Production Note

Cornell University Library produced this volume to preserve the informational content of the deteriorated original. The best available copy of the original has been used to create this digital copy. It was scanned bitonally at 600 dots per inch resolution and compressed prior to storage using ITU Group 4 compression. Conversion of this material to digital files was supported by the Andrew W. Mellon Foundation. Digital file copyright by Cornell University Library 1995.

This volume has been scanned as part of The Making of America Project, a cooperative endeavor undertaken to preserve and enhance access to historical material from the nineteenth century.

LITTELL'S

LIVING AGE.

E Pluribus Unum.

"These publications of the day should from time to time be winnowed, the wheat carefully preserved, and the chaff thrown away."

"Made up of every creature's best."

"Various, that the mind
Of desultory man, studious of change,
And pleased with novelty, may be indulged."

THE OLD FISH-POND.

GREEN growths of mosses drip and bead
Around the granite brink;
And 'twixt the isles of water-weed
The wood-birds dip and drink;

Slow efts about the edges sleep;
Swift-darting water-flies
Shoot on the surface; down the deep
Dark fishes gloom and rise.

Who knows what lurks beneath the tide?
Who knows what tale? Belike
Those "antres vast" and shadows hide
Some patriarchal pike —

Some tough old tyrant, wrinkled-jawed,
For whom the sky, the earth,
Have but for aim to look on awed,
And watch him wax in girth —

Hard monarch there, by right of might,
An ageless autocrat,
Whose "good old rule" is "Appetite,
And subjects fresh and fat;"

While they — poor things — in wan despair
Still hope for years in him,
And, dying, hand from heir to heir
The day undawned and dim,

When the pond's terror too must go;
Or, creeping in by stealth,
A bolder race, at one fell blow,
Shall found a commonwealth.

Who knows? Meanwhile the mosses bead
Around the granite brink,
And 'twixt the isles of water-weed
The wood-birds dip and drink.

Good Words.

THE SMILE AND THE SIGH.

A LOVELY smile, which smiled in sadness,
Once hailed upon the passing breeze
A new-born sigh, which sighed in gladness
To give a restless mortal ease.

The smile and sigh soon formed a union —
A union everlasting, blest —
Whereby, in brotherly communion,
Each worked to give the other rest.

Thus, mutually their toils relieving,
They lived in peaceful light and shade;
No petty jealousies conceiving,
Of nought, not even death, afraid.

And when, with friendship still unbroken,
Fate caused them for a time to part,
Each of the other kept a token,
To prove the two were one at heart.

For, smiling, the sigh to Heaven was carried
On angels' golden wings one day,
While, sighing, the smile on earth still tarried,
And lent its charm to lifeless clay.

Till then, this world was often dreary,
But *since* then (so the legend saith),
Death's sigh gives life unto the weary,
Life's smile itself illumines death.

Macmillan's Magazine.

MY SWEETHEART.

Do you know my sweetheart, sir?
She has fled and gone away.
I've lost my love; pray tell to me
Have you seen her pass to-day?

Dewy bluebells are her eyes;
Golden corn her waving hair;
Her cheeks are of the sweet blush-roses:
Have you seen this maiden fair?

White lilies are her neck, sir;
And her breath the eglantine;
Her rosy lips the red carnations:
Such is she, this maiden mine.

The light wind is her laughter;
The murmuring brooks her song;
Her tears, so full of tender pity,
In the clouds are borne along.

The sunbeams are her smiles;
The leaves her footsteps light;
To kiss each coy flower into life
Is my true love's delight.

I will tell ye who she is,
And how all things become her.
Bend down, that I may whisper,
My sweetheart's name is — "Summer."

Chambers' Journal. T. P.

A CONCEIT.

O, SWEET and true, I hold your little hand,
And gaze down into eyes so bright and clear,
They seem to hold the summer's radiance, grand
With all the golden promise of the year.

I see in them the rest that winter gave,
And bud and blossom of the glorious spring,
The shim'ring light where summer cornfields wave,
And autumn's stores that will such gladness bring.

How can I see all these, you ask? Ah, sweet,
Love holds for us all life can give to prize;
It makes its glory rounded and complete,
And love for me I see, dear, in your eyes.

THOMAS S. COLLIER.

From The Contemporary Review.

THE SCIENTIFIC MOVEMENT AND LITERATURE.

ANY inquiry at the present day into the relations of modern scientific thought with literature must in great part be guided by hints, signs, and presages. The time has not yet come when it may be possible to perceive in complete outline the significance of science for the imagination and the emotions of men, but that the significance is large and deep we cannot doubt. Literature proper, indeed, the literature of *power*, as De Quincey named it, in distinction from the literature of *knowledge*, may, from one point of view, be described as essentially non-scientific, and even anti-scientific. To ascertain and communicate facts is the object of science; to quicken our life into a higher consciousness through the feelings is the function of art. But though knowing and feeling are not identical, and a fact expressed in terms of feeling affects us as other than the same fact expressed in terms of knowing, yet our emotions rest on and are controlled by our knowledge. Whatever modifies our intellectual conceptions powerfully, in due time affects art powerfully. With its exquisite sensibilities, indifferent to nothing far off or near which can exalt a joy, or render pain more keen or prolonged, art is aroused by every discovery of new fact, every modification of old theory, which in open or occult ways can enter into connection with human emotion.

If, then, our views of external nature, of man, his past history, his possible future, — if our conceptions of God and his relation to the universe are being profoundly modified by science, it may be taken for certain that art must in due time put itself in harmony with the altered conceptions of the intellect. A great poet is great, and possesses a sway over the spirits of men, because he has perceived vividly and received powerful impressions from some of the chief facts of the world and the main issues of life. He is, therefore, deeply concerned about truth, and in his own fashion is a seeker for truth. When, in an age of incoherent systems and dissolving faiths, artists devote themselves, as they say, to art for art's sake, and their ideal of beauty ceases to be the emanation or irradiated form of justice, of charity, and of truth, it is because in such a period no great art is possible, and art works, as Comte has well said, only "to keep its own high order of faculties from atrophy and oblivion:" —

> There tiny pleasures occupy the place
> Of glories and of duties, as the feet
> Of fabled fairies, when the sun goes down,
> Trip o'er the grass where wrestlers strove by day.*

Persons who are exclusively intellectual, and have no feeling for art, often seem to suppose that while science delights in what is clear and definite, poetry and art delight in what is vague and dim; that these things, so agreeable to a class of gentle lunatics, are a certain preserved extract of moonshine and mist; and it is somewhat ludicrous to take note of the generous and condescending admissions in favor of a refining influence of poetry which are ordinarily made by such hard-headed persons. "I do not know what poetical is; is it honest in deed and word? is it a true thing?" So Audrey questions, and Touchstone answers with a twinkle of pleasure (being in luck to find such a chance of gracious fooling), "No truly, for the truest poetry is the most feigning." However this may be, whether we agree or not with Jeremy Bentham and Touchstone that "all poetry is misrepresentation," it is certain that the greatest poets love comprehensiveness, and definiteness in their conceptions. The measureless value set by every great artist upon execution favors this tendency. Intense vision renders precise and definite whatever is capable of becoming so, and leaves vague only that which is vague in its very nature. "The great and golden rule of art as well as of life," wrote William Blake, "is this — that the more distinct, sharp, and wiry the bounding-line, the more perfect the work of art; and the less keen and sharp, the greater is the evidence of weak imitation, plagiarism, and bungling. Great inventors in all ages knew this. . . . Raphael and Michael Angelo and Albert Dürer are known by this, and this alone."

* Landor's lines, descriptive of the debasement of a land or time which freedom does not ennoble.

Apt illustrations of the artist's love of definite conceptions are afforded by the great epic of mediæval Catholicism, and by the great epic of the Puritan poet of England. There is not a rood of Dante's wonderful journey which we might not lay down as upon a map. The deepest anguish, the most mystical ecstasy of love, repose on a kind of geometry. Precisely in the centre of the universe abides the earth; precisely in the midst of the hemisphere of land is placed Jerusalem. Hell descends through its circles, with their rings and pits, to that point, exactly below Jerusalem, where Lucifer emerging from the ice grinds between his teeth the traitors against Christ and against the emperor. As the precise antipodes to the inhabitants of Jerusalem climb from terrace to terrace the wayfarers upon the Purgatorial mount. Precisely above the mount, beyond the planetary heavens and the crystalline sphere, in the mid-point of the rose of the blessed, is the centre of the lake of the light of God; and yet higher, circled by the nine angelic orders, dwells God himself, the uncreated and infinite. Everything is conceived with perfect definiteness, and everything cosmical subserves the theology and ethics of the poem. God is not in immediate relation with our earth; there is a stupendous hierarchy through which the divine power is transmitted. Seraphim draw Godwards the cherubim, the cherubim draw the thrones, and each angelic order imparts its motion to the earth-encircling sphere which is correspondent to its influence. Such a poem could not have been written in an age when a divorce existed between the reason and the imagination. It is a harmony of philosophy, physics, and poetry. In it the mystical ardor of St. Bonaventura, the sobriety and precision of St. Thomas Aquinas, quicken, sustain, and regulate the flight of the great poet's imagination.

Milton was less fortunate than Dante. We are presented in Milton's case, as his most recent editor notes, "with the interesting phenomenon of a mind apparently uncertain to the last which of the two systems, the Ptolemaic or the Copernican, was the true one, or perhaps beginning to be persuaded of the higher probability of the Copernican, but yet retaining the Ptolemaic for poetical purposes." Two passages — one a long passage, where the subject is discussed in detail by Adam and the affable archangel — were deliberately inserted by Milton "to relieve his own mind on the subject, and by way of caution to the reader that the scheme of the physical universe, actually adopted in the construction of the poem, needed not to be taken as more than a hypothesis for the imagination." * Milton's serious concern about scientific truth, and Milton's demand for imaginative distinctness and definiteness, are alike apparent. The Copernican astronomy was already possessing itself of the intellect of the time, but the imagination was as yet too little familiar with it to permit of Milton's accepting it as the foundation of his poetical scheme of things. He, like Dante, needed a strong framework for the wonder and beauty of his poem. Infinite space, bounded for the convenience of our imagination into a circle, is equally divided between heaven and chaos. Satan and his angelic followers rebel; the Messiah rides against them in his chariot; heaven's crystal wall rolls inwards, and the rebel spirits are driven down to that nether segment of chaos prepared for them, which is hell. Forthwith advances from heaven the Son of God, entering the wild of chaos on his creative errand. He marks with golden compasses the bounds of the world or starry universe, which hangs pendent

> in bigness like a star
> Of smallest magnitude close by the moon.

Over its dark outside sweep the blustering winds of chaos; within, wheels orb encircling orb, and in its midst the centre of the starry universe, our little earth, is fixed. In this scheme there is united an astronomical system, now obsolete, with conceptions which the poet made use of not as scientifically but as symbolically true.

These illustrations of the desire felt by great artists for imaginative clearness and definiteness have led us in the direction of

* Milton's Poetical Works, edited by David Masson, vol. i., pp. 92, 93.

one side of our more proper subject, and we might naturally now go on to ask, How have the alterations in our cosmical conceptions effected by science manifested themselves in literature? But a difficulty suggests itself which it may be worth while to consider. As regards external nature, the materials for the poet's and artist's use are given by the senses, and no scientific truth, no discovery of the intellect, can effect any alteration in the appearance of things, in which lies the truth for the senses. However the Copernican theory may have been verified, still to our eyes each morning the sun rises over the eastern hills, each evening our eyes behold him sinking down the west. So it has been from the first, so it must be to the end. No one of course will question that the appearances of things as presented by the senses remain, if not absolutely yet for the most part constant, and are unaffected by the rectification by science of our mode of conceiving them. But from the first the mere visible presentation was associated with an ideal element. For the eye confers as well as receives, and the vision of the world to a man and to a monkey must differ, whether or not the structure of the crystalline lens and the optic nerve be identical in the two. There is an ideal element, an invisible element which unites itself to our perceptions, and while the element which may be called the material one remains constant, this ideal element is subject to continual variation and development. If our unrectified senses give seeming testimony to anything, it is to the fixity of the solid earth beneath our feet. But the knowledge that its motionlessness is only apparent leaves scope for the play of the ideal element derived from the conception of its ceaseless revolution, its stupendous whirl; and the imagination by its unifying power can bring together the two apparently antagonistic elements — the seeming testimony of the senses, and its correction by the intellect — and can make both subservient to the purposes of the heart.

Let us take illustrations, slight and in small compass, yet sufficient to exemplify the process which has been described. Mr. Tennyson imagins a lover on the eve of his marriage-day. It is a slow-waning evening of summer. All nature seems to share in his calm plenitude of joy. Yet the ultimate fruition is not attained; still a short way forward lies the culmination. Joy is like a wave which has one glassy ascent and blissful fall to make before it is perfected. What if that wave were suddenly frozen by some icy wind, and fixed in mockery just short of its be-all and end-all? The idea of advance, of motion calm and sustained, is demanded by the imagination, and this motion must be common to the individual human creature, and to the world of which he is a part. And the whole world *is* in effect calmly revolving into day: —

> Move eastward, happy earth, and leave
> Yon orange sunset waning slow:
> From fringes of the faded eve,
> O happy planet, eastward go;
> Till over thy dark shoulder glow
> Thy silver sister world, and rise
> To glass herself in dewy eyes
> That watch me from the glen below.
>
> Ah, bear me with thee, smoothly borne,
> Dip forward under starry light,
> And move me to my marriage morn,
> And round again to happy night.

One more example of the perfect use by the imagination, for the service of the feelings, of a suggestion of science. Again, it is the conception of the revolving earth, with its unceasing monotony of motion, which asserts a power to exalt and vivify human passion. But now instead of the mystery of life, and the calm of the climbing wave of joy, we are in presence of the imperious suspension of death, the obstruction and sterility of the grave. A spirit and a woman has become a clod. She who had been a motion and a breeze is one with the inert brute-matter of the globe, and as the earth whirls everlastingly, she too is whirled by a blind and passionless force: —

> A slumber did my spirit seal;
> I had no human fears;
> She seemed a thing that could not feel
> The touch of earthly years.

No motion has she now, no force;
She neither hears nor sees;
Rolled round in earth's diurnal course
With rocks, and stones, and trees.

These are petty illustrations in comparison with the extent of the subject, but they suffice to show that what we perceive, or immediately infer from our sensations, is capable of receiving modifications, or of being wholly replaced by an ideal conception. To a child in a railway carriage the trees appear to move rapidly past him; gradually the illusion submits to the correcting influence of ascertained fact; and at last it becomes difficult to enter again, even though an effort be made to do so, into the naïve error of the eye.*

But, beside the modification or replacement of our perceptions through the presence of an ideal element, the cosmical ideas of modern science have in themselves an independent value for the imagination. Four particulars of these may be mentioned as especially important in their dealing with the imagination, which, when taken together, have as enlarging and renewing a power as probably any conception of things material can have with the spirit of man. First, the vastness of the universe, and of the agencies at work in it; secondly, the idea of law; thirdly, the idea of *ensemble;* last, the ultimate of known ultimates is *force.*

The idea of mere physical vastness may appear at first sight to be a very barren possession for the human soul; but in reality it is not barren. We are conscious of a liberating and dilating emotion when we pass from channels and narrow seas into the space and roll of the Atlantic, or when we leave our suburban paddock, with its neat walks and trim flower-beds, and wade in a sea of heather upon the hills. Mr. Mill, looking back upon his visit in childhood to Ford Abbey in Devonshire, writes in his autobiography, "This sojourn was, I think, an important circumstance in my education. Nothing contributes more to nourish elevation of sentiments in a people than the large and free character of their habitations." And assuredly, for one whose sanity of mind is not impaired, his habitation among these revolving worlds has a large and free character, and is fitted to nourish elevation of sentiments. The starry heaven, so deep and pure, beheld while the trivial incidents and accidents of our earth revealed by the daylight are absent, and the silence seems to expand over a vast space — this must always have been an object of awed contemplation. But a measure of the distance traversed by the human mind may be obtained by attempting once more really to submit the imagination to the Ptolemaic system of astronomy. Under Dante's planetary spheres we move with some discomfort, we have flown in thought so freely and so far. The universe as arranged by the mediæval poet is indeed skilfully contrived, but the whole thing looks somewhat like an ingenious toy. For vast massing of light and darkness "Paradise Lost" can hardly be surpassed. While Milton's outward eye was active, it was charmed by the details of the sweet English landscape about Horton; when the drop serene had quenched his light, then the deep distances of the empyrean, of eternal night, and of chaos opened before him. But it is for spirit that Milton reserves all that is greatest in the ideas of force and motion. He is still, in the main, mediæval in his conception of the material cosmos. It needed for masters a Galileo, a Kepler, a Newton, to liberate and sustain the imagination for such a flight, so pauseless, so passionate, as that of the revolters against Deity, in Byron's dramatic mystery, among the innumerable fair revolving worlds: —

O thou beautiful
And unimaginable ether! and
Ye multiplying masses of increased
And still increasing lights! what are ye? What
Is this blue wilderness of interminable
Air, where ye roll along, as I have seen
The leaves along the limpid streams of Eden?
Is your course measured for ye? Or do ye
Sweep on in your unbounded revelry
Through an aërial universe of endless
Expansion — at which my soul aches to think —
Intoxicated with eternity?
O God! O gods, or whatsoe'er ye are,
How beautiful ye are! how beautiful
Your works, or accidents; or whatsoe'er
They may be! Let me die, as atoms die
(If that they die), or know ye in your might
And knowledge! My thoughts are not in this hour
Unworthy what I see, though my dust is;
Spirit, let me expire, or see them nearer!

Lucifer. Art thou not nearer? look back to thine earth!

Cain. Where is it? I see nothing save a mass
Of most innumerable lights.

Lucifer. Look there!

Cain. I cannot see it.

Lucifer. Yet it sparkles still.

Cain. That! — yonder!

Lucifer. Yea.
Cain. And wilt thou tell me so
Why, I have seen the fire-flies and fire-worms
Sprinkle the dusky groves and the green banks
In the dim twilight brighter than yon world
Which bears them.

The displacement of the earth from the centre of the universe, and its being launched into space as one of the least important of its brother wanderers around the sun, was followed by consequences for theology and morals as well as for poetry. The Church was right in her presentiment of a reformation, as alarming as that of Luther, about to be effected by science. The infallible authority of the Holy See was to be encountered by the infallible authority of the astronomer and his telescope; a new order of prophets, suitable to the West as the old prophets had been to the East, was about to arise, prophets who would speak what was given to them by observation and valid inference. And they declared — and men of the Renaissance listened gladly — that the legend was false which represented our earth as the centre of the spheres, and as the criminal who had destroyed the harmony of the worlds. The earth had heretofore possessed a supremacy over the stars which were set in heaven above her for signs and for seasons, but that supremacy had become one of misery and of shame; the terrestrial was corruptible, the celestial was incorruptible; a day was not far distant when the doom brought upon creation by the great traitor would come upon it. Now it was found that the earth was no leader of the starry choir who had marred the music, but was indeed a singer in the glorious chant of energy and life; the heaven and the earth were fraternally united; terrestrial and celestial alike were subject to change; the whole universe was ever in process of *becoming*.* "The study of astrology," Mr. Leckie has said, "may perhaps be regarded as one of the last struggles of human egotism against the depressing sense of insignificance which the immensity of the universe must produce. And certainly," he goes on, "it would be difficult to conceive any conception more calculated to exalt the dignity of man than one which represents the career of each individual as linked with the march of worlds, the focus towards which the most sublime of created things continually converge." It may be questioned whether man's dignity is not really more exalted by conceiving him as part — a real though so small a part — of a great cosmos, infinitely greater than he, than by placing him as king upon the throne of creation. For all creation dwarfs itself and becomes grotesque, as happens in the systems of astrology, to obey and flatter such a monarch. He who is born under Mars will be "good to be a barboure and a blode letter, and to draw tethe." In the temple of the god in Chaucer's "Knighte's Tale," the poet sees

The sowe freten the child right in the cradel;
The cook i-skalded, for al his longe ladel.

If man be made the measure of the universe, the universe becomes a parish in which all the occupants are interested in each petty scandal. Who would not choose to be citizen of a nobly-ordered commonwealth rather than to be lord of a petty clan?

Add to the conception of the vastness of the universe the idea of the unchanging uniformities, the regularity of sequence, the same consequents forever following the same antecedents, the universal presence of law. Endless variety, infinite complexity, yet through all an order. To understand what appearance the world would present to the imagination of a people who gave law as small a place, and irregularity as large a place, as possible in their poetical conceptions of the universe, we have but to turn to the "Arabian Nights." The God of Islam was wholly out of and above the world, and a belief in destiny was strangely united with the presence of caprice, marvel, and surprise in nature. The presence of law is to be found in the "Arabian Nights" only in the perfect uniformity with which Shahrazád takes up her tale of marvel each night, and each night breaks it off in the midst. Whether a date-stone will produce a date, or will summon up a gigantic 'efreet, whether a fish upon the frying-pan will submit to be fried, or will lift his head from the pan and address his cook, is entirely beyond the possibility of prediction. Nature is a kind of Alhambra, "a brilliant dream, a caprice of the genii, who have made their sport with the network of stone," with the fantastic arabesques, the fringes, the flying lines. Neither variety without unity, nor unity without variety, can content the imagination which is at one with the reason. The sole poet of our Western civilization who possessed a true synthetic genius in science, together with the artistic genius in its highest form — Goethe — represents in a well-known pas-

sage the spirit of the earth plying with ceaseless energy, with infinite complexity of action, yet to one harmonious result, the shuttles which we call causes, to weave the web of what we call effects; this is the true vision of the world to modern eyes:—

> In the tides of life, in Action's storm,
> A fluctuant wave,
> A shuttle free,
> Birth and the grave,
> An eternal sea,
> A weaving, flowing
> Life, all a-glowing,
> Thus at time's humming loom 'tis my hand prepares
> The garment of life which the Deity wears.

This conception of a reign of law, amid which and under which we live, affects the emotions in various ways—at times it may cause despondency, but again it will correct this despondency and sustain the heart; now the tragical aspect will impress us of human will and passion contending with the great ἀνάγκη of the order of things, and again we shall more and more find occasion for joy and triumph in the co-operancy of the energies of humanity with those of their giant kindred, light, and motion, and heat, and electricity, and chemical affinity. Nor is this all: the recognition of the moral order to which we belong cannot but produce in any mind that dwells upon it an emotion which would be intense if it were not so massive, and of the nature of mysticism were it not in the highest degree inspired by reason.

But not only is nature everywhere constant, uniform, orderly in its operations; all its parts constitute a whole, an *ensemble.* Nothing is added; nothing can be lost. Our earth is no alien planet wandering nightwards to a destruction reserved for it alone. We look forth. "The moon approaches the earth by the same law that a stone falls to the ground. The spectrum of the sunbeam reveals the existence in the sun of the same metals and gases that we know on earth; nay, the distant fixed stars, the cloudy nebulæ, and the fleecy comet show the same. We watch the double stars, and find them circling round each other by the same law which regulates our solar planets. We are led irresistibly to conclude that the same consensus which we feel on earth reigns beyond the earth. . . . Everywhere throughout the universe—thus runs the speculation of science—organic or inorganic, lifeless or living, vegetable or animal, intellectual or moral, on earth or in the unknown and unimaginable life in the glittering worlds we gaze at with awe and delight, there is a consensus of action, an agreement, a oneness."* And what is the poet's confession? That the life of the least blossom in the most barren crevice is a portion of the great totality of being, that its roots are intertangled with the roots of humanity, that to give a full account of *it* would require a complete science of man, and a complete theology:—

> Flower in the crannied wall,
> I pluck you out of the crannies;
> Hold you here, root and all, in my hand,
> Little flower—but if I could understand
> What you are, root and all, and all in all,
> I should know what God and man is.

But perhaps no poetry expresses the cosmical feeling for nature, incarnated by a myth of the imagination in the language of human passion, more wonderfully than the lyric dialogue which leads on to its close the last act of Shelley's "Prometheus Unbound." The poet does not here gaze with awe at the mystery of life in a tiny blossom, although that too opens into the infinite; it is the great lovers, the earth and his paramour the moon, who celebrate their joy. The Titan has been at last delivered from the chain and the winged hounds of Jupiter. The benefactor of mankind is free, and the day of the doom and death of tyranny is arrived. But it is not humanity alone which shall rejoice: the life of nature and the passion of man embrace with a genial vehemence:—

> *The Earth.* I spin beneath my pyramid of night,
> Which points unto the heavens—dreaming delight,
> Murmuring victorious joy in my enchanted sleep;
> As a youth lulled in love-dreams faintly sighing,
> Under the shadow of his beauty lying,
> Which round his rest a watch of light and warmth doth keep.

> *The Moon.* As in the soft and sweet eclipse,
> When soul meets soul on lovers' lips,
> High hearts are calm, and brightest eyes are dull
> So, when thy shadow falls on me,
> Then am I mute and still, by thee
> Covered; of thy love, orb most beautiful,
> Full, oh! too full!

Such poetry as this is indeed what Wordsworth declared true poetry to be—the breath and finer spirit of all knowledge, the impassioned expression which is in the countenance of all science.†

All that can thus be gained by the imagination from true science, the imagination may appropriate and vivify for the heart of man, free from the fear that matter is about to encroach upon us on every quarter and engulf the soul. What is matter? and what is spirit? are questions which are alike unanswerable. Motion and thought, however they may be related as two sides or aspects of a single fact, must forever remain incapable of identification with one another. When we have reduced to the simplest elements our conceptions of matter and of motion, we are at last brought back to force, the ultimate datum of consciousness; "and thus the force by which we ourselves produce changes, and which serves to symbolize the cause of changes in general, is the final disclosure of analysis." The exclamation of Teufelsdröckh in his moment of mystic elevation, "Force, force, everywhere force; we ourselves a mysterious force in the centre of that," is but an anticipation of the last result of scientific thought. And when Teufelsdröckh, in scorn of the pride of intellect which would banish mystery from the world and worship from the soul of man — when Teufelsdröckh declares, "The man who cannot wonder (and worship), were he president of innumerable Royal Societies, and carried the whole '*Mécanique Céleste*' and Hegel's 'Philosophy,' and the epitome of all laboratories and observatories with their results, in his single head, is but a pair of spectacles behind which there is no eye. Let those who have eyes look through him, then he may be useful;" what is this but an assertion, justified by the most careful analysis, that the highest truth of science and the highest truth of religion are one, and are both found in the consciousness of an inscrutable power manifested to us through all external phenomena, and through our own intellect, affections, conscience, and will? *

Such passages as have been quoted from Byron and Goethe and Shelley make clear to us what kind of scientific inquiry and scientific result is fruitful for the feelings and imaginations of men. Not the details of the specialist, but large *vues d'ensemble*. The former may help to produce such elaborated pseudo-poetry as part of Fletcher's "Purple Island" or Darwin's "Botanic Garden," in which the analytic intellect tricks itself out with spangles of supposed poetical imagery and diction, looking in the end as grotesque as a skeleton bedizened for a ball-room. But the large *vues d'ensemble* arouse and free, and pass rapidly from the intellect to the emotions, the moral nature, and the imagination.

If the bounds of space have receded, and our place has been assigned to us in the great commonwealth of which we are members, the bounds of time have receded also; we have found our deep bond of relationship with all the past, and a vista for hopes, sober but well-assured, has been opened in the future. To trace one's ancestry to Adam is to confess oneself a *parvenu;* our cousin the gorilla has a longer family tree to boast. Six thousand years! — why, a fox could hardly trim his tail and become a dog in so brief a period. We are like voyagers upon a stream of which we had read accurate accounts in our geographies; it rose, we were told, a short way above the last river-bend; it is abruptly stopped just beyond the approaching bluff. But now we ascertain that the waters have come from some mysterious source among strange mountains a thousand leagues away, and we are well assured that they will descend a thousand miles before they hear the voice of that mysterious sea in which they must be lost. Shall we, upon the breast of the waters, not feel a solemn awe, a solemn hope, when we meditate upon the mighty past and muse of the great future? Shall we not bend our ear to catch among the ripples each whisper of the former things? Shall we not gaze forward with wistful eyes to see the wonders of the widening shores? And do we not feel with quickening consciousness from hour to hour the stronger flow and weightier mass of the descending torrent?

The vaster geological periods have made the period of human existence on the globe — vast as that is — seem of short duration. What is remote becomes near. We do not now waste our hearts in regret for an imaginary age of gold; we find a genuine pathos in the hard, rude lives, the narrow bounds of knowledge, the primitive desires, the undeveloped awes and fears and shames, of our remote ancestors, who, by their aspiring effort, shaped for us our fortunes. We almost join hands with them across the centuries. The ripples have hardly yet left the lake where some dweller upon piles dropped by chance his stone hatchet. The fire in

For a stupendous example of the use made by poetry of the cosmical feeling for nature, see in Victor Hugo's new series of "*La Légende des Siècles*," the concluding poem, entitled "*Abîme*."

* Need I refer the reader to Mr. Herbert Spencer's "First Principles," for a full exposition of these thoughts?

the troglodyte's cave is not quite extinct. We hear the hiss in the milk-pail of some Aryan daughter, who may perhaps have had a curious likeness to our grandmother by Gainsborough. We still repeat the words of that perplexed progenitor who learned in dreams that his dead chieftain was not all extinct, nor have we yet satisfactorily solved his puzzle. When one sits in summer, in a glare which bewilders the brain, beside the bathing-machines, and watches the children in knickerbockers and tunics engaged with their primitive architecture, which the next tide will wash away, one falls into a half-dream, and wakes in alarm lest a horde of lean and fierce-eyed men and women may suddenly rush shorewards for their gorge of shell-fish, and in their orgasm of hunger may but too gladly lick up and swallow our babies! Forlorn and much-tried progenitors, wild human scarecrows on our bleak northern shores, we are no undutiful sons; we acknowledge our kinship; and in your craving for an unattainable oyster we recognize our own passion for the ideal; and in your torpid sullenness, when only shells were found, our own keener *Welt-Schmerz* and philosophies of despair!

In the history of the past of our globe, and the remote history of the human race, what are the chief inspiring ideas for literature? One, which is perhaps the most important idea of the scientific movement, receives here a striking illustration — the idea of the relative as opposed to the absolute; secondly, we may note the idea of heredity; thirdly, the idea of human progress, itself subordinate to the more comprehensive doctrine of evolution.

The general conclusion that all human knowledge is relative may be deduced from the very nature of our intelligence. But beside the analytic proof that our cognitions never can be absolute, there is the subordinate historical evidence that as a fact they never have been such. Now, more than at any former time, we are impressed with a sense that the thought, the feeling, and the action of each period of history becomes intelligible only through a special reference to that period. Hence it is our primary object with regard to the past, not to oppose, not to defend, but to understand. Hence we shall look upon any factitious attempt to revive and restore the past as necessarily impotent, and of transitory significance. Hence we shall abstain from setting up absolute standards, and from pronouncing things good or evil in proportion as they approach or fall short of such standards. A new school of historians, a new school of critics, have applied in many and various directions this idea of historical relativity. Nor has it failed to exert an influence upon recent poetry. Mr. Leslie Stephen has remarked that the contempt for the past, characteristic of many eighteenth-century thinkers, was a necessary stage in the progress of thought. When the breach with authority had taken place, it was at first natural that men should maintain their position of superiority by a vigorous denial of the claims of their predecessors. "Whatever was old was absurd, and 'Gothic,' an epithet applied to all mediæval art, philosophy, or social order, became a simple term of contempt. Though the sentiment may strike us as narrow-minded, it at least implied a distinct recognition of a difference between past and present. In simpler times, people imagined their forefathers to be made in their own likeness, and naïvely transferred the customs of chivalry to the classical or Hebrew histories. To realize the fact that the eighteenth century differed materially from the eighth, was a necessary step towards the modern theory of progressive development." * The spirit of antiquarian research revived in the second half of the last century. Uniting with the historical spirit and a masculine force of imagination, it produced the romanticism of Scott. Uniting with the sentimental movement in Germany, it produced the romanticism of Tieck, Novalis, and Fouqué. From contempt for the Middle Ages, men passed into an exaggerated, fantastic devotion to whatever was, or was supposed to be, mediæval. Now, at length, we would approach the past neither as iconoclasts nor idolaters, but as scientific observers; we are not eager to applaud or revile before we understand; we do not for a moment desert our own place in our own century, but we have trained our imagination to employ itself in the service of history. Among critics of literature and art, M. Taine, without himself possessing a delicate and flexible intelligence, has come prominently forward as the exponent of the æsthetics of the relative, in opposition to absolute systems of æsthetics, which absolve or condemn in accordance with standards conceived as invariable for all places and all times. Since the appearance of M. Taine's lectures on art, we have begun to suffer from a kind of critical cant drawn from science, and replacing the critical

cant drawn from transcendental philosophy. If we are not so largely afflicted by the ideal, the beautiful, the sublime, we could be content, perhaps, to hear a little less about the "organism" and its "environment." It is not sufficiently remembered that if we cannot attain to absolute standards of beauty, yet we can approximate to a standard in harmony with what, in every race and clime in which man has attained his normal development, has been highest in man. M. Taine, indeed, himself essayed to establish a scientific theory of the ideal, and happily forgot his early impartiality. We may, by a generous effort of imaginative sympathy, come to appreciate the feelings which would rise in the bosom of a South African upon sight of the Hottentot Venus; but we must return to the abiding conviction that the Venus of Melos is in truer accord with the sense of beauty in man, although, upon testing our opinion by count of heads, we were to appear in a minority of one.

In harmony with this feeling for the historically relative, and also with the idea of progress allowing as it does a right to its own place to each portion of the past, a poetry has appeared which, while remaining truly poetry, partakes of the critical, we might almost say the scientific, spirit with reference to past developments of the race, remote civilizations, and extinct religious faiths. The romantic poetry, to which things mediæval were so interesting, has thus been taken in and enclosed by a poetry which thinks nothing alien that is human, and interests itself in every age and every land, constituting thus a kind of imaginative criticism of religions, races, and civilizations. This direction in contemporary art is represented by the poet, excepting Victor Hugo, of highest distinction in France — Leconte de Lisle. His poetry, for the most part strictly objective, is not simply and frankly objective like the poetry of Scott, but rather sets itself down before some chosen object to make a complete imaginative study of it. Such poetry as this is not indicative of a retreat or recoil from our own time, as was the poetry of sentimental mediævalism; it is animated by an essentially modern motive.

The idea of transmission or heredity, over and above its purely scientific significance, has a significance in connection with morals which is of greater importance than any immediate value it has for the imagination. And yet this idea has been made a leading motive in a dramatic poem by a living writer, who unites the passion of a seeker for truth with the creative genius of a great artist. The central thought of "The Spanish Gipsy" has been so faithfully expressed by Mr. R. H. Hutton, in his admirable criticism of George Eliot, that we need not go beyond his words: —

> If I may venture to interpret so great a writer's thought, I should say that "The Spanish Gipsy" is written to illustrate not merely doubly and trebly, but from four or five distinct points of view, how the inheritance of the definite streams of impulse and tradition stored up in what we call race often puts a tragic veto upon any attempt of spontaneous individual emotion or volition to ignore or defy their control, and to emancipate itself from the tyranny of their disputable and apparently cruel rule. You can see the influence of the recent Darwinian doctrines, so far as they are applicable at all to moral characteristics and causes, in almost every page of the poem. How the threads of hereditary capacity and hereditary sentiment control, as with invisible cords, the orbits of even the most powerful characters, how the fracture of those threads, so far as it can be accomplished by mere *will*, may have even a greater effect in wrecking character than moral degeneracy would itself produce; how the man who trusts and uses the hereditary forces which natural descent has bestowed upon him becomes a might and a centre in the world, while the man, perhaps intrinsically the nobler, who dissipates his strength by trying to swim against the stream of his past is neutralized and paralyzed by the vain effort; again, how a divided past, a past not really homogeneous, may weaken this kind of power, instead of strengthening it by the command of a larger experience — all this George Eliot's poem paints with a tragical force that answers to Aristotle's definition of tragedy, that which "purifies" by pity and by fear.*

But if the stream of tendency descends to us with imperious force from remote regions, it advances broadening into the future. The idea of human progress has been so generative an idea in science, in historical literature, in politics, in poetry, that to indicate its leading developments would need very ample space. It is true that we anticipate a time when this earth will roll blind and cold around the sun, and all life upon our globe will be extinct. And the thought can hardly be other than a mournful one, calling for some stoical courage, to those persons whose creed it is that we are without warrant for believing that anything higher than humanity

* Essays, vol. ii., pp. 348, 349. The idea of heredity has been made a motive in art, with closer reference to physiology, by the American poet and novelist, Dr. O. W. Holmes.

exists. If it were ascertained that a century hence the British nation would be utterly destroyed by calamitous overthrow, we might still resolve to help our nation to live nobly and perish heroically; but the enthusiasm would be stern rather than joyous. In the face of death, joy may remain for the individual through sympathy with the advance of his fellows, and in the thought that his deeds will live when he is himself resolved into nothingness. But how if the advance of humanity lead only to a dark pit of annihilation, and for humanity itself annihilation be attended by oblivion, and not even a subjective immortality be possible? Is it a matter for rejoicing that every day brings us nearer to this, the goal of progress? Just when all has been attained, all is to be forfeited. We can train our tempers, if need be, to accept these things with equanimity; but can we celebrate with praise and joy this approaching consummation? Humanity flung into the grave, with no spices, no tender hands of mourners, no tears of loving remembrance, no friend nor even a foe, and never an Easter morning! Is such a vision of the future more elevating than are the tender myths of the past?

The idea of human progress — itself subordinate to the conception of evolution — is the only one of scientific ideas of comparatively recent date which has been long enough in the air to become a portion of the life of societies, and hence it alone has become a great inspiring force with literature. To trace the sources and the early movements of a philosophy of history, to follow its subsequent career from Bossuet to Buckle, would be an enterprise full of interest and of utility; and as far as France and England are concerned, this has been ably accomplished by Professor Flint. The popular imagination was scarcely affected by the idea of progress until toward the close of the eighteenth century, when a new millennium seemed to be inaugurated by the French Revolution. In English poetry it did not manifest itself powerfully until it became the inspiration of the writings of Shelley. And in Shelley's poetry the idea of progress appears as a glorious apparition rather than as a substantial reality; it appears like the witch in "Manfred" beneath the sun-bow of the torrent, and here the torrent is the French Revolution. For the idea of progress with Shelley was the revolutionary, not the scientific idea. Among the chief democratic writers of Europe — with Victor Hugo, George Sand, Lamennais, Quinet, Michelet, Mazzini, and others — the idea has had something of the force of a new religion. And in some, at least, of these writers the passionate aspect of the revolutionary conception of progress associates itself with the sustaining and controlling power of the scientific idea. By Shelley and the revolutionary spirits a breach is made with the past — the world is to start afresh from 1789, or some other year one; before that date appear the monstrous forms of tyrannies and superstitions which "tare each other in their slime;" then of a sudden were born light and love, freedom and truth: —

> This is the day which down the void abysm,
> At the earth-born's spell, yawns for Heaven's despotism,
> And conquest is dragged captive through the deep.
> Love from its awful throne of patient power
> In the wise heart, from the last giddy hour
> Of dread endurance, from the slippery steep,
> And narrow verge of crag-like agony springs,
> And folds over the world its healing wings.

Such is the revolutionary idea of progress. In English poetry the scientific idea hardly appears earlier than in Mr. Tennyson's writings, and certainly nowhere in English poetry does it obtain a more faithful and impressive rendering. Mr. Tennyson has none of the passion which makes the political enthusiast, none of the winged spiritual ardor which is proper to the poet of transcendentalism. But his poetry exhibits a well-balanced moral nature, strong human affections, and, added to these, such imaginative sympathy as a poet who is not himself capable of scientific thought may have with science, a delight in all that is nobly ordered, and a profound reverence for law. When dark fears assail him, and it is science that inspires and urges on such fears, Mr. Tennyson does not confront them, as Mr. Browning might, armed with the sword of the Spirit and the shield of faith, which that militant transcendental poet knows so well to put to use. Mr. Tennyson flies for refuge to the citadel of the heart: —

> A warmth within the breast would melt
> The freezing reason's colder part,
> And, like a man in wrath, the heart
> Stood up, and answered, "I have felt."

The idea of progress, which occupies so large a place in Mr. Tennyson's poetry, is more than non-revolutionary; it is even anti-revolutionary. His imagination dwells with a broad and tranquil pleasure upon whatever is justified by the intellect and the conscience, and continuously energetic

within determined bounds. If Mr. Browning had written an epic of Arthur, we can hardly doubt that he would have found a centre for his poem in the grail, which would never have been attained, not even by Galahad, but the very failure to attain which would have stimulated renewed effort and aspiration, and thus have proved the truest success. The quest for something perfect, divine, unattainable, or if attainable then unsatisfying, secures, in Mr. Browning's view, the highest gain which this life can yield to man. Mr. Tennyson brings into prominence the circumstance — found in his mediæval sources — that it is the rashly undertaken quest of the grail that "unsolders the noblest fellowship of knights," and brings in the flood of disaster. Dutiful activity in the sphere of the practical appears to Mr. Tennyson so much more needed by the world than to seek over-soon for a mystical vision of things divine. No true reformation was ever sudden; let us innovate like nature and like time. Men may rise to higher things, not on wings but on "stepping-stones of their dead selves." It is "from precedent to precedent" that freedom "slowly broadens down," not by extravagant outbursts of "the red fool-fury of the Seine." The growth of individual character, the growth of national well-being, the development of the entire human race from animality and primitive barbarism — each of these, if it be sound, cannot but be slow and gradual. It is our part to co-operate with the general progressive tendency of the race: —

> Arise and fly
> The reeling faun, the sensual feast;
> Move upward, working out the beast,
> And let the ape and tiger die.

Great sorrows, like the storms which blew upon our globe while in process of cooling, are a portion of the divine order, and fulfil their part in the gradual course of our development; such is the truth found, through pain and through endurance, in the "In Memoriam." Let science grow from more to more; let political organizations be carefully amended and improved; let man advance in self-reverence, self-knowledge, self-control, and so from decade to decade, from century to century, will draw nearer that "one far-off divine event, to which the whole creation moves."

With faith in the future equal to that of Mr. Tennyson, and a more loving attachment to the past, founded in part upon those tender, pathetic ties which make imperfection dear, George Eliot, in her conception of human progress, is also anti-revolutionary. We advance from out of the past, but we bear with us a precious heritage. To suppose, as Shelley supposed, that we can move in this world by the light of reason alone, is a delusion of the revolution in its passionate scorn of foregone ages; we need the staff of tradition as well as the lamp of reason. What is our faith in the future but

> the rushing and expanding stream
> Of thought, of feeling fed by all the past?

What is our finest hope but finest memory? The conservative instincts of George Eliot as as artist have been nourished by the scientific doctrine with reference to the transmission of an inheritance accumulating through the generations of mankind. And for the very reason that she so profoundly reverences the past, she is inspired with a great presentiment of the future: —

> Presentiment of better things on earth
> Sweeps in with every force that stirs our souls
> To admiration, self-renouncing love,
> Or thoughts, like life, that bind the world in one:
> Sweeps like the sense of vastness, when at night
> We hear the roll and dash of waves that break
> Nearer and nearer with the rushing tide,
> Which rises to the level of the cliff,
> Because the wide Atlantic rolls behind
> Throbbing resplendent to the far-off orbs.

A Parisian coterie of literary artists, whose art possessed no social feeling, and who took for their *drapeau* the words, "*L'art pour l'art*," found progress a piece of the boredom of *bourgeois* enthusiasm. It was natural, for in themselves there was nothing to create the presentiment of a future of glories and of duties. A silkworm enclosed in the delicate cocoon it has spun is insensible to the winds of change, and probably has no very vivid anticipation of the little flutter of potential wings.

Mr. Tennyson's words, "move upward, working out the beast," suggest the inquiry whether the scientific movement has modified or is now modifying, our moral conceptions. If it be so, the altered point of view must be discoverable through the work of great artists, for there are few great artists who are not indirectly great ethical teachers, or, if not teachers, inspirers. And it is obvious that scientific habits of thought must dispose men to seek for a natural rather than a miraculous or traditional foundation for morality, to

seek for natural rather than arbitrary standards of right and wrong, and to dwell chiefly on the natural sanctions attached to well-doing and evil-doing. The ancient law-givers received their authority and their code by special interposition, near secret stream, or on open mountain-top. We look for ours in the heart of man, and through the observation of social phenomena. Not less, but more than Dante we know for certain that there are a heaven and a hell — a heaven in the presence of light and blessing when a good deed has been done; a hell in the debasement of self, in the dark heart able no longer *vivre au grand jour*, in the consciousness of treason against our fellows, in the sense that we have lowered the nobler tradition of humanity, in the knowledge that consequence pursues consequence with a deadly efficiency far beyond our power of restraining or even of reaching them. The assurance that we live under a reign of natural law enforces upon us with a solemn joy and an abiding fear the truth that what a man soweth, that shall he also reap; and if he sow for others (and who does not?), others must reap of his sowing, tares of tares, and wheat of wheat. A recent critic concludes his studies of the Greek poets with a remarkable chapter which is an expansion of the thought that the true formula for the conduct of life in our modern world is no other than the old formula of Greek philosophy *ζῆν κατὰ φύσιν*, to live according to nature. The words might be accepted as our rule if "nature" be understood to include the action of the higher part of our humanity in controlling or modifying the lower and grosser part. This does not imply any acceptance of the ascetic theory of self-mortification, it is a part of the scientific doctrine of self-development, since we must recognize as one element in natural self-development the moving upward of which Mr. Tennyson speaks: —

> Move upward, working out the beast,
> And let the ape and tiger die.

The ethics of self-development rightly interpreted must, under the influence of science, forever replace the false ethics of self-mortification. A sane and vigorous human body, rich in the qualities which attract, and strongly feeling the attractions of the earth, and of human creatures upon the earth, will seem more sacred to us than the most attenuated limbs of the martyrs of early Christian art. Among our human instincts, passions, affections, the æsthetic sensibilities, the intellect, the conscience, the religious emotions, an order and hierarchy are indeed indispensable; but not one citizen in our little state of man shall be disfranchised or dishonored. So shall men see (when fatherhood and motherhood have been duly considered beforehand) youth ardent, aspiring, joyous, free; manhood powerful, hardy, patient, vigilant, courageous; and an old age of majesty and beauty. Nor will death, which has been in our globe ever since life was in it, appear the seal of human shame and sin, but the completion of a fulfilled course, the rest at the goal, perhaps the starting-point of a new career.*

All this has reference, however, to the ideal of the individual as pointed to by science, but science declares further, and declares with ever-increasing emphasis, that duty is social. The law, under which we live, does not consist, as regards our duties to our neighbor, merely or chiefly of negations. "Thou shalt not," since the great Teacher of the mount interpreted the law, has given place to "Thou shalt" — shalt actively strengthen, sustain, co-operate. The ideal of co-operation has been well defined as "the voluntary, conscious participation of each intelligent, separate element of society in preparing, maintaining, and increasing the general well-being, material, intellectual, and emotional." Self-surrender is therefore at times sternly enjoined, and if the egoistic desires are brought into conflict with social duties, the individual life and joy within us, at whatever cost of personal suffering, must be sacrificed to the just claims of our fellows. But what has this idea of duty to do with literature — what especially has it to do with the literature of the imagination? Little indeed if such literature be nothing save a supply to the senses of delicate colors and perfumes; much, if such literature address itself, as all great literature does, to the total nature of man. And what in effect is this statement, justified by science, of the nature of duty but a rendering into abstract formulæ of the throbbings of the heart which lives at the centre of such creations as "Romola," "Armgart," and "Middlemarch"?

It is not possible here to consider how the modification by science of our conception, not of the world only, nor of man,

* What has been said above is said in better words in many passages of Whitman's writings. See "Democratic Vistas," p. 41; "Two Rivulets," p. 7. To spiritualize the democracy by a religion in harmony with modern science, has been the chief aim of Whitman's later writings.

but of the Supreme Power, must express itself, if it have not already expressed itself, in literature. That power is no remote or capricious ruler; absolutely inscrutable, the Father of our spirits is yet manifested in the totality of things, and most highly manifested to such beings as ourselves in the divinest representatives of our race. Recognizing all our notions of this inscrutable power as but symbolic, we may for purposes of edification accept an anthropomorphic conception, and yield to all that, in sincerity, and imposing no delusion upon ourselves, such an anthropomorphic conception may suggest, provided always that we keep it, in accordance with its purpose of edification, at the topmost level upon which our moral and spiritual nature can sustain an ideal, and bear in mind that it has no absolute validity. Nor will it be without an enlarging and liberating power with our spirit from time to time, when circumstances make it natural to do so, if we part with, dismiss, or abolish the symbolic conception suggested by man, in favor of one which the life and beauty of this earth of ours, or of the sublime cosmos of which it is a member, may suggest to the devout imagination. Thus by all that can be seen, and known, and loved, the religious spirit will be fed, and around and beyond what is knowable will abide an encircling mystery, by virtue of which the universe becomes something more than a workshop, a gymnasium, or a banquet-chamber, by virtue of which it becomes even an oracle and a shrine. It is possible already to perceive in literature the influence of such religious conceptions as have been here suggested.

EDWARD DOWDEN.

From The Cornhill Magazine.

THE PRINCESS PAOLINI.

I.

ONE fine January night, some years ago, the Princess Paolini held a great reception. It was the first entertainment of any kind that had taken place beneath her roof since the death of the old prince, her husband, and all Rome flocked to attend it. Cardinals and ambassadors, monsignori and generals, Roman duchesses and English tourists, grey-jacketed Papal Zouaves fresh from the field of Mentana, artists and sculptors, statesmen and antiquarians, they streamed up the broad marble staircase in an unending tide; for everybody was anxious to get a sight of the beautiful young princess, and on an occasion like this invitations were not hard to come by. Outside, the grey, time-worn façade of the old palace was lighted up by a row of flaming torches; the piazza, of which it occupies one entire side, was thronged with carriages, and, from a stage erected near the portico, a brass band brayed forth operatic selections with more or less of cheerfulness and accuracy.

Everybody who knows Rome knows the Palazza Paolini, and everybody who has any acquaintance with Roman society is aware that its late owner was no lineal descendant of the famous old family whose name he bore, but a partner in the well-known Florentine banking-house of Flocchi and Company. It was upon his marriage with the orphan daughter of poor old ruined Filippo Paolini that he was permitted to assume the title and arms upon which his subsequent career reflected so much credit; and, though I believe that he was somewhat coldly received by the Roman nobility upon his first advent among them, his generosity, his artistic tastes, his fine manners, and, above all, his great wealth, soon sufficed to triumph over the prejudices of the most exclusive, and placed him, ere long, upon as high a social pinnacle as any dweller in the Eternal City, who was neither a priest nor a politician, could aspire to occupy. He bought back the palace and the lands, which had gradually slipped away from the possession of his wife's ancestors; he even, at infinite pains and expense, recovered many of their lost art treasures; he set the old family upon its legs again, and received such members of it as presented themselves to him with open arms and an open purse.

Of these there was no lack. From many a dilapidated farm in the Umbrian marshes, and many a crumbling, moribund city, they flocked to the capital, those handsome, impoverished Paolinis — priests, some of them, and some soldiers, but most without occupation — and for them all the new prince willingly expended his money and the influence which money carries with it. He revived the glories of an ancient house in short, and, in so doing, deserved well of his country. Such, at least, was the expressed opinion of his Holiness Pope Gregory XVI. and others, though some people, remembering the past history of the Paolini family, may have thought that the world would have suffered no great loss by the extinction of that race of plotters, poisoners, and spendthrifts.

And so, for a matter of thirty years, Giuseppe Flocchi, Prince Paolini, reigned in Rome as a leader of society and a liberal patron of the arts, and was beloved by all classes alike, the only drop of bitter in his cup being the want of any child to succeed him in his honors. But when, in the fulness of time, the Princess Paolini died, the widower thought fit to take a step which — at least among the ranks of his relatives — proved immediately fatal to his popularity. If, as the proverb says, no man should be accounted happy, neither perhaps ought he to be deemed wise, until he is dead. At the age of seventy or thereabouts, the sage and experienced Prince Paolini, who had undertaken a journey to London with the pardonable object of diverting his thoughts from the loss which he had sustained, reappeared in Rome, bringing with him, as his second consort, a beautiful English girl fresh from the schoolroom; and his cousin the cardinal, throwing up his hands and his eyes, cried aloud, in the bitterness of his heart, that there was no fool like an old fool.

The prince's second experience of married life proved a brief one. He was found dead in his bed one morning very shortly after his return home; and the newspapers, which united in lauding the many good deeds of his long life, differed a little as to the cause of its termination, some speaking of apoplexy, and others of heart-disease. Rumor, ever prone to be ill-natured, filled the air, at the time, with whisperings which I should be the last man in the world to think of repeating, especially as they are scarcely relevant to the present narrative; but certain it is that the sad event, which caused many tears to flow from the eyes of those who had been recipients of the dead man's bounty, left his relations wonderfully calm. However, they gave him a magnificent funeral; and I well remember seeing the procession pass slowly and solemnly down the Corso, a troop of monks leading the way, bearing huge lighted candles and chanting a melancholy dirge, some ghastly masked figures, members of the confraternity of the Misericordia, striding on either side of the bier, and a long train of mourners and coaches and carriages following. The Paolinis were all there — a goodly clan of them. They reverently deposited the remains of their departed chief in the church of Sta. Maria del Popolo; and then I daresay they drove back as quickly as they could and heard the will read.

I don't know whether it was then or upon some subsequent occasion that the contents of that document were communicated to the relatives of the deceased; but, whenever it was, I should have much enjoyed being present and watching their faces while it was announced that, barring a few unimportant legacies, the misguided man had bequeathed the whole of his vast property, real and personal, to his widow. The lady was not even hampered with any of the ordinary provisos which common prudence dictates, with regard to remarriage, or the like. Her husband's wealth was hers, and hers absolutely. The family felt this to be very grievous, and could perhaps hardly be blamed for so feeling, though, no doubt, young Carlo Paolini, of the Guardia Nobile, went a little too far when he declared publicly that, in his opinion, it would be a righteous act to dig the old idiot up out of his grave and fling his body into the Tiber. His uncle, the cardinal, very properly rebuked him for such a display of temper and bad taste, and suggested the more practical course of disputing the will. Some such attempt was, indeed, subsequently made; but it proved abortive; and then the Paolinis, with that common sense which has never yet deserted them where their own interests have been at stake, recognized the fact that by far the best thing they could do would be to keep on good terms with the fortunate foreigner to whom their ancient palace and broad lands now belonged.

Of course certain people declared that they tried to poison her; but what will not certain people declare? There was nothing in the rather abrupt departure of the young princess for her native land to excite so shocking a suspicion in any but evil-thinking minds; nor could anything be more natural than that a girl married and widowed at the tender age of eighteen should fly for comfort and consolation to the arms of a fond mother. At all events, Rome saw her again at the end of a couple of years. She took up her abode in the luxurious apartments of the Palazzo Paolini, which had been prepared to receive her as a bride; she showed herself upon the Pincian in an English-built Victoria drawn by a pair of high-stepping bays, and presently — by way, as it was thought, of manifesting in a public manner that she understood the duties and importance of her position — she issued invitations for the great reception of which mention has already been made.

Those who were privileged to attend this gathering were forced to admit that the demeanor of their hostess afforded

little room for adverse criticism, and that, Englishwoman as she was, she bore herself in all respects as became a Roman princess. She was very tall, very beautiful, and very magnificently dressed. With her dark hair and eyes and her clear pale complexion, she might have been an Italian born. She was a little proud and cold perhaps; but that was a fault upon the right side. Standing at the head of her staircase, with Cardinal Paolini at her elbow and a little court of her relations and other great people grouped behind her, she received her guests like any empress. She made no mistakes. Possibly she had gone through a private rehearsal with the cardinal, or it may have been that she had taken some pains to learn her part; at any rate she was polite to everybody, and more than polite to a favored few. She had a well-chosen word or two for each of the great ladies whose friendship was worth securing; she advanced a few steps and shook hands with the minister of a country understood to be friendly to the papal government, while the representative of another power, with whose action his Holiness had recently had reason to be displeased, was dismissed with a grave, distant bow.

The latter form of recognition was, indeed, the only one vouchsafed to the majority of the princess's guests, as they defiled before her, and passed on to the picture-gallery and the great ball-room, where a string band was playing for their benefit; but when my own turn came to pay my respects to the lady of the house, I was honored by a much warmer reception. The fact is that I had entered the Palazzo Paolini uninvited. I had only just arrived in Rome, and having heard of the proposed festivity, I thought I would walk round after dinner and see how my old friend and playmate, Sybil Ferrars (with whom I had been intimately acquainted since the day when I had the honor to attend her christening), would acquit herself in her new and rather trying situation. I flattered myself, too, that the sight of a familiar face among all those strange ones would not be unwelcome to her; and so I was not at all astonished when the princess, on recognizing me, forgot all her stateliness and dignity for a moment, and held out both her hands with a little glad cry of surprise.

"You here!" she exclaimed. "How delightful! When did you arrive? and how long will you remain? Oh, I hope you are going to stay the whole winter! Where have you been all these long, weary years?" (It was only two years since I had seen her last; but at her time of life two years is a much longer period than it is at mine.) "Will you come and see me to-morrow morning about twelve o'clock? Then we can have a good long talk all by ourselves."

Cardinal Paolini fixed his deep-set, black eyes upon my humble person, and looked me through and through. He is a handsome, commanding-looking man, as all the Paolinis are, and he has a way of confronting inferior mortals with a cold, penetrating gaze which is supposed to strike terror into their mean souls. Of course, I had no chance against him. With his tall, spare figure draped in scarlet robes and old lace, he looked the very picture of a proud prince of the Church, and seemed born to exact obedience, if not respect; whereas I, I am sorry to say, am a rather fat old man, and though I may have had my share of good looks once upon a time, I have never heard that my appearance was of an awe-inspiring kind. However, I am not afraid of Cardinal Paolini, nor, for that matter, of the whole Sacred College put together; so I favored him with a Briton's stony, stolid stare, before which he presently dropped his eyelids, while the faintest possible smile flickered for an instant about his thin lips.

I suppose the princess must have noticed the rigidity which had suddenly overspread my speaking countenance, and have guessed at its cause; for she glanced over her shoulder at the cardinal, and remarked, in a very clear and distinct voice, and in the Italian tongue (which I observed she had learnt to speak with remarkable purity), "Your Eminence need feel no alarm. Mr. Clifford was at school with my father, and, what is better still, he is married already."

At this speech there was a general smile, and I saw several of the bystanders nudge their neighbors; for of course everybody knew that the Paolinis were not going to let their fair relative take a second husband if they could help it, and the cardinal's distrust of Englishmen was, as I afterwards learnt, a matter of notoriety.

I passed on into the picture-gallery, feeling rather sorry that the princess should have thought it worth while to make something like a scene out of so small a matter. It was sufficiently obvious that the cardinal must wish and intend to get her under his thumb; and I have always observed that, when a clever and strong-willed man has such designs with regard to a woman, the only safe opposition she can bring to

bear against him is that of a wall of passive resistance. He has already taken a long step towards victory when she tries to sting him with sharp speeches.

I never have any lack of acquaintances in Rome, where I am in the habit of spending two or three months out of every year, and I soon found myself surrounded by a knot of old friends in whose society an hour slipped away pleasantly enough. I was just thinking that it was about time for me to be going back to my hotel to bed when I ran up against young Dick Seaton, the sculptor, who grasped my hand with more than his usual cordiality.

"My dear Mr. Clifford," he cried, "you are the very man of all others whom I wanted to see! You knew the Princess Paolini before she was married, didn't you? Who was she? What made her marry that drivelling old man? Tell me about her."

"Why all this eagerness?" I enquired. "What are princesses and Paolinis to you, my poor Dick? Have you fallen in love with her, you foolish boy? And do you suppose she is ever likely so much as to notice your existence? Oh, vanity of youth!"

Dick burst out laughing. "Fallen in love with that beautiful statue? — not exactly!" he answered. "I could as easily fall in love with the Capitoline Venus. Besides, I hope I know my place, and have a proper reverence for my betters. Moreover, I can tell you, if you don't know it already, that the Princess Paolini will never marry again. His Eminence yonder would have a hundred suitors poisoned sooner than let it come to that."

"Well, well!" I said. "I daresay she will be none the less happy if she does have to remain single. What do people want to get married for? Is matrimonial bliss so common a thing that all you young folks should be in such a hurry to surrender your freedom?"

Dick laughed again, and asked whether Mrs. Clifford was with me. Dick is sometimes inclined to be a little bit impertinent.

"You know very well that the climate of Rome does not suit my wife," I answered. "She is in England, paying a round of visits. So you want to hear all about the beautiful princess, do you? Well; walk home with me, and I will tell you what I know."

We made our way through the crowded rooms, down the broad staircase, and so out on to the piazza, where we lighted our cigars, and strolled away in the moonlight.

"The Princess Paolini," said I, as we turned into the Corso, "is one of that old cat Lady Augusta Ferrars's daughters. You don't know Lady Augusta, because you live abroad three parts of the year, and when you do go to London you roam about the streets in a velveteen coat and a pot hat, so that even your relations have to look in at a shop-window when you pass; but everybody else knows her, and I believe most people rather like her. A select few, of whom I have the honor to be one, hate her like poison. I don't know whether her daughters feel grateful to her, but I suppose they ought, for she has done the best she possibly could for them, according to her ideas. The eldest will be a duchess one of these days, when her husband succeeds to the title; the second is married to old Kreutzerpfenning, the German banker, and will be one of the richest women in Europe when he dies, as he is bound to do before long; the third is the famous Lady Highcliffe, of whom you must have heard. They tell me she leads one of the most exclusive sets in London; but I don't know much about her myself; she soared to a social height which I can never hope to reach. Lady Augusta arranged all these matches, and carried them through, unaided and alone, in the face of considerable difficulties. It was she who took poor Sybil almost out of the nursery, made her change her religion, and handed her over to old Prince Paolini, who might have been her grandfather. I believe the poor child made some objection; but children never know what is good for them; and, after all, now that the man is dead ——"

Here Seaton spat upon the ground in an offensive, noisy manner, of which I strongly disapprove.

"Don't do that, Dick," said I: "it is unnecessary and ungentlemanly. Live in Bohemia, if you will, but for heaven's sake keep clear of its low habits."

"I will back the habits of Bohemia against the habits of Belgravia, any day," he returned. "In Bohemia a woman has at least some natural love for her offspring."

"So she has in Belgravia, only it takes a different form."

"Faugh! don't tell me. Made her change her religion, did they? I am a Catholic myself, as you know, but then I was born one: hang forcible conversions! And you talk of it all as if it wasn't enough to make a man sick!" And here I am sorry to say that, in spite of my remonstrance, Dick repeated his objectionable

act. "But I daresay she was a willing victim," he resumed, after a pause. "No doubt she is as worldly and selfish and mean as the rest of them, and Heaven only gave her those great melancholy brown eyes by some mistake."

"She is nothing of the kind," I answered — "at least she used not to be."

"Then why did she marry that old dotard?"

"My good Dick," I said, "you don't know the stupendous power of a nagging woman. I sincerely trust you never may. Lady Augusta's daughters were all high-spirited girls, but they had to give in to her in the long run; and, for my part, I don't wonder at it."

"H'm! Well, I don't think I shall execute the order, all the same," remarked Dick, musingly.

"What order?" I asked.

"Oh, the Princess Paolini honored my studio by a visit the other day, and, after criticising my poor productions with a good deal of complimentary condescension, was pleased to say that she was anxious to sit to me for her bust. I told her that I didn't much care about that kind of work, as a general thing, but that, as her face interested me, I would see whether I could not make an exception in her case."

"That was rather impertinent of you."

"Yes; but her manner had been rather impertinent to me. Besides, I only spoke the truth. Her face interested me. All things considered, I don't think it interests me any more; and when she comes to my studio to-morrow, as she has appointed to do, I shall tell her I can't find time for her."

"You young goose!" I said, "what have you to do with the private life of your sitters? Do you institute enquiries into the antecedents of all your models, pray? The Princess Paolini, who is no worse than her neighbors, you may be sure, will pay you well for your work, and bring you into notice if you are civil to her. Don't quarrel with your bread and butter."

"I shall do very well without the princess's patronage," answered Dick, with his nose in the air; "and I am not going to degrade my art into a mere means of grubbing up money. Here is your hotel. Good-night."

And so my young friend marched away in the moonlight, ascended the broad flight of steps that leads from the Piazza di Spagna to the church of the Trinità de' Monti, and was soon out of sight. Dick Seaton's father, as I happened to know, made him, at that time, an allowance of 300*l.* a year, upon the strength of which I suspect that the young sculptor muddled away more than double that amount annually. I was rather pleased with him for respecting his art, and despising money; I like to see youth generous and careless, and free-handed; and as I knocked up the porter at the Hôtel de l'Europe, and stumbled in through the half-open door, I said to myself that Dick was a fine young fellow, though of course an ass. I daresay, though, that if he had been my son, I should have considered the latter part of the phrase more descriptive of him than the former.

II.

PUNCTUALLY at twelve o'clock on the following morning I presented myself at the Palazzo Paolini, and, after a short delay, was ushered into the presence of its mistress. She received me in what would, I suppose, have been called her boudoir, had not such a name seemed so absurdly inappropriate as applied to one of the vast lofty chambers of the grim old palace. It was too large a room to be altogether comfortable, and of course its windows fitted badly and let in currents of air, as all Roman windows do; but it had a southern aspect, it was luxuriously furnished in the modern Parisian style, and a mass of flowers and a great cage full of twittering birds gave it a certain cheery, home-like appearance. A wood fire was burning brightly on the hearth, on one side of which the princess reclined in a low easy-chair, while facing her sat a straight-backed, sandy-haired, middle-aged person, whom I at once perceived to be her lady companion.

A sense of humor, we are often told, is nothing more nor less than a quick perception of the incongruous; but to my own mind I must confess that there is no spectacle at once so ludicrous, so delightful, and so rare, as that of absolute fitness. Every condition in life has its ideal type, yet how seldom is that ideal realized! Portly bishops, weasel-faced attorneys, admirals who talk in a sustained bellow and interlard their conversation with oaths — how few and far between are they, and with what immense satisfaction does one greet a man whose appearance accords in all respects with his calling! Companions, should, of course, be tall, angular, and of uncompromising aspect; they should wear mittens, be perpetually knitting grey woollen stockings, and should never speak unless addressed. Every-

body has met the ideal companion scores of times in novels and plays; but how many people have come across her in real life? The Princess Paolini's companion fulfilled all the above enumerated conditions; and when I was introduced to her, and heard that her name was Miss O'Grady, the perfection of the specimen struck me with such force, and tickled me to that extent, that I had much ado to keep myself from bursting into an unseemly guffaw.

Miss O'Grady so completely satisfied my soul that, for the first few minutes, I really could not take my eyes off her, and was only able to lend a half-attentive ear to the conversation of the princess, who was chatting away about old times in a manner far more characteristic of the Sybil of former years than of the *grande dame* whom I had seen patronizing ambassadors on the previous evening. It was the sound of Seaton's name that roused me from my state of contented contemplation.

"I suppose Mr. Seaton is an old friend of yours," the princess was saying. "I saw you go away together arm-in-arm last night. Do you know, I have taken rather a fancy to that young man. He was so very rude to me the other day."

"And do you like people who are rude to you?"

"Sometimes. It makes a change, you know. Nowadays I find that nearly everybody crouches down at my feet; and I think those who hate me most are the most polite to me."

"I can't believe that any one can hate you," said I.

She shrugged her shoulders, but made no reply: and Miss O'Grady, without lifting her eyes from her knitting, delivered herself of a short, sharp "Hem!" which I took to mean, "Well, you *are* an old fool!"

"Would you believe," the princess resumed, "that Mr. Seaton makes difficulties about producing a bust of me? As if the greatest sculptor in Rome would not be only too glad to have such an order! I don't in the least want a bust of myself, and certainly, in the first instance, had not the slightest anxiety to sit to your friend; but when he seemed inclined to refuse my offer, I determined at once that he should accept it, whether he pleased or not; and, in fact, I am going to give him my first sitting this morning. Will you come with me, and relieve Miss O'Grady? You don't care to come, do you?" she added, turning to her companion; and that lady, looking up for a moment, answered in a deep, solemn voice, "I'd be glad to be excused."

Mindful of the foolish determination which Dick had announced to me, I thought I might manage to do the young fellow a good turn, in spite of himself, if I acceded to the princess's request, so I said I should like very much to accompany her, and shortly afterwards found myself comfortably settled on the soft cushions of the Victoria of which mention has already been made, and progressing at a round pace up the steep streets which lead to the Via di San Nicolo da Tolentino, where Dick's studio was situated.

As we pulled up before the door with a jerk, a little incident occurred which half amused and half distressed me. An elderly man dressed in a suit of threadbare black, who had been sauntering along the pavement on the opposite side of the way smoking a cigarette, halted as the clattering equipage dashed past him, and, with pardonable curiosity, stood still for a moment to scrutinize the beautiful lady enveloped in furs who was preparing to descend from it. The princess caught sight of him while her foot was on the step, and, turning instantly to the footman who was holding out his arm to assist her to alight, she said, in her quick, imperious way, "Tell that man to come here."

In a moment the stranger, hat in hand, was standing before her and bowing obsequiously, polite interrogation expressed in all his features.

"Cardinal Paolini sent you to watch for me," said the princess, looking over the man's head as she spoke. "You can tell him that you saw me enter Signor Seaton's studio, and that I shall probably remain there an hour or more. You may add that I had no one with me except an English gentleman." And with that she swept into the house.

The stranger opened enormous eyes of astonishment, dropped his head beneath his shoulders, exhibited the palms of a dingy pair of hands, and volubly assured me that the lady had made some mistake. He had never seen her before in his life, and had not so much as heard the name of Cardinal Paolini. But I was too much ashamed and annoyed to answer him, and hurried into the studio without daring to glance at either of the servants.

I followed the princess into the bare, scantily-furnished ante-room in which Dick was accustomed to keep his visitors waiting for him, and then, using the privilege of an old friend, I ventured upon a mild expostulation. "After all," I concluded,

"the man was very likely not put on to watch you."

She had turned her back to me in order to examine some bas-reliefs which hung against the wall, and had not, I am afraid, paid much attention to my harangue.

"Oh, yes, he was," she said, quietly. "I know his face perfectly well; and he knows that I know him."

"But why speak to him before your servants? Surely it would be more dignified —— "

"That is of no importance whatever," she interrupted. "It is an open secret that the cardinal surrounds me with spies, and, for anything I know, those very servants may be in his pay. Of course I might disregard his emissaries as beneath notice, if I chose; but it makes him angry to know that he is detected and laughed at; and so, from time to time, I send him a message which I am sure will be delivered, because all his creatures hate him so. Ah, here is Mr. Seaton."

Mr. Seaton now made his appearance. He was clad in a complete suit of brown velveteen, with knickerbockers; his fair hair, which in moments of excitement was apt to stand on end, was parted in the middle and carefully brushed; his beard had evidently been trimmed that morning, and a faint odor of eau-de-cologne entered the room with him. In short, I perceived at once that the young jackanapes had come in prepared to ride the high horse, and his first words convinced me of the correctness of my judgment.

After bowing low to the princess — I only got a nod — he expressed his regret that she should have been put to the trouble of revisiting his studio. He had given the subject full consideration, he said, and he had arrived at the conclusion that he must decline the honor of executing her bust. In point of fact, he did not go in for that kind of work. Of course a beautiful face was always worth studying; and that (if he might be permitted to say so) was the reason why he had hesitated a little in the present instance; but, after thinking it over, he had decided that it would be wiser for him not to depart from his general rule. He must therefore beg to be excused.

The princess was sitting with her back towards me, so that I could not see how this announcement affected her. She did not, however, appear to be offended.

"Of course, if you won't do it, you won't, and there is no more to be said," she answered; "but I confess I am disappointed. I want to have a good bust of myself, and I fancied, somehow or other, that you would succeed better with me than one of the others, to whom I shall now have to apply. I don't know what your reasons may be; but if it were only loss of time that you dreaded —— "

"You would pay me at a rate that would overrule that objection. I don't doubt it; and I am infinitely obliged. But — forgive me, princess — there are some few things in the world that money will not buy. My productions, which are very far from being first-rate, are worth a certain price; and that price I expect, and receive, for them. I don't want more, and would not take more."

At this juncture I could not refrain from calling out, "That's bosh, you know;" but I doubt whether either of the young people heard the interruption.

"I beg your pardon," said the princess, quite meekly; "I ought not to have tried to bribe you; and, indeed, I did not exactly mean to do that; but I thought perhaps your time might be valuable, and — and — but it does not signify. You don't pursue art as a profession then?" she resumed, after a momentary pause.

"Oh, yes, I do," answered Dick, laughing, and showing a fine double row of white teeth; "and very glad I am to get an order too. But I love my art for its own sake, not for what it may bring me, and I would not undertake any work that went against the grain with me, if I were offered five thousand pounds for it."

Here again I felt constrained to exclaim, "Dick, Dick, don't be such a prig!" And I am bound to say that my second observation met with as little recognition as my first.

"Oh, if it goes against the grain," said the princess softly.

An ingenuous blush suffused the cheeks of the young sculptor. "I did not mean that," he cried, quite confused and altogether forgetful of his dignity. "You cannot suppose that — good heavens, how stupid and awkward I am! All I meant was —— "

"Well?" said the princess calmly.

I suppose Dick did not quite know what he had meant; for he did not finish his sentence, but frowned and rumpled up his hair, and began to walk up and down the room.

"If you really think," he began, at length — "if you think — though, upon my word, I don't know why you should — there are so many sculptors who are my superiors in every way — but if you really wish —— "

Need I add that, a few minutes later, the princess was seated in the one easy-chair that Dick's studio possessed, that I myself was accommodated with a hard, comfortless stool, and that the incorruptible Seaton had changed his velveteen coat for a brown holland one, and was already hard at work?

"What is there in this world that all pretty women, and most plain ones, cannot get a man to do if they will only take the trouble?" I asked of the princess when the sitting was at an end, and I was once more seated beside her in her carriage.

She laughed, and said that there were a great many things which no power of hers had ever been able to effect. "Do you think, for instance, that I could induce the cardinal to leave me in peace?"

"The cardinal," I answered, "is a priest and an old man: my poor Dick is young and impetuous. I should take it as a favor if you would not make a greater fool of him than you can help."

"What do you mean?" she asked, turning her great, serious eyes full upon me.

And then I remembered that she was a princess and that Dick was only a struggling sculptor, and I had not the courage to caution her against flirting with one so far beneath her in rank.

After this the princess's visits to Dick's studio became matters of daily occurrence. Miss O'Grady went with her as representative of the *convenances*, and took her knitting. I did not offer to replace that lady a second time, having a dislike to hard, wooden chairs, but I often dropped in, in the course of the morning, and found the trio always in the same postures — the princess mounted upon her daïs, Dick working away at his clay, and the grim-visaged companion nodding a little over her interminable stocking. Entering, one day, without knocking, as my habit was, I was arrested upon the threshold by a warning "Hush!" and presently became aware of Miss O'Grady slumbering peacefully upon her high chair, her head thrown back, and her lower jaw dropped, while Dick was hastily drawing a caricature of this sleeping beauty, and the princess, peeping over his shoulder, was stuffing her pocket handkerchief into her mouth to control her laughter. When I saw Dick's sketch, which I must say was not devoid of humor, I exploded, and awoke the unconscious sitter, who glanced suspiciously first at us, then at her knitting, and finally remarked, gravely, "I believe I've dropped a stitch."

At this there was a general outburst of merriment; for indeed the poor lady had solemnly drawn out her knitting-needles, one by one, in the course of her nap, and her long grey stocking lay, a hopeless ruin, on her knees.

I was not sorry to see that poor Sybil had still so strong a leaven of childishness left in her nature. No one who had encountered her, night after night, as I had lately done, in the *salons* of the Roman aristocracy, would have supposed that the pale, stately princess was capable of giggling over a caricature like any schoolgirl; and, in truth, if rumor were correct, her life among her relations was not of a kind to encourage mirth.

"Will you drive with us to the Doria-Pamfili gardens this afternoon?" she asked, as she put on her hat and gloves. "We are going there to gather flowers, Miss O'Grady and I; and perhaps Mr. Seaton may be able to meet us."

It was a delicious warm day in the early spring; I had no special engagement for that afternoon; so I said I would go; and we went. We left the carriage at the villa, and wandered among those shady glades, which are now almost as well known to Englishmen as Richmond Park; and there, sure enough, we found Mr. Dick waiting for us. Then we all went down upon all fours, and gathered the many-tinted anemones with which the park was carpeted, till two of us were reminded by the aching of our backs that we were no longer so young as we had once been, and, assuming a more convenient attitude, left the self-imposed task to those whose limbs were still lithe and whose bones were unracked by rheumatism. Out came Miss O'Grady's grey stocking; I obtained permission to light a cigarette; and as we sat on the dry grass, exchanging a word every now and then, but making no effort at sustained conversation, the laughter of the young folks rose from the dell whither they had wandered, and gladdened the soft warm air.

Human nature is human nature all the world over. Throw an obscure, but appreciative youth constantly into the society of a lovely empress; leave them alone together; let them grow intimate, and — audacious, senseless, discreditable as it may be — it is as likely as not that that youth will become enamored of that empress. So much I readily admit. I have indeed repeatedly done so in the course of conversation with Mrs. Clifford, who is pleased to blame me because Dick Seaton chose to fall over head and ears in love with the Princess Paolini, and who,

with that terse vigor which characterizes all her utterances, has more than once observed that nothing but senile imbecility or pure wickedness can explain my conduct in not "nipping the thing in the bud." But although, from considerations which it is needless here to particularize, I have for many years made it a rule never to contradict Mrs. Clifford, I must still take leave to doubt whether, even if I had been possessed of the blighting influence attributed to me by my wife, I should have done wisely or well to exercise it. For whose sake, pray, was I to interfere? For Sybil's? Was I to deprive her of the honest devotion of an honest heart, and of a few brief hours of enjoyment and oblivion out of a life predestined to chill splendor? For Dick's, then? Why, what better thing can happen to a young man than that he should fall in love? What is more certain to bring out the good side of his nature, to subdue the earthly, to lead him to do the very best that he can to achieve name and fame? I am fat, but I am romantic. I have my own reminiscences, and have had my own experiences; and it is my deliberate opinion that no mortal has ever been otherwise than benefited by having truly loved another. I watched, then, the progress of Dick's attachment, with the serene conviction that no harm could come of it. If there had been a question of ultimate marriage, I grant you — but I was perfectly aware of the utter impossibility of any such issue.

After that visit to the Pamfili gardens we four commonly spent our afternoons together. We explored the palace of the Cæsars, we roamed over the Coliseum, we wandered among the ruins of Caracalla's baths. One pair of us developed an immense interest in ancient architecture — an interest only to be satiated by clamberings over giddy heights of masonry, where apparently no two people could safely post themselves, except hand in hand. The remaining couple, being of riper years, were content to pitch their camp-stools upon the green sward below, where the violets grew, and to gaze up at the figures of their adventurous friends standing out sharp and black overhead against a deep blue sky.

Dick was crazily in love, and showed the state of his feelings so openly, that the most indifferent of lookers-on could scarcely ignore it. Even Miss O'Grady, a singularly cautious and reticent person, honored me with an occasional meaning smile, when the young man made himself more than usually ridiculous, though she never alluded to the subject in words. As for the princess, I was a little puzzled to arrive at a comprehension of her sentiments with regard to her adorer. She was wayward and capricious with him, treating him sometimes kindly, sometimes coldly, and occasionally favoring him with a very direct and unequivocal snub. She seemed to be really fond of the lad, and yet anxious to keep him at a certain distance. I often wondered whether she sought his company for his own sake, or merely with the amiable object of annoying her relative, the cardinal.

I happened to meet that distinguished prelate, one morning, on the staircase of the Palazzo Paolini, whither I had betaken myself upon I forget what errand. Dick had trumped up some frivolous excuse to accompany me. The cardinal came stepping down the marble stairs, an erect, stately, scarlet figure, with his two footmen in their queer, old-world liveries behind him, and I stood aside to let him pass, taking off my hat, as in duty bound. Dick, on the other hand, never so much as lifted a finger to his wide-awake, and frowned aggressively.

"What do you bow to that fellow for?" he asked, rather before his Eminence was out of hearing distance.

"Honor to whom honor is due," I answered.

"Hang it all! you're a heretic; and you oughtn't to think any honor is due to the scarlet woman, as you call the Holy Church."

"I took off my hat to the scarlet man," says I. "I have nothing to do with his religious opinions; I simply acknowledge his social position."

"Social position!" echoed Dick, with tremendous scorn. "Yes, that is all you fellows who pride yourselves upon being 'men of the world' think of. You don't care two straws whether a man be honest or not; but if he can write 'Duke,' or 'Cardinal,' before his name, off go your hats instinctively. What a set of poor toadies you all are! I, who am only a poor, unfashionable sculptor, don't choose to abase myself before an infamous scoundrel, such as your friend there, whatever his rank may be. However, I confess that I hate Cardinal Paolini personally — and he hates me."

"You conceited young donkey!" I returned — for I must say I didn't like being called a toady — "pigmies may hate giants; but giants don't trouble themselves much about pigmies. I have a very strong suspicion that Cardinal Paolini

has not yet realized the circumstance of your existence."

"Very well," said Dick composedly; "have it your own way; I don't want to dispute your theories. As a matter of fact, however, the cardinal is not only aware of my existence, but has had a good try to put an end to it. I was within an ace of being stabbed on my own staircase the night before last."

"By the cardinal?"

"No; but by a fellow whom he had put on to do it. I was groping my way up the stairs when it occurred to me, I really don't know why, that I might as well strike a light. I did so; and immediately found myself almost touching a ruffian with a naked dagger, whom I clutched, and who promptly made a bolt for it, leaving a piece of his coat-collar in my hand. I let him go; it wouldn't have been any use to me to capture him; but I recognized him at once as one of the spies whose business it is to watch us."

"What spies? And whom do you mean by 'us'?" I enquired, rather startled.

"Why the princess, you know, and — and myself," replied Dick, looking extremely self-conscious.

The worst of it was that it was true. Half an hour later, the princess made some pretext to lead me away into the picture-gallery, and there poured into my ears an indignant complaint of the insolence, the wickedness, the cruelty of her cousin, the cardinal. Her interview with him that morning had been, it appeared, of a somewhat stormy nature. In the double character of senior member of the family and spiritual adviser of his young kinswoman, he had taken upon himself to denounce certain features of her conduct in no measured terms. He had admonished, he had scolded, he had threatened. Last of all, he had actually pushed audacity to the point of accusing the princess of unbecoming familiarity with — whom did I suppose? — with Mr. Seaton.

Monstrous charge! I expressed myself at once astonished and shocked.

"I told him that he would never have dared to insult me so, if he had not been a priest, and I alone and defenceless," continued the poor princess, with tears in her eyes; "but the truth is that he is so blinded by his terror of my marrying again, and taking the Paolini estates out of the family, that he will not believe that I can have any pride or self-respect of my own. I shall never marry again, as it happens; but if I did, I am hardly the person to make a *mésalliance*."

"Certainly not," I acquiesced; "and anything so preposterous as a marriage with Dick Seaton ——"

"Preposterous is hardly the word," interrupted the princess, rather inconsistently. "Mr. Seaton's family is quite as old as our own, I believe, for that matter; but of course I understand the duties of my position; and I need hardly tell you that I have never thought of Mr. Seaton except as of a friend. I have so few friends," she added, with a sigh; "indeed I have none except you, and my good faithful O'Grady, and Mr. Seaton. I don't choose to give any of you up at the cardinal's bidding."

"Quite so; but don't you think it might be prudent ——"

"To drop Mr. Seaton? I daresay it might; but, fortunately or unfortunately, neither he nor I happen to be cowards. Do you know that he was very nearly murdered a night or two ago?"

"Well, I did hear something of the kind. But who told you?"

"Mr. Seaton himself," she answered, looking me calmly and a little defiantly in the face. "Why should he not? I spoke to the cardinal about it this morning, and told him I knew of his unsuccessful attempt."

"And what did he say to that?"

"Oh, he only laughed, and assured me that, if he wanted to get rid of anybody, he should use some less clumsy means to effect his purpose. And then he said that Rome was full of robbers, and that my friend ought to keep a lamp on his staircase. After which he declared that he forgave me my suspicions, and went smiling away. It is not always easy to make him angry. There is a cool determination about him that frightens me. Sometimes I think I will give up all my money to these Paolinis, as they tried to make me do when I first got it; but then I don't like the idea of being beaten by the cardinal; and besides," she added with a sigh, "you know what sort of a welcome I should meet with at home if I returned to my mother penniless."

Indeed I did. With Lady Augusta on one side and Cardinal Paolini on the other, I could foresee little but troublous times for my poor princess.

Presently she rose from the low tapestried chair upon which she had been seated, and shook her lovely shoulders, as if to free them from some physical load. "Come," she said, "let us forget our troubles for a day or two at least. Have you ever seen my villa at Frascati? Miss

O'Grady and I are going out there for a little change: will you join us? I have asked Mr. Seaton to give himself a holiday too, and come and examine my frescoes, which he says he is very anxious to see."

I accepted willingly enough, but I confess that I should have been just as well pleased if Dick had been left out of the party. I was beginning to feel really uncomfortable when I thought of that unscrupulous old cardinal. There was a mediævalism about his course of procedure which I did not like. Romance is all very well, but it is hard that one should have to submit to the dull monotony of the nineteenth century and incur the perils of the sixteenth at the same time; and I reflected, with a shudder, that our enemy was quite capable of undermining the Frascati villa, and blowing us all up, à la Darnley.

However, my soul soon ceased to be disquieted within me. When I was sitting, after dinner, in the great cool dining-room of the Villa Paolini, sipping my Montefiascone, I was able to take a calmer and more philosophical view of the situation. The princess had at that time a *chef*, in whose praise I cannot speak too warmly; the Montefiascone was excellent; the view which I indolently contemplated through the open windows left nothing to be desired. Beyond the gardens of the villa — the marble terraces, the statues, the fountains, and the dark cypress and ilex groves — stretched the billowy Campagna, spanned by ruined aqueducts which lessened into the distance; far away against the horizon rose the dome of St. Peter's, a shadowy blue cupola, and the snows of remote Soracte were flushed with the afterglow of sunset.

"One can but die once," thinks I, being perhaps a trifle pot-valiant; "and if anybody wants to assassinate me, now is his time. We are all of us tolerably contented and happy at the present moment, and how do we know what bad times the future may have in store for us?" I added aloud, "This is better than Rome."

"Is it not?" cried the princess, who was in high spirits. "Heaven be praised! we have put twelve good miles between ourselves and the cardinal."

And Miss O'Grady, looking down at her plate, muttered *sotto voce*, "Bad luck to um!"

As for Dick, he said nothing; but I daresay that, like the parrot, he thought the more.

Ah, well, we had a very pleasant and happy week, we four, at the Villa Paolini. The young people had the best of the fun no doubt; but that was only right and proper. After a certain age one ceases to expect any special happiness on one's own score; but if a man be only sentimental enough, his grey hairs need not debar him from enjoying a good deal of vicarious bliss. We galloped over the brown, windy Campagna (Miss O'Grady in a short grey habit and a voluminous blue gauze veil was indeed a joy forever); we drove to Albano and Rocca di Papa; we climbed Monte Cavo, and picnicked among the ruins of ancient Tusculum; and at night, when the sun had set, and the heavy southern dew had fallen, we wandered among the terraces and avenues of the Paolini gardens, or sat in armchairs on the verandah, and watched the stars. That is to say, that two of the party wandered, while the other two sat still. I had, and have, a great respect for Miss O'Grady; but I like to remain quiescent for a time after dinner, and my intercourse with her was not of that kind which demands solitude and picturesque accessories. Yes; it was a quiet, happy time; and like all times, happy and otherwise, it came to an end. I well remember our last evening. The stars were glittering in a cloudless sky, the air was as soft and warm as on a June night in England, and all the good folks of Frascati had gone to bed to save their candles. There was profound silence in the garden, whither, as usual, we had betaken ourselves after dinner. I was peacefully puffing at my nocturnal cigar; Miss O'Grady, who was unable to knit in the dark, was sitting in a low chair a few paces from my own, her head supported by her long, lean hand; and Dick and the princess had strolled away together, as they pretty generally did at that hour. From time to time we caught glimpses of their dark figures flitting from shadow to light and from light to shadow among the scented orange-trees and the myrtles and tamarisks, and every now and then, the sound of their voices was borne to us and died away again as the fitful night breeze rose and fell. Once they paused by a marble balustrade some fifty yards away from us, and I could see that that rascal Dick was gazing with all his might and main into the great brown eyes of his beautiful companion.

O zarte Sehnsucht, süsses Hoffen!
Der ersten Liebe goldne Zeit!

As I have, I think, said before, I am old, but I am romantic; and while my eyes were resting upon the princess and the sculptor, my mind had skipped nimbly back

to the year 1830, and to the days when I too lingered out of doors in the falling dews and forgot this weary world and all its dull necessities in looking into just such another pair of brown orbs. I do not speak of Mrs. Clifford's eyes, which, indeed, are not of that color, but of a bluish-green or greenish-blue, I think. I have not the advantage of her presence beside me as I write, and can't be positive as to a shade or so. Poor homely O'Grady, too, must have had some recollections of happy bygone days, I fancy; for she moved uneasily in her chair, and heaved a prodigious sigh from time to time, and the bones of the formidable stays in which she was encased creaked as if in sympathy.

We all re-entered the house together at length; and upon the hall-table we found a little pile of letters which some officious person had forwarded to us from Rome.

Five minutes afterwards two, at least, of our number had stepped back with dismal haste from the domain of romance to that of reality.

III.

ONE of my letters was from Mrs. Clifford, and contained the rather startling intelligence that she proposed to join me very shortly. The east winds, she wrote, had been most piercing of late; she felt that she required a change; and, in short, she had been persuaded to try the effect of a journey to Rome by dear Lady Augusta Ferrars, who was just about to start for that city on a visit to her daughter, the Princess Paolini. Would I see about rooms at the Hôtel de l'Europe, and secure tickets for the Easter ceremonies at once? In a postscript I was asked whether I had happened to meet young Lord Chelsfield yet. Because Mrs. Clifford rather imagined that Lady Augusta expected to find him at Rome.

I took in the situation at a glance. "Dear Lady Augusta" intended to marry her daughter to Lord Chelsfield. The match would be a good one; and, moreover, it would save the Paolini wealth from ever reverting to the family of the late prince. Indeed, realizing, as I then did for the first time, how important it was, from Lady Augusta's point of view, that the princess should make a second marriage, I was at a loss to comprehend why that devoted mother had ever allowed her dear child to return to Italy. But when I remembered the antagonistic designs of Lady Augusta and the cardinal; when I recollected that these two determined persons would shortly be brought face to face; and when I further reflected upon the complications which might arise out of Dick's intimacy with the princess, and upon the measure of condemnation which was only too likely to fall upon my own head on account thereof, I could contain myself no longer, and exclaimed involuntarily, "Here's a row!"

The princess looked up, with a rather pale and weary face, from the perusal of her own correspondence, and said, "I beg your pardon?" But I did not repeat my vulgar ejaculation.

"I must return to Rome," she continued, in a tone of some depression. "Mamma is coming to see me."

"So must I," I remarked, not less dolorously. "Mrs. Clifford is coming to see me."

At which we had a brief, dreary laugh.

And so next day we all jogged back along the Via Appia to face our troubles, and left Frascati and its foolish fancies behind us.

Upon the events of the few following weeks I prefer not to dwell. I am unable to look back upon that time with any sort of gratification or comfort. Everything turned out exactly as I had anticipated. Lord Chelsfield — a feeble, dissipated youth, with a head like a kite — made his appearance simultaneously with Lady Augusta, and I was given to understand by my wife that he was destined to become the husband of my beautiful princess. I observed carelessly that the lady would probably have something to say to that arrangement, and received a somewhat acrimonious reply to the effect that she had already signified her disapproval of it pretty plainly.

"She refused him last summer," Mrs. Clifford said. "In fact, I believe that she left her mother in that abrupt way and returned to Rome simply in order to get away from him. She is obstinate and headstrong, like all her father's people; but dear Lady Augusta has always been able to manage her girls so wonderfully that I have no doubt she will succeed in the present case. I am sure I hope she will; for really poor Sybil would be so very much happier as the wife of an English nobleman than she can be among these horrid, garlic-eating Italians! And then of course there is the money to be thought of."

"Just so," I replied. "I daresay Lady Augusta will carry her point; I know she has a convincing way with her."

Of the tremendous power possessed by that ugly, fat, commonplace-looking woman

I had good reason to be aware; for poor Ferrars was one of my oldest friends, and I had seen him literally worried into his grave by her. As a tiny fly can goad a creature thousands of times its size to the verge of madness, so Lady Augusta, whom I cannot but regard as equivalent to a whole swarm of flies, would tease and torment and sting any person who happened to oppose her wishes till the wretched victim was fain to shriek for mercy. I never knew her fail to get her own way. She was utterly pitiless; she had a moral hide thicker than the material one of any hippopotamus, and she was thoroughly proof against discouragement and fatigue. Her management of her children — not, as a general rule, easy people to drive — was, as my wife truly said, wonderful. They resisted her, it is true, but she always conquered them in the end, and never forgot to make them smart for their mutiny into the bargain.

I went, as in duty bound, to pay my respects to this amiable creature shortly after her arrival, but she received me so rudely, and said such unpleasant things about certain private affairs of my own with which I had never had any reason to suppose her acquainted, that I picked up my hat, after five minutes of her company, and fled.

As ill luck would have it, at the door of the hotel I met Mrs. Clifford just starting for her afternoon drive, and was immediately ordered to accompany her. Then I soon learnt the cause of my rough reception by Lady Augusta. It was I, it appeared, who had introduced my low friends into the Princess Paolini's house, and had filled her head with the most shocking and revolutionary notions. It was I who had striven to make mischief between mother and daughter. It was I who had encouraged a monstrous flirtation between Sybil and some vulgar, designing artist, and had made her the laughing-stock — positively the laughing-stock! — of all Rome. Dear, dear! what an afternoon I did have of it! Round and round that weary Pincian — which I declare is not much larger than an ordinary soup-plate — round and round, with the record of my delinquencies, past and present, dinned into my ears in a steady, ceaseless monotone — round and round at a slow jog-trot, till my head grew confused, and my ears began to sing.

"I can't stand this any longer!" I gasped at length. "Let me go; I am getting giddy."

"Nonsense!" returned Mrs. Clifford; "what can there be to make you giddy?"

"I tell you I *am*," I reiterated, outraged nature asserting herself; "and what's more, if you don't let me out of this carriage at once, I believe I shall be sick!"

Then I was allowed to go.

After that I thought I might as well keep away from the Palazzo Paolini. My going there would have done nobody any good; and, if you will have the whole truth, I suppose I was a little afraid of that dreadful old Lady Augusta, as well as of some one else nearer home. I declare upon my honor and conscience, that I would have braved any number of old women, if, by so doing, I could have rescued my poor princess from the destiny which I saw looming before her; but Sybil, when I met her in public, avoided me in a rather marked manner, and indeed it was not easy to see in what way my visits could be of service to her, whereas they would assuredly have the effect of exasperating her dear mother.

Nor did I, at this time, see much of Dick Seaton. Several times, when I went to his studio, I found the outer door locked, and upon one occasion, when I did happen to catch him in the act of entering, he behaved in so unreasonable a manner that I very nearly lost my temper with him. I must say I was sorry for the poor lad when I saw his pale face, the dark circles under his eyes, and his dishevelled hair; nor did my pity suffer any diminution after he had taken me into the studio, and had begun prancing about the room, beating his breast, striking his forehead, and cursing the day of his birth, after the time-honored fashion of disappointed lovers. But that he should proceed to abuse me, as the chief cause of all his woe, was really rather more than I could patiently submit to.

"Upon my word, Dick," I exclaimed, "this is a great deal too bad! I make every allowance for your abnormal state of mind, but, when all is said and done, you are a man — and from a man one does expect some rough kind of justice. If you had been an old woman, you know, one would of course have had to bear your absurd accusations in silence. Now do please try to recall the true facts. Did I ever lead you to suppose that you could marry the Princess Paolini? Didn't I, on the contrary, strive, on every possible occasion, to convince you that such an alliance was, and always must be, entirely out of the question? Didn't I warn you, the very first night I was in Rome, against falling in love with her? And didn't you

reply that there was no danger of such a catastrophe — or words to that effect?"

"I don't remember anything of the kind," answered that shameless young man. "I know you might have saved me a great deal of wretchedness, if you had chosen to speak a little more plainly when you saw how things were going. Why couldn't you have told me that it was arranged that she should marry that rascal Chelsfield? I suppose you must have known it. As for differences of rank, and that kind of thing, I did not think so much of that as you do: I haven't your immense reverence for a title, you know" — this was meant to be very cutting — "and I confess I have sometimes thought that, one day, when I had made a name for myself — however, that does not signify now. She won't see me; and the hall-porter at the Palazzo, whom I bribed with a couple of scudi, told me that Lady Augusta had given orders that I was never to be admitted. I think I will go and drown myself in the Tiber."

"I wouldn't do that," said I. "I know you won't believe me, but it is nevertheless true, that you will get over this sooner than you think."

"Get over it!" shouts Dick, beginning to rampage about the room again. "My good sir, you don't know what you are talking about. Because you have 'got over' half-a-dozen flirtations, you imagine that love is nothing but a passing fancy, which resolves itself very soon into a rather pleasant memory. Well, you are wrong. I believe that love, when it has once existed between two people whose tastes and habits and ideas are the same, is eternal." He added, in a lachrymose tone, which would have been pathetic if it had not been a trifle ludicrous, "She and I thought alike upon all subjects."

I stuck my hands in my pockets, stared up at the ceiling, and murmured: —

> Oh how hard it is to find
> The one just suited to our mind!
> And if that one should be
> False, unkind, or found too late,
> What can we do but sigh at fate,
> And sing, "Woe's me, woe's me!"

I trotted out this quotation from the lumber-room of my memory, where I keep many such odds and ends, intending it as an expression of sympathy; but I think it was lost upon Dick, who only seemed to have caught one word of it.

"She is *not* false!" he cried.

"Did I say she was? To whom should she be false? Hardly to you, I imagine; for I happen to have heard from her own lips that she never harbored any such absurd notion as that of becoming your wife."

Well, I meant it for the best. What kindness would there have been in encouraging the poor fellow to foster illusions? But no sooner had I made the above veracious statement than Dick turned upon me with the utmost fury and rudeness, and requested me to take myself off.

"Confound you!" he bawled, stamping his foot, "why do you sit grinning there, and driving me mad? I wish you would get out, and leave me alone with my misery!"

Now, as I said before, I can make every allowance for the mentally afflicted, but I do think that some amount of respect is due to grey hairs. I resolved, therefore, as I made my way down the Via di San Nicolo da Tolentino, that I would leave my young friend to himself until such time as he should have recovered his senses. So for the next fortnight or so I mooned about Rome, seldom seeing either Dick or the princess, and, to tell the truth, feeling very dull and lonely without them.

Now it came to pass that, as I was sitting in a sequestered avenue of the French Academy gardens one morning, lost in melancholy meditation, I was roused by a smart tap on the shoulder, which almost made me jump out of my skin. Wheeling round, with a wrathful ejaculation — for I hate to be startled — what should I see before me but the long, lank figure of Miss O'Grady, who saluted me with a short, stern nod.

"I saw you come in here," said she, in her deep voice, "and I followed you."

"My dear Miss O'Grady," I cried, making room for her on the stone bench beside me, "I am delighted to see you! How is the princess?"

"It's much you care how she is!" retorted Miss O'Grady, with a toss of her head and a snort.

It was really astonishing how, at this time, everybody turned against me, who, as all readers of this narrative must admit, had given no sort of cause for such animosity. I shrugged my shoulders in meek silence.

"Do you know," resumed Miss O'Grady indignantly, "that they are going to marry her to this half-witted English lord?"

I took off my hat, and scratched my head irritably. "My dear madam," I answered, "really I can't help it."

Miss O'Grady positively snapped her finger and thumb within an inch of my nose. "Poh!" she exclaimed, with a suddenness which made me start back to my corner of the bench. "And you call yourself a man! If I was a man I'd let 'em see!"

"Well, my dear Miss O'Grady," said I, "and suppose you were a man, what would you do?"

"Sure I'd stand by me friends," cried the intrepid lady, her brogue developing in equal measure with her excitement. "I'd not see a poor child hunted and driven into consenting to marry a man who's not fit to black her shoes!"

"Oh, she *has* consented then? I think you forget that the princess is a free agent, and that no one can force her to marry against her will. How do I know that she may not like Lord Chelsfield well enough?"

This was rather disingenuous of me, I admit; but Miss O'Grady's violence had so taken me by surprise that I wanted time to collect my ideas.

"Indade and indade there's nothing of the kind," she returned, with much warmth, "and it's you that should be ashamed to say so. See now," she continued, lowering her voice to a whisper; "you can save her yet, if you'll do what I tell you. Her mother's gone to Naples for three days. Now here's what you have to do. Be off to England, the first thing in the morning, and take the poor child with you. She's half dazed with fright and distress, and she'll go with you if you tell her she must. And there's one we know of who won't be long in following. If you make the most of your time, I wouldn't say but you might get her safely married before ever my Lady Augusta caught you up."

"Gracious heavens!" I exclaimed, aghast, "you cannot have realized the meaning of what you propose. I kidnap the Princess Paolini! Why, my dear lady, if there were no other objection to the plan, you must see that, old as I am, it would be in the highest degree scandalous and improper ——"

"Sure, haven't you got your wife with you?" broke in Miss O'Grady composedly.

"My wife! And you really imagine that my wife would join in such an adventure? No, no, Miss O'Grady; I am very, very sorry for poor Sybil, and goodness knows I would help her if I could; but your plan is hopelessly impracticable — it is indeed. The fact is that Mrs. Clifford's views with regard to this question are by no means identical with my own, and — and in short I could not even think of making such a suggestion to her as you speak of."

"So you're afraid of your wife!" sneered Miss O'Grady, rising, and shaking out her grey skirts with a gesture of infinite scorn. "Very well. But remember now, whatever comes of this, it will be your fault. Good-morning to you."

And with that she strode majestically away, and left me. I felt a little ashamed of myself, though I did not see then, and don't see now, how I could have answered Miss O'Grady differently, nor in what way I could have impeded a marriage to which the princess had herself consented.

Later in the day, I came across Dick in the Piazza di Spagna, and, thinking it as well that he should know the worst, I caught him by the arm, and briefly informed him that the princess was engaged to marry Lord Chelsfield.

"I am perfectly well aware of the fact," he answered coldly, and turned on his heel.

So that was all the thanks I got for voluntarily undertaking a disagreeable task. Truly it is an ungrateful world.

IV.

THAT same evening I was taken by Mrs. Clifford, rather against my will, to a great ball given by the French ambassador. It was a very grand affair; there was a larger display of uniforms than usual; the stairs were lined by servants in gala liveries, and the Roman princesses had got their famous diamonds out from the bank for the occasion, and were all ablaze with them. Rather to my surprise, the first person whom I met, on entering, was Dick Seaton, who did not seem particularly pleased to see me. He was standing close to the door, and I rather gathered from his attitude and expectant look that he was waiting for somebody. My suspicions were confirmed when I returned, in the course of half an hour or so, after having made the complete circuit of the rooms, and found him in the precise spot where I had left him. I had some doubts as to the probability of somebody's arrival, and I had none whatever as to the inexpediency of a meeting between her and Dick, so I ventured, at length, to approach the latter, and to remonstrate with him upon the folly of stationing himself at the elbow of a powdered footman, who might sneeze at any moment, and cover him with flour from head to foot; but he shook me off impatiently, alleging,

with obvious absurdity, that he was standing near the doorway for the sake of fresh air.

I sauntered away again, thinking to myself that, at that advanced hour, my young friend was not likely to receive any reward for his long vigil, and that, after his conduct to me, he deserved to meet with disappointment; but just as the clock was striking half past twelve my ear caught the sound of a distant flunkey's voice bawling out, "*La Principessa Paolini*," and presently in sailed Sybil, magnificent in sapphires and diamonds, and shook hands with the ambassadress. Dick followed in her wake. I never saw the beautiful princess looking so well. Her usually pale cheeks had a faint pink flush; her eyes were sparkling; she conversed, in a far more animated manner than was habitual with her, with a circle of admirers by whom she was immediately surrounded. She was evidently excited; and, strange as it appeared to me, I could not help thinking that she was happy.

What did it all mean? I was completely puzzled, and my wonderment was increased when I saw the princess take Dick's arm, and move away towards the ball-room, whither I followed the pair in time to see them join in the waltz which was just then being played. Now I knew that the princess had never honored Dick in this way before, and I knew, too, that of late she had not even spoken to him in public: therefore I was more perplexed than ever. One of the French *attachés* offered me an explanation of the phenomenon.

"*La belle princesse s'amuse*," said he. "They are going to make her marry the milor, but they tell me she has sworn to lead him a stormy life. That will be the more easy for her, as I believe he is the incarnation of jealousy."

Following the direction of my informant's glance, I caught sight of Lord Chelsfield, whose goggle eyes were fixed upon his betrothed, while he struggled to screw up an intractable set of features into the semblance of a scowl.

"Oh, that's it, is it?" said I. And then, having seen enough, I went home to bed.

I was a little disappointed, I confess. In my young days, people who were crossed in love, or forced to marry against their wishes, took their affliction in a different, and I venture to think a more healthy spirit, from that which obtains in modern society; and I must say that I would rather have seen Sybil pale and despairing than reckless. "*Autres temps, autres mœurs*," thought I to myself, as I blew out my candle. "Perhaps, after all, it comes to much the same thing in the long run."

Mrs. Clifford has long held a theory, built upon I know not what foundation, that it is good for her health to breakfast in her own room. I myself, when I am abroad, adopt the foreign hours, and take a solitary *déjeuner à la fourchette* at midday, or thereabouts. I had just made an end of this repast, on the morning after the ball at the French Embassy, when a huge square envelope was brought to me, which I found to enclose a politely-worded request from Cardinal Paolini that I would do him the great favor to call upon him at his residence in the course of the day. He would be ready to receive me, he said, at any hour that might suit me.

My acquaintance with the cardinal being of the most formal character, I felt some curiosity as to his motive for desiring an interview with me, though it was easy to divine that it must have some connection with the princess and her affairs. That her intended alliance with the English lord must have thrown the good man into a state of furious indignation I well knew; and it occurred to me that he might possibly have formed some scheme for using me as a means of persuading or intimidating her into renouncing the project. I was resolved that, should this surmise prove well founded, I would show a bold front to the enemy. I daresay it was a consciousness of having been conspicuously worsted in several recent encounters with members of the opposite sex that made me say to myself with so much determination, as I prepared to obey the cardinal's summons, that I would stand no bullying from him or any other living man. I marched down the shady side of the Via Condotti, and so, across the Corso, to the cardinal's residence in the Via della Scrofa, and rang his door-bell as bold as a lion.

I was at once shown into a small, rather scantily furnished study, where I found the great man in conference with his secretary. He dismissed that functionary as I made my entrance, and rose to receive me, looking dignified and handsome, as he always did, and far more amiable than usual. He took my hand in his well-shaped white fingers, on one of which sparkled a huge archiepiscopal ring, and favored me with that gentle pressure which is the Italian equivalent for a handshake, and which somehow is always rather disagreeable to me.

"I thank you infinitely, sir," he said, in

his own language, "for your kindness in granting me an interview. I should not have ventured to put you to so much trouble had I not known how sincere an interest you take in all that concerns my cousin, the Princess Paolini."

I grunted, not choosing to make civil speeches till I should have heard what was wanted of me; and the cardinal, begging me to take a chair, resumed his own seat, and continued: —

"I have a piece of intelligence to communicate to you, with which you will, I think, be surprised, and I hope pleased. You can hardly have failed to notice that your friend Signor Seaton (a most agreeable and talented young man, with whom I regret that I am but slightly acquainted) has for some time past been attached — very deeply attached — to my cousin."

I smiled, and shrugged my shoulders. It might be so, I said, or it might not. Who could answer for the foolish notions that will get into young men's heads? For you see I was not going to commit myself.

The cardinal leant back in his chair, rested his elbows on the arms, and, folding his hands, peered at me over them with a sidelong, benevolent gaze. "It has been so," he said; "and I may add that the attachment has been mutual."

He paused again; but I was getting bewildered, and judged it best to hold my peace.

"Yes," he repeated, "the attachment has been mutual; and I am happy to announce to you that Signor Seaton and the princess were married at eight o'clock this morning."

I started to my feet with a cry of amazement, called forth not more by the news itself than by the fact that Cardinal Paolini should be the person to communicate it to me. For a moment I really thought that this grave ecclesiastic was making me the subject of a hoax.

"Surely you cannot mean" — I stammered. "Is it possible that this can be *true?*"

"I have the best reason for knowing it to be so," replied the cardinal, smiling, "since I had myself the honor of performing the ceremony."

After that I felt that nothing could ever astonish me again. I was quite prepared now to hear that Lady Augusta had been present at the wedding, and that Lord Chelsfield had given away the bride. I suppose I must have involuntarily uttered the name of that ill-used nobleman; for the cardinal remarked drily, as if in answer to some observation from me, —

"Ah, Lord Chelsfield — I fear this will be a disappointment to him, and also to Lady Augusta Ferrars. In truth, one of my reasons for seeking an interview with you, sir, was to request you to kindly convey the news to that lady — she having thought fit to use expressions to me, shortly after her arrival in Rome, which have rendered all further intercourse between us impossible. The young couple left by train this morning, and, for reasons the force of which you will easily appreciate, desire their destination to remain a secret for the present."

"But you yourself, *Eminenza*," I could no thelp saying, "surely this marriage cannot be agreeable to you. I should have thought that the loss of the Paolini estates ——"

"It certainly would not have been agreeable to me that the Paolini estates should pass out of the family," he replied calmly. "Happily no such misfortune has occurred. The princess has made a formal and legal transfer of all the landed property and a large portion of the personal estate of her late husband to her cousin, the present prince. I pressed upon her the propriety of some such course in the early days of her widowhood, but she did not at that time see fit to listen to my counsels. The present transfer was made at her own instance, and is therefore the more creditable to her."

I saw it all now. The priest had outwitted the lady after all. The Church was triumphant, and Lady Augusta was nowhere. I picked up my hat and umbrella and prepared to depart.

"I congratulate your Eminence," I said, "upon the excellent bargain that you have made. I regret that I am unable to carry the good news to Lady Augusta Ferrars, as you so obligingly desire me to do; but circumstances compel me to quit Rome immediately. I have the honor to wish you a very good morning."

I hurried back to the hotel, packed up my clothes, left a note for Mrs. Clifford, drove to the station, and never paused again till I was safely on the other side of the Alps. There I ensconced myself in an hotel at Geneva, drew a long breath, and awaited events.

Denunciations of an epistolary kind I did receive in due course; but at these I could afford to smile. The London season was drawing to a close before I again joined Mrs. Clifford; and by that time the Paolini-Seaton scandal was already an old story.

Dick Seaton is now a famous sculptor,

and makes a handsome income, I am told, by his art. Miss O'Grady often visits him and his wife, and I see her from time to time; but she has a poor opinion of me. A little energy on my part, she says, might have saved the Paolini property, and defeated the cardinal and Lady Augusta at one blow. She has never been able to pardon me for the failure of this pretty design; but I don't know that anybody would have been much the happier had it succeeded.

Mrs. Seaton — she dropped her title when she married again — is one of the most agreeable and popular women in London. Everybody unites in singing her praises; but, for my own part, handsome as she is, and charming as she is, I shall never be able to feel quite the same interest in her, in these days of her prosperity, that I did in the beautiful, unfortunate Princess Paolini.

From The Nineteenth Century.

LIFE AND TIMES OF THOMAS BECKET.

PART IV.

THE archbishop's letters show conclusively that the Constitutions were not the real causes of the dispute with the king. The king was willing to leave the Constitutions to be modified by the pope. The archbishop's contest, lying concealed in his favorite phrases, "saving my order," "saving the honor of God," was for the supremacy of the Church over the crown; for the degradation of the civil power into the position of delegate of the pope and bishops. All authority was derived from God. The clergy were the direct ministers of God. Therefore all authority was derived from God through them. However well the assumption might appear in theory, it would not work in practice, and John of Salisbury was right in concluding that the pope would never sanction an assumption which, broadly stated and really acted on, would shake the fabric of the Church throughout Europe. Alexander was dreaming of peace when the news reached him of the excommunications at Vezelay. The news that Chief Justice de Luci had hanged five hundred felonious clerks in England would have caused him less annoyance. Henry's envoys brought with them the bishops' appeal, and renewed the demand for cardinal legates to be sent to end the quarrel. This time the pope decided that the legates should go, carrying with them powers to take off Becket's censures. He prohibited Becket himself from pursuing his threats further till the cardinals' arrival. To Henry he sent a private letter — which, however, he permitted him to show if circumstances made it necessary — declaring beforehand that any sentences which the archbishop might issue against himself or his subjects should be void.*

The humiliation was terrible; Becket's victims were free, and even rewarded. John of Oxford came back from Rome with the deanery of Salisbury. Worst of all, the cardinals were coming, and those the most dreaded of the whole body, Cardinal Otho and Cardinal William of Pavia. One of them, said John of Salisbury, was light and uncertain, the other crafty and false, and both made up of avarice. These were the ministers of the Holy See, for whose pretensions Becket was fighting. This was his estimate of them when they were to try his own cause. His letters at this moment were filled with despair. "Ridicule has fallen on me," he said, "and shame on the pope. I am to be obeyed no longer. I am betrayed and given to destruction. My deposition is a settled thing. Of this, at least, let the pope assure himself: never will I accept the Cardinal of Pavia for my judge. When they are rid of me, I hear he is to be my successor at Canterbury." †

Becket, however, was not the man to leave the field while life was in him. There was still hope, for war had broken out at last, and Henry and Lewis were killing and burning in each other's territories. If not the instigator, Becket was the occasion, and Lewis, for his own interests, would still be forced to stand by him. He was intensely superstitious. His cause, he was convinced, was God's cause. Hitherto God had allowed him to fail on account of his own deficiencies, and the deficiencies required to be amended. Like certain persons who cut themselves with knives and lancets, he determined now to mortify his flesh in earnest. When settled in his new life at Sens, he rose at daybreak, prayed in his oratory, said mass, and prayed and wept again. Five times each day and night his chaplain flogged him. His food was bread and water, his bed the floor. A hair shirt was not enough without hair drawers which reached his knees, and both were worn till they swarmed with vermin.‡ The car-

dinals approached, and the prospect grew hourly blacker. The pope rebuked Lewis for the war. The opportunity of the cardinals' presence was to be used for restoration of peace. Poor as Becket was, he could not approach these holy beings on their accessible side. "The Cardinal of Pavia," said John of Salisbury, "thinks only of the king's money, and has no fear of God in him. Cardinal Otho is better: *Romanus tamen et cardinalis* (but he is a Roman and a cardinal). If we submit our cause to them, we lose it to a certainty. If we refuse we offend the king of France." The Cardinal of Pavia wrote to announce to Becket his arrival in France and the purpose of his mission. Becket replied with a violent letter, of which he sent a copy to John of Salisbury, but despatched it before his friend could stop him. John of Salisbury thought that the archbishop had lost his senses. "Compare the cardinal's letter and your answer to it," he said. "What had the cardinal done that you should tell him he was giving you poison? You have no right to insult a cardinal and the pope's legate on his first communication with you. Were he to send your letter to Rome, you might be charged with contumacy. He tells you he is come to close the dispute to the honor of God and the Church. What poison is there in this? He is not to blame because he cautions you not to provoke the king further. Your best friends have often given you the same advice."

With great difficulty Becket was brought to consent to see the cardinals. They came to him at Sens, but stayed for a short time only, and went on to the king in Normandy. The archbishop gathered no comfort from his speech with them. He took to his bell and candles again, and cursed the Bishop of London. He still intended to curse the king and declare an interdict. He wrote to a friend, Cardinal Hyacinth at Rome, to say that he would never submit to the arbitration of the cardinal legates, and bidding him urge the pope to confirm the sentences which he was about to pronounce.* He implored the pope himself to recall the cardinals and unsheath the sword of Peter. To his entire confusion, he learned that the king held a letter from the pope declaring that his curses would be so much wasted breath.

The pope tried to soothe him. Soft words cost Alexander nothing, and, while protecting Henry from spiritual thunders, he assured the archbishop himself that his power should not be taken from him. Nor, indeed, had the violence of Becket's agitation any real occasion. Alexander wished to frighten him into submission, but had no intention of compromising himself by an authoritative decision. Many months passed away, and Becket still refused to plead before the cardinals. At length they let out that their powers extended no further than advice, and Becket, thus satisfied, consented to an official conference. The meeting was held near Gisors, on the frontiers of France and Normandy, on the 18th of November, 1167. The archbishop came attended by his exiled English friends. With the cardinals were a large body of Norman bishops and abbots. The cardinals, earnest for peace if they could bring their refractory patient to consent to it, laid before him the general unfitness of the quarrel. They accused him of ingratitude, of want of loyalty to his sovereign, and, among other things, of having instigated the war.*

The last charge the archbishop sharply denied, and Lewis afterwards acquitted him also. For the rest he said that the king had begun by attacking the Church. He was willing to consent to any reasonable terms of arrangement, with security for God's honor, proper respect for himself, and the restoration of his estates. They asked if he would recognize the Constitutions; he said that no such engagement had been required of his predecessors, and ought not to be required of him. "The book of abominations," as he called the Constitutions, was produced and read, and he challenged the cardinals to affirm that Christian men should obey such laws.

Henry was prepared to accept the smallest concession; nothing need be said about the Constitutions if Becket would go back to Canterbury, resume his duties, and give a general promise to be quiet. The archbishop answered that there was a proverb in England that silence gave consent. The question had been raised, and could not now be passed over. The cardinals asked if he would accept their judgment

One day, we are told, he was dining with the queen of France. She observed that his sleeves were fastened unusually tightly at the wrist, and that something moved inside them. He tried to evade her curiosity, for the moving things were maggots. But she pressed her questions till he was obliged to loosen the strings. Pearls of choicest size and color rolled upon the table. The queen wished to keep one, but it could not be. The pearls were restored to the sleeve, and became maggots as before. — Materials, vol. ii., p. 296.

on the whole cause. He said that he would go into court before them or any one whom the pope might appoint, as soon as his property was restored to him. In his present poverty he could not encounter the expense of a lawsuit.

Curious satire on Becket's whole contention, none the less so that he was himself unconscious of the absurdity! He withdrew from the conference, believing that he had gained a victory, and he again began to meditate drawing his spiritual sword. Messengers on all sides again flew off to Rome, from the king and English bishops, from the cardinals, from Becket himself. The king and bishops placed themselves under the pope's protection should the archbishop begin his curses. The Constitutions were once more placed at the pope's discretion to modify at his pleasure. The cardinals wrote charging Becket with being the sole cause of the continuance of the quarrel, and in spite of his denials persisting in accusing him of having caused the war. Becket prayed again for the cardinals' recall, and for the pope's sanction of more vigorous action.

He had not yet done with the cardinals; they knew him, and they knew his restless humor. Pending fresh resolutions from Rome, they suspended him, and left him incapable either of excommunicating or exercising any other function of spiritual authority whatsoever. Once more he was plunged into despair.

Through those legates he cried in his anguish to the pope: "We are made a derision to those about us. My lord, have pity on me. You are my refuge. I can scarcely breathe for anguish. My harp is turned to mourning, and my joy to sadness. The last error is worse than the first."

The pope seemed deaf to his lamentations. The suspension was not removed. Plans were formed for his translation from Canterbury to some other preferment. He said he would rather be killed. The pope wrote so graciously to Henry that the king said he for the first time felt that he was sovereign in his own realm. John of Salisbury's mournful conviction was that the game was at last played out. "We know those Romans," he sighed; "*qui munere potentior est, potentior est jure.* The antipope could not have done more for the king than they have done. It will be written in the annals of the Holy See that the herald of truth, the champion of liberty, the preacher of the law of the Lord, has been deprived and treated as a criminal at the threats of an English prince."

It is hard to say what influence again turned the scale. Perhaps Alexander was encouraged by the failures of Barbarossa in Italy. Perhaps Henry had been too triumphant, and had irritated the pope and cardinals by producing their letters, and speaking too frankly of the influences by which the holy men had been bound to his side.* In accepting Henry's money they had not bargained for exposure. They were ashamed and sore, and Becket grew again into favor. The pope at the end of 1168 gave him back his powers, permitting him to excommunicate even Henry himself unless he repented before the ensuing Easter. The legates were recalled as Becket desired. Cardinal Otho recommended the king to make his peace on the best terms which he could get. John of Salisbury, less confident, but with amused contempt of the chameleonlike Alexander, advised Henry, through the Bishop of Poitiers, to treat with the archbishop immediately, *nec mediante Romano episcopo, nec rege Franciæ nec operâ cardinalium*, without help either of pope, of French king, or cardinals. Since Becket could not be frightened, Alexander was perhaps trying what could be done with Henry; but he was eager as any one for an end of some kind to a business which was now adding disgrace and scandal to its other mischiefs. Peace was arranged at last between Lewis and Henry. The English king gave up a point for which he had long contended, and consented to do homage for Normandy and Anjou. The day after Epiphany, January 7, 1169, the two princes met at Montmirail, between Chartres and Le Mans, attended by their peers and prelates.

In the general pacification the central disturber was, if possible, to be included. The pope had sent commissioners, as we should call them — Simon, prior of Montdieu, Engelbert, prior of Val St. Pierre, and Bernard de Corilo — to advise and, if possible, guide Becket into wiser courses. The political ceremonies were accomplished, Lewis and Henry were reconciled amidst general satisfaction and enthusiasm. Becket was then introduced, led in by the Archbishop of Sens, the son of the aged Theobald, Count of Blois. Henry and he had not met since the Northampton council. He threw himself in apparent humility at the king's feet. "My

lord," he said, "I ask you to forgive me. I place myself in God's hands and in yours."* At a preliminary meeting the pope's envoys and the French clergy had urged him to submit without conditions. He had insisted on his usual reservation, but they had objected to saving clauses. He seemed now inclined really to yield, so Herbert de Bosham says, and Herbert whispered to him to stand firm.

"My lord king," said Henry, after Becket had made his general submission, "and you my lords and prelates, what I require of the archbishop is no more than that he will observe the laws which have been observed by his predecessors. I ask him now to give me that promise." Becket no longer answered with a reservation of his order: he changed the phrase. He promised obedience, saving the honor of God.

"You wish," replied Henry, powerfully disappointed and displeased, "to be king in my place. This man," he continued, turning to Lewis, "deserted his Church of his own will, and he tells you and all men that his cause is the cause of the Church. He has governed his Church with as much freedom as those who have gone before him, but now he stands on God's honor to oppose me wherever he pleases, as if I cared for God's honor less than he. I make this proposal. Many kings have ruled in England before me, some less, some greater than I am; many holy men have been Archbishops of Canterbury before him. Let him behave to me as the most sainted of his predecessors behaved to the least worthy of mine, and I am content."

The king's demand seemed just and moderate to all present.† The archbishop hesitated. Lewis asked him if he aspired to be greater than acknowledged saints. His predecessors, he said, had extirpated some abuses, but not all. There was work which remained to be done. He was stopped by a general outcry that the king had yielded enough; the saving clause must be dropped. At once, at the tone of command, Becket's spirit rose. Priests and bishops, he answered defiantly, were not to submit to men of this world save with reservations: he for one would not do it.

The meeting broke up in confusion. A French noble said that the archbishop was abusing their hospitality, and did not deserve any longer protection. Henry mounted his horse and rode sadly away. The pope's agents followed him, wringing their hands and begging for some slight additional concession. The king told them that they must address themselves to the archbishop. Let the archbishop bind himself to obey the laws. If the laws were amiss, they should be modified by the pope's wishes. In no country in the world, he said, had the clergy so much liberty as in England, and in no country were their greater villains among them. For the sake of peace he did not insist on terms precisely defined. The archbishop was required to do nothing beyond what had been done by Anselm.

Becket, however, was again immovable as stone. Lewis, after a brief coldness, took him back into favor. His power of cursing had been restored to him. The doubt was only whether the pope had recalled the safeguards which he had given to the king. The pope's agents, on the failure of the conference, gave Henry a second letter, in which Alexander told him that, unless peace was made, he could not restrain the archbishop longer. Again representatives of the various parties hurried off to Rome, Becket insisting that if the pope would only be firm the king would yield, Henry embarrassing the pope more completely than threats of schism could have done by placing the Constitutions unreservedly in his hands, and binding himself to adopt any change which the pope might suggest. Becket, feverish and impatient, would not wait for the pope's decision, and preferred to force his hand by action. He summoned the bishops of London and Salisbury to appear before him. They appealed to Rome, but their appeal was disregarded. Appeals, as Becket characteristically said, were not allowed in order to shield the guilty, but to protect the innocent. On Palm Sunday, at Clairvaux, he took once more to his bell and candles. He excommunicated the two bishops and every one who had been concerned with his property—the Earl of Norfolk, Sir Ranulf de Broc, whom he peculiarly hated, Robert de Broc, and various other persons. The chief justice he threatened. The king he still left unmentioned, for fear of provoking the pope too far.

