WESLEYAN CHAPEL, BEVERLEY.—On the 10th inst. the new Wesleyan Chapel in Tollgavel, Beverley, erected on the site of the superintendent minister's house, and backing up to the old building in Walkergate, was formally opened. The building is from the design of Messrs. Morley & Woodhouse, of Bradford, and is in the Italian style. The chapel is designed to accommodate 100 more than the old building. A minister's vestry, inquiry-room, and kitchen are provided in the rear. The front entrance vestibule is reached by three doors, and has a tiled floor. The organ recess has pilasters with enriched capitals and trusses supporting an elliptical arch and pediment with enriched panels and cornices. The front gable windows are filled in with leaded glass. An open portico, with polished granite columns and circular arches, projects beyond the main line of frontage; the floor is laid with mosaic tiles, and the walls inside lined with glazed bricks. The total cost has been about 4,000l.

BATHS, STOCKTON.—The new baths of the Stockton Corporation were opened on the 19th inst. They have been erected on the site of the old baths in Portrack-lane, by Mr. Campbell, the Borough Surveyor. The building is of brick and stone, with wrought-iron roofing. There are two entrances, respectively for women and men, divided by the ticket or pay office. Above this is a series of first-class slipper baths for gentlemen, and also a vapour and a shower bath. Beyond these apartments is the new swimming or plunge bath. The height of this hall is 30 ft., and the width 33 ft. The length of the swimming bath is 75 ft., and its width 27 ft. It is 6 ft. 6 in. deep at the deepest, and 4 ft. at the shallow end, and holds 60,000 gallons of water, kept at an even and warm temperature, and also cleared of surface impurities by an arrangement of water sprays. The building contractor was Mr. W. C. Atkinson. The contract for the building and machinery was 6,448l.

RESTORATION OF MICKLEHAM CHURCH, DORKING.—On the 15th inst. the Church of St. Michael, at Mickleham, near Dorking, was opened by the Bishop of Winchester, after undergoing alterations and additions. New Norman arcades have been erected, and the north aisle has been enlarged. The galleries, which previously existed in the aisles, have been removed, and a lighter gallery placed in the lower above the chief entrance. The old-fashioned "box" pews have been demolished, to give place to seats of a more modern construction, and the arcades, which formerly stood in the nave on brick piers, have been taken away, and Norman pillars and caps substituted. New screens have been erected for the north aisle and the tower. The tower has also been renovated externally, the stucco having been taken off and the flint work brought out. The turret has been shingled and put in good order. A staired window, containing three lights, has been erected in one of the aisles in memory of the late Mrs. Gordon Clark. The work of restoration has been carried out by Mr. Shillito, contractor, of Bury St. Edmunds, the plans having been prepared by Mr. Ewan Christian, architect to the Ecclesiastical Commissioners, the cost being about 3,900l.

PROPOSED ARTISANS' DWELLINGS, DUBLIN.—On the 19th inst. Mr. C. P. Cotton, C.E., Local Government Board Inspector, held an inquiry at the City Hall, Dublin, in reference to the proposal of the Corporation to borrow a sum of 13,000l. to erect dwellings suitable to the working classes at Blackhall-street, Blackhall-place, and North King-street. Mr. Hart, C.E., Borough Surveyor, was examined, and stated that the place was suitable for the erection of artisans' dwellings, and there were large numbers of working people employed in that locality. He proposed to take down the old houses there, which were in a terrible state. There were various classes of houses to be built. Fronting Blackhall-street, there would be shops, and there would be ninety-one tenements included in the scheme. The annual profit on the scheme, after paying for all outgoings, would be 562l. a year. Mr. Moore, on behalf of the Governors of the King's Hospital, Blackhall-street, objected to the scheme as regards the houses proposed to be erected at the rear of Blackhall-street, and also to the conversion of the houses in Blackhall-place. If the scheme were passed it would have the effect of depreciating the property of the Corporation. Other evidence having been given, the proceedings terminated.

METHODIST CHAPEL, WETHINGTON, LANCASHIRE.—A new Primitive Methodist Chapel was opened at Wethington on the 14th inst. The building is of Gothic design, and consists of a chapel, Sunday-school, minister's vestry, and two class-rooms. The building faces Burton-road and Ashford-road. The walls are built of local bricks, faced with pressed Rusbon stools and bricks, relieved with terra-cotta dressings. The principal entrance to the chapel consists of an outer porch and a vestibule. The north and south aisles are approached from the vestibule. The chapel is capable of seating 300. The school-room, which communicates therewith, will accommodate 140 exclusive of the two class-rooms and minister's vestry. The walls of the

chapel are wainscotted in pitch pine for some distance above the pew backs, and the pews and the flooring of the chapel are finished in selected varnished pitch pine. The roof principals, and the exposed portions of the roof timbers, are of stained pitch pine. The pulpit has been treated to imitate walnut, and is relieved with figured pitch pine panels. The windows of the chapel and school are fitted with leaded lights, glazed with tinted cathedral glass. The buildings are heated with hot-water on the low-pressure system. The contract for the building was 1,600l., and has been executed by Messrs. Burgess & Galt, of Manchester, in accordance with the designs and under the supervision of Mr. Joseph Swarbrick, of Manchester.

METHODIST CHURCH, RAMSEY, ISLE OF MAN.—On the 18th inst., memorial stones of a Primitive Methodist church and schools were laid at Ramsey, Isle of Man. The church has been designed to seat 400 people, and the estimated cost is 1,700l. The architecture is Early English. On the basement there will be a schoolroom and three classrooms. There will be two aisles in the church, and the rostrum will be placed opposite the entrance. The ministers' and stewards' vestries will be behind the transepts, and the organ-loft and choir-gallery will be placed immediately behind. The inside fittings will be of pitch-pine, and open-timbered roof. The architect is Mr. Thos. Howdill, of Leeds, and the builder is Mr. W. C. Southward, of Ramsey.

STAINED GLASS AND DECORATION.

WINDOW, PARISH CHURCH, GREAT HALLINGBURY.—A stained-glass window, which has been placed in the east end of the Parish Church, Great Hallingbury, Essex, by Mrs. Houlton, to the memory of her husband, has just been dedicated. The window, which has been erected by Messrs. Clayton & Bell, of London, consists of three lights. In the centre is a representation of the Crucifixion, while on the right of it are depicted the three Marys, and on the left St. John, Joseph of Arimathea, and the Centurion. Above the centre light is represented Michael the Archangel.

WINDOWS, ST. JOHN'S CHURCH, RADCLIFFE.—A number of Munich stained-glass windows have recently been placed in St. John's Church, Radcliffe, in memory of the late vicar, the Rev. W. D. Carter, M.A. The subjects are "The Good Shepherd," "Christ's Charge to Peter," "The Pool of Siloam," and "Feeding the Multitude." Another memorial window has been placed in the same church in remembrance of the Rev. J. W. Taylor, who was the first curate-in-charge of the parish. The window has been presented by his only son, Mr. Alfred Kaye Taylor, Liverpool, and the subject is "The Good Samaritan." The windows, six in number, were supplied by Messrs. Mayer & Co., of Munich and London.

SANITARY AND ENGINEERING NEWS.

SEWERAGE WORKS, SWANSEA.—A Local Government Board inquiry was held at the Town Hall, Swansea, on the 10th inst., by Mr. Smith, Local Government Board Inspector, into the proposal of the Swansea Corporation to borrow 87,500l. for sewerage and other improvements in the borough. The Town Clerk explained the proposed works, which consisted of drainage works in the added area, a new main sewer and outfall at the western boundary of the borough, to carry off the sewage matter and storm-water for the St. Helen's district, &c. Mr. Wryll, Borough Engineer, explained the proposed works at Morriston, Pentrepech, Brynhyfryd, Cwmbwria, &c., and produced plans showing their outfalls into the Tawe or the existing sewers. With regard to the proposed western sewer, the Town Clerk explained that at Brynmill the proposed sewer was not carried to low-water mark, and that it would not be necessary to extend it so far. If it was insisted upon it would result in the total expense amounting to nearly 100,000l. Other evidence having been given, the inquiry closed.

CONYTT BRIDGE, WYRLE.—The bridge which has been built over the river Wid, at Wyrle, by the County Council, to replace the brick structure washed away by the flood of 1888, was thrown open for public traffic on the 15th inst. The bridge has been constructed from the designs, and under the superintendence of the Engineer to the Council, Mr. Percy J. Sheldon, Assoc. M.Inst. C.E. It consists of two steel girders and a steel plate flooring, filled in solid with concrete. The parapets are of cast-iron of an ornamental design. The contractor was Mr. G. Watson, of Ilford, the steel and iron work having been supplied and fixed by Messrs. Westwood & Bailey, of London. The total cost is estimated at 3,000l.

ELECTRIC LIGHT IN AUSTRALIA.—Mr. E. R. Dymond has just contributed to the *Proceedings of the Institution of Civil Engineers* a paper in which he gives a description of the electric lighting at Tamworth, New South Wales. Although Tamworth has only a population of 4,000, and a rateable value not exceeding 33,700l., its streets have been lit by electricity since the year 1888; and was, indeed, the first place in Australia to adopt the new system. The plant is in duplicate, and was sent out from

England. There are 13½ miles of streets now lighted, the distance of the furthest lamp from the station being 2,100 yards. The average loss of pressure is stated to be not more than 5 per cent. In the main street there are four arc-lamps of 3,000 nominal candle-power each, which are worked in series off a separate cable. The other lights are glow-lamps. In the most important positions near the station, each lantern has three 75-volt lamps in series. As the distance increases, two 110-volt, and, lastly, two 105-volt lamps are used. All glow-lamps are 16 candle-power. There are 185 glow-lamps contained in eighty-six lanterns. The number does not seem great for the area covered, but in a modern town such as this the engineer can place his lights to much greater advantage, as the streets are straight and run at right-angles to each other, and, moreover, are spaced regularly, the rectangular blocks of houses being of uniform shape and size. The previous cost per mile of street lighted by gas equal to 94 candle-power was 592l. 19s. 10d.; whilst with electricity it is 51l. 2s. 8d., the light being equal to a standard of 219 candles. These figures will not, of course, afford any basis of comparison for English practice, where gas is so much cheaper, and where Board of Trade rules must be observed; but the author puts them forward as a fair example of country town lighting in Australia.

FOREIGN AND COLONIAL.

FRANCE.—The statue of Theophrastus Renaudot, said to be the founder of French journalism, will probably be placed on the open space in front of the Marchés aux Fleurs, near the Tribunal de Commerce.

The statue of Balzac, on which M. Rodin is now at work, is to be erected on the Place du Palais Royal, on the axis of the Cour d'Horloge. The Société des Artistes Français has decided that the next Salon is to include a section of Decorative Art. The Government is having two casts made from Rodin's celebrated bas-relief, the "Christ in Despair," on the Arc de Triomphe de l'Étoile. One of these is to go to the Society of Arts of New York, the other the Trocadéro Museum. The "Société Française d'Hygiène" will open this year another competition on various subjects connected with town and country dwellings. The competition is to be closed on July 1. The Ministry of Public Instruction is preparing an inventory of works which are in the stores of the Louvre and for which no exhibition space is available. There are 146 of these hidden treasures. Important restoration works are shortly to be commenced at the Palace of Fontainebleau. The Pavillon Serlio will be taken in hand first, and from thence the work will proceed in the Cour de Cheval Blanc, the pavement of which, worn by the carriages of all the generations since Louis XIV., has never been repaired. The creation of a commercial and industrial museum has just been decided on at Toulouse, which will form a permanent exhibition of raw materials and their application to manufactures. The competition for a museum at Bayonne has been a failure; one "second prix" was given to M. Planckaert, but nothing further has resulted from it.

The director of the Museum of Lyons has asked for the restitution of the panel painted by Perugino which decorates the central window of the nave of St. Gervais at Paris. The painting, representing the Lord surrounded by angels, formed once the crowning portion of a grand composition of which the remainder is in the Lyons Museum. In exchange, the Lyons Museum offers four very interesting views of Paris of the fourteenth century. The Government is going to erect at Luneville a fort in béton constructed after the type of fortification made use of by the Belgian General Brialmont, for the defence of the Meuse. The work will have two armoured cupolas. The Government has allotted a credit of 3,250,000 fr. for the expenses of the French representation at the Chicago Exhibition. Mme. Cogniet, widow of the celebrated painter, has died at the age of seventy-nine. She was herself a painter and exhibited in the Salons of 1835 and 1853 some *genre* pictures under the name of "Caroline Thémis". She obtained a medal in the Salon of 1813. The death is announced also of M. Jacques Alfred Brielman, landscape-painter; a pupil of Laveille. He received a medal in the Salon of 1882. The last Salon contained two of his works. It is proposed to organise this year an international exhibition of "Black and White"; a special section being devoted to a series of collections of engravings executed by lithographers of the French, Italian, English, Dutch, German and Spanish schools. It is proposed to construct a new Lyric Theatre at Paris on the site now occupied by the Eden Theatre, which will be pulled down.

BERLIN.—The Emperor has given some further attention to the "National Monument" question, and Herr Zillor has made some proposals relative to the position of the monument on the very difficult site in front of the royal castle. The Emperor entered into a lengthy discussion of the merits of the different proposals. The sarcophagus of Emperor Frederick III. has been placed in its position in the new mausoleum near Potsdam. Reinhold Begas was the sculptor, and his work is considered to be a great success by those who have

seen it. The mausoleum is to be open to public inspection next month.—The older of the two architectural societies, the "Architektverein zu Berlin," has elected Sarah Hinkoldy as president in the last session. The "Allgemeine Electricitäts-Gesellschaft" (who are now remodeling their design of the proposed underground metropolitan railway in accordance with requirements made by a special committee) intends constructing a specimen piece of tunnelling for the purpose of demonstrating that no technical difficulties oppose the carrying out of their electric railway scheme under the main thoroughfares of the city. In one of the suburbs of the city a batch of villas and cottages is being put up in Norse style. A Swedish builder sends the logs and fittings for each residence ready for putting together, and supplies the artisans necessary for the work from his own country.

VIENNA.—The Ferdinand Bridge over the Danube Canal, which will have to be replaced by a new crossing (bearing the same name), is to have a row of shops on either side of it, and its footways covered in with arcades. The reasons for erecting the shops are purely financial, as the rents to be obtained are to cover the expense of the reconstruction of the thoroughfare. The design for the new bridge is by "Baurath" von Wiekmannsdorf, engineer. Vienna, which city since December last calls itself "Gross Wien," and, after having acquired the whole or part of the ground of some sixty neighbouring parishes, can boast of a superficial area of 177 square kilometres (i.e., 120 more than it had before, and a population of 1,300,000 (instead of 800,000), will now undergo some important changes as regards sanitation, canal regulations, and local railway intercommunication. The alteration and extension of the sewage system, which includes the construction of two main sewers on either side of the Danube canal, will cost over eleven million florins, and will have to be ready by 1895. The Danube canal, of which of some 15 kilometres length, is to have new embankments, and is to be used as a harbour for the river shipping. The proposed new railway intercommunication will be brought about partly by constructing several minor lines between the terminal stations of the different great railroads which run into the city, and partly by the construction of some secondary purely local roads. Up to but a few years back Vienna took a most prominent position in the erection of public buildings, architectural monuments of the largest scale, grouped together in an imposing way. This period of activity in architecture having come to an end, another, in which the civil engineer will play the leading part, is apparently about to commence, and, from all appearances, promises to be the most important one for "Gross Wien's" development.

NORWAY.—The Corporation of Christiansia, not wishing the city to be disfigured by the usual tall, ugly chimney-stacks of electrical stations, has offered three prizes for designs for the chimney-stack of the new municipal central station now in course of construction, the jury having been named by the Association of Engineers and Architects of Christiansia. The Norwegian production of bricks last year was about the same as in the preceding year—viz., about forty millions; and the output of calcined roof tiles about one million, against about 800,000 in 1890. The demand for bricks was brisk during summer and autumn in Christiansia, where the principal kilns are found, owing to considerable building operations. In consequence, stocks are now small. The price of bricks remained steadily throughout the year at 24 kr. (27s.) per thousand, a price leaving no room for profit. The calcined roof tiles (the price varied between 40 kr. and 44 kr per thousand (55s. and 59s. 6d.), being about the same as in 1890. Wages rose further still last year, although a steady rise has taken place during recent years. However, during the last few months of 1891 and up to the present the demand for bricks and tiles has fallen off, owing to the monetary crisis prevailing. There were imported into Christiansia in 1891 about 11,000,000 bricks from other parts, about 800,000 fireproof bricks from abroad, and about 150,000 roof tiles. The Norwegian stone industry flourished fairly well in 1891, the demand for granites of various colours from this and other countries being good.—From the report for 1890 of the Society for the Preservation of Norwegian Ancient Memorials it appears that fourteen old churches were examined and partly restored, and thirty-eight barrows excavated, but the finds were of little value. The excavations of Lyse Cloister were continued, and the ruins enclosed. The Society attempted in vain to purchase for the Christiania Museum a remarkable reliquary preserved in the Hedal Chapel, upon which is represented in relief the murder of Thomas à Becket, but it was permitted to take three casts of it for the museums of Christiania, Bergen, and Trondheim.

CONSTANTINOPLE.—The idea of bridging over the Bosphorus for railway traffic has often been spoken of. There is now some chance of it being done if the financial arrangement can be managed.—Messrs. Giano and Gourzé, two engineers resident in the city, have designed a railway-bridge which is to cross the straits from Stamboul to Scutari. This design has been put before the Government for approval. The length of the bridge, including viaducts at either end, is 2,000 metres; the central span measures 1,400 metres. The floor of the bridge will have a width of 15 metres, and its altitude over average water-level will be 40 metres.—*Deutsche Bauzeitung.*

NEW SOUTH WALES.—The Minister for Works has appointed Mr. Horbury Hunt (President of the Institute of Architects of New South Wales) to act with Mr. Vernon (Government Architect) and Dr. Manning (President of the Board of Health) to report on the competitive designs for the Rossville Asylum buildings at Goulburn; and Mr. Wardell to act with Mr. Darley (Engineer-in-Chief for Harbours and Rivers) and Mr. Hickson (Engineer-in-Chief for Roads and Bridges) to report upon the designs for the new Pyrmont Bridge.

MUNICH.—The arrangements for the "International" Art Exhibition to be opened here next summer are most elaborate, and promise well. Of the countries invited to exhibit, Austria has already accepted, and its Government has voted 5,000 florins towards the expenses of fitting up the hall of its section. Japan is to have a section, and a great novelty in form of a room devoted entirely to architecture, is proposed. We hope that there will be some English work to be seen in the exhibition.

MISCELLANEOUS.

SALES OF PRINTS, ENGRAVINGS, &c.—Last week (Feb. 18-19) Messrs. Sotheby, Wilkinson, & Hodge sold the remaining collection, formed by Dr. Joly of Dublin, of the works of Hogarth, and books in connexion therewith. One lot, bought by Mr. Quaritch for 500*l.*, consisted of twenty-five volumes, atlas folio size, containing about 158 drawings and 6,097 prints, being nearly the whole of Hogarth's engravings, and after his designs, with no two prints (plate impressions excepted), in exactly the same state included. Vols. 1. and 2. were compiled for Lord Charlemont (Hogarth's patron) by R. Livesey; vol. iii. is the Kingsbury Collection—95 prints. Similar folios, of the same size, by T. Cook, J. Nichols, J. and J. Boydell, with others, were also sold. Of the books we may mention,—Allen's "Lambeth" 1827, 5s.; "Apuleius; or, The New Metamorphosis," 1708, 1*l.*; J. Ashton's "The Fleet: its River, Prison, and Marriages," 1858, with M. Jackson's "History of the Pictorial Press," 1855, 1*l.*; A. W. Tuer's "Bartolozzi and his Works," parchment, 1855, 7*l.*; three copies, fol. size (two with faults), of G. Bickham's "Musical Entertainer," 8*l.* 1*l.*; Butler's "Hudibras," on large paper, sixty portraits by R. Cooper, India proofs, fol., 1821, 5*l.* 12*s.* 6*d.*; "Calliope, or English Harmony," with 2 vols. of G. and R. Cruikshank's "Universal Songster," 1828, 3*l.* 8*s.*; "Clio and Euterpe," a collection of songs and cantatas, 3 vols., 1792, 3*l.* 10*s.*; T. H. Ward's "English Art: in the London Public Galleries," 15 parts, fol., 1838, 2*l.* 14*s.*; J. Forbes-Robertson's "Great Painters of Christendom," 4to., 10*s.*; J. Forster's "Life of Goldsmith," original edition, 1848, 12*s.*; C. Knight's "Gallery of Portraits," 7 vol., 1833-7, 2*l.*; Mrs. S. C. Hall's "Pilgrimages to English Shrines," illustrated by Fairholt, 2 vol., 10*s.*; J. Grego's "History of Disasters and Engineering in the Old Days," large paper, 4to., 1836, 13*s.*; and A. J. C. Hare's "Walks in London," 1878, with J. Timbs's "London and Westminster," 1868, 4 vols., 1*l.* 5*s.* In the same week Messrs. Puttick & Simpson disposed of a good collection of engravings in illustration of British topography, with some scarce early views of London and Westminster. The principal lots comprised:—F. Jukes's "Athena," after E. Dayes, by R. Pollard, of Warren Hastings' Trial, 1789, 1*l.* 8*s.*; "Election of Members for Westminster, 1815," and "George IV.'s Coronation Procession," etched by G. Schari, engraved by R. Havell, in colours, 2*l.* 2*s.*; Gosselin's "Promenade at Carlisle House" (Soho-square), in mezzo, 17*s.*; "Queen-square" (Holborn), and "Grosvenor-square," by R. Pollard, after E. Dayes, 2*l.* 7*s.*; "The Masons' Procession" (with view of Denmark [Somerset] House, Strand), on Apr. 27, 1742, 15*s.*; Warner's "London and the Thames," 15*s.*; "Lord Lovat's Trial in Westminster Hall, 1747," by J. Freeman, 2*l.* 4*s.*; Alix's (old) "Westminster Bridge," showing the houses at either end, 10*s.*; W. Daniell's large coloured aquatints of the West India Docks, Isle of Dogs, 1800-2, and of the East India Docks, Blackwall, built by John Perry in 1803, 9*s.*; and two of the views, by R. Dodd, of the port of London, in mezzo, Greenwich, and Limehouse with one of the windmills upon the shore, 1793, 15*s.*; C. Bowles's "Peep into the Court of King's Bench," coloured, 1785, 12*s.*; and "Deptford Dockyard," with plan, engraved by Woullett, after R. Paton, 1775, 5*s.* The engraved copper plate, with the entire remaining stock of about 400 impressions, of J. S. Copley's painting (now in the National Collection) of the "Death of Major Piersen" (at St. Helier, in Jersey, on January 6, 1781, all the figures being portraits) was bought for 20*l.*

"L'AIR FROID" SYSTEM.—The patentee of this system, Mr. Inkpen, in reference to our comment on page 147 *ante*, writes to say that he makes no claim in his patent for any improvement in ventilating as such, but only for a system of distributing cold air over plate-glass window surfaces.

STREET HYGIENE.—At a recent meeting of the German Public Health Society, Dr. Theodor Weyl spoke on the street hygiene of Paris and London, and recommended the adoption in Berlin of many of the arrangements in vogue at those places. The gist of his remarks was as follows:—Wooden pavement has been in use in London and Paris for many years past, and has proved a great success, even in the most frequented streets. The fact that it has been less successful in Berlin may be due to faults of construction and treatment. In Paris and London there are no rails in streets paved with wood. The pavement is copiously watered. Drains and pipes are not laid under it, but under the side-walks. The main thing, however, is good construction. In London and Paris sweeping is always preceded by watering, which is not the case here, to the serious detriment of the public health. The public closets in Paris are not worthy of imitation, because hygienic considerations are to a large extent subordinated to advertising purposes, but those of London are exemplary. The depositing of rubbish within or even in the immediate vicinity of cities is altogether to be condemned. The removal of snow costs Berlin about 19,000*l.* a year, because it is not thrown into the river or sewers as in London and Paris, but carted out of the city. In conclusion, Dr. Weyl warmly recommended the London plan of regulating traffic by placing the lamp-posts in the middle of the street.—*Lancet.*

AMERICAN STANDARD FOR SEWER-PIPES.—Messrs. Blackmer & Post, of St. Louis, are large makers of vitrified sewer-pipes. Having been led to suppose that a change in dimensions of these articles would be advantageous, they took the step of sending out a circular to the city engineers, sewer commissioners, civil engineers, and others in the United States interested in sanitary matters, asking their opinions upon the subject. It was proposed to make the sewer-pipes in 2*ft.* lengths, instead of the usual 2*ft.* lengths. Over 500 replies were received, and 95 per cent. of these were in favour of the change. This has led the firm to change its standard of length, and other makers, says *Engineering News*, from which journal we take these particulars, will doubtless follow to meet this well-expressed demand for longer sewer-pipes. Long and Y junctions, however, are to remain 2*ft.* long as before. Another change in the American sewer-pipe is the alteration of the socket, which was formerly 1 1/2 in. deep, and is now increased to 3 in.

A STRONG PAVING-BRICK.—Mr. W. N. Williams, in a letter to an American technical paper, gives particulars of tests made with a paving-brick, which would seem to possess very remarkable properties. The tests were made by the Mechanical Superintendent of the Union Pacific Railway shops at Omaha. The brick is known as the "Wale Paving-brick," and is the subject of a United States patent. One specimen, a square inches in area, was subjected to crushing stress of 23,000 lbs. to the square inch, and then gave way by simply cracking in two. A piece of Sioux Falls granite, 4 in. square, tested at the same time to afford a basis of comparison, crushed when subjected to 23,300 lbs. to the square inch. The brick is said to be made of fire-clay, but in this case, we are told, the great strength of the material is due to peculiar earth found in the neighbourhood of Omaha. It is not stated how much of the "peculiar earth" is required, but, if the quantity is not excessive, one would think it would pay to import it and make these bricks in this country.

ELECTRICITY & GAS IN BERLIN.—To what extent illumination by means of electricity is becoming popular in Berlin can be seen by the figures contained in the 1890-91 report of the municipal gas-works of that city. Instead of having had to supply the inhabitants with an extra five million cubic metres of gas, as in the preceding year, only two and a-half million cubic metres extra were required, and this in its spite of an extraordinary increase in the number of new tenements and new streets. In the city proper the amount of gas required during the year 1890-91 was 7.9 per cent. less than the amount supplied in 1889-90.

NEW CLOCK, SCALBY PARISH CHURCH, near SCARBOROUGH.—Scalby, so well known to visitors to Scarborough, has had an important addition to its old parish church in the shape of a public clock, with two large external dials, one facing eastward, over the body of the church, towards the village of Scalby, the other on the west, towards the residence of the donor, Mr. J. E. Ellis, M.P., Wretham, Scalby, and the school at cottages adjoining. The clock strikes the hour upon the large or tenor bell. The work has been executed by Messrs. William Potts & Sons, Leeds.

BRUSSELS A SEAPORT.—An advance has been made with the scheme for making Brussels a seaport, as, according to official statements, the cost of enlarging the existing canal to the sea is estimated at 550,000*l.*, the cost of the harbour works and dry dock at Brussels at 500,000*l.*, and the enclosing of the river Sennette, at 83,000*l.* Negotiations are now in progress as to the division of the cost between the State and the provinces.

DEATH OF MR. THOMAS BEATY, CARLSLE.—We regret to announce the death, at the early age of forty-seven years, of Mr. Thomas Beaty, of the firm of Beaty Bros., builders, of Carlisle, which occurred on the 17th inst.

Those marked with an Asterisk (*) are advertised in this Number. Competition, p. iv. Contracts, pp. iv., vi., viii., ix., & xxiii. Public Appointments, p. xx & xxi.

THE ENGLISH IRON TRADE.—Consequent upon the break in Scotch warrants reported last week, the English iron market has been very irregular; in most districts depression is the prevailing characteristic.

A LARGE WIRE ROPE.—What is said to be the heaviest colliery wire-rope ever made in Sunderland has been produced by the Hendon Patent Rope Co. It is six miles in length, and weighs twenty-four tons.

ELECTRICAL EXHIBITION IN MOSCOW.—It is officially announced that an international Electrical Exhibition will be held in Moscow between April 14 and October 14 next.

THE FIRST TELEPHONE IN BULGARIA.—The first telephone in Bulgaria has just been opened between Sophia and Philippopolis, a distance of 160 kilometres.

ARTISANS', LABOURERS', AND GENERAL DWELLINGS COMPANY.—The twenty-fifth annual report of this Company states that the principal work of the year has been the completing of the blocks of buildings at Rossmore-street; the pressing forward of the blocks at Skinners'-street and Crawford-street; and the elaboration of a detailed scheme for the development of the Leigham-court estate.

plans in connexion with Leigham-court have received careful consideration and study in order to meet the various requirements of the London County Council, and of the Local Authorities; and the assent of these Authorities has now been given to their proposals.

MEETINGS.

SATURDAY, FEBRUARY 27.

Builders' Foremen and Clerks of Works Institution.—Annual Dinner, Holborn Restaurant, 8 p.m.

MONDAY, FEBRUARY 29.

Surveyors' Institution.—Adjourned Discussion on Mr. J. W. Crover's paper, entitled "An Explanation of the London Water Question," 8 p.m.

TUESDAY, MARCH 1.

Institution of Civil Engineers.—Discussion on the following papers:—(1) "The Bishop Rock Light-houses," by Mr. W. T. Douglass. (2) "The Illumination by Gas of Tory Island Light-house, Co. Donegal," by Mr. David C. Salmond, 8 p.m.

WEDNESDAY, MARCH 2.

Carpenters' Hall, London Wall.—Professor T. Roger Smith on "Sanitary Construction of Public Buildings," 8 p.m. (Admission free).

THURSDAY, MARCH 3.

Society of Arts (Indian Section).—Surgeon-General Sir William James Moore on "Indian Sanitation and the International Congress of Hygiene," 4.30 p.m.

FRIDAY, MARCH 4.

Architectural Association.—Mr. J. Alfred Gatch on "How they Built in Shakespeare's Time," with lantern illustrations, 7.30 p.m.

SATURDAY, MARCH 5.

Institution of Civil Engineers.—Students' visit to the Oil-gas Works of the Great Northern Railway at Holloway, 3 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS. 1,767.—SASH-FASTENER: J. Trick.—This patent refers to what is described as an improved ventilating sash-fastener, whereby the window or sashes may be partially opened at top or bottom for ventilation and may be fastened in that position from the inside, and so secured from burglars or from being shaken by the wind.

walls, composed of a series of longitudinal sections, built vertically, to slide horizontally forward over each other, as described and illustrated. There is also described the combination and use of a series of horizontal frames, and of sectional excavating side frames, working horizontally over each other.

NEW APPLICATIONS FOR LETTERS PATENTS.

February 3.—2,318, M. Syer, Disinfecting Apparatus for attachment to Flushing Cisterns, Pipes, &c.—2,349, M. Syer, Syphon Flushing Tank.—2,355, C. Baker, Safety Valve.—2,354, G. Thompson, Sails.—2,373, Sir A. Hickman, Refractory and Basic Bricks and Tuyeres.—2,385, M. Hailam, Fasteners for the Cords of Window-blinds.—2,392, W. and E. Freeman, Flushing Tanks or water waste devices.

February 9.—2,345, H. Sutcliffe, Water-closet Basins, and in Means of Ventilating the Soil-pipes of same.—2,347, H. Whiteley, Automatic Safety Apparatus for Opening and Closing the Doors of Hottow-2,436, F. Phelps and H. O'Brien, Carpenters' Planes, also applicable to Levels.—2,547, H. Baxter, Windows.

February 10.—2,560, W. Andrews, Door spring.—2,563, R. Kirtley, Chimney and Ventilating Shaft.—2,565, R. Milne, Double-locking Bolts for Doors, French Windows, &c.—2,585, W. Mounsey, Finishing and Ventilating Apparatus for Water-closets.—2,602, W. Sterling and T. Swan, Sanitary and Venting Pipes.—2,617, J. B. Somers, Constructing Sewers and Drains.—2,614, W. Bly, Flushing Apparatus for Closets, &c.

February 11.—2,642, W. Shaddock, Protection of Wood, Granite, or other Pavement in Bondways and Trays.—2,651, B. Somers, Preplaces.—2,653, W. Wardie, Ventilating Fans.—2,657, B. Faux, Stops or Checks for Doors, &c.—2,661, J. Green, Unions and Pipes for Drainage Purposes and Soil-pipes.—2,711, E. Humpherson, Automatic or Intermittent System of flushing Apparatus.—2,713, T. McCulloch, Window Sash-fasteners.—2,716, E. Parr, Screws.

February 13.—2,813, W. McKinlay, Automatic Sash-fastening Apparatus.—2,814, J. H. Hinglinton, Roofing Sheet.—2,872, H. Alexander, Chimney-tops to prevent Down-draughts, &c.—2,894, J. Golding, Arches or Grids for Flooring.

PROVISIONAL SPECIFICATIONS ACCEPTED.

21,083, W. Whitehead, Recording and Checking Workmen's Time, and for other similar purposes.—22,210, F. Wray, Apparatus for the Record of the Working of Sewer-pipes or Soil-pipes.—22,632, T. Anderson, Gasfitting.—6, G. Harrington, Cowl and Shaft Arrangements for Ventilation.—20, J. Bennett, Ventilation of Sewers and Drains.—28, G. H. Somers, Construction of Water-closets for use in Railway Carriages, &c.—46, R. Yorke, Earthenware Pipes.—T. Hunt, Glazing of Earthenware Pipes, and analogous Articles.—379, G. Parkinson, Ventilating Chimney or other Shafts.—491, W. White and H. Harry, Coverings for Walls, &c.—651, H. Sayle, New Automatic Noiseless Flushing Valve for Water-closets and Urinals.—905, T. Lane and A. May, Chimney-tops for the Prevention of the Escape of Smoke.—1,017, H. Haosen and others, Hoods or Cows for Ventilating or other Shafts.—1,323, A. Ransome, Machinery for Lifting and Cutting Timber.—1,600, H. Lake, Wood-working Machine.—1,555, E. J. Scherer, Cog Wheel.—1,577, J. Ostaway, Window-sashes.—1,321, R. Ardagh, Wooden Paving or Flooring Blocks.

COMPLETE SPECIFICATIONS ACCEPTED.

(Open to Opposition for Two Months.)

3,371, J. Piccaver, Fastener for Doors, &c.—6,041, J. Craven, Kilns for Drying and Burning Bricks or other articles or materials.—6,274, J. Jay, Lid-wood fastener.—22, Green-st., Bethnal Green, E., 620, J. 1,152; 105 and 107, Benwell-rd., Holloway, u. 42 yrs., g. 121, 3502.—By D. Watson & Sons; E. G. of 6002, with reversion in 41 yrs., Cannon-st., E. C., 18,254, 1 to 6, Stafford-cottages, Bedfordington, 1, 3504.—By Messrs. "Prologos;" No. 13, St. James's-sq., u. 52 yrs., g. 1002, r. 1,270, 10,000.—By H. J. Bliss & Sons; E. G. of 201, with reversion in 18 yrs., Elmwood, &c., Islington, 6307; 222, Green-st., Bethnal Green, E., 620, 4,152; 73, Moss-st., u. 282, 128, 2507; 185, Green-st., E. C., 324, 652; 104, Harrow-pl., 2502.—By Gilders Boro; 110, Murray-st., Hoxton, u. 50 yrs., g. 44, 48, 553, 535; 68 and 67, Ashburton-grove, Holloway, u. 145 yrs., g. 8, 81, 84, r. 2,412, 2,413, 2,414, 2,415, 2,416, 2,417, 2,418, 2,419, 2,420, 2,421, 2,422, 2,423, 2,424, 2,425, 2,426, 2,427, 2,428, 2,429, 2,430, 2,431, 2,432, 2,433, 2,434, 2,435, 2,436, 2,437, 2,438, 2,439, 2,440, 2,441, 2,442, 2,443, 2,444, 2,445, 2,446, 2,447, 2,448, 2,449, 2,450, 2,451, 2,452, 2,453, 2,454, 2,455, 2,456, 2,457, 2,458, 2,459, 2,460, 2,461, 2,462, 2,463, 2,464, 2,465, 2,466, 2,467, 2,468, 2,469, 2,470, 2,471, 2,472, 2,473, 2,474, 2,475, 2,476, 2,477, 2,478, 2,479, 2,480, 2,481, 2,482, 2,483, 2,484, 2,485, 2,486, 2,487, 2,488, 2,489, 2,490, 2,491, 2,492, 2,493, 2,494, 2,495, 2,496, 2,497, 2,498, 2,499, 2,500, 2,501, 2,502, 2,503, 2,504, 2,505, 2,506, 2,507, 2,508, 2,509, 2,510, 2,511, 2,512, 2,513, 2,514, 2,515, 2,516, 2,517, 2,518, 2,519, 2,520, 2,521, 2,522, 2,523, 2,524, 2,525, 2,526, 2,527, 2,528, 2,529, 2,530, 2,531, 2,532, 2,533, 2,534, 2,535, 2,536, 2,537, 2,538, 2,539, 2,540, 2,541, 2,542, 2,543, 2,544, 2,545, 2,546, 2,547, 2,548, 2,549, 2,550, 2,551, 2,552, 2,553, 2,554, 2,555, 2,556, 2,557, 2,558, 2,559, 2,560, 2,561, 2,562, 2,563, 2,564, 2,565, 2,566, 2,567, 2,568, 2,569, 2,570, 2,571, 2,572, 2,573, 2,574, 2,575, 2,576, 2,577, 2,578, 2,579, 2,580, 2,581, 2,582, 2,583, 2,584, 2,585, 2,586, 2,587, 2,588, 2,589, 2,590, 2,591, 2,592, 2,593, 2,594, 2,595, 2,596, 2,597, 2,598, 2,599, 2,600, 2,601, 2,602, 2,603, 2,604, 2,605, 2,606, 2,607, 2,608, 2,609, 2,610, 2,611, 2,612, 2,613, 2,614, 2,615, 2,616, 2,617, 2,618, 2,619, 2,620, 2,621, 2,622, 2,623, 2,624, 2,625, 2,626, 2,627, 2,628, 2,629, 2,630, 2,631, 2,632, 2,633, 2,634, 2,635, 2,636, 2,637, 2,638, 2,639, 2,640, 2,641, 2,642, 2,643, 2,644, 2,645, 2,646, 2,647, 2,648, 2,649, 2,650, 2,651, 2,652, 2,653, 2,654, 2,655, 2,656, 2,657, 2,658, 2,659, 2,660, 2,661, 2,662, 2,663, 2,664, 2,665, 2,666, 2,667, 2,668, 2,669, 2,670, 2,671, 2,672, 2,673, 2,674, 2,675, 2,676, 2,677, 2,678, 2,679, 2,680, 2,681, 2,682, 2,683, 2,684, 2,685, 2,686, 2,687, 2,688, 2,689, 2,690, 2,691, 2,692, 2,693, 2,694, 2,695, 2,696, 2,697, 2,698, 2,699, 2,700, 2,701, 2,702, 2,703, 2,704, 2,705, 2,706, 2,707, 2,708, 2,709, 2,710, 2,711, 2,712, 2,713, 2,714, 2,715, 2,716, 2,717, 2,718, 2,719, 2,720, 2,721, 2,722, 2,723, 2,724, 2,725, 2,726, 2,727, 2,728, 2,729, 2,730, 2,731, 2,732, 2,733, 2,734, 2,735, 2,736, 2,737, 2,738, 2,739, 2,740, 2,741, 2,742, 2,743, 2,744, 2,745, 2,746, 2,747, 2,748, 2,749, 2,750, 2,751, 2,752, 2,753, 2,754, 2,755, 2,756, 2,757, 2,758, 2,759, 2,760, 2,761, 2,762, 2,763, 2,764, 2,765, 2,766, 2,767, 2,768, 2,769, 2,770, 2,771, 2,772, 2,773, 2,774, 2,775, 2,776, 2,777, 2,778, 2,779, 2,780, 2,781, 2,782, 2,783, 2,784, 2,785, 2,786, 2,787, 2,788, 2,789, 2,790, 2,791, 2,792, 2,793, 2,794, 2,795, 2,796, 2,797, 2,798, 2,799, 2,800, 2,801, 2,802, 2,803, 2,804, 2,805, 2,806, 2,807, 2,808, 2,809, 2,810, 2,811, 2,812, 2,813, 2,814, 2,815, 2,816, 2,817, 2,818, 2,819, 2,820, 2,821, 2,822, 2,823, 2,824, 2,825, 2,826, 2,827, 2,828, 2,829, 2,830, 2,831, 2,832, 2,833, 2,834, 2,835, 2,836, 2,837, 2,838, 2,839, 2,840, 2,841, 2,842, 2,843, 2,844, 2,845, 2,846, 2,847, 2,848, 2,849, 2,850, 2,851, 2,852, 2,853, 2,854, 2,855, 2,856, 2,857, 2,858, 2,859, 2,860, 2,861, 2,862, 2,863, 2,864, 2,865, 2,866, 2,867, 2,868, 2,869, 2,870, 2,871, 2,872, 2,873, 2,874, 2,875, 2,876, 2,877, 2,878, 2,879, 2,880, 2,881, 2,882, 2,883, 2,884, 2,885, 2,886, 2,887, 2,888, 2,889, 2,890, 2,891, 2,892, 2,893, 2,894, 2,895, 2,896, 2,897, 2,898, 2,899, 2,900, 2,901, 2,902, 2,903, 2,904, 2,905, 2,906, 2,907, 2,908, 2,909, 2,910, 2,911, 2,912, 2,913, 2,914, 2,915, 2,916, 2,917, 2,918, 2,919, 2,920, 2,921, 2,922, 2,923, 2,924, 2,925, 2,926, 2,927, 2,928, 2,929, 2,930, 2,931, 2,932, 2,933, 2,934, 2,935, 2,936, 2,937, 2,938, 2,939, 2,940, 2,941, 2,942, 2,943, 2,944, 2,945, 2,946, 2,947, 2,948, 2,949, 2,950, 2,951, 2,952, 2,953, 2,954, 2,955, 2,956, 2,957, 2,958, 2,959, 2,960, 2,961, 2,962, 2,963, 2,964, 2,965, 2,966, 2,967, 2,968, 2,969, 2,970, 2,971, 2,972, 2,973, 2,974, 2,975, 2,976, 2,977, 2,978, 2,979, 2,980, 2,981, 2,982, 2,983, 2,984, 2,985, 2,986, 2,987, 2,988, 2,989, 2,990, 2,991, 2,992, 2,993, 2,994, 2,995, 2,996, 2,997, 2,998, 2,999, 3,000, 3,001, 3,002, 3,003, 3,004, 3,005, 3,006, 3,007, 3,008, 3,009, 3,010, 3,011, 3,012, 3,013, 3,014, 3,015, 3,016, 3,017, 3,018, 3,019, 3,020, 3,021, 3,022, 3,023, 3,024, 3,025, 3,026, 3,027, 3,028, 3,029, 3,030, 3,031, 3,032, 3,033, 3,034, 3,035, 3,036, 3,037, 3,038, 3,039, 3,040, 3,041, 3,042, 3,043, 3,044, 3,045, 3,046, 3,047, 3,048, 3,049, 3,050, 3,051, 3,052, 3,053, 3,054, 3,055, 3,056, 3,057, 3,058, 3,059, 3,060, 3,061, 3,062, 3,063, 3,064, 3,065, 3,066, 3,067, 3,068, 3,069, 3,070, 3,071, 3,072, 3,073, 3,074, 3,075, 3,076, 3,077, 3,078, 3,079, 3,080, 3,081, 3,082, 3,083, 3,084, 3,085, 3,086, 3,087, 3,088, 3,089, 3,090, 3,091, 3,092, 3,093, 3,094, 3,095, 3,096, 3,097, 3,098, 3,099, 3,100, 3,101, 3,102, 3,103, 3,104, 3,105, 3,106, 3,107, 3,108, 3,109, 3,110, 3,111, 3,112, 3,113, 3,114, 3,115, 3,116, 3,117, 3,118, 3,119, 3,120, 3,121, 3,122, 3,123, 3,124, 3,125, 3,126, 3,127, 3,128, 3,129, 3,130, 3,131, 3,132, 3,133, 3,134, 3,135, 3,136, 3,137, 3,138, 3,139, 3,140, 3,141, 3,142, 3,143, 3,144, 3,145, 3,146, 3,147, 3,148, 3,149, 3,150, 3,151, 3,152, 3,153, 3,154, 3,155, 3,156, 3,157, 3,158, 3,159, 3,160, 3,161, 3,162, 3,163, 3,164, 3,165, 3,166, 3,167, 3,168, 3,169, 3,170, 3,171, 3,172, 3,173, 3,174, 3,175, 3,176, 3,177, 3,178, 3,179, 3,180, 3,181, 3,182, 3,183, 3,184, 3,185, 3,186, 3,187, 3,188, 3,189, 3,190, 3,191, 3,192, 3,193, 3,194, 3,195, 3,196, 3,197, 3,198, 3,199, 3,200, 3,201, 3,202, 3,203, 3,204, 3,205, 3,206, 3,207, 3,208, 3,209, 3,210, 3,211, 3,212, 3,213, 3,214, 3,215, 3,216, 3,217, 3,218, 3,219, 3,220, 3,221, 3,222, 3,223, 3,224, 3,225, 3,226, TO CORRESPONDENTS.

G. M. M. There are unfortunately a good many instances of this kind of procedure here, but it is mostly only the result of obscure members of the profession. "General Foreman" (no name or address enclosed)—J. H. P.—G. B. C. (both have attention)—S. W. (should have sent amount)—P. W. (Hills)—G. J. R. (no label).
 All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.
 Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
 We cannot undertake to return rejected communications.
 Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED.
 All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 13a, per annum (or 4s. 9d. per quarter), can ensure receiving "The Builder" by Friday Morning's post.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER," LONDON.

The London County Council Election.

THIS number of the *Builder* reaches the hands of its readers, most of those who have their business house or place of residence in London will, no doubt, be turning their mind in which their vote shall be given at the County Council Election. We assume that no person who takes sufficient interest in municipal affairs, or in professional matters, as to be a reader of the *Builder*, will fail to vote at this election. The true way in which to assure the prosperity of the Metropolis, and to safeguard a prudent progress, is for each citizen to exercise his franchise. But it must be confessed that householders may well be in doubt what course to pursue at this election. Most men who look at things in a business-like and calm manner must regret that political influences have come so largely into this election, and that the political machinery of the Metropolis has been imported into the present struggle. It is difficult for men to realise the enormous material and social interests which the County Council has to serve. The work connected with a seat on this municipal council would tax the ability and the tact of the most capable of our men of business; and no one with a knowledge of current affairs will deny that in our large mercantile centres are to be found men of higher ability and greater practical capacity than any, except two or three, of our leading statesmen. It is such persons that we wish to see members of the London County Council,—men versed in business, well acquainted with practical work, accustomed to the management of large concerns; merchants, architects, engineers, and those who have served their country in important official places beyond the seas. The struggling journalist, the pushing harrister, the doctrinaire with a fad to air, inexperienced and without a capacity for business, these are the persons we do not wish to see on the County Council. We do not deny that a consider-

able amount of useful work has been done by the late Council, but we assert emphatically that a great deal of valuable time has been wasted by useless talk, and by mere academic discussion. We hope to see this remedied in the new Council, but it will not be cured unless the majority are composed of men of business, having a central object in view. This object is the good administration of London as it is. There is work enough and to spare, without entering on new ventures. Take for example the purchase and the working of tramways. This is a standing example of ill-considered zeal. The Council have enough to do with those matters under their control, yet they rush into new schemes when those matters over which they already have control are not satisfactorily managed. Again, take for example the resolution which was passed on April 11, 1889, that the Council should have control of the police. This was done by a body which had been barely three months in existence, which could not possibly appreciate the extent and difficulty of its existing work, and which had yet to obtain the confidence of its constituents. This act showed not only a spirit of overweening self-confidence, but a want of appreciation of the true administrative functions of the Council. It is this spirit which we desire to see banished from the new Council, and replaced by one of modest but anxious solicitude for economy and good administration.

The practical question for the voter to answer is how is he to do something by his vote towards this object. As we have already stated, we look at the election absolutely without party bias. Regarding the two parties, the Progressives and the Moderates, from this point of view, we cannot but note that the Progressives are the party which in principle asks for larger powers, and desires new principles of administration; while the Moderates desire to administer the affairs of London as they are and in an economical spirit. Therefore, without going into personal questions, a Moderate candidate is primarily more worthy of support than a Progressive candidate. In certain instances, however, the Progressive candidate may be a man of greater business capacity than his Moderate opponent. Under such circumstances it may

be desirable to support a Progressive candidate. But such a step should be taken with caution, and only when the personal capacity and character of the candidate are thoroughly known.

On the other hand, some of the Moderate candidates seem to be possessed mainly by the spirit of opposition, and to be ready to frame their programme not according to any consideration of what should be the proper scope and powers of the future County Council, but on the mere principle of opposing anything and everything that is suggested by the "Progressives." Such a candidate, for instance, will announce his intention to oppose the placing of the Water Supply of London in the hands of the Council (obviously the most fitting body to deal with the supply of a necessary of life which ought not to be made a vehicle for money-making), on no other apparent ground but because taking over the water supply is part of the Progressive platform. This kind of thing is simply puerile, and only shows that the Moderates themselves, or some of them, are just as guilty of importing party politics into the County Council as any of the Progressives. The essence, or the essential evil, of party politics, consists in the pursuance of a course of action merely to thwart the opposite party, and not because it appears in itself the best course for the general good. The spread and increase of this spirit of mere party opposition is one of the great curses of public life in the present day, and it can nowhere be more out of place than in a body the primary duty of which is the carrying out of the works necessary for the material management and well-being of such an immense city as London.

As we have said, the question must in many instances be one difficult for the voter who wishes to do his best for the Metropolis to decide. In some instances in America independent citizens have combined to place men on municipal councils who are free from political influence and belong to no party. If the result of the present election is unsatisfactory, there can be no question that before another election comes round some such movement must be begun in London. For the moment, however, the duty of every voter appears to be to vote for practical

End Wall of a Drawing room. From "Works in Architecture, by Robert and James Adam."

men, and also to bear in mind that the Progressive party have had the upper hand on the late Council, and that the spirit of their programme is theoretical rather than practical.

WILLESDEN.—A new cottage hospital is about to be built from the designs of Messrs. Newman & Newman, architects. The accommodation to be at first provided is for nine beds, with the necessary offices; but the plans provide for the future extension of the building to accommodate eight male and eight female patients, with a separation ward.

ROBERT ADAM.

THE 3rd of March will have recalled to memory the name of a man well known in the history of architecture, and, indeed, of art generally, for on that day exactly a hundred years ago died Robert Adam, whose inventive genius wrought a considerable change in the architectural style of his day, and whose taste and compositions,—although the one has been denounced as "vicious" and the other

as "depraved,"—have established his fame as an independent artist and a man who has left his mark on the architectural history of this country.

Robert Adam was born in 1728 at Kirkcaldy, in Fifeshire (the birthplace also of Adam Smith), and was the second and, we may add, the most noted of four brothers, sons of William Adam of Maryburgh, himself an architect of some distinction, having designed Hopetoun House and the Royal Infirmary at Edinburgh, and holding also the appointment of

Design for Chimney-piece. From "Works in Architecture, by Robert and James Adam."

King's Mason at Edinburgh. He was educated at Edinburgh University, where he formed friendships with such men as Hume, Robertson the historian, Adam Smith (author of "The Wealth of Nations"), and Adam Ferguson. In later life, too, he enjoyed the friendship and society of Archibald, Duke of Argyll, the Earl of Mansfield, and many other notabilities of his day.

In order to improve his knowledge of his art, the young architect visited Italy in 1754 in company with a clever French draughtsman named Clérissseau, and remained there until 1757, in which year he sailed from Venice to Spalato (as it was then called). There he was busily engaged for some time studying and making careful drawings of the ruins of Diocletian's palace for the purpose of obtaining some idea of the residential architecture of the ancients, the knowledge of Classical architecture in England being at that time almost entirely confined to public buildings. During his absence from England he was elected a Fellow of the Royal Society, and also of the Society of Antiquaries, and, after his return, was appointed architect to the King. In 1768, however, he was elected Member of Parliament for the county of Kinross, and had consequently to resign that position.

In the following year, in conjunction with his brother James, he began the large block of buildings on the banks of the Thames with which their names are associated. The shore was raised by means of a succession of arches, upon which were built three fine streets, and a terrace facing the river, the locality being called the Adelphi (*ἀδελφοί*, brothers), in memory of himself and his brothers. Before the scheme could be carried out, it was necessary to reclaim a portion of land from the Thames, a proceeding which was strongly opposed by the Corporation, who claimed the ground beneath the river as their property. The brothers, however, obtained a Bill in 1771 enabling them to effect their purpose. As a commercial speculation, this undertaking proved a failure, and in 1774 another Bill was obtained, sanctioning the disposal of it by lottery.

Robert Adam's more important works were the *façade* of the Admiralty, which was built to hide the inelegant portico designed by Thomas Ripley; Luton House, Beds; Lansdowne House, Berkeley-square; Caen Wood House, near Hampstead; Osterley House, near Brentford; Stion House; Kedleston, Derbyshire; Compton Verney, Warwickshire; and the General Register House, Edinburgh.

The brothers Adam are generally credited with introducing the method of building several houses together, so as to represent, when completed, one building of imposing dimensions, instances of which may be seen in Portland and Hamilton Places, and elsewhere. They appear, also, to have introduced the practice of facing brick houses with stucco. In 1764 Robert published the results of his visit to Diocletian's Palace at Spalato, and in 1773, with the co-operation of his brother James, commenced the publication of "The Works in Architecture of R. and J. Adam," which was not completed until 1822, after the death of both authors.

The great merit of the Adams, says Ferguson, "is that they stamped their works with a certain amount of originality, which, had it been of a better quality, might have done something to emancipate art from its trammels. The principal characteristic of their style was the introduction of very large windows, generally without dressings. These they frequently attempted to group three or more together, by a great glazed arch over them, so as to try and make the whole side of a house look like one room." Ferguson's rather hald criticism, however scarcely does justice to Robert Adam (whom we may take to have been the real mind of the "firm"), as he omits to take into account one of his greatest merits, namely that of refinement of detail, and the fact that, while, basing his work on Classic models, Adam put a good deal of his own spirit and treatment into the details, and to

some extent invented what may be called a sub-style of Renaissance of his own. He was especially good in his design for the internal decorative treatment of his buildings, and much of his design for furniture detail and the decorations of doors and windows is very good. His style in this kind of work is no doubt open to the charge of being too "pretty" and sometimes verging on flimsiness; but in spite of these defects his work was never vulgar. We give reproductions of two designs showing his treatment of this class of work. The first of these, the section of one end of the "second drawing-room" in the Earl of Derby's house in Grosvenor-square (as given in his "Works in Architecture") is a typical example of his manner of treating the side of a room, and partly illustrates the device on which Ferguson lays rather too much stress, of grouping two openings under one arch, the tympanum over the doors being in this case filled with a graceful ornamental design of somewhat Pompeian character, only that it is in relief instead of being painted. The other illustration shows a design for a chimney-piece and looking-glass frame or overmantel in the same house. The floating wreaths, cut out so as to hang free of the main design, are certainly not in very pure taste, and we should not wish to see such a feature imitated in decorative work now; but the remainder of the details are exceedingly refined and graceful in their way.

In his exterior architecture there is no doubt that Adam's style was very deficient in architectural incident, force, and generally in picturesqueness (though there are exceptions in this latter respect), but it had also the merit of refinement, and it must be said also that his buildings look better in execution than they do in the highly-finished but tame and mechanically-shaded elevations in which he illustrated them. Yet even these drawings are of interest in their way, as showing how completely the architectural taste of one age is opposed to that of another. In the present day there is always an endeavour, even in elevation drawing, to secure a certain degree of picturesque surface texture. Yet a century and a half ago the ablest and most successful English architect of his day lavished the greatest care in engraving and the most sumptuous pages, both in regard to size and quality of paper, on drawings from which all that we call picturesque was carefully excluded. It is useful to bear this in mind, and to consider whether possibly our present picturesque method of drawing architecture may not seem as much beside the mark to our descendants a century hence.

The book to which we have referred, "Works in Architecture of Robert and James Adam, Esquires" (not "architects," please to note) is in itself a remarkable relic of architectural illustration of a former day. It is in two mighty folios, printed on thick paper, and the text in broad parallel columns of English and French. The fact that it was thought necessary to have this dual language is an indirect testimony to the fact, which we know otherwise, that Adam's reputation was not only English but European. There is an anecdote we remember to have read (but cannot give the source of it) of Robert Adam's reply to the agent of some nobleman who was very much offended because the architect would not waste time in waiting two or three days to have an interview with him about a building: "Does he expect that I, who have been presented to nearly all the crowned heads in Europe, am to lose my time waiting on his pleasure?"

Robert Adam continued to display his vigorous talent almost up to the day he died, for in the year preceding his death he designed no less than eight public buildings and twenty-five private houses. His talent, however, was not confined to the limits of his own profession, for he gained no little distinction as a designer of ornamental furniture, and also as a landscape painter. He was also a man of high social qualities, a good singer and evidently

admired for his accomplishment in this respect; we quoted some time since the enthusiastic reference to him made by Fanny Burney in the diary of her younger days, where she (who was well qualified to judge) mentions his singing with admiration, and his conversation with even more enthusiasm, and evidently thought him one of the most pleasant companions for an evening that she had ever met.

It is a curious circumstance that two different branches of art,—painting and architecture,—should have been deprived almost simultaneously of their respective leaders, for only a week previously to the death of Adam, Sir Joshua Reynolds was carried to his last resting-place in St. Paul's Cathedral. The eminent architect died at his house in Albemarle-street, and was interred on March 10 in the south aisle of Westminster Abbey,—a sufficient proof of the estimation, both socially and professionally, in which he was held. The pall was supported by the Duke of Buccleuch, the Earl of Coventry, the Earl of Lauderdale, Lord Viscount Stormont, Lord Frederick Campbell, and Mr. Pulteney.

NOTES.

WHATEVER may be the ultimate result of the forthcoming stoppage in the coal trade, there seems but little doubt that merchants and agents will fare best at the outset. The general public,—especially those whose circumstances compel them to adopt a "hand-to-mouth" system with regard to coal,—are finding already that it will be a somewhat expensive experiment, as far as they are concerned. For the action of the miners in forcing a stoppage is regarded on all hands as an experiment, and one the effect of which it is very difficult to forecast. The officials of the Miners' Federation are careful to state that they have no wish to raise the price of coal to the consumers; but it is difficult to see what else they could expect. Mr. Pickard, M.P., who may be said to have built up the Federation, justifies the stoppage in the following terms:—(1) Because there is no lessened demand for coal. 2. The general public do not and will not gain any benefit if coal is lowered. 3. Because the lowering of the price of contract coal will do three things: (a) Lessen coal owners' profits; (b) lower miners' wages if allowed; (c) transfer or put into dividend-hunters' pockets the money coal owners and miners should have put into theirs. There is no depression in the coal trade," says Mr. Pickard, "and we are setting political economy at defiance, as we did in 1888. We were condemned then, as we are now, and as we expect to be condemned." It will be seen that the position of manufacturers (who are urgently pressing for relief in price of coal and coke) is passed over without any consideration, and yet our manufacturers,—especially in the iron and steel trades,—are losing much of their old supremacy in foreign markets, mainly as a natural consequence of the higher wages obtained by this boasted policy of defiance. This is exemplified by the statistics recently published by the Board of Trade with respect to contracts for railway material for Egypt. Before the year 1889, we are told, English manufacturers almost invariably secured the orders for rolling-stock, &c., no Continental firms being able to quote so cheaply. Since that year, however,—i.e., following upon the general rise in wages so triumphantly referred to,—we have gradually had to give place to our foreign competitors, who have been enabled to offer prices we could not touch. Our quotations appear to have continued to advance, and last year, in an open contract for truck work, the lowest British tender was considerably higher than four separate Belgian and French quotations. When will the labour leaders recognise that it is a fallacy for them to regard these things as being no concern of theirs?

MR. A. S. MURRAY, in an interesting letter on the subject of the mausoleum controversy, offers us some figures in controversy of our opinion (page 154 *ante*) that Professor Gardner was in the right in judging that the statues of the mausoleum room at the British Museum are out of scale with the horses. "Science is measurement" (as Mr. Marks suggested in one of his cleverest pictures), and Mr. Murray's figures are important as far as they go. He compares the measurements of the heads of man and horse. He finds that the head of Mausolus in the statue is 15 in. in length, and that of the mausoleum horse 41 in., a proportion of 1 to $2\frac{2}{3}$. The head of the Theseus in the Parthenon pediment is 12 in. high, that of the horse of Helios $31\frac{1}{2}$ in., giving a proportion of 1 to $2\frac{3}{4}$. He has measured an ordinary man's head and an ordinary horse's head, and finds them respectively 9 in. and 24 in., giving a proportion of 1 to $2\frac{2}{3}$. This is pretty close certainly, as far as details are concerned; but there is no doubt the horse as a whole is larger in comparison with the figures than the Greeks generally represented them in sculpture (their horse being perhaps a small breed); and there is a general appearance about the mausoleum horses of breadth and simplicity of style, as if intended for a position far from the eye, while the figures are much more minute in detail. If they were in the chariot, they must have looked mere dolls at the height at which they were put. The scale is only one-fourth larger than that of the Parthenon pediment figures, and the height (if they were in the chariot) nearly three times as great. We do not (and did not) regard Professor Gardner's position as proved, but those statues do not look like works to be placed at such a height, or as running parallel with the horses in regard to mode of execution for the position. If they were placed in the quadriga, they must have entirely failed in their effect as portrait statues, and have looked rather awkwardly placed, standing up in a chariot with no action connecting them with the horses. They appear to us as figures which would have had a closer decorative connexion with the architectural design of the structure.

IF we are correctly informed by an auditor, Miss Sellers, in the first of a course of evening lectures at the British Museum, delivered on Tuesday last, in dealing with the architecture of the Parthenon, told her audience that the architectural design of the Parthenon resided in the *cella*, not in the external order, and that in place of the triglyphs representing the ends of beams and the metopes the spaces between them, the real explanation was that the triglyphs represented spaces to put the ends of the beams in, and the metopes the wall between. In regard to the latter statement the lecturer cited Vitruvius, who however does not precisely say that, but that the triglyphs were an ornamental covering over the ends of the beams. Anyone however who is acquainted with the forms of the quasi-timber rock-cut designs of Asia Minor (of which Vitruvius knew nothing) can have no doubt whatever as to what the triglyphs really represented; and it was exactly because they represented solid constructive portions that the Greek architects shifted the last triglyph to the angle of the building, instead of leaving it over the centre of the column as the Romans did; the Roman method aptly representing, no doubt, the false theory of Vitruvius. And in regard to the metopes, is Miss Sellers aware that in the Parthenon itself the metope slabs are thin facing-blocks which could carry no weight, and which are entirely separated from the wall structure? And that Mr. Tadema has found representations (we think at Pompeii) of metope slabs represented as turning on a pivot, an arrangement which he reproduced in one of his pictures? In regard to the main architecture of the building, no doubt the *cella* is the constructive *raison d'être* of the temple, but nearly all which makes the exterior architecture of the Parthenon expressive in detail resides in

the column and entablature. We have no wish to say unkind things, but this kind of architectural criticism, addressed to those who come to sit at the feet of a lecturer and learn wisdom, cannot be allowed to pass without comment. Such teaching confirms us in a belief we have long held, that woman is generically incapable of understanding construction and constructional expression in architecture, just as she is generically incapable of drawing buildings upright (a weakness which she shares, no doubt, with some painters of the other sex). It is amusing also to notice the emphasis laid on Vitruvius when he can be cited to support an eccentric theory of architecture, compared with the indifference with which he is dismissed with costs when (as in the matter of the Greek theatre) his statements do not fit in with the theories of Dr. Dörpfeld, the idol of the Hellenic lady students of the day.

IN Berlin, one may say throughout Prussia, a proposed reform in all matters relating to the education of the lower classes is causing intense excitement. The Prussian Government wishes to pass a piece of legislation which will cause an entire change in the administration, the curriculum, &c., of the Board Schools (a change which must have a most marked effect on the coming generation of the labouring classes) and their new Bill has been placed before the Diet. It is well to note that in framing their long list of proposals (worded in about two hundred paragraphs) the question of the housing of the school children during the hours of their education has had attention. Whilst, according to section 21 of the proposals, the civil governors of the provinces will have the right of making special general regulations for the erection of school buildings in their districts, the Government in section 22 distinctly wishes to see the following points taken into consideration throughout the country:—1. Every school is to have its own school-building, no part of which is to be used for any purpose liable to injure educational interests. 2. Every school class is to have a classroom for its own sole use. 3. In the selection of the site for a school-building sanitary requirements are to be taken into account, and in the planning of the building the amount of air and light to be given to each pupil, the mode of heating and ventilating to be adopted, the source of and the manner of distributing drinking-water, and the arrangement of the lavatories, are to have careful attention. 4. In each school-house there are to be residential quarters for at least one teacher. According to sec. 24, it will also be compulsory throughout the country to have an open space, "on which gymnastics can be exercised," and "on which the children can inhale fresh air during the pauses between each class hours," attached to, or in close proximity to, each school-building.

THE poor accommodation provided for third-class passengers on certain southern lines, to which we incidentally alluded a week or two ago, was last week the subject of an action at the Westminster County-court. The London Chatham and Dover Company sued a Mr. Addison for the difference between second and third-class fares between London and Birchington. The defendant admitted that on more than one occasion he had travelled in a second-class carriage with a third-class ticket, but stated that it was in consequence of the third-class carriages being so bad, and that he defended the action on public grounds. The Judge gave his verdict for the plaintiffs, but refused to allow costs, a decision which was received with loud applause,—renewed outside the court in the shape of approving newspaper comments. Now at the risk of being accused of condoning the short-comings of railway companies, we must say that this creates a very awkward precedent. A decision of this kind, when it does not carry costs, is really punitive as regards the plaintiff; and the

Judge, in refusing the application for costs with indignation, evidently intended it as a punishment. Singularly enough the President of the Board of Trade was interrogated in the House of Commons the following day, as to how railway companies could be prevented from allowing passengers holding third-class tickets to travel in carriages of a higher class. Sir Michael Hicks Beach could only reply that the evil complained of would be extremely difficult to prevent. Hitherto, the first and second-class carriages have been invaded by third-class passengers mainly in consequence of insufficient accommodation. After Judge Scott's decision, however, railway companies may plead that passengers appear to be encouraged in this proceeding whenever they choose to regard the accommodation provided as being unsatisfactory. Certainly they are not allowed to escape paying the difference in the fare in the event of being discovered, but they have only to force the companies to put the matter into Court to make the latter lose more than the amount of the fare in recovering it. It may be urged that the need for improvement is so great that this discovery of a practical way of bringing pressure to bear upon the delinquents is a public gain. But where is the line to be drawn? Who is to decide whether the accommodation provided is or is not worth a penny a mile? It is, after all, only a matter of comparison. The carriages complained of would perhaps have been regarded as almost luxurious on one of the early Parliamentary trains, although, compared with the general run of modern rolling-stock, they are wretchedly uncomfortable.

THE passing of the second reading of the Bill for constructing a tramway line across Westminster Bridge must not be taken as assuring its ultimate success, for, in Committee, the Bill may be so altered as to make it useless for it to be carried out. It is clear, however, that the House of Commons was right in sanctioning the principle of the Bill. There is ample room for a tramway line on the Embankment, and it will interfere with no "amenities." Whether, however, there is any real public demand sufficient to make this extension a financial success is doubtful. There are no places of business along the route, and the District Railway, with low fares, is in competition. We should therefore be in no way surprised if the project is never realised.

TO the catalogue of the Electrical Exhibition at the Crystal Palace, now no longer "under revision," has been added a guide to the exhibits in the form of "a personally-conducted tour by the Editor." We are glad to see that "watts per hour," to which we lately called attention, has been removed from the last edition. Had we hoped for this result we would have quoted the errors more nearly in bulk, instead of giving a sample only. Since a fourth edition cannot be expected, it is now too late, and we will only give one further instance:—"A joule is the heat generated by a current of one ampere flowing with the force of one volt through a resistance of one ohm. In other words, one watt per second will produce an amount of electrical heat called a joule." Here we have two definitions, the second only of which is approximately right—we say approximately, because the joule is also a measure of energy in forms other than heat; the first is not merely incorrect through admitting the time factor, but is also redundant. Will Mr. Dowling tell us how a current of one ampere can flow through a resistance of one ohm, under any other pressure than that of one volt?

THE interest taken in electricity and physical science, stimulated doubtless by the Exhibition now being held at Sydenham, is naturally reflected in current literature. No less than three leading London periodicals contain articles on these subjects in their March issue. First in importance and interest

is Lord Kelvin's contribution to the *Fortnightly Review* on the "Dissipation of Energy," a subject which he made his own, or, rather, which he originated just forty years ago, when he was plain Mr. Thomson. The *Nineteenth Century* has an article by J. E. H. Gordon, on the "Latest Electrical Discovery," and the *Contemporary Review* one by Mrs. Faithfull, on the "Electrical Cure for Cancer." We content ourselves for the present with simply noting the simultaneous appearance of these three articles, and reserve comment till next week.

THE February number of the *Journal of the Franklin Institute* contains the first instalment of Mr. Wm. S. Aldrich's papers on Electro-magnetic Machinery. Mr. Aldrich has evidently been struck by the beauty and simplicity of M. Reuleaux's analysis and classification of mechanisms in his classical work on the "Kinematics of Machinery"; and in these papers he aims at extending these modes of classification to dynamos, motors, &c., which could not be included in the original work, because they were not then invented. He is met at the outset by the difficulty of finding anything analogous to a kinematic chain in the transmission along a cable, but he holds out the knot by assuming (provisionally) Dr. Oliver Lodge's somewhat fanciful scheme of the "gear-wheel" construction of the ether. This once granted, the writer shows by considering several practical applications of the motor-generators, or combinations of motors and generator, what electro-magnetic equivalents can be devised for belts, spurring, and like means of transfer of rotation from one shaft to another, whether parallel or inclined at an angle. He then gives some ideal examples of what he calls the Electro-Kinematic Chain, which it is hopeless to attempt to make clear without the aid of a figure. The intention seems to be, by clamping the axle of a motor armature to cause the fly to rotate and to carry with it the dynamo which supplies current to the motor, and which is rigidly connected with the rotary field of the latter. Returning from the imaginary to the real, the writer describes two electric drills, calling special attention to the "mechanical equivalents" of the electro-magnetic mechanisms. He promises in a later paper to give a "diagram of the electro-magnetic mechanism of the Van Depoel machine," which is the latter of the two drilling machines described.

SOME old London house-signs have been recently added to the Guildhall Museum. They consist of an ostrich, carved in stone; the two leather bottles purchased on the demolition,—for rebuilding,—of "The Leather Bottle" public-house at the corner of Leather-lane and Charles-street, Hatton-garden; a stone carving (one head restored) of a two-headed spread eagle, with date 1669, and initials E. (or L.) R. M., presented by Mr. M. Pope, F.S.A. Whence this sign came is not known; the spread eagle formed a common device. The famed "Spread Eagle" tavern in Gracechurch-street, whose predecessor is cited by Taylor, the Water Post, in his "Carrier's Cosmographie," 1637, was pulled down in October, 1865. A fine specimen, and well preserved, is that of the "Cock and Bottle," in blue and white tiles. It belonged to a tavern on the southern side of Cannon-street, which was removed for an improvement of the thoroughfare in 1853-4. This sign was set up there about thirty years after the Great Fire. The house has been rebuilt, being now Nos. 91-6, and known by the same sign. A collection has been deposited in the Museum to illustrate the various shapes of the seventeenth century tobacco-pipes, whose discovery we announced in our issue of 6th ultimo. They were found in a bricked-in space beneath a vaulted cellar, on a spot that was latterly a garden, but where, according to Ogilby's survey of 1677, had stood a building of some

kind. In clearing the ground two old walls, 62 ft. apart, reaching southwards from against Staple-inn towards Took's-court, have been laid bare to a considerable depth. A few of the pipes bear, on the heel, the name of a maker,—"JOHN HUNT." The Tobacco-pipe Makers' Company, ranking seventy-eighth in precedence out of eighty-nine, were first incorporated in 17 James I.; they obtained fresh charters in 10 Charles I. and 15 Charles II., with jurisdiction throughout England and Wales. References to them and to losses sustained by the grant of monopolies to certain persons, will be found in the Calendars of State Papers (domestic) for the period 1641-1667. A report (1834) of the Commissioners appointed to inquire into municipal and trade corporations shows that at that time the Company comprised 316 members, all engaged in the trade, with an income of about 100l. yearly, derived for the most part from quarterage paid by non-freemen. A petition by pipe-makers, of London and Westminster, made to Parliament in December, 1643, against the duty on their wares avers that "nearly 1,000 poor persons" lived by that industry.

IT seems likely that the projected preservation of Hilly Fields, Lewisham, as an open space, will be accomplished. The purchase-money for the 41 acres is stated to be 42,000l. Towards this the London County Council agreed, last week, to contribute, conditionally, not more than 22,000l.; the Greenwich District Board have promised 7,000l.; and other subscriptions amount to about 8,000l. The fee of 17½ acres out of the area belongs to the Bridge House Estates; in respect of that portion, the Court of Common Council have decided to offer no opposition in the event of an application being made to Parliament for a Bill to enable the Corporation to sell the same. The Kyrle and the Commons Preservation Societies are co-operating with the Metropolitan Public Gardens Association to secure the ends in view.

AT Meers. Dowdeswell's Galleries are exhibited a series of forcible though rather slightly-executed sketches of "Native life in and around Tangier," by Mr. Aubrey Hunt, some drawings of Venice by MM. Vizzotto and Mainella, and a set (second series) of water-colour drawings of London churches, by Mr. C. H. Herne. These last are of considerable interest, and as far as artistic effect and colour are concerned they are drawings of a high order, and form a valuable series of illustrations of London topography. Unfortunately several of them are marred by bad drawing. In "St. Peter's, Cranley Gardens" (15) the spire is crooked; the tower of St. Mary-le-Strand (22) is out of drawing, the different stages not being set properly over each other; in "St. Margaret's Westminster" (24) the sketch of the clock-tower in the background is absurd; but the worst of all is the largest, a drawing of "St. Paul's at Daybreak" (20), very fine in effect and colour, but the dome is completely out of drawing, and looks as if it had been squeezed out of shape. It is extraordinary how few painters can draw a circular building in perspective. The two points constantly overlooked are, that the central portion of a horizontal cornice in this position is always a comparatively flat curve, dropping quickly into a sharper curve at the receding sides; and secondly, that the vanishing curves at each side must necessarily be exactly the same. In this drawing we have a sharply convex curve at one side and a nearly straight incline at the other. It might have been thought that any one undertaking a series of drawings of architecture would recognise that correct perspective was the necessary foundation for each work. Mr. Herne, it must be added, is by no means an exceptional sinner in regard to defects of this kind, which we have frequently seen in the works of artists of much greater reputation.

OUR Berlin correspondent writes that it will only be doing justice to the Berlin workmen to positively contradict all the statements that have appeared in the daily press charging them with participation in the tumults which occurred on Thursday and Friday last week in the streets of the Prussian capital. It is true that there is a great deal of distress and discontent in the city this month, owing to the artisans and labourers of the building trades, who are out of employment in the winter, not having their usual occupation with snow clearance; and it is also true that these unemployed, after having held a meeting in one of the suburbs, marched (some 3,000 strong) to the Town-hall to ask for relief works, and sent a deputation to the "Ober Burgermeister," who did not go to the trouble of even receiving them; but these men dispersed as quietly as they had come after they had found that they could not obtain a hearing. It was an entirely different crowd that took advantage of the apparent state of dissatisfaction among the workmen, a crowd made up of the scum of the populace,—roughs and idlers of the worst and most cowardly type. At present quiet reigns again as regards the roughs, and, as to those who really require help and whose discontent was unintentionally the indirect cause of the outbreak, we hear that the municipal authorities will vote some of the same to be spent on works to be carried out according to next year's Budget, and that these works, which are then to be commenced at once, will give employment to several thousand men. The *bona-fide* workmen are exceedingly vexed about last week's occurrence, which have done much injury to their cause.

WE are glad to learn from a letter which appeared in the *Standard* last Friday, that a circular has been sent to many candidates for the London County Council, putting before them definitely as an object the suppression of the London organ-grinding nuisance, a matter which is not included, as far as we are aware, in any of the extensive promises of London reform and improvement put forth by many candidates. The following is the first portion of the circular referred to:—

"Sir,—It is earnestly requested that, if elected, you will endeavour to suppress the nuisance of organ-grinding. It may be seen, from a return presented to Parliament last year (Miscellaneous, No. 2, 1891, moved for by Mr. Jacoby), that this nuisance has been practically suppressed in all but English-speaking countries. Our law, however, amounts to a legislation of the nuisance, and puts difficulties in the way of those who want to protect themselves. No one has the right to complain at all, even at any hour of the night, unless on the ground of illness or occupation interfered with, and then you can only move them on, and they can come again as often as they please. If you will as will enable any one annoyed to promptly and effectually stop and prevent the recurrence of the nuisance within his bearing."

We have, we must confess, little hope of it, but we do earnestly wish that the next County Council would turn their thoughts towards eradicating once for all this intolerable nuisance of London life; a nuisance which is a source of continual misery and irritation to thousands; for which there is no sort of excuse; which affords opportunity to a host of idle vagabonds to avoid honest work and to prey upon and harass the community. There is nothing like it, in extent, we believe, in any other capital in the world; its existence is a disgrace to the Government of London, and the County Council ought to put it down with a strong hand.

THE LAND ON THE VICTORIA EMBANKMENT.—The *City Press* says that there is no truth in the rumour that the Corporation has at last received a satisfactory bid for the vacant land on the Victoria Embankment. There are several offers besides that of the Salvation Army before the City Lands Committee, but neither of them is considered satisfactory, being far below the value of the land fixed by the Corporation's Surveyor.

LETTER FROM PARIS.

LAST month saw a perfect avalanche of snow in Paris, which for three days pretty nearly stopped all street traffic. This event, not so very extraordinary at this time of year, has been the occasion of a storm of exaggerated accusations against the Direction des Travaux, even extending to personal invective against M. Huet, who three months ago succeeded M. Alphand as Inspecteur Général du Ponts et Chaussées, coupled with lamentations over the death of the latter, who it was said would never have left the Parisiens thus stuck in an ocean of snow and mud. As a matter of fact however the same reproaches were uttered twenty years ago under the same circumstances, and on December 15, 1871, the Municipal Council of Paris demanded the immediate dismissal of M. Alphand, who was accused of carelessness in having taken no sufficient measures for removing the snow. It is amusing to note that among the signatures to this demand was that of M. Lockroy, who, when he became Minister of Commerce, appointed Alphand to the post of Director of the Works for the 1889 Exhibition.

The recent criticisms against the engineers of the Paris Municipality are certainly unjust and exaggerated, and the fact is that the corps of the Ponts et Chaussées department has shown a great deal of activity, but there seems to be a want of unity and of a fixed system of direction since the death of Alphand, who was a man of prompt decision and an admirable organiser of labour. In this respect the municipal services require improvement and re-arrangement, and if any scheme of reorganisation is carried out it may be hoped that architects, who have been rather left out lately, will be given their old place in the service, instead of everything being left to the engineers.

At the Gallery of the Water-colour Society the celebrated water-colour by Meissonier, "1807," has been on view, taking the place of honour in the Galerie Petit; the work will probably be remembered by many in England, having been already exhibited both in London and at the 1889 Exhibition at Paris. The exhibition of the "Aquarellistes," after fourteen years of existence, is as prosperous as ever. M. Detaille, in his "Charge de Cavalerie," rivals Meissonier himself, and in minuteness of detail the picture almost suggests a coloured photograph. M. Besnard, in his fantasies, seems to be amusing himself by puzzling the good public. It is absolutely impossible to understand the meaning of his gigantic "Éléphants du Roi Baskir," tossing about women in their trunks at the edge of a cascade; M. Besnard seems in this case to have succeeded in even burlesquing himself. Among other exhibits is a fine collection of landscapes by M. Harpignies, powerfully treated though a little dry. A new comer, M. Paul Lecomte, sends some beautiful works, which at once give him a high rank among the landscape painters of the day. There are also some fine landscapes by M. Zuber, and some pretty Venetian scenes by the Baronne de Rothschild.

The President of the "Aquarellistes," M. Vibert, not only continues to inflict on us every year his eternal figures of cardinals, but these carefully-painted ecclesiastics meet us again at the "Cercle de l'Union Artistique," which has also opened its doors. This exhibition holds a good place among the smaller annual collections, and contains this year seven or eight works of great interest by such artists as Bonnat, Carolus Duran, Dagnan-Bouveret, Gervey, and Cormon; compared with which the remainder of the works impress one as rather mediocre and amateurish.

At the Palais de l'Industrie the new exhibition of "Femmes Peintres et Sculpteurs" has opened. It is the eleventh of the series, and it must be confessed that it is as mediocre in character as any of its predecessors. Two or three more such exhibitions will probably succeed in finally wearying the public of this attempt at feminine emancipation in art. The only exceptions to the general level of poverty are the sea pieces by Mme. Elodie La Villette, the cats of that able animal painter Mme. Ronner, and the studies by Mme. Berra Blanc.

Among the minor exhibitions are to be noted the "exhibitions particulières" of MM. Will, Huas, Gagliardini, and Pissaro. M. Will is an artist who excels in cloud effects and in autumn mists. His pictures, collected at the "Galerie des Artistes, Modernes," Rue de la Paix, are landscapes of great charm and variety. M. Huas and M. Gagliardini exhibit at the

Galerie Petit. The former has made a specialty of portraits of infants and young girls, which he treats with a skilled hand and which show close observation of nature. The latter, who, in spite of his Italian name, is a native of Alsace, is a painter of the sunny landscapes, white houses, dusty roads and blue sky of Provence.

M. Pissaro, the acknowledged chief of the Impressionists, exhibits at the Galerie Durand Ruel seventy-two works in oil, which form a kind of résumé of the extremely odd and curious studies of a long and (in its way) conscientious artistic life. There is a decided relation between his work and that of M. Besnard, only that M. Pissaro is an Impressionist by temperament and M. Besnard by convention.

There has been talk lately of the formation of a syndicate of artists who are to look after the material interests of painters, to undertake their defence in case of litigation, and even to intervene between them and the Government to obtain official commissions. The scheme emanates from the "Société Libre des Artistes Français" presided over by M. Bartholdi. Many objections are raised against it, and it has not much chance of success; and in fact the "Société des Artistes Français" presided over by M. Bonnat constitutes a real professional syndicate quite sufficient for all the purposes which the proposed body could carry out. In connexion with this latter society it is proposed to introduce this year at the Salon of the Palais de l'Industrie an innovation already suggested at the Champ de Mars Salon, viz. the exhibition of products of industrial art. The idea however has raised a great deal of opposition, and acrimonious discussions which have led at present to no result. If the decision is in the negative, this will probably tend further to the success of the opposition exhibition of the Champ de Mars.*

At the Ecole des Beaux-Arts the Government has nominated occupants for the two vacant professional chairs. M. Jules Jacquet, President of the "Société des Graveurs en Bas-relief," has been appointed Professor of Engraving in place of M. Henriquel Dupont. He is an artist of ability who has engraved various important works by Lefebvre, Cahanel, Meissonier, &c. Instruction in the history of French architecture is to be confided to M. Paul Borswillwald, an architect reared in the traditions of Viollet-le-Duc, and who seems eminently fitted for the post.

We announced recently the intended purchase by the Municipality of Paris of the celebrated Hôtel de Sens. Though nothing is absolutely settled, it is hoped that the purchase will be carried out and this interesting building saved from demolition. The "Société des Amis des Monuments Parisiens" has interfered in its defence, and there is little doubt that the Municipal Council, always anxious to preserve remnants of old Paris, will vote the necessary funds. The Hôtel would be admirably suited for the arrangement of the historic collections now very much crowded in the Hôtel Carnavalet. It is a building with many curious historical associations, and though it has suffered much injury from decay and rough treatment, it still remains a fine monument of French architecture of its period. It will require a good deal of reparation, but if preserved it will be a building almost equal in interest to the Hôtel de Clugny, and it is important to preserve at least all we can of the architectural history of old Paris.

INSTITUTION OF CIVIL ENGINEERS.—Mr. Berkeley, President of the Institution, entertained at dinner, at the Grand Hotel, on Thursday last week, the following officers and past-officers of the Institution:—Sir Frederick Abel, K.C.B., hon. member; Mr. Abernethy, Sir Frederick Bramwell, Bart., F.R.S.; Mr. Woods and Sir George Bruce, Past-presidents; Mr. Alfred Giles, M.P., Sir Robert Rawlinson, K.C.B., and Sir B. Baker, K.C.M.G., F.R.S., Vice-presidents; Mr. G. F. Lyster, Mr. E. A. Cowper, Sir Jas. N. Douglass, F.R.S., Mr. J. W. Barry, Sir Douglas Fox, Mr. W. H. Prescott, F.R.S., Dr. W. Anderson, F.R.S., Mr. Charles Hawksley, Mr. W. Shelford, Mr. J. C. Hawkshaw, Sir Bradford Leslie, K.C.I.E., and Sir Guildford Moleworth, K.C.I.E., Members of Council; Mr. Shand, Mr. Burk, Mr. H. Graham Harris, Mr. W. Matthews, Mr. P. S. Cochrane, Mr. Berkeley, jun., and Mr. James Forrest, the secretary.

* We may add, however, that the much-talked-of introduction of industrial art-work at this exhibition last year did not amount to anything worth speaking of, and the result was somewhat disappointing.—Ed.

SARACENIC ARCHITECTURE.*

BY PROFESSOR AITCHISON, A.R.A.

ANY description of Saracenic architecture would be incomplete without a sketch of its ornament and colour.

It might not be impossible to pronounce the style of a late building to be Saracenic, even if it were stripped of its ornament; but I think that, unless its date were known, the question of its style might be open to controversy, and some might affirm that it was of a local Byzantine or Romanesque school; but if its ornamentation were given the only controversy that could arise would be as to whether it were purely Saracenic or built under Saracenic influences. The stalactites alone would settle the question.

That much of the Saracenic ornament that consists of purely geometrical arrangement was founded on the Byzantine does not, I think, admit of a doubt; some of the Saracenic geometrical patterns, and much of their ornament, is undoubtedly Byzantine; there are patterns shown in books on Saracenic art that may be found in the Byzantine ruins of Central Syria. What Saracenic architecture got from Chaldea, from the Greek kingdom of Bactria, and from India, we know not; from Persian architecture it got something, but not much. Though Persia in Chosroes' time had shrunk to the Euphrates, it contained Assyria and Babylonia, and I believe still reached to the Indus, so I was technically right in saying that they borrowed their bearded battlements from the Persians, but these were probably of Chaldean origin, and no doubt the Saracens got something from the Westerns during the days of the Crusades, and they probably got much from the Copts in Egypt. They were greatly troubled as to their ornament by the exigencies of the faith, for not only did a pious Moslem refuse to make the likeness of any living thing, but he was troubled for his *post-mortem* interests by even sitting with them in his own room. The President has got a curious illustration of this. Some Persian fire-worshipping potter, who pretended to be a Moslem, or some infidel Cufan, had painted tile panels of a park, with men fishing, in which were swans, peacocks, falcons taking game, and cheetahs seizing antelopes; a pious, but tasteful Moslem subsequently inhabited the house, and tried to make the best of both worlds; so he cut the throats of all the living things, and thus enjoyed their portraiture with a clear conscience. Some of the Fatemite Keliphs and Turkish rulers of Egypt were not so strait-laced, and, not to speak of carpets and embroidery with wild-beast patterns on them, had animals painted on their shields, carved on the walls of their buildings, and engraved on their plate. The griffin of Pisa is an instance, and we do read of Saracenic statues; the Pisan griffin had plaques on its forelegs, one engraved with a lion, the other with an eagle; it is said to have been made by the order of El Hakem, the Fatemite Kaliph of Egypt, between 996 and 1020, and to have been captured by the Crusaders. On the citadel of Cairo, built by order of our old friend Saladin, is a double-headed eagle, supposed to be his crest, and thought by some to be a piece of ancient Egyptian sculpture; but his eunuch who ordered and locked after the building was called "The Black Eagle," so it was possibly a rebus of his name. In Kalan's mad-house are carved friezes of wood, with hunting martichores, antelopes, falcons, peacocks, and figures of men drinking or playing musical instruments; these are introduced in medallions or amid foliage. The martichore is an animal which Mahomet saw in Paradise; it had the feet of an antelope, the tail of a tiger, and the head of a woman; it is this martichore that is in the mad-house of Kalan. Some such beast, however, called by the same name, was said to have been hunted by Apollonius of Tyana in India. His beast had the head of a man and the body of a lion. Apollonius lived in Nero's and Vespasian's time, but martichores are said to have been spoken of by Ctesias 400 years before.

Apollonius, too, was a prophet, and a statue of him was in the hall or chapel where Severus Alexander had statues of illustrious persons and prophets, among whom was Alexander the Great, Moses, and our Saviour. Many of the

* Being the sixth and last Royal Academy Lecture on Architecture this session. Delivered on Thursday evening, February 11.

hand-mirrors of Saracen manufacture had martichores, animals, and hunting scenes on their backs. The ivory coffer of Bayeux has its hinges and angle and face clamps of silver, beaten up and chased into peacocks and flowers, enamelled in blue and parcel-gilt; it is supposed by some antiquaries to be Saracen work of the twelfth century, on account of the style of the Arabic writing which forms an inscription round the lock; it was deciphered by Pétis de La Croix, in 1714. The legend is the common one found on hand-mirrors and such-like objects. "In the name of God, the merciful, the compassionate, perfect blessing and complete happiness," to my possessor being understood. It is supposed to have been part of the plunder brought by St. Louis from the Crusades. Some antiquaries, however, attribute it to the days of that Abd-al-Rabman who was killed at the battle of Tours, 732 A.D., and say it was then found in the Saracen camp; it certainly has not got the geometrical forms that were prevalent at the later date, but one requires to be acquainted with the Saracen plate to give a definite opinion.

Some of Kalann's and other Sultans' plate, candlesticks, plates, water-buckets, flambeau stands, vases, and ink-horns, are ornamented with animals or figures; one candlestick has a medallion with birds round the edge; a plate has a medallion with fish nibbling at a bit of bread, with their tails curved like the flower of the cyclamen; the bottom of a water-bucket is damascened with a shoal of silver fish; a flambeau stand is damascened with gold and silver on a niello ground, and has bands of hounds, stags, elephants, and winged horses, as well as figures of men and hunting scenes.

When we get into the thirteenth century, the Easterns and Westerns had got mutually acquainted by a century of fighting, and whether this taste for animals and figures was aroused in the Saracens by the Crusaders or was merely dependent on the tastes of the rulers, or whether the Muftis had agreed that the portraits of men and animals was not sinful, but was only forbidden in mosques, I know not, but Saracen books of the thirteenth century are to be found illustrated with pictures of men and animals, no longer confined to scrolls and medallions, but forming whole page illustrations. These may be seen in an illuminated MSS. of the sittings of Hariri, a book of anecdotes of an adventurer; it was written in pure Arabic by a believing Moslem who was a poet, the author being a native of Sarondj, a small town in Mesopotamia, but the illustrations are supposed to be by Yabia-el-Wassey, a Persian artist, and to have been done in Cairo in 1236 A.D.; the borders have scrolls with cheetahs, stags, bears, and foxes, and in the spandrels of one page are winged figures with the nimbus.

The writing-masters, too, formed texts from the Koran into ducks, eagles, lions, and men on horseback. The Fatemy Kaliphs and the Mamluk Sultans and their followers had a passion for silk; the Moslems, who had still before their eyes the Prophet's objection to silk, evaded it by using cotton with the silk. The curtains of the Kaaba were woven at Cairo of cotton and silk dyed black, the colour of the Abassides. It was Mehdy, the father of Harnn al Rashid, who first stripped off the old coverings. As soon as silk came into vogue, the royal patterns of Byzantium, Persia, and Egypt seem to have been adopted by the Saracens, and many of them had figures or animals woven in them with inscriptions in Arabic, mostly in Cufic characters. Pliny speaks of the embroidered work of the Parthians and Babylonians as well as the "Attalcean vestes," and, without doubt, the wild beast patterns of India were known at an early date. Plinius speaks of "the purple carpets of Alexandria" with "wild beast patterns" (Pentolus 1, 2, 14). Quintus Curtius speaks of the robes of the Persian satraps, ornamented with golden falcons which rush at one another like the heads of ships, and not to speak of the hand of figures on Minerva's robe, we all know the imperial purple robe of Theodora in San Vitale, with the Adoration of the Magi on it. The Copts seem to have been the designers and weavers of the Egyptian stuffs with figures, which included wild beast patterns.

Persian and Byzantine artists and workmen designed and wove other stuffs ornamented with animals and human figures. Under a Turkish Governor, Iconium in Lycaonia, the Rum of the Saracens, seems to have been a

Trellis, Cairo.

great centre of manufacture; one of the patterns preserved in the Lyons Museum is of the first half of the thirteenth century, was produced at Iconium, and consists of two lions back to back in gold on a crimson ground; it has rather a Chinese air about it, the claws being like those of the Chinese dragon; and the Saracens had intercourse with China. The manufacture was also carried on by the Saracens when they were masters of Sicily, and was continued by Saracen artists and workmen when it fell under Christian sway. The fabrics of the Saracens were so celebrated that many materials bear their name to this day: "Dumask" from Damascus, though I believe this got the name before Saracen days; "Saracenet" from Saracenetum—Shakespeare speaks of "a green saracenet flap for a sore eye;" "Muslin" from Mosul, "Dimity" from Dimetia, and "Tabby" from a quarter of Baghdad, called so after Prince Attab, a great grandson of Omeiya; "Mohair," from the Arabic name for stuff of goats' hair, now called "Moire," which is watered

"And when she sees her friend in deep despair,
Oversnes how much a cheat exceeds mohair."
Pope.

Saracen artists and workmen were also employed by the Christians at Lucca, Venice, and elsewhere, just as the oriental carpets of Poland in the seveneenth century were made by Persians. When the art was learnt, the manufacture was often carried on by Christians, who not infrequently made a mess of the inscriptions. Whether we have any remains of the stuffs that were actually worked by Moslem hands in Moslem countries seems doubtful, but we have plenty of copies or imitations, mostly to be found in the treasures of churches or in textile museums. Nearly all the thirteenth and fourteenth-century textile fabrics of Europe were based on Saracen designs. We know that the Renaissance book-binders, as late as Grolier, often retained the Saracen patterns.

The Saracens followed the Byzantine habits, and royal stuffs were not to be had for love or money.

In Byzantine times the mere possession of a mantle of imperial purple was enough to found a charge of high treason on, and to subject the possessor to torture and probably to death. At Tinnis there was a factory for royal robes. Amongst other articles it manufactured was an indescant stuff called "Chameleon"; the cost of a piece of this for a turban was fifty pieces

of gold. It is said that a king of Fars offered 20,000 pieces of gold for a royal robe of Tinnis stuff, and sent an agent to get it, who, after trying for several years, gave it up in despair. The price of some of the more precious stuffs was fabulous, but I presume that the robe that cost 400,000 pieces of gold, which Harnn-al-Rashid coaxed Jafar with, before he cut his head off, was embroidered with precious stones like Choroses' carpets, that the Saracens sold by auction at Medina. Embroidery was largely employed on dresses of honour, as well as on the coverings of tents. In the inventory of the Fatemite Kaliph El Mustansir, in 1035-95 A.D., tents are described, made of cloth of gold, velvet, satin, damask, and silk; some plain, some embroidered with men, elephants, lions, peacocks, and horses, and lined with velvet, satin, or silk shot with gold. Some of these tents would contain 150 horemam, had poles 65 cubits high, nearly 100 ft., and took seventy-two camels to carry them, each camel load being 1,000 lbs. The "Arabian Nights," which represents the manners and customs prevalent amongst the last Mamluk Sultans, is full of descriptions of embroidery. You must not suppose that this was an original Saracen art; the Romans employed it largely, and it is more than suspected that some of the large chambers in Diocletian's palace were workshops for it. In the story of Seyf-el-Mnlook, he sees on the tunic sent to his father by King Solomon, "the portrait of a damsel delineated in gold," and this was so well done that he incontinently fell in love with her, travelled into barbarous countries, and endured all sorts of hardships and horrors to find her. In the City of Brass "the party entered a passage paved with marble, upon the sides of which were curtains, whereon were figured various wild beasts and birds, all these being worked with red, gold, and white silver, and their eyes were of pearls and jacinths; whoever beheld them was confounded." In the story of Alee Shif and Zomarrud, the professional embroiderer, she said to him, "Buy for us a piece of silk, as much as will suffice for a curtain, and buy gold and silver thread, and silk thread of seven different colours." The damsel took the curtain and embroider-d it with coloured silks, and ornamented it with gold and silver thread. She worked a border to it with figures of birds, and repeated around it the figures of wild beasts, and there was not a beast in the world that she omitted to portray upon it." I have gone rather far afield before coming

Trellis-work at Rosetta, Egypt.

to the great invention of the Saracens, their ornament, founded on æsthetic geometry, but, after all, I have but given the exceptions before the rule, and I have incidentally shown what we owe to them and to their passion for magnificence. I may remind you that Saracen art only admits at present of the slightest sketch, for with the exception of a few Arabic scholars, almost nothing is known in the present day of the Saracens, of their achievements, literature, arts, and sciences, and dates are out of the question, for if we know when a structure was originally built, we do not know how often it has been burnt down, rebuilt, added to, and altered. There is a story told of a flippant remark made by the late Lord Beaconsfield when a lad. The Ministry were dining with his father, and he was asked in to dessert; they were talking of the Eastern question, when he broke in by saying, "You fellows are always talking about the Eastern question, but all that you know about the East is what you have read of it in the 'Arabian Nights,'" and this is a very fair description of what most people know of it. We architects know its domes and minarets, its stalactites and curious geometric patterns; and of these last the star-shaped patterns with wide blunt points are best known, and these, with the filling between them, the French call "mail." In spite of the exceptions given, it seems most probable that the bulk of the population who could afford to build, to decorate, to have fine furniture or clothes, preferred patterns that did not contravene the glosses on the Koran, for the only prohibition I have been able to find in the Koran is against worshipping idols. Mohammed's well-known dislike of obessesmen, in the shape of men or animals, is a personal anecdote of the Prophet told by one of the "Companions." The architects, decorators, and designers must consequently have been hard put to it to find out what would enable persons to indulge their taste for richness and magnificence, without wounding their consciences or raising scandal to their friends. At last the prevalence of geometric studies solved the difficulty. The Byzantines, and especially those of Central Syria, had started ornamental designs composed of geometric figures, and the Saracens carried this form of ornament to the greatest length it has yet reached.

It is evident that the geometers revelled in their science, which must have been new to them, and one section of them turned it into a useful art,—that is, this section saw how geo-

metrical arrangements might be used as architectural enrichments, and how they might form a framework for floral ornament. The geometers doubtless began by making geometric figures of every conceivable shape, and tried with what figures they could fill them, and into what forms they could decompose them; they then tried what simple geometric figures would cover any simple rectangular space; then what combinations of geometrical figures would do the same, until they became adepts and saw fresh possibilities of variation and invention. These rectilinear geometrical arrangements were carved on stone and marble, were used for inlaid patterns on marble or tiles, were employed for mosaic pavements, for pierced stone and marble work, for wooden lattices and doors, and for wood, plaster, and metal work.

The frets and interlacing rectilinear patterns of early civilisation were doubtless suggested to the artistic embroideress or primitive weaver by the needle, by stuffs being formed of a succession of squares, and the Saracen geometers probably worked their interlaced patterns on squared paper or boards; their practice and ingenuity enabled them to make those frets and interlacings much more elaborate and intricate. The descriptions of their geometric ornament must be short, for this subject alone would be enough for six lectures, and you have had as well a sketch of the new architecture, in nearly every country of the ancient world. Great ingenuity is shown in the turned lattices, mostly used to fill in meshrebiyas and windows; the effect of these is always quaint, and occasionally artistic.

One lattice, exhibited, is made up of dodecagons with four-limbed stars between them, and is redeemed from monotony by the figures being set out on a framework of squares set lozenge-wise. This enabled the designer to make some of the main horizontal and vertical lines wavy; in fact, these wavy lines made another pattern of octagons and stars. It gives variety, it is true, but it also has the defect of making the ornament look as if it were alive, for your eye is being continually attracted from one pattern to the other. In another case, set out on the same network, solid sixteen-sided stars are put at the intersections, and the space between them is filled with irregular heptagons, the bars within them forming an eight-limbed star. A very wild pattern is made on hexagonal tiles by dividing each side into five equal parts, putting a square anglewise on it, and producing the

sides of the square; this forms a pattern of interlacing irregular hexagons with a central starred polygon. The star-shaped figures constructed from polygons are undoubtedly the most common, striking, and characteristic Saracen patterns. I should only be tiresome if I completely described their setting-out, but I may say that a network of equilateral triangles is first set-out, on whose points circles are described, and the spaces between the circles are then filled in with circles touching the former. I have given M. Bourgoin's solution of the pattern on the door of Bihar I's mosque, but it will not tell much to those unacquainted with the subject. If you will look at the mail-clad door itself (see lithograph), and see the lines that seem to run about at haphazard, you will come away with the notion that the work could not have been done by mortal hands; the bronze mail of the door seems to have been cast, chased, and probably damascened; the green patina is owing to neglect. There is little doubt that the bronze work was originally bright, in imitation of the gold-plated doors of the Kaaba; the lines between show the native colour of the wood. The genus of the pattern is very common, but its sculptural treatment, I think, shows genius. It looks like an idealised alghator's skin in bronze; its wonderful effect is got very simply; only eight out of the twelve whole smaller stars have their points enriched with a drop-shaped boss: all the other stars and half stars are only enriched with central bosses, the big stars having bigger bosses. A very similar pattern, only wholly in bronze, is rendered quite commonplace and monotonous by all the big and little stars having these drop-shaped bosses on each point.

Some of the patterns,—*e.g.*, the one carved on the lintel of the fountain of Kâi Bey, and some carved marble from the mosque of Sultan Hassan,—are what used to be called a "thunder and lightning pattern," and some, from Kâi Bey's Wekala or Khan seem to defy solution.

You will observe that, with a true instinct for ornament, the pure rectilinear decoration is mostly interspersed with floral ornament, or else floral patterns are filled into the geometrical panels. As I before said, most of the plaster ornament for walls and ceilings cannot be judged of without the colour; and the artists of Cairo and Syria have treated their work in a most artistic way, so that you find coloured patterns of great originality and effectiveness.

Much of the maddening intricate work is left plain, or but slightly relieved from the ground, and the stars, panels, or coffers are delicately or powerfully brought out, so as to please the educated eye. There is little doubt that the curved patterns after the Byzantine or Romanesque manner were designed on some geometrical framework. Were it not for the magical changing of patterns, the colouring at the Alhambra is rather too cloying.

We must allow that the exclusion of animal life was the main cause of the invention of a new style of ornament, and it is not surprising that this original invention of their own should have delighted the Saracens; we must allow that without it the world would have been so much the poorer.

I have so often said before that the highest art always looks so simple, unaffected, and natural, that we are apt to grudge the artist doing it before us. As St. Augustine is reported to have said, "Cursed be those who say our good things before us," but there is no harm in saying it again. Anything that strikes us as being ingenious, puzzling, quaint, or odd, falls into a lower category; but, as the human mind is fond of novelty, we ought to be grateful to those who give us original variety. One of the charms in Saracen art is the unexpectedness of the shapes in their ornament, and the strangeness of its application; sometimes we see whole ranges of plain parcelling, with one panel filled with "thunder and lightning"; sometimes a doorway is framed, and outside this the wall breaks out into ornamental panels like wings; and we, at least, are unaccustomed to those deeply-moulded angles which bring the square holes into octagons for the domes to spring from and to cylindrical parts, the domes being covered with elaborate ornament.

The description of the presentation of the Byzantine Ambassadors to El Maktadir has become rather hackneyed, but the cause is that the writers of the "Arabian Nights" have stock phrases about buildings, that convey little to our minds. They are described as elevated

pavilions, containing lofty chambers; or palaces are described as magnificent buildings with lofty angles. The great hall of the palace in the City of Brass is described as "a saloon constructed of polished marble, adorned with jewels. The beholder imagined that upon its floor was running water. . . . They found in it a great dome, constructed of stones, gilded with red gold. . . . and in the midst of that dome was a great dome-crowned structure of alabaster, around which were lattice-windows, decorated and adorned with oblong emeralds, such as none of the kings could procure. In it was a pavilion of brocade, raised upon columns of red gold. Within this were birds, the feet of which were of emeralds. Beneath each bird was a net of brilliant pearls, spread over a fountain; and by the brink of the fountain was placed a couch, adorned with pearls and jacinths, whereon was a damsel resembling the shining sun."

The decoration is briefly described as interlaced work, painted with vermilion, ultramarine, and gold. The hearers of stories were evidently satisfied with a slight description that implied grandeur and magnificent colour, but they were more curious about costly silks, satins, and embroidery, jewels and gold.

Whatever may be said against the sumptuousness and magnificence of clothes, personal adornments, furniture, and the architecture and decoration of private houses, I have always found them to exist when there was admirable architecture in public monuments.

In the golden age of Rome, Julius Cæsar wore shoes enriched with engraved gems; and we know from Petronius and Martial, in the silver age of Roman architecture, the splendid shawls and dresses, and the Babylonian embroideries with which the couches of the dining-rooms were covered: even as early as Plinius we hear of the carpets of Egypt with wild beast patterns, and the choice colours of ladies' dresses. I think there are many reasons for this. In the first place, there could hardly be sufficient employment in public monuments alone, to give the due reward and the necessary practice in the arts, nor could there be a sufficient taste created in those who ordered public buildings nor in those who admired them, if there were nothing but plain white robes, plain houses, and whitewash. I think, too, Hume's argument may be reversed, for when there are not excellent carpenters, weavers, stonemasons, and the like, we can hardly expect the master arts to flourish.—and architecture is one of the master arts. Be this as it may, I think it is evident that what are now called the sumptuary arts kept pace with architectural art, or architectural art kept pace with the sumptuary arts. The finest mosques, — viz., from the twelfth to the fifteenth century, were contemporary with the most gorgeous stuffs, the finest cabinet, metal, glass, and enamelled work,—in fact, much of it was used for the decoration and furnishing of the mosques.

We fortunately have an inventory of the plate, jewels, stuffs, and furniture of the Fatemite Kaliph Mustansir that were sold by auction. He reigned from 1035 to 1094, just before the Crusades. I will give you a list of the most striking things. Besides bushels of most emeralds and necklaces, each bushel being worth 300,000 pieces of gold, there were 1,200 gold and silver rings, ornamented with gems which had cost 600,000 pieces of gold,—these surely must have been bangles; hearings of the finest carved crystal; 18,000 crystal vases, amongst which were an enormous water-bottle and howl, perfectly clear, and of the most exquisite workmanship; dishes of gold, some enamelled in patterns; 9,000 caskets of precious woods, enriched with gold, and lined with silk; a hundred cups of bezoar stone, on the greater part of which was engraved the name of the Kaliph Harn-al-Rashid,—the Arab word bezoar means an antidote to poison; inkhorns of different shapes, of gold, silver, sandal, aloe, and every other sort of wood, and of ivory, enriched with gems, gold, or silver, and remarkable for the excellence of the workmanship. The gold marriage-mat of Mamnun, with his name on it; twenty-eight enamelled dishes enriched with gold, that had been presented to the Kaliph Aziz by the Byzantine Emperor, each of the value of 3,000 pieces of gold; chests full of hand-mirrors of steel, porcelain, and glass, enriched with filigree work of gold and silver, some bordered with jewels and handles of cornelian or fine stones,—one had

its handle covered with emeralds,—and these mirrors were in cases of silk, velvet, or beautiful woods, with gold or silver locks; a thousand articles enriched with gold, remarkable for their fine workmanship; a prodigious number of pieces of silk for playing chess and draughts on, embroidered with gold, with the men of ebony, ivory, silver, gold, and precious stones; 6,000 gold flower-pots for narcissus bulbs or violets; 36,000 pieces of crystal, and an enormous box of the same, sculptured; knives of the value of 36,000 pieces of gold; 22,000 large pieces of amber; a turban, embroidered with jewels of the value of 130,000 pieces of gold; a gold peacock, with eyes of rubies, enamelled in colours after nature; a gold cock, with a crest of rubies, and the body covered with pearls, and a gold gazelle, also ornamented with jewels; a dining-table, of sardonyx, with legs of the same, big enough for several persons to dine at; a garden of silver gilt, with silver trees, whose fruits were of jewels; and a palm-tree of gold, enriched with pearls, with the growing dates represented by jewels in every degree of maturity, in a golden box. A long multitude of carpets woven with gold thread, were a thousand representing the different dynasties, with portraits of the kings and celebrated men, inscribed with their names, dates, and principal works. There was a map of the world woven in blue and gold tissue, with the names of the seas, rivers, countries, mountains, and towns; besides these were tons of camphor, moulded into cups, fruits, &c., and sacks of musk; there were specimens of the fine porcelain of Persia and China; arms, armour, and standards; and the tents were extraordinary both for size and the splendor of their stuffs.

One tent, called the great rotunda, was supported by a single upright, 97 ft. 6 in. high, and said to be nearly 10 ft. diameter. It was a column presented by the Byzantine Emperor. The tent was about 250 ft. diameter. It took 100 camels to carry it, *i. e.*, the column, the cords, and the vessels for the Sultan's use. The hangings of the tent were adorned with the figures of animals, and as part of its fittings it had a vast sea of silver. It is said to have taken 150 workmen for three years to make, and to have cost 30,000 pieces of gold. Some of the tents were supported by silver pillars, and the hangings were of cloth of gold, velvet, damask, and silk of every colour embroidered with men and animals often in gold embroidery. One tent was called the "Crusher," because a man was always crushed in pitching it. One may be sure that all the appointments were on a corresponding scale of splendour. When the Sultan reviewed his troops or held a durbar, there were gold or silver layers, gold plate enriched with jewels or enamelled, candlesticks, swinging censers of the precious metals, enamelled or enriched with precious stones, the tables made of more common materials were of exquisite workmanship, the goblets and cups of crystal, gold, jasper, or agate, enriched with gems. Most of us have seen the precious cups, ewers, and centre-pieces in the Louvre, but it is their artistic merits we most admire; but at Madrid there are cups of gold as big as sugar-basins, rough with carving, and large masses of turquoise; these, the most gorgeous-looking things I have ever seen, are said to be presents from the East. Golden ewers and basins with their silk towels embroidered at the ends, and whenever they drank they had vases of flowers and dishes of fruit. A pageant of this sort must have exceeded anything we can imagine, the Sultan sitting on his throne, as often as not plainly dressed, surrounded by his Viziers and officers of the pen, all clothed in gorgeously-coloured dresses embroidered with gold and precious stones, and behind them black eunuchs and handsome page-boys, and environed by his guards, in sumptuous damascened or burnished armour; while the cavalry, on high-bred horses, pranced and curvetted in front of the tent, with their armour damascened, or clad in gilded mail, their sword and dagger hilts and scabbards jewelled, their haldricks stiff with many gems, and necklaces of jewels, with their horse cloths of velvet, embroidered satin or cloth of gold. On great festivals, when the army formed itself into a procession through the principal streets, the roads were strewn with green leaves and flowers, and the horses were all hung with costly carpets, velvets, and embroidered silks, the standards flying, and the people deafened by the tramp of horses, and the clang of armour, and the blare of trumpets, as they escorted the Sultan

to a great mosque, through the crowds of people. Most of the poor were barefooted, with blue gowns and white turbans, the girls with their long blue or white face-veils, with heads and coins dangling on their foreheads, and the whole ceremony finishing by a public banquet in the horse course, in which the banquet was spread. The huge dishes towered to a man's height above the table, filled with baked sheep, fowls, and small birds, filled between with dry sweetmeats, and the table covered with flowers. In spite of all this magnificence, "neasy lies the head that wears a crown." One of the sleepless Saltans had a pond of quicksilver made in his garden, and here he tried to woo sleep on an air bed.

I have now given you a slight sketch of the Saracens from "the days of ignorance" to their acceptance of Islam; of their emergence from their native land and of their conquests of the principal countries of the ancient world; of their early mosques in Europe, Asia, and Africa; of some of the leading characteristics of the style in Egypt, Persia, Barbary, and Spain. I have, too, pointed out the chief characteristics of the style when it became purely Saracenic. I have given you some hints of how the geometric ornament, which is most characteristic of the perfected style, was produced, and some account of Saracenic manufactures, so that nothing remains for me to say but to draw an architectural moral. Nothing is to be despaired of in our art, so long as we have virtue, energy, industry, and perseverance; accompanied by a desire to improve it, to give it the character of our age, and of our own personality. In the Byzantine lectures of last year,* I showed you that even when a nation had sunk very low, and was engaged in a death struggle with savages, there was still hope, if the architects would only keep pace with the advance of knowledge, throw off self-imposed fetters, and work out truthfully and boldly the problems they had to solve; that, even then, a style might gradually be evolved, which would charm its contemporaries and elicit the admiration of succeeding ages; an example of the truth of this may be seen in Sta. Sophia of Constantinople.

In the Saracenic style you see that a race composed of barbarians and savages, almost destitute of the commonest arts of life, but fraught with courage, energy, and enthusiasm, could gradually acquire the architectural skill that had preceded it, and carry architecture, in certain directions, to a height it had never reached before; for nothing more fantastic and magical has ever been produced. This was mainly due to an ardent pursuit of geometry, and geometry is the foundation of all architecture.

Brick Door-head.

We, like them, have most of the architecture of the world before us, at least in engravings and photographs, and since the Crusades there has never been so much travelling. During my lifetime never has such energy been displayed by young architects and students, and never have the means of acquiring a knowledge of the principles of architecture been so near the hand of students. Shall we, then, "who rift the hills and roll the waters, flash the lightnings, weigh the sun," abandon ourselves to despair, and think we are not able to surpass our predecessors? No. We must, however, remember that man's power is limited, and a new style is neither to be created in a day nor in a lifetime; all we can do is to learn the elements of architecture,—a tremendous task, I must allow,—not copy, and understand that all that an architect can do is to show his skill, taste, and the mighty thoughts within him, is by building. When we have mastered the grand fundamental

* Published in the *Builder* at the time.

principles of this almost infinite art, we can only do our best with those powers with which we are endowed; but depend upon it that when you have mastered the art, and have something beautiful or great to express, you will impress those with whom you mix, and they will entrust you with their work.

I fear, however, that the rising architects are too open to the ungallant remark of Swift about the young ladies of his day, that they were busy in making nets rather than cages. Showy draughtsmanship may get the most work, but when you can plan conveniently and construct soundly, fine composition, subtle proportion, and elegant profiling will ensure the most lasting fame.

COMPETITIONS.

BOROUGH LUNATIC ASYLUM, SUNDERLAND.—In the recent competition for the new Sunderland Lunatic Asylum, in which Mr. Howell, of London, acted as assessor, the first premium has been awarded to "Scio," Mr. George T. Hine, London, the architect for the Claybury Asylum; the second to Messrs Hine & O'gers, Plymouth, whose motto was "Turpi æcernis honestum"; the third to Messrs. Giles & Gough, London.

PROPOSED TECHNICAL SCHOOL, ASTON MANOR, BIRMINGHAM.—At a meeting of the General Committee, held on the 29th ult., the designs under *nom de plume* "Science and Art" were accepted, and the author of them, Mr. Geo. H. Cox, of Birmingham, was appointed architect for the new building.

BLACKBURN COUNTY BOROUGH ASYLUM.—We understand that the plans for this competition, confined to architects practising in Blackburn, were sent in on February 29. The assessors appointed are Messrs. Hine & Odgers, architects, Plymouth.

ARCHITECTURAL SOCIETIES.

CARLISLE ARCHITECTURAL, ENGINEERING, AND SURVEYING ASSOCIATION.—The usual fortnightly meeting of this Association was held on Tuesday last in the Town Hall, when a paper on "Trigonometrical Surveying" was read by Mr. A. Tarky, C.E. The most approved methods of surveying and mapping large areas were fully described. A system of traversing and planning without the use of the protractor, ensuring most accurate results, was fully dealt with.

EDINBURGH ARCHITECTURAL ASSOCIATION. On the 27th ult. the Edinburgh Architectural Association visited St. Nicholas' Church, Dalkeith. Mr. Hippolyte J. Blanc, who conducted the party, described the building as one of the collegiate churches, so many of which were founded in Scotland during the fifteenth century. A few were erected at the end of the fourteenth century, of which he noted that at Dalkeith as one. Mr. Blanc traced the various changes which the fabric had undergone, explaining in detail the characteristic features in the door, windows, and buttresses. He also illustrated his exposition by a series of drawings prepared from measurements of several other collegiate churches built during the fifteenth century, and which bear all the characteristic detail found at St. Nicholas'. Mr. Blanc was thanked for his lecture, and for the manner in which he had exhausted all the points of interest in his subject. The party thereafter proceeded to Newbattle Abbey, which, through the courtesy of Lord Lothian, they were enabled to visit. Mr. Archibald Macpherson acting as leader. The Abbey stands on the site of a Cistercian monastery, founded by David, the "saint sanct for the Croon," in the twelfth century—1140. The excavations made by the directions of Lord Lothian several years ago exposed the foundations of the church and some remains of the walls of the conventual residence. The church, which measured 239 ft. long and 57 ft. broad, consisted of nave with aisles, short transepts, and square-headed apse. The examinations of the remains fully bore out the theory that Newbattle shared the fate of other churches and abbeys when Richard I. of England and John of Gaunt made their expedition across the Border, herring and destroying the religious edifices on their way. It is supposed that it was restored in the fourteenth century. The party thereafter were shown through the Manston-house. At the close of the proceedings, a hearty vote of thanks was accorded Lord Lothian for his kindness, and to Mr. Macpherson for his paper.

GLASGOW ARCHITECTURAL ASSOCIATION.—The annual supper of this Association was held on the 23rd ult., in the Grand Hotel, Glasgow. The honorary president, Mr. William Forrest Salmon, F.R.I.B.A., occupied the chair, and there was an attendance of about forty members and guests. The chairman, in speaking in the toast of "The Association," congratulated the members on its continued prosperity. He also announced that the Travelling Studentship had been gained by Mr. Eric A. Sutherland, Kelvin-side, for his designs for an Art Gallery and Museum, submitted in competition with five others.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—At a meeting of this Society held on Monday night in the Law Institute, Leeds, Mr. Beresford Pite (London) read a paper on "The Architecture of Michelangelo." After describing the early life and training of the great architect, sculptor, and painter, the lecturer said Michelangelo did not undertake architecture until he was forty years of age. He was born in 1474, and died in 1563, at the age of ninety years, having spent seventy years in working. He was the contemporary of Raphael, Bramante, and St. Gallo, who all died before he had begun his work at St. Peter's. Bramante began St. Peter's in 1502, and Michelangelo followed him in 1540. The church was not completed till the next century. His work was characterised by great originality, breadth of treatment, majestic form, and vast scale.

THE LONDON COUNTY COUNCIL.

THE last meeting of the first London County Council was held at Soring gardens on Tuesday afternoon last, Sir John Lubbock, Chairman, presiding.

The Water Question.—The Chairman said:—Since our last meeting, the Committee appointed by the metropolitan and home county members of Parliament have conferred with the representatives of Birmingham. We were assured that an additional supply for Birmingham was a necessity. Mr. Chamberlain said that to obtain it would require at least eight years, and as prudent men they must look ahead. They would, however, gladly meet us on points of detail. They urged strongly that in the opinion of their engineer there would be a sufficient supply left for London. They courteously, however, consented to postpone the second reading till next Tuesday. I may add that we are informed there is considerable opposition to the Bill in Birmingham itself. The result of this interview was communicated yesterday to a second conference of metropolitan and home county members. Much regret was expressed that any further appropriation of water-bearing areas should be agreed to until the Royal Commission has reported. At the same time, though no resolution was arrived at, there was a general feeling that, if the needs of Birmingham are so urgent, which, of course, would have to be proved to the satisfaction of the Committee on the Bill, and subject to some agreement on details, it would not be reasonable to oppose the second reading. It was hoped, however, that the Bill would not be passed by the Committee unless the urgency was clearly proved. If the Council approve, I should propose to take this course on the second reading.

At a later stage of the sitting of the Council, the Water Committee submitted a special report with the following recommendation:—

"That this Council trusts that Parliament will not pass the Birmingham Corporation Water Bill before the water consumers of the metropolitan area have had an opportunity of putting their own case before the Royal Commission, except on the clearest possible evidence that the urgency of the matter in the case of Birmingham is so great that it must be pushed forward immediately without regard to the requirements of the population of the Thames basin; and the Council hope that, should the Birmingham Bill be referred to a Select Committee, an instruction will be given to the Committee in this sense."

Mr. Lloyd moved, as an amendment,

"That this Council will take every step to prevent the Birmingham Water Bill being passed until the Royal Commission has reported."

After some discussion the amendment was negatived, and the resolution of the Water Committee adopted.

Lauderdale House, Highgate.—The Parks and Open Spaces Committee reported as follows:—

"The Council on the 7th July, 1891, decided to remove the old building in Waterloo Park known as Lauderdale House, but as its removal would to a

certain extent spoil the effect of the old terrace and gardens adjacent, we have had prepared a plan showing how the house could be restored, at a cost of 2,250*l.* It is proposed to divide the upper part into sets of rooms to be occupied by the Council's employes in the park at a rental of 65*l.*, and to let some of the lower rooms for refreshment purposes at a possible rental of 65*l.*, retaining others for conveniences for both sexes. We submit the plan referred to, and recommend:—

"That, subject to an estimate being submitted to it by the Finance Committee, as required by the statute, the Council do authorise the Committee to incur an expenditure of 2,250*l.* in the restoration and alteration of Lauderdale-house, Watcote-park, to suit it for the purposes of a refreshment house, conveniences, and residences for workmen employed in the park."

This was agreed to without discussion.

The Hackney-Wick and Isle of Dogs Relief Sewer.—The Main Drainage Committee reported that they had considered the tenders referred to them on the 16th ult., for the construction of the Hackney-Wick and Isle of Dogs Relief Sewer. The tenders varied from 31,046*l.* 1*s.* to 53,221*l.*, the lowest being that of Messrs. S. & E. Bentley*. The Committee had made inquiries relative to Messrs. Bentley, and as these were satisfactory, they recommended that their tender, amounting to 31,046*l.* 1*s.*, be accepted. But the Chairman of the Committee, Mr. Howell Williams, added that since the report and recommendation were printed, Messrs. Bentley had written withdrawing their tender, owing to a serious error made by them, and the Committee therefore recommended that the next lowest tender, that of Messrs. E. & W. Iles, amounting to 36,600*l.*, be accepted.

This proposition led to considerable discussion, in the course of which it was suggested by Mr. Acworth and Mr. Beresford Hope that the contractors tendering were collusive. It was explained by Mr. Howell Williams and another member of the Committee, Mr. MacDonnell, that there was no ground for such an assertion. The error arose in pricing a large quantity of excavators' work. An amendment was moved to refer the matter back to the Committee, with instructions to re-advertise the works. It was urged against the amendment that the relief sewer in question was urgently needed, and that the tender of Messrs. Iles was well below the amount of the Engineer's estimate for the work. The amendment was defeated by 34 votes against to 15 for it, and the recommendation of the Committee was then agreed to.

The Labourers on the Blackwall Tunnel Works.—On the motion of Mr. Leon, it was resolved:—

"That the Council refuses to consider a lower payment than 4*s.* an hour as a fair rate of wages to be paid to labourers by the contractors for the works of the Blackwall Tunnel, and as complying with the declaration made in their tender that they pay the rate of wages generally accepted as fair in the trade."

Vote of Thanks to the Chairman.—On the motion of Mr. Fardell, seconded by Mr. J. Williams Benn, and supported by Mr. G. W. E. Russell and Mr. Thornton, it was resolved "That the best thanks of the Council be accorded to the Right Hon. Sir John Lubbock, M.P., for his able, courteous, and impartial conduct in the chair."

Sir John Lubbock, in reply, said:—I am, I assure you, very grateful to you for the kind resolution which you have just passed. But I have even more to thank you for the generous and constant support which you have always given me in the chair. I shall leave the Council, in many respects, with much regret and many pleasant memories. We are just now the subject of a good deal of criticism, especially as regards our expenditure; but when the time has come for a calm and impartial judgment, I think it will be said that if we have raised the rate a halfpenny in comparison with that of our predecessors, we have a good deal to show for it. I may refer, not as more important than the heavy, unostentatious, and ever-increasing work of our other committees, but in justification for the rise, to the fact that, in addition to other heavy items, we have completed Roschery-avenue, begun the Blackwall Tunnel, finished the Northern main drainage works at Barking, and our successors will be able in a few weeks to open those at Crossness. This will do much to purify the Thames. We have also increased the precautions against fire, and we have enlarged and beautified the parks. Three years ago we met with feelings of some suspicion and antagonism, but, while we still differ in opinion, we have

* For full list of tenders see *Builder* for February 20 page 149.

learnt more and more to respect and appreciate one another. We began as opponents, we end as friends; and the reason has been that, however much we may differ about the means, we have been united by our desire to promote the prosperity of London, and the comfort, health, and happiness of our fellow-citizens in this great metropolis.

Vote of Thanks to the Staff.—On the motion of Mr. Eneas Smith, it was resolved as follows:—"That the Council desires to place upon record its high appreciation of the services rendered during its term of office by the entire staff of officers, clerks, and workmen, and that this resolution be communicated to the officers at the asylums and out-stations."

A vote of thanks was also passed to Messrs. Beachcroft and Osborn for the assistance they had given to the Chairman since the death of the second Deputy-Chairman of the Council, Mr. Haggis.

The Council then terminated. The election of the new Council, as our readers know, is to take place this Saturday, March 5, and the first meeting of the new Council is fixed for Tuesday, March 15. Some ten or twelve of the old members of the Council have already been re-elected without a contest at the polls; and nine of the Aldermen, who were elected three years ago for six years, will retain their seats on the new Council. The nine Aldermen referred to are Mr. Arthur Arnold, Mr. Frank Debenham, Sir Thomas Farrer, Mr. Frederic H. Benson, Lord Hobhouse, Mr. Quintin Hogg, Lord Lingen, Mr. Edmund Routledge, and Mr. G. W. E. Russell.

DEMONSTRATIONS ON GREEK SCULPTURE IN THE BRITISH MUSEUM.

MISS EUGENIE SELLEERS considered, in her fourth lecture,* the sculptures of the Mausoleum and of the Nereid monument. Greek funeral monuments consisted of single slabs, with the figure of the dead man or woman represented as engaged in some ordinary occupation; but in Asia Minor the funeral monument of a rich prince took the form of an elaborate building, which was in effect a kind of temple, in which stood the statue of the dead man, who was worshipped there with divine honours. Such was the Mausoleum, the funeral monument of Mausolus, of Halicarnassus, which was built at the beginning of the fourth century. Miss Sellers discussed various theories with regard to its restoration, but said that in the absence of any blocks of the stylobate giving the intercolumniation no final conclusion could be arrived at.

The figure of Mausolus is interesting as being one of the earliest specimens of portraiture. The sculptures of the friezes are interesting. We know from Pliny that Greek masters worked on them. The chariot race is specially remarkable for the fitness of the planes of the relief, and for the excellence of the work, in part of which we can trace the hand of Skopas. Yet for all the beauty of individual slabs, the general effect is decoratively not quite satisfactory, missing as it does both the flow of the Parthenon and the balanced groups of the Phegaleian frieze.

The Nereid monument from Xanthos, also a funeral monument, shows Asiatic work under Greek influences. Of the friezes, that representing a fight, probably of barbarians against barbarians, is the most Greek. The besieged city of the second frieze, with its fortresses, is eminently pictorial, and not at all Greek in character. Another gives us faithful renderings of scenes of daily life.

The composition of the pediments is quite elementary, that representing a battle-scene, which is the more advanced of the two, recalling the symmetrical arrangement of the figures on the pediments of the temple at Egina.

Miss Sellers ended her lecture by a reference to the far finer work of the frieze of the temple of Niké.

ART UNION OF LONDON.—The Art Union are issuing to their subscribers Mr. Wyllie's powerful etching of the escape of "H.M.S. Calliope," a work well worth popularising. The alternative etching, after a picture by Mr. Denny Sadler, was not worth doing on the large scale on which it is executed: a constant mistake of the Art Union, which encourages the ignorant to think that half the merit of an engraving consists in its size.

* For brief notes of the previous lectures see *Builder*, pp. 141, 164, &c.

THE ROYAL COMMISSION ON LABOUR: BUILDING TRADES EVIDENCE.

SECTION C. of the Royal Commission on Labour, which embraces textile and miscellaneous trades, proceeded to receive evidence concerning the building trades on the 25th and 26th ult. The Right Hon. A. J. Mundella, M.P., Chairman of the Section, presided, the other Commissioners present being the Duke of Devonshire, Sir F. Pollock, Mr. L. Courtney, M.P., Mr. Bolton, M.P., Mr. Butt, M.P., Mr. Tate, Mr. Austin, Mr. Tunstall, and Mr. Livesey. The witnesses were representative men coming from the three kingdoms, and those from Ireland were the first called.

Mr. John Simmonds, Secretary of the Dublin Trades Council, although speaking for trades generally, alluded specifically to a strike in the building trade last June, arising from the refusal of unionists to work with non-unionists; and in reply to very pointed questions he defended this action, on the ground that workmen had a right to join a union if they chose, and to object to non-unionists reaping the benefits obtained by efforts in which they had not assented. In this instance the union used no unusual means; they first requested the employer to induce the non-unionists to join the organisation, and on his declining to interfere, they gave a month's notice. They informed the employer that they could not work with the other men, whereupon he sent a circular to other employers urging them not to employ unionists. In another instance a dispute in the carpentering trade was amicably settled after a month's duration, and in the bricklaying and building trades a six weeks' dispute was terminated by the intervention of the architects of Dublin and some other gentlemen. As a rule, strikes were few in Dublin, and his Council were strongly in favour of the creation of a Board of Conciliation. Dealing with other points, this witness stated that some members of his Council were also in favour of taxing labour-saving machinery, seeing that the introduction of machinery had greatly injured manual labour, and had driven men into the workhouses. He did not say that in his own trade planks ought to be sawn with the old saw in a pit, but at the same time there was more employment under that system than there now was. He did not wish to convey that machinery ought to be abolished.

The Chairman: But you suggest the taxation of it, which is worse.

Witness: Humanity is taxed, and what takes the place of humanity ought to bear a portion of the taxation.

The Chairman: It assists humanity; it does not tax them.

Mr. P. Lynskey, representing the Amalgamated Carpenters and Joiners' Society of Dublin, which contained about 1,100 members, said that at present there was a good understanding between employers and employees, but he agreed with the previous witness as to the right of unionists to object to non-unionists. At the same time he also approved of having a Board of Conciliation. In the instance given by Mr. Simmonds, the Society first approached the other men, who then said they would join the Union, but they failed to do so, and that caused the Union men to strike.

The Chairman: Do you think that a proper thing to do?

Witness: I do. The unionists are the men who fight, and who obtain all the reforms; and the non-unionists, who take no part whatever in the struggle, receive all the advantages which the unionists have gained. Witness added that in this case the employer got men over from Scotland, and then issued a black-list to prevent the men who had struck from earning their living in Dublin. The non-unionists were not driven to starvation because they were struck against, because there were certain "jerry-shops" in Dublin where they could get work, at rates lower than the standard rate. He did not think that that course was injuring the trade, for in Dublin the first-class shops all employed unionists, and the best men were unionists.

The inferior shops never got a fair class of workmen. Prior to 1890 the working hours were 60 $\frac{1}{2}$ per week, but they were now 51, and he believed the carpenters were satisfied with that period. But he advocated the legislative abolition, to some extent, of overtime, and with regard to the eight hours' question, he thought that such a system should be international, so that English workmen should not suffer from the competition of other countries where the hours were unrestricted. The introduction of machinery had displaced about 10 per cent. of the men of his Society. A great many carpenters had left Dublin during the last few years through the adoption of machinery worked by men who were not carpenters. In moulting they would do in ten minutes what used to require two days for to do by hand. He would, therefore, tax that machinery, to pay for the up-keep of the men displaced. He also advocated greater facilities for giving technical and manual instruction.

Mr. R. S. MacNamara, Chairman of the United Building Trades Society of Cork, which includes carpenters, masons, stone-cutters, and plasterers, and numbers about 1,000 men and boys, explained that there were something like 1,500 hands in those

four trades, of whom 600 were unionists, 150 non-unionists, 200 apprentices, and 500 unskilled labourers. The general minimum rate of wages was 6s. a day of ten hours, the working hours being 5 $\frac{1}{2}$ weeks. The relations between the masters and the men were, on the whole, amicable, and the present rate of wages and working hours had been in operation for twenty years; but the trades had given notice for a reduction of an hour a day from May 1. Personally, he should favour a Board of Conciliation for the building trades, but not for all general industries. When wages were abundant the unionists had no objection to non-unionists working with them, but otherwise they did object, and, in fact, they had struck against non-unionists. Mentioning that the Government paid a lower rate of wages than private firms, the witness recommended the appointment of a responsible Minister who should acquire information on all subjects upon which disputes were likely to arise between capital and labour, and that if possible a State Board of Arbitration should be formed, of which such a Minister would have charge. As to machinery, its introduction would, of course, at first displace a considerable number of men, but ultimately it would, he thought, benefit the workmen. This witness also considered that overtime should be abolished, and with respect to the suggestion of an international agreement as to working hours, such agreement would have to be made not only by all foreign nations, but by the United States and some of our colonies.

Mr. J. H. Jolly, representing the Trades Council of Cork, having also been examined, the Irish evidence was for the time closed. English evidence was opened by the examination of

Mr. Arthur Otley, General Secretary of the National Association of British Plasterers, who, in the course of his testimony, said his trade had had a great many disputes in recent years, and the chief cause had been the system of sub-contracts. Upon this theme he entered at some length, and not without warmth. Under this system builders sublet their work to "piece-masters" or "task-masters," who contracted for labour only. They were men who had no reputation to lose. They took the work at a low figure, but, as the builders know, they could not properly carry it out. An illustration of this subject, he mentioned an instance which occurred at the Birmingham Post-office, where the whole of the plastering work was sublet in this way, and as no other work gave such opportunities for inferior material and for adulteration, in this case there was adulteration to the extent of 50 per cent. Again, a similar case took place in connexion with the Imperial Institute, a contract being sublet to a man who was well known as one of the greatest "scampers" in London. Against this man the members of the Association struck, knowing that the work was not being done as it ought to be done, and as the result of a deputation to the Committee the Association were ultimately assured that for the future the work should not be sublet. When they found that work which should take two days was being done in one day, they considered it their business to see about it.

The Chairman observing, "You struck work because the work was not lasting long enough?" witness replied that that was not their reason. They struck against the method, because the system was injuring the trade. The men were working at the usual rate of pay of 6s. a day of 10 hours. The point being put to him whether this was not a matter for the clerk of the works, Mr. Otley asserted that the work was being "scamped," and on the question whether there was not the architect to redress their grievance, he replied that when he considered how architects were sometimes connected with building he felt that it was quite impossible to get any redress from them. He explained this by reference to cases where architects and surveyors had started building, and observed that under these circumstances it was useless to appeal to them. The strike lasted eight weeks, and in the end the contractors put in a fair foreman, and the work had been better done. A similar experience occurred in connexion with the "New Scotland Yard" buildings, and the man complained of was dismissed after representations had been made to the Planning Secretary. The witness next described certain strikes which had taken place in regard to wages, and expressed himself as strongly in favour of a Board of Conciliation.

Mr. George Dew, Secretary of the London Building Trades Committee, was the next witness, and he strongly confirmed the views of the preceding witness respecting sub-letting. Being asked to explain this, he said the practice meant that the same amount of work was squeezed out of four men which in the ordinary way would require five men. In order to do that a man must adopt various methods of slovenly work. The work was pushed on in such an inferior manner that it was not only bad for the men but for the people for whom the work was being done. This applied to every class of building—the evil prevailed in all the branches. The Council endeavoured to do away with the evil by inducing public authorities to insert in their contracts a clause prohibiting this practice. For this purpose they had appointed a special Committee, and the first body with whom

they were successful was the London School Board. It was well known that some of the schools were falling to pieces, and in consequence costing the Board a large sum of money. This kind of work had become unprofitable, and at last the workmen, who were being prejudiced by being hurried and forced, determined to submit to the system no longer. Accordingly, in 1888, the Council convened a conference of the various branches to consider what could be done, and the first result was a deputation to the First Commissioner of Works to induce him to insert a penal clause in the Government contracts to prevent subletting, and to ensure the payment of the wages recognised in the trade. They adopted the same plan with the School Board, and had succeeded in securing a clause, not only forbidding this subletting, and providing for the payment of the recognised wages, but that the rates to be paid shall be attached to the contract. Moreover, they had gone a little further with the London County Council in this matter, and had secured the insertion of a clause providing for the rate of wages and also for the working hours, and also a penalty of 500*l.* for subletting a contract. So far the penalty had not been enforced. With the Government they had not succeeded quite so well. Three years ago the contract for repairs and maintenance of all public buildings in the metropolis was in the hands of Messrs. Brass & Son, at a low rate of wages, viz., 1*l.* 1*d.* per hour less than the trade-minimum rate. By this all union men were shut out from Government work. The contract was, in fact, let on distinctly sweating lines. The Government simply issued a schedule asking contractors for their tender rates. The rate in the schedule would be 9*s.* 6*d.* an hour; and the contractors would be asked what rebate they would make and how much they would return a discount. This schedule was issued every three years, and each time the contract was retaken there was, generally, a larger amount of discount, and this became so bad that when, three years ago, Messrs. Brass took it, 16*s.* per cent was struck off. Therefore they could only pay 7*s.* 6*d.* per hour when they ought to have paid 9*s.* Under these circumstances the Building Trades Committee made a representation to the Government, and they got a resolution proposed in the House of Commons, on February 18, 1891, on the subject. They first proposed, through Mr. Sydney Buxton, that in all Government contracts a clause should be inserted "requiring that the contractor shall, under penalty, observe the recognised customs and conditions as to rates of wages and working hours that prevail in each particular trade; and that the contractor should, under penalty, be prohibited from subletting any portion of his contract, except where the department concerned specially allows the sub-letting of such special portions of the work as would not be produced or carried out by the contractor in the ordinary course of his business." Mr. Plunket, First Commissioner of Works, after considerable debate on the motion, stated that the Government were in favour of the proposal, but they were not able to accept the wording of the resolution, and proposed instead the following:—

"That, in the opinion of this House, it is the duty of the Government in all Government contracts to make such provision as to rates of wages and working hours as to prevent the abuse arising from sub-letting, and to make every effort to secure the payment of such wages as are generally accepted as current in each trade for competent workmen."

That was agreed to by the House unanimously, but it was not all the resolution. The question of hours was not included in the resolution, but if that were done they would be satisfied. They did not want the Government to fix the hours, but simply to recognise in their contracts the hours agreed to between employers and employed. Good as that resolution was, and determined as the House seemed to be to make the condition of the men better, still the Government had broken faith with them. In a schedule of wages presented to him by Mr. Plunket as to the rate to be paid in London for carpenters were to have 9*s.* an hour, and men of extra skill 1*l.* more. Masons and painters, and other men, were to have the same, but soon after the contract was signed the rate for painters was cut at 8*s.* 6*d.* to 9*s.* But after that rate had been accepted by Messrs. Holland & Hannen, to whom the contract was let, they reduced the rate to 7*s.* 6*d.* A long correspondence had been going on between the Trade Committee and the Office of Works, and the compromise had now been effected, under which no more 3*d.* was to be given, and the minimum was fixed at 8*s.* On the question of hours, Mr. Dsw expressed himself as in favour of eight hours; that was to say, that the Government should legislate for general eight hours, but that it should then be left to trade option, because some trades might want it and others not. If the Government could only insert the hours clause in their contracts, that would have a great and good effect on the workmen throughout the country. Their solution was, in fact, as much in favour of the contractors as of the men, or even more so, because it would tend to put a stop to the present at-the-rate system. Mr. Dsw's next point was that, in the building trade was carried on at a great risk, principally from scaffolds falling, the Employers' Liability Act ought to be amended. At present a

contractor was allowed to insure himself out of his liability for accidents. A great deal of plant was used by builders, and it should be of the very best quality; but, if an employer could make an arrangement with an insurance company, it would be cheaper to do that than to spend the money on good plant. That was dangerous to the men, and the practice was ruining the trade, for the contractor, knowing he was insured whatever happened, did not care. Therefore, he wanted the Act altered to make the employer personally responsible.

The Duke of Devonshire: How can you prevent him from insuring?

Witness: Well, you might make it a penal offence. The Chairman: You might say you would prevent a shipowner from insuring his ships?

Witness: Yes; I think it would be a good thing for the sailors, for I believe a great many lives are lost through insuring. The witness further urged that there should be a better system of inspecting builders' works,—not the premises being built, but the shops where the materials were being prepared. A large amount of machinery was employed, and accidents frequently occurred, for proper precautions were not taken to fence round the machinery,—the sawing machinery, for instance. Persons of all ages were employed on the machinery, and, in fact, two-thirds of the men and boys so employed had lost fingers. He had never seen an in-petector going through these shops, and he knew no one who had; but he considered that as much care should be taken in the shops as in factories. Respecting the strike at the Imperial Institute, he stated that all means possible were taken to settle it. In fact, they always tried to settle disputes amicably with the employers, by conference and conciliation, and it was never the fault of the workmen if they did not succeed. In this case they first asked the Commissioners of the Institute to interfere with the contractor, and to hold an investigation. They replied that they had no right to interfere between the contractor and his workmen, and refused to do so. The Committee, after the strike had lasted some time, again asked them to do so, but without success; and then, as a last resource, he got a petition signed by all the workmen and presented it to the Prince of Wales, asking him to intervene. How it came about he did not know, but the men were then successful, for the obnoxious man was removed, and the foreman was put back in his place. Stating, in answer to the Chairman, that he was not at present prepared to reply to questions respecting strikes in his trade in the last six months, and that that had better be left for another occasion, Mr. Dsw gave some examples of discount being allowed to the Government. He observed that the status and character of the workmen were better maintained when they dealt directly with the contractor, and insisted that the middleman ought to be abolished, for the middleman caused scamp work, and that cast reflections on the men themselves. Speaking again with regard to hours, he said he would regulate that according to districts and towns. He would let London decide for itself, and then let every other large town do the same. He was not in favour of a universal eight hours, but of the proposal in the "Evan Bill" which provided that, while an eight hours' Bill should be passed by the Legislature, then any trade might by a two-thirds majority of votes come within the provisions of the Act. With that the masters had nothing to do; for, if the eight-hours' limit was adopted all round alike in each town or district, it would not matter to them. He again urged that if employers knew they had no insurance to fall back upon, they would be more careful, and there would be fewer accidents; but on this point he admitted that there might be a strong case for allowing mine-owners to insure, though he would allow no other exception. Finally, he mentioned that the wages under the Government three years' contracts had been raised by from 25 to 30 per cent., and that had made a great difference as to the character and efficiency of the men employed. The best class of men did not work under the old system, because the union would not allow them to do so.

Mr. G. J. Davies, of Manchester, formerly Chairman of the Amalgamated Society of Carpenters and Joiners, and Mr. F. Chandler, General Secretary of the same body, were examined together. The latter stated that the Society was formed in 1880, and that in that year there were 680 members, with an income of 321*l.*; but in 1870 the number had risen to 10,178, and their assets to 17,568*l.* In 1880 there were 17,764 members, with assets 46,295*l.*; and in 1889 there were 39,693 ordinary members and 803 trade sections, with assets 66,352*l.* Having described the objects of the Society, he said the wages varied in different localities. In London the rate was 9*s.* an hour; in Manchester, Liverpool, and Birmingham it was 8*s.* 6*d.* in Leeds, Sheffield, Leicester, and Derby it was 8*s.* 3*d.* Speaking generally, the rate in the North and in the Midlands was 8*s.* 6*d.*; it was somewhat lower in the South of England, and lower again in the West. The working hours in London were 51 in the summer and 47 in the winter; and in Manchester they were 52 in summer and 47 in winter. Referring to the strike in London, he stated that it lasted seven months. The strike was for increased pay and reduced hours, and in the end, as the result of arbitration,

the men resumed work on the old scale of pay,—9*s.* an hour, but with a slight reduction in the hours per week. Thus practically the men in London had got fifty hours a week and 9*s.* an hour. The joint committees of masters and men had worked together excellently. Mentioning that the branches of the Society extended not only throughout the United Kingdom, but to some of our colonies, and to the United States, he said a great many members went to America, where they joined existing, or opened new, lodges; but owing to the relative cheapness of living in this country he thought the men were quite as well off at home as those who went to the States. With respect to the question of insurance, he admitted that the Employers' Liability Act was fairly effective, but he considered that employers ought to be made personally responsible. Insurance took away any motive for protecting the men; if employers were able to shift their responsibility on to the insurance companies, then the whole object and spirit of the Act would be defeated. Therefore, he would alter the Act so as to bring them under the common law. Mr. Davies took a similar view on this question, and held that insurance by employers ought to be abolished, for it made them careless as to their plant and as to the safety of the men. With better organisation the conditions of trade had greatly improved, and the relations between masters and men had likewise improved. The Society's working rules had always provided for masters and men meeting (six on each side) to arrange disputes, and they had generally come to an amicable understanding without having to resort to arbitration. Alluding to the Labour Bureau of the Board of Trade, he acknowledged that the information it had supplied on trade questions had been very valuable, so far as it went, but he wished to see the organisation improved, in order that the workmen should have as much information about the employers as the latter had respecting the employed.

Mr. W. Knox, Secretary of the National Association of Master Builders, Liverpool, described the existing state of affairs in the building trades in that city. Correcting Mr. Chandler, by stating that the wages in Liverpool were 8*s.*, and not 8*s.* 6*d.* an hour, he stated that the relations between the masters and the men were amicable, and experience showed that good organisation on both sides led to good feeling. They found the best workmen among the unionists, but when engaging men they did not ask them whether they were unionists or not, and they kept no black lists. Extra pay was given for overtime, and compensation was given for accidents. Labour-saving machinery was introduced whenever and wherever practicable. He was of opinion that sub-contracting worked well and harmlessly, and he denied that insurance against risks made the employers careless as to the men's safety. There had long been a system of arbitration in Liverpool in case of disputes, and it had never failed but once, viz., in 1890, when the men refused to abide by the decision of the arbitrator. A strike ensued, and lasted six months, when the matter was again referred to arbitration, and the men accepted what the employers had at first offered them. The masters had a system of mutual insurance, but they wished to see a system established jointly between the masters and the men, for they found that more money was often spent in litigation than was eventually paid as compensation. The London strike had cost the men 200,000*l.* in wages, and, after all, they had to accept the masters' original offer; but if there had been a Board of Arbitration in London, such as there was in Liverpool, he believed the dispute would have been settled without a strike.

Such evidence being next taken, Mr. J. Beveridge, of Glasgow, Secretary of the Associated Carpenters and Joiners of Scotland, stated that the Society was established in 1861, and in that year the members numbered only about 600, but it now had a membership of 5,795, out of a total of 7,000 unionists in these trades. The witness having mentioned that the Society had fifteen branches in England and two in Ireland, he was invited to account for the singular circumstance, as it appeared to the Commissioners, that an essentially Scotch association had English and Irish offshoots, especially as there was a very strong Amalgamated Society of Carpenters and Joiners in England. This he did by explaining that they were instituted mainly for the convenience of members who left Scotland in search of work. The English branches were mainly composed of Scotchmen, but still there was a fair number of English members, while the two Irish branches, in Belfast and Londonderry, were composed chiefly of Irishmen. In the next place he stated that wages varied in Scotland according to locality. In Glasgow the rate was 8*s.* 6*d.* an hour, but in Aberdeen and Inverness it was 6*s.* 6*d.*, and he partly accounted for this extent of variation by the fact that wages were generally highest where the trades were well organised. Aberdeen, he said, was very much behind Glasgow and other large towns in regard to wages. But while there was that inequality in wages, they had equality in working hours in Scotland, and employment was fairly regular, except in the winter. A good deal of machinery was used, and there was no hostility to it on the part of the men. The trade unions were generally recognised by the employers, and

the unions claimed the right to refuse to work with non-unionists. Upon this point the witness was somewhat closely pressed by the Commissioners.

The Chairman: Do you think that a wise and sound policy?

Witness: We think it is only through the unions that a number of advantages have been derived, and the non-unionists would reap the same benefits. They would get the same wages.

Do you think that is consistent with perfect freedom and individual liberty?

Witness: The employers have the same right as ourselves.

Then you think there is nothing wrong in the employers making black lists?

No.
Then you think employers are perfectly justified in putting a mark against certain men and circulating their names through the trade to prevent their obtaining employment, because they may be leading members of a trades union?

I maintain that the employers have the same right as the workmen have. We have no black list.

If you say it is a sound policy that a non-unionist may be struck against wherever he goes, how can you complain of employers for doing the same?

We do not complain. Non-unionists are sometimes as good as unionists.

Is it not hard for them to have to contend against the unionists?

It is equally hard for the unionists to have to contend against them. The contention is the other way. If a man is not connected with us in a dispute he is against us.

The witness further said that the relations between the employers and the employed were generally amicable, and there were very few strikes in Scotland. Some of their branches had Boards of Conciliation, and generally he was in favour of that method. In Glasgow there was a sub-committee of the men appointed to meet a sub-committee of masters, who only met on special occasions. Regular fixed meetings would, he thought, be better, and would tend to the disappearance of disputes. During the last ten years the Society had spent 4,109*l.*; but as the organisation had improved, the relations with the employers had been better and the strikes fewer. They were anxious to settle disputes peacefully.

Mr. J. Brough, secretary of the Glasgow Branch of the Operative Masons Society, followed, and after giving details respecting the membership, he mentioned that the wages in 1860 were 4*d.* an hour, but they rose gradually until 1877, when they stood as high as 10*d.* In the following year, however, they fell away to as low as 6*d.*, and this he attributed mainly to the failure of the Glasgow Bank, which put a stop to the building trade. By last year, however, the rate had risen to 8*d.* He described the relations between masters and men as good, and expressed himself in favour of an eight hours legal day, but admitted that it might not be right for him to insist upon other trades only working a certain time because he chose to do so, and said he had no objection to the use of machinery, if it was not employed longer than the manual labour.

This Section has now adjourned for a fortnight. When it meets again further building trade witnesses will be called.

"THE BUILDER" ALBUM OF ROYAL ACADEMY DRAWINGS.

We hope that those architects who are sending drawings to the Royal Academy will assist us to keep up this collection of illustrations of Royal Academy Architecture annually, in the same manner in which it was commenced in 1891, by lending us for publication whatever drawings they have for exhibition for this year's Royal Academy.

Every contributor of a drawing which is exhibited at the Royal Academy is presented with a copy of the Album, containing all the Royal Academy drawings of the year that have been published in this journal.

Architectural drawings have to be delivered at the Academy on March 25, 26, and 28. All drawings sent to the office of the *Builder* for illustration will be duly delivered at the Royal Academy by the publisher of the *Builder*, and removed and returned to their owners at the close of the Exhibition. It is, of course, understood that such drawings should not appear in any other publication.

We must also especially draw attention to the necessity for sending all such drawings duly provided with the descriptive labels required by the Royal Academy. We cannot undertake the responsibility of writing and affixing the required labels, which must rest with the owners of the drawings.

CHICHESTER CATHEDRAL.*

CHICHESTER has received a heavy blow, and England a warning; are the words with which this journal announced the fall of the central tower and spire of the Cathedral in the *Builder* of March 2, 1861, and the most instructive record of the great collapse is told in full by an eyewitness in the ensuing article. To the visitor of to-day, whether architect or layman, the chief interest of the place lies in the story of the fall, and a thrilling and almost tragical tone, quite unusual in the literature of Cathedral buildings, pervades the description referred to. In spite of the advice of eminent architects in consultation, aided by an experienced civil engineer and three contractors, with all the forces that they could bring to bear, the beautiful tower and spire that had stood for 600 years, with slow deliberation akin to stoneliness, descended into the body of the church, and laid itself in a conical heap. The mystery is not yet solved how it came to pass that what had stood for so many centuries, in the year 1861, after some months of warning and preparation, collapsed, in defiance of all that modern skill could effect.

The history of most English Cathedrals is interspersed with fires and falls; but they are mostly remote from our time, and do not come home to our minds with any vividness; but one

* This series of illustrations of the Cathedrals of England and Wales was begun in our issue of January 3, 1891. A list of those already illustrated, with particulars of future arrangements, will be found on page xxii.

cannot avoid the remark that such catastrophes in the Middle Ages were made the occasions of greater elaboration and beauty in the re-erected structure, as we shall see was the case at Chichester in the twelfth century, while in our time the greatest architectural authorities that could be brought to bear upon such a situation only considered the opportunity as one for imitating with accuracy all that had been done in the earlier ages, and in one modern work have reproduced the rough-hacked stonework of the Norman impost and shafts and the delicate traceries of Decorated diapering. Surely the fall and reconstruction of Chichester tower and spire should have tragic reflections for architects in this age of light and progress!

Following the method adopted by the late Professor Willis in his "Architectural History of Chichester Cathedral," the plan that is now published indicates four periods of its constructive history. Generally speaking, the Cathedral was as complete when first erected in Norman times as it is to-day, and the work of the subsequent builders was confined to rebuilding portions of the Norman church on differing lines, and in throwing out a series of chapels from each aisle of the nave, and in extending the Lady Chapel. The four periods are: 1. Norman. 2. Works consequent on the fire of 1186. 3. Addition of chapels on the south side of the nave. 4. Similar additions on the north side, and some other works. These divisions correspond roughly with the eleventh to the twelfth, the twelfth to the thirteenth, thirteenth and early fourteenth, and fourteenth and fifteenth centuries respectively. The building internally is a Norman frame, clothed with an early thirteenth-century dress, with more fully-developed accessories,

there is no evidence that this work was finished. The two lower stories of the existing southern tower are Norman.

This completes the account of Bishop Radulph's work,—a singularly great achievement, as his building, unlike most others, remains of sufficient dignity and elasticity to serve the purposes of subsequent ages. His character and work were as remarkable as his church. He withstood William Rufus manfully in Anselm's defence, and distributed the whole of his estate to the poor. The tomb in the Lady Chapel in the western bay of the north wall, marked "Radulfus Epi," has a special interest as probably being the modest resting-place of one of the group of great building Bishops of the Norman epoch, who created so many of our English Cathedrals.

The second period of architectural activity does not open until after the great fire of 1186, in the episcopate of Siegfried, formerly Dean of the Cathedral, who was Bishop from 1180 till 1204, and fourth after Radulph. This fire involved the greater part of the city as well as the church, and the Bishop energetically divided his rebuilding benefactions equally between both. The roofs and fittings of the Cathedral were completely destroyed, and the walls consequently damaged in the upper ground stories by the burning and falling timbers. The mischief, however, to the walls was only superficial, and the Norman construction, perhaps with the exception of the apse, remained intact. Siegfried refaced the lower story below the imposts of the piers throughout the nave with Caen stone, and rebuilt the inner face and arcade of the clearstory. The new Early English spirit in architecture was now beginning to glow throughout the land. St. Hugh of Lincoln came to his see in the year of the Chichester fire. Thomas à Becket had been martyred at Canterbury twelve years before, and four years before Chichester suffered the Cathedral of Canterbury was destroyed by fire, and already was beginning to arise from its ruins as the most beautiful shrine in England, rich with the offerings of pilgrims to the martyr's tomb. But Chichester and Siegfried had no wonder-working saint. St. Richard of Chichester was scarcely born, as he was not consecrated Bishop until 1245 (he died 1253 and was canonised 1261), and no very extensive or costly alterations could be made to suit the new taste. But the skill of the Bishop's architect enclosed the Norman arches with a face of delicate English moulding in place of the large rude roll, and carried it up slender Purbeck shafts with gracefully-curved capitals instead of upon the heavy semi-round Norman ones. To the side aisles these earlier and ruder features remain now for comparison.

Moulded Purbeck strings were inserted above and below the triforium throughout, and the new clearstory arcade had shafts and caps of similar material. The whole Cathedral, nave and aisles, was then re-roofed with a simple and elegant quadripartite vault supported on delicate triple shafts with foliated capitals carved in Purbeck.

The pointed arch first appears in the new vault in juxtaposition with the Norman work, Siegfried having retained in his reserved outer arches of the ground story the older form. The whole of this work was most carefully bonded into the walls, and its present condition testifies to the constructive as well as artistic skill of its architect. Limited as the Bishop evidently was in means, his simple economy in the body of the church enabled him to accomplish notable work in the retro-choir, which he built upon the site of Radulph's embryo chevet. Whether the arches and columns of the apse became unsafe on losing the support of the abutting roofs during the fire, or whether they were purposely removed, does not appear, but probably the former supposition is correct. Siegfried, being in sympathy with the new national life that was being expressed in buildings throughout the country, departs from the French type, and plans a square-ended choir with two square chapels to take the place of Radulph's circular ones, but preserves the Norman square lady-chapel beyond. Thus the area of the Cathedral was not extended, but its character altered by a bold stroke from Norman to English, and though, even in the new work, Siegfried retained the circular form for the enclosing arches, which mark his work as, after all, transitional it is the product, not of the Norman conquerors or their descendants, but of a fresh spring of art in the life of the new English people. The retro-choir or presby-

and throughout there is no breach or want of harmony in the Medieval work. The See of the South Saxons was founded at Selsey ("Seals Island"), a few miles distant, by St. Wilfrid, and removed to Chichester after the Conquest, in 1082, in accordance with the Conqueror's decree, that the Bishops were to be located in the larger towns by Stigand, who was William's chaplain. Two curious carved slabs of Our Lord raising Lazarus and of His meeting with Mary and Martha, now in the choir, of Saxon workmanship, are said to have been brought from Selsey. Gosfrid succeeded Stigand, and of his penance for some unknown default, and absolution by the Pope, a small leaden sepulchral cross, preserved in the Cathedral, tells; and he was followed by Radulph, 1091-1123, the founder of the Cathedral building. Under this Bishop the whole of the Norman work which we now see was executed.

His plan was cruciform with the four great Norman arches of the crossing, whose *facades* still exist, carrying a low Norman tower, the presbytery eastwards terminating in a large apse and ambulatory; two circular chapels and a prolonged square lady-chapel opened from the ambulatory. The foundation of the apse exists below the paving of the present presbytery, and the commencement of the radiating wall can be clearly seen in the masonry of the easternmost bay of the choir aisle from the cloister garden. The position of the Norman external triforium window, not over the centre of the square wall below, but to the westward

at this point, also clearly points to the diminishing bays which radiated around the apse. Three of the five bays of the Lady-chapel are of Norman walling, and it will be, therefore, seen that the original Cathedral of Radulph extended nearly as far east as the present one. The transepts were without aisles, but each had an apsidal chapel on its eastern side of the diameter of the arches now existing in the transepts. That on the north side can be traced in the springing of circular masonry from the wall in the chamber over the now altered chapel below. The nave consisted, as now, of eight bays, four consistent in style with the work of the choir and the four western bays differing slightly in detail and dimensions (see lithograph "View across Nave"). These may not have been erected until after a fire which occurred in 1114, during the same episcopate, of which we are informed by Malmesbury, who states that Henry I. principally assisted in repairing the damage. This difference in the dates of the nave shows that first, the eastern portion of the church was built first. The ground story, triforium, and clear-story of the Norman church remain, altered only on the face presented to the nave. The triforium is large, and lighted by small windows in the external walls. The side aisles are similarly intact, the outer wall and windows only having been altered. These were wanted, though vaulting was not contemplated for the nave, which, undoubtedly, had the usual ceiling and low wooden roof. Two western towers and a connecting front completed the church, though

ery is a work of singular beauty of design and detail; the proportions, though low, are suited to the circular arches employed, and there is a

breadth of treatment and display of wall-surface, especially in the design of the east wall, that most satisfactorily closes the Cathedral vista, and yet opens it into the lady-chapel without the weakness of result or awkwardness of expedient that exists to mind in so many

other cases. The general height and spacing of the adjoining earlier work was retained, but the strings above and below the triforium were stepped up to provide increased height for the wider arches and mouldings of the ground story. The piers are of singular and beautiful design, each member of the Parbeck cluster of shafts manifestly doing its own work around the central column, which is also of marble. The capitals are fully carved with rich trefoil leafage, and are proportioned in depth to the varying diameter of their shafts. The abacuses are varied, some round and some square, in each story. The triforium of the east wall is very fully decorated with the best type of Early carving,—strong, virile, small figures,—Our Lord in majesty in the centre spandrel, with angels on each side in the tympanum of the adjoining arches, with clusters and bands of interesting foliage, clear and simple in form, and so justly recessed that it is far more effective from the floor of the church than from any nearer position. The arches of the clear-story arcade are all pointed; in the nave only the centre one was pointed, the supporting side arches being round. The vault is continuous with the new one to the nave and choir. The work of this period includes the rebuilding of the transept chapels, thus removing the remaining apsidal terminations from the plan. Adjoining the north transept a large double chapel was built, elegantly vaulted from a central marble-shaft. After doing duty for centuries as a parish church, these chapels are now used as the chapter library, a circular stair gives access to a large upper chamber, in the wall of which are to be seen the springing stones of the former Norman apse. In this room now repose extensive remains of the fifteenth-century wooden reredos. The chapel in the south transept was simply re-designed by Siegfried, and a chamber, either for watching friars or some subsidiary

purpose, fitted into the space between it and the aisle wall. The double Norman window from the aisle exists into this room, the only one of its kind left. The south porch of the nave, now opening into the later cloisters, is of this period; a double arch with centre shaft, above which is a quatrefoil niche for a figure, forms the porch. The sacristy, which adjoins the porch and the south transept, though of the same style, must have been built after the porch, as the wall of the latter, though obviously lengthened and used, and is of a greater thickness. This is a fine apartment, and is vaulted. This room would have served the purposes of a chapter-house, but it is believed that though the site is lost, there was a detached building for the purpose. A porch on the north side of the nave, with a double arch and centre column supporting a tympanum with a trefoil niche, and the necessary addition of buttresses everywhere for the new vaults, complete the records of the Second Period. Excepting the sacristy, there seems to be no doubt that all these works were carried out by Siegfried, and the rebuilt Cathedral was dedicated in 1199 to the Holy Trinity. It was in this year that Bishop Siegfried assisted at the coronation of King John. A special chronological interest is thus given to the Early-English work at Chichester included in this description, as the date of the fire, 1086, and that of the dedication are recorded, and within the comparatively narrow period of thirteen years we are able to observe the genuinely national style springing into power, and as yet treating the pointed arch not as a matter of necessity, or the round arch as something to be avoided.

With the Cathedral so far completed, the scope of the two remaining periods is narrowed, and it can easily be imagined that if no local saint had attracted pilgrims and canonisation to his remains there would have been no need for further extension of the plan. The Third Period, however, embracing the thirteenth and the opening of the fourteenth centuries, witnessed the erection of two chapels adjoining the south aisle of the nave, each occupying two bays in length, and filling up the unoccupied space between the south porch and the south-west tower. They are divided from each other by a cross-wall, which has been removed in post-Reformation times. The eastern of these two chapels was dedicated to St. Clement, and the western to St. George. The south aisle wall was pierced by four wide arches of the period, and a width and effect gained in the Cathedral nave that was soon to be emulated on the other side. Large windows were provided with gables over them, and the ridge of the vault was tilted up in order to include a larger window area. The similarity and the slight development of the style shows that no great period had elapsed since the last link had been added to the architectural chain. A small chapel in the easternmost available bay of the north aisle was built at this period, and dedicated to St. Thomas; it contains a very beautiful and perfect stone reredos arcade and adjuncts. There are traces in the southern chapels of such reredos, but in its present condition the northern one is quite unique.

To this period we must assign the central tower that lasted until thirty years ago; the spire to the succeeding period; the battlements and turrets are not original. The rose window in the east gable of the choir, which is of graceful geometrical design, belongs to the Third Period; also the upper story of the south-west tower. The earliest works of the Fourth period are the two remaining chapels of the north aisle, which very exactly correspond with the earlier ones on the south side. They were, however, only separated from each other by a screen-wall. These two groups of chapels give, with the nave and aisles, such width to Chichester, that it is difficult to realise that it is second only to York among English Cathedrals, the former being 90 ft. and the latter a little over 100 ft. across the nave. Very picturesque and sombre effects of light and shade and of grouped arches give interest to what is quite a small interior in general appearance. The Lady-chapel was lengthened by the addition of two bays, and the same character given to the three Norman bays. This was executed by Bishop Gilbert de Sancto Leofardo, 1288-1304. For purity and beauty of detail this work can be considered as one of the best examples of the early fourteenth century. The western Galilee porch of the nave is of about the same period, but the date

of its erection cannot be fixed by contemporaneous facts; its contains a founder's tomb on its south wall, which may be that of Bishop Berghestele, the predecessor of Gilbert, who died in 1287, and was buried after a pilgrimage to Rome to be absolved from excommunication, and whose authority was obtained for the works. The design of the porch is simple and large, the mouldings and piers marking the steady development of the Geometrical into the Decorated style. The very fine Decorated window in the south transept, with the adjoining wall, buttresses, gable, and rose window, are the work of Bishop John de Langton, and recorded as given by him in 1308. The great window occupies the whole southern wall, and immediately below its south-east corner is the canopied tomb of Langton (see illustration, page 186); he was Chancellor of England, as was also his successor, Robert Stratford.

The parapets to the nave are Decorated in period. The unusually crooked character of the building, in spite of its homogeneity of design, made their treatment a matter for the exercise of considerable skill. The difficulties have been overcome by the use of two corbel tables, one over the other, the varying projection of the corbels making the parapet straight without drawing attention to the way in which it is effected. The spire, with its solid dormers and octagonal pinnacles, was added to the central tower in the fifteenth century; the proportions are distinctly elegant, and the ornament refined and well concentrated. The traceried bands around the spire emphasise the satisfactory distribution of the spire, which is of a somewhat wide angle of 13 deg. Fergusson remarks that this is similar to Lichfield, and with it differs from Salisbury, Norwich, and Louth, which are only 10 deg., and far taster.

Passing on to Early Perpendicular work, a large window was inserted in the north transept to emulate Langton's on the south, but was much more clumsily carried out, a great flying buttress being necessary to save the upper portion of the north wall from falling. The settlements caused by this window are apparent now. An upper story was added to the sacristy with two buttresses. This room was used as a consistory court, and from its access is obtained to a vaulted treasury over the south porch by a secret door in the panelling.

The episcopate of Sherborne of New College, Oxford, 1508-1536, was a time of much gain to the Cathedral. There existed until a short time previous to the fall of the central tower in 1861 a very beautiful stone roof-screen, known as the Arundel Shrine, containing two shrines within a graceful and richly-vaulted arcade of Early Perpendicular work, behind the eastern wall of which were staircases giving access to the roof, and in later times to the organ, as shown in the sketch. Most of the decorative details of this screen are preserved in the north-west tower. Within the choir Sherborne erected a complete range of simple but beautiful stalls under a canopy arcade returning at the back of the roof-screen. A fine reredos and similar screen work was also erected by him, and he provided some most interesting, painted decorations, by employing an Italian, named Theodore Bernardi, some of which remain on the vaulting of the Lady Chapel, and in the screens of kings and bishops portraits that lined the south transept walls. A drawing of Bishop Sherborne's tomb, by Mr. R. W. Paul, will be found among the lithographs in the present number.

The cloisters, which lie around the south transept as a centre, instead of against the south aisle of the nave, as more usual, are Perpendicular, with a simple arched wooden rafter roof; the detail is interesting, and the enclosing wall of the three sides is probably of very varying dates, and its irregular shape indicates that it formed the boundaries of buildings to which the cloisters lead, rather than that it was laid out on the usual plan. In the south-east corner, the cloister passes under the west end of St. Faith's Chapel, the gable of which stands upon the angle and adjoining bay of the east wall. An archway at this point opens into an interesting Vicar's close, one side of which only remains, with the ancient hall adjoining St. Faith's. The Bishop's Palace occupies the corresponding angle of the precinct. The massive detached campanile to the north-west of the Cathedral is of Late Perpendicular style (see sketch, page 187), and appears by its breadth and low proportions to have been designed for the purpose of emphasising

Plan of Ancient Rood Screen at Chichester Cathedral, between the tower piers, called the "Arundel Shrine," and the return stalls of the choir. Drawn by Mr. Beresford Pite.

Sketch from old Drawing, showing Organ-case and Return Stalls, Chichester Cathedral, before the fall of the tower. Drawn by Mr. Beresford Pite.

ing the gracefulness of the ancient central spire. There is a Renaissance monument to Bishop Sherborne in the south choir aisle, maintained by his former college. In the

heavy pendulum within it of timber to preserve its centre of gravity under wind pressure. Nothing, however, since the completion in the thirteenth century can be compared in importance to the works preceding the fall of the tower in our time. The stonework walls of the Arundel Shrine, with the return stalls and handsome organ, were removed to throw open the nave for services with the choir, and shortly after the fall took place, destroying shrine, stalls, and organ, though the damage resulting to the rest of the building was comparatively slight. Sir Gilbert Scott rebuilt the tower, with its supports, and added 6 ft. to its height. Old prints exist, and a view was published in the *Builder* of March 2, 1861, showing the old proportions, which were, perhaps, not improved upon. A very large masonry reredos was erected in the presbytery by the late Mr. Slater, and Messrs. Bodley and Garner have recently finished a large and delicate oak choir screen. The comfortable proportions and effect of the old choir will not, however, be regained until Bishop Sherborne's oak reredos and the return stalls are restored to connect what are now but two detached ranges of stalls and canopies, and complete the interest of a very satisfactory interior. A. B. P.

and the head of the effigy have been restored, and the monument is kept in repair by New College, Oxford. The heraldic charges on the shields of the tomb itself have been painted in a very indifferent manner. Those on the shield at the back of the tomb are better, and are carved in relief. A curious part of the design is the raking of the jambs of the canopy, the little turrets which flank it being, however, upright. On the front of the tomb is the following marginal inscription:—

**NON METRES
IN IVOCIVM
CVM SERVO
TVO DOAREDE
Robert Sherburne**

The tomb was made during the Bishop's lifetime, and is an effective piece of work, bearing strong evidence of Renaissance feeling. Sherborne's stalls still exist, and the remains of painted screens are in the transept. The fragments of his reredos, of wood, are lying at present in the room over the library. R. W. PAUL.

VIEW ACROSS THE NAVE, CHICHESTER CATHEDRAL.

The view has been taken from the south aisle looking north-east, showing a portion of the chapels beyond, which were thrown out in Decorated times. The large mass of the nave piers, however, makes a good view of the whole width of the church difficult to obtain. R. W. PAUL.

DETAILS OF SARACENIC ORNAMENT.

THESE formed some of the diagrams illustrating Professor Aitchison's sixth and last Royal Academy Lecture on Saracenic Architecture, printed in full in this number. They are chiefly illustrations of the geometric ornament of the Saracens, to which is added an example of floral ornament executed in tiles.

BISHOP SHERBORNE'S TOMB, CHICHESTER CATHEDRAL.

This is the best-preserved tomb in the Cathedral, and the most elaborate in design. It is of alabaster, with a good deal of colour. This

Chichester Cathedral—Monumental slab now in N. Aisle of Presbytery.

Parliamentary wars Chichester was stormed by Waller, whose men damaged the monuments and organ. Sir Christopher Wren rebuilt the upper portion of the central spire, and devised a

PROVIDENT INSTITUTION OF BUILDERS'
FOREMEN AND CLERKS OF WORKS:
ANNUAL DINNER.

The annual dinner of the donors, subscribers, members, and friends of this old-established Institution (which has just attained its Jubilee, having been established January 31, 1842) was held in the Venetian Saloon of the Holborn Restaurant on Saturday, Feb. 27, Mr. J. Howard Collis (of the firm of Collis & Sons) in the chair, supported by a very large number of the members and friends of the Institution,—so large, indeed, that some of the friends had to dine in adjacent rooms.

The Chairman, in proposing the principal toast of the evening, "Prosperity to the Institution," said that when he was asked to accept the position of President of the Institution he accepted it at once, without any hesitation, having previously made himself acquainted with the good work that it had done and was continuing to do year by year. No one could read the annual reports of the Institution without being convinced of its value and importance to a large section of the building trade. Before entering upon his position as President he had spoken about it to the respected Governor of the Institution, Mr. George Plucknett, whom he was very glad to see present with them that evening, and Mr. Plucknett said: "I have been connected with the Institution for thirty years, and I feel sure that it is doing and has done a great work." Higher testimony than that he could not have. As they all knew very well, builders' foremen and clerks of works were very often associated together,—not always quite so happily as at the present occasion,—and they were all the better for the opportunities of intercourse which they had through the medium of that Institution. The importance and responsibility of the duties which they fulfilled in their respective callings could not be over-estimated by architects or builders. The architects and builders, as well as their clients, owed a very great deal to the foremen and clerks of works, who were to be commended for combining together in an effort for mutual help and providence. But he confessed that it was a great mystery to him why the Institution possessed, comparatively speaking, so few members. Here was an Institution, excellent in its aims and objects, admirably managed, and possessed of considerable funded property, and yet it did not number nearly so many members on its roll as it ought to have, considering the number of men there must be who were fully qualified to join the Institution. The advantages of the Institution to those whom it was designed to benefit could not be questioned. To quote a few words from the annual report for 1891, "the advantages of the Institution begin to show our colleagues the advisability of joining and putting their shoulders to the wheel while young to help to build up a provision for themselves, their widows, and orphans. Eighteen new members have joined during the year, being the largest number for several years. This is very gratifying to the Directors; but, at the same time, they would urge on all our members the necessity of caution in introducing new candidates, so that everyone that joins may be a credit to the Institution." These were admirable words, and he trusted that one result of that gathering would be a substantial accession of new and worthy members. With the toast he proposed, he had very great pleasure in coupling the name of Mr. Bedford, one of the secretaries.

The toast was heartily received, and Mr. Bedford, in reply, expressed his gratification at the fact that no fewer than 363 friends of the Institution were present to testify to their interest in it.

Mr. G. Groome, in an amusing speech, proposed "The Governor, Trustees, Donors, Subscribers, and Visitors," coupled with the name of the Governor, Mr. George Plucknett. This toast was also very heartily received.

Mr. Plucknett, in reply, reviewed the work of the Institution, but expressed regret that it had only eighty eight members, while there ought to be hundreds, if not thousands.

Mr. J. Mowlem Burt, in proposing "The Architects, Engineers, and Surveyors," coupled with the name of Mr. H. Percy Monckton, F.R.I.B.A., referred to the responsibilities which devolved upon architects, engineers, and builders in the carrying out of buildings. They could not afford to work for only eight hours a day, or even for only ten hours; their responsibilities and anxieties could not be dropped in a moment, as they could be by the workman when he is "downed tools."

Mr. Monckton replied, and referred in highly appreciative terms to the work of a good foreman and a good clerk of works.

Mr. J. Adams proposed "The Builders," coupled with the name of Mr. John Mowlem Burt, who, in reply, again referred to the anxieties of builders, especially with regard to accidents and the Employers' Liability Act. Builders found that, do what they might in the way of providing proper plant, appliances, scaffolding, &c., many workmen appeared to have no thought whatever for their own lives and limbs, nor any care for those of their fellow workmen. The result was that accidents were of frequent occurrence, and these led to vexatious actions for damages against the employers,—

actions too frequently prompted by unprincipled lawyers.

The remaining toasts were "The Chairman" (proposed by Mr. J. W. R. Bedford), and "The Press" (proposed by the Chairman, and coupled with the name of the representative of the *Builder*).

During the evening, subscriptions and donations to the amount of about 110*l.* were announced by the secretary.

Correspondence.

To the Editor of THE BUILDER.

CONCRETE FOR ARTISANS' DWELLINGS.

SIR,—I cannot see why "Surveyor" should be so anxious to avoid iron joists, for they are cheap enough. I am writing far from price-lists and formulae, but I think that two rolled-iron joists, 10in. in depth, dividing each room into three modern-sized bays would cost about 5*l.* for the two. Against this "extra" there would be, of course, an "omission" of concrete, by reason of the layer having to span, say, 4 ft. instead of 12 ft.

The iron joists would tie the walls together,—a very necessary precaution, if there be none of wood,—and the centring for the concrete could be hung from them instead of being strutted. They would also help to form a scaffolding until the floors are put in,—an operation which should not be undertaken until the roof is on.

ANOTHER SURVEYOR.

P.S.—Why does not "Surveyor" make an experiment or two with different spans and thicknesses of whatever concrete he proposes to use? It would be a very simple matter, and, spite of all printed testimony, "seeing is believing."

"INSULA."

SIR,—In the articles referring to the excavations in process at Silchester, which appeared recently in the *Builder*, I noticed frequent reference to the various "insula" that had been laid bare in the course of the excavations. I understand that the term "insula" applies to the square blocks of ground, bounded by roads or streets on all four sides, and covered by houses and shops and their courtyards and gardens. Perhaps some of your archaeological correspondents will oblige by informing me if the term "insula" so applied was used by the Roman dwellers in Silchester and other Romano-British cities; or if, on the contrary, "insula" is only a term used by modern archaeologists to describe these separate blocks of buildings.

My reason for asking the question is as follows:—In Ayr we have a narrow street or lane bounded on both sides by the oldest buildings in the town, and this lane, while its official or directory title is "Hope-street," has been known from time immemorial, and is colloquially spoken of to-day by most of the inhabitants as "The Back o' the Isle." This lane lies at the back of a square block (insula?) in the very centre of the town, lying like an island in the middle of the High-street. The High-street passes on the east front of this island block, and is 50 ft. wide. The "Back o' the Isle" is on the west front of the island block, and averages 15 ft. in width.

Now, supposing the term "insula" was an old Romano-British term for such a building stance, would it be too liberal a deduction from the facts to argue that this present island block in the High-street of Ayr occupies the site of an "insula" of the old Roman township, which probably existed on the site in old Roman occupation times, and that the local "phrase-title" is a reminiscence of the old Roman days, although its origin had been long ago forgotten and lost sight of? I should perhaps have mentioned that the Roman road through the western lowlands of Scotland passed through Ayr.

If, on the other hand, the term "insula" is nothing more than a modern archaeological term, it is at least interesting that the same term, or a variation of it, should have been in use in Ayr for very many years past.

JAS. KENNEDY HUNTER.
19, February, 1892.

ARCHITECTURAL CASINGS FOR ELECTRIC WIRES.

SIR,—I notice in your report of the discussion upon Mr. Max. Clarke's paper at the Architectural Association, that Mr. R. Langton Cole considered my moulded casings excellent, but thought it curious that the covers were all screwed in the centre, although I quoted, in the preface of my book, the "Phoenix" rule that all covers should be screwed at the sides. Will you kindly allow me to explain to architects that neither the Phoenix, nor any other company, makes it a *sine qua non* that the covers shall be screwed at the sides; but simply recommends that this should be done where possible. In point of fact, so far as the majority

of "Stance," we are informed, is a Scottish term for a building lot.—ED.

of small-sized casings are concerned, there would be a considerably greater risk of the screws damaging the insulation of the electric wires, if such screws were inserted at the sides than if they were driven in the centre of the covers. In my book, where the width of the casing allows, I invariably indicate screws at the sides. I think any architect will see at a glance that the fillet between the grooves in all my designs is sufficiently wide to minimise any risk attending the insertion of screws in the centre. F. A. FAWKES.

Gleitsford, February 27.

THE LATE STRIKE STILL SMOLDERING.

SIR,—The carpenters and joiners do not appear to have got over the autumn's strike. Last week upwards of one hundred men had a shop meeting in one of the best-known firms in London (four men out of five had attained to grey hairs and "spears," presumably in their service), and passed a resolution requesting the firm to discharge two "black-legs" forthwith, because they acted differently to them in an important crisis. The reply virtually was, that the petitioners were quite as black as their two mates; and that they would not be paid off at their dictation, even if all of them left their employment. I trust you will record this to the credit of the firm and Master Builders' Association, whose ordinary course in similar cases is to discharge men. This occurred in my experience when I was shop foreman of joiners. I then kept for my own satisfaction the prime cost of the work of each man. After the men's requests were acceded to, I found the output of work of each man declined on the average three shillings per week. When firms are confronted in such emergencies, let them compute on this average for profit and loss. BENCH.

The Student's Column.

WARMING BUILDINGS BY HOT WATER.

X.
EXAMPLE WORKS (HORTICULTURAL)
(continued).

THIS next example, fig. 36, introduces a new feature, viz., the "main" pipes, which are nearly always necessary when the houses exceed two. These mains fulfil the purpose of conveying the heated water to the different branches, and returning the cooler water to the boiler after it has done its

work, so to speak. In some cases the mains do nothing but this; that is to say, the pipes are not used for radiating purposes, but are entirely covered up. In the example now treated the mains are made use of for radiating purposes as well, for it will be seen that after coming along the end of the first house they proceed direct along in front, passing through a range of melon pits which are heated by these mains.

(These pits are commonly used for melons hence the name; other things are often grown in them, of course.)

These pits are generally kept at a little lower level than the houses, and this enables the proper rise to be given to the branches as they pass into the houses. In this case, the mains would be kept below the ground-level where they pass along the side of the first house. They could be run in a channel with grating over, or be quite covered up.

It will be noticed that the particular value and need of the main flow and return is to permit of the simple yet exact regulation of the heat in the different boxes independently of one another. In the illustration it will be seen that every branch from the main has a stopcock at the point indicated by a small circle, and it will be equally obvious that by this arrangement the circulation can be adjusted to any house with the greatest ease, and almost instantaneously. This means of independent regulation, as explained in the last paper, is very necessary, for not only may there be too much pipe in a house, but sometimes, for reasons often hard to account for, one branch will work more freely than another and to the detriment of others, and has to be checked. If these four houses were heated by continuing the pipes from one to another, as in the example given last week, regulation would be next to impossible. If we attempted to check the circulation in, say, the second house, we could not do so without seriously affecting the third and fourth houses. It might be mentioned that another reason for having a stop-valve in each branch of the example being treated (fig. 36) is that it is no uncommon occurrence for one branch to work to almost the entire exclusion of the others, to "short-circuit," we may say. There are various reasons for this, and the subject will be touched upon in later papers.

When an apparatus extends a good distance in one direction, it is particularly desirable to get the boiler as low as possible so as to give a fair rise to the mains the whole of their length. The mains would only consist of two pipes, one flow and one return. To obtain this rise necessitates rather a deep boiler-pit, and this is arranged for if it is possible. In many situations when digging a pit, water is met with inconveniently near the surface, and for the pit to be taken down below this point means expense in the first place, and the risk of its being but a poor success afterwards. There are now many boilers made expressly for "shallow drainage," as the difficulty is called, and if by using these dwarfed boilers there is no occasion to go below the water-level, then it is best to adopt this course. Instead of there being the risk of water finding its way into the pit, there should always be a drainage to the pit itself. If the "shallow drainage" difficulty is known to exist, there are many remedies that can be, and are, resorted to, when building the houses. The person who erects horticultural buildings knows, of course, that they have to be heated, and should make all proper and possible preparation.

Again, referring to the "mains," it is sometimes thought best to carry them up the centre of the houses in a channel or trench. The houses then get the benefit of the heat from these as well as the branches, and allowance has to be made accordingly when calculating the quantity of pipe required. It will, however, be found that pipes in channels are not of such value in heat-giving as exposed pipes. When mains are carried in this way through the houses the rise they require necessitates their being started rather low down, and the channel would need to be deep at the commencement if all the houses were on a level. If the houses are on slightly rising ground it proves very satisfactory in many ways, supposing the boiler can be placed at the lowest end.

Carrying the pipes in this latter manner within an open channel, probably with grating over, is not considered so satisfactory as covering them. In the first place, exposed mains generally result in the end houses of a long run being poorly supplied with heat; then the expense is a little greater if gratings are used. If we cover up the mains in a satisfactory manner no loss of heat occurs, the branches are well supplied, and there is not the trouble of keeping the channels clean. In this case it is understood that the main pipes do not enter into the calculations as to the quantity of radiating pipe required. They take no active part beyond supplying the branches.

In carrying the mains beneath the ground in covered channels, they can either pass under the houses or beneath the ground just outside them. In either case it is customary to make a brick trench, allowing the proper rise required, and the pipes are laid in this. It will not do, though, to leave the pipes without filling in the trench around them, and the best material for this purpose is sand. When the pipes are thus surrounded with this poor heat-conducting material the channel is covered with bricks or slates and the earth filled in. If desired fillets of wood can be placed beneath the pipes to lift them a little, and so allow the sand to completely envelope them. Fig. 37 shows in cross

section the pipes as they lie in this covered trench. If the channel was unfilled and there was any possible chance of air entering it, we should get an action resembling in some ways the draught in a chimney, that is to say, the air near the pipes would become heated and would rise; at the same moment cold air would flow in, a continuous current would result, and the in-flowing cold air would rob the apparatus of heat at a very rapid rate and to no good purpose whatever.

Sand is the best material to surround these pipes with to prevent loss of heat. Sawdust or hair would answer well, except that it would not withstand moisture so well as tightly-packed sand, and moisture may be expected with tolerable certainty if the channel is not beneath the house. Silicate cotton is also an excellent material, but for this purpose it would be unnecessarily expensive, and give but little, if any, better results than sand.

The last question to be discussed respecting the main services is as to their size. There used to be a prevailing idea that the mains should be of a sectional area equal to the area of all the branches. When there were many branches this led to really enormous pipes being used, the bulk of water they contained necessitating some extra power at the boiler. They occupied much room, and the cost was a very disagreeable element.

This plan soon fell into disuse when it was discovered that there was no necessity for such relative areas. Theoretically it carried weight, but in practice results proved it to be unnecessary. For the example under discussion, 4-in. mains will do very well. It is found that this size is quite enough to permit of the water circulating freely, and if we get a moderately-rapid circulation to carry the heated water to the branches, and convey the cooled water back to the boiler, it will be found sufficient. A very rapid circulation is not so much needed, as the water does not lose its heat from the pipes instantaneously, and in this apparatus, although there are four houses, the distance is not great. In a larger apparatus than this, having a greater number of branches, or in instances where the branches are more extensive but the mains limited in length, it may be considered best to use 6-in. pipes for the mains. This is one of the points it is difficult to decide except by actual experience, but it may be assumed that the necessity for 6-in. mains is not very common.

LIVERPOOL ENGINEERING SOCIETY.—The ninth ordinary meeting of this Society for the present session was held at the Royal Institution, Colquhoun-street, on the 24th ult., Mr. John T. Wood, President, in the chair. The evening was devoted to the adjourned discussion upon a paper read by Mr. Thomas Morris, F.C.S., at the previous meeting, entitled "Engineers' Tests of Iron Considered," and Suggestions for Standard Uniform Tests." Mr. Thomas L. Miller, Assoc. M.Inst.C.E. opened the discussion at some length, and dealt principally with the contraction of area test. Messrs. Joseph Price, J. J. Potts, Robert E. Johnston, C. H. Darbishire, Prof. H. S. Hele-Shaw, and others, took part in the discussion, upon the conclusion of which Mr. Morris replied. A vote of thanks was accorded by acclamation to Mr. Morris for his interesting and practical paper.

OBITUARY.

SIR JOHN COODE.—The *Times* announces the death of the eminent engineer, Sir John Coode, K.C.M.G., which took place on Wednesday, at Brighton, after a long illness. Sir John, who was born in 1816, was a son of the late Mr. Charles Coode, of Bodmin. He was educated at the Grammar School of his native town, and early in life chose the profession of civil engineer, in which he soon distinguished himself. He began his career under the eminent engineer Rendel, and for a short time was employed on the Great Western Railway. As early as 1847 he was appointed resident engineer at Portland harbour and breakwater, and, on the death of Rendel, engineer-in-chief in 1856. He continued in charge until the completion of this great work in 1872, when he was knighted. He was for many years consulted by the Board of Trade and other Government departments on matters connected with harbours, docks, rivers, and drainage. Many important works were carried out from his designs, including the great breakwater and docks at Cape Town, the breakwater at Colombo, the improvement of the river Bar, in Ireland, the harbours of the Isle of Man, and similar works elsewhere. He was a member of the Royal Commission on Harbours of Refuge in 1858-59, and of the Royal Commission on Metropolitan Sewage Discharge, 1882-83. The harbour of refuge now in progress at Peterhead, and the new harbour works at Dover, for which the Act was obtained last session, are from the designs of himself and his firm. He was President of the Institution of Civil Engineers in the years 1889 and 1890.

GENERAL BUILDING NEWS.

BOARD SCHOOLS, WEST HARTLEPOOL.—The School Board have decided to build upper-grade schools, adjoining the Oxford-street schools, which were built two or three years ago for 630 children. They have accordingly instructed the architect, —Mr. J. P. Pritchett, of Darlington,—to prepare a design and carry out the erection of an upper grade school for about 500 children on land adjoining.

WESLEYAN CHAPEL, WEST AUCLAND.—On the 24th ult., Mr. Joseph Albert Pease, of Snow Hill, Darlington, laid the memorial-stone of the West Auckland Wesleyan chapel, schools, and vestries. Those comprise a chapel to seat 250 adults, Sunday-school for 350 children, infant-school, minister's vestry, large class-room, &c. The new buildings are to be constructed of stone, in the Early English style of Gothic architecture, with internal fittings in pitch-pine. The entrance doors of chapel and school are arranged to swing both ways in case of a panic arising. The work will be carried out from designs and under the superintendence of the architect, Mr. J. W. Taylor, Newcastle.

