ask, 'Why is the mortality of the Isle of Thanet, including Ramsgate and Margate, still 23?' It is the object of this report to answer the question so prominently advanced by the eminent authority at the head of the registration of the kingdom, so far as it relates to the town of Margate, and at the same time to rectify the reports so industriously circulated that the death-rate of Margate is the heaviest of all the health resorts in the kingdom.

Mr. Mottley, amongst other statistics into which he enters in order to prove his case, gives the following table of the mortality of the town and sub-district of Margate for the five years 1863-67:—

	Residents.	Visitors.	Hospitals.	Total.
Annual Average	873	265	177	1,315
	174	63	35	262

or 17 to 1,000 resident. This, he remarks, is Dr. Farr's standard of normal health. In the following table the mortality of Margate is compared with the general mortality of England and Wales:—

	England.	Margate.
General Mortality	22	17
Infant Mortality	20	10
Zymotic Diseases	40	32
Consumption	23	17
Respiratory Organs	31	17
Bronchitis	13	7

SANITARY MATTERS.

Health of St. Marylebone.—The monthly report for May, of Dr. Whitmore, the medical officer of health for the parish of St. Marylebone, has been issued. The mortality for the period was equivalent to an annual death-rate of 22.6 per thousand of the living population, and was less than the mortality of the previous month, but slightly in excess of the corresponding month of last year. But the most fatal of all diseases during the month was phthisis, to which no less than fifty deaths were attributed, showing that in every seven persons who died, one of them fell a victim to this ruthless malady. Referring to the sickness table, the returns from eleven charitable institutions in the parish give no less than 875 new cases of diarrhoea. The reporter says he is utterly at a loss to understand the cause of such a large amount of sickness from this disease at this early period of the year. It appears to prevail chiefly amongst infants and very young children. Happily the mortality from it is not at present large. Has not the dryness of the season something to do with it? It is to be hoped it is not ominous of the coming of virulent cholera in the autumn. Diarrhoea is apt to usher in cholera, and it is known that the driest summers are not the healthiest. Great

attention should be paid to cleansing operations. Sanitary work in Marylebone during the month has progressed satisfactorily. An additional duty recently imposed upon the inspectors of nuisances is the disinfecting of houses in which sickness from small-pox, measles, fever, and scarlatina is known to exist.

Whitechapel.—The report, by Mr. Liddle, medical officer of health for the Whitechapel district, for the quarter ending 28th March, 1868, has been printed. It states that during the quarter there were registered in the Whitechapel district the deaths of 657 persons, of whom 350 were males and 277 females. During the same period, the births were 703, viz., 360 males and 343 females. In the corresponding quarter of the previous year the births were 744 and the deaths 629. Epidemic diseases had been fatal to 89, small-pox occasioned 8 deaths, measles 15, scarlet-fever 9, diphtheria 3, whooping-cough 18, diarrhoea 7, and fever 29. A great increase had taken place in the number of deaths from fever, viz. 29 against 8, while the deaths from small-pox had diminished from 16 to 8. The mortality of children under 5 years of age was 231. This is 35.0 per cent. of the total mortality. In the Artillery sub-district the proportion of deaths of children to the total mortality was 50.0 per cent., and in the Spitalfields sub-district it was 60.0 per cent. A good deal of sanitary work had been done in the district during the three months ending with March.

THE NEW LAW COURTS.

The Marquis of Salisbury, pursuant to notice, in the House of Lords, asked if it was true that the Government had rejected the design for the New Law Courts which was recommended by the professional judges and the judges of designs, as the best for plan and internal arrangements, and had adopted the design which was recommended for elevation only; and further, if the competitors were instructed that utility and convenient arrangement were to be preferred to architectural effect. If counter influence, he said, was powerful enough to set aside the results of a public competition, it could not be expected that gentlemen of eminence and reputation in their profession would ever again compete for public employment. He most earnestly deprecated the decision which had been arrived at, and hoped it was not too late to alter it.

The Lord Chancellor, as president of the Commission, said that in the first place the Government had rejected no design, and it had accepted no design. His lordship, having stated the plan on which the commissioners originally proceeded, and how they had resolved to reject the idea of unlimited competition, explained their selection of the five judges of designs, namely, Chief Justice Cockburn, Sir Rondell Palmer, Mr. Gladstone, Sir William Stirling Maxwell, and Mr. Cowper, who were to be assisted by two professional architects—Mr. Shaw and Mr. Pownall. A distinct condition in the terms of competition was that each plan was to become the absolute property of the commissioners. It was, however, quite a mistake to suppose that the object of this competition was the selection of a particular design—the object was to test the relative superiority of the architects. The result was that the judges could not agree as to any one plan being the best, but they selected two, and made their award in favour of the combination. The other architects, however, objected to that, declaring that they had only been called upon to compete against single plans; and, upon reference to the Attorney-General, he decided in their favour, and ruled that the award of the judges was invalid. The whole proceeding, therefore, had come to an end. It was under these circumstances, therefore, that a single architect had been selected. Curiously enough, there had been a similar miscarriage as regarded the design for the new National Gallery. Mr. Street had been selected as the architect for the law courts, and Mr. Barry for the National Gallery.

Lord Stradbroke expressed the opinion that Mr. Barry had not been fairly dealt with.

Lord Redesdale reproached generally the manner in which matters relating to our public buildings were regulated.

Lord Overstone earnestly hoped that the erection of the National Gallery was not going to be treated as a secondary affair.

Lord Crauworth offered his testimony that Mr. Barry, when originally invited to compete for the Law Courts, was given clearly to understand that his design was to have reference to the internal arrangements of the building. He quite concurred in the opinion that not one of the competing architects had any legal rights; but, *primâ facie*, he should say, Mr. Barry ought to have got the Law Courts and Mr. Street the National Gallery.

The Earl of Harrowby hoped that in the interests of the public the Government would not select as the architect of the new Law Courts the gentleman whose design evinced the least ability in respect of what were laid down as the material points to be attended to. In his opinion the subject ought to be re-opened for consideration. He also thought that, if possible, the question of the site of the new buildings ought to be reconsidered.

The Earl of Carnarvon entreated the Government to reconsider a most ill-advised decision. He held that, once the conditions of the competition had been laid down, they ought to have been rigidly adhered to.

The Lord Chancellor, in explanation, reminded their lordships that the essential condition was, that the design to be selected must combine superior excellence, both as regards the interior and the exterior. There was no condition limiting the superiority to the internal arrangements.

The Marquis of Salisbury reiterated the charge that Mr. Barry had been most unfairly dealt with.

ACCIDENTS.

Mr. PAYNE has held an inquiry at St. Bartholomew's Hospital relative to the death of a painter, who was killed by the fall of a "cradle" suspended in front of a house. It appeared that the deceased was employed in painting the front of 30, Noble-street, and he and another man stood in a cradle suspended from the fourth floor by means of ropes 15 ft. long. The ropes broke, and the deceased was precipitated to the ground, receiving fatal injuries. It appeared that the ropes had been in use nearly six years, and Mr. Leyster deposed that a rope of that kind should last nine years. A practical man on the jury, however, dissented from this view, and said that the rope which broke was so rotten from age that the strands, instead of supporting half a hundred-weight, gave way under the pressure of a pound. The danger consequent upon the use of such ropes concerned not only the men in the cradles, but the public walking on the pavement underneath. The jury returned a verdict of "Accidental death," and added that there was great neglect on the part of the master in not providing proper ropes.

The whole of the floors of No. 92, Whitechapel, Liverpool, in the occupation of a colour merchant, have suddenly given way. The clerks and others engaged on the premises had just left for dinner, or serious loss of life must have resulted. The floors were over-weighted by the mass of goods stored on them. While the walls and roof were left standing with no apparent injury done to them, there was a blank open space from basement to roof. The damage is estimated at 1,500*l.*

THE ACCIDENT AT GATEHEAD TOWN-HALL.

At a special meeting of the members of the Gatehead Corporation, a long discussion took place on the subject of the accident by the fall of one of the platforms at the laying of the foundation-stone of the new Town-hall, from which it appears that the architect, Mr. Johnstone, sketched out a plan for the platforms, with steps to break the pressure; that the ladies' platform, which withstood the pressure, was carried out on that plan; that the managing sub-committee, with the mayor personally at the head of it, altered the architect's plan for the gentlemen's platform, in his absence, on business at Hexham, by ordering it to be made with a sloping floor, whereby, as the architect insists, the pressure on the front was increased, and the supports for the stepped plan rendered insufficient; that the sub-committee altered the supports of the stepped ladies' platform, which, in his view, did not need such alteration, but left the supports of the platform which they altered unstrengthened; and that the result was the fall of

the platform. There was a good deal of mutual recrimination; but of course, in a meeting of his masters, the architect got the worst of it; even the mayor, who personally ordered the alterations, holding the architect to be responsible! The architect, however, appears not to have informed either the committee or the mayor that he did not approve of the alterations, although he told the builder of the platform, Mr. Bell, that he would have nothing to do with it, as the sub-committee had intermeddled with his plans, and altered them in a way he did not approve of; and that if they went on with the work it must be under the instructions given by the sub-committee.

REPUTED FALL OF PSEUDO METEORIC STONES IN BIRMINGHAM.

The stones reported to have fallen were found on the surface immediately after the occurrence of very heavy rain (a thunder shower). Rowley rag-stone is largely used to make the roads of the district. The fragments found, and supposed to have fallen from the clouds or atmosphere, looked like fragments of Rowley rag-stone, and under test proved, as we have already said, to be of similar composition.

Heavy rain disintegrates the surface of a road, and the large round drops of a thunder shower strike with much mechanical force, and would cause small fragments of stone like those found to rebound, and in falling look as if they came from the clouds. It is not necessary to bring in cyclones, aërolites, or asteroids, unless it is quite settled that no other natural but more simple means will account for the phenomena observed. The exceptionally heavy rain did, no doubt, loosen and wash out small fragments of Rowley rag-stone.

BIRMINGHAM.

THE plans of Mr. Edward Holmes, of this town, for the erection of cow lairs, pig dormitories, and other improvements to Smithfield Market, Birmingham, which were submitted in limited competition, having been selected by the Markets and Fairs Committee of the Corporation of the Borough of Birmingham, were approved by the Town Council at their last meeting. The same committee have also selected a design by the same architect for a new fish-market, to be erected on a site opposite to the Market-hall in Bell-street. The report on those plans has been referred back to the committee, with a view to consider and report upon the adaptability of a site which is considered more suitable on account of its proximity to the central railway station.

FROM IRELAND.

Dublin.—The filthy state of the river Liffey from which a most dreadful stench arises in the summer-time, when the tide is low, has been long a real "grievance" to the citizens; but the corporation, whose duty it is to cleanse it, have hitherto turned a deaf ear to the loud complaints on the subject. At last, however, a pressure has been put on the town council which they cannot resist, and something is now to be done to remedy the evil. At a special meeting of the corporation a letter was read from the Lord Chief Justice to the Irish Government, complaining, on the part of the judges of the law courts, of the pestiferous condition of the Liffey at the present period. Dr. Thomas Hughes, sanitary officer of the troops in Dublin, wrote on the same subject to the assistant quartermaster-general, and this letter was also read at the corporation meeting. A lengthened discussion took place on these letters being read, and it was moved that Mr. Bazalgette's and Mr. Neville's plan for sewage be carried out, and that an application be made to her Majesty's Government for assistance. It was finally resolved that the Government should be requested to examine the various plans for the drainage of the city submitted to the corporation, and select the best.

Belfast.—The enlargement of the Imperial Hotel has now been completed. The architects employed were Messrs. Sherry & Hughes, and Mr. W. B. M'Master was the contractor. Mr.

Jury, according to the *Newsletter*, has expended upwards of 2,000*l.* in these improvements. They consist of two new stories, giving an addition of twenty-four rooms to the hotel accommodation, and increasing the total number to eighty. The Imperial is now capable of affording first-class accommodation to one hundred guests, exclusive of domestics, for whom ten extra rooms have been erected. Although this hotel is situated in the centre of the town, there is an extensive view from the upper windows.

PENALTY FOR NOT EMPLOYING A COMPETENT ARCHITECT.

Moore v. Denton & Shipney.—This action, tried in the Second Court of Exchequer, was brought by the widow of a bricklayer against the two defendants to recover damages for the death of her husband, which was caused by their alleged negligence. The defendants pleaded "Not Guilty."

It appeared that, in February last, the defendant Shipney, a publican at Finchley, employed a carpenter to design a building, and employ the defendant Denton, a builder, to carry out the design. In the course of the execution of the work a wall fell and killed the deceased, a working bricklayer.

The defence was that neither of the defendants was liable, inasmuch as Shipney had only employed Denton, who had employed the deceased, and Denton was merely engaged in carrying out the design of an architect.

The jury, after having retired, found a verdict against both defendants, on the ground that Shipney had employed an unskillful person to design the building, and that Denton was guilty of negligence in endeavouring to carry out a design which he must have known to be faulty. They assessed the damages at 650*l.*, to be apportioned thus—200*l.* to the widow, and 450*l.* to be divided among her six children.

WESTMINSTER ABBEY AND THE METROPOLITAN BUILDING ACT.

At the Westminster police station last week, Mr. Poole, the coroner, and Mr. Tylor, builder, appeared to receive the verdict of the judgment of the court in a summons taken out against them by Mr. James Tolley, district surveyor.

The facts have already been stated. Two summonses were taken out by the district surveyor of the district of St. Margaret, St. John, and of the close of the collegiate church of St. Peter, Westminster, complaining that the defendants respectively, the builders engaged in doing certain work at the building within the close of the collegiate church of St. Peter, Westminster, did neglect to give to the complainant, as such district surveyor, two days before such work was commenced, due notice in writing stating the situation, &c., of the building, &c., and the particulars of such proposed work, &c. These summonses were taken out under the 39th and 41st sections of the Metropolitan Building Act, which make it imperative on a builder to give such a notice, and impose a penalty not exceeding 20*l.* for neglecting to do so. The building under consideration is Westminster Abbey, and the question is whether that building comes within the operation of the Metropolitan Building Act. The defendants, or rather the Dean and Chapter of the Abbey, who, in fact, resist the application, contend that the abbey is, by the 6th section of the Act, exempt from its operation, as being either "one of her Majesty's royal palaces" or a "building employed for her Majesty's use or service."

Mr. Arnold delivered judgment. In conclusion he said—At whatever time and in whatever manner the Crown may have acquired its present rights with regard to the Treasury or Exchequer, there seems no doubt that at this time that portion of the abbey is employed for her Majesty's use or service, and it would appear not to be an inconsequential argument to say, if an integral part of a building is employed for the use or service of the Crown, that the whole building is so employed. But I think this argument will not hold good if pressed a little further. The Exchequer is not merely employed for the use of her Majesty; it is in the actual and exclusive occupation of the Crown, and it would certainly be a false argument that the whole abbey was in the exclusive occupation of the Crown, because a portion of it was so. I have felt bound, therefore, to come to the conclusion that Westminster Abbey is not exempt from the operations of the Metropolitan Building Act, either as a royal palace or as a building employed for her Majesty's use or service, and consequently that the defendants were bound to give the notice required by section 39; and having failed to do so, have incurred the penalty under section 41; but as the case has been brought into Court solely for the purpose of raising an important and curious question of law, I consider that a nominal penalty of 1*l.* in each case will be sufficient, and for the same reason I do not make an order as to costs. I am glad to see that under section 10 *et seq.* power is given the defendants to appeal to any of the appellate courts of Westminster, and they will of course exercise it in the manner pointed out by section 107.

The defendants gave notice that they should appeal.

"THE INFLUENCE OF EASTERN ON WESTERN ART AS SEEN IN THE ART RESULTS OF THE CRUSADES."

At the last meeting of the Architectural Association (19th inst.)* Mr. Thomas Wells read a paper on this subject. Having briefly alluded to a paper which he had read before the Association a year ago, and which treated of Eastern influence as exerted through Constantinople, he observed that their attention would that evening be confined to the fourth section relating to the Crusades. He quoted an observation made by Mr. Waring in his "Notes on Decorative Art," showing that the innate genius of the Norman race was so potent in guiding the instruments at hand, that we might date from the early period of the Crusades the commencement of a European style of decorative art distinct from that of the Byzantine, although in many features referable to it. Of this Medieval Renaissance there were two principal phases. Until the early part of the twelfth century, the Norman and Byzantine influences were seen gradually prevailing, and during the same period the Crusades were commenced. The second phase of this Renaissance was of much larger duration and importance; and chiefly to its consideration he invited their attention that evening.

In the twelfth century a formidable opposition, political in spirit, against the Papacy, arose in Christendom; but whether much of this revolutionary sentiment was or was not attributable to the experiences of the Crusades, this much was certain, that the general discontent was shared by many of the Crusaders, and especially by the Templars, the great builders of the age. He then alluded to the Armenian style of architecture, which had been treated by Mr. Fergusson, whose description of the cathedral of Ani, near Kars, was quoted as typical of that style. The Palace of Tigranes, at Diabeker (in the south-west corner of Armenia, Ani being in the north-east), was also noticed as the supposed work of the Sassanian architects, who were either its builders or their successors, and a description was given of the great Tâk Kerrah at Ctesiphon. Noticing the observation by Ducange, in his work on "Christian Constantinople," that the Emperor Theophilus built a palace on the Asiatic shore of the Bosphorus, which palace was remarkable for its arches of unusual construction, and for its mathematical tracery, Mr. Wells observed that it was remarkable that mathematical tracery should be mentioned in connexion with that building; for, although it was generally admitted that geometry was introduced into Europe by the Mahomedan Arabs, yet there were very few, if indeed any, existing examples of Saracenic geometrical tracery. But, apart from the engi- neering inquiry into the previous history of mathematical tracery, it would seem from Ducange's early mention of it that, in addition to the principal elements of Western Pointed architecture having at an early date been in general use in the East (as was shown by the existence of ruins of the style of the cathedral at Ani), one of the most notable of its minor characteristics,—viz., geometrical tracery,—was likewise known there some four centuries before it came into general use in Europe. Mr. Wells remarked that it was not always necessary to the adoption of Eastern forms for service in the Christian West that they should have been found originally accompanied by a Christian warranty. As an example of this, he noticed the existence of the church at Souillac in Aquitaine, about 100 miles due east of Bordeaux, which was in the form of a perfect mosque, a sketch of which he exhibited, pointing out that it conveyed a fair idea of the general impression received by visitors on entering the grand mosque of the Sultan at Cairo.

As evidence in support of his general argument, that Eastern influence had been produced by minor architectural details, the lecturer instanced the cathedral of Tarragona, in Catalonia, seventy miles south of Barcelona. On the apex of its columns and on the lintels of its doorways was the symbol of the Greek tau (τ);

it was also in the form of the Greek patriarchs' croziers. The Greek tau (τ), as a Christian symbol, was also noticed, on the authority of Sir Gardner Wilkinson, to be in use at Elkargeh in the greater oasis (in Upper Egypt, parallel with Thebes), where there are some Christian tombs and a church, which form a necropolis, and among the inscriptions on the stuccoed walls is the sacred tau, the Egyptian symbol of the generative and creative power of the Deity, adopted by those early Christians instead of the simple cross. Accessory pilasters and niches show these symbols to have been of the Christian era. The Cathedral at Serida, also in Catalonia, was next noticed, the general character of the building being Lombardic Romanesque. Mr. Wells then adduced examples of the very instructive manner of the change from the early forms of the Romanesque of the West to the Pointed style which followed, the word Romanesque being used in a geographical rather than in a technical sense, quoting as one of the earliest examples in England the employment of the pointed arch in the choir at Canterbury, at some time between 1179 and 1184; whilst, in 1220, the Pointed style had so far advanced that Salisbury Cathedral was commenced in it. The lecturer stated, that in referring to so much length the development of the Pointed Gothic style to the Crusades, he was but connecting the greatest intellectual, or perhaps, more correctly speaking, physical product of the time, with its greatest physical disturbance. Combating an argument which had been advanced against Gothic architecture having been introduced from the East, he said that the absence of the Crusading spirit being found together with the complete absence of the Pointed Gothic style, taken with the converse fact of the presence of that style in all countries where that spirit was a power, showed the true cause of the death of Pointed architecture in Eastern Europe, viz., that the spirit of that architecture was a product of the Crusades. General evidence, however, did not warrant them in drawing the conclusion that had the Crusades never been preached, the Pointed arch would, in the West, have been only exceptionally used; but there could be little doubt, from the evidence afforded by architecture, that Eastern influence received an exceptional impulse from the Crusades.

Mr. Wells concluded by touching briefly upon the armour and costumes worn by the Crusaders, and also upon the subject of stained glass.

FROM SCOTLAND.

Edinburgh.—A new agricultural hall and auction mart has been erected in Valleyfield-street, Leven-street. The building cost between 5,000l. and 6,000l. The front of the building to Valleyfield-street is 187 ft. long, and is in the Renaissance style. It is divided into nine compartments by rustic pilasters. Over the centre and widest compartment is a pediment, surmounted by an ornamental chimney-stalk, while under is a large three-light arched window, with centre key-stones and moulded oops at the springing of the arches. In the narrow compartments, at each side of the centre, are the entrances for the palisade and those connected with the hall. In the west division is a large arched doorway for the stock. Along the whole length of the building there is a moulded cornice and blocking course returned at the projection of the rustic pilasters. The building contains 120 stalls, and is capable of holding 250 cattle and about 1,800 sheep, the surface it covers being between 15,000 and 16,000 square feet.

Leith.—It is fully expected that the new docks will be ready for opening in time for the autumn trade of the port. According to the engineer's report, the works will be in such a forward state as to admit of the inauguration taking place about the end of August. A request, according to the *Scotsman*, is about to be made by the Dock and Harbour Commissioners to the Queen, to perform the opening ceremony.

Glasgow.—The foundation stone of a new building in Elgin-street for the Gorbals Youths' School has been laid by the Lord Provost. The building, the architect of which is Mr. John Honeyman, jun., is in the Italian style, and will have accommodation for from 800 to 1,000 scholars. There will be eight principal apartments, four of which will each be 40 ft. long by 30 ft. broad, and all of them will have a height of ceiling of 16 ft.

Paisley.—The central fountain in the Fountain

Gardens, already noticed as having been lately inaugurated, is Franco-Italian in character, and rises from a basin of some 60 ft. in diameter to an altitude of about 30 ft. Its upper basins, four in number, are supported upon a centre shaft, having a moulded and ornamental circular base, divided into sections by four trusses or buttresses, which, rising in a series of curves, form a prominent feature. Besides giving character to the outline of the under portion of the fountain, the trusses are arranged to support a number of figures. The first basin, 12 ft. diameter, is quatrefoil in form, each foil projecting over one of the trusses. It is enriched with a pendant ornament, which forms a canopy over the figures, and a cresting on the rim of the basin, which is introduced alternately with shields bearing masks of the sea-horse throwing out streams of water. From this basin rises a circular fluted base, with fluted shaft and decorated capital, bearing the second basin, ornamented with representations of the rush and other aquatic plants in relief. The diameter of the basin is about 7 ft. Inside rest four dolphins dispersing streams of water into the lower basin. The third basin, 4 ft. in diameter, representing leaves of an aquatic plant, is supported upon a circular column, well defined in outline, and enriched with crystals and a fluted capital. From this basin a coronet of water is thrown up from numerous hidden jets. Above rises the fourth basin, 2 ft. 6 in. diameter, fluted and otherwise ornamented, supported on a stem of ferns, rushes, and water-lilies. Herons in various positions are grouped about the base. The whole terminates at a height of 28 ft. with a cluster of aquatic plants, from which jets of water are thrown to an additional height of about 30 ft. The large basin which encloses the whole is cast in imitation of huge blocks of rock thrown together. Four ground fountains are placed in other parts of the gardens, and are arranged to throw water to a considerable height. The decorations of the central fountain and of the iron gateways, lamps, and railings are of an elaborate character. The main fountain at the base is toned with deep sombre tints, appropriate to iron structures, and gradually rises into a series of variegated tints, that bring out the respective ornamental parts of the structure. The gates, railings, and lamps have been all painted a sombre brown; but all of them, as well as the fountain, have been relieved with gilding. The workers of Messrs. George Smith & Co., of the Sun Foundry, Glasgow, who were the builders of the fountains, and constructors of the gates, railings, verandahs, flower-stands, chairs, seats, and general ornamental ironwork of the grounds, have had a holiday, for the purpose of visiting these gardens, in the decoration of which they have had so large a share. The workers and friends, amounting to about 600 persons, went from Glasgow per special train, provided by their employers. They were accompanied by the hand of the Glasgow Blind Asylum, and by Messrs. George and Gibson Smith, two of the partners; Mr. Horgan, the representative of the firm in Dublin; Mr. James Deas, C.E., of the Edinburgh and Glasgow branch of the North British Railway; and a large number of other friends.

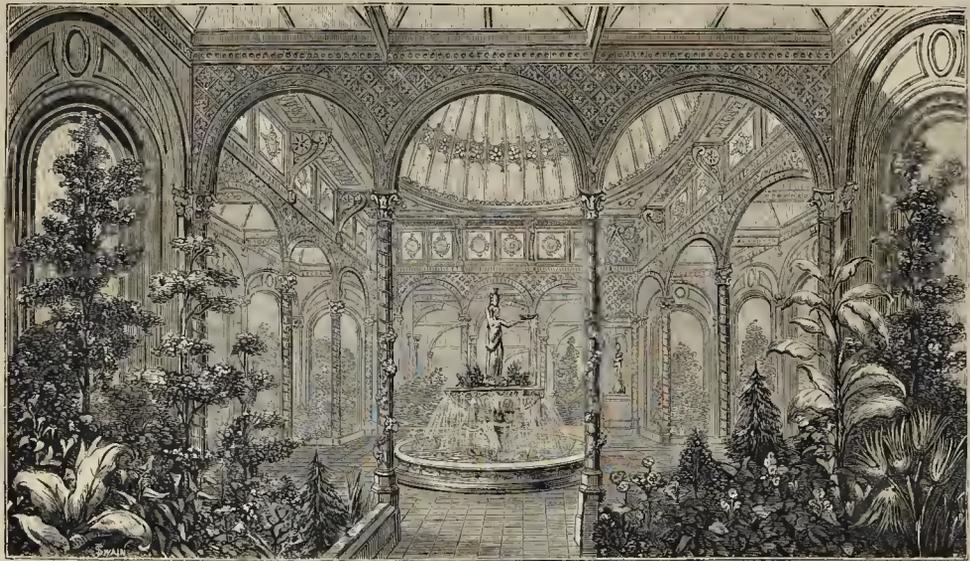

Arvan.—A correspondent of the *Scotsman* calls attention to the fact, that the shaft of a cross which for centuries marked the point whence Robert Bruce and his followers left Arvan has lately been removed, and used in the construction, in the neighbourhood, of a dry stone dyke.

WORKS IN IRON.*

ALTHOUGH entirely a Trade Book issued by Messrs. Handyside for their own special advantage, this pretty little volume will be found of considerable use to others in designing and in making estimates of the cost of works in iron. The book treats of three classes of works:— firstly, constructive iron work, such as roofs, buildings, and bridges; secondly, steam-engines and foundry work; and thirdly, ironwork of a specially ornamental character. The number of works executed by the firm in question is remarkable, and many of them are shown by photographs and wood engravings. We give two of the latter; one representing the Winter

* "Works in Iron." By Andrew Handyside & Co., Illustrated by Photographs. London: F. & E. N. Spon, 43, Charing-cross, 1868.

* On this occasion the election of officers for the ensuing session (1868-69) was proceeded with, and the following gentlemen were chosen:—President: Mr. William White, F.R.S.A. Vice-presidents: Mr. Ridge and Mr. R. H. Watson. Committee: Mr. Carpenter, Mr. C. Henman, jun., Mr. H. Jarvis, jun., Mr. R. W. Lonsdale, Mr. Perry, Mr. Plimbe, Mr. Spiers, Mr. Tarver, Mr. Aldridge, and Mr. G. G. G. G. Hon. Secretaries: Mr. Mathews and Mr. Quilter. Curators and Librarians: Messrs. O. Birch, R. Armstrong, and T. E. Munday.

IRON CONSERVATORY NEAR LONDON.

Garden occupying the central quadrangle of the new Infirmary at Leeds, as already mentioned by us, and the other a conservatory recently erected by Messrs Handy-side, near London, for Mr. Henry Bessemer, from the design of Messrs. Banks & Barry, architects. This is one of the most elaborately ornamental iron buildings yet constructed, and, with the exception of the ribs in the dome, is entirely of cast iron. The conservatory is rectangular, and from the square framework a circular dome rises to a height of 40 ft. The columns are light and elegant, with ornamental capitals, and the arches, brackets, and other main parts of the structure are of light pierced work. A building of this kind affords great scope for colour decoration.

Concerning Conservatories they say,—

“Considerable impulse was given to the manufacture of buildings of this kind by the successful erection of the large Exhibition Palace, in 1851, in Hyde Park, but for some years before that time Andrew Handyside & Co. had constructed conservatories mainly of iron and glass for noblemen and gentlemen in different parts of the country. Cast iron is particularly adapted for such work, and the slight columns and elegant arched spandrels obtained in this material afford great scope for ornamental design. The photographic frontispiece shows the conservatory in the gardens of the Royal Horticultural Society, at South Kensington, which is the largest work of its kind yet constructed by Andrew Handyside & Co. It was made by them in 1860, from the designs of the late Captain Fowke, R.E., and is probably one of the largest and finest conservatories in the world. It is 295 ft. long, 96 ft. wide, and 75 ft. high in the central aisle. Its framework is of cast iron, and the roof of wrought iron, the main semi-circular ribs of the latter being pierced. The building is remarkable for the extreme lightness of its construction, and the very simplicity of its outline offers manifest opportunities to the gardener for decoration by means of climbing and trailing plants. The total weight of iron is 226 tons. The cost of the ironwork of such a building (without erection) would be about 3,600.”

The Leeds Winter Garden is, with the exception of the lattice girders over the columns and in the clearstory, entirely of cast iron. It is 151 ft. long, 63 ft. wide, and 60 ft. high. The construction of this building is peculiar, involving no “thrust” upon the walls, the main roof, which is really carried by the four corner rafters, having its thrust taken by the parallelogram of lattice girders connecting the heads of the twelve columns. The weight of ironwork is about 150 tons. The sash frames for glazing are of wood. The framework of such a building as this, including the wooden skylight bars, delivered ready for erection anywhere in Great Britain, would cost about 3,000.

The usefulness of the book will certainly be made obvious by what we have said.

WORKING MEN'S COLLEGE.—The summer *conversations* will be held on this Friday evening, the 26th. The College choir will contribute to the social pleasures of the evening.

LEEDS INFIRMARY, WINTER GARDEN.

WAREHOUSE, SOUTHWARK NEW STREET.—MR. WIMBLE, ARCHITECT.

WAREHOUSE, SOUTHWARK NEW STREET.

THIS building has been erected for Messrs. Peter Lawson & Son, of Edinburgh, for the convenience of their London business. It covers an area of 3,700 superficial feet, and has a basement, ground, and five upper floors, and has been constructed to carry 3 cwt. per foot superficial on each floor, warehouses for seed being often loaded to that extent.

The top floor, as sample room, is lighted by skylights, at an angle of 75 degrees, and, facing the north, is at all times free from the sun's rays.

The front is carried out in bright stock-brick facings; the cornices and dressings up to the first floor are of Bath stone; and all the window-heads, string, and parapets above are of Ransome's patent stone.

The turret (the top of which is curtailed in the view) is of Bath stone, supported on a granite shaft, with carved corbel and cap, and is covered with copper, laid diagonally, and supported by a wrought-iron finial, 114 ft. from the pavement.

The work has been executed from the designs of Mr. Wimble, architect. The contractor for the building was Mr. Kilby, of Limhouse; Messrs. Cottam & Co., of Winsley-street, Oxford-road, supplying the ironwork.

SALISBURY RESTORATIONS AND UNHISTORIC HISTORY.

SIR.—The discussion on "a question of restoration" was by no means exhausted by Mr. Pritchett and Mr. Armfield on p. 415. The latter is not quite correct in saying "the whole of the walls and groinings" of Salisbury Cathedral interior "were painted in a very exquisite manner;" and still less that the whitewash "was most probably first applied in early Puritan days." These "early Puritans," so long dead, have very convenient broad shoulders. I will subjoin an account written while those decorations were perfect, as my own grandfather saw them also. It is from the only decently good description of that building in existence,—that by Francis Price, "author of the *Complete Carpenter*," in 1753. Those by Sir Christopher Wren, and in the present century, are some of the most worthless or mischievous collections of blunders any monument has suffered from; and the later edition of Price (which stands in the British Museum reading-room) omits this and other of his most valuable matter. He was a very Willis of his day,—a model of the historical critic of a building,—and after inferring truly all its relative dates, he says, p. 53—

"As a further proof of all these assertions, I beg that the choir may be taken notice of; for it is plain at sight that both the sides and ceiling were at first adorned with the painting in crayons, the sides with certain scrollwork, the ceiling with persons famous in Scripture, and labels coming out of their mouths, and over the altar with persons performing different works of agriculture, suitable to the several seasons of the year. What I infer from these is, that the choir and eastern cross of the church was so painted before the arches [the two straining arches with inverted over them, of Edward I. date] were erected, or the beam fixed across the choir. Nay, there is some of the painting upon the east side of the grand arch [tower arch], which proves the choir to have been finished [painted] before the grand arches were carved into roses or flowers; which was doubtless done when that vaulting was added [the square of late and had fifteenth-century vaulting shutting out the tower,—the sole piece of vaulting not original, and the most mischievous addition every way the building has ever had]. The upper pillars of the eastern cross have been cut away, to let down the beams that were formerly fixed there; nor are those parts painted. Besides this, the fractured parts of the walls of the choir, and its crossing, are still visible, and not closed up, as they must needs have been had not the painting been first done. [This proves the painting older than the commencement of the heavy stories of the tower, one at least of which was complete by the second dedication, in 1280.] There is yet another circumstance observable that, whenever the arches were erected in this cross, the workmen have been very careful how they defaced the original painting, which, though its colours are entire, will be mended off by the *slight touch* [alas for De Wittizers!], which makes me call it crayons."

What convenient broad shoulders have those "early Puritans" truly! Hit 'em, they have no friends! Most convenient for us presentagers: when fashion changes at the rate it does now, verily I scarce know how we should get on without them!

Now, then, come to a book of the great century,—Dodsworth's "History and Description," &c., 1814.

But perhaps at no time since the foundation have more effectual improvements been made than by Bishop Barrington, who now fills the

see of Durham, and of whose taste and unminifcence it is needless to speak." The expenses were paid by pulling down the campanile (coeval with the church) and selling its bells and materials. Britton has not a syllable of these grand and most "effectual" improvements! The nine years of Barrington's episcopate are despatched in six lines, and, for aught that his readers can learn, there might never have been a campanile, nor the great Wyatt ever have been "let loose upon Salisbury." Such is "history" in the great civilised age. We must therefore recur to Dodsworth:—

"Among the efforts of a wretched taste, which in attempting to ornament, had deformed the edifice, were various paintings on the vaultings of the choir and eastern transept. These were erroneously considered as coeval with the building, and consequently highly admired by those who regard the mere antiquity of an object as a sufficient title to admiration. But on a close inspection they were found to consist of lines drawn in imitation of brickwork, like those which then remained on the ceiling of the nave and principal transept, and may still be traced in the chapter-house and cloister. Their antiquity therefore was much less remote than was generally supposed. [If Salisbury and the "architect" between them contained neither the taste to know "exquisite" decorations from "wretched," nor the wit to infer like Price, did neither the bishop's, chapter's, nor any library contain his little book?] Drawings of these were made for the Society of Antiquaries. [I know a century not required to make "drawings" of what it destroys, that would not make in such a case even photographs.] Mr. Wyatt judiciously coloured the arches and ribs of the choir like the original stone, and contrasted the ceiling and walls with a lighter tint, which gives every part its due effect [!]. Since his time, the same plan has been carried into execution in the nave and principal transept, and the building may be considered as presenting nearly the same appearance as when left by the original architect."—Pp. 183-4.

But in vain do I copy these things: their lessons will not reach the time that needs them, but glance off effectless from the preparers, as Mr. Ruskin says, of an England "without a ruin and without a monument," in which a race, without discourse before or after, "may dispose itself to eat and to drink and to die." Would to God that our art monuments were portable enough, the land of shopkeepers impoverished enough, and America grown rich enough, to do as the same adviser would have Manchester do with America, huy and export some fragments ere the boof of Per-centage has trampled out all!

You see, then, "history in stone," or in whitewash, is liable to become, like this to Mr. Armfield, unhistoric; and so, not history at all: as we all agree, the very Pentateuch would not be, were it what the "Bishop of Numbers" fancies. The statement about the whole of the walls and groinings must also be thus modified. Figure subjects were confined, it seems, to the vaultings of the choir and east transept, and there is no evidence of wall-painting beyond the same limits (all cast of the tower), nor of its wholly covering more than the east wall with its "exquisite" scrollwork. Many living remember similar scrolls branching from the bosses of the remaining vaults, but their general surface only masoned with red lines on white, and some say with a few medallions. The building was of a rare class as to colour decoration, neither depending wholly on the opaque painting, as Italian and Southern Gothic, nor wholly on the glass, as do Chartres, Bourges, York, and did Rheims and most northern thirteenth-century work, as built. At the Sainte Chapelle, the stone painting, if authoritative (which I doubt), is totally thrown away. Salisbury had no fully-coloured windows, probably none with figures, and very little positive or intentional colour in them, especially the clearstory, for the lower windows are (as in all English works) excessive in relation to the clearstory, but less so here and in Westminster than in any other English church. The coloured glass was valued as gems among the rest, which by its unintended, but now seemingly inimitable, motting of all kinds of sea-greens and dull purples, excluded half or more of the light that now enters; but even then it was a light building, as Westminster Chapter-house was, and must be again if wall paintings are to tell.

Mr. Armfield's protest against the antiquary's claim to have such things as Temple Bar or Burlington colonnades left him as "history" does not go half far enough. I utterly deny that they are history more than the last plates of "Le Follet." "History in Stone," or in wood, clay, metal, ceases in a race when their palace and cottage begin to be in different styles; or, as Mr. Ruskin says, "any stone-cutting or joinery, or pottery, or smith's work, to be so debased in character as to be utterly unconnected with the finer branches of the same art." There are countries, as Japan and India, where all material works are history, down to this day,

their arts being, as Mr. Fergusson says, "though effete, yet not insane;" and as we come westward to Turkey, Russia, Belgium, France, art-history ceases earlier and earlier, not necessarily at the "Renaissance," often later, but in England earlier—as early as the fourteenth century; and there are our colonies and America with not a stone of such history, nor the remotest apparent chance of ever having any. The terms *new* and *young* are so misapplied that they are actually the only lands with no traces of youth. We have been young, and now we are old; but America knows *only* age and decrepitude,—born therein, if you can call it a birth, and never having seen the stage in which stone history is possible.

I deny even the right claimed for more than chief and first-rate works of the native art's decline, to more than careful photographic immortality *on paper*. Wykeham's, and the royal works of the fifteenth century, and Welsey's are history; but not such things as St. John's Gate, Clerkenwell, or the above-named square of groining that spoils the interior of Salisbury Cathedral. They are only so far history as to deserve, before being swept away, well photographing; which even things as late as Northumberland House deserve, but seemingly have little chance of getting.

It is only when we get back to Edward II., the age of Ely St. Mary's Church, for instance, that moulded stones are sacred; and before 1300 universally so; and the breaker down of any carved work with axes and hammers, a national enemy, whose name must be sought out and duly made to stink, entirely apart from "early Puritans."

Poor Salisbury! As one "munificent" bishop, you see, cost her all her nique, "exquisite," and historic painting, so has the monumenting of another cost all her sculpture! Observe, it always takes a great London man of taste to destroy these things. The local artificers have a certain innate feeling, that refuses the job, however good for trade! Mr. Osmond, the Salisbury sculptor, was the sole preserver of the Chapter-house frieze to the end of the late bishop's life. I know that he was constantly urged, but could never be persuaded to lift up tool upon it, and his lordship had an odd scruple against superseding local by strange artificers. But, alas! great men must be monumented. He died just as the Sydenham Palace, and its Panathænaic horses alternating bay and grey, bay and grey, were all the rage. Salisbury shopkeepers resolved Pharaoh's chariots and his horsemen should be equally smart, "in memory of" their excellent hishop. They forgot that at Sydenham it was not the Phidian works themselves, but *casts* they saw coloured. Their toy was to England, not what the casts were to Sydenham, but what the very Phidian frieze had to Greece!—the chief sculpture of our completeness, or, rather, *only* complete monument of the national art. What odds? It was the handiest cheapest ground for what they wanted, a showy monument (of paint) to an excellent bishop; though such ground must be made nineteenth-century workmanship (for there was all Genesis and Exodus; and the Creation, and other scenes with the Deity figured, had been purged by the careful hands of the real Puritans of what they held a breach of the Commandment). But had not another century saved us the designing? What odds whether your handy thirteenth century's own work be left in existence or not? A Londoner, of course, was sent for, and the 170 ft. of shabbied old carving (but convenient design) soon disappeared; yielding said Londoner, I suppose, due per-centage on the outlay of axes and hammers. And so, if Longfellow, or any American, asks there after the sculptures of the Parthenon of his forefathers, he must be told, the Salisbury shopkeepers of 1860, finding it theirs, not England's, and having a munificent bishop to monument (with paint), found the said frieze's place the cheapest for it. Now, I call it monstrous that the whims of the hour, in a place like Salisbury, should thus have power to disinherit the great Anglo-Saxon race throughout the world, for all time.

The real danger, you see, has now become, that however short may be the remaining term of Lord Bishops and the like among us, they will be found, with this religion of Per-centage, to have lasted just too long, by a few years, to leave (between them and their monumenting) any of England's artistic history at all. Salisbury's losses are strangely typical of England's at large. In the new frieze there,—which, by the way, has

not more than half the figures the old one gave me the impression of containing; nor that any engraving, from Duggdale to Britton, gives the idea of—the showman says three bits of figures only are original, and notably the head of Ham mocking his father. Yes, truly, Ham's will be found the only head, when this poor drunken old nineteenth-century John Bull awakes too late from his wile (if he ever does), and perceives what his younger son,—whose name is Perceuter, —bath done to him!

E. L. GARRETT.

WEST INDIES PACKET STATION.

I SAW a paragraph in the *Standard* the other day to the effect that the Government had selected the central packet station in the West Indies, and had adopted "Virgin Gorda" as the most eligible.

This is to be exceedingly regretted, as I feel confident that if thoroughly inquired into it would be found less eligible than many other islands.

It possesses a tolerably good harbour, but the island is rocky, barren, and unproductive. It is in too close proximity to the island of St. Thomas, and is quite as much exposed to the action of hurricanes and earthquakes as that island, which a more southern island would not be so much exposed to.

I think the West India Mail Company will find to their cost, by a falling off in their trade, if it has not already occurred, that a more southern point of rendezvous in the West Indies would be attended with less danger and risks, as travellers will prefer the French line of steamers that are not open to these objections.

B. B.

THE MADRAS IRRIGATION.

SIR,—It is satisfactory to find that this neglected matter is beginning to attract attention at home, as will be seen by the occasional letters which have appeared in the daily papers.

India is blessed with a productive soil, and the benefits which a well-designed system of irrigation will confer on that country cannot be measured by tonnage. The average rainfall in the Presidency is 25 in. annually. Surely it requires no great engineering skill to bring a portion of this water within reach of the cultivators of the land, where the gradients are favourable.

The Madras irrigation has been a complete failure. A large portion of the labour spent on public works in India is pure waste. Surely the enterprisers should not be so fatally blind to their own interests as to entrust great and important works to a lot of speculative adventurers, instead of treating with contractors of position.

The promoters should insist upon all contractors sending qualified engineers and inspectors to India, instead of sending out drabstons and highway surveyors; for, to spend money broad-cast and in a careless way is an easy matter; to spend it with economy and skill is really quite a different affair; and, although we do not rejoice in the worship of Buddha or Krishna, or other exalted deities, we ought to let the natives of the sunny East understand that we are not low barbarians, by leaving useful land-marks of our occupation.

PIERRE ARTHUR.

CHANCEL SCREENS.

SIR,—In your notice of "The Great Architect" the opinion is expressed that its dedication to "master builders" refers to a certain section of the clergy. The "wise master builders" appealed to by the Apostle Paul, were the great body of Christians through all ages, cognizant of their inherent dignity as "kings and priests," and willing to do the work of building themselves up into "living temples."

Ministers were appointed, not to do the work for others, but to exhort all to do it for themselves: the clergy, therefore, have no *ex officio* claim to be "master builders."

You, no doubt inadvertently, use the term "screened platform" as synonymous with railed platform. The distinction between the two phrases is most important,—the one being the

vailing to conceal a presumed mystery; the other, an expedient to prevent accidents.

The late A. W. Pugin wrote his book on "Chancel Screens" with the avowed object of trying to prove that it was the custom from the beginning to put "screens" in front of chancels. "I cannot," he says, "impress too strongly on the minds of my readers that the very *rites* of Catholic architecture are assailed by the opponents of screens." To establish this point he did not hesitate to compromise his reputation as an honest man, as he was told in your columns, by asserting the primitive antiquity of screened chancels, no such thing being known till after the ninth century. To illustrate his assertion, he gives a plate with the title "Elevation of Screen of Old St. Peter's Chancel at Rome," the said screen having been inserted about 1,100 years after the erection of the church; the plan of which shows the old real chancel behind the modern mock one.

"Real Protestants," states Mr. Pugin, "are always built rooms for their worship," an axiom which proves them to have been in accordance with primitive Christians, who never built anything else for nine hundred years; a basilica being simply an open meeting-hall.

We are entering into the great struggle of adverse principles, in which, as I have long predicted, this question of church arrangement will be a leading object of attack and defence. The aim of my little book is to place on record the indisputable fact that the very stones of Rome bear witness against her pretensions.

THE AUTHOR.

COMPETITION PLANS.

THE WALWORTH-COMMON ESTATE.

I REFLECTFULLY beg leave to offer a suggestion to the guardians who have now to decide on the respective merits of the above plans, to avail themselves of the assistance of a professional man of high standing and character to enable them to come to a correct conclusion in their selection for the benefit of the parish.

I know several competitors share the same opinion, and I dare say the entire number would agree to the above: at all events, it will help greatly to remove erroneous impressions. ONE OF THE NOMINEES.

* We have received two other letters to the same effect.

CONTENTS OF CONICAL HEAP OF BALLAST.

SIR,—Allow me to give your correspondent, "A Working Man," the following rules for finding the contents of a conical heap of ballast:—

1. Measure the two ends, and extract the square root of their product; add this to the area, and multiply by one-third of the perpendicular height.

Another rule is to divide the difference of the two ends by the diameters of the two ends by the difference of the two diameters; multiply by 7854 and by a third of the perpendicular height, which will give the solid contents.

JOSEPH E. HAYMES.

PROPOSED NEW CHURCH, ST. PANCRAS.

SIR,—In your impression of June 13th, a correspondent informs you of a church about to be built in Kentish-town, and that the son of the Rev. Mr. Champneys, the vicar, had been appointed by him architect to carry out the works. I beg to inform you I was requested to attend a committee meeting for building this church, February 21st, 1868, the Rev. Canon Dale in the chair. The Rev. Mr. Champneys, vicar of St. Pancras, I believe was there; the Rev. Mr. Andrews, the incumbent, and other gentlemen, being present. I was at that meeting formally appointed architect to the church, parsonage, and schools, proposed to be built out of a fund of 12,000*l.*, to be realised by the sale of the site to the Midland Railway Company of the former Church of St. Luke, King's-cross, which had been erected from my design.

Some time after I attended, by the request of the Rev. Mr. Andrews, at Kentish Town, to inspect and survey a site proposed to be given by one of the colleges for the new church; present, the Rev. Canon Dale, the Rev. Mr. Champneys, the Rev. Mr. Andrews, the surveyor to the College estate, and myself, when I believe it was found necessary to obtain an Act of Parliament to dispose of the funds obtained from the sale of the former district Church of St. Luke, King's-cross, to another district in the same parish; everything regarding myself remained in abeyance until this Act of Parliament was obtained, which received the Royal assent May 26th last. I was now expecting to receive instructions to proceed with the designs for the new church, and the first notification I learnt to the contrary was that contained in your journal of the 13th instant; and, on inquiring of the Rev. Mr. Andrews, I find your statement to be correct, that the vicar has appointed his son to be the architect, after being one of the committee previously to appoint myself, and without having the courtesy to give me any information or reason for removing my name.

JOHN JONSONS, Architect.

In reply to observations under this heading, in our issue of the 13th instant,* we

* See p. 433, ante.

have received from Mr. J. Pritchard, Llandaff, a strong testimonial in favour of the young architect, the vicar's son, who is to design the church, and of the builder from Wales, who is to carry out the design without competition, but we are obliged to decline inserting it except as an advertisement. The facts remain as stated.

THE POOR MAN'S MEAT IN LONDON.

A NEW view of the Foreign Cattle-market scheme is given under this title by the *Daily News*. In an interesting article on the animal food of the London poor, the writer points out how the placing of the proposed market at Dagenham, or elsewhere out of town, would react on the supply to the poor of their portion of the meat-market supply. We give an abstract:—

"The quantity of butcher's meat consumed by the poorer classes of the metropolis is considerably greater than is usually supposed. It must not, however, be hastily assumed that the meat is eaten in the shape of beef, pork, or mutton; on the contrary, large numbers of the poor have been flesh-eaters for years, without once enjoying, unless at rare intervals, the luxury of a bit of beef or mutton. The meat used by them is procured wholly from what is technically termed the 'offal' of slaughtered animals, and which forms a most important feature of the metropolitan dead-meat trade, its sale generally constituting the principal source from whence the profits of the wholesale butcher are derived. The offal consists of the head, tail, kidneys, heart, tongue, liver, and other portions of the animal, the latter being generally going with the skin or hide. The estimated value of the offal per animal is about 50*s.* for a bullock, and from 10*s.* to 13*s.* for a sheep. The offal, when fresh, generally forms in poor neighbourhoods the most saleable portion of the animal.

When it is remembered that in 1867 no less than 285,754 head of oxen, and 1,472,000 sheep, forming a total of 1,757,754 animals, exclusive of calves and swine, were disposed of in the metropolitan market, some adequate idea may be formed of the magnitude which the trade in animal offal has attained, and the important position occupied by it in the domestic economy of the poor. Anything which may tend to increase the price of the commoner descriptions of offal must inevitably press with terrible severity on the humblest classes. Yet the possibility of this has been almost wholly overlooked by the advocates of the new Metropolitan Foreign Cattle Market. The Duke of Richmond, in answer to a question by Mr. Hope Scott, declared that "he knew nothing about offal; and yet he was very anxious for the establishment of the proposed market. He had looked at the question from one point of view only. It has been shown conclusively in the evidence taken before the Metropolitan Foreign Cattle Market Committee that the compulsory slaughter of foreign animals at Dagenham, instead of in the present localities, will most certainly lead in various ways to a complete withdrawal of a large portion of animal offal from the different metropolitan retail markets; the cost of carriage and the deterioration of quality occasioned by the time and mode of transit from Dagenham to the retail shops being more than sufficient to absorb the profit of the dealer.

In fact, everything tends to prove that the animals must be slaughtered as near as possible to the place where the meat is to be retailed. If compulsory slaughter is to be insisted upon, the site proposed for the Islington *abattoirs* is far preferable to Dagenham; but in either case the poor will become the sufferers. If we are to have public *abattoirs*, they must be in different localities, as in Paris, otherwise the price of meat will rise above the reach of the humblest classes, who are already much dissatisfied with the manner in which they have been treated by the abolition of the compound householder system. The establishment of Metropolitan *abattoirs* at Dagenham, if the Foreign Cattle Market would be like pouring oil upon fire, it would prove a dangerous experiment."

PROVINCIAL NEWS.

Lynwoodville.—A monumental tomb has just been erected here, by Mr. Thomas Lewis Webb, of Hagley, to the memory of his deceased wife. The site selected is adjacent to the large vault of the Freeman family, near the pathway on the Tidnor side of the churchyard. The tomb is formed of a base of worked Aberdeen grey granite, 9 ft. 6 in. long by 6 ft. wide, surmounted by a plinth of red Peterhead granite, chamfered on the edge and highly polished. The ledger, or slayed top is of the same material, and the height of the whole is 2 ft. 6 in. The ironwork by which the tomb is protected is in the Egyptian style. Ten standards, of proportionate height, and surmounted by flambeaux torches, carry the bar rail, which is of the cable coil pattern.

Penrith.—The new market-house at Penrith is now almost completed. The new building may be adapted to any purposes, such as lectures, concerts, or public meetings. It is a large brick building of peculiar shape, but that has been caused by the whole of the available space being built upon. The roof is of glass and slate, with fifteen ventilators, and the side windows can also be easily raised to admit of more fresh

air when required. The roof is supported by strong iron pillars, and accommodation has been provided for both buyer and seller. It can be lighted from horizontal lines of gas jets. The new building occupies about 700 square yards of surface, and the roof and sides contain upwards of 1,500 ft. of glass. The architect was Mr. Stewart, of Carlisle, and the contractors were,—for the masonry, Messrs. T. & G. Dixon, Penrith; plumbing, plastering, painting, and glazing, Mr. Relson, Penrith; carpenter's work, Mr. Pollock, Penrith; gas-fittings, Mr. Porter, Penrith; and for the castings, Mr. D. Clarke, Carlisle. It has been estimated that the total cost of the building will be about 1,000l., but we understand that some of the "extras" are heavy.

ARCHITECTURE: UNIVERSITY COLLEGE, LONDON.

At the recent distribution of prizes, the following were awarded:—

In Architecture, Professor Hayter Lewis.—*Fine Art, First Year's Course:* Prize, Arthur Hill, of Cork. Certificates, 2nd, C. R. Griffiths, of London; 3rd, F. H. Reed, of London. *Second Year's Course:* Donaldson Silver Medal, Arthur Hill, of Cork; 2nd prize, C. R. Griffiths, of London; Certificate, 3rd, F. H. Reed, of London. *Construction, First Year's Course:* George Duncan, of London; Certificates, 2nd, C. R. Griffiths, of London; 3rd, J. Wallace Duncan, of London. *Second Year's Course:* Donaldson Silver Medal, George Duncan, of London; 2nd prize, C. R. Griffiths, of London; Certificate, 3rd, J. Wallace Duncan, of London.

In Civil Engineering, Professor Fleeming Jenkin.—Prize, Leslie C. Hill, of London; Certificate, 2nd, W. H. Johnson, of London.

CHURCH-BUILDING NEWS.

Carlisle.—The chief stone of St. Mary's new Parish Church has been laid. The site is that formerly occupied by the Black Swan Inn, near the Cathedral-cloze. Mr. Ewan Christian, of London, is the architect. The design is intended to harmonise as much as possible with the cathedral. The edifice will consist of a nave and transept, with a polygonal apse at the east end, and north and south aisles. The entire length of the building will be about 95 ft., and its breadth about 60½ ft. The apse will have a radius of 15½ ft., and will be 31 ft. across, the whole depth of the chancel being 36 ft. The walls will be built of red stone throughout, from Newbiggin quarries, the character of the external walling being similar to that adopted in St. John's Church, namely, rock-faced rubble; while the masonry around the windows will be dressed. The arcades dividing the nave from the aisles will consist of three pointed arches, of which the pillars will be of black Kilkenny marble, with moulded and carved base and cap, and the arches will be formed alternately of red and white stone, with white stone bands. Above these arches a lofty clearstory will be constructed, with double-light lancet windows on each side, with black marble shafts and arches of red and white stone. There will be three windows on the south side lighting the south aisle, and one triple-light lancet window on the north side, the position in which the church is placed with regard to surrounding property rendering it impossible for the architect to make the north side the same as the south. The use of the east end will contain seven single-light tracery windows, to which are placed marble shafts supporting the internal arches, and above these other marble shafts supporting the carved and moulded ribs of the roof. These windows will be filled with stained glass at the expense of Mr. Losh. The chief feature in the west end of the church will be a large window, 25 ft. high from the sill to the spring of the arch, and having an opening 14 ft. wide. This will be divided into four lights by three mullions, and the top of the window will be filled with tracery and geometrical design. The nave and chancel will be covered with barrel-shaped roofs, which will be plastered, but the main timbers will be moulded and carried round on the under side of the ceiling. The aisles will be covered with open-framed timber roofs. The church will be provided throughout with open seats, which will accommodate about 600 people. The roof will be covered with Westmoreland slates. The

contractor is Mr. George Black, joiner, of Carlisle, the estimate amounting to about 4,552l. The execution of the masonry work has been undertaken by Messrs. C. & J. Armstrong, of Carlisle, builders.

Dorchester.—The chief stone of Holy Trinity Church has been laid by the Lord-Lieutenant of Dorset. The site is in Madeira-vale. Messrs. Cory & Ferguson, of Carlisle, are the architects. The design of the proposed new edifice, which will be built of brick, is that of Lombardy, the "great brick country," at the same time introducing such features as may render it suitable for our own climate. The church will comprise nave, aisles with shallow transepts, and an apseid chancel with small aisles. There will be a Galilean porch extending entirely across the west front, and connected with the tower by a corridor. It is proposed to build the church of red brick, slightly brought out in the most salient points with moulded brick, and terra-cotta introduced in the shafts of the western porch and orders of the main doorway of the tower. The interior is to be lined with buff bricks, if they can be procured of good colour, relieved with red brick string-courses and hood-mouldings, with spaces left to be filled up with string-courses of manjolica tiles; whilst in the circular panels, and in the spandrels of the arches of the main arcade, will be fitted subjects in Venetian mosaic. It was originally intended to have a gold ground for this mosaic work, but the idea has been altered. The roof of the nave is to be barrel-vaulted, in wood, carried by laminated principals tied with wrought-iron ties, and lined with varnished wood. On the outside, the roof will be covered with the ordinary russet-coloured tiles. The church as at present designed will, when complete, afford accommodation to 1,031 adults, and it is intended that 350 sittings shall be free. Without the north aisle and transept accommodation would be provided for 802 adults. It is proposed to build at present the nave, chancel, south transept and aisle, vestry, and cellar for heating apparatus, with temporary porches over the west doors.

Kempston (Bedford).—The church of St. John the Evangelist has been consecrated. The new edifice is situated in the district of Up End. The site, which has a fall of about 6 ft. to the main road, and is very picturesque, was given by the late Mr. Littledale. The ground plan of the building (which is in the style prevailing toward the close of the thirteenth century), comprises nave, south porch, ringing chamber, chancel, vestry, and organ chamber. The materials used throughout for masonry are the local limestone from the quarry of Mr. Mitchell; the ironstone bands from Wellingborough; and the quoins, string-courses, plinths, and dressings generally are of Bath stone. The internal surfaces of the walling are rendered in ordinary plaster. The nave is 70 ft. long, 25 ft. 6 in. in width, 21 ft. and 40 ft. high to the wall plate and apex of roof respectively. This portion of the work has been designed to allow the subsequent additions of north and south aisles, the discharging arches of the arcades for which have been constructed in the masonry of the present walls. The nave is divided into five bays, and is lighted on the north side by five and on the south side by four two-light windows with lancet and circular openings; a smaller window is introduced over the ridge of the roof of the south porch. The west windows form a group of three lancets, with a rose of six foils in the upper stage. The west windows, fitted with painted glass by Mr. Wailes, of Newcastle, form a memorial to the late Mr. Littledale, of Kempston. The side windows have been glazed with cathedral glass in, quarries slightly tinted. The benches in the nave are open and moveable; executed in deal slightly stained and varnished; seats for children are placed at the west end. Accommodation is provided for 270 adults, and about 100 children. The south porch is open roofed in oak, with front truss and coupled rafters. The bell-turret is carried up from the buttresses in the form of a cross on plan. The turret is arranged to carry three bells; one only, at present has been cast and raised by Messrs. Mears & Stainburn, of Whitechapel. The chancel is 33 ft. long, 18 ft. wide, 17 ft. high to the wall plate. The east end is apsidal, with an approach of five steps from the nave, and is lighted by three lancet windows in the octagon faces; the centre light is carried up into a dormer; these openings have been fitted with painted glass by Messrs. Clayton & Bell, of London. The works connected with the erection of the building have

been executed by Messrs. Winn & Foster. The committee decided to dispense with the services of a clerk of the works. The architect was Mr. Robert Palgrave, of London.

Parnham Royal.—The parish church has been re-opened by the Bishop of Oxford. Except a portion of the chancel it has been entirely rebuilt. The cost of restoration was estimated at about 2,200l., and of this sum more than 1,600l. have been raised, leaving a balance of some 600l. still required. The church has been erected by Mr. Pope, of Dover, from the designs of Messrs. Nesfield, of London, architects.

Dinebar (Herefordshire).—The parish church has been restored and re-opened. The restorations have been under the direction of Mr. F. E. Kempson, of Hereford, architect; and have been executed by Mr. J. Stone, of Eynsham, builder. The work of restoration included the entire rebuilding of the nave, chancel, and porch, on the site of and in the same form as the old edifice, with the addition of an organ chamber and vestry on the north side of the chancel. The architectural features of the old church have, as far as practicable, been preserved, and the old materials used in the re-building of the edifice, the masonry being relieved with Bath stone buttresses, copings, and dressings of the windows. The outer walls are of stone from a quarry in the immediate neighbourhood, lined in the interior with stone of a delicate grey colour from the quarry of Sir E. F. S. Stanhope, bart., at Ballingham. The roof, which is of wood, is entirely new, the construction being shown, being open from within with plaster between the rafters. The seats are open benches of pine wood, with sloping backs. Light is afforded in the nave by two couplet windows on the south side, and a couplet and a lancet on the north side; and in the chancel by two windows on the south side, and by a triplet in the east end. The passages between the seats are paved with tiles from the manufactory of Mr. W. Godwin, of Withington, and there is affixed in the church a heating apparatus by Messrs. Rimmington. The porch is executed in pitch pine on a stone base. The tower has not been rebuilt; the masonry has, however, been cleaned of whitewash, the joints raked out and pointed, and new belfry windows have also been inserted. The roof has been re-slatted. The carving in the work of Messrs. Pearney, of Gloucester. The style of architecture of the church is Early English. The cost of the whole work was 700l.

St. Helier's (Jersey).—The town church has been restored under the direction of Mr. John Elliott, architect. The sum voted for the restorations by the parish authorities was 4,530l., and the actual cost was 4,501l. The edifice has been re-pewed in oak, the stonework restored; a new transept built and the nave extended, and various other works done, painted windows inserted, &c. The contractor was Mr. Westway; and the clerk of works Mr. Frank Le Sneur.

Herne Bay.—The new chancel of Christ Church has been consecrated. The architects of the work were Messrs. George & Vanghan, of London, who, in designing the additions to the existing nondescript structure, had first to consider the style most appropriate for the new work. The church, formerly one wide room with flat ceiling and low-pitched roof, was, nevertheless, Gothic in its windows and details, and being of brick, it was decided that the brick Gothic of Northern Italy would best harmonize with the old building. This style was adopted as requiring no great amount of carving or ornament, trusting mainly to its proportions for effect. The east wall of the church has been taken down and rebuilt, 7 ft. being added to the length of the nave. To the north of the chancel is the organ-chamber, with a wide arch to the chancel and a similar one to the nave. Seating for a considerable number is provided by the addition of north and south transepts, which are connected with the church by arches having each a span of 22 ft. These transepts are lighted by rose windows. The walls of the church internally show the brickwork, which is relieved by the introduction of occasional coloured bands, and by stone vasaors in the arches. The capitals of the shafts are of various designs in natural flowers. These, and all the internal stone work, are of Caen stone; while externally Bath stone is employed. The architects' gift to the church is a pulpit of Caen stone. As stained glass was not attainable, the architects have made a departure from the vernacular diamond lights by the introduction of geometrical forms in three shades of cathedral glass. The flat portion of the old plaster ceiling, which has

long been in a dangerous condition, has been knocked away and the main timber of the roof exposed, arched struts being inserted above the tie-beams; the rafters are covered with boarding, and the whole is stained to match the new work. The work has been carried out by Mr. Adams, of Herne Bay, builder. The additions already made, including sundry changes to the original building, have been executed at a cost of about 2,500*l.*, of which not quite 1,800*l.* have at present been raised. It is hoped that this and further funds may be placed at the disposal of the incumbent and the committee, to enable them to complete the work, by the erection of the tower and re-seating of the old portion of the edifice.

Ampleforth.—The church of Ampleforth, in Yorkshire, has been almost entirely rebuilt, and is now re-opened. The restoration, costing about 1,200*l.*, has been effected from plans by Mr. Heeley, of Bradford, architect.

DISSENTING CHURCH-BUILDING NEWS.

Attercliffe (Sheffield).—The foundation-stone of a Methodist New Connexion Chapel, which is about to be erected in Shortridge-street, Attercliffe, has been laid by Mrs. Firth, the wife of Mr. Mark Firth, the Master Cutler. The architects are Messrs. Hill & Swann, of Leeds. The building will be in the Gothic style, and it will be capable of accommodating 450 adults. The external walls will be faced with red brick and stone dressings. The extreme length of the chapel externally is 72 ft., and the width 41 ft. On the basement, a school-room, 46 ft. by 38 ft., two class-rooms, and a kitchen will be arranged. In the lobby, to the left of the vestibule, there will be a tower surmounted by a spire slated with party-coloured slates, and relieved by four dormer windows with spirelets. The roof of the chapel will be open, with arched rib-bindings, and the timbers will be stained and varnished. The whole of the pew framing and internal joiners' work will also be stained and varnished. The total cost of the building, exclusive of the cost of the site, will be about 2,100*l.*

Hilkey.—The chief stone of the Rhyddings-road Congregational Church has been laid. The church is situated on the new terrace to be called "the Grove," and is within two minutes' walk of the railway-station. It is to be in the Decorated style. The front will face the east, and the vestries and school will be in the rear. The principal entrance, with canopied heading and a five-light window above it, will lead into a vestibule faced with stone. To the left will be an octagonal tower, with slated roof and spire, and to the left, at the junction of the Rhyddings-road and the Grove, will be a tower and spire, rising to the height of 120 ft. The windows at the sides, of two lights, are set in gables, which break the roof-line. The interior of the church will be divided into nave and side aisles by iron columns. The pews will be open, 34 in. wide, with low leaning backs, and cushioned. The whole of the woodwork is to be of pitch pine. The glazing will be of cathedral glass, with coloured margins. In the chancel will be the reredos, and above it a wheel window. The dimensions of the interior will be 64 ft. by 42 ft., the extreme length 79 ft., and the accommodation in the area and an end gallery 444 sittings, allowing 20 in. for each person. By the addition of side galleries, 200 more persons can be accommodated at a very small expense, increasing the number of sittings to 644. The school, which is nearly finished, and will be opened for Divine worship in the course of a few weeks, is 50 ft. long by 22 ft. broad, with two class-rooms at the end, beyond which will be a chapel-keeper's house. The cost of the church, school, and land is expected to be about 5,000*l.* Mr. J. P. Pribbett, of Darlington, is the architect; Mr. R. Law the clerk of the works, and the following are the contractors for the works:—Masons, Messrs. T. Y. & W. Freeman, Otley; slaters and plasterers, Mr. J. Tattersall, Bradford; joiners, Messrs. John Ives & Son, Sibley; plumbers and glaziers, Mr. L. Bannister, of Pudsey; painters, Mr. Henry Mitchell, of Huddersfield; iron-workers, Messrs. Walker & Son, Newcastle; carvers, Messrs. Barnstall & Taylor, Leeds; and the warming apparatus was provided by Messrs. G. Haden & Son, of Trowbridge.

Rugby.—The chief stone of a new Wesleyan chapel has been laid here. The style of the chapel is Gothic, of the Early Pointed Period, carried out in red bricks, with black bands, and dressings

of white stone. The principal entrance faces the Market-place, and will be entirely of stone, with enriched moldings, carved caps, and polished marble shafts, the upper part above being finished as a tower, with lancet windows, and the roof carried to a well up. Next to the tower will be a small gable, filled in with a wheel window in plate tracery, the remainder of the side elevation being occupied with three-light windows under one pointed arch, which will show itself inside as well as out. The interior will have somewhat the effect of nave and aisles, the roof being supported partially upon iron columns with foliated capitals, the centre bay or nave being 25½ ft. wide, aisles, 9 ft. 9 in., the end finishing with a semi-circular apse the full width and height, and the roof timbers, springing from shafts on stone corbels, concentrating to the centre, the roof timbers being ornamented, and the entire ceiling of the nave boarded and finished in various shades of stain varnished. The windows throughout are to be glazed with cathedral glass, a narrow margin of white or colourless glass running round, and those in the apse a little more enriched. There will be accommodation for 500 persons on the ground-floor and 200 in the gallery. The total estimated expenditure, inclusive of site, &c., will be about 4,000*l.*

Mallesbrough.—A new chapel has been opened in Milton-street, in connexion with the United Free Methodists. The chapel, which is called Paradise Chapel, has been built from designs furnished by Mr. Hunter, a local architect, and is in the Gothic style. It is built of white brick with stone dressings, and archings and courses of red and coloured brick to relieve. The body of the chapel contains 300 sittings of deal, open and stained. The cost of the whole, inclusive of land, has been 1,200*l.* The vestry and schools are underneath the chapel.

Books Received.

"On the Pollution of Rivers of the Kingdom. Circulated by the Council of the Fisheries Preservation Association, 23, Lower Seymour-street, Portman-square." The purpose of this pamphlet is to point attention to the enormous magnitude of the evil, and the urgent necessity, in the interest of the public health and the fisheries, for its suppression by immediate legislative enactment, as evidenced by extracts from the reports of successive Royal Commissions, Committees of both Houses of Parliament, Inspectors of Salmon Fisheries, Medical Officers of the Privy Council, Registrar General, &c., presented or returned to Parliament between 1855 and 1868. The Fisheries Preservation Association is an influential society, under the presidency of the Duke of Northumberland, and the Vice-Presidency of Lord de Blaquiere.—The *Journal of the Historical and Archaeological Association of Ireland*, originally founded as the Kilkenny Archaeological Society in 1849. Vol. I. Third series, No. 1, January, 1868. It is not to be wondered at that so extensive and successful an Association as the Kilkenny Archaeological should become national in name as in extension. Its Transactions are published by McGlashan & Gill, Upper Sackville-street, Dublin. The number before us is as usual an interesting one, and is well illustrated by very good engravings. The most important papers in it are one on an Ogham Chamber, at Drumloghan, by Mr. Williams, of Dungarvan; and another on a class of Cromleacs, for which the name "Primary" is proposed, by Mr. G. V. Du Noyer, district officer of the Geological Survey of Ireland. As bearing out ideas urged in the *Builder*, and opposed by some Irish archaeologists, we may quote a passage from Mr. Williams' paper on the newly-discovered Ogham cave.

"The total absence of human remains here will seriously affect, if, indeed, it do not completely upset, the theory of the sepulchral character of this class of structures, notwithstanding the accidental circumstance of the presence of such remains in the solitary instance of the Dunloe cave. The promised New Zealand archaeologist, having finished his sketches of the ruins of St. Paul's, may, perchance, happen to visit Kilkenny, and would probably find abundance of human remains within the precincts of the sacred ruins of St. Canice's; but should he thence conclude that it was originally a great mausoleum, would he not err? Christians in every age, actuated by feelings which we can readily understand, have longed to be buried near the shrines at which they worshipped during life; and, as there is nothing new under the sun, it can be hardly doubted that the Pagans of old would desire to have their remains deposited in places connected with religious worship, and to which the odour of sanctity attached."

What is remarkable in reference to Druidical

practices, it appears that a broad circular fence or rampart, coeval with the Ogham chamber, passed directly over the roof of it. This external ring or rampart is concentric with an elliptical enclosure about a third of the extent, and traditionally believed to have been an ancient cemetery, but "long disused, except for the interment of unbaptised children, suicides, and others not considered entitled to burial in consecrated ground." The Druidical allusions in the Taliesin records to "ramparts" and "enclosures" over which the "light-hounding stool of Hu," the Druidical God, was said to leap, are well known. Mr. Williams states his own unhesitating belief that "this great external ring was an open-air Pagan temple."—"St. David's," its Early History and Present State." By an Ecclesiologist. London: Bemrose & Sons, Paternoster-row. The cathedral of St. David, is, of course, the chief object described in this little guide to St. David's: it is illustrated by a few engravings, the only merit of which is that they are copied from rough sketches by a *fac-simile* process, which has thus its demerits as well as its merits, since by the usual processes perhaps some improvement would have been made on the very poor original drawings.—"Examples of Modern Steam, Air, and Gas Engines of the most recent approved Types." By John Bonree, C.E. Part I. Longmans & Co. These examples of the most recent and approved types of engines are designed for the use of experienced engineers. The work is intended to give minute and practical descriptions of engines for pumping, driving machinery, locomotion, and agriculture, and will be accompanied by working drawings, and embody a critical account of all projects of recent improvements in furnaces and boilers, as well as engines. The whole will appear in twenty-four monthly parts, and form one volume quarto illustrated by about fifty plates and 400 woodcuts.

Miscellaneous.

VALUE OF PROPERTY IN MANCHESTER.—At a sale last week by Messrs. Chinnock, Galsworthy, & Chinnock, of the numerous properties sold by direction of the Court of Chancery, in the causes of Hervey v. Chapman and Hervey v. Slack, land in Fountain-street, with the Swan Inn, sold at the rate of about 24*l.* per yard, or upwards of 120,000*l.* per acre.

CUTTING GLASS BY HOT AIR.—According to *Les Mondes*, the use of hot air, or gas, for cutting glass, is an invention, already utilized by the Crystal Company of Calcutta. The hot gas issues from a pointed or flattened tube, and is driven directly upon the goblet or other object to be cut, which is placed in close proximity to the tube, and made to revolve upon its axis. A narrow circle of heated glass is thus formed upon the object in question, which being damped immediately afterwards, causes the glass to divide with extreme neatness at the part thus heated. The operation is more rapid and effectual, we are told, than any means hitherto employed for this purpose.

THE LADIES' SANITARY ASSOCIATION.—The annual public meeting of this admirable association took place on the 12th inst., at the Hanover-square Rooms, the Earl of Shaftesbury presiding. The report (which was read by Dr. B. W. Richardson) stated that the funds had increased during the past year beyond those of any previous year. Fifty-three essays had been sent in competition for the prize of 100*l.*, offered by the society for the best essay on vaccination, the majority of the writers being medical practitioners, and the successful competitor being Mr. Edward Ballard, medical officer of health of the Islington district. The financial statement showed that the receipts amounted to 1,372*l.*, and the expenditure to 1,358*l.*, leaving a balance of 14*l.* The Earl of Carnarvon proposed the adoption of the report, expressing his cordial approval of the objects and operations of the society, especially in regard to the establishment of branch associations abroad, and the circulation of tracts diffusing important information upon the laws relating to the maintenance of human health by preventive means. The Rev. J. B. Owen seconded the proposition, which was agreed to. The meeting was also addressed by the Hon. L. Stanley, the Rev. Mr. Rowsell, Mr. Godwin, Mr. Edwin Chadwick, Dr. Richardson, Dr. Aldis, and by the chairman; and various resolutions were adopted in furtherance of the objects of the association.

SURVEYOR FOR OXFORD.—Mr. Clarke, the
stant borough surveyor of Portsmouth, has
lected surveyor for Oxford. There were
enty-one candidates. Great credit has been
n to Mr. Clerke for his conduct during the
ress of the main-drainage works in Ports-
th.

PEALS FOR ST. CHAD'S CHURCH, MIDDLE-
R.—A peal of bells has been presented to
Chad's, Middlemoor, by a daughter of the
Mr. Horner Reynard, of Holgreen, West
keshire, as a memorial of the late Mr. Simon
ner, merchant, of Hull, the last of a family
known in the Dale. They are a maiden peal,
were cast by Messrs. Blows & Sons, of Bir-
gham, May 19th, 1868. Weight of the peal,
ns 10 cwt. The opening of the peal took place
some festivities on the 11th inst.

NEW TENDERS FOR THAMES EMBANKMENT.—At
last meeting of the Metropolitan Board of
orks, the Board received tenders for the con-
ction of that portion of the embankment
(th) between the eastern end of the Inner
ple and Blackfriars-bridge. They were as
ows:—Messrs. Hill & Keddle, 179,000.;
mas E. Ridley, 173,500.; Messrs. Eckers &
les, 159,500.; Messrs. Jennings & Co.,
0,000.; Messrs. T. Pearson, 144,000.;
rs. Thos. Doowre & Son, 142,000.; Kell-
ng Bros., & Lucas, 127,000.; W. Webster,
5,000. The tender of Mr. Webster was
elected.

EXPLOSION IN A THEATRE.—A serious ex-
ion of gas has occurred at the Theatre
al, Preston. The etage foot-lights are sup-
d with oxyhydrogen, and this dangerous
ture of gases is kept in bags provided
ially for the purpose on one side of the stage.
Previously to the commencement of the per-
ormance, a man named Catterall and some
ers were engaged in preparing for the ignition
the foot-lights by arranging the gas-bags, &c.,
on one of them suddenly exploded. Catterall
blown some distance, his clothes were torn,
several places, and he was considerably
ed and cut about the chin and face.

THE PLANTATION ON FIRE.—The wooded hill
rd, on the other side of Kessock Ferry from
erness, recently caught fire. About 400
ers were planted with Scotch firs. The fire
nated amongst the brushwood, and in an
r's time it had traversed a distance of nearly
a mile, and mounted to the summit of the
The flames passed through amongst the
e and whigs with such rapidity as to a cer-
extent to save the timber of the grown
s; but the bark and branches are all
kened and scorched. The fire extended over
ut 100 acres. It was not expected that it
ld be thoroughly mastered until a heavy
ver of rain fell.

LABOURERS' COTTAGES.—Mr. Lencashire, at
dinner of the Hants and Berks Agricultural
ety's show, urged that there was needed a
sh better class of cottages on farms, espe-
ly for the superior labourers whom a farmer
uses steam machinery and improved imple-
ments requires. Such men must be, to a certain
ent, mechanical engineers, and they will not
content with the ramshackled, comfortless
of mere shelter which farm labourers
e had, in many instances, to put up with.
a farmer could not be asked to erect per-
ment buildings, but he is entitled to ask that
investment in machinery, implements, and
ure shall be backed up by his landlord, and
per houses be provided on his farm for the
n, in accordance with the altered circum-
ces of the times.

THE ROYAL ALBERT ASYLUM AT LANCASTER.—
e chief stone of a new asylum for idiots of
ix northern counties of England has been
d with Masonic ceremonial by the Earl of
land, as Grand Master. Upwards of 40,000
of the 60,000 necessary for the erection of the
difice have been already contributed. The site
plot of land containing 67 acres, lying 150 ft.
ve sea-level, and about a mile south of
naster, and has been purchased at a cost
10,000. As the whole of the necessary
difices have not as yet been raised, it has been
most desirable, and the contracts have recently
n let, to erect the building so as to accom-
date 500 inmates, at a cost of 42,900. It
e erected so as to admit of easy and inex-
pensive enlargement. The building has been
igned in the Gothic style of architecture
elected to modern requirements.