Harassed on both sides, knowing perfectly well on which side good sense and justice lay, yet not daring to declare Becket wrong, and accept what, after all that had passed, would be construed into a defeat of the Church, the unfortunate

Alexander drifted on as he best could, writing letters in one sense one day and contradicting them the next. On the surface he seemed hopelessly false. The falsehood was no more than weakness, a specious anxiety to please the king without offending the archbishop, and trusting to time and weariness to bring about an end. There is no occasion to follow the details of his duplicities. Two legates were again sent — not cardinals this time, but ecclesiastical lawyers, Gratian and Vivian — bound by oath this time to cause no scandal by accepting bribes. As usual, the choice was impartial; Gratian was for Becket, Vivian for the king. So long as his excommunications were allowed to stand, Becket cared little who might come. He added the chief justice to the list of the accursed, as he had threatened to do. He wrote to the Bishop of Ostia that the king's disposition could only be amended by punishment. The serpent head of the iniquity must now be bruised, and he bade the bishop impress the necessity of it upon the pope. Gratian was taken into Becket's confidence. Vivian he treated coldly and contemptuously. According to Herbert and Becket's friends, Gratian reported that the king was shifty and false, and that his object was to betray the Church and the archbishop. Henry himself declared that he assented to all that they proposed to him, and Diceto says that the legates were on the point of giving judgment in Henry's favor when the Archbishop of Sens interposed and forbade them. In the confusion of statement the actions of either party alone can be usefully attended to, and behind the acts of all, or at least of the pope, there was the usual ambiguity. Alexander threatened the king. He again empowered Becket to use whatever power he possessed to bring him to submission, and he promised to confirm his sentences.* As certainly he had secret conferences at Rome with Henry's envoys, and promised, on the other hand, that the archbishop should not be allowed to hurt him. Becket, furious and uncontrollable, called the Bishop of London a parricide, an infidel, a Goliath, a son of Belial; he charged the Bishop of Hereford to see that the sentence against Foliot and his brother of Salisbury should be observed in England. Henry, on the other hand, assured Foliot of protection, and sent him to Rome with letters from himself to pursue his appeal and receive absolution from the pope himself. The Count of Flanders interposed, the Count of Mayence interposed, but without effect. At length on the 18th of November, the anniversary of the conference with the cardinals at Gisors, Henry and Lewis met again at Montmartre outside Paris, Becket and his friends being in attendance in an adjoining chapel. Gratian had returned to Rome. Vivian was present, and pressed Lewis to bring the archbishop to reason. Lewis really exerted himself, and not entirely unsuccessfully. Henry was even more moderate than before. The Constitutions, by the confession of Becket's biographer, Herbert, who was with him on the spot, were practically abandoned. Henry's only condition was that the archbishop should not usurp the functions of the civil power; he, on his part, undertaking not to strain the prerogative. Becket dropped his saving clause, and consented to make the promise required of him, if the king would restore his estates, and give him compensation for the arrear rents, which he estimated at 20,000*l.* Lewis said that money ought not to be an obstacle to peace. It was unworthy of the archbishop to raise so poor a difficulty. But here, too, Henry gave way. An impartial estimate should be made, and Becket was to be repaid.

But now, no more than before, had the archbishop any real intention of submitting. His only fear was of offending Lewis. The Archbishop of Sens had gone to Rome to persuade the pope to give him legatine powers over Henry's French dominions. The censures of the Church might be resisted in England. If Normandy, Anjou, and Aquitaine were laid under interdict, these two spiritual conspirators had concluded that the king would be forced to surrender. Becket was daily expecting a favorable answer, and meanwhile was protracting the time. He demanded guarantees. He did not suspect the king, he said, but he suspected his courtiers. John of Salisbury had cautioned him, and the pope had cautioned him, against so indecent a requisition. Lewis said it was unreasonable. Becket said then that he must have the kiss of peace as a sign that the king was really reconciled to him. He probably knew that the kiss would and must be withheld from him until he had given proofs that he meant in earnest to carry out his engagements. The king said coldly that he did not mean, and had never meant, to injure the Church. He was willing to leave the whole question between himself and the archbishop either to the peers and prelates of France or to the French universities.

More he could not do. The conference at Montmartre ended, as Becket meant that it should end, in nothing.

He sent off despatches to the Archbishop of Sens and to his Roman agents, entirely well satisfied with himself, and bidding them tell the pope that Normandy had only to be laid under interdict, and that the field was won. Once more he had painfully to discover that he had been building on a quicksand. Instead of the interdict, the pope sent orders to the Archbishop of Rouen and the Bishop of Nevers to absolve a second time the victims whom he had excommunicated at Clairvaux. Instead of encouragement to go on and smite the king with the spiritual sword, he received a distinct command to abstain for another interval. Last of all, and worst of all, the pope informed him that at the king's request, for certain important purposes, he had granted a commission, as legate over all England, to his rival and enemy the Archbishop of York. The king's envoys had promised that the commission should not be handed to the Archbishop of York till the pope had been again consulted. But the deed was done. The letter had been signed and delivered.* The hair shirt and the five daily floggings had been in vain then! Heaven was still inexorable. The archbishop raved like a madman. "Satan was set free for the destruction of the Church." "At Rome it was always the same. Barabbas was let go, and Christ was crucified." "Come what might, he would never submit, but he would trouble the Roman Church no more." †

Becket had now been for more than five years in exile. He had fought for victory with a tenacity which would have done him credit had his cause been less preposterous. At length it seemed that hope was finally gone. At the supreme moment another opportunity was thrust into his hands. Henry's health was uncertain; he had once been dangerously ill. The succession to the English crown had not yet settled into fixed routine. Of the Conqueror's sons William had been preferred to Robert. Stephen supplanted Matilda; but the son of Stephen was set aside for Matilda's son. To prevent disputes it had been long decided that Prince Henry must be crowned and receive the homage of the barons while his father was still living.

The pope in person had been invited to perform the ceremony. The pope had found it impossible to go, and among the other inconveniences resulting from Becket's absence the indefinite postponement of this coronation had not been the lightest. The king had been reluctant to invade the acknowledged privilege of the Archbishop of Canterbury, and had put it off from year to year. But the country was growing impatient. The archbishop's exile might now be indefinitely protracted. The delay was growing dangerous, and the object of the commission for which the king had asked, and which the pope had granted to the Archbishop of York, was to enable the Archbishop of York to act in the coronation ceremony. The commission in its terms was all that Henry could desire; the pope not only permitted the Archbishop of York to officiate, but enjoined him to do it. Promises were said to have been given that it was not to be used without the pope's consent; but in such a labyrinth of lies little reliance can be placed on statements unconfirmed by writing. The pope did not pretend that he had exacted from the English envoys any written engagement. He had himself signed a paper giving the Archbishop of York the necessary powers, and this paper was in the king's hands.* The coronation was the symbol of the struggle in which Becket was now engaged. The sovereign, according to his theory, was the delegate of the Church. In receiving the crown from the hands of the Archbishop of Canterbury, the sovereign formally admitted his dependent position; and so long as it could be maintained that the coronation would not hold unless it was performed either by the Archbishop of Canterbury or by the pope himself, the sovereign's subject state was a practical reality.

Becket saw the favorable moment, and instantly snatched at it. He had many powerful friends in England among the peers and knights. The lay peers, he says in his letters, had always been truer to him than the clergy, they on their part having their own differences with the crown. He had ascertained that the coronation could not be postponed; and if he could make the validity of it to depend on his own presence, he might redeem his past mortifications, and bring Henry to his feet after all. He knew Alexander's nature, and set his agents to work

upon him. He told them to say that if the coronation was accomplished without his own presence the power of the Roman see in England was gone; and thus, when all seemed lost, he gained the feeble and uncertain pope to his side once more. In keeping with his conduct throughout the whole Becket difficulty, Alexander did not revoke his previous letter. He left it standing as something to appeal to, as an evidence of his good-will to Henry. But he issued another injunction to the Archbishop of York, strictly forbidding him to officiate; and he enclosed the injunction to Becket to be used by him in whatever manner he might think fit. The Archbishop of York never received this letter. It was given, we are told, to the Bishop of Worcester, who was in Normandy, and was on the point of returning to England. The Bishop of Worcester was detained, and it did not reach its destination. So runs the story; but the parts will not fit one another, and there is a mystery left unexplained.* This only is certain, that the inhibition was not served on the Archbishop of York. Rumor may have reached England that such a thing had been issued; but the commission which had been formerly granted remained legally unrevoked, and on the 18th of June Prince Henry was crowned at Westminster in his father's presence by the Archbishop of York and the Bishops of London, Durham, Rochester, and Salisbury.

It was easy now for Becket to represent to Alexander that the English bishops had rewarded his kindness to them by defying his positive injunctions. To the superstitious English barons the existence of the inhibition threw a doubt on the legality of the coronation, and as men's minds then were, and with the wild lawless disposition of such lion cubs as the Plantagenet princes, a tainted title would too surely mean civil war. By ill-fortune offence was given at the same time to Lewis, who considered that his daughter should have been crowned with her husband, and he resented what he chose to regard as a wilful slight. The pope was told that the coronation oath had been altered, that the liberties of the Church had been omitted, and that the young king had been sworn to maintain the Constitutions of Clarendon. Becket made the most of his opportunity; mistakes, exaggerations, wilful lies, and culpable credulity, did their work effectively; Lewis went to war again, and invaded Normandy; the pope, believing that he had been tricked and insulted, commanded Henry to make peace with the archbishop under threat of instant personal excommunication of himself and an interdict over his whole dominions. Henry flew back from England to Normandy. In a month he dispelled the illusions of Lewis, and restored peace. It was less easy to calm Alexander, who regarded himself, if not openly defied, yet as betrayed by the breach of the promise that the commission to the Archbishop of York should not be used without a fresh permission from himself. Henry knew that a sentence of excommunication against himself, and an interdict over his French dominions, was seriously possible. The risk was too great to be incurred without another effort to compose the weary quarrel. The archbishop, too, on his side had been taught by often repeated experience that the pope was a broken reed. Many times the battle seemed to have been won, and the pope's weakness or ill-will had snatched the victory from him. He had left England because he thought the Continent a more promising field of battle for him. He began to think that final success, if he was ever to obtain it, would only be possible to him in his own see, among his own people, surrounded by his powerful friends. He too, on his side, was ready for a form of agreement which would allow him to return and repossess himself of the large revenues of which he had felt the want so terribly. More than once he and Henry met and separated without a conclusion. At length at Frêteval in Vendôme, on St. Mary Magdalen's day, July 22, an interview took place in the presence of Lewis and a vast assemblage of prelates and knights and nobles; where, on the terms which had been arranged at Montmartre, the king and the archbishop consented to be reconciled. The kiss which before had been the difficulty was not offered by Henry and was not demanded by Becket; but according to the account given by Herbert, who describes what he himself witnessed, and relates what Becket told him, after the main points were settled, the king and the archbishop rode apart out of hearing of every one but themselves. There the archbishop asked the king

* It would appear from a letter of John of Salisbury that the prohibitory letter had been purposely withheld by Becket, who was allowing himself to be guided by some idle *vaticinia* or prophecies. John of Salisbury writes to him (Letters, vol. ii., p. 236): "Memineritis quantum periculum et infortunium ad se traxerit mora porrigendi . . . prohibitorias Eboracensi archiepiscopo et episcopis transmarinis. . . . Subtilitatem vestram vaticinia quæ non erant a Spiritu deluserunt. . . . Vaticiniis ergo renunciemus in posterum, quia nos in hâc parte gravius infortunia perculerunt."

whether he might censure the bishops who had officiated at the coronation. The king, so the archbishop informed his friends, gave his full and free consent. The archbishop sprang from his horse in gratitude to the king's feet. The king alighted as hastily, and held the archbishop's stirrup as he remounted. These gestures the spectators saw and wondered at, unable, as Herbert says, to conjecture what was passing till it was afterwards explained to them.

That the king should have consented as absolutely and unconditionally as Becket said that he did, or even that he should have consented at all in Becket's sense of the word, to the excommunication of persons who had acted by his own orders and under a supposed authority from the pope, is so unlikely in itself, so inconsistent with Henry's conduct afterwards, that we may feel assured that Henry's account of what took place would, if we knew it, have been singularly different. But we are met with a further difficulty. Herbert says positively that the conversation between Becket and the king was private between themselves, that no one heard it or knew the subject of it except from Becket's report. Count Theobald of Blois asserted, in a letter to the pope, that in his presence (*me præsente*) the archbishop complained of the conduct of the English prelates, and that the king empowered him to pass sentence on them. Yet more remarkably, the archbishop afterwards at Canterbury insisted to Reginald Fitzurse that the king's promises to him had been given in the audience of five hundred peers, knights, and prelates, and that Sir Reginald himself was among the audience. Fitzurse denied that he heard the king give any sanction to the punishment of the bishops. He treated Becket's declaration as absurd and incredible on the face of it. The Count of Blois may have confounded what he himself heard with what Becket told him afterwards, or he may have referred to some other occasion. The charge against the king rests substantially on Becket's own uncorrected word; while, on the other side, are the internal unlikelihood of the permission in itself and the inconsistency of Becket's subsequent action with a belief that he had the king's sanction for what he intended to do. Had he supposed that the king would approve, he would have acted openly and at once. Instead of consulting the king, he had no sooner left the Frêteval conference than he privately obtained from the pope letters of suspension against the Archbishop of York and the Bishop of Durham, and letters of excommunication against the bishops of London, Salisbury, and Rochester; and while he permitted Henry to believe that he was going home to govern his diocese in peace,* he had instruments in his portfolio which were to explode in lightning the moment that he set foot in England, and convulse the country once more.

GREEN PASTURES AND PICCADILLY.

BY WILLIAM BLACK,

AUTHOR OF "THE PRINCESS OF THULE," "THE ADVENTURES OF A PHAETON," ETC.,

In conjunction with an American writer.

[Entered according to Act of Congress, in the Year 1877, by HARPER & BROTHERS, in the Office of the Librarian of Congress, at Washington.]

CHAPTER XXXIX.

THE COLLAPSE.

LORD WILLOWBY had heard of the arrival of his son-in-law at the Lilacs; and on the following morning he drove over to see if he were still there. He found Balfour alone, Mr. Bolitho having gone up to town by an early train.

"What a lucky chance!" said Lord Willowby, with one of his sudden and galvanic smiles. "If you have nothing better to do, why not go on with me to the Hollow? You know this is the first day of the sale there."

"Well, yes, I will go over with you for an hour or so; I need not be up in town before the afternoon," answered Balfour. "And I should like to see how that fellow lived."

He certainly did not propose to himself to buy any second-hand chairs, books, or candlesticks at this sale; nor did he imagine that his father-in-law had much superfluous cash to dispose of in that way. But he had some curiosity to see what sort of house this was that had had lately for its occupant a person who had given rise to a good deal of gossip in that neighborhood. He was a man who had suddenly inherited a large fortune, and who had set to work to spend it lavishly. His

reputation and habits being a trifle "off color," as the phrase is, he had fallen back for companionship on a number of parasitical persons, who doubtless earned a liberal commission on the foolish purchases they induced him to make. Then this Surrey Sardanapalus, having surrounded himself with all the sham gorgeousness he could think of, proceeded to put an end to himself by means of brandy-and-soda. He effected his purpose in a short time, and that is all that need here be said of him.

It was a pitiable sight enough — this great, castellated, beplastered, ostentatious house, that had a certain gloom and isolation about it, handed over to the occupancy of a cheerfully inquisitive crowd, who showed no hesitation at all in fingering over the dead man's trinkets, and opening his desks and cabinets. His very clothes were hanging up there in a ghastly row, each article numbered off as a lot. In the room in which he had but recently died, a fine, tall, fresh-colored farmer — dressed for the occasion in broadcloth — was discussing with his wife what price the bedstead would probably fetch. And there was a bar, with sherry and sandwiches. And on the lawn outside the auctioneer had put up his tent, and the flag erected over the tent was of the gayest colors.

Lord Willowby and Balfour strolled through these rooms, both forbearing to say what they thought of all this tawdry magnificence: panellings of blue silk and silver, with a carpet of pink roses on a green ground, candelabra, costing £1800, the auctioneer's reserve price on which was £300, improvised ancestors at a guinea a head, looking out of gorgeous frames, and so forth, and so forth. They glanced at the catalogue occasionally. It was an imposing volume, and the descriptions of the contents of the house were almost poetical.

"Look at the wines," said Lord Willowby, with a compassionate smile. "The claret is nearly all Lafitte. I suppose those toadies of his have supplied him with a *vin ordinaire* at one hundred and twenty shillings a dozen."

"I should not be surprised if a lot of these spurious things sold for more than he gave for them," Balfour said. "You will find people imagining everything to be fine because a rich man bought it. That claret would fetch a high price, depend on it, if it was all labelled 'Château Wandsworth.'"

Then there was the ringing of a bell; and the people began to stream out of the house into the marquee; and the auctioneer had an improvised rostrum put up for himself at the end of the long table; and then the bare-armed men began to carry out the various articles to be bid for. It was soon very evident that prices were running high. No doubt the farmers about would be proud to show to their friends a despatch-box, a bird-cage, a hall table — anything that had belonged to the owner of the Hollow. And so the ostentatious trash, that even Tottenham Court Road would have been ashamed of, was carried piecemeal out into the light of the day; and in some instances these simple folk considered it to be so beautiful that a murmur of admiration ran round the tent when the things were brought in. It was altogether a melancholy sight.

Balfour had accompanied Lord Willowby solely from the fact of his having an idle forenoon to dispose of; but he could not quite make out what his father-in-law's purpose was in coming here. For one thing, he appeared to be quite indifferent about the sale itself. He had listened to one or two of the biddings; and then — saying that the prices were ridiculously high — had proposed a further stroll through the rooms. So they entered the house again, and had another look at the old masters (dating from the latter half of the nineteenth century) and at the trumpery gilt and satin.

"Ah, well, Balfour," said Lord Willowby, with a pensive air, "one can almost pity that poor fellow, having his house overhauled by strangers in this way. Fortunately he knows nothing about it. It must be much worse when you are alive and know what is going on; and I fancy — well, perhaps there is no use speaking of it — but I suppose I must go through it. What distresses me most is the thought of these merry people who are here to-day going through my daughter's room and pulling about her few little treasures that she did not take with her when she married ——"

Lord Willowby stopped; doubtless overcome by emotion. But Balfour — with a face that had flushed at this sudden mention of Lady Sylvia — turned to him with a stare of surprise.

"What do you mean, Lord Willowby?"

"Well," said his lordship, with a resigned air, "I suppose I must come to this, too. I don't see how I can hold on at the Hall any longer; I am wearing my life out with anxiety."

"You don't mean to say you mean to sell Willowby Hall?"

"How can I help it? And even then I don't know whether I shall clear the mortgages."

"Come," said Balfour, for there were several of the auctioneer's men about, "let us go out into the garden, and have a talk about this business."

They went out. It did not occur to Balfour why Lord Willowby had been so anxious for him to come to this sale; nor did he consider how skilfully that brief allusion to Lady Sylvia's room in her old home had been brought in. He was really alarmed by this proposal. He knew the grief it would occasion to his wife; he knew, too, that in the opinion of the world this public humiliation would in a measure reflect on himself. He remonstrated severely with Lord Willowby. What good could be gained by this step? If he could not afford to live at the Hall, why not let it for a term of years, and go up to London to live, or, if the shooting of rabbits was a necessity, to some smaller place in the country? And what sum would relieve his present needs, and also put him in a fair way of pulling his finances together again? He hoped Lord Willowby would speak frankly, as no good ever came of concealing parts of the truth.

That Lord Willowby did disclose the whole truth it would be rash to assert; but, at all events, his dramatic little scheme worked so well that before the talk and walk in the grounds of the Hollow were over, Balfour had promised to make him an immediate advance of £10,000, not secured by any mortgage whatever, but merely to be acknowledged by note of hand. Lord Willowby was profoundly grateful. He explained, with some dignity, that he was a man of few words, and did not care to express all his feelings, but that he would not soon forget this urgently needed help. And as to the urgency of the help he made one or two references.

"I think I might be able to see my partners this afternoon," Balfour said in reply. "Then we should only have to step across to our solicitors. There need be no delay, if you are really pressed for the money."

"My dear fellow," said Lord Willowby, "you don't know what a load you have taken from my breast. I would have sold the Hall long ago, but for Sylvia's sake; I know it would break her heart. I will write out at once to her to say how kind you have been——"

"I hope you will not do that," Balfour said, suddenly. "The fact is—well, these business matters are better kept among men. She would be disturbed and anxious. Pray don't say anything about it."

"As you please," Lord Willowby said. "But I know when she comes back she won't be sorry to find the old Hall awaiting her. It will be her own in the natural course of things—perhaps sooner than any one expects."

It was strange that a man who had just been presented with £10,000 should begin to indulge in these melancholy reflections; but then Lord Willowby had obviously been impressed by this sad sight of the sale; and it was with almost a dejected air that he consented—seeing that his son-in-law would now have no time to get luncheon anywhere before leaving by the midday train—to go to the refreshment-bar and partake of such humble cheer as was there provided. It was not the dead man's sherry they drank, but that of the refreshment-contractor. They stood for a few moments there, listening to the eager comments of one or two people who had been bidding for a box of games (it cost £10, and went for £23) and a cockatoo; and then Lord Willowby had the horses put to, and himself drove Balfour all the way to the station. He shook hands with him warmly. He begged of him not to hurry or bother about this matter; but still, at the same time, if there was no obstacle in the way, it was always comforting to have such things settled quickly, and so forth.

Balfour got up to London, and went straight to the offices of his firm in the city. Perhaps he was not sorry to make the visit just at this juncture; for although it would be exaggeration to say that the hints dropped by Bolitho had disquieted him, they had nevertheless remained in his mind. Before this, too, it had sometimes occurred to him that he ought to take a greater interest in that vast commercial system which it had been the pride of his father's life to build up. It seemed almost ungrateful that he should limit his interference to a mere glance at the profit and loss and capital accounts. But then, on the other hand, it was his own father who had taught him to place implicit confidence in these carefully chosen partners.

Balfour was shown up-stairs to Mr. Skinner's room. That gentleman was sitting alone at his desk, with some letters before him. He was a small, prim, elderly, and precisely-dressed person, with gray whiskers, and a somewhat careworn

face. When Balfour entered, he smiled cheerfully, and nodded toward a chair.

"Ah, how do you do, Balfour? What's new with you? Anything going on at the House? I wish Parliament would do something for us business men."

"You have plenty of representatives there, anyhow, Mr. Skinner," said Balfour — the "Mr." was a tradition from his boyish visits to the office, when the young gentleman used to regard his father's partners with considerable awe — "but at present my call is a personal and private one. The fact is, I want to oblige a particular friend of mine — I want you to let me have £10,000 at once."

"£10,000? Oh, yes, I think we can manage that," said Mr. Skinner, with a pleasant smile.

The thing was quite easily and cheerfully settled, and Balfour proceeded to chat about one or two other matters to this old friend of his, whom he had not seen for some time. But he soon perceived that Mr. Skinner was not hearing one word he said. Moreover, a curious gray look had come over his face.

"You don't look very well," said this blunt-spoken young man.

"Oh yes, thank you," said Mr. Skinner, quite brightly. "I was only thinking — since you were here, anyway — we might have a short talk about business matters, if Mr. Green agrees. I will see whether he is in his room."

He rose, opened the door, and went out. Balfour thought to himself that poor old Skinner was aging fast; he seemed quite frail on his legs.

Mr. Skinner was gone for fully ten minutes, and Balfour was beginning to wonder what could have occurred, when the two partners entered together. He shook hands with Mr. Green — a taller and stouter man, with a sallow face, and spectacles. They all sat down, and, despite himself, Balfour began to entertain suspicions that something was wrong. Why all this nervousness and solemnity?

"Balfour," said Mr. Skinner, "Green and I are agreed. We must tell you now how we stand; and you have to prepare yourself for a shock. We have kept you in ignorance all this time — we have kept our own clerks in ignorance — hoping against hope — fearful of any human being letting the secret go out and ruin us; and now — now it is useless any longer ——"

It was no ordinary thing that had so disturbed this prim old man. His lips were so dry that he could scarcely speak. He poured out a glass of water and drank a little. Meanwhile Balfour, who merely expected to hear of heavy business losses, was sitting calm and unimpressed.

"But first of all, Mr. Green, you know," said he, "don't think that I am pressing you for this £10,000. Of course I would rather have it; but if it is necessary to you ——"

"£10,000!" exclaimed the wretched old man, with the frankness and energy of despair; "if we go into the *Gazette*, it will be for half a million!"

The *Gazette!* The word was a blow; and he sat stunned and bewildered, while both partners were eagerly explaining the desperate means that had been taken to avoid this fatal issue, and the preliminary causes, stretching back for several years. He could not understand. It was as if in a dream that he heard of the investments account, of the China capital account, of the fall in property in Shanghai, of speculations in cotton, of bill transactions on the part of the younger partners, of this frantic effort and that. It was the one word *Gazette* that kept dinning itself into his ears. And then he seemed to make a wild effort to throw off this nightmare.

"But how can it be?" he cried. "How can these things have been going on? Every six months I have looked over the profit-and-loss account ——"

The old man came over and took his hand in both of his. There were tears in his eyes.

"Balfour," said he, "your father and I were old friends while you were only a child; if he were alive, he would tell you that we acted justly. We dared not let you know. We dared not let our own clerks know. We had to keep accounts open under fictitious names. If we had written off these fearful losses to profit and loss, we should have been smashed a year ago. And now — I don't think any further concealment is possible."

He let the hand fall.

"Then I understand you that we are hopelessly bankrupt?" said Balfour.

He did not answer; his silence was enough.

"You mean that I have not a farthing?" repeated the younger man.

"You have the money that was settled on your wife," said Mr. Skinner eagerly. "I was very glad when you applied for that."

"It will be returned to you; I can not defraud my father's creditors," said Balfour, coldly.

And then he rose: no one could have told what he had undergone during that half-hour.

"Good-by, Mr. Skinner; good-by, Mr. Green," said he. "I can scarcely forgive you for keeping me in ignorance of all this, though doubtless you did it for the best. And when is the crash to be announced?"

"Now that we have seen you, I think we might as well call in our solicitors at once," said Mr. Skinner.

"I think so too," said the other partner; and then Balfour left.

He plunged into the busy, eager world outside. The office boy was whistling merrily as he passed, the cabmen bandying jokes, smart young clerks hurrying over the latter part of their duties to get home to their amusements in the suburbs. He walked all the way down to the House, and quite mechanically took his seat. He dined by himself, with singular abstemiousness, but then no one was surprised at that. And then he walked up to his house in Piccadilly.

And this was the end — the end of all those fine ambitions that had floated before his mind as he left college, equipped for the struggle of public life with abundant health and strength and money and courage. Had his courage, then, fled with his wealth, that now he seemed altogether stunned by this sudden blow? Or was it rather that, in other circumstances, he might have encountered this calamity with tolerable firmness, but that now, and at the same time, he found himself ruined, forsaken, and alone?

From The Cornhill Magazine.

A STUDY OF LOWER LIFE.

As has well been observed, the phrase *omne ignotum pro magnifico* is not more appropriate or true than its reverse or opposite. And it constitutes one of the greatest advantages of natural-history study, that it directs our attention to new and curious features in the commonest living forms around us, and, by aiding both our mental and physical perceptions, largely extends the range of the most commonplace observation. The "sight" of the natural historian is, in fact, anything but "unassisted;" but, on the contrary, discerns beauty and grace where vision of the latter description could perceive nothing worthy of attention or study. If Pope's dictum, that "the proper study of mankind is man," be accepted as literally true, and as tending to limit human observation to the investigation of its own peculiarities, the zoologist may fitly remind the poet that the study of lower forms not only assists our appreciation of human affairs, but sometimes actually explains and elucidates points in man's history which otherwise would remain utterly obscure. Thus the spirit of a liberal science is most decided in its opposition to any exclusiveness in the objects submitted to its scrutiny; since, recognizing the independence of the various branches of knowledge, we learn that the advance of one study really means the improvement of all.

No better illustration of the manner in which a simple study in biology may be made to form a text for the illustration of some facts and points interesting to the world at large can well be selected, than that comprised in the life-history of the little animal known as the hydra, or "common fresh-water polype." The examination of this common denizen of our pools and ditches may convince the sceptical that the issues of scientific study are not only varied and interesting, but that they also sometimes lead us to contemplate phases of life and growth not very far removed from some of the most important problems which can well occupy the consideration of the human mind.

The hydra of the zoologist by no means recalls to mind, as regards its form at any rate, the famous being of mythological lore; although, as will hereafter be noted, in certain of its features, the modern hydra may fitly bear comparison with its mythical namesake. If we take some water from a quiet pool, which has become stagnant and overgrown with lower plant life and water-weeds flourishing apace under the kindly influences of the summer sun, and place this water along with a small quantity of the weeds in a clear glass vessel exposed to the light, we may be almost sure to find that in due time certain small bodies of greenish color have attached themselves to the sides of the vessel. These bodies will congregate chiefly on the side of the vessel next the light, and as regards their size, the beings referred to are seen to be by no means large. A length of about a quarter of an inch may be regarded as a fair statement of their average dimensions; although occasionally a specimen may greatly exceed the proportions of its neighbors, and exhibit a length of half an inch or more.

Examined by aid of a hand-lens, each of these little organisms or hydræ is seen to

possess a tubular or cylindrical body, which is attached by one extremity to the glass or duck-weed, and which exhibits at the opposite and free extremity a mouth-opening, surrounded by a circle of arms or tentacles. These latter are delicate, thread-like organs, which in the undisturbed and natural state of the animal remain outstretched in the water. In the common or green hydra, the tentacles are not disproportionately developed as regards the body, but in certain other forms or species, in which the body is colored brown (*Hydra fusca*), the tentacles are very long, and the animal obtains in consequence the distinctive name of the "long-armed hydra."

The observation of the common incidents of the hydra's life reveals certain interesting features, which assist us in some degree in the appreciation of the nature and structure of these organisms. When the tentacles are touched, they at once contract and shorten, and the body also shrinks or shrivels up into a somewhat rounded mass. This simple fact proves to us that the hydra is sensitive to outward impressions, a feature in its history which is of high interest when we endeavor to understand the nature and relations of the nervous system of higher animals; and that these animals are also sensitive to more delicate impressions is proved by their clustering in numbers on that side of the glass vessel which is next the light. If the hydra is left in an undisturbed condition after being irritated, the body and tentacles will become elongated and expanded, and will once more resume their normal condition.

That the polypes are not permanently rooted or attached to the weeds in which they are commonly found, may be proved by the simple observation of their habits. They may be seen to detach themselves from fixed objects, and to move slowly about in leech-like fashion, or like the looping caterpillars, by alternately fixing and extending the mouth and root-extremity of the body; whilst occasionally they may be seen to float listlessly, with extended tentacles, amid their native waters.

When any minute animal, such as a water-flea, or some similar organism, comes in contact with the tentacles of the hydra, an interesting series of acts is witnessed. The tentacles are then observed to act as organs for the capture of prey, the victim being seized and conveyed by their contraction towards the mouth of the animal, within which cavity it finally disappears from view. That the hydra therefore possesses instincts common to all forms of animal life, high and low alike, and which lead it to supply the wants of its frame, cannot be doubted; and Schiller's maxim that hunger is one of the powers that rule the universe, may thus be aptly illustrated within the small domain and in the simple life-history of the hydra.

As might be expected, the prey at first struggles violently to escape from the clutches of its captor, but after a short period the efforts become less and less marked, and the captive may be noted to become somewhat suddenly helpless and paralyzed. The observation of these details leads us to expect that the hydra possesses some offensive apparatus, through the action of which the capture of prey is facilitated. And an examination, by aid of the microscope, of the tentacles of the polype, and in fact of its body-substance as well, would reveal the presence of numerous minute capsules, named "thread-cells," which are developed in the tissues of the body. Each of these curious little cells consists of a tough outer membrane, within which a delicate thread or filament lies coiled up amidst fluid. When one of these structures is irritated, as by pressure, the cell is observed to rupture, the thread being thrown out or everted, whilst the fluid at the same time escapes. A thread-cell of the hydra, in its ruptured condition, appears as an oval capsule having attached to one extremity the thread, which is provided at its base with three little spines or hooks. The consideration of the structure and functions of these thread-cells clearly indicates their offensive nature. Each may in fact be regarded as representing a miniature poison-apparatus; the "thread" being the dart or sting, and the fluid constituting the venom. The prey of these polypes has little chance of escape from the attack of these cells; since wounded by the threads, which doubtless become attached to its body by the hooks, and poisoned by the fluid, even animals of tolerably large size, when compared with the hydra, may be seen to succumb to its attack. The polypes are thus seen to be singularly well provided as regards offensive apparatus, the particular form and action of which reminds one, in some degree, of the famous "lasso" of Western nations. And it is at the same time interesting to note that thread-cells of essentially similar nature to those found in the hydra, confer on the jelly-fishes and allied forms the stinging powers which render these beings the terror of tender-skinned bathers.

The internal structure of our polype is

of the simplest possible description. It may seem strange to talk of an animal body which lives and grows without any of the structures or machinery we are accustomed to associate with the higher animals. Yet the hydra exemplifies the former condition; since we might accurately enough describe its body as consisting of a simple tube, the interior of which contains no organs of any kind, and which communicates with the outer world through the mouth. If we further suppose that the walls of this tubular body are composed of two closely applied layers or membranes — the outer somewhat dense and tough, and the inner of more delicate nature — we shall have formed a broad but accurate idea of the constitution of these polypes. When the prey or food is swallowed, it therefore passes into the interior of the tubular body, which evidently serves as a stomach-sac. Here the morsel is digested or dissolved, and as the result of this process, a fluid perfectly adapted for the nourishment of the polype is formed. This fluid or blood is kept circulating throughout the interior of the simple body, by the constant movements or vibrations of numerous minute processes named *cilia*, which exist like a fringe on the lining membrane of the body cavity, and which therefore perform the functions of the heart of higher animals. Thus it may be said that every part of the hydra's body is brought directly into contact with this nutritive fluid, since we note that the fluid is transmitted from membrane to membrane and from cell to cell by the process of imbibition. And in this simple manner does the hydra repair the continual waste of its parts; this process of waste being the inevitable result of the acts and functions of every living being, and the invariable concomitant of life itself.

We have already noted that the hydra possesses the power of appreciating sensations, since it shrinks when touched, and exhibits other proofs of its sensitiveness. In the possession of this power the polype resembles some plants, and most if not all other animals, including man himself. Broadly stated, this power which the hydra possesses may be regarded as presenting us with the idea of a nervous system in its simplest phase. The functions of such a system may be summarized in the statement that it is adapted for bringing the animal into relation with its surroundings. We thus say that the nervous system exercises the function of "relation;" whilst from the fact that the animal performs this function through impressions being made upon it, we are also accustomed to speak of the nervous power as exercising the function of "irritability." This power, in fact, stands mediately between the animal and the world in which it lives. The higher we ascend in the animal scale the more perfectly do we find the nervous system adapted for placing the animal in possession of a knowledge of its environments; although, as will be presently remarked, the differences between the nervous powers of higher and lower animals are to be considered rather differences of degree than of kind.

But, as an examination of the hydra demonstrates to us, the view just taken of the nervous functions can hardly be considered of a complete kind. For we find that the polype when touched is enabled to act upon the knowledge or sensation which the touch conveys; since its tentacles contract, and its whole body shrinks as if in irritation and alarm. The reception of a sensation by the nervous system is therefore accompanied by a power of acting upon "information received;" and it cannot be doubted that a certain and definite correspondence must exist between the impression and the act it evokes. Indeed, amongst lower forms of animal life this correspondence is not only exceedingly well marked, but constitutes in itself the sum total of the nervous functions in such beings. But the highest animals, including man himself, may be said to acquire a knowledge of their surroundings in an exactly similar manner. When we talk of exercising our senses — or when, to use a comprehensive term, we speak of "feeling" — we are simply expressing the idea of obtaining a certain knowledge of our environments, and as a result, we are further enabled to act upon that knowledge in ways and fashions relative thereto.

Some such ideas as those just stated, have given rise to the conception — widely known and discussed in these days under the name of the "automatic doctrine" — that the acts of all animals, including those of man — "the paragon of animals," as Hamlet terms him — bear in reality a much closer relation to their surroundings than they are generally supposed to possess. The simple acts of a hydra's life, and the most intricate operations of the human mind; the nervous action which enables a polype to obtain a particle of food, and the nerve-changes evolving thoughts which emanate from minds like those of Goethe, Shakespeare, Newton,

and Milton — thoughts which will re-echo in the minds of men throughout all time — are thus held to present, when analyzed out to their fullest extent, a striking community of origin. The polype is said to be really an "automaton," in that it simply acts through its nervous powers, as these powers are first acted upon by outer impressions; and man, we are told, must also be held as sharing this automaton nature, since his acts are determined in like manner by outward circumstances, and simply by the succession or order in which these circumstances have been impressed upon his nervous centres. "The question is," as Dr. Carpenter has expressed it, "whether the Ego is completely under the necessary domination of his original or inherited tendencies, modified by subsequent education; or whether he possesses within himself any power of directing and controlling these tendencies." Or as the case is put by Professor Huxley: "Descartes' line of argument is perfectly clear. He starts from reflex action in man, from the unquestionable fact that in ourselves co-ordinate purposive actions may take place without the intervention of consciousness or volition, or even contrary to the latter. As actions of a certain degree of complexity," continues Huxley, "are brought about by mere mechanism, why may not actions of still greater complexity be the result of a more refined mechanism?"

As may readily be noted, this theory of the physical origin of man's mental powers necessarily carries with it a special and peculiar interpretation of man's moral nature and obligations. For it implies the belief that we cannot act in any other fashion than is determined by our character; and this latter, in its turn, results from or is developed by the action of outer and physical circumstances upon the organism. Consciousness, or that knowledge of *self* which most people hold lies at the root and foundation of our mental existence, except as a secondary matter, is thus put altogether out of court; and the powers of mind come in this view to represent so many effects of the long-continued action of experience and custom in inducing various mental states, as the result of certain combinations of outer impressions.

The fierce conflict to which the discussion of this automatic doctrine has given rise can be readily understood and explained. It is no light matter to assert that the mental powers and intellect of man are, after all, simply material in their nature and origin, and that they merely represent a high development and modification of the simple nervous impressions seen in lower states of existence. Yet there is a latent truth in this view of the matter, which, when recognized and brought into relation with facts and ideas external to such a theory, presents us with a rational explanation of the origin of man's mental nature. Whatever may have been the origin of man's intellect, there can firstly be no question of the impassable nature of the gulf which exists between the human type of mind and the instincts of all other forms of life. Even if man's total origin from a lower form or forms were a proved fact, the recognition of the fact could never lessen by an iota our estimation of the infinite superiority of man, regarded as a thinking intelligent being, over his nearest allies. Preconceived notions and ideas might and probably would revolt against such an idea of the origin of man's mind; but the spirit of a liberal science would content itself with the fact that no considerations regarding its origin and development can detract from the high or immeasurable superiority of the human over every other type and form of nervous functions.

Turning next to inquire into the existence of automatic or instinctive acts amongst animals, we may in the first place be surprised to note that in the hydra, sensitive although the polype is seen to be to outward impressions, no traces of a nervous system or of analogous organs can be discerned. The polypes are thus literally sensitive, without possessing any appreciable or visible apparatus for exercising that sense. The hydra is, however, by no means alone in this respect. The sea-anemones, which are animals nearly related to the hydra, are equally if not more sensitive than the latter; since the anemones may be seen to withdraw their tentacles and to contract their bodies on being touched, or even if the light falling upon them be suddenly intercepted, as by the shadow of a passing cloud. Yet the anemones, like hydra, utterly want a nervous system. But certain plants may also not only exhibit symptoms of irritation or sensitiveness when touched, but may act upon their sensations — a feature well exemplified by the drooping leaflets and leaf-stalk of the sensitive plant; by the closure of the leaf of the Venus fly-trap, and by definite movements of contraction observed in other plants, resulting from alterations in temperature. In plants, it is almost need-

less to remark, no nervous system has been demonstrated to exist; and no botanist has even suggested the possibility of the existence of nervous tissues within the limits of the vegetable creation. Yet, tested by the acts of their lives, we might truly say to such plants, with Shakespeare, —

> Sense you have,
> Else could you not have motion;

and, judging from the sensitiveness of the plants just mentioned, the conclusion appears inevitable that plants possess means for receiving and for acting upon sensations, and that in this light they may be fitly compared with the hydra and all lower animals in which a nervous system has not been demonstrated to exist.

It is perfectly clear that the acts of these plants, and of such animals as the hydra and sea-anemone, must be considered of a purely automatic kind. We cannot reasonably suppose that consciousness, or a knowledge of why or how the acts are performed, plays any part in the life-history of such forms. And even if it be maintained that mere sensation and consciousness in this case are identical or closely allied, the latter quality must be so far removed in its nature from the consciousness of humanity as to render the comparison quite inadmissible. The hydra and its neighbors are in truth automata pure and simple, in that they are stimulated by outward circumstances and respond to such stimuli without possessing any appreciation of the why and wherefore of any act of their lives.

But that automatic acts may represent the whole life, or a very large share of the actions, of animals much higher than these polypes, can readily be demonstrated. A centipede, for example, when cut in halves, will exhibit lively and independent movements in each half of its body — a fact readily explained when we note that each joint of the animal's body possesses a nerve-centre which supplies the surrounding parts with powers of movement. And if the central portion of the nervous system of the animal be destroyed whilst its body remains intact, the front portion of the body and the front legs together with the legs lying behind the destroyed portion will continue to push the animal forwards. Here the action of the hinder legs is purely automatic. But in the insect-class we find many examples of automatic acts, which at first sight actually seem to suggest the development of a high intelligence. The young insect, just liberated from its chrysalis state performs at once and perfectly all the operations of its life. And even in the case of the wonderful operations exemplified by the ants, bees, and their allies, we find examples of automatism. The acts of these insects are in reality determined by surrounding conditions; and each insect, destitute of all previous knowledge, enters upon its duties and discharges them with unerring skill, immediately after its birth or when it has attained its full development. Here, therefore, there can be no intelligent appreciation or consciousness of the nature of the duties performed. Indeed, as Dr. Carpenter has well remarked in speaking of the adaptation of such insects to their duties, "the very perfection of the adaptation, again, is often of itself a sufficient evidence of the unreasoning character of the beings which perform the work; for if we attribute it to their own intelligence, we must admit that this intelligence frequently equals, if it does not surpass, that of the most accomplished human reasoner."

Turning lastly to the investigation of man's actions as a type of those of higher animals generally, we find that physiology makes us acquainted with the performance of many automatic acts and movements in the common existence of humanity. The earliest acts of the infant are purely automatic; they are performed without the slightest appreciation of their meaning, and without any intelligent conception of their order and succession, that order and succession being really determined by the outward or physical conditions of life. The person who walks along the street absorbed in a reverie or day-dream, but who nevertheless and all unconsciously to himself avoids his neighbors and the lamp-posts, is so far an automaton in that the complicated muscular movements of his limbs and the general equilibrium of the body are being co-ordinated independently of his knowledge and will. And very many other examples might be cited in support of the allegation that automatic acts and movements play a very important part in the existence of higher animals.

Thus we may hold it to be fully proved that automatism has a veritable existence, and really forms the basis of all nervous acts. That in itself it constitutes the essence of all the intellectual acts of man is, however, a conclusion by no means involved in the preceding statement. That the "physical" act involved in the execution of any movement — such an act being

exemplified by the change which nerve-tissue undergoes even in the act of thinking — is connected and associated with another action, the "mental" act, cannot be doubted, if it be admitted at all that we possess a rational cognizance of ourselves and our actions. And that the "mental" act in the higher animal may represent the actual source, origin, and cause of the physical act, is also, as far as human intelligence can assure us, an undoubted fact. Hence we are forced to conclude that however this mental act has originated in man, it has really come to assume a place, dominion, and power in the constitution and working of his nervous system which is utterly unrepresented in any lower forms. If man may be proved or believed to be hereditarily the "slave of antecedent circumstances," it must also be admitted that a new power has been developed out of the action upon his nervous system of these same circumstances, this power being represented by the formation of the conscious self-knowing *ego* or mind. That hereditary influences and inherited constitution possess a large share in moulding the mind, as they undoubtedly operate in producing a certain conformation of body, is but a reasonable belief. And the formation of the character of the child, and through the development of the latter that of the adult mind also, must accordingly depend to a certain extent upon influences for which neither is in any way responsible, and over which, in the first instance, neither can have any control. That automatic acts derived from and moulded upon preceding acts of like character make up the chief part of human existence in a savage state is a statement of readily proved kind, since man in his primitive condition can hardly be supposed to speculate much concerning himself, but has his acts directed and controlled to a greater or less extent by outward circumstances and by the exigencies which his physical surroundings induce. But as in man's physical development, so in his mental nature, new features appear; and explain it how we may, we are forced to recognize that out of the mere instinct and pure automatism of his earlier state has been developed that fuller knowledge and command of self which brings with it the moral sense and all the noble conceptions of his race: a progress of mental development this, imitated by the mental advance of man as he emerges from the savage to the civilized state, and typified in a closer fashion still by the growth and progress of the infant's mind, from the indefinite mists of unconsciousness to the clearer light of a rational intelligence. The development of the child's intellect in this view presents us with a panoramic picture of the stages through which we may conceive the mind of man to have passed in its progress from the condition of a hydra-like automaton to the higher phase in which he obtains a knowledge of himself. And it seems to me that only through the ideas involved in some such theory of the origin of man's mental powers can we reasonably explain the possession by lower animals of many qualities and traits of character which we are too apt to regard as peculiar to man. The community of instincts in man and lower animals, in fact, affords a powerful argument in favor of the idea that the higher intellect of humanity has originated through the progressive development of lower instincts.

Our survey of the relations and origin of nervous acts has led us far afield into the domain of metaphysics, and has in some measure alienated us from our more sober study of the commonplace hydra. We have, however, noted that our polype forms a text for the illustration of some points highly interesting to humanity at large, and in what remains to be told of its life-history we shall find exemplified several other features of highly interesting if not of most remarkable kind.

Of these latter features, probably the most notable relate to the various modes in which the hydra may reproduce its kind. We have already observed how the animal makes provision for the wants of its own existence, and how it repairs the local and continually occurring death of its parts by the reception and digestion of food, and by the circulation from cell to cell of the products of nutrition. Such a view of the polype's organization, however, presents us after all with a one-sided aspect; and like most partial and incomplete surveys of things, our ideas of the polype's life-history are apt to become erroneous and liable to misconstruction. Every living being, in addition to the duty imposed upon it of repairing its individual loss of substance, has to bear a share in the reparation of the injuries and losses which death is the means of inflicting on its species or race. Through the processes of reproduction and development, new beings are ushered into the field of active life to take part in carrying on the life of the species, just as the process of nutrition made good the wants and supplied the exigencies of the single form.

The Harveian motto, "*Omne ex ovo,*"

holds good in the case of hydra, inasmuch as we find that the animal in summer more especially may be seen to produce eggs, from which, through a process of regular and defined development, new hydræ are produced. But we may concern ourselves less with this normal phase of development than with certain strange and out-of-the-way features which our polype may be observed to exhibit. There are very few persons outside the ranks of biologists who would be inclined to associate a veritable process of "budding" with the functions of an animal organism. Yet in hydra, in a large number of its neighbors, and in a few other groups of the animal world, a veritable process of this nature occurs, whereby from a parent body certain portions are gradually budded out to assume in due time the form and likeness of the being which has produced them.

Thus, when the hydra is well nourished, little projections may be observed to sprout from the side of the body. As these projections increase in size, each is seen gradually to develope a mouth and little tentacles at its free end, and in due time presents us with the spectacle of a young hydra, which has budded from the parent to which, save in size, it bears a close resemblance. Sometimes, also, it so happens that this young bud grows and multiplies like its parent, and produces a bud in its turn. So that we meet, in such a case, with a veritable genealogical tree, presenting us with three generations of hydræ, adhering to each other, and connected by the closest ties of blood-relationship. Not only, therefore, is our hydra colored like a plant: it also imitates the plant-creation in certain aspects of its life-history, and by the process of budding converts itself from a single into a compound animal. Whilst the young buds remain attached to the parent, free and perfect communication exists between the simple body-cavities of the connected individuals, and the compound organism is thus nourished by as many mouths as there are animals in the colony. But this connected and compound state is not permanent in hydra; although, as seen in the zoophytes, it presents us with a complicated and enduring fabric, numbering it may be many hundreds of included animals which have been produced by a process of budding. Sooner or later the young hydra-buds will break contact with the parent body, and will float away through the surrounding water on their way to root themselves to fixed objects, and to begin life on their own account.

More astonishing by far, however, is it to find that we possess the means for propagating hydræ at will. We may actually imitate the experiment performed of old by that redoubtable demigod Hercules, since by the artificial division of one polype we may give origin to new beings, and may multiply the species through the destruction of a single individuality. These curious results, also obtained by experimentation on the sea-anemones, were first made known to the world at large by Trembley, an Englishman, who was tutor to the sons of Count Bentinck, and who also, whilst resident at Geneva about the middle of the last century, contrived to find time and opportunity for close observation of those polypes. In 1744 Trembley published his memoir on the hydra, and we shall leave the ingenious naturalist to detail in his own language the method and results of his experiments. Surprised at the curious life-history and plasticity of these creatures under almost every condition, Trembley resolved to ascertain if the reproductive powers of hydra were further allied to those of plants in their ability to reproduce their like by being divided into "slips." Having divided a hydra crosswise and nearer to the mouth than to the root-extremity, he put the two parts into a flat glass which contained water four or five lines in depth, and in such a manner that each portion of the polype could be easily observed through a strong magnifying glass. "On the morning of the day after having cut the polyp, it seemed to me that on the edges of the second part, which had neither head nor arms, three small points were issuing from these edges. This surprised me extremely, and I waited with impatience for the moment when I could clearly ascertain what they were. Next day they were sufficiently developed to leave no doubt on my mind that they were true arms. The following day two new arms made their appearance, and some days after, a third appeared, and I now could trace no difference between the first and second half of the polyp which I had cut."

Experimenters since Trembley's time, but following in the track of that ingenious observer, have cut and divided the hydra in almost every possible fashion, with the result of finding that the polype possesses an unlimited power not only of resisting injuries — the least of which would be sufficient to insure the death of any ordinary organism, plant, or animal — but of utilizing the results of mutilation in the multiplication of its race. But as a

final feature in the hydra's history, we must allude to one point which perhaps we should deem as even of more extraordinary kind than the traits of character just described; this point being exemplified by certain experiments of Trembley, in which he actually succeeded in turning these polypes inside out, without in the slightest degree interfering with their ultimate vitality. In 1742, Trembley first succeeded in his endeavor to place the polype *hors de combat*, and his *ruse* or plan of procedure was of so ingenious a nature that we may again let him speak for himself. He tells us that he commenced operations "by giving a worm to the polyp, and put it, when the stomach was well filled, into a little water, which filled the hollow of my left hand. I pressed it afterwards with a gentle pinch towards the posterior extremities. In this manner I pressed the worm which was in the stomach against the mouth of the polyp, forcing it to open — continuing the pinching pressure until the worm was partly pressed out of the mouth. When the polyp was in this state I conducted it gently out of the water, without damaging it, and placed it upon the edge of my hand, which was simply moistened in order that the polyp should not stick to it. I forced it to contract itself more and more, and, in doing so, assisted in enlarging the mouth and stomach. I now took in my right hand a thick and pointless boar's bristle, which I held as a lancet is held in bleeding. I approached its thicker end to the posterior extremity of the polyp, which I pressed until it entered the stomach, which it does the more easily since it is empty at this place and much enlarged. I continued to advance the bristle, and in proportion as it advanced the polyp became more and more inverted. When it came to the worm, by which the mouth is kept open on one side, and the posterior part of the polyp is passed through the mouth, the creature is thus turned completely inside out; the exterior superficies of the polyp has become the interior."

The operation thus described was occasionally frustrated in a manner by the hydræ; since, in less than an hour, Trembley observed some specimens to succeed in restoring themselves to their natural position. This observer, however, prevented the latter result in one or two instances by spitting the polype, a needle being passed through the body close under the mouth; and when thus treated the animal, with wisdom which humanity might sometimes advantageously imitate, accommodated itself without murmur to the exigencies of its position. Trembley appears to have taken the state of the appetite of his polypes as a very natural and rational test of their state of health after being operated upon; since he remarks that a hydra which had been turned inside out ate "a small worm two days after the operation;" whilst to conclude, he remarks that "the same polyp may be successively inverted, cut in sections, and turned back again, without being seriously injured." After the recital of these experiments — to which, seeing that the hydra possesses no traces of a nervous system, the most tender-hearted anti-vivisectionist could offer no objection — we may well question whether the hydra of zoology is not after all a more wonderful animal than its mythical and fabulous namesake.

The attentive consideration of these features in our polype's biography, naturally suggests some remarks on the nature of the beings which possess powers so wondrous of resisting mutilation and of recovering from serious injury. In virtue of what description or amount of vitality, it may be asked, or on what supposition can we account for the amazing reparative powers of the hydra? The answer to the question may be prefaced by the remark that the hydræ are not singular in respect of their fertility under apparently disadvantageous circumstances. As already remarked, and as the writer can testify from experiment, the sea-anemones may be subjected to the ordeal of trial by slicing and chopping with favorable results, as far as the artificial increase of the race is concerned. But animals occupying a much higher place in the scale of animal society may also exhibit reparative powers of a singular and extensive kind. A star-fish, for example, need not in the slightest degree be disconcerted by the loss of its rays, for these astronomical beings may be met with on the sea-beach in the condition of grim old warriors who have left portions of their organization on numerous battle-fields, and possessing, it may be, but a single intact ray; the other four rays having most likely served voracious codfishes as dainty, if somewhat tough morsels. Or, again, the crabs and lobsters may be cited as examples of animals to whom the loss of a limb, less or more, makes but little difference. Indeed, the lobsters seem to part with even the largest of their members on very slight provocation; for a sudden noise, such as the report of cannon, has been known to serve as the exciting cause of dismemberment.

Or, lastly, to select animals of a higher grade still, it is well known that our familiar eft or newt may lose half of its tail without suffering any permanent loss; a natural process of reparation and growth in the starfish, in the crab and lobster, and in the newt, in due time providing new members for old ones. Man in one sense may well envy the reparative powers of his inferior neighbors; since even in the comparatively small matter of teeth he has to place himself under the tender mercies of the dentist in event of loss, and must view with hopeless gaze the disappearance of the last joint of a finger or toe.

Although the physiologist is unable in the present state of his science to explain the exact and intimate manner in which the hydra and other animals reproduce their tissues, we may nevertheless by a very homely simile contrive to gain a broad idea of the nature of these reparative powers. We thus must firstly note that the process is simply one of nutrition, or nutritive growth carried out to a high degree of development. We are dealing in fact, in such cases, with an increase of the ordinary powers and processes whereby, as we have already stated, the bodily waste is made good. But at the same time we note that these powers and processes vary throughout the animal world doubtless in obedience to some law which determines the closer interdependence of the different parts of animals the higher we advance in the zoological scale. To put the matter in its plainest light, we may compare the organization of the hydra and its neighbors to that of the "republic." The essential feature of this form of human association I take to be comprised in the broad statement that one man or member of the republic is as good as any other man or member, and that each man (theoretically) has an equal voice with his neighbor in the conduct and rule of the State. In that form of government to which the name of "limited monarchy" is applied, the levelling and equalizing tendencies of the republic are wanting. Every one person is not equal in rank or value to every other person; but, although each has theoretically his definite place and voice in the rule and management of the State, some assume a higher rank and power than others. Applying the comparison to the case before us, we can form at least an intelligent conception of the relative nature of the powers of the lower and higher animal. The hydra emphatically represents an animal democracy — a veritable republic. One part is as good as any other part, when demands are made upon it for reparation and growth; and this quality of self-support and independence, this power of existing separate from other parts, forms the feature in virtue of which the organization of the hydra becomes so plastic under the most trying conditions, and so well adapted in virtue of its inherent powers to rebuild the disorganized fabric. In man and higher animals, on the other hand, we find exemplified a form of vital government represented most nearly by the limited monarchy. Here, whilst each portion of the organism possesses a certain share in the constitution and management of affairs, some parts, and notably the nervous system, take precedence of, and serve to unite and combine the others. The principle of regulation and interdependence thus involved, simply renders it impossible for all parts to possess equal reparative powers. Hence lost parts are not commonly replaced in higher animals, for the reason that the loss has entailed a separation from other parts possessing no inherent powers of reproduction within themselves, and has divided the sustenance and life of the lost parts from that of the entire, connected, and interdependent system.

The process of growth and the harmonious relation of organs and parts observed in the hydra and in most other living beings, suggest, as a final feature worthy of note, the consideration of what is implied in the growth and increase of living organisms generally. The body of hydra was, at an early stage of our investigation, seen to be composed of tissues, and these tissues, again, to be made up of minute elements or cells. The growth of the hydra, therefore, in reality, means the increase of each of its minute parts; and when we reflect on the law of growth thus evolved, we may be puzzled to account for or explain the intimate nature of the mysterious power which is seen to operate in controlling and directing in so remarkable a manner the functions of this humble organism. In the hydra, then, as representing a single organism, or, still better, in the zoophyte, which consists of a colony numbering, it may be, hundreds of animals, united in a close structural relationship, or in the bodies of higher animals still, we find the principle of the perfect co-operation of many different parts to one harmonious end, namely, the maintenance of the organism, beautifully exemplified. In most of the grave affairs of life, man strives to secure the co-operation of his

Generated on 2020-04-25 06:50 GMT / https://hdl.handle.net/2027/coo.31924079893602

Original from CORNELL UNIVERSITY

fellows; but humanity, unfortunately for the success of its schemes, exhibits many little weaknesses and failings, and the common tendency of one mind to assert its supremacy over another may result in the demolition of the co-operative idea. Man might, therefore, well strive to imitate the unselfish union of aims and ends which a zoophyte colony exemplifies, or which the vital mechanism of his own tissues illustrates. When the political economist shall have succeeded in inaugurating a scheme of human co-operation for any purpose, on the successful model of nature's colonies in lower life, he will have good cause to congratulate himself and his fellows on having solved one of the paramount difficulties which beset his day and generation.

But, lastly, the true nature of the growth of a living being can only be fully understood if we for a moment compare that process with the increase of a lifeless body. No better, truer, or more eloquent descriptions of the difference between the growth of the living and that of the non-living could well be found than in the following passages, culled from an essay,* by one of the most liberal and advanced scholars of our day, intended to illustrate the progressive nature of philosophic science. "There is one kind of progress," says the writer, "which consists simply of addition of the same to the same, or of the external accumulation of materials. But increase by addition, even though it be ordered or regulated addition, is not the highest kind of advancement. Pile heap on heap of inorganic matter, and you have a result in which nothing is changed; the lowest stratum of the pile remains to the last what it was at the first; you keep all you ever had in solid permanence. Add stone to stone or brick to brick, till the house you have built stands complete from foundation to copestone; and here, though in order and system there may be a shadow of something higher than mere quantity, there is still only addition without progress. You have here also what the superficial mind covets as the sign of value in its possessions — permanent results, solid and stable reality. Every stone you place there remains to the last cut, hewn, shaped, in all its hard external actuality, what it was at the first: and the whole edifice, in its definite outward completeness, stands, it may be, for ages, a permanent possession of the world.

"But when you turn from inorganic accumulation or addition of quantities to organic growth, the kind of progress you get is altogether different. Here you never for a single day or hour keep firm possession of what you once had. Here there is never-resting mutation. What you now have is no sooner reached than it begins to slip away from your grasp. One form of existence comes into being only to be abolished and obliterated by that which succeeds it. Seed or germ, peeping bud, rising stem, leaf and blossom, flower and fruit, are things that do not continue side by side as part of a permanent store, but each owes its present existence to the annulling of that which was before. You cannot possess at one and the same time the tender grace of the vernal wood and the rich profusion of color and blossom of the later growth of summer; and if you are ever to gather in the fruit, for that you must be content that the gay blossoms should shrivel up and drop away. Yet though in organic development you cannot retain the past, it is not destroyed or annihilated. In a deeper way than by actual matter-of-fact presence and preservation, it continues. Each present phase of the living organism has in it the vital result of all that it has been. The past is gone, but the organism could not have become what it is without the past. Every bygone moment of its existence still lives in it, not indeed, as it was — but absorbed, transformed, worked up into the essence of its new and higher being. And when the perfection of the organism is reached, the unity of the perfectly developed life is one which gathers up into itself, not by juxtaposition or summation, but in a far deeper way, the concentrated results of all its bygone history. And by how much life is nobler than dead matter, by so much are the results and fruits of life the manifestation of a nobler kind of progress than that which is got by the accumulation of things which are at once permanent and lifeless, and permanent *because* they are lifeless."

The hydra equally with the higher animal, and the lowliest plant equally with the lordly oak, present the distinctions and differences thus forcibly expressed as existing between living and non-living matter. There is thus a constant replacement of old particles by new ones; and this change is not, after all, a mere replacement, but also includes and carries with it a process of growth and increase — of which latter, as seen in the living being, perhaps the

* Progressiveness of the Sciences, by John Caird, D.D., Principal of Glasgow University. Glasgow: Maclehose, 1875.

most wonderful feature is that whereby, amid all the constant changes which living and being involve, the animal or plant should preserve and retain the form in which it was, so to speak, originally limned.

A study of the denizens of a stagnant pool may thus be shown to lead up, unconsciously it may be, but also naturally, to some matters of weighty consideration and interest, even to the most unscientific of observers. And it will be found not the least characteristic and valuable feature of all such studies, that they serve as literal starting-points and as vantage-grounds whence we may shape an intellectual course, leading us by many and diverse radii from limited perceptions and finite aims, outwards and upwards to the infinite itself.

From Macmillan's Magazine.

GERMAN SOCIETY FORTY YEARS SINCE.

In 1841–3 Mrs. Austin was in Germany, and met most of the celebrated men and women of that epoch. Some of the stories jotted down by her during a prolonged residence in Dresden and Berlin seem too good to be lost, while others show considerable insight into German life. The brothers Grimm appear to have been the most sympathetic people she met in Berlin. About Jacob Grimm she writes thus:

"His exterior is striking and engaging. He has the shyness and simplicity of a German man of letters, but without any of the awkward, uncouth air which is too common among them. His is a noble, refined head, full of intelligence, thought, and benevolence, and his whole exterior is full of grandeur — at the same time perfectly simple. Wilhelm is also a fine-looking man, younger, fatter, and more highly-colored; less imposing, less refined, but with a charming air of good nature, *bonhomie* and sense. His wife is also very pleasing. I met him one night at tea, and we began talking of fairy tales; I said, 'Your children appear to me the happiest in the world; they live in the midst of *Mährchen* (fairy-tales).' 'Ah,' said he, 'I must tell you about that. When we were at Göttingen somebody spoke to my little son about his father's *Mährchen.* He came running to me and said with an offended air, "*Vater, man sagt du hast die Mährchen geschrieben — nicht wahr, du hast nicht solches Dummezeuggemacht?*" ("Father, people say that you have written the fairy tales — surely you never invented such rubbish?") 'He thought it below my dignity,' said Grimm. Somehow the child had never seen or attended to the fact of his father's authorship."

Another story of Grimm's: —

"When I was a young man I was walking one day and saw an officer in the old-fashioned uniform. It was under the old elector. The officers still wore pigtails, cocked hats set over one eye, high neck-cloths, and coats buttoned back. As he was walking stiffly along, a groom came by riding a horse which he appeared to be breaking in. 'What mare is that you are riding?' called out the major with an authoritative, disdainful air. 'She belongs to Prince George,' answered the groom. 'A——h!' said the major, raising his hand reverentially to his hat with a military salute, and bowing low to the mare. I told this story," continued Grimm, "to Prince B., thinking to make him laugh. But he looked grave, and said, with quite a tragic tone of voice, 'Ah, that feeling is no longer to be found!'"

"Jacob Grimm told me a *Volksmährchen* too: —

"'St. Anselm was grown old and infirm, and lay on the ground among thorns and thistles. *Der liebe Gott* said to him, "You are very badly lodged there; why don't you build yourself a house?" "Before I take the trouble," said Anselm, "I should like to know how long I have to live." "About thirty years," said *der liebe Gott.* "Oh, for so short a time," replied he, "it's not worth while," and turned himself round among the thistles.'

"Bettina von Arnim called, and we had a *tête-à-tête* of two hours. Her conversation is that of a clever woman, with some originality, great conceit, and vast unconscious ignorance. Her sentiments have a bold and noble character. We talked about crime, punishment, prisons, education, law of divorce, etc., etc. Gleams of truth and sense, clouds of nonsense — all tumbled out with equally undoubting confidence. Occasional great fidelity of expression. Talking of the so-called happiness and security of ordinary marriages in Germany, she said, '*Qu'est que cela me fait? Est-ce que je me soucie de ces nids qu'on arrange pour propager?*' I laughed out; one must admit that the expression is most happy. She talked of the ministers with great contempt, and said, 'There is not a *man* in Germany; have you seen one for whom you could feel any enthusiasm? They are all like frogs in a big

pond; well, well, let them splash their best. What have we to do with their croaking?' Some things she said about the folly of attacking full-grown, habitual vice, by legislation, prison discipline, etc., were very true, and showed a great capacity for just thought. But what *did* she mean, or what did Schleiermacher mean, for she quoted him, by saying, '*La péché est une grâce de Dieu?*' These are things people say to make one stare. Among other divorce cases we talked of was the following: — Herr S——, a distinguished man, between fifty and sixty, with grown-up children and a wife who for five-and-twenty years had stood by his side a true and faithful partner through good and evil fortune — especially a great deal of the latter. A certain Madame A——, a woman about thirty, *bien conservée*, rather pretty, and extremely coquettish, made it her business to please Mr. S——, and succeeded so well that he soon announced to his wife his desire to be divorced from her, and to marry Madame A——, who on her side was to divorce her husband. Poor Madame S—— could hardly believe her senses. She was almost stupefied. She expostulated, resisted, pleaded their children — marriageable daughters — all in vain. Mr. S—— said he could not be happy without Madame A——. In short, as may be imagined, he wore out his wife's resistance, and the blameless, repudiated, and heart-broken wife took her children and retired into Old Prussia. Madame A—— then became Madame S——. But the most curious thing was that the *ci-devant* husband remained on terms of the greatest intimacy, and became the tame cat of the house. When Mr. S—— went a journey his wife accompanied him a certain way, and Mr. A—— went with them to escort her back, as a matter of course.

"At a ball given at C——, Mr. and Madame S—— were invited. He came alone, and apologized to the lady of the house about his wife's absence. She hoped Madame S—— was not ill. 'Oh, no; but Mr. A—— has just arrived, and you understand she could not leave him alone the first evening.'

"My maid Nannie told me a curious illustration of the position of servants here. The maid belonging to the master of the house, has, it seems, a practice of running out, and being gone for hours without leave. On Sunday last she had leave; Monday, ditto; Tuesday, ditto; and was out the whole of those evenings. Wednesday she took leave, and did not return till after tea. Her mistress asked her where she had been; she refused to answer, on which her mistress pressed her. 'Well,' she said, 'if I won't tell you, you can't hang me for it.' With which answer the lady went away content. Another day the master, who is lame, came down into the kitchen and said, 'I have left my spectacles; I wish you would run up for them.' 'Oh,' said she, 'I am washing dishes.' The droll thing is that they say they are only too glad to have this steady and obliging person, because she is honest — a thing almost unknown here.

"A great many ladies in Berlin have evenings on which they receive — especially the ministers' wives — not their friends, but all the world. If you don't go for two or three weeks, they tell you of it — the number of omissions is chalked up against you. Nor, except in two or three of the more exotic, can you look in for half an hour and come away. People ask you why you go, and where you are going to. In many houses you are expected to take leave. Then you have the satisfaction of being told where you were last night, and what you said; who sat next you, and especially that you did not admire Berlin, or something in it. Of course you deny, equivocate, palliate, lie. If you have the smallest pretension to be *vornehm* (fine), you can only live Unter den Linden, or in the Wilhelms-strasse.

"Social life does not exist in Berlin, though people are always in company, and one is, as Ranke said, *gehetzt* (hunted). In the fashionable parties one always sees the same faces — faces possessed by *ennui*. The great matter is for the men to show their decorations and the women their gowns, and to be called *excellency*. Generally speaking, it strikes me that the Prussians have no confidence in their own individual power of commanding respect. Much as they hold to all the old ideas and distinctions about birth, even that does not enable them to assume an upright independent attitude, not even when combined with wealth. Count G——, a man of old Saxon nobility, with large estates and the notions and feelings of an English aristocrat, tells me that he is completely *shouldered* in Berlin society, because he neither has nor will have any official title, wears no orders, and, in short, stands upon his own personal distinctions. The idea of going about the world stark naked to one's mere name! Mr. Pitt, Mr. Fox, Mr. Canning — a German would be ashamed.

"The other day I went up three pair of

Original from CORNELL UNIVERSITY

stairs to call on a nice little professor's wife. Arrived at the top, I rang the bell, and out comes a great hulking maid, who looks down upon me from a height of three or four steps. 'Is Madame G—— at home?' Answer (stereotype), 'I don't know;' after a pause — 'Do you mean the Frau Professorin?' 'Yes, Madame G——.' On this out rushes a second maid, looks half stupid, half indignant — 'What, do you mean the Frau Geheimräthin?' The joke was now too good to drop. I said again, 'I mean Madame G——, as it seems you do not hear distinctly; take my card to Madame G——.' I was admitted with the usual words, 'most agreeable,' and found the very pleasant Frau Professorin Geheimräthin, for she is both, whose servants seem ashamed of her name. Yet it is a name very illustrious in learning.

"Till a man is *accroché* on the court by some title, order, office, or what not, he may be fairly said not to exist. The Germans are becoming clamorous for freer institutions, but how much might they emancipate themselves! A vast deal of this servility is perfectly voluntary, but it seems in the blood. They dislike the king of Hanover as much as we do; but when Madame de L—— whispered to me at a ball, '*Voilà votre prince et seigneur*,' and I replied in no whisper, '*Prince oui, mais grâce á Dieu, seigneur non*.' She looked frightened, and so did all the ladies round her — and why? He could do them no more harm than me.

"In Dresden I met the grand duke of Saxe-Weimar, who told me the following anecdote on the authority of his mother-in-law the empress of Russia: 'When Paul and his wife went to Paris, they were called, as is well known, le Comte and la Comtesse du Nord. The Comtesse du Nord accompanied Marie Antoinette to the theatre at Versailles. Marie Antoinette pointed out, behind her fan, *aussi honnêtement que possible*, all the distinguished persons in the house. In doing this she had her head bent forward; all of a sudden she drew back with such an expression of terror and horror that the comtesse said, "*Pardon, madame, mais je suis sûre que vous avez vu quelque chose qui vous agite.*" The queen, after she had recovered herself, told her that there was about the court, but not of right belonging to it, a woman who professed to read fortunes on cards. One evening she had been displaying her skill to several ladies, and at length the queen desired to have her own destiny told. The cards were arranged in the usual manner, but when the woman had to read the result, she looked horror-struck and stammered out some generalities. The queen insisted on her saying what she saw, but she declared she could not. "From that time," said Marie Antoinette, "the sight of that woman produces in me a feeling, I cannot describe, of aversion and horror, and she seems studiously to throw herself in my way!"'

"The grand duke told very curious stories about a sort of second sight; especially of a Princess of S—— who was, I believe, connected with the house of Saxony. It is the custom among them to allow the bodies of their deceased relations to lie in state, and all the members of the family go to look at them. The princess was a single woman, and not young. She had the faculty, or the curse, of always seeing, not the body actually exposed but the next member of the family who was to die. On one occasion a child died, she went to the bedside and said, 'I thought I came to look at a branch, but I see the tree.' In less than three weeks the father was dead. The grand duke told me several other instances of the same kind. But this faculty was not confined to deaths. A gentleman whom the grand duke knew and named to me, went one day to visit the princess; as soon as she saw him she said, 'I am delighted to see you, but why have you your leg bound up?' 'Oh,' said her sister, Princess M——, 'it is not bound up; what are you talking of?' '*I* see that it is,' she said. On his way home his carriage was upset and his leg broken.

"I was saying that the Italians would not learn German. Madame de S—— said, 'I perfectly understand that; I had a French *bonne*, and when a child spoke French better than German. When the French were masters in Germany, M. de St. Aignan was resident at the court of Weimar. He and other French officers used to come every evening to my mother's house. I never spoke a word, I never appeared to understand a word. When the news of the battle of Leipsig arrived, M. de St. Aignan escaped through our garden. I was alone when he came to ask permission, and I answered him very volubly in French. "*Mais, mademoiselle,*" said he, astonished, "*vous parlez le Français comme l'Allemand. J'ai toujours cru que vouz n'en comprenez pas un mot.*" "*C'est que je n'ai pas voulu,*" replied I.'

"This in a young girl who talked well and liked to talk, shows great resolution,

and is a curious proof of the strength of the hatred of French rule.

"I went to see '*Figaro's Hochzeit*,' not '*Le Nozze di Figaro*.' If you have a mind to understand why the Italians can never be reconciled to Anstrian rulers go to see '*Figaro's Hochzeit*.' A Herr Dettmer, from Frankfurt, did Figaro, a good singer, I have no doubt, and not a bad, *i.e.*, an absurd, actor. But Figaro, the incarnation of southern vivacity, *espièglerie* and joyous grace! Imagine a square, thick-set man, with blond hair and a broad face, and that peculiar manner of standing and walking with the knees in, the heels stuck into the earth and the toes in the air, which one sees only in Germany. I thought of Piuco, a young Maltese, never, I believe, off his tiny island — whom I last saw in that part. I saw before me his *élancé* and supple figure, his small head clustered round with coal-black hair, his delicately turned jetty moustache, his truly Spanish costume, the sharp knee just covered by the breeches tied with gay ribbons, and the elastic step of the springing foot and high-bounding instep. What a contrast! — and what can art do against nature in such a case? Then the women; I had seen Ronzi de Begnis in the countess. What a countess! What a type of southern voluptuous grace, of high and stately beauty and indolent charm! Imagine a long-faced, lackadaisical-looking German woman, lean and high-shouldered, and with that peculiar construction of body which German women now affect. An enormously long waist, laced in to an absurd degree, and owing its equally extravagant rotundity below to the tailor. 'Happy we,' says Countess Hahn-Hahn, 'who, with so many ells of muslin or silk, can have a beautiful figure.'

"The Susanna was a pretty waiting-maid. How far that is from a Spanish Susanna, it is beyond me to say. Cherubino was the best, but he was only an *espiègle* boy playing at being in love — not the page whose head is turned at the sight of a woman. Then the language!

"After all, how immensely does this inaptitude of Germans to represent '*Figaro*' raise Mozart in our estimation; for he had not only to represent, but to conceive the whole — and what a conception! The sweet breath of the south vibrating in every note. Variety, grace, lightness, passion, *naïveté*, and, above all, a stately elegance which no one ever approached. His '*Don Giovanni*' and his '*Almaviva*' contain the most courtly, graceful, stately music that ever was conceived; and nothing like it *was* ever conceived. Only the real grandee, courtier, and fine gentleman could express himself so.

"Now, as a set-off, I must say what Germans can do, and what I am quite sure we English cannot in these days.

"I went to see Schiller's '*Braut von Messina*.' I expected little. The piece is essentially lyric rather than dramatic. The long speeches, thought I, will be dull, the choruses absurd; the sentiments are pagan. What have Spanish nobles to do with a Nemesis, with oracles, with a curse, like that on the house of Athens — with sustained speeches, the whole purport of which is *incusare deos?*

"Well, I was wrong. In the opening scene, Mademoiselle Berg has to stand for a quarter of an hour between two straight lines of senators and to make a speech — *rien que cela!* Can anything be more difficult? Yet such was the beauty of her declamation of Schiller's majestic verse, such the solemnity and propriety, grace and dignity of her action, that at every moment one's interest rose. Her acting through the whole of this arduous part gave me the highest idea of her sense and culture. Tenderness and passion were nicely proportioned to the austere character and sculptural beauty of the piece. I cannot at this moment recollect ever to to have seen an actress, French or English, who could have done it as well. Mademoiselle Rachel, with all her vast talents as a declaimer, would have been too hard for the heart-stricken mother.

"Emil Devrient's 'Don Cæsar' was quite as good. His acting in the last scene, where Beatrice entreats him to live, was *frightfully* good. The attempts at paternal tenderness, instantly relapsing into the fatal passion, ignorantly conceived, made one's heart stand still. And yet such was the extreme delicacy of his art, one felt none of the disgust which attends every allusion to such love. One saw before one only the youth vainly struggling with the hereditary curse of his house — the doomed victim and instrument of the vengeance of an implicable destiny.

"Anything more thoroughly heathenish than the play I cannot conceive, and I much question if an English audience would sit it out — on that score — not to mention others. We should find it our duty to be shocked. The audience last night was thin; those who went were probably attracted by Schiller's name, and knew that such "horrid opinions" once existed in Greece, and that a poet imitating Greek tragedy might represent Greek

modes of thinking. In short, we did not feel ourselves the least compromised by the queen of Sicily's attack upon the gods — nor the least more disposed to quarrel with our fate.

"The chorus is, as in duty bound, *versöhnend* (concilatory). The amount of the comfort, it is true, often is, 'It can't be helped; but even this is so nobly and beautifully expressed that one is satisfied. The chorus has every imaginable claim to be a bore. They deal in good advice, moral reflections, and consolation of the new and satisfactory kind above mentioned. Yet so great is the majestic, harmonious, composed beauty of Schiller's verse, so much greater the eternal beauty of truth and virtue, that the old men's words fall on one's heart like drops of balm, and one feels calmed and invigorated for the struggle with life. The chorus spoken, and in parts by all the voices at once, can never have a good effect — but somehow or other *cela allait*. Such are the triumphs of the true poet and artist."

The following anecdote dates from before the Russian emancipation: —

"The Archbishop of Erlau told me that at the time the Russian troops were stationed in Hungary, he and another gentleman were walking in the streets of ——— and suddenly heard a woman cry out. In a moment she ran into the street exclaiming that a Russian soldier had robbed, or was about to rob her. Such complaints were very frequent and sometimes unfounded. The soldiers could not make themselves understood, and took up things without meaning to rob. Be that as it may, two Russian officers were passing and heard the woman's story. They instantly collared the man, threw him down on the pavement, and, without making the smallest inquiry into the facts, they then and there spurred him to death. This, said the archbishop, I saw, with infinite horror and disgust."

Here we have a story which, though not absolutely new, is too good to be omitted: —

"Dr. F—— told me the following story of Voltaire, which I never met with before. Voltaire had for some reason or other taken a grudge against the prophet Habakkuk, and affected to find in him things he never wrote. Somebody took the Bible, and began to demonstrate to him that he was mistaken. '*C'est égal,*' said he, with an air of impatience, '*Habakkuk était capable de tout!*'

"Two days before we left Dresden, as I was dressing to go out, Nannie, my maid, came into my room and said two ladies wanted to see me. She said she had never seen them — they said I did not know them. I sent to say that I was sorry but I could not receive them, as Madame de S—— was already waiting for me. Nannie came back with the answer that they would wait in the anteroom — they only wanted to speak to me for a moment. Annoyed at being forced to commit a rudeness, I hurried on my gown and went out. In the anteroom were a middle-aged lady and a young one. I broke out into apologies, etc., upon which the elder lady said, in German, 'Pardon me for being so pressing. I only wished to give my daughter strength for the battle of life.' I was literally confounded at the oddness of this address, and remained dumb. It seemed her daughter wished to translate from the English. After a short explanation she turned to her daughter, and pointing to me, said, 'Now, my dear, you have seen the mistress, so we will not keep her any longer.' And so they went. I threw myself into a chair, and, alone as I was, burst into an uncontrollable fit of laughter. This is as good a piece of Germanism as is to be found in any novel. Even my Dresden friends thought it quite amazing.

"Dr. Waagen and I were talking of the danger of disputing the authenticity of pictures. I said I had rather tell a man he's a rascal than that his pictures are copies. 'Yes,' said Waagen, 'I always compare a man, the genuineness of whose pictures are attacked, to a lioness defending her young.'

"We afterwards came upon intercourse with princes. Waagen said, Wilhelm von Humboldt, who was a great friend and patron of his when a young man, once said to him: 'My dear friend, your position will probably bring you into frequent contact with royalty. Take one piece of advice from me; always regard them as wild beasts in cages, and the courtiers as keepers. You see how noble and gentle and beautiful they look. But if you begin to put your hand through the bars and play with them, then you'll feel their claws and fangs. Always ask the keepers first what sort of humor they are in.'

"Countess H——, wife of the Mecklenburg minister, a Rubens beauty, and a very good-natured woman, told me she was invited to a grand dinner party at V—— to meet an English great lady. The hour was five. After everybody waiting till six, the hosts determined to sit

Generated on 2020-04-25 06:50 GMT / https://hdl.handle.net/2027/coo.31924079893602

Original from CORNELL UNIVERSITY

down. Some time after dinner was begun, Lady —— came in. The hostess began to regret, hoped nothing had happened, etc.

"'*Non, madame, c'est que je n'avais pas faim*,' was the refined and graceful reply.

"At a dinner party we were talking of Niebuhr, Varnhagen von Ense's article, etc. They spoke of his arrogance and caprice, which they said he had in common with all Holsteiners. He was much disliked by the Germans at Rome, partly for these qualities, partly for his parsimony and want of hospitality.

"Herr von Raumer said: 'I went to his house one evening, and we *nearly* succeeded in boiling some hot water for tea, but not quite.' Niebuhr told him that it was a serious thing to associate with Amati the Roman archæologist, because he frequented a certain wine-house called the Sabina, where the wine was dear. Amati was keeper of the Chigi Library, and held a post in the Vatican. His learning and judgment were universally acknowledged. He was particularly well known for his transcription and collation of codices, and a man whom any one might be proud to know.

"When the late king was at Rome, Niebuhr did the honors so badly that the king was quite impatient. He showed him little fragments of things in which he could take no interest, and none of the great objects. One day Niebuhr spoke of Palestrina. 'What is that?' said the king. 'What, your Majesty does not know that?' exclaimed Niebuhr in a tone of astonishment. The king was extremely annoyed, and turning round to some one, said, 'Stuff and nonsense; it's bad enough never to have learnt anything, without having it proclaimed aloud.'

"Niebuhr's ideas about his own importance, and his excessive cowardice were such, said B——, that at the time of the Carbonari affairs, he actually wrote home to the Prussian government that the whole of this conspiracy was directed against himself.

"In the steamer from Mainz to Bonn was — *inter alios* — an individual of the genus *Rath*. He sat opposite to us at dinner on the deck, and first attracted my attention by the following reply to his neighbor, a man who appeared to entertain the profoundest admiration for him. 'Oh, yes, there are lots of *theorists* in the world, only too many. *I* represent *den gesunden Menschenverstand* (sound common sense).' Delighted at this declaration, I raised my eyes and saw a face beaming with the most undoubting self-complacency. He went on to detail certain schemes of his for the good of his country — Oldenburg, as it seemed. My husband began to interrogate him about Oldenburg, and I said all I knew of it was from Justus Möser. The worthy *Rath* looked at me amazed, and said this was the first time he ever heard Justus Möser mentioned by a lady. I said so much the worse, there is an infinity of good sense in his writings. Yes, but he never expected to hear of his being read by a lady, and that I was evidently the second representative of sound common sense in the world, 'worthy to be *my* disciple,' added he with emphasis."

JANET ROSS.

From The Cornhill Magazine.

THE POETRY OF SEPTEMBER.

WE suppose that every month in the year has its own peculiar physiognomy, by which the true lover of nature would at once recognize it were he dropped from the clouds in a balloon after a prolonged absence in some other planet. Months melt into one another imperceptibly, of course; but such a one would know that the middle of July was not the middle of June, or the middle of August the middle of July. And this not by the weather, or the temperature, or by any agricultural operation which might betray the truth, but by the peculiar expression which nature wears at different seasons of the year. In July she is still young, still soft and fresh, with cooling showers and fickle skies, and clouds and sunshine rapidly chasing each other away. And for the full and perfect beauty of ordinary English scenery there is no period of the year to compare with the six weeks which separate the end of June from the middle of August. In August comes a slight change, we know not what, something to be felt rather than described. Perhaps it is that the face of nature begins then to wear rather a more set look, to show the first signs of middle age, and that lines of thought became visible in her still lovely countenance. But with the ensuing month the change is very apparent, and it is on the manner in which the expression of nature during an English September affects both the heart and the imagination that it is proposed to dwell in this article.

A September landscape is familiar to the majority of Englishmen; but still there is a numerous class of men, com-

Original from CORNELL UNIVERSITY

prising many among us who are the best qualified to appreciate it, who rarely see their native country at all during that particular month. The crowd of tourists which flies across the Channel, bound for Alps, or Pyrenees, or Carpathians, or what not, the moment they are free from the claims of business, or politics, or fashion, rarely return till September has passed gently away. Of those others who spend September in the country many, perhaps, are too much absorbed in field sports to notice the beauty which encircles them; and many more, perhaps, if they did notice it, would never get beyond observing that it was a very fine day. We hope, however, still to find a few readers who have been touched by the same feelings as ourselves under the influence of this particular month, and with their sympathy, if there be such, we shall be satisfied. The actual physical beauty of a September day, though not so luxuriant, it may be, as July or August, stirs us, perhaps, with a deeper emotion. The corn should not be all carried, for the wheat, standing in shocks upon the hillside, has a very pretty effect in the distance. There should be meadows within view, in which the rich green aftermath, still ankle deep, has not yet been fed off. There should be the fine stately hedgerow timber of the midland counties, or the hanging copses and long woods of the west and south. There should be the cool dark green of the turnips, contrasting with the pale yellow stubble, looking sheeny and silky in the sun. There should be a farmhouse or two, and a village spire in the hazy distance; and the foliage may be flecked here and there with two or three rust-spots as a foil to the surrounding verdure. Here is an ordinary view enough. But lie lazily on your back where the eye can take in all these varied contrasts, and you will allow that the same scene at an earlier period of the year would have wanted many of the charms which it exhibits now. If by the poetry of September we meant principally its suitability for descriptive poetry we might enlarge on these charms in some detail. As it is, I shall merely observe on the singularity of the fact that descriptive poets should have turned to so little account the peculiar beauties of this season of the year. It is not so with painters. September has sat for her portrait to many eminent hands, and we would call particular attention to a picture in last year's (1876) Academy, by Mr. Vicat Cole, called "The Day's Decline," which is evidently intended for September, and which, though it does not give the variety which I have just described, brings out many of the special characteristics of the month with marvellous fidelity. But Thomson is our classic on such subjects; and, though he could not fail to catch the dominant characteristic of the month, he hardly seems to have drunk in the full beauty of it. The following lines, however, show that he was not without appreciation: —

> A serener blue,
> With golden light enlivened, wide invests
> The happy world. Attempered suns arise,
> Sweet beamed, and shedding oft through lucid clouds
> A pleasing calm; while broad and brown below
> Extensive harvests hang the heavy head.
> Rich, silent, deep they stand; for not a gale
> Rolls its light billows o'er the bending plain —
> A calm of plenty.

This is truly fine. The epithets applied to the ripe cornfields, "rich, silent, deep," are most felicitous. But the primary idea of autumn with Thomson was what its name denotes, that of a season of abundance and rejoicing.

> Crowned with the sickle and the wheaten sheaf,
> While autumn, nodding o'er the yellow plain,
> Comes jovial on, the Doric reed once more
> Well pleased I tune.

And we do not remember at the present moment either in Wordsworth, Tennyson, or Keats, the meed of even one melodious verse to the sweetest "daughter of the year," which dwells on her pathetic beauty.

For it is not the mere beauty of feature which characterizes September, great as that is, on which we are about to dwell: in this it is surpassed by other months. It is the expression which is worn by this one — all that it suggests, all the spell which it seems to lay upon us — which we hope to be able to describe, so that some few readers, as we have said, may recognize the likeness. We are presupposing, of course, that we have a seasonable September, the mild, warm, sunny month which it is four years out of five, and neither parched by drought nor yet drenched with constant rain; September, in fact, in her normal and natural condition. Then let the sky be perfectly blue, the air perfectly hushed, and the whole landscape bathed in a flood of pensive sunshine, and "on such a day" the mind becomes conscious of a mixture of melancholy and sweetness which is wholly peculiar to this season. The sweetness of September is, indeed, one of its most prominent attributes. No month in the

year seems literally to smile upon one like September. It is so gentle, so soft, so mellow.

It seems to look at one out of mild hazel eyes with an almost human love and tenderness, and an equable serenity which gives assurance of unchanged affection. And this it is which leads us by degrees to become conscious of the melancholy of September. The contrast between the sense of repose, tranquillity, and permanence which is inspired by her aspect, and the sense of the approaching termination of all summer weather which we feel at the same time, naturally gives rise to this sentiment. We feel in gazing on September what we might feel in looking upon a beautiful and sweet-tempered woman, in perfect health and strength, whom we knew had but a short time to live. It is, however, difficult to separate the elements which constitute the sweetness from those which constitute the melancholy of this beautiful season. The profound brooding stillness of a September day, when you may even hear the beetles dropping from the bean-shocks in the adjoining field, must have struck many of our readers, and one can barely say whether it contributes more to the sadness or the joy with which we are inspired at such moments.

> Hark how the sacred calm which breathes around
> Bids every fierce tumultuous passion cease,
> In still small accents whispering from the ground
> A grateful earnest of eternal peace.

How frequently have we experienced the exact sensations here described by Gray, on a soft hazy September afternoon, when, if the harvest is completed, there is often not a sound to be heard, while the soft warm glow of all around prevents the silence from being gloomy. That is a time at which to lie on the grass and "dream and dream;" when, without the help of any stimulant, you may kiss the lips you once have kissed, and recall your college friendship from the grave; gliding by degrees into a kind of dreamy feeling, which you care not to analyze too closely, that this ineffable peace of nature, which passes all description, may be a type, perhaps, of that peace of God which passes all understanding.

It is curious that September should be the one month in which we feel the strongest assurance of settled calm; have more reason to believe that to-morrow will be like to-day than at any other season of the year; and yet that it should be the last month of summer with which all the really green, warm, pleasant days practically depart. The poetry of decay is brought before us in October and November, but not in the month we are speaking of. In three seasons out of four September is green to the last, or sufficiently so to prevent one from noting much change. And it is this contrast, no doubt, a contrast we have already spoken of, which constitutes one of its chief charms: the deep stillness before the equinoctial tempest. But the same contrast may be regarded from another point of view. If there is one idea more than another which the aspect of September awakes in us, it is one of mellowness and maturity. It seems to speak of the strength and fulness of ripe and sunny middle age, the warmth of youth without its fever, the sobriety of age without its frost. The ideas of plenty and abundance, moreover, with which we associate this month come in to corroborate the impression which its outward aspect is calculated to produce; and a momentary fancy will sometimes flit across the mind that September cannot really be passing away, or that its life will be prolonged like Hezekiah's. It seems so difficult to suppose that the warm, genial, yet calm withal and tranquil weather, so redolent of life, health, and permanence, is so soon to leave us. But then come up the words of George Herbert, "But thou must die,"—and with thee all the lasting beauty of our brief English summer. October has its fine days, but the days are short and the nights are cold. It is as much an indoor month as an outdoor month. With September come to an end all the *molles sub arbore somni* in the happy afternoons, the moonlight stroll in the shrubbery, or the lounge by the garden gate, with perhaps some fair companion whom the softness of the scene makes doubly soft herself. After September these become pleasures of the past; and though of course they are as appropriate to any other summer month as they are to September, yet September is the month in which people in the country see more of each other than they do in June and July, and when, consequently, there are more opportunities for the poetry of moonlight flirtation.

And this leads us away to some lighter considerations than those which we have hitherto indulged it. Hitherto we have been trying to depict, however feebly, what may be called the moral beauty of this season of the year. We have dwelt on the particular emotions which the

Original from CORNELL UNIVERSITY

aspect of nature at such a time awakens in us; on the contrast between the sensations of sweetness and of sadness, of repose and of transitoriness, of maturity and of decay, which it suggests to us. But there is an artificial and social poetry also about the month of September at which we have just glanced in the last paragraph, and of which a little more has still to be said. September, in fact, has, owing to a gradual change of habits, appropriated to itself many of the associations which formerly belonged to May, and which are still assigned to her in the conventional language of poetry. But in the last quarter of the nineteenth century September is the lover's month. We are now, of course, speaking only of rural love-making. One month is the same as another in the life of cities, but in country life, and especially in the life of country houses, September bears away the palm. Whether any change has really taken place in our English season since the days of Milton, Dryden, and Addison, we cannot say, but the laureate contends that "those old Mays had thrice the life of ours;" and most certain it is that Dryden's well-known description of that month, if applied to any May we have had for the last twenty years, would seem simply ridiculous. We mean the lines beginning, —

For thee, sweet month, the groves green liveries wear,
If not the first, the fairest, of the year.

Winter in the lap of May is now the rule and not the exception, and "society" does well, in our opinion, to spend it in the capital. Fashion, it may be, after all, has been only unconsciously adapting herself to nature and following in the footsteps of the seasons. When May was a warm and melting month, when the "groves" were full of leaf overhead, and when every bank was "a bed of flowers" on which a lady might throw herself without any fear of the rheumatism, the upper ten thousand did right to end their season in April. There has been, however, a change of dynasty since those days. May is no longer the queen of love and beauty, and the crown is for the present in commission. But the period of the year which now corresponds more closely than any other to what May was formerly is certainly to be found in the latter end of August and September. Then are croquet and archery in all their glory. Then it is that we get our only spell of settled fine weather; the woods are dry, the nights are warm, and long rides and walks furnishing innumerable opportunities for courtship under the most favorable circumstances are of daily occurrence. Then again there is that old-fashioned amusement of nutting, so admirably described in "Tom Brown," and which contains a world of poetry in itself. What a vision of glades and dingles, and steep woodland paths, and high mossy banks, and cool dank depths of impenetrable shade, it conjures up before us. What a sense of seclusion, of complete isolation from the world, of security and irresponsibility creeps over us in the centre of a thick wood, surrounded on all sides by the tall hazel bushes whose tangled branches form an arch over our heads, through which we just discern the great spreading limbs of the oak and the beech up above! Then if you, and the lady of the hour, can only lose your way and wander into some deep leafy hollow, where a half-seen brooklet just trickles over the pebbles, and where no other sound is heard but the flight of the ring-dove, or its soft appealing note from the neighboring elm, you will own the dangerous fascination, the melting influence of the season, nor would give a fig for all your merry months of May. Then the ground would be wet and the trees bare, and very probably an east wind lying in wait for you round the corner. Now all is soft and warm and sheltered. A thick leafy girdle shuts you in; here and there, through the openings, gleam the mossy trunks of ancient trees and gnarled old thorns and hollies; while beyond again all is green darkness — the very home of the fauns and the nymphs, and of the god Silvanus. And is not this a scene more fitting for the whispers of love, for the arm stealing softly round the waist, for the lips at last venturing to the glowing half-expectant cheek, than all the village greens or May-bespangled meads in the world? Our friend Thomson understood this feature of September at all events: —

The clustering nuts for you
The lover finds amid the secret shade;
A glossy shower, and of an ardent brown,
As are the ringlets of Melinda's hair,
Melinda formed with every grace complete.

Of course! But seriously, the poetry of nutting is a large part of that second form of the poetry of September with which we are now engaged. At such a moment your wish is assuredly for what Dryden has painted better than Virgil, for the simple reason that Virgil never painted it at all, —

A country cottage near a crystal flood,
A winding valley and a lofty wood.

Then, if ever, you experience that absolute indifference to affairs which Virgil *has* painted:

Illum non populi fasces, non purpura regum
Flexit et infidos agitans discordia fratres,
Aut conjurato descendens Dacus ab Istro:
Non res Romanæ, perituraque regna.

Let them rave! the peace of September is upon you. Melinda sits beside you, with every grace complete. What can the raw half-clad, chilly month of May, with all her frost-bitten flowers, give you in exchange for this?

We were wrong, perhaps, in saying that in the depth of that cool green wood you would hear no sound but the loving coo or the noisy pinion of the wood-pigeon. You may hear at intervals the distant gun of the partridge-shooter; and little as such a sport may seem at first sight to have to do with "the soul-subduing sentiment harshly styled flirtation,"* the reader of Whyte Melville's charming novel "All Down Hill" will know better, if he has not known it at first hand. In partridge-shooting there is such a thing as luncheon, which it needs little feminine dexterity to convert into a picnic of an exceptionally free and easy character. What more natural than for the daughters of the house to bring out their papa's luncheon in the pony carriage, who meets them with his two young friends in such and such a lane, or under such and such a big hedge? Paterfamilias himself is not unlikely to go to sleep when he has finished his share of pigeon-pie and smoked his allotted pipe. But whether he does or not, he will certainly not get up to help the young ladies gather blackberries; and as that is one of the fruits of the earth of which they happen at this moment to be particularly fond, and as it grows too high on these hedges to be reached without assistance, they pair off easily and naturally in quest of this delicacy; coming back — strange to say — with neither lips nor fingers showing any trace of the coveted refreshment, though what other fruit may have been tasted in the mean time it would perhaps be impertinent to inquire. Oh, yes! partridge-shooting — the sport *par excellence* of September — has a great deal of poetry in it. It is answerable for numerous love-affairs of all kinds — serious or trifling, innocent or otherwise. And while we are on the poetry of September we must never forget that it is of all months in the year the month of honeymoons. We might expatiate on this topic to any extent: on the raptures which September has beheld by lake or mountain, by the blue sea, or in the green retreats of some patrician home. There is some evidence in the context to show that it may have been September when the Lady of Shalott began to grow sick of shadows. The long fields of barley, the reapers reaping early, the sheaves through which Sir Lancelot rode, all point to this conclusion;

Or when the moon was overhead,
Came two young lovers lately wed;
I am half sick of shadow, said
The Lady of Shalott.

It must have been so. Hence, vain, deluding May! We will none of thee. If the Italian Venus loves best the "ivory moonlight of April," our English goddess is clearly most gracious in September.

If the transition from grave to gay in the above pages has been somewhat of the suddenest, I can only say that it reflects to some extent the character of the month I have been describing. The still, deep, eloquent calm of a September day speaking to us in a language which cannot be written down — at once so sweet, so soft, and so sad — may be exchanged in a moment for all the jocund activity of a harvest field, the rough pleasantries of the mowers, and the merry tones of girls and children. Thus there are two aspects of September which present themselves to us alternately, contrasting very strongly with each other, and not shaded off by any very gentle gradations. From one point of view September is merrier than May, from another it is sadder than December. Nothing can be gayer than the human life of the month, with all the bustle and license of the harvest: nothing more calculated to inspire us with serious emotions than the face of nature. Melancholy and gladness share the month between them; and whichever mood we may be in, September can always sympathize with us.

* Coningsby.

From The Saturday Review.

QUIET PEOPLE.

THE misgovernment of the world is carried on with such an amount of talk that one has seldom time to think how little would suffice. Half-a-dozen well-chosen words would generally be better than whole conferences and debates. But,

since people must speak first and choose their words afterwards, everybody's time is taken up in saying that something was said, in saying that something quite different was meant, and in saying something fresh, which has to be explained in its turn. It naturally results that both wise and foolish people have broken much silence in praising it; and that, like abstract virtue, it is admired but seldom practised. It is in vain to point out that the silent fool often passes for a man of wit, because the fool who has wit enough to know this and act accordingly is not properly a fool. Were he a fool he would not keep silence. The negroes attribute this wisdom to the chimpanzee, who, they say, is a man, but will not speak lest he should be made to work. Silent people get through the world as well as their talkative neighbors; every one talks for them; their nod is interpreted where another man would have to make a speech; and every one is willing to excuse them, as the sailor excused his parrot, for, if they do not speak, they think the more. Foote the actor boasted of his horse that it could stand still faster than some horses could trot; and the silent man is often enabled, by the value attached to his rare utterances, to say more by his silence than a voluble talker by a string of phrases. No doubt there is a kind of silence which is the reverse of talk, and is in itself eloquent. A prisoner who reserves his defence, a witness who refuses to answer a question, a man who holds his tongue when his character is assailed — in short, all the cases in which "silence gives consent" are rather silence as the negation of speech than as a positive quantity. The old apophthegm of the Silent Club is not in point either. When the secretary presented the rejected candidate with a glass of water so full that it would not hold another drop, he went to great trouble to do in a roundabout way what he might have done in a moment by saying one word, and so have avoided the retort. The candidate, when he laid the rose-leaf on the water, answered in the language employed by the secretary; but it was a language, and not silence. It is quite easy to imagine loquacity in a deaf mute. He may not have power to utter a sound, yet, in the strict sense, he is not perhaps a silent person. And silence kept on purpose to express, by its very existence, an emotion of the mind, is only a substitution of signs for speech. Such is the reticence displayed by the well-known epitaph on a tombstone in Fulham churchyard, where, after the name, age, and date of death of the lady buried below, three words only are added by way of epitaph — "Silence is best." The estimation of the deceased by her surviving relations could not be more fully expressed had the whole stone been covered. When a character is to be given to a drunken or dishonest servant, the omission of the words honest and sober is sufficient. But this is not the silence of quiet people. Too often they resemble rather the chimpanzee than the parrot, and are not talkative because talk may involve them in further exertion. But it is not easy to pry into their motives of action, or rather of inaction. The Ulster folk have a proverb, "Nobody can tell what is in the pot when the lid is on." It is not the most unselfish people who talk least about themselves. To some the facts which relate to their personal history are too serious for words. When Queen Elizabeth visited Westminster School, it is said that the future Lord Burleigh, in answer to her question as to the number of his floggings, replied in the words of Æneas: —

Infandum, regina, jubes renovare dolorem.

Unspeakable are the emotions of silent people; a sense of personal dignity or shame keeps them quiet; but to most of them is vouchsafed a single confidential friend, into whose ear all the pent-up feelings are poured from time to time.

This is especially the case with quiet girls. What they say in their moments of confidence we cannot pretend to know. Whether they are really quiet or only shy is equally beyond the superficial observer. That they are not found to impede the pleasant flow of soul in ordinary society is often because they are eminently good listeners, and do not yawn at the utmost commonplaces. That another should commit himself to speech, with or without anything to say, is enough to interest them. They are thought sympathetic, and often draw forth the tale of woe long hidden. Men begin by telling them of other loves, and often end by loving them for themselves. In this they have a great advantage over the more gushing sister. They take no notice of a foolish speech, and a man imagines he is safe in their hands. He can say things to them which, said to any one else, might have serious consequences. A quiet cousin is thus often a great blessing to a man. He can talk a matter out as if with himself, and imagine afterwards that he has had counsel upon it. The quiet girl hears him with

outward sympathy, agrees with all his views, and, when asked to help him to a decision, gives her casting vote in favor of the course he already prefers. He finds after a time that her quiet receptiveness is grateful to him; and, when she has seen him safe through an engagement or two, and half-a-dozen flirtations more or less serious, he suddenly finds out, or at least tells her, that he has really been in love with her only all the time. Sometimes this happy result is brought about by scheming, and it is the great drawback of quietness that duplicity is so often attributed to it. The quiet girl of the family regulates the autumn tour; she silently directs its goings to the place where her bosom friend, male or female, is to be met with, and she will bury her sisters in a northern moor or bake them at Brighton with equal and unruffled composure. True, she never asks to go anywhere in particular; but at odd intervals she hazards a remark which suggests the place, and now and then reads out a paragraph from a letter or a newspaper in which its advantages are set forth. What she does say is listened to by the family, for she is always sure of an audience for her rare utterances, and gets a reputation for good sense which she does not always deserve. She is never in scrapes, or, if she is, keeps them to herself. Her allowance is never overdrawn, or, if it is, no one hears her grumble that she cannot make ends meet. There seems to be a method in her doings to which people instinctively yield, and she gets her own way, not so much because she tries to get it, as because nobody thinks of opposing her. Like the flies whose feet are provided with soft pads, so that you do not feel them when they alight on you, her influence works unnoticed, and everything seems ordered for her rather than by her. She almost monopolizes the attentions of the lady's-maid she is supposed to share with her sisters, and can always manage a cup of tea in her room or breakfast in bed. She can flirt, on occasion, in a way no frivolous girl dares to attempt, but she never writes a compromising letter, and has a most convenient want of memory. She accepts presents which her sisters would have to refuse, and keeps them laid by in cotton wool to look at during the hour she is doing her back hair and saying her prayers. She retires gracefully in favor of the other girls, as if willing to let them shine, and gets her reward in the approbation of the old people of the party. Quiet men find her agreeable, and wonder why she is said to be silent, but this is chiefly because she does not bore them by insisting on answers to her questions. When she develops into a wife, for she always marries at least once, she gets her own way in everything. Her husband probably chose her because he thought it would turn out differently, and finds when too late that he could not possibly have made a more complete mistake. Children are always fond of her; sons respect, if they do not greatly love, quiet mothers, for they have never heard them talk nonsense. Servants never give them short answers, as their words are few and decisive, and the poor people think them dignified and mines of hidden wisdom. In fact, they go through the world under a kind of false pretense; they get credit for great depth of feeling, and it is for some reason thought well worth while to win their love. Only the experienced man estimates them at their right value, and admires the merry little sister with the sharp tongue, the pleasant smile, and, as he knows well, a warmer heart and truer character than underlie the staid demeanor of the quiet girl.

Quietness is sometimes a sign of bodily health. The nervous man who is always stirring is seldom strong. But when a man is thoroughly wrapped up in himself and his own importance, perfectly satisfied with his position and prospects, the cut of his clothes, the length of his whiskers, the attenuation of his umbrella, and the lustre of his hat, the chances are that he is very quiet. Such men are habitually well dressed; but as they get on in life they cling to old fashions. They are not considerate for others, yet they give very little trouble. They exact the utmost service, but make no fuss about it. They are painfully regular and punctual, but never seem put out by other people's want of order. They are bores at a dinner party, wet blankets at a picnic, mere sticks at a ball; but excellent as officers, admirable parsons, and much sought after by match-making mothers. It is they who carry off the heiresses; who always save money; who are never in debt or difficulty, as other men are; who are regular in their devotions, and invaluable on committees, where they always get their own way without trouble or fuss. They habitually wait till every one else has spoken, and then make the single remark which concludes the matter, and which seems as if it had risen to the surface, like cream, of itself.

// LITTELL'S LIVING AGE.

Fifth Series, Volume XX. | No. 1739. — October 13, 1877. | From Beginning, Vol. CXXXV.

CONTENTS.

I. The Colors of Animals and Plants, . *Macmillan's Magazine*, . . 67
II. Doris Barugh. A Yorkshire Story. By the author of "Patty,". . . . . *Good Words*, ... 87
III. Samuel Warren, ... *Blackwood's Magazine*, . . 104
IV. French Chateaux of the Renaissance. (1460–1547.) By Mrs. Mark Pattison, . *Contemporary Review*, . . . 111
V. Green Pastures and Piccadilly. By William Black. Part XXXII., . . . *Harper's Bazar*, ... 122
VI. Interesting People, ... *Saturday Review*, ... 125
VII. The Chemical Composition of the Flesh of the Halibut, ... *American Journal of Science*, . 128

POETRY.

In Memoriam, ... 66 | September, ... 66

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For Eight Dollars, *remitted directly to the Publishers*, the Living Age will be punctually forwarded for a year, *free of postage*.

An extra copy of The Living Age is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of Littell & Gay.

Single Numbers of The Living Age, 18 cents.

IN MEMORIAM.

WAR'S horror at its worst, the seeds of change
Darkly at work for nations, churches, kings,
What is there in an old man's death so strange
To give it rank among eventful things?

Nor king is he, nor president, nor pope;
He holds nor sword of strength, nor keys of power;
Hangs on his life nor world-wide fear nor hope;
If he was e'er "the man," long past his hour.

Yet but one statesman's exit, and no king's,
Could give such theme for thought, and tongue, and pen,
As this small eighty-years-old bourgeois' brings
The lightest hearts, and quickest wits, of men.

France, save the fraction that flings filth for flowers,
Utters one voice of sorrowing regret
O'er him who gave her his long manhood's powers,
Whom death, at eighty, found her soldier yet,

Unbowed beneath the burden of fourscore,
Donning his armor for the self-same fight
In which, a stripling, erst the flag he bore
Of might enthroned in power, with law-based right.

What wonder France should sorrow so for him
Who scorned what she scorns, held what she holds dear;
Whose quick sense saw no truth, while it was dim,
Content to rest in half-truth, while 'twas clear.

The sharpest-shaping, keenest-biting wit
That kept alive the memory of Voltaire;
Most French of Frenchmen, apt with phrase to fit
The unspoken sentiment that filled the air,

So giving it the concrete life that moulds
A party's purpose, people's mood, to act;
Finding, at need, the wanted word that holds
A nation's fancy, till it turns to fact.

Against such gifts, what was it that his pen
At times postponed harsh truth to happy phrase?
If, when he ministered as chief of men,
The statesman grasped at times the meaner praise

Of winning cleverly, than on the square?
The jury he appealed to were his peers;
His history was their legend, written fair;
His spice of false won for his truth their ears.

Nor only France he glassed, in fleck and flaw;
From youth he was the soldier-sworn of right
Set in the adamantine bounds of law,
For that was first, would have been last, to fight.

And therefore France, once more upon the verge
Of that sad war 'tis still her fate to wage,
'Twixt might with power, right with but law to urge,
Took him for champion even in his age.

Prone as she is good service to forget,
And fickle in her favor, as they say,
Still in her heart she bore the man who set
Weakness aside, and cast old age away,

Posting the world to raise her up a friend;
Then, harder task, subdued his wrath and shame,
His conquered country's interest to defend,
And melt her conquerors to milder frame.

Who, when concession's utmost boon was wrung,
Despaired not of his country, stricken low,
Beaten and bleeding, but her nerves re-strung
In tune to his, weak wailing to forego;

With hardness to endure, war's debt to pay,
And peace's work with heart and hope set to,
To earn the ransom she had wealth to pay,
And envy of her conquerors thereto.

For this she mourns him — lays upon his bier,
Tribute of common grief, the civic crown;
And holds this little bourgeois, henceforth, dear,
Among her great ones to the dead gone down.

Punch.

SEPTEMBER.

THERE sounds a rustling in the standing corn;
There hangs a bright-cheeked apple on the bough;
And later lingers now the tardy morn,
And evening shadows gather sooner now.

One crimson branch flames 'mid the maple wood;
One red leaf hides amid the woodbine's green;
And clean-raked fields lie bare, where lately stood
The tawny grain amid the summer scene.

Blue gentians show 'mid meadow grasses sear,
And, from the stubble, shrill the crickets sing:
A requiescat o'er the falling year
All sounds seem sadly chorusing.

From Macmillan's Magazine.

THE COLORS OF ANIMALS AND PLANTS.

I.

THE COLORS OF ANIMALS.

THERE is probably no one quality of natural objects, from which we derive so much pure and intellectual enjoyment as from their colors. The "heavenly" blue of the firmament, the glowing tints of sunset, the exquisite purity of the snowy mountains, and the endless shades of green presented by the verdure-clad surface of the earth, are a never-failing source of pleasure to all who enjoy the inestimable gift of sight. Yet these constitute, as it were, but the frame and background of a marvellous and ever-changing picture. In contrast with these broad and soothing tints, we have presented to us in the vegetable and animal worlds, an infinite variety of objects adorned with the most beautiful and most varied hues. Flowers, insects, and birds, are the organisms most generally ornamented in this way; and their symmetry of form, their variety of structure, and the lavish abundance with which they clothe and enliven the earth, cause them to be objects of universal admiration. The relation of this wealth of color to our mental and moral nature is indisputable. The child and the savage alike admire the gay tints of flower, bird, and insect; while to many of us their contemplation brings a solace and enjoyment which is both intellectually and morally beneficial. It can then hardly excite surprise that this relation was long thought to afford a sufficient explanation of the phenomena of color in nature; and although the fact that

> Full many a flower is born to blush unseen,
> And waste its sweetness on the desert air

might seem to throw some doubt on the sufficiency of the explanation, the answer was easy, — that in the progress of discovery, man would, sooner or later, find out and enjoy every beauty that the hidden recesses of the earth have in store for him. This theory received great support, from the difficulty of conceiving any other use or meaning in the colors with which so many natural objects are adorned. Why should the homely gorse be clothed in golden raiment, and the prickly cactus be adorned with crimson bells? Why should our fields be gay with buttercups, and the heather-clad mountains be clad in purple robes? Why should every land produce its own peculiar floral gems, and the Alpine rocks glow with beauty, if not for the contemplation and enjoyment of man? What could be the use to the butterfly of its gaily-painted wings, or to the humming-bird of its jewelled breast, except to add the final touches to a world-picture, calculated at once to please and to refine mankind? And even now, with all our recently acquired knowledge of this subject, who shall say that these old-world views were not intrinsically and fundamentally sound; and that, although we may know that color has "uses" in nature that we little dreamt of, yet the relation of those colors to our senses and emotions may be another, and perhaps more important use which they subserve in the great system of the universe?

We now propose to lay before our readers a general account of the more recent discoveries on this interesting subject; and in doing so, it will be necessary first to give an outline of the more important facts as to the colors of organized beings; then to point out the cases in which it has been shown that color is of use; and lastly, to endeavor to throw some light on its nature, and the general laws of its development.

Among naturalists, color was long thought to be of little import, and to be quite untrustworthy as a specific character. The numerous cases of variability of color led to this view. The occurrence of white blackbirds, white peacocks, and black leopards; of white bluebells, and of white, blue, or pink milkworts, led to the belief that color was essentially unstable, that it could therefore be of little or no importance, and belonged to quite a different class of characters from form or structure. But it now begins to be perceived that these cases, though tolerably numerous, are, after all, exceptional; and that color, as a rule, is a constant character. The great majority of species, both of animals and plants, are each distinguished by peculiar tints which vary very little, while

the minutest markings are often constant in thousands or millions of individuals. All our field buttercups are invariably yellow, and our poppies red, while many of our butterflies and birds resemble each other in every spot and streak of color through thousands of individuals. We also find that color is constant in whole genera and other groups of species. The genistas are all yellow, the erythrinas all red, many genera of carabidæ are entirely black, whole families of birds — as the dendrocolaptidæ — are brown, while among butterflies the numerous species of lycæna are all more or less blue, those of pontia white, and those of callidryas yellow. An extensive survey of the organic world thus leads us to the conclusion that color is by no means so unimportant or inconstant a character as at first sight it appears to be; and the more we examine it the more convinced we shall become that it must serve some purpose in nature, and that besides charming us by its diversity and beauty it must be well worthy of our attentive study, and have many secrets to unfold to us.

In order to group the great variety of facts relating to the colors of the organic world in some intelligible way, it will be best to consider how far the chief theories already proposed will account for them. One of the most obvious and most popular of these theories, and one which is still held, in part at least, by many eminent naturalists, is, that color is due to some direct action of the heat and light of the sun, thus at once accounting for the great number of brilliant birds, insects, and flowers, which are found between the tropics. But here we must ask whether it is really the fact that color is more developed in tropical than in temperate climates, in proportion to the whole number of species; and even if we find this to be so, we have to inquire whether there are not so many and such striking exceptions to the rule, as to indicate some other causes at work than the direct influence of solar light and heat. As this is a most important question, we must go into it somewhat fully.

It is undoubtedly the case that there are an immensely greater number of richly-colored birds and insects in tropical than in temperate and cold countries; but it is by no means so certain that the *proportion* of colored to obscure species is much or any greater. Naturalists and collectors well know that the majority of tropical birds are dull-colored; and there are whole families, comprising hundreds of species, not one of which exhibits a particle of bright color. Such are the timaliidæ of the eastern and the dendrocolaptidæ of the western hemispheres. Again, many groups of birds, which are universally distributed, are no more adorned with color in the tropical than in the temperate zone; such are thrushes, wrens, goat-suckers, hawks, grouse, plovers, and snipe; and if tropical light and heat have any direct coloring effect, it is certainly most extraordinary that in groups so varied in form, structure, and habits as those just mentioned, the tropical should be in no wise distinguished in this respect from the temperate species. The brilliant tropical birds mostly belong to groups which are wholly or almost wholly tropical — as the chatterers, toucans, trogons, and pittas; but as there are perhaps an equal number of groups which are wholly dull-colored, while others contain dull and bright colored species in nearly equal proportions, the evidence is by no means strong that tropical light or heat has anything to do with the matter. But there are also groups in which the cold and temperate zones produce finer-colored species than the tropics. Thus the Arctic ducks and divers are handsomer than those of the tropical zone, while the king-duck of temperate America and the mandarin-duck of N. China are the most beautifully colored of the whole family. In the pheasant family we have the gorgeous gold and silver pheasants in N. China and Mongolia; and the superb Impeyan pheasant in the temperate N.W. Himalayas, as against the peacocks and fire-backed pheasants of tropical Asia. Then we have the curious fact that most of the bright-colored birds of the tropics are denizens of the forests, where they are shaded from the direct light of the sun, and that they abound near the equator where cloudy skies are very prevalent; while, on the other hand, places where light

and heat are at a maximum have often dull-colored birds. Such are the Sahara and other deserts, where almost all the living things are sand-colored; but the most curious case is that of the Galapagos Islands, situated under the equator, and not far from South America, where the most gorgeous colors abound, but which are yet characterized by prevailing dull and sombre tints in birds, insects, and flowers, so that they reminded Mr. Darwin of the cold and barren plains of Patagonia. Insects are wonderfully brilliant in tropical countries generally, and any one looking over a collection of South American or Malayan butterflies would scout the idea of their being no more gaily colored than the average of European species, and in this they would be undoubtedly right. But on examination we should find that all the more brilliantly-colored groups were exclusively tropical, and that, where a genus has a wide range, there is little difference in coloration between the species of cold and warm countries. Thus the European vanessides, including the beautiful "peacock," "Camberwell beauty," and "red admiral" butterflies, are quite up to the average of tropical beauty in the same group, and the remark will equally apply to the little "blues" and "coppers;" while the Alpine "Apollo" butterflies have a delicate beauty that can hardly be surpassed. In other insects, which are less directly dependent on climate and vegetation, we find even greater anomalies. In the immense family of the carabidæ or predaceous ground-beetles, the northern forms fully equal, if they do not surpass, all that the tropics can produce. Everywhere, too, in hot countries, there are thousands of obscure species of insects which, if they were all collected, would not improbably bring down the average of color to much about the same level as that of temperate zones.

But it is when we come to the vegetable world that the greatest misconception on this subject prevails. In abundance and variety of floral color the tropics are almost universally believed to be pre-eminent, not only absolutely, but relatively to the whole mass of vegetation and the total number of species. Twelve years of observation among the vegetation of the eastern and western tropics has, however, convinced me that this notion is entirely erroneous, and that, in proportion to the whole number of species of plants, those having gaily-colored flowers are actually more abundant in the temperate zones than between the tropics. This will be found to be not so extravagant an assertion as it may at first appear, if we consider how many of the choicest adornments of our greenhouses and flower-shows are really temperate as opposed to tropical plants. The masses of color produced by our rhododendrons, azaleas, and camellias, our pelargoniums, calceolarias, and cinerarias, — all strictly temperate plants — can certainly not be surpassed, if they can be equalled, by any productions of the tropics.* But we may go further, and say that the hardy plants of our cold temperate zone equal, if they do not surpass, the productions of the tropics. Let us only remember such gorgeous tribes of flowers as the roses, peonies, hollyhocks, and antirrhinums, the laburnum, wistaria, and lilac; the lilies, irises, and tulips, the hyacinths, anemones, gentians, and poppies, and even our humble gorse, broom, and heather; and we may defy any tropical country to produce masses of floral color in greater abundance and variety. It may be true that individual tropical shrubs and

* It may be objected that most of the plants named are choice cultivated *varieties*, far surpassing in color the original stock, while the tropical plants are mostly unvaried wild *species*. But this does not really much affect the question at issue. For our florists' gorgeous varieties have all been produced under the influence of our cloudy skies, and with even a still further deficiency of light, owing to the necessity of protecting them under glass from our sudden changes of temperature; so that they are themselves an additional proof that tropical light and heat are not needed for the production of intense and varied color. Another important consideration is, that these cultivated *varieties* in many cases displace a number of wild *species* which are hardly, if at all, cultivated. Thus there are scores of *species* of wild hollyhocks varying in color almost as much as the cultivated varieties, and the same may be said of the pentstemons, rhododendrons, and many other flowers; and if these were all brought together in well-grown specimens, they would produce a grand effect. But it is far easier, and more profitable, for our nurserymen to grow *varieties* of one or two species, which all require a very similar culture, rather than fifty distinct *species*, most of which would require special treatment; the result being that the varied beauty of the temperate flora is even now hardly known, except to botanists and to a few amateurs.

flowers do surpass everything in the rest of the world, but that is to be expected, because the tropical zone comprises a much greater land-area than the two temperate zones, while, owing to its more favorable climate, it produces a still larger proportion of species of plants, and a great number of peculiar natural orders.

Direct observation in tropical forests, plains, and mountains, fully supports this view. Occasionally we are startled by some gorgeous mass of color, but as a rule we gaze upon an endless expanse of green foliage, only here and there enlivened by not very conspicuous flowers. Even the orchids, whose gorgeous blossoms adorn our stoves, form no exception to this rule. It is only in favored spots that we find them in abundance; the species with small and inconspicuous flowers greatly preponderate; and the flowering season of each kind being of short duration, they rarely produce any marked effect of color amid the vast masses of foliage which surround them. An experienced collector in the eastern tropics once told me, that although a single mountain in Java had produced three hundred species of orchideæ, only about two per cent. of the whole were sufficiently ornamental or showy to be worth sending home as a commercial speculation. The Alpine meadows and rock-slopes, the open plains of the Cape of Good Hope or of Australia, and the flower-prairies of North America, offer an amount and variety of floral color which can certainly not be surpassed, even if it can be equalled, between the tropics.

It appears, therefore, that we may dismiss the theory that the development of color in nature is directly dependent on, and in any way proportioned to the amount of solar heat and light, as entirely unsupported by facts. Strange to say, however, there are some rare and little-known phenomena, which prove that, in exceptional cases, light does directly affect the colors of natural objects, and it will be as well to consider these before passing on to other matters.

A few years ago, Mr. T. W. Wood called attention to the curious changes in the color of the chrysalis of the small cabbage butterfly (*Pontia rapæ*) when the caterpillars were confined in boxes lined with different tints. Thus in black boxes they were very dark, in white boxes nearly white; and he further showed that similar changes occurred in a state of nature, chrysalises fixed against a whitewashed wall being nearly white, against a red wall reddish, against a pitched paling nearly black. It has also been observed that the cocoon of the emperor moth is either white or brown, according to the surrounding colors. But the most extraordinary example of this kind of change is that furnished by the chrysalis of an African butterfly (*Papilio Nireus*), observed at the Cape by Mrs. Barber, and described (with a colored plate) in the "Transactions of the Entomological Society," 1874, p. 519. The caterpillar feeds on the orange-tree, and also on a forest tree (*Vepris lanceolata*) which has a lighter green leaf, and its color corresponds with that of the leaves it feeds upon, being of a darker green when it feeds on the orange. The chrysalis is usually found suspended among the leafy twigs of its food-plant, or of some neighboring tree; but it is probably often attached to larger branches, and Mrs. Barber has discovered that it has the property of acquiring the color, more or less accurately, of any natural object it may be in contact with. A number of the caterpillars were placed in a case with a glass cover, one side of the case being formed by a red brick wall, the other sides being of yellowish wood. They were fed on orange leaves, and a branch of the bottle-brush tree (*Banksia sp.*) was also placed in the case. When fully fed, some attached themselves to the orange twigs, others to the bottle-brush branch; and these all changed to green pupæ; but each corresponded exactly in tint to the leaves around it, the one being dark, the other a pale, faded green. Another attached itself to the wood, and the pupa became of the same yellowish color; while one fixed itself just where the wood and brick joined, and became one side red the other side yellow! These remarkable changes would perhaps not have been credited, had it not been for the previous observations of Mr. Wood; but the two support each other, and oblige us to accept them as actual phenomena. It is a kind of natural photography, the particular colored rays to which the fresh pupa is exposed in its soft, semi-transparent condition effecting such a chemical change in the organic juices as to produce the same tint in the hardened skin. It is interesting, however, to note that the range of color that can be acquired seems to be limited to those of natural objects to which the pupa is likely to be attached; for when Mrs. Barber surrounded one of the caterpillars with a piece of scarlet cloth no change of color at all was produced, the

pupa being of the usual green tint, but the small red spots with which it is marked were brighter than usual.