RE-OPENING OF NORMACOT CHURCH, STAFFORDSHIRE.—On the 25th ult., the Bishop of Lichfield re-opened, after restoration, the Church of the Holy Evangelists, Normacot, Longton, and dedicated the new aisle and vestry. Nearly twelve months ago, instructions were given to Mr. John Lewis, architect, of Newcastle-under-Lyme, to form a north aisle to the church. The various works in connection with this were entrusted to Messrs. H. & R. Inskip, of Longton. According to the *Birmingham Gazette*, the initial design of the church is by the late Sir Gilbert Scott, the building being constructed of red sandstone. The new portion, although not exactly similar, is in unison with the south aisle, and is constructed of Alton stone. The principal rafters are of deal, the plaster work between being executed in alabaster. The columns are of brown Wall Grange stone to match the existing ones. The floor of the porch is laid with Hopton Wood polished stone. The aisle floors are laid with tiles from the Campbell Tlo Company. The heating arrangements have been carried out by Messrs. Hartley, of Macclesfield. The total cost will be about 1,600*l.*

NEW CHURCH, WEST BROMWICH.—On the 1st inst. the foundation-stone of a new church, which is being erected in the Becheses-road, West Bromwich, was laid by Alderman Farley. The church is to accommodate 350 people. It will be built in the Gothic style, and will consist of nave (52 ft. by 25 ft.), and a chancel with a transept on one side and a vestry on the other. It is intended at some future time to erect a permanent church in front of this, which will then be converted into a parochial room. Messrs. Henry Smith & Son, of West Bromwich, are the builders, and Messrs. Wood & Kendrick the architects.

SESSIONS COURT, GREAT WITLEY, WORCESTERSHIRE.—On the 24th ult. the new police-court at Great Witley, which has been erected by direction of the Worcestershire County Council, was opened for public purposes. The building is of red brick with Bath stone dressings. The Sessions Court is 33 ft. long by 20 ft. wide, and there are three entrances, one from the magistrates' retiring-room, one for officials, and a larger door for the general public. A room is placed near the public entrance as a witnesses' waiting-room, and there are other conveniences, a porch being erected over the main entrance. The floor of the court-room is of wood

blocks. The ceiling is partly open, and panelled; the frame-work being of pitch-pine, stained and varnished. Tobin's shafts have been introduced, with extra ventilators in the roof. The court is heated with hot water apparatus supplied by Messrs. Ward & Sons, Worcester. The architect was Mr. Rows and the contractor was Mr. T. Vale, of Stourport.

NEW POST-OFFICE, GOOLE.—On the 27th ult., the new arcade and Post-office, which occupies a position at the juncture of Aire-street and North-street, Goole, was opened. The arcade connects those thoroughfares with Victoria-street. The main front consists of rooms for the accommodation of the Post-office officials. The arcade, with light iron roof covered with glass, contains sixteen shops on the ground floor, varying in size from 27 ft. by 15 ft. to 17 ft. by 15 ft. An illuminated turret striking clock has been fixed near the Victoria-street entrance, and is the work of Messrs. Wm. Potts & Sons, of Leeds. Mr. H. B. Thorp, of Goole, was the architect.

PROPOSED NEW HOTEL, BELFAST.—According to the *Belfast News Letter*, the Belfast Central Hotel Company intend to erect a new hotel in Belfast. On the ground floor there will be a dining-hall, capable of dining over 200 persons; also billiard-room, smoking-room, and all other necessary accommodation. On the first floor there will be dining, drawing, music, writing, and ladies' coffee rooms, and a number of private sitting apartments. The hotel will contain between 200 and 300 bedrooms. There will be a large number of rooms of various sizes, which will be specially designed for stock-rooms. It is at present intended that the entire building will be lighted with electric light, and it will be fitted up with lifts for passengers and luggage. Mr. Samuel Stevenson, C.E., is the architect.

RE-OPENING OF EPISCOPAL CHURCH, PORTOBELLO.—On the 27th ult. St. Mark's Episcopal Church, Portobello, near Edinburgh, was re-opened after undergoing alterations and additions. The principal change which has been effected in the building is the erection of a chancel, but the whole interior has been altered, the side galleries having been removed and the sittings re-arranged. The ceiling has been panelled, and the church has been painted and decorated. The new chancel is 25 ft. long and 27 ft. wide, with an organ-chamber beyond, shut off by an oak screen. The floor is laid in marble and tiles, and rises in five marble steps to the sanctuary. The altar-table, of carved oak, stands on a marble footstep a step higher. The credence table is of polished alabaster. Carved stone corbels support the springing of chancel arch. A parapet of dressed stone, with polished brass rail, marks off the chancel. The architects are Messrs. Hay & Henderson, Edinburgh.

BANK BUILDINGS, OLDHAM.—New bank buildings have just been erected in Union-street, Oldham, by the Oldham Joint Stock Bank, Limited. Entrance is gained from Union-street through two vestibules. The banking-room, 50 ft. square by 25 ft. high, is lined with faience tiling, with mosaic floor. The general rooms for management of the bank are placed up to Union-street. The basement has been utilised for bullion and strong rooms, connected with the banking-room by a hydraulic lift. The upper portion of the site being Queen-street has been utilised as chambers, which have a separate entrance. The building throughout is fire-proof. The exterior of the block is faced with ashlar and moulded stonework. The following firms have been engaged upon the building:—Messrs. C. Spencer Bros., Oldham, excavating; Mr. Whitworth Whitaker, Oldham, brickwork; Mr. Thomas Dunkerly, Oldham, masonry; Messrs. Thomas Hand, Oldham, general joiners' work; Messrs. S. Ashton & Sons, Oldham, slating, plumbing, and glazing; Mr. James Hall, Oldham, plastering; Burmantofts Works, Leeds, faience work and fireplaces; Messrs. Pattison, Manchester, granite base and steps and mosaic floors; Messrs. Homan & Rodgers, Manchester, fireproof floors and ceilings; Messrs. Pearson & Brown, Manchester, fittings to banking-room and wood-block flooring; Mr. Hand, Oldham, decorating and painting; Mr. Davenport, Oldham, wrought ironwork; Mr. Schofield, Oldham, ventilator; Messrs. Kaye & Sons, Leeds, locks; Mr. R. Middleton, Leeds, hydraulic lift; Messrs. Guttridge & Co., Glasgow, lead lights; Messrs. Standing & Co., Manchester, gas-fittings, &c. The whole has been designed and carried out under the superintendence of Mr. Thomas Taylor, architect, Oldham.

NEW GOODS-RECEIVING OFFICE FOR MESSRS. PICKFORD & Co.—Messrs. Pickford & Co. are about to open an extensive new goods-receiving and forwarding office at No. 34, Queen-street, Cheapside. It is entered by a lofty gateway which occupies the greater portion of the lower part of the frontage of a new block of offices and warehouses erected by Messrs. Fink, Fryer, & Co., of Bloomburg-street, Westminster. Mr. Robert J. Worley, of Cannon-street, being the architect. The goods depot is large, light, and spacious, and from it an easily stepped incline, paved with granite sets, leads down to a stable for thirteen horses. Although this stable is below the ground level, it is light and well-ventilated. The floor of the stable is paved with

Claridge's patent asphalt laid on a solid bed of concrete 1 ft. thick. The asphalt surface is 1½ in. thick, except where the groovings for foothold occur. These groovings are V-shaped in section and cross each other at right angles, forming small squares. There is no stable-drain, except the one to catch the waste from the water-trough. It is intended to use peat or other similar litter for the horses, and this will absorb the urine from the horses and will be frequently removed, so that no drainage will be required other than that mentioned, so we were told by Mr. Bowles, the foreman of the works.

NEW OLYMPIA CIRCUS, EDGE HILL, LANCA-SHIRE.—The new Olympia Circus in Overton-street, Edge Hill, capable of accommodating over 2,500 spectators, was opened on the 24th ult. It has been designed by Mr. J. Havelock Sutton, architect, of Liverpool. The building is of brick, covering a large site. An entrance through a hall, paved with tiles and finished with light and dark oak adorned with bevelled glass, gives access to two staircases, one on either side, leading to the stalls, side, and private boxes, &c. The interior has been finished and decorated by an Italian artist, Signor Dondy, and assistants. Over a tier of private boxes is a device of the Royal arms, draped with the flags of all nations, relieved by a canopy of crimson leather. Attached to the circus are stables.

HIGHWEEK CHURCH, NEWTON ABBOT.—This church was reopened on the 1st inst., having been closed some months for alterations and additions. The chancel and south aisle have been extended, and the organ, which stood in a tower gallery, has been placed at the east end of this aisle, the gallery being removed, and the tower opened up. The work has been carried out under the designs of Messrs. Tait & Harvey, of Exeter, by Messrs. Parker Bros., of Newton Abbot, the new oak choir stalls and west screen being executed by Messrs. Luscombe, Exeter.

EXTENSION OF PREMISES, CO-OPERATIVE STORES, LEEDS.—The Leeds Industrial Co-operative Society is about to make an addition to its central stores in Albion-street. A frontage of 80 ft. on the west side of Albion-street, with a depth back of 104 ft. to Upper Mill-bill, has been acquired. The area of the site to be covered by the new structure is 1,000 yards. The basement floor, having an area of 500 yards, will be utilised for the storage of furniture. In addition, provision will be made for a gas-engine, for electric light, for heating and ventilation apparatus, and other purposes. The ground floor will be divided, with a two-thirds frontage to Albion-street for drapery, and one-third for furniture. Each department will be approached through the large central entrance, and purchasers will be able to pass from one department to the other without going outside. In addition, provision will be made for the loading and unloading of goods. Parcel-rooms, store-rooms, and lavatories will also be provided. The first floor will be divided similarly to the ground floor. The second floor will contain rooms for fur goods, for reserve stock, for the mantle and millinery department, and also dining-rooms, kitchen, lavatories, &c. The third floor will be devoted to workrooms and stockrooms. The elevation to Albion-street will be of local stone, and the other elevations will in all probability be faced with white glazed bricks. The rooms will be carried on iron girders and iron columns, and will be made fire-proof. The designs have been prepared by Mr. W. S. Braitwaite, architect, of Leeds, who will superintend and carry out the works.

SANITARY AND ENGINEERING NEWS.

THE SANITARY INSPECTORS' ASSOCIATION.—The ninth annual dinner of this Association will be held on Saturday, March 12, Dr. B. W. Richardson, President, in the chair.—A movement is on foot amongst the members for a visit to Paris for a few days. It is proposed that the party shall leave London on Thursday, June 2, returning from Paris on Monday, June 6. At the sitting of the Society of Hygiene of France, on January 8, Dr. Pietra Santa made a communication which he had received from Dr. Richardson, F.R.S., of London, President of the Sanitary Inspectors' Association, respecting the proposed visit. Upon the proposition of the Secretary-General, the Society of Hygiene decided, by acclamation, that it would do all in its power to receive heartily the sanitary inspectors of Great Britain. All necessary steps would be taken with the Municipal Council of the public bodies of Paris to facilitate the visits to the fields of irrigation of Genevilliers and other establishments which are likely to be of interest. A banquet will also be given to the visitors. A committee of twelve members, consisting of MM. Cacheux, Féret, Joltrain, Dr. E. Monin, Joseph de Pietra Santa, Nicholson, Michaels, Ch. Clifort, Bruhat, Rogers, and Dr. P. Chevandier, with power to add the names of other members who may wish to show their goodwill towards the visitors, was immediately nominated to carry out the details of the reception.

TESTIMONIAL TO A SANITARY ENGINEER.—On the 23rd ult., at the Cutlers' Hall, Sheffield, Mr. Gustav Alsing, formerly Engineer of the sewage

works at Blackburn Meadows, was presented with a testimonial in recognition of his services to the town. The testimonial consisted of a cabinet of cutlery and a travelling-bag. An ornamental plate bore the following inscription:—Presented to Mr. G. Alsing, A.M.I.C.E., on the termination of his engagement as Engineer to the Sewerage and Rivers Department of the Sheffield Corporation, in acknowledgment of the valuable services rendered by him to the town, and his uniform courtesy in the fulfilment of his duties." The chair was taken by Mr. T. J. Flockton, and among those present were Aldermen William Smith and H. Bramley, Councillors W. E. Clough, J. R. Lockwood, Mr. John Merrill, Mr. Frederick Fowler, Mr. J. D. Webster, and Mr. Charles Hadfield (representing the Sheffield Society of Architects and Surveyors). A letter was read from Mr. C. J. Innocent (President of the Sheffield Society of Architects and Surveyors) regretting his inability to be present.

THE MAIN DRAINAGE OF BOURNEMOUTH: THE EXTENSION SCHEMES.—Last week a Local Government inquiry was held in the Board-room, Town-hall Buildings, Bournemouth, by Col. J. O. Hasted, R.E., respecting the application made by the Bournemouth Town Council on the 24,000 ft. main works of sewerage, and to borrow from Mr. F. W. Lacey, A.M.I.C.E., gave details as to the proposed schemes. From these it appeared that the No. 1 scheme comprised an enlargement of and additions to the existing central sewer, including an additional 3 ft. outfall 2,150 ft. long, to be laid east of the pier. A large iron sewer in connexion with this outfall will run through the gardens. This scheme will cost £1,000. The second scheme comprised an enlargement of and additions to the existing eastern sewers, with a new 3 ft. outfall of 1,400 ft. in length, east of the Boscombe Pier. This will cost £1,000. The third scheme deals with a re-arrangement of the Wimborne-road sewer, and is to cost £1,000.

PROPOSED BRIDGE, &c., STOCKPORT.—It is proposed to construct a new bridge and road to connect Chestergate with Heaton-lane, at Stockport, on the low level. This improvement will consist not only of the new bridge and road, but also the appropriation of a large area of land known as the Jersey Mill site up to Wellington-road, which will form an open space. The levels of the streets adjoining this land vary considerably, the open space at Wellington Bridge being a considerable depth below the Wellington-road. The scheme will provide for making this land comparatively level with Wellington-road between the river and Heaton-lane. The approaches to the bridge on the Chestergate side, along Chestergate itself, will vary from 1 to 30 ft. The bridge is to be of a lattice tubular form, and will be of steel, having a span across the river of 80 ft. The width inside between the parapets will be 54 ft. The question of the construction of the bridge and the utilisation of the land has been the subject of a Local Government Board inquiry, by which authority it has been approved. The work has been entrusted to Mr. A. M. Fowler, M.Inst.C.E., of Stockport and Manchester.

FOREIGN AND COLONIAL.

FRANCE.—M. Courtois-Suffit, architect, has been commissioned to design the monument to be erected in Paris to the memory of Theodore de Banville. The poet's bust will be modelled by M. Rouleau.

—MM. Faiguière and Mercier have completed the monument to Alfred de Musset, which is to be erected on the Place d'Augustin at Paris. The poet is represented seated, his eyes fixed on a lyre. Before him passes an allegorical figure of the Muse, scattering roses.—M. E. de Joly has been delegated by the Société Centrale des Architectes to take a place on the jury which is to decide the competition for the Museum of Sculpture and Painting at Nantes.—At Molière there has been discovered a subterranean habitation composed of seven grottoes with pointed roofs separated by a central gallery. A great number of bones have been found, and it is supposed the grottoes served as a refuge for the inmates of a neighbouring convent during the religious wars.—A serious accident happened at the building in progress for the International Exhibition at Tours: a whole pavilion, 40 metres long, fell at once, injuring many of the workmen in its fall.—It is announced that the inhabitants of Hyères are about to erect two triumphal arches in honour of the Queen of England, one at the railway station and the other at the Place de la Rade.—At the Museum of Montpellier a new gallery has been opened specially for the designs and drawings of Alexandre Cabanel. In the middle of the gallery will be placed a bust of the celebrated painter, by M. Paul Dubois. Near it will be placed his palette, his brushes, and the numerous decorations which he had received.—The old houses at Rouen, so characteristic in their plans and in their half-timber work, are beginning to give way to the attacks of time.—A fortnight since, a house in the Rue Martinière fell down; last week there followed another equally curious example, No. 21, Rue du Bac. If the Municipality do not take some steps to preserve them, there will soon be no more left of these in-

teresting structures.—Dr. Cosse, who died recently at Paris, has left his fine collection of works of art to the museum at Nantes.—The Municipal Council at Nantes has voted 65,000 francs for the erection of the fine fountain by Bartholdi which, in the Exhibition of 1889, stood in the central gallery leading to the Galerie des Machines.

BERLIN.—The memorial church to the late Emperor William I., which is in course of erection in one of the suburbs, is to be inaugurated on March 22, 1895. This statement sounds strange when one hears that the 1,800,000 marks necessary to complete the building only 950,000 are forthcoming. By order of the Emperor, a collection is to be held throughout the country for the purpose of raising the funds, but how much will be obtained is very questionable.—Professor Raschdorff's latest design for the proposed Berlin Cathedral was put before a Commission of high State officials last week, and its publication for the members of the Prussian Parliament. It seems absolutely impossible to ascertain if a reliable estimate of the cost of the cathedral has been worked out; one only hears of the total sum of ten millions.—The Imperial Government has voted a sum of 75,000 marks (some 3,750*l.*) towards expenses to be incurred by artists and craftsmen exhibiting at the Chicago Show.—Some fifty architects and engineers from all parts of Germany assembled on the 24th ult. to hear some proposals of the German Special Commissioner relative to the two professions being well and practically represented at the Chicago Exhibition. Although the professional men of the different countries or cities of the Empire intend exhibiting separately or in small groups, there is to be some in their groups in the German section, and for this purpose, after much debating, a central committee, with its headquarters at Berlin, has been elected. It is interesting to note that architects are advised to send designs of practical work and not of ideal schemes.—The Emperor will attend the ceremony of laying the foundation-stone of the Kyffhäuser Monument in memory of the late Emperor William. The date selected is May 10.—The great Opera hall took place on the 24th ult., and, as usual, the complicated transformation of the auditorium and stage into a ball-room was cleverly done. This time, combinations of evergreens and water (small fountains and cascades) were used for the decoration of the stage, with good effect.—"Geh. Oberbaurath" Wiebe, a civil engineer and Government official of repute, died last week in his eighty-eighth year, and was buried with great ceremony. He played a most important part in the Berlin sewerage and its new sewage system, and has of late years done much good work throughout the country as technical adviser to sanitary boards.

VIENNA.—The proposed international "Musical and Theatrical Exhibition," before alluded to, is exciting interest among the educated classes of the capital, and we hear that a very fair show is expected as far as German, Italian, Swiss, and home exhibits are concerned. From England and France little is apparently expected, although a well-represented section from each of these countries would be absolutely necessary before the word "international" could be justified, and the Austrians would only be too glad to be able to rightly affix this word to their show. Preparations are being made with energy, and the large halls of the Prater Exhibition Building are nearly ready for the reception of exhibits, due next month. As being reserved, a temporary "model theatre" is being run in which dramatic or operatic companies from all parts of the Continent are to play in turns. This building is now roofed, and promises to be an object of interest for architects both as regards to plan, interior arrangements, and stage-fittings. Messrs. Falner & Helmer, the Austrian theatre specialists, have assigned it to hold an audience of 1,500, of which a thousand are placed on the sloping floor of the auditorium, and the rest on a balcony; the stage has a total depth of 23 metres and a proscenium opening 13.50 metres wide; measurements large enough to permit the rendering of any play. The material used for the erection is mainly timber, which has been painted over with one of the so-called fire-proof washes; coatings of asbestos have been used on the main partition wall and the curtain to the stage opening. The exits have been so arranged as to permit a clearance of the house within three minutes. Electric lighting has been adopted throughout the building, a system of ventilation which will permit an influx of 60,000 cubic metres of fresh air every hour is to be carried out, and the compulsory high-pressure water distribution laid on.

SWITZERLAND.—Last year a new theatre was completed at Zurich. Now another large place of amusement is to be erected in this city. A competition has been opened for the design of a block, containing some concert halls, two concert halls, a restaurant, &c. One of the cost of the building is not to exceed 1,200,000 francs.

OLDENBURG.—In place of the Court Theatre, which was destroyed by fire shortly before Christmas, a provisional one, with a seating capacity for an audience numbering 840, has been erected. In

spite of a severe spell of cold weather, it only took seven weeks to put up this building, the construction of which shows points of interest, as various patent fabrications, such as plaster-boards, cement and wire combinations, have been used for the vertical surfaces, the necessary support being given by a timber framework.

HEIDELBERG.—The Government of the Duchy of Baden has voted some 12,500*l.* towards works on the historical Heidelberg Schloss. The works to be taken in hand include a thorough drainage of the very damp site on which the castle stands, some alterations in the old castle-yard, and the taking of plaster-casts of the more valuable pieces of sculpture and "relief" work on the façades of the castle proper.

SWEDEN.—Herr Carl Müller, a prominent Swedish architect, has been commissioned to restore the ancient Church of St. Christina in Falun. It contains a large quantity of beautiful old wood carving, partly still in its place, and partly stored away in a loft. All will be carefully placed in the original position.—In order to raise further funds for an Artists' Club, in Stockholm, an exhibition of paintings with lottery is to be held, to which Prince Eugen, Prof. Kronberg, and other leading artists are contributing paintings.—A large quantity of the interior artistic fittings and decorations in the Old Opera House in Stockholm, just closed in order to make room for a new one, and dating from about 1600 is to be removed to the Northern Museum of Antiquities. It is intended to build a new lunatic asylum in Stockholm at a cost of 1,200,000*l.*

—In order to afford greater safety for men at work on the roofs of houses, the City Board has adopted some further regulations. In addition to iron handrails or chains, the workman is to have a rope and lifeline attached to the former, whilst chimneys of more than 1.2 metre in height are to be fitted with iron ladders, and having at least, on three sides, handrails.—An electrical central station has been opened at Heidelberg, constructed by Messrs. Siemens & Halske, of Berlin. It is intended for feeding 1,000 lamps.

ELECTRIC LIGHTING IN SOUTH AFRICA.—The progress of electric lighting in South Africa is indicated by the list of works carried out or projected in Pretoria by Messrs. Woodhouse & Rawson during the past year. These consist of the preparation of plans and specifications for the electric lighting of Pretoria; the supply and erection of plant for lighting the works, both above and below ground, of the City and Suburban Gold Mining Company and the Metropolitan Gold Mining Company; the lighting of the Battery House of the Van Ryn Gold Mining Company; the lighting of the Globe Theatre, Pretoria; and the preparation of the plans and specifications for transmission of power by means of electricity, for Moodies Gold Mining and Exploration Company.

MISCELLANEOUS.

WINCHESTER CATHEDRAL BELLS.—We are informed that Mr. John Colson, F.R.I.B.A., the architect to Winchester Cathedral, has suggested that the bells at present hanging in the tower should be taken down and rehung with the two heaviest for new ones in a temporary structure until a proper campanile can be built for them. By doing away with the two floors and removing the vaulting to a position in which the defects of its construction would be less obvious and its beauty of design better displayed, the rich interior of a most magnificent Norman lantern, hidden now save to those who can climb a close winding stair, would be open to the view of all, and the bells, at present muffled by walls never meant to enclose them, could speak their message far and wide.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.—On Saturday afternoon the students attending the Greenock Class in Plumbers' Work paid a visit to the meter department of the gas works in Crawford-street. The different sections of the works, the construction, management and care of wet and dry meters, photometers, gas-testing, meter-testing, &c., were very ably described by Messrs. Maitland, Forzyce, McCubbin, and Wright.

Fog.—In no case can it be supposed that scientific measures will prevent the inevitable formation of mist; but if London fog can be stripped of its colour which is coincided with its irritating character, and which is due to the presence of carbon particles, tarry matter, and sulphur, then a vast improvement will have been accomplished, and a giant stride onward in hygienic science achieved. As we have pointed out more than once, even when coal is perfectly burnt or consumed, we still have to deal with the products of the combustion of sulphur, which element occurs to the extent of from 1 to 2 per cent. in most kinds of coal. Carbon, hydrogen, sulphur, and nitrogen in coal, when completely burnt in air, produce carbonic acid (CO₂), watery vapour (H₂O), sulphurous and sulphuric acids (SO₂ and SO₃), and a trifling quantity of free nitrogen. Given, therefore, the complete consumption of the coal,—that is to say, that no smoke or unburnt carbon is produced,—what is to

be done with the combustion products of sulphur? and how will these products (SO₂ and SO₃) alter the character of the fog? We suggested in a leading article some time ago that probably lime or any of the alkalis placed at some point in the chimney could be used to absorb these acids, and those who claim to have secured the perfect combustion of coal by the adoption of a particularly constructed stove should be induced to put this simple suggestion into practice.—*The Lancet.*

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—On Wednesday a paper on "Some Practical Notes on the Water-supply of Boilers, and its Treatment," was read by Mr. E. J. Friswell, F.I.C., F.C.S., &c., in which a number of patents taken out between 1882 and 1891 were described, and comments made on them. The true cause of boiler incrustation was considered, and its origin traced to the enormous solvent powers of water and the character of the earth's surface. The probable cause of the presence of other than the strictly insoluble constituents of boiler deposits was indicated, and attention called to some unusual kinds of river water. Methods of treatment were then taken in hand, and it was argued that treatment previous to use is best; Clark's process was described, and modern improvements of it glanced at. Mr. Spence's introduction of soda ash was described, and also its mode of action. Caustic soda was shown to be efficient but dangerous, and silicate of soda as useful but quite safe.

INVENTORS' INSTITUTE.—At the last meeting of this Institute, Dr. Glover Lyon in the chair, Mr. Walter Smart (Member) read a paper "On Improvements in Burning Bricks, Soft-core, and other matters, without causing nuisance." The author has patented special means of roofing-over clamps, and treating the gaseous emanations therefrom for the purpose of removing the nuisances which cause so much complaint, and in many cases give rise to serious litigation against the manufacturers of bricks and tiles. A few of the advantages expected are:—Enabling the bricks to be made and lured in places where there are superior materials and conveniences, but where hitherto there has been too strong objection to the protection of the bricks when in clamp from storms and rains and the consequent depreciation of the goods produced; rendering unnecessary the expense of placing extra layers of bricks over the clamp; and expediting the burning of the bricks with the use of less fuel. Associated also with this system would be important results for Sanitary and other local authorities, and the improvement of the value of the surrounding land and of the brickfield when exhausted. In regard to the waste of prepared materials through litigation set up against brickmakers, an instance was given at Hammer-smith, where recently, through an injunction, prepared earth to the extent of 3,000,000 of bricks remained unused. And, as to the necessity for more uniform conditions of burning than under the present exposure to all the changes and inclemencies of weather, it was stated that, with a rainfall of 3 in. per month, a large clamp from first to last would receive as much as fifty-six tons of water, the detriment to the bricks being very serious. The paper was closely criticised in the discussion which followed, in which, amongst others, Mr. Pecking, of New Southgate; Messrs. Broad, Mead, and Clayton, of Paddington; Mr. Bird and Mr. Williams, of Shepherd's-bush; Mr. Eastwood, of Lambeth; and Mr. Craven, of Wakefield, took part. Mr. Smart replied to various questions, and stated that it was intended shortly to give a demonstration on a practical scale in one of the brickfields near London.

THE WIND AND ELECTRICITY.—The midst of London is not a promising site for windmills; nevertheless Messrs. Williams, of Great Eastern-street, have erected two such motors,—one on their own premises, and the other on those of Messrs. Carwardine, in the City-road. Like sky-signs, they constitute of themselves conspicuous advertisements. But the sky-signs can be turned to no other useful purpose. The windmill can; and both the firms referred to have for some time made them do intermittent duties. We say intermittent, because of the fluctuating nature of the wind, which is on no two days alike, nor hardly ever without variations of strength from one minute to another. To say nothing of calms, the ordinary fluctuations leave the wind most uncertain of all the natural sources of power. Windmills, like almost every other machine, have, however, gone through much improvement, and the Halladay type has certain special features which fit it for doing more advanced work than the old mills could possibly be put to. Under these circumstances, the application of the wind to the generation of electricity has really more chance of success than at first sight would appear. For, with a mill-wheel which adapts itself to the blast of the storm or to the gentlest zephyr, working in conjunction with a battery of storage-cells, irregularities of all kinds can be merged into a common tranquil reservoir from which electric current can be drawn off as required with perfect uniformity of pressure. The Halladay mill has a wheel divided into flexible sections, and thus differs essentially from the old rigid wheels upon which the gusts acted with brutal roughness. Each of the Halla-

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

day sections is connected to a counterpoise, and the balance is so nicely adjusted that the wind turns the sections back to angles greater or less according to its own force, thus tending to maintain uniformity of power in the wheel from winds of all strength...

of the Association for the year has been met out of the income received from investments. A further sum of 200l. has been invested, making the satisfactory total of 2,503l. The Committee thank the honorary subscribers for their continued support...

THE ENGLISH IRON TRADE.—The approaching stoppage in the coal trade has had the effect of further restricting business. As the supply of fuel is likely to be extremely limited, many ironmasters have taken the precaution of issuing notices to their men for the period during which the stoppage will apply...

PARTNERSHIP.—Messrs. Ashbee & Sons, timber and slate importers, Gloucester, inform us that they have taken into partnership Mr. C. W. Estcourt, and that the business will in future be carried on under the style of 'Ashbee, Sons, & Co.'

COUNTY COUNCIL ELECTIONS.—Mr. Silvanus Trevall, architect, Truro, has just been returned unopposed as the representative for the Eastern electoral division of that city in the Cornwall County Council.

THE SURVEYORS' AND AUCTIONEERS' CLERKS' PROVIDENT ASSOCIATION.—The annual report of this Association, which was submitted at the annual meeting of members, held at the Auction Mart, Tokenhouse-yard, on Wednesday last, states that the number of members in the respective divisions of the Association is as follows...

LEGAL.

SURVEYORS' FEE FOR NEGOTIATING PURCHASE.

LOVEGROVE v. TRUMAN, HANBURY, & CO. This was an action in the Mayor's Court, Guildhall, brought by Mr. Henry Lovegrove, of 25, Budget-row, City, against Messrs. Truman, Hanbury, & Co., the well-known brewers.

Ms. Lewis Glyn (in the unavoidable absence of Mr. Edward Doyle, instructed by Messrs. Anyone & Bromwich, appeared for the plaintiff; and Mr. Paul Taylor, instructed by Messrs. Hanbury, Hutton, & Whiting, appeared for the defendant. Mr. Lovegrove stated that in the autumn of 1889 he was acting for the defendants' lessees in Fotherlane, and when at the hewery on a day in November of that year the acquisition of an adjoining slip of land was discussed, and Mr. Fraser requested the plaintiff to try to purchase the property. After this, for some weeks, the plaintiff was in communi-

cation with the vendors, and eventually purchased the land conditionally on giving up some rights of light.

The defendants' evidence proved that such an intention took place, but they considered that plaintiff was acting on behalf of their tenant. The judge, in summing up, pointed out that the land was conveyed to the defendants, and afterwards sold by them, and it was evident that the plaintiff, and nobody else, had arranged the matter.

The jury gave a verdict for the plaintiff for the amount claimed and costs.

MEETINGS.

SATURDAY, MARCH 5.

Architectural Association.—Visit to St. Saviour's, Southwark, by permission of Sir Arthur W. Blomfield, A.R.A. 3 p.m. Institution of Civil Engineers.—Students' visit to the Oil-gas Works of the Great Northern Railway at Holloway. 3 p.m.

MONDAY, MARCH 7.

Royal Institute of British Architects.—(1) General Business Meeting to ballot for candidates. (2) Special General Meeting (a) to elect the Royal Gold Medalist for the current year (b) to receive and consider an amended paper of 'Suggestions for the Conduct of Architectural Competitions,' recommended for adoption by the Council. 8 p.m. Royal Academy of Arts.—Professor J. H. Middleton on 'Michael Angelo.' III. 8 p.m. Society of Arts (Cantor Lectures).—Professor William Robinson on 'The Uses of Petroleum in Prime Movers.' II. 8 p.m. Society of Engineers.—Mr. Stephen Sellon on 'Electrical Traction and its Financial Aspect.' 7.30 p.m. Liverpool Architectural Society.—Mr. D. Harrison on 'Pre-historic Rome.' 8.30 p.m.

TUESDAY, MARCH 8.

Institution of Civil Engineers.—Professor W. C. Unwin on 'Petroleum Engines.' 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Mr. J. F. J. Sykes on 'General Powers and Duties of Inspectors of Nuisances.' 8 p.m. Sheffield Society of Architects and Surveyors.—Mr. A. Gutch on 'How they Built in Shakespeare's Time,' illustrated with lantern slides.

WEDNESDAY, MARCH 9.

Architects' Benevolent Society.—Annual General Meeting of subscribers and donors, the President, Mr. J. Maciver Anderson, in the chair. 5 p.m. Society of Arts.—Mr. A. P. Laurie on 'Experiments on the Durability of Modern Pigments.' 8 p.m. British Museum.—Miss Eugénie Sellers on 'Greek Sculpture: Sculptures from the Temple of Artemis (Lion's) at Ephesus.' V. 2.30 p.m. Sanitary Institute.—Dr. Louis Parkes on 'The Air and Water of London: Are they Deteriorating?' 8 p.m.

Asylums for the Insane.*

FROM any of the great main lines of railway which run through the shires, a traveller will be sure to spy, in some comparatively secluded position, a great group of buildings, which by their modern air and their tall chimney stacks, and possibly their bulky water-tower, seem to belong rather to the busy town than to country seclusion. If he inquires, he will probably learn that this is the County Lunatic Asylum; for throughout England, and, indeed, throughout Europe, vast structures are now established, and are being added to almost every year, in which those mentally afflicted are to be lodged and medically cared for. To give an account of such asylums in every part of the world is the ambitious programme which Mr. Burdett set before himself when he undertook the preparation of the two bulky volumes now before us, and which are really only an instalment, though complete in themselves, as they are to be followed by two others on the hospitals of the world. A very great industry has been brought to bear upon the task, and a very large amount of information on the subject of asylums has been collected and will be found in this book, though it will be nothing but the truth if we add that the very extent of the work will stand in the way of its being as popularly useful as a smaller book containing only carefully selected and condensed information might have been.

Mr. Burdett divides asylums into four groups, separated from one another by radical differences of arrangement, for in so extensive a structure as an asylum for 500 up to 1,000 patients, the disposition of the plan becomes a matter of vital importance. His first group is the Agglomerate, or irregular in type. These asylums are buildings that are thrown together upon no very definite system,

and in many cases have reached their present extent by successive and often make-shift additions, or by the use of buildings designed for some other purpose. No new asylum of any importance would now be erected on this system; at the same time, and especially among private asylums, there are not a few buildings of this sort which, though occasioning a certain amount of inconvenience, are practically very serviceable, and are made use of at the present day, and will not soon be abandoned.

The next group is what may be termed Corridor asylums. Here the patients are, for the most part, housed in a kind of compound structure not in use in other classes of building. The day-room is a very wide corridor,—elsewhere in this volume called a gallery,—having fireplaces, and, usually, a large bay-window, or two such; while on the side opposite the windows is a series of doors opening into the bedrooms of patients and nurses. These form the units which can be grouped together to provide for a classification more or less minute, as circumstances may dictate; and, of course, with an administration block for a central feature. There are also in buildings of this class corridors proper,—i.e., passages used only for the purpose of access from one part of the building to another, and not available as living-rooms. Rather more than fifty English examples of this class are more or less briefly described, and a plan and description of one English and one American specimen are given; a plan of another English example, of which we have failed to find a description, is also given. It would, in our opinion, have added very much to the value of the book, if under this and other heads more plans had been included, notwithstanding Mr. Burdett's assertion that "it was quite unnecessary to publish more plans," and that "in effect it would almost amount to the reproduction of almost identical plans." If so, we ask, why praise some designs as better than others? If plans could not be published, at least, in the case of such of these buildings as have been illustrated in our own pages or elsewhere, it would have been easy and very useful to add some indication of the fact, and some reference to the actual volume and page, at the end of the description in the text. Perhaps, too, we may be excused if we

suggest that if Mr. Burdett had given the name of the architect of each asylum it would have been no more than an act of proper recognition. This information, however, has been left out in the very great majority of cases.

The third group are Pavilion asylums. These are asylums which resemble modern hospitals, in consisting of a series of pavilions, each two or three stories high, and connected together by corridors of communication, usually of one story only. This group includes, among others, the Asylum for Idiots at Darent, to which our author pays the compliment of saying that it is "incomparably the best-planned idiot asylum in England." No plan, however, is given of this Asylum, but plans of the second Gloucester County Asylum are included. This is a building in which the blocks project from a V-shaped corridor,—an arrangement here designated as the broad-arrow form, and which Mr. Burdett does not approve. Only a small number of asylums are described under this head, but they include the gigantic one at Coulsdon and Leavesden, each providing for about 2,000 patients.

The fourth group, the one to which our author gives the preference, consists of buildings of what he calls the Corridor-Pavilion type; and he describes this as a combination of the second and third types. Four English examples are described, but no plan is given of any one of them, though they include the Lancashire County Asylum, praised as "one of the finest specimens of asylum architecture in England," with the very remarkable addition that "its leading features show at once that it was designed by a medical superintendent. It consists of twelve blocks arranged in horse-shoe form." We are, however, furnished with two model plans, which are intended to illustrate the general idea of this group of designs, but do not show a complete mastery of the difficult art of disposing the parts of a great building. The plan of the Gtretlock Asylum for the Glasgow District Board, which is included and nearly corresponds to the description of the corridor-pavilion type of hospital, on the other hand, strikes us as most satisfactory as well as economical, and well deserves study. Asylum construction in Scotland forms the subject,

* "Hospitals and Asylums of the World." By Henry Burdett, in four volumes and portfolio. Vols. 1 and 2. London: Churchill, 1891.

we may add, of a short, pithy, well-written chapter, to which the plan we allude to is appended, and which we are disposed to consider the best bit of writing and to contain the most valuable, certainly the most condensed, practical information in the whole book. In addition to the descriptions and plans above enumerated, a large number of brief references to asylums existing in different parts of the world and belonging to the above-mentioned four types of asylum is furnished, so that Continental and American examples of each type may be readily recognised. To these notes references are in some cases added, giving indications of where published plans and detailed descriptions may be found, such as we should have liked to see incorporated with the accounts of English asylums.

Two systematic chapters on asylum construction in France and in Germany give compactly the salient features, and even many of the details of the buildings established in those countries for the care of the insane, and these chapters close the original matter of the volume which we have been considering. There remains a bulky appendix, but, before we refer to its contents, it may be desirable to add a few observations as to general principles which are treated of near the beginning of the volume. The all but invariable scheme of an asylum is to divide it into a men's and a women's side and to place the administration block in the centre. That being taken for granted, Mr. Burdett lays down certain rules which he considers should always be borne in mind. Of these there are six which are considered by him as essential.—1. Some modification of the block principle. 2. Not more than two stories. 3. Each floor of each block to contain dormitory space sufficient for those patients who occupy its day-rooms. 4. Passages between main blocks (i.e., corridors of communication) to be two stories high and fireproof, and main staircases to be incorporated in such passages. 5. A disposition making it possible to reach any ward without passing through any other ward. 6. Single bedrooms for at least one-fourth of the patients, each containing at least 800 cubic feet, and with at least 80 ft. of floor area. In the infirm ward these should open direct from the day-room. Five other principles are laid down as "highly desirable":—7. A minimum day and night space of 600 cubic feet per patient, with floor space of 60; but the day-space may be 500, when separate dining-rooms and a recreation-hall are available. 8. Each ward to have its own dining-room. 9. Minimum width of corridors to be 8 ft. No corridors to run under the window-sills of the single rooms. 10. The whole of the ground floor to be on one level. 11. In order to ensure abundance of light and air three walls of all day-rooms and dormitories should be free.

These principles and much detailed advice are supposed to be embodied in the model plan already alluded to; but the plan, whatever its excellences, is open to serious objections. Take, for example, the administration block; the text contains a careful description of what such a block should contain, and in what order the departments should come, but the plan in important respects departs from this description; and the account of it also, of course, differs, and that not merely in minor points. Which of the two is correct? or is it intended to convey the idea that the programme is not of much importance? For example, the programme very properly prescribes a porter's-room and a waiting-room. The plan omits the waiting-room. The programme provides a chaplain's-room, a dispensary, and a dining-hall. Not one of these appears on the model plan, and, though the absence of the dining-hall is accounted for by a provision of separate dining-rooms, one to each block, it does not seem easy to do without the dispensary. We think also a better provision might have been made on the plan for the surgery than to light it with south windows looking into a court less than 15 ft. wide. All the

dormitories and sleeping-rooms of the proposed buildings for the inmates are lighted and ventilated from internal quadrangles, and though the length of corridors of communication, 8 ft. wide, does not on our computation actually reach a mile, it approaches that considerable dimension very closely. While admitting the desirability of means of separate access to every ward, we cannot but think that a more skilled designer could have secured this desirable end without burdening an asylum for 750 patients with a feature so expensive to build, so monotonous to traverse, and so costly to keep clean and sweet as this enormous development of corridor,—from our measurement of which we exclude all those corridors (or galleries) used as day-rooms.

Our author's views on plans, planning, and architects, put forward with an air of great authority, are on a par with the specimen of his skill which he has furnished us. The County Surveyor, he says, should never be employed as the architect of the County Asylum, for it is "giving one man a small fortune merely because he happens to be a County Surveyor, and is holding a fairly well-paid permanent appointment." It is forgotten that if the County Surveyor has secured and kept such an appointment, it is because he is competent and trustworthy. An unlimited competition among architects must always, he advises, be adopted, and not even a limited competition among half a dozen architects of experience in asylum work will please him, "for it is notorious that, with scarcely an exception, the second or third attempts of asylum architects are not improvements on their earlier attempts." A more absurd or improbable statement was never published: and, if experience is to go for nothing, might not Mr. Burdett's boasted experience in hospital matters (see the title-page of his book) disqualify him for writing upon them with the success which as a younger and untried man he might have secured?

The appendix to the volume under notice contains, besides a good index and an asylum bibliography, papers of great value; bearing, perhaps, rather on the medical aspect of the treatment of insanity than on hospital construction. The third of these, a paper by Dr. J. P. Bancroft, an American specialist, contains some valuable suggestions to which we gladly direct attention. He desires to see simple, less formal, and more subdivided structures. In his opinion, "buildings should be provided for the noisy classes separate from others," and out of hearing. An essential feature would be, according to him, detached houses, of various sizes and styles, "not in rigid rows and uniform, but dropped down here and there in the grounds in pleasing variety and homelikeness, while convenient for administration." "The old, long, monotonous ward style should be entirely discarded," even in such situations as call for larger buildings. Such outward forms and internal divisions should be chosen as will multiply and diversify situations and give the greatest possible diversity of personal groupings, and thus afford the physician the greatest possible control over individual relations and contacts. By adopting "a broken and irregular style of architecture, a competent artist should be able to produce all these desirable conditions, adding at once immensely to utility and grace without materially larger cost than that of the traditional homely and monotonous block style." With these opinions many thoughtful men will be disposed to agree. Only if Dr. Bancroft is right, are not the hundreds of asylums described in these volumes all more or less wrong? We are glad to see that in the preface Mr. Burdett specially directs attention to Dr. Bancroft's views, and endorses them with the weight of his own authority.

What we have hitherto been considering is contained in the second of the two volumes now issued. The first volume has probably a value for persons specially responsible for the care of the insane, which it hardly can have for the majority of our readers; and it will

not detain us long, notwithstanding that it is the more bulky of the two. History and Administration form the subjects, and (with indices, &c.) the printed matter extends to 700 pages, yet that portion of it which goes back more than a few years is but scanty, and is much of it at once depressing and sad.

It is pointed out that traces, in fact, definite accounts, of the existence of lunacy and of the treatment of lunatics are to be found in ancient writings, and that there were among the Greeks and Romans "a fair knowledge of mental diseases from the earliest time, and that their methods of treatment were not infrequently wise and prudent." There seems little or no ground for saying the same of the highly-civilised Egyptians, nor can the references to insanity in the Old Testament, several of which are enumerated, be said to throw much light upon the existence of any general custom among the Jews with regard to the treatment of the mentally afflicted. The case of David playing before Saul on the harp seems to show that soothing measures were recognised as desirable.

In the earlier ages of Christendom it appears as though some pains were taken to care for those afflicted in mind, but from the end of the sixth century to the middle of the eighteenth (from A.D. 600 to A.D. 1750) was a time in which unfortunate lunatics were treated in a manner dictated by wild and barbaric superstition. The belief in demoniacal possession was strong, and in witchcraft was equally strong, and much cruelty was inflicted on the unhappy persons who were deemed to be possessed or bewitched, or to be themselves witches. It is stated that in 100 years 20,000 lunatics were burnt in France, and in double that number of years 30,000 persons were condemned to death and executed for witchcraft in England. Some places for the care of the insane were, however, established in various parts of Europe, and among the very early instances is that of our own Bethlehem Hospital, founded in the reign of Edward III. When, however, asylums had begun to be usual it is distressing to read of the treatment to which patients were subjected in them during the time which our author correctly terms that of brutal suppression and ill-treatment: a time which, as is shown convincingly by the statements in these volumes, extended far on into the nineteenth century. Under this treatment the case of a patient once removed to the hospital was practically hopeless, and the persons in whose charge he was behaved as if this were an established fact, and treated him like a savage beast rather than an unfortunate human being.

Almost within our own day, a revolution of the most complete kind has been effected,—humanity, kindness, forbearance, and intelligent care have rendered the lot of a patient in an asylum not only immeasurably more endurable, but more hopeful. The physician who deals with mental disease now endeavours, and not infrequently with success, to effect a cure; and if this be unhappily out of the question, he soothes instead of terrifying, and influences his patient by moral means instead of a strait-waistcoat and a padded room. Those who wish to pursue this history in some detail will find the facts clearly stated in Mr. Burdett's book, and will rise from the perusal of the chapters where they are narrated with a conviction that in the treatment of mental diseases we are now at last on a track which ought to lead to good results, and which, certainly, is creditable alike to the humanity and the intelligence of the medical scientists and "alienists" of the present day.

A great deal of information is contained in the chapters devoted to Great Britain and Ireland, and in the statement of the law on this subject, which it will be of advantage to County Magistrates, County Councilors, and others responsible for the care of the insane, to have in an accessible form: but we cannot help suggesting that a more frequent addition of references to the authorities for statements made by the writer would have added to the

value of the book. The field gone over is so extensive that, even in this bulky volume, much has been condensed, and a reader interested in a particular locality would have been grateful for some foot-notes directing him to the sources of information where he could pursue his studies further. While making this remark we do not desire to undervalue the carefully-prepared enumeration of books given under the title of "Asylum Bibliography," the preparation of which must have been a work of great labour. The two volumes are separately and very elaborately indexed, and the printing and style of getting-up generally are all that could be wished in a work which aspires to be the standard book on this subject, and will, no doubt, remain so for many years.

We shall look forward with expectation to the volumes in course of preparation which are to deal with the hospitals of the world, and are to include plans of all the hospitals of London in the Jubilee Year of Queen Victoria's reign. We trust that from this interesting series of plans the names of the architects to whose skill they will owe their value will not be omitted, and we trust also that small sanatoria and cottage hospitals will not be overlooked. The absence of much reference to private asylums of moderate size for the insane, and of any plans for such (except a so-called model plan capable of being altered to receive 200 private patients) seems to us a deficiency in the volumes now before us, and in hospital-building practice small institutions are far more numerous than in asylum-building. We therefore hope that while the great hospitals of this and other countries are fully described, an adequate space will be given to the smaller ones, which furnish types that are constantly required in order to meet the needs of small towns, or even of rural districts. Meantime, we cannot but congratulate the author on the thoroughness with which he has carried out this first portion of what must for years be one of the most comprehensive books of reference on the subject of asylums and hospitals.

INDIAN ARCHITECTURAL DETAILS.

WE publish among our lithographic illustrations this week some examples of decorative treatment of balustrades from various buildings in India, which are reduced from plates in Part VI. of the "Jeypore Portfolio of Architectural Details,"* a remarkably sumptuous collection of plates of detail from Indian architectural monuments, carried out under the patronage of an Indian Prince, and entirely drawn by native draughtsmen in the employ of the Public Works Department of India, and under the immediate direction of Colonel Jacob, Engineer to the Jeypore State. The drawings are in a somewhat hard and mechanical style, which however is probably due not so much to the natural tendencies of Indian draughtsmen as to the fact of the work being done under the very engineering influence of the Public Works Department. In every other respect they are admirable, and show the most conscientious care and finish.

The buildings from which the details are taken are mostly of the sixteenth, seventeenth, and eighteenth centuries, though some examples are of considerably earlier date. The first Portfolio illustrates copings and plinths, to a rather larger scale than is at all necessary with much of the very simple detail shown. Many of the examples of coping ornaments are however, very charming and interesting, and illustrate the principle of repetition of dual contrasting forms on exactly the same principals as in Greek ornament, but with the adoption of more free and sometimes partially realistic forms of flower and leaf. This is not in itself an improvement on the

mors abstract and severe forms of the Classic types of ornament, but is interesting as a contrast and as suggesting new treatment of this class of decorative detail; and it may be observed that a good deal of the treatment shown would be specially suitable for terracotta, the use of which has so largely increased in England of late years.

The second Portfolio illustrates pillars, caps, and bases; and here Indian art does not show to so much advantage. The pillars are too much encrusted with ornament and sculpture, the latter of somewhat barbaric type; the lack of reticence and severity of form is much felt in the more elaborate examples. Some of the simpler ones may afford new suggestions for balusters. What strikes one especially is the entire absence of the sense of proportion of parts and refinement of profile in mouldings: the mouldings are coarse in outline, the caps out of all proportion to the pillars, heavy and clumsy in effect; the distinction commonly found between Eastern and Western architectural detail. The sense of refinement of profile in mouldings, in fact, as has often been pointed out, is above all other things the measure of high culture in architecture.

In the third Portfolio, illustrating doors, the most notable work is in the inlaid heads and doorposts, many of which are beautiful work, and very well shown in the coloured plates. It is in this application of coloured ornament on a flat surface that the Eastern artist, in his turn, excels the Western. Some of the carved doorposts and panels are also of beautiful design, for in this kind of work the exuberance of detail, which seems out of place in the more monumental portions of a building, is quite suitably applied. There is a curiously Renaissance look about some of the ornaments applied in the panels of doors, mingled with touches half-Hindu, half-Saracenic; and the ubiquitous bead-and-reel ornament of course is not absent here.

The fourth Portfolio is devoted to brackets, a feature over which the Indian architect was apt to run somewhat wild. Heads of elephants and of creatures distantly resembling horses are worked into brackets in a style more grotesque than effective; and in the more sober foliated forms of bracket it is characteristic of Indian taste, to which decoration is always a more prominent object than construction, that the appearance of constructive power and tenacity, the true object of the bracket as a support, seems too often to be lost sight of, and the bracket seems as much hung to the superstructure as supporting it. There are exceptions to this no doubt, and there are many ideas contained in these illustrations which are worth the attention of architectural designers who are finding the possible variations on Classic forms of bracket nearly exhausted. Too great exuberance of detail, and want of severity and precision of line both in the design of the bracket itself and in its decorative treatment, are the common faults of this class of Indian detail. The well-known serpentine form of bracket, however, strengthened by a straight-lined filling within the curves, at once ornamental and constructive in appearance, will always retain its place as one of the most picturesque and suitable details ever designed for timber construction. One or two examples of this form are included among the plates.

The forms given under the heading "Arches," in the fifth Portfolio, are such as seem very familiar to the eye, and run all on the same idea of a many-cusped arch with carving in the spandrels,—at least as far as the examples in relief are concerned. In the examples showing inlaid colour on a flat surface the arches are mostly not foliated, and the colour ornament, it may be added, has a good deal of sameness and is not of a very interesting character.

The illustrations in our plate (see lithograph in this number) are taken from the sixth Portfolio, and represent two balustrades in sandstone and three in marble: the stone being worked in solid forms, the marble in that pierced ornament so dear to Oriental

fancy. The two marble examples in which foliage is employed are characteristic both of the strength and weakness of Indian decorative art in the employment of foliage forms. In the balustrade from the Madrasa, Delhi, at the lower right-hand corner of the plate, while the general lines of the design are satisfactory and well balanced, and the modelling of detail very refined it will seem on close inspection that the junction of one element in the design with another is clumsily and illogically managed; a heavy stalk butts out at right angles from the curling end of a leaf, in a manner totally at variance with any law of growth, whether as to flow of line or balance of weight. Such design would never have satisfied either a Greek or a Gothic artist.

Further Portfolios are in hand illustrating Tracery, String Courses, Wall Decorations, Cornice and Ceiling Decorations, Parapets, Projecting Eaves, and Finials, which will be issued as they are completed. The collected set will make a splendid addition to a library of illustrative architectural work, but it is almost a pity that the scale on which the work is brought out must put it out of the reach of a majority of those who would have been interested in the possession of such a collection of drawings of Indian detail.

NOTES.

NEXT week will probably find many thousands of our coal-miners voluntarily enrolled in the great army of "the unemployed," while this week some of them are working eleven hours a day. They will, perhaps, be willing to make up for lost time in a similar manner when they have taken a sufficiently long holiday,—if the demand for coal is not met from elsewhere in the meantime. The panic-price offered during the last week or two has naturally attracted attention on the Continent, and it is understood that at least one large contract has been completed for delivery of coal from Belgium. It remains to be seen how far the strikers will be successful in preventing the importation of foreign coal; for it may be taken for granted that they will forbid the unloading of vessels by Union men. It would hardly appear probable that they will receive much support outside their own industry, as the movement is such a purely selfish one. In fact, it is not even calculated to do otherwise than embarrass or positively injure nearly all other branches of trade, more or less directly. The advantages to be gained by the miners themselves by means of the stoppage are, to say the least, exceedingly problematical; and even if their "defiant" experiment (as Mr. Pickard terms it) should prove a success from the miners' point of view, the loss to the country at large will probably far outweigh any benefits that they may appear to secure. Impartial observers, however, fail to see that the miners can expect any ultimate advantage at all.

THE result of the London County Council elections has been so sufficiently commented upon by the Press generally, that it is unnecessary to notice it at any length in these columns. The elections appear to indicate that the great mass of ratepayers have not yet sufficiently appreciated the need of taking part in municipal elections. This is not surprising, for London has been without the collective local life which distinguishes provincial towns. It is at any rate satisfactory that among the dominant party on the Council are to be found some men of individual power who, we hope, though Progressive in their general views, have yet sufficient strength of character to resist impracticable proposals.

THE debate on the Birmingham Waterworks Bill shows pretty clearly that the introduction of the Bill is really, what it has before been said to be, a kind of race for a water-area, to get in before London to what

* Jeypore Portfolio of Architectural Details. Parts I. to VI. Prepared under the supervision of Colonel S. S. Jacob, C.B.E. Issued under the patronage of His Highness Maharaja Sawai Madho Singh, G.C.S.I., of Jeypore. London: Bernard Quaritch.

seems a promising gathering-ground. Though the Bill has passed the second reading, there can be little doubt that this aspect of the matter will be duly considered in Committee, as also the interests of Wales as far as possible. But unless the growth of large towns is to be checked, there can be no doubt that the time has arrived when the necessity, on mere sanitary grounds, of furnishing them with a liberal supply of water, will have to take precedence of smaller local interests.

NO one can feel surprised that Mr. Tate has withdrawn his munificent offer to present the nation with a gallery of British Art, when the nation, through its constituted authorities, gives him no better thanks than to haggle about a site. The incident is only too characteristic of this country. The loss of such an offer is a national misfortune, or would be thought so in France, but in England no one cares. Mr. Goschen's objection that the building would have been overshadowed if placed on the site adjoining the Imperial Institute, and would have been too low for its surroundings, is a valid one; but it will certainly be regarded as extraordinary, by other nations, that such an offer should have been made and that London can find no adequate site for the building.

THE deputation from the National Union of Elementary Teachers, which interviewed the Vice-President of the Council on Saturday last, had a hopeless task to perform. The deputation urged that drawing should be made an optional instead of an obligatory subject in elementary schools. Sir William Hart-Dyke showed in his reply that drawing had now been practically taken up throughout the country, and that it would be impossible to go back upon the steps which had been taken. To have acceded to the request of the deputation would have been a most retrograde step. Most persons will find with satisfaction that an educational advance of great importance has been accomplished with so little friction. Drawing throughout the country has in a short time been accepted as a necessary part of the national elementary education, and this first step accomplished, we may fairly hope that a basis has been laid for a larger extension of technical education. The deputation was ill-advised to endeavour to stop the reform which has been accomplished, but it has done some service by enabling the Education Department to show how satisfactorily the recent change has been accomplished.

USERS of the electric light must have read with alarm the account of a sad accident which occurred at Chatham on Monday. The *Pall Mall Gazette* published on Tuesday evening a sensational report, which has also appeared in other papers, according to which a tailor's cutter, named Jay, lost his life, and a foreman of the local Electric Light Company, named Readwin, was so severely injured as to necessitate the ultimate amputation of a hand and a foot. Both men are alleged to have received their injuries by coming in contact with the high tension mains of the Chatham, Rochester, and District Electric Lighting Company connected to a transformer which had been placed in a damp cellar. Having reason to doubt the accuracy of the report, we have taken some trouble to find out the real facts of the case. Messrs. J. W. Taylor & Co. on whose premises the accident occurred, being unable to get any light, complained to the Supply Company, who sent Readwin to see what was the matter. During his investigation he caught hold of one of the leads coming from a high tension fuse. One of his feet was on the wet floor of the cellar, and he had omitted to put on his insulating gloves; the covering of the wire was moist, and sufficient current passed through his body to give him a severe shock, and cause him to fall to the ground. In doing so he jammed

the wire between the fuse-box and the cellar wall. Readwin has blistered his hand and foot, but he appears to have received no serious injury. The leakage from the wire to the wet wall was great enough to make the insulation smoke. Jay heard of this, became wildly excited, and rushed to the cellar with an iron rod, intending to heat out the supposed fire. He was followed by a companion, into whose arms he fell senseless while still several feet from the apparatus, dying a few minutes afterwards. Readwin deserves as much sympathy as a gasfitter who, called upon to stop a gas leak, takes a naked light into a room filled with an explosive mixture of air and gas. The verdict of death by electricity through misadventure, returned by the coroner's jury, is not to be wondered at; but in view of the facts that Jay was several feet from the apparatus when he fell insensible, that his body showed no marks of any burn, and that the doctors who gave evidence were not familiar with the signs of death by electricity, we shall be strongly of opinion, until further evidence is produced, that his death was caused solely by excitement.

THERE is no doubt that the custom of appointing a professional assessor to advise the promoters or committees of competitions, though rendered futile at times by the had faith or unreasonableness of committees, as well as from other causes, has in the main been beneficial both to architects and to the public, guiding the latter to the selection of the best buildings and guarding the former from some portion at least of the injustice which they have so frequently suffered from either favouritism or incompetency in the adjudication of competitions. There is however one weakness which seems to be inherent in the system, and which, unless subjected to some check, is likely rather to increase than diminish, viz.: the tendency to choose the same architect as assessor over and over again for one competition after another. This is not desirable, because, however competent and however honourable is the man who is selected, he is one man and has one man's special ideas on planning, &c., and the result is naturally that whatever competitions he adjudicates upon are decided in favour of certain tendencies in plan and design which seem to him the best. And the more often any one architect is engaged as an assessor, the more often is he likely to be, as a committee are thus saved the trouble and responsibility of casting about for an assessor: they go to a man whose name they have already heard of in that capacity. We have before us, furnished by a correspondent, a list of five hospital competitions in which the same architect was assessor, and in which the same competitors were in each case placed either first or second; not through any favouritism,—that is not suggested in the least,—but because their ideas of treatment accorded with those of the assessor. In a competition of the same class, where another and equally good man was the assessor, the premiums went another way, and the architects who were first in the other competitions were not placed. This fact speaks volumes, and shows that it is well that corporations and committees should be exhorted to look for variety of professional advice in these matters, and not run it all in one groove.

WE may call attention to the letter of "A Non-Competitor" on another page in regard to the "Hallifax Artisans' Dwellings Competition," as a specimen of what is demanded from architects by the promoters of competitions. The quotation given by our correspondent from the "Conditions of Competition" deserves the attention of the Institute of Architects, and we hope will receive it. In the meantime we may point out to the promoters of the competition that by their conditions they have effectually deprived themselves of the chance of obtaining the services of any high-class architect in the profession.

THE case of Phillips v. Low reported in a recent number of the Law Reports decides an interesting point in connexion with the law of light. It is remarkable, indeed, that it has never been settled before, since it would have been thought that it must have previously arisen. The point cannot be put more clearly than it is by Mr. Justice Chitty in the beginning of his judgment. "The question then," he says, "may be stated in this simple form: a man being in possession of a house with windows and of an adjoining field over which the light required for the windows passes, devises, by will, the house to one and the field to another,—does the right to the light over the field pass to the devisee of the house, or is the devisee of the field entitled to block up the windows?" It is settled law that if the owner of a house and field grants by deed the house but retains the field, or grants house and field contemporaneously, the right to the light over the field still belongs to the house, on the principle that a man cannot derogate from his own grant. The question which Mr. Justice Chitty put to himself he answered by his judgment, namely, that the right to the light passes by will just as much as by grant. The decision is in accord with settled principles, though the point is new so far as regards judicial decisions. To have decided otherwise would have caused inconvenience and confusion, and it is a matter for congratulation that the principles of law have been worked out so as to be in harmony with the existing state of matters.

SOME twenty photo-lithographs of the drawings of Rascbdriff's latest design for Berlin Cathedral have been published. As regards general style, the design now published differs but little from the preceding one. It is, as it was generally expected to be by those who knew the author and his mode of work, simply a "reduced" design, in the full meaning of the word. As the Berlin critics put it, "everywhere the same items have been copied from good publications of Renaissance work as before; the scale to the drawings has only been changed, and hence the encyclopaedia of Renaissance ideas and details has simply been condensed." The public was not satisfied with the last design, and it is scarcely to be expected that the reduced one will tend to make the Parliamentary representatives more willing to vote money towards the erection in this session than in the last. Twenty million marks was the estimate for the former design; the present one the author would erect for ten, although no architect can see where so great a reduction in the cost comes in.

THE case of Giddy v. Ross, which was reported this week in the *Times*, shows that persons should very carefully peruse the conditions which surveyors and house agents place before them for signature when they put business in their hands. Messrs. Giddy & Giddy's conditions contained the following paragraph:—"Should a tenant eventually purchase, the commission on sale will be charged less the amount previously received on the letting." The learned Judge, who tried the case, expressed his opinion that any person who came to do business with the surveyors should put his pen through the clause. We agree with him. This clause would apparently cause an unguarded person to pay commission on a sale which might be effected several years after the tenancy began, and without any service on the part of the auctioneers. A claim was made by Messrs. Giddy under this clause, but the jury found against them. They came to the conclusion, as we read the report, that the property was not sold through Messrs. Giddy's introduction, and that it was not the same in all respects as that which they were instructed to let, and that they were not instructed to sell. It is clear their instructions were to let, and that the tenancy fell through. It was, therefore, equally clear that only by the merest technicality could Messrs. Giddy recover a

commission. Messrs. Giddy & Giddy some little time ago broke into a correspondence in the *Times* with a view of purifying the legal profession in regard to the taking of commissions. The lawyers may now ask that auctioneers should look to the character of the conditions under which they do business.

FOR a few years past the London County Council have used the gatehouse of Horsemonger-lane Gaol as their office for the verifying and stamping of weights and measures. Their new premises for that purpose, planned and designed by Mr. T. Blashill, architect, are nearly ready for occupation. They stand upon part of the prison ground next north-westward of the gatehouse. This, being the County Gaol, was erected in 1798-9, for 300 prisoners, to replace the White Lion Prison, originally an inn, mentioned by Stow and his contemporary, John Taylor, the Water Poet. It is noteworthy as having been due to John Howard's philanthropic labours. In 1791 the county justices bought for 1,350*l.* a plot of about 3½ acres in some market gardens, belonging to St. Thomas's Hospital, on the southern side of the lane now re-named Union-road. The prison, mainly of brick, and the adjoining Sessions House, pulled down thirty years ago, and rebuilt, cost 39,682*l.* They were designed by George Gwilt the elder, Surveyor to the Surrey Commissioners of Sewers, and architect, also, of Great Suffolk-street Bridewell. The gateway contained the office, gatekeeper's room, and a staircase leading to an upper floor, where they kept the scaffold, which, when required for use, was set up on the roof above. Within stood the ten wards, and the governor's house, flanked with two wings for county-court and sheriffs' debtors. An apartment in the gate-house had been pointed out to us as that wherein Leigh Hunt, despite the advocacy of his counsel, Lord Brougham, passed a part of his two years' confinement* for the libel, in the *Examiner* of March 23, 1812, in reply to a fulsome panegyric upon the Prince of Wales, printed by the *Morning Post*, in relation to the banquet on St. Patrick's Day. Here he wrote his *Descent of Liberty*, *Story of Rimini*, and *Fest of Poets*, was visited by Moore, Cyrus Redding, Horace Smith, Shelley, with others, and made acquaintance with Byron. The prison was finally closed on August 31, 1878; two years later the inner area was cleared, and in January, 1884, a portion, about 1½ acres, was opened by Mrs. Gladstone as a children's playground *à curis* St. Mary, Newington vestry. The playground, we understand, is about to be enlarged, and the remains of the prison demolished. The Sessions House interior has been remodelled under the directions of Mr. Howell, County Surveyor. The hall, the two courts, and the Magistrates' room are fine, spacious apartments, and the accommodation is much improved.

AS will have been seen by our "Tender" list of February 27, the tower and spire of St. Giles's Church, Camberwell, are about to be restored, under the direction of Messrs. Newman & Newman, architects. This (the parish) church was built in 1842-4, at a total cost of 20,000*l.*, after the designs of Sir G. Gilbert Scott and his then partner, Mr. W. B. Moffatt; Messrs. Webb, contractors. Being cruciform on plan, and built of Kentish rag, faced with hammer-dressed Yorkshire stone, and having (as seen stone dressings, it is in the Transition style, and takes rank amongst the largest churches of its kind in England. Some considered that its predecessor, destroyed by fire in 1841, retained portions of the original fabric,—cited in Domesday Survey,—as reinstated *temp.* Stephen, and subsequently enlarged. Lysons thought it was entirely rebuilt *circa* 1510; yet the north, St. Nicholas, aisle

* This must have been his second and better lodging here. See the *Examiner* of February 7 and 14, 1813 "I have obtained, as an indulgence, the society of my wife and infants. . . . I am cut off from all others, and locked up at six."

and eastern semi-octagonal apse were of an earlier date. In 1154 the advowson and church were given to Bermondsey Abbey by William de Melhent, Earl of Gloucester. The register of Bishop Edington, at Winchester, records the issue of a commission, 1346, "for reconciling Camberwell Church, which had been polluted by bloodshed." In Charles I.'s reign the rectory had passed to Sir E. Bowyer, Knight, and here were buried many members of that family, as well as of the Scotts, Smiths, and Windhams. Bartholomew Scott's second wife was Margaret, widow of Cramer. The monument of Sir Peter Scott, Knight, *ob.* 1622, recorded that "hee married Elizabeth eldest daughter of Edmund Kedermister, Esq., one of the Six Clerkes of Chancery,"—one of the very few instances which remind us that the Six Clerks' office was for a short period called Kedermister's Inn. Sir George Buc says:—

"These clerkes live and lodge and common together in one house in Chancery-lane, purchased and accommodated for them by Maister John Kedermister, Esquire. . . . Their house was in ancient time the Inne of the Abbot of Norton, in Lincolnshire, and was since the house of one Herdotee, and of him it was called Herdotee's Inne. But now it is, or ought to be, called the Six Clerkes Inne, or Kedermister's Inne, of the aforesaid founder thereof."

A COMMITTEE of the Edinburgh County Council, which met on the 3rd inst., had before them a report and plans prepared by Dr. Rowand Anderson, for the extension and internal re-arrangement of the County Buildings. This involves the entire reconstruction of the west elevation of the buildings facing George IV. Bridge, which was exposed to view when the new thoroughfare was opened up, presenting a very unsightly aspect towards that important thoroughfare. Dr. Rowand Anderson explained that the designing of the west front presented considerable difficulties of an artistic nature, as it was impossible to reproduce the Temple Greek of the east and north elevations, owing to the difference in the number of floors and distribution of the fenestration. He had, therefore, adopted a style, the details of which were borrowed from that phase of Italian architecture which acquired a distinctly British feeling in the hands of Robert Adam and the earlier architects of the period of Inigo Jones. That style, he said, formed the easiest transition from an unyielding style of architecture to one applicable to modern wants. An open balustrade will take the place of the present rough retaining wall, and a new entrance will be formed at the south-west end of the line of building. The estimated cost of these alterations, internal and external, is 20,000*l.*

THE tenth exhibition of the "Royal Society of Painter-Etchers" (the new style of the Society) contains a great quantity of interesting work in true etching style, and less than in previous years of the elaborate attempts to make etching resemble engraving, which we hold to be a mistaken direction of the art. Mr. David Law's two etchings, "Arundel Castle" (69) and "Goring-on-Thames" (135), which are in a style that is popular no doubt, and looks very finished and elaborate, contain no effect which could not be obtained by drawing with a fine pen in slightly-tinted ink, and are absolutely without the special quality and power of etching. Mr. Strang's peculiar works are there in great (too great) numbers, no less than seventeen of his ugly and eccentric creations being bung; these are true etchings in regard to method, and have a remarkable force and originality together with an apparently deliberate and defiant preference for what is ugly and repulsive—"Fleurs du Mal" in etching. The finest is perhaps "The Nymph" (292), which is remarkable for its quality of design. In "The Fish-Stall" (39), the intended effect of light is not a success, and in both this and "The Violoncello Player" and "Socialists" there is apparent a heartless enjoyment in exhibiting

the ugliness and unhappiness of the lowest types of modern humanity in an even exaggerated form. It is fortunate that there is not much of this unhealthy type of art to be found in the room; on the contrary, one of the pleasures one finds in going round the Painter-Etchers' collection is the variety of pleasant and picturesque fancy and suggestion that we obtain often even from works which are slight in their material execution. Among those which are more highly finished, architects will be interested in the various fine plates by Mr. A. H. Haig, of which an "Old Castilian City" (235), showing the town of Segovia rising dark against the sky, is perhaps the finest of all, in sentiment if not in execution. Among other architectural subjects of interest are the late Mr. Luxmore's exquisite little etchings of Canterbury (83, 92), in both of which the tower is treated with the most remarkable union of breadth of effect with delicacy in the indication of detail. Mr. Slocome has some good architectural bits, "Old Houses on the Wear, Durham" (130) and "A Canal at Amsterdam" (147) and others, and Mr. Niven contributes a sketch of "Timber Houses at Exeter" (307) now destroyed. M. Hellen's slight line etchings of girls' beads are among the things with a style of their own, especially clever is the right-hand one of the three heads in No. 21, looking down and foreshortened. Among works remarkable for special power are Mr. Slocome's dry-point study of two nude figures (44); Mr. Percy Robertson's beautiful and poetic little idyl, "Bat One" (39), and Mr. Herkomer's remarkable expression of wind and storm in dry-point line work, "Wild Weather" (183). The exhibition of a collection of portrait etchings by Vandyck, mostly in more than one state, form a special attraction of the exhibition.

AT a meeting of the Royal Scottish Academy held in Edinburgh last week, it was resolved that on the 30th inst., twelve artists should be elected to the position of Associates. The members were unanimous in recommending that of these four should be architects, two sculptors, and six painters.

THE water-colour drawings of "Vales and Dales in Derbyshire and Yorkshire," by Mr. Sutton Palmer, now on view at the Fine Art Society's Galleries, give us a somewhat regretful feeling, inasmuch as it appears to us that the artist has deliberately deserted a powerful, broad, and truly artistic style, as shown in a minority of the drawings, for a more popular, but essentially false and pretty style. Many of what appear to be the more recent drawings really look more like work painted for theatre scenes, full of strong effects of light and glitter, than like the transcripts of an artist from nature. What Mr. Palmer can do if he likes is shown in such drawings as "Moorland above the Tees Valley" (23) "Barnard Castle" (20), "Between the Showers, Cothelstone, Teesdale" (58) and one or two others. These, however, are but a small part of the show, and with the rest we could feel no kind of sympathy.

WE have received a copy of a circular issued by the Dean of Lincoln calling a meeting at 2.15 p.m. to-day (Saturday March 12) at the Chapter-house, to consider a scheme set forth in the following paragraph of the circular:—

"It has probably come to your knowledge that Mr. Shuttleworth has made some very acceptable proposals to the Dean and Chapter. He wishes to effect a long-desired public improvement on the north-east of the Minster Green by removal of the eight houses now standing thereon, and the keeping for the future, as an open space, almost all the ground so cleared. These proposals include also, by request of the Dean and Chapter, another, which seems to them a not less important, improvement, viz., the removal of Sir Christopher Wren's Library and its re-building, as near as possible stone for stone, upon the Western boundary of the ground cleared, together with the re-building of the ancient North Walk of the Cloisters—destroyed

after the Civil War. Mr. Shuttleworth, however, makes it a condition of the assistance which he offers to give that the Library be removed and rebuilt without any delay."

The circular is dated February 23, but was only sent to us on Wednesday last, otherwise we should have taken an opportunity of revisiting the site before expressing an opinion on the project. But until we know of some better reason than appears in the circular for meddling with Wren's Library, we can only say that it appears to us a very questionable proceeding, and we hope that the meeting will not come to any hasty decision to carry out or support such a scheme. The proposal to remove the houses and retain the open space is probably a desirable public improvement; about that we are not specially concerned; but the removal of Wren's Library from the place where Wren built it, to substitute a cloister in a modern imitation of Gothic, is to substitute, for what in its own way is an architectural reality, an architectural pretence; and an old building, even in a Renaissance style, standing where it was built, will be far more in harmony with the whole surroundings than a brand-new imitation-Gothic cloister. Such a proposal would no doubt have been generally popular thirty or forty years ago, when probably Wren's building would have been pulled down without it being thought necessary to provide for rebuilding it anywhere else. But of late there has been a much clearer perception as to the value of Renaissance buildings and of the picturesque harmony of old architecture in mingled styles, and the Dean of Lincoln is rather behind the age in this respect if he thinks he is going to do anything for the picturesque character of the cloister enclosure by removing an old piece of Renaissance architecture and building a new Gothic cloister.

HOW THEY BUILT IN SHAKSPEARE'S TIME:

THE ARCHITECTURAL ASSOCIATION.

The usual fortnightly meeting of this Association was held on the 4th inst., in the meeting room of the Royal Institute of British Architects, 9, Conduit-street, the President, Mr. F. T. Baggallay, in the chair.

The minutes of the last meeting having been read and confirmed,

Mr. W. Percival was elected as a member of the Association.

Mr. F. T. W. Goldsmith, honorary secretary, then proposed a vote of thanks to Mr. Aston Webb, for allowing the members to visit the new Metropolitan Life Assurance buildings, in Moorgate-street; to Mr. Innes, for permitting them to visit the tower and spire of the Church of St. Mary-le-Bow, Cheapside; and to Mr. T. E. Colcutt, for allowing them to visit the Imperial Institute. The vote of thanks was carried unanimously.

Mr. Goldsmith also stated that although the matter had not been definitely arranged, yet he believed that a visit would be arranged for the 19th inst. to the Tower Bridge by permission of Mr. Wolfe Barry, the engineer.

The Chairman said he had very great pleasure in calling upon their old friend and colleague, Mr. J. A. Gotch, to read them a paper entitled, "How They Built in Shakspeare's Time." The paper* was as follows:—

When Falstaff paid his second visit to Justice Shallow, in Gloucestershire, and was taken by his host to see the orchard, he could not help exclaiming, as he looked back upon the house, "Fore God you have here a goodly dwelling and a rich." Now, although Falstaff is supposed to have lived about the beginning of the fifteenth century, he was, in reality, drawn from contemporaries of Shakspeare; and, similarly, all the incidental touches which give so much local colour to the poet's pictures of life were suggested by the persons and things which he saw from day to day. So the goodly dwelling of Justice Shallow was, doubtless, such an one as might have been seen within a short distance of Stratford, and it is no great

*The same paper was read by Mr. Gotch before the Sheffield Society of Architects and Surveyors on Tuesday evening last, as elsewhere mentioned.

assumption to suppose that as the Justice had his prototype in Squire Lucy, of Charlcoate, so a remembrance of Charlcoate itself may have been floating in Shakspeare's mind, when he put these words into Falstaff's mouth.

It may afford us some interest to inquire what were the processes by which these rich and goodly dwellings came into existence. Whom have we to thank for these stately homes, which the public never tire of seeing on the pages of the magazines, and which present inexhaustible mines of detail whence we architects may fill our many sketch-books?

We know whom to thank for such things in the present day. It is the architect. He holds himself responsible for every scrap of design, from the plinth to the chimney-cap; he fathers every article mentioned in the specification, from the trade of the excavator to that of the hell-banger; and not content with that, when the specification is exhausted, he betakes himself to the wall-papers, the curtains, and the furniture. Or, if he doesn't, there are many who say he ought to.

One consequence of this is that a good deal of the work that is springing up around us has a very self-conscious air; it has clearly been designed, and often evidently at a great deal of pains. The same impression is hardly conveyed by most of the old work; that seems to have much more of spontaneous growth about it, though, indeed, there are a few examples of Early-Renaissance work in which the striving and the straining of the designer is amusingly evident. Possibly this difference may result from the different processes employed.

But what happened when anyone in Shakspeare's time set about building? Let Shakspeare himself answer. "When we mean to build," says Lord Bardolph, in the "Second Part of King Henry IV.,"—

"When we mean to build,
We first survey the plot, then draw the model;
And when we see the figure of the house,
Then must we rate the cost of the erection."

The necessity of "surveying the plot" might be irksome to some who occasionally find a voice in *A. A. Notes*, perhaps, but by "surveying" Shakspeare probably meant examining. However, it is clear that it was thought desirable to know something of the site before the house was designed. To "draw the model" was to prepare the drawings,—hardly to construct an actual model, though we hear of such a course being taken in one or two instances, and even of a model being brought from Italy. The drawings prepared, the next matter was to calculate the cost, and of this process we have various records and examples left to us. One I will quote in parts as a specimen. It begins:—

"It maye please yo^r to understand ane Estymate of certayne newe buyldinges to be erected and set up at Woolwich by Mr. Allen the Queens Ma^{ties} Marchant as hereafter it followeth etc. 1572."

I will only give one or two of the items, thus:—

"Imp^{ts} in a Seller of xxx^{iiij} ffoote wyde and xxx^{iiij} ffoote in lengthe to be broughte up wth bricke Rounde above vij^{ij} fote high tow bricke in thickness will take xxxij^{ij} of bricke

"The storeye upon the said seller etc. . . . will take xxij^{ij} of bricke in all—xlv^{ij} at x^s the thousande

"In to the Bycklayer for the layinge of liij^{ij} xv^{ij} of bricke at lijs liij^{ij} the thousande laying

"More to the Carpenter for the makinge and settinge up of a newe frame of tynde for the turrehouse containinge in Lengthe lxxx ffoote and in wydth xx^{ij} ffoote at v^j vij^{ij} the ffoote he layinge all masse of tymber sawinge framinge and full fymyng of all the worke belonginge to the carpenter"

Then follows the roofing. So many thousand tiles at 10s. the thousand, so many bushels of tile-pins, so much lime and sand, so many loads of lath, and so much for laying at 2s. 6d. the thousand. Similarly with the plaster; the materials so much, and the "lathing and layinge of all the wales and sellings," so much. The whole estimate amounting to 750l. 19s. and occupying only three and a-half sheets of foolscap. How many pages would a modern bill of quantities for work to the like amount run to?

But Lord Bardolph had more to say that is of interest to us:—

"Then must we rate the cost of the erection: Which if we find outwechts ability. What do we then but draw anew the model In fewer offices; or at least, desist To build at all? Much more, in this great work (Which is, almost, to pluck a kingdom down

And set another up), should we survey The plot of situation, and the model; Consent upon a sure foundation; Question surveyors; know our own estate, How able such a work to undergo, To weigh against his opposite; or else, We fortify in paper, and in figures, Using the names of men, instead of men; Like one that draws the model of a house Beyond his power to build it; who, half through, Gives o'er, and leaves his part-created cost A naked subject to the weeping clouds, And waste for charlish winters tyranny."

Not a word here about an architect. A good deal of drawing a model, and of surveyors and surveying, but nothing of an architect. Indeed, although the word was in use then, it does not seem to have been in general use, but rather as an academical term. Marcus, in the play of "Titus Andronicus," calls Aaron, the Moor, "chief architect and plotter of these woes," but I have not come across another instance of its use by Shakspeare. John Shute, in his book on the "First and Chiefest Groundes of Architecture," published in 1563, uses the term freely, but he invests it with an air of complete unreality by the remarks he makes in connection with it. His definition is the old one, derived from Classic times, of "chief-workman"; and indeed, for the next century the same definition was used, for in a dictionary of 1656, "architect" is defined as "the master-builder, the chief workman in architecture, the first inventor." Another instance of the use of the term is to be found in the epitaph of Robert Smithson, in Wollaton Church, dated 1614. He is therein described as "Architector and Surveyor unto the most worthy house of Wollaton, with diverse others of great account," which is probably the first recorded instance of that conjunction of the two words which appears to give so much offence just now.

We are accustomed to look upon the well-known John Thorpe as an architect; and no doubt he was in so far as providing plans and elevations of many large houses constitutes an architect. But he is never called so. He is always designated a surveyor: in all the references to him that occur in the State papers his functions are those of a surveyor. Among the State papers of March, 1609, there is a "list, signed by Robert Earl of Salisbury, of the Commissioners for surveying the Duchesse of Suffolkes Land, viz.: for the King, William Hill, John Thorpe, and John Woodward." On April 4, 1609, "Notes of Repairs necessary to be done about Westbury Lodge with request from John Thorpe to — Wingfield to move the Lord Treasurer that they may be done." And again on September 23, 1611, there is a "Warrant to pay various sums amounting to 52l. 3s. to John Thorpe, surveyor, for repairs of the posts, pales, and rails of Richmond Park carried away by the flood in the last winter. But although he is called a surveyor, and did the work of a surveyor, there can be no doubt that he designed architecture, and that to him we owe the general arrangement and appearance of some of the richest and goodliest dwellings of Shakspeare's time.

But my aim is not so much to show that the combined architect and surveyor flourished during that brilliant period, as to point out how widely different were the processes then employed from those in vogue at the present day. The course of procedure seems to have been somewhat as follows:—

"We first survey the plot." In the building of Hatfield House we have the Earl of Salisbury's own account of this part of the work in a letter written to Sir Thomas Lake on April 15, 1607. "I must confess unto you," he says,

"That I have borrowed one dayes retreat from London, whither no I an returninge this morninge having looked upon Hatfield also, where it pleased my L. Chamberlaine, my L. of Worcester, and my L. of Southampton to be contented to take the payne to view upon what part of ground I should place my habitation, where I doubt not ere it be long, to have the honor to see my Master. This I write because you may knowe that yo^r li^{ts} (letters) of yesterday will find me in my pilgrimage from my litle Lodge, wth a fyre sight of read deere before mine eyes."

"Then draw the model." This, so far as can be gathered, constituted one of the chief duties of the architect of those days: the other being to survey the works during their progress. Drawing the model was the work of such a man as John Thorpe, and the way in which he did it may be seen in his book at the Soane Museum.

Plans and elevations were all that the architect provided in the way of drawings, as a rule, though he sometimes appears to have furnished a few details,—as we shall presently see. Still adhering to our text, we have already

seen how they "rated the cost of the erection," and as to the process of "drawing anew the model in fewer offices" when the cost was too great, John Thorpe's book furnishes us with an example of this also; for he has two sets of plans for Sir Walter Covent's house at Slough, in Shessex, the one adopted being somewhat the smaller.

These architects or surveyors, who provided the drawings, were well versed in their art, and in the fashions of the day. Some of them went to Italy, as John Shute did, "being," he says, in the Dedication of his *First and Chief Grounds*,—

"I servant unto the Right honorable Duke of Northumberland 1550. It pleased his grace for my further knowledge to maintaine me in Itallie thier to order wth the doings of y^e skillful maisters in architecture, and also to view such ancient Monumentes herof as are yet extant. Where upon at my retourne presenting his grace with the fruites of my traucties, it pleased the same to shewe them unto that noble King Edward the VI. your maestes's most deare brother of famous memorie, whose delectation and pleasure was to see all such like. And having the sayde trickes and deliaies of sculpture and painting as also of Architecture, yet in my keeping I thought it good at this time to set forth some part of the same for the profit of others, especially touching Architecture; wherein I do followe not onely the writings of learned men, but also do ground my selfe on my own experience and practise, gathered by the sight of y^e Monumentes in Italie."

Thus writes the first travelling student of whom we have any record.

Those who either could not, or did not, go direct to the fountain-head, in the manner of John Shute, studied the books published on architecture, of which there were a good number. There is very clear evidence that John Thorpe, for instance, did this, since he has copies among his drawings of some of the illustrations of books then recently published. The "models" of houses, therefore, were drawn by experts who had imbibed great draughts of foreign influence, and who, with minds full of what they had seen abroad, and fingers itching to draw Classic columns and pediments, nevertheless had the good sense to remember that their clients were Englishmen, and lived in England. The result of these opposing forces is to be seen in the beautiful houses which covered the land from one end to the other.

But the model drawn and its extent definitely fixed, there came the process of executing it. With the amplification of his small scale drawings, the architect of those days seems to have had little to do. Of detail drawings, except a few full-size sections of strings, mullions, and mandrills, John Thorpe has absolutely none. I only know of one detail drawing of that time, and that is preserved in the State Papers, and is endorsed in Lord Burghley's own hand as Henryck's Platt (or plan) of my hays Wynd."

It is drawn to a scale of about one inch to the foot, and shows a plan and elevation, but whether it is the plan of a window already built, or is the drawing from which it was to be built, can only be conjectured. The probability is that the general small-scale drawings were handed over to a local agent or foreman, or clerk of the works, who hired labour, on behalf of the building proprietor, overlooking the men for him, made bargains with them for doing the work, and paid them from time to time. All the correspondence that has been found relating to building in those days, points to this conclusion. At Burghley we have Peter Kemp; at Cobham, Richard Williams; and at Hatfield, Robert Liminge,—each one writing to his master for instructions, and reporting progress, but always referring points that required settling to the decision of the employer, not of an architect.

The various workmen, or the chief of them, were engaged for their skill in their particular work, not only as workmen, but also apparently as designers. That is to say, the stonemason would have to carry out the work from the small scale drawings, and would supply all the details himself; and, accordingly as he was skilful or the reverse, the details were good or bad. This seems to be borne out by much of the work of that time, which looks well at a distance, but loses by a close inspection. The architects or the surveyors did undoubtedly themselves study the details of such things as cornices and columns, since Shute's book is little else than a display of the Five Orders, and Thorpe has one or two pages wholly devoted to technical drawings of the same kind; but there is no evidence that they supplied to the masons full-sized sections of any of the numerous entablatures that were executed. The masons, it is true, did not work away

entirely on their own responsibility; they kept in touch with their employer to a certain extent. We know that the mason at Burghley, one Roger Warde, got into rather a fog, as may be seen from the following letter addressed:—

"To the Ryght worshipfull Syr Wylm Cecil Knight at the canan rowe in Westminster gyve thys wybte speyde at London."

"RYGHT worshipfull my dewty Remebryd thys shalbe to adwertyse you in that I dowe understande your pleesure ys to have IIII kyndes for your lorde's court but I canot understand by Johns nores after what sort you wolde have them but as I dowe understand by hys talkinge you dowe intend to have them after the same molde that the beye wyndowe ys made by, but whether you dowe thinke to have them of the same wyde that hys ys or not I cane nott tell, therefore I shall dysseye you to drawe your menynghe how and after what fashon you wolde have them to be made in all poynte bothe the wyde of the lycht and alsoe the height of the same, wythe the fassyon of all the molde that dowe belongs there vnto and in what place ye wolde have them to stande and your pleesure knowe I shall dowe the best y^e lycht in me to dowe I wolde be verye gladd to knowe your pleesure for yore serte forthe of yourr base kowrt up to the tares and for the proportion of them and alsoe for the gate at the ende of ye tares wythe the proportion of the same bothe for the height and wythe that you wolde have theme of I wolde gladlye understande your mynde after what fashon you wolde have the gable-ende over the lychan wyndow therefore I shal dysseye you to drawe a tryke of the uppyght for your lychan wyndowe and the gabyll end over hytt that I ma the better understande your pleesure in all thynges ye wolde that I shulde dowe. I thynge yourr wyll ys to sett for to make any sere of hytt the best stone ye I dow knowe for sere or sere ys at clypsame. the lychyng god kepe your evere more frome all evyll & my goodde ladye wth all rest of yourr worshipfull howe. frome burylaye the xij of June. By yourr at all tyme to comande ROGER WARDE mason."

It is not impossible that, in consequence of this urgent appeal of Roger Warde, Lord Burghley got Henryck to make the plan of his bay window already mentioned.

The carved stonework was not always executed on the spot. The most important features no doubt were; but there seems to have been no objection to having the carved strings, where the pattern repeats, done away from the work in large quantities and then fitted into the spaces that required filling. This is very evident at Kirly Hall, where, in many cases, the carved group of flowers or fruit is ruthlessly cut in two, so as to fit up to one of the large projecting pilasters. Such an expedient is hardly excusable, even in a terra-cotta building like Sutton Court, near Guildford, where, no doubt, they sent some distance for their moulded work; but in a stone building, with masons on the spot, it is a distinct blemish, and exhibits a neglect of that good finish which marks the conscientious and careful workman.

But as the mason provided his details, so did the plasterer provide his, and the joiner, most likely, his. Richard Williams, the foreman at Cobham, has something of interest to say upon this. Writing to his master, "the right Honorable Lord the L. Cobham L. Warden of the five ports" he says,—

"I have thought it mete that the Joyner shall begin to worke upon mouldaies com sevenyght next at the furthest, and to goe in hand first with those 2 chambres wth yo^r L. means, and afterwarde wth the 2 newe Chambers, and those up Lodginge, and then y^e tyme of the year will permit the same wth the flooring of the parlour, and to then it may be prepared and made ready for his worke, the plasterer would be sent for to come to bring to yo^r L. models or patterns of the maner of the sealing that yo^r L. maie make yo^r choice of that kind of work that shall best like yo^r, and some care would be had that he be a good workman and the price reasonable, wherof this bearer the Joyner and Simondson can better judge than I am habill."

The spectacle of the plasterer submitting his models to his lordship, and a joint council of his lordship, the joiner, and Simondson passing judgment upon them, is interesting.

The same Richard Williams has also something to say about another architect: "Yo^r Lo. must resolve," he writes in 1601, "what and how much yo^r are pleased to have done by Giles de Whitt either upon some newe chymney peece or upon my Lo. yo^r father's tombe, that the poore man maye have some worcke to get wherwth all to maintaine and susteyne himself." It is evident that Giles de Whitt, apparently a Fleming, was ready to do any fine stone carving, and it is evident that he was to work from his own design, and not from that of another man. This was not the first time that Williams had written about the foreigner. Some months before he had said, "We have bargained with Giles de Whitt for making two chymney pieces for the two chambers next to your new chapel. He demands £65 for both; I will not give above £50 and he will accept

it in the end rather than fail." Here is a characteristic picture! The needy foreigner stranded at Cobham, hoping to get work "wherewithal to maintain and sustain himself"; too poor to move to more likely quarters, preferring rather "to bear those ills he had than fly to others that he knew not of." No wonder he was willing to abate his terms 25 per cent. "in the end, rather than fail."

Yet one more extract from this same Richard Williams in the same year of 1601. It is from "A pticuler of Buildinge thought necessary to be doene this year at y^r L. house at Cobham, together with an estimate of the charges thereof as well for materials to be bought as for the workmanship of the same." There are nine items, of which we need only quote four:—

1. "First the building of the fourth turret according to the modell agreed upon by yo^r Lo: alreadye."
2. "A newe doorecase to be made and sett up in the newe plot."
3. "The plastering of the same parlour over hed wth suche kind of worke as it shall please yo^r Lo. to sett downe."
4. "Joyners worck to be doon in the Great Chamber and the Lodging adjoining to the Queen's Chamber."

All these particulars, it must be remembered, are sent to Lord Cobham by his own foreman or agent, who not only looked after his buildings, but mixed up reports on building matters with the information that he had "spoken to yo^r drap^r to make provision of cloth for Liveries." We see one word of a controlling architect. We see the plasterer submitting his own models, we easily infer that the foreign mason supplied his own designs, and it is not straining probability to believe that the joiner, who was artist good enough to judge of the plasterer's work, would be able to work also from his own designs. How differently matters are managed to-day may be seen from the account in the last number of *A. A. Notes of the Association's* visit to Mr. Aston Webb's new insurance offices in Moor-gate-street, where, in criticising the plaster work, it is Mr. Webb's sections and Mr. Webb's patterns that are praised.

I have troubled you with a good many extracts from ancient letters, but my aim is to throw the light of contemporary evidence upon the subject, and in furtherance of this object I must inflict one or two more quotations upon you.

We have seen how the workmen were regarded; and now, to supplement that picture, let us see what was the position of the surveyor. One part of Lord Bardolph's advice was to "question surveyors." As a matter of fact, in the building of Burghley House, Sir William Cecil did question several. We have learnt how he employed Henryck to make a plan of his bay window. We find that at different times he sent at least two other surveyors to report upon the progress of the works. One Edmund Hall writes thus on August 30, 1564,—and it is evident from his letter that he was a man accustomed to criticise the effect of architectural features, and to advise his employers upon technicalities much in the same way as an architect would in the present day. He writes:—

"It may please you to vnderstande that accordinge to yo^r requeste I have bene at Burley and have conferred wth Kempe & Norris accordinge to yo^r pleasure to me declared: I assure you I take yo^r determination for the staires to alter into the Chappell shall do verie well, wth alter will not be past ij foote di. In the nether end of the Chappell, by occasion wherof I doubt not but you will like the proportion of yo^r chamber much the better, to passe cleane thorough to the maine wall of the hall, and a Portall to rise before the dore: To leave a half pace betwene the hall and the Chamber of liijth foote di. it wolde be to litle purpose, and yet it wolde be a great blemish to yo^r chamber to take so much in length. For though the portall risinge in the midst of yo^r chamber, takinge at the least iijth foote di yet notwithstanding it will bewittie yo^r chamber beinge well wrought and the romes on both the sides will serve for good purposes. But if the Portall might be placed in the side corner of the Chamber, it wolde stande much more apter than in the midst: on the East side of yo^r chamber it can not stande, because the dore wolde spoile the side of the hall, where the longe borde should stande, and on the West side of it, it will take half the window in the chamber, w^{ch} may be borne, but the dore standinge against the end of the high table in the hall, will pester yo^r dore, excepte you do apoint the shorter table to serve that place. You may consider of it as to youe shall seeme best, and so to be followed accordingly, youe shall finde that the breadth of the Chamber will beare the whole length very well. And accordinge to yo^r minde Kempe will provide as many Masons as he can gett, so as the south side of yo^r house may be perfected before winter, w^{ch} is a great peece of worke to cutte out of yo^r hard stone so shortle."

* State Papers, Domestic, Mary, Vol. ix. No. 4.

* State Papers, Domestic, Elizabeth, vol. xxxiv. No. 51.

The rest of the letter I need not read*; it deals with the disposition of the terraces and garden, but at least it goes to show that the surveyor (or architect) of that time had his say about the garden as well as the house. The letter concludes:—

"Thus beinge bolde to write to yone my minde w^{ch} as I thinke shal be as well a benefitt to yor orcharde as to give it an eye head before yor house, as to the beautifyinge of the groundes, next adjoininge to the principall side of yor house to be even and level, howsoever it shall please yone to use it, further herein at this tyme I have not to say; but from tyme to tyme as occasion shall serve, I shal be glad to do my dever to the uttermost of my power to do yone & yors any pleasure or service I shal be able.

Written from Greatorpe the xxixth day of August 1564.

Yours to command

EDMUND HALL
[Addressed] To the honourable Sir Willm Ceell Knighte."

The other surveyor was a Richard Shute,—not John, the author,—and he writes to report progress on July 30, 1578.

Leaving Barghley for another great palace of the time, Holdenhy, we get an interesting glimpse of that great house in course of its erection. In the year 1579 it was approaching completion, and Lord Barghley, being in the neighbourhood, and being himself a great builder, writes to Secretary Walsingham to tell Sir Christopher Hatton that on his way to Northampton he and the Chancellor "mean to survey his house at Holdenhy, and when we have done to fill our hellics with his meat and sleep also, as the proverbe is, our hellics-fall all Monday at night, and on Tuesday in the morning, we will be at Northampton." Sir Christopher was then at Greenwich, so he wrote to Lord Barghley to welcome him and make him free of Holdenhy. In the course of his letter he says:—

"I fear me that as your Lordship shall find my house unbuild and very far from good order, so through the newness you shall find it dampish and full of evil air. . . . I humbly beseech you, my honourable Lord, for your opinion to the surveyor of such lacks and faults as shall appear to you in this rule building, for as the same is done hitherto in direct observation of your house and plot at Tybals [Theobalds] so I earnestly pray your Lordship that by your good corrections at this time it may prove as like to the same as it hath ever been meant to be."

So the surveyor (or architect),—perhaps John Thorpe himself,—attended, we may suppose; while the Lord Treasurer, in company with Sir Walter Mildmay and a great multitude of gentlemen and servants, made a tour of critical inspection. How far Sir Christopher was prepared to accept Lord Barghley's suggestions, how far the soul of the architect or surveyor (if such surveyors are allowed to have) was to be wrung with the necessity of altering his design at the bidding of his client's grand friend, we are spared the necessity of inquiring, for his Lordship was mightily pleased with the house, and he wrote next day to his host to say so. He says:—

"But approaching to the house, being led by a long straight fair way, I found a great misliking in the front or front pieces of the house, and so very part answerable to other, to allure liking. I found no one thing of greater grace than your stately ascent from your hall to your great chamber, and your chambers answerable with largeness and lightness, that truly a Monnus could find no fault. I visited all your rooms, high and low, and only the contentation of mine eyes made me forget the infirmity of my legs. And where you were wont to say it was a young Theobalds, truly Theobalds I like as my own; but I confess it is not so good as a model to a work less than a pattern, and no otherwise worthy in any comparison than a foil."

Thus Lord Barghley. Yet, still, there is no acknowledgment of an architect, as we interpret the word. The praise is all given to the promoter. Such, indeed, is the custom now. If you take up any newspaper account of the opening

* We reprint it here, however. It continues: "I have advised Kempe to make a profie of v^o fote square, what the charkes wilbe, to take y^e grounde out of yor garden to the loones of the flower in yor lower gallery, so as you may have an estimate of the rest; for that yor terrasses he already set forth and the stonework of a great part are done thei will take little more earth then already is bestowed of them. But for y^e bestowinge of the earth, if it shall seme to yone so good, I thinke the angell of yor orcharde, w^{ch} lieth of the west side of yor garden, & on the south side of yor base court, w^{ch} grounde hath a great descent, w^{ch} lieth of the base court, to the end of the wall of the garden. My mind is for to spend the earth that shall come out of yor garden I w^{ch} have a wall to goe from the rounde in-unte of the south west corner of yor garden. Westward to the water, to be even with the height of the grounde adjoininge upon the wall of yor base court, and so to make all that Angell level, to use as to yone shall seme good. And if the earth that cometh out of the garden will not suffice to make the lower parte equal to the higher, as it is at this present the higher parte may be cast downe to the lower w^{ch} is no great charge, and so it will answer the better w^{ch} the flower of yor garden."

of a new building, do you ever find the name of the architect mentioned? And yet to him above all is the aliding interest of the whole affair due. Indeed, the neglect of the nineteenth century reporter is a greater injustice than that of Shakspeare's contemporary, the Lord Treasurer, for whatever hearty the building of to-day possesses is mainly owing to one man, whereas, in Shakspeare's time, the credit was divided between a dozen or more.

But now, having learned incidentally, as it were, what the public of those times thought of architects,—or rather, perhaps, having learned that they did not think of them at all,—let us see what architects thought of themselves. This we gather from the already-quoted hook of John Shute. Amid a wonderful deal of tedious verbosity and long-winded panegyric, we find a few things that are worth remembering. Among all studies he considers the most profitable to be—

"That by the Grekes named Architectonics and of the Italiane Architectura (I thinke not altogether unte nor unspelle by me termed in English, the arte and trade to raise up and make excellent edifices and buildings)."

There the wearisome John is not far wrong. Then he proceeds to dilate upon the wide reach that architecture has, the number of allied studies that its pursuits necessitates,—

"So that without a neere acquaintance or understanding in them, neyther paynters, massons, gold smythes, embroderers, carvers, joyners, glassyers, gravers in all manner of metalles and divers others more can obtayne anye worthy thinge. None all these beinge branches of that forsayd foundation, stocke or science shall bringe forth the frutes of it to their great profits."

So that he, too, regarded the artificers named as sharing almost equally with the architect in the burden and heat of design. His most interesting chapter is on "What the office and Daetie is of him that wyl be a Perfecte Architecte or Mayster of buildings." Yet this is merely an echo of Vitruvius. His rules and exhortations are those of Italy in the early years of the Christian era, not those of England in Shakspeare's time. Of course, they are somewhat to the point, but their interest is general and not particular, and one cannot help feeling that in laying down rules for the guidance of architects John Shute was addressing a body of men *in posse not in esse*. For the architect of Shakspeare's time was still a surveyor, who shared with the mason, and the plasterer, and the joiner, the glory of producing "the goodly dwellings and the rich" that Falstaff admired and that are at once the envy and admiration of us in the present day. And it will do us no harm to remember that it was not to one brain, but to many that we owe those beautiful places. Nor will it be amiss if we try to bring about such a state of things that once again the mason and the plasterer and the joiner may be able to help us in design as well as execution. And it may also be worth while to remember that the English architect of Shakspeare's time was not the great artist whom princes loved to court, but the unknown surveyor, who divided his time between designing the body of palaces like Holdenhy or Barghley or Wollaton, and "repairing the posts, pales, and rails of Richmond Park carried away by the flood."

Mr. A. H. Clark said he had much pleasure in proposing a hearty vote of thanks to Mr. Gotch for the very interesting paper which he had read to them. He (the speaker) had had a great many opportunities of examining some of the old buildings in Northamptonshire, and although he had, perhaps, devoted more time to the study of ecclesiastical remains,—which were quite as noticeable in Northamptonshire as in other districts,—than to the study of domestic work, still, what domestic work he had seen in that county had been so charming that he thought the impression it made would always remain in his mind. He thought that Mr. Gotch had conferred upon them a great kindness by so admirably illustrating his paper by lantern views. Quite apart from the high literary merit which the paper possessed, its value was doubled by being illustrated by lantern views. He felt sure that if they could improve the illustrations to some of the papers which were read in that room, and endeavour to bring them up to the very high level which had been maintained during the present session, there would be no more scanty attendances at their fortnightly meetings.

Mr. C. H. Brodie, in seconding the motion, said that if the Discussion Section of the Association, in which he was rather interested, con-

tinued to produce speakers like Mr. Clark, then the Association would owe that Section much gratitude.

Mr. F. T. W. Goldsmith, in supporting the motion, said the paper had been an excellent one. He was sure they were all glad to hear Mr. Brodie speak up for the Discussion Section of the Association, and to hear that Mr. Clark was a member of that Section. Mr. Gotch had dealt so particularly and clearly with the functions of the surveyors and craftsmen who erected the buildings about which he had been speaking, and which were admired so much by everybody, that it would be absolutely impossible to supply any information to the meeting which Mr. Gotch had not already given; but he should like to draw one or two inferences from what had been said. First of all, it seemed to him that the modern idea that the architect of the period under discussion was a great person was altogether an erroneous idea. The architect, from what Mr. Gotch had said, was a man who was not afraid of hard work, and was not above descending to minute details, which were put together so as to produce buildings which of their kind, he supposed, had no rivals. It was amusing to hear that the architect was as much concerned in the "repairing of fences washed away by the flood" as he was in the design of "my lord's chamber" or "my lord's hay window." Evidently Mr. Gotch was of opinion that the architect of that period was more identified with the craftsmen and with the practical side of his art than he seemed to be at the present day. The excellent paper which they had heard from Mr. Gotch was what they expected from him, and the illustrations which he had shown were fully worthy of it.

Mr. Bernard Dicksee said that Mr. Gotch had stated that architects in the time of Shakspeare did not supply any detail drawings. He (the speaker) would like to know whether that was the invariable rule, and, if so, when that rule was broken through? Because he believed there was a letter in existence from Sir Christopher Wren apologising for supplying so many details. He would like to know when that custom came in.

Mr. J. C. Stockdale said a similar question had occurred to him when Mr. Gotch referred to the architects of those days only supplying small-scale details. The full-size mouldings and the sections of cornices, as executed, displayed considerable knowledge of Italian work, which could scarcely have been possessed by the ordinary masons of those days. Did the architects supply them with full-size profiles? The existence of foreign workmen in this country might account for some of the mantelpieces and features of that kind, but could scarcely account for the cornices and plinths; and he thought our masons could not have had that knowledge unless they had had full-size models to work from.

Mr. A. O. Collard said it was interesting to look into the domestic life of the architects of past days, and he should therefore like to know the method of life of Thorpe, Shute, and others, and the estimation in which they were held by people,—not by Lord Burleigh and other notabilities of the period, but by those among whom they lived. Did they live in comfort or misery? And did they spring from a sort of clerks of works' existence, or were they properly educated? Did they travel about much for the purpose of collecting information? Or did only those few mentioned by Mr. Gotch act in that way for their clients? Another point upon which he should like to obtain information was as to how the architects of those days were remunerated. Mr. Gotch had quoted an instance in reference to palings and things of that sort, but could he give them any other information on the question of remuneration,—whether they were well paid, and whether they were paid just so much for their time? It was certain that in the present five per cent. system was not in use at that time. Any information on that point would be of interest, for it might, perhaps, be found that a return to the practice adopted in those days would be better in some respects than that in vogue at the present time.

The President, in putting the vote of thanks to the meeting, said the real and deep interest of the paper which they had heard read that evening consisted in the contemporary evidence of the way in which work was carried on in the period under discussion. It was most interesting to hear that a system of quantities was in use, then, not exactly in our sense of the word, but for the purpose of ascertaining the number

and, waving above his head a tube, through which the very life blood of creation pulsed, in waves of purple fire."

Macmillan's publishes an article by the Rev. Harry Jones on "Hours of Labour," which seems rather worded with the view of conveying the writer's sympathy with the working man's desire for shorter hours, without committing himself to any definite expression of opinion.

In *Lansmans* is a short charming article by poor Richard Jefferies, on the lions in Trafalgar-square, which struck him as the one outdoor work of art worth getting enthusiastic about in London. This is a little overstating it, perhaps, but he draws an eloquent contrast between the hurry and bustle of London life constantly streaming past, "and in the midst the calm lions, dusky, unmoved, full always of the one grand idea that was infused into them." The article is at least such a one as only an original and fervid mind could have produced.

The *English Illustrated Magazine* contains an article on "The Queen's Riviera Residence," with illustrative sketches of scenery which are not, however, of very special interest or excellence. An article on "The Royal Mews" conveys some information upon a historic London establishment, with illustrations of two or three of the State carriages, of which it may be said that the "semi-State" coach, built by Hutton, who was Lord Mayor of Dublin at the time of the Queen and Prince Consort's visit in 1852, is a much better piece of design in a general way than the State coach, though the latter was designed by no less a person than Sir William Chambers. State coaches, like other State articles, seldom escape the reproach of being gawdaw, and this is no exception. The panels were painted by Cipriani. Mr. H. M. Cundall contributes a brief article on The Speaker's Mace, with illustrations of that and two other maces, now in Jamaica.

In the *Gentleman's Magazine* is a very able article by Mr. Hume Nisbet on "Illustrative Art, Past and Present," to which we have not space to refer further, but which is well worth reading by any who are interested in the subject.

The *Cornhill Magazine* devotes a short and useful article to an account of "How the Egyptian Monuments were read," meaning we presume the inscriptions on the monuments. The *Antiquary* continues various serial articles before noticed, and contains one on "The Tombs of the Kings of England" and one on "Prehistoric Rome" by Canon Isaac Taylor. "Lettering on the Helms of Effigies" is the subject of another article.

The *Century* opens with a very well-written and very enthusiastic article on "St. Paul's," which should be read by Englishmen with sympathy and admiration. It is signed by M. G. van Rensselaer, and illustrated by Mr. Joseph Pennell. The article is partly historical and partly critical, and the criticism is very able and discriminating. The writer thoroughly appreciates Wren's greatness, without being blind to the defects of his famous building. The writer considers the outer dome Wren's great triumph.

"The merits of the exterior far outweigh its defects, for though we may object to certain features and arrangements, the church as a whole never fails to impress in the profoundest way both the eye and the imagination. It is a magnificent building, and we cannot always say as much of buildings in which we discover fewer special faults. People who have no eyes for the picturesque sometimes complain of its colour, or rather of the way in which smoke and soot have altered its colour. But fresh in the first whiteness of its Portland stone, it could hardly have been as imposing as today, when great streaks and patches of inky black accentuate the pallor of more sheltered portions."

The interior views by Mr. Pennell are particularly admirable specimens of illustration. In the same magazine Mr. Sillman's series of articles on "Italian Old Masters" deals this month with Giorgione, and is accompanied by two engravings, the "Knight of Malta" and "St. Iheralis." Two articles on the great pianist Paderewski, the one biographical and the other critical, with two portraits, will interest some of our readers.

In *Scribner's Magazine* Mr. W. A. Coffin concludes his series of three papers on "American Illustrations of To-day," with engravings illustrating the work of various American artists. Other articles of special interest are "The Water-route from Chicago to the Ocean," by Lieut. C. C. Rogers; "Small Country Places"

by Mr. Samuel Parsons, jun.; "Paris Theatres and Concerts" by Mr. W. F. Apthorp; and "Speed in Locomotives," three very interesting papers under one heading, giving the results of special inquiry and experiment on the subject, and leading to the conclusion that we are not likely to get higher, on the whole, than the highest speeds now habitually run.

In *Harper's* is an interesting and picturesquely-written article on "The Capitals of the North-West," describing some towns whose very names are as yet unfamiliar to Englishmen, and a well-illustrated article by Mr. Walter Besant on "The London of George II.," a continuation of the series of historical articles on London which he has been contributing to *Harper's*, and which will make a valuable book if published collectively.

Illustrations.

ILLUSTRATIONS OF OLD CHESTER.*

III.—THE CRYPT IN WATERGATE-STREET.

THIS remarkable double crypt is supposed to have been built by Ranulph de Blondville, sixth Norman Earl of Chester, about the year 1180; it runs under a substantial modern house, which was for many years the residence of Mr. Pattison Blance, who was Mayor of Chester in 1770, and is situated between the well known "God's Providence House," and the family mansion of the Leches of Cardon. Its direction is north and south; it had one entrance at the north-west angle, and a door at the opposite extremity seen in the illustration, which apparently at one time communicated with a crypt in Bridge-street, this last was cleared of rubbish in 1839. In the walls are three amulets, one in the south, seen behind the figures, which is smaller than the others, and in it one of the binges remains *in situ*, the others are on the east side, and all are in very good preservation. The dimensions of the crypt are as follows:—Length, 44 ft.; breadth, 22 ft.; and height to the groining, 11 ft. The crypt was used as the Customs' bonded cellar, No. 5, from the time that the Bonding Act came into operation, until the month of February, 1864. It is now occupied by Messrs. Quellyn, Roberts, & Co., wine merchants.

A few doors lower down Watergate-street, there is a small single crypt, of similar construction, also forming part of Messrs. Roberts & Co.'s premises. THOMAS P. IVISON.

GRANDTULLY CASTLE, PERTHSHIRE.

The drawing shows the proposed additions delineated at the request of Mr. Walter Fotheringham, "of that ilk" and of Forfar, N.B., to whom the castle has recently reverted through a very ancient entail.

The castle is intended as the future residence of Lady Stewart, widow of the late owner. It is a very ancient structure, and is believed to be the original of the old castle (Uly-Veolan) referred to by Sir Walter Scott in "Waverley." The tower portion is the old part. The plan, the architects write, "is uninteresting and uninteresting, and merely worked out to conform with the slopes of the ground"; that is their answer to our request for a plan.

INDIAN DECORATIVE DETAIL.

THESE examples of halustrades from Indian buildings are reproduced from the "Jeypore Portfolio of Architectural Details," and are referred to in an article on that publication on another page.

THE HALL OF THE WORSHIPFUL COMPANY OF BRODERERS.

The original building of the Broderers' Company dates back to the tenth century, when it formed part of a monastery; and during the excavations in forming the basement traces of Roman work were found, also pottery and glass of that period, whilst several loads of human bones were removed.

The increased value of land in the City is remarkably shown by the fact that in the year 1291 the site upon which the new Hall stands was bought by a certain William de Herlake

* For preceding views of this series, see *Builder* for Feb. 8 and Feb. 27 last.

and Agnes his wife, in fee simple, for 10 marks. It is now, in all probability, worth 20,000*l.*

The front of the building is of Portland stone and, with the exception of the ground floor story, has been kept plain on account of the narrowness of the street and the height of the building. The lower portion, however, forming the entrance, has been enriched with the arms of the Company, and also of the master and wardens. The lobby is richly treated with Roman mosaic and a moulded frieze with figures representing the ancient art or mystery of embroidery. In the upper part of the building is a large dining-hall capable of accommodating 100 persons, and the necessary offices in connexion therewith. Inasmuch as the Company have now but little use for a hall, the premises have been erected to suit the requirements of Messrs. Morley, the well-known Manchester warehousemen.

The hall was rebuilt from the designs and under the superintendence of the architect of the Company, Mr. H. Huntly-Gordon. The contractor was Mr. D. Charteris, of Westminster. The carving, and also the plaster frieze, were excellently carried out by Mr. Gilbert Seale, and the mosaic by Messrs. Simpson, of St. Martin's-lane.

The drawing from which the illustration has been taken was exhibited in the Royal Academy of 1890.

ST. STEPHEN'S CHURCH SCHOOLS, CANONBURY.

THIS view shows an addition to the old schools attached to St. Stephen's Church, Canonbury.

The new building is planned so that it might be used in conjunction with the old rooms for concerts, entertainments, and for other parochial purposes.

The work throughout is of a plain and simple character. Stock bricks for facing walls have been used both internally and externally. The

interior joinery is stained and varnished. Shortland's ventilating stoves are used for warming purposes.

The freehold site was a gift from the Marquess of Northampton.

The Bishop of Bedford opened the building last year, and expressed his approval of the arrangements generally.

Messrs. McCormick & Sons, of Canonbury, were the builders, and Mr. Arthur Ardron, of London, is the architect.

ARCHITECTURAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

At a meeting of this Association on the 1st inst., a paper was read by Mr. T. W. F. Newton on "Architectural Poetry." In his opening remarks Mr. Newton said that his object was to draw attention to the aid afforded to an architect by the study of the imaginative descriptions of architecture and the kindred arts to be found in English verse, and be wished to point out that the ideas therein contained would often prove of great value to the man who was conversant with the facts and necessities of the works under his control, and could combine the poetry with the practice. Mr. Newton then gave a large number of quotations showing from what widely different points of view the poets have regarded the art of architecture.

GLASGOW ARCHITECTURAL ASSOCIATION.—The annual business meeting of this Association was held on the 1st inst., the President, Mr. William J. Anderson, in the chair. The Committee's report on the past session's work shows that the affairs of the Association are in a satisfactory condition. There is a membership of eighty-nine; the syllabus of essays,

lectures, and visits were carried out with almost no variation; and notwithstanding heavy expenditure in improvements in the rooms, there still remains a balance in hand. The following gentlemen were elected as the office-bearers for the coming session:—Honorary President, Mr. William Forrest Salmon, F.R.I.B.A.; President, Mr. Alexander McGibbon; Vice-president, Mr. Alexander N. Paterson, M.A.; Secretaries, Mr. L. Douglas Penman and Mr. John White; Treasurer, Mr. Andrew Muirhead; Librarian, Mr. George S. Hill; Committee, Mr. William J. Anderson, Mr. Robert J. Gildard, Mr. Andrew Robertson, and Mr. William Watson.

LIVERPOOL ARCHITECTURAL SOCIETY.—At a meeting of this Society held on the 7th inst., in the Royal Institution, Colquitt-street, a paper was read by Mr. Damer Harrison, F.R.C.S., on "Prehistoric Rome." His remarks were illustrated by lantern views, showing the rude artistic efforts of the early Romans. The intelligent interpretation of these, and of the names of places and things, seemed to elucidate much of the early history of the Romans in a way that was novel and attractive.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of this Society was held at the School of Art on Tuesday night. Mr. J. B. Mitchell-Withers presided, in the absence of the President, Mr. Innocent, and Mr. J. A. Gotch, of Kettering, read a paper entitled, "How they Built in Shakspeare's Time." This paper was read before the Architectural Association of London on the 4th inst., and is fully reported on another page.

**THE ARCHITECTURAL ASSOCIATION
SPRING VISITS:**

ST. SAVIOUR'S CHURCH, SOUTHWARK.

The third spring visit of the Association was held on Saturday afternoon, March 5, when, by the kindness of Sir Arthur Blomfield, the works in connexion with the new nave to St. Saviour's, Southwark, and the old building were visited by a large party of members, under the guidance of Mr. F. F. W. Goldsmith, jun., honorary secretary. The removal of the old nave which had disgraced this church for a period of fifty years has been welcomed by all architects, and its place will be taken by a nave of six bays, with side aisles and a south entrance. A small portion of the walls and foundations of the Early English nave has been discovered and carefully incorporated in the new work. The walls are faced on the exterior with flints, and the stone used is Bath, Weldon, and Ancaster. The nave walls and arcade are hardly above the caps of the columns, and consequently little can be seen of the work at present, and comment must, therefore, be reserved. It is to be hoped that the contemplated restoration of the north transept will be proceeded with; the walls are in very bad structural repair, and the interest of the old building does not lie in this quarter. The careful examination of the old choir is always interesting, with its altar-screen erected by Fox, Bishop of Winchester, and its tombs, most notable of which is that of Gower, the poet, who died in 1402. Some interesting burials have taken place in this church. Amongst them Edmund Shakspeare, 1607, brother of the poet; John Fletcher, 1625, who collaborated with Beaumont; and Philip Hemlow, 1615.

* * It has been represented to us on the part of the Architectural Association that critical remarks in some of these reports of visits of the Association have given offence to the owners or architects of buildings, who have supposed them to emanate from the Association, which has been accused of getting permission to visit a building, and then criticising it. To prevent any such misconception, we beg to say that the reports of these visits are made at our request by a contributor who is responsible only to the Editor of this journal, and that the Architectural Association officially has no concern whatever with them.—Ed.

LINLITHGOW PALACE.—A meeting of the Linlithgow Town Council was held on Tuesday night, when, on the motion of Bailie M'Alpine, it was agreed that the whole Council act as a committee to co-operate with the Edinburgh Architectural Society, and any other parties interested in the matter, with the view of inducing the Government to augment the sum which had been voted for the repairs on the Linlithgow Palace.—*Scotsman.*

**DEMONSTRATIONS ON GREEK
SCULPTURE IN THE BRITISH MUSEUM.**

In her fifth lecture,* Miss Eugénie Sellers dealt mainly with the two temples of Artemis at Ephesus. The older temple dates from the sixth century, and was itself no doubt built about some still older shrine, where Artemis was worshipped in her distinctively Asiatic character as a nature goddess. Herodotus says that some of the columns were dedicated to the goddess by Croesus, the truth of which statement has now been proved by the fragments of an inscription to this effect discovered on the moulding at the foot of one of the drums. The drums were separated from the plinth by a deep double moulding, and were surmounted by Ionic columns. It is now clear that the drums were sculptured, for fragments of figures, recalling the type of the figures of the Harpy Tombs, have been found, rough at the back, and moreover convex. This proves the antiquity of this custom; yet, before excavations had established this, Pliny's statement that Skopas sculptured one of the drums of the later temple at Ephesus was discredited on the ground that such a practice belonged to a debased style of art. Numerous fragments have been found of the sculptures of the cornice, which has been wonderfully restored by Mr. Murray. In these Asiatic temples, which were, however, the work of Greek artists, the sculptures are far more lavishly disposed than in Greek temples, being found, as here, on the cornice and the drums, and as on the Nereid monument, and elsewhere on the architrave. This may possibly be due to the greater abundance of means in Asia Minor rather than to any difference of taste.

The second temple at Ephesus was built in the fourth century, on the destruction of the first by fire. Here, again, excavations have brought to light fragments of sculptured drums, in the figures of which, as in the figures of the Mausoleum frieze, we can recognise the characteristics, at any rate, of the style of Skopas. Miss Sellers discussed the subjects of these sculptures, and also, as usual, dealt somewhat fully with the question of technique.

In conclusion, she spoke of the sculptured frieze of the Temple of Athena at Priene, which represents a combat between Greeks and giants. This is the last development of Greek sculptures in relief, and in the rounded figures, and in their excessive activity, we find an affinity with the work of the Pergamene school.

BRITISH ARCHAEOLOGICAL ASSOCIATION.

At the meeting of this Association on the 2nd inst., Mr. J. W. Grover, F.S.A., in the chair, several curious brooches of bronze recently found in the City, in deep excavations, were exhibited by Mr. Macmichael. Mr. T. Blashill described a remarkable mould for casting leaden figures of St. Thomas-a-Becket, discovered beneath the foundations of a building at Hull, by Mr. J. Simons, who, at Mr. Blashill's suggestion, has presented it to the British Museum. Facsimile casts were produced. Mr. Earle Way communicated a notice of the discovery of portions of the palace erected by the Duke of Suffolk in Southwark, to receive his wife, the sister of Henry VIII., and the widow of King Louis. Several fragments of elaborately-moulded terra-cotta have been met with, some of which were produced. A number of crucibles, apparently for making money, have also been found close to the palace in the Mint. A portion of carving, supposed to be from the Church of St. Margaret, Southwark, demolished in the sixteenth century, has also been found on another site. Mr. Oliver exhibited a crucifix in cast-iron, which led to a discussion and the enumeration of the oldest-known examples in this material. The Chairman referred to several fire-backs which were made in the Weald of Sussex early in the seventeenth century for exportation to the Low Countries. A paper was then read by Dr. Fairbank, F.S.A., descriptive of some Roman pottery which was found at Doncaster in 1885, on the erection of the Yorkshire Bank. Among several examples of usual type, a curious grey pottery has been found with peculiar friillings of raised slip laid on to the surface, which has seldom been noticed elsewhere. The second paper, on Braebridge Church, Lincoln, was by Mr. Loftus Brock, F.S.A., who passed in review some objections that have been made to his assertion that the

* For brief notes of the previous lectures, see *Builder*, pp. 141, 164, 184, ante.

two well-known Lincoln churches of St. Peter-at-Gowts, and St. Mary-le-Wigford are of Saxon date. At Braebridge an Early Norman tower occurs added to an Early Saxon church, and he pointed out various technical details common to Norman work which appear in this tower, and which would equally have appeared in the other two were they of Norman date. The comparison of the three churches appears conclusively to confirm the Saxon age of the two first, as well as that of the body of the latter, there being a general resemblance of workmanship.

COMPETITIONS.

THE INSTITUTE "SUGGESTIONS FOR THE CONDUCT OF ARCHITECTURAL COMPETITIONS."—At a special general meeting of the Royal Institute of British Architects on Monday evening last, the amended paper of "Suggestions" having been taken as read, it was resolved "That the principle of the amended Paper of 'Suggestions for the Conduct of Architectural Competitions' be adopted; and that it be left to the Council to issue the same as an Institute Paper, after due consideration of the suggestions made at that Meeting."

NEW GENERAL HOSPITAL, BIRMINGHAM.—A meeting of the General Committee for the new General Hospital, Birmingham, was held on the 8th inst., in the Reception Room of the Council House, Birmingham, to receive the adjudication of the Building Committee and their assessor, Mr. Alfred Waterhouse, R.A., on the competitive designs sent in for the new hospital. The Building Committee recommended that the first premium of 150*l.* should be awarded to the architect of the plans numbered "1," the second premium of 100*l.* to the architect of plans "No. 2," and the third premium of 50*l.* to the architect of plans "No. 6 B." The recommendation having been moved and seconded, was agreed to. The envelopes containing the names of the three prize winners were then opened, and it transpired that the first premiated design was by Mr. W. Henman, of Birmingham; the second design that of Messrs. Worthington & Elgood, of Manchester; and the third design that of Mr. F. Barlow Osborn, of Birmingham.

NORTHFLEET CEMETERY CHAPELS.—Fourteen designs were received by the Local Board for these buildings, and at a meeting on Tuesday last the plans of Mr. J. T. Walford were accepted.

**ARCHITECTS' BENEVOLENT SOCIETY:
ANNUAL MEETING.**

The annual meeting of this Society was held in the Council-Room of the Royal Institute of British Architects, Conduit-street, on Tuesday afternoon last, Mr. J. Mavcivar Anderson, President, in the chair.

The minutes of the last annual meeting having been read and confirmed, Mr. H. B. Verity, the Assistant-Secretary, then read the annual report, which was as follows:—

"Gentlemen,—Your Council are gratified at being able to again congratulate you upon the satisfactory condition of the Society. As in the previous year, the invested capital has been increased during the year 1891, although your Council regret to state that the subscribers have not increased in the number which might have been anticipated. Fortunately, the demands upon the funds have not been so great, the number of applicants being less than that in the two previous years. It cannot be expected, however, that the demands on the funds will in future years diminish, and substantial and continuous additions to the list of subscribers is most desirable. The 'Red Book' is sent to every new member of the Institute, and it is to be hoped that as the members of that body increase in number the subscribers to the Society may increase in at the least a like ratio.

During the past twelve months seven meetings have been held by your Council; three pensions of 2*l.* each have been paid; and 539*l.* have been distributed among twenty-two persons. The number of persons who have received grants is less than in some previous years, but the benefit afforded has not decreased. In several instances permanent good has been effected by timely and substantial grants to architects and architects' assistants; and thus the hope expressed by your Council in the last Annual Report, "to be the better able to assist those to whom aid will be of permanent service, and to more effectually relieve temporary embarrassment," has been fulfilled. It is, therefore, hoped that members of the profession not subscribers will,

realising the good done by the Society, show recognition of it in a practical form.

The subscriptions received in 1891 amounted to 313*l.* 17*s.*, as against 317*l.* received in 1890; while the donations show an increase of 27*l.*, being 57*l.*, as against 30*l.* received during the previous year. Among the contributors of donations were:—Mr. William Emerson, Mr. W. Milford Teulon (Leamington), Mr. H. C. Boyes, Mr. Robert Sawyer, Mr. R. Reynolds Rowe (Cambridge), and the Leicester and Leicestershire Society of Architects. The Worshipful Company of Carpenters have become subscribers of twenty guineas, while the Architectural Association and the Royal Institute of the Architects of Ireland continue their subscriptions of ten guineas and three guineas respectively.

With reference to the capital of the Society, your Council have the satisfaction to state that they were enabled in December last to invest 320*l.* 12*s.* 6*d.* in the purchase of Caledonian Railway 4 per cent. Debenture Stock, making the total capital of the Society 8,212*l.* 6*s.*, namely, invested in Stocks (at cost price), 8,194*l.* 2*s.* 1*d.*, and cash 18*l.* 3*s.* 8*d.*

The Income Account and Balance-sheet for the year ended December 31, 1891, duly audited by Mr. Fred. W. Hunt and Mr. George Judge, are herewith submitted.

Your Council regret to have to record the deaths of Mr. Thomas Verity, a Member of the Council, who had been a generous subscriber since 1881; Mr. T. Sarancke Archer; Mr. P. C. Hardwick, F.S.A., a subscriber since 1871; and Mr. Harry Oliver, a contributor to the Society for forty-one years, who served on the Council from 1874 to 1877.

Professor T. Hayter Lewis, F.S.A., who held office as Hon. Treasurer from 1885 to 1889, resigns his seat on the Council to the regret of his colleagues, and the following gentlemen retire by rotation,—namely, Mr. Samuel Hill, Mr. Reginald St. A. Rounieu, Mr. George Soamell, F.G.S., and Mr. Lewis Solomon. To fill these vacancies and that caused by the decease of Mr. Thomas Verity, your Council have the pleasure to nominate Mr. H. H. Collins, Mr. Thomas Harris, Mr. W. Hilton Nash, Mr. J. G. Finch Noyes, Mr. Andrew Oliver, Mr. C. J. Shoppee, all of whom have consented to serve if elected.

Your Council cannot conclude without again urging the claims of the Society upon the profession generally, and in particular upon the members of the Institute,—to all of whom, whether contributors or not, the "Red Book" containing this Report, the By-laws, and list of contributors, &c., will be forwarded as soon as practicable.

The income account and balance-sheet, audited by Mr. George Judge and Mr. F. W. Hunt, were also read. From these we learn that during the year ended December 31 last, 60*l.* was paid to three pensioners, and 339*l.* was expended in grants to applicants for help. The expenses of management, including printing, advertising, Assistant Secretary's salary, &c., amounted to 522*l.* 9*s.* 6*d.*, 200*l.* had been transferred to capital account, and a balance of 467*l.* 6*s.* 11*d.* was carried forward to the current year's account.

The receipts for the year, including 138*l.* 9*s.* 9*d.* brought forward from last account, amounted to 697*l.* 16*s.* 5*d.*, including 245*l.* 9*s.* 8*d.* dividends on stock, and 313*l.* 17*s.* for subscriptions. The Chairman, in moving the adoption of the report and balance-sheet, said things were so far satisfactory that they had been able to add to their capital account to a certain extent, but he regretted to say that that was not due to any increase in receipts, but to the fact that no great demand had been made upon the funds during the past year. He thought it was a very unsatisfactory reflection that there were so few subscribers,—only about 225. The Institute itself numbered between 1,300 and 1,400 members; and then there were the architects unhappily outside the Institute, who might fairly be expected to subscribe, seeing that the benefits of the Society were not restricted to those who were members of the Institute. He thought that the limited number of subscribers to the Society was discreditable to the profession as a body.

Mr. George Soamell seconded the motion, which was agreed to.

Mr. Wyatt Papworth moved a vote of thanks to the outgoing members of the Council, and expressed regret at the retirement of Professor Hayter Lewis, owing to ill-health.

The motion was seconded by Mr. John Hebb, and agreed to.

On the motion of the President, seconded by Mr. Soamell, Messrs. H. H. Collins, Thomas Harris, W. Hilton Nash, J. G. Finch Noyes, Andrew Oliver, and C. J. Shoppee were elected to supply the six vacancies on the Council.

Mr. Arthur Cates was re-elected Treasurer, Messrs. Percival Currey and John Hebb were elected Auditors, and Mr. William H. White was re-elected Hon. Sec. During the proceedings, the Treasurer and one of the auditors spoke

highly of the way in which the accounts were kept by the Assistant Secretary, Mr. Verity.

Votes of thanks were given to the retiring Auditors, to the Institute for the use of its rooms, and to the Chairman, and the meeting terminated.

Books.

Murray's Handbook for India and Ceylon. London: John Murray. 1891.

AS early as 1859 Murray began to extend the sway of his handbooks over the Land of Ind. In that year two volumes appeared,—one for Madras and the other for Bombay. These were followed by two more, for Bengal and the Punjab; making four volumes in all for India. The handbook just published is an effort to produce a guide-book for the whole of India, and Ceylon in one volume. To accomplish this the work has been re-written, and the four volumes condensed into the size of one of the previous four handbooks. The author's name is given in the early edition as Edward B. Eastwick; and although no name appears in the new edition, it is understood to be the work of the same writer, who is a high authority on the languages and literature of India. He has evidently bestowed great care in producing the present handbook, and he acknowledges the assistance he has received from men qualified to give information, including Dr. Burgess, who has had ample means of making himself acquainted with the architecture of India; to this it may be added that all the proofs have passed through the hands of Professor Forrest, of Calcutta.

In compressing four volumes into one, it need scarcely be stated that much had to be left out; but we have the peculiar fact to record that the references to architectural remains have undergone the least curtailment, and in many cases extensive additions to these have been made. This results from the accumulation of knowledge since the early edition appeared. In 1859 the Archaeological Survey Department did not exist. It was only in 1871 that the first volume of "Reports" was published, and under Sir Alexander Cunningham's direction twenty-two volumes have been given forth. There are also the reports of the work of Dr. Burgess in the Bombay Presidency; while Madras has also something to show regarding the archaeology of that Presidency. The valuable material of all these labours has been freely used in compiling this new handbook, and this will account for the great accuracy it shows in treating of the various periods and styles of architecture to be found in Hindostan. This merit, unfortunately for the critic, leaves him but a limited opportunity for exhibiting what he may suppose to be his superior knowledge.

The new handbook would have rejoiced the heart of Mr. Ferguson, had he been living now to see it. His constant grumble was that so few persons cared for Indian architecture; he often said that "there are not above half-a-dozen persons in England who know anything about it, or who take the slightest interest in the subject." The early edition gives a very long list of books,—to be perused by the traveller before starting"; but there is not an architectural one among them. The new handbook says that to enjoy the journey through India in an intelligent manner, books of reference are necessary—and the first among those recommended is Ferguson's "History of Indian and Eastern Architecture"; this is followed by Burgess's "Archaeological Survey of Western India." Here, a great change is manifest. The large numbers who now go every winter to India, prepared for the journey with such books in their portmanteaus, will have the architecture of India forced on their notice: and it may be presumed that many will be attracted and led to study the subject.

In the introductory information there is a list of useful words, with their meaning and etymology; here again the architectural tendency is also apparent in some of the words given, as many of them are necessary in the study of ancient remains. The author frequently, in reference to Indian temples, uses the word "pagoda." This appears quaint and old-fashioned in the present day to those accustomed to the modern literature of Indian archaeology. Although not a Chinese term, it is still applied to the peculiar towers of China. The explanation of this term given in the list

of words is from the Persian, *but-kadah*, "an idol temple." This explanation has been usually accepted, but Sir Henry Yule, in his "Glossary of Anglo-Indian Words and Phrases,"—one of the books recommended in the handbook,—gives a long notice of this word, but he inclines to a derivation from *bhagavat*, or *bhagwati*. *Dagoba* is given as derived from *doh*, "the hody," and *gop*, "to hide." The usual form of the last syllable has been understood as from *garbha*, a "matrix," or "receptacle," for containing a relic. A Chaitiya is the same as a *Dagoba*, only that in some cases the first was commemorative, and did not at all times contain a relic. The handbook defines this word as "a hall of assembly," which is very wide of the sense given by it by archaeological writers. The Buddhist rock-cut temples that have a Chaitiya in them, have been at times described as "halls of assembly"; but this is doubtful, as it would imply a congregational worship; while the plan of these caves would lead to the supposition that the worshippers walked along the left-hand aisle, went round the Chaitiya at the end, and passed out again by the other aisle,—thus making a *pradakshina*, or circumambulation, of the Chaitiya, as if it were the altar of the Temple.

As the architectural remains of India seem now to be among the principal attractions of the traveller, the introductory information would become much more useful if it contained a section, even a short one, giving a list of the principal styles, with approximate dates. A description of the parts of a temple would also be useful; such distinctive features as those which belong to the northern and southern styles, or the Buddhist and Brahminical, would be valuable for a traveller to understand, and it would tend to increase his interest in the subject.

In former times Central India and Rajpntana were out of the route of travellers; now the railway has opened them up. There is a station at Ehlisa, from which the Sanchi Stupa can be easily visited. There is also a station at Chitor, which used to be known as "Chittorogah,"—a place no one interested in Indian architecture should fail to see. The old Jain Tower of Sri Alal would itself repay a visit to that city of ruins. The account given,—considering the space at the author's disposal,—of the Mohammedan architecture of Delhi and Agra will be found to be a very good guide to these two localities. As might be expected, the Taj Mahal at Agra is praised far beyond its real merits, and here the handbook fails in being up to the latest knowledge by expressing a doubt as to who was the principal architect of this monument. Judge Keene has brought forward the authority of a work published in Rome in 1653, written by an Eremitic monk, named P. Maestro Fra Sebastian Manrique, who was in Agra before the Taj was finished,—that was in 1640,—and this author states that the architect "was a Venetian named Gerónimo Veroneo, who came to India with the ships of the Portuguese, and who died in the city of Lahore a little before my arrival." Manrique gives some details about his will, and the "various models of very fine architecture" which he produced for Shah Jehan to select from, and that the Emperor was,—according to his barbarous and arrogant pride,—dissatisfied with the "modesty" of the estimates. Shah Jehan ordered three krorrs of rupees to be spent, and when this "wonderful sum" was finished the architect was to ask for more. Three krorrs would be equal to three millions sterling; but the handbook, while giving one estimate close on this sum, quotes another account which gives 18,465,186*l.*—or little more than the half of the first. The handbook states that 30 lakhs, or 300,000*l.* was paid to the masons. The piercing of the marble, and fitting in of the precious stones which form the ornament, must have been a work of much time, but unless the Emperor's magnificence, described above as his "arrogant pride," had been imposed upon, it would be natural to suppose that these reputed sums have been largely exaggerated.

I Tesori Sotterranei dell' Italia: Parte Quarta. PROF. GIUGLIEMMO JERVIS. Turin: Ermano Loescher.

The fourth and concluding part of this painstaking work certainly deserves its second title: "a repository of useful information." It deals with the economical geology of Italy, and forms a goodly volume, crammed with statistics of Italian quarries, marbles, and building-stones, with introductions, indices and tables

that (with one exception) are substantially complete. The whole of Italy and its islands is included, and is systematically noticed by provinces and districts. Much information of interest and value is incidentally gathered in accessible form,—particularly as regards the materials used for both ancient and modern buildings and works of art; many of these are illustrated. Prof. Jervis, who, if we mistake not, is of English extraction, is Curator of the Royal Industrial Museum at Turin. An accomplished geologist, he is evidently well qualified for the task, on which, we learn, he has laboured over five and thirty years. The work is well done. Its literary style is simple and direct; there is a commendable absence of "fine writing," though this lacks in foot-notes, and fairly breaks out in the introduction. The printing is excellent; the abundant illustrations are generally good,—sometimes very good indeed. On the whole, the book is welcome, with a welcome that is partly relief; one cannot be too thankful when laborious years of compiling and condensing are found congenial by someone else.

The bulk of the volume is naturally somewhat of a catalogue. The notices of more special places, however, amount to brief but valuable monographs. Thus, to Massa and Carrara nearly thirty pages are devoted, between sixty and seventy different quarries being mentioned by name, with statistics as to the different marbles, their density, weathering qualities, &c. There are woodcuts illustrative of the district and of famous works of art in Carrara marble, from a Roman bas-relief and altar to the Moses of Michelangelo, and the modern monument dedicated to Cavour at Turin. There are geological notices of the Apuan Alps and the Carrara marble beds, and historical notices of the quarrying in ancient and modern times. There is thus much interesting reading besides the dry bones of statistics. The geology is quite modern and up to date, the labours of Gerlach and Gastaldi being the basis of the author's notes. Prof. Jervis, with quite excusable complacency, points out that he has not hesitated to revise his own published opinions as to the origin of the crystalline metamorphic rocks. At the same time the revision is too sweeping. No geologist now will hesitate to accept the Apuan marbles as "stratified sedimentary rock of marine origin, a compact limestone metamorphosed"; but it is an unnecessary revision against the nitro-plutonism of former geologists to attribute the metamorphosis solely to "simple but extremely slow chemical action under enormous pressure." Heat, also, must have been a potent factor, for the limestone is practically cooked. Instances all over the world are numerous, and we need not go further than Scotland to find marbles of precisely similar derivation. The author is also not quite correct in his note on the origin of serpentine. Dr. Sterry Hunt is probably alone in maintaining it to be an original, but not an eruptive rock; the consensus of opinion is practically unanimous that it is a metamorphic product (of an olivine-bearing eruptive rock). One reads, too, with surprise that the bad weathering of some of the white crystalline marbles is due to carbonate of magnesia. The reverse is the accepted belief; but Prof. Jervis considers the carbonate of magnesia to be isomorphic only, not isodynamic with the carbonate of lime, and tending, therefore, to separate out.

To architects and archaeologists the frequent references to actual buildings and works of art, both ancient, mediæval, and modern, will be a most interesting feature of the work. It is of great importance to have an authoritative statement as to the materials used for these and their origin, such as Prof. Jervis is able frequently to give. These notes are full of varied interest. Under "Carrara," for instance, we are taken to the ancient walls of the Etruscan Luna, and are reminded of Michelangelo's personal visits to the quarries for the blocks out of which he created the David, the Moses, and the Tombs of the Medici. On another side, the author's remark is to be noted that the price of marble might be reduced one-third, and the output increased tenfold, were the industry not practically a monopoly. One learns, too, that "Sicilian marble" is the singular name given in England to the products of two Carrara quarries. The whole book is full of these most interesting notes, of which a single further specimen must suffice. Under "Verona" we find a paragraph on the famous amphitheatre (a building second only to the Colosseum), which affords very striking

evidence of the fate of these grand remains during many centuries. A disastrous earthquake, felt through most of Europe, shattered the external arcading in 793, and from the dislocated stones was derived the material not only for the walls of the city, but for many private dwellings. Still worse was the fate of the theatre, which fell in part in 895, killing forty persons. Thereupon, yielding to the prayers of the bishop and clergy and people (for once in harmony), the King Berengarius ordained its destruction. His quaint decree is given in extract, and is a very striking commentary on Mediæval respect for antiquity. By it any one who presumed to interfere in any way whatever with the "undertaking" was to be mulcted in twenty pounds of gold, refined and pure, so that every man might wreak his own sweet will upon the ruins, and without let or hindrance conduct to and the work he had begun. Truly, history has no need of either Goth or Vandal; time and again it seems the bridges of Verona have been rebuilt out of these two Roman works.

The whole of this side of the book is so interesting and useful that it might be with advantage extended and made much more complete. It is disappointing to have no single building in Verice thus identified with its original materials. The task, with collaboration, is possible, and would result in a standard work for the archaeologist and architect. In any case, the want of an index to such buildings as are mentioned is greatly felt. It is the one serious omission to be noted, and should certainly be rectified when a new edition of the book is called for.

It is a pity that its Introduction should mar this useful book. Not only are we harassed by "fine writing" and much architectural nonsense; we are launched, without profit, into controversy which is absurdly out of place. The author's sweeping division of architectural history into three periods of 1,000 years each corresponds to nothing substantially true in either nature or art. The Temple of Jerusalem was not one of the "seven wonders of the world" of antiquity, though scarcely two writers agreed as to what these seven (?) wonders were. To discuss with conviction the bricks of which the Tower of Babel was built is fatuous; as well might we canvass the building stones of the Palace of Priam. Two pages after the Tower of Babel we are bewildered by a heated attack upon evolution, in which modern pathology is cited in refutation of Darwin. There is no need to follow Professor Jervis into this; but most readers will learn with surprise that the Darwinian theory is "hasty, grotesque, ill-founded," and "dishonouring to man"; also that, "once admitted, it robs palæontological studies utterly of all their worth." The reason of it all is not apparent, but the "Index Expurgatorius" still exists at the Vatican; and from references, dragged in, to Holy Writ, one is tempted to ascribe it to the exigencies, not of science, but of creed. The learned Professor may or may not be in a position to consign the Darwinian theory to the limbo of unscientific extravagance, but in any case he should attempt the task elsewhere.

(1) *Two Hieroglyphic Papyri from Tanis*; (2) *The Mound of the Jew and the City of Onias, &c.*, by E. NAVILLE; and *The Antiquities of Tell-el-Yahûdiyeh*, by F. LI. GRIFFITH; (3) *Bubastis*, by EDOUARD NAVILLE; being an Extra and the Seventh and Eighth Memoirs of the Egypt Exploration Fund. London: 1889, 1890, 1891.

THE publication from time to time of these excellent memoirs is in itself ample justification for the existence and support of the Egypt Exploration Fund. With plans, sections, photographic reproductions, and numerous plates of objects and hieroglyphic and other texts, it is possible to follow closely the results of the excavations, and to consider at leisure the many problems they suggest. Since, also, many important objects found during the excavations have been sent to this country and deposited in the British Museum, the study of them is greatly facilitated.

The first of the volumes under notice, an extra memoir issued for 1889, treats of two hieroglyphic papyri, found by Mr. Petrie at Tanis. One of these, a sign papyrus, described by Mr. F. LI. Griffith, is the first native list of hieroglyphics that has come down to us from ancient times, and, though disappointing in some respects, is of great interest as being

"the only document bearing upon the system by which the Egyptians arranged and taught their huge syllabary." It appears to be of Roman date. The other papyrus is a sort of religious Gazetteer or Kalender.

The seventh memoir issued by the Fund gives an account by M. Naville and Mr. Griffith of the discoveries at Tell-el-Yahûdiyeh. This place is already well known from the enamelled tiles, &c., found there by Brugsch Bey in 1870, believed to be the wall ornaments of a beautiful chamber built for Rameses III. The re-examination of Tell-el-Yahûdiyeh was undertaken by M. Naville in the hope of finding proof of its identity with Heliopolis, but in this he was disappointed. From other evidence M. Naville concludes that the place was known in the time of Rameses III., as "the house of Ba on the north of On," but its civil name has not yet been recovered. It subsequently became a Jewish settlement called Onion, or the City of Onias, and under the Romans was called in official documents *Sceno Veteranorum*. The varied and numerous antiquities found are carefully described by Mr. Griffith, who prefaces his notice with some carefully-considered and useful remarks on antiquarian research in Egypt generally. This memoir also contains brief notices of some other sites visited by M. Naville and Mr. Griffith, and is illustrated by a carefully-drawn series of plates.

The Eighth Memoir of the Fund deals solely with the important excavations made by M. Naville in 1887-89 at Bubastis. Of the famous sanctuary on this site described by Herodotus all that now remains is an enormous number of granite blocks (for all the limestone has been carried away), strewn in the most hopeless fashion over an area about 500 ft. long and nearly 200 ft. wide. These represent the ruins of a great temple, comprising: (1) an entrance hall, 80 ft. long and 160 ft. wide; (2) the great "festival hall," 80 ft. long and 130 ft. wide; (3) a magnificent colonnade or hypostyle hall, 190 ft. long, and perhaps nearly 80 ft. wide, that led to (4) the great hall of Nekhtothore, 160 ft. square. All is now so completely destroyed that the explorers found it difficult ever to reconstruct the plan from what is left. The oldest temple at Bubastis is believed, from inscriptions bearing their names, to have been built by two kings of the fourth dynasty, Cheops and Chefnu, the constructors of the two great pyramids. This early temple M. Naville thinks remained unaltered until the time of Useresen III., of the twelfth dynasty (whose architraves bore inscriptions with signs over 2 ft. high), to whom is ascribed the addition of the great hypostyle hall to the west of the two first halls of Cheops and Chefnu. The great hall beyond this was not built until the thirtieth dynasty by Nekhtothore. Of the repeated alterations, &c., made by successive kings and dynasties, disclosed by the erased and snipped inscriptions, and re-use of older buildings, it is not necessary to write here. Nor can we discuss M. Naville's conclusions, which are not generally accepted by experts, as to the relative dates of many of the more important monuments found. Among other discoveries, we note with interest that of the remains of painting on statues, even when carved in black granite, and the finding of a carved head-dress that must have belonged to a colossal figure, made seemingly in separate pieces, and over 20 ft. high. The memoir is profusely illustrated by more than fifty fine plates, mostly photographic reproductions of sculptured fragments and hieroglyphics. These are, however, not always as valuable as they might be, owing to the absence of a scale. There is nothing to show, for instance, whether the fine head in the frontispiece (now in the British Museum) is there given full-size or reduced, and even the rough ground-plan on plate III. is utterly devoid of a scale. The simple expedient of setting up a rod, divided according to some standard English or French measure, by the side of the object while being photographed, would give an approximate scale sufficient for all general purposes.

Mélanges d'Archéologie et d'Épigraphie. Par ALBERT DUMONT. Réunis par TH. HOMOLLE et précédés d'une notice sur Albert Dumont. Par L. HENZEL, avec seize planches, &c. Paris: Ernest Thorin. 1892.

THIS book is frankly a memorial volume, and, as such, addresses itself primarily to M. Dumont's large circle of archaeological friends. Most of the papers, and, if our memory serves

all the plates have appeared before—mainly in the *Bulletin de Correspondance Hellénique*, to which M. Dumont so largely contributed. It is, however, convenient to have these monographs united in one volume. They are very various, both in subject and merit. The largest and every way most important is that in the "monuments and inscriptions of Thrace," which embodies the observations made personally by M. Dumont in a tour made through Thrace in 1868. This, together with No. xxiv., contains not only a catalogue of existing monuments, but a very complete discussion of their value in relation to ethnology, history, mythology, and art. It seems a pity to print along side with these valuable and original papers early essays on archaeology like that on the "Banquet Funéraire," which is now completely out of date, simply because, "l'auteur l'aime comme son premier travail archéologique."

Milling-machines and Processes; a Practical Treatise on Shaping Metals by Rotary Cutters.
By PAUL N. HASLACK. London: Crosby Lockwood & Son.

This is a large book to be written on a single description of machine tool, and, to an engineer out of touch with the recent development of workshop practice, it might reasonably seem altogether too voluminous for the importance of its subject. Those, however, who are acquainted with the working of the best-managed metal-working establishments in the country will recognise that Mr. Hasluck has chosen for his theme the most important development in engineering machinery which has taken place since the planing-machine reduced so greatly the laborious, uncertain, and costly processes of chipping and filing. The lathe will still hold its own as the chief machine tool, but its supremacy will be, perhaps, to some extent, due to precedence of invention; for were the two tools now to be for the first time invented simultaneously, the supporters of the milling-machine would have a strong case. A universal milling-machine can do the work of the planing-machine, shaping-machine, or slotting-machine, and can often be used with advantage in place of the lathe itself. Its chief drawback is its want of range, especially in surfacing long parts. In order to meet this, milling-machines have been devised of the same general design as the ordinary planer. It would, perhaps, be fairer to call these planing-machines, having a milling-cutter,—for we do not see why a tool which produces a plane surface should not be called a planing-machine, even though it work with a rotary cutter. It is true popular usage is opposed to this view, "planing" generally being understood to mean a ploughing or scraping action.

Mr. Hasluck with great industry has collected the particulars of a large number of milling-machines of various types. The book is profusely illustrated; the majority of the blocks, to judge by their appearance, being taken from the most authentic and cheapest source, *i.e.*, the manufacturers' catalogue. The plan has its drawbacks. The author exclaims against the weak construction of milling-machines, and rightly attributes to this fault the idea, that was for a long time prevalent, that milling was only suitable for light cutting. Probably this view was chiefly due to the fact that our milling practice largely came to us from America. In the United States many designers are terribly afraid of putting plenty of metal in machine standards and framing. They exclaim against the clumsy appearance of British machinery, and pride themselves on their own lighter constructions, made possible by the superior cast-iron which they use. There is no doubt that American iron foundry practice is very good, in some respects in advance of that of this country, but there is something required beyond strength of material to give the great necessary virtue of a machine tool,—steadiness. No doubt ill-disposed masses of metal may detract from, rather than add to, steadiness, and in this respect some of the older designs of British machinery were often very faulty. Again, it is needless to make the foundations and framing rigid if the cutter and the work are not well held and supported; and here again there has been great improvement of late years in this country, more especially in the design of milling-machines. British engineers owe much to the example of United States manufacturers, but it is well they have not followed the American craze for extreme lightness, which alike offends the eye and detracts from efficiency. It

is satisfactory to note that the best designs of both countries are now very similar in essential particulars; and doubtless engineers on both sides of the Atlantic have profited by an interchange of ideas.

The author's remarks which touch on the craze for universality in milling-machines are good. The milling-machine shows to greatest advantage in special repeat work, where a large number of similar parts have to be turned out.

The chapter which is devoted to examples of milling work is of interest, and well illustrated by useful sketches. After this we come to the section in which the various types of milling-machines are shown. We begin with examples of treadle-machines, a class of tool for which, we should imagine, there is but little demand. After other examples of small machines we come to some of the large universal machines. In the chapter on attachments for milling-machines various kinds of chucks, vices, slides, &c., are illustrated and described. Another chapter is devoted to cutter-grinders, and the final chapter has the suggestive heading of "speed, feed, stiffness, and chatter." On the whole the book is a useful production, and should prove of benefit to those seeking information on the subject.

Wilson W. Phipson: A Memoir. London: G. Chard, 1892.

This is a short memoir of the distinguished heating and ventilating engineer whom we recently lost, chiefly interesting from the sketch it gives of the genial personal character of Mr. Phipson, who had far more accomplishments, social and artistic, than were suspected by many who only knew him in his professional capacity.

The Year's Art, 1892. Compiled by MARCUS B. HUISE, LL.B. London: Virtue & Co., 1892.

This useful annual epitome of matters relating to art and exhibitions is continued with its usual completeness. Among the new matter added is a list of pictures purchased under the Chantrey bequest since its foundation; instructions to artists under the new American Copyright Law, and information respecting the Art Department of the Chicago Exhibition. The volume contains, as usual, a series of small reproductions from leading pictures of the year; and there is also a complete series of portraits of the members of the Royal Institute of Painters in Water Colours.

The Clifton and Bristol Pictorial. Bristol: W. F. Mack.

This is an illustrated account of the principal views and buildings about Clifton and Bristol, in which the illustrations, reproduced from photographs, are very well done, and superior to those of most guide-books of the kind.

Correspondence.

To the Editor of THE BUILDER.

COKE-BREEZE CONCRETE.

SIR,—In reference to the recent correspondence in your columns, I can confirm Mr. Potter's opinion as to the suitability of coke-breeze for concrete,—of course, for certain purposes.

I have used it for the last twenty-four years. The object in using it principally is on account of its lightness; for landings, stairs, floors, balconies on cantilevers, and for many other things too numerous to mention, it is invaluable. I have known shingle concrete to be ganged precisely the same as coke-breeze, and placed in a similar position, to crack, while the coke-breeze has stood without the slightest indication of failure. The shaking of a building, the deflection of a girder, or the slight settling of a wall, in many cases have proved fatal to a shingle concrete. Coke-breeze is more elastic, therefore it has a better chance of holding its own.

I should advise "Survivor" to have the concrete for ground floors as follows:—6 parts of coke-breeze to 1 of Portland cement; be careful that it is thoroughly incorporated, and be sure not to use too much water; $\frac{1}{2}$ in. in thickness is sufficient. Let the concrete have a chance to dry on the surface, or your boards will swell. All concrete exposed to the sun should be kept damp for a few days; when under cover it is a mistake.

Do not trust the covering over of 14 ft. by 13 ft. with 5 in. or 6 in. of concrete of any description. Introduce a 5-in. rolled-iron joist the 14 ft. way, and then two smaller ones at equal distances on each

side, all thoroughly secured into the walls. Use five parts coke-breeze and one of Portland cement for the concrete. There should always be a recess left in the walls, if only 1 in. deep, for the concrete to rest on.

The great secret is in gently tapping the concrete with a broad-bottomed wood punner till the whole is brought up to a level surface.

I have just completed a theatre under an eminent London architect. All the landings and stairs are of coke-breeze concrete, and although only completed eight or nine days before the opening, and with a tremendous rush, of course, the stairs and landings were loaded, but not the slightest sign of any defect is to be seen. CONTRACTOR.

VALUATION.

SIR,—Would any of your readers kindly state if an appraiser's licence is required by any one who values property for a building society? The valuation would be to secure the society from advancing money to a greater extent than the property would be worth.

I am informed by a trading London auctioneer that any one who makes a valuation of any sort, for which he is to be paid, ought to have an appraiser's licence; that many architects are in the habit of making valuations for mortgage and other purposes without a licence, and that if the authorities could only detect them, they would prosecute, and the parties would be fined.

I understand that if a valuation is made for the information of one party only, the valuation need not be stamped.

I should feel grateful for any information on this subject. ARCHITECT.

BRICKWORK.

SIR,—Why do London architects in their quantities reduce the item of brick walls to the rod of 272 superficial feet of a brick and a-half thick, whereas in the Northern counties the same item is reduced to superficial yards of a brick length thick?

If a builder in those parts receives London quantities, he reduces the rods of a brick and a-half into yards of a brick thick, because it is comparatively easy to ascertain the number of bricks in a yard, and the price of the same, to a rod. In the first place, all the separate items of walls, in taking out the quantities, are brought into superficial feet of one brick and then added up, which, divided by nine, gives the number of yards, and the thing is done, instead of the loss of time entailed in bringing the same into the standard rod. Surely, in these days of technical instruction and shortening up of Trade Guilds this antiquated standard will go the way of the unfitest.

To ascertain the number of bricks in a superficial yard there are several ways; perhaps the better way, if a builder has built work with the same kind of bricks as those proposed to be used, is to measure four bricks long and ten courses high as set (which) would contain eighty bricks, and they occupy with a pare the proportion of space 'twixt bricks and a-half superficial yard. Or go to the brickyard and lay down four bricks long with joint-space between, and measure the length, then pile them up and measure the height, and allow 1 in. for joints. Suppose the above thirty-two bricks measure 38 in. long by 13 in. high, equals 494 in., a superficial yard contains 1,296 in., it then becomes a simple rule-of-three sum, multiply 1,296 by 24, and divide by 494, three sum, multiply 1,296 by 24, and divide by 494, gives, say, 84 bricks to the yard. Or it may be that only one brick is sent as a sample to calculate why, say it measures 9 in. by 3 in., allowing for one joint and bed, which equals 31 in. as nearly as possible, then 1,296 divided by 31 equals 42 nearly for half brick, or 84 for one brick thick.

To ascertain the price of the bricks in a yard of one brick thick is again a simple rule-of-three (depending always, of course, on the size and price of the bricks). Supposing the bricks are 25s. per thousand, and 84 in the yard super, then 25s. multiplied by 84 and divided by 1,000, equal 2s. 11d. per yard for the bricks. WARRINGTON. ROBERT JONES.

HALIFAX ARTISANS' DWELLINGS COMPETITION.

SIR,—As a matter of interest to the profession in general, as showing the value put upon architect services by the Sanitary Committee of the Borough of Halifax, I beg to draw the attention of your readers to the conditions of this competition, just advertised.

The competition is for two large blocks of artisans' dwellings, one on a site about 190 ft. by 100 ft., and the other on an irregularly-shaped piece of ground of 2,960 yards superficial area, and averaging about 24 ft. by 150 ft.

The following extracts from the printed conditions will, I think, speak for themselves, and need no comment:—

"Clause 3. The designs of competitors must be exhibited by plans, elevations, and sections drawn to a scale of 8 ft. to an inch (except the block plan), and consist of the following drawings:—

Block plan (6 ft. to an inch), showing system of drainage, with all gullies, traps, inspection holes, sewer ventilation, &c., indicated by brown lines thereon.

* The italics throughout are our own.—ED.

Cellar plan, ground plan, roof plan, and plans of each floor where more than one is intended.

Elevations of every frontage.
Sections as may be necessary, and on such lines as may best show the general internal arrangements.

Clause 6.—All the drawings must be made upon sheets of plain white drawing-paper, without borders, and mounted on plain white stretchers of one uniform size of 4 ft. by 3 ft. As many drawings as conveniently possible to be placed on each stretcher. No framed or glazed drawing will be received.

10.—The Committee reserve to themselves the right to reject the whole or any of the designs, should they be considered unsuitable. The selected designs will only be accepted subject to a *bona-fide* tender from a reliable contractor or contractors being obtained for carrying out the work within the estimated sum so arrived at by the author thereof.

11. The Committee offer two premiums of 30*l.* and 20*l.* respectively, which will be paid to the authors of the design, which, fully complying with all the conditions and instructions herein set forth, shall in their opinion be considered as first and second in order of merit. The two premium designs will remain in the exclusive property of the Committee, who will make their own arrangements as to carrying out the erection of the building.

The stipulation in Clause 6 as to "no framed and glazed drawing" being received is distinctly amusing, and indicates a grim sense of humour in certain members of the Committee.

It would be interesting to know how many members of the profession intend to make a bold bid for fame and fortune by submitting designs.

A NON-COMPETITOR.

"THE LATE STRIKE STILL SMOULDERING."

STR.—The two "blacklegs" your correspondent, "Bench," refers to have a perfect right to work where they can. The men also have a right to object to work with them. The employers equally have the right to employ anyone they choose.

There you have three opposing interests,—first, individual selfishness; secondly, combination, sinking selfishness for the advancement of all; thirdly, capitalism, whose object is to encourage the former at the expense of the latter. These varying interests are inevitable under the present system of production.

As Adam Smith observes in his "Wealth of Nations":—

"Masters are always and everywhere in a sort of tacit but constant and uniform combination not to raise wages above the actual rate. To violate this combination is everywhere a most unpopular action, and a sort of reproach to a master among his neighbours and equals."

That being so, and modern events show it is as true to-day as it was when first written, more than a century since, your correspondent must therefore admit that the action taken by the men in the firm he refers to is merely a combination to protect their own interests; and to allow any attempt to pass unnoted that threatens such interests would be detrimental to that combination. Consequently, when individuals choose to work against the well-being of their fellows, they will have to put up with the obloquy and reproach attached to such action.

His reference to "grey hairs and specs." is in very bad taste, and quite in accordance with the mental capacity of a man who could write such nonsense, especially the latter portion of his letter.

WARMING BUILDINGS BY HOT WATER.

XI.

EXAMPLE WORKS (HORTICULTURAL)

(continued).

WITH the example commenced in the last paper, the space did not permit of dealing with more than the main services, their uses, and the different methods of laying them in. We can now proceed to deal with the branch services; but to make the explanation and reference clear, fig. 36 is repeated here.

If the mains were brought along at the side of the end house and then carried up the front in melon pits, as shown, that part from the boiler to the front would be beneath the ground level. If the boiler pit be deep then they would not lie in an open trench very well, but would probably be covered up. In this latter case it would not matter very much whether they were beneath the house, as shown, or outside. The former would in most cases be given preference.

In the first house, for tropical plants, branch services are carried along each side and around at the ends as far as the doorway. The number of pipes would be either four or six (result of calculation), half flows and half returns. Before, however, the single pipe from the main was branched into two or three, as the case may be, the stop-valves should be inserted as shown. The small circular marks on the illustration represent these. Of course only the

top pipes of the apparatus can be shown in this plan drawing.

In the second house, which we may suppose reserved for grapes, and, perhaps, also for strawberries, so great a quantity of pipe as the

FIG. 36.

last is not needed. The pipes are shown extending across the front (the coldest part) and also along the sides as far as the doorways. There would probably need to be four pipes, viz., two flows and two returns to keep up a temperature sufficient for this house. The stop-valve is shown in the melon pit; this is a convenient place for it, but it can be placed in the house, if desired. The quantity of pipe will be governed by calculation, but the actual temperature required will be, in every case, settled by the gardener. Grape-houses require different heats according to the particular kind of grape being grown.

In the third house, which may be used as a greenhouse, for plants, sub-tropical productions, &c., a less quantity of pipe than the last is needed. The quantity of pipe, however, will be governed entirely by what the gardener intends stocking the house with. In this example the pipes are shown extending across the front and up the left side as far as the doorway. Three pipes, perhaps two, will be found sufficient. The stop-valve is shown situated as with the second house.

The end, which may be termed a cool house, is shown with two pipes only, a flow and return, across the front. This will probably be sufficient, as the house may only be used for semi-hardy trees and shrubs, apricots, tomatoes, &c., which have to be preserved from frost, or have to be kept under glass until the cold nights of spring have ceased. For this purpose it is not necessary to have a distinct branch service; a continuation from the third house will do; but this, again, is a question for the gardener to decide. If the service is carried out as illustrated, there should be a means of checking the heat in this last house without interfering with the heat of the one preceding it, and it would probably be found that an H-piece with valves, inserted in the flow and

FIG. 38.

return as fig. 38, would best effect this. By the use of these valves the circulation could be stopped in the last house if desired, yet by

opening the middle valve the water will have a clear way to flow up and down the pipes in the third house normally.

The pits in front of the houses are heated by the two main pipes, but there cannot be any means of checking the heat of the water, as to do so would interfere with the other and most important parts of the apparatus. If the mains prove a little too hot for these pits, their heat can be lessened by shifting their lights or covers a little.

The extremities or farthest points of all the services, both main and branch, must have air-pipes. The stop-valves may be in the flow-pipes only, or in both flows and returns; this is another question the gardener will usually settle. Generally, the stop-valves used in this work are of the throttle pattern, being something like a short length of pipe, with a circular disc in it, which is operated by a handle. (Full description will be given in a later paper.) This disc does not fit tightly in consequence of its having to revolve freely in the pipe. Therefore, although it is well suited for checking and regulating the motion of the water, it will not entirely prevent circulation if the valve exists in one pipe only.

It can be readily seen that if a small aperture exists through the valve in the flow-pipe, and the return-pipe is quite open, a circulation will take place, and, should it be desired to keep heat from the house, this can only be done imperfectly. But by putting a stop-valve into the return-pipe as well, the circulation becomes stopped sufficiently for all practical purposes. In grape-houses the valve question is given a good deal of consideration, as the gardener can only regulate the budding of his vines by regulating his heat. If grapes are required either early or late, it is due to the stop-valves chiefly that this arrangement can be carried into effect either way. The "throttle" is not the only imperfectly-fitting valve, but, on the other hand, there are now made throttle-valves that are perfectly fitting.

It should have been mentioned when describing the arrangement of pipes in the second house, that, if it is to be used for grapes, the gardener requires to be consulted as to where the roots or trunks of the vines will be situated. Sometimes the vine is rooted inside, but it is just as commonly outside. The famous vine at Kew is rooted outside its house, the trunk passing through to the inside just as it leaves the ground. Many growers adopt this practice, considering it the most successful method.

When an apparatus has of necessity to extend in different directions from the boiler, say as in fig. 39, it becomes necessary to intro-

FIG. 39.

duce stop-valves in the mains. This is to enable the gardener to regulate the heat to his requirements, for should an apparatus branch in two or more directions it may be taken for granted that usually a more effective circulation will set in one way than the others, and it will be necessary to check one to make them work at all equally.

In this illustration the boiler is shown placed between the houses, but notwithstanding this arrangement, in works of moderate size there need be but one flow-pipe from the top of the boiler, but branched as in fig. 40. It might be advisable in this case to have the short vertical portion immediately on the top of the boiler, a size larger than the mains which proceed to the right and left. The returns of the mains need not however enter the boiler by one pipe; with these it is better to bring them in one on each side as shown in the last illustration. By this means an undue accumulation of dirt does not occur on one side of the boiler should surface water be used. This was more fully alluded to in an earlier paper.

The insertion of stop-valves in these branch mains needs a little care. They must be of the full size of the pipes (so should all the cocks in

an apparatus of fair size) and probably throttles would be best to use as they have a straight way or passage through them of the full size of the pipe, or very nearly so. Any valve that has a smaller or irregular passage through it, should be omitted from the mains

FIG. 40.

of a horticultural apparatus as a rule. There need be no valve put in the returns if regulation is all that is required. If the circulation has to be quite stopped or very carefully adjusted, then valves are required in both flow and return-pipes.

The previous examples have dealt wholly with glasshouses of the lean-to shape, and the other style, termed "span" houses, have not been dealt upon. This latter shape, usually like fig. 41 (cross section), requires different

FIG. 41.

treatment to the others in heating, as we may suppose all sides are equally exposed, and no shelter exists on one side, as is effected with the brick wall of the lean-to house. Span houses always require more pipe than a lean-to house of the same area; and owing to the greater loss of heat they are not generally used as tropical houses. The illustration shows four pipes under the staging each side and four pipes in a trench up the centre. A trench is usually required for the centre pipes, as it is a common practice to occasionally alter the position and re-arrange the middle staging, and it would not do in this case to have the pipes above ground. Of course the pipes are less effective in a trench, and if they can be arranged otherwise it is best. Fig. 42 shows in plan how the pipes in this

FIG. 42.

house would be connected up. The pipes along the right side of the house would be below ground, so as to take the pipes in the trench up the centre, and also to miss the doorway that would doubtless exist there.

SURVEYORSHIPS.

ISLINGTON.—Mr. George Green, Assoc. Mem. Inst. C.E., of the Borough Engineer's Department, Nottingham, was on the 4th inst. appointed,—out of a large number of applicants,—Assistant Surveyor to the Northern district of Islington, N., in succession to Mr. T. R. Roscoe, the recently-appointed Surveyor of Luton. Islington is one of the largest London parishes, and had a population of 319,259 in 1891.

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY. CHANGE OF ADDRESS.—The address of this Society will in future be 12, Delahay-street, Westminster, S.W.

OBITUARY.

MR. ISAAC BARRADALE, F.R.I.B.A.—We regret to announce the death of Mr. Isaac Barradale, which took place at his residence at Stoneycote, Leicester, on the 19th ult., after a short illness. The deceased gentleman was born at Leicester in 1815, and was articled to Messrs. Flint & Shenton, of that town. He commenced practice in 1870, and his works, which are mostly in Leicester and the neighbourhood, are of good repute. Several of them have been exhibited at the Royal Academy, and illustrated in this journal. Mr. Barradale was elected a Fellow of the Institute in 1879.

MR. WILLIAM HUDSON.—We record with regret the decease, on the 2nd inst., of Mr. William Hudson, architect and surveyor, formerly of Bennett's-hill, Doctors' Commons (now renamed Goddard-street). Mr. Hudson was well known throughout the City, and during his professional career held several appointments. He was, for about half a century, surveyor in London to the West of England Fire-office, at one time Assessment Surveyor to the Commissioners of Sewers, and, until his recent retirement from practice, Surveyor to the Saddlers' Company, and for many years a Fellow of the Surveyors' Institution and also of the Surveyors' Club. As an architect he erected many warehouses and City premises, and his design was selected in a limited competition for the City of London Union offices in Bartholomew-close. Mr. Hudson partially relinquished active work in the year 1880, when he was joined in partnership by his son, Mr. Arthur B. Hudson, F.S.L., and Mr. A. C. Bulmer Booth, A.R.I.B.A., under the style of William Hudson, Son, & Booth. He retired entirely in 1889, when the style of the firm was altered to "Hudson & Booth." Mr. Hudson was in his eightieth year, and was throughout a long and busy life much respected, both in his profession and out of it. He leaves a widow, and of a numerous family, five sons and four daughters survive; his eldest son, Mr. Wm. H. H. Hudson, M.A., is Professor of Mathematics at King's College, London. The interment took place on Saturday last at Brompton Cemetery.

MR. HENRY POOLE.—Mr. Henry Poole, who died on the 25th ult., aged eighty-eight years, had held the office of "Master Mason" of Westminster Abbey since the year 1856. He largely assisted the late Sir Gilbert Scott in his researches,—researches which led to the production of the well-known paper entitled "Gleanings from Westminster Abbey," read by Scott before the Institute in 1859.—*R.I.B.A. Journal*, March 10.

GENERAL BUILDING NEWS.

PROPOSED EXTENSION OF THE BATH PUMP-ROOM.—A meeting of the Bath Town Council was held on the 5th inst., when Mr. Radway, as Chairman of the Baths Committee, presented the report dealing with the proposed extension of the Pump-room to an estimated cost of 45,000. The committee state that the subject has pressed itself upon them from three considerations, viz.—1. The necessity of protecting the Roman Bath from injury by exposure to the weather. 2. The necessity of undertaking such works as would render the surroundings of the Roman Bath more presentable than they are now. 3. The crowded state of the Pump-room during the performance of the daily concerts. "With respect to the Roman Bath, which has now been uncovered for several years, it is obvious, from the most cursory examination of the remains, that unless something is done to protect them from the effects of the weather, a large and interesting portion will within a very short time have ceased to exist. With respect to providing additional accommodation in connexion with the Pump-room, it may be observed that, although it is generally admitted that the bathing establishments are unrivalled, the qualification is invariably added that Bath is sadly deficient in the accommodation offered to visitors in connexion with the Pump-room. . . . Your committee are of opinion that the present Pump-room should be devoted exclusively to the drinkers, with provision for readers. Your committee are of opinion that the new buildings should comprise on the same floor with the present Pump-room a good entrance corridor and vestibule, a cloak-room for ladies and another for gentlemen, complete sanitary arrangements, and ticket-collector's office. A concert-room, not more than half as large again as the present Pump-room, should be the first consideration in the plan; but this room must be so contrived as to permit of a corridor of sufficient length and width for the use of invalids to walk up and down in. A conversation-room and a similar room for chamber music, and, if possible, another room for smoking, should also be provided on the same floor. Connected with these rooms should be an arrangement for providing light refreshment. The Roman Bath should be roofed in and enclosed, as well as the King's Bath. The roof of the Roman Bath should be sufficiently lofty to admit of the erection of a side balcony all round it on a level with the floor of the Pump-room, or nearly so. Easy access should be provided by a staircase to the lower level of the *schola* of the bath, to which the general public should be admitted by a separate entrance. The

area beneath these additions to the Pump-room should be excavated to the level of the Roman Bath, and, if anything should be found of antiquarian interest, it should be left accessible, as are the present Roman remains. If, in addition to this, a portion of the basement, well lighted, could be set aside for a museum for all the Roman antiquities belonging to the Corporation, an more especially those that have been or may hereafter be discovered on the site of the Baths, it would be a very desirable addition. Your committee hope that in connexion with the contemplated work some arrangement may be made for storing the water, which now runs to waste during the night and on Sundays. It is proposed to acquire the whole block of property lying between the Pump-room and the Abbey. This would give an area of 88 ft. by 88 ft., or 7,744 square ft. If to this is added the area of the Roman Bath, 56 ft. by 72 ft., or 4,032 square ft., the total amounts to 11,776 square ft., or nearly three times the space occupied by the present buildings of the Pump-room. . . . Your committee recommend that the provisional contracts for the purchase of No. 3 and 4, Abbey-churchyard, be forthwith completed, that an application be made to the Local Government Board to sanction a loan sufficient to pay the purchase moneys, and that as soon as the whole of the property is in the hands of the Corporation it be pulled down and excavated to the level of the floor of the Roman Bath, in order that the arrangement of the suggested buildings may be planned with a full and precise knowledge of the foundations and the existence of any Roman work, which it shall be the imperative instruction to the committee to preserve. After the excavations are completed your committee will in due time bring up full and detailed reports." Mr. Joli seconded the adoption of the report. Mr. Joli seconded the proposal. Alderman Gibbs proposed an amendment to the effect that a minor part of the scheme should be adopted, and the rest recorded. Ald. Chaffin seconded, believing that the scheme was far too comprehensive. Ultimately the consideration of the question was adjourned.

BOARD SCHOOLS, HASTINGS.—On the 20th ult. Council of the Board opened the new board school at Olive Vale, Hastings. The school is built in the "Queen Anne" style. The external walls are of local red brick and Bath stone dressing, and the interior is lined with white Suffolk bricks. The floors are of fireproof construction by Messrs. Hoeman & Rodgers, of London, upon which is laid wood block flooring, by Mr. Rogers, of Farnworth. The heating is done by Messrs. Woulton & Waters, of Croydon. Open fireplaces have also been provided with terra cotta flues. Advantage has been taken of the raftered part of the ground from front to back to provide covered playground for both boys and girls. The building contains on the ground floor, or first school, an assembly-hall, 65 ft. 6 in. long by 30 ft. wide, with a supplementary door and stone passage, in addition to the regular entrance, which are used for rapid exit in case of panic. Opening from the hall are six class-rooms. A cloak-room and lavatory, fitted with Adams' patent wash-basin have been provided. On the first floor is the boy department, similar in arrangement to the girl. A teachers' room is provided for each department. The staircases, landings, and passages are of Elliott patent stone, and fireproof, while the walls by the side of staircases are faced with white glazed bricks. The building was designed and carried out by Messrs. Elworthy & Son, architects, St. Leonard's. The foundations and brickwork up to the ground level were built by Mr. T. Taylor, of Hastings; and the remainder completed by Mr. T. Salter, of St. Leonard's. The class-rooms provide accommodation for 534 boys and girls. The total cost of the building is about 7,000.

PROPOSED ARTISANS' DWELLINGS, MANCHESTER.—An inquiry instituted by the Local Government Board was held on the 1st and 2nd inst. at the Manchester Town-hall by Mr. S. J. Smith, C.E., one of the inspectors of the Board, for the purpose of inquiry into an application by the Manchester Corporation as the local authority under the Housing of the Working Classes Act, for permission to borrow the necessary funds for carrying out the erection of labourers' dwellings on what are termed as the Old Quay-road and Pollard-street areas, and for other purposes. Mr. Thomas Hudson (Deputy Town Clerk) appeared for the Corporation, and supported the application, which was unopposed. He stated there were four points to which the inquiry would be directed, firstly, for the sanction of the Local Government Board to a proposal that the Corporation should themselves erect the dwellings; secondly, that the restriction should be removed imposed upon the Corporation with respect to the scheme that the houses should not be raised for the second block of property in area No. until the completion of the new buildings on the first plot; thirdly, for borrowing powers to enable the Corporation to perform the work; and, fourthly, to the provision which the Corporation were under obligation to make for persons of the labouring class, by the carrying out of the scheme. Mr. Hudson further stated that the intention of the Corporation had always been to construct the new buildings themselves, as had been stated at a former inquiry, and had been approved by the Local

Government Board. Evidence would be given showing that the Corporation had greatly considered the question of providing the best class of dwellings. Desirable furniture has been obtained in competition, and those of Messrs. Spalding & Cross, of London, were adjudged by the Sanitary Committee the most suitable for the purpose. They had been modified to some extent by the Committee and the responsible advisers of the Corporation, and it was now considered that if buildings were erected upon the principles in the designs they would form a model of their class.

Mr. Councillor McDougall, the Deputy-Chief of the Sanitary Committee, stated that it was desirable the Corporation should have power to erect the buildings themselves, which they desired to make model buildings of their class. It had always been contemplated that the work should be performed by themselves, and he knew of no one who would execute the work if the Corporation did not.—The Inspector stated that the plans for all the plots chosen provided ventilation to both sides of the houses in a manner and to an extent which was quite satisfactory.—Evidence having been given by the architects in explanation of the plans, and by Mr. Andrew T. Rook, the Superintendent of the Sanitary Department of the Corporation, in confirmation of the unhealthy condition of the area, the Inspector stated that he would report to the Local Government Board in due season.

ADDITIONS TO CHAPEL, BARNSTAPLE.—On the 2nd inst. a chapel, which was built in Barnstaple fifteen years ago in memory of Rev. James Thorne, was reopened after being altered and enlarged. About 20 ft. has been added to the length of the chapel, with an organ-chamber beyond that. Side galleries have been provided at the expense of the stone arcade. These galleries contain four rows of seats, and are supported by cast-iron pillars, of terra-cotta tint, picked out in colours. The front panelling of the gallery is of pierced iron-work, bronzed. The seating accommodation of the chapel has been doubled. In addition to this work, the scheme included a tower. This tower, rising 77 ft., contains the main staircase to the gallery, a strong room, and also a large classroom. It is built of Mansfield stone, with Bath stone dressings. The total cost of these alterations and enlargements will be about 1,800*l.* Messrs. Barwick & Silliant were the contractors, Mr. John Chapple did the plumbing, and Mr. M. Croot the decoration. The architect was Mr. W. C. Oliver.

CO-OPERATIVE STORE BUILDINGS, PELAW, DURHAM.—On the 5th inst., the new branch stores of the Boldon Industrial Co-operative Society were opened at Pelaw by Mr. A. Bell. The new building is situated close to Pelaw Railway-station. The building, which has cost about 2,000*l.*, contains a large shop on the ground floor, with warehouse, committee-room, office, &c., upstairs; a house for the manager being attached to the premises. The architect was Mr. Morton, of South Shields, and the builder Mr. R. Allison, Whitburn.

MISSION CHURCH, PLYMOUTH.—A new mission church, which has just been erected in connexion with St. Matthias parish, Plymouth, at the corner of Amity-place and Armada-street, was opened on the 24th ult. It is built of red brick with Portland stone dressings, from designs by Mr. G. D. Bellamy, the builders being Messrs. A. R. Lettbridge & Sons, Ltd., W. J. Egford having been clerk of the works. It is 120 ft. long by about 45 ft. wide, and has attached to it a class-room and vestry. The roof is panelled. The stained glass and general glazing work has been carried out by Mr. Horsman, and the plumbing work by Mr. Bannerman. A chancel-screen is in process of erection. The total cost of the building has been about 1,400*l.*

RE-OPENING OF SAUNDY CHURCH, NOTTINGHAMSHIRE.—On the 25th ult., the church of St. Martin, Sandby, was reopened after restoration, by the Bishop of Southwell (Dr. Ridding). The church was restored in 1885 by a former Vicar of the parish (the Rev. T. Hudson), who has also furnished the tower, re-hung the bells, and his latest act of munificence has been the re-roofing of the nave, the addition of another aisle lighted by four stained-glass windows, by Kempe, of London; the provision of a new west screen and oak, the opening of the arches between the nave and the new aisle, and the re-seating of the church in oak. The architects were Messrs. Weatherly & Jones, of London. The contractors were Mr. Henry Clipham, Newark (masonry), and Messrs. T. & J. Hawley, Penistone (plumbing, glazing, slating, &c.). The church is heated by hot-air pipes.

VICARAGE, ST. MARK'S CHURCH, ST. HELENS.—The work of erecting a vicarage for St. Mark's Church, St. Helens, has just been commenced. The design is in Gothic, and from the plans of Messrs. J. and W. Gandy, architects. The site is close to the church on the south side, and the total cost will be about 1,600*l.* Messrs. Rothwell & Sons are the contractors.

VICARAGE, ST. MARK'S CHURCH, TORQUAY.—Various alterations and improvements to this church have been completed. These consist in some structural alterations and the addition of bishop's throne, sedilia, and new altar; a reredos, altar, credence, &c., in the morning chapel, which has been refloored in oak and teak, and a west lobby screen. All this work is in oak, and has been executed by Mr. Hems, of Exeter. New gas pendants, clusters, and brackets,

wrought in iron and copper, have been made by Messrs. Hardman & Powell, Birmingham. The new coloured windows have been added by Messrs. Burillon & Grylls and Mr. Kempe respectively. The designs for the work have been made by Messrs. Tait & Harvey, architects, of Exeter, and carried out under their direction.

FOREIGN AND COLONIAL.

FRANCE.—The Académie des Beaux-Arts has elected M. Ancelet in place of the late M. Bally. He obtained in the final *scrutin* seventeen votes against ten for M. Seillon and five for M. Guadet.—M. Deporthes has obtained the Prix Rougier at the Ecole des Beaux-Arts.—At the Montparnasse Cemetery there has just been inaugurated a monument to Mlle. Nancy Fleury, who invented or first used the method of teaching now employed in girls' schools in France.—The new Minister of Public Works, M. Viette, is to inaugurate next Sunday one of the new locks at Fécamp.—The twelfth water-colour exhibition of the Society, mostly architects, organised under the name of "Amis de la Nature," has just been opened. It is a small collection of seventy-eight water-colour sketches—"croquis de voyage." Those which may be selected as the best are the work of M. Paul Wallon, M. Desliègères, and M. Robert de Massey, the last-named of whom died only a few weeks ago.—The new Palais des Beaux-Arts at Lille, said to be a remarkable building, has just been opened.—The municipality of Plogères has acquired the chateau overlooking the town, one of the finest feudal remains in Brittany. M. Juste Lisch, Inspecteur-Général des Monuments Historiques, is commissioned to oversee the restoration of this fine monument, which has thirteen towers, and dates from the twelfth century.—At Vouziers (Ardennes) on the territory of Belval-Bois-des-Dames, a stone statue of a Roman soldier with a lance has been discovered, along with two sculptured stones representing combats of animals. The excavations going on in the same neighbourhood have also revealed an ancient Roman road and numerous pieces of Roman money with the effigy of Marcus Aurelius.—The Direction des Beaux-Arts has authorised the municipality of Toulouse to restore the "Salles des Illustres" in the Palais du Capitoul, so called because it contains the busts of the forty-four most illustrious natives of Languedoc. MM. Esquiù and Pujol, architects, are to be commissioned to direct this important work, with the assistance of a certain number of artists of Toulouse. M. Jean Paul Laurens will decorate another gallery close to this; M. Benjamin Constant will execute a ceiling and a panel; M. Henri Martin, two panels; M. Debat, Ponsard, a ceiling and a panel; M. Rixens, a ceiling; and MM. Gervais, Destrem, Yarz, and Bachon will complete the work. The sculptural portion of the work is reserved for MM. Falguère, Mercier, Marqueste, Barbédoisy, and Labatut. The total expense is estimated at half a million francs.—The death is announced of the curator of the Luxembourg, M. Edouard Arago, at the age of ninety. He was a son of the eminent astronomer François Arago, and uncle of M. Benjamin Constant the painter. He had been mayor of Paris in 1870, and since his youth had been mixed up with the Republican party. His portrait figures in the large picture by Schnetz at the Hotel d'Als, which represents the capture of the building by the forces in the Revolution of 1870.

BERLIN.—At a State Council held last week, the Emperor, after having previously conferred with his Chancellor in private, made some propositions relating to the present and future finding of work for unemployed artisans and labourers. The propositions are said to have been received favourably, and the Ministries concerned are busy working them out into practical form. According to the official *Gazette*, the Emperor has received a number of addresses from workmen in which they express their confidence in him and the different measures he has already enforced for their benefit during his reign. At a Socialist meeting held last week, the 2,000 workmen present unanimously passed a resolution in which they strongly protested against the misrepresentation in certain organs of the press about their participation in the riots, and in which they ordered all fellow-workmen to do their best to oppose such proceedings.—A well-attended meeting of those interested in the success of the "Vienna Musical and Theatrical Exhibition" has been held at the Opera House, the "Intendant" of the Court Theatres taking the chair. The German participation at the Vienna show promises well, in spite of the petty controversies between the representatives of the minor states of the Empire on matters relating to precedence and systems. All divisions are to be well represented, but special attention is to be given to "history." The Emperor wishes this part of the German group to be perfect, and has ordered the custodians of his private collections and the Government Institutions to put at the disposal of the managing committee all objects of interest at present in their charge.—Until of late the numerous interesting archaeological remains in Prussia were taken care of by only one custodian, Herr "Ober-Regierungsrath" Persius. Now each

province is to have its own sub-curator, who will be responsible to the chief-resident at Berlin, and each province is to pay its own expenses.—Entrance to the Royal Technical Colleges of the country has been facilitated. The Emperor has had the statutes altered so that the amount of schooling and class of education necessary for entrance is such as can be obtained at "Ober-Ralschulen" establishments of lower standing than the "Gymnasiums" and "Real Gymnasiums."—The so-called Louis Boissonnet Studentship (100*l.*) is to be given to a civil engineer this year. The successful candidate will have to do some extensive work in Norway, consisting of reports and illustrated essays.—A well-attended general meeting of persons interested in the Portland cement trade was held last week. It was decided to send a collective exhibition case of German samples to the Chicago Show. After the business had been gone through a number of interesting papers were read.

MISCELLANEOUS.

THE ROYAL GOLD MEDAL FOR ARCHITECTURE, 1892.—At the special general meeting of the Royal Institute of British Architects, held on Monday evening last, it was resolved, subject to the sanction of the Queen, to present this year's Royal Gold Medal to Monsieur César Daly, of Paris, "for his works as a man of letters in connexion with architecture."

THE MOVEMENT FOR THE REGISTRATION OF PLUMBERS.—An important step in this movement was the second reading of the Plumbers' Bill, on the 3rd inst. The Bill is claimed by its promoters as supplying the missing link in sanitary legislation, for they say that hitherto the numerous enactments about plumbers' work have entirely omitted any provision for the efficiency of the men who have to carry it out. Numerous petitions in favour of the Bill have been presented to Parliament from the plumbers and sanitary authorities.

THE PEABODY FUND.—The twenty-seventh annual report of the trustees of the Peabody Donation Fund states that the net gain of the year, from rents and interest, has been 29,659*l.* 4*s.* 7*d.*, as shown by the accounts. The sum given by the Peabody was, in 1882, 150,000*l.*; in 1885, 100,000*l.*; in 1888, 100,000*l.*; and received by bequest from him in 1873, 150,000*l.*; making a total of 500,000*l.*; to which has been added money received for rent and interest, 563,105*l.* 6*s.* 6*d.*, making the total fund on December 31 last 1,053,105*l.* 6*s.* 6*d.* Of the 390,000*l.* borrowed of the Public Works Loan Commissioners and others, mentioned in previous reports, the trustees have paid off 206,832*l.* 6*s.* 8*d.*, leaving a balance unpaid of 183,162*l.* 13*s.* 4*d.*, the amount repaid during the year being 29,162*l.* 13*s.* 4*d.* The capital expenditure on land and buildings to the end of the year was 1,233,904*l.* 13*s.* 9*d.*, the whole of the repairs for the year amounting to 8,322*l.* 11*s.* 1*d.*, being charged to income as in previous reports. Up to the end of the year, the trustees have provided for the artisan and labouring poor of London 11,273 rooms, besides bath-rooms, laundries, and wash-houses, occupied by 20,269 persons. These rooms comprise 5,070 separate dwellings, viz., 75 of four rooms, 1,788 of three rooms, 2,402 of two rooms, and 805 of one room.

APPOINTMENT OF CITY ARCHITECT, ABERDEEN.—The Aberdeen Town Council, at its monthly meeting on the 7th inst., proceeded, in pursuance of a resolution, to fill the vacancy in the post of City Architect caused by the death of Mr. William Smith. Bailis Lyon proposed that the appointment be deferred, to permit of the advisability of terminating the office and transferring the duties to the City Surveyor being considered, but this proposal was negatived by 14 votes to 11. Mr. John Rust, jun., till recently one of the Bailies (and who resigned to become a candidate for the post), and Mr. G. M. Mackenzie (of Messrs. Matthews & Mackenzie, architects), were nominated; and Mr. Rust was elected by 19 votes to 4 for Mr. Mackenzie.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—A Home Counties district Metropolitan meeting of this Association is to be held at Kensington this Saturday, March 12, at 11 a.m. The members will meet in the council-chamber, Town-hall, Kensington, when Mr. Weaver will call attention to certain provisions of the Public Health (London) Act, 1891, and will move a resolution thereon. Mr. William Weaver, M.Inst.C.E., Chief Surveyor of Kensington, will then read a paper on "Kensington, its progress and work." After this has been discussed, the members will partake of luncheon, kindly provided by the Kensington Vestry, and they will proceed in brackets to view the Recreation Ground, Notting Dale; Kensal Wharf; the Warwick-road and Brompton-road depôts; electric lighting station, West-Brompton (House-to-House Electric Light Supply Company, Limited); Salopion Wharf, Chelsea, Refuse Disposal Company's Works; Wharf, Lots' road, Chelsea; and Kensington-court Electric Lighting Station (Kensington and Knightsbridge Electric Lighting Company, Limited). In the evening the members will dine together at the Holborn Restaurant.

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITION.