BRITISH ARCHEOLOGICAL ASSOCIATION.—The
annual congress will be held this year at Ciren-
cester, commencing on the 3rd of August.

VENTILATION THROUGH STREET WINDOWS.—An
obvious plan of improving the ventilation of
dining-rooms, drawing-rooms, and bed-rooms in
this hot weather, without drawing up the
blinds, is suggested, or rather re-suggested, in
the *Morning Post*.—"Fix the roller of your blind
on the upper sash of your window, and then when
the sash is pulled down an open space is left
above for the free current of air, and yet the
lower part of the window is protected from the
sortery of outsiders."

SCULPTURE.—We have seen with much plea-
sure a group in marble, recently executed at
South Kensington, by Professor Jerichau. It is
titled, "The Bathers Surprised," and represents
two startled girls on the ground clasping each
other for mutual protection. The pose is good,
and the countenances are admirable. The lower
limbs of the elder girl would have borne a little
greater development. Some years ago, as we
have heard, the Princess Alexandra of Denmark
saw the design in Copenhagen, and, liking it,
said when I am rich I will have it produced for
me in marble. The promise was not forgotten,
and the group we have seen is the property of
H.H.H. the Princess of Wales.

MODEL LODGING-HOUSES, ST. THOMAS'S,
OXFORD.—New buildings for the labouring classes
are in the course of erection in St. Thomas's
parish, Oxford. In this district were the most
dilapidated courts and the poorest of the popu-
lation. The first block is now complete, and con-
sists of thirty sets of dwellings, each a complete
house in itself. They are approached by four
stairs, and all of them have a sitting-room,
one, two, or three bed-rooms, a scullery, a water-
closet, a coal place, and a larder. They have a
distinct water service unconnected with the closet
supply, and a shaft runs from each scullery, into
which dust and other refuse may be swept. The
new buildings have been visited by the Prince of
Wales, who, it is well known, has paid great
attention to the question of the dwellings of the
labouring classes, and his father, the late Prince
Consort had done, and has erected a large number
of admirable cottages on the Sandringham estate.
The Prince of Denmark and M. de Bulow were
with the Prince.

THE GREAT TRELLIS BRIDGE AT RUNCORN.—
This bridge, on the new railway which is to
shorten the north-western route between London
and Liverpool, has been successfully tested.
The contract for the construction of the line was
given to Messrs. Brassey & Ogilvie, and the most
difficult part of the undertaking—that of carry-
ing the bridge over the Mersey—was given by
them to Messrs. Cochrane, Grove, & Co., who
appointed Mr. John P. Ashton to superintend the
erection of the work. Mr. W. Baker, C.E.,
chief engineer of the London and North-Western
Railway Company, designed the bridge; and
Mr. S. B. Wells, as resident engineer, exercised
a general supervision over the whole work. It
is a trellis-girder bridge, and is close upon
1,000 ft. long, supported upon piers, at an alti-
tude of 75 ft. above high water-mark, so as to
allow vessels of considerable tonnage to pass
underneath. It is divided into three lengths of
327 ft. each, the extremities of the girders rest-
ing on lofty stone piers, two of which rise from
the bed of the river, and the other two being
situated near to, though not actually upon, the
shore. There is a clear space from pier to pier
of 305 ft., over which the mass stretches. The
piers are faced with Yorkshire stone, the body
consisting of red brick, and each one is crowned
with a small battlemented tower. On each side
of the girder-bridge are several arches which
carry the railway over the remaining portion of
the river. There are three of these arches on
the Cheshire side and five on the Lancashire
side, each having a span of 60 ft. These are
succeeded on each side the river by a long
viaduct, and that again by an embankment, with
an inclination of about 1 in 120, until the level
of the line at Ditton and Aston respectively is
reached. Altogether, independent of the girder
bridge, there are ninety-seven arches, sixty-five
being on the Lancashire side and thirty-two on
the Cheshire side. Those which form the viaduct
have a span of 40 ft. The river arches are built
of yellow brick, and the remainder of darker
coloured materials. The width of the bridge is
38 ft., measured to the outside of the girders;
it is 25 ft. between the girders, and there is a
footpath 6 ft. wide on each side.

MALICIOUS DAMAGE TO BOLTON NEW PARISH
CHURCH.—On Tuesday a labourer, named John
Smith, was apprehended by the Bolton borough
police, under the following circumstances:—
During Monday night or early on Tuesday morn-
ing it was discovered that the new parish church,
which is being erected by Mr. Peter Ormrod, at
a cost of about 40,000*l.*, had been seriously
damaged, several portions of the buttresses and
mullions at the north and south transept win-
dows, a large quantity of shafting belonging to
the north piers of the chancel, and the abacus of
two capitals for the piers, each weighing about
15 cwt., had been smashed with a hammer.
These portions will require to be replaced, and
the capitals are rendered useless. The only
reason that can be assigned for the commission
of the outrage is maliciousness.

DISCOVERY OF ABBEY VAULTS.—An interest-
ing discovery has just been made in Belgium.
A portion of the flooring of the stables at the
military school of Nemur gave way beneath
the feet of the horses, precipitating them into a
chasm about 10 ft. deep. On the rubbish being
cleared away, some of the pupils descended with
torches, and found subterranean passages branch-
ing off in various directions, and which proved
to be the vaults of the former abbey of St.
Jacques of Coudenberg. An exploration in the
direction of the King's palace brought to light
the place of burial of the clergy, and in a more
remote corner was found a mausoleum, bearing
the date 1481, and a Latin inscription, showing
that the monument had been raised to the
memory of the Archduke Francis, infant son of
the Emperor Maximilian and Marie de Bour-
gogne. The leaden coffin containing the body
was at the foot of the mausoleum, which was of
white marble.

THE SOCIETY FOR THE ENCOURAGEMENT OF THE FINE
ARTS.—The fourth *concertation* under the
auspices of this society was held at the gallery
of the Architectural Exhibition, in Conduit-
street, Regent-street, Mr. F. Y. Hurlstone, one
of the vice-presidents, officiating as chairman;
the company being seated, rather than engaged
in the more accustomed process of promenading,
and a programme of music being selected for
performance on the occasion. Mr. Hurlstone, in
addressing a few observations to the company at
the opening of the proceedings, stated that the
rise and progress of the fine arts in modern days
had shown the necessity for reviving that union
of the various departments of art which existed
in earlier times. The object of the present
society therefore was to comprehend, in a con-
nected form, the whole of the fine arts, under
circumstances which should be useful, alike to
professors and amateurs. The scheme of the
society, as far as it has already been developed,
includes lectures on all branches of the fine arts,
discussions upon questions of art, and more
especially contemporary art, *concertations*, exhibi-
tions of works of art, and performances of
vocal and instrumental music; and the pro-
moters have found that the combination they
desired to establish is happily receiving general
approval and encouragement.

THE HANDEL FESTIVAL.—A comparison be-
tween the numbers of persons who visited the
Crystal Palace at the last Handel Festival, in
1865, and those who have attended the present
meeting, may help to some estimate as to which
was the most successful of the two. Subjoined
is the official statement:—

	1865.	1868.
Rehearsal	15,420	13,597
First day	13,677	19,217
Second day	14,215	21,559
Third day	15,422	23,991
Total	59,434	82,465

In 1857, the experimental trial, the aggregate
numbers were only 38,114; in 1859—the first
real Handel Festival, in commemoration of the
100th anniversary of the composer's death—they
were 81,319; and in 1862, the year of the In-
ternational Exhibition, when it was first resolved
to make the Handel Festival in the Palace
triennial, 67,567—the absorbing interest created
by the International Exhibition satisfactorily
accounting for the considerable difference be-
tween 1859 and 1862. The second triennial
meeting—that of 1865—looked at simply from
the point of view of numbers, represented a
decadence, although, regarded in an artistic
sense, it greatly surpassed any of the three
previous festivals. A more wonderful series of
performances was never listened to, either in
England or elsewhere.

DIAMONDS.—A paper to the Paris Academy of Sciences on the artificial production of black, colourless, and coloured diamonds has been sent in by M. Saix. If a current of chlorine, he says, be made to pass through cast-iron, when in a state of fusion, perchloride of iron is formed, which disappears by evaporation, leaving the carbon of the metal at liberty, in a crystallised state. It is notable that Sir Humphrey Davy believed that the carbon of diamonds contains a trace or tincture of chlorine, or some other halogen.

LIVERPOOL ARCHITECTURAL SOCIETY.—The annual excursion of this society will take place on this Saturday, the 27th inst. At Wrexham conveyances will be provided which will take the party round some of the finest points of the neighbouring country, and through Wynnstay Park, where the house will be open for inspection, returning to Wrexham in time to visit the parish church (recently restored). The society offers to its student members a prize of 2 guineas for the best set of drawings, from actual measurement, of the pulpit and reredos in the Unitarian church in Hope-street. Mr. Bonit offers a set of photographs, from sculpture subjects in the Exchange News-rooms, as a second prize; and Mr. H. H. Vale offers a prize of 2 guineas for the best short essay on "The Application of Gothic Principles of Design to Modern Street Architecture."

NEW EMBASSY HOUSES.—In the Commons, Mr. Monk asked the Foreign Secretary whether the plans for the proposed new Embassy House at Therapia had been set aside; and if so, whether it was the intention of the Government to have new plans prepared upon the basis of the estimate already submitted to Parliament. Mr. S. Booth replied that two plans had been sent home by Colonel Gordon, one of which, as being the cheaper, was adopted. Mr. Otway asked the Secretary to the Treasury who was responsible for the large excess over the estimate given for the repairs of the Embassy at Constantinople. Mr. S. Booth said that no officer of the Royal Engineers could be held responsible for the works at the Embassy. He supposed the hon. gentleman alluded to the withdrawal of the clerk of the works from Constantinople. No doubt the expenditure at that time was under the control of the officer of works, through their agent at Constantinople, but he was not prepared to say there was now any excess over the estimates.

THE GREAT EAST WINDOW OF THE GUILDHALL, LONDON.—The chairman, and several members of the special committee appointed by the Common Council to superintend the works connected with the restoration of the Guildhall, recently held a meeting for the purpose of viewing the stained-glass window which has just been erected at the eastern end of the Guildhall, and which was presented to the Corporation by the operatives of the cotton-manufacturing districts, as a memorial of the exertions of the Mansion House Relief Committee during the distress in those districts in the years 1862-65. The amount, which was raised for the purpose in penny subscriptions, exceeded 1,000l. The window is described as of fifteenth-century character, being in accordance with that of the stonework. It is 31 ft. from sill to apex, and 36 ft. 3 in. in width. The window is divided into three unequal portions, triply chiesive. The central, and more important division, is of five lights in width, in two tiers. The lower series of five lights is devoted to a representation of King Alfred re-building the City of London, the figure of the king being in the middle light. The upper tier, in like manner, represents William the Conqueror granting the charter of the City of London, the figure of the king being central, as in the lower tier. The document in the hands of the king is an exact copy of the actual charter now existing, in the possession of the Corporation. In the tracery openings of the central division of the window are represented the arms of the City companies. In the side windows in each of the two lights, with traceries, are represented respectively the figures for London of Sir Richard Whittington and Sir Thomas Gresham; and for Lancashire those of John of Gant, Earl of Leicester, and Sir Thomas Stanley. Above, in the tracery, is introduced the personal heraldry of each figure. Lord Derby has expressed his regret that the state of his health prevents him from inaugurating the window, and the Chancellor of the Duchy of Lancaster, Mr. J. Wilson-Patterson, is to do it. The day is not yet fixed.

A CO-OPERATIVE MARKET AT KENNINGTON.—An Act has been obtained for a new general market for the south of London, at the junction of the Brixton and Clephan roads, at St. Mark's Church, Kennington, to be conducted on co-operative principles, so far as the subscribers are concerned. There will be seventy-five shops, to be let to all sorts of tradesmen, in regulated proportions, on condition of supplying their goods to the subscribers at certain prices and discounts, and under supervision as to adulteration, &c. The association will supply stabling and a parcels delivery system on a fixed tariff. The market will be in the form of a covered arcade, and new thoroughfare between the Clapham and the Brixton roads.

LECTURES ON THE VALUE OF SCIENCE TO INDUSTRY.—A lecture on mechanical drawing, showing the methods of projecting plans and elevations, and the application of geometrical drawing to the work of masons, carpenters, engineers, and metal plate-workers (as provisionally notified in these pages), was given by Mr. E. A. Davidson, on Tuesday evening last, at the London Mechanics' Institute. There was a good deal of ability in the lecturer's demonstration of the subject, by the aid of models, as where he showed how much work might be saved in cutting a hole in a plate-iron pipe, by knowledge of the form to be delineated on the plate before rolling, and so on; but on the matter of plans, elevations, and sections he was scarcely so clear as might have been desired. The lectures have not been attended by large audiences, and have left the committee, we are sorry to hear, out of pocket.

VALUE OF LAND, CARLISLE.—At a recent sale of the Suttle House and Newby estates, together with various other properties in Carlisle; Lot 1 belonged to Mr. G. Thompson, of Suttle House, and was a field called Raffles-lane field, containing 1a. and 39p., which went for 140l. Lot 2 consisted of two fields called North Head and South Head Closes, containing together 7a. 2r. 3p., which sold for 500l. Lot 3 consisted of East Close, East Roadside field, and two other fields, containing together 11a. 1r. 39p., which sold for 655l. Lot 4 was Suttle House, and 12a. 1r. 8p. of land, which sold for 1,210l. Lot 5 contained West, Well, and Barn Closes, together 13a. 1r. 31p., which sold for 700l. Lots 6 and 7 were combined, and contained West and Near Farm Closes, and the remaining portion of Newby estate, in all 95a. 2r. 37p., which sold for 3,960l. Lot 8 was a little garden, containing 17p. of land, and sold for 13s., or at the rate of 500l. an acre. Lot 9 was the Park Head, or Wharfedell estate, containing 132a. 1r. 25p., which sold for 1,260l.

SAFETY LAMPS.—Since the Davy lamp, which gives but a faint light, is not perfectly secure against the dangers of explosion by fire-damp, the English Government offered 4,000l. for the invention of a lamp burning without contact with the external air. Two young students of the Paris Polytechnic, MM. H. Lianté and J. Denoyel, have invented a lamp which carries within it the requisite supply of gas. In exhibiting this lamp, a man, in the costume of a diver, descended with it into the sluice opposite the Mint, to the depth of 8 ft.; the lamp burned beneath the water, and with it, at the distance of two yards from him, the diver was able to inscribe, with a diamond, on a piece of glass, the date and hour of the experiment. The lamp burned for three-quarters of an hour in the water, and when it was hauled to the surface it was still burning, and the flame as bright as ever. It has been made by M. Delenil, constructor to the Polytechnic. Several members of the Institute, pupils of the Polytechnic, as well as several journalists, were present at the experiment.

TENDERS.

For building new public-house, in Hirschell-street, Forest-hill, for Messrs. Day & Noakes, Mr. Robt. Walker, architect.

Williams	£1,147 0 0

The Builder.

VOL. XXVI.—No. 1326.

Leeds.—Fountains Abbey.

ESS to our surprise than our regret, we hear that, up to this time, the financial results of the National Exhibition of Works of Art in Leeds are not satisfactory. The number of visitors is comparatively small: the crowds have not yet begun to flow into the town from other quarters; and the people of Leeds themselves are somewhat apathetic on the subject. The committee, as we thought at the time, put too high a price on the season tickets; and, by thus keeping people out of the building on the opening day, created a large amount of dissatisfaction, which has spread and grown. Men who had each given two or three hundred pounds towards the erection of the Infirmary, when they found that they could not attend the ceremony with wife and daughter without paying fifteen guineas equally with those who had given nothing, or go themselves without a five-guinea ticket each, were soured, and declined to go at all,—and, moreover, have grumbled ever since. Let us hope, however, that this feeling is passing away, and that all will avail themselves of the means of instructive enjoyment now within their reach. The collection is one of great interest and value, and to all, in the North especially, affords an opportunity to see, without difficulty, fine works of art that may not soon occur again. Amongst the works of the old masters exhibited,—Italian, Spanish, German, and Flemish,—are many of the greatest beauty and value,—pictures each worth a journey to see; and the collection of ancient drawings is also one of great interest. The catalogue rightly observes that nothing gives a more conclusive evidence of the artistic ability and knowledge of the painter than those sketches and drawings which have been done off-hand from the subject or model which he wished to note or to study. They are invariably forcible and truthful, and have ever been in high esteem with all admirers of art. A distinction should be made between those sketches which are merely notes of particular objects that struck the artist's fancy, as seen in many of the present examples by L. da Vinci, and those more or less finished studies made for the arrangement or completion of a large work, such as are most of Raffaele's; whilst another series consist of the study of the work itself in chalk, completely carried out on a small scale to serve as a model for the large and finished painting. The attention paid by the old masters to this system of study was, no doubt, one of the main reasons of their success in works on a large scale, and the studies themselves have

a value and importance which place them amongst the most treasured remains of the different masters that the amateur possesses. In the collection of works by deceased British painters, Reynolds and Gainsborough reign supreme. Some works by Etty, Turner, Milne, ready, Roberts, and Philip appear here; but others by the same men will be found in the Gallery of Living British Painters. This contains a large number of beautiful works, and well represents the present position of the art. The drawings in Water Colours by British artists are also an admirable collection:—

"This is a school of art, in a great measure distinguished by different characteristics, as well in style as in practice, from any other, and is one in which we have taken the lead over other nations. Although practised to a certain degree by the early painters of Europe in the fifteenth or sixteenth century, for sketches and studies, and carried out with no slight amount of finish by the painters of the Dutch school in the seventeenth century, yet it is, as an art, essentially one of English origin and growth, and in which we have produced the greatest masters, of whom excellent examples will be seen in the present collection, commencing from the simpler style of Sandby, Girtin, Barrett, Varley, &c., through the system founded by Turner, to the large and highly-finished works of living artists, in which every appliance for effect is freely used, and with a success and power which silence the opposition of those who advocate the older system, and object to the present extensive employment of body-colour."

In the Museum of Ornamental Art some of the early works are exciting wonder and admiration. The illuminated MSS., the carvings, enamels, metal-work, and porcelain include rare objects. We shall hope to hear soon of a larger number of visitors, and that there is no longer any doubt as to the financial success of the undertaking. Let the working-men look to it as well as the gentry. Workmen, by their representatives, have lately expressed their opinion that the want of public museums of works of ornamental art is a bar to their progress, and leaves them at a disadvantage in competition with the men of other nations who have such collections to resort to. Let the working-men of the North now show that they are ready, even at some little personal sacrifice, to take the utmost advantage of museums when they are provided for them.

Leeds is full of life; improved thoroughfares are being formed, and new buildings are rising in all directions. A few days ago the Church Institute, designed in the style of the fourteenth century by Messrs. Adams & Kelly, was opened. It is of brick with stone dressings and coloured bands, and has cost about 4,000*l.* In the basement the greater part of the space is occupied by wine-cellars, and the remainder is devoted to the purposes of a sitting-room and kitchen for the use of the librarian, and a large kitchen fitted up with boilers and other appliances likely to be called into requisition when tea-meetings and *societes* are held. On the ground-floor there are the library and reading-room, together with rooms for the clergy and secretary. The first-floor consists of a lecture-hall, 69 ft. by 48 ft., council-room, and two class-rooms. On the floor above, the librarian's bed-rooms and some store-rooms have been placed. Mr. Edward Boothman has done the brickwork, and Messrs. Poulder have executed the stonework. Stained glass has been supplied by Messrs. Lavers, Barraud, & Westlake, and gasfittings have been put up by Messrs. Skidmore & Co.

The great bank recently finished from the designs of Mr. Scott, Mr. Perkin being the resident architect, so to speak, and mainly responsible for the interior arrangements, is an ornament to the town. Red brick, with stone dressings, are the materials used: Italian Gothic is the style employed. Mr. Perkin, we may add, has done much in the shape of churches round about Leeds. In the borough itself, by the way, there are now no fewer than forty-four churches. With reference to the exterior of the bank a question has been raised which is worth a thought. In the brick string-courses an incised ornament has been cut by hand *in situ*. Now, some say this is surely a mistake. Brick is a

monied material, and might as well have been moulded with the required ornament in it, of course with great saving of expense. Others, however, are found who defend the course taken on the ground that greater sharpness and vigour have been thereby obtained. Any how, the effect produced is very agreeable. The building is a credit to all concerned.

The new Northern Hotel now in course of completion under the direction of Mr. Hadfield,—Italian Gothic,—is a good, substantial, not to say handsome, structure. A building opposite to it, to be let out in chambers, with round and pointed arches, brick and stone like nearly all the new buildings, is *bizarre* in the extreme. The Cloth Hall, finished this year, is a poor thing; presenting a long straight sky-line, with clock-turret in the centre. The improvement in the architecture of Leeds within the last six years is, nevertheless, remarkable. Every shop or warehouse that is now built makes an attempt at style. The great enemy to all this is smoke, which in about four years renders brick and stone the same colour, and takes from the work all chance of giving pleasure. Surely there is power to prevent this injury if the corporation would put it in force. That any furnace not consuming its own smoke should be permitted in Leeds, the centre of the machine trade, is more than discreditable: it is stupid. Many of the manufacturers require no compulsion to do the wise thing. In the remarkable establishment of Messrs. Greenwood & Batley, whence all the Governments in the world are supplied with the machines and tools for making weapons of offence, there is a furnace at work that consumes nearly the whole of its smoke, and so, too, effects a considerable saving in coals. We were not surprised to learn that Messrs. Greenwood & Batley had received plenty of medals marked *Honoris causa*.

Of course few of our readers who visit Leeds will fail to see Bolton Abbey and bridge, Kirkstall Abbey (Norman in style, and picturesque in appearance); Brimham Rooks (including the Druid's Coffin, the Baboon's head, and the Pulpit Rook); Harrogate, the Healthy; Knaresborough, with its castle, bridge, rocks, wood, and river; Ripon Cathedral, now nearly restored; and Fountains Abbey at Studley.

"From streams and springs, which Nature here contrives, The name of FOUNTAINS this sweet place derives."

A sweet place, indeed; the ruins, since the excavations made by the late Earl de Grey, are more extensive than those of any other abbey we remember. We have made two or three small sketches, to convey some idea of its character,*—one, showing the nave and south aisle of the church; another, a view of part of the abbey from Robin Hood's Well; and the third, the lady-chapel, which extends north and south beyond the choir, at the east end,—a second transept, as it were. The line of the choir is carried on through the lady-chapel by two arches on each side, supported in each case on a lofty clustered column, seen in the view. The small columns which surrounded the octagon pillar remaining have disappeared. The effect of this part of the building must have been very beautiful. The large window seen at the end, or, rather, side, of the lady-chapel, was a Perpendicular interpolation. The nave is Transition Norman. At the west end of that also a Perpendicular window was introduced, the date of which appears above it outside in archaic numerals. The guide-book sold on the spot says,—"The large window in the west end of the nave was put in during the abbacy of Darneton, and may be looked upon as the last work of any importance, with the exception of the tower, added to the place. Above this window, on the outside, is a rude representation of a bird, holding a cross, and resting on a tun, conjectured to be a pun upon the name of

* See p. 490.

Thurston, i.e., a thrush upon a tu. A scroll behind the bird hears the word and date.—*DEBN, 1494.* Surely the more obvious pun is on the name of the abbot by whom the alteration was made,—*Dern-ann*. *Dorn*, by the way, is an obsolete word (from the Saxon), meaning sad, mournful:—

"The birds of ill presage this lackless chance foretold,
By demfulf noise."

But it is unnecessary to look further for a meaning. The remainder of this front is of twelfth-century work.

Fountains is truly a wonderfully fine ruin, and the grounds of Studley (through which it is approached) at the end of it, the river Skell widened out to a lake, the laurel bank, and magnificent trees, contribute to form a whole rarely surpassed. A Norwegian spruce, 134 ft. in height, and a splendid beech, 60 ft. to the first leaf, are noteworthy items in the grounds. The remains of the Abbey include the Norman Chapter-house, the cloisters, the refectory with readers' gallery, the Abbot's house, the ancient bridge, and the mill and forge. The artist, the lover of nature, and the archaeologist will alike find matter to delight in a visit to Fountains Abbey.

EXAMPLES OF RECENT VILLA RESIDENCES AND COTTAGES.*

Messrs. BLACKIE have now completed the issue of a work commenced by them some time ago, consisting of examples of villas and cottages recently executed in various parts of the kingdom by different architects. On the appearance of the first few parts we made favourable mention of the undertaking, and have now but to indicate the manner in which it has been brought to a close. Nineteen firms have contributed examples of villa residences and cottages erected under their care. Three of these belong to Edinburgh, six to London, four to Glasgow, four to Manchester, and two to Nottingham. There are thirty houses, in all, illustrated.

Among the villas represented are two that have been designed and built by architects for their own occupation. In these we have opportunity of seeing the plotting out of the greatest amount of accommodation in a given space; the adoption of various cunning contrivances to secure comfort, combined with an artistic eye to effect and a determination to avoid the miseries of bad construction. All this, it may be urged, should always be found in the design of an architect, whether he is building for himself or an employer; but it must be remembered that, in nine cases out of ten, a client requires an architect to embody his ideas, not to supplant them with a novel design to which his mind is a stranger. Those who resolve to build, generally ponder over the project some time beforehand, and in that period revolve in their minds somewhat of the aspect their house is to present; still more of the accommodation it is to contain, and arrange with even more precision the plotting out of the ground-plan. When the architect is consulted, these previously-formed ideas are imparted to him as part of his instructions, and, generally speaking, it is the amount of skill and taste with which he is able to place these on paper that is the criterion in the client's mind of his ability to undertake the superintendence of the execution of the project. A tangible presentation on paper of the crude ideas of the client, polished and artistically with trained skill, is, we may repeat, more acceptable than a fresh set of ideas on the same subject, starting from a different point of view, nine times out of ten. But when an architect builds for himself, he is unfettered in the matter of instructions. He has still, to be sure, fetters; such as cost, prospect, and site; but these he would have to contend with as well as the predilections presented to him for embodiment if employed to build for another. The first of these villas has been designed by Mr. Banks, of the firm of Banks & Barry, for his own occupation, and built at Dulwich Wood Park, to the west of the north end of the Crystal Palace. The treatment is quiet, composed, reticent, and finished. The eye receives from it an impression of rest, invitation, and elegant cosiness. A

* "Villa and Cottage Architecture. Select Examples of Country and Suburban Residences recently erected by various Architects." London: Blackie & Sons, Paternoster-row; Glasgow; and Edinburgh.

Tudor porch hospitably shelters those who wish to enter. The entrance-door opens into a small square hall, which in its turn gives access to an inner hall or corridor, running at right angles from it, from which the staircases and different rooms are entered. One staircase departs upstairs, a second conducts downwards, for owing to the deep dip in the site, there is a basement floor, which, although out of sight from the entrance, is level with a kitchen court or yard in the rear. On the basement floor are the kitchen, 13 ft. by 13 ft.; scullery, 10 ft. by 7 ft. 3 in.; larder, coal-cellar, beer-cellar, wine-cellar, china and dry store closet; a w.c., dust receptacle, a furnace-room to heat the conservatory above; a small work-room, 10 ft. 6 in. by 6 ft.; everything, in fine, required to rejoice the heart of a model housekeeper; and a billiard-room, 20 ft. by 16 ft. The two last mentioned are cut off from the kitchen department, by a door in the passage leading to that side of the house in which the offices are grouped together; and all are 11 ft. 4 in. high. On the ground floor are three good rooms, and a greenhouse, with steps leading out of it down to the garden. The dining-room and drawing-room are of the same dimensions, 20 ft. by 14 ft., only one lies across the ground plan, and the other along it, and both look out upon the fine prospect of the winding Thames, seen from the back of the house. The third room, which is the study, 14 ft. by 10 ft. 6 in., is in the front of the house.

On the floor above these are four bedrooms, none less than 14 ft. long, one 15 ft. 6 in., and a bath-room; and in the attic are four more rooms, lighted by dormers that must command a lovely view, and a cistern and closet. All this accommodation is packed upon a ground space of 38 ft. by 33 ft. The front elevation may be described as having two gables, separated from each other by a receding centre, which contains the single mullioned windows that light the staircase on two stories, and is surmounted by a small dormer. The right-hand gable end contains the porch and door, and on the floor above one of the bedroom windows; the left-hand gable end has the study window on the ground floor and a bedroom window above. The apices of the gables have narrow slits. There are overhanging eaves and ornamental barge-boards. The west elevation contains the windows of the principal apartments. Here is another slightly advanced gable end, occupying nearly one half of the elevation, which contains a three-lighted window on the basement, another on the ground floor with transomed mullions, and a double-lighted window on the upper floor, besides a slit in the apex. A two-storied bay extends from the basement to light the billiard-room and dining-room on the floor above it; and over this is a double light to a bedroom, and a dormer on the roof. Dividing these two parts, gable end and bay, rise three single-light windows, one on each floor. The greenhouse is placed on the south side of the house; and below it is a door leading into the furnace-room. On the north side there is a flight of steps down to a door on the basement story. The four external walls are built of Lowestoft bricks, the inner walls of common bricks, some of the partitions of 4-in. brick on the ground-floor, and the rest of timber gartering, as are all above stairs. The windows, dressings, string-courses, and door-jambes are of Box ground stone, Bath. The roof is covered with chocolate-red coloured Broseley tiles, placed in alternate bands of three eaveslaid and six plain, and the ridge has an ornamental tile cresting. Baltic timber and deals have been used for most of the woodwork, except the stairs, which are of American pitch-pine, with waincoat balusters and handrails. The cost of this house was 2,099*l.*, including gasfitting and oak framing to garden and gates, but excluding the ornamental painting, which was not executed till two years after the house was finished, and then cost 300*l.* The merit of this design consists in its repose, the provision for an orderly performance of domestic duties, its sanitary arrangements, and the amount of residential accommodation, viz: three reception-rooms, besides the billiard-room, eight bedrooms and a bath-room, conservatory, and set of kitchen offices, in small conservatory, and set of kitchen offices, in small conservatory.

The second house, erected by an architect for his own residence, is on a smaller scale, being built upon an area of 28 ft. by 25 ft., and costing but 705*l.* Its owner is Mr. George Trefnit, and its situation is in the neighbourhood of Camden-road, Holloway. Here we have no basement story, and only two day-rooms and four bedrooms, besides the offices. There is a porch, however, and a conservatory, which is heated

by a gas-stove. The house stands on an angle formed by the junction of a road and a lane, and its most distinctive feature,—a double window on the angle of the first floor,—was designed to take advantage of the double prospect this circumstance afforded. The extension of London has, since the completion of this house, nearly neutralised this advantage. Additional size is contrived for the kitchen by a projection with a lean-to roof, the whole width of which is occupied by windows, to insure an ample supply of light,—a commodity that is often scarce in London kitchens. A glass-covered way leads from the house to the back garden, and, unadvisedly, we must admit, to a combined bath-room and w.c., and also gives access to the kitchen. Opposite to the kitchen door in this covered way is a back door leading into the lane. It is built of brick. The fronts are faced with washed stocks, with bands and window-arches of red bricks, and those employed in the rest of the house are common stocks. The roof is slated; and all the gutters are external iron eaves gutters with external downpipes,—an arrangement that has prevented any wet from coming in at any point. The woodwork is of Baltic fir and yellow deal, varnished without being previously stained. The hearths and skirtings, like the floor of the hall, are of ornamental tiles, and the dining-room and drawing-room fire-places are "coved" with the same cleanly contrivance. Both architects give a second villa, in the neighbourhood of their own designed by them, in which the leading characteristics of their respective modes of treatment recur.

We next turn to one of the Scottish residences. This is a house called Holmwood, designed by Messrs. A. & G. Thomson, Glasgow, and built on the top of the steep bank of a bend of the river Carr, about three miles south of that city. It illustrates, in a remarkable way, the difference between London and Glasgow prices. Here we have a handsome residence, built in an adaptation of the Greek style, with stone walls 2 ft. thick, and, where required, stone partitions of the same thickness, covering a site 70 ft. in frontage by 95 ft. in depth, containing three spacious day rooms, seven bedrooms, and two dressing-rooms large enough to be furnished with beds, besides a capital set of kitchen appointments, with laundry and washhouse, and a very large quantity of ornamentation, for 2,608*l.* 4*s.* 11*d.* Instead of the usual cubical mass, or centre with two wings, these architects have arranged their building to consist of several masses and several heights. There is no basement. The dining-room is only one story in height; the kitchen is also one-storied; but the greater part of the building is two stories high, and this is surmounted by a circular lantern which lights the staircase. In the front elevation there is the recessed entrance-doorway nearly in the centre, at the top of a flight of steps, with a square-headed window of the same height on either side of it, the one lighting the vestibule, the other a retiring-room; the dining-room with ornamental stone piers clear of the window to the right of this central group, all one story high; and to the left of the doorway is a two-storied group of building, consisting of a parlour on the ground-floor 18 ft. 6 in. by 17 ft., with a semicircular window, 10 ft. 8 in. in diameter, with a column standing clear of it all round, and a drawing-room above, 25 ft. by 17 ft., to which the flat roof of the projection serves as a balcony. Surmounting this, though recessed from the front elevation, is the circular lantern, which, as we have mentioned, lights the staircase, and in the rear is a wing, giving on to the dining-room and looking over its roof, containing six bedrooms. In the extreme rear, but adjoining the main group, though furnished with a distinct roof, like all the rest of a low-pitch, covered with slates, with very broad overhanging eaves carried on ornamental cast-iron brackets, is the kitchen lighted with a range of five windows, placed somewhat high, below which, in the interior, stands the dresser. Away from the building, but indicated in the perspective, is a group of coach-house, stable, coachman's-house, greenhouse, cow-house, &c., which cost an additional 1,009*l.* 19*s.* 6*d.* A great point in this design is the completeness of the details. The retiring-room, for instance, is furnished with hot and cold water, a looking-glass, sofa, clothes-pegs, and a water-closet opening out of it, lighted from the vestibule. The dining-room is provided with a recess for the sideboard and a serving-way from the butler's pantry, where there are communications both

with the kitchen and scullery, with the former by means of a hot closet, and with the latter by means of lifting-sashes. The store-closet is fitted with dresser, drawers, and shelves. The kitchen is partly surrounded with low lean-tos containing places for coals, roots, and a larder. It is a drawback to the general nicety of completeness to find five bed-chambers, or three bed-chambers, and two dressing-rooms accordingly as they might be required, on the ground-floor. The materials employed are irregularly coursed rubble freestone from Giffnock quarry, a mile distant from the site; a course of Caithness flagging to prevent damp rising; Quebec red pine and St. John's yellow pine; brick for some of the partitions; a cast-iron bressumer carries the wall over the opening between the parlour and its semicircular window; and encaustic tiles for vestibule and hall. We quote the description of the ornamentation of the drawing-room—

“An enriched skirting, or dado, 28 in. in height, in wood, is carried round three sides of the room; between the window-sights, also at the sides of the doors and fire-place, and at intervals round the room, are placed square colonnettes, surmounted by a frieze, all of yellow pine, varnished, enriched with arabesques in mahogany. Six of the spaces between the colonnettes are further enriched by painted and gilded ornamentation; and the panels thus formed are filled with paintings, by H. Cameron; A.R.S.A., illustrating Tennyson's ‘Idylls of the King.’ The centres of the sides are occupied, in one case, by the fire-place, which has a white marble mantel-piece, having gilt incised ornament, and a mirror over it; and in the other case by the piano, over which is a mirror; whilst at the end opposite the window is another large mirror, with a decorated marble slab in front supported by chimera.”

We pass on to notice one of Mr. Ewan Christian's rectories, that of Goldgharg, Essex. This house was built upwards of sixteen years ago at a cost of 2,000l., the contractor averring that he had under-estimated it by 200l. This is given as a plain substantial house, intended to last for generations, in which excellence of material and workmanship have been considered before ornamentation, in deference to the stringent law of ecclesiastical dilapidations. It is situated in a flat marshy district, in consequence of which circumstance the main body is raised about 4½ ft. above the highest part of the site, and terraces are formed on three sides of it. It is built, in the Domestic Tudor style, of red bricks, with the window openings and mullions and the arches and jambs of the west front of Caen stone, the heads and sills only in the other front being of stone. The copings are likewise of Caen stone; the plinth of Yorkshire stone. The roof is covered with plain red tiles, relieved with courses of ornamental tiles and ridge tiles. There is a basement sunk below part of the house, containing an ample supply of cellars for beer, wine, potatoes, a larder, a dairy, and a furnace-room to the greenhouse, and an attic to part of it, containing two bedrooms, lighted by dormers, and a place for lumber. On the ground floor an open vestibule, in which the entrance door is placed, a hall with dining-room and drawing-room opening out of it, a large conservatory, 21 ft. square, so placed with reference to these two rooms that they may all be thrown into a suite; the principal staircase, study, w.c., butler's pantry, back-staircase, housekeeper's room, store-room, kitchen, cook's pantry, scullery, fitted to serve also as a brew-house and bakery, coal, wood, and ash places, and servants' w.c.s. Above stairs are seven bedchambers and two dressing-rooms, besides those mentioned in the attic, and a housemaid's closet. Mr. Christian also contributes a parsonage-house at Friday Bridge. There is a curate's house also shown, designed by Mr. Walker, and built at Gotham, Nottinghamshire. This is built entirely of common bricks, which in this locality are better than they are in some places, except bands and crosses of blue Staffordshire bricks placed ornamentally, and it covers an area of 32 ft. square. The plan is very compact and original. The entrance-door opens into a small passage, beyond which is an octagonal hall, in the centre of the house. The doors of drawing and dining rooms open right and left out of the passage; those of the study and kitchen out of the octagonal hall, in which is a third door opening to a space under the stairs, which communicates with the larder. There is a decorated conservatory beyond the study, which opens out of it. At the octagonal hall takes an angle off the drawing-room, and a window placed in the angle facing the junction of street and lane, cuts off another, a bookcase is placed cornerways to make the room symmetrical. The dining-room is square, because the angle cut off by the octagonal hall is not shown; for that end of the room is partitioned off to form closets, one being a

glass-closet in the dining-room, and the other, opening on the other side into the kitchen, a brush-closet. There are four bed-rooms on the upper floor, a lavatory, w.c., linen-closet, and housemaid's closet. The chimney-stacks here are a feature, for they are arranged to have no “pockets” every part of the interior being occupied by fires, or fire-places, or both. This admits of some correlling on the exterior, which, with a stone shaft, 6 in. in diameter, with a base and neck-moulding and foliated capital, placed to carry the angle of the building out away by the window mentioned in the drawing-room, is about the only external ornamentation, except that afforded by the ingenious management of the brickwork. The contract for this house was 329l. 10s.; but, with the addition of a tessellated pavement for the hall, forming a w.c., cesspit, and drain, an ornamental fence wall, 80 lineal feet, and entrance-gate, the cost of the conservatory, a rain-water cistern, a wash-house, and a few trifles not allowed for in the contract, the price ultimately became 503l. 7s. 11d. To prevent the rise of damp, a layer of boiled tar and finely-washed Trent sand one-eighth of an inch thick was laid on the course of bricks forming the top of the external plinth.

The Manchester designs are Rosebank Villa, by Messrs. Speckmann & Charlesworth; a double villa, by Mr. E. Walters; and the Sycamores, by Messrs. Pannell & Ayliffe. The first of these is a brick-built Italian villa, with a Gothic roof, covering 61 ft. by 35 ft., not including any of the out-buildings and projections, containing three reception-rooms, seven bed-rooms, a bath-room, a smoking-room, and a set of kitchen offices, and finished with so much completeness as to include a lightning conductor for 2,833l. 12s. 4d. Mr. Walters's is a group of four villas, two and two of them being built back and back, so as to look at a distance, as one house of considerable size. The two blocks are connected by a length of walling only. They were built in 1852 for 8,000l. or 2,000l. a-piece. For this sum there is an accommodation, consisting of three day-rooms, eight beds, allowing two for the nursery, two dressing-rooms and a bath-room, besides the usual kitchen offices, grouped upon an area of about 53 ft. square. The style of the exterior of these houses is also Italian, with high-pitched roofs. The Sycamores is a substantial-looking, and at the same time tasteful red-brick house, of modernised domestic treatment, curious for containing within it seven distinct levels of floors to fit in and contrive three day-rooms, six bedrooms, and dressing-room, and set of kitchen offices, on an area of 60 ft. by 50 ft., exclusive of the ground occupied by the conservatory.

None of the clever Scottish architects have represented the national style. Their cottages are miniature Italian villas in too “rural” a style to compensate for the loss of the picturesque features that combinations of those given in some of the rare specimens of ancient Scottish buildings would have afforded. That they can retain some national features we perceive in the drawings of “Strath Cottage, Dumharton,” by Mr. Rochford, where there is a servant's box-bed shown built up in the kitchen like a closet. We could see this piece of retention dismissed with satisfaction. The style of this cottage, however, is less antagonistic to the character of the surrounding scenery and associations than some. It is built of freestone, with a little Jacobean detail, and covered with Highland slates. There are three day-rooms, four bed-rooms, two dressing-rooms, bath, kitchen, scullery, &c. The cost was 854l. 18s. 4d. A second cottage, by the same architect, erected at Govan, Renfrewshire, in the Tudor style, and costing a similar sum, is a remarkably happy composition. A cottage by Mr. Baird, erected at Roseneath, Dumhartonshire, as a residence for the parish schoolmaster, at a cost of 554l. 8s. 8d., would combine harmoniously and unpretentiously with any landscape, which is more than can be said of a rural Italian villa, built by him in the southern outskirts of Glasgow.

A somewhat finny cottage ornaée, half-timbered, with porch and conservatory constructed of fir, built in Essex, by Mr. Kendal, costing 1,830l.; a quiet modern detached house at Grantham, built by Messrs. Hine & Evans, costing 1,560l.; and a gabled and mullioned Yorkshire farm-house, pleasant, grey, and sedate-looking, as though Time and it had already some acquaintance, built in 1856, by Mr. Lamb, at Blinberhouses, near Bolton, incomparably superior to the square white boxes with square openings for windows, and another to match for a door in the centre of them, now frequently affected, are further varieties of

buildings shown in this practical volume. The last mentioned, unlike every other example, has neither closet, cupboard, nor cellar. Neither is there a dairy shown. The kitchen, though, is admirably light and capacious, as all should be, but more especially so where it is still the custom of the country for the farmer's family and his domestics to take their meals together in it.

This is a volume that those about to build villa-residences or cottages may usefully study. The combined wit of nineteen architects can scarcely fail to furnish information that it will be a gain to them to acquire, and perhaps prevent them from being added to the list of those who if they set about building again would do so differently. Builders engaged in erecting such residences for sale will also find in it many valuable suggestions. There is an introductory preface, drawing attention to some of the building contrivances and structural arrangements that are most novel, such as different methods of using hollow bricks without interference with the bond, and modifications of sliding sashes, amongst which is one in which the lower sash descends in the same way that window-shutters are sometimes constructed to do. The great difference between London and country prices in some parts, the rise even in some towns, and the difference in London prices compared to those when many of the houses illustrated were built, is also pointed out. The present difference between London and Yorkshire or Scottish prices is estimated at 25 per cent. The owner of Worcester Lodge estimates the rise on London prices since his house was built to be nearly 30 per cent.; other architects have, however, quoted it at 15 per cent. In Southampton and its neighbourhood the rise is estimated as being fully 10 per cent. Architects' charges, too, are touched upon, and treated fairly—

“These are a uniform per centage (5 per cent.) on the cost of the building, where the cost exceeds such an amount as 1,000l., where travelling expenses have not to be added, where several designs have not been made, where materials of a former building have not been used, and where the architect does not act as the surveyor or measurer, taking the quantities of materials and work from the drawings and specifications for the builder's use in estimating. The measuring-surveyor's charge usually comes in as part of the cost of the building; and in London, as indeed in many of the chief towns, it is considered most desirable that the ‘surveyor’ and the architect should be different individuals. There remain, therefore, to be added to the amounts stated as building cost not less than 6 per cent. upon each, as well as the travelling and other extras, being architect's expenses, if any. Also, should the services of a clerk of works be deemed necessary to secure a closeness of superintendence beyond what an architect will be bound to afford, and which may be true economy, even where the cost of a house falls within the limits kept in view in this publication, the weekly stipend will have to be paid by the owner of the building, although the clerk of works will act as the deputy or subordinate of the architect. In the case of a cost below 1,000l., the reader may consider the professional charges as having been matter of special agreement; for most architects would consider themselves ill paid at the rate mentioned for houses of the different classes below the 1,000l. cost.”

Gobbett could not have given a clearer exposition of a vexed question.

“THE TRIUMPH OF CHRISTIANITY.”

ANGRY controversy bristles up at the sound of the name of Gustave Doré. The works of the most prolific artist of our time afford ample scope for criticism and for contest. In almost every human production exists a greater or less proportion of what is objectionable, however it may be blended with what is admirable. An artist, therefore, whose enumerated works some years ago amounted to thousands, must have furnished materials for a whole library of attack, as, on the other hand, he may have offered a basis for a cyclopaedia of praise. M. Doré has shown within the last month that he possesses two qualities which Englishmen are wont to treat with respect,—unexampled industry and unfinching pluck.

Certain writers who have sneered, and with some justice, at the “tricks” of this “clever book-illustrator,” must have rubbed their eyes at the boldness with which he has appealed to the judgment of the British public. When our streets are crowded with the busy life of the London season, and when all our exhibitions are open, M. Doré invades the West-End and opens an exhibition of his own. Thirty-four paintings, in very different styles of art, cover the walls of the German Gallery in Bond-street, all produced, we are told, within a few years. There can be no valid reason for refusing to this collection the same fair and impartial examination that we should

devote to a gallery of equal magnitude containing the works not of one, but of numerous artists.

There are four or five landscapes which, viewed from the proper distance, are actual transcripts of nature. "Morning and Evening in the Alps," and the "Effect of Sunset on the Summit of Montaine," give representations of gloom, and mist, and glancing mountain peaks that are familiar to the Alpine traveller, and that a knowledge of our own lake district, or of the Scotch or Irish mountain scenery, will prepare the visitor to admire. The "High Lake in the Alps (Valais)" is another of these coloured photographs of the sublime solitude of nature.

In the illustration of "Vivien," the head of Merlin is the same as in the original sketches,—a painful sense of weakness unfitting him to be the representative of the mighty but genial wizard of song and romance. The face of Vivien, on the other hand, is a great advance on any former delineation of the repulsive character which it has pleased Mr. Tenyson to draw, the steady cat-like glance which she fixes on the magician being highly characteristic. But the length of her arms, and the size of her hands, are not to be endured.

Over the "Scenes from the Inferno" of Dante we should be content to draw the sponge of oblivion. The "Ascent of the Matterhorn" is rather fitted for an artist's portfolio than for an exhibition-room. The "Christ bound to the Column" is only a less painful failure than are almost invariably the modern, and most of the ancient, attempts to depict the divine sufferer. Isaiah and Jonah might have been left in Paris without diminishing the attractions of the gallery.

The door of a Spanish Cathedral, garnished by the usual fringe of disgusting beggars, and lighted up by the grace of the Spanish devotees, is a very accurate and correct bit of work. The effect of the painted windows in Seville Cathedral lights up an interior which contains a row of Spanish women, one of whom, in a velvet dress, is singularly graceful. Still more charming is a figure in the "Fortune-teller," where the sly leer of the old woman's eye, and the pose and aspect of the hulking vagabonds around are tinted by a brush dipped deep in local colour.

Apart from these pictures, and from the larger, and, as we should call it, half-finished, painting which gives name to the exhibition, are five or six specimens of a new style of work. They have not, or have only in the faces, the finish of fresco, but they have all the breadth which is peculiar to a style which it appears to be impossible to transplant in healthy and vigorous vitality to our climate. A question arises, which time alone can answer, as to the durability of this style. If it be durable as far as the endurance of the pigment is concerned, it must certainly attract and retain an unusual amount of the dirt that revels in such an atmosphere as that of London. Against both dangers we should wish to see how the production, not of water-glazing, but of actual glass, can be made available without interfering with the effect of the painting. The propriety of this inquiry will be obvious from the remark that the walls, and some other portions of the background in these paintings, parts of the drapery (as well as the tree in the "Vivien"), seem to have been thrown on the canvas in the manner in which plasterers apply rough cast to a wall. The buildings are actually rougher to the touch than in real dressed stonework. But there is no denying the powerful effect that is produced. The walls in the "Gitana" and the Psalter-player are actual pictures of illusion. There is a family of peasants which most people seem to prefer, because the greater finish is more in accordance with their experience of oil painting, but the faces of the old and young women knitting, life size, in one of these rough pictures are admirable, and the others only fail to please because the faces of the sitters are low, repulsive, or common place. The fault is in the selection, not in the execution. The "Gitana," though cursed with an ugly baby, has a face worthy of Murillo himself, and a tempting little dangling foot, as to which Mr. Doré seems to have committed the rare fault (as far as he is concerned) of having had it washed before he drew it.

The largest picture in the exhibition, some 10 ft. to 11 ft., by 6 ft. to 7 ft., we should call little more than a sketch, though a sketch of great power. Its chief defect is want of finish; its chief merit is life and motion. It takes a long period to get it well on the retina.

The "Triumph of Christianity" at the first glance recalls to the mind the "Last Judgment"

of Michelangelo, or at least the method of treating that awful subject which has become conventional among Italian artists. On a more minute examination the resemblance proves to be illusory, and the student of the picture becomes aware that he is in presence of an entirely original design. It is unnecessary here to enter into any discussion of the merits of allegoric painting in general. It is only intended to describe or to explain the present work of M. Doré.

The scene of the picture, instead of being laid, as usual in similar cases, in the region of the clouds immediately above the earth, is fixed in the higher or more distant regions of space, the earth being visible, as a planet, at such a profound depth below, as to have apparently shrunk to the dimensions of the moon when viewed from the terrestrial surface. Thus the motive, or text, of the painting may be appropriately sought in the words—"I saw Satan as lightning fall from heaven." The upper part of the picture is occupied by "a globe of circular light," as Milton expresses the angelic vision, consisting of a halo or glory of angels, surrounding Christ, bearing a symbolic cross. Two of the heavenly ministers are distinguished in the foreground, who may be taken to represent Counsel and Execution, or the angels of Light and of Power. The whole celestial hierarchy are unarmed, excepting with the sword of truth and the buckle of faith, and their white and flowing garments denote purity. The emblems of Hope are designably absent from a scene which tells of hope fulfilled. Central and predominating by size in the lower part of the picture is a figure which may be regarded as the genius of Paganism, the dragon of the Apocalypse, or the Author of Evil himself. His gilded horns recall that worship of animal forms which prevailed in early superstitions. The employment of the artifices of idolatry, under every changing form, to augment the wealth and importance of the priesthood, is indicated by the golden collar which hangs out in such clear relief against the abyss. The ever-varying phases of idolatry and of sacrilegious colours in the dragon wings and scales of the great enemy of spiritual religion, and in the consciousness of defeat expressed by his countenance and attitude may be seen a memorial of the words "Woe to the inhabitants of the earth and of the sea, for the devil is come down to you, having great wrath, because he knoweth that he hath power but for a short time."

Around and below the central dragon-winged Genius, the whole pantheon of African, Asiatic, and European mythology falls in helpless terror and confusion, and with that rapid motion that is characteristic of the figures of M. Doré. To the left of the spectator the Norse gods are feeding in the distance: Thor, and Odin, and Friga, from whom our Saxon ancestors named the days of the week, are flying in terror. Below them are the representatives of the ancient British worship,—the Druids with their golden sickles and their wreaths of sacred oak-leaves. To the right, Diana and Venus, Apollo in his quadriga, wine-wreathed Bacchus, and the whole population of the classical Olympus, may be distinguished by their well-known attributes. The great Roman Jove himself is upborne by the very person of the dragon, grasping his ambrosial locks in dismay, and, as it were, discharging his boltless thunder unawares. Behind him is a figure of Juno, his sister and his wife, and their father, Saturn, stretches forth his straight-shafted scythe in vain. The head of Mercury, marked by the Caduceus, calls attention below. The gods of ancient Egypt, Osiris and Isis, and the sacred bull Apis, with either the sphynx or the cat-god Pashtor Bubastis, are falling to the left. On the corresponding part of the picture are shown Nimrod and the Assyrian gods. The winged hills of Babylon and Nineveh, lift their wings and stretch out their paws in quaint and noisy dismay. The crown of Jupiter has fallen from his head; and far below the earth, shrouded in light, awaits the irrad of the host cast down from Heaven.

We are no blind admirers of M. Doré. We have taken the liberty, before now, to point out some of his most palpable faults; as instances of which, in the present exhibition, we may refer to the ignorance of the laws of flotation displayed in the position of the cradle of the infant Moses, impossibly shelved on a shoal in the Nile under the imaginative canopy of the angelic wings; and in that of the hier or barge which conveys the corpse of Elaine. The cradle cer-

tainly, and the barge probably, would have overturned.

But courtesy is due to the industrious and remarkable artist who has thus cast himself on the verdict of our public opinion,—a courtesy which, whilst it does not exclude an honest criticism, must gladly bow to the great merits of a man who, old in the number of his productions, is young in years, and young in the power and faculty of improvement.

ON LINCOLN CATHEDRAL.*

THE Architectural History of Lincoln Cathedral has been already very ably and completely described by two most competent persons, namely, Professor Willis and the Rev. Ayliffe Poole. I am not aware that Professor Willis's remarks, delivered at the meeting of the Royal Archaeological Institute, at Lincoln, in 1848, have ever been published, or made available in any form to readers. Mr. Poole's were printed, together with a valuable appendix, comprising all the historical data bearing on the cathedral and connected with the see, in the volume of this Society's Transactions for 1857.

Mr. Poole's review of the building was based chiefly upon information derived from the light which this collection of historical facts threw upon the subject. It is in every respect a very interesting treatise. When, then, the committee of this Society did me the honour to invite me to lecture, I had to consider from what new point of view the subject could be again presented in an acceptable form.

It appears to me that I shall best serve the objects of this Society, which no doubt are continually to enlarge the circle of those who interest themselves in the noble series of monuments that contain the history of our national architecture, by endeavouring to draw from the building before us a few practical hints on the subject of church architecture generally, and by pointing out the excellent illustrations which different parts of the structure offer, of the several periods of this interesting history; and in doing this I intend craving the indulgence of the more learned, to address myself more particularly to those whose knowledge of the subject is less advanced, and who consequently stand in greater need of help and guidance in their studies.

Now, in order to render what I have to say useful, or indeed intelligible, to this portion of my audience, it is necessary that I should explain the few technical terms which I intend to use; and here I may remark, by way of parenthesis, that the fewer technical terms a lecturer uses to a mixed audience the better; and the more obvious and self-explanatory these terms are the better.

It is just twenty years ago, at the meeting, in fact, of the Royal Archaeological Institute at Lincoln, in July, 1848, that I read in this room a paper on certain parts of Lincoln Cathedral, which formed the basis of a work that I subsequently published, in which I proposed what was then a new division and nomenclature of the styles of English architecture. As this terminology is the one which I intend to use here in the classification of the different works of Lincoln Cathedral, it is necessary that I should briefly explain it.

There is one division of the architecture of Europe on which all are agreed, that, namely, which separates the buildings of the Middle Ages into two classes, the first comprising all those buildings that were erected during the prevalence of the circular arch; and the second, those that were erected during the prevalence of the pointed arch. These two classes have been by common consent called Romanesque and Gothic.

Of English Romanesque buildings we have, again, two kinds, those which were erected before and after the Conquest, and which may therefore be conveniently called Saxon and Norman.

Of the buildings constructed during the Gothic period the most natural division is that which is indicated by the several changes of form, through which that prominent feature of every Medieval building, the window, passed during that time.

For the first half-century after the complete adoption in all parts of buildings of the pointed arch the lancet window was alone

* By Mr. Edmund Sharpe, read at the meeting of the Lincolnshire Diocesan Architectural Society, June 17th.

used; during the next half-century, or thereabouts, the geometrical window, or that in the tracery of which that simplest of all geometrical figures—the circle—prevailed, was alone used. During the next half-century, the window-heads were characterised by that peculiarly English feature, flowing tracery, in which the ogee, or curve of contra-flexure, was conspicuous; and during the last or fourth period of Gothic art, straight lines, both horizontal and vertical, formed the leading lines of the tracery of windows.

I proposed, then, in the work to which I have alluded, to call those four periods of Gothic art, respectively, Lancet, Geometrical, Curvilinear, and Rectilinear,—terms which may be accepted as fulfilling the condition already laid down, and as being sufficiently self-explanatory.

But there remains to be noticed a period during which a large number of buildings were erected, of great importance and great originality, to the characteristic features of which attention has not, even yet, perhaps, been sufficiently directed; I mean those that were erected during that prolonged struggle carried on between these two rival principles, the circular and the pointed form of arch; in fact, during the interval that occurred between the first appearance of the pointed arch and the final disappearance of the circular arch. To this interval I give the name of the Transitional period, a term that has become now almost universally adopted, as applied to these buildings.

We have thus seven periods of the history of church architecture in Great Britain, to the duration of which I ventured to assign, twenty years ago, the following limits, which subsequent experience and study have not, in the meantime, led me in any respect to alter.

	A.D.	A.D.
Saxon Period	—	1066
Norman Period	1066	— 1145
Transitional Period.	1145	— 1190
Lancet Period.....	1190	— 1245
Geometrical Period.	1245	— 1315
Curvilinear Period.	1315	— 1360
Rectilinear Period ...	1360	— 1500

I have now only three other technical terms to define in order to enable me to at once enter, without further explanation, upon the consideration of Lincoln Cathedral.

Almost all the great cathedral and conventional churches of this country are divisible in their entire length into three parts, forming the three branches of the Latin cross,—namely, choir, transepts, and nave.

They are also generally divisible laterally into three portions,—namely, choir or nave, and north and south aisles.

Vertically, also, this tripartite division is again found; the entire elevation of the main interior walls being usually divided into three portions or stories, separated and defined by horizontal string-courses.

These three stories I have named—I, the ground story; II, the blind story, from its being usually dark, and opening into the roof of the side-aisle; and III, the clearstory,—terms which also sufficiently explain themselves.

Now, it will strike every one who looks down the nave of a Mediaeval building, that it consists of a number of exactly similar compartments, placed side by side and tied together by the horizontal lines or string-courses which separate their three stories. The same remark applies as well to the outside of these buildings.

For the purpose, then, of comparing the architecture of one structure with that of another, with a view to trace the progress of the art of building through the Middle Ages, it will be sufficient if we take one or two of these compartments and place such a representation of what may be called the *main idea* of a building, side by side with two similar compartments of another, or of several other buildings.

Time will not permit me to lay before you in detail the characteristic features which distinguish these six periods of Christian architecture from one another. They are, however, sufficiently obvious to all who have paid any attention to the subject.

And now let us proceed to consider how Lincoln Cathedral serves to illustrate the history of church architecture; to which of its several periods its different parts belong; and how far we may be able, by its works, to trace the progress of Christian art in this country during the Middle Ages.

Professor Willis was the first to apply colour to the ground-plans of churches, for the purpose

of indicating the different periods of their construction. He applied his colours indiscriminately, and simply with a view to distinguish one part of a building from another. It appeared to me, some time ago, that this use of colour might be carried a point further; and, in fact, made much more useful, by attaching a fixed signification to the employment of different colours, and by causing a specific colour always to represent a specific period of architecture; and it occurred to me that no better basis could be taken for such an application of colour than the prismatic spectrum itself, which, in a twofold sense, is peculiarly adapted to represent the gradual progress of art in the buildings of the Middle Ages; first, because, as in church architecture, that progress was so regular and so gradual as to be almost imperceptible, and to render it difficult for us to draw any exact line of demarcation between the buildings of one style and those of another, or to enable us to say, for example, where Norman art ends, and where English art begins; so in the prismatic spectrum it is difficult to say where one colour ends and where another begins. Yet, inasmuch as we are obliged, for descriptive purposes, to call certain portions of this blended whole blue, green, yellow, and red, so are we, for the same reason, under the necessity of selecting and characterising in the same manner certain portions of the history of this continuous art, and of designating those parts by some each specific terms as those above proposed.

And, in the second place, this adaptation of the prismatic spectrum to our wants in this respect appears to me to be a peculiarly happy one, inasmuch as our national architecture, rising out of the deep gloom of debased Pagan art in the dark age of barbarous invasion, is thus fitly represented as brightening gradually into the glory and refinement of Christian art in the Geometrical period of the thirteenth century, and as deepening again in its descent through the three following centuries, into the dark age of Pagan revival in the seventeenth.

I have therefore already for some time, for my own purposes, made use of the following selection of colours to indicate, on the ground plans of churches, the particular dates of the construction of their different parts; and I think I can safely recommend it as a convenient one for general use.

	A.D.	A.D.	
Norman	1066	— 1145	.. Black.
Transitional	1145	— 1190	.. Blue.
Lancet	1190	— 1245	.. Green.
Geometrical	1245	— 1315	.. Yellow.
Curvilinear	1315	— 1360	.. Orange.
Rectilinear	1360	— 1500	.. Crimson.

The ground-plan of Lincoln Cathedral behind me, and the elevation of its grand west front, above it, are coloured after this fashion; and you will see at once that every one of the six periods of English architecture is more or less represented in both.

Norman Period.

For all speculations as to the character and extent of the first Norman cathedral erected at Lincoln by Remigius, the first Norman bishop, I must refer you to Mr. Poole's treatise. What is certain is, that, with the exception of what remains of it at the west end, it has altogether disappeared. This fragment, however, is of the highest interest. It has been respected and preserved by all subsequent builders, and still forms an integral and very important portion of the west front. The outline of its simple and unadorned masonry is easily to be traced on the west elevation, and its massive proportions are as clearly visible on the plan.

That we see in what is left the entire breadth of the west front of the original church of Remigius, commenced probably about 1070, there is no doubt whatever. How this design was terminated above and on the north and south sides, is a matter of speculation. I think, however, that the solution of this problem is not so difficult a one as might at first sight be supposed. We have not time to enter upon it here to-day; but, if I am correct in the supposition which I have formed, and which involves the existence originally of a single western tower in place of the two western towers which actually exist, the opinion which Professor Willis and Mr. Poole appear to entertain, that these towers were built either in restoration or in continuance of Bishop Remigius's design, is incorrect.

That these two towers, and other works to be noticed at the west end, were built after the

second fire, which is recorded as having consumed the entire church in 1141, there is little or no doubt. They exhibit, up to the top of their third story, in all their ornamental details, the characteristic features of the very date. They were flanked on the north and south sides with richly ornamented projecting gables, which still remain; and on their west side also with gables of probably similar design, which have been removed. But the weather-mouldings of these gables, still to be seen under the roof of the later work of the Lancet period, reveals to us the singular fact that the apex of both of these gables, which corresponded with the centre of the two large circular side arches of the west front of Remigius, were not in the centres of the two towers, which latter were not, in fact, placed symmetrically with the earlier work of the west front.

How these and other discrepancies of this second Norman design, which could not have been in harmony with that of the first, behind which it stood, were reconciled, we have no present means of knowing; but we may naturally conclude that they furnished the reasons which induced the gifted architect who marked these irregularities, and combined the works of these different periods into one harmonious whole, to erect, towards the close of the Lancet Period, the noble west front or screen, which still remains to us as it left his hands.

Besides these two western towers, built at the very close of the Norman period, two other works of this date remain in the west front. The first is the circular arcade immediately above the plain walling of Remigius's front on each side of the central arch; the second is the great western doorway of the nave, which exhibits, in the five richly ornamented orders of its circular archway, the latest features of the period to which it belongs.

Transitional Period.

Closely following the last-mentioned work, but of clearly defined Transitional character, are the two other western doorways; those, namely, of the north and south aisles of the nave, that on the north side being of slightly earlier character than that of the south side; the limits of time within which all the three doorways were designed and built probably not exceeding ten years.

These two later doorways are amongst the most interesting and valuable remains of the entire structure. Although to be reckoned amongst the earliest works of the Transitional period, they contain not one of the characteristic features which distinguish the works of the Normans, either in this country or in their own; nor does their ornamentation resemble that of works of any other country of Europe of the same date. They prove to us, in fact, along with numerous other similar works in all parts of the kingdom, the existence in England, at this time, of a school of native artists who were not only completely emancipated from those influences which had governed the designs of buildings for the previous eighty years of Norman rule in this country, but who were able to design and to carry out their works with an originality of thought, a fertility of invention, and a perfection of execution, which most justly entitle them to our especial notice, as well as to separate classification. Although they were in reality the earliest works of English design, properly so called, in the country, we are unable to call them "Early English," from the fact that this term has been applied to, and generally received as indicating, the works of the subsequent or Lancet period; neither, although belonging to that period in which the Pointed arch was first used in this country, can we call them "First-Pointed," first, because that designation was also intended to apply to the works of the Lancet period; and, secondly, because in this really First-Pointed period the whole of the arches of decoration are usually circular, as indeed are those of the doorways in question. Until, then, we are supplied with a better term I shall continue to apply to them and to similar works that denominative expression which so aptly characterises the transitional nature of those intermediate works which were constructed during the prevalence of both forms of arch (used, as the latter were, simultaneously, but discriminately, in the same building), and which occupied, in point of time, the latter half of the twelfth century.

Lancet Period.

We have no work in the kingdom of genuine Lancet character to which we can attribute an

earlier date than the eastern transept and the choir of Lincoln Cathedral. We know, from undoubted documentary testimony, that they were commenced about the year 1190 by Bishop Hugh de Grenoble, and were on the point of completion at his death in the year 1200. The dignified simplicity of the whole of this work, and the vigorous boldness which marks the design of all its details, its simply clustered piers, the single vaulting shaft descending in their front in an unbroken line from the clear-story to the floor, their spreading capitals and projecting foliage, the bold sweep of their overhanging bands and circular bases, the deeply-moulded pier arches and vaulting ribs, and the tall single Lancet windows; above all, the largeness of treatment and the vigorous originality of conception with which the entire design has been conceived and executed, demand our highest admiration, and place this grand work clearly at the head, as well in point of time as of excellence, of the works of the Lancet period.

It is not to be wondered at that so noble an example should be rapidly followed by works designed in the same spirit. Within the next ten years several important buildings of similar character were begun; and even before the commencement of the thirteenth century this new fashion of building, the second characteristic type of English art in church architecture, had become firmly established in this country.*

A PARISH STATUTE.

A STATUE of the late Richard Cobden, chiselled out of Sicilian marble by Messrs. Wills, has been set up in High-street, St. Pancras, a good site, where several roads converge, and on Saturday last it was formally opened. The committee met first in the vestry-hall, where, some 30l. being needed to meet the total cost,—about 320l., if we understood rightly,—this was gathered in small sums, and gave a twopenny-halfpenny character to the opening proceedings that, truth to say, was not removed by what followed. The crowd that had gathered round the site was certainly the shabbiest crowd we have looked on for some time, and on the platform there was scarcely a face known out of the parish. The borough members, Mr. Harvey Lewis and Mr. Thomas Chambers, were there, of course, and did well what they had to do. But the statesman element and the artistic element were otherwise conspicuous by their absence. The statue is very picturesque, not to say disagreeable. Cobden, as we remember him, was a grave, earnest, and somewhat straight-haired man; the curly whiskers and thoughtless head here presented do not recall him to us. The pedestal, too, is coarse and common.

If the energetic corner who was present had impelled a jury of artists from some of the neighbouring studios to sit upon the marble body, the verdict could scarcely have been any other than "Found Murdered." We regret greatly to have to speak thus. The notion was a good one,—highly creditable to the gentlemen who conceived it and have worked to carry it out; but they have not taken proper advice, and the result is not satisfactory. The metropolis has yet to call on art to do proper homage to the memory of Richard Cobden.

ROYAL BOX, CRYSTAL PALACE.

THE aspect of the new Royal Box in the Crystal Palace on Saturday last deserves a line of record and a line of praise. Externally it is, as we have before said, by far the best thing of the kind that has been done in the palace for some time; elegance, dignity, and propriety distinguish it. Within it is a model of comfort, and, as it was fitted up on Saturday, of tasteful decoration also. The ante-room into which the box, or rather the boxes, open is a fine apartment, in arrangement something like the old Music Court. On the occasion in question, when the Prince of Wales and some of his Royal Highness's more intimate friends including the Duke and Duchess of Sutherland, the Duke and Duchess of Manchester, Earl Granville, the Marquis of Hartington, and others, entertained the Crown Prince of Denmark, and his Royal Highness Prince Edward of Saxa Weimar at

dinner in the intervals of the *fête* that was going on within the Palace, flowers lined the walls and steps, while on one side appeared an illuminated landscape, and on the other, within an arbour, was seen a sculptured nymph beneath a cascade of water under coloured lights. Well carpeted and well lighted, the effect of the whole was exceedingly satisfactory. The whole credit of the design and arrangement is due, we believe, to Mr. Wilkinson, one of Mr. Bowley's principal aides in the building.

The remarkable popularity of the Prince of Wales was strikingly shown on this occasion. On the party returning to the front of the boxes after dinner, when "God Bless the Prince of Wales" had been sung with great spirit by Mr. Cummings and the choir, the vast audience and the occupants of the orchestra rose and cheered again and again, the ladies waving their handkerchiefs tumultuously. The effect, as seen from the box, under a blaze of light, was fine in the extreme.

The fireworks on this occasion were particularly good. If we had not known that Dr. Price, inspired by seeing what is done in Rome in this way, had been bringing his chemical knowledge to bear upon the subject, we should have supposed them the work of a descendant of that eminent pyrotechnist not long dead who, delighted by the inscription on the tomb of the composer Purcell,—

"He is gone where alone his melodies can be exceeded," arranged that over his own grave should be written,—

"He is gone where alone his fireworks can be exceeded." Joking apart, however, the *fête* was a great success.

A NATIONAL SYSTEM OF IRRIGATION.

A PETITION to Parliament on this subject is being signed in many parts of the country by landowners, farmers, bankers, merchants, and others, showing that the present drought throughout the country is creating anxiety, and that its effect upon the grass, clover, and permanent pasture and green crops is likely to be very serious, and productive of great national loss; that the Government "agricultural returns" for 1867 show that the extent of land under grass, clover, and permanent pasture and green crops exceeds 32 millions of acres, while that under corn crops does not reach twelve millions; that the petitioners believe a national system of irrigation to be practicable over a great extent; if not the whole, of this large area, and that if established it would very greatly increase the production of the country, steady prices, and relieve the minds of the public from the alarming apprehension which the recurrence of such droughts as the present occasion, while it might be made to subserve the further purpose of preventing great damage from floods; that in countries where national systems of irrigation have been adopted the results have been very beneficial, and other countries are following the example. The petitioners therefore pray that inquiry be made as to the practicability of establishing a system of national irrigation.

THE TRADES MOVEMENT.

Wolverhampton.—Masters and men have decided upon the 13th of July as the date of the builders' demonstration to celebrate the adoption in this trade in Wolverhampton of arbitration in the place of strikes and lock-outs. There will be a procession from St. James's-square to the Exchange, where, at one o'clock, there will be a dinner. After that there will be a *fête* and tea in the grounds of Mr. Kettle, the founder of the builders' courts of arbitration; the day's festivities being wound up by a ball in the Exchange.

Liverpool.—The four unionist bricklayers who were charged before the Liverpool Stipendiary, some weeks ago, with "picketing," but who were remanded, have surrendered to their recognisances. Mr. Parkinson, who appeared on behalf of the masters, stated that there were now about 250 non-society men at work, and he was happy to say that they had not been molested or intimidated. The union had done all they could to prevent picketing, and he would ask that the prisoners might be discharged. Mr. Pemberton, on behalf of the men

and the union, gave a pledge that they would take the advice that he had given them, viz., that there should be no more picketing. The prisoners were consequently discharged.—A numerously attended meeting of workmen has been held to take into consideration the trade disputes. Explanations were given by men connected with the Bricklayers' Union of the circumstances under which the dispute in the building trade had arisen, and a representative of the foot and shoe trade stated the cause of the strike in that branch of business, and addresses upon the relations of capital and labour were delivered. A resolution expressive of deep regret at the struggles now existing, and pledging the meeting to afford those engaged in them moral and pecuniary support, was unanimously agreed to.—The bricklayers on strike here, it is said, formed a co-operative association.

Taunton.—The master builders of Taunton have issued a notice in which they refuse to advance the wages of the bricklayers, as requested, and for which they are now on strike. The men ask for 8d. per day extra, which would make 4s. per week. Masters refuse upon the grounds that at the prices at which their present contracts are taken they could not afford the increase, and also that the manner in which the work is now executed by men who call themselves "society men" is so unsatisfactory that it calls aloud for amendment. They also threaten that unless a very great improvement take place both in quality and quantity of work performed by the bricklayers, they will look out for men more skilled and efficient.

Creff.—The operative joiners, after being out for a week, have returned to their work at their former wages. The advance asked was 2s. 6d. a week, which the employers unanimously refused to give.

TREES AND SHRUBS AND SEATS FOR CROWDED STREETS.

THE vegetable creation consists chiefly of carbonic acid gas which it has absorbed from the atmosphere. The organs of trees, shrubs, and plants, imbibe air during the day, while the light of the sun is most active and vivifying, and at night their functions in this respect are largely suspended. They take in and retain the carbonic acid gas as their food, and return the oxygen gas pure to the air.

There is always more carbonic acid gas in the air in dry than in wet weather, and more of it present during hard frosty weather, because the soil, which is at those times less absorbent, imbibes it less freely. There is also more carbonic acid gas in the atmosphere of urban or town districts than of suburban or country districts; and more of it in the higher than in the lower strata of the air near the ground in the latter districts. This is owing to the large cultivation there of trees, shrubs, and plants, which absorb this gas from the air near the surface.

This fact shows that the atmosphere of crowded streets in cities and towns could be relieved of a great portion of the deleterious gases it contains if rows of trees and shrubs were to be placed along the lines of the footway kerbs, along the cab stands, and round public urinals. They would be no more obstructive to traffic than the lamp and other posts are; and a short seat for two, here and there, by a lamp, or a post, or a tree, would be a boon to many a weary traveller. The trees and the shrubs would not only absorb much of the carbonic acid gas in the air, but they would also seize and appropriate much of the noxious gases thrown into it by the breathing of animals, the combustion of fuel, the exhalations from the sewers, and the pest-stratum formed by the escape of gas from the pipes under the streets. While the trees and shrubs were absorbing these noxious gases they would be at the same time exhaling pure life-giving oxygen gas, and thus they would tend to equilibrate the air, or to preserve its salubrity.

A few minutes' rest under the shade of a tree when one is tired is as refreshing as a drink of water when one is thirsty. The *Builder* did much to promote drinking-fountains, will it urge the placing of trees and shrubs and seats in crowded streets? The improvements now going on along High Holborn to the City, and at other places, afford excellent opportunities for doing what I propose should be done.

JOHN PHILLIPS.

* To be continued.

* We have often done so.—Ed.

A CONTRAST: OR HOW MECHANICAL STUDY IS FOSTERED IN FRANCE AND IN ENGLAND.

"THEY message these things better in France," is a backneyed phrase which most thorough-going Englishmen are fonder of quoting when some opportunity of contradicting it presents itself than at other times. Yet there are occasions when no thoughtful traveller can avoid regretting that institutions which he has seen in active working on the Continent have not their parallels in this country, or have those parallels hampered by that clumsy or pedantic inefficiency which is painfully obvious in much of our official work at all times, but is made now and then doubly clear by contrast.

A comparison of one of the public establishments of Paris with what most closely corresponds to it in this country is about to occupy our attention for a moment, and we hope to show that such comparison is neither uninteresting nor ill-timed, and that in the case now under consideration an institution following the Paris model would not be extremely difficult, nor its execution so problematical or unlikely as, for instance, the idea of our remodelling London after the fashion of M. Haussmann must always prove should it ever be proposed for our acceptance.

A visitor to Paris, whether his taste leads him to seek out what little still remains of the monuments of the Mediæval city or whether he prefers to study the scientific work of the present generation and to investigate the practical side of French civilization, will be sure to betake himself to the Conservatoire des Arts et Métiers. Here he will find standing a portion of the buildings of the Royal Priory of St. Martin-in-the-Fields (Saint Martin des Champs), a foundation dating back to the year 1060. Occupying the venerable and very beautiful buildings still left, together with certain more modern galleries adjoining, which themselves stand upon ground formerly covered by portions of the Priory, he will find books, models, and specimens of the scientific inventions, the arts, and the manufactures of the most modern age of France, together with all the machinery of classes, lectures, students, and the various appliances of modern scientific study.

The buildings of the Conservatoire occupy a frontage of something like 600 ft.; but the most important parts of the structure enjoy the advantage of being remote from the noise of any public thoroughfare. The modern part of the establishment presents on the principal floor a range of galleries, not far, if at all, short of 800 ft. in length, with almost the same amount of space on the floor below, appropriated to a museum and to spacious ranges of offices, with lecture theatres, residences for officers, and other administrative buildings appended. Connected with these galleries is the very beautiful thirteenth-century refectory, a building about 36 ft. wide by 168 ft. long, and very lofty, divided in its length into eight bays. This has been restored, and in this noble hall the library is installed. Not far off stands the church of the priory. Of this building the thirteenth-century nave has been very extensively repaired,—in fact, rebuilt in part,—and is occupied, in strange contrast to its original appropriation, by specimens of hydraulic machinery. The apse, which till recently had been little meddled with in the way of restoration or appropriation to modern purposes, is an uncommonly beautiful specimen of transitional Romanesque work.

There is something more than ordinarily striking in this blending of the best workmanship of the past with the best work of the present; but if we have allowed ourselves to dwell upon it at present, it is because this circumstance is not only striking,—it is eminently suggestive. Science is the glory of modern Europe, just as much as architecture and the cognate arts were of Mediæval; and if we would do the best that we can in that race for supremacy in the arts of peace upon which we are now embarked, we shall strain every nerve to excel in the practical cultivation of science. We need now, more than ever before, to train our artificers and our engineers to the same pitch of individual and collective skill which, as the best buildings of the Middle Ages fully show, was so uniformly kept up among the masons, and carvers, and architects of the best period of the Middle Ages. It is to aid in effecting this object that the Paris Conservatoire is established.

Of the collections forming the museum, lodged

in the galleries we have described, the following is a brief summary:—Hydraulic, optical, and acoustical scientific instruments, specimens of the arts of reproduction, i.e., typography, lithography, photography, &c.; ceramic work, chemical products, models of the art of construction, models of apparatus for heating and lighting, weights and measures, lathes, tools, textile fabrics, agricultural implements and products, models illustrative of geometrical mechanics and of descriptive geometry, models of machinery and constructions relative to railways, models of machinery, motive power, engines of various sorts, machines for various purposes of manufacture; ancient and modern globes, maps, and relief maps; apparatus for experiments in physical science, electricity, galvanism, sound, &c.; specimens of horology; and a variety of machines, especially hydraulic machines, in motion. Of these varied groups of objects, the very extensive collections of models of machinery, most of them to the same scale, and excellently well placed and lighted, and easily approached, are eminently instructive and suggestive; while many of the collections of actual instruments or machines contain individual specimens of skill or patience famous in the history of science, and having an historical interest quite apart from their value as links in a chain of scientific steps.