In these caterpillars and pupæ, as well as in the great majority of cases in which a change of color occurs in animals, the action is quite involuntary; but among some of the higher animals the color of the integument can be modified at the will of the animal, or at all events by a reflex action dependent on sensation. The most remarkable case of this kind occurs with the chameleon, which has the power of changing its color from dull white to a variety of tints. This singular power has been traced to two layers of pigment deeply seated in the skin, from which minute tubes, or capillary vessels, rise to the surface. The pigment-layers are bluish and yellowish, and by the pressure of suitable muscles these can be forced upwards either together or separately. When no pressure is exerted the color is dirty white, which changes to various tints of bluish, green, yellow, or brown, as more or less of either pigment is forced up and rendered visible. The animal is excessively sluggish and defenceless, and its power of changing its color to harmonize with surrounding objests is essential to its existence. Here too, as with the pupa of *Papilio Nireus*, colors such as scarlet or blue, which do not occur in the immediate environment of the animal, cannot be produced. Somewhat similar changes of color occur in some prawns and flatfish, according to the color of the bottom on which they rest. This is very striking in the chameleon shrimp (*Mysis Chamæleon*), which is grey when on sand, but brown or green when among seaweed of these two colors. Experiment shows, however, that when blinded the change does not occur, so that here too we probably have a voluntary or reflex-sense action. Many cases are known among insects in which the same species has a different tint according to its surroundings, this being particularly marked in some south-African locusts which correspond with the color of the soil wherever they are found; while several caterpillars which feed on two or more plants vary in color accordingly. Several such changes are quoted by Mr. R. Meldola, in a paper on variable protective colcoloring in insects ("Proceedings of the Zoological Society in London," 1873, p 153), and some of them may perhaps be due to a photographic action of the reflected light. In other cases, however, it has been shown that green chlorophyll remains unchanged in the tissues of leaf-eating insects, and being discernible through the transparent integument produces the same color as that of the food-plant.

These peculiar powers of change of color and adaptation, are however rare and quite exceptional. As a rule there is no direct connection between the colors of organisms and the kind of light to which they are usually exposed. This is well seen in most fishes, and in such marine animals as porpoises, whose backs are always dark, although this part is exposed to the blue and white light of the sky and clouds, while their bellies are very generally white, although these are constantly subjected to the deep blue or dusky green light from the bottom. It is evident, however, that these two tints have been acquired for concealment and protection. Looking *down* on the dark back of a fish it is almost invisible, while to an enemy looking *up* from below the light under surface would be equally invisible against the light of the clouds and sky. Again, the gorgeous colors of the butterflies which inhabit the depths of tropical forests bear no relation to the kind of light that falls upon them, coming as it does almost wholly from green foliage, dark brown soil, or blue sky; and the bright under wings of many moths which are only exposed at night, contrast remarkably with the sombre tints of the upper wings which are more or less exposed to the various colors of surrounding nature.

We find, then, that neither the general influence of solar light and heat, nor the special action of variously-tinted rays are adequate causes for the wonderful variety, intensity, and complexity of the colors that everywhere meet us in the animal and vegetable world. Let us therefore take a wider view of these colors, grouping them into classes determined by what we know of their actual uses or special relations to the habits of their possessors. This, which may be termed the functional or biological classification of the colors of living organisms, seems to be best expressed by a division into five groups as follows: —

Animals.	1. Protective colors.	
	2. Warning colors.	*a*. Of creatures specially protected.
		b. Of defenceless creatures mimicking *a*.
	3. Sexual colors.	
	4. Typical colors.	
Plants.	5. Attractive colors.	

The nature of the two first groups, protective and warning colors, has been

so fully detailed and illustrated in my chapter on "Mimicry and other Protective Resemblances among Animals," ("Contributions to the Theory of Natural Selection," p. 45), that very little need be added here except a few words of general explanation. Protective colors are exceedingly prevalent in nature, comprising those of all the white arctic animals, the sandy-colored desert forms, and the green birds and insects of tropical forests. It also comprises thousands of cases of special resemblance — of birds to the surroundings of their nests, and especially of insects to the bark, leaves, flowers, or soil, on or amid which they dwell. Mammalia, fishes, and reptiles, as well as mollusca and other marine invertebrates, present similar phenomena; and the more the habits of animals are investigated, the more numerous are found to be the cases in which their colors tend to conceal them, either from their enemies or from the creatures they prey upon. One of the last-observed and most curious of these protective resemblances has been communicated to me by Sir Charles Dilke. He was shown in Java a pink-colored mantis, which, when at rest, exactly resembled a pink orchis-flower. The mantis is a carnivorous insect, which lies in wait for its prey, and by its resemblance to a flower the insects it feeds on would be actually attracted towards it. This one is said to feed especially on butterflies, so that it is really a living trap and forms its own bait! All who have observed animals, and especially insects, in their native haunts and attitudes, can understand how it is that an insect which in a cabinet looks exceedingly conspicuous, may yet, when alive in its peculiar attitude of repose and with its habitual surroundings, be perfectly well concealed. We can hardly ever tell by the mere inspection of an animal, whether its colors are protective or not. No one would imagine the exquisitely beautiful caterpillar of the emperor moth, which is green, with pink star-like spots, to be protectively colored; yet when feeding on the heather it so harmonizes with the foliage and flowers as to be almost invisible. Every day fresh cases of protective coloring are being discovered even in our own country, and it is becoming more and more evident that the need of protection has played a very important part in determining the actual coloration of animals.

The second class — the warning colors — are exceedingly interesting, because the object and effect of these is, not to conceal the object, but to make it conspicuous. To these creatures it is *useful* to be seen and recognized, the reason being that they have a means of defence which, if known, will prevent their enemies from attacking them, though it is generally not sufficient to save their lives if they are actually attacked. The best examples of these specially protected creatures consist of two extensive families of butterflies, the danaidæ and acræidæ, comprising many hundreds of species inhabiting the tropics of all parts of the world. These insects are generally large, are all conspicuously and often most gorgeously colored, presenting almost every conceivable tint and pattern; they all fly slowly, and they never attempt to conceal themselves: yet no bird, spider, lizard, or monkey (all of which eat other butterflies) ever touch them. The reason simply is that they are not fit to eat, their juices having a powerful odor and taste that is absolutely disgusting to all these animals. Now, we see the reason of their showy colors and slow flight. It is good for them to be seen and recognized, for then they are never molested; but if they did not differ in form and coloring from other butterflies, or if they flew so quickly that their peculiarities could not be easily noticed, they would be captured, and though not eaten would be maimed or killed. As soon as the cause of the peculiarities of these butterflies was recognized, it was seen that the same explanation applied to many other groups of animals. Thus bees and wasps and other stinging insects are showily and distinctively colored; many soft and apparently defenceless beetles, and many gay-colored moths, were found to be as nauseous as the above-named butterflies; other beetles, whose hard and glossy coats of mail render them unpalatable to insect-eating birds, are also sometimes showily colored; and the same rule was found to apply to caterpillars, all the brown and green (or protectively-colored species) being greedily eaten by birds, while showy kinds which never hide themselves — like those of the magpie, mullein, and burnet moths — were utterly refused by insectivorous birds, lizards, frogs and spiders. ("Contributions to Theory of Natural Selection," p. 117.) Some few analogous examples are found among vertebrate animals. I will only mention here a very interesting case not given in my former work. In his delightful book entitled "The Naturalist in Nicaragua," Mr. Belt tells us that there is in that country a frog which is very abundant, which hops about

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

in the daytime, which never hides himself, and which is gorgeously colored with red and blue. Now frogs are usually green, brown, or earth-colored, feed mostly at night, and are all eaten by snakes and birds. Having full faith in the theory of protective and warning colors, to which he had himself contributed some valuable facts and observations, Mr. Belt felt convinced that this frog must be uneatable. He therefore took one home, and threw it to his ducks and fowls; but all refused to touch it except one young duck, which took the frog in its mouth, but dropped it directly, and went about jerking its head as if trying to get rid of something nasty. Here the uneatableness of the frog was predicted from its colors and habits, and we can have no more convincing proof of the truth of the theory than such previsions.

The universal avoidance by carnivorous animals of all these specially protected groups, which are thus entirely free from the constant persecution suffered by other creatures not so protected, would evidently render it advantageous for any of these latter which were subjected to extreme persecution to be mistaken for the former, and for this purpose it would be necessary that they should have the same colors, form, and habits. Strange to say, wherever there is an extensive group of directly protected forms (division *a* of animals with warning colors), there are sure to be found a few otherwise defenceless creatures which resemble them externally so as to be mistaken for them, and which thus gain protection as it were on false pretences, (division *b* of animals with warning colors). This is what is called "mimicry," and it has already been very fully treated of by Mr. Bates (its discoverer), by myself, by Mr. Trimen, and others. Here it is only necessary to state that the uneatable danaidæ and acræidæ are accompanied by a few species of other groups of butterflies (leptalidæ, papilios, diademas, and moths) which are all really eatable, but which escape attack by their close resemblance to some species of the uneatable groups found in the same locality. In like manner there are a few eatable beetles which exactly resemble species of uneatable groups, and others, which are soft, imitate those which are uneatable through their hardness. For the same reason wasps are imitated by moths, and ants by beetles; and even poisonous snakes are mimicked by harmless snakes, and dangerous hawks by defenceless cuckoos. How these curious imitations have been brought about, and the laws which govern them, have been discussed in the work already referred to.

The third class — sexual colors — comprise all cases in which the colors of the two sexes differ. This difference is very general, and varies greatly in amount, from a slight divergence of tint up to a radical change of coloration. Differences of this kind are found among all classes of animals in which the sexes are separated, but they are much more frequent in some groups than in others. In mammalia, reptiles, and fishes, they are comparatively rare and not great in amount, whereas among birds they are very frequent and very largely developed. So among insects, they are abundant in butterflies, while they are comparatively uncommon in beetles, wasps, and hemiptera.

The phenomena of sexual variations of color, as well as of color generally, are wonderfully similar in the two analogous yet totally unrelated groups of birds and butterflies; and as they both offer ample materials, we shall confine our study of the subject chiefly to them. The most common case of difference of color between the sexes, is for the male to have the same general hue as the females, but deeper and more intensified; as in many thrushes, finches, and hawks; and among butterflies in the majority of our British species. In cases where the male is smaller the intensification of color is especially well pronounced, as in many of the hawks and falcons, and in most butterflies and moths in which the coloration does not materially differ. In another extensive series we have spots or patches of vivid color in the male which are represented in the female by far less brilliant tints or are altogether wanting; as exemplified in the gold-crest warbler, the green woodpecker, and most of the orange-tip butterflies (*Anthocharis*). Proceeding with our survey we find greater and greater differences of color in the sexes, till we arrive at such extreme cases as some of the pheasants, the chatterers, tanagers, and birds of paradise, in which the male is adorned with the most gorgeous and vivid colors, while the female is usually dull brown, or olive green, and often shows no approximation whatever to the varied tints of her partner. Similar phenomena occur among butterflies; and in both these classes there are also a considerable number of cases in which both sexes are highly colored in a different way. Thus many woodpeckers have the head in the male red, in the female yellow; while some parrots have red spots in the male, replaced by blue in the female, as in *Psit-*

tacula diopthalma. In many South American papilios green spots on the male are represented by red on the female; and in several species of the genus epicalia, orange bands in the male are replaced by blue in the female, a similar change of color as in the small parrot above referred to. For fuller details of the varieties of sexual coloration we refer our readers to Mr. Darwin's "Descent of Man," chapters x. to xviii., and to chapters iii., iv., and vii. of my "Contributions to the Theory of Natural Selection."

The fourth group — of typically-colored animals — includes all species which are brilliantly or conspicuously colored in both sexes, and for whose particular colors we can assign no function or use. It comprises an immense number of showy birds, such as kingfishers, barbets, toucans, lories, tits, and starlings; among insects most of the largest and handsomest butterflies, innumerable bright-colored beetles, locusts, dragon-flies, and hymenoptera; a few mammalia, as the zebras; a great number of marine fishes; thousands of striped and spotted caterpillars; and abundance of mollusca, starfish, and other marine animals. Among these we have included some, which like the gaudy caterpillars have warning colors; but as that theory does not explain the particular colors or the varied patterns with which they are adorned, it is best to include them also in this class. It is a suggestive fact, that all the brightly-colored birds mentioned above build in holes or form covered nests, so that the females do not need that protection during the breeding season, which I believe to be one of the chief causes of the dull color of female birds when their partners are gaily colored. This subject is fully argued in my "Contributions," etc., chapter vii.

As the colors of plants and flowers are very different from those of animals both in their distribution and functions, it will be well to treat them separately: we will therefore now consider how the general facts of color here sketched out can be explained. We have first to inquire what is color, and how it is produced; what is known of the causes of change of color; and what theory best accords with the whole assemblage of facts.

The sensation of color is caused by vibrations or undulations of the ethereal medium of different lengths and velocities. The whole body of vibrations caused by the sun is termed radiation, and consists of sets of waves which vary considerably in their dimensions and their rate of vibration, but of which the middle portion only is capable of exciting in us sensations of light and color. Beginning with the largest and slowest rays of wave-vibrations, we have first those which produce heat-sensations only; as they get smaller and quicker, we perceive a dull red color; and as the waves increase in rapidity of vibration and diminish in size, we get successively sensations of orange, yellow, green, blue, indigo, and violet, all fading imperceptibly into each other. Then come more invisible rays, of shorter wave-length and quicker vibration, which produce, solely or chiefly, chemical effects. The red rays, which first become visible, have been ascertained to vibrate at the rate of four hundred and fifty-eight millions of millions of times in a second, the length of each wave being one thirty-six-thousand-nine-hundredth of an inch; while the violet rays, which last remain visible, vibrate seven hundred and twenty-seven millions of millions of times per second, and have a wave-length of one sixty four-thousand-five-hundred-and-sixteenth of an inch. Although the waves vibrate at different rates, they are all propagated through the ether with the same velocity (one hundred and ninety-two thousand miles per second), just as different musical sounds, which are produced by waves of *air* of different lengths and rates of vibration, travel at the same rate, so that a tune played several hundred yards off reaches the ear in correct time. There are, therefore, an almost infinite number of different color-producing vibrations, and these may be combined in an almost infinite variety of ways, so as to excite in us the sensation of all the varied colors and tints we are capable of perceiving. When all the different kinds of rays reach us in the proportion in which they exist in the light of the sun, they produce the sensation of white. If the rays which excite the sensation of any one color are prevented from reaching us, the remaining rays in combination produce a sensation of color often very far removed from white. Thus green rays being abstracted leave purple light; blue, orange-red light; violet, yellowish-green light, and so on. These pairs are termed complementary colors. And if portions of differently-colored lights are abstracted in various degrees, we have produced all those infinite gradations of colors, and all those varied tints and hues which are of such use to us in distinguishing external objects, and which form one of the great charms of our existence. Pri-

mary colors would therefore be as numerous as the different wave-lengths of the visible radiations if we could appreciate all their differences, while secondary or compound colors caused by the simultaneous action of any combination of rays of different wave-lengths must be still more numerous. In order to account for the fact that all colors appear to us capable of being produced by combinations of three primary colors — red, green, and violet — it is believed that we have three sets of nerve-fibres in the retina, each of which is capable of being excited by all rays, but that one set is excited most by the larger or red waves, another by the medium or green waves, and the third set chiefly by the violet or smallest waves of light; and when all three sets are excited together in proper proportions we see white. This view is supported by the phenomena of color-blindness, which are explicable on the theory that one of these sets of nerve-fibres (usually that adapted to perceive red) has lost its sensibility, causing all colors to appear as if the red rays were abstracted from them. It is another property of these various radiations, that they are unequally refracted or bent in passing obliquely through transparent bodies, the longer waves being least refracted, the shorter most. Hence it becomes possible to analyze white or any other light into its component rays; a small ray of sunlight, for example, which would produce a round white spot on a wall, if passed through a prism is lengthened out into a band of colored light exactly corresponding to the colors of the rainbow. Any one color can thus be isolated and separately examined, and by means of reflecting mirrors the separate colors can be again compounded in various ways, and the resulting colors observed. This band of colored light is called a *spectrum*, and the instrument by which the *spectra* of various kinds of light are examined is called a *spectroscope*. This branch of the subject has, however, no direct bearing on the mode in which the colors of living things are produced, and it has only been alluded to in order to complete our sketch of the nature of color.

The colors which we perceive in material substances are produced either by the absorption or by the interference of some of the rays which form white light. Pigmental or absorption colors are the most frequent, comprising all the opaque tints of flowers and insects, and all the colors of dyes and pigments. They are caused by rays of certain wave-lengths being absorbed, while the remaining rays are reflected and give rise to the sensation of color. When all the color-producing rays are reflected in due proportion the color of the object is white, when all are absorbed the color is black. If blue rays only are absorbed the resulting color is orange-red; and generally, whatever color an object appears to us, it is because the complementary colors are absorbed by it. The reason why rays of only certain refrangibilities are reflected and the rest of the incident light absorbed by each substance, is supposed to depend upon the molecular structure of the body. Chemical action almost always implies change of molecular structure, hence chemical action is the most potent cause of change of color. Sometimes simple solution in water effects a marvellous change, as in the case of the well-known aniline dyes; the magenta and violet dyes exhibiting, when in the solid form, various shades of golden or bronzy metallic green. Heat again often produces change of color, and this without effecting any chemical change. Mr. Ackroyd has recently investigated this subject,* and has shown that a large number of bodies are changed by heat, returning to their normal color when cooled, and that this change is almost always in the direction of the less refrangible rays or longer wave-lengths; and he connects the change with molecular expansion caused by heat. As examples may be mentioned mercuric oxide, which is orange-yellow, but which changes to orange, red, and brown when heated; chromic-oxide, which is green, and changes to yellow; cinnabar, which is scarlet, and changes to puce; and metaborate of copper, which is blue, and changes to green and greenish yellow. The coloring matters of animals are very varied. Copper has been found in the red of the wing of the turaco, and Mr. Sorby has detected no less than seven distinct coloring matters in birds' eggs, several of which are chemically related to those of blood and bile. The same colors are often produced by quite different substances in different groups, as shown by the red of the wings of the burnet moth changing to yellow with muriatic acid, while the red of the red admiral butterfly undergoes no such change.

These pigmental colors have a different character in animals according to their position in the integument. Following

Dr. Hagen's classification, epidermal colors are those which exist in the external chitinized skin of insects, in the hairs of mammals, and, partially, in the feathers of birds. They are often very deep and rich, and do not fade after death. The hypodermal colors are those which are situated in the inferior soft layer of the skin. These are often of lighter and more vivid tints, and usually fade after death. Many of the reds and yellows of butterflies and birds belong to this class, as well as the intensely vivid hues of the naked skin about the heads of many birds. These colors sometimes exude through the pores, forming an evanescent bloom on the surface.

Interference colors are less frequent in the organic world. They are caused in two ways: either by reflection from the two surfaces of transparent films, as seen in the soap-bubble and in thin films of oil on water; or by fine striæ which produce colors either by reflected or transmitted light, as seen in mother-of-pearl and in finely-ruled metallic surfaces. In both cases color is produced by light of one wave-length being neutralized, owing to one set of such waves being caused to be half a wave-length behind the other set, as may be found explained in any treatise on physical optics. The result is, that the complementary color of that neutralized is seen; and as the thickness of the film or the fineness of the striæ undergo slight changes almost any color can be produced. This is believed to be the origin of many of the glossy or metallic tints of insects, as well as of those of the feathers of some birds. The iridescent colors of the wings of dragon-flies are caused by the superposition of two or more transparent lamellæ; while the shining blue of the purple-emperor and other butterflies, and the intensely metallic colors of humming-birds are probably due to fine striæ.

This outline sketch of the nature of color in the animal world, however imperfect, will at least serve to show us how numerous and varied are the causes which perpetually tend to the production of color in animal tissues. If we consider that in order to produce white all the rays which fall upon an object must be reflected in the same proportions as they exist in solar light, whereas if rays of any one or more kinds are absorbed or neutralized the resultant reflected light will be colored, and that this color may be infinitely varied according to the proportions in which different rays are reflected or absorbed, we should expect that white would be, as it really is, comparatively rare and exceptional in nature. The same observation will apply to black, which arises from the absorption of all the different rays. Many of the complex substances which exist in animals and plants are subject to changes of color under the influence of light, heat, or chemical change, and we know that chemical changes are continually occurring during the physiological processes of development and growth. We also find that every external character is subject to minute changes, which are generally perceptible to us in closely allied species; and we can therefore have no doubt that the extension and thickness of the transparent lamellæ, and the fineness of the striæ or rugosities of the integuments, must be undergoing constant minute changes; and these changes will very frequently produce changes of color. These considerations render it probable that color is a normal and even necessary result of the complex structure of animals and plants, and that those parts of an organism which are undergoing continual development and adaptation to new conditions, and are also continually subject to the action of light and heat, will be the parts in which changes of color will most frequently appear. Now there is little doubt that the external changes of animals and plants in adaptation to the environment are much more numerous than the internal changes, as seen in the varied character of the integuments and appendages of animals — hair, horns, scales, feathers, etc., etc., and in plants, the leaves, bark, flowers, and fruit, with their various appendages — compared with the comparative uniformity of the texture and composition of their internal tissues; and this accords with the uniformity of the tints of blood, muscle, nerve, and bone throughout extensive groups, as compared with the great diversity of color of their external organs. It seems a fair conclusion that color *per se* may be considered to be normal, and to need no special accounting for, while the absence of color (that is, either *white* or *black*), or the prevalence of certain colors to the constant exclusion of others, must be traced, like other modifications in the economy of living things, to the needs of the species. Or, looking at it in another aspect, we may say, that amid the constant variations of animals and plants color is ever tending to vary and to appear where it is absent, and that natural selection is constantly eliminating such tints as are injurious to the species, or preserving and intensifying such as are useful.

This view is in accordance with the well-known fact, of colors which rarely or never appear in the species in a state of nature continually occurring among domesticated animals and cultivated plants; showing us that the capacity to develop color is ever present, so that almost any required tint can be produced which may, under changed conditions, be useful, in however small a degree.

Let us now see how these principles will enable us to understand and explain the varied phenomena of color in nature, taking them in the order of our functional classification of colors (p. 71).

Theory of Protective Colors. — We have seen that obscure or protective tints in their infinitely varied degrees are present in every part of the animal kingdom, whole families or genera being often thus colored. Now the various brown, earthy, ashy, and other neutral tints are those which would be most readily produced, because they are due to an irregular mixture of many kinds of rays; while pure tints require either rays of one kind only, or definite mixtures in proper proportions of two or more kinds of rays. This is well exemplified by the comparative difficulty of producing definite pure tints by the mixture of two or more pigments, while a haphazard mixture of a number of these will be almost sure to produce browns, olives, or other neutral or dirty colors. An indefinite or irregular absorption of some rays and reflection of others would, therefore, produce obscure tints; while pure and vivid colors would require a perfectly definite absorption of one portion of the colored rays, leaving the remainder to produce the true complementary color. This being the case we may expect these brown tints to occur when the need of protection is very slight or even when it does not exist at all, always supposing that bright colors are not in any way useful to the species. But whenever a pure color is protective, as green in tropical forests or white among arctic snows, there is no difficulty in producing it, by natural selection acting on the innumerable slight variations of tint which are ever occurring. Such variations may, as we have seen, be produced in a great variety of ways; either by chemical changes in the secretions or by molecular changes in surface structure, and may be brought about by change of food, by the photographic action of light, or by the normal process of generative variation. Protective colors therefore, however curious and complex they may be in certain cases, offer no real difficulties.

Theory of Warning Colors. — These differ greatly from the last class, inasmuch as they present us with a variety of brilliant hues, often of the greatest purity, and combined in striking contrasts and conspicuous patterns. Their use depends upon their boldness and visibility, not on the presence of any one color; hence we find among these groups some of the most exquisitely-colored objects in nature. Many of the uneatable caterpillars are strikingly beautiful; while the danaidæ, heliconidæ, and protected groups of papilionidæ comprise a series of butterflies of the most brilliant and contrasted colors. The bright colors of many of the sea-anemones and sea-slugs will probably be found to be in this sense protective, serving as a warning of their uneatableness. On our theory none of these colors offer any difficulty. Conspicuousness being useful, every variation tending to brighter and purer colors was selected, the result being the beautiful variety and contrast we find.

But when we come to those groups which gain protection solely by being mistaken for some of these brilliantly-colored but uneatable creatures, a difficulty really exists, and to many minds is so great as to be insuperable. It will be well therefore to endeavor to explain how the resemblance in question may have been brought about. The most difficult case, which may be taken as a type of the whole, is that of the genus *Leptalis* (a group of South American butterflies allied to our common white and yellow kinds), many of the larger species of which are still white or yellow, and which are all eatable by birds and other insectivorous creatures. But there are also a number of species of *Leptalis*, which are brilliantly red, yellow, and black, and which, band for band and spot for spot resemble some one of the danaidæ or heliconidæ which inhabit the same district and which are nauseous and uneatable. Now the common objection is, that a slight approach to one of these protected butterflies would be of no use, while a greater sudden variation is not admissible on the theory of gradual change by indefinite slight variations. This objection depends almost wholly on the supposition that when the first steps towards mimicry occurred, the South American danaidæ were what they are now, while the ancestors of the leptalides were like the ordinary white or yellow pieridæ to which they are allied. But the danaioid butterflies of South America are so immensely numerous and so greatly varied, not only

in color but in structure, that we may be sure they are of vast antiquity and have undergone great modification. A large number of them, however, are still of comparatively plain colors, often rendered extremely elegant by the delicate transparency of the wing-membrane, but otherwise not at all conspicuous. Many have only dusky or purplish bands or spots, others have patches of reddish or yellowish brown — perhaps the commonest color among butterflies; while a considerable number are tinged or spotted with yellow, also a very common color, and one especially characteristic of the pieridæ, the family to which *Leptalis* belongs. We may therefore reasonably suppose that in the early stages of the development of the danaidæ, when they first began to acquire those nauseous secretions which are now their protection, their colors were somewhat plain, either dusky with paler bands and spots, or yellowish with dark borders, and sometimes with reddish bands or spots. At this time they had probably shorter wings and a more rapid flight, just like the other unprotected families of butterflies. But as soon as they became decidedly unpalatable to any of their enemies, it would be an advantage to them to be readily distinguished from all the eatable kinds; and as butterflies were no doubt already very varied in color, while all probably had wings adapted for pretty rapid or jerking flight, the best distinction might have been found in outline and habits; whence would arise the preservation of those varieties whose longer wings, bodies, and antennæ, and slower flight rendered them noticeable,— characters which now distinguish the whole group in every part of the world. Now it would be at this stage that some of the weaker-flying pieridæ which happened to resemble some of the danaidæ around them in their yellow and dusky tints and in the general outline of their wings, would be sometimes mistaken for them by the common enemy, and would thus gain an advantage in the struggle for existence. Admitting this one step to be made, and all the rest must inevitably follow from simple variation and survival of the fittest. So soon as the nauseous butterfly varied in form or color to such an extent that the corresponding eatable butterfly no longer closely resembled it, the latter would be exposed to attacks, and only those variations would be preserved which kept up the resemblance. At the same time we may well suppose the enemies to become more acute and able to detect smaller differences than at first. This would lead to the destruction of all adverse variations, and thus keep up in continually increasing complexity the outward mimicry which now so amazes us. During the long ages in which this process has been going on, many a *Leptalis* may have become extinct from not varying sufficiently in the right direction and at the right time to keep up a protective resemblance to its neighbor; and this will accord with the comparatively small number of cases of true mimicry as compared with the frequency of those protective resemblances to vegetable or inorganic objects whose forms are less definite and colors less changeable. About a dozen other genera of butterflies and moths mimic the danaidæ in various parts of the world, and exactly the same explanation will apply to all of them. They represent those species of each group which at the time when the danaidæ first acquired their protective secretions happened outwardly to resemble some of them, and have by concurrent variation, aided by a right selection, been able to keep up that resemblance to the present day.*

Theory of Sexual Colors. In Mr. Darwin's celebrated work, "The Descent of Man, and Selection in Relation to Sex," he has treated of sexual color in combination with other sexual characters, and has arrived at the conclusion that all or almost all of the colors of the higher animals (including among these insects and all vertebrates) are due to voluntary sexual selection; and that diversity of color in the sexes is due, primarily, to the transmission of color-variations either to one sex only or to both sexes, the difference depending on some unknown law, and not being due to natural selection.

I have long held this portion of Mr. Darwin's theory to be erroneous, and have argued that the primary cause of sexual diversity of color was the need of protection, repressing in the female those bright colors which are normally produced in both sexes by general laws; and I have attempted to explain many of the more difficult cases on this principle ("A Theory of Birds' Nests," in "Contributions," etc., p. 231). As I have since given much

* For fuller information on this subject the reader should consult Mr. Bates's original paper, "Contributions to an Insect Fauna of the Amazon Valley," in "Transactions of the Linnean Society," vol. xxiii., p. 495; Mr. Trimen's paper in vol. xxvi., p. 497; the author's essay on "Mimicry," etc., already referred to; and, in the absence of collections of butterflies, the plates of heliconidæ and leptalidæ, in Hewitson's "Exotic Butterflies," and Felder's "Voyage of the 'Novara,'" may be examined.

thought to this subject, and have arrived at some views which appear to me to be of considerable importance, it will be well to sketch briefly the theory I now hold, and afterwards show its application to some of the detailed cases adduced in Mr. Darwin's work.

The very frequent superiority of the male bird or insect in brightness or intensity of color, even when the general tints and coloration are the same, now seem to me to be due to the greater vigor and activity and the higher vitality of the male. The colors of an animal usually fade during disease or weakness, while robust health and vigor adds to their intensity. This intensity of coloration is most manifest in the male during the breeding season, when the vitality is at a maximum. It is also very manifest in those cases in which the male is smaller than the female, as in the hawks and in most butterflies and moths. The same phenomena occur, though in a less marked degree, among mammalia. Whenever there is a difference of color between the sexes the male is the darker or more strongly marked, and difference of intensity is most visible during the breeding season ("Descent of Man," p. 533). Numerous cases among domestic animals also prove, that there is an inherent tendency in the male to special developments of dermal appendages and color, quite independently of sexual or any other form of selection. Thus, "the hump on the male zebu cattle of India, the tail of fat-tailed rams, the arched outline of the forehead in the males of several breeds of sheep, and the mane, the long hairs on the hind legs, and the dewlap of the male of the Berbura goat," are all adduced by Mr. Darwin as instances of characters peculiar to the male, yet not derived from any parent ancestral form. Among domestic pigeons the character of the different breeds is often most strongly manifested in the male birds; the wattle of the carriers and the eyewattles of the barbs are largest in the males, and male pouters distend their crops to a much greater extent than do the females, and the cock fantails often have a greater number of tail-feathers than the females. There are also some varieties of pigeons of which the males are striped or spotted with black while the females are never so spotted ("Animals and Plants under Domestication," i. 161); yet in the parent stock of these pigeons there are no differences between the sexes either of plumage or color, and artificial selection has not been applied to produce them.

The greater intensity of coloration in the male — which may be termed the normal sexual difference, would be further developed by the combats of the males for the possession of the females. The most vigorous and energetic usually being able to rear most offspring, intensity of color, if dependent on, or correlated with vigor, would tend to increase. But as differences of color depend upon minute chemical or structural differences in the organism, increasing vigor acting unequally on different portions of the integument, and often producing at the same time abnormal developments of hair, horns, scales, feathers, etc., would almost necessarily lead also to variable distribution of color, and thus to the production of new tints and markings. These acquired colors would, as Mr. Darwin has shown, be transmitted to both sexes or to one only, according as they first appear at an early age, or in adults of one sex, and thus we may account for some of the most marked differences in this respect. With the exception of butterflies, the sexes are almost alike in the great majority of insects. The same is the case in mammals and reptiles, while the chief departure from the rule occurs in birds, though even here in very many cases the law of sexual likeness prevails. But in all cases where the increasing development of color became disadvantageous to the female, it would be checked by natural selection, and thus produce those numerous instances of protective coloring in the female only, which occur in these two groups of animals.

There is also, I believe, a very important purpose and use of the varied colors of the higher animals, in the facility it affords for recognition by the sexes or by the young of the same species; and it is this use which probably fixes and determines the coloration in many cases. When differences of size and form are very slight, color affords the only means of recognition at a distance or while in motion, and such a distinctive character must therefore be of especial value to flying insects which are continually in motion, and encounter each other, as it were, by accident. This view offers us an explanation of the curious fact, that among butterflies the females of closely allied species in the same locality sometimes differ considerably, while the males are much alike; for as the males are the swiftest and the highest fliers, and seek the females, it would evidently be advantageous for them to be able to recognize their true partners at some distance off. This peculiarity

occurs with many species of papilio, diadema, adolias, and colias. In birds such marked differences of color are not required, owing to the higher organization and more perfect senses, which render recognition easy by means of a combination of very slight differential characters. This principle may, perhaps, however, account for some anomalies of coloration among the higher animals. Thus, Mr. Darwin, while admitting that the hare and the rabbit are colored protectively, remarks that the latter, while running to its burrow, is made conspicuous to the sportsman, and no doubt to all beasts of prey, by its upturned white tail. But this very conspicuousness while running away, may be useful as a signal and guide to the young, who are thus enabled to escape danger by following the older rabbits, directly and without hesitation, to the safety of the burrow; and this may be the more important from the semi-nocturnal habits of the animal. If this explanation is correct, and it certainly seems probable, it may serve as a warning of how impossible it is, without exact knowledge of the habits of an animal and a full consideration of all the circumstances, to decide that any particular coloration cannot be protective or in any way useful. Mr. Darwin himself is not free from such assumptions. Thus, he says: "The zebra is conspicuously striped, and stripes cannot afford any protection on the open plains of south Africa." But the zebra is a very swift animal, and, when in herds, by no means void of means of defence. The stripes therefore *may* be of use by enabling stragglers to distinguish their fellows at a distance, and they *may* be even protective when the animal is at rest among herbage — the only time when it would need protective coloring. Until the habits of the zebra have been observed with special reference to this point, it is surely somewhat hasty to declare that the stripes "cannot afford any protection."

The wonderful display and endless variety of color in which butterflies and birds so far exceed all other animals, seems primarily due to the excessive development and endless variations of the integumentary structures. No insects have such widely expanded wings in proportion to their bodies as butterflies and moths; in none do the wings vary so much in size and form, and in none are they clothed with such a beautiful and highly-organized coating of scales. According to the general principles of the production of color already explained, these long-continued expansions of membranes and developments of surface structures must have led to numerous color-changes, which have been sometimes checked, sometimes fixed and utilized, sometimes intensified, by natural selection, according to the needs of the animal. In birds, too, we have the wonderful clothing of plumage — the most highly organized, the most varied, and the most expanded of all dermal appendages. The endless processes of growth and change during the development of feathers, and the enormous extent of this delicately-organized surface, must have been highly favorable to the production of varied color-effects, which, when not injurious, have been merely fixed for purposes of specific identification, but have often been modified or suppressed whenever different tints were needed for purposes of protection.

To voluntary sexual selection, that is, the actual choice by the females of the more brilliantly-colored males, I believe very little if any effect is directly due. It is undoubtedly proved that in birds the females do sometimes exert a choice; but the evidence of this fact collected by Mr. Darwin ("Descent of Man," chap. xiv.) does not prove that color determines that choice, while much of the strongest evidence is directly opposed to this view. All the facts appear to be consistent with the choice depending on a variety of male characteristics, with some of which color is often correlated. Thus it is the opinion of some of the best observers that vigor and liveliness are most attractive, and these are no doubt usually associated with intensity of color. Again, the display of the various ornamental appendages of the male during courtship may be attractive, but these appendages, with their bright colors or shaded paterns, are due probably to general laws of growth and to that superabundant vitality which we have seen to be a cause of color. But there are many considerations which seem to show that the possession of these ornamental appendages and bright colors in the male is not an important character functionally, and that it has not been produced by the action of voluntary sexual selection. Amid the copious mass of facts and opinions collected by Mr. Darwin as to the display of color and ornaments by the male birds, there is a total absence of any evidence that the females admire or even notice this display. The hen, the turkey, and the pea-fowl go on feeding while the male is displaying his finery, and there is reason to believe that it is his persistency and

energy rather than his beauty which wins the day. Again, evidence collected by Mr. Darwin himself proves that each bird finds a mate under any circumstances. He gives a number of cases of one of a pair of birds being shot, and the survivor being always found paired again almost immediately. This is sufficiently explained on the assumption that the destruction of birds by various causes is continually leaving widows and widowers in nearly equal proportions, and thus each one finds a fresh mate; and it leads to the conclusion that permanently unpaired birds are very scarce; so that, speaking broadly, every bird finds a mate and breeds. But this would almost or quite neutralize any effect of sexual selection of color or ornament, since the less highly-colored birds would be at no disadvantage as regards leaving healthy offspring. If, however, heightened color is correlated with health and vigor, and these healthy and vigorous birds provide best for their young, and leave offspring which, being equally healthy and vigorous, can best provide for themselves, then natural selection becomes a preserver and intensifier of color. Another most important consideration is, that male butterflies rival or even excel the most gorgeous male birds in bright colors and elegant patterns; and among these there is literally not one particle of evidence that the female is influenced by color or even that she has any power of choice, while there is much direct evidence to the contrary ("Descent of Man," p. 318). The weakness of the evidence for sexual selection among these insects is so palpable that Mr. Darwin is obliged to supplement it by the singularly inconclusive argument that, "Unless the females prefer one male to another, the pairing must be left to mere chance, and this does not appear probable (*l. c.*, p. 317)." But he has just said, "The males sometimes fight together in rivalry, and many may be seen pursuing or crowding round the same female;" while in the case of the silk-moths, "the females appear not to evince the least choice in regard to their partners." Surely the plain inference from all this is, that males fight and struggle for the almost passive female, and that the most vigorous and energetic, the strongest-winged or the most persevering, wins her. How can there be chance in this? Natural selection would here act, as in birds, in perpetuating the strongest and most vigorous males, and as these would usually be the more highly colored of their race, the same results would be produced as regards the intensification and variation of color in the one case as in the other.

Let us now see how these principles will apply to some of the cases adduced by Mr. Darwin in support of his theory of voluntary sexual selection.

In "Descent of Man," 2d ed., pp. 307–316, we find an elaborate account of the various modes of coloring of butterflies and moths, proving that the colored parts are always more or less displayed, and that they have some evident relation to an observer. Mr. Darwin then says, "From the several foregoing facts it is impossible to admit that the brilliant colors of butterflies, and of some few moths, have commonly been acquired for the sake of protection. We have seen that their colors and elegant patterns are arranged and exhibited as if for display. Hence I am led to believe that the females prefer or are most excited by the more brilliant males; for on any other supposition the males would, as far as we can see, be ornamented to no purpose" (*l. c.*, p. 316). I am not aware that any one has ever maintained that the brilliant colors of butterflies have "commonly been acquired for the sake of protection," yet Mr. Darwin has himself referred to cases in which the brilliant color is so placed as to serve for protection; as for example, the eye-spots on the hind wings of moths, which are pierced by birds and so save the vital parts of the insect, while the bright patch on the orange-tip butterflies which Mr. Darwin denies are protective, may serve the same purpose. It is in fact somewhat remarkable how very generally the black spots, ocelli, or bright patches of color are on the tips, margins, or discs of the wings; and as the insects are necessarily visible while flying, and this is the time when they are most subject to attacks by insectivorous birds, the position of the more conspicuous parts at some distance from the body may be a real protection to them. Again, Mr. Darwin admits that the white color of the male ghost-moth may render it more easily seen by the female while flying about in the dusk, and if to this we add that it will be also more readily distinguished from allied species, we have a reason for diverse ornamentation in these insects quite sufficient to account for most of the facts, without believing in the selection of brilliant males by the females, for which there is not a particle of evidence. The facts given to show that butterflies and other insects can distinguish colors and are attracted by colors similar to their

Original from CORNELL UNIVERSITY

own, are quite consistent with the view that color, which continually tends to appear, is utilized for purposes of identification and distinction, when not required to be modified or suppressed for purposes of protection. The cases of the females of some species of thecla, calladryas, colias, and hipparchia, which have more conspicuous markings than the male, may be due to several causes: to obtain greater distinction from other species, for protection from birds, as in the case of the yellow-under-wing moths, while sometimes — as in hipparchia — the lower intensity of coloring in the female may lead to more contrasted markings. Mr. Darwin thinks that here the males have selected the more beautiful females, although one chief fact in support of his theory of voluntary sexual selection is, that throughout the whole animal kingdom the males are usually so ardent that they will accept any female, while the females are coy, and choose the handsomest males, whence it is believed the general brilliancy of males as compared with females has arisen.

Perhaps the most curious cases of sexual difference of color are those in which the female is very much more gaily colored than the male. This occurs most strikingly in some species of pieris in South America, and of diadema in the Malay islands, and in both cases the females resemble species of the uneatable danaidæ and heliconidæ, and thus gain a protection. In the case of *Pieris pyrrha*, *P. malenka*, and *P. lorena*, the males are plain white and black, while the females are orange, yellow, and black, and so banded and spotted as exactly to resemble species of heliconidæ. Mr. Darwin admits that these females have acquired these colors as a protection; but as there is no apparent cause for the strict limitations of the color to the female, he believes that it has been kept down in the male by its being *unattractive* to her. This appears to me to be a supposition opposed to the whole theory of sexual selection itself. For this theory is, that minute variation of color in the male are *attractive* to the female, have always been selected, and that thus the brilliant male colors have been produced. But in this case he thinks that the female butterfly had a constant aversion to every trace of color, even when we must suppose it was constantly recurring during the successive variations which resulted in such a marvellous change in herself. But if we consider the fact that the females frequent the forests where the heliconidæ abound, while the males fly much in the open, and assemble in great numbers with other white and yellow butterflies on the banks of rivers, may it not be possible that the appearance of orange stripes or patches would be as injurious to the male as it is useful to the female, by making him a more easy mark for insectivorous birds among his white companions? This seems a more probable supposition, than the altogether hypothetical choice of the female, sometimes exercised in favor of and sometimes against every new variety of color in her partner.

The full and interesting account given by Mr. Darwin of the colors and habits of male and female birds ("Descent of Man," chapters xiii. and xiv.), proves that in most, if not in all cases, the male birds fully display their ornamental plumage, before the females and in rivalry with each other; but on the essential point of whether the female's choice is determined by minute differences in these ornaments or in their colors, there appears to be an entire absence of evidence. In the section on "Preference for Particular Males by the Females," the facts quoted show indifference to color, except that some color similar to their own seems to be preferred. But in the case of the hen canary, who chose a greenfinch in preference to either chaffinch or goldfinch, gay colors had evidently no preponderating attraction. There is some evidence adduced that female birds may, and probably do, choose their mates, but none whatever that the choice is determined by difference of color; and no less than three eminent breeders informed Mr. Darwin that they "did not believe that the females prefer certain males on account of the beauty of their plumage." Again, Mr. Darwin himself says: "As a general rule color appears to have little influence on the pairing of pigeons." The oft-quoted case of Sir R. Heron's peahens which preferred an "old pied cock" to those normally colored, is a very unfortunate one, because pied birds are just those that are not favored in a state of nature, or the breeds of wild birds would become as varied and mottled as our domestic varieties. If such irregular fancies were not rare exceptions the production of definite colors and patterns by the choice of the female birds, or in any other way, would be impossible.

We now come to such wonderful developments of plumage and color as are exhibited by the peacock and the Argus pheasant; and I may here mention that it was the case of the latter bird, as fully discussed by Mr. Darwin, which first shook

my belief in "sexual," or more properly "female" selection. The long series of gradations, by which the beautifully shaded ocelli on the secondary wing-feathers of this bird have been produced, are clearly traced out, the result being a set of markings, so exquisitely shaded as to represent "balls lying loose within sockets," — purely artificial objects of which these birds could have no possible knowledge. That this result should have been attained through thousands and tens of thousands of female birds all preferring those males whose markings varied slightly in this one direction, this uniformity of choice continuing through thousands and tens of thousands of generations, is to me absolutely incredible. And, when further, we remember that those which did not so vary would also, according to all the evidence, find mates and leave offspring, the actual result seems quite impossible of attainment by such means.

Without pretending to solve completely so difficult a problem, I would point out a circumstance which seems to afford a clue. It is, that the most highly-colored and most richly-varied markings occur on those parts of the plumage which have undergone the greatest modification, or have acquired the most abnormal development. In the peacock, the tail-coverts are enormously developed, and the "eyes" are situated on the greatly dilated ends. In the birds of paradise, breast, or neck, or head, or tail-feathers, are greatly developed and highly colored. The hackles of the cock, and the scaly breasts of humming-birds are similar developments; while in the Argus pheasant the secondary quills are so enormously lengthened and broadened as to have become almost useless for flight. Now it is easily conceivable, that during this process of development, inequalities in the distribution of color may have arisen in different parts of the same feather, and that spots and bands may thus have become broadened out into shaded spots or ocelli, in the way indicated by Mr. Darwin, much as the spots and rings on a soap-bubble increase with increasing tenuity. This is the more probable, as in domestic fowls varieties tend to become symmetrical, quite independently of sexual selection ("Descent of Man," p. 424).

If now we accept the evidence of Mr. Darwin's most trustworthy correspondents, that the choice of the female, so far as she exerts any, falls upon the "most vigorous, defiant, and mettlesome male;" and if we further believe, what is certainly the case, that these are as a rule the most brightly colored and adorned with the finest developments of plumage, we have a real and not a hypothetical cause at work. For these most healthy, vigorous, and beautiful males will have the choice of the finest and most healthy females, will have the most numerous and healthy families, and will be able best to protect and rear those families. Natural selection, and what may be termed male selection, will tend to give them the advantage in the struggle for existence, and thus the fullest plumage and the finest colors will be transmitted, and tend to advance in each succeeding generation.

There remains, however, what Mr. Darwin evidently considers his strongest argument — the display by the male of each species of its peculiar beauties of plumage and color. We have here, no doubt, a very remarkable and very interesting fact; but this too may be explained by general principles, quite independent of any choice or volition of the female bird. During pairing-time, the male bird is in a state of great excitement, and full of exuberant energy. Even unornamented birds flutter their wings or spread them out, erect their tails or crests, and thus give vent to the nervous excitability with which they are overcharged. It is not improbable that crests and other erectile feathers may be primarily of use in frightening away enemies, since they are generally erected when angry or during combat. Those individuals who were most pugnacious and defiant, and who brought these erectile plumes most frequently and most powerfully into action, would tend to increase them by use, and to leave them further developed in some of their descendants. If, in the course of this development, color appeared, we have every reason to believe it would be most vivid in these most pugnacious and energetic individuals, and as these would always have the advantage in the rivalry for mates (to which advantage the excess of color and plumage might sometimes conduce), there seems nothing to prevent a progressive development of these ornaments in *all dominant races*, that is, wherever there was such a surplus of vitality, and such complete adaptation to conditions, that the inconvenience or danger produced by them was so comparatively small as not to affect the superiority of the race over its nearest allies. If then those portions of the plumage, which were originally erected and displayed, became developed and colored, the actual display under the influence of jealousy or sexual excitement becomes

intelligible. The males, in their rivalry with each other, would see what plumes were most effective, and each would endeavor to excel his enemy as far as voluntary exertion could effect it, just as they endeavor to rival each other in song, even sometimes to the point of causing their own destruction.

There is also a general argument against Mr. Darwin's views on this question, founded on the nature and potency of "natural" as opposed to "sexual" selection, which appears to me to be itself almost conclusive of the whole matter at issue. Natural selection, or the survival of the fittest, acts perpetually and on an enormous scale. Taking the offspring of each pair of birds as, on the average, only six annually, one-third of these at most will be preserved, while the two-thirds which are least fitted will die. At intervals of a few years, whenever unfavorable conditions occur, five-sixths, nine-tenths, or even a greater proportion of the whole yearly production are weeded out, leaving only the most perfect and best adapted to survive. Now unless these survivors are on the whole the most ornamental, this rigid selective power must neutralize and destroy any influence that may be exerted by female selection. For the utmost that can be claimed for this is, that a small fraction of the least ornamented do not obtain mates, while a few of the most ornamented may leave more than the average number of offspring. Unless, therefore, there is the strictest correlation between ornament and general perfection, the former can have no permanent advantage; and if there is (as I maintain) such a correlation, then the sexual selection of ornament for which there is little or no evidence becomes needless, because natural selection which is an admitted *vera causa* will itself produce all the results. In the case of butterflies the argument becomes even stronger, because the fertility is so much greater, and the weeding out of the unfit takes place, to a great extent, in the egg and larvæ state. Unless the eggs and larva which escaped to produce the next generation were those which would produce the more highly-colored butterflies, it is difficult to perceive how the slight preponderance of color sometimes selected by the females should not be wholly neutralized by the extremely rigid selection for other qualities to which the offspring in every stage are exposed. The only way in which we can account for the observed facts is, by the supposition that color and ornament are strictly correlated with health, vigor, and general fitness to survive. We have shown that there is reason to believe that this is the case, and if so, voluntary sexual selection becomes as unnecessary as it would certainly be ineffective.

There is one other very curious case of sexual coloring among birds — that, namely, in which the female is decidedly brighter or more strongly marked than the male; as in the fighting quails (*Turnix*), painted snipe (*Rhynchæa*), two species of phalarope (*Phalaropus*), and the common cassowary (*Casuarius galeatus*). In all these cases, it is known that the males take charge of and incubate the eggs, while the females are almost always larger and more pugnacious. In my "Theory of Birds' Nests" ("Natural Selection," p. 251), I imputed this difference of color to the greater need for protection by the male bird while incubating, to which Mr. Darwin has objected that the difference is not sufficient, and is not always so distributed as to be most effective for this purpose, and he believes that it is due to reversed sexual selection, that is, to the female taking the usual *rôle* of the male, and being chosen for her brighter tints. We have already seen reason for rejecting this latter theory in every case, and I also admit that my theory of protection is, in this case, only partially if at all applicable. But the general theory of intensity of color being due to general vital energy is quite applicable; and the fact that the superiority of the female in this respect is quite exceptional, and is therefore probably not of very ancient date in any one case, will account for the difference of color thus produced being always comparatively slight.

Theory of Typical Colors. — The remaining kinds of animal colors, those which can neither be classed as protective, warning, nor sexual, are for the most part readily explained on the general principles of the development of color which we have now laid down. It is a most suggestive fact, that, in cases where color is required only as a warning, as among the uneatable caterpillars, we find, not one or two glaring tints only, but every kind of color disposed in elegant patterns, and exhibiting almost as much variety and beauty as among insects and birds. Yet here, not only is sexual selection out of the question, but the need for recognition and identification by others of the same species seems equally unnecessary. We can then only impute this variety to the normal production of color in organic

forms when fully exposed to light and air and undergoing great and rapid developmental modification. Among more perfect animals where the need for recognition has been added, we find intensity and variety of color in its highest pitch among the South American butterflies of the families heliconidæ and danaidæ, as well as among the nymphalidæ and erycinidæ, many of which obtain the necessary protection in other ways. Among birds also, wherever the habits are such that no special protection is needed for the females, and where the species frequent the depths of tropical forests and are thus naturally protected from the swoop of birds of prey, we find almost equally intense coloration; as in the trogons, barbets, and gapers.

Of the mode of action of the general principles of color-development among animals, we have an excellent example in the humming-birds. Of all birds these are at once the smallest, the most active, and the fullest of vital energy. When poised in the air their wings are invisible, owing to the rapidity of their motion, and when startled they dart away with the rapidity of a flash of light. Such active creatures would not be an easy prey to any rapacious bird; and if one at length was captured, the morsel obtained would hardly repay the labor. We may be sure, therefore, that they are practically unmolested. The immense variety they exhibit in structure, plumage, and color, indicates a high antiquity for the race, while their general abundance in individuals shows that they are a dominant group, well adapted to all the conditions of their existence. Here we find everything necessary for the development of color and accessory plumes. The surplus vital energy shown in their combats and excessive activity, has expended itself in ever-increasing developments of plumage, and greater and greater intensity of color, regulated only by the need for specific identification which would be especially required in such small and mobile creatures. Thus may be explained those remarkable differences of color between closely allied species, one having a crest like the topaz, while in another it resembles the sapphire. The more vivid colors and more developed plumage of the males, I am now inclined to think may be wholly due to their greater vital energy, and to those general laws which lead to such superior developments even in domestic breeds; but in some cases the need of protection by the female while incubating, to which I formerly imputed the whole phenomenon, may have suppressed a portion of the ornament which she would otherwise have attained.

Another real, though as yet inexplicable cause of diversity of color, is to be found in the influence of locality. It is observed that species of totally distinct groups are colored alike in one district, while in another district the allied species all undergo the same change of color. Cases of this kind have been adduced by Mr. Bates, by Mr. Darwin, and by myself, and I have collected all the more curious and important examples in my address to the Biological Section of the British Association at Glasgow in 1876. The most probable cause for these simultaneous variations would seem to be the presence of peculiar elements or chemical compounds in the soil, the water, or the atmosphere, or of special organic substances in the vegetation; and a wide field is thus offered for chemical investigation in connection with this interesting subject. Yet, however we may explain it, the fact remains of the same vivid colors in definite patterns being produced in quite unrelated groups, which only agree, so far as we yet know, in inhabiting the same locality.

Let us now sum up the conclusion at which we have arrived, as to the various modes in which color is produced or modified in the animal kingdom.

The various causes of color in the animal world are, molecular and chemical change of the substance of their integuments, or the action on it of heat, light or moisture. It is also produced by interference of light in superposed transparent lamellæ, or by excessively fine surface striæ. These elementary conditions for the production of color are found everywhere in the surface structures of animals, so that its presence must be looked upon as normal, its absence as exceptional.

Colors are fixed or modified in animals by natural selection for various purposes; obscure or imitative colors for concealment — gaudy colors as a warning — and special markings, either for easy recognition by strayed individuals, females, or young, or to direct attack from a vital part, as in the large brilliantly-marked wings of some butterflies and moths.

Colors are produced or intensified by processes of development,— either where the integument or its appendages undergo great extension or modification, or where there is a surplus of vital energy, as in male animals generally, and more especially at the breeding-season.

Colors are also more or less influenced

by a variety of causes, such as the nature of the food, the photographic action of light, and also by some unknown local action probably dependent on chemical peculiarities in the soil or vegetation.

These various causes have acted and reacted in a variety of ways, and have been modified by conditions dependent on age or on sex, on competition with new forms, or on geographical or climatic changes. In so complex a subject, for which experiment and systematic inquiry has done so little, we cannot expect to explain every individual case, or solve every difficulty; but it is believed that all the great features of animal coloration and many of the details become explicable on the principles we have endeavored to lay down.

It will perhaps be considered presumptuous to put forth this sketch of the subject of color in animals, as a substitute for one of Mr. Darwin's most highly elaborated theories — that of voluntary or perceptive sexual selection; yet I venture to think that it is more in accordance with the whole of the facts, and with the theory of natural selection itself; and I would ask such of my readers as may be sufficiently interested in the subject to read again chapters xi. to xvi. of the "Descent of Man," and consider the whole theory from the point of view here laid down. The explanation of almost all the ornaments and colors of birds and insects as having been produced by the perceptions and choice of the females has, I believe, staggered many evolutionists, but has been provisionally accepted because it was the only theory that even attempted to explain the facts. It may perhaps be a relief to some of them, as it has been to myself, to find that the phenomena can be shown to depend on the general laws of development, and on the action of "natural selection," which theory will, I venture to think, be relieved from an abnormal excrescence, and gain additional vitality by the adoption of my view of the subject.

Although we have arrived at the conclusion that tropical light and heat can in no sense be considered the cause of color, there remains to be explained the undoubted fact that all the more intense and gorgeous tints are manifested by the animal life of the tropics, while in some groups, such as butterflies and birds, there is a marked preponderance of highly-colored species. This is probably due to a variety of causes, some of which we can indicate, while others remain to be discovered. The luxuriant vegetation of the tropics throughout the entire year, affords so much concealment, that color may there be safely developed to a much greater extent than in climates where the trees are bare in winter, during which season the struggle for existence is most severe, and even the slightest disadvantage may prove fatal. Equally important, probably, has been the permanence of favorable conditions in the tropics, allowing certain groups to continue dominant for long periods, and thus to carry out in one unbroken line whatever developments of plumage or color may once have acquired an ascendency. Changes of climatal conditions, and pre-eminently the glacial epoch, probably led to the extinction of a host of highly-developed and finely-colored insects and birds in temperate zones, just as we know that it led to the extinction of the larger and more powerful mammalia which formerly characterized the temperate zone in both hemispheres. This view is supported by the fact that it is amongst those groups only which are now exclusively tropical, that all the more extraordinary developments of ornament and color are found. The local causes of color will also have acted best in regions where the climatal conditions remained constant, and where migration was unnecessary; while whatever direct effect may be produced by light or heat, will necessarily have acted more powerfully within the tropics. And lastly, all these causes have been in action over an actually greater area in tropical than in temperate zones, while estimated potentially, in proportion to its life-sustaining power, the lands which enjoy a practically tropical climate (extending as they do considerably beyond the geographical tropics), are very much larger than the temperate regions of the earth. Combining the effects of all these various causes we are quite able to understand the superiority of the tropical parts of the globe, not only in the abundance and variety of their forms of life, but also as regards the ornamental appendages and vivid coloration which these forms present.

A. R. WALLACE.

From Good Words.

DORIS BARUGH.

A YORKSHIRE STORY.

BY THE AUTHOR OF "PATTY."

PROLOGUE.

CHAPTER I.

SWINGING ON A GATE.

THE day had been full of mist, a soft white veil clung to the side of the steep hill, and blotted out the village straggling up from the river below to the old grey church with its low crenellated tower and screen of tall fir-trees, standing on the skirts of the moor, five hundred feet above the valley.

This screen of old, thin fir-trees, set north and west within the loosely-piled stone fence that shut in the churchyard, gave a weird, haunted look to the spot.

It may be that this gaunt weirdness, for beyond the thin, outstretched fir-arms the moor spreads for miles in a barren level, has fostered the superstition that still hangs over Burneston; but even nowadays there are ghost-stories about Burneston Hall — the grey old manor-house in the valley below — stories which tell how the wife of the last Burneston of Burneston walks up and down, up and down the terraces beside the river, mourning her sin and her sorrow.

To-day even, there is something chilling and mysterious in those tall, thin fir-trees looming above the mist, as if trying to keep sight of the long range of pale grey hills across the valley.

Mr. Burneston, the present owner of the Hall, had come up through the mist from the old grey house beside the river to call at the parsonage, but he had not taken the steep way through the village, there was a nearer way by the avenue, and now as he stood looking at the church and its screen of weird trees, he was opposite Farmer Barugh's pig-yard. The white gate was open just now to admit seven fine, brown cows, breathing fragrance as they passed, and Mr. Burneston went through it whistling. One could see that the mist had not depressed his spirits, he looked very bright, very happy, and though there was an ease in his movement that betrayed carelessness, he looked like a well-bred, kindly English gentleman. He went on past the range of cow-stables, then through a rick-yard where a few empty stone posts seemed waiting for the coming harvest, and suddenly came in sight of the gate which led to the glebe field, a swelling green croft high above the white gabled parsonage below.

A girl, dressed in a lilac cotton frock, with short sleeves, a long, buff-striped pinafore, and a white sun-bonnet, was swinging on the gate. Her back was towards him, and her head was hidden by her sun-bonnet. She did not hear his footsteps, and she went on singing to herself in a sweet voice.

She made such a pretty picture there, with the background of golden starred meadow, that instinctively he stood still, and these words of her song reached him: —

> May it so happen, an' may it so fall,
> Ah may be lady of Burneston Hall.

He had been smiling as he looked at the careless grace of the girl's attitude, but as she ended the smile broadened, and he burst out laughing.

The girl started, looked round, and then jumped down; her sun-bonnet fell back as she reached the ground. Mr. Burneston saw the loveliest little face he had ever seen in his life. Large, blue-grey eyes gazed at him in bright terror from under delicate, finely-marked brows, shadowed by a frizzled crop of brown hair, which straggled over her forehead, but did not hide its beauty; the red lips were parted with the sudden alarm, but the nose and chin were so delicate, yet so firm in their outline, that they might have belonged to an ancient statue. A bright, deep blush spreading over her face and throat wakened Burneston from his sudden enchantment.

"I beg your pardon," he said, as if he were speaking to an equal; "but where do you come from?"

It had all happened too quickly for words to render — before his sentence had ended the girl snatched at the strings of her sun-bonnet and fled past him like a bird on the wing.

Mr. Burneston's blue eyes followed her till she disappeared, and he stood staring till two huge geese came and hissed at him.

Then he rubbed his hands across his forehead, and looked about as if he had had a sudden awakening.

"Good heavens, I never saw any one like her; where can she come from?"

Philip Burneston was easy-going, but he was an only son, and had early been his own master; he was accustomed to have his orders obeyed and his wishes gratified at once. He was impatient to know who the girl was, and he came back into the

farmyard, and turning his back to the church, looked at the farmhouse, which showed through wreaths of brown and golden apples above the low stone wall.

"I cannot ask there," he said, "they are almost strangers, and the girl may belong to them."

On the other side of the road which ran down-hill past the churchyard and the large white gate of the farm, were two stone cottages with thatched roofs and low broad lattice windows, and over the door of one of these, making a frame of graceful foliage, stirred now by the breeze that was lifting the mist, was a large-flowered white convolvulus.

Mr. Burneston crossed the road, tapped at the door of this cottage, and raised the latch. The inner door was opened by an old woman, her head and hands shaking with palsy; but she smiled when she saw Mr. Burneston.

"Ay, ay, sir, ye mun coom in," she spoke heartily, "an' sit ye doon. An' how's yersel', Maister Burneston, an' how is t' wi' t' yung maister? It's long sin fooaks seed yer face oop here."

Mr. Burneston had to stoop as he went into the neat, exquisitely clean little room. The fire-irons and the steel fittings of the oven shone as if they were not meant for use, the walls and heavy-beamed ceiling were of chalky whiteness, in one corner was an old oak press with glistening brass handles, and in the other corner a triangular cupboard, the red Indian lac door brass-mounted, and through this half-open door showed treasured old china cups and saucers, and plates, and even a blue and white teapot on a high shelf.

"Well, how are you, Mrs. Duncombe? And how is Rose, eh?"

The old palsied head shook more than ever. "Ah'se as hard o' heearin as ivver ah war; howsomivver, if ye'll bide here a bit, ah'll just gan an' call t' laahttle lass. Rose, Rose, coom here."

There stole in from the back door a little girl with a round saucy face that in a minute was suffused with a blush of pleasure and shyness at sight of the visitor. Rose's tawny hair, with occasional tinges of red, was brushed smoothly behind her ears, and her fair, freckled skin looked scrupulously clean and well kept; but there was something disorderly in the expression of her yellow-brown eyes, her small turned-up nose, and her full, parted lips. She was very plump, and looked much younger than she really was.

"Why, Rose, when are you going to grow?" Mr. Burneston always had kind words for the little village girls, provided they were pretty. He pinched the child's blushing cheek: "you must grow tall as well as broad, little woman."

Rose's eyes drooped at the implied reproof. She thought the want of rapid growth must be caused by her own idleness, and she sighed heavily.

Her grandmother could not hear the sigh, but she noted the confusion of the downcast face.

"Mebbe it's aboot t' sewin', eh, Rose lass? Ain't ah allays tell'd thee as thee'l nivver mak a decent stiddy lass wiv'oot thou sticks te t' needle? Mebby thee'l be bud a poor shiftless thing as lang's thee lives."

At this picture of the possible result of laziness Rose's full pouting lips quivered, her cheeks puckered, and from the closed eyelids came a shower of tears.

Mr. Burneston's bright, frank face clouded in a moment.

"Oh, don't scold her, grannie," he said in a suffering voice, as if some one had wounded him keenly; then bending over Rose, he said tenderly, "There, there, my dear, don't you cry, grannie doesn't mean it, I'm sure you're a good girl; come down to the Hall, and Mrs. Emmett shall give you a pot of jam."

Rose looked up through her tears with a loving reverence that struck Mr. Burneston, though his mind was full of some thing else. "How fond that child must be of jam!" and somehow he felt less pity for Rose.

He put his lips close to Mrs. Duncombe's ear.

"Have the Barughs, those new people at the farm, any family?" he said.

The shaking old head nodded as if it meant to roll off.

"Ay, ay, t' missus, Dorothy her man calls her, cooms ov a better sort o' fooak an ther is aboot here, ah reckon. Fooalks sez as sheea cooms frae t' south, an' 'er fayther 'ad lots o' brass. Neea, bud it wad be a coom doon i' life fer sike as sheea te wed wiv a mon like John Barugh. If ah ain't gaumed reeghtly, ye mun axt' laahttle lass fer t' rest o' t' teeal."

The increasing impatience in her listener's face had shown Mrs. Duncombe that she was answering wrongly.

"Are there any children at the farm, Rose?" he said abruptly.

The soft-hearted child felt the change in his manner, and she blushed with pain. She who worshipped the ground the squire walked on had managed somehow to be all wrong with him in this visit.

"There's a lass an' a lad."

"And how old are they? Is the girl, for instance, older than you, and — and what like is she?"

The change in his voice made the girl look up, and Mr. Burneston reddened as he met her questioning eyes.

"Thea call t' lad George, an' he's a reet nice un, he is, an' he's goin' thirteen, an' he plays wi' me," said Rose; "bud t' lass is nae better an if sheea'd lost her tongue. Sheea's bigger nor me, an' as fer her 'air it's nivver tidy like, an' sheea deean't play. George sez as sheea's fair daft."

In her bias against Doris she spoke eagerly, quite forgetting her shyness, and Mr. Burneston felt a sudden dislike to Rose Duncombe.

"Ah," he said carelessly, and then he stood thinking — it was useless to question the old woman, she could not hear a word.

"Well," he nodded, "good-bye, Mrs. Duncombe. Be a good lass, Rose, and mind your sewing, or else when you're old enough to get a husband you won't be able to mend his stockings."

The old woman nodded repeatedly, but Rose did not curtsey, she stood with her fat fingers clasped together over her lilac pinafore, watching Mr. Burneston with rapt, loving eyes; he had spoken to her again with a smile, and every word was treasured in her warm little heart.

"If ah sud try fer te please my man as ah try t' please t' maister," she thought, "why then ah mun be able te do t' sewin' o' all sorts."

People talk sentimentally of the sufferings of worms trodden on heedlessly, of birds robbed of their young; very few have pity or sympathy for the unrequited love of children or of ugly or unattractive men and women. I say this advisedly, for ugly people are often gifted with extraordinary power of attraction. Perhaps much of this want of sympathy comes of unconsciousness; for people are less conceited or conscious of the love they win and slight, than of their personal gifts or intellectual acquirements.

Certainly Philip Burneston had no consciousness of the warm love that lay nestling for him in little Rose's heart.

Her words had stung him; he felt sure that the rough-headed daughter of Farmer Barugh must be the vision of beauty he had seen on the gate, and it jarred him that this mere village child, Rose, should speak as if the girl were her equal.

He stood facing the farmyard, and then he turned so as to front the steep descent on each side of which lay the village. The mist had lifted and revealed the opposite side of the valley, with plots of golden corn-land, some with shocks ready for carrying; with green strips of meadow here and there, and darker lines of green hedge dotted with trees. Beyond came a long stretch of woodland, then as the land rose towards the point where the sun was just about to sink behind the hills, the corn was glittering gold and the meadow gleamed emerald against dark fir-woods. Beyond all, rose the purple brown of the moor, cresting the long range of hills, purple almost to blackness as after a few minutes the sun sank into the leaden clouds that bordered the horizon.

The river which ran through the valley, and the Hall with its circling woods were not visible from where Mr. Burneston was gazing, the hill was so steep; and yet he seemed to be searching for his home as he stood looking so fixedly down the winding road with stone cottages on either side, some of these mounted so high on grassed banks above the road that they were reached by quaint flights of broken, time-stained stone steps.

Mrs. Duncombe had shut her door. Rose in a sudden and virtuous impulse had brought out a checked duster, and was hemming, with her eyes fixed on her needle. No one was looking at Mr. Burneston while he stood first rapt in thought, and then amused by his own hesitation.

He could not make up his mind to go home till he had had another vision of that frizzled head and the exquisite face belonging to it.

"I have not called on these people yet," he said, "and it is the right thing to do."

He pushed the gate open and crossed the yard diagonally from right to left, passing by the horse-pond which was near the road in the extreme left-hand corner, and in which four black and white ducks were dipping and splashing as if they thought water more invigorating when in motion.

There was a small gate in the furthest corner of the yard, almost hidden by apple boughs pendent from their weight of russet fruit, and through this gate Mr. Burneston entered the small, trim garden, showing few flowers on its neatly-raked brown borders, except tufts of monkshood and coral plant and some pink blossoms on the blue-green thrift border.

The door stood open, the squire knocked, and then stood waiting.

Mr. Barugh was a new tenant, and was therefore a new feature in Burneston: all the other inhabitants had been born in the village.

These new tenants had come into the Church Farm while Mr. Burneston had been travelling, and as yet he had only exchanged greetings with Mr. and Mrs. Barugh.

"George, lad, ther's yan at t' deear," a deep voice said from within; "thee mun gan an' see wheea's theer."

There was a door at the end of the passage, and one on each side, and the doors and walls were all painted buff and yellow.

A brown-eyed, pleasant-faced boy opened the left-hand door, and came out into the passage. He looked very shy when he saw the visitor.

"Mayhap it's t' squire," he said over his shoulder.

There was a momentary pause, and then a tall, powerful-looking man, with heavy red eyebrows and bushy red whiskers, appeared at the door.

"Nay, nay, Mr. Burneston, coom in, an' welcome," he said, awkwardly hitching one shoulder a little above the other, and holding out an enormous, but well-shaped red hand. "T' missus an' ah'se reeght pleased te see ye, that we is. Weean't ye sit ye doon?"

Mr. Burneston looked round eagerly, but as he entered there was only one person in the low-roofed room, and she was rising with evident difficulty from a couch placed beneath the long low window. He started forward at once.

"Please don't get up, Mrs. Barugh. I'm afraid I have disturbed you. I am very sorry. I did not know you were ill."

While he spoke his eyes were dazed with the faded likeness in the wasted, delicate face; it was as if he got here and there a faint trace of the beautiful vision he had seen on the gate, but it was all misty and uncertain. Mrs. Barugh looked very sickly; she wore a cap with lilac bows, and she was wrapped in a faded yellow crape shawl; but she must have been once a lovely woman.

She took the squire's proffered hand, and then pointed to a chair near her sofa, with an ease that surprised her visitor, accustomed to the stiff awkwardness of his other tenants on such occasions.

"Sit ye down, John." There was a mixture of pity and of irritation in her voice, and the big man started at the summons, but as he passed her on his way to the fireplace she frowned at him till her delicate brows met.

Mr. Burneston was amused; there was no real ill-temper in Mrs. Barugh's face, she seemed to regard her husband as a performing dog who was not going through his part correctly.

"You have very delicate health, I am afraid," he said; "but I hope you like Burneston."

John Barugh had been standing like a stone block beside the large open hearth, where a few charred logs were burning feebly; at this question he turned to answer, without a trace of his first shyness, —

"Sheea wur fairlings weel — fair eneugh while we coomed oop here; bud it's ower cauld, or sheea's too silly, mair's t' pity. T' stock throddens weel, an' George, t' lad ther, is as cobby as sud be."

"I'm very sorry to hear this of your wife. We always reckon the hill so healthy; even down at the Hall, where, as you know, the river goes almost round the house, the air is considered excellent."

"Perhaps it's not owing to the air" — Mrs. Barugh's voice was so soft and pleasant that it was a pity she minced her words — "but I'm so dull, Mr. Burneston; there's no kind of society to be found hereabout."

Mr. Burneston looked puzzled, and John Barugh gave an uneasy laugh.

"Confound it, yon word society'll dua fer ye sum fahne day, ah'se thinkin', Dorothy. Neeghbers ther' is, an' plenty, ah tak' it."

"Oh yes, there's neeghbers." Mrs. Barugh's lips curled with the scorn her gentility repressed.

John went on as if he had not heard her.

"What neeghbers is gude fer," he said, in his strong mellow voice, "is te hev sum fooaks te speeak tiv besides thae i' yer own hoose; else a man mud get taken up ower metch wi' his own doin's; besides, a mud find a chance o' helpin' whoor help's needful. One neeghber's as gude as annuther te ma thinkin'."

Mrs. Barugh drew her faded yellow shawl closer together, and then shrugged her thin shoulders, wondering how she ever could have thrown herself away on John Barugh.

"Well, not quite that, John, but every one can't think alike; an', besides, there are the children to be considered — they must have playfellows."

Mr. Burneston smiled at George, who had stood close by the door, with both hands in the pockets of his brown trousers; his eyes were fixed on a half-open book on the table. He was wondering at

that moment if it would be manners to go back to "Robinson Crusoe."

"I suppose that fellow goes to school somewhere," said Mr. Burneston.

One of John Barugh's shoulders rose higher than its fellow.

"Ay," he said uneasily.

The mother broke in eagerly. "Yes, Mr. Burneston, we have sent George to a fairly good school, for a small school, that is to say; but the master says there's somethin' wrong with the lad, an' that if he studies like the rest mebby he'll grow crippled."

"Skeealmaisters has their notions as weel's ither fooaks," said John grimly.

"Such nonsense," sighed the mother.

"So you're turned out to grass for a time, eh, my lad; and you haven't got a brother to help you into mischief?"

George fixed his large, languid brown eyes on Mr. Burneston. "Ah'se getten Doris," he said, "an' ther's Rose Duncombe; sheea's as gude as a lad."

A faint tinge of color came into his mother's pale face.

"There's a specimen of what I meant jist now, Mr. Burneston. How can I like my children to play with a gurl who runs wild like little Rose? They gets to speak like she do, an' I've tried hard to make Doris speak properly, an' now she's gettin' to speak like Rose."

"How old is your daughter? Is she at home?" He was growing impatient to see Doris.

"Doris is goin' fifteen, Mr. Burneston, but she doesn't look so old, though she's tall. George, go fetch yer sister."

George shook his head.

"Doris'll none coom. Ah axed her a while syne, an' she sed ah wer t' say if they axed fer her, she'd bide wi' t' bees."

John Barugh looked wrathful, and moved towards the door, but Mr. Burneston rose.

"Never mind, never mind. I shall find her in the garden," he said. "I know my way to the beehives." Then, bidding good-bye to Mrs. Barugh, "I wish I could make the place pleasanter for you," he said, "but I hardly know how. The housekeeper, Mrs. Emmett, shall come and see you if you like; she is a very clever woman, though perhaps not much of a companion."

Mrs. Barugh looked vexed.

"I am obliged to you, Mr. Burneston. I shall be extremely happy to see *you* whenever you like to call."

As soon as the door closed on Mr. Burneston and her husband she fell back on the sofa.

"There's nothing but disappointment in this life," she said. "I did think, whenever I saw the squire, that he would understand and see for himself I was not a ordinary person. Depend upon it, George, there's been some low marriage in the family some time or another, or a gentleman like that would never so forget himself as to recommend a housekeeper as companion for me. Why, George, lad, what ails ye? Why d'ye go white in that way and niver speak a word?"

She spoke irritably, but she rose up swiftly, as if nothing ailed her, and put her arm round the boy. He had turned a sickly white, and stood shivering, as if he were going to fall.

At first he clung to his mother, glad to let his head sink on her bosom, but next minute he raised it.

"Nay, nay, mother, deean't — thee'll hurt theesel'. Fayther'll be here soon." A groan, and then he fainted, just as his mother had drawn him close to a low chair, on which he fell seemingly lifeless.

CHAPTER II.

DORIS.

"BEES is fond things," said Doris; "they'se rare an' clivver, so they mun know how t' mak some sort o' change i' ther lives. Jist to think o' goin' on year after year, allays doin' t' same things, livin' on i' t' same house, wearin' t' same lilac pinny, an' warkin' hard all t' time. Weel, that's t' best part; wark's some fun when it ain't darnin' socks; if poor mother cud wark as she used, she'd hev somethin' to think on, she wadn't be so hard on fayther."

Doris paused, and looked round to see if there was any work to be done near at hand; and all at once a frown, so like her mother's, knitted her delicate brows, and her firm lips pouted with vexation.

"Fayther's i' t' reeght; Josh is a lazy gude-for-nought; he've gathered in t' beeans an' left t' stalks liggin. Howivver, ah'll soon fettle 'em."

She had been standing, sun-bonnet in hand, in front of the beehives at the end of the house farthest from the yard — a very quiet corner with a herb-garden in front, and a plot of beans and artichokes behind. High above this garden was a screen of leafy ash-boughs, but there were no near trees to shade the sun from the busy bees, or the loveliness of Doris Barugh. She had recovered from her fright.

There was no color on her transparent skin, except that of youth and health. Her eyes had kindled as she spoke, and glowed deeper in color — a color that it is hard to define; there was blue in it, and green, grey, and yellow. Perhaps the eyes looked darker than they really were, from the long dark lashes above and beneath — darker even than her eyebrows, though these were a shade darker than her hair, and the hair would have looked darker brushed flat like Rose Duncombe's, instead of curling at its will over her head, gilded by the sunlight.

As she stood erect and thoughtful, it seemed that Doris was faultless. She wanted color, perhaps, but then color would have marred the spiritual tone of her beauty. At first sight she might have been likened to Undine, an Undine with brown hair and grey eyes, but the chief attributes of Undine, her love and her humility, were wanting in this fair English child. Poor Undine would not have met her hapless fate had she had the broad thoughtful forehead and the firmly chiselled lips and chin of Doris. A fault might have been found with the size of her head; it was too small, and something in it spoke of narrowness. Also there was a certain stiffness in her gait. But no eyes looking at the girl could thus have judged her; her beauty would have blinded all criticism.

Just as her father and Mr. Burneston came up the walk, she set her sun-bonnet firmly on her head, and stepping behind the beehives, began to drag the bean-haulms into a heap.

"Where's t' lass?" said John, but Mr. Burneston put his hand on his arm.

"Don't frighten her, or she'll run away." He hardly knew what he said, he so feared this lovely apparition would again take flight.

John chuckled inwardly.

"What would t' missus say if she knawed as Doris fettled t' beean-stalks, an' t' squire theer an' awl?"

A tawny-colored dog with short legs, a sort of mongrel Dandie Dinmont, came running up the walk, barking at two white pigeons which hovered near the eaves of the farmhouse. Doris looked up quickly, and the dog ran towards her, its bark changing into a joyous cry of welcome.

She stood, her arms full of bean-stalks; dumb with surprise and shame; her sweet face aglow with blushes.

"Set 'em doon; 'at 'll do, lass. Sheea's a rare 'un, sheea is, fer fettlin' owt 'at's nut dirty wark," he said proudly to Mr. Burneston. "Coom, coom, Doris, an' speeak t' squire; it's reel kind on him, it is, t' hev coomed an' hev a chat wi' t' mudher."

By this time Doris had mastered her longing to run away. She still longed for any sort of screen to hide herself from the master of Burneston, but as there was none to be had, she strove to seem cool and unconcerned, though she could not raise her eyes to his face. She curtsied awkwardly, but he held out his hand, and she put her trembling, clammy fingers into his warm clasp. Philip Burneston did not notice the chill touch of the frightened fingers; his eyes were fixed on the girl's downcast face, as if they could not get away; some power, he could not tell what, some magic had bound him to the sway of the slender, unformed creature standing there in her lilac frock and white sun-bonnet, so utterly unconscious of the spell she was working, that she longed to unloose her hand and run away before the squire should recognize her as the girl he had seen on the gate.

Mr. Burneston let go her hand, but he did not speak. Perhaps he feared to spoil the effect of this vision of beauty by drawing out words that did not match the face and the unconscious repose which made the charm of Doris. She did not look humble and shrinking, as Rose Duncombe had looked, but rather as if her thoughts were occupied with matters of more importance than herself, or than that which passed around her.

"Are you fond of bees?" Mr. Burneston said at last.

She looked up in slight surprise. "Nay, ah'se nane so fond on 'em, but ah likes t' see 'em at wark," she said shyly.

The farmer had stood watching with pride the effect produced by his daughter's beauty. His wife, in her teens, had been to John Barugh's mind the fairest piece of womanhood his eyes had ever seen, when she came on a visit to some north-country cousins; and he had looked at her and looked at her market-day after market-day as if he fancied his eyes were magnetic, and would draw her to him unsought by words, till one day he found a neighbor also looking at fair Dorothy; then he roused himself to begin his own wooing in a manly and earnest fashion, and to his own surprise he succeeded. He saw that Doris promised to be fairer still than her mother, and with but little chance of admirers. The Burneston farmers had either young wives and young children, or

else they were old and childless. Even John, who shrank from his wife's notions about society and speaking proper English, had to own that there was no one in the village fit to be put beside Doris or George. It was a triumph to see a real gentleman like Mr. Burneston so struck by the child's good looks.

"Ay, bud t' lass diz like te see t' wark done, let t' wark be done by whom t' will. Ah tells her sheea wur made te be t' maister; sheea'd keep us all in order, 'at sheea wad, bless her."

"Fayther!" Doris spoke reprovingly, and then, as her long thin arms fell straight on each side of her, she clasped her hands firmly, and wished the visitor would go.

He asked a few questions about the bees, but Doris let her father answer. Mr. Burneston was unable to find an excuse for remaining, though he tried; he could not stand there gazing silently, though the contemplation of her face made him strangely unwilling to talk.

"Perhaps," he looked at Doris, "your mother might like some books to read; there are plenty of story-books at the Hall. Shall I send some up?"

"Thank you kindly, sir." She flushed a little. "Mother does like books, but she's none so set upon tales as upon them 'at is more graver like; you know tales is nobbut fond stuff."

Mr. Burneston laughed, and the angry color rose to the girl's forehead.

Why was he laughing at her?

"I rather like story-books," he smiled at her. "Good morning, but I will not forget what you say; good day, Mr. Barugh." He looked at his watch. "I am too late for the parsonage now, and I shall be late for dinner."

John Barugh went with his visitor as far as the outside gate, and then stood looking after him as he went down the steep village, which straggled nearly a mile in length from the top of the hill to the river below.

"He's a nice chap yon," said John, "as pleeasant-lookin' a chap, an' as free-speeakin' too, as ah've knawn, so ther." He said this aloud, slowly and emphatically, to an audience of black, short-legged pigs, and then went back to Doris and the beehives.

She had not wasted her time in thinking of the squire. The bean-stalks were piled up in a heap, and the ground on which they had lain was raked into order. And now she stood resting while she watched the bees.

"Weel, my lass!" her father put his broad red hand on her shoulder, "an' what's thee think o' Mr. Burneston, an', Doris, lass, what made thee so shy-like wiv 'im?"

Doris still felt sore and angry, and she did not know on whom to vent her anger.

"He's well eneaf, ah suppose, but he's nut like wersels. Ah wer shy," she forced herself to speak out, "because — because ah'd seen him afore. Seest 'ee he fun me singin' fond stuff on t' gate."

She hung her head, and tears came into her eyes.

"Deean't freeat aboot that, my lass," the farmer said kindly, "ah'd warrant thoo'se not t' first lass 'at he's heeard singin' fond stuff afooar; let's hear t' fual sangs, Doris."

"Oh, fayther, t' wer ower fond!" She had broken down at last as the full remembrance of the scene at the gate came back, and she was crying in earnest. "He mun think me such a poor, fond lass," she sobbed, "he'll nobbut laff at me. Joseph Sunley has a tale of a lass 'at went fond an' deed, an' a' fer t' maister o' Burneston, an' she had a feeal's sang, an' a feeal's rhyme."

John Barugh looked puzzled and inquisitive, but he understood Doris too well to question her further. There was that kind of implicit unspoken trust between this father and daughter which often exists between people who never to one another expand into acts of tenderness. I say acts, for, after all, tenderness receives its value from the character of its recipient; and perhaps the most intense tenderness towards some natures is to make them feel that thorough though unspoken trust is felt in them. Doris and her father seldom talked together, but they never quarrelled.

John knew at this moment that a smile, a word even, might at once put a seal on the girl's unwonted confidence, and he stood still, only turning his face into a yet more listening attitude.

"Ah wer swingin' on t' gate as Rose might a' done," Doris spoke, with strong contempt against herself, "an' ah sang t' same words as t' poor mad lass sang, as Joseph Sunley tellt me, —

> May it so happen, an' may it so fall,
> Ah may be lady of Burneston Hall.

John's lower jaw fell. He looked so utterly confounded that Doris laughed, spite of herself. He reddened at this and then recovered himself.

"Thee's i' t' reeght te laugh, Doris.

Thoo's little mair an a babby, an' it's as like as nut as Mr. Burneston heared na'er a word o' tha fond rhyme. Bud it's a feeal's rhyme for a' that, an' Joseph's a feeal te go learnin' thee such a rhyme."

"Joseph didn't learn it me, faything. He said it once, an' then ah couldn't get it out o' my head. Ah says it over an' over again," she said angrily.

"Weel, nivver freeat theesel' aboot 'un; theer's neean harm." John felt uneasy, though he tried to hide it. He was wondering what Dorothy would think of this adventure. "Nivver freeat theesel' aboot un, lass; thoo may be seer Maister Burneston heerd nowt on it."

He did not look at Doris, but her eyes fixed on him with a hard scrutiny. It was difficult to believe that such eyes, so full of sweet reflection, could concentrate their expression into such hardness. Then, as her father turned his back and went slowly and heavily towards the house, the girl said to herself, —

"Faything forgets how old ah is when he puts me off like a babby. Wheeah! Mr. Burneston heared ivvery word o' t' rhyme, ah'se sure o' that; an' it wer reeght doon cruel o' him to coom an' find me out."

She pulled at the strings of her sun-bonnet with each hand, and walked indoors with even more dignity than usual.

CHAPTER III.

THE SHADOW OF A PURPOSE.

SOME one has said that you should never judge of men and women till you have seen them at home in the familiarity of domestic life, where all the angles of their characters are in broad light, and where these reflect and refract prism-wise the various influences brought to bear on them directly by tempers and tongues of near kin, as they stand unprotected by any of the blinds and shields which the reticence and ignorance of strangers make for them when abroad.

Till his marriage Phillip Burneston had never suffered from any domestic contradictions. He was the only child of loving parents, who died before he was twenty, and though he then spent a short time at Cambridge, his health as a boy prevented him from learning discipline and self-control at a public school, or at least did not give him the opportunity of learning it. And yet his natural gentleness kept him from any headstrong or self-willed measures when he came into the management of considerable property.

He married at twenty-two the wife assigned him by family arrangements ever since he and Miss Beaumont had been twelve years old, and he had made an irreproachable husband.

The first discipline of life came to him in those nine years of marriage. Mrs. Burneston was very elegant and fashionable, very shallow, exacting, and affectionate. In all larger matters, such as expenditure, place of residence, choice of friends, disposal of time, her husband soon found domestic peace was only to be had by submission, and as human nature must ordinarily, with regard to its fellows, have some compensation for self-sacrifice, this submission, so long unknown to his life, had for compensation a quality also hitherto undeveloped — a determined obstinacy about his own special fancies.

At the end of nine years Mrs. Burneston died, leaving a little boy of eight years old, and a great blank in her husband's life. She had been his occupation rather than his companion, but she had so often asserted her love for him, that it would have been impossible to the loving, gentle-natured man to disbelieve in it — to realize that love is an active rather than a passive quality. He would have been indignant to learn that his wife had died with a falsehood on her lips — unless, indeed, mere fidelity and lip-assurance constitute love.

The sensation of freedom was, therefore, alloyed with a sense of loss, and for two years he had wandered about aimlessly, his wife's dislike to foreign travel having kept him from much that he willed to examine, and during this time he had come home only to get occasional and brief glimpses of his boy Ralph, left ostensibly to the devoted care of Faith Emmett, the housekeeper of Burneston, and to the guardianship and tutorship of Mr. Spencer, the vicar. In reality, Ralph had been left free to exercise his own small despotisms on all who came in contact with him.

Mr. Burneston was an archæologist, and though he often had with him a companion sympathetic in the matters of stonework and stones, yet of late he had felt a new discontent, a longing for some more human interests, and on his return from a long Scandinavian excursion he had announced his intention of settling down for a year at least at Burneston.

The villagers smiled at this announcement, and Faith Emmett laughed in the bailiff's face as he made it.

"Mr. Burneston hev nivver stayed three months at once at t' Hall sin' I knawed

it," she said scoffingly; "it's nut t' place te suit a lively gentleman. Just t' little she did see o't wur the death o' t' poor lady — it fair gi' her t' horrors, poor soul."

But the butler, Benjamin Hazelgrave, an old servant of the Burnestons, was sternly indignant when he heard of Faith's prophecy.

"Mistress Emmett sud knaw," he said loftily, "that the gentlemen of Burneston are nane fond, like silly wimmin, an' it does nut become one taken fra t' other side o' t' country, an' slipped in as laady's favorite ower awder heads than her own, to be talkin' o' t' maister as if he wur lahk herself."

This he said at, not to, Mrs. Emmett, and then treated her with scornful silence, it being a sore point with Mr. Benjamin that his own wife, the cook at Burneston, should have had Mrs. Burneston's maid and nurse, Faith Emmett, an entire stranger, set in authority over her as housekeeper.

Faith was right, however, about the aspect of Burneston Hall. It was very weird and dreary; a heavy mass of grey building which, on closer inspection, took the shape of an E, two wings projected towards the river, and in the centre was a shorter projection; between this, which formed the back entrance, and the river came a smooth lawn swept by drooping cedar branches in the centre, and at the sides by low-growing beech-trees, so closely set that even from the meadow, planted like a park, on the other side of the river only occasional bits of the grey house and its upper lattice windows could be seen. The river ran swiftly and darkly past the low wall, which formed a long semicircular terrace with here and there willow-trees bathing deeply in the water, and giving a weird, damp look to the manor-house, especially in the dark corners formed by the ends of the semicircular wall, one of which was completely overshadowed by pendent boughs, while the other emerged from its mystery in a straight bit of wall, behind which, at a little distance, rose the lofty enclosure round the real entrance to the house and the stable-yard. Originally Burneston had been used as a shooting residence, and little pains had been taken either with the entrance or with the garden. Her husband's refusal to improve these had determined Mrs. Burneston's dislike to the place.

Just beyond the Hall, on the right as one faced the house, was a stone bridge with three arches, and through these the current swept strongly, the river broadening to nearly double its width on the farther side till there was room for a tree-covered islet in its midst. Beyond this islet was a narrow wooden bridge, and leading to this came the road down-hill from the church, with the village scattered along its sides; but the Hall was so thickly belted in with trees that no signs or sounds of human life reached it; even the smoke curling from the cottage chimneys as they mounted the hill was hidden away. It was just a place where ghosts might linger.

But at this moment, within the Hall itself, there is noise enough to banish all ghostly fancies. In the entrance hall, a square pleasant room with a Turkey carpet, painted glass windows, and old pictures, a tall slender woman is struggling with, and trying to pinion the arms of a fair-haired boy about ten years old. The woman's abundant white hair confined by a black net contrasted strangely with her long, deep-set, dark eyes flashing brightly with anger and excitement.

"Oh! you limb o' Satan!" she calls out amid the boy's outcries. "An' how dare you? It's none my fault, it's yer own, Master Ralph, if I say them words; it's yer conduct what makes me say 'em. Yer as brassend as Hector."

Ralph's blue eyes are bright with mischief rather than anger, and his face has got scarlet in his efforts to free himself; but at this he stands still, and laughs contemptuously.

"Oh, I like that, I do, you hardened old hypocrite! You know you're as glad as you can be to get a chance of using bad words, or they wouldn't come to your tongue so easily. Let go, I say, or I shall twist your wrists, and then you'll be sorry, you old marplot — I hate you!" he adds angrily.

Faith Emmett lets go of his arms at once, and drops exhausted into a high-backed cane chair. The flush leaves her face; she sits there grey and colorless.

Ralph, in his surprise, forgets his purpose, he stands looking at his nurse, and a sudden hush comes over the storm. Into this hush, startled by the previous clamor, comes Mr. Burneston from a doorway at the end of the hall farthest from the windows.

"Ralph, what are you doing? Is anything the matter with Faith?" for in an instant he sees the woman's pale face.

She rises at once.

"It's nowt. Master Ralph was playin', an'——"

"Hold your tongue, Faith, and don't tell stories to my father."

Faith turns paler still.

"Master Ralph," she says sadly, "that's nut t' way te speak te me."

"No, Ralph, it is not, and you ought to be ashamed of yourself." Mr. Burneston speaks in a vexed tone; he does not like the nurse's interference, and yet he cannot resent it.

"The long and the short of it is, father" — Ralph looks up coolly in his father's gentle face — "neither of us have been behaving at all. I wanted to shoot at Sir Marmaduke" — he points to one of the old pictures — "with my pop-gun — his nose annoys me — and Faith was goose enough to think she could hold my arms back and prevent me."

Ralph laughs, but looks uneasy when no smile comes on his father's face.

Mr. Burneston looks inquiringly at Faith, but she has seated herself again in the high-backed chair, as if the case were going to be tried before her. Seeing this, he raises his head slightly, and turns to the door by which he came into the hall.

"I want you in the study, Ralph." And he walks on, leaving the boy to follow.

But, instead, Ralph turns indignantly on the old woman.

"Bother you; why can't you hold your tongue? My father doesn't care what scrapes I get into and get out of by myself, but he hates to find me sparring with you. I know it by the look of him. Well, I'll just tell you what'll happen. He'll send me to school, and I'm not sure but what, after all, I sha'n't be jolly glad of it."

This was too much; he had said, "I hate you," he had accused her of telling a story, but to be glad to go to school! — she broke down into tears, though she struggled hard to hide her tears from Ralph.

He stood a moment, then he dashed up and gave her a kiss.

"Don't be an old silly, you'd much better go and make that toffy you promised me, than sit here crying."

"Gang, gang, maister Ralph, honey, gang quick, or yer papa will be mad wi' you." She choked down her sobs and smiled, as the boy nodded and ran away, and then she sat with her hands in her lap, frowning till nothing of her eyes was visible but the yellow light gleaming through her black lashes. She had a curiously-shaped face, so wide at the angle of the cheek bones that it seemed as if in infancy the forehead and chin had been pressed towards each other, and the loss of her front teeth had increased this nearness by shortening the space between nose and chin.

Her face was plump, though her figure was slender, but spite of this plumpness there was a stern, inflexible expression about the mouth, and an almost baleful glare from her eyes which did not impress one favorably.

She sat for some time clasping her bony hands and looking at them as if for counsel. At last she shook her head.

"Eh dearie me, an' how'll it ivver end, he'll nivver hev no beeans, he's all made o' gristle, he's as wake as a sneeze. That comes o' so much blood from t' south i' t' family. Ah'd liefer far hev seed him gang away stubborn, an' keep stubborn too, than get all in a moment like a bit o' silk with the creases smoothed out on't. Bud neeah, neeah, he'll be fierce as a buck-rat one minnit, an' t' nixt as soft as a dumplin'; no mair puppose in him than his fayther afore him, unless it's fer some folly or other, an' then if he wur te want t' moon he'd waste all t' brass as ivver he'd getten i' steers to reach it. Weel, so lang as ther ain't no new mamma brought heeame te vex him, mebbe he'll get on, bud 'at ud bring bad tiv us all, let alone Master Ralph, an' I misdoubt t' maister hissel'."

She rose up at the sound of footsteps, and it was surprising to see how quickly her vindictive look changed into a smile of welcome as she went forward to hold the door for the person who had opened it from the outside, and now entered the hall.

He was tall and thin almost to leanness; long dark lively eyes and the dark hair hanging over them gave him the appearance of a gypsy, and his slouched felt hat, threadbare coat, and patched boots, might have carried out this idea, but for the housekeeper's deep curtsy, and for that something about Gilbert Raine which made him look like a scholar and a gentleman.

He held carefully a fragment of dark-colored glass so frosted over with long interment that it was covered with prismatic tints; there were fragments of clay sticking to it, and Faith held out her hand.

"Where's Mr. Burneston, Mrs. Emmett?" He took no notice of her outstretched hand, but spoke in a quick, abrupt voice that seemed unused to contradiction.

"Maister's i' the study, sir; bud sha'n't I wash that for ye, Mr. Raine? It ain't fit to tak indoors, it ain't."

Raine pressed the precious relic against his coat.

"Wash it, indeed — no, thank you, Mrs. Emmett — I haven't quite forgotten the scrubbing you gave to my terra-cotta Latona and the mural frescoes you took care of for me last year. Ah, you want a month's training at Austin's End, you do. I expect you'd like to polish my brazen shield there, and send a good deal else to the dusthole." He laughed and went out to the study with his relic. "She can't help being a woman," he said to himself, "and women's ideas are confined to decorating their persons, and cleaning all that doesn't want cleaning."

He found Mr. Burneston alone. Ralph had been dismissed with a lecture.

"Look here, Phil, I was just digging beneath the wall of the fruit-garden, where that bit of brick turned up the other day, and I found this." He paused, for Mr. Burneston looked up with only a sickly smile. "Is anything the matter?" said Gilbert Raine, with a sudden change of tone.

Philip Burneston pressed his hand on his forehead.

"Well," he tried to laugh, "I suppose I ought not to have stayed away, and then all these minor miseries would have been such a part of my existence that I should not have minded them; but I seem now always to be called on to interfere about Ralph."

"What's the matter now?" Raine's quick, jerking utterance had returned and formed a striking contrast to the slow, refined speech of his companion, it was full of seeming impatience, and the fire of his dark eyes enhanced this idea.

"Oh, a trifle not worth repeating, except that trifles make or mar life. I was asking myself, just as you came in, how I am to bring up Ralph without his mother to help me."

"Nonsense — I beg your pardon, my dear fellow" — his voice was gentle in an instant, for he had had deep sympathy with his cousin's sorrow, though he considered Mrs. Burneston had spoiled her husband's life — "but at ten years old I think a boy is better away from women."

Mr. Burneston fidgeted with a paper-knife on the table near him.

"Yes, I know I ought to send him to school, but then h.s mother thought him too delicate, and Faith says it would be the death of him."

"I shouldn't listen to Faith."

"No, you would not, because a single man of your age does not believe in a woman's judgment on certain points of health as a married man does, simply because the single man is a theorist in such matters."

Gilbert Raine shrugged his shoulders and laughed. "I intend to keep to theory; but if you don't send the boy to school, you must marry again, Phil; you can't expect Ralph to submit to an old nurse, the boy wouldn't be worth his salt if he did." A slight flush tinged Mr. Raine's dark, hollow cheeks, he was conscious of having encouraged Ralph in small rebellions against the housekeeper's interference.

"Well, perhaps not, but you are the last man I expected such advice from." Mr. Burneston sat upright and looked hard at his friend.

"I dare say — well, yes — but one can't always preach what one practises; a wife would destroy my happiness, she might increase yours; at least, I can see very plainly that you must have some one to take these petty worries off your hands, though, to tell you the truth, I always thought you much too light-hearted to let yourself be worried easily."

Burneston got up, shook himself, and laughed.

"So I am. You happened to come in at a moment when I had been vexed, by this evening I should have forgotten all about Ralph's scrape. I believe," he laughed again, "it is not anything in itself that worries, it is rather that nature revolts from the harness of civilized life after our two years of Arab freedom."

Raine groaned.

"Ah, there is the outcome of having been drilled by a wife. Now I'm going back to Austin's End. I don't mean that my responsibilities equal yours. I have one small estate to look after, and you have two large ones and a boy besides; but still I sha'n't allow myself to be worried, any more than I worried while we were vagrants."

"I wish we were vagrants again," Mr. Burneston sighed.

Raine went on, "Then again I keep the fewest possible servants, not only from economy, but because I find that servants are a worry. I never study fashion, either in dress or anything else, or that would soon grow into a worry, and I never allow dusting in my rooms: dusting is the greatest worry I can conceive in life, and a wife, you see, would at once bring servants and fashion, and dusters and brooms to Austin's End."

Burneston was laughing heartily. "My wonder is," he said, "that you don't try and find some one of your own way of thinking. You must often want help in arrang-

ing your treasures in that wonderful den of yours."

Raine looked serious for an instant.

"No, Phil, I thought of it once, I even argued it out, but I found it would not do. No," he shook his head. "A woman with my tastes would be a sloven, and I could not stand that in a wife; and probably she would be ugly. I thought once of another plan, but it would be too troublesome."

"And what may that be?"

"Well,"— Raine reddened, he shrank from his friend's ridicule —"it is an experiment that has been tried, but the result seems doubtful; of course it may not have been tried under favorable conditions. I thought whether it would do to choose out some young, good-looking, healthy country girl of twelve or thereabouts, and have her brought up precisely to suit me."

"But, my dear Gilbert, don't you see that to suit you she must have a certain amount of culture, and with that very culture would come the seeds of all you shrink from, love of dress, fashion, order, and need of attendance, just as one foot follows the other as you walk."

"Yes, I know," Raine looked foolish, "I saw all that, and I also saw another evil harder to bear than any — there might be children, and then there would be that unutterably vexed question of confusion of race, and though the Raines are poor, they have managed to keep to conservatism hitherto."

"You think opinion is influenced by blood then?"

"Undoubtedly; from such a marriage might spring a thorough-going Radical, who would perhaps level the old place, and build a modern mansion lighted by gas," he said mockingly.

"You are joking; you know as well as I do that outward surroundings and associations do much to cultivate and refine, and that whoever married you would for peace and quietness' sake adopt your opinions."

"Well, I shall not try the experiment, though I think the idea as an idea is not a bad one; but, to go back to the beginning, take my advice and send your boy to school."

CHAPTER IV.

THE FIRST STEP.

GILBERT RAINE only stayed another day at Burneston, and then set off for his cheerless, quaint, museum-like home at Austin's End, nearly a hundred miles away.

Mr. Burneston felt doubly lonely without him; Gilbert Raine was not a talkative companion, unless some favorite topic was discussed; but he was so full of genial warmth, so ready with rough counsel or with full-hearted sympathy, so deeply read and many-gifted, that when he went away the old manor-house felt as chilly as if the fires had gone out in the wide hearths, and the candles had sunk in their sockets.

There had been a singularly strong affection between the friends in their university life, when Gilbert Raine's public-school training had enabled him to be of great service to his home-trained cousin. Gilbert Raine had never known the spoiling of prosperity. He had been brought up by an eccentric bachelor uncle, who had made his inheritance of the small estate called Austin's End dependent on the boy's success both at school and college, and had besides enforced on him the strictest economy and self-denial. So that when at thirty he became his uncle's heir, he went on instinctively with the same simple, inexpensive habits, content to be left alone with his books, and only rejoicing in his larger means for the power they gave of adding to his treasures. Some of his equals called Gilbert Raine a miserly book-worm; but his poor tenants knew better, and said that there was a real good master at Austin's End.

Mr. Burneston had been so long with his cousin that he felt strangely unsettled at his departure, and yet he had no wish to leave the Hall. He took a lively interest in some planting on one side of the estate, and in draining and farm-building in another quarter; it was only when he came home tired out with his day's work that a restless discontent mastered him. And as discontent requires a very strong guardian, to be kept entirely out of sight, he was stern to Ralph and harsh to Faith, and disposed to general faultfinding with his household. Benjamin shook his head and whispered to his wife, "Theer'll be a new missus afore lang at t' Hall."

"Gan yer ways, sheea'll be a furrineer then, t' maister hevn't had t' chance o' seein' English laadies, an' after all it 'wad be bud nat'ral, he's too yung te be left aleean."

Joseph Sunley, the old sexton, who lived in the stone cottage next Mrs. Duncombe, was growing much disturbed by the squire's ways. He saw Mr. Burneston often now, and he commented on his frequent visits to the Church Farm. Joseph was not a conscious gossip, but by

living alone he had got a habit of talking to himself, and being a little deaf, was unaware how much of his mind he gave to the public.

One evening about a fortnight after Mr. Raine's departure, he sat at his door in a round-backed, three-cornered wooden chair; it was a warm evening, and he sat in his shirt-sleeves smoking a pipe.

His old brown face was puckered more than could have been caused by the effort of holding his pipe, and when he removed it, and held it between his fingers, the creases deepened round his mouth.

"Dang it," he struck his hand heavily on his brown fustian knees, "it fair caps me, that it diz. John Barugh's a decent chap, a trifle slow an' awkard; bud 'at missus o' hiz sheea's as fahne as a fiddle, an' that's aboot t' truth, an' ah deean't think Mr. Burneston can find owt te say tiv 'er. Mebby he gans noo t' see t' sick lad, bud ah deean't knaw, an' ah can't reeghtly tell what fer he gans theer so oft, it's mair an a boddy like me can knaw; bud he diz gan theer, an' that's sure an' certain, so theer."

He stopped not a minute too soon. Looking across the road, he saw Doris opening the white gate. She came slowly in answer to his nod. "How's t' lad?" he said. Doris looked very grave.

"Nay, but it's sad then," she spoke slowly, "t' doctor hev telt mother yisterda 'at t' poor lad'll mebby nivver hev t' reet use o' his legs ageean."

"Eh, what's 'at he sed, lass?" Joseph's face contracted, till a fan of wrinkles spread from the corners of his eyes and lips. "Poor chap, nut hev t' use o' his legs ageean—nut walk! What diz t' lass meean?"

"He'll mebby nut walk 'cept wi' crutches. Eh, Mr. Sunley, think o' George wi' crutches!" she pressed her lips tightly together. "But t' doctor hev said so—so now ye know."

"Mr. Burneston gans to see t' lad, eh lass; it's reeght kind o' him te gan so oft; ee's a kind chap, t' maister is."

"Ay," said Doris, "but he deean't say much te George, he talks te mother an' me; but ah mun go, Mr. Sunley, ah mun go te t' vicarage."

Joseph sate still watching the girl as she went round the corner to the churchyard gate, and then out at a smaller gate in the corner nearest the farm, which led into the glebe field. She could have done this just as well by going through the farmyard, and out into the glebe field by the gate on which she was swinging when the squire first saw her. But ever since that luckless afternoon Doris had hated the gate with all the strength of her nature. She did not hate Mr. Burneston, her sense of justice told her that he was not to blame because he had heard her foolish song; but she never felt at ease with him, and when she could she avoided being present at his visits, although she secretly delighted in listening to his gentle voice and refined speech.

To-day, besides her dislike to the glebe gate, she had seen Mr. Burneston standing in the rick-yard talking to her father, and she at once remembered that she had promised George to fetch him a book from the vicarage.

"Bon it!" Joseph said to himself, "t' wurld's full o' strange things. Te think o' a stiddy chap like Mr. Burneston spendin' his time wit' t' like o' Dorothy Barugh as he diz. Ah'd thowt he'd hev cared to hear o' his fayther an' his grandfayther when a' wer lahtle lads like Maister Ralph. Ah minds 'em both; they wor fahne lads, mebby not so bonny-lookin' as what this chap hev growed into; bud neea, neea, t' times is changed, fooalks nivver looks back noo, it's allays forrad, forrad, forrad."

At that moment Mr. Burneston was an apt illustration of Joseph's words. For more than a week he had been soothing his restlessness by mental pictures, which he felt only required an act of will to be converted from castles in the air to realities. And the past—which he had even thought of with regret, even if he had never felt a longing for its return—was gradually fading into a grey mist, in which indifference made all indistinct.

No wonder that Ralph complained of his father's dulness—every link that bound the boy to his father formed part of other links that went backwards into life; there was as yet nothing to bring Ralph into this dreamlike fancy which so entirely absorbed the present.

Mr. Burneston saw Doris go out of the house, and then he saw the gate swing, and he knew that she would not come through the rick-yard. But to-day he had made up his mind to act, and her absence was a necessary preliminary to this action.

He watched the girl pass beside the screen of fir-trees, and then he turned with a new purpose in his face to John Barugh.

"I want to have some talk with you and your wife together," he said; "shall we go in?"

He did not wait for the farmer's assent, but led the way to the house.

Joseph had seen Mr. Burneston coming

from the rick-yard, and by the time they were crossing towards the house he had reached the gate.

Pre-occupied as he was, Philip Burneston could not forget his habitual courtesy.

"Good-day, Joseph. How's the stiff knee? Did Mrs. Emmett's stuff do any good?"

Joseph shook his head.

"Neeah, neeah, sir, 't wurn't likely 'at t' sort o' stuff 'ud deea fer a knee, when t' wur wrote o' 't i' plain writin' fer a airm; a knee an' a airm ain't made alike, bliss t' lass. Shea sud read o' t' bottles afore sheea sends 'em te fooak."

"Well, I'll tell her," but Mr. Burneston spoke so absently as he turned away, that a fresh pucker rose on Joseph's forehead.

"Dash mah! Ah's fair capt, ah is; he's as glum as a sperret," he said, as he limped back to the seat outside his door. "Mebby Mrs. Duncombe knaws summat aboot 'un; shea's a 'cute awd lass."

Generally Mr. Burneston's visit only lasted half an hour, but to-day, though Joseph never relaxed his watch, an hour and a half passed, and still the squire did not come out. Doris came back, went in with the book, but she did not stay indoors, and Joseph saw her go on to the beehives.

At last the house-door opened, and Mr. Burneston appeared, followed by both husband and wife. Joseph gave a grunt of disapprobation, as he watched the cordial leave-taking, and then he tried to listen as Mr. Burneston stopped, when he came to the gate, to say a few more words to John Barugh.

They seemed very earnest words, but the sexton's deaf ears disappointed his eager longing; he could not hear Mr. Burneston say, —

"Well, I hope in time you will see the matter as your wife does. All that Doris gains at school will be undone if she spends her holidays here; you shall go and see her once a year, and she will of course write to you constantly."

John Barugh's face was full of trouble.

"Ah knaws 'at yeh mean it fer t' lass's gude, sur; bud ah mean no offence when ah say ah cann't see 't, ner ah cann't say ah thank yeh nowther. Ah cann't thank any mon as wants t' tak mah lass away fra' me."

Book I. — School.

CHAPTER I.

TWO SCHOOLGIRLS.

About four miles from London, on the skirts of a large common overgrown with golden gorse, there stood and still stands a large old-fashioned house, probably dating as far back as the Tudors.

In the large plot of front garden is a group of tall trees round which sweeps a broad, gravelled carriage drive, entered through tall, iron gates set in the high, iron railing which mounted on a low wall screens the house from the road. There is a portico over the central doorway; and above the old-fashioned windows are three quaint gables. The entrance under the portico is closed, but on the left side of the house is a conservatory, and through this you can, if you please, enter Pelican House, cross its slippery, marble-floored hall, and find your way out through double glass-doors on the left into a sort of second matted hall and thence to a pleasant lawn surrounded by shrubberies, and shaded on one side by the lofty elms which screen the grounds of Pelican House from those of its neighbor.

If you look round the matted hall a variety of garden bonnets hanging on pegs, a collection of battledores and shuttlecocks, with here and there the hoops and sticks for a game called *la grâce*, skipping-ropes and balls, will have suggested to you that Pelican House is a girls' school, and a few steps outside the glass-door will convince you of this fact, for the bell is ringing, and about a dozen girls of various age and size come rushing out, some by the way you have come, some from other doors, for the house is much larger than it looks from the gates; and in a minute, although almost all have disappeared among the shrubberies, a soft buzz of girls' voices, and occasional notes of merry, ringing laughter, reach you as you stand on the range of shallow steps which forms a terrace above the lawn.

The girls divide as they pass out of sight into small groups, and some twos go hand-in-hand or with arms circling each other's waists. The last two are neither the eldest nor the youngest. They are well matched in height and age, very different in face and figure.

The tall, slender girl, with erect head and delicately-cut, regular features, is Doris Barugh; but the ease with which she walks, and a nameless something which has spread over her whole person, show that the two years spent at Pelican House have given her, at least, outward refinement both when in movement and in repose. As the "principal," or schoolmistress, as she was simply called forty years ago, had said to Mr. Burneston, "The girl has so much natural refinement of look

Generated on 2020-04-25 06:50 GMT / https://hdl.handle.net/2027/coo.31924079893602

Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

and dignity of manner, that there will be little up-hill work in training her."

And as Miss Phillimore's idea of education for her pupils did not go beyond refinement and culture, both of look and manner, with the amount of head knowledge and the accomplishments necessary for "a young lady," Doris was from her point of view a complete success.

Mr. Burneston had said to the schoolmistress that a friend of his wished to place his daughter under her care — a remarkable girl, but one whose education had been neglected. "Outward refinement and polish are what she chiefly wants," he said, getting a little confused under the calm eyes of the observing lady; "she has plenty of self-respect and dignity."

Miss Phillimore had that quickness in perceiving weak points which is so often found in a shallow nature incapable of deeper insight or sympathy, and she at once, woman-like, jumped at the result which this charming, pleasant-looking gentleman was contemplating; but she kept her surmise a secret, only, having ascertained the extent of Mr. Burneston's property, and the importance of his position, she resolved to attach the new pupil to herself, and to fit her in every way for the future that she divined lay before her. For even cold, world-hardened Miss Phillimore was at once fascinated by the girl's beauty, and the graceful dignity of her manner.

Often to herself the schoolmistress wondered how it was that this farmer's daughter had so rapidly shot out of the sheath of ignorance and broad speech which had at first separated her from her schoolfellows, and had now distanced them all in any study to which she chose to apply herself.

"Choose is the word," said Miss Phillimore thoughtfully. "Doris is so conscientiously in earnest in all she does, that I have never yet had to thwart her will. I fancy she could be very stubborn." But the schoolmistress dismissed the half-revelation which came to her with these words; and on the old plan of "leave well alone," she was doubtless in the right, having, with all her learning and perfection of outward manner, about as much knowledge of the human heart or of the way to help it in its struggles against self, as a hairdresser has of the inside of the heads that pass under his hands.

"Ah, Doris," she said with a smiling bow, as the two girls met her at a turn in one of the shrubberies. "A delightful afternoon, is it not?" and then she included Doris's companion in her very pleasant smile, and passed on towards the house.

"I wonder" — the girl shorter and stouter than Doris looked and breathed fresh country air, she might have just been gathered from a wild-rose spray — "I wonder," she hesitated, pushing her hazel-nut-brown hair out of her eyes, "if that smile may be trusted."

Doris lifted her long, dark lashes, and gave a surprised look at her companion.

"I should not have thought you mistrustful, Miss Masham."

"Why 'Miss Masham'? I told you this morning that if I did not bore you I should like to be your friend. I will call you Doris."

"I will call you what you like," said Doris quickly. "I think your name is Frederica?"

"Yes, is it not horrible? but you must call me Rica. At home the boys call me Freddy, but I don't like it, and my mother always calls me Rica."

"You have a mother, then?"

"Oh yes," sadly, "that is why I work so hard. I want to be very clever; my mother is so delicate, and if anything happened to my father, I should like to be of use. You see I am so terribly unlike other girls, at least they say so, and I am come here to be got into shape."

Doris smiled, and such a rare sweetness spread over her face that Rica looked up at her lovingly.

"Certainly you are not like other girls," she said in the soft, low voice that had charmed Mr. Burneston. She had lost the dialect, and she said I for ah now, but she had still the sweetness of northern tone. "But then these two years that I've been here, I've seen so many girls, and I've often wished they were not all so like one another."

"Ah! but," Rica broke in with impulsive abruptness, "are you quite sure they were alike? Don't laugh at me, Doris, but it seems to me that you do not notice much that goes on round you. You often seem to be dreaming; perhaps," she looked admiringly at her lovely friend, "you are thinking out thoughts beyond our comprehension."

Doris blushed so deeply in such confusion that Rica felt puzzled.

"Don't say that to me, please. I can't talk about my own thoughts. I dare say we are none of us quite so good or quite so bad as we seem. But I want to know why you distrust Miss Phillimore?"

"Well, I've only known her a few days,

but she never has any phases or moods. It is natural you should like her, she treats you like a queen, but it seems to me that such a perpetually serene smile must be artificial and mechanical. People feel hot and cold, and glad and sorry, and well and ill; and of course all these phases must affect both mind and body; and somehow I don't think Miss Phillimore goes in for religion enough to make her perpetual sweetness the result of saintliness."

"I know nothing about saints," said Doris coldly, "but I fancy they must be dull and uninteresting, even if there are such people."

Rica's large grey eyes had been fixed earnestly on her companion. In an instant they grew dark and liquid as the pupils dilated, and she said with intense feeling, "Hush, Doris, dear! Don't say that. My father and mother are both saints, and so was my sister who died."

"Why"—began Doris, but she stopped. Rica's pink dimpled hands were placed on her eyes to keep in the tears which began to show through them.

They walked on silently. Doris soon forgot Rica, she went on thinking out a thought that often occupied her—what would life be like when she went to live at home? To-day this thought pressed heavily, and after it came another, how much longer should she stay at school? And then the dread, which week by week grew stronger as she brooded over it, should she be happy when she left Pelican House? Whenever she thought of her parents and her old life, she grew more and more aware of the change in herself. Another thought sometimes intruded, but she did not let herself dwell on it. A feeling that was partly pride, partly a kind of awkward shyness, which linked her to the past she so longed to forget, always made her banish any reveries about Mr. Burneston, and the share he had had in her going to school; but still every now and then, seemingly against her will, she found herself wondering whether she should ever see him again, and whether he would see the change in her; but her face grew crimson at the memory of that first interview, that by degrees she had made herself regard as a thing of no consequence.

Mr. Burneston had paid several visits to the farm before he could get John Barugh to listen patiently to his plans for Doris. He argued that the girl must be educated somewhere; that there was only an infant school in Burneston; even at Steersley, the nearest town, there was only a third-rate school, where Doris would learn more harm than good; even there she would have to go as a boarder, so that there must be a separation. If Mr. Barugh would tell him how much he would spend on his daughter's schooling, he (the squire) would promise that the sum named should satisfy the schoolmistress he had in view. But at this point John shrugged his broad shoulders and retreated to the mantelshelf, leaving Mr. Burneston to finish the talk with his wife.

At last, at the end of a month, wearied out by the squire's persistence and his wife's persistent persecution, he conceded that the decision should be left to Doris herself, on condition that he was present when the matter was put before her.

On the evening following this concession her mother called Doris in from the beehives. She spoke very cheerfully.

"Doris, lass, will ye like to go to school again?"

The girl had a sort of quiet mistrust of her mother's wisdom. She looked on to the tall, red-bearded father for answer.

John sighed, and a smothered groan sounded as he leant on the mantelshelf.

"Neeah, lass, gin thee dee'ant cotton tiv't, thee sall bide at yam. Better be content wi' thy awn fooak than freeat theesel to be made a laady."

"Nay, nay, father, that's not fair." There was a sharp anxiety in Dorothy's thin voice, and as her husband listened to it his head sank as if his last hope was gone. "We was to put it fair before her, an' she was to choose herself."

"What is t' choice?" said Doris firmly. "An' wheea is't can hev owt te do wi' me, beside fayther an' thee?"

John Barugh made a step forward, and then, with a great effort at self-control, he went back to the hearth.

"You tell her if you like," his wife said fretfully. She was trembling with eagerness lest her father's evident unwillingness should check the girl's ambition.

John Barugh shook his head.

"Wheea dee'ant thee tell it out, mother?" said Doris contemptuously.

"I'm sure it's time you was sent to school to learn manners, let alone how to talk. I'm sure I can't teach you, even to speak properly, though it's not for want of trying," said Dorothy. Then, afraid that her husband would tell her story for her, "If you like, Doris, you may go to a good school, such as reel ladies goes to, an' be taught everything heart can wish, an' to talk like 'the quality,' as your father says, an' cost little to him neither."

"Tell t' truth, Dorothy." John Barugh had come forward, and there was a bitterness in his voice that startled the girl. Rarely had her mother's fretful twitting and constant complaints drawn an angry word from the strong, patient man, who sixteen years before had married for love, and he had never, before one of his children, rebuked his wife thus sternly. Then turning to Doris, who had become pale with sudden shrinking from this token of deep unspoken strife between her parents, "Ah'll tell t' lass mysel'. Neeah, neeah, Doris lass, ther's tweea sahdes t' ivverything i' life, an' thy moother's telt thee t' bright o' this'n. T' ither's a sad sahde te me, lass. Mebbe ah'm wrang, an' if ye think ah's wrang, ye'll be noane feard o' speakin' oop an' tellin' yer faythe, lass."

She looked at him trying to understand.

"Ah can't say while ah kens nowt, faythe."

It was curious that the girl's accent always broadened in speaking to her father.

"Well," said Mrs. Barugh pettishly, "there's a vast o' words wasted. It's soon said; you'll have to spend yer holidays at school, and never come home till ye've done with the learnin'."

Doris stood with open mouth and staring eyes. It was too much to take in all at once. She had first been dazzled, now she was shocked.

"Nivver coom yam!" She looked longingly at her father, and the pain in her voice soothed the hunger which had been gnawing at his heart.

"Neeah, lass" — and then, with an effort against himself, the supreme martyrdom of which no child could ever comprehend — "bud ah tellt ye t' leeak a beath sahdes, yan as mitch as t' other. Ther's t' scheeal an' t' learnin' ye says noo an' again ye wearies after, an' books, an' music, an' sike; an' ther's stayin' on in t' yam wi' faythe an' moother an' t' poor lad."

"George 'd miss me," said Doris simply.

John Barugh turned his back, went again to the mantelshelf, and gulped down a sob there. Then came a silence.

"Faythe" — Doris spoke resolutely — "scheeal is a great thing fer a lass. Ah'd liever not say out at yance what ah chooses."

"Neeah," he sighed; "at's trew an' fair eneeaf; t' mooarnin' 'ell deea te talk ageean, if it's t' be."

But his heart was very heavy; he had clung to the hope that he was as necessary to the girl as she was to him, and her hesitation told him what her decision would be.

And he was right. In less than a month Doris had bade good-bye to her mother and to poor, sobbing George, and found herself less sorrowful than she expected when she had parted from her father at the gates of Pelican House. For John Barugh would not risk a farewell before witnesses.

"Neeah, neeah," he said to Dorothy when he got back, "Doris looks a laady; no need for the fine scheeal-missus to see as she hev sike a rough chap te her faythe."

At the end of the year, he claimed Mr. Burneston's promise to go up and see Doris; he managed to see her alone and to exchange as few words as possible with any one else. And when he came back he said to Dorothy,—

"Gi' me a kiss, lass. Thou was i' t' reeght an' ah was i' t' wrang. T' lass is as beautiful an' as sweet as any queen; nowt's too gude fer t' like o' Doris. sheea's i' t' reet place. Sheea war clean thrawed away on sike as wersels."

And Mrs. Barugh gave the kiss. She did not hear the sob in her husband's voice; she hungered for a sight of her beautiful child, but her ambition was stronger than her love, and she sat with half-closed eyes and smiling lips, listening to all John had to tell, and weaving the part she meant to play in the brilliant future which lay before Doris.

Only George looked dissatisfied.

"Faythe," he said, after a pause, "is thee quite seear Doris is i' t' reet road?"

Even his mother's doating fondness could not keep her from an angry word.

"George, ye're turning foolish, lad; was ever the like o' such silly stuff as that?"

"Ah me-ans, faythe" — the boy's eyes looked earnestly in John Barugh's face — "it says, 'to do our duty in that state of life to which God hev been pleased to call us.' Now God didn't make Doris a laady."

His father's face clouded; but his mother laid her hand on his lips.

"Ye want yer supper, my poor lad." Then going over to her husband, who was stooping to get a light for his pipe, "Don't heed his sick fancies," she said; "it's best not take notice."

George was silent; but the day after his father's second visit to Pelican House, when he was alone with his father, he asked for writing-tools, and with much effort wrote to his sister.

When he had finished he looked at his father. "Seal it oop, fayther, an' send it on to Doris." And then he fell back, white and exhausted with the effort he had made.

It was this letter that had made Doris so very dreamy and abstracted for the last few days.

She was not troubled by George's earnest question. "The poor, sick lad," she said to herself, no wonder he takes fancies as he lies there day after day; but I will write. Nay, nay, it's not a fancy. Any one must be i' t' right who's trying to better herself; Miss Phillimore has said so." Now and then, and especially when she was thinking of home-life, Doris would fall into the old familiar thought, and then check herself proudly for the error.

She glanced at her companion, whose pure, refined enunciation had greatly impressed her, and she felt thankful she had not spoken aloud.

Meantime Rica had recovered her self-possession.

"You have no sisters, either," she said quietly. She was glad that Doris was not demonstrative, for she shrank from some of her more gushing school-fellows, but still she wished her new friend had kissed her just now, when she must have seen she was very sad.

Doris started. "No. I've only got that poor, sick brother I told you about, who is almost always lying on a sofa."

"How dreadful!" and Rica's sympathetic face grew puckered in an instant. "How glad you must be when your holidays come, to go home and amuse him! Are you good at making up stories?"

Doris laughed.

"I never made up a story in my life, unless" — she hesitated — "do you call looking forward and planning what may happen to oneself making up stories?"

Rica looked curiously at her companion.

"What a strange creature you are!" Then, noticing a quick flush on her friend's delicate face, "I beg pardon. Do you mind — did I vex you? I did not mean to; I only thought that you take the same trouble and get less fun."

"I don't understand." There was pain in Doris's voice.

"Why, isn't it more amusing to make stories about people one has never seen, to make new people to think about, than to go on thinking about oneself? Of course you're a different self to me; but I've heard so much about myself in the way of scoldings, and so on, that I believe I'm rather sick of Rica Masham and all that belongs to her."

Doris thought before she answered.

"It may be more amusing to do as you say, but it's not reality, Rica. How old are you?"

"I am fifteen and a half, and you ——"

"I am just seventeen; but it seems to me I am ever so much older than you are. I dare say you'll do me good. Some day I'll tell you about myself, and why I am what you call such a strange girl."

"Tell me all this minute: you know all about me, and my father, and my mother, and my four brothers — such jolly boys! — and all I know of you is about poor sick George. When I love people I like to be able to imagine them in their home-life. Perhaps you will let me go and see you some day. I have written to my father already to ask you."

Doris blushed brightly, but this time she was evidently pleased.

"You are very kind indeed; but I stay here in the holidays; I do not even go home. Some day, if we keep friends, you shall know all about my home and everything, and then perhaps" — she made a great struggle to be frank — "you will not want to come and see me."

"Naughty Doris" — Rica's arm stole round her neck and drew her down to be kissed. "But, no, I will not go to see *you*; I shall go to your home on purpose to tell stories to that poor darling George."

From Blackwood's Magazine.

SAMUEL WARREN.