Table with 4 columns: Nature of Work, By whom Advertised, Premium, Design to be delivered. Includes entry for Cemetery Chapel and Caretaker's Lodge.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor or Engineer, Tenders to be delivered. Lists various construction contracts.

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor or Engineer, Tenders to be delivered. Continuation of construction contracts.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Applicant to be invited. Lists public appointments.

Those marked with an Asterisk (*) are advertised in this Number. Competition, p. iv. Contracts, pp. iv., vi., & vii. Public Appointments, p. ix.

ENGLISH FIRE ENGINES IN AUSTRALIA.—The Sydney Daily Telegraph contains an account of the setting of a new steam fire engine of the "spiral-pattern" pattern sent out by Messrs. Shand, Mason, & Co. of London...

STANFORD HALL.—In reference to our illustration of this house in our issue of February 29, Messrs. John Smeaton & Son ask us to mention that they carried out all the work of water-supply, pumping engines, drainage, and sanitary work generally, under the supervision of the architect, at a cost of about 11,000l.

METROPOLITAN DRAWING-CLASSES.—Lord Cranbrook has accepted the invitation of Mr. Busbridge to deliver the "Queen's Prizes" to the students of the Metropolitan Drawing-classes. The ceremony will take place in the Carpenters' Hall on Friday, March 15.

DEBT RECOVERY AND WATER-SUPPLY.—A case was decided last Saturday at the Westminster Police-court, which clearly shows the great inconvenience and injury which threaten the ratepayer who may from any mischance be unable to discharge his account with a London water company. The defendant, who seems to have been overcharged, refused to pay for water which he had not used. The company, not seeing the matter in this light, proceeded to enforce payment by cutting off his household supply, and for seven days,—that is, until the bearing of the case in court,—persisted in this course. Their attitude in the matter, though entirely legal, was severely criticised by the presiding magistrate, who regretted that none of the various Acts as at present constituted allowed consumers any guarantee against such a big-handed mode of procedure. He was strongly of opinion that the water-supply to any house should under no circumstances be terminable at the will of a company. Debt recovery should rather be arranged, as in the case of parish rates, by taking proceedings in a court of summary jurisdiction. In this opinion we concur. Whatever may be said of the commercial principle involved, it is indeed astonishing that no legal check should be placed upon the application of a process which prohibits the use of an absolute necessity of life and health. Water certainly can under no circumstances be dispensed with, and it is no mitigation to say that the sufferer by an adverse verdict may borrow sufficient for his temporary needs. It is not clear to our mind how he can avoid this. Yet his necessities, his health and cleanliness, are intimately connected with the well-being of his neighbours, and the case is one in which, if

he suffer, others suffer by and with him. Some amendment of the existing law such as that above suggested is, therefore, evidently needed as a mere matter of sanitary requirement.—The Lord Mayor, Chairman of the General Purposes Committee of the Company, was spokesman on the occasion, and, after a graceful acknowledgment by the Lord Mayor, those present dispersed to view the installation. This consists of 825 lamps, mostly of sixteen-candle power, fitted over the whole of the Mansion House. The fittings are chiefly in handsome brass-work, and the lamps are for the most part hung so high that shadows are avoided, and shading is unnecessary. In the drawing-room the lamps are mounted in imitation of candles, and the old spangled fittings have been adapted to them. In the billiard-room and saloon also the gas-fittings have been utilised, with the result, in the former case, that the corners of the billiard-table are imperfectly illuminated. The lamps in the dining-room and the Lady Mayoress's boudoir are enveloped in coloured leaf-shade, the light is thereby much softened, and the effect is pleasing, but we doubt if the sacrifice of illuminating power is not carried too far. The switchboards in the basement are mounted on marbled slate, and (a somewhat unusual arrangement) the main fuses are copper strips. The current is direct, and is supplied by the City of London Lighting Company. The band of the Coldstream Guards played a selection during the evening in the saloon, where also was an exhibition of electrical apparatus.

DISCOVERY OF METOPES AT SELINUS.—Of the three metopes found on February 10 at ancient Selinus during the excavations now in progress amongst the fortifications to the north of the acropolis on the east side, one is irretrievably broken, but the other two are of the highest artistic value, both as regards technique and colouring. The first is 0.84 metre high by 0.68 wide, and represents Europa seated on a bull, with long thick tail waving over its head in the air. The treatment is altogether archaic. The second, measuring 0.81 m. by 0.68, has quite an Egypto-Assyrian character, and represents a winged sphinx in the usual beryllic pose. Both metopes are ascribed to the seventh century B.C. Strabo says, neither of them corresponds in measure-

ment with the dimensions of any of the known temples at Selinus. The excavations will therefore be continued in search of some other building which they may have belonged to. Photographs and a descriptive account of these important landmarks in the history of art will appear as soon as possible in the Monumenti Antichi of the Roman Institute of Athens.

MANCHESTER CATHEDRAL.—A new footpace had been made for the high altar at the Manchester Cathedral. The steps are of richly figured marble, the lower of Vert des Alpes, and the upper of Levico marble, moulded on the edges and highly polished. The footpace is executed in mosaic, with a guilloche border, enclosing emblems of the Trinity and the Virgin, also the Alpha and Omega, and a floriated cross with Central Sun of Righteousness, worked in various coloured marbles and gold and blue Venetian glass. The work is from the designs of Mr. J. S. Crowthor, architect, and has been executed by Messrs. J. & H. Patteson of Manchester.

HINTS TO TAXPAYERS.—We have received a handy and practical little book, entitled "Hints to Taxpayers: or, How to Appeal against Income Tax Assessments, with Illustrative Cases," by C. J. Mitchell, which is published by the author at 1 Victoria-street, Wolverhampton. It is just one of those cheap and useful works which are handy for everyday reference, and, being without any pretensions, are frequently of greater value than works which make a greater show.

THE ENGLISH IRON TRADE.—Very little change has taken place in the English iron market during the past week. Business is restricted to hand-mouth requirements, and on every side notices of close works on account of the miners' stoppage are being exhibited. The Cleveland market remains an unsettled condition, with prices exceeding irregular, and in all the other pig-iron centres trade is very quiet. Manufactured iron is in limited inquiry, and hammers remain dull. The steel trade shows little alteration. The rail branch is neglected. The Board of Trade Returns just issued exhibit a deplorable falling-off in the quantity of railway material exported, which amounted to only 18,444 tons, a decrease on February, 1891, of 37,350 tons. Shipbuilding shows no change since our last report. Engineers are getting slacker. The coal trade is still active prior to the suspension of work.—Iron

MEETINGS.

SATURDAY, MARCH 12.

Incorporated Association of Municipal and County Engineers.—Home Counties District, Metropolitan Meeting, (Keisinger Town Hall, 11 a.m.—Dinner, Holborn Restaurant, 6.30 p.m.) Sanitary Inspectors' Association.—Ninth Annual Dinner, First Avenue Hotel, Holborn, Dr. B. V. Richardson, President, in the chair, 6 p.m. Edinburgh Architectural Association.—Visit to Ross Chapel and Roslin Castle.

LONDON—For making certain alterations to Mr. R. Segar's premises, Highgate, Kilburn. Mr. Reginald G. Willis, architect and surveyor, 31, Willesden-lane, N.W.:—
 S. Barrett £57 11
 F. Colwell 84 0
 C. Shire 65 15

LONDON—For alterations and additions to the Guardians' Office, Broad-st., Mile end, under the superintendence of Mr. C. P. Bardon:—
 C. B. Penton & Co. £70 0
 T. & C. ... 620
 H. Martin & Co. 447
 White & Sons 623
 A. S. Judd & Son 440
 Hall & Co. 584
 A. Martin 400
 J. H. Johnson 512

LONDON—For erecting stables, "Brambling," Strathearn, Mr. William Hunt, architect, 8, York-buildings, Duke-street, Atlephi, W.C.:—
 Charles Wall £1,195 10
 B. Nightingale £1,070
 E. H. Holloway 1,147
 Halliday & Greenwood 1,047
 Bolls & Co. 1,113
 William Down 1,022
 Vernon Wells & Co. 1,112
 Sausford & Sons 1,028
 Hill Brothers 1,110
 Spidsey Knight 1,028
 Jart & Appleton 1,028
 R. P. Bull & Co. 1,027
 Johnson & Co. 1,027

LONDON—For erecting additional office accommodation for the Infants' Department of the East-street School, Plumstead, and for fitting the existing infants' water-works, for the School Board for London. Mr. T. J. Bailey, architect:—
 W. H. Gordon & Son £1,153 10
 J. H. Bell, 66, Sandy-hill, J. G. Gerrard 1,153
 * Recommended by the Works Committee for acceptance.

LONDON—For fittings and machinery to public wash-house and laundry, Horse-rd., N. Mr. A. Hessel Tilston, F.R.I.B.A., architect:—
 Contract No. 1. No. 2. Total.
 Clements, Senke & Co. £2,536 10 0 2,942 0 0 5,478 10 0
 J. Frost & Co. 1,912 0 0 2,792 10 0 4,704 10 0
 Z. Berry & Son 1,267 0 0 1,783 10 0 3,050 10 0
 J. & F. May 1,220 8 0 660 13 6 2,280 1 6
 Thomas & Taylor 1,220 8 0 660 13 6 2,280 1 6
 T. Bradford & Co. 1,220 13 0 660 6 6 2,155 1 6

Contract No. 1 includes washing-box, mats, drying-closet, and supplies. Contract No. 2 includes machinery.

LONDON—For the erection of Providence Baptist Chapel, Hansborough road, Strathearn. Mr. Harold Griffin, architect:—
 Hainman £474 0
 Jenkins 407 0

LONDON—For new jeweller's shop window, at 72, Westbourne-grove for Mr. B. K. Minant:—
 Spreckley (accepted) £100 0 0

LONDON—For fitting up new premises at 235, Regent-street, W., for the Crown Bond Company:—
 Charles Spreckley, President-street, Goswell-road, £115 17 0
 * Accepted.

LONDON—For alterations and additions, for Mr. George Wright, Brompton Lodge, Chiswick park:—
 T. Robertson, William (accepted) £430 0 0

MALDENSTONE—For sewerage work, at Boleyn-road, for the Urban Sanitary Authority. Mr. W. G. Spooner, C.E., Borough Engineer, Maldenstone:—
 J. Neave £269 0 0
 G. Candler £140 0
 C. J. Slade 243 0
 J. C. Trueman 240 0
 J. Barrow 180 0
 J. E. Brock, Maldenstone 120 0
 W. Coler 169 10
 * Accepted.

MALDENSTONE—For the construction of sewers, &c., at Plant-lane, for the Urban Sanitary Authority. Mr. W. G. Spooner, C.E., Borough Engineer, Maldenstone:—
 C. J. Slade £545 0 0
 G. Candler £315 0
 J. Neave 428 0
 J. C. Trueman 305 0
 Hope & Freeman 379 0
 Barrow 360 0
 W. Coler 333 0
 * Accepted.

PAIGNTON—For new judge, alterations of chapel, &c., at cemetery. Mr. W. J. Wyatt, surveyor:—
 R. Harris £212
 Rablitch & Brown £48
 Webster & Mauder 415

REDRUTH—For alterations and additions to the "Commercial Hotel," Camborne, for the Holbroth Brewery Company, Limited. Mr. Jas. Hicks, F.R.A.S., architect, Redruth:—
 W. H. Stevens, Penzance £1,200
 Foote 1,207
 * Accepted.

ROCHESTER—For the erection of six cottages, Queen's-road, Southland, for the City of Rochester Land and General Investment Company, Limited. Mr. J. W. Nash, architect, 7, Melville-terrace, Rochester:—
 G. Lee £1,213 10
 M. C. Fenton £927
 R. Langridge 1,113
 E. G. Brown 305 0
 E. Norman 1,030
 J. Willford, Southland 900
 W. E. Bishop 1,017
 * Accepted.

ROMFORD—For the erection of new school, for the Handchurch School Board. Mr. G. A. Ains, architect, Dashedwood House, New Broad-street, E.C.:—
 A. Brown £2,195
 Trappett & Hatley £1,330
 A. Kellott 3,472
 J. Webb 3,275
 H. Booth 1,785
 G. Greenwood 3,224
 French & Ethelwood 3,183
 Martin & Co. 3,235
 H. Rubin 3,467
 J. D. Carter 3,127
 W. Watson 3,481
 J. D. Johnson 3,127
 W. Wallis 3,267
 Ramsdell & Son 2,783
 * Accepted.

SWANLEY—For the erection of villa residence and stabling, for Mr. F. Ansell:—
 T. W. Jones, Bockenham (accepted) £1,050 0 0
 [No competition.]

TRING—For erecting chapel by remodelling and boundary walls, for the Tring Local Board. Mr. W. Backwell, architect:—
 Richardson £237
 Payne £2,247
 French & Co. 2,371
 Fisher 2,009
 Facey 2,789
 G. H. Martin & Co. 2,403
 Honour & Son 1,901
 Webster & Chalmers 2,790
 * Accepted.

WEST HAM—For 8,500 yards of wron, bitum, fencing on the top of the Metropolitan Northern Outfall Sewer, West Ham. Mr. Lewis Angel, Borough Engineer:—
 J. G. B. Marshall & Co. £4,000 0 0

THE BATH STONE FIRMS, LTD.
BATH,
FOR ALL THE PROVED KINDS OF
BATH STONE.
FLUATE, for Hardening and Preserving ;
Calcareous Stones and Marbles.

DOULTING FREESTONE.

The stone from these quarries is known as the "Weathered Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. It is of the same crystalline nature as the Cheltenham Stone, but finer in texture, and more suitable for facemoulded work.

Prices, and every information given, on application to CHARLES TRASK & SONS, Doulting, Shepton Mallet. London Agent—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C. [Advt.]

RAM HILL STONE.

The attention of Architects is especially invited to the durability and beautiful colour of this material. Quarries well opened. Quick despatch guaranteed. Stonework delivered and fixed complete. Samples and estimates free. Address, The Ram Hill Stone Co., Norton, Stoke-upon-Ham, Somerset. London Agent: Mr. E. A. Williams, 16, Craven-st., Strand, W.C. [Advt.]

Asphalts.—The Seyssel and Metallio Lava Asphaltic Company (Mr. H. Glenn), Office, 42, Fonthley, E.C.—The best and cheapest material for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk rooms, granaries, tin-rooms, and terraces. Asphalt Contractors to the Forth Bridge Co. [Advt.]

SPRAGUE & CO.,
PHOTOLITHOGRAPHERS,
 4 & 5, East Harding-street,
 Fetter-Lane, E.C. [Advt.]

Architects, Surveyors, Contractors, &c., are cordially invited to call at Stand No. 111, Building Exhibition, Agricultural Hall, Islington, and view the ART CONCRETE EXHIBITS AND INTERESTING PHOTOGRAPHS of Churches and other Works, executed by Messrs. FAMBERTON, DANIELS, EXCELSIOR ART CONCRETE WORKS, LINCOLN.

On View, March 14th to 26th, 1892.

TWELVE GOLD AND SILVER MEDALS AWARDED.

IRON CASTERS.

F. BRABY & CO.

VERY PROMPT SUPPLY.
LARGE STOCK READY.

Particulars on application.

LONDON: 352 to 362, Euston-road.
LIVERPOOL: 6 and 8, Hatton Garden.
GLASGOW: 47 and 49, St. Enoch-sq.

The Competition for the Birmingham New General Hospital.

THE insanitary nature of the surroundings of the existing General Hospital at Birmingham has been generally acknowledged, and the removal of the establishment to a more convenient and central site, and the more healthy, has occupied the attention of the Hospital authorities for some time. A generous bequest by the late Miss Weyland, of the sum of 25,000*l.*, upon the condition that within five years of her decease proper and permanent accommodation for the whole of the in-patients of the Hospital shall have been provided on a new site, and the liberal donations of the people of Birmingham, have enabled the Committee to take immediate steps to provide the stipulated wards prior to the expiration of the five years, some time in 1894, at an estimated cost for the building of about 80,000*l.* The acquisition of a site that would be suitable for a Hospital, and at the same time central, was no easy task, but it is a matter of congratulation that such a good one has been obtained. The new site lies at the back of the Victoria Law Courts, and is bounded on the south-east by Steelhouse-lane, and on the other sides by Whittall-street, Weaman's-row, and Loveday-street; its shape approaches that of a square, and it has an inclination from south-west to north-west, producing a considerable gradient. A fine open space surrounds the site on the north-west. A portion of the site at the corner of Steelhouse-lane and Whittall-street has not yet been acquired, and this has affected the disposition of the buildings. At the present time workshops and small dwellings occupy nearly the whole area, and the removal of these will shortly be commenced.

The engagement of Mr. Alfred Waterhouse, R.A., as consulting architect and engineer insured that the conditions would be complete and explicit as possible, and

that the award would be satisfactory, and one that would be generally endorsed. The accommodation required in the new buildings as scheduled may be briefly summarised thus:—Total number of in-patients 304, of whom 117 will be in two male and two female medical wards of twenty-four beds, and two separation wards to each, and a half-sized twelve-bed ward, and one separate ward to accommodate thirteen children; 156 patients will be provided for in three male and two female surgical wards of twenty-four beds, and two separation wards, each with a half-sized twelve-bed ward, and the separation ward to accommodate thirteen children. In addition to these, eight patients must be provided for in a half-sized ward for six gynaecological cases, with two single-bed separation wards. A half-sized ward for severe burns, to contain twelve beds, and a separation ward, will accommodate thirteen patients, whilst a small ward for septic and delirious cases will accommodate ten more patients, making up the total of 304.

It is stated that seventeen invitations to compete were issued, and that complete sets of designs were received from the following twelve architects:—Mr. W. Henman, Messrs. Worthington & Elgood, Mr. F. B. Osborn, Mr. Brightwen Binyon, Messrs. Dempster & Heaton, Messrs. Dunn & Hipkiss, Messrs. Cossins & Peacock, Mr. W. Doulleday, Mr. William Hale, Messrs. Bateman & Bateman, Mr. Ewen Harper, and Mr. W. H. Bidlake. The report of Mr. Waterhouse was made on Tuesday, March 8, and awarded the first place to Mr. Henman, and the second and third to Messrs. Worthington & Elgood and Mr. F. B. Osborn respectively. The drawings of the whole of the competitors were privately exhibited in one of the reception-rooms of the Council House on Wednesday, Thursday, and Friday of last week. A considerable diversity of opinion appears to have existed in the minds of the competitors as to the proper position for the principal entrance and frontage, and each frontage has found favour with some one or more of the competitors. There are points in favour of each, but we are inclined to think that Mr. Henman has chosen the right position in placing the main entrance in Steelhouse-lane at a point where the roadway is

fairly level, and a slight angle occurs in the boundary. Here Mr. Henman has placed his entrance-gates and porter's lodges leading into a quadrangle, with buildings upon three sides. The end of the administrative block faces the street, and on the left is the building, which contains on the ground floor the board and committee-rooms, and wards above. A covered cloister connects this building and the one on the opposite side, and crosses the front of the administrative block. It was required that one entrance should serve both in and out-patients; that out-patients should have access to the dispensary and thence to the street, and that a separate corridor should allow the in-patients to reach the hospital. This entrance for patients Mr. Henman places on the right-hand side of the entrance quadrangle. The block of buildings at the angle of Steelhouse-lane and Loveday-street accommodates the out-patients' waiting-hall, &c. To briefly explain the disposition of the blocks, it may be stated that a main corridor runs through the centre of each, from south-west to north-east, parallel with Weaman's-row; the nurses' home occupies a separate block facing Whittall-street. The lecture-theatre is at the east-end of the corridor facing Loveday-street. The main corridor passes through the administrative block, and the rest of the wards lead right and left, as will be further explained. The laundry and pathological department occupies a separate building facing Weaman's-row, immediately at the back of the administrative block, and this block has wards on each side of it. A septic ward block also faces Weaman's-row, and is at the end of the gynaecological ward, which will be further described.

The patients' entrances from quadrangle shows a vestibule, with space for splints and ambulance and porter's box on one side, with a consulting-room on the other, to which badly-mutilated cases can be carried without exposure to the gaze of patients in the waiting-hall.

The waiting-hall, which it is intended shall be also occasionally used as a recreation-room, is lighted from a clearstory, and is surrounded by a ring of top-lighted retiring-rooms in connexion with an outer ring of top and side lighted consulting-rooms, with lavatory accommodation. At the west corner of

the hall an exit leads into the quadrangle, and an adjacent door opens into a waiting-room to the dispensary, which occupies a position between this and the administrative block, and is chiefly top-lighted. A separate exit gives out-patients egress into the quadrangle, after calling at the dispensary. A short corridor connects the main corridor and the north end of the hall, and here are placed two wards for noisy patients. This corridor will be used for in-patients, and access to the wards on each floor will be gained by the lift in the administrative block adjacent to the main corridor. The lecture theatre at this end of the corridor has been mentioned. On the opposite side to the waiting-room a corridor leads to a twenty-four-bed male surgical ward block, which overlooks, and is parallel to, Loveday-street. This ward is rectangular in shape, with canted corners. Thirteen beds are placed on each side, with a window on each side of every bed. Angle turrets at the north end, separated from the ward by cross-ventilated lobbies, contain the patients' baths and water-closets, and the turrets are connected to the exterior by a balcony with a north-west aspect. A kitchen and two single-bed wards are placed at the other end of the ward. Continuing down the main corridor, a bath-room and water-closet are found on the right, and then the administrative block is reached. On the north of the corridor dining-rooms for the nurses, servants, and medical officers are placed in close proximity to the lift-room, communicating with the third floor of this block, where the kitchens for the whole establishment are placed. Mr. Henman has made a point of providing only two lifts, side by side, for goods and for patients, in this central position, and has also enclosed these in a service room, which prevents accidents to, and interference from, those using the adjacent corridor. It may be mentioned here that the entrance for goods is in Weaman's-row, and that carts will unload at the basement level of the administrative block, and stores will then be in a convenient position for immediate hoisting by the lift to the third floor kitchen. The upper floors of this administrative block are devoted to the medical officers' quarters in front, and the servants' and matron's quarters at the back. The third floor has the kitchen in front, and the carving and service rooms behind. Following the corridor the central block is reached; the front portion, or that to the south, accommodates board and committee rooms and general offices; these are reached by an entrance from the corridor to the quadrangle, which has been already mentioned, and here a waiting-room for patients' friends is provided adjacent. Above this portion, on the first and second floors, twenty-four-bed female medical wards are placed, with two single-bed wards, and patients' day-rooms at the north end. On the ground floor of this block, to the north of the corridor, two six-bed burn wards are placed, with corridor on the east side, and kitchen and a single-bed ward at the main corridor end; above these wards on the first and second floors are twenty-four-bed female surgical wards, each with two single-bed wards and a secretion-room. On the ground-floor corridor adjacent to this block, a sewing-room, linen and bedding stores are placed, and above this, on the first floor, the patients' chapel appears, with a small restry. Only one block now remains between the nurses' house and that last mentioned; this has on the south two circular children's wards for twelve beds each, and to the north a six-bed gynaecological ward, with a small, carefully-devised, north-lighted, small operating-room. The main corridor then leads on to the house; but before reaching it, it is widened out into a spacious conservatory, which will serve as a pleasant oasis for the refreshment of nurses who are off duty, and convalescent patients. The main corridor is provided with thorough ventilation in several positions between the blocks, and, in addition, air space is provided at intervals by arching the wall over the roof of the corridor below. The staircases in this corridor are treated as separate chambers, cut off as much as possible, to prevent unnecessary

draught. Two of the staircases have been carried up above the roof, and treated as water-towers. With regard to Mr. Henman's elevations we refrain from naming the style, though we may mention they have been described as free Classic, conceived in a Gothic spirit. They will harmonise well with their near neighbour, the Victoria Law Courts, and a certain impression is somehow conveyed by the design that the work of Mr. Waterhouse has received a certain amount of study. The elevations, however, are distinctly pleasing in their treatment, and there is every reason to expect that they will also look well in execution. The materials intended to be used are red brick and terra-cotta, and green slates.

Messrs. Worthington & Elgood, who have been awarded the second premium of 100*l.*, have adopted a different disposition of their blocks of buildings. Though they have placed the main entrance in Steelhouse-lane, the frontage of the building has been brought out to the street line. A covered carriage-entrance leads to a vestibule, with a short corridor running right and left. On the right the waiting-hall is reached, and around this are arranged the medical and other consulting and retiring rooms. The dispensary occupies a somewhat inconvenient position away from the rest of the building, and the patients who are to be admitted to the hospital from the consulting-rooms will have to retrace their steps against the stream of the incoming patients. On the left of the entrance a corridor runs at right-angles to Steelhouse-lane, and joins the main east and west corridor. The principal staircase is centrally placed at the junction of these two corridors, and communicates with the upper floors of the administrative block, which are arranged as officers' quarters and nurses' home. The kitchens are placed on the third floor. The arrangement of the nurses' quarters and the other compartments of the administrative block, does not appear to be a good one. The gynaecological ward is placed in the block which runs back to the centre of Weaman's-row, and on each side are placed smaller blocks containing children's medical wards and wards for severe burns. The surgical and medical wards are placed parallel to, and facing, Loveday-street, and are separated by the main corridor, which terminates in a staircase at each end. The laundry has been placed on the south-west of, but distinct from, the main corridor, and abuts upon the block of old buildings. The number of lifts appears to be excessive. The elevations are treated in a Renaissance style, both Late and Free, and are kept studiously plain. The position of the tower, placed at an angle of the frontage to Steelhouse-lane, does not appear to be a happy one.

The design of Mr. F. B. Osborn, which has gained the third premium of 50*l.* value, differs in many respects from the others. A main corridor runs direct north-west and south-east from the centre of Steelhouse-lane to Weaman's-row. At the corner of the lane and Loveday-street the out-patients' block is placed. This block has a top-lighted waiting-room, surrounded by top-lighted consulting-rooms and retiring-rooms, some of which will necessarily be poorly lighted, owing to the position of the ward above. From this waiting-room a passage on the west leads to a second waiting-room adjoining the dispensary. For the removal of bad cases, a somewhat circuitous corridor leads into the main corridor, and is joined by a shorter corridor from the north side of the waiting-room for out-patients. Once the main corridor is reached, the wards are easily gained by the staircase in the centre or by the lift immediately adjacent thereto. On the south-west of the main corridor facing Steelhouse-lane, the administrative block is placed, and immediately behind this another block accommodates the dining-rooms and the kitchens above. The first and second floors of the administrative block accommodate the quarters of the officers and nurses on duty, and the third floor is devoted to maids' quarters and housekeepers' rooms. On the first floor on the

south-east of the main corridor two female surgical wards of twenty-four beds are followed by the gynaecological wards, and the children's ward at the corner of Weaman's-row and Loveday-street. Two female medical wards of twenty-four beds each occupy the north-west, with male medical wards above each. The lecture theatre is placed on the main corridor, opposite the main stairs, and the operating theatre above it. The nurses' house occupies the west corner of the site, and overlooks Weaman's-row and the open space beyond, but this gives a north-west aspect. The elevations show a Renaissance treatment of rather a severe aspect.

Of the remaining designs space prevents any adequate mention, but it may be noted that design No. 4 has the entrance in the centre of Weaman's-row frontage, which is the least accessible to the city. Design No. 3 also favours Weaman's-row for the main entrance, and provides a quadrangle. Design No. 5 places the main entrance in Whittall street.

The award of the first place to Mr. Henman can be entirely endorsed, though we fail to see sufficient reason for the award of the second premium.

STEAM-ROLLING ON MAIN ROADS.

I referred some time since* to a report which had been compiled for the County Surveyors' Society by Mr. Heslop, the County Surveyor of Norfolk, and hoped that this might be an annual publication. We are therefore, pleased to see that this is, to some extent, the case.† But it is only to a certain extent, for the number of County Surveyors who have, in 1891, supplied answers to the questions circulated to them is considerably less than in the previous year,—e.g., in 1890 replies were received from forty-eight counties against thirty-five in 1891. As there are sixty-three County Council counties in England and Wales, it will, therefore, be seen that Mr. Heslop's report relates to very little more than one-half of this part of the kingdom.

Nevertheless, there is very much in it which is most worthy of careful perusal, and so far as it goes, it is an indicator, and is only one, of the progress, or the want of it, which is being made in this important branch of public work. Not the least interesting of the replies to the question, "Have you any further information to offer as to cost and desirability of road-rolling by steam or otherwise?" Many of the County Surveyors have either given no reply, or not one of any value; but it appears from the remainder that (a) eleven counties the main roads are now steam-rolled, and that the adoption of this method in those counties meets with general approval; (b) in three counties steam-rolling is not practised, but is recommended; whilst (c), the other hand, three County Surveyors are doubtful of its advantage, or disapprove of it. These are as follows:—1. Hertfordshire still think that too much is expected from the use of a steam-roller, and frequently remark that by its use are less able to bear heavy traffic than roads formed without a roller. It is apparent, however, from what the gentleman subsequently adds—"I am, however, going to try the use of steam-rollers and horse-rollers on some of our main roads"—that his opinion is not based on any experience with respect to the main roads of Hertfordshire, and that he still proposes an experiment with that which has been unanimously condemned, viz., horse-rolling. We beg leave to doubt the value of the evidence on which this opinion about the comparative inability of steam-rolled roads to bear heavy traffic may have been formed.

We will pass on to the report from the North Riding of York. The County Surveyor here says, "I find that steam-rollers wear to a very uneven surface, lump

* The Builder, May 30, 1891, p. 423.
† Particulars of Management of Main Roads in England and Wales." 1891.

and full of potholes." The experience of this surveyor is not exceptional, but is generally due, not to the use of the steam-roller, but to carelessness or ignorance in the best mode of applying it, in the arrangement of the metal which has to be so treated, in the want of judgment of the nature and treatment of the subsoil, and in the quantity of water and binding material necessary. Where these points have received the considerable attention which is necessary, the defects above mentioned have disappeared. It is a business which requires to be learned, like all others, and is successful if well done, but not otherwise.

The third case of objection is that of Northamptonshire, whose Surveyor is very decided, as follows: "Nothing further than this, that I will do my best to prevent steam or other rollers being used in my county. Abundant use of the rake, &c., is far better, and considerably more economical, than any roller."

It will be as well before making any further comments on this matter, to quote one or two opinions from other counties, in diametrical opposition to those proceeding from the three counties above named.

Kent.—"Experience proves beyond doubt that the lengths of roads which were rolled last season in those districts where the roller had not been previously used, bear the traffic better than the remainder not so treated, and the general public highly approve of the change."

Westmoreland.—"I am a strong advocate for rolling by steam-power, and think it is in the long run a great saving of cost. In one case, on a heavy-traffic road, which required metalling every second year, it has stood five years."

Norfolk.—"The two 10-ton rollers worked by me have given every satisfaction, and have effected a considerable saving in labour and materials."

York (West Riding).—"All roads should be rolled by steam-rollers. Horse-rollers are worthless. Having the supervision of 1,000 miles, I am decidedly of this opinion."

The actual cost of steam-rolling is not given in a many cases, but is stated to be as follows:—

Sheshire...	12, per day per roller.
Worshshire.	18s. 8d. "
Essex	1d. per yd. super.
Worfolk ...	9d. to 1s. 1d. per yd. cube for granite.
Kent	1s. per yd. cube for flint and limestone.
	1s. 3d. per yd. cube for granite.

There is no doubt that though there are certain limits above and below which the cost of steam-rolling never runs, it is not very easy to generalise.

One of the most complete reports recently made of the cost of steam-rolling has been that made by Mr. Allan Greenwell (the Surveyor of Frome Highway Board) to his Board of Somersetshire. The stone used, 6,000 cubic yards, was nearly all mountain limestone, and the cost was 8-8d., or nearly 9d. or cube yard, or about 3d. per square yard. Each cubic yard sufficed for 17 superficial yards of road. Part of this work was on main and part on district roads, and the work was carried on in the spring and summer. The roller used was 10 ton, with a width of ft. 3in. He says:—"I believe that at least 10 per cent. of material is saved as compared with stone worked in by the traffic; and, as regards labour, all after-raking is avoided, and scraping is reduced to a minimum. Extraordinary instances in favour of steam-rolling have been furnished by the late severe winter. Materials which were laid in the autumn of 1890, but not rolled, were still consolidated in the spring of 1891, and the waste caused by the trituration under the traffic upon the frozen roads was so great as to necessitate a further coating in that year. This coating had been rolled, it should have lasted three years."

In connexion with this matter the importance of the use of a binding material is very often overlooked, and it is well to

recall the experiences of Mr. Deacon* at Liverpool:—

No. 1. 1,200 superficial yards trap rock took twenty-seven hours to roll and consolidate without any binding.

No. 2. 1,200 superficial yards ditto took eighteen hours to consolidate with trap rock chips from a stone-breaker.

No. 3. 1,200 superficial yards ditto took nine hours to consolidate with a binding composed of one-fourth macadam sweepings, obtained in wet weather, mixed with silicious gravel, from 3/4 in. to pin's-head size.

And he reported that No. 3 wore better than No. 2, and No. 2 better than No. 1, whilst the time taken for No. 3 was one-third that for No. 1. This points very clearly to the fact that it is an economy, as practised in Monmouthshire and some other parts of the country, to transport binding material as well as metalling on to the roads; and more especially is this the case where inferior metal, such as Kentish rag, is used.

But the point of all others which is to counties the most vital is the establishment of a correct system of management, and, therefore, we have perused with considerable interest the replies which this report supplies to the question, "Do you contract for the entire maintenance of any of your roads?" In analysing these replies, we find that after two years of County Council control, six different methods are at the present time being practised in these thirty-five counties, as follows:—

- 4 counties, viz., Leicester, Hereford, Northampton, and the North Riding of Yorkshire, contract with Highway Boards.
- 4 counties, viz., Hants, Oxford, Huntingdon, and the West Riding of Yorkshire work on agreed estimates between Highway Boards and County authorities, the actual cost of the work being paid in some, and perhaps in all, of these cases to the Highway Boards.
- 2 counties, viz., Salop and Wilts, contract for a portion of the roads with Highway Boards, and place the remainder under the direct control of the County Surveyor.
- 1 county, viz., Gloucester, contracts for labour only.
- 1 county, viz., Kent, contracts for the whole, partly with Highway Boards and partly with private contractors.
- 20 counties are under the direct management of the County Surveyor and his staff, and
- 3 gave vague or no replies.

It will be seen, therefore, how large a proportion have decided to adopt the policy which has on several occasions been advocated in our columns, viz.: the direct control and management of the main roads for the County Councils by an experienced professional man of satisfactory status, in preference to any form of general contract for maintenance.

The systems of Gloucester and Kent are in each case peculiar. In the former the contracts are confined to labour only, a method which meets with the decided disapproval of the County Surveyor. The County Surveyor of Kent, on the other hand, says that "the result has been very satisfactory." There seems to be something in connexion with contracts in that county which we do not understand, but it is certainly remarkable for roads to cost over 100l. per mile throughout a whole county, even for one in metropolitan proximity, and it must not merely be questionable whether the system in that county is an economical one, but whether the great satisfaction is real or imaginary.

Next to the system of direct control, that of agreement to repay Highway Boards the whole cost of the main roads seems the most sensible one, where those Boards have authority over large areas, or considerable lengths of main roads; but there are these etrong objections to it,—firstly, that the Highway

Board's surveyor, who executes the work under the County surveyor's specifications, has two masters,—his Highway Board and the County Council,—and, secondly, that one part of his work is paid for out of local rates, whilst the cost of the remainder is covered almost entirely by general taxation. We have treated this branch of the subject at greater length than we should otherwise have done, because we are satisfied that much public money is being wasted or misdirected in those counties where the direct system of control of main roads is not in force. There are other matters in Mr. Heslop's Report, especially those connected with footpath responsibility, and the working time of roadmen, which merit perusal, and we trust that he will receive general support in the compilation of complete returns from every part of the Kingdom, for the preparation of these annual reports, from which everyone should derive much benefit.

NOTES.

print in another column a letter which Mr. W. H. White has been commissioned by M. Chipiez to write in answer to our remarks (pp. 114-115 ante) in regard to the inaccuracies of the Parthenon model made under his direction. M. Chipiez does not apparently attempt to question our statement as to the inaccuracy of the position of the metope sculptures, but asserts that the Americans must have made a mistake in putting together the model, which was sent over in pieces. As far as the metopes alone are concerned the succession of subjects is arranged, as he says, in accordance with Michaelis; but the series commences at the wrong end of the building; the series is right in itself, but wrong in relation to the pediment sculptures. Whether they were correct in the model as erected at the 1889 Paris Exhibition we cannot say, because though we visited that Exhibition two or three times, the model was not on view there till a late period of the Exhibition, subsequently to our visits. In regard to the entasis of the columns, M. Chipiez states that they were worked according to a photograph which showed fully that degree of entasis. This appears to amount to an admission both that the model was not made from measurements, and that M. Chipiez did, as we said, neglect English data which would have prevented this mistake. Owing to the partial decay of the upper parts of many of the columns, a photograph of the remains does at first sight produce the effect on the eye of a considerable entasis; but we have examined the line of the better preserved columns in a photograph which gives them about 6 in. height, and found the lines absolutely straight with a straight-edge, while a photograph of M. Chipiez' model, making the columns 3 1/2 in. high, shows a most decided and measurable curve. The actual curve is about half an inch in 31 1/2 ft., which of course could not possibly show on that scale.* M. Chipiez is indignant with us for accusing him of indifference to British sources of information. We may ask him whether it ever occurred to him to test his work by the minute measurements given in Mr. Penrose's hook on the Parthenon? If he had availed himself of that source of information as to the actual facts of the Parthenon design, instead of trusting to the general impression conveyed in a photograph, he would have saved himself from a palpable mistake (which he cannot in this case put off on the Americans), and would have been able to say that he had gone to the best source of information within reach, which he has obviously not done.

REPORTS had reached us that the Corporation of Manchester intended to alter the interior of Barry's building, the Royal Institution, in order to obtain more hanging

* We may add that the entasis is equally exaggerated in the model in the British Museum, but that is confessedly a much rougher piece of work.

* "Proceedings Inst. C.E.," vol. lviii. p. 13.

room for the annual picture exhibitions, but it is only within the last few days that we received the information that the Corporation propose to do this by deliberately destroying the most original and characteristic feature of Barry's interior, viz.: the two colonnaded corridors leading from each side of the gallery of the central hall. It seems almost incredible that such a piece of stupidity should be seriously contemplated, and that too in the name of Art. Barry is our greatest architect since Wren, and his work should in any case be respected; but in this case the feature it is proposed to destroy is one of special elegance and originality. The two small galleries were designed for the exhibition of sculpture, for which they are admirably adapted, while the effect of the vista through them is a charming one, worth in itself a visit to the building. The additional space obtainable for hanging pictures by this piece of architectural destructiveness will be very small, but the important point to be noted is that the Manchester Corporation or their advisers seem totally blind to the fact that architecture is an art as well as painting; that art does not mean pictures (which is the popular idea of the matter) but all forms of artistic expression; that architecture is the monumental and central art on which all the others depend and around which they are grouped, and that to destroy the most artistic feature in the building in order to find more room to hang pictures is the most ludicrously illogical proceeding that can be conceived, and is opposed to common sense as much as to artistic perception. The proposed alteration will rob the building of an area for light and air which is very much wanted, will add very little to the picture-hanging space, and destroy the best feature of the architecture. If it is carried out, it will be a lasting discredit to the Manchester Corporation authorities, in regard to any claims to æsthetic perception, that they should have deliberately spoiled the work of a great architect on such illogical and inadequate grounds. No one has more interest in pictorial art than we have, but the idea that painting is the only art, and that everything else is to give way to banging pictures, and architecture to be cut up or destroyed at pleasure with this object, is the idea only of people who are ignorant of what art really means.

THE meeting in the Chapter-house at Lincoln last Saturday, to which we referred last week, appears to have resolved on the demolition of Wren's Library without a dissentient voice. The scornful remark of one speaker that "in one case they had a specimen of the most beautiful period of Gothic architecture, and in the other they had a Palladian structure," is like going back to the days of the *Ecclesiologist*. Cathedral cities are usually about fifty years behind the rest of the world in their ideas, and Lincoln seems to be no exception to the rule.

THE great "stoppage" experiment in the coal trade is now being tried, and a great amount of unanimity prevails among the many thousand miners of this country on the subject. A very small proportion remain at work this week, and great pressure has been brought to bear upon the few who have not come out. Several collieries in North Wales at which the men had not given in their notices were visited by Federation agents last Saturday with the view of persuading the men to cease work. The attempt was only partially successful, and those who still persisted in remaining at work were threatened with expulsion from the Federation. Certainly many worse things might befall them, and perhaps some of the more far-seeing among their English brethren would be rather glad if they were likely to be punished in a similar manner. There is no disputing the fact, however, that the majority of the miners look upon the step they have taken as being a wise one;

and consider that they will be able to resume work next week free from any apprehensions of a reduction in wages. They are exhibiting an utter disregard for anyone but themselves, and appear to think that they are now in a position to dictate what shall be done in regard to production, hours of labour, &c., independently of masters, or of any other interest whatever. The spasmodic inflation of prices, combined with the reduced output, will doubtless produce great temporary activity; but it cannot be long before things will find their own level again, and the loss sustained by the country in the meantime will intensify the demand for a reduction in the cost of fuel. The effects of the struggle will be keenly felt on the Tyneside, where much distress exists already in consequence of the protracted strike of engineers, which is still unsettled. There will doubtless be distress in many other districts, and certainly a great amount of inconvenience in all directions; but it is to be hoped that the fact that the greatest hardships are already falling upon the poorest classes, will have its due influence in bringing about a speedy termination of the dispute.

THE following are the members of the Royal Commission appointed to consider the question of metropolitan water supply: Lord Balfour of Burleigh (chairman), Sir George Barclay Bruce, C.E., Professor James Dewar, F.R.S., Sir Archibald Geikie, Mr. George Henry Hill, C.E., Mr. James Mansergh, C.E., and Dr. William Ogle, M.D., F.R.C.P. This is a very good and representative Commission, but the terms of the reference are not satisfactory. The Commission is only to consider—

"Whether, taking into consideration the growth of the population of the metropolis, and the districts within the limits of the metropolitan water companies, and also the needs of the localities not supplied by any metropolitan company, but within the watersheds of the Thames and the Lea, the present sources of supply of these companies are adequate in quantity and quality, and, if inadequate, whether such supply as may be required can be obtained within the watersheds referred to, having due regard to the claims of the districts outside the metropolis, but within those watersheds, or will have to be obtained outside the watersheds of the Thames and the Lea."

Thus apparently the most important question, viz. where London is to go for water if the supply has to be obtained outside the watersheds of the Thames and Lea, is outside the power of the Commission; so at least the wording of the reference would lead one to infer.

THOSE who are interested in the maintenance of open spaces and the prevention of the further overcrowding of buildings in London should turn their attention to the proceedings on the Bedford Estate, where there seems to be a fixed intention to turn every available corner of ground into money, at the expense of sanitary conditions. Lately some small houses facing Caroline and Charlotte streets, just south of Bedford-square, have been pulled down, and the longitudinal space between them, parallel with the south side of Bedford-square, is offered as a building lot, for the formation of a new street of houses between Caroline and Charlotte-streets. Not only will such a street crowd up the houses very much, and deprive the district of some much-required breathing space, but the operation must necessitate the cutting down of a good many trees now standing on the ground. To deprive the centre of London of any trees still remaining, unless under absolute necessity, is a piece of mischief which cannot be too strongly deprecated, and the policy of the Bedford Estate in these matters is both selfish and shortsighted, as it is not only spoiling the amenity and healthfulness of the neighbourhood, but reducing the value of the property in the effort to grasp every penny that can be made out of it. Surely some higher authority ought to have power to check this insanitary crowding up of London spaces by grasping ground landlords.

BY a clever *coup* the Prussian Government obtained from the Budget Committee of the Diet a resolution which recommended the House to vote ten million marks (some 500,000*l.*) towards the expense of erecting a cathedral at Berlin, and, as such recommendations are mostly followed, Professor Raschdorff now has some chance of seeing his design for the new "Dom" carried out. According to a report on the discussion that took place on the matter in the Budget Committee, the Emperor will erect the cathedral and not the nation as such. The nation will only vote the money towards the erection; the Emperor's private Board of Works will manage all matters relating to the building, and will also bear all responsibilities. The Government stated that on no account would they at a future date ask the taxpayers for more money than the ten millions, and must hence assume that the Emperor will raise such extra funds as may be necessary. For the German public the cathedral question no longer exists,—the matter has become distinctly distasteful to them. In art circles the feeling is not so much against the cathedral scheme, as such, as against the despoiled selection of the architect (a Court favourite) and the adoption of a poor design on an unpopular site.

FROM Berlin we hear also that the distribution of the Schinkel Medal and Travelling Studentships which took place on Sunday last has, for once, after an interval of several years, been a most satisfactory affair, and that in spite of the small number of candidates Architectural competitors were required to send in a design for a "people's theatre," and engineers were to send in designs for a bridge over the Rhine between Cologne and Düsseldorf. In both cases only two sets of drawings were submitted, but in both cases each piece of work was considered to be so satisfactory that the assessors decided to give four medals of equal value. The names of the two architects are O. Spalding and H. Heutrich. The medals were, as usual, given at the special meeting which the Berlin Architekten-Verein regularly holds on Schinkel's birthday, and this time the Minister of Public Works represented them in person instead of sending a representative.

IT was recently announced that the "Jerusalem" Exchange would be removed Tuesday last from Cowper's-court, Cornhill, to fresh quarters in Billiter-buildings. This is severed an old association, in respect of locality, with its quondam neighbours "Robin's," "Jonathan's," and "Garraway's" in Change-alley, and the "Jamaica," in St. Michael's-alley. The last-named was rebuilt from the designs of Mr. Banister Fletcher, architect, in 1885. The "Jerusalem," which is stated to have been established in 1660, became a well-known coffee-house some years later, when coffee had been first made and sold in St. Michael's-alley; Aubrey says by John Bowman, or, according to other accounts, Pasqua Rosee, a Greek, "at the sign of his bandhill, 'of his own head.'" Unlike others, it retains its pristine character, having for long formed a meeting-place for merchants and shipowners connected with our South African, East Indian, and Australasian commerce. The subscription-rooms, and Jerusalem-chambers, Cowper's-court, were built in 1879, after the late E. Bassett Keeling's designs. A fire which broke out in the powder-closet of Eldridge, wig-maker, in Exchange-alley, on March 24, 1748, destroyed all the coffee-houses we mention: "Tom's," "Rainbow," and the "Three Tuns," in Cornhill; with several others between Cornhill and Lombard-street, including the "Geese and Vulture," the "Pennsylvania," the "Marine," the "Fleece," the "Swan," also the house in which Gray the poet lived, and the London Insurance Office, which appears from a plan made by Thomas Jefferson in that year.

AT the Mart, on May 30 next, will be offered for sale the Rothley Temple estate, lying on the high road between Loughborough and Leicester, by a branch of the Soar, and near Charwood Forest. It consists of 900 acres, with a total rent-roll exceeding 2,000*l.*, that of the house included. In the house, which is built of stone, and was at that time the seat of his uncle, Thomas Babington, was born Lord Macaulay (of Rothley) on October 25, 1800. Adjoining it stands a small chapel, reputedly of the thirteenth century, a relic of the Templars' Commandery or Preceptory at Rothley. In 1086 the manor of Roels or Rodolie, was held by the King. In 1230 Henry III. granted the manor and church together with Croxton Abbey to the Knights Templars, who had another settlement at Swinford, in the same county. On their suppression these possessions passed, 17 Edward II., to the Knights Hospitaller of St. John. At the Dissolution the preceptory was valued at 87*l.* 13*s.* 4*d.* in the MS. *Valor*, but Dugdale's assessment of Rothwell, Heather, and Dally-on-the-Wolds preceptories (Leicestershire) amounts to 231*l.* 7*s.* 10*d.* nett.* In 35 Henry VIII. Henry Cartwright had a grant of the manor and advowson: he sold the former to Humphrey Bahington, who, in 1667, bought the latter of Sir Amhrose Cave. Some exceptional jurisdiction, in both civil and ecclesiastical affairs, prevails throughout the Soke, as derived under Henry III.'s grant to the Templars, and which passed with the conveyance to Bahington. In 1722 a Roman pavement, and some foundations of a wall, were discovered at Rothley.

SOME extensive re-building is about to be carried out at and near the southern end of Tottenham-court-road. The Association for Promoting the General Welfare of the Blind, founded in 1856 by the late Miss Gilbert, have cleared a large space for their new premises and workshops by the north-western corner of Tavistock-street, the ground slutting on Morwell-street in the rear. The "Horse Shoe" tavern and dining-rooms are to be re-built after the designs of Mr. J. M. Knight, architect; the "Oxford" Music-hall,—one of the earliest of the kind in London, and standing on the site of the old "Boar and Castle" posting-house,—is to be reconstructed at a cost, we hear, of 27,500*l.*; and the "Flying Horse," together with some adjoining premises in Bozier's-court, is to be demolished (Messrs. Saville & Martin, architects). Our readers will perhaps remember that the last-named quarter was marked for demolition under the first London County Council's scheme for widening this end of Tottenham-court-road, at a cost of 42,900*l.* A committee recommended that the owners of houses on the western side of Bozier's-court, which would then acquire frontages to the road, should contribute one-half of the increased annual rental value for a limited period, but their recommendation was rejected—see the *Builder* of October 10 last. The beneficial leasehold interest in the "Oxford," together with the "Boar and Castle," and Nos. 18 and 20, Oxford-street, was sold at auction in October, 1890, for 57,100*l.*, the lease having then twenty years to run, and the ground rents amounting to 25*l.* per annum.

A GENEROUS offer, made by Sir John Lennard, Bart., lord of the manor, to sell his interest in West Wickham Common for 2,000*l.*, considerably lightens the labours of the Bromley and District Commons and Footpaths Preservation Society. That Society, we gather, proposed to contest a threatened encroachment of the land. The area consists of 25 acres, whose value is tentatively computed as between 700*l.* and 800*l.* per acre, lying between Hayes Common and Coney Hall

Farm, and not far distant from Croydon, Bromley, and Beckenham. It includes some finely-wooded hilly ground, together with some ancient earth-works. In response to an application for a scheme to secure the land for public enjoyment, the Board of Agriculture undertook to hold a preliminary inquiry to decide whether it falls within purview of the Metropolitan Commons Acts. The Board have now postponed such inquiry *sine die*, and it is to be hoped that the efforts promoted by Miss Octavia Hill, Mr. S. B. Bevington, Mr. Shaw-Lefevre, M.P., Mr. Israel Davies, and others to raise the necessary purchase-moneys will prove successful.

WE may call attention to the useful work unobtrusively carried out by the "Society for Preserving Memorials of the Dead," one of whose recent meetings is briefly noticed in another column. The Society takes on itself the task of promoting the repair and preservation of memorials which seem in danger of being forgotten, neglected, or injured, and in so doing is carrying out (in accordance with its motto, "Patribus et Posteris") a work of reverence towards past generations and of usefulness, in a historical sense, for future generations.*

A CORRESPONDENT sends us the following extract from the *Kentish Gazette* of July 4, 1878, which, in connexion with the subject of strikes and combinations of working men, is worth reprinting as a curious illustration of the way in which these things were regarded a century ago, and of the progress of Liberal ideas since then:—

"TO JOURNEYMEN CARPENTERS.
NOTICE.

The Commissioners of the Canterbury Pavement, having taken into consideration the late combination among the journeyman carpenters for advance of wages, by which the public improvements intended to be made in this city, are very much impeded, do hereby give notice, that they are determined, at the next General Sessions of the Peace to be holden for this city, on Monday next, the 9th inst., to indict such of the said journeyman carpenters as do not in the meantime return to their work, all such combinations being contrary to law, and every person having entered therein by subscription or otherwise, is liable to be punished by fine or imprisonment, or both, at the discretion of the Court.

By order of the Commissioners,
JOHN HONGES, Clerk.

Guildhall, Canterbury,
July 4, 1878."

THE rage for architectural competitions seems in Australia to be passing all bounds of reasonableness. A Sydney building journal mentions the case of a man who has been advertising for competition plans and designs for "a mountain residence," not even offering a premium or hindering himself to accept any design or employ any one of the competing architects. We have not quite got to that in England yet, though we seem on the high road to it.

THE exhibition of the Institute of Water-colours cannot be said to rank very high this season. There is the usual amount of commonplace and less than the usual amount of noteworthy work to redeem it. We may remark however in the first place that there is rather a large proportion of drawings in which architecture takes a principal part. Mr. Yeend King's small works, "Salisbury Spire" and "On the Bath Road" (20, 22) are very clear little pictures full of light; Mr. Alfred East in "Wet Weather" (30) gives the prominent place to a curious little roadside church; Mr. S. Graham Petrie has painted "Clivus Capitolinus, Rome" (57); Mr. Jules Lessore sends a large view of the "St. Mark's, Venice" (120) and the Piazza, broadly treated but dull in colour; Miss Louise Rayner sends what we call a topo-

graphical drawing of "High-street, Oxford" (130), correct but ineffective; Miss Walker's "Tomb of Richard II., Westminster Abbey" (131*) has the same kind of merit; Mr. Walter Tyndale gives a pleasant study of a quiet old building, "The Beuginage at Bruges" (133); Mr. C. E. Herne makes a fine study, on a large scale, but again somewhat prosaic, of the west towers of Westminster Abbey (168); Mr. Macquoid paints effectively "An Old Cloister, S. Pablo, Barcelona" (248); Mr. Yeend King again greets us with a brightly-treated little view of "Norwich" (388); Mr. Graham Petrie contributes a fine study of part of the Roman forum remains, one of the best things of the kind in the exhibition; Miss E. Rynd gives a carefully-worked but rather loaded view of the "Court-yard of the Palazzo Vecchio, Florence" (443); Mr. H. Pilleau the entrance to the Ducal Palace (447), a pretty but hard drawing; Mr. H. G. Hine a clever and real effect of "Ludgate Hill in Fog" (472); Mr. Lessore has a study of houses bordering "Tutton Pool, Plymouth" (504), and Mr. Macquoid a view of "Stokesay Castle" (709). Among works of special interest in a larger field may be mentioned Sir James Linton's one contribution, "Ah me, when shall I marry me" (407), a figure of a country girl, with more of character and less of decorative effect than is usual with this artist; "Harvest Time" by Mr. Leopold Rivers (121); "Arab Trophies" (255), a good bit of still-life, by Mr. S. B. G. Watkin; "Ammonites" (283), a study of the same class by Miss Kate Whitley; "His ain fireside" (284), a capital little painting of an interior with a Renaissance mantelpiece, by Mr. Fulleylove; "Carting sand, Hambleton Common" (19) by Mr. Jas. Orrock, a large landscape in a fine pure water-colour style, a little dead in colour; "On the Downs" (416) by Mr. E. M. Wimperis; "Pilgrims to Holy Island" (459), a characteristic scene by Mr. F. G. Cotman; "Evening Glow" (487) by Mr. J. M. Bromley, a large powerfully-treated landscape rather startling at first in its strong colour, but which is really a very truthful representation of a landscape under a rather unusual effect of evening light; and "On the River Arun, Sussex" (596), a fine landscape by Mr. C. E. Johnson.

THE views of "The Tidal Seine" by Mr. W. H. Bartlett, now at the gallery of the Society of Fine Arts, form an interesting collection of views of the lower Seine, executed in a slight but broad and thoroughly artistic style. Some of the best are not on the Seine (visibly) but in field-looks on its banks. The artist has in two of the drawings endeavoured to give a realisation of the remarkable feature of the river, the formidable "hore" that rushes up it at spring tides, a phenomenon so striking and unusual that any picture of it must be interesting, though we cannot feel that the effect is very powerfully given here. The quieter scenes are more successful; "Among the Willows, Vieuxport," which has a beautiful effect of sunlight; "A Lavoir on the Gertrude," with the village on the opposite bank framed in the opening of the washing hut; "On the Villequier Road;" "The Quarries, Yainville;" "A Silver Summer Morning," &c. The collection is well worth a visit both for its artistic and topographical interest.

AN interesting and clever Friday evening discourse was given at the Royal Institution last week, by Mr. F. T. Piggott, whose articles on Japanese decorative art in our columns a little while since, under the signature "F. T. P." will be remembered by our readers. Mr. Piggott took for the title of his lecture "Japaaesque," the word expressing the character of some of the English work done when Japanese art first began to attract attention here, and when it was thought that any kind of irregular throwing of sprigs on a plate or other object gave it Japanese character; an idea which perhaps is not quite

* See vol. vi., part 2, of the 1890 fol. edition. In W. Burton's "Leicestershire," 1777, will be found full details of the three rentals, as scheduled 46 Edward III.

* The Secretary is Mr. William Vincent, to whom communications can be addressed at the rooms of the Royal Archeological Institute, 17 Oxford-mansion, Oxford-street.

extinct now in some quarters. Some of the illustrations of "Japaneque" of this kind were very amusing, and fully justified Mr. Piggott's criticisms. His claim for true Japanese art is that it shows a clear regard for proportion and contrast in the placing of decorative design, and a perception of the value of untouched spaces; that Japanese sprigs are not tossed anyhow on a surface, but exhibit a definite system of growth and design, which is of course perfectly true, and was illustrated in the examples shown. Some other conclusions of the lecturer we cannot so readily accept. He denies that the Japanese misuse landscape as decoration, maintaining that they only paint a landscape upon a plate instead of on a piece of canvas, and that it is "landscape" and not "decoration." The result to the eye, however, is the same, and we are still of opinion that landscape-painting is out of place on plates and trays. Mr. Piggott also pointed out that in decorating door-panels the Japanese do *not*, like their English quasi-imitators, begin a branch of tree on one panel and continue it on the next as if it had passed under the stile; they paint a picture the size of the two panels, and cut it in two, placing half in each panel, and the line of a tree or a hill commences on the second panel where it left off on the first, and is not continued by an imaginary line under the stile. This was illustrated by a picture of the eternal Fusiyama, treated in this way. The method is constructively logical, no doubt, but that does not prevent it from being pictorially clumsy. Some of the illustrations of Japanese design shown on the screen, however, were charming, and the library was filled with interesting pieces of Japanese work which formed a centre of attraction after the lecture. The subject of Japanese figure-drawing was wisely avoided, and the lecture was a complete success in the way of interesting an audience and giving them something to think of; but we fear it did not convert us to a belief that all the mystery of decorative art resides in Japan, and there only.

ARCHAIC COMPARED WITH ARCHAISTIC SCULPTURE:

ROYAL ACADEMY LECTURES.

DR. A. S. MURRAY, F.S.A., Keeper of the Greek and Roman Antiquities in the British Museum, delivered the first of a series of three lectures on sculpture to the students of the Royal Academy on the 13th ult. He commenced by observing that the archaic age of Greek sculpture lasted, roughly speaking, from 600 B.C. to 500 B.C. There was no doubt much sculpture before 600 B.C., but it inclined rather to the primitive order. After the year 500 B.C. there was a period of perhaps fifty years in which many traces of archaism lingered on, but, broadly, it was between 600 and 500 B.C. that Greek sculpture passed through the stages commonly called archaic. Considering the archaic sculptors, with their love of minute observation in every kind of detail, and the graciousness with which their laborious accuracy was generally set forth, one was struck by the amazing contrast which they presented to the great age which immediately followed,—which, in fact, followed so quickly that the men who were greatest in the great age had been as youths trained in the archaic school. It was matter of conjecture whether the great age of Greek sculpture would ever have been but for the long period of elaborate painstaking which had gone before. But we failed to trace the transition, so suddenly did the new age burst forth in all the glory of Pheidias. The archaic sculptors were as men leading the way to a Promised Land which they must not enter. One or other of them might have had a pre-cognition of what was to come, but as a rule the scope of all their thought and labour was the attainment of perfection within the particular manner and method in which they had been trained. When that perfection of manner and method was achieved, it was for a fresh generation to break new ground, and so it happened that in archaic sculpture we had a clear and distinct set of phenomena which might be studied apart, without reference to

the subsequent age. They had to make a comparison between archaic sculpture on the one hand, and between a series of sculptures which at first sight seemed not to be different. The latter were called "archaistic," and perhaps the very slight difference in the form of the two words "archaic" and "archaistic" was not a had indication of what they had to expect. Yet there was in the meaning of the two words a strong contrast. The Greek in which the New Testament was written was called "Hellenistic" because the writers were not Hellenes; but, not to cite further instances, the distinction was that "archaic" meant truly "old" while "archaistic" meant an "affectation of being old," the termination "istic" always implying imitation or affectation. They might demand to have some proof that there was such a thing as archaistic sculpture, however ready they might be to accept a stage of sculpture of that kind as a perfectly natural result of civilisation of Greece in later times. The lecturer pointed to a cast of a marble relief found in Athens, and representing the side view of a temple, in front of which, separated by a wall, were two figures, recognisable as Leto with her sceptre and Artemis with her torch. On the extreme left, behind Leto, is a pillar surmounted by a tripod; and when they compared that fragmentary relief with other reliefs of the same subject (there were several in existence) they found that the missing portion on the right had contained a group of Apollo Citharodes receiving a libation from Victory; just such a group, in fact, as they saw in another marble relief in the British Museum, where Apollo Citharodes was receiving a libation from Victory beside a temple. From the presence of a tripod on the fragmentary relief it was supposed that all these reliefs had been sculptured at the instance of men who had gained prizes in musical contests and who wished to commemorate their own success under the guise of a victory of Apollo. That would be consistent with the reverential feelings of the Greeks. But a special point in these reliefs was that the capitals of the temples were always Corinthian. It was plainly impossible that the sculpture could be archaic, since the Corinthian capital was not known until long after the archaic age. One of the earliest examples of the Corinthian order was the monument of Lysicrates at Athens,—the "Lantern of Demosthenes," as it used to be called,—and it was erected to commemorate a musical victory in the year 335-4 B.C. Between then and Roman times was the flourishing period of that order, and somewhere in that period the two reliefs mentioned would fall. If for no other reason than the architecture they could not be archaic, but they affected to be archaic, and, therefore, they must be called "archaistic." Incidentally, the lecturer pointed to the curious device of the sculptor in placing a high wall between the figures and the temple; what he wanted was, of course, a background for the figures, and nothing could be better than a wall. Most temples were enclosed by walls, and figures outside the walls would revive a familiar association of ideas. In a similar manner the sculptor of a well-known relief in the Museum, called the "Apotheosis of Homer," had chosen to hang a curtain in front of the columns of his temple. So, also, in another very interesting relief in the Museum, representing the visit of Dionysos to Icaros in Attica, there was a curtain stretched to form a background to the figures, and so far concealing the architecture behind. What the sculptor required in all these instances was a background. What the facts of the case required was a view of the interior of a temple or a house within which the scene was believed to be taking place. If we took the sculptor literally, the scene was quite outside the temple,—even outside the enclosing wall. But he meant the temple to be taken as a sign or symbol of a locality where there was a temple within which such scenes were conceived to be enacted. In the case of these musical reliefs the Temple of Delphi seemed to be indicated by the presence of an omphalos and of a great plane tree in another of these reliefs. The lecturer next directed attention to a cast from a relief in granite which represented Hermes holding his caduceus and a lyre,—not that he was a musical god like Apollo, but he was inventive, and it was he who invented the lyre. He had thus a right to carry the instrument as a symbol. The relief in question was found at Canopus in Egypt, on the site of a temple erected there by King Ptolemy

Euergetes I. It could not therefore be older than the date of that king,—the second century B.C., and might be considerably later. Yet at first sight it seemed a piece of archaic sculpture. The lowness of the relief, the way in which the mantle was folded and pressed flat, the attitude of the figure, the shape of the head, the manner of rendering the hair, these were all points suggestive of archaic art. But that was only at first sight. Looking closer, we saw that the long piece of drapery was absurd, and that the whole figure was decidedly imitative. These instances, selected from many, would be sufficient to show that there did exist in the later age of Greece an actual school of archaistic sculpture. But how did that curious taste arise? We had to remember that in that later age Greek art was in the condition of having exhausted its creative faculties. It had expended them in the grandest fashion; it still had but exhausted them. Its technical skill was unshaken. Demands for new sculptures came thick and fast from the Roman conquerors, and perhaps those Romans might have spared some of the older sculptures of Greece if the contemporary Greek artists could have supplied them with works equally suitable to their tastes. No one could justly say that the Greeks after the Roman conquest never made an effort to do something great,—to lash their jaded imagination, and to create a new school. The sculptures of Pergamon would be a contradiction. But the general fact remained, that after the Roman conquest the imaginative power of the Greeks was gone, while their technical skill and training were great. Artists in that condition would naturally have a keen sympathy for archaic sculpture. Its mannerism and methods were all within narrow limits. They could easily be appreciated. The trick could be acquired of imitating them with the same facility as contemporary poets showed in imitating Homer, and what added to the success of the new movement was that the Roman conquerors and patrons had a particular passion for archaic Greek sculpture. But it was only fair to the Greeks to hear in mind also that though the spirit which had pervaded archaic art was swept out of existence in the early part of the fifth century B.C. by the great wave of freedom which produced works like the sculptures of the Parthenon, yet a very considerable portion of those archaic sculptures remained in Greece to be seen of all men ever down to the time of Pausanias. Under these circumstances the appreciation of works of archaic sculpture would never wholly die out. Mr. Murray concluded his first lecture by appealing at some length and in great minuteness to the evidence afforded on the subject by painted vases and coins.

Mr. Murray delivered his second lecture on the 18th ult. He said it would not take long to run over the various points which, according to his light, distinguished the archaic from the archaistic among the sculptures of which I exhibited casts or drawings. Among the casts were two figures from the outside of a marble cylinder which appeared to have been used as a well-head or puteal, forming a sort of herring round the mouth of the well. For its purpose there was an obvious convenience in the low flat relief. If the work were archaic, the lowness of the relief would be a simple matter of necessity, for nothing else was then known. But let them see whether the work was archaistic. The marble puteal in question was found at Corinth and brought to this country by Lord Guilford in the early part of the present century. It was placed in his house in St. James's-square, and was there seen frequently by persons interested in ancient art. A cast was made and presented to the then Lord Aberdeen,—The traveller Thane, Athenian Aberdeen,—The traveller Thane, Athenian Aberdeen. From him the cast came to the British Museum. But meanwhile the original marble had disappeared. What had come of it no one knew. The time came when Lord Guilford's house was sold. The new owner set to work to alter it greatly, but it did not appear to be quite certain whether he had acquired a right to the sculptures in the house as well as to the house itself. There were other sculptures besides the puteal. At all events the house seems to have been pulled to pieces a good deal, and the sculptures were no more heard of, with one exception. A few years ago the lecturer was asked to look at an interesting Greek bas-relief in a house in Comaught-square. It turned out to be one of Lord Guilford's marbles, and was at once presented to the Museum. But the puteal was still missing, notwithstanding.

creditable attempt which was made by the Hellenic Society some years ago to hear of it by circulating engravings which they had made from the casts. For the immediate purpose of the lectures this Corinthian puteal was a sort of test. The Hellenic Society, in publishing the engravings referred to, printed at the same time an article by Prof. Michaelis, of Strassburg, to whom they had sent photographs. Speaking of one of the figures known as Alomena, he said (*Hellenic Journal*, vi., p. 48):—"The character of real archaism is still more apparent in the figure of Alkmena, the hard archaic treatment of whose drapery is scarcely to be recognised in the engravings. It strongly recalls some figures in the Thasos relief in the Louvre. On the whole, the photographs strongly corroborate the view of those scholars who would like to ascribe the marble, not to some late period of imitated archaism, but to an earlier epoch in which true archaic feeling began to be blended partly with a certain dawn of freedom, partly with a slight exaggeration of traditional habits." It would thus be gathered that there had already been a good deal of dispute about this Corinthian puteal. The subject, which extended around the whole surface, represented the gods going to the marriage of Heracles, the principal feature being a line of deities following one after the other, each carefully marked out by some special attribute, and each at a fair distance from the other, as would be seen in the casts exhibited. There was a suggestion of fear lest the deities might not be all recognisable unless their familiar attributes were clearly put forward: that did not look archaic by any means. Then we were struck by the amount of vacant space between and around the individual deities, which gave the design an air of parade—not to mention that it saved the sculptor from difficulties of composition, which a closer grouping of his figures would have caused. Further, there existed a number of reliefs on marble, which represented very similar subjects, and in a strikingly similar manner. These reliefs had been found in Rome; they occurred on bases or altars which from their shape belonged as clearly to the Roman age as anything that could be conceived; there never had been the least question about it. On these also the figures were wide-spread, reminding us of a line of columns; the relief was low and flat; there was hardly such a thing as artistic composition in them; whatever composition there was was more of an architectural kind. There was a manifest intention to imitate archaic sculpture in details, but an equally evident regardlessness of its spirit of design. What was true of these Roman altars and bases seemed to be true also of the Corinthian puteal, and the lecturer therefore considered it quite natural that many archaeologists had considered the sculpture to be an archaic work of Roman times. If others, like Professor Michaelis, had thought otherwise, it was because they assumed that the true archaic age had in its last days exhibited an "exaggeration of traditional habits," and because they left too wide a margin for these exaggerations. Prof. Michaelis had compared these casts with the archaic reliefs from Thasos, in the Louvre. But on examination the widest differences would be found. For example, to take the figure of Hermes, with wings on his heels. Archaic sculptors knew that these wings were attached to sandals, and did not grow out from the heels of Hermes; they would never have allowed themselves to represent those wings in such a manner. The sculptor of the figure must also have known that the wings ought to be attached to sandals; but he was probably afraid to put sandals on the feet, lest by so doing he might take away from what some would call the purism of his figure, but which we should call the affectation. Besides, the archaic curl of the wings told more instantaneously when not attached to sandals, and the desire of the sculptor was to get an instantaneous effect of archaism. So, also, the drapery which fell over the arms of Hermes had been planned and sketched simply and solely for a pretty effect. The female figure, taken by itself, and not, as it stood on the marble, in the middle of a line of ten figures, had not much that was easily detected as archaic. It was a much simpler matter to catch the archaic manner in a draped female figure like that. But even then, how different was the beautiful freshness and significance of every part of the Thasos reliefs. One

could never see the originals in Paris without the deepest admiration, so sweet was the conception of each individual figure, and so true to that conception was the careful, assiduous, affectionate working-out of the details of drapery and form. Of the ten figures in the Corinthian puteal, three were male, the Hermes already referred to, then Apollo and Heracles. The lyre of Apollo was very conspicuous, as was to be expected; but when we came to Heracles, the sculptor had made quite sure of the recognition of the figure. A club or lion's skin would have been enough; he had given us club, lion's skin, bow, and quiver. The lecturer next proceeded to speak of another and unquestioned archaic example—a marble relief in the British Museum representing a female figure offering an oblation or sacrifice before a warrior, behind whom was his horse and attendant. On the top of the slab was a late Greek inscription commemorating certain men who had fallen in some battle. The battle was not specified, nor was the name of any particular man mentioned in the inscription. The writing was clearly very late, and it was equally clear that the monument was not the monument of one man, but a memorial tablet for a certain group of men who had fallen. The warrior with his horse and attendant was a type of those who had fought and perished. The slab being undoubtedly of a late date, it followed that the sculpture, so far as it professed to be archaic, must really be archaic. It professed very much to be archaic. To consider the figure of the warrior, and to take just one point,—the way in which the lower part of his cuirass was rendered. Compared with fact or with true archaic art, it was an absurdity, a gross exaggeration; and yet, with its preciseness, and its truthfulness to the actual shape of a cuirass apart from its adaptability to the man who wore it, the cuirass might be archaic. The aim of the sculptor was first to get his cuirass exact, whatever happened to the man; and, secondly, by that and similar means to imitate archaic art, which he knew was always faithful in details. The horse was a great difficulty, and the sculptor was, perhaps, wise in his generation to show us only a part of the animal. Anything more wooden it was impossible to conceive. Horses and animals generally did not suit the archaic sculptor, for they were the same, or nearly so, in all ages. They had no pronounced habits or peculiarities which could be caught up and made conspicuous, like the armour of men or the costume of women. In the costume of men and women in the archaic age there were certain points which were easily recognised. For instance, there was a love of long ends of drapery falling in characteristic folds of a zig-zag outline. Having dwelt upon the treatment of drapery in archaic sculpture, Dr. Murray concluded his second lecture by referring to the influence of the conquering Romans in promoting the production of archaic Greek sculpture. We could not but feel, he said, that the imitation of archaic work must always have appeared more or less insincere to the Greek artists, however little able they might have been to produce anything original. The Romans had no such ideas. They had known archaic Greek work in its own day, and their hereditary love for it caused them to seek imitations of it. When the great ages of Phidias, Praxiteles, and Lysippos were passing in Greece, the Romans were busy with their own affairs. When the archaic revival occurred in Greece, it must have appealed strongly to the Romans, who, as fate would have it, just then acquired dominion over Greece.

Dr. Murray delivered the third and concluding lecture of this series on the 22nd ult. In the latter portion of it he returned to the archaic manner of representing animals. In one relief they had already seen the fore-hand of a very feeble horse. But there was in the British Museum another sculpture which represented, in very low, flat relief, and with an obvious pretence of being archaic, a group of Castor holding back his horse; behind him was a dog. He might say "Beware of the dog!" but, had as it was, it was not much worse than most of the dogs of true archaic art, and therefore its badness could not be cited alone as a proof that the work was archaistic, but only as being perfectly consistent with that being the case. Even in so fine an archaic work as the Harpy Tomb, there was a dog which, so far as he was visible at all, was little better than the one on the Castor relief. But it was the painted vases

which furnished the best examples of the feebleness of the archaic Greeks in the representation of dogs. Indeed, the Greeks never appear to have succeeded perfectly in their dogs,—a strange thing, considering how unsurpassed they were in most other animals. The dogs of modern Greece were very ferocious and unfriendly; they might have been so in antiquity also, and that might have led to negligence in the study of them. But even pet dogs, like that of the poet Anacreon, as we saw it on several of our painted vases, were rendered with an amount of feebleness which was unintelligible, side by side with the strong, confident drawing of the figure of Anacreon. Returning to the relief, it would be a fair inference to say that the sculptor could have made a much better dog if he had not been following a poor archaic model, making bad worse. The tail of the horse was a failure as a reproduction of the archaic manner. His mane was more like a frill than a true hogged mane, such as was seen in the Parthenon frieze. But here there was some excuse, because the hogged mane was rare in archaic work; a long, flowing mane was what was liked, as we saw in abundance on the painted vases. What struck one as curious in this relief was that a sculptor who was obviously desiring to produce an archaic effect should have taken the conception of his group from the Parthenon frieze, which had nothing to do with the archaic spirit. The figure holding back a horse was a conception which was first immortalised in the Parthenon frieze. But while retaining the Parthenonic element in the horse, the sculptor had added an archaic element in the figure of Castor. The design as a whole suggested a comparison with a slab of the west frieze of the Parthenon, where we saw a horseman on foot holding back a horse which reared with impatience to join the cavalcade in front. In that slab the horseman was standing at the off-side of the horse, and was thus partly concealed from view; but we could compare the manner in which the drapery flowed across his left shoulder with what was seen in the Castor relief. It would be observed that the mantle of Castor was represented in very low artificial folds, intended to look archaic, and that at the point where they had to cross from the shoulder to the background the sculptor had made them sink down immediately to the background, as if he had been afraid lest an appearance of thickness in the drapery just there would have been injurious to the effect of very low flat-relief which he desired to produce. It was a complete disregard of the true and natural movement of drapery in such an attitude. How different it was on the slab of the Parthenon. There, the left arm was extended in the same way; and the mantle, in a perfectly natural manner, was thrown backwards by the movement, and then rushed out into one of the most magnificent realisations that could be imagined of the thick folds of a mantle as affected by rapid movement. It was true enough that the Greeks, even in the good times, did not always pay due regard to the obvious effects of movement in such matters. In the Phigaleian frieze, for instance, there were many examples of drapery which, instead of following the movement of the figure, was made openly to adapt itself to a certain space which had to be occupied, even in defiance of the action of the figure. The lecturer next called attention to another cast from a marble relief in the British Museum, representing Heracles overpowering the Keryneian stag. The subject was common in antiquity, and as to this particular version of it, it had been disputed whether it was truly archaic, or only archaistic. Suspicions were aroused at first by the fact of its being placed within a frame obviously designed for some casual decorative purpose, and from its being altogether wanting in those true architectural mouldings which we should expect in earlier work. Some parts of the relief were modern restorations. But among other parts the neck and shoulders of the deer were ancient; and yet, could anything be more absurd than the rendering of them? It was the merest feebleness and imbecility. The body and head of Heracles were more carefully studied from earlier models; but if they were examined in detail it would be seen that they also were little better than a parody of true archaic art. Yet the whole composition and execution had passed for a time, among otherwise good judges, as "probably archaic," with just a slight reservation of doubt. In

conclusion, Dr. Murray said that in these lectures he had tried to point out the differences that existed between archaic and archaistic sculpture. In most cases those differences were obvious enough. In regard to others, a certain amount of controversy still existed. He had thought it would be interesting if we could in some measure trace the origin of the archaistic movement in Greece in the third and second centuries B. C., and the reasons why the Romans, when they became masters of Greece, gave so liberal an encouragement to that movement. These inquiries had often led them away from the actual works of sculpture to the consideration of such matters as the conditions of national life, or the characteristics of national literature in the two periods in question, in the hope of deriving some light from those quarters. He could only hope that those inquiries might not have been altogether unprofitable.

EGYPT EXPLORATION FUND.

THE fifth ordinary general meeting of the members of this Fund was held on the 11th inst. in the hall of the Zoological Society, Hanover-square. Sir John Fowler, the President, occupied the chair.

Mr. H. Gruber, the hon. treasurer, read his report, which stated that the balance-sheet would be found to compare very favourably with its predecessors, and even with that of last year. The favourable state of affairs was again due to the indefatigable labours and splendid organisation of the hon. secretary and vice-president, Miss Amelia B. Edwards; to the continued valuable and unremitting labours of the hon. treasurer for America, the Rev. W. C. Winslow; and to many individual members of the Fund. The total expenditure for 1890-91 was 2,547l. 15s. 4d. The total receipts for the same period were 3,092l. 18s. 8d., including subscriptions and donations amounting to 2,694l. 1,050l. being sent through the Rev. W. C. Winslow; and 100l. from the University of Philadelphia. He wished to draw attention to the fact that the Fund was now freely launched into a double undertaking,—viz., into that of survey as well as excavation. How successful the latter had been it was unnecessary for him to say, but he might add that the survey promised well to follow in its footsteps.

Mr. Mackrell, in moving the adoption of the report, said that it was not creditable that England should be almost outdone, in its support of the work by America.

Mr. A. J. Woodhouse seconded the motion, which was adopted.

The President said that the first word he had to address to them was to express his and their deep sorrow and regret at the absence of Miss Edwards, and especially at the cause of her absence. Miss Edwards had been for many weeks dangerously ill, and he was sure they all hoped that she might be soon restored to health and strength. They had suffered great losses in the deaths of Sir William Gregory and the Hon. Russell Lowell. Proceeding to mention some of the work which their explorers had done in Egypt last season, he said that M. Naville had excavated the Temple of the Egyptian Hercules at Abnas, which he surveyed the previous year. He had found six granite columns, about 17 ft. in length, with palm-tree capitals. One of these, quite perfect, was now in the British Museum, and having personally seen and admired it, he (the President) could strongly recommend them all to pay it a visit, for it appeared to him to be one of the most perfect and remarkable Egyptian works he had ever seen. This column bears the names of Ramesis II. and his son Meneptheteh, the Pharaoh of the Exodus. The other five columns had been distributed amongst various museums. M. Naville had also found a granite colossal statue of Ramesis II., sent to the United States, also a large lion couchant, which had been sent to the Watt Institution, Greenock, and a red granite bust of Ramesis, sent to the Charterhouse, besides many valuable small objects which had been distributed. The Rock Temples of Beni Hassan and Elbesheb had been surveyed, the inscriptions copied, and the best of the wall-paintings reproduced. This important work had been performed by Mr. Newberry, Mr. Fraser, and Mr. Blackden. The whole of their united work would be brought out in two parts during the present year, and would undoubtedly be one of the most interesting and valuable publications of the Fund. In conclusion, the

Chairman mentioned that Mr. Blackden, the artist (an Academy Student), had given his services gratuitously to the Fund.

A report by Miss Paterson, on behalf of Miss Edwards, having been read, a resolution was passed recognising the valuable services of Miss Edwards and Miss Paterson.

Mr. Percy E. Newberry then read a paper on the work of himself and his colleagues at Beni Hasan and El Bersheb, in the course of which he said:—I have been asked by the Committee to lay before you the report of the work done by the officers of the Archaeological Survey of Egypt since it was started eighteen months ago, and to report to you that the great work which you have undertaken now rests on a solid basis. The general object of the survey was explained to you at the last general meeting in a paper by Mr. Griffith, the originator of the idea and the honorary superintendent of the work. The object was briefly this,—to catalogue, measure, and copy all the monuments which exist above ground in Egypt. The scheme was suggested by Mr. Griffith in 1889, approved of and referred to the Committee at the general meeting in 1890. The Committee considered the matter, and in August, 1890, a sum of money was voted in order to enable me to study under Mr. Griffith and work out with him the details of the scheme. The details having been duly prepared, I started for Egypt early in November, 1890, and, on my arrival in Cairo, I was joined by Mr. Fraser, who had meanwhile been appointed engineer to the survey. On the 25th of the same month we left Minieh, and arrived the following day at Beni Hasan, the site agreed upon for our first season's work. The report of that work has already been published by me. . . . Mr. Fraser, Mr. Blackden (the artist who joined the expedition in February, 1891), and I remained at work in the tombs of Beni Hasan until the early summer, when we returned to England. During the summer Mr. Fraser was engaged in drawing in ink the plans of the tombs at Beni Hasan; I meanwhile preparing for the photographer some 10,000 square feet of tracings which I had outlined in pencil at Beni Hasan. At the same time I also worked through the MSS. of Burton, Hay, and Wilkinson, preserved in the British Museum. Early in October Mr. Fraser left England for Beni Hasan, where he arrived on October 30, to complete his sketch survey of the tombs there, and on the 15th of the same month I followed, taking Paris on my way, to examine the MSS. of Champollion and Nestor de l'Hôte. After making copies excerpts from these, I immediately proceeded to Egypt, and was joined at Alexandria by Mr. Howard Carter, a young artist whom the Society had engaged to assist me in tracing. We then proceeded together to Beni Hasan, and within three weeks Mr. Carter and I finished our work there, having traced some 2,000 square feet of painting. We then moved on to El Bersheb, and encamped in the ravine behind the Coptic village of Dér en Nakhlleh. At El Bersheb, curiously enough, only two inscribed tombs were previously known to Egyptologists. These were: the well-known tomb of Tahutihotep, containing the paintings of a colossal statue on a sledge being drawn by 172 men; and the tomb of Abarekht, inscriptions from which had been published by Professor Sayce in the *Revueil* about two years ago. Within a quarter of an hour of my arrival at El Bersheb, however, I had the good luck to discover ten more inscribed tombs, all of about the twelfth dynasty, and containing many lines of inscriptions. It is simply extraordinary that these should never have been noted before, as they all lay within 100 yards of the tomb of Tahutihotep, and six of them were actually on the same level. They had most of them suffered from the effects of an earthquake, which must have taken place before Coptic times, as on many of the fractures of the stones are painted Coptic crosses and inscriptions, which date from an early period. Several of the walls of the tombs here have fallen in, and been fractured into hundreds of pieces,—some weighing about a ton, others no higher than a walnut-shell. The bigger blocks had to be carefully moved, and then I had, with Mr. Carter's assistance, to fit the smaller pieces on to the bigger blocks and then trace them. By this means I was enabled to restore many a picture and several important things. In one case I fitted together about thirty fragments, and restored a block about 1 ft. square, taking nearly half a day to do it. But I was well repaid for my trouble, as I found that the name of one of Tahutihotep's

daughters was inscribed upon it, and, moreover, the name of one of the daughters we did not know of previously. By fitting up an innumerable quantity of fragments, and by the help of the inscriptions and paintings still intact upon the walls, we have been able to glean a goodly harvest from the El Bersheb tombs, and withal a harvest which shows the importance of the scheme which the Society has undertaken. It is only by the most patient examination and study of the inscriptions and paintings that one can attain any really satisfactory result. . . . The chief result of the past two seasons' work is, of course, that we have now not only plans of the tombs, and water-colour *fac-similes* of many of the most interesting scenes, but copies of the inscriptions and outline tracings of all the wall-paintings in the tombs at Beni Hasan and El Bersheb. The entire work of the past two seasons up to three weeks ago (with the exception of four of Mr. Blackden's drawings) is now before you. There are, as you will see, water-colour drawings by Mr. Blackden, plans by Mr. Fraser, photographs by Mr. Fraser and myself, as well as these rolls of tracings. The majority of these I pencilled in on the walls during my first season's work; and I reckon that there are here upwards of 14,000 square feet of tracing-paper covered with pencil outlines, 12,000 ft. of which at least I have done with my own hand. . . . Before concluding this part of my report, I ought to add that the sketch survey of the tombs and hill at El Bersheb is now being done by Messrs. Blackden and Fraser, and that it is hoped that it will be completed before the hot weather sets in. It is much to be regretted that we have not more water-colour drawings this season (we have only about an eighth part of what were done last year), but this is owing to the fact that Mr. Blackden has had to superintend the work of excavating and the sketch survey of the tombs. . . . Making copies of the paintings and inscriptions at Beni Hasan and El Bersheb is not, however, all that I have done for you this season in Egypt. I have also explored the Nile Valley from Minieh to Kusiye, on the left bank, and from Zawyet el Mayyitin to Hawata, on the right bank, and have noted all the mounds, place-names, and objects of archaeological interest within that district,—a district about forty miles long. No records of exploration on the left bank have been made since the beginning of the century. Going down the Nile as far as Nezala Ganuh, I struck to the west through the town of Kusiye to a Coptic village named Mór. To the west of this village is the Bahr Yasef, then a stretch of cultivated land. To the west of this, again, is a wide expanse of sandy desert, traversing which one reaches the hills of the Libyan chain. Excavated in these hills nine east of Mór are tombs of the sixth, twelfth, and twenty-sixth dynasties. A few miles farther to the north is the village of 'Awiga. To the west of this are tombs in the hills, and a very large cemetery at the edge of the desert,—a cemetery which extends northward nearly as far as Bawit. North-west of Bawit are two uninscribed limestone quarries. From Bawit to Minieh the hills are all sand-choked, with the exception of a few cliffs east of Derwa and Tunek. At Gebel Tunek is one of the boundary steles of Chbenaset, dated in the eighth year of that monarch's reign. Having explored the Libyan hills from Mór to Minieh I then took a horse and explored the villages and mounds of the cultivated lands. At Daschtit, Honr, Dernt en Nakhlleh, and a few other villages are small mounds. The village of Gilga is built on an enormous mound, one of the highest that I have seen in Egypt. The mounds at Esbmannin, which mark the site of the Greek Hermapolis, are being dug away for shakh, and in a few years' time all traces of them will be as completely obliterated as the extensive mounds which are said to have existed opposite Beni Hasan. On the east bank of the river are remains of sixth dynasty tombs at Zawyet el Mayyitin and at Shekh Said; eleventh and twelfth dynasty tombs at Beni Hasan and El Bersheb; eighteenth dynasty tombs and monuments in the ravine behind the modern village of Beni Hasan, at El Bersheb, and further south at Tel el Amarna. Behind Dér ahu Hannes and Der en Nakhlleh are enormous limestone quarries in the hills, containing hundreds of Demotic graffiti of the time of Nectaneho, as well as many Coptic graffiti and paintings. In the *débris* below the tombs at El Bersheb and Shekh Said I also found a large number of stone chisels

similar to those I discovered last year. It is probable that these boulder-chisels were used very generally in Egypt, but none have been recorded from other sites than those already mentioned. On December 21 I left camp early in the morning with Mr. Carter to visit Mr. Petrie at Haggi Qandil—a village situated about twelve miles south of El Bersheh. Returning along the hills the same evening, we fell in with a party of Bedawin. I had previously been making inquiries among the natives as to whether any tombs existed in the ravines some distance from the river. These Bedawin had heard of this, and their Shekh volunteered the information that he knew of a tourah, or tomb, some distance back and in the desert immediately east of Haggi Qandil. On my offering him a little bakbabbish he promised to take me to the place. I then bargained with him to supply the necessary camels, and asked him to stay the night at our camp, so that he might not have the chance of giving us the slip, as Arabs often try to do. He stayed with me; and next morning, at sunrise, Mr. Carter and I, together with the Bedawee Shekh and four of his men, armed with guns and spears, started off into the desert for this "tourah." At four o'clock the same afternoon, after a hot day's desert ride, we sighted large masses of limestone and alabaster chips, and in less than half an hour were inside what proved to be, not a tomb, but the famous alabaster quarry of Hat-Nuh,—the quarry to which Una went to cut the alabaster altar for his sovereign more than 5,600 years ago. This quarry was the most famous one of the ancient kingdom, and in it I found cartouches of Chufu, Mer-en-ra Pepi, and Nefer-Ka-Ra, as well as several short inscriptions.

The paper was illustrated by a number of water-colour drawings by Mr. M. W. Blackden, an Academy student, and tracings and genealogical tables by Mr. Newberry.

The President, in proposing a vote of thanks to Mr. Newberry, said that his paper was a clear indication of the immense value of the publication which would shortly be issued.

Mr. Stanley Lane Poole, in seconding, alluded to the patience and assiduity which Mr. Newberry had bestowed on the work, and to the exceedingly valuable records which he had rescued.

A vote of thanks to the President brought the proceedings to a close.

DEMONSTRATIONS ON GREEK SCULPTURE AT THE BRITISH MUSEUM.

MISS EUGÉNIE SELLERS began her sixth lecture,* which was the last of the series, by shortly summing-up the subject-matter of the preceding lectures, in which she has traced the development of Greek sculpture in relief from its beginnings in extremely realistic work, such as we find on the Harpy Tomb, through its later stages, in which increasing concessions are made to the principles of decoration, down to the sculptures of Priene, the last examples of pure Greek art, which ceased to exist before the combination of living forms into pattern was perfected.

The rest of the lecture was occupied with the examination of various sculptures in the Græco-Roman rooms, in many of which we have copies, or at least distant echoes, of the works of great masters. Such are the figures of a youth binding a tænia upon his head, which recalls Polykleitos, whose statues were made to conform to his canon of proportions; the disc-thrower, after the famous bronze statue of Myron, who is in the very act of swinging back his arm preparatory to the throw,—a momentary action, the representation of which was Myron's individual contribution to the art of his age, of which the frequent copies attest its popularity in later years; the slim figures of athletes which are echoes of the work of Lysippus, who aimed rather at the representation of Nature as it appeared to him than at the accurate reproduction of the anatomy of the human form; and, lastly, of the class of *genre* subjects, the figure of a boy pulling a thorn out of his foot, long thought to be Italian work, but now considered to be a copy of an early statue, to which parallels may be found in the homely scenes on the pediments of Olympia, pointing, perhaps, to a Peloponnesian school that affected *genre* subjects.

* For brief notes of the previous lectures, see *Builder*, pp. 141, 164, 184, 207, *ante*.

ARCHITECTURAL SOCIETIES.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—The annual meeting of the Devon and Exeter Architectural Society, which is in alliance with the Royal Institute of British Architects, was held at the College Hall, South-street, Exeter, on Monday last. The President (Mr. E. H. Harottle) occupied the chair, and, in the course of his address, observed that in the Associate section no names were yet enrolled, but seeing there was no lack of assistants and pupils possessing the necessary qualifications, no doubt this would soon be altered, especially if the society was enabled to offer some inducements to them. The forthcoming lectures should form an attractive commencement. He referred to the projected excursions by members for the purpose of visiting, as a body, architectural works of interest, and called their attention to a communication received from the Secretary of the Royal Institute of British Architects, on the subject of "Education in Non-Metropolitan Centres," in which reference was made to the efforts of the Sheffield Society to inaugurate a scheme of education in that centre. He fully concurred with the Secretary in the importance of the movement, and hoped that some such scheme might be inaugurated, with Exeter as a centre, for the south-west. Unfortunately, Exeter had not the educational advantages possessed by Sheffield, where, in addition to the School of Art, there was the Firth College, as well as a Technical School. In that town it was proposed to establish a studio affiliated to those institutions, and conducted by an efficient paid teacher or superintendent. In Exeter they must be content, for the present, at least, with a much lesser scheme by expanding as far as possible the combination of office instruction with that which might be gained at the Science and Art Schools.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On the 10th inst. a meeting of this Association was held in the Architectural Hall, 19, George-street, Edinburgh. Mr. J. Balfour Paul (Lyon King of Arms) gave a paper on "Heraldry in Relation to Architecture," and, after referring to the views of Mr. Ruskin on the subject, he went on to state that the tomb of the so-called Earl of Essex in the Temple Church was the most frequently mentioned instance of early heraldry in Britain. He pointed out that it was perhaps not heraldic at all, and that the practice of bearing arms did not generally prevail in this country till the thirteenth century. In Scotland they found shields adapted to the purpose of mural decoration in the walls of Daudonald Castle, which dated from the fourteenth century, but it was not till considerably later that heraldic decoration became general. He exhibited examples of armorial lintels from Woodhouselee, Caxton Tower, Balconie Castle, Ancrum, and other houses. After describing the heraldic carvings of churches, he exhibited a fine series of armorial hatlements from Harpley Church, in Norfolk, and also an interesting coat-of-arms from the Bridge of Dee at Aberdeen. Having specified the form of heraldic decoration in the interior of houses, he concluded his paper with some observations on the use and the beauty of heraldry as applied to architecture, and gave some practical hints to architects on the treatment of heraldic details. The paper was illustrated by lantern views, and at the close Mr. Paul was heartily thanked.—The Secretary read the following letter he had received regarding the proposed restoration of Linnithgow Palace:—"Her Majesty's Office of Works, 12, Whitehall-place, S.W., March 8, 1892. Sir,—I am directed by the First Commissioner of her Majesty's Works, &c., to acquaint you that the resolution of the Edinburgh Architectural Association, copy of which was forwarded with your letter of 16th ultimo, has been laid before the Board. As, however, the estimates for the ensuing financial year were closed before the resolution was received, it was too late to consider the matter further in connexion with the services of that year,—I am, sir, your obedient servant (signed), H. W. PRIMROSE." There was also read a letter from the Town Clerk of Linnithgow, expressing the desire of the Town Council to co-operate with the Association in approaching the Board of Works to have the amount proposed to be expended on the works increased.

LEEDS AND YORKSHIRE ARCHITECTURAL ASSOCIATION.—On Monday, Dr. Waite, of Wortley, delivered a lecture on "Some English

Ecclesiastical Buildings." Mr. W. H. Thorpe (president) occupied the chair. Dr. Waite treated his subject chiefly from an historical and antiquarian point of view, but additional interest was imparted to the lecture by the exhibition of views of the principal cathedrals, abbeys, and priories of England, which were thrown upon a canvas through the medium of a lantern.

YORK ARCHITECTURAL ASSOCIATION.—At a meeting of the York Architectural Association, held at the Church Institute, on the 10th inst., Mr. W. G. Penty, F.R.I.B.A., past-President, delivered the first part of a lecture on "Technical Education in Relation to Architecture and Building." Mr. A. Pollard, President, presided. A discussion subsequently ensued, and Mr. Penty was heartily thanked for his excellent lecture.

SURREY ARCHEOLOGICAL SOCIETY.

THE annual general meeting of this Society was held on Wednesday afternoon, at the offices, 8, Danes' Inn, Strand, the President, Lord Middleton, in the chair.

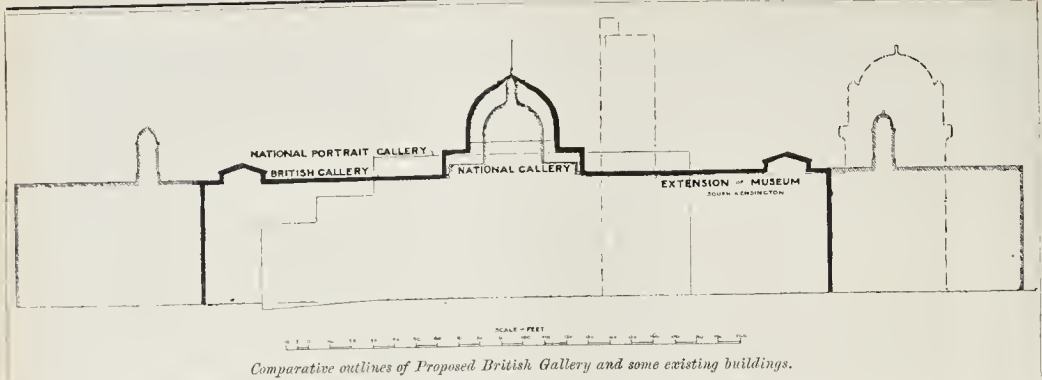

Mr. Mill Stephenson, F.S.A., one of the honorary secretaries, read the thirty-seventh annual report, which, after referring to the meetings of the year, said that Part II., Vol. X., completing the volume of "Proceedings" was issued in August last. It contained several highly interesting papers, that on the "Early History of Battersea" being an important addition to local history. The first instalment of the "Catalogue of the Church Plate of the County" was also appeared, and the catalogue would be continued in the succeeding parts. In carrying out this laborious task the Society was to be congratulated upon having such an energetic worker as the Rev. T. S. Cooper, one of the honorary secretaries. To those working at genealogy the extracts from the "Surrey Wills" and the continuation of the "Visitation" would be found of value. The volume for 1892 was well in hand, and would be issued in due course. An offer of a manuscript "Calendar of the Feet of Fines for the County of Surrey from Richard I. to Henry VII." had been made to the Council, on condition that it be published in a single volume complete. In order to enable the Council to publish that important contribution towards the history of the county, it was proposed to ask for authority to borrow from the reserve fund a sum not to exceed £01., the same to be repaid by yearly instalments of not less than 10*l.* per annum. It was proposed to issue the calendar free to all members whose subscriptions were paid up to date, the Council being of opinion that some recompense was due to the members for shortcomings in the past. The Council regretted the loss of a valued and active member by the death of Mr. C. Vade Walpole, C.B. Mr. F. A. Crisp was elected to fill the vacancy. The following eight Members of Council retired by rotation, but were eligible for re-election, viz.: Hon. G. C. Brodric, D.C.L.; Mr. J. W. Butterworth, F.S.A.; Mr. G. E. Cokayne, M.A., F.S.A.; Lieut.-Col. Davis, F.S.A.; Mr. E. Freshfield, LL.D., F.S.A.; Major Heales, F.S.A.; Mr. W. M. Molyneux; and Mr. Ralph Nevill, F.S.A. The number of Members is 317, viz.: Annual, 218; Life, 95; Honorary, 4. During the year 23 Members had been elected, viz.: 19 Annual and 4 Life. By death, the Society had lost 7 Members, viz.: 3 Annual and 4 Life; by resignation 12 members. Gain over loss, 4. The Society was again represented at the Third Conference of Societies in Union with the Society of Antiquaries of London, held at Burlington House, on Thursday, July 23. A summary of the proceedings will be found in the next part.

The report and balance-sheet having been adopted, and the President and Officers and Council having been re-elected, the meeting was made special for the discussion of the following resolutions, which were unanimously agreed to:—

I.—"That this Society undertake the publication of a Calendar of the Feet of Fines for the county of Surrey, from Ric. I. to Hen. VII., the MS. having been placed at the Society's disposal by one of its members, on condition that it is printed and published in a single volume."

II.—"That, in order to carry out this work, the Council be empowered to borrow a sum not exceeding £01. from the reserve fund, the same to be repaid by annual instalments of not less than 10*l.* per annum."

A vote of thanks to the Chairman concluded the proceedings.

Comparative outlines of Proposed British Gallery and some existing buildings.

Illustrations.

PROPOSED BRITISH GALLERY.

THE view and plan published in this number illustrate the Art Gallery as proposed to be built by Mr. Henry Tate for a gift to the nation, together with his valuable collection of modern paintings, which offer (owing to the Government being unable to find a site) has been withdrawn.

All pictures would be brought in at the back of the building and under the large gallery, for which purpose a good receiving-room is provided, as also cleaning and store-rooms, lifts being in accessible positions to convey the pictures and sculpture to the principal floor; a tramway is also formed to convey the heavy works from one side of the building to the other, and to the lifts. There are also the private and public staircases; the latter continue up to the principal floor, and also to the first and second floors and gallery round Hall, and have at the sides lavatories for men and women; these are externally placed, and can be thoroughly well ventilated; corridors also on either side of staircases lead to special rooms.

The entrance to the principal floor is by a broad flight of steps, having figures on each side (which would be emblematic of Painting and Sculpture), into a large vestibule with offices on either side for the sale of catalogues, and umbrella counter; immediately adjoining this vestibule are covered corridors, in which seats could be placed.

The general entrance to the galleries is (after passing the vestibule) into a large arcaded hall, and with a gallery round. The roof over the hall would be a cupola glazed with ground and figured plate-glass, all the columns, walls, &c., being in British marbles; the floor in centre in large marble slabs, and the parts under the gallery in marble mosaic, and in the centre of the hall a basin and fountain. The hall and adjuncts would be exclusively devoted to sculpture, while the galleries round could be used for the exhibition of miniatures and other pictures.

Not more than two (or at the most three) varieties of marbles, with gold introduced into some of the principal positions, would form the decoration.

The picture-galleries themselves would not be much ornamented, but would simply be in decorative painting in the Pompeian style, and with a good warm colour for background of pictures. The wall-space for pictures (from floor to cove) is on an average 24 ft. high, and the skylights single (blinds being provided to regulate the light).

The floors of galleries would be of concrete, with iron girders, and the top surface finished with oak parquet, while the roofs would be of iron, and ironwork doors at places shown on plan to divide galleries into sections.

The number of galleries is as follows:—

- Two 75 ft. by 40 ft.
- Two 70 ft. by 35 ft.
- Two 50 ft. by 35 ft.
- Two 40 ft. by 40 ft.
- Two 30 ft. by 35 ft. } These could be used as special rooms.
- One grand gallery 130 ft. by 40 ft.

On the first floor is provided the gallery round the large hall, approached from two staircases, and with two galleries for pictures. On the first floor also is a council-room, secretary's office,

cloak-room, lavatories, &c., while above would be two rooms for clerks.

As to the style of the building: Necessarily a picture-gallery must be top-lighted and practically on one floor; the only suitable style is Classic; refined mouldings with Greek feeling and ornament sparingly introduced, the chief study being to get good sky outline, proper massing, good proportion, and well-broken front, and carving and figures of the best character. Panels for suitable inscriptions are introduced, and the crowning feature (at the base of the cupola) is a bronze group of figures which would be illustrative of British art.

The building would have been faced with stone in two colours, with polished granite columns to the principal entrance.

A diagram is given showing the size of the building as compared with the National Gallery, National Portrait Gallery, and South Kensington Museum new proposed additions.

SYDNEY R. J. SMITH.

INTERIOR OF HOUSE, QUEEN'S GATE.

THIS is the hall and staircase of one of the two houses in Queen's Gate, illustrated in our issue of February 13th, which have been altered under the direction of Mr. F. G. Knight. A description of the work was given when the elevations were published.

TWO SUSSEX BRASSES.

THE two brasses of which we give representations are very fine specimens, and they have also an interest apart from their beauty.

BRASS OF WM. DE ETCHINGHAM.

Etchingham Church is of much interest to the archaeologist. Mr. Sharpe, addressing the Archeological Institute at the Chichester meeting (Chichester Volme, 1856) said:—

"... The two finest examples of entire churches in Sussex (of the Curvilinear period, 1315-1360) are undoubtedly those at Etchingham and Alfriston; they belong both to the latter part of the period, but differ from one another considerably in their general design. Etchingham has nave with aisles, central tower, but no transepts and chancel; its windows have all their original tracery, of good but peculiar form; the chancel retains its original woodwork and wood screen,—its sedilia and piscina, all of considerable interest, as well as two fine founder's brasses. . . ." The screen is now gone.

The two brasses Mr. Sharpe refers to lie in the centre of the chancel; one of them is the brass now represented. It lies immediately in front of the steps of the sacarium. It is perfect with the exception of the head, which has been wrenched away, the hilt of the sword, and the canopy, which is all gone except one base. There is an inscription on a quadrangular plate below, and another, a semicircular one, over his head, which latter sets forth that:—"This William caused this church to be entirely,—*de novo*,—re-built in honour of God, and of the Assumption of Blessed Mary, and of St. Nicholas. The said William was the son of James de Etchingham, Knt." The inscription below states that he died about midnight,—*entour my noet*,—January 13, 1388. This inscription is useful in arriving at the date of the building.

THE BRASS OF WILLIAM FFLENLES, CHEVALER.

This is an extremely fine brass, and it has a

perfect canopy. It lies in the floor of the chancel of Hurstmore Church, immediately in front of the steps of the sacarium. The inscription is peculiar in setting forth a promise of six score days' pardon for all who shall say a "Pater Noster" and an "Ave" for the soul of the deceased. The inscription is imperfect; the name and date only are given in the illustration.

The proof of age of this William Ffienles was taken at Worthing, December 6, 1378. Among the witnesses who remembered his birth, one knew the day because it was written in the Missal of the parish church,—an early form of "registration." Another because in that year,—1357,—Giles Parker struck an arrow through his leg in the churchyard of Hurstmore. Another, because the father of the said William Ffienles, then lord of Hurstmore, came to his house and wished to heat him.

There is also in the chancel of this church a fine canopied monument to a descendant of this Wm. Ffienles and his son. They were the lords Dacre "of the South." F. R. F.

HOUSE, STANMORE PARK ESTATE.

THIS is the second of a series of houses lately designed by Messrs. Goddard, Papet, and Goddard, of Leicester, for Mr. Frederick Gordon, Chairman of the Gordon Hotels Company. They are situated upon the Stanmore Park Estate, a new residential district in the neighbourhood of London. Five houses of varying dimensions and a pair of cottages have already been built upon the estate from the designs of the architects above named. On Dec. 12, 1891, the *Builder* published a drawing of "Montrose," the largest of these villas, "Evan House," the subject now illustrated, is of a smaller type; but the most has been made of the space at command.

Leicestershire bricks have been used throughout; those for the facing being wire cuts from Heather. The tiles for the roof and wall hangings are from Messrs. Lewis's Works, at Cannon Chase. Mr. John Bentley, of Leicester, was the contractor, and Mr. Rees, the estate surveyor, has acted as clerk of the works.

MOUNTFIELD, CHISLEHURST, KENT.

THE above house is composed of red bricks with portions half-timbered. The dressing to windows, porch, &c., is Portland stone; parts are tile-hung, and the roof covered with red Broseley tiles.

The hall is oak-pannelled and the ceilings of the reception-rooms are ribbed; casements and other windows are painted white.

The kitchen is placed in front, owing to the situation of the house, which faces nearly north.

The work was carried out by Mr. W. Willett, of Camden-park, from the designs and under the supervision of the architect, Mr. W. Harber.

DESIGN FOR SEDAN-CHAIR.

THIS very graceful design was made by Robert Adam for a sedan-chair "for the Queen": it is not apparent which Queen, as we have not the date of the design. It is engraved in "Works of Architecture, by Robert and James Adam," and we give it as a pendant to the notice and illustrations of Robert Adam's works published in our issue for March 5.

THE LONDON COUNTY COUNCIL.

The first meeting of the newly-elected Council was held on Tuesday last, when Lord Rosebery was elected Chairman (although he only promised to hold the position for a few weeks); Mr. John Hinton (Chairman of the Building Act Committee in the last Council) Vice-Chairman; and Mr. W. H. Dickinson Deputy-Chairman, at a salary of 1,500l. a year, although notice was given by some of the members of their intention to move that the salary to be attached to this post in future shall be reduced to 1,000l. per annum. Mr. Dickinson, as Chairman of the Parks and Open Spaces Committee on the last Council, and in other ways, did good work.

The ten aldermanic vacancies were filled up, Sir John Lubbock and Mr. Beachcroft receiving the highest number of votes. Mr. Beachcroft is a "Moderate," but his work on the Housing of the Working Classes Committee, and on the Parks and Open Spaces Committee during the last Council made him an acceptable candidate to the "Progressives."

The remainder of the sitting was devoted to the consideration of the appointment of committees.

Now that the new Council is complete, it may be interesting to mention that it includes one architect (Mr. Walter Emden), five builders (Messrs. Holmes, Keylock, Marsland, Roberts, and Stevens), five engineers, and six doctors. The lawyers are, however, much stronger numerically than either of the professions we have named.

BUILDING EXHIBITION AT ISLINGTON.

What is described by the promoters as "The Tenth Annual Building Exhibition" was opened in the half-ready and confused state which seems a chronic weakness of such enterprises, on Monday morning last, but even on Wednesday evening it was not completely ready. The tenth exhibition of the kind held in the same building it may be; but it is not the "tenth annual" exhibition in the sense that such an exhibition has been held for ten consecutive years past. As we said on the occasion of the last two or three exhibitions,—which were egregiously failures so far as they claimed to be properly representative of the building trades and allied industries,—the idea that such frequent exhibitions can supply any deeply-felt or widely-spread want seems to be played out. Such exhibitions, as we have before said, may be useful, and even desirable, occasionally,—at intervals of sufficient length to enable progress to be marked. But to be really useful they should be promoted on other grounds than are involved in the pecuniary benefit of the promoters. There should be a responsible and qualified Committee of selection, who would certainly not admit some of the things shown in the present exhibition. For example, there are two or three large stands taken up with broughams, Hansom cabs, and carriages of all kinds. Again, there are several stands occupied with furniture, which might have been more usefully replaced by exhibits of sanitary appliances, which are very meagrely represented. The present exhibition is undoubtedly a better one than the last two or three which were held, but it is not by any means up to the standard which it might attain under such conditions as those we have indicated. Not that there are not here and there a few novelties to be met with, but they need looking for. The great bulk of the exhibits are things which have been shown over and over again. The Exhibition does not by any means completely cover the ground floor, and it would have been far better and more convenient if the exhibits of the Polytechnic and People's Palace Technical classes, &c., had been placed in the vacant space available downstairs, instead of being relegated to the dreary desolation of the otherwise empty galleries.

It is not necessary for us to do more than to give a brief summary of the contents of the Exhibition, which we will for convenience group together according to their kind, without any reference to the numbering of the stands, which is incomplete, and therefore somewhat difficult to follow.

Messrs. Mark Fawcett & Co. show, at the end of the hall nearest the Islington Green entrance, a couple of sections, built up *in situ* full size, of their now well-known method of fireproof floor construction, the merits of which

we were amongst the first to recognise. A recent improvement consists in ribbing or fluting the haunches of the tubular lintels, which are shown made in freeclay (in which material they are being used in the New National Portrait Gallery) as well as in ordinary clay.

The Patent Adamant Stone Company show specimens of their material in its varied applications. In the *Builder* for November 28 last we described this material, and detailed some experiments which were made with it at that time, so that we need not now say more about it. Messrs. A. C. W. Hobman & Co. show specimens of their "Clifton stone" mosaic paving, which has many useful applications, and has been laid in some of the London Board schools, for corridors, &c. Messrs. Fambrini & Daniels show what they call their "Excelsior Art" concrete. Whatever may be the excellence of the material, we will not pledge ourselves as to the "artistic" treatment of some of the specimens exhibited. Mr. E. Jarrett, as agent for Mr. Erik A. Gade, exhibits some columns of Norwegian granites, syenites, and labradorites, which are worth attention.

In the department of bricks, tiler, &c., Messrs. F. Rosher & Co. have a large display of Suffolk and other facing bricks, moulded bricks, copings, string-courses, fluted garden vases, balustrades, &c. Messrs. Ellis, Partridge, & Co., have also a good display of "Redbank" pressed bricks and "Woodville" sandstocks, together with Broseley roofing tiles and Welsh slates. Messrs. Geo. Skey & Co., Messrs. P. & S. Wood, Messrs. Carter & Co., and the Lane End Works, Ltd., are exhibitors of decorative wall and encaustic tiles, &c.

Sanitary pottery is well represented by Messrs. Thomas Smith & Co., and by Messrs. Broad & Co. The exhibits of both these firms include a great variety of stoneware pipes, traps, inspection channels, &c., too numerous to mention in detail.

Architectural joinery and decorative woodwork is represented by Mr. F. A. Fawkes, who shows a pediment-headed door, a dado, and a chimney-piece and over-mantel; by Mr. S. Elliott, who exhibits some admirably clean mouldings; by Mr. Henry Bassant, who has a good display of parquetry; and by Turpin's Parquetry Company, who show, besides parquetry, a large carved oak chimney-piece and over-mantel. The Hand-Carved Wood Company exhibit a large collection of stock patterns of various carved features.

Plaster-work is represented by the Adamant Company, Limited, who show a small erection decorated externally and internally with their "Adamant" plaster; by Messrs. S. Wright & Co., who show their fibrous slabs, with cornices and other enrichments; and by Messrs. Robinson & Co., of Carlisle. As a key for plastering we may mention the production of the British Metal Expansion Company; and as a fireproof and sound-deadening material for packing the hollows of partitions there is exhibited the silicate-cotton or slag-wool exhibited by Messrs. Frederick Jones & Co.

Ventilators are well represented by Messrs. Baird, Thompson, & Co.; Messrs. C. Kite & Co.; the British Ventilating Company; Messrs. J. D. & W. Fryer (at Messrs. Walter Monnery & Co.'s stand); and Messrs. H. W. Cooper & Co.; the last-named firm exhibit glass louvre and hit-and-miss disc ventilators. As mechanical ventilators, we may mention the Blackman and the Wing disc fans, which are shown in motion.

Machinery in motion is exhibited by Messrs. Tangey, of Birmingham; by Messrs. M. Powis Bale & Co.; by Mr. E. S. Hindley; by Messrs. Thomas Middleton & Co. (who exhibit Murray's patent brick-making machine); and by Mr. S. Eddington (who shows brick-moulding machinery). One of the machines at work which attracts a great deal of attention is Moore's "Universal Carving Machine," which performs its work by means of a small reciprocating center revolving at a very high speed. The results attainable with this machine appear to depend upon the operator, but the effect is somewhat flat and tame, as there is no undercutting.

Glazing is shown in two or three varieties. Those we noticed were Mellows & Co.'s "Eclipse" glazing and Mr. S. Deards's "Victoria glazing."

Safety window-sashes and casements are shown in a variety of forms; among them we may name the "Brüloo," Denbeigh's, and Hough's; they all effect the same end by means

differing in detail but not essentially in principle, and there is nothing very new about any of them that we saw. Fast-fasteners are too numerous to particularise.

Amongst miscellaneous exhibits we may mention Kemp's "Unique" water-closet, which is a very good form of the improved hopper closet, with direct flushing, the pan and trap being made in one piece. As far as we observed, Mr. Kemp is the only exhibitor of water-closets in the whole exhibition. Messrs. Durrans & Co. show their patent double-pointed nails, and their man-hole covers, &c. Messrs. E. H. Bayley & Co. show a very good tip-up dustmen's or scavenger's wagon, with top-covers arranged in a better way than any we have hitherto seen. Mason's stair-treads, excellent for their durability; Aspinall's enamel, always useful; Hamilton's brushes; Tilghman's sand-blast apparatus, shown in action engraving glass, granite, or other materials; and a large trophy of tools of all kinds shown by Mr. Nurse, are among other miscellaneous exhibits which we can do no more than mention.

The Harrison Patents Company show self-sustaining gear for hoists and lifts. Harper's new portable elevator or safety scaffolding, consists of a movable platform geared by toothed wheels into the sustaining angle-posts, and capable of being raised or lowered by a man on the platform working a winch handle. The apparatus appears to have a variety of uses, especially for internal decorative work, &c., as well as serving as a lift from floor to floor. It should certainly be seen by visitors to the exhibition.

The "Homocoustic" speaking-tube, shown by the company bearing its name, is certainly a marked improvement on the old-fashioned speaking-tube, with its faulty mouth-piece and whistle, always getting out of order, and its many other objectionable features. This invention should be seen and examined by visitors to the exhibition.

We must not bring our notes of the Exhibition to a close without mentioning that Mr. W. H. Thompson exhibits, amongst other things, a patent appliance in the shape of a safety hold-fast for the jibs of cranes. Every one is now familiar with the huge Scotch cranes now used on every large building job, and numerous have been the serious accidents caused by the chain which holds up the jib suddenly breaking. The method which Mr. Thompson adopts consists of having an automatic pawl and ratchet arrangement at the head of the jib, which comes into play when the sustaining chain breaks, causing the load-bearing chain to become locked in the head of the jib, and thus holding it up. One of these safety jibs is now at work on the building for the Royal College of Music at Kensington, for which the exhibitor's father (the well-known "Thompson of Peterborough") is the contractor. This invention is certainly well worth the attention of builders and contractors; it has only just been made public.

The Exhibition will remain open until Saturday, March 26.

SANITARY INSPECTORS' ASSOCIATION:
ANNUAL DINNER.

The ninth annual dinner of this Association (the first since its incorporation) was held on the 12th inst. at the First Avenue Hotel, Holborn. The President (Dr. B. W. Richardson, F.R.S.) occupied the chair, the vice-chair being occupied by Mr. Hugh Alexander, Chairman of the Council. Among the principal guests were Earl Fortescue, Professor Banister Fletcher, F.R.I.B.A., Mr. Thomas Woolner, R.A., Mr. J. Robbins, Mr. F. O. Crump, Q.C., Dr. Edmunds, Dr. Louis Parkes, Dr. George Reid (Stafford County Council), Dr. Lyon, Mr. Lewis Thomas, Mr. Bonthron, Mr. Macmillan, Mr. F. W. Lyon (L.C.C.), and other well-known sanitarians. In succession to the loyal toasts given by the President, that of "The Houses of Parliament" was proposed by Mr. Crump, and responded to by Earl Fortescue for both Houses, in the absence of Mr. J. J. Colman, who had been put down to respond for the Lower House. Lord Fortescue congratulated the Association on attaining to the dignity of an incorporated society, and on the fact that they appeared so well to comprehend and to apply the motto "Union is strength." He regretted to know that harmony did not always prevail among authorities charged with the care of the public health, and when members of local bodies,—either through ignorance, prejudice, or other motives,—set themselves against the reforming suggestions of the sanitary inspectors, they would

have reason to feel glad that they had become an incorporated body.

The President, in subsequently proposing the toast of the evening, "Success to the Sanitary Inspectors' Association," commenced by referring to the question asked by the Prince of Wales in opening the Congress of Hygiene, "If these diseases are preventible, why are they not prevented?" That question had by some been thought childish, but it was one that demanded an answer, though it was found difficult to answer by those who made these matters their special study. Many diseases were preventible, but there were some which were beyond their control altogether. It was not surprising that it should be so, for the planet on which we lived, in its flight through space, was influenced by causes out of human control, and certain diseases were produced by causes that man would never know. On the other hand, there were diseases caused by famine, war, had sanitation, had social customs, and want of cleanliness; and no better argument could be advanced in favour of the toast than the fact that the Association whose success they pledged was formed for the purpose of controlling preventible diseases. It would interest some of those present to know that it was not only in this but in other countries that the importance of the work of that Association was meeting with due appreciation. A great French Association, the Society of Hygiene, had invited the Association to visit Paris next June, where the Municipal Council and other public bodies would co-operate with the Sanitary Society, and would entertain them at a banquet after showing the members everything that was best worth seeing by men of their profession. He had given reasons to show that a great amount of success had been already achieved, but they must not rest there. They had obtained by the charter the status of a teaching body, and they must both learn and teach. They must have a school, and that school they should have a real, scientific, and not a dilettante school. They must have a home, and some person would some day be generous enough to give them one, or would help them to get it. The toast was then drunk amidst cheering.

The toast of "The President" was proposed by Mr. Macmillan, who said that on first making the acquaintance of the Association at the previous annual banquet, he had been much impressed with the importance of the work of the Association, and what he had since learned of it deepened that impression.

Dr. Richardson replied to the toast. He said that whatever might be his own opinion as to the eulogies bestowed upon himself by his friend Mr. Macmillan, he had no hesitation in declaring his agreement with the high estimate he put upon the work in which they were all engaged. Quoting two lines of his own, founded on a Classic text, the President said:—

"Men never nearer to the gods attained
Than in the task of giving health to men."

He subsequently proposed "Science and Art," coupling with the toast the names of Dr. Louis Parkes (instead of that of Sir J. Crichton Browne, absent through illness) and Mr. Woolner, R.A.

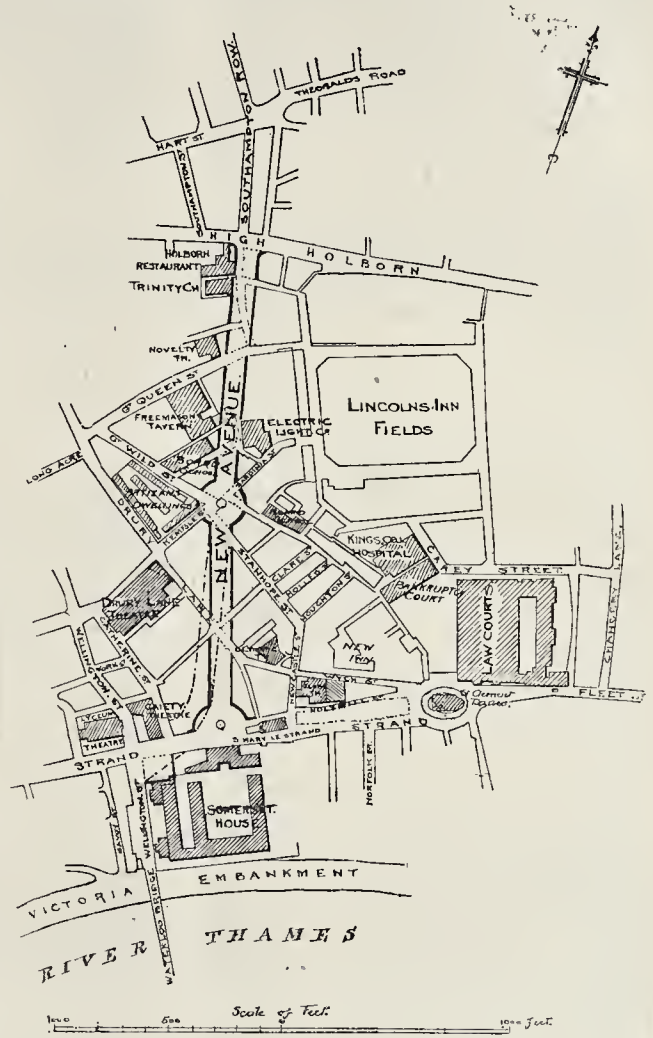

In replying for "Science," Dr. Parkes said he had a due sense of the honourable nature of the task, and he was personally grateful for the generous words of their President in encouraging him to hope to succeed a famous father. The greatest desideratum of the time was that a closer spirit of unity should exist between the two branches of the sanitary service. Between the Medical Officers of Health, charged with the task of curing the sick, and the Sanitary Inspectors, charged with the task of preventing the health of those who were well, there ought to be the most complete entente cordiale.

Mr. Woolner, R.A., said he could perceive the beneficial influence of work such as that of the Sanitary Inspectors' Association upon art and upon the community in general. There could be no question that when persons were healthy they were larger and better shaped, and their faces were more comely. People now were less in sympathy with the poetical idea which was once accepted as a characteristic of beauty—that the face should be "sicklied o'er with the pale cast of thought," than with that of our greatest living poet when he spoke of "Daughters of the plough, blowed with health." If their labours did not yet produce the splendour of colouring of the old Venetian paintings, their tendency was in that direction, for the paintings of our day were more ruddy and splendid in colour than in the days of his youth. Coming suddenly to a practical point, Mr. Woolner said he wished they would help the community to do away with dust-holes. When they went to Paris they would find no trace of the unclean thing. There the dust was brought from the houses by ten o'clock every morning, and by eleven o'clock it had disappeared. He thought one little ounce of practice was worth a good deal of theory.

Among other toasts were "The Executive," proposed by Professor Baillister Fletcher, and responded to by Mr. Hugh Alexander; and "Local Government," proposed by Mr. E. Lewis Thomas, and responded to by Dr. Geo. Reid and Mr. J. Boulton.

PROPOSED THOROUGHFARE STRAND TO HOLBORN.

New Avenue shown thus ———
As suggested by Improvements Committee. - - - - -

Correspondence.

To the Editor of THE BUILDER.

"PROPOSED THOROUGHFARE—STRAND TO HOLBORN."

SIR,—Any proposed alterations affecting London streets must be of interest to architects and lovers of London alike. I hope, therefore, that you will allow me to draw attention to what I consider to be a great fault in the scheme suggested by the "Improvements Committee of the London County Council" for the "Proposed new thoroughfare from Strand to Holborn."* I am aware that the project has been abandoned for a time, but as it is probable that something of the sort will be done before very long, I trust you will be able to find space in your journal for this letter and the accompanying plan.

Of all the large new thoroughfares which have been formed in London during the last

few years, there is not one which has a decent beginning or a decent ending. If this new street is to be "gently curved," as suggested, half into the Strand, and half into Catherine-street facing a portion of the side of the Gaiety Theatre, it can only result, I feel certain, in one more architectural failure.

"The object of bending the street in this direction is to obtain an easy gradient" (I quote from the report), a laudable object, and one to be considered no doubt, but not, I venture to think, the only one when planning a new and important thoroughfare like the one suggested. Its effect architecturally surely ought to receive some consideration. This portion of the scheme is to be condemned not only because it would result in another of those shapeless spaces to which the eyes of Londoners are, unfortunately, becoming so accustomed, but also because, by slightly altering the direction of the street, a noble and dignified termination can be obtained, and without, I believe, any great difference in the gradient.

Somerset House is one of the few fine public buildings that London possesses; unfortunately

* Published in the Builder, October 19, 1889.

the Strand front is so hemmed in at present that it is impossible to see it properly. Any scheme, therefore, which touches that part of the Strand and does not take into consideration the possibility of improving the view obtainable of that fine building carries its own condemnation. But this scheme goes further. If carried out it would utterly prevent any attempt at improvement in this respect being made in the future; in fact it ignores Somerset House altogether. This is, I think, the great mistake its authors make. They take trouble to plan an ugly, inartistic ending to their street, when a grand artistic one can be obtained without any trouble at all. If this new thoroughfare, instead of curving to the west, were brought a little to the east,—barely its own width at the widest point,—it can then, as you will see by the accompanying plan, be carried in a straight line (from Great Wild-street) into the Strand, exactly central with Somerset House. The result will be a fine ending, worthy of a fine thoroughfare. The vista down the new street and under the entrance vestibule of Somerset House into the courtyard beyond ought to be particularly pleasing, and one will then too be able to see Sir William Chambers' design as it deserves to be seen; to greater advantage probably than has been possible since the days it was built.

It may be urged that this plan necessitates a bend in the street higher up. This must be so, I am afraid, in order to avoid interfering with large existing buildings, but I do not think the drawback a really great one. The most pleasing parts of the principal Boulevards of Paris are where they curve, following the lines of the old fortifications, and in this new avenue there would still be a straight vista of nearly 400 yards, which is far enough to be effective, especially considering our existing atmospheric conditions.

To turn to the difficulty in the gradient, I should suppose that a half ciron be formed at the end of the new street, so that the traffic would not have to go up at right angles to the Strand. This, I believe, would bring the gradient pretty much the same as in the plan suggested by the Committee. Even if such were not the case, even if the gradient were a little steeper, better that surely than an ending which it would be impossible to treat satisfactorily. A large open space would consequently be formed here,—the Strand is already wider opposite Somerset House than it is at the end of Catherine-street,—and this space, with the Strand and the new avenue branching out on two of its sides, and Somerset House and St. Mary-le-Strand on the other two, ought to have a really fine effect.

I am told that if proposed alterations interfere with existing public-houses they have to be abandoned. Is London, then, so poor, and are Londoners so indifferent to all artistic considerations affecting their great city, that they will allow a public-house or two to block the way of manifest, artistic improvements? I hope not, sincerely.

One other point I will merely touch upon, and that is the way it is proposed to cut a "slice" off the houses at the end of Wellington-street, to assist the traffic over Waterloo Bridge. That something must be done here is evident; that this is not the way to do it is, I trust, still more evident. If possible, the whole block of houses east of Wellington-street ought to be swept away, and Somerset House allowed to stand free; if that be impossible, at all events some arrangement better than the one "recommended" can surely be managed.

FRED. M. SIMPSON.

18, Conley-street, Westminster.

M. CHIPIEZ'S MODEL OF THE PARTHENON.

SIR,—A "Note" written in the *Builder* on the 13th ult.,—an extract from which appeared in the R.I.B.A. *Journal* on the 10th inst.,—referred to a model of the Parthenon, which is now at New York, but which was executed in Paris, two or three years ago, under the direction of M. Chipiez; and the writer based his remarks upon it from a set of photographs received from America. Having stated that the model appeared to be (1) far from accurate, he criticised (2) the sculptural additions introduced by the restorer, described (3) the entasis of the columns as greatly exaggerated, and stated (4) that the sculptured metopes were in their wrong places, adding (5) that the model was a curious example of French lightheartedness

in matters of the kind, as a French *savant* could not be supposed to learn anything from English sources.

From a written statement by M. Chipiez, which he has forwarded to me, I have learnt:—
1. The Committee in New York, by whose instructions the model was made, appointed a sculptor to prepare a reproduction of the existing portions of the Parthenon according to Mr. Penrose's measurements, and this sculptor employed an architect, unknown to M. Chipiez, to make the necessary drawings. The only drawings supplied by M. Chipiez for the model were of the destroyed parts of the Parthenon.

2. Many of the restorations thus made were "creations." The entire system of roofing was restored, and so were the doors of the Naos and the Opisthodomos. In France, where innumerable restorations of the Parthenon have been and are being made, it is usual to say, "so many architects, so many different restorations," the best of which can only be described as likely to be possible. The declared object of the munificent American donor of the model was to obtain, not a scientific study of archaeological restoration, but a general idea of the complete Parthenon as a work of architecture.

3. The model was exhibited in the Paris International Exhibition of 1889, and the photographs then taken of it, compared with photographs, to the same scale, of the actual monument in Athens, show,—M. Chipiez states,—an entasis of column almost identical. If in the American photographs the entasis appears exaggerated, it is due to circumstances beyond his control.

4. The sculptor referred to appears to have arranged the metopes after Michaëlis, whose work is thought to be an authority on the subject. The metopes, when fixed in Paris, were numbered in the order followed by the German archaeologist. The model was despatched to New York, not in one piece but in a hundred pieces, and put together again after its reception in that city; for the results of which M. Chipiez is not responsible.

5. Both M. Perrot (who has also written to me) and M. Chipiez express themselves much hurt at the assumption that they could not be supposed to learn anything from English sources; and they point to the five volumes of which they are joint authors, and which are well known in England, as direct evidence to the contrary.

I feel sure, from your habitual courtesy and sense of fair play, that you will allow this letter, which is written with the authority and at the request of M. Chipiez, to appear in an early issue of the *Builder*. Permit me, at the same time, to add that a slight acquaintance during many years with distinguished French architects, and with the text of their literary works, has convinced me that their respect for British Classical learning is almost deferential, and that they attach an exceptional value to the collections of the British Museum.

COKE-BREEZE CONCRETE.

SIR,—The apparent uncertainty of some of your correspondents on the subject of concrete induces me to repeat what I have formerly said thereon in your columns.

Several years ago I put up, in some large blocks in London, about sixty floors of coke-breeze concrete, without joists and with a hearing (in the majority) of between 12 ft. and 14 ft. the narrow way of the rooms. The concrete was laid 7 in. thick, and had 2½ in. by ½ in. iron bars buried 18 in. apart on edge an inch above its soft, the ends being threaded on continuous iron rods, built into the walls. Each floor was made as the walls reached the required level. A cement ceiling and floor-surface afterwards increased the thickness to 9 in. For a plaster ceiling and wood floor I would have made the concrete itself 9 in. thick. These floors set so as to form single slabs, and a heavy weight, accidentally dropped on one of them from a great height during the building, merely cut a clean hole, and did no other damage. The roofs were similar, but asphalted on top. Their only fault is that they allow the rooms next under them to get unusually cold in winter, on account of the rapid radiation of heat through the single solid slab; and if I were repeating them now, I should make them double, putting a second skin of concrete 3 in. or 4 in. thick on rough boards, or fillets resting on the main slab. These boards would have to be left there, as they could not be got out.

I have also made a concrete floor and roof, ea 60 ft. by 20 ft. between the walls, without joists or girders. The bars were only a foot apart, but rather smaller, and the aggregate was mainly broken brick (now hard bats). I would never trust so heavy and brittle a material as river ballast shingle for floors and roofs.

I think it is best to put up the floors along with the walls in order that the bars and the rods which they are threaded may be securely built in. The hearing of the concrete itself is of no consequence, as, even if it merely abuts against the walls, it becomes absolutely one with them so soon as it has set.

The walls of the former building were mainly concrete made of Thames ballast, and, on occasion, when the British workmen, with his usual thoughtfulness, had made a large fire in a stove chimney-opening, the ballast concrete was damaged and some woodwork on the other side of the party wall got charred. But I never heard of any trouble with our coke-breeze hearths. I remember to have been told by an experienced concreter that, when one wished to make floors especially proof against sulphur with the cement, I think the proportion named was one measure of sulphur to twenty cement. This might be worth trying for hearth if there is any difficulty.

It is strange to me that we go on making skirting, rotting, combustible floors and roofs of foreign materials, for which we have to pay away at cash, whereas we have at home all the means of making such as will neither shrink, rot, nor burn, and that cost scarcely more than the others. Chinese pigsties one could account for it as done with a view to cheap roast-pork, but we do not do our best humanity.

WILLIAM SIMMONS.

Rosebank, Enfield.

SIR,—Your correspondent, "Contractor," says (page 210) "be sure not to use too much water. Some of your readers might, from this remark, to the other extreme and not use enough. It should be borne in mind that coke-breeze in its pores absorbs a great quantity of water, and that, therefore, more water is required, in fact that it should be more sloppy than would be right for skirting concrete."

There seems to be some doubt as to the capability of coke-breeze concrete to resist fire. I have no experience in this respect myself; but a builder told me the other day that he once set a stove with coke-breeze concrete, made, however, with lime, not Portland cement, and it had to be taken out & reset with brickwork, because the coke-breeze concrete got red hot and set the skirting on fire.

C. F. M.

THE ROYAL COMMISSION ON LABOUR.

SIR,—To avoid mistakes cropping up, I beg to say most emphatically that my clear and distinct contention in to-day's evidence before the Labour Commission—("Building Trades of England Section")—was as to the vicious system of "general contracting" for works of magnitude. I explain that a superintending architect could "let out" each branch of the works to a master workman or better still, price the work by surveyor's valuation and hold the master workman responsible for quality of materials and workmanship.

By this means the skilled workman of energy and enterprise and with a small capital could enter the field as a master workman in his proper branch of trade.

I know of more than one architect of eminence who began by being a skilled workman first. 19d. or 10d. per hour rate of payment for one man is deadening in its effects upon workmen. The most skilful and industrious are discouraged by their pecuniary reward is no greater than that received by their fellow workmen.

In Italy and the United States of America, "master workman" is well-known and appreciated; and I venture to say that it will be a happy day, England when we return to that grand old custom of trade under which our noble old abbays, castles, palaces, and castles were erected, and refer to our standing evidences of hearty and strong construction.

F. A. MOORE.

March 15, 1892.

PAYMENTS ON CONTRACT.

SIR,—May I, in your columns, ask a question some importance?

A contract is signed and sealed between a Self Board and a builder to carry out certain work (with clause as to extra works, &c.), "to the satisfaction of the architect."

Payment is to be made in the usual manner during progress, leaving 20 per cent. (say) to be paid "two months after completion."

The architect gives his "final certificate," including his assessment of extras on completion. The builder thereupon claims payment of same.

Question: Is he entitled to payment before two months have elapsed, as some allege, but I fail to understand? If so, it seems to me that

certificate does more than that great friend to architects, Louis XIV., who changed the gender of a noun, for it abolishes an appreciable portion of time!

I send you my name, but for this purpose initials will suffice. D. Y. B.

HALIFAX MODEL DWELLINGS COMPETITION.

SIR,—I was interested to read the letter in your issue of last week relative to this competition, more especially as four days before I had written to the Institute for their "Suggestions" on competitions, and forwarded these at once to the Corporation, clearly stating that unless the conditions were materially altered I should be unable to send in a design. If all who have applied for the "Conditions" did likewise, whilst under the stimulating influence of their disgust at the clauses, it would be well for the profession.

LOCKE WORTHINGTON.

VARNISH.

SIR,—I should be much obliged if any of your numerous readers would be good enough to advise me, through your columns, as to the best varnish to use over delicate and artistic internal paint work; a clear and transparent varnish, that will not in any way change or dull the finishing tints, but, at the same time, one that is hard and durable, and easily applied.

Copal varnish or French oil varnish make a marked difference in the tone of the light tints, so much used at the present time. INQUIRER.

The Student's Column.

WARMING BUILDINGS BY HOT WATER. XII.

FORCING-PITS OR BEDS (HORTICULTURAL WORKS).

IN every horticultural work of any pretension there will be required a pit, or bed, with pipes beneath it, for forcing purposes, or for the growth of pine-apples, &c. The term "pit" is not intended to convey the idea that it is a place dug in the ground, as this is rarely, if ever, the case. Fig. 43 shows

FIG. 43.

the thing in question. This represents a structure of wood, with a false bottom supporting about 18 in. of earth. The bottom is perforated. The heat is applied to this by three or four pipes run underneath as shown, or should the bed be standing alone, away from the general run of pipes, a branch might be carried to and under it, as fig. 44 (plan). The

FIG. 44.

object of this bed is the cultivation of those things which require a bottom heat, that is a heat to the earth in which the roots exist, as well as a warm atmosphere to the parts above ground. It is the same result as we obtain by putting manure at the bottom of a bed, except that in the latter case the heat is not so regular and uniform, nor can it be regulated when required.

Sometimes a gardener will signify a preference for the pipes being carried through the material of the bed itself. When this is required the pipes are run at the bottom, and first well covered with clinker and rough material, as fig. 45. If the pipes were a distinct branch, an air tube would require to be carried up through the earth from the highest extremity as shown.

When these beds are arranged for cucumbers, &c., they usually extend along the side of the house, as fig. 46; this permits of the proper training of the vines. In a span house the side will be governed by the gardener's wishes, but in a lean-to it would in nearly every case be

FIG. 45.

along the front furthest from the wall. If the pipes are simply carried underneath, as shown in the last illustration, they contribute heat to the bottom of the bed, and also to the atmosphere generally. This is not so effective for

FIG. 46.

the beds as when the exit of heat from beneath is less free. Messrs. Messenger & Co., specialists in this work, have an ingenious plan of affording bottom heat to pits, yet afterwards utilising the air for top heat. Fig. 47 illustrates the

FIG. 47.

method, and it will be seen that the heat does not so readily pass up from the bottom as to prejudice the heating of the bed.

When expense is not of primary importance, it is often arranged for pipes to run under the beds for bottom heat, and additional pipes run round the edge of the bed for top heat, or heat to the atmosphere.

For the growth of many things it is the practice to have a tank of water beneath the pit or bed, as fig. 48, the object being to afford abund-

FIG. 48.

ance of moisture of a warm temperature, or, in other words, a warm atmosphere fully saturated with moisture. To effect this, pipes have to be run beneath the surface of the water as shown, and should they be a branch by themselves, an air-pipe must be carried up through the bed. In the construction of this bed conveniences for adding water to the cistern as it evaporates, &c., have to be provided.

Means to impart a sufficient moisture to the atmosphere have always to be provided in these works in conjunction with the hot-water apparatus. It requires to be explained that as air is raised in temperature it has an increased capacity for water in equal ratio with its increased heat. In fact, it has not only greater capacity but a positive need of water, for if no means are provided by which moisture be added in sufficient quantity, the air will help itself from the surroundings. This proves that the air actually requires the moisture, and it would never do to have it furnished from the earth and the very plants which are in particular need of it themselves.

Now it is not only necessary to provide for what we may term the normal saturation of the air as it increases in temperature, but it is necessary to furnish a superabundance of this moisture, particularly in fern-houses, as an instance, which usually require an atmosphere heavily laden with water. Provision should be made in every house for this purpose, although it is not always required. In some instances, with grapes for example, moisture is required at certain times but not at others.

The provision for saturating the air is usually in the form of a trough fixed on one of the hot-

FIG. 49.

water pipes. It can be a trough to lie on the pipe as fig. 49, or the pipe can be procured with the trough cast on it as fig. 50. The latter is generally used; the former being more in request when the amount of ordinary trough pipe is afterwards found insufficient. If a

FIG. 50.

gardener cannot conveniently get a cast-iron trough of this description to lay on his pipes, a local whitesmith can make one in zinc which will prove just as effective.

There is a trough or channel-pipe, made as fig. 51, but this is not in common request, as it

FIG. 51.

can only be placed at the highest point in an apparatus (level with the supply-cistern), otherwise the water would overflow or escape from it. It will be noticed that this trough differs from the others by being practically an open top pipe, the water flowing from the pipe at one end into and through the trough, making its exit at the other end. A pipe like this has sometimes been placed at a high point, and used as a supply-cistern.

It should have been mentioned that the tank beneath the bed, fig. 48, has very frequently a tap in it, which the gardener applies to for the warm water needed in watering his beds and delicate plants. If this be so, a little extra pipe would be needed, so as to more quickly heat up the fresh water that is introduced.

SURVEYORSHIPS.

SOUTHAMPTON.—Major W. B. G. Bennett, Borough Engineer of Southampton, who met with an accident three months ago, has now so far recovered as to be able to resume his duties, which have been carried out during his absence by the Assistant Borough Engineer, Mr. A. D. Grestorax. The Borough Surveyor of Southampton has been instructed by the Hartley Council to prepare plans for the erection of an engineering laboratory in connexion with the Hartley Institution.

DORSET.—Mr. C. E. Ponting, F.S.A., Lockeridge, Marlborough, who holds a similar appointment for the Archdeaconries of Wilts and Bristol, has been elected Surveyor for the Archdeaconry of Dorset.

OBITUARY.

PROFESSOR FREEMAN.—The *Times* of Thursday announces that Professor E. A. Freeman died at Alicante, in Spain, on Wednesday morning, from small-pox. In addition to his work as a historian, he will be well known to many of our readers for his writings on architectural subjects. He was approaching his seventieth year.

GENERAL BUILDING NEWS.

NEW COLLEGE, GLASGOW.—St. Peter's College, New Kilpatrick, the gift of Archbishop Erskine to the Catholics of the archdiocese of Glasgow, has just been completed. The new college occupies a situation at the junction of the Dumbarton and Stirling roads. The building, which is four stories in height, is in the domestic Gothic style. The principal front, including the two wings, measures 190 ft.; and to the copesone the height is about 70 ft.; and from the centre rises a flèche, 142 ft., to the top of the spire. The main entrance leads into a hall, open to the top of the central tower. To the right and left runs a corridor, repeated on the several floors, which are reached by stone staircases at either end of the building. On the ground floor, in the central block, are waiting-rooms, reception-rooms, and four class-rooms. The west wing, which measures 78 ft. in length by 36 ft. in width, is meantime set apart as a dining-hall, kitchen, and servants' apartments; while the east wing, measuring 90 ft. by 36 ft., will be fitted up as a temporary chapel. The scheme includes a chapel to be erected to the east of the main building, and a refectory, kitchen, and servants' rooms at the rear to the north; but the construction of this section of the work is meanwhile delayed. On the first floor of the college is a suite of rooms for the Archbishop, and adjoining are rooms for the rector. In the back portion of the main block are four class-rooms. The western wing is occupied chiefly for library purposes, and the eastern is fitted up as students' rooms. The professors' rooms are in the front portion of the main building, and on this floor are four class-rooms, the remainder of the space being devoted to rooms for the students. On the third floor the chemistry class-room and laboratories are placed, and here also is the billiard and recreation room. The entire cost is estimated at about 25,000l. The contractors for the work were Messrs. John Devlin & Son, and Mr. Thomas Geoghegan represented the architects, Messrs. Pugin & Pugin. We gave an illustration of the building in the *Builder* for September 21, 1889.

PROPOSED RECONSTRUCTION OF MARKET HALL, ABERDEEN, MON.—The present market hall being found very inadequate for the growing requirements of this district, a company has been formed to acquire and reconstruct it. It is proposed to considerably extend the market, erect shops and offices, and to build a hall to accommodate 1,600 people. Plans are being prepared by Mr. Alfred Swash, architect, of Newport, Mon.

SCHOOLS, BEARPARK, CO. DURHAM.—The Board schools here are shortly to be altered and enlarged for the Elvet St. Oswald School Board by Mr. H. T. Graddon, architect, Durham.

PUBLIC BATHS, SOUTHAMPTON.—On the 10th inst. the new Corporation Baths on the Western-shore, Southampton, were opened by the Mayor, Mr. J. Lemon. We gave a description of the new buildings in the *Builder* for March 21, 1891. The contractors are:—For the sea-wall round the baths, Messrs. Roe & Co.; for the buildings, Messrs. Morgan, Isted, & Morgan; for the iron roofs, Messrs. Roe & Co.; and for heating apparatus, Messrs. Bradford & Co., of London and Manchester. The ornamental ironwork has been supplied by Messrs. Macfarlane & Co., the electric bells by Messrs. Sanby & Co., the fittings and furniture by Messrs. Horsman, Mr. Freely, Messrs. Hart & Co., the Provincial Furnishing Company, and Messrs. Permain & Co., of Southampton. The buildings have been designed and erected under the superintendence of the Borough Surveyor, Mr. W. B. Bennett, C.E., assisted by the Assistant Borough Surveyor, Mr. A. D. Greatorex. The open-air swimming-bath has been made ready for use, and new dressing-boxes have been provided by Messrs. Roe & Co., and a boundary-wall is being erected.

PRESBYTERIAN CHURCH, NEWTONBREA, NEAR BELFAST.—The opening services in connexion with the Newtonbrea new Presbyterian Church took place on the 13th inst. The new building has been designed by Mr. Vincent Craig, of Belfast, and erected under his direction by Mr. Robert Corry, contractor, of Donegal Pass. The style of the building, which has been constructed of Scotch stone, with red cut stone dressings, is Gothic, of the Early English period. Its width at the transept is 78 ft., and its length 92 ft., while the chancel is 13 ft. long and 17 ft. wide. Situated at the northeast corner is the spire, which when completed will be 150 ft. in height. Accommodation has been provided for 600 sittings. In the front there are two entrances facing Ormeau-road, and on the north side a third entrance is provided from Knocktraa-road. The buildings at the rear include a session-room, vestry, space for organ-hellows and motor, a ladies' room, lavatory, and heating apparatus accommodation. In the interior the columns are of cut stone, with moulded caps, and spring arcade arches dividing the nave and side aisles. The transept and chancel arches are of the same materials. Above the level of the side aisles runs a row of clerestory windows. The woodwork in these windows is of polished pitch-pine. The same has been used in sheathing the ceiling, which has the constructional timbers exposed to view. The heating is by Musgrave's high-pressure

system. Two ornamental windows have been supplied by Messrs. Carlisle & Wilson, while the plumbing and gas-fitting have been done by Mr. John Dowling, both of Belfast.

CONSECRATION OF CHURCH, TOTTINGTON, LANCA-SHIRE.—On the 10th inst. the new Church of St. Mary, at Hawthorn, Tottington, was consecrated by the Bishop of Manchester. The new building is in the thirteenth-century style of Early English Gothic, from plans by Messrs. Maxwell & Tuke, of Manchester, which have been carried out by Messrs. Thompson & Brierley, builders, of Bury. Yorkshire stone has been employed, hacked by rubble, with facings from the Holcombe quarries. A nave 65 ft. and a chancel 17 ft. long give a total length of 82 ft. A tower is to be erected at the north-west corner. At present the tower is carried only to the eaves and surmounted by a bell turret. The church is entered through the tower, and a large western door has been placed in the building to be used for exit on special occasions. The side windows are filled in with cathedral glass. An open timbered roof in one span covering the nave is of varnished pitch-pine, and the benches for the worshippers are of the same material. The pulpit and font are of Caen stone and alabaster. On the north side of the chancel is the organ chamber, and the vestry is reached through an arch at the southeast corner of the nave. Choir stalls have been presented by the girls' Sunday school. Accommodation is provided for 364 worshippers. The cost of the church is about 3,600l.

COMPLETION OF ST. CATHERINE'S CHURCH, CARDIFF.—On the 9th inst. the corner stone of St. Catherine's Church, King's-road, was laid by Mrs. Vaughan, of Cardiff. Up to the present time only a portion of the nave has been completed, but funds being now forthcoming, it has been decided to complete the chancel and east end, with vestries, organ-chamber, and side chapel. The style is Early English, and the plans from which the work will be executed have been prepared by Messrs. Kempson & Fowler, architects, of Landaff, the total cost of the added portion to the building being about 2,000l. The existing building is composed of three bays out of a total of five, which will form the completed church. The chancel will be 40 ft. in length by 24 ft. in width, and opening from it through arcade arches will be a south chancel aisle or mourning chapel, 20 ft. long by 16 ft. wide; an organ-chamber and vestry 25 ft. by 20 ft. in all. The design provides for the chancel being rectangular in form, with a three-light eastern window and a two-light window in the east end of the chancel aisle. The floor will be finished in tiles. The outer walls will be of Treforest stone with Bath stone dressings and mullions. The contract has been let to Mr. Councillor W. Symonds, of Canton. When finished, the church will provide sitting accommodation for about 836.

THE PROPOSED EXTENSION OF THE BATH PUMP-ROOM.—A meeting of the Bath Town Council was held on the 15th inst., the Mayor (Mr. J. S. Turner) in the chair, when the debate resumed on the report from the Baths Committee recommending the addition to the pump-room and the covering in of the Roman remains, estimated to cost 45,000l., as mentioned in last week's *Builder*, p. 212. After a long discussion, the amendment moved by Alderman Gibbs was put. Thirteen voted for and 35 against. The adoption of the report was then carried by 31 votes to 15.

ADDITIONS TO THE "MORNING POST" OFFICES.—Considerable additions are being made to the offices of the *Morning Post*, and a new block of buildings is to be added at the corner of Wellington-street and the Strand. Mr. H. O. Cresswell is the architect. The whole of the floors and both staircases are to be fireproof, on "The Fawcett" system. Messrs. Mark Fawcett & Co. are also doing the constructional ironwork.

NEW INFIRMARY BUILDINGS, LEEDS.—On the 12th inst., on the invitation of Mr. George Corson, the architect, the members of the Leeds and Yorkshire Architectural Society were shown over the new buildings which have been erected in connexion with the General Infirmary. The cost of the building, which, it is said, will in a few weeks be opened for the reception of patients, will be about 35,000l. Mr. Corson explained all points of interest, and at the close of the inspection, a cordial vote of thanks to that gentleman was passed on the motion of Mr. Thorp, and seconded by Mr. Watson. The new ward pavilion, the out-patients' department, the pathological department, and the isolation wards. The new ward pavilion follows, externally, the design of the original building, and is connected with it by a screen of four open arches, of brick and stone, supported on polished granite pillars. The internal arrangement differs from the original wards. Instead of one large ward on each floor, with staircase at the end, the staircase is placed in the middle, dividing the wards. There are on each floor one ward, 55 ft. long by 27 ft. 6 in. wide, arranged for sixteen beds; and another 37 ft. long by 27 ft. 6 in. wide, for ten beds. These wards are in height, from floor to ceiling, 18 ft. on the ground floor, 17 ft. on the first floor, and on the top floor, which has an arched

ceiling rising into the roof, there is an average height of 22 ft. There are on each floor three floors a special ward for one patient, and a nurses' room. Bath-rooms and water-closets are also provided, the baths being of earthenware, white glazed, out and in, without casing, and standing free in the middle of the room. These were made by the Farnby Company. The water-closets were supplied by Doulton, of Lambeth. Over the nurses' room and small wards, &c., an entresol is arranged on each story, containing a small special ward and a room for patients' clothing; and a water closet. Altogether there is provision for eighty-four beds. An hydraulic lift, provided by Robert Middleton, of Sheepscar Foundry, gives access to all the floors. The floors throughout are constructed with iron joists and concrete, upon which, in the wards, a solid oak block floor has been laid in pattern and polished by Mr. J. P. Ebner, of London; and in the corridors, stairs, baths, and water-closets there is a marble terrazzo floor, laid by Messrs. J. and H. Patteson, of Manchester. On the ground floor the new building is connected to the old by a corridor, and on the first floor to the out-patient corridor by a bridge. The wards are heated by steam pipes, and also by open stoves, by Sborland, of Manchester, placed in the middle of the wards, with down draught flues. The out-patients' department consists of a waiting hall, surrounded by the consulting, examination, operating-rooms, &c., of the various departments. The hall is 126 ft. long by 45 ft. wide, with two aisles, each 74 ft. by 12 ft., divided from the main area by arches and granite pillars. The roof is semi-circular, and the height from floor to ceiling is 42 ft. The hall is lighted by a series of clerestory windows, and also by gas pipes, gasolines, and brackets. The floor is on a level with the first floor of the Infirmary, and the department is connected with the original building by an extensive of the north and south corridors. The entrances, by a carriage porch, and an entrance-hall (23 ft. x 17 ft.), from the New-street, and a separate exit for patients are also provided. The Dispensary, which is 56 ft. by 15 ft., is at the west end of the hall, and is in connexion with it rooms for the dispensary. Two staircases are provided in recesses for the corridor, for access from lower stories. Bats for men and women are arranged below the surgery department, and on the south side, owing to the fall of the ground, two stores of rooms are obtained the upper intended as bedrooms for domestics, the lower for stores. The pathological department, placed on the north side, and is connected by a corridor from the main north corridor. It contains a post-mortem-room, a mortuary, a laboratory with retiring room, and a waiting-room, for relatives. The isolation wards are placed upon the site on the north of the New-street, and are reached from the Infirmary by a tunnel under the street from the basement floor level. These wards will consist of one story only, with steel from the tunnel and a lift from that level to the ground floor. There will be two wards (15 ft. by 16 ft.), with kitchen, pantry, and storeroom. The out-patients' department is to be heated by steam radiators, from the present boiler and Messrs. Ashwell & Co., of Leicester in London, have the contract for this work. The principal contractors and sub-contractors are Messrs. Gosdell & Stevenson, for brick, stone, and woodwork; Watson & Worsnop, for slating; Lindley, for plumbing and glazing; A. & C. Wheatley (Calverley), plasterers; Stephen Macfarlane, concrete; Bateman, painter; Leons Cooper, steel and iron beams, joists, and ribs; Macdonald (Aberdeen), granite pillars; Verity Bros., gearing for windows; C. Smith & Son (Birmingham), locks and boundary railing; J. & H. Patteson (Manchester), "terrazzo" floor; and J. P. Ebner (London), oak floors in ward. Mr. J. T. Brown is the clerk of works.

NEW CHURCH, BRIDGETON, LANARKSHIRE.—A new church, which has just been erected in Muirhead-bridge, on the site of the old church. The architect is Mr. John C. McKellar, I.A., Glasgow. The walls are of red stone. The church will be seated for 900 persons; and in the rear of the building, on the same level, there is a large hall, 350 ft. small hall for 100, a vestry, and a few other rooms. The estimated cost is 4,500l.

BATHS, ASTON, BIRMINGHAM.—At the public baths, now in course of erection, the first and second swimming-baths are roofed in, and the baths are being electrically heated by the bath and the public offices will be generated with the baths' pumping engine. A reflux-destroyer being erected, and will commence work in a course of six or eight weeks.

PROPOSED PUBLIC OFFICES, &c., BARKING, ESSEX.—On the 10th inst. a Local Government Board Inquiry was held by Major-General Philip Carey, R.E., respecting the application by the Barking Town Local Board for a loan of 17,300l. for the erection of public offices, free library, engine station, mortuary, stables and cart-sheds and works of street improvements, as described in Mr. C. J. Dawson, F.R.I.B.A.'s Surveyor to the Board. The buildings are proposed to be erected on two acres of land in East-street, sufficient space being reserved for future extension of public offices and the erection of public baths.

STAINED GLASS AND DECORATION.

MEMORIAL WINDOW, ST. MARK'S CHURCH, SHEFFIELD.—A new window has just been added to St. Mark's Church, Broomfield, Sheffield. Mr. W. F. Dixon, of London, the artist, has devoted the space to the subject of "The woman and shepherds travelling from the East to the hirthplace of the Saviour." The window contains six large lights with considerable tracery.

ST. JOHN'S CHURCH, BRADFORD.—A large rose window of Munich stained glass, representing Christ in twelve distinctive characters, such as the Good Shepherd, the Light of the World, &c., has recently been presented to St. John's Church, Bradford, by Mr. C. Briggs, in memory of his late parents. The window was designed and executed by Messrs. Mayer & Co.

MEMORIAL WINDOW, PARISH CHURCH, POWERSTOCK.—On the 12th inst., at the parish church, Powerstock, Dorset, a window in memory of the late Archdeacon Sanctuary was unveiled. The window is placed above the west door, and was supplied by Messrs. Hardwick & Co., Birmingham, who also supplied the windows in the chancel. The representations are,—the central figure, Christ as the Good Shepherd, with a crown of thorns; on the right is St. John the Baptist; while on the left is St. Paul. A brass plate is to be placed underneath the window with an inscription.

PAINTED WINDOW, SOUTH DARLEY CHURCH, DERBYSHIRE.—The east window of South Darley Church has, says the *Manchester Courier*, just been filled with painted glass by Messrs. Morris & Co., of Merton Abbey, Surrey. The design and drawings were prepared by Mr. Burne Jones, A.R.A., while the colouring is the composition of Mr. William Morris. The window consists of three separate lights, the architecture of the church being an imitation of the Norman style. One of the side lights is filled with the figure of St. Mary. The other side light is occupied with the figure of St. John. The centre light is taken up with a representation of the Crucifixion.

MEMORIAL WINDOW, LANGTREE PARISH CHURCH, DEVON.—A three-light stained glass window has recently been dedicated to the memory of the late Archdeacon Barnes in Langtree Parish Church. In the centre light of the window is depicted Our Lord as the Good Shepherd under a canopy, of the Perpendicular period, of white and gold upon a quarry ground. In the two side lights are sacred monograms of I H S and X P C. The quarry treatment, as groundwork, is maintained in these two side lights also, as well as in the centre. The window is situated on the south side of the chancel. The work has been executed by Messrs. Ward & Hughes, of London.

WINDOW, ST. MARY'S CHURCH, WEST WORLINGTON.—On the 13th inst., a stained glass window, the gift of Mr. J. G. S. Troake, was unveiled in the Church of St. Mary, West Worlington, Devon. The window stands on the north side of the chancel immediately over the choir stalls, and consists of two lights, filled respectively with figures of King David and St. Mary the Virgin. The work was designed and executed by Messrs. Fournace & Son, of Stonehouse.

FOREIGN AND COLONIAL.

PARIS.—On the 15th inst. the general annual meeting of the "Société Française des Habitants à Bon Marché" was held, under the presidency of M. Jules Simon. M. Siegfried read a history of the movement, and the Society's first prize, 1,500 francs and three silver medals, was awarded to M. Tissier, Muller, and Guinard, of Marseilles; the second, 1,000 francs and a silver medal, to M. Chas. Robin, of Poissy; the third prize, 500 francs and a silver medal, to M. Léon David, of Havre.

BERLIN.—The election of new members of the Prussian Royal Academy, which took place last January, has been officially recognised by the Government. The number of vacancies to fill up was a large one, so that no less than twelve painters, three sculptors, two etchers, and an architect were nominated. The architect is Herr "Stadtbaudirector" Hugo Licht, the city architect of Leipzig. Among the painters we notice Mr. Walter W. Ousez, of London, two Spaniards, an Italian, and a Frenchman, of the three sculptors one is Professor Unger, of Vienna. The municipal authorities have received a petition signed by the majority of junior artists resident in Berlin, requesting that a certain sum of money be annually voted for the purchase of works of art either for the decoration of municipal buildings, or for one of their city collections. The municipality has done little or nothing in the acquisition of works of art for several years. We hear that the petition was favourably received.—The number of *bona-fide* unemployed has increased this week. The Municipality is unfortunately not keeping its promise relating to the quick commencement of relief works. Several persons who could find work for over one thousand men, cannot do so on account of others in the grading of the so-called "building of permission." The municipal authorities have at last decided on the adoption of some suitable means of facilitating the reading of names of streets and

house numbers at night. The regulation white lettering on blue enamel in use has given much satisfaction in daylight, but is difficult to distinguish under dark.—The railway tickets on the metropolitan railway are henceforward to be distributed by automatic machines. There will be no booking-offices at the stations, but change-offices instead.—The Imperial Bank (Reichsbank) has had to pay 4,750,000 marks (or over 235,000*l.*) for a further addition to their reserve block, which is required for the new wing to be erected this year.—Herr Louis Schwartzkopf, an engineer of great repute, whose iron castings and machines are used all over the Continent, died on March 7, in his fifth year. He was a member of the Emperor's Special State Council and of the Academy of Public Works.

MUNICH.—The Bavarian Government has voted 5,000*l.* towards the acquisition of works of art for the Munich Phakothek, and 2,000*l.* for the purchase of works of art for the decoration of Government property.

MISCELLANEOUS.

CLOCK-TOWER AND SANITARY CONVENIENCES NEAR VICTORIA STATION.—On Monday morning last the Vestry of St. George's, Hanover-square, threw open to the public use some very admirably arranged underground conveniences, situate below the "refuge" at the junction of Vauxhall Bridge with Victoria-street. The conveniences, which have been constructed by Messrs. Doulton & Co., of Lambeth, include five water-closets of the "Simplicious" wash-out pedestal type; and thirteen urinals, semi-circular on plan, the backs being tiled, the enamel fire-clay, and the divisions being of marble. The urinals are automatically flushed at intervals. The whole of the interior is well-lighted from the top by means of prismatic pavement lights, and there is a convenient recess for the attendant close to the entrance steps. This work has been carried out from the plans and under the direction of Mr. C. Livingstone, the Surveyor to the Vestry. The whole is surmounted by an iron clock-tower 25 ft. high, containing a clock by Messrs. Gillett & Co., of Croydon. The clock is illuminated at night.

SOCIETY FOR PRESERVING MEMORIALS OF THE DEAD.—At the second general meeting of this Society for the Session 1891-92, held in the rooms of the Royal Archaeological Institute, 17, Oxford Mission (Regent-circus), London, W., on Monday, February 15, a paper, "Don Abbey, Herefordshire; an Outline of the Principal Facts and Features," by the Rev. Alfred Phillips, rector, was read by Mr. Arthur E. Griffiths, supplemented by some valuable and interesting remarks from Miss E. Bayley. A discussion on this comparatively unknown, half-ruined Cistercian abbey in the Golden Valley of Herefordshire took place, and in which the President, Messrs. G. E. Keyser, S.A., F. Chancellor, Herbert Jones, and the Rev. Prebendary Salmon joined. For the tenth annual meeting, the second or third week in June was suggested, and combined with it two days' excursion to some interesting churches, where great good may result from the Society's visit. Bishops Stortford was considered a suitable place for headquarters; one day to be given to Essex churches, and the other to Herefordshire churches. At the next general meeting on Tuesday, April 5, a fully detailed plan will be submitted for approval.

PHENIX PHILANTHROPIK SOCIETY OF HOUSE PAINTERS.—The annual meeting of this, which we are told, is the oldest benefit society in the trade, was held on the 12th inst. at the Society house, 28, London-street, Fitzroy-square. First established in 1823 as the "Charter of Comradeship," this Society has had an interesting history. According to a correspondent, it has paid over 20,000*l.* in sick and funeral benefits. Some years ago it nearly collapsed from the payment of a too liberal scale of benefits. For the usual weekly subscription, it endeavoured to assure to its members not only the customary sick benefit, but a superannuation pension more than double that proposed by Mr. Chamberlain's scheme. In ten years 2,500*l.* was paid by way of superannuation. A reconstruction of the rules placed the Society on a sounder financial basis, and the balance-sheet for the past year shows that for the sixth time consecutively a satisfactory increase has been made in the capital of the Society. The funds are entirely applied to the relief of sickness, and the assurance of a small sum on the death of a member. There is, however, a winter fund for the relief of members out of employment. None but duly-qualified painters can become members, and for many years it has numbered among its members most of the foremen and leading workmen of the first West-end firms.

NEW USE FOR WASTE SLATE.—M. Victor van Heyden, a Belgian engineer, has devised a method of treating waste slate-chippings as the constituent of an artificial material which he calls "arcolaine." The waste slate is, in the first place, reduced by the steam-hammer to fragments of a size suitable for being thrown in the crushing-mill, which comminates them into small nuts. These nuts, taken up by a bucket-chain, are disposed on a grinding-machine of very ingenious construction, which, in addition to its work of pulverising, acts simultaneously as a separator, the powder being placed on one side, while the chippings or scales are carried

elsewhere. These are the two substances which, united with certain agglomerants, form the principal ingredients of "arcolaine." The powder and the chippings, in calculated proportions, are carried, by means of a channel furnished with an interior agitator or mixer, into a mill-hopper with a movable bottom, which constitutes the office of a kneader of special construction, which is heated by gas, in order to regulate more exactly the degree of heat. In this kneader are automatically cast in exact proportions the above-mentioned agglomerating substances, which, in their totality, constitute 9 per cent. of the product. When it leaves the kneader, it is run into a mould; a portable wagon receives it, and conveys it under a press of the power of 150 tons. It then forms a material capable of use for paving and other similar objects, or of high polish as slabs, and it is claimed that it resists a very high crushing pressure. Unfortunately, we are not told what are the "agglomerants" which form a large part of the material, and till we know that we cannot form much opinion as to its durability.

SITE FOR NEW PATENT OFFICE.—A portion of the property which the Government have taken for the Patent Office extension buildings consists of two houses in Took's-court, occupied by Mr. John C. Francis, in succession to his father, the late Mr. John Francis, for the printing and publishing departments of our contemporaries,—*Notes and Queries* and the *Athenæum*. For those papers new premises will shortly be ready, at the corner of Church-passage, Bream's-buildings, Chancery-lane, built by Mr. B. E. Nightingale, contractor, after the designs of, we are informed, Mr. W. C. Street, architect. They stand next the westwards of the *Field*, *Queen*, and *Law Times* offices, designed by Messrs. Satchell & Edwards, architects, of which we gave a description on May 31, 1890. *Notes and Queries*, as established in 1849, was at first issued by Mr. George Bell, from No. 186, Fleet-street; in 1872 its ownership passed to the proprietor of the *Athenæum*, and the two journals were thenceforward issued from No. 20, Wellington-street, the *Athenæum* having been meanwhile removed from No. 5 Catherine-street. The two publishing departments were subsequently transferred to Took's-court, where the latter has been printed for more than sixty years past. Mr. Nightingale is building the first block of the Patent Office extension, next southwards of Staple Inn, after designs by Mr. Taylor, architect to the Office of Works. The block will be about 55 ft. high, with a front of Portland stone towards Took's-court, and is to contain one large room, rising through two stories, for the purposes of consultation and the adjustment of matters wherein counsel and patent-agents are employed on behalf of their clients' interests.

NEW SOUTH WALES.—According to the *Sydney Building and Engineering Journal* (February 6), satisfactory progress is being made with the work of judging the designs sent for the Rossville Asylum, to be erected near Goulburn, New South Wales. There are thirty-nine competitors for this work, whose plans number 350 sheets of drawings. Mr. Vernon, the Government Architect, and Mr. Horbury Hunt, have inspected the site, and Dr. Manning and these gentlemen have paid a visit of inspection to the two principal asylums in that colony, for the purpose of ascertaining the nature of the best arrangements connected with these institutions. It is expected that several weeks hence Dr. Manning, Mr. Vernon, and Mr. Horbury Hunt, as an advice board, will forward a recommendation to the Minister for Works concerning the designs under examination, and all inquiries made a few days ago. Mr. Lyne personally inspected the plans now on view in the Museum. In the opinion of the Minister, the competitive drawings are so excellent in quality as to be superior to any yet submitted for works connected with the public service.

REGISTRATION OF PLUMBERS: SHEFFIELD MEETING.—The annual meeting of the Sheffield Centre of the Association for the National Registration of Plumbers (connected with the Worshipful Company of Plumbers, London) was held on the 9th inst., at the Fifth College. The chair was occupied by Mr. J. B. Mitchell-Withers, Vice-President of the Sheffield centre. The Chairman, in opening the proceedings, referred to work done in connexion with the Sheffield branch during the past year. He said the importance of such a society was being more thoroughly appreciated, and public bodies were beginning to see the importance of the necessity that none should be allowed to do drainage and other such plumbing work unless they were registered as thoroughly qualified men. The Chairman next distributed the certificates granted by the Worshipful Company of Plumbers to those plumbers who had qualified themselves for the same. Mr. Thompson, C.E., next gave an address on "Modern Sanitary Improvements." Professor Hicks proposed a vote of thanks to Mr. Thompson, and this was seconded by Professor Ripper, and carried with applause. A vote of thanks to the Chairman concluded the proceedings.

NEW ADDRESSES.—Messrs. W. & G. Shearburn, architects and surveyors, of Dorking, have opened a London office at Bingham House, Arundel-sreet, Strand.—Mr. T. E. Colcutt informs us that he is removing his offices from 5, Lancaster-place, Strand, to 36, Bloomsbury-square.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premium, Designs to be delivered.

CONTRACTS.

Table with 4 columns: Nature of Work or Material, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Appointments to be made.

Those marked with an Asterisk (*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, vi, vii. Public Appointments, p. xx, and xxi.

RAILWAY ACCIDENTS IN INDIA.—The statistics furnished by the Public Works Department of the railway accidents in India tend to show that if railway trains do not run with such speed in this country as they do in others, they are at least worked with more than average immunity from accident. The New York Central Railway Company claims recently to have eclipsed all the fast runs of the world, and asserts that it has run 436½ miles in 42½ minutes, exclusive of stoppages. It will be many years, says a Bombay contemporary, before India can even hope to do this, but it may be assumed that the New York Central would be glad to show so clean a record per thousand miles and per thousand passengers in the way of casualties involving loss of life or personal injury. English railway managers, we imagine, will not willingly admit that they have been surpassed as regards speed, for the American train was an experimental one specially run; the record speeds in England have been made by every-day express trains in ordinary competition. But in England out of seven hundred officials one was killed and almost one in every hundred injured during the last year; 1,076 lives were lost and 4,721 injured; 118 of the killed and 1,361 injured being passengers. Of course, this is but a small total compared with the enormous number of passengers carried; but it is greater than is the case in India, and we doubt if any country can boast so few accidents. The returns are not so prepared as to make any minute comparison between the railways of the world possible. Indian returns are furnished half-yearly, and details are given which are not readily available on other lines. But a total of twenty-three killed and eighty-four wounded in accidents to trains over almost five millions of miles run is surely not a bad average. This is the return for the half-year ending June last. More than half the fatal accidents occurred to trespassers, or were due to want of caution or misconduct; of the injuries exactly half were due to want of caution by servants and others, 118 to carelessness on the part of passengers.—Indian Engineer.

BIRMINGHAM ENGINEER STUDENTS.—A meeting of the Birmingham Association of Students of the Institution of Civil Engineers was held on the 9th inst. at the Midland Institute, the President, Mr. J. Edward Wilcox, A.M.I.C.E., being in the chair. A paper was read by Mr. H. Shoosmith, A.M.I.C.E., on "Stability of Walls," which was followed by a discussion.

NEW BUSINESS PREMISES AT STRATFORD.—Messrs. Young & Marten, of Calodonian Works, Stratford, London, E., wholesale purveyors for the building trade, have recently made extensive alterations and additions to their already large establishment in the Broadway, Stratford. In it are the show-rooms for chimney-pieces, mantels, and over-mantels, tile-grates, stoves, and tile-boards, &c., &c.

THE ENGLISH IRON TRADE.—Great irregularity prevails in the iron trade, owing to the minor "play period." Most of the large ironworks are

suffering from the scarcity of fuel, and in many instances have ceased work altogether. Prices are rather firmer on account of the limited production; but business in both crude and manufactured iron is only of a hand-to-mouth character. The steel trade exhibits little alteration, but heavy rails are a trifle weaker. The tin-plate trade shows a slight improvement. Shipbuilding is quiet and the engineering branches are in an unsatisfactory condition. The coal trade is somewhat easier.—Iron.

MEETINGS.

SATURDAY, MARCH 19.

Architectural Association.—Visit to the Tower Bridge Works, by permission of Mr. J. Wolfe Barry, 3 p.m.

Glasgow Architectural Association.—Visit to Kilmorie Church.

MONDAY, MARCH 21.

Royal Institute of British Architects.—Professor Aitchison, A.R.A., on "Byzantine Art," 8 p.m.

Society of Arts (Lecture).—Professor W. Robinson on "The Uses of Petroleum in Prime Movers,"—IV, 8 p.m.

Victoria Institute.—8 p.m.

Liverpool Architectural Society.—Special meeting. Paper by Mr. H. Hartley.

TUESDAY, MARCH 22.

Institution of Civil Engineers.—Mr. A. R. Binnie on "Mean or Average Annual Rainfall, and the Fluctuations to which it is Subject," 8 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Professor A. Wynter Blyth on "Sanitary Law, English, Scotch, and Irish; General Enactments; and Public Health Act, 1875; Model Bye-Laws, &c.," 8 p.m.

Photographic Society of Great Britain.—(1) Mr. Dallmeyer will show his Telephotographic lens. (2) Mr. Chapman Jones on "Copying Inclined Pictures," 8 p.m.

WEDNESDAY, MARCH 23.

Society of Arts.—Mr. Gilbert R. Kesteven on "Manufacture and Industrial Application of Flexible Tubing," 8 p.m.

THURSDAY, MARCH 24.

Society of Antiquaries.—8.30 p.m.

Edinburgh Architectural Association.—Mr. J. J. Burnett on "The Relative Position of the Architect and the Craftsman," 8 p.m.

FRIDAY, MARCH 25.

Institution of Civil Engineers (Students Meeting).—Mr. G. Lambert Gibson on "The Seafield Dock and the Kierkaldy and District Railway," 7.30 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Professor A. Wynter Blyth on "Sanitary Laws and Regulations Governing the Metropolis," 8 p.m.

Institute of Certified Carpenters.—7.30 p.m.

SATURDAY, MARCH 26.

Edinburgh Architectural Association.—Visit to Roman Wall at Croy.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

2,919.—WINDOW-SASHES: J. T. Nicholls.—This patent relates to additions in the construction of the improved window-sash holder patented November 10, 1889, No. 5,501.—WHITE LEAD: W. Smith and W. Elmore.—This invention consists of improvements in the production of white-lead from galena or from suitable residual

products or substances containing sulphide of lead. The process is fully set out in the specification.

1,783.—FLUSHING CISTERNS: J. Southall.—This invention relates to an improvement in flushing cisterns. The inventor uses by preference a cistern having a well cast in a suitable position in its bottom. In this well is mounted a valve, terminating at its upper end in a valve seat, the top of the valve being above the bottom of the well. On this seat works a valve, which can be raised at will in the usual manner by means of a lift worked by a rod or chain outside the cistern, the lift being attached to a loosely connected lever. This link works through a hole in a piece of metal bridging the top of the well, the lever of the hall-cock works up and down between its two sides for a certain distance, the sides being connected by two cross-pieces of metal, one at the top forming a jaw and another lower down at such a point as to be under the hall-cock lever, so that when the link is raised the jaw, the sides being raised, the lever of the hall-cock, and when the valve is on its seat permitting the hall-cock lever to fall just low enough to allow a flow of water to come in at the cock. The link has a projecting part near the lower end forming a catch which holds the valve up off its seat whilst the cistern empties as it slips over, and rests on a bridge piece, as described below, when the link is raised. On the bridge piece of metal near to one end of the hole in which the link works are two links, which a lever is pivoted, the lever having a float at one end, the other end nearest the link having a slot into the slotted part working between the sides of the link, the float operates by means of a pin passing through the slot. The pin is fastened at its end into the side of the link. The action of the above arrangement is fully described in the specification.

12,799.—BRICK-PRESSING MACHINES: J. S. Pugh and Others.—This is an invention to provide an automatic stop motion on brick-pressing machines, which, after the brick is pressed, and the plunger raised to the top, the machine automatically stops the removal and insertion of the bricks. It has also its object the making the bricks of one uniform thickness outwardly. For this purpose a catch or projection is employed, preferably operated by, and connected with, the crosshead of the machine. This catches in contact with the handle of the clutch-lever, and automatically stops the machine at the top of the plunger raised. A following-up spring rests on the handle. The clutch consists of a pin passing through the clutch-hoss, and having an angular projecting lip in the groove of the boss of the clutch. A similar angular projection is formed on the clutch-lever.

NEW APPLICATIONS FOR LETTERS PATENT.

February 29.—3,886, W. Fox, Mica-cutting or Tempering;—3,905, J. Root, Suspended railing, or lowering Girders, &c.—3,908, S. Jacobs, Fire-grate.—3,939, C. Luth Wood Flooring.

March 1.—3,901, G. Nunn, Electrical call and Indicating Apparatus.—4,037, T. Hawkesley, Dry-ditch Glass.—4,045, J. Ottoway, Window-sashes and Frames.—4, J. Thomas and G. Kitcheon, Work Bench.—4,052, P. M. Cheron, Fire-grates.

March 2.—4,051, G. Williamson, Kitchen Ranges.—4,062, C. & C. Kite, Ventilators.—1,083, G. Leicht, C. nesting or fastening together building stones or bricks for the formation of Walls.—4,131, J. Knowles, a process for the treatment of raw materials to be used in the production of Portland Cement.—4,149, W. Charlesworth, Slurry Drying Structures used in the manufacture of Cement.—4,159, H. Austin, Sash-fasteners.—4,162, P. Carr, Screw Nuts.

March 3.—4,051, G. Williamson, Kitchen Ranges.—4,062, C. & C. Kite, Ventilators.—1,083, G. Leicht, C. nesting or fastening together building stones or bricks for the formation of Walls.—4,131, J. Knowles, a process for the treatment of raw materials to be used in the production of Portland Cement.—4,149, W. Charlesworth, Slurry Drying Structures used in the manufacture of Cement.—4,159, H. Austin, Sash-fasteners.—4,162, P. Carr, Screw Nuts.

March 3.—4,158, W. Waite, Window-sash Fastener.—4,213, H. Cheesman, Ladders.

LONDON.—For the erection of shop addition to Norfolk Villa, 168, Larkhall-lane, Clapham, for Miss Manning. Mr. Richard Price surveyor, 25, Park-road. £115 10 [Ford accepted]. £125 0

LONDON.—For gas-fitting work and lamps at the "Abbey" Tavern, Kentish Town-road, for Mr. A. T. Cowling. Mr. John T. Alexander, architect, 40, Great James-street, Bedford-row. £231 10
Vanham & Brown £300 0
Steedman 202 0
Biggs, Boro'-road, S.E. 1 218 0

LONDON.—For rebuilding warehouse, No. 10, Osborn-street, Whitechapel, for the Victoria Works, Mr. George Wainwright, architect, 23, Moorgate-street. E.C. Quantities supplied by Mr. Alan Paul & Co., Quality-court, Chancery-lane:—
F & P. W. Wood £5,450 0
M. W. Marlet £5,839 0
Perry & Co. 5,260
Richardson Bros. 5,288
W. Gladding 5,560
J. Sparks (accepted) 5,273

LONDON.—For the erection of new warehouse in Dream's-buildings, Fetter-lane, E.C., for Messrs. Sampson Low, Mar tin, & Co., Limited. Mr. W. Beckham Witherington, architect, 79, Mark-lane, E.C.:—
Foster & Dicksee £2,333 0
O. Cromwell £7,365 0
W. H. Lascelles 7,563
N. Nightingale 7,167
J. Grover & Son 7,563
W. Sharnar 6,993
W. G. Larke & son 7,563
H. King & Sons 6,482
C. F. Kealey 7,546

LONDON.—For alterations and additions to the "Black Lion" public-house, High-street, East Ham, E., for Mrs. C. Keep. Mr. Fred A. Ashton, architect, 3, Crooked-lane, E.C.:—
W. Sluerman £2,843 0
W. Watson £2,750
Hearle & Farrow 2,823
Walker Bros. 2,577
F. Volter (accepted) 2,373

LONDON.—For three steel Cornish boilers for ink factory, Fincham park, N., for Mr. R. C. Stephens, M.P. Messrs. Crickmay & Sons, architects, 17, Parliament-street, Westminster:—
J. Foster & son £1,000
Fraser & Fraser £942 0
Oldham Boiler Works Co. 1,000
E. Weston & son, Manchester* 848
* Accepted.

LUTON.—For the erection of warehouses, Bute-street, Luton. Mr. A. E. Smith, architect, Luton:—
Wright £1,760
Neville 1,750
Baumler 1,840
Parkin 1,830
Smart 1,700
Fryer (accepted) 1,897
[All of Luton.]

LUTON.—For the erection of saw-mill, Bedford-road, Luton, for Messrs. Arnold & Co. Mr. A. E. Smith, architect, Luton:—
Rivham £213 0
Neville 775 0
Long 750 0
Parkin 720 0
Smart 720 0
[All of Luton.] * Accepted.

MORPETH.—For the erection of a doctor's-house, for the Ashington Medical Society. Mr. W. J. Charlton, engineer, Ashington Colliery, Morpeth:—
Waterford £550
Douglas Bros., Elyth* £520
* Accepted.

NEWCASTLE-UNDER-LYME.—For the erection of certain drainage works, for the Town Council. Mr. Joe. Pattison, Borough Surveyor, Newcastle-under-Lyme:—
J. Hornbin £1,012 10
Smith & Taylor* £1,753 10
F. Bocke 1,452 10
[Surveyor's estimate, £1,374.]

PLYMOUTH.—For building new parish room and school, All Saints, Plymouth. Mr. Edmund Sedding, architect, Plymouth:—
John Fisher £1,400 0
P. Blowsy, Plymouth (accepted) 1,150 0 0

SEVERN TUNNEL JUNCTION (MON.)—For the erection of ten cottages at Severn Tunnel Junction, for Messrs. Pennell. Mr. Alfred Swash, architect, 3, Friar-chambers, Newport, Mon. Quantities by architect:—
Morgan & Roberts £2,560
Jno. Linton £2,550
Wm. Price 2,880
Executors of W. Gradwell 2,330
Thos. Webb 2,580
Gen. Wilkins 2,227

TOOTING.—For the erection of chapels, lodges, and boundary walls, for the Streatham Burial Board. Mr. W. Newton Dunn, A.R.C.E.A., architect, 1 and 2, Bucklersbury, E.C. Quantities by Messrs. Evans & Deacon:—

Chapels.	Lodges.		Boundary Walls.		Totals.
	E.	S.	E.	S.	
Hill Bros.	4,750 0	0	2,271 0	0	3,229 0
Carmichael	4,920 0	0	2,425 0	0	3,450 0
Candler & Sons	4,750 0	0	2,250 0	0	3,450 0
Higgs & Hill	4,614 0	0	2,269 0	0	3,540 0

Lorden & Sons	4,683 0	0	2,172 0	0	2,284 0

Drainage and Roads.
C. T. Newman £2,142 10
Neave & Son £2,065 0
Pell & Sons 2,338 0

Wrought-iron Railings and Gates.
Byrles, Jones, & £319 7 6
Hall & Smith 275 0 0
E. L. Cooper 275 0 0
Letherham (Cheltenham) 162 5 10
Stevens Bros. 270 0 0

SHEFFIELD.—For the erection of a school, Derbyshire-lane, Norton, for the Norton School Board. Mr. T. H. Wilson, architect, 23, Norfolk-street, Sheffield:—
School £1,225 0 0
Walls £400 0 0
Theos. Astling 1,696 0 0
Tom Morton 1,617 0 0
J. B. Hurst 1,575 0 0
J. Bee & Sons 1,502 10 0
Abrams & Brown 1,620 0 0
Thos. Roper 1,647 0 0
Gentilington 1,465 8 0
Hy. Harrison, Greenhill, Derbyshire* 263 3 4
* Accepted.

N.B.—Separate tenders required for boundary walls.

WALTHAMSTOW.—For alterations at the "Lorne Arms" public-house, Queen's-road, Walthamstow, E., for Mr. C. A. Nicoll. Mr. Fred A. Ashton, architect, 3, Crooked-lane, E.C.:—
W. Sbermar £396
Hearle & Farrow £798
Gambell Bros. 221
F. Volter (accepted) 284
W. Watson 312
F. Linsell 205

WATERHOUSES (see Dutch-nal).—For alterations and additions to property for Mr. Jonathan H. H. Mr. H. T. Gradon, architect, Dutch-nal:—
Wm. Aytton & Sons £403 15 0
James White £340 0 0
Thos. Walton 385 16 0
M. R. Draper & Sons 328 1 10
James D. Carr 380 0 0
West Roper* 328 1 10
James Robson 380 0 0
* Accepted.

WEST BROMWICH.—For the construction of a brick gas-holder tank, 124 ft. diameter, at Alldon, for the Town Council.—
Jno. Aird & Sons, London. (Accepted on a schedule of prices.)

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 19s. per annum (or 4s. 9d. per quarter), can ensure receiving "The Builder," by Friday Morning's Post.

TO CORRESPONDENTS.

J. P. M. W.—T. L. W.—W. L.—T. S. (shall have attention).—V. & S. (we cannot conveniently insert the information in the tender column).—F. G. W.—W. A. D.—A. Non-Gambler (we have not space for your letter).—H. N. (inserted, amount not being sent).

All statements of facts, lists of tenders, &c., must be accompanied by the names and addresses of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matter should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

The Building Sandstones of Ireland.

EVERY little attention has hitherto been paid in this country to the various building stones of the sister island, yet there is a more complete literature on the

subject than we possess respecting the building stones of England. Wilkinson,* Kane,† Hull,‡ Houghton,§ Griffith,|| Kinahan,¶ and others, have produced many excellent treatises on Irish building stones, and all these works are remarkable for their philosophic inception and characteristic thoroughness. We would call particular attention to the recent papers by Mr. Kinahan, last referred to, which, if little accessible in their original form, are decidedly the most complete of them all. The subject is a large one, and we can do no more than dissect a part of it. On the present occasion we shall restrict our observations mainly to the consideration of the sandstones of Ireland which, in remote times, have been, or are at present, used for building purposes. We shall also briefly glance at the deposits of sandstones hitherto untouched by the quarryman, and which could easily be made accessible to the builder with the expenditure of but little capital.

We know that sandstones were favourite building materials with the early inhabitants of Ireland, in spite of the fact that softer and much easier worked stone was frequently nearer at hand. When we reflect on the primitive tools with which the refractory material was wrought into shape, it speaks not a little for the perseverance of these ancient builders, who evidently thoroughly appreciated the enduring qualities of the

sandstones, and were careful in the selection of what they used. Whether they intended that their work should stand as monuments to their ability in the remote future, we know not, but certain it is that much of it will remain for centuries to come when the flimsy productions of the modern "competitive contractor" will have decayed into dust—despised and then forgotten.

Slate rocks were called into requisition in those districts where they existed when mortar first began to be used in the country; eventually the sandstones were largely superseded by limestones, which were capable of being worked with greater facility, and lent themselves more readily to delicate mouldings. The bias of the workmen, however, frequently led them to employ stones brought from a distance, even in those districts where equally good stones could have been raised; and this peculiarity is by no means extinct at the present day. Thus, we learn from the researches of Mr. Kinahan, that when the Scotch workmen were building at Muckross Abbey, Killarney, about forty years since, they ignored the excellent limestone of the neighbourhood, and imported sandstone from Chester, that being the nearest place where they could get sandstones similar to that which they were accustomed to work. The engineers of the Ballast Board, when building lighthouses, brought Dublin granite to various localities where stone well suited to the purpose already existed.

Good examples, showing the durability of the sandstones, may be seen in the old doorway of Maghera Church, co. Derry; a doorway at Killeslin, co. Carlow; St. John's gate, Drogheda; at Boyle Abbey, co. Roscommon; and some dressed work at Mellifont. The last mentioned also shows that the prevalence of mica materially influences the weathering of certain parts of the stone.

Irish sandstones are found in nearly all the geological formations of the island. The most ancient come from rocks of Silurian and Devonian age, but they are not much worked at the present time, by reason of their extreme hardness and the proximity (in some instances) of good limestones. Many of the early structures were made of it, however, and the stone has proved very durable. The Old Red Sandstone, met with about Castle-

bar, and extending from Newport to Lough Conn, in Mayo, is a reddish-brown sandstone and conglomerate. In the central tracts of Ireland red sandstone occurs in the elevated parts of Slieve Bloom, the Inchiquin, Beragh, Keeper, and Galtee Mountains. Other areas of the same class of stone occur in the promontory of Dingle, the vicinity of Killarney and Bantry, Kenmare River, Bantry Bay, and in Muntervary, Mizen Head, and Cape Clear promontories. The Old Red Sandstone in co. Cork is, at least, 5,000 ft. in thickness; but the largest area is that which surrounds Cork, Youghal, Dungarvan, and Waterford. The beds in the last-mentioned districts have much analogy with strata of the same geologic age in Pembrokeshire, and, like them, are traversed by slaty cleavage, the angle of inclination of the cleavage to the plane of the strata often varying from bed to bed. In Ireland, the Upper Old Red Sandstone consists of a lower thick series of green, purple, and red grits and slates; and an upper and thinner group of yellowish, or grey, flagstones, frequently suitable for paving purposes. These divisions have also been partly classified with the Lower Carboniferous.

Carboniferous rocks occupy more than half the area of Ireland, but they are largely composed of limestone. Here and there on definite horizons, however, sandstones occur: in the southern part of Ulster and the adjoining part of Connaught a pure arenaceous rock is found in the limestone, or as independent beds. This arenaceous rock is called the "Calp" sandstone, and furnishes the stones now held in the highest esteem by Irish architects and builders. The Coal Measures, as usual, contain sandstones, but, with the exception of those of the Fermanagh series, are not in much repute.

Mr. Kinahan states that in the West Munster coal-fields the sandstones are almost invariably hard, and although they can be dressed on the face of the beds, they cannot be worked across, as they chip and fly at the edges. In places, they produce excellent flags, but to give good joints their edges generally require to be sawn, as they chip on the face if dressed. In the East Munster (Tipperary) and Leinster coal-fields

¶ G. H. Kinahan, "Journ. Royal Geological Soc. of Ireland," vol. xviii. 1896-98.

good stones suitable for dressed work are found. In Monaghan and Fermanagh are the well-known Lisnaskea stones; and good flags were formerly sent extensively to the market from the Connought coal-field.