If the galleries are richly filled, the noble library of scientific books equally claims our admiration. Appended to this library is a collection of drawings to scale of all the most valuable and most recent machines manufactured, available for purposes of study to inventors, mechanics, and others.

Fifteen professorships are attached to the Conservatoire, and the classes and lectures include a certain number of public gratuitous courses of evening lectures on subjects upon which it is considered desirable that some degree of scientific training should be readily accessible to those who cannot afford to pay for the instruction they need.

Such, in some of its features, is the Conservatoire des Arts et Métiers—a noble group of buildings, to house a rich museum and useful public library; and a staff of professors, including many of the best-known names in science in their several branches. This machinery is devoted to the promotion of the scientific education of the rising race of French engineers, machinists, and artificers, or, in short, to what we are beginning to know by the title—not, perhaps, strictly correct, but now well understood—of technical education.

Where shall we turn to find an establishment of an analogous character in England? There exists such an establishment, and it is with the hope of possibly aiding to win for it that very moderate degree of encouragement, or at least of forbearance, on the part of the Government, which it needs to render it prosperous, that we have drawn this parallel. We allude to the museum and library of her Majesty's Commissioners of Patents.

The Patent Museum and Library contain between them the germs—nay, not merely the germs, but most of the materials—of an institution as useful, as complete, and as famous as the Paris Conservatoire, but present every possible contrast in their situation, the mode of their display, and the degree of support afforded by the Government to their more fortunate rival across the Channel. The library and the museum are, for example, separated by a distance of from two to three miles,—the former being housed in the recently-added upper story of a building in Chancery-lane, devoted to the other purposes of the Commissioners of Patents, and in a good position for its purpose; the latter being tolerated rather than taken care of in a forgotten and still lingering fragment of the old "boilers" building at South Kensington.

The museum has been formed mainly through the exertions of the present able clerk to the Commissioners of Patents (Professor Woodcroft) and to no inconsiderable extent, we understand, the nucleus of it was provided by his private collection of models and other objects valuable to students of mechanics. It now includes the most interesting objects known in the archaeology of mechanics, if such a word exists. The "Rocket," Stephenson's successful effort, which established the locomotive in its position as the iron horse, furnished new, and, till then, impossible resources for commerce. Earliest still is the first complete engine of Bolton & Watt, showing the dawn of that revolution in which the introduction of the locomotive was the most important step. The earliest steam-engine, too,

ever used on a steam-boat, is to be found in this museum; also the old wooden printing-press of Franklin's day, presented by Messrs. Wyman. These, and many other such venerable monuments of our mechanical triumphs, are there themselves; and by their sides are numbers of the most exquisite and elaborated models, showing how the same leading principles have been applied, elaborated, and carried to their further results in all the infinite mechanical wonders which British ingenuity has produced for the railway and the steamship, the spindle and the loom, the factory, and even the farm.

This collection is housed so badly, that it can be seen only with the greatest inconvenience; and yet, notwithstanding its remote situation, at South Kensington, and the great disadvantages under which it can alone be studied, it has been visited during the space of about eleven years that it has been open, by more than a million and a quarter of persons.

The Patent Library, situated as we have stated in the heart of London, is an eminently practical institution in its scope and intention. It contains printed copies of all the specifications of patented inventions, together with the elaborate indices, abstracts, and other guides which the commissioners have caused to be prepared for the service of students, inventors, and others.

A Reference Library upon all subjects connected with science and the industrial and fine arts was proposed to be collected round this nucleus, and perfectly free and unrestricted access to be given to all who desired to consult it. As far as it has been possible, this plan has been carried out. The library contains now about 50,000 volumes, selected with judgment; and it includes almost all the scientific periodicals. The access is, and always has been, perfectly free to every person applying and entering his name in a book, and the readers number about 16,000 annually.

The new room, though recently constructed, is full, or very nearly so, and any large increase of books would render it necessary to do what had to be done for long previous to this room being built,—keep the books least often wanted in packages in adjoining stores, whence they were fetched when wanted.

These institutions ought never to have been placed apart; they ought to be brought together, to be well housed, and to be fostered by liberal grants; nor is it necessary for this purpose to expend the ordinary revenue of the country. The annual surplus from the fees and stamps paid on patents amounts to from 40,000*l.* to 50,000*l.* a year. It was the intention of the Legislature when last the patent law was the subject of legal enactment, that so much of this surplus as was needed should be available for purposes such as those of the patent museum; and should this intention ever be loyally carried out, an extremely short time would suffice to convert these two divided and cramped institutions into branches of a noble establishment equally fitted with the Paris Conservatoire to minister to the education of those upon whom England depends for her future greatness.

The country is gradually awaking to the necessity that our artisans should be instructed in at least the elements of such sciences as bear upon the arts they practise, and that those who are to guide and direct them should be men of the highest scientific culture attainable. Yet no better provision than what we have described has yet been made for supplying reference books and models to our students of mechanics. We have repeatedly pointed out in this journal the need of appliances to forward the great and pressing work of technical education. We recognise the great services to the cause of decorative art rendered by the Science and Art Department, and the solid advantages given to a limited extent by the Government School of Mines. We were among the first to point out the value of Mr. Whitworth's noble and opportune establishment of scholarships; but all these things are not enough: we want more and more complete means and appliances, and we consider that nothing could tend more to this end than the uniting of the museum and library of the Commissioners of Patents, and the so completing them to the full scope of their original intention, that they should serve as a great storehouse of knowledge for all students of science, inventors, and artificers; and, in fact, that they should render the same services to science which the British Museum does to literature.

A society, the list of vice-presidents and supporters of which includes a large number of well-known names in the scientific and

literary world, has been lately formed for promoting the public education in a way sufficiently indicated by its title of "Public Museum and Free Libraries Association." The object of this society is to promote the establishment of museums and libraries wherever possible, and it has turned its attention to the institutions which we have just been considering, and proposes to urge on Government the importance of establishing these valuable creations of the Commissioners of Patents on a basis worthy of their great national importance. There can be no question that this object is one that falls legitimately within the scope of the Public Museum and Free Libraries Association, and that their action, if properly supported by public opinion, cannot fail to have great weight with the Government. The readers of this journal are few of them without a direct interest in this question. None of them, no Englishman, indeed, is without a strong interest in the progress of means of scientific education, and we trust that a fitting response will not be wanting to any appeal that may be made to the public voice on the general question of fostering our institutions for scientific culture, and especially on the specific point now being agitated for the niting and completing the museum and the library of the Commissioners of Patents.

LAND AND MARINE SURVEYING.

THE out-door labours of an engineer give scope for the application of the exact sciences, and require a large amount of technical knowledge and experience. It is to be regretted that the ordinary course of office education offers little chance of the young architect becoming acquainted with the duties of the engineer, but to duly qualify himself for future professional success, the conscientious student will gladly learn all he can of engineering practice. The works of the surveyor and engineer precede those of the architect,—the ground is prepared, roads are made, the river pent within a safe channel, the sea controlled, before the edifice is raised; and yet the engineer and architect are so dependent the one upon the other, that it is a question whether the two should not more often be found combined in the same person. At all events, the architectural pupil should embrace every opportunity of acquiring the theory of engineering practice, and exercise himself in such out-door exemplifications thereof as circumstances permit. The elementary proceedings necessary for surveys of lands, taking of levels, and many other simple practical operations may be practised with advantage, and after thus obtaining an insight into the use of the various instruments employed, the student will be encouraged to perfect himself in working out more elaborate and difficult problems.

Leisure time may generally be found for this: "where there's a will there's a way," and there must be, we hope, few artied pupils but who at some time or other during their term can find an opportunity of outdoor practice and of indoor study of the simpler processes of engineering fieldwork.

Perhaps no craft possesses so many well-digested elucidatory works united to the student, to say nothing of the scientific and technical treatises written for the experienced professor, as are provided for the engineer. The necessities of our enormous towns make a constant call upon the services of the profession, and although railway mismanagement seems for a time to have arrested employment of engineers in one particular branch, there is yet so much to be done by these "pioneers of civilization," as to serve as an encouragement to many clever young fellows to take up the theodolite and the transit, and to qualify themselves to compete for the prizes held out.

Three hooks by the same author now upon our table, show that publishers, at all events, believe in the steadiness of the demand for practical engineering literature. These are "The Practice of Engineering Field Work," vol. i., 8vo, price 24s. London: Atchley & Co.; the second volume of the same, by same publishers, 1868, price 20s.; and "Land and Marine Surveying," Lockwood & Co. 1868," each by W. Davis Haskoll, civil engineer, and author of many previous works on subjects connected with his profession.

The two volumes published by Atchley & Co. so nearly cover the same ground as the "Land and Marine Surveying" of Lockwood & Co.

that it seems hard to understand why separate works were written. Each commences with definitions of different kinds of land surveys; descriptions of the 100 ft. and the Gunter chain, the foreign variations thereof; directions how to proceed to use them, &c., and so through the various stages of out-door and of office work, using almost identical illustrations, and enforcing the same well-digested rules for practical guidance in almost the same words.

So throughout the entire volumes, excepting that the last-named book ("Land and Marine Surveying") is more systematically written, and, if it be "a twice-told tale," is yet so well told, and hath so much of pith and marrow in it, that we must suppose the different publishers were understood to reach different circles of readers, or else how could the two almost twin books simultaneously appear?

Each work abounds with useful hints. The following is worth attention:—

"Many years ago, the writer was assistant to a gentleman who was engaged on a very extensive survey, on which one base line measured upwards of seven miles. A straight-edge (?) was purposely made for laying down this base, which was on mounted paper, and strained on a large board. When we came to fill in the survey, a great number of lines were run from, to, or through this base, and on plotting the work we were very much annoyed and surprised, for great pains had been taken, to find that many of these lines plotted too short or too long; many of them were chained over again, without finding any defects to account for the cause of our annoyances. At last the guilty one was suspected; a long piece of the strong silk was procured, slightly waxed, and strained from end to end of the base, which was then discovered to be in many places as much as ten and fifteen links out of the straight line, and accounted for apparent errors in the field work."—*The Practice of Engineering Field Work*, vol. i., p. 19.

Ergo, test your straight-edge before using it; the simplest way being to place one against another and hold against the light, when the defects can be seen and corrected.

On page 24 of the same volume is a description of a home-made heliotrope. We would suggest as an improvement upon the author's swinging bit of mirror an American modification, which consists of a moveable cap, on which are two hemispheres of cut glass (like a decenter-stopper) silvered between. The reflected rays from this are visible at great distances, and the cap is strong and easily carried in the pocket.

The value of large ground-plans, in which the lines of survey are set out to a large scale, is very properly insisted on, and the author truly says that, although costly, the expense will in the long-run be an economy. The description of the various instruments used by engineers, which completes the first volume, is clear and satisfactory, and the illustrations are sufficient for the purpose. In the letter-press a little confusion is occasionally created by not making the references to the illustrations at the end of the book distinct from those that occur in the pages. The price of this volume, 24s., is startling; and that of the second volume, a thin octavo of 184 pages, 20s., is still more inexplicable.

The second volume is devoted to the subjects of water-supply, sewers, and irrigation, with, at the last, apparently to make the bulk of the volume somewhat more imposing, a supplementary chapter on "Traverse Surveying." The remarks on water-supply and the kindred topics of sewage and irrigation are well collected and valuable. The author has no hobby to ride; and when he expresses an opinion, does so with force and with well-applied reasoning. His references to statistics and ascertained facts are always fairly made; and his testimony against the present ignorant waste of sewage matter is given in the strongest terms.

The remarks on organic matters causing impurities in rivers we would gladly put, for their length, transfer to our pages; the reader is therefore referred to the work itself, pages 21 to 30. Following these are some useful facts relative to the comparative value of hard and soft waters. Contrary to popular opinion, our author correctly gives the balance of recommendation to the former.

The well-known works at Croydon and Edinburgh are of course described, and the subjects of constant and intermittent water-supply are discussed at full length. At page 128 he says: "We will now venture to make a few observations as to the present state of the outfalls at Barking Creek, because we believe that the whole of the question of the disposal of the London sewage will again demand the attention of the engineering profession;" and then gives the pith of all the evidence that has been collected upon this most important subject,—one full of difficulties. This portion of the work concludes

with well-put arguments for the more frequent employment of irrigation as a means of increasing the wealth of our island.

Land and Marine Surveying is a most useful and well-arranged book for the aid of a student. It contains all the practical directions of the two volumes previously reviewed, omitting the remarks on sewage, water-supply, &c. The table of contents gives exactly the character of the volume, and we can strongly recommend it as a carefully-written and valuable text-book.

WORCESTER ARCHITECTURAL SOCIETY.

THE first excursion for the present season of this society was to Redditch and the neighbourhood. The weather was excellent. The party started by train at half-past nine in the morning, arriving at Redditch in about an hour, and the places visited, a monster omnibus from Birmingham and several other carriages being engaged for the purpose, were Redditch, Headless-cross, Ipsley, Besley, and Alvechurch.

At Redditch the party were very kindly received by Mr. R. S. Bartlett, who showed them over his extensive manufactory for needles, fish-hooks, &c., describing and illustrating all the various processes used in the trade. Then the company were taken to Mr. Bartlett's house and gardens, where they inspected many relics of the ancient Bordesley Abbey, including tiles, fragments of foundations, windows, doorways, &c., preserved by Mr. Bartlett during a recent excavation, and of which he has published an interesting account. After visiting the site of the abbey, where Mr. Bartlett described the ground-plan and the other features of the spot, the excursionists returned to his mansion, where a substantial luncheon had been spread, and all were thoroughly refreshed. Then they took to the carriages and sped away to the various churches of the places already mentioned, which were briefly described by Mr. J. S. Walker. After one of the most agreeable rides possible, the party arrived at the last halting-place for the day,—namely, Archdeacon Sandford's retreat at Alvechurch. They visited the Church of St. Lawrence, and, on leaving it, they were hospitably entertained by Archdeacon Sandford and Lady Eskine, and after remaining for a time at the rectory, and wandering about the grounds which surround it, the party proceeded leisurely to the railway-station, and returned to Worcester.

SIR DAVID WILKIE.

WRITTEN BY THE LATE JOHN BURNET.

WITH much enthusiasm for, and but little knowledge of, art, Wilkie went to Edinburgh in his sixteenth year to pursue his studies in the Trustees' Academy. This establishment (for good sometimes comes from evil) arose out of forfeitures for rebellion in the years 1715 and 1745; and though the sum, like that allotted for the Kirk of Scotland out of the plunder of the ancient Church, was scarcely sufficient to keep breath in a body which it should have animated with life, it awakened the slumbering spirit of the country. The aim of the institution was to improve the elegance of our manufactures; and the directors invited students from all professions in which taste had a share to come and study in their school of design. A succession of professors, who loved and excelled in painting, gradually extended the original plan. Runciman, scarcely inferior to Fuseli, came with the influence of his enthusiasm; David Allan succeeded, who brought from Rome some knowledge of Italian art; and how still loved to evoke characteristic scenes for Scottish song and domestic story. In short, the forerunners of Wilkie raised the fame of the school in the elegant as well as the useful. On the death of the master, who followed Allan, the Trustees, deceived by sketches which Wood, one of the candidates, did not himself draw, made him master, but presently resented the fraud by displacing him and electing John Graham, a man of probity as well as talent, in his stead. The new master, who had studied at Rome and in London, took an enlarged view of the duties of his station; and, though he continued to lend manufacturers the aid of art, and render more graceful the leaves and buds and blossoms and the tracery from the looms of Glasgow and Dunfermline, he gradually introduced art of a

higher reach, and directed the students to draw both from the flat and the round, from statues as well as from pictures. To this for a time the selfish and short-sighted objected, for they failed to see that he who could successfully draw the unity and proportions, the poetical geometry, of the human figure, could draw anything.

Graham used, it is said, to relate, after Wilkie rose to eminence, how he was surprised one morning by a call from a sedate lad with a low voice and a country air, who presented a letter from the Earl of Leven requesting that the bearer, the son of a neighbouring clergyman, might be admitted to the benefits of the institution. He produced the drawing of a shepherd's dog, and sketches of men's heads, which the professor saw at a glance were not copied from pictures, and was surprised to find that David—for this was Wilkie himself—had drawn them from living nature in that wide academy, the world, and chiefly from the heads of the members of his father's congregation. In the art of drawing he was, indeed, far behind others of the students in whose ranks the professor immediately placed him; but he surpassed them all in comprehending the character of whatever he drew; indeed, as one of his comrades said, Wilkie would draw nothing till he understood it, and when he seized the meaning he proceeded to draw it on studiously and slowly, saying that the meanest figure in the smallest group had a meaning and a character, which it was evident all great painters observed. Artists who have since risen into eminence were in the same class with him. Allan the second—for Scotland has had two distinguished artists of that name—made room in the class for Wilkie, and went abroad. John Burnet (destined to aid in diffusing the fame of his fellow-students to the uttermost ends of the earth), together with Thomson, since dead (the brother of George Thomson, secretary to the Institution, and the editor of "The Melodies of Scotland," and correspondent of Burns),—these three were regarded soon as the ablest of Graham's pupils: Burnet for quietness of tints; Thomson for what was called historical loftiness; and Wilkie for original observation. One of the first drawings which Sir David made was a Niche, in red and white chalks, still preserved; the second a man's foot, of which one of the elders of Cultra remarked, when his attention was called to it, "A fit? It's mar like a flute than a foot;" the third, and this was done out of school, a shepherd's dog, which, during the first vacation, he carried to the castle of the Earl of Leven, nor did he hesitate to own, when, long afterwards, he happened to meet the Hon. Leslie Melville, how his heart beat when he approached the gate. He occupied very humble apartments in Rose-street, in keeping with the condition of a minister who had eight children and a stipend of 115*l.* a year; and in keeping, too, with the perfect modesty and good sense always as conspicuous as the genius of Wilkie.

The time of study in the Trustees' School was in the morning from ten to twelve, when the mind is unjaded with the business of the day, and the eye fresh: to this some of the masters, whose apprentices were students, objected, as it tended to unsettle the young mind for the soberer duties, and at last—but that was long after—the study-time was fixed for the evening, thus bringing to a work of genius a body fatigued and spirit hunted by a work of the hand. This suited the selfish feelings of business; but Wilkie, heedless of all but the studies of art, laboured on. Of a frame too delicate for the boisterous amusements and laborious wit of the younger citizens of Edinburgh, he watched the idle groups in the streets and the market-places, shoemakers at their task, masons at their toil, ploughmen between the stils of the plough, and all the postures which crafts or professions put men or women into, and found a difference in all. He made nature his Ostade, and his Teniers, and Carse, a Scottish painter, with a fine tone of colour, was his Rembrandt, for neither Fife nor the Lothians had one of those artists, though the critics found both in him, when his first pictures burst on their sight. The nearest point of his approach was, Carse had seen a Teniers, and he had seen a Carse. Next to the contemplation of nature he loved the works of David Allan, and as Raffaele was traced to Perugino, so was David the second supposed to be descended from David the first, and Wilkie borrowed some of Allan's attitudes, but the one was all propriety, and the other never stumbled upon it even by accident. Wilkie's early study of heads for portraiture—his skill in representing individual character

—his art in catching Nature in her grotesque mood when she was all negligence, was the origin of his great success in the subjects of domestic or familiar life.

Graham loved historical painting, and had painted several successful pictures. His "Murder of David Rizzio," "Chevy Chase," and the "Burial of General Frazer," particularly the last, were meant to Wilkie's mind, and he kept a print of it in his study. The professor represented the value of the higher studies to the Trustees, and was allowed to choose subjects in which the ablest students might exercise their talents in oil colour, and stimulate ambition by premiums. The first runners in this race were Thomson, Burnet, and Wilkie, and they were directed to find their subjects for themselves in the tragedy of "Macbeth." The picture of Burnet was the sinking of the cauldron; that of Thomson, the scene where Banquo is murdered on the skirts of the forest; and that of Wilkie, the interior of Macduff's castle, where Lady Macduff defends her little ones from the murderers. The landscape showing the torches of Banquo flashing through the glades of the forest, was the chief attraction in the work of Thomson; the mingled supernatural light and darkness in which the cauldron sank into the earth, the most expressive in that of Burnet; the fine expression on the face of young Macduff is still remembered in that of Wilkie. Thomson obtained the prize, though, with some, not the praise; and some were not slow in imputing his success to his brother, the secretary, who influenced, they alleged, the distribution. Wilkie, if disappointed, did not show it, but bore it with a modest tranquillity; and so far did his gentle manners and after fame touch the fancy of the secretary that in letters still extant to the minister of Cultra he forgets the name of Graham altogether, and speaks of David as his noblest student, and how he laid, under him, the sure foundation of his fame.

BELLHOUSE'S SAFETY APPARATUS FOR HOISTS.

The greatly increased use of hoists and colliery cages renders more and more important the invention of means of preventing accidents with them. Bellhouse's apparatus appears calculated greatly to increase their safety. The following is the arrangement of it. Upon a strong wrought-iron pin secured to a wrought-iron fixing (which in its turn is bolted to the cross pieces of the chair or cage) is hung a weighted lever, one extremity of which is connected to the suspending chain or rope by means of a clip, which is attached firmly to both; whilst the other extremity is, after passing over the wrought-iron pin, jointed into a wedge or inclined plane, and terminates in a sharp pointed pin. The wedge is made to fit the conductors, so that in the case of corner guides these wedges are V shape on the face, in side conductors they are flat, in both cases they are serrated. When the suspension ropes or chains break, the weighted levers fall some 3 in. lower, which lifts the wedge by forcing the sharp end of the lever into the conductor. The cage is meanwhile moving downwards, but the wedge having been stopped it follows that a thicker part of the wedge must be between the pin and the conductor, and the heavier the cage the more will the pin be forced on to the thick part of the wedge; so that the greater the weight to be stopped the greater is the pressure on each wedge by which it is again transmitted to the conductors. This is a feature peculiarly its own. It is the weight of the cage itself which, with the momentum, supplies the power to stop it; the weights and springs merely move, or rather set in motion, the wedges, which are instantly fastened by coming into contact with the conductors: this first action does not stop the cage, but merely places the wedges in such a position that the cage must stop itself.

By these means the greatest simplicity is preserved, and consequently the liability to get out of order is materially lessened. By employing wedges against the conductors, the tendency to break is reduced to a mere nothing, and the injury to the conductors, which in most arrangements is very great, is here only nominal, owing to the large bearing surface of wedges as compared with forks, spikes, or excentrics. No rack is required; and as there are so few joints, and in those few the metals working together being made purposely different, prevent liability to rust or to become fast from disuse.

The weight of this apparatus is very trifling, and the cost is said to be moderate. An arrangement is attached in mills, warehouses, hotels, and hospitals, which enables the catches to be instantly brought into action by any one in the cage; in the event of the strap which drives the gearing breaking or slipping, or over-weighting of the cage, or even of the break not acting with sufficient promptitude; so that whenever the descent is too rapid for safety, a chain overhead, hanging in easy reach, may be pulled, and the stoppage effected instantly.

LECTURE ON EPITAPHS.

A LECTURE on epitaphs was recently delivered by the Rev. E. C. Lewis, of Rochdale, in Macclesfield. The lecture was both interesting and amusing; its more sombre features being relieved by an enlargement on the lighter and more humorous or even absurd phases of the subject. A cruel epitaph on a doctor runs:—

"Here lies the corpse of Dr. Chard,
Who filled the half of this churchyard."

At Oakham, 1736, on a wood-cutter:—

"The Lord saw good, I was lopping off wood,
And down fell from the tree;
I met with a check, and broke my neck,
And so death lopp'd off me."

The following is an epitaph on a man who was too poor to be buried with his relations in the Church of Kingsbridge:—

"Here lie I, at the chancel door;
Here lie I, because I'm poor;
The further in, the more to pay:
Here lie as warm as they."

In an Irish village churchyard:—

"Here lies the body of Mary Quin,
Who was so very pure within,
She broke her outward shell of skin,
And hatched herself a cherubim."

There is a humorous epitaph in a churchyard in Wales, on the grave of an organ-blower, thus:—

"Under this stone lies Meredith Morgan,
Who blew the bellows of our church-organ;
Tobacco he hated,—to smoke most unwilling,
Yet never so pleased as when pipes he was filling.
No reflection on him for rude speech could be cast,
Though he gave our old organist many a blast.
No puffier was he,
Tho' a capital blower,
He could fill double G,
And now lies a note lower."

Our readers may recollect of a Yankee epitaph on a husband by his disconsolate widow, who stated in it that she still carried on the tripe-and-trotter shop round the corner: the following, on the other hand, looks as if it were intended to damage the sale of Cheltenham waters:—

"Here lie and my three daughters,
All from drinking the Cheltenham waters;
While, if we had kept to the Epsom salts,
We should not now be in these here vales."

Many epitaphs are, no doubt, not merely "only fit for Punch," but never appeared in any churchyard; and we may very fittingly sum up the present selection with one from *Punch* itself:—

"On a Locomotive: Written by the sole survivor of a deplorable accident (no blame to be attached to any servants of the company):—

Collisions four
Or five she bore,
The signals were in vain;
Grown old and rusted,
Her boiler busted,
And smashed the excursion train.
Her end was pieces."

ACCIDENTS.

Manchester.—A fatal accident has occurred at the Flixton cotton mill. The mill, which is eighteen windows in length and three stories in height, has only been built about three years. Last Christmas a massive iron cistern, supported by iron beams, was built on the top of the central portion of the mill. The rooms below this cistern were used as head and hobbin rooms, the ground-floor being used as a stable. The cistern had only been half filled with water during the week, and was for the first time quite filled when it broke, by its own weight, the supporting iron beams, and crashed through into the stable, completely destroying the floors of the head and hobbin rooms. Some 300 persons were employed in the mill at the time, and the

noise of the crash sent them running out of the building. Two men were in the stable. They were both got out alive, but one was so injured that he died in an hour and a half. The other man received a severe blow on the back by the falling iron, but it is considered that the injury will not prove dangerous. At the inquest it was given in evidence that the tank was made and erected by Mr. Robert Hall, of Bury. It was supported by five cast-iron beams, and rested on the walls on three sides. The ends of the beams rested on two walls. The building over which the tanks was fixed was not exactly square, and the beams were of different lengths. Four of the beams had broken, and one was still resting on the walls, which had not given way. The tank was calculated to hold 8,050 gallons of water. The weight of the tank and beams was over nine tons. Mr. Hall was called, and said he could not account for the accident. His son and one of his men had superintended the work, but his son was not there that day owing to his nervous temperament having been so much affected in consequence of the accident. He thought the tank was 4 ft. deep, perhaps 13 ft. wide, and 18 ft. long. He believed the beams were sufficiently strong. They had made and fixed tanks for twenty years, and had never known one to give way before. Ultimately a verdict of "accidental death" was returned.

Hook-Norton.—A man had just finished some repairs at the bottom of a deep well at Park Farm, and had ascended some 20 ft. on his return to the surface, when the walling began to give way beneath him. A moment or two more, and the whole of the stonework and surrounding earth had fallen in, burying him under at least 30 ft. of earth and stones. At the mouth of the well appeared a great chasm, of perhaps 12 ft. diameter, and the carb, &c., that had fallen in, reached to within about 12 ft. or 15 ft. of the surface. Digging out the well was commenced at once, and throughout the whole day untiring efforts were made to recover, as was imagined, the body of the unfortunate man. To the surprise and delight of the workmen, his voice was at last heard, earnestly entreating them to be quick, for that he thought he could not last much longer! He was brought up at last alive to the surface, and is now progressing as favourably as possible. No bones are broken, and the internal injuries, it is hoped, are not much. He was protected by a very large stone, which rested on a stout bar which had been thrown across the well to strengthen the masonry. He seems to have been supplied with air from a wooden tube, belonging to a pump which was fed from the well, this tube fortunately broke just opposite where he lay.

Crief.—At a hydropathic establishment in the course of erection on the rising ground on the north side of Crief, ten masons were in the act of carrying a large stone along a gangway, when the planks broke, and all the men, with the exception of one who clung to a beam, were thrown to the ground. All were more or less injured, but three of them were seriously bruised.

SANITARY PROGRESS IN THE LAKE DISTRICT.

THE tourists' season will soon commence, and many persons will be pleased to learn that great improvements have been made in the English lake district. Until very recently a warm bath could not be obtained at any town in the mountain part of Cumberland; neither did there exist either main-sewerage, house-drainage, or a public water-supply in any one of the lake towns or villages. Keswick has set the example, and we trust all the other places will follow. Keswick has been sewered and drained, and receives an abundant supply of soft and pure water from Skiddaw side: there is railway accommodation, a fine new Station Hotel, with the Royal Oak, the Queen's, as also the Lodore and Borrowdale Hotels, having warm and shower bath accommodation with other sanitary arrangements and conveniences of the most approved kind. The *Builder* has more than once pointed out the glaring sanitary defects in the lake towns, and remonstrated with the inhabitants on their apparent apathy. It is but fair, therefore, we should notice the improvements which have been effected, and we venture to promise an abundant repayment for the costs incurred. Penrith and Cockermouth have each been sewered, drained, and provided with public supplies of soft, pure, and wholesome water.

FOUNTAINS ABBEY, YORKSHIRE.

The Lady Chapel.

ENTRANCE TO THE VICTOR-EMMANUEL GALLERY, MILAN, ITALY.—SIGNOR MENGONI, ARCHITECT.

THE VICTOR-EMMANUEL GALLERY,
MILAN.

Not long ago, this fine new gallery, constructed in Milan, by an English company, was illustrated & described in our pages.* We now give a view of the entrance to one end of the gallery, embracing a view of the monument to Leonardo da Vinci. It will be observed that the external end of the gallery is not at right angles with its axis, and that an arrangement was necessary to produce symmetry and regularity within. The ornamentation is rich and elegant.

THE WIDENING OF PARK LANE.

In answer to Mr. Goddard, in the House of Commons, Lord J. Manners detailed the steps taken by the Board of Works with a view to improve the approaches to Park-lane. At the present moment there was no scheme, and until further proceedings had been taken it would be quite impossible for the Board of Works or any other body to widen Park-lane. A recommendation had been made that the east side of Park-lane should be pulled down; but the whole matter would no doubt be carefully considered before next session.

At the last meeting of the Metropolitan Board of Works, the chairman drew the attention of the Board to what had taken place in the House of Commons in reference to this question. The Board, he said, had made application to the Government, asking that a surveyor should be sent down to make arrangements for the opening up of Park-lane, but they refused to entertain the question. The next thing the Board did was to consider the opening of Hamilton-place, when they met with the most determined opposition on the part of the Commissioner of Woods and Forests. They then had no course left to them but to open Park-lane itself, and in the consideration of the public interest, which they were bound to attend to. If they had attempted to open Park-lane on the opposite side, they would only have had a 50-ft. roadway instead of one 70 ft. or 80 ft. A strong opposition was offered to this proposition of the Board for the widening of Park-lane, and the consequence was that the hill was thrown out, and now the committee of the House of Commons recommended that the Board should go back to Hamilton-place. What were they, as a public Board, to do when driven about from one thing to another in this way? After some further discussion the subject was referred to the works and general purposes committee.

The Piccadilly end of Park-lane cannot be equalled in the "West-ends" of all Europe for inconvenience, all things considered: it is narrower now, as the *Morning Post* remarks, than when it was only known as "the lane leading to the gillows." Could not the plan some time since suggested in the *Builder* be reconsidered, with the view of its adoption, as the easiest way out of the difficulty?

FROM IRELAND.

Dublin.—A plan for increasing the width of Carlisle Bridge has been designed by Mr. Georgehan, architect. It could be carried into execution, it is said, without disturbing the present bridge, and would not cost half the amount which would be required to erect a new bridge. Mr. Georgehan proposes to allow the present bridge to remain, removing the parapets, and extending the width to that of Sackville-street, 53 ft., and reducing the roadway to a perfect level, the centre arch only having to be altered, the stone voussoirs being replaced by cast metal beams, arranged so that the water and gas pipes may pass between the beams in the depth of the new crown, the extensions each side being supported on hollow cylinders sunk down to a solid bed, and filled with concrete, the roadway being maintained on cast metal arched beams and iron plates, filled in with road metalting. The façades facing the river on each side would be of ornamental metalwork, concentric with the arches of the present bridge, the whole forming to all appearance a new and ornamental structure. The old bridge may remain undisturbed until the lateral extension is completed.

Belfast.—The foundation-stone of a projected

Masonic hall has been laid with Masonic ceremonial. The site is central, occupying a considerable portion of one side of Arthur-square and Ann-street. It is approached from Cornmarket, Arthur-street, Castle-lane, and Ann-street, and there is an open space in front which will show the dimensions and general character of the building. The architects are Messrs. Lanyon, Lynn, & Lanyon; and the builder is Mr. McKeown. The cost is estimated at 8,000. The building will consist of a ground, first, second, and third floors, with a total street frontage of 170 ft.—100 ft. in Arthur-square, and 70 ft. in Ann-street. On the ground floor there will be six spacious shops and a suite of apartments for the caretaker. On the first floor will be a large and small dining-hall, a billiard-room, and a committee-room. The arrangements on the second-floor will be somewhat similar to those on the first, and it is intended that this floor shall be devoted to the purposes of a Masonic club. The third floor will be used solely for the purposes of Masonry, and will consist of one large hall, 42 ft. 6 in. by 26 ft., and 18 ft. high, for the meetings of the Blue and other symbolical lodges; a smaller hall, 30 ft. by 20 ft., same height, which may be used for the Royal Arch Chapters. There will also be another hall, 30 ft. long by 18 ft. 6 in. wide, and same height, for the purposes of an encampment of the High Prince Masons, and also for their chapters. Each of these rooms will be provided with an entrance-porch and ante-room. On the same floor is a small room for the paraphernalia connected with the various degrees. The design is in the Early French style. The lower portion of the exterior, from the ground-line to the level of the windows, will be executed in Cookstown sandstone, and the remainder of the building in white brick. The quoins, orbel moulding, string courses, and all the other dressings, will be of sandstone.

THE CANTERBURY SEWERAGE.

The main drainage and sewerage works have been handed over by Mr. Pilbrow, the engineer to the local Board. The report presented by him shows that the house connexions only are now required, and these must depend upon an efficient water-supply to make Canterbury a thoroughly-drained city. The total cost has been 13,157l., which is considerably within the estimate.

The total quantity of sewers laid, of all classes, is about thirteen miles, together with about fifty-four large inspection-shafts, seventy-six flushing-shafts, 100 ventilating-shafts, and crossing the river at five different places. The outfall works, or sewage deodorizing tanks and filters are said to be now satisfactory; but the nearly submerged state of the land below the city, and the boggy character of the soil, rendered this portion of the works more costly and difficult than was anticipated.

The principle upon which the system of sewers is laid down is the "Separating System" (and which Mr. Pilbrow claims to have originated in 1850). All surface and storm waters are excluded, so that the sewers are for the exclusive purpose of carrying away from the houses and city the sewage proper, the vehicle for conveying and forcing this through them being the artificial daily and hourly supply of water to each and every house.

The most of the sewers laid in the city are of stoneware pipe of Messrs. Doulton & Co.'s manufacture, ranging in size from 8 in. to 18 in. in diameter, and of the kind known as "coned and related pipes," originally devised by the engineer, and always specified by him. The sewage from these is eventually collected into a main brick sewer of oval shape, measuring 3 ft. by 2 ft., built of 4½ work in Portland cement, and rendered with the same.

From this sewer the sewage is emptied after traversing the Broad-Oak-lane, about a mile and a quarter from the city, into the sewage-house, which is a plain rectangular building of brick, the greater part of it being below the surface. It is 160 ft. long by 60 ft. wide internally, and divided longitudinally into three compartments, the centre one comprising the filter and charcoal rooms, the former 120 ft. by 19 ft., the latter 39 ft. 3 in. by 19 ft., and situated on the ground level. The compartments on each side consist of the subsiding tanks, which collectively run the whole length of the building, the brick partitions with iron strainers on the top acting as

weirs. The sewage on entering the building is received in a pit, and made to pass into the first tank through an aperture at the bottom of the partition, thus keeping all solid matter down at once as much as possible. As each tank is filled the liquid passes over the several weirs, and eventually into the filter-house, which contains two sets of filters 3 ft. apart, two in each set, at different levels, 2 ft. apart, 120 ft. long, 2 ft. wide, and 2 ft. high. The sides of the filters are cast as gratings, the openings ¾ wide and bars ¼.

The sewage-water after passing laterally through two filters filled with charcoal (one set being in operation while the tanks on the other side are being cleared of deposit) finally flows as clear, it is said, as inodorous water down the 24-in. outlet pipe to the river below Fordwich, a further distance of ¼ mile passing twice in its course through iron pipes laid under the bed of the river Stour.

The execution of the works has been attended with some discoveries and findings of considerable antiquarian interest. We may mention the Roman tessellated pavement referred to in a letter in our number for May 23rd, but which was broken up in removing. The engineer, however, had luckily had it photographed and an accurate key for colouring it taken (by his assistant, Mr. W. H. Fox), and has since presented the Society of Antiquaries (London) and the Kent Archaeological Society with coloured photographs of each.

Other portions of Roman pavement were found in different parts of the city, as also remains of the ancient city walls constructed by the Romans. The engineer is preparing a plan of the city to show the position of this and other interesting features.

The whole of the works have been designed and carried out under the personal supervision of Mr. J. Pilbrow. Messrs. Good & Inlens acted as clerks of the works. Messrs. Dowell & Tyler, of London, were the contractors for the construction of the brick sewer; and Messrs. Dickinson & Oliver, of London, for the sewage-house and pipe-laying. The pipes were found by the Local Board.

LIGHT AND AIR: IMPORTANT
JUDGEMENT.

The case of *Horsley v. Leak*, decided by Vice-Chancellor Malins on the 22nd ultimo, appears to be of more than usual interest as a practical test of the law on this frequently perplexing subject. From a full report in the *Yorkshire Gazette* we extract the following portions:—

"This bill was filed to restrain the alleged obstruction of the plaintiff's light and air, in Coxy-street, in the city of York. It appeared that the plaintiff and the defendants derived their title from the same vendor, the plaintiff being a gun-maker, and the defendants, Messrs. Leak & Thorp, drapers. The land on which the respective houses stood had originally formed portions of the site on which the well-known George Hotel had stood, and the defendants had contemplated building on a yard or space fronting the plaintiff's house, which, it was sworn, if carried out according to the plans, would materially obstruct the light and air, especially those of the engraving and finishing rooms. The case came on originally as a motion for an injunction to restrain the alleged obstructions, when, by arrangement, it was agreed that the case should come on upon motion for decree, and a reference was directed to Professor Kerr, to examine and report on the obstruction of the intended building. The professor had made his report, suggesting two lines of building, which may be called the upper and the lower. By the former sufficient light would be secured to the plaintiff to be serviceable for domestic and other purposes; and by the latter, practically, the whole light which he had before he would still enjoy."

In explanation of these "two lines of building," we are enabled to quote from the referee's report, "The average elevation of the old skyline would be very little more than 20 degrees above the horizon. It also appears that the elevation of the intended new buildings of the defendants would rise up to about the 45th degree. In precise measurement I estimate the original arc of exposed sky to have been on an average 36 degrees vertically, and the obstruction by the intended new buildings to be about 24 degrees thereof, leaving only 12 degrees still to remain exposed. Upon these data I have to answer the question, 'Whether the proposed new buildings of the defendants will materially diminish, obstruct, or prejudicially affect the passage or access of such light as passed or had access to' the window formerly. If these words were to be taken to mean that the whole of the former light-yielding sky-surface ought to be preserved,

* See pp. 297-299, ante.

* Terms of Order as agreed by counsel.

it cannot be disputed that a large and material portion thereof would not be preserved; but if it is rather to be understood that the defendants' new buildings may possibly be permitted to a certain extent to enroach upon that former extent of sky-surface, but only so far as not to diminish materially the serviceableness of the window for purposes of ordinary occupation and work within the room, then I am of opinion that the said new buildings may be permitted to rise to a considerable degree above the old sky-line without the plaintiff suffering any sort of practical injury in carrying on his business or otherwise. As regards the precise height to which the new buildings ought to be confined, I need scarcely point out, that if the principle of preserving the whole of the old sky-surface were laid down, the limit of about 22 degrees above the horizon" (illustrative drawings being referred to) "would obviously be a fair average, which would render it necessary to cut down the new buildings to the line *z z*; but if the other principle of preserving only the serviceableness of the window for occupation and work be laid down, then my opinion, after very careful consideration, is that, so long as the new sky-line to be formed by the summit of the new buildings does not reach above the summit of the new wall called E in the evidence, as seen from the window, the efficiency of the window for purposes of ordinary occupation and work within the room (which is a small one) will not be found to be materially interfered with, and the line *z z* (drawn from the head of the window through the top of the wall E) would be the limit to which it would on this account be necessary, in my opinion, to cut down the new building."

The Vice-Chancellor, in delivering judgment, said.—These questions, with regard to light, are about the most embarrassing questions that come before the Court. In the present case it appears that it does not depend on the question of the antiquity of the light, but is a question between two adjoining proprietors claiming under one common vendor, and the plaintiff rests his right upon a grant contained in his deed. The whole of the property in question—that which is held by the plaintiff, and that which is held by the defendants—is an old hotel, called the George Inn, in York. That having, in the year 1856, in consequence, I suppose, of the establishment of railways, become an unprofitable concern as an hotel, it is offered to public competition as a site by auction in four lots. None of the lots were sold at the sale, but that day after the sale the plaintiff became the purchaser of the most northern lot, namely lot 4, and subsequently adapted it for the purposes of his business as a brewer. As to the remaining lots, how they were occupied does not appear, but they appear to have remained unsold until the year 1856, when they were again put up in three lots, being, I suppose, the same lots as are specified in the particulars of sale of 1855, and were bought by the defendants. The defendants, who are carrying on the business of linen drapers, and, I suppose, on a large scale, desired to enlarge their premises, I presume to pull down the old buildings altogether and erect new buildings, and have as much space as they could get, and they proceeded to build on that vacant space of ground, as stated in the plaintiff's conveyance. To erect buildings of some kind it is perfectly clear they were entitled; but it is also, I think, quite clear, that they were not entitled to erect such buildings on that vacant space of ground as would derogate from the grant to the plaintiff, that grant being of "all lights," which means the existing light. Now, as regards the grant to the plaintiff, I take it, the effect of a grant of all lights, meaning the existing lights, was to put the plaintiff (whether these were ancient lights or not) now material as between himself and his vendor, and, consequently, as between himself and all persons who, by subsequent title, derived a title from the vendor in the situation of grantee of the lights, having the same rights against the vendor as if they had been ancient lights. I am, therefore, of opinion that the defendants were entitled to erect some buildings. I am also of opinion that they were not entitled to erect such buildings as would derogate from the grant to the plaintiff. There seemed to be great uncertainty as to what the defendants could do; and then, from this correspondence, which has been read, it appears that, in the month of August, the defendants made a communication to the plaintiff to the effect that they would be willing to abide by the decision of any independent architect to be appointed between them, half the expenses of which they were ready to bear. The plaintiff gives an answer, which contained amounts to this,—that he contended then, as he contended most unequivocally to contend up to the day of the filing of the bill, that they had no right to build on the vacant space. He contended the right altogether. The plaintiff is proved to be entirely wrong in that part of his contention. On the other hand, the defendants have made an offer, which I think the plaintiff would have done well to have accepted to in August, at the time this dispute was going on, they gave up that reasonable course, and employed an architect to prepare plans for them to erect a building on this vacant piece of ground to the height, in round numbers, as I recollect as nearly as may be of 45 ft., and they insisted on going on with that building. That led to the institution of the suit. The plan existing plan would have given the defendants twenty bed-rooms at the back of their shops; but they are now willing, in consequence of Professor Kerr's report, to submit to the line recommended by him, which would cut down their building from twenty bed-rooms to fourteen. The result of all this, therefore, is that the plaintiff has been entirely wrong so far as he has contended that they were not entitled to build at all, and the defendants have been equally wrong so far as they have contended they were entitled to carry their buildings to any height whatever. The matter coming before the Court in April, feeling myself much embarrassed by the evidence on both sides, I referred it to a gentleman, whose name was acceptable to both parties, namely, Professor Kerr, of King's College, to ex-

amine the premises, and not by way, of course, of deciding anything, but simply to report to the Court what in his opinion ought to be done. He has made a report which I think is very satisfactory, because he has made a recommendation which both parties have accepted, which in the result comes to this, that the buildings, instead of being carried to the height of 45 ft. should be carried to the height of 35 ft. only; that is, the defendants are satisfied to diminish their building 10 ft., and the plaintiff has said that he is content to acquiesce in that (the line 22). Under these circumstances it has been contended on the one hand by the plaintiff that the defendants ought to pay the costs, and, on the other hand, it has been vigorously contended that the plaintiff ought to pay the costs. But it being considered that both parties are wrong, and that both parties contended for more than they were entitled to, I think the justice of the case would be met by saying that each party should bear his own costs. Therefore the substance of the decree will be—The defendants, undertaking not to erect any building beyond the height of the line 22 in the plan in the report of Professor Kerr; and the plaintiff being satisfied that a building of no greater height should be erected, there will be an order in the terms of the prayer of the bill, against the defendants. Each party pays his own cost, and the costs of Professor Kerr to be paid by the plaintiff and the defendants in equal shares.

WHERE ARE WE GOING TO?

SIR,—In perusing the article so headed in the *Builder*, it gave rise to thoughts mingled with sadness and reproach. I have thought them down as they presented themselves, and send them to you. If you find anything worth notice do with them as may seem best. I have a vivid recollection of living in a house where there were many children, all very healthy and full of animal spirits. Neither the father nor mother had the least conception of proper parental authority; consequently the children ran wild, and the poor woman was continually complaining of their waywardness and ingratitude. It never once suggested itself to her that the greater part of the fault probably lay with herself. In making a comparison of society and its complaints against trades' unions with the woman and her children you will bear in mind exercised authority, and the consequent disobedience of the children. Whenever any startling effect presents itself in relation with the physical laws it is known there must be a cause; if new men bend their minds to find it out. Cause and effect in the moral laws work with the same unerring certainty, but through not presenting themselves so suddenly and startlingly, their connexion is not always so apparent. I will endeavour to form a chain to connect the cause of the formation of trade unions and the effects we see. The cases I shall name came under my own observation, being at work with the trowel at the places. Of course they will be but the type of a system generally practised where it could be done. Some eighteen years ago I worked for a task-master who used to do most of Messrs. Lock & Nesham's large contracts. At that time we were building Wandsworth Prison: we used to tumble in from 1,500 to 2,000 bricks in ten hours per man: still the cry was, "More! More!" Every mean advantage was taken of the men, who were compelled to do the work in such a manner that a man with the least conception of what was right must rebel against it. The men had a fair price for their work; but, besides providing for themselves, it cost much to buy those whose duty it was to see the work was done properly.

The next scene is the North Kent Railway; the same sub-contractor; principal contractor, Mr. Little. On a summer's morning at daybreak, as the occasion required, might be seen a gang of labourers wheeling bricks into the spandrels of the arches (they used to build them solid, or were supposed to do so at that time) and tipping them in the same as they would rubbish into a hole. When they got to a certain height brick-layers came and levelled them down, and paved a course or two on the top in the proper way before the ordinary time of coming to work. The inspectors had got so fat by gratuities, eating and drinking, &c., that they could see nothing of that sort. As many as 20,000 or 30,000 bricks placed put away in a morning in that manner. If it were wanted to be done in the day-time those that should have looked after it were taken off to the public-house, when of course they did not see it. I myself was told by the man's own brother, that he got 1,000*l.* out of the work on that line—labour only.

No doubt the same evil influences have been at work in other branches of industry (though not in that form), leading men, as it did in the circle in which I moved, to see the necessity of organization to resist the system.

I think I have shown causes sufficient in them-

selves to call up a spirit of antagonism, and induce men to combine to give it effect. In these operations what has led, then, to produce such fruits as we see? During the great lock-out in the building trades a deputation waited on the Home Secretary, Sir Cornewall Lewis (Sir Morton Peto was spokesman—shrewd man!), to ask for the interference of Government. After enumerating the many concessions in the shape of leaving off at four o'clock on Saturday, and the rise of wages, &c., he said they felt bound to resist any further demands. The Home Secretary asked under what circumstances those advances were made? Sir Morton replied, when the men struck for them. That is where the worst evils in connexion with trade unions spring from. If a concession is just, and can be granted when asked for, give it; but if wrong, it becomes ten times more so if granted under the pressure of a strike.

Do not infer from what I have said in reference to piece-work that I condemn it,—I see no objection to that with honest supervision;—or that I have any sympathy with trade unions in their operations; but believing there are causes that bring them into existence, and the evil effects that follow, I have endeavoured to point out a few; and, if right, let all in society who should set an example of right and duty done take it to themselves and work it out in their lives, and then the cry of the strong against the weak would cease, and we should not have to ask, with anxious minds,

WHERE ARE WE GOING TO?

MORE THINGS WORTH KNOWING.

1. Why are not the names of streets painted on the lamps instead of being stuck up high on the wall, where, when night comes on and they are most needed, they cannot be seen? Or a stencil plate hung inside would do.

2. Why do not owners of house property have their chimney-stacks occasionally looked to? Life is not safe in some parts of London during a gale.

3. Why, when there is a trap-door in the roof to facilitate escape from fire, do lodgers allow the householder to keep the necessary ladder down in the back yard for the purpose of elevating his clothes-line? This is more often the case than many would think.

4. Why are Thames steam-boats allowed to carry as many passengers as can crowd on board, to the peril of those persons' lives? Take, as a sample, any boat returning from Battersea-park on a fine summer Sunday evening.

5. Why, as the cry is still "more bridges," does not some one start the idea of bridge bazaars? The rents would pay for their erection, and they must become thoroughfares for traffic, toll free. Why not have a bridge fish-market?

6. Why are our new bridges being built without seats on them?

7. Why, as attempts are sometimes made to upset a train by placing impediments on the line, is not something fitted to engines that would chip even a sixpence off the metals if it were there? Present precautions are insufficient.

8. Why are paupers clothed in so absurd a style? Does Mr. Bumble mean it as a deterrent?

9. Why are not the Volunteers enrolled as permanent "special constables"?

10. Why do not all artisans begin their day's work at six a.m., and have two hours a day,—a day a week!—to recreate themselves, more than they get now? A factories' doctor once said to the writer of these queries, "It is between six and eight o'clock in the evening that you mechanics get old."

11. Why is not every lift to a mine-shaft fitted with a self-acting apparatus which, directly the tackle breaks, shall throw out projections to catch the sides of the shafts, and thereby prevent it smashing itself at the bottom and killing its contents?

12. Why are not those men who drill monkeys on tables in the streets until their poor little lives are not worth having, punished by the Society for the Prevention of Cruelty to Animals?

13. Why are not the long-ago-suggested subways, or overhead footpaths at busy crossings, commenced before more lives are lost?

14. Why not have life-lines and buoys bandily placed along the Thames Embankment (say, under the trees we hope to see there), for while

boys will climb, and women will lean over the river wall with children in their arms, something of the kind is necessary? The suggested fastenings of chain would only be serviceable to those close in at the side.

15. Why not remove the gate by Tavistock-square and a few buildings by Clare-market and Drury-lane that want removing, and so have a direct road from Hampstead Heath to the Embankment?

16. Why is the Cobden Memorial, in High-street, Camden-town, put up the wrong way? Sir Robert Peel might as well turn his back on Chapside.

17. Why does not somebody keep a sharper eye on speculative builders in new localities? Judging by some carcasses, it is a wonder that many houses do not collapse under their own weight.

18. Why does not the Government at once take steps towards working the railways itself? After the lamentable show of inefficiency in the arrangements for the late Windsor Review, no more argument is required to show why the item of conveyance should be under the direct control of the War-office.

19. Why are boats let out on the Thames to little boys too weak to manage them and too thoughtless to sit still?

20. Why are "muzzled" dogs' mouths sealed up with a tight hindling-strap, so as almost to prevent them breathing? Would not a wire-work nose-cap be cooler and less irksome to them?

21. Why do hutchers always drive so fast? Do they and Hansom cabmen think it proper to turn corners on one wheel? J. G.

BOTANIC GARDENS: CONSERVATORY ADDITIONS.

APPLICATION has been made to the Fellows of the Botanic Society by the Council to raise 3,500*l.* in order to enlarge the conservatory and provide a covered way to it from the road to the north side. A conservatory ought to be a part and parcel of the decorative embellishments of a pleasure-ground, and we see how the Government, usually so parsimonious in such matters, have erected very elegant conservatories at Kew. The present conservatory at the Botanic Gardens is already most unsightly, and unworthy its position as the culminating point at the end of the broad long-walk. But the outlay is to go to increase this mass of ugliness in the same taste. I am no advocate for useless show; but disposition of mass and variety of outline need not necessarily involve increase of cost. I think it would be more judicious in the Council, if they have not the spirit to employ an architect of taste, to invite designs and tenders from other tradesmen in that class of ironwork, stating the amount the Council are prepared to expend and the additional accommodation required, and I am convinced they will have a much more sightly and possibly more extensive erection than that shown by the model in the council-room of the Botanic Gardens. Messrs. Handyside's trade-book on "Works in Iron," reviewed in your last number, shows what can be done for comparatively little money.

THOS. L. DONALDSON.

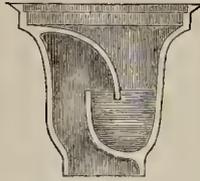

ADULTERATION OF LABOUR.

SIR,—Has not the time arrived when this question should be taken into consideration. Is it not notorious that the expenditure of thousands of pounds is in abeyance, on account of the disgraceful manner in which works of decoration and repair are now executed. Do the workmen give a fair day's work for a fair day's wages? It is notorious that when a job is to be executed, it is done in a most indolent manner, to the great inconvenience of the householder, who of course has in the end to pay the master builder or employer. Talk of the adulteration of food, it is nothing to what the holders of house property have to submit to. My contention is, that ample work is to be found, if the workmen would do justice to their employers, and enable them to execute the work they could obtain, if it were not put off indefinitely, in consequence of the difficulty in getting rid of the workmen when once they commence a job.

W. H. B.

ANTILL'S PATENT STENCH TRAP.

OUR attention has been called to a stench-trap invented and patented by a working man, J. Antill (Merton-road, Wandsworth), which has this advantage, that the grating may be taken off to clean it out without thereby admitting bad air

from the drain. The section shows its construction. The principle is old enough; the novelty is in application. A builder writes that he has had one of these in use for some time, and finds it answer well.

LOLLARDS' TOWER.

SIR,—The Lollards' Tower is mentioned in Masekyn's Diary, a.º. 1555. "The xx. day of September was cared from Nugst [Nowgate] unto the Lollar stowre serten men;" and a.º. 1556, "the xx. day of October was delivered out of the Lowlar Torre alle the heretykes that came out of Essex," &c. Stowe's Survey also notices that the southern bell-tower at the west end of St. Paul's Cathedral was so called. The northern tower, near the Bishop of London's house, was attached "to the use of the same palace; the other, towards the south, is called the Lollards' Tower, and hath been used as the bishop's prison for such as were detected for opinions in religion contrary to the faith of the Church." In the "Churches of London," by George Godwin, F.S.A., and John Britton, a note states that "in 1514 Richard Hunn was hung in a tower at the S.W. corner of the church for heresy" (p. 17).

MACKENZIE E. C. WALCOTT, B.D.

WAGES IN THE UNITED STATES.

SIR,—It may interest some of your readers if you like to publish the following paragraph, which I copy from a letter dated 30th May, 1868, just received from a friend who returned from London to Chicago, Illinois, last November, and is now actively engaged with a partner in erecting several houses as their joint property, on a plot of suburban land, lately purchased for 5,000 dollars. The wages for skilled workmen may be easily reckoned by allowing 5 dollars to the pound sterling.

W. H. ESPENETT.

He writes as follows:—"You will say, why do we take off our coats and do our own work? Bricklayers are getting 5 dollars a day; masons 4 dollars; carpenters, painters, &c., 3 dollars. No man will touch a hod or a spade as labourer for less than 2 dollars a day. My partner and I yesterday hauled with our team 10,000 feet of boards to a planing-mill; it would have cost us 10 dollars to have employed two other men to do it. When a man makes 5 dollars a day, he can afford to hurry his gentility, particularly if his gentility would only starve him."

* * * Paper currency must, we suppose, be allowed for.

MAIDSTONE MUSEUM.

SIR,—With reference to the interesting notice of the Maidstone Museum, in your last number, permit me to send a few supplementary remarks as to the past and present condition of the museum. The late excellent curator, who had been the personal friend of Dr. Charles, the founder of the museum, was advanced in life before he accepted the office, and, during his latter years his memory failed him a good deal. The present curator, therefore, on succeeding, had not only to reduce to some order the original collection, but to incorporate and catalogue the extensive and valuable bequests of his predecessor. This he has at length completed, and

he has likewise prepared, for the use of the visitors and readers, a catalogue of the library. He is also engaged on a catalogue of the antiquities, &c. These he hopes to get printed; but, as the Corporation have only a limited sum at their disposal for the improvement of the museum, time must be allowed for all you wish to be done.

It is due to the Corporation to state that they seem fully alive to the importance of their trust; and that they give as much encouragement as is in their power to the recommendations of their curator for making the museum what I hope in a few years it will become—a model museum.

The old Manor-house had been sold in portions, and that of which the Corporation became possessed was the centre and back premises and garden. They have very recently (partly through the liberality of the gentleman referred to by you) purchased another portion of the house, and at this time the holders are engaged in making the alterations necessary for the enlargement of the museum. One of these will consist of a new library, adequate to the proper arrangement of all the books, many of which are at present useless for want of room. Another apartment will give space for a collection of curiosities, which has been presented by a gentleman connected with the town by family ties. These alterations will involve an outlay of many hundred pounds; and I think that Maidstone may fairly be congratulated on having a Corporation of intelligence and public spirit, by all strangers who visit its museum, and who ascertain how much has been effected in a few years with limited means.

A LONDON VISITOR.

LEIGHTON ("BUZZARD") AND VICINITY.

SIR,—This subject was included in your notice of "Woburn Abbey and Vicinity."* You even recommended the spot—far more generally known now by "railway" connexion than (as many other things) would have been dreamt of half a century ago,—as a desirable "standing ground" for excursions within a moderate circle.

Its adjunct of "*Beau Desert*" has long been known, apart from any local "merit," as being without proof. The origin is believed to have been from a family named "Bozart," or "Bussart," connected with the place. But I am unable now to give the date. Probably about 1350.

Doubts, since Lyson's time, have been thrown as to this having been the "*Lygean-Burgh*" of the *Saxon Chronicle*, A.D. 571, one of "four towns" taken from the "Brit-Welsh" (for this seems a natural interpretation of "*Brit-Wealas*" by *Cuthwulf*, after a victory at Bedcanford (Bedford). In the writer's very humble opinion probability is on the side of this, as it was the first place of probable importance on the undoubted line of route.

But "that as it may," there is no doubt that from the considerable details in "Doomsday Book," 500 years afterwards, it was then a place of no trifling repute. The tolls of its market (still the largest for a considerable distance), being then "7*l.*" per annum, a very considerable sum for that date. It is now the second parish in extent, 8,000 acres, to Luton (16,000), in its county, and has a much more unusual feature in this part of the kingdom, four ancient Chapels of Ease; one of them, Stanbridge, a small three-aisled "church," possessing also a peal of five good bells, and having, though a hamlet, given name to a "Half Hundred," three or four parishes, in "Doomsday Book."

The population, about 3,500, with the hamlets, in 1801, is supposed to be now about, or upwards of, 7,000. The neighbouring parish, or (Bucks) "railway suburb" of Linslade, from 100 then, has between 1,500 and 2,000. The first modern move in the prosperity of Leighton was the "Grand Junction Canal," sixty years ago; a great boon in the supply and price of coals.

The "Cross," a "market" one (the only other in that county being at Stevenage), was perhaps built about 1400; and has certainly small claims to beauty. The church is a tolerably spacious and neat, though plain, cruciform building, showing to much advantage to railway travellers. Its best feature is the oleanatory (Mr. Rickman says "plastered") with double-windowed bays. A superior and perfect row of stalls is on either side of the chancel. The spire is 192 ft. high,

* See p. 365, *ante*.

and the loftiest within a large circuit, perhaps of forty miles; Olney, 185 ft., approaching nearest.

Here also, as at Dunstable and Ampthill (before alluded to)* are good almshouses. Eight founded, besides other acts, including an augmentation of the poor vicarage, by Matthew Wilks, a simple "Squire," some 250 years ago, the favoured inmates of which receive now eight shillings a week each, besides some fuel and clothing.

An additional church, of moderate pretensions, has been erected for the town; also one long before at Linslade. The "Corn Exchange," in Roman style, is equal to a larger place.

Distress from the unhappily little use now made (it is hoped slightly increasing) of "Straw plait" bonnets, on which the public were appealed to in the *Builder* last year, extends to Leighton and farther.

Wing (Backs) has, also, a lofty and imposing tower window. Here was a grand tenor of six weighing 33 cwt., re-cast lately to 30 cwt. only. (Leighton has the best, though not quite heaviest, pool of eight in Beds* tenor 26 cwt.)

Stewkeley Church (engraved, I think, both in Grose and Lysons), which I once saw, very long ago, appears, except that it has one transept, most resembling Ilfley, Oxford. Some five miles north of Leighton is Bow, Brickhill Church Hill, very nearly 700 ft. high, and seen below Northampton (an "Ordnance survey" station, I was told, about 1800). Bletchley Church (from a very out-of-the-way village, now a still more important railway station), and Fenny Stratford Chapel, both connected with Browne Willis, deserve the notice of the antiquary.

J. D. PARRY.

CONTENTS OF CONICAL HEAP OF BALLAST.

Your correspondent, Mr. Haynes, has given correct rules in this case; but I think an alteration in the formula as below might make it less troublesome in practice,—

$$(d^2 + d^2 + d^2) \times 7854 \times \frac{h}{3} = s$$

or, in words, add together the square of each diameter, and the product of the diameters, and multiply the sum by 7854 and by a third of the perpendicular height. Jos. A. DAVIES.

BUILDERS AND DISTRICT SURVEYORS.

Sir,—I forward the annexed, thinking you may print it in your paper. If builders who do not pay till they are summoned become known to the district surveyors, it may save trouble. N. E. J.

At the Wandsworth police court, June 25th, 1868, before Mr. H. S. Selfe, Mr. George Godbolt, King's-road, Chelsea, was summoned for non-payment of the sum of £5. 6s. due by him to the district surveyor for the district of Central Lambeth and part of Battersea for his fees in respect of a certain building of which he said George Godbolt was the builder. Ordered to pay the sum of £5. 6s., with 12s. 6d. for costs, forthwith.

THE WALWORTH-COMMON ESTATE.

Sir,—Will you kindly allow me to endorse the opinion of "One of the Number," in your last week's *Builder*, that the Guardians should appoint a professional man, of high standing and character, to report upon the plans? It appears to me quite unreasonable to expect that, without such assistance, they will be able to arrive at a just and satisfactory conclusion. I would also beg to submit other suggestions, which I think should be taken into consideration, either by the Guardians or by the gentleman who may be appointed as aforesaid.

1. That all plans not strictly adhering to the "Instructions" should be put out of the competition. If they should be more suitable plans than the others, let the competition be decided regardless of them, and the Guardians afterwards adopt such one of them as may prove the best.

2. That those plans which disregard the laws for the better local management of the metropolis in having only one entrance to some of the streets be also set aside.

3. That in considering the relative merits of the designs the plan for laying out the land should be the first consideration, and the elevations of the buildings the next, as these may be varied *ad infinitum*.

4. That in calculating the income to be derived from the estate (which is doubtless a subject of importance) care should be taken not to give the sole preference to the amount of frontage regardless of the space left open by fore-courts, gardens, or yards for ventilation.

5. That short streets enclosing square blocks of build-

* See p. 428, ante.

ings, with plots of but little depth, must be very objectionable on the score of health.

6. That courts, alleys, and small plots must be very detrimental to the health and respectability of the neighbourhood, and calculated to increase the poor-rates and reduce the frontage value.

7. That right-angled streets and plots are usually most advantageous and economical.

ANOTHER COMPETITOR.

PORTABLE GAS-STOVES.

Sir,—The advantages of gas-stoves, especially in warm weather, are too obvious to require any comment. Where there is gas laid in a house, they can easily be made use of; but there are many houses, both in town and country, into which gas has not been introduced, and there they are unavailable, unless an apparatus is attached to them for generating gas. This can be easily done, as is shown by the great variety of portable gas-slamps for lighting purposes now manufactured; but I have not been able to find any gas-stoves with such apparatus, and I will feel much obliged if you, or any of your correspondents, would inform me where an article of the kind can be had. Spirit-lamps answer the purpose pretty well; but they are too expensive for general use; and, besides, they do not afford the same degree of heat regulated according to the degree of heat required. I have spoken about this to gas-engineers, but none of them appeared to see the importance of it, though I feel satisfied that if a thing of the kind, not too expensive, were to be brought out, it would command a very large sale. A LINGERER.

LINCOLN AND NOTTINGHAM DISTRICT SCHOOLS.

Sir,—As there is at present a competition advertised emanating from Lincolnshire, it may interest your readers to know how a similar thing has been managed there. The Lincoln and Nottingham Union Schools were advertised, and several plans submitted, ranging in estimate from 12,000l. to 22,000l. The committee met, and, I believe, rejected all the "high-priced" plans; that is, not the more elaborate ones, but those whose authors had given what they believed to be the real cost. No test, as I hear, was taken, but the superficial feet of each design I append below, as sent in a printed list to me:—

	Super. feet.	Estimate.
Cooke.....	9,178	£23,000 0 0
Giles & Biven.....	6,014	13,000 0 0
Peyton & Co.....	8,466	19,000 0 0
Hendray & Kingsburgh.....	3,684	18,000 0 0
Lee.....	11,962	14,000 0 0
Peck.....	8,704	12,000 0 0

Gut of this list the committee selected the design of Mr. Peck, covering 8,764 ft. super., and to cost—everything being of the best description—12,000l.

I may mention that heights and spaces for beds, &c., are in all the designs alike, so that a comparison is easy, and a notion may be formed that about 1½. per cubic foot is the calculation of the supposed cost.

Some of your readers may perhaps know something of the value of buildings of this kind, and will give their opinion on the subject. I would, with your permission, ask them to do so, believing that the time has come when architects may fairly ask from fellow competitors for fair and proper estimate of the designs they submit. I trust you will aid this object. A COMPETITOR.

"SINK TRAPS."

Your correspondent "M. A. B." in your issue of the 13th ult., complains of the inefficiency of the bell-trap: that I have for some time found to be a great objection in house-drainage, in which I have had much experience, and have been led to adopt another principle (and do so now) with the bell-trap where practicable, viz., in connecting the waste-pipe from the sink with the branch drain, to fix an ordinary S siphon outside the building, and allow the waste-pipe to dip into the siphon, which being much larger (say 3 in. to 4 in. diameter) than the ordinary bell-trap, we invariably find that they seldom or never choke up, and the siphon being placed outside the building is easy of access should it ever be necessary to examine it.

The above method has the great advantage of economy over the other, as we can have the siphon fixed complete for 1s. 9d. each. J. B.

THE PROPOSED NEW LAW COURTS.

Mr. GOLDSMID, in the House of Commons, called attention to the recent appointment of architects for the new Law Courts, and especially to the claims of Mr. Barry to the appointment, and moved that a select committee be appointed to inquire into the subject.

Mr. Gladstone said that to appoint a committee would be to recommence from the beginning an operation which had been extremely laborious and complicated, and there would be less chance of arriving at a more satisfactory conclusion than that which had been already come to. The only prudent course would be to leave the matter in the hands of the Government, for them to act upon their own responsibility.

Mr. Lowe thought it would be an unwise course to incur a large expenditure by a renewed inquiry into the subject, though at the same time he believed the Government had missed their way, and had not arrived at the conclusion which they ought to have done. They had set aside the fact that Mr. Barry's plan was the best, in regard to its internal accommodation, and they had given the work to an architect whose plan the judges had reported possessed the least merit with respect to that point.

Sir K. Palmer, as one of the judges, said that while there could not be any doubt that it was a main and leading point, they should attend to the internal uses for which the building was intended, yet they certainly did not think they were to pay attention to this point alone. They considered that where the internal arrangements clashed with architectural effect, they were in that case

to give a preference to the former; but it would have been a great injustice to judge the plans merely upon the simple point of their internal arrangements. Though Mr. Barry's was the best in this respect, yet unless it had been also the best in other respects, could they recommend it for absolute adoption? As to the point before them, it was a fallacy to suppose that the Government were to be bound by the opinion of the judges, who had failed to make any selection of a plan as judges.

Mr. Hope did not think any good would be attained by appointing the committee asked for.

Mr. Hoag thought that the two architects who had been bracketed together might have had the building entrusted to them jointly. He did not think the building could be placed on the site that had been prepared for it, and he suggested that the Chancery Courts should be placed on the site, and that the Law Courts should be placed on the Thames Embankment, Mr. Street being entrusted with the erection of one, and Mr. Barry with the other.

Mr. Powell hoped that whatever they did they would not have the court in two divisions.

Mr. Writterbotham believed that the difficulty had arisen by adding Messrs. Shaw and Powell to the five judges already appointed. Messrs. Shaw and Powell were added at the request of the London architects from a trades union feeling against Mr. Waterhouse, who came from another part of the country, and whom they wished to exclude. He supported the reference to a select committee.

Mr. Childers hoped the suggestion of having two courts would not be listened to.

After a few words from Mr. C. Bantick,

Mr. Pease said Mr. Street had only proved himself a snigger in this respect, and he would have followed Mr. Street would have been called for a new competition. They considered, however, that it would be unwise to pursue that course, inasmuch as they had already come to a decision which in the main should be fair, and at the same time give security to the country and the profession that a proper building would be erected. He reminded the House that a petition had been presented from the judges and officials of the Divorce and Probate Court, stating that although they were to occupy one-fifth of the new building, yet the arrangements for them were of a most inefficient character in Mr. Barry's plan. Therefore, if the Government had appointed Mr. Barry to be architect of the interior and Mr. Street to be architect of the exterior, this result would have followed; Mr. Street would have been able to carry out his own design, while Mr. Barry would have had the mortification of finding that his plan for the interior would have to be mysteriously altered before it would give satisfaction to one important branch of the new courts. To re-open this subject after the decision of the Government would only make the complications worse.

The motion of Mr. Goldsmid was negatived by a majority of 90 to 45.

A PREMATURE DEATH.

THE *Sydney Morning Herald*, of May 1st, records at some length the melancholy death, at the age of 29, of Mr. Thomas Duckett, late a pupil of Mr. Thornycroft, and a young sculptor of great promise, who had been in his studies and made the journey to Rome, was preparing for the contest in the grand arena, when he was recommended to visit the Australian Colonies for the purpose of averting consumption. But the voyage was taken in vain. During his absence his young wife died, and two little ones are left orphans.

Mr. Duckett had been advised to visit the Australian Colonies for the purpose of averting consumption. But the voyage was taken in vain. During his absence his young wife died, and two little ones are left orphans. Mr. Duckett had been advised to visit the Australian Colonies for the purpose of averting consumption. But the voyage was taken in vain. During his absence his young wife died, and two little ones are left orphans.

THE "OWNERSHIP" OF ST. PAUL'S, CAMDEN-SQUARE.

In the Court of Common Pleas (sittings in Banco, before Mr. Justice Willes and Mr. Justice Byrne), the *Vestry St. Pancras (Appellants) v. Thomas (Respondent)*. The facts of this case were these:—The respondent, the Rev. A. R. G. Thomas, was incumbent of the church of St. Pancras, and the Vestry of the same church summoned him before Mr. Justice at Chancery Lane, to show cause why he should not pay 683l. 6s. 10d., the estimated cost of making a new road and footway round the land on which his church stood. The question of the respondent's liability depended upon whether he was "owner" of the church and land within the meaning of the Act of Parliament. The churches in the parish of St. Pancras are under the management of a board of trustees, and these gentlemen received the pre-rents of the respondent's church, and paid him his stipend out of the amount so received. On the one hand, it was said that the legal estate was in the respondent; but, on the other hand, it was contended that the possession of the legal estate did not necessarily imply an ownership within the meaning of the statute. The Metropolitan Local Management Act defined the "owner" as the person who received the rack-rent. The appellants said that the respondent was entitled to vote for a member of Parliament in respect of his interest in the church; but to this he replied that he claimed to vote not as the owner of the land, but in respect of his interest in the benefice. Mr. Justice Wille said that the parties, besides the respondent, had submitted the question, decided in favour of the respondent, and dismissed the summons. The question raised for their lordships was, whether he was right in his decision. The court held that the respondent was not liable, and they dismissed the appeal.

Sanitary Regulations for Work-shops and Work-places.

The Sanitary Committee of the Legislature have issued a notice, under the advice of Mr. Ballard, their medical officer of health, a portion of which we may usefully reprint:—

"SANITARY ACT, 1866, AND WORKSHOPS' REGULATION ACT, 1867.

The following are among the more important regulations of the above Acts, which are applicable to all places not under the operation of the Factory Acts. It is the duty of the Vestry to see that they are observed in this parish.

1. Work-rooms and work-places must be kept in a sanitary condition.

2. They must be well and effectually ventilated, so as not to endanger the health of the persons employed therein.

3. The Medical Officer of Health will regard any work-room not sufficiently ventilated in which an unpleasant animal odour is perceptible, or in which the temperature is found materially to exceed that of the external air during the warmer months or 60° in the colder months of the year.

4. No overcrowding of workrooms is permitted; that is to say, the number of persons working in any room must be so great as to endanger their health.

5. The Medical Officer of Health will regard any work-room to be overcrowded, in which for the number of persons employed therein a sufficient ventilation as above described cannot be constantly maintained without exposure of the work-people to dangerous draughts; also any room in which a floor-space of at least 30 superficial feet cannot be allotted to each person, or in which the cubic space of the room is such that at least 300 cubic feet of air are not allowed for each person.

6. The superficial floor space of a room is found by multiplying its length by its breadth; and the cubical space of a room by multiplying the result of this by its height.

For example:—A room 25 ft. long and 15 ft. wide = 375 ft. of the surface, and (if properly ventilated) can be occupied by ten work-people, provided that it is not less than 8 ft. in height = cubical capacity of 3,000 ft. If less than this in height, the floor space must be proportionally larger, or the number of occupants reduced.

7. An infringement of any of the above three regulations will render the master or mistress liable to prosecution under the 19th section of the Sanitary Act, 1866, and the Penalties Removal Act.

THE CONSTRUCTION AND FITTING-UP OF METROPOLITAN WORKHOUSES.

The Poor-Law Board have just issued a circular letter informing the Guardians of the Poor in London, that they have prepared instructions or the guidance of architects in the construction of workhouses and workhouse infirmaries. These instructions are intended "as a general guide to the architect employed by the Guardians, and are not designed unduly to fetter his discretion in the preparation of plans for the consideration of the Guardians, or to apply to every detail connected with the construction of the workhouses;" but the Poor-Law Board say that "they will generally be guided by these instructions when considering plans which may be submitted to them for their approval." With regard to the fittings, the circular says:—

"It appears to the Board to be desirable that there should be a nearer approach to uniformity in the mode in which workhouses are furnished, and they are of opinion that whilst for the ordinary wards only a few conveniences, and those of a simple character, are required, the sick wards should be more carefully furnished, and all the necessary medical appliances supplied. It is the duty of the medical officer, under the regulations of the Board, to suggest the number of articles that may be required from time to time, and they do not doubt the Guardians will usually consider such suggestions, or that they will be made by the medical officer with all reasonable discretion and with due regard to economy."

CHURCH-BUILDING NEWS.

Arnold.—The church of Arnold, a village in Nottinghamshire, has been closed for some time past for general restoration and improvement, and is now re-opened. The restoration has been at present not partial, as there yet remain the chancel and porch and other parts in an incomplete state. The work has been carried out under the management of Mr. Henry Currey, of London, the architect for the new St. Thomas's Hospital, and of Mr. S. Dutton Walker, of Nottingham, architect. Owing to a dispute with the contractor, and other difficulties, the work has been more than two years in progress. Amongst other difficulties with which the architects had to contend was the insecure state of the arcades, which were at least 10 in. out of the perpendicular, and which upon examination were found to be absolutely without any solid foundation, growing to original faulty construction, and to the numerous burials which had taken place. Saw-grooves were out in the stonework of the inclining piers, and the whole arcade was heeled

over until it had attained a perpendicular line; and this was done without crack or flaw, every pier being underpinned with a solid foundation. The whole of the stonework and tracery of the exterior of the building has been repaired, the gallery at the west end have been cleared away, new benches have been placed in the nave and aisles, new floors laid, the windows re-glazed, new roofs constructed, &c.

Gretton.—The church here has been rebuilt and re-opened. It is situated close to the high road between Winchcomb and Tewkesbury. Its tower and spire, which rise to the height of about 100 ft., are visible from most parts of the surrounding country, and may be discerned even so far off as Malvern. The plan of the church consists of nave, chancel, south transept, tower (the lower part forming a porch), and a vestry on the north side of the chancel, from which it is separated by an arch. The design is Decorated, the walling being constructed of Guiting stone, with Bath stone dressings. The spire is wholly of the latter material, and the roofs are covered with Staffordshire tiles. The tower adjoins the transept, and is square at the base; at the helix stages it diminishes to an octagon, which form it preserves to the top. The windows are in part single lights, and in part coupled. Three of these windows are filled with stained glass, by Messrs. Hardman, and it is contemplated to fill the remainder also in like manner. In the gable of the transept is a rose window, consisting of a series of circles with trefoil cusps, arranged round a central circle, also cusped, the whole being comprised in an outer circumscribing circle. Of similar character, though differently treated, is the west window, which is a large composition of four lights, under a pointed head, and having lofty jamb moldings. In this window, as well as in those of the apse, chancel arch, and principal doorway, are introduced shafts of various, coloured stone. The roofs throughout are open, and differ in design in the several parts of the building. In the chancel the principals spring from stone corbels, carved as angels bearing shields, and picked out in gold and colours. The seats in the nave and transept are of deal, those in the chancel are of oak, as are also the pulpit and desk. The floors are paved throughout with tiles, plain and encaustic, in various patterns designed by the architect, and the chancel is lighted by a brass corona. A medal has been struck as a memento, and presented by Mrs. Dent to those who have been most engaged in carrying out the work. It bears on one side a view, in relief, of the church, and on the other an inscription. Mr. J. Drayton Wyatt, of London, was the architect, and Messrs. Collins & Collis, of Tewkesbury, were the builders.