BORN, 1807 — DIED, JULY 29, 1877.

On the 29th July died Samuel Warren, the author of "Ten Thousand a-Year" and the "Diary of a Late Physician." Although it is now many years since any contribution from his pen appeared in the columns of this magazine, his fame is so much bound up with *Blackwood* that we feel sure our readers will sympathize with us in an attempt to give expression to our sorrow and our sense of loss. His place has for years stood vacant in the circle of authors, but his name is as familiar to the present generation of readers as to that which laughed and wept with him in turn, while the passages of the "Diary" and the fortunes of Tittlebat Titmouse were first passing through these pages. His family has sustained a heavy afflic-

tion; but it is tempered to them by the sympathy, not merely of those to whom he had personally endeared himself, by his kindness of heart and devoted friendship, but of all who have read his fictions, — for no one ever read Samuel Warren's books without conceiving a liking for the author. To us his loss is especially painful, for he was almost the last of a distinguished circle of coadjutors, whose connection with "Maga" in the earlier half of this century shed a mutual lustre over themselves and on us. The pride which he took in his connection with this magazine, so frequently expressed in his writings, was as gratifying to us as it was honorable to him; and we feel a sad pleasure in now recalling the chief incidents of his literary intercourse with us.

Samuel Warren was born in Denbighshire in 1807, the son of a Wesleyan clergyman, who afterwards took orders in the Church of England. He studied medicine in Edinburgh for some time, but, changing his mind, he went to London and began to read for the bar. It was while still a student in the Inns of Court that he commenced his literary career, and his first introduction to our pages cannot be more fittingly told than in his own words, in the preface to the fifth edition of the "Diary of a Late Physician," published in 1837: —

The first chapter of this "Diary" — the "Early Struggles" — was offered by me successively to the conductors of three leading magazines in London, and rejected, as "unsuitable for their pages," and "not likely to interest the public." In despair, I bethought myself of the "great northern magazine." I remember taking my packet to Mr. Cadell's in the Strand, with a sad suspicion that I should never see or hear anything more of it: but at the close of the month I received a letter from Mr. Blackwood, informing me that he had inserted the chapter, and begging me to make arrangements for immediately proceeding regularly with the series. It expressed his cordial approval of the first chapter, and predicted that I was likely to produce a series of papers well suited for his magazine, and calculated to interest the public. It would be great affectation in me, and ingratitude towards the public, were I to conceal my belief that his expectations have been in some degree verified by the event. Here I wish to pay a brief and sincere tribute to the memory of my late friend, Mr. Blackwood. I shall ever cherish it with respect and affection. I have this morning been referring to nearly fifty letters which he wrote to me during the publication of the first fifteen chapters of the "Diary." The perusal of them has occasioned me lively emotion. All of them evidence the remarkable tact and energy with which he conducted his celebrated magazine. Harassing as were his labors at the close of every month, he nevertheless invariably wrote to me a letter of considerable length, in style terse, vigorous, and accurate, full of interesting comments on literary matters in general, and instructive suggestions concerning my own papers in particular. He was a man of strong intellect, of great practical sagacity, of unrivalled energy and industry, of high and inflexible honor in every transaction, great or small, that I ever heard of his being concerned in. But for him, this work would certainly never have been in existence; and should it be so fortunate as to *live*, I wish it ever to be accompanied by the tribute I here sincerely and spontaneously pay to the memory of my departed friend, William Blackwood.

So full of deep and varied experience and knowledge of life was the physician's "Diary," that Mr. Blackwood naturally concluded it must be the work of a man of mature years. What was his surprise, then, when a bright-looking young man of two or three and twenty introduced himself as the author. "Bless me," exclaimed the astonished editor, as he glanced at the glossy black curls of his visitor, "I had thought your hair must be as grey as my own!" It was in August 1830 that the "Diary" began, and it was carried through the magazine at intervals during the next seven years, until a work of greater ambition began to occupy his mind. The merits of the physician's "Diary" were speedily acknowledged. The profession was indignant at the breach of etiquette implied in the publication of records of practice, and its journals anxiously sought to discover the offender. Month after month fresh passages were eagerly expected, were critically scanned when published, and not unfrequently made the subject of warm newspaper discussion. It does not appear that any suspicion was excited regarding the reality of the author's assumed profession, until circumstances brought about a revelation of his personality. Although the popularity of the "Diary" was so great as to insure success for any other work from the same pen, Warren's next venture was also at the outset an anonymous one. The first chapter of "Ten Thousand a-Year" appeared in the magazine of October 1839, and at once excited a powerful interest, which was not exhausted until all that there was to tell of the fortunes of the Aubreys and of the career of Titmouse had been revealed. The time was one when no novel not of intrinsic strength and merit could have held its ground. Some of the great-

est masters of English fiction were then before the public, and both genius and power were needed, not to beat but to keep neck-and-neck with them in the race. The public were not slow to find many faults with "Ten Thousand a-Year." Some cavilled at the characters, many at the political bias, a good few at the plot, but all were impressed and all were interested. The success which attended the appearance of the story as a separate work was not at all impaired by its previous serial publication, and the hold which it then took upon the public has never up to the present moment relaxed.

The anonymity was now no more; and the hand of the author of "Ten Thousand a-Year" was easily traceable in many papers contributed to these pages down to a period of about twenty years ago. These sketches, now collected in a volume of "Miscellanies," are still read with great interest. As chips from the workshop in which the "Diary" and "Ten Thousand a-Year" were constructed, they naturally possess a strong claim on the critic's attention; and he will not fail to recognize in them the germ of many incidents which Warren has turned to good account in his great fiction. The same power of extracting dramatic effect out of ordinary judicial processes, which holds us spell-bound while the court is deciding the fate of the Yatton property, is displayed to great advantage in the sketch, "Who is the Murderer?" and in others of a similar character, which have proved a mine of wealth to subsequent novelists of the sensational school. Many writers of fiction could be pointed to who are largely indebted to Warren's works for their knowledge of the bar and the courts. A series of papers reviewing Townsend's "Modern State Trials" furnish a very readable account of some of the more remarkable *causes célèbres* prosecuted by the crown during the present reign. The treason of the Welsh rioters; Oxford's attempt to assassinate the queen; the murder of Mr. Drummond, Sir Robert Peel's private secretary, by M'Naughton; the trial of Humphreys, the claimant of the Stirling peerage, whose case is described at length under the title of "The Romance of Forgery;" the trial of Lord Cardigan by his peers for duelling; and the cases of O'Connell and Smith O'Brien, are all told in a manner that happily blend the acumen of the skilled lawyer with the vivacity and picturesqueness of the novelist. The last of his works that we shall notice, "Now and Then," was reviewed in *Blackwood* of February 1848, when an attempt was made to do justice to the lofty purpose, the dramatic power, and the exquisite pathos of the story of Adam Ayliffe. It is less ambitious in conception than "Ten Thousand a-Year," and is characterized by far less striving for effect than we meet with in that novel; but to our mind it possesses a sweetness and a softening influence that mere literary art could hardly have given it, and that could have sprung only from a pure mind feeling deeply for human distress. The fame that these works had secured him was sufficient to satisfy his literary ambition; his legal duties naturally claimed his first care; and his contributions to the magazine grew more infrequent, until at last he stood aside, and the pages which his writing had so often adorned knew his pen no more.

Such in brief outline is the story of Samuel Warren's literary life. It would be incomplete without some reference to his professional career. After practising for some years under the bar as a special pleader, he was called by the Inner Temple in 1837. Notwithstanding the mark which his novels had made for him, his progress was not rapid. He had to bear the full share of disappointment that falls to the lot of most lawyers, and to practise that patience which he had so forcibly preached in his fictions. Men accounted for this by the time-honored superstition that when a barrister begins to dabble in literature, his chances of professional success are altogether thrown away. Warren consoled himself with the more flattering belief that the attorneys were revenging themselves on him for the severe picture which he had drawn of their practices in his account of the firm of Quirk, Gammon, and Snap. We believe the real reason to be one more honorable to his character. Possessing, as he did, a high sense of the dignity of his profession, he not only did not resort to the common expedients for securing business, but did not even make such advances as are sanctioned by professional usage toward those who had the distribution of work. But if the Quirks and Gammons of the profession made him the object of their spite, he was more than compensated by the esteem in which he was held by the worthier members of the profession. Such men as Follett, Talfourd, and Pollock, Fitzroy Kelly, Grove, and Barnes Peacock, were his personal friends and admirers; and though no doubt they made quiet jokes at the way in which he bore his literary honors, they loved and respected him as a colleague.

He went the Northern Circuit, and if none of those splendid chances which sometimes lift a man at one stroke from obscurity to wealth and professional advancement presented themselves to him, a still more propitious fortune gave him an opportunity of winning for himself a place in the first rank of the authors of the day. His law books, which had met with fair success, showed that amid the greater attractions of literature his professional studies were not being neglected. In 1851 he was made a queen's counsel, and became a bencher of his inn, of which he subsequently acted as treasurer. The return of the Conservatives to power in 1852 gave his friend Mr. Walpole, the home secretary, an opportunity of recognizing Warren's merits in the way that was most agreeable to his feelings, and he was made recorder of Hull. We cannot doubt that the office was a congenial one, and that Warren spared no pains to augment the dignity and character of his bench; and we can easily suppose that his charges to the grand jury would be very fine addresses in point of law as well as in point of rhetoric. In 1853, on the occasion of Lord Derby's installation as chancellor of the university, he was made an honorary D. C. L. of Oxford, along with Lord Lytton, Sir Archibald Alison, and Professor Aytoun, his fellow-contributors to the magazine. He was returned to Parliament for the burgh of Midhurst in 1856, and continued to sit for that place until he vacated his seat in 1859.

His Parliamentary career does not call for many remarks. His self-consciousness was, perhaps, against his success in the House; perhaps he felt that he had already achieved too great triumphs to be content to submit to the novitiate which has to be undergone before a member can take his place as a party leader. But he left pleasant recollections behind him in the Commons, and a popularity which was not bounded by the ministerial benches. When the offer of a mastership in lunacy was made to him by Lord Derby in 1859, it was not accepted without some natural regrets for the attractions of a Parliamentary career, and the possibilities which he was leaving behind him. But prudence came to his assistance, and he accepted an office which he of all men, by his psychological experience, his keen perception of character, and his unswerving conscientiousness, was so well qualified to fill. And thus was partially fulfilled the vaticination which had been spoken of him by Sir George Rose: —

Though envy may sneer at you, Warren, and say,
"Why, yes, he has talent, but throws it away;"
Take a hint, change the *venue*, and still persevere,
And you'll end as you start with "Ten Thousand a-Year."

That in his new office he was a valuable public servant, doing his work with zeal and fidelity, we know well; and it does not speak little for the man that he should have devoted himself to the labors of an unostentatious office, nor allowed himself to be distracted from his duties by work which would have kept his name more prominently before his public.

Of Warren we are almost tempted to say that we are never so conscious of the novelist as when he is penning a law treatise, or of the lawyer as when he is moulding the structure of one of his novels. But if he has not left so lasting a mark upon the literature of the bar as upon that of his country, few of its members have done more to vindicate its honor, or to elevate its professional standards. Almost the only occasions when he really dips his pen in gall are when he has to deal with those who lower its position by their lives, or abuse its forms in their practice. But not only has he painted for us the character of Mr. Toady Hug that all may take warning by him, but he has presented the aspiring lawyer with some noble ideals like that of the attorney-general in "Ten Thousand a-Year." The respect which he invariably shows for the bench, and the zealous care which he exercises to assert its dignity, by his representations not only of the justice of its decisions but of the exemplary lives and characters of those who occupy it, deserve to be kept in honorable remembrance. The fact that his sketch of Lord Widdrington is more or less a portrait, does not detract from the skill with which it had been executed, or make us less proud that it can be said of the English bench this man was of it. And where shall we go for a nobler, a more touching picture of a struggle between justice and mercy, of the strivings of a lenient mind charged with the execution of stern decrees, than in the description of the chief justice in "Now and Then," when he is appealed to for a respite to Adam Ayliffe?

No critic is likely to do justice to the works of Samuel Warren who fails to see that he has to do with a moralist as well as a novelist. A generation less acquainted with the rules of literary art, used to apply to their books the simple

test, "whether they made one wiser and better." Antiquated as this criterion may appear to some, we cannot forbear applying it to Warren's novels. A great novelist has it even better in his power than a great preacher to justify to men the ways of the Almighty; and Warren never for a moment loses sight of the responsibility which the exercise of his genius imposes upon him. He thinks it no shame to confess that his fictions are written with a purpose. And the lessons which he teaches, when once learned, will not easily be forgotten. Is there any reader whose moral nature is so unimpressionable that he or she can lay down "Ten Thousand a-Year" without the feeling that they have been listening to a great preacher who has expounded the weighty text of human life as it had rarely ever been expounded before? What lessons of patient, hopeful endurance under unmerited reverses do we not learn from the story of Aubrey? Could deceit and hypocrisy be shown in all their native loathsomeness and with their terrible consequences more forcibly than in the career and ending of Gammon? How close is the acquaintance we make with suffering, both mental and physical, each in its many-sided and painful aspects, in the "Diary of a Late Physician"! And who can read that noble story of the peer and the peasant in "Now and Then," without a deep feeling of the overruling power of God's providence over the mutable condition of human society — a power that puts down the mighty from his seat and exalteth the humble and meek?

Impressed as he was with the responsibility of exercising his powers for a higher object than the mere amusement of his readers, it is not strange that he would not trim his sails to catch the popular breeze. The free vent which he gave to his political convictions excited hostility and prejudice against his works which nothing but their rare literary merits could have overtopped. "Ten Thousand a-Year" especially has been stigmatized as a "Tory novel." We would be doing an injustice to his memory if we either disavowed or apologized for the fact. He was not one of those who would allow the text, "Fear God: honor the king" to be divided. His conservative principles were a part of his religion; and some of the most prominent of his creations owe their pre-eminence to this combination. A very natural objection has been taken to "Ten Thousand a-Year," that its art is all of a partisan character — that the Tories are all demi-gods and angels, and the Whigs for the most part incarnations of vice and vulgarity. There may be some justice in this allegation, but the complaint has not lowered the place of the novel among the classics of English fiction. To form a just estimate of this charge, we must consider the society which "Ten Thousand a-Year" seeks to portray. The estate of Yatton is lost and won amid the furious agitations which preceded the first Reform Bill. The stirring politics of the day penetrated everywhere, and leavened the tone and feelings of society to an extent which the present generation has some difficulty in conceiving possible. Even amid the excitement of the trial of the great case of "Doe *dem.* Titmouse *vs.* Jolter," Mr. Quicksilver, one of the counsel for the "lessor of the plaintiff," employs the intervals in court to pen an article for a Radical review. A novel of English life during the reign of the fourth William without any allusion to the political aspects of society would have been like the play of Hamlet with the part of Hamlet left out. Mr. Titmouse, launched into politics under the auspices of Messrs. Quirk, Gammon, and Snap, naturally came into contact with the dregs of the Radical party, just as naturally as the best and most cultivated representatives of the Tory side are found in alliance with a man of Mr. Aubrey's refinement and position. And the partisan cast thus incidentally given to the book is of little account when we remember that a deeper motive than a purpose purely political underlies the whole. Atrociously grotesque as some of the Parliamentary caricatures unquestionably are, we doubt if they will appear as extravagant to the present generation as they did to that which read "Ten Thousand a-Year" for the first time in these pages. The Irish patriot who "showed infinite pluck in persevering against shouts of order from all parts of the house for an hour together," and his allies Mr. Phelim O'Doodle and the Och Hubbaboo, are not the only legislators whom Warren had a prophetic prescience that the "Great Bill for Giving Everybody Everything" would introduce into Parliament. But he would be a bigoted Whig indeed whose party prepossessions would not allow him to enjoy the pungent sarcasm and the wild humor which enter so largely into the descriptions of Mr. Tittlebat Titmouse's legislative career.

Of the "Diary of a Late Physician," it has been said that it betrayed a far more intimate acquaintance with the affections of the heart than the diseases of the body. But so fully does Warren's intense sym-

pathy with suffering cover his limited command of medical experience, that we are hardly sensible of any shortcoming. The field which the "Diary" covered was then a fresh one, and to the favor with which it was received was due the host of fictions cast in the form of professional experiences that speedily followed it. Probably none of his contemporaries could have played the *rôle* of the kind-hearted, philanthropic physician, who, not unacquainted with misfortune himself, has learned to hold out a helping hand to the miserable. His deep knowledge of the human heart, and his compassion with distress whether bodily or mental, enabled him to feel quite at home when dealing with the cases of those who were either expiating the consequences of their sins or were suffering from the unmerited harshness of a cold world. No one is likely to read the "Diary," however hurriedly, without perceiving that the author has probed each passion and dissected every feeling before settling in his own mind the parts which were to be allotted to them in the action of the plot. Mr. Warren was a psychologist in days when psychological inquiry was less a requirement of the novelist's art than at present. The story of the period depended for its success less upon the study of character than upon novelty of plot and energy of action, and we do not hesitate to trace the part which mental analysis now occupies in fiction in some measure to the influence which the delicate studies in the "Diary" soon began to exercise upon literary taste. Since the days of Richardson, scarcely any English novelist had studied human nature with the same minuteness and care, or had given the same attention to the proper coordination of the affections with the requirements of literary art; and, like Richardson, Warren not unfrequently falls into the mistake of making his readers a party to his analytical investigations; instead of placing merely the results before them. But though the detailed exposition of feeling which characterizes so prominently all Warren's novels may be occasionally pushed to such a length as, in the case of a less-gifted writer, might run the risk of impinging on the reader's patience, it tends greatly to preserve the illusion of naturalness and probability which we never miss from his creations. In this way the passages from the "Diary" come to have all the *vraisemblance* of a real record of medical experience. So powerfully is the mental side of suffering delineated, that we scarcely notice that its physical aspects receive a somewhat slight treatment. But though with our knowledge of the authorship, we can detect professional trippings, we must still wonder at that fulness and diversity of medical knowledge which were sufficient to impose upon the faculty of the day.

It would be superfluous on our part to recall the testimony which particular passages of the "Diary" bear to the literary powers which Warren had matured at that early age. In treating of a book so universally read, the critic has no need to refer to the evidence on which his judgment is based. Yet we cannot help feeling that we are arousing pleasant as well as tender recollections in the minds of old readers of Maga, when we mention some of the more striking scenes in which the physician took part. Who that has read "The Scholar's Deathbed" will ever forget the painful picture of a life unable to divest itself of its ruling passion for thoughts befitting the verge of the unseen world? The miserable termination of the "Man about Town's" career, with the loathsome picture of the grosser vices and their punishment, does not take a less-firm hold of the memory; and there is probably no "passage" in the whole of the "Diary" that better illustrates Warren's power of securing the whole of his intended effect without entering upon descriptions from which the sensitive mind might be in danger of revolting. "The Statesman," which seems to mix up so strangely the stories of Canning and Castlereagh, and in which we can hardly distinguish between what is taken from history and what comes from the imagination, is another sketch which the mention of the "Diary" will at once bring back to the remembrance of those who have read it. Another paper, "The Martyr Philosopher," in which Warren deals with a subject that always presented a powerful attraction to his genius — the effects of unmerited misfortune upon a pure and noble mind — is one of the finest specimens of vivid description combined with pathetic power that he has left behind him. He himself tells us, with pardonable pride, in his preface to one of the later editions of the "Diary," how an excellent nobleman, since dead, was so much interested in this paper that he wrote to the conductor of this magazine, asking permission to reprint it, at his own expense, for circulation among the upper classes of society. But what need have we to discuss individual stories, when the whole of the "Diary" itself bears a far stronger testimony to his

literary genius, high purpose, and warmth of heart, than it would become us to offer to one whose fame is so closely bound up with our own? It will suffice to say, that the "Diary" at once took a high place, not in our own literature alone, but with American and Continental readers, to whom reprints and translations speedily introduced it; and this position it has continued to maintain amid the many inducements which contemporary literature holds out to make us forget the works of preceding generations.

In "Ten Thousand a-Year," next to the interest of the plot, to which Warren gave so much thought and study, the powerful cast of characters constitutes its most notable feature. Amid a larger crowd of actors than we generally meet with in the pages of a single novel, there is hardly one whose outlines are not filled in with sufficient distinctness, even if only by a few graphic dashes of the pen, to give it an individuality and lifelikeness that retain a firm hold of the reader's recollection. There is a host of lay figures who, like the Toady Hugs, Smirk Mudflints, and Dismal Horrors, are simply brought on the scene by way of interlude between the graver business of the piece, to be ignominiously kicked off it; there are many sketches from contemporary life, in the fidelity and justice of which the world has had no difficulty in identifying the originals; but there are also a number of creations that offer ample attestation to Warren's powers as a delineator of character. Of these we can only notice two, which are beyond question his masterpieces. Exception is frequently taken to the portrait of Aubrey as a strained ideal, whose virtues are pushed to an excessive and improbable degree, and whose patience under his tribulations seems so unnatural, that the reader is apt to lose his own patience in his behalf. Those who go away with this impression can hardly have understood the principles upon which Aubrey's character has been formed. It is not merely to serve as a foil to the worthlessness and selfishness of Tittlebat Titmouse that Aubrey has been endowed with virtues that may appear at first sight to be superhuman. The oft-quoted lines of Horace, which supply a motto to the novel, indicate the keynote in unison with which the chords in Aubrey's character have been struck. The author's design was to show that a mind regulated by principle, refined by philosophy, and fortified by the teachings and the hopes of Christianity, had in itself resources against any change of fortune. And how well he has done so! If the heroism and patience and gentleness of Aubrey are unnatural it is surely a matter of deep regret; and we rejoice to think that English society, with all the hollowness and imperfection that are laid to its charge, can afford many proofs that Warren has not conceived a character too ideal for human nature.

If either of the characters is overstrained, it is that of Gammon. Such a Satanic combination of lofty intellect and daring purpose, with deceit and baseness, had hardly before been depicted in prose. And as with Satan, the character of Gammon is pushed to a point where we are attracted, instead of repelled, by its hideous proportions. When contrasted with the sordid, grovelling rascality of Quirk, and the petty chicanery of Snap, the smooth and easy-flowing guilt of Gammon seems almost venial; and it is not until we remember that it is his directing mind keeps these tools at work, that we are able to view him with the reprobation which he deserves. However despicable and worthless Tittlebat Titmouse may seem, we must always remember that he had Gammon for his evil angel, and that it would have been utterly impossible even for a better man to have turned out well under such a master. And it is not until Gammon is brought into contact with a mind so pure and noble as that of Aubrey that the full loathsomeness of his nature stands revealed. As in the case of Aubrey his whole strength had been derived from his firm convictions of religious truth, so the character of Gammon forcibly illustrates the effects of the absence of any guiding principles higher than self-interest and expediency. So irresistible is his villany that we cannot help being fascinated by it; and Warren himself seems to have fallen in some degree under the spell of his own creation, for he provides him with a termination to his career at once more dignified and dramatic than that vouchsafed to his wretched associates. We would have been glad, if the limits of this notice had allowed of it, to forget the career of Gammon in the recollection of Kate Aubrey, Dr. Tatham, and the other pleasant characters met with in "Ten Thousand a-Year." Our regrets are, however, the less that the reader will readily learn to love and appreciate these for themselves.

Outside his family and the wide circle of his friends, there is no place where Warren's loss will be more marked than in the Temple Church. In the benchers'

seats he was one of the most familiar figures; and as a member of the choir committee he took a great interest in improving the vocal service — a task which his delicate ear for music well qualified him to discharge. The allusion made by Dr. Vaughan, the master of the Temple, on the Sunday after his death, was as well merited as it was appropriate, and must have gone at once to the hearts of the audience. Those who only saw the outside of Warren's character must have been little able to appreciate the serious depth of his nature and the vein of sincere piety that lay within; but we who knew and loved him well, can testify from our hearts to the truth of the reverend master's tribute to the memory of our dear old friend, with which we may be permitted to close this imperfect notice. Speaking of the deaths of Mr. Ward Hunt and Mr. Warren, Dr. Vaughan said: —

"Many things conspire to make the word to-day vocal. It is a parting day. It is a closing service. "Who knoweth what a day may bring forth?" how much more a period of thirty days, or of sixty? But our last services of this season are services of mourning. Two chief men have fallen in our Israel — to-day the dirge is our music. One of these was less to us than to the country. His funeral oration was spoken in Parliament. Long years ago he forsook law for politics; his renewed connection with us was but a compliment to the statesman. Such a connection is honorable to both parties — it dignifies the man, it strengthens the society.

"But the other lost friend was a very part of this 'house.' You know how he loved it! This church has never looked the same since he left it — left it, not knowing that it was forever, on the eve of last Christmas. Who shall replace him in that seat, where we can see him still — that grey head, that keen eye, that fixed, that rapt devotion? Some of his last thoughts were with us — he is gone where there is 'no temple.'

"He was a man of mark in his generation. The memory of my boyhood goes back to the intense interest, the curious mystery, of his first work of fiction, combining so strikingly his two educations — the training of the physician, and the training of the lawyer. Honors fell thick upon him in that brilliant seed-time; he would have been more than man if they had not — just a little — elated him. His genius was less to us than his character. The servants and officers of this house can tell how kind he was. *I* can tell. He leaves behind him in his house those who hallow — who almost idolize — his memory; well may they! These things are too sacred for public mention. I may but tell in one last word, how gently, how lovingly, he sank gradually to his rest, amidst thoughts and looks, all of peace, all of blessing. Two days ago it was given me to speak the last words over him in his beloved son's village churchyard, where love will still survive him, as he lies waiting FOR 'THE GREAT EASTER'!"

From The Contemporary Review.

FRENCH CHATEAUX OF THE RENAISSANCE.

(1460–1547.)

BY MRS. MARK PATTISON.

THE architectural activity of the French Renaissance is of the greatest moment in its civil aspect. The secular character of the revolution in thought and manners found expression in the erection of palaces and châteaux. The religious architecture of the day only reflects social changes which took their first shape in civil monuments. It is therefore to these civil monuments that we must look for illustrations of the nature and succession of the changes which go to make up the history of the movement in its relation to architecture.

The French Renaissance may be said to embrace two distinct periods. The first extends from the middle of the fifteenth century to the reign of Francis I. The second ends with the last of the Valois (Henri III., 1589). Each period has peculiar and characteristic features; features which are not only indicative of the artistic revolution which was afoot, but of the political and social change of which that revolution was a part, and which are plainly affected by the influence which the centralization of government had upon every branch of art. The king was at last king, and the court took the initiative both in politics and arts. The finest châteaux built in the sixteenth century are the châteaux of the king, or of those princes who stood nearest to his throne. The progressive alterations and developments which transformed the fortified castle of the Middle Age into the prototype of the modern palace may be traced, one after another, in each succeeding building, and the history of these alterations and developments is the history of French architecture as fashioned by the Renaissance.

During the first period, the period

which begins even in the days of Louis XI., the transition from the *maison forte* to the *maison de plaisance* was accomplished. The old traditions of defence were shaken off. During the second period, which ends with the extinction of the house of Valois, the central idea of the *maison de plaisance* was elaborated till it touched the highest point of luxury and convenience permitted by the resources of the time.

The actual change in construction, necessitated by the changes in requirement, was accompanied by a great change in style. This change in style is so distinctly marked by different features in the two succeeding periods that some have regarded them as independent and separable epochs. They have called the first the French Renaissance, and have abruptly cut off the men who worked during the reigns of the Valois from national traditions, looking on them as forming, in all branches of art, a bastard Italian school. They have depicted their work as animated wholly by foreign inspiration, the importation of which acted injuriously on the characteristic promise of French art; and for this importation Francis I. is regarded as mainly responsible.

The theory is certainly false as regards French architecture. If we examine the buildings erected during this time of more than a century, there appears no evidence of forced and sudden transition. It would rather seem that the elements of change were slowly absorbed by a simple and natural process. From Langeais to Gaillon, from Gaillon to Azay le Rideau, from Azay le Rideau to Ecouen, the passage of a gradually developing style can be traced. First come minor modifications of detail which herald great constructive change, and then great constructive change itself.

The type of that which should be, was revealed in the drawings of Fouquet (painter to Louis XI.), thirty years before the stubborn stone began to yield to the force of new impressions. When Fouquet filled his backgrounds with architecture, the fashion of which expresses an ardent desire for classical symmetry and perfection, Gothic in France was prostrate beneath the wealthy burden of decoration which it had heaped upon itself. All outline had disappeared beneath an accumulation of frail and toylike prettiness. The costly church, erected by Margaret of Austria at Brou, in the decoration of which some of the most distinguished workmen of Tours were employed, is the helpless protest of an expiring style.

Michel Colombe, who had labored with Fouquet in the pay of Louis XI., lived on into the sixteenth century. In 1511, at the age of eighty, he designed the centre tomb, the tomb of Philibert of Savoy, which stands in the chancel of the church of Brou. He followed in this work the set precedent of Gothic fashion as he had seen it in the "*sepultures de feuz messeigneurs les ducs de Bourgoigne*," when, as a boy, he worked at Dijon under those "*souverains tailleurs d'ymaiges maistre Claux et maistre Anthoniet*" (Antoine le Mouturier), but on the minor details he engrafted the delicate arabesques and surface patterns which all men had then begun to love. In the tomb of Margaret herself, the signs of the time are even yet more evident; the border of her dress, her pillow, are all patterned with interweaving of Renaissance ornament; the very columns which support the upper shafts have undergone strange modifications, and their surface is subtly varied with threading of figured lines.

Already at Tours the effort was being made to carry matters a step further, to find the lines which should fitly enforce these lovely details, and at the same time to adapt these details to architectural features rapidly undergoing important alterations. The battlement, for instance, which had defended a castle of the previous century was destined to become the cornice, which, rich with moulding and ornament, surmounted, like a crown, the *maison de plaisance* that was to be. Elsewhere in France the same process was going on, but Touraine, where the court long dwelt, was necessarily the centre of the movement. It is to Tours that we look, until, with the commencement of the second period, the centre of activity is completely transferred to Paris. Gaillon, Chenonceaux, Azay le Rideau, Chambord, all arose before the sure force of political centralization had finally sucked into the capital the rich springs of provincial energies. Before many years elapsed each of these monuments was re-handled by Parisian architects, and brought as near as might be to the point of fastidious symmetry required by Parisian eyes. But when Bastien François built the cloister of the chapter of St. Martin of Tours, and Pierre le Nepveu worked at Chenonceaux, the school of Touraine was still holding its place with honor, and had also absorbed the flagging strength of a formidable rival.

The ancient vigor of the school of Burgundy had been slowly and certainly

exhausted in disturbing struggles for a political independence, the loss of which was plainly inevitable. Claux and Anthoniet, the men whom Colombe mentions in his contract with Margaret of Austria as the most skilful sculptors in France in the middle of the fifteenth century, were the last names of the Burgundian school. Although a Breton born, it was by them that Michel Colombe was trained. But Michel Colombe did not remain in Burgundy. He left Dijon for Tours, and took service with Louis XI. The school of Tours did not owe its existence to, but it received a renewal of energy from, the breaking up of the Burgundian centre. The works of the artists of Dijon are impregnate with the sentiment of the Flemish school, to which they were in truth affiliate. The artists of Tours were of a different ancestry. Once introduced into their circle, the Burgundian artist received its inevitable stamp. Touraine had never been in permanent contact with northern influence, but had long enjoyed a frequent, if not continuous communication with Italy. Travellers coming from Rome, and landing at the port of Narbonne, passed this way on their road to England, or even to Paris. Now and then the artists of Tours themselves, as Fouquet, visited Rome, and before the close of the fifteenth century many Italian artists had, in their turn, made their way into Touraine; and in 1502 the château of Bury, now in ruins, was built for Florimond Robertet by an Italian architect whose name has perished with his work.

This occasional commerce with the south brought to the men of Tours moments of precious insight, by which they were naturally well fittted to profit. From the north they seem to have been practically cut off. The journey into Flanders is spoken of by Michel Colombe in a letter already quoted, as a voyage unknown in those parts, and not to be undertaken unless a competent person be sent to guide travellers thither. This was probably no disadvantage, for so the school was left free to develop in the direction best suited to it, only receiving now and again from Italy a stimulus not too foreign to be well assimilated, and which inspired the keen French senses with a richer passion.

A few years after the building of Bury arose the cloister of St. Martin of Tours, and other buildings of very decided character. But the triumph of the new style was not to be rapidly complete. M. Lassus, in his valuable criticisms on the architectural designs which occur in the "*Hypnerotomachia Poliphili*" (1467), has remarked that the author solves the structural problems which they contain by the procedures of that very Gothic which he at the same time broadly condemns. Even so, in many of the chateaux of Touraine, the architect relies in construction on that very school the principles of which he denies in every minor detail. Here and there, as at Azay le Rideau, a boldly innovating hand may be seen at work; but for the most part throughout this transitional period men are feeling their way towards constructive change, not daring to touch essential features, but tentatively busy on the transformation and adaptation of minor details. Chambord is truly typical of the earlier stage of the movement. In the general arrangement, in the *ordonnance*, late Gothic caprice and fantastic love of the unforeseen rule triumphant. The older portions of the château, the seemingly irregular assemblages of half-Oriental turrets and spires, are debased Gothic full of audacious disregard of all outward seeming of order. The architect, instead of seeking to bring home to the eye the general law, the plan on which the whole is grouped, wilfully obscures and conceals it beneath the obviousness of the wild and daring conceits heaped above. But even here as at Brou, the mark is set which promises other days. It is the transition moment; Gothic fancy may wildly distribute ornament and obscure design, but the ornament which it distributes is Gothic no longer. The *obscœna* which haunt the cathedrals of the Middle Ages, which infest the earlier towers of Amboise, and linger defilingly about Gaillon, these are banished. In their place come faint foliated traceries and arabesques in low relief, enriching every surface, disturbing none, moving with melodious adaptation of subtle line, winding, falling, rising in sympathy with every swiftly ascending shaft or slowly hollowing curve.

Each success gave fresh courage for fresh audacity. The movement fully developed itself, and grew to the full knowledge of its secret strength. The aid of ornament was now rejected, except to accent the intelligible triumphs of construction. At last arrives the culminating moment — the instant which contains the fusion of perceptions excited to the most exquisite point of sensitiveness with the vital intellectual forces which invigorate and control the whole. With this moment the name of Francis I. has had the acci-

dental good fortune to be associated, but the art-activity of his reign was not the arbitrary creation of despotic free-will, it was the natural result to which previous conditions had been tending. When Francis sent Le Fevre d'Etaples to collect MSS., or bade Primaticcio bring works of art from Italy, or summoned Leonardo from the ruined city of Milan, he was but giving royal effect to an impulse shared by all about him. The currents of the day carried him away; he neither controlled nor could he direct their course.

Before the accession of Henri II. took place (1547), the character of future effort was irrevocably fixed. The transitional air which much of the work done during his father's reign still wears had finally disappeared. Paris now enjoyed that established pre-eminence which Tours had so long and so honorably maintained. The names of local artists no longer occupy the leading place on the lists of those engaged in carrying out work of importance. They are replaced by Parisians; if not indeed Parisians by birth, Parisians by training. Instead of Bastien François, and Pierre le Nepveu, we have Bullant, Lescot, and De Lorme; instead of Chambord and Madrid, Ecouen, Anet, and the Louvre.

In the attempt to sketch that earlier period which, beginning after the middle of the fifteenth century, closed with the death of Francis I., we find that though many buildings of that epoch shows signs of strongly individual treatment, nothing is to be learnt concerning the lives, nor can we, except in rare instances, even identify the names, of those who built them. All that can be done is to trace the tendencies expressed in the buildings themselves, selecting in their order some of the most typical monuments of that district which was the cradle of the Renaissance in France. In so doing, it will be necessary to treat each as if it were indeed the product of a single epoch and of a single mind, but this is true only in a strictly limited sense. Each building was an agglomeration of work done by different hands at different times. Not even Chambord was the sole creation of Francis and his architect, Pierre le Nepveu. Many a stone bears the monogram of Henri II., and the names of Primaticcio and Philibert de Lorme are associated with certain portions of the building. But at Chambord, and even at Chenonceaux, the characteristic form had been determined by those who began the work. Chenonceaux owes much more to later additions than Chambord, yet the general character of Chenonceaux is unmistakably that of a château built under Francis I. The after-touches, such as the gallery-bridge built over the Cher by De Lorme for Diana de Poitiers, or the chapel thrown out by Catherine de Medicis, show plainly as after-touches — as so many distinct and separable additions, the value of which we estimate having always reference to the main intention as declared at the very commencement. It is the evident predominance of this main intention which justifies the consideration of each building as belonging to the epoch in which it originated, so that it may be counted as of that epoch, all later additions being reserved as exceptions always made, if not always specified. Beginning with Langeais, an almost pure example of the fortress-château (1460), we pass the cloister of St. Martin of Tours (1508), taking next Blois and Chenonceaux (1515), then the Hôtel Pincé at Angers (1525), Chambord and Azay le Rideau (1526), until at last with the building of Madrid and the works of Fontainebleau, we find the centre of activity wholly transferred to Paris, and a second period commencing with the accession of Henri II.

Langeais is a fortress of the Middle Ages, but it bears within its very walls the traces of coming change. It stands on the banks of the Loire, not far from Tours, and is one of the finest existing examples of a French castle built about the middle of the fifteenth century. Pierre de la Brosse, barber to Louis XI., is said to have begun laying the foundations, but there ended his share in the construction, which was taken up and completed by the next possessor, Jean Bourré, minister to the same king. The problem which the architect had to solve was how to conciliate the necessities of defence with the already increasing demands of domestic life. The system on which the fortifications were planned seems to have been curiously behind the science of the day. The effects of gunpowder are, it is said, left wholly out of calculation, but every means of repelling attack by scaling-ladders has been provided. One gate only affords access to the interior court, and that gate is flanked by massive towers, and protected by a portcullis. The interior court is almost wholly confined by the buildings around it, the high walls which defend it on the outside are cut up at well-guarded angles by massive towers, and pierced at irregular intervals by narrow openings. The whole length is crowned

by heavy machicolated battlements. The aspect of the exterior is severe, but the façade which looks upon the court within is not wanting in elegance. Four small towers, each of which contains a spiral staircase, break the monotony of the front, and give access to the different stories. The interior space is divided out in the simplest fashion, and the arrangements adopted on the ground-floor continue in unvarying repetition tier above tier. But above, along the roof, run no heavy battlements; a bold projecting cornice takes their place in surmounting the wall, and over this rises a sharply pointed roof, the outline of which is broken by towers, and pierced with chimneys and dormers.

This cornice in the interior court gives the first note of change, and the way in which it was developed out of the battlement is curiously illustrated by the Tour des Gendarmes at Caen, built towards the close of the fifteenth century. Each battlement in this tower contains a sculptured medallion. Thus one has Janus, another the heads of a woman and two children, a third a woman's bust. The next step was to fill up the notch between the subjects and make the mouldings continuous; we then get the first form of the cornice, which rapidly became one of the most important and distinguishing features of every considerable building. At Langeais it replaces the battlements on the walls of the inside only, but it was destined soon to replace them on the outside also. At Chenonceaux, at Azay le Rideau, at Blois, at Chambord, its bold projecting lines encircle each building with a crown. The fresh spirit, which has taken the direction of the failing energies of French art, next commands yet another change. The sculptured dormers which are handed down by Gothic tradition are grouped with a symmetry hitherto unknown, and the *croisées,* which take us back into the far-off thirteenth century, are ordered inexorably one above the other. Not only do all openings at irregular intervals disappear before the growing exigencies of an instinct which marshals even the smallest details into fitting place within an ordained framework of well-considered lines, but gradually all these openings are placed so as to give the perpendicular lines of the general design, and are thus opposed to the sense in which they had been previously taken, for in Gothic work openings, when disposed regularly, are almost invariably made to indicate horizontal bands. Horizontal bands, when required in Renaissance work, are obtained by the accentuation of the division line between the superimposed stories of the building. Both these peculiarities are to be seen in the still-existing remains of what was once one of the most beautiful constructions left by the Renaissance in Touraine — perhaps even in France — the cloister of St. Martin of Tours. "On the 24th of May, 1508," so runs the entry in the register of the corporation, "the chapter commences building the beautiful galleries, such as they are." Of these beautiful galleries, the eastern side has alone survived. It is little known, and has, fortunately, been left to go quietly to ruin; but even in its present condition, the sculptures with which it is enriched, the bas-reliefs, arabasques, and medallions which fill the delicate lines of the pilasters and arcades, testify to the brilliant and decided character which the Renaissance early assumed in Touraine. It is conjectured that the credit of this work, which was executed just after the completion of the château of Bury, is due, to Bastien François, nephew of Michel Colombe, for we happen to know from the cathedral accounts that he held the appointment of architect to the chapter in 1511, when this work was still in progress.

But notwithstanding the distinct and positive assertion of certain leading principles made by the architect of these galleries, they have yet to win their way with other men. The foundations of the château of Chenonceaux were laid in 1515, the year of the accession of Francis I., by whom it was acquired in 1535.* The name of the architect has never been positively ascertained, but there is reason to suppose that he was no other than Pierre Nepveu dit Trinqueau, who became at a later date *maistre de la maçonnerie du batiment du chastel de Chambord.* In the plan of the building, the same wild, fantastic spirit which lends its unreasonable charm to Chambord still pierces sharply through the later refinements and additions with which the original work has been overlaid. On approaching the château from the eastern side, the eye is caught by a confused medley of spires, minarets, and cupolas; the lines of the roof seem lost beneath the luxuriant and disorderly growth of shafts springing towards the sky. Here is the same quality of harmonious extravagance which in a few years later was to rule with royal liberality at Chambord. Tourelles break out from the massive walls at points where

they cease to suggest the flanking towers which they originally replaced. Every turret, every pinnacle, is crowned with some fantastic ornament, and the angles, at which gables jut forth here and there from the pierced and carved work which surrounds them, seem to be selected with the express intention of misleading the eye, so as to hinder rather than aid it in divining the general purpose of construction, but the determined lines of the heavy cones which surmount the larger towers, thrust through the ornaments which flame about them and bring a sense of order into troubled places, giving an accent of precise intention even where every element of design seems animated by a spirit of wilful fantasy.

The surprises, the accidents of the interior multiply with incessant mystery. The numberless halls, chambers, cabinets, present the most striking signs of diversity both as to size and character. The infinitely varied necessities of a complex civilization have begun to make themselves felt. M. Michelet, writing of Chambord, remarks that it is neither a Gothic design nor an Italian palace. The Italian palace is roomy, but has few rooms: Chambord, on the contrary, affords every facility not only for the life in common, but also for the life apart. The convenient passage, the double staircase, permit of every freedom for pleasure, and M. Michelet sees in these arrangements a reflection of the state of health and temper of Francis on his return from Spain. But this idea of the secular convent which should bring together under one roof halls of state, private apartments, secluded cabinets, and hidden cells, was not peculiar to Chambord; it is the ruling idea at Chenonceaux, at Azay le Rideau, at Nantouillet, and reaches its full proportions in the splendors of Anet and Ecouen.

It is not to the liberties of pleasure only that these buildings afford all opportunity. At the court of Margaret of Navarre, Des Periers complains that "*il y'a si grand' presse de gens ceans qu'on ne se peut tourner.*" His motto is a cry for "*loysir et liberté;*" he entreats for freedom, for time, specially for *room.* These numerous and separate chambers gave room, they gave freedom from the overbearing pressure of other lives, they permitted the individual life to develop even in the midst of a common society. When the queen of Navarre sketches a division of the day for the courtly company of the "Heptameron," she allots a certain space to be spent by *chascun dans sa chambre.* The demands of a more complex and luxurious civilization coincided with the necessities of the growing intellectual activity of the epoch. The fortress of Louis XII. was built to house one noble family with its officers, guards, and dependents; the palace of Francis I. gathered within its walls a congeries of families of which the royal house was but the centre. Social life assumed an importance hitherto unknown in this assemblage of great personages of both sexes. A few *hautes chambres tapissées* might suffice for the needs of Jean Bourré when he raised the château of Langeais, but the wants of Thomas Bohier, as they stand expressed in Chenonceaux, were far more complex; and not only do the châteaux of great nobles give evidence of the change in the manners of the day, the less pretentious hotels and country houses of private persons present the same striking differences. The Hôtel de Beaune at Tours, the Hôtel de Bourgtheroulde at Rouen, and the Hôtel Pincé at Angers, were not built by princes, yet each provides according to its space and means for the separate as well as for the common needs of many dwelling beneath the same roof.

Whilst Chenonceaux was building Louis XII. died (1515), and the reign of Francis I. began. The building of the eastern wing of the château of Blois, commenced by Louis, was already far advanced, and to Francis fell the speedy honors of its completion. The names of the architect who planned and of the sculptors who decorated this splendid monument of the earlier Renaissance are alike unknown to us. The main features are such as are common to other châteaux in the valley of the Loire; but there are important though minor differences which specially individualize it. The architectural scheme is very simple. Three rows of pilasters are superimposed one above another. At about two-thirds down the front the open spiral staircase juts out and towers upwards. It seems at first to stand free, breaking up the even succession of small columns and their perpendicular descent with the bold projection of its octagonal lines. But above it is embraced and caught into the whole mass by the broad crowning cornice which gathers within its strengthening bands every various curve. The sculptured dormers fret along its edge, searching the air with their pointed tongues, and twice the carved cases of the chimneystacks break aloft through the roof, like towers. So far this eastern façade at Blois brings to mind the general

type which may be recognized in other châteaux of the district. It is but by the grave simplicity of the *ordonnance* that Blois appears to detach itself from the rest, and to stand somewhat alone. A disciplined intellect, disposing soberly of the means at its command, here carries on the work begun by Bastien François in the cloisters of St. Martin. It may be Bastien François himself, or that unknown Italian who raised ten years earlier the beautiful chateau of Bury, now lying a heap of ruins on the shores of the Cissé. The fine and choice instinct for proportion which makes every disposition, the symmetrical order preserved in the distribution of ornament, show at least that the architect of Blois had wholly given himself up to the intention of the new movement.

The division between the stories, plainly defined at Blois, is yet more strongly marked in the little Hôtel Pincé, built at Tours for Pierre de Pincé, *lieutenant criminal du seneschal d'Anjou* about 1525. The effect of the horizontal bands of ornament introduced for this purpose is vigorously counteracted by the introduction of rapidly descending perpendicular shafts, which span the wall curtain, group the openings, and keep the whole building together. This is precisely the mode of treatment on which the chief architects of the second period wholly rely. It is the method in virtue of which De Lorme triumphs at Anet, and Bullant at Ecouen. At Chambord, which was in building a year or two later (1526), the storeys are, it is true, very forcibly indicated, but the whole building is pulled together in Gothic fashion by the towers of the *corps de logis*, and by those which flank the wings or pavilions which stretch out on either side of the main body. In a building of the size of Chambord the result of this treatment is scarcely satisfactory to the eye. The lines of the wings to right and left of the main body seem to droop away from the heavy towers on either side like the lines of a suspended chain. At Chaumont, indeed, De Lorme depends wholly on the corner towers for the necessary amount of perpendicular ascent, but Chaumont is not a palace. It is a château of ordinary dimensions, the whole extent of which might be enclosed within the space occupied by the *corps de logis* alone at Chambord. Inside the court the unpleasant effect disappears, for the apparent length of the wings is greatly abbreviated by the action of the two spiral staircases which run up outside the building at the internal angles, on opposite sides.

It is not now possible to approach Chambord carrying in our eyes a vision of the great Renaissance château, as engraved by Du Cerceau in his "*Plus Excellens Batiments de la France*." Burdened by the weighty labors of Louis XIV., effaced by eight improving years at the hands of Stanislas Leczinski, mutilated by Marshal Saxe, the Chambord which we now go out from Blois to visit is not the Chambord of Francis I. The broad foundations and heaving arches which rose proudly out of the rolling waters exist no longer to the eye. The truncated building squats ignobly upon the turf, the moat is gone, gone are the deep embankments crowned with pierced balustrades, gone is the no-longer-needed bridge with its guardian lions. All the outlying work, which gave the actual building space and dignity, has vanished, and we enter directly from the park outside to what was once but the inner court of the château. It is not until we stand within this inner court, until we have passed through the lines of building which enclose it on the western side, and which show the unmistakable signs of stupid and brutal destruction, that we can believe again in the departed glories of Chambord. Lippomano, ambassador from Venice to France during the reign of Henri III., as he journeyed to Paris turned out of his way to visit Chambord.

> On the 21st [he says] we made a slight detour in order to visit the château of Chambord, or more strictly speaking the palace commenced by Francis I., and truly worthy of this great prince. I have seen many magnificent buildings in the course of my life, but never anything more beautiful or more rich. They say that the piles for the foundations of the château in this marshy ground have alone cost three hundred thousand francs. The effect is very good on all sides. . . . I counted one hundred and eighty-six steps in the spiral staircase which occupies the centre; it is constructed with such skill, and is so convenient, that a party can go up one side and down the other, six or eight abreast, at a time. . . . The number of the rooms is as remarkable as their size, and indeed space was not wanting to the architect, since the wall that surrounds the park is seven leagues in length. The park itself is full of forests, of lakes, of streams, of pasture land, and of hunting grounds, and in the centre rises the château with its gilt battlements, with its wings covered in with lead, with its pavilions, its towers, and its corridors, even as the romancers describe to us the abode of Morgana or of Alcinoüs. More than half remains to be done, and I don't believe it will ever be finished, for the kingdom is completely exhausted by war. We left much marvelling, or rather let us say thunderstruck, and we

arrived that evening at Blois. ("*Documens Inédits*," v. 2, p. 300.)

To destroy the character of this château from the outside was not difficult. It was not easy to tame the rude defiance of Vincennes, or give facility to the reserved and guarded approaches of Gaillon. Solid rectangular towers, heavy machicolations, and ponderous drawbridges offer a stubborn resistance to schemes of ruthless innovation; but Chambord was no fortress, it was a country house. The very site is motived by no other reason than the pleasures of the chase. The battlements of Gaillon gave back the echoes of the trumpet, but the galleries of Chambord resound with the huntsman's bugle. The construction of these galleries in itself points to the rapid progress of social change. There are not only such as may be called covered passages communicating from the spiral staircases with the rooms on each story; galleries which have their special cause in actual need and daily use; but the roofs of the range of one-storied buildings which connect the side wings of the main building on the north and south, and which run along the western front, are finished up from the cornice with a balustrade, and turned into a promenade for courtiers. The women whom Francis I. was blamed for bringing about the court throng the spaces of Du Cerceau's cut, idling with their fans, attended by their servants, and followed by their little dogs. The drawbridge of the past age is already replaced by a fixed bridge, and a couple of lazy sentinels find their occupation in watching the groups who saunter by the side of the moat, the waters of which rush by at full speed, sending coolness into the thirsty air.

Yet, in spite of these marked indications of change the ancient spirit lingers. The unrestrained freedom of grotesque caprice finds expression everywhere, even in those later portions which belong to another reign. Pierre le Nepveu has left on all his work the imprint of profuse and fantastic force; the wild outlines of his cupolas strike the sky with an audacity which seems to defy the adverse criticism of those who moved within the limits of more cautious rule. Symmetrical balance for which the masters of a succeeding era sought, and by which they strove to harmonize every portion of their design, obliged them to reject the aid of those varied resources which Nepveu shrewdly marshalled with a vigorous hand. Chambord is a brilliant example of transition. The early Renaissance is there to be seen, taking on itself the burden beneath which had sunk the failing forms of the Gothic spirit. But the intention of the work is wholly foreign to the main direction taken by the new movement. If we turn from Chambord to Azay, we shall see the point which was actually being made by others, whilst Nepveu was engaged in the execution of a project condemned, by its very nature, to remain, in spite of the wonderful genius lavished upon it, an unfruitful *tour de force*.

The graceful château of Azay le Rideau rises directly out of the waters of the Indre. It was in actual progress during the earlier years of the works at Chambord. It is built on two sides of a square, one side of which is prolonged somewhat and then abruptly truncated at an outward angle. This unsymmetrical ground-plan is a trace still retained of earlier days, which are also faintly recalled by the elegant tourelles, carried on corbels, which complete each angle. In every other respect, Azay is a continuation of the intention manifested in the eastern wing of Blois. The openings, like those of the Hôtel Pincé at Angers, are grouped within pilasters one above another so as to strengthen with their perpendicular lines the broad and outspread surface. Ornament, with one exception, is reserved to accent the bands of the different stories, and to enrich the cornice. The one exception is important, the very pretence of defence having been abandoned: the entrance is made by a high portal, and this portal, together with the staircase which it supports, is magnificently enriched with carving. The first frieze shows bas-reliefs of the salamander of Francis I., and of the ermine of Claude of Brittany his wife, who lay dying at Blois in July, 1524, when this château was still in course of building. On the plinth which supports the two windows of the pediment the same devices appear, then a little arcade connects the ground-floor with the upper stories, the pilasters and other members of which are covered with arabesques which may challenge comparison for beauty of design with the most exquisite passages produced at a later period.

From Azay to the château of Longchamps or Madrid we pass with ease. But the erection of this château in 1527 marks the transference of the chief activity to Paris, and the building itself shows important modifications, both in the fashion of the exterior and in the disposition of the internal arrangements. Azay, though minor portions were added at a later period,

may be considered to have been practically finished before the building of Madrid was begun. Francis had undertaken the works at Chambord in 1526, and throughout succeeding years he went on building there and elsewhere with incessant rapidity. In February, 1527, fresh alterations were set on foot in the Louvre. The great tower, the destruction of which is deeply lamented by L'Etoile, was pulled down to make room for these improvements. But Chambord and the Louvre together could not absorb the restless energies of the king. Before the close of the same year the foundations of Madrid were laid. The château of Longchamps, in the Bois de Boulogne, which was afterwards called Madrid, is to us now no more than a name, but on this château Francis lavished the utmost resources of wealth and art. Du Cerceau has again preserved for us the original outlines. They are expressive. There is no room for official display or state ceremonial: we are within the consecrated precincts of private pleasure. The covered galleries, running round outside every story, are pleasant places for idle enjoyment, a sheltered lounge where may be watched out the long course of a summer day. The interior is destined to be filled with light, and brilliance, and air. The sun streams in through numberless panes of fixed glass, wooden shutters are placed beneath, and they fly open at the gust of fresh winds blowing past them. This gay summer-house is full, too, of little touches of personal fancy, and marks of individual caprice. The ceilings of the small rooms which flanked the great hall on either side were placed at half-way of the whole height. A secret chamber occupied the space above them. Here Francis could creep unseen, by means of staircases hidden behind the imposing chimneypieces of the rooms below; the object of all this contrivance being to afford, says Du Cerceau, a retreat to the prince whence he might at any time, without being seen, play the spy upon those who met and talked in the great hall below.

But the distinguishing feature of the internal arrangements, and that which was then regarded as a specially remarkable innovation, was the commodious completeness of the offices. They were partly underground, but they were also as convenient and well lighted as the other apartments, and in this respect differed wholly from the sombre and mysterious dungeons which lurked amidst the heavy supporting piles of the château of Chenonceaux. At a later period at Anet, at Ecouen, attention was paid to the offices as a matter of course, but at Chambord, at Amboise, at Blois, special provision for the service was unheard of. The architect provided for the guard-chamber and left the household to seek refuge in the cellar. As for sleeping accommodation, any hole, any bed, was good enough for those in attendance. Des Periers says, —

> En cour pour le beau premier soir,
> Couché fuz comme en un pressoir,
> En lit bien autre que de plume,
> Un petit plus dur qu'une enclume:
> On le peut sentir à s'y seoir.

An improvement in the number and arrangement of the upper chambers had been rendered necessary by the press of nobles about the court, and it finally became an imperative necessity to provide in some measure for the wants of a service greatly enlarged by the train of attendants who accompanied them.

The *corps de logis* or main body of the château of Madrid was flanked by two pavilions, the angles of which were accented only by ordinary projections. This is a noteworthy change in the external plan. The tourelle no longer records the tower which fifty years before of necessity defended each outward point. This feature, which had not elsewhere ceased to be indispensable and prominent, is at Madrid relegated to the unimportant office of carrying certain staircases at the sides. It may be said that Madrid was not raised by French hands, and that we are not justified even in giving it a place among French work. The enamelled terracottas, ornamental tiles, the delicate friezes and medallions, which are to be seen in Du Cerceau's engraving, filling the springing arches of the windows, marking out the stones with brilliant lines of decoration, were, it is true, the work of no other than Girolamo della Robbia himself, who left Florence for Paris in order that he might execute this task. The actual practice of covering the wall surface with a veneer of enamelled tiles was not indeed unknown in France. Two houses at Beauvais dating from about the end of the fifteenth century are often instanced, on the authority of M. Léon Vaudoyer, as still-existing examples; and the tiles with which the façades of these buildings are overlaid are said to be ornamented with little figures enamelled and in relief, so that, in one respect at least, they resemble the brilliant works presenting "all the characteristics of sculpture" which "shone on the walls of Madrid." These relics were destroyed

together with the rest of the château at the great Revolution, and there is no existing record of their fashion, but Du Cerceau reproduced several of the arabesque designs which enriched the tiled pavements of the rooms, and these present those characteristics of delicate elegance and symmetry of arrangement which invariably belong to Italian decorative work, whilst here and there are bits which might rival passages from the hand of that perfect master of the art, Giovanni da Udine. The chimneypieces, too, seem in Du Cerceau's drawings to have been due to the chisels of Italian sculptors. The accent is softer and more languorous than is the wont of definite French speech, but over the accumulated mass of foreign detail the spirit of the soil maintains its ascendency and compels the strange exotic to shape itself anew. The fantastic devices which cover the building *entrelacez les uns les autres* announce the action of a kindred instinct to that which puts forth at Chenonceaux, and prevails at Chambord. In spite of the importation of Italian craftsmen, Madrid became a French château; the ornaments which they designed and the caprices which they invented were alike subjected to the controlling force of French taste, and to the rule of outlines planned probably by a French architect. The name of him who built this china palace has indeed perished, lost in the renown of the decorator, but the elevation, as given by Du Cerceau, has neither the proportions nor the style of Italian design.

It is mere matter for conjecture who were the architects employed by Francis I. on the numerous works he had in hand both at Paris and in its neighborhood, even at this late moment. In the same year, (1527), says Corrozet, that the king commenced the superb edifice of the château of Madrid, "*il fit poursuivre avec diligence les bastimens qu'il avait fait commencer à Fontainebelleau, à St. Germain en Laye, au Bois de Vincennes, et en nôtre ville.*" It has been supposed that Pierre Lescot was the architect entrusted with the alterations going on at Fontainebleau,

> chasteau qui s'appelle,
> Du gracieux surnom d'une fontaine belle.

Felibien des Avoux seems to have been the first to have put this tradition on record; but he, writing in 1680, has not even the weight of second-hand authority; and had Lescot early given proof of his ability as architect of Fontainebleau, the king would not have sent to Bologna in 1541 for Sebastian Serlio to fill the place of "*surintendant des bastimens et architecte de Fontainebleau.*" Rosso, who held the same post before Serlio, did not arrive in Paris till 1530, and not only was Madrid far advanced before his arrival, but the works at Fontainebleau and the Louvre were also in full progress.

M. Berty conjectures that, as regards the Louvre at least, the additions projected by Francis I. were only carried out on paper. The letters patent which confer on Lescot the whole charge and superintendence of the works, and approve his plans, were only granted by Francis, at Fontainebleau, in the year before his death (1546).* Little progress, therefore, can have been made during his reign with the additions planned by Lescot, and M. Berty supposes that nothing was done before this date, because Corrozet, who, in the 1550 edition of his "*Antiquités de la Ville de Paris,*" says, "*François I. fit faire au Louvre de grandes reparations, et nouveaux édifices,*" is silent concerning them in an earlier edition, that of 1543, although he mentions the destruction of the great tower as a preparation for the execution of future plans. If, then, says M. Berty, Corrozet, who gives these details in 1550, does not give them in 1543, it must be because in 1543 the works of reconstruction had not then begun. But there is another edition of the same book which has escaped M. Berty's notice, a yet earlier edition, the edition of 1532, and in it we find, on p. 49, "*Celluy seigneur* (*François I.*) *a aussi fait reparer le château du Louvre de plusieurs riches édifices, lequel lieu il a esleu pour sa demourance.*" From this passage it is plain that Francis had indeed made important additions to the Louvre fourteen years before he sanctioned the plans of Lescot, but it is impossible to say by whom they were conducted or designed. Rosso, it is true, arrived in 1530, two years before the date at which Corrozet writes; but even two clear years would scarcely give time for the erection of "*plusieurs riches édifices;*" and his name is wholly connected with Fontainebleau, where he nearly always resided during his ten years' life in France.

As long as we are dealing with the châteaux of Touraine we half accept the mystery which seems to shroud their erection, as the natural result of their connection with a more remote past. They seem to hang on, as it were, to the skirts of that ghostly Middle Age which is enveloped in even deeper obscurity; but Paris in the reign of Francis I. should be well within the

reach of modern curiosity. We expect to get easily at definite knowledge concerning its work and those by whom it was done. But again we are forced to acknowledge that often the utmost efforts of search will not even yield a name, and that, if we are sure of a name, we are sure of nothing else. Considerable works were undoubtedly undertaken at the Louvre, at Fontainebleau, at Longchamps (Madrid), and other places, during the first four or five years which elapsed after Francis I. returned from his Spanish captivity (1525); but we know neither by whom they were planned, nor by whom they were executed. One thing only is certain, the number of Italian artists in Paris was not considerable until the sack of Rome (1527) and the fall of the Medici drove them northwards. Such as had come into France earlier, coming in one by one, found themselves absorbed by forces already active, and added only some inappreciable impulse of foreign vigor. After a while, when they flocked in greater numbers, they constituted an individual school, which drew to itself some French followers, but which as a rule was regarded with envy and dislike by native artists. Prior to the coming of Rosso, who was, as has already been said, specially engaged at Fontainebleau, no Italian of note is known to have been employed in directing the works undertaken at the various royal châteaux.

It was in the course of the year 1530 that Maître Roux (Rosso del Rosso) arrived in Paris, where, says Vasari, "*fu con molte carezze della nazione fiorentina ricevuto.*" Francis was very liberal to him. His appointments began with a yearly pension of four hundred crowns, and a house in Paris, which he rarely inhabited, spending most of his time at Fontainebleau, where he also had apartments. In the following year (1531) Primaticcio came. Born at Bologna in 1490, Francesco Primaticcio quitted his native city for Mantua at the age of thirty-five, attracted by the fame of Giulio Romano. There he worked for six years with great credit, and now came into France with all the prestige which could accrue from the fact that Giulio, unable to accept for himself the invitation which Francis had addressed to him, had nominated Primaticcio as his worthy representative. He was welcomed at Paris with all the honors due to his credentials. Francis named him prior of Bretigny, and *abbé* of St Martin de Troyes, two places which brought him in an annual income of eight thousand crowns; but he does not seem to have found active and immediate employment. Rosso, who, as a man of general cultivation, well-bred, well-mannered, of good figure and address, had rendered himself acceptable to the king, was already in possession of the title of *surintendant des bâtimens.* The arrival of Primaticcio seemed to threaten his supremacy, and it is conjectured that, in consequence of the difficulties which arose between them, Primaticcio was eventually despatched to Italy, under commission from the king, to take casts of the finest examples of ancient and modern sculpture, and to purchase other works of art.

The field was now left clear for Rosso (1531). Under his supervision were constructed the Galerie François I. in the Cour Ovale at Fontainebleau, and a portion of the Cour de la Fontaine, in which Charles V. and his suite were lodged in 1539. That either Primaticcio or Rosso were practically skilled as architects is doubtful. The province of art in which both specially distinguished themselves was purely that of decoration. Decorative painting and every class of ornamental work in relief, from surface patterns to statuettes, were familiar technic in the hands of both; and in this respect, by the introduction of methods of procedure and ornament common only in Italy at that date, they enlarged the boundaries and reunited the resources of French art. Their action on the construction of the buildings which they decorated was probably limited to a merely general dictation and control. Such portions of Fontainebleau as were in building during the rule of Rosso do not differ essentially from parts previously executed, and we shall probably be right in concluding that the legitimate credit due to him is simply that of having developed and extended changes which had already taken place in interior decoration and architectural detail, and of having thus carried forward the work of preparing and educating the national taste to relish the decisive revolution which was now inaugurated, and destined to be accomplished with the next reign.

For it is to the era inaugurated by the accession of Henri II. that we must look for a complete expression of change; and it is a significant fact that the works of this reign are signed. Ecouen speaks to us of Bullant, Anet and the Tuileries once bore witness to the talent of De Lorme, and the genius of Lescot is still acknowledged by the Louvre. Of these men we know not much indeed, but enough to individualize our conception of their character, and to make them appear to us not as names only, but as men.

GREEN PASTURES AND PICCADILLY.

BY WILLIAM BLACK,

AUTHOR OF "THE PRINCESS OF THULE," "THE ADVENTURES OF A PHAETON," ETC.,

In conjunction with an American writer.

[Entered according to Act of Congress, in the Year 1877, by HARPER & BROTHERS, in the Office of the Librarian of Congress, at Washington.]

CHAPTER XL.

A FLASH OF NEWS.

WE dragged a lengthening chain. As soon as we had left Niagara and its hotels and holiday-making, and plunged into that interminable forest-land that lies between Lakes Huron and Erie, one could have noticed that the gravity of our women-folk was visibly increased. Did they half expect, then, while they were idling about these show-places, some sudden summons which they could readily answer? Bell, at least, could have no such hope; but all the same, as this big and ornate car was quietly gliding away westward, in the direction of her future home, she was as sad as any of them.

What was the matter? It was a beautiful afternoon. The country through which we were passing was sufficiently cheerful; for this forest was not dark, gloomy, and monotonous like the Schwarzwald, but, on the contrary, bright, varied in hue, and broken up by innumerable clearances. Every few minutes the window next us became the frame of a pleasant little picture, — the sudden open space among the trees; a wooden house set amidst orchards in which the ruddy apples showed in the evening light; a drove of cattle homeward going along the rough road; tall, silver-gray stems of trees that had been left when the wood was burned down; and everywhere, in every available corner, maize, maize, maize.

"What is the matter?" says the German ex-lieutenant to his wife, who is gazing somewhat absently out of the window.

"I know," says Queen T., with a gentle smile. "She is thinking how she could ever make her way back through this perpetual forest if she were all by herself, and with no road to guide her. Fancy Bell wandering on day and night — always toward the east — toward her children. She might take some food from the country people, but she would not enter their houses; she would go on, day after day, night after night, until she got to the sea. And you want to know what she is thinking of now? I believe she is consumed with hatred of every thing lying westward of the River Mole, and that she considers the Pullman car a detestable invention. That is the pretty result of Colonel Sloane's ingenuity!"

It certainly was not fair to talk in this slighting fashion of poor old Five-Ace Jack, who was but recently dead, and who had done what he considered his best with such worldly possessions as Providence had allowed him to thieve and amass. But at this moment the lieutenant struck in.

"Oh, that is quite foolish!" he cried. "There is no longer any such thing as distance; it is only time. It is foolish to think of the distance between the Rocky Mountains and Surrey; it is only how many days; and you may as well be living in a pleasant car, and having good food and very capital beds, as in a hotel, while all the time you are travelling. And indeed," continued this young man, seriously addressing his wife, "there is very little difference of time either now. You want to speak to your children? You speak to them through the telegraph. It is an hour or two — it is nothing. In the morning you send them a message; you say, 'How do you do?' In the evening, as you sit down to dinner, you have the answer. What is that separation? It is nothing."

"I think," says Bell, with savage ferocity, but with tears springing to her eyes, "I will spend the whole of the first year's income of this wretched property in telegrams to the children. One might just as well be dead as living without them."

And if she was to derive any comfort from this reflection that the telegraph was a constant link of communication between herself and those young folks left behind in Surrey, she was not likely to be allowed to forget the fact for any length of time. Even out in this forest wilderness the most prominent feature of the smallest hamlet we passed was its telegraph posts and wires. Very plain, unpretending, picturesque hamlets these were, even in the ruddy glow now shining over the land. They consisted of a number of wooden shanties all set down in rectangular rows, the thoroughfares being exceedingly broad and bare, the whole place having an oddly improvised and temporary look, as if the houses and shops could in a few minutes be put on wheels and carried along to the next clearance in the forest. But what could even the smallest of these here-

to-day-and-gone-to-morrow-looking places want with such a multiplicity of telegraph wires?

That night the three women, having been bundled into the prettily decorated stateroom that had been secured for them, and being now doubtless fast asleep, saw nothing of the strange thing that occurred to us. Had Von Rosen gone mad, or had the phrase "stateroom" confused his fancies, that, looking out of the car window, he suddenly declared we were at sea? Rubbing his eyes — perhaps he had been dozing a bit — he insisted on it. Then he must needs hurry out to the little iron gangway at the end of the car to see if his senses were forsaking him.

Here, certainly, a strange sight was visible. We were no doubt standing on a railroad car; but all around us there was nothing but black and lapping water through which we were rapidly moving, propelled by some unknown power. And the blackness of this mysterious lake or sea was intensified by the flashing down on the waves of one or two distant lights that seemed to be high above any possible land. Then, as our eyes became accustomed to the darkness, lo! another phenomenon — a great black mass, like a portion of a city, moving after us through the night. We began to make it out at last. The bewildering lights ahead were two lofty beacons. We were crossing a lake, or a bit of a lake. The long train had been severed into lengths, and each portion of the huge serpent placed on a gigantic steam ferry-boat, which was taking us across the black waters. And when this night passage ceased, we scarcely knew whether we were on sea or on shore, whether on a boat or on a line of rail. But people began to talk about Detroit; and here undoubtedly was a railway station, to say nothing of a refreshment bar.

"I believe we have got into the States again," observed the lieutenant, thereby showing a knowledge of geography which was not surprising in a German.

Next morning our little party had most obviously improved in spirits. Perhaps there was some secret hope among the women-folk that they would have further news from England when they arrived at Chicago, though what good could come of that it was hard to say. Or perhaps they were delighted to find that they had suffered no discomfort at all in passing a night on board a railway train. They praised everything — the cleanness and comfort of the beds, the handiness of the lavatories, the civility of the attendants. There was no fatigue at all visible in their fresh and bright faces. And when they sat down to breakfast, it was quite clear that they meant to make it a comic breakfast, whereas breakfast in an American railway car is a serious business, to be conducted with circumspection and with due regard for contingencies. For one thing the hospitable board is not spacious; and with even the most smoothly going of cars there are occasional swayings which threaten peril to coffee-cups But the chief occasion for fear arises from the fact that your travelling American is a curious person, and insists on experimenting upon every possible form of food that the districts through which he is passing produce. Moreover, he has a sumptuous eye, and likes to have all these things spread out before him at once. No matter how simple the central dish may be — a bit of a prairie-chicken, for example, or a slice of pork — he must have it, perhaps merely for the delight of color, graced by a semicircle of dishes containing varied and variously prepared vegetables. Now we never could get the most intelligent of negroes to understand that we were only plain country-folk, unaccustomed to such gorgeous displays and varieties of things, and not at all desirous of eating at one and the same time boiled beans, beet root in vinegar, green corn, squash, and sweet potatoes. Sambo would insist on our having all these things, and more, and could not be got to believe that we could get through breakfast without an assortment of boiled trout, pork and apple-sauce, and prairie-chicken. The consequence was that this overloaded small table not unfrequently reminded one or two of us of certain experiences in northern climes, when the most frugal banquet — down in that twilit saloon — was attended by the most awful anxiety.

"She pitches a good deal," said Bell, raising her cup so as to steady it the better; "the sea must be getting rougher."

"Madame Columbus," asked the lieutenant, "when shall we come in sight of land? The provisions will be running short soon. I have never seen people eat as these people eat: it is the fine air, is it not?"

"Mr. Von Rosen," said Lady Sylvia, "do you know that you can have Milwaukee lager-beer on board this ship?"

"Do I know?" said the young man, modestly. "Oh, yes, I know. I had some this morning at seven o'clock." And then he turned to his shocked wife: "I was

very thirsty, and I do not like that water of melted ice."

He would have explained further, but that his wife intimates that such excuses are unnecessary. She has got used to this kind of thing. Happily her children are now beyond the sphere of his evil example.

"Ah," said he, "this is all very poor and wretched as yet — this crossing of the American continent. I am a prophet. I can see the things that will come. Why have we not here the saloon that we have across the Atlantic — with a piano? I would sing you a song, Lady Sylvia."

"Indeed," said that lady, very sweetly, "you are very kind."

"But it is a long time ago since we used to have songs in our travelling. I can remember when we had to try a new piano every day — some of them very queer; but always, in any case, we had the guitar, and 'Woodstock Town' and 'The Flowers of the Forest' ——"

"And '*Prinz Eugen, der edle Ritter*,'" says Bell, in a suddenly deep and tragical voice, "'*wollt' dem Kaiser wiedrum krrrrrrrriegen Stadt und Festung Belga-rrrrrr-ad!*'"

"Ah, Bell," says Queen T., "do you remember that morning at Bourton-on-the-Hill?"

Did she remember that morning at Bourton-on-the-Hill! Did she remember that bunch of fiddlesticks! No doubt they were very pleased to get away from the small inn where they had had ham and eggs and whiskey for supper, and ham and eggs and tea for breakfast; but here, in this bountiful and beneficent land, flowing over with broiled bluefish, Carolina widgeon, marrow squash, and Lima beans, what was the use of thinking about Bourton-on-the-Hill and its belongings? I do not believe we were charged more than a shilling per head for our lodging in that Worcestershire hostelry; here we were in a country where we could pay, if we chose, a couple of shillings extra for having a bottle of wine iced. And, if it came to that, what fresher morning could we have had anywhere than this that now shone all around us? We dragged these nostalgic persons out on to the pleasant little iron balcony at the end of the car. There had been a good deal of rain for some time before, so there was little dust. And what could be brighter and pleasanter than these fair, blue skies, and the green woods, and the sweet, cool winds that blew about and tempered the heat of the sun? We seemed to be rolling onward through a perpetual forest, along a pathway of flowers. Slowly as the train went, we could not quite make out these tall blossoms by the side of the track, except to guess that the yellow blooms were some sort of marigold or sunflower, and the purple ones probably a valerian, while the rich tones of brownish-red that occurred among the green were doubtless those of some kind of rumex. And all through this forest country were visible the symptoms of a busy and shifty industry. Clearing followed clearing, with its inclosures of split rails to keep the cattle from wandering; with its stock of felled timber close to the house; and with, everywhere, the golden yellow pumpkins gleaming in the sunlight between the rows of the gray-green maize.

"What a lonely life these people must lead!" said Lady Sylvia, as we stood there.

"Yes, indeed," responded her monitress. "They are pretty nearly as far removed from telegraphs and newspapers and neighbors as we are in Surrey. But no doubt they are content — as we might be, if we had any sense. But if the newspaper is ten minutes late, or the fire not quite bright in the breakfast-room ——"

"Or the temper of the mistress of the house," says another voice, "of such a demoniacal complexion that the very mice are afraid of her ——"

"Then, no doubt, we think we are the most injured beings on earth. Oh, by-the-way, Lady Sylvia, how did your dado of Indian matting look?"

This was a sudden change; and, strangely enough, Lady Sylvia seemed rather embarrassed as she answered.

"I think it turned out very well," said she, meekly.

"I suppose some of your guests were rather surprised," is the next remark.

"Perhaps so," answers the young wife, evasively. "You know we never have given many dinner-parties in Piccadilly. I — I think it is so much better for my husband to get into the country whenever he can get away from the House."

"Oh yes, no doubt," says Queen T., with much simplicity. "No doubt. But you know you are very singular in your tastes, Lady Sylvia. I don't know many women who would spend the season in Surrey if they had the chance of spending it in Piccadilly. And what did you say those flowers were?"

Our attention was soon to be called away from the flowers. The forest become scantier and scantier — finally it disappeared altogether. In its place we

found a succession of low and smooth sand-hills, of a brilliant yellowish-brown in this warm sunlight, and dotted here and there with a few scrubby bushes. This was rather an odd thing to find in the midst of a forest, and we were regarding these low-lying mounds with some interest when, suddenly, they dipped. And lo! in the dip a dark blue line, and that the line of the horizon. The sea! — we cried. Who can imagine the surprise and delight of finding this vast plain of water before the eyes, after the perpetual succession of tree-stems that had confronted us since the previous morning? And surely this blue plain was indeed the sea; for far away we could pick out large schooners apparently hovering in the white light, and nearer at hand were smart little yachts, with the sunlight on their sails.

"Madame Columbus," cried the lieutenant, "have we crossed the continent already? Is it the Pacific out there?"

"Why, you know," says the great geographer, with a curtness unworthy of her historic name and fame, "it is Lake Michigan. It is a mere pond. It is only about as long as from London to Carlisle; and about as broad as — let me see — as Scotland, from the Clyde to the Forth."

It was a beautiful sight, however insignificant the size of the lake may have been. Nothing could have been more intensely blue than the far horizon line, just over those smooth and sunlit hills. No doubt, had we been on a greater height we should have caught the peculiar green color of the water. Any one who has unexpectedly come in view of the sea in driving over a high-lying country — say in crossing the high moors between Launceston and Boscastle — must have been startled by the height of the suddenly revealed horizon-line. It seems to jump up to meet him like the pavement in the story of the bemuddled person. But down here on this low level we had necessarily a low horizon-line; and what we lost in intrinsic color we gained in that deep reflected blue that was all the stronger by reason of the yellow glow of the sand-hills.

We got into Michigan City. We were offered newspapers. We refused these — for should we not have plenty of time in Chicago to read not only the newspapers, from which we expected nothing, but also our letters from England, from which we expected everything? As it turned out, there was nothing at all of importance in our letters; whereas, if we had taken these newspapers, we could not fail to have noticed the brief telegraphic announcement — which had been sent all over the commercial world — of the suspension of the well-known firm of Balfour, Skinner, Green, & Co., liabilities £500,000. In happy ignorance we travelled on.

It was about midday, after skirting the southern shores of Lake Michigan through a curiously swampy country, that we entered Chicago, and drove to the very biggest of its big hotels.

From The Saturday Review.

INTERESTING PEOPLE.

WHENEVER we see the term "interesting" applied to a character it excites an especial curiosity. Perhaps there are few epithets so flattering; but when we attempt to define it we find it impossible to treat the subject apart from oneself, to make it other than a personal question; we cannot say what is interesting in the abstract apart from what is interesting to us. Of course, indeed, it is this alliance between the interesting and the interested that gives the epithet its meaning and constitutes the charm. We can define a sensible, an amiable, a generous person without our individuality being concerned; but if we set about a definition of the interesting, assuming the same conditions, we are pulled up at once by the consciousness of the standard being different according as we treat the question in the general or from our own particular point of view. If we would say what sort of persons are interesting to the world at large we assume a cynical spirit; the abstract interesting person is another creature altogether from the man who has the honor to interest us. We invest him with the touches of the sentimental, the lackadaisical, the Byronic, the affected, the sham and illusory, to fit him as the ideal of the common run of undiscerning, easily deceived men and women; but, if we are interested, it must needs be by some choice special grace of nature which it implies some fellow-feeling on our part to detect and bring into prominence. Our highest sympathies may, however, be awakened long before we know why; and the question what it is in some men that separates them by this marked distinction from their fellows may cost one some expense of thought while the interest excited is at its strongest.

We have said that personal considerations come in first in dealing with this question. People may indeed think a

man interesting without any prospect of personal experience of his qualities; but, when driven to justify their preference, they will find it to rest on a belief of mutual affinity; the interesting person is supposed to have an exceptional share of sympathy, not for the world at large probably, but for those worthy of his sympathy. He must be capable of strong human likings and — as inseparable from strong likings — strong dislikes. The interesting person that pleases us is a marked character, but differs from the character often so described by being not easy to read. If there is any one point essential to the interesting person, it is a touch of mystery. Nobody is really interesting who does not stimulate curiosity, whom we think we know all round, who leaves no room for guessing. There must be something supposed to exist that is not altogether of a piece with appearances. Nobody is interesting who can be interpreted by general laws, who needs no tenderness of insight, who awakens no speculation. The difference between those who excite strong personal feeling — we are not speaking now of close personal relations — and those who are generally esteemed for their important or great qualities lies in some such point as this. The latter do not excite the imagination; they do not appeal to that faculty whose exercise gives the greatest pleasure and sense of intellectual power to its possessor. We may respect and admire a man without being drawn towards him; we are drawn towards the man of interesting qualities by the suspicion of some latent attraction over and above his open and definable worth and value, which attraction our penetration is to discover; for of course the more the subject of our inquiry and observation gives us to do — the more he exercises our acuteness — the larger space he fills in our minds. Nor does the interesting character maintain its attraction if it becomes, as it were, independent of our indulgence. We must have our points of superiority; our award must go for something. The topmost point of success has its advantages, but, as a station to pose upon, it does not specially interest. We shall find in all fiction that success detracts from this quality. The interesting characters are those to whom the reader is kinder than their surroundings. As a hero, who so interesting as Hamlet? not only because from beginning to end he is a mystery, but because the reader is forever excusing, explaining, making discoveries. In the absence of this particular quality, Walter Scott, great as he is, does not present many examples of the "interesting person;" the Master of Ravenswood is the almost too obvious, and as such commonplace, exception. Most beautiful touches of romantic interest there are in his personages, but not, we should say, in his leading characters. Not, of course, that we are not interested, but that our praise expresses itself in other epithets. Wherever principles and temperament are in strong antagonism, there the novelist at least aims at the quality we are speaking of, appointing the reader arbiter in the conflict. It is this that gives misfortune its value in fiction, especially the misfortune of being misunderstood and undervalued. The reader is brought into a particular and close relation with the sufferer, and sees further than his blind companions of the story.

In pronouncing a person to be interesting, we are claiming more comprehension of, and insight into, his character than in attributing to him positive qualities. In fact, there is an assumption, a certain claim of equality, in conferring the title. To be a fit subject for it, a man must have more in him than he shows to everybody; we detect, or at least suspect, some striking or amiable contradiction to the outside tone and bearing. Persons of weak or excitable minds are constantly finding people interesting through mere mistake and blundering. We would, therefore, take no one's judgment on this point whom we consider to be himself wholly without this delicate quality. The one purpose and aim of affectation is to excite interest, and undiscerning people who cannot distinguish between real and sham respond to the appeal; but if there is one thing more than another essential to the genuine gift, it is truth and nature. Many natural people are not interesting, but no one who is not natural can be interesting to sensible people. Not, of course, that there may not be a side of concealment or display, for interest attaches to complex characters; but it is only where we see nature assert itself than we are interested. Every contradiction between the manner and bearing of the man, the character borne before the world, and his inner life, excites an interest, and where this contradiction is revealed in an unexpected devotion to the simpler duties and affections, the person who shows it is eminently interesting. Biography reveals these contrasts. Poor Charles Lamb, so airy and witty in speech, known to the world even as a boon companion, with his hidden grief and his life-

long sacrifice which few would have undertaken and fewer still could have endured to the end, is an example; and Cowper, in the strange contrast between his humor and his gloom, between his domestic winning gentleness of character and the harsh severity of his graver verse, was pre-eminently interesting to all with whom he was brought in contact. There is another contrast which is equally interesting, especially to minds with a strong bent of their own, and ever in search of illustrations on views and points on which their own faculties are exercised. We do not suppose, for example, that Lord Wellesley was abstractedly a case specially to our purpose; but Macaulay writes of him, "I am particularly curious, and always was, to know him. He has made a splendid figure in history, and his weaknesses, though they make his character less worthy of respect, make it more interesting as a study." Going on to give a description of the person of that distinguished man, he says, "Such a blooming old swain I never saw; hair combed with exquisite nicety, a waistcoat of driven snow, and a star and garter put on with care and skill." Perhaps, though this does not answer to any ideal of the interesting, there is something to our point in the notion of a mind occupied with statesmanship linked to a person in the disguise of a *petit maître*. But, if weaknesses even of the smaller kind may add to interest, they must be clear of moral taint. The "greatest, wisest, meanest of mankind," if his greatness and wisdom did not make him interesting, would not be rendered so by his meanness except as a psychological study.

The biography of Macaulay himself shows him to the outside world in an interesting light, with all the elements of the unexpected. While he shone before the world in one character, he had an inner life which no stranger could have attributed to him, and this inner life was, as it seems, the more intense and engrossing of the two. To ill-natured people, even to persons with nothing but his public aspect and circumstances to go by, his brilliancy, versatility, and domineering powers of speech might seem to represent the whole man; and these qualities do not make a man interesting; in fact, he was too much of a prodigy for the epithet to occur to anybody as descriptive; still no reader of his biography can withhold it. There are men idolized in their families, and dull or fantastic to the world at large, who are properly interesting to nobody, the element of nature, pure and unalloyed, being wanting; but Macaulay's letters to his sisters, and the delightful image they raise of his home life, placed side by side with the blaze of his public fame, constitute him a specimen example. On this point literary people prove themselves no better judges, invested with no keener discernment, than common folks. It is amusing to read, along with these domestic revelations, Miss Martineau's summary condemnation of the man as author, politician, and social star. To be sure, her book makes it apparent that nobody was very interesting to Miss Martineau but herself and those to whom she was interesting. We are quite open to Macaulay's faults, so we need not produce here the long string of offences, failures, and errors with which she leads up to her conclusion: "My own impression is, and always was, that the cause of the defect is constitutional. The evidence seems to indicate that he wants heart. He appears to be wholly unaware of this deficiency; and the superficial fervor which suns over his disclosures probably deceives himself, as it deceives a good many other people; and he may really believe that he has a heart. To those who do not hold this key to the interpretation of his career it must be a very mysterious thing . . . that he should never have achieved any complete success." People in the turmoil of literary work — its hopes and fears, its vanities and small transient triumphs — are not at all in a condition to detect the hidden and to see behind the curtain of manner. However, we do not know whether even the testimony of Macaulay's home life would have influenced the exponent of positivism in her verdict.

In all notable public examples the element of mystery carries it over everything else in exciting and sustaining interest. We see this conspicuously in Swift, so profoundly interesting to the last century; though in his case the mystery did not admit of resolution into contradictory excellencies. Descending to the domestic and social standards of this quality, we should say that in family life those are most interesting who are most fully known to the observer, whose intricacies of character have been a long study; while in social life it is the new and unfamiliar, which has to be guessed at, that gives the most amusing and exciting exercise to this vein of observation. The lovers of new acquaintance are always expecting to make discoveries of more than meets the eye, of depths unsuspected by the careless and indiffer-

ent; but they are impatient and often miss what they are looking for. The really interesting character grows in interest, and only fully reveals itself to the constant sympathy of a kindred nature.

We think it may be observed that the epithet is oftener applied to men than to women, which may be explained by the fact that women, in their easy, unscientific way, are much oftener students of character than men; and, as men play the more conspicuous part in the world, they are naturally the objects of this study. But also it may be that mystery, if we may so apply the word, belongs rather to man's organization. Those who do not take much pains in the choice of their epithets, but use those in vogue, will call a woman charming where they would call a man interesting; both epithets connect the object of admiration with the admirer. The man who calls a woman charming has both felt her charm and believes himself to be the object of an intention to please. The praise of moral and intellectual excellence may be bestowed without this condition, but there is always a subtle affinity between the interesting man and the person interested, between the charming woman and the person charmed.

From The American Journal of Science.

THE CHEMICAL COMPOSITION OF THE FLESH OF THE HALIBUT.

THE halibut (*Hippoglossus americanus*, Gill), which abounds in the waters of the Atlantic, as far north as Newfoundland and as far south at Cape Hatteras, is highly valued as food in the United States. The flesh is of a fine white color, is delicate and tender, and resembles that of the whiting (*Merlangus vulgaris*). The fresh flesh of the halibut has been analyzed by Chittenden, and he gives in his paper the results of his examination side by side with those of Payen, who investigated the composition of the flesh of the whiting. They are as follows: —

	Halibut.	Whiting.
Water	82·87	82·95
Solid constituents	17·12	17·05
Ash	1·08	1·08
Fatty matter	1·26	0·38
Nitrogen	2·01	2·41

The flesh of the American fish, when dried at 100° C., was found to consist of —

Carbon	50·38
Hydrogen	7·43
Nitrogen	11·68
Oxygen	6·35
Ash	24·16
	100·00

and of the above constituents 7.11 per cent. were present in the form of fatty matter. The ash of the flesh of this fish is composed of —

Silicic acid	0·32
Chlorine	11·11
Carbonic acid	1·13
Sulphuric acid	1·30
Phosphoric acid	34·36
Iron	0·19
Lime	0·15
Magnesia	2·43
Potash	37·07
Soda	12·22
Lithia	trace.
	100·28

Some considerable part of the alkaline metals which the author gives as oxides in the above percentage numbers must in reality be present in the form of *chlorides*, combined with the 11·11 per cent. of chlorine, and the total constituents found must therefore fall short of the total above given. In fact, the 11·11 per cent. of chlorine has, so to speak, been left out in the cold, uncombined, and must take the place of oxygen in these calculated results; this will reduce the total considerably. More than 70 per cent. of the constituents of the ash, according to the author's mode of regarding them, consists of phosphoric acid and potash.

THE FLIGHT OF THE SWALLOWS.

AROUND the old minster the swallows are flying;
Soon into white winter the year will be dying;
Soon, soon the chill winds through the boughs will be sighing,
And ice will be here;
South, south are the summer and happy birds singing,
And sunshine, that only here spring will be bringing,
So the wise swallows gather in flocks for their winging
To warm climes so dear.

Are they twittering and chattering of bright days departed?
Of dear happy nest-homes from which they have started?
How they wheel, as if exiled, they lingered, sad-hearted,
Their known eaves to leave;
And why should they thus stay the moment of starting?
Why so seem to loathe from grey skies to be parting?
Think they of the happy hours here they spent, darting
Through many a red eve?

Do birds, like to men, hover round parted pleasure?
Has the past its dear memories, to bird-thoughts a treasure?
Is the gone to you swallows, oh, sweet beyond measure?
Ah, that who shall tell?
Men know not the mysteries that haunt their own being,
And swallows may hide feelings deep from our seeing.
Well, fleet ones, speed far, from the snows to come fleeing;
God guides you. Farewell!

Sunday Magazine. W. C. BENNETT.

A CONTRAST.

BLOW fresh, ye winds, blow fresh and strong,
Sing loud, dear lark, your sweetest song,—
In the deep blue, sing loud and long.

Shine brightly, sun, in summer might,
Flood all the fields with golden light,
And drive far off the envious night.

To-day there is no room for care,
A heavenly beauty fills the air,—
Fair is God's world, yea, very fair!

Upon our peaceful English shore,
Heaven's love is resting evermore,
And wealth of Heaven a boundless store.

From east to west, from south to north,
No voice of discord echoes forth,—
We hear no muttering sounds of wrath;

But careless song of youth and maid,
Mirth-making in the woodland glade,
At leisure in September's shade,

With music of the bird and bee,
And hum of civic industry,
Are borne o'er England's guardian sea.

Deep is our peace, while from afar
Roll on the murd'rous wheels of War,
And Famine's Juggernautine car.

Far off, our brethren cry to Heaven,
By lust, and hate, and hunger driven,—
Scathed as the oak by lightning riven.

Here, bask we in serenest light,
There, horrors crowd from morn to night;
And love is lust, and might is right.

Spectator. JOHN DENNIS.

HYMN.

IMITATED FROM THE FRENCH.

O THOU, my heart's best treasure!
O Friend unchangeable!
Sweet spring of ceaseless pleasure
For all who love thee well!
Take of my heart possession,
And reign alone therein,
Thou, whose dear cross and passion
Have saved me from my sin.

Joy of my life! thou feedest
My soul with living bread;
Still to faith's sight thou bleedest,
And richest drops are shed.
When tired and faint I languish,
By thee the weak is strong,
And in my night of anguish
I tune my loudest song.

Ah! pour on me thy favor,
Rich fount of love and grace;
Around me shine forever,
Great Sun of Righteousness!
Without thy smile peace-giving
Life were but death to me;
But in thy presence living
True light and life I see.

My heart, in closest union
With thine, dear Lord, made one,
Finds here in sweet communion,
Its heaven on earth begun:
Better 'mid flames fierce-wreathing,
Safe in thy love to be,
Than heaven's own fragrance breathing
If heaven were void of thee!

From The Church Quarterly Review.

LORD FALKLAND AND HIS MODERN CRITICS.*

WE know of no sign of the times more truly healthy and hopeful than the desire which finds frequent expression amongst us for a worthy commemoration of the great representative men of English history. In the case of Lord Falkland it is only surprising that such an effort to raise a fitting monument as was lately inaugurated at Newbury has been so long delayed. That remarkable nobleman — remarkable in so many ways, the statesman, soldier, poet, theologian, controversialist, and scholar, "the inspiring chief," as Principal Tulloch calls him, "of a circle of rational and moderate thinkers, amidst the excesses of a violent and dogmatic age" — has always been one of our truest British heroes. Immortalized by the glowing and most eloquent praise of his bosom friend, Lord Clarendon, the idol of the poets of his day, — Ben Jonson, Cowley, Waller, Suckling, who find an echo in Pope, — the loving companion and intimate friend of Sheldon, Morley, Hammond, Earles, Chillingworth, the gracious host of Great Tew, where he was visited by "all men of eminent parts and faculties in Oxford, besides those who resorted thither from London; who all found their lodgings there as ready as in the colleges;" † the chivalrous victim of the Civil War, which he had done his utmost to prevent by timely reform; the representative, as he may be considered, of the Old English Constitution, which he found so grievously out of joint; the rare example of a private virtue consistent in the minutest particular with his public character, and of a true and practical religion which found outward expression in every act of his exalted career; the splendid example of a deeply learned layman, who "never declined controversies on political or religious questions," now overthrowing the Jesuits with their own weapons, now attacking the abuses of an ecclesiastical government, now defending with equal vigor the essential foundations of the Church of England, and dying for the cause of those very bishops whose errors he had resisted, — where shall we find a figure more deservedly placed in the niche of fame? where a study more deserving of the attention of historical students? And yet, while Hampden had his pillar erected on Chalgrove Field nearly half a century ago; while Cromwell, the mighty king-killer, finds his place amongst the kings; while the various merits of the men who have made Britain glorious by sea and land find recognition in brick and mortar, pillar and monument, it has been reserved for this very year, 1877, to do public honor to Lork Falkland. The more honor is due to the promoters of this tardy act of justice, to the Field Club, of Newbury, and especially to Mr. Money, of that place, who have conceived and almost carried the project into effect,* and to Lord Carnarvon, whose admirable speech on the late occasion the public press has with one voice ratified and approved.

In the present paper it will be unnecessary to reproduce in another form what has been brought out in modern times relating to the life and works of this great man. Mr. Teale in 1842, Lady Theresa Lewis in 1852, and Principal Tulloch in 1872, have given elaborate and eulogistic biographies of Lord Falkland; Mr. Grosart has lovingly collected all his poems, with an appreciative sketch of his life, while Lord Lytton successfully defended his memory in the *Quarterly Review* of October 1860.†

But the attention drawn to the subject by the late meeting at Newbury has, for the first time, attracted the general public, and its intrinsic interest is evinced, not only by the numerous newspaper articles of that date, but by the notice which it has been receiving in periodicals and re-

views. The new *Nineteenth Century*, breaking off from its parent the *Contemporary Review*, signalized its assertion that it could run alone by a characteristic essay on Falkland from the fastidious pen of Mr. Matthew Arnold; and the parent desired to prove that it still possessed the vigor of youth by enlisting the masculine services of Mr. Goldwin Smith in reply. In neither of these literary efforts could the authors speak with a congenial spirit on such a topic; though indeed the former discovers in the hero a shining example of that "sweetness and light" of which he is the self-constituted prophet, and a typical smiter of the Philistines, whose discomfiture, whether under the buff coat of the old Puritan or the greasy apron of the modern tradesman, he has devoted his life to compass; while the latter claims all the support for his well-known admiration of the Cromwellian party which he can derive from the consideration of one portion, and one portion only, of Falkland's twofold career. There has indeed been a vein of depreciation running along with the eulogy of Falkland from the time of Horace Walpole, who was tired of hearing Aristides always called "the Just," while in our own time Lord Macaulay, Mr. Forster, Mr. Sanford, and others, have unsparingly condemned his political course from the simple point of view of the Cromwellian partisan. There is still room then for an attempt to discriminate between opposing views, and especially to save the memory of Falkland from some of his admiring friends, who have contrived to read within the lines of the few prose works he has left behind a nearer agreement with their own peculiar sentiments than facts will justify. The course of our remarks bring us into contact with some questions which are at least as interesting now as they were two centuries and a half ago.

Taking first, and very briefly, Lord Falkland's political career, we must suppose the reader to be familiar with its general outline, with his learned, and no doubt indignant, retirement at Great Tew, from 1632 to 1639, while Charles I. was governing without Parliaments, and under the tutorship of Laud and Strafford, and with his first appearance in public life as one of the most vehement of that consummately able band of reformers who sat in the Short and the Long Parliaments of 1640, and soon acting as a leader, along with his friend Hyde, in every measure adopted for the destruction of the tyranny under which the old Constitution had been well nigh lost. Then, finally, when Strafford was executed, the Star Chamber and all the old tyrannical courts abolished, Laud imprisoned, the ecclesiastical government in civil affairs destroyed, triennial Parliaments become law (Charles having even consented to his own virtual dethronement by relinquishing his prerogative of dissolving the existing Parliament), the power over the public purse and the national forces taken out of the king's hands, — hopeless of stemming the advancing tides, we know how, still along with Hyde, he threw himself into the opposite scale, and devoted the short remainder of his life as secretary of state, fighting in the front rank with sword and pen for the cause of Church and king, yet contending with Charles's own corrupt courtiers as decisively as against the forces of the Parliament, till the end came — came so speedily on the fatal field of Newbury, that the world had scarcely begun to understand what a hero it possessed, till he was removed with an awful suddenness which adds no little to the dramatic force of the tragedy.

We shall not attempt to defend through thick and thin every isolated act or opinion of one whose example would be useless to his fellows had he not been beset with the same infirmities as other men. Whether he carried his impetuous attacks on the government of Charles further than was necessary for reform, whether he can be justified in the violence of his invectives against Strafford and the bishops, whether he chose exactly the right moment for leaving the side of those who had misled him, and were bent on very different courses from his own, — questions of this sort are so difficult to decide, and we who are enjoying the political calm which he did so much to secure for us are so strictly bound to a modest style of criticism when dealing with them, that it

seems our duty rather to look to broad and general outlines of conduct, and to balance against one another opposing tendencies and results. In all this impetuous and chivalrous earnestness, first on one side and then on the other, in this combat of principles so fruitful for all future time, we cannot but discern the noble but impulsive action of the youthful student, called to sudden action at a great crisis, and impelled with all that soldierly order which he evinced at the very outset of his life, and which burned all the more fiercely for its previous repression in the learned pursuits of his ancestral home.

But we have no doubt whatever as to the correctness of the judgment which Falkland and Hyde formed on the whole as to their eventful course; and it would hardly be necessary to reassert what was once so generally received, were it not that (as we showed in a former article) the modern school of historians has so slavishly followed the lead of Lord Macaulay and the Reform-Bill-period writers, that they now profess to consider the point settled, and to assume that the sympathies of every true Englishman must necessarily lie with Pym, Hampden, and Cromwell in the final struggle, rather than with Hyde and Falkland.

We have promised brevity on this point, and therefore at once refer the reader to the article in the *Quarterly Review* noticed above. It will not be easy to present the broad outlines of the two political courses in a more succinct form.

> The reforms [says Lord Lytton] which were re-established (after the Great Rebellion), and which we enjoy now, were the reforms, not of Pym and St. John, but of Hyde and Falkland, the reforms already achieved before the Grand Remonstrance was flung forth to substitute the soldier for the reformer. All that we owe to the violent men are the military usurpation of Oliver Cromwell, and the reaction and arbitrary monarchy under Charles the Second.

The famous nineteen propositions, to which Hyde and Falkland contributed — we know not in what proportions — so admirable an answer, were the manifesto of republicanism. The cause of the sovereign, after the proper safeguards had been secured, was the cause of the people of England, the cause of the British Constitution. We cannot expect all persons to be of one mind on these points; there will always be those who would prefer that our Constitution should not be what it is, and who, failing to find a response in the public opinion of their own times, fondly hope to influence that opinion by asserting the righteousness of the party which attempted to overthrow the Constitution in days gone by. The character of such heroes as Falkland is a very serious obstacle in their way. When such a man, an apostle of "sweetness and light," illuminates the narrow middle course in the most critical and typical struggle in the history of England, it is an awkward fact not easily got rid of. The admirers of the later policy of Pym, Hampden, and Cromwell find themselves deserted by the logic of facts; unless indeed they openly reject the criterion, and boldly proclaim their dissatisfaction with the laws of their own land, and their preference for the ruder forms of government which prevail elsewhere.

These brief remarks are in themselves a sufficient answer to the condescending criticism of Horace Walpole, who pronounced Falkland to be "a virtuous and well-meaning man, with a moderate understanding, who got knocked on the head early in the Civil War because it boded ill."* There could hardly be found in the language a sentence less creditable to the head and heart of a writer. It would, indeed, be easy to produce any number of instances, on either side of the struggle, of such strength and such capacity as Walpole admired; but to support the Constitution on both sides, to beat down the old tyranny, and then to save for posterity what had been purified of its dross, this required the eagle eye and the lion heart given to few, and a singleness of purpose rarely met with in the world's history, a character, when found, to be held aloft, like the admiral's lantern over the dark waters in which his scattered fleet pushes its devious way.

There has been a feeble attempt to cast dishonor on Falkland's memory by accus-

ing him of complicity with Charles in his arrest of the five members. Mr. Forster* has more than insinuated this charge; and it is a serious charge, because it would not only involve our hero in a political blunder of the most serious kind, but convict him of something like treachery and deceit. There never was a more wanton accusation. Lord Lytton, whose article was a review of Mr. Forster's violent and one-sided book, has elaborately shown that it is contrary to everything we know on the subject; and Principal Tulloch dismisses it with indignation as "without a tittle of evidence." † Those who blame Falkland for remaining in Charles's service after this event forget that one main object in his changing sides was to correct the errors of the king, and that his disgust at the conduct of the advisers who had hitherto misled Charles must have had the strongest influence in deterring him from throwing in his lot with fallen majesty. It was his highest honor that he combated this fastidious delicacy, and suffered nothing to stand in the way of the call to heroic duty — a duty which, he well knew, meant in his case early death.

We close this part of our subject with a declaration of hearty adhesion to Lord Carnarvon's summing up on the occasion referred to. The first point which he singled out as chiefly significant in Falkland's career was his surrender, the painful, yet the cheerful and ready surrender, of his delightful country life and splendid literary society, so dear to his cultured intellect, at the call of duty. The second was "the striking combination in Lord Falkland's character of a reformer and a devoted servant to the crown." The third was "the spirit of singular moderation which pervaded his character — moderation without lukewarmness, partisanship without at any time forfeiting his own respect or the respect of others — a moderation consistent with strength and also with honor."

Those great ends for which Lord Falkland and his friends spoke and acted, lived and fought, but which the great Rebellion could not accomplish, have been since achieved in the peaceful progress of two hundred years. There are indeed many things which we may yet seek to gain; but in the England of to-day, in her abundant prosperity, in her equal laws, in her well-ordered Constitution, in her united classes, in her beloved monarch, — in all these things, after making due allowance and deduction for all human institutions, we have a picture that our ancestors hardly ever dreamt of as possible, even in the pages of their fondest Utopias. Many objects of legitimate ambition still remain for us to try for, but the heritage to which we have succeeded may be prized and preserved, and we may rejoice to honor the men by whom it was won.

* Arrest of the Five Members.
† Rational Theology, etc., i. 148.

These graceful words of Lord Carnarvon's, some of which perhaps apply more strictly to the course taken by Falkland as a whole than to the exact steps by which he pursued it, invite us to extend our inquiry beyond the results of Falkland's training, beyond the external and political course which is familiar to all, to the training itself which produced such results, and to the proofs which we may be able to discover of the position which his studies and the society of his learned friends had led him to assume on the great religious questions which lay at the bottom of all politics in that age, as indeed they have so lain for many an age before and since.

In the years immediately preceding his political career theology and the learned languages had been the main studies of Falkland's retirement. He had received an excellent education at the University of Dublin on which to found these studies. It was probably at Dublin, under the influences of the learned and pious Ussher, that he obtained the high standard of literary research which so remarkably distinguished him. It was also probably under Ussher's influence that he imbibed those notions as to the episcopate which will now engage our attention. Checked in his aspirations for a military career, left his own master in early manhood, with a fine estate and convenient residence, married — a marriage of affection — to one who was the glory of her sex, it is the lot of few to have such a splendid opportunity for developing the noblest tastes. Two circumstances pointed out the direction of his studies, which had at the outset been rather those of the more ordinary wit of the day — poetry and general literature. How he shone in that brilliant society which met at the "Apollo" under Ben Jonson's presidency, Suckling has told us; and his own verses, admired in their day, have at least the quality of wit and ingenuity, if wanting in the grace and elegance of some of his contemporaries. But his genius lay in a higher sphere. To theology he was attracted, not only by his own earnest and serious character, but also by the consuming desire he felt to trace to the fountain head the great controversy with Rome, in which

his clever mother had engaged him; for she had already led her two younger sons to follow her own desertion of the Church of England for that of Rome. The other circumstance was the proximity of Great Tew to Oxford, the chief centre of theological and classical study. It is a mistake to connect him with St. John's College, Oxford — a mistake which has arisen out of his affiliation to St. John's College, Cambridge; where, however, he never seems to have resided. But the pleasant ride of twelve miles which lay between his mansion and the University of Oxford was no barrier to a man so prepared to receive all Oxford teaching from the many men of surpassing ability and goodness of whom the university at that time boasted. For those years at Great Tew happened to be exactly coincident with one of the most remarkable periods of Oxford history. They witnessed the termination of the lengthened conflict between the Calvinism of Abbot and his party, and the Arminianism of Laud and his followers. The great reform of the university, which had so long been called for, was effected during this period by Laud. If his busy hand was too fatally sowing the seeds of the subsequent disasters, his pervading influence had most assuredly elevated the standard of learning and piety in his beloved university. Scarcely at any time before or since has Oxford sent forth so many men trained in all the learning of the schools, and capable of taking a great place in the struggle which now lay before them. These were the days when a symposium in an Oxford college, to which we may well suppose Falkland, Hyde, Sandys, and Wenman invited as honored guests, might have included Sheldon, Jeremy Taylor, Hammond, Earles, Sanderson, Morley, Prideaux, Juxon, Brian Duppa, Pococke, and Samuel Fell. Chillingworth and Hales might have joined the entertainment, Stewart have left his deanery, and Laud sent a haunch of venison for the occasion. In many another decade of Oxford history the possession of even some one or two of such names would have redeemed it from the charge of barrenness.

Of the above names, Clarendon, in those most happy passages from his "Life," only a few words of which need here be quoted, mentions several; and, from the tenor of those passages, it is clear that the intercourse he there describes between Falkland and his Oxford friends was of the most uncommon character. They were encouraged to spend as much of their time as they liked at Great Tew.

Nor did the lord of the house know of their coming or going, nor who were in his house till he came to dinner or supper, where all still met; otherwise there was no troublesome ceremony or constraint, to forbid men to come to the house, or to make them weary of staying there; so that many came thither to study in a better air, finding all the books they could desire in his library, and all the persons together whose company they could wish, and not find in any other society.*

This mention of his library exactly corresponds with Bishop Barlow's reminiscences, supplied in his old age to Sir Peter Pett, one of which attributes Chillingworth's success in his controversy with the Jesuits entirely to Falkland's library, and to Falkland's intimate knowledge of the passages in his books which supplied Chillingworth's references, but of which he himself was quite ignorant.†

It is observable that this galaxy of literary men, whose daily and hourly converse was forming Lord Falkland's mind and character, through a series of years, to a far greater degree than we can imagine in the case of any ordinary university or collegiate life, was by no means principally composed of those whom it is right to style "Latitudinarians." This term has been very freely used, we are bound to say misused, to designate the company which met at Great Tew; and their accomplished host has been called the founder of that section of the Church of England. But in the first place the term when brought into use somewhat later than Falkland's time implied a very different color of opinion from that which it bears in our own day; and then, secondly, it is certain that no one can designate Sheldon, Morley, Hammond, or Earles, by that name, nor Hyde, who mentions them as Falkland's chief friends, nor can they, in justice, Falkland himself. If it applied to Hales and Chillingworth, we have no reason for confus-

* Lord Clarendon's Life and Continuation, i. 48.

† "When Mr. Chillingworth undertook the defence of Dr. Potter's book against the Jesuits, he was almost continually at Tew with my lord, examining the reasons of both parties *pro* and *con*, and their invalidity or consequence, where Mr. Chillingworth had the benefit of my lord's company and my lord's library. The benefit he had by my lord's company and rational discourse was very great, as Mr. Chillingworth would modestly and truly confess. But his library, which was well furnished with choice books (I have several times been in it and seen them), such as Mr. Chillingworth neither had, nor ever heard of many of them, till my lord showed him the books, and the passages in them which were significant and pertinent to the purpose. So that it is certain that most of those authorities which Mr. Chillingworth makes use of, he owes first to my Lord of Falkland's learning, that he could give him so good directions, and next to his civility and kindness that he could direct him." — Bishop Barlow's "Remains," collected by Sir Peter Pett, 1693.

ing them with their host. Chillingworth, indeed, went through fluctuating phases of belief and profession, some of which exceeded the bounds even of modern latitude; for there is no doubt that, as he had at one time joined the Church of Rome, so at another time he had a strong leaning to Socinianism. It was indeed asserted of Falkland that he had adopted the last-named opinions; but Cressy's evidence is conclusive against it, for he heard Chillingworth "dispute with my Lord Falkland in favor of Socinianism, wherein he was by his lordship so often confounded that it really appears he has much more reason for his engine (a military machine of his invention) than for his opinion." * Many of these men were indeed independent and original thinkers, but that is a very different thing. Sheldon had given proof at All Souls' of a sturdy spirit, which braved the displeasure of Laud in the height of his power; Hammond was a prince among reasoners; Earles was a man of great originality; but they were not Latitudinarians, nor, as we shall see, was Falkland. The mistake has arisen from a misconception of the line of argument which he pursued on the subject of the episcopate; and some color has been supposed to be given for the use of the term in his controversial works against the papal infallibility. As we cannot enter into any detail on the latter of these points, it may be enough to say that Falkland's exhaustive treatise against papal infallibility was most learnedly and effectively defended by the great Hammond † three years after Falkland's death, and that the identification of the two writers is absolute and complete throughout the argument, which proceeds on the grounds, chiefly Patristic, taken by Hammond's school of what we should call High Churchmen, certainly not Latitudinarians; and this might alone be thought conclusive.

Thus then his relations with Chillingworth and Hammond afford concurrent testimony from opposite sides, of at least a negative character, against the accusation of Latitudinarianism. Let us now see whether his speeches upon episcopacy, the sole remaining foundation for the charge, will bear it out.

There are two of these speeches. The first is by far the best known, and indeed the only one generally known, for it was the only one actually delivered; and as it exercised a very important influence on the course of events at a critical moment, it finds a place in every history of the period. The other is a draft of a speech of a later date, found among Falkland's papers at his death, and published in the following year (1644) at Oxford. It was in his own handwriting, and its authenticity has never been doubted.

It was in the first of these speeches, delivered on February 9, 1640, that Falkland poured forth his long-pent-up indignation at the abuses of episcopal government, which had, under Laud's primacy, driven the people to madness.

> The kingdom hath long labored under many and great oppressions both in religion and liberty. The great, if not a principal cause of both these have been *some bishops* and their adherents.

As a specimen of his powerful method of denouncing the innovations of the Laudian school, rhetorical and highly colored, no doubt, as might he expected under the circumstances, the following passage may be quoted: —

> The truth, Mr. Speaker, is that, as some ill ministers in our State first took away our money from us, and after endeavored to make our money not worth the taking, by turning it into brass by a kind of anti-philosopher's stone, so these men used us in the point of preaching — first depressing it to their power, and next laboring to make it such as the harm had not been much if it had been depressed. The most frequent subjects, even in the most sacred auditories, being the *jus divinum* of bishops and tithes, the sacredness of the clergy, the sacrilege of impropriations, the demolishing of Puritanism and propriety, the building of the prerogative at Paul's, the introduction of such doctrines as, admitting them true, the truth would not recompense the scandal, or such as were so far false that, as Sir Thomas More says of the Casuists, their business was not to keep men from sinning, but to confirm them — *quam prope ad peccatum sine peccato liceat accedere;* so it seemed their will was to try how much of a Papist might be brought in without Popery, and to destroy as much as they could of the Gospel without bringing themselves into danger of being destroyed by the law.
>
> Mr. Speaker, to go yet further, some of them have so industriously labored to deduce themselves from Rome, that they have given great suspicion, that in gratitude they desire to return thither, or at least to meet it half way. Some have evidently labored to bring in an English, though not a Roman, Popery; I mean not only the outside and dress of it, but equally absolute, a blind dependence of the people upon the clergy, and of the clergy upon themselves, and have opposed the papacy

* Quoted in Lady T. Lewis's "Life of Lord Falkland," i. 170.

† This was published at first without Hammond's name, but afterwards placed in the second volume of his works, collected and published by himself.

beyond the seas that they might settle one beyond the water [Lambeth]. Nay, common fame is more than ordinarily false if none of them have found a way to reconcile the opinions of Rome to the preferments of England, and to be so absolutely, directly, and cordially Papists, that it is all that fifteen hundred pound a year can do to keep them from confessing it.

The bitterness of this philippic — and it would be wrong to omit it in this sketch — will be the more excusable when we remember that two of these bishops, Mountagu and Goodman, did as a matter of fact sufficiently scandalize even their own brethren at this period by their approaches to Rome, and that the last is very much misrepresented indeed if he did not actually join that Church.

The mischief that had been done in the State by these episcopal advisers of the crown, Falkland sums up in the same glowing language: —

Mr. Speaker, I come now to speak of our liberties; and considering the interest these men have had in our common master [the King], and considering how great a good to us they might have made that interest in him, if they would have used it to have informed him of our general sufferings; and considering how a little of their freedom of speech at Whitehall might have saved us a great deal of the use we have now of it in the Parliament House — their not doing this alone were occasion enough for us to accuse them as betrayers, though not as the destroyers of our rights and liberties; though I confess that if they had been only silent in this particular, I had been silent too. But alas! they whose ancestors in the darkest times excommunicated the breakers of Magna Charta, did now by themselves and their adherents both write, preach, plot, and act against it by encouraging Dr. Beale, by preferring Dr. Mainwaring, appearing forward for monopolies and ship-money, and if any were slow and backward to comply, blasting both them and their preferment with the utmost expression of their hatred — the title of Puritan.

Mr. Speaker, we shall find some of them to have labored to exclude both all persons and all causes of the clergy from the ordinary jurisdiction of the temporal magistrate . . . to have encouraged all the clergy to suits, and have brought all suits to the Council-table; that having all power in ecclesiastical matters, they labored for equal power in temporal, and to dispose as well of every office as of every benefice . . . so that indeed the gain of their greatness extended but to a few of that order, though the envy extended to all. We shall find them to have both kindled and blown the common fire of both nations [English and Scotch] . . . to have been the first and principal cause of the breach, I will not say of, but since the pacification of Berwick. We shall find them to have been the almost sole abettors of my Lord Strafford, whilst he was practising upon another kingdom that manner of government which he intended to settle in this, . . . to have assisted him in the giving such counsels and the pursuing of such courses as it is a hard and measuring cast whether they were more unwise, more unjust, or more unfortunate.

These extracts will at least serve to explain the cause of Falkland's conduct at the crisis which had arrived. We all know how much there is to be said in extenuation of the errors committed by the king and his advisers, of whom the ecclesiastics were not the least influential; but the facts remain: the government was a tyranny, and the Church had mixed herself up with it in such fashion that a learned and devoted Churchman like Falkland could see no way of escape short of the expulsion of the bishops from the House of Lords. He was mistaken, and not that only, he was misled. He fondly hoped that by this means the nation would be saved from the disgrace and loss of abolishing episcopacy outright, and he plainly saw that the stroke was imminent. It was indeed effected in less than twelve months afterwards. In the first vehemence of his reforming ardor he would, to save the order, give up what was after all but an accidental feature of it in England. And he himself declared, at a later date, that he acted under false hopes held out to him by Hampden and others.

For we next observe that the rest of the speech, as well as, in a still more suggestive manner, the second and undelivered speech, was devoted to the *defence* of episcopacy, and to the most pressing arguments for staying the attack which the more violent politicians of the "Root and Branch" were directing against the Church. Long before the final and successful attack, Falkland had discovered the error into which his hatred of tyranny had led him. Accordingly in October 1641, he resisted the bill for depriving the bishops of their seats in the House of Lords, and obstructed the movement to the utmost of his power. By December he had so far left the side of his old friends, that Charles offered him the post of secretary of state. On the first of January 1641-2 he was sworn of the Privy Council.

In Falkland's defence of the episcopate in his first speech it is impossible to admire too much the rhetorical skill with which he attempts to influence a Parliament, which had such good cause for disgust, towards the side of moderation.

He would have them distinguish between individual offenders and the whole order. He reminds them of the debt due to bishops in old times, of the early martyrs, of the Reformation martyrs; even now there were examples enough to show that "bishops *may be* good men." It was something to get as far as this. Remove excrescences, make new rules, strict rules; but beware of reducing the Church so low as to debase learning and discourage students.

Let us not invert that of Jeroboam, and as he made the meanest of the people priests, make the highest of the priests the meanest of the people. Let us not abolish in a few days' debate an Order which hath lasted (as appears by story) in most churches these sixteen hundred years, and in all, from Christ to Calvin; or in an instant change the whole face of the Church like the scene of a mask. Mr. Speaker, I do not believe them to be *jure divino*—nay, I believe them to be not *jure divino;* but neither do I believe them to be *injuria humana.* I neither consider them as necessary, nor as unlawful, but as convenient or inconvenient. No wise man will undergo great danger but for great necessity.

His principle in short may be thus expressed: where it is not necessary to change, it is necessary not to change.

This speech does not, however, fully convey his sentiments. He had a deeper view of the episcopate than this. It was as much as he dared to say at the time, but it was not all he meant, or believed. Not that in the second speech there is any indication of a belief in the divine right of episcopacy, strictly so called; but the grounds of his adherence to the order were far more powerfully laid down. He declares that it was "so ancient, general, and uncontradicted in the first and best times, that our most laborious antiquaries can find no nation, city, church, nor houses under any other, that our first ecclesiastical authors tell us that the Apostles not only allowed, but founded bishops, so that the tradition for some books of Scripture which we receive as Canonical is both less ancient, less general, and less uncontradicted." This is pretty strong language as well as pretty strong argument, and then he goes on to show that no substitute had been agreed on for the episcopate; but "to restore it again would be a miracle in State like that of the Resurrection to nature." How few could then have foreseen that such a "miracle" would indeed take place! He next dwells on the evil of an unlearned priesthood. There would be "no controversialists to match Bellarmine." Many would "go over to Rome when an Apostolic institution was abolished in our Church."

Sir, it hath been said that we have a better way to know Scripture than by tradition. I dispute not this, sir, but I know that tradition is the only argument to prove Scripture to another, and the first to every man's self, being compared to the Samaritan woman's report, which made many first believe in Christ, though they after believed him for himself. And I therefore would not have this so far weakened to us as to take away Episcopacy as unlawful, which is so far by tradition proved to be lawful.

What would succeed episcopacy? The Scotch government, which was *jure divino* by profession, unlimited, independent, and so against the liberty of the *subject* and the privileges of Parliament, "while, after all, Episcopacy was only said to be injurious to the supremacy of the *Crown.*" It might be said that this Presbyterian claim was made for spiritual power alone; but spiritual power soon carries temporal power after it, as we see in the case of the pope.

And sure, sir, they will in this case be judges, not only of that which is spiritual, but of what it is that is so; and the people receiving instruction from no other will take the most temporal matter to be spiritual if they tell them it is so.

Here, then, we have the deliberate attitude of Lord Falkland on the question of Church government; and it enables us to judge in the first place what to think of an author, eulogized by one of the critics we have mentioned for his correct estimate of Falkland's position, Mr. Sanford, who, in his "Studies and Illustrations of the Great Rebellion," tells us that Falkland's "hatred of episcopacy" guided him at the commencement of the struggle, but when a "morbid dread of anarchy and the overthrow of constitutional monarchy took possession of his mind," he saw only the "danger which existed," and "threw himself unhesitatingly into the arms of the king."* It is, as Mr. Grosart has remarked, much more correct to say that the king threw himself into Falkland's arms. But where is there any "hatred of episcopacy"? On the contrary, we find the greatest reverence and affection for it. The "hatred" was simply a hatred of certain abuses which had clouded over the fair prospect he so much admired, and which had brought into extreme danger an "Apostolic institution," whose claim to

allegiance no one in England asserted more decidedly than himself.

Was this position, viz. that episcopacy was an apostolic institution, but not *jure divino*, the badge of a "Latitudinarian?" Certainly not in the modern sense; and it may well be questioned whether in any sense. Burnet associates the term "Latitudinarian" with the rise of the school of More and Cudworth, and their pupils Tillotson and Stillingfleet; while Hoadly has always been considered its chief and most typical representative; but the principles of these men included a far wider range of disagreement with the prevailing opinions of the Church than simply maintaining the apostolic origin of episcopacy in preference to its absolute divine right. On this point Falkland was in agreement with the reformers themselves, or, at any rate, with the more important of them; and on the practical corollary of that doctrine he was entirely at one with them; for if episcopacy was not of direct divine command, but simply carried with it, like the institution of the Lord's Day and infant baptism, the authority of the earliest primitive Church, it would not be wrong, they thought, to hold communion with the foreign Churches. Those bodies were in error, but still not an excluding error. In rejecting episcopacy he regarded them as rejecting what had a greater authority than even some parts of the Bible itself; therein they suffered great loss, but still not a loss which gave us a right to treat them as aliens, especially as their loss might be said to have been forced upon them rather than voluntary. It was not till the close of the reign of Elizabeth that the school of Bancroft and Laud claimed the establishment of bishops in the full sense of *jure divino*. The doctrine made its way side by side with the same claim for the sovereign.

In a sense, indeed, Falkland would probably himself have admitted the claim. For if it was of apostolical origin it must in a very real sense be of divine origin too. But this was not what in those days the term *jure divino* carried with it. It placed the bishops in the very seat of the apostles, and proclaimed the episcopacy as an article of faith. He would probably have consented to the ancient canon — "*Nulla ecclesia sine episcopo*" — but he claimed, as we have said, to extend his active sympathy to those foreign bodies which the violence of the breach with Rome had left destitute of the legitimate office, and he saw no inconsistency in so doing. He made it one of his charges against the Laudian government that it had refused to accept this position.

Here we must observe that we are simply considering how far, under the circumstances of the time, Falkland's view justified the charge of Latitudinarianism. On the great question itself we have no need to enter, especially as the rubrics and services of the English Church have treated it in precise accordance with the primitive, as distinct from the mediæval ruling of Rome: —

> It is evident unto all men diligently reading the Holy Scriptures and ancient authors, that from the Apostles' time there have been these orders of ministers in Christ's Church — bishops, priests, and deacons.

It is only necessary to remark that Falkland fully accepted the authority of the English Church, and that his profound and uncommon learning had enabled him to penetrate much more deeply into the relative value to be attached to patristic utterances at different periods than many of those who have written most confidently and authoritatively on the subject. On the same historic basis which he thus learned to accept theories of the episcopate have since his time been built up of more than one species, from the ultra-sacerdotal view of Dodwell and some of the non-jurors, down to the very moderate theory put forward by Canon Lightfoot in our own times * — a view, be it observed, which by no means excludes, but rather postulates, the belief that the Holy Spirit guided the primitive Church into the adoption of the three orders of the ministry.†

Enough has been said to show that it is a gratuitous assumption to claim Falkland as the parent and leader of our modern Latitudinarians and rationalists, or to suppose that his fearless controversial spirit and force of logical reasoning had led, or would have led him, into any the slightest concession to that impatience of dogma which betrays the shallowness of so much of our current literature. "Follow truth" indeed he did, but it was in no sense of questioning revelation or apostolical tradition. It was only in the sense of removing the gloss of mediæval interpretation which he found still, in spite of the light of the Reformation, overlaying so much of primitive truth. There are no signs of his considering "the frame of the Church of England" as admirably suited to afford

"room for wide differences of dogmatic opinion and the free rights of Christian reason pursuing its inquest after truth;" nor, in the assertion that "he would have reformed, but preserved and purified it, as the flexible and appropriate vehicle of the nation's religious progress," do we trace the true notes of Falkland's course; still less when we are told that "his ideal of the Christian Church may yet be realized when men have learned that patient search for truth is better than all dogmas." * If Falkland's researches had taught him no more than this he would not have broken with the Root and Branch party, much less have died on the bloody field of Newbury. It was precisely because he recognized and devoutly bowed his capacious intellect to dogma that he rejected the pseudo-dogma of Romanism and the assumptions of Presbyterianism. His "rational theology" extended not to the exercise of the mental faculties in a sphere in which they cannot expatiate, an atmosphere in which they cannot draw breath, but was confined to the modest limits which our own Hooker had delighted to circumscribe for the members of the Church of Christ, and within which all the most orthodox, the most learned, and the most sagacious of our divines have ever since found sufficient scope. If a modern school, under the mistaken hope of making gains for religion by concession to modern unbelief, has advanced very much further than this, let them abstain from demanding that we should give up Falkland as their patron and leader. We claim to retain him in the non-Latitudinarian ranks, and are not aware that he ever hoisted the signal of defection.