Sandstones in Ireland of later age than the Carboniferous do not seem to bear a very good character, with the exception of some, of the Triassic period, coming from North Devon, Sorsbo, and Dundonald, which are much sought after. Other Triassic sandstones are abundant enough, but they are not of a very durable nature.

We will now briefly describe the chief building sandstones as they occur in the various counties, adopting the classification of Mr. Kinahan, but omitting many geological details, and arranging the counties in alphabetical order.

Antrim.—The Geological Survey Memoir states that the fine beds at Cave House were at one time largely quarried, and shipped to Belfast for building purposes. At Ballyvory quarry, near Ballycastle, the stone is very fine-grained and friable, largely made up of grains of quartz, slightly micaceous, and with a few iron spots; it works with facility, but, of course, the blocks containing the iron spots should be rejected. It is light yellow and pink in tint. Certain varieties have been used for bridge-work and in several buildings in the North of Ireland, and have proved to be very durable, but the stone requires to be carefully selected. It is remarkable that in Ballymena, the nearest large town to the quarry, Ballyvory stone is not much used, it having been beaten out of the market by the Scotch and Dungannon stones, which are cheaper. Several quarries in red stone, of Triassic age, known as "Red Free," exist in the valley of the Lagan, and near Larne.

Armagh.—Many sandstones occur in this county, but they have not been quarried to any great extent. A fine-grained stone of Carboniferous age is raised at Grange, and was employed in the restoration of Armagh cathedral in 1835; and a conglomeratic bed, near the county town, was formerly used for building.

Carlow.—The Lower Coal Measures in West Carlow contain many fine sandstones, which might be raised for architectural purposes but only one quarry, worthy the name, now exists—namely at Killshin. The material is of a brownish-grey colour.

Cavan.—Quarries in the "yellow sandstone" formation near the county town have been much drawn from for local purposes; and good building stones exist in the north-western part of the county, but they are not worked to an appreciable extent.

Clare.—At Ballyheigue, near Scariff, a yellowish, ferruginous sandstone is found which was largely employed in the Shannon improvement works at Killaloe. A dark grey stone is raised at Ennistimon, and at Crag and Money Point good flags occur, which have been largely exported to different places along the coast in times gone by. Rather more than thirty-five years since there was a large industry at Killaloe manufacturing these flagstones into chimney-pieces, but the business has long since disappeared. This is another instance similar to those which, on previous occasions, have been pointed out in these columns of the decay of the stone industry of Ireland. The causes of the closing-up of the "Killaloe Marble Works" are not very apparent. As Mr. Kinahan very truly remarks, "Killaloe is most favourably situated, having command of the greatest water power in Ireland, and ought to be one of the great centres of industry; but for some reason all this great water-power is allowed to remain idle. Prior to 1850 the Killaloe works were a great source of employment, not only in the town, but in the flag quarries on the Lower Shannon, and in various marble quarries, principally in counties Tipperary and Limerick. All these quarries seem to have failed when the Killaloe works ceased."

Cork.—This county has many sandstones

* "Journal Royal Geological Society of Ireland," vol. xviii. (1837), p. 233.

of excellent quality, and several quarries exist, but the industry is not as important as it should be. The greyish-green stone from Sherkin Island, off Baltimore Harbour, has been extensively employed in Skibbereen, and is said to be very durable. The greenish stone of Drumcona is also in good repute, and so is the brown freestone of Horse Island. Other good sandstones are found at Glandore, Rahan, and Quarry mountains, near Mallow, Knightfield, Whitechurch, and Youghal. In rocks of Carboniferous age quarries occur, amongst other places, at Coolcoming, Belleview, Shippool, and Ballymartel, the two last-mentioned localities being situated near Kinsale. Speaking of the stones raised on the river Lee, north of Cork, Mr. Wilkinson says that some are yellowish-white, close, having compact quartzose grains, with felspathic cement, and semi-vitreous; whilst others are green, siliceous, close, and dense, but with numerous fissures and bedded portions, the latter causing the stone to fail.

Donegal.—Quarries near Mount Charles produce durable stone of much repute. That from Drumkeelan has recently been used in building the museum and library at Leinster House, Dublin; it is a yellowish-grey material, felspathic, slightly micaceous, with a siliceous, ferruginous matrix or cement. There seems to have been some difficulty in getting an adequate supply, judging from experience in building a bank at Ballyshannon. The greyish-yellow sandstone of Altdo, near Donegal, was used as ashlar in Lough Eske Castle. Other stones of a somewhat similar nature are found at Beauwin, Kildoney, near Ballyshannon, and at Dog's mountain.

Down.—The Triassic beds along the valley of the Lagan yield a dark red stone which has been considerably worked for local requirements. The different quarries at Scrabo Hill, near Newtownards produce some of the best-known sandstones in Ireland. The variety is very good, and, as is usual in such cases, the material is variable in quality. The predominant colours are grey, yellow, and red. It has been much employed in the neighbourhood of the workings, and in Belfast; examples in that city are afforded by the Albert Memorial, St. Enoch, Fortwilliam, Sinclair's Elmwood, and Donegal-street churches. The red stone from Dundonald is also used in Belfast and in Dublin; it is very similar to Scotch Annan stone in appearance.

Dublin.—In the city of Dublin, sandstone is largely displayed in the public buildings, but Mr. Kinahan states that none of the cut stone appears to have been obtained in the county, whilst most of it, especially in the buildings erected during the last century, and in the beginning of the present, is English stone. Arenaceous rocks, belonging to the Carboniferous system, have yielded good flagstones, especially in the "Windmill" quarry, Rathgar; whilst local stone is obtained from the lower Coal Measures in the north of Co. Dublin.

Fermanagh.—Near Lisnaskea several quarries of note occur, which produce a cream, yellow, or greyish free-working stone. That from Slush Hill has been used in several buildings in Enniskillen, Clones, and Irvinestown, but the quarry is now closed. The "Geological Survey Memoir" for the district states that good hard siliceous stones may be procured in the Derrygonnell "Calp" area, to the west of Lower Lough Erne—as in the neighbourhood of Church Hill. About Monea they are, in general, massive, with subordinate flaggy beds. Other sandstones are found in the west of the county, where there are several small quarries.

Galway.—Although fine stones occur in Co. Galway they are not, at present, much worked. A thin laminated flag, known as "Dunmore slate," was formerly raised at Slieve Dart for roofing purposes.

Kerry.—The Devonian and Coal Measure sandstones were much used in the early Norman architecture in the county; but the numerous small quarries open at the present time merely provide material for local pur-

poses. Fine red stones occur at Minnar near Dingle, and at Poulawaddra Wood and Tomenane, near Tralee.

Kildare.—Very little sandstone crops out in this county, and that is not exploited to any extent.

Kilkenny.—Many excellent sandstones occur in Co. Kilkenny, but their interest principally historical. Near Carrick-on-Sliabh, Kiltown, and Coolcullen, yellowish and red stones are raised for local purposes. The celebrated "Carlow flags" were obtained at Shankill, Kellymount, and Conahy. Mr. Kinahan says that the Shankill flags were considered the best. They ranged in thickness from 4 in. to 1 in., and could be raised as large as 12 ft. or 14 ft. square, but in general they were from 8 ft. to 10 ft. long, and 3 ft. to 4 ft. wide. The trade is not so brisk as formerly.

King's County.—In the neighbourhood of Kinnity, along the north-west flanks of Slieve Bloom several small quarries exist in Carboniferous age stone, of a cream tint.

Leitrim.—Near Manorhamilton, at Killea, a fine-grained, argillaceous sandstone of varying shades of grey is extensively worked; and several small openings are found near Mohill and between Dromod and Drumsna.

Limerick.—The well-known Doon freestone furnishes another example of the decay of the Irish sandstone industry. It was especially suitable for staircases, and was largely shipped to England and elsewhere. Marble bridges have been erected with the hard quartzose rocks found in the coal-measures of this county; and flags have been worked near Atbea and Barna.

Londonderry.—Near Maghera, at Gorturk, the light cream-coloured sandstone is found, of which the elaborately-sculptured doorway of the ancient church of Maghera is built. A blue stone occurs at Drumard which has been used in Belfast; whilst from the Drumquin, Altmover, and other neighbouring quarries comes the "Dungiven" stone, which is held in high repute in the Belfast district. It is stated to be an excellent material, of a light colour, free from iron, very durable, and tools with facility. It has been used amongst other places, in Coleraine Church, Protestant Church, Belfast; several buildings at Killea, and in the Diocesan Seminary, Londonderry.

Longford and Louth.—Several sandstones are raised in these counties, for purely local purposes,—some are of fair quality and others are very indifferent.

Mayo.—Flags of large dimensions, of Silurian age, are found between Foxford and Swinford, and in the north-west of the county. Quarries in Carboniferous freestone are at Meelick, near Killala; Westport, and Pouharavog, near Swinford.—old buildings, in the vicinity of these places attest to the superior quality and endurance of the material. Flagstones are raised in many places.

Meath.—Westward of Kells, near Oulston castle, are sandstones presenting different shades of brown and yellow; and between Navan and Drogheda similar stones have been raised here and there. Carricklick quarry, near Carrickmacross, produces a variety of greyish stone, which works freely, and has been much used in the last-mentioned town.

Monaghan and Queen's County.—The Calp stone in Monaghan, of a yellowish colour, has been somewhat extensively exploited; and the Lower Carboniferous sandstones raised near Mountmellick, in Queen's County, were formerly much requested; whilst a number of openings exist near Clonslea, Ballysally, and Clogrennan.

Roscommon.—St. John's Hole quarry, near Boyle, is interesting from a historical standpoint. The stone is grey and hard, and has been used in great quantities in the neighbourhood, notably at Boyle Castle. Mr. Wilkinson, in speaking of it, says that "it has resisted exposure to the weather well, some of the marks of the tools being still visible." He adds that the quarry was situated in the bed of the river; and in the connexion Mr. Kinahan writes an instructive note to the effect that "This raising of stone

out of the bed of a river or stream seems to have been not uncommon with the early builders, as in different places holes are pointed out so situated, which tradition states were quarries where the stones were procured for adjoining structures." A good example of such a quarry, he adds, may be seen at Kilmacrenan, co. Donegal; not long since this hole was pumped out, and a rude set of steps to the floor of the old working was discovered. Near Castleria good sandstones have been raised, and also in Slieve Bsun, near Roscommon, and other places.

Sligo.—Although this county is by no means deficient in fine sandstones, they are not much drawn upon by reason of the preference given to limestone for building. West of Ballysodare Bay, and in Dromore West, freestone quarries occur.

Tipperary.—Sandstones were largely raised in this county in ancient times, but, although of good quality, they are not much sought after at the present time. Quarries exist in the Devonian rocks at Knockmeeldown and Mount Anglesy; and in Carboniferous at Dundrum, Tinnakilly, Drumbane, and near Roscrea.

Tyrone.—This county produces the best sandstones in Ireland, and they are largely quarried. The majority are of Carboniferous age. The "Calp," especially, yields some beautiful stones; the workings in the vicinity of Cocketown show a cream or blue tint-stone, slightly micaceous, open-grained, and having a calcareo-siliceous cement. North of Dungannon, at Bloom Hill, cream and red tones are raised; and the quarries of Gortnagluck and Carlan have provided much building-stone for Ballymena, Londonderry, &c. Renfurly or Mullaghana stone is yellowish, fine-grained, and does not tool easily. It was used, amongst other places, in the Post-office and Northern Bank, Belfast. These materials are known generically as "Dungannon stone."

Waterford.—The Devonian and Lower Carboniferous sandstones are very generally used throughout the county; they are usually brown, yellow, or greenish. Quarries occur near Dunganvar, Lismore, Clonmel, and at other places.

Westmeath, Wexford, and Wicklow.—The first-mentioned county, being almost entirely composed of Carboniferous limestone, contains no sandstone of any note. In the vicinity of Wexford Harbour shaly sandstones have been wrought, and also at places in Forth and Burgly. The only sandstone worth mentioning in Wicklow is quarried at Glencormick, north of the Great Sugarloaf. It is cream-coloured, fine-grained, and has been much used at Bray, and in the surrounding district.

From the foregoing it will be observed that Ireland is rich in arenaceous rocks, and many of them are of excellent quality. With increased prosperity, and the introduction of a little more capital, the Irish sandstone industry would doubtless be revived. It is a deplorable but significant fact that, whilst suitable building material is found in abundance in the island, a considerable quantity is imported. Surely such a state of things will not exist much longer!

NOTES.

THE coal-miners have had their holiday, and the merchants their harvest at the expense of the public, and now we may look for the reaction. It set in, indeed, some days before the men resumed work, prices dropping (almost as rapidly as they had risen) even while there was hardly a ton of coal being raised in any part of the country. Such, however, had been the activity during the week preceding the stoppage,—particularly in regard to household coal,—that there was actually more coal in the London depôts at the beginning of this week than there was before the stoppage. The resumption of work was delayed in some instances owing to the refusal of the Federation to allow work of any kind to be proceeded with during the

stoppage. With regard to the scheme for working five days a week, it is not anticipated that the masters generally will offer much opposition to its adoption, as the demand for fuel has now fallen to such an extent that there would, in many cases, be some difficulty in finding work enough to occupy the men full time. Probably, if the suggestion had come from the masters there would have been a great outcry; indeed, some difficulty will doubtless be experienced as it is, for this continued voluntary sacrifice of wages is not altogether approved of by some of the men. From Derbyshire, for instance, where there are 33,000 miners, it is reported that many of the men complain of loss of wages, and opposition may develop to the five-days week resolution. The present outlook is most serious in Durham, where the strikers will receive the support of the Federation men in their efforts to resist a reduction of wages, and where some had feeling is already being displayed.

THE hearing of the Bill of the Manchester, Sheffield, and Lincolnshire Railway Company, for the extension of their line to London, has commenced. It is clear that so far as the extension is concerned it is practically an unopposed Bill. The real fight is over the question of the London terminus. The company proposes to swallow up squares and streets in a very wholesale fashion. When all the facts and plans have been clearly stated, it is really a question for the House of Commons to decide. As the matter is in a sense *sub judice* it would be undesirable to enter into details, but the absorption of a large part of a district of London is a subject not only of vital importance in itself, but is also a matter which must be regarded as likely to become a precedent. For some days, perhaps, the South-Western Railway might wish to locate themselves in the midst of South Kensington. Then, again, there is in close connection with the terminus, the question of street approaches. A large terminal station must obviously have an influence on the vehicular traffic for a considerable distance. The points will be found probably to resolve themselves into conditions upon which the Bill should be passed; but these conditions seem to be of a character which require discussion from a larger assembly than a handful of members in a committee-room.

THE demolition of the block of buildings near the Rolls Chapel, at the south-east side of Chancery-lane and opposite Carey-street, will, it is to be hoped, result in the widening at this part of the "Lane." This main communication between Holborn and Fleet-street is too narrow for the traffic, and the ground which has lately been cleared should not be allowed to be built over to the same extent as before the destruction of the old buildings. We must also again call attention to the fact that though the new Bankruptcy Court and offices are completed, the access to them for carriages and cabs is very inadequate. There must be a direct approach made from Holborn if persons who have to attend at these buildings are not to be delayed and inconvenienced, since both the Chancery-lane and the Little Queen-street routes are constantly blocked.

RAILWAY passengers are decidedly getting the best of it just now in regard to the overcrowding question. The latest decision in their favour was given at the Birmingham County-court last week, when the Midland Company were sued by a first-class passenger for having inflicted some third-class company upon him against his will. It was decided that the company had no right either to put more than six passengers into a first-class carriage, or to put third-class passengers into carriages of a higher class, without the consent of the occupants; and the complainant was awarded forty shillings damages for the inconvenience and discomfort to which he had been subjected. This gentleman seems to have fre-

quently been the victim of overcrowding, for it appeared from his evidence that on two occasions he had to take refuge in the guard's van in consequence of insufficient accommodation. It was argued, however, that entering the guard's van was his own act, and the Judge held that no case had been made out in this instance. There may have been, perhaps, some difficulty in deciding whether such an act, under such circumstances, should be described as voluntary or not, although it is certain that it would go very much against the grain; but it would be some satisfaction to the plaintiff to succeed on the other portion of his case. The Midland will evidently have to look to their accommodation for this section of their line, while other defaulters in this respect will do well to take warning.

MR. CECIL TORR'S article in the last number of the *Classical Review* (March, 1892) is sure to be the beginning of a smart controversy on a point of importance to all Hellenists. The occasion for the article in question is the appearance of Mr. Flinders Petrie's "Illahun, Kahun, and Gurob," but Mr. Torr directs his polemics mainly against what he is pleased to call Mr. Petrie's "sensational article" in the *Hellenic Journal* for October, 1890. To this article and its great importance we drew attention at the time. Mr. Torr, in his dogmatic fashion, says: "Nobody could take such an article very seriously; but nobody could fairly criticise it at the time, for Mr. Petrie merely stated his results and reserved most of his evidence for publication in his work on Illahun." By an odd coincidence in this very same number of the *Classical Review* we have evidence that one Homeric archaeologist of notably sound judgment does take Mr. Petrie very seriously. In reviewing the English edition of Schuchardt's book on the Schliemann excavations, Dr. Walter Leaf writes:—"It is pure ill-luck that it (*i.e.*, second German edition) should come out just too soon to take advantage of Mr. Petrie's paper in the 'Journal of Hellenic Studies,' which must form the foundation of all the chronology of the Mykenean period." The lists are set for a tournament of no common interest, and we hope to see Dr. Leaf, as well as Mr. Petrie, break a lance.

THE Prussian Diet has granted the ten million marks asked for by the Government towards the cost of a new Berlin Cathedral, and the House has made a start by voting the first 300,000 marks necessary for the preliminary works on the proposed site. The grant of the ten millions has been made on condition that no extra sums shall at any future date be asked for, that the money be voted in smaller sums, according to the requirements, and that a Board of Works standing under the sole control of the Emperor's Master of the Royal Household Affairs carry out the building, and bear all responsibility in relation to it. As to who will have the future responsibility of keeping the building in condition when it is in use, nothing has been decided. In the course of the discussion that took place before the voting, Herr Richter, the Leader of the German Liberals, opposed the grant. He considered the financial state of the country too bad at present to permit of such luxuries as cathedrals, whilst urgent necessities were being crossed out in the General Purposes Budget; he also reminded the Government that the number of places of worship in the country was considered to be far too small in comparison to the population, and that the sum asked for would cover the expense of erecting a number of these buildings. He then went on to question the House as to who was to guarantee that such money as they were asked to vote would not be used for the erection of a public eyecore, and that the Emperor's despotic *sic volo sic jubeo* would not also be used in this matter. If the House was going to acquiesce in the Government's demand, the right of having a

hand in the selection of architect and design should, at all events, be reserved. He finished by pointing out that the means of the reigning Hohenzollerns were not so small as not to permit the Emperor to build a cathedral on his own account, if he thought fit, without making the taxpayers' burden a heavier one than it was already. Another member observed that the discussion would not have taken so disagreeable a turn if it had not been for the selection of the unpopular design and architect. The end of the matter was as above stated, that the country will have to pay its money towards the cost of an erection, the design of which is decidedly unpopular, without any power of interference on the part of their representatives.

THE Church of St. Gervais, some of whose fine old windows, and images in the baptistry, narrowly escaped total destruction by an explosion with felonious intent upon the Lobau barracks, is one of the most noteworthy in Paris. Conspicuous for its range of flying buttresses, it stands behind the Hotel de Ville* and the (former) Caserne Napoléon. The fabric was completed in 1420; a Classic facade by Salomon de Brosse was added in 1616. The windows, originally filled in by Pinaigrier and Cousin, had already suffered much. One, in a chapel on the south side of the choir, representing the "Judgment by Solomon," was set up in 1531. The older glass in the Lady Chapel, restored in 1845, is ascribed to Pinaigrier. Here were buried Scarron, after whom the Chapelle Scarron, with late seventeenth century decoration, is named; P. de Champeigne, painter; the Châucellor Letellier; and Madame de Maintenon's husband. The grotesque carvings of the choir stalls are of the sixteenth century. St. Gervais is clearly depicted in Mr. H. W. Brewer's "View of Paris in Francis I.'s Time," published by us on January 5, 1889.

SOME repairs, undertaken by the Burial Board of St. Margaret's and St. John's, Westminster, to the churchyard of the former parish, supplement the more extensive alterations that were made ten years ago. The present turf and Eureka-paved pathways are a great improvement upon the unsightly area of cracked and sunken tomb-stones. The latter were re-laid some feet below the surface, and the only stone now visible is one opposite to the church's new western porch, which is inscribed "T. II." St. Margaret's grave-yard is crowded to excess. The Report by the General Board of Health upon a scheme for Extramural Sepulture (1850) contains some forcible strictures by Dr. Reid on its insanitary condition. In the churchyard were buried Hollar, in a grave, says Aubrey, near the north-western corner of the tower (1677), and Dr. Hickeys, author of the "Thesaurus" (1715). After the Restoration, they dug a pit for the remains, taken out from the Abbey, of Admiral Blake; his bust, by Baily, was put in the Shire-hall of Taunton, his native county town, about thirty years since. Since the date (August 29, 1885) of our illustrated article upon the artistic features of this church, which in antiquity of foundation ranks next to St. Paul's and the Abbey, two coloured windows have been set up. One was presented by Mr. G. W. Childs, of Philadelphia, in memory of Milton's marriage to, and the burial of, his second wife, in the church.† Another, of three lights, by subscription, in honour of Blake, designed by Mr. Edward Frampton. At the ceremony of unveiling the latter, on December 18, 1888, Archdeacon Farrar is reported to have said it formed the thirteenth window placed in the church to the memory of great men since his became rector. The lines on the Caxton, Milton, and Blake windows are by

* For description, with illustration, of the old Hotel de Ville see the *Builder* of January 26, 1889.

† Buried on February 10, 1685: a gift to the poor by the poet's daughter is cited in Mr. Wm. Barlow's "Brief Historical Narrative of the Royal Church and Parish of St. Margaret the Martyr," circa 1873. The marriage took place on November 3, 1666.

Lord Tennyson, Browning, and Mr. Lewis Morris respectively. The original organ, by "Father" Smith, was sold soon after his death. In 1882, the then organ was rebuilt and enlarged by Messrs. W. Hill & Son, and enclosed in an oak case designed by Mr. A. G. Hill, F.S.A. It is now proposed to set up here a stained-glass window to the late Mr. W. H. Smith's memory.

AT the sale by auction on the 18th inst. of the Farringdon-market site (for 68,100L) the question was raised whether portion of the area covers a disused burial-ground. There seems to be but little doubt that this is so. For the market buildings, between Shoe-lane and Farringdon-street, was cleared a space whereon stood (reckoning southwards from Plum Tree-court) Mellin's-rents; St. Andrew's, Holborn, Workhouse, in the lane, and just opposite to Robin Hood-court; Brew House-yard: Cross-alley; George-alley; the "Rose and Crown"; and Love-court. A grave-yard belonged to, and lay behind, the Workhouse, and is that wherein Chatterton found a pauper's burial. Close by, southwards, between Stonecutter-street and Harp-alley, stands another disused grave-yard, which belongs to the parish of St. Bride.

THE collection of paintings by Mr. Whistler, at the Goupil Gallery, consists mainly of works which have been exhibited before in London, and seems to have been intended as a kind of demonstration in honour of the fact that his portrait of his mother has recently been acquired for the Luxembourg Gallery. Mr. Whistler is always amusing on these occasions, and in his catalogue he quotes after each picture some of the contemptuous remarks which have been made about it by various critics, and winds up with a quotation from the *Chronique des Beaux-Arts* in praise of the Luxembourg purchase as "destinée à l'éternité des admirations," with the object of showing what imbeciles are the English critics who have scoffed at Mr. Whistler's productions. We fear the argument will not bear much examination. In the first place the Luxembourg picture is one of the very best Mr. Whistler ever painted, and has been recognised as such by many who would not stand his nocturnes and other vagaries; and in the second place the work exactly hits the most recent French taste in painting, and therefore naturally gets rather extravagant praise from a French critic. This will not prove that all the things in the Goupil Gallery are worth the same praise. In regard to the portrait of Miss Alexander (23) Mr. Whistler is kind enough to put on record our own criticism, "There is character in it, but it is unpleasant character. Of anything like real flesh tones the painting is quite innocent." We are obliged to him for giving prominence to a criticism which we believe the majority of people who know anything about painting will admit to be a completely fair and just estimate of it. Among works exhibited are some that we can admire more unreservedly, especially the "Dame au brodequin Jauns" (why this affectation of French in an English exhibition?), a full-length portrait of a lady just in act to walk away from the spectator, showing her profile over her shoulder, which we have before remarked on for the admirable indication of figure and movement given in it. The exhibition as a whole is half amusing, half vexatious,—the work of one who might have done great things in his art if he could have troubled himself to take it seriously.

CARLISLE ARCHITECTURAL AND ENGINEERING ASSOCIATION.—The usual fortnightly meeting of this Association was held in the Town Hall on Tuesday last, when a paper was read by Mr. J. W. Smith, the Sanitary Inspector for the city, on "The Sanitary Arrangements of Public and Private Buildings." The paper contained some good, practical information as to matters of house drainage.

ROYAL INSTITUTE OF BRITISH ARCHITECTS:

BYZANTINE ARCHITECTURE.

The tenth general meeting of this Institute for the present session was held on Monday evening last, Mr. J. Macvicar Anderson, President in the chair.

The late Professor E. A. Freeman.

The President: Gentlemen, I am sure you will all mourn with me the loss of a distinguished man, Dr. Freeman, Professor of Modern History at the University of Oxford. Dr. Freeman was, as you are aware, an Honorary Fellow of this Institute, and has been so for many years. Whatever may be the exact position which posterity may assign to him as a historian and as a prolific writer of the English language, we at all events will all agree in deploring the removal from our roll of members of so eminent and distinguished a man. As architects we are more particularly interested in his loss from the circumstance that, prolific as were his writings, "History of Architecture," followed in 1849, and by his "Essay on Window Tracery," and 1851 by his pamphlet on "Llandaff Cathedral." I am sure, gentlemen, you will all mourn with me the loss of our distinguished Honorary Fellow.

The Examinations.

The President next made what he called an *interim* report on the Institute Examination. He said that eighty applications had been received to be admitted to the Preliminary Examinations, seventy-four of which were applications, six being applications from candidates who had been relegated to their studies on previous occasions. Of the total of eighty-two-nine were exempted, in accordance with the rule, and were admitted as Probationers; the remainder, thirty-six had been examined in London and fourteen in Manchester. Results of this Examination were not yet known; the number of papers to be dealt with by Examiners being so large. An Intermediary examination had also been held, at which twenty-two Probationers presented themselves out of twenty-five who applied; of the thirteen had passed, the remainder being relegated to their studies for a period. Examiners reported that "the testimonies submitted in this Examination have been of high merit, particularly those of non-metropolitan candidates. The names of successful candidates in this Examination in order of merit, as follows:—Crompton, E. V., Bradford; Consens, H. W., Haslemere; Stratton, A. J., East Sheen; Vercoe, A. A., London; Phillips, J. St. J., Belfast; C. J. P., London; Marchant, R., Sutton-at-Bell; Kent; Davis, E. R. O., Leicester; W. E. A., London; Gordon, T. W., Nottingham; Parkinson, F. J., Blackburn; Col. P. P., London; and Kendall, F. K., London. These gentlemen were now qualified for admission as Students of the Institute, a subscribing class of members now numbering forty-one. For the Examination in Architecture which would commence on Monday next, March 28, there had been seventy-one new applications received from candidates,—a larger number than had ever before applied at one time. In addition, twenty-one candidates who had been relegated to their studies on previous occasions had also applied to be admitted to the examination, making a total of ninety-two; but the applications of eleven of the new candidates having been disallowed, by reason of their probationary work not being equal to the requirements of the Board of Examiners, the number of candidates to be examined is eighty-one,—sixty-six of whom would be examined in the Institute Rooms, and fifteen in Liverpool. He ventured to think that figures he had quoted were eminently satisfactory.

A New Theatre at Amsterdam.

Mr. J. M. Brydon said he had been asked by Jan Springer, a well-known architect at Amsterdam, to offer, for the acceptance of the committee, a complete set of the working plan of the new theatre now being erected in that city. He thought they would be found very interesting. The theatre itself was an important structure, costing about 100,000, and was built entirely on piles. The whole construction was shown in the most masterly way, and he thought that the drawings would be found very well worth study.

The President said he was quite sure the meeting would give its thanks by acclamation to Mr. Jan Springer.

Byzantine Architecture.

The President, in calling upon Professor Aitchison to read his paper on Byzantine Architecture, said it was with great gratification that they all welcomed their elderly friend and colleague, Professor Aitchison. It was particularly kind of him to undertake to give them a paper so soon after the arduous labours of his course of lectures at the Royal Academy.

Professor Aitchison then read his paper, of which the following is an abstract:—In the author's introductory remarks he said architects were now interrogating every architectural monument to discover how building had been converted into architecture in every country in the world, so that they might make the step forward towards a style characteristic of modern civilisation. In Byzantine architecture was to be seen the gradual adaptation of the plans of antique buildings to the ritual of a new faith; the universal adoption of the dome; the successive devices by which the equilibrium of the dome was at last attained; and the new æsthetic problems solved. In studying Byzantine architecture, two difficulties were encountered: the date of its beginning and its chronological sequence. He had taken the dedication of Constantinople (330 A.D.) as the first, although the buildings erected then were of Roman architecture, and probably designed by Roman architects. Having referred to the buildings erected in the time of Constantine, the author said the greatest benefit the Emperor had conferred on architecture, beyond his buildings, was to enact that all persons in North Africa and Italy should be freed from taxes if they allowed their sons of eighteen years of age and of liberal education to be brought up as architects. As to the sequence in date of Byzantine buildings this could be traced from Constantine's death to the days of Justinian, because the study of Byzantine architecture had been neglected; but if masterpieces were again to be erected old ones must be studied, and one masterpiece of the world was the Sta. Sophia of Constantinople. From a description by Eusebius of Cæsarea, of an early Christian church, it would be seen that the churches originally faced east and the priest faced the congregation; the right and left sides of the altar were the priests' right and left, the right or south aisle being for men, and the left or north for women. In the fifth century the orientation was reversed, the priest standing with his back to the congregation and facing east, although the sides of the altar remained as before. The pure basilica type, in the form of a circus, did not, however, find favour except in Italy and the West. When domes on pendentives were first used was not known; M. Dienlaff and others had discovered that the ancient Persians used egg-shaped domes over square chambers, carried by a pendentive pierced by a squinch; and M. Choisy was of opinion that those found at Serbistan, Firouzabad, and Feracbad were of the days of the Achaemenides (about 800 B.C.). A pendentive, not quite regular in form, was found at Caracalla's Baths (211 A.D.), and mentioned by Ware in his tract on vaults in 1822. It was generally agreed, however, that the first great dome on four pendentives was that of the great Sta. Sophia; and next to Sta. Sophia the most important building, for its influence, was the Church of the Apostles at Constantinople, eventually destroyed by Mohammed II. for his mosque, but said to have served as the model for St. Mark's at Venice and St. Front at Périgueux. The earlier buildings of Central Syria seemed to have had considerable influence on Byzantine architecture. After the building of the great Sta. Sophia, the constructive problem to be solved was making domes on pendentives safe. The original dome of Sta. Sophia had fallen twice, and, though rebuilt with a higher rise, was not absolutely secure. The weakness of the abutments to the dome and pendentives was mainly on the north and south sides. No other big dome was to be found in Byzantine work; in minor and later examples barrel-vaults took the place of the arches. M. Choisy had pointed out that the dome of Sta. Sophia at Salonica was shunted by vaults one-third the diameter of the dome, but that the church was probably two centuries later than its prototype. The church to the Virgin at Salonica, called by Texier and Pullan St. Bardias, has been looked on as an early specimen

of a dome on a drum, but the date of its dedication was 1028 A.D., and its arrangement also pointed to a late date, for the plan showed three apses at the east end, with a large central dome supported on columns and surrounded by four small domes. A similar arrangement of five domes was found at St. Nicholas at Myra, which was nearly identical in plan with St. Theodore at Constantinople. In Greece the squinch or conch seemed to have been preferred to the pendentive. Most of the peculiarities in churches after the building of the great Sta. Sophia were structural ones to prevent the spread of domes on pendentives, and the use of drums added to the weight; they showed, however, that the Byzantines had learnt to build domes securely. The æsthetic devices of early Byzantine work were not easy to describe, for most of the columns came from temples. The slips of entablature over the columns in the groined halls of the Roman baths were roughly imitated by a block put over the capitals; these blocks were universal up to a certain period. It was also possible that the treatment of the arcade over the Porta Aurea at Diocletian's Palace was a common practice. Besides the cup, cushion-shaped, or cubical capitals, the turning of the apophyses of the columns into bands was worthy of note. Æsthetically, the outsides of the buildings appeared to have received little attention, although some fronts were ornamented with blind arches or open arcades, and in later work bricks in zigzags, or rude imitation of the Greek fret, were used. The profiles of Byzantine work were tame and commonplace, with no proper æsthetic sequence in the mouldings. The interiors were splendidly decorated after the Roman manner, which the author described. The five Imperial palaces at Constantinople all joined together were as curious in construction as they were splendid in internal decoration. As the Byzantine Empire shrank away, the position of these palaces was found to be too exposed to attack from the Bosphorus, and another was built at Blachernæ, on the Golden Horn. The great tank called the Cistern of Phloxenns, believed to be of Constantine's time, was interesting as exhibiting how the Byzantines built for pure utility. The peculiarities of Byzantine construction were given in M. Choisy's work, *L'Art de bâtir chez les Byzantins*, and was most original and interesting. The vastness of the interior of Sta. Sophia, the author considered, was most striking, and was greatly aided by one having to go down the narrow narthex, through the Imperial door into the main edifice. In the course of his description of the interior, Professor Aitchison drew special attention to the lighting, as matter he deemed not sufficiently thought of in modern buildings. There were forty windows round the base of the dome; the aisles on both floors were flooded with light, and there were many windows in the north and south clerestories. The decoration also was splendid; the lower part of the walls panelled with precious marbles, the sprandrels of the upper arcades and friezes inlaid with magnificent patterns on black and white marble, superb monolithic columns of porphyry and verd antique and gold mosaic combined to produce a dignified and superb magnificence. The Professor concluded his paper with a reference to the present age, perhaps the most marvellous the world had seen, and said architecture had made great strides, and architects were hestiring themselves to make greater. What seemed, however, to be overlooked was that architecture was a structural art, and that all that architects could tell was by building; yet very few seemed to thoroughly acquire the art of construction. As a nation, the English could not pose like the Greeks as lovers of the beautiful; but they were not so far removed from the Roman character that they need despair of producing the grand and the dignified. Success was only to be achieved by the united and continuous efforts of many for generations. Noble architecture could not be looked for until there was a passionate desire for it among the people, devotion in the architects, and the opportunity of acquiring perfection by a long series of monuments to one noble purpose.

The President, in inviting discussion, said that not only did the valuable paper to which they had listened bristle with information interesting to architects, but it was occasionally enlivened by characteristic touches of what he would venture to call that Aitchisonian humour so familiar to them all. The Professor was also particularly deserving of

their thanks for the very complete way in which he had illustrated the paper by means of drawings and plans.

Mr. R. Phené Spiers, in moving a vote of thanks to Professor Aitchison, said he had had the advantage of visiting Constantinople and of seeing Sta. Sophia; there was no building in the world which gave an internal effect equal to that which one obtained on entering that great church. Professor Aitchison had brought before them the various features of the interesting style of which he had spoken, and he had also drawn a moral. He was glad to say that the advice contained in his moral was carried out to a certain extent in the French school, where, according to his recollection when he was a student at Paris, the Mosque of Sta. Sophia, as illustrated in Salzenberg and in Reynaud's *Traité de l'Architecture*, was frequently referred to by them. In fact, the new Greek style in France was based much more upon Byzantine than upon Greek elements. He therefore cordially endorsed the Professor's remarks, as he did not know that there was any style which it would be of greater advantage for a student to begin to cut his teeth upon, if he might so express it, because of the great simplicity of its masses and the exquisite beauty, as he thought, of its detail. He confessed that he should have liked to see a little longer duration given to the Byzantine style. The Professor had fixed the period at 1123 years—from the time of the removal of the Empire to Constantinople to probably its being taken by the Turks; but he thought it would be well to direct the attention of students to the fact that the elements of Byzantine art existed for centuries before that, in Central Africa and elsewhere, and that we might go back another couple of centuries to find some of its earliest features. As a matter of fact, curious as it might seem, by bringing all his Roman architects to Constantinople, Constantine really retarded the development of the Byzantine style for probably half a century. It was a singular and peculiar judgment on him that of all the works which he erected at Constantinople by the hands of Roman workmen, not a single one remained, and it was only in the cistern of the 1,001 columns, and in the Yerehahan Serai, both of them executed by Byzantine workmen, that we found two examples of his work existing at the present day. Constantine would have done better if, instead of being in such a hurry, he had trusted to those Eastern workmen who were the builders of that magnificent system of vaulting which the Professor had brought before them. The Neo-Byzantine style was continued in Russia till nearly the end of the seventeenth century, so that instead of 1123 years about fifteen centuries would be more correct. In a paper which he (Mr. Spiers) read before the Institute some months ago, he attempted to prove that the theory of M. Dienlaff as regards the Palaces of Serbistan and Firouzabad in Persia was illusory, but the Professor was of a different opinion.

Mr. Alexander Payne seconded the motion, and said it always seemed to him that the period of Byzantine architecture was perhaps one of the most original periods of architecture that we had in the whole list; and when one came to consider why it was so original, he thought the reason was not far to seek—which was that the whole needs of Christendom then were quite different from the needs that had gone before. The old Roman Empire had fallen, and the architects had to work out a new problem altogether. Hence we had that extraordinarily interesting period of architecture. It always seemed to him that the real birth of the style was in Syria. In the Marquis de Vogué's book,—a book not well known except amongst architects,—one saw almost all the types of the churches that were to be found in Constantinople; and when one came to Constantinople one came to perhaps absolutely the most interesting architecture one could find. There was a great deal more to be found out in Constantinople than was known.

Professor Kerr and Mr. Loftus Brock having supported the vote of thanks, the President put it to the meeting, and it was heartily carried.

Professor Aitchison having replied, and Mr. E. Wyndham Tarn having made a few supplementary remarks, the meeting terminated with the announcement that the next meeting of the Institute would be held on Monday, April 4, when Mr. Starke Gardner would read a paper on "Wrought-Ironwork of the Renaissance Period."

SOME RECENT DEVELOPMENTS IN
THEATRE PLANNING:

ARCHITECTURAL ASSOCIATION.

The ordinary fortnightly meeting of this Association was held on the 13th inst., in the Meeting Room of the Royal Institute of British Architects, 9, Conduit-street, Mr. F. T. Baggalay, the President, in the chair.

Mr. F. T. W. Goldsmith, junior honorary secretary, announced a change in the date of the *series*, which is now fixed to be held on May 6, and not on the date mentioned in the "Brown Book."

Mr. Goldsmith further announced that the next Visit would be made on April 2, to the new South London Ophthalmic Hospital, St. George's-circus, by permission of Mr. Keith D. Young, the architect.

Mr. Goldsmith also proposed a hearty vote of thanks to Sir Arthur Blomfield for allowing the Association to visit the Church of St. Saviour's, Southwark, on the 5th inst. The vote of thanks was carried by acclamation.

The President then called upon Mr. E. A. E. Woodrow to read the following paper on "Some Recent Developments of Theatre-Planning":—

When the Committee of the Association honoured me with the request to read a paper on theatres to-night, I was asked if I consented to send the title of the paper to the secretary by return of post, as the Brown Book was ready to go to the printers. In my haste to obey and anxiety not to delay so important a publication as our Brown Book, I pitched upon the title of "The Planning of Theatres," thinking that wide enough to cover any ground; but when I seriously sat down to prepare for this evening, I found I had committed myself to a task quite impossible to fulfil within the limit of time allowed. In fact, if I had attempted to speak at all fully on theatre-planning, it is probable that I should have been left here till midnight reading my paper to empty benches. The feelings I experience on finding out this may, perhaps, have been also felt by some of you who have had similar commands from our committee. On wondering how I was to overcome this dilemma, it occurred to me that I had better confine myself to recent developments and improvements in theatre-planning, but I fear I can only touch upon the fringe of even this section of my subject. Through the kindness of several gentlemen, I am enabled to-night to bring before you notice several drawings of theatres that have been erected in London during the past few years. It will be my endeavour to trace from these drawings some of the recent developments in theatre-planning. I think it will be of more practical use to us, as members of the Association, to spend the evening studying the plans of buildings built, or being built, than to deal with any ideas for theatre-constructing that exist only on paper, and have not undergone practical test. The great difficulty the student in theatre-planning has to surmount is to learn all that is wanted in and about a theatre; and unless he has had the advantages of seeing the nightly working of the front of the house, as well as of the stage, it is quite impossible for him to design a theatre that will meet the requirements of a London manager. Theatres have to be built to pay. It is a notorious fact that the same play may be a great success in one house and a perfect failure if produced in another. The theatre must be chiefly designed for the particular and special business that the manager intends carrying on therein, although, with changes of fashion and fortune, there *must* be some slight changes of the class of entertainment. I cannot quote a better example to illustrate my meaning than the special arrangements made by Mr. Phipps when he reconstructed the Haymarket to meet the demands of the class of performance given at this house and the class of people frequenting it. Large sums of money are required to mount a Haymarket piece; Mr. Bancroft, therefore, decided to abolish the pit, and fill the whole of the ground-floor of the house with high-priced seats. On the first night the experiment looked like failing, as loud cries of disappointment came from the exalted pit circle; but experience has proved that architect and manager were right in arranging the auditorium as they did. The same arrangement of seats would, however, be fatal to such a house as the Grand Theatre, Islington, the Olympic, or the Adelphi, where the large pit is looked upon as the mainstay of the house. The President of the Royal

Institute of British Architects, in his excellent address this year to students, said that "a perfect plan is, and can only be, the result of the thoughtful study of every principle and every detail." It is necessary to find out all that is wanted, and to provide for such wants. To again quote Mr. Macvicar Anderson:—"It is impossible to produce a satisfactory result without practical knowledge of the requirements." . . . "A plan to be good must be simple."

Site.—The first point which we should consider is, what is a desirable site for a theatre? and in endeavouring to answer the question we shall do well to ascertain what are the regulations enforced in other countries with regard to sites for places of public entertainment. In Austria, theatres holding more than 600 people must be perfectly isolated; those with a seating capacity for less than that number may have the back wall abutting on other houses. In St. Petersburg, there must be an open space on every side, with doors and windows upon all four sides. In Brussels, every theatre must be separated from adjoining premises by an open space or by brick walls. In Italy, perfect isolation is insisted upon; and in Paris, theatres that are detached must have a clear space of at least 9 ft. 10 in. to divide the theatre from neighbouring houses; where they are attached, there must be an independent wall within the theatre 9 in. thick, to protect the party-wall. From this it will be seen that on the Continent isolated sites are required. Such a site is undoubtedly the most desirable, but there is one serious drawback,—the cost. It must be remembered that on the Continent there is "State aid" to assist theatrical enterprise, but that in England it has to be carried on entirely as a private speculation. The New York regulation is a good one: the front must be on the public way, and open spaces at least 8 ft. wide must be left on both sides, from the line of the proscenium wall, the full length of the auditorium. It is seldom in a city like London that the chance offers itself for an isolated site; indeed, it is only when there are important street improvements that theatres such as the Royal English Opera House can be built within the given radius in which the theatres can be made to pay. There are a few cases where houses have been successful outside the centre of the Strand and Haymarket; for instance, the old Prince of Wales in Tottenham-street, made famous under Mrs. Bancroft's management; but there are few managers who would to-day care to risk such an experiment and start a theatre beyond the fashion-bound limits of the West-end. By the aid of street improvement an isolated site was obtained for the Shaftesbury Theatre, but the Savoy site was formed by pulling down a whole block of buildings. The insurmountable difficulties in acquiring perfect isolation in London renders it necessary to make the best of what can be got. How this difficulty has been overcome in some of the new theatres now in course of construction will be seen from the plans of the new theatre in Cranbourne-street, where two sides and part of a third are on public ways, and the new theatre in St. Martin's-lane, where Mr. Emdin has so designed the theatre that above the ground level there is an open area or passage-way left all round the building. The drawback to perfect isolation is the prohibitive cost of the land; but a theatre must of necessity be a costly building; a cheap theatre is sure to be a dangerous one. The advantages of isolation are that the risks from fire and panic are greatly reduced. There is not the same danger from surrounding property; the exit passages, staircases, and corridors can be made shorter; and deliver into four different streets. The old-fashioned plan of having a house in the main thoroughfare, and a plot of vacant land some distance in the rear on which to build a hack-yard theatre, reached by a tunnel, is no longer permissible. Theatres on cramped sites hemmed in on all sides, with a narrow frontage to the principal street, sufficient only to carry a flaming gas device, are things of the past. Nearly all the plans before us show that a site of oblong shape is best adapted to a theatre. The Lyric, however, is an example of what can be done on an irregularly-shaped plot of ground. A very clever arrangement of the auditorium is displayed by Mr. Phipps in the planning of the Gaiety on a site of most irregular formation, but with exits into four different streets. We have before us examples of one of the greatest modern improvements

and economy of space if we look at the drawings of the Savoy, Lyric, the Garrick, Cranbourne-street, and St. Martin's-lane theatres. In all these cases it will be observed that a limit to the height of the building is obtained by sinking the pit below the level of the pavement, thus placing the hack of the dress-circle on a level with the street. The many advantages of this arrangement do not, perhaps, assert themselves at first sight. The distance to be travelled by the various sections of the audience are equalised; the gallery and upper circle have shorter staircases; the dress-circle is on the street level; and the pit and stalls have but a few steps to the exits. In the case of the Savoy, the sloping site is taken advantage of. It has been argued that a pit below the ground level must be dangerous, but surely people are less likely to fall ascending than descending a staircase. There is another great advantage in reducing the height of the building above the ground. It tends to facilitate the extinction of fire by the brigade, and renders the fire-escapes of greater value in their work of rescue. The pit of a theatre, if not below, should be on the ground level. I do not think any room or hall where large numbers of people congregate should be built over and above other premises, as it only augments the dangers of fire, and needlessly adds to the height. It is certainly unwise to rob the space which is most valuable for exits by hiding shops or cafés as part of the scheme, on the ground floor of a theatre. A theatre should be a theatre pure and simple. Even with every precaution enforced that is known to man, there must and will be dangers from fire and panic; and dangers arising from other sources should not be added thereto. The passage of smoke to the theatre from a fire in such a shop or restaurant, would be sufficient to cause a panic. There is undoubtedly a great temptation in making the largest return for the outlay on the building, and the rents from shops in the vicinity of popular playhouses assist to swell the profits.

Exits.—It is clearly the duty of the architect to design his building so as to reduce the chances of panic to a minimum, and one of the chief provisions to this end is short and unobstructed exits. Everything in and about a theatre should tend to make the audience have confidence in their own security, and give them a feeling that, should anything happen, they would be able to help themselves without causing injury to others. Where people feel that they are safe, the chances of danger are small. As better sites have been acquired, better designs have naturally followed. Simplicity in the plan, and uniformity in the two sides of the house tend towards the solution of the difficulty, as seen by the plans of the Shaftesbury Theatre designed by Mr. Phipps. Thus, where there is a pit entrance on the one side, a pit exit will now be found on the other; where there is a gallery staircase on the right, a gallery staircase is on the left, and so on for each tier or division of the audience. Every such division is provided with two separate exits leading directly to the street. Such is the London theatre to-day. People, as a rule, naturally desire to leave a building by the door by which they enter, and it seems it is only by making two sides of a theatre alike that the public will find the exits provided. The audience should be taught the way out of a theatre's habit; to speak of "alarm exit," "fire exit," "exit in case of need," is only to encourage nervousness. The suggestions of danger should never be hatched in a building where human beings are packed. I believe that printing key-plan on the programmes would greatly assist many visitors to theatres in acquiring confidence and self-possession, and learning the way out. The use of automatic panic holes on exit doors is undoubtedly a great boon, and it renders them always available to the public.

Entrances.—There is a great deal to be said with regard to the manner in which the pit and gallery of a theatre are entered, and there is much to learn from our Continental neighbours, both as to the arrangement of the entrances and the way in which to enter them. Mr. D'Oyly Carte was, I believe, the first to introduce the *queue* system to a London pit. An example which has been followed at the Lyric, Shaftesbury, and Royal English Opera House and within the last month, I believe, at the Gaiety. At the Shaftesbury you enter by narrow passage which discharges into the main corridor after you pass the pay-box. A similar

arrangement is contemplated at the new Cranbourne-street Theatre. This allows the whole width of the main passage to remain free for exit at all times, as no obstructing barrier or pay-box is needed. The arrangement shown on the above-mentioned drawings obviates the necessity for barriers, and allows the public to stand in *queue* to await admission one by one, and prevents the scurrilousness seen nightly at most pit and gallery doors—a state of affairs that prohibits a visit to the play to many an one who cannot afford more than 2s. 6d. for admission, and who has not the courage to face the fighting mob which assails the houses where popular plays are running. Were it possible to adopt the *queue* at all theatres, those who desire to stand, or rather her camp-stool, at the Lyceum pit-door at ten in the morning for admission to the first night of "Henry VIII.," would spend the day with just a degree more comfort than that lady could have done with the pressure of a pit crowd behind her. The wonder is she survived to tell the tale. I think that much of the excitement created by the struggle to enter a theatre is retained during the whole evening, making the audience highly sensitive to alarm.

Staircases.—One feature of the old theatre seems to have completely disappeared in the theatre of to-day. I refer to the grand staircase, such staircases as are found at Drury-lane, Covent Garden, and Her Majesty's. The principal staircase at the Royal English Opera House is the only attempt in theatres of the last few years to create such a special feature in the interior. One has not far to seek to find the reasons for the change. With the pit sunk below the ground, and the dress-circle on the ground level, there is no demand for such a luxury. Much space is therefore saved, for a staircase of ordinary proportions, as a rule, leads to the upper-circle and saloon on the first level. From an architect's point of view we cannot help regretting the loss of this grand staircase, with the spacious vestibule and rush-rooms; but the demands of to-day are small theatres not requiring such adjuncts. As to the width generally allowed for the ordinary staircase, it has been found that 4 ft. 6 in. is sufficient for 400 persons, with an additional 6 in. in width for every additional 100 persons to be accommodated. There should, however, be a limit to the width, as a staircase too wide is as bad as one too narrow. Beyond a certain width those occupying the centre obtain no support either directly from the handrails, or indirectly by holding on to those who grasp the handrails. Six feet wide is sufficient to allow four persons abreast to go up or down, and should the numbers accommodated in the house require it, a third staircase should be provided in lieu of a greater width. Every division of the audience should have at least two staircases leading to the street. For economy of space two staircases are frequently constructed within the same containing walls, as the new upper circle and gallery exit staircases at the Gaiety. Long, straight flights of steps are bad, as they do not afford the rest on landings required in ascending or descending. Too few steps in a flight are as bad as too many, there should not be more than twelve or less than three. Single steps, or steps at half landings are certain stumbling blocks. Of course there should be no winders, and the steps should be supported at both ends upon brick walls carried up to the roof. The risers and treads must be uniform throughout. No exit staircase should serve two tiers, or have pass doors leading from tier below, through which any stream of people would be likely to enter and impede the progress of those at a higher level. With regard to landings, they should never be less in length than the width of the staircase. The rest they afford the better.

The Auditorium.—Returning once more to the drawings of the several new theatres, which we have had lent us to-night, we find that by the recent development of planning and construction the audience have been relieved of the numerous columns, which were ever a cause of annoyance and an obstruction to the view of the stage from several seats in each tier. It was the constant cry for the abolition of these obstacles that first gave birth to the cantilever construction now almost universally adopted in theatre-building. I believe I am correct in saying that the Alhambra was the first house constructed in this manner, and I am able to bring to your notice the details of this con-

struction, as well as the general plans of the excellent auditorium of this house and its rival, the Empire. Those members of the Association who took advantage of the visit to the Royal English Opera House during its construction will remember that these cantilevers were tied into the back walls of the theatre; projecting from these walls, they were connected by girders, making a perfect cobweb of steel-work upon which to build up the fireproof construction of the tiers. The drawings of the ironwork of the Royal English Opera House, kindly lent me by the Horseley Company, and of the Garrick Theatre, and the diagrams of fireproof construction, lent us by Mr. Emden, will convey more to your minds of the manner of construction than anything I can say in the short time I must necessarily give to this branch of our subject. Doing away with the supporting columns of the galleries has done far more than remove the annoyance from the audience of obstructing the view of the stage; it has also tended towards perfecting the fireproof qualities of the structure. Theatres that were built with supporting columns had the tiers and roof, as a rule, entirely constructed of wood. With the cantilevers the tiers are made of concrete or firebrick on steel girders imbedded in concrete, and the roofs are made fireproof. Where a theatre is constructed entirely of fireproof materials, and the audience know it, and there are good exits, the chances of panic are small. The knowledge that the building is fireproof will do as much to reduce panic as good exits—in fact, even more, as it will destroy the nervousness which generates a stampede. There has been a recent improvement in the auditorium, first introduced, I believe, by Mr. Emden in Terry's Theatre, whereby every row of the tiers have direct access to the side corridors by a doorway. By this means much inconvenience is overcome in gaining the seats, and the exit from the circles is greatly facilitated. Theatres of the past were, as a rule, dark holes into which daylight never entered; the consequence was they became dirty, dusty, and unhealthy, besides being much more dangerous than a building which is flooded with daylight. The cleaners in a theatre are, like most human beings, liable to scamp their work and leave little heaps of dust and rubbish in out-of-the-way corners. The recent disaster at Gateshead to a certain extent teaches us that there is danger in the accumulation of dirt in a theatre, for we hear by some of the accounts that a lighted match fell on some paper and sawdust, which produced the smoke that filled the gallery, and caused the stampede. In Austria there is a special regulation enforced, insisting upon the daily removal of all rubbish and trade refuse, and advocating cleanliness in all parts of the house as a special duty. Where an auditorium is provided with daylight, the use and cost of artificial light during the day-time is saved, cleaners and candle-stand attendants have not to go about their work with lamps or candles, and there is no excuse for striking matches in the building. Another and still more important demand for windows, quite apart from their use for ventilation, is the means of escape they provide in case of fire, especially where they lead to outside balconies. Hundreds of lives could have been saved if windows, external balconies, and escape ladders had been provided not only in theatres, but in all buildings where large numbers congregate. I, for one, shall be glad to see the day when external balconies and staircases are adopted in this class of buildings, as seen in the drawings of Mr. Jan Springer's Municipal Theatre, Amsterdam, which he has specially sent for our use. Iron bars before windows should never be allowed, as they prevent the firemen entering a building by the windows, or the occupants to use the fire-escape. It was not my intention to enter into the smaller details of the arrangements of the auditorium, or to speak of sight lines, the curves of balcony fronts, or the seating of the house; but I must refer for one moment to the gangways. Much diversity of opinion appears to exist as to the number of the seats that should be placed between intersecting gangways. Managers complain that certain portions of the audience will stand in the centre gangways and create a disturbance. On the other hand, long rows of seats without intersecting gangways, make it difficult for the people to get out, especially where the seats have backs. I expected to have had a model here to-night of an automatic seat, a

German patent, the back of which falls, and the seat rises when the occupant gets up, thus leaving gangways at right-angles to the curtain line, as well as parallel to it. In the rules enforced in Continental cities, the question of intermediate gangways is rigidly dealt with. For instance, in Austria gangways must divide every six seats, and be in a line with an exit door; in Brussels there must be at least two lateral gangways to the rows of seats, and a central gangway may be required. In St. Petersburg not more than twelve seats may be in a row between the gangways, and the middle passage must not be less than 4 ft. 8 in. wide; but in Paris the authorities appear to be satisfied with two side gangways, each 3 ft. 3½ in. wide, or in lieu thereof with a single centre gangway 4 ft. 3 in. wide. I cannot now enter into the questions of acoustics, ventilation, heating, lighting, or fire protection of the auditorium. I therefore propose to pass rapidly over a few details with regard to the improvements behind the curtain.

Stage.—I think we all know that modern theatre-construction demands the division of the stage from the auditorium by a brick proscenium wall passing up through the roof above the stage, and down below and across the underside of the stage to divide the orchestra from the mezzanine. This, of course, leaves the large or proscenium opening unprotected. Common-sense at once tells us that a proscenium wall without a proscenium fire or smoke resisting curtain is but a half-measure for retarding the spread of smoke or fire from stage to auditorium. I am fortunate to-night in being able to ask my friend, Mr. Max Clarke, to speak to us on this subject; as you know, he has made a special study of this very important detail of theatre-construction, and it would be presumption on my part to dwell further on the point, when I hope we shall have his views laid before us at the conclusion of this paper. From the various sectional drawings and models of the theatres it will be seen that there are two floors below the level of the stage; the mezzanine floor, on which is placed all the machinery for working the traps and sliders below the stage, and the cellar or well into which the scenes and sets are lowered. Above the stage are galleries on either side known as the "flies," from whence the ropes governing the cloths and scenes are manipulated, and over the whole of the stage in the roof, or at level of the wall-plate, is the gridiron, an open or skeleton flooring, so-called on account of its likeness to that domestic utensil. From the gridiron hang all the cloths, sky-borders, gas-borders, &c. Over the gridiron, modern requirements demand a large exhaust ventilator to carry off the fumes of the many gaslights on the stage, and the smoke in case of fire. The next point we have to consider, after the division of the auditorium and stage, is the size of the stage. Everything is governed by the size of the proscenium opening; 30 ft. is about the average width of the proscenium opening in the medium-sized theatres, so I will take that width as an illustration. Supposing the opening to be 30 ft. square, the width of the stage from side wall to side wall should be at least 60 ft., or twice the width of the proscenium opening, to allow the removal of the scenes to right and left; passage-way is necessary in addition to this. The height from stage-floor to gridiron should be 60 ft., or twice the height of the opening, to allow the scenes to be lifted up to the gridiron without rolling or folding. Where this can be done the scenery lasts much longer, and money is therefore saved in wear and tear of material; there is also less danger of gas batters coming in contact with the canvas. I do not propose dwelling upon the much-debated question of turning the stage into a furnace or tall chimney by carrying up the walls to a great height above the auditorium, and placing huge ventilators in the roof, or making the stage-roof entirely of wood, that it may burn away and create a tall shaft. There are doubtless some present who will give us their views on this matter. All I have to say is that ample ventilation, both inlet and outlet, should be given to the stage, and, unless there are inlets at a low level, the outlets in the roof will make a draught. With regard to the dressing-rooms, the plans of the Garrick and the new theatre in St. Martin's-lane show an excellent arrangement, whereby the dressing-rooms are erected in a separate block or building connected with the theatre by one opening only, and with a separate exit into the open air from such block. By this means the whole of the fire-

risk in the dressing-rooms is taken away from the theatre. As so much of the scene-painters' and carpenters' work which used to be done in the theatre is now done by the scene-painter in his own painting-room, and by the carpenter in his own workshops away from the theatre, it has been found unnecessary to provide rooms for these purposes in our modern play-houses on such a scale as was necessary in the past, and the risks arising from the various trades have been removed. Many of the larger theatres still have their workshops in use, but the day has gone by when the space over the auditorium ceiling, commonly called the "dome," was used for a carpenter's shop or a store for any old lumber and scenery. This space in old theatres was divided from the audience by only a canvas ceiling and wooden floor, with the sunlight fine passing through the midst of the shavings and inflammable material. Where workshops are needed they should be built, like the block of buildings, Garrick, in a separate building. Another improvement in theatrical matters is that nowadays a large stock of scenery is never kept on the premises. In the West-end theatres pieces are played which are intended for, even if they do not have, long runs. In the outlying theatres travelling companies fill the bill, and bring with them their own scenery. The consequence is that large scene-docks and stores are not wanted. The valuable space can be used by the architect to better advantage, and the manager avails himself of an outside store. So the risk of large stores, like the risk of workshops, is taken away from the theatre. Scene-docks on the stage level are, of course, needed to shift the scenery into, which is in nightly use. You will see many examples on the plans. The introduction of electric light into theatres has induced managers in many houses to provide the wherewithal to generate their own light. Engine-rooms, boiler-houses, and heating-furnaces should be placed away from the theatre, or divided from it by brick walls and fireproof floors and ceilings. In no case should an opening from the engine-room be permitted into any part of the theatre; access should be either directly from the street or from an open area. There is one part of the play-house which does not seem to have gone ahead like the rest of the building. I refer to the stage machinery. The model upon which the stage of to-day is built is the same as used years ago. This, I believe, is the case in America as well as here. No one has appeared to think it worth while to seriously study the requirements of stage machinery, and endeavour to improve the present state of things. It is looked upon purely as a stage carpenter's job, and when a theatre is built, it is left for the stage carpenter to put in his stage to please himself. When the Royal English Opera House was first started, I remember hearing of the great improvements that were to be made in stage machinery, and that nearly everything but the boards of the stage was to be in iron. True, there are some minor improvements in the details, but the broad principles on which this stage is built is the same as used generations ago. There is certainly an opening for the architect to use his power of design towards the perfection of the stage. Mr. Emden, in a paper read before the Society of Arts in 1888, described at great length the stage of the Budapest Opera House, where the stage floor could be raised in sections, or as a whole by hydraulic pressure. I believe hydraulic power is used in some of our theatres to raise the larger traps called the "bridges" but the "sliders" are still taken off in the old-fashioned way. I cannot enter into the details of stage lighting, or the advantages gained by the use of the electric light; this, like many other points I have not touched upon, I think comes beyond the scope of my paper; but, before concluding, I wish very briefly to draw the attention of the members of the Association to the great improvement in the materials now used in the construction. We have already noticed how the cantilever system brought about the use of the concrete tiers in lieu of the wooden balconies. In the new theatre in St. Martin's-lane these tiers are constructed of patent metallic stone, 2½ in. to 3 in. thick, composed of granite chips, iron slag, and Portland cement. Fawcett's fireproof floor was used in some recent alterations at the Lyceum. The roofs, ceilings, and staircases are now constructed of concrete, in place of wood and stone, and where ironwork is used it is always protected. In providing fireproof construction,

so necessary for the safety of the public, one may depend upon materials which, either by nature or the aid of man, have passed through the ordeal of fire, being safe units of fireproof construction. To-day, in place of the theatre on a bad site, constructed of wood, with match-boarded partitions, no proscenium wall, exits, and staircases out of proportion to the number who had to use them, ill-lit, ill-ventilated, with no regard to sanitation, and everything that was most unsatisfactory, we have rising in London playhouses on good sites, built entirely with fireproof materials, with good exits and staircases, and every precaution taken to prevent fire and panic. Nothing I can say to you will illustrate this more, or make a greater impression upon you, than these drawings, and I am deeply indebted to the gentlemen who have so willingly lent me the many plans I have been able to bring here to-night. They tell their own tale, and I wish to take this opportunity of thanking Mr. Phipps, who has specially prepared these plans for our use, Mr. Emden, Mr. Chadwick, Mr. Jan Springer, Messrs. Perry & Reed, Mr. Verity, Messrs. Crewe & Sprague, Mr. Max Clarke, Mr. Holloway, and the manager of the Horseley Company, for the valuable aid they have rendered me in endeavouring to explain to you some recent developments in theatre planning. Many thanks are also due to Mr. Baker and Messrs. Kaye for the models of automatic panic-bolts, and Mr. Nolting for the automatic theatre-seat.

[For want of space we defer our report of the discussion until next week.]

THE LONDON COUNTY COUNCIL.

The second meeting of the newly-elected County Council was held on Tuesday afternoon last, the Chairman, Lord Rosebery, presiding.

Tenders.—Tenders were received for alterations at the Cane Hill Asylum. The list will be found under the heading "Tenders."

Proposed Reorganisation of Internal Administrative Work.—The Chairman made a speech of some length as to the internal conduct of the work of the Council, which, as it has been fully reported in the daily papers, we need not give here; and he moved

"That it be referred to a special committee of twenty-four members, with the Chairman, Vice-Chairman, and Deputy Chairman as *ex-officio* members, to examine into the present organisation of the Council's business, and the method of conducting it, and to report whether any and, if so, what changes are expedient and practicable."

Mr. J. W. Benn seconded the motion, which was unanimously agreed to.

The Committee was then constituted as follows:—Messrs. Arnold, Beachcroft, Benn, Barnes, Boulnois, M.P., Clarke, and Paddell, Sir Thomas Farrer, Mr. C. Harrison, Lord Hobhouse, Captain James, Sir John Lubbock, M.P., Mr. Martineau, Lord Carrington, Lord Monkswell, the Duke of Norfolk, Messrs. Pickersgill, M.P., Russell, Saunders, Eneas Smith, Strong, Spicer, Stuart, M.P., and Howell Williams.

The Council then proceeded to elect its standing committees.

The Building Act Committee is constituted as follows:—Messrs. Fletcher, Ford, Harvey, Holmes, Longstaff, Marsland, Banyard, Roberts, Stevens, Strong, H. R. Taylor, and Yates.

The "Betterment" Proposal Again.—The Parliamentary Committee reported, as to the General Powers Bill of the Council, now before Parliament, that the second reading of the Bill had been postponed by the House of Commons in order to afford the new Council an opportunity of considering its provisions. Mr. Banmann had given notice of his intention to move the omission of clause 7, relating to the improvement rate proposed by the Bill to be levied for the purposes of the Cromwell-road Bridge improvement. The Committee thought it advisable that the new Council should definitely state its opinion upon the provisions of the Bill, more especially with regard to the question raised by Mr. Banmann's opposition, and they therefore recommended that the approval of the Bill by the Council on December 10 last be confirmed.

Mr. Charles Harrison said that the proposed improvement involved the principle of betterment, and that it would greatly strengthen the hands of the Committee in promoting the Bill if they were able to state that the new Council had endorsed the policy of the old Council on that question. He, therefore, asked that a

division might be taken, so that there might be a record of the opinion of the Council.

The result of the division was that the recommendation of the Committee was approved by 82 votes to 17.

After transacting some other business, the Council adjourned.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS: THE TOWER BRIDGE.

The fourth visit of the session, on the afternoon of Saturday, March 19, was attended by a large number of members of the Association. Mr. J. Wolfe Barry, the engineer, having courteously granted permission for the inspection of the works of the Tower Bridge. The party was met by Mr. Crutwell, the resident engineer, who gave an interesting description of the works. Considerable progress has been made since the Association last visited the bridge. The centre towers have been carried up to the full height as far as the steelwork is concerned, and the cantilevers, which are being built out from each tower, without scaffolding, have made considerable way across the centre-span. These cantilevers will become two bridges for foot passengers when the centre-span of the lower bridge is open for the passage of vessels. Portions of the balance girders for the centre span, and the steel cables which will connect the upper and lower towers, were to be seen, though in an incomplete state at present. There is a yet little to be seen of the architectural casing which will conceal the elaborate steelwork of the frames of the towers, though some portion of this casing appears in the gateway on the north shore. Messrs. Arrol & Co. are the contractors for the steelwork, and Messrs. Perry & Co. for the builders' work.

THE LABOUR COMMISSION.

FURTHER BUILDING TRADE EVIDENCE.

DURING the last sittings of that section of the Royal Commission on Labour, over which Mr. Mundella, M.P., presides, further evidence was taken with respect to building trades.

Mr. D. B. MacGregor, Secretary of the Glasgow Master Masons' Association, which embraces forty three firms, employing 3,000 men, explained the appointment of a joint committee of masters and men appointed, which met once a year to discuss matters relating to work and wages. At that annual meeting the hours and the wages were settled for the year, and the system had worked very well. If an master or workman violated the regulations thus laid down, he would be brought before a standing committee, by whom the matter was arranged. This had not, however, been able to apply that method to masons' labourers, because the Masons' Labour Union comprised all the labourers in Glasgow, whether they served the masons or were engaged in other industries. Mr. MacGregor further stated that the standard wages were 8d. an hour for operative masons and 5½d. an hour for mason labourers. The ordinary working hours were a week—that was nine hours a day for five days and six on Saturday. During the five days men worked from six a.m. to nine; from ten a.m. and from six to nine p.m. The employees insured with the Accident Insurance Company for all their men, and this was found to be a very good plan. He also explained that the Association did not at all object to operatives being members of the trades union, and, as a matter of fact, the masters would be very glad if all the operative masons and the masons' labourers were members of the Union. Finally, he said he was in favour of boards of conciliation and arbitration for the settlement of trade disputes.

Mr. F. Moore, a London carpenter, speaking on behalf only of himself, complained very strongly of the system of overtime, which he described as one of the deadly evils of the building trade, mentioning that he had known men to be kept at work from six in the morning to nine and ten, and even twelve, at night when they returned home completely exhausted. This evil had existed in the building trade in London generally until recently, when trade had become less brisk, and there was consequently less overtime. The men were, no doubt, paid for overtime, but he felt that the system ought to be abolished, because it was detrimental to the welfare of the men. Mr. Moore also complained of the sweating and driving which prevailed in the building trade, employers sometimes engaging a foreman, not because of his superior knowledge of the trade, but solely because of his capacity for driving and bullying, and getting the utmost

* For previous report of Building Trades evidence see *Builder* for March 5, p. 184.

amount of work out of the men, irrespective of the quality. The result of this was that work was scamped, especially in the busy season. Further, the workmen complained of the insanitary condition of many of the shops, and the total absence of proper inspection. Then again, he considered the position of skilled workmen very unsatisfactory. For instance, the cleverest man was on exactly the same level as to pay as the most inefficient man in the shop; there was a dead level of mediocrity, because the sharp workman was not encouraged to make the most of his abilities. He admitted that to a certain extent the action of the trades unions had tended to improve the position of the men and to ameliorate the conditions under which they worked, but still there were isolated shops where these abuses existed unchecked. He also admitted that, although he was himself a non-unionist, the evils he had described would have now been more prevalent, and that the workmen's position was far better in these days than it was, owing to the better education which youths entering the trade had received at the elementary schools. The introduction of machinery, too, had done good by relieving the men of much of the heaviest and most laborious work. Citing other evils existing in the building trades, Mr. Moore stated that it was notorious that at one time foremen often received bribes from workmen to keep them on, but that was now a matter of rare occurrence, owing to the more encouragement given to the foremen. The association of the men was a protection against that practice, but the inferior shops, where it might still exist, were largely isolated. But for the trades unions these evils would have run riot. But there were certain evils in the unions. One was the equality of wages to which he had previously referred. He considered that the men in London were in a better position than men in the country, for they had a wider field of observation and work, and thus had a better chance of getting on. Speaking generally, the workmen now were well educated, and there was a great desire for improvement. The higher they rose the higher became their standard of living, and general refinement increased. In many cases architects' and surveyors' sons entered the trade, and served time both in the shops and in the office, in order to acquire a perfect mastery of the trade. The rising young men, having received technical instruction, were better fitted for constructive work than their predecessors were; while the introduction of machinery tended to make the men more intelligent and serviceable. This, no doubt, cheapened production, but it was better for the men in the end. Reverting to the trades unions, Mr. Moore, while allowing for all the good that had been done, advanced as a strong ground of objection to them the fact that the meetings of branches were so often held in public-houses. He was not a sworn teetotaler, but an abstemious man, and he knew that a great many men who were staunch unionists strongly objected to this system, as opposed to the moral welfare of the men, and he urged that the public-house as a place of meeting ought to be done away with. He next advised that more encouragement should be given to individual merit among the men, and that there should be a better understanding between employers and employed, for, with the master on a pinnacle at one end and the men at the other end, there could be no common ground of good relations. He was anxious to see some system of settlement of difficulties in London such as that described by Mr. Macgregor, and in reply to the inquiry whether such a more encouraging qualification of the men must be a union, and bound by the decision, he replied that in the last strike in London a number of men who were not unionists had a great deal to do with the settlement, many non-unionists being put forward to speak upon the question. As to the reasons which prevented many men from joining the union, he thought the necessity of continually giving a shilling a week for problematical benefits was a strong deterrent. The men did not derive benefit corresponding with the subscription, and they did not care to keep up such a subscription. It seemed to him that the time had come for us to readjust our views as to the status of skilled workmen. He objected to a common term of description being applied to skilled workmen; and he urged that the general status of the men ought to be still further improved in the future. He allowed that the workman was socially more respected and honoured for any virtues he possessed than he formerly was, but even that was not so much the case in England as in America. He believed that the men of the best ability and education did not come to the front in the trade union agitations, but remained quiescent in the background. The agitation was left largely to the official representatives. The superior class of men were steadily increasing, especially among the younger men, who benefited by the easy access to free libraries, by cheap literature, and by the facilities for attending social meetings and educational classes. With respect to hours, Mr. Moore did not advise legislative regulation, because many difficulties might arise, but he would have legislative action to prevent overtime, to which employers so readily resorted. This might be done by the insertion of clauses in the Metropolitan Building Act, prohibiting work being carried on beyond a certain hour by the same body of men. If the work was really necessary, day and

night shifts could be provided. This might be accomplished by the trades unions demanding and obtaining regulations, each trade accommodating itself to the circumstances of the case, if they could; but the recent strike the masters had been able to coerce the men. The best mode of settling disputes would be a standing board, with a referee, but the referee must be a practical man, and not the architect, whose whole interests were bound up with those of the employer.

Replying to questions from the general members of the Commission present, Mr. Moore complained that there was too much equality of pay, and he objected to piece-work, although in America it acted well. He would discriminate between the different abilities of the men, and have a varying scale of wages. He would not, however, say a joiner, for example, should be called second class or third class, but would use his own discretion and see that his foreman carried that out, in order to encourage the best workmen. If the foreman was incapable of discriminating as to the qualities of the men he would not be capable of carrying on the work. Every man should have a minimum pay, and increased pay according to abilities. The inferior workman was the loudest, and the first to complain; the slower and more inferior his work the louder was his grievance. Witness had not paid attention to a discussion in the engineering trade as to introducing a gradual classification, but no doubt in general terms the question was much the same as he had raised.

Professor Marshall: Do you think it would be worth while to have for each district various minimum rates for class A, B, and C, and so on?

Mr. Moore replied that that might be possible, but if it led to hard and fast lines it would not work. Such arrangements must be simple to be effective,—there must not be too much hard and fast classification. There should be direct dealings between the masters and the men, with a view to sympathetic action. In the next place, Mr. Moore condemned the present system of giving contracts for public works. The acceptance of the lowest tender was a serious evil, for the contractor had then to rely upon sweating and driving and inferior material. The Law Courts were carried out under the lowest, or nearly the lowest, tender, and the result was bankruptcy of the builder and any inferior workmanship. He knew of buildings which within two or three years had to be shored up, and those had been erected on the lowest tender, driving, and sweating system. The reasonable method would be to receive a good number of tenders and to select the middle tender. The witness finally advocated the establishment of trade halls as valuable and useful, and the provision of technical libraries.

Mr. George Sunley, Secretary of the National Amalgamated Society of House and Ship Painters, having described the constitution, membership, and financial arrangements of that body, explained that they had a system which they called "working rules," which were mutually agreed upon by masters and men, and signed by both. They had also arrangements for providing an arbitrator to decide disputes, and, although they had had several small strikes since 1887, they had generally been settled by arbitration. There was a strike at Hartlepool. It was not about wages, but with respect to the legality of a notice by the men. The employers locked the men out for a fortnight, and the matter was settled by arbitration, the decision being that the notice of the men was illegal. His experience led him to the belief that unionist men were superior as workmen to non-unionist men in many cases. The branches of his Society met in public-houses, and he did not agree with the last witness on this point. He had often heard the meeting at public-houses given as an excuse for not joining, but it was not a reasonable excuse. He did not say that public-houses were the best meeting places, but many of the branches were respectably conducted in public-houses, and no drink was allowed in the room while the business was proceeding. The Branch paid for the use of the room. In Chester, their meetings were held in the Court House, and in Huddersfield in the Trade Hall; and he was very much in favour of that system as to meetings. Being invited to make suggestions, the witness urged an amendment of the Employers' Liability Act, so that employers should not be able to shift the responsibility for accidents on to the shoulders of insurance companies. To illustrate this, he mentioned the case of a man who recently sustained a serious accident through insufficient scaffolding, and he had to have one leg amputated. The man had taken action in the County-court, and the employer, on receiving notice of claim, simply sent it on to the insurance society. That was not likely to lead the employer to improve his scaffolding, and he had heard of several complaints by men in the same employment respecting insufficient scaffolding. He was not prepared to say that in consequence the insurance society would require the employer to erect safe scaffolding, or would charge a higher premium; but he knew of many employers in Manchester who were in insurance societies, and he had never seen an insurance inspector examining the scaffolding. At the same time, he admitted that there had been in some directions more care and better material employed

in scaffolding. It might be difficult for some of the small and comparatively poor employers to provide compensation if they were not allowed to insure, but as a rule the larger employers were more negligent as to the safety of their men, owing to the system of insurance.

Mr. W. Phillips, speaking as a representative of the London and Counties House-Painters' Society, informed the Committee that his trade had established a rate of wages, and this had been done through the agency of this Society and men who were not organised. In 1872 an agreement was entered into between the masters and the men with the result that the rate of wages was 8½d. an hour. Less was, however, paid in some cases, which was due to the action of employers in employing inferior workmen, putting in scamped work, and refusing to concede the full rate. The recognised rate was paid by the most respectable of the masters; if any paid less, then that was a matter for the union to deal with. The subscription was 2d. a week, but that included nothing beyond the membership of the union. The normal working hours were 52½ per week. Considerable overtime was in operation, which was a matter of serious grievance, especially with respect to night shifts. That work ought to be paid for according to the schedule of the agreement of 1872, but it was not, and he thought the masters ought to be made to observe that agreement. Scamped work, and the employment of unskilled labour, were causing serious injury to the trade, and he suggested that employers should be required to employ only skilled labour, and skilled supervision of the work. That, perhaps, was one of the objects of his Society, but at the same time he thought the Legislature should exercise some control and supervision in the matter. In the same way, he believed that if the Legislature adopted some means by which the qualifications of workmen were inquired into, that would remedy a great many of the existing evils. Being asked how this was to be accomplished, Mr. Phillips replied that opportunity might be given to the public in regard to work done, to call in a properly-qualified inspector to see that the work was properly carried out. That would be better for workers and the trade and the community generally. In fact, it should be open to the people interested to have the work examined just as they could have a pound of butter analysed, and he suggested the appointment of some skilled person in every town and district for this purpose. With a view to disputes, he also suggested the appointment of a committee consisting of an equal number of representatives of masters and men, to whom any issue should be submitted prior to a strike taking place. He believed that would effectively do away with strikes. The committee would take care that no strike or lock-out took place without serious grounds and close investigation. In his trade, witness further stated, there was a small amount of co-operation, and there had been some attempt at profit-sharing, but the experiments, so far, had been very limited for him to deal with the question at present. Turning to other points, Mr. Phillips urged the amendment of the law as to the relations between employers and men. For instance, it ought to be made a penal offence for an employer to apply any power against a workman for joining a trades union; any man should be at liberty to do so, and any attempt to black-list or boycott him should be a penal offence. That being so, he would accept the converse, viz., that the boycotting of non-union men by unionists should also be made illegal. With respect to the regulation of hours, he considered that legislative restriction was the most effective method. He would have the Legislature fix a maximum rate as to hours, and make it punishable to employ men beyond that period. A statute should be passed enforcing a maximum of eight hours a day, but with permission to work beyond on sufficient evidence of necessity being shown,—provided also that men who were idle should be taken on, and that under no circumstances should extra hours be imposed on those already employed, unless there were no others. This should be decided by a joint committee of masters and men. Many serious difficulties which now arose with reference to season work could in that way be removed. A great deal of the work could be done in the winter which was now done in the summer, and he advised that Government work and municipal work should be held over in order that men should be able to fill up time at a later period, believing that the community would prefer to see a useful worker properly employed than to have to support a pauper and his family. Public work, in short, should be done either in the winter or during the slack season. In many cases external work could be as well done in the winter as in the summer, and in some cases internal work could be better done in the winter; and in the winter there was not so much temptation to the men to "play" at the work. Local authorities should do all they could to employ men when they were not generally engaged in private houses. Making a black-list was the refusal of an employer to employ a man because he belonged to a trades union and took part in a strike, not only during the strike, but even afterwards, so that a man might starve. He did not know of any specific cases during the last nine years; but the practice might crop up again, and unless there were some

means of dealing with them the evils would increase.

Mr. J. Anderton, President of the Operative Plumbers' Association of Great Britain and Ireland, stated that up to the end of 1891 the Association had 5,500 members, and there had been some subsequent increase. There was another Plumbers' Association in Scotland, but it was an open institution only, and his Association had a number of ledges in Scotland. The subscription had advanced in time from 6d. a week to 8d., and now it was 9d. Having explained the system of relief and benefits, the witness said the trade had had eleven disputes between 1889 and the end of 1891, but they had arbitration rules whereby a board of conciliation and arbitrators were appointed by employers and employed, and all those disputes,—in Birmingham, Newcastle, Liverpool, and elsewhere,—had been settled in that manner. Since 1865 they had spent 13,180*l.* on trade strikes and disputes, but during the last two years only 132*l.*, for they found they could arrive at the same results without strikes. They had, indeed, spent a great deal more in sick-relief and other benefits than on all the strikes and disputes; and he admitted that they would now be very glad to have in hand all they had spent on strikes. In this trade there was very little friction between masters and men, for the fact was that most of the masters had been workers themselves. They knew the workmen's ways and weak points, and stubbornness, and the workmen knew their ways, and thus there was mutual respect and sympathy. They did not want the Legislature to settle disputes, but they had spent on strikes to do all that themselves, but they were very much in favour of boards of conciliation all over the country,—voluntary boards. They also desired voluntary registration, and not registration enforced by the Legislature. The registration measure now before Parliament aimed at elevating the men, doing away with slop work and jerry work; and it was to the interest of the public that every plumber should be registered. He further advocated an examination and test, and suggested the appointment of a registration committee when a new district was opened.

Mr. Albert Emmett, Secretary of the Operative Bricklayers' Society, Ashton-under-Lyne and District, explained that his union, which numbered some 300 members, decided for itself all questions respecting pay, hours, and so on; and although the men might strike if they chose, they would do so at their own risk, and would receive no strike pay. The weekly subscription was 6d. For this the men received no sick pay, but if they met with an accident they received 12s. a week for three months, and 9s. a week for a further three months. In the event of total disablement an allowance gradually falling to 5s. a week was made. He was in favour of the establishment of a standing committee of masters and workmen for settling all disputes and avoiding strikes, but no attempt has as yet been made in that direction; but he was not in favour of legislative regulation of hours.

Mr. J. Stirr, Secretary of the Leeds and District Operative Stonemasons' Society, stated that although that Society only numbered about 400 members, and there were about the same number of non-union masons, there were in the district something like 3,000 men altogether concerned in the building trade. The Society had no means of settling disputes, and, therefore, if any difficulty arose they must fight it out with the masters as best they could. But as six months' notice had to be given on either side, they thought that allowed sufficient time for arriving at a conclusion, and for making up their minds. They did, however, settle the wages and hours themselves, subject to the consent of the executive. There was no feeling in the trade against settlement by arbitration, and the feeling between the employers and the men was very good. Mentioning that at the present time there was a notice out which was given last October for a rise of wages, which notice would expire in May next, the witness said the present rate of wages was lower than it was ten years ago. During thirty-six weeks they worked fifty hours a week, and during the remaining sixteen weeks, forty-three hours. They were paid overtime, and double for work on Sundays, Good Friday, and Christmas Day; but their work was very irregular, and they suffered a good deal from that. He thought they would get on better if all the masters were associated as well as the men, and when they had any difficulty with a non-associated employer, they tried to induce him to become associated. They got on "first-class" with the employers; but they objected to work with non-unionist men when the unionists were in a majority, otherwise they worked all together. They did not directly refuse to work with non-unionists; but if the latter were in a minority they had to join the union, or the unionists would leave. They did, in fact, boycott the non-unionists when they could,—the latter could not boycott them,—and they had a black-list on which they placed a man for six years, unless he joined the union before that time elapsed. He admitted that it would be fair for the non-unionists to "black-list" the unionists if they chose; and, as the union had got fully half of the men in the trade with them, he thought they had done very well. The trade had no piecework,

for they objected to it; and there was no sub-contracting. He thought the Employers' Liability Act operated fairly, but no case had yet arisen in his district. And, in fact, since the Act was passed there had been a great improvement in regard to scaffolding and other matters, which he attributed to the enactment of that measure.

Mr. H. Hamm, Secretary of the London branch of the Alliance Cabinet Makers' Association, next gave the Commission some striking information respecting his trade. In the whole country, he said, there would be about 70,000 or 80,000 cabinet makers; of these London had from 20,000 to 25,000, and his Association had 6,500 members. He calculated that only about 15 per cent. of the total were union men, and this he attributed to apathy. In fact, he rather thought the trade was deteriorating, partly because the older firms mostly bought their furniture, instead of making it as they formerly did, and partly because the men were not allowed sufficient time, and had to hurry over their work. A further reason was that the trade was now very much split up into departments, so that men had less chance of becoming good all-round workers. Some men worked by the day, some on piecework, and some on the "lump." On the "lump" work the employer paid so much for the whole article; on the piece system, so much for each portion of the article. In the provinces the rate for piecework was from 7d. to 8d. an hour; in London it was 9d., but some men took less. The hours in London were fifty-four a week, but the sanitary condition of the workshops was in some cases very bad. To illustrate his views as to the decline of the cabinet-making trade, Mr. Hamm said not only was furniture frequently displayed and described as "our own manufacture" when it was not so, but had been bought in, but very often a piece of furniture marked "solid brown oak" was likely enough only white oak, browned or veneered. It was the same with regard to articles marked "solid walnut"—it would be white oak overlaid. It was supposed that there was a law to deal with such deception, and they meant at some future time to test that point. The Merchandise Marks Act might make such a trick punishable, but 99 out of 100 purchasers would not detect the fraud. Another trick was for a master, on being offered a new design by a workman, to detain it on the pretext of considering the offer, to get an imitation of it made up, and then to return the original, as not wanted, to the designer. A further evil was that apprentices were taken in and allowed to play about in the shops without being properly instructed, and the result was that very few ever became highly skilled workers. Mr. Hamm further stated that his Association managed to maintain, and to some extent to improve, the rate of wages without resorting to strikes, and he expressed himself favourable to the establishment of an eight hours' day.

Mr. Whitley, Secretary of the Leeds Branch of the Alliance Association, described the prejudicial effect of the employment of Jews, who worked at a low rate for long hours, and turned out inferior articles; he denounced the system of inspection as inadequate, and stated that there was a diversity of opinion in his district as to the eight hours' question.

The remainder of the evidence taken by this section related to coach-building, coopering, chemical, and copper works.

The Commission have decided to present to Parliament an *interim* report, comprising the evidence taken up to Christmas, and to adjourn all the sections from the close of this week to May 3.

Illustrations.

SCULPTURE: "JEANNE D'ARC."

THIS group, entitled "Jeanne d'Arc attend ses voix," represents Joan of Arc in the act of listening to the "voices" which inspired her to arise and save her country. The figures above represent St. Michael, St. Catherine, and St. Marguerite. The group, which is by M. André Allar, was commissioned for the new church in course of erection at Domrémy to the memory of Joan of Arc, and is to be placed over the porch. The group formed a conspicuous object among the sculpture exhibits at the Salon of 1891. The figures are of life-size.

"TOKEN HOUSE," COPTHALL AVENUE.

THIS building is situated in what was formerly known as Little Bell-alley, but which has now been improved by the Commissioners of Sewers into Copthall-avenue, and has been recently erected by Messrs. Fred. C. Mathieson & Sons, printers and financial publishers.

In the facade an attempt has been made to gain a somewhat greater effect of repose and solidity than is sometimes found in elevations, which are required, as in this instance, to comprise the greatest aggregate area of openings allowed by law. The horizontal divisions

between the ground and first and the second and third floors respectively have with this view been almost obliterated, so as to leave greater masses of wall-space available for the pavilions at either end of the building.

The materials of which the front is built are Cornish granite from the Colcevor quarries for the lower portion, the plinth and base being rough and the piers polished, and Portland Whitbed stone for the remainder.

The ground and first-floors have been arranged for letting as offices; the hasement being used by Messrs. Mathieson for their heavy machinery, the second and third floors as composing-rooms, and for reference books, and papers, and the upper floors for binding and work in connexion therewith. A hydraulic and other lifts connect these floors.

The work has been carried out from the designs and under the superintendence of Mr. T. Barnes-Williams, F.R.I.B.A., and the contractors were Messrs. Higgs & Hill.

BIRMINGHAM GENERAL HOSPITAL.

WE give this week the plans and principal elevations and sections of the designs for this important hospital by Mr. Henman, of Birmingham, which have been selected in the recent competition. We gave such a full description of the general arrangement of the plan in our leading article of the 19th (to which the reader is referred), that it is only necessary here to give a few further details from the architect's report, in regard to some special points.

In regard to the subject of lifts, staircases, and water towers the report says:—

Lifts.—Two in number, worked by hydraulic power,—viz., one suitable as a bed-lift, and a smaller one for stores, &c., are advisedly placed in a service-room holding a central position just off the main corridor.

In most of the hospitals visited I noticed that the lifts open direct from the main corridor; and as an evidence that they have been abused or the cause of accident, printed notices are posted near them giving warning that they are not to be used without the presence of an attendant. In some hospitals two or more lifts are provided in different parts of the building. This is proved to be unnecessary, for I found in such cases only one in general use. It must be evident that such appliances, when constantly used, are more likely to be kept in perfect working order,—available at a moment's notice,—and, requiring the attendance of a person experienced in manipulating same, should be in the most central position. The use of light stretchers on wheels, so greatly facilitating the transference of patients from one part to another on the level, obviates the necessity of distributing lifts throughout the buildings; and when the kitchen is on the top story, the frequent traffic up and down warrants the employment of an attendant being constantly in charge of the lifts.

Staircases.—With lift accommodation such as is proposed, the staircases become of secondary importance, but must be well distributed for the use of the staff, and of fireproof construction as a precaution in the event of fire or alarm (more than ever necessary since the recent deplorable catastrophe in America). In many hospitals the staircases appear to have been designed rather with a view to architectural effect than to utility, and being entirely open to the corridors on the several floors, convey the air from the lower to the upper wards. This it is proposed to obviate by screening them off on each story, and separately warming and ventilating them.

Water Towers.—Above the two principal staircases the buildings are carried up as towers, in which large cisterns, for the storage of water, will be placed.

Although Birmingham is fortunate in having a constant water-supply, there are occasions when, for repairs to mains or to other causes, the supply is cut off for a time. Even such a temporary stoppage might be attended by serious, and even disastrous, results, in case of fire, unless there were on the premises ample storage capacity at a high level. Hence, what at first sight may appear simply ornamental features added for architectural effect, are in reality, when used as proposed, supplemented by suitable mains and properly-distributed hydrants, of the utmost importance for the well-being and safety of the establishment.

The following remarks may be quoted in reference to the sanitary arrangements, heating, ventilation, &c.:—

"The utmost care has been exercised in planning the several sanitary requirements so that they shall be convenient, inoffensive, simple, and effective.

To all the principal wards they are situate in octagonal turrets at the ends furthest from the main corridors, cut off from the wards by intercepting lobbies provided with cross-ventilation,—an intentionally of moderate size,—so that they can only

used as passage-ways, because where of large dimensions they are often improperly supplied with wash-up sinks, and are used for storing articles which would be better further removed from the wards. The octagonal turrets will not obstruct light and air so much as if they were square on plan.

On one side are two w.c.'s and a wash-up sink; on the other, lavatories and a bath, with crane arrangement above for bathing helpless patients. The w.c. apparatus throughout will be of the pedestal-hopper form, with trap and funnel-shaped outlet (which prevents syphonage, and does not need the lodgment of sewer-gas in any part), taken directly through the wall to the soil-pipe and upcast-buttler (see detail drawing).

An attempt has been made to incorporate these flues and vent pipes in the architectural composition without detriment to their sanitary usefulness; for, though they must necessarily become prominent features, there is no reason why they should appear all their crude ugliness. The wastes from baths and lavatories are treated in a similar manner. . . . I propose to rely upon what is popularly known as natural ventilation. Steam-pipes will be employed for the general heating of the wards. Cheerfulness is secured by the open fireplaces at the ends of the side walls, between the windows, and east venting flues are provided,—separate for each ward,—carried up to the very apex of the roof, or draught being accelerated by means of steam-ails, and down-draughts prevented by oiled silk flaps. Fresh air will be admitted by the windows and by special openings direct from the outside, arranged so that in cold weather the incoming air will be warmed by impinging upon the steam-pipes, provided with a filter for filtering the incoming air through cotton-wool, &c. The ventilating openings of heat can thus be regulated in each room by self.

To each of the principal wards there will be six east flues, each 18 in. by 18 in., in addition to the flue from fireplace, or a total superficial area of 108 sq. ft. super, so that if the upward movement in any room is at the rate of only one foot per second, the whole air of the ward will be changed every 15-16 hour, whereas it is generally accepted as adequate if provision be made for the air to be renewed once every hour, travelling at the rate of two feet per second in the flues. In certain states of the atmosphere, however, this so limited a flue area, difficulty is in practice experienced to secure a sufficiently rapid change of air in hospital wards. I therefore advise that the flues be large and numerous,—for they can readily be reduced in power of extraction, when necessary, by closing valves, but can only be increased hereafter at heavy cost, and probably by a disfigurement of the buildings.

For use in summer weather, means of propelling air into the wards may be advisable. In such case I suggest that it should be applied direct, the motive power being from the Corporation high-pressure hydraulic mains, the apparatus being attached to each ward to be supplied with air. The advantage of using water as the motive power is that as its force is spent it may, in the same apparatus, be employed for cleansing the incoming air.

Cross Ventilation to Corridors.—With a view to the freedom of any ward, in case of need, porous of the corridors are of less height than the remainder, entirely open above to encourage circulation of air around the buildings. Generally, doors across the corridors would be objectionable if inconvenient, but, when necessary, temporary ones could easily be provided at those points.

Windows.—As boxings and linings of all kinds objectionable in a hospital, solid frames will be employed throughout, the lower portions of the windows formed as casements, and the upper portions hung at bottom, all opening inwards. By this means the patients are best protected from draughts when the windows have to be opened, and are necessary to thoroughly air the wards, the whole area of each window will be capable of being opened to its full extent,—a feature of considerable importance, yet very rarely attained. To prevent draughts to patients, light iron guards are provided inside.

The Electric Light is suggested for use at night, so that the air of the wards may not be heated by the fumes from burnt gas. A movable skat would be provided to each bed, so as to be available for close inspection of the patient.

As regards the question of cost, the architect considers it preferable to prepare as complete a plan of a building as possible, and state which portion could be erected for the proposed day. He estimates that by omitting such portions of the building as are not detailed in the requirements, viz., the two towers (leaving the staircases, &c.), the conservatory, the Turkish and medicated baths, the porter's lodge, the septic wards as a separate building, a portion of the nurses' home, and reducing the laundry to the course now adopted be continued of doing the bulk of the washing to be done by hand, the remainder may be carried out for the sum of 80,000*l.*, and, as funds permit, the design could be completed.

COMPETITIONS.

THE COXLOGE ASYLUM EXTENSIONS.—A meeting of the Visiting Justices was held at Coxlogge Asylum on the 16th inst., under the chairmanship of Alderman W. H. Stephenson. After the ordinary business had been transacted, it was resolved that the recommendation of Mr. Hine, the architectural assessor, with respect to the premediated designs for the extension of the Asylum should be adopted. That recommendation, as mentioned in the *Builder* for February 20, places the plans of Mr. J. W. Dyson 1st, those of Messrs. Carr and Montgomery 2nd, those of Mr. W. L. Newcombe 3rd, and those of Messrs. Kull Freeman and S. R. Robins 4th. Mr. Dyson will consequently be appointed official architect of the extension, and premiums of 150*l.*, 100*l.*, and 50*l.* will be proportioned in the order named to the other successful architects. This decision requires the confirmation of the Newcastle City Council to be carried into effect.

NEW BOARD SCHOOL FOR GOOLE.—A special meeting of the Goole School Board was held on the 18th inst. for the purpose of deciding the best and second best of the fifteen sets of plans sent in to the Board for competition in respect of the new school premises proposed to be erected in Bookferry-road. Premiums of 50*l.* and 20*l.* had been offered for the first and second best designs. The plans of Mr. W. Watson, of Wakefield, were accepted, and that gentleman was appointed Architect to the Board. The second premium was awarded to Mr. A. Williamson, Goole and Bradford.

Correspondence.

To the Editor of THE BUILDER.

MANCHESTER ROYAL INSTITUTION.

SIR,—May I be allowed to express my warm sympathy with you in your remarks as to the contemplated destruction of the beautiful interior of this unique example of happy adaptation of Classical forms and character to modern uses?

From the first time of my acquaintance with it, now nearly half a century ago, I never lost an opportunity when in Manchester of looking into the building, were it only for a possible minute, to enjoy the charming architectural picture you so well describe, and it is really almost inconceivable that a municipality possessed of such a gem of art should be so insensible of its value, or so utterly without sound advice in the treatment of their buildings, as to propose branding their community with vandalism to such a degree. It is hard to express the feelings of astonishment, and, indeed, shame, which such a project inspires, and one would fain hope that a timely protest might yet avail to prevent what would be almost a national disgrace; and in a day when so much is urged as to the need of general instruction in art to enable us to keep our place in the ranks of European civilisation.

AN OLD ARCHITECT.

March 22, 1892.

"RESTORATION" AT LINCOLN CATHEDRAL.

SIR,—It now seems but too certain that the Dean and Chapter of Lincoln are preparing to destroy a part of that most majestic and historical building entrusted to their care. The building bears on its face the evidences of its growth through many centuries. It is left to the nineteenth century folly to discover that this is not as it should be. It is left to us to forge, to tell archaeological lies, to try and falsify history under the name of restoration.

We are told that the page of architectural history written out for us in this church by Sir Christopher Wren (who, it must be remembered, did not himself pull down, but, finding a void, filled it up in the style current in his time, just as his predecessors had done before him) is out of keeping. Of course, we all knew this, but a genuine work of any style is better than a piece of sham. You have, however, in the *Builder*, so well stated the case against the absurdity of setting up a sham Gothic side to the cloister that on this head no more need be written.

We cannot doubt that Dean Butler and most of his colleagues have visited Salisbury. No

doubt they have, as the fashion is, condemned the harsherities of Wyatt. Wyatt pulled down the Hungerford and Beauchamp Chapels, because they were intrusions and not in style with the rest of the cathedral. The Dean and Chapter of Lincoln wish to do the same by their cloisters. Wyatt pulled down the bell tower because it spoiled the view. These gentlemen do the same by their close, removing, amongst others, one mediæval house of great interest; and if it be true that they propose to set up Wren's Library where they have pulled down the houses, such a course seems but the adding of folly to folly. Bnt, Sir, are we quite right in throwing all the blame on the Dean and Chapter of Lincoln? Does not the evil begin in our own profession? If the architect had been more anxious to preserve and honestly repair, rather than to "restore" and build up sham antiques, would our churches be the cold, lifeless, unhistoric edifices most of them have become? It is to be feared that our profession is chiefly answerable for raising the monster of destructive restoration, and it is only as yet amongst a few that the hopeless folly of trying to turn back the wheel of Time is realised. The clergy have learnt the lesson of restoration but too well. When their churches have been "thoroughly restored" they look brand new, and that is what is really liked.

We may excuse the ardour of the budding Gothic revivalist. Nothing, however, can make up for the destruction he has wrought; and still less can be forgiven deliberate falsifications by those who in the fulness of time and ripeness of knowledge go on in the stupid rut in which they first began.

It seems clear that in the present instance Mr. Pearson is responsible for the useless destruction now recommended to the Chapter. This unfortunate cloister has already suffered at his hands. The open walls toward the garth had soon after their erection swung over a little. They had been supported by small intermediate buttresses, examples of the skill with which our forefathers could make even a prop an object not displeasing to look upon. Mr. Pearson has "restored" the cloister and restored away the intermediate buttress so that this page of history is carefully removed. Then to reveal the outside of the doorway to the Chapter-house which was altered by the builders of the cloister, the cloister itself has been cut about and its eastern walk falsified. To crown the work we are now to have a sham north walk. A good building is to go and a thing which can have no real interest for any intelligent man is to be set up.

Are we told that Wren's building is to be set up somewhere else? Our answer is that it is impossible. Wren's work was often somewhat dull, but he was always careful of his proportions and that the building he designed should suit its place and purpose.

The library, following these rules, stands on an arcade, which forms the north walk of the cloister. When the building is set up elsewhere, what reason will there be for the open cloister below it? The east end of the library, with the stairs, is engaged in the east walk of the cloister, the west end is similarly engaged. Here is a nice opportunity to "complete" Wren's design and add that to his building which he never thought of.

Would any man of cultivation venture to treat a manuscript in the way in which a restoring architect treats an ancient building? Would he tear out a damaged page and trust to put in a new one so that no one should know? or would he daub his fanciful restorations over the old but damaged page?

The worst feature of an architectural restoration is that the old evidence is destroyed in setting up the new work. If the restorer would confine himself to paper it would not matter.

I venture to believe that we ought not so much to blame the cathedral dignitaries, and find them fifty years behind their time, as we should blame their advisers. Who now thinks about the Chapter of Salisbury who followed the advice of Wyatt? It is Wyatt himself who is held up to reprobation. So is Scott blamed for many a so-called "restoration," and not the Chapters under which he worked. So will be Mr. Pearson, as the historic spirit grows and the restorer fades away. Perhaps one niche in this temple of fame may be reserved for Lord Grimthorpe; but, fortunately, his practice is limited, and his attempts at architectural restoration so

clumsy that the youngest tyro would hardly be deceived.

SOMERS CLARKE.

Dean's-yard, Westminster Abbey, March 21, 1892.

CRYPT IN WATERGATE-STREET, CHESTER.

SIR,—Every architect must feel grateful to Mr. T. P. Ivison for his beautiful illustrations of Old Chester which you have so admirably reproduced. The view in Watergate-street which you published in your number of 27th ult. is a masterpiece. Both Mr. Ivison and yourself will, however, be glad of two corrections—

1. The date of the erection of this crypt is given in your text as about A.D. 1180.* From the sketch, however, it is clear that the work is of the reign of Edward I., 1272-1307. The writer states that it is believed to have been erected by the sixth Earl of Chester of the Normac line, which shows that the date given for Earl Ranulph de Blonville (query Fairton) is correct, as this allows an average of nineteen years to each tenant of the title.

2. Mr. Ivison has introduced an altar. This is right enough, but he has placed the altar against the south wall, instead of toward the east. No Catholic altar can be placed, according to the rubrics, as that the celebrating priest shall face in any other direction than eastward, following, of course, the arrangement both of the Jewish Tabernacle and Temple, and of the Pagan temples also, as mentioned by Vitruvius.

I may here state that there exists a very similar crypt,—known as that of the Grey, or Franciscan Friars,—in Middlegate-street, Great Yarmouth. GEORGE GILBERT SCOTT. London, March 14, 1892.

P.S.—The Jewish Holy of Holies was toward the west (cf. Exodus, cap. 26), and the Petrine Basilicas followed this occidentation. The Pauline Basilicas, however, have their sanctuaries toward the east, in this following the Orientation of the Pagan temples. But in all cases the celebrating priest faces eastward (cf. my "Essay on the History of English Church Architecture," cap. 1, and 2).

MISS SELLERS'S LECTURES.

SIR,—I have only just had my attention called to a paragraph in your issue of March 5, criticising portions of my lecture on the development of the Greek temple. I would ask permission to state what I actually did say, as the writer of the paragraph obviously laboured under the disadvantage of having to criticise statements which he had only heard at second-hand. The attack being chiefly directed against my explanation of a passage in Vitruvius (lib. iv., cap. ii. 4), it will be simplest to begin by quoting the passage in full. "Non enim, quemadmodum nonnulli errantes dixerunt fenestrarum imagines esse triglyphos, ita potest esse quod in angulis contraque tetraides columnarum triglyphi constituuntur; quibus in locis omnino non pectitur res fenestras fieri. Dissolvuntur enim angulorum in adificia iunctura, et in his fuerunt fenestrarum lumina relicta; etianque ubi mure triglyphi constituuntur, si ibi luminum spatia fuisse indicabuntur, isdem rationibus denticulis in Tonicis fenestrarum occupassse loca videbuntur. Utraque enim, et inter denticulos, et inter triglyphos, que sunt intercella metope nominantur; etiam enim Greci thronorum cubilia; ita assorum apollant, opas ost intertignium, id metopa est apud eos nominatum." The first passage I have italicised shows sufficiently that Vitruvius is speaking of buildings where the triglyph occupied precisely the position which the writer in the Builder claims for it in Greek buildings, where "it was shifted to the angle of the building," and not left "over the centre of the column," as the Romans did. My words are most unfortunately misstated in the Builder. To say that "the triglyphs represented spaces" would be a more repetition of the nonsense which even Vitruvius had to refute ("... nonnulli errantes dixerunt," &c.); what I did say was that I believed the architrave represented the binding-beam of the old mixed clay-brick and wood construction, and then, following Vitruvius,—that the triglyph represented the end of the beam that was laid in the eye, i.e., the cubite, or "bed," made or left to receive the beam in the strip of wall above the architrave, while the metope (a space between two opae) represented the solid piece of wall left standing between the opae. I

* Mr. Ivison, who signed the article, is responsible for its contents. We felt some doubt about his date.—Ed.

think this may be allowed to be a rational explanation. As to the metope representing a space originally left open (the explanation given in any architectural primer), this is by no means proved by the facts that the metopai of the Parthenon are thin facing slabs. Because at some given date an architectural member had become merely ornamental, and was, therefore (probably for economy), built as slightly as possible, there is no need to deny its constructive origin. Nor does the pivot metope help the matter. A more striking instance, which I am astonished not to have had quoted against me, is afforded by the well-known passage:—

ἕρα δὲ γέλωσ (ὁρ γέτωσ) περιλήφον ὅσοι κενόν ἕμας καθέιναι.—Eurip. "Iphig. Taur.," 113.

Quite so, but starting with the solid wall,—a portion of it could be removed to make one or more windows, in the same way as portions had been removed for the opae.

Bötticher has been a great authority in his day, but the difficulties he created for himself and his readers from his attempt to preserve the metope as the open space between two triglyphs, instead of the closed space between two opae are quite amusing. He tries to show that one and the same is the same ("Tektonik der Hellenen," p. 205). He gets enraged with Vitruvius, calls him "unklar und verworren"; further, does not hesitate to correct him on the passage "quod inter duas opas est intertignium." Not so, he says, "Sonderu es hätte heissen sollen quod inter duas opas est intertignium." And yet Vitruvius had read Silenus on the Doric orders, and Iktinos on the Parthenon! (Lib. vii. Pref.). The great Sempster thought the whole of triglyphos merely ornamental in its purpose. It would be pure pedantry to go on quoting. A glance at the list of contradictory opinions collected by Joseph Durm (p. 83 of "Baunkunst der Hellenen") affords perhaps sufficient excuse for the bewildered student who deserts these latter-day authorities, and finds that Vitruvius's statements become absolutely luminous when he is read in the light of the facts of Greek architecture, without the help of his commentators.

Further, the connexion of Doric architecture with the "qua-timber rock-cut designs" of Asia-Minor is by no means so well proven as the writer in the Builder implies. It is not a point I feel competent to discuss, yet I may quote the following passage from so able an architect as M. Charles Chipiez: "Dans la charpente asiatique on ne rencontre pas de triglyphes—on ne voit pas de moulures; on reconait simplement le principe des modillons." ("Hist. Critique des Arts et de la Formation des Ordres Grecs," p. 207, seq.) Surely it is in the clay-brick construction, with its binding-beams and stone-sub-structure—such as the excavations of Hisarlik, Tiryns, Mycena, and, above all, the Heron at Olympia, have revealed it to us—rather than in the lignite construction of Asia-Minor, that we must seek for an explanation of Doric forms.

With regard to one other point, I am criticised for starting architectural examination from the cella instead of from the order, though my critic owns that "in regard to the main architecture of the building, no doubt the cella is the constructive *raison d'être* of the temple." Without entering into the large question of the *genese* of the temple of woman, I can yet honestly state, as an individual, that I was fully aware of how unpopular my attempt at arguing from the essential to the ornamental would be with a public trained amid those productions of English architecture where the *raison d'être* is so often left for a possible afterthought. EUGENIE SELLERS. March 19, 1892.

P.S.—May I take this opportunity of answering one other stricture made upon my lectures, and which had escaped my memory till now? In a note to the report of my second afternoon lecture at the British Museum (Builder, February 29), when I had interpreted the so-called Selene of the eastern pediment as a figure of Nux, because she drives, it is stated that "the head of the 'Selene' horse quite allows of the supposition of a rider." Possibly, so long as we only had one horse to deal with. Bruno Sauer's admirable investigation of the actual Parthenon pediments (See "Athen. Mittheil.," p. 118, 1892) has fortunately settled the whole question. In addition to the one horse in London, two remain *in situ* on the temple, leaving us to infer a fourth. Short of being a circus-rider, the charming little figure must henceforth be looked upon as a charioteer. In speaking to a class of students I had not thought it necessary to revert to the Sauer discoveries. I had discussed them at great length last term.—E. S.

* Miss Sellers's clever letter certainly shows that she has given more attention to the subject than we had expected, but it does not convince us that Vitruvius knew nothing of the origin of the triglyph, and it does not alter the fact that, to any architect, the triglyphs are the piers or supporting parts of the upper structure (just as the columns are below), and the spaces between of less constructive importance; hence their peculiar suitability for sculptural treatment. On the subject of the original open-space character of the metopes we may call Miss Sellers's attention to

Fergusson's foot-note and sketch in the "History of Architecture," Vol. I., page 248 (second edition), which is much more to the point than the remarks of Vitruvius. Miss Sellers's sarcasm at the close about the productions of English architecture where "the *raison d'être* is left as an afterthought" is neat enough, but has nothing to do with our criticism. What we pointed out was that in regard to architectural design and expression the Greek exterior columnar order is the great fact of Greek architecture. It has influenced the architectural designs of the whole civilised world for two thousand years, which certainly cannot be said of the *cella* of the temple, however important that was at the time.—Ed.

STEAM-ROLLING ON MAIN ROADS.

SIR,—I have read with much pleasure your article upon "Steam Road Rolling" in your issue of the 15th inst. My report upon the subject to the Frome Highway Board, to which you so kindly refer, was written mainly for the use of the County Council, and was made the basis of a resolution offering the various contracting Highway Authorities in the county the sum of 10d. per cubic yard for all stone rolled in by the steam-roller, subject to the quality of the stone being approved by the County Surveyor. It is almost impossible to obtain any accurate comparison of the actual cost of steam road rolling in different districts, owing to the variety of opinion as to the particular items which should be included in that cost. In some statements only the wages of the driver and cost of coal, oil, and waste are included; whilst, on the other hand, some surveyors include the cost of the stone. In the report above referred to, I have included all the extra items of expense which would not have occurred had the stone been left to consolidate by the traffic, and these items only. They consist of driver's and sweeper's wages; horse hire for hauling water; coal, oil, waste, brushes, &c.

The principal item is the horse hire, and this must depend upon the distance from which the water has to be hauled. I find, however, that by using a water-barrel containing 175 gallons I can generally manage with one horse, making the cost about 2½d. per cubic yard.

The steam-roller and water-carts are the property of the authority, and, in a further report to my board, I have estimated that the depreciation and repairs would be about 1½d. per cubic yard consolidated.

Including these last-mentioned items, I find that I can satisfactorily consolidate Black Rock (Mountain Limestone) at a cost of 9d. per cubic yard.

With regard to "binding," I always use a small quantity (about 5 per cent.) of well-sifted road-scraps, applied when the materials are nearly consolidated.

I have all stone broken to a 2½ in. gauge.

ALLAN GREENWELL, A.M.I.C.E., Surveyor to the Frome Highway Authority. Surveyor's Office, Frome, March 22, 1892.

SIR,—Kindly allow me to correct a few errors in the Gloucestershire note on the above.

Gloucestershire does not contract for manual labour. We employ day labour, except in one district of 54 miles, where the system of letting the labour on stated lengths of road (we found in this instance when we took over the roads) is continued. It does not commend itself to me in any way and encourages a low form of sweating. My own experience of road contracting is that it does very well for five years, then the roads go to pieces, and you have to spend all your previous savings to put them to rights.

Steam-rolling cannot be defended on economy costs, but it can as a saving to the user of the road. Ten years' careful watching their cost in this county show they add 58d. per mile to the annual cost, that rolling alone costs 24d. per mile.

It saves by consolidation without abrasion or deterioration one-eighth of the metal. There are three distinct operations,—rolling, watering, brushing,—not required for wheel-rolled roads, and I have hitherto failed to find the surveyor that can do this for nothing.

The cost of breaking-up the surface to refuse is also considerable. Notwithstanding this, I am convinced that they are necessities of civilisation; that I am asking my council to buy four more making eight in all, and I could find work for thirty on the 1,000 miles of road we maintain.

It must be a thicker coating to make steam-rolling economical, and we find that a cubic yard only covers 8 yards superficial, and not 17 yards as at Frome.

The use of blinding requires great judgment, and for that reason I discourage it. Town experience such as Mr. Deacon's is useless for rural roads, where the roads are wet and unsheltered; and a road blinde as we see done in towns would be like a plough field after a frost. But there is a time,—when the stones have begun to interlock and are settled in

...when blindage is invaluable, and this is especially necessary in finishing steam-rolled roads, to horse-rolls, the blows of the horses' hoofs do what the roller does.

ROBERT PHILLIPS,
County Surveyor for Gloucestershire.

MEASURING.

Sir,—The letter of Mr. Robert Jones, in your issue of March 12, raises a question which ought to be let drop. He asks why London architects use brick walls to rods a brick and a half thick? I suggest the adoption of the Northern (and I think) "use" of yards one brick thick. Why do we? A new building is planned,—an old one measured,—in feet. Why, then, should not all antiques be taken in feet also? For surfaces over a larger unit is wanted, we have already (in me trades) the "square" of 100 ft. sup., which might well be made general. Then all measurements taken straight from the plan or building by rule or rule could be put into quantities at once. I'd the yard relegated entirely to the linen-draper, my generations may, indeed, have gone on comfortably in the old way, but will any architect say at be likes, when looking out or receiving prices, have some in rods, others in feet, some in yards, others in squares, and that he would not prefer to have them comparable at a glance, without any process of reduction? With the much longer list of materials, and the much finer cutting of their prices, that we have now deal with, the simplification of our needlessly undabont methods of measuring would surely be reform worth making? Could not the "Practical Committee" of the Institute take it up?
A. S. FLOWER.

keep up a heat of 60 deg. in the house, when the outer temperature is 10 deg.

All calculations are usually based upon using 4-in. pipe, as 1 ft. length of this is almost exactly a superficial foot, and should any irregular-shaped radiating media be used, then by ascertaining the superficial measurement in feet, its value can be instantly seen. 3-in. pipe is three-fourths of a superficial foot per foot-run, and 2-in. pipe half a superficial foot per foot-run. In other words, if 100 ft. of 4-in. pipe was required to give a certain temperature, it would require 133 ft. of 3 in., or 200 ft. of 2-in. pipe, to attain the same result.

In arriving at the quantity of glass in a glass-house the material of the frames are included, but if they be wood about one-eighth total area can be deducted. If the frames be metal, no allowance can be made, as they reduce the temperature as quickly as glass. In the same way, if corrugated sheet-iron should ever enter into calculation, it can be treated as glass.

As just mentioned, Hood's rule, although possessing accuracy, is rarely, if ever, used. It is hardly suited for the understanding of many who undertake these works. Even those capable of using it give preference to some more expeditious mode of arriving at results, and this has led to the almost universal use of tables based upon cubical contents.

The particular objection to these tables has been pointed out,—viz., that we get a certain quantity of pipe to a given area, quite irrespective of the quantity of glass. This is a great weakness, as it is the glass wholly, and nothing else (except open ventilators), that goes to reduce the temperature. In span and lean-to houses it is sometimes possible to get nearly double the quantity of glass in the former than in the latter, with the same cubical contents; under such circumstances as these, the tables referred to give erratic results, to say the least. It is usual to apply the tables to lean-to houses, and allow a certain additional percentage for span houses, &c.

An example of rapid calculating tables is as follows:—If we have a glass-house, 30 ft. by 10 ft. by 10 ft., we can easily find its cubical capacity or contents is 3,000 ft. If we require a temperature of 60 deg. (Fabr.) when the thermometer registers 10 deg. outside, we must allow 50 ft. of 4-in. pipe to each 1,000 ft. capacity, which would amount to 150 ft. of 4-in. pipe for the house in question.

The following table shows the length of 4-in. pipe needed to keep up a given temperature to every 1,000 cubic feet capacity in a glass horticultural building, the pipes being at about 180 deg., and the outer air at 10 deg. or higher:—

Temperature Required (Fabr.) Deg.	Quantity of Pipe to each 1,000 cubic feet capacity. Ft.
40	80
45	75
50	70
55	65
60	60
65	55
70	50
75	45
80	40
85	37
90	35

The above table requires allowances, &c., as follows:—

For span-houses add one-fifth or one-fourth to the above quantities. About the same allowance should be made for any house that has glass on all four sides and top.

The position of the house should be considered. They are invariably placed in a sheltered position when it is possible, but if impossible, then it is desirable to put a little more pipe.

Pipes carried in trenches must be calculated as being one-fourth less effective than those that are exposed; therefore one-third must be added to the quantities given for pipes carried in channels with gratings over. Channels should be as roomy as possible, or the pipes will be still less effective. At least a width equal to the diameter of the pipe used (say, 4 in.) should exist between the pipes and the sides of the channel.

If the hoiler is attended to by a gardener or man having some skill in stoking, very different results will be obtained to what will be effected if the reverse is the case. It might almost be taken for granted that a horticultural apparatus will have the best attention, but it is not

always the case. If such a thing has to be provided against, then a little extra pipe will meet the trouble, as it only means that the water will not be kept at a regular high temperature, as it should be. This trouble is of common occurrence in residence and buildings works, as the hoiler is then very generally attended to by a page-boy or odd man, whose chief idea is to economise the time spent in stoking.

The quantities given in this table, although sufficient and correct for all ordinary purposes, can be increased with decided advantage if cost is not of chief importance. It is quite recognised that a benefit is derived by putting a more than necessary quantity of pipe, in the same way that a fully-large boiler (beyond the size arrived at by calculation) gives better, more reliable, and economical results. In the first place, it is an advantage to have an apparatus that will respond rapidly to whatever attention is devoted to the fire. Then, with an apparatus that would be considered overpowered in the ordinary way, we can afford to keep low fires, with little attention, and the fires when banked for the night will, without fear of failure, keep up an efficient heat during the night, when they have the least, or perhaps no, attention whatever.

This is a question that should always be prominent in the engineer's mind, viz., that during the daytime, when attention can be and is given to the hoiler, and the best result can be easily effected, the natural temperature is higher than at night, and assists matters materially. At night, when the fire is banked and left to smoulder and do the best it can by itself, the temperature registers its lowest point, and if the hoiler and apparatus are not fully capable, mischief will be done—sufficient, perhaps, to destroy the work of the season. With all calculations of quantities, heating surfaces, &c., the coldest winter temperature has to be guarded against, with a fire that is left, perhaps, all the night through without attention.

It has been mentioned how uncertain the results must be with a table based upon cubical contents, especially when comparing lean-to and span-houses in which the quantity of glass varies to such a great extent. This variation, however, can be met by a fixed allowance as just shown, but the quantity of glass varies in other ways. Supposing we have two glass-houses of exactly the same height and width, but one measuring 15 ft. and the other 30 ft. in length, here we get exactly double cubical capacity, but not double the quantity of glass (the glass being the sole cause of heat-loss as explained). In this case no harm would ensue, as by calculation we should give the smaller house sufficient pipe and the larger house too much. The only objection would be, that assuming the job to be one in which cost was of primary importance, we should be spending money on pipe unnecessarily in the larger house. It will be understood that the difference in quantity of glass occurs by the fact that the 30 ft. house has but two glazed ends, whereas two 15 ft. houses would have four glazed ends.

Another example may be illustrated in a high-domed conservatory or a palm-house. With these we get double the cubic contents (or more) of a low glass-house, but not double the glass area. In this case, if we get a more than exact quantity of pipe, certainly no harm ensues, for in high houses we require a full sufficiency of pipe, as the heat, or, rather, heated air, rises, and gets out of the way at the top more quickly than is desirable.

Hood plainly saw the fault that the complexity of his rule gave rise to, and compiled a table of figures which greatly simplified matters, although it still remained based upon the glass area, and not cubic contents. A cubic contents table was also given by Hood, but not willingly, as it was opposed to the exactitude of his general information. Although errors crept in here and there, his work has been practically beyond criticism, and has only fallen behind by reason of its age, which made it somewhat unsuited to modern practices and requirements. An excellent new edition of this work has, however, now been published.

When an apparatus is first tested, some idea of its efficiency can be gained by the time it takes to heat up the previously cold and possibly damp interior. Of course, accuracy is rather out of the question, as results will vary with the normal temperature of the air. If an apparatus be erected in the summer time, it is difficult to judge its efficiency except by feeling the temperature of the pipes, and having con-

The Student's Column.

HEATING BUILDINGS BY HOT WATER.

XIII.

QUANTITIES FOR HORTICULTURAL WORKS.

HOOD, in his standard work upon hot-water engineering, published a rule for arriving at the quantity of pipe required to raise and keep the temperature of a building to whatever heat was needed. Owing, however, to the complexity of the calculations needed this rule has been little thought of, notwithstanding the very correct result it gave. The rule in question ran as follows:—"Multiply 125 by the difference between the temperature at which the room is supposed to be kept, when at its maximum, and the temperature of the external air, and divide this product by a difference between the temperature of the pipes and the proposed temperature of the room; the quotient thus obtained, when multiplied by the number of cubic feet of air to be warmed per minute and this product by 222, will give the number of feet in length of pipe, in. in diameter which will produce the desired heat."

This rule is based upon the fact that every superficial foot of glass which constitutes the glass house will cool 1 1/2 cubic of warmed air per minute down to the temperature of the external air. The result arrived at by this rule gives the quantity of 4-in. pipe that is required containing water at about 180 deg. to make good this loss of heat. In calculating in this manner, only glass has to be considered, wood, brick, and one work being practically inactive in the interference and loss of heat. The rule is thus good for any shape of house, whether high or low, lean-to or span, and in this respect it is much better in results than the rapid calculating tables that will be spoken of directly. These latter are based upon cubical area, or contents, and consequently a house bounded on one side by a wall would be given the same quantity of pipe as a house having glass on all sides, unless a certain allowance is made.

The working out of Hood's rule would be as follows:—Supposing a grape-house, having 1,000 superficial feet of glass, was required to be heated to 60 deg.; this temperature to be maintainable during the coldest mid-winter nights, for this purpose it would be necessary to calculate upon the external air being as low as 10 deg. Fabr. Multiply 125 by 50 (difference between the external and the required internal temperatures) = 6,250, divided by 120 (the difference between heat of pipes, 180 deg., and internal temperature, 60 deg.) = 52, multiplied by 1,250 (cubic feet of air cooled by 1,000 superficial feet of glass per minute) = 65,000, divided by 222 = 293 ft. of 4-in. pipe, to

vidence that the quantity of pipe is sufficient. If, on the other hand, the first trial of the apparatus be made in cold weather, the time occupied in getting the interior of the house to its required heat should be about as follows:—

Width 4-in. pipe	...	4 hours.
" 3 " "	...	3 1/2 "
" 2 " "	...	2 1/2 "

A perfectly dry house would be heated in less time than this, for with moisture (water) we have a substance that possesses a great affinity for heat. Moisture is a very necessary feature in all glass-houses, and its presence materially delays the heating up of the air. When the apparatus is first getting warm, it is the air and moisture alone that takes up the heat; after the air becomes somewhat warm, the glass begins to transfer the heat from the air in contact with it to the outer air which is in need of it. A familiar example of this is the cold downward current of air that always exists near windows, this down current being air robbed of its heat by contact with the glass, and being thus rendered heavier than the general air of the room. It is much like the circulating action of hot water, but reversed as to the cause.

GENERAL BUILDING NEWS.

PROPOSED TECHNICAL SCHOOL FOR SALFORD.—Mr. Arnold Taylor, an inspector of the Local Government Board, held an inquiry at the Salford Town Hall, in respect of an application by the Salford Corporation for sanction to borrow £5,000, under the provisions of the Municipal Corporations Act and the Technical Instruction Act, 1889, for the provision of a school of technical instruction in the borough. Plans of the proposed new school were exhibited on the walls of the committee-room where the inquiry was held, and the details were explained to the inspector by the architect, Mr. Henry Lord.—The Town Clerk, in supporting the application of the Corporation, said the purchase of the land was put at £,837, and the cost of the erection of the school buildings at 43,500. The subjects proposed to be taught in the school included chemistry, building construction, machine construction and drawing, magnetism and electricity, mechanical engineering, and theoretical mechanics. After the inquiry closed the inspector visited the site of the proposed school.

NEW CLUB, LINCOLN.—On the 9th inst. a Liberal Club building was opened at Lincoln. The building is situated between St. Swithun's-square and Waterside. The approach to the building, which is of red brick with stone dressings, is from the first-named street. A vestibule leads into a large central hall. On the left of the vestibule is a reading-room, 26 ft. by 22 ft., and on the right is a corridor leading to two offices. At the back of this corridor, on the west side of the building, there is a lecture-hall, capable of seating 500 persons. It is 60 ft. by 20 ft., and has at the end two cloak-rooms and the usual offices. On the left of the central hall is a refreshment bar, and beyond, on the east side, is a smoke-room, 32 ft. by 22 ft. The first-floor is reached by a staircase from the central hall. The billiard-room, 62 ft. by 28 ft., occupies the entire front of the building on the first floor, and two French windows in it give access to a verandah, 22 ft. long, over the main entrance. A room, 24 ft. by 22 ft., is set apart for games, and there is also a lock-up library, 15 ft. by 10 ft., on the first floor. Adjoining it is the directors' room, 16 ft. by 14 ft. The caretaker's rooms are also situated here. In the basement there is a cellar, 7 1/2 ft. by 28 ft., a club kitchen, two hot and cold water baths, and the apparatus for heating the club. The architects were Messrs. Slagton & Brameld, of Manchester; and the contractors Messrs. Lansdown & Son, of Lincoln.

CO-OPERATIVE STORES, SEATON BURN.—On the 19th inst. new branch stores at Seaton Burn, belonging to the Cramlington Co-operative Society, Limited, were formally opened. The buildings comprise upon the ground floor dry goods and grocery warehouses, with large cellar underneath, grocery and drapery, boot and shoe, and hardware departments, grocery and vegetable store, butcher's shop, slaughter and hamper-houses, oil store, and the usual conveniences. Upon the first floor is a large hall 65 ft. by 36 ft., capable of holding 500 adults, and two ante-rooms. The ventilation is by means of Messrs. Boyle's air-pump ventilator, the heating by hot-water pipes, the apparatus having been fixed by Messrs. Henry Walker & Son, engineers, Gallowgate, Newcastle; the seating by the North of England School Furnishing Company, Darlington; and patent roller shutters by Messrs. Francis & Co., London. The architect for the buildings is Mr. J. G. Crone, 50, Granger-street, Newcastle-upon-Tyne, and the contractor was Mr. Amos Gray, of North Gosforth, while the clerk of works was Mr. Amos Gray, jun., Wide-open. The internal fittings are carried out in

pitch-pine, also the cleading of walls and ceilings, and the cost of the buildings has been 2,250.

FORESTERS' HALL, PLYMOUTH.—On the 19th inst. a new Foresters' Hall, which has been erected at the Octagon, Plymouth, was opened. The building is three stories high, and is built of local stone with Portland stone dressing and stucco front. On the ground floor, on the left of the entrance lobby, is an apartment intended as the district secretary's office, and approached through a small waiting-room. Behind it is court-room No. 1. The large hall is approached through a passage leading from the Octagon entrance to a circular porch, which opens through swing doors into the hall. The latter is 65 ft. long by 28 ft. 6 in. wide, and lighted from the top by a double sky-light, the framework being formed of steel, filled with Helliwell's patent glazing. At the upper end a platform will be erected, and seating accommodation will be provided for 500 persons. Behind the hall is a kitchen, and over it a retiring-room for ladies. Emergency exits open out into Bath-stone. On the second floor of the main building are two additional court-rooms; overhead are the caretaker's apartments. All the court-rooms are fitted with mica flap ventilators, the window being filled with cathedral stained-glass. There are also cloak-rooms and lavatories, fitted with Italian marble ware, for both ladies and gentlemen. The premises have been erected by Mr. S. Harvey, Plymouth, from the designs of Mr. H. J. Snell, architect. Mr. G. H. Julian has been clerk of works.

BAPTIST CHAPEL, LAUNCESTON.—On the 17th inst. the foundation-stone was laid of a Baptist Chapel, which is to be erected in the Western-road, Launceston. The building, designed by Mr. Otho B. Peter, architect, Launceston, will be of Gothic style. A gable end and porch of cut and dressed stone will face the Western-road. Seating accommodation will be provided for 120 persons, the seats and stanzas being of pitch pine. Underneath the stanzas will be a school room. The building is to be heated throughout by hot-water pipes. Mr. G. H. Strike is the contractor.

SANITARY AND ENGINEERING NEWS.

HEMSWORTH WATERWORKS.—On Wednesday, March 9, a Local Government Inquiry was commenced at Wakefield relative to an application of the Hemsworth Rural Sanitary Authority for a provisional order to acquire lands and easements otherwise than by agreement. Major General Crozier presided. There was no opposition on the part of the landowners concerned, but the project, which is to supply water to no less than nine townships, was opposed by ratepayers in some of the contributory places, and the inquiry was adjourned to Monday, the 14th inst., and again to March 24. The scheme is to supply an ultimate population estimated at 25,000, with 350,000 gallons of water to be purchased from the joint Boards of Dewsbury and Heckmondwike, with whom a provisional agreement has been completed. The water is derived from the moorlands at the head waters of the River Don. The works are estimated to cost about 25,000. The supply will be by gravitation. Mr. M. Paterson, M.Inst.C.E., gave evidence, and stated that he had investigated the existing supply, which consists of surface wells and springs, more or less polluted, and entirely inadequate to the needs of the district; that he had failed to find a sufficient local supply, and that this was the best and cheapest scheme for a combined supply. He also stated that it had been agreed to supply the high levels of two townships on the line of pipes, and also the township of High Hoyland. The chairman (Col. Ramsden), Dr. Coleman (medical officer), and others gave evidence.

FOREIGN AND COLONIAL.

FRANCE.—A committee has been formed to raise a monument at Paris to M. Alphonse—M. Achille Jaquet has been elected a member of the Institute, in place of the late Henriquel Dupont.—On the recommendation of M. Daumet, the ten pupils who have entered in competition for the Prix de Rome in architecture have been given as a subject "Un Musée d'Artillerie." The "Société des Amis des Arts" at Dijon is to open its seventh exhibition of painting, sculpture, and architecture on June 1. The exhibition is to be open till July 5.—The "Société Académique d'Architecture" of Lyons proposes to architects (French and foreign), for the subject of the competition of 1892, "Une Ecole de Commune," to be erected on a site at Lyons. The first prize will be a gold medal and a sum of 200 francs; the second a silver medal, and the third a bronze medal. The designs must be sent, carriage paid, to the Palais des Beaux-Arts at Lyons, addressed to the Secretary of the Society, before December 1 of this year.—Six French architects have sent in competition designs for a cathedral for Tunis, but no decision has yet been arrived at.—A monument to the painter Angerix Bruneau is to be erected in the cemetery at Rueil (Seine-et-Oise).—The sculptors Desca, Escoulin, and Mathé are commissioned to make the model for a

monumental fountain for the town of Tarbes (Hautes-Pyrénées).—The Société des Amis des Arts at Cognac is organising an art-exhibition in that town, to open on June 1.—M. Manceau, a former pupil of Cabanel, has been appointed professor of drawing at the College of Beauvais.—The death is announced of Madame Jenny Caupillat, sculptor, author of a fine bust of Voltaire. M. Baskirtseff exhibited in the Salon of 1886.—M. Gabriel Emanuel Farail, a talented sculptor, has died suddenly at the age of fifty-four. He was a pupil of Oliva and Faronch. From 1886 to 1891 he exhibited at the Salon various statues and busts remarkable for their conscientious execution. Among his works may be mentioned a figure of a young girl which gained a third medal in the Salon of 1886, and a large bronze statue of the painter Rigaud which stands in one of the public squares at Perpignan, after having figured in the Salon of 1889.—A fine painting by Mantegna, representing the martyrdom of St. Sebastian, in the parish church of the small town of Aigueperse (Puy-de-Dôme), has been seriously damaged by some person unknown.

BERLIN.—The proposed metropolitan overhead railroad scheme is apparently to be carried out without much delay. The electrical engineers, Messrs. Siemens & Halske, have altered their route in accordance with the wishes of a special committee which had criticised their scheme for the authorities when first mooted. The altered plans have been put before the Police President for approval, and he has sent them to the Minister of the Interior with his recommendation. If the Minister's approval be obtained at once, the preliminary works are to be commenced at once, and, if this be the case, the new line can be opened in 1894.—The Emperor wishes to have some of the old houses in the vicinity of his "Schloss" pulled down. This proposed extension of the "Schlossfreiheit" will require a large sum of money. For the purpose of raising the necessary funds, the Emperor wishes again to have recourse to his favourite "lottery" system. The Prussian Government in whose department the matter would have to be settled has apparently refused to help the Emperor this time. He has asked for his dismissal from his unpleasant post, and will receive it.—According to the annual report there is a decrease in the number of members in the older of the two architectural societies, "Der Architekten Verein zu Berlin." The number is 1,849 this year; it was 1,887 last year. This is probably due to the popularity of the new "Vereinigung." The library has 11,783 volumes.—A third society has been founded; its name is "Skizze," and it will have a large number of juniors on its roll.—The money for the Berlin Cathedral being forthcoming, the old "Dom" is now to be pulled down and an iron church put up for the use of the parish during the years in which the new building is to be erected. 20,000 are at the disposal of Professor Raschdorff for this purpose.—The total cost of the eight covered markets lately erected is 829,000.

MUNICH.—The *Deutsche Danzführung* states that the preparations for the Munich International Art Exhibition this summer have progressed wonderfully well. Besides a good show of Bavarian and North German work there is to be a good representation of Spanish art. Hungary is expected to send a large collection of paintings, and it is hoped that Scotland will be fairly represented. A member of the managing committee has gone over to America to bring over a collection of paintings from the United States. As to the architectural group, we hear that there are to be some specimens of von Hansen's, von Ferstel's, and the late Semper's drawings on view in separate rooms.

SWITZERLAND.—Nineteen designs were sent in for the proposed concert-halls and assembly-rooms to be erected at Zurich. The competition for this imposing work has been won by Herr Bruno Schmitz, the "memorial monument specialist" at Berlin. He had also won the preliminary competition some time back.

MISCELLANEOUS.

WREN'S LIBRARY AT LINCOLN.—At a numerously-attended meeting of the Society of Antiquaries, on Thursday, March 17, Dr. John Evans, F.R.S., President, in the chair, the following resolution was unanimously adopted:—"That the Society of Antiquaries of London bears with much regret that the Dean and Chapter of Lincoln have avowed an intention to pull down the north walk of the cloisters of their church, and the library over it, in order to build on the same site an imitation of the other three sides of the cloister, which are of the fourteenth century; against this proposal the Society desires to protest as strongly as it can, and at the same time to point out that the existing building, which is the work of Sir Christopher Wren, is a good piece of architecture, well fitted to its place, and convenient for the uses for which it was intended, whilst the substitution of new work in its place will be a falsification of history, and there will be little compensation for the loss of Wren's building, even if the ornamental parts of it should be worked up, as has been proposed, into

The Remains of Ancient Rome.

LITTLE more than six years ago we had the pleasure of noticing at some length* Professor Middleton's single volume on "Ancient Rome in 1885," a hook which, though a small one for so great a subject, had the special value that it combined the observation of the practical architect with that of the archaeologist, and brought to notice many points in regard to the construction of ancient Roman buildings which had been overlooked, and probably not understood, by the many archaeological writers who have described and illustrated the topography of Rome. In the meantime Professor Middleton has not been idle, and he now produces what is to a great extent a new hook,† though founded on the former one. The two volumes of "The Remains of Ancient Rome" contain most of the matter which was to be found in "Ancient Rome in 1885," but rearranged and largely added to both in regard to literary matter and illustrations.

Professor Middleton's hook is one to be recommended to those who take their Rome seriously. It is not a handbook for the general sightseer, who would no doubt be much the better for studying and endeavouring to understand it, but is hardly likely to do so; he will find the practical descriptions interesting to him and the diagrams of construction unintelligible, and will probably return contentedly to his "Murray" for food more convenient for him. But to those who wish for real knowledge about the ancient buildings of Rome, and especially to architectural students, this is a most valuable hook, the more so in containing so much information in such small and convenient volumes. Professor Middleton appears to

possess an unusual faculty of noting little things in ancient remains, indications which are slight in themselves, but which furnish the data for very important conclusions as to the structure and structural history of a building. He seems in many cases to have looked into the actual indications of construction in a manner which has hardly been done before, and though he has not given us sumptuous drawings of the remains of ancient Rome, he gives us a number of diagrams of facts of construction, from observation at first hand, which are of permanent value.

In the present form of the hook we commence with a chapter on the general question of the site of Rome, followed by one giving a general description of Roman methods of construction. In the Introduction we have also a useful list of existing hooks on the topography and antiquities of Rome, and of the most important existing inscriptions, coin collections, and other sources of information ancient and modern. In the sketch of the history of the site of Rome we are reminded of some of the early history of London; "the Forum Romanum, the velarum, the great Campa Martius (now the most crowded part of modern Rome), and other valleys, were once almost impassable marshes and pools of water." There seems to be a tendency in the history of great cities to this crowding important quarters on to low marshy sites. London has her Westminster and Lambeth, and Paris her "Marais." The history of the contour of the site of Rome, in the author's rapid generalisation, is the history of a progress from accentuating the natural inequalities of level to reducing them as far as possible: a common history in the progress from an uncivilised to a highly civilised stage. At an early period, as Professor Middleton observes, when each hill was crowned by a separate village fort, it was an object of the rival inhabitants "to increase the natural steepness of the cliffs, and so render access more difficult and defence easier." As the various parts of the site became united under one Government, the object naturally became to get rid of the disjoining effects of this variation of contour, and in Imperial times especially great works were carried out in

order to get rid to some extent of the inconvenience of hills and vallies. The same history is repeated constantly in large cities on uneven sites, as we see in the case of Holborn Viaduct; Union-street, Aberdeen; and the bridges which connect the Old and New Towns of Edinburgh. The two Scottish towns, however, have not obliterated the naturally picturesque character of their sites, and the passenger along Holborn Viaduct has still the evidence before him that there was once a Holborn valley. But under modern municipal regulations Rome is being, as far as possible, reduced to a condition of entire oblivion of her old title as the city of seven hills; the effort being not so much to connect the high levels by bridges and viaducts as to gradually obliterate the differences of level altogether and bring the town to the condition of an elevated plain half way between its ancient higher and lower levels. Along with this effort goes the constant formation of new and uninteresting modern streets intruding upon and shouldering out the reverend vestiges of the ancient city. In our review of the former hook in 1886, we referred with gratification to the map of modern Rome appended to it, as showing that the contemplated improvements and extensions, the new quarters, seemed at all events to be kept pretty well out of the range of the most valuable portions of the ancient city. But alas! since then the march of enlightenment has gone on with giant strides. In his former preface the author could refer, without any expression of dissatisfaction, to the important discoveries of early tombs and houses "brought to light by the extensive excavations made in laying out a new quarter of modern Rome." But now it seems to be not so much a question of laying out new quarters as of laying out ancient Rome over again. It is melancholy to read in the preface to the new hook of what Professor Middleton has noted since the publication of the earlier volume; the Ludovisi gardens built over with "villas," the demolition of the picturesque old houses on the Tiber banks to make way for a stone embankment. "No words," he says, "can adequately express the disgust which must be experienced both by the antiquary and by the lover of beauty in any form who now visits

† "The Remains of Ancient Rome." By J. Henry Middleton, Slade Professor of Fine Art, Director of the Fitzwilliam Museum, and Fellow of King's College, Cambridge. London & Edinburgh: Adam & Charles Black; 1892.

this unhappy city. The injury done in former periods of destruction was but superficial compared to the ruin which is being wrought by the present scheme of *piano regolatore*, which aims at and is partly succeeding in levelling the seven hills and filling up the intermediate valleys; changing the very face of nature, and utterly destroying the character of the former capital of the world." The author is reasonable enough, however, to remember that since Rome has become the capital of Italy, it would be hardly fair to blame the administration of a modern city for doing what every other modern municipality is doing, improving roadways and approaches. It is the case of Venice over again. As we observed some time since, in connexion with the much-dreaded Venice "improvements," we can hardly demand that the modern Venetians, who have their own way to make in the world, should keep ancient Venice as a picturesque sight for the rest of the world, if it is not to their own interest or convenience to do so. To modern Romans, as to modern Venetians, the ancient buildings, seen by them every day, have apparently none of the poetic interest which they have in the eyes of the visitor; they are only obstacles in the way of modern improvement. The great monuments of Rome are indeed of such exceptional and world-wide importance and interest that they have so far escaped any threat of demolition, though we should not be surprised to find that there were those among the modern Italians who would be willing, if public opinion permitted it, to clear the Colosseum and Forum sites and lay them out for new building-lots. The great monument of all, however, is Rome itself, the most wondrous and enthralling remnant of the central life of the antique world, which is now in process of being gradually wiped out. The poetry, the glamour, of this great relic of a great past will ere long be only recognisable in the verse of Byron, and the next generation will be left to wonder what it was which inspired his nobly-expressed enthusiasm. It is a melancholy consideration that all these links with the past are being little by little stamped out and effaced; but apparently the only remedy for it, before long, will be for Europe to buy up some of the great sites of ancient splendour and preserve them as a possession for the educated world. Whether that is a possible alternative we do not venture to suggest; but it appears likely that it will prove the only one.

To return to Professor Middleton's book: in his second chapter, on Roman methods of construction and decoration, he warns the reader that no subject has been treated in so misleading a manner, partly because it has been largely treated by archaeologists who had no practical knowledge of building, partly because "the real methods of construction in ancient Rome are frequently hidden behind very deceptive modes of surface decoration." The author notes that the purpose of mortar, which was only introduced at a late period in Roman building, was apparently not to bind the blocks together but merely to give the joints and beds smooth-fitting surfaces. In still later times, towards the close of the Republic and under the Empire, even this thin bed of mortar disappears, and the stones are apparently fitted as in the Greek columns, by rubbing them on one another. He mentions a remarkable example in the recently-exposed angle of the temple of Faustina, where the masonry has been well preserved at the lower part under accumulations of earth, and where he remarks that the beds and joints are so close as to be imperceptible except with the closest examination. This is the perfection of masonry building, but a perfection not to be obtained, of course, under a contract system of building against time. The Romans were bad artists (as Professor Middleton fully admits), but there is something worthy of the highest respect in this kind of perfection of building work; in which we might learn a lesson from them, if we could first unlearn our own modern lesson

of building as quickly as possible rather than as well as possible.

The most singular feature in Roman construction is perhaps the constant employment of superficial brick arches, surface arches, too shallow to be of any use constructively, and not intended for appearance, as they were used on walls intended to be stuccoed. The so-called relieving arches in the wall of the Pantheon are of this class, the wall being solid concrete behind them. Professor Middleton offers no explanation of this curious custom, though he comments on it in several places; nor does it seem possible to give any reasonable explanation. It seems as if it were a survival from some earlier manner of building; it is certainly oddly at variance with the otherwise practical character of Roman building, that they should have persistently used a piece of sham construction of this kind for which no practical object can be assigned. But the author arraigns the whole apparent brick construction of the Romans as a mere sham, a face to concrete walls, but a face which was to be covered up again either with stucco or (in special cases) with marble veneer. He gives a sketch showing the exterior facing and the section of a wall of this kind, the entire mass composed of concrete except a facing of thin bricks, triangular on plan, with the points inwards. As the author observes, this brick facing could not possibly be meant as a matrix for the concrete, for it obviously would not have withstood the pressure of the latter while in a wet state. It must have been necessary to support this and the concrete with an external timber framing in the same way as for un-faced concrete; and the author evidently set himself to look for the signs of such timber framing, which ordinarily would not show on the brick-work, and thinks he has found it in the remains of the Golden House of Nero, under the *Thermae of Titus*, where he says "the channels formed by the upright posts are clearly visible. These upright grooves on the face of the wall are about 6 in. wide by 4 in. deep, and they were afterwards filled up by the insertion of little rectangular bricks so as to make a smooth unbroken surface for the plastering." We cannot suggest any other meaning for the upright grooves as described, but the explanation seems rather problematical. If the object were to support the brick skin along with the concrete, why place the supports within the line of wall-surface? They would have been more effective for their purpose outside of it, and left no spaces to fill in afterwards. In regard to the concrete itself, Professor Middleton notes that the larger pieces of the aggregate in the concrete, which are not close together, are so evenly spaced apart as to lead to the conclusion that they must have been put in by hand, piece by piece; a hint perhaps for our concrete builders. But that again would not do for building carried out against time and at prices cut down to the lowest margin by competition.

Of the boldness of the Romans in using their splendidly-made concrete for roofs and vaults Professor Middleton points out some significant examples besides the now well-known one of the Pantheon: we say "now" well-known, because it has been described and even drawn by various writers as essentially a brick dome, being in fact a vast inverted cup of concrete standing in its place like a single solid mass. Professor Middleton mentions a striking instance in the *Thermae of Caracalla*, at a point where a brick-faced concrete wall originally rested on a marble entablature supported by two granite columns. "In the sixteenth century the columns and the marble architrave above them were removed for use in other buildings,† and yet the wall above remains,

hanging like a curtain from the concrete vault overhead." The vaulting and dome system of the Romans, indeed, may he said to have been the use of the arch form with the statics of the beam, the cohesion of the material supplying the place of the buttress in preventing the spreading of the walls, the vault having practically no thrust at all. Brunel practically adopted this system on one occasion, when a railway bridge fell just after building; instead of altering the design of the bridge, he simply rebuilt it in cement. The Roman method cannot be called unscientific as the Romans used it, for the science, instead of going into the constructive problem, went into the composition and making of the concrete; thought was saved in construction by thought bestowed on material. There must, as the author observes, have been very elaborate construction of centring for these great thick concrete vaults. He gives, as an ascertained fact, a common late method of avoiding the necessity of building the centring from the ground, by setting the springing of the arch back from the face of the pier, so as to leave a ledge from which the centring was built, the line of the pier being afterwards carried up till it met the intrados of the arch, thus filling the lower part of the arch and leaving it the segmental one. This is a very ingenious surmise on existing evidence, very likely to be correct, but ought it, with the diagram of the centring, to be given as an ascertained fact?

The third chapter of the book deals with the half-legendary subject of the prehistoric period, which has left only the remains of the wall of Roma Quadrata as hard fact, and the regal period, in regard to which the author brings together the record of all remains, known or imputed, of this period. Further chapters in the first volume deal with the Palatine Hill (to which two chapters are devoted), the Forum Romanum, also occupying two chapters, the Capitoline Hill, and a chapter on "The Architectural Growth of Rome." The description of the remains of the Palatine is very full and detailed and of great interest. In speaking of the Flavian palace Professor Middleton remarks in regard to the porphyry statues with which the stateroom is known to have been decorated, that the Romans probably acquired from Egypt both the taste for statues in this hard material and the tools with which to work it; and in a note on another page he observes that the circular markings on the side of drilled holes in this material "show by the rapidity of their spirals that the drills must have sunk into the hard granite with wonderful speed;" a passage which we quote as showing the minuteness of observation which the author has brought to bear on his subject.

In speaking of the *rostra* in the Forum also, he has not failed to notice the positions of the holes drilled, and the remains of metal pegs, for securing the *rostra* (beaks of ships) which gave the name to the erection, and by which it is possible to fix their position and number, as shown on a restored elevation of the front of the platform. A restored plan of the Forum printed in colours to show the different materials and the distinction between restored and existing work, is given in a pocket in the cover of the volume, and forms one of the most valuable items in the book; it should be studied by all who intend to visit this famous site. A similar coloured plan was given with the author's former book, but has been revised and brought up to date for the present publication.

The second volume treats of the *Imperium* of Rome, the *Circi*, *Theatres*, *Baths*, *Tombs* and *Honorary Monuments*, and two chapters are devoted to the water-supply of Rome, and the *Roads* and *Bridges*. These latter are not the least interesting portions of the book. The author reckons the amount of water brought into Rome by the aqueducts as probably 340 million gallons per day. Of course the extensive and constant use of baths necessitated a quantity far in excess of what would be considered liberal for a city of the same size in the present day; but though with

* We are not, however, the worst sinners in this respect among modern nations. To judge from accounts which we have printed not long since of American methods of bricklaying, it should seem that the United States is quite ahead of us in the art of rushing through walling in the quickest way in which a tolerable show can be made on the surface, bond or no bond.

† What is the evidence of this, and of the date of removal? It is not given.

all not see the Roman passion for bathing revived in our day and in this climate, it is well to remember, in connexion with the question of water-supply, that the increasing use of bath-water by all classes is a now constantly-increasing factor in the estimate to be made for the water-supply of a modern English city.

We have been able but to indicate a few of the items of interest in this book, which for its size is one of the most complete treatises the kind ever produced, and is full of information on every page, and can hardly be said to contain a superfluous line. The author deserves the best thanks of all who are interested in the history and monuments of the greatest and most important of ancient cities within our knowledge, for the conscientious and acute observation with which he has treated the subject, and which render his work unquestionably the standard English work on ancient Rome.

DISCOVERIES IN THE ATHENIAN AGORA.

It drew attention in a recent number to the discovery by the German Archaeological Institute, in their excavations during the winter, of traces of the Panathenæic-road and of the aqueduct of Peisistratos, both of the first importance for deciding certain moot points in the topography of Athens, points left peacefully uncertain by the account of Pausanias. Since then a fuller report of these excavations has been issued in the last number of the Athenian *Mittheilungen*, a summary of which may be of use to our readers.

The German Institute began its work at the end of January, with the avowed intention of throwing light on the arrangement of the buildings known to exist in the Athenian Agora. The idea was to begin a line to the east of the so-called Theseion, north of the new railway line, just at the place where, according to Pausanias, the Stoa Sileios (Paus. I, iii., 1) must have stood. Obstacles, however, at once arose; negotiations could not for the present be concluded with the owner of that particular piece of ground, so the excavators, though hoping to return to that point later, have decided to renounce the natural sequence of their work, and begin to the south, between the Areopagos and the Pnyx. Any one walking along the modern road can see, to the right as he comes from "Theseion," traces of an old water-course traced through the Pnyx rock, the purpose of which was obviously to carry water to the ancient market-place. These traces were seen as the starting point for excavation; the problem was to find the continuation of the aqueduct,—whence the water came, and what point in the Agora it was directed. One fountain in the Agora, and one only, is mentioned by Pausanias,—*i.e.*, the Enneakrunos (I, xiv., 1), there is, of course, no presumption,—nay, almost certainty,—that if the goal of the water-course be discovered, that goal is the Enneakrunos.

The first part of the problem is already solved, and to it we have recently drawn attention, and have only now to add a few particulars. To the left side of the modern line the continuation of the rock channel is already visible has been discovered and cleared. It consists of a watercourse constructed of large limestone blocks, and covered in with some sort of masonry. About its direction there is no doubt. It ran, as Dr. Dörpfeld predicted, from the Ilissos Valley along the south slope of the Acropolis. It can be connected unquestionably with the rocky channel described in detail by E. Ziller (Athen. *Mittheil.*, II., p. 112), which runs round the palace garden, and which is now known as a water-course. The character of the masonry of the portion of this water-course which has just now been laid bare shows clearly that it was Greek, not Roman work. It size further makes it certain that in Greek

times it was the source of the chief water-supply of the ancient city.

The excavations have now been finished northward, beyond the point where the traces were visible in the rock. So far it is a little disappointing that no evidence of the continuation of the watercourse has come to light. Continuation, of course, there must have been, as the watercourse could not have ended abruptly in the Pnyx rock. The excavators, however, have found what is almost better, *i.e.*, a substantial ancient road, resting on a supporting wall, built of large stones. This led in a gentle curve through the market to the Acropolis. Its inclination is just of the gradual nature required for such a road. Near this road, a little north of it, there was found a structure of Roman or Byzantine date, which proved to be a cistern with a clay pipe. Beneath this a late Greek or Roman building, with a mosaic pavement; close at hand three marble heads, of Roman date, and a statuette of Hekate came to light.

The excavation of the ground between the ancient road and the end of the rock channel is as yet unfinished. From the elevation of the ground at that point, the fountain may quite well have stood there; the hope of finding the Enneakrunos may still be cherished. Even, however, if it has altogether been destroyed, to make room for subsequent structures, or if it lay too far north or west for the present excavations, the discovery of the aqueduct and of the ancient road is a substantial contribution to Athenian topography, and one for which we have to thank Dr. Dörpfeld, who predicted the lie of both lines before the excavation was begun. This may plainly be seen by the plan of the agora issued in a recent work on Athens ("Mythology and Monuments of Ancient Athens," p. 3), based on Dr. Dörpfeld's conjectures. The Panathenæic road followed by Pausanias is here made to pass round the west of the Areopagos, whereas in every previous plan it was made to pass east; the western position is now conclusively proved.

We have elsewhere given from the Athenian *Mittheilungen* some detailed account of the excavations in the Agora at Athens. Since writing this account, we learn from a note in the *Athenæum* of March 26 that the hope there expressed of the discovery of the site of the Enneakrunos has been practically fulfilled. The excavations have been pushed a little further north and west, and Dr. Dörpfeld has come across three terminal stelæ, inscribed, ἑνὸς λέκτους,—one of them in archaic letters of at latest the early fifth century, the others about the beginning of the fourth. Close at hand is a small building in the form of a \square , and in front of it an altar. This must have been a small temple-like building in some relation to the Enneakrunos. That the Enneakrunos really was here is clearly shown by the fact that all about the building are water-conduits leading in various directions, and their masonry shows them to have dated before the Persian wars. The small original building seems to have been superseded by another structure, which served as a *lesche*,—a very natural appendage to a large public fountain.

NOTES.

THE clearest exposition that has been given of the effect of the new maximum railway rates,—so far as they are at present settled,—is to be found in the report of the Mansion House Association on Railway and Canal Traffic, which has recently been issued. Numerous comparative tables are given, a complete copy of the new classification, and all necessary information as to the charging powers of the companies; together with a summary of the advantages and disadvantages of the new Acts as compared with the old. The conclusion is that, so far as the general conditions are concerned, they are, on the whole, favourable to the traders; while,

with respect to classification and the maximum rates and charges for all classes of traffic, the decisions of the Joint Committee are regarded as equivalent to an emphatic condemnation of the railway companies' proposals. It is remarked that this goes to prove that the opposition of the traders has found ample justification; and to this it might be added that the energetic body presided over by Sir James Whitehead may be congratulated upon their share of the work. In spite of the oft-repeated declarations of the railway companies that they had no intention of disturbing their rates where they were found to be within their statutory powers, we believe that on most lines a completely new set of rates will be put into operation as soon as practicable after the date fixed by Parliament; and that, in respect of some classes of traffic, the system of charging will be entirely different from that now in force. In view of this probability, the information given in the report referred to will be of great value to members of the A. Association, as the powers of the companies are defined in a manner at once clear and concise. The Bills of the North-Eastern and some twenty or thirty other lines are now under the consideration of a Joint Select Committee of both Houses of Parliament, and will probably be disposed of this Session.

WE are very glad to see that the London County Council, at its meeting on Tuesday last (reported in another column), resolved to make application to the Railway Commissioners for an order calling upon the London, Chatham, and Dover Railway Company to carry out such works at the Walworth-road Station as will render it adequate to its great traffic, and will put it into a safe and sanitary condition. The state of this station has been a scandal for twenty years; repeated remonstrances of passengers have received little attention until lately, when the Company condescended to erect some 60 ft. or so of cover over No. 1 platform. The staircases are steep and dangerous, and, from the multitudes who are forced to descend them, the station was long ago not inappropriately nicknamed "the Shoot." If the County Council can succeed in compelling the London, Chatham & Dover Railway Company to improve Walworth-road Station, there are other stations on the metropolitan extension of the line that may also be taken in hand.

IN reference to the proposed destruction of Wren's Library at Lincoln, the following letter was read by the chairman, Dr. John Evans, at the meeting of the Society of Antiquaries last week, being the reply of the Dean of Lincoln to a protest from the Society against the removal of Wren's building:—

The Deanery, Lincoln,
March 19, 1892.

The Dean of Lincoln begs to acknowledge receipt of Mr. Milman's letter and enclosure. The Dean and Chapter are acting under the strongly-expressed opinion of their highly-competent architect, Mr. Pearson, and they have no doubt that his judgment is right in the matter. The Library will not be destroyed, but re-erected in a far better situation and made more available for its purpose, which is to hold books and encourage study. They have reason to believe that for lack of proper accommodation they have already lost a most valuable legacy of books.

It is, moreover, to be remembered that the cloister existed for 400 years before the Library, and there is ample evidence in the other three walks for the restoration of the fourth, of which, indeed, traces still remain.

H. S. Milman, Esq.,
The Society of Antiquaries of London,
Burlington House, Piccadilly, W.

Thereupon it was moved by Mr. Higgins, seconded by Sir J. Charles Robinson, and carried unanimously:—

"That the Society of Antiquaries of London, having heard the Dean of Lincoln's reply to the Resolution passed by the Society at its meeting of March 17, desires to point out that the competency of Mr. Pearson as an architect, which the Society does not question, affects in no way the point at issue, *viz.*, whether it is proper to demolish a piece of architecture of undoubted historic interest and of considerable beauty to make way for a presumed

reproduction of a building which has long since disappeared, and thus to destroy a portion of the history of an important national monument;

That it is quite clear from an inspection of the plans of the cloister and adjacent buildings that ample room might be found for the extension of the library without interfering with the present buildings;

That this is the only example of a cathedral cloister of post-Reformation date in England;

And that for these reasons the Society views with the greatest possible concern the proposal to remove and thus practically to destroy this interesting example of the work of Sir Christopher Wren."

THE case of Nickalls v. Briscoe, which came before Lord Penzance, the Dean of Arches, on appeal from the Chancellor of the Diocese of Rochester, is one of more than merely ecclesiastical interest. A gentleman desired at his own expense to place a new stained-glass window in Watfield Church. The "faculty" allowing him to do so was issued by the Chancellor of the Diocese, though it was opposed by the majority of parishioners, not on any tangible grounds, but because the donor was suspected of a leaning towards Ritualism. The window was characterised by Lord Penzance as being "handsome and artistic, of appropriate design and good taste." It was also, in his opinion, an improvement to the church. It was therefore clear that the faculty was properly granted, unless the fact that the majority of parishioners were adverse to the change was a valid reason against it. But, said Lord Penzance, "if a majority of parishioners is to eettle the question, what becomes of the discretion,"—that is, of the Bishop? Clearly the mere wish of the majority could not prevail unless supported by valid reasons. That it is doubtful policy to force, so to say, a gift on an unwilling parish may be granted, but it is well that parishioners who object without real grounds to changes in their church should understand that a mere negative unsupported by reasons is not sufficient.

YET one more "overcrowding" case is entitled to a passing allusion, in fairness to the railway companies. Last week, at Wolverhampton, a passenger was fined 10s. and costs for travelling in a second-class carriage with a third-class ticket. The defendant in this case was a season-ticket holder,—one of the class of whom it was said at one of the recent half-yearly meetings with somewhat severe sarcasm,—that "in consequence of paying in advance they consider themselves sole proprietors of the company's rolling-stock." The action was brought by the London and North-Western Company, and the defendant did not contend that there was not sufficient third-class accommodation, but that all the third-class smoking-compartments were full, and that he consequently got into a second-class smoking. This places the matter on a different footing from the other cases to which we have recently alluded, and the conviction scores one to the railway companies. Season-ticket holders are looking after themselves just now, and it seems that the companies are looking after them, too.

THE Staffordshire County Council have set a good example in the conditions for the competition for their proposed new County Council buildings. They have not only offered the liberal scale of premiums of 150*l.*, 100*l.*, and 50*l.*, for a building which is only to cost 18,000*l.*, but they also state that the architect who receives the first premium will be employed as architect to the building, and that his commission on the usual scale will be paid in addition to the premium, instead of the too common practice of deducting the amount of the premium from it. This is really the only fair way to treat the architect in such a case, as the premium in almost all competitions affords no more than the barest return for the time employed, and it is inevitable that fresh drawings have to be made for the actual working out of the building.

IN the last issue of the *Athenian Mittheilungen* (xvi. 4, 1891), which has just appeared, Dr. Paul Wolters publishes some fragments of a "Loutrophoros" which, besides the importance of their subject, have a melancholy interest as having been the chief "find" in the very last excavations conducted by Dr. Schliemann in a piece of ground close to the new building of the German Archaeological Institute—ground, it will not be forgotten, that belonged to the great excavator himself. The Loutrophoros, or, to give it its nearest English equivalent, "holy-water carrier," in question is one of the well-known shape, with the long, slender neck and high handles. On it is represented a ekle, standing on two steps, on one of which is lying a broken lekythos. Close at hand, on a low basis, is a youth riding a horse. The fact that the horse stands on a basis is painted white instead of being the natural colour, shows that the horse is a monument and the rider the dead man. Three other youths are grouped about representing living visitors to the tomb. Dr. Wolters takes occasion to discuss the whole class of loutrophoroi. They are of great interest, as we know from a passage in Demosthenes (c. Leoch. § 18), that they were placed only on the grave of the unmarried—the orator uses it as *proof* that a certain man (Archibades by name) died unmarried, that a loutrophoros stood on his tomb. They were used in marriage ceremonies for carrying water, and hence placed on the grave of the unmarried by way of compensation, perhaps, for the blessing missed. The actual terra-cotta vase was temporarily set up and later replaced by a stone copy.

THE many old-fashioned almshouses built along the Mile-end-road, and by Stepney-green, are being gradually removed. The Drapers' (John Pemel foundation) has disappeared from what was known as the Stone Bridge, Bancroft's has given place to the "People's Palace," and now the Skinners' Company invite tenders for the purchase of their freehold building-site on the northern side of Mile-end-road, in St. Dunstan, Stepney, parish. The ground, having a 51-ft. frontage to the road, covers 10,850 sq. superficial. The twelve one-storied cottages are built in two rows, with a chapel and garden at the further end. Over the gate are a carving of the Company's arms and two little figures of cripples,—these, together with the cistern, door-knockers, the pulpit and woodwork in the chapel, the two inscription stones, and other similar objects, the Company wish to retain. A modern painting of these almshouses is at Skinners' Hall: they make a pretty picture. One of the inscriptions sets forth that they were built in 1688, in the mastership of Benjamin Alexander; the other stands thus:—

The GIFT of
MR. LEWIS NEWBURY
BUILT BY
THOMAS CLOVER, Esq.
his Executor committed
to the Management of the
COMPANY OF SKINNERS
LONDON.

On March 21, last year, we called attention, in a "Note," to the proposed pulling down of this Company's almshouses, founded by Sir Andrew Judd, in Great St. Helen's. Next, eastwards of their almshouses in Mile End-road, stands a handsome and larger property. "THIS ALMESHOUSE / wherein 28 decay'd Masters & / Comanders of Ships, or y^e Widows / of such are maintain'd was built / by y^e Corp^s of TRINITY HOUSE / AN. 1695." On the grass-plots are statues of two benefactors,—Captains Robert Sandes (1721) and R. Maples (1680). The older buildings, of red brick, and two stories high, are very little changed from what they were in the time of S. Gribelin's print; but an extensive addition has been made behind the chapel, upon the removal, in 1875-6, of the hospital at Deptford. The buildings are richly ornamented with carved work, coats-of-arms, the models of four ships, &c. Then again, a few yards further east, are the

Vintners' almshouses, originally founded in Viutry Ward in 1357, erected here in 1676, and re-built, with extended benefits, under the will of Benjamin Kenton, citizen and Vintner, in 1802. Close by stood another set, which, with one at Hoxton, was established under the will (1592) of Judge Fuller, of Stepney parish. The Mercers' almshouses, on Dame Mico's foundation, were built in 1691, near to St. Dunstan's Church.

CONSEQUENT upon the death of Sir J. Pope Hennessy, M.P., a historical property is about to be sold. It is the house at Youghal, county Cork, which Sir Walter Raleigh built for himself in 1587-8, and is known as Myrtle Grove. The grounds, about five acres in extent, had long been famed for their plantations of yew, bay, myrtle, and arbutus trees. It was on a hill behind the town that Raleigh is said to have first planted the potato. The greater part of his estates here passed to the Boyle family, some of whom, together with Richard, first Baron Boyle, of Youghal, Earl of Cork, who migrated hither from Hereford, *temp.* Elizabeth were buried in Our Saviour's Chapel of St. Mary's Collegiate Church, founded for Dominicans by Thomas Fitzgerald, circa 1370. Here, too, they set up monuments to Sir Edward Villiers, Viscount Grandison (1636), the popular governor of Munster province, a half-brother of George, first Duke of Buckingham, and grandfather of Barbara, Duchess of Cleveland; and to Roger Boyle, the Lord Broghill of Cromwell's day. King John gave a charter of incorporation to Youghal in 1209; a few years later Lord-Justice Maurice Fitzgerald established a religious house of Franciscans, the oldest, it is said, of the order in Ireland. Raleigh's house is a good example of the Domestic Elizabethan style, and, whilst containing some modern windows, is well preserved.

THE volume of the *Transactions of the American Society of Civil Engineers* for last November contains a paper written by Mr. Ward Baldwin on the stresses on "Railway Bridges on Curves." The author gives several general formulae, from which the effect of the side-pressure on such structures can at once be calculated. This side-pressure due to centrifugal force, is considerable, and produces a very appreciable effect. As an example of this we may take the case of a train passing over a bridge of 100 ft. span and at the same time round a curve of 1,000 ft. radius. With a speed of 40 miles per hour there will be a uniformly distributed horizontal pressure developed along the bridge of 16 tons. The same volume also contains an interesting paper by Mr. William A. Saunders on "Dimension Stone Quarrying." The Knox system of blasting is only a recent invention, but it is rapidly growing in America and is being much adopted. Its purpose is to release dimension stone from its place in the bed by so directing an explosive force that it is made to cleave the rock in a prescribed line and without injury.

ON the 12th instant will be offered for sale at the Mart, a freehold building-site of some 51,800 ft. superficial, until lately occupied by the Artillery Brewery, Westminster. That property, including the "King's Arms" has frontages to Victoria-street and Strutt's ground. The sale will extend to an adjoining plot, of about 4,000 square ft., held in Michaelmas, 1904, at a reserved rent of 4*l.* per annum. Thus long has been preserved memory of the time when the men of St. Margaret's would rally forth to practise in the butte set up there by the parish in compliance with Queen Elizabeth's ordinance. The vestry accounts for the sixteenth and seventeenth centuries contain many entries: divers sums paid for cleaning "pairs of harness," daggers, and bills; to men "wearing the same harness" on muster-day for powder and shot, and so on. John Loel mentions (1679) shooting with the long-bow.

and stob-hall, in Tothill-fields; and Steele, in the "Tatler" says:—

"You shall have a fellow of a desperate fortune, or the gain of one half-crown go through all the dangers of Tothill-fields, or the artillery-ground"

In 1720 this artillery-ground covered a space of about 300 ft. east to west, and 400 ft. north to south. The northern portion, which was against Palmer's Alms-houses,—removed seven years since to Rochester-row,—is now traversed by Victoria-street. According to some old maps, encroachments appear to have been begun towards the end of last century, but some of the field, westwards of rutton-ground, is yet shown as open in

Horwood's supplemental map, fourth edition, of 1819. Strutton-ground comprises Stourton House, a home there of the Lords Dacre of the South. Artillery-row, Chiswell-street, Artillery lane and street, Hatfields, and Artillery-street, Horsely-down, still remain elsewhere in evidence of a fellow citizens' bygone military exercises. The site in part of Palmer's Village, close to that under review, has been taken for ad-quarters in James-street of the Queen's Westminster and of the "London Scottish" planters, those for the latter being planned and designed (1885) by Mr. John Macvicar Anderson.

TWO vacant houses on the eastern side of Panyer-alley, Newgate-street, with their es, upon an eighty years' building lease, are offered for sale. Their removal will interfere with the position of the old sign, carved in stone, representing a naked boy seated upon a pannier or basket, and holding a staff; it is commonly taken for a hunch of apes, together with his foot, in one hand. Beneath is an inscription which says that the site is the highest ground in the City; lowered by the date August 27, 1688. The sign, once vulgarly known as "Pick-my-toe," stands on the pavement level; half of it is bedded in the wall of one of the two houses. This property appertains to an old man formerly known as the parish clerk of St. Michael-le-Querne.

SOME years ago the Mortuary Chapel of the Sick Children's Hospital in Edinburgh was decorated as a labour of love by Mrs. Traquair. The same artist has now completed a much more important work of art decoration at the Cathedral Soag-nook, on which she has been engaged since 1888. The Mortuary Chapel, a tiny room which has been spared in the recent demolition of the hospital, is an essay full of life, with much suggestive treatment, considerable imagination, and, on the whole, pleasingly good colour. It is very pleasant to note that this former promise has been well filled, the later, and much more ambitious work showing advance in every way. The Soag School is a sober Gothic building by Rowand Anderson, a somewhat commonplace adjunct to Sir Gilbert Scott's prosaic Cathedral. The whole of the interior from the doorway to wall-head has now been decorated in part by Mrs. Traquair, who has taken as her theme the canticle "Benedicite Omnia terra." The work is thus of considerable gaitude and importance, on a wholly unimportant scale of effort from the diminutive scale. Yet of the two it is the more successful; both intention and execution are marked advance; the indefinable sense of being amsteur work is greatly lessened; colour is stronger and richer; faults in drawing are less obtrusive; and the creative imagination is both fuller and more certain. In these qualities of decorative sense and appropriate imagination, Mrs. Traquair excels; the rendering of her theme is fresh and modern, quite free from the stock-in-trade symbolism of well-worn types at such as the square yard; the whole has a delicately been a labour of love and staneity, and the procession of praise bodying the works of the Lord, praising

and magnifying Him for ever, is full of interest and charm. Especially noteworthy is this modern spirit in the groups representing the "Powers of the Lord," the "Servants of the Lord," and the "Spirits and Souls of the Righteous," in which are introduced portrait heads of the great men of to-day, from Browning, Carlyle, and Watts, to Cardinal Newman, Father Damien, and General Gordon; the cathedral clergy and the choir are gracefully introduced, as also the workmen engaged upon the building. Faults, of course, there are, particularly in drawing. Mrs. Traquair is much stronger at ideal heads than at suggestive portraiture, and she is rarely successful with the "hasts of the field"; she lacks architectural and constructional knowledge, her architecture being more suggestive of missal-illumination than of structure. But, taken as a whole, the St. Mary's Long School is a remarkable piece of work, of great merit and much charm. It is an addition to the art-possession of the city, and may be looked to with confidence to exercise strong influence for good on local decorative work.

THE thirty-ninth Exhibition at the French Gallery in Pall Mall, which was opened to the public on Monday, contains a remarkable work by Professor Von Uhde, who, as our readers will remember, has devoted himself a good deal to the treatment of subjects of New Testament history in a realistic spirit. It is called "Der Heilige Abend," (43) and represents a desolate snow scene on a winter's evening; in the foreground stands a poorly-clad young woman, the mother of the Christ who is to be born, leaning against a fence, while in the distance Joseph, a labouring man, is seen going off to the village to look for lodgings. Strange as is the contrast to the usual method of treating such subjects pictorially, it is impossible to deny that Von Uhde comes nearer to the simplicity of the New Testament narrative than most of the more conventionally "religious" painters. There is a true pathos in the picture, and the pictorial effect of the scene is fine and true. Fauvel's large landscape, "Les Fonds de Beaurepaire" (60), is out of place in so small a gallery, and cannot be fairly judged of except as to the fine drawing of the landscape; his smaller work, "Sheep Pastures, Brittany," can be appreciated better, and though the texture of the landscape is somewhat peculiar and crude, nothing can exceed the care and truth with which the effect of the light and shadows on the hills is rendered. The exhibition includes a small number of works by deceased artists,—Dupré, Daubigny, Corot, Millet, Rousseau, and Troyon. The larger of the three Corots, "Le Clocher de St. Nicholas, près Arras" (15) is an exquisite work, one of the most beautiful in sentiment and balance that we have seen; it is a woodland scene really, the tower only coming in in the distance and serving to give a distinctive name to the picture. Rousseau's real genius is best shown on a large scale, his small works here do not do justice to him. There is a fine little work by Georges Michel, "Outskirts of Fontainebleau" (7). Millet's "L'Amour Vainqueur" (25), which we have seen before (unless this is a repetition) shows a quality of design and composition which this painter did not often display. Among other noticeable works are Professor Seiler's "A Critical Move" (34), admirable both in the painting of costumes and accessories and in the expression of the figures; Joaowich's "Servian War Dance" (39), spirited enough in action; Poetzelberger's "The Well-known Footstep" (52), a beautifully painted interior with a figure looking through the window; C. Probst's highly-finished little scene "A Hard Bargain" (63), and Professor Firl's large painting, "A Rehearsal" (71) a very clever work in which a young woman is singing to the accompaniment of another who is seated at a piano facing the spectator. The intense and rather puzzled expres-

sion of the player, who apparently finds the music difficult, is admirable, and the whole scene pictorially effective, except that the piano forms rather an awkward mass of dark on the right of the foreground. This and other paintings here, however, are somewhat large for the scale of the room; the exhibition was originally supposed to be *par excellence* an exhibition of cabinet pictures, and had better be kept to that.

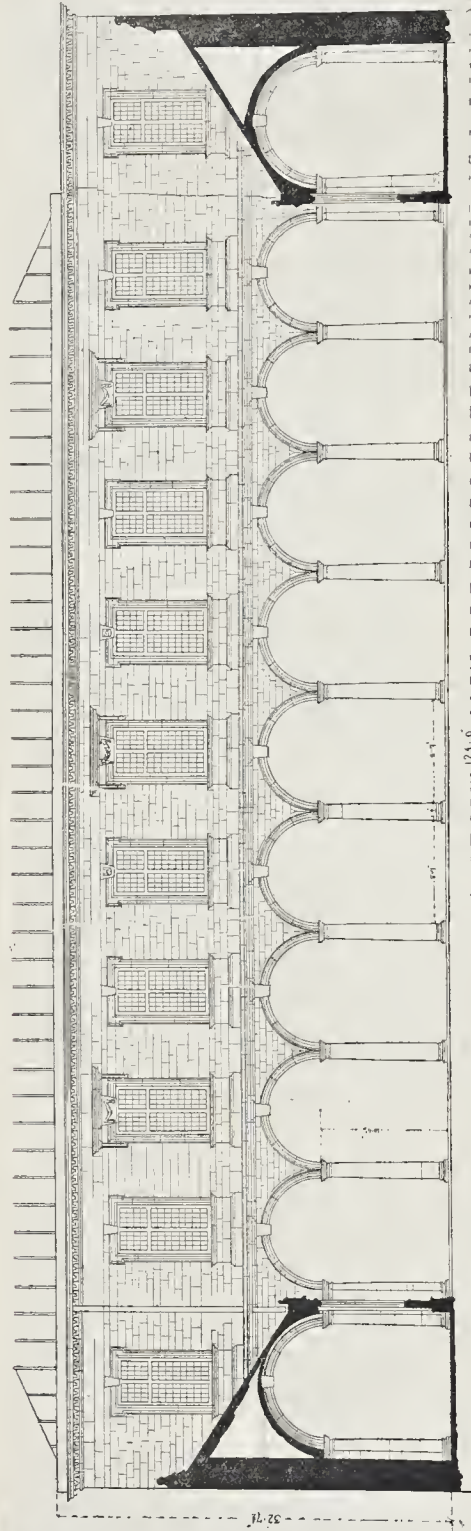

IT is difficult to believe we live in the nineteenth century when we read that the Committee of Visitors of the Northamptonshire County Asylum recently gravely marched after one Mr. John Mullins, who calls himself "Water Discoverer" by means of the Divining Rod," whilst this individual walked about the grounds to see where his twig would point to the presence of water. If some inmates of the asylum had amused themselves in this manner we should not have been surprised. Curiously enough, this divining-rod nonsense is still believed in by some worthy persons who ought to know better, though it is exceedingly difficult to understand the character of such persons' minds, or of what, as the late Lord Westbury would have said, they are pleased to call their minds. But that a body of presumably competent business men should go through this comedy would not have been believed, were it not apparently, according to the reports of the newspapers, actually a fact.

WE must enter a protest against a system which has come into favour in daily journals, of quoting passages from publications possessing special information, with only an ambiguous reference to the paper from which the paragraph is taken, leaving the reader to infer that the bulk of the matter is original and not quoted. We have just been favoured with an attention of this kind on the part of the *Globe*, which a few days ago quoted a long paragraph from an article in the *Builder* of March 19 on "Steam rolling on Main Roads," merely introducing towards the end of the paragraph a parenthesis, "as *The Builder* points out," leaving the reader to infer that the rest of the paragraph was original matter. It must be obvious that the intention of this disingenuous system of quotation (?) is to produce this confusion of *meum* and *tuum* in regard to literary matter, and that it has that effect is proved by the fact that the paragraph in question has actually been quoted in a country paper as an extract from the *Globe*, though every word of the matter is from our columns. We prefer not to say all we think about this system of "quotation," which is not a creditable feature of modern journalism, but we may observe that publications which indulge in it at our expense will be likely to hear more about it.

SIR CHRISTOPHER WREN'S LIBRARY AT LINCOLN CATHEDRAL.

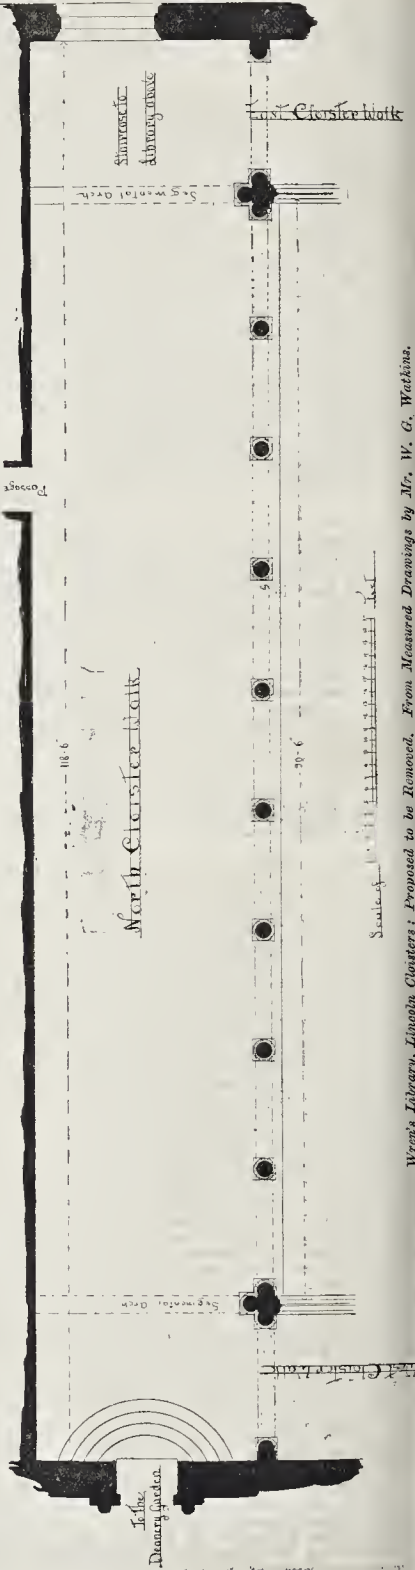

THE attention recently directed to Wren's Library at Lincoln Cathedral by the scheme proposed for taking it down and re-erecting it on another site, according to a plan of Mr. Pearson's, on which some criticisms were passed in the *Builder* for March 12 (p. 202), will, we think, render some account of the building interesting at the present time. We are fortunate enough to be able to give a copy of the articles drawn up in 1874 between the Dean, Dr. Michael Honeywood, who not only supplied the funds for the erection of the library, but provided it with books, and the builder he employed, which, from the extreme rarity of documents of the kind of so early a date, possesses no little value.

The library of Lincoln Cathedral is almost coeval with the Cathedral itself. But it was a library in the sense of a collection of books, not of a room for housing them. For the safe keeping of the small collection of MSS. volumes which formed a Cathedral library in its earlier years, a strong, iron-bound chest, under lock and key in a closet (*armarium*, Fr. *armoire*) was quite sufficient. The chest or cupboard would

and in the treasury, or in some other strong place where it would be secure against theft or fire. A long course of years usually passed before the hooks outgrew these narrow hounds and required a separate chamber for their lodgment. The earliest catalogue of the Lincoln library, dating from the middle of the twelfth century, speaks of the hooks, not more than thirty in all, being kept in a cupboard "in armario," under the charge of the Chancellor, the literary officer of the chapter.* The nucleus, elsewhere, was a copy of the Holy Scriptures according to the Vulgate translation. It was two volumes, and, as a contemporaneous entry at the head of the first page testifies, it was the gift of Nicolas, the first Archbishop of Huntingdon, who was appointed Remigius, the earliest bishop of Lincoln, and died about 1109. The name under which it is entered in the catalogue, written on the first fly-leaf of the volume, is not "Biblia," the earlier title, found in the writings of Rome, describing its composite character, Bibliotheca, "the Divine Library,"—not one book, but many. Of the two volumes, the second has, unhappily, been lost for several centuries. The first is still in the place it has occupied for nearly eight centuries, a huge folio vellum, recently rebound in strong oak boards in the workshops of the British Museum, and preserved with all the care due to so precious a relic of antiquity, the germ from which the present library, with its thousands of volumes, has sprung. Some twelve of the forty volumes in the twelfth century catalogue are still on the shelves of the library. All belonged to patristic or canonical literature, with the exception of Virgil, Eutropius, Vegetius, and Isidore. There was also a "Mappa Mundi," which it would have been interesting to compare with that still existing at Hereford. But it is gone. The catalogue also particularises

the gifts of later donors. Bishop Alexander, "the magnificent," Bishop Chesney (five of whose hooks are still in the library), and others, including Giraldus Cambrensis' "Topography of Ireland," given by himself.*

Where the hooks were kept after they outgrew the limits of the original "armarium" is not known. Towards the middle of the second decade of the fifteenth century, c. 1420, we find notices of a new library, "nova libraria," being built. Bishop Repynodon, after his resignation of the See in 1419, gave a hook, "Petrus de Aureolis"—which, subsequently, somehow found its way into the Royal Library, and thence to the British Museum.—"to the new library to be built within the Church of Lincoln." Thomas Duffield, formerly Chancellor, who died in 1426, bequeathed another hook, "Nova Libraria ejusdem Ecclesie." We may, therefore, safely place the erection of this "new library" between 1420 and 1426, a date with which the portion still remaining, forming the vestibule to Wren's Library at the east end, perfectly agrees. It was a long, low room, built, as at Wells and Salisbury, over the eastern walk of the cloister, running north and south, and approached by a newel staircase from the vestibule of the Chapter House. The existing fragment is a very good plain work of the period, with a timber-framed roof, having the tie-beams slightly arched and struts, the intersections of the rafters being ornamented with boldly-carved bosses of angels and foliage. At a later period,—tradition fixes it in 1609,—the library suffered from fire, of which the charred remnants of some of the MSS. are as evidence. What was the extent of the damage done to the building and its contents we have no certain knowledge. Few books, however, seem to have perished, as the greater part of those enumerated in the second extant catalogue, c. 1450, which were, of course,

exclusively MSS., are still in the collection. From a view taken by Lumby, the cathedral surveyor, in 1784†, supplemented by the Chapter accounts,† the damage would appear to have been made good in a mean and inexpensive fashion with timber and plaster and small casement windows, continued southwards over the east walk of the cloisters up to the Chapter House. This poor, patched-up building served as the Cathedral library till the latter part of the seventeenth century, when, on the Restoration of the Monarchy, Bishops and Deans, almost universally, set about vigorously redressing the havoc made in their cathedrals by the Puritan fanatics. The Chapter of Lincoln was then presided over by Dr. Michael Honeywood, appointed Dean Oct. 12, 1660. He had been a Fellow of Christ's College, Cambridge, while Milton was a student there, and Henry King ("Lycidas") a brother Fellow. At the beginning of the Parliamentary Wars, Honeywood retired to the Low Countries, where he resided, chiefly at Utrecht, during the Protectorate, devoting himself to the collection of books, of which he amassed a huge store, amounting to between 4,000 and 5,000 volumes. The whole of these Dean Honeywood presented to his Cathedral, and there being no adequate place to receive so large a collection, he determined, at his own expense, to erect a building to receive them.‡ The place selected for the new building

* Now in the possession of Alderman P. F. Dickinson, of Lincoln.

† The Cathedral accounts give the following estimate: 1783, "Taking down ye old library, i.e. the timber side and end, Hoard Floor, Joist, and Roof, £2. 6s.; making good the roof up to the Front of the Library Wall, same pitch as the Cloister Roof, £4. 6s.; taking down the old Stairs, strings, and Banisters, 14s.; two shed partitions, £2. 18s.; two new window frames, £1. 3s.; Roofing and ceiling joists, £5. 12s. 6d.; Putting up old Stairs, £6. 10s.

‡ Honeywood's epitaph on the mural monument now at the east end of the south aisle of the nave contains these words, "Monumentum abli cum libris datarum ponit, utpote qui claustru hujus ecclesie dilapsu in latere extracto prius, sumptibus suis non exiguis, Bibliothecam eam postea libris nec parvis nec vulgaribus locupletavit."

* This catalogue, written on the first page of the Vulgate, which was the first book of the library, begins as follows:—"Quando Hamou cancellario cancellaria data est, et illorum cura commissa, nos in armario inventi res." Hamou was Chancellor from 1160 to 1183.

* This, which is one of the earliest known catalogues of a Medieval library, is printed in the Rolls edition of "Giraldus Cambrensis," vol. vii., pp. 165-171, with notes by the late Prebendary Dimock. It will be found of great interest.

was the north alley of the cloisters, originally erected under Bishop Oliver Sutton, in 1296, which, through faulty construction, had fallen down, and had lain in ruins for a long period. For the erection of the new library, he called in the services of the great architect of the age, Sir Christopher Wren, who, naturally, we may almost say, necessarily, designed it in the Classical style, which was then in possession of the field. Wren's library, which comprises the whole north side of the cloister, as the accompanying illustration shows, consists of an arcade of nine semi-circular arches, with uncarved keystones, supported on eight Roman Doric single columns, with a clustered pier at each end, where the arcade joins the walls of the other sides of the cloister. The upper story, or library proper, has eleven windows of the Classical type, rising from a slightly-projecting plinth, set in moulded window-cases, that in the centre of the range, and two of those on either side, being further decorated by a cornice supported on consoles, and having a wreath of flowers over the centre window, and drapery of a corresponding form over these on each side. The keystones of the windows right and left of the central window bear the arms of Dean Honywood, a chevron between three cocks' heads, erased. The windows are casements, with the customary upright and horizontal wooden divisions. The design is finished with a bold entablature, ornamented with acanthus leaves. The bay at the north end (where a break in the masonry is indicated) represents the remaining fragment of the fifteenth century library, refaced to correspond with the other portions. This refacing appears to have been done nearly a century later, when the old library over the east cloister was taken down. A different stone was employed, and, as the elevation shows, the blocking-course was omitted. The old library being so much lower than the new, the upper part of this bay is a mere screen wall, and the upper part of the window is blocked, sham Gothic casements being framed within. On the outside of the west end of the cloisters, opening towards the Deanery, is a portal, under a compass pediment, supported on Roman Ionic columns, the capitals much mutilated. Above is a window of the same character as the others, but of larger dimensions and more richly ornamented, bearing Dean Honywood's arms.

Within the library forms a long, narrow apartment, 104 ft. long, by 17 ft. 6 in. broad, and 14 ft. high. The ceiling is flat, springing from a hollow cove, and perfectly plain. The room is lighted by ten windows in the south wall, and one larger one at the west end. The entrance is by a richly-ornamented portal at the east end, the jambs of the door case carved with acanthus leaves, and surmounted by a compass pediment supported on Corinthian columns with gilt capitals. In the centre of the pediment is a shield bearing the arms of the founder. The same stately design is repeated at the west end, a window occupying the place of the door. According to Wren's plan the shelves for books occupied the whole of the north wall, the other walls and window jambs being wainscotted. This arrangement afforded sufficient accommodation for the books given by Honywood, but with no room for subsequent additions. To receive these, shelves corresponding in form and arrangement to Wren's have been set up between the windows along the south wall. This must be acknowledged to be a very inconvenient position, as no light falls on the backs of the books, and, the eyes being dazzled by the bright light coming through the windows, it is by no means easy to read the titles. In the libraries of earlier date, the books universally occupied cases running into the room, at right-angles to the walls, between the windows. The windows being on both sides, this plan afforded sufficient light for every shelf, but the cases being usually low, the accommodation for books was not large. Wren appears to have been the first to adopt the arrangement which has, since his time, been almost universally followed of shelves along the side-walls. It is commonly said that the library of Trinity College, Cambridge, was the first in which this new arrangement was introduced. But as that was not begun till 1676, nor completed till 1689, the Lincoln library, which was commenced in 1674, affords an earlier example. The book-cases rise the whole height of the wall from a plinth 3 ft. 2 in. high, which may have originally contained cupboards, but which now is filled up with shelves. They are

set in compartments, wider and narrower, of two and three divisions alternately, the whole being finished with a bold entablature running all round the room, decorated with acanthus leaves and the egg-and-dart moulding, broken in the middle of each compartment with a gilt bracket bearing a grotesque mask, below which is a tablet on which are inscribed the languages to which it was intended that the compartment should be devoted. Of these two were for manuscripts, two for Greek books, nine for Latin, one for Latin and English, five for English, one for English, French, Spanish, and Italian, one for Italian, German, Flemish, Dutch, one for Saxon, Irish, Welsh, Russian, &c. These titles indicate the breadth of Honywood's book-collecting avidity and the varied riches of his collection, which it is stated on a tablet over the doors, amounted to 4,451 volumes. The furniture of the room in the main is of Wren's time, and was probably designed by him, as that at Trinity College Library certainly was. It consists of sturdy oak tables, with moulded legs, strongly braced at the bottom, of different sizes and heights, and provided with drawers with quaint bronze handles. The sitting accommodation consists of high-backed arm-chairs, which can hardly claim Wren as their designer. The table, of which a drawing is given, is earlier than Wren, being an example of Jacobean work. The most noteworthy objects in the library are the magnificent oak desks, which evidently belonged to the old library, and which afford an excellent example of the ancient arrangement for chaining books in medieval libraries. Unhappily, these have lost their chains, and a wooden rod has been substituted for the iron rod to which they were attached, while only cavities in the wood show the position of the hasps and locks which fastened the rod in its place. They are described by Mr. J. W. Clark, in his "Architectural History of Cambridge," as "provided with two shelves, a broad one below and a narrow one above the sloping portion,"—or desk,—“on either of which the books could be laid when not in use. The bar passes through the standards,”—which are of considerable height, and resemble the poppyheads of church stalls,—“at about six inches above the top of the desk.” The arrangements for opening and shutting the casements and securing them open are very interesting. But they will be better understood from Mr. Watkins's sketch than from any description.