Clifton (Bristol).—The new church, dedicated to All Saints, has been consecrated. It will, when completed, be one of the largest in the city, taking the place, so far as extent and solidity of construction go, between churches of an ordinary size and a cathedral. When finished it will accommodate 1,200. At present, however, the structure consists of only a portion of the original design. The whole design, when carried out, will cost somewhere about 20,000l. The plans were made by Mr. G. E. Street, who has designed the structure in the transition period (Gothic). For some time the work was left in abeyance. The chancel, with its side aisles, the vestries adjoining, and the pillars of Mansfield stone supporting the nave, were erected, and the foundation of the whole building built up to a certain height. Recently a temporary nave, for the accommodation of about 500 persons, and constructed so as not to interfere with the erection of the original design over it, has been formed of stonework, inside the pillars of the original design. The pillars supporting the arches and the chancel are formed of alternate hands of Pennant, red sandstone, and freestone. The whole of the chancel is paved with Minton's tiles.

Sedgeberrow.—For some months past the parish church of Sedgeberrow has been closed during the progress of extensive works of restoration and decoration, which have been carried out at the sole expense of Mrs. Barber, widow of the late rector of the parish, as a memorial of whom the work was initiated. The church consists of nave and chancel only, the nave terminating at its western end in an octagon tower, surmounted by a spire of about equal height, and reaching an entire altitude of 104 ft. The exterior works of the present restoration comprised the rebuilding of about two-thirds of this spire, which has been fitted with Newell's

lightning conductor, carried through the vane, and a galvanised iron cross, the entire reconstruction of the roof, and the rebuilding from the window-heads upwards of the exterior walls. Entrance to the interior is obtained through a porch, in keeping with the rest of the edifice. The roof is an open ribbed one of English oak. The seats are uniform and open, with pierced backs and carved ends. The floor is of English oak, the nave and chancel being paved with Minton's red and black encaustic tiles, interlaced with stone bands. The nave and chancel are divided by a carved oak rod-screen, filled in with tracery. Most of the windows throughout the church have been, and the rest are, understood, in due course to be, filled in with painted glass, painted by Mrs. Barber herself. The works have been carried out at a cost of upwards of 2,000l. The architect employed was Mr. W. Butterfield.

Blitchley.—The parish church of St. Mary has been restored and re-opened. The whole of the exterior has been restored in Ancaster and Bath stone. The interior has also been restored, the incrustation of brickwork and other materials used in the "churchwardening" process having been removed. The most conspicuous alteration is in the chancel, all the windows in which, together with the doorway, have been altered so as to harmonize with the original character of the building. In the east side is a five-light traceried window, with trefoils and quatrefoils in the head. There is a screen, consisting of a canopied centre panel, surmounted by a foliated cross, and two narrow side panels of Painswick stone, with carved caps and bases, and Mansfield red shafts. In front is a detached cross of Mansfield stone, carved, backed by a painting of radiated nimbus in the centre panel, the side panels being diapered, with an angel in the centre beneath the cusping. The chancel is fitted with return stalls of carved oak. The ceiling of the chancel, "painted," says Lipscomb, "with extravagant expense, but little taste," representing the twelve Apostles, has been preserved, partly in deference to the memory of Browne Willis, and partly on financial grounds. The body of the church has been fitted with oak seats, and a paving of wood blocks under the seats, the other portions of the floor being covered with Minton's tiles and the old paving. The old tower had fallen into a state of dilapidation which was almost dangerous. The "four handsome pinnacles of the angles," commemorated by Lipscomb, have been removed, as out of character with the rest of the building. The clearstory windows and parapets have been entirely removed. The whole of the work has been executed under the superintendence of the architect, (Mr. W. White), by the contractor, Mr. Kimberly, of Banbury; the carving was done by Mr. S. Allen. The entire cost has been 2,300l. The chancel has been restored by the rector, at a cost of 550l. An organ, designed by the Rev. W. G. Corker, of Fenny Stratford, and built by Mr. T. Atherton, Leighton Buzzard, has been placed in the north aisle.

Limbury.—The new district church of Limbury-cum-Biscot, by Luton, has been consecrated by the Bishop of Ely. The church, which has been built at the sole cost of Mr. John S. Crawley, consists of a nave 58 ft. by 26 ft., a chancel 35 ft. by 20 ft., a north chancel aisle 16 ft. by 10 ft., divided from the chancel by a double arch, supported on a polished marble pillar, an organ-chamber, a sacristy, a north porch, a double bell-cote, and a warming crypt. The style is Decorated. The walls, which are 3 ft. and 4 ft. thick, are faced inside and out with light-coloured bricks, relieved with others of a deeper tone, and cased with chalk. All the dressed work is out of freestone. The roofs are open-framed of pitch pine, covered with heavy green slates, and are boarded and felted. The benches are also of pitch pine. The aisles are laid with encaustic tiles, and the chancel-hall below the windows is faced with similar tiles supplied by Mr. Godwin, of Hereford. The pulpit and font are carved, the former diapered. An oak screen separates the chancel from the nave, and the chancel is fitted with stone sedilia, piscina, and credence. The church was erected by Mr. Gough, of Bishop's Castle, builder, from the designs and under the superintendence of Mr. T. Nicholson, of Hereford, the diocesan architect.

Curbar, Derbyshire.—All Saints' Church, Curbar, has been consecrated. The church is a Gothic structure, which has been erected by the exertions of the Rev. J. Stookdale, the incum-

bent of Baslow. The edifice is completed and opened at a cost of from 1,800l. to 2,000l. There still remain to be built a passage and schools towards which there is a sum of 200l. or 300l. in hand. The Duke of Rutland gave the site. The architect is Mr. A. Salvin, jun., of London; and the builder Mr. Ashwell, of London.

Bebbington.—The Bishop of Chester has consecrated the Church of England portion of the new cemetery at Bebbington. The cemetery is situated about the centre of the parish, some 500 yards from Old Chester-road, on the south side of Rock-lane, which leads to Higher Bebbington. There is a main entrance from Rock-lane, and a drive, 24 ft. wide, leading to the chapel, which is erected on the crest of the ground forming the main entrance. On either side, about 100 yards inside the ground, and the same distance apart, facing each other, are the Nonconformist and Roman Catholic chapels, the Nonconformist being on the left hand side when you enter.

Neath.—We are requested to state that the gas-fittings of St. David's Church were provided by Messrs. Hale & Sons, of Bristol—not Hall, as misprinted.

DISSENTING CHURCH-BUILDING NEWS.

Lindley.—The new Wesleyan chapel, which is now nearly completed, was recently opened. It has been designed in the Geometric style, by Mr. George Woodhouse, of Bolton. The principal façade faces East-street. It is set back some 30 ft. from the canalway. The approach is flagged with sawn flags. This front has two side and one central entrance-door openings, each having a flight of three steps to the threshold. The ground-floor story has a frontage of 60 ft. To the left, with its west and south front, is the tower, 13 ft. square on plan. Above the foundations of this tower, which have been sunk below the workings of an old quarry, is a base course, 2 ft. 6 in. deep, the upper part of which is splayed and moulded. The whole is crowned with a light ornamental cornice on the four sides. The principal decorative feature in the front is the large four-light window. It is 22 ft. high and 11 ft. wide. The whole of the windows are glazed with selected rolled glass, in diamond panes, with coloured borders, executed by Messrs. Edmundson, of Manchester. The outer walls throughout are built of pitch-faced wall-stones from the Elland-edge quarries. The roof is a steep Gothic pitch, rising 30 ft. high from the square. The roofs are all hoarded and covered with felt, on the top of which are laid the slates, in blue and green bands. The ridge has an ornamental ridge-cresting, set in cement. The following contractors have executed the several works:—Masons' work, Messrs. Thos. & Geo. Rhodes; joiner and carpenters, Robert Whiteley; plasterers, I. Jowitt; plumber's, H. Garton; painter's, John Brook; slaters', Goodwin & Sons; gasfittings, J. W. Dovers, of Manchester. Accommodation is provided for 650, and the cost of the whole works, not including architect's commission, is expected to be about 3,600l.

York.—The new Baptist church has been opened for divine worship. The edifice is situated in Priory-street, Micklegate, and will accommodate about 700 persons. The building stands with its side to Priory-street. The style is the Early Decorated. The plan consists of a nave and aisles, with transepts. The extreme length of the nave is 78 ft., the width, 24 ft. 6 in.; height to the eaves above the clearstory, 32 ft. 6 in., and to the collar beam of roof (where it is ceiled) 44 ft. 6 in. The extreme width is 44 ft. between the aisle walls, and 49 ft. 6 in. across the transepts. The arcade below the clearstory is of brick, with plaster mouldings, and supported upon cast-iron columns, with foliated capitals. A gallery has been erected over the aisles and across the ends over the vestibules. The front of the galleries is in pitch pine, with Quebec pine panels in the lower part, and ornamental ironwork in the upper part, the framing being relieved with ornamental chamfering. The iron columns supporting the arcade divide the gallery front into bays, as they are seen the entire height. The seats are all open benches, with ornamental ends. Behind the church, with its end to the street, is a lecture-room, 40 ft. by 21 ft., ministers' vestry, lobby and staircase to schoolroom, which is 45 ft. by 25 ft. The timber work of the roof of both church and school is exposed to view. The exterior is faced with stone, the dressings in

Whitby stone, and the walling of Bradford sets in thin beds. The side being to the street is the principal front. There is a tower at the entrance corner towards Micklegate, containing one of the staircases to galleries. The tower itself is to the top of the parapet 54 ft., and to the top of the pinnacles 61 ft. It is covered with a high-pitched roof of ornamental slating, having iron cresting on the roof. The architect was Mr. W. Peachey, of Darlington. The contractors for the several works were for the brick and stone work, Messrs. C. Bowman & Co.; plastering, Mr. Croft; slating, Mr. T. F. Wood; carpenter and joiner's, Mr. W. Bellerby; plumbing, gasfittings, and glazing, Mr. J. Dickinson; painting, Mr. Poulter; smith and ironfounder's, Mr. Bonsfield; and warming, Messrs. J. Longbottom & Co. The cost, including everything but school fittings, was 3,538l., and the total cost, including the land, about 5,000l. This does not include the cost of the organ (nearly 200l.), erected by Mr. Postill, organ builder, of York.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Longton.—The corner-stone of a new church has been laid here in the presence of Dr. Ullathorne, Roman Catholic Bishop of Birmingham. The site of the new building is Heathcote-road, a short distance from the existing edifice. The new church will be in the Early French Decorated style of Gothic architecture, and will accommodate 1,000 persons. It will be erected of Staffordshire red brick, with Bath stone and Hollington stone dressings. It will be a parallelogram in form, the nave being 138 ft. long by 36 ft. wide, with two aisles 110 ft. long by 14 ft. wide. The external height of the building is to be 78 ft. The nave will terminate in a pentagonal apse, and will be divided from the aisles by nine equilateral arches resting upon columns 17 ft. high, formed of Mansfield and Paisley stone. The sanctuary is to be raised 4 ft. above the body of the church, at the end of which will be placed a reredos, made of Caen stone, with marble columns in various colours, and cappings of the same material, the gift of a private benefactor. The sides of the sanctuary will be lined with polished oak stalls, and the pavement will be laid with Milton's encaustic tiles. The roof over the sanctuary is to be formed with a concentric groin. The rest of the sanctuary will be covered with a timber roof decorated. The nave is to be divided into eight compartments by framed and moulded principals, with painted and gilt iron roses at the several junctions. The same will be divided and sub-divided with framed and moulded ribs, the intervening spaces being filled with plaster, which will also eventually be decorated. The organ-loft will be placed at the west end, and supported by a stone arch extending the entire width of the nave. Above the organ will be placed a western rosette window 18 ft. in diameter. The roofs will be covered with green and purple slates in various devices. Attached to the church are to be extensive sacristies, and also a presbytery for three priests. The plans further contemplate a south-west tower and spire. Independently of the site, the cost of the work already contracted for is about 5,000l.; this being exclusive of fittings, carving, and the contemplated tower and spire. The architect is Mr. E. W. Pugin, of Ramsgate; and the builder is Mr. Geo. Heveningham, of Wolverhampton.

STAINED GLASS.

St. Michael's, Worcester.—The chancel window of St. Michael's Church, Worcester, has been filled with stained glass by Messrs. Duncanson & Davies, of Shrewsbury. The design was chosen and executed under the direction of Mr. H. Bennett, who presented the window to the church. The subject, which occupies the three openings of the window, is the Crucifixion. In the upper part of the centre opening is our Saviour on the Cross, looking towards the penitent thief, who is in the side opening on His right hand, the impenitent thief being in the side opening on His left. At the foot of the cross are Mary Magdalene and His mother.

St. John's, Cowley.—A stained-glass memorial window of three lights has just been placed in this church. The subjects are the Marriage at Cana, the Man at the Pool of Bethesda, Raising

the Widow's Son, Christ blessing Little Children, and, in the centre, our Lord raising Lazarus. The detail of the window is grisaille, the subjects in the centre being surmounted by a canopy. It was designed and executed by Mr. Baguley, Newcastle-on-Tyne. The east window of same church is in hand, by the same artist, the Rev. R. M. Benson, of Cowley, and is shortly to be erected.

Abbey Church, Cambridge.—One of the windows of this church has been filled with stained glass in memory of the late Mrs. Preston, widow of Mr. T. Preston, of the Abbey. The central opening is filled with the Crucifixion, and the Saviour is surrounded with an aureole of glory, on a blue and ruby ground-work; latter representing heaven and the former earth. In the trefoil above is an angel holding the emblem of the Trinity; at the base is the emblem of our Saviour, with ornamental work. The left-hand opening contains the Nativity; the right, the Baptism. The windows are under Early canopies. At the base of the outer subjects is the Alpha and the Omega, surrounded with ornamental ground-work. The trefoil above there are angels holding scrolls. The artist engaged was Mr. Constable, Warwick.

Kimbolton Church.—A stained-glass window from Messrs. Avery & Sons, London, representing the Resurrection of our Lord, and the appearance of the Angel to the Marys at the Tomb, has been placed in one of the windows on the south side of the church. The window is erected to the memory of the Rev. T. Ainsworth, the late vicar.

Bulkington Church, near Nuneaton.—There has been recently fixed in this church, by Messrs. Holland & Son, of Warwick, a stained-glass memorial window containing the subjects Healing the Sick and Raising Lazarus to Life, surmounted by canopies in a floriated treatment containing figures of Faith and Hope, an angel in tracery holding a scroll, with the words, "Faith is the substance of things hoped for." An inscription is placed at the foot of the window.

SCHOOL-BUILDING NEWS.

Carlton (Nottingham).—The chief stone of new national schools for Carlton has been laid. When completed they will accommodate 400 children. The schools will be situated almost in the centre of the village. There will be three rooms, 50 ft. by 20 ft. each, the class-rooms behind. Messrs. Goddard & Son, Lincoln, the architects, propose to erect the buildings in the Tudor style. The builders are Messrs. Key & Cave, Carlton.

Stratford, Essex.—New schools are now in course of erection in the district of St. Paul's Stratford. They are being built of stocks with brick dressings. The contract has been taken by Mr. James Rivett, of Stratford, builder, for 2,400l. Mr. Henry Ough is the architect and the building is being erected under his superintendence. The foundation-stone was laid on the 6th instant, by Mrs. T. Ewel Buxton, whose family have been great benefactors to the district. St. Paul's district contains more than 10,000 inhabitants, principally mechanics and labourers, without any schools; and it is feared from the great difficulty experienced in making up the present deficiency of 500l. it will be necessary to postpone the erection of the boys' and girls' school.

Prittlewell (Chelmsford).—The new national schools recently erected are now open. The building, which is Ecclesiastical in style, is situated at the south end of the church, and is in keeping with its architecture and general character. The architects were Messrs. Wenham & Blake, of Westminster, and their designs have been carried out by Mr. Carter, of Rochford, builder, at a cost of 1,500l. The school-room, which can be divided by a temporary partition into boys' and girls' rooms, is 54 ft. long by 24 ft. wide, and will accommodate 180 children. The benches have been constructed under the superintendence of Mr. Edmunds, of London. In their ordinary position each forms a bench with a lean-to behind, but the back can be opened so as to form a level desk for reading, and by touching a spring this becomes a writing-desk sloping at an angle of 45 degrees, while by joining two benches together with the desks in the level position a table is formed, 10 ft. long by 4 ft. wide, with seats on each side. Opening from the schoolroom is a class-room, 18 ft. square, which is also intended for readings, con-

certs, and other parochial purposes, and is provided with a moveable platform suitable for such occasions. Adjoining the schools is a residence for the master and mistress, the style being uniform with that of the school buildings.

Chester.—The Bishop Grabam Memorial Ragged School, in Princess-street, is now completed and opened. The building has been designed by Mr. W. M. Boden, of Chester, architect; and Mr. Edwin Harrison was the builder. The elevation presents a porch with two doors, divided by a shaft of slate, with carved stone capital. Above the doorway is a statue (executed by a Chester artist, Mr. Griffiths) of the late diocesan, Dr. Grabam, as a tribute to whose memory this school has been erected.

Miscellanea.

MEMORIAL TABLETS.—At the annual meeting of the Society of Arts, it was stated that leave has been obtained to affix tablets on the former residences of Benjamin Franklin, Sir Joshua Reynolds, Lord Nelson, and James Barry, but that the progress in fixing these and others had been delayed by experiments in the manufacturing, which Messrs. Minton, Hollins, & Co. have been making.

ELECTRIC ORGAN.—An electric organ, which will shortly be opened by Mr. Glenn Wesley, is being built by Bryceson Brothers & Co. for Christ Church, Camberwell. This organ is to be placed in a chamber on the south side of the chancel above the vestry, but the organist will sit on the opposite side amongst the choir, some 40 ft. distant from the organ. The electric system is forthwith to be applied to the organ in St. Michael's, Cornhill, Messrs. Bryceson's contract having been accepted for the entire reconstruction of this large organ. The manuals will be placed at a distance of 30 ft. from the instrument. Various pressures of wind and other improvements will also be introduced.

CROPS FROM LONDON SEWAGE.—At the usual meeting of the Metropolitan Board of Works, the chairman said he had received a letter from Mr. Hope, of the Essex Reclamation Society, in reference to the effects of sewage manure applied to the land. In this letter Mr. Hope said—

"Here with I have the honour to send duplicate specimens of the samples of our crops, which we are exhibiting at the show of the Essex Agricultural Society this day. Some of the samples are quite unprecedented. The sample of wheat is grown on a piece of land which bore the same crop last season. The oats, which are perhaps the most extraordinary ever seen, have been produced by the unexhausted manure left on the land by the application of 4,000 tons of sewage per acre last year to a piece of land from which we got last season 71 tons of grass per acre. This is a conclusive refutation of those enemies who pretend that sewage farming exhausts the land. I trust that these samples will be interesting to the Board."

Some specimens of wheat, barley, oats, potatoes, and strawberries accompanied this letter, and were of extraordinary size and quality.

THE MARQUIS TOWNSEND'S SCHEME FOR IMPROVING THE GOVERNMENT OF THE METROPOLIS.—A Bill has been presented to the House of Lords by the Marquis Townsend, "to provide regulations for the government of the metropolis in certain matters." This Bill has been made sufficiently comprehensive to bring within its scope a variety of minor but more or less important matters which have not hitherto been deemed of sufficient importance to be dealt with by specific legislation. He proposes to make it a penal offence to drop fruit-peel on a footway; or to ride across a thoroughfare at a greater speed than six miles an hour. Other persons to be subjected to a penalty, not exceeding 40s., are those exposed upon the foregoing offenders are persons exhibiting or distributing pamphlets relating to diseases; women who place themselves outside houses for the purpose of cleaning the windows; and persons who place flowerpots, &c., outside their houses without securing them. Cleansing-sweepers not employed by the guardians of the district in which they ply their calling are to be put down, and a decided nuisance those beggars are. Another object of the Bill is to compel all stall-keepers to take out licenses, under which clauses impose penalties for retaining dead animals in rooms occupied by living persons for more than twenty-four hours, and for conveying hackney carriages persons suffering from infectious diseases. Some of the clauses are not very clear in purpose, and others may not meet with universal approval, but the intention generally is good and useful.

A NEW DYE FROM GAS REFUSE.—A new golden-yellow dyo, called dinitro-naphthyl, has been obtained from the naphthaline of gasworks, by treating a solution of muriate of naphthylamin and nitrate of potash with nitric acid.

LONDON'S DIRT.—Sir: The intolerable noise caused by the wheels of vehicles on the London streets is distressingly painful to many; sleep is often broken by the rasping of midnight cabs and lumbering carts. With the view of silencing this turmoil and ceaseless din, I beg to propose as an experiment to twirl the wheel in a pan of hot thick glue, so as to coat the iron tire, then roll along the ground struck with sand or fine gravel: it hardens quickly, and adheres tenaciously, if not wet or dirty. Any uniform thickness can be insured by a fixed scraper; the composition can be purchased at 2s. 6d. per can. It is gutta-percha and india-rubber dissolved by naphtha. The horse's hoofs and shoes might receive a covering with advantage.—R. T.

M. MUSARD'S STABLES.—The Paris papers give the following description of the new buildings to M. Musard, of musical fame:—The visitor enters beneath a vast *porte cochère* into a vestibule entirely unroofed by glass, whence, without the trouble of moving from his divan, the master of the establishment can survey his equine property. On the right are eleven loose boxes, at present unoccupied, as monsieur or madame are at their chateau in Normandy. On the left are the coach-houses containing the town carriages,—that is, Victorias, landaus, cocottes, hanches, &c.,—all eight springs. The harness-rooms next occupy your attention: to reach them you pass the stalls belonging to M. Musard's saddle-horses, which are built round a court, the central ornaments of which are three marble fountains. The names of twelve of these fortunate animals are recorded. I spare you the recital, but beg to assert that carpets extend the whole length of the stalls, within which the animals are allowed to repose on ordinary straw.

THE IMPROVEMENT OF GLASGOW.—At a meeting of the Glasgow town council, in their capacity as City Improvement Trustees, held in Glasgow last week, some details were given with regard to the operations of the trustees for the improvement of the city. The committee reported that the loans obtained by the trustees amounted to 393,000l., while the assessments received were in all 64,728l. The committee estimated that they would be able to pay the trustees still 200,000l. below the sum which the trustees authorized them to borrow. The total purchases of property amounted to 291,307l., and the whole expenditure to 274,211l. A considerable number of houses had been taken down in the old parts of the city, with a view to open up densely populated and unhealthy localities, and the work of demolition was still proceeding. On the other hand, the committee had made arrangements for the erection of four blocks of dwelling-houses for the working-classes, and were prepared to proceed at once with a block capable of accommodating about 200 persons. It was hoped that when these houses were erected private builders would come forward and provide for the displaced population, in which case the committee did not propose to proceed further in this direction.

A SANITARY DEPARTMENT FOR INDIA.—At a recent meeting of the health section of the Social Science Association a paper on the necessity of establishing a department for public health in connexion with the Government of India was read by Mr. W. C. Bonnerjee, in which he pointed out the extremely unsatisfactory state of India from a sanitary point of view. Both in cities and in the provinces people die by thousands from preventible disease. In the provinces, he said, there is no drainage, nor even the open-air drains as in towns. No death-rate is kept, but it is known to all the world that the percentage of deaths in India is far above the common. There being no officer to advise the Governor-General in sanitary affairs, the recommendations of subordinate medical officers are not properly considered, and medical officers fear being considered "pushing men." He thought that India would improve in matters of sanitation if there were created a department to look after the public health, and he submitted a plan for the consideration of the Association, which was, that there should be a central board of health in the different provinces, with local boards all over the country, the presidents of the central boards to be members of the council of the governors.

THE SURVEY OF CITY PROPERTY.—An officer is about to be appointed by the corporation of London to make periodical and systematic surveys of the City property. The salary attached to the new office will be 400l. per annum.

DEMOLITIONS IN THE STRAND.—Several of the houses on the north side of the Strand, lying between Wellington-street and Catherine-street, are closed, prior to demolition, for the purposes of the new circus which is to be erected there. The building known as the Strand Music Hall is to be in a great measure rebuilt.

INFANT MORTALITY AT LIVERPOOL.—At a recent meeting of the local health committee, the chairman remarked that there was one serious feature connected with the medical officer's report, to which he wished to call attention. The number of deaths of children under five years of age was 50 per cent. of the total mortality, and it varied little from that every week. It was very extraordinary that the average should be so steady, but he had observed for a long time that the rate kept at 50 per cent.

STANGROUND CROSS.—There has been erected in the grounds of Stanground Vicarage an early cross, which had been doing duty as a footway over a narrow water-course in the village. Before the Conquest there was a church at Stanground, and the existence of the latter ornament raises the question among ecclesiologists whether the cross recently discovered may not have been erected before the time of William I. It is in fair preservation, and the thanks of the antiquary are due to the Rev. R. Cory for preserving this relic.

THE INAUGURATION OF THE LUTHER MONUMENT.—The inauguration of the Luther monument attracted to the small town of Worms sufficient visitors to fill a large capital. As many as 90,000 people were present, who, of course, could not be lodged in the town, and had to seek shelter as well as they could in the villages of the neighborhood. Besides the Kings of Prussia and Wurtemberg, and several of the minor German Protestant princes, about 2,000 clergymen had arrived from all parts of Germany and Switzerland, and even from France, England, and America. The festivities were rather of a serious than a gay character.

SOCIETY FOR IMPROVING THE CONDITION OF THE LABOURING CLASSES.—The annual meeting has been held at Willis's Rooms, St. James's, under the presidency of the Earl of Shaftesbury. The report presented a favourable account of the success attending the various model lodging-houses belonging to the society, as well as several renovated dwelling-houses in different parts of the metropolis. The report was adopted, and addresses were given by the Right Hon. W. F. Cowper, the Hon. A. Kinnaird, Mr. Dimsdale, the Rev. Canon Nisbet, &c. The gold medal awarded to the society at the Paris Exhibition was presented to the president.

ILLUMINATING GAS has many impurities, of which perhaps the most objectionable is sulphur. Some tests have recently been made by Mr. Valentin, of the Royal College of Chemistry, to ascertain the amount of this noxious substance evolved in the combustion of given quantities of the gas supplied by various companies; and it has followed that the purest samples give as much as from 20 to 30 grains of sulphur for every 100 cubic feet consumed. An ordinary fish-tail jet may be said to burn 5 cubic feet an hour. From this and an inspection of his gas hills, a consumer may compute the quantity of brimstone that he diffuses through the atmosphere of his house in the course of a year.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—At the last meeting of this Society on Thursday—Mr. Samuel Carter Hall in the chair—Mr. Wyke Baylis delivered the last lecture of the season, "On Certain Effects of Religion on Art." He showed that for good or evil religion and art have always been associated together, and in the refined idealism of Classic, the devotional character of Medieval, the broad human sympathies of modern art, he traced the influences of the dominant religions under which these schools existed. Mr. Baylis contended that Greek art, in its eleticism, limited itself to few but grand types of human beauty; that Medieval art added new types in heroism or saintly virtue; and that it remained for the modern schools to show that the theme of art should be as limitless as is the splendour of the creation.

PORTRAIT OF BROUGHAM.—A remarkable portrait of Lord Brougham, life-size, is given in the *British Workman* for July, price one penny. It is wonderfully like him as he appeared lately, and a capital specimen of wood engraving for the million.

THE TOWER OF ST. MARY SOMERSET CHURCH, UPPER THAMES STREET.—Mr. Bostwick, in the Commons, asked the Government whether they would obtain, by purchase or otherwise, the materials of the tower of St. Mary Somerset Church, Upper Thames-street, advertised for sale by tender, with a view to the re-erection of the tower in some fitting locality. In reply, however, Lord J. Manners said he thought the Government would not be justified in asking Parliament for the money for the re-erection of the tower referred to.

THE BRADFORD SUPPLY OF WATER.—A season of unusual drought has seriously diminished the store of water in the Stubbin Reservoir, from which two-thirds of the supply for the high-level district are drawn. The waterworks committee at length decided to limit the supply from the high-level service to one day per week, commencing with the following day, when notices to this effect were extensively posted, and naturally created no little consternation throughout the district affected, which includes, besides the high-level parts of the borough, Thornton, North Bierley, Wibsey, Comersal, Birstal, Tong, Yersal, Padsey, and Eccleshill.

BIRMINGHAM ARCHITECTURAL SOCIETY.—The annual meeting of this society was held on Thursday, the 25th of June; the president, Mr. John J. Bateman, in the chair. The report of the council showed that during the past session six papers had been read upon various subjects of interest, and that the present number of professional members is thirty-seven. Votes of thanks were awarded to the returning officers for their services, and the following gentlemen were elected officers for the ensuing year:—President, Mr. A. B. Phipson; vice-president, Mr. Y. Thomson; treasurer, Mr. J. J. Bateman; hon. secretary, Mr. B. Corser.

THE PEEL STATUE IN NEW PALACE-YARD.—Lord Elcho, in the Commons, moved that in the opinion of the House the Peel statue ought to be removed from Palace-yard. No one, he remarked, could say with truth that this statue was an ornament to the metropolis. It ought to be broken up and melted, and a better statue of Sir Robert Peel obtained, as this one was a disgrace to the memory of that great man. Mr. Bunsford Hope said the friends of Baron Marchetti ought to have it put out of the way. There should be a first-class minister, with full control over all matters of art in the metropolis. Mr. Cardwell said the original statue was objected to by Sir C. Barry, as being too large for the site, and Baron Marchetti had made this one at his own cost, and obtained Sir C. Barry's consent to its erection on the present site. Other members expressed their opinion, and Lord John Manners said that, after the public faith had been pledged to the original subscribers to erect this statue, a very strong case ought to be made out before the House sanctioned a violation of the pledge. Lord Elcho's motion was agreed to by a majority of 182 to 71.

MASTERS AND WORKMEN.—The House of Lords, at one of its recent judicial sittings, gave judgment in the case of Weir v. Merry, which was a Scotch appeal raising the question of the liability of masters to their workmen for injuries sustained by the latter in the performance of their duties. The Lord Chancellor, in giving judgment (in which Lord Cranworth, Lord Westbury, Lord Chelmsford, and Lord Colonsay concurred) said that the liability or nonliability of a master to his workmen could not, in his opinion, depend on the question whether the author of the accident was or was not the fellow-workman, in any technical sense, of the sufferer. The duty of an employer, who did not take part himself in the work, consisted only in providing competent persons to do it, supplied with proper materials; that done, his liability ceased, and the fact that an injury had been caused, as in this case, by the act of a person who had been formerly, but was no longer, in the service of the master, but who had been selected as fully competent, would not have the effect of making the master liable, though this person and the injured man could not be technically described as fellow-workmen in a common employment.

THE ART-UNION OF LONDON PREMIUM.—The premium of 200l., offered by the Council of the Art-Union of London, for the best set of designs illustrative of some English literary work or period of history, has been awarded to Mr. Henry C. Selous, for a series of drawings illustrating the romance "Hereward."

SEA WALLS.—Where a man buys land below the level of high water, and which could be daily covered by the overflow of sea-water, were it not prevented by the obstacle of a sea-wall, the purchaser has notice, and is thereby made aware that by law, unless for some custom, or unless some special contract exists exempting him, he is liable to contribute to its repair. The Master of the Rolls thus held in the case of Morland v. Cook—a suit instituted by the proprietors of certain land within the parish and level of Broomhill, in Romney parish, in the counties of Sussex and Kent, to compel the defendants to contribute towards the repair of a sea-wall formed on the southern extremity of the parish, to exclude the inroads of the sea.

NEW WAREHOUSES AT BOSTON, MASSACHUSETTS.—The Donahoe buildings, on Franklin and Hawley streets, Boston, are in the French Renaissance style, for which the Boston streets are noted. The two façades of the block on the two streets above named have together a frontage of 175 ft., with a height of 65 ft. above side-walks. This height is subdivided into four stories, all of which are faced with white granite from the quarries of Concord, New Hampshire, with the mouldings and other enrichments selected from the latest Paris structures by Visconti and other architects who have received the patronage of the Emperor Napoleon. The stonework of the façades is crowned by a double two-story roof. The building has been designed and superintended by Messrs. Gridley J. F. Bryant & Louis P. Rogers, architects. The mechanical execution of the various works has been carried out by Messrs. John W. Leighton; Cranite Railway Company (O. E. Sheldon, agent); George W. & F. Smith; Carlisle & Cummings; Francis Richards; C. Parker & Son; Duffey & Hartnell; and Otis Tufts.

TENDERS.

For rebuilding the Star Inn, Reading, for Messrs. Langton, Burrows, & Co. Messrs. W. & J. T. Brown, architects:—
Wheeler, Brothers (accepted) ... £500 0 0

For the erection of a house in the Downs, Park-road, Hackney Downs, N.E. Messrs. Shaw & Torlington, architects:—
H. E. & A. E. Abery (accepted) £670 0 0

For the conversion of three railway arches at the Surrey end of the Cannon-street Bridge, into a wharf. Messrs. Shaw & Torlington architects:—
H. E. & A. E. Abery £670 13 0
Rawlins 632 0 0
A. & J. Smith 539 0 0
Lewis 475 0 0
Goslin 460 0 0
Holmes (accepted) 420 0 0

For the erection of new farm-buildings at Spring Farm, Bulphan, near Tilbury, Essex, for Mr. J. Mitchell. Messrs. Shaw & Torlington, architects:—
Lewis £245 0 0
Turner 535 15 2
Blake 389 0 0
Horscroft 389 0 0
Larkin (accepted) 290 10 0

Accepted for the erection of a brewery for Messrs. Bentley & Shaw, Huddersfield. Messrs. Davison & Samuel, architects:—

Excavators, Bricklayers, Masons, &c. Work.
Mallinson, Bremnar, & Gledhill £2,620 0 0
Carpenters, Joiners, and Ironmongers' Work.
Rushworth £362 0 0
Ironfounders and Smiths' Work.
Harrison & Bedford £1,800 0 0
Plumbers and Glaziers' Work.
Taylor & Co. £147 0 0
Slaters' Work.
Goodwin & Son £127 9 0
Painters' Work.
Brighouse £48 10 0
Plasterers' Work.
Longbottom £7 5 0

For four shops and houses in Acre-lane, Brixton, for Messrs. Standing & Marten. Mr. Hiscocks, architect. Quantities by Mr. Shrubsole:—
Wardle & Baker £2,500 0 0
Wilkins 2,484 0 0
Blackburn 2,409 0 0
Soper 2,385 0 0
Harrison & Edwards 2,330 0 0
Richards 2,315 0 0
Hosgood & Covert 2,150 0 0
Warr 1,980 0 0
Pierce 1,798 0 0
Minty (accepted) 1,648 0 0

For new school and addition to the Baptist chapel, New Swindon, Wilts. Mr. Thos. S. Laandown, architect:—
Drew £1,405 0 0
Walt 1,317 0 0
Beaven & Son 1,262 9 0
Barrett 1,219 9 6
Sheppard 1,200 0 0

For new roads and drains, Morden, Surrey, for Mr. E. Garth. Mr. Charles Rowe, surveyor:—
No. 1 contract. No. 2 contract.
Doggett £2,251 19 8 £1,933 5 10
Topell 2,241 19 8 1,923 10 4
Holmes 2,277 0 0 1,739 10 0
Bloomfield 2,250 0 0 1,888 10 0
Neal 2,210 10 0 1,790 0 0
Clarke 2,231 10 0 1,897 0 0
Goodair 2,212 0 0 1,892 10 0
Blackman 2,237 10 0 1,772 10 0
Parker 2,150 0 0 1,510 0 0
Osentor & Co.† 2,082 0 0 1,882 0 0
Pezzey 2,119 0 0 1,790 10 0
Rough 2,150 0 0 1,510 0 0
Coker, Junr. 1,823 0 0 1,344 0 0

* Accepted for No. 2 contract (conditionally).
† Accepted for No. 1 contract.

For memorial synagogue, Chatham. Mr. H. H. Collins, architect:—
Naylor (accepted) £4,000 0 0

For model farm-buildings, Cutsey. Mr. J. Watson, architect:—
Shobrook & Son £5,287 0 0
Harvey 5,178 0 0
Goslin 5,160 0 0
Pollard & Son 4,900 0 0
Gibson 4,800 18 0
Calt & Pethick 4,900 0 0

For building warehouse for Messrs. Turner, Nott, & Strong, West Bate Dock, Cardiff. Mr. J. Hartland, architect. Quantities supplied:—
Estate & Co. £2,394 0 0
Webb, Brothers 2,390 0 0
Cooper & Day 2,325 0 0
Lock 2,284 0 0
Sheppard 2,290 0 0
Seager (accepted) 2,200 0 0

For labourers' cottages, at Binfield, Berks, for Mr. P. H. Crutchley. Mr. Jos. Morris, architect:—
Plan A per pair. Plan B per pair.
Bryant £320 15 0 £348 16 0
Sheppard 317 0 0 377 0 0
Higgs 318 0 0 377 0 0
Alway 305 0 0 355 0 0
Lawrence* 284 10 0 340 10 0

* Accepted: two pairs to be built on plan A.

For house on the Redlands Estate, Reading, for Mr. Holder. Mr. Joseph Morris, architect:—
Oldfield £442 0 0
Higgs 423 0 0
Goslin 423 0 0
Dunn 419 14 0
Smith 417 11 0
Simonds 369 0 0
May (accepted) 359 0 0

For stabling at Messrs. Brown's brewery, Reading. Mr. Joseph Morris, architect:—
White £214 15 0
May (accepted) 212 18 0

For the erection of the Sheerness public rooms. Messrs. Jeffery & Skiller, architects:—
Contract No. 1. Contract No. 2.
For hall and offices. Tower.
Hall £2,299 0 0 £230 0 0
Jeffery 4,474 0 0 431 0 0
Naylor 4,327 0 0 267 5 0
Muller 4,218 0 0 254 15 0
Dover & Co. 4,556 0 0 307 0 0

For rebuilding premises in Milton-street, Cripplegate for Mr. J. H. Maskee. Mr. Parris, architect. Quantities by Mr. Shrubsole:—
Heysman & Cookrell (accepted) ... £1,127 0 0

For the construction of sewers on the Ashburnham Estate, for T. B. Simpson, esq. Mr. H. Currey, architect:—
George £5,250 19 0
Nicholson 4,980 0 0
Robinson 4,600 0 0
Threlkeld 4,625 0 0
Dickenson & Oliver 4,300 0 0
Wigmore 3,550 0 0
Moxon 3,260 0 0
Whitlock (accepted) 3,097 0 0

Longdon and Eldersfield drainage. Mr. T. Curle, Hereford, engineer.—The tender of Mr. William Field, Shrewbury, for 6,138l. 2s. 2d., has been accepted. Mr. Thomas Brassey, Westminster, surety.

VOL. XXVI.—No. 1327.

Suburban Growth of London and Suburban Railway Accommodation.

SUBJECT has lately been brought prominently under public notice which is of great importance in relation to the growth and increase of the metropolis. We have ourselves not infrequently called attention to the steady and rapid pace at which this increase proceeds, a rate which, if unchecked, will demand shelter within the limits of the London of A.D. 1900 for from six to seven millions of inhabitants.

With increase of size we now see coincident transformation of character. The old nucleus of this immense group of parishes, cities, and boroughs, the City of London itself, is becoming more and more the office of the world. Stately buildings replace the ugly and cramped houses of the Georgian era, and these buildings are almost entirely parcelled out in offices. The City lives out of town. And not only the wealthier but the poorer inmates of these lofty rooms by day, escape to a comparatively less dense neighbourhood to snatch their few hours of sleep, and to bring up their numerous families.

In this architectural and social transformation of the central part of London the railways have had no small share. It is evident to those who have given due attention to the subject that no traffic pays like a metropolitan traffic. The powerful engines and well-managed trains of the underground railway conduct a constant stream of human life to and fro (without any apparent diminution of the crowds that fill the streets), that resemble only the march of an enormous army. While the interior traffic of the metropolis assumes such commanding dimensions, the suburban traffic is hardly less important. For the constant circulation of the former is substituted the steady tidal flow of the other part of the same great system. To reach the business centre from eight to eleven, to leave it from four to eight or even later, is the daily habit of a large mass of persons, who have become accustomed to arrange the whole routine of their business life on the assumption that a decent and reasonably paid service will be continued by the different railways.

To catch and to convey this steady and increasing stream has been, for many years, the great object of railway rivalry. A third line was created to snatch a portion of the wealth for which the Brighton and the South-Eastern Companies were fighting at each other's throats. Nothing was too much to attract the public. lofty and costly stations, so far in advance of the requirements of the traffic that they must be regarded rather as advertisements in brick, and glass, and iron, than as the provision made by public carriers for the accommodation of their customers, form the most prominent objects to be seen from London end from Westminster

Bridges. Duplicate bridges of gigantic proportions span the Thames. Acre after acre of London has been denuded of its ancient roofing. And so headlong has been the race that the rival claimants, for instance, have found themselves not only out of breath, but out of pocket. Ruin came to stare them in the face.

Then succeeded that which took place in the good old days of the road. When the coach proprietors had come to the end of their tether in their efforts to ruin one another, it was their wont to combine. Up, then, went the fares which, in the attempt to underbid one another, had sunk almost, or (in one instance) altogether, to zero. The late rivals, now partners, charged their own prices; and it was only the possibility that some "outsider" might be tempted to come in for a share of the harvest (exactly as did the London, Obatham, and Dover Company), that kept the charges of the newly-combined opponents within limits. They had raced, at each other's cost, to catch the public. They now strove to make the public pay for their losses.

Within certain limits this kind of thing is quite consistent with our national peculiarities. These limits, to a certain extent, imposed themselves. The capital necessary to set up a stage-coach was not out of the reach of many a man with a turn for sporting. Any particularly "close" road would be likely to attract some of this floating capital. Private enterprise had offered certain facilities to the public. When those facilities were restricted, private enterprise might always be invoked to repeat its original effort.

But when, instead of hundreds of pounds laid out on horse-flesh or in coaches it became a question of millions invested in railways, the good old rule of leaving wrong to right itself ceased to be applicable. It was no longer a question of private enterprise; for, though the money invested in the new carrying business was that of individual proprietors, the conduct of the concern was by a corporation, and the powers of each corporation were given by *ad hoc* legislation. In the earliest legislation on the subject some idea of justice was apparent. There was a desire to protect the public, an uninformed desire, it is true, but still one evinced under the new exploded impression that Parliament was responsible for its proceedings. There was also, in the second place, an idea that the new property which thus, with no small amount of speculative courage and of professional skill, had been created under the incubation of the Legislature, should be protected from wanton assault. Thus men grew up, and went on, to plan the steady course of their daily lives on the strength of one or two assumptions the unpardonable folly of which is now apparent. First, they thought that Parliament would protect the public, and that in granting to certain individuals large powers, in the exercise of which all the earlier means of conducting the traffic of the country would be destroyed, provision would be made to insure a wise and fair use of those powers. Secondly, men took for granted that when difficulties had been incurred, property had been purchased and created, and the carrying trade had been placed on a new footing, such property would be protected from wanton attack. Thirdly, they thought that, certain laws having been passed on certain conditions, those conditions would be adhered to by the corporations, and would be enforced or respected by Parliament. In each of these three assumptions we reckoned miserably without our host. The least amount of public convenience was attained at the cost of an expenditure of which it is little to say that the half was unnecessary. No care or industry was allowed to count as a defence against wanton attack. The problem how to spend most money with the least advantage to the public at present, and in such a manner as to render future improvement all but impossible, was worked out by our railway

legislators with full and unexampled success. Even this was not all. First, having thrown clean nway ten shillings out of every pound they spent, in order to injure their neighbours, then having ceased to fight from sheer exhaustion, those great corporate malefactors, so soon as they met in truce, agreed on one point alone. They decided to kill the goose that laid their golden eggs, and they came to Parliament to hold the neck of the bird while they did so. The House of Commons gaily and instantly assented. Had it not the mission to take a grand leap in the dark—and could it be bothered by trumpery questions of public faith or utility? The men who objected to have their fares doubled on them were probably non-electors. Even if they were electors, were not the chairmen of the railway companies M.P.s? Who could care for the inconvenience of printers' devils and those low sort of people when it was a question of passing a Bill supported by honourable members. So the House of Commons readily gave power to the companies to reverse all former bargains, and to make the public pay through the nose for the wasteful squandering of an intercomend fend. It was a characteristic way of making things pleasant.

The House of Lords had a little more scruple: not inaccessible to the force of the argument that money was wanting, and was only to be squeezed out of the public, it yet scrupled to hand over the whole South-Eastern traffic of the metropolis, with its suburbs, and with the world at large, to the unchecked power of persons who had shown such utter want of consideration for the public interests, or of wise cultivation of their own. The small end of the wedge their lordships admitted, but they scrupled to show the perfect indifference to the need of the people, proper to the people's House.

The subject is one on which it may indeed be pardonable to use the language of irony, for it is the only refuge from that of shame and of anger. It shows a miserable inefficiency in our boasted institutions, that the vital interests of thousands should be thus exposed to the sport of any greedy assailant. Omitting any further reference to the earlier stages of an inconsistent and discreditable legislation, let us look at the vested interests that have sprung up around even the present ill-conducted union of the South-Eastern systems of railway. Even while the only reason for a Brighton train starting at any fixed hour was that a Dover train started at the same time, New Cross grew into a succursal of the city. Croydon became as Clapham or as Camberwell. The dense population of middle London spread itself out to breathe along the Kent and Sarrey lines. Discouraged, as far as possible, by railway mismanagement, the true friends and exporters of railway traffic swelled the dividends in spite of the directors. What might have been done had a wise attention to the wants of the public, and thus to the true interests of the shareholders, been paid by the several Boards, let the returns of the Metropolitan Railway indicate. But even as it is, thriving and growing colonies have sprung up all along these ill-managed lines, which the directors cannot nproot without the aid of Parliament. It is not their fault. They have done all they could to drive the smaller occupiers of house-room back into the crowded city. They threaten, if refused their new powers, to do still more to spite their own shareholders.

Once and again has it been pointed out that the evil stato of the South-Eastern Railways is to be amended, not by the application of the principle of protection, but of that of free trade. Let the managers set themselves to develop their traffic according to the rules of common sense and of railway experience. Let them economise in the distribution of trains. Let them conduct the traffic so as at once to suit the

convenience of the public and to avoid that duplication of every item of expense which is the peculiar feature of the district. In spite of the large sums laid out on the stations, the arrangement of the tangle of lines between New-cross, London Bridge, Cannon-street, and Charing-cross is such as to leave no element of danger and disturbance out of play. All depends on the accurate use of a complex system of signals. Every train runs over the line of other trains. Every passenger (almost every passenger) from Charing-cross to London-bridge is sent to Cannon-street by the way. In other words, except in the few trains that run direct, every passenger carried from Charing-cross to London-bridge, or *vice versa*, is so carried at a double expense. If it pays to take a third-class passenger in this awkward fashion for twopence, it would pay as well to take him in half the time for a penny.

We might speak of the neglect of mechanical law which is evinced in the unnecessary weight, and rigid structure, of the engines and carriages. Into this subject, however, it is impossible to enter in a few words. It is a question of great pecuniary importance to the shareholders. But the jumble of up and down lines on the same level is a question of life and death to the public. To avoid a constant choking, which is not always avoided, great expense and considerable danger are daily incurred in the working of this group of railways,—unnecessary expense, and unnecessary danger. It is probable that some frightful accident will some day give weight to the remonstrances which we do not now for the first time utter.

To all householders, residents, or proprietors of London, the subject is one of direct and lively interest. The method of suburban extension is intimately connected with the mode in which Parliament enforces the faith of contracts, or hands over the poorer classes who earn their bread in London to the short-sighted greediness of the railway companies. Nothing can be more unsatisfactory than the manner in which the advocates of the latter bodies have conducted themselves when driven to appear in print. Questions of justice to the poorer (but yet the more valuable) customers, who have fixed their humble suburban dwellings in reliance on Parliamentary faith, and on fair and ungrasping arrangements for their accommodation, have been entirely ignored. "I have made a most extravagant outlay. I am out of pocket. Therefore the public must pay." Such is the argument of the embodied railway interest. "Other people have gained something by our expenditure. Land has risen in value near our stations, and people have been induced enough to sell land at this increased value, or to buy it in hopes of a still further rise; therefore we shall double our fares." was another argument. Public faith, adherence to contracts to the strength of which Acts of Parliament had been obtained, convenience of customers, wise development of traffic by giving facilities of travel at low cost,—acknowledgment of error in past contests,—all these things were entirely ignored. The applications to Parliament, and still more the letters of the applicants, have taught the public that nothing whatever is to be expected from the directors, except what they are compelled to do, and that the contentions and ungenerous spirit which has long regulated the relations of board with board may be expected for the future to preside over those which subsist between carrier and customer.

Secondly, if neither kindness nor true prudence can be expected of the boards, it is clear that still less can any aid be looked for from Parliament. But for one or two public-spirited members of the House of Lords the measure which the chairman of one of the companies described in the columns of the *Times* as an application to Parliament to allow of the *reduction* of fares, would by this time have been law. Owners and occupiers must watch future applications to Parliament for themselves.

Thirdly, and even more important than the convenience of the colonies along the Kentish lines, or than the future traffic returns of the companies, is the architectural question,—the mode in which the future development of London will be influenced by the greater or smaller amount of good faith and good sense shown by the managers of the South Eastern lines.

The present tendency of building is to expand along the course of their railways, not in dense lines of streets, but in villa or even cottage residences, each furnished with a breathing-ground in the way of garden or paddock. Of all the

forms of that great evil, agglomeration of habitations, this is the least obnoxious. Again, the physical features of the ground, the lofty hills which catch the breezes from the Channel, the chalky and sandy soil, the fact that the prevalent winds carry off the products of vitality and of combustion to the open country, instead of pouring them on to the already asphyxiated town, are all arguments in favour of that method of suburban growth which can only be checked by the blindness or by the greediness of the railway companies.

There is no room to doubt that had the Amalgamation Bill been passed (for it is childish to speak of its being passed and not acted upon by its promoters) the first result would have been to force back into London itself a dense population which has just escaped from its confinement. The next result would have been to check the wholesome and rational style of building which is now dotting over the district between Camberwell and Croydon. The third would as surely have been the covering, with regular lines of unbroken street, of that wide flat sweep of meadow land between Bayswater and Kilburn, and even Hampstead, which is now the only inlet by which fresh western and north-western breezes can enter to ventilate the metropolis. With the level district about Kensal-green turned into a manufactory of smoke and of carbonic acid, and covered by that alternation of lofty houses, and of dense small streets, crowded with shops and with mews, which characterizes the Bayswater quarter, the more habitable part of London will be reduced to a state of permanent gloom and stagnation such as that which now prevails in the most unhealthy neighbourhoods. The North-Western, the Midland, the Great Western lines will thrive at the expense of those south of the Thames. London will extend to Slough, to Stanmore, and to Elstree, and we shall be advancing rapidly towards the fulfilment of the old prediction which spoke of Highgate-hill as the future centre of the metropolis.

RESERVOIRS AND WATER SUPPLY.

A CORRESPONDENCE has appeared in the leading London papers on the subject of the realization of the surplus water of rivers and brooks of this country, for the use of the population situated on their respective drainage areas, and a claim has been put forward for certain persons as the originators or discoverers of that provident and useful system of storing up the redundant waters as near the rainfall as possible, so that an ample supply of good and pure water may be obtained at all seasons for the supply of the inhabitants; and it is suggested that a large debt of gratitude is due to those far-seeing and discerning men for having made the discovery, and sketched out a scheme that may be put into a practicable shape, and so lead to a good and matured plan to effect this very necessary and desirable object.

To show how futile and upon what slender grounds these claims are propounded, we may observe, that to collect and impound water in rainy seasons as proposed, is of very ancient origin. In Eastern and all tropical countries water has been collected and stored in reservoirs from a very remote period; and perhaps in this place it may be interesting to draw attention to a few examples of these ancient works used for storing water for the supply of large populations.

The Romans, in the same of their glory and the zenith of their greatness, bestowed considerable attention on the water-supply of towns that came within their dominion; and it is said that at one period they had no less than twenty aqueducts for the supply of the city of Rome, and so abundant was the supply, that Strabo remarked that "whole rivers flowed through the streets of Rome."

Many of their aqueducts took their supply of water from springs and streams situated many miles from Rome; the number of reservoirs situated at various points, to store up and keep the water pure and cool, exceeded 1,800; and the supply of water at one period amounted to fifty million cubic feet, while the population of Rome at that time was about one million; the quantity was therefore equal to 50 cubic feet per head of the population.

This water being procured from elevated springs and streams was conveyed through their particularly strong and enduring aqueducts of masonry, many of which are now in existence,

having endured the wear and tear of centuries, to covered reservoirs; so the water was at all times deliciously pure and cool, and even this system of protecting the water from exposure is handed down to us from tradition.

But although the Romans constructed no large impounding reservoirs at their ancient city strictly of the kind alluded to, they left many important examples in those countries that became subject to their dominion; and we may instance Constantinople, by way of example, as affording a clear and lucid type of their practical knowledge of the mode of obtaining water from gathering grounds and impounding it in large reservoirs, and thus delivering it by means of their favourite aqueducts, and other means, to supply the inhabitants.

The site upon which the city of Constantinople is erected is very remarkable, and surpasses in many respects that of any other city in the world. It is erected on a triangular peninsula composed of seven hills, and two of its sides are washed by the seas of Marmora and the Golden Horn, and besides having a considerable elevation in parts, it is surrounded with views and prospects of the most beautiful and enchanting character, and scenes of the most picturesque grandeur.

Constantinople was originally supplied by means of water collected from the roofs of houses, and stored up in reservoirs beneath them; but the quantity of water so collected was found insufficient for the wants of the Turks, whose peculiar religion requires frequent ablutions; besides, it became impure from various causes, which rendered the water unfit for use.

Fortunately another source presented itself to the enterprising Romans, from which a profusion of water could be obtained for the supply of the city, and this source was situated on a range of mountains to the north of the city, and bordering on the Black Sea. As the frequent rainfall on this mountain range produced a large supply of water, and numerous streams flowed down the valleys and ravines, the idea occurred to construct monads at certain elevations across these valleys to intercept the different descending streams so as to impound and preserve the water for the supply of the city.

Six large almost triangular-shaped reservoirs are there formed, some of great depth and capacity, and the monads erected to dam up the water are of great breadth and height, and being faced with white marble finely sculptured in the Oriental style, they exhibit a bold and magnificent appearance; and these sources of supply are religiously guarded and preserved, and heavy penalties inflicted for injuring or improperly abstracting the water.

The aqueducts that supply the city are four in number, and constructed on the well-known Roman system: one of the structures is 440 ft. long, and 107 ft. high, with a double tier of arches, one over the other, supported at intervals with strong buttresses; at others the valleys are crossed by means of "souterrazi," or water towers. The water descends a lead pipe affixed to the tower on one side and ascends on the other, and at the top of the tower is a small basin to permit the escape of the air from the conduit, so as to relieve the pressure on the pipes.

A capacious reservoir contiguous to Constantinople, receives the water from the impounding reservoirs and distributes it gradually over the city, through the various conduits, for the supply of the Seraglio of the Sultan, as well as the numerous fountains that usefully adorn the different parts of the city.

To show the extent and magnitude of ancient reservoirs, we may mention the Imperial reservoir at Constantinople, said to have been built by Justinian, the ruins of which now remain in a very perfect state.

The reservoir is 336 ft. long, 132 ft. broad, and 40 ft. 9 in. high; the sides, arches, and roof are all of brick, covered with terrass; and the roof is supported by 336 marble columns, the capitals of which were of the Corinthian order of architecture; the intercolumniation is 12 ft., and each column is 40 ft. 9 in. high, and they stand in regular ranges, twelve in one direction and twenty-eight in another.

Over the arches of every pillar is placed a large stone, which forms the bed course which supports the arches that spring from the tops of the columns, and which form the vault or roof.

This is a very remarkable and interesting reservoir or cistern; its mode of construction is on a large and magnificent scale, such as usually characterizes the works of the wealthy and luxurious Romans, and stands out in strong

contrast to the constructions of the present age, which are commonplace and rude in comparison. We do not desire to imitate them in holiness of design and splendour of execution, but rest ourselves satisfied with roughly hewing our works out of the commonest material.

In Spain and Portugal are many remains of Roman works of equal interest carried out in a similarly hold and comprehensive scale, evidently showing that that enlightened and enterprising people were far advanced in the knowledge of the laws that govern health and sanitary science, and a study of their remarkable works affords us good examples and precedents, and doubtless will do to remote generations, when many of our modern erections shall have crumbled away to their original dust.

In all tropical countries, particularly the East, it has for generations been the custom to store up water for the use of the population, and for irrigating the land for the purposes of agriculture; and one stupendous reservoir in that wonderful country (India), we may mention, is of extraordinary extent; it is situated at Hussein Segur, Secunderabad, Deccan, and was made, it is supposed, about the middle of the sixteenth century.

It covers an area of about 2½ superficial square miles, or 1,760 acres in extent. Its principal embankment is upwards of 1 mile long, 30 ft. to 40 ft. broad at top, at the deepest part, and gradually narrows towards each end of the embankment, and it is 72 ft. high. The fore slope is 1 to 1, rear slope, 2 to 1, and the face of the inner slope is pitched with large blocks of granite.

The level of high water is maintained at 12 ft. below the top level of the bank. There are many other works of a similar character in that very extensive and interesting country, which cannot be referred to in the limits of this paper. In the course of the recent expedition to Abyssinia, Aden was visited, and some interesting tanks examined there, which are objects of archaeological attraction. On the face of the steep rocks, wherever there are any channels for the rainwater to find its way to the plain below, erections which appear like fortifications, but are in reality tanks for water.

At the head of the plain is a circle of hills which surround Aden, and a ravine descends therefrom; and here are very extensive and massive tanks, built of very solid masonry, very deep, and are lined with a white cement. They are said to be large enough to contain water for Aden for two years, but we understand they contain about thirty million gallons.

These tanks are of extreme antiquity, and were only discovered three or four years ago. They were completely covered up with the debris brought down by the heavy rains of ages past, and their existence was unknown or unsuspected.

They have been cleared out with great labour, and were found to be in as perfect condition as when they left the builders' hands, which is supposed to be about the sixth or seventh century.

It is quite a mystery by whom these tanks were built; but it is supposed to have been by the Egyptians, who at one time possessed a very extensive territory, and in that case these tanks were not improbably contemporaneous with their celebrated Pyramids. The discovery of these tanks is most important, both on account of the shipping calling there, and the garrison, as rain only falls at Aden once in every four or five years, and then it comes down in such torrents as to fill the tanks in a very short period. Another interesting and ancient tank was found some time ago in the Island of Ceylon, it is called the Pathavie Tank, but it is now in ruins. It was discovered in the great central forest of the Wannu, about seventy miles north of Trincomalee, and twenty-five miles from the sea.

It is considered the largest as well as the most perfect of the extraordinary works of this island, and which possesses about thirty of these immense tanks, and from 600 to 700 others of smaller capacity, scattered about the island, many of which are repairable.

The Pathavie Tank occupies the basin of a broad and shallow valley, about twelve to fifteen miles long, with a breadth varying from six to ten miles.

The embankment by which the waters were accumulated within this area is nearly seven miles long, 300 ft. broad at the base, tapering to 20 ft. at the top, and upwards of 60 ft. high, formed throughout its whole length by layers of squared stones.

One of the existing sluices consists of hewn

stone, 6 ft. to 12 ft. long. These run into ponderous wells immediately above the weir, which regulates the escape of the water. Each layer of the work is kept in its place by frequent insertion, endwise, of long ties of hewn stone, whose extremities project beyond the face of the work with an enlarged head, so as to prevent the courses from being forced out of their places.

The projecting heads of these ties are carved with elephants' heads and other devices, somewhat resembling the extremities of Gothic corbels.

The front embankment of this reservoir has been estimated to contain 7,744,000 cubic yards of stone, and the cost to have been, for that portion of the work, about 870,000 sterling.

At some unknown period a breach was effected in the embankment about 200 ft. long and 100 ft. broad, which injured the efficiency of the works, and which was never repaired; and this remarkable reservoir is thereby rendered perfectly useless.

Having quoted a few examples of remarkable ancient reservoirs, we will now call attention to a few of the extraordinary works of this kind in this country. It was the establishment of the canal system that first drew the attention of engineers more particularly to the execution of reservoirs on a large scale as receptacles for storing water, and these were usually formed by choosing a suitable site in deep and narrow valleys or ravines, generally above the level of the summit of the canal it was intended to serve; so that a regular supply of water could be obtained at all times and seasons for the passage of boats, and also to supply the locks constructed for the purpose of transferring the boats from one level to another.

Many of these reservoirs are of considerable extent and executed most substantially and with considerable engineering ability and skill, and several of them are placed in situations where the geological formation is not well adapted for them, on rock, or porous strata, or other objectionable sites, but, still, the best that could be selected in point of level to afford the supply of water required.

If we cursorily examine the sections of country over which our canal system has been carried, our readers will be able to appreciate a few of the difficulties our old canal engineers had to contend with in the execution of such works; and as these have been ably surmounted with substantial and enduring works by their indomitable energy and perseverance, it redounds more to their honour and fame, and no failures are recorded, or even hinted at, to tarnish them, which cannot be said to be the case in the present day, as several of our important works are stated to be not quite free from serious defects. In running our eye over the sections of the respective canals at that time forming main arteries for the traffic of the country, taking the one from Liverpool, by way of Birmingham, to the river Thames at Limehouse, a distance of 262 miles, we cross four summit levels,—first at Harescott, 420 ft. above low-water at Liverpool; another at Knowle, 380 ft. above low-water; another at Brampton, 365 ft. above low-water; and another at Tring, 395 ft. above low-water at Liverpool, and the Thames, of course. To supply these summit levels there are series of reservoirs and locks on the line, to pass the boats up and down the inclines.

On this line of canal there are some very interesting examples of reservoirs, and amongst them I may mention those of the Grand Junction Canal Company. These are situated at the following places, and of the capacity and depth enumerated below:—

Daventry	7,905 locks of water...	35 ft. deep.
Drayton	1,337	28 "
Marsworth	994	18 "
Stanhope End	2,296	24 "
Tring	1,016	29 "
Wilton (old)	1,413	15 "
Wilton (new)	1,413	18 "
Weston	1,856	22 "

Each lock is computed to contain 9,000 cubic feet of water, so that the largest of these reservoirs (Daventry) would be capable of holding 64,845,000 cubic feet of water, and the whole series of reservoirs 167,770,000 cubic feet, for the supply of this particular canal.

But the highest of these reservoirs (Marsworth) is 31 ft. below the summit level at Tring, and the water has to be pumped up to supply that level, and also as there are various levels, to pump the water from one reservoir to another, as a very small supply only is received from the springs and other sources in the vicinity, the summit level requires to be kept regularly sup-

plied to meet the demand required by the lock for each boat, as it carries a lock of water (viz. 9,000 cubic feet) in descending to the lower levels.

The date of the execution of these works varies from 1793 to 1795.

Another important line of navigation is from the River Severn at Bristol, by way of Devizes, to the River Thames at London Bridge, a distance of 178 miles; and on this line we cross only one summit, at Crafton, which is 474 ft. above the level of the English Channel. This line is principally supplied from rivers, and the date of the first Act is 1794.

The aqueducts, bridges, tunnels, and works of this canal are of superior construction and excellent workmanship, the fruits of a master mind, the late John Rennie, C.E.

Another important line of navigation proceeds between the ports of Liverpool, Goole, and Hull, making a distance of about 159 miles: in this distance one summit level is crossed near Stanfield, which is 600 ft. above the level of low water at Liverpool and Hull.

The water for the supply of this line of canal is taken from the rivers and brooks in the vicinity of it, and forced up by means of pumping machinery to the summit levels, from whence it is locked down to the Duke of Bridgewater's Canal one way and the Aire and Calder navigation the other. The date of the first Act for this work is 1794.

On many of the canals there are other interesting reservoir works: on the Barnsley Canal the Hindley Reservoir is 127 acres in extent, and has a depth of 40 ft. of water, and this is supplied by means of pumping from the long level when full, and is returned to the canal in droughty seasons. The date of the Act for this canal is 1793.

The Birmingham system of canals is also of considerable magnitude, connecting the town of Birmingham with the South Staffordshire coal-fields and the rivers Trent and Mersey. The works that have been executed on this line of canal by the late Messrs. Telford & Walker are of the heaviest description.

The supply of water is obtained for lockages from many of the old coal works, raised by steam-power, and there are service reservoirs at Smethwick and near Oldbury; and these being found inefficient to supply their extended works, another reservoir was made at Rotten Park, near Birmingham, by the late Mr. Telford: it was constructed of 80 acres in extent and 45 ft. deep, and to supply this reservoir a feeder was carried from the Oldbury Reservoir to connect them together, contouring the country over ridge and dingle in such a manner as to intercept all the flood-waters of the county, and to conduct it to the great reservoir at Rotten Park. The date of these works was about 1824.

On the Birmingham and Liverpool Junction Canal there are also extensive reservoirs, one of fifty acres at Belvide, and another at Knighton of fifty acres, to supply the lockage of that canal, but their main supply is derived from the Birmingham Canal summit, with which it is connected near Tettenhall.

The Cromford Canal is supplied chiefly from feeders at the Cromford end, and also by reservoirs near the Butterly Iron Works of fifty acres in extent, containing when full 2,800 locks of water, or 25,000,000 cubic feet; besides, there are two other reservoirs of twenty acres and fifteen acres in extent respectively, one of which is situated at the eastern end of the great tunnel, and another where the Pinxton branch commences; besides, the summit level of the canal, which is fourteen miles in length, acts also as a reservoir in consequence of being made of 1 ft. extra depth of water than is required for the traffic, and this would supply 2,117,600 cubic feet of water. The date of this canal is about the year 1790.

The Ellesmere and Chester Canals are also an extensive system of canals connecting the Mersey with the Dee, and the Montgomeryshire Canal in Wales with sundry branches. It takes its supply of water from a natural reservoir, the Bala Lake, by means of a feeder carried up from the celebrated Pontycysyllte Aqueduct to Llandysilio. This supply of water not only affords lockage down to the Dee and Mersey, but also in the other direction towards the Birmingham and Liverpool Junction Canal.

In consequence of the quantity of water supplied from Bala Lake being in excess of the amount required for lockage, a very fine and interesting reservoir was formed at Imbleston, in Cheshire, for the purpose of collecting the surplus water of the upper pond locks, and

supplying the lower in times of scarcity; the area of this reservoir is twenty-four acres, and the greatest depth 40 ft., and its cost was said to be 31,200*l.* The date of this work was 1830.

The English and Bristol Channel canal carried out in 1825, has also some very interesting reservoirs; the canal itself is 90 ft. wide, and 15 ft. deep. It is supplied from several reservoirs in the Axe valley, near Seaborough, covering a surface of 217 a. 3 r.; and another in the same valley at Winsham, a third at the upper end of the valley of the Yarty, near Hilhaven bridge, of 105 a. in extent; and another at the Ridge of 16½ a. The two last mentioned reservoirs are connected together by a cut of 6½ miles long, and from the Ridge reservoir to the canal the feeder is 3½ miles long.

The Forth and Clyde canal is also another important undertaking; it is 35 miles long, and its summit level is about 155 ft. above low water on the Clyde, and it affords a passage for vessels drawing 10 ft. of water from the Irish sea to the German Ocean. Its summit level is supplied with water from reservoirs, one of which is at Kilmanuir of 70 a. in extent, and 22 ft. deep, and another at Kilsyth of 50 a. in extent, and 24 ft. depth of water. The date of this first Act for this work is 1768.

The Nottingham canal, made in 1802, although a short line of 15 miles, and is connected with the Cromford canal and the river Trent, has a large reservoir at Amworth, with a self-regulating sluice whereby 3,000 cubic feet of water per hour, or 72,000 cubic feet per day, is allowed to the Erewash canal and certain mills on the line, reserving sufficient for their own wants.

In addition to those reservoirs above-mentioned, we may state there are several others: one on the Carlisle canal, one on the Croydon, two on the Dearne and Dove, one on the Dudley (Cradley Pool), one on the Huddersfield, containing 20,000 locks of water, or 180 million of cubic feet, one at Darnall, and two others on the Sheffield canal, of 32½ acres in extent; one on the Stourbridge canal, at Pensnet Chase, of 12 acres area; two large reservoirs at Earlewood, on the line of the Stratford-on-Avon canal; one on the Trent and Mersey canal, at Knyperley. The Grantham canal has two reservoirs, one of 20 acres extent at Denton, and the other of 60 acres at Kipton. On the Leeds and Liverpool canals, near Fowlbridge tunnel, there is a reservoir of 104 acres in extent, containing 32,400,000 cubic feet; the Todda Brook, containing 47,412,270 cubic feet, and the Combs reservoir, containing 64,259,000 cubic feet. The Macclesfield canal has two reservoirs, the Sutton, containing 12,817,000 cubic feet, and the Bosley reservoir, containing 64,266,399 cubic feet; these latter were recommended to supply Manchester with water, before the present water-works were laid out and made, and would certainly supply very pure water.

Besides the examples above given, there are many others situated in different parts of the country of equal extent and interest, but we believe we have enumerated many of the principal reservoirs, and the construction of several of them dates back to the latter end of the last century, so that the idea of conserving and using the water for the supply of canals, irrigation works, mills, &c., dates back to a very remote period; and many of these works are of great extent and large capacity, much greater than are generally adopted for the supply of our towns; and it is idle to suppose that the idea is a modern one, or that any one person can reasonably claim the merit of their invention.

In the same way as the water is collected and the rainfall economised for the uses above mentioned, it may be collected on the respective water-sheds of our rivers, and used either for the proper water supply of the inhabitants, to irrigate the land for agricultural purposes in dry seasons, or to aid the navigation of rivers where navigable, or to assist in cleansing and purifying them by flushing, until legislative measures can be generally adopted to prevent their being fouled by the sewage of towns, villages, manufactories, or other improper means.

And in this place we may observe, that we have drawn attention more particularly to those vast stores of water supply situated in different parts of the country, as a few examples out of the many that exist for the supply of our system of canals as a means of transit for goods, &c., that are daily growing obsolete and into disuse, occasioned by the rapid and more certain system of railway locomotion; and as the former becomes abandoned or broken up, it assumes a

question of serious import whether we ought not to avail ourselves, where practicable, of this vast system of storage of water collected in the country, and not used, or only partially, as a preliminary measure, and in aid of the one proposed for rendering available the complete rainfall produced upon the drainage areas of our respective rivers and their tributaries for the proper supply of our growing population in times of drought and scarcity.

As it is likely that legislation will be protracted in consequence of the time required in the examination of the state of the rivers, holding inquiries, and reporting on the state of the same, and then to found a measure thereupon, would it not be advisable to pass a short Act, so as to put a peremptory stoppage on the present system of fouling our rivers, and to force upon the authorities of towns the absolute necessity of applying an immediate remedy to this monster grievance?

The passing of the Thames Conservancy Act is one of the best measures that has emanated from Parliament for many years past; and we understand by instructions given to the official staff, that it is intended to be carried out to the letter and spirit of the Act; and this is as it should be. After well-considered and matured measures have passed the Legislature, they ought to be carried out in all their integrity, and not left, like many of our health and sanitary Acts, to be carried out only so far as agreeable and pleasant to the ruling magistrates.

If the rainfall on the water-sheds of our rivers is to be collected and utilized, as proposed in a former part of our journal, some strong and efficient measures must be adopted to dispose of the sewage refuse of our towns, otherwise our water-supply will continue to be contaminated as hitherto with the sewage. The great object should be to collect the water as pure and as near the rainfall as possible, and to pass the sewage beneath the soil, so that it cannot appear again upon the surface, except as supernatant water, purified by its filtration through the upper strata, depositing the whole of its varied fertilising matter in the soil as food for vegetation.

In tropical countries where scarcity of water frequently exists, every drop is carefully collected and stored up for periods of scarcity; and it is quite an unaccountable anomaly that in a country like ours, blessed with copious rainfall at frequent intervals, and droughts are few and far between, that the cry should be anywhere, "Water, water, and not a drop to drink," that millions of gallons should be allowed to flow back to the great ocean unstored or unutilized while any living creature should stand in need, at any season or period, of this indispensable and vital element of life.

We think we have shown satisfactorily that the very natural sciences to our water supply, reservoirs, are of rather ancient origin, and that it has been a work of time and of close study of many clear heads to arrive at the present stage of knowledge possessed by professional men on this subject; but as the data on the proper construction of reservoirs, as we observed in our article on "Water Supply," is not very well understood, and different formula are used by eminent practitioners in the construction of such works, we have an idea that in a future article we may draw attention to these differences and discrepancies, examine into the methods adopted in ancient works and those of our old engineers, so that we may deduce therefrom a data and theory founded on practice and experience that may serve as a guide in the future.

CEDAR AND ITS RELATIONS.*

In pointing out some of the practical purposes to which cedar is applicable, we must, of course, give the first place to carpentry. Such uses in ancient times were confined to the Oriental nations; and in our own times, with the exception of Japan and some of the islands of the Indian Archipelago, to the continent of America. The boundless forests of the Amazon and the Mississippi supply, as we have seen, much larger quantities of the timber than could be sent to us from Lebanon. Nevertheless, the highest illustrations of its original and most magnificent applications to the purposes of building.

Sir Christopher Wren had a curious hypothesis with regard to the construction of the Temple of Dagon by the Philistines. This was probably a quadrangular pile of buildings, having a court in their centre; but he conceived to himself a vast roof of cedar beams resting at one end upon the walls, and centering at the other upon one short architrave that united two cedar pillars in the middle. Such a method of construction would doubtless render the celebrated feat and dying effort of Samsoos intelligible; but this view, as we have said, was merely an hypothesis. It is to the minute and graphic account which is furnished by the sacred historian respecting the building of Solomon's Temple that we must look for the earliest authentic account of the carpentry of this valuable timber.*

We need not recapitulate the details of that ancient and honourable contract which Solomon made with the King of Tyre. Let us call attention to one or two of its features which are still worth the attention of our modern political economists. In the first place, the wise monarch makes no attempt to conceal the want of "technical education" on the part of his own subjects. "For thou knowest that there is not among us any that have skill to hew timber like unto the Sidonians." At the same time, although the pastoral tribes of Israel could not hew timber, they had plenty of corn and oil, which they were willing to exchange for this architectural skill. In order to see that this exchange was equitable, agreeable, and profitable to both parties, let us simply note the result. "And there was peace between Hiram and Solomon; and they two made a league together." Is there anything, we should like to ask the question, so antiquated in this simple but sacred principle of those ancient Syrian monarchies that the governments of modern Europe and America could not find it their interest to act upon it? In the second place, although Solomon did not set his subjects up as skilled artisans equal to those of Tyre and Sidon, he made no difficulty about supplying a host of inferior labourers, "three score and ten thousand that hew hurdens, and four score thousand hewers in the mountains." This is a lesson in the division and subordination of labour that might be usefully taken to heart by our Irish fellow-subjects, when contrasting with their own passionate and heated imagination the comparative merits of the condition of England and that of Ireland. Once more, we are told that Hiram delivered the timber and stone-work in a finished state; "so that there was neither hammer, nor axe, nor tool of iron heard in the house while it was building." The circumstances, in fact, were these. The river Adonis was in the vicinity of the forest of Lebanon, and discharged itself into the Mediterranean Sea near Bilhos. Accordingly Hiram could transport the timbers all squared, and not only cut to scantling, but cut up as to occupy the places each timber was to occupy in the building. From Bilhos those rafts might easily be sent down the coast, and landed at Joppa, the nearest port to Jerusalem. On this most singular circumstance we will only remark that Solomon, with all his wisdom, would not have been able to do such a thing—at all events, in England,—in the nineteenth century. Our wise carpenters, bricklayers, and stonemasons have far too much good sense to permit their timbers to be worked in the forest, their stones at the quarry, or their bricks in the field, even although it can be demonstrated that the builder would obtain a better article, save much time and the cost of transporting superfluous materials. Whether they are wiser in their generation than Solomon is a question which we will not stay to determine.†

To proceed. The roof of Solomon's Temple was constructed with beams and boards of cedar, as well as the lining or panelling of the walls, and even the foundations. We must always remember, however, that the Eastern customs of construction respecting the roof are very different from our own. We construct our ceilings with plaster, and our floors with wood. They, on the other hand, construct their floors of plaster or painted tiles, and their ceilings of wood. As to foundations of timber, these, of course, are only possible in a dry, porous, sandy soil, such as that of Palestine. We need not dwell on the cedar ornaments of the Temple; indeed, the whole timber used, even to the most minute finishing or decoration of that celebrated

* 1 Kings, v. vi.; comp. 2 Chronicles, x.
† We cannot call to memory—it is curious—a passage of any modern political economist wherein these important Scriptural illustrations occur.

* See p. 356, ante.

Temple, was composed of cedar. The altar was of cedar overlaid with gold, the oracle was of cedar,* and the cedar of the house within was carved with gourds and open flowers: † all was of cedar; there was no stone seen. ‡

Cedar timber, thus so lavishly used by David and Solomon in their buildings, was also, we read, used in the second temple rebuilt under Zerubbabel. The timber employed was cedar from Lebanon. † Cedar is also said by Josephus to have been used by Herod in constructing the roof of his temple. And the roof of the Rotunda of the Cbrurob of the Holy Sepulchre at Jerusalem is said to have been of cedar, and that of the Church of the Virgin at Bethlehem to have been of cedar or cypress. ‡ Nor was the use of this famous tree always confined to the purposes of house building; it was sometimes employed, we are told, even in shipbuilding. The Prophet Ezekiel tells us (xxvii. 6) in that valuable historical account of the ancient Phœnician commerce—then at the period of its greatest prosperity (B.C. 600)—that the Tyrian shipbuilders constructed their shipboards of the fir trees of Senir, and their masts of the cedars of Lebanon.

It should always be remembered, however, in speaking of the cedars of Lebanon used in building by the ancient Jews—particularly when beams, pillars, or ceiling-boards are mentioned—that it is extremely probable the wood of more than one tree was employed. The generic name, indeed, of the tree was used. But under that name (*Pinus Cedrus*) were also (as Dr. Boyle has shown) § comprehended the *Cedrus deodora*, the yew (*Taxus Baccata*), and the Scotch pine (*Pinus Sylvestris*). The latter tree might have furnished the material of the ships' masts mentioned by Ezekiel, which recent commentators consider was the case.

In our day the chief consumption of cedar for building purposes lies in the States of South America. There is a species of cypress called white cedar in the Brazilian territories, which is valuable timber; and in Bermuda and other islands of the West Indies a brown quality of wood is much employed. The tree gives the name to a range of hills called the Cedar Mountains, in Cape Colony, which supply the township of Clan Willans and its neighbourhood with planks for building. It is very little known in Africa, although the cedar of Algiers is compact, very durable, and said to be susceptible of a high polish. But the Japanese employ a species of cedar, which, however, Thüningberg describes as a kind of cypress,—a beautiful wood that lasts long without decay. || Cedar is now seldom employed in England or the Continent for building purposes, although there is a species indigenous to Spain and the south of France, which possesses many of the essential requisites. Indeed, there seems to be as great a difference between the various qualities of cedar as there is between the Scotch fir and the Norwegian pine; and it is obvious that the ordinary failures of strengths of materials must be grossly defective when they speak of cedar as representing a constant quantity, as most of them do. The fact is, in many of its physical qualities, particularly in its powers of resisting strain or compression, it is much inferior to the most ordinary description of yellow pine. It is seldom fire-grained or sufficiently compact to take a fine polish, and the green timber is extremely prone to crack and rend in the process of drying. Its colour, indeed, is varied, and often beautiful, and its capacity for being easily worked is very great. But it possesses one simple feature which distinguishes it and gives it a value above all other trees of the pine tribe, and that is the important quality of durability.