But the history of Lord Falkland's opinions also throws light incidentally upon an interesting and difficult Constitutional question, on which it may be worth while to make some remarks. Few such questions are more obscure than that of the "three estates of the realm," an expression which has been used in many different senses, one on which the best authorities not only have differed during the last two centuries and a half, but differ still, and one which, at the period of the great Rebellion, was in so confused a state that people supported their arguments for taking up one side or the other in the war by considerations arising out of it. Thus, to state the case briefly, the law-books in general lay down the law, in a very decided way, to the effect that the lords spiritual, viz. the bishops in Parliament, form one of the "three estates of the realm," along with the lords temporal and the commons.

"The Three Estates of the Realm, viz., the Lords Spiritual, Archbishops and Bishops, being in number twenty-four . . . the Lords Temporal, in number at this time one hundred and six. The third estate is the Commons of the Realm." * "The constituent parts of a Parliament are the king sitting there in the royal political capacity, and the three Estates of the Realm — the Lords Spiritual, the Lords Temporal (who sit together with the sovereign in one house), and the Commons, who sit by themselves in another. The Sovereign and these Three Estates, together, form the great corporation or body politic of the kingdom, of which the Sovereign is said to be *caput, principium, et finis*." † "And by divers statutes Bishops are called Peers of the land; one of the Three Estates of the Realm; one of the greatest Estates of the Realm, and the like." ‡

But it is equally certain that the clergy, lords, and commons, the clergy "by a pious courtesy," as the first order, the lords as the second, and the commons as the third, are the three historical estates of the realm; and that this term "clergy" included the whole body of the clergy, and not merely the bishops. "The first or spiritual estate comprises the whole body of the clergy, whether endowed with land or tithe, whether dignified or undignified, whether sharing or not sharing the privileges of baronage." § "In England, where the clergy have been esteemed one estate, the peers of the realm the second estate, and the commons of the realm, represented in Parliament by persons chosen by certain electors, a third estate." ‖ "The name of the three estates, that is, the nobles, clergy and commons, is equally well known in England, though the meaning of the three names differs not a little

† Stephens' "Blackstone," 3rd edition, ii. 319.
‡ Burn's "Ecclesiastical Law," i. 213.
The references to statutes made by Burn in this place are the following: 25 Edw. III., st. 3, c. 6; 1 Eliz., c. 3; 8 Eliz., c. 1; but it may be noticed that in none of them are the bishops called an estate of the realm, and in only one, viz., 1 Eliz., c. 3, said to represent an estate: "We, your said most loving, faithful, and obedient subjects, representing the Three Estates of your Realm of England;" and these are "the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled." In 25 Edw. III. the expression is, "The holy Church of England was founded in the estate of prelacy," which proves nothing to the point; but in 8 Eliz., c. 1, the expression is, "The state of the Clergy, being one of the great States of this Realm." The statutes do not, in fact, bear out the assertion of the lawyers on this point.

in England from what it meant elsewhere."*

How can the clergy in general be an "estate of the realm," and the bishops sitting in Parliament, the "lords spiritual," be called, in our authoritative law-books, by that very same title? As the historical facts cannot be disputed, we are driven to the conclusion that the term is used by lawyers inaccurately, or at least unhistorically, and that they mean by "estates of the realm" "estates in Parliament," an expression which has become current in modern times.

The way in which the clergy dropped out of the position in the Constitution which Edward I. vainly attempted to assign to them, is too well known to require repetition here; the fact is enough that they did so drop out, and that the prelates, who, as *sapientes*, were councillors of the sovereign, and as barons (so reckoned in the Constitutions of Clarendon) sat in the House of Lords, gradually and insensibly came to be reckoned as the representatives of the clergy, though they were not elected by them. Such has been the tendency of our government from the earliest ages. In Anglo-Saxon times the position of the bishop in the county courts and Witenagemote made him a a great State officer; and this position, though changed in form by the establishment of the Courts Christian, was rather magnified than diminished in Norman and Plantagenet times. The popes, quite as much as the sovereigns of England, found their account in ruling the clergy through the bishops in a summary fashion, and the constant rivalry of the monastic and mendicant orders still further added to the political depression of the secular priesthood. The Tudor period emphasized these relations of the episcopate to the clergy; † for the bishops, during the Tudor dictatorship (excluding of course Mary's short reign), could only be selected from the ranks of those who heartily accepted the Reformation; while the mass of the clergy offered more or less resistance to a movement which proceeded either from the superior powers of Church and State, or from those vehement reformers of the middle and lower classes with whom they had little sympathy.

Besides, then, this character of practical representation the bishops appeared in Parliament as guardians of the Church, "guardians of the Spiritualities," *ne quid ecclesia detrimenti capiat*, as is proved by the fact that the dean and chapter are summoned during the vacancy of a see, and that the bishops of the newer creations, though no barons, are summoned equally with the rest. And here we distinguish a cause of the changed political position of the bishops, which, at and after the Reformation, grew up side by side with their more distinct representative position. This has never been sufficiently observed. It was this difference between the baronial tenure of the ancient bishops and abbots, and the non-baronial tenure of Henry VIII.'s and subsequent bishops, together with the suppression of the abbots and their seats in Parliament, which, probably, led to the forfeiture by the bishops of the baronial privileges of the lords temporal, though the seat in the same house with them was retained. It was as barons that they shared the judicial functions of that house; but, having themselves objected to exercise the right of judging in criminal cases, and at the same time being diminished in number, and not all alike barons, they were held to be only quasi peers of the realm; or, as it got to be expressed, peers in Parliament. Instead of being tried by their peers they are tried, as we know, like commoners by jury, and have to give their testimony upon oath. Thus while the clergy were more and more lost, politically, in the episcopate, the bishops themselves took up, relatively to the other branches of the body politic, a lower position than of old.

But if not peers of the realm, nor an estate of the realm, in the full and proper sense, does this make the lords spiritual any the more an "estate in Parliament"? Not a bit. But the above limitations may have had a tendency to favor the adoption of the phrase; and it must be remembered that the clergy, having retained their right of self-taxation up to the period of the Restoration, were still considered an estate in convocation; for the term "estate" was always connected principally, though not altogether, with the exercise of taxing power. As the bishops in Parliament were distinct from this "estate" in convocation, the idea of an "estate in Parliament" seemed in a rough way to signify the anomalous position of lords spiritual who were already only "peers in Parliament," as opposed to peers of the realm. It must have been in some such way that the phrase, which is radically incorrect, came to be customary.

To add to the confusion existing on this

point, a "republican conceit," as Roger North terms it,* obtained circulation in the seventeenth century that the sovereign was himself one of the three estates of the realm. Readers of Clarendon † must have been astonished to find that even Lord Falkland fell into this error. Soon after he became secretary of state he and Colepepper drew up an answer, in the name of the king, to the Nineteen Propositions of the Parliament, and in this paper the king, lords, and commons are called the three estates, whereas, says Clarendon, "in truth the Bishops make the Third Estate." The king submitted the paper to Hyde, who would not print it. Falkland was angry with his friend for thus suppressing his handiwork, but Hyde having informed him of the reason, he at once expressed his regret, and

> imputed [his mistake] to his own inadvertency and to the infusion of some lawyers who had misled Sir John Colepepper, and to the declarations which many of the prelatical clergy frequently and ignorantly made that the Bishops did not sit in Parliament as the representatives of the clergy, and so could not be the Third Estate.

This is a very suggestive passage as to the three estates. Here is a secretary of state, of immense learning, and of such devotion to the Constitution and the episcopate that he has "set his life upon the cast" for king and bishops in the tremendous struggle which has now commenced, utterly forgetting that either clergy or bishops were an estate of the realm or estate of Parliament, and inserting "from inadvertency" what "some lawyers" had told his coadjutor, who was, indeed, a rough, soldierly man, not likely to be perfectly conversant with the Constitution. It is evident that the lawyers, or some of them, were very imperfectly acquainted with the history of England; but his second excuse is still more interesting to us, for it shows that not only some of the lawyers, but some of the clergy themselves, had repudiated, as early as 1642, the claim of the bishops to represent the clergy in Parliament as an estate of the realm. In so doing they were, no doubt, technically right. Whether in the later and secondary sense above mentioned, the bishops were, as Clarendon said, a third estate, depends on how far we may consider custom to have by that time hardened into law; but the "prelatical clergy" were able to adduce three indisputable facts on their side. The bishops, not being elected by the clergy, were not representatives of the clergy; they had no veto on the proceedings of the temporal peers — the very essence of an "estate," and the clergy did at that time (not after the Restoration) sit in *convocation* for taxing purposes as an estate of the realm, though they had no place in Parliament as legislators.

Thus the case was hardly so clear as Clarendon thought; and Falkland had more excuse than he himself claimed for dropping the bishops out of the category of the three estates of the realm. But he was inexcusable for allowing the king to be inserted in their place. It was tempting to make up the number "three" in this manner; but the sovereign never had been considered an "estate," for the simple reason that it was his business to "rule all estates and degrees committed to his charge by God, whether they be ecclesiastical or temporal."* He is a component portion of Parliament. "I am a part of Parliament," said, with perfect propriety, Charles the First; but an estate is an order or body of men.

> On no mediæval [or other] theory of government could the king be regarded as an estate of the realm. He was supreme in idea, if not in practice; the head, and not a limb, of the body politic; the impersonation of the majesty of the kingdom, not one of several coördinate constituents.†

It is easy to see what an advantage this "republican conceit" gave to those Parliamentarians who still professed to respect the Constitution. If the king were only one of three estates, it might be argued that the concurrence of two out of the three, viz., the lords and commons (however little they might truly represent those orders at the time, for this might be put aside), was enough to overbear the resistance of the third. But when the sovereign is allowed his legitimate place above, and yet inseparable from, the estates in Parliament, all proceedings of Parliament are illegal without him. This is the Constitution, and it brings matters at a crisis to their true issue — the issue of the Revolution of 1688. To pretend that a Parliament can make war upon the king is wholly contrary to the Constitution; but the country having, in the best manner available at the moment, deposed a sovereign who obstinately breaks the laws, and establishes a successor, is then free,

if such a necessity should ever arise, as in the case of James the Second, to act through its legally constituted Parliament.

Instead, then, of attempting to force an interpretation of the Constitution which might suit the ancient tradition of an assembly of three estates of the realm, but which was utterly alien to the Constitution, and incorrect in every respect, it was open to Constitutional writers either at once to give up the theory of a representation of three estates of the realm in Parliament, and to admit that they had practically, in the course of ages, been reduced to two, the lords spiritual being merged in the lords temporal, and the bishops merely sitting in respect of their baronies as far as they still held them, and also as *sapientes* and guardians of the Church, which was the view to which Blackstone,* as distinguished from his commentators, himself leant; or else it was open to them to invent a sort of *tertium quid*, the appellation of which we have already spoken, the term "estate in Parliament." This last may be said on the whole to have prevailed, and it is perhaps the nearest approach to a fact; though the word "estate" suggests, and always will suggest, the erroneous inference that the bishops are an "estate of the realm," which they are not, except by a gross and unhistorical fiction. They are an order, class, or rank, and are in that respect an estate; but not with any ancient claim to that title, like the peers of the realm, or the estate of the commons, though the old baronial bishops were no doubt peers of the realm, and inseparable from the peers in their civil capacity. If the lawbooks, which speak with so much decision on this point, still designate the bishops in Parliament as "an estate of the realm," we must, then, only consider it as a modern adaptation, destitute of real authority, of an ancient term which once had a very different meaning; and if, on the other hand, a Constitutional position is claimed, as it often is nowadays, for the clergy in general as an estate of the realm, we must remind those who use it that all practical meaning has passed away from the phrase, and that it passed away many ages ago. Applied to the clergy as clergy, the term is a mere bit of antiquarianism. But no one who understands the Constitution can admit that the right of the clergy to be heard by representation in matters concerning the doctrine and discipline of the Church is affected by the fact that the term which is sometimes erroneously held to confer that right, has become obsolete. That right rests on other and far stronger grounds, which need not be discussed in this place.

Nor is the right of the bishops to their seat in the House of Lords the least affected by the above considerations; still less the justice and propriety of the place thus assigned to them by the Constitution. Their right is as old as that of the sovereign and the peers, older than that of the commons. Justice and propriety demand it as long as the Church is established. As Falkland so keenly felt, where it is not necessary to change it is necessary not to change. It is not our business here to consider the various aspects of this question from the modern point of view; we are regarding it from the Constitutional side, and in relation to the opinions of the great man whose career we have been considering. To him, when he had rallied from the effects of the oppression which he labored to remedy, the seat of the bishops in the House of Lords presented itself as part and parcel of the compact between Church and State, the privilege granted in return for the sacrifice of independence made by the Church, the guarantee that the power exercised by the State should not be perverted to the injury of the Church, the channel by which the consent of the Church should be given to laws which affected her external state and condition. To him this symbol of compact, this guarantee against perversion, this channel of consent, was none the less real because undefined, none the less valuable because it had been abused, none the less vital to the Constitution because anomalous and unsymmetrical. That the expulsion of the bishops from Parliament proved to be the immediate precursor of revolution and anarchy is the best commentary on the sagacity which led Falkland to break with his party on this precise question, as it is also on the imprudence with which he allowed himself, in the first burst of his reforming enthusiasm, to listen on this same question to the counsels of Pym, Fiennes, and Hampden. Nor is the lesson of the great Rebellion, in connection with this subject, without its special application to our own day. But here we stop.

Our object will have been attained if we have shown that we may learn something

* "And from this want of a separate assembly and separate negative of the prelates some writers have argued very cogently that the Lords Spiritual and Temporal are only one estate, which is unquestionably true in every effectual sense, though the ancient distinction between them still nominally continues." — Archbold's Blackstone, i. 156.

even from the mistakes of a most remarkable man. That he made fewer mistakes than any one except Hyde, in the most critical and difficult period of English history, is perhaps the highest tribute we can pay him; for as it was the maxim of our greatest modern general that this was the only title to supreme praise in the art of war, so also it is still more true in civil strife. But at any rate let us take him as we find him, not attempting to build an ideal palace for our hero, but recognizing him in the place where he placed himself, along with the friends of Oxford and Great Tew, who shared his principles and admired his acts, with Hyde, Sheldon, and Hammond, the types of the statesman, the ecclesiastical politician, and the divine, who may most fairly stand out as representative of English Church and State in the seventeenth century. No party badges, no nicknames, no misapplied watchwords, can obscure the fact that the line taken by these men, along with Falkland, was that on which we have moved — moved forward, indeed — but moved ever since, the true *via media* of the English Constitution and the English Church; and in honoring by a monument the brilliant soldier-student whose romantic life and death we have noticed, England is doing honor to herself.

From Good Words.

DORIS BARUGH.

A YORKSHIRE STORY.

BY THE AUTHOR OF "PATTY."

CHAPTER II.

ROSE.

WHAT is the instinct which tells us that loving thoughts are with us — that loving words are spoken of us, or written to us; nay, which even heralds the approach of some dearly-loved friend, and when the thought of us is deep and more special makes us conscious of soothing and help in a subtle and inexplicable way? This spiritual or electric wave touched George Barugh as Rica's interest in him deepened; and as Doris only spoke of her friend vaguely, George grew up in ignorance of this sweet new sisterly love that had ripened for him; and when the tide of instinctive feeling flowed warmly into his bosom he said to himself, —

"Doris is thinking of me. How dearly Doris loves me!"

At such times the boy's generous heart was full of self-reproach. He knew that he had often chosen Rose Duncombe as a playfellow instead of Doris, and he felt that even when his sister came back it would be hard to give Rose up for Doris.

Rose had spent part of every day with him during the first two years of his illness, and these visits had grown to be a part of his life. At first Mrs. Barugh had tried to keep Rose away, she said that "George must learn to speak properly against Doris came home," but the boy craved after his playfellow, and at last the mother yielded, the doctor having told Mr. Spencer, the vicar, that Rose's visits were as good as change of air and scene to his patient; for the disease which had appeared with such apparent suddenness had been latent in the system, and there was little hope of perfect cure; even if George outgrew it, he could scarcely hope to outgrow the lameness it had produced, for at the end of two years one leg was shorter than the other.

But then came a heavy trial for George. Joseph Sunley was a kindly man, folks said, but he dearly loved his prerogatives. He had been petted by the squires of Burneston for three generations, and it seemed hard to him that new-comers like the Barughs should absorb the attention and interest which he felt were due to him.

Ever since Doris had gone away to school in London — and Joseph always looked sceptical on this point — the squire, during his occasional visits to Burneston, went more often to the Church Farm than anywhere else.

"He's nae getten t' same head-piece as his faything an' his grandfayther had, ah suppose." Joseph was sitting in his usual place at his cottage door, where he now often found a companion, for the kitchen felt dull without Rose, and Mrs. Duncombe brought her knitting to the door while her grandchild sat with George. She nodded her head, but it was all one to Joseph whether she heard or not; he was far too much accustomed to preaching to need an audience.

"He'll nae settle at Burneston. He's here yan day, an' t' neeit he's away te Lunnon, or mebbe Paaris. T' only wise thing 'at he hev done sin he coom back fra travellin' war puttin' t' lahtle lad te skeeal. Skeeal's t' making o' yung 'uns, let 'em be big or lahtle. Ah say, missus" — he leaned forward to shout in the old woman's ear — "when is ye thinkin' o' puttin' t' lass te skeeal?"

The old woman's smooth full face looked troubled, and her large double chin wagged.

"Ah've nae thowt o' sendin' 'er ageean," she said querulously; "t' skeeal-teacher said sheea did neeah gude — sheea nobbut made t' ither lasses laff when thea sud be sewin'; an' ah war vexed an' took 'er away. Sheea's fowerteen now — she's over awd fer t' skeeal."

Joseph shook his head.

"Sheea mun gan wi' sum 'un 'at 'll keep 'er tighter than what ye deea, ye awd feeal, mebbe sheea'll gan te t' divvil else — sheea's just t' soart is Rose; sheea's as ahdell as a alligatur." Then projecting his old dark withered chin, and bringing it into striking contrast with the blond, easy-going face beside him, "Bon it! ye' mun send t' lass away fra Burneston. Ye cann't larn 'er to wark here; sheea'll spend mair an' mair o' 'er time wi' t' sick lad. My word, ye hevn't seea mitch brass, neeghber, 'at ye can keep Rose loake a leeady."

Mrs. Duncombe's chin waggled, and she began to cry.

"Neeah, neeah," she said piteously; "skeealin' costs brass, it deeant save it; an' wheer'll be t' use o' seea mitch skeeal te t' lass?"

"Ah knaws t' skeeal fer Rose." Joseph spoke oracularly. "At Steersley ther's t' skeeal wheer sik a lass as Rose 'll larn te get 'er own livin' by teeachin'. They takes 'er and larns 'er, an' after a bit sheea teeaches t' lahtle lasses; an' theer's nut ower mitch te pay; an' if sheea stays win 'em t' three years, they finds 'er t' pleeace as teeacher, seea noo ye knaws."

He waited for an answer, but Mrs. Duncombe sat thinking, and her easy face grew stiff in the unusual process. Rose was a trouble, but she was loving, so loving that the grandmother could not summon courage to send her away.

"Neeah, neeah," she said weakly, in a struggling voice, as if she were trying to get free from a strong grasp, "mebby she'll larn mischief at t' skeeal, an' she'll get nae ill fra t' sick lad."

Instead of answering, Joseph looked straight before him, and spoke in his loudest, strongest voice.

"Caps me, it diz, wheea God A'mighty made t' lasses, so ther. Theer's need fer summat female ah knaws, bud a few on 'em wad hev done; an' they needn't hev had as mitch tongue as t' lads; an' ah aims if you war to leeak fer't ye'd find a lass had twice seea many roots tiv 'er tongue as 'at a lad hev. It's 'at as keeps it waggin' feeal's notions." Then shouting in his companion's ear, or more truly through the net of her frill-bordered cap,—

"For seear t' lad's nae harm in him, bud 'e cann't larn t' lass te keep 'ersel when ye're deead an' gone, an' 'at's what a laakely lass like Rose sud larn. Put her te manty makker, or mak her a teeacher if ye pleease, it's all yan to me," he said loftily, and went on in his usual voice. "T' ane puts vanity outside, an' t' ither puts it inside t' 'eead o' t' lahtle lasses. Weel, theea're made fer 't. Ah tak it follies mun hev owners, an' mebby t' lasses wur made t' help t' peacock spread his teeal — theea keeps him in mind o't ov Sunda's."

The old woman wiped her eyes, but did not answer. Joseph saw that for the present he must give up the subject, but next day he found a potent ally in Rose herself.

The grandmother had poured out Joseph's suggestion to Rose with many tears, and, to her surprise, the girl announced her willingness, and indeed her wish, to go to the Steersley school.

"Ah's tired o' Burneston," Rose said; to herself she added, "ther's nobbut George to speak wiv, an' he's dull noo he can't gan nuttin' nor nowt; and ah aims ther's shops in Steersley, an' grandmother mun gi'e me new frocks gin ah gans te boardin'-skeeal."

So Rose had her way, and went to Steersley to be educated for a nursery governess. The boarding-school was kept by an ignorant woman, who, having once been housekeeper in a gentleman's family, though herself qualified to teach; by means of an artificial manner modelled on a good pattern she had managed to get under her care most of the farmer's daughters round Steersley, and a few girls from other districts whom she took at a cheaper rate, and whom, as she asserted in her prospectus, she fitted for teachers. Rose grew prettier and perter every day, but she managed to be a universal favorite, especially among the little ones she was set to teach. Her fellow-teachers were always willing to undertake her duties, and left her plenty of time to practise affectations and follies. Still in her holidays she was as devoted as ever to George, and he saw no change in her, except the improvement in her reading and the pleasure she gave him by singing the pretty songs she learned from her richer school-fellows. She did not learn much besides, except what she considered an improved way of speaking, that is to say, she lost much of the coun-

try dialect and quaint expressions, and picked up the vulgarisms of some of her southern schoolfellows. George had at first pined after his playfellow, and his mother took him to the sea for a while. The air had a wonderful effect both on mind and body. The boy's eyes, so long obliged to content themselves with the surroundings of his own home, devoured all he saw with delighted intelligence, and when he came back his face was full of life and color, and he could walk with a stick.

Mr. Burneston gave him books, and, what he wanted most of all, sympathy in his studies, and between these and the delight of Rose's holidays his life passed happily enough. The bond between him and his mother had drawn closer during Rose's absence; and now that the three years were over and the girl was to come home for a few months, Mrs. Barugh felt some pangs of fear lest her place in her son's heart should be taken from her.

He had been very fidgety this afternoon.

"Moother, is thee seear 'at's t' best nosegay 'at thee can find i' t' garden?" to which the fond mother's answer was to go out and gather a glorious group of autumn leaves, crimson, and scarlet, and purple, and yellow of every shade, from palest gold to tawniest orange. These she placed in a little flower-basket, one of Rose's gifts, beside the nosegay of China asters on George's book-table.

But even this attention did not satisfy him, though he got up, and, limping across to his mother, kissed her and thanked her.

"Flowers and leaves don't suit side by side," he said, "'cept t' leaves is green." Then when he came back to his seat he said, half aloud, as if talking to himself, "It seems ower gude news, don't it, mother, 'at Rose is comin' — we'll see her ivvery day?"

Mrs. Barugh bent over her knitting. She looked far less delicate, and she led a more active life; even the sound of her voice told of better health.

"I don't know about that, lad," she said gravely. "Rose 'ull never be able to stay at home, unless she takes to t' dressmakin', an' there's two or three before her there. I suppose Mrs. Duncombe ain't got enough brass to keep a likely lass such as Rose at home doin' naught. If she meant that, what for did she give her schoolin'?"

"She went to school to get clevver like our Doris; eh, but, mother, Rose is growin' vaary 'cute — she knows ivvery-thing."

"You must not think of Doris and Rose i' the same breath, lad. Doris is a lady now."

A flush spread over the boy's face.

"Moother, Rose is kind an' lovin', an' I don't know whether 'ats not as gude as being a laady, but d'ye really think 'at Rose 'ell go fra' home?" he looked full of anxiety. "Mr. Burneston helped pay for her schooling. I'll ask him if she mun go away, or if she can get little lasses to learn at home."

Dorothy felt vexed that she had troubled him. George was the centre of her life now, all her thoughts circled round her poor crippled boy.

"I mean nought, lad, but I think a pretty face like Rose's won't bide at home for long. Why, she's seventeen an' past. Maybe Nicholas Crewe or Ephraim Wigglesworth 'll be wanting her to wed; they're both marryin' men."

George leaned back in his chair and sighed wearily.

"Ye're tired out, lad." His mother gave him a quick glance full of a new and sudden fear. Though she consulted her wise thoughtful son, and looked up to him on all intellectual subjects, till this moment it had not occurred to her that he was nearly eighteen, and that he might no longer think of Rose only as a playfellow. "Ye've been afoot," she said, with a sudden indignation against his lameness, "on that poor stupid leg of yours since six o'clock, and ye've ate no dinner, an' ye must have yer tea at once — get on the couch, lad, an' take a wink o' sleep whiles I make the kettle boil."

George obeyed silently, turning his face towards the wall, and Dorothy went on with the tea-making; but presently as she stooped over the kettle, she thought she heard a groan. She turned round quickly and looked at the couch. George lay quite still, seemingly sound asleep with his face buried on his pillow.

"Poor lad," said Dorothy, "he's tired himself out — and a good thing it 'ud be for Rose if a steady chap like Nicholas were to ask her. I've a mind t' put it in his head."

She went away to call her husband in to tea. The husband and wife had drawn closer together over the sick-bed. As her footsteps sounded in the passage George opened his eyes and looked round him with eager burning glances.

"Rose — marry some one else," he said, with passionate scorn, "Rose is

mine, sheea shall keep to me. Sheea hev always been mine." And then, as he rose up and limped across the floor, he sighed heavily.

Tea was quickly over, for John Barugh did not come in, and soon after Dorothy went out with a sort of vague purpose of seeking Nicholas Crewe. "If our lad wants her to stay i' the village she must stay, but she'd best have a man of her own."

Presently there was the click of the gate, and George's heart beat very fast as he listened; a light tread came on the gravel, and then a bird-like chirping voice said at the open door, "Please may I come in, Mrs. Barugh?" The wan wearied look left the boy's face, his brown eyes grew dark with happiness.

"Pull t' bobbin, an t' latch will gan up, Rose Riding Hood. Eh! why cann't I run to meet you?" he said, as the door opened before he could reach it.

There stepped down into the room a pretty, coquettish-looking damsel, who looked quite twenty, though she was really about three years younger. Her complexion was as pink and as white as when we first saw her, but her freckles had disappeared, and her face was more oval than round, her blue eyes and her little turn-up nose were still as saucy as ever.

"Grumbling, George, oh fie for shame, all t' little dogs shall know yer name!" She gave her head a little toss, and untied the strings of a gay bonnet covered with artificial roses. "I thought I taught you to say go instead o' gan," she said pertly.

George was taking her hand, but she drew it back to pull off a glove before she shook hands with him.

"Gloves, eh! Rose, lass, you're grown a fine lady, an' no mistake."

"I pay for 'em myself," she spoke sharply, and then she softened into a smile as she seated herself in the chair he had placed for her. "Look here, George," she said, "we put on our best on prize-day, an' as I got a prize," she glanced at a book under her arm, "I came away in haste to show it just as I wer i' my Sunday clothes, an' ——"

"Show us the prize," George said eagerly; "is it a gude story?"

Her face clouded as she gave him the book. "Nay, it's dull readin', it's a sermon or something o' t' sort, but t' pictures is pretty an' t' outside," and she pointed to the gilt lettering and scarlet binding.

Such a glow of pleasure came into his face as he read the title, "The Pilgrim's Progress."

"Eh, lass, I have wanted this sorely. T'awd yan ther" — he pointed to a dingy-looking bookshelf with some old volumes on it — "hev only two pages at t' beginnin', an' half o' t' middle is torn out, and Mr. Burneston hev oft sed he'd lend it me fra t' Hall, but I suppose he forgot. Oh, Rose, how happy we'll be readin' this!"

He looked at her with glowing eyes, but there was no sympathy in Rose's face, she was gaping unrestrainedly.

"I tell ye what, George, lad," she said hurriedly, "I'se a mind t' gie ye t' book. I've got to like another sort o' books this half, an' I'm not sure they'll please you; so ye shall hev t' Pilgrim to read yourself. Will ye take it as a keepsake?"

The glow faded out of his eyes. "I can't take yer prize, Rose, but ye'll come an' see me as ye used to," he spoke timidly, something, he could not name the feeling, seemed to come between him and Rose.

"Com an see ye! why, George, lad," she said heartily, "what d'ye mean by sayin' that? What sud I do all day if I didn't come t' teaze ye a bit? An' ye can walk again now, an' if ye'll like my books, I'll read 'em out t' ye; they's t' sort that don't bear dawdlin' over, they goes along like lightning."

George fixed his eyes on her earnestly. "I doubt they'se none so safe as t' gude old sort," he said.

"Niver trouble about t' books," said Rose, "I want to tell ye about t' prizes. Why, Mrs. Tower, t' squire's wife, gies 'em away herself, an' ther wer lots o' quality besides. She's a bonny young lady from Lunnon, she is, an' she said ivver so many pretty things to me."

"What do ye mean by pretty things?"

"Oh, I don't call to mind the words, but they came so pat; an' the things, well, she sed that bright red an' gold was the right sort of bindin' for me. Now t' others was plain bindin's, an' plain lasses got 'em. So of course it wer easy t' see what she meant, an' then I heeard her say my complexion was wonderful. She said, 'I sud like to paint it, Mrs. Jones;' so of course I wer pleased."

"Of course ye wer," she looked so bright and pretty in her animation that George thought no one could praise her too much. "Ye do look bonny; but, Rose, lass, ye wadn't like ivvery one te praise ye, wad ye now?" He looked at her earnestly, she seemed puzzled.

"Why not, lad?"

"Ah mean to yer face, ye wadn't like any kind o' lads to praise ye."

Don't say "ah," George, it's I. Why, my gracious, lad, an' why not lads to praise me? What else wer I made fer? That's t' use o' not havin' a real sweetheart, an' that's why I don't mean te take up with one yet awhile;" and she sang in a sweet teasing voice, —

"An' a' the lads they lo'e me weel,
An' what the waur am I?"

There was a silence. George's heart was throbbing so violently that he could not speak.

"Weel, lad," Rose went on in an excited tone, "look at me, 'what the waur am I?' an' there's plenty o' likely lads in Steersley, I can tell ye, to have fun with."

She waited for his answer.

"Why don't ye answer?" she said pettishly. "Come, lad, ye'se grown sulky while I've been away."

"Not sulky, Rose," he had flushed at her words, now he tried to smile, "I was wonderin' howivver ye could get on wiv yer learning at school if ye war carryin' on wiv t' lads."

"Bless him, what an innocent! Why, George, lad, yer too good to live; ye forgit playtime an' our walks two an' two along the road, an' t' maid as was allays ready to take our letters an' giv 'em; but ther was no harm, lad, don't you be feared, I niver cared for ne'er a one of 'em as much as I care for you." She looked at him affectionately, but a faint flush, rather of vexation than of pleasure, rose in the boy's face.

"Mebbe ye'll think ah'm strict and solemn, lass, but ah say that makes it worse. Ye may not care, but ye may hev made some poor lad right mad wi' luv for ye; an' such ways is wrong, they makes t' lads speaks lightly of ye too. I sud not like te think o' Doris doin' so, Rose, and ye're as good as Doris."

"Doris!" Rose grew very red, and she tossed her head angrily. "My word, Doris an' I is quite different; Doris is a lady, you know," she said, with a pert mimicry of Mrs. Barugh's manner that vexed him, it was so like. "I'm only a village lass. It's all very well, lad, but I should like ye te read how some ladies carries on i' t' books I reads now; my way is nothing after that, so there. I must go now," she got up gaping. "Grandmother said I weren't to stop. Give my love to yer mother." But she turned round on her way to the door and shook her finger in his face as he followed her, "Don't tell her nought I've told you, mind ye, not one word." She frowned, and then went away laughing and nodding.

George stretched out both legs and sighed as he looked at them: one was at least half an inch shorter than the other.

"Ah mun get well," he said resolutely, "if it's only to save Rose. She'll get a bad name if she goes on i' that way; she'll be just like a plum wi' t' bloom rubbed off. She's sound-hearted, I know, that I'll niver doubt, I cuddent; but ther's no puttin' t' bloom on once it's rubbed off. Eh! I must get well."

Again the burning longing filled his eyes. Usually his patience was most remarkable, he had borne severe suffering without a word of complaint; but the sight of Ross had unhinged him.

"She disn't luv me as ah luv her," he said bitterly; "how can she luv a cripple?"

CHAPTER III.

A "COO'S" HEART.

From Gilbert Raine in the Island of Bornholm, to Philip Burneston, at Burneston Hall: —

"My dear Philip, — I am getting on famously, at the same time the book you sent is full of mistakes — mistakes only to be understood by the hypothesis that the writer never visited the places he describes. The round churches here are wonderfully curious. I send you a detailed account in order. . . .

"But to come back to England, and first to you. A sentence here and there in your letters has struck me curiously, but being very intent on making my observations, I confess I read hastily, and crammed the letters into my pocket to enjoy when I had more leisure. Yesterday while I sat taking my lunch in the middle of a hard morning's work at some stones at G——, I began to wonder how you were occupying yourself, and I took out and read your three last letters over again. You say, 'I think your idea of educating a wife for oneself excellent, so excellent that I believe I shall adopt it,' and in each of the other letters you refer seriously to the same project. Perhaps you are only joking, perhaps too I have been living and working seriously here for so many months that I have got to take everything literally, and you are only trying to see how much you can make me swallow. I will hope so, for you know, Phil, I always speak my mind, whether you like it or not. A fellow like me, without any relations to

speak of but yourself, may do very much what he likes; but you are in quite another position, you must not be eccentric, you are a match for any one, that is, if you must marry again, though why a man having achieved the chief end of marriage — an heir to his possessions — and having freed himself from the restraints of such a life, should want to give up his freedom a second time, passes my comprehension. Education is a fine thing, but after all there are habits and ways of life which education does not touch; you may put on as much outside varnish as you like, but it is liable to crack, and then the coarse texture shows through the rent. Good-bye, old fellow; don't be offended, but write again soon, and send me all the news you can, specially about yourself and Ralph. I suppose I shall find the fellow in tails and stick-ups, no, I forgot Eton practices when I wrote that. I'm glad he loves the old place. Tell him we must have cricket at Burneston when I come home." . . .

It has been said already that Mr. Burneston was as obstinate on certain points as he was yielding on others. If he had wanted any confirmation in his intentions about Doris Barugh, this letter would have given it.

He read it through twice with increasing impatience, and then turning round from the breakfast-table, he threw it in the fire.

"I thought Raine was strong-minded, different from other men, in being able to stand to his own opinions, no matter what fire of world's judgment was brought to bear on them. I shall have no tolerance for his eccentricities in future, they are not signs of real originality, merely affectations to save himself the trouble of conforming to rules."

He rose up and left his breakfast unfinished, giving thereby a fruitful topic of wondering comment for the rest of the day to Mr. and Mrs. Hazelgrange as to "what could have gone wrang wi' t' maister."

During these five years Mr. Burneston's temper had been far less equable than it had ever been in his life, for although nothing would have made him give up his project, after the first step had been taken, he was a prey to fits of doubt which would not have troubled a stronger and less-impulsive nature. He had resolved not to see Doris while she was at school, he wished entirely to blot out the past relations between them, and to meet the girl as an equal and try to win her love. This was the chief source of his disquiet, and it was a puzzle to himself. He was not a romantic man, he had been fascinated by Doris's first appearance, and impressed by the strange fortuitousness of the words he had heard her singing; but he knew that he could have forgotten her, it was the singular appositeness of Raine's idea that had seemed to make a fate for him out of that chance meeting.

"I did not trouble about being married for myself in Louisa's case," he said; "why should it be more difficult to make a young creature like Doris care for me, a girl who has never known society or received any attention or admiration? Yes, that is part of the beauty of this idea, that there will be nothing to unlearn or eradicate, she will be so perfectly guileless and simple."

He went out through the doors leading on to the lawn, and then with his hands clasped behind his back, and his hat pulled over his eyes, he walked beside the river.

The five years were just over, and he was in daily expectation that John Barugh would demand his daughter's return. Mr. Burneston had not committed himself by any direct avowal of his intentions; he had told the farmer and his wife that Doris ought to have a good education. She was not, he said, an ordinary girl, and the ordinary education of a country town was not enough for her, and he had promised to provide handsomely for her if he were allowed to choose a school for her, but on the condition that she was never to be told she owed him anything.

His dread had been that the idea of marriage might suggest itself, and that this would lower the girl's tone of mind, and defeat all his hopes of happiness. He told himself he was not romantic, that he had no idea of inspiring Doris with violent love for him, but he did not want her to marry him for his position only.

"After all," he stopped in his walk and turned to his house again, "it is quite possible I may be disappointed in her, and I certainly shall not marry for the mere sake of taking a wife. I have educated her, and I will settle such a sum on her as will make her independent of her father and mother."

He had determined on one point in this long meditation. Doris should not make her first appearance at Burneston. When she met him again there should be nothing to remind her of the girl swinging on the gate.

He went round the house, and out at the great gates, and then on beside the river till he reached the foot of the village, where another bridge, a rough one of open planks, crossed to the meadows opposite.

Joseph Sunley was leaning against one of the posts at the end of the bridge, with a very weary look on his face, but seeing Mr. Burneston, he started forward.

"Neea, neea, squire; bud if ah'd aimed ye be coomin' oop this way, mebbe ah'd hev bided atop, instead o' gien' mysel' t' clim back. My legs iz no' that strong 's they wur."

"Good-day, Joseph." Joseph had been far too much excited to remember any greeting. Were you coming to see me?"

"Weel, I wur that; an' it's summat perticler 'rt mun be spoke aboot, wivoot loss o' time nowther. T' things gans on an' on, an' gets fra bad te worse, just as a corn grows on t' fut, an' its a' fer want o' settin' streight."

Mr. Burneston felt impatient.

"Well, what is it, Joseph?" he said carelessly.

"Bon it, squire! it's nut like a nail oot o' pleeace, or a withered tree 'at sud be uprooted; mebbe in a way, 't is a withered shoot 'at sud be lopped off a healthy body; bud it's a evil 'at sud hev been stopped sooner gin ye'd been at t' Hall, Maister Burneston." He said this reproachfully.

"Well, I'm here now," the squire answered good-humoredly; "so let me hear it at once, Joseph."

"T' hearin's nowt — it's t' doin' 'at is wantin', unless ye wants te see devvel wark spread ower t' village like a curse." He shook his head, but the effort at mystery in his face weakened the effect of his words.

"Weel, Sunley, I can do nothing until I hear something." And Mr. Burneston looked impatiently towards the village.

"Well," Joseph sighed, "d' ye mind t' awd uncanny lass Prudence, wi' a crooked e'e an' yan shoulder higher 'an t' ither?"

"Oh, yes, I remember her; she's a queer body. What about her — is she dead?"

Joseph shook his head, and then looked at the squire with slight contempt; this expression was, however, transient, and it was soon lost in the sort of officious mystery with which he had at first accosted Mr. Burneston.

"Neea, neea, *sheea's*" — with much emphasis — "not deead, sike as sheea deean't dee." He held up both hands with the palms outward, his face wearing a look of abhorrence, as at some awful spectacle. "It's t' ither way wi' t' witches — they dissen't dee if they's nut called te t' reckonin' fer mischief — it's t' ithers 'at dees."

Mr. Burneston laughed. He had heard that a belief in witchcraft still lingered in the village, but secretly he was shocked to find it upheld by such a person as Joseph Sunley.

"Nonsense, Joseph, that's all very well for old women to believe, but men like you and me know better. Just because this wretched old woman has a bad temper and an ugly face, no one likes her, but this very circumstance ought to make you pity her, — a sensible man like you." He said the last words extra loud, and though Joseph still frowned, his lips relaxed at the compliment. He laid his wrinkled hand solemnly on Mr. Burneston's shoulder.

"Yer too gud te see it, sir. Parson oop at t' vicarage" — he jerked his head towards the hill — "Lord luv ye, he ain't a mossel o' sense i' t' matter; an' ah says t' him, 'Parson, ye knaws aboot ivven an' all as gans on oop ther, an' mebbe ye knaws aboot t' ither pleeace; but deean't gan for t' meddle with these yere earth matters, 'at ye knaws nowt aboot."

Mr. Burneston laughed, but he felt impatient.

"Well, Sunley, I'm going up the village" — Joseph's lips curled again — "and you can walk with me, and we'll talk this matter over. For what cause do you call poor old Dame Wrigley a witch?"

"Ye seys yes goin' thruft t' village; mebbe ye's bund te t' Church Farm? Eh! eh! an' it's Farmer Barugh 'at hev t' best reeght te call Prudence a witch."

It was so absurd to hear of such an idea being entertained by John Barugh, that Mr. Burneston laughed again, even more heartily than before.

"This is too much of a good thing, Sunley. I can't believe a man like Mr. Barugh would listen to such nonsense."

Joseph's face quivered with anger; he stopped short and raised his head stiffly, for in the uphill walk he had bent till his nose nearly touched the hand which grasped his stick.

"John Barugh's nut a feeal, Maister Burneston, an' if he feels hissel' witched he's i' t' reeght te leeak abrooad an' seea wheea't be 'at hev warked t' mischief. He hev lost tweea coos, an' there's a calf a dyin', an' he knaws, an' ah knaws, it's t' awd divvelskin's withered 'em fer spite."

Mr. Burneston thought he began to understand; he looked very serious.

"Do you mean to inform against this

woman, Prudence Wrigley, as having poisoned Mr. Barugh's cows?"

Joseph laughed scornfully.

"Lord luv ye, ye're nowt wahser ner parson, squire. T' witch warks wivvout puzzom; sheea" — he looked cautiously up and down the hill, and then at the open doors and windows of two cottages perched on the steep green bank above the road — "bide a bit," he said, and walked on beside his companion.

A little higher up the houses stopped, giving place, on the left, to a lofty hedge on the top of the bank, and on the right to a low stone wall shutting in a paddock, in one corner of which stood a huge walnut-tree, its branches shedding gold and green leaves down into the road. In the midst of the grey wall was a large white gate, and Joseph limped quickly up to this and peered round the enclosure, to make sure that no listener was to be seen.

He then came close up to Mr. Burneston.

"If ye'll jist bend ye'r heead doon ah'll tell ye. Sik as sheea dizzent use puzzom; they's got puzzom i' t' inside on 'em. They gans an' gets a coo's heart — ah knaws Prudence did — an' they sticks it wi' pins, an' they buries it, an' they seys a damnable rhyme, an' in three days t' ither coo's deead as mutton; an' when they cuts t' poor beast open its heart's withered leeake a bit o' skin an' full o' small holes. So noo ye kens," he added triumphantly.

Mr. Burneston looked shocked and incredulous. "I tell you what, Joseph," he said earnestly, "you are about the oldest man in the village, and till now I have thought you one of the wisest. I tell you the thing's impossible; even if the poor creature thinks herself a witch, she can do nothing; she is most likely crazy, and you will drive her quite mad if you spread this ridiculous nonsense about the village, and I tell you, as a magistrate, I shall interfere to protect this woman, if I find any one molesting her."

He spoke severely, for Joseph's eyes were gleaming with a decidedly cruel expression.

They had just reached the top of the hill, and Mr. Burneston turned to the farmyard gate.

The action roused Joseph's jealousy and completely upset his self-control.

"An' ah seys 'tis magistrate's bounden dooty te stop t' witch's mischief, an' nobbut t' draw blood ill do't. Eh, an' if they 'at sud do it weean't do't, then it mun be done best way it can."

But Mr. Burneston paid no heed to this outburst; he pushed open the white gate and went on to the rick-yard, leaving Joseph trembling with passion in the middle of the road.

John Barugh's tall, erect figure and massive red beard made him look like one of his stalwart Danish forefathers, as he stood against the light, contemplating the last of his newly-made ricks with some satisfaction, for there had been an exceptionally good harvest; but this satisfaction was soon over; his thoughts went back to their favorite subject of contemplation — his daughter Doris. He was growing very restless to see her. He had given a sad, unwilling consent to the separation; but then it was only to be for three years. At the end of that time Doris had herself asked for two years longer, and her father had not found himself able to refuse consent. "Ah war a feeal te let her gan," he said bitterly; "bud yance a feeal ah mun gan on wi' t' folly."

He had never forgiven Mr. Burneston for having as it were cheated his consent out of him, for he knew that if the request had been made to him alone he should have refused it. But Dorothy had been present, and had sided entirely with the squire, and as, except where marriage means complete union, husbands and wives seldom like others equally, John was conscious of a contradictory feeling towards his landlord, whom Dorothy held up as a model of perfection. The sight of Mr. Burneston always recalled to him his own weakness in yielding up his better judgment, and he felt constrained and ill at ease when they met.

He was stiff now in returning the squire's greeting.

"Ah war thinkin' of comin' awa' te speeak wi' you, Maister Burneston," he said coldly.

Mr. Burneston smiled.

"I dare say I am come about the same business. At least I fancied you would be going to fetch your daughter home, and I thought it would be better that she should not come back here at first."

The same thought had come to the father, and yet he felt irritated.

"Ah deean't see wheea not," he said, sullenly turning one shoulder awkwardly towards his visitor.

"Now, if Doris is what I hope and expect," said Mr. Burneston to himself, "she will not like this kind of behavior."

A slight flush rose to his face.

"Well, Mr. Barugh, you must of course do as you please, but I was thinking of

Doris. It seems to me in many ways pleasanter that your reunion should not take place in the midst of your neighbors. Mrs. Barugh said last time I was here that George was flagging again, and I thought of taking a cottage near Steersley, where you could be all to yourselves for a time."

John looked taller and prouder than ever.

"Ah'm obleeged, Maister Burneston, an' 'at's what ah'm nut fond o' bein' te onny man. Gin ah wants a cottage at Steersley, ah'll get it mysel' wivout troublin' ye, sir. It wur aboot summat else 'at ah wur comin' awa' te t' Hall.

Mr. Burneston had grown fiery red, but he saw that remonstrance would provoke a quarrel.

"Ah wur comin'," said John, squaring his shoulders and stuffing his hands to the bottom of his pockets, "te speaak aboot t' uncanny awd lass, Prudence Wrigley."

"Let her be," said Mr. Burneston. "For heaven's sake don't you join with that cruel old man opposite against the poor creature."

John gave a derisive smile; he could not control his irritation.

"Sheea's getten ye too, hev sheea, squire, as weel as parson? Weel, Satan's a cute chap, seear eneeaf, he knaws how te set his limbs te wark; bud mark ye this, gin ah lose t'other coo — sheea's been sick sin t' mornin' — ah diz this, ah takes mah biggest cart-whip an' ah slashes t' owd divvel's feeace across till t' blood spirts, 'tis t' only cure," he said calmly.

"No, you won't," Burneston said earnestly; "you're too much of a man to strike a woman; now mayn't I come in?" He put his hand on the farmer's arm. "I want to have a talk with George. I envy you that lad, Mr. Barugh. I wish Ralph would take after him."

CHAPTER IV.

COMING HOME.

DORIS, in whom the hopes of both these men were so firmly centred, was looking forward to her new life at home, so near at hand, with keen interest, and at the same time with much shrinking.

It was a definite sign of the change wrought in her by culture, that she now shrank more from daily intercourse with her mother's artificial attempts at gentility, which, though really softened since Dorothy had lived George's life instead of her own, still lived in a somewhat exaggerated form in the letters which she sent to her daughter. Doris had no shrinking from her father's roughness. She found full sympathy in his simplicity, and his perfect truth — for she saw that he never hid his opinions even when they clashed decidedly with her own.

"I shall get on with father, but then I always did, and mother is so kind that I must try not to get vexed with her. George is the one who puzzles me, he seems to have grown downright unreasonable. Rica is right when she says an invalid is sure to be full of fancies."

Her face was full of wounded feeling. Next to her father she loved George better than she loved any one, and though Doris was free from petty conceit, still school-life had taught her that she was some one who had a right to expect deference, and affection too, from her companions. Of the last she had had far more offered than she could possibly accept, and her dislike to demonstrative affection had given to her manner a slight haughtiness with most of her companions.

It has been said that the schoolmistress at Pelican House did not trouble herself about the inner life of her pupils, but she had a rapid perception of outward manner. She saw this haughtiness in Doris, and did not attempt to check it. She foresaw a brilliant future for this beautiful, well-mannered girl, and when she saw Doris walk away from some gushing schoolfellow, with her head rather higher than usual, Miss Phillimore smiled and thought, "She is learning to govern others," and probably, to use the language of the outside world, manner is one of the great essentials of a successful ruler.

There was another quality in Doris, to which even Miss Phillimore submitted without being aware that it had a far deeper source of life than could have been supplied to it at Pelican House.

Spite of this occasional haughtiness, at times almost *brusquerie* — spite of the quiet, unimpulsive manner which was sometimes called reserve, and sometimes a singular self-control, there was in Doris an irresistible fascination — the more difficult to strive against, because as it was never assumed or visibly put forth, there was nothing tangible to resist. Her smile was delightful, it seemed so heartfelt, and as it spread over her lovely face, irradiating the delicate skin and exquisitely perfect features, no one could stop to realize the strong power of will, that in this charming form drew all hearts to itself, and its own way of seeing things.

She was far more conscious of her sway

than strong-willed people often are, but she attributed this chiefly to her surroundings.

"You say I shall be so happy," she said to her friend on the last morning; "in some ways no doubt I shall be, but life will not be so peaceful at home as it is here. You are the only person in this house who ever finds fault with me."

They were to leave Pelican House together, and to say good-bye at the railway station, where their respective fathers would meet them; and now in the hour that must elapse before starting they were together in the schoolroom.

"Doris" — Rica stopped suddenly, and turned round to face her friend — "do you want to stagnate, or to grow into a grand Turk? for you must do one or other, perhaps both, if you're not contradicted. People who are never contradicted are odious. Besides, it is an incomprehensible idea that you, who are always wanting to get cleverer and cleverer, should be content to stand still. Don't disappoint me, Doris, in these last moments; I can't bear it."

Doris laughed, for Rica's vehemence had brought bright color rushing to her cheeks, and her eyes had grown dark with excitement. "You torrent," Doris said, "you put me in mind of a volcano. You go about for days dreaming in a kind of black or brown study, and then suddenly you pour out a stream of glowing, burning words that scorches one."

"Well" — Rica looked ashamed of herself — "I really am going to be matter-of-fact for the rest of my days. I mean that — stop, I'm going to give you a bit of my father, I have not wit enough to grow such ideas — well, I mean that life goes on, and we must go on along with it. We may shut our eyes and let ourselves be carried; that is stagnation according to my ideas; if not, we are always learning and being acted upon by what we learn. In all conscience you've done enough with book-learning; you've got enough to last you for life if you keep it bright. Well, then, now you've got to learn life from real people; and nothing will teach you that and yourself, too, as contradiction will."

"How do you mean teach me myself? A girl must be stupid who does not understand herself."

"I know, so it seems to me; and when I said so to my father he laughed, and said I wanted a lantern."

"But, Rica," — the subject of self-knowledge did not interest Doris; she had a great dislike to sermons, and she thought this sounded like a fragment from Mr. Masham's pulpit — "you are unjust, and also not quite true."

"What do you mean?" in a very impetuous voice.

"I mean, that if people don't agree with me I am always content to let them go on in the wrong so long as they leave me in peace; live and let live, is my motto, but you are never happy till you have persuaded people to agree with you."

"You see" — Rica stood thinking — "I'm not proud; and perhaps though you are such an angel, you are a trifle proud. Now give me a good kiss, Doris, to wipe out this argument. We can't afford to argue on our last day."

Then, as they stood a moment, with moistened eyes, and circled by each other's arms,—

"And you will really give my love to George, and make him fond of me. My heart is quite ready to take in a fifth brother."

"Thank you;" then, with most unusual impulse, for the coming change in her life had shaken Doris out of all restraint, "What a loving heart you have, Rica! I believe you love my father, and mother, and George as much as I love them myself, and I seem to love your people so little, though you talk of them so much."

"That's because I'm a chatterbox."

They walked up and down silently after this. Doris's thoughts soon left her friend to picture life at home, and its difficulties; while Rica, who in the glamor of her intense friendship could not really see a fault in her companion, was saddened out of any looking forward beyond the coming sharpness of separation.

And meantime, in a pretty cottage covered with scarlet leaves, Mrs. Barugh had been busy for the last fortnight making preparations to receive her daughter. Dorothy had at once seen the wisdom of Mr. Burneston's suggestions, and by means of George's health, always better away from Burneston, she had worried her husband into consent. Probably the victory had been made easy to her by Doris, who, when informed of the idea, wrote at once to say she preferred to return to Steersley instead of to Burneston.

It was late afternoon, and Mrs. Barugh stood looking at the neatly-spread tea-table with a nervous, dissatisfied face.

"I doubt about Doris liking to eat her tea in the room we sits in," she said fretfully, "she'll have been used to a proper drawing-room."

George was sitting at a little side-table reading out of the red and gold book Rose had given him, and which had become his favorite companion. He looked up with a smile on his pale face, for he too was tired. He had been trying to carry out some of his mother's constantly changing ideas of preparation through the morning, without being able to satisfy her over-wrought notions of that which was fit for Doris.

"Mother, ye'll be so weary. Ye'll not be able to look at Doris when she cooms here."

He rose up, and going to her, kissed away the frown that was gathering on her face and put her in an easy-chair.

"Coom, mother, ye have to do as ah tells you now father's away, an' ye mun do as e're bid, ye know."

George had lost much broadness of dialect, but his accent was still broad, and specially to-day, for he felt greatly moved at the near prospect of seeing Doris.

His mother sighed.

"She'll think us far beneath her, poor girl. She'll not care for you, George, if ye speak so broad and common," she sighed. "I wish ye'd speak more like me."

"Nivver fear, mother." His smile brought into his face a strange likeness to Doris, it was so winning. "Ye're a bit upset now, an' so cann't see things rightly. She cann't help lovin' us, ye know, for we're her own. Nay, nay, mother, if ye'd try and read Rose's book, ye'd see these things clearer; ye'd see it's not worth while to worrit so much aboot this life after all."

"It's all very well, George." She could not keep the irritable tone out of her voice. "Ye're very good, an' all that, but ye're not real; them things reads well in books, but they don't do for life."

"Now, mother," he patted her shoulders lovingly, "you carry out what t' book says yourself; ye've spent all your time an' thought on the bedroom an' t' sittin'-room Doris is to hev; but as to t' passage, beyond 'at it's clean an' orderly, ye've took no thowt about it. Now life's our passage, an' t' rooms is t' place we're getting ready for us in heaven. So you see t' book 's reet after all."

Dorothy did not answer, and George thought she was pondering his idea; but all at once she started up with a scared look in her eyes.

"They're comin', lad; they're comin'. Don't ye' hear the wheels? An' my cap not changed." She ran away up-stairs, while George felt as suddenly taken by surprise as if he had not been schooling himself for days past for the meeting with Doris.

CHAPTER V.

SYMPATHIES.

"How small — how very small it all is! and how my mother stoops!"

Doris looked round the small square room with its low ceiling, cheap white curtains, and commonplace furnishings, almost before she looked at its occupants.

Her mother and George had received her at the door, and she had returned their hearty kisses warmly; and now came that lull which with English people is apt to succeed any unusual outburst of affection, as if we want to give emotion time to subside into an equable flow of feeling. The silence was broken by the father, usually the least talkative member of the Barugh family. He had stood gazing at Doris; now he said suddenly, —

"Wheea, George, lad, thee's as glum as a deearnail. Ain't thee fain te see Doris?"

"Aye, fayther," he smiled, and limped nearer the chair where his sister sat, looking at her with loving admiration.

Doris did not want to speak. She would have liked to sit quietly taking in all these new impressions, but her own sense of good-breeding and this appeal roused her. At present she felt too much a stranger for affection.

"How you have grown, George!" She looked up at the tall, slender lad; he was paler even than usual; his brown eyes were full of feeling as he smiled in his sister's lovely face.

All the repulsion he had fancied, all the coldness he had feared his manner would betray, had melted in the genuine delight of her presence. He had imagined he should see an artificial, stiff, grandly-dressed young lady, and here instead was a lovely, simple girl smiling at him as if she were quite at her ease.

"D'ye find him altered, my dear?" Mrs. Barugh spoke to her daughter with great respect, pulling nervously at her cap-strings; though she had paid for the clothes Doris wore, Miss Phillimore had chosen them, and the make of the girl's gown, the set of her shawl, and the style of her simple straw bonnet impressed Dorothy's mind at once. "John's right; she's like a born lady," she said to herself.

Doris looked earnestly at George's brown eyes still bent on her face.

"Yes, he is altered," she said gravely;

"he looks so much older" — then turning to her mother — "and you are altered too, mother," she said, with her sweet, rare smile, "but you look younger than I could have expected."

The tinge of color that rose in Dorothy's cheeks made the likeness between herself and her daughter very perceptible.

"That's just what Mr. Burneston remarked yesterday," she said in a fluttered voice; "he said ——"

"Bother Maister Burneston," said John good-humoredly. "We'll hev t' rest o' 'teeal presently — t' lass 'll need t' gan oop-steers an' fettle hersel'."

Doris sat down in a chair near her bedroom window. She saw how small everything was, and that the ceiling was very low, but she never glanced at the little details about the room, at which Mrs. Barugh and George had worked so hard.

"How different things are from what one expects!" she said. "I thought mother would vex me, and that father and I should get on well; and now it's father's way of speaking that vexes me, and this little ugly house. I feel as if I must stifle in such small, poky rooms. Mother looks nice if she wouldn't stoop, and George looks like a gentleman — somehow I feel timid with George. But it's too soon to judge fairly of anything, and it *is* nice to be like Rica, and have people of one's own to love one."

Doris's notions of the outside world were somewhat vague. Twice a year there were parties at Pelican House, and in these she had danced with, and had been spoken to, by "grown-up" gentlemen and ladies, for every one was attracted by Miss Phillimore's "lovely pupil," who never seemed the worse for the notice she excited. Then at church she saw many people, and in the long summer holidays Miss Phillimore had taken her sometimes to Cromer, sometimes to Broadstairs, and Doris had found friends everywhere. She never sought them. Her proud northern nature shrank from any deception, and she felt that with strangers she was a deception, and that if they could see her in her home surroundings, with her mother in place of Miss Phillimore, these refined acquaintances would not care about her.

There was no outspoken confidence between Doris and her schoolmistress about her home or her parents. Miss Phillimore had asked no questions and made no comments — even on John Barugh's broad accent — for she saw him once or twice; and so the girl's natural reserve had deepened and strengthened. Till Rica Masham came to school, Doris had not opened her heart to any one — even to Rica she merely said her father was a Yorkshire farmer. She had tried to forget her surmise that Mr. Burneston had been the means of sending her to so good a school. The feeling of obligation was galling to Doris, but it came back now; and she wondered how her father could ever have brought himself to submit to it.

"Well, perhaps it is a way landlords have." She roused herself to take off her bonnet and smooth her hair — for she now wore it smoothly brushed behind the little ears that blushed like a delicate sea-shell — it would not lie flat, there was a lovely ripple on the silken masses, especially over the creamy temples, where a blue vein showed through the tender skin. "George said, when he wrote about Rose, that Mr. Burneston was going to pay half her schooling; but Rose and I are different." Then, after a pause, "Perhaps father's richer than I thought, and took nothing but advice from Mr. Burneston."

Doris came into the room below, and the sight of the tea-table gave her a fresh shock — she had forgotten the old home customs — it was piled with cakes of all kinds, besides cold ham and fowls, and a huge pie. She looked at the plateful her father carved for her, and pushed it gently away.

"I can't eat half this, father; indeed I can't," she said.

"Nivver fash theesel', my lass," John said. He was so happy that he was almost frolicsome this evening. "Eat it or lay't back, it's all yan, bless thee; thee's safe to be reeght."

George said little; he was studying Doris, and wondering whether she would like Rose. He always felt better in health away from Burneston, but it had been a sacrifice to give up Rose's visits, though lately she had been visiting some of her schoolfellows, and he had seen little of her.

John Barugh noticed the lad's silence, and the wistful looks he cast at Doris; and, though he grudged to lose a moment of his darling, he understood George's feelings.

"Dorothy," he said when the meal was over, and the smart little maid had cleared the table, "coom awa. Ah'se summat fer thee." Then in the kitchen he added, "T' lad's fleyed. He weean't speeak te Doris while ther's nobbut him an' her aleean. Coom, mah lass, ah'se brought ye a fairin' frae Lunnon."

It was true; false shame or perhaps

strength of feeling, had kept George dumb. As soon as his father and mother had departed his shyness fled. He limped across the room and took a chair beside his sister.

"I'm afraid" — he spoke much less broadly now; his intercourse with Mr. Burneston and with Rose had rubbed away some of his accent, while his reading had changed the old idioms of his forefathers into a nearer approach to standard English — "I'm afraid," he repeated, "that at first ye'll find us rough an' unlike what ye've been used to."

"Yes, it's very different." Then, with an effort, "But then you are my own people, and it is so lonely to live among strangers."

George raised his eyebrows, and his young face looked almost stern.

"Then why did ye stay on so much longer than was thought of?"

"Ah, that was different. I had got used to the loneliness, and I felt that if I came away at the time that had been fixed, I should be only half taught; my learning and music would have been of no use; I should most likely have given them up."

"You would nivver give up readin'."

"Oh no; every one must read, but reading is not all. I suppose any one can read, whether educated or not," she said, loftily.

George felt humbled, and the old distance seemed to rise between him and Doris. He had grown to consider reading a high acquirement, because it was the only means of culture that came within his reach; and besides this, his reading had taught him the meaning of some of his own feelings. In these years of separation from Doris he had often blamed himself for their disputes, or rather silent estrangements, for they both felt too deeply to get their grievances readily into words. Now this pitiless speech, which he exonerated Doris from meaning unkindly, carried him back to childish days, and revealed the root of the want of sympathy between them.

"No, it's not all," — he made an effort to smile — "but it is a good deal to a chap that has to keep quiet most of his time, Doris."

"Yes; I was not thinking of you when I spoke," said Doris simply.

She had had no intention to wound; she was so accustomed to look at everything from her own point of view that it could not occur to her to study the feelings of others; and this manifest ignorance restored George's balance.

"School don't teach everything, I see," he thought, looking admiringly at his beautiful sister, "or may be my notion of a lady ain't t' right 'un; an' yet there's Mr. Burneston, he quite sorts wiv all I fancy; he's good an' gentle an' 'refined,' as mother calls it; he's proper an' kind too, but he nivver speaks a word 'at 'll mak' a lad feel sore when he's out at door; instid mah heart seems to gan after him."

"D'ye mind t' squire, lass?" he said presently.

Doris had gone up to a little bookshelf, and was reading the names on the backs of George's favorites. She did not turn her head; she felt her cheeks had grown red at the words.

"Yes, of course I do; he used often to come to the farm, you know; he's not altered much, I expect." And as she spoke, really and vividly came into her mind that meeting at the gate, and the foolish rhyme which during her school-life, and the complete severance from home scenes, had grown vague, and when recalled had made her wonder why it had so greatly troubled her. Now she seemed to see the golden-starred meadow, and the white parsonage house nestling down below it, and she said over to herself the words, —

> May it so happen, and may it so fall,
> I may be lady of Burneston Hall.

George laughed loudly, and Doris started and cried out. The reality of it all seemed to scorch her, and she turned round suddenly so as to break away from the vision which had effaced present surroundings.

"Eh, lass, did I fley ye?" He got up, and, limping towards her, laid his hand gently on her shoulder. "Why, I'se sorry, Doris, ye looks real skeeared; sit ye down, lass, on t' squab. I laffed t' see ye potterin' at t' old books. D'ye know aught o' this 'n?" And he pulled Rose's well-read gift from under the squab-cushion and gave it to his sister.

"'Pilgrim's Progress.'" Doris turned over a few pages, and then gaped a little. "I've heard of it, but I don't think I ought to read it, George. Miss Phillimore told us never to read 'Don Quixote,' or 'Pilgrim's Progress,' or 'Vicar of Wakefield.' She said they were common books, quite unsuited to girls."

George's lips curled. "Well, so is Shakespeare an' t' Bible, an' yet they'se not common. If ye choose t' read the Pilgrim, I'll mark ye what t' read; an' ye'll hev a real loss wivout, Doris. It's as full o' wisdom as a pudden is of plums.

Maybe it wad help ye; it hev me, oft an' again."

"Help me!" Her delicate eyebrows curved in wonder, but she was not ruffled by her brother's bluntness. "I fancy one must always get help from superiors, and John Bunyan was an ignorant man."

There was a silence.

"This isn't the old piano." Doris went up to a small pianoforte at the end of the room and opened it; then her eyes glistened. "Oh, how very kind of father! Has he really bought this for me?"

She touched a few notes carelessly, and a bright flush stole into the boy's pale face. He limped up to her, put his arm round her neck, and kissed her.

"Sing me a song, honey," he said tenderly; "ye could sing like a lark when ye were a little lass."

CHAPTER VI.

DORIS'S WALK.

THE beauty of the dales round Steersley, and the picturesque little town itself delighted Doris; in the fresh glow of reunion and the novelty of all around, she lost the stiffness which the first strangeness had created.

"Thee's ma ain lass, after all, 'at ah thouwt ah'd nivver see again," said John Barugh on the third morning after her arrival. "Ah war reet afeared o' thee, lass, at first, thee war as set-oop as a duchess."

Doris looked at him gravely.

"Only shy, father, I think; you see you were all used to one another, and I was the only stranger."

"Weel, weel," he patted her soft hair with his broad red hand, "'t war t' sangs, lass, t' sangs hev put new life into me an' George."

And it seemed as if the magic power of her music had melted reserve and distance between the brother and sister. Doris did not yet know how to talk to George so as to win his confidence, but she had found out how to please him and her parents too, and the three sat entranced while she sang song after song, or played little snatches of Mozart or Beethoven.

Her chief longing in these first days was to get out of doors, and her father had gone with her in her walks. George tired so soon, and Mrs. Barugh never walked farther than to church and back: spite of the tiny house and the clever little maid, the notable Dorothy always had something to do indoors.

John Barugh had walked out twice with Doris, swelling with pride as he crossed the square market-place with its old pump in the midst, and saw the landlord of the Black Eagle come to his door, which faced the said market-place, to look after the fair creature walking beside her father; but on the fourth day John departed for Burneston without trusting himself to any leave-taking.

"Tak tent o' mah lass," he said to Dorothy, "an' see sheea deeant want nowt, but, mind ye, mah lass, no visitors." He said this stubbornly, and got into his dog-cart and went back to his farm.

Mrs. Barugh had gone down to the gate with her husband, and now, instead of going back into the little sitting-room, where Doris and George were reading, she turned into the room they dined in, on the other side of the passage.

"My word, one would think Doris was more John's nor mine, he seems to set more store by her than by any one else." She went up to the small, gaudily-framed looking-glass and settled her cap. "I suppose it's natural; she calls to his mind, poor fellow, what I was twenty years ago." She gave another look in the glass, and a little sigh escaped her. "Ah dear! I little thought then to take up with a man that couldn't speak English. Perhaps Doris'll improve him — though somehow I don't think she'll bide long with us."

Mrs. Barugh went off into a reverie on the subject nearest her heart, — a subject so sternly forbidden by her husband on the occasions when she had ventured to hint at it, that Dorothy had grown to consider it almost criminal, and seldom now spoke of Mr. Burneston lest she should say more than she intended.

"It's all a pack o' nonsense o' John," she said at last, pinching and pulling her large worked muslin collar to make it sit more like those worn by Doris. "Such a face and such a figure as she's got would ha' made her look like a lady anyway, and now she can play and sing and talk as she do — I ask where's the hindrance? John's a good husband, but he's a fool in some ways, he's clivver too, an' he ought to know where a woman's wit comes in useful; ah, if he'd just let me manage, I'd soon see the squire courtin' our lass."

She shrugged her shoulders impatiently, she hated to be forbidden anything, but to be forbidden to ask Mr. Burneston to come to the cottage was insupportable.

"Mother, I want father." Mrs. Barugh started. There was Doris standing in the doorway. "I'm going to walk alongside the river we crossed yesterday, there's

beautiful country down in the valley. Where is father, perhaps he'll like a walk?"

"Why, child, how you scared me! Your father's gone back to Burneston, he's wanted there. Why, my dear, he's taken a longer holiday than he's took for many a year, all along of you."

"It was very kind of him," she said, and she went up-stairs.

She had grown used to her father's broad speech, and his great kindness had touched her deeply, but there was a certain sense of freedom in his absence. The tiny house oppressed her, and so did her mother's quiet commonplace talk. George was interesting, but he gave her much food for reflection, and the complete change in her life had caused, after the first excitement awakened by it, a powerful reaction and a longing for space in which to dream as she had dreamed till Rica came to Pelican House.

There was this distinction between Doris's craving for solitude and that of a more imaginative dreamer, out of whose reveries creations are evolved — she only wanted to digest and consider this new life. It seemed to her that she was a woman now, and she must plan her future, as when at school she had planned her return home and its consequences. This was over, and home was on the whole more satisfactory than she had expected, her mother was so much quieter, and George was so superior to her remembrance of him; but yet it seemed to her that all was not over. Some day they would have to go back to Burneston, and what would life be like then? Must she always be content to live alone at home? for she could not associate with the village people. As she looked forward to this part of her future, she saw that there lay the sting of the difference between herself and her family. Her mother and George spoke with delight of Mr. Burneston's visits, and she could not endure the prospect of seeing him. Doubtless there would be a charm in listening to his refined talk, and in the sympathy she would find in him; but it would be too galling to be visited as an inferior, and how else could Mr. Burneston regard her? She turned gladly from this thought to the picture she was occupied in painting of her own future usefulness. She meant to seek out poor ignorant girls and teach them to refine themselves, to make them give up the taste for smart cheap finery which she remarked in Steersley, and imitate her own simple ways; also she would teach them to think less of lovers; it was so very absurd that a man almost a stranger should claim all the thoughts of a woman, and make her forgetful and careless even of her parents. This last idea had been created by George, who argued that the first duty of a woman was to become devoted to one man.

Many of these thoughts haunted Doris as she tied her bonnet strings and came slowly down-stairs.

"Doris, love," — her mother came out into the passage and spoke timidly; she was not nearly so much at her ease with her beautiful child as clumsy simple old John was, — "it's best not to go far off, unless the father's with ye, my dear. This isn't Burneston, where all the folks know ye; we're strangers here."

"Mother," the girl held her head very proudly, "what's the use of trying to be different to what I am? If there's no one to walk with, I must walk alone. I suppose other farmers' daughters have to do it. I shall be ill if you coop me up indoors. You would be far better yourself if you got more air and exercise, and so would George." Then seeing the look of timid dismay on her mother's pale face, she added gently, "Will you come a little way with me now?"

Poor Dorothy was so touched and flattered by this request, that, almost involuntarily, she kissed her daughter.

"I'd like it of all things, my dear, and maybe another day I'll manage it; but George's heart is set on apple-pie to-day, and as to trusting Harriet to make it alone, I'd liefer go without, — 't would be leather or chips, and maybe burned as well. You needn't look so troubled, Doris. Indeed, my dear, I don't do kitchen work, your father couldn't abide it, let alone that I was never brought up to anything dirty; but standing over piecrust is a thing that not even a lady need look down on, so I tell you." Her cheeks flushed as she ended. Doris smiled and went down to the gate. "Good-bye, mother," she nodded, and it seemed to her that in that little outburst her mother had been more real, more like the fretful woman she remembered, than she had seen her since her own return home.

"There is really nothing to be ashamed of in my present life except that I am idle," the girl thought. She tried to be dispassionate, and to look at the whole matter as if she herself were detached from it. "I don't think I'm ashamed of any of them; if I had not been to school I shouldn't have known any difference, I

suppose. Then, if I hadn't been I should have lost, oh, how much! Why, I had no more perception of things than a dog or a cat has! I enjoyed nothing but puddings and new frocks. At school I was always looking forward. Well, then, there must be a want of some kind in life, so perhaps in time I may feel satisfied."

There was a stern contraction in the delicate eyebrows, a firm compression in the exquisitely-curved lips, which told that the prospect of her future life gave Doris deeper anxiety than she would acknowledge. But her mind was too strong to indulge in repining, and she looked round to enjoy the exquisite country she delighted in.

Behind the two old-fashioned inns, with their quaint signs, the square-towered church stood at the corner of three roads; on the right was the highroad on which she had walked with her father; the path which ran up past the church followed the course of the little beck for some way, and then divided, and broadened on the left into another highroad, which went northward, leading on the right through a gate into pleasant-looking meadows.

Doris stopped a red-headed boy at the gate, and made out from him as well as she could her way to Steersdale; she had heard of it in her yesterday's walk, and had resolved to see it without delay. A fresh breeze blew her hair into her eyes as she climbed up the steep meadow which rose in a long green hill on the right. She paused for breath, before her was the wood the boy had spoken of, rising from a stretch of intervening waste grown over with brown gorse and dark orange brake and long red bramble arms. The wood was bordered by oak-trees which, though set some way apart, stretched their branches till one met the other. Doris soon crossed the waste, and when she reached the shade of the oak-trees she looked back across the broad stretch of waste.

The tower and roof of the church, with its belt of poplar-trees, gave some token of a village, but the houses lay hidden in the valley from which she had climbed, and only betrayed their whereabouts by wreaths of blue smoke, which blew this way and that as the breeze reached them. In the background lines of pine-trees stretched east and west, and above the dark trees rose the top of the hill, on the right glowing with golden corn, and on the left purple with a stretch of heathy moorland; far as her eye could reach, rose interminable trees, veils of grey mist showing here and there where the dales came between the wooded hills. These soft mists varied in hue according to distance, and at times seemed to melt into the skyline. Doris sighed with the fulness of peace such a scene brings, and then as her eyes fell on the foreground on each side of the waste — a foreground of emerald-green meadows, and fat yellowing turnip-fields — she turned and resumed her journey.

Her road lay through the wood, and this was suffused with green light, for the trees within it were planted closely, and the thin branches intermingled overhead; but soon the light grew whiter, and she found a small gate leading into the highroad. Crossing this, she passed through another gate into a lane with grassed banks and hedges gay with honeysuckle. Except these flowers, which made the air sweet around her, and the clumsy buzz of a humble-bee blundering in and out of the heavy-laden blossoms, there was no sign of life near; there might have been cows in the fields on either hand, but the hedges were too thick to see through. The perfect solitude was delightful to Doris; she wanted to think about George, especially about his manner on the previous evening.

Her mother had spoken of Rose Duncombe, and Doris had answered coldly. She had never liked Rose, and one of the resolutions she had made at Pelican House was, that she would not associate with this girl. As she answered her mother she looked at George, and his expression of sudden anger puzzled her.

She walked on, her eyes bent on the ground, striving to puzzle out the meaning of the vexation in her brother's face, but after her usual fashion, simply from her own point of view. All at once a bright flush flew over her cheeks, her eyes grew brilliant with indignation, and she gave a little stamp as she walked.

"It sha'n't be. It can't be. If George were to marry a girl like that, I could have nothing to do with him. She's not good enough for him — she can't be. Oh, it can't be! He only cares for her for old acquaintance' sake."

A stile which she had been told to cross stopped her, and she looked round to be sure that her landmarks were correct. Yes, there in front was a meadow rising into a green hill, and at the top, on the left, she saw smoke curling upwards from the farmhouse, which she knew must be lying under the shoulder of the hill; but her way lay slightly to the right, over the hilltop. Here were black-faced sheep

nibbling busily, and every moment a faint tinkle came from a bell among them. A girl in a lilac frock and a sun-bonnet of the same color was coming slowly down the hill path, leading by the hand a tiny copy of herself; the tiny child lagged behind at the end of its sister's long thin arm.

"Nance," the little voice said fretfully, "ah'se sare weary." Then as her sister went on with her head bent, taking no heed of her, the child spoke angrily, "Thee taks nae gaun o' what ah says, Nance."

"Hod thee gab," said Nance, sententiously, and she went on silently as before.

Doris looked after the children, and an expression of uneasiness crossed her face.

"I was like that girl once," she said, "exactly like her. I never had charge of George, but I remember how I used to vex him by my silent dreamy ways; but when we played or talked we used to quarrel; surely silence was better than quarrelling, and it is almost the same now. George is good, very good, much better than I shall ever be or should care to be, but he and I cannot see things with the same eyes." She paused for a while, but the thought kept its place. "Well, Rica and I seldom agreed, but we never quarrelled; but then Rica can argue so well about things. She has seen and heard so much more than George has, she can give new light on subjects. Rica is so bright and original, and then she never broods over things, one knows exactly what she means. I did not know how much I cared for Rica till I came home."

She sighed deeply. At Pelican House she had felt herself Rica's equal, in some ways her superior; but now she asked which was real, her present estimate of her own position or the Doris she had seemed to be at Pelican House; the well-dressed, looked-up-to young lady, whose notice was sought by all her schoolfellows.

"I cannot ask Rica to come and see me," she said mournfully. "She is poor, poorer than we are, no doubt, and poverty seemed to be inferiority at Pelican House; but I am sure that every one who belongs to her is as refined as she is; there is no falseness about her anywhere."

Even if Rica would excuse and tolerate the roughness of her people, Doris felt that there was an insuperable obstacle to the happiness of their meeting at the farm. Sooner or later Mr. Burneston would visit them, and there would always be the chance of his meeting Rica, and Doris felt bitterly that Rica, with her home-made merino gown and her untidy careless ways, would be Mr. Burneston's equal, while she, so much better dressed, in what Miss Phillimore herself had called "such much better style," would have to behave to him as to a superior.

"Clergymen are the equals of every one," said Doris, "and these Mashams are refined people besides."

She left off thinking, and looked, with a longing for escape from these worries, at the peaceful English landscape, and at a long stretch of moorland bounded by the Hambledon Hills. In front of her lay another wood, enclosed and entered by a large white gate, and as this slammed behind her Doris wished she could shut out her worries with it. This solitude, for which she had longed, had brought torment instead of soothing to her.

It was a very different wood to the oak copse. Tall ash and beech trees sent out such massive roots across the track that she had to walk heedfully. A rushing sound close by told her she had at last reached the river, and now the path which had been winding in and out among the trees turned abruptly and began to descend, and Doris saw through the tree-trunks on her right that she was near the edge of the bank overhanging the stream; the sound told her how very high she was above it, but the path in front descended more and more rapidly, and she felt she should soon see the water that rushed along with so hoarse a voice below. She was too dispirited, or she might easily have broken a way through the brush-wood and clinging brambles to the edge of the ravine, but instead she went on pensively planning her future, under the new light that had come on it.

Should she give up Rica and all her upward clingings, and try to content herself with her parents and George, and the neighbors? "I cannot, I cannot!" she said. "Why should I fling away all that I have gained so hardly? Books may keep up my learning, but they won't keep up my manners or my speaking; and I can't give up Rica; I never knew what she was to me before."

She might leave home and be a governess. More than one of Miss Phillimore's pupils had been educated with this intention. Why, even Rica herself contemplated taking such a position should need require her to do so. Doris sighed.

This was not the future she had planned, the future in which she was to influence and help others unaided. Well, could she

not as a governess influence and help the childish minds confided to her?

"I would not mind taking care of orphans" (the exquisitely-set head was proudly erect) "if I could be entire mistress; but I could not live in another person's house and adopt the ideas I found there, — no, that is not the life I have planned."

There was another future — Doris flushed angrily when the thought came; it was perhaps because this other future, viz., marriage, had a way of subtly connecting itself with Mr. Burneston, that the girl shrank with such dislike from the prospect of seeing him.

"Any way but that." She turned her head as if to shake off the idea, but to-day it clung like a burr; generally she found it easy to dismiss. For refuge she went back to the maxims of Miss Phillimore. Doris set far more store by the schoolmistress's scraps of worldly wisdom than her warm-hearted friend did.

"Rica used to laugh at Miss Phillimore; she thought her shallow and a prig, but I learned things from her that I find useful every day, little things that I never knew till she taught me. Yes, mother perhaps meant the same thing in what she used to say about getting married before I ever went to school, only" — her lip curled — "poor mother said girls shouldn't think about 'sweethearts;' and she was right, though she ought not to have talked so at my age. Miss Phillimore said more than once there was nothing so common and underbred as for a girl to think about getting a husband, or to think about love nonsense of any sort. Well, of course," she smiled, "it is absurd; no one could think of falling in love with a middle-aged man like Mr. Burneston; but I will not think about him at all."

To shake off this unwelcome puzzle she began to run down the steep path, smooth now, for the very tall trees had stopped on the brow above, and she ran on violently till she stopped herself in a green meadow into which the wood suddenly opened.

A bright tinge of color glowed on the girl's cheeks, and her eyes were glistening as she looked round for the river. The light had begun to fade down in this valley, and the evening looked later than it really was. Yes, there lay the river, dwindled to a tiny brook now and screened behind a hedge that ran along the opposite side of the narrow strip of meadow. A gap in this hedge showed a plank laid over the stream, and across this Doris found herself in the dale she had so longed to reach.

The stream went winding on along between green banks, gravel-edged, for the heat had shrunk the water; down below large stones showed green and brown through it with here and there grey projecting masses against which the stream struggled hoarsely. Ash-trees rose from the hedge beside it, a hedge backed by the ever-rising hill she had just descended, and now as she went on the sun began to set behind the wood, and the breeze rippling the water made thereon grey patches which contrasted with the reflection from the glowing sky overhead; the grassy dale broadened as she advanced, and a steeply-rising wooded bank on the left made the place a charming green valley which seemed to have no end, and through which the broadening stream might so far as eye could reach "flow on forever."

The trees looked dark and massive now, and as the sun sank and the light faded, the grass toned down from the bright emerald of its midday hue; it was wonderfully smooth, like a huge soft carpet, through which the river went on babbling, sometimes by a sudden curve making its way almost to the middle of the dale, and then again retreating to its ordinary channel on the right. It had so shrunk in some places, though the tops of the banks were a good distance apart, that the water ran along below like a silver thread. Doris grew tired of following its meanderings, and at last, when it curved and recurved like an S in the middle of the dale, she scrambled a little way down the bank, and drawing her skirt closely round her jumped four times in succession across the brook. The last jump was a wide one, and her bonnet fell off as she reached the farther side. She laughed as she replaced it; the exercise had brought back her serenity.

"What would they say at Pelican House?" she thought, but her eyes and cheeks glowed, and the breeze sent her hair straggling over her forehead. It had just occurred to Doris that she was taking a very long walk, and that her mother might grow anxious. She looked on to the end of the dale. Framed by the trees, which closed all distant view, was a man on horseback. He was not coming towards her; he seemed to be waiting for some one. "He is too far off to have seen me jump," Doris thought, "but it was foolish of me to behave so like a child;" and again a bright flush rose in her face.

From Macmillan's Magazine.

PRUSSIAN HISTORY.*

Do we ever mean to make ourselves acquainted with the modern history of Prussia and Germany? The complete change which has taken place of late years in our estimate of the Germans as politicians might reasonably lead us to consider whether their politics are not worthy to be studied. Half a century ago our estimate of the German literature and philosophy underwent a similar change. We then discovered, to use the language of an Edinburgh Reviewer, that Germany was not "a tract of country peopled only by hussars and editors of Greek plays," but that it had its poets, its critics, its thinkers and philosophers in greater excellence and abundance, for a time at least, than any other country. But when we had discovered the new German wisdom, we made without delay a serious attempt to master and assimilate it. A considerable part of the literary ability of England has been occupied during the present century with the task of interpreting German thought. After Coleridge, the earliest, and Carlyle, the most industrious, laborer in this field, how many distinguished writers have lent themselves to the work! Is it not time that our second discovery about the Germans should be put to profit as our first was? Then we discovered that "*un Allemand peut avoir de l'esprit*," but we did not even then imagine that the Germans could have any politics. With the exception of Niebuhr no German politician is ever quoted among us, and the "Life of Niebuhr" is the only elaborate biography of a German politician (later than Frederick the Great) that is known to the English public. We picture to ourselves Goethe, Schiller, Schleiermacher, Kant, Hegel, not with any background of public institutions or public affairs, but as if they moved like heavenly bodies in the empty sky. And we have had some excuse for doing so. We could hardly disregard their politics much more than the Germans seemed to do themselves. They did not tell us of great German statesmen or great German political doings unjustly neglected by us. Rather they were fond of confessing that they had no political life, or that they were not yet out of their political nonage. In their minds as in ours their philosophers and writers had a great precedence over their statesmen. Two or three years ago, when I inquired of a most accomplished German whether there were any news of the "Memoirs of Hardenberg," those very memoirs which are at last before us, he took it for granted that I must be speaking of Novalis. To be sure Novalis is usually spoken of by his *nom de plume*, but his real name was Hardenberg, and it was intrinsically so probable that I was interested in this young mystic who died — I think — at the age of twenty-eight, and so inconceivable that I could care about Prince Hardenberg, who was only first minister of Prussia at the time of the War of Liberation and for nine years afterwards, that my friend jumped to the conclusion that I had adopted an unusual way of speaking. And for an example of the consciousness of a certain political inferiority which the Germans retained not many years back, we may take Bunsen as we see him in his biography. He looks up to Arnold in politics almost as Arnold looks up to him in learning. Bunsen, the pupil of that Niebuhr who had sat at council with Stein and Hardenberg, and who surpassed Arnold in experience of public affairs even more than in historical knowledge; Bunsen, who was himself by profession a public man, feels it quite natural to look up in political questions to an English schoolmaster, and is converted to Whiggism by him! But all this is changed now. The largest and hitherto the most successful political exploit of the century has been done by the Germans. They have their Parliaments, as we have, in fact too many Parliaments; they have their great orators, and debaters, and journalists, and statesmen, and have no reason any longer to yield the precedence in politics to the most political people on earth. We cannot but recognize this fact; but is it enough to recognize it? Is it not necessary to study it? Should not our readers read and our writers write about it?

I venture to suppose that there are some among my readers who have actually little information on this subject, and may almost be instructed about it as if they were beginners. They know of course in outline the great occurrences of 1866 and 1870; but it will occur to them that successes so sudden, complete, and on so vast a scale must have been prepared by a long antecedent history. As the horrors of the French Revolution lead us when we reflect on them to examine with a new interest the last age of the old *régime* because the explanation of them must lie there, so do the successes of 1866 and

* Suggested by the "Memoirs of Prince Hardenberg," edited by Leopold von Ranke.

1870 give a new interest to the period that precedes them in German history. Our inquirer then will search that compartment of his memory in which is stored up the German history of the first half of this century. Beyond the wranglings of Bismarck with the Prussian Parliament at the beginning of the sixties, he will remember that there were certainly great disturbances in Germany in 1848. How they began and how they ended he finds it hard to say, but he feels certain that he has heard speak of a Frankfort Parliament. Beyond this what does he remember? What was happening in Germany earlier — in the forties and in the thirties? Something occurs to him about a bishopric of Jerusalem; what curious thoughts will come into one's head at times! But beyond this stretches a cloudless expanse, a perfectly empty region. "Plumb down he drops, fluttering his pennons vain," until the strong rebuff of the battle of Waterloo stops him. Of course there were some Prussians there, though it is difficult to say how or why, and every one knows that before that Napoleon won some great battles in Germany. As to the Prussians, since they have become so important now, their beating was — at Austerlitz? no, it was at Jena, certainly at Jena. And then before that there was Frederick the Great, you know. Besides this, military men occasionally mention Scharnhorst, who did something to the Prussian army; and when political economists come together they sometimes mention a man called Stein, and sometimes another man called Hardenberg, who concerned themselves with land questions.

This I suppose would be the account my reader would give of German history if he were taken by surprise. If he had a little time to prepare he would give it somewhat more arrangement and precision. He would then discover that the reforms in Prussia, those affecting both the army and the tenure of land were connected with the disaster at Jena, and that the old system which had come down from Frederick the Great was brought to an end in consequence of its failure in the contest with Napoleon, and that Scharnhorst, Stein, Hardenberg, and others were the founders of a new system which has since made the greatness of Prussia. He would also discover that Napoleon did not merely win battles in Germany, and annex territory which was afterwards recovered again, but that his victories produced a political revolution over the whole country, destroyed the empire, raised several German princes to the rank of kings, and that after his fall the old system was not restored, but a new system in many respects widely different was introduced, and in particular that this was the time of the foundation of that German Confederation which fell in 1866.

Even this meagre outline would be enough to convince our inquirer that if he would understand the transition of 1866 and 1870, he must go back to the Napoleonic age, and that in that age he must give particular attention to the transformation of Prussia, which took place after the campaign of Jena, under the direction of Stein, Hardenberg, Scharnhorst, and the rest. He will then of course consult the English authorities upon the period. He will look in Alison to see what was done by Stein and Hardenberg, and I can promise that he will meet with the most complete disappointment.

This brings us to the book before us. It seems in Germany a great event that the "Memoirs of Hardenberg" are out at last. They are out, and their editor, the illustrious Leopold von Ranke, has accompanied them with two large volumes of his own, in which not only the gaps left by the memoirs in Hardenberg's biography are filled up, but the history of Prussia from the beginning of the Revolutionary War to the War of Liberation is re-written from new documents, with all the master's well-known subtlety, and in a style which betrays no trace of the languor or garrulity of age.

But in this announcement our investigator will find a curious stumbling-block. he will say, "No, at the very outset of my inquiries I have learnt more than will allow me to believe this. The "Memoirs of Hardenberg" cannot be just published, for it is well known that they have for years past formed one of the principal sources of the history of that age. Alison draws from them more than from almost any other book, to judge by that abbreviation "Hard.," which is almost invariably to be found at the side of his pages when they treat of German affairs." Indeed it is a remarkable fact that for years past while the Germans have been waiting for the appearance of these memoirs, and conjecturing what they would be found to contain, English and French students have been in happy and contented enjoyment of them. Perhaps this is the reason why, as we hear, there is no market here for Von Ranke's book. Any how it is certain that for years past if you asked the librarian at the Athenæum Club for "Hardenberg's

Memoirs," he would place before you without hesitation a book in thirteen volumes written in French, and entitled "*Mémoires tirées des Papiers d'un Homme d Etat*," of which the catalogue declared Hardenberg to be the author. It is certain that not Alison only but most other writers on that period both in England and France have used this work freely, nay for German affairs, more freely than any other book, and generally as the work of Hardenberg. Especially the first two volumes, which profess to explain the causes of the first coalition against revolutionary France, have mainly contributed to form the current opinion on the subject; and the book is a forgery!

The fact is that this book has the great advantage of being in French, and that some of these writers would have been compelled to remain in ignorance of German affairs altogether if the knowledge had had to be sought in German books. And yet there was a certain difficulty in writing the history of the Napoleonic age without any of this knowledge. In these circumstances the belief that one of the most conspicuous and necessarily best-informed German statesmen of the period had written his memoirs in French, and that these memoirs had been published, was too consoling and precious to be parted with. Yet it is somewhat difficult to understand how they can have entertained the belief in good faith. On a closer inspection we find that at least one of them actually did not. Alison, who, as we have said, is so lavish of his "Hard.," actually has the following note, which perhaps few of those who consult his voluminous work remark. After declaring himself happy to agree with "the able and candid Prussian statesman who concluded the treaty of Basle," and introducing a quotation from the "*Mémoires*," etc., with the words "says Prince Hardenberg," he remarks on the next page, "These able memoirs, *though written by the Count d'Allonville*, were compiled from Prince Hardenberg's papers" (vol. ii. p. 926). Now even if it were true, as Alison supposes, that there was reason for regarding the memoirs as founded upon the papers of Hardenberg, it is surely unjustifiable, and betrays a very lax historical conscience, to refer to them habitually, without qualification of any kind, as Hardenberg's memoirs. But there was no such reason. It is indeed not improbable that the compiler had access to documents of some kind, and his statements, sifted with proper caution, may in some cases have their value. But even before the book appeared, and when the advertisements of it which spoke of a *Prussian* statesman seemed to point at Hardenberg, it was shown by Schöll that there was imposture at work, and that the papers, if there were any, were certainly not Hardenberg's. Accordingly D'Allonville and his accomplices did not venture in any positive way to declare that they were. It was not necessary to do so. The world, that is, in England and France, jumped at the bait, which was scarcely even held out to it, and the forgery has been "Hardenberg's Memoirs" to our historians ever since. Yet they have not even had the excuse that the exposure of it was only to be found in a language which they did not read, for a most complete examination and detection of the forgery is to be found in Barbier's French "*Dictionnaire des Œuvres Pseudonymes*."

Meanwhile the Germans have submitted to this injury with most magnanimous meekness. They have probably felt that they had no remedy, for though they have the ear of Europe on questions of learning or science, and certainly of history also, when the history is remote enough to have become the property of *savants*, on recent history it matters not what they say or what they prove, since no one either in France or England reads it. Accordingly Von Sybel merely remarks, without a word of complaint or indignation, that the current notion of German affairs in that age has been taken chiefly from the spurious memoirs of Hardenberg; and Von Ranke now, in introducing the genuine memoirs to the world, merely remarks in the same placid tone that the "*Mémoires tirées*," etc. have no connection with them whatever.

This explanation may convey to the reader a new impression of the importance of the publication before us. It finally dissipates a cloud of illusion which has hung over the period for about half a century — for the first two volumes of the "*Mémoires tirées*," etc., appeared in 1828, and at the same time it opens a new source of knowledge, the importance of which we may measure by the authority which the mere name of Hardenberg gave to the forgery now exploded. It is to be added, that in addition to the memoirs of Hardenberg, this work gives us the conclusions drawn by Von Ranke from a collection also made by Hardenberg, and now first applied to historical purposes, of original documents bearing on Prussian history.

Our inquirer will in fact find that he has

taken up the study of recent German history at a moment when it is fast changing its aspect. The period to which Stein, Hardenberg, and Scharnhorst belong is now in the act of passing out of twilight into day, and this, it will be remembered, means far more when it is said of a country such as Prussia then was — a country without a Parliament, where government is a secret — than when it is said of our own country. These memoirs are only the most important of several publications of the kind which have lately appeared. Duncker, the late archivarius of Berlin, gave us not long since a paper full of new information on the state of Prussia during the French occupation; Treitschke published a full account of the Constitution dispute which occupied the politicians of Prussia in the early years of the peace, and of which former historians, such as Gervinus, had been able to learn little. More curious and amusing, though less satisfactory, than these publications, have been the selections from the papers of Schön, which have appeared in successive volumes to the number of four during the last two years. Schön was a politician who stood to Stein in the same relation as Shelburne to our own Chatham, but he outlived both Stein and Hardenberg by many years, and was in his old age a patriarch of Prussian liberalism, of whom men said that he was the real author of most of the great legislative acts upon which Stein's fame rested; and indeed for saying so they had the warrant of one who certainly must know, viz., of Schön himself. Diaries, fragments of autobiography, biographical and historical letters from his hand are now before us, and seldom has there been such an exhibition of self-conceit, envy, and reckless malice as they afford. Fortunately most of Schön's calumnies refute themselves by their inconsistency and unskilfulness. But the examination of them has given the Prussian literary world much to do lately. And when the student has digested all this mass of new material he becomes aware, on looking again at what used to be the best histories of the period, *e.g.* Häusser, that they have become insufficient, and that they paint a landscape in twilight upon which the day has now risen.

But if this period is all-important in the history of modern Germany, is it also interesting in itself? What! the battle of Jena — the downfall in a single week of the monarchy of the great Frederick — and then its resurrection seven years afterwards — the War of Liberation — the fall of Napoleon — can a period which offers occurrences like these be other than interesting? And of course all admit the interest of it, but then most come to it with a curious preoccupation, as if all these occurrences belonged to French and not to German history, or at least as if it were only the French aspect of them that was interesting. It is with this chapter of history as with "Paradise Lost"; the character of Satan stands out so strikingly that it kills all the rest of the piece. Just as in the poem we forget to think of what the poet undertook to unfold to us — the destiny of mankind and the grand redemptive schemes of Providence — because all this is dim and remote, and think only of Satan because he is passionate, intense, and dramatic; so does Napoleon, the great deceiver and destroyer, absorb the interest that ought to be given to the progressive movement of Europe in his age. But what is excusable when we are dealing with a poem is less so when we are studying history. Poetically, perhaps, evil is more interesting than good, but it is not so important historically. The work of Napoleon looks smaller and smaller as time goes on, but the work which was done in Germany at the same time looks greater and greater. At the time Napoleon's lawless violence was taken for creative genius; but now we see how small a part of his creation stands the test of time, but that all attempts to revive it only prove its worthlessness more decisively; and how even after being restored it falls again. We can now only praise him negatively, as one who swept away what was bad, and even if we try to represent him as a great impulsive force which roused mankind out of lethargy, we discover that he only produced this effect because he failed, and that had his empire endured, with its centralization and brutal military repression, it would have produced a far more fatal lethargy than any that it disturbed. We see that his place is not among the gods, but among the Titans of history, not with the Cæsars and Charlemagnes, who founded the enduring fabric of civilization, but with Louis XIV., Philip II., and others, who have merely established ephemeral and mischievous ascendencies. Meanwhile the work of those who resisted Napoleon — even if no one of them should ever be placed in the highest class of the benefactors of mankind — has in some cases proved enduring, and nowhere so much as in Germany. They began two great works — the reorganization of Prus-

sia and the revival of the German nationality, and time has deliberately ratified their views. Without retrogression, without mistake, except the mistake which in such matters is the most venial that can be committed, that, namely, of over-caution, of excessive hesitation, the edifice which was then founded has been raised higher and higher till it is near completion. The French empire revived again only to fall again with disgrace; France annexed Savoy and Nice, but she lost Alsace and Lorraine; and she did not avenge Waterloo. But Jena has been avenged; the manes of Queen Louise are propitiated; Barbarossa is awake at last.

This being so, we might read over again the history of that age with new feelings. We might cease to think of the German princes of that time as of nine-pins whom it amuses us to see bowled over by Napoleon; still more might we cease to think only of Napoleon when we read the history of his fall, as if the heroism and the skill were even then on his side, and his opponents had nothing but luck and superior numbers. Nay, even if we sympathize with France, and with Napoleon himself, we may still recognize that, putting them out of the question altogether, the fall and resurrection of Germany is far more interesting than most passages of history, and that the interest centres on the whole in Prussia. We in England enjoy something of that happiness which proverbially makes the annals of a people dull. Since the seventeenth century nothing has been witnessed here either so painfully interesting as what Prussia witnessed in the unhappy years 1806 and 1807, or so elevating and poetical as her *levée en masse* and victories in 1813 and 1814. And to the student it is far more interesting than to the seeker of amusement. To the student indeed it is an interest quite independent of its exciting incidents, for it is one of those periods of radical and successful reconstruction of a State which are rare in history, and which abound beyond others in political lessons.

Let us now look more closely at the book before us. At his death, in November 1822, Hardenberg left a considerable collection of papers sealed up, with the direction that they were to lie unopened in the archives for fifty years. This fact is of itself sufficient to destroy the pretensions of the "*Mémoires tirées*," etc., which our editor describes as "a compilation of heterogeneous materials in which a few genuine documents are lost in a mass of statements partly well-known before, partly unauthenticated," and as "in itself more calculated to bewilder than to instruct." When the fifty years had expired the director of the archives brought the whole collection to Prince Bismarck, who with his own hand broke the seal. The commission was then given to Von Ranke to examine and report upon them. He found them to consist, first of a memoir in Hardenberg's own hand, covering the years 1804–1806 and part of 1807; secondly of a voluminous history — in French, and comprising a large number of official documents — by Friedrich Schöll, well known as one of the authors of the useful "*Histoire Abrégée des Traités*." The history deals with the years 1794–1812, while Hardenberg's own memoir, which was intended to be translated into French and incorporated into it, is occupied solely with the years 1804–1807.

Our editor had to consider whether it would be advisable to publish Schöll's work as he found it. There were weighty objections to this course. It was in French, and Hardenberg's memoir was in German, so that they could not be joined together, as had been originally intended, to make one work. Moreover, there was something artificial in the style of Schöll, who had made Hardenberg speak throughout in the first person, and an attempt was discernible to efface the pretty strong tinge of Liberalism which belongs to Hardenberg's administration in order to suit the taste of the restoration period in which Schöli wrote. An alternative course was to publish Hardenberg's memoir with an introduction founded on the materials furnished by Schöll. This also seemed unsatisfactory, because these materials were copious enough to furnish a complete history. The end has been that the public are presented with four volumes, each consisting of from five to six hundred full German pages, of which the second and third contain Hardenberg's memoir, and the first and fourth a history of the whole period from 1793 to the War of Liberation by Ranke. In other words, historical literature is enriched at the same moment by two books, each of the utmost value in its own way, a history of a most memorable period, written by a great master of historical investigation from new documents, and an account of the foreign relations of Prussia in the years which ended with the great catastrophe of Tilsit, by one who was for the greater part of that time himself Prussia's foreign minister.

Hardenberg can hardly be regarded as

a great man. Our editor himself says: "There is nothing very great in Hardenberg himself. His only title to a historic delineation is that he did more than any one towards the securing and restoring of Prussian independence." In his personality there was not the same strongly marked character, force, and grandeur that is to be observed in that of Stein, of whom we may observe that our editor speaks in a very different tone, *e.g.* "We have to introduce here again the Titanic Stein, who then took a world-historical position worthy of himself by Alexander's side;" and again, "Stein is the first and grandest representative of the German idea; he had Germany as a commonwealth ever before his eyes, and its unity ever as a thing in one way or another to be restored."

Nevertheless Hardenberg had force enough to carry him through the tasks, heavy as they were, which his lot imposed upon him; and as he was at the head of affairs far longer than Stein, the sum total of the services he rendered to Prussia is very great; his performance, though less unique in quality, is scarcely inferior in quantity to that of Stein; and his name is inseparably connected with that reorganization of Prussia which has led to her present greatness. Moreover his importance is materially increased now that he appears as a historian of some of the events in which he had a share.

It is to be observed, however, that he cannot be called the historian of his own achievements. Those achievements began with his assumption of office in 1810, two years after the fall of Stein. From that time to his death in 1822 he remained first minister. His important legislation belongs mainly to the years 1810 and 1811, and the memorable resurrection of Prussia belongs to 1813. But his original memoir deals exclusively with the time preceding the Peace of Tilsit, which was concluded in July 1807, a time in which he achieved nothing memorable. It is in fact mainly apologetic in its tone, explaining the reasons why its author was not able, in spite of all his efforts, to prevent, or even in any degree to mitigate, the calamity which fell upon Prussia at the close of that time. Instead of describing the restoration of Prussia, in which he had so large a share, he has described only its fall, which he witnessed and foresaw, but was unable in any degree to prevent. The fall of Prussia, however, is not less interesting, if it is less agreeable to read of, than its restoration, and just at present it may be even more instructive to English people. For in our extreme scarcity of English books on the history of Prussia, in the fragmentary state of our knowledge about it, we are in danger of arriving at erroneous conclusions by piecing arbitrarily together the fragments of knowledge that we have. Thus we are apt to jump from the one book on the subject which we have read, Carlyle's "Frederick," to those modern Prussian triumphs which we know so well, and to argue — then Carlyle was right after all, and the heroic form of government turns out to be, in the long run, the best! I by no means wish the reader to run hastily into the exactly contrary conclusion, yet it is the exactly contrary conclusion which is really suggested by the facts. Frederick's government did not lead to those modern triumphs, but to the unparalleled catastrophe of Jena, and after that catastrophe the necessity was forced upon the country of radically destroying his system. By a series of changes, scarcely inferior in magnitude to those which France underwent in her first Revolution, both government and society in Prussia were reconstructed. A generation later a Parliament was added, and the triumphs which have impressed us so much began nearly twenty years later still. *Post hoc, ergo propter hoc* is of course a very weak argument; but the slight presumption that it may afford is really a presumption against and not in favor of, the *régime* of Frederick, for it was not Sedan, but Jena, that was *after* it.

This account then of the downfall of the old system we have from Hardenberg himself, and Von Ranke's first volume furnishes an excellent introduction to it. His second volume, the fourth of the work, gives some account of the reconstruction. But we should by no means describe it as a complete account. The historical manner of Von Ranke is well known; his element is diplomacy and international affairs. In his view of the period between Tilsit and the War of Liberation, he has traced with much care the fluctuations of the long negotiation that went on between Prussia and Napoleon, but the internal reform that went on at the same time does not suit his pen so well, and is therefore not so fully treated. Altogether, though the work before us, if we consider only what it gives, seems to us the most important historical work of recent years, yet it has deficiencies, whether it is considered as a biography of Hardenberg or as an account of the fall and reconstruction of Prussia. As a biography of Hardenberg, besides closing at 1814, instead of 1822, which was the end

of Hardenberg's career, it gives no sufficient account of his legislation of 1810, 1811. The same omission, joined to the slightness of the view given of Stein's legislation, makes it incomplete as a history of the transformation of Prussia.

Nevertheless the appearance of such a book affords a good opportunity of pointing out the vast historical importance of that transformation. We are most of us so ignorant of Prussian history that the very outline of it in our minds wants one of the principal features. Our view of it is such as our view of French history would be if we had never heard of the Revolution of 1789. This may seem a startling statement, but it is possible to imagine that but for one or two very glaring occurrences — such as the execution of the king and queen, and the positive destruction of monarchy and Church — we might have looked at the events that began in 1789 purely from a military and foreign point of view. We might have overlooked all internal changes, and seen nothing but that France at that time undertook a war against Europe, a war in which she was successful for many years, but afterwards lost again all the advantages she had gained. This is something like what we do with the history of Prussia. We see her neutrality between 1795 and 1806, then her ruin at Jena and Tilsit, then her period of humiliation, then her War of Liberation, and so on; but because Frederick William III. remains quietly seated on the throne through the whole period, we remain totally unaware that a Prussian revolution took place then — a revolution so comprehensive that the old reign and glories of Frederick may fairly be said to belong to another world — to an *ancien régime* that has utterly passed away. It was a revolution which, though it did not touch the actual framework of government in such a way as to substitute one of Aristotle's forms of government for another, yet went so far beyond government, and made such transformation both in industry and culture, that it deserves the name of revolution far more, for instance, than our English Revolution of the seventeenth century.

Thus the first step which our imaginary student of German politics must take, is to move the battle of Jena out of the life of Napoleon into the history of Prussia. Instead of thinking of it as a military feat, he is to think of it as the beginning of a political revolution. And next remembering that in Prussia two movements go on together, viz., the internal development of the state and its movement towards the headship of Germany outside, he must treat the battle of Austerlitz in the same manner and begin to think of that as the beginning of the revolution which brought down the old empire. Thus we get — 1805, fall of old Germany; 1806, fall of old Prussia. And so in Germany as in France we have an *ancien régime* and a revolution, and, as in the case of France, we ask first, what was the corruption, or weakness of the old *régime* which caused it to fall? and what was the nature of the new system which took its place?

The downfall of the old system in Prussia was much less appalling and amazing than in France; but, on the other hand, it was much more unforeseen. Many prophets had prophesied of strange things to happen in France, — *nos enfants verront un beau tapage* — for all the most unmistakable signs of decay met in the Bourbon monarchy. The Hohenzollerns too had been guilty of crimes, but they were the crimes of youthful energy, not of decrepitude; and the ambition of Frederick, if unscrupulous, was patriotic. Considered as an internal administrator, he was a pattern of self-sacrificing industry to all the sovereigns of his time. He and Louis XV. were at the opposite poles of kingship. Was it not strange, then, that a similar catastrophe should await the work of both? that the one system should perish in the rout of Jena, as the other in the Tenth of August? Napoleon is often described as having a sort of indefinite commission to remove out of the world whatever was rotten or decaying. Was it not strange then, that that which went down most instantaneously before his shock should be precisely that system which was youngest, and whose glories were most recent? and that even the old clumsy fabric of the Habsburgs should make a better fight than the new construction of the Hohenzollerns, the pride of the eighteenth century?

The explanation is that the Prussian State was as weak from immaturity as the French from old age; that the gigantic labors of Frederick William I. and Frederick the Great, though they had raised Prussia from insignificance to greatness, had not been sufficient to make her greatness stable and secure. But in this instance the image of a building is more convenient than that of a living body. If a State be regarded as an edifice reared on a foundation, we may say that in France the fault lay in the building itself, while in Prussia the building, the work of

the Hohenzollerns, was good, but the foundation insufficient. The building is the visible part of a State — its government, administration, revenue, army. All this was rotten in France under Louis XV. and sound in Prussia under Frederick the Great. But the foundation on which all such buildings must stand is, as foundations are generally, out of sight, and may easily be left out of consideration. It is the unity of the country and of the nation; and this is marked in various ways — by continuity of territory and strength of frontier, by homogeneousness of the population and separateness of it from neighboring populations, and this again is marked by the distinctness of language, form of civilization and literature. In France this foundation was immensely strong, — no nation had so intense a self-consciousness — and therefore, when the structure of the State crumbled, the nation, after a very short interval of embarrassment, showed itself stronger than ever. But in Prussia this foundation was exceptionally weak. It could scarcely be said that either a Prussian nation or even a Prussian country existed. No one spoke of a Prussian language, or of a Prussian literature; no one supposed that Kant and Herder, because they were Prussians, belonged to a different literature from Goethe and Schiller. The ministers who conducted the government of Prussia were not necessarily Prussians either by birth or education. Who ever hears in England of a statesman being borrowed for a high official post from the French or Austrian service? Or when a public man among us is driven from office, or loses his seat in Parliament, who expects to hear that he has applied for employment to the czar? But in Prussia few of the most distinguished statesmen, few even of those who took the lead in her liberation from Napoleon, were Prussians. Blücher himself began life in the service of Sweden, Scharnhorst was a Hanoverian, so was Hardenberg, and Stein came from Nassau. Niebuhr was enticed to Berlin from the Bank of Copenhagen. Hardenberg served George III. and afterwards the duke of Brunswick before he entered the service of Frederick William II.; and when Stein was dismissed by Frederick William III. in the midst of the war of 1806, though he was a man of property and rank, he took measures to ascertain whether they were in want of a finance minister at St. Petersburg. And how weak was the frontier — how discontinuous the territory! How much of it too had in 1806 been quite recently acquired, and was inhabited by a discontented population which did not even profess to be Prussian! The partitions of Poland were quite recent; Warsaw was then a Prussian town; other large acquisitions had been made within Germany itself in 1803; and Hanover had just been taken from George III. In these circumstances, from the very nature of the case, and not from any exceptional coldness of disposition, there could not be in Prussia any of that burning spirit of nationality which showed itself in France in 1792, or in Spain in 1808; and where such a spirit is wanting the best-disciplined army and the most diligent administration and the best-intentioned government have no firm foundation under them.

Next to the baselessness of the whole fabric we are to consider the essential precariousness of an absolute form of government, and then some special abuses in government which had sprung up at that particular time. But in estimating all these influences, we are to bear in mind the immensity of the power which assailed Prussia in 1806. If the system of Frederick succumbed, it succumbed not like the French, to the sheer weight of its own corruption, but to an external force to which other systems thought good, our own for instance, might have yielded had they been equally exposed to its attack. It was this evident superiority of force which gave Napoleon himself an absolute confidence of success. On October 12th, 1806, he wrote to the king of Prussia, "Your Majesty will be defeated. Europe knows that France has thrice the population of your Majesty's states, and is not less developed than they are in a military point of view." It was in itself no great disgrace to be worsted by Napoleon at the head of such a force; the condemnation of the system lies in the fact that it did not offer a stout resistance, but collapsed at once. It was the curious fate of Prussia twice in little more than half a century to be attacked by a greatly superior force, and to wage on the first occasion the most glorious and on the second the most inglorious defensive war known to modern history. To explain this we are certainly obliged to point out the personal insufficiency of the king for the ponderous task which had devolved on him.

An administration both civil and military, if it cannot draw inspiration both from above and from below, must at least do so from one quarter or the other. If

there is no patriotic nation below, there must be an energetic will above. But the great race of Prussian kings seemed to have come to an end when Frederick the Great died in 1786. His successor, the hero of Valmy and of the Treaty of Basle, had had something *grandiose* and generous about him, and got through his reign of eleven years without any conspicuous disaster. But he had dissolved the strictness of discipline and broken the spell of success, when he delivered over the government to the young Frederick William III. in 1797. The reign which now began lasted forty-three years, and resembles that of George III. in English history. In the course of it there were great disasters and glorious successes, and the king had good qualities of a homely kind enough to justify those who chose to attribute the successes not less than the disasters to him. Moreover the successes, coming later, effaced the disasters, and thus King Frederick William III. has preserved a fair reputation in history. We cannot but be glad of it, considering how respectable and well-intentioned a king he was; and indeed he had this merit, that as George III., after bringing himself near to ruin in his first twenty years, saved his reign by committing himself to William Pitt and remaining faithful to him, so did the Prussian king repair most of his mishaps by confiding, after 1806, in two meritorious statesmen, Stein and Hardenberg. But the mishaps themselves were due very much to his own mistakes, and this all the more because of the immense prestige which in Prussia had gathered round the crown.

Though the sudden collapse of the renowned Prussian army in 1806 took the world by surprise, yet the decline of the Prussian government had been recognized by all the world long before. In the long neutrality between 1795 and 1806 its reputation had suffered so much that it had come to be regarded with contempt, and in some sort may be said to have begun to despise itself. Hardenberg in these memoirs makes no defence of its foreign policy in the years 1804, 1805; and he defends himself by saying that his advice was not taken. The mistrust of Prussia by other powers, and her own self-mistrust, were among the leading causes of her overthrow, and for this the king himself was responsible. At least Hardenberg here throws it in pretty plain language on the king. That ruinous neutrality when all the world was in arms — what was the cause of it? People said at the time that the king was a coward, and though this was not true, yet Hardenberg himself traces it to fear. In speaking of one of Napoleon's encroachments, he says, after remarking that the king *would* not see it in its proper light: "I say he *would* not, for there was no doubt that he understood it all perfectly, but he could be inexhaustible in plausible arguments when the object was to maintain an unsound principle once adopted, and in such cases repugnance to a decisive measure outweighed his better reason. Mistrust of his own power to encounter the formidable Napoleon, a foreboding of the misfortune which afterward came so heavily upon him, were the grounds of this repugnance. Often perhaps did Frederick William curse his own high position, and wish for the unobserved life of a subject!" In other words, it was not a cowardly fear of the battle-field, but it was the fear of a war in which he felt himself certain to be worsted — yet in which, as a near successor of Frederick the Great, he would be regarded by the people as responsible for the campaign — which was the secret motive of his neutral policy. This weakness in the king concurred with a disturbance in the administrative system which had been caused by the restless personal government of Frederick the Great to throw the foreign department into the strangest confusion. In the first place the king found it necessary always to have a foreign minister who would advise unlimited concession when his favorite neutrality was endangered. He had such a minister in Count Haugwitz, whose conduct during the Austerlitz campaign has not been forgotten by history. In the summer of 1804 the count desired to retire in order to look after his estates in Silesia, which required the master's eye, and Hardenberg was to take his place. But the king did not feel sure of Hardenberg because he was a man of spirit, and accordingly it was arranged that Haugwitz should still receive a part of his salary, should be always ready to resume the duties of his department, and "particularly in the winter when he would wish to reside in Berlin, should receive information of all affairs, and be present at all conferences." Here was a pretty confusion of responsibility! And Hardenberg complains that he could never with all his exertions get his relations to Haugwitz properly defined. But how this arrangement served the king's purpose he makes perfectly clear by an example. In the matter of Sir George Rumbold, who had been seized by French soldiers near Ham-

burg, Hardenberg had recommended that his extradition should be demanded, and that the demand should be backed, if necessary, by war with France. The king was in a flutter, though for a wonder he took the first part of the advice. An express is at once sent to Haugwitz in Silesia, with a letter proposing the question in the following form: "I have demanded satisfaction of Bonaparte for the violation of neutrality, and because Rumbold was accredited to my person. His extradition has been demanded. If this is not granted, but recourse is had to subterfuges, what should Prussia do to maintain her dignity and to fulfil her engagements both towards Russia, in accordance with the existing understanding, and towards her co-estates in North Germany? Many persons vote for war; *I do not* (*moi pas*). Reflect on the matter, and give me the benefit of your views. *You know that I reserved to myself the right of having recourse to you in critical circumstances — and these are critical indeed!*" Hardenberg remarks, "How significant was that *moi pas*, which the king underlined!"

It may in fact be said that there were times when Haugwitz and Hardenberg might be considered indifferently as foreign ministers, though they represented opposite policies. But the confusion in the foreign department went really much further than this. Hardenberg gives us a clearer view than we could get before of an abuse which caused much outcry at the time — the secret influence of the cabinet secretaries. Of course the ministers in Prussia, where the king governed personally, had not the same undivided responsibility as they have in constitutional countries. The king took their advice or not, as it pleased him. But in 1806 the condition of things was this, that the control of affairs was in the hands neither of the ministers nor of the king, but of two or three men called cabinet secretaries who went and came between them. This abuse had risen out of a habit which Frederick the Great had formed of transacting business without any personal communication with his ministers. The reports of the ministers were laid before him and upon these his decision was formed. It was the business of the cabinet secretaries in his time simply to draft the orders of cabinet from his rough notes and to take charge of them. This form of transacting business continued after Frederick was gone, but began then to have a very different meaning and effect. These secretaries, originally merely clerks, began now to rival the ministers in influence. From drafting orders of cabinet they passed to practically originating them; and as they had the advantage, which the ministers had not, of personal communication with the king, they gradually reduced the ministers to mere tools. Meanwhile they had no real responsibility, and at the same time, compared with the ministers, they had no accurate knowledge of the affairs they conducted. The particular cabinet secretary who controlled foreign affairs, making Haugwitz, and as far as he could, Hardenberg also his agent, was one Lombard, a Frenchman by birth, and very naturally suspected, though Hardenberg pronounces him not guilty, of being in Napoleon's pay. Just before the catastrophe came, Stein complained in a letter to the king that "the guidance of the diplomatic affairs of the state, at a period unparelleled in modern history, is in the impure and feeble hands of a French poetaster of mean extraction, a *roué*, in whom is combined with moral corruption a complete physical prostration and decrepitude!"

If we put aside the considerable part which accident played in the fall of Prussia — for Alexander's sudden change of policy at Tilsit was an accident as far as Prussia is concerned — the causes of the catastrophe seem such as we have described: on the one hand, the want of any nation, in the proper sense of the word, underlying the State, on the other hand, a deplorable confusion in the administration arising from a failure of that powerful royal initiative by which the administration had been originally created. And now let us pass from the fall of Prussia to its reconstruction.

We misapprehend the nature of what took place when we say, as we usually do, that some important and useful reforms were introduced by Stein, Hardenberg, and Scharnhorst. In the first place, such a word as reform is not properly applied to changes so vast, and in the second place, the changes then made or at least commenced, went far beyond legislation. We want some word stronger than reform which shall convey that one of the greatest events of modern history now took place in Prussia. Revolution would convey this, but unfortunately we appropriate that word to changes in the form of government, or even mere changes of dynasty, provided they are violent, though such changes are commonly quite insignificant compared to what now took place in Prussia. And the effect of our want of a word is not less

than this — that one of the very greatest events is never heard of among great events, and therefore by the mass of mankind is never heard of at all.

The form of government indeed was not changed. Not merely did the king continue to reign, but no Parliament was created even with powers ever so restricted. Another generation had to pass away before this innovation, which to us seems the beginning of political life, took place. But a nation must be made before it can be made free, and, as we have said, in Prussia there was an administration (in great disorder and an army, but no nation. When Stein was placed at the head of affairs in the autumn of 1807, he seems, at first, hardly to have been aware that anything was called for beyond the reform of the administration, and the removal of some abuses in the army. Accordingly he did reform the administration from the top to the bottom, remodelling the whole machinery both of central and local government which had come down from the father of Frederick the Great. But the other work also was forced upon him, and he began to create the nation by emancipating the peasantry, while Scharnhorst and Gneisenau were brooding over the ideas which, five years later, took shape in the *Landwehr* of East Prussia. Besides emancipating the peasant he emancipated industry, — everywhere abolishing that strange caste system which divided the population rigidly into nobles, citizens, and peasants, and even stamped every acre of land in the country with its own unalterable rank as noble, or citizen, or peasant land.

Emancipation, so to speak, had to be given before enfranchisement. The peasant must have something to live for; freewill must be awakened in the citizen; and he must be taught to fight for something before he could receive political liberty. Of such liberty Stein only provided one modest germ. By his *Städteordnung* he introduced popular election into the towns. Thus Prussia and France set out towards political liberty by different roads. Prussia began modestly with local liberties, but did not for a long time attempt a Parliament. France with her *charte*, and in imitation of France many of the small German States, had grand popular Parliaments, but no local liberties. And so for a long time Prussia was regarded as a backward State. F. von Raumer complains in 1828: "In Paris we are often obliged to hear it said, 'We live in a constitutional country, while you, you know . . .' In spite of the polite suppression of the sentence this simply means, 'We are free, but you are still slaves and subject to an unchecked tyranny.'" He protests that this representation is quite unjust so long as the Prussians have Stein's *Städteordnung*. It is to be added, however, that it was only by accident that Stein stopped short at municipal liberties and created no parliament. He would have gone further, and in the last years of the wartime Hardenberg did summon deliberative assemblies, which, however, fell into disuse again after the peace. For as the legislation of those years may be called a revolution, so the reaction which set in afterwards might be regarded as a counter-revolution. The reformers were driven from office, calumniated, and persecuted; the *Städteordnung* was revised in 1831; instead of the promised Parliament only Provincial Estates, carefully controlled by government, were instituted; and the reformed administration, working with more unity and efficiency than before, became that imperious bureaucracy which Schön compared to the Catholic priesthood, and of which a leading member rebuked some Prussian citizens for supposing that with their "narrow private understanding" they could possibly form a judgment of the views of the government!

In spite however of all reaction, the change irrevocably made by the legislation of that time was similar to that made in France by the Revolution, and caused the age before Jena to be regarded as an *ancien régime*. But in addition to this, a change had been made in men's minds and thoughts by the shocks of the time, which prepared the way for legislative changes which have taken place since. How unprecedented in Prussia, for instance, was the dictatorial authority wielded by Hardenberg early in 1807, by Stein in the latter part of that year and in 1808, and by Hardenberg again from 1810 onwards! Before that time in the history of Prussia we find no subject eclipsing or even approaching the king in importance. Prussia had been made what she was almost entirely by her electors and kings. In war and organization alike all had been done by the Great Elector or Frederick William I., or Frederick the Great. But now this is suddenly changed. Everything now turns on the minister. Weak ministers are expelled by pressure put upon the king, strong ones are forced upon him. He is compelled to create a new ministerial power much greater than that of an English prime minister, and more

like that of a grand vizier, and by these dictators the most comprehensive innovations are made. The loyalty of the people was not impaired by this; on the contrary, Stein and Hardenberg saved the monarchy; but it evidently transferred the monarchy, though safely, to a lower pedestal; it evidently prepared the way for such constitutionalism as we now see.

Another powerful impulse moved the State in the same direction. If we consider the transformation of Prussia as covering the whole period between 1807 and 1813, we may consider that it was accomplished in two movements. The first was the legislative movement guided by dictatorial ministers — Stein in 1807 and 1808, Hardenberg in 1810 and 1811. The second is the great popular movement which ended in the War of Liberation. Now, while in the former the king for the first time in Prussian history is eclipsed by his ministers, in the latter the initiative is taken out of the hands of the government altogether, and the most important step of all is taken by a parliamentary assembly. The great transition of Prussia from the French to the Russian alliance at the beginning of the year 1813 was begun and wellnigh completed without the intervention, and ostensibly against the wish, of the Prussian government. It began with Yorck's Convention of Tauroggen, which was concluded on his own responsibility, and was afterwards disavowed by the government. Then came the meeting of the Estates of East Prussia at Königsberg. In this assembly Yorck appeared and spoke openly of "beating the French wherever he should find them;" and yet the French were at this time the king's allies! The assembly then proceeded to make one of the greatest institutions of modern Prussia — they created the *Landwehr*. But of course they were summoned by the king, and acted under his directions? Not at all; they were summoned by Stein, and his commission did not run in the name of the king of Prussia, but in that of the emperor and autocrat of all the Russias!

No doubt the king resumed a little later the guidance of his people. The *Landwehrordnung* was sanctioned by him and extended to the other provinces. Nevertheless, such a fact as the creation of the *Landwehr* by a Parliament, and a Parliament not summoned by the king, could not be forgotten. It tolled the knell of the absolute monarchy in Prussia. No wonder that when, a month after, Stein lay at death's door in the Hotel Zum Zepter at Breslau, the king, though the court was in the same town, would know nothing about him, and caused no inquiries to be made after his health.

Parallel with this fall and reconstruction of Prussia we see the fall and reconstruction of Germany. Here too the first step is to create, so to speak, the nation. A great space had to be traversed from the time when Lessing and Herder wrote of the very virtue of patriotism with disapprobation, wondering at the same time what the feeling might be like, to the days of Arndt and Körner. And when the feeling had been awakened the difficulty of expressing it in institutions seemed to have grown greater than ever. The Confederation of the Rhine had thrown half Germany into the foreign camp. New kings had been created, all whose interests were involved in the division of Germany. At the moment of the fall of Napoleon, perhaps, with decision and good fortune, something might have been done. Stein, who is even greater in the history of Germany than he is in the history of Prussia, formed a daring plan of dethroning the princes of the Confederation of the Rhine along with their master, and in this way constituting the unity of Germany, or at least its duality under Austria and Prussia, at the same time that its independence was secured. But Metternich disappointed him. And we have witnessed since the slow and wonderful attainment of the same goal by another path.