The erection of the library having been undertaken by Dean Honywood entirely at his own

expense and under his own direction, the building accounts do not appear in the capitular records, nor, strange to say, is there any allusion to this noble gift in the chapter acts.

The following document, already referred to, which gives the terms of the contract between the Dean and the builder employed by him, is taken from a transcript made by the well-known Lincoln antiquary, Mr. E. J. Willson, recently purchased by the Dean and Chapter. Mr. Willson does not state whence he derived it, and the original has been searched for in vain among the muniments.

Articles agreed upon and made between Dr. Michael Honywood Deane of the Cathedral Church of Lincoln of the one part and William Evison of the City of Lincoln of the other part. Jan. 2, A.D. 1674.

Imprints the above-named William Evison doth for himself covenant and promise that he will before the feast of St. Martin Bp. next ensuing (Nov. 11) raise up and build a range of buildigs designed for a Library and cover it with timber and lead, which will take up the whole length of the north side of the Cloyster adjoining to the said Cathedral which North side is now ruined, and that this building shall contain eighteen foot breadth within according to Sir Christopher Wren's directions and Mr. Tompsons modell, which it shall agree with and equal in all things therein specified; having one upright stone wall of the same height and consisting of the same number of stone pillars and arches and which pillars shall not have less (sic) than in the same modell contained and that the whole building shall be made according to the same modell and directions in all things, excepted or thereunto in these articles hereafter excepted.

2. He doth also covenant and promise that he will bear all the charges of glazing as well lead as glass and all the charges of Iron with Iron bars for the Windows, and whatsoever other Iron works the building shall be judged to require.

3. And that he will make the lead wherewith the roof is covered of the better & softer sort of lead and of substance enough to weigh seven pounds in each square foot.

4. That he converts to his own use in this building now (sic) of the stone of that ruined wall that is to be pulled down but only that which is no carved nor moulded & so employ what is allowed for his own use nowhere but in that building; and that he may have that parcel of lead that remains of the roof of the North Cloyster and joins to the floor and stairs and boards under the lead, which should be at least an inch thick, and the two board doors, and that all the rest of the wood and timber shall be Oak and that of the better sort and well seasoned.

LETTER FROM PARIS.

It is fortunately very rare to find a genuine artist becoming the principal actor in a sanguinary drama, and quitting the pursuit of art to sit in the criminal's seat in the assize courts. Some years ago, however, the sculptor Baifer stabbed a Republican deputy who did not realise his political ideal, and now another sculptor, Lecrenx, who under the pseudonym of Jacques Frame had obtained a certain notoriety, has made a murderous attempt on the life of an arbitrator of the Tribunal of Commerce. He is a typical specimen of the Bohemian class, who in 1878, in conjunction with one of his friends, Charles Ganthier (recently deceased), produced a bust of "La République" which he wished to have accepted as the official type of this head imposed by the Government on all its documents. The work had no artistic value, and could not be compared with the bust by Gautherin, the least bad production of the kind so far. From the time when he failed in this attempt he seems to have given himself up to dissipation and intrigues, terminating in a crime which seems to have been the result of an utterly disordered intellect. It is not the first time that a sculptor has had the idea of getting a bust accepted as the official type of the Republic. The Municipality of Paris even instituted a competition in 1880, in which many artists took part, with the object of securing a satisfactory and typical official bust; but the result was a failure, none of these symbolic works rising above utter commonplace.

Symbolism of another kind seems to have occupied the minds of a group of artists who have opened at the Durand Ruel Gallery an exhibition under the title of the "Rose Croix." Among the painters in this group are M.M. Derenx, Aman Jean, Maurice Chabas, Henri Mertin, Durasse, Léon, and others; among the sculptors the better known names of Charpentier and Pézioux; and a Swiss architect, M. Vrachsel. The exhibition is a curious kind of reaction against realism, not without interest, but with a good deal of charlatanism mingled with it, especially in the architectural conceptions which M. Vrachsel calls "visions plastiques de l'Art," things without rhyme or reason, the nature of which may be partially guessed by their titles, "Palais des Extases," "Le Palais de l'Effroi," "Scherzo," "Le Temple du Silence" &c. After this kind of thing one quite looks forward to the annual architectural exhibits of the Salon, with their severe and sober restoration studies of Classic work!

The exhibition of the "Independants" is another artistic eccentricity which has become an annual institution and made itself a certain name. It is enlarging its borders, and on this occasion the exhibition includes no less than 1,230 works. It is held in the Ville de Paris Pavillon. The quality of the exhibition however does not progress in the same ratio with the quantity, and, as usual, its real interest is centred around a small group of names, and the remainder of the works are more or less absurd.

After the Independants the Pastellites, and after these the Engravers, have successively opened their exhibitions. In the meantime the jury of the Salon has been pursuing its labours, having commenced eight days since on the paintings. The admission for works in architecture commences to-day (April 2) and will last till the 5th. No architect can send more than two works.*

It is to be hoped that there will be seen at the Salon the monumental fountain for Tarbes, by the sculptors Desca, Escoula, and Mathet, which has already been referred to in the *Builder*. This work is 14 mètres in height, and includes a circular basin from the centre of which rises a group of figures surmounted by a statue of Anrora. The lower statues personify the principal rivers and torrents of the Pyrenees, and around the lower basin are groups symbolising the principal valleys of the country.

We may mention in the same connexion, that M. Cain, the well-known animal sculptor, has offered to the city of Paris a monumental fountain with a design representing eagles and vultures fighting over the body of a bear. It is proposed to erect the fountain in the Square Montholon.

It is proposed also to adorn presently some other public places in Paris. The statue of

* That is, two designs; each design may be illustrated by several drawings, if necessary.—Ed.

Sketch of Casement showing Opening Gear

6. That he will make spouts and conveyances for water to go clear off the roof, the spouts to be near the ground.
7. That he will make large two-leaved doors out of the new into the old Library with rails and casters to the steps there and also large two-leaved doors above the same stairs at the West end at the entrance into the new Library with rails and casters at the head of those stairs.
8. That he will draw the inside walls where there are to be no shelves and both ceilings with lime and air.
9. That he will make the timber which bears the garden covering to rise above the plain, three foot and a half.
10. He doth also covenant and promise to and with the said Doctor Honeywood, that he will maintain the stone wall with Arches and Pillars upright and good for Ten Years; that is against such effects as may proceed from ill workmanship or bad materials, and no other.
11. That he will also provide Casements as well as Ironwork as glasse for every second window.
12. That he will carry off all the rubbish of the ground and leave the said North Cloyster when the work is finished fit for pavement.
13. That he will take down the Coping of the North Wall where it is too high, & where it is on the upper part too thin, take it down and make it of sufficient thickness for such a building.
14. And the above named Dr. Michael Honeywood doth for himself covenant and promise to and with the said William Evison, that he will pay to the said William Evison for the work above mentioned the summe of seven hundred and eighty pounds [£780] of lawfull current money of England in the proportion and at the times following,—that is to say, two hundred and fifty pounds in hand, on July 1 one hundred pounds! on Augt 1 one hundred pounds more, and on Septemb 1 one hundred pounds more, and on October 1 fifty pounds more, and on Nov 1 eighty pounds, and

when the work is finished, so that he takes of his workmen, one hundred pounds more.

15. And he doth also grant that the said William Evison may have the use of any pulleys, ladders, and ropes that belong to the Church, when they are not about the Church otherwise employed, and that he may his time out of the Church limekiln at the same rate as the Church payeth.

16. And the above named Dr. Michael Honeywood and William Evison joyntly covenant each with other and agree that all such matters that by their part are forgotten and about which there (sic) any difference hereafter shall be referred to the decision and arbitration of two indifferent persons, each party then making choice of one and in case those arbitrators so chosen cannot agree in their award, that then the difference be referred to one single person chosen by those two arbitrators, and that from him there shall be no appeal.

And it is also agreed between both parties that when the Chapter Clerk comes home, these articles without adding or diminishing any material thing shall be put into a more legal form if it be thought fit by either party, and then, this paper being cancelled, sealed, and in witness whereof both these parties above mentioned have interchangeably set to their hands and Seales. June, A. Dom. 1674.

Sealed and Signed in the presence of
William Wyat [Precentor]. William Evison.
Jam. Gardiner [Sub-Dean].

AN ELECTRIC SAW-MILL.—An installation of wood-working machinery for Lord Rothschild has just been erected at Tring Park. The plant comprises hand-saw and circular-saw machines for converting logs, deals, &c., as also planing, moulding, mortising, and tenoning machines, the whole of which are driven by electric motive force. The machinery has been supplied by Messrs. A. Ransome & Co., of Chelsea, and erected under the superintendence of the resident engineer, Mr. C. Burman Callow.

Claude Chappe, an inventor in telegraphy, will be placed on the Boulevard St. Germain, opposite the Ministry of War; that of Renaudot, the earliest French journalist, will be erected at the Marché aux Fleurs; and M. Mercé has just completed his model of the Meissonier monument intended for the "Jardin de l'Enfance" at the Louvre. As will be seen, the public ways are more and more invaded by the homages rendered to departed merit.

The Commission des Bâtimens Civils has given its approval to various important works to be carried out at the Louvre and the Tuileries. These works have been the subject of a voluminous report drawn up by M. Bardoux, formerly Minister of Fine Arts, who has divided them into three categories; *travaux urgents*, requiring an expenditure of 480,000 francs; *travaux nécessaires*, for which 1,235,000 francs are required; and *travaux d'avenir*, estimated at 1,168,000. Among the "travaux urgents" is included the completion of the Jardin du Carrousel and that of the mosaics of the Escalier Daru, so much abused in Parliament by M. Antonin Pronst. M. Bardoux, on the other hand, strenuously defends this experiment in the Italian style of decoration, and insists especially on the completion of the various cupolas and of the lower parts of the staircase, the marble steps of which have been hid in the cellars of the Louvre for twenty-five years back.

The "Travaux nécessaires" refer to the work necessary for keeping the buildings in repair. The "Travaux d'avenir" concern the enlargement of the museum by the addition to it of the Salle des Etats and the Pavillon de Flore, still occupied by the Prefect of the Seine. The Louvre galleries would then occupy the whole side parallel to the Seine, and would suffice for all demands for some time to come. Although the cost is considerable, there is no doubt that Parliament will vote the money to make the Louvre worthy of and adequate to the great national collection of works of art.

At the Luxembourg, M. Bénéite has been appointed curator in the place of the late M. Etienne Arago.

At the Gobelins Museum a gallery has been opened to be exclusively dedicated to the drawings of Van der Meulen, which have been at the manufactory since the time of Louis XIV. This curious collection comprises views of the royal châteaux of the seventeenth century, the military displays of that epoch, and the sieges at which the "Roi-Soleil" was present.

Dynamite has been a good deal talked of for some time in Paris, and after having attacked private property, it is putting in peril our public monuments. The last attempt in this way has been to blow up the Caserne Napoléon, behind the Hôtel de Ville, and the explosion has seriously damaged two old windows in the church of St. Gervais. These windows with figure designs, which represented a value of at least 30,000 francs, were painted by Robert Pinaigrier, and were two splendid specimens of the art of the fifteenth century. The church of St. Gervais being at once a property of the Municipality and a "historic monument," it is probable that the Administration will take the necessary measures to secure it for the future, and save the remainder of the windows. Some reaction is required against the carelessness of the authorities in regard to the religious edifices under their care.

This carelessness is shown, not only in the religious buildings, but also in the most-frequented cemeteries, where the tombs of eminent persons are at times in a terribly dilapidated condition. A rich foreigner, of whose good taste we have several times had occasion to speak, M. Osiris, and to whom we owe the monument to Alfred de Musset, now in course of construction, has generously offered to restore a certain number of monuments. It will be curious to see if this private offer will be accepted in place of administrative protection.

We have to announce two new competitions, which will shortly be opened, one for the Hôpital Boucicaud which is to be erected in the Quartier de Vaugirard. The money has been left by the widow of the late proprietor of the "Bon Marché." The second is for the decoration of the Hôtel de Ville and includes the painting of the ceilings and walls of the large Salle des Fêtes. We may mention that the public may have an opportunity of seeing in the Salon this spring the designs executed for this Salle by MM. Benjamin Constant, Gabriel Ferrier, and Aimé Morot.

M. Benjamin Constant has painted in a masterly manner great allegorical figures against a background of dark-blue sky. M. Ferrier has represented in a charming manner flowers and perfumes, and M. Morot, who had to symbolise the dance, has copied M. Gervey's design for music, which is already in its place. Whatever may be the merit of these paintings taken separately, it is to be feared they will not be satisfactory from a decorative point of view, when in place. On the other hand, the Salon du Champ de Mars will contain a magnificent work of Pavis de Chavannes, entitled "L'Hiver," and which will worthily complete the decorative ensemble which has been commissioned for the Hôtel de Ville. The artist will also at once set to work on the ceiling of the grand staircase which has been entrusted to him, which was before given in turn to Baudry and Delaunay. M. Dalou has been commissioned to produce a statue in marble, for the Salle des Banquets, symbolising "Le Chanson," a former commission to Chappu.

The celebrated founder Barbédienne has just died at Paris, at the age of 81. He founded in 1838 the establishment on the Boulevard Montmartre. His success grew rapidly under the Second Empire, and in 1867 he was created Officer of the Legion of Honour, and was promoted to be Commander in 1878, after the Vienna Exhibition. For more than sixty years, besides its reproduction of antiques, the firm of Barbédienne has reproduced the greater portion of the works of our modern artists. He leaves an important collection of works of art, among which the bronzes of Barye hold a prominent place.

We have to record also the death of the painter Jean Baptiste Auguste Leloir, who has died at the age of eighty-two. He studied in the atelier of Picot, and obtained a Third Medal in the Salon of 1839, and a Second in that of 1841. He was especially a painter of religious subjects, and among his most important works are the decoration of the chapel of St. Louis in the Church of St. Severin, the cartoons for the windows of the Church of La Trinité, and the mural paintings in the Church of St. Jean Baptiste at Belleville. Auguste Leloir was the father of the painters Louis and Maurice Leloir, of whom he was the first instructor. The former, of whom much was expected, unhappily died some years ago.

SOME RECENT DEVELOPMENTS IN THEATRE-PLANNING: ARCHITECTURAL ASSOCIATION.

IN the discussion which followed the reading of Mr. E. A. E. Woodrow's paper on this subject, read before the Architectural Association on the 18th ult., and printed *in extenso* in our last number.

Mr. E. Woodthorpe proposed a hearty vote of thanks to Mr. Woodrow for the very exhaustive paper which he had read to them, and also for the trouble he had taken in bringing together such a large collection of plans. The paper had, he was sure, been of great interest to them all. With what had been said by Mr. Woodrow about the advantage of getting rid of the pit in the Haymarket Theatre he could not agree. He thought it a very great mistake to remove the pit from the place which it had occupied ever since theatres had been established—at any rate, in this country. Our English theatres did not compare at all favourably with a great many theatres in Paris and abroad, because here no support was given to them by the State; and people who built theatres found that if they spent too much money on the architecture and the site, and if they gave up much room to lounges and staircases, their theatres did not pay. Mr. Woodrow had said that he did not attempt to touch upon a great many subjects connected with theatre construction, and doubtless for that reason he had not mentioned the value of iron curtains. The first iron curtain that was put up in England was erected by Mr. Phipps in the Prince of Wales's Theatre, but its use in stopping fire had not been practically shown, and he was glad to say that there had not been a great theatre-fire in London in recent years. Mr. Woodrow had not gone into the large subject of heating and ventilation, as to which he (the speaker) was astounded by some remarks made by Mr. Phipps at a recent meeting of the Institute, to the effect that in London there was not a theatre which was thoroughly well ventilated and heated, because the owners could not afford to spend enough money on such a matter.

Mr. Bernard Dicksee, in seconding the vote of thanks, said there was one point that was not sufficiently attended to in the planning of theatres, and that was the proper width of the exits. It was even worse to have the exits too wide than too narrow. The regulations of the London County Council made provision that the width of the exits should depend upon the number of people who would have to pass through, but he thought that was a mistaken provision. He did not think that any exit should be more than 5 ft. wide at the outside, 4 ft. 6 in. would be better. There should also be a handrail for every person to place his hands upon, and the exits should therefore only be wide enough to allow two people to pass out side by side. There should be a greater number of exits rather than a few of large width. The reason why grand staircases had almost entirely gone out of use was their great danger. That in Her Majesty's Theatre was particularly dangerous. He thought it should be made compulsory that on the backs of programmes the plan of the theatre should be clearly indicated, and that the exits should be clearly marked. In reference to the remarks made by Mr. Woodrow with regard to hydraulic arrangements for the stage, he (the speaker) remembered that Mr. Phipps had said that at the Lyric Theatre he had provided hydraulic power for working the stage, but that it had never been used.

Mr. Max Clarke said that Mr. Woodrow had gone so fully into the subject under discussion that what he could say would be very largely a reiteration of what had already been said. The first thing that they had to do in designing a theatre in London was to get the new regulations to work to, for it would be possible to select six or more of the plans exhibited, which were twenty years in advance of the County Council's regulations as in force at the present time. With regard to the exits, the County Council regulations stated that the staircases must be 4 ft. 6 in. wide for a building which would accommodate 400 people. If this arrangement were carried out, there would be eighty-eight persons coming out of the door of a theatre per foot wide of opening. At the Shaftesbury Theatre, which was the first modern symmetrical theatre built in London, and which was, indeed, the most symmetrical theatre built up to the present time, there was a series of openings to the street, which totalled up to 75 ft. Supposing that the Shaftesbury Theatre held 2,000 people, there would be a provision for exit of 1 ft. for twenty-five people, so that at the Shaftesbury they were about sixty people ahead of the regulations. The regulations only asked for 1 ft. of exit for eighty-eight persons, and the exits at the Shaftesbury provided 1 ft. for twenty-five people. At the present time, according to the regulations, it was not compulsory to build a theatre of fireproof material. The new regulations stated that the dressing-rooms were to be of fire-resisting materials, but not a word was said about the auditorium; and so far as the regulations were concerned, they might construct the tiers and line the walls completely with wood. It was a question whether the County Council would pass the plans for such a theatre, probably they would not, for although there was no written law against the erection of wooden theatre, there was an unwritten law. With regard to theatre-building in London, there was a growing desire on the part of successful actors to be complete masters of buildings of their own, and the consequence was that there were many small theatres. In the designs of the new theatre at Amsterdam, which Mr. J. Springer had sent for exhibition that evening, the Continental idea of theatre-building was exemplified. There was a large foyer or vestibule, right underneath the pit, and very wide entrances, which were divided by bars. The staircases were very wide; but supposing there were a sufficient number of handrails down the wide staircase, the difficulty which had been mentioned would be obviated. Mr. Woodrow had spoken about the balconies for the Amsterdam theatre, but he had forgotten to say that at the Shaftesbury Theatre was provided wide balconies on three sides to the dressing-room portion. In New York it was possible to run an iron staircase right down to the street, and that would have been done at the Shaftesbury Theatre had it been permitted. At the Théâtre Flamand at Brussels there was a series of balconies round the theatre, so close together that a person could jump from one to the other. Eventually the balconies finished at so small a height from the ground that a person could drop

to the street without difficulty. With regard to the cost of management of large theatres, the takings at the Grand Opera House in Paris in 1884 were £7,167, and yet there was a dead loss on the whole year of 650*l*. Mr. D'Oyly Carte also found that he could not keep his large theatre open without entailing a loss. Without disagreeing entirely with what Mr. Woodrow said about the absence of columns in theatres, he would call his attention to the Alhambra, where there were columns all round. Mr. Woodrow's remarks on this point might not have been understood by all of them, but what he had meant was that in small theatres like those they were speaking about, although there were no columns, the cantilevers were significant. But in the new Opera House and the Alhambra and the Empire Theatres the cantilevers became increasingly larger, having the first-named building a projection of about 20 ft.; but in small theatres it was not more than 12 ft. or 14 ft. Mr. Emdeu's, Terry's, "Court," and "Garrick" theatres were constructed upon a similar principle, but it was at the English Opera House that there was the greatest amount of cantilevering, which had been very successfully carried out by the Horseley Iron Company. In remarking upon the development of theatre-planning, one notice ought to be taken of the fact that although Mr. D'Oyly Carte's theatre (the new Opera House) showed a perfectly symmetrical arrangement according to the partial plan exhibited, it was very different when the whole of the plan was seen. The entrances and exits were certainly not symmetrical, and as the theatre was built upon a fairly symmetrical site and was isolated, it seemed a failure as far as the arrangement of the exits was concerned. He did not know whether Mr. Woodrow had mentioned the matter, but in New York the authorities objected to more than six seats being ranged without a gangway. In the Royal English Opera House first tier, although the doors were at the side, there was what he considered an objectionable feature, and that was that the very best position in the house for a seat,—viz., the centre,—was given up to a gangway. In the Lyric Theatre, although there were only four rows, there were two good gangways, and there were only two rows of seats between any of the doors. It was the same at the Shaftesbury Theatre, where there were six doorways round the sides. With regard to fireproof curtains, a fireproof curtain was put up in Edinburgh many years ago, which was made of some material like twisted iron wire, but it was a complete failure. But where his own curtain had been put up, and there had been a fire, the curtain had been found to answer. The only objection against which one had to guard in a properly-planned fireproof theatre was smoke. An architect had told him that a piece of cloth fixed between the auditorium and the stage was quite sufficient to keep back the smoke, and so long as this was done they did not require anything more. It was questionable whether this was the case. The owner of the Garrick Theatre had said that a fireproof curtain was perfectly useless, and so did the owner of the Royal English Opera House; but at the back of the gallery of the last-named building, right at the top, there was an air-propeller, which extracted the hot air, and it seemed to him (the speaker) that if a fire occurred in that building the extractor could draw the smoke up into the gallery. Attention had been made of the fact that Mr. Hipps had put up an iron curtain at the Prince of Wales's Theatre and he (the speaker) supposed that more of those curtains would have been erected had he not thought of something which was less costly and less in weight, and not so liable to damage when a fire did occur; and the County Council had backed up his efforts by making similar provisions in their new regulations. His own curtains had been put up in London, Liverpool, and in two or three other cases, before any regulations of the kind were made by the L.C.C. With regard to staircases, the grand staircases at the Lyceum Theatre, which had not been referred to, were, though on a small scale, as successful as any. The Lyceum and Drury Lane Theatres were built by the same man, Mr. Beazley, and he had the same idea carried out in both theatres, which were perfectly symmetrical. At Her Majesty's Theatre the staircases were not very symmetrical, nor were they very grand. One must not forget that at a theatre had to be built for a particular purpose, and in Her Majesty's Theatre there were many private boxes, and the tiers were very close together. Mr. D'Oyly Carte's theatre

had been built with a small number of tiers, no boxes, and the tiers wide apart, something like the arrangement at the Cranbourne-street theatre. Mr. Woodrow had said that they should not make their staircases with more than twelve steps or less than four steps in each flight. But suppose that an extra staircase could not be put in without eighteen or nineteen steps in one flight, would it not be better to have the extra staircase than not? It was important that the tops of the staircases should be covered with separate concrete ceilings of their own. That was a very important matter, because if a theatre had a wooden roof which went right over the exit staircase, it would be a bad thing for the people in the staircase if the roof caught fire, while if the staircase had a concrete ceiling of its own, the people passing out stood a good chance of getting out without damage. He did not think that Mr. Woodrow's interpretation of the word "pass-door" was quite right. A pass-door was one which was put in the theatre merely for the use of the management, and for no other purpose, and, if it was used by the audience, then it was the duty of the County Council to interfere. If an iron door was used,—although generally he did not believe in iron doors or iron shutters,—or some fire-resisting material, they obtained all that they required without any objectionable features. The question of sites was a very important one, but he could not make head nor tail of the County Council regulations respecting them. If they had a theatre with a passage-way round it, 8 or 10 ft. wide to the open air, that passage-way would contain all the people that the theatre would hold without any difficulty whatever. Why one street should be 40 ft. wide and why another should be 20 ft. wide was very difficult to understand. He supposed that unless they had one street 40 ft. wide on the site they could not build a theatre there at all. Again coming to the regulations, why should not the pit be more than 15 ft. below the ground? Mr. Buckle, who had published a book on theatres, had shown a design for a theatre entirely below the ground level, and it seemed to him (the speaker) that it would have been perfectly safe to have built it. Such a theatre would take a large area of ground, but why it should not be safe he did not know. There was a small point in the planning of theatres which had not been sufficiently touched upon, he thought. Most people knew that at the Exeter Theatre fire a great many people were burnt to death, and those people were burnt because a man at the top of the gallery staircase had a wooden ticket box, which was knocked down, and the first person who left that part of the theatre tumbled over the fallen box. The box had no business to be there. He thought the Lyric Theatre was the only theatre where the ticket-boxes were built into the wall. The ticket-man, too, had no business to have a chair at the top of the stairs; that should be absolutely prohibited. The Gateshead Theatre accident occurred, it was said, owing to a lighted match falling through a crack in the wooden floor and setting light to an accumulation of rubbish. It was enough to say that there should be no floors in theatres with such cavities. It was unnecessary to have the floor of granite concrete, as suggested. The best material was broken-up brick, and there was no reason why that should not be used. Granite was difficult to fix to, and the only benefit to be derived from its use was the hard wear that it would take. With regard to the ventilation of the stage, if the regulations were followed, it would be found difficult to prevent a great down-draught, as there would be, he feared, at the Cranbourne-street Theatre, where a large ventilator was to be used. He suggested as a means of curing that difficulty that a sort of velarium should be stretched over the opening, and the air would go round the curtain without producing the down-draught.

The President, in putting the vote of thanks, said that as most of them were no doubt anxious to look at the drawings, he would not detain them by any words of his own. He thought they ought to include Mr. Max Clarke in the vote of thanks for the valuable information which he had given them. They were particularly indebted to Mr. Woodrow for bringing together such a large collection of diagrams and models, and for all the trouble which he had taken.

The vote of thanks was then put to the meeting and carried unanimously.

Mr. E. S. Gale said that Mr. Woodrow had expressed his own thanks to the architects who had lent him drawings, but he (the speaker) wished to move a vote of thanks to those gentlemen from the Association.

This being agreed to, Mr. Woodrow briefly replied, and the meeting terminated.

Discussion Section.—The ninth meeting of the Discussion Section for the present session was held on the 14th ult., when Mr. E. Greenop, A.R.I.B.A., read a paper on "The Public Health (London) Act, 1891." The Special Visitor for the evening was Mr. Charles Mason, A.M.I.C.E., A.R.I.B.A., Surveyor to the Vestry of St. Martin-in-the-Fields. Mr. Greenop dealt with his subject in a short, pithy manner, and pointed out that the chief sections affecting architects were those relating to underground-rooms, drainage, and water supply; and the Special Visitor added some valuable hints in the discussion which followed the paper.

THE ATMOSPHERE OF RAILWAY TUNNELS.

No one who has travelled much by the Metropolitan Railway will be inclined to deny consideration to any feasible scheme that may be proposed for preventing the fouling of the atmosphere, which now renders such a journey a most disagreeable penance; and we are therefore glad to notice a scheme which has been proposed for the prevention of the fouling of the atmosphere of the London Underground Railways by the products of combustion.

On Saturday last this scheme was practically illustrated to a large number of gentlemen representing the engineering and other societies, and the inventor, Mr. Anderson, gave an explanatory account of the way in which the scheme is proposed to be worked.

The invention consists, briefly, of a cast-iron trunk, or foul-air duct, laid between the metals, through which the products of combustion from the engines are drawn off by means of powerful fans placed in suitable positions. Coming to the detailed method in which this is carried out, we have first of all the cast-iron duct 2 ft. 9 in. wide by 6 in. deep internally, which is put together in sections connected by india-rubber flanged joints. On the top surface of the cast-iron duct are valves 16 ft. apart, which are opened by a slider suspended beneath the locomotive as it passes over them. When the slider has opened a valve, it forms a connexion between that valve and the smoke-box, so that this latter is in direct communication with the duct as long as the slider is in contact with any particular valve. The valves are so arranged with reference to the length of the slides that at least one valve is always in contact, and at the moment of passing from one valve to the next the slider is in contact with both, hence for a moment two valves are connected with the fire-box, thus it will be seen that the fire-box is always in connexion with the cast-iron duct.

This is the great point of Mr. Anderson's invention, as it is at once obvious that if the smoke-box of a moving engine can be always brought in connexion with a fixed duct, the products of combustion may be readily taken away from the smoke-box, through the duct, by the application of a sufficiently powerful exhausting apparatus, instead of passing into the external air by the chimney in the ordinary way.

The inventor proposes to place his exhaust stations about two miles apart, and, by means of powerful fans, to exhaust one mile of duct each side of the station.

At the demonstration on Saturday, Mr. Anderson gave some particulars as to the cost of his scheme, and taking the thirteen miles of the Metropolitan and Metropolitan District Railways as a basis, he told the visitors that the complete installation of his arrangements for that distance would cost 130,000*l*, that is at the rate of 10,000*l*. per mile. Allowing 5 per cent. interest on this sum, and the cost of working expenses, depreciation, and other outgoings, the inventor estimates the annual expenditure for the same installation at 28,000*l*. These figures are, of course, at first sight very considerable; but turning to the other side of the account Mr. Anderson considers himself justified in assuming that if the tunnels of the Metropolitan and Metropolitan District Railways were free from mephitic vapour the increased receipts from passenger traffic would

amount to 5 per cent. on the present takings of this company; this amounts to 52,000*l.* a year, hence the inventor is sanguine as to the financial aspect of his scheme. It was urged, moreover, that a considerable space of ground which is now devoted to openings for the tunnels and stations of the company might, if Mr. Anderson's scheme were adopted, be covered and built over at a very considerable profit.

At the demonstration which took place on Saturday, a light engine belonging to the Metropolitan Company was run backwards and forwards over a length of about half a mile of the duct, and, as care had been taken to feed the engine with a coal producing large volumes of smoke, the utility and efficiency of Mr. Anderson's invention was clearly demonstrated, and the contrast between the dense volumes of smoke which poured from the chimney of the locomotive while it was off the duct and the perfect absence of that smoke when the same engine was over the duct was very striking, emphasised as it was by the appearance of the smoke from the chimney over the exhaust station half a mile away.

The inventor stated that the cost of altering this engine for the purpose of fitting his invention was about 60*l.*, but intimated that in building new engines this expense would be avoided.

Certainly the very serious drawback to the health and comfort of Londoners which the tunnels of the underground railways now present would alone be sufficient to induce the directors of the railway companies to adopt some such scheme as that now proposed if they had not the fear of shareholders and dividends before their eyes; but as the inventor appears to have a good case from a financial point of view, the question ought to be considered as practically settled if Mr. Anderson is able to make good his financial statements.

We certainly think that he is within the mark in assuming that a clear atmosphere in the tunnels would increase the traffic of the Metropolitan Railway, if not of the Metropolitan District, by the 5 per cent. which he assumes. Increased traffic would, however, not be wholly profit, and Mr. Anderson certainly did not on Saturday last take any account of the increased cost to a railway company of carrying this increased traffic of 5 per cent.

It would be interesting also to know what would be the probable annual cost in repairs to keep the valves in order. Taking a double line of rails of thirteen miles in length, we have about 8,580 valves in constant process of being opened and closed by violent and sudden action every two or three minutes during about seventeen out of the twenty-four hours. How long will the system remain in working order under those conditions?

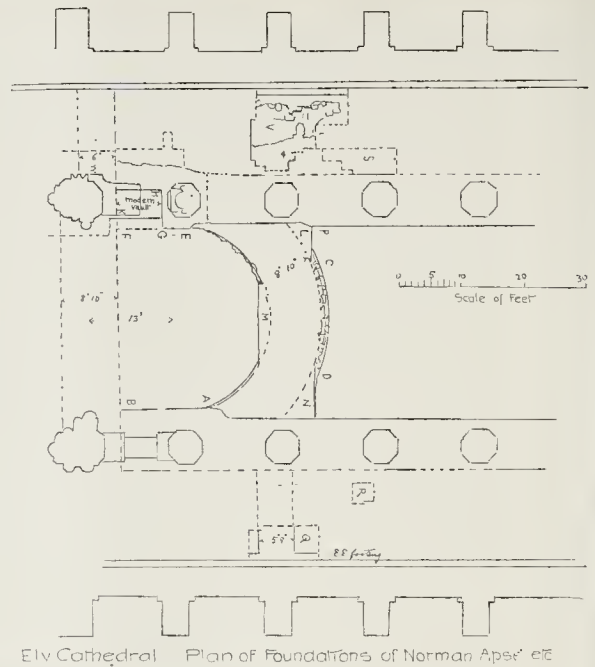

Illustrations.

ELY CATHEDRAL.*

ELY has not got what is called a picturesque Cathedral. Its great church does not occupy such a commanding position as Durham does, dominating over the city at its feet; its half-ruined west front is disappointing, after those of Lincoln and Peterborough; the reckless destruction of the monastic buildings, the cloisters, and gatehouses, gives a bareness to the precincts which contrasts painfully with the surroundings of Canterbury or Wells; and, finally, the loss of the chantry on the Green, and of the gallery or ancient connexion between the Bishop's palace and the west transept, has destroyed the continuity of structure which probably once formed an entrance-court similar to that which has been spared to its sister Cathedral at Peterborough. But, in spite of the ravages of age and neglect, the Cathedral has, for an architectural student, interests of the highest order; it has specimens of the rudest and of the richest Norman masonry; of Early English, almost coeval with that of Hugh the Burgundian at Lincoln; and it possesses examples of the work of the fourteenth century, which it is difficult to rival.

The foundress and first abbess of the monastery was Etheldreda, daughter of Anna, the ruler of East Anglia, and she is said to have been born in the year 630, at the little village of Exning, in Suffolk. When she was two-and-

* This series of illustrations of the Cathedrals of England and Wales was begun in our issue of January 3, 1891. A list of those already illustrated, with particulars of future arrangements, will be found on page 276.

twenty years of age she married Joubert, an ealdorman, or prince, of the South Givrii, and the Isle of Ely was settled on her as a marriage-dower. Joubert did not live long; but died A.D. 655. The isle became her separate estate, and she settled herself in her little kingdom, and spent four years in strict retirement. At the end of this seclusion, when she must have been thirty-two years old, she married Egfrith, or Egfrid, of Northumbria, then a mere youth, but, after being his wife for twelve years, she became a nun in the monastery of Coldingham, where Egfrith's aunt was abbess. Her husband wished to carry her off from his aunt's custody, but she escaped, was miraculously saved from apprehension by his agents, and, after toilsome wanderings, reached Ely with two of her women, and in the year 673 she began to build a church, which she endowed with her estate.

The events connected with Etheldreda's second marriage maintained their hold on East Anglian sentiment, and some six hundred years after her death became the subjects of the eight pieces of sculpture which are the bases of the tabernacles which decorate the lantern piers, built by Alan de Walsingham in the time of Edward III, viz.:

Her marriage with Egfrith.
Her taking the veil at Coldingham.
Her escape from Egfrith by means of a miraculous flood.

Her staff budding while she slept,—a repetition of the prodigy which converted the javelin of Romulus into the cornel tree of the Palatine.

Her election as Abbess of Ely.
Her death and burial.

Her translation.
A representation of a miracle wrought by her merits after she had been canonized.

In 870 the Danes destroyed Ely, but a college of seculars established themselves there, and remained undisturbed till the pacification of England by Edgar and the revival of a stricter monachism by Dunstan, the inspirer of Edgar's wise policy. Ethelwold, Bishop of Winchester, and friend of Dunstan, repaired the monastery, settled in it a body of monks, and appointed an East Anglian, Brithnoth, as the first abbot.

In the year 1081 William I. appointed two of his connexions, Walkelin and Simeon, respectively to the See of Winchester and Abbey of Ely. Simeon was an old man of eighty-seven, but nevertheless he laid the foundation of the church which now exists. Shortly after his brother began a similar undertaking at Winchester, and it is instructive to remark the

similarity in the plans of the two structures. If any part of Ely Cathedral can be attributed to the Abbot, it is the basement storey of the eastern transept, which was originally built with continuous aisles, like the corresponding part of his brother's church.

Under the pavement are the foundations of an apse, which Simeon intended to build on the Winchester model. These foundations were laid bare in 1850, and examined with great care by the late Professor Willis.

The result of his investigation is shown in the accompanying plan. The pavement of the whole of the central portion of the presbytery was uncovered, but the side aisles are so occupied with large monumental slabs and sepulchres that it was very difficult to find places in them that admitted of being uncovered and examined. In the central aisle are the foundations of a large apse. The centre of the semi-circle was ascertained with great care on the spot, by planning the foundations by ordinates, and verifying the results by sticking a stake in the ground, and trying the lines of the curved walls with a string swinging round the stake as a centre. From this it resulted that the central point was 13 ft. to the east of the line, joining the centre of the great shaft of the Norman piers, which still hold their place between Northwold's work and Hotham's. The foundations of this Norman apse are entirely traversed at the sides by the foundation walls of the Early English piers of Northwold's work. It seems that the Norman foundations were not considered trustworthy by the architects, and accordingly were completely removed, as shown on the plan, and a foundation of a deeper and better construction substituted for them, which runs completely from one end to the other of the presbytery on either side. The curved portions of the Norman walls are not sunk completely down to the rock, and are built in a trench, the bottom of which is 4 ft. 6 in. below the surface level on which the Early English plinths of the piers stand. This is the most convenient datum line; for example, at CD large rough boulder stones are laid upon the bottom, forming a broad footing projecting 1 ft. 9 in. beyond the surface line of the wall, and the whole is built of rough rubble work set with a loose, coarse, sandy, yellow mortar, which in its present state has very little cohesion, and is wet.

The construction of the Early English foundation, which was carefully examined by completely trenching along the northern face of the southern wall at A B, was entirely different. It was about 6 ft. deep, rested on the rock

ELY CATHEDRAL.

A BAY OF ARCADING
WEST SCREEN.

DRAWN BY MR. S. K. GREENSLADE.

was formed of a kind of concrete, and the face exposed slightly overhung its base. The southern face of this Early English wall in the side aisle was not accessible, because the pavement was wholly occupied by large monumental slabs. The corresponding wall at E F on the opposite side of the Presbytery was almost entirely destroyed by a vault which had been excavated in this foundation under Bishop Redman's monument for the reception of some unknown person, apparently in the seventeenth century. The extent of this rashly-constructed and injurious chamber is marked on the plan G H K. The outer corner of the semi-circular apse and the middle of its internal curvature were filled up by portions of foundation work as shown on the plan at L, M, N, so as to convert the whole into the foundation of a straight wall of the same thickness as the circular wall.

These outside portions were certainly constructed before the Early English foundation. A very careful examination of the junction of the two walls at the northern angle P, showed that these portions had been cut through to allow of the passage of the Early English work, and that they had not been subsequently applied against its face. The first, and most natural, conjecture was that these triangular pieces had been put in to form a foundation for some transverse steps or works required for the decoration of the Presbytery. But this, for other reasons, was very improbable, even if the nature of these foundations had not shown that they were subsequent additions to the Norman work, and previous to this Early English.

These portions were built with more care than the Norman already described, and with a somewhat deeper foundation; their faces also, when exposed, appeared nearly vertical.

A sub-wall of the same thickness as that just described, namely, 8 ft. 10 in., crossed the presbytery, connecting the great Norman piers from F to B, as shown in the plan, the centre of the wall coinciding, as nearly as possible, with the centre of the existing prominent Norman shafts. No foundations of a wall forming a semi-circular aisle surrounding the apse as at Norwich and Gloucester could be found. For the purpose of verifying the existence of this aisle and laying it down with precision, search was made in the side aisles at the places indicated in the plan at Q R S and T (the only ones practicable), and the ground in the presbytery to the east of the apse was carefully sounded. No foundations, however, of such an external aisle wall could be discovered. The whole of the central space, with the exception of a few vaults, proved to be soft ground.

In the south-side aisle at Q, instead of a curved wall, a transverse wall, 5 ft. 8 in. in thickness appeared, as shown in the plan, nearly opposite to one of this Early English piers. The mortar and construction of this was similar to the added portions of foundation L, M, N, and its want of symmetrical position with the Early English piers also shows that it was not a bond wall connected with them. The ground at R was completely soft.

In the north-side aisle the removal of the pavement disclosed soft ground at S, in the track of the supposed side-aisle wall, and at T, an irregular mass of stones V, about 1 ft. below the pavement, that would not have belonged to any foundation, but might have been the remains of a canopy, or a mere undisturbed collection of rubbish. There was clearly no transverse wall here to correspond with that discovered on the south side at Q; but a transverse wall was found in this north aisle at W, opposite to, and in continuation of, the Norman wall of the great piers.

This foundation was 6 ft. in thickness and its eastern face coincided with the eastern face of the central wall, as shown in the plan. It was impossible to ascertain whether a similar wall had existed in the corresponding position in the south aisle, for the whole space there was occupied by gravestones.

The interpretation of these remains appears, in the whole, to be that the original plan of the great Norman apse was circular, that it had aisle round its eastern extremity, and that before it was completed it was resolved to convert it into a square-ended presbytery, such as we now see at Oxford Cathedral and St. Cross.

Simon's brother, Walkelin, raised his church at Winchester on a crypt; at Ely the rock was not near the surface, and it was not advisable to have such a sub-structure in a marsh country.

With this exception, the plan adopted by the two brothers was very much the same.

The presbytery at Winchester was terminated by an apse with a circumscoring aisle. The great bond wall which connects the two existing Norman piers shows that a lofty arch was erected there, probably carrying an eastern gable, from which the circular apse would have projected; and in a similar manner the square-ended presbytery, which served as the chancel of Ebelredra and her three relations, did actually project. The change of form was probably because this square form better suited the quadruple group of shrines than the semi-circular plan would have done. The great arch must have been flanked and buttressed by walls crossing the aisles, and hence the foundation W discovered in the north aisle, to which must have corresponded a similar one in the south aisle. Peterborough, Hereford, Norwich, and many other churches exhibit this construction. These side aisle walls are sometimes pierced with arches which give access to lateral aisles, or to eastern aisles when they exist. In the present case no apse was traceable on the north side, and on the south the transverse wall to the east of the one under discussion seems to show that a chapel stood there in continuation of the south aisle. This was probably the lady chapel still kept on the south side of the church.

Simon died November 20, 1093, and for seven years the temporalities of his Ahhey were appropriated by William Rufus; but on August 5, 1100, Henry I. appointed Richard, a Norman monk, Abbot, who carried on the work begun by his predecessor, and had so far finished the church that on October 17, 1106, the second translation of the remains of Ebelredra and her sisters took place. The eastern part of the church must have then been complete, and, as the Norman choir included two compartments of the nave, a good deal of the western limit must have been built. Richard may, of course, have left behind him a completed transept, but, even if he did, the present west transept and tower belong to a later school of Norman architecture, and are the work of unknown builders, except in their upper ranges, which were added between 1174 and 1189 by the third Bishop, Ridel. Hervey, who succeeded Abbot Richard, became the first Bishop of Ely, and discharged himself and his successors from any obligation to support or repair the fabric of the church. Bishop Nigel, who came next, was a member of an able family, in whose hands the financial business of the kingdom had been for thirty years; he was one of the Barons of the Exchequer under Henry II., while his son sat in the same court as Treasurer; he was a politician exclusively rather than a builder of churches, so that the history of Ely's west transept must remain a problem till some new documentary evidence solves the puzzle.

Bishop Ridel's magnificent additions to the fabric of the Cathedral are characterised by the introduction of the pointed arch, and it would be difficult to find more graceful open arcades than those erected under his direction,—fore-runners, it may be, of the complete Early English style adopted by Bishop Eustace in the west porch which he added between 1197 and 1220, during the reigns of Richard I., John, and Henry III. Bishop Ridel seems to have contributed to the fabric of the infirmary, which is tributed to the canons' dwelling-houses, for the details of his north door are nearly identical with those of his transept windows, and the style of the opening in the central cross wall represents the Transitional Romanesque or Norman style prevalent in his day. The only known representation of the stone retables of the Norman Cathedral is a very rude diagram made by the late Mr. Essex in the last century, and it represents the central opening as a doorway with a segmental arch and ornamental tympanum, possessing a family likeness to the features of the north door of this infirmary.

The west porch is now only a fragment of a much loftier structure built by Bishop Eustace at the beginning of the thirteenth century on the foundations of an earlier one, which may have been an original entrance to the Norman church, and it has been brought into its present condition by neglect, and by repairs of which no detailed accounts exist, which might have supplied a clue to the Bishop's whole design.

In 1757 Mr. Essex reported this porch and the west transept to be so ruinous that they were not worth the cost of repair, and advised the Chapter to take them down and "apply the materials to the use of the other parts of

the church." This recommendation was rejected, and the porch must have been repaired to some extent, because in 1796 Mr. James Wyatt stated that its restoration "will neither be difficult nor expensive," and he proposed to make good all defects with "composition stucco," to plaster the vault, and wash the whole with a stone-colour wash. He "restored" the west front, but seems to have left the north and south walls pretty much in the state in which he found them. The remains of the Bishop's work have a special historical value, because they must have been built very shortly after Hugh the Brngundian laid the foundation of his cathedral at Lincoln, and the works of the two Bishops are possibly the earliest examples we have of that new style which the Rev. G. Miller so happily named Early English in 1805. Bishop Hugh is said to have become Bishop of Lincoln in 1186, to have laid the foundation of the Cathedral in 1192, and to have died in 1200; and the main characteristic feature of the portion of the church he is believed to have left complete at his death is the double-wall arcade of the east transept, which consists of a range of trefoil arches, combined with an inner range of pointed ones, both being carried by shafts of equal height rising from the same bench-table. The same design is found in the Ely porch, but with such differences or extensions as unusually thick walls afford to the resources of a skilful architect. The vault is planned in two compartments, and the face of the wall below the wall ribs of each takes the form of two tiers of arcades, separated by a flat vault. The upper tier has a single range of arches, but the lower is composed of two, and represents the Lincoln feature. At Lincoln, however, the two ranges are combined, and carried by slender columns rising from the same level, while at Ely they are set apart as far as the thickness of the wall allows, and carried by shafts, whose bases are disposed at two different levels. At Ely the front range consists of three trefoil arches in each compartment, rising from a bench or ground table, while the pointed arches behind them have bases set on a high broad plinth.

If Bishop Hugh laid the foundations of Lincoln Cathedral in 1192, Bishop Eustace must have begun his work at Ely at least five years later, since his episcopate was limited to the period 1197-1220; but whether he thought out for himself an independent design for his porch, or adopted the suggestions of the Lincoln choir, he proved himself to be a consummate artist, and everyone interested in the development of English art must regret that we can now see and study nothing but the wreck of the Bishop's conception of a fitting entrance to a Norman church.

Nine years after the death of Eustace, i.e., in 1229, Hugh Northwold became Bishop of Ely, and built an Early English presbytery in continuation of the Norman one, an extension of the east arm of the building, which is one of the many examples we have of churches lengthened to enoble the shrines of founders and benefactors. Although the cost of this new work was borne mainly by the Bishop, general contributions were sought in aid of the expenses entailed by it, and the sacrist's accounts show the amount of annual subscriptions paid to them from 1234 to 1250, inclusive.

As the new building was a continuation of an old one, the Bishop placed its architectural members within and without at the same levels as in the corresponding parts of Abbot Richard's Church, and so maintained the low outer wall of the triforium, and one compartment of this Early English triforium still remains on the south side of the church.

The new building was consecrated in 1252, and the whole fabric remained without important changes till 1322, when the old Norman tower in the middle of the church tumbled down and ruined the choir beneath it.

The catastrophe was not unexpected; but the Sacrist of the Monastery and the Bishop of the Diocese happened to possess unusual architectural taste, and, as they were prepared for the disaster, Alan de Walsingham at once began the construction of the lantern, and John Hotham, the Bishop, undertook to build the three compartments which still join it to Bishop Northwold's work.

In replacing the ruined Norman choir, Bishop Hotham preserved the interior levels of the great members of the composition; but the outer wall of his triforium is high, and furnished with lofty windows filled with the tracery of

his period, and this seems to be the first introduction of the high outer triforium wall into this Cathedral. The open tracery of the high inner triforium is singularly delicate; but the symmetry of the whole design, and to some extent of Northwold's work also, is disturbed by the intrusion of a modern organ-case. In Hotham's day the floor of the Cathedral was not level, but rose gradually from the west end; the choir occupied two compartments of the nave; its stone rood-loft was in existence; and the floor of the presbytery was raised by two steps, which crossed the central aisle between the two eastern piers of the lantern.

In the south aisle of the Early English presbytery the Lady Chapel was standing over the fragmentary foundations noted in the plan of the abandoned Norman apse; but it was superseded by the magnificent structure which Bishop Montacute completed, A.D. 1373-4, and became the chapel of John Typtoft, Earl of Worcester.

Ely has fragments of the tombs of several of the bishops who helped to build the church, we can see and admire; and the chapels of West and Alcock are tolerably perfect. The tomb of Bishop De Ludd stands at the entrance of the old Lady Chapel, and belongs to that class which may be treated as open Ciboria, and of which Westminster Abbey possesses valuable specimens on the north side of the presbytery.

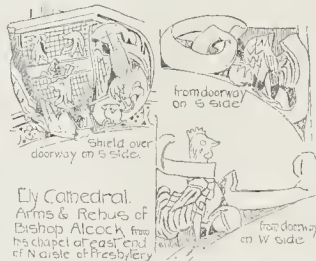

D. J. STEWART.*

In addition to the ground-plan and a general view of the Cathedral as far as the lantern from the south-east, showing the west tower and central lantern, we give illustrations of a bay of the interior of the west porch, and the ironwork,—very good of its kind,—from the late chapel of Bishop West, which terminates the south aisle of the presbytery eastward (see lithographs). For these we are indebted to Mr. S. K. Greenslade† The doorway to the cloisters from the south aisle of the nave, known as the Prior's door, is a rich piece of Late Norman, and traces of another of similar character remain blocked near it, formerly communicating with the west aisle of the south transept. In the north aisle of the presbytery are remains of a stone chair, said to have been brought by Bishop Northwold from the Abbey of Bury St. Edmunds. A lion is represented holding the head of St. Edmund, and a sculptured panel at the foot of Northwold's effigy, hard by, gives the scene of the martyrdom. Amongst a good deal of florid detail, the arms and rebus of Bishop Alcock, on his chapel, are

* Mr. Stewart wishes us to mention that the portion of his article giving the description of the old foundations is taken from his book "On the Architectural History of Ely Cathedral."

† We will give next week a drawing of the east end of the choir (exterior) by Mr. Greenslade, which we are not able to give in the present number.

good examples of a mode of decoration common in Perpendicular times.

SKETCHES NEAR PETERBOROUGH.

THESE two charming sheets of sketches by Mr. Arnold Mitchell, from churches and houses in the Peterborough neighbourhood, we give along with our illustrations of Ely Cathedral, as they are from nearly the same part of the country, and will be of interest to many of those who are also specially interested in Ely.

The subjects speak for themselves. As examples of refined and artistic architectural sketching our readers will agree that the drawings can hardly be too highly praised.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On the 21th ult., Mr. John James Burnet, of Glasgow, read a paper on "The Relative Position of the Architect and the Craftsman," to the members of the Edinburgh Architectural Association, in the Hall, 42, George-street. Mr. Burnet said he was of opinion that there never had been an age when the life of the individual was more governed by the practical necessities of the day, nor the demand upon him more clearly defined; and therefore never before was the architect's problem, if varied, more easy of enunciation. Defining what an architect of the present day was, he said he was first a master-builder, having a thorough knowledge of the science of building and of the crafts engaged in building, keenly appreciative of the possibilities of each, and ingenious in their application to the needs of his fellow-men, and he was also the poet of modern necessity. If they accepted that definition then they might easily permit, or even recommend, the registration of master-builders, as, while all of them could not be architects, all architects worthy of the name would be proud to call themselves master-builders, and would be pleased that

while on the one hand the public might be protected against the device of incompetent professional men, the profession would also be protected against the degrading results of their incompetency. Describing the function of an architect, he believed the most important factor was that he should have the confidence of his clients, and that harmonious working of the craftsmen without which it was impossible that the work could be satisfactorily accomplished. The modern architect must be prepared to act, if his work was to have any of the grandeur and nobler qualities of master-building with the keenest and most detailed appreciation of the crafts, his particular work being in their co-relation and the co-relation of the contrivance arts. If the work was to be true architecture it must not only be suitable for its purpose, but it must be the work of one man, executed by craftsmen and artists each free to the development of his own art or craft, with that individual liberty of thought and action without which art in any form was impossible, leaving it only to the hand that guided him to his work to restrain him in its execution. Passing on he said that they would agree with him that the handing of schedules to tradesmen, or advertising for tenders indiscriminately was one of the greatest weaknesses of the present contract system; and he concluded by throwing out a few suggestions, in the course of which addressing himself first to the architects, I said that they should dread no advance in science, whether in economic production or in form of demand; and that they should persuade their clients against an indiscriminate issue of schedules, which made the skilled craftsmen's work appear costly by contrast with that of his less skilled brother. He advised the craftsmen to study their craft and the theories which underlie its practice, so that they might not fail to see its application to the work to be executed.—Mr. Burnet was accorded a hearty vote of thanks at the close of his paper.

LEEDS ARCHITECTURAL SOCIETY: STEEL APPLIED TO CONSTRUCTION.—At their meeting in the Law Institute, Leeds, on the 28th ult. members of the Leeds Architectural Society listened to an interesting and practical lecture on "Steel as Applied to Construction," delivered by Professor Goodman, of the Engineering Department of the Yorkshire College. Mr. W. J. Thorp presided. The lecturer gave a comparison between timber and cast-iron, wrought iron and steel, pointing out the irregularities and defects of cast-iron, and its low tensile strength. Wrought-iron, he showed, was considerably stronger, but very inferior to the best qualities of mild steel. By using iron and steel any structure could put in much bigger span and take up less head room. Steel, not recently made by the Siemens process, was very largely made by the Basic process, and

first-rate material was turned out by the various steel works in Leeds. The strength of each varied from 30 to 32 tons per square inch, and stretched 25 per cent. before breaking. A much stronger steel could be made, but it was brittle, and not so reliable for structural purposes. Steel was liable to hidden defects, which could only be detected by testing. It required more careful handling than wrought iron, otherwise it might be very seriously damaged. Although from 30 to 50 per cent. stronger than iron, it was only about 10 to 12 per cent. stiffer, consequently steel girders deflected more in proportion than iron. The following officers were elected for the ensuing year:—President, Mr. G. B. Bulmer; vice-presidents, Mr. H. B. Buckley and Mr. J. H. Reeves, and the past presidents of the society:—hon. treasurer, Mr. W. A. Hobson; hon. librarians, Mr. J. Mettam; hon. secretary, Mr. W. Carley; Hall; Council, Messrs. W. Watson, J. H. Thornton, A. Neill, E. J. Dodgshun, Peavers, and Marshall; auditors, Messrs. F. Austo and F. W. Bedford.

THE LONDON COUNTY COUNCIL.

The usual meeting of this Council was held on Tuesday afternoon last at Spring-gardens, the Chairman, Lord Rosebery, presiding. Tenders were received for alterations, &c., at the Southwark Gas-meter Testing Station. They will be found amongst our lists of orders.

Finance.—The Finance Committee reported that they estimated that it would be necessary to borrow the sum of 5,761,748*l.* during the present year, including 2,215,000*l.* to be sent to other bodies, the amount required for the Council's own purposes being 3,546,748*l.* The estimate was referred to the Parliamentary Committee in connexion with the preparation of the Council's Money Bill, which will this year be introduced as a private Bill, and not under the auspices of the Government, as has hitherto been the case. Some discussion arose on the scope of proposals for loans to local bodies, on the vexed question of the relative advantages of the annuity and the instalment systems of repayment; and complaint was made of the action of the Treasury in vetoing a plan proposed to be made to the Shoreditch Library Commissioners, at the desire of the Commissioners and with the sanction of the local Government Board, on the annuity principle of repayment. The Commissioners desired that system of repayment, it was stated, because, if the loan were repaid on the instalment principle, it would leave them no money wherewith to purchase books during the next few years. As the Treasury had refused to sanction the loan being granted by the County Council on the annuity principle, the Library Commissioners had arranged to borrow the money from an insurance company. Eventually it was decided to raise the question at a future meeting of the Council.

The Easter Holidays.—On the motion of Mr. Egan, it was resolved that the Council should adjourn for the Easter Recess on Tuesday, April 12, and meet again on Tuesday, May 3.

Mr. Tate's Offer.—On the motion for the adoption of the Corporate Property Committee, Mr. Egan Spicer moved

"That it be referred to the Corporate Property Committee to report whether there is any land on the Thames Embankments, or elsewhere, belonging to the Council which would be suitable to offer to the Government for the purpose of building the picture gallery desired by Mr. Tate."

He reminded the Council that Mr. Tate had offered pictures to the value of about 80,000*l.*, as well as a sum of 80,000*l.* for the erection of a building, if a site were provided. The Government had not been able to find a site, but he thought it was very important that London should not lose the benefit of that munificent offer. In answer to a question from the Chairman, it was understood that Mr. Spicer proposed that the Council should give a site for the proposed gallery.

Bars and Gates.—The Highways Committee presented a report relating to a reference made to the Committee during the last Council as to the controlling authority of the gates in Harley-zet and Portland-place. It appears that the gates are under the control of the Commissioners of Her Majesty's Works, and the Committee reported that in their opinion no effective steps could be taken for the removal of the gates

until the Council should see fit to promote a Bill for the removal of all such obstructions in the streets of the metropolis. The Committee added that in due course they intended to submit a recommendation upon the subject.

Walworth-road Railway Station.—The same Committee's report also contained the following paragraph:—

"We have had before us a report by the Architect (ordered by the Sanitary and Special Purposes Committees before the transfer to us of the same under this Act), as to the state of the Walworth-road Railway station, and what steps had been taken by the company to remedy certain defects at the station. In July last the company was furnished with a statement of the Council's grounds of complaint and the relief or remedy to be claimed, and at the same time the company was asked what measures it would take to remedy the matters complained of. To this the company replied, in September, that plans would be prepared for the improvement of the station, and that the works would shortly be proceeded with. The Architect now reports that certain alterations which have been carried out, although improvements, do not in any way remedy the defects which he had previously reported, namely, amongst others (1) bad arrangement of ticket-office and absence of waiting-room in connection therewith; (2) bad arrangement and ventilation of urinals; (3) want of protection to the skylight over the passage-way from anything falling upon it from the railway, and (4) steepness of stairs. We are of opinion that measures should be taken for effecting improvements in these matters; and we therefore recommend—

"That an application under the Railway and Canal Traffic Acts be made to the Railway Commissioners for an order enjoining the London, Chatham, and Dover Railway Company to carry out such works at the Walworth-road station as will remedy the defective arrangements therein."

The recommendation was agreed to without discussion.

Toole's Theatre.—The Theatres and Music Halls Committee's report contained the following paragraph and recommendation:—

"On July 23 last a draft notice was transmitted to the owner of Toole's Theatre, King William-street, Strand, containing certain requirements which were, in the opinion of the Council, necessary in order to render the premises safe for the reception of the public. We have since conferred with Mr. Toole's architect, and it appears that it would be quite impossible to carry out the principal requisitions within the limits of the present site, and further, that the Council of Charing-cross Hospital, who are the landlords, have passed a resolution to the effect that they had no premises they could lease to Mr. Toole for the extension of his theatre. Mr. Toole's lease has only three and a-half years more to run, with the option on either side of its being renewed for another seven years. We are of opinion that all the requirements mentioned in the draft notice are absolutely necessary, but it appears to be impossible to carry them out. The minor requisitions which could be done would, in our opinion, remedy matters but very little. Having fully considered the case in all its bearings, we recommend—

"That Mr. Toole be informed that, though the Council considers the present condition of the theatre unsatisfactory, it recognizes that the conditions cannot be adequately altered, except by practical rebuilding, and the Council is, therefore, willing not to proceed with the requisitions contained in the draft notice, if Mr. Toole will give an assurance that neither he nor any assignee of his will renew the lease of the theatre when it terminates in 2½ years' time."

This led to some discussion, in the course of which Mr. B. Bowen Rowlands moved that the report be referred back. He said he thought the recommendation made by the Committee was most inconsistent and weak. Either the theatre was dangerous or it was not: if dangerous, it ought to be closed or pulled down. The Rev. Fleming Williams having seconded the amendment, Mr. Routledge, Mr. Russell, and Mr. Emden defended the Committee's report and recommendation as embodying the only course that could be taken without inflicting great hardship on Mr. Toole. Mr. Stockbridge supported the amendment, which was, however, lost, only 9 members voting for it.

The London Water Question.—Sir Thomas Farrer, upon the presentation of a report, with correspondence, dealing with the London Water (No. 1) Bill, stated that the constituents of the present Council had entirely approved the policy of the late Council on this subject. In proof of that he would quote from the *Economist* the statement that there had been a great fall in the price of the shares of the water companies. Between the date of the elections and March 19 the fall in the price of the shares had ranged from 2½ per cent. to 17½ per cent., and on the whole the average fall was from 8 per cent. to 10 per cent. That fall had been, as he thought, rightly attributed to the consciousness on the part of the companies of the fact that the population of London,—the voters of London,—approved

of the Council's policy on the water question, and intended to follow it out. Still, the realisation of that policy was no easy matter, although they were in accordance with the views of their constituents. There was a great deal to be done, and one of the most important questions to be decided was—What were to be the future sources of supply? Upon that question the Special Committee of the Council were preparing evidence to lay before the Parliamentary Commission. He asked to be allowed to move a resolution to the effect that the Council adopted the policy of the late Council in regard to the water question, and approved of the London Water Bill.

The Chairman said he did not think he could take so large a resolution without having received previous notice of it; but, on the motion of Mr. C. Harrison, the report was received, and it was resolved to proceed with the Bill.

The Salary of the Deputy Chairman.—Mr. Elliott proposed, "That the resolution of November 7, 1889, fixing the salary of the Deputy-Chairman at 1,500*l.* a year, be rescinded." Mr. Fletcher seconded the motion.

Dr. Longstaff moved, as an amendment, "That as the Council has recently appointed a Committee to consider the organisation of the Council's business, it be referred to that Committee to consider and report as to the duties and emoluments (if any) of the Deputy-Chairman." Mr. Westacott seconded the amendment, which was lost by a large majority.

Mr. Thornton then moved a further amendment to the effect that the amount of the salary be 1,000 per annum in the future. Mr. Hubbard seconded the amendment, which was also lost by a majority of 16,—by 59 to 43.

The original resolution of Mr. Elliott was then submitted, and a division was taken, with the result that there were for the motion, 49; against, 53; majority against, 4.

After transacting other business, the Council adjourned.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION:

FOURTEENTH ANNUAL DINNER.

The fourteenth annual dinner of this Institution was held on Wednesday evening last in the Venetian Saloon of the Holborn Restaurant, Mr. Colin G. Patrick, President, in the chair, supported by members and friends of the Institution to the number of 254, including Messrs. W. R. Freeman (John Mowlem & Co.), B. E. Nightingale, W. A. Colls (Colls & Sons), B. Hannen, jun., and E. C. Hannen (Holland & Hannen), Joseph Randall (Kirk & Randall), J. W. Hobbs, J. P. (J. W. Hobbs & Co., Ltd.), E. S. Rider (Rider & Son), H. D. White, Geo. Pearson, and J. G. Drower. The usual loyal and patriotic toasts having been honoured, Captain Roe responding for the "Army, Navy, and Auxiliary Forces."

The Chairman proposed the toast of the evening, "The Builders' Clerks' Benevolent Institution." The Institution, as they were aware, was founded for the relief and the granting of temporary pensions to decayed builders' clerks, and for granting pensions to the widows of builders' clerks who might be left unprotected. In addition, the Institution had within the last few years started an orphan fund, which had been found very useful in giving a start in life to the orphan children of builders' clerks. In order to make the charity as far-reaching as possible, the amount that could be paid to any one pensioner was limited. The Institution had now a sum of between 4,000*l.* and 5,000*l.* invested in Consols. Although he was glad to see that they had a most influential list of subscribers to the funds of the Institution, including not only builders, but merchants and others intimately connected with the building trade, he was sorry to find that there were a great many names absent from the list which ought to be there, and names of repute too. He believed that there were between 3,000 and 4,000 master builders in the London district. Now if they could only get a subscription of one guinea from each of those firms, what a splendid position the Institution would be in! He was speaking only of the builders, not of the merchants. Why, the little blue-book of the Institution ought to be as thick as "Laxton," and it ought to contain as many figures. It certainly could not be said that the building trade was overridden with charities. The master builders had their own excellent Builders' Benevolent Institution for those of their number who had been unfortunate; then there were the Provident Institution of Builders' Foremen and Clerks of Works, and their own Institution, so that he did not think it could be said that the building trade, as a trade, was overdone with charitable institutions. At any rate, he was quite sure that there was no society connected with the building

trade which had greater claims to their support than the Builders' Clerks' Benevolent Institution. It was greatly to be wished, however, that a greater number of builders' clerks would interest themselves in the Institution. There were probably 10,000 builders' clerks in the London district, and if they would each give but a small annual subscription, the Institution would not only be able to meet all demands upon it, but would probably have no further occasion to appeal for outside aid. In conclusion, he asked the company to drink with him "Prosperity and Success to the Builders' Clerks' Benevolent Institution."

The toast was very heartily received. Mr. W. A. Collis next proposed "The Architects and Surveyors." The architects, he said, sometimes grumbled at the builders, and the surveyors did not always give them the prices they desired; nevertheless, the builders were very frequently much indebted to those gentlemen. With the toast he coupled the name of Mr. George Pearson, who briefly replied.

Mr. J. E. Drower proposed "The Builders," saying that as a surveyor he was able to bear testimony as to the excellent manner in which the principal builders of London carried out their contracts, turning out the best work they could for the money they got. But, greatly as he respected the builders, whenever he came to think of builders' clerks he always felt inclined to take off his hat and make a deep obeisance to them, because they were the gentlemen who were responsible for those remarkable documents called "Prime Cost Accounts," according to which any builder must infallibly go to ruin if he did not get 15s. per rod for brickwork; and yet the same gentlemen would price-out any number of rods at 12s. 10s. How that came about was a problem which he regarded as insoluble. With the toast he had much pleasure in coupling the name of Mr. Joseph Randall, of the well-known firm of Kirk and Randall.

Mr. Randall, in responding, expressed his acknowledgments of the appreciative words which had been uttered by Mr. Drower regarding the London builders.

Mr. W. R. Freeman proposed "The Merchants, to whom, he said, the Institution was much indebted for generous support. He paid a high tribute to the good qualities of builders' merchants, observing that, no matter how sorely those gentlemen were tried, they were always amiable and obliging and ready to do the best for their customers. He thought that in many cases difficulties could be smoothed over if the merchants and dealers in specialties could more often be brought in direct contact with the architects. At present the builder had not always an enviable position between architect and merchant. With the toast he had great pleasure in coupling the name of Mr. J. Nicholls, of the firm of Nicholls & Clarke.

Mr. Nicholls briefly replied. The other toasts were "The Past Presidents" (proposed by Mr. Edwin Brooks, Treasurer of the Institution, and coupled with the name of Mr. Benjamin Hancou, jun., who was President last year); "The President" (proposed by Mr. J. W. Hobbs); and "The Visitors" (proposed by Mr. B. E. Nightingale, and responded to by Mr. F. Dashwood, Secretary of the Clerks of Works' Association).

During the evening, subscriptions and donations to the amount of 311l. 9s. 4d. were announced by the Secretary (Mr. H. J. Wheatley). This sum included 26l. 5s. given by the President, and 10l. 10s. given by the Worshipful Company of Carpenters, the total of the President's list alone being 211l.

WORKS OF REFERENCE.

"The City of London Directory for 1892" (London: W. H. & L. Collingridge, City Press office), presents, in this its twenty-second annual issue, all its old excellent features and many new ones, and we can speak from experience as to the reliability and exactness of its information relating to the City and City institutions. An excellent coloured map of the City, to a large scale, accompanies the volume, but, as we have said before, the usefulness of this map would be enhanced if it were mounted on linen in the same manner as the map in the "Post Office London Directory."

"The Newspaper Press Directory" for 1892 (London: C. Mitchell & Co., Red Lion-court, Fleet-street) is the forty-seventh issue of what is the oldest book of reference of its kind. Though it has now many competitors, it more than holds its own, and the present issue contains many useful features. Besides a revised alphabetical list of the newspapers, periodicals, and magazines of the United Kingdom, there is a supplement relating to the press of Australasia, South Africa, and India, while particulars are given of the principal journals of all foreign countries. The notes of recent cases as to the law relating to the press, by Mr. W. F. Fikison, chief of the law reporting department of the *Times*, will be found very useful. A new

feature of some interest is occupied with portraits and memoirs of deceased pressmen of distinction.

"Willing's (late May's) British and Irish Press Guide" (London: Willing & Co., 162, Piccadilly) is the nineteenth annual issue of a very compact and well-arranged handbook and directory for advertisers and readers.

"Shelley & Co.'s Complete Press Directory for 1892" (London: Shelley & Co., 38, Gracechurch-street) is the sixth appearance of the work, a useful feature of which is the summary of leading newspaper law cases for the year 1891.

"The Garden Oracle and Illustrated Floricultural Year-book, 1892" (London: *Gardeners' Magazine* office, 4, Ave Maria-lane) appears this year in a new dress, and has been considerably enlarged. The "Oracle" was ably and successfully conducted for thirty-three years by the late Mr. Shirley Hibberd, the Editor of the *Gardeners' Magazine*, and the present issue has been compiled by Mr. Hibberd's successor in the editorial chair. It is full of useful information, and among the new features is a section devoted to the enumeration and brief description of the public parks and gardens of the country, but this is by no means complete. Glancing at it haphazard, we find, for example, Exeter and Southampton absent from the list of towns having public parks and gardens. This section will no doubt be made more complete in future issues of the work.

Correspondence.

To the Editor of THE BUILDER.

THE LINCOLN LIBRARY QUESTION.

SIR,—I have just read with painful interest Mr. Somers Clarke's letter about the "restoration" proposed at Lincoln. As an outsider, being a clergyman, unconnected with the S. P. A. B., or, in fact, any society of the kind, I venture to ask your leave to endorse every word of his letter. It is more than lamentable,—it is monstrous, that some semi-public, semi-private bodies, like the chapters of Lincoln and Westminster, the governing fellows of Pembroke College, Cambridge, the vicar and churchwardens of St. Helen's or St. Stephen's, should have the power to do what they have done, or contemplate doing. We want a law like that of France as to "national monuments."

March 23, 1892.

W. J. LOFTIE.

SIR,—I venture to think that in Mr. Somers Clarke's excellent letter of last week he has not done full justice to the late Sir Gilbert Scott. I have it in my mind that when Sir Gilbert Scott was engaged in the restoration of Ripon Cathedral some thirty years or so ago, he was called on to take down the Lady-loft, now the Library, an addition of the fourteenth century to the early apsidal chapel, which forms the Chapter-house and sacristy on the south side of the choir, in order that this chapel might be restored to its supposed original condition. This, Sir Gilbert Scott, to his great honour and credit, declined to do, and we may, therefore, reasonably assume that Sir Gilbert Scott would have acted at Lincoln as he did at Ripon, and would have been on the side of preservation.

CHARLES J. FERGUSON.

BUILDING-STONES IN IRELAND.

SIR,—The article on this subject in the *Builder* of March 26 gives some condensed information that it may be worth some man's while to pigeon-hole as a geological memorandum, but for practical or commercial considerations it is of little value to anyone. The game of seeking most of the stones set out in the list is not worth the candle, and never will be. As to the kindly hit of sentiment that winds up the article, we almost inevitably look when Ireland or Irish industries are brought up for a little poetic touch about "long-faded glories," &c., and "decay of arts and industries" and their "revival," which practical people, who are not professional patriots or poets, in Ireland know had never any existence to be decayed from. "Surely," says the sanguine writer, "such a state of things in importation of stone will not exist much longer."

It has so existed from very early times, and

is likely to exist. The hewn stone in the vast majority of the Medieval buildings in Ireland is an English colite, and we know the district of its source from records of cargoes occasionally impounded at Bristol, and it is not, as is mistakenly the same species of stone as is found at Glastonbury and Montacute. It is nearly universal in Ireland wherever stone could be water-borne, and there are not many places that could not be reached by water-carriage from the sea-board *vis* rivers, lakes, and creeks. It is the ancient stone of the Dublin Cathedrals and Castle, and of such ancient churches as there are remains of. It is the stone of Tintern Abbey, in the extreme south-east, in Wexford; of Altrassell Abbey, in Tipperary (close to abundant granite and limestone); of the French Abbey of Mellifont mentioned in the article, lying beside the Drogheda limestone quarries, in the midlands county of Louth; and is found far north at Gretna Abbey, lying close by those sandstone quarries of Scrabob, county Down, commended by the article, and in hundreds of the ancient buildings that lie between these places. The facilities of water-carriage, or the familiarity of English builders with English stone, does not account altogether for this nearly universal employment of a Somerset colite.

People who write magnificently about the development of Irish mines and minerals are apt to leave out of sight the peculiarly constituted and fire-affected geological system of Ireland, and form their notions on the basis of like and well-behaved strata, reliable to be found in their proper place when looked for in England. As to your Irish stone,—you are rarely sure where you can get it at, or what found how you will get it out of the quarry, or what it will be like to work when you get it, or how at any reasonable cost you can get it to your building. In a great number of the localities indicated in the *Builder* article, the industry of stone raising ever did exist or ever will be started. Here and there, in the century, a quarry has been opened, and you get a few quoin-stones and window-cases for the big plain house the Irish country gentleman used to build. Now, the country gentleman of Ireland builds no house, and local demand for the local stone there never will be. But lately I was architect of a new stone mansion for an Irish country squire, about the last of his race likely to build an Irish mansion,—and we proceeded hopefully to build that house from a quarry of promising sandstone three miles from the house. It is one indicated in the *Builder* article. It was not long until, to my disappointment, it was proved that Portland stone shipped to Dublin trans-shipped across that city, carried rail 87 miles, and carted 5 miles was much more economical! Flagstones are referred to as near this same district, also at Carlow and elsewhere. So there are plenty of flagstones, but who wants them or is ever likely to want them, now? In Avigna quarries in the Leitrim coal-fields, for instance, will find you big flags,—cheap flags,—say for a yard super., 2s. 3d.; a carriage to Dublin and cartage, say 2s. 6d. more, and you have it laid in Dublin certainly not less than 6s. per superficial yard. You have then a rough kind of floor at hand. Who is likely to want such flags, where beautiful granolithic cement floor can be laid for 2s. 6d. or 3s. per yard? Carlow flags spoken of as worth consideration. Were Carlow flags of old Dublin houses are one of the horrors of the basements of that city, black, moist, and unsanitary, and they being rooted out everywhere, to be replaced concrete or dry tiles. In fact, with the development of the cement industry, the day of flagstones is over. For no useful purpose that can be seen will flags be ever quarried in Ireland again.

Take, again, as an example, under head "Dublin," a stone described approvingly as the "arenaceous rocks belonging to the Carboniferous system such as found in the White Mill Quarry, Rathgar." This once prevalent stone, locally known as "the Calk," has been the cause of Duolun, and chief cause of ruinous condition century after century. Now, not only discredited and unmarketable, but cept to mend roads with, for which purpose about the very worst stone to be found in British Isles. It is a hard, indurated dolomite which softens and reverts to its ancient condition of mud if it gets water enough. It is to be universally used for foundations. S

the Vartry water supply came into Dublin, and the lower Dublin became water-logged from disease of its thousands of pumps, the Calk foundations have universally softened and rotted, and the houses have settled and cracked, and many totter towards their doom. It is a vile one in walls, as it "sweats" in Irish climate. concrete is universal in new foundations; new walls are never built of this Calk stone, and as an "industry" it will never be heard of again.

Where is the chance of any practical development of Irish sandstone industries by people in their senses?—of, say, such folly as bringing on the interior of the country by expensive allway carriage hard, unworkable, uncertain ones at great cost, while at most places in each of the seaboard excellent Dumries stone, which stands the Irish climate well, can be laid out at 2s. per cubic foot?

There are exceptions, but they are very few, and should be distinguished as alone worth the hilt of practical people to catalogue them. It will not be said that I have a preference personally for "foreign" stone. Some of the buildings noted in the *Builder* are works of mine where prevailed in forcing in the native stone. I shelve I was the first person thirty years ago to suggest the trial of Irish limestone in an important front in a Dublin street. It would, of course, have developed in time without my patronage, but limestone is now the building-stone of Dublin—in my opinion the first of all building-stones in the British Islands. What it is capable of is witnessed in the last important stone building of Dublin, the Uster Bank, in College-green. There is, if you will, a store worth cataloguing and developing, but there is no fear of its being an industry wanting fostering care. It can take care of itself. Granite is good stones, but they are not neglected either, and require no sentiment wasted on them. The sandstone of Mount Charles quarries is worth attention. Sir Thomas Deane is to be credited with forcing this stone into notice. Mount Charles quarries are on the seaboard of Donegal. Magnificent specimens of stone are being now raised and shipped. This one has, probably, a future before it, both in Ireland and other parts of the world.

But there remains a strange stone with a future, I think, which lies unknown and unmarred and utterly neglected, the Steatite of Donegal, not alluded to in the *Builder* notice, but was lately my experience to find this curious one, in the course of a restoration, as being mainly used in the out-of-way ancient Cathedral of St. Admann, Raphoe. It is a thirteenth century building, and its cut stone remains as sharp as if it were cut yesterday or cast in bronze, and yet you may cut it with a carpenter's hand-saw or carve it with your pocket-knife. It is fire-proof, and called by the natives, Cam stones, and only used by them in modern times when they want to line a lime-lime. Then they strip the top of a quarry and take out what is wanted and cover it up again. They cut it with a carpenter's axe. It is admirably adapted for lining furnaces, fire-grates, boiler ranges, &c. You select a "seasoned" one, cut it with your hand-saw to any size and shape, and "there you are." The dust on the saw, like French chalk, seems adapted to make an asbestos paint with silicate. Asbestos is found in layers in the quarry. Soft as it is, the stone can be polished, and thus resembles Lizard Serpentine.

I am glad to say I believe I have aroused a good spirit to have these quarrels re-opened to supply the store required for the restoration of the small cathedral. Its locality—but five miles from railway carriage—makes its development not hopeless. I believe, with the exceptions I have noted, the laments of the *Builder's* kindly reviewer over the long list of neglected Irish stones are thrown away.

A specimen of the limestone, which I do not think I unfairly want, may be seen in a great monolithic cross at Lee Church, Blackheath.

THOMAS DREW, F.R.I.B.A.

* * Mr. Drew has apparently forgotten the subject of the article in our columns alluded to. I expressly wrote on the "Building Sandstones of Ireland," and not on Irish building-stones generally, as our correspondent's letter seems to imply. Moreover, we distinctly stated that the article treated not only of the sandstones at present raised, but of those of historic interest and of deposits as yet untouched. If we had alluded merely to the Irish sandstones at present quarried, the list would have been considerably curtailed. We are perfectly aware of the fact that English

and Scotch stone is largely used in Ireland, and have more than once written on the subject in these columns; indeed, the article under notice stated as much, and that is one of the reasons why we said that, with such an abundance of good stone at hand, it was remarkable that so much was imported. That the Irish sandstone industry has declined in importance is evident *inter alia* from the quarries at present abandoned. Mr. Drew's observations on Irish mines and minerals and steatite, like many of the other remarks in his letter, are irrelevant to the subject of the article.—E.D.

SIR,—With reference to the very interesting article upon the above in the *Builder* of this date (perhaps the more interesting to those of us who are either Irishmen or directly connected or concerned with the Emerald Isle), I may add that, not only did the Scotch workmen, when building Muchross Abbey, Killarney, about forty years since, according to Mr. Kinahan, ignore the excellent stone of the neighbourhood, and import sandstone from Leicester, but I noticed when visiting the Nunery at Kenmare (not far from Killarney) a few years since, the dressings of that establishment were constructed from Bath stone, notwithstanding the fact that they have, according to Mr. Kinahan, a very excellent stone close at hand. It was not as though there was any apparent benefit in thus importing stone from practically the heart of England to the far West of Ireland, but it was rather a case of going farther and farther worse, as the stone has already begun to decay considerably.

Their reason for doing this was, probably, the immediate saving in the cost of manipulation, but, as I should imagine they would have now to restore these decayed portions, instead of their submitting themselves to the first and only expense, the expenses will now be continuous.

I. of Portland. SEMI-HIBERNIAN.
March 28, 1892.

RIPON CEMETERY COMPETITION.

SIR,—The frame of mind in which promoters of competitions sit down to draw up their instructions to architects is difficult to realise. Apparently, if they have any common-sense to start with, they cast it all to the winds. The Corporation of the city of Ripon have, perhaps, "beaten the record" in this respect. They made up their minds to have a new cemetery,—of course they did not make up their minds themselves, the Government did that for them,—and, according to a wise law, all Burial Board works must be put up to public competition. I was induced by an advertisement in your paper to invest ten shillings in the purchase of their instructions for the same, and received for my money a plan of the ground and two sheets of (restrictions rather than) instructions, all printed on splendid paper, in a very good style, but the purport of the documents failed to fulfil the augury of their presentation.

In the first place, the ground, about 4½ acres, is to be laid out, at a cost of not more than 2000l., which sum is to pay for all roads and footpaths, levelling, planting, and the superintendence of these works. For such a design, provided the Corporation obtain a tender to do the work for a sum not exceeding the specified amount, including the commission, they offer a premium of 10l. (the secondary premium need not be considered); they do not bind themselves to accept any design, or to employ the designer; but, if the last-named event result, he is to prepare "all sketches for approval," to write "full and complete specifications," to make "working and detail drawings and estimates," to "superintend the works as landscape gardener," and give "all attendances on the Corporation." As 5 per cent. on 2000l. comes to 100l., and the premium "merges" into the commission, it is not clear that the "successful" man gets anything for doing the long list of work enumerated; apparently, he had better leave it alone severely, and yield himself to the delight of spending the premium only, or he will find that, by a wonderful bit of prestidigitation, somewhat resembling the three-card trick, the same sum covers both—in the right hand it is a premium; in the left hand it is a commission. The Corporation will employ an assessor (at what fee!), but they do not undertake to abide by his report; they put the pot on the fire, but they take care that it shall never boil. For this lovely 100l. they will not allow any one to send in more than "one alternative scheme"—that is, two designs in all! To deprive the designer of all hope of other remuneration, the Corporation announce that they will themselves make the drains and boundary walls—that is to say, the easy and remunerative work is to be given perhaps to a salaried official, or to some other favoured individual—anything, in short, rather than pay the designer for his work. But, they have one trait of munificence: any one may inspect the site, free of charge.

In the second place, they offer a premium of 200l. for designs for a chapel, a lodge, front boundary

wall (length indefinite) and entrance gates, to cost collectively 1,670l. The usual commission on this stupendous amount must form in the eyes of the Corporation, a veritable Golconda—so rigorously is it guarded in the instructions. The stretchers are to be 30 in. by 20 in.,—no other size will do,—surely an unnecessary annoyance to would-be competitors if they have others in stock! No framed or glazed drawings; all drawings are to be black and white. (Why has it come to be the rule that plans may not be coloured in competitions? The reasons against colouring elevations and sections are cogent enough; but colour is necessary to help unpractised eyes to read plans.) You may send perspectives. All the restrictions and limitations described for the laying-out designs are repeated in this.

Is this the way that an enlightened community expects to get good service? Architects must either be too wealthy to need any payment for work done, or so poor that they must accept any dole that is offered. Where is the commonsense of the Corporation of Ripon? ISISSIMA.
March 28, 1892.

JAPANESE ART.

SIR,—I think Mr. Piggott's discourse on Japanese art, referred to in your number of March 19, is, in one particular, not absolutely correct.

I have a Japanese cabinet in which the landscape on the door panels is obviously continued from one panel to the other, as if it had passed under the stiles.

The cabinet was brought from Japan for my father, in one of his own ships, about twenty-five years ago, and there is no doubt as to its being genuine Japanese. NORMAN WIGHT.
Santa Catalina, Boscombe Park, Bournemouth,
March 26, 1892.

VARNISH.

SIR,—In reply to the letter of "Inquirer" (page 231 ante), No reliable varnish for the purpose he requires is made. The best method is to get up the work in enamel—i.e., varnish colour—and Blundell, Spence, & Co., Hull, I believe, supply the best ready-made article; but painters usually make their own enamels. L.

The Student's Column.

WARMING BUILDINGS BY HOT WATER.

XIV.

BOILERS.

WE have now practically come to an end of those subjects which exclusively apply to horticultural works. With boilers, the subject of this paper, and appliances which follow, no distinction can or need be made, as, even with the ordinary description of hot water pipe that is so regularly seen in glass-houses, there is a large demand for identically the same article in heating buildings, particularly church work, warehouses, &c. If there is a distinction at all in boilers, then it is that the somewhat recent pattern upright cylindrical boiler is better suited than some of the other patterns, the saddle for instance, for withstanding the great strain or pressure that exists when an apparatus extends up several floors of a high building. It is generally understood that the saddle and similar shapes are likely to bulge if subjected to heavy pressure. This pressure, and its attendant features, will be fully referred to presently.

Within the scope of these articles it will be impossible to do more than treat the subject briefly, as will be understood. The first question is as to what constitutes a good boiler. To judge by the great number of patterns already introduced and the regular and frequent advent of new designs, it might be thought that the question had never been satisfactorily settled. Of course the primary object sought to be attained is to get the greatest possible effect from a given quantity of fuel, but in doing this there are other features that must not be wholly sacrificed. The heating surfaces of a boiler are divided into two kinds, viz., direct and indirect, which are really those surfaces which are directly against and opposite the fire, and those that are not, but are in flues. Direct heating surface is the most useful in about the proportion of three to one, that is to say, one foot of direct heating surface will heat the water as effectively as 3 ft. of flue surface. This is the rule usually laid down in books relating to this subject; but either it is intended only to apply to what we may term primary flues,—that is, the flues that receive the flame—or

heated products immediately they leave the furnace,—or the figures were arrived at before the more complex forms of boilers were introduced. The flue-heating surfaces that receive the heat directly it leaves the fire-box doubtless bear the value just attributed to them; but second and third flues do not. Third flues are now quite common (as fig. 53),

FIG. 53

if the chimney draught is sufficient, and the works require a powerful boiler occupying small space. It would be somewhat exceptional for a boiler of this description to be used in private horticultural works, as the chimneys are usually very short, and the draught proportionately poor. This does not apply, however, to professional growers, who do not study whether a high chimney is unsightly or not, so long as they gain efficiency.

It is somewhat evident that the old pattern saddle-boiler, fig. 54, has fulfilled the require-

FIG. 54

ments that are at present considered necessary in a good boiler, so far as our knowledge of the subject extends at present, for, notwithstanding its age, it is still in great demand, and the majority of new patterns follow it in some way or another, as a glance at any maker's list will show.

The particular feature to be aimed at in a boiler is, as just stated, to benefit to the utmost extent by the direct heat from the glowing fuel. If the fire is in an incandescent state we have the effect of the glowing fuel lying against the boiler plates, and which we might say are absorbing the heat; and we have radiated heat acting against all those surfaces which are opposite to, or face the fire so to speak.

This is best effected by making the boiler to envelope the fire, to encompass it, and a boiler made many years ago, much resembling a large inverted basin, was very effective in this way, although leaving much to be desired in other directions. The "terminal end" saddle boiler has the advantage referred to, without the disadvantages. It will be seen how much less effective a boiler can be made by unskilled stoking, by the fact that unless the fuel be kept bright at top, that is to say the fire not too heavily fed, we lose the effect of radiant heat, which cannot pass through the mass of black coal or coks that overlays the bright fuel, and a considerable lessening of results must ensue. Those forms of boilers that have top feeders are apt to induce careless stoking, if the attendant is so inclined.

With the direct heating surfaces of boilers we may consider that those parts over the source of heat are more effective than those that come at the side of a source of heat, in the same way that we should expect a kettle to boil more quickly if placed over a fire than if placed at the side of the fire. This difference in the value of heating surfaces is balanced, however, by the fact that the top and most effective surface of the fuel is not always as bright and active as the rest, owing to each fresh charge deadening it for the time being.

With flue surfaces we have quite a different action so far as the application of heat is concerned, by the fact that we have neither radiant heat nor the contact of glowing fuel to rely upon, and the absence of these two sources of intense heat goes far to make the effectiveness

of these surfaces much less. In addition to this, we seldom have top-flue surfaces, that is a flue bounded on the top by a heating surface (having, of course, water on the other side of it). We do not get this with the saddle or any, what we may call common, form of boiler, only when a flue is carried through the boiler itself, as fig. 55. From this it will be seen that

FIG. 55.

flue surfaces are at a special disadvantage in not experiencing any of the direct results of the fire heat, and then only having side or vertical surfaces to be acted upon or surfaces which come beneath the source of heat, and which are, as a rule, practically useless. By surfaces beneath the source of heat is meant those like the top of a saddle-boiler, which generally has a flue-way made over it. A surface beneath flame or heated gases will always be found nearly, if not quite, valueless for practical purposes, and in addition to this it so readily gets a coat of dust or fine ash upon it, that, by its poor heat-conductive properties, quite completes its uselessness. In the majority of modern boilers, especially (strange to say) those that are held to be very powerful, the illustrations show the brickwork brought right tight on to the boiler-top, and this surface in question is made no use of whatever except to carry building material.

We now have to consider the actual value of heating surfaces. Of course, a hot-water engineer does not measure up and by calculation determine the size of the boiler by allowing so much heating surface to so much pipe. The usual plan is to study a boiler-maker's list, where the dimensions of boilers are given, and their capability to deal with certain quantities of pipe under normal conditions plainly stated. Notwithstanding this, however, the question of heating-surface values ought to be treated, as no papers on these works are considered complete otherwise, and, further than this, the writer has to point out one or two things that are both important and interesting.

The first thing to be observed is that the values of boilers given in nearly all makers' lists are theoretical and not practical values, and if an engineer buys a boiler listed as being capable of heating, say, 500 ft. of pipe, and puts it to heat this quantity, or even 450 ft. of pipe, he will experience a disappointment, to say the least. It must not be thought that this is a deception on the makers' part, but they are a little to blame. It came about in this way:—Hood, who we have referred to, and whose rule the majority of boiler-makers have followed in compiling their lists, settled that one square foot of direct heating surface was capable of heating 50 ft. of 4-in. pipe, and for flue surface three times the area should be allowed (that is, 3 square feet of flue surface to 50 ft. of 4-in. pipe). By means of a rule like this, it was easy enough to arrive at the heating power of certain sized boilers. By measuring the surface that bounded the fire-box, and measuring the outer surface which would have heat conducted to it by flues, the quantity of pipe this boiler would heat was known in a few minutes.

This method of calculating the power of a boiler was, we may assume, only applicable to the saddle and older forms of boilers, and the method had a very desirable degree of certainty attending it. The fault, however, was that Hood, notwithstanding every care and allowance he could think of, put too high a value upon the heating surfaces in question, and although a boiler constructed upon these lines will actually heat the quantity of pipe given, it will only do so by forced firing, and great care in stoking and attention. For ordinary practical purposes it has been settled that the allowance is insufficient, and conducive to ill results.

This was not discovered until most of the boiler-makers had compiled their lists upon it, and the remedy adopted is to issue a little slip or notice in each catalogue, which generally runs as follows:—"The heating powers given in

this price-list of boilers are based on the allowance in Hood's standard work upon hot-water heating,—viz., 50 ft. of 4-in. pipe for each foot of direct heating surface in boiler, and one-third this quantity for indirect or flue surface; but for ordinary actual work the heating powers in the list should be reduced 30 per cent.; thus a boiler estimated to heat 1,000 ft. should only be put to 700 ft. to do its work well or economically."

Of course, a notice like this is sufficient if brought conspicuously to the purchasers' or users' notice, but, as a rule, the notice is far from prominent, and unless the buyer is accustomed to the subject, very awkward mistakes may occur. This happens very readily with architects when specifying, and also with some building contractors who undertake this work but now and again. It would be far better if the boiler-makers rectified their lists; but, of course, all would have to act simultaneously, or some lists would, to the inexperienced buyer, appear to be much higher than others, to the detriment of those whose lists gave actual, and not theoretical, working quantities. The writer's custom, and which he has found effectual, is to deduct one-third from the quantities given on the general lists, if the boiler has good and proper attention. If, however, the boiler is in a residence and has attention of a rather irregular or unskilled character, then a little greater allowance is desirable, say, a 1,000-ft. boiler for 600 ft. of 4-in. pipe, or its equivalent in smaller pipe or other surfaces.

The general and theoretical list of saddle-boilers is as follows, but the makers so compile their lists that the 30 per cent. allowance is applicable to all patterns alike:—

Wrought welded plain saddle-boilers, with from 2-in. to 3-in. water-ways according to size:—

L. W. H.	Approximate heating power 4-in. pipe.
24 x 12 x 12	300 ft.
30 x 14 x 14	425 "
36 x 16 x 16	600 "
42 x 18 x 18	800 "
48 x 21 x 21	1,000 "
54 x 24 x 24	1,300 "
60 x 24 x 24	1,500 "

This list is abbreviated.

It should have been observed, in connexion with the last article on this subject, that in calculating the cubic contents of a lean-to house, the mean height is easily got at by measuring to a point half way from the eaves to the top, as fig. 52. The same plan can be

FIG. 52.

adopted with span-houses. The question of ventilation does not require our attention in glass-house work. Ventilation is not resorted to during winter nights when the air is at its coldest, and we can afford to lose a little heat at other times. Ventilation is not of importance that it is in building works, the roof not becoming so vitiated.

STORING CEMENT.—Professor Meidinger writes in the *Deutsches Bauingenieur's Blatt*:—"With a view to preserving the quality of cement, it is by no means a matter of indifference under what conditions it is stored. In a dry atmosphere it suffers no appreciable alteration, even after lying for several months. Damp air has, however, an injurious effect on it; the hardness of the mortar (beton, concrete, &c.) prepared therefrom is diminished. It was found that cement which was kept in a dry place showed a tensile strength of 178 kilogrammes (39-16 lbs.) and an elasticity of 201 kg. (442-2 lbs.); while for that stored in a damp situation the respective figures were reduced to 135-5 kg. (29-7 lbs.) and 143 kg. (314-6 lbs.). Cement should, therefore, not be kept in damp cellars, or places contiguous to much water.

GENERAL BUILDING NEWS.

A PROPOSED CATTLE MART FOR WIGAN.—The streets Committee of the Wigan Corporation had before them on the 23rd ult. the details of a scheme or a proposed cattle mart for the town and district. The author of the scheme is Mr. Thomas Johnson, architect, Wigan, who has had plans prepared by Messrs. Maxwell & Tuke, architects, Manchester. The site for the mart, which will be situated in Prescott-street, has a frontage of 140 yards, and covers an area of 15,000 yards. Rising from Prescott-street there will be buildings for the accommodation of sheep, cattle, and pigs. The principal entrance by road will be from Prescott-street, and the gate there will be an hotel, which will occupy no side of the entrance passage, the other side being occupied by various other places. At the end of the passage there is a toll office, beyond which is the parade ground, coming direct from the railway wharf. Beyond the parade ground are more houses for the storage of animals, while nearer the railway are stores for meat, and two slaughter-houses. The slaughter-houses will be constructed that 200 cattle and 600 sheep can be slaughtered a day, and by means of overhead rails the carcasses can be sent from the stores to the railway trucks. There are also four ale rings, and provision is made for the conducting of a branch banking business on the spot. The accommodation for storing and keeping cattle provides for the housing of 800 cattle and 5,000 sheep and smaller animals. All the internal fittings are of iron, and the draining has, it is said, been carefully considered. The floors of the various buildings will be of concrete, and the inside walls will be lined with enamel bricks. The whole place will be lighted by a continuous line of skylights also so as to provide ventilation. The mart will be connected with the Lancashire and Yorkshire Railway and the North-Western Railway. At the Lancashire and Yorkshire it is proposed to construct siding and railway wharf.

HIGHER GRADE SCHOOL, PORTSMOUTH.—The Higher Grade School for boys, Portsmouth, which has a frontage of about 206 ft. and 100 ft. respectively in Victoria and Fawcett-roads, is rapidly approaching completion. The main building is constructed of brick, from the Rowland's Castle brick works, with Portland stone string courses, sills, &c. The east front, some 200 ft. from Fawcett-road, has a central tower, carrying a short conical spire, which is surmounted by a stone arch. The tower is the entrance to the school, leading to a wide corridor or small central hall, and surrounded on three sides with class-rooms, while on the fourth side are the cloak-rooms and lavatory. On the upper floor is another corridor, at one end of which is the lecture-room. At the other end is the laboratory, and the remaining space on the floor is appropriated to another class-room, a preparation room, teachers' rooms, and other rooms. The heating arrangements have been carried out by hot water in the low-pressure system. The vitiated air from the building is carried through a shaft in the tower, into which the waste steam from the boiler-furnace induces a rapid up-draught. In the rear of the main block stands a range of buildings for workshops, and the caretaker's lodge. The erection of the school is being carried out by Mr. W. Learmonth, contractor, of Portsmouth, from plans prepared by Mr. C. W. Lewis, architect, of Southampton. Mr. Henry Lawrence is clerk of works. The hot-water and ventilating arrangements have been left to Messrs. Haden & Sons, the wood-block flooring has been supplied by Messrs. Duffy & Co., London, and the driving has been executed by Mr. S. Horsman, London.

CHURCH OF ST. MARGARET'S, HARROW-GREEN, LEYTONSTONE.—On the 19th ult., the Marchioness of Salisbury laid the foundation-stone of the new church of St. Margaret's, Harrow-green, Leytonstone. The site upon which the church is being erected is situated at the corner of the Woodhouse and Cobolds-roads, near Leytonstone High-road. The designs are by Messrs. J. T. Newman & Jacques, of London, and the work has been entrusted to Mr. S. J. Scott, builder, of Walthamstow. The church will be the thirteenth century style, and will be constructed of brick. Seating accommodation will be provided for 321, exclusive of the choir.

CLUB BUILDINGS, NEWMARKET.—On the 18th ult. the foundation-stone of the Newmarket Townspeople's Conservative Club was laid by Lord Hesse. The site of the club is at the corner of Water-street. It will be built of red bricks, with Bath stone facings. There will be an entrance hall, an assembly-room, 60 ft. by 29 ft., a billiard-room, and committee rooms, bar, lavatory, &c., on the ground floor, and rooms for the caretaker on the first floor. The roof will be covered with broseley tiles. The estimated cost of the building is 1,010. The architects are Messrs. Holland & Son, and the builders Messrs. Hunt & Blyth, of Newmarket.

NEW CHURCH, GREENOCK.—On the 24th ult., the new Congregational Church in St. Lawrence-street, Greenock, was opened. The new buildings measure 120 ft. along St. Lawrence-street, the church occupying the east or higher portion of the

ground, and the hall buildings the west end. There is sitting accommodation in the church for 550. The pulpit is an open platform, with a lower platform in front for the choir; and behind is a recess for an organ. The church longitudinally is divided into five bays, three of them having single lancet windows. The gable to the street is flanked by a turret spire 67 ft. in height. The hall buildings comprise a Sabbath-school hall, with two class-rooms, a vestry, and deacons' room; and there is a kitchen under the basement at the west end of the church. English Gothic is the style of architecture. The cost is about 2,000. Mr. D. B. Stewart, Greenock, was architect.

RESTORATION OF PARISH CHURCH, WINTERBORNE STICKLAND, DORSET.—The parish church at Winterborne Stickland, Dorset, was opened on the 29th ult. after restoration. To the tower a new roof and nave have been provided, and the walls, as well as those of the main structure, have been repaired and defective stones replaced. On measuring a portion of the chancel roof for repair, portions of an old oak wagon-headed roof were discovered. This has been carefully restored and made good. Portions of an old oak carved screen were also found behind the wooden lining of the doorway, between the chancel and the chapel. This also has been restored, and left in the position in which it was discovered. A discovery was also made in the porch of a rude sculpture of the Holy Rood. The sculpture was found bedded with the faced side hidden in the east wall of the porch. The walls, which were probably rebuilt in 1716, says the *Dorset County Chronicle*, have all been underpinned with concrete, as the foundations were found to be very defective. The roof of the porch has been taken off and repaired where necessary. A new heating chamber has been built at the north side of the tower for heating the church with hot air, the apparatus being supplied by Messrs. Haden & Sons, of Trowbridge. The "Skinner" mausoleum has also had its roof repaired. In the interior, the old gallery and organ have been removed; the tower has been thrown open and the west window is plainly seen; the arch from the nave to the tower has been cleaned and repaired; and the old high-backed pews have been replaced by modern pitch-pine seats. The floor within the Communion rails is of tiles of various colours, laid in pattern. The entrance to the mausoleum is ornamented with oak carving. The floor of the body of the church is formed of wood blocks laid on cement. The windows are glazed with cathedral glass with a coloured design in the centre of each light. The walls are coloured grey. Mr. W. J. Fletcher, of Wimborne, was the architect; Mr. George, of Milton Abbas, the contractor; Mr. Gillingham executed the plumbing, glazing, and painting; and Messrs. Meyrick & Son, of Glastonbury, undertook the renovation of the old oak roof.

SANITARY AND ENGINEERING NEWS.

LOUGHBOROUGH SEWAGE DISPOSAL.—The Borough Surveyor of Loughborough, Mr. A. V. Cross, has prepared a scheme for the sewage disposal of Loughborough. The population of Loughborough is about 18,000. A provisional agreement has been signed for the purchase of 33 acres of land. It is proposed to pump the sewage and treat it by chemical precipitation in tanks, followed by filtration through sand. There will be three precipitation tanks, of a total capacity of 600,000 gallons. There will be a storage tank for night sewage, and buildings for pumping and mixing-machinery. The dry ash refuse from the town will be carted to the works and utilised in "forced draught" destructors for the production of steam for pumping the sewage. About half the land will be laid out with carriers and under-drainage for land filtration. The sewage will be brought to the site through 21-in. and 24-in. iron intercepting outfalls, the sewers being laid about 8 ft. below subsoil water-level. The Town Council have decided to borrow 20,000. The Council have engaged Mr. W. H. Radford, C.E., of Nottingham, to act as Consulting Engineer throughout the preparation of the plans and the execution of the work, and various amendments and alterations suggested by him have been incorporated in the scheme.

DRAINAGE AND SEWAGE WORKS, STONE.—The Stone (Staffordshire) Local Board a few months ago invited engineers to submit designs for the drainage of the town and for the disposal of the sewage, and a premium of 100 guineas was offered for the most suitable. Twelve schemes were submitted. A special committee, having carefully considered these, have now reported in favour of the scheme prepared by Mr. Theo. S. McCallum, C.E., of Manchester; and at a meeting of the Board on March 24 the committee's recommendation was adopted. Every street in the town will receive a separate sewer. About nine-tenths of the sewage will reach the purification works by gravitation; the remainder will have to be pumped. The sewage will be purified by the "International" process—precipitation by "Ferrozone" and filtration through "Poliarbit." The sludge will be pressed. A large proportion of the sewage of Stone consists of brewery refuse.

FOREIGN AND COLONIAL.

FRANCE.—A bust of Dr. Damascino, the work of Alfred Bouche, sculptor, has just been erected in the Hall of the Faculty of Medicine, Paris. The sculptor Michel Malherbe has been commissioned to execute a monument to the poet Ephraim Michiel, which is to be paid for by a subscription committee.—The Department of Fine Arts has just presented to the Faculty of Literature in Paris (for the decoration of one of their amphitheatres) a Gobelins tapestry representing the dedication of Homer. It has been executed about fifteen years after a copy of Balzac and Dumas, which forms a ceiling in one of the halls in the Louvre.—The Fécamp Museum has just received an addition in the shape of a very fine drawing by Ulysse Butin, one of a collection belonging to Louis Lelois.—June 2 is the day fixed for the inauguration of the Monument at Agen to the memory of the leaders of Lot and Garonne.—The French Alpine Club is going to hold an exhibition of pictures at Gronoble, which is to consist entirely of Alpine scenery. This exhibition will last from July 10 till August 31.—The statue of Admiral Brest at Colmar has been defaced by some unknown persons.—The Municipality has offered a reward for the discovery of the authors of this act of vandalism.—The new Lycée of Argentineuil at Mantes is to be opened on May 29 instead of April 25.—The death of M. John Flornoy, artist, is announced from Nantes. In the recent exhibition in that town he had some fine landscapes.—We have also to record the death of M. Andru, who had a very fine collection of works of arts at Tours, and one which was much appreciated by connoisseurs.

MISCELLANEOUS.

EXHIBITION OF WORKS IN WOOD.—It is announced that the Worshipful Company of Carpenters and the Worshipful Company of Joiners will hold an exhibition of works in wood and wood-carving in May next. All particulars as to prizes, &c., may be obtained at Carpenters Hall, London Wall, where the Exhibition will be held.

THE NEW FRENCH EMBASSY IN ST. PETERSBURG.—According to the *Grashdanin*, the new French ambassadorial office is now ready. It is a palace situated on the Neva. On the ground floor are the official rooms of the Ambassador. The walls are hung with real Gobelins tapestries, and the entire furniture is of historic and artistic value. The colours used throughout the building are purple and olive-green. On the first-floor are situated the fête rooms, and in the grand reception-room, the colour prevailing being red, the walls are hung throughout their entire length with costly Gobelins tapestries. Next to this room is situated a smaller chamber, in olive-green, ornamented with valuable paintings and huge mirrors, and next to this again is a card-room, in red. On the same floor are situated the grand banquet hall and a smaller dining-room for the personnel of the Embassy. In the former is mounted a stately group in marble, representing Lully, in the dress of a kitchen boy, playing the violin before the Duo de Montpensier. Between the two latter chambers is situated the concert-hall—a chamber with rich stucco gold ornamentations. From this hall huge portals open upon a balcony, affording a fine view of the Neva. The French not only one of the finest buildings in St. Petersburg. The Gobelins tapestries therein alone are valued at several million francs.

AN ARTIFICIAL STONE.—The *Moniteur de la Céramique et de la Verrerie* gives a formula for an artificial stone.—Forty parts of granite, fifteen parts of flint, and five parts of feldspar are mixed as a fine powder with four parts of plastic clay and slightly moistened. The compound is then powerfully compressed, dried, and burnt at a high temperature in a porcelain-oven. The stone thus obtained is stated to be capable of withstanding great pressure, and is impervious to water.

THE ENGLISH IRON TRADE.—Depression still characterises the English iron trade. Business in both crude and manufactured iron is extremely limited; few changes in quotations, however, are recorded. For tin-plates the demand continues quiet, and in the steel trade rail mills and works engaged in manufacturing shipbuilding material are those best employed, although only to a moderate extent. In the shipbuilding and engineering trades a quiet tone is manifested. The coal trade is rather inactive.—Iron.

THE RAILWAYS OF THE WORLD.—According to the *Eisenbahn Zeitung*, the railways of Europe increased from 214,325 kilometres in 1883, to 220,261 kilometres in 1889, or by 12.6 per cent. The largest increase, 119.2 per cent., is shown by Greece, Roumania coming next with 61.2 per cent. The increase in Great Britain and Ireland was 4.0 per cent. In the United States the increase was 52,779 kilometres, or 25.1 per cent. In British India the increase was 6,180 kilometres, or 32.0 per cent.; in the Cape Colony, 80 kilometres, or 2.9 per cent.; and in Natal 190 kilometres, 102.1 per cent. In Australia the increase was 4,975 kilometres, or 38.3 per cent. The increase for the entire world was 108,600 kilometres, or 22.3 per cent.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

Table with columns: COMPETITIONS, CONTRACTS, PUBLIC APPOINTMENTS. Includes details on work nature, advertiser, premium, designs, and nature of work/materials.

A WARNING TO BUILDERS.—At the North London Police-court, on March 25, Messrs. Parsons & Co., contractors, were summoned for executing work at the Lead Works, S. utgate-road, Islington, without having previously given notice to the District Surveyor.

centre light, and the figures of Mary Magdalen, Mary, the mother of James, and Salome, in the two side lights. The window was designed and executed by Messrs. Mayer & Co., of Munich and London.

WALLS OF INSUFFICIENT THICKNESS.—Mr. Pereira, a builder, was summoned by Mr. C. Fowler, District Surveyor of Shoreditch, for erecting a building with walls of a thickness less than as prescribed by the Building Act.

MEETINGS. SATURDAY, APRIL 2. Architectural Association.—Visits to (1) the Newington Weights and Measures Office, Union-road, Blackman-street, S.E. by permission of Mr. Thomas Blackhill.

RECENT PATENTS: ABSTRACTS OF SPECIFICATIONS. 18,755.—SAWS: J. Jung.—This relates to an invention for using saws with teeth presenting sharp knives.

PORTLAND CEMENT TESTS.—Mr. V. de Michele, the inventor of the well-known testing machine which goes under his name, sends us his suggestion for a specification for cement under his test, which he considers may be relied on to ensure good sound Portland cement.

MONDAY, APRIL 4. Royal Institute of British Architects.—(1) Paper by Signor Luca Euterpi on "The Construction of the Central Pillars of Milan Cathedral." (2) Mr. J. Henry Gardner on "Wrought-Ironwork: the Renaissance Period." 8 p.m.

6,845.—VENTILATORS: J. W. M. Peyton and O. Y. Rhodes.—This specification relates to a new form of apparatus specially designed for ventilating or removing foul air from rooms, railway-carriages, drains, soil-pipes, and the like.

REMOVAL.—Messrs. Prickett & Ellis inform us that they have removed from No. 59, Chancery-lane, to No. 57, the adjoining building.

TUESDAY, APRIL 5. Institution of Civil Engineers.—Mr. H. Alfred Roebeling on "The Sewage-Farms of Berlin." 8 p.m. Society of Arts (Foreign and Colonial Section).—8 p.m.

6,859.—GAS FITTINGS: J. Fairbank.—This relates to a new form of gas fitting, which is of white light, so that the escape of gas while not burning. The inventor constructs a spring of brass, steel, or other suitable material, having notches, steps, or grooves at one end.

FIRE AND WATER.—This little periodical for April gives as a supplement a sheet of illustrations, to a small scale, of some new English fire-brigade stations. It also contains much interesting information relating to fire extinction, including a description of a system of fire-recording adopted by the Chief of the Chicago Fire Brigade.

WEDNESDAY, APRIL 6. Royal Archaeological Institute.—(1) Mr. A. L. Lewis on "The Stone Circles of Britain." (2) Mr. L. Lind on "Widows and Wives." 4 p.m. St. Paul's Ecclesiastical Society.—Mr. F. J. Beckley on "The Round Towers and Romanesque of Ireland." 7.30 p.m.

6,869.—GAS FITTINGS: J. Fairbank.—This relates to a new form of gas fitting, which is of white light, so that the escape of gas while not burning. The inventor constructs a spring of brass, steel, or other suitable material, having notches, steps, or grooves at one end.

THE WATER TUNNEL UNDER THE MERSEY.—A comparatively small but nevertheless essential part of the great scheme for bringing water from the Vyrnwy Valley to Liverpool,—it might be more fully described as the last link in the gigantic chain,—has been broken to a successful termination.

THURSDAY, APRIL 7. Society of Arts (Indian Section).—4.30 p.m. Society for the Encouragement of the Fine Arts.—8 p.m. Society of Antiquaries.—8.30 p.m.

6,879.—GAS FITTINGS: J. Fairbank.—This relates to a new form of gas fitting, which is of white light, so that the escape of gas while not burning. The inventor constructs a spring of brass, steel, or other suitable material, having notches, steps, or grooves at one end.

STAINED GLASS WINDOW, ABERROATH.—A Munich stained glass window has just been erected in the St. Mary's Episcopal Church, Arbroath, N.B. The scene represented is the Angel at the Tomb in the

FRIDAY, APRIL 8. Institution of Civil Engineers (Students' Meeting).—Mr. R. J. Darley on "Some Forms of Petroleum Engines." 7.30 p.m. Royal Institution.—Professor W. E. Ayrton on "Electric Motors, Motors, and Money Meters." 9 p.m. Bradford Historical and Antiquarian Society.—Mr. W. Claridge on "Bradford Grammar School." 8 p.m.

6,889.—GAS FITTINGS: J. Fairbank.—This relates to a new form of gas fitting, which is of white light, so that the escape of gas while not burning. The inventor constructs a spring of brass, steel, or other suitable material, having notches, steps, or grooves at one end.

The Builder.

The Architecture of the Lake Dwellings of Europe.

It is proposed in this essay to give a rapid survey of the facts already known in regard to this remarkable class of building works, mostly of remote antiquity, which until comparatively recent times were altogether unknown; to trace their extension into many of the countries of Europe, indicate some of the modes of construction adopted, with notes on some of the works discovered on the various sites.

It is now almost an old story, which need only be glanced at, to refer to the winter of the years 1853-4, when a very great drought and continued cold caused an unusual event in the Swiss lakes. Not only the rivers, but the lakes, sank much below the oldest recorded level, and, in consequence, much of the shores that had been covered with water was left high and dry. The inhabitants took advantage of this state of things to reclaim portions of the land, and at Ober Meilen, on the Lake of Zurich, the workmen were surprised to find that the land they were claiming was covered by a mass of wooden piles firmly driven into the bed of the lake, but so rotten as to indicate very recent age. The piles commenced about 300 feet from the existing shore, and extended parallel to the head of the lake about 500 feet further into the water until it became suddenly deep. They might be counted by thousands in the portion operated upon; they were driven below and covered by an upper bed 2 ft. thick, consisting of yellowish mud, such as is deposited all over the surface of the lake where not much exposed to the action of the waves. Beneath this is a bed of sandy loam from 2 ft. to 2 ft. 6 in. in thickness, black with organic matter, called "relic beds" by Swiss antiquaries, and in these the heads of the piles and many antiquities were found. Below this was a bed of clean loam, of great thickness, into which the piles were driven, but nothing was

found. The piles are of oak, beech, fir, and birch, from 4 in. to 6 in. thick. Some are whole trunks, but the majority of the sizes named consist of split stems, the ends being either pointed by fire, or in some cases roughly hacked into form by stone implements. Only a few bronze articles were found, the others consisting of stone celts, chisels of varying size, form and material, several being of stone foreign to Switzerland, some of nephrite, and some few articles of flint being also met with, this material being rare in Switzerland. This, the first site met with, proved to be one of the oldest, since it belongs to the age of stone, with evidences of some, but not much, later occupation.

The description given is more or less typical of numberless other discoveries that were made in an incredibly short space of time, in many other of the Swiss lakes, varying only in details of construction, extent, and in the articles found in the "relic beds," which latter have been invariably found beneath the ordinary and most recent deposit. Discovery followed discovery: an eager hand of investigators emulated another in making search, either by excavations wherever possible, or by dredging the lake bottoms, and all were well rewarded.

A map of any Swiss lake, on which the discoveries are recorded, affords ample subject for comment, for the lake dwellings prove to be remarkable in respect to their numbers, indicating the existence of a large population. Almost all along the lake of Neuchatel, the sites which have been found up to the present are at distances averaging about an English mile apart, or fifty sites in all. On that of Bienne four sites are met with within a single mile. On the shores of the little lake of Morat fifteen sites are indicated in Keller's "Lake Dwellings," in a shore-line of about eleven miles. The lake of Geneva is dotted with a remarkable number of sites from the capital quite up to and past Lausanne. These sites are in some cases just opposite to modern villages, suggestive of what is probably a fact,—that, when the lake dwellings were finally given up, their inhabitants settled on the mainland opposite to their old homes.

The discoveries in Switzerland were not

likely to remain for long isolated. Investigators in other countries,—Italy, Holland, Germany, France, Great Britain, Austria, and elsewhere,—speedily had discoveries to record; and what seemed at first but a peculiar mode of building of an unknown people, now has spread to the greatest part of Europe, revealing to us an entirely new and unexpected field of study. Since these structures afford, perhaps, the oldest system of building construction at present known, the system claims attention, and the more so since the traditions of early architecture all refer to a time when the grandest features of Classic art had their prototypes in structures of wood. But the buildings of Switzerland are, doubtless, of earlier date and of simpler design than the earliest and most incipient form of the Doric order in its first wooden conception.

Investigators of the lake dwellings soon became aware that various modes of building were adopted, and these will now be referred to. The simplest type consists of a platform supported on piles driven into the shallow sides of the lakes, generally of rectangular form, connexion with the shore being obtained by means of a narrow causeway of piles supporting a timber gangway. On the platform huts were erected, forming the habitations of the tribe or settlement, together with enclosures for cattle. A large hearth was placed in the centre of each hut, hedged upon a layer of clay to prevent the timbers of the platform from becoming ignited, and in some instances there are indications of long occupation, as is evidenced by there being one hearth above an older one at a higher and more recent level. The flowing waters of the lakes passed freely between the piles, and trapsdoors in the platforms afforded a ready means of disposal for the refuse of the settlement into the water. By this means a vast amount of *débris*, broken pottery, worked bone, and other articles numberless in quantity have been deposited, all of which help to form the "relic bed" which is met with on the site of each settlement. The piles are found, in most cases, singly, in others close together, generally placed with a certain amount of regularity, in parallel rows, but sometimes in great confusion of position. The points show very distinctly the marks of the

implements with which they have been cut, and distinction can be made as to whether with flint, by fire, with bronze, or, in the late examples, with iron hatchets. The piles are formed close to the shore in the earliest examples, but the revolution caused by the introduction of bronze is at once marked by the piles being longer, and driven into deeper water. In some instances a settlement of the Stone Age has been found, extended in this way into deeper water; in other instances, fresh formations are found. The piles being cut to a level, the platforms were then laid above them, the beams of support being fastened to them by pins or by mortises, central hollows, or notches. The floors were formed by unbarked stems of trees, in some cases in two layers, and, in one of the Italian examples, of rough split boards. The floor was then covered with clay and gravel firmly pounded down into position; and in some of the Italian examples, which resemble in other respects those of Switzerland very exactly, there is a layer of large pebbles.

In a few cases, the outer line of piles had an upright enclosure of wattles or hurdles above water-line, in order, apparently, to break the force of the waves from the piles. While this advantage would be secured, it would have to be at the risk of the retention of the decaying mass of deposit thrown in from above, and which would have been better washed away.

Another mode of construction of the platforms was for a mass of earth and stones to be brought from the land and thrown into the water, as the site of the intended settlement. By this means a certain amount of earth was deposited to form a mound beneath the water, into which the piles were driven, stones being afterwards deposited between the piles to steady them and keep them better in position. This arrangement is far from uncommon, especially in certain of the Swiss lakes, and is known to antiquaries as a "Steinberg." In some examples the "Steinberg" has been brought to the surface, and at Nidau there is evidence of its having been occupied by the Romans. This site has been known for centuries, but the mass of ancient pile work beneath the later deposits has only been observed in the recent years of these discoveries.

While the formation of platforms upon piles has existed from the earliest beginnings quite to the Iron Age, with but little alteration, except in better workmanship, another mode of construction has been noticed in many instances. The platform is carried on a solid mass of sticks, small trees, stems, and such like, in fascines piled together in the water of the lakes, and kept in position by a few piles driven here and there to steady the mass. When it was sufficiently consolidated the platform was laid. This system is found mostly in the smaller lakes, but a high antiquity has been assigned to them which is sufficiently attested by the nature of the articles found.

It is far from improbable that this system is the older of the two, and certainly its simplicity would be likely to commend itself to an early people rather than the elaborate system of felling trees by means of flint implements, with all the labour of sharpening them, driving them into position in the waters of the lake, together with the framework of the carpentry platforms.

Sufficient attention has hardly yet been given by Swiss antiquaries to the difference between the systems named in regard to which is the earlier of the two, but a study of the subject, and of the articles found, can hardly leave a reasonable doubt that the formation of solid platforms of twigs and boughs, readily carried and deposited into position, was the earlier of the two. The insertion of a few guiding piles would readily enough be called for as a necessity, and this would lead in process of time to their entire use for the supporting of the platforms, for the advantage of obtaining a ready output for deposits.

Of the construction of the Dutch terpen,

and the crannoges of Ireland and Scotland, mention will be made later.

The dwellings above the platforms were formed of small piles, and the framework filled in with branches, and wattle-covered with plaster inside and out. This is no mere matter of conjecture, for in several instances, quantities of the plastering have been found in the submerged mass of *debris*, with the marks of the wattles remaining. Fire has frequently caused the destruction of the settlements, and in such cases the whole mass of the burnt material is found where it fell. Nor were the surfaces left undecorated, if we may judge by the fact that in one of the sites met with on the Lake Bourget portions were found ornamented with incised lines and concentric circles, while on others the circles, arranged in a row, were filled in with the Fylfot cross. But this site is of late date. At Windisch, the clay coating was seen by the late Dr. Keller to be coloured white and red.

The covering of the huts was of thatch, various portions having been found; white moss was often used to stop the inequalities of walls and roofs. The huts were possibly circular in form in some few instances, but, apparently, for the most part rectangular, traces showing the sizes of the apartments having been met with in many places, in Switzerland and Italy especially. At Schussenried a settlement has been found, abandoned probably by its occupants on account of its being overgrown by peat. It is, at least, completely so overgrown now, and deep beneath it. One of the huts has been excavated, and found to have been about 33 ft. long and 23 ft. wide, divided into two unequal chambers. Other sites have produced indications of buildings of very similar size. In others, a sort of skirting-board is found on the platforms marking the sites of huts. In some places it is evident that they must have stood very close together, with compartments for cattle,—doubtless for security of keeping.

Safety from attack, with convenience for fishing, &c., appears to have prompted this singular and laborious mode of construction, although Switzerland did not possess, even at a remote period, wild animals of great ferocity, and foreign foes might have turned these timber dwellings speedily to ashes. Although many have suffered from conflagration, there is but little or no appearance that this was the work of an enemy. No traces of surprise and massacre, at least, are to be met with, except in the settlement, of late date, at La Tène. The general absence of human remains points forcibly to the peaceful existence of the inhabitants through a very lengthened period. But that they did actually indulge in warfare is apparent from the mass of offensive and defensive weapons which abound in all the sites, early as well as late; while at Estavayer something decidedly like a bronze arrow-head, with a groove for poison, has been found. The lake of Bienne and some other places have produced cups formed out of human skulls,—most probably those of enemies slain in battle.

It could hardly be expected otherwise than that the reports, made at intervals rapidly following one another, of the discoveries taking place in Switzerland, would have the effect of stimulating inquiry in other districts. Italy was the first to follow, by directing systematic inquiry into the subject. This is no more than was to be expected, for records of many chance discoveries were in existence, some of which, notably those made in the works of deepening the harbour of Peschiera, in which remains had been found very analogous to those in Switzerland. Some of these were communicated to Professor Keller, who pronounced upon their general resemblance and the importance of further investigations. But, indeed, inquiry had only to be made to produce evidence of a great many discoveries which had previously been made. These were eagerly sought for by Professor Dart. Gastaldi, who published, in 1862, a small volume full of records of such discoveries. At this early stage, the Anthropological

Society of London rendered excellent service by the publication of a translation, by Mr. Harcourt Chambers, of Professor Gastaldi's book, under the title of "Lake Habitations and Prehistoric Remains in the Turbaries and Marl Beds of Northern and Central Italy." This was in 1865. The book is filled with records of discoveries of objects of remote antiquity, which evidently had no relation to, and were of much earlier origin than, any of the antiquities previously known which the prolific soil of Italy has yielded.

Aided by an opportune grant from the Society of Natural Sciences at Milan and the zeal of a number of explorers,—M. Desor, Sig. Stoppani, M. Mortillot, the Abbé Rauchet, Pignorini, Chierici, Strobel, and many others,—investigations were made in all directions followed by a great number of discoveries. It is neither possible nor necessary that these should be examined in detail, but the general results are as follows. Avoiding to a great extent the larger of the Italian lakes, for the reason which was very soon recognised,—namely, that the cliffs are rocky and so precipitous that no shallow water is to be found, or any soil into which piles could be driven,—the lake builders attached themselves to the smaller lakes, where these conditions do not occur.

Several sites around the little Lago d' Varese have proved to be those of pile dwellings, while the whole of the Isola Virginia has been shown to be of artificial origin, for its whole area has been found to be filled with piles, the number of which have been estimated to be between 35,000 and 40,000, the area of the piles being now filled in with solid earth, probably, as supposed by Professor Castelfranco, after a fire had consumed the earlier wooden settlement towards the close of the Bronze Age. Articles of remote antiquity, down to others of Roman times, have been found here, the earliest at the lowest level. The small adjacent lakes of Monate, Varano, and Biandrono, and many others have all rewarded the explorers, the objects found, at the latter place, being in many instances in regular sequence from the polished Stone Age to that of Iron.

All the sites found, so far, have been lake dwellings of the Swiss type—placed in shallow water, close to the land, with traces of a bridge across to the latter. But there is another class of buildings to which Italian antiquaries have given the name of *terremare*. "Mare" is, in fact, the rich, marl-like soil called *mare* by Prof. Gastaldi. It was noticed at an early period that these sites were to be found in places far removed from where water is now found, or at a higher level; that they had been originally surrounded by a ditch and bank, and that the original platform, supported on the usual piles of a lake dwelling, was sometimes covered by a second platform and piles; and in some few instances, by a third, the whole being now filled in solid by what has proved to be the accumulated rubbish from droppings made from the various platforms. This deposit is now eagerly sought for by the agriculturist for the purposes of manure, and hence the constant discovery of new dwelling sites. A lengthy controversy arose with respect to the mode of erection stated above, which involves the supposition that when the thrown-out refuse came up to the floor-level of the first platform the second then became necessary; after that the third. It is but again the principle by which an Eastern village is now found to be raised on a mound, formed by the nameless droppings of rubbish, which cover traces of more ancient dwellings. The weak point of the theory, to us, is, that much of the deposit seems to have been stratified by aqueous agency, and, although this might be easily accounted for in the case of the first platform, in some examples, supposing that there was then some shallow water, yet which would be an impossibility so far as regards the upper ones, except on the hypothesis that, at one time, the country was all at a much lower level, that it sank again and again, and that it has

since been raised up to a level above the present water-line. But this is not an idea that appears yet to have been discussed, and it is only mentioned since such changes of level have occurred again and again in other parts of Italy, and it would account for all appearances.

Only a few of the curious results that have already been recorded can be glanced at. At Castelnuovo the devoted explorer, Chierici, found beneath a Bronze Age terramare, indications of an older settlement. At Lagozza, no animal remains of any kind have yet been found, but ample evidences of vegetable food in the way of hazel-nuts, wild apples, acorns, wheat, and six-eared barley. Here were also traces of cherry and poppy-seeds, &c., while there were many others also found by Prof. Sordelli of wild flax. At Peschiera, Prof. F. Unger has recognised the distance of rye, and also the vine. The bones of dog, sheep, horse, ox, pig, goat were common, and occasionally the bones of an

Many of the structures are rectangular in form, and are remarkable from the fact that they frequently face the cardinal points, or nearly so as to justify the belief that they were set out to face sunrise at the varying periods of the year when first begun.

Our observations, so far as Italy is concerned, must close with a brief reference to the exploration of the remarkable terramare of Castione, undertaken in 1877 by funds provided by the Minister of Public Instruction, and directed by Prof. Pigorini. Judging by the area of ground excavated, the settlement consisted of a quadrangular block, with an inclination 30 deg. from east to north. The central area consists of an enormous number of uprights, which supported the wooden platform, the evidence being that the entire area below was once open, and left so as a convenient place for the deposit of rubbish. Around the block was a series of projecting buildings, the square towers of defence. These were made of lengths of timber crossing and meeting at the angles, and projecting irregularly, the internal space of each being filled solid with earth. Beyond was an earthen rampart and ditch. In process of time, the area beneath the platform became filled up, and then the builders enlarged the rampart and proceeded to erect a second platform above the first. The recent explorers have ascertained themselves that, although the site was once covered with water, it was not so during the period when the erection took place, as on what was then somewhat rising ground. The earthen rampart is some sort of defence as to this; but the whole structure, with its indications of double platforms, has to be excavated from a fairly deep bed of recent aqueous deposit, which covers all the locality. The theory is proposed that the projecting towers were intended to render support to the earthen bank outside them,—an idea not involving very profound structural knowledge. It is far more likely that the towers were to act as external buttresses to a large internal mass of pile work. Where piles have been met with, feebly fixed as they must have been, and with but little, if any, strutting, except the top platform, held together, not by nails, but with the rudest bolts and mortises with pins, it is not to be wondered at that the mass of uprights would suffer deflection. Indeed, every photograph of the condition of either Swiss or Italian piles, taken when first found, readily states such deflection, and that it must have been a serious matter. Here, indeed, at Castione, the remedy proposed has not been adopted, for the piles have all sunk out of the perpendicular, and are all deflected towards the towers.

More recent researches have revealed the fact that late dwellings or terramare are to be found all over the valley of the Po, from a point quite away to Bologna, while the city of Parma is studded with sites already discovered. In other directions the amount of discovery has been great, and is constantly on the increase. In addition to the results already noted, there are bones of the

bear, fox, dog, wolf, badger, pole-cat, wild boar, donkey, roe deer, fallow deer, reindeer, sheep, hare, wood-mouse, porcupine, wild cat, and hedgehog. The horse is of two kinds, and is not uncommon. The raven, domestic fowl, stork, heron, wild goose, duck, and tortoise, have also been traced.

From Italy to Holland is not a very connected passage; but, in the low-lying lands bordering the North Sea, from West Friesland,—in fact, right away to East Friesland,—there are a great many sites which very closely resemble those of the Italian terramare, with certain differences which are readily noted. They are called Terpen in Holland, and Warfen in East Friesland. Dr. Monro, in his invaluable "Lake Dwellings of Europe," has given an interesting notice of these structures, including a visit to a terp near the town of Dokkum, or about four or five miles from the present seashore. Here, in a flat country he found the terp to consist of a slight elevation, crowded by a small, ancient church and a clump of trees. Workmen were busily engaged in the removal of the elevated mass, where not covered with buildings, for the purposes of manure, and the excavations revealed a section 15 ft. or 18 ft. high, in which he soon detected upright piles of oak in the last stage of decay, while elsewhere was a heap of oak beams recently removed from the diggings. The mass of the mound was stratified. These structures, which are very numerous in the district, appear to be those referred to by Pliny, who, in his "Natural History," describes the wretched race of the Chauvi, who construct their cabins or mounds just high enough to be above the level of the sea which covers the entire land twice daily, far and wide, and who, on the receding of the tides, catch the fish entangled in the land.

We have, in the mound described by Dr. Monro, where the uprights were clearly intended to support a timber flooring on which the huts were erected, the same system of erection as in the Italian terramare, and also the same accumulation of earth beneath them, now quite covering the timbers, which is here, as there, highly prized by the agriculturist for manure. The objects found, however, are of later date. Up to the present time no objects of very remote antiquity have been met with, while, indeed, they continue to Medieval times. Roman Samian ware, Saxon and later coins, tiles, &c., have been found. It is doubtful, too, if any additional discoveries are likely to arise on other sites, since exploration of several have been so completely made, the excavations revealing the entire contents of many of these structures, leading to their entire removal. The whole character of the country is now changed, and the sea now no longer invades it, the sea-walls, erected in Medieval times, having steadily kept out the ocean, allowing of the cultivation of the land which was once covered by its waters.

In 1883, Dr. Hartmann investigated the prehistoric structures which exist in the Holstein Fen districts, near the Elbe. Here there are artificial mounds from 13 to 23 feet high, covering structures of piles and fascines, the piles being apparently placed to keep the latter in position. The elevation was skillfully adjusted to carry the structure above the tides where the country was open to the flow of the sea, now happily excluded, and it is supposed by Dr. Hartmann to have been based upon a layer of cowdung. Above the first erection, examined in one instance, was a second, and a third above that again, the whole being now covered with a mass of debris as in the other cases. The belief in pile dwellings here is not entertained by Dr. Hartmann, but the general resemblance of construction goes far to warrant our idea that here, as in Italy and Holland, the mode of building was similar. The general mass of objects met with relate to very ancient times, but in one of the structures investigated, masses of iron slag were found.

The Rhine district has produced several sites, but the objects found appear to be later than those of Switzerland. That at Bebro,

near Mayence, appears to have been in existence in Roman times. At Billigheim, while oak square-cut beams and pottery of late date have been found, prehistoric flint implements have been discovered at a lower level. At Giegelow, North Germany, late objects as well as early ones have also occurred. At Spandan, near Berlin, in what was formerly a lake, piles partly burnt have been exhumed, and the same may be said of many another site, already more or less investigated, in Poland, East Prussia, Livland, in Carinthia and Carniola, Pomerania, and Prussia; in Austria and Hungary; along the Danube, and many more.

At Zahsow, near Cottbus, and at Potzlow, lake dwellings on piles have been found beneath the early constructions called Burgwalle by German antiquaries. In other northern country sites curious examples of circular huts have been discovered; and at Bouslack was the curious structural feature of some of the timbers being tied together with thongs of birch.

One of the most singular constructions was that in the Lake Persanzigersee, where what had once been a small island was surrounded by sixty or more rectangular enclosures, in the water, erected in the usual manner of log huts, with horizontal beams notched at the angles. Upon these platforms had been erected, which contained the huts of the settlement. A bridge connected the island with another mound nearer the shore, which was itself connected to the mainland by a second bridge. The quantity of timber used had been enormous.*

NOTES.

WE have received from Mr. John Waugh, C.E., of Bradford, his report to the Coroner on the fall of the chimney of Messrs. Thornton's mill at Cleckheaton on Feb. 24, by which fourteen persons were killed and a considerable amount of property destroyed. The history of the chimney can leave no surprise at the catastrophe. It was built in 1850 under the superintendence of a hybrid person described as "a joiner and architect." When it was 40 yards in height it was found that it had gone out of the perpendicular by about 7 in. in a south-easterly direction, a circumstance which at once showed either that the foundation was inadequate or that some of the lower portion had been badly constructed, and it ought to have been taken down again and rebuilt under better advice. It was however straightened as it stood (the particulars of the straightening operation are not given). On February 8 of this year the attention of the owner was called to signs of distress in the chimney, and Messrs. Moulson builders of Bradford sent one Harrison to look to it, who said vaguely that "the chimney appeared all right," but advised the renewing of the brickwork where the cracks and the bulge existed, for which purpose considerable portions of the brickwork appear to have been removed on each day and made good with new brickwork. Harrison had, on his second visit, practically condemned "the chimney, saying 'you had better get out a new foundation and build a new chimney';" but this advice seems to have fallen on deaf ears.

"Before leaving for the night of Wednesday, the 24th, Harrison thought it advisable to prop the loose brickwork of the bulge from the boiler-house wall; whilst in the act of performing this operation, he felt the brickwork of the outer shell press against his knees, the chimney then settled down, and finally tumbled over in an easterly direction, destroying about half the adjoining mill, and killing fourteen persons."

Mr. Waugh's Report further says:—

"In the building of a chimney it is customary to select the bricks from the very best kilns in the district, and, further, to carefully inspect such when delivered, and reject the unsound ones. Had this latter course been adopted in regard to this chimney a great proportion used in its construction would have been rejected. In fact, they were, with the exception

* To be continued.

of the firebrick, unfit for the purpose of building a chimney, even if constructed of solid brickwork. They were of various sizes, various material, and differed very much in the degree of burning. I am strongly of opinion that from some cause or another, bad as the bricks were in the first instance, that they, along with the lime, forming about one-fifth of the volume of the bricks, have both undergone a deterioration. I can attribute this marked deterioration of bricks and lime to nothing less than moisture extending over a long period. I have examined chimneys which have fallen by accident, and some by design, but I have never seen such a crushing to powder of the material of a structure as in this instance, and where bricks appeared to be stuck together in any quantity, they could be separated by hand with no effort whatever. . . . The total weight of the whole structure was about 500 tons, the weight of the two shells above the solid was 480 tons. The outer shell alone weighed 325 tons. The distressed area, including bulge and cracks on the easterly and northerly sides, was equal to half the circumference. Therefore, if the chimney had been vertical the weight above the half the circumference would equal 162 tons, or 6.33 tons per square foot, but the chimney leaned over on this side, and it is impossible to say how much the weight was increased by this fact without a knowledge of the amount of departure from the vertical. Given this crushing weight above (apart from any lateral strains due to vibration) and a solid brick base and foundation below, with the weak places—bulge and cracks—in between, remembering the quality and condition of the brick and the nature of the structure, and the result should have been anything but a surprise. The chimney fell on the calmest day in the whole month, from a combination of causes, and in the following order as regards importance:—1st, bad bricks; 2nd, weak construction; 3rd, deterioration by moisture; 4th, the attempted repairs. Sooner or later, however, it would have fallen, apart altogether from the 4th head. The repairs were too late: the chimney was a doomed structure before either Monson or his man saw it. In conclusion, I would say this is the second inquiry I have assisted at in regard to the deaths of persons from the fall of chimneys in ten years, making in those two instances alone a death-roll of sixty-eight. My earnest recommendation to the authorities is, that such structures should be annually inspected, a certificate as to the owners should be possessed of persons, and that to the safety of the structure as the result of such thorough inspection, such certificate of safety to be produced to Her Majesty's Inspector of Factories when required."

To which we need only add a remark as to the morale of false and we might say criminal economy in erecting such a structure. To save expense the chimney was proceeded with, after weakness had already shown itself before it was finished. To save expense the owners apparently refused to listen to the only sensible thing their bricklayer said about it, to have a new foundation and a new chimney. The result has been the loss of fourteen lives as well as the wrecking of part of the property. Most deplorably in this case has "penny wise" turned out to be "pound foolish."

THE *Architectural Review* (Boston) publishes an able article by Mr. R. D. Andrews, on "The Compensation of Architects," which is, in fact, an attack on the percentage system of payment. The main argument Mr. Andrews uses is the same which has been often suggested in our columns, and which must be obvious to every reflecting person, viz., that while other artists, as well as some professional men (as doctors and barristers), can get the value of superior ability in superior fees, the architect can only get this value by an increase of work, by taking in fact more work than he can attend to personally, and making his office an architect-mill. Mr. Andrews does not forget also the minor objection (detrimental in principle perhaps rather than in practice), that by the percentage system the financial interests of the architect and his client are directly opposed to each other. Mr. Andrews proposes that the architect should have a salary during the progress of a building, on condition of devoting a specified proportion of his time to it, and urges that it would be more economical in the end to pay out in this manner a sum twice the amount of the usual commission and secure the eminent architect's personal

attention to the work. We do not think this idea would be found very practical, and Mr. Andrews seems to forget that there would be the same conflict in that case between the financial interest of client and architect, as it would be obviously to the interest of the latter to prolong the period of construction. What Mr. Andrews does see clearly, and puts well, is that the present system is not only unfair to architects of superior attainments and reputation, but inimical to the interests of art, as it prevents an architect from profiting by superior ability except by taking more work than he can attend to personally. The simplest method by far is for the architect to name a fee for which he will design and carry out the building, just as a painter names the sum for which he will paint a portrait. A man who has achieved a reputation for special genius or ability would then be able to obtain a just return for it without overburdening himself with work he could only do by proxy. There can be little doubt, at all events, that the 5 per cent. system of payment to architects is about the worst that could be devised; but (owing partly to the fact that it is officially recognised by the Institute) the public at all events seem to have an almost superstitious reverence for it, and look suspiciously upon any architect who proposes to be paid in any other way, as a half-caste kind of person who is not to be trusted.

THE outlook in the North is disheartening in the extreme, and, at the time of writing, shows but little sign of improvement. Were the Durham miners to re-commence work at once, it would still be some time before the normal activity prevailed in the district,—trade having been so seriously disturbed. The *Times*, indeed, goes the length of referring to the dispute as having already done more harm than any strike of modern times; and attributes the present deadlock to the want of a strong leader on the men's side. The absence of such a leader is very significant, for it can hardly be said that capable men are not to be found, especially in mining centres. The probability is that the heroes of previous labour disputes recognise the fact that in this case there is but little prospect of victory, and that the only way to ensure peace would be to counsel the unpalatable course of giving in. Such advice as this the majority of the Durham miners are not yet in a mood to listen to, although the proportion in favour of keeping up the strike, as shown by the ballot, is much smaller than at the outset. The last ballot showed 31,483 in favour of continuing the strike, as compared with 43,956 on the previous occasion; but only some 50,000 voted last Saturday out of a total of 92,000. The tone of the strikers at mass meetings held this week is distinctly against accepting any reduction, in spite of the many indications that the state of trade calls for it. The collapse of old-established works, together with the prevailing feeling of insecurity and apprehension, ought to convince them that their action is threatening a permanent stoppage of other industries. The folly of the engineers' strike, which has now lasted ten weeks, is so far recognised, that a number of members of the Amalgamated Society of Engineers are cutting themselves adrift from that body, and resuming work. The obstinacy of the strike committee has produced a widespread feeling of exasperation, and there is every indication that they will be defeated by the gradual defection of their allies.

AS the Metropolitan Railway Company have obtained legislative sanction to subscribe to the capital of the Eiffel Tower at Wembley, this work will, no doubt, be constructed. We assume that the public have not shown a disposition to put money into this work, but we have no doubt that this would not stop Sir Edward Watkin from carrying out his scheme. We have

already stated our doubts as to whether this building,—not inside London, but like the Crystal Palace, well outside of the Metropolis,—can be a commercial success; and we are not enamoured of the principle of railway companies becoming partners in affairs outside their own legitimate business. The principle may be carried out to disastrous results, and is not altogether unlike a practice in the City by which trust companies brought out new concerns, and practically took part of the capital.

IT seemed almost beyond hope that we should be able to lay a finger on an actual monument of the battle of Marathon. This, however, Dr. Studniczka seems to have effected in his paper in the last issue (*Banquet*, vi., 4, 1892) of the Prussian *Archaeologisches Jahrbuch*. Every one who has recently visited the museum in the Acropolis at Athens has been struck by the fragments vividly painted and but little below life-size of a mounted horseman, dressed in the closefitting garb of an Oriental. These fragments, five-and-twenty in number, Dr. Studniczka reconstructs, by ingenious comparison with a plate in the Ashmolean Museum at Oxford, in which is represented a Persian Bowman seated on a horse, and wearing a tiara; he holds a bow in his left hand, and carries a quiver in his side; the plate is inscribed "Miltiades Kalos." This plate, Dr. Studniczka shows by a most careful examination of the fragments, must have been a fairly good copy of the actual statue in question. We have, therefore, in these fragments, not only a monument profoundly interesting in itself, but one of the greatest decisive battles of the world; but a piece of archaic sculpture accurately dateable, and so of the first importance in the history of art. Other papers of interest in the same issue are a discussion, by H. Winnefeld, of the plan and arrangements of the two country seats of Pliny the Younger, i.e., Tuscum, in the upper valley of the Tiber, and Lankelinum, on the sea-coast. They are described, as will be remembered, in two of his letters to Domitius Apollinadrus (v. 6) and to Gallus (ii., 37). Considering the scantiness of the notice of such structures by Vitruvius—i.e., private as opposed to public houses (Vit. vi., 8),—any help to the reconstruction of their details is of great value. In concluding paper, by Dr. Winter, on a vase in the Cook Collection at Richmond, may serve to remind Englishmen that much remains yet to be done in the matter of such publications. The vase, a krater of late style, represents the adventure of Odysseus with the Cyclops, and after a fashion so far unprecedented. The escape of Odysseus beneath the ram is a familiar type with black-figure vase painters, but here we have for the first time a representation improved, not by type but the dramatic form of the tragedy. Polyphemus, with a huge eye in the centre of his forehead, lies in drunken sleep, while the Satyrs of Euripides gather round, and the companions of Odysseus prepare to break the huge tree-trunks. It is surprising that this unique vase has so long gone unnoticed.

M. PERROT contributes to the number of the *Bulletin de Correspondance Hellénique* a long analysis of the state of the Vaphio cups. His article is illustrated by excellent plates. The two colour fac-similes of the actual shape of the cups give a better idea of the gold surface than any we have yet seen, but it seems a pity to republish the designs which the archaeological public already have in adequate form in the *Ephemeris Archaeologica*. M. Perrot comes to the conclusion,—not a new one,—that the cups are the outcome of local Peloponnesian art, and that they owe little, nothing to foreign, i.e., Oriental, influence. M. Lechat publishes a beautiful little brooch statuette of Aphrodite, recently acquired by M. Carapanos, and devotes most of his paper to the discussion of the nature of the *patina*. He believes this patina to have been

not the result of natural decay by exposure to air or lapse of time, but to have been artificially produced,—he would call it rather "enduit," than patina. Plutarch speaks in his life of Pericles (n.c. 159) of a class of artisans at Athens known as βαφεικὸν χροσόν workmen who dyed gold of various colours. May there not also have been βαφεικὸν χάλου?

FROM a recent issue of the *Manchester Guardian* we get the substance of the report of the City Surveyor to the Art Gallery Committee, and their remarks thereupon, on the subject of the proposed alterations to the Royal Institution. It is characteristic enough. It attempts in the first place to depreciate the interior architecture which is to be destroyed by pointing out that part of the details are plaster. At the time when the Royal Institution was built it was the fashion to execute in plaster or cement many things which would now be executed in a nobler material; but that does not affect the value of the design. But the most noteworthy point is the admission that the space gained by destroying Barry's galleries would only afford temporary accommodation for about ten years, after which it is hoped that a more ambitious scheme in the nature of a separate permanent Gallery may be carried out. So at the Art Gallery Committee of Manchester propose to destroy the most characteristic feature of the interior of a great architect's building to fit it for temporary use, and having spoiled the building irremediably, to leave it for a new one. This is worse and worse, and only renders the proposal the more defensible.

THE St. Pancras Vestry have now their first reward in the completion of their present Park Station with a plant capable of a simultaneous output for 10,000 incandescent lamps of 16-candle power each,—the sole of which has been contracted for by customers,—and 90 arc lights for street lighting of 10 ampères each. The station has been erected on a freehold site of 21,000 square feet purchased by the Vestry for £10,000; the remainder of the houses not required for the works still contributing their rents. The plant consists of nine dynamo incandescents coupled separately to six triple-expansion engines; and two smaller dynamo engines for the arc lights; boiler-house with five boilers, and a storage cistern of sixty cells. There is an underground tank for condensed water containing 2,000 gallons; and surrounding the lower portion of the chimney, attached to an iron lining, is a series of corrugated iron plates over which the hot water pumped from the condensers flows back to the tank. The maximum amount of water required in the day is 10,000 gallons, so that as the water is purchased of the water company, this innovation in cooling will play an important part in the economy of the station. There are seven orders in the distribution of current in addition to the mains, and there is an underground sub-station, with two batteries of fifty-eight cells each, on the open space by the Cobden monument in Camden square. The mains are laid on the three-wire system, the conductors being of copper strips supported on insulators. The culverts are of concrete, with asphalted roofs to render them watertight. The street lighting is very good, arc lamps being carried on handsome cast-iron standards 25 ft. high, and placed centrally on roads at about 200 ft. apart. In all the above great care has been taken by the City's engineer, Professor Henry Robinson, of King's College, to whom the work was entrusted.

WE have received from Mr. Brandreth, architect, a scheme for a Public Works and Construction Stock Exchange, Institution constituting a link between the different branches of the builders', the contractors', and the engineers' businesses

under the dome of a central hall in London." The further objects which such an Institution might serve are thus stated in Mr. Brandreth's letter or prospectus:—

"A practical and permanent Building and Construction Exchange with a classified exhibition of specifications, plans, samples, models, tariffs, price lists, adjudications, tenders, the latest notices and advertisements relating to work at home and abroad and the leading English and foreign technical papers.

A market for the introduction of new projects, and for dealings in matters relating to the above-said trades in all their branches, the sale and purchase of materials by private treaty or public auction.

A financial centre for the negotiation of monetary transactions, contracts, agreements, referring to advances, mortgages, purchases and sales of land and building property, on strictly impartial principles and with the least possible expenditure of time and money."

That such an institution would be useful if it could be established and kept going is very probable, but it is not very easy to see where the funds are to come from. Similar attempts have been made before and have not answered practically.

WE learn from the *Magazine of Art* that the Hanging Committee for the Royal Academy Exhibition this year consist of Messrs. Calder Marshall, Brock, Calderon, Gow, and Dicksee; two sculptors and three painters. Architecture, we suppose, is left to take care of itself.

THE Court of Contributors of the Edinburgh Royal Infirmary have, with only three dissentients, approved of a scheme for the extension of the hospital, the cost of which is estimated at 100,000. The additional buildings will be situated immediately to the west of the present infirmary, and will occupy the site of the Schools of the Merchant Company. The Directors of the Sick Children's Hospital have secured the School of the Trades Maiden Hospital, at Kill Bank, which will be adapted to the purposes of the hospital, and additions will be made thereto, for which the ground annexed affords ample scope.

THE *Daily News* of last week printed some letters concerning York House, Strand, and its water-gate,—the latter now lying neglected, in a hollow of the Embankment-gardens. What we believe to be the true story of the house and gate is as follows: In the sixteenth century a town "inn" of the Bishops of Norwich stood next eastwards of Villiers-street. In or about 1535 the inn was exchanged to Charles Brandon, Duke of Suffolk, for St. Bennett Holme Abbey, Norfolk. The house was bought for, or by, Heath, Archbishop of York, temp. Mary, but reverting to the crown in her sister's reign, it was let to the Lord Chancellor Egerton, and then to Sir Nicholas Bacon, whose son, Francis, as he himself tells us, was born there. By an Act of May, 1624, King James I. obtains possession of the property, which he grants to the first Duke of Buckingham. Whether Buckingham rebuilt the house or not is not exactly known. Campbell says, in *Vitruvius Britannicus*, that the water-gate was erected by Buckingham when Lord High Admiral of England in 1626. Its design is commonly attributed to Inigo Jones; yet some would ascribe it to Nicholas Stone, the elder, upon evidence contained in the Soane MS. list written by Charles Stoaques of some of his uncle's most eminent works.* Having sold the property for, we think, 30,000, the second Duke of Buckingham went to live on College-hill, Upper Thames-street. The site was then cleared for building purposes, and York-buildings is now known as Buckingham-street.

* We discussed this matter in an article on June 21, 1879, vol. xxvii., p. 677. See also our vols. xii., 252, and xxii., 450, *in fine*.

WE have received a number (containing two parts) of the *Zeitschrift für Bauwesen* (Wilhelm Ernst & Sohn, Berlin), a periodical devoted to matters concerning architecture and engineering. Its scope is wide, embracing such articles as timber buildings in Brunswick, the mechanics of railway lines, the drainage scheme of Naples, and a list of buildings, both small and large, erected during 1890 by the State of Prussia, the particulars being carefully arranged under several columns; one devoted to ground plans,—a very interesting and valuable item. The larger buildings,—technical high schools, laboratories, &c.,—and the humbler buildings of the Pfarrhaus class are treated in the same way. The value of the plans would, however, be increased by having scales attached, especially the larger ones. Issued separately from the letterpress is a series of plates illustrating the various articles. Some are reproduced from photographs, others from pen drawings. A very curious house forms one of the plates illustrating the timber work of Brunswick, work from a town and district which is not so well known to Englishmen as other parts of Germany. There are also a number of plans of a large asylum for the insane at Landsberg, and the building of the Berlin Electrical Works, which naturally derive more interest from their plans than from their elevations. Altogether the publication seems well got up and carefully printed.

AT a general meeting of the Royal Scottish Academy held in Edinburgh last week for the purpose of electing Associates, no less than seventy nominations were made. There were twelve vacancies to fill up, four of which were caused by the deaths of four Associates, and the number had to be made up to twelve in terms of the new charter which provides for an increase of the number of Associates. Amongst those nominated were twelve architects, viz., Messrs. H. J. Blanc, Edinburgh; G. Washington Browne, Edinburgh; G. Burnett, Glasgow; Campbell, Glasgow; J. Dunn, Edinburgh; J. Honyman, Glasgow; Kinneir, Edinburgh; W. Leiper, Glasgow; J. Keppie, Glasgow; Sydney Mitchell, Edinburgh; J. MacLachlan, Edinburgh; and Boss, Inverness. Of these four secured the necessary number of votes, viz., Messrs. W. Leiper, Washington Browne, H. J. Blanc, and J. Honyman. Mr. Leiper was one of the first four at the top of the poll, and, therefore, becomes a full participant in the benefits of the Association, filling as he does one of the vacancies under the old charter. The other three who are in a similar position are Messrs. John Rhind, sculptor, Edinburgh; A. D. Reid, painter, Edinburgh; and John Lavery, painter, Glasgow.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The eleventh general meeting of this Institute for the present session was held on Monday evening last, the President, Mr. J. Macvicar Anderson, in the chair.

Obituary.

Mr. William H. White said that it was with deep regret that he had to announce the death of Mr. Thomas H. Eagles, Fellow, Professor of Architecture at Cooper's Hill College, and a member of the Institute's Board of Examiners. He also regretted to announce the death of Mr. John Murray, Honorary Associate of the Institute.

Mr. John Slater said he thought that the death of Mr. Eagles, who was a comparatively young man, inflicted upon them one of the most deplorable losses that they had had to record of late. He had only recently taken a seat at the Examination Board, where his services had been of the greatest possible value, owing to his knowledge and attainments being of a kind not common amongst architects. The Board of Examiners would hear of his death with very great regret.

The Examinations.

The President said he had now to report the results both of the recent Preliminary Examination and of the qualifying Examination for candidates for the Associateship of the Institute, which were held during the month of March. For the Preliminary Examination there were 71 new applicants, and six who had been previously relegated to their studies made the total number of applicants 80; 35 of these were examined in London and 13 in Manchester, 29 were exempted in accordance with the regulations, and three did not attend. Of the exempted candidates, 9 were relegated in London, and 3 in Manchester, making 12; 36 candidates passed, and these, with the 29 exempted candidates, the 12 who were relegated to their studies, and the 3 who did not come up for examination, accounted for the total of 80. In the Examination in Architecture, qualifying for the candidature for the Associateship, there were 71 new applicants, besides 21 candidates relegated to their studies on previous occasions, making a total of 92. Of the new applicants, 11 were not admitted on account of their probationary work not being sufficiently good; 70 candidates were examined in London, and it was no easy matter to accommodate them in the Institute rooms, which presented a very busy sight indeed, 70 men all working at the examination at once, and 11 in Liverpool, making 81. Of these, 38 candidates passed in London and 11 in Liverpool, making a total of 49 who passed, 32 candidates being relegated to their studies for a further period. The result of the Examination in point of numbers appeared to be eminently satisfactory, and not the least satisfactory feature about it was that a considerable number of the applicants had been relegated to their studies, inasmuch as it showed that the examination was a real one. The names of the successful candidates in this examination were as follows:—

Angel, R. J., Liverpool
Ayling, R. S., London
Bain, J., London
Baker, C. W., London
Blaker, J. W., Liverpool
Bredon, A. C., London
Bridgman, N. G., Raignton
Burt, W. H., London
Child, E. H., London
Cleaver, A. W., Leytonstone
Cooper, T., London
Corlette, H. C., Sydney, N.S.W.
Cranfield, S. W., Enfield
Cummings, E. S., Edinburgh
Dobie, W. G., Birkenhead
Ford, G. M., London
Goodman, H., London
Grace, W., London
Greene, W. H., Liverpool
Greenslade, S. K., Exeter
Hack, M. S., Leicester
Hale, A., Birmingham

Harvey, F. M., London
Hodgson, J. L., jun., Heaton Moor
Houston, A. G., London
Howdill, C. B., Leeds
Jarvis, A. W., London
Jones, E. H., Liverpool
Kennedy, D. W., London
Kitchen, L., Manchester
Maclaren, T., London
Mansell, T. G., London
Murray, J., Greenwich
Ogby, H., London
Pasmore, H., Whetstone
Paxton, J., Kilmarnock
Rees, T. T., Birkenhead
Reid, R. A., London
Rix, R. A., Croydon
Sakari, K., London
Saunders, J., Gillingham
Shearman, E. C., Buenos Ayres
Thornton, E., London
Vaughan, W., London
Walker, B., Birmingham
Warburton, A., Bolton
Ward, F. E., Belfast
Watt, J. C., London
Wills, F. R. G., London

M. Chipiez's Model of the Parthenon.

The President said that before the reading of the papers was proceeded with, Mr. Statham would make a short communication in reference to M. Chipiez's model of the Parthenon.

Mr. H. H. Statham said he wished to endeavour to clear up the point which has been raised by M. Chipiez in his letter* in regard to the model of the Parthenon, which was made, as was understood, under his direction, and which had been purchased for America and set up in New York. The two mistakes that he (Mr. Statham) particularly referred to were that the metope sculptures were at the wrong end,—that was to say, the metopes of the east end were under the pediment of the west, and *vice versa*; and the next was as to the entasis of the columns. In regard to the first, M. Chipiez said that the model was sent over in pieces numbered, and that they must have put it up wrong in New York. They must accept that explanation. With regard to the entasis of the columns, he could not quite under-

stand M. Chipiez's argument. He said that his model was made from a photograph which showed quite as great an entasis as he showed, and that if the photograph which was sent over from America showed a greater entasis, it must have been a mistake made over there. He (the speaker) could only account for that by supposing either that the Americans had remodelled the columns to suit their own ideas, or that the laws of optics were different in Paris and New York. He had brought a pretty large photograph of the Parthenon, and anybody who applied a straight-edge to the uninjured lines of the columns would see that it showed absolutely straight lines, as everybody knew that it must do who knew the facts. The deviation from the curve was less than half an inch in a height of 31'43 ft. The American photograph of the model was taken from the front of the model as it stood in New York, and if one looked at it closely, one would see that although the columns were only half the scale of the photograph of the actual remains, there was quite a visible curve in them, although the actual height was only about 33 in. in the photograph, and no such curve could show on that scale. He confessed that he could not understand M. Chipiez's explanation. He believed Mr. White had some other photograph to produce, and he should like to know what really was the truth of the matter. It was obvious that the columns as shown in the New York photograph were wrong, and that they showed a degree of entasis which did not exist in the Parthenon, and that they professed to be from a model which was made in Paris, and which was afterwards purchased and set up in New York. He had only one other remark to make, and that was that it appeared to him from M. Chipiez's letter (and Mr. White would correct him if he were wrong), that in furnishing the data for that model he had neglected what was really the best source of accurate information, and that was the hook of their distinguished member Mr. Penrose, which contained exceedingly minute measurements from the Parthenon, from which the actual facts of the case could be got. If so, he thought there was some justice in the complaints which had been made, that the French architects, in restoring buildings in that way, did to some extent neglect the information which they might get from English sources, and that they had neglected it in the present case. He saw no reference in M. Chipiez's letter to Mr. Penrose's book, or to his having got any facts from that book. If he had referred to it, he would have got the facts correctly; whereas, so far as he (the speaker) could understand at present, it seemed that he had not.

The Secretary, Mr. W. H. White, said that as he happened to have the honour of knowing personally that distinguished architect M. Chipiez, they would perhaps excuse his taking up a few minutes in reply to the statement made by Mr. Statham. M. Chipiez had sent over a photograph of the model as it was taken in Paris, while it was still in his hands. This model, which was sent over to New York in hundreds of pieces, had to be put together again, and possibly there might have been some errors in putting it together, for, in a letter just received from M. Chipiez, he said:—"I have not furnished any drawings for the existing parts of the Parthenon. In accordance with his contract the sculptor caused the necessary working drawings for those parts of the model to be made by an architect of his own choice, and he did this after the measurements of Mr. Penrose. In the workshop of the sculptor I placed the metopes in their regular order, with the hook of Michaelis in my hands." He added that, in the temporary and too hasty putting together of the model at the Exhibition of 1889, the order was inverted by the sculptor, and hence the same inversion occurred, no doubt, at New York. With regard to Mr. Statham's error (if he would excuse his saying so) that the entasis of the columns in the model was determined by photographs of the actual Parthenon, he thought that in his letter M. Chipiez did not state that. The entasis was decided by the drawings provided for M. Chipiez, and not made by him.*

* The result seems to be that all the mistakes are admitted, but M. Chipiez denies responsibility for them. If so, why was the model referred to in all the French architectural papers as "M. Chipiez's model"? If the model was supposed to be based on Mr. Penrose's measurements, there has evidently been a mistake in applying them.—H. H. S.

The Construction of the Central Pillars of Milan Cathedral.

An abstract of a paper by Signor Beltrami on this subject was read by the Secretary, Mr. William H. White.

The author said he was glad to supplement Mr. Somers Clarke's Paper on "The Fall of one of the Central Pillars at Seville Cathedral," with the result of investigations carried on at Milan Cathedral. The Ministry of Public Instruction authorised a committee of architects and builders to carry out the investigations, with the object of ascertaining how the central pillars had been built, the causes of their decay, and the most satisfactory remedial to keep them in repair. The south-eastern central pillar was drilled to the depth of 90 centimetres, boring two blocks of marble, after which was a core of common stone (*sarizzo*). The same pillar was drilled through the course below, and the *sarizzo* was found at a depth of 35 centimetres. In the north-eastern pillar the *sarizzo* was met with at depths of 66 and 58 centimetres in one course, of 58 centimetres in the course under, and of 28 centimetres in the course above. Thus proof was obtained that the thickness of the facing of marble varied from at least 28 to 97 centimetres; that the builders of the Cathedral had meant to erect the central pillars as solid shafts; and that they considered the resistance to pressure of the white marble equal to that of the *sarizzo* stone. From a list of building materials (date fourteenth century) preserved in the archives of Milan, *sarizzo* cost a quarter the price of the marble, and the author thought the use of small pieces of marble in the core of the pillars might be accounted for on the supposition that they were too small for decorative purposes. Experiments to test the actual resistance of the two materials were made by the Building Construction Department of the Technical Institute of Milan. These experiments proved that the average resistance of the *sarizzo* was about $\frac{1}{2}$ of that of the marble, and $\frac{1}{3}$ of the weight supported by each was $\frac{1}{2}$ of its resistance to crushing, and $\frac{1}{4}$ of its resistance to crushing. Signor Beltrami then turned the nature and causes of the decay of the pillars. The white marble came from the quarries of Gandoglia; and its saccharoid texture varied from the granular to the perfectly crystalline, and sometimes to the spathic form, the general structure being spathic. The *sarizzo* is a stone extracted from the sediments of the glacial period in the northern part of the valley of the Po. Its structure is granitic, much varied in texture. Of these materials in Milan Cathedral the marble showed signs of decay, which consisted in fissures or fissures perpendicular or tangential to the surface of the pillars. The former were attributed to the inequality, or occasional imperfection, of the surfaces of horizontal contact; or to the oxidation of the iron clamps originally used to bind together with the central mass the moulded blocks forming the surface of the pillars. Such fractures split were not, however, to be considered dangerous, especially when limited to the course of masonry, and ought not, therefore, to be made a pretext to tamper with the original surface of the stonework. The tangential fractures and chipping off of the edges of the facing courses were caused by the fact that in many cases the pressure was transmitted in course to course along the edge; or else by concentration of the pressure around the periphery of the pillars consequent upon condensation of the mortar. The peculiar nature of the fissures was due to the spathic structure of the marble; and that defect should be considered as a natural consequence of care taken by the mediæval builders to obtain a perfect surface in the pillars they erected and to prevent damp from penetrating into the cores of the pillars. Only the larger fractures were to be repaired, such as were dangerous, altered the architectural appearance of the masonry, leaving untouched the minor ones, testimony of its peculiar structure, its force, decay, and of its age. Signor Beltrami enclosed his paper with a reference to the opinion of Mr. Somers Clarke, F.S.A., that Seville Cathedral "stands far above it" [Milan Cathedral] "as a specimen of mediæval"—an opinion Signor Beltrami thought it not easy to dissent as the two buildings were not erected contemporarily, and were not of the same size. In case he believed Mr. Somers Clarke would change his opinion were he to verify one spot that the vaults of Milan Cathedral are

'domee with ribs on their faces;" that its columns are not "quite cut off from the members above them," and that the windows are not "in many cases half sham."

Mr. R. Herbert Carpenter, F.S.A., said he read a letter from Mr. Somers Clarke on this subject. He wrote:—"What the Signor says about the materials of the pillars at Milan is very interesting, and supports my view that had the pillars at Seville been well built and of good stuff they would have been of ample strength to do their work. The dimensions I gave were taken: (1) from rough measurements of my own; and (2) from the book issued to competitors for the façade, of which I got a copy at Milan. In answer to the concluding sentences of the printed paper, I have to say—1. That I have visited the Cathedral of Milan several times. 2. That I cannot affirm that the vaults have not the ribs through their substance; but I can affirm that they are domes rather than intersecting vaults. They are not on the lines of the best Mediaeval vaults. 3. I respect Signor Beltrami's statement very much, but I can only affirm what every student knows,—that the columns are quite cut off from the members of the arch above them. A reference to the drawings I have referred to shows this, outside one examination of the church itself. 4. The same drawings show the clearstory windows of the centre nave to have their lower part opening into the nave, their upper part opening over the steep sides of the very domical vault. This is very easily seen as one walks along the aisle roofs. I very much respect Signor Beltrami for sticking up for so glorious a fabric as Milan, and in comparing it with Seville I have wished to treat it with all respect, it—facts are facts."

Mr. Alexander Payne proposed a vote of thanks be accorded to Signor Beltrami for his paper and present of books.

Professor Atchison, A.R.A., seconded the vote of thanks to Signor Beltrami. They were extremely indebted to him for sending them copies of his works. He was one of the most distinguished architects in Italy. They should, he thought, elect him as an Honorary Corresponding Member.

The vote was passed by acclamation.

Wrought-Iron Work: The Renaissance Period.

Mr. Starke Gardner next read a paper on this subject, copiously illustrated by lantern slides. In his preliminary remarks, Mr. Starke Gardner said he considered the industry of ironworking, like every other art, subject to fixed laws which regulated its growth, development, and decay. Its signs of youth were seen in a robust and playful vigour when the smith manipulated the hot iron with his hammer without any artificial aid, the forms thus obtained being unsophisticated and without refinement. The next stage was in introducing organic forms, a decorative, not a superstitious, sense, by the use of smith's tools alone. Its maturity was reached when such crude results were no longer deemed satisfactory, and the file, saw,isel, drill, and punch were called in; the introduction of mouldings, tracery, and other architectural features necessitating more calculation in both designer and executant. Next, a better finish still was required, and the iron had to be turned on the lathe, polished, carved, chased, &c., in fact, treated as a precious metal, wholly apart from painting in colour or gilding. That, as the last step, denoted old age and approaching death. After that might come a renaissance, when the process would begin again, the phases of development following, however, with greater rapidity, and concurrently. In Italy the smith's art had made considerable progress during the period of Gothic architecture. Churches, in their principal expression, were almost always based on the quatrefoil, which was merely a development of the circle, and that itself probably suggested by the effect of the leaded roundels with which St. Mark's and other churches were glazed. The quatrefoil certainly became the traditional form, and grilles of that design were often mounted by very deep friezes and crestings of the richest work. The Doge's Palace and elsewhere seemed to possess nothing more decorative than latticed grilles; these, however, occasionally showed a desire for better effect, and the fifteenth-century *Case* had some beautiful scaled grilles in the window-heads. The open scale pattern grille at St. Mark's was copied in 1481 by Pietro Lombardo in the

Vendrami Palace. A far more decorative effect was obtained by scrolling up the ends of the scales, as seen in the Manzoni Palace. From these to window grilles of C scrolls placed vertically and in all possible directions was a natural and inevitable development. Under Sansovino the style was at its zenith, and spread far beyond the limits of Venice. Italian smithing reached maturity about the close of the fifteenth century, and was ripened, perhaps, almost to decay when "Vitruvius" and its overwhelming influence, leading to an entire suppression of decorative ironwork in buildings, gave architectural smithing its *coup de grâce*. A renaissance took place when Palladian architecture degenerated, and, though smithing was feeble, it marched onwards to the Italian version of the French rococo.

In Germany it was otherwise; the laws of Vitruvius were not current over the border, at least as far as concerned ironwork; the smith had a free hand, and his art had for once an opportunity of showing of what magnificent developments it is intrinsically capable. Considering the advantages, however captivating the work might seem, the result was disappointing; the designs were the same for a palace or a church, the guest-chamber or the grave, and all changes were rung on three leading themes: the thistle, the passion-flower (both introduced in the Gothic Period), and the threaded work. The thistle in the Renaissance had its curving leaves fashioned into rich grilles formed entirely of intertwining scrolls, a grand example of which, from Lübeck, was as late as 1781. The passion-flower, the origin of which seemed to have been the twelfth-century iris, was a favourite as far as the German language was current, and consisted of erect and recurved petals, &c. There was at first no intentional reproduction, but as the work became richer the resemblance became strikingly apparent, and must have been purposely heightened. The flower was invariably combined with the typical threaded work traceable to the early French lattice grilles; and, after relatively simple stages, became elaborated with bewildering complications, as many as 400 threadings having been counted in a single specimen. Examples in the cathedrals and churches extend from 1550 to 1673, and an offshoot of the style showed the sheathing leaves growing in the reverse direction,—a variety much used in grave crosses, and taken originally from an attempt to introduce the snail. In the Baroque style broken scrolls and acanthus leaves were introduced, and following that was the German Louis XV. work. Before turning from German ironwork Mr. Gardner referred to the contemporary locksmith's work, the designs for which were, he said, far more varied and fantastic than those for grille-work, and he mentioned the carving of even equestrian statues out of solid blocks of iron. The remarkable fact about Flemish ironwork was the rapidity with which it developed; but under the Renaissance little was made beyond wall anchors, kitchen utensils, finials, and door furniture, &c., all of which, especially shutters, hinges, and fastenings, had quite a peculiar style. At a church at Bruges, however, there was a pair of gates of an interesting style, made in 1690, which constituted an example of an arrested development. The guild and shop signs were remarkable, preserving an altogether Flemish rotundity of curve, though French in details. The Flemish art was most noteworthy, however, for being the parent stock of the magnificent school of Spanish ironwork. Spain seemed to have realised with a rush the great capabilities of iron. First, the Flemish grille was imported into the churches; next,—a bold step,—creatings were added to them, directly borrowed from liliaceous plants; next, the grilles were carried three stories in height; and, finally, the details were translated into their fine new plateresque, and the freest play given to the imagination with the most astounding results. The colossal *rejas*, produced between 1500 and 1600, which screened the *coros*, high altars, and chapels, the author considered the most magnificent specimens of the smith's art extant; not unfrequently they reached a height of 30 ft., and they were divided into several tiers of long halsters, often enriched with leaf work forged and carved out of solid iron. These tiers were separated by deep hands of the richest scroll and arabesque work, nothing, apparently, being too ambitious for the smith to successfully achieve. The artificers were known in many cases to have been in holy orders. The extraordinary perfection to which Spanish ironwork

had reached was even more apparent in the arms and armour, where, too, the Moorish influence was decided. It declined rapidly with the Baroque, but no country so abundantly with it. In the south every house had well-designed balconies and window grilles, &c. In France the Renaissance found the art deeply rooted, and affected its traditions but little; the most beautiful and refined ironwork ever executed was the French late Gothic and early Renaissance work. The pierced steel locks had reached a point beyond which real progress was impossible, and the transition simply meant that such sumptuous works slowly lost Mediaeval features and followed Classic models. Under François I., due to Italian influence, an abrupt change was seen in the locks; and the lock covers, instead of being chiselled and formed of layers of pierced work, were embossed in high relief out of single sheets of iron. Bolt cases and knockers were treated in a similar manner. But far more beautiful and satisfactory were the exquisite keys, purse-mounts, flambeaux, &c.; as a beauty of design and for refinement they, as a rule, far surpassed Italian work, although usually mistaken for it. During the perfecting of the locksmith's and armourer's work, there appeared to have been little demand for ordinary blacksmith's work; a grille made for Henri II. was a mere series of parallelograms with crescents, but the finials showed more originality of design. The germs of the new school were first discerned under Henri IV., and under Louis XIII. a fully developed style was found, which rapidly developed until it reached its culminating point under Louis XV. During this period nearly every cathedral in France and Belgium seemed to have had new choir and chapel grilles, and the demand for high-class smith's work must have been prodigious. Mr. Gardner then turned to the art in England, which he considered, although enjoying the least consideration in our museums, as the most valuable and interesting to the English. Unfortunately, the art had sunk so low that during the Renaissance it practically was a missing chapter in the development of the native arts. From the practice of fencing in church monuments with iron rails, one might best judge of the state of iron working. The series in the cathedrals was most valuable. During the Renaissance they were no longer made of massive bars, and the traceried cornices and huddled angles also disappear towards the sixteenth century—only the closely-set lighter bars with small spear points, or sometimes ending with *fleur-de-lis*, remain. The finest series must have been in Westminster Abbey, and several examples were mentioned by Mr. Gardner, including the rail to the tomb of Dean Wotton, 1566, in Canterbury Cathedral. Good examples of a later style existed at Old Chelsea and other churches. Among the rarer objects was the valuable herse or canopy in Tanfield Church, and that in South Kensington Museum from Snarford Church. After describing in considerable detail a fine alms-hox in St. George's Chapel, Windsor, door-hinges, especially those at Dartmouth Church, together with the wrought-iron columns there supporting the gallery, Mr. Gardner turned to lock-plates, which, though not rivaling those of France, Belgium, or Germany, began to show, during the Renaissance, design of a higher order. Rich locks, especially of James I. and Charles I. periods, were more often of brass, but the keys were of iron and of the most exquisite finish. After describing in detail specimens of English locksmith's work, the author dealt with flat work, of forged hands out into arabesques, scrolls, and other figures, of which the so-called cradle of Henry VI. in the Ashmolean is a good example. The gates to the chapel in Farley Castle show the work on a larger scale, while the staircase at Holyrood seems to show what an Elizabethan iron stair might have been. The oldest strap work in a church hour-glass-stand is 1597, with a wheel arabesque design; and another, dated 1636, introduces branches of oak. These and other examples of knockers, work on chests, door and window furniture, &c., show that, though rude and uncared for, the English smithing was full of character, quaintness, and individuality; and, had the architecture shown any disposition to make use of it, might have blossomed into a fine industry.

The President, in inviting discussion, said that there were few subjects possessing a greater charm for architects than that of wrought-iron work. They had had the privi-

lege of listening to an exceedingly admirable paper by an able expert on the subject. He thought the paper possessed a unique value.

Mr. H. H. Statham said he had very much pleasure in moving a hearty vote of thanks to Mr. Starkie Gardner for the interesting sketch which he had given of the history of the subject, and for the interesting series of illustrations which he had shown to them. There were, perhaps, one or two ideas which the paper suggested. One was the absurd mistake which was committed when realistic foliage was introduced into wrought-iron work. Two or three illustrations of that had been shown: they were useful as warnings, in that they were opposed to all true canons for the treatment of the work. Another thing that occurred to him was that considering that a number of the examples were based upon certain vegetable forms,—he alluded to those which were properly conventionalised,—after all, very few of the available forms of the vegetable world had been used as a basis of design in wrought-iron work. The examples which they had been shown, although there was a considerable variety in the treatment of them, really represented but a very few types, when one came to add them up. That fact suggested what a large field there was for new treatment in wrought-iron, and what a scope there was for a far greater variety in design than at present existed. It had often occurred to him, in looking over designs for wrought-iron-work, that one saw very much the same ideas over and over again,—the same kind of leaf, treated more or less satisfactorily, the same use of spirals, with a little variety in the way of working them or placing them, and very little attempt to get anything different from what had been done before. In the illustrations which had been shown by Mr. Gardner, they had seen a great variety of treatment of design from very few types. The types of nature were almost endless, and the aim of the modern worker and designer in wrought-iron should be to make the most of the hints which existed in nature; he should turn to forms which had not been worked out already; he should endeavour to evolve something new in wrought-iron work, of which we did not see much. Modern taste in wrought-iron was very much better than it used to be. We seldom saw things in such bad taste as we saw thirty years ago. Those with a turn for designing wrought-iron work should devote their energies, not only to excellence of execution and to purity of taste, but to the selection of new forms suitable to the material.

Professor Aitchison, A.R.A., said he had great pleasure in seconding the vote of thanks, for personally he felt extremely indebted to Mr. Gardner for showing him those splendid specimens of Spanish ironwork, with which, he was sorry to say, he was entirely unacquainted. He thought this Spanish ironwork was the finest of any ironwork he had seen. There was, doubtless, a peculiar charm about work roughly done on the spur of the moment. Although the rococo work of Louis Seize was not beautiful in itself, still the way in which it had been treated by some of the ironworkers was remarkable. There was an iron screen in one of the churches at Munich which was the most wonderful instance of delicate wrought-iron-work that he had ever seen. It was certainly worthy of a picture being made of it by an accomplished artist. The fine artistic way in which the iron was treated was quite unlike anything that he had seen before, and reminded one of the curled leaves in a young plantation. We of the present day were no doubt like the Athenians,—we were ever looking for something new; and it was the characteristic of every generation that it wanted something different from that which had gone before. But the thing we wanted was to get ironwork properly treated, with such slight variety as the taste of the day might call for. The only other thing he wished to refer to was Mr. Gardner's remark, that in future wrought-iron might be used as a medium for modern architecture. It was, however, too large a subject to attempt to enter on at any length, but he might say that iron had one great peculiarity which we wanted particularly at the present time. There was no doubt that architecture, when it went on again, would take a new development, and that development might possibly take place in the moulding of the material to the shapes that the strains indicated. Iron being a costly

material, we were now obliged to give it the shapes that it should have to meet the strains, only at present no architect had been fortunate enough to put these forms into an architectural shape, nor to ornament them characteristically. There certainly appeared to be a vast field for the exercise of invention in the application of new and appropriate shapes of ornament.

Mr. J. Hunter Donaldson, as a visitor, spoke of the great difficulty there was in obtaining photographs of old ironwork in the Italian cities.

The vote was passed by acclamation.

Mr. Starkie Gardner, in reply, said that as a hotanist he was quite alive to the endless forms which nature provided from which we might take hints in designing ironwork. But, practically, and as a matter of every-day expediency, one had more or less to follow the styles of ironwork that were recognised. Very few buildings would, he thought, admit of entirely fresh treatment,—entirely fresh departures in their ironwork. They had to be more or less assimilated to the styles and periods in which architects were working.

The proceedings terminated with the announcement that the next meeting would be the annual general meeting, on May 2, to discuss the annual report of the Council.

LITERATURE AND ARCHITECTURE.

ARCHITECTURAL ASSOCIATION.

At the ordinary fortnightly meeting of this Association, held on the 1st inst., Mr. F. T. Baggallay, President, in the chair,

Mr. E. S. Gale, Honorary Secretary, announced a donation to the general fund of the Association of 10*l.* from Mr. J. A. Gotch; and some donations to the Studio and Library. He also announced that a prize of 5*l.* 5*s.* had been offered by Mr. James Brooks, open to any member of the Association, for the best set of measured drawings of the vaulting of Christ Church Cathedral, Oxford. He moved a hearty vote of thanks to the various donors, which was carried by acclamation.

On the motion of Mr. E. T. W. Goldsmith, a vote of thanks was accorded to Mr. J. Wolfe Barry for permitting the members to visit the Tower Bridge on a recent occasion.

This being the last ordinary general meeting but two of the present session, Mr. E. S. Gale, in accordance with By-law 31, on behalf of the Committee, submitted a list of members willing to serve as officers and members of committee for next session. It would be premature to give this list *in extenso* now, but we may mention that Mr. H. O. Cresswell was nominated by the Committee to fill the office of President. Subject to the terms of the By-law, it is open to members of the Association to nominate other gentlemen to serve as officers or members of committee.

Mr. Horace Townsend then read the following paper entitled "Literature and Architects":—

Mr. President and Gentlemen,—When last year I had the pleasure and honour of appearing before you in this place, I remember that I had to frankly appeal to your more charitable sentiments in that I came before you hearing but little with me that might prove of material advantage to you, the active professors of an art which has about it much of the practical as well as of the purely aesthetic. You were hospitable enough upon that occasion to receive me with all friendliness and courtesy, and to grant me so full and free a pardon for my first offence, that you yourselves are surely to blame if I have presumed upon those expressions of goodwill to travel to-night yet farther from the straight pathway of rectitude and virtue in that same regard. Your Friday evening meetings here are, I take it, of the nature of educational symposia, and those who are so far dignified by you as to be invited to take prominent part therein should, as a rule, endeavour to add something to the general stock of architectural knowledge.

Judging from the list of subjects upon which, during the session now drawing to its close, you have been enlightened, I am rejoiced to be able to say that I am probably the one striking exception which helps to prove this undeniably meritorious rule. But I may at least lay this flattering mention to myself, that were I not to exhibit so striking a contrast to my utilitarian predecessors, you would never perhaps realise how exceedingly edified you had been by them in the past—you all of you, I am sure, have too much of the artistic temperament

to be indifferent to the value of the judicious opposition of strength and weakness. And yet, perhaps, though no precisely gangleable amount of instruction is to be imparted to you this evening, the time devoted to considering, however pertinaciously, the relations of two such leading arts as Literature and Architecture, even if those relations are at present not the most intimate that can be conceived, will be time not wholly misapplied.

In the little journey into the abstract we are about to take, the deviously winding side paths, rather than the direct high roads are likely to lead us to the most advantageous spots, and the subordinate phrases and variations will probably in our ears sound more pleasingly than the main theme. The old book-men of the Middle Ages have won the scoffs and sneers of more enlightened generations because it was their pleasing custom to debate at prodigious length as to how many angels could dance on the point of a needle. Owing to the regrettable absence of the lightning-reporter on these interesting occasions we are debarred from any exact knowledge of the tenor of these discussions. I can myself, though, see no reason to doubt but that they were at least as provocative of material advantage as a modern debate on such subjects as, for example, "whether Architecture is an Art or a Profession," for consider how many sides issues of absorbing interest might have been raised, from deliberations concerning the angelic host to the more mundane considerations touching the economic history of the needle itself.

Do not, however, imagine for one moment that I am going to subject you to the risk of incurring the pains and penalties earned by those guilty of even tacitly aiding and abetting the criminal who is in unlawful possession of hard-and-fast theories concerning either literature or architecture. I do not even intend to confine myself over strictly to my text, but merely to consider, somewhat casually perhaps, but I trust not altogether unprofitably, such questions as the conjunction of the names of two of the leading arts may serve to suggest. It will not be unprofitable, in the first place, to indicate such points of comparison as offer themselves between literature on the one hand and architecture on the other. At first I am sure you will all be disposed to say that no two arts could be more dissimilar or have fewer features in common, save, perhaps, such abstract and underlying æsthetic principles as are common to art in general. A little reflection, however, will I think convince you that if they are unfortunately, as I shall later endeavour to point out, a little less than kindred, they are, if not more, at least no less than kindred, and that certain special artistic faculties nurtured by the follower of one need but the mere differentiation to be of service to the other. Thus the basis of artistic literary form, whether displayed in the guise of poetry, fiction, or drama, is undoubtedly construction, and the constructive faculty is after all a specialised and somewhat theorised sense of planning, such as finds its place among the most important and necessary tools of an architect's mental workshop. I remember discussing, not many years ago, the subject of stage-craft with a dramatist who not only stands at the head of his profession in America, but is held in sufficient high esteem on this side of the Atlantic. "If," he said, "I were to come across an architect who also had taste and talent for literature, I should look to see a better play from him than from ten out of a dozen of our masters at fiction. Constructing a play," he added, "demands, I am convinced, a cognate mental faculty to that required for the planning of a house." One has only to apply this same rule to other branches of literature, in which though the construction may not be of such vital importance as it is to the playwright, it is by no means to be slighted, to see that the two arts touch at this point somewhat closely.

Again, somewhat similar limitations are imposed upon both author and architect as regards the medium in which they work. There is language and grammar of architecture quite as complex and quite as conformable to tradition and general usage as the language and grammar by which the literary artist is, not so much fettered, as strengthened and sustained. The genius of the one, as of the other, is to be found in the skill and aptitude with which old and conventional symbols, some of them the force of association representing concrete and abstract ideas, others serving but as the mean

whereby these ideas are linked together, are disposed in so novel and original a manner as to convey to us a new thought or a novel impression. And I may, perhaps, be permitted to parenthetically suggest at this point, that as by this time the dream which has deluded not only our own but other generations, the dream of a new and arbitrarily formed language to usurp the places of those diverse tongues which are undoubtedly a hindrance to the universal exchange of thought, has proved itself to be but the fallacious confining of the desirable with the possible, so that similar vision which, like a misleading but fair-appearing mirage, has mocked so many otherwise far-seeing and clear-thinking men, that will-o'-the-wisp, if I may be allowed the expression, of a "new architectural style" is destined to a corresponding dissipation under the latest-dispersing rays of reason. "Volapük," the mist of the universal language crazes, is no more ludicrous and abortive an attempt to override deep-seated traditions and conventions than is the essay to provide us with an entirely new order or style of architecture.

But there are other matters of technique wherein the two crafts closely approach one another, though they may, after all, be chiefly classed as subordinate rules of construction. One of the most perfect literary artists of our generation, considered simply as an artist, but one who, because she wrote nominally for young people has had denied to her by the unthinking public her due meed of praise in this respect, always declared that she owed much of her education in those matters of masterpiece which have helped to render her masterpiece the perfectly cut and polished gem of literary art it is now admitted to be, to the latter part of the third letter in Ruskin's "Elements of Drawing," a treatise which is, perhaps, more familiar to you than Mrs. Ewing's "Jackanapes," the little book to which I refer. She clearly saw that the principles there laid down with regard to music, poetry, and painting applied to prose with at least as equal force as to architecture. I need not, to those who are so well versed in Ruskinism as yourselves, dwell upon that consummate literary artist's analyses of the Laws of Principality, Repetition, Continuity, Contrast, Harmony, and so forth, which are there to be found. I can only regret that those incomparable artistic stylists the French have seen the light in this respect so much more clearly than our own writers, and that, however much we may excel them in the imaginative aspect of our modern literature, we are obliged to admit that their constructive ability is of a far higher order. This, I take it, is chiefly due (and this is a point I cannot too strongly emphasise) to the more intimate relationship between the arts, to the better comprehension of the common principles underlying them, which in that nation exist. It is the old story emphasised by each successive "Salon" and each "Academy." We may have an excellent story, but we tell it in a slovenly manner; the French may have no story at all, but, if you will excuse the Hibernicism, they tell it remarkably well. This, however, is perhaps wandering a little too far afield, though, as I warned you when I began, I intended to explore any side-alley that should seem promising as I rambled down the main avenue of my subject.

Let me return for a moment to the application of Ruskinian theories to literature. I cannot do better, perhaps, than take as my concrete example the very story to which I have referred. In "Jackanapes" the law of principality is clearly demonstrated. All the minor characters, touched in with loving fidelity, are yet grouped around the hero in such artistically subordinated a fashion as to cause us to feel that all they do, and say, and feel, serves but to increase the pre-eminence of the principal figure; they all conspire, as has been said by one before me, with one consent to reflect forth the glory and beauty of the noble, generous, recklessly brave, and gently tender, spirit of "Jackanapes." What aunt could fail to dote on such a boy? What village lad refrain from leaving his father's plough and following so inspiring an example to the field of honour? What brother-officer, however seared with sorrow and made taciturn by trial, could hold that dying hand, and not weep for him who begged for the grace of Christ and the love of God as he passed away?

The same story, too, is a good example of the values of the law of repetition and the law of contrast. With the rapid sweeping action of the human lives with which the story is con-

cerned, are finely contrasted the eternal peace and quietude of the village-green; a quietude and the abiding sense of which is gained by close attention to the law of repetition; over and over again in constantly, but unobtrusively, recurring sentences the picture of this peaceful old village-green is evoked, for, as Ruskin says, "In general throughout Nature, reflection and repetition are peaceful things."