Pliny tells us that the durability of cedar was proved by the duration of the cedar roof of the Temple of Diana at Ephesus, which had lasted 400 years; and at Utica, the beams of a temple of Apollo, constructed however of Numidian cedar, lasted 400 years. ¶ It was on this account—*propter æternitatem*—that Vitruvius recommended it to be employed in the construction of temples and other public buildings, and particularly in the formation of statues to the immortal

gods.* It is not so much prized for those sacred or ecclesiastical purposes in the present day; but that is not owing, as we shall see, to its properties of durability.

This unrivalled quality is undoubtedly owing to the essential oil of its resin. The wood, cones, bark, and even the leaves of the best species of cedar are saturated with resin, of a peculiar and powerfully aromatic odour, a slightly bitter taste, and a rich yellowish brown colour. It renders the timber proof against the attacks both of the worm and the moth. This cedar resin, which is sometimes called *cedrin*, flows spontaneously from the trunk upon incision. It somewhat resembles mastic, and was often used by the ancients, along with other aromatic gums and resins, in the embalming of the dead. It was burnt as a perfume at the funeral pyre; it was also used in certain diseases as a medicine.

It is proper to mention, however, that Pliny, to whom we are indebted for these facts, comprehends under this name the lesser cedar (*oxycedrus*), or Phœnician juniper, which is still common on Lebanon, and the resin of which is also aromatic. Cedar oil, a kind of turpentine, was likewise prepared from the wood, and was applied to the rolls of papyrus in order to preserve them. Hence the celebrated sentence attributed to Persius, that in order to deserve fame one should leave words which were worthy of being preserved in cedar! The resin or oil of cedar are almost unknown in the present day. We wish it were otherwise; for in that case we might present a striking contrast to some (most, indeed) of the modern chemical processes of the destructive distillation of resin. The essential oil of cedar, we may add, belongs to a family of hydrocarbons which are all celebrated for their antiseptic properties. The oil of juniper, the oil of cloves, the oil of nutmeg, and some others, belong to the same family,—of which, however, the most perfect chemical type is the essential oil of bitter almonds.

The next important purpose to which the timber of cedar is applied must come under the wide category of interior decoration. But to whatever extent it may have been applied in this direction in eastern countries, it cannot be said to have taken root in Europe. For wainscot or panelling it cannot be compared for a single moment with oak, or even in certain respects with red pine. The fact is, being a very porous wood, it is liable to absorb moisture, and so become extremely sensible to changes of temperature; in other words, to split and crack. Although it is very easily cut, it does not preserve its form when cut; and besides, we are half of Mr. Ruskin's opinion, that carving in cedar is too easy to be valuable. Some of the American river steamers, we are informed, have their large and handsome saloons fitted up with cedar, carved and heavily gilded; but even here it cannot compete with mahogany. Certain Mediæval Greek churches, as we learn from the ecclesiastical historians, had their roof screens, and sometimes their altars, constructed of this material; but it was seldom or never employed for the sedilia or other internal fittings. The best example we remember to have heard of with regard to the application of cedar to interior decoration, was a very handsome library, fitted up in the Cinquecento style by the late King of Bavaria; but whether the material was derived from Lebanon or from South America we do not at this moment recollect. No doubt but for this purpose cedar is a highly useful and proper material. Book-shelves constructed of cedar would have the very same conservative influence on books that Russian leather binding exercises, and their common effect springs from the same cause—in each case the antiseptic properties of the oil. Besides, as we have seen, there is the antiquity of the practice to recommend it. If the ancients kept their writings in cabinets of cedar, why should we moderns not follow their example with regard to our books?

We must not overlook entirely, in our cursory survey of the subject, the tablets of cedar mentioned by Vitruvius. These consisted of wax tablets, that were written upon with a stylus, and which were furnished with timber backs and raised mouldings on the front edge, either composed of citron or of cedar. The wood tablet used by the prophet Isaiah (iii. 22) signifies perfume boxes. In Hebrew it is literally "Houses of the soul or breath." Many Eastern women still wear an ornament composed of cedar, resembling a house or temple, containing a

small image, obviously at once a symbol of purity and of devotion.

If we wished to institute a comparison derogatory to our modern sentiment, we must refer to the very popular application of cedar to the manufacture of cigar-boxes. The boxes in which Havannah cigars are usually imported consist, however, of a very common tree, a native of the West Indies, known in the trade as Barbadoes cedar. It reaches often to the height of 80 ft., and its trunk is remarkable for its circumference. The cones, bark, and leaves have a bad smell, resembling that of asassaftida; but the wood has a rather agreeable fragrance. Enormous quantities of the timber are annually consumed in the form of cigar-boxes and light packing-cases, and it is sometimes used in France and Germany in making the cheaper sorts of blacklead-pencils. This tree (*Cedrea odorata*) is so common and plentiful in the West Indies that it is used for the most ordinary domestic purposes, such as shingles; and it has been even applied by the natives to the construction of their canoes.

The next and probably the most important modern application of cedar we shall notice is that of furniture. And here the same principles, of which we have already spoken, will govern the extent of its consumption. It will not make a good chair; but it will make an excellent work-box or dressing-case. It could never, we think, supersede mahogany as a table or a side-board; but it will make a splendid wardrobe and the best of all book-cases. It must always be remembered that the value of cedar resides in its virtue of resistance to the parasites which infest other timber, its general antiseptic properties, its pleasant odour, and its light agreeable tone of colour. We understand that Messrs. Morrison, of Edinburgh, under the direction of Lord Lindsay, have ingeniously contrived a description of wardrobes in which the best features of mahogany, rosewood, or walnut are combined with an interior skeleton of Florida cedar, thus uniting the properties of both woods in the same article of furniture, and we can easily imagine that the conception is a sound one. The lining of wardrobes and drawers with cedar, however, is of old date in Scotland. As a material for furnitur, *per se*, Florida cedar is by no means the best. That which is imported from the Northern States, although possessing less perfume, is harder, more susceptible of polish, and capable of standing greater tear and wear. This species of timber is also the best adapted for the cases of pianofortes, although we cannot admit that cedar is the best, or even one of the best, forms of timber for this trying purpose. Some of the finest specimens of cedar that can be applied to furniture or such like purposes may be seen in the museum at Kew Gardens; and we may add that we saw in the Paris Exhibition several highly creditable examples of light cedar bedroom furniture, for which purposes we think it will be found highly suitable. ¶ Its chief consumption at this moment, however, consists in the lining and interior fittings of drawers, wardrobes, sideboards, and tables; in which respect it is, owing to its low price and abundance, gradually superseding oak and even black birch. As we have said, it will never stand comparison by itself with mahogany or black oak for dining-room furniture, or with rosewood or walnut in that of the drawing-room. But in the library and the bedroom there are grounds for believing that cedar furniture will gradually obtain a principal place.

The last and certainly not the least important application of cedar is that of its use in the manufacture of black-lead pencils.

On this head we shall be brief. Some years ago, we described at great length the whole process of the pencil manufacture in Cumberland; and to that volume we must refer the reader who cares to pursue the subject minutely. We shall just state here that its adaptation to pencils is threefold. First, its freedom of manufacture; secondly, its pleasant perfume; and lastly, its property of easy cutting along with the lead. Keswick pencils are mostly the produce of Florida cedar; and the kind which is best suited for the purpose is the free, quick-growth wood; there is a harder sort of slower growth, which, however, is more fitted for the purposes of furniture. Those who are in the habit of cutting good pencils will know better than we can describe the feelings of impatience and disgust which one cannot avoid on coming across a piece of hard cedar in the pencil-stick! The red

* Vitruv., lib. ii., 9. In the time of Vitruvius the timber (*cedrus*) was principally obtained from Crete, Africa, and some parts of Syria.

¶ Since this article was in type, Sir Wm. Maxwell Stirling tells us that his library at Kew is lined and stored with planks of cedar.

cedar, so well known in the pencil trade some five-and-twenty years ago, was chiefly derived from the Virginia cedar, which is in fact a juniper (*Juniperus Virginiana*). Like the cedar, these junipers are distinguished for their resinous qualities, and have been also applied to furniture and other purposes; but its chief consumption was in pencils.

We began this article with a description of the cedars of Lebanon, and we conclude by once more expressing the hope that these splendid historical trees will not be allowed to become extinct. Here, after all, resides the poetry of the subject. There are other woods, such as Spanish mahogany and walnut, which are more beautiful in their colour. There are some, too, such as rosewood and sandalwood, which are possessed of a stronger fragrance and a more agreeable perfume. But no other tree carries back our associations to the time when Solomon, in all his glory, ruled the dominions of Israel; and no other was thought fit to be applied to the sacred purposes of the Temple altar and the covering of the cherubim.

LETTERS BY SIR THOMAS LAWRENCE.

THE following hitherto unpublished letters addressed by Sir Thomas Lawrence to Mr. Perry Williams will interest many of our readers, not merely by their references to men and incidents, but by the advice and criticism they include:—

"Russell-square, August 31, 1867.

DEAR SIR,—You have not been absent from my thoughts, although my too numerous engagements and professional labours have prevented my sooner writing to you. I received with the greatest pleasure the little sketches* that you sent to me by my friend, Mr. Camuccini, which are touched with your usual taste, delicacy, and truth. They will be always retained by me, as evidence equally of your talents and of your thoughtful remembrance of me. I shall most sincerely rejoice to hear of your continued health and the successful prosecution of your studies.

You inform me that you have been making sketches of the peasant—*their costumes, &c., &c.* You are right in keeping up this attention to the human figure, since it will not only be of great advantage in the introduction of it in your landscapes, but, from the increased difficulty of its study, it will exceedingly enlarge your power of copying inanimate nature. The best historical painters have always been painters of good landscape; and perhaps there are examples in Titian of a greater style in that department of art than can be found in Nicolo or Gaspar. I would add Claude, but that he is so exclusively devoted to the beautiful (or to that species of grandeur that is united to it) as not properly to have place in the comparison. The chief direction of your studies, however, will be landscape; and I have no fear of your interpreting my advice into abandonment of it for any other.

I am now about to ask you to employ your genius on it for me, and on such a scale as your Windcliff drawing. If the evenings are still of the same beautiful serenity that I remember, will you give one of their happiest effects to a general view from the front terrace of San Pietro, in Montorio? I used often to drive up there for the delighted admiration which the grand expansion of that scenery so constantly excited. It reminded me of Milton's fine description of Rome in the 'Paradise Regained.' A faithful delineation of that scene, touched with your usual finishing and pure taste, would be much valued by me, and, I need not say, possessed by me for your own price. Do not, however, let me fetter you by this commission, nor, above all, break in on the rational happiness of your stay at Rome. Be free as air in your choice of subject, so that you employ your talent, and do not lose this spring-time of your life, which, from your present residence, will hereafter appear its happiest epoch.

I am rejoiced to learn that you have for your companion young Mr. Theod.; he left England with great promise, and a regard has followed him from the esteem and respect in which his father was held by us. Give my kind remembrance to him.

You will probably have been introduced to Mr. Eastlake, whose admirable picture† was so justly

admired in our late Exhibition. Pray offer him the inquiries of my high esteem and regard, and cultivate as much as you can (without intrusive freedom) his advice and friendship. To my friend, Mr. Pietro Camuccini, I beg you will not fail to offer my best thanks for his kind friendly letter. I do not want you to tell him that I consider him as one of the most amiable and estimable men that I have ever known, but I privately tell it to you for your guidance and advantage, as I know you can safely trust to his judgment, and have perfect confidence in his worth, whatever be the subject of your application to him.

Pray, if you have time to write again, inform me if Mr. Metz is still living and in health.

Believe me always, dear Sir,

Your very faithful servant,

THOS. LAWRENCE."

"Russell-square, March 9, 1829.

MY DEAR SIR,—I have received and read your welcome letter with great pleasure, and shall carefully attend to your wishes respecting the exhibition of the picture you are sending for Mr. Bailey, and the having it properly framed; the drawings I shall give to Mr. Robson, should anything prevent your sisters calling for them.

I trust I need not tell you how sincerely I rejoice in your success, and in the good taste and liberality of my countrymen; but, hitherto, you have 'won your own spurs by your own valour,' however the kindness of friendship may have cheered you in the contest. Think no explanation to me necessary for change in your choice of subject, provided it be advance in character; for the painting of your figures last year convinced of your increasing ability in the study of the human figure, and, unless you attempt the higher dramatic or epic style of composition, you already walk in perfect safety, and need fear no pit-fall in your path. I am anxious to see the picture you are now sending, of which I heard last night a very favourable opinion from Mr. Turner.

You give me sincere pleasure in still considering Mr. Bailey as your first friend, in your own selection of the purchasers of your pictures. Neither can it be undelightful to you to send down the best efforts of a genius that is now generally acknowledged, to that private and humbler scene where it was first nurtured and advanced. There were many competitors for your little picture of the 'Youthful Italian Lovers;' but having your own authority for considering it to be Mr. Bailey's, I carefully retained it for him. Beautiful as your drawing of the same subject was, I preferred the picture.

I am well acquainted with the talents and intelligence of Mr. Havell, from my own knowledge of his works and the report of his friends. Your tour to Naples must have been rendered both pleasanter and more improving by such companionship. If, indeed, you now go to complete those sketches which were but slightly traced with him, and add to them the colour and effects of Nature, your tour with a man of such known taste and knowledge of composition, whether beautiful or grand, will have been all gain, and the benefit be lasting.

You inform me that you have not forgotten my own commission, which I took the liberty to offer you, of a drawing of Rome from San Pietro in Montorio. You will oblige me much by executing it for me. Your powers are now in their youthful vigour, and there is a truth, delicacy, and refinement in your drawings that, except in our greatest artist, I have seen in no other. From my own recollection, a sun-set or evening is the finest moment for that glorious scene.

You have so many commissions of importance that I hardly venture to press others on you. There is a gentleman, however, who is desirous of having two small pictures by you, about the size of the "Boy and Girl," at your own price and subject. He is not in the circles of fashion, but known to almost all our artists by his liberal patronage and gentlemanly conduct,—his name is Vernou. Let me know that you undertake them for him.

I shall not fail to give your remembrance, with your thanks, to Mr. Calcott, who will be much gratified by the report of your success. You are fortunate in having still the society of Mr. Eastlake, an advantage that cannot be too highly appreciated. I am much pleased with your account of Mr. Uwins. He very greatly obliged me by sending me some interesting sketches from Urbino, that birthplace of the prince of

painters; they are drawn with a Raffaellesque simplicity and taste. I shall have to write to you again in a day or two, on the receipt of your picture.

In the meantime believe me to remain, with my best regards to Mr. Pietro Camuccini (which I particularly beg you to communicate),

My dear Sir,

Your very faithful friend,

THOS. LAWRENCE."

"Russell-square, March 27, 1829.

MY DEAR SIR,—I have the pleasure to tell you that your picture and the drawings are safely arrived; I have ordered a frame for the former, and the latter are now either with Mr. Robson, or gone from him to your sister.

Your drawings will doubtless be much admired, but I prefer your picture, which I think very beautiful; you have rendered an incident in nature,—a peasant woman suckling her child (which, though it ought always to be hallowed, is yet sometimes unpleasant in itself, and often grossly represented),—with a delicacy and affection that make it deeply interesting and pathetic; and you have likewise given that essential in such subjects—beauty. The composition and colour of the picture are exceedingly good, and altogether make it a decided advance on your popular little picture of last year.

I have little to add of other criticism, except to notice a trifle of defect. You have taken great pains with your principal figure, and the eyes are as well drawn as the other features of her sweet countenance; but in the two boys, the one on the ass, and the other accosting him, the eyes are two dark blots, and ill-formed. Let this carelessness be soon impossible to you. Besides the incorrectness, it is a check to the interest of the work, or the incident, however trifling, when there is meant to be communication between the figures.

In that sweet little work, too, of last year, the boy was not looking quite in the girl's face. Be at the pains often to draw that feature. I can quote you high authority for it; I have a sheet of eyes drawn by Michelangelo for some young Perry Williams, whose genius had excited the friendly effort.

The fault equally exists in one of your drawings,—in the child just beginning to walk; and there, by-the-by, you have a little failed, for the child is not pretty, nor have the features the delicate form of infantile character.

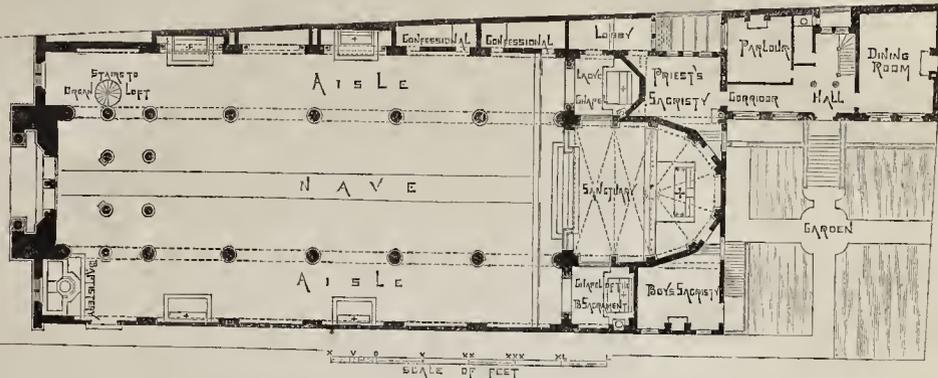

Try now to get something of more precious character of surface in your skies and distance. Don't be content with insipid, fair, Roman painting (this between ourselves); Claude's, 'tis true, are all softness, but we have been too long accustomed to see them touched with the expression of the pencil to be content with their tame and spiritless representations. 'Tis the same with your distances; they are very accurate, of true and sweet hues, but you do not scumble enough, nor give that finer zest of pencilling that is so exquisite in the first works of Claude and Turner. One thing I see is very much against you, viz., the coarseness of your canvas, which no quantity of colour could well amend.

Your sister has just sent me your letter with the description of the picture, which I shall direct to be inserted in the catalogue. I have not yet written to Mr. Bailey. This picture, I am to understand, is his; but pray tell me what would be your price for either of the same sort of subject and size? I mean your general price to any visitor of your study. I am now going to ask a trifling attention from you which may not be without its use. Never write a letter home without adding to its date the place of your residence at Rome. Letters are mislaid, your friends may be old, and their memory of the numbers and names of streets be rapidly decaying; whereas, if one only of the former is preserved, the direction is found which some intended patron may be soliciting at that moment, or which may be wanting to the direction of some letter. The Duke of Wellington never writes a note but with scrupulous attention to this little form. Besides, the habit of doing one thing leads to application of it in another, and the peculiar danger to which talent and genius are exposed, is irregular desultory thought and neglect of method—of that love of order which is essential to respectability and happiness. I fear you will think my letter and lecture too long, but their extension springs from sincere regard, and an esteem that will always leave me, my dear sir,

Your faithful servant,

THOS. LAWRENCE."

ST. MARY'S NEW (R.C.) CHURCH, KENSINGTON.—Plan of Church and of Residence adjoining.

[See p. 511.

ST. MARY'S NEW (R.C.) CHURCH, KENSINGTON, MIDDLESEX.

We illustrate this week the new Catholic Church of St. Mary, which is being erected on a site adjoining Newland-terrace, in the High-street, Kensington, from the designs of Messrs. Goldie & Child, architects.

The style of the new church is that of the earlier part of the thirteenth century, with the introduction of Geometrical tracery in the apse and principal façade. This will face the high road, and will comprise a great central doorway under a moulded and carved arch spanning the deep recess formed by the projection of the buttresses, and carried by polished granite shafts with moulded bases and foliated capitals, the whole being surmounted by a light arcade forming a parapet, and bearing effigies of the Virgin Mary carrying the Saviour, with attendant angels on either side, and above this will rise the window lighting the nave, and composed of six lights, with a rose of six many lights, cusped, in the head. The gable will contain a triple-lancet window, above which, at the apex, will rise a cross of suitable design.

The aisles are lighted from the principal façade, by two-light windows, having a rose in the head of each, while the spires of the buttresses are crowned with carved statues of angels.

The central portal will display a broad arch of foliage carved on marble shafts, enriched with encaustic tiles and inlays with a moulded base and foliated cornice. The entrance is divided into two, by a central shaft carrying the lintel, the ends of which rest on foliated corbels springing from the jambs. The tympanum will contain a large seated effigy of our Lord in majesty, attended by adoring angels, the intervening spaces being filled in with foliage, which will be, throughout the church, of the severe conventional type, consistent with the style.

Entering the church, the dimensions will be striking. The entire length will measure 143 ft., of which 33 ft. will be devoted to the choir and sanctuary. The width of the nave will be 30 ft., and the total width of nave and aisles 58 ft. The internal height of the nave will be 65 ft. The nave will be separated from the aisles by a lofty arcade of six bays, carried on cylindrical shafts of polished granite, already fixed, with moulded bases and bands and foliated capitals. Above this runs an arcade, carried by shafts of terra-cotta, with moulded caps and bases, stopping between the pillars which carry the deeply-recessed clerestory arcade, which is lighted by single lancet windows. The aisles will be lighted by cinque-folled rose-windows, and have recesses for confessionals and side altars.

The sanctuary will be raised 4 ft. above the nave, and will be reached by six steps leading to the choir, and two more into the sacristy. This portion of the church will be divided from the nave by a moulded arch, springing from foliated and moulded corbels, and will consist of nine bays, whereof seven will form the apse, all

lighted by two-light windows, having a seven-lobed circle in the head of each.

The roof of the nave will be a continuous barrel vault of timber, with a moulded king-post and tie-beam to each principal. The sanctuary and two lateral chapels will be groined, and the organ will be placed in a gallery at the western end of the church, carried on six granite shafts, banded, and with moulded caps and foliated caps. At the entrance to the sanctuary will rise, on the exterior, a lofty niche, covered with lead, and bearing on its apex a rich vase and cross, at a height of 120 ft. from the ground. At the rear of the church will be a residence for the clergy, suitable in style and arrangements to the rest of the edifice, and communicating with the sacristies behind the high altar. The foundations, which are very extensive, have been executed by Mr. Simpson, builder, of Tottenham-court-road. The foundation-stone, bearing a suitable inscription and containing the usual deposit, was laid with ceremony on the 14th of May last.

ON LINCOLN CATHEDRAL.*

For those who desire to study the progress of style through the Lancet period, Lincoln Cathedral presents the amplest opportunities. We can trace the hand of the designer of Bishop Hugh's works, in continuation of that of the choir, along the east walls of the great transepts, as well in those of the east aisles as in the upper parts of the building; we can trace even the gradual slackening of the work, and its absolute cessation in the north and south walls of these transepts. Here a pause of many years must have occurred, probably whilst the crossing and central tower were rising, which, however, fell from insufficiency of some kind, *per insolentiam artificia*, in the year 1239. Meanwhile Bishop Hugh, having been canonized, became the patron saint of Lincoln; the odour of sanctity attached to his memory attracted crowds of the faithful to the cathedral, and the contributions, which flowed in largely, permitted the rapid prosecution of the works, which, judging from internal evidence alone, must have been resumed about 1215, and carried out without intermission in the course of the next twenty years. These later works of the Lancet period comprise, — 1. The central transept (west side). 2. Nave and aisles, with north and south chapels. 3. West front, with north and south pinnacled turrets. 4. Chapter-house. 5. West porch of south transept. 6. The crossing and lower part of the central tower (rebuilt); and, 7. The two western doorways of the choir aisles. They were constructed probably in the order above given, and show, with the exception of the two last-named, but slight differences of style in their details.

With regard to the Chapter-house there exists a singular discrepancy between the internal

evidence afforded by the character of its work and the external evidence of documentary history. We are told by Giraldus Cambrensis, on the authority of Wharton, that Bishop Hugh built the "Capitulum," a term which can only correctly be interpreted "chapter-house." Professor Willis, feeling convinced that the work was of later date, endeavored to explain away the difficulty by arguing that the word "capitulum" meant, in this case, "caput ecclesie," the head, or east end of the church.

It is always unfortunate when, as is sometimes the case, antagonism arises between the internal evidence furnished by the building itself, and the external evidence of contemporaneous history. In the earlier days of archaeological study the tendency was to discredit the former and to accept the latter; in these days the results of strict analytical investigation and comparison of the minor details of the buildings of the Middle Ages dispose us to place much more reliance upon this species of internal evidence than on even the most unequivocal assertions of ecclesiastical historians. The inductive reasoning based on the former appears to be safer than the possibly hearsay testimony of the latter.

Without, then, contending for, or, indeed, accepting, Professor Willis's interpretation of the word "capitulum," as used by Giraldus Cambrensis, I have no hesitation in asserting that the stonemasons who executed the work of the Chapter-house of Lincoln Cathedral did not live in Bishop Hugh's time, but twenty or thirty years later.*

The two latest of this second group of Lancet works, namely, the west porch of the south transept, or Galileo porch, as it is usually called, and the two doorways situated at the west end of the choir aisles, exhibit much greater elegance of treatment and delicacy of execution than the others. Of these two works, the former may be advantageously compared with a similar work, similarly named, at the west end of Ely Cathedral, which belongs to the earlier, as this porch does to the latest part of the Lancet period; whilst the exquisite carved work and capitals of the former correspond closely with those of the elegant work of contemporaneous date at the east end of the choir of the same cathedral, which was commenced by Bishop Northwold in 1235.

Before quitting the work of the Lancet period, it may be well to notice an opinion which has prevailed, and which is due, I believe, to Professor Willis, who discovered that the name of Bishop Hugh's architect was Geoffrey de Noiers,

* In a paper which was read at Lincoln by the Rev. J. Dymock, on "The Documentary History of Lincoln Cathedral," the day following that on which Mr. Sharpe's lecture was delivered, the difficulty above referred to was completely solved by the fact announced by Mr. Dymock, that, on reference to the original text of Giraldus Cambrensis, he had discovered that the passage in question had been erroneously transcribed and printed by Wharton, the real word in the MS. being plainly and legibly written, not "capitulum," but "capitulum," which cannot otherwise be interpreted than as signifying the head or east end of the church.

* By Mr. Edmund Sharpe. See p. 484, ante.

to the effect that the design of the east transept and choir of Lincoln Cathedral is of French origin. The only feature, however, in this work which at all resembles French work of this date is the pier capital of the choir, which, with its double row of stiff foliage, and four attendant shaft capitals, all attached to the same block, is not unlike those of Chartres and Soissons. But we have in the pier capitals of the presbytery of Chichester Cathedral, designed and constructed only a few years earlier, at the close of the Transitional period, the very idea, in genuine English workmanship, of which these Lincoln capitals are the Lancet version, and to which, with their detached shafts, they bear a much stronger resemblance than to the capitals of any French cathedral with which I am acquainted. In all other respects, in the general outline of the design, and in all its minor details of mouldings and carved work, there is no resemblance whatever between the work of Geoffrey de Noiers and that of French buildings of corresponding date.

Geometrical Period.

The introduction of Tracery in the middle of the thirteenth century caused a rapid and complete change in the appearance of buildings: it arose from the practice of perforating in various ways the spandrels of arches, and the solid stone-work lying between the heads of contiguous lancet windows. Of this practice, and its progress through the Lancet period, we have excellent examples in Lincoln Cathedral. In the plain circles, trefoils, and quatrefoils, with which the solid stonework above the sub-arches of the blind story of the choir and early transept of Bishop Hugh is perforated, we see an early and a somewhat clumsy effort to relieve this blank space. In the nave three foiled openings more completely occupy it; and in the noble wheel-window of the north transept, so entirely is the large plate of stonework, which fills the circle, pierced, that but small portions of solid stone remain between the circular voids.

To call this a tracery window, however, would be a mistake: the principle of tracery, which consists in the conversion of the whole of these intervening portions of stonework into moulded bars, is wanting. This is the invention, then, which, applied in circular forms to the windows of the succeeding period, forms its chief characteristic.

1. Of the noble series of monumental works which were constructed in England during the Geometrical period, one of the earliest, and certainly one of the finest, is the presbytery of Lincoln Cathedral. Designed, as we know it to have been, about the year 1256, at the exact moment when Gothic architecture in its chief forms, its sculpture, its carved and moulded work, had reached its highest development, it exhibits in every part a refinement and elegance, as well as a delicacy of finish in its minutest details, to which it would be difficult to find a parallel in the whole range of Gothic art. To attempt to describe to you its varied beauties in the short space of time at our disposal, would be a vain effort.

I cannot, however, pass over without notice its chief and most characteristic feature, its glorious east window of eight lights, confessedly the finest of its kind in the kingdom, which, occupying as it does the entire east end on the inside, and worked out as it was with a wealth of deeply-moulded detail of surpassing excellence, may be looked upon as the crowning work of the singularly beautiful building of which it forms the termination, and the chief ornament.

This building, commenced, as it is reasonable to suppose, immediately after the granting of the Royal permission to remove the city wall, in order to allow its construction in 1256, was so far finished in 1282, that Bishop Hugh's shrine was transferred into it in that year.

Among the remaining works of the Geometrical period may be noticed—

2. The stone screens of the choir on the east, north, and south sides. They were probably all commenced soon after the completion of the presbytery. One of them, on the north side, has on its aisle front an arcade of circular foliated tracery so exactly similar to that of the aisle arcade of the nave of York Minster, and is finished with straight canopies carrying mouldings, crockets, and finials so identically the same, that it is scarcely possible to suppose that they were not designed by the same hand.

3. An Easter sepulchre on the north side of the choir, with figures and carved work of great

excellence, belongs also to this later Geometrical work.

4. It was not until the middle of the Geometrical period that the stone-carvers of the Middle Ages began first to imitate in their works the foliage of nature. The period is thus divisible, almost equally, into two portions, Early and Late; during the earlier of which the carved work was of conventional design, and during the later in imitation of natural forms. In the presbytery the capitals, not only of the piers, but of all the host of minor shafts, carry foliage of the most elegant conventional type, consisting of curled leaves of the most varied outline, but all designed in the same spirit. In the passage leading from the north-eastern transept to the cloisters, and in the cloisters themselves, we have an opportunity of contrasting the new fashion of carving, introduced about the years 1280—1290, with the old; the capitals of all the shafts, of the tracery of these two later Geometrical works, having natural foliage only, chiefly in imitation of the oak and the vine-leaf. So much as remains of this cloister is in other respects an interesting example of the works of the second half of the Geometrical period.

5. Whether the central tower, of which the two lower stories remain, was ever carried higher, we have no record, and no present means of knowing; what is certain is, that its noble upper story, belonging to the latter part of the Geometrical period, must have been commenced about the year 1306. It is justly reckoned one of the finest central towers in the kingdom, and groups as grandly with the two smaller western towers, as the central spire of Lichfield Cathedral does with the two subordinate western spires of that building.

Curvilinear Period.

1. Whether or not all may be disposed to agree that the progress of art from the point at which we have now arrived was in a downward direction, and that the decay into which church architecture fell, at the close of the Rectilinear period, dates, in its earliest beginnings, from the time when natural foliage was introduced into the ornamentation of buildings, and flowing tracery into their windows, it cannot be denied that, in one respect, the builders of the two latest periods surpassed their predecessors. The graceful finish of the upper walls and gables of by far the greater part of our cathedral and parish churches, of whatever date, is due to the panelled and pierced parapets, and crocketed pinnacles of the Curvilinear and Rectilinear periods. Of this we have notable examples at Lincoln; the earliest of which occurs in the panelled parapet of the west front, which crowns so appropriately the earlier work below. To the same date belongs the flowing pierced parapet of the south clearstory of the nave, with its Curvilinear pinnacles marking the limits of each compartment. Following this parapet westwards we arrive at the west wall of the south transept, along which this open parapet of flowing tracery is still continued.

2. The chief work of this period, however, was the remodelling of the south front of the south transept. This work consists of a large circular window, corresponding with the rose window of the north transept, and filled with flowing tracery of Flamboyant character, of a large five-light window above, and of a pierced parapet of flowing tracery on the gable.

3. It is not improbable that this work is due to the Burghersh family, one of whose members was Bishop of Lincoln from 1320 to 1340, during the time, in fact, that it must have been executed. This supposition is confirmed by the circumstance that a chantry belonging to this family was founded at the east end of the north aisle of the presbytery, one side of which was formed of the tombs of Lord Burghersh, the founder, who died in 1356, and of his brother, the bishop, who died in 1340. They are both interesting monuments.

4. The last works of this period were the two canopied tombs at the east end of the presbytery, under the last pier-arch on the south side. They are, although late, of very elegant workmanship, and were probably erected during the lifetime of Lord Cantilupe, by whom the adjoining chantry is said to have been founded, but who did not die until 1372.

One of the most elaborate and admirable screens of any kind that exist, designed in this style, is to be seen in this cathedral under the east arch of the crossing, and serves at present as the organ screen. It is stated by Wild to

have been constructed in the year 1775; but it is scarcely credible that so excellent a work is due to a period when Gothic architecture was so little understood and appreciated. It is probable that it is a very careful and accurate restoration of an existing work of undoubtedly great merit, and that the greater part of what we see belongs really to the earlier part of the Curvilinear period. It deserves attentive study.

Rectilinear Period.

1. Strongly resembling the Cantilupe tomb, is the arcading of the interior of the ground story of the two western towers, with its elaborate vaulting; and to the same early date probably belongs the interior of the west doorway.

2. The upper part of the west towers was, no doubt, the next work executed. They are plain, but well proportioned.

3. The insertion of the west window of the nave and north and south aisles followed; and the construction of the canopied walk, above the west doorway, with its row of kingly statues, is of the same date.

4. The west porch of the south transept received in this period its richly panelled parapet; and the airy lightness of the skyline of the central tower is due to its pierced Rectilinear parapet, constructed probably about the same time.

5. The three last works remaining to be described belong all to the latter part of this period. They are the chantry chapels of Bishop Fleming, who died A.D. 1432; of Bishop Russell, who died A.D. 1480; and of Bishop Longland, who died A.D. 1521. The two last named are excellent examples of this kind of sepulchral oratories, which were often erected by the prelates themselves during their lifetime.

In the transepts are several screens of excellent Rectilinear design; and the stall-work of the choir, executed in the early part of the period, is amongst the best in the kingdom.

PARIS.

In the interior of the new Opera-house the works of decoration advance slowly but steadily, and it will be many months before they assume a comprehensible form. The iron ribs of the dome are in place: it will have a very flat and *enfoncé* appearance, especially as the base from which it rises, though apparently of some consequence as seen in the elevation, cannot be perceived except from afar. The ornamentation of this base cannot, tasteful as it may be, appear at a great distance; and, as all cats are grey in the dark, so all details of ornamentation, good or bad, are equal in artistic merit when viewed from afar. The term *dome* is a misnomer here, as, in all cases, this feature should *dominate* over the rest of the building, whereas in this building it is completely masked, from the north side, by the roof. It is a pity, also, that the side on which the new opera stands cannot permit of its being all seen from the line of the Rue de la Paix and the Place Vendôme. The clearance for the new Place de l'Opéra and the new street from the Palais Royal to lead to it has been undertaken on a scale which is truly appalling. Looking at this vast plain of *débris*, from the Opera-house, one would imagine that Baron "House-manie" intended to demolish every thing between the "noble" building and the river. The new street, it is said, is to be the most magnificent in Europe, and of course in the world, and a profitable speculation for the Ville de Paris, &c. The façade of the Opera is not yet completely uncovered; the same hoarding that we saw last year is still in its place, with this improvement, that it has been decorated with a coat of slate-coloured paint, and the unsightly placards and street hills have been removed totally.

At the corner of the Rue de la Chanssée d'Antin the new Théâtre du Vendôme is in a forward state, and the plank hoarding, which sheathes it from top to bottom, is disappearing piece by piece, and the cupola of the auditorium is terminated, as are also the floors of the first four galleries.

From a return sent by the municipal authorities of Paris to the Commission of the Budget, it appears that since 1853 the population of the town has doubled; but they forget to say that the area of Paris at that epoch was only 3,222 hectares (hectare equal to about 2½ acres), whereas since the annexation of the new eight arrondissements the area is 7,902 hectares. The number

of houses demolished during the last fifteen years is put down at 20,000, and the new houses built 45,000. The 25,000, representing the surplus of the construction over the demolition, give a surplus of 110,000 apartments, and it is estimated by the authorities that there exist in Paris 80,000 lodgings, the rents of which are less than 500*l.* per annum.

Seven bridges are now in construction over the Seine below Paris; two below the park of Neuilly, three below Clichy, across the two Isles des Ravageurs, and two below Saint Ouen. These will permit the Parisians to locate themselves on the verdant hills of the *rive gauche*, from Courbevoie to Cenevillers.

The Ambassador of Russia has forwarded to the Prefect of the Seine a marble bust of the Emperor of Russia, presented by him as a *souvenir* of the *exposé* he passed at the Hôtel de Ville, June 8th, 1867. It has been placed in the gallery of sovereigns, containing the busts of those who since 1853 have honoured the Hôtel de Ville with their presences. There are twelve already there: those of the Queen of England, Prince Albert, Victor Emmanuel, the late Dom Pedro of Portugal, Dom Luis I. of Portugal, the Queen of Portugal, the late King Maximilian of Bavaria, the Sultan, the Emperor of Austria, the King of Prussia, the King of the Belgians, and the Queen of the Belgians.

Notwithstanding the protest made to the Prefect of the Seine, signed by 2,500 inhabitants of the *arrondissements* of the town of Sens against diverting *their river*, the Yanne, for the purpose of supplying Paris with more water, the reservoirs of Montrouge were commenced on the 29th ult. This colossal structure, placed between Montsouris Park and the riding-school, is bounded on the south by the Avenue Reille, on the east by the Avenue de Montsouris, on the west by the Rue de la Tombe Issoire, and on the north, at some distance, by the Boulevard du Transit. It will be of two stories high, built entirely out of the ground, and will contain 305 millions of litres (123 for the higher quarters of the left bank, and 182 for the low quarters of the left and part of the right bank). It has been decided that the Palace of the Barde (Bey of Tunis), as yet standing on the Champ de Mars, shall be re-erected at the Montsouris Park. All the materials purchased by the administration are to be made use of, and the present rubble hasement replaced by one of ashlar.

We mentioned some time ago that the Bièvre river was to be diverted into the collecting sewer of the left bank, and to cross the Seine by a gigantic iron siphon-tube, near the Pont de l'Alma. This is being carried out, and the immense pieces of tube may be seen on the banks of the river. The barge carrying the dredging apparatus and the immense diving-hell is moored close to the left bank, and the workmen go down by relays and work at their ease, as the depth is not very great. Only one of the arches of the bridge is at present available for navigation.

THE SANITARY STATE OF BARRACKS.

FOLLOWING up what we did some years ago, the *Lancet* has sent sanitary commissioners to examine several of the metropolitan barracks and that at Windsor. The barracks of the Household Cavalry at Knightsbridge they condemn as unfit for either officers, men, or horses. The whole place is reodent of horses and horse-mannure, the buildings being huddled together, and the litter thrown out directly under the windows of the barrack-rooms. The mess-rooms of the privates have been taken from them for regimental offices, and they are now compelled to take their meals in their bed-rooms. The married men and their children are lodged in the most shameful manner. They have no supply of water, no water-closet, no domestic conveniences whatever. They are worse off than they would be in a workhouse or a prison. The managers of the Zoological Gardens would be execrated if they kept their animals in such an unhappy state. There appears to be an almost total neglect of sanitary laws: bad ventilation, offensive urinals, disgusting privies, untrapped drains, and badly ventilated barrack-rooms. In the hospital the bath for the 6 ft. troopers is 4 ft. 2 in. long! Extraordinary pains appear to have been taken to secure ventilation and pure air by complicated tubes over the gas-burners, louver openings near the ceilings, Sheringham valves and Galton stoves, to the utter neglect of

the simpler, but far more efficient, expedient of making a sufficient number of windows opening at the top. The Commissioners recommend that this barrack should be at once rebuilt.

Great fault is found with the situation, arrangement, construction, and ventilation of the barrack-rooms to the Regent's Park Barracks, which have neither lavatories, urinals, nor latrines close at hand. The troopers eat, drink, and sleep in the same rooms. The married quarters are still more emphatically condemned. The single apartment allotted to a man, wife, and three or four children, has no domestic conveniences of any kind, and absolutely no ventilation. It appears that the hospital has been repeatedly condemned, but as often patched up at considerable cost. Half the building is again in the hands of the engineers for repairs, which will be equally misplaced. The water-supply is intermittent, and the commissioners deem it incredible that the War Department should be guilty of such a piece of economy at the risk of the health and lives of the men in such a costly establishment. The sanitary condition of the men is good, which seems owing mainly to the extraordinary sanitary precautions carried out, not at the expense of the Government, but of themselves. Three men are employed to flush the drains, urinals, latrines, &c., daily, and to sprinkle them with disinfecting powder. The labour, expense, and supervision bestowed are worthy of the highest commendation, but do not justify the postponement of more permanent reforms. The commissioners recommend the removal of the barracks to a more appropriate site, and the sale of the valuable land and buildings to defray some portion of the cost.

Of the Windsor Cavalry Barracks, reported to be the *chef d'œuvre* of the military engineers, complaint is made that the barrack, although constructed for half a regiment, is now forced to contain a whole one. Horses worth several hundred guineas each have so little room that it is dangerous to pass behind them. The barrack-rooms are more spacious. Here, also, as in the other barracks, the meals are eaten in the sleeping-rooms. At the end of each room, and approached by a short corridor, are the lavatory and urinal, fitted up with the latest patents. But the misfortune is that they are continually out of order. There was not a single urinal which did not stink abominably, and the floor of nearly every lavatory might reasonably be called a lake, from leakage from the pipes. In one instance the thoughtful ingenuity of the corporal has placed a pair of heavy boots for those who desire to wade across without wetting their feet. The water-closeta appear to yield an excellent annuity to their ingenious inventors. Those, for example, in the officers' quarters have never been in working order for a fortnight together since they were put up. There is an insufficient supply of water: not a drop in any of the taps; and this is said to be of almost daily occurrence. Cases of scarlatina have been constant in the portion of the barrack set apart for families since April last, and one of the married sergeants is now in hospital. Any day it may extend to the troopers' quarters. The state of the water supply is simply disgraceful. Many of the tanks are nearly always empty. There is not enough for ordinary cleanliness, much less for flushing drains and watering roads. The hospital is spoken of in terms of almost unqualified approbation. The wards are lofty, light, and well ventilated; the floors and furniture exquisitely clean; the walls panelled higher, and decorated with prints. A protest is entered against the employment of complicated sanitary machinery without proper skilled supervision. In conclusion, the *Lancet* commissioners express their belief that simple arrangements and daylight are the best remedies for dirt and filth, and that a proper sanitary state can only be maintained, where large numbers of men are congregated together, by making care and trouble obviously necessary.

In the House of Commons, since this last report was published, Sir John Pakington made a very unsatisfactory reply to a question which Colonel Leslie put to him with reference to the odious condition of the Windsor cavalry barracks. Sir John spoke of the failure of certain modern inventions for the promotion of cleanliness. Nobody doubts that these inventions sometimes fail and often get out of order, but that surely is no reason why matters should be made worse by gross neglect. So much complaint had been made on this subject, that last winter Sir John appointed a medical officer and an engineer to go through the various barracks of the country and

report on their condition. These gentlemen have not made their report; but why have they not? and why, too, should it be necessary to appoint a commission of inquiry in order to insure in any barrack common respect for the laws of decency? Then, again, Sir John states, that during the last ten years the country had spent a quarter of a million in providing suitable quarters for married soldiers. Nobody doubts that the money has been spent; but it is not the less certain that the work of reform has not been satisfactorily accomplished.

STEAM CULTIVATION.

A LECTURE was delivered by Professor Coleman, of Estrick, York, upon the application of machinery to agriculture, at Brayton Hall, the mansion of Sir Wilfrid Lawson, on rent-day, to his tenant farmers and the gentlemen connected with the Wigton Farmers' Club. About 150 sat down to dinner in a large farm building fitted up for the purpose, and the company afterwards adjourned to another room to hear the lecture. Having sketched the history of steam cultivation, Mr. Coleman said the question they had to consider was how small farms of one to three hundred acres could have the benefit of steam cultivation. There could be no doubt that the double engine system was the best. If they had the land drained, capital, and the co-operation of the landlord willing to remove obstacles in this direction, the farmer would be justified in purchasing a double cylinder engine, and he would never regret it. The reason why steam cultivation had progressed so little was, that landlords would not support tenants in their enterprises. They were told to use steam as an auxiliary to horses, and he believed it was a beneficial and practical thing, and well worthy of consideration. He believed the time was coming when small farmers would come in for the benefits of steam cultivation. He did not suppose they had much faith in steam cultivation companies. They had nothing of the kind started. In the northern part of Shropshire, however, there was a company with more than eighty farmers on the books, who regularly looked for the steam plough, and were extremely disappointed if they did not get it. What had been done in Shropshire might be done in Cumberland. Let landlords and tenants combine, and they would find it answer the purpose. There had been disappointment felt that they had not more reliable information with regard to steam cultivation, but they must bear in mind that the whole thing was in its infancy. It was only within five or six years that machinery at all approaching practical form had been in use, and sufficient time had not elapsed for the collection of facts; moreover, farmers had no time or taste for collecting facts. It was all to be got at by general impressions. In many instances they were told absolutely that the crops had increased. The roots had undoubtedly been benefited in strong soils. As great a success had been achieved with regard to reaping and mowing by machinery as with regard to steam cultivation. He contended that a farmer's education was not complete unless he had acquired a practical knowledge of the management of machinery.

MEMORIAL OF THE LATE DOWAGER COUNTESS OF ELLESMERE, AT WALKDEN MOOR, MANCHESTER.

THIS monument is to the memory of Harriet Dowager Countess of Ellesmere, who died in 1866. She was widow of the first and grandmother of the present earl. Her good works among the labouring population and others on the estate will long be remembered, and the memorial which forms the subject of our illustration is intended to commemorate them.

Walkden Moor, the site of the monument, is near Worsley, the seat of the Earls of Ellesmere, and in the middle of the colliery district included in their extensive property.

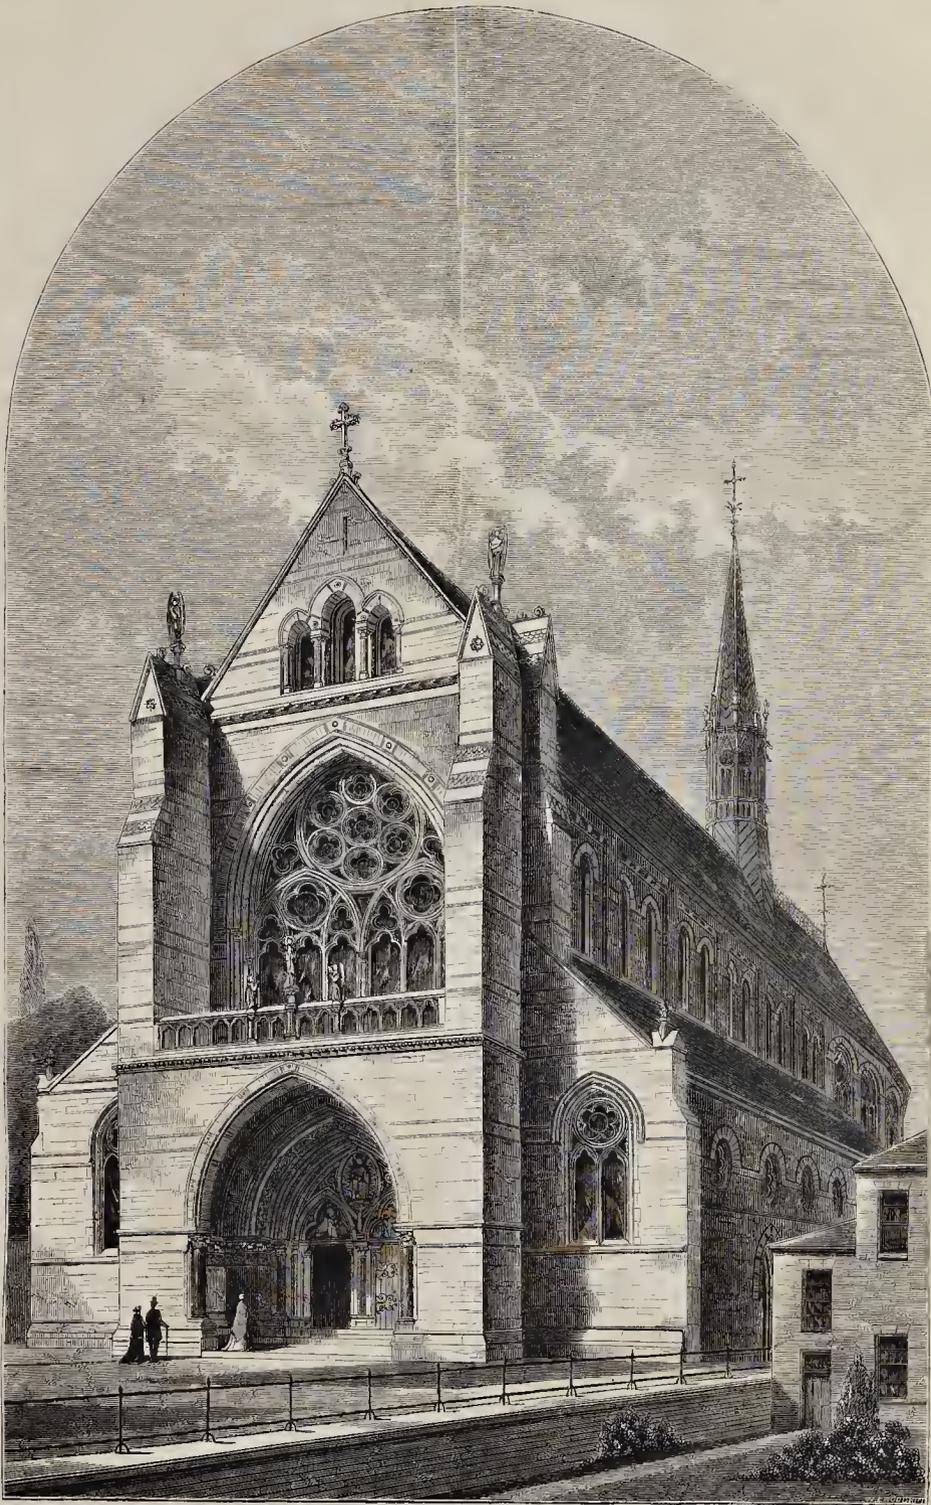

About fifty designs were submitted for the monument in answer to an invitation by advertisement. Mr. G. E. Street was consulted by the committee, and their final decision was made in accordance with his opinion.

The architect whose design was accepted, and is now being carried out as shown in the accompanying illustration, is Mr. T. G. Jackson, of London, Fellow of Wadham College, Oxford.

MEMORIAL OF THE LATE DOWAGER COUNTESS OF ELLESMERE, WALKDEN MOOR, MANCHESTER.

MR. T. G. JACKSON, ARCHITECT.

ST. MARY'S NEW R. C. CHURCH, KENSINGTON, MIDDLESEX.—MESSRS. GOLDIE & CHILD, ARCHITECTS.

[See p. 507.

MEMORIAL OF
THE LATE F. W. FAIRHOLT.

A HANDSOME mural "brass," let into a slab of black marble has been prepared for this purpose by Mr. J. G. Waller, and is about to be fixed up in the church of Stratford-upon-Avon. It is thus inscribed:—"Frederick William Fairholt, F.S.A., artist and author, bequeathed his Shakespearean collection to the town of Stratford-upon-Avon. He died April 3, 1866, and was buried at Brompton. This tablet is erected by his memory by his friend and executor C. R. Smith." Above this there are three small crocketed canopies with a shaft at each side. Within the centre is the letter F, crocketed with a pen and pencil. The foliage used is artificial, and the effect of the whole unpretentious and good.

The remark will not be out of place here, that Mr. Fairholt, by the disposition he made of his property, which was not large, has benefited the public to a much greater extent than is done by the majority of persons who die with ten times the amount of money at their disposal.

COMMITTEE ON LABOUR AND WAGES.

The Social Science Association have appointed a committee for the purpose of spreading information as to the natural laws regulating the rate of wages and the supply and demand for labour. A great want of information exists as to the nature and operation of these laws. Mr. Overend, Q.C., has stated to the executive committee that, in his opinion, "almost all the crimes in trade matters originate in ignorance." It is this ignorance, wherever existing, which the association desire to remove. In forming the committee they have sought to present to employers, to the working classes, and to the country generally, a list of names calculated to inspire confidence in the disinterestedness of the promoters of the object in view and in their ability to carry on the work wisely and efficiently.

Besides spreading abroad information on the laws which regulate wages, an attempt will be made to induce employers to avail themselves of the last amendment of the law of partnership, which enables them, without risk, to pay their work-people, in part, by granting them a share in the profits, so as to give them in some degree the interests and feelings of proprietors; and also to promote amicable conferences between operatives and their employers, such as have so long been in successful use at Nottingham and elsewhere.

We are enabled to give a list of the committee.—Messrs. Edward Akroyd, M.P.; Rev. Samuel Bache; Arnold Baruchau; T. B. L. Baker; Thomas Barnes, M.P.; James Beal; Thomas Beggs; Adam Black; C. H. Braoebridge; Thomas Brassey, jun.; Thomas Briggs; H. C. Briggs; Samuel Brown; the Right Hon. H. Anstin Bruce, M.P.; Charles Buxton, M.P.; Sir T. F. Buxton, bart., M.P.; Nathaniel Caine; David Chadwick; Edwin Chadwick, C.B.; F. S. Corrance, M.P.; Samuel Courtland; Right Hon. William Cowper, M.P.; Rev. R. W. Dale; W. T. S. Daniel, Q.C.; the Hon. George Denman, Q.C., M.P.; Sir Wentworth Dilke, bart., M.P.; George Dixon, M.P.; Earl Ducie; Lord Dufferin and Glendebone; Andrew Edgar, LL.D.; William Ewart, M.P.; William Fairbairn, LL.D., F.R.S.; Professor Fawcett, M.P.; H. W. Freeland; George Godwin, F.R.S.; Sir Francis H. Goldsmid, bart., M.P.; Julian Goldamid, M.P.; Walford Greatorex; E. O. Greening; Right Hon. Russell Gurney, Q.C., M.P.; Thomas Hare; G. Woodruff Hastings; William Hawes; Charles Hawkins; Edwin Hill; Frederic Hill; M. D. Hill, Q.C.; W. B. Hodgson, LL.D.; Lord Houghton; John Howell; Thomas Hughes, M.P.; J. K. Jeffrey; Thomas Jessop; Professor Stanley Jevons; Hon. Arthur Kinnaid, M.P.; W. C. Levy; Right Hon. the Earl of Lichfield; Danton Lupton; Lord Lytton; J. McClelland; Horace Mann; Hugh Mason; Samuel Morley; Walter Morrison, M.P.; J. W. Murland; Charles Neate, M.P.; William Newmarch, F.R.S.; W. Overend, Q.C.; Charles Paget; Rev. Mark Pattison; Professor Lyon Playfair; John Plummer; Edmund Potter, F.R.S., M.P.; Hodgson Pratt; Robert Rawlinson, C.B.; Earl Russell, K.G.; Arthur Ryland; W. Lucas Sargant; Russell Scott; William Shenae; Sir J. Kay Shettleworth, bart.; Robert Slater; Rev. S. A. Sneathal; Robert Stuart, Q.C.; Colonel Sykes, F.R.S., M.P.; P. A. Taylor, M.P.; J. Pitt

Taylor; Seymour Teulon; William Tite, F.R.S., M.P.; R. R. Torrens; H. S. Tremenehere; Sir Walter C. Trevelyan, bart.; E. Carlton Tufnell; Sir Harry Verney, M.P.; Thomas Webater, Q.C., F.R.S.; T. W. Weguelin, M.P.; Sir J. Eardley Wilmot, bart.; his Excellency M. Van ds Weyer; Professor John Wilson.

The meeting whereat this committee was appointed was presided over by the Right Hon. W. E. Gladstone, M.P. The speakers were (in the order of their speaking) Sir John Kay Shuttleworth, Mr. (Godwin, Mr. Ludlow, Mr. Applegarth, Mr. Neate, Mr. G. W. Hastings, Mr. Dering, Mr. John Ruskin, Mr. Hare, Mr. Mundella, Mr. Thos. Hughes, M.P., and Mr. Taylor.

A FEW THOUGHTS ON STRIKES, TRADES UNIONS, LABOUR, AND CAPITAL.

SIR,—At no time in the history of our country has the relation of employer and employed been more unsatisfactory, or the war between capital and labour been more deadly. The harmony which once existed between the contending parties is gone, and a new order of things is in existence. The hewers of wood and the drawers of water believe they are unfairly dealt with by the upper and employing classes, and are by combination fighting for a larger reward for their labour. Although this movement is more noticeable among those who receive weekly wages, there is not any doubt but that the movement has extended to every class of society. Any one who can for a short time cast aside class prejudices, and impartially view the present state of things, must come to the conclusion that the working classes are not alone in an unsatisfactory condition, but that the body politic is almost rotten to the core.

As the condition of the labouring classes is largely influenced by the actions of the classes above them, I think it may be fairly assumed that the agitations which have for some time characterised them are, after all, but a reflex of the selfishness of the other classes. In looking around we see that political life, as represented by the ruling parties, is out of joint. Principle, which ought to be the guiding star, is cast to the winds,—one section trying to outbid the other. Their only aim seems to be place, and the distribution of State loaves and fishes, whilst great social and educational measures are neglected, to the nation's injury and loss. Can it be wondered at, that under this low state of morality, the workmen should make demands which are, in many instances, injurious to their class? The present state of the nation is more unsatisfactory than it has been for a long time. The registrar's returns state there is a large increase in pauperism, and a decrease of trade, whilst local taxation is also on the increase. These are matters which affect all classes, and if a change do not soon take place, must bring disaster and ruin to every portion of the community. The workmen seeing the apparent prosperity, and that a rise take place in various articles in daily use, demand a higher price for their article—labour; and looking at it from their point of view, there seems nothing wrong in that demand. Nevertheless, I have often thought the members of trade societies place too much reliance on their unions to gain whatever demands they may in their ignorance or wisdom think fit to make. Their place of meeting are not fitted for a calm consideration of the important subjects brought before them; and under the excitement of Boniface's adulterations, they are ready for war upon any real or imaginary issue. Often the boast is made that a thorough union of the working classes would accomplish any desire, forgetting that there is a limit to the price of every commodity, and that by raising its price to a fictitious value, they in the end do an injury to themselves, and society soon finds other means to supply its wants; or else there is an influx of outsiders into their trade or trades which is paid so much better than others, so a corresponding fall takes place, and the last condition of that class is worse than its first. Society in the aggregate is generally left out of account by the unionists, and they act as though there were no opposing force to their demands. What I more particularly find fault with is their rashness in not calculating the effect that a rise of wages creates. Often a strike takes place, and society is plunged into a wage war by the crochets of a few individuals, without the slightest prospect of a successful result; and even if it happens that

success is by some chance with the operatives, it is but the prelude to a general rising of other trades. As war between two countries on a great continent excites the passions of all others, a wage war is no exception, but causes a general commotion and a general rise in all commodities consumed by them. If not at once apparent in the price, the difference is made up by adulteration; and, on the whole, the apparent gain is a loss. It also appears to me that the workmen cannot by their strikes interfere with or limit the employer's profits, and, therefore, they cannot affect his position in the relations which he before had with his men. The employer would still have the same amount of capital in his business, and his interest or profit on his capital would remain; but it would affect the workman, as the enhanced cost of the article to the consumer would restrict the demand, whilst he received less for his money; and his income in many instances being fixed, a less quantity would be produced and a less number of labourers required. Those thrown out would have to seek other employment, or be a burden to their society. Such appears to me to be the effect of a continual agitation for a rise in wages. Although it is an imperfect sketch, it might be enlarged; but I think it is born out by the experience of the past few years and in the reports of the great trade societies.

Another fallacy of the unionists I will touch upon. At the Manchester conference, it was assumed by the whole of the delegates that the low remuneration of slop-workers and others was due to their not having a union. The delegates forgot that the value of slop-work and other easily learnt trades, which require no mental and but little physical energy, is fixed by society, or, as some have it, by the law of supply and demand; and it is self-evident to every one who has passed a moment's rational reflection on it that all departments of labour which are easily acquired will always be badly remunerated, and all the unions in existence cannot for even a short period alter what is a natural law. I am not one of those who are blind to the advantages of association, or want to abolish trade unions; but I think, in spite of all the leaders claim for them, their action has not been always beneficial to the workers, and that great improvements are needed to make them really advantageous to society. Being disappointed of a ticket for the meeting on Saturday at the rooms of the Society of Arts, I jotted down a few thoughts as my contribution, and have sent them to you, air, thinking that they may not be out of place in the columns of the *Builder*. JACK PLANE.

RIVER POLLUTIONS.

THE RIVER THAMES.

In the third report by the Rivers' Pollution Commission, that on the Aire and Calder, it is stated that rivers are polluted and obstructed by semifluids and solids, to the extent of hundreds of thousands of tons annually. The fluids, consisting of town and house sewage, as also of dye-refuse and waste washing and scouring water; the solids being furnace-ashes, foundation material, sludge from reservoirs, road scrapings, and every other kind of refuse in a solid form, thrown away by a large population. Whatever restrictions Parliament may put on river pollution in general, we think that the casting in of solids and of sludge, will be prohibited. The solids and sludge may be abstracted, both from sewage and from waste dye-water, and experiment has shown that even the colouring matter of black dyes can be taken out by mere liming and mechanical filtration, either through furnace ashes or through Needham's press. Solids and sludge are extracted from sewage by rining and subsidence in several places, and with most beneficial effects to the adjoining streams, as the volume and weight of sludge abstracted shows. London, by some means, appears to have escaped the obligation of removing sediment and sludge from its sewage before discharging it into the Thames, hence the regret now as to blocking this river at Barking, both above and below this point. The Metropolitan Board sorely form a strange notion of their duties if they think that the purification of the Thames is effected by what they have done and by what they are doing. A writer in the *Engineer* (July 3rd) states that "about 1,338 tons of solid filth finds its way into the river at Barking daily;" this makes no less than 488,370 tons of solid filth

annually. This weight and volume may probably be in excess, and the terms, "solid filth," a little confusing. The statement as to volume and weight may, however, not be far from the mark. If the Metropolitan Board is compelled (as it ought to be) to remove the solids and sludge of sewage, there probably will be not much less than 300,000 tons of sludge to abstract and deal with annually. At Birmingham, the corporation of that town has to deal with upwards of 30,000 tons of sludge per annum, and the work is imperfectly performed. London may be set down at ten times the population of Birmingham, and if the weight of sewage-sludge is also ten times greater, there will be some 300,000 tons per annum to be removed. This vast body of sludge has, however, been sent year by year through the Barking sewer months into the unfortunate river Thames, which was to have been purified by the very costly operations of the Metropolitan Board. What is the meaning of this pollution? What is it capable of doing? 300,000 tons of sludge would form a bank having a cross-sectional area of one yard, or 9 square feet, 170 miles in length, or it would form a lake of sludge of sixty-two acres in area and one yard in depth; or it would coat both banks of the Thames with sewage-mud 20 miles long, 17 yards wide, and 9 in. thick. It is not assumed that fouling of the Thames in this form and to this extent actually takes place; as that which is soluble of this sludge in the tidal water is scoured up; and, with the estuary and river mud, oscillates about; but some of the foul sewage-matter coats the margin of the river both above and below the point of discharge, just as Sir G. Gurney stated would be the case. Those who navigate the river find foul banks of sewage-matter, and the engineer to the Thames conservators complains of the obstruction caused to shipping; those who work on the river, and also those who live on both banks in the vicinity of the outfalls also complain loudly of the stench they have to endure. Are these to be all the results of the Metropolitan Main Drainage Works, which have cost some four millions of pounds sterling?

COMPETITIONS.

Basingstoke Mechanics' Institute.—The committee having received eighteen designs, have selected one which was found to be the joint production of Messrs. Messenger & Gundry and Mr. W. Seymour, of London.

Slough Church.—The committee have made their final choice of the plans for the new parish church. The plans selected are those of Messrs. F. & H. Francis, of London, whose motto in the competition was "In Domino confido." The tower is at the south-west angle. The principal entrance is by a south porch. The church will accommodate 1,200 persons, and it will cost about 10,000l. The site is between Mackenzie-street and the Stoke-road, near the railway station.

THE KINESCOPE, A NEW PHOTOGRAPHICAL BIJOU.

MM. LANCOIS & ANCIERS, of No. 14, Rue de Castiglione, Paris, have constructed a clever little apparatus, to which they have given the name of *kinescope*, showing objects in relief and in motion. To show them in relief does not require couples of dissymmetric photographs, as those used in this apparatus are microscopic, and each of the photographs is separately shown in relief. The movement consists only of two different positions of the subject, the first and the last, without passing through the intermediate positions, so that two images only are necessary. The apparatus, thus amazingly simplified, is contained in a small oval locket, the greatest length being about $\frac{1}{2}$ in., and the two photo-microscopic cylinders are placed in the centre of and perpendicular to the face of the *brevete*. They represent the same object in two positions, and the effect of change of position is obtained by a very simple mechanism. The two photomicroscopic cylinders are placed in a vertical guide, surrounded by an india-rubber membrane, on which rests a vertical pin, terminated by a small button on the top of the locket. For instance, in the locket we examined, on looking through the central aperture, the normal state of the apparatus shows a little child holding in its outstretched hand an india-rubber ball, which he

contemplates with evident pleasure, the head being bent towards it. But, if the button be pressed down with the finger, the force exerted on the coudonchoc changes the relative position of the cylinders, and, the first image disappearing, the second image is brought to view, showing the ball thrown up into the air, while the head is thrown back to watch the movement of the projectile. If the motion of the finger be rapid enough, the images succeed each other instantaneously; and, owing to the persistence of images on the retina, the illusion of the child tossing up the ball is perfect. Thus, by this very ingenious idea can be produced the effect of a distant or departed friend appearing full of life.

FROM AUSTRALIA.

Melbourne.—St. Patrick's (R. C.) Cathedral, in course of erection on Eastern-hill, is making progress. The whole plan of the cathedral comprises nave, transepts, and choir, with aisles to each on both sides. The choir has an apsidal end, and five chapels open out from the aisle which surrounds it. There are to be two towers with spires, each 220 ft. in height, at the south-west end of nave, and a lantern tower and spire, 330 ft. in height, at the intersection of the nave and transepts. The extreme length of the church inside is to be 345 ft., and to extend across the whole Reserve to Albert-street. The width inside of nave and aisles is 76 ft. The inside length of the transepts is 160 ft., and the height to the ridge of the roof is 92 ft. The design proposes remodelling the present house for the bishop, to form part of the grammar-school buildings, and includes a plan for a new house for the bishop, with chapter-house, sacristies, cloisters, &c. Comprehensive as is the design, it is only intended to complete it by instalments, and at present the works only of the nave and aisles, with the two western towers, have been commenced. The nave and one aisle are now roofed in, and nearly completed, and the stone vaulting of the second aisle is making rapid progress, so that, in all probability, this part of the church will be completed in four or five months; and, when it is completed, the transepts and central towers will be commenced as the next instalment. The fittings inside are all temporary. One of the towers is up, ready to receive the spire, and the other is complete to the floor of the upper belfry. Some of the bells have been hung in the eastern tower. The stained glass in the principal window of the nave is by Messrs. Hardman, of Birmingham. The subject is the Ascension of our Lord. The works of the cathedral have been carried out, under the superintendence of Mr. Denny, by Mr. Young, the contractor, who has recently executed the Independent church in Collins-street. The architect is Mr. Wardell, now inspector-general of public works.

The City Council has begun to move in the matter of sewerage, and there has been an interview between the Sewerage Committee and the Commissioner of Public Works. They went to look after a special grant of 200,000l., made for Melbourne sewerage in 1853. The Commissioner of Public Works replied that nearly six times that amount had since been spent in supplying Melbourne with water; and he implied that to mention the 200,000l. at this time of day was somewhat cool. In the mean time Dr. Girdlestone, the health officer, is keeping the Health Committee up to their work, and there is to be a *coup* upon those sources of pollution the cesspools which drain into the streets and the unmade lanes, and especially upon an open sewer which drains from the hospital into Swanston-street.

The place called the Western Market, where some bluesome ruins have been an eyesore for a long time to the architectural appearance of the west portion of Collins-street, is now turned to account as a site for a pile of buildings in course of erection, which, when finished, will form a block having a frontage of 230 ft. on Collins-street, 300 ft. on William-street, 230 ft. on Little Flinders-street, and 300 ft. on Market-street, arranged for twenty-eight large and distinct places of business. The Anglo-Italian style of architecture has been adopted. In each of the four respective façades there is a central pile with wings of increased heights to that of the remainder, and to these there are groups of coupled Roman Doric columns, supported upon panelled and moulded stylobates, and surmounted by the

usual Roman Doric entablature. The windows in both stories are circular-headed, those on the ground story having rusticated piers and arched heads; and the others will be finished with archivolts, impostes, and enriched keystones. The entablature over these is of the Ionic order, with a halustrated parapet with moulded piers and blockings, and each pier finished with an enriched finial. The whole has been designed and is being carried out under the superintendence of Mr. John M. Barry, architect. The *Australian News*, which keeps its readers well posted in illustrations of new buildings, gives an engraved view of the buildings.

The City Council have ratified a contract for the construction of a portion of the new cattle and sheep market, at Flemington. Designs had been called for and premiums awarded for two approved plans. But neither plan was adopted, from their inapplicability in some respects to the views of the Corporation, and the city surveyor was accordingly instructed to execute a design embodying such portions of the premium plans as were considered most adapted to the extent of the ground and the requirements of the cattle salesmen. This plan has, for convenience, been subdivided, and the first portion of the work about to be undertaken has been let to Messrs. Plant & Parker at 9,399l. The market committee of the City Council determined to use red gum for posts, and that only of the very best quality procurable. The contract embraces the erection of delivery and cattle yards and calf-pens, and will cover about nine acres. There will be no less than 340 gates required for admission to the drafting and cattle yards, and calf-pens. There is a considerable amount of levelling to be done, and the yards are to be pitched throughout. The present contract is for the accommodation of cattle and calves, and as soon as the work is finished, the old sheep-pens will be entirely remodelled at a further cost, which will increase the expenditure by something like 20,000l., making the gross outlay upon the whole yards little short of 30,000l.

FROM IRELAND.

Cork.—On the last day of the period fixed for raising the sum of 12,000l. required to complete and open the cathedral for divine service, there was a large meeting held in the Protestant Hall, the Bishop of Cork being in the chair. The Rev. Mr. Gregg stated how the collection stood. They had collected 9,401l., and there was consequently a deficiency of 2,600l. He then announced amid enthusiastic cheering that Mr. Francis Wyse, of the city of Cork, and lately connected with the famous distillery, desired him to say that he had noticed the manner in which all classes had contributed towards the work, and that he would make up the deficiency. The whole amount was thus subscribed as promised, and the work proceeds with all possible speed.

PROVINCIAL NEWS.

Doncaster.—The building recently completed for the Doncaster Infirmary and General Dispensary has been formally opened by the mayor and the Rev. J. Campion. There are altogether five wards,—one male accident ward, two male medical wards, and two female medical wards, which are constructed to contain twenty-five beds. There is also accommodation for two nurses. The full complement of beds, however, has not been fitted up, twelve being thought sufficient for present requirements. The beds are fitted up in a style precisely similar to that adopted at Manchester, and are provided to meet the necessities of different cases, some with spring mattresses, some with hair mattresses, and others with flock beds. The ventilation is all by the windows, the result of the inquiries made by a committee appointed in connexion with the Leeds Infirmary to investigate the subject, being to the effect that window-ventilation was upon the whole the most reliable and the best. The majority of the windows are louvres, being divided into four sections, which work on a lever, and are opened by a vertical rod. They open so that the air enters in an upward direction, intended to prevent draughts being felt by the occupants of the beds below. The blinds, a patent of Messrs. Gardner & Son, Glasgow, are constructed of thin strips of wood, and while requiring no washing, which seems to

be regarded as an advantage, are durable. There is no fever ward.

Ringwood.—The new corn exchange at Ringwood, Hants, has been opened. It is in the Italian style of architecture, and occupies a position in the centre of the town. It was designed by Mr. Thomas Henry Wyatt, of London, architect. The front of the structure towards the street is three stories in height, part of the upper story being arranged in the curved roof. The building is entered through a stone archway of 7 ft. clear opening. The exterior of the archway has cinctured three-quarter columns, and a stone cornice over same, projecting and forming a balcony, which is enclosed with a wrought iron railing. The central part of the building over the doorway has a semicircular-headed window, the opening of which is broken up by the wood-work of the frame. The general facing material is red brick, and all the dressings are executed in Bath stone. The exchange hall is 72 ft. long, and 37 ft. 6 in. wide. It has an open-framed timber roof, with glass to the upper portion. The sides of the hall are relieved by the introduction of red brick piers or buttresses. The general facing of the interior is yellow brick, red work being used in the arches, impost, &c. The west side has semicircular-headed windows, and the east side wall is occupied by blanks corresponding in outline with the windows on the opposite side, at the end of the hall. The balcony or platform is about 19 ft. by 9 ft. At the top of the grand staircase, and entered from a spacious landing, is a large room over the lower offices and corridor; this is a room 40 ft. by 19 ft., and 14 ft. high, and is, we believe, to be used for magisterial and other purposes. The rooms in the upper portion of the exchange are arranged as bedrooms in connexion with the White Hart Hotel adjoining. The building of the exchange and the whole of the work in connexion therewith has been carried out by the firm of Joseph Bull & Sons, of Southampton, and no clerk of the works has been employed.

MONUMENTAL.

The Palmerston Memorials.—It is finally settled that the inauguration of the Palmerston memorials at Romsay shall take place on Tuesday, July 21. A special service will take place, and a sermon be preached by the Bishop of London. At the termination of the service a procession will be re-formed and proceed to the market-place, when the statue will be uncovered, and an inaugural address be delivered by one of the late Lord Palmerston's colleagues. The park and grounds at Broadlands will be thrown open, and the band of the Royal Marine Artillery will perform there. In the evening the vicar will illuminate the western window of the abbey.

The Jones Memorial at Sandhurst.—A new monument is about to be erected in the chapel of the Military College at Sandhurst in memory of the late Lieut. General Sir Harry Jones, G.C.B., who was long the governor of the college. The monument, which is the work of Mr. Giffin, of London, is of white Carrara marble upon a black ground. At the top are carved the old Ordnance arms and a field officer's sword, and at the bottom, on the plinth, his family arms, &c. The central part, or table, is surrounded by a carved wreath of oak-leaves, bearing the names of the many engagements in which he had served, and the inscription.

CORN HARVESTING IN WET WEATHER.

THE present season is suggestive of anything but wet corn sheaves; but an experiment which has been tried at Gilwell Park, near London, depends in no way upon a rainy sky or a given day for its importance. Mr. G. Gibbs, who resides at Gilwell Park, has just succeeded amongst twenty competitors in winning the prize offered by the Society of Arts for the best practical essay on the question how to harvest corn in wet seasons; and on the occasion referred to he invited a party to witness the apparatus at work. Asks described by the *Gardener's Chronicle*, the hot breath of a steam-engine diverted from its ordinary exit is driven, by means of a blower, into a cavity underneath an artificial floor of sheet-iron, which floor is crocketed with hollow upright cones or funnels, open at the apex, and placed at such intervals as to allow the wet sheaves to be stooked upon them, as close as may

be, to receive the drying blast up through their centres, from the funnels on which they stand. Of course the chamber is closed as soon as the sheaves are thus disposed within it; and the heat inside is soon considerable, absorbing every particle of moisture, and allowing the stooking process to be quickly repeated upon another wagon or cart-load of sheaves—that is, wet-fresh from the field. For the treatment of damp, or half-made hay, a simpler plan is adopted, the hay being merely shaken before the drying blast of the engine, the effect of which in rapidly driving off every particle of moisture caused some surprise among those present.

OPERA AND STAGE.

Royal Italian Opera, Covent-garden.—Gounod's "Romeo e Giulietta" goes remarkably well at the Royal Italian Opera House, and has given a triumph to Madlle. Patti especially. We cannot agree, however, with those critics who have said that the acting of this lady in the part (good as it is) is equal to her singing. There was a want of elegance in her movements at times which might with ease be remedied, and this would greatly increase the spectator's pleasure. Of her singing no one word of qualification need be said: it was unexceptionable from beginning to end. Signor Mario acted and sang his part on Monday evening charmingly. Signor Boggiolo, as *Friar Lawrence*, Signor Cotogni as *Mercutio*, Neri-Baraldi as *Tybalt*, Petit as *Copulet*, and Madlle. Locatelli as the page, all deserve more than a word of praise. The scenery is admirable: we must particularly notice the ball-room, a Venetian interior with a wealth of carvings, marbles, inlays, and colourings, and the gardens and terrace at night.

The Princess's Theatre.—It is much to be regretted, in the present dearth of talent, that so graceful, touching, and, on occasion, powerful an actress as Miss Kate Saville is should be so often absent from the London stage. A new version of Mosenthal's "Deborah," titled "Ruth," gives her, in the part we have known as *Leah*, scope for the display of her abilities. It was fully taken advantage of, and secured her the hearty and unanimous applause of the house. She was exceedingly well supported by Mr. J. G. Shore, certainly one of the cleverest and most versatile actors on the stage. An actor new to London, Mr. Allerton, is playing *Hamlet* here with considerable intelligence and art; Mr. Shore making an excellent *Horatio*.

CONVERSAZIONE OF THE INSTITUTE OF ARCHITECTS.