This chapter of history has commonly been thought uninviting, partly I suppose because of the intricate appearance which German history always presents from the multitude of small States, partly, perhaps, because the Germans do not write history in a dramatic or epigrammatic style. The first difficulty lies altogether on the surface; as to the second, it must be confessed that the Germans as a nation have not the art of posing like their neighbors. The French contrive to make the long ignominy and decay of Louis XV.'s reign interesting, while the Germans cannot make even the age of Stein and Hardenberg seem so. Nor, I fear, will the two thousand judicious pages in German type, which have suggested this paper, mend the matter. German history will never be read by the novel-reading public. But that it should be read by *nobody* seems a pity. It is quite as instructive and important as other history. And if it does not make a good novel of plot, it makes, at least in the age we are thinking of, a very fair novel of character. It is unfortunate that the only biography of an eminent

German politician of that age which is known to the English public is confessedly unsatisfactory from the political point of view. Miss Winkworth, when she translated Niebuhr's life, regretted in her preface that "the account given in it of his public career was very incomplete, and by no means one that enabled the reader to perceive the relation in which Niebuhr stood to his times." Yet Niebuhr's character is so interesting, even when a good part of it is left in the shade, that two or three editions of the book have been called for. Let some one put by the side of it a portrait executed on the same scale of the other great scholar-statesman of Prussia, W. von Humboldt, the great educational reformer and founder of the University of Berlin. The life of Arndt, with its wanderings and adventures, might be made even popular. Blücher, Gneisenau, and Yorck, are striking military figures. Scharnhorst is perhaps more important than any of these, but his reserved and unimpassioned character is not much adapted for biography, at least if we may judge from the admitted failure of Klippel's attempt; but perhaps the rising historian, Max Lehmann, who promises a new life of Scharnhorst, will teach us better. The age too is rich in interesting specimens of more or less perverted character. Such are Dalberg, prince primate of the Confederation of the Rhine, Johannes Müller, Gentz, the first king of Würtemberg.

Who, in all this assemblage of characters, holds the regal position? I think it is the proud *Reichsfreiherr*, Karl von Stein, greater than any by the breadth of his views and the commanding force of his character, even if we should grant that Hardenberg might claim to rival him in the sum of his achievements. Our author closes his work with an elaborate comparison between the two statesmen, in which, as was natural, and perhaps proper, in a life of Hardenberg, somewhat more than justice is done to him, and somewhat less to Stein. The great superiority of Stein lies in the influence he exerted outside Prussia upon Germany as a whole. In 1813 it was the custom to speak of him as emperor of Germany; and the phrase was a happy way of marking that, as our author says, he was "the first and grandest representative of the German idea." Who else could write as early as 1812 what Stein wrote to Count Münster? — "I am sorry your Excellency suspects a Prussian in me and betrays a Hanoverian in yourself. I have but one fatherland, and that is Germany; and as under the old Constitution I belonged to Germany alone, and not to any part of Germany, so to Germany alone, and not to any part of it, I am devoted with my whole heart." It is the strangest ignorance which pictures this great-hearted man — who had his life in large and simple ideas, and who has been called Germany's political Luther — merely as a successful legislator on land questions.

If we made a commencement by becoming familiar with the lives of a few of these men, we should find the fog which now hides German politics from our view insensibly dissipated, and I believe, also, we should be astonished at the richness, variety, and interest of the scene which would be disclosed.

J. R. SEELEY.

GREEN PASTURES AND PICCADILLY.

BY WILLIAM BLACK,

AUTHOR OF "THE PRINCESS OF THULE," "THE ADVENTURES OF A PHAETON," ETC.,

In conjunction with an American writer.

[Entered according to Act of Congress, in the Year 1877, by HARPER & BROTHERS, in the Office of the Librarian of Congress, at Washington.]

CHAPTER XLI.

CHICAGO.

WE knew nothing of this dire announcement, though it was in every one of the newspapers published in Chicago that day. We were full of curiosity about this wonderful city that had sprung up like Jonah's gourd; and as we drove through its busy thoroughfares — the huge blocks of buildings looking like the best parts of Glasgow indefinitely extended — and as we saw the smoky sky over our head streaked in every direction with a black, rectangular spider's web of telegraph wires — and as we caught glimpses at the end of the long thoroughfares of the tall masts of ships — we knew that we had indeed reached the great commercial capital of the far West. And, indeed, we very speedily found that the genius of this big, eager, ostentatious place was too strong for us. We began to revel in the sumptuousness of the vast and garishly furnished hotels; we wanted more gilding, more marble, more gaudy

coloring of acanthus leaves. A wild desire possessed us to purchase on speculation all the empty lots available; we would cover every frontage foot with gold, and laugh at all the assessments that were ever levied. Look at this spacious park on the south side of the town; shall we not have a mansion here more gorgeous than the mind of man can conceive, with horses to shoot along these wide drives like a flash of lightning? We began to entertain a sort of contempt for people living on the north side of the town. It was hinted to us that they gave themselves airs. They read books and talked criticism. They held aloof from ordinary society, looked on a prominent civic official as a mere shyster, and would have nothing to do with a system of local government controlled by thirty thousand bummers, loafers, and dead-beats. Now we condemned this false pride. We gloried in our commercial enterprise. We wanted to astound the world. Culture? This was what we thought about culture: "It is with a still more sincere regret that the friends of a manly, vigorous, self-supporting, and self-dependent people, fitted for the exercise of political liberty, see that the branches of culture called blacksmithing, corn-growing, carpentering, millinery, bread-making, etc., are not included in the course of studies prescribed for the Chicago public schools. Society is vastly more concerned in the induction of its youthful members into these branches of culture than it is in teaching them to bawl harmoniously and beat the hewgag melodiously." Yes, indeed. Confound their hewgags, and all other relics of an effete civilization! And again: "This city, and every other American city, is crowded with young persons of both sexes that have been 'cultured' by a vicious and false public-school system in music, drawing, and other fanciful and fashionable but practically useless arts, but that are actually incapable, by reason of their gross ignorance, of earning an honest living. They have acquired, under some well-paid 'professor' (who has bamboozled himself into the erroneous belief that he and his profession are necessary to the existence of society), some smattering of 'musical culture,' pencil-sketching, etc., but of the practical arts and sciences of living and getting a living they are more profoundly ignorant than south-African Hottentots." What would our friends on the north side say to that?

"Bell," said the lieutenant, as we were driving through this spacious southern park, in the clear light of the afternoon, "I suppose that we shall be allowed to come up here occasionally from the ranch — what do you say? — for a frolic, and for to spend a little money? I would like to have one of these little traps — it is like the ghost of a trap — *hé!* look at that fellow now!"

We looked at him as well as we could; but he had flashed by before we could quite make out what he was sitting on. In fact, there was nothing visible of the vehicle but two large and phantom wheels, and a shaft like a prolonged spider's leg; while the driver, with his hands stretched forward and his feet shot out before him, and therefore almost bent double, was, according to all appearance, clinging on as if for dear life to the horse's tail.

"It would be very fine to go whizzing through the air like that, and very good exercise for the arms too ——"

"But where should I be?" asked his wife, with some indignation. Certainly a vehicle that seemed to have no inside at all — that appeared to be the mere simulacrum of a vehicle — could not very well contain two.

"Where would you be?" said the lieutenant, innocently. "It is Chicago. You would be divorced."

It was this recalling of the divorce business that led us to see the announcement of the failure of Messrs. Balfour & Co. To tell the truth, we were not much interested in American politics; and while there were plenty of new things to be seen everywhere around us, we did not spend much time over the papers. But on this evening Queen T. had got hold of one of the daily journals to look at the advertisements about divorce. She read one or two aloud to us.

"There, you see," she remarked, addressing Bell more particularly, "you can run up here from the ranch any time you like, and become a free woman. 'Residence not material.' 'Affidavits sufficient proof.' 'No charge unless successful.' And the only ground that needs to be stated is the safe one of incompatibility. So that whenever husband and wife have a quarrel, here is the remedy. It is far more swift than trying to make up the quarrel again."

"And a good deal more pleasant too," remarks a humble voice.

Whither this idle talk might have led us need not now be guessed. The little woman's face suddenly grew ghastly pale. Her eye had been carelessly wandering away from that advertising column, and

had lit on the telegram announcing the suspension of Balfour's firm. But she uttered no word and made no sign.

Indeed, there is a great courage and firmness in this gentle creature when the occasion demands. In the coolest possible manner she folded up the newspaper. Then she rose with a look of weariness.

"Oh, dear me," said she, "I suppose I must go and get all these things out. I wish you would come and open my big box for me," she adds, addressing her humble slave and attendant.

But all that affectation of calmness had gone by the time she had reached her own room.

"See!" she said, opening the paper with her trembling small white fingers. "See! Balfour is ruined — he has lost all his money — half a million of debts — oh, what shall I do, what shall I do? Must I tell her? Shall I tell her at once?"

Certainly the news was startling, but there was no need to cry over it.

"Oh, I know," she said, with the tears starting to her eyes; "if I were to tell her now, she will start for England to-morrow morning. And I will go back with her," she adds, wildly — "I will go back with her. You can go on to Colorado by yourself. Oh, the poor child! she will fly to him at once ——" And still she stares through her wet eyes at this brief announcement, as if it were some talisman to change the whole course of our lives.

"Come, come, come," is the patient remonstrance. "You have got to consider this thing quietly, or you may blunder into an awkward position, and drag her with you."

"How, then?" she says. "It must be true, surely."

"You are taking heaps of things for granted. If you consider that absence and distance and a good deal of covert lecturing have told on the girl's mind — if you think that she would now really be glad to go back to him, with the knowledge that people have got to put up with a good deal in married life, and with the intention of making the best of it — that is all very well; that is first-rate. You have effected a better cure than I expected ——"

"Don't you see it yourself?" she says, eagerly. "Don't you see how proudly she talks of 'my husband' now? Don't you see that every moment she is thinking of England? *I know.*"

"Very well; very good. But then, something depends on Balfour. You can't tell what his wishes or intentions may be. If he had wanted her to know he would have telegraphed to her, or caused her father to telegraph to her. On the other hand, if you take this piece of news to her, she will appeal to you. If she should wish to go back to England at once, you will have to consent. Then you can not let her go back alone ——"

"And I will not!" says this brave little woman, in a fury of unselfishness.

"Well, the fact is, as it appears to an unemotional person, there might be, you see, some little awkwardness, supposing Balfour was not quite prepared ——"

"A man in trouble, and not prepared to receive the sympathy of his wife!" she exclaims.

"Oh, but you must not suppose that Balfour is living in a garret on dry crusts — the second act of an Adelphi drama, and that kind of thing! People who fail for half a million are generally pretty well off afterward ——"

"I believe Mr. Balfour will give up every penny he possesses to his creditors!" she says, vehemently; for her belief in the virtue of the men of whom she makes friends is of the most uncompromising sort.

"No doubt it is a serious blow to an ambitious man like him; and then he has no profession to which he can turn to retrieve himself. But all that is beside the question. What you have got to consider is your guardianship of Lady Sylvia. Now if you were to sit down and write a fully explanatory letter to Mr. Balfour, telling him you had seen this announcement, giving your reasons for believing that Lady Sylvia would at once go to him if she knew, and asking him to telegraph a 'yes' or 'no;' by that time, don't you see, we should be getting toward the end of our journey, and could ourselves take Lady Sylvia back. A week or two is not of much consequence. On the other hand, if you precipitate matters, and allow the girl to go rushing back at once, you may prevent the very reconciliation you desire. That is only a suggestion. It is none of my business. Do as you think best; but you should remember that the chances are a hundred to one that Lady Sylvia sees or hears something of this telegram within the next day or two."

A curious happy light had stolen over this woman's face, and the soft dark eyes were as proud as if she were thinking of a fortune suddenly inherited instead of one irretrievably lost.

"I think," said she, slowly — "I think I could write a letter that would make Mr. Balfour a happy man, supposing he

has lost every penny he has in the world."

Any one could see that the small head was full of busy ideas as she mechanically got out her writing-materials and placed them on the table. Then she sat down. It was a long letter, and the contents of it were never known to any human being except the writer of it and the person to whom it was sent. When she had finished it, she rose with a sigh of satisfaction.

"Perhaps," said she, with a reflective air — "perhaps I should have expressed some regret over this misfortune."

"No doubt you spoke of it as a very lucky thing."

"I can't say," she admitted, frankly, "that I am profoundly sorry."

Indeed, she was not at all sorry; and from that moment she began to take quite a new view of Chicago. There could be no doubt that this person of High-Church proclivities, who liked to surrender her mind to all manner of mysteriously exalted moods, had from the very first regarded this huge dollar-getting hive with a certain gentle and unexpressed scorn. What was that she had been hinting about a person being able to carry about with him a sort of moral atmosphere to keep him free from outside influence, and that the mere recollection of the verse of a song would sometimes suffice? Lady Sylvia and she had been talking of some of Gounod's music. Were we to conclude, then, that as she wandered through this mighty city, with its tramways and harbors and telegraphs and elevators, that she exorcised the demon of money-getting by humming to herself, "Ring on, sweet angelus!" As she passed through the Babel of price-quoters in the central hall of the hotel, it was no echo of their talk that got into her brain, but quite a different echo: —

Hark! 'tis the angelus, sweetly ringing
O'er hill and vale;
Hark! how the melody maidens are singing
Floats on the gale!

. . . .

Ring on, sweet angelus, though thou art shaking
My soul to tears!
Voices long silent now with thee are waking
From out the years —
From out the years!

That may have been so; but anyhow, on the morning after she had despatched her letter to Balfour, she entered into the business of sight-seeing with quite a new spirit. She declared that Chicago, for a great city, must be a delightful place to live in. Away from the neighborhood of the manufactories the air was singularly pure and clear. Then there were continual cool winds coming in from the lake to temper the summer heat. Had anybody ever seen grass more green than that in the vast projected park on the southern side, which would in time become one of the most noble parks in the world? She considered that the park on the northern side was beautifully laid out, and that the glimpses of Lake Michigan which one got through the trees were delightful. She greatly admired the combination of red sandstone and slightly yellowed marble which formed the fronts of the charming villas in those pretty gardens; and as for drives — well, she thought the chief part of the population of Chicago must live on wheels. It was so rare to find this august lady in so generous and enthusiastic a mood that we all began to admire Chicago; and quite envied our relative the ranch-woman in that she would be able to forsake her savage wilderness from time to time for this centre of the arts and civilization. We revelled in all the luxuries of a great city, while as yet these were possible to us. We went to theatres, concerts, picture-exhibitions. We drove out to the park in the afternoon to hear the band play. We purchased knickknacks for friends at home — just as if we had been a party of tourists.

"Come," said our German ex-lieutenant on the final day of our stay there, "this is our last great town, is it not? before we go away to the swamps, and the prairies, and to the bowie-knives. Shall we not dress for dinner? And I propose that the dinner is at eight. And we will drink a glass of wine to the prosperity of this fine town."

The women would not hear of this proposal in its entirety; for as we had to start by train about eleven at night, they did not relish the notion of pulling out all their finery and putting it back again in a hurry. But we dined at eight all the same; and we did not fail to drink a glass of wine to the prosperity of that fine town. Long before midnight we were all fast asleep in snug berths, the train whirling us on through the darkness toward the country of the Mississippi.

From Good Words.

COMMODORE GOODENOUGH, R.N.

Two years ago all the newspapers contained some account, more or less, of Goodenough's death, and many will remember how they suddenly came upon words there such as are seldom read anywhere — words that went straight to the heart and filled the eyes with unbidden tears, not of sorrow. His memoirs have now been published by his wife, and the book — one of some bulk — has doubtless carried the lesson of a noble life into many a home and many a ship; still it is probable that a considerable portion of our readers are not yet acquainted with a story which gives us a heartening glimpse of the purest Christian heroism in the midst of our most advanced civilization.

It was the manner of his death that fixed the eyes of the world on Commodore Goodenough; but men die as they live: no circumstances could have suddenly produced that display of heroism in its highest form; we must look for the secret of it in the faithful discipline to which he had subjected his spirit during more than thirty years of labor and success. When the poisoned arrows struck him on the beach of Santa Cruz, in August 1875, Goodenough had scarcely lived forty-four years and eight months. He was nearing by rapid strides the highest place in his profession, and might very lawfully anticipate many years of usefulness and honor. Yet he left all, not only without a sigh, but with a smile. Now that we have read the record in which a worthy love has embalmed his life, we understand how this came about.

One lesson which Dean Goodenough, his father, taught him at the early age of seven years may have done something towards moulding the man who compelled many difficulties to give way before him. The boy's pony had a trick of bolting in at the stable gate, and his father "insisted on the little boy riding up and down the road till long after dark one winter evening, and till he had mastered his pony."

Nothing is said of the origin of his religious impressions; indeed, the memoir is more reticent about such matters than some would wish, though we are disposed to regard such reticence as, under the circumstances, anything but a fault.

It was a rare occurrence [says Mrs. Goodenough] for him to speak of his inner life and thoughts, and of his faith; and therefore to many, who thought they knew him well, the last few days of his life were a revelation, and they then first learnt what was the secret spring of the life they had admired and revered.

It may be assumed that the son of the Dean of Wells and grandson of a bishop imbibed Christian influences during the seven years of childhood, the only years spent at home. "By their fruits ye shall know them," and there can be no doubt as to the root from which there grew such blossoms and fruits as clothed Goodenough's life from first to last. He is spoken of by an intimate companion at Westminster (we presume Captain Clements Markham, who has lately told us the story of life in the Arctic regions) as having been when under ten years of age what he continued to be in manhood — "honorable, true, tender-hearted, modest, brave, and a hater of all evil things. There was something in his society which roused others unconsciously. . . . Everybody liked him and rejoiced at his successes in school and on the water, which were extraordinary for so young a boy." At the same time he had some fighting to do with his fists, as boys at public schools unfortunately have, and he did it thoroughly well, beating boys older than himself.

On the 7th of September, 1844, when he wanted still two months of fourteen years, he sailed for the Pacific as midshipman in the "Collingwood," and that old two-decker was his home till the 12th of August, 1848. In the course of these four years he saw much of the world and developed the good character he had begun to show at Westminster. He gave himself heartily to the study of his profession; he acquired a knowledge of the French and Spanish languages, which proved of great service in after-life; he became the favorite equally of his fellow youngsters, in whose rambles ashore he was leader, and of the naval instructor, whose cabin he frequented for quiet study. "Always modest and unassuming, he naturally took the lead in everything; the best as a linguist, in navigation, in seamanship, in gunnery, and in all exercises, and among the foremost in all expeditions." At Juan Fernandez, when he cannot have been over sixteen years of age, an incident occurred which remarkably brought out the unselfishness and courage of his nature. He was rambling with a companion among dense foliage, and, being a few steps in advance, suddenly fell over a precipice, spraining his ankle and getting very severely cut. His companion, on coming up, heard Goodenough's voice from below eagerly warning him not to follow, though

he himself was lying in extreme pain in a spot from which he could not be got out for twenty-four hours. His companion never forgot that warning cry, which probably saved his life, and which added a feeling of reverence to his love for such a messmate.

No wonder that when the "Collingwood" was paid off the captain named Goodenough to the port-admiral as one of the juniors with whom he was specially satisfied, and wrote across his certificate, "An officer of promise." The promise was nobly redeemed.

The only prize of scientific merit open to him in these days was the lieutenant's commission given to the mate who passed the best examination after a year at the Royal Naval College. For this he went in, and won it in July 1851. His competitor was also his most intimate friend, and now looks back to that year of close companionship as one in which the good and great qualities which endeared Goodenough to him ripened and intensified. "We taught in the Sunday school together; we read and prayed together every night." His refreshment from hard work was found in attending the Bible reading which Sir Edward Parry held with the seamen in Hasler Hospital. Having won his commission he sailed in H.M.S. "Centaur" for the South American station, and spent there two years and a half; but the only new thing told us about this period is that he interested himself in the ship's boys, teaching them on Sunday afternoons. His next ship was the "Hastings," in which he served under fire at the bombardment of Sweaborg, and the chaplain tells us he found the young lieutenant his friend and counsellor in every scheme for the good of the junior officers and crew. "He was genial, kind, and sympathetic, and would help me at all times to gain the end I had in view, without violating ship's rules and naval discipline. He supported me in introducing the celebration of the Lord's Supper, then almost an unknown thing on board ship." When a youth full of spirit, talent, and professional ardor spends the critical years of life from the eighteenth to the twenty-fifth after such a fashion, not ashamed of his religion either in private or public, yet allowing none to excel him in diligence and all manliness, we know what the end will be under whatever circumstances the end may come.

The way in which the following story comes to us is as significant of Goodenough's character as the story itself. In 1857 he was at the taking of Canton and was put in command of five guns and a party of fifty men. In 1874 one of these men, who had left the navy and settled in Adelaide, met Goodenough by chance in the streets of that city when he was commodore of the Australian station, the best-known and best-liked man in that portion of her Majesty's dominions. With very excusable pride the old seaman writes to Mrs. Goodenough, telling how, "although seventeen years had passed since I last saw him, I recognized my old commander. We had a short conversation, and I begged for a visit, which he did me the honor to pay next day, and had a quiet cup of tea with me and my wife; and we had an hour's delightful conversation." He then goes on to relate how just before they went into action at Canton, he saw his leader standing with his face to a wall, a naked sword in his hand, and in the act of slowly opening his eyes, after silent prayer; how this made him think of the Bible story of Gideon and his three hundred; how, when the rush on the foe was made, Goodenough singled out and engaged a big Tartar mandarin, breaking the strap of his field-glass and flinging it away because it hindered him in the struggle; and how, when they were looking for the glass after the enemy had been scared away, they came on a Tartar lying wounded in the thigh, and he saw Goodenough empty his water-bottle into the dying man's mouth. "That man's look was a reward for the self-denial; if a painter could have painted such a look it would have created a sensation." By all means let it be painted; and a companion picture too of the young hero standing in prayer with his face to the wall, the gleaming sabre gripped in his right hand. Nothing could better illustrate the simple genuineness of his nature in its piety, its courage, its humanity.

In May of 1864 he found leisure to marry, although it was not until ten years later, and then away in Sydney, that he was able to "form his first and only established and settled home," so constantly was he kept moving from one remote place to another. He was in America during the Civil War to gather information on behalf of our government, as to matters touching his branch of the service. After that he served as flag-captain of the Channel squadron for three or four years. He was no sooner relieved from that post on the 25th of October, 1870, than, seeing an appeal for volunteers to assist in distributing food in connection with the French

Peasant Relief Fund, he offered himself, and by the 8th of November he had started with his wife for the neighborhood of Sedan, to spend the remainder of the year in hard work of a kind for which his head and heart and habits made him eminently fit. The director of the undertaking thus expressed the delight with which he and his companions hailed Captain Goodenough as a helper: —

In the dreariest period of the gloomiest of November, when autumnal rains were giving place to snow and sleet and frozen winter fogs, and we, whose business it was to convey food and clothing over the slippery and almost impassable roads to the destitute in the villages about Sedan, were almost in despair at the task we had undertaken and were in sore need of encouragement, there came in answer to our appeal for volunteers a man, the very sight of whom at once communicated new life to us. Here was a man, the very model of an Englishman, with unbounded energy, and combining extreme gentleness with an iron sense of duty; born to command, and with a genius for communicating the love of order and regularity which characterized him; a man before whom one could only feel inclined to bow down; here was this man come to place himself meekly under orders, and to go plodding day after day through snow and slush.

In August 1871 Goodenough was appointed "naval attaché to the maritime courts of Europe, with orders to visit the different arsenals of the Continent, and to report to the Foreign Office upon the navies of the European powers." At St. Petersburg he picked up one of the best of the good stories which he used to tell. He visited a factory which was shown with much ostentation as having a management exclusively Russian, and went over the whole of it without being undeceived; but at the lunch which followed an unassuming individual came in. "Oh! I beg your pardon," said the director, "this is our Scotchman, taken over with the establishment." "Yes," said the Scotchman in unmistakable accents, "lot ninety-nine!"

In April of 1873 Goodenough was made commodore of the Australian station, in command of H.M.S. "Pearl;" and much useful and honorable work filled up the brief remainder of his life. Those who are interested in the annexation of Fiji, in the missionary work going on in Polynesia, or in the kidnapping known as the labor traffic, will find much information, capitally given, in the commodore's journal, which forms the larger half of this volume. One is tempted to quote racy accounts of adventures on shore, such as that of an excursion in which he took one hundred and thirty men and officers from his ship to the top of a volcano on Tanna, getting the missionary for guide, and finding him "a famous walker and a good companion;" but we must rather, before describing his death, give the reader an idea of two things in which there was a significant revelation of character. One is the position he took up in connection with the temperance question, which it will be best to present in the words of his wife: —

In the spring of 1870 Captain Goodenough was asked to take the chair at a large tea-meeting given to the seamen by some English residents at Lisbon, who were promoters of the temperance cause; and speaking on this occasion, he told his hearers how much he appreciated their efforts and wished them success — that though he considered total abstinence a less high standard than temperance, yet, looking upon it as an extraordinary remedy for an extraordinary evil, he felt that in many cases it was a man's only safeguard, and the only means of saving him from ruin: adding, that he thought it right to tell them that, though he approved and applauded what they were doing, he did not do it himself. In June, on the return of the squadron to Portsmouth, he was asked to a similar meeting at the Sailors' Home in Portsea, and spoke in similar terms; but on his return from this second meeting, he came to the conclusion that he could not, consistently with his own ideas of right and wrong, continue to advise people to do what he did not do himself. Having already become much more firmly impressed with the advantages of total abstinence from intoxicating liquors — an opinion which gained strength with him every year that he lived — he from that day, though he took no pledge, gave up the use of all wine, beer, or spirits; and, except in case of illness, continued to do so all his life.

He had at first, as he once expressed it in a letter, taken the step out of sympathy with those who were doing what they could to raise his men, and to make their path easier; but as he continued he found it of increasing value, not only furnishing him with an answer to those who said — excusing themselves, or others, for any excess — that it was impossible to do without stimulants in hot climates, or after much hard work, but he also found his own health improve, and when again in the tropics he observed that he suffered less from the climate than he had ever done, and that he was, as he said at a meeting at Sydney only a few weeks before his death, "as much up to hard work, as ready for any enjoyment, any exertion, or exposure (even to passing a night under a tree), as I have ever been in my life, or even more so." (Pp. 78, 79.)

The other thing which has arrested our attention specially is the way in which, so

early as his thirty-third year, he looked forward to death. Just before sailing for the United States he had become engaged. The following words occur in a letter sent from that country to the lady soon to be his wife: —

December 20th, 1863.

It is a happy thing to begin a day with such vivid poetry, so rich and full of meaning, as that fifth chapter of Isaiah, especially in the dreamy life of a passage, when one's thoughts are not violently disturbed. How immensely humbling and still how soothing they are! How one always feels the beauty of them afresh, and in a new way from the last. . . . I have thought of death sometimes with a weary expectant wonder, and now it is all so different. It seems more like the happy crown of life. I was reading yesterday of Johnson's intense dread of death, — as death, the end — and of his saying that every one feared death whose thoughts were not occupied by some stronger feeling which displaced, but did not conquer that one. I think that saying quite true, and that the fear of death can only be blotted out by looking beyond and upwards to the Hands which help us over. You don't mind my talking of death; for you would have me brave, and *the only real bravery is that which can look quite calmly and in cold blood upon it.*

December 23rd, 1863.

How beautiful those words are, "Beloved, if our heart condemn us, God is greater than our heart, and knoweth all things," and it is understood, "knows all things to forgive, and to love us still." *How true it is that love is strongest of all!*

The end came thus. The commodore had come to the place where John Coleridge Patteson, first bishop of Melanesia, had fallen on the 20th of September, 1871, at the age which he himself had now reached, forty-four. It is worth while to take note of the dates of the following extracts from Goodenough's last letter: —

Off Santa Cruz,
Thursday, Aug. 12th, 1875.

I am going on shore to the spot where the "Sandfly" was last year, to see if I can't make friends with the unfortunates, who seem most friendly and anxious to be civil.

Tuesday, August 17th. — But I was disappointed. I take it they are an intractable people, without much respect for authority or for each other. I wrote the above on Thursday, *thinking that in the very remote possibility of anything occurring you should have my last word.* [After a minute and vivid account of his interview with the natives, he proceeds]: I saw Harrison up a little passage between a stone wall and the side of a hut, and went up to him to see what he was about and to be with him. He was bargaining for some arrows with a tall man who held his bow in his left hand, and was twiddling his arrows in a rather hectoring way, as I thought. Casting my eye to the left I saw a man with a gleaming pair of black eyes fitting an arrow to the string, and in an instant, just as I was thinking it must be a sham menace and stared him in the face, *thud* came the arrow into my left side. I felt astounded. I shouted, "To the boats!" pulled the arrow out and threw it away (for which I am sorry) and leapt down to the beach, hearing a flight of arrows pass. At my first sight of them all were getting in and shoving off, and I leapt into the whaler; then feeling she was not clear of the ground, jumped out, and helped to push her out into deep water; and while doing so another arrow hit my head a good sharp rap, leaving an inch and a half of its bone head sticking in my hat. . . . Messer came at once and dressed my wound, burning it well out with caustic, and putting on a poultice. The arrow seemed to have struck the rib, and being pulled out at once, no poison (supposing there to have been poison on them) could have been dissolved in the time. To-day is Tuesday, just five days; it seems but a day. In five days more we shall be able to say that all danger of poisoning is over; *but from the first moment I have kept the possibility steadily before me*, so as to be prepared; it is very good to be brought to look upon a near death as more than usually probable. The weather is lovely, and entirely favorable to the little wounds, which are absurdly small. My only trouble is a pain in the small of my back, which is a little against my sleeping. I am exceedingly well. I have asked Perry to put out a statement for the papers so that we may have no outrageously foolish stories. I can only imagine the motive to have been plunder or a sort of running-a-muck. I don't feel . . .

Here some one coming into the cabin interrupted him, and a few hours later that pain in the small of the back proved the first symptom of tetanus. Even the frightful agony produced by that disease, convulsions bending the head to the heels and rapidly making total wreck of the nervous system, was in part overcome "by his immense force of will." In the course of Thursday, during a pause of the torment, he took leave of all his officers, assuring them how he had loved them, saying a fit word to each, telling them of his happiness in the love of God, and bidding each one kiss him as a token that no hastiness on his part was unforgiven by them. He had feared that pain might overcome his better part, and had given directions that "if bad words were heard from him, those with him were to leave him, as it would not be his spirit speaking." He had also feared that some dark picture of his past life might rise before him; but he gratefully made known that,

"instead of that, God would only let him dwell on the words 'with whom is no variableness, neither shadow of turning.'" "These words," he said, "were a little window which God had opened to him in heaven;" and he said to the chaplain, "If in pain I cannot smile, let me see you smile, and do you repeat these words."

The same day he insisted on taking leave of the ship's crew, saying, "If I can only turn one soul to the love of God, if it be but the youngest boy in the ship, I must do it. Perhaps when they hear it from the lips of a dying man they will believe it."

He was carried out in his chair, wrapped in blankets, and laid on a bed on the quarter-deck, the ship's company being all around him. He begged the men to smile at him, and not to look sad. He told them that he was dying, and therefore he wished to say good-bye to them. He told them that he had had a very happy life, and now God was taking him away before he had any sorrow. He told them how happy he was in the sense of God's love and in the conviction that whatever happened was according to God's will; and he exhorted them most earnestly to the love of God, saying, "The love which God himself will give you if you trust him is very great; it will guide all your goings and doings." He begged them to try and resist when on shore the temptations to sin, which led them to break their leave and desert. "When you are tempted," he said, "think of the love of God."

He begged the older men, who had influence over the younger ones, to use it for good; adding, "Will you do this for my sake?" He begged the forgiveness, or rather he took for granted the forgiveness, of any who might feel he had been mistaken in his dealing with them, assuring them that he had always loved his ship's companies, even those among them whom he had punished, for he had always seen some good even in the greatest offender. "As to those poor natives," he added, "don't think about them and what they have done. It is not worth while; they couldn't know right from wrong. Perhaps some twenty or thirty years hence, when some good Christian man has settled among them and taught them, something may be learned about it." After again speaking of the vastness of God's love, he said, "Before I go back to die, I should like you all to say 'God bless you,'" which they did; and he then said, "May God Almighty bless you with his exceeding great love, and give you happiness such as he has given me."

He then shook hands with all the petty officers, having a special word for each; and then, again saying "Good-bye" to all, he was carried back to his cabin. He had spoken for twenty minutes or more; his voice, which was very weak at first, became quite strong and clear as he went on. On getting back to his bed he said, "Well, I suppose there is nothing more to be done now, but to lie down and die quietly!"

And so on the next day, the Friday, he died quietly and peacefully. On the Monday morning the "Pearl," which had turned back for Sydney as soon as the commodore was wounded, steamed into the harbor with yards scandalized and his ensign and broad-pendant flying half-mast. When his remains were carried to the cemetery they were followed by weeping thousands, his wife and two little boys (God bless them!) walking behind the coffin. When the tidings reached England, the dean of Westminster made his cathedral ring with these words: "Englishmen! when you are tempted to think goodness a dream, or the love of the Almighty a fable, when you are tempted to think lightly of sin, or to waste your time and health in frivolous idleness or foolish vices, or to despair of leading an upright, pure, and Christian life, remember Commodore Goodenough; and remember how in him self was absorbed in duty, and duty was transfigured into happiness, and death was swallowed up in victory."

ALEX. MACLEOD SYMINGTON.

From The Spectator.

AFRICA "TRANSLATED."

THAT familiar and expressive illustration of incongruity, "a trout on gravel-walk," comes forcibly into one's mind, on beholding the spectacle presented by the enclosure at the Alexandra Palace, where, behind a strong and high barrier of iron wire, a crowd of strange animals and stranger men are exhibited to the spectators collected on a hillside to look at them. The scene is like the woodcut in the old Bibles which represents the Garden of Eden on the naming-day of all the animals, with the candidates waiting about, in attitudes more or less desultory, for the turn of each. The long necks and fine heads of black dromedaries are pushed through the lower spaces in the wire-work, as the animals nibble the edges of the grass; camel-leopards rear their soft noses on high, and feel with their spongy tongues for imaginary leaves of the trees

they have left behind them in Africa; camels moon about, grunting and discontented, as if they wished to know why, as they are not just then being packed or unpacked, or racing, or pursuing the lumbering ostriches — whose forte seems to be the getting in the way of every other animal in the company — they are not allowed to remain in their stables. A large female camel, with a small and fluffy foal, the softest, gentlest little creature imaginable, with a confidence in human beings quite touching, and of course due to its extreme youth, is not an amiable mother, apparently. She administers its lawful nourishment to her offspring reluctantly, and sends it off among the others with promptitude. A very handsome white donkey, with reddish-brown patches, a strong, intelligent, self-willed beast, sniffs the air of Muswell Hill as if it might be a little breezier and a little sandier with advantage; an elephant, who looks surprisingly small among the crowd, considering his vast bulk in his stable, lifts up his trunk and trumpets; while several smaller elephants, yet in their infancy, shamble about in the uncouth fashion of their kind, wagging their mean little tails, and actively canvassing the spectators through the wires for cakes and fruit. The little elephants are very pleasant, friendly fellows, and one of them is a person of resource and enterprise. It was charming to watch him, as he insinuated himself between one of the Nubian tents and a tree-stem, whereon some tempting leaves and shoots were sprouting greenly, quickly slid his trunk along the bark, which it resembled in color and texture, and devoured the twigs, packing them away in his soft, cushiony mouth with haste and furtiveness, remarkably like the demeanor of a child surreptitiously engaged with a jam-pot. It was painful to learn, on the authority of this young person's trainer, who is much attached to his charge, that "green-meat" is very bad for the elephant in this climate. "Gripes!" said the trainer, who had watched this proceeding, shaking his head with prophetic sadness; "gripes! It always does it. And apples are awful, — they *will* give 'em apples in the gardens. As for oranges, they're death to' em." Cayenne pepper is successfully administered occasionally as a corrective of the results of this cruel kindness. Mild-eyed, silver-gray, horned and humped bovine animals march soberly up and down the length of the enclosure; and by far the strangest sight there, three juvenile "rhinos," all under two years old, trot about after their keeper, hustling each other close at his heels, and uttering queer little cries, very human-sounding indeed. These massive creatures, enormous in their littleness, with their huge, unwieldy heads, their clumsy limbs, and their great pot-bellied bodies, are exceedingly docile and intelligent. Their keeper, a handsome Nubian lad, talks to them, and they answer him in their odd, squeaky voices, which will become gruff as they grow older; roll and tumble about him, mumble his fingers, and are on the best of terms with him. They are very affable towards strangers also, and come up to be played with, — which is rather embarrassing, for what can one do, except pat their preposterous heads, and think of Sidney Smith's joke about tickling the dome of St. Paul's to amuse the dean and chapter. The effect of this crowd of strange animals, all perfectly tame and harmless, turned loose in the great space of the inclosure, is very striking — quite unlike what one feels at the separate sight of them in the Zoological Gardens — and by degrees, as the business of the "camp" proceeds, the illusion takes hold of one's mind; the books of sport and travel one has read come back to one's memory; these are the creatures who come down to drink, in crowds, at the brink of African lakes, by night, and travel in long, patient procession across the deserts. On the hillside the Nubian huts are constructed; they are made of strips of matting, about a yard and a half high, and in front of each is the "trophy" of its owner. A very unpleasant object is a trophy, consisting of hippopotamus-skulls, all black and ghastly, and the crossed horns and antlers of other animals slain in the chase. The hunters never move without these trophies, are very particular about their mats, never suffering any one but themselves to touch them, and have also brought to this country a huge box full of miscellaneous bones, which is regarded with considerable dislike by their white comrades. Camel-saddles, head-stalls, ropes, leathern water-bottles, shields of rhinoceros-hide, long spears, and sundry clumsy packages lie scattered on the grass and under a wide white canvas tent, until the hour arrives at which the camels are to be laden, and the caravan is to start for the desert journey with respect to which it must be acknowledged the spectators have to make believe very much indeed; and for which the Nubians, under the presidence of the head man, a Turk, in a fez, but who is otherwise inappropriately arrayed in rough English costume, make

ready with unrestrained shouts of laughter. They probably do not see the humor of the proceeding from our point of view of it, but they undoubtedly have a point of view of their own, and insist upon it to each other pretty strongly. It is a good deal assisted, no doubt, by the gravity of the spectators, which is remarkable. A suspicion of the genuineness of the Nubians lurks in the bosoms of many of the visitors, whose notions of "blacks" in the histrionic sense are mostly derived from the "minstrels" of the music-halls; and it is pleasant to observe the ingenuous satisfaction afforded by the growing conviction among the multitude that the color is "fast," and does not "run," when the Nubians do. They believe implicitly in the Turk, and hugely enjoy the legend which circulates among them that he has a wife who has never been out of doors for twenty-one years! but as for blacks,— well, have we not read how "the African Swallower," among the talented company of Mr. Vincent Crummles, was very like an Irishman, and how Corney Delany deceived even Mrs. Paul Rooney, until his ire was aroused to the point of self-betrayal by "the haythens, the Turks." The Nubians are, however, undeniable, and very fine-looking men, for the most part; not in the least ferocious, but with beaming faces, eyes like jewels set in mother-of-pearl, tall, slight, elastic figures, slender hands, the white nails showing strangely at the slim dark finger-ends; and skins of fine smooth close grain, the color a deep brown-black, like the darkest tint of antique bronze, and with the roundness and polish of bronze upon it. Only one or two have the thick lips of the negro, as we think of him, the others have thin, rather wide mouths, with white, perfect teeth, just a little protruding, arched noses, and a peculiarly fine, free carriage of the head. All their hair is wool, close, thick, jet black, elaborately combed, and in some instances curled, raised high over the smooth, polished forehead, and evidently an object of much pride and solicitude. One handsome, saucy lad, who stepped, and jumped, and flung himself off and on his camel, and clung round the neck of an ostrich as if he had not a joint that could be put out or a bone that could be broken about him, having run his lissome fingers with an air of triumph through the six inches or so of upright wool on his own head, smacked his open palm suddenly on the bald pate of one of the European assistants, and then snapped his fingers derisively, with a gleeful shout of laughter which could not have been surpassed by any white schoolboy. A little man in a white skull-cap is the chief and priest of the party, and it was very curious to observe him summoning them to some mysterious religious ceremony. They all attended promptly, wholly indifferent to the spectators — indeed, their cheerful absence of all restraint is one of the striking features of the spectacle — squatted around him, and made queer gestures with their heads and hands, then broke up the meeting, and began to jump, dance, and lunge playfully at each other's shields with their long spears. Their movements are soft and graceful, they jump strangely and noiselessly with both feet, they fling their long, slender arms out, as they talk and laugh together, and they shout in a musical tone. In the hunting scene, when the camels gallop in their lopsided way, and the ostriches blunder and lollop about, more fussy than frightened, and presenting an appearance of being half-plucked preliminary to being cooked, which was supremely ridiculous, the hunters show to great advantage. They sit, or lie, or dangle about the tall, clumsy animals anyhow, and as they come down to the end of the enclosure, waving their shining black arms, with their white muslin garments fluttering about them, their eyes and teeth glittering, and their wild chattering and laughter ringing in the air, the scene is as strange a one as the most ardent lover of novelty could desire. The lading and starting of the caravan is a curious sight, too, absurd as some of the "properties" are, and the conduct of the camels justifies one's expectations. "Good and mild" they certainly are not; they kick, squeal, bite, and protest, as we have every reason to believe they do in their native lands, and this gives a pleasant realism to the scene. But when the caravan is really started, and is wending its way through the trackless desert of the smooth enclosure — which the ostriches have cleared of pebbles — under escort of the whole troop of Nubians; when the pair of monkeys sit melancholy on a big box slung on the side of a black dromedary, and the camels follow in pairs — like Eliezer's, to the well where he met Rebecca and gave her the earrings — when the little elephants trot demurely, with their flapping ears laid back like saddle-cloths upon their shoulders; and the little "rhinos" plod heavily and whine like children taken out for a walk against their will; when the giraffes come loafing along, with their forelegs all right, but their hind legs conducting themselves independently,

and as if they belonged to somebody else; when the mild bulls plod solemnly, the ropes swaying loosely in the escort's hands; when the ostriches form a flying squadron, with thrust-out necks and thick-lashed eyes, peering into the illimitable wastes of Hornsey Rise, and sniffing the simoom from the quarter of Wood Green, — then the strangeness vanishes! We have seen all this before. Our fondest memories are associated with it, we return to the epoch of tin toys, and the soldiers whom we were forbidden to swallow. This is none other than our own old Noah's ark come to life, and formed in procession; there they are, bless them! all the beasts by twos-and-twos, even the sheep-dogs barking around; only the raven is not there, nor yet the dove; but then, for compensation, we have Shem, Ham, and Japhet, multiplied many times, and in white muslin and bare legs, instead of the "ulsters" of the period.

From Good Words.

A HIDDEN LIFE.

We all know how in the world of natural science the lines that are laid down to mark off the various divisions from each other, and are at first felt to be useful and true aids to knowledge, have often before long to be revised in view of phenomena that reveal new affinities between orders that had been hitherto regarded as absolutely distinct. So it is, in some measure, in the religious and spiritual world. The lines of separation created by rigid dogmatic constructions are now and again benignantly dimmed or effaced through the presence of some reconciling spirit, who almost unconsciously, and simply by the exhibition of the higher graces, by patience, unselfishness, and the brave bearing of burdens amidst weakness, causes those even who could find no intellectual point of unity with him to say, "After all, he was one of us," and to feel that his unobtrusive ministry of faithful self-denials carries a rich practical lesson to all who may be influenced. We believe that such a service was unobtrusively rendered by him whose memory is preserved in the little volume which recently issued from the press, titled "A Layman's Legacy." Mr. Samuel Greg lived, in the strictest sense, "a hidden life;" he was borne down by losses in his business at an early stage, and was latterly weakened by disease; he made no claims to high intellectual distinction, and underwent all the trials inseparable from a character sensitively fine rather than strong; but his memoir exhibits such devoutness, liberality, largeness of heart, and fine discernment, that we are persuaded his influence will be very deep where it is felt at all, and are certain that it must increase through the publication of his remains by his wife. To aid in this result as far as we can is the purpose of this brief sketch.

Samuel Greg was the fourth son and the eleventh child of Samuel and Hannah Greg, and was born in Manchester on September 6, 1804. His childhood, however, was spent at Quarry Bank, near Wilmslow, where his father owned a factory. As a boy, he delighted both in the rustic rides taken in the neighborhood and in the ongoings of the factory life, affording thus an early forecast of his love of nature and his interest in industrial work and workers. At seven he was sent to the school of the Rev. J. J. Tayler, a well-known Unitarian, at Nottingham. Here, timid and sensitive as he was, he suffered much misery from homesickness and other causes. We are told, however, that "he made friends for himself among the teachers as well as among the boys, with some of whom he remained on terms of warm affection as long as they lived." Thus early the love of poetry sprang up in him, and proved a solace. The delights of meditation, too, were revealed to him while at Nottingham. "He used to tell how he would go up to his bedroom in the dark, and sit down between the two little beds and give himself some question to answer, or some subject of meditation, upon which he taught himself to fix his attention."

From Nottingham, at the age of fifteen, he went to the school of the well-known Dr. Lant Carpenter at Bristol. Here he had for schoolfellows the Rev. James Martineau, Miss Mary Carpenter, the Rev. S. Bache, and the late Lord Suffolk. His literary tastes were now encouraged, and he was made to feel less of a child and more of a friend and companion to his elders.

After leaving Bristol he spent a year or two in learning mill-work at home; but his love of science was encouraged by attendance at a course of lectures in Edinburgh in 1823. When he returned to Quarry Bank, we find him deep in Adam Smith, and projecting a course of lectures in geography, earnestly intent, also, in making clear to himself the various theories of the atonement; for, though educated as

a Unitarian, he honestly endeavored to examine all points for himself, and would throughout his life have found as little sympathy from rationalizing Unitarians as from dogged Evangelicals. He and his younger brother, Mr. W. Rathbone Greg, found in each other's company the best society. They were never tired talking together of poetry, philosophy, science, politics, and social questions. "They would pace up and down all evening under the stars, and sometimes late into the night, discussing things in heaven and earth with a zest that seemed inexhaustible."

In 1832 Mr. Greg took the Lower House Mill, near to the large manufacturing village of Bollington, on the eastern borders of Cheshire. "He found the place when he took it nearly empty and desolate-looking enough — few people in the village, no machinery in the mill. He had, as it were, to form the place from the beginning, and to import hands from the neighboring districts." In spite of bodily weakness, due to attacks of illness which he had experienced some time before, and which had caused much anxiety to his friends, he went into this work with great energy, feeling that no work could be more interesting than such a creation of a little kingdom of his own, beginning afresh, as it were, in a retired valley, shut out from the rest of the busy world, where he could organize things as he liked. The welfare of his work-people, indeed, soon became an obsorbing interest. He incessantly thought and planned for them, and when he married it is clear that he found in Mrs. Greg a willing and sympathizing helpmate. In two letters addressed to Leonard Horner, Esq., he tells how the work proceeded. First, he started a Sunday-school. The superintendent and teachers were drawn entirely from among the workers, to whom he left the management; he himself, however, being present an hour every Sunday. Games and gymnastic exercises were the next thing to look to, in his idea, and accordingly he set apart for this purpose "a field near the mill, that had originally been designed for gardens; and taking advantage of a holiday," he says, "I called some of the boys together and commenced operations." Quoits, trap, cricket, and leap-frog were started; other games were added, as evening by evening the attendance increased; a section was separated for the girls, who had a swing, bowls, etc. Very soon he felt that there was no need for his presence to restrain, though he naïvely confesses, "I am generally present at the games, because I enjoy them as much as any of the party." Then he established drawing and singing classes, and started winter-evening parties. These were held in the schoolroom, which was handsomely decorated on such occasions. Warm baths were instituted, as well as library, day-school band, and flower-shows. Very careful he was on one point — not to raise individuals above their condition, but to elevate the condition itself; all his efforts had this end in view. His care descended to the minutest details; but he always proceeded on broad principles drawn from patient study of human nature.

"If I wished to make an honest man, or to keep one," he says, "I would treat him with confidence, openness, and respect, and make him feel that I trusted him, and that if he forfeited my good opinion, he would add treachery to dishonor. If I wished to make a man a villain I would treat him with harshness, suspicion, and contempt; and could hardly blame him if I succeeded in the experiment. And so if I wish to make a woman modest, kind, gentle, and mindful of the proper bearing and best graces of her sex, I would treat her with respect, gentleness, and attention, and make her feel that I think her worthy of it all. This plan I have always followed with the fair maidens of our colony, and I have never yet had cause to think that my notion was a false one."

It is not very surprising that in after-days his work-people would wistfully recall these times. "We used to want the morning to come," said one, on reading the account of his death, "that we might get back to our work. But it was not like going to work; we felt more as if we were going to school, or something like that, we were all so happy and comfortable together."

But this season of fair weather did not continue: it is hardly in the nature of things that such seasons should; and if ever man drew wise discipline from the disappointments that succeeded, Mr. Greg did. Mrs. Greg must herself tell of the failures that crushed him: —

In September, 1845, soon after the birth of his eldest son, the family removed to their larger and more commodious quarters at the Mount. But Mr. Greg was not destined long to enjoy his new surroundings. Some time before this he had been trying some new machinery for stretching the cloth, which proved very unpopular in the mill; and the work-people, instead of coming to talk the matter

over, as between friends, trusting to his meeting them in the same spirit, surprised and grieved him by a turn-out. He always regarded such a measure as an extreme step, only to be taken as a last resource, when all other means had failed, and one that need never come if a proper relation existed between master and men; and he was deeply hurt by the want of confidence in him, shown by his people having recourse to it. One of the old inhabitants of the village, speaking of this lately, said, "That was the beginning of our troubles; he never seemed to feel the same after that, and it seemed to break his spirit."

Other cares and grave anxieties supervened. "Bad times," as they are called, came and lasted; profits, never perhaps studied as vigilantly or pursued as keenly as they should have been, were replaced by losses; the means of carrying out his benevolent schemes were greatly crippled, at the very time when his over-sanguine confidence in their efficiency had been rudely shaken; and mingled disappointment and distress helped to bring on a terrible attack of illness, affecting the spine and nervous system, from which he never entirely recovered. He was obliged to retire altogether from business, and found himself, notwithstanding the kindness and generosity of relations, a comparatively poor man. He felt that he had been struck down in mind, body, and estate, at one blow. The hopes and plans that had made his life worth living, seemed suddenly swept away into darkness; and what added bitterness to the grief, was the feeling that others would point to his model village as a failure, instead of drawing example and encouragement from his success. Perhaps he felt the blow too keenly, and succumbed to it too absolutely. Perhaps a sturdier frame and a less sensitive nature might have taken up the plough again, with matured experience, renewed energy, and chastened hopes. But no one knows what tasks are possible to shattered nerves and broken health, or what is absolutely beyond the reach of the sufferer. There are some maladies which impair every capacity, except the capacity of endurance.

After this, Mr. Greg's chief interests lay in the education of his family, in theological study, in public affairs. He never lost his keen interest in social questions; but for many years he was practically an invalid and unable to take any part in practical life. One sphere of activity he never ceased to find delight in. Whilst at Bollington he had begun to conduct divine service for the people there — a duty for which he was singularly well fitted; and in nothing perhaps does his character more fully express itself than in portions of the sermons which occupy the greater part of the volume. He has the direct simplicity of sincerity and experience: he presents the results of much thought in the most lucid way, and illustrates it by admirably chosen examples. Passing by very remarkable sermons on the "The Mariner's Compass," "The Voices of the Dead," and "Almost and Altogether," in which he proves that it is easier to be a Christian altogether than to be half a Christian, we take the following from the sermon headed "The One Talent:" —

Those who have but a small trust committed to them are apt to think that, because they have not ten talents, they have not one; that because they are not among the giants of their race, they are nobody; that because they cannot do everything, they can do nothing; and therefore they make no attempt to do anything. This may be mere idleness, or it may be rebellious discontent. Because we cannot be what we should like to be, rich, great, powerful, therefore we will not be what we might be, what God invites us to be, commands us to be. Moreover, because such talents as we have are common to all, or to many, we refuse to recognize that they are talents. And yet some of the very greatest talents given to man are given to all. . . .

Have you the power of speech? Think what that power is. It is the telegraph between mind and mind. By making certain sounds I can communicate the thought that is in my mind to your mind. This, then, is to be used in God's service. It is a talent we seldom wrap up in a napkin, but we often do worse with it. It were better for many men that they were dumb, for they would thus escape much sin. For many, instead of using it for the purpose for which God gave it, use it for the very opposite. The tongue was given that it might praise God and bless men. Often it does neither: it takes the name of God in vain, it blasphemes, it curses, it breathes poison into other's ears, it speaks evil of the good and good of the evil, it sneers at what is innocent and holy, it soils itself with slander, it repeats the evil story which stabs a fellow-creature in the dark, it becomes, in short, a talent of the devil. This is worse than wrapping it in a napkin: we had better have been dumb. And yet what a talent that tongue might have been! What words of truth, and love, and purity, and sublimity, and prayer might have been spoken by it, if only the heart of which it is the utterer were thus noble, pure and loving! How it might have helped along the feeble steps of some friend or neighbor on the right path; how it might have put good thoughts into some darkened mind! how it might have spoken gentle words of comfort to some half-broken, drooping, wounded, or trembling heart! how it might have spoken the word in season for the right and good, or have helped to withstand falsehood and wrong! how it might have gone to some poor trembling spirit, cast down with fear and doubt as to the hereafter, thinking that God's wrath was pursuing it and that weeping and gnashing of teeth were awaiting

it beyond the veil! and how it might have pointed to the heaven above and reminded that spirit of God's love, of his fatherhood to his children, of his mercy, tenderness, and long-suffering, and asked that poor trembler if a God of mercy could so treat a weak child of mortality, the work of his own hand, the child of his own love! and how it might have repeated the words of Christ and the promises of God, till these sounds of heaven should have silenced men's ravings about hell, and perfect trust and love should at length have cast out fear! Might it not have done all this? And if it had done so, would it not have been a talent worth having and worth using? And might not the man who held it have lifted up his face even before his all-perfect Master, and brought his talent, not wrapped in a napkin, but laid down openly, humbly, trustingly, at his feet?

He never loses sight of the practical lesson, though he does not deal in "applications." He occasionally chooses every-day topics, but without being sensational; the following is from the sermon on "Sunshine:"—

There are some who have not the excuse of ill-health, who yet needlessly bring clouds and gloom over what might otherwise be a sunny lot. They allow a fretful and complaining temper to be as a dark shadow, blotting out the brightness from their own lives and the lives of all around them. Look at the man of evil temper. How he darkens the sunshine of heaven! How gloomy is the scene when *he* stands in the midst of it! See the anxious, fearful, unloving, sad, or scowling faces that gather round that man. The sunshine fades away in that evil presence, and a dark, cold chill falls upon the air around. Look at another — the man of kindly temper and loving heart, the smile in the eye, the word of cheery kindness on the lip, the helping hand, the strong or ready arm, the upward-looking eye. He stands the centre of a smiling circle looking on him with a love like his own. Life, light, and warmth are round him, shadows fly, bad spirits come not near, all evil things shrink away, and "tears forget to flow." How charming to come within this sweet influence! How our hearts warm in the glow! The very air seems filled with sounds of music, and sweet voices seem to sing, "Rejoice ever more!"

If we would protect ourselves against the visits of dark and evil spirits, we must have an active, well-stored mind. The mind of man is like a hall opened within his animal nature, to be the gathering-ground of ideas, thoughts, memories, hopes, fears — things not visible to the outward eye nor to be touched by mortal hands, yet which have the power to act upon our outward bodily selves, and to mould our character as clay is moulded in the hands of the potter. It is here, in this invisible chamber, that we seem to meet again the spirits of the departed. It is here that religion, its hopes, prospects and revelations, becomes a present thing, felt and understood. Now, what if this hall be empty?

Occasionally he rises to an unaffected eloquence, and, like some of the Puritan orators, uses figures very efficiently: —

Prayer is the gate of the spiritual world; it is the door of the sanctuary. It is by prayer that we rise above mortality, and sense, and sin, and draw near to the very throne of God. What a power is this! what a privilege! what a refuge! what a link between the mortal and the immortal, the creature and the Creator, the child and the eternal Father!

What man ever rose to a knowledge of either Christ or God, or to the depths of his own nature, who has not lifted up his soul in prayer? Who that *has* prayed, not once, but day by day, in every crisis and danger of his life, in every deep emotion — whether of love, or joy, or sorrow — has not felt how wonderful a provision is here made for the deepest want of our nature? What power there is in prayer to purify, to strengthen, to enlighten, to lift us into the nearer presence of that Great Being whom our spirits seek. The scoffer may scoff, and the prayerless may doubt, and philosophers may deny, and worldlings may forget, but the spirit that has been accustomed to go to God in prayer is above the sound of such voices, is not troubled by them, hardly hears them.

The mode in which Mr. Greg bore his sorrows and sufferings — shedding over the lives of others a benignant light, amply proves that such utterances came from the depths of a true experience, enriched and brightened by faith the most sincere. In the light of such utterances and facts as we have given, these words of Dean Stanley do not seem to be overcharged: "The frequence of infirmity and pain hardly ever seemed to quench his ardor, in listening, on our return from foreign countries, or in connection with our pursuits in London or elsewhere, to the accounts of the movements of the great world of science or politics. He is gone; but the glimpses which he gave to me, and doubtless to others, of the combination of a sincere trust in the divine goodness, with a sincere attachment to truth, and freedom, and progress, furnished a proof such as we can in these latter days ill afford to lose, that such a combination is not so impossible as the narrow notions of contending parties would fain represent."

From The Academy.

M. THIERS AS AN HISTORIAN.

HE was before everything a journalist, a publicist: a rapid, brilliant and sensible *improvisateur*, for whom alike speech and writing are pre-eminently means of action, having for their aim a practical result — viz., the persuasion of those to whom they are addressed. It was some time before he discovered the form of utterance most fitted for his talent. Endowed with the Marseillaise volubility, he began by writing and speaking with a certain oratorical amplitude, a certain florid emphasis; but after he had acquired more sureness and experience, he soon changed his manner, and developed a style of writing and speaking at once simple, abundant, and facile; more facile than accurate, more lucid than powerful, in which all is sacrificed to the purpose in view — viz., clearness and demonstration. A sincere passion, often mixed with somewhat of personal vanity, but generally inspired less by violence of temperament than by definiteness of conviction, and the ardent desire of communicating what he believed to be true, animated and colored the somewhat invertebrate and diffuse matter of his discourse. This passion at times raised him to the level of real eloquence, just as his lucidity of mind pointed by his ardent patriotism gave him at times an historic sense of singular depth. The famous evidence which he gave respecting the events of September 4 before the commission of inquiry of the National Assembly is in this respect a *chef d'œuvre;* and will remain the finest speech and the finest piece of history which we owe to M. Thiers.

Lamartine admirably defined M. Thiers' eloquence when he wrote in 1830 as follows: —

Il ne frappait pas les grands coups, mais il en frappait une multitude de petits avec lesquels il brisait les ministères, les majorités, et les trônes. Il n'avait pas les gestes d'âme de Mirabeau, mais il avait sa force en détail; il avait pris la massue de Mirabeau sur la tribune, et il en avait fait des flèches. Il en perçait à droite et à gauche les assemblées; sur l'une était écrit "raisonnement"; sur l'autre "sarcasme"; sur celle-ci "grâce," sur celle-la "passion." C'était une nuée, on n'y échappait pas.

M. Thiers was neither a scholar nor a thinker; but he had acquired by practice in affairs a solid acquaintance with administration, with policy, and with finance. His marvellous memory, his vast reading, and his practical energy, gave him the largest and most varied information; his practical sense and his experience supplied the lack of meditation and profundity of thought. A wonderful *ensemble* of mediocre qualities in perfect equilibrium and brought into play by an indefatigable energy gave him a superiority which might in certain moments pass for genius.

That which M. Thiers was as a journalist and a speaker, he was also as an historian. Here, also, he remained a publicist and a man of action: we must not ask of him either completeness or depth; he only says what he knows, and he says it with a particular audience in view. The characteristic of the publicist is to write always with his public in his eye; he thinks and he writes not so much the mere results of his reflections or his studies, but is influenced, modified, transformed by those whom he addresses. It was thus with M. Thiers. His "History of the Revolution," written during the restoration, was an apology for the Revolutionary period adapted to the Liberals of that time. All these had been successful against Louis XVIII. and Charles X. M. Thiers satisfied by turns all the sections of the opposition. With a fatalism which has often been the subject of censure, he praised the men of the Constituent Assembly as against the defenders of the *ancien régime*, the Girondists as against the Assembly, the Jacobins as against the Girondists, the men of Thermidor as against the men of the Terror. He knew how to make an admirable use of all the printed documents he had before him at Paris; but he never dreamed of carrying his researches further, of turning over original records, examining the reports of each important day of the Revolution, of each personage in the drama. His fatalism provided him with a philosophy at once convenient and short; and his only care was to narrate with liveliness and vigor. His "History of the Consulate and the Empire" is a more mature work, more studied, more meditated than the "History of the Revolution," but it has the same faults. In this case M. Thiers had access to many manuscript documents, but he only used them as a political speaker makes use of facts and figures — for the needs of his cause. Intentionally or unintentionally, he has neglected entire aspects of his subject, and keeps in view only those about which he has theses to support. Administration, finance, war, seemed at that time the only things worthy of the attention of a statesman: they were accordingly the only objects of his attention as an historian. The

movements of the public mind, manners, public education, the development of literature, religion, had only a secondary value for him, and play no part in his "History of Napoleon." Having begun it under Louis Philippe at a time when the Liberals were still united with the Bonapartists, profoundly imbued as he was with the administrative ideas of the empire and with some pretension to being a strategist himself, he shows in his first volumes an exaggerated admiration for the great captain who organized the Revolution. Later, under the second empire, and writing for a generation which threw back on Napoleon I. the odium inspired by Napoleon III., and also with the historic fatalism which made him admire success and condemn failure, he became severe towards the hero whom he had before unreservedly praised.

This slightly superficial point of view, conforming as it does to the illiberal passions of the great public, doubtless contributed to the success of the book, but deprives it of a permanent value, as much as the incompleteness in the manner of treatment and in the documents used. M. Thiers, again, has ignored foreign documents; and accordingly his work gives no idea of the state of Europe at the time of Napoleon — either of its political or social condition, or of the sentiments animating foreign nations. It is as a narrative that the "History of the Consulate and the Empire" is admirable. Never were military and diplomatic affairs endowed with such life. There are portions, like the first Italian campaign, which are veritable masterpieces. As an historian, though his point of view is less large, his originality of treatment inferior, while his practical sense and the justness of his judgment are greater, M. Thiers recalls the manner of Macaulay.

But, I repeat, it is wronging M. Thiers to judge him from a single point of view. He was above all, and always, a man of action. He acted all his life and in every sort of way — as journalist, deputy, minister, man of the world, historian, academician, ambassador, first magistrate. No man has been more persevering, more *routinier* even, in his ideas; none has shown more adroitness in giving effect to them. A man of sense before everything; a patriot, endowed with wit, judgment, penetration, always keeping himself in a middle region which rendered him accessible to all; he remains the noblest and most complete representative of the liberal French *bourgeoisie* of the nineteenth century with all its qualities and all its defects.

In the last twenty years of his life he began two new works, a "History of Florence" and a "System of Natural Philosophy." We must not regret that he did not live to finish them. He had neither the erudition nor the speculative qualities necessary for such efforts. M. Thiers has accomplished his work; he has died in his full glory, after having bestowed upon his country all that he was capable of bestowing upon her. Up to his last hours he was a happy man. G. MONOD.

From The Academy.

M. THIERS' WILL.

M. THIERS has left a considerable legacy to his country. By an article in his will of which up to the present moment only his intimate friends have been aware, he leaves to the State not only all his collections, but also the immense historical materials which he had gathered for his works, as well as the house which he had partly rebuilt with the funds voted by the National Assembly after the defeat of the Commune. We understand that this house will be converted into a museum. The packets of MSS., comprising documents of the highest political and diplomatic interest, which he used for his "History of the Revolution" and his "History of the Consulate and the Empire," and which had been given him or transcribed for him by the surviving members of the families of the historical personages concerned, or by the chancelleries of the various countries, will be deposited in the national archives, after the friends of the deceased have selected from them all matter of a purely personal nature. This explains why the government abstained from sealing them up, as is customary with the papers of late ministers the day after their death. The copies of Italian paintings which M. Thiers had had executed for him, mostly in water-color, by the pupils of the Ecole de Rome, will be presented to the museum at Marseilles, his native town. We hear, too, that a committee is being organized by the editors of the republican newspapers for the purpose of opening a subscription for the erection of a statue of the deceased statesman in front of his house in the Place Saint-Georges.

From Macmillan's Magazine.

LOVE'S ARROWS.

AT a league's distance from the town of Ponteille in Provence, and hard by the shrine of our Lady of Marten, there is in the midst of verdant meadows a little pool, overshadowed on all sides by branching oak-trees, and surrounded at the water's edge by a green sward so fruitful that in spring it seemeth, for the abundance of white lilies, as covered with half-melted snow. Unto this fair place a damsel from out a near village once came to gather white flowers for the decking of our Lady's chapel; and while so doing saw lying in the grass a naked boy: in his hair were tangled blue water-flowers, and at his side lay a bow and marvellously wrought quiver of two arrows, one tipped at the point with gold, the other with lead. These the damsel, taking up the quiver, drew out; but as she did so the gold arrow did prick her finger, and so sorely that, starting at the pain, she let fall the leaden one upon the sleeping boy. He at the touch of that arrow sprang up, and crying against her with much loathing, fled over the meadows. She followed him to overtake him, but could not, albeit she strove greatly; and soon, wearied with her running, fell upon the grass in a swoon. Here had she lain, had not a goatherd of those parts found her and brought her to the village. Thus was much woe wrought unto the damsel, for after this she never again knew any joy, nor delighted in aught, save only it were to sit waiting and watching among the lilies by the pool. By these things it seemeth that the boy was not mortal as she supposed, but rather the Demon or Spirit of Love, whom John of Dreux for his two arrows holdeth to be that same Eros of Greece. — MSS. Mus. Aix., B. 754.

THE story that I write of shows how Love
Once wandering in the woodlands, to a grove
Of oak-trees came, within which was a pool,
Fed by a stream of water, clear and cool.
Such a lovely pool as this
Love had hardly seen, I wis:
All about its edges grew
Blue forget-me-nots, as blue
As the hue of summer skies,
Or the light of Love's own eyes.
From this belt of flowers the sward
Upward sloped, and did afford
Footing soft as is most meet
For the soles of bathers' feet:
And upon this sward oak-trees
Stretched their branches to the breeze,
And with pleasant sound and shade
Covert from the sun's heat made.
'Neath the trees were violets seen
Mixing with the grass's green,
And white lilies, at whose sight
Life seemed merged in one delight.
When Love saw the oak-tree's shade,
And how soft the sward was laid,
He at once did throw aside
Bow and arrows — nought beside
Was he cumbered with — and then
Plunged into the pool. Again
Will not be a sight so fair
As the love-god bathing there.
How can I, poor modern, write
Of his beauty, or how white
Were his limbs, how gold his hair,
Or how passing fine and fair
Was his form: I should but spoil
Beauty's bloom, and waste my toil.
If great Marlowe could not sing
All Leander's praise, nor bring
All his beauties in his line,
Shall it be allowed to mine?
When Love tired of swimming grew,
From the pool his limbs he drew,
And on the sward himself down threw.
Love upon the green sward lay,
Flowers about him every way.
The soft turf that formed his bed
Was with lilies overspread;
And from out his hair there gleamed
Blue forget-me-nots (that seemed
Like to turquoise stones when gold
Their blue beauty doth enfold);
They had caught and tangled there
As he swam with streaming hair.
Thus Love lay and laughing played
With a grass's spiky blade,
Watching with half-closing eyes
The green-crested dragon-flies,
That about the pool did skim,
Or the bird that on its rim
Came, with outstretched thirsty bill,
From the pool to drink its fill.
But not long did Eros keep
His blue eyes from coming sleep:
For the humming of the bees,
And the murmurs from the trees
That his bed of wild flowers shaded,
All to drowsiness persuaded;
Soon he did begin to feel
Sleep o'er all his limbs to steal;
Soon the pool and meadow grew
Less distinct upon his view;
Soon his sleep-o'erweighted head
On his arm dropped down; then fled
From the eyes of conquered Love
Flowers and meadow, pool and grove.
Now, as chance had it, to the pool-side came
This very day a maiden, one by name
Margaret, a comely damsel, full of grace
Both in her form and in her fair young face.
Tall and upright she was, with black hair crowned;
Her eyes were black, and seemed to look around
With gentleness on all things, and did show
Her love for all things lovely; and here now
White flowers she sought wherewith to deck the shrine
Of Christ his Mother, and to intertwine
Their stems upon her altar. When, she drew
Near to the pool a something met her view
That glittered in the grass: she nears to see,
And, lo! a naked boy! At first thinks she
To fly and hide her blushes, but some power
Holdeth her spell-bound, and she doth devour
The sleeper with her eyes till all her soul
Grows drunken with his beauty, and the whole
Of her fair heart is moved. She presently
Among the grass his quiver doth espy,
And takes it up. Two arrows doth it hold,
One with lead barbed, the other barbed with gold.
Ah! little does she know the evils dread
Roused by these arrows: that which bears the lead
In those it touches a fierce loathing wakes;
But that which has the gold for loving makes.

Not witting this, poor maid, she draws them
out.
The gold one pricks her finger — then about
Her body runs a trembling, and a joy
Unspeakable doth hold her. On the boy
She looks, and straight doth love him. But,
ah woe!
As she stands gazing thus on him below,
The leaden arrow from her fingers falls,
And strikes the boy. He, springing upright,
calls
With hate upon her; she with love replies,
Feasting the while upon him with her eyes;
In haste he turns to fly; around his neck
She casts white clinging arms. But little
reck
Immortal limbs such binding; forth he flies,
Crying, "Thou burn'st me;" after him she
hies;
But all in vain. Soon spent she falls, and
would
Have died had not a goatherd in the wood
Found her, and led her home. From this sad
day
Margaret ne'er joined in any youthful play,
But lived disconsolately. In the grove
She would sit oft, waiting her scarce-known
love,
Who never came. Thus was much woe to
thee
Fair Margaret — and the Love-god, how fares
he? St. Loe Strachey.

Influence of Light on the Electric Resistance of Metals. — Some two or three years ago we were startled by the announcement that the electric conductivity of selenium is capable of being affected by light. It has, however, been since determined that not only selenium but also the allied element tellurium has its electric resistance diminished after exposure to luminous rays. Desirous of determining whether other bodies are similarly affected, Dr. Börnstein has carried out some interesting researches in the Physical Institute at Heidelberg. His results are published in a paper which has been translated by Mr. R. E. Day, in the *Philosophical Magazine* (June, 1877, p. 481). Gold, silver, and platinum are the only metals which Dr. Börnstein has yet examined, but as he finds that all these are sensitive to light, he is inclined to infer that the property, so far from being exceptional, is one enjoyed in greater or less measure by all metals. In the case of selenium and tellurium, it has been suggested that the alteration of resistance is due to the action of calorific rather than of luminous rays. But no such objection can be urged against the experiments with the noble metals. In fact, the resistance of these metals *increases* with the *temperature*, so that when it is found that on exposure to direct light the resistance is diminished, it is clear that heat can have nothing to do with causing such a change. Heat, indeed, tends to mask the effects of light, and the diminution of resistance is therefore a differential effect; an effect representing the difference between the increase of resistance consequent on rise of temperature, and the decrease of resistance due to the action of light. Dr. Börnstein's experiments, therefore, show beyond question that the electric conductivity of the noble metals is exalted, or their resistance diminished, by the direct effect of luminous rays.

Popular Science Review.

The Electric Candle. — Experiments have been recently conducted at the West India Docks with the view of testing the illuminating power of the so-called electric candle devised by M. Paul Jablochkoff. This simple means of producing a steady electric light consists in placing two carbon pencils side by side, but separated by a bar of a composition called "kaolin." On the passage of the current the carbons slowly burn down, and the kaolin is consumed by the heat at exactly the same rate. The carbons are thus kept always at the same distance apart, and the light playing between them is thus rendered constant without the aid of complex regulators. In the experiments at the West India Docks the current was produced by a magneto-electric machine, worked by a small steam-engine, and the results are described as having been eminently satisfactory. For lights of small and medium size, an apparatus of even greater simplicity may be employed, the carbon points being dispensed with and nothing used beyond a piece of the so-called kaolin held between the electrodes. But M. Jablochkoff's prime improvement, which promises to greatly extend the use of the electric light, consists in his ability to divide the current, so as to supply several candles placed in the same circuit, each with its own coil. These candles may be of various degrees of illuminating power, and may be lighted or extinguished separately. In short, the electricity appears to be under such control, that it might be generated in some central establishment and laid on through wires to the several centres of illumination, just as freely as gas is at present distributed through pipes to any number of burners. MM. Denayrouze and Jablochkoff, who have employed the light in Paris, have described their process before the French Academy of Sciences.

LITTELL'S LIVING AGE.

Fifth Series, Volume XX. | No. 1741.—October 27, 1877. | From Beginning, Vol. CXXXV.

CONTENTS.

I. THE SCIENCE OF ELECTRICITY AS APPLIED IN PEACE AND WAR, ... *Quarterly Review*, ... 195
II. DORIS BARUGH. A Yorkshire Story. By the author of "Patty." Part III., . . . *Good Words*, ... 217
III. ON THE DISCOVERY OF OXYGEN IN THE SUN. By Richard A. Proctor, ... *Contemporary Review*, ... 240
IV. GREEN PASTURES AND PICCADILLY. By William Black. Part XXXIV., . . *Harper's Bazar*, ... 251
V. GLAMOR, ... *Queen*, ... 255

POETRY.

TRANSLATIONS FROM HEINE. By Theodore Martin.
"Mein Kind, wir waren Kinder, ... 194
"Und wüssten's die Blumen, die Kleinen," 194
"Sie haben heut' Abend Gesellschaft," 194
"Die Jahre kommen und gehen," 194
LINES TO A TEACUP, ... 194

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

TRANSLATIONS FROM HEINE.

BY THEODORE MARTIN.

"MEIN KIND, WIR WAREN KINDER."

MY bairn, we aince were bairnies,
Wee gamesome bairnies twa;
We creepit into the hen-house,
An' jookit under the straw.

We craw'd like the cock-a-doodles —
An' to hear us the passing folk
At ilk "kickericoo" wad fancy,
It just was the bantam cock.

The kists in the yaird we papered,
And made them bonnie and crouse,
An' we dwalt there, we twa thegither —
The laird had nae brawer house!

An' aften the neebor's auld baudrons
Look'd in for a mornin' ca',
We made her our bobs and curtsies,
And snoovelin' speeches an' a'.

"An' how hae ye been? an' how are ye?"
Was aye the o'erword when she came;
To mony a queer auld tabby
Sin' syne hae we said the same.

Whiles, like auld carles we sat, too,
And oh! what gran' sense we talk'd then,
An' bemoan'd us, how things were a' better
In times when oursels were young men.

How love, an' leal hearts, an' devout anes
Had flown frae the warld clean awa';
How the price coffee stood at was awfu',
An' gowd no to come by ava'.

They are gane, thae ploys o' my childhood,
An' a' things are ganging, guid sooth!
The gowd, time itsel', and the warld,
Love, faith, and leal-hearted truth.

"UND WUSSTEN'S DIE BLUMEN, DIE KLEINEN."

IF the little flowers knew how deep
Is the wound that is in my heart,
Their tears with mine they'd weep,
For a balm to ease its smart.

If the nightingales knew how ill
And worn with woe I be,
They would cheerily carol and trill,
And all to bring joy to me.

If they knew, every golden star,
The anguish that racks me here,
They would come from their heights afar
To speak to me words of cheer.

But none of them all can know;
One only can tell my pain,
And she has herself — oh woe! —
She has rent my heart in twain.

"SIE HABEN HEUT' ABEND GESELLSCHAFT."

THEY have company coming this evening,
And the house is ablaze with light;
Up yonder a figure in shadow
Sweeps past by the windows bright.

Thou seest me not, — in the darkness
I stand here, under thy room, —
Still less canst thou see the darkness
Is shrouding my heart in gloom.

My dark heart loves thee, adores thee,
It loves, and it breaks for thee, —
Breaks, quivers, wells out its dear life-blood, —
But all this thou dost not see!

"DIE JAHRE KOMMEN UND GEHEN."

YEARS come and go; generations
Are perishing day by day,
But the love that my heart aches with,
It never will pass away.

If once, but once, I might see thee,
And sink on my knees at thy feet,
And, dying there, dying might tell thee,
"I love thee, I love thee, sweet!"

Blackwood's Magazine.

LINES TO A TEACUP.

DEAR little teacup,
Oh! my rare wee cup,
Work of Celestials! you must be divine;
Tea no one drank in
Porcelain of Nankin
So fit to rank in
Richer ceramic collections than mine.

Those curious blue marks,
Not sham, but true marks,
Prove you are nearly five centuries old;
In your young beauty
Perhaps you did brew tea
For the King Chuty,
Robed, like the sun, in a mantle of gold.

. . . .

Where is his charmer?
Who would dare harm her,
She who ruled over the ruler of men?
But in the places
Which knew her graces
She left no traces,
They have forgotten their fair denizen.

She was not brittle,
Frail perhaps a little,
Why is she missing, and you here to-day?
Say by what token
You are unbroken?
Patent to no ken
Is the distinction, for both are of clay.

From The Quarterly Review.

THE SCIENCE OF ELECTRICITY AS APPLIED IN PEACE AND WAR.*

NOT many years ago, a distinguished member of Parliament was asked to deliver a lecture to his constituents on the subject of electricity. It was necessary to obtain the sanction of the mayor for the use of the town hall. His worship's ideas of electricity were very limited; indeed, his knowledge of science generally resolved itself into a belief that scientific theories attacked revealed religion. It was impossible to disoblige the borough member, but the permission to use the town hall was accompanied by an intimation that although his worship, personally, did not entertain any objection to electricity, he earnestly hoped that the thing would not be carried too far.

Although we by no means consider electricity antagonistic to religion, we have a solid reason for not carrying the thing too far, which is, that we know too little about it. We know that it is present in the heavens above, and in the earth beneath, but in what the subtle element consists we know not. In most branches of physical science we can refer observed phenomena to some ultimate and universal elementary principle. But such is by no means the case with electricity; indeed, Sir William Snow Harris goes so far as to say, that almost every speculation relative to the phenomena of magnetism — and in this we must include electricity — partakes more or less of the nature of a mere hypothetical assumption. We have a large collection of observed facts, but with respect to the hidden or efficient cause of the facts, we really have no knowledge whatever. The problem that baffled Benjamin Franklin still defies Sir William Thomson; and the motive force still remains to be determined, of which Faraday said that he "once thought he knew something about it, but that the more he investigated it the less he found he understood it."

The telegraph has taken such a large place in the practical business of life, that the world in general is apt rather to look upon electricity only in light of an agent for rapid communication, than to regard it in its true position as one of the most extensively pervading elements of nature. It is true that the requirements of practical telegraphy have done, and may be expected to do, more than anything else, for the science of electricity and magnetism: accurate measurement of electrical quantities was a condition precedent of any solid improvement, and we owe it mainly to the demands of the telegraph operator that the requirement has been fulfilled. Men of abstract science were satisfied to know that the measurement and definition of electric resistance, electro-motive force, and so on, were within the range of scientific possibility; but the demand for such measurements and definitions was not sufficiently general to make it worth while to invent a compendious method of determining the one and stating the other. We owe to Gauss and Weber the first practical realization of a system of absolute measurement; but the principles laid down by them did not extend rapidly, even among the few by whom their theory was well understood, because there was no urgent need for its practical application.

The use of a definite electrical unit of measurement only became prevalent when it was imperatively required by the daily working of the telegraph. For many years measurements of electrical quantities were habitually performed in the telegraph factory and in the telegraph station-house, at a time when the means of performing them were still generally unknown in the scientific laboratories of Europe. The professors of science who threw out the general principle have gained a rich harvest from the seed they sowed: they gave the principle; they got back from the

practical telegrapher accurate standards of measurement, and the ready means of transmitting those standards, and of preserving them for years without change; improvements of extreme value to the work of scientific research.

In a science so new and so progressive, the dogma of to-day will often prove to be the exploded fallacy of to-morrow; knowledge is so rapidly accumulated, and so many opposing views have at different times obtained assent, that those who have no special call to follow the progress of discovery hardly know, to use a homely phrase, where they are.

The philosophers of the sixteenth century, not having any definite notion of the phenomena of the compass needle, conceived it to be influenced by some mysterious point of force existing in the regions of space. Descartes and others supposed it to be under the dominion of vast magnetic rocks. Gilbert, taking a bolder view, conceived the terrestrial sphere to be in itself a vast magnet, endowed with permanent polarity, and hence approaching the general condition of an ordinary loadstone. The hypothesis of Halley on the subject will be gathered from the mention made of it in the speech of Sir William Thomson quoted below; and the theory remained pretty much where Halley left it till 1811, when the Royal Danish Academy proposed the variation of the needle as the subject for a prize essay, and so induced Professor Hanstein to undertake a re-examination of the whole subject; the result was, in his opinion, to establish the existence of four instead of two magnetic poles. These four poles Hanstein imagined to be of unequal force, and continually shifting their places. Each, he said, has a separate movement and period, and each has a regular oblique-circular motion round the poles of the earth. The stronger north pole he calculated to perform its cycle in 1740 years, the weaker in 1860 years: the stronger south pole in 4609 years, and the weaker in 1304 years. We mention this theory principally for the occasion it affords of transcribing, for the benefit of those who are curious in such matters, a note of Sir William Snow Harris on the remarkable coincidences involved in the numbers deduced by Halley from his researches.*

We pass over the learned investigations of the Rev. Mr. Grover, Professor Barlow, and M. Biot, all of whom are spoken of with respect by Sir William Snow Harris to come to the theory of Gauss. This accomplished philosopher, whose magnetic researches have become the admiration of Europe, starting from the general principle that magnetism is distributed throughout the mass of the earth in an unknown manner, succeeded in obtaining, partly by theory and partly by adaptation, a sort of empirical formula, which represents in a wonderful way the many complicated phenomena of the magnetic lines, and has thus embodied our knowledge of them in a law mathematically expressed: —

Gauss's investigation [we quote from Sir William Snow Harris] depends on the development of a peculiar function much employed in physical astronomy. . . . By this process it is demonstrated that, whatever be the law of magnetic distribution, the dip, horizontal direction, and intensity at any place on the earth may be computed. Having exhibited his resulting formula in converging series, Gauss determines the declination, inclination, and intensity of ninety-one places on the earth's surface, and which are found to coincide with observation: one great feature, therefore, in this theory of terrestrial magnetism is, that the earth does not contain a single definite magnet, but irregularly diffused

* "By a curious coincidence, these periods involve a number, 432, sacred with the Indians, Babylonians, Greeks, and Egyptians, as being dependent on great combinations of natural events: thus the periods 860, 1304, 1740, and 4609, become, by a slight modification, 864, 1296, 1728, 4320, which are not inadmissible, considering the complicated nature of the observations from which the first numbers are derived. Now these numbers are each equal to 432 multiplied by 2, 3, 4, and 10 successively. According to the Brahmin mythology, the world is divided into four periods: the first being 432,000 years; the second, 2 x 432,000; the third, 3 x 432,000 years; the fourth, 10 x 432,000 years. It is also, according to Hanstein, not unworthy of remark, that the sun's mean distance from the earth is 432 half-radii of the sun; the moon's mean distance 432 half-radii of the moon: but what is more especially striking is the circumstance, that the number 25,920 (= 432 x 60) is the smallest number divisible at once by all the four periods, and hence the shortest time in which the four poles can accomplish a cycle. Now this time coincides exactly with the period in which the precession of the equinoxes completes its cycle. Certainly curious and remarkable series of coincidences." — Sir Wm. Snow Harris's "Magnetism," p. 17.

magnetic elements, having collectively a distant resemblance to the condition of a common magnet.

It will be acknowledged that among all these authorities we want a sure guide to lead us by the hand; fortunately we are able to obtain such assistance. Sir William Thomson, the acknowledged chief of living followers of applied science, a short time ago, in delivering the annual president's address to the Society of Telegraph Engineers, took occasion to define the present state of our knowledge on the subject of what he called atmospheric electricity: * —

As to terrestrial magnetism, of what its relation may be to perceptible electric manifestations, we at present know nothing. You all know that the earth acts as a great magnet: Dr. Gilbert, of Colchester, made that clear nearly three hundred years ago; but how the earth acts as a great magnet, how it is a magnet, whether it is an electric magnet in virtue of currents revolving round under the upper surface, or whether it is a magnet like a mass of steel or loadstone, we do not know. This we do know, that it is a veritable magnet, and that there is a motion of the magnetic poles round the axis of figure, in a period of from nine hundred to a thousand years.

When the phenomena of terrestrial magnetism were first somewhat accurately observed, about three hundred years ago, the needle pointed here in England a little to the east of north. A few years later it pointed due north; then, until about the year 1820, it went to the west of north, and now it is coming back towards the north. . . . Everything goes on as if the earth had a magnetic pole revolving at a distance of about twenty degrees round the true north pole. . . . About two hundred years from now we may expect the magnetic pole to be between England and the north pole, and in England at that time the needle will point due north, and the dip will be greater than it has been for a thousand years, or will be again for another. That motion of the magnetic pole in a circle round the true north pole has already, within the period during which accurate measurements have been made, extended to somewhat more than a quarter of the whole revolution. It is one of the greatest mysteries of science, a mystery which I might almost say is to myself a subject of daily contemplation, what can be the cause of the magnetism of the interior of the earth. Rigid magnetization, like that of the steel or the loadstone, has no quality in itself, in virtue of which we can conceive it to migrate round the magnetized bar. Electric currents afford the more favored hypothesis; they are more mobile. If we can conceive electric currents at all, we may conceive them flitting about. But what sustains electric currents? People sometimes say, heedlessly or ignorantly, that thermo-electricity does it. But we have none of the elements of the problem of thermo-electricity in the state of underground temperature which could possibly explain, in accordance with any knowledge we have of thermo-electricity, how currents round the earth could by its means be sustained. And if there were currents round the earth, regulated by some cause so as to give them a definite direction at one time, we are as far as ever from explaining how the channel of these currents could experience that great revolutionary variation which we know it does experience. Thus we have merely a mystery. It is rash even to suggest an explanation. One explanation has been suggested by the great astronomer Halley; that there is nucleus in the interior of the earth, a magnet, not rigidly connected with the upper surface of the earth, but revolving round an axis differing from the axis of rotation of the outer crust, and exhibiting a gradual precessional motion, independent of the precessional motion or the outer rigid crust. I merely say that has been suggested. I do not ask you to judge of its probability: I would not ask myself to judge of its probability. I only say that no other explanation has been suggested.

This is the latest word on the state of electric science. The ultimate cause is unknown, but two or three things, as appears from this extract, we may allow ourselves confidently to accept. The earth is a great magnet; but how magnetized we do not know. The magnetic poles revolve round the axis of the earth's rotation; but why, we do not know. The probability, as Sir William Thomson thinks, is that the magnetism of the earth is induced, a term we shall have to discuss further on, by atmospheric currents of electricity revolving round it; but why and how they so revolve Sir William evidently considers entirely unproved. He dismisses as untenable the theory of thermo-electricity, first, we be-

lieve, started by Sir David Brewster, who imagined* that the magnetism of our globe depended on thermo-electric currents, produced by the heated belt of the equatorial regions and the mass of the polar ices on either side of it. It is, however, plain that although Sir William Thomson dismisses the thermo-electrical theory as untenable, he considers the magnetism of the earth to be produced by electric currents, circulating around it in virtue of some cause to us as yet unknown.

It may be interesting to describe, in confirmation of this view, the ingenious experiments made by Professor Barlow. He wound a copper wire spirally around a hollow globe of wood in such a manner as to make the coils coincide with the parallels of latitude; he then covered the sphere and its spiral wire with the pictured gores of a common globe in such a way as to bring the poles of the electro-magnetical spiral into the same position as the observed terrestrial magnetic poles. The globe, thus arranged, was then placed under a delicately suspended needle, and electro-magnetic currents were caused to circulate through the spiral wire beneath the paper surface. It is a very remarkable fact that the needle so suspended represented on a small scale, under the influence of the spiral currents, all the phenomena of dip and variation exhibited by the compass-needle on the actual globe. Professor Barlow thinks "that he has proved the existence of a force competent to produce all the phenomena of terrestrial magnetism without the aid of any body commonly called magnetic." But we will not further weary our readers; they will probably be inclined, in the face of all these varying theories and ingenious experiments, to agree with Sir William Thomson and Sir William Snow Harris, that although we may reason of observed phenomena, the inducing causes of those phenomena remain a mystery of which we know nothing.

If anything can contradict the saying of Solomon that there is nothing new under the sun, it is the recent development of the powers of this mysterious agency. Neither the toying of Greek philosophers with amber, nor the description of the magnet by Lucretius, nor even the alleged knowledge of the mariner's compass by the ancient Chinese, detract from its novelty. The application of electric force to the practical affairs of life belongs to the last forty years. Our old men remember when it took many months to get a letter to India; but the rising generation would think themselves ill-treated if they did not read in the *Times* each morning the report of any important event which had occurred in India the day before. Electricity rings our bells, lights our shores, runs our errands, and, as we hope, will blow up our enemies if they approach our coasts. It has become indispensable in peace, and doubly indispensable in war. Last, not least, it has young and vigorous literature, and a special language of its own. It is perhaps owing to the latter circumstance that it is not more generally studied. Its text-books bristle with technical terms completely strange to the uninitiated, and even those terms have not in all cases arrived at their final and definite meaning. Besides this, mathematics have stepped in and claimed it for their own.

> The hard-grained Muses of the cube and square,

as Tennyson calls them, have more and more taken possession of it.

The reasoning of writers on magnetic subjects is now so uniformly conveyed by means of algebraic symbols, that only a skilled mathematician can follow them with comfort. This is doubtless unavoidable in the case of masters dealing with the higher branches of a science that depends on highly abstract reasoning; we do not complain, we only assign the fact, as one cause of the purely esoteric position that electricity is rapidly assuming. We are quite ready to admit the truth of Miss Moucher's remark, that there is a rule of secrets in all trades; the physician's prescription is still written in Latin, and Miss Cornelia Blimber gives her analysis of Little Dombey's character in numbers. We all know how that delightful lady, taking eight as her standard or highest number, found the poor child's natural capacity stated at six and three-fourths: violence, two; and inclination to low company, as evinced in the case of a person named Glubb, originally seven, but since reduced: but notwithstanding these precedents, outsiders like ourselves may be permitted to speculate whether a good deal of information might not be made public property which is now hidden under a heap of symbols.

Whatever we may think of the propriety of always affecting mathematical notation, we have no intention of laughing at the very ingenious nomenclature which

* Sir William Snow Harris quotes as his authority for Sir D. Brewster's views, "Edin. Phil. Trans.," vol. ix.

has been adopted by the framers of electrical language. It must be confessed that it sounds strange to unaccustomed ears; but we must remember that it was invented to express ideas absolutely new, and that the mind soon becomes used to any word to which definite signification is attached. When electricity passed from the position of a phenomenon to be studied only by philosophers, into that of an agent subservient to the daily wants of man, it was found necessary to invent words and technical terms to express its new conditions. No doubt it is possible, as we propose to show, to express the main facts and even the scientific methods of electricity without employing symbols, or unduly parading its scientific terminology; just as a traveller, returning from a distant country, can gossip pleasantly about the wonders he has seen, describe the manners and customs of the people, and even give a very fair idea of their cultivation and modes of thought, without conveying his information in a foreign language.

Still, as we cannot quite keep clear of technicalities, we propose to do the next best thing; namely, to collect them in a couple of preliminary pages, which well-informed people, and very idle people, are hereby solemnly warned to skip.

It is not of course to be supposed that the "Journal of the Society of Telegraphic Engineers," and the writings of Sir William Thomson on "Electrostatics and Magnetism," the titles of which are at the head of this article, will afford the inquirer much information of an elementary character. Written by professed masters of the science and addressed to a professional audience, these works presuppose a kind of information which the generality of people are not likely to possess. But if we succeed, as we hope to do, in giving such a general outline as will supply this defect, our readers will find in the "Journal" a mine of interesting information. The society from which it emanates is only in the seventh year of its existence; but it has already assumed a leading position among learned societies, and it numbers among its members most of those who, either in this country or on the Continent, have devoted themselves to electrical science. The papers it contains, written and read from time to time by busy men on subjects arising in the daily exercise of their calling, are of course desultory, but it will be found that few improvements worthy of remark have escaped notice; and the progress of telegraph work all over the world has provided a body of skilled and able observers, whose collective watchfulness will no doubt soon raise the new science from the somewhat empirical position it has hitherto occupied, and enable it to rank with the more exact branches of physical research. The daily experience of telegraphic operators, constantly noting new electrical phenomena, and with busy brains puzzling out their cause, ranges of course far beyond the comparatively narrow domain of mere telegraphy, and the labors of the leading telegraphists have gone far to build up a tenable theory of electricity; but, as we have seen, their acknowledged leader, Sir William Thomson, is fain to confess that the desired object is not yet by any means attained. Sir William's own papers on "Electrostatics and Magnetism" are marvels of industry and patient research. But it must be confessed that they are "caviare to the general." The titles of them alone would be enough for most people. For instance, one that we transcribe almost at random from his table of contents, on "Hydrokinetic Analogy for the Magnetic Influence of an Ideal Extreme Diamagnetic," sounds anything but light reading. Fortunately we are not obliged to invade this part of the learned professor's domain; we consult him principally for his opinions on the general magnetic condition of the earth, and for occasional dicta on subjects which he is acknowledged to have made especially his own.

It is hardly necessary to remark that to voltaic or current electricity, and to its congener electro-magnetism, all modern improvements are due. Frictional electricity, such as was known to Franklin, and to observers before the time of Galvani, though it is a manifestation of the same force which now works our telegraphs and explodes our torpedoes, so far differs from it in kind that it could never have been utilized in the every-day business of life. In modern electrical parlance, frictional electricity was high in tension and deficient in quantity; it could break with ease through the opposition of a non-conductor which would stop the feebler current of an ordinary galvanic battery, but its energy was exhausted by the effort of a single discharge. There was a spark; a crack; a shock if any sentient being was in the circuit — and then all was at rest. There was no means of obtaining a continuous current such as that we now command at will. A modern battery combines both requirements, it will keep up a continuous stream of electricity through a long circuit, for days and even

for months together. It can, on the other hand, be so arranged as to deliver a flash, of power so tremendous that it would penetrate thick glass, or leap from pole to pole of conductors held a yard apart. It is this manageable nature of the agent which gives it all its value.

The discovery of current electricity was the result of pure accident. The wife of the professor of anatomy at Bologna being indisposed, her physician prescribed a broth of frogs. It would seem that the professor's domestic and professorial arrangements were carried on in the same apartment, for the frogs destined for the lady's refreshment were laid out, properly prepared for cooking, on the table where the professor was engaged with his electrical machine. With true scientific curiosity, Galvani tried a few experiments with the animals before they were consigned to the pot. A spark from the conductor caused their limbs to contract: struck by a phenomenon new to his experience, he determined to follow it up, and devoted himself to experiments on the electricity of animals with such zeal, that he became the terror of every pond near Bologna. He one day hung a dead frog by a copper hook to the iron balcony of his window. The limbs of the animal became convulsed, and the professor, unable to account for the phenomenon, took refuge in the hypothesis of what he called animal electricity, supposing opposite kinds of electricity to exist in the muscles and nerves.

This theory Galvani supported till his death with great ingenuity and determination; but a rival philosopher, Volta, professor of physics at Pavia, started a new view. He contended that the two metals, copper and iron, in the experiment of Galvani, were the real electromotors, and that the muscles of the dead frog only played the part of moist conductors in completing the circuit.

This was vigorously opposed by the partisans of Galvani, and a scientific war of opinion waged for many years between the schools of Bologna and Pavia, out of which Volta ultimately came victorious. Volta, in the course of a series of experiments, in which he tried to produce effects similar to those witnessed by Galvani, substituted other substances for the animal tissues, which Galvani regarded as essential, and discovered the means of producing a continuous current, which is called after him, voltaic electricity. Although Volta was right in his main contention, he had only advanced one step beyond Galvani, when he, too, fell into error. It was his opinion that the simple contact of two dissimilar metals was sufficient to produce an electric current; but the theory now generally adopted is that first suggested by Fabroni, which regards chemical decomposition as necessary to the development of the voltaic current. The contact theory of Volta assumes that the origin of the action is due to the simple contact of two dissimilar metals, and that the mere juxtaposition of these begets and sustains a force which is the sole cause of all the energy displayed. But Volta, and all those who afterwards supported him in his view, were ignorant of dynamics. They did not know that the quantity of energy in the universe is constant, that to create *de novo* the smallest fraction of it is as far beyond the power of man as it would be to add one grain of matter to that which is already in existence. All that man can do is to alter the direction of existing energy, but in whatever form it is made to appear it is but the equivalent of some pre-existent form, which, Proteus-like, is driven to assume an altered shape. It is now thoroughly understood that in a zinc-copper battery the decomposition of the zinc is a condition necessarily precedent to the production of a current.

It has been customary to speak of electricity as if it had a distinct existence, and were an extremely subtle fluid capable of flowing as a current. The theory of Symner, as this hypothesis is called, however convenient for the purpose of simplifying explanation, must not be looked upon as scientifically tenable. Symner assumes that every substance in nature contains an indefinite quantity of an imponderable matter formed by the union of the two fluids, to which the names of positive and negative electricity have been given. These two fluids when in combination neutralize each other, and the body containing them is then said to be in the neutral or natural state. By friction, and by several other means, the two fluids may be separated; but one of them cannot be produced without the simultaneous production of the other. Such is the theory; but, however convenient it may be for the purpose of reasoning about a purely abstract idea in the common language of life, it contains fundamental errors. There is no fluid, properly so called; the agency exists only as a force. Its subdivision, then, into mutually opposing fluids also falls to the ground. Sir William Thomson says that, although according to pre-

vious writers, "a hypothesis of two magnetic fluids has been adopted, no physical evidence can be adduced in favor of such a hypothesis, but, on the contrary, recent discoveries, especially in electro-magnetism, render it extremely improbable." *

The term "electric fluid" must be looked on as purely conventional; electricity must be conceived of as a force, pervading all nature, latent in every substance, and liable at any moment to be excited by mechanical or chemical means. This force obeys certain laws, and acts in a particular manner; but the terms "fluid" and "current" do not accurately represent its action, inasmuch as it does not flow bodily from place to place, as a current would do, but follows rather the analogy of the undulations of light or the waves of sound. This, however, is of little practical importance; it is enough for our present purpose that the earth is an inexhaustible reservoir of electricity, and that it is possible to separate a portion of that electricity from the main body. The portion so separated will struggle to escape and recombine, and the energy it thus exerts can be utilized for the purposes of work. In forcing its way through or over obstacles, electricity exerts force which may be directed, utilized, and measured.

Force may be exerted either to produce motion in bodies at rest, or to oppose resistance to the motion of moving bodies. In either case it will do a definite amount of work, and that amount of work can be compared with a standard. The first step, then, was to contrive a standard, by which electrical energy might be measured, and in terms of which it could be expressed. In mechanics, a force sufficient to raise one pound to the height of one foot, affords such a standard, for it is practically invariable. This would be too rough for the measurement of electrical force, which is minute in quantity; but one analogous in conception has been adopted: namely, a force which will lift one gramme to the height of one metre, in one second of time; this standard force has been named an "absolute unit." In measuring a force it is not necessary to inquire whether it is employed in promoting motion or in resisting it; so that the strength of a current, the resistance offered by a wire to the passage of a current, the quantity of electricity passing through a given circuit, and the capacity for electrification of a given condenser, can all be expressed in the terms of the absolute unit.

* Electrostatics and Magnetism, p. 340.

The next step was to invent and give a name to some measure which should be an accurate multiple of the absolute unit. A man calling for a pint of wine does not calculate the cubic contents of his bottle; he compares the quantity he buys with a standard pint: and if he buys a cask, he ascertains that it contains a certain number of standard quarts. In the same way electricians have given to their standard measure, and to its derivatives, names which sound very strange to unaccustomed ears, though they fulfil very well the objects for which they were designed, being short, striking in sound, easy to remember, and significant.

The whole of this useful labor was performed by a committee of the British Association, which was appointed some years ago, and comprised most of the principal electricians of the country; their report has been adopted both in England and abroad. They found that a prism of pure mercury, one square millimetre in section, and 1·0486 metre in length, at a temperature of 0° centigrade, offered a resistance to the passage of a current equal to ten millions of absolute electric magnetic units. This measure they called a "British Association unit," or shortly a "B. A." unit. This designation has now been practically superseded by an arbitrary name; it is called, after a great electrician, an "Ohm." Certified copies of this standard, consisting of coils of platinum silver-wire, each of which oppose to an electric current a resistance equal to a given number of ohms, are now everywhere obtainable. They are known by the name of resistance-coils, and are marked with the number of ohms' resistance which they offer. They are conveniently arranged in boxes, and so connected that a current can be easily passed through any required resistance; and at the present time all electrical resistances are as habitually measured in ohms, as liquids are by the pint, or ribbons by the yard.

Force being imponderable, we can measure and weigh only the work which it performs; the names of weights and measures employed in electrical science are coined out of the patronymics of those who have been distinguished in electrical science. Faraday gives his name to the unit of capacity, under the name of a "Farad;" Volta impresses his name on the unit of tension, under the name of a "Volt." The unit of current is called of the professor of that name, a "Veber." The unit of resistance, as we have said, is an ohm. These designations are

further compounded with Greek adjectives, a "macrofarad" is a million times, and a "microfarad" the thousandth part of, a farad. A "megohm" is a million ohms, a "megaveber" a million vebers, and so on.

We need, however, trouble ourselves very little with the greater part of these names; the reader who will take the trouble to remember that the ohm is the standard measure of electricity, and who will glance at the explanation of some half-dozen electrical terms which we now proceed to describe, may consider himself free of the guild as far as the purposes of this paper are concerned.

The first, and perhaps the most important of these terms is the word "potential:" to say the truth, the text-books are curiously puzzling in their attempts to explain it. The matter is, however, very simple. If two electric batteries, or other sources of electricity, A and B, are of different electrical strength, there will be a tendency in the electricity at the point most highly electrified, to combine with that at the point of lowest electrification.

If A were electrified twenty times as strongly as B, the potential of A would be said to bear to the potential of B the proportion of twenty to one, and the greater the difference of potential the more strenuous becomes the effort of the electricity to recombine. It would force its way at once from one point to the other, were it not that air is a non-conductor, and electricity requires a prepared path or conductor to travel over. If the two points be brought close together, before they actually touch, a spark will overcome the resistance of the intervening air, and spring from one to the other; but if, instead of approaching the two points to each other, the distance between them is bridged over by a conductor, the same thing will occur; the only difference will be that, supposing the electromotive force to be constant, in the first case there will be a succession of sparks, and in the second a continuous current. It matters not whether the distance to be overcome be traversed by the leap of a spark across half an inch of air, or by the passage of a current along a thousand miles of telegraph; the cause is in each instance the same, namely, difference of potential between the two poles. This is an axiom of fundamental importance. The anxiety of electricity to recombine is called its "tension," and the degree of tension existing on any substance is spoken of as the potential of that substance.

Very often by atmospheric agency, or by some other of the many means which nature employs in such cases, a difference occurs in the electrical potential of the earth at two places on its surface, say at New York and in London, and the result is an earth-current passing from one to the other, very much, as we shall presently see, to the embarrassment of telegraph-working between those two localities.

Our next definition must be the meaning of electrical *resistance*. Every substance can be electrified; some very easily, and some with great difficulty. For instance, the metals, with German silver and copper at their head, can be electrified almost instantaneously. Other substances, such as glass, carbon, shellac, or gutta-percha, take a very long time, and very strong and persistent electric excitation to become so. Those substances which are quickly electrified are roughly, but not very accurately known as conductors; and those over which electricity moves slowly, are with equal inaccuracy, called insulators. It is all a question of degree; the best conductor offers a certain amount of retardation, or, in electrical language, resistance, to the march of the fluid; and the worst conductor known is permeable in time, and does not afford perfect insulation. To be sure, electricity moves along a copper wire at the rate of two hundred and eighty-eight thousand miles a second,* and it would take a very long time to creep over a few inches of gutta-percha; but as a mathematical fact, neither insulators nor conductors are perfect. If we take one hundred as the standard of conductivity, or absolute non-resistance, pure copper wire would show, perhaps, ·95 or ·96 of conductivity, and consequently ·05 or ·04 (the reciprocals of those numbers) of resistance. Gutta-percha, at the other end of the scale, would perhaps show ·01, or perhaps not nearly so much, of conductivity, and ·99 of resistance. A mathematical formula, discovered by Ohm, states electrical resistance to be inversely proportional to the strength of the current.† We see the result of this in the case of a lightning conductor. A small copper wire would carry away a moderate current without disturbance; the current and the resistance of the wire would have some man-

* See page 204.

† $I = \frac{E}{R}$ where I is the intensity of the current, E the electromotive force, and R the resistance.

Original from CORNELL UNIVERSITY

ageable relation to each other; but a flash of lightning discharged along the same wire would be so intense that it would fuse the wire. The resistance would be the same, but the proportion would be destroyed by enormously multiplying the strength of the current.

On the same principle, a piece of carbon introduced into a circuit would stop the passage of a feeble current, being a bad conductor; it would, however, let a stronger current pass, but before doing so it would offer such a vigorous resistance, that the energy necessary to overcome it would develop caloric sufficient to heat the carbon white hot. This is the principle of the electric light. The reader will now, we hope, follow us when we speak of the resistance of a wire, a battery, or an electric circuit of any kind.

We now come to electrical *induction.* This curious property of electricity exercises a most important and sometimes a very unmanageable influence, in practical work. Indeed, it would hardly be too much to say that it thrusts itself into every problem which arises for solution. Sometimes it is utilized to the greatest advantage, as when it is applied to the purpose of storing up electricity ready for future service in condensers or accumulators; sometimes, as in the case of the well-known Ruhmkorff coil, it is invaluable in producing secondary currents even more useful than the direct products of the battery. Sometimes it presents itself in a less manageable form, as an influence retarding, and nearly destroying, the transmitted currents in submarine cables; but in whatever form it appears, whether as ally or as opponent, it plays a most important part.

Electrical induction may be defined as the mutual effect of electrified conductors in presence of each other, but separated by a non-conductor. The phenomenon may be produced in its simplest form by fixing two pieces of tinfoil, facing each other, one on each side of a sheet of glass. If the tinfoil on one side of the glass be connected with the earth by a wire, and the tinfoil of the other side be connected with a battery or electrical machine, electricity will be simultaneously produced on both sides of the glass, and the two electricities so produced will hold each other prisoners by their mutual attraction through the glass, till one or other of them is discharged, or till they are allowed to unite by means of a conductor. This "holding" power is utilized in the shape of instruments known as "condensers," for the purpose of storing electricity. A large number of sheets of conducting material, such as tinfoil, each separated from its neighbor by a non-conductor, for instance, paraffined paper or sheets of mica, are bound up together; when in use one of each pair of conductors is connected with earth, and the other with a battery; a number of such pairs, packed in convenient form, and connected together in series, may store up any required amount of electricity for the purposes of experiment or work.* Condensers are now sold with their capacity in farads marked upon them.

Like most of the discoveries which have made the progressive development of electrical science possible, the invention of the Leyden jar, as the earliest and best known form of condenser is called, was the result of a lucky accident. It dates from the last century. Most amusing accounts are given of the dismay with which the discoverer looked upon its effects. Professor Muschenbroek, it seems, had been thwarted in some of his experiments by the escape of electricity into the air. This he attributed to the vapors and effluvia suspended therein. It occurred to him that if he could electrify water in a glass bottle, the dissipation of the mysterious fluid might possibly be prevented. He accordingly half-filled a bottle with water, and proceeded to electrify it from a battery. When he considered the water sufficiently charged for his purpose, he attempted to remove the connecting wire with his left hand, holding the bottle in his right. He received a shock which terrified him beyond measure. He wrote to his friend Réaumur that he had received a blow on his arms, shoulders, and breast; that he lost his breath, and was two days before he recovered from the shock and the terror. In Muschenbroek's experiment the water acted as the inner coating, the glass, as usual, was the dielectric, the professor's right hand, as he held the bottle, was the outside coating, and the left, when he innocently touched the wire, completed the circuit, and discharged the stored-up fluid through his body. Modern Leyden jars are glass vessels coated inside and out with tinfoil. Muschenbroek wrote to his friend Réaumur that for all the kingdom of France he would not receive another shock; but he was sufficiently public-spirited to try the experiment on his friends; they were almost as alarmed as

* The electricities will be of opposite name, that is, if the battery current be positive the induced current will be negative, and *vice versa.*

himself. M. Lallamand, on taking a shock, declared that he lost the use of his breath for some ten minutes, and then felt so intense a pain along his right arm that he feared permanent injury to it. Herr Winkler stated that the first time he underwent the experiment he suffered great convulsions through his body; that it put his blood into agitation; that he feared an ardent fever, and was obliged to have recourse to cooling medicine. This professor was a very bold man. He administered a shock to his wife, and it made her nose bleed. From all which we learn that either the electrical machine, or the imagination, of Professor Muschenbroek, possessed a strength unattainable in these degenerate days.

A curious, and to practical telegraphers a very convenient, development of the phenomenon of induction is offered in the case of submarine cables, by the retardation of signals. A telegraph cable is, as one may easily see, only an elongated condenser; the copper wire of which, representing the inner coating, is separated from the outer coating of water and earth in which it is laid by its gutta-percha insulator. It is obvious that two or three thousand miles of wire present collectively an enormous inductive surface; indeed, Sir W. Thomson tells us that, if it were possible from some extraneous source to give a charge of electricity to the whole earth, no greater amount would be necessary for that purpose than is held prisoner by a few miles of cable.* The holding power of the wire when fully charged is very great; so great that a current, instead of flowing through the cable with the rapidity of light, follows one may almost say, the analogy of a viscous fluid, and dribbles through with comparative slowness.

On submarine telegraph cables messages are transmitted at the rate of fifteen or twenty words a minute, whereas, if the effect of induction could be removed, three or four hundred words per minute might be sent. The current has been experimentally found to move through the Atlantic cables at the rate of 6,125 miles per second — an enormous velocity, of course, but nothing like the pace of the fluid in overhead insulated wires. The speed of electricity under the latter circumstances was found by Sir Charles Wheatstone to equal two hundred and eighty-eight thousand miles per second. This enormous speed, forty-five or forty-six times as great as the velocity of the current through a submarine cable, was ascertained in a manner which has since become the standard method of measuring enormous velocities and infinitesimal fractions of time. Wheatstone suspended around the walls of his lecture-room at King's College about four miles of wire. On his table he placed a little instrument which he called a spark-board, and before the spark-board he made a circular mirror rotate at the rate of eight hundred turns per second. The wire was so arranged, that its two ends were connected one with the outer and one with the inner covering of a charged Leyden jar. When the jar was discharged, the spark traversed the whole length of the wire. But in the wire were three beaks. The first occurred at the spark-board, soon after the wire left the jar, the second at the end of two miles of wire, and a third just before the wire returned to the jar. All these openings were so arranged as to occur at the spark-board. The current of the jar at the moment of discharge was thus made to show itself in the form of a spark three times, as it overleapt the three intervals; these were reflected in the mirror. When the mirror was at rest, the sparks showed only as three dots; but when the mirror was made to revolve very rapidly, the dots changed into lines of light, the length of which varied with the rapidity of the revolution of the mirror. By measuring the length of these lines and the rate of rotation of the mirror, and noting how much the central line lagged behind the others, Wheatstone was able to calculate how long the spark took to traverse the intervening wires. This experiment gave, as we said above, two hundred and eighty-eight thousand miles per second for the velocity of the spark.

One of the exemplifications of induction most familiar to our senses, is a thunderstorm. Here, again, the analogy of the Leyden jar comes into play; the earth, highly charged with electricity, is separated by a non-conducting stratum of air from the thunder-cloud, also charged to a high potential. The two electricities, that in the earth and that in the cloud, hold each other prisoners by their mutual attraction, and, as the charge on each continues to accumulate, the particles of intervening air are raised to such a high degree of polarization that they fall into a state which is described as of "tottering equi-

* Journ. Soc. Tel. Eng., No. vii. p. 12. "Such amounts as we deal with in our great submarine cables would, if given to the earth as a whole, produce a very considerable electrification of its whole surface. The earth's radius is about six hundred and thirty million centimetres, and its electrostatic capacity is therefore six hundred and thirty million microfarads, or about that of sixteen hundred miles of cable."

librium;" the slightest change destroys this condition, and electric discharge follows with all the effect of light, heat, and mechanical energy.

An electrified cloud decomposes the combined electricity of every object over which it passes, repels the electricity of the same kind as that contained in itself, and attracts the opposite kind. The earth and objects beneath an electrified cloud are in this manner charged by induction. When the attraction between the opposite kinds of electricity becomes greater than the resistance of the intervening air, a discharge takes place. It is the accumulation of induced electricity on buildings, which offers the attraction for the opposite electricity contained in the electrified cloud, and causes them to be struck by lightning. The flash will pass along the line of least resistance at the moment when earth and air can bear the mutual tension no longer. Any accidental object may turn the scale. As Mr. Preece puts it, a ship sailing calmly over the ocean, a moving railway train, a horseman galloping home for shelter from the approaching storm, may be the last straw that breaks the camel's back.

Everybody knows the celebrated experiment of Franklin, by which he demonstrated the identity of electricity with lightning.

Franklin, when he sent up his kite, fastened a key to the string, and to the key a silk ribbon, intended (silk being a non-conductor) to isolate him from danger. For some time he was unable to perceive any appearance which would justify his theory; but a shower came on, the kite-string was wetted, and therefore became a good conductor. Franklin, in his impatience, presented his knuckle to the key, and was gratified by receiving a smart shock. It was lucky for him that his success was not more complete than it proved to be, for he would have paid dearly for the honor of his discovery.

He thought that his kite had withdrawn electricity from the thunder-cloud, whereas the discharge he witnessed depended on the inductive action of the thunder-cloud on the kite and string; he escaped destruction, because the electricity with which his kite and its string were charged was the small amount induced on them by the thunder-cloud.

Philosophers who followed in his footsteps did not escape so easily. Professor Richmann, of St. Petersburg, was killed by lightning in the following year. He had erected an apparatus in the air, making a metallic communication between it and his study, where he had provided means for repeating Franklin's experiments. He was describing to his friend, Sokoloff, the nature of the apparatus, and was stooping towards the electrometer to observe the force of the electricity, when a great white and bluish fire appeared between the rod of the electrometer and his head; at the same time a sort of steam or vapor arose, which entirely benumbed Sokoloff and made him fall to the ground. Several parts of the apparatus were broken and scattered about, the doors of the room were torn from their hinges, and the house shaken in every part. The wife of the professor, alarmed by the shock, ran into the room, and found her husband sitting on a chest, which happened to be behind him when he was struck, and leaning against the wall. He appeared to have been instantly struck dead; a red spot was found on his forehead, his shoe was burst open, and a part of his waistcoat singed.*

This dreadful accident was caused by the neglect on the part of Richmann to provide an arrangement by which the apparatus, when too strongly electrified, might discharge itself into the earth. If in Franklin's experiment lightning had really passed from the clouds to the earth, he would infallibly in like manner have been killed. People are very little wiser than they were in Franklin's time. At a recent meeting of the Society of Telegraph Engineers, Mr. Preece, one of our most distinguished electricians, spoke as follows: —

> When I go into country towns or places, and have a few minutes to spare, I invariably go to the church, not only to admire the architecture, but especially to see what sort of lightning-protection it is furnished with; and I am bound to say this: I have never been to one church yet where the lightning-conductor comes up to my notion of what a lightning-protector should be. . . . Sometimes it has no point and even no earth. Generally it is made of the most expensive copper rod; sometimes of the most inefficient iron tubes, broken in the middle; but in my experience of hundreds of churches, I have never seen one single lightning-conductor that I would pass as a lightning-conductor.†

Now considering the professional eminence of the speaker, and the fact that his remarks refer to no remote date, but were spoken on the 12th of May, 1875, it behoves us all to look to our defences. It

seems almost incredible, yet we believe it to be the fact, that St. Paul's Cathedral, situated as it is in the heart of the city of London, was, until very lately, in an electrical sense, totally unprotected. During all the years since first it raised its golden crown over the murky atmosphere of Cheapside, until the year 1872, it was in such a condition that a single one of the thousand storms that must have played around it might have crumbled it to the dust. At its summit, on the exterior, there is a mass of metal weighing many tons, all of which was electrically insulated. The reverse, of course, should have been the case. The whole of these — cross, scrolls, and ball — should have been connected by some good conductor with the earth. Beneath the cross, and immediately below the great leaden dome, is a gallery of massive iron-work ; still lower are the immense lead-covered surfaces of the aisle-roofs. All these were found to be so completely insulated, that if insulation had been an object to be attained by the utmost possible exercise of scientific ingenuity, it could hardly have been more effectually accomplished.* The lightning should by rights have found no resistance in its passage to the earth, whereas the resistance opposed to its course was nearly infinitely great.

> Inside the building [said the same writer] we had, to tempt the lightning, the iron stanchions of the scrolls and ball ; and around the whispering gallery were the immense iron gas-mains which supply the ring of jets immediately beneath the gallery. The sections of these mains are insulated from each other by the packing of the joints, and so are the successive sections descending the main shafts to the bottom of the building.

The writer goes on to show how the conductors originally put up to protect the building had been in the course of years eaten entirely away by rust, so as to afford great gaps which would have to be overleaped by the lightning, and so far no doubt the appointed means of safety entirely failed; but the sentence quoted above appears to us rather to indicate a source of safety than of danger. We cannot help thinking that the immunity enjoyed by the building for so many years was probably due in a great measure to the accidental circumstance of the iron-work of the whispering-gallery being connected, by means of the gas-pipes, with the enormous area of iron sewer-pipes of subterranean London. The writer of the account seems, however, from other parts of his article, to be so much the master of his subject, that we hardly think the sentence we quote was meant to imply exactly what the words appear to convey, for he could not have intended to say that the connection of the gas-mains with the whispering gallery was otherwise than a means of safety. Another expression in the sentence appears to point to adhesion on the part of the writer to a popular fallacy. The idea that metal "tempts the lightning" is unsupported by any fact, and is at variance with the whole course of experience. Lightning-rods do not attract lightning. Lightning is atmospheric electricity moving through bad conducting matter in an explosive form ; metals are good conductors, and therefore the course of the flash will, in nine cases out of ten, pass along metals, because from their conducting properties they form part of the line of least resistance. But it cannot be supposed that an agency, which moves with such terrible velocity and irresistible force as lightning, could be arrested in its onward course and drawn aside by an insignificant piece of metal in the form of a lightning-rod. If metal did really possess the power of attracting lightning, the use of metallic eave-troughs, gas-pipes, water-pipes, speaking-tubes, bell-wires, and the thousand and one adaptations of metal in use in buildings, ought at once to be discontinued.

But this is not the case. So far from lightning-rods attracting lightning, an ideally perfect series of lightning-conductors would prevent the possibility of any disruptive charge within the limits of the action. The effect of lightning-rods is due to the fact that large quantities of electricity pressing upon small surfaces become quite unruly ; and when the surface is reduced, as in the case of a lightning-rod, to a mere point, it gives rise to an escaping current and causes the electricity with which it is charged to diffuse itself in the air, much as a stream of water would do through the nozzle of a garden-hose. Points do not receive electricity from bodies with which they are not in contact ; except in case of disruptive discharge, the silent flow is always from points, never towards them.

A good lightning-conductor offers a peaceful means of communication between the earth and the clouds ; it leads the terrestrial electricity gently up into the sky and allows it to combine with its opposite without disturbance ; but if the tension is too great to be thus quietly disposed of, the flash strikes downwards, and is led

* See an article in the *Telegraphic Journal*, August 1st, 1873, on the subject.

harmlessly to the earth by the conductor. A well-constructed conductor is uninjured by the flash, because if offers but small resistance. But if in any part of the circuit between the electrified cloud and the earth there is an interval of badly conducting material, or if there is any break in the continuity of the conductor, the lightning will leap over, rend, and shiver to atoms anything that opposes its passage.

Owing to the affinity of electricity for points, when an electrified cloud passes over a building electricity will accumulate with most intensity upon ridges, gables, and finials; for this reason all such objects should be connected with the lightning-rod, and the rod itself should be fastened to the walls, instead of being, as is too often the case, insulated from them by glass. In short, the great object is to present such a number of points to the electrified cloud as to neutralize it, and prevent the necessity of disruptive discharge; if, after all, an explosion should ensue, the lightning-rod will form the line of least resistance, and afford the means of harmless escape to the earth. A good lightning-conductor should have a sharp point, be continuous without fracture throughout, and have its end buried deeply in moist earth. In fixing a conductor, a hole should be dug deep enough to reach earth permanently moist, or, failing the possibility of this, it should be fixed to a considerable quantity of old iron, or an iron drain-pipe. But this is a much less desirable plan. It is very commonly the custom to lead the end of the conductor into a tank. For purposes of safety it might as well be attached to the ironwork of the proprietor's bed. If the tank is full of water, the cement, preventing percolation through its sides and bottom, would to a great extent, insulate the earth-connection; if the tank is dry, the conditions are still worse, for there is then no "earth," in an electrical sense, at all. We are told of one instance in which a gentleman coiled up the end of his lightning-rod, and put it into a bucket in his cellar, apparently under the impression that the water would extinguish the lightning. Another point to be noted is, that galvanized-iron rope forms as efficient a conductor as the expensive bar of copper which tradesmen usually recommend. "Remain indoors during thunderstorms," says a writer on this subject, "keep out of cellars, and avoid being near trees during the passage of electrified clouds. In case the gas or water pipes of the buildings are not connected with the lightning-rods, it is not safe for a person to remain in a position in which his body would become part of the line of least resistance between them. Beds should be removed from the walls. Persons in chairs should be in the centre of the room and keep their feet off the floor." We imagine, however, that only very nervous persons will think it necessary to obey all these instructions to the letter.

If a discharge from an electrified cloud takes place from any cause whatever, at any point, the cloud is left in a neutral condition. Induction ceases, and all the bodies charged by induction instantly return to a neutral state. The suddenness of this return constitutes the dreaded "return stroke," which often destroys buildings and animal life at a great distance from the place where the direct charge takes place, and is often more fatal than the direct discharge. A curious circumstance, which was the subject of discussion at one of the meetings of the telegraph engineers, affords an apt illustration of this. A gentleman named Pidgeon, with his wife and son, were on the grass-plat of their house at Torbay close to the seashore, when a violent and sudden thunderstorm destroyed the flagstaff near which they were standing, and inflicted injuries more or less severe on all three of them. As many of the principal English electricians took part in the discussion which followed the reading of the account, and it seemed to be pretty generally the opinion of the authorities that the effects on Mr. and Mrs. Pidgeon were due to the return stroke, we will tell the story.

Mr. Pidgeon and his family were looking out to sea, and watching an approaching thunder-cloud. Suddenly, with a crash that was compared by bystanders to the explosion of a three-hundred-pounder gun, the lightning broke over the mast, which was shivered to atoms. Fragments of it were forced one hundred and fifty yards to windward, showing that great mechanical force must have been developed at the time of the discharge. Of the effects on themselves, we must allow Mr. Pidgeon to speak. We extract from a letter written by him to *Nature*, and reprinted in the "Journal;" *—

Of the three, my wife only was "struck," and fell to the ground, my son and myself remaining erect, and all three lost consciousness. For more than half an hour my wife lost the use of her lower limbs and left hand, both of

which became rigid. From the feet to the knees she was splashed with rose-colored tree-like marks, branching upwards, while a large tree-like mark, with six principal branches diverging from a common centre, thirteen inches in its largest diameter, and bright rose-red, covered the body. I had almost forgotten to mention that my wife had just closed the lower door leading from the garden to the shore, and was looking over it out to sea. The iron bolt which fastens this door is *exactly* the same height from the ground-line as the mark on my wife's body . . . As I turned to help my wife, who was on the ground, I shouted, as I thought, that I was unhurt; but it seems I only uttered inarticulate sounds, and my son in his first attempt to answer did the same.

It was very truly remarked on the account, of which the above is a brief extract, that if the Pidgeon family had been struck by lightning they would not have been there to tell the tale. The probability was that they, as well as the flagstaff, were strongly charged with induced electricity by the advancing cloud. When it reached the flagstaff — and, coming from the sea, the flagstaff is the first object it would encounter — a discharge took place, and Mr. Pidgeon and companions returned to the neutral state so rapidly as to cause severe inconvenience. In the *Telegraphic Journal* is published a drawing which is described as a "facsimile of chief marks made by the discharge on Mrs. Pidgeon," but on the subject of its exact resemblance we have no certain information. We should have thought that printers' ink could hardly produce a facsimile of a rose-red object. But we must not allow imagination to carry us too far. We content ourselves with the remark that the design is remarkably elegant.