I have endeavoured to briefly compare, or rather to suggest on what lines a comparison may be drawn between two arts at first glance as widely dissimilar as those we are considering, but have so far confined myself entirely to the actual technique. From such consideration it is not easy to see what practical advantage is to be gained by the student on either side, though perhaps, after due reflection, we may be enabled to recognise that even here material advantage is to be secured by the earnest and thoughtful. One takes a new point of sight from which to view the perspective, and though the lines converge according to the same formula in either case, a very different impression is often conveyed through the retina and optic nerves to the brain. Thus the very question of Principality is apt to assume a new meaning to us in our own art, when we see how it applies to, and the effect it produces in one apparently alien to us. This trick, if you care to apply to it no higher term, is one that has been learnt to perfection by some few architects, who, I fear, are but exceptions to the general rule; though, if we journey across the Atlantic, we shall find that it is the dominant note in the scheme of the American school. Last year I ventured to briefly draw attention to this fact, but upon that occasion I borrowed from the stock of current art terminology or slang, another phrase to express the same meaning. I referred then to the impressionism of much of what is best in Transatlantic architecture, by which I said I meant that quality or characteristic of a building which leads the spectator to carry away from it when he departs a more or less vivid impression of some one feature which so dominates the rest as to be thereafter primarily called into imaginative existence by the reminiscence facilities. It may be an entrance, or a gable, or a bay, or a chimney-stack, that is thus insisted upon, not necessarily to the detriment of other features, but to their semi-effacement. Is not this but another exemplification of an artistic truth dwelt upon with such insistent effect by all masters of literary style? The value of repetition, too, is one which is but dimly and sub-consciously recognised by the great mass of architects, though in literature, as has been shown with fine effect by Robert Louis Stevenson in the "Merry Men," for instance, and by Dickens perhaps to excess in nearly all his later novels, it has proved a veritable gold-mine of artistic effect. I need only refer to the Houses of Parliament as a striking example of the power of a countless repetition of details to produce, when employed by the hand of a true artist, and with a sense of the wide difference between this quality and that of mechanical triviality, an effect of reposeful and dignified quietude. Nor are these the only means whereby a study of a sister art may prove of indirect advantage to the architect. I have hinted already that those well-meaning but irrational individuals who persist in looking forward to that problematical millennium when we shall have evolved a new style, may take comfort in its non-appearance by reflecting that our Tennysons and Brownings, our Thackerays and George Eliots, our Carlyles and Ruskins, needed not even even wished for a new language wherein to express the messages of originality and genius which they have delivered to our ears, and that the search for a new style in architecture is closely akin to the quest for a new language in literature. But, on the other hand, it must not be forgotten that those architects who are content to slavishly reproduce the models of the past, adapting them as little as may be to the requirements of the present, carry with them no message at all, save that of archeological investigation. They put themselves into the position of a poet who would convince us that not only is the language of Chaucer capable of neither extension nor improvement, but that it would be but truckling to the pervasive utilitarian and materialistic spirit of the age to endeavour to alter the exact sequence of ideas which the Father of English poetry used the linguistic symbols of his time to convey. It is in the underlying sentiment in the creative thought, clothed though they may be

in conventional forms of speech, that true literary and poetic originality consists, and so it must always be with architecture. To be too conservative is as grave a fault as to be too iconoclastic. I remember when the fashion of the day,—healthy in the main, but, as all reactionary fashions are apt to be, not a little exaggerated by its votaries,—led us to turn back for our vocabulary to the earlier forms of our language, and to forsake the superabundant Latinity then prevalent, an enthusiast published a series of sermons in words of one syllable, and mainly of early English origin, to show how true eloquence might go hand-in-hand with absolute archaism. Well, it was exceedingly and cleverly interesting, but it was not literature; and so I venture to believe that a nineteenth-century building, whose chief title to favour is that a ghost of the thirteenth stumbling upon it by accident, between midnight and cock-crow, might be led to think the hand of time had somehow been turned back, and that he was in his own newly-built parish church, is neither more nor less than a deceptive study in archaism; it may indeed be archeology, but it is not architecture. Don't misunderstand me, I beg of you. I do not decry,—I should be the last in the world to decry,—that patient study, that sympathetic assimilation of the records of the past, which is one of the watchwords of our English architectural generation. I only wish to protest against the confusion of the means with the end, against the slavish worship of the word, accompanied by a blind indifference to the spirit which should inform the word; and here it is, in my estimation, that even the casual study of an art outside our own is likely to have a beneficial effect, for, once admitting that the premises are the same in both, the *reductio ad absurdum* is more apparent in the one than in the other, and, therefore, more salutary.

But, gentlemen, literature has another relation to architecture, or, perhaps, I should say to architects. It is nearly a score of years now since I first entered an architect's office, the world is constantly moving, and so, doubtless, things are not what they used to be in regard to what I am about to touch upon. In my day, however, it was the exception rather than the rule to find an architect's pupil or assistant who was also well read in his own literature. There was much, doubtless, to excuse this in him. He worked at his office all day, and if he were earnest and industrious he spent a majority of his evenings over his drawing-board or his books of professional reference. Nowadays, perhaps, from what I gather, his leisure time is even more fully occupied with studies having direct bearing upon his profession, for examinations appear to be the chief end of architectural man, and we are fast rivaling, as devotees of the Competitive Cult, our almond-eyed friends the Chinese, who have headed us off by a few score centuries in this, as in so many other inventions of our newer civilisation. Let the cause have been what it might, the effect was one to be deplored, and unless things have altered very much for the better in this respect, one to be deplored fully as much in the 'nineties as in the 'seventies. Of all artists an architect is the better craftsman in direct ratio to the width and extent of his general knowledge. One can just barely conceive that a great painter may be ignorant of everything save of a technical knowledge of his craft and of an intuitive knowledge of human nature, but there is hardly a fragment of general information to be acquired, which may not at one time or another be of inestimable service to the architect in the direct line of his profession. The great genius, perhaps, who appears in a decade of centuries is, of course, superior to all rules and regulations, and is, to a certain extent, complete within himself, unless we adopt the meretricious diagnosis of genius as the gift of taking infinite pains. I am, however—and I trust in saying this I do not wound your self-esteem—I am, however, not speaking to a room-fall of geniuses, but rather to a body of men of talent and artistic taste. To such I would say that it is at least necessary in my opinion for an architect to have an appreciation of the higher forms of literature as it is for him to be able to properly calculate the strain on an iron girder. Now, appreciation without familiar knowledge is a contradiction in terms, so that it is evident that a portion of the working day or night should be as sedulously set aside for the assimilation of general literature as for other more definitely and distinctly professional branches of study.

Our contemporary architecture suffers, more than from any other cause, from want of imaginative faculty, and I cannot accuse myself of riding a hobby to death if I maintain that this very want arises from that widespread indifference to imaginative literature, which is characteristic, not of the architect alone, I beg to say, but of the majority of our nominally well-educated and refined upper classes. Imagination is, beyond a certain point, more or less of a habit of mind, and, like all similar functions of the intellect, can be developed or retarded by circumstances and surroundings, quite exterior to, and independent of, itself. We may starve it, or we may feed it, and to carry the analogue a little further, we may stunt its development as effectually, by confining it to one species of food alone, as by depriving it of sustenance altogether. Thus, though the benefit may not be objectively apparent, you may quicken your capacity for original designing quite as successfully by reading and enjoying an act of "Hamlet," or one of "The Idylls of the King," as by committing to memory a chapter of Fergusson or a page or two of Gwilt. Nor, again, should it be forgotten that the narrowness of mind which is the inevitable consequence of an indifference to literature is of all intellectual faults most to be avoided by the architect who, by the very nature of his art, is bidden to enlarge to the very widest extent the horizon of his sympathetic appreciation.

Without culture you can hardly hope for refinement, a lack of which quality in your work is, as you all know, one of the most detestable of faults. And now, gentlemen, I have endeavoured, all too imperfectly I fear, to make clear to you to what degree literature is the creditor of Architecture. But is there not a counter claim, as law records have it? Is the balance all on one side? I hardly think so, though I must confess that, if the debt *per contra* has not been expressly repudiated, it has at least been but grudgingly acknowledged. If it had not been for the inherent poetry and mystic imagination, for instance, of Notre Dame de Paris, we should have never enjoyed what, from some points of view, is the masterpiece of that literary demigod Victor Hugo, and Quasimodo and Esmeralda would for us have never been. To the same cause, though in a somewhat more indirect manner, those Wizardries of the North, the "Waverley Novels," owe their very existence, while how much of William Morris and of Rossetti, as we know them, is due to the influence of the late Gothic revival I leave you to judge for yourselves. I doubt, indeed, if much that is characteristic in Browning's later volumes is not due to the subtle influence of the sun-kissed, weather-stained marbles of the Italian Renaissance with which at various critical periods of his poet's life he was surrounded. Finally, there is no manner of doubt in my mind that literature has to thank architecture far more than architecture has to be grateful to literature for the gift of that master of melodious phrase, that great prose poet of the century, John Ruskin. It is architecture itself that the "Stones of Venice" and the "Seven Lamps" have to thank for their existence, and it grows with each year more clear to our eyes that, despite his marvellous rhetoric, despite his riotous wealth of eloquence, Ruskin has impressed the literature of his generation with a seal more enduring than that with which he has stamped its architecture. Ruskin apart, has any literature of an ennobling eloquence been devoted to the service of architecture? To my knowledge, at least, none. We have our Fergussons, our Parkers, our Gaults, but how little else? Trustworthy educational treatises, encyclopedic in style, even if absolutely reliable in fact, are but a poor return for literature to pay you for all she owes to your art. It is surely somewhat humiliating for us to consider that the majority of such architectural works as can claim to be really literature, and not mere samples of book-making, are, as the phrase goes, "made in France" or "in Germany," as the case may be, for we have, alas! no Viollet-le-Duc to adorn his subject with grace of manner and charm of diction, as well as to bring to it the treasured results of a lifetime of patient and laborious investigation. Even the books of that intermediary rank, which act as a sort of link between the professional man and the layman, are much fewer and farther between than should be the case in a country, the average level of whose literary culture is so high as that of England. Nor are the reasons for this difficult of recognition; the fault is not wholly upon one side or the other. It is only

within the memory of the last generation that the great majority of architects have caused their own profession to be estimated by the outside world as worthy of that dignified position which is now universally accorded to it, while, on the other hand, outsiders have never felt, for they have never been taught to feel, an interest in architectural technique, comparable to that with which they have ever regarded the technical aspects of painting and sculpture. That something more than mere taste or general education is necessary to enable them to justly estimate an architectural creation, is a somewhat novel idea to the vast majority of the public. This indifferent, well-nigh contemptuous attitude towards the art itself has reacted naturally enough upon its professors, and is curiously reflected in the attitude towards architects assumed by the practitioners of the art of fiction. An essay upon the appearance of the architect in fiction would be almost as brief as the celebrated chapter on "The Snak's in Ireland," and for the same reason. Dickens, however, whose portrait gallery is hung with the counterfeit presentations of representatives of nearly every trade which is to be found within the covers of the London Directory, has not forgotten the architect, and painfully suggestive too, is his method of treating our honoured profession. Mr. Pecksniff, as you will remember, is perhaps the most offensive of the amazingly offensive personages by whom the action of "Martin Chuzzlewit" is carried on; so offensive indeed is he, that he has been declared to be an altogether impossible personage. Certainly he is an absolutely impossible architect, and the ignorance displayed by the author of those details which would have helped to give *raisonnable* and local colour, as it were to his creation, is little short of surprising. In introducing him to us, as you may remember, the author's remarks that "of his architectural doings, nothing was clearly known, except that he had never designed or built anything, but it was generally understood that his knowledge of the science was almost awful in its profundity," and further that "Mr. Pecksniff's professional engagements, indeed, were almost, if not entirely, confined to the reception of pupils; for the collection of rents, with which pursuit he occasionally varied and relieved his graver toils, can hardly be said to be a strictly architectural employment." And yet but a few pages farther on we find Mr. Pecksniff has evidently been invited to send in a set of competitive drawings for a new grammar-school. Not only does he do this, but he uses for that purpose a set of plans which had been drawn in the course of a very few days by young Martin Chuzzlewit, who, whatever his other valuable qualities may have been, was clearly as ignorant of the practice of architecture or of the principles of design as a new-born babe. And yet these plans are successful, and win the competition. More than this, Mr. Pecksniff, though bereft of the services of his only assistant, and himself engaged in non-professional affairs which take him here, there, and everywhere, somehow manages to prepare the working drawings, and to be present at the laying of the foundation stone by, as you will remember, "the member for the gentlemanly interest." After this, as far as the book is concerned, he ceases even to be nominally an architect, and (for no apparent reason) after he has finished his triumphant career as a hypocrite, becomes a mere begging-letter writer. The one redeeming quality which I can find in the character of this liell on an honourable profession, to whom I have already perhaps devoted too much of your time, is that he recognised the importance of literature to architecture. "Various books," he is reported to have observed upon one occasion, waving his hand towards the wall, "connected with our pursuit! I have scribbled myself, but I have not published."

That Thomas Hardy, the only other novelist of distinction who to my knowledge has made of an architect a seriously-considered character, should have displayed a more intimate knowledge of the subject is not so surprising as, at first glance, would appear, for, before he was a novelist, Mr. Hardy was himself an architect. Much as I admire those works of imagination, with which the distinguished biographer of Wessex folk has presented us, I am at times tempted to regret that he did not remain longer in his original profession, and use, in a measure at least, his literary gifts in her service. We might have lost "The Return of the Native," or even "Tess of the D'Urbervilles," but we should

have gained that *Iustus natura*,—a work of the highest degree of literary merit with the name of a real live architect upon its title-page.

Finally, a word must be given to the periodical literature of architecture, and here, I suppose, I am treading upon somewhat delicate ground. I think, though, that I voice the sentiments of some of you at least, when I declare that ideal provision has not yet been made for us in that respect. Year by year the architectural profession is counting upon its rolls fewer who look upon it as a mere business, and more who regard it as a sacred art. The paths of the contractor and the architect daily diverge more and more, and, though I have no words save of praise for those organs which, at present, represent so worthily the entire community which depends upon the art of building, I do not think that the ideal architectural paper is yet in existence. It will, as I conceive it, when, if ever it does arise, concern itself not with architecture alone, but with all those subsidiary arts which she has enlisted in her service, and with those artistic crafts which are subordinate only because they differ in degree and not in kind. It will be, from its inherent interest, the medium which shall bridge over the chasm which now seems to cut off so effectually the architect from the general community, a chasm the existence of which is due only to the hereditary ignorance of the latter, and the hesitation of the former to assume that position which, in the empire of art, is his inalienable right. It will be a model of all that the representative of artists should be, in regard to its printing and its illustration, while in its pages will be found that perfection of literature which is only possible when the men who write concerning an art, of whose principles they are thoroughly cognisant, are also thoroughly informed with the principles of the literary art itself, and have recognised that the two are one and indivisible.

And now, gentlemen, conscious of having trespassed somewhat unduly upon your good nature and of having taxed beyond the bounds of due discretion your patience, I can, as my excuse, find nothing better to bring forward than the mention of the fact that literature and architecture are arts in which I am equally interested, and to which I owe an equal share of my allegiance. I warned you when I began, that of practical suggestion I should have but little to offer you, and I fear that I have only too well fulfilled my prophecy. But, after all, I may be fortunate enough to be wrong in this gloomy surmise; perhaps, weak and halting as has been my utterance, loosely knit as have been my arguments, random and fortuitous as have been my illustrations, I may yet have added one poor stone to the great House of Art we are all of us, in our several ways, helping to build. You know how the violinist, standing by an open piano and idly drawing his bow across the strings of his own instrument, strikes every now and then a note to which responsive *echo* is made by the silent strings beside him; so perchance at intervals to-night I have unconsciously touched some chord which may in either your hearts or your brains have set some responsive string vibrating in harmonious accord.

If this be so, and if the memory of those palpitations remains with you even for a little while, my time or yours has not been wholly mis-spent. Let me then, while thanking you for the attention, far beyond my merits, with which you have listened to me, urge on you once more the consideration of what, in my own mind, I have dimly recognized as the text from which to-night I have been preaching; that art, namely, is one and indivisible and that he who would be pre-eminent in one must not be absolutely without rank or recognition in the others; that from the architect, as from no other artist, there is required a catholicity of sympathy with all that is great and ennobling in human life; that, with Terence, you ought each one of you to declare that "*Homo veni; humani nihil a me alienum puto*." "I am an architect, and nothing that belongs to man do I regard as insignificant to me," as we may not unaptly phrase it. How then can you fail to take into your communion that art which is the link between all others, without which we should still be sunk in the apathetic ignorance of the middle ages (for it must not be forgotten that it was the Revival of Learning in Italy which made possible the Renaissance of Art); how, in short, unless you are servitors of literature, can you aspire to be Masters of Architecture?

Looking at the matter from the narrowest and most direct view, the study of literature is necessarily enjoined upon you, for the meaning of the architecture of the past can hardly be clear to us until we have a clear conception of the conditions which prevailed when each particular style was in process of formation. To those who are ignorant of what manner of people that wonderful handful of the human race were, who leavened the whole mass of the world's posterity with the vital germs of all the arts, the shattered fragments which strew the abrupt Acropolis must speak but haltingly or in an unknown tongue; to those who have not appreciated the more material supremacy exercised by those ethical prototypes of our own nation, who held a score of centuries ago the empire of the world, the arches and the columns of the City by the Tiber must be bereft of half their meaning; to those who have not studied that unutterably awful spectacle presented to us by the nightmare-like gloom which over-spread society in medieval Europe, the long-drawn aisles and fretted vaults of the Gothic cathedrals must lose no little of their suggestiveness; while to those who are unacquainted with the passions and the transports, the agonizing vices and the moral excellences of thirteenth-century Italy, the legacy it has left to us of such surpassing beauty and symmetrical grace must be as a scaled hook. Here again our only guide is literature, and with her to aid us, you can clothe again those dried skeletons of the past with fair-seeming flesh and make them speak to you, when to others they would reserve but a Sphinx-like silence, the message of art which it is theirs to deliver, and ours to interpret to your own time and your own people.

In the discussion which followed,

Mr. W. Burrell said he had much pleasure in proposing a vote of thanks to Mr. Townsend for his paper, which had been one of great interest and suggestiveness. Such papers as that fitted them out of the turmoil in which they are generally engaged. Usually, papers read before them dealt with some more or less technical matter relating to the science of construction, but on the present occasion they had had a literary treat which would, he thought, be very wholesome for them, for Mr. Townsend's paper had served to show them that there were more things in heaven and earth than were embraced in their Curriculum. As a matter of course, the list of things which they had to learn as architects could not include everything which was necessary to make them men of culture, although the study of literature was one of the most important aids to that end. Mr. Townsend, as one who had himself practised as an architect, and who was now engaged in literary work, thoroughly understood how to treat his subject from their point of view. Until he (the speaker) had heard Mr. Townsend's paper that evening, he had not thought that there was so close a connexion between the art of the architect and that of the playwright as the gentleman in America, to whom Mr. Townsend had referred, seemed to think. As to the little book mentioned by Mr. Townsend, entitled "Jackanapes," he (the speaker) had read it and had been very much interested in it; but the statement made by Mr. Townsend that Mr. Ruskin's "Elements of Drawing" had anything to do with it quite astonished him. He was hardly prepared to see with Mr. Townsend that Dickens had together misrepresented the architectural profession in his portrayal of Mr. Pecksniff. He did not think that Dickens meant to portray anyone but Mr. Pecksniff himself; but, nevertheless, he (the speaker) was bound to say that there were still to be found in the profession some gentlemen who were not wholly devoid of one of Mr. Pecksniff's peculiarities. As to the probability of Dickens's story about the competition designs for a grammar-school having been gained by a young and inexperienced man, well, they all new that grammar-schools and their buildings were won in competition, even under present conditions, by young gentlemen who did not know much about the architectural profession. He had much pleasure in proposing a vote of thanks to Mr. Townsend.

Mr. A. H. Clark, in seconding the vote of thanks to Mr. Townsend, said his paper was a very difficult one to follow in discussion. There seemed to be only one thing that could be done fault with in the paper, and that was Mr. Townsend's excess of modesty; but the

members of the Association had a far higher opinion of Mr. Townsend's merits than he himself entertained. Amongst the whole phalanx of truists to which he had adverted there was none which struck him (the speaker) so much as that concerning the light that literature was able to throw upon old buildings. No one could visit old buildings without feeling that their interest was dimmed and trebled if they had been the theme of some of the celebrated writers. With regard to what Mr. Townsend had said in reference to the Renaissance and the parallel which he had drawn between the literature and architecture of that time, it always seemed to him (the speaker) that the Renaissance poets, or the poets who wrote just about the time that the Renaissance architecture was coming to the front, possessed a distinct flavour of the old Roman poets,—so much so, that in reading some of the Renaissance poets one really seemed, so far as style was concerned, to be reading translations of Virgil. Mr. Townsend had briefly referred to a subject which might, perhaps, with advantage have been more fully treated in his paper, viz.: the relation of modern current literature to architecture. Literature owed a very great debt to architecture, although it did not seem to be at all adequately recognised. The public, in their estimation of architecture, would always be led, to some extent, by current literature and by the press; but he very much regretted that in the present day the press showed such callous indifference to architecture, such an ignorance of its details, and such a want of appreciation of good work by the best architects of the day. In proof of that, one had only to read those garbled accounts of great public buildings which appeared in the daily papers. It was a regrettable fact that while other artistic subjects were treated with due attention, architecture received such meagre treatment; hence there was so large a portion of the public who were unable to form their own opinions, or whose opinions, when formed, were not worth anything, and they were ready to lean on the current literature of the day, particularly on the press, and not only to adopt the opinions expressed in the public prints, but to repeat them to their friends. He thought that if architecture were represented in the way it ought to be by the press, the effect on the general public would be very beneficial.

Mr. E. H. Sim supported the vote of thanks. Of course he quite agreed with the general spirit of the paper, but he was afraid that an acquaintance with the story of "Jackanapes" on the part of an architect would not be so good a recommendation to a client as a knowledge of the price of brickwork. He quite agreed that architecture in the present day was very much overlooked by the press. In the descriptions of new buildings which appeared in the general press, the architect's name was hardly ever mentioned.

Mr. J. C. Stockdale remarked that although it was no doubt true that an acquaintance with the story of "Jackanapes" or any other literary work would not teach a man how to draw a moulding, it should be remembered that imagination played a most important part in architecture. There was no doubt that imagination was of supreme importance to the architect, and that much of the work which now appeared so unskillfully would have been improved had the architect drawn his work with a greater amount of feeling and refinement, and that was only to be obtained by a study of literature.

Mr. F. T. W. Goldsmith said he desired to support the vote of thanks to Mr. Townsend, whose paper had not only been of great literary merit, but had treated the subject most comprehensively. Without question, the wider and more extensive the knowledge possessed by architects of the present day, the better it would be for architecture. So long as the architect was confined to one groove of reading, his work (as affected by such reading) would be hindered. He was very glad to hear Mr. Townsend refer to the influence of the imagination on architecture. Mr. Stockdale had alluded to an eminent politician (Mr. Goschen, he believed), who had not long ago discoursed on the uses of imagination. Mr. Goschen himself was a man who combined, in a singular degree, a practical, hard-headed knowledge of the world, with the imaginative faculty. He did not think that any architect, with any pretensions to literary taste, could fail to have his work influenced by every book, or even chapter of a book, which he read during

the working out of his design. For instance, if the building to be designed had some poetic purpose to serve, and if its architect were studying at the time some eminently un-imaginative book, the practical work which he was reading would have a direct and subtle influence on the general conception of the design and its details. On the contrary, if he allowed his mind to become imbued with the fine imaginings of some great poet through the reading of some distinctly poetic works (not necessarily in rhyme, but such works as those of Mr. Ruskin's), which were emphatically the great poetic works of the age), his design would be brought under such poetic influences, in such a manner as would not, perhaps, be felt by himself, but which would be impressed on every feature of the work. He thought that Mr. Townsend had good reason for the deduction that the literary tendency of architects was in the direction of dramatic rather than in purely literary taste.

Mr. Houston said he thought there was some analogy between what was called the "New Journalism" and the had architecture that one saw at the present day in Shaftesbury-avenue and elsewhere.

The President, in putting the motion, said he supposed that the analogy, or some of the analogies, between literature and architecture could not have escaped any thinking architect; at the same time he thought it was the first time that the subject had been treated in a paper before them. He thought that some of the analogies referred to by Mr. Townsend were fairly apparent. They were quite accustomed to call the styles of architecture languages, or to use words having that significance. The more one looked into it, the more one saw that what we called styles were languages of which it was necessary to learn the grammar before one could compose in them. He thought there was some little confusion sometimes in the present day between learning the grammar of a style and executing a building in a particular style; it seemed to him that they were two very different things. It seemed to him very useful to learn what other people had done,—to learn the grammar of the old styles,—but it was a very foolish thing to copy old work exactly. The President, in conclusion, said he should like to add his own personal thanks to Mr. Townsend for his paper, which had given them all a great deal of food for reflection, and he had great pleasure in putting the vote of thanks to the meeting.

The vote of thanks was then put and carried by acclamation.

Mr. Townsend, in acknowledgment, replied to some of the points raised in the discussion. In reference to Mr. Burrell's criticisms on what he had said with regard to Mr. Pecksniff, he (Mr. Townsend) was perfectly aware of the fact that many pupils and many assistants did design grammar schools, or buildings of a similar kind, on the foundation stones of which other men's names were placed; but he had never heard of a pupil of three days' duration who was able to make a successful set of competition plans. He merely referred to that point as showing in a very striking way how Dickens, who took such immense pains in his work, even spending days in tramping over London in order to find a suitable name for one of his characters, seemed to have regarded an architect as a man of so low a grade that it was not worth the trouble of making the least inquiry,—which he could easily have done,—as to how he carried on his profession. On the other hand, with regard to his medical and legal characters, Dickens seemed to have taken the greatest pains to be accurate.

GOOD FRIDAY WEEK.—Next week we go to press a day earlier than usual. All communications for the Editor should reach him by first post on Wednesday morning; but lists of tenders will be received up to 12 noon of the same day.

THE BEXLEY SYSTEM OF EMPTYING CESSPOOLS.—This system, which we described in detail in the *Builder* for June 13 last year, is becoming increasingly used. Mr. Boulter, the Surveyor of the Local Board of Bexley, informs us that he has now dealt with 700 cesspools without the least of complaint. The Public Health London Act 1891 has been the means of the introduction of the system within the metropolitan area, the Plumstead Board using it both in Plumstead and Eltham. Since we described the system, it has been adopted at Gravesend, Chatham, Richmond, Staines, Enfield, and Chichester; and it is in contemplation to introduce it at Dunstable.

Illustrations.

ILLUSTRATIONS OF OLD CHESTER.
IV.—SUPPORTS OF BISHOP LLOYD'S PALACE.

THE drawing shows the boldly-designed story-posts which support the overhanging portion of the old house called "Bishop Lloyd's Palace" in Watergate-row. They appear on a small scale in the marginal sketch appended to the general view of Watergate-street published in the *Builder* of February 27.

INTERIOR, NORWICH CATHEDRAL, AND EAST END OF CHOIR, ELY.

THESE two illustrations are reproduced from two beautifully-executed pencil sketches by Mr. S. K. Greenlake. The exterior of the choir at Ely is one which he kindly placed at our disposal for illustrating Ely Cathedral, but as there was nothing to balance it well among the other Ely drawings, we preferred to give it this week along with the interior of the crossing at Norwich.

The two form interesting examples, in very different ways, of the solidity and monumental character of the earlier forms of Medieval architecture. In spite of the large amount of window area in the east end of Ely, the massive yet gracefully decorated flanking buttresses give the effect of ample strength and stability, further emphasised by the massive buttresses and pinnacles at the angles of the aisles.

DESIGN FOR A STEEPLE.

THIS is the design, by Mr. T. Rogers Kirtell, for which the Tite prize was awarded this year by the Institute of Architects. The design fulfils the conditions of the bequest, which was to promote the study of Italian or Renaissance architecture, and the design is graceful and satisfactory, if not showing any very new or original features. The treatment of the spire at its junction with the tower is elegant, the curved lines at the base giving lightness and play of line in a manner in keeping with the style. We may suggest that the balustrade over the cornice is in the wrong place. It forms a fence to an inaccessible corner where no one would ever require a fence; whereas the section will show that the window opening, which comes right down to the floor under the spire, is left entirely unprotected. Balustrades have come to be very much a conventional ornament, but they should be placed where there is most semblance of use for them.

ROTHERHITHE INFIRMARY, ST. OLAVE'S UNION.

OUR illustration shows the additions and enlargement recently carried out at the Rotherhithe Infirmary, for the Guardians of St. Olave's Union, and opened by the Chairman of the Board, Augustus Scovell, Esq., on December 16 last.

The new portions of the building are shown in black, the hatched portions showing the building as erected in 1873 by Mr. Soell. The additional accommodation provided consists of a new male block with separation-wards, day-rooms, and duty-rooms for 177 inmates. New female block for 96 inmates; nurses' home for 40 nurses. The enlargement of the laundry, kitchen, receiving-wards, new officer's mess-room, and new dead-house and *post-mortem* room.

The wards are 88 ft. long, 21 ft. wide, and 13 ft. high, and contain twenty-eight beds each, and at the end, separated by disconnecting corridors, are the bath-rooms, lavatories, and w.c.s. In the disconnecting corridors are the fire-escape doors, which lead on to the escape staircases. The heating is carried out by hot water, and by central hot-air stoves, with vertical flues, which, with the flues provided in the external walls, carry off the vitiated air; the fresh-air inlets are fixed in the external walls, and communicate with the boxes covering the hot-water pipes. In the centre of each block are the day-rooms, duty-rooms, and separation-wards, and the new buildings are connected up with the old by open corridors.

The buildings have been carried out from the designs of the architects, Messrs. Newman & Newman, of 31, Tooley-street, London Bridge, by Mr. J. O. Richardson, of Albert Works, Peckham. The clerk of works was Mr. William

* For preceding views of this series, see *Builder* for February 6, February 27, and March 12 last.

Gannaway, and Mr. C. W. Read, the contractor's foreman. The engineering works were carried out by Messrs. Clements, Jessops, & Co., of Great Russell-street; the lifts by Messrs. Waygood; the sanitary works by Messrs. Tylor & Son and Mr. M. Siver; and the heating by Messrs. Clements, Jessops, & Co. and Mr. John Grundy. The amount of the contract was 30,857l.

MAGAZINES AND REVIEWS.

The *Gazette des Beaux-Arts* includes an article on Opie by Mr. Claude Phillips, giving a fair summary of the painter's merits and defects, with perhaps rather an undue exaltation of the former. We presume French art magazines are about to "discover" Opie as they have "discovered" Lawrence. M. Salomon Reinach contributes a paper on the "Musée des Antiques à Vienne," which he praises as one that in the matter of installation can fear no comparison with any similar establishment in Europe; he also draws attention to the excellent arrangement and editing of the catalogues and guides. Illustrations are given of some of the most remarkable fragments of antique sculpture in the Museum. M. Marcel Raymond endeavours to show that one or two pictures attributed to Raphael are really the works of Cesare de Sesto. M. de Pourcaud gives the second part of a communication on "L'Art Gothique," in which he sums up with the conclusion that the heart and soul of Gothic art is to be found in France, and speaks (naturally enough) with approval of the work on Gothic architecture by Mr. Moore, whom he refers to as "un savant Anglais." French critics should really distinguish between English and American writers; Mr. Moore's book is one that no Englishman would care to own to.

The *Art Journal* gives the second of a series of articles under the title "Outings in India," dealing with Poona and its neighbourhood, and including among its illustrations a reproduction of a photograph "On the River Moola-Moola" giving a remarkably real effect of strong sunlight. The article on "Paris Pleasure Resorts" continues the illustrations of the Marne, and Mr. J. F. Boyes contributes an article on Sir A. H. Layard. Mr. Aymer Vallance's article on the decoration of the house (No. 4) deals with "Furniture," giving some illustrations of furniture which are unexceptionable in taste and refinement of design.

The *Magazine of Art* illustrates a short article on Mr. Stanhope Forbes by reproductions from his two best works, "The Health of the Bride" and "By Order of the Court." The paper on "Artistic Homes" is this month on "Wall-papers" by Mr. Lewis F. Day, and gives some illustrations of mostly fine designs, of which the most original is what is called a "Tile-paper," we presume from its being designed after the manner of tiles; it is said to be designed by "Arthur & Co." Why does not the *Magazine of Art* insist on the real name of the designer being given, instead of the name of a firm? A "company" cannot make a design; it can only sell it when made. Other articles are on Sir George Reid, the President of the Royal Scottish Academy; on "Painter-etching"; and on "The Art Treasures of the Comédie-Française," giving some exceedingly interesting illustrations.

The *Fortnightly Review* contains an article by Sir Robert Ball, "How Long can the Earth sustain Life?" to which some persons, not conversant with the proportions of cosmic time, will possibly turn with some anxiety to find out the probable fate of their immediate descendants, and will be relieved at finding that four million years is the smallest period promised, and that it may be extended to ten million. Considering what an immense space even the period of about four thousand years of human life of which we have anything like historic knowledge appears to us, we may well regard Sir Robert Ball's few million of years as further, at all events, than we can think to the end of; although there is a distinct difference to the mind, no doubt, in regarding the habitable state of the earth as necessarily to terminate within a period calculable on definite data. The data, of course, are the considerations as to the rate of waste of the sun's heat. As long as the sun remains in a gaseous state, it may lose heat, accompanied by shrinkage, without losing temperature; but when once it begins to solidify, then loss of heat means loss of temperature, with no replenishment. So physicists understand it

now; and as far as they have got there is no great probability that the conclusions are wrong. Sir R. Ball even suggests as a probability that the dark bodies in the stellar system are more numerous than the luminous ones; that luminosity is but a temporary stage. So stupendous to the human mind, however, are the intervals of time involved, that one thinks rather of the positive than the negative results. If knowledge "grow from more to more," what may not the human intellect have achieved after even a million years from now? So vast are the considerations involved, that one turns with a smile to Mr. Walter Sickert's hysterical splutter about Whistler's pictures in the same number; the "Nocturne in Blue and Silver—Bognor," that is an "immortal canvas," and the man that created it "thereby alone immortal a thousand times over." Poor little paint-pot of a day!

The *Nineteenth Century* contains a well-written article by Sir Henry Wood on "Chicago and its Exhibition," the object of which is partly to reconcile Englishmen with a city which has been painted recently in no very attractive light. From his official connexion with the Exhibition Sir Henry no doubt must be taken rather as an advocate than a judicial critic, but he presents the Exhibition side of the case in an able and persuasive manner.

The *Atlantic Monthly* contains "Some notes on French Impressionism," by Miss Cecilia Warren, serving up again the old argument that the eye cannot rest simultaneously on two things, consequently that "a more open-air impression" is conveyed by a painting which shows only one object distinctly and leaves the rest a blur. It seems to be forgotten by those who use this curious argument that the eye looks from point to point of the picture as it looks from point to point of the real landscape, and has a right to expect some recognisable form in all parts of the painting; not to say that the principle involves the quiet assumption that the world of landscape-painting has been wrong up to the present generation. The article is well written and contains some good criticism in detail.

Scribner's contains an article on the "New Parks of the City of New York," referring to parks laid out in pursuance of an Act passed in 1853, appointing a Commission to secure new parks beyond the Harlem River. The land for three large and three small parks was purchased at a cost of 9,000,000 dollars, after much opposition from economists who objected to the outlay. The large parks referred to are the Pelham, Bronx, and Van Cortlandt Parks, of which some sketches are given, looking very much like park scenery all over the world. There appear to be some interesting old houses on the estates, which have been preserved. The same number contains an article on "Charles Keene of Punch," by Mr. G. Some Layard, written both with enthusiasm and judgment, and including a letter addressed to Keene in 1853 by a Dutch admirer, which in itself is worth getting the number for, on account of its delightful mingling of true enthusiasm with naïveté and broken English.

The *Century* contains a long and carefully considered article by Mr. Edward Robinson on the question, "Did the Greeks paint their sculptures?" going pretty fully into the at present attainable evidence, and concluding that the Greeks probably painted their sculpture fully and strongly; if not realistically, at least as near to realism in flesh tint and colour of draperies as the slightly conventional treatment of the sculptured form is to the natural form. This can hardly be proved to be the case, but we think the available evidence points very strongly in that direction. All we can say is, so much the worse for the æsthetic perception of the Greeks, which must have been less immaculate than was once supposed. We may observe that Mr. Robinson makes the same observation which Mr. Statham made not long since at a discussion at the Institute on the relations of sculpture and architecture, viz.: that the frieze of the Parthenon (the *cella* frieze) was placed in such a position that "much of the labour spent upon its execution was in vain." Mr. Robinson uses this as an argument in favour of strong polychromy, which alone could have made the sculpture intelligible in the position in which it was placed. The same number of the *Century* contains an interesting paper by Mr. E. S. Holden on "The Total Solar Eclipse of 1889," with illustrative diagrams. An article on "Our Common Roads" (meaning we suppose what we call High Roads in England), by

Isaac B. Potter, serves to show by its illustrations of the state of main roads in the vicinity of great American cities, how discreditably careless and behind the age is the United States civilisation in the matter of the maintenance of roads. Some of the illustrations (apparently taken from photographs) show a state of things almost incredible to an English road surveyor.

Harper's Magazine contains an article on Shakespeare's *Tempest*, or apropos of a French criticism of the play, by Mr. Andrew Lang, with a number of illustrations; by Mr. E. A. Abbey. The article suggests some new critical ideas which are worth attention, but we cannot say the same of Mr. Abbey's illustrations, which appear to us singularly poor and weak in conception, except perhaps the one representing Trinculo's first encounter with Caliban. Mr. F. D. Millet's series of articles "From the Black Forest to the Black Sea, continua," and is illustrated by capital sketches of figures and bits of landscape and buildings. Mr. Julian Ralph's article on "Western Modes of City Management" is rather political than municipal, to the perception of an English reader, but is not without interest. A short poem, "In a London Street," may interest English readers as an instance of the fascination which our great smoky capital exercises on some minds.

The *English Illustrated* has an article by Miss Rose G. Kingsley on "A Hampshire Moor," with illustrations by Mr. Alfred Parsons; and "A Look Round Swindon Works," by Mr. A. H. Malan, with illustrations from the workshops. It is a pity the magazine should have admitted such nonsense as "A Middy Hero," of which it is difficult to say whether the illustrations or the text are the more absurd.

The *Antiquary*, in its notes of the month, remarks that "the regularity with which we have to chronicle complete or partial destruction of ancient churches through fire caused by faulty heating flues becomes almost monotonous. This timing is the old parish church of St. Nicholas, Rochester." Some stained-glass windows, a good deal of the roof, and the organ were destroyed; and the *Antiquary* probably does not exaggerate in regard to the frequency of this kind of mischief from heating-flues. Among special papers, are the conclusion of a series on "Prehistoric Rome," by Dr. Isaac Taylor; one on Norwich Castle by Mr. Mottram; and the third of Dr. Halbherr's papers on "Researches in Crete."

Temple Bar gives the conclusion of an article on B. R. Haydon, chiefly written, as the writer observes, "to direct some sympathetic attention to a very human document," viz., Haydon's autobiography, a book which certainly ought not to pass out of notice.

In the *Cornhill Magazine* the only noticeable article from our point of view is one on "Early Railway Travelling," which gives some details as to the conditions of railway travelling in the earlier days of the art, serving to show what a rude performance it was in comparison with the speed and comfort of modern railway travelling.

The *Revue Scientifique* contains an article on trans-continental railways of South America, by M. Daniel Bellet, giving among other things some account of the proposed railway across the Andes, a bold undertaking, which however will probably be carried out, and which among other results "will bring Valparaiso ten days nearer to Europe."

THE ENGLISH IRON TRADE.—Unfortunately, there is no change to record in the depressed condition of the English iron and allied trades, and the near approach of the holidays prevents any hope of amelioration. From all the pig-iron centres complaints as to the stagnation in trade continue to be received. The prolongation of the Durham coal strike has caused a decrease of 85,136 tons in the production of pig-iron in the Cleveland districts, and a reduction of seventy in the number of furnaces in blast. Stocks have been drawn upon to the extent of 43,639 tons; but despite this fact the price has fallen 9d. per ton during the week. The Scotch warrant market is practically lifeless. Manufactured iron is very quiet, and a further weakening of prices is manifested. The tin plate trade shows no change, and the steel trade is dull. Many of the engineers who have been on strike in the Tyne districts are returning to work, but engineering establishments are slack. Ship-building yards are only moderately engaged. The coal trade generally shows little movement, and prices exhibit a certain amount of fluctuation.—Iron.

THE ARCHITECTURAL ASSOCIATION SPRING VISITS: NEWINGTON WEIGHTS AND MEASURES OFFICES.

THE members of the Architectural Association had the opportunity on Saturday last of inspecting the first public testing offices for weights and measures erected in London by the County Council, and a large number availed themselves of the opportunity. The visitors were met by Mr. Spicer and several officers of the London County Council, who explained the purport and working of the various features of the establishment. The plan consists of a good-sized courtyard, with weighbridge, and on one side stabling and coachhouse for the various travelling inspectors; on the other, a weighing-room, treated like a hall, with open-timbered roof, and used for testing the ordinary weights and lineal measures of every-day use in ordinary trades. Beyond this are a room for the examination of jewellers' and apothecaries' weights with balances of various degrees of delicacy, and standard weights from the cental to the grain, and beyond this room again, another with exceptionally good light for the testing of measures of capacity, both dry and liquid. Amongst the interesting features of this room are the sandblast machine for marking glass measures of approved fidelity, and various old standard measures of the counties of Kent and Surrey. A vote of thanks to their hosts by Mr. F. T. W. Goldsmith, the honorary secretary, concluded the reception, and the members then proceeded to the second portion of their visit, after remarking on the advance made in the matter of design shown in these buildings beyond the average level of official architecture.

ROYAL SOUTH LONDON OPHTHALMIC HOSPITAL.

The members subsequently visited the new South London Ophthalmic Hospital, designed by Mr. Keith D. Young, with the co-operation and direction of Professor McHardy. It occupies a site on the north-west of St. George's-circus, which, though admirably situated as a house of relief for the sufferers of South London, must have presented considerable difficulties to the designers in scheming the arrangements of the hospital. Professor McHardy met the members, and, in his own attractive and imitable manner, conducted them over the building, and explained the details of the construction and fitting of the hospital, so that no doubt could exist in the minds of the visitors that careful attention and forethought had been lavishly expended by the doctor and the architect on all the minutiae of the building, a description of which we hold over until next week.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday afternoon at Spring-gardens, the Chairman, Lord Rosebery, presiding.

The Deputy-Chairman's Salary.—Another futile attempt was made, on the motion of Mr. Elliott, to rescind the resolution of November 7, 1890, fixing the Deputy-Chairman's salary at £1,500. The motion was lost by 64 votes against to 44 votes for, a majority of 20 against.

The Water Question.—On the recommendation of the General Purposes Committee, it was resolved:—

"That the following be the order of reference to the Special Water Committee:—

"The Committee shall prosecute and conduct all legal inquiries and negotiations relative to the supply of water or to companies supplying water in or near London, and shall consider the steps to be taken for acquiring the undertakings now supplying London or for providing a new supply.

The Committee shall conduct any negotiations with the water companies for purchase or otherwise which may be authorised by the Council.

The Council shall take all necessary steps for the purpose of promoting and conducting conjointly with the Corporation of London the Water Bill of the Council.

The Committee shall conduct the case of the Council before the Royal Commission appointed to inquire into the subject of the London water supply."

The Proposed Amendment of the Building Acts.—The Building Act Committee reported for the information of the Council, that they had appointed a Sub-Committee to consider as to the amendment of the existing Building Acts, and as to other matters, such Committee to consist of the Vice-Chairman of the Council, the Chairman of the Committee, and Messrs.

G. B. Holmes, J. Marsland, A. C. Ranjard, R. Roberts, L. Stevens, R. Strong, and H. R. Taylor.

Contracts for Lime.—The Main Drainage Committee, referring to a report which they made to the Council on the 1st ult., on the subject of the tenders for lime, now reported that they had received a letter from Messrs. C. Christopherson & Co., asking that they might be permitted to supply 2,000 additional tons, which they offered to do at 16s. per ton, being the same price as had already been accepted by the Council for 2,000 tons of lime. The Committee recommended:—

"That, subject to an estimate being submitted to the Council by the Finance Committee as required by the statute, the offer of Messrs. C. Christopherson & Co. to supply 2,000 tons of lime at 16s. per ton be accepted, and that the solicitor be instructed to prepare the contract."

An amendment that the recommendation be referred back, with instructions to the Committee to re-advertise for tenders, was moved by Mr. Goodman and seconded by Mr. Leon, but it only found 16 supporters, and the recommendation was agreed to.

The Brook-street, Limehouse, Scheme.—The Public Health and Housing Committee's Report contained the following paragraph and recommendation:—

"The Brook-street, Limehouse, area comprises two plots of land cleared under a scheme confirmed by Parliament in 1853. The land was advertised for sale by the late Board in 1887, for the erection of artisans' dwellings to re-house 562 persons, but without result. In March, 1890, application was made to the Secretary of State for his consent to a reduction (viz., from 562 to 281) of the number of persons to be re-housed on the area, such reduced number to be accommodated in buildings to be erected on plot 1, and for permission to devote plot 2, which measures only 20 yards in width by 50 in length, to the purpose of an open space. The Secretary of State declined to sanction the reduction, suggesting that as a tentative measure the Council should again advertise plot 1, with the condition of re-housing 281 persons, the disposal of plot 2 being left for future consideration. Accordingly, plot 1 was offered for sale by auction on July 17, 1890, and again on March 24, 1891, but in each case without result. It was thought that the failure to find a purchaser might be due to there being no demand in the neighbourhood for block dwellings, and the Council therefore decided to make application to the Secretary of State, requesting him to sanction the reduction of the number of persons to be re-housed under the scheme to 281, on condition that both plots were used for the erection of cottage dwellings. The sanction of the Secretary of State was obtained to this proposal in due course, and the land was again put up for sale on the 23rd ult. on the altered conditions, but again to no purpose, no offers being made. Taking into consideration the fact that the plots have been put up by the Council four times for sale without result, and that an improvement scheme under Part II. of the Housing of the Working Classes Act, 1890, is now being proceeded with close to the area, with a consequent displacement of persons of the working classes, we are of opinion that a duty is cast upon the Council to see that the erection of dwellings is no longer delayed, and to this end that the Council should itself undertake to erect dwellings on the plots in question. The Housing of the Working Classes Act fully contemplates the possible necessity of the Council itself undertaking building in connection with an improvement scheme, but provides (1) that the consent of the Home Secretary shall be first obtained, and (2) that the dwellings when erected shall be sold within ten years of completion, unless the Home Secretary otherwise determines. The first step, therefore, is to obtain the consent referred to, and if this is given, to cause proper specifications and estimates to be prepared for the approval of the Council. The recommendation we make at this moment is:—

"That application be made to the Home Secretary under section 12 (3) and (5) of the Housing of the Working Classes Act, 1890, for permission for the Council to erect cottage dwellings on the vacant plots on the Brook-street site, in general accordance with the plans which have already been approved by him, and that if such application be granted, proper specifications and estimates be prepared and submitted to the Council."

The recommendation was agreed to, and after transacting other business the Council adjourned.

ROBERT BOYLE & SON (LIMITED).—We are informed that the Directors of Robert Boyle & Son (Limited), ventilating engineers, London and Glasgow, have resolved to pay an instalment on account of dividend at the rate of 12 per cent. per annum, free of income-tax, for the half year ending March 31 last.

NEW OFFICES FOR THE ATHENAEUM.

FROM the designs and under the superintendence of Mr. William C. Street, F.R.I.B.A., new premises have been erected at Breams-buildings, Chancery-lane, for the accommodation of the Editorial and Publishing Departments of the *Athenaeum* and *Notes and Queries*, also the printing establishment of the Athenaeum Press, of which Messrs. Francis & Co. are the proprietors. The upper floors or composing-rooms are well lighted by means of the side and back in Church passage and ordinary square windows, while the extensive machine-rooms in

the basement are lit through the medium of a central wall and pavement lights back and front. The front of the building is Venetian-Gothic in character, and the premises are built of red brick, Portland stone, and Aberdeen granite, the contractor being Mr. B. E. Nightingale, of the Albert Embankment.

FINNISH INDUSTRIAL EXHIBITION.—It has been decided to postpone the holding of the projected Finnish Industrial Exhibition at Helsingfors until next year.

ENGINEERING SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—At the ordinary meeting of this Institution, on Tuesday last, Mr. Berkley (President), in the chair, it was announced that five Associate Members had been transferred to the class of Members, and that fourteen candidates had been admitted as Students. The monthly ballot resulted in the election of five Members and of thirty Associate Members. Mr. H. A. Roebling, Associate-Member, read a paper on "The Sewage-Farms of Berlin."

SOCIETY OF ENGINEERS.—A meeting of the

Society of Engineers was held at the Town Hall, Westminster, on Monday evening, April 4, Mr. Joseph William Wilson, jnr., President, in the chair, when the adjourned discussion on Mr. S'ephens Sellon's paper on "Electrical Traction and its Financial Aspect" was concluded, and a paper was read by Mr. Reginald Bolton, on "The Application of Electricity to Hoisting Machinery." The author dealt with various methods of distributing power to cranes and hoists, and instances of steam, water, and compressed air, ropes and belts, shafting and gear, and stated the comparative advantages of electricity, among which are handiness, cleanliness, quietude, and economy. Some description was next given of the peculiarities of the electro-motor, which converts the electrical energy into rotative movement, and its distinctive characteristics is applied to the duties of lifting and hauling, and the machine is described as admirably effective, simple, and useful, with the minimum of working parts and an extraordinary efficiency. The author contended that the success of the application depended largely upon mechanical considerations, with several electrical conditions, and instanced several successful instances where these had been neglected; proceeding next to a description of simple mechanical gear, fulfilling all the requirements laid down, and which are embodied in the design of a ship's winch described and illustrated. A safety device, which also forms part of the apparatus, was described in detail, and it was shown how this prevents the overloading and consequent stoppage of the motor, overcoming in the simplest automatic manner the chief danger to their use. Several successful installations were described, and finally the question of first cost was dealt with, and compared with that of other systems. At the close of the meeting, the usual monthly ballot took place, when the following were duly elected, viz.:—As Life Member, Mr. Ernest Doowra; as Members, Messrs. Douglas Allport, junr., James L. Mingay, Frederick Lennard; as Foreign Members, Messrs. John A. Rossbach, Edward C. Harvey; as Associates, Messrs. Alfred H. C. Alley, William H. Sadler, Arthur S. Harbord, James H. Paul, Maximilian W. H. Clarke, Henry Conradi, Charles N. Spencer, William B. Martin, Lionel C. H. Savory, Henry T. Jackson, John E. Campbell, Frederick Southey, Joseph E. Kimfull, Takeo Nitta, John H. Austin, William P. Lipsett, Henry A. Scott, Alexander Mora, Douglas Clark, Gerard L. Baldwin, Harold L. Phillips, Harold T. Creasy, Alexander A. Rawlins, Alexander M. Furlonge, Cyril D. Bary, Reginald L. Bennett, Whitbread S. Silcock.

Books.

Electric-light Cables and the Distribution of Electricity. By STUART A. RUSSELL. London: Whitaker & Co. 1892.

THIS book belongs to "The Specialist's Series," and may, therefore, be regarded as "caviare to the general reader." For all that, the "general reader" who cares for such things will find it both more interesting and more intelligible than nine-tenths of the scientific works written expressly for him. Just as school histories are expressly designed to create a loathing for the study of history, so popular science is, generally, at once obscure and dull; sometimes owing to the ignorance of the writer, but more frequently because he is thinking of his audience, while the specialists writing for specialists think only of their subject,—"And sing natural, naturally please."

Mr. Russell begins with a short sketch of the earliest attempts at cable-laying in the early days of telegraphy, pointing out the causes of their failure, and how they were eventually replaced most universally by the overhead system. In chapter II. he comes to the subject of "Electric Light Cables," founding his whole treatment of the subject, with an instance which is rather amusing, on "Thomson's Economic

law." No doubt, when electrical distribution was in its infancy, and no one knew what thickness of cable to lay, this law was of some use as a rough guide; it could never be more than that; an exact calculation founded on uncertain data, and the cost of labor, allowance for depreciation, and rate of interest on capital, is little more than waste of time; but now that experience and natural selection have settled the

matter, the companies that laid wasteful cables have been crowded out, and the survivors have learnt an economic law, as bees learn geometry, without calculation. Mr. Russell states with admirable clearness the various considerations which modify the application in practice of this law; but he apparently fails to perceive that the existence of these qualifications takes the matter out of the hands of the Professor and puts it into those of the practical engineer. As for the tables he quotes from Professor Forbes, we have tried in vain to discover how they were constructed, nor does a reference to the report of the original papers (Cantor Lectures, 1885) help us. One thing, however, is clear, the tables profess to give the current density in terms *inter alia* of "the cost of laying one additional ton of copper." Now we were told at school that an equation was not solved if the unknown quantity appeared in the result; and since the current density in any particular case involves the section of the cable, and the cost of laying a ton of copper must greatly depend on its length, and therefore on its cross section, the tables lose even the academic value they might otherwise possess.

After a chapter on "Rise of Temperature" and "Fall of Potential" in the mains, which, as before remarked, modifies greatly the conclusions of the preceding chapter, we come to an excellent account of the different systems of distribution, followed again by a discussion of their relative economy, in which we find the advantages and disadvantages of the various systems impartially and graphically set forth. We doubt, however, whether there is in actual work any such system of double accumulators as described on p. 69, and we think Mr. Russell hardly does full justice to Mr. Bernstein's ingenious system.

After this are four practical chapters dealing with questions of insulation, making of joints, and the various systems of cable-laying, to which last he returns more fully in the last four chapters of the book.

All these matters are entered into in full detail and with knowledge evidently at first hand. The general consensus of authority, and the carelessness of American linesmen, support Mr. Russell in his general condemnation of bare overhead wires, but if he had had any experience of such a system properly carried out, as in Brighton about 1885, he might see reason to qualify the severity of his judgment, and allow that they are, in many cases, at least as satisfactory as overhead cables with heavier wires, while they are certainly much cheaper.

With respect to this latter system our author gives good reason for objecting to the Board of Trade regulation that the heater wires should be insulated, pointing out that it is closely analogous to metal sheathing, which it is universally recognised should be connected to earth.

The remaining chapter of the book treats of internal wiring and the testing of cables and circuits, and is as satisfactory and thorough as the rest. To the many disadvantages of wood-casing that the author has collected we may add one more,—it is a favourite resort of cockroaches.

We hope that in a subsequent edition the test given on pp. 184 and 185, and the accompanying figure 50, may be made clearer; at present we cannot see how two relations can be got by one observation; if a key were placed in the short circuit between the resistances the difficulty would vanish. We think Mr. Russell should note, moreover, that this method is identical with the bridge test, instead of so carefully contrasting the two.

The page or so devoted to the calculation of the insulation resistance of a cell might be cut down to a couple of lines if Mr. Russell would make use of the integral calculus.

Forty Plates on Building Construction. By F. MITCHELL. London, Paris, and Melbourne: Cassell & Co.; 1891.

THESE plates, prepared by Mr. Mitchell, the lecturer on building construction at the Polytechnic Institute, should be in the hands of every young student of architecture and building.

Mr. Mitchell has been assisted by other lecturers at the Polytechnic, and, with their help, has produced a series of plates of the very highest value, and certainly superior to any other illustrations of the detailed construction of modern builders' work, that a student can readily find. Specially noteworthy is the

care which has been exercised in figuring dimensions and scantlings, and in providing details, for the most part in isometrical projection, showing the various portions of the construction separate from each other, so as to make it easy for a learner to understand the precise articulation of the structure which he is studying.

We should advise all students who work from these plates to draw them out to a very much larger scale, as naturally the drawings here given have been considerably reduced in order to prevent the plates from being unwieldy. The reduction, however, has not seriously affected the clearness of the diagrams, though it has made some of the plates look rather full of work.

We do not suppose that the author intends that these plates should be used entirely without the assistance of a master or of a good text-book, since it would be quite impossible for an unassisted student to comprehend, for example, the meaning of the diagrams given to illustrate the levels and face moulds for wreathed hand-rails.

One especially good feature of the work is the fact that pains have been taken to bring the diagrams up to date by incorporating illustrations of modern specialised forms of construction.

Ventilation of Buildings.—By ALFRED R. WOLFF, M.E. New York.

In this small pamphlet by Mr. Wolff we have, within the compass of an ordinary lecture, what the writer accurately describes as "the terse presentation, in a popular way, of the great general principles underlying the proper ventilation of buildings."

We are glad to find ourselves in accord with the principles herein laid down, most of which we have from time to time drawn attention to in our pages, such as, for example, that temperature is no criterion of the efficiency of ventilation.

A useful feature in the pamphlet is the series of tables which the author gives for simplifying the calculations necessary in applying ventilation. Within the compass of such a pamphlet the author could not, of course, fully describe all that he touches upon, but he has well pointed out the chief factors determining the amount of ventilation, the method, and the warming, which necessarily follows the introduction of ventilation, as well as some general hints, which we completely endorse, as to the expense of various methods and forms of apparatus.

Elaïta. La Ville le Temple d'Athéna Cranaïa; par Pierre Paris. Paris: Ernest Thorin. 1892. (Bibliothèque des Ecoles Françaises d'Athènes et de Rome, publiées sous les auspices du Ministère de l'Instruction Publique. Fascicule Soixantième.)

M. PARIS' book is practically, as he states in the preface, intended to be a monograph on the ancient city of Elaïta, but practically by far the greater part of it is devoted to the discussion of the Temple of Athene Cranaïa, to which the city owed much of its fame, and the excavation of which is due to the French School of Archaeology at Athens. Reports of the progress of this excavation have, of course, appeared from time to time in the Bulletin de Correspondance Hellénique since the beginning of the work in 1884. Now, for the first time, M. Paris presents us with a valuable summary of the results, preceded by an excellent account of the history of the town in ancient and modern times. Elaïta was always second in interest among the towns of Phocis to Delphi, with its world-wide renown; but if we may trust Strabo, it was the largest of all. Pausanias (x., 84) devoted a whole chapter to its history and the discussion of its monuments; and he especially notes the Sanctuary of Athene Cranaïa, the seat manifestly of an ancient local cult. It is recorded that the priest was always a young boy, and that he used for his bath a peculiar and ancient form of tin called an *ἀσπίς*; this *ἀσπίς* dates from Homeric days, and M. Paris believes he has found some specimens just big enough to bathe a rather small boy. There is little doubt the tradition must be connected with the famous ceremonial "Bath of Pallas." The book altogether is of great interest in connexion with that early local cult of Athene. The site of the temple itself struck even Pausanias as remarkable; it stood on the crest of a precipitous hill. M. Paris devotes a chapter

to its ground-plan and proposed reconstruction. He believes it to have been of similar construction to the so-called Theseion at Athens, but of somewhat earlier date. There is evidence that baked clay was largely employed in its structure, whereas the Theseion was entirely of marble. Only second in interest to the temple itself are a large collection of votive terracottas and inscriptions, which M. Paris discusses in detail.

A Plea for Liberty. An Argument against Socialism and Socialistic Legislation. With an Introduction by Herbert Spencer and Essays by various writers. Edited by THOMAS MACKAY. New and Revised Edition. London: John Murray. 1892.

THIS is a cheap edition of a book which all persons who are interested in the affairs of their time would do well to read. The various writers state their case with clearness and brevity, and in a plain, common-sense style. The faults of Socialism, and the weak points of a system which represses individual freedom, are exposed in a way which any ordinarily educated man should understand. Thus Mr. Herbert Spencer points out what is very apposite at the present time, that every society is apt to take away from the freedom of its members. In trades unions "the regulative agency becomes all powerful, their members, even when they dissent from the policy pursued, habitually yield to the authorities they have set up." This is perfectly true, and will in time be recognised by working men. Considering that the price of this edition is only 2s., it ought to be very widely read.

Olympia. Die Ergebnisse der von dem deutschen Reich veranstalteten Ausgrabung. Herausgegeben von ERNST CURTIUS und FRIEDRICH ADLER. Textband IV. Die Bronzen und die übrigen kleineren Funde. Tafelband IV. Berlin: Verlag von Asher & Co. 1890.

THIS is the fourth volume in the sequence of the great official work, "Olympia," to whose programme we drew attention about a year ago, but it is the first to appear. It is based mainly on the elaborate studies made by Dr. Fürtwangler on the spot, at Olympia, in 1886,—studies which he revised and enlarged during a shorter stay there in 1888. Dr. Fürtwangler had for years been second in command (under Dr. Curtius) over the Antiquarium at Berlin, where all the smaller antiquities, vases, terracotta, bronzes, &c., of the Museum, are stored, and there could be no one more competent to undertake the work of elucidating the bronzes of Olympia than he. The task is no light one. In a series of eighty plates he has published and elucidated no less than 1,371 minor objects of antiquity, ranging in date from pre-historic votive offerings to Byzantine jewellery. The antiquities published are as diverse in character as in date. They comprise fragments of statues, statuettes, tektonic fragments, and a vast hoard of votive offerings of every description in bronze and terra-cotta. Of these, the most interesting are undoubtedly those with mythological subjects,—e.g., Herakles and the Old Man of the Sea (inscribed), Ajax and Cassandra, and Hermes, Achilles and Priam, which designs are all impressed on thin bronze plates. The book, as a corpus of a certain class of discoveries, is essential to all archaeological libraries, but its appearance will not arouse such interest as many of the subsequent volumes,—e.g., that on the topography, and that on the architecture, of Olympia, in both of which novel discoveries may be looked for.

Wiener Vorlegeblätter für Archäologische Übungen, 1890-91. Mit Unterstützung des K. K. Ministeriums für Cultur und Unterricht. Herausgegeben von Otto Banddorf. Wien: A. Hölder. 1891.

THIS new issue of the invaluable Vienna "Vorlegeblätter" is divided into two parts. The first consists of a corpus of the works of one Greek vase-painter, and that the most prolific of all,—i.e., Nikosthenes; the second contains plates devoted to the statement of certain archaeological problems dealing with vase interpretation. The vase-painter Nikosthenes has special claims to attention. He is, perhaps, of all whose signature we possess, the most decorative, and his work in antiquity attained to an extraordinary popularity. We have no really fine examples in the British Museum (his finest work is in the Louvre), so the "Vorlegeblätter" this time specially appeals to English

students. The plates are, as usual, first-rate. Not only are many vases published for the first time, but,—a matter scarcely second in importance,—vases hitherto known in inferior plates are now reproduced from new and accurate drawings. Even the most recent publications are not reproduced without the most exact revision. The "problem" plates will be a genuine delight to all ingenious archaeologists, and should be a lively stimulus to students. A well-known but hitherto unexplained vase is reproduced, and, side by side with it, analogous types-forms which may and should help to its solution. Another form of problem is to publish in one sheet a number of fragments known to have been found together, and leave it to the student to reconstruct the design. This is real actual archaeological practice, and training alike for mind and eye.

Fünfzehntes Hallisches Winckelmannsprogramm. Scenen des Ilios und Aithisipis auf einer Vase der Sammlung des Grafen Michael Tyskiewicz. Fest-schrift zur Eröffnung des Archäologischen Museums der Friedrichs Universität. Halle-Wittenberg: von Carl Robert. Halle: Niemeyer. 1891.

WE have again and again called attention to the necessity of the prompt publication of important works of Greek art in private collections, and collections, from the nature of the case, less accessible to science, and always liable to unnoticed dispersion, and we are glad to find the last Winckelmann's Programm devoted to the reproduction of a truly magnificent red-figured krater in the possession of Count Michael Tyskiewicz. The vase is notable for its perfect preservation, it not only being intact, but every line even of the super-imposed freshness being preserved with extraordinary brilliancy. The scenes represented are also of great interest. On the one side Diomedes contends with Aeneas in the presence of Aphrodite and Athene, on the other Achilles and Memnon fight over the fallen body of Melanippos,—Eos and Athene advance on either side to protect their favourite heroes. All the figures are inscribed, so happily the interpretation is undoubted. The text is as valuable as the plates. We cannot here enter into details, but Dr. Robert, with his usual brilliancy, discusses, apropos of the figure of Melanippos, a new element in the type,—the relation of literature and vase-painting with some new and interesting results.

London Street Improvements. By HENRY CLARKE, Chairman of the Improvements Committee of the first London County Council. 1892.

THIS is a pamphlet containing some practical remarks on the special problems of London improvements, with a map and a list of suggested street improvements. Some of the general remarks on the subject are well worth attention. As usual in this country, the improvements are suggested on mere practical and financial grounds, and take no account of opportunities for architectural effect.

La Peinture Antique, par Paul Girard. Bibliothèque de l'enseignement des Beaux-Arts. Publiée sous la direction de M. JULES COMTE. Paris: Quantin.

ON the general excellence of this series, it is now superfluous to insist. Seven of the manuals have found their way into English translations, and we hope this small handbook on ancient painting will shortly appear in the same form. It is unfortunate that whereas the French volume can be got for 3 f. 50c., they emerge in England (certainly with some substantial additions) at the comparatively high figure of 10s. 6d. We may note one point in which M. Girard's manual on painting is distinctly in advance of the rest, and that is in the matter of illustration. They have been, M. Girard says in his preface, the object of his special attention, and not in vain. So often these elementary and cheap manuals go on reproducing *ad nauseum* wretched cuts of subjects already thrice familiar, that it is a distinct relief to turn over the pages of a book which gives really excellent reproductions of works of art only brought to light within the last three years, or hitherto only accessible in rare or costly publications. We note,—e.g., p. 104,—the remarkable painted bull of Tyros and the famous Vaphio gold cups which have so lately appeared in the "Ephemeris Archæo-

logike," the lovely painted plaque with the figure of a warrior, recently discovered in the Acropolis; and the fragments,—if possible still more beautiful,—of the white cylix with Orpheus and the Thracian woman, lately published in the *Hellenic Journal*, but reproduced here from original drawings. The book should be specially welcome to artists, to whom Greek vase-paintings are, as a rule, almost unknown, but by whom, when known, they are highly prized.

SOME RECENT TRADE CATALOGUES.

Messrs. John Bolding & Sons, of Southampton-street, send us a new edition of the illustrated catalogue of plumbers', engineers' and gasfitters' brasswork, valve and earthware pedestal closets, sanitary earthenware gullies, air-chambers, and drain-disconnectors. The catalogue is a very comprehensive one extending to nearly 500 pages. It is well printed and indexed. Its contents include good variety of excellent valve and other closets, water waste-preventing cisterns, bath lavatories (the "Paragon" lavatory basin with its flushing-rim and quick-waste is one of the best things of its kind known to us; on turn of a lever shuts the waste and fills the basin for use; by reversing the lever the basin is emptied and rinsed), and many other things too numerous for mention.

Messrs. Baird, Thompson, & Co., send us their revised and illustrated catalogue of ventilating and heating appliances to meet all requirements. It is clear and concise, and will repay keeping for reference.

Messrs. J. M. Bennett & Sons, of Ardwick, Manchester, send us a useful little catalogue priced details of stock of logs, dry oak and a held by them at the present time. The catalogue gives the length and sale contents, a table of the number of boards into which each log sawn, also the date of sawing, sawing content, and the net cost of log,—timber and saw included. The catalogue will be found exceedingly convenient by builders, joiners, cabinet-makers, and others in all parts of the country, for in addition to the before-mentioned particulars, there is a table of railway rates for the conveyance of timber from Ardwick station.

From Woodhouse & Rawson United (L) we have received an illustrated catalogue of hydraulic machine tools manufactured by them on the Payne-Galloway system. It is an interesting and suggestive production, and contains illustrations likely to be of use to any building contractor. The portable hydraulic riveters will be of great service wherever there is a quantity of ironwork to be built up *in situ*. A hydraulic pile-extractor, figured on page 10, is also worth attention. The catalogue has been compiled by Mr. W. Payne-Galloway.

Correspondence.

To the Editor of THE BUILDER.

ARCHITECTURAL EDUCATION.

SIR,—A foremost place in the April number of "A.A. Notes" is given to a letter from Thos. G. Jackson, A.R.E.A., concerning "Training of Architects to the Pursuit of Architecture," which said letter has a wider interest and more reaching consequences than is apparent in the publication in which it appears. Mr. Jackson tells us in his letter that his memorialists against registration and examination have not been idle, and that on more meetings have taken place between the half-dozen of those who signed the memorial and some half-dozen members of the A.A., that, at the request of the latter, Mr. Jackson writes to let "the Association know what has been and is being done," and he very plainly and honestly tells us on what grounds memorialists will extend their aid to the A.A., and on what conditions; we are promised a volume of essays, setting out the view of "various artists, especially the delusive character of a diploma obtained by examination." The italics are our own. The conditions of help from this quarter are the giving up of the present scheme of studies, which "points definitely to preparation for the examination of the Institute," and return the memorialists will, Mr. Jackson "feel it an honour to help . . . as vi-

The Student's Column.

WARMING BUILDINGS BY HOT WATER.

XV.

BOILERS (continued).

IN the previous paper the list given applied to saddle boilers having 2 in. to 3 in. water-ways, according to the size of the boiler. Some people prefer a larger water-way than this, especially if a considerable accumulation of dirt is anticipated, but the boiler-makers, for some reason or other, put a considerably higher working valve upon these than on those with the smaller water-ways first referred to. This is deceptive, as the mere fact of adding an inch to the water-way does not increase the direct heating surface at all, it adds a trifle to the outer line surface, though scarcely sufficient to be worth calculating. Some makers actually attribute one-eighth greater total heating valve to the boiler for this little addition in the water-way. It would be unsafe to trust to this.

This larger water-way brings us to consider a question that requires every attention when fixing boilers, viz., provision for, and easy access to clean out, any accumulated matter that may collect or be deposited. In almost every case it is dirt, pure and simple, that has to be removed periodically, and the periods have to be regular and moderately frequent if the apparatus is fed with ditch or pond water, as is frequently the case. Then the supply or filling cisterns are just as commonly without lids, and foreign matter of many kinds, leaves, insects, &c., enter, and all go to increase the collection at the lowest point in the apparatus, the boiler.

The provision for the removal of this is a hole drilled at the bottom of the two sides or legs of the boiler in front, and from these holes, say 14 in., are brought two short lengths of pipe through the brickwork that must exist in front. The front ends of these pipes are plugged. By removal of the plugs, a cane or wire can be inserted, and made to disturb whatever soft dirt deposit there may be in the boiler, and this can be flushed out.

Another and entirely different kind of deposit occurs when the apparatus is fed with what is known as "hard" water, and this water frequently renewed,—that is, water withdrawn and replaced with fresh. This deposit, which is actually carbonate of lime, adheres to the boiler plates tenaciously, and is very hard, and requires very generally to be chiselled off.

This state of things is not common in heating works as, in the first place, the water must be "hard," such as we get from water companies' mains in the South of England, and not surface or rain water. Then, in addition to this, the water must be rather frequently changed, as, although we get a certain quantity of lime deposit from one charge of water, the quantity is so very small as to be harmless and imperceptible. If an apparatus is used for both heating and yielding a supply of hot water in a building, then the trouble will certainly occur if the water be "hard." Kitchen-range boilers that are used exclusively for yielding hot water suffer greatly in this way in London and the South of England.

Boilers are made of cast iron, wrought iron, and copper. The latter material is but seldom used. Cast iron is used to some extent, particularly in small boilers, and its adaptability to larger ones is successfully illustrated in Keith's boilers, which can only be spoken well of. The great fault with articles of cast iron lies with the founder, who does not, for reasons known to himself, use a good admixture of metals. It is quite possible to have cast iron of a quality that possesses features quite contrary to what are generally expected. It will not crack if subjected to really violent usage and blows; if struck with moderate care at an edge, the material will burr over instead of particles flying off, and by skilful hammering flat plates can be actually bent a little, and all this without annealing or specially treating, except in the selection of the different brands of pigs. A metal like this is really tough, and shows a most irregular and rough fracture when broken.

Wrought-iron, however, is the material chiefly used at present for boilers of moderate and large size, both of the brick-set and independent kind, the joints being welded. Welded joints are cheaper than rivetted, and are very satisfactory. Of course, very large boilers, like the Cornish pattern, &c., have rivetted joints, as

they are too large to be conveniently welded. The general thickness of plate is $\frac{1}{2}$ in. This is a serviceable strength, and can be recommended, but there is no objection to $\frac{3}{8}$ -in. plate if the boilers are small. The difference in cost between $\frac{3}{8}$ in. and $\frac{1}{2}$ in. is about 20 per cent. The thicker plate should be used wherever cost will allow, although the writer is in doubt whether it would give 20 per cent. more service than that which is only $\frac{1}{2}$ in. thinner. It is possible that when thinner plates are used they are of a less quality than the others; perhaps some boiler-maker will contradict this if incorrect. It has to be remembered that the majority of boilers fail by an accumulation of dirt causing their fracture, and not from ordinary wear and tear.

There now remains one other feature to be treated before proceeding with the actual description of boilers, and this is the area of furnace bars needed to effectually work certain sizes and certain patterns. This subject is of importance, though, of course, those who use boilers but little, have no need to calculate the size of furnace-bars required; the boiler maker will supply them with the other fittings of a correct size, with the boiler, if ordered.

This is a question that Hood also treats fully and successfully in his book. His allowance in this respect is 50 square inches area of furnace bars to each 100 ft. of 4-in. pipe, or 100 superficial feet of radiating surface. This allowance only applied to the saddle boiler. The newer forms of boilers having internal flues, &c., do not require so great an area in proportion to the pipe they can effectually heat as is shown in the table given further on. It will be noticed that the area of furnace bars is fixed by the quantity of pipe to be heated, and this, at first sight to the inexperienced, may appear to be a peculiar arrangement. Such, however, is not the case, and a little thought will show that no better plan could be devised. If we tried to decide the area of bars by the width or length of boiler, we should probably get irregular results, and if we calculated by the actual direct and indirect heating surfaces, then we should get exactly the results as calculating by the quantity of pipe, but at unnecessary trouble.

Table showing the area of furnace-bars required for each 100 ft. of radiating surface, with the various kinds of boilers at present in use:—

	Square inches.
With a plain saddle boiler	50
With a saddle boiler having one check or waterway end	45
With a saddle boiler having two waterway ends	40
With a saddle boiler having a tubular flue as fig. 56	40
With boilers as figs. 57 and 58, which have both waterway ends and tubular flues ...	35
If a boiler is fitted with an oval cross-tube, the above figures can be reduced by ...	5 to 10

The above will be seen only to apply to boilers which are brick-set. Independent boilers are always fitted up with bars and the other fittings by the maker. Many independent boilers are worked with a less proportionate area of bars than the above. Keith's Challenge boiler, for instance, only has about 20 square inches of bars per 100 ft. of radiating surface. It is understood that, when speaking of area of fire bars, the spaces between the bars are included.

From the table it will be seen that a plain saddle-boiler, estimated to heat 800 ft. of radiating surface, should have an area of bars of 400 in. (say 24 by 17); but if this same-sized boiler was fitted with an oval cross-tube, its estimated power would be increased to 1,000 ft., but it would not require any greater area of fire-bars.

If the pipes to be used are not 4 in., then allowance must be made as follows:—For 3-in. pipe a fourth less, for 2-in. pipes one-half less area of fire-bars than 4 in. For instance, if we can work 100 ft. of 4-in. pipe with 50 square inches of bars, then the same area will be suited for 133 ft. of 3-in. pipe, or 200 ft. of 2-in. pipe. It was mentioned in the last paper that in calculating the working value of boilers, similar allowance has to be made.

THE FERDINAND'S BRIDGE, VIENNA.—As everyone knows, it was the custom in the Middle Ages to build houses on both sides of bridges, such as was the case with old London Bridge, the Rialto, and the Ponte Vecchio in Florence, and now it is projected to follow this ancient custom in rebuilding the Ferdinand's Bridge across the Danube. It is proposed to line the bridge on both sides with shops, the rents of which would go far towards covering the cost of construction.

and aid in drawing up, facilitating, and superintending," if we desire it, our scheme of studies; out unless the A.A. purges itself of the old even, the memorialists cannot take any interest in our programme. In plain language, renounce the Institute and all its works, and embrace the true faith as set forth by us, the memorialists. Another bait offered is a promised reform of the Architectural Schools at the R.A., and the further possibility that our schools should be affiliated to those of the Academy. Mr. Jackson concludes his invitation to forsake the Institute and join his party thus:—"In conclusion, I can only remind you that the future, so far as concerns any help or co-operation on our part, rests with you. If you turn your faces the right way, you will not find us backward in going with you, if you should think proper to invite our assistance."

Now, sir, I am curious to know who the half-dozen members of the A.A. are who have entered into negotiations with Mr. Jackson and his friends, and whether they have been authorized to do so, and by whom.

That the present scheme of education in the A.A. is more or less the outcome of the Institute examinations is patent; that the promoters of the scheme and the examiners and many of the teachers are members of both bodies is perfectly well known.

That the A.A., by the mouth of its President, in an admirable address, quite recently set forth the new scheme and the claims of the A.A. to the sympathy and aid of the Institute; and that the Institute in reply made a generous grant to the friends of the A.A. stands reported. That many members of the Institute have, in a very appreciable manner, shown their interest in the work of the A.A., every member who cares to inform himself may know. What the gentlemen, who now seek to destroy the close relationship which exists between the Institute and the A.A., have done for the latter body is not so clear.

If the members of the A. A. are content to be patronised, and to change a very carefully thought out scheme at the invitation of men hostile to the Institute, however distinguished some of them may be, then they have sadly deteriorated from the vigour, determination, and unflinching they once possessed, and which has made the A. A. what it is. Everything that the memorialists offer can in time be grafted on to the present scheme, and in the ranks of the Institute are men every bit as able as those few who stand aloof from it to aid with instruction. I trust that before very long the members of the A.A. may have an opportunity of meeting together to discuss Mr. Jackson's invitation, and to reply to it, and at the same time to hear from the half-dozen of their confederates without pretext, and by what right, they led Mr. Jackson to suppose that they expressed the voice of the A.A.; and that at the solicitations of the memorialists the A.A. would go back on their old traditions, and,—renouncing their old sturdy independence,—lean upon others for support and guidance.

COLE A. ADAMS,
Past-President Architectural Association.

LINCOLN CATHEDRAL LIBRARY.

SIR,—In my letter on this subject it was not my wish to speak with any disrespect of the late Sir Gilbert Scott. Mr. Ferguson refers to his preservation of old work at Ripon, and I think he might have quoted other places where he was prompted by the same good spirit. Sir Gilbert was, indeed, a man of great activity and intelligence, and by no means anxious to close his mind against new schools of thought, but the sad fact remains that, following in the old grooves, the so-called restorations carried out under his direction involved the most wholesale destruction. His practice having been most extensive, so, too, was the destruction, and this was wrought more particularly in our cathedrals, from which all fittings not approved "Gothic" were cruelly turned out.

SOMERS CLARKE.

REMOVING OLD PAINT.

SIR,—I should be much obliged if any of the readers of your paper could give me any information of any process, other than chipping with a chisel, of removing old paint from stonework. The case to which I refer is that of some stone pillars in a church which years ago have had several coats of paint, which it is now wished to remove. I should be very grateful for any information on this subject.

H. F. WHITE.

OBITUARY.

Mr. T. H. EAGLES.—At the meeting of the Royal Institute of British Architects on Monday evening last, as reported in another column, the death was announced of Mr. Thomas Henry Eagles, M.A., F.R.I.B.A., and Professor of Architecture at Cooper's Hill College, Staines. He was elected an Associate of the Institute in 1871 and a Fellow in 1881.

MR. JOHN RHIND, A.R.S.A.—On the 5th inst., Mr. John Rhind, sculptor, who was recently elected an Associate of the Royal Scottish Academy, died in Edinburgh. He was born in Banff, where his father was a builder, and to that trade he served his apprenticeship. He went to Edinburgh to study architecture; but, having a taste for sculpture, he entered the studio of the late Mr. Handyside, A.R.S.A. In 1858 he commenced practice for himself, and subsequently carried out many works in connexion with Scottish buildings.

MR. W. J. BEADEL, M.P.—We regret to bear that Mr. W. J. Beadel, M.P. for the Chelmsford Division of Essex, died on the 5th inst., after several weeks' illness, at his residence, Hutton Hall, Brentwood. He was born in 1828. Since 1846 Mr. Beadel had been an estate agent and surveyor, and he had served as President of the Surveyors' Institution.

DR. JOHN COLLINGWOOD BRUCE, F.S.A.—We regret to learn that Dr. J. C. Bruce, the well-known antiquary, died at Newcastle-on-Tyne on Tuesday last. He was a prolific writer on antiquarian subjects, but will be best remembered by his "Historical and Descriptive Account of the Roman Wall in the North of England." He was in his eighty-seventh year. The *Newcastle Chronicle* of Wednesday last contains a long and interesting memoir of Dr. Bruce and his labours as a minister of religion, philanthropist, and antiquary.

GENERAL BUILDING NEWS.

ADDITIONS TO CATHOLIC CATHEDRAL, PORTSMOUTH.—On the 31st ult., the consecration took place of the new additions to the Cathedral church of St. John the Evangelist, in Edinburgh-road, Portsmouth. The building is from the designs of Mr. Joseph S. Hanson, and is in the Gothic style of the Decorated period, cruciform in shape. When completed it will have a tower and spire at the west end, but for the present this portion of the scheme remains in abeyance. The building of the transepts, sanctuary, &c., has been carried out by Messrs. W. R. & C. Light, of Landport, under the superintendence of Mr. J. W. Randle as clerk of the works, and Mr. John Townsend as foreman. The new work consists of the transepts, each 24 ft. wide by 20 ft. deep; the sanctuary, terminating in an apse, 52 ft. long from the eastern arch of the nave, by 25 ft. wide; the Lady Chapel, on the south side of the sanctuary, 39 ft. long by 12 ft. wide; and St. Edmund's Chapel, on the north side, 22 ft. long by 12 ft. wide; while there have also been added a porch and entrance lobby on the south side of the Lady Chapel, and on the Alfred-road side of the Cathedral four confessionals, sacristies, tribune, guardian's room, and other apartments that cover a considerable area, extending access to the school wall, which they join. A covered way leads from these to the Bishop's house. The external walls are of Farnham red bricks, relieved by Portland stone dressings, and the roof is covered with red tiles. In the sanctuary there are thirteen two-light windows, with pointed and tracery heads. In the north transept a five-light window, 32 ft. in height and 13 ft. across, the pointed arch filled with tracery, is constructed, and in the gable of the south transept is a rose-window of floriated design, 18 ft. 6 in. in diameter. Below this a recessed arcading of stonework is formed, which will accommodate a peal of ten of Harrington's tubular bells. The sanctuary walls are flanked by a series of buttresses, each of which is surmounted by a Portland stone pinnacle, with carved crockets and finials and sunk tracery panels. A coping of stone, pierced with a quatrefoil design, also runs round this wall. The apex of the apse is crowned by an ornamental wrought-iron cross. At the outer angles of the transepts are four buttresses, supplied with stone weatherings, and surmounted by carved crocket finials, and the gables are coped with moulded stone, terminating on either side in a carved stone cross. Above the principal windows in the gables are two small quatrefoil lights. At the entrance to the porch is an ornamental wrought-iron gateway, manufactured by Messrs. Jones & Willis, of London. The stone carving, both externally and internally, has been executed by Mr. George Porter, of Chelsea. In the interior the sanctuary is divided from the nave by a rod-screen of wrought-iron, constructed by Messrs. Powell, Hardman, & Co., Birmingham. Around the apse the walls (which, like the other parts of the interior, are faced with Beer stone) are relieved by dark marble columns extending to the ribs of the roof. The ceilings both in the sanctuary and transepts are of wood, groined, perforated, and stained and varnished; in the chapels they are of deal, stained and varnished, with ribbed mould-

ings. The floors are of wood-block, Duffy's patent. The altar is raised some 3 ft. above the floor of the nave. In the Lady Chapel a carved stone reredos, which formerly occupied the wall at the end of the south aisle, has been placed above the altar. The doors are of paneled oak, and the windows are filled with cathedral-tinted glass with ruby borders.

ADDITIONS TO GENERAL POST OFFICE, EDINBURGH.—Extensive additions are being made to the General Post Office, Edinburgh, on vacant ground immediately to the east of that building. When the present Post Office was completed, the Office of Works objected to the plans prepared by their local architect, the late Mr. Robert Mathieson, as being beyond the requirements of the department, and it was only owing to pressure being put forth by the local authorities that the design was carried out in its entirety. Two departments,—the Board of Lunacy and the Ordnance Survey,—were accommodated for a time in the new edifice, but these departments had after a short time to make way for the increasing requirements of the Post Office. It is lucky that there is ground left for the addition now urgently required.

MISSION HALL, CARDIFF.—The memorial stones of a new mission hall were laid at the East Moors, Cardiff, on the 23rd ult. The hall is situated in Carlisle-street, and is designed to accommodate 1,000 worshippers. The large hall is 72 ft. by 48 ft., and a gallery runs round the entire building, supported upon light iron columns, which help to support the roof. In front of the hall is a large class or committee room. The fresh air inlets will be fixed about 7 ft. above the floor level, and exhaust ventilators in the ceiling for the extraction of vitiated air. The cost of the building when completed will be 2,000*l.* Schools are intended to be erected in the rear of the present building, land being reserved for this purpose. The building is being erected by Messrs. Thomas & James, of Cardiff, from the design and under the superintendence of Messrs. Habershon & Fawcner, architects, Cardiff.

THE NEW NATIONAL SCOTTISH OBSERVATORY.—The plans of the new National Scottish Observatory have now been completed, says the *Scotsman*, and the erection of the buildings on Blackford Hill, Edinburgh, will, it is expected, be proceeded with immediately. The plans have been prepared by Mr. W. W. Robertson, of her Majesty's Board of Works. The buildings consist of an observatory proper and transit house, placed along the north front of the site, with detached residences on the south slope. There is also a gatehouse at the entrance, which is to the south side. The Observatory proper will consist of a T-shaped building, with a frontage towards the north of 180 ft. It shows towards the city an unbroken range of flat-roofed central buildings having a mean height of 30 ft., and consisting of a principal story and a basement. These are flanked by octagonal towers of unusual size, crowned with large cylinders of copper,—the larger tower 75 ft. high and 40 ft. in diameter, placed at the east end; and the smaller, 44 ft. high and 27 ft. in diameter, placed at the west end. The design is Italian in style, with an admixture of Greek feeling, says the same journal. The stone employed is freestone, and the basement is built of rusticated ashlar, and the principal story of the central building is pierced with eleven windows. They have carved jambs and lintels, and on the wall spaces between them are carved the signs of the Zodiac. Along the length of the building, over the windows, runs a moulding, and the whole is surmounted by an ornamental balustrade. In the larger tower there are two rows of windows. The lower story windows have pilastered jambs and carved pediments, and the decoration of the upper story windows is after the same style, and has been combined with that of a projecting parapet. In the smaller tower there is one row of windows, which have been similarly treated, and the pediment of the window facing the town has carved upon it a representation of Phaeton driving the chariot of the Sun. The Observatory will be used for physical as well as for astronomical observations. In the towers are to be placed the two large equatorial telescopes. The telescopes are to rest on massive, hollow, brick piers, completely isolated from the surrounding walls and floors. The larger pier is 50 ft. high and 23 ft. square at the base, and both taper towards the seat for the telescopes. A small vault is to be formed in the interior of the larger tower for housing the standard sidereal clocks. The upper stage of each tower will consist of the cylinder of copper in which the equatorial telescopes are placed, and each has an observing aperture extending from the horizon to the zenith. Each will rotate upon a vertical axis so as to admit of its being turned with the telescope. The apartments below the domes will be used as chart rooms, and in the case of the larger tower will be placed a suite of rooms for photographic purposes. The central range of buildings between the towers is to be occupied by laboratory rooms for the astrophysical side of the Observatory work. In the angle between the large tower and the central buildings, at the back, has been placed a turret carrying a spiral stair, and beside it is a smaller turret carrying a lift for convenience

in moving apparatus. The flat roof of the central buildings has been adopted to facilitate communication between the towers. In the principal story, beginning at the west end, there will be a room used for spectroscopic work; and to the south of the building, outside this room, will be placed a heliostat, by which the rays of the sun will be reflected into the apartment through an 10-in. aperture in the wall. Next will come the experimenting room, or working laboratory, having three isolated pillars for delicate measuring operations, and there also the mean time clocks will be kept. Then comes an electric room, which will be the centre of the electric system for lighting and scientific purposes. Next will come the mechanics' workshop and cleaning room; and, lastly, the chronograph room. The basement of the range is to be occupied by stores, workshops, and printing room. Southward from behind the central building extends a wing 80 ft. in length and 28 ft. wide. It consists of three floors, and has the entrance to the Observatory on the west side. The basement floor is to be occupied by the heating apparatus, and rooms for the dynamos and accumulators in connexion with the electrical apparatus. The principal floor will contain the library, with accommodation for about 30,000 volumes. Beside the library, this floor will contain the directors' room, ante-room, and computing room. The top floor is to be occupied by a long apartment to be used in connexion with the 15-in. heliostat. It is for spectroscopic and photographic purposes when long distances are required, and insulated rails are fitted upon it so that the delicate instruments in use are free from vibration. The room will be lighted from the roof by skylights; the shutters of which can be closed instantaneously at a distance of 50 ft. west from the main Observatory, and in line with the north-west front of it is to be placed the transit house, which is connected with the main building by a covered way. The walls and roof are to be of corrugated iron, covered with curved louvres of tinned steel, with an air space between of about 6 in., the object being to prevent radiation and to secure uniformity of temperature between the inside and the outside of the building. The Observatory being above the level at which the water of the Edinburgh and District Water Trust can be supplied by gravitation, a large tank will be provided on the principal floor of the great tower for the storage of water, which will be forced up by a pumping apparatus placed in an underground chamber near the Harrison Arch, and worked by an electric motor with a current supplied from the Observatory. The dwellings will be lighted with gas, but electric light will be provided for the Observatory buildings. The whole Observatory will be heated with hot water from a central furnace. The cost of the building, including fittings, will be about 34,000*l.*, and the contract has been entrusted to Messrs. W. & J. Kirkwood, Edinburgh.

ENLARGEMENT OF CHAPEL, BROMPTON HOSPITAL.—The Chapel of the Brompton Hospital for Consumption is undergoing considerable enlargement from designs by Mr. Wm. White, F.S.A., and there has just been re-laid, in the centre of the east wall of the extended chancel, the foundation stone which originally occupied a similar position. The bottle found, containing an inscription in good preservation on parchment, was replaced beneath the removed stone. The ceremony was of the simplest character, only members of the Board, besides the architect, being present. The stone was laid by Mr. T. Percival Beckwith, the chairman of the Board. The chancel will be extended in length and breadth to about double its former area; a new aisle is added on the north side, and the organ aisle is rebuilt to a similar extent. The dress-stonework of the old chapel is much decayed, but as much as possible of the old work is retained, re-used, incorporated into the new work. The stained glass, given by various benefactors, has got into a bad state, much of the painting having peeled off, and the leadwork being decayed. This is being carefully repaired and made good for replacement in the removed windows.

SANITARY AND ENGINEERING NEWS.

PEASMARSH SEWERAGE.—The Rural Sanitary Authority of the Peas Union (Sussex), at their meeting on the 29th ult., appointed Mr. H. Bertram Nichols, C.E., of Birmingham, to prepare a scheme and report on the sewerage and sewage disposal of the parish of Peasmarsh.

ROYTON (LANCASHIRE) SEWERAGE.—A Local Government Board inquiry was held at Royton, Lancashire, on the 31st ult., by Colonel Luard, R.E., with regard to the application of the Local Board for permission to borrow the second instalment of money for works already sanctioned by the Local Government Board, and also for sanction of further loan for the erection of sludge-pressing plant, a refuse destructor, and sundry other works to complete the sewage works now in course of construction. The original sewerage scheme was approved by the Local Government Board two or three years ago, and a loan of 27,500*l.* sanctioned. This sum was chiefly for the sewers of 11

district, and the subject of the recent inquiry was chiefly the purification works to be completed in the most efficient manner suggested by recent experience. The engineer for the scheme, Mr. Theo. S. McCallum, C.E., of Manchester, explained the general arrangement of the works and the details of the works. Nearly one-half of the district is now sewered and the work is progressing. The purification process decided upon is the "international," and the settling tanks, filters, &c., are nearly completed. The sewage will be added to the sewage automatically by one of Keirby's patent mixers. The sludge will be pressed and subsequently calcined in destructor furnaces. The refuse destructor will adjoin the sewage tanks, and the waste heat from the burning of asphalt refuse will be utilised to raise steam for the sludge-pressing. The destructor and sludge-pressing plant is being supplied by Messrs. Goddard, Massey, & Warner of Nottingham. Jones's time-creator is to be used. The cost of the sewerage scheme for Royton, the sewage purification works (including fifteen acres of land), and the destructors will be about £1,500. In connexion with the sewage works, several special features have been introduced. The contractor for the tanks, filters, &c., is Mr. S. Johnson, of Pendleton.

FOREIGN AND COLONIAL.

FRANCE.—In the large gallery of the National Conservatoire of Arts and Crafts in Paris, a marble bust of Nicolas Appert has been erected. He was the inventor of the process of preserving foods. The bust is the work of the sculptor Roulléau. The annual exhibition of Pastellists, and the Black and White exhibition, have just been opened, the former in the Galerie Georges Petit, the latter for the first time is held in the Palais des Arts Libéraux in the Champ de Mars.—It is announced that the Society of the Rose Cross is going to be dissolved owing to the violent discussions between the principal organisers.—The Museum of wood carvings, copies of old works, which was begun in 1883, in the Trocadero, by M. Ravaisson, is going to be re-organised provisionally in the old riding-school of the Louvre. This Museum is replaced by a new collection of similar sculpture in the Trocadero.—On account of the re-organisation of the Service of Historical Monuments MM. Sauvageot and Darcy have sent in their resignations. They have been replaced by M. Guérin, member of the Institute, and M. André Michel.—On Sunday last a hospital was opened in the neighbourhood of Vincennes and Montreuil. It will serve for the suburbs of Paris in that quarter.—During the course of some works carried on under the direction of M. Mazoy, in the Canal of Briare, the remains of a Roman town have been brought to light. The town, built of gneiss, lies between Châtillon sur Loire and Bourges. Amongst the things found are some well-preserved pavement, several tools, ornaments, and coins. Owing to the necessity of continuing the work, all traces of the town will have disappeared by the end of the year.—The Society of Amis des Arts have placed in one of the halls of the Evreux Museum a bronze bust of Philippe Rousseau, modelled by M. Gérôme.—The Cardinal-Archbishop Langénieux is about to resign the Cathedral of Reims a great state of St. Paul. It is in the style of the sculpture of the Roman decadence. The draperies are in bronze, the head, hands, and feet in white marble.—The bust of the poet Pierre Gringoire is to be erected by public subscription. The bust has been executed by M. E. Bussière.—The competition for the Hôtel de Caisse and Salle des Conférences at Leaux has been decided. The first premium has been awarded to M. Fortrigé, the second to A. Simon, and the third to M. Bondinand.—The Mairie situated in the Rue Drouot, one of the richest centres of Paris, is going to be the object of an important artistic decoration. Independent of the Salle des Mariages which will be decorated with paintings, there is to be placed in the courtyard an interesting specimen of eighteenth-century work—a group of busts of the principal celebrities of the quarter—Lamarzelle, Mirabeau, Pigalle, and Berlioz, and four statues symbolising the nature of her respective talents.

BERLIN.—During the last week of the Session the Imperial Reichstag devoted some time to the inland navigation question. A Bill had been brought in relating to the construction of the Dortmund-Ems Canal, which is to run in connexion with the proposed great "trans-Prussian" canal.—In the course of a debate on the General Purposes Budget, Herr von Meyer (Arnsvalde) proposed that the Government should place in the Budget for 1893-94 a item "to be spent in studentships, &c., for young and talented artists engaged in the study of monumental painting and sculpture." The proposal was coolly received by the Government and strongly opposed by Clerical and German Liberal parliamentaries. It hence fell through.—Owing to the bad sanitary result obtained by the Administration of state Railways, the number of so-called "quick" rains running on the main lines is to be reduced.—The Railway Administration intend introducing the mean European time for the time-tables

and actual working of all its railroads throughout the country.—Again the foundation-stone for a new church has been laid with royal pomp. The Emperor has given the site for this church, and 200,000 marks of the 880,000 required for its erection. There will be 1,300 seats in the building. Herr F. Schulze is the architect.—The Berlin Chamber of Commerce will meet on the 6th inst. to discuss the preliminary steps that are to be taken in the arrangement of the proposed Berlin International Show for 1896.—The question of altering Berlin's chief thoroughfare, the "Unter den Linden," has again come to the front. The authorities have elected a special committee to decide on a practical plan, according to which the traffic on this thoroughfare can be more conveniently regulated.

MISCELLANEOUS.

GLASGOW INSTITUTE OF ARCHITECTS: THE BUILDING REGULATIONS BILL.—At a quarterly meeting of the Glasgow Institute of Architects, held on the 31st.—Mr. William Leiper, A.R.S.A., in the chair,—a report by the Council of the Institute with regard to the Building Regulations Bill was submitted to the meeting. The Council reported that they had drawn up a petition to Parliament against the Bill, embodying the principal points in the report formerly printed and circulated, that the petition had been lodged in the private Bill Office of the House of Commons, but that an intimation had subsequently been received from the promoters of the Bill that it was their intention to object to the *locus standi* of the Institute. The Council, however, did not consider it incumbent upon them to contest the matter, considering that they had sufficiently performed their duties towards the public in making the views of the Institute known. Attention was called to the inconsistency shown by the promoters of the Bill in respect that at first they had objected to the amendments urged by the Institute on the ground that the Institute was an interested party, but that when the Institute wished to have an opportunity of bringing its views under the notice of the Committee of the House of Commons before which the Bill is to come, the promoters then objected to the Institute being heard on the ground that it had no interest in the Bill.—The congratulations of the Institute were offered to the President and Mr. Honeyman on their election to the Association of the Royal Scottish Academy, which in honouring them did honour to itself and the profession. Mr. W. F. Salmon, vice-president, and Mr. J. J. Burnett were appointed Governors of the Glasgow School of Art for three years, in terms of the new articles of association. After some other business the meeting separated.—*Glasgow Herald.*

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—The thirteenth Examination, held under the auspices of this Association, was held at the Institution of Civil Engineers, Westminster, on Friday and Saturday, the 1st and 2nd of April, when eighteen gentlemen presented themselves for examination, the written portion of which was taken on the first day. The greater part of the second day was occupied with the *viva voce* division of the examination. The Examiners were: I. For Engineering as applied to Municipal Work, Mr. Clement Drummond, M.A., M.Inst.C.E., Westminster; II. Building Construction, Mr. James Lemon, M.Inst.C.E., Southampton (Past President); III. Sanitary Science, Mr. Charles Jones, M.Inst.C.E., Ealing, W. (Past President); and, IV., Public Health Law, Mr. Joseph Lobley, M.Inst.C.E., Hanley (Past President). The next Examination will be held in October.

INTERNATIONAL ELECTRICAL EXHIBITION IN MOSCOW.—It is officially announced that La Section Moscovite de la Société Impériale Technique Russe intends holding an international electrical exhibition in Moscow between April 14 and October 14 this year. There will be eight sections, viz.: 1, electric lighting; 2, telegraphy and telephony; 3, electro-technology, the use of electricity on railways, in war, medicine, &c.; 4 and 5, electric motive power; 6, scientific apparatus; 7, new discoveries in all branches of technical science; 8, literature, plans, designs, &c., connected with electricity. The cost of space is 90 francs per square metre in the main building whether wall or floor, and for detached exhibits 180 francs per square metre. The charges include the cost of cleaning, watching, catalogues, &c., as well as the installation of mounted exhibits.

SANITARY CONVENIENCES IN MARLEBONE.—On Thursday, the 7th inst., the public convenience which the Vestry have constructed at Oxford Circus was opened for inspection. It is noticeable that accommodation has been provided for women as well as for men. The convenience, which is placed under the centre of the roadway north of the Circus, is so arranged as to cause the least possible hindrance to traffic,—the exterior being a rest of 6 ft. in width, and about 60 ft. in length. The entrance steps at each end are surrounded by an ornamental cast-iron railing. The walls of the interior are faced with white glazed

bricks, the floor being of coloured encaustic tiles. In addition to urinals and closets, lavatory accommodation is also provided. The convenience is well lighted during the day by means of pavement lights, and at night by the electric light. For the purpose of ventilation Kite's system has been adopted. The whole of the work has been carried out by Messrs. Finch, from plans prepared by Mr. Tomkins, Surveyor to the Vestry. The total cost is about 2,400.

"THE LOCAL GOVERNMENT JOURNAL."—After an existence of twenty years, the weekly journal hitherto known as *The Metropolitan* has changed its title, and will in future be known as *The Local Government Journal*. This change is brought about by the fact that the scope of the paper has outgrown the limited, though large, area of London, and has spread over the whole kingdom, dealing with the news connected with local government of every department all over the country. It is an exceedingly useful journal, and under its new name it will no doubt be increasingly successful and useful.

SQUARE-HOLE BORING-TOOLS.—We have received the prospectus of a company formed to work the square-hole drill patented in 1890 by Messrs. James Melling and J. R. Hughes. The invention consists of a drill, triangular in section, but working through a square template, and drilling a hole the size of the template. The promoters claim that this drill requires no costly machinery, depending on the shape and action of the drill, which can be fixed in any lathe or machine.

REMOVALS.—Mr. Evelyn Hollicar, architect, has removed his offices from Wellington-street to 10, Serjeants'-inn, Fleet-street.—Messrs. Wheatley Kirk, Price, & Gouly announce that they have removed from 52 to 49, Queen Victoria-street, E.C.

NEW MAPS OF LONDON.—We have received from Mr. Stanford a map of London showing metropolitan railways, tramways, and miscellaneous improvements according to plans deposited at the Private Bill Office up to November of last year. As many of these will probably be carried out sooner or later, this constitutes a map in advance of future improvements. Mr. Stanford also sends us a "County Council Map of London," showing the boundary of jurisdiction of the Council, and boundaries of urban sanitary districts and Boards of Works.

SURVEYORSHIP APPOINTMENT.—At a meeting of the Hanwell Local Board, held on Tuesday last, Mr. Sidney Barnes, Assistant to the Surveyor to the Ealing Local Board, was appointed Surveyor to the Board. Mr. E. J. Reynolds, late of the same office, has just entered on his duties as Surveyor to the Friern Barnet Local Board.

EATON HALL.—The Duke of Westminster has commissioned Messrs. Shand, Mason, & Co., of London, to construct an improved pattern-stem fire-engine for the protection of Eaton Hall, near Chester, and the numerous farms upon the property. A trained fire-brigade is maintained on the estate.

LEGAL.

LIABILITY OF LANDLORD FOR SANITARY DEFECTS:

CASE UNDER THE PUBLIC HEALTH ACT (LONDON).
In the City of London Court, on Monday, before Mr. Commissioner Kerr and a jury, the case of *Gebhardt v. Saunders* was heard. The action was brought by Mr. Thomas Gebhardt, 9, Tankerville-road, Streatham Common, to recover the sum of £18, 5s. 7d. from the defendants Messrs. Saunders, Hawksford, & Bennett, of 68, Coleman-street, E.C., for which it was contended they were liable (as the plaintiff's landlords) under the Public Health Act of last year.
Mr. Johnston Watson, counsel for the plaintiff, stated that the case was one of some importance, as it was the first which had been tried under the Public Health Act, which came into force on January 1 last. The plaintiff became the tenant of the defendants of the house, 9, Tankerville-road, Streatham Common, at a yearly rental of 47l. After he had been in occupation of the house for a little time he noticed bad smells arising from the cellar, and these continued for several months, until the cause was discovered in January last. A quantity of soil had accumulated in the cellar, where it was found that the drain-pipe had become broken, and the sewage went on escaping until there were 3 in. of water and soil covering the whole area of the cellar. The plaintiff communicated with the defendants, his landlords, and also with the Sanitary Inspector of the Wandsworth District Board of Works. The inspector served a notice on the premises, addressed to the "owner or occupier," giving orders for repairs to be done to the drains. These the plaintiff did by calling in his builder, and then it was discovered that the drain-pipe was a 4-in. instead of a 6-in. pipe, and that the pipes were simply laid on the ground instead of on a bed of concrete. This caused the pipes to become irregular, and was the reason which accounted for their breaking. Additional repairs had to be done, and now it was sought to make the defendants liable under the Public Health Act.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premium, Designs to be delivered. Includes entries for 'Improving Open Space called "The Mass"' and 'Town Hall and Public Offices'.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Lists various construction contracts such as 'Sewerage Works', 'Police Station', 'Caretaker's House', etc.

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor or Engineer, Tenders to be delivered. Continues the list of construction contracts from the previous table.

PUBLIC APPOINTMENTS.

Table with 3 columns: Nature of Appointment, By whom Advertised, Salary. Lists appointments such as 'Inspector of Nuisances, Surveyor, &c.', 'Builder's Clerk', etc.

Those marked with an Asterisk (*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, vi, vii. Public Appointments, p. xii.

Section 121 showed that "any costs and expenses which are recoverable under this Act by a sanitary authority from an owner of premises may be recovered from the occupier for the time being of such premises; and the owner shall allow the occupier to deduct any money which he pays under this enactment out of the rent from time to time becoming due in respect of the premises, as if the same had been actually paid to the owner as part of the rent." The plaintiff had paid the rent to avoid a distress, and he, therefore, now claimed for the repairs.

Mr. Rufus Isaacs, counsel for the defendants, did not dispute that there was a structural defect in the house, but he raised the technical objection that the defendants had been served with no notice to do the repairs, and that as the plaintiff chose to do them on his own responsibility, he must pay for them. The owners were only liable for structural defect when notice had been given. The Sanitary Inspector's notice said nothing about there being any defective structures. It only spoke about repairs to drains and stoppage.

Mr. Watson explained that the reason for that was that when the Sanitary Inspector called at the house he only saw the cellar flooded with sewage. When the ground was opened, and the drains laid bare, he saw there was no concrete underneath them, and then he gave orders for the work to be completed properly.

Mr. Isaacs said, if that were so, when the additional work was found to be necessary the Sanitary Inspector should have given notice to the owner. As that was not done, the plaintiff could not recover.

Mr. Watson pointed out that Section 123 provided that notice should be served by leaving it on the premises.

Mr. Isaacs: That is not on the owner.

Mr. Watson urged that it was sufficient.

Mr. Commissioner Kerr, after further argument, said he was inclined to take Mr. Isaacs' view of the technical objection that the defendants ought to have had notice. The plaintiff would have to go to the High Court, as the question was one of so much importance. He knew that houses were built very badly in the present day, but legislation was only passed to make landlords do repairs when they had had notice. An Act of Parliament did not necessarily make landlords erect sanitary houses. He non-suited the plaintiff, and allowed the defendants costs.

The jury were therefore discharged without being called upon to give a verdict.

CAPITAL AND LABOUR.

THE LONDON BRICKLAYERS.—The Operative Bricklayers' Society have submitted for the approval of their members a proposed code of working rules should come into force on June 1 next. The workmen, we understand, have approved of the proposed code of rules by a large majority, and the code has been submitted to the master builders, who have

not yet expressed their views on the subject. Failing compliance with the men's demands, a strike is talked of. The following is the code proposed by the workmen:—

RULE 1.—The working time for bricklayers in summer shall be nine hours per day for the first five days of the week, and five hours on Saturday. Work to commence at 6.30 a.m., and cease at 5 p.m., except on Saturday, when work shall cease at 12 noon. There shall be allowed half an hour for breakfast each day, and on the first five days of the week one hour for dinner.

RULE 2.—From the second Monday in November and the twelve following weeks the working time shall be 8½ hours per day for each of the first five days of the week, and 4½ hours on Saturday. Work to commence at 7 a.m. each day, and cease at 4.30 p.m., except on Saturday, when work shall cease at 12 noon. There shall be allowed half an hour for breakfast each day, and on the first five days of the week half an hour for dinner.

RULE 3.—That the minimum rate of wages be 10d. per hour; this clause to apply to all bricklayers wherever employed, and of whatever class of work employed at.

RULE 4.—That no time beyond the above hours be worked except when necessary, and then to be paid at the rate of time and a half from the ordinary time of ceasing work until 8 p.m., and double time from 8 p.m. until the ordinary time of commencing work next morning. On Saturdays double time to commence from 12 noon, and continue for all time worked until the ordinary time of starting on Sunday. Bank Holidays and Christmas Day to be paid for the same as Sundays.

RULE 5.—One hour's notice to terminate the engagement on either side, and all wages due to be paid at the expiration of such notice.

RULE 6.—That all bricklayers sent to country jobs be paid London rate of wages, with 1s. per day in addition as country money. Employers to pay lodgings, and bus fares to and from, and if the workman is discharged through no fault of his own, his time travelling home to be paid for.

RULE 7.—That payment of wages commence at 12 noon on Saturdays, and to be paid on the job, but if otherwise arranged, walking time at the rate of three miles per hour to be allowed to get to the pay table at 12 noon.

RULE 8.—That no part of a workman's wage be deducted for charitable, benefit club, or insurance purposes, under any circumstances. That the employer men can have their meals.

RULE 9.—The wages earned on Saturday only be kept in hand as back time.

RULE 10.—The London District shall comprise the area contained within a radius of two miles from Charing Cross, and in which these rules shall be in force.

MEETINGS.

SATURDAY, APRIL 9. Edinburgh Architectural Association.—Visit to Yester House and Old Castle, and Nunraw.

MONDAY, APRIL 11. Society of Arts (Cantor Lectures).—Mr. Bennett H. Brown on "Mine Surveying." III. 8 p.m. Clerks of Works Association (Carpenters' Hall).—Annual Meeting. 8 p.m.

TUESDAY, APRIL 12. Institution of Civil Engineers.—Discussion on Mr. H. A. Roebling's paper on "The Sewage-Farms of Berlin." 8 p.m.

Society of Arts (Applied Art Section).—Mr. C. Purdon Clarke on "English Brocade and Figured Silk." 8 p.m.

School of Architecture and Surveyors.—Annual Meeting at the School of Art. Mr. W. H. Bidlake on "Timber, its Growth and Characteristics."

WEDNESDAY, APRIL 13. Civil and Mechanical Engineers' Society.—Mr. G. M. Lemml on "The Development of Ordnance." 7 p.m.

THURSDAY, APRIL 14. Institution of Civil Engineers.—Students' visit to the works of Messrs. Siemens Bros. & Co. at Charlton.

Dundee Institute of Architecture.—Mr. W. D. McKay on "The Art of the Low Countries." 8 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

1,435.—FLUSHING APPARATUS: W. H. Bodin.—This specification relates to automatic flushing apparatus for water-closets, urinals, fountains, and other lavatories and drains. As supplied to water-closets, urinals, or lavatories, the apparatus consists of a flushing-pipe and a closed tank at the top thereof which are normally empty, and a valve or valve-gear operated by the movement of the water in the closet-seat or by a footboard, so that upon the seat or footboard being depressed one of the said valves is opened and water under pressure flows from the water supply into the flushing-pipes into the tank and presses the air therein, and upon the seat or footboard being allowed to rise the water supply to the tank is closed and a valve in the flush-pipe opened, allowing the contents of the flush-pipe and tank to be expelled by the compressed air and by gravity, and the basin flushed out. The arrangement and combination of the valves and pistons as applied to different forms of urinals, lavatories, and for drains are fully set out and illustrated in the specification and drawings.

7,138.—ARCHITECTURAL FACINGS: E. Wehrli.—This patent relates to the manufacture and use of cast or moulded covering plates, slabs, or the like, of cement or concrete. These slabs can be employed for covering the whole structure of the facade or other part of a building, and are arranged as facings and supported between binding pieces, such as border and cornice pieces, and the like, and also cast in moulds to form comparatively thin slabs, as well as the binding pieces, area to enable them to be secured held, and to be readily arranged in position, formed at their sides or edges with a construction of the facade and the like may be obtained. Insertion pieces for ornamental purposes, or for binding or strengthening them. Any desired colour may be imparted to these slabs, and a great variety in the construction of facades and the like may be obtained.

7,145.—FLUSHING BASINS: W. T. Allen.—This specification relates to an improved form of automatic basin for flushing water-closets, drains, &c., consisting of a basin of any material fixed on a pivot, and secured in a frame or pipe, which receives water from surface drainage or otherwise, and is so weighted that when it becomes filled with water to a certain level, it revolves automatically and discharges the contents into the drain or otherwise for the purpose of flushing the same.

7,209.—WINDOW-FASTENERS: W. Edleston.—This invention relates to improvements in fasteners for securing in a frame or pipe, when the latter is either closed or open, and preventing the same from being moved from the outside. It consists of a rack or recessed bracket on the window-sash, and a bolt on the window-frame, by which frame distance the window is open can be adjusted and then secured.

LONDON.—For the enlargement of the Pakenham-street School, Lower Holloway, by 300 places, for the School Board for London, Mr. T. J. Bailey, Architect:—
 G. S. S. Williams & Son £1,745
 W. Greig & Son 3,284
 Atherton & Latta 3,440
 * Recommended by the Works Committee for acceptance.

LONDON.—For the enlargement of the boys' and girls' departments of the Portobello-road School, Notting-hill, by eighty places; and for erecting new water-closets for all departments of the school, for the School Board for London, Mr. T. J. Bailey, Architect:—
 Cowley & Drake £2,888
 Davis Bros. 2,573
 J. Garrett & Son 2,673
 J. Derry 2,574
 * Recommended by the Works Committee for acceptance.

LONDON.—For erecting the east portion of the school on the Swan-street site, Minories, which will provide accommodation for six hundred, for the School Board for London, Mr. T. J. Bailey, Architect:—
 John Grever & Son £10,290
 Williams & Bracy 10,211
 John Maxwell & Co. 10,999
 Thomas Boyce 9,970
 Kelly & Graydon 9,081
 * Recommended by the Works Committee for acceptance.

LONDON.—For erecting a school-keeper's house and cookery and laundry ranges on the site in Charing-cross-road, Solo, for the School Board for London, Mr. T. J. Bailey, Architect:—
 Treasler & Son £2,818
 J. Longley & Co. 2,914
 J. C. Chapman 2,771
 T. Boyce 2,908
 S. A. W. Pattinson 2,881
 J. Freeman 2,658
 M. Marshall 2,641
 * Recommended by the Works Committee for acceptance.

LONDON.—For refitting the water-closets in connection with the Hollybush-road school, Nunhead, with stone-wares troughs and automatic flushing-tanks, and for providing better ventilation in the offices, &c., for the School Board for London, Mr. T. J. Bailey, Architect:—
 J. Garrett & Son £235
 J. Smith & Son 348
 J. Marshall 383
 * Recommended by the Works Committee for acceptance.

LONDON.—For enlarging the infants department of the Victory-place school, Walworth, by fifty-five places, and for carrying out additions and improvements to the existing school, for the School Board for London, Mr. T. J. Bailey, Architect:—

Hart Bros.	£8,424	£150

 The attention of Architects is especially invited to the durability and beautiful colour of this material. Quarries well opened. Quick despatch guaranteed. Stonework delivered and fixed complete. Samples and estimates free. Address, The Ham Hill Stone Co., Norton, Stoke-under-Ham, Somerset. London Agent: Mr. E. A. Williams, 16, Craven-st., Strand, W.C. [ADVT.]

Asphalte.—The Soyessel and Metallic Lava Asphalte Company (Mr. H. Olenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, ware-house floors, flat roofs, stables, cow-sheds, and milk-room granaries, tan-rooms, and terraces. Asphalte Contractors to the Forth Bridge Co. [ADVT.]

SPRAGUE & CO.,
 PHOTOLITHOGRAPHERS,
 4 & 5, East Harding-street,
 Fetter-Lane, E.C. [ADVT.]

TWELVE GOLD AND SILVER MEDALS AWARDED.
IRON CISTERNS.
F. BRABY & CO.
 VERY PROMPT SUPPLY.
 LARGE STOCK READY.
 Particulars on application.
LONDON: 352 to 362, Euston-road.
LIVERPOOL: 6 and 8, Hatton Garden.
GLASGOW: 47 and 49, St. Enoch-st.

The Architecture of the Lake Dwellings of Europe. II.*

THE Lake Dwellings of Great Britain form a class far more numerous than at first might be supposed, and now that attention has been drawn to their existence, it is probable that a few more years will add

materially to the lengthening list. The Franchises of Ireland have been noted by Sir V. R. Wilde, Mr. Shirley, and others, and later, these and many examples in Scotland, by Dr. Monro, whose monograph, published in 1882, renders an extended list. They were frequently formed on shallow islands, but not infrequently built up with boughs and deposited material upon the bed of a shallow lake, the area being first enclosed by a framework of piles to keep the structure in position. The examples given by Dr. Monro render full details, and also of the manner in which several of the sites indicate continuance of occupation, and many structural alterations. Nevertheless, the objects found, up to the present time at least, do not possess very high antiquity, and there are records of their occupation to quite recent times.

Various sites in England and Wales have been partially investigated, and among these certain sites in Holderness, now on dry, or at most on marshy land, but once covered with water, appear to be counterparts of the pile dwellings of Switzerland, as far as the meagre investigations have been followed. They have been met with so late only as 1881 during some extended drainage works, and piles and relics of apparently great age were discovered. It is greatly to be hoped that some one or other of these promising sites may be systematically explored. In 1886 General Pitt Rivers described a remarkable area in London-wall, which on being laid bare by excavations for a new warehouse was found to be the site of a timbered structure having many piles and planks. Its existence

within the City is subject for comment, and this more so since the objects found were not older than Roman times, possibly later.

London antiquaries have not to be reminded that the entire course of the Walbrook, which enters the City close to this site, is hounded by piles, but which have no reference, so far as has yet been pointed out, to timbered dwellings. But at Southwark, on the shallow banks of the River Thames, a discovery was made which seems to point to a construction very analogous to the Swiss dwellings. In 1866, the late Mr. Wimple reported to the British Archaeological Association that a site on the south side of Southwark-street, between the square and Winchester-street, was covered with piles 7 ft. to 11 ft. long, and their heads about 12 ft. beneath the modern level. Masses of Kentish rag had been used to steady them. Wherever the excavations were carried for a new building these piles were found. Mr. Syer Cuming testified at the same time to their existence in what had been the marshy ground of Moorfields, and elsewhere in the north of London.

The articles of the Stone Age are in many cases wrought with very great mechanical skill, and neatly finished, while there are many curious evidences of straight sawing through and the perforation of hard material, most probably by friction caused by rapidly moving a board or a stick for the latter purpose, with sharp sand and water for the cutting material. The labour with which so many thousands of trees were felled, and their trunks pointed to form the piles for the platforms, all indicate a considerable amount of skill of no mean order,—certainly not the work of savages.

But actual ornamentation occurs on some of the pottery, doubtless of late date in the Stone Age, which is fully developed in the succeeding one. Some of the Bronze Age pottery is of elegant form, very neatly turned on the wheel, and ornamented with graceful lines and mouldings, the patterns in some few instances being filled in with a white substance. But the most remarkable development found in Switzerland is the ornamentation of pottery with an inlay of tin-foil. This well-known dish found at Cortaillod is of great beauty, the pattern being of considerable intricacy. A vase found at the same place is similarly ornamented, as is also a few frag-

ments found at La Crasaz, and some other places.

One fragment of pottery found elsewhere was ornamented with fine triangular cuttings of beech fixed to it by asphalt, and either asphalt or, as supposed by Dr. Dom, of Tübingen, an adhesive glue derived from heech bark, was used with charcoal for a black glaze.

The Weavers' art has furnished several really elaborate designs, while one figured by Keller, found at Irgenhausen, is of very great elaboration and artistic beauty. But it is the bronze articles that claim our particular attention. The greatest number are admirably wrought, and present a multiplicity of forms. The fibule and other personal ornaments are covered with lines, dots, perforations, &c., while some objects supposed to relate to religious uses are occasionally met with. These consist principally of moon-shaped figures. The cross has been found punctured on crockery at Polado, and a tin cross was found at Peschiera, both, of course, of pre-Christian date. A bronze vase, cast, found in Lake Bouget, is a remarkable article, but many others, bowls, horse-trappings, a chariot wheel, lance heads, &c., demand notice. The swords of bronze are numerous, and of considerable interest, since they agree in many respects with the forms of Roman swords, and also with many of the fine examples found in the north of Europe, having curves at the ends of the handles. The pear-shaped blades are of common occurrence, and found under circumstances that entirely forbid their being considered of Roman date.

The most remarkable group of iron implements yet found are the swords and scabbards from La Tène—the Marin of the older antiquaries. They are ornamented with raised patterns in a variety of ways, all of great interest, and of a style generally called late Celtic. One has three quaint animals in relief. The general resemblance of these articles to four others found at Lisnacoghera, Ireland, has been pointed out by Dr. Monro. It remains to call attention to an interesting discovery recorded in 1890 by Mr. A. T. Evans, M.A., at Aylesford, Kent, where in an interment of a form seldom met with in England, some bronze articles were

* See p. 217, ante.

found ornamented in a style so remarkably like that of the La Tène swords as to fully justify the inference that both works were the production of one people. It is impossible to enter into the arguments that were adduced which seem to show the emigration of a people westward. But, in addition to traces of their presence in Switzerland and England alike, must now be added Lisnacroghera.

The archaic type of the pottery found in all the early settlements has been referred to by many foreign writers, and Dr. Deschmann has pointed out the remarkable resemblance which exists between the early pottery found by Dr. Schliemann at Hisarlik and that which has been met with at the sites of lake dwellings in Laibach Moor, Carniola. There is resemblance also between the jadeite articles found at Troy and similar ones in Switzerland. The latter district has produced many articles of pure copper. In fact, these have been found in such numbers as to give some warrant for the belief in an age of copper as well as of bronze.

The number of sites which have been explored, or partially so, up to the present time, being so great, it necessarily follows that, since every settlement has been found to be prolific of relics, the quantity of articles found has been enormous. Many examples are scattered abroad, but a large number remain in private collections in Switzerland and in the other countries where the sites occur; while, fortunately, various local museums, notably those of Switzerland, have fine collections, for the most part carefully arranged. In the British Museum is a small but very interesting assortment of articles, one of many things for which the nation is indebted to Mr. Franks. There are examples of almost all the varying relics that have been found.

The objects found on the sites consist of stone and flint implements, scrapers, hatchets, arrow-heads, &c. Pins and many other articles worked in various kinds of bone; clay weights for nets; spindle whorls; pottery, made by hand in the earliest examples, and on the wheel in the later ones, the clay showing gradations of skill in the working, pebbles and many fragments of quartz being found in the earliest, and much better baking in the latest. The Bronze Age produced a vast number of implements of all descriptions and classes, while some few sites in Switzerland have produced worked gold in small quantities.

Flint is not common in Switzerland, and in many sites there is reasonable ground for believing that it was an article of import, as was certainly the obsidian used for scrapers and such-like, which have been found in small quantities. Nephrite or jadeite has already been mentioned.

The articles found on various sites present curious points of resemblance to others met with at distances far removed; there being many points of difference, while the recurrence of some indicate that the sites were occupied mainly by fishermen, others more particularly, perhaps, by hunters.

Weaving utensils are found in some places, while others are destitute of them. Corn and fruits appear in like manner. But it has to be remembered that only a very few sites have been systematically explored, and fewer still in any very extended manner, except the Terpen of the Low Countries, although, their removal having been for agricultural purposes and not for research, it follows of necessity that many relics have been lost. Everything indicates, in the Swiss examples, at least for the most part, a steady and continuous occupation from very remote times until the mode of building over water was abandoned altogether. Some sites are found to be of the stone age, no articles of metal being found, with indications of conflagration and abandonment. The same is observable in others of the bronze age, but many indicate that occupation was continuous, through the earliest to a late period, the relics being in some instances found above one another. In others, the earliest examples of stone, &c., are close

to shore, while articles of the bronze period are found farther away.

The Iron Age in Switzerland has produced some fine and remarkable articles; but it does not appear to have been of long duration.

The various articles, when studied in any of the well-arranged museums, where the specimens are of sufficiently comprehensive character, present a remarkably perfect and complete gradation from the rude works of the earliest period of these articles down to historic times,—the latter is marked by the presence of a few Gaulish and other coins, and, lastly, of Roman pottery. Traces of the Roman occupation on the lake-dwelling sites are, however, so very few in number as to warrant the belief that then the practice of occupying them had all but ceased. To indicate the retention of sites in some cases, it has been recorded that some Frankish and German relics have been found; while, as we have seen, the system of construction with but little variation was continued in the Dutch and other settlements, occupied until even later date.

That the first founders of these sites were well advanced in civilisation appears to be proved by the skilful nature of their buildings and the presence of implements, showing that they were good weavers, hunters, and agriculturalists. The latter is abundantly testified to, not alone by the cultivation of wheat of more than one kind, flax, fruits, and even of grapes.

The inquiry has often been made, with reference to these discoveries, as to the period of time when they were erected.

A very cursory examination of the objects found in the sites is sufficient to show that, so far as the Swiss examples are concerned, the dwellings were erected at very various periods, extending from a remote stone age of antiquaries, although Neolithic rather than Palæolithic, to late times, while it is no doubtful conjecture that several of the modern villages which line the margin of the lakes are the representatives from Mediaeval times of the sites of remote antiquity which lie buried opposite to many of them deep beneath the waters. We also possess evidences further than that of the objects found which give an idea of the extreme remoteness of time since the foundations of some of these structures were laid. The lake of Zug affords important indications in this direction. In excavating for the erection of the Kellenhof Hotel, in the suburbs of the Town of Zug, on a site among the houses, the workmen came upon a bed of decayed organic matter at a depth of about 5 ft. Piles were also found, and all the usual deposits of a lake dwelling, including evidences that the settlement had been destroyed by fire. The site is 60 ft. distant from the present waters of the lake, and as much as 15 ft. higher than their present level. The excavations showed very clearly that when the piles were driven the site was covered with water. This, too, is not an isolated instance, for further research has shown that there are several more sites around the borders of the lake of Zug, all now being on dry ground, away from the level, and high above its waters. The lake has shrunk materially in its volume, which points to a period of remote antiquity since the settlements were founded. There is no historical evidence whatever of any convulsion of nature that would account for the change, but there is a dim tradition that the waters once were higher.

The articles found on all the sites around the lake of Zug belong for the most part to the Stone Age, which affords further evidence of their great age.

Many of the sites, not alone in Switzerland, but elsewhere as well, are found on dry land covered with a growth of peat, affording evidence of remote antiquity. Thus, to refer to the well-known and important settlement of Rubenhausen, which occupies an extent of about three acres, the site is found to be now 2,000 paces from what was the ancient shore. The growth of

peat has so completely encroached upon the waters of the entire lake that the remains of the piles are now covered with a depth of about 6 ft. of that material, which exists above the relic bed, the latter having 3 ft. more of thickness. All this encroachment must have taken place since the piles were placed in position. There are abundant traces that this settlement was consumed by fire.

The observations made by M. Louis Rochat on the lake dwellings found in the neighbourhood of Yverdon, have the same tendency as at Rubenhausen. At Les Urtines, also, he describes vast deposited plains which have been formed between the present borders of the lake and the pile dwellings, which are now entirely covered, one site being 1,856 yards from the water, and another 2,200; the whole of this mass of added material having been deposited by a little torrent, La Baine, and he makes some weighty observations as to the extreme length of time that must have elapsed to enable the deposit to have been formed. This site has evidently been of long duration, since articles of stone have been found here, as well as a great many of the bronze age.

Several others of the Swiss sites, as we have seen, indicate that the first settlements were made fairly close to the shore; and at a later period, probably owing to the silting up of the lakes, piles were driven beyond the original site into deeper water beyond. The articles of stone do not compare in antiquity to the implements found in drift deposits, but their high antiquity is attested by many facts. Thus, at St. Aubin, flint arrow-heads have been found white with age, and yet in the bronze period they have been resharpened for re-use. In Switzerland, traces of wild animals are found in the earliest period, such as the large ox with large semilunar horns, which has been found in a fossil state in Italy, then contemporary with the mammoth and the hippopotamus. Bison has been found at Wauwyland elsewhere, and in several places, but in all its varieties in early and in late settlements. The great preponderance of wild animals disappears in the Bronze Age, while traces of domestic animals appear, mainly such as now exist. Wheat is small in the early settlements and larger in the later ones, but wild plants do not evidence any change having undergone no cultivation, and as they appear in the earliest sites so are they now.

These discoveries reveal to us the state of the arts at a remote period. But they also stand as evidence (if any were wanted) of the exceedingly slow nature of the changes which evolution has wrought on the earth's surface. We find, over and over again remains of animals and vegetables which agree with those still on the earth, or of some well-known type of animal easily recognisable, but now extinct or absent from the district. We have already spoken of the various varieties of bos and other extinct animals. The beaver, not now in Carinthia and its district, has been proved by discoveries at Laibach Moor to have been common there. The marsh-pig is recognised by its bones in many of the Swiss sites. Wheat of many varieties, as there may be to-day improved by cultivation, but still wheat, has been found in a burnt state in many places. The oak, the fir, the cherry, all the other kinds of timber used in the various constructions, have all been identified, not only on one site, but on many throughout the whole area of the investigations; showing that, at what appears a comparatively remote era in the history of man, the conditions under which he lived were still much the same as in the present day.

WORKHOUSE EXTENSIONS, PATRICROFT, LANGLANDS, SHIRE.—On the 6th inst., at the fortnightly meeting of the Barton Board of Guardians, Mr. Noah Robinson presiding, the Clerk reported that the Local Government Board had given its sanction to the amended plans prepared by Messrs. Mangin & Littlewoods, architects, for the workhouse extensions at Patricroft, and that tenders had been invited for the foundations for the first block of buildings. The cost of the proposed alterations, inclusive of land, will be 30,000*l.*

NOTES.

HERE seems some hope that the monument to the Duke of Wellington by Stevens may at last be dragged out from the obscure corner in St. Paul's Cathedral where it can be seen, and placed where the artist always hoped and expected it was to go, in a central position in the nave. We do not now what special circumstance may have prompted Sir F. Leighton's letter to the *Times* in the subject at the present moment, but it seems that he has ascertained that we now at least have the support of the Dean and Chapter of the Cathedral, which is the most important point to be gained, and in that case is only a question of funds. It is hoped that there are a sufficient number of persons in England who feel interest in a great work of art to subscribe the sum required for moving the monument, which is estimated at about 1,000*l.**; though of course we are aware that to the majority of Englishmen the subject is of no consequence at all. They have not a monument to Wellington; they can go and look at or take their friends to see; as to the sculptor was or what his merits they mostly know and care as little as they do about the unsatisfactory position of the monument. No great monument, could be created worse than this has been. On the only one on which it is lighted you must stand close to it to see it; on the only side on which you get a comprehensive view the lower portion is barred off by a screen, and the sculptures of the upper portion are reduced to dark masses in outline against the light. In the centre the monument would make a grand central object, quite in keeping with the style of the cathedral. Then would follow the question of completing the monument by the equestrian figure at the top. The monument certainly requires that both in regard to design and sentiment; the idea was that the figure of the dead warrior below was to be contrasted with his living presentment above. The portrait-figure of the man only will not suit the proportions of the monument; it is designed for an equestrian group. Some persons, we believe think it incongruous to have a horse in the church, though they would never be troubled by the incongruity of grotesque carvings in a Medieval church. The horse is one of God's creatures (as Kingsley could have said), and a very noble one, and very architecturally in his lines and design. And as to precedent, have we not the De Metz monument in Rouen Cathedral, with an equestrian statue which has stood there for many generations without scandalising anybody?

THE recent fall of a piece of stonework from the north-west tower of Lincolnminster may be regarded as fortunate, both as drawing the attention of the Dean and Chapter to the dilapidated condition of that part of the fabric, and as diverting it from other more questionable projects. The stone which fell was a portion of one of the vertical mouldings of the octagonal north-west staircase turret of the Perpendicular belfry stage. These mouldings are throughout applied externally, and are kept in their place by bond-stones running into the wall at intervals. An examination conducted by the cathedral mason proves that these bond-stones are mostly much decayed, and that the mouldings resting on them, together with much of the surface decoration, are in a perilous state of insecurity. All portions likely to fall have now been removed, and insecure places have been temporarily pointed and cemented to stop further damage. This work, however, is only extended to the west side of the tower, which is threatened danger to life; but it is only too clear that the stonework of the other three sides is equally decayed, and demands immediate attention. The beautiful pierced parapet is in an especially bad condition, and only needs a strong gale to bring it over bodily. The Dean and Chapter

* Sir F. Leighton and the Dean and Chapter of St. Paul's have already set an example by subscribing 50*l.*

are waiting for Mr. Pearson's report on the tower generally; but there is good reason to believe that the fabric itself is structurally sound, the decay extending no further than the external ornamental features, which, in the lower Norman stages, as well as in the Perpendicular upper storey, are much dilapidated. The most serious structural feature is a crack extending from south to north, and gradually widening along the crown of the barrel vault of a wall passage in the upper part of the Norman screen in front of the tower. This seems to indicate that the front wall is parting from the tower behind it, and that the two will require to be tied together with iron rods, as was successfully done by Mr. Pearson in the south-western tower a few years back. We shall anxiously wait for Mr. Pearson's report. Under the most favourable circumstances, the expenditure required must be large, and will probably effectually stop any unnecessary work.

THE paper by the Rev. A. C. Headlam, on "A newly discovered Byzantine church in Cilicia," read at the meeting of the Hellenic Society on Monday and illustrated by drawings and photographs, introduced to our knowledge a curious and interesting example of a building which seems to form a link between Classic and Byzantine architecture. The plan is a curious mingling of the Basilica form with a kind of hint of the future central treatment of the plan, which was to characterise Byzantine architecture proper. The main supports have the plan of the Roman Basilica pier (approximately), but with the centre emphasised on plan and marked on the design by a tower, where the true Byzantine dome would come. The chancel terminates in an apse, and the aisles in small apses adjoining the chancel arch, but with doors in them opening through into two apartments at each side of the chancel. In the western façade are three doorways which present a strange mixture of Classic and Christian feeling; one of them especially, of which a photograph was shown, has all the general characteristics of a Classic doorway with a cornice and architrave mouldings, and consoles at each end of the cornice, but the architrave is decorated with vine-leaf carving in which all Classic feeling seems to have disappeared, and which may be classed as Byzantine work in point of style and feeling. There seems no reason to suppose, however, that the whole of the work is not of the same date; indeed, it is difficult to see how it could be otherwise. The illustrations, which have been prepared by Mr. Schultz, will be published, we believe, in the Hellenic Society's *Journal*. The locality of this interesting discovery is Koja Kalessi. It is to be hoped that some further discoveries of the same interest are still to be made in the district, which may help to fill up the debatable land between the confines of Roman and Byzantine architecture.

THE result of the international competition for the drainage of Sophia sheds a curious and edifying light upon the way in which things are managed in Bulgaria. The judges consisted of certain officials, two doctors, one geologist, three State engineers, and two civil engineers, the latter a German and an Austrian. Of the twenty-five plans submitted, seventeen were at once excluded, and although none of the remaining eight were declared perfect, their order of merit was announced as follows:—1. "Stoneware" (author, Mr. Montchiloff, of Sophia). 2. "Circulation pas de stagnation" (Mr. Louis Masson, of Paris). 3. "Propriété est la Santé" (Weigand, of Sophia, and Paulsen, of Strasburg). 4. "Tarquinus" (J. and L. Botto, of Rome); whilst the judges recommended the purchase of the other four, which were by Knauff and Grove, of Berlin; Hallenstein and Edwards, of Munich; Brix and Frank, of Wiesbaden; and Almond, of Paris. So far there seems nothing unusual in the course and result of this competition, but we are now informed that the gentleman, whose design was

placed first in the above order, not only was one of the judges, not only attended the meetings, but actually took part in the discussions and deliberations upon his own design. In vain did the German and Austrian (Messrs. Kühn, of Charlottenburg, and Rella, of Brünn), protest and demand Mr. Montchiloff's exclusion, either as a judge or competitor, and they had to content themselves with refusing to sign the protocol and drawing up a separate statement as a mark of their disapproval of this instance of Bulgarian morals.

WE are glad to note the appearance,—after much too long an interval,—of a new number of Daremberg & Saglio's invaluable "Dictionnaire des Antiquités" (16, Epi-Eup). Perhaps the most useful article is that by M. Jules Martha, on the Etruscans, which gives an admirably clear résumé of the known facts respecting the religion, life, and manners, and especially the monuments, of this problematic people, an account supplementary in many respects to the well-known popular handbook on the subject by the same author. As to the vexed question of origin, M. Martbucites the various hypotheses ancient and modern, and, perhaps prudently, concludes: "Au milieu de tant cobie d'hypothèses. le plus sage est de s'abstenir. Un problème qui comporte toutes les solutions possibles est, a vrai dire, un problème insoluble." Perhaps so, but it is strange in glancing through the bibliography of the subject to miss the great names of Otto Crusius and Hesselmeier,—will the French ever learn to read German? Other articles of interest are those on the structure and management of ancient stables (equitatio, &c.), which seem to have been surprisingly like modern ones. Pompeii furnishes us with the plan of two, and at Mondoleia, in Syria, there are substantial remains which may be new to some of our readers. The mythological articles are, as usual, of the weakest.

THE most important paper in the last issue of the *American Journal of Archeology* (vii, 3) is unquestionably that which deals with the excavations at Eretria. The American plan is to divide out the area to be excavated among various members of the School, Dr. Waldstein, the director, holding, of course, in his hands the general supervision of the whole. Dr. Waldstein was most anxious that the Eretria theatre should not be prematurely dragged into the burning controversy about the Greek stage. As, however, it has been freely quoted on both sides during the past year, he has thought it well to issue at once certain sections of the work and a plan of the theatre as far as at present excavated. The section relating to Epigraphy and Topography has been undertaken by Professor Richards, of Dartmouth College, and the all-important *skene* excavated by Mr. Fossum, late of John Hopkins University, appears in the present number. Still, though offering, as far as possible, all new facilities for the solution of the problem, Dr. Waldstein, with commendable caution, declines to take sides. "This reticence," he says, "I thought called for, because, though what may be called the 'orthodox' view of the Greek stage has had adequate exposition, the new views of Dr. Dörpfeld have not yet been supported by a full and systematic account of the numerous data collected by that eminent archeologist in support of his theories. Pending this publication it did not appear to me wise for archeologists who had not access to all the material at the disposal of Dr. Dörpfeld, either to accept his views unconditionally or to oppose them." For all details as to this very interesting theatre, we must refer our readers to the easily accessible *Journal*, only reminding them that in a recent number of the *Athenæum*, Professor Pollard, the present director of the school, reports the supplementary excavation of the eastern portion of the orchestra, and the eastern parados.

THE appointment of a Judge specially to adjudicate on the winding-up of limited companies and of a registrar and official staff should not pass unnoticed. It is of the utmost importance to men of business that the winding-up of companies should be quickly and economically performed. This new departure also emphasises the tendency to the specialisation of legal business which is so marked at the present time. This specialisation cannot stop here: as we have more than once pointed out, patent business should be dealt with by a specially-appointed judge assisted by competent assessors. It would also be very desirable were all cases relating to building contracts, which are referred to the official referees, assigned to one particular referee who also should have the assistance of an architect. What may be called a more pronounced "business" spirit is required in the transaction of the legal work of the country.

THE Crown lease of the Albert Palace, Battersea Park, will be offered for sale at an upset price of 5,000*l.*, on the 27th instant, at the Mart. The purchaser will be given a right to take the freehold, at a sum to be agreed upon. It is stated that more than 100,000*l.* have been expended upon this ill-starred property. The hall (Messrs. F. & H. Francis, architects) was opened in June, 1885, the late Sir R. Carden, M.P., being at that time chairman of the Albert Palace Company. Three years later, by order of the Court of Chancery, the property, as covering ten acres of land, and held on two leases from the Commissioners of Works for a ninety-one years' term from 1886, at a ground-rent of 1,425*l.* per annum, was put up for sale by auction. No offer, however, was made upon that occasion (June 7, 1888). In the forthcoming sale will be included all the furniture and equipment, together with the great organ that formerly belonged to Mr. W. Holmes, of Primrose-hill. On July 20 last, the Prince of Wales laid the foundation-stone of the Battersea Polytechnic Institute, to be erected near to the Palace, on a site of rather more than two acres, acquired, we believe, from out of the original grounds of the latter. We published a perspective view of Mr. E. W. Mountford's selected design for the Institute, together with his ground-floor plan, on March 28, 1891. We read in the *Times* that Messrs. Holloway have contracted to erect the larger part of the new buildings for 35,988*l.*, and that these will be ready in October of next year.

THE eighth exhibition of the New English Art Club, just opened at the Dudley Gallery, is much less aggressive in style than most of its predecessors, and in fact many of the works exhibited have no special stamp on them of any artistic school, and impress one merely as sketches by artists of the ordinary profession of faith, who have sent in clever studies which they did not care to finish. Thus Mr. James's "A Writing-table" and "Yellow Polyanthus" (3 and 10) are masterly sketches, the flowers especially, but betray no "mission," any more than Mr. Simpson's "From Southwold Pier" (13) or the "Snow Effect, Whitehall" (16), by Mr. Herbert Marshall, who is not a member of the club, and has indeed very little in common with their apparent aims. The English apostle of impressionism does not exhibit, but there are attempts on the part of other exhibitors to "do Whistler," as in Miss Draper's "Green Signal Lamps, Blue Night" (62), and some others. Among works savouring more of the old leaven of the English Art Club is the "Study for a Portrait in the Open Air" (47) by Prince Trouhetzkoy (not a member, however), a three-quarter length sketch of a woman, with a most brilliant open daylight effect, which would look however still better if the picture were finished as to detail and texture, instead of being left in a state of splashes. Mr. Theodore Roussel's portraits of Miss Pettigrew

and Mr. Bernard Sickert (50 and 57) have strongly-marked character and fine colour in the costumes, but the artist contrives to impart a very unpleasing colour and texture to the faces. There is character also in Mr. Purse's two portraits of ladies (67, 73), though the "lady in a grey dress" is in a position in which she would find it difficult to maintain her balance. The best portrait in the room is that by Mr. George Thomson (82), a genuine portrayal of face and action in a powerful but perfectly uneffected style. Mr. Maitland's sketches of London neighbourhoods (14 and 79) are very good, though it is difficult to understand why in "Oakley Crescent" the tree near the foreground should be far fainter in tone and detail than the houses in the middle distance. Mr. Lindner's "Over the Moonlit Sea" (89) is a charming effect, but has too much light for moonlight. Mr. Hope McLachlan's "Bathers" (35) is a fine little work with no eccentricity about it, but the artist is not a member of the club. In short the conclusion from the contents of the exhibition seems to be that the English Art Club has practically abandoned its colours to some extent; that its members are rather backward in exhibiting, and that the merits of the exhibition may be divided pretty equally between members and non-members.

IN the Gallery of the "Nineteenth Century Art Society" Mr. Edgar Barclay is exhibiting a set of small paintings of Stonehenge and its neighbourhood, giving "the stones" (as they are called in the district) from every point of view, and giving also various bits of scenery and building within a circuit of three miles round. Mr. Barclay announces a forthcoming book on Stonehenge, with a new inquiry into its meaning and the ideas originally associated with it. Along with the paintings in the exhibition we find a careful survey of Stonehenge and the ground around it, with pen-and-ink drawings of the remains, which we presume are to form a portion of the illustrations of the book. We fear we cannot feel very sanguine that anyone will now be able to throw any more light on the origin, date, and meaning of Stonehenge, but Mr. Barclay's book, when it comes out, may popularise the study of the subject by bringing before the general public considerations and questions which have mostly hitherto been confined to the transactions of learned societies. In the meantime the oil paintings make a very interesting collection even topographically, and some of them are beautiful little works in an artistic sense also. Among these latter may particularly be named "Storm Clouds" (17) and "Thunder Clouds" (27), two very fine studies which make an effective pair; and "Water Meadows below Amesbury Bridge" (32). Our only complaint is that there is rather a want of light in them; "Stonehenge, Midsummer-day" (22), for instance, certainly does not produce the effect of midsummer. Dull weather at the time of our visit, and a consequent unsatisfactory light, may however have had something to do with this.

A CIRCULAR which is being sent out by "Johnson's Patent Pulley and Lock Manufacturing Co." is an amusing instance of the naïveté with which trading companies propose to associate architects with them in pushing their goods. The circular sets out that "the great success which has lately attended Commercial Companies where the Shares were allotted to the Customers of the Companies—in which case the Shareholders directly influence trade—is the real cause of the large dividends and present high prices of the Shares of such Companies. We lay considerable stress upon the fact that the shares in this Company will be allotted in first instance to the Architectural profession, contractors and buyers of Locks generally, so that most of our Shareholders will be able to influence business to the Company."

This is evidently said in entire good faith; and without the least suspicion that there is anything questionable in the position which the company invite architects to take. Are they aware that architects who take their shares are thereby (if the fact is known) disqualified as members of the Institute of Architects?

THE RED ROCK CANTILEVER BRIDGE

THERE are to be found in the "Transactions of the American Society of Civil Engineers" for last December three papers describing a bridge lately built by the Atlantic and Pacific Railway Company, to carry their line over the Colorado River, at a place known as Red Rock. We are accustomed to find in the contributions made to this Society,—especially when the deal with bridge-work,—descriptions of important undertakings, often executed with great skill and rapidity. The Red Rock Bridge is, however, somewhat an exception to the rule, since it is not a particularly large structure, and, for an American bridge, it was not constructed very expeditiously. Although the work contains many points of interest, its chief importance consists in the lesson it should teach the promoters of arch schemes, as well as the engineers who are called upon to carry them out.

The Colorado river over which the bridge passes drains an area of some 230,000 square miles, and is a powerful excavator and distributor. During the floods, about eight million cubic yards of earth, in the form of silt, are carried away by it in twenty-four hours. Geologically, this may be very satisfactory; but it is to be regretted that such immense power cannot be employed more usefully. Could the rate of excavation be attained in making the Manchester Ship Canal, for instance, it would occupy but a week to do the work that has taken 10,000 men and 100 steam navvies many years to accomplish.

On both sides of the river the railway company had to construct some miles of approaches to their new bridge, and for these surveys and estimates were made, but no soundings and borings were taken across the river, along the line of the bridge, because the authorities hesitated to incur the expense of the necessary appliances for doing such work if not having been absolutely decided at the time to carry out the scheme. When the railway company made up their mind to proceed with the work everything had to be done in the least possible time, and soundings that had been made in 1881 were accepted as being correct, and, upon this information, the contracts for making the bridge and approaches were let. The work being now commenced, it was thought expedient to employ a professional man to make new soundings and borings, as it was not long before it was discovered that those formerly made, and upon which the design had been based, were so inaccurate that it would be necessary to suspend work. When the soundings were completed, they indicated the position of the rock to be such as shown in the line marked "supposed rock, 1888," in the above diagram. The first design for the bridge was consequently modified to suit this new condition of affairs; the cantilever system was adopted, it being thought that the east pier would only have to be sunk to a moderate depth before it reached the bed rock. The work was, therefore, again started, and pushed on with the greatest speed. In three months the approach lines were finished, the two west piers were completely built, and most of the stone prepared for the east pier. A considerable portion of the superstructure, which was being prepared by the Phoenix Iron Company, was also constructed in their shop. The work was in this condition when the caisson for the east pier was ready to be sunk. The sinking progressed satisfactorily until a depth of 10 ft. had been reached, and it was then discovered that what was originally thought to be bed rock was only a compact boulder bed, 3 ft. to 4 ft. thick, portions of which could be penetrated by the drill. Below this bed sand and gravel were met with, until, at a depth of 61 ft., the solid rock was reached. It was at once evident that a stronger caisson, sunk to a much greater depth would be required if a pier was to be made in this position, and the work on the superstructure was, therefore, again stopped to allow the whole scheme to be reconsidered. When it became

known what a large amount of work had been done by the Phoenix Iron Company in connexion with the steel-work, it was thought desirable to make no change in the designs they had been working to, but to carry out the cantilever system, as previously settled upon. The total cost of the bridge, without the approach lines, is stated to have been 92,500*l.*, and one item of this expenditure is 1,600*l.* for the soundings and borings. Had these few hundreds been spent at the proper time, they would most probably have saved the company as many thousands.

In dealing with the superstructure we must remember that the cantilevers were originally proportioned in accordance with information concerning the foundations which was afterwards found to be incorrect. If the bed of the river had been as indicated by the line marked "supposed rock, 1888," in the above diagram, there is no doubt that the positions of the piers were fixed with a due regard to economy, although the centre span is somewhat long.

The arms of each cantilever are 165 ft. long, which gives a central span of 330 ft., or one-half of the total span. It was stated by Mr. Robinson in his paper that if this span had been reduced to 275 ft., the saving in the total amount of metal required for the superstructure would only have been about 1 1/2 per cent. The distance between the trusses is 25 ft., or one-twenty-seventh of the span, and it has been shown that this proportion gives the same lateral stiffness to a cantilever bridge that is obtained in a single truss bridge where the girders are placed one-eighth of the span apart. Greater stability could have been given to the structure by increasing the width between the lower trusses at the piers, while retaining the 25 ft. width at the ends of the cantilevers; but this method was objected to because of the extra work it would cause in the shops, and also because it would necessitate a tie of considerable section being placed between the trusses at the piers, which, when altering its length, due to temperature, would tend to split the masonry. Where the anchor arms of a cantilever bridge are particularly short, the weight of the structure between the piers may be sufficient to over-balance the combined live and dead loads on the shore arms. This is the case with the Red

Rock Bridge, and consequently no alterations in the stresses from compression to tension, or *vice versa*, can occur in any member of the shore arms.

The material used throughout the structure, except for a few minor parts, is open hearth steel, having a quality almost identical with that adopted for the Forth Bridge.

In building the superstructure at the site, the shore arms had, of course, to be first erected on staging, and when these were finished and anchored down the cantilevers on the river side were built out. The central girders were built by overhang in the same way, until the two halves of each met at a point half way between the piers.

The bridge was completed on June 25, 1891, about twenty months after it was commenced. A considerable portion of this time was lost through the information regarding the nature of the bed of the river being inaccurate, as above alluded to. What extra expense the company was put to from this cause, it is impossible to say, but the amount must have been very large, and those who are responsible for similar undertakings would do well to remember that it is not economical to unduly cut down preliminary expenses, and that it is possible to delay the completion of such works by hurrying too much.

THE ROYAL SOUTH LONDON OPTHALMIC HOSPITAL.

THIS new building, which, as we mentioned last week, was recently visited by the Architectural Association, has been in course of erection for the past three years. It is now approaching completion, and has already been opened for out-patients. The building occupies the whole site of the old hospital and that of some adjoining property which was acquired. The whole frontage is about 174 ft. in length, partly towards St. George's-circus, and partly towards the open space at the junction of Waterloo and Westminster Bridge-roads. The site is thus a commanding one, with abundance of light and air, and it may be said to occupy one of the best possible sites for such a hospital, where the out-patients largely predominate, for it is computed that no fewer than 4,000 public vehicles,—omnibuses, trams, &c.—going to almost all parts of London north and south of the Thames, pass the Obelisk in the centre of St. George's-circus every day. The old frontage-line has been set back, so that there is a pavement 22 ft. wide towards St. George's-circus,—a very desirable thing in the interests of the large number of blind or nearly blind out-patients who will see it daily. The building consists of a half-basement, ground floor, and four floors above, with a flat roof on top having an area of about 4,000 ft. super., covered with Claridge's Seyssel asphalt, and a very airy promenade and recreation-ground it will form at certain times of the year for the staff and some of the in-patients.

The half-basement is principally devoted to the purposes of a large and well-lighted, warmed, and ventilated waiting-hall for the out-patients, having a separate entrance in the Waterloo-road. From this waiting-hall, which is provided with sanitary conveniences for both sexes, the patients will ascend by a staircase direct to the surgeons' examination and consulting rooms on the ground-floor, and thence will pass into a corridor to the "refractory" or spectacle-room, and thence past the dispensary (where they will get their medicines or lotions) direct into the street by a separate exit, so that patients coming in and going out will not meet each other. The ground floor also includes ophthalmoscope-rooms, bandaging-rooms, dark-rooms, and offices for the staff. There is also an isolation-room and an office for the Secretary closely adjoining the main entrance. The entrance-porch and staff entrance face towards Westminster Bridge-road, and consist of a flight of steps within a recessed archway closed by a Bostwick folding gate. The porch is lined with chocolate and pale-green glazed bricks, of special make, supplied by Messrs. Cliff & Son, of New Wortley.

A notable feature of the arrangement of the building is the devotion of a portion of the ground floor at the Waterloo-road end of the frontage (with a mezzanine floor above) to the purposes of a coffee-tavern or temperance restaurant, so that the poor patients, many of

whom come long distances, will be able to get a cup of tea or other light refreshment at a cheap rate. This will be quite distinct from the hospital, however, and will have to be entered from the street. It will not be under the management of the committee of the hospital, though possibly conditions as to the quality and price of the refreshments will be imposed upon the tenant.

The first-floor is occupied partly by rooms for paying patients, and partly by apartments for the resident surgeon and for the matron. The second and third floors are chiefly devoted to in-patients' wards, with a few private rooms for paying patients. The wards contain seven or eight beds each. The fourth floor is occupied by the kitchen and other domestic offices, and by bedrooms for the servants of the hospital.

There are some noteworthy points about the planning of the hospital. The staircase, for instance, is semi-circular on plan, and is 5 ft. wide, this width, however, being divided into two by a double handrail in the centre, supported on standards, into an up and a down road, with the risers and treads of each differently arranged. There is a separate handrail on each of the wall-sides of the staircase, which has been specially designed for the use of blind or half-blind patients. The water-closets, &c., are built in projecting blocks on each side of the staircase, and are cut off from the main building by cross-ventilated lobbies. In the construction of these blocks of convenience, iron stanchions and girders are used as framing and support for the brick enclosing walls. Near these, and also external to the building, is a lift, by Messrs Archibald Smith & Stevens, going up to the top floor. Another point worth note is that there are no square corners or angles in the whole building, the corners of rooms and projections being rounded off, as well as the junctions of walls with ceilings and floors. The building is throughout of fireproof construction, and will be fitted with the electric light. An interesting feature of the arrangements is a system of telephonic and electric communication from all parts of the building, even from the bedside of each patient, to a small lobby where an attendant is always on duty. Mr. Julius Sax fitted up these appliances.

The architect of the building is Mr. Keith D. Young, the general contractor being Mr. William Downs, of Hampton-street, Walworth-road. The red facing bricks of the facade were supplied by Messrs. Lawrence & Sons, Bracknell, and the moulded red bricks in all window dressings, string-courses, and cornices were specially made, to the architect's designs, by Mr. James Brown, of Cannon-street. The terra-cotta was modelled to the architect's designs by Mr. J. C. Edwards, of Ruislip. The whole of the glazed bricks were supplied by Messrs. Cliff & Son. The terra-cotta air-extraction shafts from each room, and the drain-pipes, were made and supplied by Messrs. Doulton & Co. The whole of the plumbing and sanitary fittings are by Messrs. Dent & Hellyer. Messrs. James Slater & Co., of High Holborn, were the contractors for the hoisters and heating apparatus, the entire building, in every room, being heated by hot-water coils. The same firm also fitted up the kitchen and scullery with gas-cooking apparatus. The whole of the structural ironwork is by Messrs. W. H. Lindsay, Neal, & Co., of Paddington. Mr. T. Elsley supplied and fixed the gun-metal casements. Messrs. Richardson, Ellison, & Co., supplied the tradesmen's entrance-gate and wrought-iron grilles. Messrs. Marrell, of Chelsea, the wrought-iron screen-gate to out-patients' entrance, exit tramstile, and wrought-iron hand-railing; Messrs. Hayward Bros. & Eckstein the pavement and roof-lights; Mr. J. Gibbons the locks; and Messrs. Hart, Son, Peard, & Co. the general ironmongery. The damp-course work and the floor of out-patients' waiting-hall were executed by Messrs. Pilkington; the *terrazzo* floors by Messrs. Burke & Co.; the parquet floors to public and private wards by Messrs. Turpin & Co.; the slate work for optobalmscope rooms, baths, &c., by Messrs. Robert Holland & Co.; the dispensary fittings by Messrs. Hawke; the gas-fittings by Mr. Biggs; and the glazing by Messrs. Clark & Sons. The clerk of the works is Mr. H. J. Heathe, to whom, and to Professor McHardy, we must express our thanks for having been shown over the building. Professor McHardy has seen the life and soul of the work, and to him are due many details of the hospital. We congratulate him on the near completion of his arduous work.

OLD HOUSES, BISHOPSGATE.

We give a sketch of the houses generally supposed to have been designed by Inigo Jones, which form a part of the south side of Great St. Helen's, Bishopsgate, and which are about to be removed. They are of brick, with bands on the pilasters, caps and bases in stone. The wall-jambes, and window-heads are rusticated, and a bold cornice projects over the first-floor window. The original finish, probably a deep cornice carrying the eaves, has been destroyed, and a more modern window-storey built in its place. There are one or two fireplaces and a staircase, which we understand are going to be preserved.

In his "Illustrated Itinerary of the Ward of Bishopsgate," 1862, the Rev. Thomas Hugo, F.S.A., refers to the house in Bishopsgate-street. Within named "Crosby Hall Chambers," and says:—

"The front towards the street has lost all its ancient peculiarities, except two beautiful festoons of flowers inserted between the windows of the first and second floors."

He then goes on to say:—

"The north front, which faces an inside court, is very remarkable. The base is composed of rustic work, and the wall above is relieved with pilasters and capitals. The whole of this front is another pleasant specimen of the graceful ease with which the genius of Inigo Jones, for to him I attribute it, could invest ordinary objects with an air of essential beauty. . . . In a room behind the front last described is a chimney-piece which bears the date 1633, and is a gorgeous specimen of English ornamental work of the earlier half of the seventeenth century."

Mr. Hugo, whose book we cite, as well as his "Last Ten Years of the Priory of St. Helen's" (1865), which we commend to the perusal of our readers, mentions other work in this neighbourhood as by, or reputedly by, Inigo Jones, such as the south entrance to St. Helen's Church, bearing date "1633" and Nos. 11 and 12 in Great St. Helen's, a red-brick house with pilasters of the same material, though the doorways have a somewhat later character (this building must not be confused with Nos. 8 and 9, supposed to be Sir John Lawrence's, and bearing date "1646"). Crosby-square was built in 1677, over that part of Crosby-place that had been burnt in the previous year; between the square and Crosby Hall Chambers lies a pleasant little garden, whose whereabouts Mr. Basant is fearful to find disclosed.

THE SEWAGE FARMS OF BERLIN: INSTITUTION OF CIVIL ENGINEERS.

At the eighteenth ordinary meeting of this Institution for the present Session, held on the 5th inst., the President, Mr. George Berkeley, in the chair, the paper read was on "The Sewage Farms of Berlin," by Mr. Herman Alfred Roebling, Assoc. M. Inst. C.E.

Berlin is situated in the sandy plains of North Germany, on both sides of the River Spree, which empties itself into the Havel, at the town of Spandau, about 5½ miles below the city. The Havel is a tributary of the Elbe, and forms a succession of lakes immediately above and below the junction with the Spree, which are picturesque in places, and are a favorite holiday resort of the population. The flow of water in the Havel and in the Spree is very sluggish, and the latter river, in periods of great drought, discharges only about 460 cubic feet per second. The area of the city is about 21½ square miles, and its population at the last census (December 1, 1890) was 1,578,794. The density varies from 220 to 25 persons per acre, each dwelling-house (sixty system) being inhabited by an average of sixty-five people. There are about 250 miles of streets, 80 miles of brick sewers, 285 miles of stone-ware pipe sewers, and 55½ miles of pumping mains to the sewage farms. The Waterworks were purchased (from an English company) by the city authorities in 1874, and the authorities also established their own gasworks, as they could not come to terms with the "Imperial Continental Gas Association." The city provides for its extraordinary expenditure by the issue of loans, the last loan, that of 1886, 2,500,000, was issued above par (101-18); this is an excellent indication of the credit it enjoys in the money market.

After the Franco-German War, Berlin became the German metropolis. Since then it has grown rapidly, and the changes it has undergone have been very marked. Whole districts have been cleared of their old insanitary houses, new streets have been formed, and others have been widened. Many new and elegant buildings have sprung up, the old, abominably-smelling street-gutters, which were practically open sewage-carriers, have disappeared, and under the sway of an intelligent and enterprising City Council, which is the sole municipal authority, Berlin has become one of the finest and best managed cities in the world. It was originally intended to drain the city in the ordinary way by two main intercepting sewers

one on each side of the river, with one common pumping station, and to discharge the sewage, after some slight treatment, into the Spree. A scheme was prepared on these lines in 1861, but it was not accepted, and finally, after numerous experiments respecting the best mode of sewage disposal had been made, the City Council decided to employ sewage-irrigation, and Mr. Hohrecht's new plan for the main drainage of the town was adopted in March, 1873. The works were commenced in August of the same year, and they have been in hand ever since. Under Mr. Hohrecht's scheme the whole area of the town is divided into twelve separate drainage areas, called "radial systems," which are entirely independent one of the other. They have each a pumping station, from which the sewage is raised direct on to the farms, two drainage-districts being, in some cases united to one rising-main. The area of these radial systems varies from about 674 acres to 2,117 acres, the total population in such of them as are entirely built over being about 200,000.

The authorities have purchased the whole of the land required for sewage-farming; some of this land lies in the north and north-east, about six miles from the city, and some in the south about twelve miles distant from it. The total area of all the farms has now reached 18,790 acres, of which at present only 11,016 acres are under sewage-treatment; the remainder is, however, being prepared for sewage-farming, and the acreage of the farms is extended as circumstances require. The sub-soil on the farms is, generally speaking, sand, with a preponderance of sandy loam in places, especially on the northern farms, and is well suited for sewage-irrigation. The land is practically level, with small eminences here and there. The sewage of about 112 persons is now treated on each acre of land.

The distribution of the sewage takes place by means of underground cast-iron pipes, which start from the stand-pipes on the rising-mains and terminate on the small summits, where the open earth carriers commence. The whole of the land that receives sewage has been specially prepared for irrigation by leveling and draining. The effluent from the farms is conveyed in open ditches into small streams, which empty into the River Spree, partly above, partly in the city, and partly below it.

The authorities employ a large number of "misdemeanants" in the work on the farms; these are men who have been sentenced for various minor offences to undergo a period of confinement in the House of Correction; they are loafers of the Berlin streets. From a philanthropic point of view, this course cannot be too highly commended, as it gives the men a chance to get back into regular habits and thus to redeem their character.

The city has spent about 2,906,792*l.* in works of sewerage, and 1,173,618*l.* in the sewage-farms, and about 350,000,000 tons of sewage have been utilised on the farms since the commencement of irrigation. Broadly speaking, the largest acreage in 1889-90 was under cereals, viz., 2,817 acres, then follow the grass plots with 1,785 acres, the roots and green vegetables take the third place with 1,013 acres, and oil-producing plants are cultivated only on 237 acres. There has been a very fair profit on the management of the farms since 1886, but, of course, the amount has not been sufficient to meet the payments for capital expenditure. The deficiency, however, is not a large one, as it has necessitated only an average annual rate of 0-89*d.* in the £ during the last five years, or a payment of 7-11*d.* per head of the population per annum. This is a remarkably small amount, and compares favourably with what has been paid in England or sewage-utilisation.

The degree of purification attained has been excellent, as on an average from 95 to 98 per cent. of the organic ammonia contained in the sewage has been abstracted on the farms. This is considerably above the figures quoted by the Rivers Pollution Commissioners as the result of sewage-farming in this country. The farms have had no ill-effect upon the health of the population living on them, and the prejudice against them has almost died out, which is evidenced by the ever-increasing demand for sewage by adjacent farmers and landowners.

On the whole, Berlin is to be congratulated upon the cheap and efficient way in which it utilises the sewage. Where other towns have failed it has succeeded, and that upon a scale not present without a parallel.

ARCHITECTURAL SOCIETIES.

THE ARCHITECTURAL ASSOCIATION (LONDON).—The tenth meeting of the discussion section (late advanced Class of Construction and Practice) was held at the rooms of the Association, on the 6th inst., when Mr. Francis R. Taylor read a paper on "Science applied to Architecture." Mr. Henry Adams, M. Inst. C.E., attended as special Visitor. The paper, which was illustrated by the limelight lantern, was, of course, merely a sketch of this big subject, but was very interesting, and created a good discussion. Votes of thanks were passed to Mr. Taylor and to Mr. Adams for the useful information which they had brought before the class.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At a meeting of the Edinburgh Architectural Association held at 42, George-street on the 7th inst., Mr. Hippolyte Blanc presiding, Mr. A. H. Millar, of Dundee, read a paper on "The Hie Gait and Sautmercat of Glasgow in the Olden Time." Mr. Millar said his purpose was to apply the analytical process and show why Glasgow had taken its present form. There were various theories to account for the present form of the city, but he would confine his attention to the most reasonable of them. The nucleus of the city was the Cathedral, which was built on the side of a hill, around which the houses of the ecclesiastics had been planted. The extremity was the river Clyde, and here had been the colonies of salmon fishers. With the passing and repassing of the ecclesiastics on an errand for fish, and of the fishers for the ministrations at the Cathedral, a footpath would be gradually formed. The footpath would soon become a beaten track, and develop into a road. Artificers, &c., settled in the place, and they also chose the side of the river. There was no trace of the name Sautmercat until about 1600. The name would be given to the place at the Cross round which the salt sellers took their place. There were also lateral extensions by Drygait and Rottenrow, and by Gallowgait and Trongait. Such was the skeleton of the city. The people wended their way on solemn occasions either to the Cathedral or to the other chapels, and the footpaths through the fields had determined the form and fashion of the great city of Glasgow.

—About forty members of the Association paid a visit on the 9th inst. to Yester House and the old Castle of Yester, near Gifford. They were received by the Marquis and Marchioness of Tweeddale, by whom they were entertained. Mr. Thomas Bonar, the leader of the party, explained that very little was known of the early history of the old feudal tower, which dated back as far as 1267. Notwithstanding its great antiquity, there still remained evidence enough to show that it must have been a very powerful stronghold, and a castle of the very first importance for the defence of the surrounding district. Tradition had it that it was the last castle that stood out against Cromwell's troops. After that date it fell completely into disuse and decay, owing not only to the effect of time, but to the removal of its stones for building operations by the people of the locality. After discussing at some length its architectural features, Mr. Bonar mentioned that the Castle came into possession of the present family some time in the fourteenth century. The character of the architecture of Yester House was known as Scottish Classic, and resembled such houses as Arnishton, Airth, Drum, and others. The building dated from 1740-48.

GLASGOW ARCHITECTURAL ASSOCIATION.—The usual monthly meeting of this Association was held on the 5th inst., the President, Mr. Alexander M. Gibbon, in the chair, when a paper on "Early Irish Architecture" was read by Mr. Charles E. Whitelaw. The Irish examples of pre-Anglo-Norman building were, he said, specially valuable, as of that period England had but a meagre collection. The diminutive size and austere simplicity of the Celticatories was to be attributed as much to veneration for some prototype as to poverty and social rudeness. St. Patrick formulated a model, whose dimensions very nearly approached those of the Greek churches of somewhat similar date. Cormac's Chapel, 1127, was about the earliest example of true Norman, in most points similar to English usage, excepting the chancel, that continued to be constructed with square east end rather than semi-circular or polygonal. The round towers were not now considered to date earlier than the ninth

century. They range from 50 ft. to 150 ft. in height, and from 40 ft. to 60 ft. in diameter at the base, and have from four to eight stories. Their purpose was undoubtedly for the secure storage of valuables. Mr. Whitelaw showed drawings of Celtic ornament and moulding of features, such as doors and windows, and photographic views. The discussion which followed was opened by Mr. Blane, and at its close the customary vote of thanks was awarded the essayist.

BRITISH ARCHEOLOGICAL ASSOCIATION.

AT the meeting of this Association on Wednesday, April 6, Mr. C. H. Compton in the chair, it was announced that H.R.H. the Prince of Wales had consented to act as one of the patrons of the Congress of the Association, to be held at Cardiff in August next. Some antiquities recently found at Peterborough and Sison were exhibited by Mr. Bodger. Among these were some interesting Roman coins, and a Saxon comb, found at a great depth beneath one of the roadways of Peterborough. Mr. Wood exhibited an impression of the sixteenth century seal of the town of Sudbury, Suffolk. Mr. De Gray Birch, F.S.A., sent for exhibition a series of impressions from the seals of Boxley Abbey, Kent, cleverly restored by Mr. Beady. A paper was then read by the Rev. J. Cave Browne, on the seals of Boxley Abbey, all the known examples being referred to and described. On one of the most elaborate of the examples, the heads of St. Benedict and St. Bernard appear within small quatrefoils, placed central upon the shafts of elaborate tabernacle work, while a branch of box in reference to the name, appears on one side. Box still grows on the neighboring chalk hills, close to the site of the Abbey. Mr. Loftus Brock, F.S.A., described the present condition of the remains of the conventual buildings. The second paper was on the discovery of a Roman hypocaust at Chester. It has been met with in erecting new business premises for Mr. Sykes, who, with praiseworthy regard for the preservation of the remains, has had the work altered to allow of this. The hypocaust, which is in Northgate-street, consists of a large number of square pillars, worked in red sandstone, in excellent preservation. The meeting concluded by the passing of votes of thanks to the author of the paper, and to Mr. Sykes for arranging for the preservation of the remains, so far as they exist on his property.

THE LONDON COUNTY COUNCIL.

The last meeting of this Council before the Easter holidays was held on Tuesday afternoon last at Spring-gardens, the Vice-Chairman, Mr. John Hutton, presiding.

Payments to Contractors During the Recess.—The Finance Committee's report contained the following paragraphs and recommendation:—

"We have had under consideration the question of making the necessary provision to meet payments to contractors during a recess. At the last Christmas recess, nineteen cheques were drawn, of which six had to be cancelled as not required, and in the interval between the last Council going out of office and the election of the present Council, of the forty-six cheques drawn nineteen were cancelled. With a view of preventing so large a number of cheques being drawn and cancelled, we suggest the adoption of a different course of procedure, as also to meet the difficulty of a contractor, who, although entitled to some payment, but not having done a sufficient quantity of work to cover the cheques drawn, is unable to obtain an advance which he is, under the contract, entitled to on obtaining the certificate of the certifying officer concerned. The only payments likely to be required in the Easter recess are for Mr. Gabbitz, the contractor for Claybury Asylum, 15,000*l.*, and Mr. Hine, the architect, 450*l.*

It is proposed (1) that the Council should authorise the Treasurer to pay the contractor such sums as will be mentioned on certificates signed by the architect, and countersigned by a member of the Council, not exceeding in all (in the present case) the sum of 15,000*l.* and 450*l.*; the Treasurer to take receipts only on forms vouched by the Cashier or other authorised officer in the Comptroller's department. (2) That the certifying officer should have a book of forms of certificate which he would fill up as required, and send, when signed, to the Cashier, who would then obtain the counter signature of the appointed member of the Council, and issue it with the form of receipt to the contractor, who would convey it to the Treasurer and obtain payment. (3) That the Treasurer do receive from the Council, before the recess, orders

in favour of certain contractors, and record on each order every payment made on account of that order.

We propose to try this as an experiment for the ensuing Easter recess, so that if found satisfactory it may be brought into general use for all similar occasions. We recommend—

That the Treasurer be authorised, upon a certificate or certificates of Mr. G. T. Hine (architect), and countersigned by a member of the Council appointed by the Finance Committee, to pay the sums mentioned therein not exceeding the following amounts—Mr. Edmund Gabbutt, for erection of Claybury Asylum, 15,000*l.*; Mr. G. T. Hine, architect, commission at 3 per cent., 450*l.*

The recommendation was agreed to without discussion.

Proposed Public Buildings at Battersea.—The Finance Committee also reported as follows concerning an application for a loan by the Vestry of Battersea:—

“We have considered the application of the Vestry of Battersea for the loan of 35,000*l.*, to purchase a site and erect new parochial offices, repayable in 50 years.

The property purchased by the Vestry is situated between Lavender-hill, Eland-road, and Elsiey-road, and has a frontage of 163 ft. to Lavender-hill and extends to a depth of 650 ft. Included in the purchase are two houses in Eland-road, which, being part of the same property, the Vestry state that they were compelled to purchase. The price paid for the whole is 8,450*l.*, which the Council's Valuer considers reasonable, and the Vestry apportion on the site for the Vestry offices the sum of 6,000*l.*

The Vestry offices will be provided in the building to be placed on the front portion of the site, and these offices include accommodation for the holding of inquests, approached by a separate staircase. In the rear it is proposed to erect a large hall 98 ft. by 55 ft. 3 in., with a reception-room and a small hall 55 ft. 6 in. by 33 ft. 8 in. underneath this, together with retiring-rooms and the conveniences incidental to such a structure as might be let or used for public meetings, entertainments, &c.

We caused to be notified to the Vestry the fact that there were legal difficulties which prevented our recommending the Council to consent to the loan as applied for, as no authority had been obtained to raise money for the erection of the large halls or corner's court, and we have since received an explanatory communication from the Vestry and seen a deputation on the subject, and our objections not having been removed, we are unable at present to recommend any advance for these purposes.

The Council's Architect has examined the drawings and specification for the proposed buildings, and apportioned the cost as follows: Vestry buildings proper (15,200*l.*), professional and incidental charges (1,300*l.*), and fittings and fixtures (3,000*l.*), making 19,500*l.*. Coroner's court and professional charges, 1,400*l.*, and the public halls, 10,000*l.*, making a total upon the buildings of 30,900*l.*

The amount which we consider may be now advanced is 19,500*l.* (15,200*l.* and 1,300*l.* and 3,000*l.*) for Vestry offices, and 6,000*l.* for the land, and we accordingly recommend—

“That, subject to the Council hereafter giving its written consent under seal to the borrowing, and subject to all necessary consents and evidence being furnished to the satisfaction of the Solicitor of the Council, the application of the Vestry of Battersea for a loan of 35,000*l.*, to defray the cost of purchasing a site and erecting Vestry offices, be granted to the extent of 25,000*l.*, on condition that the loan is taken up at once, interest being charged thereon at the rate of 5*l.* 10*s.* per cent. per annum, calculated quarterly, and with the principal being repaid by such equal half-yearly payments of principal and interest combined as will repay the amount borrowed as to 6,000*l.* for site within a period of 57 years, as to 10,500*l.* for buildings within 30 years, and as to 3,000*l.* for fittings within 15 years; that it be referred to the Solicitor to take the necessary measures for completing the loan, and that the amount be advanced out of the Consolidated Loans Fund.”

This led to some discussion, on an amendment moved by Mr. Costelloe, to the effect that the recommendation be referred back to the Committee. He expressed the opinion that, for the purpose specified, a larger loan should be made. It was, he said, very desirable that facilities should be granted for the erection of public halls.

Mr. Harben seconded the amendment. Mr. Evan Spicer (Chairman of the Finance Committee) said they had taken legal opinion, with the result that, though they regretted the circumstances, they did not feel justified in recommending that a larger loan should be made.

Mr. Westcott said they should endeavour to get the law altered rather than go beyond their present powers.

Mr. Spicer suggested that they should pass the present recommendation, and later on consider a separate application in reference to the halls, &c.

Mr. Costelloe, in view of Mr. Spicer's suggestion, withdrew his amendment.

Mr. Cohen next moved to omit the words “and interest combined.”

Mr. Fardell seconded the amendment, which was lost by a large majority. The recommendation was then agreed to.

The Annual Estimates: Grants in Aid of Technical Education.—Mr. Evan Spicer, Chairman of the Finance Committee, next brought up and explained the estimates of the Council's receipts and expenditure for the year ending March 31, 1893. He explained that the total sum required to be raised during the year would be 1,696,034*l.*, of which 1,403,688*l.* would be on the General County Account, and 292,346*l.* on Special County Account. This sum total was the difference between the estimated total expenditure for the year (2,959,330*l.*) and the estimated total receipts (1,263,296*l.*) from all sources other than the rates. This would necessitate a rate of 10*l.* 1*d.* in the pound on General County Account, and of 2*d.* 4*d.* in the pound on Special County Account, making a total rate, outside the City, of 12*d.*, as compared with 11*d.* in 1891-92, or an increase of 1*d.* in the pound. Mr. Spicer concluded a long explanatory statement by moving a series of resolutions, of which the first was as follows:—

“That the estimates now before the Council, of the receipts and expenses of the Council for the year ending March 31, 1893, be approved, and that the Council do hereby estimate the amount that will be required to be raised in the first six months and in the second six months of the said year by means of contributions, to be as follows:—

	In the first six months.	In the second six months.	Total.
General County Account	£701,844	£701,844	£1,403,688
Special County Account	146,173	146,173	292,346
	£848,017	£848,017	£1,696,034

On this recommendation, Mr. Quintin Hogg moved, as an amendment:—

Provided that 30,000*l.*, being part of the amount receivable by the Council under the Local Taxation (Customs and Excise Duties) Act, 1890, be carried over to a suspense account, instead of being applied in reduction of rate, and that such 30,000*l.* when carried over, be dealt with on or before October 1 next, by the Council for any purpose authorised by the above Act; and that a special committee be appointed to consider what action the Council should take under the Technical Education Acts 1839-91, and the Local Taxation (Customs and Excise Duties) Act, 1890, with power to draw up a scheme or schemes for the consideration of the Council.”

Mr. Hogg said he moved this amendment because he saw with regret that the Finance Committee proposed to follow the course adopted by the last Council, and to devote no portion of the money coming to them from the Imperial Exchequer to the promotion of technical education. It was clearly the implied, if not the expressed, intention of the Legislature that the London County Council should devote part of the money thus accruing to it to the cause of technical education, as other County Councils had done, instead of applying it to the relief of the general rate. He contended that to help on the cause of technical education was one of the surest ways of relieving the rates, for our workmen would become better skilled in their various trades and able to cope more successfully with foreign competitors.

Mr. Baum, as a representative of the skilled artisans in the metropolis, said he was pleased to second the amendment. He thought the matter should not be met by charitable doles, but by some systematic scheme of technical instruction all over London, of which every child might take advantage.

Colonel Hughes, M.P., thought it rather a reproach to the Council that they had not looked at the matter of technical education with sufficient earnestness up to this moment. He supported the amendment.

Mr. Charles Harrison opposed the amendment, and pointed out that by an Act of Parliament the Council were empowered to impose a rate not exceeding a penny in the pound for the purposes of technical education, but he doubted whether there was a single councillor who would propose the increase of the rates to that extent for that object. In his opinion it was premature for the Council to apply funds over which they had absolute discretion in that way, as it was inexpedient to relieve the pressure which otherwise existed on the City Guilds to provide and have their moneys applied for technical education and for works of public utility within the meaning of the report of the Royal Commission on the City Guilds.

Mr. Sydney Webb supported the amendment. Sir Thomas Farrer said it appeared to him that the County Council were not in default on

this question, as Mr. Goschen had suggested in his Budget speech. Mr. Goschen showed distinctly in 1871 that the persons who needed assistance in the matter of rates were the towns, and especially the metropolises. When they came too look at the way in which the Exchequer contribution was distributed, they found that the towns, and London especially, had not received anything like their fair share of that contribution.

Dr. Collins supported the amendment, because he believed that at the present time the question of technical education in the metropolis was one which was ripening for solution.

Mr. Doubleday also approved the amendment, as he considered it would provide the quickest way of getting at the funds in the hands of the City Guilds.

Mr. Pickersgill, M.P., opposed the amendment, although he admitted that, by the action of the Science and Art Department curtailing or withdrawing grants to technical schools, on the assumption that all the County Councils would help on the cause of technical education, certain institutions in London would suffer great hardship, and their work would be seriously crippled.

Sir John Lubbock said that as treasurer of the Technical Education Association, perhaps he might be allowed to say a few words. The amendment had been appropriately moved by Mr. Quintin Hogg, who had done so much for the technical instruction of London. It was fortunate indeed for London that Mr. Hogg had not himself acted on the advice of Mr. Harrison. The opponents did not deny the importance of technical education, as if we wished to maintain our supremacy in commerce and manufactures we must give to people the same advantages as they enjoy elsewhere. Other counties and cities had applied their funds to technical education, and he hoped London would not remain behind. It was said that the Council was not the proper body, but Parliament had decided that for them. He trusted that the Council would support Mr. Hogg; for if, on the contrary, they rejected the proposal, it would be a great discouragement to the cause of education throughout the whole country.

Mr. Torr claimed that the money of the City Guilds belonged to the ratepayers, and ought no longer to be wasted in feasting. The Council ought to have it, so that they might as soon as possible set to work to establish seriously technical education in London.

After some further discussion, the amendment was adopted, on a show of hands, by a large majority.

Mr. Arthur Arnold next moved to amend the amendment by omitting all words between “that,” in line 1, and “a special committee,” towards the latter part of the amendment, as to confine it to the question of the appointment of a committee, without setting aside or tying up 30,000*l.* or any other sum.

This amendment was seconded by Mr. Harbard, but was defeated, on a division, by 25 votes against to 39 for, a majority of 25 against the amendment.

Major Frohyn next moved, and Mr. Embleton seconded, as a further amendment:—“That it be referred to the General Purposes Committee report as to the desirability of devoting at least 100,000*l.* derived from the Customs and Excise duties, for the purposes of technical education. The amendment was immediately negatived, and the recommendation of the Finance Committee, as amended by Mr. Hogg's addition, was approved.

The other recommendations, which were of formal nature, were then agreed to without discussion.

The Limit of Height of Buildings, whether old or new Foundations.—The Public Health and Housing Committee's report contained the following:—

“The Council, on the 8th December last passed the following resolution:—

“That it be referred to the Building Act Committee to consider and report whether, with a view to preventing the increase of insanitary areas in London, it is desirable that effect should be given to the recommendations made in 1885 by the Royal Commissioners on the Housing of the Working Classes, with regard to limiting the height of dwelling-houses according to the space about them, whether built on old or new foundations, and what amendments of the Building Acts are practicable in this direction.”

Shortly after the passing of this resolution, the Building Act Committee reported to the Council the amendments which they suggested were required by the Metropolitan Building Acts, which are the subject of a Consolidation Bill. The amendments

Remains of Roman Hypocaust, Chester.

then suggested included one framed on the principle of a rule prevailing in Liverpool for securing an open space in the rear of all buildings, whether built on old or new foundations, based on an angle of 45 deg., and such an alteration in the law would undoubtedly greatly assist in preventing the creation of slums in the future. It does not, however, go to the length to which your Committee would wish to see an alteration in the law, as it does not deal at all with the air space in front of the building.

Again and again cases have come to our notice, either by complaints from local authorities or private individuals or otherwise, in which it is proposed to erect buildings on old foundations, which from lack of air space would inevitably be insanitary; and beyond warning the builders that proceedings may be taken when the houses are erected to obtain their closing and demolition, perhaps at the cost of the ratepayers, no action has been possible owing to the defective state of the existing law. Any efforts of the Council to abolish narrow and unhealthy courts and yards are constantly frustrated by the fact that the law permits the erection of dwellings of any height so long as they are on old foundations, and we consider that steps should be taken with a view to the insertion of a clause in the Building Acts Amendment Bill dealing fully with this important question. We therefore recommend:—

That the Council do pass the following resolution. That, in the opinion of the Council, it is desirable that a clause should be introduced into the London Building Law (Consolidation) Bill controlling the height of buildings, whether built on old or new foundations, in relation to the street or open space in front of them, and that it be referred to the Parliamentary Committee to give effect to this resolution."

Dr. Longstaff, Chairman of the Building Act Committee, objected to the action of the Public Health and Housing Committee in this matter, and opposed the adoption of the report, the consideration of which was adjourned.

After transacting other business, the Council adjourned until Tuesday, May 3.

REMAINS OF ROMAN HYPOCAUST, CHESTER.

We give a drawing of the remains of a Roman Hypocaust recently discovered behind Northgate-street, Chester. The pillars, of red sandstone, rest on the sandstone rock; the tiles forming the roof vary from 1½ in. to 2½ in. in thickness by about 10 in. on the face; the concrete is about 6 in. deep.

The section shows part of two rows of columns,—the three to the right are 18 in. behind the others. We give in the margin the dimensions of a pillar which has been removed for preservation.

SHAKESPEARE AT STRATFORD-ON-AVON.—The annual series of Shaksperian Memorial Performances at Stratford-on-Avon have again this year, for the fifth time, been undertaken by Mr. F. R. Benson, and will consist of eight representations of Shaksperian plays, including a most interesting revival of "Timon of Athens," a tragedy that has not been seen on the boards since Phelps produced it at Sadler's Wells about twenty-five years ago. The performances commence on Monday, April 18, and will be as follows:—Monday, 18th, and Tuesday, 19th, "A Midsummer Night's Dream;" Wednesday, 20th, "Julius Caesar;" Thursday, 21st, "Twelfth Night;" Friday, 22nd, and Saturday, 23rd (Shakspeare's birthday), "Timon of Athens." There will be also two matinees, one of "A Midsummer Night's Dream" on Monday, 18th, and one of "Timon of Athens" on Saturday, 23rd. Special trains will be run from London on Friday, the 15th, and Friday, the 22nd. There will also be special trains from Northampton, Birmingham, Wolverhampton, Leamington, and surrounding districts.

Illustrations.

MURAL PAINTING IN THE CHAPEL, MAYNOOTH COLLEGE.

OUR illustration represents the first of a series of fourteen "stations," which go round the choir of the chapel of Maynooth College. Each station, with its accessory ornament, occupies a space of 15 ft. by 8 ft.

The subject of the first station is taken from St. John, xviii., v. 28, &c. Our Lord is before Pilate; in the background are the Jews who will not enter the hall; Pilate, therefore, comes to the atrium to meet them, and there listens to their accusations, &c.

The other thirteen subjects are those now commonly used to complete the pilgrimage of the "Via Crucis." Seven of these are completed. In the adjoining bay, next to the first station, are the four Major Prophets, with their prophecies of our Lord's sufferings and passion.

Besides these paintings in the lower part of the choir, Mr. Westlake has designed the roof decoration; and the figures (lifesized), ninety-two in number, are from his atelier. It is one of the largest painted roofs now existing in a Gothic church, and may be classed with those at Ely and St. Albans, in England; and St. Michael's, at Hildesheim, in Germany. The figures in the sanctuary roof, twenty in number, represent Apostles, Evangelists, and Prophets. Those in the nave comprise Our Lady with the Divine Infant, SS. Michael, John the Baptist, Joseph, Celestine, Patrick, Bridget, and Laurence. Following these are a series of angels with instruments of the passion, &c., whilst the western end contains the principal national saints. Around each saint or angel there is a versicle. The whole of the three hymns, the "Te Deum," "Quam Dilecta," and "Benedictus," are thus given.

Around the scroll and versicle are ornamental foliated borders, in gold and low-toned colour. The whole of the work is done under the care of Mr. Hague, the architect, of Dawson-street, Dublin, whose designs won the competition which was called some three years ago for the completion of the decoration of the chapel, which has been pushed on with untiring energy by the present President, the Very Rev. Canon Browne, D.D.

N. H. J. W.

DESIGN FOR A CHAPTER HOUSE.

THIS design, by Mr. John Begg, was one of those submitted to the Council of the Institute of Architects in competition for the Soane Medallion, and obtained for its author a "medal of merit" as the second best design sent in.* The material was intended to be brick with stone dressings for the exterior, with a lead-covered roof. For the interior work stone and red brick, the latter being proposed for the filling in of the groining. The stalls would be of oak, and the floor of dark grey or black and white marble.

We give the exterior perspective, a reduced copy of the plan, and the section. The treatment of the buttresses, carried right up to the plane of the mullions, with the arch mouldings hinging against them, has a very bold effect, and the whole design is very creditable to its author.

DESIGN FOR A STONE RAILWAY-BRIDGE.

THIS is the design for which the Grissell Gold Medal, for constructive work, has been awarded

*The design, by Mr. Heber Minner, which gained the Soane Medallion, we shall illustrate later on; it is unavoidably postponed for the present.

by the Council of the Institute to its author, Mr. Harold Harlock. As the author has sent us no description of his design, we must leave the drawings to speak for themselves. The Grissell medal being given for constructive design, the work is to be judged, we presume, purely from an engineering point of view; though we may suggest that architects, in competing for such a medal, might very well endeavour to improve a little upon the engineering type of design, and see if construction could not be combined with a little more of architectural effect and expression than we usually find in works of this class.

COMPETITIONS.

TECHNICAL SCHOOL, HEYWOOD, LANCA-SHIRE.—On the 8th inst., at a meeting of the Technical Instruction Committee held in the Council-chamber, Heywood, the assessor's award was opened and the result made known of the competition amongst architects for plans for the proposed Technical School, Heywood. Mr. Tuke (of Messrs. Maxwell & Tuke), Manchester, was the assessor, and in his award he stated that he had no hesitation in awarding the first premium in the competition to the plans marked No. 2A and No. 2B, alternative plans, sent in by the same author. He experienced some difficulty in deciding upon the respective merits of the plans for the second and third premiums, but he suggested that the premiums should be divided equally between the plans marked No. 3 and No. 10. The Committee resolved, after deliberation, to adopt this suggestion, and the premiums are, therefore, awarded as under:—First, Messrs. Woodhouse & Willoughby, Manchester and Stockport; second and third, Messrs. Butterworth & Duncan, Rochdale, and Mr. F. Brockbank, Liverpool.

FAIRWORTH PUBLIC BATHS.—In the limited competition for this work an amount was stipulated for the cost which was not to be exceeded. This condition not being fulfilled by the design at first selected, tenders were obtained for the execution of the buildings according to the design which was placed second in the competition, and as submitted by Messrs. Bradshaw & Gass, of Bolton. These tenders being satisfactory, the work has been put in hand according to their designs.

ROSSVILLE ASYLUM, N.S.W.—In the competition for Rossville Asylum (New South Wales), the judges, after no less than twenty sittings, have placed the competitors in the following order of merit:—

- 1st, Messrs. Sulman & Power, } Sydney.
- 2nd, Mr. Jno. Kirkpatrick, }
- 3rd, Mr. C. D. Payne, }
- 4th, Mr. — Clarke, Brisbane,
- 5th, Messrs. McKinnon & Weitzel, Sydney.

The name of Mr. Sulman, whose design in conjunction with Mr. Power is placed first, will be well remembered among our London readers.

BUILDING INDUSTRY, MEXICO.—According to a recent report of the British Consul at Mexico, there were in that city, at the end of 1890, houses worth 19,853,152l., an increase of 2,447,866l. or 14.3 per cent., since 1888. The increase in value of the same class of property in the small suburban towns of the Federal district during the same period was 125,342l., or 20.55 per cent. This development of the building industry is due not so much to any great increase of the population as to the general increase of wealth and a consequent demand for more commodious houses. It has a direct interest to British trade, in having opened a market for foreign building material, which, a very few years ago, did not exist.

LONDON PROPERTIES FOR SALE.—At the Mart, on the 25th instant, the second portion of the City-road Estate, Islington, comprising twenty-four houses, situated in the City-road (western end), Duncan-terrace, Sidney-street, and Goswell-road, being freehold, and yielding a rental amounting, in the aggregate, to about 1,394l. per annum. Also, consequent upon the death of Mr. J. J. Kelly, twenty-four freehold houses in the same quarter,—including Nos. 1-5, Colebrook-row,—producing an aggregate rental of 1,545l. a year; and Black-horse-yard, with other building sites, tenements, &c., covering a total area of 2½ acres, near to the "Angel" tavern, and lying north and south of the City-road. Many of the houses have large front or back gardens; some of them, being Nos. 2-15, Duncan-terrace, and 391-403 (odd), City-road, are scheduled in the Bill for an extension of the City and South London Electric Railway.