THE *conversazione* of the Royal Institute of Architects was held at the House, in Conduit-street, on Wednesday evening, the 1st of July. The rooms and approaches were painted and decorated on the occasion, large numbers of flowers lending their aid with pictures and models to form a sparkling *ensemble*. The principal contributors were the president (Mr. Tite, M.P.), who received the guests, Professor Donaldson, Mr. F. Leighton, R.A., and Mr. Sandys, whose picture of *Medea*, an elaborately finished work, attracted considerable attention. Mrs. Marrahle contributed some fine Indian jewelry. Amongst these present, about 600 in number, were Professors Scott & Donaldson, Drs. Bird, Druitt, Barlow, Oppert, Dickson, Sir Bartle Frere, Colonel Sykes, M.P., Messrs. Beresford Hope, M.P., E. M. Ward, R.A., E. Smirke, T. H. Wyatt, E. Corbould, Charles Mayhew, Vaux, H. Baker, B. Ferrey, Slater, W. P. Griffith, F. Cockerell, G. Trneffitt, F. M. Brown, Critchett, Pugin, Marcus Stone, Chas. Martin, Wybnd, M. D. Wyatt, Westcott, Woodward, C. Fowler, W. Cave Thomas, G. Mair, Grantham, Dunning, L. Wyon, H. Roberts, E. Hall, Walter Severn, Worthington, Gordon Hills, A. Donaldson, E. B. Lamb, W. Papworth, Collman, A. Moseley, F. Marrahle, Allom, Hiscocks, Darbyshire, Edmeston, Spiers, Hakewill, Lamair, Blashfield, P. Anson, Burges, Houle, Roger Smith, D. Brandon, W. White, H. Oliver, Lewin, J. Norton, C. Eastlake, Tarn, J. Thomson, H. Shaw, Sidney Godwin, G. Godwin, &c., &c.

There were also many ladies. The band of the Coldstream Guards played during the evening in the Architectural Exhibition gallery, which was open for the occasion.

CONFERENCE OF INSTITUTIONS AT THE SOCIETY OF ARTS.

THE seventeenth annual conference between the Council of the Society of Arts and the representatives of the Institutions in Union and Local Educational Boards was held on Friday, the 19th ult., at twelve o'clock, noon. Mr. William Hawes, F.G.S., chairman of the Council, presided.

The Secretary having read the annual report of the Council.

The Chairman invited discussion upon the report, and also upon the programme of examinations for the ensuing year, as well as upon a list of subjects which had been suggested.

The only resolutions formally agreed to in course of the discussions were the following:—

"That this conference, having heard a statement of Mr. Curwen's plan for a system of prizes and certificates in elementary musical composition in connexion with the Tonic Sol-Fa School, beg to recommend them for the adoption of the council."

"That this conference, agreeing with the Metric Committee of the British Association for the Advancement of Science in the importance of diffusing information on the metric system of weights and measures, highly commends the proposal to institute a prize to be given to the candidate who exhibits the greatest knowledge of the principles and practice of the same, and commends the subject to the earnest attention of the council."

"That the council be requested to enter into communication with the Government, with the universities, and with such other bodies concerned in public education as it may seem expedient, with a view to ascertain how far it is possible to combine the various examinations that are now in use, and to render them more generally useful in promoting the general and technical education of the people."

The Chairman said the last four questions on the list, Nos. 6, 7, 8, and 9, appeared to form one class, and they were, therefore, considered together, but no formal resolution as to them was agreed to. The conference, however, was agreed as to the desirability of opening museums and galleries in the evenings. There was a difference of opinion as to Sunday afternoons. The Council have announced in the Journal of the Society of Arts that a discussion having taken place on the subject of workmen's holidays at the conference of representatives, the council would be much obliged to any manufacturer or other employer of labour who, having tried the plan of allowing his workmen to take their holidays at once, rather than piecemeal, would communicate his experience to the secretary.

SUFFOLK PRIZE COTTAGES, 1867. AGRICULTURAL ASSOCIATION, IPSWICH.

THE Suffolk Agricultural Society have published the plans for a double cottage to which they awarded their offered premiums of 25l. and 15l., as well as four other of the plans. They give, also, a general specification and particulars of cost. For 4s. the publication may be obtained; and though we do not discover anything particularly new in the plans, many will find the purchase a good investment. The committee give the following hints:—

"Employ a tradesman to whom you can with confidence advance, if necessary, 40l., in order that materials may be purchased with ready-money. Give your orders in September, so that the builder may prepare all woodwork, and do such brickwork as weather will permit, and when wages are the lowest. If stones and sand are plentiful, before deciding to build of brick, inquire as to concrete lump, which the committee are assured by a gentleman, who has used it extensively, makes a stronger and drier work at half the cost of brickwork, thus effecting a saving of about 20l. in a double cottage. By brick-on-edge hollow work a considerable saving in brick is effected. By pan-tiling instead of slating about 8l. is gained."

PREMIUMS OF THE INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have just awarded the following premiums for original communications submitted to the Institution, and read at the ordinary meetings during the sessions 1867-68.

1. A Telford Medal, and a Telford Premium, in books, to G. Higgin, for his paper, "Irrigation in Spain, chiefly in reference to the Construction of the Henares and the Esla Canals in that country."
2. A Telford Medal, and a Telford Premium, in books, to C. P. Sandberg, for his paper "On the Manufacture and Use of Rails."
3. A Telford Medal, and a Telford Premium, in books, to Lieut.-Colonel O'Connell, R.E., for his paper "On the Relation of the Fresh Water Floods of Rivers to the Areas and Physical Features of their Basins."
4. A Telford Medal, and a Telford Premium, in books,

* Mr. J. T. Clarke, Newmarket; see letter in *Royal Agricultural Journal*, vol. xxiv, part 2.

to W. Wilson, for his "Description of the Victoria Bridge on the line of the Victoria Station and Pimlico Railway."
 5. A Telford Medal and a Telford Premium, in books, to C. Douglas Fox, for his paper "On New Railways at Battersea; with the Widening of the Victoria Bridge and Approaches to the Victoria Station."
 6. A Telford Medal and a Telford Premium, in books, to J. Wolfe Barry, for his paper "On the City Terminal Extension of the Charing Cross Railway."
 7. A Watt Medal to Edwin Clark, for his paper "On Engineering Philosophy; the Durability of Materials."
 8. A Telford Medal to W. Jarvis McAlpine, for his paper "On the Supporting Power of Piles; and on the Pneumatic Process for Sinking Iron Columns, as practiced in America."
 9. A Telford Premium, in books, to T. Logan, for his paper "On the Benefits of Irrigation in India; and on the proper Construction of Irrigating Canals."
 10. A Telford Premium, in books, to Allan Wilson, for his paper "On Irrigation in India."
 11. A Telford Premium, in books, to Wilfrid Airy, for his paper "On the Experimental Determination of the Strains on the Suspension Tie of a Bowstring Girder."
 12. The Manby Premium, in books, to A. C. Rowden, for his paper "On Floods in the Nerunda Valley; with Remarks on Monsoon Floods in India generally."

CIRENEOSTER CONGRESS OF THE BRITISH ARCHEOLOGICAL ASSOCIATION.

The proceedings of the Congress will be as follows:—

Monday, August 10.—At Cirencester. — Inaugural address of the president (Earl Bathurst) at 3.30 p.m., at the Assembly Rooms. — Examination of the church and town-hall.—Dinner at the Assembly Rooms.

Tuesday.—At Cirencester.—Inspection of the antiquities of the town, under the guidance of Mr. John Brasenuder.—At 11 o'clock the Roman Amphitheatre.—Visit to the Roman Wall at Watermoor, the tessellated pavement at Mr. Brown's and the pavement at the Barton.—Roman capitals and antiquities in the Abbey grounds.—Luncheon at 2.30.—Then to the Museum of "Corinthus Antiquities."

Wednesday.—Excursion to Ranbury Rings.—Maisey Hampton Church and Fairford Church.—Lunch at Fairford.—Visit to Bibury Church.

Thursday.—Excursion to Trewhary camp.—Akeman-street.—Crudwell Church.—Mismisbury Abbey Church and Cross, and Abbot's Hall.—Oxford Park.—Ancient stones at Kemble, and visit to the Agricultural College of Cirencester.

Friday.—Excursion to Daglingworth Church.—Dunstable House.—Elstone Church.—Lunch at Birdip Hill.—Return by Brimsfield Church and Castle, Miserden Church, and Edgworth.

Saturday.—Visit to the newly-discovered Roman villa at Chedworth.—Return to Fossebridge to lunch.—Examination of Chedworth Church.—Calmeden Wayside Cross, and North Cerney Church.

Evening meetings each day (except Monday), at the Assembly Rooms, for the reading of papers and discussions.

SEWERING WOLVERHAMPTON.

A WORK of great importance to the borough of Wolverhampton has been formally begun by Alderman Hawkesford, the chairman of the sewage committee of the corporation, laying, at the Atherley Junction, certain of the masonry necessary to the carrying out of the system of sewerage by which that town is henceforth to be drained, at an estimated cost of 40,000*l.* The whole of the sewage of the borough is to be taken into one outfall. For mitigation, the Barnhurst Estate of Mr. Hellier, consisting of somewhat over 283 acres, was bought for 28,000*l.*; and two fields, comprising over nine acres, were purchased on the west side of the canal, and immediately adjoining the Shrewsbury Railway, for the purpose of constructing the outfall sewer and filter-beds, and as a communication between the canal and the Barnhurst Estate. The nine acres were an addition to the work upon which the 40,000*l.* were estimated, and the price of "The Barnhurst" is not included in that larger sum. But there is every reason to conclude that when the estate has been brought fairly under irrigation, the rent will be sufficient to meet the outlay under that head.

RAILWAY MATTERS.

The two last girders of the viaduct across the Solway Firth, which forms the chief engineering work on the Solway Junction Railway, have been laid by Mr. Brogden, of Ulverston, the chairman of the directors, in the presence of the engineers and leading promoters of the undertaking. The bridge is 1,940 yards in length, and, with its sea embankments at each end, forms a road across the sea nearly two miles in length. About 1,800 tons of wrought-iron and 2,900 tons of cast-iron have been used in its construction. The bridge is formed upon iron piles

* Has previously received a Telford Medal.

screwed and driven into the subsoil. The foundations proved better than had been anticipated, and the work is said to be of great solidity. This railway bridge will form a new connecting link between England and Scotland, and will provide a short route for the rich iron ore of Cumberland to the Scottish iron masters.

An Act has just passed through Parliament for the making of a tramway in the town of Street. This is the first instance where Parliament has sanctioned the construction of a tramway along a high road, and is, therefore, considered an important precedent. The cost of making it, as estimated by the engineer, Mr. Hamilton Fulton, is 3,800*l.* per mile. By its completion all the material facilities of a railway will be secured, and if such tramways can be generally constructed throughout the country for the sum estimated by Mr. Fulton, they will probably be adopted, and so save a considerable outlay in horse-power and in the expense of the wear and tear of the road, and doubtless will become valuable feeders to the railways.

A Mr. Kerr, of Edinburgh, has invented a reflector for a locomotive, by means of which the engineer is able to see the rear of his train, the conductor, and all who are either getting on or off, without moving from his seat. It can be arranged for any length of train by simply changing the angle of reflection. It has been tried on the Jeffersonville-road, and pronounced to be a success in every respect.

A NEW PLAN FOR STATING ADDRESSES.

Sir,—If the following plan were adopted, as it might be, all over the world, it would save much trouble and inconvenience with regard to communication between persons living at different parts of a town, country, or the world.

It is simply to mark, in towns, on all streets running east and west, or nearly so, the minutes and seconds of longitude; in those running north and south, of latitude; in their regular succession, from one to sixty, and upon each door a figure representing the number of thirds of latitude and longitude.

In the open country, the degrees and minutes would suffice in their proper places, and the latitude or longitude, in degrees, minutes, seconds, and thirds, on every guide-post or milestone. This would soon be learned and easily understood, and would make it much easier for letter-carriers and others to find their way in large towns; besides which it would educate the people in the science of geography much better than half the books written on that subject.

In London the figures would run in regular succession from Bow to Tyburn; and wherever a person's address might be: for example,

6' 31" 15" W.

51° 3' 9" 45" N.

it would be perfectly easy to trace it out without asking the way, or requiring the name of the street or the number of the house.

A second of latitude is about 101 ft., and of longitude about 62 ft., in the parallel of London.

WALTER SCARBELL.

BLOOD PRODIGES.

SOMETIMES, during the hottest weather of Midsummer, bread, paste, meat, &c., and a few other substances, are liable to become suddenly covered with a vivid carmine stain, exactly resembling arterial blood. Only a day or two ago, a pot of paste made for me in the evening had come, during the night, coated with this brilliant crimson parasite; once or twice before I have observed it during the hottest days of July, and each previous time on bread, first appearing as a blood-red spot, and rapidly spreading over a large surface. I have tried to cultivate it, but without success, as it appears to require some peculiar state of the atmosphere, moist air at once destroying it. It may probably have been observed by other readers of the *Builder*; if so, it may be at once known by its *vivid crimson hue*. Its growth is very rapid, and its occurrence most capricious; it is of great interest, as affording in itself a clear explanation of the many apparently well-authenticated instances of "bleeding hosts," and of waters used at the sacrifice of the Mass being suddenly blood-

stained or transformed into real flesh and blood. The persecution of the Jews in the thirteenth century, at Rotil, near Frankfort, when 10,000 were murdered, is said to have been caused by some Jews "torturing" a host till it bled. The plant itself is little understood, and is at times referred to as an alga, or water-plant, but it probably belongs to the fungus tribe.

Every reader of the *Builder* must have observed claret-colored gelatinous patches near old walls in damp places; they look very nasty, are seldom bright in colour, and have been compared to the dregs of port wine: these patches often grow on the ground near walls, creep up the mortar and adhere to the bricks, and look like a coating of dirty red jelly. To this plant many old writers referred when describing omens of fearful presage in blood issuing from the ground, trickling down walls, &c. It is a common alga (*Palmella crustacea*).

Allied to the latter are the large lumps of quivering green jelly (*Nostoc commune*), which are sometimes strewed in such abundance along paths and grassy roadsides in the autumn, and of which no traces were to be seen an hour or so before. They come up after showers, often in abundance, and in large trembling sticky masses. Country-folk call them "fallen stars" (1), and more aptly, "witches' butter." W. G. S.

THAMES EMBANKMENT STOCK-TAKING.

Sir,—The following is suggestive.
Southern Embankment.—From Ginn-House-alley, near Vauxhall Bridge, to Westminster Bridge.—Of this contract 136,000*l.* remain to be done. The progress during the twelve months ending June 30, 1868, was 43,320*l.*

Northern Embankment, Contract No. 1.—From Westminster Bridge to Somerset House.—Of this contract 65,000*l.* remain to be done. The progress during the twelve months ending June 30, 1868, was 68,800*l.*

Northern Embankment, Contract No. 2.—From Somerset House to east end of Temple Gardens. This contract is finished.

Northern Embankment, Contract No. 3.—From east end of Temple Gardens to Blackfriars Bridge.—This contract was let on June 19 to the gentleman who has the Southern Embankment contract. It is to be finished in a year. Amount of contract 126,500*l.* JASPER.

LONGDON AND ELDERSFIELD DRAINAGE.

Sir,—Can you inform me why the Longdon and Eldersfield drainage contract has been given to a Mr. Field, when such name did not appear in the list of those who tendered, as quoted in your publication of 27th of June last. Ours was tendered.

ONE WHO TENDERED.

"ENGINEERING FIELD WORK"

We are much obliged for your notice of our book by W. D. Haskell, but wish to remark that "Engineering Field Work," vol. 1, just published, is a second edition of that work, published by us in 1858, revised and rewritten, with some parts, that are not now required, omitted, and new matter added. We think it ought to be known that while we were preparing this second edition, Mr. Lockwood published his work on "Land and Marine Surveying." We are inclined to mention this from your saying, the almost twin books simultaneously appeared. Of course ours was the first book, from having, as we before said, been published (that is, the first edition) ten years ago; so if there is any copying done by the author, it must have been done from our book into "Land and Marine Surveying." We cannot help adding, if our position had been reversed, and Mr. Haskell had brought this work to me, we would not have published it, knowing he had already written a work on the subject, which work was published by us ten years ago (1858).

ATHERLY & CO.

UNAUTHORISED GAS COMPANIES.

VICÉ-CHANCELLOR MALINS has decided a point of considerable importance affecting water and gas companies. The matter arose out of the proceedings of two rival gas companies at Cambridge, and the principal question was, whether one of those companies, having no Act of Parliament, could be restrained by injunction from opening streets and roads for the purpose of laying down pipes and mains. The feature of the case, however, was the expression of the Vice-Chancellor's strong dissent from the decision of Lord Chancellor Cranworth and Lord Justice Turner in a well-known case, *The Attorney-General v. The Sheffield Gas Company*, which case, the Vice-Chancellor said, was cited before him about once a fortnight. He was surprised that two learned judges should have come to the conclusion that the general admitted license exercised by

an unauthorised company to break up the streets of a great town like Sheffield was not such a nuisance as called for the interference of that Court. It was afterwards approved by a decision in the Court of Queen's Bench that it was a nuisance, yet that decision of the two learned Judges was held to be the law in all analogous cases. His Grace the Vice-Chancellor was glad to have an opportunity of expressing his strong dissent from that decision, and his dissent to the opinion of Lord Justice Knight Bruce, who differed from the opinion of his two learned brethren. So far as the matter before him was concerned, in so far as the Sheffield case applied to it, the matter was overruled by a recent decision in the Court of Queen's Bench, and he therefore warned the defendant company that they were committing a nuisance and could not proceed with their works without an Act of Parliament. He should, after the bill had been amended to meet a collateral point, grant an injunction against the defendant company.

ELECTRO-TELEGRAPHIC PROGRESS.

The Atlantic Telegraph promises, should no disaster occur, to become one of the most remunerative undertakings of modern times. At the recent meeting of the shareholders a dividend at the rate of 8 per cent. for the nine months ending April last was declared, and from the statement of Mr. Cyrus Field it is likely that an increased dividend will be declared at the next meeting. The receipts under the reduced tariff are more by 100 per cent. than they were previously, and it is probable that a further reduction will shortly take place. Under the 25th tariff the receipts were 505^{l.} per day; under the 10th they were 579^{l.}; and under the five guineas, 693^{l.} Mr. Field stated that the company was in a position to do six times the amount of business it is now doing without adding a shilling to the expense.

Towards the close of the banquet given to Mr. Field, it was announced that telegraphic messages addressed to the chairman (the Duke of Argyll) had just been received from America, in response to two of those sent by his grace during the evening:—

"From H. Seward, in the name of his Excellency Andrew Johnson, President of the United States, Washington.—Your salutations to the President from the banquet-hall at Willis's have been received. The dinner-hour here has not arrived; it is only five o'clock; the sun is yet two hours high. When the dinner-hour arrives the president will accept your pledge of honour to our distinguished countryman, Cyrus W. Field, and will cordially respond to your Highland aspiration for perpetual union between the two nations."

From Mr. Cyrus Field's daughter, in acknowledgment of the duke's congratulations:—

"New York, 4th p.m.—I thank you most sincerely for the kind words you have spoken of my father, causing me to feel that we are friends, although our acquaintance is thus made across the sea and in a moment of time."

From San Francisco the following telegram was despatched to Mr. Cyrus Field:—

"The Governor of California presents his compliments and congratulations."

The Governor of Oregon telegraphed as follows:—

"The people of Oregon salute you as the world's benefactor, and offer you their hand across the waters as a token of their high appreciation of the services which you have rendered to mankind. Let our kindest wishes in your behalf be our representative at your meeting."

The Governor-General of Cuba also forwarded a reply to the Duke of Argyll.

METROPOLITAN BUILDING ACT AND EXEMPTIONS CLAIMED BY RAILWAY COMPANIES.

District Surveyor of Kensington v. Kell, Waring, & Lucas.—Professor Donaldson, an district surveyor, summoned the defendants, underpinnings, for neglecting to give notice of underpinning the sewer at No. 18, Cromwell-place, which they were carrying on in connexion with the retaining wall of the Underground Metropolitan Railway Company, at the distance of about 2 yards from the said retaining wall.

The defendants pleaded that they were contractors under the railway company, and consequently exempt under Part I of the Building Act; that they had purchased the premises in question; and that the Act of the Company, under p. lxxxv., of 1867, sec. 22, gave them power to underpin houses and buildings within 100 ft. of their railways.

The district surveyor, in reply, contended that it was not sufficient that the premises in question should belong to, but should be used for the purposes of the railway company, which did not appear to be the case, as a mere building operation could not be so interpreted; and he contended the case of Tolley v. the same parties, as

reported in the *Builder* of February 8th, 1868, and decided by Mr. Arnold against the defendants. In regard to the power of underpinning granted by the Act of 1867, it would be seen that in the preamble the following words occur:—

"And whereas it has been found, in the construction of the railways under the powers of the Acts already obtained by the company, that in many instances the works of the company interfere, or threaten to interfere, with the stability of the buildings, which are not necessary for the purposes of the company, and the safety of which might be easily secured without permanent interference with the occupation thereof, and it is expedient that the powers heretofore contained should be granted to the company for securing the stability of such buildings, subject, nevertheless, to the restrictions hereinafter also contained."

Therefore as these premises were purchased for merely enabling the company to carry out their works, by underpinning this building, which, in the words of the preamble, was "not necessary for the purposes of the company," the exemption clause did not apply to this case; and to constitute their exemption, the buildings must not only belong to, but be used for the purposes of the Railway.

The magistrates, Mr. Self, held that the defendants ought to have given notice.

MAREZZO MARBLE.

The entrance-hall of the House of the Society of Arts, in the Adelphi, has been lined from floor to ceiling, including skirting, wall-covering, and cornice, with this new material, Marezio Marble. It is somewhat similar in appearance to Senghita, as we have had occasion to observe when describing it on a previous occasion, but its application appears to be more extensive: it takes a good polish, and is said to be moderate in cost.

Its basis is cement. The manufacture of the material in the form of slabs is simple. The veining of the stone intended to be represented is carefully copied on a sheet of glass, and of course dried. On this prepared surface is poured the cement, coloured to the tint required; and the whole, when dry, is removed from the glass, and polished in the usual way. The markings extend some depth, for if the surface be chipped they are still apparent in the substance of the material.

The decoration at the Society of Arts consists of panels of violet vein, with Bardiglio mouldings bordered by rich antique jasper, and with Egyptian green skirtings. The soffit of the arched doorway to the left of the entrance is executed in one piece, representing a beautiful formation of Bardiglio marble. The chimney-piece and ornamentation for the clock are included. The effect of the whole harmonizes with the Mosaic pavement, and the result is a very handsome apartment. We are disposed to think that some of the combinations of colour might have been more happily made, but that does not affect in any way the capabilities of the material.

CHURCH-BUILDING NEWS.

Easton.—The chief corner-stone of a new church (St. Gabriel's), at Upper Easton, has been laid. The site of the new building is close to Messrs. Leonard & Bonit's colliery. It is intended to accommodate about 700 people. It will consist of a nave, transepts, and chancel, and will be built chiefly of bricks. The original cost was estimated at 2,100^{l.}, but after the foundation had been dug it was discovered that the ground had been previously worked, and it was found necessary to build foundation walls of 18 ft. to 20 ft. in depth. The consequence is that the original estimate has been increased by about 400^{l.}

Bathaston.—A vestry meeting has been held at Bathaston, the vicar presiding, when a report was presented from the church restoration committee announcing the completion of the work, and stating that a sum of upwards of 1,800^{l.} had been raised towards the enlargement, resating, lighting, &c., of the church, and that after paying all expenses a small balance remained in the hands of the treasurer. A subscription is now being raised under the auspices of Mrs. Rogers for the purchase of a new font.

Streatham.—The chief-stone of the new church of St. Peter and St. Paul, Leigham-road, has been laid. The church, to be built of coloured brick with Bath stone dressings, is from the designs of Mr. R. W. Drew. The length will be 80 ft., and

this breadth 52 ft.; and the seats, 870 in number, will all be free. The cost is estimated at 4,000^{l.} From its elevated position the new church will form a noticeable addition to the buildings which dot the hill. The tower will not be built with the first contract, and the church is planned so as to be capable of extension. Messrs. Perry, of Stratford, are the contractors; and Mr. J. Meadows clerk of the works.

Clifton (Derbyshire).—The foundation-stone of the chancel of Clifton church has been laid. At a vestry meeting held in the spring, it was resolved that, to make a chancel, an apse should be added at the east end of the church, and also that a vestry and organ-chamber should be built on the north side near the apse. Suitable designs having been provided by Messrs. Slater & Carpenter, of London, architects, Mr. W. Thoreley, of Ellastone, was selected to be the builder. The proposed alterations, when completed, will afford an increased number of sittings for the congregation.

Birmingham.—The foundation stone of St. Anne's Church, Cato-street, Nechall, has been laid. The building is oblong on plan, and consists of nave, a small chancel, and north, south, and west galleries. The principal elevation is in Cato-street, where there will be a west gable, in which are three large lancet windows. There is also provision for a spire, to be built hereafter. A centre doorway from Cato-street opens into the body of the church, and there are side entrances leading to the galleries. The walls will be built entirely of brickwork, no stone being used in the church excepting for the steps and the font. The roof over the body of the church is of one span, the timbers being exposed to view. The building will be covered with tiles, and the church will be plastered inside. The entire cost, including galleries, will be 2,177^{l.}, and the building will afford accommodation to 810 adults. Mr. J. A. Chatwin is the architect, and Mr. J. Briley the builder.

Yazley.—The parish church of Yazley, about two miles to the west of Eye, between Ipswich and Norwich, has been re-opened, after having undergone a restoration. The repair of the chancel devolved upon Sir E. C. Kerrison, the lay impropriator, and he determined to pull down and rebuild it. The tower has not been touched externally, and several cracks may be seen. The north wall of the nave is brick, and has been stuccoed, but in several places the plaster has fallen. The roof of the nave is of lead, and in the restoration nothing appears to have been done to it. The ceiling of the porch is groined, and has been restored. Both north and south walls of the chancel have been rebuilt of flint, with white stone dressings, but the east wall has been left. In the nave the walls have been replastered, the columns cleaned; for the pews solid oak benches, with carved poppy-head ends, have been substituted; the windows have been touched up, and the stonework of the two-light east window of the aisle restored. The nave is lighted by two clearstory windows, as well as by those in the south aisle. Here, as, indeed, throughout, the flooring is new, the passages being paved with Minton's encaustic tiles, those in the nave and aisle plain red, but in the chancel a pattern is formed. In both the north and south walls are two new two-light windows, filled with cathedral glass, with an edging of blue. The roof is of oak and is open, the principals springing from stone corbels. Mr. Blackburn, of London, was the architect; Mr. Rampling, of Eye, the builder; Mr. Vine, of Eye, did the stonework; Mr. Neale, of Eye, the plumbing and glazing; and Mr. Frost, of Watton, was the wood carver. The total cost of the restorations is said to be about 1,000^{l.}

Enderby.—The church here, having been almost entirely rebuilt on an enlarged scale, has been consecrated and re-opened for Divine service. The edifice has been almost entirely rebuilt at the sole expense of Mr. Brook. The designs and plans for the building were provided by Mr. E. Birchall, of Leeds, and he has adapted the style of the ancient church to the extended requirements. The contract for the building was taken by Mr. J. Finn, of Leicester. The church now consists of a nave of five bays, with side aisles, and a chancel of three bays. There is also a vestry added to the chancel, and an organ-chamber adjoining it. The windows are of geometrical form, with tracery, and are filled with different coloured glass. The roof is supported by clustered columns, with moulded arches in Bath stone and red coloured labels of Alton stone. The chancel window, which is of stained glass, contains the following subjects:—"The

Nativity," "The Entombment," and "The Ascension of Christ." The tracery is filled with cherubim and seraphim in the act of adoration, the *Agnus Dei* being the centre subject. The roof and seats are of deal. The tower, which as yet has undergone but little alteration in the exterior, but which it is now intended completely to restore, has been considerably altered in the interior. The tower-arch has been restored, and a small stained-glass window, with the figure of St. John the Baptist, and the beheading of St. John, as the subjects, has been placed there instead of the door, which originally opened into the tower. A new peal of five bells has been furnished, cast by Mr. Taylor, of Loughborough. The stone work has been executed by Mr. Firz; the woodwork by Messrs. Taylor & Son, Thurston; and the plumbing and gas-fitting by Mr. Alfred Adams, of Littlethorpe. The restoration of the church will cost over 5,000l.

Seal.—The new church on Seal Chart, erected at the expense of Mr. Horace Wilkinson, has been consecrated. The edifice is situated in the vicinity of a road leading in the direction of Seal Chart on the one hand, and Stone-street, &c., on the other. Mr. Constable was the builder of the church and a school connected with it.

St. Deny's, Southampton.—The new church at St. Deny's has been consecrated by the Bishop of Mauritius. The structure has been built in the Early English style, from designs furnished by Mr. Gilbert Scott, and the work has been carried out by Mr. Fletcher, of Salisbury. The church is constructed of red brick, with Bath stone dressings. At present there is a nave, with chancel at the eastern end of a circular form, a north aisle, and north chancel, and doubtless the structure will remain in this condition till its enlargement is absolutely necessary, when a south aisle and chancel will be added. The contract for the work, as it exists at present, is about 5,000l. The church, we understand, will accommodate some 700 persons. The pews are of stained deal. The roof is also of stained wood. The principals supporting the roof rest on brackets, carved with designs characteristic of the style of architecture. The windows are plain quarry lights, but are arched. The doors, also are arched. An anonymous donor offered to contribute 3,400l. towards the structure if an additional 3,000l. could be raised. 1,000l. more are still required.

Wilton, Bristol.—We are asked to say that the chancel of All Saints is paved with tiles supplied by Mr. Godwin, of Lugwardine; not Minton's, as stated.

STAINED GLASS.

R. C. Church, Teignmouth, Devon.—A stained-glass window was placed in this church a few days ago, at the instance of Captain Keating, and containing in the centre opening the Crucifixion, and at the sides the figures of St. John and the Virgin Mary, upon diapered ground-work. In the tracery are the I. H. S. and ornaments. The work was executed by Messrs. Holland & Son, of Warwick.

Blidworth Church.—This church, which has for some time possessed a stained-glass window of the Nativity, the gift of Colonel Welfitt, has been further provided with one emblematical of practical Christian charity. It has been executed by M. M. Marchal, of Metz.

Welford Church (Nottingham).—The movement for erecting a window in this church to the memory of Henry Kirke White has, under the management of Mr. Davies, the rector, proceeded satisfactorily. A design for a stained-glass window, to be placed in the south side of the church, has been prepared by Messrs. A. & W. H. O'Connor, of London. The design, which is in two compartments, gives a representation (why we do not know) of the Star of Bethlehem; one compartment shows the Virgin and Child, and the other the Wise Men making their Offerings. Along the top of the window are figures of angels. The window is to be placed in the church in September next.

Kimbolton Church.—We are requested to state that Messrs. Lavers, Barrard, & Westlake produced the window already announced as having been placed in this church.

St. James's, Carlisle.—The decoration of the chancel of this church has now been completed, the small windows on each side of the apse having been filled with stained glass, corresponding in form and colouring with the window at the east end of the chancel which was put in previously to the opening of the church. The

windows were designed and executed by Messrs. John Scott & Son, stained glass manufacturers, Carlisle. Each window is composed of one large panel, and contains in the centre a pictorial representation of an incident in sacred history, surrounded by a rose border on an azure and ruby ground. The subject of the left window is the raising of Jairin's daughter. The window on the right side of the apse contains a delineation of the youthful Saviour disputing with the doctors in the temple. The west window is large, and if it were also filled with stained glass, the strong light which streams through it would be softened, and a more pleasing effect would be produced. Two of the three stained glass windows in the chancel have been presented to the church by Mr. Nelson, of Murrell-hill House, and the third by Mrs. Nelson.

SCHOOL-BUILDING NEWS.

Stockport.—The corner-stone of Wesleyan day and Sunday schools, in the southern part of the town, has been laid. The building consists of three wings. The first, which is at the corner of Brentnall-street, its external dimensions being 74 ft. by 40 ft., is two stories high. The lower story is divided into numerous class-rooms, fitted up with galleries; the upper story being all one room, 25 ft. high, lighted at the sides by a large three-light transome window, and at each end by large seven-light transome windows, and fitted up with large galleries extending across the room. The second wing, which is adjoining and facing Wellington-road, 30 ft. by 17 ft., consists of the principal entrance vestibule, with a stone staircase for access to the large rooms above, with infants' class-room adjoining. The third wing is also two stories high, its external dimensions being 43 ft. by 25 ft., the lower story of which is to be used for the infants and the upper story as a lecture-room. The ground-floor of the school is elevated 4 ft. higher than the path. The style of architecture will be Tudor Gothic, faced round the principal elevations with bricks, embellished with stone quoins, millions, and transomes, with moulded and sunk tracery heads. The principal gable of the wing will have a large projecting window, 20 ft. wide and 38 ft. high, the other elevations being carried out in similar way. The contractors are Messrs. T. & W. Meadows, Heaton Norris; the architect is Mr. T. H. Allen, Stockport; and the probable cost of the buildings (including the fixtures, &c., and the land) will be about 3,600l.

Books Received.

The Life of George Stephenson and of his Son, Robert Stephenson: comprising also a History of the Locomotive. By SAMUEL SMILES. New edition, revised and enlarged. Loudon. Murray.

THIS fresh edition of Mr. Smiles's capital volume on the Stephensons includes a new preface, in which the author gives a review of the progress of railways and railway traffic since the appearance of the volume in its original form ten years ago. As the author regards the present edition as probably the final one, he has taken pains to render it, by careful amendment and revision, worthy of public acceptance. It includes a history of the railway locomotive in its earlier stages, uniform with the early history of the steam-engine, given in vol. iv. of "Lives of the Engineers," and a fuller memoir than had yet appeared of Richard Trevithick, with a portrait of him. The volume contains an alternative title-page, as "Lives of the Engineers," vol. iii.

We may quote a passage from the conclusion of the preface, to show the number of persons now employed on railways in the United Kingdom, and the author's views of the present and prospective state of railway management:—

"A few words in conclusion as to the number of men employed in working and maintaining railways. According to Mr. Mills 186,437 men and officers were employed in the working of 13,283 miles open in the United Kingdom in 1865, besides 63,923 employed on lines then under construction. The most numerous body of workmen is that of the labourers (81,284) employed in the maintenance of the permanent way. Being mostly picked men from the labouring class of the adjoining districts, they are paid considerably higher wages; and hence one of the direct effects of railways on the labouring population (besides affording them greater facilities for locomotion) has been to raise the standard of wages of ordinary labour at least 2s. per week in all the districts into which they have penetrated. The workmen next in number to that of

artificers (40,107) employed in constructing and repairing the rolling-stock; the porters (25,881), the plate-layers (12,801), guards and brakemen (5,769), firemen (5,265), and engine-drivers (5,171). But besides the employees engaged in the working and maintenance of railways, large numbers of workmen are also occupied in the manufacture of locomotives and rolling-stock, and in providing the requisite materials for the permanent way. Thus the consumption of rails alone averages nearly 400,000 tons a year in the United Kingdom alone; while the replacing of decayed sleepers requires about 10,000 acres of forest to be cut down annually and sawn into sleepers. Taking the various railway workmen into account, with their families, it will be found that they represent a total of about three-quarters of a million persons, or about one in fifty of our population, who are dependent on railways for their subsistence.

While the practical working of railways has, on the whole, been so satisfactory, the case has been very different as regards their direction and financial management. The men employed in the working of railways make it their business to learn it, and, being responsible, they are under the necessity of taking pains to do it well; whereas the men who govern and direct them are practically irresponsible, and may possess no qualifications whatever for the office excepting only the holding of so much stock. The consequence has been much blundering in the part of these amateurs, and great loss on the part of the public. Indeed, what between the confusion of the directors, and often unjust legislation of Parliament, on the one hand, and the carelessness or incompetency of directors, on the other, many once flourishing concerns have been thrown into a state of utter confusion and made, until railway government has become a by-word of contempt.

And this state of things will probably continue until the fatal defect of Government by Boards—an extremely limited responsibility, or no responsibility at all—has been rectified by the appointment in France, of executives consisting of a few men of special ability and trained administrative skill, personally responsible to their constituents for the due performance of their respective duties. But the discussion of this subject would require a treatise, whereas we are now but writing a preface.

Whatever may be said of the financial mismanagement of railways, there can be no doubt as to the great benefits conferred by them on the public wherever made. Even those railways which have exhibited the most "frightful examples" of scheming and dissipation, so soon as placed in the hands of practical men to work, have been found to prove of unquestionable public convenience and utility. And notwithstanding all the faults and imperfections that are alleged against railways have been admitted, we think that they must, nevertheless, be recognized as by far the most valuable means of communication between men and nations that has yet been given to the world."

Metal Work Trade-Book.

MESSRS. J. BATCLIFF & SONS, of Birmingham, have issued a catalogue of their "Medieval and Metal-Work," and claim to bring into great prominence than others do the services of the sculptor and the chaser to assist in producing works of the character peculiar to the twelfth century. With much that is clever and original in the designs, they are for the most part not Medieval in character. They are too spiky, and where not too spiky too "pretty." They had better put away the word Medieval, and let their designs stand on their own merit.—which is considerable.

VARIORUM.

Mr. C. Roach Smith's "Collectanea Antiqua" (Parts III. and IV., vol. vi.), contains besides the biography of the late F. W. Fairholt already referred to, notices of the late Dawson Turner and Hudson Gurney. It is certainly sad, that men like these should pass away, and be so soon lost sight of as they are. Some relative or friend should supplement what Mr. Smith, without special materials at command, has well and kindly written. The numbers of the "Collectanea" before us are altogether good ones.—Bernard Quaritch's "General Catalogue of Books, arranged in classes," 1868 (15, Piccadilly), is a portly volume of 1,130 pages, and contains the titles of many books of which it is desirable to know the whereabouts.—The *Popular Science Review* for July contains some very interesting papers, especially one on "The Study of Chemical Geology" by David Forbes, F.R.S.; one on "Animals between Birds and Reptiles," by Professor Huxley; and one on "The Great Eclipse of August 17th of this Year," by R. A. Proctor, F.R.A.S.—"Iron Ship Building." With practical illustrations. By John Grantham, C.E., &c. Fifth edition, with supplement and index. London: Virtue & Co. 1868. This is an enlarged edition of an elaborately illustrated work, consisting mainly of engravings. The supplement traces the progress made in iron ship-building up to the present time.—"Observations and Suggestions on the Railways of the United Kingdom." By F. E. Causton & Sons, 47, Eastcheap. The chief object of this pamphlet is to show how the railways may be immediately rendered more serviceable and beneficial to the public generally than they now are, and much more remunerative to their proprietors. This, the author rightly thinks, would be done simply

by low fares and charges, say "for second-class to a rate of one penny for every five miles, and of third-class to one halfpenny for every five miles" for goods and parcels also the rates to be largely reduced,—parcels under 14 lb. say, for one penny each, and proportionally for greater weights. But why should not first-class passenger fares be also reduced? Second and third class carriages ought to be improved and made more safe, as by means of cheap stuffing or cushioning. Why should the less wealthy classes be less safely conveyed than the more wealthy, or why should they be thus forced to pay more than they can afford? Passengers who can afford first-class tickets are not so placed under the screw to force higher fares out of them, although they can as a class far better afford it.

Miscellaneous.

BARNSELY.—At a recent meeting of the local Board of Guardians the clerk read a letter from the Poor-law Board on the subject of the workhouse hospital accommodation, recommending the guardians to take into consideration as early as practicable the erection of an entirely new infirmary, detached from the main building. A committee was appointed to take the matter into consideration, with power to consult an architect and report to a future meeting of the Board.

PRESENTATION TO BISHOP SELWYN.—A few old New Zealand colonists, resident in England, have presented to the Bishop of Lichfield, who was now sailed for New Zealand, a pastoral staff. The staff, executed by Messrs. Cox & Son, of London, is of massive silver, with the top crocketed and jewelled, the knob below the crook pinnacled and chased, and the stem of polished ebony with silver bulb and base. An address was read to the bishop on behalf of the donors by Archdeacon Paul, prebendary of Lincoln.

IMPROVEMENTS IN HIGH HOLBORN.—The crossing from Gray's Inn-road to the south side of Holborn having been rendered highly dangerous to pedestrians since the removal of Middle-row, and consequent widening of the carriage-road or the increased traffic, the Metropolitan Board of Works have caused a cast-iron gas-lamp pillar to be erected in High Holborn, at its junction with the carriage-road of Gray's Inn-road. The pavement around the pillar is raised, so as to afford a place of refuge to persons crossing; this is also inclosed with iron posts, in order to prevent carriages from being driven on the raised pavement. At the Holborn viaduct workmen are actively engaged in filling up the hollows between the arches with gravel dredged from the river, and dry brick rubbish, so as to form a solid foundation, preparatory to being paved with cubic blocks of granite. At the western terminus of the viaduct a pillar is to be erected with brackets, each supporting a lantern with four burners. The place in which the pillar is to stand is of large diameter, perfectly circular, and is intended to afford a place of safety to foot-passengers crossing the main thoroughfare.

GENERAL BUILDERS' ASSOCIATION.—The annual meeting of this Association was held in St. George's Hall, Bradford, on the 7th inst. Mr. Whiteley presided. The secretary read the reports of sub-committees on the subjects of working rules, the establishment of a builders' fire insurance, the amalgamation of the labour registration offices established by the Association in various towns, and those of the free labour registration of London, and other matters. A lengthy discussion arose on the proposition to approve the working rules drawn up by the sub-committee appointed for that purpose. The first of these rules provides that payment by the hour shall be adopted by all members of the Association on and after the 1st May, 1869, and that due notice of this be given to the operatives. Others of the rules provide that a court of arbitration between employers and employed be formed, and that the rule restricting the use of worked stone be abolished. A very strong feeling in favour of the adoption of the rules was manifested, but it was finally resolved that the report of the sub-committee be referred to the branch associations, and that they send delegates to the September meeting, with power to vote upon a question.

"THE SONG OF THE SHIRT."—The sitting female figure by Mr. Marshall Wood, which under this title attracted deserved attention in the Paris International Exhibition, is now on view in the gallery belonging to Messrs. H. Graves & Co., Pall-mall, and will well repay a visit. The attenuated form, and the care-worn face of the poor shirtmaker are represented with grace as well as touching truth.

BAK-CUTTING MACHINE.—In an article on the Sawmill at Cummertrees, the *Annan Observer*, says:—"The most serviceable improvement that has been introduced into their works by Messrs. Matthews & Boyd, is the bark-cutting machine, invented by Mr. Jonathan Thompson, engineer, Penrith, which can, with only three men to attend it, do the work of forty men and sixty women in the ordinary way by hand."

FIRE ON THE MOORS.—By the fire in Yorkshire nearly 4,000 acres of moorland have been left black and desolate, with probably scarcely a living bird, or animal, or vegetable, excepting the largest trees, over the wide expanse. The grouse and rabbits which abound on these moors have been destroyed, and sheep grazing thereon have in some instances perished. A fire somewhat similar has been burning for the last few days on Chat Moss. The fire has passed over a considerable area.

THE GREAT DOME AT WASHINGTON.—The dome of the Capitol at Washington is the most ambitious structure in America. It is 108 ft. higher than the Washington monument at Baltimore, 68 ft. higher than that of Bunker Hill, and 28 ft. higher than the Trinity Church spire at New York. It is the only considerable dome of iron in the world. It is a vast hollow sphere of iron, weighing 8,200,000 lb. Directly over your head is a figure in bronze, "America," weighing 14,985 lb.—*New York Observer*.

THE ART TREASURES OF WALES.—An Exhibition of Works of Art is being got up at Ruthin, Denbighshire, North Wales, to commence on the 4th of August, and remain open to the public for a month. Mr. Cornwallis West, of Ruthin Castle, is an active promoter of the undertaking; while Mr. Chaffers, the collector, is principal superintendent. The promoters, who in the new townhall at Ruthin have a very convenient set of apartments for the proper display of the collection, are very sanguine of success.

BROUGHAM AND BISMARCK.—It is said that the charming chateau inhabited by the late Lord Brougham at Cannes, is to become the residence of no less a personage than the statesman Herr von Bismarck. The story goes that General Bulow, who had just concluded a bargain in the name of the illustrious minister, set to reading the famous distich of Ovid inscribed on the colonnade:—

"Inveni portum; spes et fortuna valet;
Sed me miseris, ludicræ nunc alios."

A young gentleman who accompanied him asked, wagslily, if this was to become the motto of the Prussian minister.

THE HOLY SEPULCHRE.—A letter from Jerusalem in the *Moniteur* says:—"The works for the reconstruction of the cupola of the Holy Sepulchre, which have been carried on with extreme rapidity, appear to be approaching their termination. At the end of last year the iron ribs were completed, and the lantern placed on the summit. An idea could then be formed of the elegant proportions of the new dome. The previous edifice, being too flat, had a heavy appearance. The present cupola, being about 6 ft. higher, and surmounted with a cross, rises more conspicuously above the surrounding buildings."

THE BIRMINGHAM WORKHOUSE SCHOOLS.—At a recent meeting of the local guardians, Mr. Biddle said the Poor Law Board's architect and medical examiner of plans had conceded all that the guardians asked in reference to the workhouse schools, except that they wished the building to be a little wider and longer.—Mr. Hawley: And to have a large bath, to teach the boys to swim.—The architects (Messrs. Martin & Chamberlain) reported that they had had two interviews with Dr. Smith, the medical examiner of plans, and Mr. Savage, the architect to the Poor Law Board, with reference to the plans of the proposed new schools for 300 boys. Mr. Hawley moved that the plans, modified in the manner indicated in the report, be sent to the Poor Law Board for their seal. This was agreed to.

CLEAN ROADS.—R. T. writes:—"It is computed that three-fourths of the dirt on the London streets arise from horse-dung, either as pulverized dust or mud. It causes much damage and annoyance, ill-health, and ophthalmia. To remedy the above, I would hook a wire basket with hinged front on the vehicle immediately behind the animal, so that the upward motion of the tail would open the front (by means of a thong fixed to the crupper) to receive the droppings, to be emptied into parish receptacles if necessary. All shop sweepings ought to be thrown into the dust-hin. I hope no squamisher will expect an apology for this dealing with Nature."

THE PROPOSED PAXTON MEMORIAL AT LEIGHTON BUZZARD.—The members of the Leighton Buzzard Working Men's Mutual Improvement Society have had a meeting at the Cedars, the residence of Mr. J. D. Basset, where they presented an address to Lord Charles J. F. Russell, advocating his lordship's suggestion, made at the inauguration of the recent industrial exhibition, to establish in this town an educational and popular institute, to be associated with the name of the late Sir Joseph Paxton, as we have before mentioned. It was resolved in course of the proceedings, "that the proposed memorial shall be called 'The Paxton Institute,' and shall be devoted to the advantage of the working-classes and the inhabitants of the locality generally." A committee was appointed to carry into effect the proposed Paxton Institute.

PUBLIC MUSEUMS AND LIBRARIES.—A meeting has been held at the Society of Arts for the purpose of urging upon the Government "the duty of placing upon a footing worthy of national institutions the public museum of inventions and free scientific library connected with the Patent Office." The objects of the association by which the meeting was convened are the opening of the national collections on week-day evenings, and the promotion of the adoption of the Free Libraries and Museums Act. Professor Leone Levi occupied the chair, and was supported by a considerable number of gentlemen interested in promoting the extension of public museums and libraries. Appropriate resolutions were agreed to, including one authorizing the Chairman to petition Parliament through Mr. Layard and Lord Lichfield.

THE LIVERPOOL ARCHITECTURAL SOCIETY AT WYNNSTAY.—The annual excursion of the Liverpool Architectural and Archeological Society took place on Saturday, Wrexham and the neighbouring locality of Wynnstay being the scene of the Society's visit. There were about thirty in the party. After their visit to Wynnstay they partook of dinner at the Wynnstay Arms Hotel, Wrexham. The chair was occupied by Mr. F. Horner, the president, and the vice-chair by Mr. William Hay, one of the vice-presidents; and the company included the Mayor of Wrexham, Mr. Walker. Afterwards the party visited the parish church of Wrexham, and several ascended the tower, from the summit of which a most extensive view of the surrounding country is obtained. Shortly before ten o'clock the visitors left the Wrexham station, and returned by rail to Liverpool.

THE COST OF THE NEW WORKHOUSE FOR SOUTHAMPTON.—At a recent meeting of the local Guardians, a letter was read from the Poor Law Board as to the letter of the Guardians forwarding a statement to show the manner in which the £8,800, borrowed by the Guardians for the erection of the new workhouse had been expended, and also a statement showing the purposes for which the further sum of 7,000, was required. The estimated cost of 4,689, for extra works seemed to the Poor Law Board to be rather large, being nearly 23 per cent. on the amount of the original contract. Before determining what further amount they should authorise the Guardians to borrow, they requested some general particulars of the several items. The Deputy-President thought that the Poor Law Board were not warranted in asking for such information, and that the architect should not be called upon to go into an explanation of detail in matters which should rest for the present entirely with himself and the builder. A committee, however, was appointed to consider the letter, and to furnish the information required by the Poor Law Board. The architect mentioned that there had been matters in connexion with the foundations of the workhouse building that could not be foreseen, and which had tended very considerably to raise the expenses which had been incurred for extras.

ENGINEER OF NEW WORKS FOR ST. PANCRAS GUARDIANS.—The guardians of St. Pancras have elected Mr. S. Tinney for the office of resident engineer and clerk of the works, at the Leaveland Schools, at a salary of 300*l.*, with house, coal, and gas.

SOUTH KENSINGTON MUSEUM.—The number of visitors during the week ending the 4th of July, was, on Monday, Tuesday, and Saturday, free, 14,755; on Wednesday, Thursday, and Friday (admission, 6*d.*), 3,806; National Portrait Exhibition, by payment, 2,089: total, 20,650.

ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY OF DURHAM AND NORTHUMBERLAND.—The second general meeting of this Society has been held at Dunstanborough, Bamburgh, and neighbourhood. The committee met at Alwrick at an early hour, and drove *via* Rock and Rennington (visiting the churches *en route*) to Embleton. The ruins of Dunstanborough Castle were then visited. A pleasant drive along the coast brought the committee to North Sunderland and Bamburgh, where the castle and churches were inspected. After staying all night at Belford, the committee drove to Old Bewick, by Chetton and Chillingham, where the old chapel and old British camp were visited by the party and described by Mr. Greenwell. The committee dined with Mr. Langlands and several friends at Old Bewick. They returned to Alwrick by way of Egingham, and reached Newcastle at a late hour after a most pleasant excursion.

METROPOLITAN DRINKING FOUNTAIN ASSOCIATION.—The annual meeting of the members and supporters of this useful association has been held in St. James's Hall. The chair was taken by the Hon. F. Byng. Mr. John Lee submitted the report from the committee. It expressed a hope that the generous support the association had hitherto received would not fail it until public free supplies of water for man and beast were placed in all the leading thoroughfares of the metropolis. The association had now 117 fountains and 99 troughs under its care and supervision, and although they were spread over an area of something like 100 square miles, and were exposed to all the injury which thoughtless mischief, willful malice, and unavoidable accident could inflict upon them, yet so efficiently had the supervision been carried out that at the present time there was not a single one out of repair. The total amount received during the year had been 3,649*l.*, but of that sum no less than 1,340*l.* had been contributed for memorial fountains of special designs, and on special sites chosen by the donors. The report complained that in the establishment of cattle-troughs the society had not received that amount of support they had a right to expect from the Society for the Prevention of Cruelty to Animals, which had offered simply a sum of 10*l.* for each trough, which was only equivalent to one-year's maintenance. Eight fountains and thirty-five troughs had been erected during the year.

THE BATH AND BRISTOL COLLIERY PARTNERSHIP, LIMITED.—The prospectus of this company states that at Twerton, about two miles from Bath, ten miles from Bristol, and 103 miles from London, a colliery has been opened on the Somersetshire coal-field, and the present lessees, Messrs. F. & D. Brown, have expended thereon about 10,000*l.* Seams of coal, seven in number, and of the aggregate thickness of 26 ft., have been discovered, and, to a great extent, placed in order for mining, removal, and sale. It admits, therefore, of being worked with safety and economy. The colliery is near the Kennet and Avon Canal, and half a mile from the Great Western Railway. It is convenient for the supply of Bristol and Bath, and there is only one colliery nearer the metropolis. The proprietors desire to complete and extend the works by the addition of a second shaft, and other arrangements, for effecting with greater economy large and profitable deliveries of coal. These objects it is thought may be best obtained through the instrumentality of a small limited partnership. The partners would have to provide a capital of 26,000*l.* On this capital it is calculated that a net annual profit would be earned of 16,320*l.*, enabling a dividend to be paid of 30 per cent., and leaving a sum for reserve, improvements, and extensions. The proposed capital of the company is 35,000*l.* This is probably the first partnership under the Limited Liability Act brought out for public participation without any board of directors, solicitor, &c.

MR. LONGFELLOW.—Mr. John Watkins, of Parliament-street, has made some excellent photographic portraits of this distinguished poet. On Tuesday last, Mr. Longfellow sat to Mr. E. Goodwyn Lewis for a crayon portrait.

THE DEBTS OF THE METROPOLITAN BOARD OF WORKS.—The total amount borrowed up to January last was 3,073,000*l.*, of which 1,520,633*l.* 6*s.* 8*d.* have been repaid, leaving the sum of 6,552,366*l.* 13*s.* 4*d.* still outstanding. The rates of interest at which the money has been borrowed vary from 3½ to 4½ per cent.

THE OPENING OF THE ABBEY MILLS PUMPING STATION OF THE METROPOLITAN DRAINAGE WORKS.—It was announced at the last meeting of the Metropolitan Board of Works that, as the Duke of Edinburgh could not open the Abbey Mills Station, there would be no public opening and no invitation to members of Parliament.

DEATH OF THE INVENTOR OF THE REAPING MACHINE.—Mr. John Common, of Denwick, near Alwrick, has recently died, in the 91st year of his age. He is held to be entitled to renew for his many useful inventions and improvements in agricultural implements, especially for the American Reaper, of which he is known as the original inventor.

PROPOSED REMOVAL OF BILLINGSGATE MARKET. A proposal is now before the Corporation of the City of London for the removal of this ancient market to some central part of the City, where it can be brought in direct communication with various railroads. The Markets Committee of the Common Council have reported that the most eligible situation would be in connexion with Farringdon Market, or some spot adjoining or near the new Meat and Poultry Market at Smithfield.

THE PROPOSED NEW ASYLUM IN WARWICKSHIRE FOR IDIOTS.—The committee appointed at the last sessions to consider the question of founding a new Asylum for Idiots has presented to the Court of Quarter Sessions for the county plans and estimate for the new building, which had been prepared under the guidance of Dr. Parsey, the medical superintendent of the county asylum. The estimate was 10,000*l.* The purchase of the land had been completed for 1,500*l.* The committee recommended that the plans should be forthwith forwarded to the Commissioners in Lancashire for approval. The report was received and adopted. The site of the new building is close to the present asylum at Hattou.

HYDE PARK AND FINSBURY PARK.—In reply to questions in the House of Commons, Lord J. Manners said that it was not proposed to cut down any more trees of the slightest importance in the present year for the purpose of making a drive in Hyde Park to the north of the Albert Memorial. It was only proposed this year to make the drive at the south side of the Albert Memorial, to rebuild the lodge at the other side of the Queen's-gate, and also to carry the drive from the Serpentine straight across to the Exhibition-road. Next year it would be necessary to propose a further vote for relaying the grounds to the north of the Albert Memorial, on which occasion explanations would be given of the intentions of the Government. As to Finsbury Park, Mr. Tite said that the Finsbury Park Act dated ten years back, at which time the Government of the day undertook to defray half the cost of the park. In consequence of the opposition and rejection of the first vote of 50,000*l.* towards the expense of the park, the Board had an extremely difficult duty thrown upon them, for they had not only to pay the original outlay but also to maintain the park. The Board, therefore, decided, instead of purchasing 230 acres, to purchase 130; and they were now enclosing the ground at a cost up to the present of 94,000*l.*, but which would exceed 100,000*l.* before the work was completed. With the view of diminishing the cost to the ratepayers, the Board had resolved to lay out a portion of the land for holding purposes, without, however, damaging the larger area of the park, which amounted to 110 acres.

TENDERS.

For alterations and additions to a detached house at Stamford-hill. Mr. Herbert Ford, architect. (No quantities).—

Hayworth	273 0 0
Kent	298 0 0
Lewis	682 0 0
Crab & Vaughan	561 0 0
Freedy & Son	493 0 0

For alterations and additions to house No. 242, Blackfriars-road. Mr. George Perry, architect:—

Pearman & Fothergill	21,325 0 0
Axford	1,175 0 0
Gadsby	1,016 0 0
Bishop	993 0 0
Bamford	870 0 0
Langmead & Way	970 0 0
Macey (accepted)	940 0 0

For a lodge at Erit, Kent. Mr. Herbert Ford, architect. (No quantities).—

Kelph	187 5 0
Grumbrell	2,991 0 0
Willis	167 0 0
Catchpole (accepted)	164 0 0

For alterations to Star Life Assurance Office, Moorgate street, City:—

Weekes	23,930 0 0
Dove	2,560 0 0
Clummen	2,991 0 0
Bennett	2,880 0 0
Cloogh	2,575 0 0
Nixon	2,795 0 0
Cole	2,550 0 0

For villa at Lower Sydenham, for Mr. G. Sully:—

Morrill & Ashby (accepted)	4,440 0 0
----------------------------	-----------

For new chancel, spire, roofs, &c., and restoring St. Mary's Church, Walkworth, Northamptonshire. Mr. O. H. Driver, architect. Quantities by Mr. R. O. Harris:—

Jacker & Shaw	4,180 0 0
Orchard	3,888 0 0
Kimberly	3,790 0 0
Davis, bricklayers	3,493 0 0
Franklin & Son	3,450 0 0

For additions to Grove Hall Lunatic Asylum. Messrs. Tolley & Dale, architects:—

Fawcett	23,449 0 0
Rivet	1,573 0 0
Perry & Co.	1,707 0 0
Perch	1,907 0 0
Abraham	1,696 0 0
Hill, Keddall, & Waldram	1,888 0 0
Hedges (accepted)	1,698 0 0

For alterations, &c., to premises, Southwark-street. Mr. N. S. Joseph, architect:—

Conder	2,503 0 0
Hill & Keddall	1,807 0 0
King & Sons	453 10 0
Newman & Mann	403 0 0

For Sandy National schools, Beds. Messrs. Wm. G. Heberston & Pite, architects:—

Cowland	21,990 0 0
Patinson	1,900 0 0
Curter & Son	1,807 0 0
Curvin	1,737 0 0
Twelvetares	1,678 0 0
Field	1,595 0 0

For alterations and additions to the vicarage-house Mucking, Essex. Mr. Charles Innes, architect:—

Curbet	2,256 0 0
Place	895 0 0
Rivet	893 0 0
Blake	735 0 0
Davey	769 0 0
Lilleystone	730 0 0

For villa residence, St. Peter's-road, Croydon. Mr. Brooks, architect:—

Henshaw	22,178 0 0
Goodwin	2,449 0 0
Holledge	1,925 0 0
Langmead & Way	1,750 0 0
Wells	1,744 0 0
Cowland	1,690 0 0

For country house at Wantage, Berks, for Mr. F. F. Bullock. Mr. J. P. Spencer, architect. Quantities supplied:—

Briant	23,213 0 0
Dover & Co.	3,000 0 0
Nightingale	3,727 0 0

For alterations and additions to 19, Great Windmill street, for Mrs. Kemp. Messrs. Olazie & Son, architects:—

Nightingale	227 0 0
Nightingale	227 0 0
Batchelor	177 0 0

For national schools, Harst Pierpoint, Sussex. Messrs. Gaulty & Gibbins, architects:—

Stanbridge	22,200 0 0
Lockyer	2,405 0 0
Chappel	2,075 0 0
Cheesman	2,470 0 0
Howell	2,468 0 0
Kirk	1,470 0 0
Nash & Co.	1,922 0 0
Nightingale	1,838 0 0
Hill & Co.	1,870 0 0
Holland (accepted)	1,807 0 0
Wasey	1,583 0 0

For the erection, above basement, of house, for Dr. Edward Davies, in Grosvenor-road, Wrexham. Mr. Edward Jones, architect:—

Samuels	22,350 0 0
Owens	2,390 0 0
Rogers	2,155 0 0
Rogers (with alterations)	2,140 0 0

* Accepted.

For two brick bridges and four iron and brick bridges, proposed to be built at Goldings, near Hertford. Mr. John B. Badcock, architect and engineer:—

Fleet & Newey	110,665 12 6
Dixon	8,180 0 0
Floyd	7,400 0 0
Crampton	7,230 0 0
Shaw & Co.	7,110 0 0
Conch	6,880 0 0
Clarke	6,886 0 0
Jackson	6,128 0 0

The Builder.

VOL. XXVI.—No. 1328.

Alleyn's College of God's Gift, Dulwich.

EW buildings, extensive and handsome, are being erected for Dulwich College, and it may be hoped that the Institution is about to be re-organized. A magnificent future is before it if proper advantage be taken of circumstances. The 10,000*l.* invested by the "poor player" for the purposes of education and charity have become many hundreds of thousands, and will continue to augment enormously. Rightly applied, what an immense amount of advantage may be obtained from it. That Dulwich College has heretofore fulfilled its mission, few will be found to assert.

Two very valuable papers, recently published in *Macmillan's Magazine*,

give the story of the foundation in a pleasant form, and help us to some facts. Edward Alleyn, the founder of Dulwich College, was born on the 1st of September, 1566, in the parish of St. Botolph, Bishopsgate, where his father, a gentleman by birth, followed the calling of an "inholder." The Pye, near Devonshire-square, was the name of the inn, and there Edward Alleyn first saw the light. His father died when our hero was only four years old. His mother contracted a second marriage with an actor named Browne. At an early age Alleyn manifested a great aptitude and liking for his stepfather's calling, and was initiated while still in his early teens into the mysteries of the stage. He rose rapidly to eminence in his profession. Heywood calls him inimitable, and the best of actors. Sir Richard Baker's Chronicle tells us that Alleyn and Burbage were "two such actors as no age must ever look to see the like."

Like Shakspeare and other players of the time, Alleyn early became a part-owner in theatrical property. He acquired a partnership with Henslowe, in the Rose Theatre, at Bank-side, in close proximity to the Globe, where Shakspeare a few years earlier first assumed the huskin. In 1592 he married Henslowe's step-daughter. Henslowe's Diary (Dulwich manuscripts), gives the date of the wedding in the following terms:—"Edward Alen was married unto Jone Woodward the 22 daye of October, 1592, in the iij and thirtie yeare of the Queene's Ma^{tie} Rayne, elizabeth, by the grace of god of England, france, and Iarland, defender of the fayth."

The picture afforded by existing documents of the domestic life of Alleyn, his wife, her mother, and Henslowe, at their home "harde by the

chapel ohynde, by the banksyde neere Wynchester House," is a pleasant one.

Alleyn acquired by his marriage a property in Sussex, which he disposed of in 1596 for 3,000*l.* He withdrew from the stage for about a year (1598-9), and lived in retirement at the house of a friend (The Brill, Lewes) in Sussex. He then resumed his position among the foremost players. At a city pageant on the 15th of March, 1603, in honour of King James's visit, Alleyn, attired as Genius, recited a congratulatory address to his majesty. Dekker reports (1604) that his speech was delivered with "excellent action, and a well-tun'd, audible voice."

In 1604, Alleyn and Henslowe purchased from Sir W. Stuart, for 450*l.*, the patent office of master of the king's games of bears, hulla, and dogs." The speculation seems to have turned out a good one. Alleyn was the chief, if not the sole proprietor of the Fortune Theatre, between Golden-lane and Whitecross-street. The property became a source of much trouble to Dulwich College in after years, but in Alleyn's time it appears to have proved a very remunerative speculation. It was commenced in 1600, and opened for representations in 1602. He was now a prosperous, yet withal a very thrifty man. Between 1606 and 1611 he bought numerous estates, most of them copyholds of the manor of Dulwich.

Alleyn appears to have taken up his residence in Dulwich in 1607. He occupied the Manor House, afterwards called the Court House, an old-fashioned stuccoed residence, which is still tenanted. He now resolved to found and endow in his own lifetime an institution like the Charter House, for the reception of aged pensioners and the nurture and education of orphan boys. He began his building in 1613, and completed it early in 1617, on a plan which he appears to have originated, and in the development of which he was assisted by Benson, his builder. The specification for Benson's work is still preserved, with memoranda showing payments made to him as the work progressed. Henslowe died in 1616, and his wife in 1617, and their property fell to Alleyn in right of his wife. This of course added to available resources for setting the college going. Much tedious negotiation ensued with Lord Chancellor Bacon and the officers of the Star Chamber, before Alleyn could secure the royal authorization of his scheme.

The Letters Patent of King James, dated June 21st, 1619, at last empowered Alleyn to found the College of God's Gift at Dulwich, to endure for ever, for the maintenance of poor men, women, and children, and the education of poor children; the college to consist of a master, warden, four fellows, six poor brethren, six poor sisters, and twelve poor scholars; the Archbishop of Canterbury to be visitor thereof. On September 13th, 1619, he formally established the college by an inaugural ceremony, followed by a banquet. His diary-record of the event runs as follows:—

"They first heard a sermon, and after the instrument of erection was by me read, and after an anthem, they went to dinner."

Inigo Jones is mentioned as amongst the guests on the occasion.

By deed dated April 24th, 1620, Edward Alleyn conveyed the lands specified in his Letters Patent to the sole use of the members of the corporation which he had established. A second statute provides for a large addition to the members. The original statutes are now superseded by the scheme of 1857, so that it is unnecessary to speak here of their unwise provisions.

The founder's preference for the four parishes named by him as those from which the poor scholars and brethren and sisters should be selected, was based on his perception of the doctrine that property has its duties as well as its rights. He owned theatres and houses in St. Saviour's and St. Luke's; his patrimonial

estate was in St. Botolph's; and he had acquired by purchase the whole lordship of Dulwich, in the parish of Camberwell.

The old buildings are capacious, having regard to the limited numbers they were built for, and comprise a chapel, dining-hall, parlour, library, school-room, kitchen, and appurtenances. They occupy three sides of a square. In the rooms, corridors, and staircases of the college are numerous pictures and portraits bequeathed sixty years after the founder's time, by Cartwright, the actor, as well as pictures left by the founder himself, his own full-length portrait, and portraits of later date. These are distinct from the collection forming the well-known picture gallery, which is a modern supplement to Dulwich College.

Alleyn's first wife died in June, 1623. He soon after married Constance, daughter of the well-known Dr. Donne, Dean of St. Paul's. The marriage is recorded in the parish register of Camberwell Old Church in the following terms: "Married, December 3rd, 1623, Edward Alleyn, Esq., to Mrs. Constance Donn." Alleyn, who was older by six years than his father-in-law, Dr. Donne, lived less than three years after his second marriage. The date of his will is 13th November, 1626. He died on the 25th of the same month (though his gravestone erroneously states the 21st), and was buried in accordance with that clause of his will which runs—

"My body I will to the earth from whence it came, without any vain funeral pomp or show, to be interred in the quire of that chapel which God of His goodness hath caused me to erect."

A polished black marble slab lies over his remains in the College chapel, bearing the inscription:—

"HERE LYETH THE BODY OF EDWARD ALLEYN, ESQ. THE FOUNDER OF THIS CHURCH AND COLLEGE, WHO DIED THE TWENTY-FIRST DAY OF NOVEMBER, A.D. 1626, ÆTAT. 61."

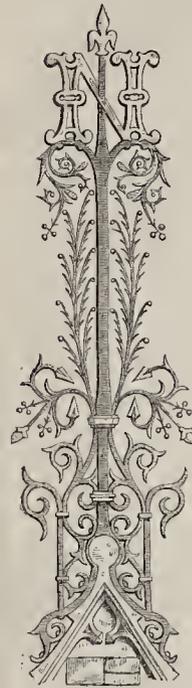

All who cherish the memory of Alleyn, and of the good old times in which he played so well his earthly part, would rejoice to see an earlier stone, and a memorial of Joan Alleyn formerly in the chapel, restored to the light of day. They should be dear to Dulwich as memorials of that old English worthy to whom the place owes so much.

The original College buildings, according to *Macmillan*, soon proved wanting in stability. Serious dilapidations, entailing heavy expenditure for renovation, mark the whole history of the College. Within a dozen years of the founder's death the steeple fell, and occasioned an outlay which swamped the salaries of all the higher officials, and necessitated a partial suspension of other ordinary expenditure for half a year. Not long after, the whole east wing fell down, and part of the other.

In 1667 other portions of the college fell down. The chapel register tells us, under date May 28th, 1703, "The colledge porch with y^e treasury chamber, &c., tumbled to y^e ground." In 1740 the east wing was so dilapidated as to necessitate rebuilding. From 1812 to 1833 the expenditure on repairs and restorations exceeded 22,000*l.* In more recent years, up to 1866, the outlay under the same head has been proportionately heavy.

In 1857 the Charity Commission gave Dulwich a new scheme, and pensioned off the members of the dissolved corporation.

The range of instruction now embraces the usual English subjects, with Latin, Greek, modern languages, mathematics, physics, mechanics, chemistry, and natural sciences. At present only one modern language (French) is taught, and science is postponed until the new buildings are ready to receive the boys, now crowded into a set of inconvenient rooms in the old college. It seemed at one time that suitable buildings could be only hoped for, but never seen, by the present generation. Mr. Rogers, chairman of the governors, when laying the foundation-stone of the new schools, on the 26th

June, 1866, stated that the money paid by the two railway companies, whose lines intersect the estate, had put the College thirty years in advance of what would otherwise have been its position.

Of the new schools, now nearly completed, we give a view and plans.* The main buildings are of four stories, and comprise residences for the under-master of the Upper School, and the head-master of the Lower School, besides library, board-room, &c.: a detached house will be built for the master of the college. One wing takes the Upper School, the other the Lower; both communicate by a cloister with the central hall, for collective gatherings, such as speech-day celebrations.

They are intended to fulfil the intentions of the Act of Reconstitution of the charity of 1853 so far as the educational part of the scheme goes. The acreage appropriated for the school buildings, official residences, administration offices, with play-grounds and play-fields for both schools, is 25 acres. A further area of 20 acres is reserved adjacent, to be hereafter appropriated for boarding-houses or other college requirements as may be found desirable. The precincts are thus about 45 acres,—equal, we believe, to those of any public school in England.

The new buildings are designed to provide accommodation for 600 boys, equally divided between the upper and lower schools for education on the class-room system and according to the "curriculum" provided by the Act of Parliament.

Foundation scholars, who will be clothed, fed, and educated free of all cost to their parents or guardians, will be accommodated to the number of twenty-four in the upper school and thirty-two in the lower school. The various usual appendages to great schools are also provided, such as libraries, reading-rooms, day-rooms, bath-rooms, and so on, with hat and coat rooms and lavatories, of course. The buildings are disposed so as to keep the upper school complete in the south wing and the lower school in the north wing, while the central mass of building (connected by the play cloisters with each wing) will contain the great hall, library, lecture-theatre, laboratory, &c., which are for the common use of both upper and lower schools.

The governors have been enabled to build the new college buildings at the present time in consequence of having received large sums in compensation for land taken by several railways traversing the estate, and being permitted by the Charity Commissioners so to apply these sums. But for these circumstances they could have raised the funds only by sinking their annual rental to such an extent as would have been liable to cripple the immediate efficiency of the schools when built. As it is, this special fund will provide the cost of building, and rental (which is on the increase) will provide means for carrying out the scheme liberally and well. Let us hope this will be done.

The estate which forms the rich endowment of the College consists of about 1,400 acres of as beautiful and attractive land for building as is to be found within five miles of London, and is being occupied with villa residences of an superior kind, pains being taken to preserve its present beauty while developing its resources in this respect.

The income in the founder's time was 800*l.* per annum. The last year's income from rental of Dulwich estate was about 13,000*l.*, of which about 4,500*l.* were absorbed by life annuities to the members of the late corporation, in accordance with the Act of Parliament, leaving 8,500*l.* if not more, available for the educational branch, the eleemosynary branch, and general estate and administration expenses.

The governors have founded two scholarships of 60*l.* a year each, and propose largely to add to these as their expected resources will gradually allow. An income of at least 20,000*l.* a year may be plainly seen in the middle distance.

It is probable the report of the Public Schools Commissioners which refers to Dulwich, will result in some important changes both affecting the division of the school into upper and lower schools, with different endowments; and also as to the appropriation of some parts of the building in a different manner to that at first intended, and in relation to which first intention they have been designed. All this, however, is at present unsettled.

The four parishes of St. Botolph, Eishops-

gate; St. Luke, Old-street; St. Saviour, Southwark; St. Giles, Camberwell, equally participate in all the benefits of the foundation; but it is anticipated that ample room will remain for scholars from all parts of the country as at our other English public schools. The plans also will admit of enlargement should it ever be found necessary.

The governing body consists of nineteen governors, of whom eleven are appointed for life by the Crown, and the remaining eight are made up by two governors from each of the above parishes, who are elected by the vestries for a term of seven years.

The new buildings, which are from the designs of Mr. Charles Barry (the architect and surveyor to the governors), are approaching completion under his personal superintendence.

The style is Northern Italian of the thirteenth century, of which beautiful examples are seen at Milan, Verona, Parma, Pavia, &c. The materials are almost exclusively brick and terra-cotta of various colours; the use of which latter material has been of late much studied, and the manufacture for building purposes brought to considerable perfection. The roofs are covered with Taylor's patent dull red tiles, glass tiles being inserted where light is required.

The whole building will be of fireproof construction, substantial and good, with only sufficient ornament to be appropriate to its position and objects, and the important rank it is hoped that Dulwich College will take in future times.

The contract for the buildings (exclusive of finishings, fittings, &c.) has been taken by Mr. Downs, of Union-street, Southwark (whose tender was the lowest sent), at 62,000*l.*; and the fittings, finishings, &c., will cost an additional 15,000*l.* The present contract does not include a school chapel, for which, however, an appropriate position in the general plan is reserved, and which will, it is hoped, be commenced ere very long.

Class-rooms provide about 12½ ft. floor per boy, 250 cubic feet per boy, and are about 15 ft. in height.

The terra-cotta work is being executed by Mr. J. M. Blashfield, of Stamford. A paper on this interesting subject was read by Mr. Barry at the Royal Institute of British Architects; part of which we print in our present number.

A few lines concerning Dulwich Picture Gallery will be in place. One Noel Desenfans, a picture-dealer residing in London, had been commissioned to form a collection of pictures for Stanislaus, king of Poland, and had bought many in consequence. Political changes prevented the fulfilment of his commission, and when he died he left all the pictures he had in consequence acquired to his intimate friend Sir Francis Bourgeois, R.A., a Londoner, though of foreign extraction. Bourgeois determined on bequeathing them to the country, and, according to the story, asked John Philip Kemble where he should build a gallery to contain them. Kemble, an actor, suggested Alleyn's College at Dulwich, and the advice was taken. The present gallery attached to the college was built from the designs of Sir John Soane, in 1812. Bourgeois, reserving a life interest to Mrs. Desenfans, left 2,000*l.* towards the building, and 10,000*l.*, the interest of which was to meet current expenses. Mrs. Desenfans gave up her life interest, and left 4,000*l.* in addition. The bequests having been invested when the Funds were very low, are now represented by a total of 17,500*l.* Consols. We heard with pleasure at the last "speech-day" that it is in contemplation to establish an Art-School near the Gallery, the pupils of which may get their general education at the college with the other boys.

LONDON: ITS CHARITABLE AGENCIES AND WANTS.*

WHEN energetic, pious, charitable people arrive in London from villages, or other small spheres, where they have been accustomed to see much of their poorer neighbours, visit them, advise them, sometimes relieve any pressing wants that merited misfortune may have brought to them, sometimes entertain them, and more frequently assist in educating their children, they generally find themselves unable to continue this branch of well-doing. They would

often like to treat the dismal houses of the slums as they have been accustomed to regard the cottages of their country quarters, but they do not know how to begin, or how their attempt might be received. This difficulty was felt, a few years ago, by a young barrister, among others, who, however, surmounted it, and has now recorded his experiences for the benefit of those in a like position. He points out a few ways in which it is easy for the new comer to London to help the poor, and gives information of some of the most prominent existing agencies, to the end that they may place themselves in communication with them if they think proper. His work is not intended to supersede such parochial machinery as may be already in existence, but rather to supplement it with information concerning the more general charities available for the deserving poor. In the course of visiting it is frequently the case that some families never require pecuniary aid; that those may be materially assisted by advice of various kinds, letters of recommendation, information in cases of sickness, where to obtain surgical appliances gratuitously, and other help that the well-informed are able to give the unformed. The work is quick with suggestions to laymen of the modes in which they may make themselves useful to their fellow-creatures. Its pages disclose, too, that there are among us numbers of professional men who have not yet learnt to believe in the efficacy of compounding by money for personal service, and who, undisturbed by the distractions of the great metropolis, spend their leisure among the poor, consoling, sympathising, helping, and teaching.

Mr. Bosanquet informs us that when he first came to live in London he used to tell persons who begged of him in the streets to go to their clergyman, or to some one who knew them,—not to come to one who knew nothing of them. This was under the supposition that there was as much intercourse between the rich and poor in London as there is in villages, and that there could be no really deserving persons without a friend better off than themselves to whom they could go for advice and help. But he soon found that respectable persons might be reduced to beggary and starvation without any such assistance being available. To make the inadequacy of the existing systems clear, he gives an account of the growth of London in the days of yore, and in the present century; of the church-building movements previous to 1856; of those subsequent to that date; and of the principal charities. The Society for the Promotion of Christian Knowledge is the oldest in London. It was founded in 1698. The first district visiting society was founded in 1812, and now nearly every parish has its society, chiefly composed, however, of ladies. The number of these is too frequently insufficient. The author tells of one parish in the south of London divided into twenty-eight districts, twenty-seven of which were hopelessly vacant, and the twenty-eighth undertaken by the clergyman's wife. In 1835 the first paid agency was introduced by the London City Mission. This association divides the metropolis into districts containing about 500 poor families, and appoints an agent to visit from house to house, who is either under the superintendence of the clergyman of the parish, or of a non-conforming minister, or of a layman. There are 351 of these missionaries now at work. Then comes the Bible Society, with its 230 Bibles-women. Ragged schools, refuges, reformatories, services in theatres, are next touched upon. The Pure Literature Society is another attempt at improvement. Some young barristers, who regretted the class of publication most eagerly bought up by the working-classes, combined to help forward a more wholesome kind of mental fare, and to assist in establishing libraries in connexion with working men's clubs, hospitals, and other institutions. There are two other societies that visit and relieve the poor, the Metropolitan Visiting and Relief Association; and the Society for the Relief of Distress; and, besides these, there is the Mendicity Society, whose begging-letter department is one of the curiosities of London. With all this, there is great need of much more. "In some places," says Mr. Bosanquet, "the poor are over-attended; whilst in others they are allowed to starve in soul and body. There is no sufficient understanding between the different agencies, and, consequently, there is a want of system, and thoroughness, in the way the work is done." He calls for an undenominational organization, when it would be less frequently the case that one cholera patient should have three bottles of

* London: Some Account of its Growth, Charitable Agencies, and Wants. By Charles B. Bosanquet, Barrister-at-law. London: Hatchard & Co. Piccadilly, 1863.

* See pp. 530, 531.

brandy and his next-door neighbour none, than it has sometimes been. We are told by a clergyman that there was only one family in his district that kept a cook, and that was his own; and another clergyman is quoted who stated there was not a family in his district whom he could ask for a shilling, and not a family who would not be glad to accept one from him; while in some parishes there are so few poor that they run a risk of being spoilt with too much attention, and in others there is actually no employment for willing workers, nor use for contributions. Organization and distribution of forces and funds are clearly wanted.