Of all the recent developments of electricity, the submarine cable has, perhaps, exercised the greatest effect on modern life. Its history and mode of manufacture have been in recent years so much before the public, that most people have accurate general ideas on both these subjects. But there are a few points connected with the working and maintenance of sub-oceanic cables, on which information is not so readily attainable. For instance, it is curious how little is known of gutta-percha. This substance, which is the dielectric in most ordinary use for separating the conducting wire of submarine cables from the ocean bed on which it is destined to repose, is the concrete juice of the *Isonandra gutta*, or taban-tree. It grows to a height of sixty or seventy feet, in alluvial soils, at the foot of hills in the Malayan Archipelago, in southern Asia, and in Dutch Guiana. The chief supply has hitherto been obtained from Singapore. We are told by Mr. Douglas, that the words *gutta percha* are Malayan; the former signifies gum or concrete juice of a plant, the latter the special tree.

When first this substance was introduced into England, and before the manufacture of telegraph cables made it an article of such primary necessity as to require economy in its use, it was the practice to fell the tree, and cut rings through the bark a foot or eighteen inches apart; the milky juice was received in suitable vessels, and inspissated by boiling. Eventually the matter was taken up by an English company, and the juice is now obtained in the same way as caoutchouc or india-rubber. It arrives in Europe in blocks several pounds in weight, and is generally found to be adulterated with sawdust, earth, and other impurities, introduced by the native producers to add to its weight. This adulteration offers one of the most serious difficulties encountered by the cable-manufacturers. Elaborate and expensive machinery has to be employed, in order to reduce it to the absolute purity required to permit its use as an insulator.

The blocks of gutta-percha are often rudely fashioned by the native workmen into grotesque imitations of animals, men, or deities. We have sometimes seen these so well executed as to make it almost a pity not to keep them as curiosities, rather than cut them up into shreds and plunge them into boiling water, preparatory to passing them through the ruthless masticating machines. Even now the processes in use in the best cable-manufactories are rude and inefficient; and a method of manufacture has been patented by a well-known London dentist, which would no doubt at some future time revolutionize the working of gutta-percha, were it not that the saving and improvement effected has not hitherto been found to counterbalance the expense of discarding the present expensive machinery. Circumstances, easy to be understood, have reduced the manufacture of insulated telegraph wires to a virtual monopoly, in the hands of a few firms who can supply the limited demand without altering their existing plant. We have already seen to what extent the inductive action of gutta-percha retards the transmission of messages through the wire it covers. It is

supposed, with a great show of probability, that increased purity of material, consequent on improved methods of manufacture, would diminish the inductive capacity, and consequently promote greatly increased speed of transmission.

Other objects of curiosity are the instruments employed at the seashore termini of submarine cables for transmitting signals under the ocean. Our readers are probably acquainted with the principle on which the signalling apparatus in use on land lines is constructed; it will be sufficient to remind them in general terms that most of these depend mainly on the discovery, by the German philosopher Oërsted, of electro-magnetism.

About the year 1820, there occurred to Oërsted one of those brilliant accidents which, happening to a mind prepared to seize their significance, ripen into great discoveries. He was engaged in some electrical experiments with a voltaic battery, and held a small mariner's compass in his hand. He observed that the compass was deflected as the current passed. He repeated the experiment, and found that the effect of the current varied, according as the current passed above, below, or around the magnetic needle. It was soon ascertained that the magnetic needle had a tendency to place itself at right angles to the direction of the current. By a brilliant effort of inductive reasoning, Oërsted sprang to the conclusion that the magnet obeys a constant directive action of the earth, caused by electric currents constantly passing the magnetic equator from east to west, and that the magnetic needle, subjected to the action of a current could, as his experiment showed to be the case, be moved at will; because the motive force, being nearer, and consequently more powerful than the ordinary terrestrial magnetism, overpowered the directive action of the earth. The identity of electricity with magnetism was thenceforth established.

Oërsted's experiment was soon followed to new and startling conclusions. The needle, it was observed, always placed itself in the same position relatively to the direction of the current. That direction may be best understood by an illustration.

If the wire were a canal, and the reader were swimming along it in the direction of the current, the north pole of a needle would always be deflected, to his left hand if placed before his breast, and to his right hand if placed behind his back.

It will be perceived from this, that if the wire is bent round the needle, its two halves act in the same direction, and the effect is doubled. If the wire be bent a second time round the needle, the effect will be again doubled, and a still further increase in the number of turns will produce a corresponding increase of force. If, then, a wire, covered with silk or gutta-percha, or other insulating material, is wound several times round a needle, and the current is thus compelled to pass along its whole course, at such a distance from the needle as to direct its action without touching it, the force of the current is multiplied in proportion to the number of turns.* A comparatively feeble current is thus able to effect great results. This, it will be seen, is, in fact, the modern telegraph. Currents of negative and positive electricity are sent along the line-wire, and passed at the receiving end round a magnetized needle. The result is the alternate right and left deflections with which every frequenter of railway stations is now so familiar.

On this principle, too, instruments for measuring currents are constructed. The simplest kind of galvanometer consists in a magnetized needle placed in the centre of a hollow frame filled with covered wire; the degree to which the needle is deflected (as shown on a graduated scale which is centred on the needle pivot), indicating the quantity of electricity passing through the coils. The differential galvanometer differs from this instrument, in that it measures not the absolute strength of a current, but the difference of strength of two currents. Its wires are wound in two coils side by side; they are so arranged as to be exactly equal in their effects upon the needle. When two equal currents are made to pass in opposite directions through the coils, they will exactly balance one another, and the needle will not move. but if one current be stronger than the other, the balance will be destroyed, and the needle will obey the stronger, to an extent determined by the difference of strength of the two currents. The use of the differential principle will be very apparent when we come to the subject of duplex telegraphy. A wire through which a current is flowing, possesses for the time properties similar in many respects to those of a magnet. It attracts iron filings, attracts or repels the poles of a magnet,

* The action of the current cannot be multiplied indefinitely, because the intensity of the current diminishes as the length of the circuit increases. So if the wire is too long the current becomes very feeble, and at last there would be no current left to multiply.

and acts upon other wires through which currents are moving. If, instead of passing round a magnetized needle, the wire is twisted round a bar of soft iron, the iron core becomes magnetic, and acquires for the time much greater power than it is possible to give to a permanent magnet. A current after traversing a line-wire can be made to electro-magnetize a bar at a receiving end, in such a manner that, in virtue of its temporary magnetism, it attracts a lever attached to its armature, and puts a fresh battery into circulation. By this means a current too feeble to record intelligible signals may be made to renew its strength over and over again, and transmit itself, strong and clear, through a circuit of length otherwise unmanageable.

Perhaps it would be as well to say here that a "circuit," telegraphically speaking, comprises first the earth, then batteries and other apparatus at the terminal station, then the line, and so through the other terminal apparatus and batteries to the earth again. Intermediate stations are introduced by cutting the wire, and placing the instruments between the divided ends. In the same manner a box of resistance-coils, shunts, or any kind of conductor may be interposed at any point of the circuit.

Steinheil was the first to employ the earth as a substitute in a telegraphic circuit for a return wire. He buried two copper plates, one at each station, and connecting the extremities of his telegraphic lines to these plates, he found that signals could be transmitted with as much facility as when a return wire was used. In fact, a circuit will work to a much greater distance when it is composed of half wire and half earth, than when it is composed only of wire.

It may readily be seen that as each mile of cable offers a certain resistance to the passage of the current, and each mile is subject to its own inductive retardation, the cumulative action of these causes through two or three thousand miles of cable so weakens the current that it retains but a small fraction of the strength with which it left the battery. So feeble is it, that it is unequal to the task of electro-magnetizing an ordinary relay — an operation which, as performed on land lines, we have already described — nor is it strong enough to work even the lightest needle which could be suspended at the receiving end.

It is to the genius of Sir William Thomson that we owe the solution of this apparent impossibility. He attached a magnetized needle to a tiny mirror (mirror and needle together weighing scarcely more than a grain), and suspended it by a single fibre of unspun silk within the coils of a galvanometer. A cardboard screen was placed in front of the mirror, in which was perforated a narrow slit, and behind this he placed a lamp. The light from the lamp was reflected through the slit, on to the mirror and thence back in the shape of a pencil of light to the screen. When the mirror galvanometer was connected with the line-wire, and a current, however feeble, passed through its coils, the needle and mirror were deflected, and the reflected beam of light moved along the scale. By this arrangement, even though the movement of the needle should be so minute as to be quite imperceptible to the eye, the reflected beam moves through a very sensible arc on the screen, and the ordinary right and left signals of telegraphy can thus be easily given and clearly read.

We have, of course, only given in mere outline the principle of this delicate instrument, which is adapted to practical work by many beautifully simple arrangements. But the main idea of making an imponderable beam of light do the duty of a heavy lever has alone made ocean telegraphy a possible feat. Another point of general interest is the manner in which electrical tests are performed. It does not at first appear easy to imagine how the position of a break or fault in a cable, hundreds of miles away under the sea, can be discovered with such precision that a repairing ship can be sent to the very spot. Here again we can only indicate a principle, the practical working is far too complicated to be understood without minute and careful examination, and the use of diagrams. But the principle may be made clear, and will give a good general idea of the *modus operandi.* It is all effected by a careful comparison of resistances. Those who have done us the favor to read the earlier part of this paper will understand what is meant by the resistance of a given circuit, and will also be acquainted with the construction and use of the instruments principally employed, namely, galvanometers, boxes of resistance-coils, and condensers of known capacity.

If a needle be suspended between the coils of a differential galvanometer, and a current be sent through one of them, the needle will be deflected, say, to the left. A current of exactly the same strength as the first, sent simultaneously through the other coil, will cause the opposing cur-

Original from CORNELL UNIVERSITY

rents to neutralize each other, and the needle will remain at rest; the box of resistance-coils accords to the operator the power of placing in the path of the current any required resistance, from the tenth of an ohm up to forty thousand ohms, or more, by simply inserting or removing metal plugs in holes made for the purpose in the lid of the box. If, then, to the right-hand galvanometer-coil be attached the box of resistances, and to the left-hand coil the line-wire requiring to be tested, all the operator has to do is to shift the resistance-plugs till the line and the resistance-box balance each other on the galvanometer. He then reads off the resistance which has brought the galvanometer to a standstill, and as he has made the two equal, it follows that he thus knows the resistance of the line-wire. Constant tests, made during manufacture and afterwards, have made him familiar with the exact resistance *per mile* offered by the line-wire; so that dividing the total resistance by the resistance per mile, he obtains the length of wire under examination. Suppose the resistance per mile to be four ohms, and the resistance which has produced a balance at the galvanometer is forty ohms, it follows the length of wire under examination is ten miles. Now, assume that the matter to be ascertained in the above test was the unknown position of a "fault," you discover that the circuit was completed by the escape of the current to earth at a distance of ten miles; you have thus determined that the naked end of the cable touches the earth at that distance, and that the fault is an absolute break in the cable ten miles away.

It need not be said that this is testing in its simplest form; we have omitted all collateral circumstances which in practice would obscure the result, and make an apparently simple into a difficult operation. It is a very different matter when the fault is a mere flaw in an otherwise perfect cable, but this is the principle. Tests are taken hourly during the manufacture of a cable, to determine that it is electrically sound throughout, and that the insulation is complete. To ascertain the latter point, that is to say, that there is no leakage of electricity through the gutta-percha covering, the wire is first suddenly charged from a battery, and as suddenly discharged through a galvanometer. A certain deflection of the galvanometer needle is thereby produced, and noted as deflection No. 1. It is then charged a second time, and left for a few minutes, at the end of which it is again discharged through the galvanometer, and deflection No. 2 is noted; the difference between deflection No. 1 and deflection No. 2 corresponds to the amount lost by leakage during the time the wire remained charged.

It may easily be imagined that the tests are never more anxiously performed than when the cable, duly completed, and coiled in great tanks on board the telegraph ship, is being slowly paid out into the deep. Every minute signals are passed from the shore to the ship, through the gradually increasing length of submerged line, through all the thousands of coils which lie piled, tier above tier, in the cable tanks, down to the testing cabin. There the electrician on duty sits with his mirror galvanometer, watching the reading-screen, where the movements of a small spot of light give him tidings of the shore he is leaving. The whole interest of a great and costly expedition is thus centred in the little quiet testing-room.

The operations, both of the ordinary working of submarine telegraphs and the testing operations, are much complicated by earth-currents. Very often, especially at the time when the phenomena of the Aurora Borealis are prevalent, strong currents pass over the lines, entering by one of the earth-connections, and leaving it by the other. They are never constant for long together, and they change direction so rapidly as seriously to affect the delicate instruments in use on submarine lines. They are most violent during magnetic storms, which seem in some mysterious manner to be dependent upon the aurora, which, in its turn, is a manifestation of some ultimate cause of which nothing positive is known. Observation shows that earth-currents are frequent at the time of earthquakes; the "Journal of the Society of Telegraph Engineers" contains constant notes of these coincidences, observed by the ever-watchful members of the society. Many of the most distinguished electricians think that the sun is the ultimate cause of this, as of all other forms of terrestrial magnetism, and it certainly seems probable that such is the case. It is well known that the period of maximum and minimum of spots on the sun extends over a cycle of eleven years, and during that time the aurora becomes proportionately more or less intense. "In 1850," says Mr. Latmer Clarke, "two simultaneous observations of the sun were made by observers many miles apart, when both saw a body flash into

the sun and cause a disturbance of the sun's chromosphere; and it was subsequently found that at that moment almost all the magnets of the world were disturbed by this sudden movement." * The fact that the cause and effect were apparently simultaneous incidentally confirms the inference that the velocity of the transmission of magnetism is the same as the velocity of the transmission of light.

Sometimes the earth-currents are of enormous power. In 1871, a break having occurred in the Atlantic cable, Mr. Graves was able to devote a great deal of time to the investigation and tabulation of the earth-currents which appeared on the broken line. At one time during a great magnetic storm, which was felt all over the world, Mr. Graves, who was observing at Valentia, saw currents of such strength, that "a distinct arc of flame burned between the key and the earth-connection." The power necessary to produce this he estimated at not less than two thousand cells of Daniell's battery. The late Admiral FitzRoy found the indication of coming storms predicted with singular fidelity by magnetic disturbances of the earth. He could sometimes see the approach of a storm days before the barometer and thermometer indicated anything of the kind. The ordinary observations of the telegraph-operators confirm this. They can actually feel a storm coming across the Atlantic for days beforehand, by the increasing vagaries of their troublesome visitor, the earth-currents. It is not improbable that observations may eventually be found susceptible of such generalization as to afford really reliable weather forcasts.

One of the latest telegraphic marvels is the arrangement by which it is made possible to send two separate messages along the same wire in opposite directions at the same time. This is known as duplex telegraphy; and perhaps nothing connected with the practical working of telegraphs has excited more wonder, and been found more difficult to understand. The first question which is naturally asked is, How can the currents pass one another in the line-wire? and, if they do pass, how is it that they do not interfere one with another? If, however, we have been fortunate enough to make clear the principle of the differential galvanometer, the difficulty will vanish. In sending an ordinary message, the current passes from the battery at the sending end through the instrument at that end, along the line, through the instrument at the receiving end, and so through the earth back to the battery from which it started. In doing so it of course moves the instrument at the sending end, as well as the distant one; for it passes through them both. Now suppose that the operators at both ends were to dispute for the possession of the circuit, and send opposite currents simultaneously through the wire, the result would be hopelessly to confuse the signals, and make reading impossible; but if the operators were to set to work to unravel the apparent confusion, they would soon find that when station A and station B, in the course of their confused struggle for the possession of the line, happened to send a current in the same direction, the needle acted upon would strike the stops with double force, while, if they sent in opposite directions, the needle would hardly move at all. Thus each operator would be able to perceive that the signals of the other station were *visible* on his instrument, and were only prevented from being *legible* by the confusion introduced by the current he himself was sending along the wire. It would doubtless occur to them that if by any means each could so arrange that neither station's own or outgoing currents should affect his own needle, leaving the dial free to show only the effect produced by the incoming current, the difficulty of reading would vanish. The question then arises, How can each instrument be so connected that neither sender shall move his own needle, and yet so that the coils shall always remain in circuit?

Now, in a differential galvanometer, if two equal currents are simultaneously sent through the two coils in opposite directions, the result is that the needle stands still. Apply that principle to the line in such a way that the current, when either end makes a signal, shall at that end divide itself into two, and the two halves pass round the sending instrument in opposite directions. This will only happen when the two half-currents are exactly equal, which will only be the case if the two circuits they have to travel are equal. To effect this, one half-current must pass along the line-wire to earth, and the other half be sent to earth through a resistance exactly equal to the line-wire.

When the balance is established, neither sender, when he signals, will move his own instrument, which will be left free to record signals from the opposite side; but the operator at the other end will be able

to read them, for each station will see the current sent by the other, though neither can see his own.

It will be seen that the two currents do not pass one another, as has been imagined, but that, when both stations signal at the same time, the current sent by either station acts upon the distant instrument by determining whether the currents sent by that station shall pass through the line or the resistance-coils.

On land lines suspended in the air the resistance of the signalling-wire to the current is easily ascertained, and is easily imitated on the second or artificial circuit; but in submarine lines there is not only the resistance to be taken into account, but the retarding capacity of the cable. In any given cable each mile presents a certain resistance, and also a certain retarding capacity. The second circuit on land lines need only imitate the resistance, but in cables the retarding capacity must also be imitated. It is not enough that the whole of the second circuit should be equal to the whole of the cable, but that each separate part of it should be equal to each corresponding part of the cable. The latest plan, which seems at length to have made duplex working in submarine wires practicably possible, is that adopted by Mr. Muirhead. He forms his second circuit by sheets of paper, prepared with paraffin, as an insulator, having on one side a strip of tinfoil wound to and fro to represent the resistance, and on the other a sheet of tinfoil to represent its retarding capacity. Each strip of paper may thus be made to represent precisely a given length of cable; and a given number of such sheets would exactly imitate the cable in every part of its length; so that the non-signalling half of the current sent through the artificial resistance escapes to earth under precisely similar conditions to that which passes over the line.

The result of this is that a single wire will convey signals simultaneously in two opposite directions, and that one wire will do the work of the two which have hitherto been required. On all marine lines this invention is of the greatest possible importance, because while theoretically it only doubles the carrying capacity of each cable, in practice it does a great deal more; as it does away with the loss of time consequent on arranging about the precedence of outward and homeward messages.

The method was first tried on the line between Marseilles and Bona, and it has since been brought into operation between Marseilles and Malta, between Suez and Aden, and, lastly, between Aden and Bombay. It is stated that on a recent occasion, when there was a breakdown of the Indo-European line, the duplex system became of the greatest possible use; and although there are still practical difficulties to be encountered before it can be adopted in lines where very long distances have to be accomplished without a break, there is no doubt that the theory is so well established that its universal adoption is only a question of time.

"The telegraph," says Sir Lintorn Simmons, "is an essential in war; war can scarcely be carried on without it." Mr. George Von Chauvin, who was secretary to the German director-general of telegraphs during the Franco-German war, appeared as a witness before a committee of the House of Commons on postal telegraphs last year, and gave a very animated account of the way in which that service was performed by the German army during his period of service. He tells us that the telegraph was in constant use for the arrangement of the transport of ammunition; of the whole service of the commisariat; the transport of wounded soldiers and prisoners; for the regulation of traffic in the field railways, which was very heavy, and which frequently necessitated the shunting of ammunition trains to let a train of wounded soldiers go by, or stopping a train of soldiers to bring up ammunition. It was also used for the investiture of fortresses like Paris and Metz, where it would have been impossible to have an army large enough to girdle round the whole enceinte. The lines of attack round Paris extended some twenty German (above ninety English) miles; the field telegraph was used along this extended line to bring together troops whenever they were wanted, either to repel a sortie, or to make an attack. It was also used to keep the various corps of the army, operating in the centre, north, and south, in permanent connection with the headquarters' staff at Versailles. Telegraphs also accompanied and kept up the communication of all detachments of independent corps, brigades or divisions, which operated independently against the smaller forces of the enemy. Thus immediate information was conveyed to headquarters whenever an engagement took place within any of the ramifications of the gigantic spider's web, of the number of troops engaged, the result of the contest, and its probable effects; and new orders

were given as to fresh steps to be taken. It may easily be believed that it was perfectly recognized by the German officers that the war could not have been conducted on this scale at all without the assistance of the telegraph.*

The Germans had acquired telegraphic experience in two former wars. They consequently entered on the Franco-German campaign with a very complete organization. They used three kinds of telegraph: the first, which was taken into the immediate proximity of the enemy; the second, the duty of which was to keep up communication between the advanced army corps and their basis of operation; and the third, the ordinary telegraph of the State. The whole system was under the command of a colonel of the royal engineers, attached for service to the telegraph department of the State; the officers under him were officers of the royal engineers, the men mostly soldiers, but not necessarily engineers. They were taken from all arms, and a good many of them were employed as civilians in the ordinary time of peace. The duty of the advanced part of the field telegraph was to push on into the close proximity of the enemy. They did the service in the trenches before Paris, and carried on the work of communication whenever an action was going on. The telegraphists employed in the Prussian army during the war were trained in the State telegraphs: the soldiers taken from the ranks during the time of peace were put for a certain time into the offices of the State telegraph department, and did the usual work of telegraph operators, linesmen, battery-men, and the other ordinary duties of telegraph departments. In peace-time they were placed under the command of civil-service officers, and there was practically no distinction between them and the ordinary civilian who was employed by the government. But this was the smallest class of trained military telegraphists employed by the Germans; a very large class were at once soldiers and telegraph-men.

In Germany, as formerly in Prussia, a soldier who has served his time as non-commissioned officer, and bears a good character, is entitled to employment in the civil service. By that means not only does the army obtain a better supply of men for its non-commissioned officers, but it furnishes to the telegraph department a large class of men who, although not very smart operators, are yet very trustworthy, and, for the purposes of war, are perfectly indispensable. "I do not know," says Mr. Von Chauvin, "what proportion of our ordinary telegraph-operators in Germany have formerly served for a lengthened period in the army, but I should think it is a very large one, and the difficulty which we found whenever war broke out was not how to offer an inducement to our telegraph-men to join the troops, but how to console those who were ordered to remain at home. They all wanted to go."

The material used in the advanced telegraph services was exceedingly portable. Very light copper wire, light poles, which could be stuck into the ground by not too great an effort of a man ramming it down, and a large quantity of wire insulated with india-rubber, which was rolled out as necessity arose. The department was furnished with wagons, such as are in use now in England, containing instruments, a small battery, a certain amount of wire, and accommodation for an operator to sit and to write in. The wagons could be taken about by a couple of strong horses at a pretty rapid pace; and the wire could be rolled out as it went along, and thus keep up communication with the troops behind. The second class of field telegraphs were what is called in Germany *Etappen* telegraphs; their duty was chiefly to maintain telegraphic communication between the advanced heads of the army corps, and these places which, having been made depots for ammunition, or hospitals, formed the basis of operation for the more peaceful part of the warfare; there they linked on to the ordinary telegraphs of the State, which extended its ordinary strong and well-built lines over the frontier as the army advanced into France. As the Germans gradually introduced their postal sytem, sanitary arrangements, judges, and all the necessary machinery of civil government, they also introduced the State telegraph system, which was thus kept in communication with the outposts. These three corps might be compared to light skirmishers, to a more solid advancing line, and then a solid mass of reserves. The materials which they used were very light in the first instance, were of intermediate size and quality for the second class, and were the ordinary heavy materials for third class.

When Mr. Von Chauvin was asked whether in his opinion soldiers must be specially trained for telegraphic services in the field, and whether civilians could not

supply their place, his answer was, that he believed a soldier would require a good training to be of any use as a telegraphist, and that a civilian would, as a rule, be of very little use. It would be very difficult and very irksome to place him under martial law, and operations cannot well be conducted in an enemy's country without having everybody under your command under martial law. It was also found by the Germans, as well as by ourselves, that, again, you cannot expect a civilian who has made up his mind to be a telegraph-man for the rest of his life, and to work in a peaceful occcupation, to sit in front of an enemy who is firing at him, and risk his life for the purpose of sending a message; whereas a soldier, who makes up his mind when he joins the army to run the risk of being knocked on the head, will sit down to his work under fire without remonstrance, and in the ordinary course of duty.

The opinion expressed by Mr. Von Chauvin as to the competency of civilians to work the telegraph in the vicinity of a hostile force was strongly confirmed by Sir Lintorn Simmons. He referred to the case of a civilian force in the Crimea, namely, the Army Works Corps, in which great difficulties occurred in carrying on the necessary works.

The organization of the military telegraph department in this country does not differ very greatly from that adopted by the Germans. The nucleus of the force is a small body of Royal Engineers under their own officers, who in time of peace have charge of what is called "the eastern engineering division" of the postal telegraphs. They have under their charge nearly ten thousand miles of wire, and their *personnel* consists of four officers and forty-three non-commissioned officers and sappers, besides a few occasional additions to assist in the ordinary construction and maintenance work. These employés correspond to the ordinary division of the civil force. The senior officer takes the duty of divisional engineer; the next officers, captains and lieutenants, take the duty of superintendents; sergeants-major and sergeants take the duty of inspector and chief clerk; the corporals take the duty, as a rule, as clerks. The sappers become linesmen, storemen, and mechanics.

In the "Journal" is found a very amusing account of the construction of the telegraph used during the Ashantee war, from the pen of its constructor, Lieut. Jekyll, of the Royal Engineers. At first, as will be remembered, it was intended to carry on the war by the aid of native levies alone, without the intervention of any Europeans. But a few days were sufficient to show that the idea of a railroad which was first contemplated was impracticable from the nature of the country, and that the idea of native levies was impracticable from the nature of the people. On landing at Cape Coast Castle, Sir Garnet Wolseley found it necessary to resolve on a total change of plan. He sent for English troops, countermanded the railroad material, and ordered a telegraph instead. So short was the notice, that the supply of stores could not be got ready in time to accompany the troops. The detachment, therefore, of twenty-five non-commissioned officers and sappers, started with such stores as they were able to collect on the instant, leaving the main bulk of their preparations to follow. Lieut. Jekyll, on his arrival at Cape Coast Castle, at once proceeded up country, and, armed with a bag of silver coins, bought a supply of bamboos from the chiefs to form posts for his telegraph wires. Starting from a shackle on the roof of Government House, the line proceeded in the direction of Coomassie at the rate of about two miles a day.

Lieut. Jekyll says of his native workmen, "We were now furnished with a gang of fifty natives, whom we were to retain permanently, that is if we could. They were not promising in appearance, and I was compelled to dispense with the services of those who were less than four feet high. But they had with them an intelligent headman, and by dint of supervision, supplemented by a little flogging now and then, they soon turned out a tolerably useful body for light work, as niggers go." The line ultimately extended to Accrofumu, about one hundred miles from the coast.

The telegraph was regarded as the white man's fetish, and was looked upon as a most powerful charm. Shortly after crossing the Prah, the advanced parties discovered a white cotton-thread suspended from the trees, obviously in imitation of the line, for a distance of several miles. Part of this respect was, no doubt, owing to the fact that the workmen in making the line received several smart shocks of lightning while handling the wire. Lieut. Jekyll was at one time afraid that he would suffer serious inconvenience from that cause. One of the greatest difficulties to be encountered was naturally the climate. Many of the Europeans, including Lieut. Jekyll himself, were at one time down with fever. At one office the sapper operator

Original from CORNELL UNIVERSITY

was so ill with fever that he lay in bed in his office, with a black fellow to rouse him up whenever a message came which claimed his attention. Recording, that is, printing instruments, were principally used. But in the discussion which followed the reading of Lieut. Jekyll's paper, a great preference was expressed by the officers present for the sounder, which addresses itself to the ear. A quaint practical difficulty which was urged in favor of the recorder, was that in fever districts the operators got deaf from the effects of quinine, and were unable to hear the sounder. In reply to which, a distinguished member of the society triumphantly told a story, which, we are bound to admit, was received according to the report with "laughter," of a blind girl who was able to read by smell: —

"She placed her nose," said the speaker, "above the instrument, which was Bain's chemical recorder, and thus cyphered the despatch."

The task of organizing the field electric-telegraph equipment was undertaken at Chatham, and we now possess specimens of carriages and apparatus which seem well adapted for the purposes required to be fulfilled in a light-equipment. The instruments employed are Morse recorders and sounders, arranged in a very portable form. The batteries are modifications of Daniell's, and the conductor is Hooper's core. A few light iron telegraph-poles are also carried for special purposes. The instruments, batteries, etc., are fitted in travelling offices, which are simply telegraph offices on wheels, and the conducting-wire poles, etc., are carried in wagons adapted for the rapid construction of a line telegraph. The conducting wire is arranged to be laid on the ground at a minimum rate of two miles per hour; with well-practised men a line has been constructed at a rate of four miles in an hour and a quarter. This insulated cable is not like the Prussian, susceptible of injury by the passage of heavy wagons over it, and it has stood some very severe tests in that and other respects without injury. The light iron poles are for use at road-crossings, where continuous heavy traffic would in time produce injury. Spikes of a peculiar form are also carried to enable the conducting wire to be suspended to trees, or walls, in order to meet the contingency of passing through a town or village.

We have left ourselves no space to make more than a passing allusion to the use of the torpedo in warfare. Indeed, the whole subject is still so much a matter of experiment, and is so far from having arrived at the point when it can be treated with any completeness, that it would not be easy to do more than detail experiments, even if we had space at our disposal. In the report of the secretary of the United States navy, published as far back as December 1865, when the torpedo system was only in its infancy, and manipulated by the Confederate engineers under every possible disadvantage, it is stated that when the United States fleet attacked Mobile and Wilmington, the sea defences of which mounted more than six hundred guns, although the shore batteries of the Confederates were splendidly served, the only vessels lost by the United States government in both these attacks, were destroyed by electric torpedoes.

The important defence of the water approach to Richmond was entrusted to a single electric torpedo, sunk in the channel-way of the James River. The mine was under the control of an officer, who, stationed on one of the river banks, watched from the sand-pit where he lay concealed the approach of the enemy. A single stake planted on the opposite bank served to indicate the exact moment when an approaching vessel would be within the area of destruction. With the patience of a spider watching its victims, for thirteen months did this officer watch the opportunity to explode the mine with effect. At length the Federal fleet, under the command of Commodore Lee, entered the James River, the commodore's vessel being third in the advancing rank.

The foremost vessel, carrying seven guns, and manned by a picked crew of one hundred and twenty-seven men, was allowed to pass over the mine in safety, it being by arrangement held in reserve for the commodore's ship: but an order having been passed from the deck of the next ship, audible from the shore, to return and drag for torpedo-wires, the officer determined to explode his mine as she descended the stream. The explosion took place on a clear afternoon, and was witnessed by many persons. The hull of the vessel was visibly lifted out of the water, her boilers exploded, the smoke-stacks were carried away, and the crew projected into the air with extreme velocity. Out of the crew of one hundred and twenty-seven men, only three remained alive, the vessel itself being blown to atoms. The awfully sudden destruction of this ship saved Richmond for the time. Commodore Lee retired, sinking several of his ships to block up the channel.

Torpedoes are now so improved, that after they are submerged the operators on shore retain the power of the submarine and land circuits without fear of explosion, and are even able to speak and telegraph information through the charge without risk.

Every torpedo consists in its complete form of three parts; the ignitor, the charge, and the torpedo case or tank, together with the necessary arrangements for electric connections and conductors for giving the operator the entire control of the mine. The importance of accuracy and precision of ignition at sea will be easily understood, by calculating the length of time the enemy remains in the line of vision. A vessel steaming at the rate of nine miles an hour will move through the water at the rate of eighteen feet per second; and supposing her to be three hundred feet in length, she will remain in a position to receive the effects of a blow only sixteen seconds. One thing may be considered entirely proved, that for shore defences the old form of mechanical torpedo may be considered as quite superseded by the application of electricity to the purpose.

We had hoped to be able to give some account of the underground and overhead system of the postal telegraph in London and our great towns; but the subject would require a paper to itself, and our space is exhausted. We have not even room to discuss the system by which daily meteorological observations are transmitted from a hundred stations to the Royal Observatory to be tabulated and arranged. For a similar reason we must leave unnoticed the application of the electric light to the lighthouses on our shores, the use of electricity as applied to clocks, and the system of time-signals daily transmitted from the Royal Observatory to our naval arsenals and ports. We only enumerate them here to give point to the observation how completely this, the newest of the sciences, has entwined itself with the every-day business of life.

From Good Words.

DORIS BARUGH.

A YORKSHIRE STORY.

BY THE AUTHOR OF "PATTY."

CHAPTER VII.

A MEETING IN THE DALE.

MRS. BARUGH lingered at her gate, looking after Doris, perfectly unconscious of all that was happening down street, as she would have called it; for the High Street, after leaving the market-place, sloped downwards, and passing the cottage, which stood sideways from it, descended somewhat rapidly to the river, out of which came the little beck which flowed through the town. Up street there was coming at a quick pace, which did not seem to suit with his worn face and bent figure, a clergyman. He was scarcely an old man, and yet he was past middle age; he had a thin, red face, which had no pretension to beauty, and his hair was very grey, but there was a look of much sweetness in his faded blue eyes, of refinement in his timid mouth. As he drew near the gate Mrs. Barugh's quick ears heard footsteps, and turning round she faced the clergyman. He raised his hat, and she curtsied, but she made no effort to open the gate.

The clergyman's face flushed, and his lips quivered nervously.

"I — I came to call on your son, madam, and have a chat with him, if you will permit," he said, in so deferential a tone that Dorothy curtsied again, and a pretty little tinge of color made her look almost young. "I noticed on Sunday that he is rather lame, and I hear he is fond of reading. I shall be very glad to offer him the use of my small store of books."

"You're very good, sir, I'm sure."

Dorothy forgot all about her gentility in the outburst of her touched feelings. "Will you walk in, sir, if you please? George 'll be right pleased to see ye. Tho' I'm his mother, and have perhaps no right to praise him, yet, sir, there's few lads like him."

The clergyman stopped and looked earnestly at her.

"I'm sure of it," he said, "he has goodness in his face;" then with a little nervous twitch of his mouth, "I had forgotten — I must introduce myself as the rector of Steersley; my name is Hawnby."

Again Dorothy curtsied, and then she opened the door and announced the rector to George.

The boy's eyes brightened with pleasure as the clergyman shook hands with him and renewed his offer of books.

"It's the greatest kindness you can do him, sir," said Mrs. Barugh, and then she hurried out of the room to fetch the ginger wine and seed-cake, which in her opinion, were the necessary accompaniments of a visit, whether it was paid at eleven o'clock in the morning or at four in the afternoon.

George looked at Mr. Hawnby's sweet, gentle face, and a thrill, the electric consciousness of a long-wanted sympathy, made the boy's heart beat quickly.

"It's great kindness, sir," he said shyly, "but not the greatest. I think coming to see a poor crippled lad's wonderful kind, an' I don't know what to say for 't."

A clatter outside made him look out of window.

"It's t' squire," he said.

The rector left his chair and went to the window; a strange gentlemen on horseback was an event in Steersley.

Mr. Burneston at the gate was looking for some one to hold his horse.

"Mebbe you'll excuse me, sir," said George, and he limped out of the room in search of his mother. "Mother," he called out, "here's Mr. Burneston."

Mrs. Barugh nearly let fall the tray she had just arranged to bring into the sitting-room. She forgot the rector in her surprise.

"Lor', what will John say?" and then came this consoling reflection. John had said she was not to invite Mr. Burneston to call; he had not said she might not see him if he came. Oh, what a misfortune that Doris was out! She straightened her cap and hurried to the gate.

"How d'ye do, Mrs. Barugh?" The squire spoke so frankly and cheerfully, that Dorothy felt she could not deny him anything, let John say what he would. "So you have your daughter back again; is she at home?"

"No, she's not, Mr. Burneston, and I'm rare and vexed; she's gone out for a walk."

"She'll not be long, I suppose," he said carelessly. "I have some business in Steersley, and I'll come back again in ten minutes or so."

Mrs Barugh had been thinking while he spoke, and she answered eagerly,—

"Doris hasn't been gone above a quarter of an hour, Mr. Burneston; she was going to find out Steersdale; she's a famous walker is our Doris."

"Steersdale! why it's ever so far: you shouldn't let her go so far by herself," he said, pettishly. "I'm afraid I can't wait; good day," and raising his hat he rode off.

He was very angry. He had met John Barugh the day before he started for London to fetch Doris, and ever since his craving to see her had gone on increasing at a rate which showed him how strong a hold she had got on his imagination.

"Nothing but idle curiosity," he said to himself; but the curiosity would not be quieted, and this morning he had ridden over to Steersley to satisfy himself by the sight of Doris.

On his way he had tried to prepare himself for disappointment. Miss Phillimore had written him a letter full of praise of her "elegant pupil," as she styled Doris; but she had laid so much stress on the girl's "acquirements, which would do credit to any one," that Mr. Burneston feared he should find her spoiled.

"That schoolmistress has overdone it. If there's anything I hate, it's a clever woman," he said. "Half the charm of a girl lies in her little ignorances, and in the way she has of looking up to a man for information. I sent Doris to school to get polished, not to be turned into a blue-stocking. Learning takes all charm from a woman. I believe, after all, I had better have seen her now and then."

But as he reached the cottage, his eagerness to see the girl had returned, and he could not restrain his anger when he learned her absence.

"What a fool that woman is! Fancy a girl like Doris wandering alone in such a place as Steersdale!"

He only knew the way thither by the highroad, which crossed a bridge over the river, and ended the dale, and he rode off at once in that direction. He had no fear about recognizing Doris.

"If Miss Phillimore is to be trusted, whatever else she is, Doris is a lady," he said to himself, as he left the highroad and entered the dale.

The river was broader here, but still it was evidently much narrower than usual. Gradually the ground rose on each side; on the right the lofty bank was clothed with trees fenced off from the dale by a low grey wooden paling, while beside the river on his left, as Mr. Burneston advanced up the green valley, was a hedge, behind which sloping meadows climbed to the top of a hill, on which a fence of dried furze and twigs stood out in strong relief against the pale green sky.

All at once there came into the picture this vision of a girl springing from bank to bank. He was too far off to see her face, but the grace and freedom of her movements impressed him at once, and he reined up his horse till she had jumped over the last bend of the brook. Then, as her bonnet fell off, something in the slight, erect figure, in the queenly poise of the head, set Mr. Burneston's heart beating quickly, and without pausing an instant, he galloped forward, and sprang

to the ground to greet Doris with all the impetuous eagerness of a boy.

"How do you do, Miss Barugh? I must introduce myself, if you have forgotten me. I called on your mother this afternoon, and she told me where you had gone."

All this time Doris had stood blushing, partly from vexation at her own heedlessness, and now under the squire's admiring gaze. But she made a great effort at composure, and probably her anger at having appeared childish helped her more than she knew.

"I have not forgotten you," she smiled and raised her eyes to his face; "you are Mr. Burneston."

He thought he had never heard words more sweetly spoken, and for the moment he forgot that he had resolved to consider Doris in a calm, dispassionate manner; he forgot everything but the delight of gazing at her exquisite face, and he turned to walk beside her, leading his horse along the dale.

"You have a good memory," he said; then feeling that he must have those eyes once more raised to his own, "Do you find your brother much altered?" he said earnestly.

The long lashes lifted again, and the wonderful blue-grey eyes fixed on his, the pupils dilated with sudden emotion, so that the eyes looked very dark.

"Yes, I find George quite altered, more altered than — than anybody;" then more timidly, as her eyes drooped again, "It was easy to recognize you — you have not changed at all, I think."

He laughed. "Well, I suppose I may consider that satisfactory; you have changed in many ways in these five years."

The bright color flew over her face.

"Yes, I hope so," and there was a stiffness of tone which took him back to the child Doris. They walked on a little while in silence, and then the girl said, —

"Is your son quite well?" As she spoke a flash of angry feeling passed out of her face, and was seen by his ever-watchful eyes. It startled him. Why should she be angry when he spoke of Ralph? She had scarcely seen him, she could not dislike him, and the squire's thoughts went on to a possible future. The solution of her frown was simply self-centred; Doris could hardly keep from calling him "sir" when she spoke, and her anger against herself was vehement.

"Yes, Ralph is quite well, thank you; he is still at Eton, but he will be home at Christmas — at least I am not sure." Mr. Burneston spoke dreamily; it had just occurred to him that Ralph might as well spend Christmas with his aunt and cousins in Scotland. "It is rather dull for him, poor fellow, at Burneston all alone; though he and your brother saw a good deal of one another last holidays."

"I should think he finds George too quiet," said Doris. She spoke easily, seemingly without interest, but also without shyness.

"Well, but" — even as he spoke, it seemed strange to the squire, he almost smiled to find himself treating Doris as an equal, and eager that she should think well of him — "do you think that people should be alike to suit one another? Your brother's silence is just the thing to suit a lively fellow like Ralph, and then your brother is more indulgent than quiet fellows often are, and my boy is a young scapegrace."

"What a pity!" she said simply.

Mr. Burneston felt jarred and yet fascinated. He did not care to hear Ralph blamed, and yet he admired the freshness of nature which could make Doris independent of the fear of giving offence. He walked on in silence.

Doris was glad of the silence; notwithstanding her calm manner, she was inwardly flurried. She had been taken so completely by surprise that she had been obliged to answer hurriedly, and her thoughts never moved very rapidly. She wished Mr. Burneston would leave her, and then she should regain composure. She felt in a nervous and most unusual state under his eyes. "I like to hear him talk," she said, "I always did; but he used to make me feel shy, and it is the same thing now, and it is hateful to feel shy at nineteen."

"Have you been here before?" he said abruptly.

"No. I wish I had come sooner; the country is charming. I should like to stay here for hours."

He looked grave.

"It is too far for your brother, is it? I suppose he is glad to have you as a companion in his walks, when you do not go so far."

"Yes, but he is so lame, he can only go as far as the old castle, or maybe the terrace in the park."

"And you care for longer walks? Well, then, do you know I think Mr. Barugh or your mother should come with you? This is a lonely place without a companion — too lonely, I think, for a young girl to walk in."

Doris looked quickly at her companion,

and her spirit rose against what seemed to her quite unjust interference.

"Father is gone back to the farm, and mother does not like walking," she said stiffly, "and I have always gone where I like in the country."

Mr. Burneston laughed, and Doris felt completely at fault. She had been so accustomed to rule those around her by a quiet stiffness, or rather coldness, of speech and manner — not natural to her, but used knowingly as a means of government — that this want of heed, or rather submission, surprised her.

She felt a sudden interest in Mr. Burneston; he reminded her of Rica. She had not thought he could do anything so un-matter-of-fact as to laugh at any one openly; but she was not courageous enough to ask him why he laughed.

"I must talk to Mrs. Barugh about it," he said; then, feeling that he was not sure of the mother's authority after such a long separation, "I think you had better not come here again alone," he said; "next time your father comes over he will bring you here, no doubt, if you wish."

Doris had recovered herself. She felt so entirely free of Mr. Burneston's authority, that his assumption of this fatherly part amused her.

"I don't think father minds my going so far alone," she smiled. "I loitered to-day, looking about me, or I might have been home now." Then feeling a sudden resolve to take her own position with Mr. Burneston, "You see," she said, blushing at the words, "I am only a farmer's daughter, and girls like me must go about alone, or they must stay at home."

He felt as if some one had struck him a sudden blow, and he answered impetuously, —

"You make a great mistake. If your father had wished you to adopt the ways and habits of — of an ordinary farmer's daughter, he would not have sent you to Pelican House: that has changed everything. Tell me honestly, Miss Barugh" — his color rose, and his eyes grew very earnest — "what you wish — to return to the companions you had before you went to school, or to associate with educated people?"

"I had no companions before, except Rose Duncombe."

She spoke proudly. It was insupportable to walk beside this man and submit to be questioned and advised on her secret trouble, hitherto unshared with any one. She looked very angry, her cheeks burning with mortification and resentment.

"Ah, no," he smiled, "I forgot you were new-comers; but I am sure Rose Duncombe will not suit you now, and yet you must have friends. Will you let me consider myself one of your friends?" he said gently. "Will you let me advise you?"

"Thank you — you are very kind." She was in such a tumult of feeling that she answered mechanically.

"It is something gained that she did not refuse," he said to himself. "She looks like a tempest. What could make her so angry? With all her simplicity, she is very difficult to get on with. However, shyness alters people, and she is shy with me, of course."

They walked on again in silence to the end of the dale by which Mr. Burneston had entered it. As they reached the high-road he stopped.

"I will say good-bye here. I am not going back through Steersley. Then we are to be friends?" he smiled so genially as he held her hand, that Doris smiled back again with a radiance that glowed in the squire's mental vision all the way back to Burneston, even after he had reached the old manor-house beside the river.

CHAPTER VIII.

ON THE ALERT.

It is a truth which every one may not have realized, although of course, as Truth lives at the bottom of a well, only those whose faith is earnest enough can ever brave the risk of seeing her face to face; but thousands who just peep over the well's edge think they have gone to the bottom, from the persuasion they hold that a glimpse is as good as a full view.

The special view of truth I am now meaning is, that time has not the same apparent duration to all of us, though it acts on all. Days which in crowded cities and among busy workers will seem to fly as they pass, and yet to fly carrying with them work achieved or preconceived purposes accomplished — indeed fulfilled progress of all kinds, empty of nothing but of that wonderful old-world charm of leisure which, like the lichen on ancient stone-work, gives to country life its special idyllic beauty — such days, sweeping by with seeming swiftness, carrying with them rest and health, and so much of life's best energies, how full they seem now they are gone! how long we are in reviewing them! And yet, in the sweet peace of country existence, free from the manifold interruptions of town life, when day after

day only the actual routine of life has to be lived, when there is full time for the minutest duty, and abundant leisure for recreation besides, how slowly such days go by, with a delicious long-drawn-out sweetness that seems a foretaste of heaven! How short they are as we look back, because seemingly we have done nothing in them! We cannot see, without a much closer, more earnest investigation, all they have done for us. Link by link, hour by hour, habits have been forming, affections have been developing into love, dislikes have been strengthening into hatreds, and all has gone on secretly and strongly, because uninterruptedly. There have been few external distractions to weaken or stunt the growth of a passion or a purpose.

So days had gone on to weeks, and Mr. Burneston found that his visits to the Steersley cottage had become a necessity of his existence. He did not think or argue how these visits were to end, but he knew secretly that if he were to follow the bent of his inclination he should ride over to Steersley every day. He had surprised himself by the freedom with which he had first spoken to Doris, and he thought he had been premature. When he saw her again she was far more distant.

Ostensibly his visits were paid to George, but Doris was always present; and poor Mrs. Barugh found herself so left out of the lively conversations that the squire kept up with the young people, that after a time she usually took her work into the other room. Dorothy began to find life dull at Steersley. She had few of her wonted occupations, and she wanted John to tease and scold. There was fresh sickness among the cows at the farm, and he only came over for Sunday, and then he was a visitor, and had to be made much of. It was tantalizing to live so shut up alone. George was always with Doris, and the talk of these two did not amuse Dorothy. Steersley was different to Burneston. There were neighbors here whose acquaintance she would have been proud to make, but the squire's visits held these neighbors aloof.

One day she hinted to Mr. Burneston that Mrs. Selby, the wife of the Steersley attorney, and Mrs. Cotswold, the wife of Lord Moorside's agent, were pleasant people, and well inclined to be sociable.

"Please don't make any new acquaintances without consulting me, Mrs. Barugh," he said hastily, "I shall be jealous if you do. I shall think my friendship is not enough for you; and you really know nothing about these people; they may be mere gossips."

His word was law to Dorothy. She smiled and bridled in a glow of satisfaction, but in her heart she felt isolated, or, as she said, "moped." Her longing for gentility had been gratified by the squire's notice, but she knew that this very notice had alienated the people of Burneston from her; they were jealous of the favoritism shown to strangers. Poor Dorothy! her "society" was something like the guinea given by Mrs. Primrose to her daughters; and although she had suggested Mrs. Selby and Mrs. Cotswold to the squire, she felt that she should be quite content with Mrs. Gilling at the Black Eagle, or Mrs. Byland, the wife of the carpenter of Steersley, just to be able to open her mouth on what was happening.

Mrs. Byland lived just opposite; and when Dorothy retired from the trio in the drawing-room, as she persisted in calling it, she spent much of her time at the window, looking for a glimpse of her neighbor over the way.

It was delightful to have an elegant-looking and ladylike daughter, who could sing and play and talk as Doris did, but the luxury was robbed of half its importance when it had to be kept solely for home use, and when there was no one to talk it over with.

To-day, while she watched, she became so much absorbed by this thought, and by her own speculations as to the result of the squire's visits, that she did not hear the street door open and shut. She only roused herself to see Mr. Burneston wave his hand as he rode away, and George standing at the gate looking after him.

"My mercy! to think of my so behaving to a visitor, and such a visitor, of all people! Whatever would John say? It 'ud give him a fine peg over me — that it would. I wish that cow 'd just live or die outright, so as I could get a word with John. There's no speakin' to George; he turns up his eyes an' calls me worldly, before he knows what I rightly mean. And, after all, men's wits is not of much account, unless it's all plain sailin'. It's been one o' the mischiefs o' my life, that I've seldom met with a 'cute woman I could talk over things safely with; though I'm not sure of that; sharp women is apt to be like razors — sharper than safe. Why, what on earth! Oh, my mercy! Yes; it's her, and no mistake."

Mrs. Barugh's delicate mouth opens to its widest, and her faded eyes have brightened, and are staring, as if they mean to

spring from their sockets, over the way, to follow the spare active woman who is entering Mrs. Byland's house. If Doris had not been in the next room, Mrs. Barugh must have called out to George, and have asked for his sympathy in her curiosity; but she was not at her ease before Doris. The girl's quiet simplicity seemed to be always rebuking her mother's strain after "genteel ways," and Dorothy had the constant fear that her child thought her vulgar.

"It was Faith Emmett; I'd swear to her; there's not such another looking woman in these parts. What can she want, prowling here, I'd like to know? I wouldn't have Doris know for anything. Sly old toad!"

Mrs. Barugh altered her position, and placed herself behind the white lace curtain, so that she could see without being seen. Her quick wits at once jumped to the right explanation of the housekeeper's presence at Steersley. "She's come to spy after her master; she wants to see where the squire goes, and she'll make some mischief, as sure as a gun," said the anxious mother. "Well, perhaps, after all, it's a mercy that I didn't get neighborly with Mrs. Byland, for" — Dorothy smoothed out the faded lilac gauze cap-strings which hung on each side of her delicate face (in those days, though only old ladies tied their cap-strings under the chin, cap-strings were a necessary part of the head-gear) — "I should have told her everything — just filled her mouth ready for this old spy. I believe John's right; he's always kep me from makin' friends, because he says I tell too much to every one. Well, Mrs. Byland can only tell what she's seen; but she's a rare Paul Pry, always watching at the window, just like a woman without children; they're a rare lazy lot."

She longed intensely to be in the opposite house listening to the talk between Mrs. Byland and her visitor, and yet she felt helpless; she could do nothing. Mrs. Emmett had a right to visit any friend she might have in Steersley, so Dorothy stood watching and fuming behind her muslin screen, with two fingers pressed against her quivering lips.

On the previous day Faith Emmett's nerves had received a severe shock. Ten years ago her cousin Hezekiah Byland, having grown tired of waiting for his elderly cousin, had married a handsome, dark-eyed York girl, though he had been engaged to Faith for eight years; but as she was much older than he was, and had moreover often refused to leave the Hall to become his wife, her fellow-servants held Byland acquitted, and told Faith she ought to let bygones be bygones, and make friends with the young wife.

Faith bore the desertion silently, and as long as her cousin lived in York it was easier to bear it; but when, previous to settling in Steersley, he wrote asking leave to present his Peggy to his much-loved and respected cousin, the smouldering fire blazed up in Faith Emmett's soul.

"The coward!" she said; "the mean lad, to suppose I waste a thought on him or his!"

But this was only an outburst. Faith summoned her dignity, and wrote a courteous invitation to the recreant Hezekiah; and then, dressed in an old velvet gown given by her mistress, she awaited her visitors.

The grandeur of everything and the stately courtesy of Mrs. Emmett's manners, the way in which she seemed to be a part of the old house itself, her sway over the household, and her lofty patronage, quite overpowered Peggy. She blushed and giggled, answered in the wrong place, and finally threw her glass of port wine over Benjamin Hazelgrave's best trousers, which he put on to do honor to the housekeeper's guests.

Hezekiah Byland had never seen his wife behave so awkwardly, and, being proud and slow-witted, he was vexed, and told her to "mind herself," at which the luckless Peggy, being overwrought and frightened, burst into tears, which under the cold, surprised glances of Faith, and her lofty pity, ended in hysterics and a sudden leave-taking.

"A gude riddance, too," Mr. Hazelgrave had said. "Yer cousin sud hev stuck te his fost Missus Emmett. This missus he's getten is nobbut a haveril."

Since this visit Faith had heard nothing of her cousin, but this morning had come a letter from Peggy.

It began by an affectionate invitation to Steersley, and an assurance of cousinly regard. Peggy said that her dear cousin, Mrs. Emmett, had been brought to her remembrance by the sight of Squire Burneston, who was now a constant visitor at Steersley, courting a bonny young lass from London.

The Burneston people had heard from Joseph Sunley, who managed to know everything that happened to his neighbors, that John Barugh had committed the extravagance of sending Doris to a London boarding-school, and that to save expense

— this was Joseph's version — Doris was not to come home for holidays. "Penny wahse an' pund feealish," Joseph said, and went on to argue that the lass would have been better and happier had she been sent to school with Rose Duncombe.

Faith Emmett had taken little heed of this gossip till one day the sexton said in her hearing that the squire made fools of the Barughs by the notice he bestowed on them. The housekeeper despised Dorothy, who had always scrupulously avoided her, and her contempt deepened when she learned her master's favoritism.

The sudden departure of the Barughs had made, of course, food for fresh gossip, but Faith did not trouble about this, except to rejoice at their absence.

Peggy's letter struck her to the heart; for a moment she was capable of murdering the "bonny young lass" who had dared to attract the squire, and then she laughed at herself.

"'Tis a trick o' Peggy to fright me, bud I'se nut sik a feeal as she thinks. I'se bund t' Steersley the day, an' I'll see wiv me e'en what she me-ans."

She had not heard of Doris's return. Even if she had heard of it, so wild an idea as the truth would not have presented itself; but she went into the village and asked Ephraim Crewe to drive her over next day to Steersley.

Peggy Byland had expected this result. For some time past, she had been burning to show the arrangements of her smart house to some of her husband's people, by whom she considered herself snubbed. She had lost her shyness, and had gained much in self-importance, since she had lived in Steersley, where her handsome face and showy dress attracted far more notice than they had done at York, where she had lived in an out-of-the-way corner, "quite wasted," as she said. Therefore when she wrote to her husband's cousin, the wish to teaze her was mingled with the hope of provoking her to visit Steersley. When the knock came at the door Peggy was sitting in her smart parlor in her best black silk gown and the gold chain she had made Hezekiah buy for her, so that she might look, as she said, like a lady.

The maid showed in the visitor, and then Peggy rose, her great black eyes sparkling under their thick straight brows, and her color brighter than ever, as she went forward with outstretched hands to greet Mrs. Emmett.

"Now this is real kind on ye, ah's zeear is it. Ah hopes ye'se not tired by coomin' oot so far fra home, Missus Emmett?"

But even while she tried to speak as boisterously as possible to show her perfect independence, Peggy's heart sank under the cold scrutinizing glances of Faith's yellow eyes — glances all the more stabbing from the covert way in which they shot from under their long dark lashes.

Faith took the chair set for her with cold self-possession. She did not even ask for Hezekiah; she was resolved that Mrs. Byland should understand that her visit was due only to the importance which she, the housekeeper of Burneston, attached to reports affecting the credit of the Hall.

"What did ye me-an by sending sikan a feeal's tale to me, Peggy Byland?" she said sternly; "writing a post letter, an' mebbe it hev been opened? I'se sham'd on ye."

Peggy's carmine cheeks grew purple.

"Don't ye mak no mistaks, Missus Emmett; there's mair mistaks than haystaks i' t' warld. Ah spose t' squire, as ye calls him, has a right to pleese hissel, and t' lass has a bonny face o' her ain. Ah believe she's leeakin' out in t' windy noo."

Peggy rose, rustling her skirts, and pointed to the cottage.

"Div ye me-an t' say" — Faith's face had grown rigid — "'at Maister Burneston visits at sik a poor owlish place as yon? Mebbe he's gude to 'em — he's rare an' gude, is t' squire. Ye sud mind yer tongue when ye speak agin t' quality, Peggy. Coortin', ye said! coortin', in sik a place as yon! T' ways o' t' quality ain't t' same as fooaks like yersen."

Peggy tossed her head. Faith's provocation had given her the courage she wanted. As she said to her husband afterwards, "Ah wur fair raageous. Ah wern't to be sed by any awd lass."

"Weel, mebbe he kens 'em; but they'se not poor. An' when ah sent t' letter ah didn't spose ye kenned 'em; but Hezekiah said t' mornin' they'se Burneston fooak, an' t' name's Barugh."

She kept her eyes on the window, in the hope that Doris and her brother would come out, as they often did, for a walk. She did not see the change in her visitor's face. Faith turned suddenly pale, her yellow eyes dilated till she looked like a cat ready to spring; but even then she was watchful over her words. The strange part of this woman was, that her outbursts were deliberate, and calculated to produce a certain effect, while her real impulses were as strongly controlled as they were violent.

"They'se not awd Burneston folk," she said coolly; "new-comers — t' farmer, an' t' missus, an' a lame lad?"

She gave a quick, interrogative look at Peggy, who nodded, and then spoke eagerly, —

"Eh, there's more nor t' fayther, an' t' muther, an' t' lad. They come first, an' mebbe two weeks after comes a lass, an' ah sposes she's their lass by the ways on 'em; but she's a lady for a' that."

The withering rage and scorn that possessed Faith are indescribable. She looked at tall, broad-chested Peggy, and felt that she could shake her into fits; but she still kept a seeming calm. Peggy was looking curiously at her. Faith forced herself to smile.

"Mebbe it's Doris, the lass fra scheeal — an' ye ca's her a lady! Fahne feathers maks fahne bods, Peggy. She's nobbut a farmer's lass." She gave a scornful glance at Mrs. Byland's gold chain. "Nae doubt it's t' Lunnon gown; but Doris's nooan a lady, Peggy. They 'at's allays wi' t' quality kens t' differ, where sikan as yersen wadna finnd t'." She ended so loftily that Mrs. Byland's courage forsook her.

"Weel" — she spoke doubtfully — "ah cann't say but yes reeght; but Mr. Burneston hev come tweea tahms sin' Sunday, an we'se at Friday noo."

Faith grew paler, but her face remained still. "How's yer man, Peggy?" she said. "I can't bide wiv ye longer; ye mun just say to Hezekiah I'd bizness in Steersley an' I gied ye a visit."

She refused hospitable Peggy's offers of a meal, and even cake and wine had no power to stay her; she departed professedly to transact her business at Steersley, really to seek Ephraim Crewe and his cart at a farm about half a mile out of the little town.

She did not try to verify Peggy's story; she felt it was true. There had always been something in Mr. Burneston which had eluded her vigilance, and now she felt sure he was disgracing himself. The removal of the Barughs, the long absence of Doris, all sorts of tokens and foreshadowings, dimly seen before, came upon her with sudden vividness. Did Mr. Burneston mean to marry this girl, and set her over the heads of her betters? She felt dizzy as the thought came.

"Gin he'd meant waur he'd not ha' waited while she coomed fra Lunnon," and she trembled with suppressed fury.

But as she sat silently beside Ephraim Crewe, Faith forced her anger into the background, and set herself to see what could be done. Master Ralph had a will of his own, if he could be brought to sustain it; and he was as proud as need be; if he knew the truth, he would not tolerate Doris Barugh in his mother's place.

"There's his cousin," she said doubtfully; but she had not much faith in Gilbert Raine's conventional notions. Mr. Burneston had no other near relative, and Faith knew little about his friends, except the hunting and shooting companions, who came once a year to the old Hall.

No, she must trust to Ralph, and she resolved to write to him; she knew he would not betray her. She should simply tell the boy there was a report that the squire was going to marry a young girl, the daughter of one of his own tenants, and that it might be too late to stop the marriage if he waited to interfere till the Christmas holidays.

Book II. — Courtship.

CHAPTER IX.

GILBERT RAINE IN HIS DEN.

Gilbert Raine was an early riser, and often hard at work in his study before the post came in. In levelling ground on which he meant to build cottages he had come upon some Roman brickwork, and by unremitted digging during the last few days, he and his two gardeners had succeeded in exposing the foundations of part of a Roman house. He was busy writing an account of this discovery for one of the learned societies of which he was a member — so busy, that when the post came in he suffered his letters to lie unopened beside him.

He looked thinner, and, if possible, more eccentric than when he was last at Burneston. His hair hung in dark elf locks over his bright, restless eyes, and the wrinkles on his forehead had deepened, so that when he raised his eyebrows, as he did now, he looked much older than he really was. He wore very little hair on his face; and while he held a letter close to his near-sighted eyes, he pulled at his scanty whiskers with his left hand till his cheeks grew red with pain.

"What on earth ——" Then he turned to the first page and read the letter again.

"My dear Gilbert, — You always said I was to write to you when I was in trouble, and I don't know what can be done about my father. I hear he is going to make a low marriage. Now, you know

I don't want a stepmother at all; they're always a mean, mischief-making lot; even if it was a lady, it would be bad enough. What can my father be thinking of? It seems to me he may be off his head, or some one's taking him in; so will you go down to Burneston and look after him? If you won't, please tell me, and I shall go off post-haste, and get expelled in consequence. But you're such a dear old chap, I know you'll go. We ought, between us, to prevent my father from disgracing the family.

"Your affectionate cousin,
"RALPH AYLMER BURNESTON."

Gilbert Raine left off pulling his whiskers, and grasped his chin tightly, while he once more read Ralph's letter.

"Then I was right, after all," he thought; "and those allusions in Phil's letter pointed to this intention; that's to say" — he crumpled the letter vigorously in his brown, sinewy hand — "if there is a word of truth in this letter of Master Ralph's. I'll bet anything that old housekeeper is at the bottom of it all, and she has set on the boy to get me to interfere. Well, then, shall I interfere? Why should I make myself Faith's tool?"

He stood thinking, screwing up his brown face till it was seamed with wrinkles, while he frowned and closed his eyes. He was so dark, and gaunt, and keen-looking, that, but for the manly, candid expression of the bright eyes, seeing him in this den, with its queer counter-like tables, high stools with black leather seats studded round with brass nails, and walls formed of shelves and pigeon-holes, you might have taken him for an old alchemist or magician.

The tables were laden with books, pamphlets, papers, bits of tiles, etc.; and the mantelshelf was a chaos of ancient fragments — the toe-bone of a mummy, relics from an Indian temple, a stone from one of the lost cities of Central America, a bit of granite from the Menhirs at Erdeven, a Roman statuette from the south of France, coins from the pyramids, with sundry other things — all heaped one on another in a state of dusty confusion, that called loudly for the housemaid and a pair of bellows.

All at once Raine roused from his reverie and walked hastily out of his den, across the black-and-white chess-board floor of the entrance to the dining-hall, a long, bare room, with a dark, polished, uncarpeted floor, six tall windows with small panes set in white window-frames, on the left, and on the right a huge wide chimney with an open hearth, guarded by enormous brass dogs. All round the upper part of the oak-panelled walls were portraits of Gilbert Raine's ancestors, dating as far back as Queen Elizabeth.

It looked very cheerless to see the meagre breakfast — a small coffee-pot, a roll, butter, and an egg — set at the end of a long, narrow table, capable of dining a score of persons, and Raine ate his breakfast in a cheerless, ungenial fashion, walking up and down from end to end of the long room with his mouth full.

Austin's End was a fine old mansion, with a great square oak staircase, up which the wind came rushing on this cheerless September morning to the many galleries and passages up-stairs, and into the large old-fashioned guest-rooms, making the tapestry wave on the walls, till the nymphs and trees thereon depicted seemed to be courtesying in concert to the wounded knight lying outstretched above the scroll-work border. But the bare aspect of the rooms, and galleries, and halls made one shiver even in July. Except the aforesaid tapestry up-stairs, the family portraits in the dining-hall, and a few large blue and white china jars on the staircase, suggestive of rose-leaves strewn therein long ago by fair fingers, there was nothing in the house to relieve the universal dark oak and whitewash. There were treasures in the shape of antiques and curios, locked up in old oak cabinets and chests about the house, but Raine had never yet found time to arrange these stores, he was always seeking fresh discoveries, without an idea of digesting those in his possession.

Before he had been a quarter of an hour in the dining-hall he rang the bell.

"Tell Buxton I'm going to Burneston," he said. Then he went up to his gaunt, comfortless bedroom, with its bare, uneven floor, and packed his own bag.

"Whether it is Faith's mischief or not," he thought, "I must stand by Phil. He's the best friend I've ever had, and I am the only creature in the world he'll take advice from."

But more than once, as he journeyed northward, he remembered that his cousin had taken no notice of the remonstrances he had written from Bornholm, and he sighed as he remembered how very obstinate Philip Burneston could be.

So many years ago it was a two days' journey from Austin's End to Burneston, and Raine did not reach the hall till the next afternoon. "I must be very careful

in what I say." This was his final resolution, as he drove slowly over from the railway station at Wolden, some fifteen miles distant from Burneston.

What a time it was since he had seen the old place! He began to reproach himself for his long neglect, and the seemingly important matters which had kept him at home dwindled into trivialities in memory before the idea that if he had not left his cousin so much to himself, Burneston might not have got into this entanglement.

Faith was in the hall as he arrived. She made a deep courtesy, while Mr. Raine asked Benjamin for his cousin.

"T' maister's gaan ridin' alane, sir. Mebbe he's nut far off."

"Ah! I'll go and look for him presently. How d'ye do, Mrs. Emmett? Have you heard from Master Ralph lately? You'll be having him back at Christmas."

He glanced sharply at the yellow eyes, but they looked perfectly unconscious of mystery.

"Yes, sir, we hope so," and then she added a few words about his room, and Benjamin conducted him to the dining-room.

Raine thought he was glad his cousin was out. The strong dislike to interference which had come upon him as he read Ralph's letter returned with yet more power, and he asked himself what right he had to speak to Philip Burneston on such a special matter unless he consulted him. Benjamin stood behind his chair wondering at Mr. Raine's silence, for Gilbert always had a joke or a kind word for the old servants, some of whom had known him all his life.

"Do you know which room I'm to have?" he said at last, and Benjamin summoned Mrs. Emmett.

"Yey'll like yur aohn room, sir, beturist," she said quietly; "it's awlus fettled, an' it's bin waitin' longer than usual."

She turned to lead the way up the old dark staircase, and, pausing on the first landing, went up three shallow steps into a gallery on the left, and threw open the door of a small room with an oriel window, in which were two easy-chairs and a writing-table strewn with papers.

"It's fair as ye left it, sir, we'se remmoned nought. Master Ralph hev said 'at t' papers waaz nut to be stirred."

Gilbert Raine sighed as he looked round. There was something very comfortable and pleasant-looking in the square Indian carpet and the pale blue and drab hangings; the books and pictures, too, seemed like old companions, and the newly-lighted logs were sputtering and sparkling noisily in the wide grate.

A moment's vision of Austin's End with all these beautifying comforts, and with some one to direct and order all, and take domestic cares from his mind, and then he shrugged his shoulders and screwed up his eyes.

"No, no, let well alone. At least, I have freedom, especially from heartache; and women have a knack of causing that."

He whistled and stooped over his bag, which he never allowed any one to unpack. No one seeing the boyish glee with which Gilbert Raine enjoyed trifles, and his careless way of looking at life, would have guessed how deeply a woman had once made his heart ache. It had happened in his youth; he was twenty-two and the girl was twenty-five. She was engaged to a man in India, but she thought herself free to listen to the clever talk of the young Oxford man, and receive his admiration. He was only a boy, she said, and he was the only congenial companion she could find among the guests in a large country house. So she rode with him and let him repeat poetry to her on long delicious summer evenings beside the river that ran through the grounds; and one evening she was quite taken by surprise when the poor unconscious fellow asked her, with passion in his eyes and voice, if she could ever love him.

"Oh! why did he do this?" she asked. "She was so happy in his friendship, and she had meant to keep him for a friend always." But Gilbert was desperately in earnest. He would not be put off so; and she had to humble herself and avow her engagement, and then endure the lad's scornful reproaches.

Poor fellow! he could leave her in anger, but the effort nearly broke his heart — it made a man of him, and also a woman-hater; for since he had come into his uncle's property many a mother and daughter had tried in vain to make Gilbert Raine take a wife. But that first impression, so sweet and then so bitter, could not be obliterated; he had never seen any one so charming as that girl; and if she could be false, who could be true?

He soon went out in search of his cousin, and meeting Jock, Mr. Burneston's collie, in the hall, he took him with him; but, though they made a long circuit, they could not find the master. All at once, as they paused on the hilltop beside the church, the dog pricked up his ears and went forward, barking joyously. In a

few minutes Mr. Burneston had ridden up to his cousin.

"Why, Gilbert, old fellow, this is capital. I thought it was you, and yet I couldn't believe it."

But after the greeting was over, Mr. Raine thought Philip was unusually silent. He began to hope that after all he might not have to begin this difficult subject. Burneston had always come to him spontaneously with his troubles, and he looked troubled now.

As they passed the two cottages, Joseph came to the door and gave Raine a hearty welcome, but the squire went on scarcely turning his head.

"Well," Gilbert said as the silence continued, "what has been happening in Burneston, Phil? Have you burned Dame Wrigley yet, or has she given up riding on a broomstick?"

"It's curious you should ask that to-day. The poor old wretch has been left in peace since young George Barugh took her under his protection." An inquisitive look came into Raine's keen eyes as the squire flinched at the name. "But now there is fresh sickness among the cows, and old Sunley is more violent than ever; I am afraid he would like to see Patience worried to death."

"Bloodthirsty old wretch; and he'll see it done, too, Phil. He looked as tough as an ash stick when we passed him just now. Why don't you get the woman away?"

"She won't go."

"Can't you get the young fellow you spoke of, George Barugh, to influence her?"

"I never thought of it, and he's not in Burneston now; he's away with his people." He rode on, getting out of the range of those observant eyes.

"Gone, are they? They were the people on the hill, I think. Have you a new tenant then at Church Farm?"

Gilbert Raine's long legs had soon brought him beside his cousin again, and the downward road through the village was so steep that the horse went slowly.

"I didn't say they had left the farm." Burneston spoke irritably. "I wish they had." This was muttered to himself. "Mrs. Barugh has taken George to Steersley for a time for — for change of air."

"I forget — is he the only child? I don't seem to know anything about these Barughs."

Mr. Burneston twitched his bridle, and then spoke angrily to his horse. He had a vexed consciousness that his cousin, instead of playing with the collie or speaking to the children crowding to the cottage doors, was observing him closely.

"There are two children, a boy and a girl." And then without any intention, except that of changing the subject, "Have you heard lately from Ralph?" he said.

Raine was, as he said, a blunderer. He had no idea of introducing a subject adroitly. In his anxiety to have done with restraint, he forgot his cautious resolutions; it seemed to him that he had better speak, and here was the opening he needed.

They had reached the bottom of the village, and turned to the right beside the river, over which lay a brooding mist.

"Yes, I heard from him this morning." He stopped, but Mr. Burneston did not help him with a question. His cousin's uneasy manner had warned him that something had to be told. "The truth is," Raine went on hurriedly, "his letter brought me here."

"Really! Anything very important the matter?" very drily spoken.

How strange it is that when we are vexed with those we understand best, we often take the worst possible method of making them do what we wish! Philip Burneston wished to silence his cousin, and he showed his displeasure to that end, while he knew, or might have known by experience, that opposition was sure to rouse Gilbert Raine's determination.

A bright flush rose on the dark wrinkled face, and a slight frown deepened the creases round the eyes and mouth.

"Yes, Phil; the boy is anxious about you. It's no use beating about the bush; the truth is, some one has told him you are going to be married."

Mr. Burneston laughed, but he spoke fretfully.

"People are very clever. I certainly have not promised to marry any one."

Raine gave a sigh of relief. "Thank God!" he said, gravely. "I thought it was possibly gossip. The story was, that you were going to marry some girl — well, out of your own position."

Burneston rode on in silence till they reached the great gates which shut in the stable yard and the entrance.

"Wait till we get in, Gilbert," he said. "I should have told you sooner or later, so I may as well get it over."

CHAPTER X.

LOVE IS LORD OF ALL.

MRS. BARUGH felt ill-used and irritable. She had, as she expressed it, been "led a life" by her husband and her son.

When John Barugh returned to Steersley and heard of the squire's visits, he broke out in stubborn anger. It required Dorothy's utmost care and tact to prevent him from showing his displeasure before Doris.

At last the storm quieted; and when he understood that the meeting in Steersdale had been accidental, and that Mr. Burneston always came over to Steersley, as Dorothy asserted, on business, he softened, and was obliged to confess that it was but natural the squire should call in when he was there to see George, as he had done at the Church Farm.

"Dhu mun keep t' lass fra seein' him ivvery tahme he cooms," said simple John.

As he was starting to go back to Burneston he said that Rose Duncombe was anxious to see Doris, and that he had given her leave to come.

"Oh no, John, don't say so. Doris can't abide Rose, they never suited; it'll be a sad mistake for her to come."

But John was in a hurry.

"Bon it," he said, "waat harm can t' lass deea? Bud settle it amang yersels," and he went.

Dorothy gave a sigh of relief. She respected her husband and loved him after her fashion, but just now she did not want him; she was free for a week, perhaps for a fortnight, from his supervision; and she went back into the little sitting-room with a smile on her face.

But at the sight of George standing in the middle of the room, looking taller than usual, and pale with anger, she stopped in dismay, and gave a little cry of fear.

"Why, lad, why, what is it? Are ye ill? What's got ye to look so at your mother?"

"Whist, mother! don't be a silly, an' steek till t' door." Then, recollecting himself, he pointed to a seat, and tried to control his passionate anger. "Mother!" the tears springing in poor Dorothy's eyes softened his rebuke more than she knew. "Yur talk fair caps me; is there no such a thing as t' right an' t' wrang, or are we to make what Doris likes an' dislikes our rule i' life?"

But Dorothy had begun to cry. George had never before rebuked her so sternly.

"I can't bear it, I can't," she sobbed. I do all I can to please the lot of you, and it's one twitting here, and t'other scolding there, and now you lecturing, George, about nothing; it's too hard; so there."

George's mouth twitched. He shrank from giving his mother pain, but he could not shrink from what seemed to him positive duty.

"I'm sorry to grieve ye, mother." He stood before her as if he were the offender; but he went on firmly. "But it's for Rose I speak. Rose was good an' kind to me when I was nobbut a poor helpless sufferer, an' are we to gi' her t' cold shouther now? More than that, Doris an' Rose waazn't friens when they was little lasses; but mebbe tane's as much changed as t' ither now."

Dorothy tossed her head.

"Never, lad, never; can't ye feel a difference as well as see it? Rose is——"

"Stop, mother; deenut say what I cannut listen to. Rose is my friend, and I waenut hearken to a word o' blame about her from you or any other. If she an' Doris deenut fancy yananidur, let 'em keep apart. But it's hard on Rose an' me, an' I say, gi' 'em the chance. An', mother," he said earnestly, "for my sake ye'll be kind to t' lass whenivver she cooms."

And Mrs. Barugh felt how much harder it was to resist the sway of her quiet invalid son than of her more irascible husband. John was patient; but when his anger was roused it was tremendous, and defeated its object.

"'Tis the worst of being so good, lad," Dorothy said as her son kissed her. "You're so often right that you can never think ye're wrong. Well, I s'pose I must take the long wi' the short, and let ye have your will; but don't say a word to Doris."

Her earnest hope was that, as she knew Rose had other friends in Steersley, the girl's visit would be short, and would happen during Doris's frequent walks.

For Doris, who had become very lively and companionable, had lately gone back to the silent abstracted moods of her childhood. Mrs. Barugh noted this, and drew her own conclusions; but George was puzzled and disappointed.

He had been growing stronger every day, and he often walked with Doris; but she was more dreamy and listless alone with him than in her mother's presence.

To-day, as they sauntered on the velvet turf within the grey ruins of Steersley Castle, he said suddenly, "What ails ye, lass; is it love?"

"George!" She blushed and looked annoyed, and then, recovering herself, she laughed. "Oh, George, what nonsense! Don't you remember I was often like this?

My friend Rica Masham said she had cured me; but I don't know. I wish you could see Rica, George; it would be nice for you to have a friend like her."

George flushed, but Doris's eyes were on the grass at her feet. "I has you an' Rose," he said with an effort — for he rarely spoke of Rose to his sister. "I think a lad has enough wiv two of ye."

Doris raised her head, and her lips curved in a slight smile.

"But I can't help thinking if you knew Rica you would like her best of all; she's so bright, so joyous, so full of mischief, she makes one feel so young."

George forgot his vexation. His brown eyes twinkled merrily.

"Young — that gude for ye, lass. Mebbe ye'll be wanting a cap soon like mother's. Make hay while t' sun shines; ye'll never be younger than ye are now."

"I'm getting old; I really am getting old, George," she said; "I'm nearly twenty."

But after this she roused, and talked of Rica and her school-life till they reached the cottage.

"Please, miss, there's a visitor."

Doris's heart beat with she scarcely knew what anticipation; but George went on eagerly, opened the parlor door, and saw, as he expected, Rose Duncombe seated beside his mother.

Rose jumped up eagerly, shaking out her skirt with excitement, and rustling in the consciousness of a new, stiffly-lined gown and a showy scarlet shawl.

George's smile of glad welcome was slightly subdued as he watched the two girls shake hands. Rose was much prettier than Doris, he thought; her eyes were so sweet, her hair so bright and golden, and her color as fresh as a rose. But, although he thought his sister's dress too staid and quiet for a girl, it seemed as if Rose was a parroquet beside her. The village girl flamed with blue and pink and scarlet, and her hearty laugh and boisterous greeting jarred on him as it had never done before. But this feeling was only transient; he saw that Rose grew shy, and that Doris was stiff, almost haughty, and in a moment his allegiance came back.

"My word, you hev grown tall!" Rose tried to cover the awe she felt of Doris by a familiar manner which sounded pert. Doris was even more disgusted than she had expected to be, for she had not counted on Rose's assumption of equality. She thought school would have made the girl affected and silly; but this off-hand freedom took her by surprise, and made her own manner constrained.

"I suppose my nose is out o' joint wi' you, lad," Rose laughed at George, "now 'at ye've set up a real sister. D'ye find him changed, Doris? My word, yey've changed yurself; I wouldn't hev known yey!"

"You are not much altered," said Doris in a polite, cold voice. She was angry with herself for being so irritated; but every word the smart, rosy-cheeked damsel said took her back years — to the farm kitchen and to herself, in her lilac pinafore and sun-bonnet. She felt that she hated Rose Duncombe.

"Not much altered!" Rose was violently mortified. "That's what *you* think, is it?" she turned to Dorothy with flushing cheeks. "She's not changed in some ways, Mrs. Barugh. She's just as short-spoken as ivver, I see, an' she cocks up her chin as like——" Doris gave a slight shiver of disapprobation, and George looked troubled. "But nivver fash yourself, Doris; I'll take myself off. I don't need to force my company where it's not wanted; there's plenty only too glad on it." She turned her back on Doris, her eyes sparkling and her face hectic with passion. "Never you mind, lad; I'll come an' see yey when yey gits back to t' farm; she'll" — jerking her head towards Doris — "hev settled down by then. Good-bye, lad; I've a heap of friends to go an' see in Steersley, though I began wi' you. Good-day."

All this was spoken in breathless haste, while the listeners were dumb with surprise; and, squeezing George's hand, and nodding to Mrs. Barugh, Rose ran away without taking any leave of Doris.

"Oh, Doris! What have you done?" George spoke at once and angrily, for he had seen tears in Rose's bright eyes.

"Done!" — Doris drew herself up with dignity — "I really do not understand. I do not wish to 'vex you, George, but Rose Duncombe seems to me a very ill-behaved young woman. She certainly has not changed for the better."

"It's easy for those 'at haven't got strong feelins to keep cool and quiet. You know nothing about feeling, Doris; all you think of is manner. How would you like to be snubbed by one of your equals? and Rose Duncombe" — he looked at her sternly — "is much more your equal than Mr. Burneston."

"Ah, my lad, don't" — Mrs. Barugh placed herself between the brother and sister, for George's vehemence frightened

her, she could not understand it — "why should you bring the squire's name up at all? What can he have to do with Rose?"

Doris walked away to the other end of the room. She did not give a thought to George's wounded feelings; she only felt that this kind of rude quarrel was wholly ruffling and unsettling; during all the five years she had spent at Pelican House she had never been so much moved out of her habitual self-control.

"It all comes from their want of breeding," the poor girl thought; "and what will become of me? Shall I sink to this, to quarrel and be rude, like Rose, and grow altogether coarsened?"

But George was speaking in a steady, determined voice, that compelled her to listen. "Mother," he said, "mebbe you didnut take notice; but it was varra hard. The girl have comed over here with a heart full of affection to welcome an old friend, an' t' old friend treats her like a stranger. I'm sorry I spoke so sharp, Doris. Mebbe you didnut mean no harm; mebbe them's London manners. If they is, I says I likes t' old ways best. But I'se grieved for Rose; she's vexed with hersel', poor lass. She wur fair set on Doris."

Doris looked very grave.

"I'm sorry too, George, but you know I never was Rose's friend, and I do not think I should get on with such a hasty person. Pray do not let us talk about her."

"No, my dear," Mrs. Barugh spoke soothingly, "it is not to be supposed you would get on with poor Rose. She's a kind, good-hearted girl as ever lived, and she's been an amusement to George when I couldn't be with him; but she's had none of your advantages, of course, and George won't think so much of her now he has you."

"Mother," George blushed like a girl, "dinnut find fault with Rose, I cannut bid'un. Mebbe she's wanting in many ways. She's old-fashioned an' countrified. Well, so's I, but she hev got a heart, and she hev nivver said an unkind word since I knawed her, an' I'm not going to gi' her up to please Doris."

"You are unjust, George, I do not ask you to give up Rose." Doris spoke calmly, but she looked pained. In her heart she was shocked at her brother's persistence.

"Why should I?" he said sternly. "She braids o' us; she's o' t' class we waaz born in, Doris. Eh, deeant yey go for to cheat yoursel', lass, yur friend Rica, as yey calls her, 'll cock up her neb at yey when she sees what sort yey are, an' as for t' squire, he just cooms t' see us as his tenants."

"You're out there, my dear." Mrs. Barugh bridled and looked as nearly angry as she could be with her beloved son. "We're not Mr. Burneston's tenants here: it's one thing for him to come and see us at Church Farm, lad, quite another for him to come here: it's plain he looks on us as friends."

"I nivver meant he didnut think us friends, mother, what I means is equals. D'ye think, mother, t' squire wad bring a friend to see ye or ask ye to t' Hall nobbut to see Mrs. Emmett, an' I fancys Doris wad be as ill pleased wi' Missus Emmett as wi' Rose Duncombe."

"George" — Doris came back and stood beside him — "don't let us talk about this. We can't see things from the same point of view; only I think you ought to remember that I never did like Rose."

"An' ah says," George spoke earnestly, "yur wrang. Yey've changed by yur learnin', an' so hev t' ither lass, an' yey just sits in judgment on her wivout gi'in' her a chance o' pleasin' yey. But nivver fear, ah deeant want to force Rose on yey, Doris; she an' ah's coompany for ane anither; bud maand off! Ah wonnut hear a word agin t' lass fra yan o' yey."

He limped out of the room. He was himself troubled by his own agitation, which he found quite beyond control (in speaking he had returned to the words of his childhood), and he wanted to prevent further strife.

Directly the door closed, Mrs. Barugh broke out in lamentation.

"Oh dear, oh dear, this world's a trial, and George and me have never had a word in our lives before. I wish you could have seemed more friendly to the lass, Doris, just for George's sake. You see he looks on her as his friend, and so he takes it to himself."

Doris made no answer. She was walking up and down the room, her fair forehead puckered by a frown and her delicate lips firmly pressed together.

"Don't you see what it is, mother?" — she stopped short in her walk and looked reprovingly at Dorothy.

"No, my dear. What d'ye mean? I ——"

"Well, then, mother, I think you ought to have seen, for this cannot have come all at once. At least" — her cheeks flushed a little — "I fancy not. George loves Rose Duncombe." Mrs. Barugh turned so pale that Doris spoke more gently.

"I'm sure of it. He would not excite himself in that way if he did not feel very strongly, and, besides, he has said other things." She was thinking of what he had said in the park that morning.

"Oh, Doris, I can't think it. How could a poor lame lad like George take a wife? He'd have nothing to live on, and we'd be forced to have her to live with us. Oh, George, lad, no wife'll ever love ye as your mother does."

She sat down crying, and smothered her face in her handkerchief. It was the most miserable moment she had ever known. George, her own George, to whom at least she thought she was all in all, had given his love to Rose, and here was Doris, her own child too, and yet so much a stranger to her family that she was not grieving at the loss of her brother's love, but only angry that he had given it so unworthily.

"Mother" — Doris spoke in the proud, resolute tone that had so awed some of her schoolfellows at Pelican House — "you must leave off crying, and you must think. George is so young that it's nonsense to take such a thing to heart. It could never have happened if he had lived anywhere else and seen other companions as well as Rose, and I think it is all on his side. I am not sure that she cares for him. She seems too much at her ease."

"Not care for him!" Mrs. Barugh wiped her eyes hastily and sat upright in her wonder. "D'ye mean to tell me, Doris, that such a lass as Rose wouldn't be proud of your brother George's love? Not care for him! Why, who is there in all Burneston, or for that matter in Steersley neither, fit to hold a candle to my lad?"

Doris smiled. "It's not that, mother, but George is too quiet for such a girl as Rose. She's not one who'll care to sit still in-doors. She is vain and silly, I am sure she is, and she has the common sort of nature that would seek to be admired. I can't bear to think George loves her."

"He's seen no one else, that's it," Mrs. Barugh sighed; "but it's too late now, Doris; if it's as you say, it won't do to be finding fault with her; it will only make him worse. You've made me sadder than I ever was before. O George, lad, how can ye take up with a girl like that instead of your mother! She'll never love ye half so dearly. O my lad, my lad!"

She covered her eyes with her hands. Doris stood thinking with a very anxious face.

"Mother," she said at last, "it will be better never to go back to Burneston. Such a girl as that will soon forget George, supposing that you are right; and if she does not love him, will it not be much kinder and wiser to keep George out of her way?"

Mrs. Barugh shook her head miserably. "You don't know yer father, child. He can't abide changes — the trouble I had to get him to leave Pickerton! And though he's never, as one may say, taken to the Church Farm, still he's begun to lay out money there, and I doubt if he'd be willing to leave before he's got it's value returned."

"But you don't cling to Burneston, mother." She did not wait to be answered. A sudden hope, the outcome of her long reveries — reveries which, beginning in fear, always ended with the certainty of future mortification in life at the Church Farm — made Doris strangely earnest. "I own to you that I shrink from going back there. Yesterday you told me that George's health was so much better away from Burneston. Surely my father will not sacrifice us all for the sake of a few pounds."

Mrs. Barugh looked utterly miserable. "I'm sure I don't know, Doris. Your father has been at great expense for you, and then there's this cottage and the giving notice. Why, child, a man can't step out of one farm and get into another as easy as he changes his boots."

"I suppose not." Then, while a rush of color flew over her face, making her frown with vexation, "but with Mr. Burneston it might be different, mother." She threw her head back and spoke very coldly. "I don't think Mr. Burneston wants us back at the Church Farm."

CHAPTER XI.

A THANKLESS OFFICE.

Mr. Burneston was silent until he and his cousin were seated in the library; even then he seemed unwilling to return to the interrupted conversation.

He sat whistling and playing with a paper-cutter, which he had taken off the table.

"Yes," he said at last, "I wish that old Wrigley would go away, it might save mischief."

Gilbert Raine had been feeling more shy and ill at ease than he had ever felt in his life; it was a relief to be able to speak of something else than the subject in his mind.

"Why don't you see about it? But it's new to see you worried, Phil; except now

and then when Ralph was troublesome, or one of the hunters came to grief, you took life so easily."

"And so I shall again, old fellow; just now I can't."

There was silence after this. Raine fidgeted and made a most hideous scraping by moving his chair on the uneven oak floor. At last he told himself he was a coward.

"Phil," he cleared his throat, and there was a comical twinkle in his bright eyes, "when we were little chaps, we used to tell our troubles to one another. I suppose this story I've heard is true then?"

Mr. Burneston rested his elbow on the back of his chair, and shaded his face with his hand.

"True in some ways, but not in saying the — the person in question is my inferior."

"Thank God!" said Raine with energy, and he settled himself for a comfortable talk. "Let's hear all about it, old fellow," he said; the relief was so great that he felt cheerful. "I hoped you would have kept your freedom, but I suppose you can't get on alone."

Mr. Burneston looked uneasy. "I speak as I feel," he said pettishly; "the world, of course, will not agree with me; it remains to be seen, Gilbert, whether you can venture to have an opinion of your own, or whether you are influenced by Mrs. Grundy."

"I think I have shown the contrary." But Raine was troubled by this beginning.

"Well, it's soon said. We were speaking of the Barughs just now. The daughter, Miss Barugh, is very refined, highly educated, and — in short, if she will have me, I mean to marry her."

Raine sat stupefied for an instant; then forgetting all restraint, he said eagerly, —

"Then you've not asked her yet? for God's sake, don't, Phil."

Mr. Burneston got up from his lounging position, and went and stood against the mantelshelf, with his hands behind his back.

"Gilbert," he said quietly, "did you ever know me to give up anything when once I had made up my mind?"

"Perhaps not; but hitherto the question has been about something which did not touch the welfare of your whole future life, and Ralph's also."

"Am I to give up my whole happiness, then, to avoid a possible annoyance to Ralph? Nonsense. Don't you see that in three or four years Ralph will have his own friends and live his own life, without the slightest reference to me? We have scarcely a sympathy in common ——"

Raine sighed.

"Pardon me, Phil; but I must think a good deal of that is your own fault."

A flush was rising in Mr. Burneston's face. "You mean," he spoke quickly, "because I left him. Well, then, I think you are wrong. I was unhinged and restless, and I always have disliked boys. If I had stayed at home, probably the boy would have hated me; now, at least, he cannot feel that I am harsh or stern — in fact, we are very good friends when we meet."

"But do you think he wi. submit patiently to a step-mother out of the village? Now stop, Phil, I am only speaking from Ralph's point of view. How will constant domestic strife and petty squabbles suit with your fastidious notions of refinement, culture, etc."

"To begin with, if you knew Miss Barugh, you would see that one of her great charms is the absence of all pettiness or feminine frivolity. She has not been brought up in her own home; she is ——" He broke off with an irritable laugh. "I really don't know why I enter into the question; almost every man left as I am marries again, and if I am satisfied, what does it matter? And certainly Miss Barugh wants no defence. She is just the wife I want. I intend to live quietly at Burneston; you know I always disliked London and society; after a bit Ralph will be quite satisfied."

Raine sat musing. It was so impossible to him to believe that Philip Burneston of all men could be hopelessly in love with a farmer's daughter, that he could not bear to give up the matter as settled.

"Don't do it, old fellow," he broke out impetuously; "you'll be so sorry if you do. That sort of polish is like varnish or veneer — it only hides, it cannot eradicate. Now could you bear to have sons and daugters of a different breed to Ralph? Fancy how he'd look down on such brothers and sisters — a row of little farmers."

Mr. Burneston had looked very angry, but he laughed as his cousin ended.

"We have argued this subject once before, when, as you may remember, you put this idea in my head, Gilbert," he said ironically. "I do not mean this as reproach; on the contrary, I am thankful to you, it has given me something to live for. I believe I shall be very happy, though I am prepared for an outcry at starting."

"You think nothing of example then. Suppose a woman in your position married

Joseph Sunley, or a young man of his class, do you think the precedent would be a good one?"

Mr. Burneston looked grave. "No, of course not; nor are the cases parallel; it is absurd to put it in that way. I don't say my own affair is good for others; but I don't set myself up as a pattern. Besides, I am not doing this in a hurry. I have thought it well out. If I see any reason to suppose I am mistaken, I shall not ask Miss Barugh to marry me."

"Then is it quite fair to go on raising expectations which perhaps, after all, won't come to anything?"

"What are you driving at?" Burneston turned round and faced his cousin, and he saw the keen anxiety in Raine's face. "What do you want me to do?" he said more gently.

"Well, as you ask me, I'll tell you. Don't see Miss Barugh for three months or so. Come down with me to Austin's End, or we'll go away abroad somewhere together; and then when you come back you will see with clearer eyes, and will, besides, have had time to think it over calmly and dispassionately."

"And find that some one else with more courage has won her. No, Gilbert." He looked as hard as the mantelpiece behind him.

"I should say there is no fear of that: there are very few men such as you who would dream of marrying Miss Barugh, and with her notions and the education you speak of she would not accept a young farmer. No no, she'll wait for you. My dear Phil, do open your eyes; do you suppose the girl will give up the chance of being mistress of Burneston Hall?"

"She does not dream of such a thing," said Philip angrily; "you don't understand her a bit; how should you? You know nothing about women. Certainly, you never met such a woman as"—he was going to say "Doris," but he checked himself—"Miss Barugh."

Perhaps his voice had taken an angrier tone because he remembered so vividly the child swinging on the gate and her song.

"If she does look forward to it," he thought, "it's only natural; and it is my own fault;" but this excuse did not take away the sting of Raine's accusation.

Gilbert was growing tired of his position.

"Well," he said, "I have done my duty. I came for your sake and Ralph's, and I seem to have done no good. I had better have left it alone." He got up and walked to the window whistling.

Burneston always found it difficult to be long angry with any one. He loved peace so much that he was always willing to make the first advance; and his wife had understood this, and had profited by the knowledge.

"Look here, Gilbert," he said, "of course I get vexed easily about this affair. I don't want to deceive you, it's true I love this girl more than I ever loved any one, but I am not besotted; come over with me to-morrow to Steersley, and judge for yourself. If after seeing her you say she is not fit to be my wife, then—I don't say I'll give the thing up, but I promise to think it over again, to be prudent, and not to pledge myself to any hasty engagement."

"Very well," but Raine spoke unwillingly. He could not see how, by looking at this girl, he was to ascertain her merits.

"I'm too late," he thought, "the mischief's done; what unutterable folly this love is!"

They separated after this; and though they met soon after at dinner, and seemed as friendly as ever, each was conscious that they had grown farther apart than they had ever been before in their lives.

CHAPTER XII.

"OH, HELL, TO CHOOSE LOVE BY ANOTHER'S EYE!"

GILBERT RAINE woke next morning with the consciousness of an unpleasant weight on his spirits, which, like a bad taste in the mouth, took away the flavor of the day before him. But as he threw his window wide open, a keen crisp touch in the air was exhilarating, and the silvered grass and tree-twigs showed there had been a white frost. One of the mercies most carelessly and thanklessly received is that of change of temperature to a worried mind, and as the keen air found its way in freely, an elastic freshness pervaded Gilbert's mind, and went downstairs with him to greet his cousin.

It seemed as if Mr. Burneston had forgotten his annoyance. He was smiling and cheerful as usual, and had a half-conciliatory manner, which puzzled his cousin. He really cared for Gilbert Raine's good opinion, and, more than for that, as has been said, he cared for living in peace. He was resolved not to increase his cousin's prejudice against Doris by showing any vexation, he felt so sure all prejudice must vanish in her presence.

"Shall you be ready to ride this morning?" he said. "I have ordered Punch for you. He used to be a favorite of yours."

"Thank you, old fellow." Raine began to see that his cousin was really anxious to propitiate him; and he felt hopeful for the result of his advice. He was fond of riding Punch, nearly the best horse in the Burneston stables; but he was such a careless rider that he had seldom been offered the chance of mounting him.

He was rather put out by the hurry Mr. Burneston was in. He had discovered one or two old books in the library relating to some work he had in hand, and would have liked an hour's look at them before starting; but he was hurried and bustled, and not left in peace till he found himself riding beside his cousin on the highroad to Steersley.

Mr. Burneston had determined not to take his cousin to the cottage, nor to introduce him to Mrs. Barugh. By this time he had grown acquainted with Doris's habits, and he knew that at the time he counted on reaching Steersley, he should find her taking a walk with George in Lord Moorside's park, or seated reading among the ruins of the old castle of Walter l'Espec. He had more than once found the brother and sister thus occupied, and he thought he should like Raine to see them too, where her surroundings would be in keeping with Doris's perfect beauty. One thing he had not counted on — the absence of George.

Ever since Rose's visit, there had been an unspoken but decided coldness between the brother and sister. George told himself that he was in the right to hold fast by old friends and keep in his own station; beyond this he thought he was teaching Doris a salutary lesson, for he disliked and disapproved the pleasure she seemed to find in Mr. Burneston's visits.

"I likes t' squire," he said to his mother, "he's very kind, an' I'se reet glad to hear him talk and see his kind, cheerful face; but when he's gone, I'se t' same as ivver I was, while Doris sits glum, an' when I speak she gives a start as if I'd stuck a pin in her."

Mrs. Barugh smiled with an apparent mystery that irritated George. "Perhaps Mr. Burneston's talk makes her think," she said. "It's an uncommon advantage for you and her too to get such talks about things with such a gentleman."

"I'se none sure o't," said George. "Mebbe it's pleasant, but it's safer not to get to like things out o' reach, mother. Mebbe Doris 'll end by thinking hersel' t' same as t' squire."

He looked so stern that Dorothy suppressed the first answer that came to her lips.

"My word! ye've taken to lecturing, lad, and it don't suit ye," she said; "go out in the sunshine, 'twill do you good. Go after Doris; she's at the castle, I fancy, for she took a book with her."

George muttered an answer, but he stayed in-doors. Something, he could scarcely tell what, seemed to be creeping into his life. As he sat thinking, he roused to a consciousness first that he was being mastered by Doris, and when he had quenched the stubborn resistance which this thought brought there came another revelation. George had thought himself a sufferer denied the amusements and enjoyments of his fellows, he had pitied himself, but as he looked back grudging his former liberty, it flashed upon him that he had been spoiled into self-will. "I'se selfish, that's what it is, I'se got to cling to mah ways an' mah likings till I'se stubborn at being crossed. What for sud I feel vexed when Doris talks about her friend Rica? The lass means nae harm, an' she's free to love her friend as I love Rose. Nay, I'se wrang, Doris taks likin' cooler than I diz."

George was right. Doris felt that there was a coldness between herself and her brother, but she did not suffer from it. Her thoughts were now always so filled with Mr. Burneston's visits, and the memory of the talks that went on in them, that she had no time to waste on George.

"After all," she thought, as she sat down beneath the castle-wall and looked through the yellow leaves at the village at her feet, "life at Burneston will be pleasant enough if he comes to see us there." Here she stopped with a sigh. Only yesterday Mr. Burneston had again said he hoped they would not be in a hurry to go back, and before that he had told George that it might entirely restore his health if he left Burneston and went to live near the sea. Did he want to get rid of them? It was a puzzle.

"I am growing idle," she went on. "I must remember to ask Mr. Burneston for the books Miss Phillimore recommended me to read. I shall go back if I don't keep up my studies, if I get interested in books I shall feel more settled. I think too much about Mr. Burneston's visits;" but she went on thinking of them.

She liked him very much. By talking chiefly to George he had managed to set

her completely at her ease, and he so carefully restrained any expression of admiration that she had no excuse for suspecting it, and although she often found him looking earnestly at her, she did not suspect it. She delighted in his visits because his refined speech and cultivated ideas were at once a link to the past she prized so highly, and a help against the future she dreaded; but the tumult of excited feeling and gratified vanity aroused by the meeting beside the brook had soon subsided. She thought of Mr. Burneston now as a valued, middle-aged friend; it would not have occurred to her to think of him as a lover, he was so much older than she was; and, besides, Doris had taught herself long ago that she could never marry, now that education had taught her to shrink from her equals. It would be the price she had to pay for the advantages she had had, but she knew nothing of love, and she did not look on it as a sacrifice.

She had not heard any footsteps, but the click of the gate of the little green plot in which she sat made her look up, and she saw Mr. Burneston and his friend.

"Good morning, Miss Barugh." And then Mr. Burneston presented as his cousin the tall, dark gentleman, whose keen, searching glance made the color rise on Doris's cheeks. "Is your brother ill?" the squire asked, for he saw an amused smile on Gilbert's lips.

"No; but he does not always come with me — at least, not lately." Doris spoke stiffly; she had a consciousness of being silently observed.

"I thought he did; perhaps the hill tries him." And then Mr. Burneston stopped; he could not think of anything more to say.

"Do you sketch?" Raine said. "There is plenty of subject here, I fancy; and this is a very good point."

"No; I don't draw at all." Doris raised her eyes and looked gravely at Mr. Raine, and then she looked away. It was intolerable that he should keep those bright, keen, black eyes fixed on her face. She wondered that Mr. Burneston's friend should be so rude.

"That's a pity; it's a great resource in the country. Ah!" he went on, "perhaps you're fond of reading?"

"Very." But Doris looked still graver.

"Novels and tales, I suppose, with plenty of romance, and so on."

"I have read very few novels. I like history."

Gilbert was provoked. "Ah, you have solid taste, I see. Do you like the country?" he said flippantly.

Doris smiled, and the radiance in her face thrilled through her questioner. "She's beautiful!" he said to himself. "I can't deny that."

"Yes," she answered. "At least I like Steersley, and I don't like Burneston; those are the only country places I know."

"You don't like Burneston, don't you? Why, what's amiss with it?"

His familiar tone amused Doris. It reminded her of Rica, but it wounded Mr. Burneston. It seemed to him that Gilbert had been catechizing Doris like a child, and that he talked to her as if she were an ordinary farmer's daughter.

"Miss Barugh is right; there is not much to see in Burneston."

"I did not like it when I was a child," said Doris.

"Why not?" Raine asked eagerly.

Doris was puzzled by his questioning; she did not care to give her reasons to this inquisitive man.

"I think because I had no playfellows, and because there was no sea there. We came to Burneston from near the sea."

"Perhaps you would like it now."

Raine spoke mischievously; he really wanted to provoke Doris out of what he thought an assumption of sedateness. Mr. Burneston could hardly keep in his impatience.

"No, I don't think I should," said Doris, calmly. She looked at the squire, wondering at his silence; and it seemed to him that she appealed against Gilbert's impertinence.

"Well," he said, "we are keeping you from your book. Good morning, Miss Barugh; perhaps we shall find your brother as we go through the market-place."

Raine made a profound bow, and was taken aback by the grace and self-possession with which Doris returned it; he had not succeeded in making her feel shy; she was a little annoyed by his rudeness, but his originality amused her; he felt foiled and vexed with himself, and was not in a patient humor.

Mr. Burneston did not speak till they found their horses again at the lodge gates.

"Well?" he said, as they rode out of Steersley.

"She's a very fair creature," said Gilbert Raine heartily. "I must own that much."

"Her beauty is the least of her attractions, but of course you gave yourself no opportunity of judging."

"You're wrong there; I proved her

temper and her temperament; she's as cold as a bit of granite, and as proud as Lucifer."

"Any girl would have been irritated by your manner."

"Not if she were thoroughbred. This one has all her horns out, and suspects mischief where none is meant. It won't do, Phil; she's too raw and untrained for you, my boy, if you want to keep a quiet house."

"What do you mean? I consider her manner quite charming." Burneston spoke in a huff.

"Well, then, shall I tell you something else, usually a consideration in matters of this kind? She doesn't care two straws for you. If you ask her, and she says 'Yes,' it's because she means to be mistress of Burneston."

Mr. Burneston turned half round on his saddle, with a very set look on his face.

"Look here, Gilbert; you know how I hate quarrels; don't say anything more, or I may say more than you like; Miss Barugh behaved as well as possible; my mind's made up, and you only waste words." Presently he said cheerfully, "Come, come, old fellow, you had better make up your mind to be my best man at the wedding."

Raine felt very angry. He considered all women inferior beings, not fit to be trusted; and it seemed to him that this one, a mere farmer's daughter too, had placed herself on an equality with him. She would be hateful as mistress of Burneston. It was a selfish way of looking at the matter, but he could not help it.

"No; I can't be that, Phil," he said earnestly, "and I must be consistent. I can't bear to think of that girl as your boy's stepmother. Don't let us quarrel." Mr. Burneston was frowning in a most unusual manner. "I must just say this, for the sake of old times, don't do anything in a hurry. No good can come of an unequal match — only divisions and heart-burnings; and I fear, in this case, sorrow and disappointment to you."

CHAPTER XIII.

A PROPOSAL.

It seemed as if the return of Doris had been trying to the temper of all her friends. Rose came home with a face swelled with crying; and when at last she succeeded in making Mrs. Duncombe hear her grievances, the deaf grandmother gathered that Doris was a "set-up dowdy, wi' not so much as a flower to her bonnet," and "as sour as a apple in May," with other disparaging comments, all of which were duly enjoyed by Mr. Sunley as he sat smoking at his cottage door. The evening was chilly, and he had "happed" an old worsted comforter round his neck. He would have preferred the enjoyment of a pipe beside his own snug little fireplace, but so rare an event as Rose's return from a day's pleasuring was not to be disregarded; and there he sat listening with all his might, nodding and making comments on the passionate sentences which the girl jerked out in the intervals of taking off her bonnet and shawl, rolling up the strings of the one, and flattening out the creases of the other with her plump pink hand. His face grew more and more content as he listened.

"Eh, eh. It's t' way wiv yaal t' lasses: ane cannt abide t' idur gin sheea's bonnier," he said. "John Barugh's lass war a bonny lahtle lass, an' mebbe shee's mitch bonnier noo. Sheea mun be, else Rose wadna sharpen her tongue agin her. Poor Rose! sheea's as sharp as a briar, bud sheea's a feealish lass! Skeal ain't takken that oot o' her."

John Barugh had been extra reserved when his old neighbor had asked after Doris. He had indeed been thoroughly unsociable, spending much of his time with his sick cows, and brooding so over the question of their bewitchment, that he had little time or thought to spend on Doris, except when he went to the Steersley cottage. A vague feeling of uneasiness crept over him when he remembered Mr. Burneston's visit, but he did not care to revive his disagreement with Dorothy, and had not recurred to the subject. He was therefore entirely ignorant of the frequency of the squire's visits, or of the notice they were attracting.

"T' squire hev'nt been tuh t' farm sin t' missus an' t' sick lad gaanged tu Steersley," Joseph said, quite unconscious that if there had been any one near his words were audible. "Ah cud nivver tell 'at he cud finnd i' t' tawk o' t' missus. It fair capt mah. Ah thowt John wad hev been mair neeghberly wivout her, bud isted he's as glum as a dour-neel. Eh, maister, how's a' wi' ye?" he shouted as the tall red-bearded man came in sight within the white gate of the pig-yard.

"T' coo's deein'." John spoke sullenly, and there was a lowering, gloomy look in his eyes, as he opened the gate and came across the road.

"Eh, neeghber, yey deean't say sae. Tell yey waat t' is, lad, yey mun draw bluid

Generated on 2020-04-25 06:50 GMT / https://hdl.handle.net/2027/coo.31924079893602

Original from CORNELL UNIVERSITY

fra t' witch, an' draw it sune. Ah's staggonated at sikan deeings. Bon it! wheea can stay yey, sin' yey'ne a moind t' reet yursel'. T' coo's yur ain — nut t' parson's ner t' squire's. Dheh'se gude, bud dheh'se reet fond in sikan a case. Gin ah'd been left t' reckon wi' t' awd divvel, yur coo wad hev thraavun reet an' proper."

He clenched both fists, and his shaggy grey brows met in a savage frown.

John stood silent, looking straight before him, his face even sterner in expression than the old man's beside him.

"Ah wad dee 'at," he said at last. "Ah wad hev deean it wivout yer axing mah tweea tahmes, Joseph Sunley; bud it's t' lad George. He wonnot hev t' awd lass harmed, an' he awlus axes arter her."

Joseph stuck his pipe in his pocket, and then clasping each knee with a brown wrinkled hand, he looked up scoffingly in his neighbor's face.

"Wheea spoke o' harmin'? I'se seear 'at t' spillin' a drop o' deevil's bluid wad be a blessin' tiv t' witch isted o' harm. Sheea's reet full o' deeviltry, an' it would be a marcy to set some o' it free — mebbe she'll bost wiv it. Bud it's yur ain coo, neeghber, I'se nowt te deea wiv it — it's yur ain coo"

Mrs. Duncombe's flat round face and stout pillow-shaped figure came into the doorway of the next cottage.

"Good-day, Maister Barugh," she said. "Our Rose hev been t' Steersley t' day."

Barugh was glad of the interruption.

"Hev she that? An' hoo hev sheea foond them? Did sheea see Doris?"

He roared this out loudly, but Mrs. Duncombe only nodded her head, as if she did not quite hear him. She had not understood all the purport of Rose's complaints, but she had gathered that the girl was angry with Doris, and she had no mind to let the farmer know this. She did not want to quarrel with the Barughs, who were kind and neighborly in the way of skim-milk and vegetables, ay, and even to the extent of a bit of pork now and then.

But Rose's ears were sharp; and though she was up-stairs, she heard John's question. She put her head out of the bedroom window above.

"Gud evenin' to ye, Maister Barugh. I hev been to Steersley, an' I hev seen Mrs. Barugh an' Doris, but I didn't stay with 'em. Doris is such a grand lady. She's fair nunty, she is; I was shy like, an' I comed away," she ended with a broad laugh.

John Barugh had smiled as the pretty, rosy-cheeked damsel looked down at him, but he frowned again as she spoke of Doris. It seemed to him a sort of profanation that Rose should so speak.

"Ye deeant ken her, lass," he said reprovingly. "Doris is a lady noo, bud sheea's reet gude fer a' thaat."

Then he nodded to Mrs. Duncombe and Joseph, and moved slowly back to the farmyard.

Silence fell on the little group till he had passed through into the rick-yard and was out of sight.

Then Rose burst into a peal of laughter so loud and harsh that her grandmothe looked up and shook her head reprovingly.

"A lady!" Rose cried out. "My song! Doris a lady! Eh, ye sud hev seen my schoolmistress; she was a lady, I s'pose. Ye could tell it by her clothes. I don't believe Doris hev got so much as a silk gown to her back. She a lady, indeed! She never said so much as 'I'm glad to see you, Rose Duncombe.' She's a poor, pale, dowdy, aud-farrand, set-up thing; an' that's not what I calls a lady. So there!"

She drew in her head, and shut down the window with a bang.

Sunley laughed and slapped his knees with his hands.

"Woonkers! Sheea's a doonreet lass yon. She deean't miss t' neel," he said. "No luov lost atween her an' Doris, eh, neeghber?" But Mrs. Duncombe shook her head feebly and sighed. She knew something or some one was wrong, but she had only a hazy idea of life altogether. She heard a fragment here and a fragment there, but she had no wits to put them together, so that her mind was something like her patchwork counterpane, full of unconnected bits, which it was impossible to fit harmoniously.

John Barugh had taken away a far more definite idea of Rose's meaning. He was angry at first, and called the girl hard names to himself; but next day, and on the days after, he pondered the difference between Doris and Rose, and he grew more and more troubled. Doris seemed happy with him and her mother and George, but was she really happy, or was it only her good manners that kept her from showing disgust to them and their ways; and how would it be when they all settled down at Burneston, and Doris and Rose would be subject to the chance of meeting every day? John dreaded his next visit to Steersley; he dreaded to hear that there had been a quarrel with Rose Duncombe, and though she was pert to speak so of Doris, he was fond of the

bright pretty girl who had been so kind to George.

He usually went over on Saturday afternoon, but on this Friday the other sick cow was, to his surprise, recovering, and he thought he would surprise Dorothy next day by reaching Steersley for dinner at one o'clock. The place was very lonesome and dreary in the absence of its neat mistress, and Sally, the old woman who minded the house in Mrs. Barugh's absence, cleaned it from morning till night, till the smell of wet wood and soap grew overpowering.

It took John some time to put a thought into action, and while he stood twisting a bit of straw in his blunt red fingers, hesitating about his next day's journey, he saw Mr. Burneston coming from the glebe-field into the rick-yard. The squire did not often come that way since he saw Doris swinging on the gate of the glebe-field, but to-day he took a pleasure in the remembrance; he even lingered at the gate while the collie, who had been following his master, sprang forward, barking joyously when she saw the farmer.

"Weel, then — weel, then, awd lass." John stooped to pat her black head as she sprang up to caress him. "Thee's nut ane 'at forgits awd freends."

Mr. Burneston had come forward, and he heard the last words.

"Do you mean that for me, Mr. Barugh?" he smiled pleasantly as he held out his hand. "But I'm not so neglectful as you think. I hear of you whenever I go to Steersley. I heard of you only yesterday from Mrs. Barugh. How well George looks! It's plain Burneston does not suit him."

This speech jarred John on more than one point; first, by giving him the knowledge that Dorothy had concealed Mr. Burneston's visits from him, and next by the implied interference about George.

"Mebbe it's t' change, nut t' air," he spoke sullenly; "t' lad's awlus better for a change: 'tis so wiv young fooaks."

"I think the change benefits Mrs. Barugh too, she looks wonderfully bright since she's been at Steersley; the air seems to suit her."

One of John's shoulders was visibly nearer his ear than the other. "Yeh'ar wrang there, squire; t' aant t' air. Mah missus faands too mich tu deea i' t' house tu gan gaddin' after air; sheea's awlus weel at t' farm noo!"

"Ah, just so." Mr. Burneston looked about uneasily, and then he clasped both hands on the knob of his stick, and looked earnestly at the farmer. "I want to speak very seriously to you, Mr. Barugh; shall we go in-doors?"

John felt as awkward as he could, and his capacity for awkwardness was large; his hospitality checked the churlish answer he wanted to give, for an undefined shrinking warned him that Mr. Burneston's visit was bringing a shadow to his hearth.

"Coom in-doors then," he tried to speak heartily and went on first, but there was no welcoming smile on his face when he added, "Sit ye doon, squire; we'se noane so carded oop noo t' missus is at Steersley;" he gave an uneasy glance at the empty grate, which shone brightly, but looked cold.

For a moment the two men sat silent in the shining wooden high-backed armchairs on each side of the empty grate.

"I have, as you have doubtless heard," Mr. Burneston began — he took it for granted that his visits to Steersley had prepared the farmer for this interview — "seen a good deal of your daughter since she came home, and ——" He paused; the sound of a smothered execration disturbed him; but John was only frowning a little more heavily, and the sunburnt red of his cheeks was a trifle deeper than usual. Mr. Burneston went on, "I greatly admire her; and I think it right to tell you before I speak to her that I hope she will be my wife."

John swung round in his chair so as nearly to overturn it, but he steadied himself by a vigorous grasp at its wooden arms.

"Yur wife, squire! Din yee mean yee hev bin axing mah lass tu wed yee?" he rose up with stern wrath burning in his face.

Mr. Burneston felt angry too; he cursed the farmer's denseness, for evidently his carefully prepared preface had not been heeded.

"I said just now," in a stiff voice, "that I think it right to tell you my intention before I speak to Miss Barugh."

"An' noo to begin, ah says neea, neea, Maister Burneston. Deean't say nowt tu mah lass." John spoke stubbornly, anger and bitterness throbbing in every vein, till he hated the soft courtly gentleman who sat asking for what he prized most on earth — as if it were a bit of cake.

"But you won't say it," Mr. Burneston's sympathy helped him to guess at John's feelings; "I know you too well to believe that you will interfere with my happiness, and possibly too with your daughter's."

John straightened his tall, broad figure

till he and his red beard seemed to glower through the long low room.

"Maister Burneston, yey'ar quality," he said doggedly, "bud ah'd scorn tu deea 'at yey've bin deein'. Yey cooms an' tawks mah ower while ah sends mah lass tu skeeal, mah lass 'at war t' pride o' mah life! an' sehs yee, let her bide at skeeal, no coomin' yam, yey sehs; an' noo yey gans an' stihls her luove away fra mey 'at hev t' best reet tu 't, wivout a word, or sae mich as axing my leave — it's a burnin' shame, by God!" he clenched his fist and struck it heavily on the tall chair-back.

Mr. Burneston flushed to his temples, but he did not look cowed or ashamed. He made an effort to speak coolly. "We'd better sit down again, Mr. Barugh; you're angry, and you don't see things as they really are. I have been over to Steersley as I used to come here, and Mrs. Barugh always seemed glad to see me. Why should I have spoken to you beforehand? I could not be sure that I should become attached to your daughter."

John recovered himself a little; he would not sit down, but he wiped his forehead with his handkerchief. "Duov Doris care fer yee?" he asked abruptly.

"I cannot tell — I hope so."

"Then, in God's name, mon, leave her aleean. Keep awa fra Steersley, an' ah'll taak t' lass whoor sheea'll seea an' hear nowt aboot yee."

"This is folly;" and then Burneston smiled, and told himself he was as foolish as the farmer. "Try and look at the thing calmly, Mr. Barugh. Your daughter is certain to marry some one; she is far too attractive to be left in peace. Well, then, as she must take a husband why do you object to me? You ought to know me fairly well by this time. I love your daughter as a man should love the girl he means to make his wife; and I will spend my life in making her happy. Will you leave the decision to her? Give me leave to ask her, and I promise you to submit to the answer she gives."

There was silence. Mr. Burneston was surprised to find that he could hear his own heart beat in the intense anxiety he felt. This opposition was so utterly unlooked for.

At last John spoke hoarsely.

"Ah's a plain mon," he said; "bud ah deeant seea 'at gude ivver com o' sikan a marriage as yer wantin'. Yeh sud tak t' wife laake yursel', an' Doris wad be happier gin sheea tehk t' husband fra fooaks siken oursels. It's a mistak, Maister Burneston, fra beginnin' to t' end, yey aar gaain agin yur ain welfare, an' gin yey'll be guided yey'll keep awa from Steersley, and lihv Doris aleean."

Mr. Burneston took John's unwilling hand and shook it heartily. He had understood the farmer's nature far too well to say one word about any advantage that would accrue to Doris as mistress of Burneston; but he was greatly impressed by the simplicity and disinterestedness which could set so little value on worldly distinction.

"It's too late for me to do that," he said earnestly. "I never loved any woman as I love her, and no one else could make me so happy. I must try to win her; let me have your good-will in the matter, and remember that I consider your daughter fully my equal, and quite suited to be my wife"

John stood struggling with his pride; he felt that Doris as she was would be happier with such a man as the squire than in her own home; he knew it, and Mr. Burneston's words only stung the knowledge in with keener force, but it was too painful to acknowledge. He could not own that it was for himself that he longed so hungrily and jealously to keep his darling at home, nor could he bring himself to give a hearty consent to his landlord's wooing — he could not get out a word.

"Well, then," Mr. Burneston's smile was winning in its sweetness, "I am going on at once to Steersley. I am not ashamed to tell you, her father, that I cannot rest until I know my fate. Can I take any message from you?"

He stood waiting; he was not vexed with John's boorish silence. It was only natural, he thought. His admiration for the farmer's disinterestedness gave him new and warmer feeling for him. He prized Doris so highly, that he knew it must be very hard for John to give her up, and yet he could never have guessed at the mighty struggle that was wrenching the father's heart. At last Barugh spoke.

"Ye mun gan, ah caanut stay ye, bud ah caanut bid yeh God speed. Ah'd ginner thank yey fer settin' mah ricks o' fire. Deng it, ah caanut stay ye, an' thaat's as mich as ah caan tell yey noo."

John followed his visitor to the door, but he left him to cross the yard alone. He turned back to the parlor with a smothered oath.

"It's mah ain fondness ah sud curse," he said. "Ah wer nobbut a wake feeal; ah knawed it war wrang, an' jist fer tu

keep t' house quiet ah let her gan tu skeeal. Ah've arn'd all ah've getten."

He turned to the high mantelshelf, and pressed his hand against his forehead.

There was no outward sound, no groan or sigh, but in the unbroken silence he was reviewing a load of sorrow and bitterness — the five past years of his life, the more sorrowful, the more bitter, because reflection offered no salve for the past, no hope for the future.

John Barugh seldom communed with himself, but just now these five past years stood out in distinct periods to their first beginning — back even to that first day when he had been fool enough to show Doris to the squire, and then he stood suddenly upright.

Like the spell of a witch, or the memory of a curse, there came before him the blushing, shame-stricken face of his child, and, sounding clearly in the stillness, "the feeal's rhyme" of her confession, —

May it so happen, an' may it so fall,
Ah may be lady of Burneston Hall.

"Curse him!" he said fiercely; "he hev planned it fra te'hn end tiv t' id'ur."

From The Contemporary Review.

ON THE DISCOVERY OF OXYGEN IN THE SUN.

THE most promising result of solar research since Kirchhoff in 1859 interpreted the dark lines of the sun's spectrum has recently been announced from America. Interesting in itself, the discovery just made is doubly interesting in what it seems to promise in the future. Just as Kirchhoff's great discovery, that a certain double dark line in the solar spectrum is due to the vapor of sodium in the sun's atmosphere, was but the first of a long series of results which the spectroscopic analysis of the sun was to reveal, so the discovery just announced that a certain important gas — the oxygen present in our air and the chief chemical constituent of water — shows its presence in the sun by bright lines instead of dark, will in all probability turn out to be but the first-fruits of a new method of examining the solar spectrum. As its author, Dr. Henry Draper of New York, remarks, further investigation in the direction he has pursued will lead to the discovery of other elements in the sun, but it was not "proper to conceal the principle on which such researches are to be conducted, for the sake of personal advantage." It may well happen, though I anticipate otherwise, that by thus at once describing his method of observation, Dr. Draper may enable others to add to the list of known solar elements others which yet remain to be detected; but if Dr. Draper should thus have added but one element to that list, he will ever be regarded as the physicist to whose acumen the method was due by which all those elements were detected, and to whom, therefore, the chief credit of their discovery must certainly be attributed.

I propose briefly to consider the circumstances which preceded the great discovery which it is now my pleasing duty to describe, in order that the reader may the more readily follow the remarks by which I shall endeavor to indicate some of the results which seem to follow from the discovery, as well as the line along which in my opinion the new method may most hopefully be followed.

It is generally known that what is called the spectroscopic method of analyzing the sun's substance had its origin in Kirchhoff's interpretation of the dark lines in the solar spectrum. Until 1859 these dark lines had not been supposed to have any special significance, or rather it had not been supposed that their significance, whatever it might be, could be interpreted. A physicist of some eminence spoke of these phenomena in 1858 in a tone which ought by the way seldom to be adopted by the man of science. "The phenomena defy, as we have seen," he said, "all attempts hitherto to reduce them within empirical laws, and no complete explanation or theory of them is possible. All that theory can be expected to do is this — it may explain how dark lines of any sort may arise within the spectrum." Kirchhoff in 1859 showed not only how dark lines of any sort may appear, but how and why they do appear, and precisely what they mean. He found that the dark lines of the solar spectrum are due to the vapors of various elements in the sun's atmosphere, and that the nature of such elements may be determined from the observed position of the dark lines. Thus when iron is raised by the passage of the electric spark to so intense a degree of heat that it is vaporized, the light of the glowing vapor of iron is found to give a multitude of bright lines along the whole length of the spectrum — that is, some red, some orange, some yellow, and so on. In the solar spectrum corresponding dark lines are found along the whole length of the spectrum — that is, some in the red,

some in the orange, yellow, etc., and precisely in those parts of these various spectral regions which the bright lines of glowing iron would occupy. Multitudes of other dark lines exist of course in the solar spectrum. But those corresponding to the bright lines of glowing iron are unquestionably there. They are by no means lost in the multitude as might be expected, but, owing to the peculiarity of their arrangement, strength, etc., they are perfectly recognizable as the iron lines reversed, that is, dark instead of bright. Kirchhoff's researches showed how this is to be interpreted. It means that the vapor of iron exists in the atmosphere of the sun, glowing necessarily with an intensely bright light; *but*, being cooler (however intensely hot) than the general mass of the sun within, the iron vapor absorbs more light than it emits, and the result is that the iron lines, instead of appearing bright as they would if the iron vapor alone were shining, appear relatively dark on the bright rainbow-tinted background of the solar spectrum.

Thus was it shown that in the atmosphere of the sun there is the glowing vapor of the familiar metal, iron; and in like manner other metals, and one element (hydrogen) which is not ordinarily regarded as a metal, were shown to be present in the sun's atmosphere. In saying that they are present in the sun's atmosphere, I am, in point of fact, saying that they are present in the sun; for the solar atmosphere is, in fact, the outer part of the sun himself, since a very large part, if not by far the greater part, of the sun's mass must be vaporous. But no other elements, except the metals iron, sodium, barium, calcium, magnesium, aluminium, manganese, chromium, cobalt, nickel, zinc, copper, and titanium, and the element hydrogen, were shown to be present in the sun, by this method of observing directly the solar dark lines. In passing, I may note that there are reasons for regarding hydrogen as a metallic element, strange though the idea may seem to those who regard hardness, brightness, malleability, ductility, plasticity, and the like, as the characteristic properties of metals, and necessarily fail to comprehend how a gas far rarer, under the same conditions, than the air we breathe, and which cannot possibly be malleable, ductile, or the like, can conceivably be regarded as a metal. But there is in reality no necessary connection between any one of the above properties and the metallic nature; many of the fifty-five metals are wanting in all of these properties; nor is there any reason why, as we have in mercury a metal which at ordinary temperatures is a liquid, so we might have in hydrogen a metal which, at all obtainable temperatures, and under all obtainable conditions of pressure, is gaseous. It was shown by the late Professor Graham (aided in his researches most effectively by Dr. Chandler Roberts) that hydrogen will enter into such combination with the metal palladium that it may be regarded as forming, for the time, with the palladium, an alloy; and as alloys can only be regarded as compounds of two or more metals, the inference is that hydrogen is in reality a metallic element.