BRADFORD SMALL-POX HOSPITAL.

WE give the plans and section of the new isolation wards of this hospital, of which Messrs. Morley and Woodhouse are the architects. The hospital is arranged with two wards, each 72 ft. by 15 ft., which are placed back to back, having a space of 3 ft. between them. Bath-rooms, w.c.'s, slop sinks, and linen shoots are arranged at the end of each ward, and nurses' rooms adjoin the wards at the entrance ends, with supervision windows to each ward. A private ward is also provided. A special feature of the arrangements is an undressing-room for convalescents, where they leave behind hospital clothing, and then pass into a bathroom, and thence into a dressing-room, where their own clothes are put on, and from this room they pass direct into the outer air, thus doing away with all risk of carrying infection away with them. The drainage is divided into two separate and distinct systems; the one for roof and surface-water goes direct into the mains, but all the foul drains empty into disinfecting tanks, which are duplicated, so that whilst one tank is being emptied after disinfection, the other is receiving the drainage, and going through the process of disinfection by an admixture of chemicals.

Special arrangements are made for the destruction of the germs of disease. All the windows are made tight, and the fresh air is let in by three shafts from the outside, carried under floors and into the lowest compartment of the 3-ft. space between the two wards. Above this compartment, and divided from it by flags with open joints, in another compartment are placed the heating pipes, which are very powerful, and from this compartment flues are carried into the wards which conduct the fresh air (warmed in cold weather by contact with the heating pipes last named) into the same through gratings in the floors, one being placed at the foot of each bed. Above the compartment last named is an extracting flue made perfectly air-tight, and into this flue openings are made at the ceiling level of the wards over each bed. A powerful furnace, with honeycomb fire-brick divisions, is placed in the cellar at the end of this flue, and this furnace draws the foul air out of the ward, and it passes through the furnace and out into the open air by a large chimney. Thus all vitiated air from both wards, w.c.'s, bath-rooms, &c. (which are all connected with the flue), passes through a furnace which is heated up to at least 800 deg., and therefore is more than sufficient to destroy all obnoxious germs. The working of the scheme has been properly tested by the anemometer, and it has been found that at least 10,000 cubic feet per hour per patient can be passed through the wards and out through the furnace, and that at the same time in cold weather a temperature of at least 60 deg. can still be maintained in the building.

The contractors for the building were:—Mr. Farish, mason; Messrs. Wilkinson & Dawson, joiners; Mr. J. Wood, plumber; Messrs. Cordingley & Sons, plasterers; Messrs. Hill & Nelson, slaters; and Mr. J. Arndel, painter. Mr. Bancroft acted as clerk of works.

DECEMBER 1917

THE SANITARY INSPECTORS' ASSOCIATION.

AN earnest and interesting address was delivered on the 2nd inst. before the members of this Association at Carpenters' Hall, by Mr. J. Davenport, C.E. (Nantwich Union), one of the founders of the North-Western Sanitary Association. Mr. H. Alexander, the Chairman of the Council, presiding. The title chosen for the lecture was "The Sanitary Inspector—His High Calling." The paper claimed not only the sanction of the noblest of sciences,—that of saving human life, for the work of the Sanitary Inspector,—but the sanction of a Divine prescription as express as that which those who seek to save souls obey. A very close parallel was drawn between the canons of sanitary law as developed by science during the last sixty years, and the canons of the Mosaic law. A Divine origin was, in short, claimed for the "laws of health." Isolation of patients, destruction of sources of contagion, and cleansing of the most thorough character, were enjoined by this law, and God himself was declared ready to inspect the results, in the passage, "For the Lord thy God walketh in the midst of thy camp; therefore shall thy camp be whole, that he see no unclean thing in thee and turn away from thee." The leper and every one that was defiled was made responsible for his own isolation, for he must call out with a loud voice, "Unclean!" if any healthy person came near his place of banishment. An infected house must be scraped, and the dust be removed to a special place outside the city; and, if that were not effectual, the house must "be broken down, and the stones, timber, and mortar carried out of the city." Infected garments of woollen or linen, warp or wool, or skin must be burnt with fire. The reward of obedience was immunity from epidemics, the penalty of disobedience, annihilation by them. The penalty was illustrated by reference to plague years in England in the seventeenth century, when 310 per 1,000 (in 1625) and 430 per 1,000 (in 1665), were the horrible death rates of the years of the plague. The reward of obedience was also illustrated. The Great Fire of London so effectually carried out the Mosaic precept, that London has never since had a return of the scourge. At the village of Eyam, in Derbyshire, where a tailor had received a parcel of woollen clothes, the death rate reached its maximum, the tailor and five out of every six of his fellow-villagers dying of the plague in a few months. It was only after the survivors had been induced by two heroic parsons to isolate their village from the rest of the world and to burn every stitch and stick, that the plague was stamped out. In the present century, the visit of the Asiatic cholera in 1817 had been a blessing in disguise, for that epidemic had originated sanitary reform, and thus been the main cause of the advances made since by sanitary science. It had been shown that the death-rate from certain of these diseases was only one-hundredth of the rate of sixty years ago, and in the typhoid classes the mortality had fallen from 1-23 to 0-18, or down to one-seventh. A report of the Local Government Board showed that 250,000 lives were saved in the decade 1871-80, which would have been lost had the death-rate of the previous thirty years been maintained, and counting twelve cases of sickness for one death, three millions of people, or one-ninth of the population, had been saved from sickness, by causes not previously in operation. Their late president, Sir Edwin Chadwick, then whose name stood higher in sanitary circles, had calculated the money saving by the improved state of the British Army at 344,000*l.* a year, and a life saving of 40,000 men in ten years. But from him we also knew that there still remained a great deal to do, for even with our reduced death-rate, preventable disease was slaying over 100,000 lives every year, that might be saved with improved sanitation. The sanitary inspector represented to a great extent for the people of his district the present state of hygienic knowledge and to the other functions of his "high calling," he therefore added that of educator. It was in the spirit of study and contemplation that the duties of the sanitary inspector should be undertaken, and if so undertaken he must become a power in the regeneration of the world.

The Chairman, in inviting discussion, said that when they found they could not hope to get Sir Robert Rawlinson to give them an address by reason of his great age and feeble health, he had selected the next best man, well knowing that Mr. Davenport would talk of something better than D-traps and drain-pipes. A vote of thanks was proposed by Mr. West (Walthamstow), who warmly endorsed the paper. Mr. Poulson (Chelsea) seconded the motion, and continued the discussion. He objected to the idea of a Divine origin being ascribed to sanitary laws on account of anything that Moses might have said or done. Moses had learned all he knew from the Egyptians. If they had seen, as he had, at the Natural History Museum, "The Book of Death," they would find out that the ideas of the Egyptians on public purity and sanitation were simply splendid. They had their sanitary inspectors, their sanitary regulations, aye, and their sanitary engineers, whose works spoke of their almost superhuman talent in the remains of the great city

of Memphis. The Egyptians were the very antithesis of another ancient people, the Chinese, whose sanitary ideas were beneath contempt. Mr. Thomas (Bermundsey) said he felt as deeply impressed with the importance of his work as any minister of the Gospel did of his ministry, but nothing was to be gained by confusing the calling of the one with that of the other. He had the cooperation of his clergy, and very glad he was of it, because they always left the care of the bodies of the parishioners to the proper officers. He had been so well supported that he had cast down 300 houses to the ground, and twelve more rotten houses would have gone the same way but for the opposition of certain interests. At every meeting of his Board he had repeated the same cry, "The disgraceful state of things still exists in Crosby-row" until, weary of the iteration, they had armed him with the authority asked for. He agreed thoroughly with the spirit of the paper. The motion was supported by Messrs. Edwards, Dee (Westminster), Turner (Greenwich), Goodwin (Richmond), &c., and on being put was carried by acclamation.

Books.

Encyclopédie de l'Architecture et de la Construction. Volume V.; deuxième fascicule. Directeur, P. PLANAT. Paris; Dujardin et Cie.

THE fifth volume of M. Planat's encyclopædia takes us nearly to the close of the letter M, and contains several important articles: "Lombardie," "Louvre," "Lycee," "Mairie," "Maison," and "Moderne (architecture)" among them. It may be questioned whether such a heading as "Modern Architecture," which is so large and extended a subject that it would require a treatise to itself, fairly comes within the proper scope of an article in a publication of this kind. M. Planat, who contributes the article himself, has succeeded, however, in bringing it within reasonable scope and making it fairly representative. He proposes as the object of the article "to indicate rapidly, by some examples, the actual tendencies of architecture in different countries" at the present day. Taking the principal countries alphabetically, "Architecture Anglaise" takes the lead, is treated with more knowledge and sympathy than we find accorded to this country in some other portions of the encyclopædia, and is fairly illustrated. It may be interesting to the reader to notice the buildings which the French critic selects for illustration. Remarkable that the variety of religious sects in England leads to an interesting variety in their religious edifices, M. Planat gives first a view of Mr. Waterhouse's chapel in Mayfair, in which the architect "a fait la marque caractéristique de son talent, et qui permet de reconnaître sa main comme on discern celle d'un peintre." Next comes "L'Eglise St. Pierre" at Ruddington by Messrs. Bell & Roper, followed by "L'Eglise St. Jean Baptiste" at Brighton, by Mr. S. J. Nicholl. But that ends the churches! Of Mr. Pearson the editor seems ignorant. We have next the Art Gallery at Sheffield by "MM. Flöken & Gibbs" (how is it that French writers cannot copy English names correctly?), and following that the interior of Mr. Robson's library at the People's Palace. Then we have the central portion of the Natural History Museum at South Kensington, where "nous retrouvons également l'emploi de ces hautes tours multipliées, sans lesquelles il semble qu'il n'y ait pas d'architecture moderne en Angleterre." The same architect's University College at Liverpool follows; then a part of the centre of the Law Courts' façade, apparently copied from a photograph, without the trouble to correct its distortion of lines; not a creditable illustration. The Girls' School at Bristol, by Mr. Gough, "se rattache à ce style de la Renaissance anglaise qui n'est pas sans analogie avec le caractère des constructions allemandes, hollandaises et flamandes;" the Town Hall at Leamington, by Mr. Candall; the buildings for an insurance company in London, by Messrs. Aston Webb & Bell; the Liberal Club at Leeds, by Messrs. Chorley & Cannon. This is followed by Ascot House, at Leighton, by Messrs. Williams, West, & Slade, as an example of the picturesque style of modern English house; one is sufficient, for "qui a vu un cottage anglais les a tous vus" (!). An entrance-hall interior from Palace Court, Kensington follows, by MM. Harvey and Bernard Smith. That is the end of the English examples. Can it be believed that the name of Mr. Norman Shaw is not even mentioned, nor one of his works illustrated! Mr. Planat has

something more to learn about contemporary English architecture. The illustrations, though necessarily on a rather small scale, are mostly very well executed.

Modern German architecture is fairly illustrated; the subject is of course much larger, as it covers far more ground. Of Italian architecture the largest illustration given is that of the new Palais de Justice at Rome. American architecture does not fare well; the design for New York cathedral is shown in a very poor and small illustration, and the Capitol at Washington, which is going rather far back for contemporary architecture. The remarkable development of modern domestic and street architecture in the United States seems to have escaped M. Planat's notice altogether. French modern architecture is omitted, having been treated sufficiently already, we presume, under "France."

M. Dedart's article on Lombard architecture is a long and very largely illustrated treatise, giving both plans, sections, and a considerable illustration of ornamental details. The history of the Louvre is treated by M. H. Nodet, and the subject of "Lucarne" by M. Rivoalen, "lucarne" of course corresponding to "dormer" in English. As far as it goes this is a good article, well illustrated; but it has the defect that we have noticed in many others of the smaller articles in the Encyclopædia, that it is entirely confined to French examples, without the slightest hint of any others, and is an essay which could only find its proper place in an "Encyclopædia of French architecture," not in an "Encyclopædia of Architecture." In the article on "Lycee," which is really a term peculiar to France, the author, M. Charles Lucas, is more broad in his views, and divides his article into two sections, "France" and "Etranger," though we are bound to say that the latter is by far the smaller section. The buildings in England illustrated are Manchester New College, Oxford; Holloway College, and the Technical Institute in Exhibition-road. The article on "Mairie" is more general in character and in the selection of its illustrations. "Maison," by M. Rivoalen, is a rather shorter article than we should have expected for such a large subject, compared with the length at which less comprehensive subjects have been treated. The illustrations are very inadequate, and are nearly all French; there is a curious travesty of the "Cottage Ouvrier Anglais," professing to be taken from a model in the Exhibition of 1873. Among the practical articles, "Matriel de Chantier" is treated at some length by M. C. Bazin, and "Menuiserie" rather inadequately by "E. B." M. Rivoalen treats of "Metope," which (we need hardly say) he regards as essentially *remplissage*; he omits to give the Greek form and derivation of the word. "Morceaux" and "Musem" are treated as separate subjects, the former being referred to museums of art, the latter to natural history museums. The most pleasing building under the heading of Musée is that at Laval, an excellent example of the graceful semi-Classical architecture often employed by the French on works of this class. M. H. Saladin contributes a long and elaborate article on Mahomedan architecture, and M. Charles Lucas finishes the volume with a biographical notice of the Mylne family of architects in this country. As a whole, the present volume of the Encyclopædia quite keeps up the standard of the former volumes.

Correspondence.

To the Editor of THE BUILDER.

ARCHITECTURAL EDUCATION.

SIR,—In reply to the letter of Mr. Cole A. Adams, published in your last issue, we should be glad if you would allow us to make it quite clear that "the some half-dozen members of the A. A.," referred to in it, met Mr. Jackson and his friends but once, and at that meeting Mr. Jackson's letter to "A. A. Notes" was not so much as thought of or referred to in any way, and was not written at the request of the "some half dozen," as stated by Mr. Adams.

We will now proceed to give Mr. Adams the information he asks for. The meeting referred to was held on March 15, at 7, Storey's-gate, and the following members of the A. A. were present:—Messrs. C. H. Brodie, H. O. Cresswell, O. Fleming, E. S. Gale, W. Millard, T. E. Pryce, F. M. Simpson, and L. Stokes. The following

PHOTO LITHO. SPRAGUE & CO. 4 & 5 EAST HARDING STREET, FETTER LANE, E.C.

DESIGN FOR A CHAPTER-HOUSE.—BY MR. JOHN BEGG, A.R.I.B.A.

Longitudinal Section of Centre

Plan thro' Abutment (looking up)

Note All the voussoirs, the quoins & facing to three sides of abutments to be hardest grey granite, remainder of facing to be sandstone.

members of the A. A. were also present: Messrs. R. T. Blomfield, T. G. Jackson, A.R.A., R. Macarthey, E. S. Prior, and E. P. Warren; met with the object of ascertaining whether or not Mr. Jackson and his friends would help to do the work of the A. A. Now, it was clearly stated and understood that the members present simply attended in their private capacity, and did not represent any one of their own views but their own. Mr. Jackson, therefore, was not "led to suppose that they" the some half dozen—"expressed the voice of the A. A.," as Mr. Adams assumes.

Mr. Jackson and his friends stated their willingness to help, but stipulated for the absolute independence of the A. A. and its scheme, and pointed out that this was endangered by the frequent reference to the institute examinations made in our Brown Book and Curriculum. Other points were discussed, but the independence of the A. A., strangely the very cry that Mr. Adams has so curiously set up,—was the only one that was insisted upon.

The result of this meeting has since been formally laid before the A. A. Committee. Perhaps if Mr. Adams had known this he would not have troubled you with his letter. We, however, are glad that he did so, as we now have it clearly recorded that Mr. Adams intends to fight for the good "old traditions" and "sturdy independence" of the A. A., which is what most of us desire.

Mr. Adams reminds us,—quite unnecessarily, that the Institute has made a generous grant of the funds of the A. A. We also are aware at several prominent members of the Institute have likewise helped us generously; but Mr. Adams appears to forget that on our subscription list there are also such names as Sir F. Bighton, P.R.A., R. Norman Shaw, R.A., Professor Herkimer, R.A., Sir A. Blomfield, A.R.A., Professor Aitchison, T. G. Jackson, A.R.A., Messrs Clarke, B. Champneys, C. H. Mileham, & others.

Mr. Adams misrepresents Mr. Jackson—no doubt, unintentionally—when he states that Mr. Jackson wants us to "give up our present scheme of studies." This is not the case, as with the exception of a few details, he and his friends generally approved the scheme.

It would be difficult, we imagine, to adopt a more "independent course" or one more calculated to serve the best interests of the Architectural Association, than to seek advice from capable men, without stopping to inquire to what body they may happen to belong.—We are, &c.,

"STEAM ROAD-ROLLING."

Sir,—Will you kindly allow me space for a few remarks on the letter from Mr. Robert Phillips, County Surveyor for Gloucestershire, published in your issue of March 20 last?

Mr. Phillips makes a broad statement that steam-rolling cannot be defended on economy of cost, and afterwards adds "it saves by consolidation without abrasion or trituration one-eighth of metal."

It must, therefore, be apparent that if the cost of rolling in a cubic yard of material, less the cost of re-raking is less than one-eighth of the cost of a material when spread on the road, economy is a result.

In illustration I here give actual figures from my own district:—

Costs cost per cubic yard of material used on main roads.	Average cost of rolling in one cubic yard of material.
£. s. d.	£. s. d.
Carrying 0 4 3	Wages of driver 0 0 9
Rolling 0 1 0	do. 2 sweepers 0 0 9
Grading 0 0 0	Coal 0 0 0
Raking 0 0 0	Stores 0 0 0
Rolling (including hauling from depots) 0 0 0	Depreciation of steam roller and water carts 0 0 0
One eighth = 0 0 7 3/4	Less cost of after-raking. 0 0 2
	20 0 7

A saving of 3/4 of a penny is therefore made on every cubic yard of stone rolled in by the steam roller.

This is taking Mr. Phillips's view, viz., that the saving in materials is one-eighth. My own experience, however, is that the saving is very much greater, and that one-quarter would be much

nearer the mark. Taking this standard the above calculation would show a saving of nearly 9d. a cubic yard. ALLAN GREENWELL, A.M.I.C.E.
Surveyor to the Frome Highway Authority.
Frome, Somerset, April 8, 1892.

REMOVING OLD PAINT.

SIR,—Referring to Mr. H. F. White's letter in your issue of Saturday, permit me to state that I have found the following a very successful method of removing old paint from stonework. Take a fresh lime shell and strong black soap, mix together into a slather and lay on the paint. The mixture cannot be too strong for this purpose. Allow it to lie for two hours, and if at the end of that time the paint does not come clean away it can lie longer. A brush may be used gently. I hope this may serve Mr. White's purpose.—Yours, &c.,

D. McARTHY.

SIR,—I beg to recommend the following as a sure remedy.—Three pounds of common washing soda, 4 lbs. of unslacked chalk of grey stone lime dissolved in boiling-water, and made about the thickness of cream, and applied but with fibre brush and washed off with clean cold water with a fibre scrubbing brush. This applied two or three times will remove the paint and leave the stonework perfectly clean. The materials are cheap, and can be easily mixed in any quantity at the same rate. GEO. GODBOLT.

The Student's Column.

WARMING BUILDINGS BY HOT WATER. XVI.

BOILERS: INDEPENDENT.

INDEPENDENT boilers, as the term signifies, are those that need no brickwork in their setting (assuming that the floor upon which they stand is not inflammable), and all that is usually necessary is to place them in position, and connect with the nearest chimney by a pipe. If no brick chimney exists, then the fine pipe is carried up to a sufficient height to form a chimney in itself. The fire-box is situated below the boiler, within an iron casing, in fact, forms a base upon which the boiler rests.

As a rule, these boilers are not used in large undertakings, although there is no reason why they should not be. The boiler, however, in large horizontal works is placed in a pit, and in building works is similarly situated, or given a little house or room to itself. In both these cases the brickwork is not objectionable, and it is understood that brick-set boilers are cheaper than the independent kind. In many forms of boilers brick-setting is really necessary to benefit by the flues that can be conducted around their outer surfaces. This cannot be done with independent boilers, and the other surface or shell cannot be made use of. This is the drawback to boilers of this kind, for we are not only unable to conduct the flames or hot gases around to the outer surface as they leave the fire, but this outer surface goes to waste a considerable amount of heat by radiation, if it is not covered with some poor heat-conducting compound.

Reference must again be made to Keith's boilers, as these, in this respect, differ from the ordinary independent patterns. The chief peculiarity in these boilers is that, being made of cast-iron, and in sections, the inner direct heating surfaces can be made of any design to best benefit by the heat; designs such as cannot be made with wrought plates. For instance, the sections of the Challenge boiler are chiefly made much resembling large gratings, the bars of which have a waterway through them from side to side of the jacket. By an arrangement of this kind we get such a great direct heating surface, within a small compass, that it is doubtful if the heated products would be of much value when they eventually escaped. By making such a number of surfaces, all obstructing the free passage of the heat, we can rob the air and gases, and make them of quite a low temperature at the outlet.

Every kind of independent boiler should, if economical results are aimed at, be covered with some bad heat-conducting material. The loss of heat from the outer surface of a boiler, when exposed, is really considerable. Brickwork would effectually prevent this, but independent boilers are intended to dispense with this. Silicate cotton would answer excellently, but it is somewhat difficult of application, upon

upright boilers in particular. The material used by the writer is Leroy's composition, which, when once become accustomed to, is easy of application, and decidedly efficacious. We shall have to refer to the subject when speaking of main pipes when they are not used for radiating purposes, but merely to convey hot water to the branches.

There is a little care needed in fixing independent boilers. It is possible to fix a boiler so that the fuel will not burn properly, that is to say, the fire will not "draw"; and, doubtless, most of our readers know that it is quite possible to fix a boiler and its flue pipe, so that it suffers with a down draft.

It takes but little draft to work an independent boiler of any kind, as, supposing it is one having flues within it, these all ascend or incline towards the chimney, very different to fixing an independent or portable cooking range, having flues for the flame to be carried down beneath the oven boiler, &c. If a brick chimney exists, a pipe is carried from the boiler into this chimney, either up through the mouth or bottom aperture, or through the brickwork of the breast. The flue pipe can be carried horizontally or ascending, but, without a skilled opinion, it is not desirable to make the pipe descend anywhere. If the pipe is carried up into the mouth of the chimney the opening must be closed up tightly around the pipe with sheet-iron. If the pipe is carried through the breast, the brickwork is made good around it and the lower opening quite closed up. The rule that has to be followed in fixing close fire-stoves, ranges, and boilers is to complete the work so that all the air passing into the chimney first passes through the fire. There should not be any means whatever for air to pass into the chimney without first passing through the burning fuel. This rule will bear relaxing a little, if necessary, with stoves and boilers which have no descending flues within them, but if it is convenient to strictly adhere to the rule it is better, and the work will then bear criticism.

Every independent boiler is provided with a ventilator arrangement in the ashpit door, which acts as a damper, by regulating the passage of air as the openings are opened or closed. This is correct in principle, but they are often badly fitted and not liked by the average attendant. It is much better to put a proper damper in the fine-pipe, near the boiler, and convenient for use. A throttle-damper (like a throttle-valve), a disc of metal in the pipe operated by a handle outside, is commonly used, but these are not very reliable. A sliding damper, which works in a little square casting, is better. They are cheap and easily obtained.

Independent boilers are more generally used in building works, which accounts for our explaining how they can be connected with existing brick flues, but if no brick chimney can be pressed into service, it becomes necessary to carry the pipe through an outer wall, and up outside to the top of the building. If a glass house, then the pipe need not be carried far; but if a residence or warehouse, the pipe may have to go a great height, and on this account every effort is made to utilise one of the chimneys of the building. In any case, we cannot hope to be free from down draught unless the chimney terminates above the building, and well above its highest part. It is impossible to even briefly treat the subject of down draughts here on account of the many points it involves, but it must be understood that unless a chimney terminates as high as stated, trouble will ensue. If some form of cap or wind-guard can be used and permit of the pipe terminating at some point below this, then it should be considered a fortunate circumstance due to some favourable condition, such as could not be expected to happen every time by any means. If the boiler is situated in a boiler-pit outside a glass-house, the question of down-draught is not considered so much, for, supposing down-draught does occur, it does no harm, and the gases only last for a moment or two at a time in certain weathers. If, however, the boiler is in a residence, or building of almost any kind, the outbursts of smoke, &c., from the furnace would be intolerable, and would have to be prevented by some means. When using pipe-flues, it is very necessary that the joints be made airtight. Common putty is best for this, it hardens with heat.

The smallest independent boilers we have are those heated by a gas-burner or lamp-flame, and which have the pipes, &c., complete as

fig. 59. These are very useful appliances for the little greenhouses that are attached to small residences. They merely require the gas to be connected, and are then ready for use and act very effectively. If oil is used, no connexion whatever is necessary, but there is a general

aversion to oil for heating purposes, as a disagreeable odour is easily obtained. If the stove is of any but very small size, and is heated by gas, it is necessary to have a flue to it to convey away the products of combustion. This flue only requires to be of small size, but if it is to be effective it must be carried in the same manner as a smoke-flue; it is important to note this.

The products of combustion from a gas-burner are water and carbonic acid. Heat is also evolved, but this is more an effect of combustion than a product. In addition to the products named, there are certain gases which are the result of impurities or foreign substances in the gas. The particularly objectionable one of these is sulphurous acid, which comes from the small percentage of sulphur which the gasworks cannot wholly eliminate. This product is very hurtful indeed to plant life, and were it not for this the other and proper products could be borne to a considerable extent. One maker of these little appliances fits them with a purifier (as he terms it) which is intended to intercept and absorb this particular ill product.

There are several gas boilers made that are intended for larger and more practical purposes

than that just referred to, one, as fig. 60, made by Fletcher & Co., being a good example. Keith also makes a good gas boiler, as fig. 61. Gas boilers are never made very large; it is considered to be more economical to use two or more of them,—a battery, so to speak, if there

is much pipe to be heated. Effective flues have to be provided with these larger sizes, and, as a rule, it is considered best if they can be fixed in a little outhouse of some kind, so that any escape of gas may prove harmless. The flue should also be outside the building for the same reason. If the flue exhibits a draught, a great deal of trouble will be occasioned by its extinguishing the gas-flame, or causing it to light back in the air chamber, if it be an atmospheric burner. It must not be forgotten that the water product will probably be condensed in the iron pipe, and a tiny stream will be constantly trickling down it. This can be easily disposed of.

These blocks were inadvertently omitted in the last chapter of "Student's Column." They are referred to in the table of the area of furnace bars in various types of boiler, page 293, ante.

OBITUARY.

MR. E. H. BURNELL.—We regret that we have to announce the somewhat sudden death of Mr. Edward H. Burnell, F.R.I.B.A., of Bedford-row, W.C., which occurred on the 5th inst. at his residence, 13, Orsett-terrace, Hyde park. Mr. Burnell carried on for many years an extensive practice as a surveyor in the metropolis and elsewhere. He was the senior member of the Surveyors' Association, and for many years its secretary, and only nine months ago he retired from his appointment as Surveyor to the Skinners' Company, on the ground of failing health, after having filled that office for nearly thirty years. On his retirement the Company unanimously voted him a large retiring pension. He was elected a Fellow of the Institute of Architects in 1877.

GENERAL BUILDING NEWS.

LINCOLN CATHEDRAL.—We hear from Lincoln that the committee appointed to consider the form which the proposed memorial to the late Sir Charles Anderson should take, have unanimously decided in favour of the restoration of the chantry chapel of Bishop Fleming in the north aisle of the retrochoir of the Minster. Bishop Fleming died in 1431, but, according to the fashion of the day, his chantry was erected and his monument executed previous to his death. It is a good specimen of Early Perpendicular, having three windows to the north, with rich buttresses and parapets and paneled work. But the whole has been long in a miserable state of squalor and decay, receiving little credit on the members of Lincoln College, Oxford, of which Fleming was the founder. The proposed work may be a good one in itself, but we fail to see the appropriateness of the restoration of one man's chantry chapel as a memorial to another, at the distance of four centuries and a half, and we shall be curious to know in what way it will be identified with Sir Charles Anderson. The restoration, if done at all, should have been taken in hand by Lincoln College, "in priam fundatoris memoriam."

POOR LAW BUILDINGS, CROYDON.—The foundation-stone of the new Board room, offices, and out-relief station for the Croydon Union was laid on the 5th inst. by Mr. J. Farley, Chairman of the Board of Guardians. The architect is Mr. Fredk. West, of Croydon, and the contractor Mr. Alfred Bullock, also of Croydon. The cost of the building will be about 6,500*l.*

HOSPITAL FOR CONSUMPTION, MANCHESTER.—On the 30th ult. the new out-patient department of the Manchester Hospital for Consumption and Diseases of the Throat and Chest was opened by Miss Balfour. The building is situated in Hurdman-street, Deansgate. It is twice the size of the former one, which occupied a portion of the same site. The new waiting-hall (capable of seating 200 patients), the entrance to which is from Hurdman-street, is 40 ft. by 40 ft. It is lighted by an octagonal dome 30 ft. in height, which terminates in a turret for the extraction of vitiated air. Round the hall are grouped nine consulting and examination rooms, each having double doors and windows. The new dispensary is placed at the junction of Byrom-street with Byrom-place. There is also a patients' exit therefrom into Byrom-street. Fresh air is admitted into the basement, and after passing over hot-water coils, is driven through underground flues to the various rooms by a fan, the motive power being supplied by a gas-engine. The work has been executed by Messrs. Wilson & Tolt, of Hulme, from the designs and under the superintendence of Messrs. Penington & Bridgion, architects, at a cost of upwards of 2,500*l.*

WESLEYAN CHURCH, WOLVERTON.—The foundation-stones of the new Wesleyan Church which is being erected at Wolverton, North Bucks, were laid on the 2nd inst. The new building will seat about 350 persons, and will involve an outlay of 2,300*l.* The style is Early English, and the architect is Mr. Ewen Harper, of Braunston, and the builders Messrs. H. & C. Burden, of Chipping Norton.

CLUB BUILDINGS, GLASGOW.—The plans of the new Conservative club-house to be erected at the corner of Bothwell and Wellington-streets, Glasgow, were on the 31st ult. passed by the Dean of Guild Court. The drawings have been prepared by Mr. R. W. Edis, architect, London. The external design of the building is Scotch Renaissance, grossly treated, with projecting bays and oriel, and crows'-feet gables, flanked by small turrets. The

main entrance in Bothwell-street is flanked with red granite columns. This entrance is on the street level, and leads into an outer hall, from which access is gained to the main ground floor level by a flight of steps. On this floor are the morning-room, reading-room, 46 ft. by 25 ft., facing Bothwell-street, with two bay windows; the dining-room, 73 ft. by 25 ft., with the usual service arrangement communicating with the kitchen, still-room, &c., and the lavatories and cloak-rooms. On the first floor is a smoking-room, 70 ft. by 25 ft., fronting Bothwell-street, with three bay windows. Fronting Wellington-street is a library and private billiard and dining-rooms. On the second floor, above the smoking-room, is the billiard-room, also 70 ft. by 25 ft., and a card-room. There are twenty-five bed-rooms for the use of the members, and, in addition, there are dressing and bath-rooms on a mezzanine floor. In the basement is the kitchen, with a ceiling 22 ft. high, also the servants' hall, sitting-rooms for the maids and messengers, wine cellars, &c. On the mezzanine floor above the basement are the steward's office, closet, the servants' and tradesmen's entrance in Wellington-street, housekeeper's rooms, still-room, a still-room maids' sitting-room, upper servants' dining-room, men servants' dormitories, &c. The building is to be of brick, faced with ashlar, and the alterations that have taken place in the work of brick construction, and all partitions to be of brick and cement.

RESTORATION OF ALL SAINTS' CHURCH, HILTON DORSET.—On the 28th ult. the Church of All Saints, Hilton, Dorset, was re-opened after restoration. The architect for the restoration states that the principal works that have been carried out under the present restoration are the taking down and rebuilding, stone by stone, as before, the whole of the south arcade and the wall of the south aisle as far as the porch. The shoring up of the chancel pier on the south side of the chancel arch, which was crippled and out of the upright. In carrying out this work the pier was found to have contained the steps which formerly led to the roof-loft. The masonry of this pier was in a very unsafe condition, partly from the removal of the ground under the foundations in the formation of vaults and grave-ways and south wall, &c., and also on account of the alterations that have taken place in it at various times. The original openings, at the bottom at top of the staircase, seem to have been walled up and two more (doorway) openings found, one on the south side of the pier leading from the south transept and one on the west side of the pier, the cell of which was about 3 ft. 6 in. from the floor. All four openings were, when found, walled up, also the interior of the pier, with solid masonry. All four doorways have now been opened out, an provision made for the stability of the pier by inserting slabs of stone to bond it together, and, in order to obtain a sufficiently firm footing, it was necessary to go down to a depth of 6 ft. below the floor of the church. The perpendicular roofs of the north and south aisles have been reconstructed and restored, care having been taken to preserve the work in again all the old timber that was sound. A new open hammer-beam roof of pitch-pine replaces the former roof of the nave, which had a round plaster ceiling, and which was erected about 100 years ago. None of the oak in the original nave roof was found. During the progress of the work a few fragments of Norman architecture have been found. The tower arch has been repaired and made good, where it had been cut away and mended for the housing of the gallery timbers. The font, which was formerly placed under the gallery, has been cleaned and repaired, and re-fixed in the centre of the tower. The walls of which have been pointed and made good, and an ornamental tile floor laid down. The paintings of Apostles and Saints, which were before fixed on the north and south walls of the chancel, have been cleaned and placed in oak frames, as re-fixed on the north and south walls of the tower. The whole of the floors of the nave, aisles, and vestry have been re-laid with pitch-pine floor-boarding on a bed of concrete. The church has been re-seated with pitch-pine framed open seats. The old pulpit has been cleaned, and the carved panels repaired, and the moulded stone base, which was before buried under the floor, replaced, as the pulpit again fixed on it. A new vestry, with heating chamber under it, has been built on the north side of the tower. The exterior masonry of the church has been repaired and made good. The missing parapet, &c., on the north aisle restored, and the defective gargoyles replaced. The south porch, which projects into the church, has been made good, the floor laid with tiles, and the roof renewed. The porch has a ground roof of Ham Hill stone, with two of the bosses, at the intersections of the ribs of the treasury, are carved the arms of Milton Abbas and the arms of Abbotsbury. On removing the iron from off the wall of the south aisle to take it down certain ornamental panels, with initials cut in them, were found. These have all been replaced as near as possible in the position in which they were found. At the south-east angle of the parapet on the south aisle was fixed a stone sundial, bearing the date 1695. This has been re-fixed in its original position. The roofs of the aisles have been covered with

ting on false roofs, raised above the old oak
lings. The masonry of the tower has been
repaired, and the defective stonework made good.
e windows of the south aisle and transept and
st window of tower have been filled in with new
heral glazing. The church has been heated
h hot-water apparatus by Mr. Poul, of Biand-
d. The chancel of the church has also been
restored by the Ecclesiastical Commissioners, and
new open-timber roof fixed, the chancel fitted up
h oak reading-desks and chor-benches, and the
or paved with tiles. This part of the work has
one done under the direction of Mr. Ewan
ristian, the Architect to the Ecclesiastical Com-
missioners. The whole of the work to the nave,
aisle, &c., has been carried out by Messrs. Merrick
son, of Glasbury, and under the direction of
W. Walter J. Fletcher, F.R.I.B.A., of Wimborne.

**RESTORATION OF THE OLD CHURCH OF HADDIN-
GTON.**—The restoration of the Old Church of Had-
dington, which has been in progress for the last
thirteen months, is, says the *Scotsman*, now all but
complete. The church is built on the cruciform
plan, with aisles in nave and chancel. When the
present restoration of the building was under
consideration about a couple of years ago, it was
proposed not only to restore the nave, but also the
ruinous portion of the structure,—the chancel
transepts. Owing chiefly to the large expendi-
ture involved, the restoration of the nave was
not proceeded with. The building is an
example of Late Ecclesiastical Scottish Gothic.
The work of restoration, it was necessary to
begin with the chancel, as it was the most im-
portant as to admit of the bases of the old
columns being exposed to view. The former galleries,
which were placed round three sides of the nave,
were disappeared, and also the old box-like pews
with high wooden pulpits. The former entrances
on the north side of the nave, which were alterations
of the original building, have been closed up, and
the present restoration of the building was under-
taken by a new doorway in the east wall, and
immediately below the central tower. These door-
ways open into porches enclosed with oak screen-
work. In the north-east corner of the nave a small
brink or vestry is screened off by oak-work.
The old iron and vestry is screened off by oak-work.
The old iron and vestry is screened off by oak-work.
The old iron and vestry is screened off by oak-work.

the progress of the restoration, a doorway leading
from the south-east aisle to the turret, giving access
to the roof, was discovered. The doorway has been
carefully restored, and is now in use. Messrs. W.
& J. Kirkwood, Edinburgh, were the principal con-
tractors, and Mr. Laird acted as clerk of works.

NEW COURT-HOUSE, BIRKDALE, LANGSHIRE.—
On the 7th inst. the new court-house which has
been erected in Wald-road, Birkdale, by the County
Council, was formally opened. The building is in
the English Renaissance style, and is constructed of
brick, freely relieved with carved stone panels and
cornices. Divided into three blocks, the adminis-
trative block occupies the centre, on the south side
of which is the house for the inspector, while on the
north side is the sergeant's house. The central
block contains, on the ground floor, charge-office,
constables' day-room, and four cells; and on the
first floor are the magistrates' room, apartments for
solicitors and witnesses, and a court-room, 40 ft.
long by 28 ft. wide, with accommodation for nine
magistrates. The building was erected from the
designs of Mr. William Verity, architect, Wigan,
and the contractor was Mr. George Johnson, Sea-
forth.

CO-OPERATIVE PREMISES, JARROW.—On the 26th
ult. new co-operative premises, which have been
erected at the corner of North-street and Market-
square, Jarrow, were opened. The new premises
occupy the site of the old stores, together with that
of two dwelling-houses, and cover an area of about
5,227 superficial ft. They are four stories in
height, and contain on the ground floor six shops.
On the first floor are four and grocery warehouse
and tea-room, work-rooms for tailors, milliners,
and shoemakers, and also a large millinery show-
room. There are also cellars in the basement.
Communication between the different departments
has been provided by staircases and corridors; lifts
and hoists being also fixed in various positions.
The lecture-hall on the second floor is 84 ft. by
36 ft., and 25 ft. high, and will accommodate
between 600 and 700 people. The building is
warmed throughout by a low-pressure
hot-water heating apparatus, fitted by Messrs.
Dinning & Cooke, of Newcastle. The building is
to be lighted by electricity. The dynamo will be
driven by a 10-horse-power gas-engine, which will
also work the hoists, lifts, and other machinery
about the premises. The building, which is of
Normandy bricks with Denwick stone dressings, is
Renaissance in character, and has on the North-
street side a clock-tower about 65 ft. in height.
The total cost of the building will be upwards of
7,000. Mr. Pringle, of Gateshead, was the con-
tractor. The electric lighting has been entrusted
to Messrs. King, Brown, & Co., of Edinburgh, and
was carried out under the superintendence of Mr.
Alfred Flood; the plumbing and sanitary work,
together with the tiling, by Messrs. Tweddle & Co.,
of Newcastle. The plastering and painting have
been in the hands of Messrs. Dodds and Hopper,
respectively, both of Jarrow; Mr. George Gordon
acting as clerk of works. The whole of the work
has been carried out from the plan, and under the
superintention, of the architect, Mr. J. Walter Hanson,
of Jarrow.

PROPOSED RESTORATION OF BRISTOL CATHEDRAL.—
According to the *Bristol Times and Mirror*, the
Dean and Chapter of Bristol Cathedral have been
considering matters relative to the restoration of
the Cathedral. It has been decided to take in hand
at once the restoration of the Cathedral as a whole,
and not do the work in sections. The plan to be
adopted is that of the late Mr. Street, and it is to
be carried out under the superintendence of Mr. Pearson.
It embraces the restoration of the central tower,
the lady chapel, the re-arrangement of the whole
of the choir, involving the restoration of the older
lady chapel, and a new organ, that is to be divided,
and not to be placed on the screen. An approxi-
mate estimate of the cost which Mr. Pearson has
furnished is 20,000. Another matter to be taken
in hand is the transformation of an apartment at
the south end of the cloisters into a vestry for the
minor canons, for which work separate estimates
have been received.

sary funds to carry out the restoration of the
Church of St. Eustache, which is one of the most
beautiful specimens of the Renaissance. It is
calculated that it will require about 430,000 francs
to restore it thoroughly.—An interesting
hibition of the works of Mdlle. Abbéna is
announced, to be held in the Galerie Georges
Peit.—The Municipal Council have just
voted the necessary sum for the construction
of a bridge over the Seine, between the Pont de
Greville and the viaduct of the Pont du Jour.
This bridge will connect the quarters of Auteuil
and Javel, and will be called the "Pont Mirabeau."
—The sculptor Fremiet, the decorator Jambon,
and the medal-engraver, Chaplain, have just been
elected members of the Commission for the decoration
of the Hôtel de Ville, in place of MM. Chapu,
Lavastro, and Bailly deceased.—The sculptor
Elienne Leroux has lately finished a statue of
Surcouf, the celebrated sailor, which is to be
placed in the town of St. Malo.—The military
authorities are proposing to demolish the old forti-
fications of Lille, which extend from the Porte St.
André to the Porte de Louis XIV. The exist-
ent enclosures and the moats are to be replaced by
a simple wall with a moat and slope, which will allow
the construction of a large exterior boulevard, thus
giving light and air to the old quarters of this
populous town. In consequence of this plan there
will be several large works commenced, namely,
the enlargement of the Hospital St. Sauveur, the
General Hospital, two large barracks, and the
station of the Chemin-de-fer du Nord.—A monu-
ment to Dr. Coste is to be inaugurated this week at
Villes-eu-Michaille (Ain). He was chief sur-
geon in the army during the war of the
American Independence and the first Revolution.
—M. Martel, senator and able minister, has
just left a most important artistic collection to
the town of St. Omer.—The permanent exhibi-
tions of local works of art at Rouen have not
been satisfactory during the last two years. The
committee have, therefore, decided not to hold
them any longer.—The late Duc de Trevis
has left to the town of Ajaccio, in Corsica, an in-
teresting collection of works of art and historical
souvenirs of the time of Napoleon.—An exhibi-
tion of modern decorative art of Lorraine is in course
of preparation at Nancy.—The death of M. Thomas
de Barbarin is announced as having taken place in
Paris at the age of seventy-one years. He was a
pupil of Delacroix and Scheffer. Since 1846 he
has annually exhibited in the Salon.—A young
artist of considerable talent, M. Charles Armand
Elienne Thomas, has died in Paris, aged thirty-six.
He confined himself principally to landscapes and
flowers, and had been a pupil of Leclaire. He had
obtained a medal of the third class in 1886 for a
beautiful composition, entitled "Veille de Fête,"
bought by the town of Havre. He obtained an
honourable mention in the Universal Exhibition of
1889.—We have to notice the death of M. Jules
Louis Haro, at the age of thirty-nine. He had
studied painting with M. Carols Duran, and en-
graving with M. Hédouin. He was an artist from
whom much was expected.

SWEDEN AND DENMARK.—At the last meeting of
the Swedish Sjöjd, or Handicraft Society, Herr E. G.
Foelker read a paper on English wall-papers, illus-
trated by numerous specimens of such.—The pro-
posal to sell the two wings of the Norwegian Minis-
terial Hotel in Stockholm for building purposes is
strongly disapproved by a committee appointed to
examine into the matter. The building is one of the
most imposing in the Swedish capital.—A fine new
thoroughfare is in course of construction, running
right through the city from the Nybrovick to the
Trisk Market. Its construction involves the dem-
olition of numerous unsightly "rookeries."—King
Oskar has presented to the National Library the
valuable and copiously-illustrated work "Hand-
buch der Architektur," by Prof. J. Durm, of Carls-
ruhe.—The leading land-owning associations of
Copenhagen have framed a grand scheme for the
rebuilding of a large portion of the old town and
the construction of a wide new avenue right through
the city.

FOREIGN AND COLONIAL.

FRANCE.—The Government will shortly give
commissions for bronze statues of the following men:
Veignand, Danton, Casimir-Perier, Ledru-Rollin,
and Gambetta. These statues which have been
asked for by the Bureau of the Chamber of Deputies,
will ornament the Committee-room of the Bourbon
Palace, where M. Dalou's bas-relief of Mirabeau
and the tiers-etat is.—The large room in the
Court of Appeal has just been opened. It was
begun by M. Coquery and finished by M. Paul
Bouhel, who, after the ceremony was presented
with the Legion of Honour.—M. Adrien Moreau
artist, has also been decorated on the occasion of
the Exhibition of Pastellists.—The jury of archi-
tecture is composed as follows, for the Salon des
Champs Elysees: MM. Coquery, Pascal, Garnier,
Rauil, Daubet, Glatin, Guastet, Mayeux, Normand,
Lévy, Vaudranor, Courcier—supplementary jurors,
MM. Ancelet and Paulin.—The administration
is going to ask the Municipal Council for the neces-

MISCELLANEOUS.

THE PROJECTED NEW RAILWAY TO LONDON.—The
Committee of the House of Commons on the pro-
posed extension of the Manchester, Sheffield, and
Lincolnshire Railway to London met on Tuesday
last, when, after hearing further evidence, the
room was cleared and the Committee deliberated.
On the re-admission of the counsel and parties, the
Chairman (Sir Richard Paget) stated (says the
Times report) that the Committee were unanimously
of opinion that the preamble of the Bill was
proved, but that, as there were certain incidental
matters which would have to be discussed,—such
as the reports of the Home Office upon the rehousing
of the displaced working-class population (the
recommendations upon which point the Committee
were inclined to accept), together with the reports
of the Local Government Board and of the Com-
missioners of Woods and Forests,—the Committee
would adjourn until April 28, in the hope that
nearly all the matters referred to might be satis-
factorily arranged in the interval.

LONDON.—For providing and fixing heating apparatus, exclusive of radiators, on the low-pressure hot-water system for the under-mentioned new schools now in course of erection, for the School Board for London. Mr. T. J. Bailey, Architect:—

Table listing construction contracts for schools in London, including names like Wrenham & Waters, L.L., and amounts.

* Recommended by the Works Committee for acceptance.

LONDON.—For erecting the "Wheatheaf" Hotel, Balham, for Messrs. Tucker Bros. Mr. W. Hutton Nash, architect, 5, Addlestone Lane, London-Writing:—

Table listing construction contracts for the Wheatheaf Hotel, including names like R. J. Humphries and amounts.

LONDON.—For the erection of fire-escape stairs at the Rotherhithe Infirmary, for the guardians of the St. Olave's Union. Messrs. Newman & Newman, architects, 31, Dooly street, London-Writing, S.E. 1:—

Table listing construction contracts for fire-escape stairs, including names like The Cadwell & Co. and amounts.

LONDON.—For making roads and laying out grounds at the Rotherhithe Infirmary, for the Guardians of the St. Olave's Union. Messrs. Newman & Newman, architects, 31, Dooly street, London-Writing, S.E. 1:—

Table listing construction contracts for roads and grounds, including names like The Seyssel Asphalt Co. and amounts.

LONDON.—For works at the Chancery-lane Safe Deposit extension, Chancery-lane, W.C. for Mr. Thomas Clarke. Mr. William A. Barr, architect, 60, Chancery-lane, W.C. 2:—

Table listing construction contracts for safe deposit extension, including names like Denton & Co. and amounts.

LONDON.—For the erection and completion of the St. George's Hospital, for the trustees of the St. George's Hospital. Messrs. J. Buckley Wilson & Glendinning, Architects, Swansea:—

Table listing construction contracts for St. George's Hospital, including names like G. H. Jones & Co. and amounts.

LONDON.—Accepted for the erection and completion of staid near the town hall. Messrs. J. Buckley Wilson & Glendinning, Architects, Swansea:—

Table listing construction contracts for staid near town hall, including names like D. C. Jones & Co. and amounts.

PLYMOUTH.—For the reconstruction of a portion of the Public Market, on three sections, containing the Corn Exchange, Portico shops, the six large butchers' stalls, and covered entrance to markets. Mr. Charles King, architect, Plymouth. Quantities by the architect:—

Table listing construction contracts for Plymouth market, including names like A. R. Debonam and amounts.

FWELLBELL.—For the construction of outfall-sewers, Fwellbell. Messrs. Thomas Roberts & Son, engineers, Furtmoad:—

Table listing construction contracts for outfall-sewers, including names like Fortescue & Co. and amounts.

REPTON (Derbyshire).—For the erection of a new sanatorium for the school at Repton, for the trustees of Sir John Paine's Charity. Messrs. John Shaw & Son, architects, The College, All Saints, Derby. Quantities by the architect:—

Table listing construction contracts for Repton sanatorium, including names like W. A. Stevenson and amounts.

SHANGHAI.—For the supply of 16,500 tons of broken granite, 5,000 tons of sand, and 2,000 tons of broken bricks, for the Shanghai Municipal Council. Mr. Chas. Mayne, Engineer and Surveyor:—

Table listing construction contracts for Shanghai, including names like Yung Ming Cheng and amounts.

* Accepted.

SWANSEA.—For the erection and completion of St. Thomas's Vicarage. Messrs. J. Buckley Wilson & Glendinning, Architects, Swansea:—

Table listing construction contracts for St. Thomas's Vicarage, including names like Thomas Wain & Co. and amounts.

SWANSEA.—For the erection and completion of residence in England, near Swansea. Messrs. J. Buckley Wilson & Glendinning, Architects:—

Table listing construction contracts for residence in England, including names like G. H. Jones & Co. and amounts.

WORMLEY (Herts).—For the erection of new parish room at Wormley, Herts, for the Rev. F. W. Gwynett. Messrs. Newman & Newman, architects, 31, Dooly street, London-Writing:—

Table listing construction contracts for parish room at Wormley, including names like G. A. Hunt, Brookburne and amounts.

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 10s. per annum (or 4s. 9d. per quarter), can ensure receiving "The Builder," by Friday Morning's Post.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum. To all parts of Europe, America, Australia, and New Zealand, 20s. per annum. To India, China, Ceylon, &c., 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 4, Colchester street, W.C.

HOWARD & SONS

25, 26, 27, BERNERS STREET, W., MANUFACTURERS AND CONTRACTORS

- List of products and prices: Deal Dadoes, Oak Dadoes, Walnut Dadoes, Oak 1 inch Parquet Floors, Solid 1-inch Oak, Solid 1-inch Oak Parquet, Oak Wood Tapestry Dadoes, etc.

Prices given for all Interior Work, Doors, Architraves, Over-doors, Chimney-pieces, Stoves, and Hearths. Architects and Surveyors' attention particularly called to the above Quotations for

BILLS OF QUANTITIES.

HOWARD & SONS

Tender for Contracts for any Joiners' work, or Ornamental Plaster, Painting, Plain or Decorative, Wrought-iron Work, Stained Cathedral Glass, and any other Interior Work.

TO CORRESPONDENTS.

A. B. (next week).—W. J. L. (next week). All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the author. We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other Journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

THE BATH STONE FIRMS, LTD.

BATH, FOR ALL THE PROVED KINDS OF BATH STONE. FLUATE, for Hardening and Preserving Calcareous Stones and Marbles.

DOULTING FREESTONE.

The stone from these quarries is known as the "Washing Beds," and is of a very crystalline nature, and is undoubtedly one of the most durable stones in England.

THE OBELYNCH STONE.

Is of the same crystalline nature as the Obelynch Stone, but finer in texture, and more suitable for domestic work.

THE BRAMBLEDITCH STONE.

Prices, and every information given, or application to CHARLES TRASK & SONS, Doulting, Shepton Mallet. London Agent—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C. [ADV]

HAM HILL STONE.

The attention of Architects is specially invited to the durability and beautiful colour of this material. Quarries well opened. Quick despatch guaranteed. Stonework delivered and fixed complete. Samples and estimates free. Address, The Ham Hill Stone Co., Norton, Stokes under-Ham, Somerset. London Agent: Mr. E. A. Williams, 16, Craven-st., Strand, W.C. [ADV]

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY. SOLE AGENTS for England, J. & A. CREW, Cumberland Market, London, N.W.

Asphalte.—The Seyssel and Metallic Lava Asphaltic Company (Mr. H. Glenn), Office, 43, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehous floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tin-rooms, and terraces. Asphaltic Contractor to the Forth Bridge Co. [ADV]

Glasgow Art Galleries Competition.

IN September last the Association for the Promotion of Art and Music in the City of Glasgow advertised an open competition for the proposed new buildings in Kelvingrove Park, to cost about 120,000. Mr. Waterhouse, R.A., an assessor, and from the sixty-two designs submitted in December he selected for the final competition those by Messrs. Simpson & Allen, Mr. T. M. Deane, Messrs. Malcolm, Ark, & Rowntree, Messrs. Honeyman & Keppie (two designs), and Messrs. Treadwell & Martin. The drawings for the final competition were submitted in the end of March, and the award was given on April 13 in favour of Messrs. Simpson & Allen. The task set to competitors was a hard one. A single building were to be combined a central or Music-hall, Art Galleries, Museum and Galleries, and a School of Art. It is evident that this is in a measure to accommodate irreconcilables, and that the executive committee had not a perfectly definite conception of their own requirements from the start. A hall for hearing music and a central hall to "give easy access to all parts of the building" are not compatible; a school of art students is with difficulty associated with galleries and halls requiring unemphatic circulation for easy-going sightseers. And in the end the art school has had to be abandoned, while no one of the six final designs achieves a complete solution of the central hall. This is unfortunate, though scarcely surprising, and is largely due to want of clear decision and instructions on the part of the committee. "music-hall" with "special attention given to its acoustics" was asked for in the preliminary competition. In the final conditions this is modified. "The central hall is intended so much for vocal concerts as for instrumental music, and the better music is heard in the courts of the museum and the lecture galleries, corridors, and staircases surrounding the hall, the more nearly the building meet the object of

the promoters." Two only of the six designs really embody this at all, and it is evident that the committee have not clearly defined either to themselves or to their architects "the object of the promoters." Apparently what is required is a hall which shall be at once the centre of the whole building architecturally, a grand reception hall for special functions, and a suitable space for music of the more popular sort, a kind of glorified and grandiose hand-stand. It is meant, presumably, to impress the casual visitor on his first entrance, before he proceeds to wander through the galleries; to be for the systematic visitor the centre round which all else is grouped; to be the gathering hall for all when orchestral music is provided; and to be the centre and climax of the whole building when receptions and ceremonial take place. It is evidently neither a concert-room nor a *salle des pas perdus*; equally, evidently, it is capable of a genuine architectural character of its own, and should be the artistic expression of its definite purpose and intention.

The six designs selected, as worked out, differ very greatly in scheme of plan, architectural composition, and, it must be added, in merit. The site is a somewhat special one, a rectangle, in the West-end Park of Glasgow, on the southern bank of the Kelvin. It is immediately below Gilmore-hill, the commanding site of the University, which rises steeply on the northern bank. From the north, therefore, the new art galleries will be overlooked from directly above, very much as in Edinburgh the stately Classic buildings of the Mound are overlooked from the Free Church College, so disastrously for their Classic reputation. Three of the six designs rank decidedly above the others, and two are of outstanding merit. We take them in detail in inverse order.

Messrs. Treadwell and Martin's design,—as have five out of the six,—has the central hall running north and south across the site, and approached from either end, the grand vestibule and staircase being to the south, or city, side. The circulation round the museum halls on the ground floor, and art galleries on the first, is complete and most straightforward, forming, with the central hall, two hollow squares, which enclose two museum

courts. The plan is thoroughly obvious, but it is not monumental. The central hall does not sufficiently dominate; it is simply a larger room reserved for music, undoubtedly the principal room, but not a central hall. It is destitute of side corridors or aisles on either floor, which precludes all but the outer circulation round the galleries above, and greatly detracts from the ground floor also. The internal museum courts have galleries above, which are entirely cut off from the rest of the building, with out-of-the-way staircases of their own, liable to congestion if used, but more likely to be practically unvisited. The dining and refreshment rooms are separated, which implies an unnecessary double service; they somewhat unnaturally form a sort of internal pendant to the lavatory accommodation, which, on the other hand, is the better for being doubled. Subsidiary staircases are lacking in the east and west blocks, which would certainly be practically desirable. The art school is a small subsidiary annex on the western side. On the whole the plan, though straightforward, is commonplace, a defect which is still more regrettably true of the elevations. The main feature of the composition is the four great angle towers; the style is what presumably passes for "Queen Anne" of the most accepted type, but is sadly far removed from the best work contemporary with Wren's old age; some of the Renaissance detail is extraordinarily out of scale.

Messrs. Honeyman & Keppie, of Glasgow, have two designs included in the six; the plans bear a family likeness, but the elevations are as dissimilar as possible. The central hall, running north and south, divides the building into museum on the east, and art galleries, art school, &c., on the west, the staircases, of which there are four, being scarcely emphasised sufficiently to the east and west of the great hall. The division of the building is not quite natural and confuses the plan, which is in strong contrast to the obviousness noted in the last. Both these plans, however, have first-floor communication from north to south alongside the central hall, which is a great gain; it is managed with much greater skill in one plan than in the other. There is in both a lack of directness in planning, doubtless increased by the mistaken exigencies of accommodating

the art school, but which could not fail to detract from the monumental character of the building. Of the elevations the finer is attached to the poorer plan. It is a scholarly design of quiet dignity, strictly Classic throughout. It is, however, open to the objection of being quite unsuited to the site. To have Sir Gilbert Scott's Gothic University on the hill-top (flattened to receive it), dominating a strictly Ionic Art-gallery on the plain below, would have been a strange inversion of natural order in architecture, in which we should have had repeated the disastrous effect of roof-lights, above noted, as seen to demonstration in Playfair's Classic buildings in Edinburgh. The central hall in this design is most disappointing: instead of the Classic dignity of the exterior, we have a most commonplace concert-hall, quite unworthy of the building, with disjointed architectural decoration, and an ugly ceiling: the whole has little dignity and less interest. Messrs. Honeyman & Kieppie's second design is the exact converse: the central hall is far superior (in spite of its railway-station roof), with arched gallery on both floors; it is far less a concert-room, and much more a central hall to the building, both in plan and design. The exterior elevations, on the other hand, are a most curious medley of architecture, full of unexpected "features," for the most part out of place. In spite of considerable dignity in general design, the exterior is robbed of its unity and marred by these ill-studied features and a certain trickiness.

Messrs. Malcolm, Stark, & Rowntree, of Glasgow, have an exceedingly able design on strikingly different lines. The central hall is still north and south, but forms a genuine centre to the composition, with important approaches for all four sides. The main entrance, of course, is from the south, with a lordly vestibule that is distinctly out of scale. The plan is exceedingly clever. The museum is kept quite distinct on the east, with its own galleries and circulation on the upper floor, which is kept, however, secondary in importance. The art galleries, art school, &c., are to the west, for the most part concentrated with much skill on the ground floor, so that the galleries are top-lighted. There is thus no general circulation to provide for, and the art school is less of a difficulty, being placed in the north-west angle. The ingenuity shown in the plan is very great: at the same time it is in some respects by far the least monumental of the six. It possesses four fine approaches, with vistas to the central hall, but otherwise is rather a congeries of galleries most deftly fitted in, but still without a feeling of unity, and with a sense of false balancing in parts; the six picture galleries and one sculpture gallery are huddled together on the ground floor, and would be most monotonous, while the additional galleries eked out on the first floor would be as lost to the ordinary visitor as some of the upper salons in the Louvre. The central hall is rather dwarfed by its vestibules, and appears too small, and the whole is unsatisfactory for its absence of all grip of the design as a monumental whole. Out of this unpromising material the authors have contrived symmetrical Classical elevations of much dignity and interest. They are, however, largely helped by screen walls; consequently the whole would appear most undignified from Gilmorehill. Perhaps none of the designs would suffer so considerably from its position as this, as it would be impossible to hide its real want of due symmetry and balance. The perspectives shown damage rather than help the design, which is a pity; especially the interior of the central hall is quite inadequate, though the design in itself is fine, and, while rather too much of the concert hall, is yet, perhaps, the most successful of the six. The actual detail drawing is a most beautiful one, with a charming organ, in great contrast to the others shown.

Mr. T. M. Deane's design is masterly, and certainly disputes the palm with that of the successful architects. The central hall is here reversed, running east and west; it

has a vaulted gallery or aisle completely encircling it on either floor, while the main galleries make a grand circulation round the entire building. The main entrance is from the south, with a fine vestibule and grand staircase; subsidiary entrances are provided on the east and west; to the north is the art school, a separate building, but connected so as to allow entrances to the galleries from this side also. The whole plan is most monumental and ably studied; both ground and first floors are equally successful: the library, refreshment-rooms, &c. are most conveniently placed, set so as not to interfere with the admirable circulation. Almost the only criticisms to be passed are on the side entrances, which are somewhat of excesses in plan and elevation, and on the four subsidiary staircases in the four angles, which are so stowed away as to lose their serviceableness. The elevation is a fine one, admirably rendered in perspective by (presumably) Mr. Raffles Davison. It is, however, somewhat monotonous, and the addition to the four angle towers of two more that are practically identical, and are quite uncalled for, over part of the art school, is a great mistake. The design has evidently been intended to be Scotch in character. It is, however, a curious parallel to Sir Gilbert Scott's attempt (and failure) on Gilmorehill hard by; apparently it is still supposed that a multitude of round angle-turrets scattered broadcast turn a design into "Scotch baronial." The central hall is very fine, but it is quite out of harmony with the object of the building. It is utterly unlike a hall for music or for any of the arts; it is the Salle des Pas Perdus in its extreme form, with huge semicircular transverse ribs and complicated Renaissance vaulting. This probably, and it may be presumed, the excessive cost of such a design, has prevented its adoption; for, even at the author's estimate, the lopping required to bring it down to 120,000*l.* would have been disastrous to the design.

Messrs. Simpson & Allen's design is also very masterly, especially in plan. The difficulty of the art school has been got over by boldly thrusting it into a basement, a cutting of the Gordian knot that has been successful. The central hall, running north and south, is here most absolutely the centre of the whole composition, which is grouped around it in masterly simplicity; the circulation is complete on both floors, though a little tortuous at the angles; the central courts are part of the design, not smothered up, and the east and west staircases are architectural additions, instead of being stowed away in obscure corners. The merits of the plan are very great; at the same time it has some serious faults. The great central hall is decidedly out of scale, though it barely gives the accommodation asked for. It is impossible to get from the main entrances to the ground floor courts and galleries without absolutely passing through the central hall, which is surely a grievous restriction. On the first floor the complete circulation is only obtained by passing through the refreshment rooms. Moreover, from the practical point of view, there is no wall space provided for the larger exhibits, such as tapestries or the full-sized architectural casts which are the glories of South Kensington and Paris. Still the plan is, on the whole, most able, and is no unworthy outcome of the competition. The elevations of the building are scarcely so satisfactory, though presented in a fascinating perspective, we presume by Mr. Raffles Davison. A want of sobriety and repose, felt in the outline of the plan, is most conspicuous; the due sense of breadth is lost, and the dignity that is missed is but ill made up for by more or less happy inspiration after Mr. Aston Webb. The whole is far too much a casino rather than a gallery of art. The central hall, which, with its adjuncts, completely traverses the building from north to south, is too large in scale on plan; it is still more markedly so in elevation. The flanking museum and gallery wings on either side, instead of being

simply treated to be as broad as possible in feeling, are deeply recessed and overpowered by angle pavilions, which again are flanked by towers on the side elevations. The details are often equally wanting in repose, especially in the north front, where a great porch is quite unnecessarily projected forward in all aggressiveness. The whole is amusing, and likely to be popular, but sadly wanting in sobriety, and restfulness, and dignity; breadth and power have been abandoned for the picturesque. The central hall is scarcely quite successful, a double arcade to the upper gallery standing upon a great square-linted opening below; nor are the great clearstory windows and barrel ceiling as interesting as they might be. The hall does not quite realise its special character, and is capable of much re-study. The whole design, however, is so completely re-studied from the original competition that this further re-study will doubtless be forthcoming. In any case, it is a very wonderful improvement on the same author's design for the Edinburgh Municipal Buildings, years ago.

On the whole, particularly in view of the Committee's intimation as to cost, it is difficult to see how any other award could be made out of the six selected. In a further article we hope to touch upon some of the designs which were not selected in the six.

RECENT EXCAVATIONS IN ATTICA BURYING-PLACES.

THE beginning of the present century saw the opening of the first tomb in the ancient cemetery of the Cerameicus at Athens. From 1800-1812 Fauvel, Gall, Stackelberg, and others were at work, and some of the finest results of their earliest excavations are embodied in Baron von Stackelberg's "Gräber der Hellenen." Naturally, however, according to the fashion of the times, though the excavations were carefully conducted, and with a genuine enthusiasm for the objects of art found, the topographical data noted were meagre, and for any scientific investigation of the relative ages of tombs and the objects buried in them practically useless. Up to 1862 little further was done. That year is memorable from the fact that Mr. Daniell, civil engineer, while making a road from the Place de la Concorde to the Peireus, had cut through the little hill of the Ilagias Trias, and in so doing came upon the hill of ancient grave-stones to the south of the Sacred Way. Rather than deflect his road by a few feet, he earned for himself an enviable notoriety by carting off the monuments wholesale, shattering many in process of transit. Naturally, his discovery could not be utilised for scientific purposes. From 1862 to 1871 the Archaeological Society took the matter up and laid bare three other parallel rows of tombs, but still chiefly with view to the discovery of fresh instances of lovely grave-reliefs that had so excited public attention. Then came a pause in the investigations, till two and a-half years ago Dr. Stais undertook again the excavations both of the Dipylon site and other burying places of Attica, with the definite intention of establishing the chronology of the subject. Dr. Brückner, who assisted at many of the excavations, whose name is well known in connexion with Greek grave-reliefs, took the opportunity afforded by the Carl Winckelmann's Feast lay before a large gathering of archaeologists, the principle data of the subject, and the results he believed to be deducible. His report is of great interest; it appeared in "Deutsche Wochenblatt" (No. 50), on which the following account is based:—

The consecutive history of graves and grave monuments in Attica begins about 700 B.C., with the so-called Dipylon period. The characteristics of this period are, generally, simplicity of the tomb and the uniform practice of burying, not burning, the body. The large number of "Dipylon" vases

collected from the twenty excavated graves of this period, no single one presents races of burning, and to this fact, no doubt, they owe their fine state of preservation. The grave of this period, then, presents the following appearance: it consists of an ample trench, in which the body of the dead man was laid, with room for the disposal about him of an abundant display of household utensils,—vases of every shape and size, cups, cylikes, wine-pourers, and, in one instance, a large cooking-pot. Golden diadems are the chief personal ornaments, and the man has his iron sword or spear, the woman her terra-cotta wheel for spinning. Everywhere there is abundant evidence of a lively conviction that the dead man had need, in the tomb below the ground, of the furniture of his life above.

The grave was then covered in with wood, earth was heaped over the covering, but not as to level it up,—there always remained a trench, and this is certainly the intention, for fortunately one of these ancient graves has been preserved, with its monument still standing over it. Here it is clear that the monument, a large terra-cotta vase, stood with its foot buried in the trench, and only the body of the vase visible above it. The purpose of the trench is clear enough,—it was a sacrifice to the dead men below, just as the Lyseus dug his trench and poured into it the blood of the black ram, to revive the souls of the heroes. Bones of the sacrificed animals are found in masses about the Dipylon graves. It is a curious point that the vases set up as monuments have holes round the bottom, and it is conjectured that through these holes the offerings were poured.

Passing to a grave dating two centuries later the contrast is clearly marked. The inside is resplendent with slabs of polished marble, and to the uninitiated would raise high hopes of treasure within,—hopes certain to be disappointed. A single chryseion or a lekythos, a chance mirror,—that is all. The splendidly-decorated vases of the sixth and fifth centuries n.c. were for funeral, and not for home use. Faith in the dead man had perished, and ritual offerings narrowed to a minimum of convention,—a minimum strictly regulated by the legislation of Solon.

What strikes us most (to go back a little) is the contrast between the "Dipylon" mode of burial and that known to us through Homer. In the Dipylon, burial; in Homer, entombing; in the Dipylon little outward show, such provision for the ghost below; in Homer huge memorial mound and a stele, but no ritual sacrifice. The ghost banished for ever to Hades, remote, inaccessible, apart. All the spiritual significance of the contrast has been brilliantly worked out by Dr. Rohde in "Psyche." About 600 B.C. (i.e. a hundred years later than the Dipylon tombs) the influence of epic thought is apparent: burning, monumental burial; huge mounds, such as those of Eurva and Velanides, are prepared; the outward pomp contrasts with the inward emptiness. Most striking of all, in place of scenes from real life, burials and battles which appear on Dipylon vases, the huge ab vases are decorated with scenes from the mythology—Perseus and Medusa, Achilles and Neos.

With the fifth and fourth century came that magnificent series of grave-reliefs that we know so much for the history of art, which belong to the story of the influence of Pheidias and Praxiteles, and of nothing of the convictions of the survivors. Next, suddenly in the third century B.C. the grave-reliefs cease. Grave-reliefs still abound, small columns with inscriptions, small table-like vases,—*trapezoides*—but no groups of figures. Cicero tells us in the second book De Legibus the cause,—the enactment of Demetrius between 317 and 287 B.C.: "Sepulcris autem novis finitum dum: nam super terre tumulum noluit statui nisi columnellam tribus cubitis noverem aut mensam aut labellum." Of all these sorts,—the pillar, the table, the vase,—

we have instances; the vase, a large sort of wide-mouthed water-vessel, appears not only in actual monuments, but in the representation on later Italian vases.

Athens was sunk very low; she altered the whole fashion of her funeral monuments at the word of the tyrant. Sculpture and decoration only revived, and in very modest form, under Roman rule. Once the conviction in the after-existence of the dead man weakened, if not destroyed, the manner of burial and the form of monument became mere matter of passing fashion.

NOTES.

It might have been expected, the proposal of the Manchester Corporation authorities to destroy the best interior feature of Sir Chas. Barry's Royal Institution building has been carried. Such propositions always are carried in England, in cases where art is on the one side and the making or saving of money on the other. Those who understand and care for architecture are in a minority, and can only protest; they may have all the reason and knowledge palpably on their side, but when it comes to counting votes the majority will be with the Philistines. In this case the majority was unusually large, fifty-six to six, which we presume represents the proportion of artistic enlightenment in the Manchester Town Council. The names of the protesting six should be given; they were Mr. Alderman J. Thompson, Mr. Alderman King, Mr. Alderman Lloyd, Councillors Abbot, Pingstone, and Milne. These gentlemen deserve the thanks of those interested in architecture for doing their best to preserve one of the not too numerous pleasant bits of modern town architecture, which Manchester is prepared to wipe out in order to get room for a temporary occupation of the building for a few years, when it will probably be deserted for a new gallery. It is a discreditable and stupid affair, and will long be remembered against the Manchester official authorities by those who understand what is the value to a city of any detail that is beyond the ordinary run of architectural commonplace. The wrath of one of the Town Councillors against this journal and its editor for what he called our "insolent" remarks on the subject of the proposed demolition was an amusing feature in the proceedings of the Council meeting, but no doubt the worthy Councillor really felt himself and his colleagues aggrieved: it is so difficult for some people to understand why anyone should feel strongly about a mere effect of architecture when the saving of money or of space is in question.

SINCE the fight about the Royal Institution began, another unfortunate case of architectural muddling in Manchester has been started, in the shape of a proposal to enlarge the Royal Exchange by, as far as we can understand, advancing the whole front wall to the plane of the front colonnade of the portico, and leaving the building with a closed front and a couple of mean-looking side entrances instead of the stately columnar portico and central entrance. The Manchester Royal Exchange is not a building we can quite feel enthusiasm about; it is not refined in detail; but it is a dignified structure in the average classic style, and there is no question that to alter it as proposed would be simply to ruin it architecturally; nothing less can be said. The reason of course is that the area of the building is not large enough for the present demands upon it; but is that a reason for architecturally ruining the facade of one of the most important modern buildings in the city, designed by a Manchester architect? The architect (Mr. Murgatroyd) is himself to be entrusted with the task of destroying the architectural effect of his own building, but we fear that will be rather a poor consolation to him. We

wish to emphasise the fact that to alter the building in the way proposed is a kind of operation which cannot be described as remodelling: it is simply destroying the front architecturally. Manchester, though a commercial city, used to have a kind of name as a centre of artistic interest, but she seems resolved on flinging away deliberately whatever reputation of that kind she possessed.

THE Manchester, Sheffield, and Lincolnshire Railway have got their Bill for a new line to London. In technical parlance, the preamble has been "proved." This does not prevent a large number of details,—in this instance of an important kind,—being yet reserved for consideration; but the fact that the Committee have found the preamble proved, means, as we understand in this case, not only that the line may be constructed, but also the terminus, as desired in the Bill. There may be some public safeguards inserted, and a certain number of details; but the site chosen is approved. As that forms an integral part of the undertaking, we hope that care will be taken by the Committee to safeguard, to the full, all public and private rights. Sir Edward Watkin is not a man to look beyond the mere selfish interests of his company, as witness, for example, the way in which Charleywood Common, in Herts, has been severed by the open cutting for the Metropolitan Extension when the line could have been constructed through a tunnel, and this important open space have been left unimpaired. No doubt "Lord's" has been generously dealt with by the company, but simply and solely from the point of view of railway policy. Therefore it is the bounden duty of the Committee, before the Bill receives its final sanction, to examine all the clauses with care, and with a view to protect all the rights involved.

THE loss of life at the Hampstead Heath Station of the London and North-Western Railway is surprising only because no accident of a similar kind has recently occurred. The really surprising thing is that accidents are not of constant occurrence at many suburban and metropolitan railway stations where large crowds are assembled. Many of these stations are difficult of access, and the mere weight of the crowd on such staircases as those, for instance, on nearly all the Metropolitan and District stations, is in itself a danger. It is equally surprising that on bank holidays passengers are not pushed on to the line in the insensate rush for the trains which is visible on these days. The bad lighting of many of the approaches to metropolitan and suburban stations is also a source of danger to the public. In fact it is questionable whether the Board of Trade ought not to make periodical surveys of all railway stations. The convenience of passengers may, perhaps, not be within the jurisdiction of that department, but their safety undoubtedly is.

THE idea of having an international exhibition at Berlin in 1896 or 1897 has been coming up again of late. Meetings have been held on the subject by several public bodies, by various guilds and chambers of commerce, and now the municipal authorities of Berlin have elected a special committee of thirty members of the town executive and the Common Council to consider the matter thoroughly, and to decide on what steps the city as such should take, and to what extent, and in what way, pecuniary assistance should be given. Herr von Berlepsch, who holds the Prussian portfolio of Commerce, is also taking interest in the scheme, and has gone so far as to declare that the idea of having an international exhibition at Berlin has the sympathy of the present Government. There is certainly a strong probability of the exhibition being held now, especially as rumour says that both Government and the Municipality will, for once, loosen their purse-strings and try to compete with France as

regards liberality. The money question will probably not be the great difficulty, as patriotism will be an ally in that matter; the difficulties will commence in the selection of a site for the exhibition grounds; a conveniently situated site will be most difficult to find, and when found the monotony of Brandenburg's dusty plain will have to be diversified by artificial means.

THE new number of the Prussian Archaeological "Jahrbuch" (1892, vii. 1) is so full of good things that it is hard to make selection. Dr. Puchstein, who has done so much for the investigation of early architectural forms, contributes an article, which architects should not miss, "On the column in Assyrian architecture." Briefly, the conclusions he draws (based chiefly on the architectural statements made in cuneiform inscriptions,—of which he thinks sufficient use has not, so far, been made) are these,—that the column was originally an element unknown to Assyrian structures,—that in this respect they offer a marked contrast to Hethite, i.e., Syrian work, for Syria shows an acquaintance with the column that dates from the tenth or eleventh century B.C.—that the column came to Assyria from Syria by way of a fashion for imitating the Hethite style, which came in about the middle of the eighth century B.C.; but down to the seventh century B.C. the column was regarded as a foreign element, and only employed under exceptional conditions. Dr. Puchstein reserves for a second article the consideration of the special base and capital forms customary in Assyria, and of their relation to the Hethite form from which they are derived.

ANOTHER structural article of interest is that on nautical archaeology, which forms in effect a sort of supplement to the article on "Seewesen," which the writer (Herr Ernst Assmann) contributed to Baumeister's "Denkmäler." Herr Assmann draws largely on the British Museum for his illustrations, the collections of which, he thinks, have so far not been made of adequate use. Two articles of special importance are devoted to vase paintings. Dr. Fröhner publishes two Corinthian vases, with Homeric subjects, hitherto unknown in this class of work. One, the most remarkable piece of ceramography that has been published for many years, represents the Greek heroes pouring out of the Trojan horse. We examined the vase, some years ago, in the Oppermann collection of the Bibliothèque Nationale at Paris, with a view to publication, but renounced it owing to its extremely damaged and effaced condition. Dr. Fröhner, however, has succeeded admirably, though the inscriptions still baffle him. Another vase painting published by Dr. Kretschmer, shows Perseus contending with the Bacchantes, a myth hitherto not known on vase paintings. Dr. Hanser contends that the interesting and beautiful bit of archaic sculpture, usually known as the "woman mounting a chariot," and sometimes connected with the frieze of the earlier Parthenon, is in reality the god Apollo. Last, Dr. Maximilian Mayer contributes an article,—valuable in relation to the Vaphio cups,—on the Mycenaean representations of hull contests and capture.

THE "Vereinigung Berliner Architekten" some time since sent a petition to the municipal authorities asking them to consider the advisability of making some alterations in the management of their buildings, so that not only the members of the Municipal Board of Works, but also the "unattached" architects, might have the chance of putting up some of the public buildings. It was hoped that these alterations would tend to give the citizens not only a more practical, but also a more beautiful, set of municipal erections than they could at present boast of. Some fifteen members of the Municipal Board of Works have now sent in a counter petition, according to which they apparently consider

their work perfect, and excuse the hideousness of their façades by stating that any embellishment would be a sin against economic considerations. We are under the impression that no extra expenditure need be incurred for the purpose of putting an end to the erection of the worst forms of Berlin official architecture. The so-called "Pomeranian" brickwork, as is used on the simplest Hamburg warehouse, is not only cheaper but more agreeable to the eye than brickwork with poor copies of ornamented Greek mouldings in a bad terra-cotta. If we consider that no less than 180 schools, twenty covered markets and fire-stations, and four hospitals and asylums have been put up under the present head of the Board of Works, and then examine some of the latest planning, we can safely affirm that a change in the management of municipal building affairs can at least not do any harm.

AS we stated in a "Note" in our issue for February 27 last, the Middlesex County Council intend to enlarge, at an estimated cost of 20,000*l.*, the Council Chamber and Sessions House at the Westminster Guildhall. On the date mentioned we gave some particulars of the history of the site and its surroundings: we now append a description of the building itself, which, we fear, will be more or less altered in appearance when the works, now just commencing, are completed. James Elmes, in a work published in 1828,* gives a view of the building, and writes of it as follows:—

"The Guildhall, Westminster, is an insulated structure, designed for the use of the municipality of Westminster, standing on the south side of the ancient sanctuary, near to the Abbey. In this building are held the sessions for the city, and the trials in the court of the High Bailiff, and it afforded accommodation for the various high courts of law and equity during the repairs of Westminster Hall. It is a quadrangular brick building, with recesses at the angles, that give it somewhat the form that continental architects call a Greek cross; and has a tetrastyle portico of the Doric order, with a pediment, in the principal front. The centre of the building is crowned by an octagonal tower, with semicircular windows in every face that give light to the principal court below. At each angle is a pier that serves for a buttress, which, with a connecting moulding that runs round the entire building, crowns and connects the whole. On this cornice is a blocking-course, with a light and lofty balustrade, in three panels to each face. The roof meets in a point over the centre of the building, on which is a lantern and vase. It was designed and executed by the late Samuel Pepy (sic) Cockerell, Esq., a pupil of Sir Robert Taylor's, and father of the able and travelled architect, Mr. C. R. Cockerell,† who designed the beautiful Ionic chapel of St. George in Regent-street; which is noticed at p. 100 of this work."

It was in this building that, in 1888, the Royal Commission of Inquiry into the proceedings of the Metropolitan Board of Works, presided over by Lord Herschell, held its sittings, which we reported at some length in the volume of the *Builder* for that year.

THE *Scotsman* draws attention to an act of vandalism in course of being perpetrated on a well-known historical landmark,—the Abbey Craig of Stirling. This grand object in the scenery of the Forth is threatened with something like piecemeal removal for building material and road metal. Many who were sound patriots, as well as men of taste, lamented and protested when the summit of the Craig was crowned by the nondescript form of a National Wallace Monument. They held that, as in the case of a later proposal to perch a monument on the top of Arthur's Seat, nothing could be added by art to the grand handiwork of Nature without spoiling it,—that the Craig itself was the best monument of the national events that

* "Metropolitan Improvements; or, London in the Nineteenth Century; displayed in a series of engravings of the new buildings, improvements, &c., by the most eminent artists, from original drawings, taken from the objects themselves expressly for this work by Mr. Thos. H. Shepherd."

† Afterwards Professor Cockerell, R.A.
; Latterly known as "Hanover Chapel," and now, by an Act of Parliament passed last session, doomed to destruction.

had taken place around its base, and of the national heroes who had sheltered in its recesses. Now, however, that the monuments in its place, and that time has begun to mellow its tone, it is found to harmonise with the landscape, in which the Abbey Craig forms so prominent an object, better than many of its critics expected. In any case, those who found fault with its appearance will be as energetically opposed as the most enthusiastic of its promoters to the removal of the monument, along with the magnificent natural pedestal upon which it stands,—the Craig itself. Hardly less than this seems to be implied in the quarrying work in which the Stirlingshire County Council are diligently engaged; and it is quite true that the voice of Scotland was joined to the Town Council of Stirling in arresting the progress of pickaxe and dynamite charge, which have already made ugly scars on the flank of one of the most beautiful and famous of the national high places. An appeal to the county authorities has hardly been received in the spirit which should be looked for in such a quarter, and the weight of opinion of that wider public who are interested in the preservation of the Abbey Craig ought to be brought into play to arrest the work of destruction.

THE proposed alteration of the great thoroughfare "Unter den Linden," at Berlin, will be both an artistic and a practical improvement. The promenade in the centre will remain as before; it will, however, be hemmed in on either side by a broad strip of grass, with flower-beds, and two double rows of trees standing closer together than the present ones. The three carriage-ways and riding-path will be turned into two broad carriage-ways, one on either side of the promenade, and then will come the footpaths, each having an extra 8ft. added to its present width.

IT is satisfactory to find, as has been already noted in the daily papers, that owing to the English Government having increased the vote for the Chicago Exhibition to 60,000*l.*, instead of the 25,000*l.* originally granted, it will no longer be necessary to charge exhibitors for space in the English Section, which will be free to all whose claims to exhibit are accepted. This is as it should be.

THE Clerk of the St. Pancras Vestry has sent us a copy of a report which he made on the 21st ult. to the Highways, Sewers, and Public Works Committee of that body, as to the steps taken in the parish of St. Pancras under the provisions of the Public Health Act (London) for cleansing of footways from snow during the winter which is still to leave us. As the report possesses some interest, and gives particulars as to cost we extract a few passages from it. With regard to the snowfalls in February, we are told that immediately on the first fall, steps were taken to cleanse both the footways and roadways in the principal thoroughfares; and that every man applying for work at all several stone yards was employed thereon, as well as all the men in the ordinary gangs.

"These workmen of superior grade in the Vestry's regular employ were made foremen over the newly-formed gangs.

The number of additional men employed was 518, and the number of ordinary gangs was 426, making a total of 938.

The cost of the extra men amounted to 280*l.* 16*s.* 8*d.*

Carts were employed on day work in removing the snow to the sewer shafts, at a cost of 69*l.* 13*s.* 9*d.*

As there were three snowfalls in close succession the work accomplished was twice obliterated, but as testimony that it was effectively done to the extent of the means available, I may mention that there were fewer complaints than were ever received on such occasions, and they were principally unreasonable demands for the footways to be cleansed in bye streets.

On the occasion of the second visitation in the month, 273 additional men were engaged at a cost of 103*l.* 6*s.* 3*d.*

On account of the severity of the frost, salt was used in some places, but with the caution usually for such an expedient, having regard to the adverse

opinion expressed in a report to the Committee by Dr. Stevenson some years ago.

The cost of salt was 24s. 2s. for 17 tons." The officials of the Vestry seem to have acquitted themselves well on the occasion of this, their first experience of fulfilling the duty cast upon them by the new Statute, and in this respect St. Pancras has shown a good example to some other parishes, whose activity was almost as masterly under the new as it used to be under the old *system*. But we are doubtful about the use of salt, and, as the report says in its concluding paragraph, it yet remains to be seen what will be the effect of a really heavy nowfall, when the clearance of the main roads will form, as it has before, the work of paramount importance.

AMONG the different publications about to be made under the auspices of the Vereinigung Berliner Architekten, we notice one which is to be taken in hand by the editor of the *Deutsche Bauzeitung*, which will contain plans, elevations, and sections of all the more important Protestant churches in Prussia.

THE penny catalogue of the Birmingham Museum and Art Gallery, recently issued under the direction of Mr. Whitworth Wallis, is indeed a remarkable pennywork. It contains long and ably-written critical and descriptive notes on the various artists whose works are represented, and is well printed on fairly good paper, and Mr. Wallis calculates that on an edition of 10,000 there will be a profit of 15l. Why are there not such penny catalogues to the National Gallery, British Museum, and South Kensington? they would be of immense service in providing a better understanding of the objects exhibited among the poorer classes; and, of course, such a catalogue in regard to the British and South Kensington Museums could only be of a general kind, dealing with groups of objects, general knowledge is better than none.

FROM a letter in the *South Wales Daily News*, signed by the Hon. Secretaries of the Cardiff Architects' Society, we regret to see that in the conditions of competition for the Town-hall at Llanelly there is a clause providing that competitors shall quote the terms on which they will be prepared to carry out the work if appointed, thus making it a condition of terms as well as designs. We had to notice a similar case at Brighton a short time ago. Nothing could be more improper or more calculated to degrade the architectural profession than such a condition, and it is to be hoped that no architect will have anything to do with the Llanelly Town-hall competition until its promoters agree to rescind the clause referred to.

A CORRESPONDENT sends us the following charming example of a "professional" touting letter now in circulation in Midland town:—

"GENTLEMEN.—Having opened offices at the above address I am prepared to wait upon you at any time you are desirous of effecting alterations, additions, or erecting new buildings of any kind. From an early practical training and a long and successful practice in —, I am able to design in the most economical manner possible, combining it with utility. Preliminary advice free of charge. My support and recommendation earnestly solicited.—Yours faithfully,

only remains to add that the author of this precious epistle writes "M. S. A." after his name, and is therefore apparently a member of the Society which is endeavouring again to set up a Registration of Architects Bill in order to raise the tone and standing of English architects.

VENTILATION.—Messrs. Baird, Thompson, & Co., inform us that they have obtained the highest award for improved systems of ventilation (automatic and mechanical), and improved ventilating appliances at the Leather Trades Exhibition, London.

EFFLORESCENCE ON BRICKWORK.

THE white, semi-crystalline powdery efflorescence that appears on new bricks after being placed *in situ* has engaged the attention of builders and experts for a considerable time; nevertheless, no rapid effectual remedy has yet been promulgated for preventing the unsightly white patches appearing on a newly-erected wall. The result of some experiments the writer has conducted during the last twelve months may be of value to all builders, as the writer believes he has found the true remedy for the effectual removal and permanent prevention of this disfiguring efflorescence.

In the first place, a few words on the probable causes of the white appearance may not be out of place.

Bricks are naturally porous, and, therefore, readily imbibes moisture and gases. The mortar in which they are set contains two very active ingredients for the incipient evolution of organic life and crystalline formation of mineral substances,—viz., oxygen and lime (an oxide of calcium). The yellow or red colour of the sand mixed with the lime in the preparation of mortar is due to the presence in varying quantities of oxide of iron. This salt,—oxide of iron,—is one that readily gives up a part of its oxygen to any suitable body with which it may be in contact, or it readily acquires a further proportion of oxygen from the air if placed under suitable conditions. The lime also is a body in which the union of the metal (calcium) with the oxygen is not very permanent, the metal uniting with any other suitable compound substance, as, for example, carbon from the air, to form carbonate of lime,—a combination of calcium, carbon, and oxygen, CaCO₃, which is a body that is also unstable in composition, readily breaking up and forming new combinations or salts of other metals. Besides the sand,—silica coloured with oxide of iron,—and the lime, there are present in mortar small portions of other bodies, notably sodium salts of some kind. Now sodium (Na) unites with oxygen to form soda (Na₂O), and also with the iodide CO (carbon dioxide) to form carbonate of soda, Na₂CO₃. (There are several other formulae for this salt, as it varies in the proportions of its constituents, but the above simple form will do for our purpose.) Now, carbonate of soda can exist in the crystalline form when water is combined with it, or it can be a dry anhydrous powder; and this salt when it loses the CO₂ radical becomes Na₂O (oxide of sodium or soda), and if the elements of water have been present in the carbonate, a deliquescent salt, sodic hydrate (NaHO) can be formed. Without going further into chemical questions, deliquescent is applied to a body capable of imbibing moisture, and hence becoming semi-liquid. Suffice it to say that it is with the salts of soda we purpose to deal.

Let us imagine that the soft porous brick has imbibed water from a passing shower of rain, that it dissolves some of the sodium salts in the water, and thereby becomes impregnated with a solution of a salt of soda. Now, as the surface of the brick dries, this salt of soda, or hydrate of sodium, will become dry and converted into the anhydrous sodic oxide (Na₂O) (every one has seen a piece of ordinary mortar crystallised, and washing soda fall to a white powder after some days' exposure to the air) if the weather be dry. This is the white efflorescence that appears on the surface of the brick. If the weather be damp, it will not be positively dry (anhydrous, but appear in minute crystals (as a crystalline carbonate?). In any case, there the white efflorescence is, and it is a positive eyecore to every builder, for the white patch on the surface of the newly-built wall spoils all architectural beauties by its glaring whiteness and irregular patches. So long as any soluble salts of soda remain in the mortar to be dissolved out by the water imbibed by the porous brick, so long will this white efflorescence continue until the supply of soluble soda salt has been dissolved out and brought to the surface.

The nearest approach to a successful remedy the writer has come across amongst the various proposals for removing this disfiguring white efflorescence is hydrochloric acid (HCl). This liquid combines with the Na₂O to form water and chloride of sodium (viz., 2 HCl + Na₂O = H₂O + water + 2NaCl, sodic chloride, *i.e.*, common salt).

As this sodic chloride that is formed is a soluble salt, its presence is not manifested, as it

is soluble in water, and, therefore, washed away by every shower of rain. If the efflorescence is due to the presence of NaHO (sodic hydrate), the hydrochloric acid will form sodic chloride and water, as before, only half the quantity of acid being required to effect the re-formation of salts.

The remedy, therefore, would seem to point to saturating the bricks with this acid,—a process that, however, would be expensive, and dangerous to the workmen using such fluid.

Acting on the hint conveyed by the fact that the excess of sodic hydrate in soap-making is expelled from the soap by salting it,—*i.e.*, strewing the surface of the soap as it floats on the ley with common salt,—*i.e.*, sodic chloride,—the writer applied a solution of common salt to the white efflorescence on some bricks that were badly stained therewith. In every instance where such fluid was applied the white efflorescence was instantly removed, and, what is more, has never reappeared, and in obstinate cases three applications, or one application well saturating the bricks with the common salt solution, has sufficed to effect the desired result.

The chemical reaction that takes place is represented below:—

NaCl (common salt) + NaHO (sodic hydrate) produce Na₂O (sodic oxide), and HCl (hydrochloric acid). Now, theoretically Na₂O is the body we wish to expel or convert into something else, and, therefore, we are actually forming the body we are endeavouring to expel, and, *in fact*, the acid would be the best body to effect the desired result. One fact, however, stands strongly in evidence against such theory, and that is the remarkable non-appearance of the white efflorescence after the application of the salt solution. This may be accounted for by the fact that the combination between hydrogen and chlorine (HCl) is stronger than between sodium and chlorine (NaCl), and, therefore, the chemical reaction represented above as occurring between the efflorescent and acid occurs only to a limited extent, whereas in the application of the sodic chloride (NaCl) solution, the chlorine in the sodic chloride readily forsakes that body to unite with the hydrogen (H) in the sodic hydrate, and that although sodic oxide is formed thereby, the simultaneous production of hydrochloric acid also neutralises the effect of the sodic oxide efflorescing. As a solution of common salt is much cheaper than hydrochloric acid, the writer would suggest that the bricks should either be dipped in a pall of such solution before being laid *in situ*, or else he well washed,—impregnated,—with it afterwards. H. C. STANDAGE.

PROFESSIONAL CHIT-CHAT.*

I PROPOSE this evening rather to provoke discussion on certain matters connected with our profession than to enunciate any new ideas; and the first topic is that of Architectural Drawing. In doing so, I propose to regard the architect as a business man. The true architect must, of course, be an artist; he must have the feelings and aspirations of an artist; he must be imbued with the importance of making his work beautiful as well as fitting; but the great aim of his drawings must be to convey intelligibly the ideas which he conceives. To do this he is somewhat handicapped, for, unlike the mere painter, he must take no licences; he must set aside pictorial effect in his drawings, and define most accurately the actual and true effect of his buildings when erected; in other words, his drawings are simply the tools by which he works.

An architect must, of necessity, for the sake of accuracy and definition, work mainly with the point, and produce his drawings in line,—that is to say, his spaces must be bounded by lines, and not, as the painter's, defined by colour or surface treatment, only because the latter treatment is practically too undefined for drawings which have to be interpreted by rule and compass; but there are lines and lines.

In the days of my pupillage we were taught that an architectural line could hardly be too fine, and I have a vivid remembrance of the magnificent drawings of competition work which were given to us as copies for draughtsmanship; drawings in which the lines were almost imperceptible in their fineness; draw-

* A paper by Mr. E. Appleton, F.R.I.B.A., recently read before the Devon and Exeter Architectural Society.

ings which were fit to be bound up in books, and which would vie with the line engravings of that day.

Now, if we take Euclid's definition of a line (viz., length without breadth) we know that we can only conceive it; it cannot be practically realised.

In drawings of great precision, such as the architect has to deal with, he cannot do without lines, though I remember well once being in Beavais Cathedral and watching a man making a drawing of the interior, and the only lines he used were simply guide lines for setting out the intersections of the groining and springing of the arcade arches; the whole of the remainder of the work he was putting in with direct colouring. But this was not the sort of architectural drawing I am alluding to; it was simply a picture, and could not have been used for building purposes. And this brings me to a point which I wish to emphasise,—viz., our architectural drawings must not be mere pictures, not even our perspective views, for our aim, if we are truthful men (as every architect should be), should be to portray our work as it will appear when it leaves our hands nearly completed. Do not misunderstand me. I do not mean to say that an architect must not make pictures; he ought to be able to do so, both of his own work and the work of others, old and new,—in fact, if he be a true artist, he cannot fail to do so, his very conceptions will be truly picturesque; he will think picturesque, and his thoughts will take form in his pencil, but his drawings must not be pictures only.

Who of us can say that our clients have not been misled by pretty drawings, that the realisations of our designs have frequently not come up to what was shown on our drawings? This, no doubt, has partly arisen from the fact that the drawings have been made from one point of view only, by the simple front or side elevation, without considering what the effect would be in perspective; but apart from this, the present tendency and practice of architects is to give a fictitious picturesque effect, even to their geometrical drawings. In some cases these effects are very subtle, and the client is deceived. How often do we not see false and impossible shadows given, picturesque surface treatment and broken lines—such surfaces and such broken arises as, if we found them in any of our new work, we should make the contractor take it down? Now, this kind of work I can call by no other name than deception. The test of how a new building will appear is best conveyed by photography (except as regards colour). By that we get the best effect of light and shade, projection and perspective, and in making an architectural drawing we should honestly consider "How will it appear when it leaves my hands, brand new, if photographed?"

In my opinion, great mischief has resulted in the modern system of etching with pen and ink in architectural drawings, instead of as, in former days, of tinting them. I am quite aware that this mode of execution is very seductive; a good etched drawing is most charming, most picturesque, but as a simple architectural drawing, most delusive. You have only to take up any number of our professional illustrated journals at haphazard to prove what I affirm. Then, again, the very system so much now in vogue of drawing with coarse lines is deceptive, and does not give the correct appearance (when finished) of new buildings, for the coarse lines give the effect of impossible shadow; there is no such thing as a line in nature, and though, as I said, lines must be used by the architect, for the purpose of accurate definition, to work by, yet these lines must be reduced to a minimum if we wish to show as nearly as possible by a drawing what the actual appearance will be.

To my mind the coarse, thick line drawings of the present day have a very slovenly, crude, and unrefined appearance; they look more like the production of a carpenter working with a broad pencil than that of an educated architect. We hear a good deal about vigour nowadays, but vigour is apt to degenerate into vulgarity.

If, then, you desire, as architects, to show faithfully by your drawings how the buildings you design will actually appear when they leave the builder's hands, let me urge the abandonment of etched, coarse line, pictures. If you must, or wish to work with the point, then do as the old line engravers did, work with such delicate, fine lines as will produce texture of surface almost like simple tinting; but you will,

doubtless, say (or think) this is far too laborious a process for these go-a-head days, and would not pay. Well, then, I would say, do not etch at all in dealing with your purely architectural drawings. If we respect our craft, if we are true, honest men, and if we are real artists we must not, we dare not, give a false, delusive, deceptive effect to our drawings, or we shall surely rue the day and hear our clients say:—"I am disappointed with the result of the work; it does not look like what I thought it would from your drawing."

One of the most conscientious draughtsmen I have known was the late W. Burgess; his drawings for architectural purposes, such as elevations and sections, were as near perfection as possible, consisting, as they did, of simple, fine, firm lines bounding the spaces, parts, and details without any surface treatment or shadows; little notes were put to denote particulars, such as "these stones to be bedded in cement, these to be joggled, this iron bar to be fixed with molten lead, these beams to be pinned with oak pins," and so on, which greatly reduced the labour of the quantity surveyors in arriving at the exact quality of work intended.

The late Mr. F. P. Cockerell, one of the most accomplished architects of the day, worked with fine, firm lines frequently without shades or shadows, sometimes tinting his drawings with raw sienna, putting in his shading and shadows with sepia, in which case the lines of the drawing were almost imperceptible.

I know it is exceedingly tempting, when making an architectural drawing, to give a crispness and a thereby dazzling effect,—it makes it look picturesque. By all means do this, if you please, in making sketches of old buildings for your own delectation; but not with drawings intended to be worked from and shown to your clients as representations of what their building will be.

I need not lay stress upon the infinite importance of great accuracy, even in the smallest matters of detail, to insure which it is a good plan to figure profusely every part of a drawing, whether elevation, section, or plan, and by so doing (when the drawings are being made) much labour is saved hereafter, both to oneself and the builder, by not having to resort to a scale; moreover, the scale cannot always be read sufficiently accurately; the thickness of all walls, heights of floors, width of openings and spaces, depth of strings and cornices, scantlings of timbers, centres of arches, projection of parts, outside and inside total dimensions, direction, and scantlings of joists, &c., should all be carefully figured, and it is a good plan to work from axis lines, in order to check dimensions,—in fact, the more a drawing is figured, the less likely are errors to creep in, and the more readily will all the work he set out. To my mind it is not fair to put the builder to the trouble of using a scale upon drawings, nor to throw the responsibility of taking dimensions upon him. I think, too, it is a good plan to put as many drawings as possible on each sheet; it saves a vast amount of trouble in compassing parts and dimensions. Quantity surveyors will tell you how greatly it helps them in their work. It will be found very useful, as, no doubt, you have frequently experienced, to prepare drawings showing one half of the external elevation and one half of the internal elevation, side by side, by which means the proper execution and fitting together of parts may be readily seen; the nature of the materials used should also be shown by simple tinting, showing, for instance, what parts are intended to be of brick, what of stone, what of timber; and with the elevations should be sections of the walls, if there are any details of construction to be indicated. The scale of general drawings must be left to the judgment of the architect, but I think it will be found to save a great deal of trouble if the elevations and sections are made to a large scale,—say $\frac{1}{4}$ in. to a foot, or even $\frac{1}{2}$ in. to a foot, as before hinted. Notes on drawings greatly facilitate their correct interpretation; in fact, time and labour spent upon drawings; in careful figuring and noting, is well spent, and saves much trouble hereafter.

Before concluding, let me say a word upon the value and importance of making true perspective sketches of the work in hand, not only of the entire building from various points of view, but also of the leading details. How very different a capital, for instance, looks on an elevation drawing, to what it appears in perspective; how disappointing frequently is a broach spire when viewed on the angle. In the

elevation drawing the junction of the octagonal spire with the square tower looks perfect, the lines flowing into each other with ease and grace, but when seen on the angle there is freedom of abruptness and want of assimilation of parts. So, too, a circular or curved bay looks perfectly right in elevation, but when viewed at an angle the window heads and cornices are overhanging in a most uncomfortable manner.

Let me repeat, for I lay great stress upon the importance of it, make sketches in perspective to a good large scale of all leading details before finally adopting them, such as windows, doors, carving, cornices, strings, capitals, terminals and last, though not least, of internal effects, both of form and light and shade, remembering that work will be subject to very different conditions when viewed inside a building and by artificial light; shadow and shade are very different indoors to what they are outside. We lose shadow, for the most part, and must design accordingly.

Much might be said about harmony of colouring in our buildings. We are too often apt to lose sight of this, with the result that many modern buildings are wanting in repose. Violent contrasts of colour in materials give a building: crude, harsh, vulgar appearance, lacking what artists term "breadth," the eye is distracted by patches of colour, and is unable to take in the whole treatment. There is no doubt that the charm of old buildings greatly arises from the mellowing of time and weather.

I think this is a strong argument in favour of tinting our drawings in colours, rather than etching them, because the absence of colour in etching is liable to mislead us as to the real effect.

THE SURVEYORS' INSTITUTION:

EXAMINATIONS FOR THE PROFESSIONAL ASSOCIATESHIP.

THE following Student Candidates have passed the Examination for the Professional Associateship:—

Bate, W. H.	Hankinson, F. H.
Brinkworth, R. E.	Jarman, F. W.
Brown, G. T.	Johnson, E. M.
Burder, R. E. C.	Knight, G. E.
Child, C., Jun.	Little, H.
Cooks, A. E.	Morris, R. P.
Crookes, C. R.	Ouvry, P. A.
Parker, F. W.	*Raffety, H. W.
Elgar, W. R.	Scott, T.
Evered, G. E.	*Squires, G. R.
Everett, A. S.	Weatherhead, D. W.
Flinn, F.	Wells, W. H.
Foster, J. H. F.	Whitaker, E. V.
Fraight, T. F.	
Hales, A. J.	

* Special Prize, 1892. + Institution Prizeman, 1892.

THE following Non-Student Candidates have also passed the Examination for the Professional Associateship:—

Allen, J. P.	Maughan, J.
Amos, F.	Mollenfeld, J. H.
Barker, G. L.	Menzies, R.
Bevan, S.	Mew, R. H.
Davies, D. T.	Miller, G. E.
Dobson, F. B.	Morris, H. K.
Edis, A. E.	Newman, S. F.
Flight, A.	Ovenden, C.
Ford, S.	Prall, H. A.
Fox, C. E.	Price, R. A.
Gardner, G.	Skipper, H. H.
*German, G., Jun.	Thomas, E. M. D.
Griggs, H. J.	Tory, J. E.
Hellicar, G. T.	Vennings, A. J. M.
Jarrett, T. W.	Wheeler, J. H.
Johns, P.	Wilson, J. H.
Lucas, J. A.	Wing, G. S.
McCarthy, H. R.	Woods, A. G.
Macer, A. T.	

† Driver Prize, 1892.

The results as regards the Fellowship Examination will, it is hoped, be announced next week.

DANISH ANTIQUITIES.—As is generally known, the southern part of Denmark is very rich in antiquities from the Stone, Bronze, and Iron Ages, and, although the war with Germany, it was the custom to send such antiquities to the Museum at Kiel. However, the Danish press in Northern Schleswig having protested against sending these valuable archaeological relics into Germany, local museums for their preservation are now being formed in various parts. As an illustration of the movement, it may be mentioned that of the 133 antiquities sent to the Museum during the last half of 1891, only one came from South Jutland, and this was of doubtful origin, a potter's disc.

The "Pine" Ceiling Paper.

The "Vine" Ceiling Paper.

COMPETITIONS.

NEW BOARD SCHOOLS, PENRITH.—We hear that the designs sent in under the motto "Experience" have been selected as the best by the Penrith School Board for the new schools in Brunswick-road, Penrith, from amongst sixteen sets submitted in open competition. The author proved to be Mr. Geo. Dale Oliver, F.R.I.B.A., of Carlisle, who has accordingly been appointed architect for the new schools.

THE DESIGNS FOR THE NEW COINAGE.—The *Pall Mall Gazette* announces that, in accordance with the report of the Committee appointed by the Treasury, the coinage has been entrusted to two competitors. They are Mr. Thomas Brock, R.A., and Mr. Edward J. Poynter, R.A. Mr. Brock's design has been chosen for the head of Her Majesty which will appear on all the new coins. One of his reverses has also been absolutely accepted. It was intended for the two-shilling piece, but it is thought likely that it will be adopted for other coins. Mr. Brock's "St. George and the Dragon" for a second reverse has also been accepted, but his design has been returned to be studio for a slight modification which has been suggested. Mr. Poynter's designs for all the other reverses have been selected.

ARCHITECTURAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—A meeting of this Association was held on the 20th inst. at the Birmingham and Midland Institute. The following gentlemen were elected as officers for session 1892-93:—President, W. Hale, F.R.I.B.A.; Vice-President, Barry Peacock; Hon. Treasurer, C. E. Bateman; Hon. Librarian, H. Deak; Hon. Secretary, Herbert R. Lloyd, A.R.I.B.A.; Council, W. H. Bidlake, M.A., A.R.I.B.A., H. H. McConnell, F.R.I.B.A., W. Hawley Lloyd, T. Naden, R. Dawson Bewlay, S. P. Harris, and C. Silk. Mr. C. E. Bateman then read a paper on "Castle Bromwich Church," in which he described, with considerable minuteness, the discovery which he has recently made, that within the eighteenth century pseudo classical building are the remains of a much earlier Gothic church, which was apparently chieflly, if not entirely, a timber building. The remains of its earlier church, which are still *in situ*, are the roof of the nave, with its supporting oak columns, clearstory, and gable ends, all framed by extraordinarily massive oak timbers, the present nave being merely a plaster case to the timber work, with aisles and chancel probably built in the lines of the original aisles and chancel, but in brick and stone, in the fashion of the eighteenth century, in place of the timber Gothic work. Mr. Bateman illustrated his paper with an elaborate series of measured drawings of the church, and gave extracts from the parochial accounts, proving the dates of the various works carried out from time to time. A vote of thanks, proposed by Mr. Newton, was reported by Messrs. Bidlake, Naden, Doubly, Harrison, Peacock, and Hale, who each alluded to the great value of the discovery

made by Mr. Bateman, and to its great interest to both architects and archaeologists.

DUNDEE INSTITUTE OF ARCHITECTURE.—At the meeting of the Dundee Institute of Architecture, Science, and Art, on the 14th inst., a lecture was delivered by Mr. W. D. McKay, R.S.A., Edinburgh, on "The Art of the Low Countries." Mr. Charles Ower presided, and there was a fair attendance. At the outset the lecturer said in two at least of the fine arts,—painting and architecture,—the Low Countries were a treasure-house hardly second to Italy itself. Certainly no part of the world contained such a mine of artistic wealth within so narrow a compass; nor had any lands exhibited such a full measure of artistic activity in the development of painting as did Belgium and Holland during the first half of the seventeenth century. He then proceeded to treat his subject from the painter's point of view. Photographs illustrative of several of the paintings to which the lecturer referred were exhibited, and at the conclusion Mr. McKay was, on the motion of the chairman, awarded a hearty vote of thanks.

Illustrations.

DESIGNS FOR WALL-PAPERS.

THESE are three recent designs for wall-papers. That marked A, by Mr. Walter Crane, is founded on an alternating grouping of peacocks and cockatoos; one of the many new fancies which Mr. Crane has contributed to wall-decoration of this kind. We confess that we are not altogether in favour of the adoption of birds or animals in wall-papers, unless they are very highly conventionalised, and conventionally interwoven, as one may say, with the design; these of Mr. Crane's seem a little too much as if merely placed where they are on the wall, they do not sufficiently grow into or out of the design, in spite of the clever attempt to unite them with it by conventionalising their tails. As a whole, however, it is a rich and effective wall covering, with a strongly-marked character of its own.

The paper marked B, designed by Mr. Lewis F. Day, is named the "Florentine," from the use of the Florentine fleur-de-lis as the centre ornament of the panels formed by the rich Romanesque foliage. It is a relief paper, produced in rich effects of colour and gold as in the old Venetian leathers, and in this form can be appropriately used in combination with oak or painted dados. The paper is only suited to a large and somewhat sumptuous class of interior, but it is a fine powerful design, one of the best recent ones that we have seen of this kind.

The design marked C, also by Mr. Day, consists of a paper marked "The Artichoke," being founded on that vegetable, with a frieze of very different character, distinguished by the introduction of a small snake as an element in the design, and hence called the "Serpent" frieze. Though a frieze should always show a sufficiently marked contrast with the wall surface

below, it may perhaps be a question whether the frieze and the wall pattern in this case are not too much at variance in style and detail; they have not the appearance of having been designed together. The frieze is, however, a very graceful and rather novel design in itself.

All the papers illustrated were designed for, and are manufactured by Messrs. Jeffrey & Co., the well-known makers of Islington. We append also cuts of two other recent designs made for the same firm, the "Vine" and the "Pine," intended for ceilings.

CHURCH OF ST. JOHN THE BAPTIST, HOLLAND-ROAD, W.

THE elevation we publish this week is the western facade, a plan to a small scale being added. All the church is finished with the exception of the turret porch at the west end. The building is of great height. It is situated between houses, so is, therefore, difficult to get a good view of; the west end abuts on to the Holland-road.

The church is in the Early Pointed style; the exterior is faced with Ancaster rag rubblework, the dressings of the windows, copings, &c., being of Bath stone. The roofs of the aisles are covered with lead, and the remainder of roofs with green slates. The internal surface of the wall is formed with Bath stone, and the whole area of the church is covered with stone groining. The arches are all richly moulded.

The chancel is raised four steps above the nave floor, and the altar five steps more above the chancel floor, the pavings of these portions being of encaustic tiles and brown and blue Ancaster stone. The organ is placed in a tribune over the north aisle of the chancel. On the south side is the Lady chapel. A large stone and painted panel reredos is about to be erected behind the high altar. The paving of the passages in nave and aisles is of stone, with wood blocks under the seats. The church is warmed by Mr. Grndy, and consists of hot air in conjunction with hot water.

The total length of the building as at present completed is about 151 ft., and breadth 67 ft., interior height to groining, 55 ft., exterior to ridge of roof, 75 ft., the length of the chancel is 38 ft.

During the progress of the building, the Architectural Association paid a visit to the works.

The architect of the building is Mr. James Brooks.

THE OLD GUILDHALL, LAVENHAM.

THE old Guildhall at Lavenham, of which we publish a sheet of measured drawings and details by Mr. J. S. Corder, stands at the south side of the Market-place, at the corner of Lady-street, and has a frontage of 48 ft. to the former and 27 ft. to the latter. These dimensions refer to the main structure, though it is probable that the buildings abutting on it, and now used as cottages, were at one time connected with it.

The hall consists of a ground-floor with cellars underneath one portion, and an over-

hauging upper storey, ceiled at the plate level, the roof space over being lighted by small windows in the gable ends. The construction is as follows:—The walls to cellars and up to ground-floor line are very thick, and built of brick and rubble mitted by mortar, as are also the massive chimneys. On this substructure was placed oak framing ingeniously morticed and tenoned together and pegged with oak pins, the interstices of the framework being filled with clay and chopped straw and wattles intertwined, and the durability of this construction is marvellous.

The first floor overhangs the ground floor 18 in., and this is continued on both frontages by means of an angle beam and corner post, the joists being framed into the former, and showing at right angles to the wall all round; thus carrying the framing above, which rests on a beam beautifully carved with twisted leaf pattern. The roof would be covered with either tiles or thatch.

All the windows, except the small lights under the overhanging first floor, were in the form of projecting bays, but of these only one exists, namely, that on the ground floor to Lady-street. The gables originally projected over the wall face and had carved large boards, but only that to the porch remains.

On the exterior is an elaborate corner post, on which is carved a small full-length effigy of John, the fifteenth Earl, its noble founder, in plate armour. He stands on a pedestal or hutchess beneath a cusped and crocketed canopy, the underside of which is groined in imitation of stone roofing. In his right hand he grasps a distaff, on which may be seen some unspun yarn, and in his left bears the scroll or charter of the Guild. The post is richly decorated with sunk tracery and Tudor flourishes.

Entering by the porch, at the corners of which are two angle posts of similar design to the one above mentioned, but having beneath the canopies, in place of effigies, two lions sejant rampant, emblematical of the Corpus Christi, we find ourselves in the main hall of the Guild, a room without a fireplace, 20 ft. by 17 ft., with elaborately-moulded beams and joists overhead. It was here that the merchants met and transacted business.

On either side of the hall are two smaller rooms, offices of the Guild, each having a large open fireplace.

In the rear of the left hand one was probably the kitchen, from the vast size of the fireplace, being over 10 ft. in width.

The central hall communicates with the staircase by a door immediately opposite the entrance. This staircase leading to the first floor is formed of solid halks of wood, sawn through diagonally, and resting on bearers. The arrangement of the rooms above follows that below, a small room being over the porch. Two of these rooms have large open fireplaces.

In the room to the right of the central hall are remains of linen pattern panelling, and doubtless the whole of the walls on the ground floor were covered with this, or similar material. The upper rooms probably showed the timber framing inside, plastered between the studs.

The doorways are all Tudor-headed, those on the ground floor having carved spandrels; the doors were ledged and boarded, hung on massive hand hinges, of which several examples exist. The outer door of the porch was probably a large one, with a smaller door cut in the centre, similar to examples which still exist in the town.

The windows were filled with glass in lead quarries, and, in the upper lights, rich hazonings and coats of arms were doubtless inserted.

Beneath the principal staircase to the first floor is a brick stair leading to the cellar; this is a most interesting apartment, about 16 ft. 10 in. by 31 ft. 9 in., 7 ft. 3 in. high, lighted by three small iron-barred windows. In the walls of the cellar are small recesses about 2 ft. wide and 1 ft. 2 in. deep, arched over with Tudor heads in brick, and having seats in them 1 ft. 3 in. above the floor, but for what purpose they served remains doubtful. Besides these there are other recesses for lamps and cupboards.

After the Guild was abolished, the building passed successively through the stages of town-hall, prison, and workhouse; falling into private hands, it was converted into cottages, and finally a granary and wool-store.

The building is now the property of Mr. W. C. Quilter, M.P., who is restoring it with a view to its future preservation.

J. S. C.

STAMFORD-ROAD SCHOOLS, KETTERING.

THESE schools are the first of those erected by the School Board for the town of Kettering. They include the large mixed school, the smaller infants' school, and the offices for the use of the Board. The accommodation is for rather more than 1,100. The class-rooms are all on the ground floor, and are grouped round two central halls; they are in every case lighted from the left, except in one of the infants' rooms, where left-hand lighting is not of so much importance. Half of the class-rooms in the mixed department accommodate sixty children, the other half forty, and on each side there are two rooms communicating, so that a pupil-teacher may take a class under supervision. There is also a cookery class-room placed outside the main group, and accessible for classes in the evening without throwing the whole school open. The corridors are broad, and communicate directly with the cloak-rooms. The master has his private rooms over the boys' cloak-room; the mistress has hers in the central block, near the offices; and the infants' mistress has hers over the infants' cloak-room. The w.c.'s for the children are in detached buildings in the playgrounds; those for the teachers adjoin their own quarters. The offices comprise a waiting-room and clerk's office on the ground floor, and a board-room and committee-room upstairs.

The heating and ventilation are by warm air on the plenum system, the engineers being Messrs. Ashwell & Co., of Leicester. The fresh air is taken in at the traceted openings of the tower, and is driven by a fan along large corridors under the ground-floor, and then up a shaft into each of the class-rooms. At the base of each shaft is a battery of steam-pipes, which warms the air as it commences its ascent, and the supply can be regulated by valves. The air thus impelled into the class-rooms is then expelled by the same force up extract shafts into a large trunk in the roof, and so out through the turret. The air is taken in at a comparatively high level, as being likely to be purer. The other stages of the tower are devoted to a clock and a bell.

The building throughout is of red brick, with dressings of Weldon stone. The exterior is in Leicester sand bricks; the interior in hard-pressed bricks from Kettering, painted and colour-washed. The cloak-rooms and corridor have a high dado of glazed bricks. The roof is covered with Broseley tiles, except to the inner parts surrounding the central hall of the mixed school, where the pitch is kept flatter in order not to obstruct the light to the clearstory windows more than possible; the roofs here are slated, but the change in covering is not visible from any point of view. The floors throughout are of pitch-pine wood blocks.

The works are being carried out by Mr. A. Barlow, of Kettering, from the designs of the architects, Messrs. J. Alfred Gotch, F.S.A., and Charles Saunders, Mr. W. J. Vinnell being the clerk of works.

LODGE AT COMPTON, SHERBORNE.

THIS lodge has lately been built almost entirely by workmen on the estate, from the designs and under the superintendence of Mr. Evelyn Hellicar. The walls are in coarse rubble work, brought to a fairly smooth face, of a capital walling stone quarried on the property. The moulded work and quoins are in stone from the neighbouring Ham-hill quarries, and the roof is covered with red Broseley tiles.

CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.

THE distribution of certificates awarded to the students of the Crystal Palace School of Practical Engineering took place on the 13th inst. Mr. John Aird, M.P., presiding.

Mr. F. K. J. Shenton, the Superintendent of the Science and Art Department of the Crystal Palace, having read a report setting forth the result of the examinations.

Mr. Aird addressed the students. He said (we quote from the report in the *Standard*) that it was a great pleasure to him to note the progress which had been made, and also to observe the further efforts which had been put forth by the Crystal Palace Company to develop and encourage good work by providing increased conveniences and comforts for both teachers and pupils. It was very gratifying to observe in the report that in

regard to Mechanical Engineering, 41 of the students had passed out of 52 available, and he was sure it must be a pleasure to all who had the welfare of the School at heart to see that with a maximum of 288 marks Mr. H. J. Lintott should have been successful with 251 marks. He was followed very closely by Mr. J. B. E. Gwira with 248 marks, and by Mr. A. Edwards with 244 marks. That was a most satisfactory result, and said a great deal for the earnestness of purpose of many of the students of the college. Comparing the progress made now with that of the year 1888, he found that the number of students had increased from 73 to 112. As to the advantages of the School, he might, having some little knowledge of the matter, assure the parents and friends of the students that he did not think any more complete engineering school could be arranged. Nor did he think that any engineering school offered such advantages as could be obtained there for those students who really intended to work. Having been through the workshops, he was able to bear testimony to the perfection of the work there exhibited, whether it related to practical construction or the preparation of plans, &c. He did not think that any occupation offered such vast interest to young men as by its means they not only secured a position for themselves, but were so placed that they could do much good to the world at large. He could only hope that the Crystal Palace School of Engineering would continue to prosper in the way it had done in the past.

In 1888 he put forward a suggestion that the time was rapidly approaching when, in the interest of the country, it would be desirable that there should be again a great International Exhibition. He not only communicated that suggestion to the Press, but had an interview with the Council of the Society of Arts upon the subject. Great attention was given to it by the Duke of Abercorn and others associated with him; but the Duke afterwards wrote him stating that, after having given the matter careful consideration the Council had come to the conclusion that it would be premature to take any steps at that time, as it was doubtful whether an International Exhibition could be arranged with advantage until 1894 or 1895. What he now wished to put forward for consideration was that four years had now elapsed since then, and that although the suggestion might have been premature then, it might not be so now. In fact, he held that such an exhibition was necessary if the country was to hold its own in the trading world, and such an exhibition could not be held to be complete unless advantage was taken of the Crystal Palace, which its extensive grounds, for the purpose. I threw it out as a suggestion to Mr. Shenton, and Mr. Wilson that it might be worth while for the students who had shown such great capacity for drawing to devote some of their spare time to devising some general scheme by which the exhibition, if carried out, might be held in the grounds of the Palace.

Mr. J. G. Rhodes, in moving a vote of thanks to the examiners, mentioned that the Board of the Crystal Palace Company, at a meeting by on the previous day, had passed a vote for the installation of an electric plant in connection with the School, for the benefit of the students who were making electric engineering their special study.

Mr. J. Day, Mr. C. W. Best, and Mr. Milne having acknowledged the compliments the certificates were distributed, and Mr. J. Wilson (the Principal of the School) having offered a few observations, the ceremony closed with a vote of thanks to Mr. Aird.

CO-OPERATIVE STORES, SHIREMOOR, NORTHUMBRIA.—New co-operative stores were opened at Shiremoor on the 6th inst. by Mr. T. Burt, M.P. The front of the building is 70 ft. The ground and drapery shops occupy the full length of the frontage, and are divided by a central entrance, with a staircase leading to the first floor. At the rear the front shops are four shops, milliners' and goods warehouse, beneath which is a cell. On the first floor is the hardware and boot department, 45 ft. by 30 ft., tailors' and tea rooms. The rear warehouse is over the four shops. The committee-rooms, manager's office, and check-off are at the east end, and are also provided with separate side entrance and staircase. There are a stable, &c., at the back. The total cost will be £3,000, and the work has been carried out from the designs of Messrs. Davidson & Bendle, architects, Newcastle, by Messrs. M. Hogarth & Sons, build. Choppington.

ARCHITECTURAL EDUCATION.

SIR,—I must again trespass upon your valuable space, but the answer of Messrs. C. H. Odie, H. O. Cresswell, O. Fleming, E. S. Le, W. Millard, T. E. Pryce, F. M. Simpson, and L. Stokes is in many respects so at variance with what Mr. Jackson stated in his letter to "A.A. Notes," and with my letter to "The Builder" of the 9th inst., that I ask your permission to reply to it, and then, as far as am concerned, to trouble you no more in the matter.

These gentlemen state that, "the some half-dozen members of the A. A.," referred to in my letter, met Mr. Jackson and his friends but do not. I find in Mr. Jackson's letter he distinctly mentions two meetings with his friends and some members of the A. A. Again, they state that the letter in "A. A. Notes" was not written at their request. Mr. Jackson says, "I have been asked by some of your members to let the Association know what has been, and being, done, &c." Discrepancy somewhere! These gentlemen state that they met Mr. Jackson and his friends with the object of certaining whether they would help actively the work of the A. A., and that they did not present any one or any one's views but their own. This I am glad my letter has brought forth. On reference to the "Brown Book" I find that no less than six of these gentlemen are members of the Committee of the A. A., two the number editors of "A. A. Notes"; that Mr. Millard was the only notified member present at the meeting at Storey's-gate; and that, though these gentlemen were quite unauthorised to enter into negotiations with the Memorialists, they yet laid the result of their deliberations formally before the Committee of the A. A., and six of them would, in their authorised capacity, have a vote in Committee upon every subject they discussed in their unauthorised capacity with the Memorialists. They were elected to serve on the Committee of the A. A. for such purposes as these?

That Mr. Jackson and his friends were, as I inferred, led "to suppose that they expressed the voice of the A. A." by those they met, would be no matter of surprise, finding that they included the past President of the A. A., who had brought the new educational scheme to the front, and five other members of the Committee of the A. A.

I do not forget (as these gentlemen fear) that the list of subscribers were the well-known names that these gentlemen recite; but that does not affect my meaning as to the greater significance the A. A. is under to the Institute and its members, and I contend that my remarks were perfectly just on that point. On reference to the list of donations lately published, I find that the Institute, members of the same, and members of the A. A., subscribed under 1,900l., and those outside the ranks of both bodies about 80l.

I am told that I misrepresent Mr. Jackson when he states that he wants us to "give up or present scheme of studies." Mr. Jackson says, "Your printed scheme of education, in spite of a show of disclaiming it, points definitely in preparation for the Examination of the Institute. While this remains in your pages we cannot take any interest in your programme," and again, "If all this were swept away, &c.," tolerably conclusive evidence, think, of what Mr. Jackson meant.

A few words in conclusion. On reference to the "Brown Book," I find that out of the list of members, ninety-six are Fellows, and 193 associates of the Institute, roughly 25 per cent. of the total number; are they to renounce the Institute at Mr. Jackson's invitation? Mr. Jackson, of course, sees the importance of training over the A. A. to the views of the Memorialists, and tells us that the A. A., if it pleased to use it, held in its hand the key of the situation. I quite agree, and believe I am rightly interpreting the voice of the majority of our members if I say that we intend to keep it; that we do not approve the alternative set forth by the Memorialists; that we do not consider these eight gentlemen were serving the best interests of the A. A. in what they did, and, lastly, that before any of these gentlemen seek re-election, they should place their views without delay and

without reservation before the A. A. electorate, so that we may know upon whom to rely and where we stand.

COLE A. ADAMS,
Past President A. A.

TWO VIEWS OF SIR GILBERT SCOTT'S RESTORATIONS.

SIR,—If Mr. Somers Clarke's two letters in the *Builder* had been confined to the subject of the proposed removal of Sir Christopher Wren's library at Lincoln, his case against the Dean and Chapter would have been stronger than it now stands, prejudiced by wholesale denunciation against all who undertake under the name of "restoration" any necessary repair, alteration, or adaptation of our ancient buildings to modern use for fear lest their historical value should be impaired.

Scott the restorer and Grimthorpe the destroyer alike fall under his ban. There is something so obviously unneary in this combination that it must surely be the result of a belief that the one view they had in common was a mistaken one rather than an objection to their mode of action. Scott and Grimthorpe both had reparation and adaptation to modern use in view.

The school to which Mr. Somers Clarke has allied himself has a negative theory and do-nothing policy.

Upon what principle can a judgment of the theory and practice of this school be formed, or their results gauged?

May it not be found in the old saying, "The man that does the most good does the least harm," and "The man that does nothing, does nothing but harm."

Mr. Clarke acknowledges that Sir Gilbert Scott preserved much old work, and, as the country is full of examples of his skill in not only preserving the fabric of our ancient buildings in imminent danger of destruction, but also in bringing to light many architectural features of intense historical interest, such as the apse of the south aisle of Chester Cathedral, I think, in his case, the verdict must be that he had an excellent record of good deeds to weigh against his misdoings, which Mr. Clarke characterises as "wholesale destruction" as "extensive as his practice," worris strong enough to convey the impression of his worthiness to stand in a niche with Lord Grimthorpe, whereas the reference is only to "fittings."

That this charge is to a slight extent true in respect to Sir Gilbert's early work is manifest, and no one deplored the fact more deeply than himself in his latter days, when he endeavoured to preserve everything of historical value.

He often remarked on the strange irony of fate which brought to his own door the fault which he always sought to overcome in himself and others.

Sir Gilbert spent a life in inspiring a love for ancient art and history, and in creating the science by which it might be shown in the preservation of our ancient buildings.

Being but a man and beset by tremendous difficulties, his practice was not always abreast of his theory, and so his critics, regardless of the greatness of his work, sought in every little failing an excuse for leaving the field of action for the school of thought. A new school, forsooth, only founded on the old truth, and to which the saying may well be applied, "What is new in it is not true, and what is true is not new," for the new leave-alone principle must in time, by the sheer force of its masterly inactivity, bring about the very evil which the old principle seeks to avoid.

If this new principle had been in vogue when Sir Gilbert Scott first drew attention to the need of "restoration," he would have been snubbed, and our cathedrals would not only have remained melancholy monuments of neglect, but in many cases would have been by this time both worthless and rootless; or if they had succeeded in their endeavours to prevent architects engaging in this work, the cathedrals might have fallen into the hands of distinguished builders, and shared the fate of St. Albans, which owes much of its treatment indirectly to the action of the Anti-Restoration School, whose early attacks were made against Sir Gilbert Scott as architect to the Abbey. Partly owing to the violence of this attack, and partly owing to the action of Lord Grimthorpe in preventing Sir Gilbert making the investigation necessary for the restoration of the west portals, the work was delayed. His death came, and Lord Grimthorpe, the great anti-restorationist, prevailed.

Leaving the new school to the enjoyment of this triumph, I would ask, why those who are alike interested in the preservation of our ancient buildings, should not start from this excellent standpoint to a practical consideration of the subject by bringing it to bear upon the undoubted fact that our old buildings can neither be allowed to become ruinous or be kept as curiosity shops.

If, then, they must be touched, some practical rules should be laid down as to their treatment, and a supply of professional men capable of treating them should be maintained. If an anti-restoration theory prevails, the result must be that the race of architects capable of dealing with ancient buildings will die out for want of employment, and the present idea that an architect is an architect, and, there-

fore, capable of undertaking every class of architectural work, which is now sadly too prevalent, would be still more universal.

To prevent such a lamentable event as this the matter should be taken up by the Institute and Architectural Association, and the subject of the treatment of ancient buildings made a special subject of study, and opportunities given to the public of knowing to whom such work can be safely entrusted.

ARTHUR BAKER, F.R.I.B.A.

21, Lower Phillimore-place, Kensington, W.

SIR,—I think few lovers of old architecture who had not the advantage of studying under Sir G. Scott will share Mr. Somers Clarke's evident awe at the mention of his name. I withstood him while he lived to the utmost of my poor ability, and venture to hope I did so with some small success. I do not feel now in the least called upon to speak of him with bated breath. I should mention that I had no personal acquaintance with him whatever, or perhaps I might have come under the remarkable influence he seems to have exerted over all, or almost all, he knew. But when Mr. Somers Clarke speaks of his cruelty to cathedrals, I am tempted to send you the following list, if only for the warning it may prove to some who contemplate "restorations."

At Canterbury he was called in shortly before his death, and though he put forward schemes for the destruction of the noble carved stalls, he had no opportunity of carrying it out. At York the two fires of 1829 and 1840 left little to destroy. At Winchester he restored the wretched screen which replaced Ingulo Jones's Palladian work. He practically rebuilt Bangor to a design of his own composition, carefully wiping off every ancient feature. Bristol was dealt with by Street. Mr. Christian is responsible for Carlisle. But Scott rebuilt Chester, wholly destroying the exquisite charm of antiquity which made it one of the loveliest of cathedrals. At Gloucester he rebuilt the spire, altering the design, in spite of his own stipulations and the opposition of the local folk. He was a near-sighted man, and probably was unable to recognise the result of the alteration. He was also singularly ignorant of proportion, for which, indeed, he seems to have had no eye whatever, and even if he could have seen his new spire, would have considered it quite as good as the old one. He also built a new reredos, but it is so unpleasing in design, so heavy, and so incongruous, that every one will be glad it was never completed, and will possibly be removed as an eyesore.

His reredos at Ely is much lighter. Exeter, "restored" in 1875, is not much the worse, but the reredos is very heavy and of poor design. Gloucester was undertaken in 1865, Scott's most rampant period. Nothing ancient that could be "restored" away was left, though the Council of the Archaeological Institute intervened on behalf of history and old art. The reredos here also is very costly and gorgeous, but not lovely. Hereford had been pretty thoroughly mangled by Wyatt, Scott's worthy predecessor, but in his later days Scott acknowledged that he did things at Hereford which he almost regretted. There is little, except a reredos, of his work at Lichfield, Lincoln, Llandaff, and Manchester escaped him; but between 1873 and 1877 he completely remodelled Newcastle. He does not seem to have touched Norwich. At Oxford, the east end is wholly a conjectural "restoration," its historical features having been carefully obliterated by Scott. Peterborough escaped him, being reserved for a worse fate; but at Ripon he worked his will. He rebuilt the west end, put in new windows of his own design, renewed the vaulting, and made a wooden vaulting for the nave. He does not seem to have carried on Cottingham's destructive work at Rochester, which has been left for Mr. Pearson, if funds do not fail, as I hope they will. At St. Albans, Sir Gilbert commenced the vandalic operations now being carried out by Lord Grimthorpe. St. Asaph's was rebuilt in 1868 and the following years, nothing of interest from the old church being preserved. At St. David's, Scott had an opportunity he was not slow to seize. There was no one on the spot to meddle. He pulled down the front and rebuilt it from a design of his own. Partly pulled down the Perpendicular east end and made it Early English. He rebuilt the tower and raised the roof. At Salisbury, what traces of antiquity Wyatt had left Scott scrupulously removed. In his "Recollections" he regrets some of the work he carried out here, and throws the blame on others.

Southwell was reserved for another "restorer." Wakefield had suffered much at his hands, as has been set forth by Mr. Micklethwait, but some of the alterations were improvements. Salvin tinkered Wells, but Scott rebuilt the Chapter-house at Westminster, the cloisters, where he removed the traces of the *Scriptorium*, and the greater part of the north side. At Worcester little could be done, but that little Scott did. Perkins had been before him, and now the cathedral may be described as their joint work. At Durham we have some of the worst of all his vandalisms. The choir-screen would be a frightful eyesore anywhere, and is peculiarly out of place in this church.

Such is, I think, a complete list of the cathedrals "restored" by the late Sir G. G. Scott, but any of

your readers who wish for categorical information will find it in the "Reminiscences," a kind of apology. Had I kept silence while he was yet alive I might be ashamed to speak out now, but I never hesitated to protest against his dogma, his very principles appearing to me to be radically wrong.

W. J. LOFTIE.

SIR G. SCOTT AND RIPON MINSTER.

SIR,—No doubt Sir G. Scott preserved much Medieval work at Ripon. But he gratuitously destroyed the ancient ritual arrangement of the choir by moving the sedilia a bay east, and setting the altar against the very low-tilled east window,—a place which it assuredly never occupied before. Let us hope this may be soon remedied, together with the similar barbarism at Bristol.

The Lincoln scheme (now happily in abeyance through the need of repairs to the north-west tower), seems to have arisen from the wish of an implement-maker to get a view of the Minister from his new house—in great measure at other folks' expense.

VIA TOR.

STEAM-ROLLING ON ROADS.

SIR,—My broad statement is based on the cost for several years of steam-rolled roads and seven steam-rollers used by urban and rural authorities. It is my experience; your correspondents' may be different.

Twenty years' cost-keeping teaches me to place no reliance in single isolated experiments. One of the long jumps last week was reported at 23 ft., but this does not prove that all men jump that distance.

Waste in consolidation is governed by weather, crushing-power, and binding qualities of the materials. Many tests with various materials resulted in my figures. Mr. Greenwell may have equal reasons for his estimate.

I must object to any cost calculated on per cubic yard of material as misleading; it should be per yard superficial road.

Many wheel-rolled roads are maintained with 80 tons of limestone per mile. If Mr. Greenwell can roll a mile of road for 3*l.*, he has beat the record.

ROBERT PHILLIPS,

County Surveyor for Gloucestershire.

The Student's Column.

WARMING BUILDINGS BY HOT WATER. XVII.

INDEPENDENT BOILERS (continued).

THE subject of gas boilers cannot well be left without referring to an ingenious introduction of Mr. Fletcher's. This is a water-heater, or boiler, as fig. 62. The peculiarity consists in the quantity of solid metal (copper, in this instance), pins projecting from the lower heating surface. Mr. Fletcher, in a paper read before the Gas Institute meeting, describes how he has ascertained by experiment that flame never has actual contact with surfaces which are at or below 212 deg.—the temperature of boiling water. He adduced in evidence several facts to show that surfaces at this heat had a sort of repelling action, and

FIG 62

FIG 63

between the flame and the surface there always exists a thin film or space, to the disadvantage of the water receiving the full benefit of the heat. The remedy proposed, and which he has brought into practice, is to furnish the heating gills (all can be adopted to the same end), as when flame is applied to their free extremities, it has ready contact, owing to the much higher temperature that they (the extremities) can be raised to.

It will be seen that although we cannot get a surface, having water on one side of it, hotter than 212 deg. (and rarely this with boilers), if solid rods or projections extend from this surface sufficiently far, we can get their extremities red hot, although at their other ends they are in contact with water. Mr. Fletcher

makes his rods about 1½ in. long; this permits the extremities to attain about 500 deg., and flame has actual contact at this temperature, and the greater and more effective heat so obtained is readily transferred to the water by conduction. Now, the peculiar effect of these rods does not end here. It has been common knowledge for many years that the affinity of water for heat,—its heat-absorbing power,—is 2½ times greater than a plain heating surface can impart the heat to it. This power of water is met with these rods, which, being solid, go to increase the heat-receiving surface to the extent named without increasing the water-surface. In other words, if the flat bottom of this little heater be a superficial foot, the addition of the rods make the actual heat-receiving surface some 2½ ft., and the superficial foot of water-surface resting on the flat bottom is quite able to absorb all the heat of this greater heat-collecting area. There is now advertised a boiler-tube made upon this principle having a series of flanges inside it, where the flame and heated gases have contact, and the makers contend that these flanges, which are solid, and simply additions to the heat-receiving surface, add fully 30 per cent. to the boiler-tube's effectiveness. Mr. Fletcher's experiments showed a really great difference between boilers that had the rods and those that had not. The length of the rods has a limit, as when the heat received is more than the water can dispose of, the extremities perish.

This little gas-boiler would require to be fixed in a house or little structure by itself, like the others. There must be free ingress of air for combustion, and equally free outlet for the products of combustion. This provision of inlet and outlet ventilation must, however, be unattended by violent draughts, or the flame will be blown out, or caused to "light back." In the former case, a disagreeable effect might

FIG 64

FIG 65

he experienced when re-lighting the burner by the explosion of the unburnt gas that may have collected.

INDEPENDENT BOILERS FOR COKE FUEL.—It will not be possible to enumerate more than a few of these, having distinct features peculiar to themselves. The number is too great to speak of them all. About the smallest and least expensive we have is what is generally termed the "Star," as fig. 63; it is, however, unsafe to give some of the old patterns, as this is, any specific name, for a similar design of boiler may be found in every maker's list, but not more than two will name it alike. This is a useful little boiler for small purposes, for heating a greenhouse or carriage-house, or for two or three coils in an entrance-hall. Its size does not admit of taking a charge of fuel to last many hours without attention, but it can be had with an extension, or fuel chamber, as top, as fig. 64. They are also made with sloping sides,—that is, slightly conical, which assists the free movement of the fuel in its falling to replace that which is consumed below. These boilers are made to heat from 150 ft. to 700 ft. of 2-in. pipe (theoretical quantity), and can have the pipe coiled on right or left side or at back, as desired; the smoke-nozzle can be on top or at back.

Fig. 65 represents a distinct form of small boiler, if it can be termed such, the heat-receiving surface being a coil of rather small pipe, as shown. A coil is undoubtedly effective, for it presents a greater surface to the fire in comparison to the quantity of water it holds than any other water-heater; it has the advantage of being wholly direct heating surface in contact with hot fuel. The drawback to coils is, however, that accumulation of deposit cannot be readily removed, even if some sort of provision is made for it. With this particular pattern accumulated dirt may soon

do harm, as the pipe is small, and would be readily filled. Deard's coil boiler, to which we may presently refer, is considered successful for the pipes being 3 in. and 4 in.

The next description of boiler to notice is Messenger's "Loughborough," as fig. 66. The

FIG 66

peculiarity of this boiler, as every reader must know, is its being adapted for building in the wall of the greenhouse. When it is so fixed, the stoking, &c., is all conducted outside, and the fire-pipe is similarly placed; but the opposite side of the boiler projects inside the house, and the pipes are there connected. By this arrangement there is practically no loss of heat from the boiler, and the whole of the circulating-pipes do good service in radiating heat. The only loss of heat is from the front surface, which faces outward. The writer cannot see any reason for making waterway fronts with these boilers. Messrs. Kinnell "Horseshoe" boiler, of a somewhat similar design to the "Loughborough," has an air-chamber in front, by which the air which enters the fire is heated; this is in lieu of the waterway front, and seems a very good idea. Another good form of boiler for building in the thickness of the wall is Jenkins & Sons' "Ivanhoe." This has a fire-brick front, as fig. 67.

A very good pattern of boiler, made by a maker, is the "dome-top," as fig. 68. This is a very good and serviceable form of upright boiler, and has had general use and approval for many years. This boiler has a waterway top, and is the first we have shown with its flow-pipe starting vertically, which is decidedly the best way for it to start if the works are of any magnitude. It is unnecessary to describe this boiler in detail, the illustration gives what

FIG 67

FIG 68

is needed in this respect, but there is one feature in the drawing which requires special alluding to.

The feature in question is the waterway shown carried down below and beneath its fire-bars. This arrangement, owing to the increased cost it incurs, is not generally adopted, but it certainly has pronounced advantages. In the usual way, the waterway terminates exactly level with the fire-bars all round, except where the stoking-door comes; it is arched here, as is necessary. Terminating the boiler at this point means that the lowest point of the boiler, where dirt accumulates, comes exactly where the very greatest heat is felt, and where it can bring about the most harm, and what aggravates matters is that a weld-joint has to exist at this important point. If the waterway is carried below, as shown, the accumulation of deposit occurs below the point where heat is felt, and the dirt, being at this low point, can do no harm; but it

dition to this, it is so much easier to remove the dirt from this flat surface than it is from the cylindrical space. Added to this is the gain effected by the absence of welds and joints immediately at the glowing metal—it is better to keep them away from this point. Welded joints are, as a rule, strong and very serviceable, but exceptions to this rule are not uncommon. If a hoiler of this type is used for the supply of hot water at the boiler, and the water it heats is "hard," the waterway bottom is a very great advantage, and is not to be over-estimated. The hard deposit is almost entirely kept away from the heated surfaces where it so readily causes damage, and its removal of the deposit is facilitated. This hard deposit is difficult enough to remove at any one point, but particularly so with cylindrical hoilers, owing to the waterway ending level with the flanges. The waterway bottom forms a sort of tilting bed for sedimentary or precipitated matter of every description, as very little can adhere to the vertical surfaces just round the end-hoiler. It will be understood that matter deposited anywhere else than just where the heat is felt does little or no mischief. There are several effective shapes of independent hoilers that are not of vertical design, and we have hitherto referred to, but are not horizontal, as fig. 69, for example. These are

FIG 69

early all much like square saddle hoilers, and are upon iron bases, and furnished with the necessary furnace fittings, making them independent of brick setting. The illustration shows one with waterway front and back, with a top-feeder. This is a very good form of hoiler, in that he fed to last the night without attention, at a deal of heat can be radiated and lost from its exterior if not covered, or if not fixed on a little close brick chamber. It could have a smoke-nozzle on top, if desired. This style of hoiler is made to heat up to 2,000 ft. of 2-in. pipe, and is fitted with internal flow or cross-connections, and is much more powerful. It is a hoiler that has been used, and given every satisfaction. A square hoiler can be cleared out with comparative ease.

SURVEYORSHIPS.

GRANTHAM.—The *Leeds Mercury* says that Mr. G. Gamble having resigned the post of Borough Surveyor, on his appointment as second officer of the Metropolitan Fire Brigade, the Grantham Town Council received applications for the vacancy. At an interview by the Council. They were—Messrs. Joseph Evans, of Wolverhampton; Thos. W. Banks, West Bromwich; and Frank Bagshaw, Urograte. The first-named gentleman was unanimously appointed. The post is worth 200l. per annum. Mr. Evans has been engaged as chief assistant to the Borough Surveyor of Wolverhampton.

HEREFORDSHIRE.—The *Liverpool Post* says that Mr. H. T. Wakelam, M.Inst. (C.E.), who has been Surveyor to the Garston Local Board for four years past, has been selected, out of eighty-four candidates, for the office of Surveyor to the Herefordshire County Council.

OBITUARY.

MISS AMELIA B. EDWARDS.—We regret to see, in the *Times* of the 19th inst., the announcement of the death of this lady. Up to the year 1880 she was best known to the public as a novelist, and since that date her attention has been mainly devoted to archaeological and especially to Egyptian subjects, on which she wrote frequently in the columns of the *Times* and the *Academy*. Miss Edwards also contributed articles on Egyptology to the "Encyclopaedia Britannica," and wrote for the recent Archaeological Discoveries in Egypt. The fund in 1883 of the Egypt Exploration Fund is largely due to her efforts, and she has been for many years its honorary secretary; indeed, as was mentioned by one of the speakers at the recent meeting of that Fund, reported in the *Builder* for March 19 inst., she was the life and soul of its

work. Egyptology was the subject of a very numerous course of lectures delivered by her in the winter of 1889-90, in the United States.

Mrs. WILLIAM CHAFFERS, F.S.A., the veteran antiquary, who died a few days ago, and eighty at his residence at West Hampstead, in comparative obscurity and oblivion, was, says the *Times*, very little known, even through his standard works and useful life, to the present generation of art collectors. Mr. Chaffers will be principally remembered by the following works:—(1863), "Marks and Monograms on Pottery and Porcelain" (several editions); "Hallmarks on Plates," illustrated with tables of date letters; (1865-1889), "Handbook of Marks and Monograms on Pottery and Porcelain" (ninth thousand); (1889), "The Ceramic Gallery of Pottery and Porcelain," with numerous illustrations, 2 vols.; (1887), "Gilda Aurifabrorum," a history of goldsmiths and their marks on plate, &c.

GENERAL BUILDING NEWS.

PROPOSED MEMORIAL HALL, LIVERPOOL.—It is proposed to erect a "People's Hall" for Liverpool, in memory of the late Mr. Clarke Aspinall, to be situated at the corner of Byron-street and the Old Haymarket. Messrs. Ware and Rathbone, of Liverpool, are the architects, and their designs show that the hall will be built of salmon-coloured terra-cotta, relieved by broad bands of red, and the roof covered with green slates. On the ground floor there will be a café 80 ft. by 40 ft., reading-room 50 ft. by 30 ft., billiard-room 55 ft. by 35 ft., smoking-room 55 ft. by 35 ft., committee-rooms, lavatories, &c., while the frontage will be occupied by several shops. Part of the basement is to be utilised as a gymnasium. The first floor will be occupied by the great hall—104 ft. by 75 ft., with accommodation for 2,500 people; small concert-room, 60 ft. by 35 ft., capable of seating 300 persons; various committee and retiring-rooms. The remaining space on the second and third floors not occupied by the upper parts of the great hall and small concert-hall will be devoted to committee-rooms, &c. A large lift is to be placed at one end of the building for the convenience of the people attending the hall.

NEW CHURCH, PAISLEY.—The memorial stone of the new Original Secession Church, now in course of erection in Wellmead, Paisley, was recently laid by Mr. Wm. Dunn. The church is in the Gothic style, and is being built of Auchinlea stone. It will be seated for 500 persons, while underneath the church there will be three halls, capable of accommodating 30, 80, and 250 respectively. Owing to the site being between two tenements, no light can be obtained from the sides, but, besides a two-light window in the frontage and a three-light at the south end, there will be a large amount of borrowed light from the roof. These will all be of cathedral tinted glass. The entrance is from Wellmead by a flight of ten steps, leading to a vestibule, from which there are two passages to the area seats. There will be, besides, a stair leading to a small gallery at the north end of the church, the pulpit, which will be more of the character of a platform, being at the other end. The interior of the church will be finished in red pine. At the south end a small building will be erected, attached to the main edifice, and will comprise the minister's vestry, ladies' room, heating apparatus, &c. The whole structure is estimated to cost about 3,000l. Mr. T. G. Abercrombie, Paisley, is the architect.

PROPOSED ISOLATION HOSPITAL AND PUBLIC MORTUARY, PLYMOUTH.—According to the *Western Morning News*, so soon as plans, which have been prepared by Mr. G. D. Bellamy, the Borough Engineer, have been finally approved by the Local Government Board, some definite progress will be made in the erection of both an isolation hospital and a public mortuary for Plymouth. The provision of an isolation hospital for the borough has become a necessity for the due carrying out of the Infectious Diseases (Notification) Act, 1889. The present temporary wooden structure at Mount Gould is unfitted to the requirements of the borough. It is on the site of this building that it is proposed to erect the new premises. The site covers nearly two acres, and varies from 100 ft. to 175 ft. above sea-level, it being on slate rock. The new premises will be approached from the Higher Mount Gould-road, which is now being widened by the Corporation. On entering the hospital grounds, the porter's lodge will be found just within the gates, and further up the path, on the left will be the administration block. Local limestone will be used and Portland cement will serve for the exterior. In this block there will be a room and living-room accommodation for the matron and nurses; the medical officer's quarters and the servants of the hospital will be also housed here. A distinct building is proposed to be erected as an isolation pavilion. This will be divided for the use of male and female patients. In other portions of the building will be a ward, measuring 24 ft. by 18 ft., which will take two beds, and a nurses' and duty-room, so placed that a complete oversight of the patients will be obtainable. Each wing, also, will have a ward, measuring 36 ft. by 18 ft., attached, capable of accommodating three

persons. The height of these rooms will be 13 ft., with ordinary plaster ceiling. The southern side of the pavilion will be provided with a verandah. More in the centre of the site will be two ward pavilions, one to accommodate twelve and the other sixteen patients, and there will be attached the customary nurses' duty rooms, bath room, and other conveniences. The area of the land will allow for the erection in the future of two additional wards. All the premises will be on one floor, raised above the level of the surrounding ground so as to allow for the free circulation of air under the building. The floors will be of wood block paving, which will be saturated with paraffin wax and will rest on concrete. The subordinate erections proposed include two laundries, one for the staff, and the other for patients. At the extreme rear will be a public disinfecting apparatus, which will serve for the use, not only of the patients in the hospital, but of those residing in the borough whom it may not be necessary to remove, but whose garments may need treatment. Disinfection is to be effected by the use of steam. Near by will be a comparatively small mortuary, with a room adjoining for post-mortem examinations. The new public mortuary will be near the old cellage, which has served the purpose for so many years. This is situated near Vauxhall-street, and the new premises will be on some property belonging to the Corporation, lying between Vauxhall-street, Sutton Wharf, and West Quay. It has been planned to serve a population of 100,000, and will consist of a mortuary chamber, lighted from the top, and large enough to take twelve bodies. The block of buildings will face the road with a facade of red brick, with stone dressing. The caretaker's quarters will consist of four rooms. An entrance at the side of this building will give access to the coroner's court and the mortuary. The coroner's court will be approached from the entrance by a covered way, which will be continued from front to back, linking the buildings together. The measurement of this room will be 17 ft. by 16 ft., and it will be possible to shut off a portion of this with folding doors. From this enclosed portion of the court a door will lead to the coroner's private room, which will have a separate approach to the mortuary. The death chamber will be divided into two compartments, one being for infectious cases. At the rear of the mortuary there will be a room, 15 ft. by 12 ft., for the holding of post-mortem examinations. A small store-house and a shell-room will be adjacent.

GIRLS' INSTITUTE, MANCHESTER.—A technical institute for girls was opened at Ancoats on the 9th inst., by the Countess of Aberdeen. The site of the institute, which adjoins the Ancoats Hospital, contains about 1,250 square yards, the greater portion of which is covered by buildings, with its main frontage to Mill-street. The *Manchester Courier* says that the ground floor contains a large restaurant fronting Mill-street, which will accommodate several hundred girls, a cooking and other class rooms, together with a large cooking kitchen, scullery, and pantries. The lavatories are arranged on one side of the central court or area, and are well lighted and ventilated. In the front basement under the restaurant is a gymnasium, well lighted, containing a dressing-room and also a gallery at one end for the use of the public. The other portions of the basement contain private wash baths and various class rooms. On the first floor is an entertainment room capable of seating 700 to 800 persons; there is also a committee-room and social and class-rooms on this floor. A caretaker's house, containing a living room, bedroom, and scullery, is provided in the second floor. The staircases and corridors are of ample width and are fireproof, and a hoist is provided for easy access to all parts of the building. The laundry and wash-house are placed over the boiler-house and heating chamber, which form a separate block of buildings at the rear of the institute, but which are connected therewith by a covered corridor and staircase. The corridors, staircase, walls, and walls of baths are lined with glazed brick dados. The cost of the works will exceed 3,000l. The architects were Messrs. Darbyshire & Smith, of Manchester.

WORKMEN'S INSTITUTE, DEEPBAR, YORKSHIRE.—On the 11th inst. the Earl of Wharfedale opened at Deepbar the Lowood Institute. The total cost of the building was 1,500l. On the ground floor are a billiard-room, a smoke-room, committee-room, and conveniences. A caretaker's residence, fitted with cooking apparatus, is added. Upstairs there is a lecture-room and reading-room. The contractors for the work were Messrs. Joseph Mastin & Sons, of Sheffield; Mr. Joseph Esherby was the carpenter and joiner; the plasterer and plasterer Messrs. Hodkin & Jones; and the plumber, Mr. Corrie. The building was erected from the designs of Mr. W. J. Gardiner.

CHURCH SCHOOL, BARRY, GLAMORGAN.—On Easter Monday memorial stones were laid of a new Church school for Barry parish. The building, which will occupy a site near the parish church, will be 60 ft. in length, 27 ft. in width, and 21 ft. to the ceiling. It will be of Gothic design, the material to be used being Cartybrook brick outside and stone inside, with brick facings. The seating accommodation will be for 200, and the structure will be heated by a special apparatus, with chamber

running underneath. The architects are Messrs. Kempson & Fowler, of Llandaff, and the contractor Mr. F. Small, of Barry, the cost of the work being about 900.

PROPOSED FEVER HOSPITAL, STONE NEWINGTON.—The nine acres of land at Stone Newington which some members of the Metropolitan Asylums Board were anxious to purchase as the site of a fever hospital are to be used for building purposes. On the day that the proposition came before the Asylums Board in the first instance, the plans for laying out the grounds for building were approved by the Hackney Board of Works, the local authority in the matter. When those have obtained the further sanction of the London County Council, the actual work will be commenced.—*City Press.*

ADDITIONS, JEDBURGH PARISH CHURCH.—The recent additions to this church, which include chancel, vestry, organ-chamber, chancel furniture in oak, and stone and alabaster pulpit, were formally dedicated on the 7th inst. The works have been carried out by Messrs. Brunton, Jedburgh, to designs by Mr. P. MacGregor Chalmers, architect, Glasgow.

CLAYBURY ASYLUM, WOODFORD, ESSEX.—Messrs. Reed, Blyth, & Co., Limited, contractors, Plymouth, have been selected by the Loudon County Council to carry out the alterations and additions to Manor House, Claybury Asylum, Woodford, Essex, from plans by Mr. G. D. Hine, architect. The amount of the accepted tender is \$,9357.

MARLBOROUGH HOUSE.—We learn that alterations are about to be made at Marlborough House, for H.R.H. the Prince of Wales. All possible precautions will be taken against fire, and Messrs. Mark Fawcett & Co. have received the order to construct the floors with their special fireclay tubes, the same as are now being used at the New National Portrait Gallery.

ALTERATIONS TO ST. MARY'S CHURCH, WAINFLEET, LINCOLNSHIRE.—It has been decided to carry out the following works at Wainfleet St. Mary's Church:—To take down and rebuild the north arcade, put new roofs to nave and north aisle, add new organ-chamber on north side of chancel, and to restore lower windows, in accordance with plans prepared by Mr. J. B. Corby, architect, Stamford. Nine builders sent in tenders, and that sent by Mr. J. T. Turner, of Wainfleet, was accepted at 973.

SANITARY AND ENGINEERING NEWS.

SEWERAGE, ASH-NEXT-SANDWICH.—The Sewerage and Sewage Purification Works for Ash have just been completed. The system of purification adopted is that of the International Water and Sewage Purification Company, Limited. The engineers for the works are Messrs. Charles H. Beloe, M.Inst.C.E., and Frank E. Priest, A.M.Inst.C.E., of Westminster, and the contractors Messrs. C. H. Denne & Son, of Deal.

WATER-SUPPLY, RUGELEY.—An artesian-bored cistern, yielding 120,000 gallons per day by continuous pumping, has been completed for the town of Rugeley in little over four weeks. The depth is 152 ft. and 5 in. in diameter. After passing a few feet of alluvial deposits, the conglomerate beds were reached, from which the water is obtained. The town of Burnam, near Taplow, is having similar work carried out by Messrs. C. Isler & Co., of London.

HARBOUR WORKS, ARDROSSAN.—There has just been completed at Ardrossan, Ayr, a new dock and other harbour extensions. The additions include a wet dock about 10 acres in extent, a tidal basin of 5 acres, an extensive entrance channel, a considerable extension of the quay accommodation for passenger steamers outside the dock, and a breakwater 1,330 ft. in length. The new dock and outer basin occupy the site of an old tidal harbour. This has been deepened to the uniform depth of 13 ft. below low-water level, and divided into two portions—wet dock and tidal or outer basin—by means of a cross-pier, 80 ft. wide. In constructing the walls of the dock a portion of the Montgomery pier has been removed, but as much of it as could be utilised has been widened from 30 ft. to 165 ft. in order to give the necessary railway and other facilities on the north side of the new dock and tidal basin. At the end of the pier as it now stands the Lanarkshire and Ayrshire Railway Company have erected a station. The old quay walls on the north and south sides, which were taken advantage of in constructing the new dock, have been underbuilt with concrete. The walls on the east and west sides of the dock are new, and have been constructed of rubble concrete. The new dock is 700 ft. long and 620 ft. broad. It is separated from the new tidal basin by a quay 80 ft. wide, with a connecting passage for vessels 60 ft. wide near the north-west corner of the dock. This passage is provided with gates of green-heart timber, and with strut-gates behind for protection in stormy weather. The new outer or tidal basin is 500 ft. long and 370 ft. broad. The old walls on the south and west sides, having very shallow foundations, were discarded, and new walls constructed of rubble concrete have been built in front of the old quay walls. These walls were constructed in lengths of from 60 ft. to 100 ft. inside cofferdams, the new walls here, as elsewhere, being

founded on the rock. The new breakwater, which is 1,320 ft. long, has been constructed of concrete. At the southern extremity it is founded on a rock, which forms the north boundary to the entrance, named "The new pier," which takes the place of the old Montgomery Pier, has accommodation on the south-side for a large steamer, and on the north side for two passenger steamers. The old pier on the south side of the outer basin has been replaced by a new erection, which extends 20 ft. further into the water than the old structure, and has been carried down to the rock. The accommodation at this pier has been improved, and will be further improved when the Glasgow and South-Western Company complete the erection of a new pier station, which is now in progress, for the accommodation of their Arran and Belfast traffic. The hydraulic machinery for the equipment of the dock has been supplied and erected by the Hydraulic Engineering Company, Limited, of Chester. In connection with the extensions, a tract of land, about 700 ft. wide, has been reclaimed from the sea, the material excavated from the harbour having been used for this purpose, and a portion of this reclaimed ground is used as the site of the Lanarkshire and Ayrshire Railway Company's station for the town of Ardrossan. The harbour extensions were designed by and carried out under the superintendence of Messrs. Strain, Robertson, & Thomson, civil engineers, Glasgow and Westminster, while the works have been completed by Messrs. Lucas & Aird, contractors, London.

SEWERAGE OF WHITBY AND ELSMESERE PORT.—The sewerage of Whitby and Elmsmere Port, Cheshire, has recently been completed by the Wirral Sanitary Authority. The work was rendered all the more necessary by the great increase in the population of Elmsmere Port through the construction of the Manchester Ship Canal. The sanitary condition of the place was becoming exceedingly defective. The total length of the sewers constructed is about 5,000 lineal yards. They are laid with stoneware pipes supplied by Messrs. Doulton & Co., ranging in diameter from 9 in. to 18 in., and provided with Stanford's joints. Flushing-tanks and all other modern appliances are provided, and the manholes are furnished with deodorising baskets fitted with polarite. The work, which has cost 4,250*l.*, was designed by Mr. Charles H. Beloe, the Engineer to the Authority, assisted by Mr. Frank E. Priest, and has been executed, under their superintendence, by Messrs. Young & Sons, contractors. The clerk of works was Mr. Geo. Mollivaine.

STAINED GLASS AND DECORATION.

MEMORIAL WINDOW, MANCHESTER CATHEDRAL.—The westernmost window on the south side of the Manchester Cathedral is now being filled in with the Chadwick memorial, by Messrs. Heaton, Butler, & Bayne, of London. The subject of the window is "Moses Coming Down from the Mount," which will fill the five lights of the clerestory. In the tracery is the inscription, "Moses coming down from the mount," the rest of the tracery being filled with the passion flower and foliage. In the centre division Moses appears bearing the tablets of the law, and to his left, in the two centre compartments, the subjects are "The Sacrifice" and "The Golden Calf." The corresponding window on his right are occupied by a banner-bearer and foliage.

STAINED GLASS WINDOW, ST. GILES' CATHEDRAL, EDINBURGH.—One of the two-light clerestory windows on the south side of the choir of St. Giles' Cathedral has just been filled with stained glass. In the one light is placed the arms and in the other the crest of the Worshipful Goldsmiths' Company, surmounted by their motto—"To God only be all glory." These are placed within canopied ornament. The work was executed at the studios of Messrs. Ballantine & Gardiner, Edinburgh.

WINDOW, KIRKWALL TOWN-HALL.—A large stained glass window has been placed in the Town-hall of Kirkwall. The window consists of three lights, divided by a transom. The left-hand light, being the gift of Shetland to Kirkwall, shows a figure of Henry St. Clair, one of the Earls of Orkney and holder of Kirkwall Castle. At the base of the centre light appears—"Erected by public subscription. Thomas Peace, Provost, 1892." It contains a figure of James III. presenting a charter to Kirkwall. The third light—the gift of Sheriff and Vice-Admiral Thomas—contains the figure of King Hakon Hakonson. Above the transom are placed the arms of Shetland, Orkney, and Sheriff Thomas, the whole surmounted in the centre light by the Royal arms of James III. impaled with those of his spouse, Queen Margaret of Denmark. The windows were executed at the studios of Messrs. Ballantine & Gardiner, George-street, Edinburgh.—*Scotman.*

MEMORIAL WINDOW, ST. PHILIP'S CHURCH, HOLME.—St. Philip's Church, Chester-street, Hulme, has been presented with a stained glass window as a memorial of the late Mr. Herbert Birley. The window, which has been designed and executed by Messrs. T. Thomason & Co., of Manchester, contains three lights, the left-hand subject representing "Eli instructing Samuel," and the centre depicting "The Good Samaritan," and the

right hand subject representing "Christ blessing little children." Surmounting the whole are figures of angels, embellished with tracery.

FOREIGN AND COLONIAL.

FRANCE.—The President of the Republic has signed the decree authorising the erection of the statue of Balzac on the Place du Palais Royal. 1,730 pictures have been admitted to the Salon this year. The number of artists in 1730 last year. It is announced that the Gare de Lyon at Paris is to be completely transformed and increased to double its present size, according to plans prepared by M. Noblemaire, the engineer to the company. The scheme will take five years to carry out, and will cost about eleven million francs.—A new hospital for aged paupers is to be built at Pantin, near Paris.—The Council of State has before it a recommendation to extend the railway from St. Lazare to Molineux, Courbevoie, &c., up to the Esplanade des Invalides. The terminal station would be placed near the Quai d'Orsay, adjoining the Ministry of Foreign Affairs.—The Académie des Beaux-Arts has not awarded the Prix de Rome this year, because the only design sent in does not conform to the conditions. The statue of Clémence Marot, the poet of the Renaissance period, is to be inaugurated in June, at the town of Cahors. An art exhibition is to be open at Cognac during June.—The works begun some years ago for the formation of a port at Marmande, or the Garonne, have just been completed.—A fire broke out a few days ago in one of the chapels of the Cathedral of Dol, but was fortunately got under before much damage had been done. The church is a fine monument of thirteenth-century work, containing some splendid oak stalls, an episcopate of the fifteenth century, and the remarkable tomb of Bishop Thomas James, executed in 1501 by Jean Juste.—A fire has nearly destroyed the ancient and curious church at Avon, near Fontainebleau. It contained the tombs of Mousdelah, Ambroise Dubois, Bezout, and Daubenton. The high altar, which dated from the time of Louis XIV. was entirely destroyed, as was the sacristy. The ornaments lately given by Queen Anne of Austria.—We hear at the last moment, with much regret of the death of an architect of great talent, M. Alphonse Crépinet, at the age of sixty-six. He was a Government architect, entrusted with the care of the Hôtel des Invalides, and it was he who carried out in 1855, with great skill, the restoration of the dome of that building. In the competition for the Paris Opera House his design was classed next to that of M. Garnier; his design for the Hôtel de Ville was one of the most remarkable, and M. Thiers had commissioned him to make the plan for the Parliamentary Palace which he had intended to have built at St. Cloud. At the time of his death M. Crépinet was busy with the plans for the Opéra Comique, in accordance with a commission from the Minister of Public Works.—The publication is announced of the posthumous memoirs of the painter Eugène Delacroix.—The Minister of Public Instruction will shortly lay before the Chamber of Deputies a financial scheme for providing for the rebuilding of the Opéra Comique.

BERLIN.—In the course of a debate on the petition of some seventy-five artists that the municipal authorities should set aside a sum of money in their Budget for the purchase of works of art, one of the city councillors, Herr Kyllmann, spoke in a most spirited way in favour of the proposal, and even went so far as to say that it was high time that the City of Berlin should no longer be subject to the reproach that the art treasures the citizens had the benefit of were being held either to the Crown or to the nation, and that the city as such did not do nothing in the matter. He was not only in favour of the municipal buildings having some works of art in them, but also that the city should establish a good municipal art collection in a similar way as such cities as Leipzig or Cologne had done. Thanks to this speech the councillors have decided on having a fairly large sum put down for the purchase of works of art in 1892-93.—Owing to the unsatisfactory results of the various competitions for Government Prizes and Studentships held under the auspices of the Prussian Royal Academy, the Minister of Educational Affairs has now made some radical alterations in the unpopular regulations referring to them. They will no longer be the preliminary examinations within the walls of the Academy, and then a distribution of ideal subjects to be worked out at home by the candidates. The competition will simply be in the form of an application tendered, together with examples of work already done. As regards the examples of work to be sent in by candidates for the architectural studentships, it is interesting to note that they need simply consist of drawings or photographs of any buildings put up or in course of erection from their designs, one drawing in perspective being the only compulsory adjunct. Candidates must be Prussians by birth, and must not have entered their thirty-third year of life. The value of the studentships has also been altered. There will now be an annual architectural one, having a value of 165*l.*, instead of a biennial one of 330*l.*—Acco-

MISCELLANEOUS.

to their report for 1891, the managers of the Great Berlin Tramway Company (which has of a total length of over 240,000 metres) have been discussing the advisability of introducing electricity as a motive power instead of horses. They have come to the conclusion to postpone their plan for several years, so as to be able to see the development of the electrical traffic in other cities. They do not consider any of the present plans perfect, there would be great local difficulties to contend with, and they shun the expenses of experiments as their concession to run the lines is a short one.—Owing to the several railway accidents caused by faults of overworked railway engines, the Minister of Public Works has sent a gentle reminder to those responsible that he will use of his powers without leniency whenever there is over-work comes before him.—Herr Fessenden, the librarian of the "Arts and Crafts Society," read a paper on the taste shown in wood work of this class. The meeting was attended by members and visitors.—The meeting of the General Post Office in the Leipziger Platz will not be commenced this year, owing to necessary funds not having been voted. This is a great pity, if only on account of the excellent office museum, which is terribly cramped in dark rooms of the old building.

NORWAY.—The Norwegian Government has presented a bill with plans to the Storting for erecting Government Offices in Christiania. There are three designs, the one principally suggested being that of Herr Lenschow, the so-called "H" shaped plan, and a "rectangular" one by Herr Bull, city architect, and awarded second prize in the competition. However there is but little difference in cost between the two plans, about 10,000,000, total cost being estimated at 200,000,000. It is intended to locate in this building the offices of the Central Statistical Bureau, and those of the Lighthouse, canal, agriculture, and forestry. Provisionally a sum of 15,000,000 is set for the building, which will be situated on the site of the old city hospital, now to be pulled down.—We have on previous occasions referred to the disgraceful manner in which the competition designs to a museum at Bergen was conducted.

The "fathers" of that city, and, as a closing act, the Norwegian Association of Architects and Engineers have now issued a formal letter of protest against the same, particularly against the entirely ignoring the suggestions of that representative body as to the competition.—The Professor L. Dietrichson, "The Norwegian Churches," to which we have previously referred, is the object of a highly laudatory article in the *Centralorgan für die Interessen des Realwesens*. Arrangements are being made for installation of a municipal electric central station in Thronbjørn, in order to light the streets with electricity.

NETHERLANDS.—The following sums are to be devoted to building purposes on the Bavarian Government roads: (1) for the Eger railway station extension 70,000; (2) for the new central station at Eger 100,000.

NETHERLANDS.—The competition for a design of a new gas system for the city has been decided by an awarding jury, consisting of the Mayor, several urban civil engineers and medical men, and an Austrian specialist (Ingenieur Rella, Wien, and "Stadtbaurecht" Koehn, of Charlottenburg). None of the twenty-five designs sent in were considered suitable, and hence no first premium was given. The four designs considered best, however, received awards. Their authors are: Mr. Schloffer, of Sophia; Mr. L. Masson, of Paris; Mr. Weigand & Paulsen, of Sophia and Strassburg; and the Botto Bros., of Rome.—*Centralorgan für die Interessen des Realwesens*.

INTERNATIONAL BUILDING EXHIBITION IN LEMBURG.—From August 30 to September 20 this year an international building exhibition will be held in Lemburg, Galicia, which is intended to illustrate the present-day efficiency of the building industry, especially the progress which has been made in the manufacture of both the older-fashioned and the building materials. Applications for space to be made on a specially-printed form, which will be obtained gratis from Die Komitee der Ausstellung in Austerlitz in Lemburg, Ringstr. 30. The reception of exhibits will begin on August 30, and terminate on August 25, 1892.

CAPE TOWN, SOUTH AFRICA.—The *Cape Times* of 20th ult. says that some serious defects in drainage having been discovered at Government House, the official residence of his Excellency Sir John and Lady Loch, extensive alterations are being carried out in the sanitary arrangements, the design of Mr. Corbett, late of Southampton. Chief Sanitary Inspector of the Municipality of Cape Town.

PROPOSED RESTORATION OF BRISTOL CATHEDRAL.—We quoted a paragraph last week from a Bristol paper, which stated that the restoration of the cathedral (under Mr. Pearson) was to be carried out according to the design of the late Mr. Street. Mr. Pearson writes to say that this is a mistake, that Mr. Street left no plans for any restoration, and no record of what his ideas were as to the cathedral.

A TIMBER-TRADE VIEW OF THE EXAMINATION IN ARCHITECTURE.—The *Timber Merchant*, a trade journal published at Liverpool, in its issue for the 10th inst., under the heading "Awkward dimensions," refers to the examination held under the auspices of the Royal Institute of British Architects the other day, and says:—"The candidates seeking to be admitted as Associates of the Institute were examined on a variety of useful subjects, but to the list we think one other could very appropriately have been added. We think they might have been questioned as to what are the general and usual sizes of sawn wood imported into this country, and by dividing these into two, it could have been made even more interesting and beneficial. The students might have been asked as to what are—firstly, the standard dimensions of sawn wood imported into the West Coast Ports, and, secondly, into the East Coast Ports. A large number of our readers will already see our drift, for builders and contractors, from experience, painfully aware that very many architects are comparatively ignorant of the standard sizes of sawn wood, and consequently often specify, in quantities, very awkward dimensions of timber. This causes more irritation amongst builders and contractors using Canadian timber than perhaps amongst those who chiefly use Swedish wood, for the sizes of the former wood are much more limited in number than are those of the latter. Spruce comes generally in three sizes, 7, 9, and 11 by 4, and pine deals are also largely of the same dimensions. Swedish, Norwegian, and Russian wood varies in thickness from 1½ in. to 4 in., and in widths from 4 in. to 12 in. We have not referred to boards, as they do not concern our present point. Now, we affirm that architects should be tolerably well acquainted with the standard sizes of these different woods, and that they should specify only such dimensions as can readily be sawn from them without waste of material and money. Especially should they know the sizes of Canadian woods, for the reasons briefly given. It is very annoying to the builder when he finds spruce floor joists specified 6 in. by 3 in., or 5 in. by 2½ in.; or spruce ceiling joists, 2½ in. by 2 in.; or spruce spars, 3½ in. by 2½ in.; yet these and other awkward sizes are constantly met with in quantities. A knowledge of the standard sizes of spruce would dispense with such specifications, and prevent the display of such bad temper, and the utterance of hard and impolite expressions. The lot of a builder and contractor is sufficiently worrying, without his being needlessly harassed by specifications of timber which he knows cannot be obtained without incurring a deal of extra cutting, and a deal of waste."

SEA DEFENCES AT LANCING.—An inquiry was held on Tuesday last, the 19th inst., by Mr. Arnold Taylor, Inspector of the Local Government Board, at the Town Hall, Worthing, when the scheme for providing sea defences for the frontage of Lancing was considered. Mr. R. F. Grantham, M. Inst. C.E., explained the plans and estimates, and the features of the proposed system of groynes. The system, when carried out, will form, together with the series of groynes erected some years ago to the seaward of Lancing, a complete defence for a length of frontage of two miles. The groynes are generally 300 ft. long, and are placed at from 400 ft. to 500 ft. apart. It is claimed for this system that it is the most economical form of defence in such situations, costing about 12s. per lineal foot of frontage. The Inspector determined to recommend sanction for a loan for the purpose.

ANEMOMETERS.—At the meeting of the Royal Meteorological Society, on Wednesday evening, a paper was read on "Anemometer Comparisons," by Mr. W. H. Dines. This was a report on a valuable series of experiments, which have been carried out at the request of the Council of the Society with the view of obtaining a direct comparison of the various anemometers in common use, so that some opinion might be formed as to which type of instrument is the most suitable for general purposes. The Meteorological Council have defrayed the cost of the work. The anemometers which were compared were:—1. Kew-pattern Robinson. 2. Self-adjusting Helicoid. 3. Air-meter. 4. Circular pressure plate (1 ft. in diameter). And 5. A special modification of tubeanemometer. Most of these instruments are of the author's own invention, as well as the apparatus for obtaining automatic and simultaneous records from all the instruments upon the same sheet of paper. It appears that the factor of the Kew-pattern Robinson is practically constant, and must lie between 2.00 and 2.20. The Helicoid anemometer is quite independent of friction for all excepting light winds, and different sizes read alike, but it is not so simple in construction as the cup form. The air-meter consists of a single screw blade formed of thin aluminium, and made as nearly as possible into the exact shape of a portion of a helicoid. A similar instrument with a larger blade, and with the dial protected from the weather, would probably form a useful and correct anemometer. It would be light, and offer a very trifling resistance to the wind. The oscillations of the pressure-plate must have been considerably dampened by the action of the floating weight, but as it was they were sufficiently violent. It seems probable that the remarkably high values some-

times given by the Osler Pressure-plate may be due to the inertia of the moving parts. The tube anemometer appears to possess numerous advantages. The head is simple in construction, and so strong, that it is practically indestructible by the most violent hurricane. The recording apparatus can be placed at any reasonable distance from the head, and the connecting-pipes may go round several sharp corners without harm. The power is conveyed from the head without loss by friction, and hence the instrument may be made sensitive to very low velocities without impairing its ability to resist the most severe gale.

THE ENGLISH IRON TRADE.—Unfortunately, there cannot be recorded any amelioration of the depressed condition of the English iron market. Prices show little variation, but new orders are not forthcoming, and the continuance of the Durham miners' strike prevents business in the Cleveland district, where not a single furnace is working on Cleveland pig, and only five in all are in blast. Manufactured iron is still in limited request, and the demand for steel is slack. There is, however, some improvement in the inquiry for tin-plates. Engineers and iron-founders continue to experience only a moderate enquiry, but shipbuilding yards are fairly active. The coal trade is tolerably active.—*Iron*.

MOSAIC AT ATHENS.—In the atrium of a Roman house recently excavated at the Piræus an unusually fine mosaic pavement has been laid bare, of which a large Medusa head occupies the centre. The head, 60 centimetres high, has abundant hair, and on the forehead two wings, like those of the *petasus* of Heracles, and is flanked by serpents and the inscription which runs round it is a reproduction of verses 741-2 of the fifth book of the Iliad, describing the Medusa on the shield of Athena. In the same ruins was found a terra-cotta antefix bearing in the centre a Gorgoneum, but dissimilar from the above, as it is of savage and repulsive appearance, with the tongue hanging out of the mouth.—*Attenaion*.

THE BRITISH CLAY TRADE.—This is the title of a new monthly journal especially devoted to all products of which clay is the raw material, bricks, tiles, terra-cotta, earthenware, porcelain, faience, drain-pipes, sanitary ware, &c., &c. The contents of the number are varied and interesting, one of the features being the first of an intended series of articles entitled "Modellings in Clay," of which the subject is Mr. Thomas Minton, J.P., Chairman of Minton's, Limited, of whom we have given. Brick and tile-making machinery, and new forms of kilns, are included among other items of technical interest described and illustrated.

TRADE CATALOGUES.—Messrs. R. Waygood & Co.'s abridged Catalogue of Lifts, Hoists, and Cranes, recently issued by them, contains, within a small compass, a very useful series of illustrated and priced descriptions of their well-known lifts and hoists for all purposes. It may be truly summed up in the words *multum in parvo*.—Messrs. G. B. Kent & Sons send us their "Painting Brush List," for March, 1892. It includes all kinds of tools for decorators, painters, and glaziers, and is illustrated and priced. This catalogue also is of small bulk, although it is very complete and useful.—Messrs. George Waller & Co. send us illustrated catalogues of their specialities in sanitary machinery and appliances, including cesspool-pumps and vans, as used in the "Boxley" system of emptying cesspools, already fully described by us. The catalogues also include air-tight covers for sewerage systems, inspection and man-hole covers, side-entrance covers, ventilators, gullies, penstocks, tide-flaps, drain and gully cleaning tools, &c., &c.

THE LONDON COUNTY COUNCIL AND THE TRAMWAYS.—It is stated by the *Times* that the Board of Trade have appointed Sir Frederick Bramwell as referee in the arbitration proceedings between the London County Council and the London Tramways Companies as to the former taking over control of the tramways.

LONDON PROPERTIES FOR SALE.—On May 18 next, by order of the Ecclesiastical Commissioners, will be put up for sale at the Mart, the site (about 3,900 square feet) and materials of the St. Mary Magdalen (Old Fish-street) Church, in Knightbridge-street. The church was destroyed by the fire that broke out in an adjoining block of warehouses on December 2, 1886. In our issue of December 11 of that year we gave a history, with an illustration, of the church, as re-built by Wren, and a description of the walls and interior as they stood after the fire. About eighteen months ago it was stated that a large number of ferns had sprung up amongst the debris on the floor. The parish has been united, we believe, with that of St. Martin, Ludgate, whose church is one of the four that are specially exempted from demolition under the powers to which public attention is just now directed in the case of St. Dunstons-in-the-East. The organ, to which we allude in our article, was by Green, and reconstructed, in 1857, by Messrs. Gray & Davison; it was cleaned for removal, together with some other relics, to St. Martin's.—On the 28th and 29th inst., in 250 lots, some freehold ground-rents, amounting to 2,400l. per annum, secured upon about 600 houses on the South Bermondsey estate, and covering more than 30 acres. On the 27th inst., will also be let on lease for 99 years, at the Mart, the final portion of the London-ward estate belonging to Stion

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with columns: Nature of Work, By whom Advertised, Premium, Designs to be delivered. Includes entries for Valuation of Property, School, Teachers House, and Town Hall and Public Offices.

CONTRACTS.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Includes entries for Stone Retaining Walls, Platers and Plumbers Work, Carpenters Work, and various other construction contracts.

CONTRACTS.—Continued.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Continuation of contracts from the previous table, including entries for Paving Local Board, Casual Work, and various other works.

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be received. Lists appointments for Clerk of Works, Engineering Assistant, Office Assistant, and other public roles.

Those marked with an Asterisk (*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, vi, & viii. Public Appointments, p. x.

College. It consists of an area of 1,440 ft. superficial, having a frontage to Philip-lane, and is at present occupied by the Cripplegate Ward Schools, to be vacated by next Midsummer-day. On October 20, 1888, we published a view, taken from the court, of the gateway of the old College, which was pulled down twelve months afterwards. On May 11, by an order in Chancery, de re Hope v. d'Hedouville, some freehold property covering two acres, and comprising 126 houses, cottages, and shops, in Lever-street, Central-street, and thereabouts, in St. Luke's parish, yielding an aggregate rental of 2,064l. per annum. And in June, by direction of the late Mr. P. B. Leyland's executors, the house No. 49, Prince's-gate, whose interior has been richly decorated under the superintendence of Mr. Jeckyll, Mr. Norman Shaw, and Mr. James McNeill Whistler. The main staircase, leading from the ground floor, was brought hither from Northumberland House by Charing Cross.

CLOCK, HURNWORTH-ON-TEES.—A new public clock has been fixed here. The clock has Lord Grimthorpe's gravity escapement and maintaining power, compensation pendulum, and all the latest improvements inserted. The hours are struck upon the fine tenor bell of about 18 cwt., and the Cambridge chimes upon four bells. All the bearings are of gun metal, screwed into the frame, and the dial or motion wheels of gun metal, cut and polished on the engine. Messrs. Wm. Potts & Son, of Leeds, were the makers.

"SHOULD GAS COMPANIES DO ALL GAS-FITTING?"—This question formed the title of a paper read by Mr. W. H. Anson, of Columbus, Ohio, at the eighth annual meeting of the Ohio Gaslight Association, held at Columbus on March 16 and 17 last. The proceedings of the meeting are fully reported in the American Gaslight Journal for April 11. Mr. Anson answered the question with a decided affirmative, on the ground that the so-called "gas-fitters and plumbers" in that part of the world are generally merely plumbers, with no proper knowledge of gas-fitting and its requirements. He concludes his paper with these words:—"The taking in hand of internal fitting by gas companies would, I think, have a tendency to decrease, instead of increase, their liability for damages because of leaks, explosions, &c., for by doing so they can greatly improve the character of the work, thus lessening the chances of accidents. Many accidents have been caused by carelessness on the part of plumbers, and very few are caused by bad work on the part of the gas companies. Damages have been recovered by individuals from gas companies as the result of an accident caused by the ignorance or carelessness, or both, of plumbers, simply because it was the gas company's product which was contained in the pipes. If a gas company is assumed to be financially responsible for all the accidents occurring through the poor work of the professional fitter, then, I think, the sooner they take in hand this branch of their business the better. Gas companies should enlist the co-operation of the architect, the contractor, the builder, the owner or agent, and the manufacturer of and

dealer in all gas appliances. The co-operation of these individuals with the gas companies would be of more pecuniary benefit to the latter than the combined efforts, as now put forth, of the united kingdom of plumbers. For they, especially the dealers and manufacturers, are sufferers with the gas companies at the hands of the plumbers. In view of all these and many other considerations, I am of the opinion that gas companies should do all gas fitting." In the discussion which followed, Mr. Anson's views were fully endorsed by all the speakers.

FATAL CRUSH AT HAMPESTEAD HEATH RAILWAY STATION: EIGHT LIVES LOST.—On Easter Monday evening, shortly after six o'clock, the railway station at Hampstead Heath was somewhat suddenly besieged by a dense crowd of holiday-makers on their way home. The day had been fairly fine, and the Heath had consequently been thronged with people, but shortly before the time named the weather became threatening, and large numbers of the holiday-makers hastened to the station. A staircase leading down to the platform was packed with people when it is said, some one fell at the foot of the stairs, this caused others to fall, and in the result eight persons (two women and six boys) were crushed or trampled to death through the pressure of the surging and undisciplined crowd behind and above. Of course there will be a coroner's inquest into the circumstances of the disaster, but there can be no doubt that, as the Times says, "the practical lesson which should be learnt from the accident is that the whole system of railway accommodation at stations in or near populous towns requires consideration, and that the companies themselves cannot be accepted as the best judges of its adequacy for all the requirements which it may be called upon to fulfil."

STREET IMPROVEMENTS AT SHEFFIELD.—At the meeting of the Sheffield Town Council on the 13th inst., Alderman W. J. Clegg moved "That the Corporate Common Seal be affixed to agreements for the purchase of land and premises in Watson-walk, belonging to Messrs. Cockayne, Messrs. Birks, Sir Henry Watson, and the trustees of Mr. William Watson, at not exceeding the prices mentioned in the report of the sub-committee of the Improvement Committee, and presented to that Committee on April 4, 1892." This notice was the result of a discussion which took place at a meeting of the Improvement Committee on April 4. On the latter day a sub-committee of the Improvement Committee made a report to the effect that the widening of Watson-walk to a street of 42 ft. wide could be carried out at a cost of 47,000l.; the re-sales of property would probably realise 16,000l., leaving the net cost 37,000l. To this would have to be added 1,000l. for making the new street and 250l. for the purchase of tenant rights. The Improvement Committee discussed the report, Alderman Clegg moved that the Council be recommended to adopt agreements for acquiring the needed properties. This motion was not carried, and Alderman Clegg intimated that he should bring the matter forward at the next Council meeting. The motion was then carried, after a long discussion, by a majority of one vote only. The Sheffield Daily Telegraph criticises the scheme and says it would have been better to widen the High-street.

meeting. The motion was then carried, after a long discussion, by a majority of one vote only. The Sheffield Daily Telegraph criticises the scheme and says it would have been better to widen the High-street.

WARMING AND VENTILATION OF FACTORIES.—The Eastern Evening News of the 23rd ult. describes Messrs. Harman's new clothing factory in St. Andrew's Broad-street, Norwich, which is warmed and ventilated on the Blackman-Smead system. This we are told is "an elaborate system of ventilation, introduced by an American company, and on which has not before been tried in this country. At the rear of the premises there is a square iron chamber containing a number of steel tubes through which the air is drawn, being cleansed off its way by passing through sieves of gauze, whose efficacy is attested by their blackness. A large fan forces the air up a brick shaft running from the basement to the top. Another fan at the top of the building is at work extracting the air which has been used. In this way a constant circulation is kept up throughout the whole building, and thus the air of the factory is changed every half-hour by the same apparatus the heat being applied, not directly to the air itself, but to the outside of the steel tubes. A walk through the premises is sufficient to demonstrate how great are the advantages of this system as compared with the old method of heating the air over and over again by flues or steam-pipes."

MEETINGS.

- SATURDAY, APRIL 23. Society of Antiquaries.—Anniversary meeting. 7 p.m. Edinburgh Architectural Association.—1. Visit to Callender House and Grounds, including the Roman Remains of the Antonine Wall. 2. Visit to Town and Churchyard of Falkirk. MONDAY, APRIL 25. Surveyors' Institution.—Mr. E. G. Wheeler on "Leases to Limited Liability Companies." 8 p.m. Leeds and Yorkshire Architectural Society.—Presentation of Annual Report and election of officers. 7.30 p.m. TUESDAY, APRIL 26. Institution of Civil Engineers.—Mr. James Swinburne on "Electric Light Measuring Instruments." 8 p.m. Royal Institution.—Professor T. G. Bonney on "The Sculpturing of Britain—its later Stages"—1. 3 p.m. Society of Arts (Foreign and Colonial Section).—Sir Edward Braddon on "Australia: its Progress and Resources." 8 p.m. WEDNESDAY, APRIL 27. Civil and Mechanical Engineers' Society.—General Meeting for the Presentation of the Report, Election of Council, &c. 7 p.m. Society of Arts.—Professor R. Wallace on "Egyptian Agriculture." 8 p.m.

SOUTH SHIELDS.—For the erection of houses and shops, for Mr. H. Chapman, in Westborough, South Shields. Mr. Henry Grievs, architect, Albany-clause, South Shields:—
 Jas. Young £2,700 0 0
 E. Sumnerbell 2,600 0 0
 W. J. Robertson 2,428 12 4
 Shields (accepted)..... 2,066 0 0

STOCK (Essex).—For erecting house and shop. Mr. Ed. Mawhood, architect, Chelmsford:—
 H. Gornell £350
 F. Johnson 875
 W. Fincham 875
 E. West 4843
 Chest & Son, Chelmsford 796
 * Accepted.

WAINFLEET (Lincolnshire).—For the restoration of St. Mary's Church, Wainfleet, Lincolnshire. Mr. J. B. Corby, architect, Stamford:—
 J. M. Thompson & Sons £1,600 0 0
 S. Shorewell 1,867 0 0
 A. Wood 1,867 0 0
 Ruhl & Son 1,240 16 1
 S. F. Haulday 1,690 0 0
 Walter & Henman £1,648 0 0
 Thos. Elmes 1,808 19 3
 E. Bowman 3,374 0 0
 J. T. Farmer, Wainfleet 1,268 2 8
 * Accepted for part of the work.

WALTHAMSTOW.—For the erection and completion of new caskery rooms and teachers' room at the south-west end of the Higham Hill Girls' School, for the Walthamstow School Board. Mr. W. A. Longmore, architect, Bridge Chambers, Rue-street, Walthamstow. No quantities supplied:—
 Calnan £700
 Chisholm 588
 Evans 615
 Aney 897
 Conell £293
 Kelland 535
 Chisholm (accepted) 423

WATFORD (Berks).—For new oak ceilings to chancel and transepts of St. Matthew's Church, Oxhey, Watford. Messrs. J. E. K. & J. P. Catts, architects:—
 E. Robliss, Bloomsbury, London £435 0 0

WOOLWICH.—Accepted for erecting five dwelling-houses in Brewer-street, and two in Broomfield, Mr. H. H. Church, architect, Woolwich:—
 Builder's work—Dooms £1,715 0 0
 External mason & work—Benson 140 0 0

WOOLWICH.—For alterations and additions to the "General Hospital" Barracks, for Mr. G. H. Campbell. Mr. H. H. Church, architect, Woolwich:—
 Munday & Son £2,136
 Nelson & Wallis 1,397
 Holloway (accepted) 1,545
 For Painter's work.
 Helling 298
 Worne 213 0
 Sanders & Son £191 15

WOOLWICH.—For erecting additional offices for the Woolwich Local Board of Health. Mr. H. H. Church, architect, Woolwich:—
 Pricer £297
 Chapman 889
 Kirk & Russell 12,250
 Baitam Brothers 12,250
 Woodward & Co. Limited 12,700
 Nightingale £12,335
 Chapman 12,350
 Young & Lonsdale 7,196
 Holloway 795
 Holloway (accepted) 792

WOOLWICH.—For rebuilding Kent-House, Powis-street, for Messrs. Garrett & Co. Limited. Mr. H. H. Church, architect, Woolwich:—
 Treasure & Son £14,880
 Allen & Sons 14,250
 Kirk & Russell 12,250
 Baitam Brothers 12,250
 Woodward & Co. Limited 12,700
 Nightingale £12,335
 Chapman 12,350
 Young & Lonsdale 7,196
 Holloway 795
 Holloway (accepted) 792

Aldringham House, Leiston.—In the list of tenders for alterations at Aldringham House, Leiston, in the *Builder* of 18th Inst., p. 315, the name of the firm who sent in the lowest tender was, by a mistake of our printers, given as "Girling & Co." It should have been "Girling & Coe."