People who doze away their Sunday afternoons will be startled to hear how these few leisure moments are seized by ardent spirits, who have worked as hard as the dozers have throughout the week, to go about and do good. It is on Sundays, it is argued, that the poor are left most to themselves, and a little unofficial visiting with reading or conversation with them in their homes has been found welcome in quarters hitherto considered unapproachable. The infirmary of a workhouse, where many of the inmates cannot attend chapel, is a place where a little attention of this kind is sure to be appreciated. Schools, too, afford ample scope for great working powers. Some of the ragged schools have been founded and are worked exclusively by young professional men. Mr. Bosanquet gives an account of the families in a *cul de sac* among whom he first broke ground. It requires an effort, he admits, to make acquaintance with strangers, but when effected the result is sure to be satisfactory. How the first plunge, as he calls it, was made in his instance the reader must ascertain by reference to his volume.

We pass on to remind our readers what has been done for London by the dwellings improvement associations towards making up for the arrears of two centuries. There are eight of these societies at work, and much private effort has been made in this direction, foremost among which must be recognised the munificence of Mr. Peabody and Miss Counts. The overcrowding and other insufficient sanitary arrangements that first attracted attention in the reign of Queen Elizabeth, and had been gradually getting worse and worse as the people settled down again after the Great Fire and time passed by, were first grappled by the Society for Improving the Condition of the Labouring Classes, who about the year 1814 began to build a range of improved houses at Bagnidge Wells. In 1847 a lodging-house for single men in George-street was opened by the late Prince Consort, which is now always full. Another single man's lodging-house, formed out of three old houses in Charles-street, is also always full, and brings in a net return averaging 12 per cent.; but here the society has only a short lease, and no sinking fund has been provided. In 1850 the model building for families in Streatham-street was finished, which contains fifty-four tenements, which are much sought after by respectable mechanics. This brings in 4½ per cent. This society has also improved old houses in Tyndall's-buildings and Wild-court, Drury-lane. Altogether it provides accommodation for 350 families and for 258 single men. It issues a quarterly publication called the "Labourer's Friend." The Metropolitan Association began to build in 1845, and its first block, for 110 families, in Old St. Pancras-road, was opened in 1847. This is now paying 6 per cent. The Soho-chambers, taken on lease and fitted up as lodgings for single men, have never filled well, and are still a loss to the association; neither have the Metropolitan-chambers, built in 1849 at Mile-end, for 254 single men, paid well; but ninety-six cottages, built at Peuge, near the Crystal Palace; Gathie-buildings, near Chelsea Bridge; and Ingressre-buildings, near Golden-square, are more popular. Owing to the experiments of this society taking the direction of providing for single men, whose requirements have since been considered by the Common Lodging-house Act, their operations do not appear to have been so successful as they have been in reality, for 2 per cent. has been the average interest paid to the shareholders until quite recently, when it has advanced to 3½. The St. George's, Hanover-square, Parochial Association for Improving the Dwellings of the Labouring Classes, was the next to take the field. The capital consists of donations. It owns two buildings, one in Grosvenor-mews, with thirty-two tenements of two rooms each, purchased for 3,200l., and another in Grosvenor Market, containing forty-seven

tenements. The Marylebone Association, also local, composed of shareholders, began by paying 1 per cent., and is now paying 3½ per cent. This society is considered by our author to have been more successful than any other in keeping and improving the people whom it found in occupation of the old houses which it purchased. Gray's-buildings, Duke-street, Manchester-square, twenty-ones houses, densely packed with poor Irish people, have been taken in hand, and are still let out in single rooms, at about 2s. 6d. a week, after their remodelling. Experience of this class of tenant shows that it is unwise to lay water on to the upper floors, for the sink is sure to get stopped up by mense, and disaster ensue. A new block, in Lisson-grove, belonging to this association provides for 418 families, in single and double rooms, at 2s. and 3s. 9d. per week. The Strand Buildings Company, 1857, owns but one pile of dwellings, in which the tenants pay 4s. to 5s. 6d. a week, for two rooms. The Central London Dwellings Improvement Company, of which our author is one of the hon. sec., was formed, in 1861, by gentlemen most of whom belonged to Lincoln's-inn, who wished to see for themselves whether it was not possible to provide good accommodation for small tenants without loss. So far this company has purchased three freehold properties and one long leasehold, all in the neighbourhood of Drury-lane, thoroughly cleaned and repaired them, and let them out again, often to the same tenants they found in them, in single rooms, in "rooms and slips"—that is, with a portion of the room partitioned off—and in two rooms. About 180 families are comfortably housed by them, and their dividend varies between 3 and 4 per cent. The London Labourers' Dwelling Society has paid 5 per cent. from the first. Its promoters had some experience upon which to base their operations. They were shareholders in the very successful Cottage Improvement Society at Hastings, and simply applied the plan they found answered well in the country to London, under the same auspices. They purchased houses in St. George's-in-the-field to begin with, which brought a dividend at the end of the first half-year. Subsequently they purchased houses in the east of London and in Lambeth, and they are now covering part of the famous Vauxhall Gardens with houses built in flats, and furnished with every necessary appliance for the family of a mechanic. At present the society houses 215 families, some of whom pay 7s. and 8s. a-week; others 1s. 6d. for a single room; and others, occupying a whole house at 12s. per week, are allowed to take lodgers. The next company that appeared upon the ground was the Improved Industrial Dwellings Company, Limited, 1863. This owes its existence to the example of Sir Sydney Waterlow, who built a block, containing twenty tenements, to the north-west of the railway station, and strongly advocated an extension of the experiment. The net profit of this block is said to exceed 8 per cent. The company formed with a view of multiplying this class of buildings has blocks in Old St. Pancras-road, in Wapping, and Southwark, which provide homes for 376 families at rents varying from 7s. 6d. to 4s. 6d., neatly plastered and papered, furnished with sink, scullery, and closet, and supplemented with a drying-ground on the flat roof; but these only bring in a dividend of 5 per cent. They have, too, additional property in Farringdon-road, containing 168 tenements and 12 shops. This company is the last of the metropolitan associations who have as yet made much progress. The Lambeth Association has a pile of dwellings, with external galleries, that is seen from the South-Western Railway; but it has not made much way. Miss Counts's Columbia-squares, and Mr. Peabody's still more recent gifts, are fresh in everybody's recollection. And yet with the combined efforts of these open-handed givers, not so many families have been provided for as have been turned out of small houses in the last ten years, under Parliamentary powers, to effect improvements of other kinds. "Improved dwellings of different kinds have been provided, on the closest calculation I can make," says Mr. Bosanquet, "for 3,500 families; it is obvious that, though this is not an inconsiderable result in itself, it is quite out of proportion to the wants of a city containing 3,900,000 inhabitants, the majority of whom, of course, are mechanics, labourers, or irregular poor." Our author suggests that a commission should be appointed to ascertain the best mode by which overcrowding may be effectually diminished. He also suggests that mechanics should be encouraged to build

themselves houses in the blocks we have been mentioning, as they are assisted to do by building societies in the suburbs.

It is disheartening to find that small tenants will not always second the efforts that disinterested people make in their behalf. Their drains are constantly getting stopped up through their gross carelessness, such as would warrant the dismissal of any servant from a respectable house. Pieces of flannel, rags, green stuff, are constantly found in them, and even a hammer and a spoon have been found to be the cause of their obstruction. As there never will be a day when people will voluntarily visit the houses of the poor to clean their drains for them, it is very essential that they should be instructed in this simple matter when the rooms are let to them; and perhaps it would be well if it were clearly understood that carelessness in this respect would be the just cause of notice to quit. Owing to this disregard and the frequent changes of the very poor, it is not considered safe to calculate on clearing more than 50 per cent. of the nominal weekly rent of rooms in the lowest class of house property in London. "Repairs and rates, collection, bad debts, and empty rooms swallow up the other half. If any but the simplest and strongest fittings are put into such houses, they are a permanent source of expense."

The modes in which poor relief is administered in Elberfield, in Paris, in New York, and amongst the Jews in London, are shown as, in some particulars, affording useful information. In conclusion, Mr. Bosanquet gives extracts from the papers of an association of which he is lay-secretary, formed since his book was planned, for the organisation of the efforts of lay-helpers for the disease of London, in which Sunday work, evening work, day work, and general work are laid out for the acceptance of the eager souls anxious to give their personal services to the poor. He advocates the appropriation of a fixed proportion of a man's income to religious and charitable purposes, and urges that all should be ready to give and glad to distribute. If the squalor of London were found in a village some one would be sure to take the matter up. The size of London should be no discouragement, for the number of workers is also large. Mr. Bosanquet recommends new-comers not to take too much in hand when first to their work, but to choose whatever branch they feel most fitted for, and make themselves masters of it; and he reminds people not able to visit the poor that they can still exercise consideration on their behalf, and materially improve matters by such simple means as ordering work in slack seasons, and any necessary repairs and renovations to property to be done when possible in the winter. His work, as we have said, abounds in suggestions for the profitable use of spare time, and is written in a commendable spirit.

ON TERRA COTTA, ESPECIALLY AS USED IN THE NEW BUILDINGS FOR DULWICH COLLEGE.*

Difficulty in Use of Terra-cotta.

It is but fair to point out some of the disadvantages in the use of this material that do certainly exist, and cause much vexation at times to the architect. Of these, perhaps, the most embarrassing is the arrangement necessary to have the terra-cotta blocks made and ready on the ground almost before the rest of the work is begun, in order to work in when wanted as the bricklayers progress. At times this is found impossible, and annoying delays in the general work take place, for which clients will be apt to blame their architect. The lesson, of course, to be learnt from this is, to carefully mature the design at the outset, instead of our contenting ourselves, as we now too often do, with a mere sketch of what is intended, with the hope and intention of working in parts as time goes on and the work proceeds. I am not sure that architects ought to object to this, since it must produce decision of thought and precision of detail, which may be an advantage in an educational point of view, and is a serious corrective to indolence of thought in design.

There is some considerable extra labour in the office put on the architect by the use of terra-cotta, arising from the necessity of making all

* From a Paper by Mr. Chas. Barry read at the Institute of Architects, June 2nd.

full-sized detail drawings full 1-12th larger than the work is to finish, in order to allow for its contraction, which I have already said is in that proportion. I have found it necessary, therefore, to make two drawings for all such parts: one made with the usual 12-in. scale, for the use of the general contractor, the calculation of bending courses of the breaks, and the like; the other made with a special scale, 13 in. in length, but divided into twelve parts, representing inches; and with this scale making all drawings (full size) which were to be issued to Mr. Blashfield.

Another disadvantage is, of course, the risk in making and burning, which has been adverted to, the annoying result being sometimes that all the pieces of a large window or door are perfect except a few, but these few being equally essential with the rest, the work must stop till new blocks in lieu of the defective ones are made,—a matter generally of several weeks, or a temporary block must be put in and replaced with the proper one when ready.

Next, there is the difficulty (which is, indeed, only a maker's difficulty) of burning blocks which are to constitute jambs, strings, and continuous features, so as to be perfectly true and correct in the mouldings. That this is only a maker's difficulty and will be got rid of, if the use of terra-cotta in England receives the encouragement that it seems to me to deserve, I cannot doubt; the marked improvement that has taken place in this respect in the work sent up now to Dulwich, compared with that at first sent, is a complete proof of this. At the same time let it be remembered that the joints and surface of adjacent blocks can be brought into truth after being set, by rubbing down with sharp sand and water; nor if the ware is properly made, homogeneous throughout its mass and well burnt, is there any risk from rubbing down of getting a less lasting weather surface. I found this process of rubbing down much needed with the first work sent to Dulwich; but as I had contracted with Mr. Blashfield to fix his work himself, true and correct, the expense thus caused to him, without repayment, produced such increased care in the making, drying, and burning, that little or no such rubbing down is now needed. The same remark may be made as to the lines and arrises of mouldings made in lengths: there is no reason for their having a round or concave edge; but to prevent it, certain precautions must be taken before the work is burnt, and it is only necessary for architects who use terra-cotta to let the makers know that they will not pass defective in this and some other respects, to ensure that perfection in line, surface, mitres, and the like, which is necessary to good effect. Here, however, I would say that, of course these risks are much reduced if the size of the blocks is not great, and all idea of imitating the large blocks which are to be had in stone is given. There is no difficulty in this, and, indeed, it is a questionable taste to attempt it, even if it were easily practicable, inasmuch as a peculiar distinctive effect arising from the size of its pieces may, and should, perhaps, be preserved, and make at once evident to a spectator that he is looking at a terra-cotta building, no less than is now the case with a stone or a brick one.

Cost of Terra-cotta Work.

I will now touch on that question of so much interest and importance to architects, viz., that of cost: and in doing so, I think it right to say that although I shall mention some actual facts by way of examples which, as far as they go, are highly satisfactory, yet, in my opinion, the cost of terra-cotta would be largely reduced, if it became, as I hope it may become, a material far more largely employed in this country than it has been. The items which make up the cost of terra-cotta are, of course, in the first place, the clay or clays used, and their necessary weathering, mixing, and duly amalgamating; and in this part of the process greater experience will lead to greater certainty, as to the best mixtures with reference to colour, homogeneity, quality of contraction, power to resist weather, and mechanical strain, and hence some of the economy to which I have alluded may arise with greater demand for the work. Next there is the manual labour of working the clay into forms required, which I am sure, from my own observation, may be much reduced and superseded by mechanical appliances, if the cost of machinery can be incurred. Next there is the air drying, the time this process takes, and the shed space required for extensive works. Next the masons' work,

while the material is hard and dry, but not burnt, to make the blocks or mouldings true and square in their arrises, &c. Next the cost of kilns and their wear and tear, and the cost of fuel. In each or all of these items in the manufacture, we cannot doubt that more economical arrangements might be made than those now found in terra-cotta manufactories; but as all such appliances and machinery are in the first instance costly, it becomes essential that the manufacturer should clearly see such a probable demand by architects and the public for his work as may justify him in the outlay necessary. At the same time, with all these drawbacks, the economy of terra-cotta, as compared with stone, is great. Speaking in general terms, I think I may say that taking cube for cube as fixed in a building, terra-cotta costs a little less than the soft stones, as Bath, Caen, &c., while, as regards Portland, the average difference would be about 35 to 40 per cent. The greatest economy is to be found when there is much work either in extra-cutting of mouldings (which cost nothing extra in terra-cotta over ordinary mouldings) and in artistic modelled work; when, as I have already said, under-cutting and almost full relief of features is as cheaply produced as low relief. In these cases the economy is often several hundred per cent. over hard stone. Plain strings, friezes, and plinths cost comparatively more in terra-cotta than other and more enriched works in the material. To give the members of the Institute some useful facts, I will mention that the ground-floor windows at Dulwich, shown in the drawing exhibited, have been made and fixed complete for 19*l.* each; their cost in Bath stone would have been 20*l.*, and in Portland 28*l.*

The principal floor windows, which are of rather elaborate design, have been fixed complete for 41*l.* each. They would cost in Bath stone 57*l.*, and in Portland 86*l.* This cost includes the modelling the busts in high relief, which are all different, and represent from carefully sought out authorities where they can be found, men of literature, science, and art, philosophers and sages of antiquity. There are also the Muses, and a few fanciful and original female heads taken from the most familiar characters of Shakespeare. These windows do not come, with all their work, to more than 5*l.* 6*d.* a foot cube. The second-floor windows have been fixed complete for 10*l.* each; they would have cost in Bath stone 19*l.*, and in Portland 28*l.* 10*s.*

The cornice will be seen to be richly treated, the whole is terra-cotta, save only the corona, which is formed of a slab of Portland stone, bonding right through the wall. When this was designed I did not know so much of the qualities of terra-cotta as I do now, or of its transverse strength; but in a future case I should not hesitate to make these slabs in terra-cotta. The cost per foot run of this cornice, which is 15 in. projection and 4 ft. high (exclusive of the stone corona), fixed complete, is 33*s.* a foot run. In Bath stone it could not be done for less than 80*s.*, and in Portland 120*s.* per foot run.

A double-sided moulded coping, suitable for balustrades, walls, &c., 14 in. wide and 9 in. high, costs in terra-cotta about 2*s.* a foot. It would cost in Portland 3*s.* 9*d.* to 4*s.* The cost of terra-cotta for garden balustrades, vases, terminals, and the like may be stated to be between that of cement and stone; for instance, a bust, heroic size, can be modelled as an original work in terra-cotta, and completed for 10*l.* or 12*l.* A statue life-size for 25*l.* Balustrades of ornamental character, with base and capping complete, for 12*s.* to 15*s.* per foot run. The cost of the open parapet to the railway viaduct of the Brighton Railway Company in Dulwich was, exclusive of vase and coping, only 5*s.* a foot run of a thickness of 6 in.

I have referred to solid terra-cotta blocks, and those made hollow with an average thickness of 2 in. of material. The specimens in the room will explain what I mean. There is no physical difficulty in producing solid terra-cotta, and using it as enbe-stone; the only difficulty being the long time such blocks, if of large size, take to dry thoroughly and equally throughout their mass, and to be thoroughly burnt in the kiln. In almost all cases no consideration of strength renders this use of solid blocks necessary, as the strength of hollow-filled blocks is very great, and quite sufficient in nearly all cases. I shall advert to this part of my subject again; but meanwhile, as we are upon cost, I will say that solid terra-cotta blocks can be made in ordinary colours at about 3*s.* 6*d.* a cube foot. If the blocks are made hollow and filled

in with broken terra-cotta or brick in Roman cement, the cost may be stated at 3*s.* 1*d.* a cube foot; these pieces include all ordinary face-work in mouldings, panels, &c. The relative cost taken in the same way would be about 5*s.* 6*d.* for Bath stone, and 9*s.* for Portland stone.

In this place I may properly say a word as to the filling in referred to. This, it is found, should always be done with good Roman cement, and not Portland, lias, or other cements, which all contain more or less lime in a free state. Particles of lime may be found in a latent state in nearly all the ordinary Portland cements. These particles do not slack or expand for a long time after the cement has apparently set; and when they do in a confined space, such as a hollow terra-cotta block, they do so with expansive force enough to crack a block several inches thick. Roman cement does not seem liable to this, and may, I think, be safely used: also pozzuolana, thoroughly slacked lime, and clean sand. It requires about one peck of sand and one peck of cement to make solid a cube foot of terra-cotta with a thickness of 2 in. of that material. These hollow blocks so filled in may be very thoroughly and economically bonded together in the most solid way by pieces of galvanised hoop-iron being turned into the hollows of adjoining blocks before the cement filling is run in.

In the work at Dulwich college it will be seen, on reference to the section on the wall, that I have used these filled-in blocks bonded into the walls just as stone would be used, and I think this is the only legitimate way in which to employ the material, and give it its true value as a building material. Mr. Scott, in one of his works, calls terra-cotta "the highest development of brick." As such it should, I think, be used, bonding into the work as brick does, but in proportion to the size of brick or block employed. In some works recently executed this has not always been done, and terra-cotta has been put on as face slabs, or filled in to brick openings, like a wood sash or door frame would be, and not bonded at all. I have endeavoured to obtain information from actual sectional measurement of how the terra-cotta was treated in this respect by the old Italian architects, but without any definite success. All the published works show external profiles and views, but never, as far as I can find, the section. I believe myself that the old architects, like ourselves, sometimes bonded in and sometimes did not, and that the instances of the first method remain to us for our instruction, while the others have become more or less ruinous.

Strength of Terra-cotta as a Building Material.

The next part of my subject will be the strength of good terra-cotta as compared with that of stones in ordinary use. At my request Mr. Blashfield has had a series of interesting experiments made by Mr. Kirkaldy, of The Grove, Southwark, whose special attention for some years has been given to testing the strength of materials of all kinds with a degree of precision and philosophical nicety that render his results most useful and perfectly reliable. The following table will show the results, and will, I am sure, convince architects that we have here a very trustworthy material:—

Portland stone stood a crushing strain of...	283 tons.
Bath " " " " " "	83 " "
Terra-cotta block of similar size, as above seen	412 " "
A good hard stock brick has also been tested (Exp. No. 710) of the usual size, about 9 in. by 4½ in. by 3 in. and stood	17 " "
A terra-cotta block (Exp. No. 671), nearly the same size, of 12 in. by 4 in. by 3 in. stood a strain of	125 " "

The experiments have been made with different shaped pieces of terra-cotta, some of them solid, some hollow but left empty, and some with the hollow blocks filled in, as I have done at Dulwich, with brick and Roman cement. The result of experiments shows that the filling in doubles the strength of the hollow blocks, as the one showed signs of cracking with a strain of forty-two tons to the square foot, and the other required eighty-six tons to produce the effect. In these two experiments, I should mention that the ware was 1½ in. thick only, while the thickness of that used at Dulwich is always 2 in.

The first experiment showed that a solid 12-in. cube of terra-cotta will not show a crack until a crushing strain is applied of 442 tons to the square foot; and to crush a hexagon stable-floor brick 4 in. diameter and 2½ in. thick required no less than 855 tons. Mr. Blashfield informs me

that the terra-cotta of the specimens here experimented upon is a composition of clays from Cornwall, Devon, Poole, and Northampton, banded together and mixed with ground-glass, felspar, Lynn sand, and pulverized terra-cotta fragments. Before leaving the experiments, it may be remarked that the clays which are technically termed "fire clays," and resist the largest amount of heat, are the weakest against a crushing or transverse strain, and those which flux or run at a less heat are the strongest. The pieces experimented on, which were hollow, were filled with Roman cement twenty-seven days before the trial. With a longer time, the cement would have been more completely hardened, and a greater pressure would have been resisted, but this was done to represent roughly what would actually be the case in the progress of a building.

General Remarks on other Qualities of Terra-cotta.

The relative absorption of terra-cotta and stone, such as Bath stone, as a measure of possible decay, is also interesting. It has been found to be very considerably less, but I have not had the time (as I had intended) to test the proportions accurately, not only as compared with Bath, but with Portland and other stones.

When it was subject of debate with Mr. Page, whether stone paving or terra-cotta tiles should be used for the footways of Westminster Bridge, he was anxious to test its wearing capabilities for foot traffic, and had an experiment tried by grinding together with sharp sand and water a terra-cotta tile 12 in. square and a similar piece of York stone. The friction was continued for five hours, at the end of which it was found that the terra-cotta tile had lost 1.16 in. of thickness, while the York stone had lost 1/4 in. The cost of such tiles as those of which this pavement is composed can now be stated at 7d. a square foot, exclusive of cost of laying. The tiles for Westminster Bridge were made and pressed by hand; they have stood the wear of six or seven years in as busy a thoroughfare as any in London, with no very serious wear. If made now, they would, however, be pressed by machinery, and be much harder and more durable.

It is necessary here to caution my hearers that all that has been said is of course only applicable to terra-cotta in the proper sense of the word; that is, a "body" composed of such materials as have been above enumerated, very carefully mixed and blended, and very carefully burnt, with a proper regard for the greater or less amount of firing which experience teaches is required for different "bodies." Some materials, I am informed, are offered as "terra-cotta" in the market which are nothing but clay and common sand. Such compositions will not bear, without great distortion, the necessary firing heat, and are consequently soft on surface, with little transverse strength, and not durable. This ware, of course, has the specious advantage of being much cheaper, and therefore architects should be very careful to test the terra-cotta of any particular maker before deciding to use it, if they do not wish the surface of their work in a few years' time to flake off like had brick.

There has recently been discovered at Watcombe, in Devonshire, some very excellent terra-cotta clay nearly pure from all foreign matter. The ware made from this, without any mixture of other substances, is said more nearly to resemble the best Italian terra-cotta than any other. It belongs to Mr. Allen, of Watcombe, a gentleman of scientific knowledge, who has spent some time and made many experiments upon it, and it has been analysed by Dr. Percy, at the laboratory attached to the Museum in Jernynstreet.

It has not yet been largely introduced into the market, but as it is found in an enormous mass not far from the surface, and as it is considered that it can be put on board ship at Watcombe for about 3s. a ton, no doubt it will receive the attention its merits may deserve.

There is, no doubt, much more interest taken in this material quite recently than for a long time previously. Among former instances of its use I may advert to the statues, panels, reliefs, capitals, friezes at Buckingham Palace, which were executed by Croggon. Rossi executed the statues, antefixæ, pateræ, &c., at St. Pancras Church, at a cost, by the way, of 12,000l. Buhh made the bassi reliefs in the façade of the Opera House in the Haymarket; Messrs. Cubitt a great deal of ornamental terra-cotta work to the London and North-Western railway station at Broad-street, City. They have also done work

in cornices and strings at Darleston Hall; and some terra-cotta work at Columbia Market, lately erected for Miss Burdett Coutts by Mr. Darbyshire. Mr. Blanchard has done several large works recently, among them the Charing-cross and City terminus hotels, the Star and Garter Hotel, and nearly all the terra-cotta work at South Kensington; he also executed a large number of garden works for my late father, as well as the capitals to the Corinthian columns of the façade at Cliefden House, near Maidenhead. Mr. Blashfield has executed considerable works for India in public and private buildings at Bombay and Moorsheadabad, also for buildings in New Zealand; while at home, he has done the work at the Duke of Cornwall Hotel, Plymouth, for Mr. Hayward, architect; the Sun Fire-office, Charing-cross, for Mr. C. Freeman, architect; Hall and Allen's new warehouse, St. Paul's-churchyard, for Mr. R. Tress, architect; the townhall, Farnham; some work at Castle Ashby and the New India Office, for Mr. Digby Wyatt; Holy Trinity Church, Barking; sundry parapets, panels, &c., for the viaduct in Dulwich, of London, Brighton, and South Coast railway; and the works at New Dulwich College, under my own direction, are also among his recent works.

For grave-stones and sepulchral monuments in the open air terra-cotta seems peculiarly suitable, as it is fondly hoped by relatives that these memorials from the living of the dead shall remain unchanged for ever. In terra-cotta there would be no falling off of decorations, no obliteration of inscriptions as we now see in the case with the stone monuments in our churchyards and cemeteries.

The following rough and no doubt very imperfect list of some of the best moulded brick remains in England will have some interest, and can no doubt be largely added to. It shows that a considerable development of the use of this material took place in the Eastern counties, possibly from the abundance of clay and comparative scarcity of building stone in those counties. I have endeavoured to fix the dates to these works as well as I could from Butler, Smith, and the "Baronial Halls" of England.

Holland House	about 1607

The growth of interest in making terra-cotta is perhaps represented in an encouraging way, when I name that in the International Exhibition of 1851, only eighteen exhibitors were represented, while that number was more than doubled in 1852, and I believe a still larger number presented themselves at the Parish Exhibition of last year.

There need be no jealousy or fear on the part of masons that, if terra-cotta be largely substituted for stone, their trade will be injured. It is but a new material for them with only this peculiarity, that their work with it lies in the manufactory when the clay is in a rather hard dry state. Then they can work mouldings, mitres, &c., in it with ease and perfect truth,—then stone-carvers may add their work of taste and fancy in a material soft and plastic enough to give them free scope, but to become as their hands leave it, by being then burnt, an imperishable work. In the building, also, terra-cotta should always be fixed by a mason, and not an ordinary bricklayer.

I have now touched, I believe, on all the more important points connected with the subject I had in view, viz., the wider introduction of terra-cotta for architectural works than for many years past has been the case, and can only hope the patience of my audience has not been quite exhausted. Much might of course be said of the application of such a material for decorative purposes, simply such as diaper wall enrichments, balustrades, terminals, bases, statues, fountains, garden edgings, and other matters connected with garden architecture where no great qualities of strength or wear are necessary, though the indifference of cotta to weather, and especially to frost, makes it particularly valuable for these purposes and far superior to any stone,

while its cheapness is a further recommendation. For internal decoration its capabilities of being made in a great variety of colours, any of which can be enamelled and blended with portions gilt, silvered, or bronzed, make it peculiarly suitable; in short, I may repeat the remark made at the commencement of this paper, and say we have here a material which, for structural, decorative, and many useful purposes, has not received from us the study and attention it deserves, nor so much as it has received in past ages of the world. If architects could be now led to give this study, and try to introduce terra-cotta generally into their works, the manufacturers would be encouraged to spend money in producing a material which would be unequalled. Such encouragement was given thirty or forty years to the different kinds of stucco and cement, and with important results in this respect; but, after all that has been done and discovered, that material is but a perishable one after all, needing constant painting to preserve it, and subject to many other inconveniences. Terra-cotta, on the other hand, when well manufactured and burnt, is practically everlasting and unchanging in its effect artistically, and it may be, in some ages to come, when our stone and stucco buildings may have become ruinous or altogether disappeared, that, as in Egypt, as in India, as in America, so the terra-cotta works of England may remain as one of those "landmarks of the civilisation of mankind" in England to which Sir Charles Lyell alludes.

PICTURES PURCHASED BY THE ART-UNION OF LONDON.

The following are amongst the principal works selected by the prizeholders of 1868 since our first statement:—

From the Royal Academy.—The Head of the Glen, G. E. Hering, 200l.; Rustic Gallantry, C. Landseer, R.A., 150l.; Under the Willows, W. Field, 60l.; The Musical Genius, E. Opie, 40l.; Sunshine, J. H. S. Mann, 31l. 10s.; Look, here's Punch, T. K. Pelham, 30l.; The Baths of Caracalla, Rome, E. H. Fahey, 20l.; The Evening Hour, J. V. De Henry, 20l.; Haymaking near Henley, late H. J. Boddington, 15l.; East Ashore, A. Corbould, 15l.; The Confluence of the Bore and the Yare, Yarmouth, G. Eaton, 15l.; In the Island of Capri, D. W. Deane, 15l.; A Moorland Stream, T. J. Banks, 15l.

From the Society of British Artists.—"About Nelson" scene on board a Yarmouth lugger, T. Roberts, 75l.; Pembroke Castle, A. Clint, 50l.; The Grand Canal, &c., Venice, W. Henry, 50l.; Ewaddonnan, near Land's End, H. K. Taylor, 45l.; A Lesson in Lace-making, H. King, 45l.; Junction of the Moselle and Rhine, Mrs. P. Phillips, 45l.; The Dogana and Ducal Palace, Venice, J. B. Pyne, 40l.; "Now came still Evening on," &c., W. Gosling, 40l.; Antinual Morning, Lledr Valley, R. Harwood, 40l.; Tan-y-Ralt, North Wales, A. Pantou, 40l.; Off Folkestone, J. E. Meadows, 35l.; Entrance to a Dutch River, J. J. Wilson, 35l.; "In Ruins now," &c., R. H. Wood, 30l.; Girl Knitting, E. J. Cobbett, 30l.; The Farmyard, H. B. Gray, 25l.; View of Lacraal, Norway, A. Duncan, 25l.; The Path through the Wood, G. Wells, 25l.; Rochester—Winter Evening, G. A. Williams, 25l.; Cookham on Thames, W. Williams, 21l.; A Farm near Ougar, Essex, E. L. Meadows, 17l. 10s.; Barnard Castle, Durham, E. W. Robinson, 15 guineas; Elaine, Miss E. Perry, 15l.; On the East Oakmead, Dartmoor, H. Moore, 20l.; The Penmaen Mear Mountains, A. J. Woolmer, 15l.

From the Society of Painters in Water-colours. Maple, Durham Loch, W. Evans, of Eton, 35l.; Cartoon Gallery, Knole, Kent, J. Nash, 26l. 5s.

From the Institute of Painters in Water-colours. Harvest, J. Absolon, 52l. 10s.; Desenzano, Lago di Garda, North Italy, C. Vacher, 50l.; Piazzetta of St. Mark, Venice, W. Telhin, 40l.; Arundel Castle, J. Fahey, 15 guineas.

FRESQUES IN THE ROBIN-ROOM.—Mr. Cowper asked in the House of Commons when the public would be admitted to see the frescoes painted by Mr. Dyce in the Queen's robing-room in the Houses of Parliament. Lord J. Manners said that he believed the frescoes referred to were quite fit to be inspected by the public; he was not able to state precisely how soon the room would be opened, but he trusted it would be ready very shortly.

THE DEAN CEMETERY, EDINBURGH.

We were never much in love with Scotch burying-grounds: we mean, in love with their architecture; for there is many a little kirkyard with its venerable firs and yews, underneath whose shade—

"Each in his narrow cell for ever laid,
The rude forefathers of the hamlet sleep,"

and where their descendants smoke their pipes and exchange their mulls of a Sunday as they discuss the past week's news during the half-hour preceding the minister's arrival in his Geneva gown and hands, inexpressibly dear to us, owing either to its associations or to its picturesque or quiet, secluded situation. But a Scotch churchyard is not, *per se*, "a thing of beauty"; indeed, there is too often about it much that is in execrable taste and even repulsive, the burial vaults (where there are such) being ordinarily enclosures guarded by nosseonly walls and a rusty iron gate, or encased in iron rods, and filled with rank grass and nettles growing as they list.* The Glasgow Necropolis and the Dean Cemetery in Edinburgh, however, are exceptions to the general rule; and some description of the latter and the sepulchral monuments it contains will, it is trusted, prove acceptable to the readers of the *Builder*.

This cemetery has been in existence for little more than twenty years, the wood and shrubbery, however, being of much older date. It is charmingly situated, overhanging, as it does, the precipitous bank of the Water of Leith, opposite the little village of the Dean, an ancient suburb now almost absorbed in the city. It is beautifully wooded with venerable oaks, sycamores, elms, firs, hircles, willows, yews, and hollies, some of the latter of which have attained a height of 80 ft., as well as with younger laburnums, lilacs, hawthorns, mountain ashes, and foreign pines. The greatest care is bestowed upon the trees and ornamental shrubs, the turf is smoothly shaven, the parterres are trimly kept and well stocked with flowers, and the whole place is resonant, from morn till dewy eve, with the melody of song-birds. Mossy ivied walls support the terraces overhanging the river, to whose very edge the wood descends. Over beyond the north wall rise the turrets and eave roofs of Stewart's Hospital, while behind the grand natural screen formed on the west boundary by a row of sycamores and willows appear the two open lantern turrets of the Orphan Hospital. Standing on the upper terrace, you may get through the trees charming glimpses of the grand old Castle rock, the General Assembly's spire, the dome of St. George's, with Arthur's Seat forming the background of the picture. The sylvan beauty and peaceful seclusion of the situation cannot be surpassed; and, indeed, unless the recollection of some near and dear one buried there dims the eye, there is no pleasanter spot than the Dean Cemetery.

Till the year 1845, upon this charming spot stood the House of Dean, the baronial residence of an old and proud, but now extinct Scottish family, the Nesbits of Dean. The mansion dated from the end of the sixteenth century, and is said to have served Sir Walter Scott as a prototype for Tully-Veolan House, the residence of the barons of Bradwardine, in his novel of Waverley. Many of the pieces of sculpture in *basso-relievo* which ornamented the windows and doors of the old mansion are now let into the walls of the cemetery. Two of these are especially remarkable. On one of them, which occupied the upper part of a pointed arch, is represented a judge upon a throne, with a lamb in his arms. His left hand holds a drawn sword, and his right a pair of scales. "Two lions rampant stand on either side, as if contending litigants on the poor lamb; and the one resting his fore paw on the sword, and the other placing his paw in one of the scales." On the other piece of sculpture, which formed the pediment of a dormer window, a man is seen armed with a stout pole, with a hook at the end, by which he grasps it. A goat is running towards him, as if hitting at him, while a bear seizes it (the goat) by the waist with its teeth, and another is lying

* Prior to the passing of the Anatomy Act in 1832, most of the graves of the better classes were fenced in in this unwholesome way in order to protect them from desecration, which the Scotch people have always held in great horror.

† An eminent American essayist has recently thrown out the suggestion that it were good to scoop out of the tombstones cavities so as to catch and retain the rain, and thus induce the birds to come and sing over the graves.

dead beyond. Mr. Daniel Wilson, the antiquary, supposes that the first-mentioned *basso-relievo*, as it has the Hopes' arms sculptured beneath it, may refer to a family alliance with the Great Lord Advocate, "though the key to the ingenious allegory has perished with the last of their race."

Apart from its historical associations, its natural beauty, and that of many of its monuments, there is much interest attached to this necropolis. Considering how short a period it has been in existence, and how prevalent is the desire to be buried with one's fathers, it is surprising how large a number of illustrious dead lie there interred. Many of the brightest ornaments of Edinburgh society in the early part of this century—men distinguished and world-known in the battle-field, and in the more peaceful fields of art, philosophy, literature, law, and medicine, there repose peacefully side by side. In the north-west corner, where we are almost tempted to say that "lawyers most do congregate," lie Francis Lord Jeffrey, the celebrated critic of the *Edinburgh Review*; Henry or rather Harry Cockburn, the author of the "Memorials of his Time;" and their brother judges of the Court of Session, Lords Rutherford and Humsyde. There, too, are deposited the remains of Thomas Thomson, jurisconsult and antiquary. A red granite obelisk marks the resting-place of John Wilson, professor of moral philosophy in the University of Edinburgh, but better known as the accomplished editor of *Blackwood*; while close to it, and marked by a white marble monument surmounted by a foliated cross, is the grave of his scarcely less talented son-in-law, William Edmondstone Aytoun, author of "Bothwell," the "Lays of the Scottish Cavaliers," and many humorous contributions to *Blackwood*. A cenotaph of freestone in memory of that other John Wilson, of Scottish vocalists *fugate princeps*, who died and was buried at Quebec, stands close to his namesake's monument. A mural monument and medallion placed against the north wall marks the spot where lie the remains of the author of "The Constitution of Man," George Combe; while close to it is the grave of the kind and genial John Burt, president of the Royal College of Physicians of Edinburgh. Among others buried here may be mentioned Lord Murray; the gentle naturalist, Edward Forbes; Professor Fleming, known from his works on natural science; the great limner, Sir William Allan, president of the Royal Scottish Academy; the architect who did so much to beautify Edinburgh, although his buildings are not all faultless, William Playfair; and Robert Reid, Crown Architect for Scotland. A lofty cenotaph in the form of an obelisk keeps green the memory of the colonel, officers, and men who perished in Bulgaria and the Crimea, or fell in action during the campaign of 1854-55.

There is perhaps nothing more surprising to any one acquainted with the general characteristics of Scotch graveyards than the marked dissimilarity between the monumental erections in such and those in the Dean. Not a single "thru-stone" is to be found. The headstone with its cherubim with trumpeters' cheeks and expanded wings, has disappeared. We doubt if you could discover either sculptured skeleton, death's-head, cross-bones, or hour-glass. These more pretentious tombstones which were ornamented with pillars and pilasters, pediments and flying buttresses, so as to resemble a dormer window of the French Renaissance period, and of which the Greyfriars' churchyard contains so many examples, are altogether unrepresented. But, in place of these, what an endless variety of sepulchral monuments have we not got! Egyptian obelisks and pyramids of stone and granite; Grecian cyclostyle and peristyle temples; columns of the five orders, broken and unbroken, with doves and butterflies about to take flight from them; sarcophagi; "storied urns and animated busts" set on pillar or pedestal; statues of sorrowing matrons and virgins, and of sympathising angels; crosses of every description, the plain, the wheel, the Runic, the crosslet, the decorated; altar tombs; long tapering coffin-stones coped *en dos d'âne*; ornamental chains hung on pall pillars; bronze and iron railings imitating natural foliage; mural monuments—Medieval, Decorated, Flamboyant—in some instances forming niches containing sculpture, or holding slabs of marble or of polished granite for inscriptions, or for bronze

or stone medallion portraits; in others forming arcades, with details belonging to the most ornate period of the Decorated style.

And, if such has been the improvement in the taste which has erected these outward symbols of affection and regret, so also has there been a marked improvement in the tone and style of the inscriptions. If there be much "sculptured marble" there is, at any rate, no "pompos lay" nor mendicant sentiment. No child will be tempted in the Dean Cemetery, by the continued recurrence of fulsome praise of the departed, to imitate of his mother where they bury the wicked people. Such inflated inscriptions, as are but too common in every place of sepulture a century old, find no place there. We know only of one exception, which we shall afterwards quote, as the fatality has been often admired. Ordinarily the inscription records nothing more than the name and age of the deceased, with the date of his or her death, and perhaps some suggestive or consolatory text of Holy Scripture. Byron, who in one of his early poems says,—"My epitaph shall be my name alone," elsewhere observes that a name and a date are all that are required above one's grave,—and we agree with him. Let us be thankful that the occupation of the epitaph-writer is gone; and, as we wish ill to no one, let us hope, as we believe, that he is more profitably employed writing poetical pills of Jewish-made clothing or Parr's Life Pills. Conspicuous, too, by their absence, are heraldic shields and coats of arms. It seems as if it were that those who have raised monuments to their departed friends were anxious only to indicate the spot where they lie buried, and to leave their fame, when such exists, to be perpetuated by their own good works,—those

"Footprints on the sands of time;
Footprints, which perhaps another,
Sailing o'er life's solemn main,
Some forlorn and shipwreck'd brother,
Seeing, may take heart again."

We shall now offer some general observations on the styles of the monumental erections of the Dean, and direct particular attention to a few of the more noteworthy. Perhaps the obelisk is more numerous represented than any other kind of sepulchral monument. The material most frequently employed is polished Peterhead granite, either grey or red; but there are many examples executed in freestone and marble. In nearly every instance the dictum of most writers, that obelisks should never be placed on pedestals, has been disregarded. For our part, we agree with the authorities that the doing so is an error of judgment. It were much better to do, as did the Egyptians, elevate them on a cubical die narrower at the top than the bottom, with two or three steps under it. Where the greater part of an erection increases in width as it approaches the ground, the eye travelling downwards should not be unpleasantly arrested, as it is by the perpendicular lines of a pedestal. Let any one visiting the Dean contrast with its obelisks the graceful and easy manner in which, as it were, some of the Runic crosses (take, for example, that erected in memory of William Ambrose Moreland) rise from the ground. The cross in question is a very effective one. It is about 20 ft. in height, the material being Peterhead granite highly polished. The shaft, which is surmounted by an open-wheel cross, is a quadrangular prism, diminished upwards; and has its north face divided into three compartments, or panels, filled with sculptured hieroglyphics. It is placed on a block, or die, which with convex sides, is broader at bottom than at top. Underneath it are three steps, and the whole rests on a large slab. The die, the shaft, and the cross are of red granite, while the steps are of grey. On the north face of the die the inscription is chiselled out in such a way as to leave the letters red while the ground is grey. The whole reminds one forcibly of the Iona crosses.

To return to the obelisks, our sculptors would do well to imitate the Egyptians, who, as Professor Donaldson has pointed out, made the face of each side of the obelisk convex with the effect of rendering the light much softer upon the surface, and the shades less crude. The pyramids of some of the obelisks are ornamented in very questionable taste with a sculptured chaplet, or wreath of flowers, set as angularly and jarringly as the Light Huzzar balances his forage-cap upon his head.

The Egyptian Pyramids do not admit of imitation on a small scale. It is the vast size of these structures rising from the level sands of

* "Memorials of Edinburgh," by Daniel Wilson, vol. ii. p. 145.

extensive flat country, and the notion or idea of almost superhuman power and energy which they are calculated to suggest, coupled with their known antiquity, which give them their interest. In themselves they are not beautiful. Accordingly the writer cannot approve of the taste which induced the late Lord Rutherford, a distinguished and most accomplished lawyer and judge, no doubt, to erect in memory of his wife, a pyramid, which is probably not more than 12 ft. high. Built of blocks of red granite, which required teams of horses to transport them to the cemetery, it has yet the appearance of a model, and that on the smallest scale possible, intended for no other purpose than to illustrate a lecturer's description of the Pyramids. It stands near the west wall upon a large sandstone base or plinth. In its east face there is a square-headed opening fitted with a bronze door, on which are medallion portraits of his lordship and his wife, with an inscription underneath. The door has the effect of further dwarfing the size of the monument. We promised to give the inscription, and here it is:—

Sophie Francisca
Uxor
Cœlestis Mariae
Contra Votum Superstites
Mœrens Pœsult
Andreas Rutherford
Et Sibi
M. D. C. C. C. L. I. I.

The Latinity is good enough, and has been much praised; but we fancy we remember reading something very much like the words before, when at school.

The Dean Cemetery contains several good examples of sepulchral monuments, which are made in imitation of the long narrow tapering stone coffins of the thirteenth and fourteenth centuries, with the covers coped *en bas d'âne*, and ornamented with crosses. There is one monument of this description especially worthy of attention, namely, that erected in memory of James Murray, of Wick, his wife, and son, who perished in the wreck of the *Royal Charter* in 1850. The coffin, which is mounted on a massive slab of stone with good mouldings, is of polished red granite, picked or hollowed out on the top, like the matrix for a brass in the shape of a cross *florissée*. At the head of the coffin-stone, and between two lovely hawthorns, rises a pediment-shaped canopy, containing a pointed trifoliated arched recess with hood-mould and side pillars, with polished grey granite shafts. In the upper part of the recess there is the figure of an angel in white marble, and beneath the angel a red granite panel, which contains the inscription. The sides of the pediment are enriched with crockets, and the apex crowned with a wheel cross, the wheel of which is ornamented with the dog-tooth moulding. Besides these, there are other horizontal tombstones made in imitation of those which prevailed during the second half of the fifteenth century, having the form of a cross, and when seen from above presenting the appearance of a church's roof. Sometimes two such are placed alongside of one another to cover two graves,—that of husband and wife. There are examples, too, of horizontal gravestones made like the covers of the sarcophagi, which were in vogue from the fifth to the tenth centuries.

Table or altar tombs are not infrequent, ornamented with panelling, medallions, and otherwise. That of Lord Jeffrey, erected out of the surplus funds subscribed by the public for the execution of the marble statue of his lordship in the Parliament House, is of fine Etny freestone. It is elevated on three steps. A stone medallion portrait occupies the centre of a panel inserted in the die which faces the nearest footpath. Another good altar-tomb is that (by J. McEwen, sculptor) of Adam Mercer, F.R.C.S. It is surrounded by tall pillars and intermediate panels of iron rail-work. The tomb of Sir John Peter Grant, of Rothiemurcus, is another good example. Upon the adjacent wall, in a white marble panel, which is let into a slab of white sandstone, an angel holds a scroll, with the name of the deceased and the date of his death.

Many of the mural monuments are in the shape of pedimental canopied recesses or of blank arcading, which are often highly decorated. Among others we may notice the monument to William Anderson, of Cleadon. The pediment, which is carried on columns with highly ornate capitals and bases, has foliated drip-stones, an extremely rich finial, and intermediate rows of the ball-flower ornament placed in a hollow moulding. Within the recess is a

pointed arch, springing from elegant pillars, and containing a slab of white marble, in the upper part of which is a small trefoiled panel, with the monogram I.H.S.

The hurrying-ground of Findlay Anderson is marked by an arcade of three pointed arches, recessed under a low-browed arch, which springs from the upper part of buttresses at either side of the structure. Above all there is a lean-to stone roof, beneath the eaves of which is a hollow moulding, ornamented with the ball-flower. The openings in the arcade are occupied by slabs of white marble, intended for the reception of inscriptions. The shafts of the columns of the arcade are divided by cinctures.

Very conspicuous is the monument erected by his widow in memory of James Buchanan, the founder of the "Buchanan Institution" in Glasgow.* This is a Greek choragic monument, in the style of that of Lysicrates at Athens, commonly called the Lantern of Diogenes. It is an open cyclostyle of seven composite pillars.

Here we take farewell of the Dean, a cemetery where, to quote the language of a writer in *Blackwood*, describing the kind of last resting-place he should wish to find,—"a friend may freely come and cheat his fancy, and give breathing to his affection, without having to seek sexton or bundle for key, and a permission to be paid for. Not too gay for sorrow, nor too sad for love; but where there may be an indwelling sanctity that may hallow both; whence sorrow might receive comfort and love trust; where there is a sweet green shade for the tales of the young, and a lingering sunshine upon many a sod to rest the aged as they sit. . . . Such is a scene of peace. Here the living may hope to "sleep with their fathers."

WATER-COLOUR PAINTING.

The ancient adage, *Arx longa*, must be taken with a qualification. It is perhaps only strictly true in one sense. Art is tardy in growth: it is long in arriving at perfection. If viewed in another light, we must contest the truth of the apothegm. Art is not long minded in the sense of memory: it is not permanent in the production of excellence. The most lamentable shortcoming connected with the art of painting, for instance, is the total loss and oblivion of many of its greatest discoveries and most valuable traditions. When chemical success has once been attained we have a right to expect it to be permanent. Strange stories are told of the jealousy with which Titian regarded the secret of his colouring; but the fact that the colours of Perugino, to say nothing of feebler colourists, are now in any carefully preserved works of that great master bright and fresh, while those of Reynolds, probably the most anxious experimentalist in colour of any English artist, more generally faded to the hue of blotting-paper, is anything but satisfactory.

While oil painting is still so far involved in mystery that modern artists are unable to reproduce the permanent tones of the Early Italian masters, it may not be any great matter of wonder that water-colour should be entirely *en vauir*. Yet it does strike one as unaccountable, on a visit to the Water-Colour Exhibitions, not only that a new style of colouring should have come into vogue within the last quarter of a century, but rather that there should be attempts at so many different styles, and that artists in this branch of study should not rather commend their labours, by deciding what were the true qualities of this medium, and in what manner these qualities are most successfully developed. This, which is a mere matter of the mechanics, or rather the physics, of art, is independent of those subtler qualities of grace, and truth, and sense of light and colour, in which the distinctive individual peculiarity of the artist lies. If a student in water-colour were to visit the exhibitions with the view of learning from the counsel of the best masters how to practise the art, he would be likely to come away more puzzled than enlightened.

In some cases you see such an evident resolve to deal with water-colours as with oil, that you are at a loss to know why the artist adopted the more perishable medium. He may reply that he trusts to the protection of glass, but the answer will be that any one who knows what ho

is about, and who has an oil painting worth preserving, will do the same. It is almost incredible that any artist or amateur who has observed how much the exposure of a painting for even the term of a single season in the crowded rooms of the Royal Academy acts upon the freshness of its tint should not consider the glazing of a picture to be a far more essential requisite than a gilded frame.

The old idea of a water-colour drawing, that of a rapidly-drawn permanent sketch of scenery, preserving the freshness and contrast of colour, but holding the same position in landscape that crayon does in portraiture, and not intending to compete with the more patient toil of the painter in oils, we fear must be held to be exploded. On the contrary, in the use of water-colours (and, in a very noticeable instance indeed in that of oils) there becomes apparent an actual return towards one of the features, long held to be barbarous, of Egyptian or Assyrian art. Our limners do not, indeed, engrave or relieve in marble, and then colour their work, but they occasionally lay on relief and colour at the same time, and produce a surface which, whatever it may be, is not either smooth or level.

It may be true that an artist has the right not only to select the medium most obedient to his touch, but to deal with that medium so as to produce the effect which he desires. Gozzini has a prescriptive claim to a certain freedom from rule; but the question will arise whether genius would not produce something more worthy of its powers by adherence to than by departure from the traditions of art. In finishing paintings with an irregular or relieved surface, for instance, there must in the first instance be found a greater liability to injury, and a less probable durability of work. Then the point of view from which the picture can be seen with satisfaction will be more restricted. If instead of a work which is more or less admirable from distinct points, and under different lights, you obtain one which is only properly visible at one distance and in one light, you have, *pro tanto*, an inferior production. You regret that the time and the talent devoted to the latter were not bestowed upon the former.

One word may be added as to the pest, trouble, and annoyance of all the exhibitions of the season,—namely, the catalogue. It is hard to look at these productions in any light except that of an imposition on the public. The information which they afford is the minimum, the price at which they are charged is the maximum. In these days of cheap literature the extortion of sixpence for a bare list of 300 pictures, or of a shilling for one of four times the number, is sheer imposition. It is a method of raising a tax on the public under a false pretence. To those persons who are the most likely to need a memorandum of the contents of the exhibition the catalogue is useless, unless profusely annotated in pencil during their tour round the rooms. To find any individual work, or to visit consecutively the works of any individual artist, by means of the catalogues, is a matter of extreme difficulty and annoyance. The principle of the numbering is often more inexplicable than that which has guided the position of the pictures. Frequently number and position seem entirely unconnected. Then, occasionally we find some favoured artist occupying a comparatively large space, by dint of a poetic quotation; while in the majority of instances there is nothing to direct the attention of the visitor to the idea embodied in the painting. A list of works and authors is, of course, indispensable. Such a list should be furnished to every visitor as a part of the consideration for the entrance fee. If a more detailed catalogue is prepared, which would be often very serviceable, it should be guided by some principles of explanation or of description, as in the case of the Portraiture Exhibition at South Kensington, in which, however, we have taken occasion to point out certain shortcomings. But every artist who exhibits should make a point of doing justice at once to himself and to the public by attaching once to the frame of his picture a small piece of gilded wood, on which title, and signature, and any essential brief description, should be legibly printed in black. The constant and most annoying distraction of the attention from picture to number, from number to page of the catalogue, then to the title, and then to the artist's name, which is the source of so much weariness and fatigue to any conscientious visitor, would thus be avoided. You would not be exposed to the risk of missing the very picture you came to see, or of being guided in your

* Mrs. Buchanan, it is worth recording, has recently subscribed the magnificent sum of 5,000*l.* towards the erection of the new Medical Hospital in Edinburgh.

attention by the density of the crowds which render invisible the more popular paintings. The injustice, involuntary injustice, let us hope, of hanging committees would be thus, to some extent, counterbalanced.

To this requisite, which no artist, and no connoisseur can deny to be extremely desirable, there is one sole objection. It is not that of the cost to the artist, for that would be amply repaid by the additional publicity which would thus be given to his work and his name. Ninety-nine people out of a hundred, on being shown a picture, inquire what does it represent, and whom it is by. Deny them this information, and the picture fails to take hold of the attention sufficiently to effect a lodgement in the memory. Expect them to put these questions three hundred, or twelve hundred times to a catalogue, and you must be unaware of the normal limit of human patience. The one objection is, if we allow the pictures to tell their own story, people will not buy our shilling catalogue. That is the true cause of the continuance of a barbarous custom, injurious to artists, extortionate, wearisome, and unjust to the public. We hope that our artists will make a stand—that they will announce for themselves their own names and their own subjects, and that they will refuse to lose a considerable part of the benefit which they might derive from a public exhibition, by having the due exposition of their names and designs stuffed for the sole sake of selling a few half pages of names at sixpence or a shilling a bundle.

MANCHESTER CITY POLICE AND SESSIONS COURTS.

The foundation-stone of the new City Police and Sessions Courts has been laid by the Mayor of Manchester (Mr. Robert Neill). The site of the new building is in Minshull-street, Bloom-street, and was formerly used by the paving department of the corporation. The style of the building will be that type of the Pointed Gothic of which examples abound in Florence, Siena, Pisa, Verona, and other cities of the north of Italy. At the angle of Minshull-street and Bloom-street will be placed a clock-tower, the fourth in number, occupying the central portion of the block of buildings, surrounded by offices and corridors, which, it is hoped, will prevent the noise and bustle of the adjoining streets from being heard in the courts themselves. The basement or cellar is raised 6 ft. above the footpath in the street, in order to give the opportunity of effectually lighting and ventilating the various rooms and passages, especially those connected with the cells for prisoners. The floor of the basement is 8 ft. below the footpath, so that the entire story will be 14 ft. in height. A broad corridor or passage, 15 ft. wide, extending along the back of the building, 14 ft. high, and two shorter passages at right angles with the main corridor, give access to the cells, which are of various sizes. About half of the cells are placed under the police-courts, and the remainder under the Court of Quarter Sessions. It is proposed to provide each cell with a water-closet and lavatory, screened off in the corner of the cell, the materials used being, as far as possible, non-absorbent, and the apparatus self-acting. The windows in the passage will be large and numerous, glazed on the inside with obscured plate-glass of great strength, and protected outside by wrought-iron bars similar to those recently fixed at the City Gaol and police-stations.

The main entrance into the building, for the use of the magistrates and persons officially connected with the courts, is in Minshull-street, in the centre of the façade. A spacious porch and vestibule give access to the principal staircase, at the foot of which is the porter's lodge and inquiry office. A small room for the governor of the City Gaol is on the right of the entrance. The frontage to Minshull-street may be let off wholly or in part for offices. The remainder of the ground-floor is occupied by the halls for the public, for witnesses, and rooms for prisoners awaiting trial. In the centre of the building is a large open area, 43 ft. wide, with entrance for the police-van to drive into the interior court, and a large yard for the use of the police. This open area divides the building into two portions, separating the part appropriated to the police-courts from the sessions side of the building. It will be closed at the end by gates, and will be an important aid to light and ventilation.

The large halls for the general public on each side are 84 ft. by 23 ft., exclusive of the compartments for witnesses, solicitors, court offices, partitions, &c., which are screened off by glazed partitions. That on the police-court side is entered from Bloom-street, in the centre. The witnesses' rooms, male and female, have private access on each side of the general entrance, and also a door from the large hall. Each of these rooms is about 16 ft. by 11 ft. 6 in., and will be open to the general hall above the glazed partition, which will reach about 8 ft. above the ground.

The object in the arrangement of the courts has been to concentrate, as far as possible, the business of the court, and to bring the prisoner, the witness, and the jury, the barristers, &c., as near to the bench as possible. The warming and ventilation of the courts is a subject to which especial consideration has been given, and provision is made in the construction of the court walls for passing heated air from the basement, through a series of cavities or flues, into the courts. Air-ducts, in suitable places, will convey the supply of fresh air to such positions in the courts as may be desirable to secure a complete and constant change in the atmosphere of the court. A heating-chamber and boiler-house are provided in the cellar, and a large channel for fresh air is constructed under the former room, to convey fresh outer air to the heating-chamber, which, after being warmed, passes into the court or courts at the time in use. The extraction of the vitiated air from the courts will be provided for in various ways.

The foundations are being executed by Mr. Thos. Clay, of Andeshaw, under the direction of Mr. Thomas Worthington, of Manchester, who is the architect of the building.

THE TRADES MOVEMENT.

Free Labour Association.—Colonel Maude and a deputation from the Free Labour Registration Association, London, have attended a meeting of manufacturers, merchants, and others in the Mayor's Parlour, Town Hall, Manchester, and explained the objects of this association. Mr. H. Nicholls was in the chair. Colonel Maude gave a history of the foundation, objects, and progress of the association, from which it appeared that through it, it was attempted to afford to those men not in connexion with any trade union the real advantages of a union without any of its drawbacks; that is to say, it was not only a benefit society, but a registration society, by which means men received support when in need, and when out of work might ascertain where work was to be had. By the rules provision was also made for the prevention and settlement of disputes between the men and their employers by means of conciliation and arbitration. Each workman undertook not to interfere in any way with another workman in any contract he might make with his master. Already the association, whose head office was in London, had established branches in Liverpool and other large towns, and the number of members in the society was 13,000. In reply to questions, Colonel Maude said the association had received very limited support, and it had been placed in an unfortunate position in consequence of its only having been brought before the public in times of strikes and disputes. Owing to that it was looked upon as an organization formed to help the masters. Nothing, however, was further from the truth, it being for the benefit of those who wished to be free workmen.

Wolverhampton.—The success which has attended the adoption of the principles of arbitration upon the method of Mr. Rupert Kettle, was celebrated in Wolverhampton, on Monday last week, after quite a jubiliant fashion. Arbitration is practised in this town by the carpenters, the plasterers, and the bricklayers, but not yet by the masons and the labourers. Mr. Kettle had remembered with much pleasure the annual holidays of the operatives of the French towns, and at the last arbitration meeting he suggested that some such yearly holiday should take place in Wolverhampton, masters and men, and their families, cordially fraternising during the festivities. The suggestion was taken up, and on Monday "the first annual demonstration in commemoration of the adoption of the principles of arbitration as a medium for the settlement of trade disputes," as the hills termed it,

came off. The occasion was made a general holiday throughout the building trade there, the masters having closed their shops for the purpose.

Birmingham.—The master builders say they have now a sufficient number of non-society men to carry on all their works. The matters in dispute with the union men were the worked stone question, piecework, and sub-contracting. On these, and all other questions, the non-society men accept the masters' rules. They have been engaged for twelve months certain.

TRADE SOCIETIES AND COMBINATIONS OF WORKMEN.

The Bill introduced by Sir Thomas Fowell Baxton and Mr. Richard Young to repeal and amend the laws relating to trade societies and the combination of workmen has been issued. The preamble recites the Acts 6 Geo. iv. cap. 129, and 22 Vict., cap. 34; which by clause 1 are repealed.

Clause 3 provides that,—

"From and after the passing of this Act, if any person shall, by violence to the person or property, or by the threat of such violence, or by the threat of the commission of any offence punishable by statute for or in relation to any trade, or by the threat of the loss or forfeiture of any office, or by the threat of the loss of any employment, or work, or to return his work before the same shall be finished, or prevent or endeavour to prevent by such means any journeyman, manufacturer, workman, apprentice, or other person, not being hired or employed, from hiring himself to, or accepting work or employment from, any person or persons; or if any person shall use or employ violence to the person or property, or the threat of such violence, or the threat of the commission of any offence punishable by statute for the purpose of enforcing any person to belong to any club or association, or to contribute to any common fund, or to pay any fine or penalty, or on account of his not belonging to any particular club or association, or not having contributed or having refused to contribute to any common fund, or to pay any fine or penalty, or on account of his not complying or refused to comply with any rules, orders, regulations, or resolutions made to obtain an advance or to reduce the rate of wages, or to lessen or alter the hours of work, or decrease or alter the quantity of work, or to regulate the mode of carrying on any manufacture, trade, or business, or the management thereof; or if any person shall, by violence to the person or property, or by the threat of such violence, or by the threat of the commission of any offence punishable by statute, force or endeavour to force any manufacturer or person carrying on any trade or business to make any alteration in his mode of regulating, managing, conducting, or carrying on such manufacture, trade, or business, or to limit the number of his apprentices, or the number and description of his journeymen, workmen, or servants; every person so offending, being convicted thereof, shall be imprisoned for any term not exceeding three calendar months, with or without hard labour."

Clause 4 enacts that a mere combination for trade purposes shall not be deemed a conspiracy.

Clause 7 provides for the legality of trade societies established for the purpose of raising funds for the mutual relief and maintenance of their members, wives, &c., during such time as the members thereof shall be unemployed; provided that no such society shall be deemed to be established for an unlawful purpose by reason of its being subject to rules, or of its imposing penalties of a restrictive character respecting the terms upon, or the mode in which, or persons with or by whom any trade-work shall be done, except such rules as are or shall be declared to be illegal.

Clause 8 provides for the punishment of officers of trades unions found guilty of embezzlement.

The Act is to be cited as "The Trades Societies Act, 1868."

AN EPITAPH IN KENSAL GREEN CEMETERY.

Among the more recently erected monuments in Kensal-green Cemetery is a marble bust of or to Mr. Sam Collins, who was, we believe, a great music-hall favourite a few years ago. The bust and pedestal are very well executed, and the monument altogether is in good taste, except the inscription, and that is—well, very curious, to say the least. Here it is—

"A loving husband and a faithful friend,
Ever the first a helping hand to lend,
Farewell! good-natured, honest-hearted Sam,
Until we meet before the great 'I am.'"

This, we presume, is the effusion of some comic brother of Sam's. We thought that this style of epitaph had died out with the last century.

BERKHAMPSTEAD CASTLE.

THE Castle of Berkhamstead stands in the parish of Berkhamstead St. Peter, in the county of Hertford, and geologically, upon the lower chalk. Its position is in a chalky bottom, on the left bank of the Bulborne rivulet. Between the stream and the castle the ground is naturally low and marshy, but it is now traversed by the Grand Junction Canal and the London and North-Western Railway, which, with the water-course and the turnpike-road, separate the castle from the town.

To the east and north-east of the castle the ground rises steeply towards Whitehill and Berkhamstead Common. To the west and north-west it rises more gradually towards Berkhamstead-place. Between the two, towards the north, is a comb or nearly dry valley, occupied by the old park, called the Berkhamstead estate, and in this valley stands the castle, about 400 yards from its termination in the river.

The constituent parts of the castle are a mound; an inner *enceinte* or ward; an inner ditch; a second *enceinte*; a second ditch; a third *enceinte*, enveloping the northern half only; a ravelin upon the west face; and a third or exterior ditch, also confined to the northern half of the work.

The mound is wholly artificial. It is conical, about 60 ft. high and 40 ft. diameter at the top, having steep sides and a wet ditch round three-fourths of its circumference. Its top was crowned with a circular shell of wall, about 8 ft. thick, of which the foundations only remain. Up its southern side is a certain wall, much ruined, and about 8 ft. thick. This commences at the ground level at the top of the mound, and runs into a fragment of the *enceinte* wall of the inner ward. It evidently connected this wall with the shell tower, and was probably, as at Tamworth, parapeted on either face of its rampart walk. It was not continued down the further side of the mound, which was not a part of the *enceinte*, but a citadel placed outside it, and connected with it only by a single wall.

Probably the ditch of the mound was originally continued all round it, and simply traversed by the wall. Much of the ditch between the mound and the inner ward is filled up, probably very recently, as the works are now in progress, the object being to connect the level sward of the *enceinte* with the mound for pleasure-purposes.

The inner ward is an oval space, about 500 ft. north and south by 300 ft. east and west. It is encircled by a wall about 7 ft. thick, and now about 20 ft. high, and which may have been 4 ft. to 5 ft. higher. Traces of the crenellations are visible. This wall is broken down in parts, but nearly three-fourths of it remain. The northern, or end opposite to the mound, is concave, the ditch of the mound having been run into it. There is a fragment of a mural tower on the west face, much mutilated and apparently rectangular. In the east face are two openings, one of which may have been a postern. In the north-east quarter a cross-wall seems to have belonged to a domestic building. The gap for the main gateway is at the south end. There are no traces of towers there, and there do not appear, judging from the wall, ever to have been any. The interior *terre-plain*, or platform, is level, no terrace against the wall, and no trace of a bank against which the wall could have been built. Outside the wall is a space of about 5 ft. broad, beyond which the ground falls sharply towards the wet ditch.

The inner ditch is carried quite round both mound and inner ward wall, being in plan an unbroken oval. It is deep and everywhere wet, and in parts it opens out into a pool. This is the case where it gave off the ditch, embracing the mound, now in part filled up, and in the south-eastern quarter, where its overflow escapes into the river.

Outside, and forming the counterscarp of this ditch, is the second or middle *enceinte*. This is a steep and narrow bank, carrying a walk of about 8 ft. broad, having about an equal slope upwards towards the inner ditch, and outwards towards the outer. For about its northern two-thirds this bank is very uniform, but at the south-west quarter it swells into a small mound or cavalier, about 22 ft. in diameter at top and about 20 ft. high, close to which the land has been cut away to effect a modern entry. Opposite to this, on the south-east quarter, is another rather larger mound, about 30 ft. across and 25 ft. high; and at this point the bank

makes a loop outwards, which somewhat destroys the symmetry of its plan. These two mounds are evidently intended to flank the extremities of the outer bank.

This middle bank is perforated by a modern culvert at its southern part, by which the waters of the inner ditch escape; and a few yards east of this the bank is crossed by two parallel walls, 13 ft. apart, and which evidently belonged to the outside of the main entrance.

The second or middle ditch, also deep and wet, envelops the middle bank very regularly. At present it is wanting on the south side, for a short distance, having been filled up and converted into a road when the railway was constructed.

Outside this ditch is the third or outer *enceinte*, a steep bank, which forms the counterscarp of the middle ditch, and envelops rather more than the northern half of the castle. It is about 10 ft. broad above, and is strengthened outside by eight bastions, also of earth, placed at distances of from 60 ft. to 150 ft., and each, at top, about 30 ft. broad by 40 ft. projection, and rounded. The five best marked of these, being steep and about 20 ft. high, lie to the north-west. A small streamlet coming in from the north then cuts the line, and to the east of this, covering the north-east and east faces, the bank is continued for about 580 ft., strengthened by three bastions, which, however, are low, and have nothing of the sharpness of the others. These latter three have scarcely any ditch, but the other five have at their feet a ditch, which, even now, is boggy, and no doubt was once a formidable defence. South of this outer bank, and ranging with it so as to cover the west face of the castle, is an earthwork of very doubtful character. Its lines are rectangular, it has a ditch, and it much resembles the early ravelin which were common in the fifteenth century, and not unknown in the fourteenth and thirteenth.

Connected with its ditch is a pond, which appears to have been a mill-pond and fish-stew. No doubt all these extensive ditches were turned to account, and fed the mill which is known to have been attached to the castle.

Berkhamstead is altogether a very striking and a very peculiar fortification. The mound was no doubt a Saxon castle, and, as was not uncommon, had its own defences. The inner *enceinte*, though not, as is usual, encircled by a bank, was encircled by a steep slope and ditch, which, with a palisade, would have been a very sufficient defence in Saxon times. These probably were the whole of the Saxon works, and within them may well have been held the famous Council of Berkhamstead in 637. The two outer works seem to be later. The outer certainly, from its bastions, must be later than the Conquest, and the middle bank is far too slight in its construction and too sharply preserved to be of remote antiquity. But it is remarkable that there is no trace of any other than the inner *enceinte* wall, and it is pretty evident that there never was any other. The earthworks, except the mound, would not have carried a wall, and had such been built it would have been liable to be mined and overthrown with very little trouble. Evidently these banks were crested with palisades, and probably careful cutting into them would show traces of the stakes.

Further, it is singular that though there is a second and a third line of defence, there is no middle or outer ward. These lines of defence include ditches only, and not the space which, however narrow, was always left between the walls of Norman castles for the assembling their defenders. Here the garrison of the two outer lines must have been drawn up in line close in rear of the stockade, with hut room to pass between it and the ditch in their rear.

It should be mentioned that an earthwork, composed of bank and ditch, and known locally as Grimsdyke, traverses the high road above the town, and there are several barrows in the immediate neighbourhood. The Berkhamstead earthworks are quite peculiar, but the neighbourhood is rather rich in military earthworks of a circular character, among which, to the south and west, may be mentioned Bushwood, Hawridge, Cholesbury, and, at a greater distance, Kimble.

The masonry that remains is all of chalk flint rubble, hatched in a pure white mortar, and probably faced with coarse flints, picked if not squared. Here and there parts of the face remain. This work may be Norman, or it may be later, though probably not much. The absence of towers is remarkable. There is no asblar at all. This, no doubt, was removed when

Berkhamstead-place was built, but there could not have been very much of it.

Berkhamstead was a seat of the Kings of Mercia, and the place of a council of magnates in 697, summoned by Wightred, king of Kent, and, at the time of the Conquest, it belonged to Edmar, athane of Earl Harold. It was evidently a strong place, for when the Conqueror gave it to his brother Robert, Earl of Mortaigne, amongst the vassals there was a certain "Fossrins," whose duty must have been to clean the castle ditches. Robert is said to have fortified it with a double ditch and rampart, and he held it at Domesday. Moreover, under the Conqueror, it was expanded into a very extensive honour, of which it was the seat. The manor is named, but not the castle, in Domesday.

The castle seems to have been held by King Stephen and by John with the earldom of Cornwall. It had suffered in Stephen's wars, and John gave it, 1206, to Geoffrey Fitzpiers, Earl of Essex, who rebuilt or restored it, and may have erected the present walls. Prince Louis laid siege to and obtained it in 1226. The attack was from the north side, and it held out for a considerable time.

Richard earl of Cornwall and king of the Romans, brother to Henry III., held it. He wrote to his brother from hence in 1261, and died here in 1271-2, as did his wife Isabel Marescal in 1239. His son Edmund had the castle, town, and balmoit. In 1299 the castle was returned as yielding no rental; but the millpool and the castle ditches let for the fishing at 20s. per annum. There was then a water-mill and a park with deer. It was a part of the dower of Margaret of France, the second wife of Edward I., who died 1317. Edward II. gave it, with the earldom of Cornwall, to Caveston; and to Prince Edward, as duke of Cornwall, came the castle, manor, vill, park, and honour of Berkhamstead, the lands of which extended into Herts, Bucks, and Northamptonshire. By Edward III. it was ordered to be put in order for the residence of John of France, and the Black Prince was here not long before his death. It was also used by the favourite of Richard II., Robert de Vere, Marquis of Dublin, who had licence to inhabit it. Here, also, died Cicely Nevill, the mother of Edward IV.

Queen Elizabeth leased it to Sir Edward Carey, whose grandson employed its material to build Berkhamstead-place, since which it has been leased to various persons, and was finally sold to the Egertons, the owners of the adjacent park of Ashridge.

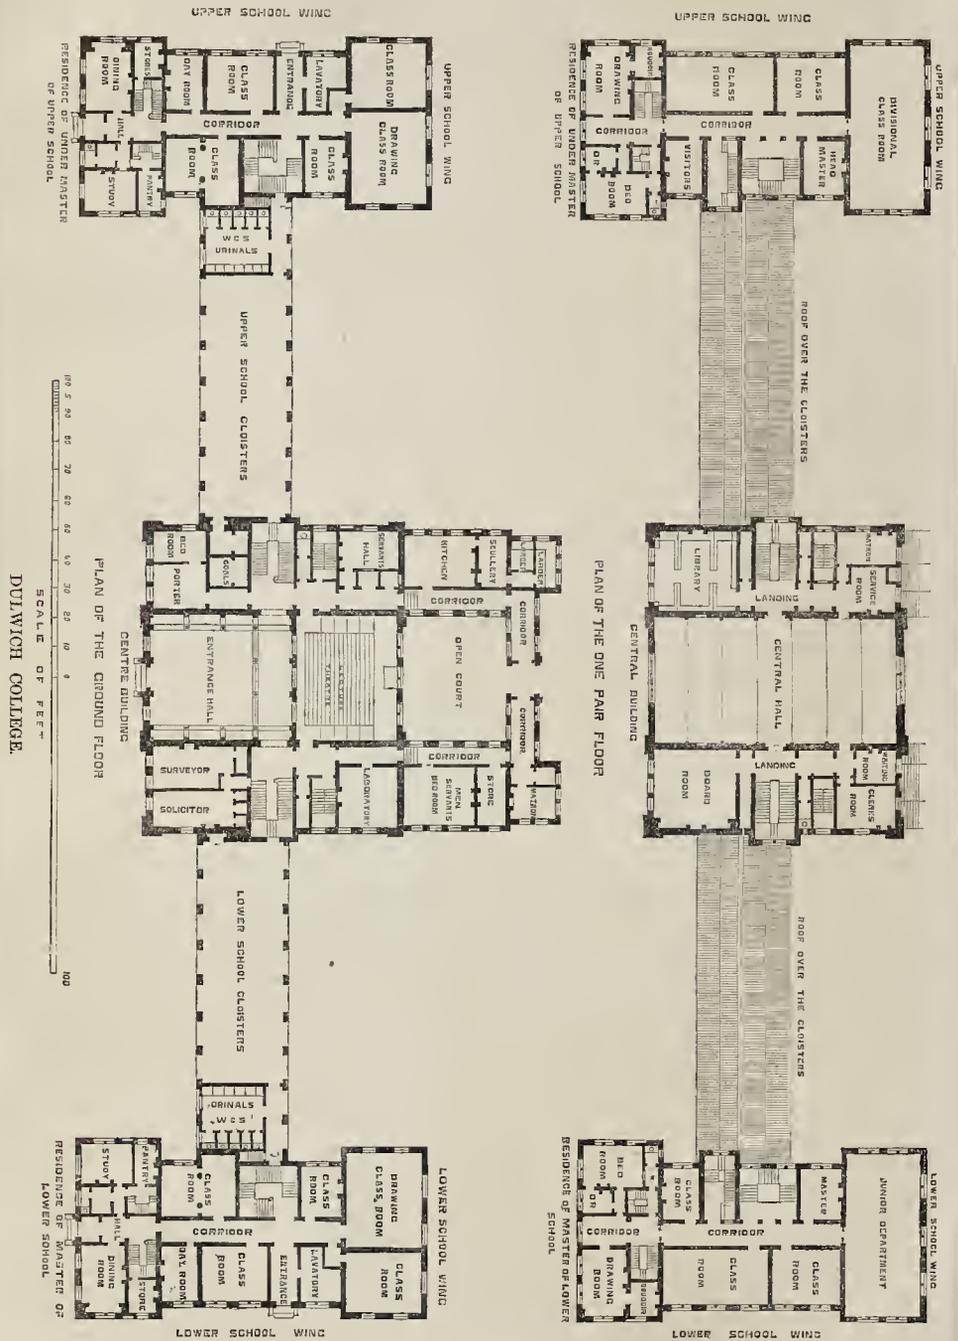

C.
1868.

FROM IRELAND.

Dublin.—Premises, with frontage to Middle Abbey-street and rear to Princes-street, have been in part rebuilt or remodelled and altered respectively for the *Nation* and *Weekly News* journals, Mr. Alexander M. Sullivan, T.C., proprietor. The facade to the former street is of Italian character, with cement ground-floor piers and entablature, the superstructure of brick, with cement decorations. Mr. Lyons, architect; Mr. Meade, builder. Messrs. Ross & Murray executed all the works in connexion with hoiler, engine, and other machinery, gasfitting, &c. —A large building of its kind has been erected at Lower Sheriff-street, with frontages of 60 ft. and 40 ft. respectively, for Mr. W. Meagher, T.C., wine and spirit merchant, &c. The height to apex of roof (which is high-pitched and ornamented with cresting from Sun Foundry, Glasgow) exceeds 50 ft. The architect was Mr. Lyons. Messrs. Clark & Co. fitted up the lower portion of the establishment with their self-coiling steel shutters.

St. Paul's Oburch, Glensgarry, has been consecrated. The church is built on ground given by Lords Longford and De Vesce, the lords of the soil. It was erected in accordance with the bequest of the late Miss Shannon, in order to provide for the spiritual wants of the Protestants of the surrounding locality. The foundation-stone was laid some time since by Lord Longford. The church is in a commanding situation. There are sittings for a considerable number of persons.

Belfast.—The foundation-stone of a new Orange hall has been laid in the famed Sandrow, Belfast, by the now noted Mr. William Johnston, of Ballykilbeg. The proceedings were witnessed by a large crowd of artisans and labourers, amongst whom they excited considerable interest.

THE COLLEGE OF GODS GIFT, DULWICH, SURREY.—MR. CHARLES BARRY, ARCHITECT.

[See p. 522, ante.]

SCHOOLS OF ART.

The Nottingham School.—The results of the national medal contest amongst the students of all the Schools of Art in the United Kingdom have just been made known. The Nottingham School has again this year taken the lead of all the provincial schools of art in the kingdom. The schools (to the number of 117) compete for ten gold medals, twenty silver medals, and fifty bronze medals; in all eighty medals, or one-tenth of the entire number. Nottingham obtained one gold medal, one silver medal, six bronze medals, and two Queen's prizes; total, ten awards. This year Nottingham and London are equal, each having obtained silver medals, Edinburgh this year having obtained the gold medal for this subject. Only one other provincial school (Dublin) has this year, along with Nottingham, obtained a gold medal for original designs. The Mayor of Nottingham's silver medal for the best original designs for lace has been awarded to George Broadhead, a lace draughtier, in the establishment of Messrs. Ward & Cope, who also obtained the gold medal, both being for designs for lace curtains.