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 19s. per annum (or 4s. 8d. per quarter), can ensure receiving "The Builder," by *Friday Morning's Post*.

TO CORRESPONDENTS.
 J. S.—M. J. L. (we cannot publish such a very elementary inquiry).
 H. H.—"Walter's" inquiry should be addressed to the manufacturer of the material. Another Member A.A. (we cannot publish letters not authenticated by name or address).—Architect and Surveyor (ditto).
 All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessary for publication. We are compelled to decline pointing out books and giving addresses.
 NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the author.
 We cannot undertake to return rejected communications.
 Letters or communications (beyond mere news items) which have been duplicated for other journals, are NOT DESIRED.
 All communications regarding literary and artistic matter should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

THE BATH STONE FIRMS, LTD.
 BATH,
 FOR ALL THE PROVED KINDS OF BATH STONE.

FLUATE, for Hardening and Preserving of Calcareous Stones and Marbles.

DOULTING FREESTONE.
 The stone from these quarries is known as the "Wantage Beds," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England.

THE BEAMLEDITCH STONE.
 Is of the same crystalline nature as the Chelney Stone, but finer in texture, and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK & SONS, Doulting, Shepton Mallet.
 London Agent—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C. [ADVT.]

HAM HILL STONE.
 The attention of Architects is specially invited to the durability and beautiful colour of this material. Quarries well opened. Quick despatch guaranteed. Stonework delivered and fixed complete. Samples and estimates free.

Address, The Ham Hill Stone Co., Norton, Stoke-under-Ham, Somerset. London Agent: Mr. E. A. Williams, 16, Craven-st., Strand, W.C. [ADVT.]

Asphalts.—The Sycossal and Metallic Lava Asphaltic Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms; granaries, tin-rooms, and terraces. Asphaltic Contractors to the Forth Bridge Co. [ADVT.]

Architecture at the Royal Academy.

THE collection of architectural drawings at the Royal Academy is somewhat more heterogeneous, perhaps, than usual, and does not present anything which can be singled out as of special and marked interest. It contains over a great many interesting drawings, the general level of draughtsmanship is kept up. The hanging is somewhat mixed in its arrangement, and the absence of either carelessness, ignorance or partiality is perhaps stronger than usual. Which of these qualities is the ascendant it is of course impossible to surmise unless we knew (which no one does) under whose direction the drawings were selected and hung. As we have already noticed, the Hanging Committee this year did not include an architect, and how sculptors and painters are able to judge of architecture we know only too well. The fact goes that one well-known painter superintended the conclusion of part of the architectural hanging excused himself for having skied some small drawings of sight by the plea that "they had the wall better so," that being apparently the main object. There is evidence of either incapacity or carelessness in the rejection of some drawings of which we have seen and the acceptance of some others; and some of the rejected drawings were hung on the side some of the accepted ones, the latter would be rather curious. Lastly, however, we cannot but think that there is an element of unfairness in the manner in which the drawings representing one or two of the largest buildings in progress were apparently deliberately put on one side and counted aloft. We noticed this last year in the case of Mr. Mountford's view of the Field Municipal Buildings, which was the most important new building of that year, and the drawing of which was placed where no one could see it. We find again this year a drawing of the most important new

building of the year, Mr. Webb's completion of the South Kensington Museum, put on one side at an angle of the room, and one of the non-accepted designs given the central place. There is an obvious intention in this, and though of course it is always possible that the accepted and executed design for a building may not be the best artistically, we cannot see any valid excuse for the treatment in this case. Generally speaking we believe there is a widespread feeling of dissatisfaction among architects with the way the architectural exhibits at the Academy are dealt with; the acceptance or rejection of a drawing is regarded by many (as an architect remarked to us the other day) as "a mere toss-up"; and we cannot but feel strongly that if there is to be any pretence on the part of the Academy of treating architecture as an art on the same level with painting and sculpture, the Hanging Committee ought invariably to include one of the architect members who would be known to be responsible for the hanging, and exhibitors would then know in whose hands they were. As it is, no one has any idea who selects and arranges the architectural drawings; the whole thing is done in a corner, and there is consequently a general feeling of distrust in regard to it.

Once again we point out that the system of exhibiting architecture at the Academy is radically wrong. The room set apart specially for architecture is too small to provide space for any such drawings as would readily give the facts and structure of an architectural design. Preference is given to picturesque views of buildings on a small scale, which, regarded as pictures, are of course of little interest in comparison with the other pictorial exhibits, and with the space allotted no other system is possible. With the public such drawings may be more popular than true architectural delineations of a building, although even this popularity is so limited that the room is generally nearly empty; but an academy of arts ought to lead the public taste, not follow it, and some consideration ought to be given to what is of interest and value to architects and to serious students of the art of architecture. In Paris an architect can exhibit a whole set of drawings giving the plan, section, and

detailed treatment of a single building, and that is the true way to illustrate architecture by drawings. In the case of architecture the picture of the building is not the real thing, it is only a representation of it, being thus in an entirely different class from the other pictorial exhibits. On the French system of exhibiting a complete set of constructive drawings, we have before us the facts and the genesis of the architectural design, instead of a mere picture of it; we can see how the architect has dealt with the problem constructively as well as artistically. The drawings do not represent the mere appearance of the building, but they represent the work itself, and we can put together the architectural treatment of it from the drawings. Until this system is accepted at the Royal Academy, the architectural section of the exhibition must always remain a thing of merely superficial interest, and mere draughtsmanship take the precedence of design properly so-called, as it obviously does at present. The majority of architects who exhibit depend upon a draughtsman to put their idea into a shape in which it is likely to prove acceptable; a most vicious system. But for anything better than this the space allotted is wholly inadequate. Architecture, the central art, is allowed to be cornered instead of taking its proper position, and until the Royal Academy awakes to the fact that art does not mean pictures merely but design in every sense, there is no hope of any improvement. Whenever that principle is realised, it will be recognised that the space allotted for architecture is too limited to serve any good purpose, and it will then be seen that architecture must have more space, in order to meet its claims for exhibition adequately. We fear however that it will be long before the perception of this necessity takes any root in the minds of the majority of Royal Academicians. The majority of the Academicians are painters, and think art means pictures; a heresy in which the public are only too ready to follow them. Architects have some right to complain for they at least have wider views, and are interested in painting and sculpture,—while the painters and sculptors for the most part think of no art but their own. So things

are, and for the present one can only make the best of it.

The three central points of the walls are occupied respectively by Mr. Waterhouse's "Examination Hall, Yorkshire College, Leeds" (1751), Mr. Pearson's view of Truro Cathedral as it will appear when (or if) completed (1687), and Mr. Belcher's geometrical elevation of the competition design for the completion of the South Kensington Museum (1809). No plans are given with any of these. Mr. Waterhouse's Examination Hall is a solid-looking brick building with stone dressings introduced a good deal in the way of flat bands, which form a feature in the upper story of the towers. The entrance front takes the form of two square towers with corbelled-out turrets on the upper stage, and slated spires square on plan; between which is, on the upper floor level (we presume from the appearance of the exterior design that there are two floors), a large Perpendicular tracied window of the orthodox type marking the end of the hall. The side of the building is treated with two ranges of tracied windows of the same type between buttresses, but with segmental arched beads, and a strongly-marked corbelled cornice over. The building has a solid and monumental appearance: the drawing is executed in water-colour in Mr. Waterhouse's well-known and effective if rather heavy style. The drawing of Truro Cathedral is a beautiful water-colour drawing, but gives a false impression of the tone of the exterior of the building, giving it the appearance of a breadth and quietness of tone in the masonry which is not the effect which the actual building has. The general effect in the drawing is fine, the western towers group well with the central one, but they are perhaps rather deficient in power and character themselves; a little more solid wall left in the lower portion would have given them more. The delicate detail about the south porch is carefully touched in the drawing, and contrasts well with the plainer portions of the design. On the whole however the best parts of the cathedral are those now executed; the completion of the nave will not add much to the architectural interest of the cathedral beyond taking away the painful appearance of incompleteness from the eastern portion.

Mr. Belcher's elevation of his design for the South Kensington Museum is an unusual and original piece of design, but very much wants a plan to furnish the key to it. This is a point on which we have spoken so often and so strongly that it becomes wearisome to have to repeat it every year. It is a quasi-Classical elevation, with a long row of columns on the ground story of rather abnormal tenacity. We see no reason why the proportion of the Classic column should not be modified at pleasure and in the desire to get a new effect and expression from the feature, but in this instance we cannot but think that the long row of very thin columns would have a weak effect, and when we find the upper story again striped down with thin columns or pilasters (it is difficult to say which at some points), one feels that this feature has been repeated rather to superfluity. The two cupolas are elegant in design, and so is the upper portion of the tower, though we certainly do not like the columns corbelled out from the plain mass of wall, below the line where the chief decorative treatment of the upper stage begins; they look as if stuck on, and carry nothing but a slight projection suggestive of a balcony. The detail elevation (1675) is a very fine piece of work, and a kind of drawing of which we wish to see more in the architectural room. The sculptural decoration above the ground-floor windows, between the columns, is very original: over each keystone is a shield with the name of an eminent artist, and two female figures, one on each side of the shield, holding up a symbolic accessory: the shield with the name of Chantry is flanked by two nude figures holding up a statue; in the next compartment Mr. G. F. Watts is commemorated, and an easel and brushes sym-

bolise painting; in the next is the name of Gottfried Semper, and two figures hold up a model of a Classic building. Whether however it was well to show these figures carved in stone built into a red brick wall which occupies the plain spaces is a question; it looks piquant and unusual, but it detaches the sculpture too much from the architecture and destroys the appearance of breadth and repose. The drawing is a beautifully executed one, and quite a model for the getting up of detailed elevations. Whether the design could really be quoted as in keeping with existing portions of the museum which are completed externally (which was we think a requirement in the competition), may be a question.

As before observed, Mr. Aston Webb's perspective of his South Kensington design (1716) bangs in one of the angles. It was illustrated and commented upon by us at the time of the competition. The building seems to group in a very satisfactory manner, and suits its site; in another Academy exhibition we hope we may see some illustrations of the further treatment of the building in detail design and in construction. Occupying the position balancing this, at the other angle of the room, is a view of the front of "Gosford House N.B., as completed" (1790), by Mr. W. Young, a design carrying one back to the old days of "Classic" mansions. The entrance is approached by two flights of steps at each end of a terrace carried on a rusticated arcade, which represents apparently the principal floor level of the central part of the house. A great mass of wall rises behind this, broken up by pilasters which are not very happily placed, and pierced with three great round-arched windows divided horizontally at the springing by an entablature carried on a couple of small columns. A pediment occupies the centre of the skyline, with a balustrade on each side crowned at the extremities with lions, and behind the pediment is a low octagon crowned by a circular dome. At each side of the central mass we have wings in orthodox fashion; a square mass in the centre of each wing with lower recessed portions at each side, one of which connects it with the main central building. The front is absolutely symmetrical, and has the dignity of the old-fashioned type of "mansions of the nobility and gentry," but the want of a plan renders it absolutely impossible to form any real judgment as to the treatment of the building: what is the central block, and what do the three large windows light? And what are the functions of the symmetrical side blocks? Do they lend themselves conveniently to the arrangement of the plan, or is the whole simply an architectural screen? These are questions which the design at once suggests, and to which no answer is given.

The exhibition contains another illustration from a mansion on a great scale, this time an interior, "Hawell Grange; interior of Hall" (1629), by Mr. Thomas Garner. This is a very large central hall with a ponderous flat panelled oak ceiling, the ends of the beams carried on carved brackets. The height of the wall is divided halfway by a band of carved ornament running round. On the left is an arcade with marble columns opening from the centre of the side of the hall, a large square-headed opening with pilasters facing it on the other side. The first floor galleries are seen above, with intermittent arcaded openings with marble shafts, leaving solid piers at intervals, and across the end of the gallery is a similar but uninterrupted arcade, through which are seen the arches of a larger arcade in a further part of the building. The lower part of the wall is panelled, the upper part hung with tapestries or carpets. The drawing, a water-colour, is a fine and rich one, and the whole effect exceedingly sumptuous, but there is an impression conveyed that the scale of the apartment is exaggerated, and that it can hardly be really so large as it is made to appear here, where it suggests the central hall of a great hotel rather than of a private house.

The Sheffield Municipal Buildings is illustrated by Mr. Mountford in several drawings. A view of the principal staircase (1679) shows a wide and dignified staircase-hall, the first floor portion carried on arches, with an open arcade on the principal landing, the design of which is carried round the wall on the other sides, the pilasters between the arches supporting a large panelled cove over which is a lantern. The general effect is fine and spacious, but we cannot say that the details are interesting. The Surgeon street front of the building is shown in another drawing (1737), and makes a very agreeable architectural composition, in which the author has succeeded in indicating the multiple nature of the uses of the building while preserving a sufficient degree of architectural unity. The view towards the churchyard, the front at the opposite side from the last mentioned, is not quite so satisfactory in this respect, and appears somewhat too much like a group of buildings put together accidentally, and the end of the council-chamber might have claimed a rather more striking architectural treatment. The staircase tower adjoining it comes in well, and makes a good feature in the façade.

The front of the Royal College of Music at South Kensington, by Sir A. W. Blomfield (1636), is one of the important new buildings illustrated, and one which suffers much from want of a plan, as the elevation gives the idea that the architect has been restricted to treatment mainly of a utilitarian character. The building may be suitable for the site and for its purpose, but the elevation can hardly be said to present much architectural interest in itself.

Prominent features in the room are two large decorative panels, hung at each end above the strictly architectural doorway. One of these is Mr. J. Babb's "Amor Caprarum-frieze" (1678), a design of the same type which its author has previously exhibited at the Academy, consisting of a procession of figures in a yellowish tone relieved on a dark ground, and with painted architectural decoration forming horizontal borders above and below. The present one is a procession of young men and goats arranged in a purely decorative manner; the general effect is pretty and suitable to its position, though the figures are abnormally thin. The other work referred to is one of a more serious type, "Decorative Panel: Youth; the Toilers at the Idlers" (1796), by Mr. Gustav Natrop; wall-painting with a moral. There are no necessary decorations, the design consists simply of figures of men and women, nude and somewhat conventionalised in colour against a light indication of sky as a background; the figures are not too much modelled, but the whole kept flat in effect. The composition is arranged in two sloping lines descending towards the centre (the reverse of a pediment composition), the blank spaces in the background in the centre serving to divide off the two groups distinctly, the toilers on the left and the idlers on the right. The whole composition is agreeable and suggestive, and an effect truly decorative; there is however one mistake, to our thinking, in drawing the recurrent "idler" figure near the centre as partially foreshortened, the feet receding somewhat. As all the other figures are nearly as possible in a flat plane, the result is to give this particular figure the appearance of having the legs too short and the feet too small.

Other drawings in the Architectural Room will notice in future numbers.

LECTURES AT UNIVERSITY COLLEGE.—The following lectures on Archaeology are announced: Five lectures on the "Medieval Archaeology of the West," by Professor Stuart Poole, on Mondays, from May 2 to May 23; five lectures on "The Relations of Religion and Art in the Middle Ages," by Mr. Maurice Hewlett, on Mondays, from May 30 to June 27; six lectures on "Medieval Archaeology of the East," by Professor Stuart Poole, on Thursdays, from May 5 to June 9; and four lectures: "Art in India," by Mr. J. Kennedy, on Thursday, June 16, Friday, June 17, Thursday, June 23, and Friday, June 24.

THE SKETCH DESIGNS FOR THE GLASGOW ART GALLERIES.

OF the sixty-two designs submitted for this competition, fifty-one only are included in the public exhibition of the drawings, and of these several are anonymous. It is unfortunate at the preliminary conditions left competitors the option of withdrawing their designs, or it cannot be too strongly insisted that full publicity is essential to a rightly-conducted competition. It is strange that architects could fail to see this, and should have withdrawn their work when invited by the committee to exhibit.

It must be confessed that of these fifty-one large proportion is frankly bad; it is somewhat disappointing to find nearly one-half included in this sweeping category. The density, of course, is of varying degree; such of it arises from ignorance of planning, an art in the higher sense, not less capable of artistic inspiration than an elevation; much of it, too, arises palpably from simple inexperience. This last is almost welcome, for we cannot but feel that an important competition, such as this, may be of genuine educational value. What is not welcome is the aggressive badness of experienced incapacity, the tawdry "Classic," the unspeakable paronial, or the atrocity of a Leicester-square "Alhambra."

It is abundantly evident that the committee's unfortunate instructions, or, rather, lack of explicit definition, as to the central hall, have completely misled the majority of the competitors, who have most naturally interpreted it as a concert-hall. That this crucial feature of the whole design, should have been left so vague and ill-defined in the original instructions is the most unsatisfactory point about the competition; it must have occasioned many murmurs and heartburnings that could, and should, have been avoided.

Mr. J. J. Burnet's design is, in point of plan, exceedingly able and well studied; it is somewhat unaccountable that it should not have been included in the six selected. The central hall is here placed lengthwise, east and west, as in Mr. Deane's design; the main entrance is from the south, with a subsidiary entrance from the north or river side; the administration and school of art are grouped to the right and left in the south front, so that, by recessing the main entrance to the building proper, an exceedingly ingenious yet obvious arrangement has been effected, in which the three separate entrances are grouped together most conveniently. From the vestibule, which is really part of the museum, the circulation is uninterrupted and complete round the entire building on both floors, with entrances to the central hall on all four sides below. The whole plan is dignified and broad, with much skill shown in its adjustment and combinations, even to the basement service of the galleries and schools of art. Its chief defect is that the central hall, which is likely a hall for music, and rather long for its depth, is too much cut off on the first floor, and destitute of all circulation commanding the whole on the ground floor it is not quite happy that the main approaches should be on the sides. This would detract considerably from its impressiveness on entering. The elevations to this design are evidently sketched off sufficiently studied, and rather forbidding in their sketchiness. The style is a dignified Modern Classic, that would, however, require care to make the building as attractive as it might be. The four thin towers round the central hall recall rather obviously Mr. Peck's (perhaps cheap) criticism of King's College Chapel, "a table upside down."

Mr. G. Washington Browne's design may be grouped with Mr. Burnet's in that it also combines the entrances to the building proper with those to the school of art and the administration; these form, however, a separate block thrown forward on the south front, and connected with the main building

by a vestibule. The central hall is here elliptical, with gallery or corridor all round it on both floors; to the right and left are the museum and art galleries in most straightforward simplicity, with an admirable circulation for the public. The staircases are not adequate, but the plan is otherwise an able one. It is, however, doubtful if an oval hall would be of sufficient dignity; it is certainly disappointing here in section. The elevations are less successful, being disjointed and overpowered, in spite of two towers, by the huge roof of the central hall; some of the detail is seriously out of scale.

Mr. W. J. Anderson has also an exceedingly good design, which does much credit to the younger school of Glasgow architects. The art school and administration are similarly grouped with a main entrance, but in this case to the north: the great hall and galleries are thus a complete whole, with the same uninterrupted circulation, and a satisfactory sense of unity. The central hall is square, with great bays on all four sides, two of which are separated off by columnae into aisles, and restore the hall to the rectangle. The section of the hall is poor, but the design as a whole is very good, the elevation to the south being very fine. To the north the art school, &c., are most unnecessarily large, which leads to a quite exaggerated vestibule; but the semicircular entrance is very good indeed. The north elevation is scarcely successful, and the side façade is marred by the disjointed connection of the museum proper and north block. These defects, however, could doubtless have been greatly overcome (particularly as the art school has been ultimately abandoned), had the author been accepted for a second study.

In a totally different category comes the remarkable design of Mr. Wm. Leiper. Here the plan, though in detail artistic and with a certain poetry about it, has been somewhat fatally sacrificed. It is open to much criticism for its want of broadly thought-out circulation, its galleries that are *culs-de-sac*, its staircases to the north that are too hidden away; nearly one-third of the site is left vacant "for future extensio," which makes the plan lapsidate. But the building would have been beautiful, full of poetry and character. The elevations are most studied, broad and dignified, yet each with a special interest of its own. The style adopted is Italian Gothic, more especially Venetian, and with a certain almost Oriental feeling, full of poetry and charm; the entrance to the east, which more directly serves the museum and galleries, is particularly good. In the south front the central feature is a finely-proportioned dome over the entrance-vestibule; on the north is a flatter dome, with behind it two beautiful octagonal towers flanking the great hall, containing staircases and ventilation shafts. The angles of the building are emphasised with turrets, thoroughly in keeping with the style. It is, however, doubtful whether a more important motive might not have been adopted, to which the plan, with its square-angle rooms, would have lent itself most readily. The façade has a tendency to run on *ad infinitum*, with no very evident termination, a criticism which, however, is equally true of the old buildings on whose inspiration Mr. Leiper has worked. The museum courts are very interesting in section, and the great hall would be very fine, with galleries round it on both floors, a semicircular arcade below and traceried triforium above. In plan the hall itself is very skilful, though with an almost ecclesiastical feeling about it; it is arranged for orchestra, but could easily have been modified to suit the committee's revised conditions. One cannot but regret that a design so artistic and full of poetry was not admitted among the six, in spite of plan. It is probably an instance where the personality of the assessor counts for much.

Another design to be noted for its elevations is that of Mr. A. N. Paterson. Here the plan is good, with continuous circulation and very well-placed staircases; it is not big enough in conception, being too much cut up,

and the parts too small, but is well-balanced and clear. The central hall is purely a concert-room, but interesting in section. The elevations are distinctly noteworthy, as being the only attempt, and a very interesting one, to treat the building in monumental Scotch architecture; the whole is dignified and good, if somewhat too cautious in design. The central motive on the northern front is a fine Scotch tower, but all the elevations are carefully studied, restrained, and effective.

Mr. J. A. Campbell's design, though wholly different, is also very able and refined in elevation. The plan is scarcely successful, the outer circulation being incomplete, and the galleries too much cut up into small and monotonously similar rooms; the museum courts enclosed within the outer galleries are practically isolated. The central hall, both in plan and section, is very good, with galleries round it on both floors. The elevations are broad in feeling, and interesting in point of architecture, the style being Modern Classic, somewhat French in character. The semi-dome that covers one end of the great hall is distinctly theatrical and out of harmony,—a distant reminiscence on a small scale of a feature that has been made typically French by the great roof of the Paris Opera. Two towers flanking the great hall are the central motive in the south front; they are scarcely high enough to be as elegant as might be; the sculpture shown is greatly out of scale; the side elevation is very good. Messrs. Honeyman & Keppie have yet a third design, in plan not essentially differing from the two designs included in the six selected. The elevations are classical, broad, and restrained. The central feature is a dome which is not very obvious in plan, but is very good in outline and design. It distinctly recalls the dome recently added by Dr. Rowand Anderson to Edinburgh University.

Messrs. Morris & Hunter have adopted an oval hall (which, as shown in section, is singularly uninteresting), and have spread the museum over the whole ground floor. A maximum of floor space is gained at the cost of all sense of unity or assured design; nor would the lighting be always satisfactory. On the first floor the arrangement of the picture galleries is monotonous in the extreme, and the general circulation is quite interrupted (save for a narrow corridor) by the art school. The elevations on the other hand are very broad and dignified Renaissance, a trifle dull perhaps, and not always true to plan, but with a genuine character of their own. To the park front is a fine terrace, approached by stairs in a semi-circular portico.

Messrs. Chorley & Cannon have a disappointing design in uninteresting Classic, with an overpowering pediment on a dozen columns. Behind this gigantic pediment is a (square) dome that cannot be called beautiful, with similar roof to the angle pavilions of the building. The central hall is oval and quite isolated on the first floor, as are also the upper galleries to the museum halls, with separate staircases of their own. The circulation, however, is very straightforward; the school of art is relegated to the basement.

Mr. T. L. Watson's design is strongly Byzantine, both in plan and elevation, and is an interesting piece of work. The central hall is approached from three sides, and forms a genuinely central feature; the galleries around it are grouped in rather haphazard fashion, with little sense of a circulation for the public.

A design more original than reasonable is that of Mr. J. Wallace, who has elected to preserve a passage-way (at present existing) across the centre of the site; the main entrance is accordingly at the east-end, with a lordly vestibule and an enormous development of the school of art and administration. The central hall, a concert-room pure and simple (no longer central), is grouped with the museum to the west of this passage-way; the museum is, in consequence, grievously confined. Otherwise, however, the plan is skilful, and the elevations are exceedingly good, strictly Classical, well-designed, and

starely, with a very successful dome over the vestibule.

In reviewing this competition from the broader standpoint of the architectural profession generally, one or two matters certainly call for criticism. Allusion has already been made to the indecisive and misleading instructions issued in regard to the central hall. This is the most serious blunder of the competition, and naturally provokes severe comments. The first and foremost duty of a Committee is to issue precise and definite instructions, in common fairness to competitors. In the present instance nearly all have misinterpreted the principal requirement, and many of the designs have been thrown out in consequence. Either the Committee did or did not know their own minds; if they did, they should have given unmistakable expression to their wishes; if they did not, they should have said so plainly, and left the competitors a free hand.

In the next place, public exhibition of the drawings should be not optional, but a condition of competition. If, for fear of misappropriation of ideas, it is impossible to have the designs on public view after the first competition, which would be the best solution; at any rate, all should be ultimately exhibited together. In no other way can the fairness of the award be vindicated; in no other way can the genuine educational value of an important competition be turned to use.

Further, the assessor's report should be made public, and be detailed. There is, of course, safety in silence, but, for the good of all concerned, a full and thorough report by the assessor should be invariably published. It is not too much to ask a well-paid assessor to take the trouble; to most of the competitors it is their only consolation; while to all it is the best instruction to be gained from the competition. In this case the report of Mr. Waterhouse has been published, but it is very meagre.

For a competition of this importance, it is open to question whether a single assessor, however eminent, should be appointed sole judge. No one questions for a moment the ability, the eminence, or the impartiality of the assessor in this case; a committee of experts might, however, have been more open to some artistic considerations that are very valid. The temptation to design "up to" an assessor's personal predilections (real or presumed) is great. As a matter of fact, the award has been given to a design that embodies, skilfully enough, the latest "London fashion." The commercial capital of the North, grey, grimy, and damp, yet palatial Glasgow, has an architectural character of its own that is well worth studying. It is a pity that the new Art Galleries will hardly be in keeping with this character.

NOTES.

THE conditions upon which the Durham coal-owners are prepared to resume work are, as had been anticipated, based upon an immediate reduction of 10 per cent. on the wages paid at the time work was suspended. Indeed, it would not have been surprising if the loss they have suffered in the interim had caused them to stipulate for a further reduction. The rate arrived at may be revised after July 31, if either masters or men establish the necessity for such revision, but the Association suggests the immediate formation of a Wages Board, to deal with the question, in order to prevent a recurrence of suspension of work during its discussion. Surely the disastrous effects of the present mode of procedure must by this time be apparent to all engaged in the contest, even without the lesson of the engineers' strike. This has dragged along for weeks and months, inflicting incalculable hardships upon businesses and individuals, and is only just coming to a termination. Certainly the two contests are of an entirely different nature, but each appeals for the adoption of conciliatory measures for the prevention of unnecessary

conflicts in the future. Mr. Burt told the Miners' National Union Conference on Monday that, although the Durham men were doubtless acting perfectly within their rights in refusing arbitration, they had made a mistake. With characteristic bluntness he explained the difference between arbitration resulting in reductions and strikes having a similar termination, and showed the necessity of abandoning the latter unsatisfactory system. The advice given contrasted very strongly with the reckless defiance of economic laws which has recently been advanced by certain labour leaders. "Turn it how you will," asserted Mr. Burt, "demand must ultimately control the market." It is to be hoped that moderate counsels will prevail, and that work will soon be resumed, as the distress in the district is very keen, and the loss daily becoming more serious.

THE appointment of a Royal Commission to decide upon the question of a teaching university for London is a satisfactory step. No doubt those who strongly favoured the new charter for the proposed university will see in it only a hindrance to the quick establishing of a university. But it is much better that the scheme should be thoroughly considered in all its bearings, and in a somewhat wider manner than is possible in the judicial proceedings before the Privy Council when the grant of the charters was opposed. Those who favour the creation of this new university will probably find that the report of the Commission will, in the end, serve to strengthen this university when it is established. Such a university, if wide and thorough in its teaching, should do not a little to improve the education of the architects of the country.

IT appears to be contended by some patentees and patent agents that Mr. Goschen has not gone far enough in the reduction of the fees on patents. This contention is natural; persons interested in patents would, of course, like to have no fees on patents. No remission of taxation ever occurs without those who gain by it thinking that more might have been done for them. There is a good deal to be said for making patent fees as low as possible, and even for their entire abolition. On the other hand, the fact that the fee on the renewal of patents causes a considerable number of patents to lapse is not one altogether to be regretted in the public interests. The tendency to patent every trifling improvement in every trifling thing is not to the public advantage, and if the patent fees prevent the renewal of a certain number of patents one may be pretty sure that the patents are of no very great value, and that it is as well that they should be thrown open to the public without restriction.

RAILWAY time-tables are getting very bulky, but they are, at the same time, certainly becoming rather less puzzling than they used to be. The small type and other economies of space are gradually giving way to bolder figures and less abbreviated, and, consequently, more lucid directions; the desired information being far more easily obtained now than formerly, both in "Bradshaw" and in some of the companies' guides. It will be noticed that the Midland Guide for the ensuing month exhibits a marked improvement in this respect, no fewer than sixty additional pages being used as a consequence of the complete re-arrangement of the tables and the employment of larger type and bolder figures. Another improvement is the adoption of italic figures for trains that only run on certain specified days of the week. This system has been in use for some time on the London and North-Western and one or two other lines, and might with advantage be adopted by all compilers of railway guides. The attention is thereby at once arrested and drawn to the exceptional circumstances connected with the running of the train, whereas, as many know to their cost,—these "traps" are often easily over-

looked, even by constant travellers, when ordinary type is used. Many would hail with considerable satisfaction the general substitution of larger figures for the microscopic type which tries the eyesight in some of the time-tables.

THE *Times* has recently printed several letters relative to the proposed destruction of St. Dunstan's-in-the-East, upon the union of that parish with All Hallows Barking, under the Union of Benefices Act. Some writers, it appears, are ready to sacrifice as a peace-offering to the Commissioners under the Act, one of Wren's two neighbouring churches: St. Mary-at-Hill, and St. Margaret Pattens, Road-lane, which latter has a lofty octagonal leaden spire, virtually Gothic in form. All seem to be agreed upon saving the steeple, at any rate, of St. Dunstan's. For this there are precedents, as witness Wren's tower of St. Mary Somerset, in Upper Thames-street, conspicuous for its eight pinnacles in shape of angle and side pedestals, carrying, respectively, vases and obelisks capped with balls; and the fifteenth-century tower of All Hallows Staining, by Mark-lane. A model of the latter was included in Mr. Birch's "Old London," prepared for the International Health Exhibition of 1884. All Hallows escaped from the Great Fire; but the body of the fabric fell down five years afterwards, and was then re-built. Since the untoward fate of St. Antholin's spire has been cited in the correspondence, we may direct attention to a passage in a letter from Major H. A. Joseph, O.C., and churchwarden of St. Antholin, printed in the *Times* of April 21. He says:—

The parishioners with great regret consented to the removal of their church. They, however, worked hard for, and obtained the retention of the spire, supposing it to be one of Wren's. When it was found to be a modern structure the consent of the parishioners was obtained for its sale.

It will be interesting to learn what proofs were found for upsetting a current belief. We have always understood that the stone spire of St. Antholin, which is shown upon the bas-relief that has been set up in Sisle-lane, Watling-street, to mark its site, was designed by Wren. Hutton (1708) says so, adding that it was "built by Mr. Cartwright"; the late George Godwin, in his "Churches of London," vol. 1. (1838), with many other writers, speaks of it as having been due to Wren. In Mr. Andrew T. Taylor's illustrated monograph upon "The Towers and Steeples designed by Sir Christopher Wren" (1881), based upon the essay which gained the medal of the Royal Institute of British Architects, we read:—

St. Antholin (or St. Anthony), Watling-street, was erected in 1682, and was the only stone spire pure and simple, which Wren carried out. . . . It was pulled down in 1875. One cannot but deeply regret the loss of this spire, unique in its way amongst Wren's works; especially as it could very well have been allowed to remain, and, indeed, did remain for a short time after the church was pulled down.

However, less mercenary considerations did not prevail, and the tower, after standing for, we think, two years only, followed the church. In one of his letters to the *Times*, Canon Venables writes (25th instant) that the whole edifice was Wren's work, and that sometime back the spire, having been damaged by lightning, was rebuilt, and its apex rudely blunted. (The apex was somewhat in shape of a Corinthian capital, 154 ft above the ground). But the re-building, upon the original lines, did not constitute a modern structure, as commonly understood. The steeples of St. Mary-le-Bow and St. Bride's Fleet-street, have both, if we remember aright, been in part re-built. Of other churches by Wren that have been removed in pursuance of the Act, we recall to mind, St. Matthew, Friday-street; St. Benet, Gracechurch-street; St. Dionis Backchurch; St. Mildred, Poultry; St. Mary Somerset; All Hallows, Bread-street, successor to that

* See "Note" as to this in our issue of November 2nd last.

herein Milton was baptised; and St. Michael, Queenhithe, whose spirelet and nave are replaced above the new rectory-use for St. James, Garlickhithe, in Upper Thames-street.

NEW kind of casing for electric-light wires has been patented by Mr. Thomas Smith. In general form it is like the ordinary wood casing in common use; the grooves receive the cables are made by rolling iron, other metal, from sheets of such thickness that the wire can be slipped into place and held there by the spring of the metal. The wires are made to spring or slide on or off, and can be made to any design. The grooves are covered with some suitable insulating substance, but in practice it will be found to chip off in places, and the casing will not, therefore, add to the insulating resistance of the circuit in the way of ordinary wood-casing does; on the other hand, if a sufficient number of fuses are employed, the risks from fire will be less than in wood is used. In the event of the spring of the cable failing, the leakage and consequent local heating will take place entirely within an incombustible case, and the heating can possibly become dangerous the fuses must go.

ACCORDING to the Vienna local press, the Duke of Cumberland has notified the authorities of the "Austrian Museum" that city that he will soon require them to return the collection of antiquities which George V. of Hanover, soon after his coronation, lent them for exhibition. This collection of some eighty-two objects, known as the "Welfenschatz," is considered to be exceedingly valuable one, and includes a much-admired reliquary not unlike the Holy Shroud at the South Kensington Museum. The collection has a somewhat interesting history dating as far back as 1173, first about being in the St. Blasius Church Brunswick. Among the various journeys collection made, we notice one from Hanover, to England in 1803, on account of the expected invasion of the French. On the death of George V. losing his throne, the collection "disappeared" for some eighteen months, to turn up again at Vienna in September, 1877, after it had been officially made out to the deposed monarch's private property.

DESCRIPTION of the large steel dome of the proposed Government Buildings the Chicago Exhibition will be found in the January volume of the *Transactions of the American Society of Civil Engineers*. The structure, which is 118 ft. diameter, is one of the tallest iron or steel domes in the world, its total height being 235 ft. It is supported by sixteen columns, under each of which there are fifteen timber piles. The maximum weight that can come on each of these piles is 14 tons, the wind pressure being allowable for no less than 90 per cent. of full load. In order to secure good foundations, it was specified that test piles should be driven to ascertain the probable length of piles would be necessary, and these were driven until they would not sink more than 1 in. under a hammer weighing 2,500 lbs., falling 25 ft. In making the calculations the tests were first found in the dome proper, and afterwards in the columns supporting it. It was assumed to start with that the structure was a braced arch, hinged at the crown ends,—the ends being at the springing,—although, as a matter of fact, the ribs are all riveted up at these points. The vertical loading was taken at 50 lbs. per square foot on the horizontal projection of dome, and a horizontal wind pressure of 10 lbs. per square foot was also allowed for.

In the last number of the *Journal of the Franklin Institute* there is a paper by Elmer G. Willoughby, on "Resistance Standards; their Manufacture and Adjustment." The author first states the qualities

which should be possessed by the material of which a resistance standard is made. It should have high specific resistance; it should not change its resistance in time, nor be acted upon chemically by the medium in which it is enclosed; it should have as small a temperature coefficient as possible. Dr. Matthiessen, who was chairman of the sub-committee (of the Committee on Electrical Standards of the British Association) from 1862-65, decided that an alloy of some sort would most closely fulfil the required conditions. He found a considerable time change in many of the alloys examined; zinc always seems to crystallise out from alloys containing it, changing the homogeneity of the wire, and, at the same time, its resistance. Dr. Matthiessen suggested that in other cases the time change is due to a process of gradual annealing. It is worthy of note that when the original platinum-silver coils, finally adopted by the British Association, were examined last year, it was found that even their resistance had increased by 0.06 per cent. Resistance may be permanently changed by temporary change of temperature; in 1869 Berymann found that if coils of copper, aluminium, and zinc are kept at a temperature of 300 deg. C. for one hour and then cooled, a permanent increase of resistance takes place which is as great as 6.8 per cent. in the case of magnesium, though with German silver there is a decrease of 0.2 per cent. The specific resistance of a substance obviously varies with its density; if a wire is wound on a spool whose diameter is less than eight times that of the wire, the resistance increases from 0.5 to 2 per cent., falling again, however, as the wire slowly anneals. From some results obtained by Drs. Feussner and St. Lindeck in 1891, it appears that an alloy consisting of copper 70 parts and manganese 30 parts has a temperature coefficient of 0.004 per cent., while an alloy of copper 73 parts, manganese 24 parts, and nickel 3 parts has a negative coefficient of 0.003 per cent.; it therefore seems that by taking proper proportions of these three metals an alloy may be obtained with the coefficient zero. All things considered, however, Mr. Willoughby regards platinum-silver as the most satisfactory material yet used. In conclusion the author describes a modification of the Carey-Foster method of measuring a resistance.

IN the same number of the *Journal* above referred to there is also a paper by Wm. S. Aldrich "On the Variable Action of Two-coil Solenoids." Experiments were carried out upon (1) The combination (the differential coil-and-plunger of Silvanus P. Thompson's classification), consisting of two solenoid coils of two parts of one coil, traversed by a pulsating current of variable intensity in each part, and giving rise to a resultant magnetic field from the combination of the two variable-intensity electromagnetic stresses of like character, and constant in direction. (2) The combination operating as two distinct solenoids, producing resultant stresses in the ether medium from the two variable-intensity electro-magnetic stresses of opposite character and constant in direction." The results obtained are shown by means of some carefully-drawn diagrams.

AMONGST the principal sales set down for the coming season is that of Apethorpe, the Northamptonshire seat for 300 years past of the Mildmay, and their descendants the Earls of Westmoreland. Extending over nearly 8,500 acres of Willybrook Hundred, it lies near to King's Cliffe, midway between Oundle and Stamford, and within the district formerly covered by Rockingham Forest. In 15 Hen. III. Ranulph Brito obtained grant of Apethorpe, or Apythorpe, Manor, out of the Royal demesne, at a yearly rent of 10*l.*; of the house built in that reign some remains, including a fireplace, are, we believe, extant. In Edward VI.'s time it reverted from Lord Mountjoy to the Crown, and was next exchanged to Sir Walter Mildmay, Knight,

Chancellor of the Exchequer to Queen Elizabeth, and founder, in a house of the Black Friars, of Emmanuel College, Cambridge.* His son, Sir Anthony (by his wife, sister to Sir Francis Walsingham), entertained here James I. on his first coming into England, and introduced George Villiers to the King. Stow relates in his "Chronicle":—

"Ye 27th of Aprill ye King removed from Barleight towards Rinchingbrooke, to Sir Oliver Cromwell's, and in ye way hee dined at Sir Anthony Mildmay."

To the early sixteenth-century house Anthony added a larger quadrangle, having a screen or cloister along one side, to the building whereof James I. gave some timber. This quadrangle resembles that of Rushton, in the same county, as enlarged by Sir Thomas Tresham, of which we gave a description and illustration on October 27 and November 3, 1888.† Anthony and his wife, Grace Sheringham, rest beneath a sumptuous tomb, carrying figures of Justice, Wisdom, Charity, Devotion, and Hope, in the parish church (1617-21). Their daughter and sole heir, Mary, married Francis, Lord Burghersh and Earl of Westmoreland, eldest son of Lady Mary Fane, who had been restored, 1604, to the ancient dignity of her house as Baroness Le Despencer. Of their eldest son, Mildmay, second Earl of Westmoreland, a portrait, by Van Dyck, was hung at Apethorpe; the two full-length paintings of Philip and Mary are, says Bridges, supposed to have been done by Holbein; yet Holbein died,—of the plague it is believed,—in 1543. His will bears date October 7, and was proved on November 29 of that year. The pictures may be by Sir Antonio More, who painted other portraits of Mary and her consort, and followed the latter into Spain. Apethorpe justly ranks amongst the best examples of its kind in England. A plate of the principal front will be found in J. P. Neale's "Views of Seats," 1820. Our article "Round Stamford," of October 17, 1885, is illustrated with several details of the exterior and interior of the house and the church. Near to Apethorpe are Rockingham Castle, originally built *temp.* the Conqueror, in the chapel of which William Rufus called his great council of bishops and abbots who renounced Anselm; Fotheringhay; and Cotterstock Hall, built by one Norton, the friend of Dryden, who here composed his last work, the "Fables," and passed the final two summers of his life.

IN the course of next month the Hummums Hotel, Covent Garden, together with "Rockley's" Restaurant (in the same building), will be offered for sale by auction, with possession. A company was formed in October, 1888, to acquire the premises then newly rebuilt for Mr. Harry Smith, by Messrs. Peto Brothers, from the designs of Messrs. Wylson & Long, architects. The present hotel stands at the south-western corner of Russell-street, Covent Garden, on the site of Small's (formerly Rigg's) Bagnio, which is cited in Hutton's "New View of London" (1708), and formed the scene of the reputed appearance of Parson Ford's ghost, as related by Dr. Johnson to Boswell. The Bagnio had supplanted a popular place of resort known as Mrs. Dubois's, afterwards the "Three Chairs" tavern. The Hummums,—a corruption of the Arabic, *hammam*, a bath,—and Pero's, in St. James's-street, were amongst the earliest hotels opened in the town. We gave a detailed description of the new premises in our issue of January 7, 1888.

THE Society of Watercolours has a very good exhibition, though we do not agree with some of the critics that it is better than

* On 31 May, 1539, his tomb is in the south aisle of St. Bartholomew's the Great, West Smithfield. He was son of the Thomas Mildmay, lord of the manor of Chelmsford, whose tomb forms an illustration to our review, April 18, 1891, of Mr. Fred. Cancellor's book on "The Ancient Sepulchral Monuments in Essex."

† See also Mr. J. A. Gosch's paper on "A Building Suite of the time of Elizabeth" printed in our columns of April 29, 1889; and our review, July 21, 1893, of his work upon Tresham's Buildings in Northamptonshire.

usual, or even quite so good. Mrs. Allingham's non-appearance is a serious loss; on the other hand there is a drawing by Mr. Tadema, which has not happened often of late. This is "Calling the Worshippers" (179); a young woman in a leopard skin, a piece of carving, marble flooring and wall, a charming silver vase, and the corner of a temple up the steps, make the picture, which is fully worthy of the painter's unique reputation in this class of subject. Mr. Alfred Hunt exhibits a view of "Grasse" (104) which is one of the most beautiful water-colours he has ever painted; the sense of mere pigment seems etherealised away, and we look into air and sunlight. Mr. H. Moore also has never done a finer and more powerful water-colour of sea than his "Pack Clouds Away" (84). Mr. Albert Goodwin has attempted a very difficult effect in "Salisbury Close" (14), a bright summer night with a mingling of sky light and lamp light; it is a remarkable work, and seems to come out more as it is studied. Mr. Tom Lloyd has a picture of a Thames garden gate where the "lord of the manor" (a little boy) comes out to admire the swans: the two figures make a harmony in blue and saffron: the swans are admirably painted; his "Reapers" (120), a kind of semi-decorative horizontal composition, is a finer work in feeling and colour; one of his best. Among the old school of landscapes may be mentioned Mr. A. D. Fripp's "Isle of Portland" (111), and Mr. G. A. Fripp's "Cleve Mill" (106); and "Penryn Castle" (85); Mr. Cuthbert Rigby's "Under Wetherlam" (16), Mr. Philip's "Crags of Glenogle" (140); Mr. Rigby has also a very fine snow picture (155), and Mr. Eyr's Walker, in "When sweet summer airs do blow" (88), has succeeded in getting really the light of summer: nowadays we too often see pictures called "summer" with no sunlight in them at all. Other landscapes by the same artist are among the best of the exhibition. Mr. R. W. Allan has been painting Eastern scenes; his "Golden Temple, Amritsar" (114) is admirable as a representation of architecture under a tropical sun; "On the Beach at Madras" (267) is another Indian study; there are also some excellent drawings of Scotch scenery by him. Mr. Rooke and Mr. S. J. Hodson contribute some architectural subjects, and Mr. H. Marshall has painted the Mansion House and its surrounding in a mist. Among other architectural subjects Mr. R. Little makes a capital little picture out of the "Greek Church, Bayswater" (38), in snow. Mr. Herbert Marshall has also very successfully treated "The Embankment" (22) on a winter evening. Mr. Thorne Waite's finest work is "Changing Pasture, Alborough" (61). We regret to see the increase of large drawings of an essentially vulgar type in the exhibition, such as 156 and 102 and others. These are the kind of things to engrave in the *Graphic*, no doubt, but not for an exhibition which has such traditions as the Society of Water-colours has, and ought to cling to.

THE NEW GALLERY EXHIBITION.

THE exhibition of this year is not up to the standard of most of its predecessors. Mr. Burne-Jones, whose works have been usually the great attraction of the New Gallery, does not exhibit, and others among the prominent exhibitors are hardly at their best.

The finest work in the collection is Mr. Adrian Stokes's landscape, "Roman Campagna; Early Spring" (143), showing the undulating sward of the Campagna, with a forsaken quarry and a clump of small trees on the right, the back of a Roman aqueduct just showing in the distance over the horizon made by the uneven ground, and a sky full of light and air above it, the line just broken by a thin fleecy cloud. A landscape more real in all its details is not often seen; it looks as if one could walk into it, and yet this is no mere realism, the artistic balance of the whole is perfectly kept. It is a real pleasure to see such a landscape as this. Among the more prominent figure pictures a high place must be given to one hanging

near this, Mr. Collier's "Gretchen" (140). Goethe's heroine is shown in her night dress, looking at the casket, at the moment of her reflection that everything with men turns on gold, and "Ach, wir Armen!" The figure is backed by a delightful old German cabinet, painted with great care. Gretchen is, as Goethe imagined her, a lower-class girl, with handsome but somewhat coarse features and a profusion of reddish hair; the face is a little wanting in definite expression, but the whole conception is at all events not commonplace. The figure is lighted by artificial light, the effect of which is well conveyed.

Mr. Watts's "Sic Transit" (77), which holds the place of honour in the West Gallery, is one of those pictures of his which look like an attempt to say in painting what is better said in poetry. As a painting it is not interesting. A shrouded dead figure is laid out on a bier, while on the floor are strewn various emblems of the occupations of life,—armour, a lute, and other objects, the metal painted in a subdued rich tone, as of things that have the *patina* of age on them; but of the whole one feels that there is more moral than pictorial power about it. The very reverse is the case with Mr. Tadema's "A Silent Greeting" (15), in which the thought is of the slightest, but the pictorial effect perfect. A Roman in soldier's dress is going out at a door, facing the spectator, just laying his hand in farewell on the hand of a woman seated inside the door; beyond is seen the blue sky and brightly-lighted wall; a building, yellow in the sunshine, opposite. The great charm of the painting is its carefully-wrought and perfect harmony of colour, in which sense it affects one like a perfectly-balanced musical composition, without a discordant note in it, and yet there is no appearance of contrived effect about it. Near this is Mr. Poynter's "When the World was Young" (10) a small study for the picture in the Royal Academy; and the same artist's "White Roses" (13), a half length of a woman backed by foliage which, as well as her face, seems hard and artificial in texture and colour; in this respect we much prefer the artist's figure seated in a Greek window, "Chloe" (57), with a tortoise lyre in her hand; there is a flush of life in the face which is certainly wanting in the lady of the white roses.

Sir J. Millais's figure entitled "Sweet Emma Moreland" (69), if we are to accept it as a representation of Tennyson's figure, seems a curious instance of the failure resulting from giving an ideal name to a figure too closely copied from a model which does not answer to the ideal. The face is a fine one, richly painted; the hands are large, coarse, and bony, and as much out of keeping with the character of the face as with the title of the picture. The only other figure picture in the West Gallery (except portraits) which is worth a thought is Mr. A. Moore's "A Revery" (104)—so spelt in the catalogue, a seated figure of a woman facing the spectator, backed by a rather too busy mural decoration which interferes a little with the breadth of the painting; the figure and the composition have the artist's usual grace and completeness, though it is hardly one of his best works.

Mr. Kennedy's "Jonah" (142) in the north gallery is incomprehensible; it seems to be a struggle going on in a Viking ship, but what the meaning or point of it is we cannot pretend to understand. Mr. Brighton's "Black-eyed Susan" (32) is a pretty figure in the foreground of a coast landscape, but much too refined for the idea suggested by the title. Mr. R. W. Macbeth has made a brilliant study of flowers in "An Alsatian Flower Stall" (166), and the picture has a marked character of its own. In "Bedtime" (139), an interior with a woman and child looking out at the moonlight, Mr. Philip Burne-Jones has realised a very true effect of a moonlit interior. The north gallery shows two "conscientious nudes" (as the French students say), Mr. Fowler's "Spirit of the Morning" (180), a kind of Venus Anadyomene in which the nudity is more evident than the poetry, and Mrs. Swynerton's "Mater Triumphalis" (187), a portentously stout and thick figure with a crown at her feet, well painted but by no means attractive, and not very clear in its apparently ideal meaning.

In portraits the exhibition is stronger. In the west gallery Mr. Richmond's portrait of "The Venerable Archdeacon Wilson" (48) is more successful than his "Mrs. Marsden Smedley" (55), a lady in a white dress with a green-lined cloak; a graceful figure, but hard

and mechanical in execution. Mr. Shannon's "Lady Skelmersdale" (92), seated with a violin in her hand, in a white dress, shows a noble and queenly head and a beautifully-drawn right hand and arm; but what a waist! It is almost like a fashion-plate, and appears exaggerated from what is possible in life; an artist should rather have erred from nature (if this be nature) the other way, and refused to paint a woman like a wasp in figure. His portrait of "Mrs. Wordsworth, principal of Lady Margaret Hall Oxford" (93) is one of the finest portraits in the exhibition, both in character and colour. Mr. Collier's "Mrs. W. H. Foster" (137), in a satin dress with a richly-coloured screen behind her, is a powerful piece of work. Mr. Shannon's "Mrs. Chapman" (153) is perhaps his best portrait, with a very finely-painted head. Mr. Horsmer has two "presentation portraits," "Sir Gabriel Stokes" (181) and "The Rev. T. E. B. Mayor" (185), belonging to that class of realistic portraits in which the dark costume leaves little chance for pictorial effect, and everything is concentrated on the expression of the head, which is very powerfully given in both cases. The exhibition includes two portrait heads of M. Paderewski, one by Mr. Tadema and the other by the Princess Louise; the former, representing the great pianist facing the spectator and apparently in the act of playing (though the hands are not visible), is a splendid piece of painting, but does not seem to convey the concentration of expression of the face of a great executant intent upon his work. Mr. Watts has also a fine portrait of Mr. Walter Crane.

The exhibition contains a good many small landscapes of interest, and two or three large and important works, besides the fine one by Mr. Stokes to which we have already referred. Landscape painting at the New Gallery generally tends rather to the study of special and unusual effects rather than to the representation of nature under ordinary atmospheric circumstances. Mr. P. Burne-Jones has another good moonlight effect in "The Harvest Moon" (26). Mr. Parton's "In the Autumn Sunshine" (30) does not seem necessarily to suggest autumn, the trees at least rather suggest spring than autumn. Mr. Christie's "The Wreck" (59) is a small painting with a definite style (rather impressionist in its leanings) and fine colour. In "A Riverside Pastoral" (71) Mr. Calvert seems to have been "doing Corot's second-hand—not unsuccessfully." Mr. Frank Walton's "In Opulent June" (80) is one of the old school of straightforward landscape work, prosaic perhaps the modern school would call it; but it realises its title in the sunlit effect and the rich heavy masses of foliage. Mr. David Murray has a small but fine and poetic landscape "Gathering Mists" (91), with one dark tree like a ship at anchor on the plain, and a beautifully faintly-lighted aerial western sky. In the north room we have a contrast between the old and new in Mr. Wimperis's "Way Across the Marsh" (128) and Mr. McLachlan's "Evening" (129), hung next to each other, both good in their way. Mr. North's winter scene, with no title but a verse (136), is a remarkable work, somewhat different from his usual range of effect; a bright but misty landscape with the first hint of coming spring in it. Mr. Padgett's "Moonrise over the Marshes" (148) has a character of its own. Mr. David Murray sends a large and powerful work "Hampshire Haying, 1891" (175), representing only too well the characteristics of that terrible autumn of last year; a thunder-cloud hangs over the right of the scene, on the left a bay cart is being dragged home over flooded meadows, the hay blown back by the wind, which roars also through the trees on the right; the scene is dashed here and there by that strong sunlight which often produces such startling effect when half the sky is overcast with a thunder-cloud: it is a powerful rendering of a wild and striking moment of storm. Mr. H. W. B. Davis has a large twilight landscape, "Approaching Night" near Calais, and Miss Anna Alma-Tadema contributes a very charming study of sky—fleecy white clouds hovering amid the blue. In the South Gallery is a very fine study of sea by Mr. Tristram Ellis, "In Mediterranean Waters" (222), with a long blue swell rolling through the picture; Mr. Henry Moore contributes a very windy sea-piece in his best style; and Mr. Albert Goodwin exhibits one of his ideal scenes "The Rich Strand" in the "Fairie Queen" where dwelt Marinell, and where all things ric

ud rare were cast up by the sea. As a Spenserian landscape it is not to the purpose to say that it is not like any landscape in this world, for the Spenserian landscape is of the world of romance; but it is a fine and imaginative work, and more to be remarked on because painters seldom attempt to illustrate Spenser, who is rich in subjects for painting nevertheless. The sculpture this year is not very important, the most noticeable thing is Mr. Simonds's mermaid, with a mermaid on the top playing a pipe, and sea lions grouped symmetrically beneath looking up at her. This is a variation on the usual form of aquatic subject for a fountain; the mermaid indeed is a well-worn piece of furniture in fountain design, but this is not a conventional mermaid, but a figure seated and modelled in a very spirited manner, especially in the hold curves of her double fish-tails (they make mermaids' extremities double)—see Mr. Jacobm-Hood's picture in the South Gallery. Mr. Mullins's "Comus and the lady" is a very well-composed group, though the lady is rather too naïve for Milton's high-end and high-minded creation. Mr. Dressler's bronze figure of a "Girl tying up her head" repeats very pleasantly an old Classic type of sculptural design.

- 10 large Doulton ware jugs, the copyright of the society.
- 10 " " " beaded vases " "
- 10 " " " Burslem vases " "
- 10 " " " Burslem 'Rose' vases " "
- 10 repoussé bronze 'Eclerophon' vases.
- 33 portfolios of 10 engravings, to be selected by the prize-winners.

Twenty-five artists' proofs of a fine mezzotint, engraved by Mr. F. McCallloch after the diploma picture of Sir John Millais, Bart., R.A., and entitled by him a "Souvenir of Velasquez." The proofs are signed by Sir John Millais and by the engraver, and the Council have every belief that this fine work will be found a most valuable acquisition by those who are fortunate enough to obtain it.

Making, with the prizes given to unsuccessful members, 292 prizes.

The Council have suffered several losses since the last annual meeting. Early last summer they had to deplore the death of Mr. Edwin Henry Lawrence, who had been their colleague for many years, and later in the year they lost an old and valued member of their body in Mr. George Wallis, for nearly thirty years Keeper of the South Kensington Museum. Mr. Wallis was born at Wolverhampton in 1811, and was one of the earliest Art Masters of the old Schools of Design. He was a Deputy Commissioner of the Exhibitions of 1851 and 1862, and was appointed Keeper of the Art Collections at South Kensington in 1863. His life was spent in the endeavour to improve and promote the art industries of the country.

The pressing claims of other business have deprived them of the assistance of Sir Philip Cunliffe Owen and Mr. T. E. Callout, and of the valuable services of one of the Honorary Secretaries, Mr. H. J. Francis, who, however, continues to give them the benefit of his co-operation as a member of Council. They consider themselves very fortunate in having obtained the consent of Mr. T. Buxton Morrish to undertake the duties of the Honorary Secretaryship, rendered vacant by the retirement of Mr. Francis, and in retaining the very valuable services of Mr. John Sparkes as Honorary Secretary.

To fill vacancies on the Council, Mr. J. T. Bennett Poë and Mr. L. B. Sebastian have been elected.

The Royal Naval Exhibition, held last year, afforded an opportunity, of which the Council were happy to avail themselves, for the exhibition of the original oil-painting by Macleod of "The Death of Nelson," from which the popular plate, issued to the members of the Society in 1876, was engraved. The picture attracted much attention in the exhibition, and at the request of the Committee of the Naval Exhibition now being held at Liverpool, it has been lent by the Council for the gallery of that exhibition.

For the coming year the Council have been fortunate enough to secure the copyright of this year's Academy picture by Mr. W. Robert Macbeth, A.R.A., who is now engaged upon an etching of the work on the commission of the Council. The picture represents the ancient and picturesque town of King's Lynn, seen from across the river, towards which a number of fisher-folk in the foreground are hurrying to catch the last ferry-boat, which waits on the tide below.

The advantages offered by the society can only be brought adequately before the public by zeal and energy on the part of the Council's representatives in various parts of the world; and the special thanks of the members are due to several representatives, many of them old friends to the society, who have succeeded in recruiting an increased number of subscribers. Mr. F. G. Bonsor, of Balham, has surpassed himself with a return of 139 subscribers. The Council hope that his example may serve to stimulate others to still greater efforts in the future.

Various circumstances, above referred to, somewhat hampered the Council in the preparations for the year's work, and occasioned delays which cannot but have hindered the efforts of their representatives in distant parts of the world. Nevertheless, several of the returns received from their Colonial representatives show an advance upon the lists of last year.

No undertaking responds more quickly to the fluctuations of the general prosperity than one like that of the Art-Union of London, and the commercial depression which has been so marked a feature of the past year, especially in London, has not been without its effect upon the society's operations. In spite of these drawbacks, several of the society's friends have succeeded in securing an increase in their number of subscribers.

The Chairman, in moving the adoption of the report, said he thought that on the whole it was very satisfactory, especially in view of the circumstance of the loss of Mr. Watson's services, whose retirement and death they were deeply regretted. He thought they were exceedingly fortunate in his successor, Mr. Harrison.

Mr. J. W. Butterworth, F.S.A., seconded the motion, which was unanimously agreed to.

On the motion of Mr. Butterworth, seconded by Mr. T. G. Donaldson, a hearty vote of thanks was accorded to the honorary secretaries, Mr. John Sparkes and Mr. T. Buxton Morrish, who

were both, from unavoidable causes, absent from the meeting.

On the motion of the Chairman, a vote of thanks was given to Messrs. A. & S. Gatti for their kindness in granting the use of the theatre for the meeting.

The drawing for the prizes was then proceeded with, the principal prize falling to Mrs. M. Sutherland, of Beckenham.

LIVERPOOL ENGINEERING SOCIETY.

The thirteenth ordinary meeting of the present session was held at the Royal Institution on Wednesday, April 20, Mr. John T. Wood, President, in the chair.

After the usual routine business, including the nomination of the Council and Officers for the ensuing session, a paper was read by Mr. H. Percy Boulnois, M.Inst.C.E., entitled "Refuse Destructors."

After describing house refuse, and the different methods of collection, the lecturer recapitulated the various methods at present adopted for the ultimate disposal, and gave an interesting description of the manner in which the greater portion of the refuse of Liverpool is barged away to sea, and sunk in deep water. The lecturer then proceeded to describe in detail, and with diagrams, the various destructors which are now being erected in different parts of the country, and gave a fully detailed description of the twelve-cell destructor, on the "Fryer" principle, which he had recently erected for the Corporation of Liverpool, and a new method of charging which had been adapted thereto. In conclusion, the lecturer stated his opinion that the hurrying of town refuse was at present the best and most sanitary method known for dealing with such material, and, although the cost may be slightly in excess of other methods of disposal, the safety of such an operation, from a sanitary point of view, more than counterbalances any small increase in the amount of cost for its disposal.

The discussion upon the paper was adjourned until the next meeting.

BRITISH ARCHEOLOGICAL ASSOCIATION.

At the meeting of this Association on the 20th inst., Mr. J. W. Grover, F.S.A., in the chair, Mr. F. Williams reported the discovery of further portions of a Roman hypocaust at Chester, and exhibited photographs of the remains, and also of a curious open timber roof of fifteenth-century work, which exists as part of the old buildings adjoining the site, which, it is feared, will have to be shortly removed.

Mr. Earle Way exhibited a fine sixteenth-century bronze medallion of Paolina the Elder, Italian work, which was described by Mr. Allan Wyon, F.S.A. It is cast and not struck, the size being too large to admit of the latter process. Mr. de Gray Birch, F.S.A., exhibited illustrations of the sculpture on the font of Winchester Cathedral. Mr. C. J. Williams described a curious example of pottery made at Southwark. Mr. Marriage exhibited a perfect bowl-shaped vessel of light-coloured pottery, of Roman date, found probably at Rhodes. A paper was then read on "The Hog's Head: the Nuptial Cup of Sussex," by Mr. H. Syer Cuning, F.S.A., Scot. It was descriptive of an old custom, once common in the county,—and apparently confined to it,—of drinking the health of the bride, at wedding festivals, from a vessel made in the form of the head of a hog. Various examples of these vessels were described, some being of silver, but mostly of pottery; but one, formerly kept at Elstead, is of pewter. Several of the speakers, in the discussion which followed, spoke of other forms of these cups, and Mr. Way described one in the form of a pig, with a movable head, which formed the cup. The custom is now obsolete. The paper was read, in the author's absence from illness, by Mr. Loftus Brock, F.S.A. A second paper on "A Recent Discovery in Rome in connexion with Mythology in England," by Miss Russell, was then read. Some few months since, a Roman mosaic pavement was discovered on the Cælian Hill, Rome, on which the Evil Eye was represented, attacked by various forces. Miss Russell pointed out the general resemblance of the design to various cup and ring markings in England, which are traversed by a parallel line like a javelin, and suggested that these markings were charms against the Evil Eye.

THE ART-UNION OF LONDON:

ANNUAL MEETING AND PRIZE-DISTRIBUTION.

The fifty-sixth annual meeting and prize-distribution of the Art-Union of London was held in the Adelphi Theatre on Tuesday afternoon last. In the absence of the President (the Earl of Derby), the chair was taken by Mr. John Acrell, Chairman of the Finance Committee. The annual report of the Council, read by the Secretary, Mr. R. W. Harrison, contained the following passages:—

"At the close of the fifty-sixth year of the society, the Council have pleasure in reporting a continuance of the support which the society has enjoyed in various parts of the world.

The Council, with the object of giving earlier facilities to prize-winners for the selection of pictures in the May exhibitions, have convened the annual meeting for the day on which it used to be held in former years, and earlier than in the past few years. Although this arrangement was duly announced to all the society's representatives, many of them have apparently not observed the date, as, in the close of the list a number of returns had not come to hand, representing a considerable deduction from the expected total of subscribers.

In 1890 the Council foresaw that they could not hold hope to have the services of their valued Secretary, Mr. Watson, and in view of the importance of having a successor to him experienced in the peculiar duties of the office, they engaged as an assistant-secretary Mr. R. W. F. Harrison, at the time assistant-secretary to the City Guilds Technical Institute. In the course of last summer, Mr. Watson, who had served the society faithfully for forty-six years, desired to retire and enjoy a well-earned repose to which his long labours for the society's service entitled him, and the Council were glad to have at hand so excellent and competent a successor as Mr. Harrison has proved himself to be. They regret to have to report that in December last, within three months of his relinquishing his activities, Mr. Watson died, at the advanced age of eighty-nine. Mr. Watson's retirement necessitated some reorganisation of the office, which, being at a time when all the operations for the coming year had to be prepared, naturally occasioned some difficulty in carrying on the complex and widely-ramified work of the society; and in regard to these circumstances, the Council congratulate the members upon the issue of the year's operations.

The change of secretary offered a favourable opportunity for a reorganisation of the system of accounts, and the Council thought it best in the interests of the society to appoint a firm of professional accountants as auditors of the society's accounts. They accordingly appointed the firm of Messrs. Pridoux, Booker, Frere, & Co. to act in their capacity, and the books are now kept under their supervision. The accounts for the past year have been audited and printed and circulated among the members, with the full report of the Council.

The amount available for prizes, after providing for the annual work given to every subscriber and the other objects of the year, enables the Council to award the following prizes:

- work of art of the value of 100*l.*
 - works " " " 45*l.*
 - " " " 35*l.*
 - " " " 20*l.*
 - large bronzes, the "Warrior," after H. Thornycroft.
- to be selected by the prize-winners.

Illustrations.

NEW CLOISTERS AND PROPOSED NEW CHAPEL FOR RADLEY COLLEGE.

RADLEY COLLEGE, near Abingdon, has lately become the possessor of the old mansion and park of the Bowers, which it had before occupied as a tenant. When the tenure of the College was uncertain, it housed itself in buildings of a temporary character, with the exception of the fine old house which was occupied by the Warden and some of the Masters, and by the dining-hall. Having now acquired the ownership of the property, the College has begun to replace its temporary buildings by others of a more substantial kind, for which Mr. T. G. Jackson has been employed as architect. An infirmary has been built of a very complete type, and on a somewhat novel plan, and a long range of cloisters, with studies and dormitories above, connects the various rows of buildings with themselves and with the Chapel. A new chapel, to seat 300, is now about to be erected to meet the growing requirements of the school, which has increased, and is still increasing, in numbers under the present Warden.

BEDROOM FITTINGS AT 29, LENNON-GARDENS.*

This illustration shows how such useful and nromantic accessories to a bedroom as a hoo-cupboard, a medicine-chest, wardrobes, are mixed up with Italian *casone* fronts and delightful nick-nacks of all sorts in the bedroom.

It will be remembered that a *casone* is a chest about 4 ft. long, 2 ft. high and wide, made to contain the valuables, which in Italy are presented to a bride by her parents. Many exquisitely-carved old specimens exist in South Kensington Museum.

The front and ends shown in the drawing over the chimney-piece, and which now give interest to the cupboards containing the more practical treasures of an English lady's room, were rescued from Messrs. Wright Bros., in Wardon-street, and bear many marks of the vicissitudes of their lengthened career.

All the other fittings are in hard wood painted white; they were made by Messrs. Jackson, of Rathbone-place, and arranged by Mr. Arthur Casson, the architect.

INTERIOR OF DRAWING-ROOM, "BROOKLANDS," WEYBRIDGE.

THE illustration shows the interior of a drawing-room, forming part of some extensive alterations and additions carried out at the house in 1889-1890. The two rooms were thrown into one by means of the arcade. The lady who appears to be stepping out of the wall, is really a life-size portrait on the wall. A view of the entrance front of the house as altered, and of a design for the billiard room, were in last year's Academy. The architect was Mr. Reginald Blomfield; Mr. Thomas Hunt, of Hoddesdon, was the contractor for the work.

HOUSES OF PARLIAMENT, MELBOURNE.

THE Houses of Parliament, Melbourne, which are not yet finished, though for some years past work has been almost continuously carried on there, are situated on a hill at the east end of the city, in Spring-street. The Parliament Houses, when completed, will occupy an approximately square space, the actual dimensions being 320 ft. by 312 ft., the site is a portion of the Parliament Gardens, a small reserve, on the laying out of which considerable skill has been expended.

The principal entrance is opposite the end of Bonke-street, up a great flight of steps, 130 ft. wide. These lead to a decastyle portico, 140 ft. long, consisting of nine bays; from each end of the portico doorways lead to the offices, committee-rooms, &c.; and from the centre of the entrance vestibule, 44 ft. square, the lower portion only of which has yet been completed; over this vestibule a double stone dome, 45 ft. in external diameter, will eventually be erected, surmounted by a stone lantern, the topmost portion of which will be 218 ft. above the ground. Immediately behind the

* "Sussex-gardens" on the plate was a mistake in reading the MS. title, not discovered till too late for altering the plate title.

entrance vestibule is the Queen's Hall, 85 ft. long by 45 ft. wide, and 54 ft. high; on either side of the Queen's Hall lie the two Chambers, and at its east end is the Library; it serves, therefore, as a ready means of communication between these, the three most important centres. Across the east end of the Queen's Hall runs an elegant loggia, supporting a small gallery. This loggia forms portion of the direct line of communication between the Chambers, and the gallery over serves to connect the reporters' galleries belonging to them.

The Legislative Council-chamber is on the south side of the Queen's Hall. The portion of the floor reserved for the use of members only measures 44 ft. by 30 ft.; and the extreme size of the chamber, including the galleries at the sides and ends, is 72 ft. by 42 ft.; the height of this chamber is 33 ft.

The Legislative Assembly Chamber is on the north side of the Queen's Hall. The portion of the floor reserved for the use of members only measures 46 ft. by 40 ft.; and the extreme size of the chamber, including the galleries at the ends, is 72 ft. by 40 ft.

From the east end of the Queen's Hall access is gained through a small lobby to the central library, on either side of which, and communicating with it, are the two side libraries; these three libraries occupy the centre of the east frontage of the site, and additional libraries on either side will eventually be erected. The central library is 41 ft. square; the central portion of it is carried up on columns to a height of 46 ft., and carries a highly-ornamental dome; the remaining portions of the central library form a gallery at the first-floor level round the central portion. The two side libraries are each 49 ft. by 23 ft., and are 18 ft. high.

The refreshment and billiard rooms are over the side libraries, and are each 49 ft. by 23 ft., and are 24 ft. high.

The north and south frontages will be occupied by committee-rooms, offices, &c. These have not yet been erected, temporary accommodation in the meantime having been provided in a wooden building.

The external architecture consists throughout of a single Roman Doric order, standing on a hluestone rusticated basement, and is surmounted by an attic. This order embraces both the floors (principal and first) of which the building consists, each inter-columniation including a doorway or window-opening on each floor.

The internal architecture of the entrance vestibule consists, so far as it has been at present executed, of a single composite order, with coupled attached columns, standing on high pedestals.

The internal architecture of the Queen's Hall is in two orders,—the lower being Ionic, and the upper Composite. Above the upper order the ceiling is deeply coffered, and is pierced so as to form a clearstory; this lights the hall. The centre portion of the ceiling is elaborately coffered, highly enriched, and profusely ornamented.

The internal architecture of the Legislative Council Chamber belongs to the Corinthian order; the ceiling over the centre portion is vaulted and coffered, and the ceilings over the end portions are vaulted; domed ceiling-lights cover the side galleries.

The internal architecture of the Legislative Assembly Chamber is executed in the Ionic order, and this chamber is covered by a coffered, coved, and enriched ceiling.

The architecture of the interior of the central library is in two orders, the lower being Doric and the upper Ionic; and the central portion is surmounted by pendentives carrying a highly ornamental coffered dome, pierced with openings to light the space below.

The west front, which is the portion last completed, has been executed in beautiful white and very hard sandstone from Mount Difficult in the Grampian Ranges, near Stawell, and it is intended eventually to complete the building in this material.

As we observe that the so-called architectural journals of Australia are very indignant with us for some occasional depreciatory comments on the existing state of Australian architecture, we give this illustration of one of the most important Government buildings recently erected in an Australian city, and our readers can form their own opinion on it.

We may observe that a design for the Melbourne Houses of Parliament, by Messrs. Knight & Kerr, was published in the *Builder*

for September 8, 1860, but appears to have been never carried out. The present building appears to be based on the same design, somewhat altered and modified. The architect of the building in its present form is Mr. P. Kerr.

Books.

Handbook of Greek Archaeology, Vases, Bronzes, Gems, Sculpture, Terra-cottas, Mural Paintings, Engraving, Architecture, &c. By A. S. MURRAY, LL.D., F.S.A., Keeper of Greek and Roman Antiquities in the British Museum. With numerous Illustrations. London: Murray, Albemarle-street. 1892.

THE market has been of late flooded with manuals of Greek Archaeology, but so far as they have all been a wad of second-hand character,—just so many *pis-allers* translated from the French or German, and somewhat perfunctorily posted up to date. It is a relief to turn from such books,—useful, even indispensable, as they have hitherto been,—to Mr. Murray's work, which is stamped with originality, or, to define more closely, idiosyncrasy. The book had its origin, the author tells us in his preface, in the Rhind Lectures given in Edinburgh in 1887. Books based on lectures are apt to be tiresome, but we may say at the outset that the author has entirely succeeded in shedding that mixture of the "preacher and the play-actor" which makes the lecturing personality intolerably irritating in print.

Archæology has suffered from its own inherent complexity. It is required of the archæologist that he be two men, the artist to appraise, and the man of science to interpret. Mr. Murray holds, and perhaps rightly, that "the artistic element must be the first consideration in Greek archæology," but he is too wise not to allow that interpretative study must go along with technical appreciation. In characterising the book as a whole, what we feel is that its strong side is a minute and most diligent technical criticism; its weak side constructive and scientific interpretation; very few minds combine the two faculties. For this reason, perhaps, we think it will be read with more both of pleasure and profit by the advanced than by the elementary student; indeed, we are sure there are few professed archæologists who will not gain much from every chapter, and will not thank the writer for the persistently personal angle which compels the reader in salutary fashion to shift his own point of view. At the same time the book suffers, as Mr. Murray's are apt to do, from a certain want of subordination of detail, very puzzling to the beginner who lacks land-marks. It is, however, easy enough to get *enough* from the manual of some fallacious, clear Frenchman, and then the full corrective value of Mr. Murray's deliberative proceedings will be duly felt. One example may suffice: "The rule of the black figure vases is to represent the eyes of men as circular, those of women as an almond shape," so the handbook universally, "but this distinction was not much observed in the early art of Asia Minor, as we see in the pottery of Naucratis, Daphne and Camiré, where Asiatic influence was felt; there the almond eye is conspicuous in men as in women," &c. Mr. Murray, with a precise differentiation that is valuable.

The whole section on vases seems to be the most valuable in the book, specially the portion on the primitive period,—doubtfully valuable to the English student, because he is here, for the first time, in popular and accessible form, the results of English excavation at Daphne and Naucratis, and he can examine the originals themselves in the British Museum. Of course, it is easy to wish details other wise; we hold ourselves, *e.g.*, that unquestionably painted vases were in actual use, but we do not think the story cited on p. 72 as evidence, is of the smallest value. Asklepios is recorded in an inscription to have mended a broken vase for a boy. His pious master presented the vase to the Temple. "We are entitled to conclude," says Mr. Murray, "from the vase attached to the vase that it had been painted with a design, probably one of great beauty." Not at all, the point was the glory of the god, not the grandeur of the vase. Fortunately, there are few "conclusions" of this precarious character. Again, when illustration are so numerous, it is hard that we are given no instance of a real masterpiece of the early fine red period,—*e.g.*, the remarkable Meusa

T. G. Jackson. Arch^t. for Mar. 20/92

dance of Hieron, or some sample of Euphronios at his best. An artist glancing over the book would form from the illustrations a needlessly low estimate of the merits, as to fine design, of Greek vase-painting. While speaking of illustrations we may note that the reproductions are, as a rule, excellent; those of vases in red and black are a new and most desirable feature in a handbook. Some admirable plates come from the author's large book on sculpture; only a few,—e.g., slah from the Harpy tomb (fig. 69), are cruelly harsh.

We said at the outset that we felt interpretation to be the weak side of the book, and a certain fatality seems to compel Mr. Murray here and there to waste most valuable space on issues hopelessly doubtful. Who knows and who cares whether the wretched design from a cello (p. 142) represents an efigie type of the Judgment of Paris or not? The writer himself has not much ground for confidence in the interpretation he is going to propose, and yet it occupies four and a half pages (!), just because the writer loses it as a troublesome child. Again, Mr. Murray has something like a mania for the conjectural restoration of lost works of art; a harmless pastime it may be for an advanced archaeologist if out of work, but waste of time for the student. Why encourage him in twisting such sand-ropes by tahnlar views of the subjects of the paintings in the "Lesche." There was no space, we are told, for that most dateable, most real branch of archaeology, numismatics, and yet there are lost pages that we sigh over. The chapter on architecture is slight, but, perhaps, sufficient for its purpose. It is odd though, in discussing the transit from hut-shaped house to hut-shaped temple to find no reference to Mr. J. G. Frazer's delightful article (in the *Journal of Philology*) on the circular Hestia-Vesta temples, and their origin in the Græco-Italic hut-house.

The critic is bound to note omissions and omissions; but, all said and done, the book is an admirable piece of work, and no self-respecting student can leave it unread.

Les Artistes Célèbres: Velasquez, par PAUL LEFORT; Antoine Watteau, par G. DARGENTY; Gerard Terburg, par EMILE MICHEL; Les Brueghel, par EMILE MICHEL; Gavarni, par EUGÈNE FORGÈS; Abraham Bosse, par ANTHONY VALABREQUE. Paris: Librairie de l'Art; 29, Cité d'Antin.

THIS series of this volume, in their artistically designed parchment covers, form a portion of a very admirable collection of brief biographical and critical treatises on eminent artists, each illustrated with a good many engravings after the artist's principal works, some coarse in execution but sufficient for purposes of reference and description, and by a certain number of fac-similes of original drawings, which have a special value as being in many cases representations of works of which the originals are not well known or easy of access. As the two last issued (those on the Brueghels and on A. Bosse) one dated in the present year, we may presume that the series, former volumes of which we have noticed some time since, is still in progress, and when complete it will form a very useful and interesting set of artistic biographies, popular in form and pleasant to read, but each one written by a learned and competent critic.

M. Lefort regards the great Spanish painter as especially the apostle of naturalism, the spirit which has had such a revival in recent French art, but in which he declines to see that danger to art which some see in it. Those who take this view he says, "forget that art being a convention can only exist through convention, and that the artist himself is only worthy of the name in proportion as something of his own personality mingles itself with his manner of understanding, feeling, and interpreting Nature." In other words, the so-called realists are only, after all, indulging in a new form of convention. This, though sounding somewhat paradoxical, is no doubt true in a sense. Instead of the convention of conception, which gave rise to purely unreal and theatrical representations of historical events or of Nature, the school of Velasquez, and of the moderns who follow him, adopt a realism of conception, with a conventionalism of representation or of technique. The event, as in Velasquez' noble picture of the "Surrender of Breda," is represented as it might have happened, but the method of painting does not aim at realistic minuteness of detail, at anything like deception of the eye: it is the artist's rendering of

nature through painting, in accordance with his own special faculty of perception and execution.

M. Lefort regards the celebrated picture of his younger period, "Les Buveurs," as containing the germ of all the remarkable qualities of Velasquez. One peculiar quality in this celebrated work is that while it is antique or classic (in a way) in its leading idea and grouping, it is frankly realistic as to the figures taken separately; there is no attempt at ideal beauty; the figures are ordinary types of humanity, repulsive even (some of them); they have the air of being an ancient bacchanalian group translated into the human semblance of the painter's own period. The more essential point to be noticed is that it is essentially an artist's picture; there is nothing to interest or attract one in the incident or the personages, the attraction is in the grouping and treatment, representing exactly that kind of power which can be exhibited through painting alone, and the attraction and suggestiveness of which it is absolutely impossible to define in words: there is a harmony about it which appeals to the eye as music to the ear, but which is equally indefinable in both cases. In his portraits, especially those of his later days, what we feel impressed by is rather the remarkable power and mastery of execution without laboured finish, execution to which, as M. Lefort remarks the painter "has brought a boldness and freedom absolutely disdainful of unnecessary detail and accessories." Yet in spite of his apparent negligence the effect is always obtained, and the effect he wanted and aimed at. The fac-simile illustrations in the volume are few; they include a characteristic pen sketch of a coach and horses seen in perspective from the rear (another of Velasquez' peculiarly painter-like qualities is his love of experiments and *tours de force* in foreshortening), and two heads of that scornful the Duc d'Olivarez, reproduced respectively from an etching by Velasquez and an engraving attributed to him.

It is like going into another world to turn to M. Dargent's volume on Watteau; though Watteau was a far more versatile painter than is realised by those who only judge him by the "Fête Champêtre" pictures to which he chiefly gave himself. These indeed have qualities of the highest order in composition, drawing, even in imaginative power, which many ordinary gallery-goers overlook because the subjects are of a light and frivolous order. But he could have done pretty nearly what he pleased, had not the fashion of the day led him into the pleasant paths of "Fêtes Champêtres." The tolerably numerous fac-similes from his studies in this volume are sufficient to show this. The author commences his biographical sketch with a brief sketch of the state of France at the time. "Où lions le passé! Le bon côté des choses, voilà ce qu'il faut voir; heureux, voilà ce qu'il faut être. Rattrapons le temps perdu; la vie est court, coutons la honne. La Grèce, Rome? Sans doute: les grand dévouements, les nobles sacrifices, les vertus austères? Oui, certes; mais nous foulons le sol de Ganle! Nous sommes les enfants frivoles de cette vieille terre facile et gaie! . . . Voilà ce que pensait la France quand Watteau se mit à peindre; son génie est de l'avoir deviné, sa gloire est de l'avoir traduit." There is the case in a nutshell. An artist of genius paints the life of his day; it may be a frivolous life in itself, but his genius will show itself all the same. His real power of figure-drawing is somewhat masked by the stiff and unnatural costume in which the figures in his usual scenes are dressed, but his studies of figures in more dégagé costume give quite a different impression. It is curious to read, in connexion with the prevalent style of his pictures, that he was a sombre and melancholy man in ordinary temperament and manner.

Watteau's Fêtes Champêtres are at all events more elevating subjects than Pierre Brueghel's horrible moral fantasies, which are an instructive contrast to Watteau. The latter treated light subjects so as to give them a serious artistic value; P. Brueghel treated serious subjects in a manner that is a travesty of all idea of art in the true sense. Jean Breghel,—"Velvet" Breghel,—was of course an artist in a very pretty way. It is curious to contrast the portraits of the two men with their works. They give the impression, with their fine chivalrous-looking heads and military bearing, of artists whose natural tendency would have been towards a far higher class of subjects.

Terburg, of whom M. Michel gives a well-illustrated noont (so far as pictures depending so much on colour can be illustrated in cuts), may be said to have been intellectually an artist of the same type as Watteau, one who treated the society of his day in an artistic sense. Unfortunately, he had a graver (certainly) but a less graceful and *spirituel* society to depict, and his feeling is bourgeois compared with that of Watteau, but it is extraordinary what an air of grandeur, and an amount of suggestion of a story, he gets out of a group of two or three plain Dutch people in their heavy stiff costume. The figure of the large young woman with her back to the spectator in the celebrated picture of "The Satin Dress" (M. Michel calls it "La Remontrance Paternelle") is one of the most unforgettable things in painting, as far as expression and suggestion are concerned; a novel might be based on it.

The volume on Abraham Bosse gives a large number of engravings from his curious half-grotesque figures of various types of society and professions of his day, and that an Gavarni gives a number of fac-similes from his inimitable sketches of character.

Plain Handicrafts; being Essays by Artists setting forth the Principles of Design and Established Methods of Workmanship. A guide to elementary practice, with a preface by G. F. WATTS, R.A. Edited by A. H. MACKMURDO. London: Percival & Co.

THIS little book is issued by the National Association for the advancement of Art, one of the principal objects of which has been to promote an artistic spirit in what may be called every-day work-objects of ordinary use. The artists concerned in it are Mr. Selwyn Image, who writes "On the Design and the Study of Nature"; Mr. Lethaby ("Cabinet-making"); Mr. E. Roscoe Millies ("Modelling" and "Carving"); Mr. Ernest W. Gimson ("Plaster-work"); Mr. Reginald Blomfield ("Metal-work"); Miss May Morris ("Embroidery"), and Mr. Heywood Sumner ("How to make Stencil Plates and how to use them"). Though it is a thin little volume of only sixty-three pages, it will thus be seen that it contains the opinions of some very accomplished artists in several important branches of art.

Mr. Watts' short preface takes the line that "it is a social demand, rising into a religious duty, to make every endeavour in the direction of supplying all possible compensating consolation for the routine of daily work, because so mechanical and dreary." . . . "The hoy encouraged to imitate some natural object will ever after see in that object something unseen and unknown to him before, and he will find the time he formerly did not know what to do with—a state of being that continually drives thousands to the congested metropolis—henceforth full of pleasurable sensations." What drives thousands to the "congested metropolis" is, we fancy, in the main an idea that they will somehow get on there, though they cannot get on in the country, which proves in most cases a delusion; but in the main sense of Mr. Watts' remark we thoroughly agree. Of the other essays perhaps the most practical useful is Mr. Lethaby's on cabinet-making, with its little sketches showing how to fashion simple pieces of furniture. "Do not pretend," he says, "to cleverness or originality" (this is for the young workman employing his leisure in making things for himself), "consider place, use, size, strains, and other conditions of shape, make, and service. For, by putting your work together in the best practical way; by smoothing a surface, or rounding an edge as thought will suggest, you will reach the beauty of pleasant form, because you will have sound, sensible form." The suggestive sketches bear this out, unless we may take exception to the wavy outlines of the supports to the bench (fig. 7) which we do not quite see the advantage of, even in appearance. Mr. Gimson in his chapter on plaster work gives a wholesome piece of advice as to staying within the limits of plaster, and condemns the practice of teaching modelling in our schools from examples of carving; it may be excellent training, but tends to lead him into wrong ways of designing. Both this and Mr. Blomfield's paper would have been the better for a few sketches to explain more fully to the eye what is meant; but Mr. Blomfield's is a most practical paper apart from this, and concludes with some excellent advice as to the spirit in which natural forms should be adopted for use in the material. It is just here

that a sketch would have come in well; beginners do not always understand the meaning of directions in regard to a principle of working, though the meaning may be perfectly obvious to more experienced minds. Miss Morris gives a few illustrations chiefly of a practical kind as to the use of the needle in embroidery, and Mr. Heywood Sumner's chapter on the use of stencil plates is accompanied by some illustrations showing the adaptation of natural forms to the conditions of stencil work, without which the directions could hardly have been intelligible.

The book, as far as it goes, is one of the most useful and sound little works of the kind that has been published; and should be of use for others besides those whose lives especially warrant brightening. It might well be in the hands of all children as soon as they are come to an age to feel interest in making things for themselves, and learning to make them in the right way.

A. CARFAULT. *Terres Cuites Grecques Photographiées d'après les Originaux des Collections Princes de France et des Musées d'Athènes*. Paris: Colin et Cie. 29 pl. fr. 25.

This book is only mentioned by way of warning. It is little more than a specious snare set for the newby, who are wholly unacquainted with recent investigations as to the authenticity of a certain class of terra-cottas. Not only does M. Carfault pay no manner of attention himself to the arguments by which M. Reinach has convinced, we may safely say, the whole scientific world, but he—and it is for this that we quarrel with him—suppresses all mention of a literature of whose existence he cannot well be ignorant. Glancing over the plates we find, e.g., No. xviii., the Thetis seated on a dolphin, with the helmet of Achilles, and no word to hint that this manifestly modern forgery has ever been suspected; upwards of a dozen others out of the twenty-nine stray plates might be cited. After such evidence of incapacity it is not necessary to dwell on the shortcomings of the annoyingly pompous text.

Christian Thought in Architecture. By BARR FEBREE. New York: American Society of Church History. 1892.

THIS is a reprint of a paper read by the author before the Society named on the title-page, and is a consideration of the extent to which Christian feeling is represented or symbolised in Gothic architecture. The ideas embodied in the paper are not new—in fact are rather old—to English readers. In regard to one point we may observe that the author is no doubt correct in upholding the view that the cross was not deliberately selected as the typical plan of the church for any symbolical reason; that it was evolved by natural steps from the ritual requirements of the early church, which first pushed out the side chapels from which the transept gradually developed. But it does not therefore follow that the frequent inclination of the choir northward was not symbolical. Although the origin of the cross form was not symbolical, there is no doubt that a symbolism of the cross was tacked on to it by the medieval mind, and when once that idea was adopted the temptation to carry it further into detail was natural enough. The explanation that the peculiarity arose from careless setting out of the plan is hardly tenable, since there is no setting-out problem so easy and natural as that of aligning a long narrow building correctly on its axis.

The Geometrical Problem Solved. By W. D. DOUGLAS, of Cardiff. Cardiff: David Douglas & Co.

A SMALL manual designed for scientists and students, purporting to illustrate graphic methods of dividing any angle into any number of equal or fractional parts. The plan is ingenious, and described by fifteen propositions, in which the measuring or dividing of arcs of circles is rationally introduced as the most approximate method of geometrically dividing up a given angle, and as the author claims that the problems indicated in his book are infinite, so there is also no limit to the division of the angles discussed. The treatise is, however, more likely to be useful in setting out workshop drawings full size than when drawn to scale on a drawing-board, and would have been more suitable for a paper on the Transactions

of a Mathematical Society than as a special textbook for students.

Cashbook and Money-Kent's Universal Office Manual. London: Published by the authors, 17, Victoria-street, S.W.

THIS work contains a sensible treatise on accounting-house and business routine, an exemplification of book-keeping on the modern double-entry system, and a number of specimen account-book page rulings and examples suitable for every description of business. The authors, in their preface, disclaim any desire to pose as exceptionally qualified instructors of those who conduct their business on systematic principles, their work being primarily intended for the guidance of the few, very large body of traders whose opportunities for acquiring sound business knowledge have not been great. We can cordially recommend the work. The lessons inculcated by it will, if taken to heart and acted upon, not only save many a man from filing a petition in bankruptcy, but will start him on the high road to success. The specimen pages of account-books include builders' prime-cost books (with separate sections for materials and wages), analyses of materials used and wages paid, summaries of materials and wages, workers' time record, manufacturers' cost-book, &c. The way in which these and other account-books should be kept is lucidly explained. The cost of the book, which is very well got up, is 5s.

Correspondence.

To the Editor of THE BUILDER.

ARCHITECTURAL EDUCATION.

SIR,—In reply to Mr. Cole A. Adams, may I try to clear up one or two points on which there appears to be some misunderstanding?

The two meetings referred to by Mr. Jackson in his letter to A.A. Notes had nothing whatever to do with one another.

The first was held at my office, as already stated. The second was held at Bernard's Inn, when about fifty architects, all members of the A.A. as to what was being done, and not the first.

What Mr. Adams says about my being "the Past-President of the A.A. who had brought the new educational scheme to the birth," ought to have been sufficient guarantee that I was not likely to try and strangle the child,—as he infers,—before it was even a year old. However, as there seems to be some doubt upon this point, I wish to state clearly that no such idea ever entered my mind.

Mr. Jackson did not suggest any such thing as sweeping away our present curriculum at our meeting; if he had, he would not have been listened to for a moment by any of the members of the A.A. who were present. On this point I am quite clear.

I am of opinion that the scheme we have started with so much trouble, and with which "the some half-dozen" have been so intimately connected, is a very good one, and with this Mr. Jackson generally agreed. The one point to which he took exception was,—not the scheme itself, as Mr. Adams states,—but the fact that it "points" definitely to preparation for the Examinations of the Institute. Omit this pointing (which consists of some few paragraphs and foot-notes), amend your scheme in one or two small details, and we will help you, if you like, and your students can then go in for the examinations or not as they may elect. This is what Mr. Jackson told "the some half-dozen." In his letter to A.A. Notes, however, he puts his views into words so very different to those he used to us that, without some satisfactory explanation,—which I hope will be forthcoming,—it would obviously be quite impossible for the Association to accept his offer as it may at first sight appear to be laid down in A.A. Notes.

These, I have reason to believe, are generally speaking, the views of "the some half-dozen" with Mr. Jackson and his friends on the 15th inst.; and I venture to think that the general body of members of the A.A. will consider that we were serving their best interests in acting as we did. LEONARD STOKES.

"GLASGOW ART GALLERIES."

SIR,—I have read your criticism upon my design for the above, and I am not sure whether it means,—on the average,—praise or the reverse. You say it is one of two of "outstanding merit," and go on at first to give it what seems to be a full measure of praise; but did you get sorry for what you said? For in the latter part the lash is laid on pretty hard.

If my design be a curious parallel to Sir G. Scott's "failure" at Gilmore-hill, it is quite accidental. I never heard of, nor saw,—either in print or reality,—the place; and as to the Central Hall it was intended to be "unconventional," and not like the orthodox thing. But I think I read correct; the intentions of the Committee, as every one, including, I believe, Mr. Waterhouse, admired it. The vaulting is not "complicated," and I should be glad to know how a span of 70 ft. may be covered in fireproof construction in any simple manner, except with a roof like Cannon-street Station? You should not have drawn your criticisms from my internal perspective view of this, as I am quite aware it was a poor drawing.

As to style, what is one to do? Please to remember the cruel fact of a competition, we can only select what we believe will be most popular. It is seldom one can really consult one's own taste, and practise the style he thinks most true. In this case, my father and I made a design for the Imperial Institute, which most people admitted to be fine; it would not do. We tried another style at South Kensington with equally bad luck, and no this,—of which I had much hope,—"with towers scattered broadcast," as you say, to produce "the Scotch baronial": all no use. Do let me know why you think is right and *à la siècle*, so that I may do better the next time.

Anyhow, I must say for my design that it is a copy, either of Sir Gilbert Scott or Mr. Aston Webb and I do not think my late friend and respected master, William Burges, A.R.A., would have been ashamed of his pupil on account of his latest effort at least. THOS. MANLY DEANE.

3, Upper Merriam-street, Dublin, April 23, 1892.

* * * We admired Mr. Deane's design, and did not intend to suggest otherwise; nor did we mean to imply that he had copied Scott. We did imply the neither Scott in his Glasgow University nor M. Deane in his Art Gallery design had succeeded in being genuinely Scotch in character. The criticism we said was "very fine," but not a "hall of music." This Mr. Deane admits. "Complicated vaulting" was not intended in a depreciatory sense.

As to the latter part of Mr. Deane's letter, we can only say that it is a melancholy confirmation of what we have often said as to the evil effect of competitions on architecture, the object being, as Mr. Deane so frankly admits, not to produce the best possible architecture but to secure the appointment. The "assessor" system in this respect seems to increase the evil—"So-and-so is it assessor; what is his favourite style? Let us go for that." Truly a melancholy state of things for the art of architecture.—ED.

The Student's Column.

WARMING BUILDINGS BY HOT WATER.
XVIII.

INDEPENDENT BOILERS: BRICK-SET BOILERS.

 MONG types of independent boilers we may mention first Keith's Challenger Boiler (fig. 70), which is well-known and for those purposes to which it is adapted it is decidedly successful. The peculiarity in its internal construction, which, as before referred to, presents a very large area of direct heating surface in a comparatively small space. It is a cast boiler, and built up in sections as the illustration shows, and it can be seen that the power of the boiler can be increased, or the reverse, within certain limits by the additional removal of some of the sections. The lower sections which constitute the furnace are convoluted inside, which about doubles the area of surface compared to flat plates. The upper sections are more complex, being partly convoluted, and also having cross water-way extending from side to side. Other devices of a similar nature are resorted to to increase the internal heat-receiving area. The fact of the parts being cast-iron permits of these varieties of surfaces being easily obtained in the manufacture, a result that would be difficult and costly to obtain (to this extent) with wrought plates.

If desired, the sections can be arranged in the feeding-door to be placed at a high position, so that the boiler may be charged with coke to last several hours. This, however,

is not desirable if the full power of the boiler is needed. In fact, every boiler is at a disadvantage in being filled up in this manner with fuel, as the black mass in the upper part of the boiler effectively prevents the plates at that part receiving the heat that should be imparted to them, and the boiler is worked almost wholly by the glowing fuel in contact with the plates at bottom.

A boiler of this character must necessarily be coated with non-conducting compound, or surrounded with brickwork, to prevent loss of heat, and with a boiler having such a large direct heating surface, with comparatively little water, there should always be two or more flow pipes and returns. This boiler is made to heat up to 7,000 ft. of 4-in. pipe.

The last boiler of the independent order to be mentioned, is by the same maker, and

FIG 70

termed the "Python," as it is of a horizontal shape, and can be shortened or lengthened by the withdrawal or addition of sections. Fig. 71 shows the boiler in front elevation, but with the front casting, and its fire-doors, &c., removed. This boiler has a convoluted inner surface, top and sides, and a multiplicity of other heating surfaces, chiefly in the form of cross water-ways. This, and also the last boiler mentioned, has fire-bars that, by the movement of a lever handle outside, set up a racking motion to clear the bottom of the fire and assist in preventing slinker-forming. This arrangement prevents the too frequent opening of the stoking-doors. This is the most powerful boiler made, and is

Fig 71.

used for such works as public washing and swimming baths and laundries.

The automatic damper, or draught-regulator shown in the flue-neck at back, is worth describing, as it acts upon a good and reliable principle. This damper is practically an Arnott's ventilator in its action, opening into the flue or chimney and permitting air to pass in, in variable quantity according to the extent that its flap is open. The flap or door is nicely pivoted at its lower edge, and by the use of a little balance weight it swings to and fro with very little impulse. Now, it is probably known to most of the readers that the draught in a chimney is very irregular, even within the space of a few minutes, at one moment being strong and another moment rather slack. This quick irregular action is generally due to wind, but at a slower, but just as inconvenient irregu-

larity is brought about by careless or insufficient attention to the fire. If an ordinary damper is left open a little too far and the attendant absent himself, a deal of annoyance may be experienced by the fierce burning of the fire, &c., and this automatic damper obviates this.

If we make an opening in a chimney a short distance above a stove or boiler, we shall find that an inrush of air immediately sets in through this aperture, and the current of air through the fire below will be reduced proportionately. Now, the automatic damper is this opening, but its balanced door or valve regulates the amount of air that passes in. If the fire commences to burn fiercely, the draught in the chimney at once becomes strong, but its strength in this case defeats itself, as it causes the valve to open and the inrush of air robs the fire below of draught which at once checks its fierceness. With the abatement of the fierceness, the draught in the chimney also slackens, and this allows the valve to wholly or partially close until called upon to act again. Any irregularity of draught caused by wind, and which would make the fire burn badly, is checked by the same means. Whether the fire or whether the wind is the cause of excessive draught in the chimney, this valve checks it just the same. (The draught in a close-fire kitchen-range can be regulated in precisely the same manner by inserting an Arnott's valve in the chimney-breast.)

BRICK-SET BOILERS.—The shape that necessarily takes precedence in this description is the "saddle" boiler. It is one of the oldest forms we have, cheap to make, effective (up to a certain size), and its shape is calculated to benefit by the heat evolved from the fire. The addition of water-way ends front and back

FIG 72

makes it as nearly perfect as a wrought boiler can be. When, however, we require a great quantity of pipe to be heated it is more economical in results to have some one of the more complex forms of boiler, which present a greater heating surface within a restricted area.

It will be noticed that with the saddle boiler, fig. 72, at a point about half way up, the plates begin to describe a half circle over the top, both outside and inside. This, in the writer's opinion, is a disadvantage, not so much inside, however, as outside.

With the outside flue, or indirect heating surface, it has been explained that plates which come beneath the source of heat are practically valueless, owing to flame and heated gases having no efficient contact with surfaces beneath them (unless the flue be choked somewhat, when an objection of another kind presents itself). In addition to this, these surfaces always have a collection of dirt upon them, which by itself would prevent a ready transfer of heat to the water. A square shape, as fig. 73, would give

FIG 73

better results, as the inside and more effective direct heating surface would be increased and the vertical surface outside would be added to: vertical surface, notwithstanding its low value, being more useful than a surface beneath the source of heat. By having the boiler of this shape, the flame can be led up and down its length as usual, but along the side, the mid-feather being central, as shown. The top, the useless surface, need not be made use of

except to support the brickwork above, and this would reduce the cost of fixing. Most of the newer shapes, which follow the saddle somewhat, are of square cross section, and the top outer surface is not used except in the way just mentioned.

In fixing saddle-boilers (ordinary shape) there are two methods in common use, one being adapted for the smaller sizes and the other and more usual method for small and large sizes alike. The former method is to fix the boiler so that heat and heated products escape from beneath the boiler at all points, and so envelope the boiler without being specially conducted by fines to this end. It is a very effective method. Fig 74 shows in

FIG 74

longitudinal section the boiler so fixed; it is set upon four fire-bricks, one at each corner, these raising it three inches above the fire-bars. By this means the draught in the chimney causes the heated gases to pass from the fire-hox under the sides, and then embrace the outer surface of the boiler, as a moderately close-fitting arch is thrown over. The space between the boiler and the brickwork of the arch would be, say, three inches.

The illustration shows the chimney leading off from the centre at top, this can commonly be arranged and gives the best results; if, however, the chimney must be carried up at the back, the feathers must be introduced to keep the heat from inclining towards that point too much. It will be noticed that only a narrow space is left between the boiler and brickwork at front and back. The object of this is to prevent the too free escape of heated gases at these high points, as otherwise we should not get heat to pass under the lower sides. This space in question should be 1 in. to 1 1/2 in.

If the chimney was carried up at the extreme back, the boiler could be batted tight against the brickwork at that end. A damper to regulate the draught would have to be fitted in the brick chimney immediately where it starts at from the top. This is the usual, and the best and most convenient position for it. This method, as mentioned, is only suited for small boilers, as will be readily understood. It possesses a disadvantage in the fact that when the fire has been going slowly for a little time without attention, the passage-ways beneath the lower side edges of the boiler become choked with ash, &c., and the outer indirect heating surface has little of the heat. The less useful spaces at each end of the boiler would be more active then, but it would not do to stop or omit them. Boilers fixed in this manner will more quickly fall with accumulated dirt, than when they are fixed with their lower edges level with the fire bars.

OBITUARY.

MR. R. J. JOHNSON, F.R.I.B.A.—We regret to hear of the death of Mr. Robert James Johnson, F.R.I.B.A., F.S.A., of Newcastle-on-Tyne and York. He died, after a long illness, on the 18th inst., at Tunbridge Wells, aged 60. He was elected an Associate of the Royal Institute of British Architects in 1861 and a Fellow in 1865.

SIR GILBERT SCOTT'S RESTORATIONS.—We are compelled to hold over several letters on this subject, which will appear next week.

STEAM TREE-FELLING AND CROSS-CUTTING MACHINERY.—Some fourteen or fifteen years ago Mr. Allen Ransome, of Chelsea, took out a patent for a steam tree-felling machine, and we were present at some practical trials of it made on the Rouppel-park estate, Tulse-hill. (See *Builder* for January 19, 1878, p. 71, for an account of the trials). *Engineering* for last week (April 23) contains a description and illustrations of a new and improved form of tree-felling machine which is free from some of the difficulties experienced in the use of the old machine. By a simple mechanical contrivance, the machine can be partially rotated on its axis when required for cross-cutting.

GENERAL BUILDING NEWS.

LABOURERS' DWELLINGS IN MANCHESTER.—In the Ancoats district of Manchester, by the side of Jersey-street, a disused cotton-mill has just been converted into a dwelling-house in flats. The total accommodation is for 149 families. The block is seven stories in height. The total cost of the undertaking has been about 20,000. All the old windows of the mill have been replaced with modern sashes. From top to bottom, both front and back, there are a series of iron balconies to which access is obtained from the staircases, four in number, and which have been erected at each corner of the building. These are of concrete and iron. The walls of the building are from 3 ft. thick at the bottom to 2 ft. at the top. Every floor is covered with concrete, resting on brick arches. Each room has a good light. In front of each window is a sink, with a supply, night and day, of hot and cold water. Self-cleansing water-closets are provided, and there are dust-shoots on all the floors. The balconies do not run from end to end of the structure. Each staircase and each landing has its separate balcony. There is a large playground at the back of the building, one end of which is to be converted into a drying-ground. A washhouse, with coppers, hot and cold water, &c., has also been provided. Two clourooms, both apart from the main structure, are being fitted up for the use of the males and females. Each has separate conveniences. The clubroom for the men is 40 ft. 6 in. by 15 ft., that for the women 53 ft. 6 in. by 13 ft. 6 in. Baths have also been provided for both sexes, each supplied with hot and cold water. Every dwelling has a cupboard. A double system of ventilation has been provided for the water-closets. Mr. C. J. Maycock, of Manchester, was the architect, and the work has been carried out for the Manchester Labourers' Dwellings Company, Ltd.

TRADE SCHOOL, SOMERSET.—The opening of the new building of the Trades School, Bruton, took place on the 19th inst. The buildings have been erected from designs by Mr. George J. Skipper, of Norwich, by Messrs. Francis & Sons, of Castle Cary, and cost over £3,000. They consist of a master's residence, with principal schoolroom, class-rooms, chemical laboratory, workshops, dining-room, cloak-room, lavatory, &c. The laboratory has been fitted for twenty students, gas and water are laid on. The workshop is fitted with benches, &c.

PROPOSED SALVATION ARMY "CITADEL," ABERDEEN.—This proposed block of buildings, the plans of which have just been approved, will occupy a site at the east end of Castle-street, with a frontage of 160 ft. The barracks have been designed in the Scottish Baronial style, and the whole building will be of block-stone, finely axed. Almost the whole of the ground and basement floors will be occupied as shops, several of which will be the largest in Aberdeen, being about 40 by 80 ft., and about 20 ft. high. On the first floor, and to the south of the tower, there will be a hall capable of accommodating 2,000 persons, the three front windows forming features in the front elevation. Over the front entrance of the building there will be oriel windows hung on projecting corbels, and the block at its chief corners will be flanked by round towers, about 100 ft. in height. A prominent feature of the building will be a large tower. At the foot of the tower there will be the grand entrance to the Citadel, an archway 20 ft. wide by 30 ft. high, with massive piers, and an arch containing ornamental stones, on which it is proposed to put the initials and crests of leading men who are taking an interest in the erection of the building, which is estimated to cost about 13,000, and has been designed by Mr. James Kontar, architect, of Aberdeen.

PARISH BUILDING, ALL SAINTS', PLYMOUTH.—The corner-stone of the new Parish Building for All Saints', Plymouth, was laid on the 23rd inst. by Mr. Shelly, of Plymouth. The cost of the building will be about 1,250, and it is to be completed by October next. The materials for the structure are the same as used in building the vicarage by Mr. John D. Sedding five years ago—namely local limestone and red brick. Mr. Edmund Sedding, of Plymouth, is the architect, and Mr. Blouey of the same town is the builder.

CONVENT OF MERCY, GRANARD, CO. LONGFORD.—On the 21st inst. the ceremony of laying and blessing the foundation-stone of the Convent of Mercy, Granard, was performed by the Rev. Dr. Woodcock. The general plan of the building comprises an entrance-hall and staircase, with parlours and reception-rooms, community-room, &c.; culinary apartments, cells, and a suitable oratory placed in a convenient position. The architect is Mr. Wm. Hague, of Dublin, and the contractor Mr. P. Kelly, of Longford.

REOPENING OF HAMMER CHURCH, FLINTSHIRE.—On the 19th inst. the parish church of Hammer, in the detached portion of Flintshire, which was almost destroyed by fire in 1889, was reopened, after restoration, by the Bishop of St. Asaph. The church, says the *Birmingham Gazette*, was not insured, but immediately after the fire steps were taken for its reconstruction, Messrs. Bodley & Garner, of London, being the architects entrusted with the work, the estimated cost being about 10,000. The architects have been able, by means

of photographs, to reproduce the ceiling of the north aisle, and, with the exception of the chancel, the restoration has been carried out, as far as possible, upon conservative lines. The chancel has not been restored, it being decided to build one more in character with the rest of the church. The new chancel is larger than the old, and an organ-chamber and vestry have been added. The pulpit is of font are the work of Mr. Forsyth, from designs by Mr. Bodley, and the screen was entrusted to Mr. Douglas, of Chester.

COUNTY TRUANTS' SCHOOL, QUAKERS' YARD, GLAMORGAN.—Tenders have just been accepted for the erection of a Truants' School at Quakers' yard, Glamorgan. The building will provide a large schoolroom, with a portion divided off as one end by a sliding partition, forming a class-room, dining hall, plunge-bath, three dormitories, drilled, and workshop. In addition, a laundry, with drying and ironing room, will be provided, with top lights, and supplied with stored rain-water; a reception-room for new-comers, and a disinfecting-room, with separate entrance from the outside. There will be three entrances to the buildings. At the main entrance, for the Board and visitors, there will be a large vestibule and hall. The superintendent has a wing of the building to himself, with all necessary conveniences and private staircase. Two other staircases will be provided, both of Forest stone, one in the boys' hall and the other in the servants' hall. The dormitories will be provided with inspection-chambers, entered from the master's rooms. On the same floor and under the matron's supervision will be sick and convalescent sitting-rooms. Adjoining the former, but disconnected, and with separate staircase entrance and conveniences, will be provided a room for the reception and isolation of cases of infectious diseases. The matron and staff will be accommodated with private apartments. The linen and store-rooms will be kept aired by means of pipes from the heating apparatus. It is proposed to heat the main building by hot-water, and the cooking will be done by steam. In the disinfecting room will be a steam disinfecting machine. The water to the plunge-bath and lavatory will be warmed by an injection of steam, and the wash-tubs in the laundry will have a continual supply of hot water, kept at a given temperature throughout washing operations by the same means. There being no sewer to connect the drainage to, it is proposed to collect and filter it. Provision will be made for a board-room, and an office for the superintendent and waiting-room will adjoin the main hall. A fire hydrant will be fixed on each floor. The walls will be built of local stone, the front and sides faced with hammer-dressed random ranged work, relieved with box-ground stone and buff, and red terra-cotta and brick bands. It is proposed to use plain "hit-and-miss" inlets and Kite's patent automatic exhaust ventilators. The building is designed in the Italian Renaissance style, and the plans, which were selected in open competition, have been prepared by Mr. W. H. Dashwood Caple, architect, of Cardiff. The design and plans have been approved by the Home Office and the Education Department. The tender of Messrs. Stephens, Bastow, & Co., of Bristol, has been accepted at 4,279.

LIBERAL CLUB, BACUP.—On the 9th inst. the foundation stones of a new Liberal Club were laid at Hempsteads, Bacup, Lancashire. The club will be built of stone, parquetry facing and stone dressing, and the style will be English Renaissance. The new building contains, on the ground-floor, a vestibule, with screen doors leading to the corridor. On the right-hand side is a billiard-room, 27 ft. by 21 ft.; on the left-hand side is the news room, 27 ft. by 21 ft., with an octagon projecting window at the angle; at the back of these two rooms is the steward's serving-room, lavatory, and kitchen, with side entrance and staircase to be used for public entertainments only, and which leads to the large assembly-room. The first pair floor is approached by a staircase 4 ft. wide, and contains a public room, 51 ft. by 29 ft., capable of holding 400 to 500 people, with a raised platform at one end, and having a retiring-room, lavatory, &c., adjoining; lavatories and steward's bedrooms are also on this floor. The second pair floor contains a billiard-room, card-room, and lavatories. Messrs. Mangnall & Littlewoods, of Manchester, are the architects, and the premises will cost about 4,000.

SANITARY AND ENGINEERING NEWS.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—The Friday and Saturday (April 29 and 30) the Incorporated Association of Municipal and County Engineers will hold a meeting at Nottingham. Papers will be read, (1) "On Municipal Works in Nottingham," by Mr. Arthur Brown, the Borough Engineer; (2) "On Public Health Acts Amendment," by Mr. W. Spinks; and (3) "On County Management of Main Roads," by Mr. James Robinson, County Surveyor of Hampshire. "Notes will be given on the sewage farm, the epidemic hospital, and other places."

THE TUNNELS UNDER THE CLYDE AT GLASGOW.—Work on the Glasgow Harbour tunnels has been

proceeding without interruption since last autumn, according to *Industries*. Only about 100 ft. of the west tunnel remain to be driven, while the heading of the east tunnel has been advanced about 60 ft. from the south bank. The material encountered is boiler-plate on the south side, thinning off to sand and gravel. No large boulders have yet been met. The maximum progress of the shields in the clay has been 2 ft., and in the sand 3 ft. The air-pressure has never exceeded 160 lb. The shields are 17 ft. in diameter by 7 ft. in length, the shells being built up of two $\frac{1}{2}$ in. plates and $\frac{3}{4}$ in. by $\frac{3}{4}$ in. angles. The rams are of cast-steel, and worked under a water pressure of 1,000 by means of hand-pumps attached to the shafts. In the west tunnel a brick wall forms the entrance to the air-chamber, while in the east tunnel a stiff steel diaphragm is used.

WINCANTON SEWERAGE.—The Wincanton Rural Sanitary Authority have called in Mr. A. P. I. Cotterell, Assoc. M. Inst. C.E., of Bristol, to advise them as to what may be done to improve the purification of the sewage at their disposal works. Mr. Cotterell has visited the town, and recommended the adoption of the International Sewage Purification Co.'s system, with polarite filter beds, but with a new form of precipitating tank not hitherto used in this country. The tank is constructed like a circular well, about 25 feet deep, and the sewage is conducted by a pipe to the bottom, precipitating as it slowly rises. The sludge which collects at the bottom is pumped out daily without emptying the tank. The top is covered in, and the sewage is not, therefore, open to the action of the sun's rays. These tanks are, it is stated, already in successful operation on the Continent, and we are informed that experiments made in England have produced very satisfactory results, much superior to those from the usual form of tank. The Sanitary Authority are now considering the report.

FOREIGN AND COLONIAL.

FRANCE.—MM. Gustave Morsau and Carolus Duran have been appointed members of the Conseil Supérieur des Beaux-Arts, in place of the late M. Delaunay and of M. Bonnat, who has become President of the Société des Artistes Français. By a decision of the Minister of Public Instruction, the Prix de Salon given each year to a painter, a sculptor, an architect, or an engraver alternately, will henceforth be known as the "Prix de Paris." The prize cannot be given to an artist older than 32, and is accompanied by a sum of 10,000 fr. payable in two annuities, to enable the holder to travel for two years.—An exhibition of the works of Raffet is to be opened at the Galerie Georges Petit, the proceeds to go towards a monument, consisting of a column surmounted by a bust, and surrounded by French soldiers.—M. Maze Leucier has left to the Carnavalet Museum a curious collection of snuff-boxes belonging to political celebrities of the revolutionary period.—The Ecole des Beaux-Arts has set apart a special room for the valuable collection of manuscripts, drawings offered by Madame Lenoir, the widow of the architect who died two years ago.—A fine ceiling attributed to Mignard has been fixed in one of the rooms of the Gobelins Museum; it represents Apollo playing the lyre. It is said to have formed the ceiling of Lebrun's atelier.—There is talk of building a large military hospital near Issy, to replace the St. Martin and Grosvenor hospitals, which are now inadequate.—The first stone of a large boys' school has been laid at Meudon.—A bronze statue of Rouget de Lisle was inaugurated last Sunday at Choisy-le-Roi.—There has just been opened at the Hôtel de Ville at Paris an exhibition of the designs sent in by MM. Courcelle Dumont, Delancey, J. Ferry, Proaër, and Simas for the Salle des Banquets. The decision will be made known during the week. The design of M. Delancey appears to us far superior to the others.—The second competition for the Beaumarchais statue is also to be settled shortly. The three designs in competition are by MM. Allouart, Clausade, and Lornier.—There has been installed in the Palais des Beaux-Arts a collection of the views of old Paris, executed by M. Hoffbauer, and which formed, some years ago, the diorama of "Paris à travers les âges" exhibited at the Champ-Blysés. These views have been presented to the Paris municipality by M. Firmin Didot, the well-known publisher.

BERLIN.—The Special Committee of members of the Town Executive and the Common Council, elected by the Municipal Authorities of Berlin, to consider matters relating to the proposed opening of an International Exhibition in that city, has decided in favour of the scheme, and has recommended that the greatest possible assistance be given to those entrusted with the arrangement of the exhibition. The committee will now consider in what form the assistance is to be given. The Imperial Chancellor has now also assured the Chamber of Commerce of the Government's interest and aid. It is therefore now being taken for granted that the exhibition will come off. The German public seem to be greatly in favour of it.

lea, and the press throughout the country has taken it up warmly. Some doubt, however, still exists as to the feeling in the German trades. Continental exhibition at the large international fairs, at the national and the various local ones, has so far been felt as a great burden, especially as the exertions made have not had much of a beneficial result.—There is still a probability of the Emperor's idea of having further alterations made in the vicinity of his "Schloss" being carried out, in spite of the enormous expenditure which would have to be covered by the profits of another lottery.—The Bill put before the Prussian Landtag relating to the extension of the Government Railway System proposes that some ninety millions of marks shall be spent in the course of a few years on "special extensions." Of this sum 26,000,000 marks will be required for new lines, some 44,000,000 marks for the extension and alteration of existing ones, and 10,000,000 marks for rolling stock.—The municipal authorities have decided to erect a so-called "Provincial" museum in which some local collections and several libraries are to have room found for them. A suitable site for the museum building has been found, and a competition for designs (three prizes, 500, 1,500, and 1,000 marks) is to be opened.—The Municipal Authorities of Berlin have for some time been paying attention to the various advantages and disadvantages of cremation. They have now decided to introduce cremation in the Municipal burial-grounds, and hence all un-identified corpses, as well as those of paupers, &c., having no relations or friends who might be desirous to this mode of proceeding, will henceforward be thus disposed of. Instead of using the usual zinc box some 15 cm. cube will be used as a receptacle for the ashes, and the numbers or names relating to the contents will be marked on copper plates, which are to be enclosed with the remains as well as the figures or letters on the outside. The apparatus necessary for the burning process has been ordered. The Schneider system is to be used.

VIENNA.—The "International" Theatrical and Musical Exhibition is to be officially opened on May 7.

SWITZERLAND.—The committee in charge of the designs pertaining to the proposed erection of a large block containing concert and assembly rooms for the block are apparently not satisfied with the result of the (second) competition lately held for the purpose of obtaining a suitable design. Herr Bruno Schmitz, of Berlin, who took the first prize in both competitions, is not likely to have the erection of the block, as Messrs. Fellmer & Helmer, Vienna theatre specialists (who have put up the new municipal theatre at Zurich last year), and Professor F. Bluntschli, of Zurich, have now been invited to tender designs. It is true that Bruno Schmitz's work is to serve as a basis for the designs, but that will give but little satisfaction to the architect or his friends. Apparently Messrs. Fellmer & Helmer are favourites of the committee, as they were invited at once after the issue of the competition, and Professor Bluntschli was only invited after the Swiss architects had expressed their disgust. That the German professional journals rely by no means very gently in their criticism on the behaviour of the committee is only natural.—Some thirty designs were sent in for the competition for the design of a Toll Monument at Atdorf, the first prize (2,500 francs) was given to the architect, R. Kissling, of Niesbach, Zurich.

NEW ZEALAND.—The April Circular of the Emigrants' Information Office and the new annual editions of the penny and other handbooks, with maps, which have just been issued, show the present prospects of emigration. Branch offices are now organised at Bradford (Yorks), Bury, Edmunds, Cardiff, Devizes, Glasgow, Hereford, Southampton, Leeds, Liverpool, and Reading, mostly in connexion with Free Public Libraries, where all the above publications and other information may also be obtained. This is the best season of the year to go to Canada, and there is likely to be a good demand for farm labourers, and to a less extent for general labourers and navvies and for mechanics in the building trades. In New South Wales and Victoria mechanics are wanted, except in a few districts, and in Victoria especially the demand is great. The Queensland Government will receive 100,000 passengers last February, so that now all except uneducated and indented emigrants have to pay all fares. There is no demand whatever for mechanics in Queensland, many carpenters, plumbers, and general labourers have been out of work, and no one should go there at present in the chance of finding employment. Western Australia offers free and reduced passages for certain classes of emigrants, but the passages for farm labourers have just been suspended. Work there has been much brisker than for some time past, and there is a demand for a limited number of farm labourers, men in the building trades, miners, and labourers on railways and in stores, farms. In Tasmania the chief demand is for stonemasons, the new silver mines at Zeehaan on the West Coast are giving employment to considerable numbers of miners, railway navvies, and small traders. In various districts of New Zealand there

is a demand for farm and station hands and for miners. Cape Colony and Natal offer reduced passages to mechanics, female servants, and others, for whom there is a limited demand. Government Labour Bureaux have recently been opened in New South Wales, Queensland, and New Zealand. Emigrants on arrival should apply to the local offices at Sydney, Brisbane, or Wellington, or to one of the country branches, which are very numerous. The warnings already issued by the Emigrants' Information Office against emigration to South America still hold good. Intending emigrants are especially strongly warned not to go to Brazil at the present time.

MISCELLANEOUS.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION: ELECTION OF PENSIONERS.—A special general meeting of the donors and subscribers took place on Tuesday last, at the offices of the Institution, 21, New Bridge-street, E.C. The President, Mr. Colin G. Patrick, who occupied the chair, stated that as there were but two candidates, it had been decided that the election should be by show of hands. The candidates were Mr. William Marcham, and Mrs. Mary E. Robb, and after some particulars respecting each had been given by the President, they were elected in due course, the former to the Clerks' Pension of 25l. per annum, and the latter to the Widows' Pension of 20l. per annum. A vote of thanks was accorded to the chairman at the close of the business.

A NEW IRISH SEAL.—A new great seal for Ireland has been completed by Mr. Allan Wyon, chief engraver of her Majesty's seals, to take the place of the seal designed on the accession of the Queen, which is now worn out. The new seal is an exact replica of its predecessor, and is similar in all respects to the great seal of England, save that in the exergue a harp with shamrock leaves takes the place of the trident-head and sprays of oak, which form the distinctive mark of the English seal. The material is silver, the weight of the whole about 15 lb., and the diameter of the impression is 6½ in.—Irish Builder.

THE NOVELTY THEATRE, GREAT QUEEN STREET.—This property, having a lease for 69 years unexpired, will by order of the mortgagees, be offered for sale at the mart, on May 20 next. The premises have a second frontage, with entrances, in Park-street. They were built from the plans and designs of Mr. Thomas Verity, architect; the theatre was opened on December 9, 1882, under its present style; but for an interval was known as Jodrell's. We may supplement the tale of celebrated residents in Great Queen-street, as given in the guide-books, by stating that Mr. Frederick Craze, who formed the collection of maps, plans, prints, and drawings of London,—purchased from his son, Mr. John Gregory Craze, for the British Museum,—lived for a while in the house on the southern side, into which Sir Godfrey Kneller removed from the Piazza, Covent Garden; and that the *Mercurius Politicus* for the week November 16, 20, 1657, contains an advertisement of the robbery from the Earl of Chesterfield's, in this street, of certain "pictures" in gold and jewelled cases.

THE SANITARY CERTIFICATE'S EXAMINATION FOR INSPECTORS OF NUISANCES.—At an examination for Inspectors of Nuisances, held in London by the Sanitary Institute on April 8 and 9, 105 candidates presented themselves. Questions were set to be answered in writing on the 8th, and the candidates were examined viva voce on the 9th. Sixty-eight candidates were certified to be competent, as regards their sanitary knowledge, to discharge the duties of Inspector of Nuisances.

CHICAGO EXHIBITION, 1893.—The *Journal of the Society of Arts* announces, on behalf of the Royal Commission for this Exhibition, that her Majesty's Government, having increased the grant placed at their disposal for the purposes of the Exhibition, Section from 25,000l. to 60,000l., they can dispense with any charges for space at the Exhibition, and will return to the intending exhibitors the amounts already paid on that account. The available space in the General Manufacturers Building is now almost entirely filled. In the Agricultural Building, and in the Machinery Building, space is still available. All applications for space must be made upon forms to be obtained from the Secretary of the Commission, at their offices, John-street, Adelphi, London. The French Chamber of Deputies have just voted 130,000l. as a grant for the proper representation of France at the Exhibition.

FRENCH ROAD-MAKING.—The British Vice-Consul at Dieppe, in his last report, says that the roads which surround the docks, and the national roads which lead out of the town on the east and on the west, have been made with an exceptionally good quality of stone, of singular hardness and durability, which was brought from Cherbourg. In fact, it is so hard that it will split glass. It is broken up into macadam, and forms splendid material for making roads. Her Majesty's Consul at Cherbourg mentioned this stone very favourably in his report for 1890, and its use has proved so satisfactory in Dieppe, that the Vice-Consul thinks it might be worth inquiring whether it could be employed on some of our English roads, where a

lesson in road-making might be learnt with advantage from the French *cantonnier*. The material is usually marble, flint, stone, or gravel, and whatever is used must be of the best quality and cleansed from all foreign substances. The stone must be broken up so that each piece may pass through a ring 2½ in. in diameter. It is then spread evenly over the road, the interstices being carefully filled in with smaller pieces, so that the whole is smooth and free from abrupt eminences and depressions. A steam-roller then crushes and levels the whole, after which a superficial layer of clay and earth completes the work. In Normandy, where the roads are perfect, they are made slightly convex, with a trench on each side, and are diligently scraped to keep them dry. One of the most important ingredients used in road-making is a little chalk, which helps to bind together the macadam and small stones into a firm and hard mass. If too much chalk were used it would render the roads sticky after frost.—Times.

ROBINSON'S IMPROVED PLASTERING.—A demonstration of the qualities and modes of application of Robinson's "Fireproof Cement and Paragon Plaster" was given at a new building (No. 45, Chancery-lane) on Saturday, the 23rd inst., by permission of the architects (Messrs. Somers Clarke and J. T. Micklethwait) and the builders (Messrs. Langdale & Hallett). One of the advantages claimed by the manufacturers, and apparently with justice, is that by the use of the "Paragon Plaster" the plasterers "can commence in a room in the morning and completely finish it before the day is out, without previously having been in to first coat." The next day there is a hard surface, which continues to harden, until the result is a wall or ceiling which will withstand damage even from the exercise of a considerable amount of force, as was demonstrated in our presence on the ceiling of a room which had only been finished a week previously. The manufacturers claim that walls, ceilings, battened or cragged walls, and steepled partitions which are covered with this material will never crack. Used pure, the "Paragon" plaster lays on the ceiling like gauged putty. Floating coats can be used with or without sand, but if sand is used it must be clean sharp river or pit sand. Finished with a thin coat of Robinson's "No. 1" cement, this plaster makes admirable work. Messrs. Robinson & Co. are also introducing a new and simple form of lattice ceiling, in which their "Paragon" plaster is laid between and is carried by the joists, a light temporary centring of floor boards being required until the plaster has set. Where rolled-iron joists are used, the bottom flange supports the plaster; in the case of wooden joists, fillets or cleats are nailed on to serve as bearings. Messrs. Robinson's specialities will be on view in the room in Chancery-lane, to which we have referred, up to the end of this week.

RECENT SANITARY CATALOGUES.—Messrs. Young & Marten, of the Caledonian Works, Stratford, have sent us their new illustrated catalogue of plumbers' brasswork, cast-iron and earthenware goods, and other requisites for sanitary work. It consists of 99 pages of well-arranged and well-printed illustrated letterpress. It is a very complete and useful production, and contains an abundance of good things. From this category, however, we must exclude the appliances represented by fig. 91, on page 40, which is no other than the old-fashioned and now generally condemned pan-closet, with its abominable filth "container." We had hoped that the pan-closet was rapidly becoming a thing of the past, so far as new "installations" of it are concerned; it has disappeared from the catalogues of some manufacturers and merchants, and we can only regret that Messrs. Young & Marten express their willingness to supply it, in these days of supposed sanitary enlightenment. We shall no doubt be told that manufacturers and merchants are "compelled" to make and supply this old form of closet; some years ago we were told by a manufacturer that he was compelled to make and stock it for his country and foreign trade, and that he "regretted" that it averaged a dozen a week. Messrs. Young & Marten also send us their "Tariff No. 16," which is the most complete they have yet issued, containing as it does 120 pages of illustrated letterpress and a few pages of chromo-lithography. It includes illustrations, descriptions, and prices of a large selection of stock articles, including traps, waste-preventing flushing cisterns, cisterns, ventilators, brasswork, plumbers' tools, pumps, baths, water-closets, lavatories, urinals, leaded glasswork, oils, colours, varnishes, chimney-pieces, tile hearths, stoves, grates, ranges, locks, door furniture, builders' ironmongery, &c. Both these catalogues will be found exceedingly useful in every builder's office.

THE ENGLISH IRON TRADE.—There continues to be little of note stirring in the iron trade, which maintains its lethargic condition. The Durham coal-miners' strike seems as far off settlement as ever, and while this prevails business must necessarily be withheld. Prices throughout the trade are fairly upheld; but the orders coming forward are extremely limited. In the steel trade, the furnaces at Barrow have been re-started. Tinplates remain dull. The return to work of the engineers

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

on the Tyne who have been on strike is to be recorded with satisfaction. Ship-building is rather depressed, except on the west coast. The coal trade is rather quiet.—Iron.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On the 23rd inst. about twenty members of this Association paid a visit to Falkirk and Callendar House and grounds, the latter being thrown open to them by Mr. Forbes of Callendar. The excursionists afterwards visited the Antonine Wall, which runs through Callendar grounds.

THE LONDON WATER QUESTION.—Apart from the fact that our water charges are unfair, and our supply not what it should be, advocates of the tedious process of a Royal Commission should bear in mind that London is growing at an alarming rate, and as the sources of supply are not being increased, the quality of the water will deteriorate as the quantity required increases. We are now face to face with the fact that we are asking the London water companies to supply us with eight million gallons daily more than we required last year. Every day we postpone the solution we are nearing the great water famine.—Local Government Journalist.

ENAMELLED METAL.—Messrs. Angles Ward & Co. send some specimens of coloured enamel on thin metal, representing a process which they have patented and by which they claim that colour can be applied in this way much more cheaply than by any other process. Of course the value of the special system entirely depends on this, as enamelling on metal is nothing new. The specimens sent are very poor in design, but they seem to show that good colour effects may be produced by the process, in the hands of a good designer.

FORTHCOMING EXHIBITION OF INDIAN METALWORK.—An exhibition of Indian metalwork is to be held at the Imperial Institute early in June next. The Maharajah of Jeypore is sending a very complete collection, and it is expected that his example will be followed by the rulers of other feudatory states. The British authorities, as well as private owners in India, have been specially invited to contribute any artistic specimens in their possession. Many collectors at home promise interesting exhibits, and the show of armour and weapons ought to be unique. There is to be a section solely for the purpose of discovering how dealers can meet the increasing demand for metalware manufactured in our Eastern Empire. Some valuable jewellery will be displayed in a separate apartment. A suite of fine rooms has been set apart for the exhibition, and an experienced committee, with Surgeon Lieutenant-Colonel Hendley as its honorary secretary, is actively engaged in the work of organisation.—Iron and Coal Trades Review.

THE EARLY DAYS OF KEENE'S CEMENT.—Looking casually through the number of the Printers, Stationers, and Kindred Trades Effective Advertiser for March, we met with a few lines referring to the early days of Keene's cement in a bio-

graphical notice of Mr. E. G. Tomsett, a well-known printer and a prominent supporter of the printing trade charities, who is now connected with Lloyd's Register of Shipping. Mr. Tomsett, it is stated, "was born at Alford, near Port Charles, in France, where his father had settled a few years previously in conjunction with Mr. R. Keene, the inventor of Keene's patent cement, and set up a factory for turning out large quantities of cement, mosaic pavement, and imitation alabaster, for clock pedestals, then coming into favour." It is stated that Messrs. Keene and Tomsett found it necessary to carry on their business in the part of France referred to "in consequence of some quarries of a particular stone, essential to their business, being there." Mr. Tomsett and his family left France in 1848.

A BIG RAFT.—It is understood that the idea of towing large quantities of logs in cigar-shaped rafts is becoming very popular on the Pacific coast, and is giving, generally, success. The inventor of the Joggins system, Mr. H. H. Robinson, of St. John, N.B., is constructing a large raft of timber at Fort Braze, for the Fort Braze Redwood Company, and which, when completed, will be transported to San Francisco. The raft will carry a crew, and will consequently be equipped with rudder and steering gear, besides a complete code of signals for night and day use, anchors, chain, &c. The affair will be 360 by 36 ft. at the centre, and will contain 3,000 piling sticks.—Timber.

LEGAL.

LAW REPORTS IN "THE BUILDER."—The Building and Engineering Journal (Molbourne) for March 19 inst says that at the last meeting of the Builders and Contractors' Association of New South Wales, Mr. Murray suggested that a small committee should be formed for the purpose of collating all law records relating to building suits. Mr. Murray instanced a case in which he had searched the London Builder for eleven years back to find a case parallel to the one in which he was then engaged, and had succeeded in finding such an instance, and, although this particular case was unknown to the lawyers, the judge who was conducting Mr. Murray's case admitted the Builder as evidence, and Mr. Murray won his suit.

MEETINGS.

MONDAY, MAY 2. Royal Institute of British Architects.—Annual General Meeting, to discuss the Annual Report of the Council. 8 p.m. Royal Institution.—Annual Meeting. 5 p.m. Victoria Institute.—Sir C. Wilson on "The Past and Present Water Supply of Palestine." 8 p.m. Society of Engineers.—Mr. S. H. Cox on "Dry Crushing Machinery." 7.30 p.m.

Society of Arts (Cantor Lectures).—Dr. Percy Frankland on "Recent Bacteriological and Chemical Research in Connection with the Fermentation of Beer." 8 p.m. Liverpool Architectural Society.—Annual General Meeting: President's Closing Address.

TUESDAY, MAY 3.

Institution of Civil Engineers.—Further discussion Mr. James Swinburne's paper on "Electrical-Measuring Instruments." 8 p.m. Institution of Builders.—Dinner at "The Monks Piccadilly-circus." W. 6.30 p.m. Royal Institution.—Professor T. G. Bonney on "The Sculpturing of Britain—Its Later Stages." II. 3 p.m. Society of Biblical Archaeology.—8 p.m. Glasgow Architectural Association.—Mr. A. Fryers "Half-Timber Work." 8 p.m.

WEDNESDAY, MAY 4.

Royal Archaeological Institute.—Mr. F. C. J. Spurr on "Early Painting and Colours from Medium." 4 p.m. Society of Arts.—Mr. James N. Shoolbred on "Bradford Corporation Electricity Supply." 8 p.m. War Department and Clerks of Works' Institution. Ordinary meeting. 8.30 p.m.

THURSDAY, MAY 5.

Institution of Mechanical Engineers.—Ordinary General Meeting. (1) Inaugural Address by President, Dr. W. Anderson. (2) Two papers to read. 7.30 p.m. Royal Institution.—Professor Dewar on "Chemistry of Gases."—II. 3 p.m. Society of Antiquaries.—8.30 p.m.

FRIDAY, MAY 6.

Architectural Association.—Members' Soiree. Institution of Mechanical Engineers.—Ordinary General Meeting (continued). 7.30 p.m. Royal Institution.—Captain Abney on "The Sensitiveness of the Eye to Light and Colour." 9 p.m.

SATURDAY, MAY 7.

Edinburgh Architectural Association.—Visit Pittshead Castle (ruin), Seaford Tower.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

3,020.—NAILS: A. Chandler.—This patent refers an improvement in horticultural nails, which form kind of brackets or support to clip the branches of trees and plants, and secure the same to the fence, or trellis work. On or over the head of suitable nail a form of soft metal, such as lead, is provided with a finger, rectangular and flattened sheet metal. Two modes of fixing this soft metal nail are given in the specification. The nail is formed can be driven in in the usual way, and the lower part can be bent round or over the branch or limb of the tree or plant, by means of the thumb finger without injury to the tree or plant.

459.—KILNS: H. Warrington.—This specification describes an improvement in kilns for bricks, earthenware, and similar materials. The improvement consists in forming such ovens in the form of two

The Royal Academy Exhibition.

CAREFUL examination of the array of pictures at Burlington House justifies the conclusion that this year's is an exhibition of more than usual interest. No doubt a good many important specimens of commonplace are deposited on the line by Academicians who have outlived their reputation; but these are counterbalanced by the presence of a good many very clever and interesting works by men who are not Academicians, as well as by some eminent R.A.'s who are quite at their best in the present exhibition.

The picture of the year is unquestionably Mr. Orchardson's "St. Helena, 1816; Napoleon dictating to Count Las Cases the history of his campaigns" (173). Mr. Orchardson is one of the few English painters of the day whose works, admirable and conscientious as they are in execution, have an intellectual interest quite beyond that which arises from mere skill in technique. The figure of Napoleon on the cocked hat and grey overcoat has been painted hundreds of times, well, badly, and differently: Mr. Orchardson has endeavoured to show the man without his war-paint, according to a frequent practice with this painter, there are but two figures on this other large canvas, each of which is the complement or balanceto the other. Napoleon, in the ordinary dress of the period, stands in the middle of the floor, his arms behind him, his face fixed on the large map which lies for the moment above the others on the floor, except down at one end by a book, and at the other by a sheathed sword. His countenance expresses intent recollection and concentration, as he endeavours to recall on the map the memory of one of his marches over the country it represents; and the look of power in his face is curiously blended with a certain largeness; giving the character of a man whom you might fear but not respect. This is no mere conventional "historical painting"; the figure is a brilliant realisation which will live in the memory of all who are capable of

appreciating its power. Las Cases sits at his desk in a corner of the room, waiting with upturned face for the next communication from his chief. The accessories, not numerous or elaborate, are most carefully painted, and it hardly seems possible to find a fault in this truly memorable work.

The President, in his own very different manner, is at his best, too, in "The Garden of the Hesperides" (204). The composition of the picture, of course, is essentially decorative. The three maidens, draped respectively in red, saffron, and green, are reclined with their heads nearly meeting against the magic tree; the serpent (not a conventional dragon) coils in friendly fashion round one of them and turns its head to her caress; the head, by the way, is somewhat mixed with the dark purple sea in the distance, and does not quite stand out from it. The colour harmony of the draperies is perfect and the attitude of the figures graceful; only is there something harsh and crude in the tones of the foreground foliage. Besides this, Sir F. Leighton exhibits "The Sea (Cave up the Dead Which Were in it)" (115), a repetition of his study for a decorative painting for St. Paul's, and which seems to us a gruesome and unhappy conception: "At the Fountain" (156), a half-length draped figure rather hard and mechanical in design and treatment; a "Bacchante" (257), leaping along in a leopard-skin dress (a much finer piece of colour, but surely the left hand, stretched as it is towards the spectator, should be larger than it is drawn,—the perspective of the arm seems the wrong way about); and "Clytie" (489), a small landscape in which the heroine, on an altar in the foreground, passionately worships the god of day setting over a mountain, and illuminating the rolling clouds with a brassy splendour which effectually kills Mr. Furse's portrait of the Bishop of Oxford hung above it.

In their usual neighbourhood in the Third Gallery appear the chief works of Mr. Tadema and Mr. Poynter, the rival classicists. In Mr. Tadema's picture, "A Kiss" (258) is a very innocent one offered to the sweetest of little children by one of a group of Greek ladies at the top of a marble stair which leads to a bathing resort, as we see by the one or two figures swimming in the water and

undressed on the beach below. A great marble balustrade, and an inscription in bronze relief on the side of the stair wall, most carefully drawn in very sharp perspective, are characteristic of the painter's preferences. Mr. Poynter's "When the World was Young" (265) hardly answers to its title; it has been absurdly called in some of the papers a Greek interior; it is Roman in every detail, in the design of the mosaic floor, in the painted decoration under the window, in the marble columns carved with foliage in relief; and the Roman world was anything but "young" in the days of these decorative details. Two very pretty maidens are seated on the floor playing with knuckle-bones; a third sits half dozing in the window; figures and decorations are alike solidly and learnedly painted, with uncompromising care; the picture is one of the best its artist has produced.

Mr. Watts's large picture (164) is a bewildering mistake, and the title, "She Shall be Called Woman," suggests at once an absolute refusal to concur. This colossal bronzed figure, half seen through circling vapours, and with head upturned so that only the chin is visible, is apparently intended as a kind of typical representative of ideal woman; as far as it can be seen at all, a rather terrible ideal. This is the snare into which this remarkable painter not infrequently falls, of thinking more of expressing a meaning than making a picture. Mr. A. Moore in his one picture "Lightning and Light" (672), represents, perhaps, the opposite error of thinking only of pictorial effect and being content with no meaning; but as painting, after all, is painting, this mistake is the least mischievous of the two. Sir John Millais' much-talked-of work is a winter-landscape, "Blow, blow, thou Winter Wind" (211), a hillside with the beginning of a snowstorm. It is a disappointing work with very fine passages in it, especially the wild look of the distant part of the landscape half seen through whirling snow, but the foreground is more realistic than powerful, and the tree very hard and metallic-looking. His other landscape, "Halcyon Weather" (142), a quiet pool in a wood, with a wooded distance beyond, is admirable in detail, but does not give us the summer-like impression as a whole. His best work is the pretty

little child portrait named from the flower she holds, "The Little Speedwell's Darling Blue" (256), which contrasts happily with the seated child's white frock and fair complexion. There is obvious reference to Reynolds in the attitude and placing of the child. The tree and landscape are most happily touched in, just indicated and left in subordination. A little more of that subordination in the landscape previously mentioned would probably have made all the difference in its effect.

It is to be hoped that Mr. Stanhope Forbes will not believe the critics who tell him that "Forging the Anchor" (287) is his best work. It is his largest, and it is a fine pictorial subject powerfully treated, but it (necessarily) exhibits nothing like the varied discrimination of character which charmed us in "The Health of the Bride" and "By Order of the Court." Mr. Brangwyn's "Convict Ship" (307) is hung too high to be well seen, but it does not appear to be among his successes, and is not either agreeable in colour or very pointed or intelligible in motive. Nor can we congratulate Mr. Crofts much on his two pictures in the same room, "The Gunpowder Plot: the Conspirators' last Stand at Holbeach" (311) and "Charles I. at Edge Hill" (331). Perhaps the subjects are deficient in interest in comparison with some others which he has treated; at any rate, considering that they are Mr. Crofts' work, they are disappointing. Battle pictures are not at their best this year; Mr. Laslett J. Potts has a splendid subject in the "First Sight of Moscow" (609), but it is only a very average Napoleonic picture, and one cannot afford an average one now. The military picture of the year is Lady Butler's "Halt on a Forced March: Peninsular War" (27), a curious example of the power which real knowledge of and sympathy with the subject will lend to a picture hard in execution and deficient in pictorial effect. It is *real*, and therein lies its strength. The prominent object is a gun-carriage and horses, with wounded men propped on the carriage under various conditions of suffering. One of the leading horses has just dropped dead or exhausted.

Mr. Waterhouse's "Circe Poisoning the Sea" (20) is weird enough; a long lank figure (apparently too long) in clinging drapery, standing on tiptoe on the water and dropping the poison in a thin stream from the lip of a shallow glass vessel. The uncanny look of the face reminds one of Mr. Burne Jones's "Mermaid." Mr. Waterhouse's other contribution is "Danaë" (924) helped out of her box on the shore by men who are as old-world as the crew of the Ulysses ship last year, but "Danaë" looks too modern to group with them. Much is made of the antique brass-bound box, and not much of the sea. Mr. F. D. Millet has abandoned his Georgian ladies and interiors for Puritan figures, in "Between Two Fires" (12), and paints figures and details as well as ever, but there is not the same completeness about it as we are accustomed to in his favourite class of subjects. In the same room hangs Mr. Leslie's only work, "Queen Rose of the Rosebud Garden of Girls" (60), a set of pretty English girls on the terrace and steps of a garden, with a straight line of hedge behind; grace and prettiness there is in the figures, but the whole *facture* of the picture is dry, hard, and flat, there is no sensation of air and life. Mr. Briton Riviere paints a lion with a Cupid riding on his back (his face to the tail), under the title "A Master of Kings" (46), the lion looks rather long, but he is a grand beast, and there is fine colour and a real element of imaginative creation in the work, which is far superior to "The Haunted Temple" (38), where the realism of the tigers in the foreground rather clashes with the idea of the supernatural. That is the difficulty of combining animal painting with ideal and especially supernatural subjects. Among other things to be noted in Gallery I. (we exclude landscape for the present) are Miss M. Dicksee's picture of Angelica Kauffman at Reynolds's studio (the head of Angelica is one of the most bright

and charming things in the exhibition), and Mr. Boughton's twilight winter scene "The Home-light" (66).

Mr. Frank Dicksee produces under the title "Leila" (97) a very brilliant and successful study of a blonde eastern girl in bright red embroidered draperies, oddly set off by its next neighbour, Mr. H. Mosler's "Last Moments" (36), one of the "harrowing" order of pictures, in which dirt and desolation are predominant; pathetic, but pictorially repulsive. In the same room is Mr. Dicksee's pretty and impossible diploma picture, where a modern girl and her little sister, clutching up their classic draperies, are hurrying away from the bank in a quiet reach of the upper Thames where they have been disturbed in bathing by the alarming apparition of a Norse galley suddenly rowing up the stream from Henley Regatta: at least that is the general impression conveyed. There are so few painters who, like Mr. Tadema, give a really antique air to figures in an antique scene. Mr. Prinsep does not, in his large picture of "The Broken Idol" (368), where a Christian slave is brought before his mistress in the atrium for having "reversed" an idol in a fit of holy indignation. We have the usual thing; Christian slave pointing upwards, modern lady in Roman dress looking touched and puzzled; the master of the slaves is the only real-looking figure. Artists who are going to paint Roman ladies of the Empire should read Mr. Swinburne's "Faustine" first.

Mr. Riviere's "Dead Hector" (242) is another failure in a poetic sense; there is the naked corpse of a man on his face, and there are jackals, but we do not realise that it is Hector; it is painted for the jackals. In "A Day of Mortification" (88), where a lady going to church orders the dogs to stay at home, the balance is complete and the picture a success. Mr. Marks's "The Great Auk's Egg" (228), shown by one old connoisseur to another, is also a perfectly balanced work of its kind, in its author's best way.

The centre place facing the President's "Hesperides" is occupied by M. Bouguereau's "Distraction" (250), a maiden and cupid, one of those perfectly executed academical works which yet remain mediocre in their very perfection. Galleries III. and IV. present us with two noteworthy nudes, Mr. Jacob-Hood's "Summer" (219) and Mr. Hacker's "Syrinx" (344), a curious contrast in treatment. Mr. Hacker's figure is conventional in design, the figure reduced to "Classic" lines, but realistic in colour; Mr. Jacob-Hood's is realistic in drawing, without even beauty in the head and face, but conventional in colour, a study of a white body against whiter drapery thrown behind on the rocks. It is an unusual and interesting work, though the Syrinx will probably have the popular vote.

Among works of pure imagination there are few more interesting than Mr. Arthur Hughes triptych "Viola d'Amore" (893-4-5), a real little allegorical poem in painting. A girl in the first picture tunes the viol, looking brightly up to the open window, where are seen the blue sky, the may-blossoms, and the birds; in the second she sits on a terrace, holding the instrument, but a winged cupid behind handles the bow, and she sits amazed at the sound; in the third she is in her room at evening, an embroidered curtain making a kind of suggestion of a bridal veil floating over her head, the viol is drooped in her hand and a spray of yellow flowers is grasped with it. The three scenes are full of charming bits of detail, though the whole is far too refined in thought to be popular; one is almost surprised to find it in the Academy, and then to compare it with some academicians' works on the line! Miss Henrietta Rae has also done well in her "Mariana" (557), Tennyson's Mariana, a beautiful woman seated at the window with a weary look; among the details may be noticed the delicate way in which the embroidery and ornaments on the bosom of the dress are indicated. Mr. Solomon's "Orpheus" (666) is a large ideal work in which the size is more striking than the ideality; Mr. Arthur Hacker's

"Annunciation" (901), another large work of the ideal class, is far superior to this, but fails in what should be the central point of interest, the face of the Virgin, which is deficient in expression.

Among figure subjects of more prosaic meaning are two noteworthy works in Gallery XI., Mr. La Thangue's "After the Gale" (977), a big painting of a small boat in which an injured man from a wreck is being sculled home, and which is a capital study of rough seafaring figures in full daylight; and M. Melton Fisher's "A Summer Night" (1,022), a most clever representation of figures grouped by lamplight in a verandah overlooking Venetian waters, and containing some remarkably pretty women. This is a picture of the "new school," in which detail is indicated rather than suggested. In regard to both it is a question whether they are not far too large for the interest of the subject, and the same remark applies to Mr. F. Hal, clever and brilliant interior of a "vet." surgery (apparently), with a number of both and knick-knacks, and the vet. preparing to prescribe for a fat King Charles which has come there as "The Result of High Living" (1,041). The execution is brilliant and clever to a degree; but is it worth all this canvas?

Among works in the way of *genre* paintings which justify themselves by their subject a scale is Mr. Bridgeman's spirited "La Tennis Club" (102), a thoroughly English scene by an artist American by birth, a French by education. Mrs. Forhes's "Mimnet" (343) should be looked at for originality of design and colour: Miss Bir's "Orphans" (374), an orphan-school scene and (in a much more serious key) Mr. Tebb's "Alone" (511), an interior with one sea figure of a girl in mourning, marvellous both by true pathos and very good and careful painting. Mr. J. R. Reid's "The Mate of the Mermaid's Wedding" (513) is a good crowded scene of fishing to life, rather recalling Mr. Filde's "Vill Wedding" some years ago; many of the figures are admirable studies, and one is glad to find that the painter has cast aside the unfortunate experiments in a violent eye of colouring which had threatened to smother him altogether not long since. "A Bit of a Yarn" (660) by Mr. C. T. Garland is admirable for the varied expression in three children's faces.

Among pictures dealing prominently with architecture two by Mr. Woods should be missed by any visitor interested in architecture, "The Church of the Friars School of San Rocco, Venice" (157), a mirably solid and brilliant in its painting and a more interesting because more unusual subject, "In the Bellry of the Campanile St. Marks" (233); there is also a good study of the "Grande Mosque de Tangiere" (3) by M. Emile Wauters. We may mention here also one admirable piece of still-life painting by Miss Catherine Wood (Mrs. R. Bright), "Onions" (317), a piece of imitative painting perfect in its way, and justified by the pithy quotation from Browning—

— "Paint these

Just as they are, careless what comes of it!

Portraits are not perhaps striking this year, but include a good many thoroughly good ones. Mr. Herkomer's large group of portraits under the title "A Board of Directors" (458) is one of the most important works in this class; and among others we may mention Mr. John Collier's brilliant but somewhat too stagey portrait of "Miss J. Neilson" (210), Mr. Tadema's remarkably vivid likeness of "Mr. Alfred Waterhouse" (222), Mr. Oule's "Herbert C. Gibbs" (305), noteworthy for its simplicity of style and pose; and Miss Anna B. Skelton's "Portrait de l'Auteur" (502), a frank piece of Bohemianism, repeated in colour but wonderfully spirited in character and execution. Two pictures which might be portraits but are not called so should not be overlooked, Miss Gulland's head of "Honeysuckle" (438), a very fine piece of colour, and Miss Mary Field's charming

length called "Daisy" (491), a picture which both for colour generally and for the fine ripe painting of a very sweet face, merited a more central position than it has obtained.

We had nearly passed over the finest animal painting by far in the room, Mr. Swan's "Thirst" (454), a picture of two leopards drinking. The remarkable element in Mr. Swan's animal pictures is the way in which he realises the action and life of savage animals in their wild state. His leopards are not as taking animals as picture-book leopards in pretty attitudes, but he sprawls of the one facing the spectator, his forepaw and shoulder splayed outward in his eagerness to stoop to the water, has something thoroughly animal about it not to be easily forgotten. But we must turn to landscapes, of which there are some very fine examples this year, and many more or less worth study.

The landscapes of the year afford, taken together, an interesting exemplification not only of the inexhaustible variety of nature, but of the variety of ways in which nature may be regarded in painting. They might be classed under the heads of pictures simply representing nature, and pictures representing the painter's method of translating nature, though we will not venture to follow out the classification in detail in regard to the pictures exhibited. Perhaps the most powerful work of the year is Mr. Brett's "The Isles of Skomer and Skokham" (596), in which this painter has surpassed himself in the treatment of sea. He has quit the representation of calm sunlit sea of which we have had perhaps rather too many repetitions, and shows the sea rolling in dark foam-crested billows under a fresh breeze, with a realism in regard to movement, colour, and reflected skylight, which is extraordinary. He exhibits several other works which are for the most part repetitions of effects with which he has familiarised us. Mr. H. Moore's principal work, "Perfect Weather or a Cruise" (19), gives fortunate evidence that he has entirely recovered from the painful accident which incapacitated him from painting for some time. Sea pictures otherwise are not very numerous, but attention should be given to one by Miss A. J. Walters, "A Bright Gleam from the West" (73), which is remarkable for the truth and tenderness of its aerial effect and the subtle tones of light on the water. Mr. L. W. B. Davis's paintings rank as landscapes, though the animal painting in them of nearly equal importance. His "Springtime" (191) is beautiful in its rendering of the delicate light on the slopes of the distance; his "Summer Time" (665), with sheep in the foreground under strong light, is perhaps a little too hard in the foreground, though we thank him for not shirking sunlight as some painters of "summer" do, but the "Shadow of Evening" (671) is an almost perfect work of its class; it shows the foreground sloping down from the spectator, shadowed from the western sun, which lights the rising land beyond with a calm warm radiance; the whole thing is as true as it can be. Mr. Davis has never been seen to more advantage than this year. Mr. David Murray's principal work is "The White Heat" (919), an expanse of level meadows half flooded, under an empty summer sky; but we do not realise the effect of heat suggested by the title. "The River Road" (79) is a finely composed landscape, with a mass of dark trees and a bridge on the right; this is one of the school of landscapes composed, as one may say, from one side, of which another and very fine example is Mr. C. E. Johnson's "Evening Shadows" (460), a beautiful specimen of the purely natural landscape effect, in which the painter is transcriber rather than translator. There is a taste at present for flat level landscape with a large sky, as in Mr. Murray's "White Heat" just mentioned, and Mr. East gives a fine example of it in "Hayle, from Lelant" (104), where the centre of the canvas is occupied by the sands of a nearly empty tidal river or

estuary, the houses gleaming warm in the sunlight in the distance. Mr. Logsdail, who has not been much seen as a landscape-painter, produces a somewhat similar class of effect in "Venice from the Public Gardens, Early Morning" (125), a very pleasant work. Mr. MacWhirter's "June in the Austrian Tyrol" (120) is remarkable as a painting of a profusion of bright wild-flowers occupying the banks in the foreground; it is a *tour de force*, but gives rather too much that impression, and does not quite convince us of its truth. Nor does Mr. Parsons's "The Flowers appear on the Earth" (184), they seem rather to appear on a surface of green haze, displaying none of the texture of grass. Mr. H. G. Hewitt's "November" (367) is a landscape of great merit by an artist whose name is not familiar to us. Mr. East's "Autumn Afternoon" (591) is one of the pleasantest of the quieter landscapes of the year; and Mr. W. L. Wyllie's "Spanish Armada" (691) should not have been overlooked among sea-pieces. Mr. Arnesby Brown's "Low Land" (988) is a very good work of decidedly French tendencies, one of those in which the interest lies as much in the idiosyncrasy of the painter's treatment as in the scene itself; the same might be said, though in rather a different sense, of Mr. North's "Druidcombe, Somerset" (602) which has a great charm about it, but it is not nature so much as nature idealised. Mr. Adrian Stokes's "Sunset, Roman Campagna" (475) contains a fine sunset effect, and would strike one more perhaps if it were not so entirely dominated in our recollection by his much more powerful Campagna landscape in the New Gallery. Mr. Vicat Cole's large picture of "Westminster" (396) may we suppose be classed as a landscape; as such we do not like the general tone of it, which is muddy and disagreeable, and we object even more strongly to the theatrical and stagey painting of the Victoria tower, which is loaded with yellow in order to get a sunlight effect, to the extent of making the main lines of the tower appear as if gilt as well as the lantern. As a painting of a great building it is a thing that no architect could regard with satisfaction. We may also class with landscape Mr. A. Goodwin's remarkable illustration of the scene in Dante's *Inferno* where Virgil and Dante attempt to enter the city of Dis. Here, as in the poem itself, we are in a sense out of contact with nature, but it is worth while to try to realise in painting some of Dante's lurid and tremendous scenes; the attempt has not been often made (partly no doubt on account of its extreme difficulty), and on the whole Mr. Goodwin has been successful; he has produced a grand and striking effect which assists us in realising Dante's conception, and if a picture does that the attempt is justified, though it is moving no doubt on dangerous ground for painting. Mr. Goodwin has some special facilities for illustrating Dante, and we should not be sorry to see some further attempts at it from his hand.

There are many smaller pictures of interest besides those we have named, and in the process of going through these notes we have been more than confirmed in our first impression, that this year's Academy is one of great and varied interest. Of sculpture we will say something on another occasion.

THE 19TH CENTURY ART SOCIETY.—Saturday, the 14th inst., has been appointed for the Private View of the Summer Exhibition (the twenty-seventh) of the 19th Century Art Society at the Conduit-street Galleries, and the exhibition will be open to the public on Monday, the 16th inst. We are informed that the Society has been recently considerably strengthened by the enrolment of many additional well-known artists as members. With the view of enabling the members to exhibit their works in a thoroughly adequate and advantageous manner, the requisite alterations and improvements have been carried out by throwing the Mackintosh Galleries into those already occupied by the Society, thus forming one of the most important and attractive suites of galleries in London.

TESTS OF BUILDING-STONES.

WE have received an excerpt from the current volume of "Minutes of Proceedings of the Institution of Civil Engineers," entitled "Building-Stones of Great Britain—their Crushing Strength, and Other Properties," by Mr. Thomas Hudson Beare, B.A., B.Sc., Assoc.M.Inst.C.E., which is deserving of notice as an example of how elaborate "tests" may be carried out on stone, and yet may possess but little practical value. Seeing that the excerpt is merely a pamphlet, thirty-one pages in length, including the appendices, it will readily be understood that the author deals with a comparatively small number of building-stones. We do not find in it a single reference to any of the building-stones of Wales. Tests on the following properties of English and Scotch stones are recorded: crushing strength, density, absorptive power as a test of weathering, effects of low temperature, and, lastly, an inquiry into the behaviour of stone under gradually increasing pressures, with a view to determining the modulus or co-efficient of elasticity. The author commenced work by applying to various quarry-owners for samples, instead of obtaining them from the quarries himself. All the specimens were carefully prepared in the form of cubes, 2½ in. in the side, before being experimented with. The crushing tests were carried out in the large Greenwood & Batley testing-machine belonging to the laboratory of University College, London, which is a horizontal machine of 100,000 lbs. capacity. In every case, except two, the specimens were placed in the machine in such a way that the pressure was applied on the bedding faces,—i.e., the axis of pressure was perpendicular to the planes of the quarry-bedding. The author shows,—and this is decidedly the most interesting part of his communication,—that the practice of interposing sheets of lead, or thin pieces of soft wood, between the die of the machine and the specimens to be tested, does not yield a fair result. Of course, it is not the first time that this has been pointed out,—a paper on the subject was read to the British Association a few years since, whilst Professor Unwin, in his "Testing of Materials of Construction," also deals fully with it, and the question has received much attention in America; but Mr. Beare's observations are especially useful, as being additional evidence derived from direct investigation. His experiments indicate that, by using lead, there is an enormous reduction of strength, varying from 36 to 55 per cent., and the stronger the stone the greater the loss. Therefore, he prepared the surfaces of the stone with a thin layer of plaster of Paris only, and applied them directly to the steel faces of the dies of the testing machine. It is a pity, however, that the author was unable to deal with samples of larger dimensions than 2½ cubic inches. Such small pieces do not fairly represent the lithological and other physical features of any class of stone, so that the majority of the tests recorded can have but little practical value. Large blocks of stone used for ordinary building purposes very frequently have a number of minute—microscopic—fractures running through them for short distances, which considerably weaken the material as a whole, and 2-in. cubes are not sufficiently large to reveal the effect of these. But even supposing the tests were satisfactory in that respect, it is difficult to deduce much of practical value where the results on the same stone vary from 288 tons to 460 tons per square foot, as they do in Gunnerton sandstone; 341 tons to 579 tons as in Corsehill; 171 tons to 245 tons as in white Grinshill stone; 395 tons to 546 tons as in white Mansfield; 383 tons to 703 tons as in a yellow magnesian limestone; 74 tons to 126 tons as in Corsham Down Bath stone, &c., &c. Yet the author informs us that "the figures for crushing loads are very closely concordant." True enough, the granites give higher results than dolomites,

dolomites than sandstones, and sandstones than limestones, but no elaborate tests were required to carry conviction on those heads. In speaking of the absorption of water tests, the author states that "the relative amount of absorbed water must be a very good guide to the relative weathering power of stones, since it shows to what extent deleterious agents in rain-water and fogs will penetrate the stone," which, as we have on previous occasions pointed out, is a very unfounded, though prevalent, notion.

NOTES.

THE *conversazione* of the Royal Society, held at the Society's apartments, Burlington House, on Wednesday last (the 4th inst.), although successful so far as the attendance of a large number of influential scientists was concerned, was a little disappointing in regard to the exhibits. Many of these latter were by no means novel, and included minor discoveries whose chief claim for space consisted, apparently, in their startling, ocular results, or the noise they made. The really interesting portion of the exhibits were chiefly in the domain of electricity, as usual. Amongst the more prominent, we noticed the various electrical apparatus shown by Captain Holden, R.A. One consisted of a high-speed chronographic pen with automatic re-setting attachment, the object of which is to take a number of successive records of short intervals of time on a revolving drum or moving surface, under as nearly as possible the same conditions. Another was an improved compensated voltmeter, on the hot-wire system, a very simple instrument. Mr. W. Crookes, F.R.S., showed some experiments with electrical currents of high potential and extreme frequency, which were somewhat similar to the celebrated demonstrations of M. Tesla. The physiological action of the high frequency current is feeble, and Mr. Crookes in dealing with a current having an electromotive force of about 100,000 volts, the frequency of alternation being 1,000,000 per second, to show its harmlessness caused it to pass through his body, and then communicated it to bystanders, who experienced merely a slight shock on its application. Mr. J. Wimshurst exhibited some interesting phenomena connected with Leyden jars with wire coatings; and Professor Oliver Lodge, F.R.S., produced interference hands by projection, electric sparks in and to water, illustrating lightning effects, multiple flashes, &c. An electric chronograph, designed for the measurement of the velocity of projectiles, and small periods of time in physiological research, was shown by the Rev. F. J. Smith, M.A.; and Messrs. Pyke & Harris had some high tension apparatus. Dr. G. Gore, F.R.S., exhibited a remarkable electrolytic formation of copper in the form of wires, produced during the ordinary process of electrolytic refining of copper. A selection of the proof plates to the first memoir of the Archaeological Survey of Egypt, which, we learn, will be published very shortly, were shown on the wall of the Council room by Mr. Percy E. Newberry, by permission of the committee of the Egypt Exploration Fund. Mr. A. P. Maudslay showed photographs of ancient Central American monuments and buildings, some of which have been recently described in our columns. The Royal Geographical Society and Mr. J. T. Bent had rather an extensive series of finds from Zimbabwe ruins, Mashonaland; there was also a small model of a circular temple at the same place. This temple is built of small blocks of granite, without mortar; it is 20 ft. in diameter; the walls are 32 ft. high and 17 ft. thick in parts, and the solid round tower is 34 ft. high. Various photographic, astronomical, natural history, and other objects were also exhibited.

AMONG the cases submitted to the Board of Trade in 1889, under the "conciliation" clause of the Railway and Canal Traffic Act, was a complaint by the Liverpool Chamber of Commerce and others of undue preference in the rates from Birkenhead to Birmingham. Meetings between the complainants and the railway company's representatives were held at the offices of the Board of Trade, but no satisfactory settlement could be arrived at, and the Board gave the matter up as being too wide and complicated a problem for them to deal with. The rates complained of were those charged by the Great Western Railway for the carriage of grain; but the principle involved was one of general interest, it being alleged that Birkenhead traders were prejudiced owing to the rates from that port to Birmingham being unduly high as compared with those from Bristol and Cardiff. The case has now been submitted to the Railway Commissioners, and they gave judgment on Monday last, to the effect that the action of the railway company did not constitute an undue preference under the Act. Taking all the facts of the case into consideration, this cannot but be regarded as a satisfactory decision, although the Birkenhead traders certainly had a strong case. From Cardiff and the Bristol Channel ports the Great Western have to compete with various other means of conveyance, and must either charge comparatively low rates, or allow their competitors to carry the whole of the traffic. If they were compelled to regulate their rates from these ports to Birmingham by those in force from Birkenhead, they would simply throw away the former traffic and nobody would be benefited. If they had overstepped their Parliamentary powers in the Birkenhead rate, a different decision would have been given; but it did not appear that the rate is in itself excessive, and Mr. Justice Wills expressed himself satisfied that the Liverpool traders were able, notwithstanding the difference in rates, to compete effectively in the Midland markets with the traders in the West. We should be very sorry to see any trade, unfairly prejudiced by a railway company, make an ineffectual appeal to the Commissioners; but they are clearly right in looking at such matters from all points of view,—not excepting that of the consumer, to whom the maintenance of effectual competition is often both a benefit and safeguard.

THE two interesting speeches at the Royal Academy dinner were Mr. Balfour and Professor Butler's, the latter of which, full of clever and piquant points of criticism in regard to art and literature, came rather as a surprise. His remarks on "the cult of the meaningless," and his story of a critic of the new school who explained to him the artistic object of a certain portrait—"Think away the head and face, and you get a residuum of pure colour"—are much to the point at present. In literature, for which he spoke, Professor Butler said that such a principle, form without substance, meant sure decay. Art and literature are not quite parallel cases, but the warning in regard to art is certainly needed just now. It is refreshing to find in Mr. Balfour an ardent politician whose political fighting has not deadened his love of art. His lament over the fact that such monstrous things as the Charing-cross Station and railway viaduct should be allowed there at all to spoil a site with such opportunities as the Thames Embankment, will come home to the sympathies of many of our readers. But when Mr. Balfour laments, further, that the "great public," whose property such a site is, cannot make its voice heard, we fear he was attributing to the great public perceptions which it does not possess. The great public of England is absolutely indifferent to any question of architectural beauty, and would ask no questions about the ugliest railway viaduct than whether it was convenient and safe; on those conditions, it may be as ugly as any engineer likes to make it, for all the public care.

THE action of Macleod v. Thrupp, which was tried this week before Mr. Justice Wills and a special jury, exemplifies the great care necessary in putting a value on property when money is to be lent on the security of it. The action was by a lady against her solicitors to recover a sum which she had lost by reason of the property which was the security for the loan proving not to be of sufficient value when realised. The amount advanced was 3,100*l.*, in 1879, the security two sets of property in Fulham; both properties, when sold in 1890, realised together only 1,360*l.* The opinion of a surveyor had been taken as to the value of the first security he advised that 2,500*l.* might be lent upon it, and he estimated the value of the buildings on it to be 3,200*l.*, there being in addition the security of the freehold site. The jury returned a verdict for the plaintiff for the difference between the sum advanced and that which the property fetched when sold. But the point which we desire to emphasise is the great caution required by professional men when advising on these matters. House property, as we all know, is liable to fluctuations, but the figures which we have given above, printed in the report of the case, appear to show that a margin for contingent shrinkage in the value of the property had not been, in this case at least,—properly taken into account.

THE new platform at Euston Station for some of the local traffic has, undoubtedly, helped to make the despatch of the longer distance traffic both easier and more convenient to passengers. But this new local platform is at present inconvenient for those using it as there is no connexion by means of a bridge between it and the main platform. Not a passenger in ten can discover the local hooting-office,—a mere shed near the gate for the departure of cabs from the arrival platform. Moreover, not every local train leaves from the new platform, so that there must always be confusion with the present makeshift arrangements. But in any event, a bridge should connect the new platform so that passengers may enter in the usual manner and cross directly to the new departure platform.

THE case of the London County Council v. Pearce, heard before Mr. Baron Pollock and Mr. Justice Williams, settles the matter (which we had regarded as already settled) whether a builder's movable office on wheels is a structure within the meaning of the Building Act. The plaintiffs contended that the case came within the Act, but the two Judges who concurred on Tuesday in giving judgment for the defendant. The judgment appears to be in accordance with what we should expect to be the common sense of the matter.

IN districts which are fortunate enough to be within the area allotted to an electricity supply company it is almost common to wire the houses for the electric light as to fit them with the necessary gas pipes. A natural consequence of this is the new systems of wiring are constantly being devised, and Messrs. Cook, Smythe, & Partners have patented a "fire-proof system of conductors" which are usually arranged on a concentric principle. An inner metallic tube or rod is kept apart from an outer tube by means of glazed earthenware rings or spacers, and the combination, which forms the conductors, is mechanically protected by a third tube. Wherever rods would be used for hanging pictures or curtains, &c., the conductors may be employed. This system, like that adopted by some of the supply companies in their mains, relies upon air for insulating material. In practice, the insulation resistance has not been found to be high as was anticipated, but within a building better results may be obtained. Convenience of this form of conductor should not be pointed out, but it is not free from risk. It would not be considered prudent to hang weights from gas-pipes, and, tho-

lectricity cannot leak like gas, any undue strain might bring the positive and negative leads into dangerous proximity.

ON the 26th of last month the Duke of Devonshire laid the foundation-stone of St. Werburgh's, Derby. For this church, to be erected at an estimated cost of 9,000*l.*, Sir Arthur Blomfield was chosen architect, as we announced on June 14, 1890. The old church, which yet stands by Wardwick, at foot of Friar-gate, and once belonged to Derley Abbey, as,—like its more famous neighbour All Saints,—a Gothic tower, rebuilt after the storm of 1602, with a later nave and chancel after the Tuscan order. Here are a monument by Chantrey; and a font cover, a brazen celtic "in her piety," latterly serving for a cetera, given in 1711 by Charles Bensky. Goswell tells us that Dr. Johnson set out with Mrs. Porter on horseback from Birmingham to be married in Derby. It is not generally known that the wedding took place at this church. The register contains an entry, dated July 9, 1735, thus:—

"Mar. Saml. Johnson, of ye Parish of S. Mary's, in Lichfield, and Eliza. Porter, of ye Parish of S. Phillip, in Birmingham."

Having adverted to the history of bridge-chapels in our illustrated articles of November 2 and 29, 1890, and a "Note" on March 28 following, we may say here that the chapel, with a floor-space of about 45 ft. by 15 ft. on it. Mary's-bridge across the Derwent, which was used in turn for a Presbyterian meeting-house (*temp.* Charles II.), a residence, and a carpenter's shop, was re-fitted and licensed for service in 1873. A view of it will be found in Fullarton's Gazetteer (1843). Dr. Erasmus Darwin practised for the last twenty years of his life in a fine Elizabethan house, now, or lately, No. 15, in Tenant-street. In the grammar-school, founded, 1170, by William de Burgh, Bishop of Lichfield, and William de Barbi Aprilis, were educated Joseph Wright, painter, and Flamsteed, our first astronomer Royal. The school, which recently returned to its original situation at St. Helen's, claims also Thomas Linacre, founder of the Royal College of Physicians, and two Archbishops—Juxon and Vernon Harcourt—amongst its *alumni*.

THE Danish Art School of Needlework and Embroidery gave a private view on Monday, the 2nd, at 12, Queen's-road, Bayswater. The school is in connexion with the Royal Technical College for Ladies at Copenhagen, and classes are held in embroidery, Swedish wood-carving, art weaving, and lace-making. The embroideries were their ordinary; inferior in design to the best class in South Kensington, and perhaps execution. In the wood-carving and metal-work there were many very nice things, especially some paper-knives in metal inlay. The old Celtic designs in the woodwork and metal inlay were quaint and charming, and the work was beautifully finished. In an upper room visitors were initiated into all the mysteries of the hand-loom, and very pretty it was to see the shuttles flying swiftly and fro, and hear the sweet foreign accents of the Swedish ladies, who explained the working of the looms. Very pretty; and the looms would undoubtedly look very picturesque in a houndir; but we cannot understand anyone with much artistic feeling visiting a whole day weaving a chamber towel, and after all is not artistic, it is merely a good piece of woven stuff with a conventional border at each end, which border could as well be done in a machine. Embroidery, of course, is an art; weaving merely requires practice, and, given a pattern, anyone with ordinary perceptions could do it. The patterns seemed to us very commonplace, with the exception of one or two pieces of tapestry, which represented a marriage scene, in the centre of an altar with three lighted candles, the bride and bridegroom on each side in Swedish dress, and attended by four solemn storks, who are supposed to bring good luck to the happy pair.

IN our columns of the week before last we gave a short notice of the death of Mr. R. J. Johnson. A few words more on his work and career will not be out of place. His work was remarkable for the way in which it was carefully thought out to the smallest detail, whilst in house-planning, in which he was remarkably successful, convenience was combined with great charm of invention. Preferring the study of architecture to that of civil engineering, he was apprenticed to Mr. Middleton, the father of Professor Middleton, of Cambridge. He was afterwards in the office of Sir Gilbert, then Mr. Scott. Returning to the north, he purchased the business of Mr. Dobson, a man well known in times past in Newcastle. In that city he practised with much success, and was appointed Diocesan Surveyor to the Dioceses of Durham and Newcastle. Among the churches he built or repaired, may be mentioned the repair and refitting of St. Nicholas, now the Cathedral of Newcastle; the Chapel at Castle Howard; Monkwearmouth Parish Church; Cramlington Church; St. Hilda's, Whithy; St. Matthew, Newcastle; Transept of Hexham Abbey Church. Among secular buildings should be named Hodgkin's Bank, the College of Science, the Northern Insurance Office, and the Tyne Commissioners' offices, all at Newcastle,—the last in conjunction with Mr. J. J. Stevenson. Among houses, Haughton Castle, on the North Tyne; Urrbeth Lodge, Chester-le-Street; Provost Watson's house, Hawick; Mr. Pease's house, Pendover, Newcastle. Mr. Johnson was one of the very few men standing quite in the front rank of the profession, who continued to practise in the country instead of being absorbed in the great vortex of London.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

1618; "Edginton Priory Church, Wilts. View showing restoration of ancient parish altar." Mr. C. E. Ponting. This is hung too high to be well seen; it is an interior view of a fourteenth-century church executed in sepia, and showing the restored altar at the further end. Perhaps a detail of the altar restoration would have been more to the purpose; little of it can be seen in the drawing.

1619; "Hall, Buller's Wood, Chislehurst"; Mr. Ernest Newton. A pen-drawing of a moderate sized hall of a country house with pedimented doors and a ceiling divided into four by two beams or soffits at right angles; rather a mechanical kind of division; the surfaces of the ceiling are divided up into panelling in which hexagonal figures predominate. A certain character is given to the large window on the right by the introduction of a large arched rib spanning two of the lower compartments of the window. Altogether a pleasant bit of homely quiet domestic work.

1620; "Design for Boat-house and Entrance-lodge"; Mr. C. E. Mallos. A picturesque little pen-drawing of a boat-house of Gothic predilections [close to the arch of an (apparently) mediæval bridge, but this may be only to keep up the fitness of things. The most characteristic point in the building is the way in which the entrance from the garden is scooped out of it, as it were, with the wall running in obliquely under the upper story of the building.

1622; "Bronze Doors, Adelphi Bank, Liverpool"; Mr. W. D. Caroe. This is a well-executed tinted elevation drawing showing an attempt (unnatural enough) to make something artistic of a bank entrance. The doors are designed in panels with small sculpture subjects, the relevance of which to a bank is not apparent on this small scale, but might be if we could see the details. The faint space is filled in with colonnettes with a scroll ornament behind. In the masonry design of the doorway the twisted columns and their capitals seem hardly in keeping, either in style or proportion, with the carved brackets over them; a side elevation is rather wanted to show the working of the design. The whole thing is original, but a little wanting in refinement of detail; the bronze doors are the best part.

1623; "Warnham Lodge Sussex"; Messrs. Batherbury & Huxley. This is, as appears from the small plan judiciously appended, an addi-

tion to an existing old house. It is a long block of black and white work on a solid basement wall, the timbers kept vertical, and a certain character given by the row of little carved posts which run all round just above the solid wall; but why cut these into the shape of buttresses, which is the last thing they can be compared to? The gables and the tall mass of brick chimney are effectively placed, and the whole is a picturesque bit of Domestic architecture of its kind.

1624; "Design for a Window, Jesse Haworth Memorial Church, Walslow"; Mr. W. Pape. A three-light window, with the transfiguration represented in the three large centre panels, subjects from the New Testament in smaller panels below, and kneeling angels with trumpets in the heads of the lights; these latter are the most pleasing bit of the work, which is satisfactory but presents nothing original in idea or treatment.

1625; "Retable for St. Alban's Church, Teddington"; Mr. A. H. Skipworth. This is a really original bit of design in a very cleverly executed pencil drawing with a little tinting. It should have been hung lower. There are octagonal colonnettes at each end, with a twisting ornament on them which gives them a certain character. Within these is a broad band of decorative work, foliage intermingled with sacred emblems, which runs horizontally along the whole design and is returned vertically within the colonnettes. Angels are introduced at the angles, and a further line of foliage enrichment and moulding above the wide band completes the design. Without the least pretentiousness, this is a really original and refined little bit of ecclesiastic decorative work.

1626; "Design for Altar Cross, Carshalton Church"; Mr. Reginald Blomfield. Metal cross and candlesticks shown on a dark ground. The angles between the arms of the cross are filled in with a light scroll connecting the arms, and making an approximate quarterfoil with a leaf form apparently (cannot be well seen) in each of the four spaces. The wide heavy base gives a look of monumental security.

1627; "House in Connecticut, U.S.A." Mr. E. J. May. This seems a picturesque house, drawn in Mr. May's well-known style; a tower-like mass projects in the centre of the front, giving a marked character to the house, and the employment of three gables of the same size along the return side gives an architectural breadth to this part. Mr. May employs his favourite device of a window at the outer meeting angle of two walls, which is quaint but rather unconstructive. By the way, one of Vitruvius's reasons why the triglyphs could not have originally represented windows is that they were placed at the angle of a building, "where no one would place a window;" but we have altered many things since Vitruvius.

Numbers 1628 and 1629 we have already described; No. 1630, "The Mount, near Wolverhampton," by Messrs. Grayson and Ouse, is a fine pen-drawing by Mr. Raffles Davison showing a central hall with a strongly-marked first-floor string carried round it, with the balustrade of the landing along one side. The ground-floor shows a considerable amount of architectural picturesqueness in the manner in which nooks and staircase openings are contrived out of different arches, and the corbelled-out balcony above is a picturesque feature of which the most is made in the drawing, which is an unusually good one, and with more effect of light and shade and consequently more power of contrast than its clever draughtsman usually allows himself.

1631; "St. Paul's Cathedral," by Mr. H. H. Statham, is the original drawing for the lithograph published in January last as one of the *Bilder* series of Cathedral illustrations; we merely note its presence here.

1632; "Albion Church, Ashton-under-Lyne"; Mr. John Brooke.—This is a well-executed pen-drawing of a church in the received Gothic style, with the tower and spire forming the prominent object at the nearest angle. The stair-turret at the angle is well arranged and forms an effective feature in the tower. A small plan shows that the church is one of those designed with narrow side-aisles for passage only; flying buttresses are introduced over them.

1633; "Ambone from the Cathedral, Salerno"; Mr. F. D. Bedford. Apparently a very good and effective piece of pencil drawing, hung too high to be well seen. It shows a

large spacious square ambo with a rich inlaid balustrade, supported on columns, three on each face.

1634. - St. Peter's Church, Newton-le-Willows, Lancashire. Messrs. Domine & Brierley. A church which derives a certain marked character from its large low square west tower, which is apparently oblong on plan with three large windows towards the nave roof and two on the other face. The drawing cannot be well seen, but there seems a general breadth about the treatment of the building which gives it a satisfactory effect as a whole. A plan is appended.

1635. "Chapel, Ridley Hall, Cambridge"; Mr. W. Wallace. Rather a heavy drawing of rather a heavy building, but it has the proper treatment of a college chapel in a somewhat ordinary Gothic style. The only feature of any originality is the turret at the south-west angle, the lantern of which is effective.

To No. 1636 we have already referred.

1637. "The Ulster Bank, College-green, Dublin," by Mr. Thomas Drew. Shows that in Dublin the good old faith in Classic orders and pediments as the proper adjuncts and architectural characteristics of a bank is still retained. This is not however a common-place Classic front; there is a good deal of richness and originality in the decorative treatment of details, and one very effective point in the manner in which the top story between the large columns is set back, so that the latter, which are engaged columns below, become at their upper portion free columns with a deep shadowed recess behind shaft and capital. This is a distinctly original and picturesque incident. The capitals are not of regular Classic type, but with a Renaissance freedom about them. The ground-floor is a plain rusticated wall, forming a good base to the whole. The spectator who is at first tempted to pass this by as one of the many bank fronts of the columnar type will find, on looking into it, that it is not a common-place piece of work at all, and differs materially from the average front of which it seems a type.

1638. "Competition design for the Birmingham General Hospital; Corner of the Administrative Block;" Mr. W. H. Bidlake. We presume this was not a drawing sent in for the competition, but sent here to illustrate the picturesque qualities of the building. It shows a corner out of a large building, which groups very well without appearing unduly decorative for a hospital; the entrance to the administrative block, which of course is a legitimate occasion for a little architectural treatment, is marked by a projecting bay in stone with pilastered windows in the middle story, an open arched porch (an arch on each face of the semi-octagon) below, and a lightly treated open loggia or balcony above. The rest of the building that is shown is in brick. The main interest of the drawing is as a piece of architectural water-colour work, in which respect it shows an artistic freedom of execution and a feeling for colour which place it quite above the work of the "architectural draughtsman" as too commonly understood.

1639. "New Organ for the Church of St. Mary, Botolph Claydon;" Mr. G. C. Horsley. This is rather a hard pen drawing, nor do we think the design shows by any means as much freedom and effectiveness as the author's admirable organ-case sketch of last year; the general idea is more like the usual organ-case type. The best point in it is the bold large treatment of the foliage filling up the spaces on each side of the lower portion of the organ, flanking the keyboard. The same large free character is maintained in the scrolls on the top, but this kind of free semi-naturalistic treatment is better suited to fill in a space bounded by decisive lines than to be treated free as a scroll, in which case it gives a rather too ragged outline.

1640. "Design for a Town House," Mr. Herbert Baker. A dignified design of Italian type, with a strongly marked cornice, and a wide band of carved decoration in relief between the first and second floor windows. The tier of first-floor windows is given dignity and connexion by pediment heads and by niches between the windows, which would, however, have looked much better if filled with the sculpture, without which they have no meaning; and on paper at least sculpture can be introduced *ad lib.* The heavy square mass of the solid porch projecting outward to the pavement is rather an eyesore, and seems to want connecting more closely with the main design.

LETTER FROM PARIS.

In spite of the serious considerations occasioned by the attempts and threats of the Anarchists, the Salon had a brilliant opening on "varnishing day," a profitable one for the Société des Artistes Français, thanks to the fashionable crowd which collected on an occasion more consecrated to spring fashions than to art. The formal opening took place on April 30, when, in place of M. Bonnat, who was kept away by a domestic loss, M. Paul Dubois and M. J. P. Lanrens did the honours of the Salon to the President. The example set by the new Salon has not been without its effect, and the old establishment showed, this year, various improvements in its interior arrangements. Tapestries and hangings abounded, and the Salle de Conversation has been adorned with shrubs and flowers, and tapestries from the national collection, and the hanging line for the paintings has been kept lower. Lastly, in the central area occupied by the sculpture, a semicircle of trellis has been formed opposite the main staircase, which produces a good effect as a background to the principal sculptures.

The exhibition seems one of about average excellence. Some account of it will be given in a future number of the *Builder*. It may here be observed, however, that among the principal attractions of the year are the ceilings, by M. Bonnat and M. Benjamin Constant, intended for the Hôtel de Ville, and a somewhat pretentious allegorical picture of the sculptor Carpeaux dying in the midst of his works, which descend from their pedestals to do homage to their creator. Among the sculptures are noticeable the decorative fountain of M. Peynot and the monument to Cabanel by M. Mercié.

Paris now possesses a third Salon rejoicing in the pompos title of "L'Union Libérale des Artistes Français." This new exhibition, which is to be open till June 20, contains about 600 works; but the result hardly justifies the new venture, for the collection includes little of interest, and the "Christ aux Outrages" by M. Groux, which the jury of the Salon made a mistake in refusing, is the only really powerful work to be seen there. The decorative studies of M. Mellechean deserve notice however, and the still-life paintings by M. H. Stevens. The rest are below the level of the worst pictures of the ordinary Salon.

The "Black and White" exhibition is this year installed in the Palais des Arts Libéraux. It is divided into six sections: Black and white drawings; pastels and water-colours; modern engravings; old engravings; Japanese art, and sculpture. Altogether there are about 2,500 works, far too many, for the exhibits really worth study are lost amid a crowd of mediocrities. We may mention only the drawings by M. Renard, the charcoal landscapes by M. Osbert, the rather mannered pastels of M. Carrier-Belleuse, and M. Sirouy's engravings after Prud'hon and Delacroix.

The first international photographic exhibition is also to be found at the Champ de Mars, near the entrance from Avenue Rapp. This very curious exhibition is divided into seven groups intended to illustrate the history of photography, its commencement, its progress, and its application to scientific, artistic and industrial pursuits.

Now that the Salon of the Champs-Élysées is open, the smaller exhibitions lose much of their interest, but the different special exhibitions of the past month deserve a word of recognition. First we may name the Pastellistes, among whom M. Bernard is still the defiant leader. Beside the works of this artist, open to much criticism but always original and interesting, may be named the contributions of M. M. Jas. Tissot, Whistler, Billotte, Duez, and Lhermitte, as well as two fine studies by M. Puvion de Chavannes.

A small exhibition at the Georges Petit gallery is devoted to the works of six painters grouped under the denomination of "Les Inquiets." It may be said that every artist who loves his art and studies nature is an "Inquiet," always analysing his work and demanding of himself whether he has succeeded, so that the special assumption of the title seems hardly fair. Then there is the small exhibition which Mlle. Louise Abbema forms every year at the Georges Petit gallery, the *résumé* of her work of the year, always full of charm, truth, and grace. At M. Durand Ruel's gallery we have had also a third

exhibition of "peintres graveurs," where MM. Braconne, Guérard, Goussier, Hellen, and Lepère occupy a considerable place. Among the collection we may mention the very characteristic works in the Japanese manner by M. Henri Rivière, whose powerful execution shows great delicacy and sincerity. Etchings by the late Mr. Keene are also to be seen here, the fine qualities of which command great admiration.

Lovers of art have also been specially attracted by the too short exhibition of the works of Raftet, organised to raise funds for a monument to this remarkable artist, who perfectly understood how to represent in painting and lithography the military types of France. More than 500 subjects were got together in this exhibition, which was only open for seven days, and which served to bring before us, with a splendid mastery of style, the wars of the Revolution, the First Empire, and the Algerian and Roman campaigns. Most of the scenes composed by Raftet are very well known, but this exhibition brought out from private collections drawings entirely unknown and unpublished in which Raftet reveals himself as the true painter of the French army, superior to Horace Vernet, Bellanger, De Neuville or even Meissonnier, if not in drawing, at least in vigour and energy of representation.

Two new second competitions for the Hôtel de Ville decoration have just been decided. One is for the Salle des Banquets; the names of the five competitors have already been given, but no prize was awarded and the competition was cancelled, with a consolation fee of 2,500 francs to each competitor. It is to be hoped this will be a lesson to the authorities, who seem to wish for these eternal competitions for artistic work in Paris, which cost a great deal of money, and from which the highest class of artists stand aloof.

The object of the second competition is for the erection of a statue of Beannarchais on the Boulevard of the same name. M. Allonard's sketch was charming in its aristocratic grace; but he has not received the prize, which has been awarded to M. Clansade's rather trivial figure. M. Clansade is a pupil of M. Falguière.

The *Builder* has recently spoken of the windows in the Church of St. Gervais, which have been seriously damaged by the recent dynamite explosions. We are now able to announce that the Service of Historical Monuments is going to make a valuation for the restoration, the expenses of which are to be defrayed by the Government. The sum required will be about 3,000 francs.

The gifts to the Musée de Louvre are becoming more and more frequent. We hear that M. Léon Moreaux has just made a donation of six fine pictures of the Dutch school, by Hondedeoeter, Weenix, Téniers the younger, Ruyssildt, Adam Fynaeker, and Van Huisum. A few days ago the Museum received from M. le Député Clémenceau a curious portrait of Madame de Lamballe, by Gabriel taken as the unfortunate Princess was on the way to the scaffold. M. Gerspach, Director of the Gobelins Tapestries, has in his turn offered to the section of the "moyen âge" a very rare Venetian mosaic of the twelfth century. We have also to announce the opening, which will shortly take place, of a new hall consecrated to Punic inscriptions, where will be gathered the votive steles, or funeral emblems, which almost all the historical monuments that Carthage has left us. Paris is soon to have a new panorama, which has been painted by MM. Poillot and Dupaty, the ordinary executors of this class of paintings, which are more commercial than artistic. This panorama, which is situated near the Palais de l'Industrie represents the terrible naval combat, in which the French vessel "Le Vengeur" preferred sinking herself to surrendering. The scene is made rather too realistic for those who have not their sea legs, by a moving foreground representing the oscillation of the sea.

The recent death of the painter Andrieu, who was the favourite pupil of Eugène Delacroix, and the trustee of many of his sketches, necessitates a public sale of many of the master's works. Among the number will be seen nearly all the sketches of the fine paintings that he executed in the Salon de la Paix, in the Hôtel de Ville. It is also M. Andrieu who possesses the notes written from day to day by Delacroix, and which contribute to the point of view of the greatest interest from the time of view of the history of Art. The memoirs which are announced as shortly to be published are very voluminous, and they will complete the corre-