The Stoke and Fenton School.—The awards made by the Science and Art Department to this school on the works submitted for the annual examination, were as follow:—National competition, one silver medal, four bronze medals; free scholarships for one year, the Science and Art Department paying their fees, have been awarded to nine students for advanced works; book prizes were awarded to five students. In addition to the above, twenty-seven students passed in the art examination in March last, of whom seven took prizes for excellent papers.

The Dorchester School.—There is said to be a marked success in the progress of this school under the direction of Mr. Dewar Campbell, and it may now be regarded as one of the permanent educational institutions of the town. The result of the inspection of the year's work by the Department of Science and Art at South Kensington, to which some 600 specimens of the pupils' drawings, paintings, &c., had been forwarded, is that prizes have been awarded to Mr. Joseph Dibben, builders' foreman; to a coach painter, in the evening class; and to another student in the afternoon class. Mr. Dibben is also recommended to a free studentship in the school during the next year.

FROM AUSTRALIA.

Sandridge (Melbourne).—The Wesleyan church was recently completed and opened. It is designed in the Early English style of the thirteenth century, and consists of nave, north and south transepts, chancel, vestries, porches, &c. The nave is 64 ft. long and 32 ft. wide, the transepts each 25 ft. by 23 ft. The chancel for choir, organ, &c., is 22 ft. by 21 ft. 6 in. The main piers are open to the ridge, the height from floor to ridge in nave being 44 ft., and in transepts 36 ft. The nave is lighted by a large Gothic-headed window of four bays with stained-glass borders in the east gable. Each of the transepts has a similar window, though smaller, having only three bays; the church is also lighted by small diamond-paned windows between the buttresses. The west gable is surmounted with an octagonal bell-turret. The turret and spire are of Point Vendinet freestone and bluestone intermixed, which, for greater strength and resistance, is cramped throughout with iron, cement also being used for building instead of the ordinary mortar. All the main walls are built of bluestone, in sneaked rubble work; the windows and doors with white moulded brick dressings, as also the corbels, string mouldings, &c., the arches being red and white brick alternately. The church is seated for 530 persons, but provision has been left in the walls by stone corbels, &c., for the erection of two galleries capable of containing 200 more. The total cost of the entire structure is 2,200l. The first portion, consisting of a part of the nave only, was erected in 1861. The architect was Mr. William Ebdon, engineer to the Melbourne and Hobson's Bay Railway Company.

St. Kilda.—The new public market at St. Kilda has been opened. The buildings, which face Walkerman-street, consist of a centre avenue, 100 ft. long and 20 ft. wide, and two smaller divisions on either side for vehicles, 14 ft. wide.

Ballarat.—The Ballarat Gas Company have declared a dividend of 6 per cent. on the last year's business. The company have promised

to reduce the price of gas to 16s. 3d. the thousand cubic feet.

Geelong.—The Mechanics' Institute, Geelong, has been completed. The reading-room, which is said to contrast favourably with those of Melbourne or Ballarat, is well furnished with the leading colonial, European, and American newspapers, magazines, reviews, &c. The entire building covers an area of 130 ft. by 54 ft., and comprises hall; lecture-room, 50 ft. by 30 ft.; reading-room, 43 ft. by 20 ft.; library, 30 ft. by 20 ft.; three class-rooms, secretary's office, and private apartments. The upper story, which is the most recent addition, contains the lecture-room and two class-rooms. The front, facing Ryrie-street, presents a combination of Italian and Grecian styles. The total cost of the edifice is 5,600l. The paper already named gives a good view of this building, as well as of others, in the same issue which contains the illustration already referred to.

HARVESTING IN WET WEATHER.

In an essay on this subject, Mr. E. Eddison says,—"I have dried corn in a room into which hot air was forced by a blowing-machine, and on a small scale I have tried the drying of the ears cut off close to the straw; but I have no present intention of repeating the experiment, the cost being too great." He describes the principle of corn-drying adopted by Mr. Gibbs, of which we have already spoken. It consists of forcing currents of hot air into a chamber in which wheat-sheaves are placed, the chamber being made with two compartments, so that one may be emptied and refilled while the other is "baking."

The blowing of sheaves through a slanting spout on the stack, after being dried, is also alluded to.

Mr. Gibbs obtains his hot air in this way:—"We found an old 8-horse portable steam-engine, with the chimney off; and an iron fan, of 4 1/2 ft. diameter and 2 1/2 ft. wide, in a sheet-iron case, was placed close to the open smoke-box, drawing in the hot air, and delivering it between the two bottoms of the drying chamber. To intercept sparks a screen of malt-kilo wire is placed between the fan case and the smoke box. The engine drives the fan by means of a belt off the fly-wheel; and, working at only 10 lb. pressure of steam, drove the fan with a speed of about 600 revolutions per minute. To avoid smoke, anthracite coal or coke is used. It is evident that by simply increasing the velocity of the fan to double or treble (by working at a high pressure of steam), double or treble the volume of warm air may be injected into the chamber, and thus either the thirty-two sheaves be dried in a shorter time, or a larger number of sheaves be dried in the same time."

Boilers can be constructed purposely for this work; indeed, upright boilers (as those of Woods & Cocksedge) are already in use, which have no tubes at all, while other boilers (as some of Tuxford's) have flues and tubes too—either construction promising safety in this air-heating process. It is predicted that this novelty of desiccation will be the fashion, if need be, by next harvest. Any building of brick walls, lined inside with galvanized sheet-iron, is precisely adapted for keeping in the heat. Ample apertures for egress of the damp air must be provided. The engines are in the farmer's hands in readiness, and a fan is one of the simplest pieces of machinery to make, buy, or keep in order.

ACCIDENTS.

A MAN has been buried alive near the Loughborough-road station of the Metropolitan Extension Railway, where a number of new streets are being constructed. A very large and deep excavation had been made, for the purpose of procuring a supply of sand for mortar, and a man was engaged in getting up the sand and gravel. He incautiously began to dig under the perpendicular side of the excavation, and although cautioned of his danger, he did not desist. The man that cautioned him went away, and in about ten minutes it was noticed that he was nowhere to be seen. The side of the cutting had fallen in, and completely buried him. A number of workmen immediately set about the removal of the fallen earth, and he was eventually got out still alive, but fearfully injured. His thighs were broken in several places, and his chest nearly crushed in. He was removed to the hospital in a hopeless state.

The railway offices at Daisie Station on the North British line have been burned to the ground. It is supposed the fire originated in a cellar below the ticket office, which was situated

on the north side of the line. The cellar was used for lumber, and it is said that there was a quantity of straw in it at the time, which had been ignited by a spark from the engine of a goods train which passed shortly before.

A serious conflagration has just occurred at Auerbach, in the Oberpfalz, Bavaria. More than two hundred buildings, a hundred of them dwelling-houses, were consumed. Three men met their deaths, and three others were severely injured. At Kuppenheim, near Rastadt, in Baden, twenty-five dwellings, with nearly everything they contained, have become the prey of the flames. The church was partially burnt, and the bells fell inside. One child was stifled, and a fireman lost his arm. The disaster is attributed to children playing with matches.

THE PROPOSED RAILWAY TUNNEL BETWEEN SCOTLAND AND IRELAND.

MR. L. LIVINGSTON MACASSEY, C.E., and Mr. William Scott, C.E., a Fellow of the Royal Scottish Society of Arts, have just published a report on the proposed railway tunnel between Scotland and Ireland. This project is, of course, a different one from that of an embankment recently proposed in the House of Commons by a member of the bar, as a panacea for all the ills of Ireland. In the tunnel scheme the tunnel extends from Cushendun, Antrim, under the sea, north-easterly, descending with a uniform gradient of 1 in 60 for about a mile and a quarter, when it intersects a projection of sand-bank on which would be placed a ventilating shaft. The tunnel then proceeds due north-east, keeping nearly parallel to the bottom of the channel, and about 50 ft. below it, having the gradients of 1 in 60 and 1 in 82, to the lowest point in its course, which is about five miles from the Irish land. It then begins to ascend with gradients varying from 1 in 100 to 1 in 700, being still parallel to the bottom, when the land on the Scotch side is reached at Leak's Point, with a gradient of 1 in 60. Here would be another ventilating shaft of similar dimensions to that on the Irish side. The tunnel would be then continued through the head of the Mull of Cantyre to Gleastrone, where the entrance would be located. The total length under water would be fourteen miles and three furlongs. The material would be chiefly sandstone and brick. The bore would be mainly through mica shale. The total cost, including two connecting railways, is estimated at 4,224,490l. The estimate of probable traffic is set down at 12,699,778. 6d., and the dividend at 5 per cent.

WORKMEN'S HALL, HITCHIN.

A WORKMEN'S HALL has been erected in Brandstreet, Hitchin, under the superintendence of Mr. James Shilcock, architect. The total cost, including site, has been about 2,000l., furnished by Messrs. Sharpley, Tuke, Seeborn, and A. and W. Ransom. The hall is intended generally for the behoof of the working men of the town, and will be used for meetings, entertainments, classes, and whatever else is deemed conducive to the combined amusement and instruction of the members. We believe the donors retain the control of the structure, but furnish it rent-free to the members, who will have to pay some small subscription. It is intended, if possible, that the institution shall be self-supporting, with the exception that there shall be no rent to pay. The other disbursements need be but small. There is no financial difficulty to be apprehended; nor will the experiment fail of success, if it should prove that the working men of the town show a readiness to appreciate and enjoy the means provided, with a view to their physical enjoyment and their intellectual advancement. The large hall, round which a gallery runs, will accommodate about 350 persons: there is a small platform at the upper end, and both floor and gallery are provided with comfortable seats. Above this hall is another lofty chamber, which will probably be used as a class-room, when the projects of the donors are more fully developed. There are news-rooms, supplied with a fair selection of newspapers and periodicals; a game-room, fitted with a bagatelle-table and conveniences for playing chess and draughts—gambling being of course rigidly forbidden; and there is a kind of retiring-room, where men who want to study or avoid the talk of the common rooms,

may read or meditate without boisterous or distracting interruptions. Outside there is a lavatory, plentifully supplied with soap and water; and every necessary convenience is applied on the premises. Tea, coffee, and plain eatables are provided, at a cheap tariff; and smoking will be permitted in some of the apartments. The place, as regards accommodation, will be "a public-house without the beer."

MAIDSTONE MUSEUM.

A CORRESPONDENT writes to us from Maidstone in reference to our notices of the local museum there. He wishes to say that "since the death of Mr. Pretty, the late curator, the contents of the museum have been in such a phase of transition that the getting out of a catalogue has been impossible," and that "what has been done and is doing to restore the place is owing not a little to the agitation of the present curator, backed up certainly by the liberality and influence of Mr. Randall." We did state that the collection had been largely added to through the liberality of the latter gentleman, the executor of the founder of the museum. A large number of the objects in the museum have been presented by private individuals, whose names are attached to their gifts. All we intended was to note the more interesting features of the collection, giving the names of the principal benefactors of the institution. We willingly make the correction that "the Pilgrims' Chapel was the Newark edifice now known as St. Peter's Church, not All Saints," as was stated in our account.

PROTECT THE POLICE.

Sir,—As many of the improvements of the day, in regard to building, &c., have sprung into existence through your able advocacy, I trust I may be pardoned for venturing to suggest another.

On the three days of the "Handel Festival," at the Crystal Palace, it was painful to witness the sufferings of the police, who were exposed for many hours to the terrific influence of a broiling sun (the thermometer being 100°). It occurred to me at the time, so it doubtless would to other individuals, that an avenue of plane trees on each side of the road would not only afford shelter to these poor fellows while on duty in front of the Palace, but would considerably add to the beauty of the building itself. R. P. N.

* * * We can scarcely imagine any objection to this very sensible proposition.

CRUSHING WEIGHT: WROUGHT AND CAST IRON.

THE ARCHITECTURAL DICTIONARY.

A CORRESPONDENT, signing "T. M.," writes,— "Will you allow me to call attention to the article 'Crushing Weight' in the Dictionary of the Architectural Publication Society, and to ask which of the two tables therein numbered I. and III. is the least likely to mislead in seeking to learn whether a cast or a wrought iron column will bear the greatest crushing weight? By the first table we are told that the breaking weight of a wrought-iron column is nearly three-fourths greater than that of the cast-iron column; while by the third table we are informed that a cast-iron column will bear as a safe load twice as much as a wrought-iron column. Wrought-iron being generally considered a safer material to trust than cast-iron makes these tables still more perplexing; in fact, breaking weight of Table I. for cast-iron is very little over safe load of Table III. for the same material."

No doubt if "G. R. B.," the writer of the article, were in a state of health that would permit him to attend to the question, the seeming discrepancy would be readily explained. Table I. appears to have been made by himself from the formulae given in the text, which can be worked out by our correspondent; and the writer says on p. 169, that "Table I. is to be used only as an approximation to truth under the conditions hereafter mentioned," showing the care with which it has been drawn up. Table III. is prepared from Morin, as stated in

the article, and has probably been worked out from the results of earlier experiments. Our correspondent might usefully refer to the *Builder* for 1857, p. 321, for remarks made by "G. R. B." himself, "on the unsatisfactory character of the recorded observations upon the subject of crushing weights."

We opened some works of reference on the subject with the following result. Gregory, "Mathematics for Practical Men," 1862, p. 380, says, "The strength of a column of cast-iron of given dimensions being 1,000, the strength of a column of wrought-iron of the same dimensions would be 1,745; of cast-steel, 2,518; of Baltic oak, 1088; and of red deal, 785." Hurst, "Architectural Hand-book," p. 22, gives, cast-iron, 100; wrought-iron, 79; steel, 180; English oak, 18; and red pine, 15.

With reference to the observation that "wrought-iron is generally considered a safer material to trust than cast-iron," we must direct our correspondent's attention to the statement that "Engineers assume in practice that wrought-iron may be safely submitted to a compressive strain of 4 tons, and cast-iron of 6 tons," in Hurst, p. 209.

THE STORAGE OF WATER.

RESERVOIRS AND WATER SUPPLY.

Sir,—The following extract from a letter which I received some years ago from Sir Arthur Cotton may, perhaps, be useful to your readers.

J. H. C. C. GODSMAN, C.E.

"I am, of course, very ignorant of the nature of the rivers of England, and of that of the surface of the country they drain, but I am greatly surprised that in all the papers I have seen of river navigation there I have never seen any investigation of the question of improving it by storing up water in the winter in tanks. This is, I believe, one of the modes adopted in Russia; though from the account I have seen of it I should suppose that it had been very imperfectly carried out, yet it seems to have answered to a considerable extent.

In Madras I finally consider that a project which does not, on a rough examination, offer a prospect of giving 1,000 cubic yards of water a year for every rupee of capital expended, may be thrown aside,—not because water is not worth purchasing at that rate, but because there are innumerable situations in which it can be obtained without a greater expense. Allowing for the difference in the value of money there and in England—about six to one—on the one hand, and our clumsy way of executing earth-work entirely by human labour on the other, which may double the cost as compared with such work in England, the above rate of one rupee per 1,000 cubic yards would be equivalent to 6s. for that quantity in England, or more than 3,000 cubic yards per l.

I cannot but think, however, that in England, but particularly in Wales, where there are good basins, and the land is less in value, water might be retained at the rate of at least 5,000 cubic yards per l. If this, or anything like it, be the case, could not running rivers be improved as to their navigation by simply storing waters towards the source of their feeders?

For instance, in your report on the Severn* it is stated that in a very dry summer the quantity of water passing down the Severn was only 3,000,000 cubic yards a day; I should suppose that to prevent the quantity falling below 9,000,000 cubic yards per day would not require more than 300,000,000 cubic yards for the whole summer, which at 5,000 cubic yards per l. would cost about 60,000l. It appears that 200,000l. have already been expended in the four weirs and locks before constructed, and that 50,000l. more was required. It would therefore seem that if water could be stored at less than 1l. per 1,000 cubic yards, it would be incomparably better to provide for the summer droughts in this way than by means of weirs, as being a mode entirely free from the vast objections to which weirs are liable; indeed, all objects would be promoted at once by thus regulating the flow of waters in the rivers.

All this is, of course, little more than a guess on my part; and yet, after so many years' attention to the subject of storing water, I cannot think that there are not rivers in England where tanks might be used with advantage."

* Report to the Admiralty upon the Improvement of the Severn Navigation. Printed by order of the House of Commons, 11th August, 1848.

REMOVAL OF LARGE TREES.

At Nesham Hall, Durham, the seat of Mr. James Cookson, vast improvements were made in the park scenery by the transplantation of full-grown trees from ranges and hedge rows, so as to open out vistas, and to formylvan groups. Mr. Newton, who about two years back commenced the landscape gardening there, adopted a new method of raising up and withdrawing some of the most umbrageous and ornamental denizens of the forest, and in locating them in positions, suitable for effect, as viewed from the mansion, or other parts of the grounds. A hedge-row of 100 years growth, little tributary to adornment of a park, in this instance furnished fine samples of arborage, which were successfully transplanted, and now, in the second year, are in a flourishing condition. An oak, measuring 54 in. girth, and spanning a diameter of 36 ft., was taken up with a ball of earth weighing 10 tons; a sycamore, 35 ft. high, spreading over a diameter of 44 ft., weighing with hole and mass, 16 tons. Another sycamore larger still, and weighing 17 tons, were, together with various others, drawn over a loose and soft surface, and successfully planted.

As to the *modus operandi*, Mr. Newton had a frame constructed simply of two pieces of timber, 12 ft. long, connected by two other pieces of 6 ft., to which, being secured by bolts, was attached a strong triangular frame of iron, having also bolts. This framework could be separated and placed under the tree.

In the first place, the soil was dug away and the road formed; and the two longer timbers were inserted under the ball, one on each side; tunnelling under the ball was then commenced; planks, shod with iron, were laid down, and rollers laid under the framework for the wheel to run on. By means of a hauler's crab, a double block pulley, and the strength of eight men, the trees were drawn up the incline on to the level, the rollers working out and being replaced, as in the action of a common mangle; thus each tree was carried the required distance, without losing any appreciable quantity of earth; thence a descent was made to the site on which the tree was to stand.

Earlier in the spring, previously to removal, the soil had been dug out around the block, in trenches about 5 ft. or 6 ft. deep, leaving a nearly square ball of earth; and on this preparatory process depends the success of transplantation, for whilst the tree stands *in situ* for the season, it becomes partially disconnected and prepared.

On replantation, new fibres will spring in the prepared mould, and if done sufficiently early in the season, and before germination, the vigour of the tree seems to be scarcely affected.

An idea of the extent of operations at Nesham Park may be gleaned from the fact that some 25,000 yards of soil were removed for the purpose of opening out a view towards the river Tees. Some of the richest earth was used to make a kitchen garden, and to improve the park and ornamental grounds, whilst the coarser material was employed in the construction of terraces. T. H. H.

NEW LAW COURTS.

Sir,—As the return laid before Parliament does not contain all the correspondence, I shall feel obliged if you will publish the enclosed letter, which would not have been necessary if the letter referred to had been printed.

EDWARD M. BARRY.

"2, Abingdon-street, 29th June, 1868.
Sir,—I have just seen the Parliamentary papers presented to the House of Commons in reply to the motion of Mr. Henckell on the subject of the new Law Courts.

Mr. Street's memorandum calls for no remark from me, except that I feel bound to point out that he relies entirely upon the reports of Departments Committees and others, who were not the judges, but only the professional advisers of the judges; while I rest my claim on the reports of the judges themselves, whose decision the competitors were informed would be treated as "final" by Her Majesty's Government, and on the faith of which promise I in common with the other competitors agreed to enter the competition.

I take this opportunity of calling your attention to the no doubt, accidental omission from the return of several letters respecting the award of the judges, which have an important bearing on the facts of the case.

I allude particularly to a letter from me to the Right Hon. the Earl of Derby, the then First Lord of the Treasury, dated 20th of January, 1868; a letter from me to the Right Hon. G. W. Hunt, then Secretary to the Treasury, dated 29th of February, 1868; and some letters from Mr. Street written about the same time,—1 om, &c., (signed) EDWARD M. BARRY.
G. Selator Booth, Esq., M.P."

The glazing is of rolled cathedral glass, of three or four tints, intermixed with white crown bullions, the leadwork forming various patterns to suit the windows. The carving throughout has been executed by Sansom; the ornamental tiling in chancel by Godwin, of Lugwardine; the ornamental ironwork, from the architect's designs, by Messrs. Hart & Son; the marble-work was executed by W. H. Burke & Co. The architect was Mr. Bassett Keeling.

Walsall.—St. Peter's Church, Walsall, has been re-opened for divine service after being closed for several weeks for the purpose of being restored and decorated. The work of restoring the edifice was undertaken by Mr. G. B. Nichols, architect, West Bromwich. The whole of the ground-floor pews have been swept away and open pews substituted, with plain bench ends of pitch pine, the divisions being of red pine stained and varnished. The aisle floors are paved with red, buff, and blue quarries. The chancel has been divested of the wood panelling, cast-iron railing, and the cast-iron window, and a stained glass window has been put up representing the patron saint, by Mr. T. W. Cam, of Smethwick, which is the gift of Mr. Butler, one of the churchwardens. The floor is now paved with Minton's tiles, and a new railing put up, which is of oak, supported on four wrought-iron standards, executed by Mr. Job Edwards, of Wednesbury; this, with the railing to the pulpit, is presented by the architect. The organ, which formerly stood in the front gallery, has been removed within the arch of the tower. The contractors were Messrs. J. & T. Taylor, of Walsall. The decorations have been executed, under the direction of the architect, by Mr. Arthur Gee, of Stafford, decorator.

Wentworth.—The parish church of Wentworth, Cambridgeshire, has been re-opened after repair both internally and externally, at a cost of over 1,000l. The chancel had previously been partially rebuilt, and its floor laid with Minton's tiles, at the expense of the late Dean of Ely, who also re-seated the body of the church with open benches, and now the rest of the church has been rebuilt, the tower restored, and its windows renewed with stone, and a new porch substituted in the place of a very decayed one of wood. The plaster ceiling of the nave has given way to an open timber roof, supported on corbels of carved stone; an arch of stone now divides nave from chancel, an Early English window fills the east end of the chancel, and a reredos of stone, painted under the direction of Mr. F. Preedy, the architect, who furnished the designs for the whole work, which was carried out by Messrs. Freeman, of Ely, builders.

Hampnett.—The parish church has been re-opened, after restoration, for divine service. Mr. Street was the architect employed to survey the building and furnish plans for its restoration, in accordance with which the work has been carried out. On the restoration about 650l. have been expended.

Market Drayton.—The new cemetery has been consecrated by Bishop Trower, acting for the Bishop of Lichfield. The building consists of two stone chapels, surmounted by a spire. The stone, with the exception of the dressings, was excavated by Messrs. Brassey & Field, in cutting the Wellington and Market Drayton Railway, which runs close past. Mr. C. Wright, of Nottingham, was the builder, and the designs were supplied by Messrs. Clarke, of Nottingham, architects. The chapels and lodge will cost about 1,200l., not including the stone. The land, of which there is about four acres, cost about 1,000l.

Kelsall.—The church at Kelsall, dedicated to St. Philip, was consecrated by the Bishop of Chester, on the 9th instant. The church, which has been built chiefly at the expense and through the exertions of Colonel Tomkinson, of the Wiltshires, and members of his family, was completed about seven years since; but there being then difficulties in the way of the conveyance of the site, and other preliminaries to consecration (which have since been overcome) it was opened for divine service by licence granted by the late Bishop Graham. The building, which is a small structure, is fitted up with open benches, capable of affording accommodation for 150 adults and 80 children. The church is in the Early Gothic style of architecture of the thirteenth century, and consists of nave, chancel, sacristy, and organ recess on the north side of the chancel, together with bell-gable constructed over the chancel-arch. The architect was Mr. Thomas Bower, jun., of Nantwich, and the work has been principally executed by local workmen.

Worthing.—On the 10th, St. George's Church, of which we have given a view in a previous number, was consecrated by the Bishop of Chichester, before a large congregation. It is at present only partly built, the tower, spire, and transepts being left for a future time. Mr. George Truefit is the architect, and Mr. Longhurst, of Worthing and Hastings, the builder; the glazing and gasfitting having been done by Messrs. Cook & Son. The walls of the edifice are externally of stone, and internally of brick, with a space between. The tile borders and chancel paving were presented by Mr. R. P. Daniell, a gentleman well known in Worthing; and the font was presented by a lady in the town. At the luncheon which followed the architect's health was drunk.

DISSENTING CHURCH-BUILDING NEWS.

Leves.—The foundation-stone of a new Presbyterian church, to be called the Hamilton English Presbyterian Church, has been laid, in Market-street. Mr. W. F. Poulton, of Reading, is the architect, and the contract has been taken by Mr. J. W. Sawyer, of Dulwich. The church will be in the Lombardic style of architecture, and will include a chapel capable of accommodating 300, a school-room, class-room, sessions-house, and vestry. The interior dimensions of these will be: chapel, 58 ft. by 32 ft.; school-room and class-room, 46 ft. by 19 ft.; sessions-house, 21 ft. by 16 ft.; and vestry, 16 ft. by 10 ft. The front elevation, including a bell-turret, is 54 ft. The entrance is in the centre, and will consist of three doorways, separated by columns, and surmounted by round arches. The principal window is also in the front, and is divided into five semicircular lights of equal dimensions. The materials to be employed are red brick and Bath stone dressings. The cost of the building, including the site, will be about 2,500l., of which sum 1,300l. have been already raised, and 3000l. are promised by the Presbyterian Church Building Committee.

Brighton.—The foundation-stone of a new Wesleyan chapel has been laid, in Norfolk-road. The contractor for the erection of the building is Mr. John Chappell, of Steyning and Brighton; the architect is Mr. C. A. Ellison, of Liverpool; and the work is being carried out under the immediate superintendence of Mr. Arthur Loader, of Brighton.

Northampton.—The foundation-stone of a new Baptist chapel, in Grafton-street, has been laid. The architect is Mr. Ingman, of Northampton, and the builders are Messrs. Clark & Heap. In the spring of this year the building fund was considered large enough to justify the old chapel being taken down and the new chapel being commenced, and tenders were advertised for, in accordance with the plan furnished by Mr. Ingman. Messrs. Clark & Heap's tender, at 1,236l., was accepted. The purchase of the ground and old chapel, with two cottages, was 600l., making a total estimated cost of 1,836l. Towards this sum 917l. have been received. The foundation-stone of the new school-room was laid on Easter Monday.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Barton-on-Trent.—The new church which has recently been erected here, at the sole expense of Sir Humphrey de Trafford, bart., of Trafford Park, has been formally opened. The edifice is dedicated to All Saints. It is designed in the Geometric English Gothic style, in harmony with the family chantry founded by Sir Humphrey and Lady Annette de Trafford, and erected at a cost of 3,000l. Attached to the same is a presbytery for the rector, and there are also sacristies and cloisters. The church, which is 140 ft. in length and 54 ft. in width, principally consists of a nave, in which the whole of the benches are placed, the aisles being little more than cloisters, and a chancel 40 ft. in length, having a width of 20 ft. The nave opens into aisles with seven moulded arches, which, together with the supporting columns, are formed of Runcorn red and Painswick white stone, alternately, with carved capitals intervening. From these spring rectangular arches, supporting the aisle roofs, which terminate on responds against the aisle walls, where they are again intersected by the arches over the windows. The roof of the nave is composed of

English oak and Savannah pitch pine, inlaid with various coloured woods, enriched with gilding. The chancel pavement is composed of crimson marbles, enriched with encaustics, and the communion rail is of brass. The sides of the chancel are filled with Riga oak, with carved and moulded hacks and tracing panels, the armlets being adorned with quaint representations of curious animals. The altar is placed some 4 ft. above the level of the nave, and is executed in Carrara, Sicilian, Sienna, and Devonshire marbles, and Caen stone. The reredos extends across the whole width of the chancel, on which are ranged angels in the attitude of adoration. On the tabernacle four carved angels, with uplifted hands, support a jewelled silver gilt crown which forms the canopy. On the front of the altar is carved the "Annunciation," and on either side of the tabernacles are groups representing the life of our Lord. The chancel is lighted with eleven two-light tracery windows, which are filled with stained glass. This portion of the work has been executed by Messrs. Powell & Hardman, of Birmingham. Below the window sills is a carved cornice, from which are suspended hangings of crimson velvet. Externally the church is erected in Stanton free-stone, with dressings and walling of Yorkshire parapet. Behind the de Trafford chantry rises the gabled roof of the chancel. The nave and aisles are comparatively plain. There is seating accommodation, exclusive of the gallery, for about 400 persons. The whole of the work has been carried out, at a cost of 16,000l., from the designs of Mr. E. Welby Pugin, by Mr. Glaister, of Liverpool.

Books Received.

A General Gazetteer in Miniature. By R. BROOKES, M.D., and A. G. FINDLAY, F.R.G.S. New edition corrected to the last date. By J. A. SMITH, editor of "Joyce's Scientific Dialogues," &c. London: W. Tegg, 1868.

Brookes's was a good old gazetteer; but a good old gazetteer may be a bad new one unless it be really and thoroughly "corrected to the latest date." We are sorry we cannot say much in favour of this edition of "Brookes's Gazetteer." In the first place, it is not one gazetteer merely, but two; for there is a superficial gazetteer of nearly 100 pages, called a supplement, appended in separate alphabetic arrangement, instead of being incorporated with the original, even although something like one half of it consists, not of new headings (which, however, would have been no proper excuse) but merely of information additional to that given under headings already entered in the body of the Gazetteer, as is somewhat awkwardly announced at the head of the supplement. Nor is this additional information by any means altogether new. Thus, under the head of London in the supplement, the occurrence of the plague in 1665 is announced, together with a considerable amount of information of similar antiquity. Then, again, a great mass of the less out-of-date statistics, instead of being digested and properly placed under the respective headings, either in the main gazetteer or in the supplement is stuck in at the end, all together, as an appendix. The result of this may be conceived by all who turn up the Gazetteer for information under any one heading. Thus, while, in the appendix, we find that the population of Berlin in 1858 was 438,961, we are told, under "Berlin," in the main body of the Gazetteer, that "the population is 236,830, or nearly one-half less in 1868 than it was in 1858! Apart from these serious defects, we find the information given to be otherwise very unsatisfactory. For example, under "London" we find that Westminster Bridge "is being removed," and Blackfriars "is to be removed." The Parliament House are "now erected;" but the Metropolitan Underground Railway seems to have as yet no existence, any more than other metropolitan lines, although lines terminating in the metropolis (not all of them) are noticed. Nothing has as yet been done with the Thames Embankment; and as for the new sewerage works, they are not worth mentioning. The Clyde at Glasgow is still an insignificant stream, notwithstanding the conversion of it into a first-class river; so that though "the river is navigable for vessels of eight feet of water as far as the bridge," the larger vessels stop at Port Glasgow or Greenock, at the mouth of the river, to unload. We regret to be severe on any well-intended work, but

really there is no excuse for treating the public to a stale hash of this sort. Who is really to blame for it is not so clear: it does not necessarily follow that the editor named is so, although he has made himself responsible for all shortcomings.

British Mosses: their Homes, Aspects, Structure, and Uses with a Figure of each Species. By F. E. TRAPP. Bell & Daldy.

The number of students of cryptogamic botany in this country is so limited, that publishers are often deterred from producing works like the handsome volume before us, the work of a lady, which affords a capital introduction to the study of British mosses. It is illustrated with an elaborate engraving and brief scientific description of each species, and as it gives a key to the genera, cannot fail to be of real use to amateurs. It is beautifully printed on toned paper, and bound in green and gold; the plates are well etched and singularly faithful to nature. Some, however, represent herbarium specimens, and the subjects are lavishly spread over more plates than appear necessary. Nearly all the recent cryptological additions to our flora are to be found in the work. The author's name is not given after the specific name in the descriptions; this oversight should be remedied in a future edition, as the name of the founder of a species is quite as important as the specific name itself, and should on no account be omitted from a scientific book.

We must compliment Miss Tripp on the production of so good a book, and trust her ability and enterprise will be rewarded.

VARIORUM.

"The Royal Guide to the London Charities, 1868-9." By Herbert Fry. Sixth annual edition. London: R. Hardwicke." We have already borne witness to the value of this extraordinary list of London Charities. We have merely to add that, as time passes, Mr. Herbert Fry is able to extend it, and to remove such accidental errors as may have crept in. Mention of the book is appropriate in our present number, wherein we have spoken of the charitable wants and shortcomings of London.

"Shakespeare for a shilling! Longfellow for a shilling! both issued by F. Warnes & Co., under the heading "The Chancery Classics." Of all the compliments tendered to Mr. Longfellow during his brief visit to London (and we have heard of a few), the admirable poet will probably find none greater than this expression of a belief that his admirers in England are sufficiently numerous to make his shilling edition pay. It is printed with large clear type, contains recent poems, and consists of 628 pages.—Messrs. Routledge, who also have issued a shilling "Shakespeare," have given additional value to it by printing on the title page "Edited by Charles Knight."—Messrs. Longman, Green, & Co. have published Macanlay's two fine essays, "Milton" and "Machiavelli," in clear type for sixpence. Cheap and good.

Miscellaneous.

"CLEOPATRA'S NEEDLE."—Once more the suggestion gets abroad that we should bring from Alexandria the obelisk that belongs to us. Some years ago we gave an estimate of the cost of doing this, by one who was willing to undertake the work.

NEW SHOREHAM CHURCH.—The efforts made to restore this interesting edifice have been brought to a standstill, and the work now rests entirely with the parishioners. The cost of restoration is estimated at between 9,000, and 10,000; and a large sum has been promised by gentlemen of the county and others interested in the proposition; but their subscriptions are to be forthcoming only on condition that the church is restored, not merely repaired; also that the parishioners will lend some aid. It appears that 2,500,000 are required from the latter; and the Committee recommend, as the only mode of raising this sum, that a special rate be made under a special Act of Parliament, which gives them the power, and the rate thus made mortgaged for a term of years. It is said that this method has been adopted with great success in many parishes.

INTERNATIONAL ARCHEOLOGICAL CONGRESS.—The International Congress of Archeology and History, organised by the Society of Rhenish Antiquaries, will be held at Bonn, in September next. It will open on the 14th and close on the 21st. The Prince of Prussia is the honorary president. A list of questions for discussion has been printed.

EXPERIMENTS ON EXPLOSIVE MIXTURES.—We notice that "a course of experiments on gunpowder and other explosive mixtures, is about to commence at Woolwich, under the direction of the Ordnance Select Committee." We would remind the authorities and others interested in this subject, of the article "Explosions of Gunpowder Stores" printed in the *Builder* of 1865, p. 760, which contains a valuable collection of facts on the subject not before brought together.

NEW PIER AT MORECAMBE.—A new pier is about to be constructed at Morecambe. The length will be 950 ft., and the general width 20 ft. At the entrance the width will be about 40 ft., and here a refreshment-room and offices will be erected. At intervals there will be recesses, where sitting accommodation will be provided; and at the pier-head,—which will be 130 ft. long and 40 ft. in width,—there will be refreshment and retiring rooms, and facilities to enable visitors to get on board boats or steamers. The pier is the property of the company, and the cost will be 9,000, or 10,000.

IMPROVED DWELLINGS FOR THE WORKING CLASSES OF SALFORD.—At a meeting of gentlemen interested in the project for obtaining improved dwellings for the working classes of Salford, articles of association (as a "limited" company) have been signed, and ordered to be forwarded to London for registration. The articles provide that the Board shall not consist of fewer than five, or more than seven gentlemen, and five were appointed, namely, the mayor (Mr. H. D. Pochin), Mr. Oliver Heywood, Alderman Cawley, Mr. Henry Russell Greg, and Alderman Davies. Subscriptions to the amount of 8,000, have been received, and the intention is to purchase property in the worst part of Salford, and replace it with property of an improved description.

RESTORATION OF CHESTER CATHEDRAL.—The Dean has succeeded in obtaining promises of subscriptions to the extent of about 11,500, in addition to the 10,000 assigned to this purpose by the Ecclesiastical Commissioners before the county meeting, when this subscribed sum was made over by him to the committee then appointed "to co-operate with the Dean and Chapter" in this undertaking, and "to act on behalf of the subscribers to the restoration fund." The committee held their first meeting in the Chapter-room on Wednesday, the 10th of June, when additional subscriptions to the amount of about 900, were announced. On the 24th of June it appeared that further subscriptions to the amount of about 1,200, had been received, thus making the sum raised since the county meeting about 2,100. The work of restoration was actually begun before the county meeting, the 10,000 assigned by the commissioners being already at the disposal of the Dean and Chapter. The stone employed is from the Runcorn quarries, and all the evidence which has been obtained, according to our authority, the *Chester Courant*, tends to show that it is excellent, both in durability and in facility of working. It is, of course, red in colour, but of a lighter tint than that used in the original construction of the cathedral, and which seems to have been taken from the quarries within the city itself. Sheds have been erected in St. Oswald's churchyard, a plan having previously been made, so that each tombstone can be replaced in its original position; and the masons have been for some time at work on the stones intended for the buttresses near the east end. The state of the walls in this part of the Cathedral was found on examination to be even more perilous than had been supposed. The present work is in the hands of Mr. Haswell, of Chester, who, like his father before him, has already had much to do with the stone-work of the Cathedral. Each portion of the work is priced under the direction of the architect, and is under the inspection of Mr. Frater, the clerk of the works; and it is understood that if satisfaction be given, successive portions of the choir will be restored on this method. However, it is the wish of the Dean and Chapter to place the nave and southern transept in the hands of a contractor. For this purpose a considerable accession to the funds must be made.

LOOK TO YOUR COIN DEPOSITS.—The *Northern Whig* states that all the coins, documents, &c., deposited according to custom in a cavity in the foundation-stone of the Orange Hall, in Sandy-row, Belfast, which had been laid on Saturday week, were on that night, or early next morning, carried off by some thief, and have not since been heard of.

THE WEST LONDON SCHOOL OF ART.—The prizes to successful students are to be presented in the theatre of the Geological Museum, on this Saturday evening, the 18th inst. by Mr. Beresford Hope, M.P. The success of this school has been considerable. Though the latest established of the ten metropolitan Schools of Art, it is teaching more than a fourth of the entire number of artisans (1750), taught in the whole of the London schools!

HOLBORN VIADUCT.—With reference to the Holborn Valley improvement, Mr. Haywood, the engineer, states that, since his last report, the works to the churchyard of St. Sepulchre's have been completed. The whole of the houses between that churchyard and Snow-hill had been removed, and the works of the viaduct at that spot had been resumed, and were being actively pushed on. The three public staircases at the angles of the Farringdon-street bridge had been carried up to some height, and the stonework had been prepared and was ready for fixing. Some of the granite for the abutments had arrived, and the rest was shortly expected. The subway sewer and vaults in the western approach street between Hatton-garden and Holborn had been completed, and the pavement of the street at that spot was now being laid. The pavement of the circus was also approaching completion.

THE RACE TO THE NORTH POLE.—After we have tried for the best part of a century to reach this goal or win this race, we give in just as others, benefitting by our experience, are starting for the winning-post. The French expedition, according to a statement in the *Moniteur*, may now be considered as certain of being undertaken. The delay has hitherto been occasioned by the want of funds, which the subscriptions entered into have not yet brought up to the required standard. Owing to the activity of M. Gustave Lamher, sub-committees have been formed in all the departments of France, thus making the expedition a national undertaking. When the necessary amount is subscribed, measures will be immediately taken for the purchase and equipment of a ship. The departure of the German and Swedish expeditions for the same destination will in no way diminish either the chances of success or the importance of the French expedition, and it will only act as an incentive to the starting of that expedition.

HOUSES OF LEGISLATURE.—The cubical contents of the Senate Chamber at Paris are 240,000 ft.; it has 208 seats for members, and 430 seats in all. The Chamber of the Corps Legislatif has 277,000 cubic feet of space, 372 seats for members, and 712 seats in all. The cubical contents of the House of Lords at Berlin are 83,000 ft.: seats for members, 278; total seats, 471. House of Representatives at Berlin, 200,000 ft.: seats for members, 416; total seats, 827. The cubical contents of the House of Lords at Florence are 253,400 ft.: members' seats, 372; total seats, 787. Chamber of Deputies, 467,000 ft.: members' seats, 492; total seats, 944. At Washington the cubical contents of the Senate Chamber are 244,000 ft.: members' seats, 88; total seats, 876. House of Representatives, 409,000 ft.: members' seats, 312; total seats, 1,312. At London the cubical contents of the House of Lords are 173,000 ft.: members' seats, 270; total seats, 466. The present House of Commons of the United Kingdom is 68 ft. long by 44 ft. wide on the floor; on the gallery level, 83 ft. by 45 ft.; height, 44 ft.; cubical contents, 127,000 ft.: members' seats, 428; total seats, 691. The new house now proposed by Mr. Barry would be 63 ft. by 63 ft. on the floor; 74 ft. by 71 ft. on the gallery level; height, 39 ft.; cubical contents, 154,300 ft.: members' seats, 569; total seats, 899. The cubical contents would be less than those of any other of the popular Chambers above named; but in the number of members' seats it would exceed them all; and in the total number of seats it would exceed Paris and Berlin, but be exceeded by Florence and Washington. It would be shorter than any of these Houses of Commons. The House of Representatives at Washington is 112 ft. by 74 ft.

HASTINGS SEWERAGE.—The new intercepting sewer for Hastings is now complete, and the event is to be celebrated by a dinner on Monday, the 27th inst.

VICTORIA STATION AND PIMLICO RAILWAY COMPANY.—The half-yearly meeting of this company has been held. The adoption of this report was carried unanimously, and a dividend for the last half year, at the rate of 4½ per cent, was declared.

THE PIMLICO CARPENTERS' AND JOINERS' CLASSES.—In connexion with these classes, a public meeting on the subject of Technical Education is to be held on this Friday, the 17th inst., in St. Gabriel's Schools, Pimlico. Earl Granville, it is stated, will take part in the proceedings.

GIFT TO BARNINGHAM CHURCH, YORKSHIRE.—Mr. Augustus Sussex Milbank, a godson of the late Duke of Sussex, has presented an illuminated coron with four lamps, enriched with ruby and crystal settings, to this church. It bears the inscription in Medieval characters, "Given by Sussex Milbank, 1868." There accompany it two lamps for the reading-desk of corresponding pattern. The whole are from the manufactory of Messrs. Hart & Son, of London. The only other chandelier in the church was given by an ancestor of Mr. Milbank 130 years ago.

THE ARCHAEOLOGICAL INSTITUTE CONGRESS.—Lancaster has been fixed upon this year for the annual congress of the Royal Archaeological Institute of Great Britain and Ireland. The inaugural meeting takes place on the 28th inst., and the congress will sit until August 4th. Colonel Wilson Patten, M.P., Chancellor of the Duchy of Lancaster, is the president, and the programme of the week's proceedings has been thus arranged.—On Tuesday, July 29, the inaugural meeting will be held in Lancaster Castle, and on the same day the principal objects of antiquarian interest will be visited. A reception will be held by the mayor of Lancaster in the evening. On Wednesday morning there will be a meeting of sections and an excursion to Heysham. Papers will be read in the evening. On Thursday the great excursion will be to Dalton Castle, Peel Castle, and Furness Abbey, where a lecture will be delivered and the rains he described by Mr. E. Sharpe. The mayor of Barrow-in-Furness gives a déjeuner. On Friday there is again a meeting of sections and more excursions, and so again on Saturday several excursions to localities of interest in the neighbourhood are proposed. On Monday, August 3, there will be an excursion to Bolton Abbey, Barton Tower, and Shepton Castle; and on Tuesday the final meeting will be held, and papers will be read in the sections. Excursions are also projected to visit the Art Treasures Exhibition at Leeds in the course of the week.

PROPOSED DRINKING FOUNTAIN, &c., FOR LEWES.—A meeting has been held at Lewes to take into consideration the proposal to erect a drinking-fountain in some central part of the town, and supplemental troughs for cattle. Mr. Crosskey said he introduced the question at a recent meeting of the Market Committee, and the general feeling seemed to be against having drinking-troughs for cattle. In the first place, there was an objection raised that there would be a chance of spreading the foot and mouth disease, if healthy animals drank at the same place as those which might be diseased. One would be efficient to propagate disease: one calf brought the cattle plague into this district. Another objection was that the cattle would not drink; and it was further alleged that the owners would not let them do so, because bullocks did not look so well in the market after a good drink of water. Besides all this, it was stated to be positively injurious to cattle to drink after having been driven. Mr. De Putron said another objection held by some is that calves will only drink muddy water; but if so, they had better provide muddy water than nothing at all. Mr. Parsons did not think that the drinking-fountains would propagate disease. He mentioned as a fact that separate flocks coming to the fairs in the neighbourhood were placed in the same fields without any objection that such a course would be likely to spread disease. After some discussion a committee was formed, consisting of the gentlemen present at the meeting, the residents in the vicinity of the spot where the fountain is proposed to be placed, and gentlemen of the town who transact business in the market.

LEEDS EXHIBITION.—The visitors in the week ending Saturday, the 11th inst., numbered, by season tickets, 5,787; by payment, 18,243; total, 24,030.

"LETTERS BY SIR THOMAS LAWRENCE."—The first of the letters given in our last number (p. 506, ante) was dated, by a misprint, 1867. It should be 1827, as the two following letters would serve to indicate.

ST. PANCRAS NEW INFIRMARY.—The Poor-law Board have given their sanction to the plans for the St. Pancras New Infirmary at Highgate, and have empowered the guardians to raise a loan of 40,000l. for building the same.

ROYAL GALLERY OF ILLUSTRATION.—A piece by Mr. F. C. Bernard, the author of "A Yachting Cruise," under the title of "Inquire Within," will be performed for the first time on Monday next. Mr. and Mrs. German Reed, Mr. John Parry, and Miss Annie Sinclair, will take part in it.

SOUTH KENSINGTON MUSEUM.—The visitors during the week ending the 11th July amounted on Monday, Tuesday, and Saturday, free, to 23,302; on Wednesday, Thursday, and Friday (admission 6d.), 3,248; to National Portrait Exhibition, by payment, 1,935; making the large total of 34,485.

ORGAN FOR GLASGOW CATHEDRAL.—A movement has just begun in Glasgow for getting an organ of the largest size into the cathedral. The sum of 3,000l. is spoken of as necessary. An unsuccessful attempt was lately made by the Rev. Dr. Cunningham to introduce an organ into his church at Crieff.

A CHURCH STRUCK AT BRIGHTON.—At Brighton the recent storm raged at intervals, and the lightning struck the tower of St. Peter's Church. One of the pinnacles was completely shattered, and a considerable portion of the lead roof torn up and displaced, some of the rubbish being forced down into the belfry and clock-tower.

BARNARD CASTLE.—At a meeting held in the Witham Testimonial, the Rev. F. Brown, M.A., vicar, in the chair, it has been resolved that Mr. Pritchett, of Darlington, architect, shall be associated with Mr. Haswell, architect, in making a preliminary survey, and report, upon the state of the fabric. The subscriptions amount to 1,850l.

WANT OF LUNATIC ASYLUM ACCOMMODATION.—The annual report of the Commissioners in Lunacy deals with the want of asylum accommodation which now exists in different parts of the country. Middlesex, Lancashire, and Yorkshire are described as having been for some time conspicuous for their lack of proper institutions for the reception of the insane poor.

THE SURVEYORSHIP OF THE HOLBORN DISTRICT BOARD.—The Holborn Board of Works have rejected a motion brought against their surveyor, Mr. Isaacs, for accepting the additional post of surveyor to the Hon. Society of Gray's Inn, in contravention of their regulations forbidding private practice. They have also, on the recommendation of a committee, rescinded the prohibitory resolution, which has been in force eleven years. The motive adduced on the part of the Board was that they did not wish to cramp a young man of fine abilities, and one in whom they had full confidence. The motion was carried by thirty-two votes against eleven.

TENDERS.

Table with 2 columns: Contractor Name and Amount. Includes entries for Mr. A. Davis, Ramsay, Henderson & Cairns, King & Sons, Breeze & Co., Hearle, Ward, and others for various construction and repair works.

For various reparations to the parish church of Christ Church, Newgate-street, E.C. Mr. H. H. Collins, architect:—Fisher 497 10 0 Shaw 366 0 0

For a villa residence in Tufnell Park, Holloway. Mr. George Treaditt, architect:—Carter (accepted) 21,350 0 0

For the Tufnell Arms, Tufnell Park, for Mr. Page. Mr. George Treaditt, architect:—Exclusive of the bricks. Heath, jun. (accepted) 21,400 0 0

For alterations and repairs to House, No. 9, New Quebec-street, Portman-square, for Mr. Ades. Mr. C. Crapp, architect:—Brett 2312 0 0 Water 239 0 0 Taylor 225 0 0 Godden & Webb 225 0 0 Waters 234 0 0 Colson 215 0 0 King (accepted) 201 0 0 Mitty, Brothers 180 0 0

For new church, St. Mary's, Strood, near Rochester. Mr. A. W. Bloomfield, M.A., architect:—Brown & Robinson 26,675 0 0 Vaughan 6,452 0 0 Stamp, architect 6,456 0 0 Wallis 6,386 0 0 Hill & Sons 6,328 0 0 Wheeler 6,300 0 0 Anson 6,258 0 0 Ford & Sons (accepted) 5,983 0 0 Futeher (withdrawn on account of an error) 5,099 0 0

For alterations, Holloway-road. Quantities prepared and supplied by Mr. Wagstaff, architect:—Wiltshire & Sons 2810 0 0 Lacey 777 0 0 Williams & Son (accepted) 777 0 0

For New Wesleyan Chapel, Ealing. Messrs. J. Tarring and C. J. Quantities supplied:—Brook 4,825 0 0 Myers & Son 6,189 0 0 Adamson 6,141 0 0 Kirby 6,069 0 0 Chamberlain 6,049 0 0 Dove, Brothers 6,009 0 0 Higgs 5,862 0 0 Saunders 5,840 0 0 Nye 5,769 0 0 Hill 5,670 0 0

For New Congregational Church, Hanwell, Middlesex. Mr. C. Jones, architect. Quantities by Messrs. Richardson & Waghorn:—Waters 21,633 0 0 Adamson 1,793 0 0 Myers & Son 1,783 0 0 Nye 1,635 0 0 Gibson 1,610 0 0 Gibson, Brothers 1,630 0 0

For the erection of a public-house, shop, and premises, Lower-street, Deptford. Messrs. Hill & Son, brewers. Mr. Edward W. Fry, architect:—Excavators, Bricklayers, Masons, Slaters, and Plasterers' Work W. & G. The Builder.

VOL. XXVI.—No. 1329.

Asylums for the Imbecile Poor of the Metropolitan District.

OUR readers will remember that at the beginning of the present year the Board acting for the Metropolitan Asylum District offered premiums for the best designs that might be submitted for two proposed asylums for the Imbecile Poor: one to be erected in Leavesden, near Watford, Herts; and the other in Caterham, near Croydon, Surrey. We gave at the time some particulars of the designs sent in, and stated that a design by Messrs. J. Giles & Biven had been selected, and would be carried out at both places with merely such differences as might be enforced by differences in

the sites. This design we now illustrate by a view of the buildings, a block plan showing the general arrangement of them, and plans drawn to a larger scale of the administrative portion, the Dormitories, and the Infirmary.*

These asylums being the first of their kind that will be erected under the new arrangements, a full description of the intended buildings will interest many of our readers, and for this, where the engravings are insufficient, we shall go to the designers' own statements.

The small plan shows that the central administrative block extends from the south front, facing the road to the lower part of the ground northwards. The south front is occupied by the medical and official department, the centre by the stores department, the extreme north by the laundry and engineer's department, to obviate nuisance from steam and the necessarily offensive exhalations. The corridor to these buildings has a fall of about 1 in 30, to meet the natural fall of the ground, without resorting to steps.

From the central kitchen, right and left, are corridors (10 ft. wide), with the workrooms of the females and the workshops of the males each on their respective sides, occupying the space which forms the connecting link between the administrative department and the blocks on either side, and convenient of access from both. The entire width between these is 110 ft., giving space for the erection of the chapel without interfering with the free passage of air.

At right angles with this corridor, north and south, on either side, extend the corridors connecting the blocks. These are 8 ft. wide, one story high, and fireproof, both sides having windows, with tops opening, so as to admit of the free passage of air through them. By this means each block is entirely isolated. The infirmary block occupies the south end of each corridor, and next these, on either side, are placed the steward's and matron's houses. It has been thought better in each case to give a small detached house at a distance from these central offices, than apartments immediately adjoining them. Practically, these officials spend a certain number of hours each day at their business, and after that time it is thought equally convenient and more agreeable to be somewhat removed from the scenes of their duties, but within call if required by the head attendants.

There are on the female side five general blocks, each for 160, and one infirmary block for 60 patients. This gives 860. On the male side are three blocks of 160 each, and a shorter one for 110. These, with the infirmary block, give 650. This shorter block can, if required, be extended to the general size, and will accommodate 50 more.

The extreme length of the corridors from the kitchen to the most distant blocks is 180 yards on the female, and 138 on the male side.

The detached infirmary, for infectious diseases, is placed in the rear, north of all the buildings, so that the prevailing winds which blow south-west would not pass from it to the other buildings.

The chapel is placed on the left of the administrative block, rather than in front of it (as at first seemed its best position), because it is believed that a large detached chapel in front of the entrance to such a building must have a gloomy effect, and practically throw into shadow that to which it should be but an accessory.

The engineer's house is on the right, within easy reach of the boiler and engine-houses, and those parts of the building likely to require his attention. The chaplain's house is on the right of the main body of the buildings, and near the main road. Both these have private access to their houses without passing the asylum grounds.

Administrative or Central Block.

This being the great centre—the store-house—the manufactory of everything consumed by so great a number of people, it is of

the highest importance to its economical working, that every apartment within it shall be neither so unnecessarily large as to cause waste in building and require extra labour and attendance, nor so small as to impede the due and proper execution of each attendant's work.

There are fireproof corridors to every part of the building; every apartment, it is claimed, can be reached without passing through any other; each is accessible both from the male and female sides, and all food, stores, clean linen, &c., can be obtained for their respective patients' blocks without either sex of attendants trespassing on the department of the other.

Male and female departments of attendants are separated day and night by the door across the centre corridor, and that across the corridor by the female's visiting-room.

In the front and centre of the main building is what for convenience of examination we may call

The Official and Medical Department.

Here is the principal entrance-hall, on one side of which are placed the board-room, waiting-room, clerks' offices, &c., and on the other the medical superintendent's residence, a house complete in itself, having bed-rooms on this floor above, in addition to the three reception-rooms, kitchen, scullery, &c. On the right is the board-room with retiring-room and offices, and the apartments of the medical assistants on the floor above them. It is also near the head attendant's offices and the visiting-rooms of both sexes.

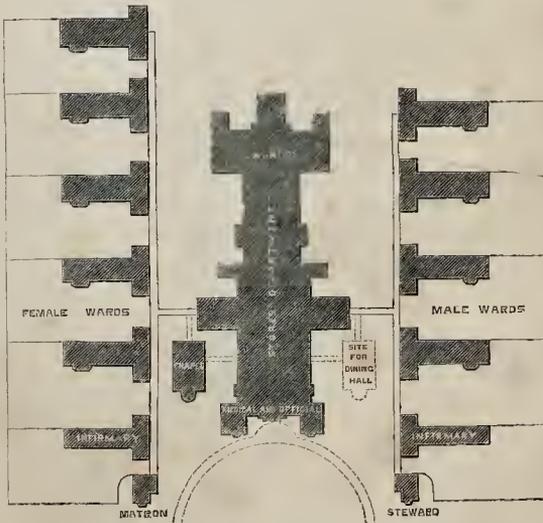

From each side of the entrance-hall branch two corridors, one to the male, the other to the female side of the buildings, thus giving from this point a separation of sexes both as regards patients and attendants.

On the outer side of these corridors are placed the visiting rooms for patients, with separate entrance, overlooked by the head attendant's office adjoining in each case. Here commences the

Attendants' Department,

male and female, on either side. These entrances are for all the subordinate officers, as well as the visitors to patients: thus no person can enter or leave the building without being seen by the head attendant on duty. On each side, and under the head attendant's supervision, are the staircases leading to the attendants' dormitories of each sex.

The centre of the administrative department

BLOCK PLAN: LEAVESDEN ASYLUM.

* See pp. 560, 561.

is occupied by the general store, large enough for separation of the different kinds of stores, and with small stores leading out of it. The steward's office is in the centre. On one side is a large open court, into which all carts containing beer, flour, or stores can be taken and unloaded under the eye of the steward and his attendants. Beyond this is the bakehouse, with scullery, &c., attached, and this extends to the line formed by the interesting corridor.

The kitchen is 50 ft. by 45 ft., by 25 ft. high, with through ventilation and light above, large enough to cook for fully 2,000 persons if necessary. The scullery adjoins the kitchen, and is 50 ft. by 25 ft., by 22 ft. high. Adjoining are the cook's larder and dairy, and a meat store is placed on the left conveniently near, in which all meat will be received and weighed before entering the kitchen to be cooked. Near these are cooks' store and kitchen servants' room, and, on the opposite side, a coal store for kitchen and the general daily distribution.

Outside the corridors, which enclose the kitchen, and in the north angle formed by these and the intersecting corridor leading to the patients' blocks, on the male side are workshops, and on the female side the work-room, with the matron's office and store, and the workmistresses' apartments and stores adjoining. Beyond these, and near the boiler-house, on both sides, are the bath-houses for both sexes, each containing twelve baths, with dressing-rooms and W.C.

The Laundry Department.

The linen, conveyed by trucks from the patients' blocks, will be brought into the "receiving rooms," passed into the "wash-houses" for either sex, and washed and dried either in the grounds or on the steam-horses, thence passed into the laundry, and folded, mangled, or ironed, as may be necessary. It will then be passed into the delivering-room, and there sorted and given out at the slides to trucks in the lobby.

It is calculated that about eighty female patients will be required to assist in the laundry, and, as great loss of time and inconvenience would arise if these were compelled to return to their respective blocks for their meals, a hall for dining has been placed close to the laundry, with a servants' mess-room adjoining. Close by the laundry is

The Engineers' Department.

This is kept distinct in itself, and is entered from the yard only. This position of the boiler and engine houses and their attendant workshops is, for convenience of supplying steam to the kitchen and scullery, bath-houses, laundry, machinery-room, drying-houses, &c., and it will be seen that economy of heat, and necessarily fuel and labour, will be effected by its position being central between these apartments. It will also be seen that the infirm patients' blocks of both sexes have their baths supplied from these boilers, one boiler-house thus supplying the entire establishment without waste of heat. Here also is placed the water-tower, with the smoke-shaft from the boiler within it. This tower will rise to a height of 65 ft., and have a cistern at the top containing 30,000 gallons, for the supply of water in case of fire in any block or part of the building—an efficient supply until the engine could be got to work. Fire-cocks, with hose, will be fixed on the staircases of each block, and at other parts of the buildings, by means of which, if kept right, any portion could be deluged with water in a few minutes.

Patients' General Blocks.

Of the blocks, which run at right angles to the intersecting corridor, all are, with the exception of the infirm block, precisely alike.

The ground-floor of each block is a day-room for the patients, 105 ft. by 36 ft. and 14 ft. high, with windows on the north side 6 ft. from the ground of day-room, on the south side within 3 ft., and with a large bay on that side also.

The designs differ from the plan followed in modern infirmary pavilion blocks of placing all the W.C.s and lavatories at the end furthest from the connecting corridor. It is essential that the class of persons here should be, with the least possible labour to attendants, constantly watched, and this could never be the case with those plans far removed from the centre of supervision.

Each of the two dormitory floors is alike, and accommodates eighty patients on a floor, divided by an iron partition and iron columns in the

centre. Each division has an attendants' room, a lobby for the patients' clothes at night (it being very undesirable for those to remain in the dormitory), a linen store, and a spacious lavatory.

Each attendants' room has a window giving supervision of each division of forty patients.

The windows of the dormitories, twelve on each side, are opposite each other, they are 3 ft. wide and 4 ft. from the floor. In all cases they come between the beds, and not over them. There are also windows at each end, giving through, direct ventilation to the staircase of each block.

Infirmary Blocks.

These blocks are in each case of three floors; each floor being in its internal arrangements alike, it being assumed that the ground floor would be occupied by the very infirm or epileptic patients, whom it would be undesirable and almost impossible to take up and down stairs. Should this not be the case, the ground floor could be used as a day-room for the sixty patients; although beds are shown over the entire floor of the wards, the end of each might be used as a day-room for patients becoming convalescent, and separated by a screen or partition from the other portion if required.

Each ward has three fireplaces, the windows are opposite each other, and within 3 ft. of the ground, it being more cheerful for the sick to see out of them. On each of the three floors are placed rooms for excitable patients—four in number. These are approached direct from the staircase, and have a lobby between the dormitory and them, so that noise may not annoy the sick.

With reference to ventilation and heating, all the corridors connecting the blocks have windows on both sides of their entire length, and those in the administrative block are lighted and ventilated above and, at intervals, at the sides.

Open fireplaces are employed generally throughout the buildings, and wherever gas is used it will be made the means of carrying off the vitiated air by means of galvanized iron tubes in the thickness of the floors, connected with the spare ventilating flues from the various rooms.

In order to keep up necessary movement of the air in the upper part of the ward, the whole of the windows, twenty-four in number, in each dormitory have a portion of their height, about 2 ft., working on a swivel, so as to open to any desired inclination. The top of this swivel-light is constructed as a cast-iron hopper-shaped frame, glazed in front and ends, but left open about 2 in. wide at the top, the opening being covered with fine wire gauze. The lower portion of all the windows will also be constructed so that the middle part, about 1 ft. in width from top to bottom, can be unlocked and turned upon a centre, and thus a flood of pure air be admitted when desired.

In addition to this, air-bricks are built into the wall at intervals, at the level of the ceiling, with fine zinc gauze covering the inside, and a sloping lip projecting about 6 in. from the wall, to give an upward current to the air and prevent down-draught. In order to disperse the stratum of foul gases, which is found to be about the level of what may be called the *bed line*, or about 2 ft. from the floor, there are a series of bit and miss gratings, lined with fine gauze, and communicating, by means of galvanized iron horizontal tubes in the floors, with the outer air.

The fireplaces are entirely of firebrick back and sides; and in order more effectually to distribute the heat in the wards and save fireplaces, a principle is adopted which has been found to answer extremely well. A fine convective fresh air to a chamber at the back and sides of the fireplace, where it is warmed, and passed by a pipe built in the wall to midway between each fireplace in some cases, and in others into the single patients' rooms near infirmaries, lavatories, clothes lobbies, linen-chests, and W.C.s, and staircases, where by means of a hit-and-miss grating it is let out.

The cost of each asylum, as now altered, is estimated at about 85,000l.

It will be seen that the whole of the buildings are of a plain, substantial character. No stone is used except in cills and door-steps. In the windows circular heads have been avoided, as entailing expense.

In the wards and elsewhere all the sashes are of cast iron.

The insides of the wards, corridors, staircases, &c., will be of brick, with neat joint, and coloured a light green or grey colour.

THE SCANDAL OF LEICESTER SQUARE.

LIBERTY is a grand word. Unfortunately it is one of those which involve much difficulty when definition is attempted. People are apt to attach very different meanings to the phrase. King James VI. of Scotland and I. of England defined a free king as a king who was free to make his subjects do what he chose. And many people even now hold that their own right to liberty includes the power to incommode their neighbours.

We have had recently brought before our courts of justice an instance of the respect shown by the law, and we may add by the police authorities of the metropolis, for the liberty claimed by an individual to perpetrate a public nuisance for his own pleasure. In no other part of the civilised world would such a degree of liberty have been successfully asserted. We must be pardoned if we think that it is an instance of the truth of the adage that there may be too much of a good thing.

The condition of the enclosure of Leicester-square has long been a scandal to those who have any regard for the proper maintenance of our public monuments, and for the dignity or even for the decency of the metropolis of Great Britain. The disgraceful condition of this enclosure has long been a subject of ridicule, of gibing, and of shame. One of those spots which, by a happy provision on the part of those who could form little anticipation as to the value of any open breathing-place in the enormous mass of houses that is so rapidly spreading over the counties of Middlesex, of Surrey, and of Kent, has been left available for a public garden, is converted, by the wrong-headedness of the proprietor, into a public nuisance. The happy situation, at the break and bifurcation, or rather trifurcation, of one of the great western lines of thoroughfare is especially appropriate for one of those oases of verdure and of flowers which the art of the gardener can so readily produce. The less said about some of the architectural surroundings, perhaps, the better. But where building of any description covers in a dense mass,—a large area,—the value of open space in an æsthetic no less than in a sanitary point of view is very great. The central portion of Leicester-square, if surrounded by a graceful railing and laid out and tended as an ornamental garden, would be a greater addition to the beauty of the neighbourhood than the architect alone could offer. The effect on the jaded passenger of a peep, in the midst of his daily cares, at the bright colours and graceful forms of vegetation so rarely brought before him, is not to be readily over-valued; and the influence on the health of any particular locality, and thus, indeed, on the whole great system of localities that we call London, of a well-tended and healthy pleasure, is of no slight importance. To retain, in the place which might be occupied by such a centre of pleasure and of advantage, a neglected enclosure, ragged and disreputable from rank weeds and overgrown grass, surrounded by a shabby palisade, only designed to keep the public out of a spot which ought to be adorned by the effigy of the Dog in the Manger, is a moral offence. It is in England alone that it would not soon be made plain that it was a legal offence. The doctrine that individual whim should not be allowed to interfere with the public welfare, is admitted elsewhere as an axiom. It is admitted to a certain extent in England, but the limits of that admission are not only narrow, but capricious.

If the owner of Leicester-square, not content with the pleasure of maintaining an eyesore in the face of his fellow townsmen, were to promise himself the further pleasure of establishing a *nuisance*, or of offending either of the other senses, we should lay hold of him as the perpetrator of a nuisance. If he were to think the spot appropriate for a lay-stall, and were to invite that large and useful fraternity who exercise the odorous calling of nightmen, to empty, provisionally, some of their enormous muck-trucks in the disputed area; if he were to found on it soap works, or a vitriol manufactory, or a powder magazine, or a bombproof building for the testing of gun-barrels, or an oil-mill, or a fireworks establishment, the worthy magistrates to whom the neighbours would rush for redress would speedily find a method of convincing the eccentric proprietor that he could not, under the circumstances, do what he liked with his own. But so long as the aggression on taste and decency is passive, the public is passive too. It

is difficult to see the logical line which we draw in the matter.

If a company that purposed to hurray amid the sewers and cellars from Euston-square or from Paddington to Charing Cross had put Leicester-square in the schedule of its bill, Parliament would have handed over the rights of Mr. Tulk to the invaders without the smallest scruple of hesitation. For any purpose of a commercial character that demands a legislative sanction, the power to help oneself freely to one's neighbour's property is freely accorded. If a whole town full of poor lodgers were to be turned out of house and home in order to allow a little breathing space around a railway station, a magnificent approach, or a mere open area, to be built on or no as the engineers and architects should afterwards think fit, Parliament would say with alacrity, "Take your Bill." It is only if the comfort, the health, and we may almost say the æsthetic education, of a large number of persons who form no corporate or commercial entity are concerned that the law dispensers and the law makers frown, and say "Private rights must be respected." In other words, as against inroads for the purposes of making money, private rights have but a very shadowy force, while as against public welfare they are unassailable.

Nor is the state of the enclosure in question purely a passive nuisance. Neglected vegetation is a source of ill-health, and to leave such a squalid spot in the midst of a great population amounts at least to an offence against sanitary prudence. And there is another point of view which should not be altogether ignored. Our neighbours find it to be a crime of no small magnitude to excite to "hatred and contempt" of the Government. As to the individual application of this rule, in many instances of press and other offences, we have nothing to say. We are not on the jury. We do not take fire so rapidly at the lucifer-match of a penny, or even of a threepenny, journal, as do our friends on the banks of the Seine, and we have no wish to interfere in their domestic difficulties. But the principle itself must be held to be involved in the very existence of any State government. Exciting to hatred and contempt is the commencement of that form of political aggression which our laws (rudely, it may be) denigrate and repress. Now while it would be absurd to speak (in language which would have found an echo within the last century) of the treasonable disrespect shown to departed majesty in the mangled and crutchborne state of what was once an equestrian effigy in this unfortunate square, it is impossible to deny that the influence which such neglect tends to exert is unwholesome. While monarchy is an English institution, it should not be allowable to present the effigy of an English monarch as an object for popular scorn. However indisposed we may feel to prevent the proprietor of Leicester-square from exciting "hatred and contempt" against himself, we have right to forbid him to do so with reference to the representation of an august personage which has so unfortunately fallen into such irreverent hands. It is probable that legislation may be silent on the subject, as the case was one which those grave and decorous ancestors to whom we owe the traditions of our common law could never have imagined to be possible. But we may be pretty sure what would have been the sort of summary justice measured out, at those periods of our history to which we look back for precedents, to the person who should have prostituted his freehold ground to the public display of such an outrage on loyalty, as well as on decency, as the nondescript royal effigy in question.

The Metropolitan Board of Works have laid siege to Mr. Tulk, the proprietor of the area of the square. That individual has set them at defiance, beaten them hollow, and no doubt laughs them to scorn. Our brief is for the public. It seems that the machinery of legislation has been set in motion in behalf of the Board, and that such is the increasingly cumbersome and awkward state of the mechanism that it has broken down by its own weight. In 1863 was passed an Act of Parliament, called 26 Victoria, cap. 13, "for the protection of certain garden or ornamental grounds in cities and boroughs." The express object of this Act, as may be gathered from its title, purported to be a means of despatching such cases as that to which we refer. It has long been matter of public notoriety that the result of our peculiar method of legislation has been to make laws which none but lawyers could understand. That, of course, is

but natural and proper, if the object of legislation be (as we suppose it confessedly is), the encouragement and multiplication of harristors and attorneys. But 26 Victoria has gone beyond that time-hallowed obscurity. It defies not only English grammar, English idiom, and English lay understanding, but legal acumen itself. The obstructive spirit that has inspired the owner of Leicester-square must have revelled in the consultations amid which the famous Act was framed. The Lord Chief Justice gave up the attempt to attribute to it any intelligible meaning. Public Journalists have taken the trouble to count more than 600 words which the indeters of this model law have crammed, or rather pitch-forked, into a single sentence. The result of this triumphant legislation is, that Mr. Tulk, without attempting to show that he had kept his inclosure in proper order, or avoided that "neglect" which it was the object of the Act to prevent, is entirely untouched by the enactment. The most flagrant instance of neglect which could have been present to the contemplation of the authors of the act is quite untouched by its provisions. Is it worthy of a great nation to allow the highest of all social functions, that of determination and amendment of the law, to be thus miserably trifled with?

Leicester-square is only one out of the many instances in which the architectural beauty and pictorial grandeur of the metropolis are destroyed by the loud-voiced self-assertion of private bad taste. It is time that this should be put a stop to. For those who regard architecture as merely a trade, which enables a speculator to stow away so many human beings, like rabbits in hutches, in the smallest possible space, and for the least possible cost, it may be all very well to ignore questions of taste. To those who attribute to architecture the higher functions of inscribing in noble edifices the successive phases of national history, and of educating the taste of mankind by an admixture of the noble with the useful, the subject is one of no trifling importance. It is, in our opinion, a positive injury to the young to bring them up in close contact with the hideous. Bad taste is an outward expression of an ill-informed or distorted mental vision. Pure and perfect taste is the gift of comparatively few, and even when originally present, is never independent of culture. To know how a certain object has been most satisfactorily attained is necessary to the fair development of the artistic faculty. It is thus that stately buildings, truthful and striking sculpture, fine paintings, have been at all times regarded by the wisest statesmen as important elements in national education. It is as recognising the importance of this branch of culture that we have collected a national gallery, not unworthy of the name, but we have housed it in an ill-adapted home, and we are about to build a new edifice, in which, we venture to hope, there may be a series of galleries in which the *chefs d'œuvre* that we possess or may acquire may be seen without interfering with one another. But what is the use of encouraging our youth to admire the works of Raffæello or Correggio within doors, while we condemn them to the view of caricature statues of Kings William III. and IV. without? How can we expect any result but ridicule if we say one minute, "Look! it was thus that Vandyck and Holbein drew the men and the women of their day," while we tacitly add—"and it is thus that we do honour to the victor of Waterloo and to the minister who piloted the vessel of the State through the dangers of the Corn-law question." We exhibit one on the top of a fine gateway, in the guise of the most gigantic scarecrow that disfigures any European capital. We fix, in the most unsuitable spot that can be selected, such a gaily caricature of the other that even the House of Commons revolts at the outrage. Better to revert to window-tax architecture, to tea-garden Corinthian, and churchwarden Gothic; better to attempt nothing higher in street architecture than a wall pierced with glazed rectangular holes at regular distances, than, while cultivating taste at one moment, continue the most ingenuitous outrages on its best established canons at another.

It is altogether unworthy of our position among civilized nations that matters like these should be left to chance, or to what may be worse than chance,—private caprice, or the extravagances of the uneducated dilettante. We are alone, among civilized nations, in this expression of our contempt for art, that we have not thought it worthy of administrative attention. In all other European states an

educated some department of the Government concerns itself with the guidance of the art education of the people. In one instance it is committed to a minister of public instruction; in another, it may be superintended by a minister of public works. In no two instances are the arrangements identical, but nowhere except in this country, is the subject actually ignored or neglected. It is impossible for an educated taste to become prevalent without some degree of guidance and direction from those who are competent to guide and to direct. It is (what many politicians hold to be the worst off-noon) positive waste of public money to buy pictures and build galleries while we lend the same emphatic solemnity of sanction to the worst outbreak of rampant bad taste that we do to the finest remnants of ancient art. Contrast the economical value, in its influence on the education of the youth of the metropolis, of the outlay on a Raffæello, a picture which it demands a certain degree of education (as well as a position and light, which are at present denied it) to admire, with that of the application of a similar sum to the expenses of a department of fine art, the permanent head of which might, as a non-political adviser of the ministry, be in a position to put a veto on the invasion of the best sites of the metropolis by statue-erecting Goths! The noble structures erected and now erecting in London can never produce their proper effect, whether on the admiration of strangers, or on the habitual feeling of the inhabitants, while they are flanked by abortions which defy the simplest laws of decent good taste.

COMMITTEE ON TECHNICAL EDUCATION.

At a meeting held at the Society of Arts on Tuesday last, Mr. W. Hawes in the chair, the committee on Technical Education received and adopted a report drawn up by a sub-committee, appointed by them on February 25th. The closing portions of the report, which bring together the recommendations of the committee, are as follow:—

Young workmen living frequently as lodgers in the houses of married workmen have now few facilities for study, and we believe that the creation of lodging-houses for these unmarried men, in connexion with evening classes systematically arranged, would greatly assist young workmen in their studies. Thus each man might have his own furnished room as a bedroom and study. Meals might be provided in common halls at a small expense; and regular evening classes might be held, the attendance at which should be a necessary condition of residence. A library, reading-room, and museum would complete the establishment, which would thus offer to our workmen something analogous to the collegiate life of our great universities. Notoriously vicious conduct would be followed by expulsion, and students who failed to pass satisfactory examinations would also lose the privilege of residence. The classes might also be open to married men and other non-residents, on the payment of sufficient fees. Gratuitous instruction and board might be given to a certain number of men in the form of scholarships and exhibitions, and certificates should be granted to all who pass good examinations. Some portion, if not all, of the funds required for an experimental college of this kind could be provided by taking advantage of the "Act to enable the Public Works Loan Commissioners to make advances towards the erection of dwellings for the labouring classes."

It appears that workmen are beginning to organise evening classes for themselves, appointing their own teachers and framing their own rules and terms of admission. Thus the trade union of Amalgamated Carpenters and Joiners have succeeded in establishing large classes both in London and Manchester. The chief difficulty met with by these men has been in finding suitable rooms for these classes. These efforts are especially worthy of encouragement, and the form of encouragement which would least interfere with the independence and self-reliance of the men would be assistance in finding meeting-rooms, either by paying the rent or by the erection of suitable buildings. It would indeed be lamentable if a movement of this kind were stunted in growth from the mere want of suitable places in which instruction could be given. Mechanics' institutions might offer accommodation in some cases, and grants

might also be made by Government through the department at South Kensington. Suitable guarantees that the rooms would not be used for improper purposes could easily be devised.

Have the Sub-Committee would call attention to the great necessity there is for sailors' institutes in the colonial and Indian ports, in many of which there are always from one to three thousand officers and seamen needing a building where their leisure time may be spent in self-culture, and where the proposed instructors could hold their classes.

In conclusion, the following series of resolutions express the recommendations of your committee as respects the action of the government of existing colleges or universities and of the leading men in each profession or business considered by the committee. An expansion of each of these resolutions has already been given, and should the wording of any one resolution appear ambiguous, the meaning attached to that resolution is to be gathered from what has been said above:—

It is desirable that Government should encourage systematic scientific instruction by the following measures:—

1. By adopting the recommendations of the Schools Inquiry Commission, for the introduction of the teaching of natural science into all secondary schools, and for establishing new science schools of the first grade, which schools should be on all points on a footing of equality with the endowed classical schools.

2. By co-operating with universities and colleges in holding examinations, which are, or may be, established for the purpose of conferring certificates or diplomas in connexion with systematic studies, intended to educate civil engineers, mechanical engineers, officers of the mercantile marine, metallurgists, miners, naval architects, and marine engineers, architects, merchants, chemists, and agriculturists.

3. By giving some official value to those certificates or diplomas, such as allowing certain diplomas to represent a given number of marks in competitive examinations.

4. By putting at the disposal of the leading colleges which give methodical courses of scientific instruction, and diplomas of recognised value, a limited number of nominations annually.

5. By assisting old and new endowments where local subscriptions or donations prove the value set on the instruction proposed or given.

6. By instituting night classes for workmen in connexion with all new scientific endowments, with access to a library.

7. By providing free libraries suitable for the use of the students in night classes generally.

8. By providing suitable meeting-rooms for night classes organised among workmen, for the purpose of obtaining scientific instruction.

9. By according liberal prizes to workmen for excellence in mechanical drawing.

10. By taking steps to extend and improve primary education.

It is desirable that colleges should encourage systematic scientific instruction by the following measures:—

1. By instituting methodical courses of scientific teaching, adapted to students intending to enter a profession or business among those which have been enumerated above.

2. By the establishment of diplomas, corresponding to the several courses of study in conjunction with Government, and with the leading institutes belonging to each profession.

3. By the establishment of fellowships and scholarships in connexion with those diplomas.

It is desirable that the leading civil and mechanical engineers, manufacturers, merchants, ship-owners, chemists, manufacturers, and agriculturists, should encourage systematic scientific instruction by the following measures:—

1. By the creation of scholarships and fellowships in connexion with those schools and colleges where methodical courses of instruction are given.

2. By co-operating in the examinations for diplomas.