Fourteen only of the elements known to us, or less than a quarter of the total number, were thus found to be present in the sun's constitution; and of these all were metals, if we regard hydrogen as metallic. Neither gold nor silver shows any trace of its presence, nor can any sign be seen of platinum, lead, and mercury. But, most remarkable of all, and most perplexing, was the absence of all trace of oxygen and nitrogen, two gases which could not be supposed wanting in the substance of the great ruling centre of the planetary system. It might well be believed, indeed, that none of the five metals just named are absent from the sun, and indeed that every one of the forty metals not recognized by the spectroscopic method nevertheless exists in the sun. For according to the nebular hypothesis of the origin of our solar system, the sun might be expected to contain all the elements which exist in our earth. Some of these elements might indeed escape discovery, because existing only in small quantities; and others, as platinum, gold, and lead, for example, because but a small portion of their vaporous substance rose above the level of that glowing surface which is called the photosphere. But that oxygen, which constitutes so large a portion of the solid, liquid, and vaporous mass of our earth, should not exist in enormous quantities, and its presence be very readily discernible, seemed amazing indeed. Nitrogen, also, might well be expected to be recognizable in the sun. Carbon, again, is so important a constituent of the earth, that we should expect to discover clear traces of its existence in the sun. In less degree, similar considerations apply to sulphur, boron, silicon, and the other non-metallic elements.

It was not, however, supposed by any one at all competent to form an opinion on the subject, that oxygen, nitrogen, and car-

bon are absent from the sun. It was perceived that an element might exist in enormous quantities in the substance of the sun, and yet fail to give any evidence of its presence, or only give such evidence as might readily escape recognition. If we remember how the dark lines are really caused, we shall perceive that this is so. A glowing vapor in the atmosphere of the sun absorbs rays of the same color as it emits. If, then, it is cooler than the glowing mass of the sun which it enwraps, and if, notwithstanding the heat received from this mass, it remains cooler, then it suffers none of those rays to pass earthwards.* It emits rays of the same kind (that is, of the same *color*) itself, but, being cooler, the rays thus coming from it are feebler, or, to speak more correctly, the ethereal waves thus originated are feebler than those of the same order which *would* have travelled earthwards from the sun but for the interposed screen of vapor. Hence the corresponding parts of the solar spectrum are less brilliant, and contrasted with the rainbow-tinted streak of light on which they lie as on a background, they appear dark.

In order then that any element may be detected by its dark lines, it is necessary that it should lie as a vaporous screen between the more intensely heated mass of the sun and the eye of the observer on earth. It must then form an enclosing envelope cooler than the sun within it. Or rather, some part of the vapor must be thus situated. For enormous masses of the vapor might be within the photospheric surface of the sun at a much higher temperature, which yet being enclosed in the cooler vaporous shell of the same substance would not be able to send its light-rays earthwards. One may compare the state of things, so far as that particular element is concerned, to what is presented in the case of a metallic globe cooled on the outside but intensely hot within. The cool outside of such a globe is what determines the light and heat received from it, so long as the more heated mass within has not yet (by conduction) warmed the exterior shell. So in the case of a vapor permeating the entire mass, perhaps, of the sun, and at as high a temperature as the sun everywhere except on the outside. It is the temperature of the outermost part of such a vaporous mass which determines the intensity of the rays received from it — or in other words, determines whether the corresponding parts of the spectrum shall be darker or not than the rest of the spectrum. If the vapor does not rise above the photosphere of the sun in sufficient quantity to exercise a recognizable absorptive effect, its presence in the sun will not be indicated by any dark lines.

I dwell here on the question of quantity, which is sometimes overlooked in considering the spectroscopic evidence of the sun's condition, but is in reality a very important factor in determining the nature of the evidence relating to each element in the solar mass. In some cases, the quantity of a material necessary to give unmistakable spectroscopic evidence is singularly small; insomuch that new elements, as thallium, cæsium, rubidium, and gallium, have been actually first recognized by their spectral lines when existing in such minute quantities in the substances examined as to give no other trace whatever of their existence. But it would be altogether a mistake to suppose that some element existing in exceedingly small quantities, or, more correctly, existing in the form of an exceedingly rare vapor in the sun's atmosphere, would be detected by means of its dark lines, or *by any other method depending on the study of the solar spectrum.* When we place a small portion of some substance in the space between the carbon points of an electric lamp, and volatilize that substance in the voltaic arc, we obtain a spectrum including all the bright lines of the various elements contained in the substance; and if some element is contained in it in exceedingly small quantity, we may yet perceive its distinctive bright lines among the others (many of them far brighter) belonging to the elements present in greater quantities. But if we have (for example) a great mass of molten iron, the rainbow-tinted spectrum of whose light we examine from a great distance, and if a small quantity of sodium, or other substance which vaporizes at moderate temperatures, be cast into the molten iron so that the vapor of the added element presently rises above the glowing surface of the iron, no trace of the presence of this vapor would he shown in the spectrum observed from a distance. The part of the spectrum where the dark lines of sodium usually appear would, undoubtedly, be less brilliant than before, in the same sense that the sun may be said

* More strictly, it plays the same part as a glass screen before a glowing fire. When the heat of the fire falls on such a screen (through which light passes readily enough), it is received by the glass, warming the glass up to a certain point, and the warmed glass emits the heat thus received in all directions, thus scattering over a large space the rays which but for the glass would have fallen directly upon the objects which the screen is intended to protect.

to be less brilliant when the air is in the least degree moist than when it is perfectly dry; but the loss of brilliancy is as utterly imperceptible in the one case as it is in the other. In like manner, a vapor might exist in the atmosphere of the sun (above the photosphere, that is), of whose presence not a trace would be afforded in the spectroscope, for the simple reason that the absorptive action of the vapor, though exerted to reduce the brightness of particular solar rays or tints, would not affect those rays sufficiently for the spectroscopist to recognize any diminution of their lustre.

There is another consideration, which, so far as I know, has not hitherto received much attention, but should certainly be taken into account in the attempt to interpret the real meaning of the solar spectrum. Some of the metals which are vaporized by the sun's heat below the photosphere, may become liquid or even solid at or near the level of the photosphere. Even though the heat at the level of the photosphere may be such that, under ordinary conditions of pressure and so forth, such metals would be vaporous, the enormous pressure which must exist not far below the level of the photosphere may make the heat necessary for complete vaporization far greater than the actual heat at that level. In that case the vapor will in part condense into liquid globules, or, if the heat is considerably less than is necessary to keep the substance in the form of vapor, than it may in part be solidified, the tiny globules of liquid metal becoming tiny crystals of solid metal. We see both conditions fulfilled within the limits of our own air in the case of the vapor of water. Low down the water is present in the air (ordinarily) in the form of pure vapor; at a higher level the vapor is condensed by cold into liquid drops forming visible clouds (cumulus clouds), and yet higher where the cold is still greater, the minute water-drops turn into ice-crystals forming those light fleecy clouds called cirrus clouds by the meteorologist. Now true clouds of either sort may exist in the solar atmosphere even above that photospheric level which forms the boundary of the sun we see. It may be said that the spectroscope, applied to examine matter outside the photosphere, has given evidence only of vaporous cloud masses. The ruddy prominences which towers tens of thousands of miles above the surface of the sun, and the sierra (or as it is sometimes unclassically called the chromosphere) which covers usually the whole of the photosphere to a depth of about eight thousand miles, show only under spectroscopic scrutiny the bright lines indicating gaseity. But though this is perfectly true, it is also true that we have not here a particle of evidence to show that clouds of liquid particles, and of tiny crystals may not float over the sun's surface, or even that the ruddy clouds shown by the spectroscope to shine with light indicative of gaseity may not also contain liquid and crystalline particles. For in point of fact, the very principle on which our recognition of the bright lines depends involves the inference that matter whose light would *not* be resolved into bright lines would not be recognizable at all. The bright lines are seen, because by means of a spectroscope we can throw them far apart, without reducing their lustre, while the background of rainbow-tinted spectrum has its various portions similarly thrown farther apart and correspondingly weakened. One may compare the process (the comparison I believe has not hitherto been employed) to the dilution of a dense liquid in which solid masses have been floating: the more we increase the quantity of the liquid in diluting it with water, the more transparent it becomes, but the solid masses in it are not changed, so that we have only to dilute the liquid sufficiently to see these masses. *But* if there were in the interstices of the solid masses particles of some substance which dissolved in the water, we should not recognize the presence of this substance by any increase in its visibility; for the very same process which thinned the liquid would thin this soluble substance in the same degree. In like manner, by dispersing and correspondingly weakening the sun's light more and more we can recognize the light of the gaseous matter in the prominences, for this is not weakened; but if the prominences also contain matter in the solid or liquid form (that is, drops or crystals), the spectroscopic method will not indicate the presence of such matter, for the spectrum of such matter will be weakened by dispersion in precisely the same degree that the solar spectrum itself is weakened.

It is easy to see how the evidence of the presence of any element which behaved in this way would be weakened, if if we consider what would happen in the case of our own earth, according as the air were simply moist but without clouds, or loaded with cumulus masses but without cirrus clouds, or loaded with cirrus clouds. For although there

is not in the case of the earth a central glowing mass like the sun's, on whose rainbow-tinted spectrum the dark lines caused by the absorptive action of our atmosphere could be seen by the inhabitant of some distant planet studying the earth from without, yet the sun's light reflected from the surface of the earth plays in reality a similar part. It does not give a simple rainbow-tinted spectrum, for, being sunlight, it shows all the dark lines of the solar spectrum; but the addition of new dark lines to these, in consequence of the absorptive action of the earth's atmosphere, could very readily be determined. In fact we do thus recognize in the spectra of Mars, Venus, and other planets, the presence of aqueous vapor in their atmosphere, despite the fact that our own air, containing also aqueous vapor, naturally renders so much the more difficult the detection of that vapor in the atmosphere of remote planets necessarily seen through our own air. Now, a distant observer examining the light of our own earth on a day when, though the air was moist, there were no clouds, would have ample evidence of the presence of the vapor of water; for the light which he examined would have gone twice through our earth's atmosphere, from its outermost thinnest parts to the densest layers close to the surface, then back again through the entire thickness of the air. But if the air were heavily laden with cumulus clouds (without any cirrus clouds at a higher layer), although *we* should know that there was abundant moisture in the air, and indeed much more moisture than there had been when there had been no clouds, our imagined observer would either perceive no traces at all of this moisture, or he would perceive traces so much fainter than when the air was clear that he would be apt to infer that the air was either quite dry, or at least very much drier than it had been in that case. For the light which he would receive from the earth would not in this case have passed through the entire depth of moisture-laden air twice, but twice only through that portion of air which lay above the clouds, at whose surface the sun's light would be reflected. The whole of the most moisture-laden layer of the air would be snugly concealed under the cloud-layer, and would exercise no absorptive action whatever on the light which the remote observer would examine. If from the upper surface of the layer of cumulus clouds aqueous vapor rose still higher, and was converted in the cold upper regions of the atmosphere into clouds of ice-crystals, the distant observer would have still less chance of recognizing the presence of moisture in our atmosphere. For the layer of air between the cumulus clouds and the cirrus clouds would be unable to exert any absorptive action on the light which reached the observer. All such light would come to him after reflection from the layer of cirrus clouds. He would be apt to infer that there was no moisture at all in the air of our planet, at the very time when in fact there was so much moisture that not one layer only, but two layers of clouds enveloped the earth, the innermost layer consisting of particles of liquid water, the outermost of particles of frozen water. Using the words ice, water, and steam, to represent the solid, liquid and vaporous states of water, we may fairly say that ice and water, by hiding steam, would persuade the remote observer that there was no water at all on the earth — at least if he trusted solely to the spectroscopic evidence then obtained.*

We might in like manner fail to obtain any spectroscopic evidence of the presence of particular elements in the sun, because they cannot exist in sufficient quantity in the vaporous form in those outer layers which the spectroscope can alone deal with.

In passing I must note a circumstance in which some of those who have dealt with this special part of the spectroscopic evidence have erred. It is true in one sense that some elements may be of such

* The case here imagined is not entirely hypothetical. We examine Mercury and Venus very nearly under the conditions here imagined; for we can obtain only spectroscopic evidence respecting the existence of water on either planet. In the case of Mars we have telescopic evidence, and no one now doubts that the greenish parts of the planet are seas and oceans. But Venus and Mercury are never seen under conditions enabling the observer to determine the color of various parts of their discs.

I may add that a mistake, somewhat analogous to that which I have described in the cases of an imagined observer of our earth, has been made by some spectroscopists in the case of the planets Jupiter and Saturn. In considering the spectroscopic evidence respecting the condition of these planets' atmospheres, they have overlooked the circumstance that we can judge only of the condition of the outermost and coolest layers, for the lower layers are concealed from view by the enormous cloud masses, floating, as the telescope shows, in the atmospheric envelopes of the giant planets. Thus the German spectroscopist Vögel argues that because dark lines are seen in the spectrum of Jupiter which are known to belong to the absorption-spectrum of aqueous vapor, the planet's surface cannot be intensely hot. But Jupiter's absorption-spectrum belongs to layers of his atmosphere lying far above his surface. We can no more infer the actual temperature of Jupiter's surface from the temperature of the layers which produce his absorption-spectrum, than a visitor who should view our earth from outer space, observing the low temperature of the air ten or twelve miles above the sea-level, could infer thence the actual temperature of the earth's surface.

a nature that their vapors cannot rise so high in the solar atmosphere as those of other elements. But it must not be supposed that the denser vapors seek a lower level, the lighter vapors rising higher. According to the known laws of gaseous diffusion, a gas or vapor diffuses itself throughout a space occupied by another gas or several other gases, in the same way as though the space were not occupied at all. If we introduce into a vessel full of common air a quantity of carbonic-acid gas (I follow the older and more familiar nomenclature), this gas, although of much higher specific gravity than either oxygen or nitrogen, does not take its place at the bottom of the vessel, but so diffuses itself that the air of the upper part of the vessel contains exactly the same quantity of carbonic-acid gas as the air of the lower part. Similarly, if hydrogen is introduced, it does not seek the upper part of the vessel, but diffuses itself uniformly throughout the vessel. If we enclose the carbonic-acid gas in a light silken covering, and the hydrogen in another (at the same pressure as the air in the vessel) one little balloon will sink and the other will rise; but this is simply because diffusion is prevented. It may be asked how this agrees with what I have said above, that some elements may not exist in sufficient quantity or in suitable condition above the sun's photospheric level to give any spectroscopic evidence of their nature. As to quantity, indeed, the answer is obvious: if there is only a small quantity of any given element in the entire mass of the sun, only a very small quantity can under any circumstances exist outside the photosphere. As regards condition, it must be remembered that the vessel of my illustrative case was supposed to contain air at a given temperature and pressure throughout. If the vessel was so large that in different parts of it the temperature and pressure were different, the diffusion would, indeed, still be perfect, because at all ordinary temperatures and pressures hydrogen and carbonic-acid gas remain gaseous. But if the vapor introduced is of such a nature that at moderate temperatures and pressures it condenses, wholly or in part, or liquefies, the diffusion will not take place with the same uniformity. We need not go farther for illustration than to the case of our own atmosphere as it actually exists. The vapor of water spreads uniformly through each layer of the atmosphere which is at such a temperature and pressure as to permit of such diffusion; but where the temperature is too low for complete diffusion (at the actual pressure) the aqueous vapor is condensed into visible cloud, diffusion being checked at this point as at an impassable boundary. In the case of the sun, as in the case of our own earth, it is not the density of an element when in a vaporous form which limits its diffusion, but the value of the temperature at which its vapor at given pressure condenses into liquid particles. It is in this way only that any separation can be effected between the various elements which exist in the sun's substance, and though such separation is unquestionably competent to modify the spectroscopic evidence respecting different elements, it would be a mistake to suppose that any such separation could occur, as had been imagined by some — a separation causing in remote times the planets supposed to have been thrown off by the sun to be rarest on the outskirts of the solar system and densest close to the sun. The small densities of the outer family of planets, as compared with the densities of the so-called terrestrial planets, must certainly be otherwise explained.

But undoubtedly the chief circumstance likely to operate in veiling the existence of important constituents of the solar mass must be that which has so long prevented spectroscopists from detecting the presence of oxygen in the sun. An element may exist in such a condition, either over particular parts of the photosphere, or over the entire surface of the sun, that instead of causing dark lines in the solar spectrum it may produce bright lines. Such lines may be conspicuous, or they may be so little brighter than the background of the spectrum as to be scarcely perceptible or quite imperceptible.

In passing, I would notice that this interpretation of the want of all spectroscopic evidence of the presence of oxygen, carbon, and other elements in the sun, is not an *ex post facto* explanation. As will presently appear, it is now absolutely certain that oxygen, though really existing, and doubtless, in enormous quantities, in the sun, has been concealed from recognition in this way. But that this might be so was perceived long ago. I myself, in the first edition of my treatise on the sun, pointed out, in 1870, with special reference to nitrogen and oxygen, that an element " may be in a condition enabling it to radiate as much light as it absorbs, or else very little more or very little less, so that it either obliterates all signs of its existence, or else gives lines so little brighter or darker than the surrounding parts of

the spectrum that we can detect no trace of its existence." I had still earlier given a similar explanation of the absence of all spectroscopic evidence of hydrogen in the case of the bright star Betelgeux.*

Let us more closely consider the significance of what we learn from the spectral evidence respecting the gas hydrogen. We know that when the total light of the sun is dealt with, the presence of hydrogen is constantly indicated by dark lines. In other words, regarding the sun as a whole, hydrogen constantly reduces the emission of rays of those special tints which correspond to the light of this element. When we examine the light of other suns than ours, we find that in many cases, probably in by far the greater number of cases, hydrogen acts a similar part. But not in every case. In the spectra of some stars, notably in those of Betelgeux and Alpha Herculis, the lines of hydrogen are not visible at all; while in yet others, as Gamma Cassiopeiæ, the middle star of the five which form the straggling W of this constellation, the lines of hydrogen show bright upon the relatively dark background of the spectrum. When we examine closely the sun himself, we find that although his light as a whole gives a spectrum in which the lines of hydrogen appear dark, the light of particular parts of his surface, if separately examined, occasionally shows the hydrogen lines bright as in the spectrum of Gamma Cassiopeiæ, while sometimes the light of particular parts gives, like the light of Betelgeux, no spectroscopic evidence whatever of the presence of hydrogen. Manifestly, if the whole surface of the sun were in the condition of the portions which give bright hydrogen lines, the spectrum of the sun would resemble that of Gamma Cassiopeiæ; while if the whole surface were in the condition of those parts which show no lines of hydrogen, the spectrum of the sun would resemble that of Betelgeux. Now if there were any reason for supposing that the parts of the sun which give no lines of hydrogen are those from which the hydrogen has been temporarily removed in some way, we might reasonably infer that in the stars whose spectra show no hydrogen lines there is no hydrogen. But the fact that the hydrogen lines are sometimes seen bright, renders this supposition untenable. For we cannot suppose that the lines of hydrogen change from dark to bright or from bright to dark (both which changes certainly take place) without passing through a stage in which they are neither bright nor dark; in other words we are compelled to assume that there is an intermediate condition in which the hydrogen lines, though really existent, are invisible because they are of precisely the same lustre as the adjacent parts of the spectrum. Hence the evanescence of the hydrogen lines affords no reason for supposing that hydrogen has become even reduced in quantity where the lines are not seen. And therefore it follows that the invisibility of the hydrogen lines in the spectrum of Betelgeux is no proof that hydrogen does not exist in that star in quantities resembling those in which it is present in the sun. And this being demonstrated in the case of one gas, must be regarded as at least probable in the case of other gases. Wherefore the absence of the lines of oxygen from the spectrum of any star affords no sufficient reason for believing that oxygen is not present in that star, or that it is not as plentifully present as hydrogen, or even far more plentifully present.

There are other considerations which have to be taken into account, as well in dealing with the difficulty arising from the absence of the lines of particular elements from the solar spectrum as in weighing the extremely important discovery which has just been effected by Dr. H. Draper. I would specially call attention now to a point which I thus presented seven years ago: "The great difficulty of interpreting the results of the spectroscopic analysis of the sun arises from the circumstance that we have no means of learning whence that part of the light comes which gives the continuous spectrum. When we recognize certain dark lines, we know certainly that the corresponding element exists in the gaseous form at a lower temperature than the substance which gives the continuous spectrum. But as regards that continuous spectrum itself we can form no such exact opinion." It might, for

* In "Other Worlds than Ours," I wrote as follows: "The lines of hydrogen, which are so well marked in the solar spectrum, are not seen in the spectrum of Betelgeux. We are not to conclude from this that hydrogen does not exist in the composition of the star. We know that certain parts of the solar disc, when examined with the spectroscope, do not at all times exhibit the hydrogen lines, or may even present them as bright instead of dark lines. It may well be that in Betelgeux hydrogen exists under such conditions that the amount of light it sends forth is nearly equivalent to the amount it absorbs, in which case its characteristic lines would not be easily discernible. In fact, it is important to notice generally, that while there can be no mistaking the positive evidence afforded by the spectroscope as to the existence of any element in sun or star, the negative evidence supplied by the absence of particular lines is not to be certainly relied upon."

instance, have its origin in glowing liquid or solid matter; but it might also be compounded of many spectra, each containing a large number of bands, the bands of one spectrum filling up the spaces which would be left dark between the bands of another spectrum, and so on until the entire range from the extreme visible red to the extreme visible violet were occupied by what appeared as a continuous rainbow-tinted streak. "We have, in fact, in the sun," as I pointed out, "a vast agglomeration of elements, subject to two giant influences, producing in some sort opposing effects — viz., a temperature far surpassing any we can form any conception of, and a pressure (throughout nearly the whole of the sun's globe) which is perhaps even more disproportionate to the phenomena of our experience. Each known element would be vaporized by the solar temperature at known pressures; each (there can be little question) would be solidified by the vast pressures, did these arise at known temperatures. Now whether, under these circumstances, the laws of gaseous diffusion prevail where the elements *are* gaseous in the solar globe; whether, where liquid matter exists it is in general bounded in a definite manner from the neighboring gaseous matter; whether any elements at all are solid, and if so under what conditions their solidity is maintained and the limits of the solid matter defined — all these are questions which *must* be answered before we can form a satisfactory idea of the solar constitution; yet they are questions which we have at present no means of answering." Again, we require to know whether any process resembling combustion can under any circumstances take place in the sun's globe. If we could assume that some general resemblance exists between the processes at work upon the sun and those we are acquainted with, we might imagine that the various elements ordinarily exist in the sun's globe in the gaseous form (chiefly) to certain levels, to others chiefly in the liquid form, and to yet others chiefly in the solid form. But even then that part of each element which is gaseous may exist in two forms having widely different spectra (in reality in five, but I consider only the extreme forms) — that whose light is capable of giving characteristic spectra of lines or bands (which will be different according to pressure and may appear either dark or bright), and that portion whose light is capable of giving a spectrum nearly or quite continuous.

It will be seen that Dr. H. Draper's discovery supplies an answer to one of the questions, or rather to one of the sets of questions, thus indicated. I give his discovery as far as possible in his own words.

Oxygen discloses itself [he says] *by bright lines or bands in the solar spectrum*, and does not give dark absorption-lines like the metals. We must therefore change our theory of the solar spectrum, and no longer regard it merely as a continuous spectrum with certain rays absorbed by a layer of ignited metallic vapors, but as having also bright lines and bands superposed on the background of continuous spectrum. Such a conception not only opens the way to the discovery of others of the non-metals, sulphur, phosphorus, selenium, chlorine, bromine, iodine, fluorine, carbon, etc., but also may account for some of the so-called dark lines, by regarding them as intervals between bright lines. It must be distinctly understood that in speaking of the solar spectrum here, I do not mean the spectrum of any limited area upon the disc or margin of the sun, but the spectrum of light from the whole disc.

In support of the important statement here advanced, Dr. Draper submits a photograph of part of the solar spectrum with a comparison spectrum of air, and also with some of the lines of iron and aluminium. The photograph itself, a copy of which, kindly sent to me by Dr. Draper, lies before me as I write, fully bears out Dr. Draper's statement. It is absolutely free from handwork or retouching, except that reference letters have been added in the negative. It shows the part of the solar spectrum between the well-known Fraunhofer lines G and H, of which G (an iron line) lies in the indigo, and H (a line of hydrogen) in the violet, so that the portion photographed belongs to that region of the spectrum whose chemical or actinic energy is strongest. Adjacent to this lies the photograph of the air lines, showing nine or ten well-defined oxygen lines or groups of lines, and two nitrogen bands. The exact agreement of the two spectra in position is indicated by the coincidence of bright lines of iron and aluminium included in the air spectrum with the dark lines of the same elements in the solar spectrum. "No close observation," as Dr. Draper truly remarks, "is needed to demonstrate to even the most casual observer" (of this photograph) "that the oxygen lines are found in the sun as bright lines." There is in particular one quadruple group of oxygen lines in the air spectrum, the coincidence of which with a group

of bright lines in the solar spectrum is unmistakable.

> This oxygen group alone is almost sufficient, [says Dr. Draper] to prove the presence of oxygen in the sun, for not only does each of the four components have a representative in the solar group, but the relative strength and the general aspect of the lines in each case is similar.* I shall not attempt at this time [he proceeds] to give a complete list of the oxygen lines, . . . and it will be noticed that some lines in the air spectrum which have bright analogues in the sun are not marked with the symbol of oxygen. This is because there has not yet been an opportunity to make the necessary detailed comparisons. In order to be certain that a line belongs to oxygen, I have compared, under various pressures, the spectra of air, oxygen, nitrogen, carbonic acid, carburetted hydrogen, hydrogen, and cyanogen.
>
> As to the spectrum of nitrogen and the existence of this element in the sun there is not yet certainty. Nevertheless, even by comparing the diffused nitrogen lines of this particular photograph, in which nitrogen has been sacrificed to get the best effect for oxygen, the character of the evidence appears. There is a triple band somewhat diffused in the photograph belonging to nitrogen, which has its appropriate representative in the solar spectrum, and another band of nitrogen is similarly represented. [Dr. Draper states that] in another photograph a heavy nitrogen line which in the present one lies opposite an insufficiently exposed part of the solar spectrum corresponds to a comparison band in the sun.

But one of the most remarkable points in Dr. Draper's paper is what he tells us respecting the visibility of these lines in the spectrum itself. They fall as I have mentioned in a part of the spectrum where the actinic energy is great but the luminosity small; in fact while this part of the spectrum is the very strongest for photography, it is close to the region of the visible spectrum,

> Where the last gleamings of refracted light
> Die in the fainting violet away.

It is therefore to be expected that those, if any, of the bright lines of oxygen, will be least favorably shown to direct vision, and most favorably in what might almost be called photographic vision, where we see what photography records for us. Yet Dr. Draper states that these bright lines of oxygen can be readily seen. "The bright lines of oxygen in the spectrum of the solar disc have not been hitherto perceived, probably from the fact that in eye-observation bright lines on a less bright background do not make the impression on the mind that dark lines do. When attention is called to their presence they are readily enough seen, even without the aid of a reference spectrum. The photograph, however, brings them into greater prominence." As the lines of oxygen are by no means confined to the indigo and violet, we may fairly hope that the bright lines in other parts of the spectrum of oxygen may be detected in the spectrum of the sun, now that spectroscopists know that bright lines and not dark lines are to be looked for.

Dr. Draper remarks that from purely theoretic considerations derived from terrestrial chemistry, and the nebular hypothesis, the presence of oxygen in the sun might have been strongly suspected; for this element is currently stated to form eight-ninths of the water of the globe, one-third of the crust of the earth, and one-fifth of air, and should therefore probably be a large constituent of every member of the solar system. On the other hand, the discovery of oxygen, and probably other non-metals, in the sun gives increased strength to the nebular hypothesis, because to many persons the absence of this important group has presented a considerable difficulty. I have already remarked on the circumstance that we cannot, according to the known laws of gaseous diffusion, accept the reasoning of those who have endeavored to explain the small density of the outer planets by the supposition that the lighter gases were left behind by the great contracting nebulous mass, out of which, on the nebular hypothesis, the solar system is supposed to have been formed. It is important to notice, now, that if on the one hand we find in the community of structure between the sun and our earth, as confirmed by the discovery of oxygen and nitrogen in the sun, evidence favoring the theory according to which all the members of that system were formed out of what was originally a single mass, we do not find evidence against the theory (as those who have advanced the explanation above referred to may be disposed to imagine) in the recognition in the sun's mass of enormous quantities of one of these elements which, according to their view, ought to be found chiefly in the outer members of the solar system. If those who believe in the nebular hypothesis (generally, that is, for many of the details of the hypothesis as advanced by Laplace are entirely untenable in the pres-

* Dr. Draper remarks here in passing, "I do not think that, in comparisons of the spectra of the elements and sun, enough stress has been laid on the general appearance of lines apart from their mere position; in photographic representations this point is very prominent."

ent position of physical science) had accepted the attempted explanation of the supposed absence of the non-metallic elements in the sun, they would now find themselves in a somewhat awkward position. They would, in fact, be almost bound logically to reject the nebular hypothesis, seeing that one of the asserted results of the formation of our system, according to that hypothesis, would have been disproved. But so far as I know, no supporter of the nebular hypothesis possessing sufficient knowledge of astronomical and physical laws of facts to render his opinion of any weight, has ever given in his adhesion to the unsatisfactory explanation referred to.

The view which I have long entertained respecting the growth of the solar system — viz., that it had its origin not in contraction only or chiefly, but in combined processes of contraction and accretion — seems to me to be very strongly confirmed by Dr. Draper's discovery. This would not be the place for a full discussion of the reasons on which this opinion is based, nor does space indeed permit such a discussion. But I may remark that I believe no one who applies the laws of physics, *as at present known*, to the theory of the simple contraction of a great nebulous mass formerly extending far beyond the orbit of Neptune, till, when planet after planet had been thrown off, the sun was left in his present form and condition in the centre, will fail to perceive enormous difficulties in the hypothesis, or to recognize in Dr. Draper's discovery a difficulty added to those affecting the hypothesis *so presented*. Has it ever occurred, I often wonder, to those who glibly quote the nebular theory as originally propounded, to inquire how far some of the processes suggested by Laplace are in accordance with the now known laws of physics? To begin with, the original nebulous mass extending to a distance exceeding the earth's distance from the sun more than thirty times (this being only the distance of Neptune), if we assign to it a degree of compression making its axial diameter half its equatorial diameter, would have had a volume exceeding the sun's (roughly) about one hundred and twenty billion times, and in this degree its mean density would have been less than the sun's. This would correspond to a density equal (roughly) to about one four-hundred-thousandth part of the density of hydrogen gas at atmospheric pressure. To suppose that a great mass of matter having this exceedingly small mean density, and extending to a distance of three or four thousand millions of miles from its centre, could under any circumstances rotate as a whole, or behave in other respects after the fashion attributed to the gaseous embryon of the solar system in ordinary descriptions of the nebular hypothesis, is altogether inconsistent with correct ideas of physical and dynamical laws. It is absolutely a necessity of any nebular hypothesis of the solar system, that from the very beginning a central nucleus and subordinate nuclei should form in it, and grow according to the results of the motions (at first to all intents and purposes independent) of its various parts. Granting this state of things, we arrive, by considering the combined effects of concretion and contraction, at a process of development according fully as well as that ordinarily described with the general relations described by Laplace, and accounting also (in a general way) for certain peculiarities which are in no degree explained by the ordinary theory. Amongst these may specially be noted the arrangement and distribution of the masses within the solar system, and the fact that so far as spectroscopic evidence enables us to judge, a general similarity of structure exists throughout the whole of the system.

Inquiring as to the significance of his discovery, Dr. Draper remarks that it seems rather difficult

> at first sight to believe that an ignited* gas in the solar atmosphere should not be indicated by dark lines in the solar spectrum, and should appear not to act under the law, "A gas when ignited absorbs rays of the same refrangibility as those it emits." But in fact the substances hitherto investigated in the sun are really metallic vapors, hydrogen probably coming under that rule. The non-metals obviously may behave differently. It is easy to speculate on the causes of such behavior; and it may be suggested that the reason of the non-appearance of a dark line may be that the intensity of the light from a great thickness of ignited oxygen overpowers the effect of the photosphere, just as, if a person were to look at a candle-flame through a yard thickness of sodium vapor, he would only see bright sodium lines, and no dark absorption.

The reasoning here is not altogether satis-

* The word "ignited" may mislead, and indeed is not correctly used here. The oxygen in the solar atmosphere, like the hydrogen, is simply glowing with intensity of heat. No process of combustion is taking place. Ignition, strictly speaking, means the initiation of the process of combustion, and a substance can only be said to be ignited when it has been set burning. The word *glowing* is preferable; or if reference is made to heat and light combined, then "glowing with intensity of heat" seems the description most likely to be correctly understood.

factory (or else is not quite correctly expressed). In the first place, the difficulty dealt with has no real existence. The law that a gas when glowing absorbs rays of the same refrangibility as those it emits, does not imply that a gas between a source of light and the observer will show its presence by spectroscopic dark lines. A gas so placed *does* receive from the source of light rays corresponding to those which it emits itself, if it is cooler than the source of light; and it absorbs them, being in fact heated by means of them, though the gain of temperature may be dissipated as fast as received: but if the gas is hotter, it emits more of those rays than it absorbs, and will make its presence known by its bright lines. This is not a matter of speculation, but of experiment. On the other hand, the experiment suggested by Dr. Draper would not have the effect he supposes, if it were correctly made. Doubtless if the light from a considerable area of dully glowing sodium vapor were received by the spectroscope at the same time as the light of a candle-flame seen through the sodium vapor, the light of the sodium vapor overcoming that of the candle-flame would indicate its presence by bright lines; but if light were received only from that portion of the sodium vapor which lay between the eye and the candle-flame, then I apprehend that the dark lines of sodium would not only be seen, but would be conspicuous by their darkness.

It is in no cavilling spirit that I indicate what appears to me erroneous in a portion of Dr. Draper's reasoning on his great discovery. The entire significance of the discovery depends on the meaning attached to it, and therefore it is most desirable to ascertain what this meaning really is. There can be no doubt, I think, that we are to look for the true interpretation of the brightness of the oxygen lines in the higher temperature of the oxygen, not in the great depth of oxygen above the photospheric level. The oxygen which produces these bright lines need not necessarily be above the photosphere at all. (In fact I may remark here that Dr. Draper, in a communication addressed to myself, mentions that he has found no traces at present of oxygen above the photosphere, though I had not this circumstance in my thoughts in reasoning down to the conclusion that the part of the oxygen effective in showing these bright lines lies probably below the visible photosphere.) Of course, if the photosphere were really composed of glowing solid and liquid matter, or of masses of gas so compressed and so intensely heated as to give a continuous spectrum, no gas existing below the photosphere conld send its light through, nor could its presence, therefore, be indicated in any spectroscopic manner. But the investigations which have been made into the structure of the photosphere as revealed by the telescope, and in particular the observations made by Professor Langley, of the Alleghany Observatory, show that we have not in the photosphere a definite bounding envelope of the sun, but receive light from many different depths below that spherical surface, four hundred and twenty-five thousand miles from the sun's centre, which we call the photospheric level. We receive more light from the centre of the solar disc, I feel satisfied, not solely because the absorptive layer through which we there see the sun is shallower, but partly, and perhaps chiefly, because we there receive light from some of the interior and more intensely heated parts of the sun.* Should this prove to be the case, it may be found possible to do what heretofore astronomers have supposed to be impossible — to ascertain in some degree how far and in what way the constitution of the sun varies below the photosphere, which, so far as ordinary telescopic observation is concerned, seems to present a limit below which researches cannot be pursued.

I hope we shall soon obtain news from Dr. Huggins's observatory that the oxygen lines have been photographed and possibly the bright lines of other elements recognized in the solar spectrum. Mr. Lockyer also, we may hope, will exercise that observing skill which enabled him early to recognize the presence of bright hydrogen lines in the spectrum of portions of the sun's surface, to examine that spectrum for other bright lines.

I do not remember any time within the last twenty years when the prospects of fresh solar discoveries seemed more hopeful than they do at present. The interest which has of late years been drawn to the subject has had the effect of enlisting fresh recruits in the work of observation, and

* It would be an interesting experiment, which I would specially recommend to those who, like Dr. Draper, possess instrumental means specially adapted to the inquiry, to ascertain what variations, if any, occur in the solar spectrum when (i.) the central part of the disc alone, and (ii.) the outer part alone, is allowed to transmit light to the spectroscope. The inquiry seems specially suited to the methods of spectral photography pursued by Dr. Draper, and by Dr. Huggins in this country. Still I believe interesting results can be obtained even without these special appliances; and I hope before long to employ my own telescope in this department of research.

many of these may before long be heard of as among those who have employed Dr. Draper's method successfully.

But I would specially call attention to the interest which attaches to Dr. Draper's discovery and to the researches likely to follow from it, in connection with a branch of research which is becoming more and more closely connected year by year with solar investigations — I mean stellar spectroscopy. We have seen the stars divided into orders according to their constitution. We recognize evidence tending to show that these various orders depend in part upon age, — not absolute but relative age. There are among the suns which people space some younger by far than our sun, others far older, and some in a late stage of stellar decrepitude. Whether as yet spectroscopists have perfectly succeeded in classifying these stellar orders in such sort that the connection between a star's spectrum and the star's age can be at once determined, may be doubtful. But certainly there are reasons for hoping that before long this will be done. Amongst the stars, and (strange to say) among celestial objects which are not stars, there are suns in every conceivable stage of development, from embryon masses not as yet justly to be regarded as suns, to masses which have ceased to fulfil the duties of suns. Among the more pressing duties of spectroscopic analysis at the present time is the proper classification of these various orders of stars. Whensoever that task shall have been accomplished, strong light, I venture to predict, will be thrown on our sun's present condition, as well as on his past history, and on that future fate upon which depends the future of our earth.

RICHARD A. PROCTOR.

GREEN PASTURES AND PICCADILLY.

BY WILLIAM BLACK,

AUTHOR OF "THE PRINCESS OF THULE," "THE ADVENTURES OF A PHAETON," ETC.,

In conjunction with an American writer.

[Entered according to Act of Congress, in the Year 1877, by HARPER & BROTHERS, in the Office of the Librarian of Congress, at Washington.]

CHAPTER XLII.

LIFE ON WHEELS.

WE rub our eyes. Have we wandered into a Brazilian swamp, then, during the long dark night? The yellow light of the early morning is shining down on those dusky pools of sluggish water, on the dense forest, on the matted underwood, and rank green grass. How the railway track does not sink into this vast mere passes our comprehension; there seems scarcely sufficient mud on these scattered islands to support the partly submerged trees. But, as we are looking out, a new object suddenly confronts the eyes. Instead of that succession of still creeks we come on a broad expanse of coffee-colored water that broadens out as it rolls southward; and we cry, "The Mississippi!" And over there, on the other side, we see a big and straggling town picturesquely built along the bluffs, and all shining in the early sunlight. But the Mississippi detains us not, nor Burlington either. Our mission is westward, and forever westward — through the perpetual forest, with its recurrent clearances and farms and fields of maize. Surely it is a pleasant enough manner of passing this idle, beautiful day. The recent rains have laid the dust; we sit outside the car and lazily watch the rich colors of the underwood as we pass. Could any thing be deeper in hue than the lake-red of those sumach bushes? Look at that maple — its own foliage is a mass of pale transparent gold; but up the stem and out the branches runs a creeper, and the creeper is of a pure vermilion that burns in the sun. Westward — and forever westward. We lose consciousness of time. We resign ourselves to the slow passing-by of the trees, and the farms, and the maize. It is like a continuous dream.

And was this, we asked ourselves — was this, after all, America? In the bygone days, before we ever thought of putting foot on this vast continent, we had our imaginary pictures of it; and surely these were bigger and nobler things than this trivial recurrence of maize,maize, maize — an occasional house — endless trees and bushes, and bushes and trees? Who does not remember those famous words that thrilled two nations when they were spoken? "I have another and a far brighter vision before my gaze. It may be but a vision, but I will cherish it. I see one vast confederation stretching from the frozen North in unbroken line to the glowing South, and from the wild billows of the Atlantic to the calmer waters of the Pacific main — and I see one people, and one language, and one law, and one faith, and, over all that wide continent, the home of freedom, and a refuge for the op-

pressed of every race and of every clime." But where were the condor's wings to give us this vision, now that we were about midway between the Atlantic and the Rocky Mountains? We only saw maize. And then we tried to imagine an American's mental picture of England — something composed of Stratford-on-Avon, and Westminster Abbey, and Rydal Mount, and Milton, and Shakespeare, and Cromwell — and his bitter disappointment on sailing up the Mersey and coming into view of the squalor of Liverpool. This was the nonsense that got into our heads on this sleepy and sunny day.

But by-and-by the horizon widened, for we had been slowly ascending all this time; and you may be sure there was a little excitement throughout our party when we began to get our first glimpses of the prairie land. Not the open prairie just yet; but still such suggestions of it as stirred the mind with a strange and mysterious feeling. And, of course, all our preconceived notions about the prairies were found to be wrong. They were not at all like the sea. They were not at all melancholy and oppressive. On the contrary, they were quite cheerful and bright in the sunshine; though there was still that mysterious feeling about them, and though the unaccustomed eye could not get quite reconciled to the absence from the horizon of some line of hill, and would keep searching for some streak of blue. Surely there was nothing here of the dreary wastes we had imagined? First of all, and near us, was a rich wilderness of flowers, of the most bountiful verdure and variegated colors — masses of yellow sunflowers, and lilac Michaelmas daisies, and what not, with the blood-red of the sumach coming in. Further off the plain rose and fell in gentle undulations covered with variously-tinted grass; and here and there were the palisades of a few ranches. Further away still were wider and barer undulations, marked by one or two clusters of the minutest specks, which we took to be cattle. Then beyond that again the open prairie land — long, level swathes of the very faintest russet, and grey-green, and yellow-gray, going out — out — out until the blue sky of the horizon seemed quite close and near to us compared with that ever and mysteriously receding plain. This vast distance was not awful, like the sea. It was beautiful in its pale colors; it was full of an eager interest — for the eye appealed to the imagination to aid it in its endless search; and if it was an ocean at all it was an ocean that broke at our feet in a brilliant foam of flowers. This similitude was, indeed, so obvious that we unanimously were of opinion that it must have been used by every American poet who has ever written about the prairie lands.

We had for our nearest travelling companions two commercial gentlemen of a facetious turn, who certainly did their best to amuse our women-folk. It was the lieutenant, of course, who had made their acquaintance. One was a Philadelphian, the other a New Yorker; but both were in the sewing-machine business; and it was their account of their various experiences in travelling that had induced Von Rosen to join their conversation. They were merry gentlemen. They ventured to ask what might be his line of business — white goods, or iron, or Western produce?

"And if it is white goods, what then?" said the ex-soldier, with great *sang-froid.*

"Why, sir," said the Philadelphian, gravely taking out a number of cards, "because money is money, and biz is biz; and you want to know where to buy cheap. That's Philadelphia sure — the American metropolis — the largest city in the world — yes, *sir!* — eighteen miles by eight — two rivers — going to have the Centennial — the best shad —— "

He was regarding the New Yorker all this time.

"Yes — shad!" said his companion, with affected contempt; for we could see that they were bent on being amiably funny. "If you want shad, go to Philadelphia — and cat-fish, too — cat-fish suppers at the Falls only seventy-five cents a head. And fresh butter, too — go to Philadelphia for fresh butter, and reed-birds, and country board — best country board outside of Jersey — keep their own cows — fresh milk, and all that. But if you WANT TO TRADE, colonel, come to New York! New York ain't no village — no one-horse place — no pigs around our streets. We've got the finest harbor in the world, the highest steeples, the noblest park, the greatest newspapers, the most magnificent buildings — why, talk about your Coliseums, and Tuileries, and Whitechapel, and them one-horse shows — come and see our Empire City!"

"Yes; and leave your purse in Philadelphia before you go!" sneered his enemy, who quite entered into the spirit of the thing. "And ask your friend here to show you the new Court-house, and tell you how much *that* cost! Then let him drive you up the avenues, and have

your life insured before you start, and show you the tar-and-sand, the mush-and-molasses pavements — patent pavements! Then ask him to introduce you to his friend the Boss, and mebbe he'll tell you how much the Boss got away with. And then about the malaria? And the fever and ague? And the small-pox? And people dying off so fast they've got to run special trains for the corpses? And the Harlem Flats?"

"Now hire a hall, won't you?" said the Knickerbocker. "Hasn't our cat got a long tail! Why, you could roll up Philadelphia into a bundle and drop it into a hole in the Harlem Flats. But I wouldn't mislead you — no, sir. If you want water-power, go to Philadelphia — and grass — splendid grass — and mosquitoes. Tell him about the mosquitoes, now! Friend of mine in the sugar-line married and went to Philadelphia for his honeymoon. Liked a quiet country life — no racket, except the roosters in the morning — liked the cows, and beauties of nature — and took his bride to a first-class hotel. Fine girl — bin chief engineer on a double-stitch sewing-machine. Well, sir, the Philadelphia mosquitoes were alive — you bet. In the morning he took her to a hospital — certain she had small-pox — two weeks before the doctors could find it out. The man's life was ruined — yes, sir — never recovered from the shock; business went to the dickens; and he ran away and jined the Mormons."

"Jined the Mormons!" cried the Philadelphian. "Why don't you tell the general the story straight? Don't fool the man. Jined the Mormons! He threw her into a sugar-vat — sweets to the sweet, sez he — and married her mother, and went to New York, and was elected mayor as the friend of Ireland — eleven hundred thousand Irishmen, all yelling for the pope, voted for him. No, general, if you want to trade with Americans, with white men, you come to Philadelphia; we live cheap and we sell cheap; and with our new line of steamers, and our foreign trade —— "

"Tell him about the canal-boats — why don't you tell him about the three canal-boats?" said the other scornfully. "It is a fact, general — when three canal-boats loaded with pop-corn and sauer-kraut got to Philadelphia, the mayor called out the militia for a parade — yes, *sir!* — the town was illuminated; the newspapers had leaders on the revival of commerce, and the people all had two inches sewed on to their coat-tails. And mind, general, when you go to Philadelphia, you tell the conductor where to stop — tell him the wood-and-water station opposite Camden — the train stops by signal —— "

Whither this conflict might have led us can only be conjectured. It was interrupted by our halting at a small station to have a midday dinner. And we did not fail to remark that the shy and handsome girls who waited on the crowd of ravenous people in this humble hostelry had bright complexions and clear eyes that spoke well for the air of this high-lying country. The lieutenant was furious because he could get nothing but water or iced tea to drink. His wife remarked that she hoped he would always be as well off, showing that she had had her speculations about her probable life as a ranch-woman. But another member of the party was anxious to get away as soon as possible from the devouring multitude; and when she was outside again, on the platform, she revealed the cause of that pensiveness that had at times dwelt over her face during the morning.

"Really now, *really*, do you think I was right?" she says in a low voice. "I have been thinking over it. It seems so cruel. The poor thing is just breaking her heart over the mistake she has made — in ever leaving him; and now, when she would have this excuse, this opportunity of appealing to him, of going to him without any appeal, it seems dreadful to keep her in ignorance."

"Tell her, then."

"But the responsibility is terrible," she pleads again.

"Certainly. And you absolve yourself by waiting to know what Balfour's wishes are. What more?"

"If — if I had a daughter — of her age," she says, with the usual quiver of the under lip, "I do not think I should let her go further and further away from her husband just when there was a chance of reconciling them —— "

"Will the chance be less next week, or the week after? However, do as you like. If you tell her, you must appeal to her not to do anything rash. Say you have written. Or you might suggest, if she is so very penitent, that she should write to her husband —— "

"Oh, may I do that?" exclaims this tender-eyed hypocrite, as if she ever demanded permission to do anything she had set her mind on.

You never saw one woman so pet another as she petted Lady Sylvia during the rest of that day. She had never shown so

much solicitous attention for the comfort of her own children, as far as any of us had ever noticed. And it was all because, no doubt, she was looking forward to a sentimental scene when we should arrive at Omaha, in which she should play the part of a beneficent fairy, and wise counsellor, and earnest friend. Happily it did not occur to her to have a scene in the railway car before a score of people.

This railway car, as the evening fell, was a sore distress to us. Our wish to have that fleeting glimpse of the Mississippi had led us to come on from Chicago by one of the slow trains, and from Burlington there was no Pullman car. Ordinarily this is about the pleasantest part of the long trans-continental ride from New York to San Francisco; for on it are dining-cars, which have within their narrow compass pretty nearly every luxury which the fancy of man could desire, and which therefore offer a capital way of passing the time. If one must go on travelling day after day without ceasing, it is surely a pleasant thing to occupy the last two or three hours of the evening by entertaining your friends to a banquet — and if you are alone, the conductor will accept an off-hand invitation — of twelve or fourteen dishes, while the foaming grape of eastern France, if Catawba will not content you, is hard by in an iced cellar. With these wild delights we should have been disposed to dispense had we obtained the comparative seclusion of a Pullman car; but as the long and dull evening set in we learned something of the happiness of travelling in an ordinary car in America. During the day we had spent most of the time outside; now we had to bear with what composure we could show the stifling odors of this huge and overcrowded compartment, while the society to which we were introduced was not at all fastidious in its language, or in its dress, or in the food which it plentifully ate. The lieutenant said nothing when a drunken woman sat down on his top-coat and refused to allow it to be removed; but he did remonstrate pitifully against the persistent shower of beetles that kept falling on our heads and necks. We could not understand whence these animals came. Their home could not be the roof of the car, for they were clearly incapable of maintaining a footing there. Or were we driving through an Egyptian plague of them; and did they come in through the ventilators? It was a miserable evening. The only escape from the foul odors and the talk and the shreds of food was sleep; and the close atmosphere gave its friendly help; but sleep is apt to disarrange one's head-covering; and then, that guard removed, the sudden sensation of having a beetle going down the back of one's neck banishes sweet dreams. About half past eight or nine we got to Council Bluffs; and right glad were we to get out for a walk up and down the wet platform — for it had been raining — in the pitch darkness.

Nor shall we forget Council Bluffs soon. We spent three mortal hours there. All that we saw was a series of planks, with puddles of dirty water reflecting the light of one or two gas-lamps. We were now on one bank of the Missouri; and Omaha, our destination, was immediately on the other side, while there intervened an iron bridge. An engine would have taken us across and returned in a very short time. But system must be followed. It was the custom that the passengers by our train should be taken over in company with those arriving by a train due from somewhere else; and as that train had not made its appearance, why should we not continue to pace up and down the muddy platform? It was not the least part of our anxiety that, after an hour or so had passed, ex-Lieutenant Oswald Von Rosen seemed disposed to eat six or seven railway porters, which would have involved us in a serious claim for damages.

He demanded whether we could not be allowed to walk across the bridge and on to Omaha. Certainly not. He wanted to have some clear understanding as to how late this other train was likely to be. Nobody knew.

"*Du lieber Himmel!*" we heard him muttering to himself, somewhere about eleven o'clock, "and in this confounded country the very sky is black with telegraph lines, and they cannot tell you if we shall be here all the night! *Is it the beetles that have stopped the train?*" he suddenly demanded of a guard who was sitting on a handbarrow and playfully swinging a lamp.

"I guess not," was the calm answer.

"We might have been over the river and back half-a-dozen times — eh?"

"That's so," said the guard, swinging the lamp.

It was near midnight when the other train arrived, and then the station resounded with the welcome cry of "All aboard!" But we flatly declined to re-enter one of those hideous compartments full of foul smells and squalor. We crowded together on the little iron balcony

between the cars, clinging to the rails; and by-and-by we had a dim impression that we were in mid-air, over the waters of the Missouri, which we could not see. We could only make out the black bars of the iron bridge against the black sky, and that indistinctly. Still, we were glad to be moving; for by this time we were desperately hungry and tired; and the sumptuous hospitality of Omaha was just before us.

Alas! alas! the truth must be told. Omaha received us in the most cruel and hard-hearted fashion. First of all, we imagined we had blindly wandered into a kingdom of the bats. There were some lights in the station, it is true; but as soon as we had got into the hotel omnibus and left these gloomy rays it appeared as though we had plunged into outer darkness. We did not know then that the municipal authorities of the place, recognizing the fact that business had not been brilliant, and that taxes lay heavily on themselves and their neighbors, had resolved to do without gas in order to save expense. All we knew was that this old omnibus went plunging frantically through absolute blackness, and that in the most alarming manner. For what were these strange noises outside? At one moment we would go jerking down into a hollow, and the "swish" of water sounded as if we had plunged into a stream, while we clung to each other to prevent our being flung from one end to the other of the vehicle. And then, two seconds afterwards, it really did appear to us that the horses were trying to climb up the side of a house. There was one small lamp that threw its feeble ray both outward and inward; and we saw through a window a wild vision of a pair of spectral horses apparently in mid-air, while inside the omnibus the lieutenant was down at the door, vainly trying to keep his wife from tumbling on the top of him.

"It is my firm conviction," said Queen T., panting with her struggles, "that we are not going along a road at all. We are going up the bed of the Missouri."

Then there were one or two more violent wrenches, and the vehicle stopped. We scrambled out. We turned an awe-stricken glance in the direction we had come; nothing was visible. It was with a great thankfulness that the shipwrecked mariners made their way into the hotel.

But was it hospitable, was it fair, was it Christian of the Grand Central of Omaha to receive us as it did, after our manifold perils by land and water? Had we been saved from drowning only to perish of starvation? In the gloomy and echoing hall loud sounded the remonstrances of the irate lieutenant.

"What do you say?" he demanded of the highly indifferent clerk, who had just handed us our keys. "Nothing to eat? Nothing to drink? Nothing at all? And is this a hotel? *Hé!* It is nonsense what you say. Why do you let your servants go away, and have everything shut up? It is the business of a hotel to be open. Where is your kitchen — your larder — what do you call it?"

In reply the clerk merely folded up his book of names, and screwed out one of the few remaining lights. Happily there were ladies present, or a deed of blood would have dyed that dismal hall.

At this moment we heard the click of billiards.

"Ha!" said the lieutenant.

He darted off in that direction. We had seen something of billiard-saloons in America. We knew there were generally bars there. We knew that at the bars there were frequently bread and cheese supplied gratis. Behold! the foraging soldier returns! His face is triumphant. In his hands, under his arms, are bottles of stout; his pockets are filled with biscuits; he has a paper packet of cheese. Joyfully the procession moves to the floor above. With laughter and gladness the banquet is spread out before us; let the world wag on as it may, there is still, now and again, some brief moment of happiness. And we forgave the waiting at Council Bluffs, and we forgot the beetles, and we drank to the health of Omaha!

But it was too bad of you, Omaha, to receive us like that, all the same.

From The Queen.

GLAMOR.

WHAT is the spell which binds sweetness to peevishness, feminine delicacy to hybrid coarseness, unselfishness to domination, and self-denying love to rampant egotism? Who knows? There are mysteries in sea and sky which no man has yet fathomed; but greater than them all is the mystery of human love, and why one ungainly soul is prized, and another, beautiful and precious, is discarded!

What friendship is in its degree, so is marriage to a still more striking extent. We sometimes see the sweetest and dearest little woman in the world married to a bluff, burly, crossgained fellow, who goes through life like a perpetual thunder-cloud

from which the slightest shock brings angry splutterings, sullen murmurs, and fiery outbursts, destructive of all peace and comfort. Yet Titania worships her rough-skinned treasure; he is her "gentle joy" to her, and she finds her happiness in wreathing garlands for his long-eared head, and in idealizing him — dull ass as he is — till she has made him into a god by whom all men might take a pattern. Her sister, married to Hyperion, as good as he is beautiful, and as clever as he is good, finds her lot in life a hard one, and thinks every wife is to be envied where she is only to be pitied. She talks feelingly of the dreadful punishment which falls on women who make the one great mistake of their lives, and waxes eloquent on the sin of parents in suffering their daughters to marry before they know their own minds or those of the men whom they take for better and worse. Her eyes fill up with tears when she speaks of Titania's happiness, and how good and kind, for all his rough exterior, is that long-eared Bottom of hers who shows his rough side to the world but keeps only his down and velvet for home. And then she sighs, and looks out into the distance as one whose heart is full of sadness, and whose tongue might say bitter things if she would; but she will not. If unhappy, she is loyal; if unappreciated, and not fairly dealt by, she understands the holy reticence of martyrdom; and though her marriage has been a mistake, she will not make the world the confidant of her griefs. Nevertheless, she gives that same world clearly to understand that she is unhappy and has been taken in, and that man for man Hyperion does not come near to Bottom, and Titania is to be congratulated while she is only to be commiserated. This is glamor in an inverted form — glamor dealing with poison not ambrosia, but quite as general as the other, if somewhat more distressing.

It must not be thought that women alone have the fee-simple of this kind of thing; that they and they only love the base and despise the noble by the influence of that strange state of mind which, for want of a better word, we are forced to call glamor. Perhaps we see it even more distinctly in men, for the objects to which the stronger sex sometimes carry their worship, or it may be their displeasure, are certainly of a kind which make other women — behind the scenes — open their eyes and ask, Why? Look at that unsuspecting honest-hearted gentleman who gives his good old family name and personal honor into the keeping of a woman who has not one qualification to make her a worthy custodian of either; and very many which one might have thought would have made any wise man hesitate before he gave himself and his precious treasures into such perilous guardianship. He alone ignores what all other men know; he alone believes where others more than doubt. The woman, to eyes untouched by glamor, has not a charm; she is rude and violent, ill-bred and vulgar; her very beauty, what there is of it, is of a low type; and in all probability she has lost the freshness of her skin as long ago as that of her mind. Yet the man whom she holds in thrall loves her, and marries to his ruin a kind of nineteenth century Circe, who, if she does not transform him into a swine, does lower the tone of his mind, so that she makes him accept dishonor for fame and humiliation for glory. But his brother, who has found Solomon's "crown of glory," thinks no more of his treasure than if it were an old brown paper cap; and lets what might have been the sweetness of his married life run to waste through neglect and indifference — as one who gives up his stately flower-garden and noble orchard to thorns and briars, and lets his cask of Shiraz wine run into the sand for the want of a little care in hoops and nails to keep the wood together.

Love of itself is glamor, and the strongest to be found. No lessons learnt by experience, however sharply taught and sadly conned, can enlighten the numbed senses which love has sent to sleep by its magic fascination; and things as plain as the sun in heaven to others, are dark as night, unfathomable as the sea to those who let themselves love before they prove.

Glamor, the fascination of certain professions; glamor, the passionate absorption of art; glamor, that unreasoning love of place which makes you accept all sorts of personal discomfort and moral disquietude that you may look out on those woods, watch the coming and going of those waves, study the lights and shadows as they fall on those mountains, find the maidenhair in that cleft, and the bee-orchis in yonder bank! But what would life be without this glamor? A dull house of rough wood wherein the soul gloomed through its miserable days, and whereto no beauty came, no love, no poetry, no idealizing brightness of fancy, making the mean things great and the sordid noble. If a bad master, glamor, like much else, is a good servant; and while kept under manageable control is a faculty for which we may thank God for his gift, not bewail the lot of man for his possession.

A MOTHER'S THOUGHTS BY HER CHILD.

O GOD of boundless purity,
How strange that thou should'st give to me
This young and tender heart,
To train to walk in thine own ways,
That he may end his mortal days
In glory where thou art!

Alas! how slow, how helpless too
Am I, this sacred work to do!
My utmost strength must fail.
Yet, Holy Spirit, if thy power
Be given to me from hour to hour
I surely shall prevail.

O Gracious Influence, to his heart
Give will to choose the "better part,"
Which none can take away.
By him, O helping God, be found;
To him in gifts of love abound;
Be with him every day.

And, God of grace, his mother bless
With prayer, and faith, and watchfulness,
Now that she has a child.
Let not her weak indulgence spoil,
Nor yet her stern, harsh manner foil,
This heart, so soft and mild.

Help her in every act and word
To follow close her lowly Lord;
Be this her only pride—
That she may holy influence shed
Around this dear immortal's head,
And keep him on thy side.

Then, when the last great trump shall sound,
And all before their Judge be found
To hear their sentence pass'd,
May he in glory then appear,
Receive thy prize, thy "Well done" hear—
A conqueror at last.

Yes, may this soul, of rarer worth
To me than all the souls of earth,
But wear thy diadem;
Then, through eternity I'll raise
A mother's song of unmixed praise,
To Thee, redeeming Lamb.

Sunday Magazine. M. E. P.

LOCH CARRON, WESTERN HIGHLANDS.

A BLACK and glassy float, opaque and still,
The loch, at farthest ebb supine in sleep,
Reversing, mirrored in its luminous deep,
The quiet skies; the solemn spurs of hill,

Brown heather, yellow corn, gray wisps of haze;
The white low cots, black-windowed, plumed with smoke;
The trees beyond. And when the ripple awoke,
They wavered with the jarred and wavering glaze.

The air was dim and dreamy. Evermore
A sound of hidden waters whispered near.
A straggler crow cawed high and thin. A bird

Chirped from the birch-leaves. Round the shingled shore,
Yellow with weed, came wandering, vague and clear,
Mysterious vowels and gutturals, idly heard.

Cornhill.

THE FRIGID ZONE.

O YE who dwell beneath the temperate sun,
And till the happy fields of every day,
Know ye what lands are lying far away,
Where never birds rejoice, nor waters run,
But all the seasons wear the robes of one,—
Too white, too fair for aught but death's array?
Know ye that human hearts like yours are there,
That human life breathes in that icy air?
Great dawns are there, of stainless pearl and rose,—
There the white splendors of still greater nights
Stream up the sky. But heavenly lights are cold!
And the earth moans under her weight of snows,
Keeping a thousand uses and delights
Hid in her breast, that never may unfold.

Catskill, New York. CARL SPENCER.

Spectator.

OCTOBER.

EDGES of stormy dawn and murky night
Trespassing harshly on his mellow hours,
October plucks the present while it flowers,
And revels as a splendid Sybarite.
What tho' his noontide wear the yellow light
Of sunset, hinting of the doom that lowers,—
He recks not; now astride the west wind scours
Blue steppes of air; now, languid with delight,
Reclines in violet haze; flings silver rime
To the gossamer, bead-coral to the thorns,
And showers on tree and fern his ruddy gold.
But as pards couch until the herded horns
Slant valewards, winter lets him pass his prime,
Then springs, and hales him to the caves of cold.

Spectator. HENRY G. HEWLETT.

From The Contemporary Review.

THE TRIAL OF JESUS CHRIST.

II.—THE ROMAN TRIAL.

THE trial of their Messiah by the Sanhedrin, had it stood alone, would have no doubt been the most interesting judicial transaction in history. The law of Moses, perpetuated though modified by Christianity, has perhaps been more influential than any other code of the world. Yet that law has had one rival, in the mighty jurisprudence of Rome. "The written reason of the Roman law has been silently or studiously transfused" into all our modern life, and lawyers of every nation look back with filial reverence to the great jurisconsults of the great age of the imperial republic. But between the two influences there is one important point of contrast. In the Hebrew commonwealth, law was the product of religion. It was received, as Christendom has been content to receive it, as a divine rule. There is no evidence whatever that the Jewish race was remarkable for an innate passion for justice, or for any such "tendency to righteousness" as might have originally led it to religion. Their whole history and literature indicate, on the contrary, that it was the intense sense of the divine which moulded the nation originally, and which afterwards led to a widespread though imperfect cultivation of the *ars boni et æqui.* Even that rabbinic cultivation, as we have seen, was marred by continual exaggerations and artifices which reveal the original inaptitude of the race for high judicial excellence. Accordingly, down to the time with which we are dealing, it remained a small, isolated Asiatic tribe, filled through and through with national and religious prejudices. It is not to such that men look for a model of the administration of equal laws. But there have been races in the world who reflected, as there are races who do reflect, in an eminent degree, that deep sense of righteousness which lies at the root of all law. And of all such races, ancient and modern, the greatest was that which at this time ruled over Palestine and over the world. When the sceptre departed from Judah, it passed into the strong, smiting hands of Rome; and already all the nations had begun to exchange their terror of its warlike might for that admiration of its administrative wisdom which has grown upon the world ever since. And already, too, that admiration was mingled with confidence and trust. Those Eastern races felt, what we two thousand years after can historically trace, that the better part of the unequalled authority of the Roman law was due to the stern, hard virtues of the early race and early republic. Its influence was dimly recognized then, and it is clearly traceable now, as having sprung from the instinct of righteousness which guided prætor and proconsul in every subject land, long before Ulpian or Gaius had written out that instinct into immortal law.

Pontius Pilate was at this time the representative of Rome in Judæa; the governor, as he is called in the Gospels. But it will be found instructive to note more carefully what his exact position was. He was the *procurator Cæsaris;* the procurator, deputy, or attorney of Tiberius in that province. And he was no *procurator fiscalis*,* with functions equivalent to those of quæstor. Pilate's was no such subordinate or financial office. He was a procurator *cum potestate;* a governor with civil, criminal, and military jurisdiction; subordinated no doubt in rank to the adjacent governor of Syria, but directly responsible to his great master at Rome. And what was the relation of the emperor himself to the inhabitants of Judæa and to the world? The answer is important. The emperor was neither more nor less than the representative of Rome. In modern times men associate the imperial title with absolutism and a more than royal power. To Romans, even in the days of Tiberius, the name of a king was intolerable, and absolutism, except under republican forms, distasteful. Accordingly when Augustus became the undisputed chief of the republic, and determined so to continue, he remained nominally a mere private nobleman or citizen. The saviour of society did not dare to attack the constitution of the State.

* The name is still used in Scotland, having had there originally its old sense of "the deputy of a provincial judge appointed by him to look after money matters."

He effected his object in another way. He gathered into his own hands the whole powers and functions, and accumulated upon his own head the whole honors and privileges, which the State had for centuries distributed among its great magistrates and representatives. He became perpetual *princeps senatûs*, or leader of the legislative house. He became perpetual *pontifex maximus*, or chief of the national religion. He became perpetual tribune, or guardian of the people, with his person thereby made sacred and inviolable. He became perpetual consul, or supreme magistrate over the whole Roman world, with the control of its revenues, the disposal of its armies, and the execution of its laws. And lastly, he became perpetual imperator, or military chief, to whom every legionary throughout the world took the *sacramentum*, and whose sword swept the globe from Indus and Gibraltar to the pole. And yet in all he was a simple citizen — a mere magistrate of the republic. Only, in this one man was now visibly accumulated and concentrated all that for centuries had broadened and expanded under the magnificent abstraction of Rome. Tiberius, therefore, the first inheritor of this constitution of Cæsar Augustus, was in the strictest sense the representative of that great city that ruled over the kings of the earth. And the Roman knight who now governed in Judæa was his representative in his public capacity. For Augustus, as is well known, had divided the provinces into two classes. To the more peaceful and central, he allowed the Senate to send proconsuls, while even over these he reserved his own consular and military power. But some provinces, like Judæa, he retained in his own hands as their proconsul or governor. Strictly and constitutionally, the governor of the Jewish nation, at the time of which we write, was not Pilate at Cæsarea or Vitellius at Antioch, but Tiberius at Rome. He was the proconsul or governor of Judæa under the still-existing republic, a republic now almost identified with himself. And Pilate, whom the Jews popularly called their governor, was strictly the procurator of the great proconsul, holding civil and military authority by delegation from him in whom was now concentrated the boundless authority of Rome. Such was the tribunal before which the council of the Sanhedrin is now to lead a prisoner.

Pilate sat in his prætorium on the morning of that "preparation-day," to transact business and administer justice as usual. In what spot in Jerusalem his judgment-seat was on this occasion set up, cannot certainly be known. It may have been within the fortress and under the tower of Antonia, the visible symbol of Roman predominance which frowned beside the temple. Much more probably it was "Herod's prætorium," that magnificent palace to the north of the temple which Josephus describes, and which had been recently built by the Idumean kings. Their former palace was also still in existence, and the visit of the Roman procurator and the tetrarch of Galilee to the same feast, while it raises the question which of them occupied the new and more splendid residence, suggests the inevitable rivalry and possible "enmity" of their relation. If we suppose that Pilate, like Florus, asserted his right to occupy the new palace, we may remember that its white marble semicircle enclosed an open *place* which looked out on the sacred city, and was almost as public as the space between Antonia and the temple. In the open space in front of this or any other prætorium the movable *bema* or tribunal could at once be set up. But on this morning Pilate was still sitting in the judgment hall. Outside was the roar of the Eastern city awakening on a Passover dawn; within, the clash of Roman steel, the altars of the Roman gods, and perhaps the sculptured frown of the distant demigod Tiberius. Into that heathen chamber the priests and doctors of the separated nation would not enter during their sacred week; and the Roman, with his Roman smiles, willingly removed their difficulty by coming with his soldier-lictors to the gate. But his first words there, as his eyes fell upon the prisoner who stood with his hands bound before him, were, "What accusation bring ye against this man?" We recognize instantly the spontaneous voice of Roman justice. It was

no doubt meant to suggest his own authority and power of review, and in that respect we must presently consider it. But it was before everything else the instinctive utterance of a judge, and it at once recalls that singularly noble dictum of Pilate's succesor in the same seat, "It is not the manner of the Romans to deliver any man to die, until that he which is accused have the accusers face to face, und have license to answer for himself concerning the crime laid against him." So ever spoke the worst of the Roman governors — and neither Pilate nor Festus was among the best — out of the mere instinct and tradition of justice which clung to their great office among the treacherous tribes around. The chief priests and scribes on this occasion avoided the demand to know the accusation. "If he were not a malefactor, we would not have delivered him to thee." The insolent evasion of his question was not likely to propitiate Pilate, who instantly puts the matter on its true footing by the calm but somewhat contemptuous reply, "Take ye him, and judge him according to your law." Sullenly came the answer, "It is not lawful for us (it is not permissible — οὐκ ἔξεστιν) to put any man to death." The answer revealed (what the word "malefactor" had perhaps already implied, and what may have been involved in their bringing their prisoner to Pilate at all) that it was a capital charge which they had come to make. But it closed this important opening dialogue. The conversation just narrated is only found in the Gospel of John; and it is remarkable that a narrative apparently very much later than the others should record words which not only have the strongest internal evidence of truth, but to which subsequent investigation has given immensely increased historical value.

For at this point of the story comes in the question of conflict of *jurisdiction*. Why did the Jews go to Pilate at all? We have seen that their council condemned Jesus "to be guilty of death." Had they no right to pass such a sentence? or, having the right to pass it, had they merely no power to execute it? How far did the authority of the governor trench upon, or supersede, the authority of the Sanhedrin? Which of them had the *jus vitæ aut necis?* What was the relation of the two powers, the Jewish and the Roman, to each other at this time? This broad historical question lies at the root of the views which may be taken of the legal point — views which have sometimes been extremely contrasted. In the controversy between Salvador and Dupin, the former (true in this to the sad claim of some of his nation of old, "His blood be on us") urged that the Sanhedrin had full authority to try even for capital crimes, and that their sentence of death required only the countersign or endorsement of the Roman governor. His opponent held that the Jewish court had no right to try for grave, or at least capital crimes at all; that their whole procedure was a usurpation; and that the only real or competent trial was that which we are about to consider. I have no intention of going into the great mass of historical investigation which has been undertaken on this confessedly difficult point. There seems no one consideration which is quite conclusive upon it. Thus it would be rash to ascribe to the assertion of the Talmud, that "forty years before the destruction of the temple the judgment of capital causes was taken away from Israel," the praise of exact chronological accuracy. Yet it is very striking as showing the time about which the doctors of the Jewish law were willing to hold that their power of life and death (no doubt already restricted or suspended under the despotism of Herod) had finally passed away. But on the general subject of the relation of the two powers in that age, there are some considerations which reasoners on either side do not seem to have always kept in view: — 1. There was no *concordat* on this subject between the Romans and the Jews. The latter were the conquered nation; their jurisdiction, including the power of life and death, was wrested from them *de facto*, and they were obliged to submit. But *de jure* they never did. To them, at least to the great mass of the nation, the Sanhedrin was still the national authority, especially in accusations relating to religious matters. 2. On the Roman side, the matter was of course precisely otherwise. Their view of the jurisdiction of subject

races generally, and of the Jews in particular was (I suspect) that it was just so much as they chose to leave them. In most cases that formed a very large field. The Roman governor sanctioned, or even himself administered, the old law of the region; but the policy of the ruling power was to concede to local self-government as much as possible. The concession was of course all the larger where there was no disposition on the part of the province to provoke a contest. In Roman law as in Roman campaigns, in questions of jurisdiction as in questions of politics, the maxim of the haughty and wise rulers of the world was *parcere subjectis et debellare superbos*.

3. It is evident that a large latitude was allowed on this subject to the great Roman officers — proconsuls or procurators — who administered *la haute justice*. The republic and the emperor permitted, and indeed demanded, that they should stretch or relax their authority as the particular case or exigency required. In ordinary matters brought before their tribunals, the rule on which they acted is perfectly expressed, a few years after this, by Annæus Gallio, the humane proconsul of Achaia and brother of the philosopher Seneca, "If it were a matter of wrong or wicked lewdness, O ye Jews, reason would that I should bear with you: but if it be a question of words and names, and of your law, look ye to it; I will be no judge of such matters." But while they drove such questions from the judgment-seat, so long as they did not affect the rights of the sovereign power, the least hint that one of these words or names or questions of another law could prejudice the supreme power of Rome was enough to authorize the governor to plunge his axe into the offending part of the body politic with prompt and savage severity. These general considerations should never be forgotten in reading the scattered and often inconsistent historical notices on the subject. They show that the extreme views, which critics in our own time have maintained, were probably held even then by the opposing powers whose jurisdictions were in poise. But the balance of evidence is very strong that, at this time, all questions of life and death in Judæa were by Roman law and practice reserved for the final decision of the Roman governor. In such cases the Jews had, at the most, only the *cognitio causæ*. Nor can there be much doubt that the governor's final power in these cases was not a merely ministerial right of endorsement and *executio;* it was also a power of *cognitio*, or review, in so far at least as he chose to exercise it. Whether this reservation to the governor was such as to deprive the Jewish courts of their rights as tribunals of first instance — whether any previous trial of a capital cause before the Sanhedrin was necessarily a usurpation — is another and a more difficult question. With regard to ordinary civil crimes — robberies or assassinations — the Jewish rulers may have been content not to interfere farther than to bring the perpetrators to the Roman tribunal for judgment. The Roman governor, on the other hand, may have been quite willing to send to the cross without much inquiry any ordinary malefactors against whom the authorities of their country, having already inquired into the case, were willing to appear as accusers. But obviously a more serious question arose when the alleged crime was a religious one — a claim, as prophet or Messiah, to change the ecclesiastical institutions. In such a case the Sanhedrin itself no doubt maintained, as the Jews generally did on its behalf, an exclusive right to judge in the first instance; and its tendency would be very strong to deny any *re-cognitio* by the Roman power, and either not to call in that power at all, or to limit it to a mere right of countersign. What view the Roman governor might take, in the very unusual case of such a charge being brought to his tribunal, was another matter.

But in truth, while the dialogue-narrative of the fourth Gospel admirably illustrates the historical relations of the parties at the time, the narrative, in that Gospel and in the others, supersedes the necessity for referring to these more general relations. Whether it was legitimate or not for the Jews to condemn for a capital crime, on this occasion they did so. Whether it was legitimate or not for Pilate to try over again an accused whom they had condemned, on this occasion he did so. There were certainly two trials. And the dialogue already narrated expresses with the most admirable terseness the struggle which we should have expected between the effort of the Jews to get a mere countersign of their sentence and the determination of Pilate to assume his full judicial responsibility, whether of first instance or of review. The reluctance of the Jews on the present occasion was no doubt prompted not so much by their usual ecclesiastical independence as by their dread lest inquiry by Pilate should prevent his carrying out their scheme. But as matters actually turned out, the collision

which the procurator's first words provoked had the effect of binding him publicly, before the men of both nations who surrounded his judgment-seat, to deal with this capital case in his judicial capacity. It was henceforth no mere matter of administration; no incident of summary police jurisdiction or military court-martial; it was a deliberate judgment of life and death by the supreme civil ruler who had interposed his jurisdiction between an accused man and the chief authorities of the subject nation.

The *accusation* demanded by Pilate necessarily followed, now that he had insisted on being judge in the cause. We have this given with considerable formality in the Gospel of Luke; and though it is omitted in the three others, the first question of Pilate to Jesus, which they all record, implies a previous charge. Luke gives it thus: "We found this man perverting the nation, and forbidding to give tribute to Cæsar, saying that he himself is Christ a king." Had the accusation retained the form in which it was brought before the Sanhedrin — had it been a merely religious or ecclesiastical crime which was now named — a different question would have arisen. Had the chief priests, when they "began to accuse" Jesus, said at once what they passionately exclaimed at a later stage of the cause, "We have a law, and by our law he ought to die, because he made himself the Son of God," it may be doubtful what Pilate would have done. He was authorized as governor to administer their law, or to preside over and control its administration; and while his leaning would be, like that of Gallio, to consider this question a matter of words, he might have been induced to see that these words covered grave consequences to the State. But such questions are superseded by the deliberate change in the form of the accusation — or rather, the reverting to that accusation which had been originally intended, and for which the ecclesiastical procedure of the night before was a pretext or preliminary. If we accept the sentence of Luke as equivalent to the *nominis delatio* of the Roman law, or to the affidavit of the prosecutor-witness of the Hebrew law already considered — and it has resemblances to both — it throws a flood of light before as well as behind. The charge of "perverting" (*διαστρέφοντα*), including perhaps "revolutionizing" as well as "seducing" the nation, was fairly true, and was distinctly included in the Jewish procedure of the night before. No doubt to Roman ears it was ambiguous, but the ambiguity recalls that very real doubt which had governed his mind who said, "If we let him alone, all men will believe on him, and the Romans will come and take away our place and our nation." The culminating charge, that Jesus called himself "Christ a king," was also true, and had just been acknowledged to be true, though scarcely in the sense in which the accusers expected that the ears of the governor would receive it. But if we are to take Luke's narrative, we must believe that the charge was not left in this doubtful and ineffective form. The managers of the impeachment had no doubt not intended to make a deliberately untrue statement before the heathen judgment-seat. They wished, at as small an expense of falsehood as possible, to throw upon the foreign power the odium of a prophet's death. But the prompt utterances of Pilate seem to have forced them into the villany they would rather have avoided, and between the more ambiguous charges of seducing the nation and claiming a royal Messiahship, they add, by way of illustration, "forbidding to give tribute to Cæsar." It was a sheer falsehood, and some of the accusers must have known it to be the converse of the fact as recently ascertained. But it was a suggestion which, as they must also have known, would give the most deadly significance to the other vaguer and truer heads of the indictment, and would make it impossible for the governor to waive the capital charge.

For there is no mistake as to what the crime here imputed is. It is *majestas* — the greatest crime known in Roman law, the greatest crime conceivable by the Roman imagination — an attack upon the sovereignty or supreme majesty of the Roman State.* In the early days of the republic the name *perduellio* was applied to treason and rebellion, and the citizen condemned by the people for that crime was interdicted from fire and water, or hanged upon an *arbor infelix*. As the rule of the city spread over the world, treason came to be known as an attack upon its majesty; and various laws were passed to define this crime and the treatment of it, the chief enactment being the *lex Julia*. According to this law every

* "Crimen adversus populum Romanum vel adversus securitatem ejus." (Ulpian, Dig. xlviii. 4. 1.) The origin of the name is plain. Cicero defines *majestas* as "magnitudo populi Romani," and the full name of the crime is "crimen læsæ aut imminutæ majestatis." It is very adequately expressed by our word treason.

accusation of treason against a Roman citizen must be made by a written libel. A Jewish provincial had of course no such protection. He stood before the procurator of the Cæsar, with no defence against the summary exercise of absolute power but the plea of justice.

We come now to the *defence*. All the narratives bear that Pilate put the same question to Jesus, in the same words, "Art thou the king of the Jews?" but that on his answering in the affirmative, the Roman came to the paradoxical conclusion that there was "no fault in him." The fourth Gospel contains the explanatory conversation which these facts almost necessarily imply. The statement of Jesus is unusually impressive. It is couched, no doubt, in that involved, allusive, and aphoristic style of utterance which we find in this Gospel from end to end. But we must remember that all the biographies represent this very style as occasionally used by Jesus, and as characteristic of him in critical circumstances. It comes out in all the histories when he touches on the esoteric "mysteries of the kingdom" he preached, or where his own claims are brought in question; and it manifestly grew more and more his manner of utterance towards the close of his career. We hold therefore that a statement which, though only recorded in the latest Gospel, must according to all the others have been substantially made, and which as reported is at once startlingly original and intensely characteristic, has every internal evidence of being historical. This dialogue took place in the prætorium, where Jesus may have possibly been detained while the question of jurisdiction was settled with his accusers. (It rather appears, however, that he must have been present while the accusation was made; the two first Evangelists state that either then or at a later stage his silence extorted the marvel of the governor, who said, "Hearest thou not how many things they witness against thee?") He now, however, brings his prisoner within, and puts the sudden question, "Art thou the king of the Jews?" Jesus' answer, "Sayest thou this of thyself, or did others tell it thee of me?" does not seem to have been a request to know what had been uttered by the Jews in his absence. The words evidently have a deeper reference. They are equivalent to, "In what sense dost thou use the expression? If thou sayest it of thyself, in the sense in which a Roman would naturally use the word, then I am not the king of the Jews. But if others told thee this of me, if thou art using the words of Hebrew prophecy, or of the world's hope, that may need further explanation." Pilate strives to reply as a Roman should, "Am I a Jew? Thine own nation and the chief priests have delivered thee to me: what hast thou done?" It was throwing back, and not unfairly, the burden of explanation upon the accused; and he who had kept silence before the midnight Sanhedrin, and who made no answer even now to their dissimulated accusation, at once frankly responded to the heathen magistrate who desired himself to know the truth of the case: "My kingdom is not of this world: if my kingdom were of this world, then would my servants fight: . . . but now is my kingdom not from hence." In considering words so memorable we must avoid as much as possible the theological and ecclesiastical, and look only from the historical, and in particular the forensic and judicial point of view. Whatever else these words import, they are in substance, and almost in form, a defence. If they imply a confession of kingship, they express an avoidance of the particular kind of kingship charged. They do not set up a plea in bar of the jurisdiction. They seem to acknowledge that a kingdom of this world would be a legitimate object of attack by the deputy of Cæsar, but they deny that the kingship of Jesus could be so described. The most important commentary on the words is of course the recent and famous scene of the tribute money, where Jesus being demanded as a Jewish patriot and prophet, "Is it lawful to give tribute to Cæsar, or no?" answered, "Shew me a penny," and, having asked the significant question as to Cæsar's image and superscription engraved upon it, closed the discussion with the words, "Render therefore unto Cæsar the things that are Cæsar's, and unto God the things that are God's." The two incidents, in common with the whole of the history, make it certain that it was no part of his plan of kingdom, as it was no part of the plan of Christianity historically, to attack the Roman power. But this critical utterance to Pilate (like that former one) seems to go farther. On the face of it, it indicates that there was no necessary collision between the kingdom which Jesus was prepared to assert as his own and that great "kingdom of this world" which his judge represented. An actual collision there too probably might be. But the words are meaningless unless they are taken as asserting separate spheres within which it was possible for each power to confine

itself, and by confining themselves within which it was possible for them to escape collision. Only one of these kingdoms is described, and it is defined generally as "of this world," the definition being illustrated by the suggestion that in every such kingdom the monarch may suitably be defended by the armed force of his subjects. The other is as yet only defined by the negation of these characteristics. Pilate, as the result indicates, was already impressed by the statement, and perhaps convinced by it of the innocence of the accused of all conspiracy against Rome. And yet Jesus still spoke of a kingdom — a kingdom too in this world, though not of it * — and his words of renunciation were more royal than all the Roman had ever listened to of greatness. With true judicial tact, the governor lays his finger on the exact point which required to be brought from negative implication into express statement. "Art thou a king then?" he asked the prisoner whose kingdom was not of this world. And as before, to the adjuration of God's high priest, so now, to the representative of all the greatness of earth, the answer came back, making a crisis in the world's history, "Thou sayest it: I am a king." He who spoke so to a Roman governor knew that he was offering himself to the cross, and that the next few hours might close that fateful life. And the thought was in his mind when he deliberately added, "To this end was I born, and for this cause came I into the world, that I might bear witness unto the truth." Whatever else is included in words so great, this "witness to the truth" certainly embraces the testimony which a moment before had been given by the speaker himself — by him "who before Pontius Pilate witnessed the good confession" — to the existence of a kingdom, true and real, though not of this *kosmos*. But this supreme utterance struck a deeper note than even the assertion of a spiritual and separate kingdom. It proclaimed that which is the basis of all human veracity and virtue, but which in those later ages was becoming strange to Roman ears — the existence of an eternal world of truth outside of man — a universal divine system of things, high above all local or national tradition, and indeed above all human beliefs and desires. Over that objective truth men have no power: their highest privilege is to recognize and to confess it. And those do recognize it who have already a certain kinship and relation to that central truth — who are "of the truth." For the last words of him who now claimed to be both the witness and the king of that greater world were, "He that is of the truth heareth my voice."

"Pilate answered, What is truth?" The blank response, half-sarcastic, half-despairing, wholly sceptical, will claim notice at a later stage. In the mean time we follow the course of the judge,* who, thus waiving the personal question presented to him, goes on to deal with the accusation and the accused. The narratives all bear that Pilate reached and expressed the conclusion that the crime charged had not been proved — that indeed he found in the accused "no fault at all." And the last Gospel distinctly refers the first public utterance of this conviction to the exact point in the conversation and defence at which we have now arrived. It was the only defence which the accused is at any time stated to have offered; and Pilate now went straight out from the prætorium, and announced his verdict, perhaps from the judgment-seat. Yet was this utterance, as it turned out, only the first step in that downward course of weakness the world knows so well: a course which, beginning with indecision and complaisance, passed through all the phases of alternate bluster and subserviency; persuasion, evasion, protest, and compromise; superstitious dread, conscientious reluctance, cautious duplicity, and sheer moral cowardice at last; until this Roman remains photographed forever as the perfect feature of the unjust judge, deciding "against his better knowledge, not deceived." Upon some of the points in the Evangelic narrative we need not dwell. The graphic incident of the judge catching at an allusion to Galilee, and, on ascertaining that the man was a Galilean, sending him to Herod, may be just noticed in passing. The word used is ἀνέπεμψεν (*remisit*), which seems the proper technical term for restoring an accused to his proper jurisdiction, as here in sending him from a

* "My kingdom is not of this *world*." The word used is κόσμος, not αἰών.

* The apocryphal "Acts of Pilate," after giving this conversation with much accuracy, adds a few sentences which, while they rather vulgarize the previous utterances, indicate a special application of the words of Jesus which may have occurred to the mind of the governor as he passed from their higher suggestions to announce his judgment in the cause:

"Pilate saith unto him, What is truth? Jesus said, Truth is from heaven. Pilate said, Therefore truth is not on earth. Jesus said to Pilate, Believe that truth is on earth among those who, when they have the power of judgment, are governed by truth and form right judgment."

forum apprehensionis to a *forum originis*. Herod's declinature was prudent as well as courteous, when we remember the terms of the accusation. A man, even a provincial, accused of *majestas*, "stood at Cæsar's judgment-seat, where he ought to be judged;" and the Idumean "fox" may have dreaded the lion's paw, while very willing to exchange courtesies with the lion's deputy. The second appearance at the tribunal of the governor, shows a distinct accession of weakness on the part of the judge, and of pressure upon him by the accusers. His wife's * morning message troubles his conscience, but does not purify his heart. Pilate is now willing to "chastise him and let him go," *i.e.*, to mangle an innocent man with the savage Roman scourge. The Jewish accusers refuse the compromise; and Pilate, characteristically, seems to have left them under the impression that he had finally sent him to the cross, while he still intended to make a postponed appeal to their compassion. But before taking his first step in actual guilt, the judge washes his hands with the memorably vain words, "I am innocent of the blood of this just person: see ye to it." After the scourging, the three Evangelists record nothing but the insults of the fierce soldiery to one who was given up to them as a Jewish traitor to their emperor. But the later Evangelist interposes a series of incidents which are now as before noted with the finest characterization and the most delicate verisimilitude. He alone records the "Behold the man!" with which the struggling procurator, whose "faith unfiathful" still made him "falsely true," sought to move the multitude. He alone records the response, "We have a law, and by our law he ought to die, because he made himself the Son of God"—an utterance in exact accordance with that narrative of the Hebrew trial which is given by all the synoptics, but which John has omitted. It is he who notices the unexpected but most natural effect of this claim upon the governor, whom the former utterances of the king "come into the world" had deeply impressed. "Whence art thou?" he almost tremulously demands. But from the first moment of his vacillation Jesus had given him no answer. Pilate, accordingly, at the very time when he is described as inwardly "more afraid," flashes out in that insolent tone which less discriminating secular historians regard as the only one characteristic of him, "Speakest thou not unto me? knowest thou not that I have power to crucify thee, and power to release thee?" Jesus breaks the silence by a final word of answer, which is of high importance for our subject: "Thou couldst have no power at all over me, unless it were given thee from above: therefore he that delivered me unto thee had the greater sin." Some writers who hold that Pilate alone had "jurisdiction" in this case, and that the proceedings of the Sanhedrin were a usurpation, have appealed to this text, as containing in its first clause an acknowledgment of the exclusive right of the Roman tribunal, and in its last a denunciation of the illegality, as well as treachery, of Caiaphas. This is unwarranted, and in the circumstances grotesque. Yet while we notice here first of all the extreme consideration and almost tenderness with which the sufferer judges his judge,* we must confess that the words, "Thy power (ἐξουσία) is given thee from above," do relate themselves to the previous acknowledgment of a "kingdom of this world," a *kosmos* in which men are to give to Cæsar the things that are Cæsar's; while they add to that former acknowledgment the explicit idea (afterwards enforced by the apostles) that this earthly kingdom with its earthly aims is also from above. The powers that be are ordained of God; Pilate, who knew this not, was abusing a great and legitimate office partly through a heathen's ignorance; and in so far he was less guilty than the false accusers who sat in Moses' seat. It was not strange that the words should have prompted one last effort on the judge's part to save himself from his weakness; but it was too late. The Jewish hierarchs had now taken the full measure of the man, and their final argument was one fitted to bear down in him all of conscience that remained. "If thou let this man go, thou art not Cæsar's friend: whosoever maketh himself a king speaketh against Cæsar." Few utterances are more valuable historically than this last general statement. To feel the full force of it we must recall how, as already explained, the Cæsar had gathered up in himself all the public offices of the republic, so that treason against the State and treason against him had become almost the same. The old Roman watchfulness to crush out attempts against Rome was now intensi-

* There is a curious historical question whether the wives of governors were at this time permitted to go down to the province with their husbands, which turns out in favor of Claudia Procula.

* "Judex judicantium."—Goesius.

fied by being absorbed into the jealous personal suspicion of a despot. It was no anti-climax when the shrewd Jewish politicians, instead of saying, "Whosoever maketh himself a king speaketh against the majesty of the State," preferred to say, "Whosoever maketh himself a king speaketh against Cæsar." Long before this period of the reign of Tiberius the latter had become the deadlier form of the crime. Some of the accusers must have remembered the early days of the dynasty, when Julius and Octavius perpetrated their own successful *lèse-majesté*, and the nation of the Jews, adhering to them in the great convulsion, merited the name which came afterwards to be known as a title of honor, of "Cæsar's friends." And all of them must have been aware that while the first emperor had extended the law of treason to punish libels against his own person, Tiberius, still more watchful in his jealousy, used the *leges majestatis* continually against all who failed in respect to the majesty of Cæsar, even if they did not speak against him (ἀντιλέγειν) in the sense of favoring counter-claims by themselves or others. The great historian records how, even before the date when Pilate was sent to Judæa, when the provinces appeared before Tiberius with complaints against their proconsuls, they took care to throw in along with the usual accusations of rapacity the added charge of treason — "*Addito majestatis crimine, quod tum omnium accusationum complementum erat!*" * To Pilate, as a personal dependent on the favor of the emperor (a favor seemingly originally procured through Sejanus, about this time hurled from power), all this must have been continually and urgently present, the more as he had already earned the hatred of his province, and dreaded its revenge. His fears were not groundless. Tiberius was still upon the throne when, a few years after, Pilate was superseded, and ambassadors from Palestine, relying on the hereditary attachment of the nation to the imperial house, were sent to Rome to witness against the recalled and degraded governor. The shadow of that distant day paralyzed Pilate on this morning. What if he were to be accused before Cæsar of spoliation and bloodshed, and, too well knowing himself to be guilty of those wrongs, should read also in the eyes of his gloomy master that other charge, the complement and the crown of every lesser crime? He who had so long persisted against all other arguments now succumbed at once before the well-chosen words, "If thou let this man go, thou art not Cæsar's friend: whosoever maketh himself a king speaketh against Cæsar." He ascended the tribunal, from which alone a final sentence could be legally pronounced by a Roman judge — in the present case, apparently, a portable seat carried out from the prætorium and placed in front upon a *lithostróton* or tesselated pavement. Yet even here he relieved his bitter feelings by the words to the accusers, "Shall I crucify your king?" But on the chief priests making the historical answer, "We have no king but Cæsar," the judge turned to him who had claimed another kingdom, and, in such words as "*Ibis ad crucem*," delivered him to be crucified.

* Tacitus, Annales, iii. 39.

"Was Pilate right in crucifying Christ?" The question has recently been asked in a book of extraordinary ability, which opens with the most powerful attack in our language on what has been known in modern times as the right of "liberty of conscience." If you deny that right, argued John Stuart Mill and others, you must approve of Marcus Aurelius and the other persecutors of Christianity — nay, you must go farther, and find "a principle which will justify Pontius Pilate." A keen critic has accepted the challenge; and his argument, while in the first instance it rather departs from the question of principle so raised, ultimately returns to it, and I think justifies the selection of so memorable an illustration. The discussion will be found to lead directly to the only legal question which remains for me to take up — the relation of the Roman State and the Roman law to the sentence of the Roman governor.

1. The suggestion however which is first made,* that Pilate may have "believed in good faith that what he did was necessary for the preservation of the peace of Palestine," is purely gratuitous. Whether that would have justified him in condemning a man he believed to be innocent, we may touch upon hereafter. But in the mean time there is not the slightest ground for the suggestion itself. The

* "Was Pilate right in crucifying Christ? I reply, Pilate's paramount duty was to preserve the peace in Palestine, to form the best judgment he could as to the means required for that purpose, and to act upon it when it was formed. Therefore, if and in so far as he believed in good faith and on reasonable grounds that what he did was necessary for the preservation of the peace of Palestine, he was right." — Liberty, Equality, Fraternity. By James Fitzjames Stephen, Q.C. P. 87.

narratives are uniform in asserting his expressed conviction of his prisoner's innocence, his knowledge that Jesus had been delivered "for envy," his scoffing incredulity in speaking to the Jews of their king, and his final yielding, as a judge, to those *vanæ voces populi* against which his own law warned him, only when his personal and private interests were menaced. And the Christian narratives which have handed this down are, strange to say, in no respect hostile to Pilate. Jewish and other writers who expressly treat of the character of this governor give us his portrait as rapacious, cruel, and unjust. The Christian historians give no portrait, and have occasion to refer to him incidentally only where his actions are fitted to excite the keenest exasperation. Yet these few historical side-touches represent the man within the governor with a delicacy, and even tenderness, which make the accusing portrait of Philo and Josephus look like a hard, revengeful daub.* Is there, in the Tito or Bulstrode of modern delineation, anything more true to nature, more provocative of sudden sympathy from men who know the pressure of public life, than that morning's mental history of the sixth procurator of Judæa, as given by the friends of the man whom he crucified? The motives for Pilate's vacillation are only too intelligible. But that at any point of it he believed his sentence was called for to preserve the peace of the province is an unhistorical suggestion.

2. Had the history run at all in that direction, there are various situations which might be figured. That a judge, even if he were not a military governor with *merum imperium* delegated from Rome, should slay a man who was overtly and in intent seditious, raises no question. Neither Mr. Mill, nor any other advocate of liberty, questions the duty of government to preserve the peace. That a governor, sitting or not sitting as a judge, should deliver to death a man whom he believed to have no intentions against the peace, because he was in point of fact dangerous to it, might raise a serious question.† In particular, it raises the distinction between the judicial and the administrative. What Pilate as administrator of the province might do in the way of deporting or even killing an innocent man for the sake of its peace, is one question. What he might do sitting as a judge and inquiring whether there was "fault in this man touching those things whereof ye accuse him," is another matter; and it is the one with which we have to deal. The distinction, kept sacred in all jurisprudences, is beginning to be confused in the minds of English lawyers by the powerful but provincial theory of utility which they are taught, but the spread of which from the professor's chair to the judgment-seat will, I think, be prevented by both the scientific traditions of Europe and the moral sense of mankind. In saying so, I

* My view of his true character scarcely varies from that so tersely given by Dr. Ellicott: "A thorough and complete type of the later-Roman man of the world: stern, but not relentless; shrewd and world-worn, prompt and practical, haughtily just, and yet, as the early writers correctly perceived, self-seeking and cowardly; able to perceive what was right, but without moral strength to follow it out." — Historical Lectures, 6th ed., p. 250. Compare with Philo, in his letter on "Ambassadors."

† "If this should appear harsh [the assertion that Pilate's duty was simply to maintain the Roman power], I would appeal again to Indian experience. Suppose that some great religious reformer — say, for instance, some one claiming to be the Guru of the Sikhs, or the Imam in whose advent many Mahommedans devoutly believe — were to make his appearance in the Punjaub or the North-west Provinces. Suppose that there was good reason to believe — and nothing is more probable — that *whatever might be the preacher's own personal intentions*, his preaching was calculated to disturb the public peace and produce mutiny and rebellion; and suppose, further (though the supposition is one which it is hardly possible to make even in imagination), that a British officer, instead of doing whatever might be necessary, or executing whatever orders he might receive, for the maintenance of British authority, were to consider whether he ought not to become a disciple of the Guru or Imam; what course would be taken towards him? He would be instantly dismissed with ignominy from the service which he would disgrace; and if he acted up to his convictions, and preferred his religion to his queen and country, he would be hanged as a rebel and a traitor." — Liberty, Equality, Fraternity, p. 94.

Of course the true parallel would rather be: suppose that the Guru or Imam were delivered to a British officer by his co-religionists on a charge of erecting a national system against the English raj, and refusing to pay an English tax; that the officer, on personal examination, came to be satisfied that the man was innocent and the charge was false; that to pacify the other priests, he proposed an intermediate punishment of one in whom he found no fault; that under great pressure brought against him to act contrary to his view he vacillated half a day; and that at last, on being threatened with a complaint to his official superiors which might endanger his place or promotion, he ordered his prisoner to torture or to death. Suppose all this, and suppose that the story came out fully on his arrival in London, in how many drawing-rooms would he be received?

But take it even that the case were not so bad. Assume that a British officer thought himself compelled to order for execution a native preacher whose "personal intentions" were not in the least hostile or seditious, because his preaching might in point of fact be, or had in point of fact been, dangerous to the English power, and because the example would have a good effect. This is about the best case made for Pilate. If done judicially, it would be a judicial murder. If done administratively, what ought it to be called? I believe there are few circles which would hold that mere hesitation by a British officer to do such an act would infer ignominy or disgrace to the service. As to the farther step of becoming personally a disciple of a "higher form of morals" than any previously known (the immediate peace of the region being first cared for), there does not seem any other difficulty than what is dealt with in the text, on next page.

do not forget the story of the English judge who told a prisoner, "I sentence you to die, not at all because you have robbed this house, but in order that other people may not rob other houses in future." That judge, if he existed and pronounced such a sentence, simply committed murder. But it was Caiaphas, not Pilate, who thought it *expedient* that one man should die for the people. And neither the one nor the other grounded the expediency on any immediately apprehended outbreak or on any danger to the peace. There was indeed no such immediate danger. How far there might be ultimate danger to the Roman State from the spread of convictions and the acceptance of claims like those of Jesus, was another matter, and it was the really important one. The true question, as the critic of the liberty, equality, and fraternity watchword soon discerns, is between the universal supremacy of a government whose functions extended to something much higher than keeping the peace on the one hand, and the claims of a kingdom not of this world on the other.

3. Accordingly the final defence made for the Roman governor — the only one which can be of any weight in consistency with the history, and the only one also which bears on the great question of liberty of conscience or repression of opinion — is contained in the following passage of very general theory, illustrated in the quotation in my note on the previous page: —

> Pilate's duty was to maintain peace and order in Judæa, and to maintain the Roman power. It is surely impossible to contend seriously that it was his duty, or that it could be the duty of any one in his position, to recognize in the person brought to his judgment-seat, I do not say God incarnate, but the teacher and preacher of a higher form of morals and a more enduring form of social order than that of which he was himself the representative. To a man in Pilate's position, the morals and the social order which he represents are for all practical purposes absolute standards. — P. 93.

Whether this was the theory of Roman law, we may afterwards see. But it is here presented as the universal and true theory against which it is difficult to contend seriously. It may be so. This at all events is not the place to deal directly with it, farther than by recording a fundamental dissent and implacable opposition.* But it is exactly the place to point out that this was the theory which the defence of the accused seems directed to meet. The doctrine of the powerful book from which we quote is that "sceptical arguments in favor of moderation about religion are the only conclusive ones." To suggest such arguments to the governor, or at least to leave his mind to the sceptical poise of the average educated Roman of the day, might have seemed the prudent part in a prophet accused of treason. His words take very much the opposite course. The assertion of a kingdom — a higher and ruling "form of morals and social order" — set up in the earth, but in a different plane and kosmos from the secular power of Rome, might of itself have implied the assertion of a duty to recognize that kingdom. But when its assertion was backed by an immédiate appeal to the truth, as that which men are born into the world to confess, the defence plainly resolved into a claim that this truth, and not any social order or traditional belief, should be the "final and absolute standard." And the last words addressed to Pilate clinch "the duty of any one in his position to recognize the teacher" of that higher order and extramundane truth; for "every one that is of the truth heareth my voice." Besides, even if we should prefer to disbelieve this conversation, we cannot escape from the fact that this was precisely the attitude taken up historically by Christianity. It did not claim merely to be one higher form of morals or religion among others. It claimed to be the true religion — in the sense of being both universal and obligatory. And the empire, which would have been content to ignore it while it presented itself as simply a higher form of morals or even of social order, could not ignore it when it appeared as the universal and obligatory form. When it is claimed to be the truth, Rome first answered, "What is truth?" and when it insisted on the right of truth to be obeyed, Rome answered again with persecution. And Christianity responded by the constant reiteration of the duty of every member of the State, whether an official or not, to recognize this truth, to bear witness to it, and, if need be, to die for it. Hence the immense interest which has always attached to Pilate's answering inquiry. It was the utterance of one who was neither a

* It is the same theory, *mutatis mutandis*, with Ultramontanism, and that not merely because in both the individual conscience is crushed under authority. "It appears to me," says the author, "that the Ultramontane view of the relation between Church and State is the true one" (p. 109), because, as is explained, Ultramontanes correctly hold that of the two powers one must be supreme and the other must obey, and that there is no real distinction of a spiritual and a secular province in human life.

philosopher nor a statesman, but simply a typical Roman gentleman, in a position where he represented his State. And precisely because it was so, the question, "What is truth?" lays bare the hinge upon which the mighty Roman world was then smoothly revolving into the abyss. The republic, we must never forget, had already ceased to believe in its own morals and social order. The fact is certain, but the pathos of it has too seldom been acknowledged. Again and again in the past we have mused and mourned over Greece, and its search of truth intellectual — its keen and fruitless search, never ending, ever beginning, across wastes of doubt and seas of speculation, lighted by uncertain stars. But to-day let us for once remember that greater race, the greatest this earth has known; called and trained through long centuries to the work of governing a world, and when at last that mighty inheritance came into its hands, stricken with inward paralysis for want of a motive and a hope. Too well has our own poet drawn the picture: —

> In his cool hall, with haggard eyes,
> The Roman noble lay;
> He drove abroad, in furious guise,
> Along the Appian way;
>
> He made a feast, drank fierce and fast,
> And crowned his hair with flowers:
> No easier and no quicker passed
> The impracticable hours.

And so there crept upon men that moral languor and satiety of life which underlay the whole time of the empire, hardening often into cruel apathy or reckless despair. But have we always reflected how certainly this cynical moral mood of the dominant race was the result of the new circumstances into which it was thrown? In early days the Roman believed in himself, in his gods, in his institutions, and, above all, in his State. It was for him *theatrum satis magnum* — his standard, his rule, his righteousness. And so he was righteous, in his stern, relentless way. But now the world had grown wider. And what had sufficed for virtue in former times did not suffice for virtue now. A provincial belief, a national religion, was too narrow for a world: it *necessarily* collapsed, and left the lords of earth, with strong hands and empty hearts, sceptical as to truth, and so lapsing from righteousness.

That this had become largely the result even in the reign of Tiberius, is admitted. And it was plainly a position of matters very unfortunate for the application of the general rule suggested. That Pilate, or Pliny, or any Roman official, should have to refuse a higher order of morals which his conscience approved, simply because his State believed in a lower, was hard enough. But that such an official should have to refuse that higher morality or religion, after both he and his State had ceased to believe in the lower, was harder still. And that in such circumstances a judge should have to use systematic persecution against the confessedly higher convictions, simply to prevent their making head against a legal standard of faith which he and all men had begun to disbelieve, was the most unfortunate thing of all. There is probably nothing which so excites the loathing of mankind as when the State persecutes for a faith which it is already beginning to lose. And yet, obviously, that is precisely the time when it is most likely to happen, and on the theory with which we are dealing it is what ought to happen. That theory we are not to discuss, but in answering the question by which its author so courageously illustrates it, "Was Pilate right in crucifying Christ?" we must for a moment shred away all circumstances of aggravation. Suppose that Pilate and the Romans of his time still believed in the old religion of the little Tiber city, that Jesus had been a native subject of that city, and *that the law of the city demanded* persecution of all religious convictions hostile to its old faith. What in such circumstances was the "duty of a man in Pilate's position"? I answer that his duty was (having first cared for the immediate peace of his district) to refuse to obey the law, and to resign his position rather than outrage a principle of conscience, which lies deeper than all social superstructures of either the Church or the State. There are laws which are invalid because they strike against the basis of all law. But this brings us to the final question, What was the law of Rome in the matter of the trial of Jesus Christ?

My space warns me to give a general answer to this question, and to avoid references to sources. It is well known that the policy of Rome as a conquering power towards the religions of subject states was one of toleration. But that meant little more than toleration of existing religions in their local seats. Because the worship of Serapis or Isis was tolerated on the Nile, as a monotheistic worship was in Judæa, it by no means followed that either of them became a *religio licita* on the banks of the Tiber. Even if such a religion was tolerated on the Tiber, exclusive

Original from CORNELL UNIVERSITY

devotion to it was tolerated only in natives of the country from which it came, and was at no time permitted to Roman citizens. For them all over the world the old religion was imperative; and for the world, the religion of the Tiber though not imperative was dominant. The concessions made to the provinces for their religions were strictly concessions, not concordats. Accordingly the concession was generally limited by the idea, *Cujus regio, ejus religio.* Outside the region or province where the local cult ruled, it was denied the rights of publicity and of proselytism, and was restricted to a passive and a private existence. These general considerations explain some of the variations in the Roman treatment of the Jewish and Christian faiths. The old Jewish religion had the paradoxical quality of being national or local on the one hand, while on the other it claimed to be exclusive truth. The union of the two qualities went far to explain that hostility to the human race which the Romans were fond of ascribing to it. A faith which attacked that of all other men, without inviting them to share in it, invited this misconstruction. But its very want of aggressiveness saved it from collisions. When Christianity appeared, a different problem had to be dealt with. Here was a faith which not only claimed to be the absolute truth, but which refused to be confined within local limits. It was essentially proselytizing and therefore essentially public; and it demanded universal individual acceptance — acceptance by the Roman as by the Greek and the Jew. What was the result? "The substance of what the Romans did was to treat Christianity by fits and starts as a crime."* That occasional persecution was not founded upon any specialities in the nature of Christianity, or excited by any great dislike to it as a form of worship or belief. It was persecuted generally as a form of atheism, or of opposition to the established and tolerated institutions. And the opposition to it on this ground was set in motion and regulated by some of the greatest and wisest, and even, in a sense, most tolerant emperors. Trajan and the Antonines were wise and large-hearted monarchs. There was little in Christianity to repel, and there was much in it to attract such men. They were not bigots, and those around them were generally sceptics. They did not believe in absolute or universal truth in matters of religion, and they did believe in the sovereignty and supremacy of the Roman State. The consequence was that while they protected in Egypt and Palestine and Italy all *religiones licitæ* which would live in peace with each other and claim no universal dominion, they bent the whole force of the State against the one religion which said, "For this cause are men born, that they should bear witness unto the truth," and "Every one that is of the truth heareth his voice." There is no way of explaining the history except by acknowledging that the constitutional law of Rome reserved to the State the right on the one hand to approve and license, or on the other to repress and forbid, the expression of new religious convictions, the public existence of a new faith. And this prerogative was held to form part of the *majestas* or supremacy of the State.

It was so in the days of Tiberius as truly as in the *terreur juridique* of Domitian. Pilate, as his deputy, seems to have been convinced that the claim of Jesus to be "Christ a king" was not a claim to temporal sovereignty. He accepted in some sense his own assurance that it was a kingdom not of this world. Yet this meant, at the least, that his kingdom was a religion which he was about to found. It meant more. A religion which takes the form of a kingdom, with a king and his non-combatant servants, however little "of this kosmos" it may be, must be not only religion but a Church. A universal religion, starting with individual faith, but adding immediately an obligation to confess that faith and to proselytize, is already (according to the Protestant definition) a Church. The defence of Jesus gave at least as much prominence to this as his disciples did during the early ages; and it gave additional seriousness to the charge of treason. A great student of history of our time has perhaps gone too far in holding that the Roman laws against unlicensed association or combination were the unhappy root of all the persecutions,* too far even in holding that they were the instrument by which all these persecutions were carried on. These laws were the branches rather than the root, but they were in liv-

* Liberty, Equality, Fraternity, p. 90.

* "La seule chose à laquelle l'empire Romain ait déclaré la guerre, en fait de religion, c'est la théocratie. Son principe était celui de l'état laïque ; il n'admettait pas qu'une religion eût des conséquences civiles ou politiques à aucun degré ; il n'admettait surtout aucune association dans l'état en dehors de l'état. Ce dernier point est essentiel ; il est, à vrai dire, la racine de toutes les persécutions. La loi sur les confréries, bien plus que l'intolérance religieuse, fut la cause fatale des violences qui deshonorèrent les règnes des meilleurs souverains." — Renan's *Les Apôtres*, p. 351.

ing union with it. There can be no doubt that the laws regulating *collegia*, and repressing all unlicensed associations, had from the beginning a close connection with the *majestas* of the State, and especially with its right to institute and enforce religion.* The two things worked together, and they did so in theory and practice. A claim of Jesus merely to found a universal religion might no doubt, in practice, have come into collision with the law of Rome. But his claim to found it as a kingdom, though not of this world — "*une association dans l'état en dehors de l'état*," as it is happily expressed — seems to me to have been essentially inconsistent with the public principle of that law. Christianity, in short, was incompatible with the Roman public law, and that not merely because its contents were different from those of the old religion of Rome, but because its claim to universal individual acceptance and public confession conflicted with the unlimited and unbalanced sovereignty of the Roman State. And on these very points that law came into conflict with the author of Christianity. It does not, perhaps, follow that Pilate, as its administrator — supposing him to have apprehended the existence of this religious conflict, as he apprehended the non-existence of any civil conspiracy — was bound to condemn Jesus. As Trajan explains in his famous letter to the governor of Bithynia, it was the duty of the higher magistrate to use his own discretion in dealing with those who had transgressed the law on religion. Pilate seems, indeed, to have believed Jesus to be both just and harmless; and, so believing, he sinned in swaying from his first judgment, and betrayed the innocent blood. But when he ultimately sent him to the cross it was as claiming to be a king, and on the original charge of acting *adversus majestatem populi Romani*. And in point of fact, whatever his judge may have thought, the claim of Christ was truly inconsistent with the claim of the State which Pilate represented; and the world must judge between the two.

In considering the most famous of all trials from a merely legal and, indeed, formal point of view, we have come to some conclusions. We have found that it was a double trial, and that both parts of it were conducted with a certain regard to the forms of the two most famous jurisprudences of the world. In both the judges were unjust, and the trial was unfair; yet in both the right issue was substantially raised. And in both that issue was the same. Jesus Christ was truly condemned on a double charge of treason. He died because in the ecclesiastical council he claimed to be the Son of God and the Messiah of Israel, and because before the world-wide tribunal he claimed to be Christ a king.

ALEX. TAYLOR INNES.

* "La prétexte de religion ou d'accomplissement de vœux en commun est prévu et formellement indiqué parmi les circonstances qui donnent à une réunion le caractère de délit; et ce délit n'était autre que celui de lèse-majesté, au moins pour l'individu qui avait provoqué la réunion." — P. 362.

A YORKSHIRE STORY

BY THE AUTHOR OF "PATTY."

CHAPTER XIV.

THE ANSWER.

MR. BURNESTON had left his horse at the vicarage while he went across the field to Church Farm.

He could hardly have told why he did this; he had made up his mind to ask Doris to be his wife, let her father's answer be what it would, and yet he had hesitated to show this determination beforehand; as we have seen, he had not begun by saying he was on his way to Steersley.

The vicar had been out, and Mr. Burneston met him at the gate where the gardener's boy Joshua was holding the squire's horse. Mr. Spencer's rosy face and bright eyes twinkled at the sight of his "young friend," as he generally called Philip Burneston.

"Coming in for a chat, I hope. No worries, eh? Ralph all right? That's well; come along." Without waiting for any answer, he turned into the vicarage garden. Mr. Burneston felt impatient.

"Look here, Spencer," he said, "I can't come in, you must let me off to-day. I — I am rather hurried. I'm going to Steersley on business."

The vicar wheeled round; he was short and square in figure, with a broad, flat, kindly face and humorous mouth; he laid his finger on the lappel of Burneston's coat and screwed up his eyes.

"Business that won't keep, eh, Phil? Well, you know best, but there is a proverb which says, 'Look before you leap.'"

"What *do* you mean?" But the vicar,

frightened at his own indiscretion, had turned away and retreated into his house.

The squire muttered a strong-sounding word, and that was all; he did not even thank Joshua, but flung him some pennies, and rode away as fast as he could.

The keen east wind had so dried the soil that the dust followed him like a cloud. Perhaps there was a likeness between it and the hazy tumult of his thoughts.

"I don't know what all this means," he said angrily. "What can Spencer have heard unless Raine spoke to him? It's not like Gilbert, though," he rode on thinking; "but it was not like him to come all the way from Austin's End, as he did the other day. No," he said angrily, "they all mean well, but have made a great mistake; they treat me as if they thought I was like Ralph, still a schoolboy." Ralph — that was really the thorn that lay beneath all this irritation.

Mr. Burneston did not care for the opinion of the little world of Burneston, or for the more general disapproval of his friends; but he shrank with the shyness of a girl or a boy from the disapprobation of this lad of fifteen.

"So like his mother, too, in all his notions. I must write to him fully to-night, it's only fair; he will be none the worse for my marriage. I shall probably save money by living quietly at home."

A picture rose, self-created, to his view which made him laugh at these pricking doubts. Ralph, and all possible annoyance connected with him, faded before the image of Doris and the home she would make for him. It was not only her beauty that filled this man's mind; there was a sweetness of subdued manner, a gentle calmness, very restful when contrasted with the frivolous, exacting nature of the woman who to him had been as wives are apt, however wrongly, to be, to their husbands, a representative type of womankind.

"Doris is perfect now," his thoughts ran; "but there is so much in her to develope that there is no saying how grand a character she may become."

He did not want to depend on his wife for guidance or even counsel; he liked, after the fashion of one who had been an only child, to be left alone and neither teased nor thwarted; but he did not care to be burdened with the weaknesses or indecisions of another mind, and it seemed to him that a very happy and free life lay before him.

Just as he rode into Steersley, flushed with joyful anticipation, the old flat face and screwed-up eyes of the vicar came back with his warning.

"'Look before you leap.'" Mr. Burneston's lip curled as he smiled; "Yes, look when there is fear of a pitfall, or any kind of treachery. I may fall utterly because there is just the possibility that — that Doris cares for some one else; but failing that, I am taking no blind leap."

He felt anxious till he reached the cottage gate lest Doris should be absent, but as he dismounted and told the boy who seemed to be waiting for him, so ready was he in his appearance, to take his horse to the Black Eagle, he heard the sound of music coming from the cottage.

He had long ago given up asking for Mrs. Barugh. His visits were ostensibly paid to George, and the little maid had got into the way of throwing open the "drawing-room" door and leaving him to announce himself, or if George was out she told the visitor so without any asking.

Mr. Burneston went in eagerly. Doris was rising from the piano, and without looking round he saw that George was absent.

It was the first time they had been alone since the meeting in Steersdale, and Doris was instantly conscious of a change in Mr. Burneston's manner, he seemed so much younger and more impulsive. She looked at him with a puzzled face, and he saw it and went back to his usual reserve.

"I saw your father at the farm just now, he is quite well," he said, "and the sick cow is better."

Her eyes brightened as she looked at him.

"How sympathetic she is!" he thought, while Doris was merely rejoicing that this change would ensure her father's Sunday visit; for this had become doubly precious since her disagreement with George.

Before she could answer, her brother's halting step came across the passage, and he was in the room shaking hands with Mr. Burneston.

In Mr. Burneston's absence Doris could think of so much to say to him, but to-day his altered manner had made her shy, and she felt a sense of relief when George came in; while her companion experienced a sudden and quite new antipathy to his future brother-in-law. How broadly George still talked, spite of the advantages he had had! and a slight shiver passed through Mr. Burneston. "There is nothing so catching as a bad way of speaking," he thought, and he resolved that Doris should not be exposed to this association longer than could be helped.

George was less cordial than usual. This was the first time the squire's visits had been paid so near together, and it seemed to him that it was his duty to put them on a different footing. Love had sharpened George's eyes, and he, too, saw a marked change in the visitor. There was a flutter and eagerness in his manner that surprised the lad, accustomed to look up to his friend with a kind of loving reverence.

The talk flagged; the chief speakers, the squire and George, were each thinking how they could best say their say. Mr. Burneston wanted to be rid of George, and George of Doris.

But the older man's impatience mastered all restraint — moreover, he still considered George as only a boy.

"George," he smiled, "I want to say a few words to your sister; go in the next room till I come to you, there's a good fellow."

George flushed scarlet. Doris was stooping down looking out a piece of music for Mr. Burneston, and she did not hear distinctly. When she turned round George stood close by the squire, and was speaking almost in a whisper. She could not hear what he said, but she thought he looked angry.

"I mun speak to yey, sir, before yey speaks to Doris," George was saying. Mr. Burneston hesitated a minute; but the determined manner of the lad impressed him. "I'll come back," he said to Doris, and he led the way into the room opposite.

"Maister Burneston," George began, and then he turned and closed the door.

The squire had been so completely taken by surprise that he had acted on impulse. As recollection came back, anger came too. He looked sternly at the tall, pale youth; but the pleading earnestness of those honest brown eyes kept him silent.

"Maybe it's again all manners, what I'se getten to say, Maister Burneston; but I cannot put manners before duty." He paused to choose the least offensive way of framing his speech, for he shrank from paining his friend. "Donnut yey think 'at yur visits is bad for Doris? I means," he added hurriedly, "'at they spoils the rest o' her life for her?"

As he went on his voice had grown less and less assured, the words sounded to his sensitive notions so ungrateful.

He looked timidly at Mr. Burneston, and to his surprise the stern look had changed to one full of radiant happiness.

"Perhaps they do, and if you are right, my dear boy, I had better take care of her for the rest of her life, I think."

George looked stupefied.

"I donnut see your meanin'," he said.

"Well, my boy," Mr. Burneston was now excited out of his usual reticence. "I have had a talk with your father to-day, and I told him I was going to speak to Doris, and — and," then the certainty of hope that George's words had given him conquered his reluctance, and he added, "I am going to ask her to be my wife."

George turned an ashy whiteness, and then he flushed up all over his face.

"Then yey'll be doin' us all a great wrang, an' yersel and Maister Ralph a greater. Let us keep to oursels, Maister Burneston," the lad raised his head till he looked as tall as his father. "I's seear gude nivvers com' of a weddin' 'at warn't a match."

Mr. Burneston smiled, the lad's sturdiness amused him.

"Well, my boy, you are hardly of an age to judge," he said. "Now if that is what you had to say, I will go back to your sister."

But George stepped forward.

"Nay, sir, nay, do leave t' lass quiet. She's happy enough, an' if she sees you less oft, she'll maybe think more o' her own. I donnut say I can talk tiv her the same as you, bud if she has only me she'll learn to be content."

"This is nonsense, I can't listen to you any longer." Mr. Burneston's impatience rose. "I tell you I have spoken to your father — you really must not interfere in what you cannot judge about, though" — he spoke more gently — "if I did not hope to marry your sister, you would of course be perfectly right in all you say."

George laid one hand on the squire's arm, and the other on the door-handle.

"That donnut change nowt," he was almost panting with excitement; it seemed to him that the squire was going to do wrong, and that he was bound to prevent it. "I mean this. God has made men and women and placed them in different states of life. Ay, and set up landmarks, such as speech, and dress, and looks, too, for that matter, atween them, and if we's to take these things to wersels and break 'em up here and down there, mebbe we's all end in more of a maunge than t' Tower of Babel."

"Well, look here," Mr. Burneston's laughing manner jarred the lad's earnestness; "in theory you are perfectly right; this is a practical question, and I have no time really for theories to-day."

He motioned for George to open the door, but the lad would not do this; he withdrew his hand from it, and walked proudly and sorrowfully to the window.

"I've been as blind as any mole," he thought. "Diz mother ken what's doin'?"

Mr. Burneston walked quickly into the next room.

Doris had felt puzzled by what had happened; but there was so much reserve between her and George that she could not guess at what he might have to say to Mr. Burneston. She only wondered that he had not come back with the squire.

Mr. Burneston walked up to where she sat with a book, and placed himself on a chair beside her.

"Doris," it was the first time he had called her so, and her color rose in a pink flush that made her lovelier than ever. "Do you recollect the day I met you in Steersdale?"

"Yes," the question was a relief, she looked up as she answered, and saw the strange agitated expression of his face, and the trouble which that talk in Steersdale had created, came back.

"Well, then you promised to look on me as a friend. Now, my child, I want you to have complete trust in me — a friend, you know, is always trusted."

Doris was getting bewildered, it seemed as if she were being accused of deceit.

"I have always trusted you," she said proudly.

"Ah, but I want a still deeper trust, I want you to tell me — even if I seem very bold in asking — whether, Doris, you have" — he hesitated, spite of all, he so dreaded her answer that he lingered as long as he could — "ever had a dearer friend."

She grew lovelier while he spoke, for the pink flush deepened with wounded pride, and also with disappointment. Instinct told her the real meaning of his question, and she had looked on Mr. Burneston as faultless with regard to delicacy: what right had he to try and force a confidence of this kind? "If I had had any love nonsense," she thought, "does he really suppose me weak and silly enough to talk about it?"

She raised her head slightly, but she did not look at him as she answered, —

"I have never had *any* other friend," with emphasis, "but the Miss Masham I have spoken to you of, my school-fellow."

"Well, then" — he was glad to have made her angry; any mood seemed easier than her usual calm, smiling reserve — "I want you to let me be your very dearest friend, much dearer" — his voice grew very tenderly earnest — "than your friend Rica. Tell me, Doris, can you love me better than any one else?"

She had raised her eyes in sudden wonder, but they fell quickly, for his eyes told the story that a woman cannot mistake when it is a true one; her heart fluttered in her bosom like some little startled bird, and her breath came and went quickly.

"Tell me, Doris, can you love me better than your dearest friend?" he said softly; but though he was so near her he did not even take her hand in his; he felt that this was not the confusion of surprised love, and that the answer he waited for was more than doubtful.

Slowly the eyelids rose, and those wonderful far-off gazing eyes gave him a timid, wavering glance.

"I do not know," Doris said gently, "I like you more than I can tell."

Her hands lay in her lap, he lifted one of them to his lips.

"I am satisfied," he said. "Doris, will you say you like me well enough to be with me always, and be my wife?"

He still held her hand, but his clasp tightened as he waited breathlessly.

She tried to speak, but the words would not come. At last she gave a little nervous smile.

"If you let go my hand I can tell you better," then as he released it she drew a deep breath.

"I had better tell you all the truth; if it is ungrateful, and not what I ought to say, you are so good that you will forgive me" — she stopped.

"Yes — yes," he said, "go on."

"To be your wife and to be always away from what I shrink from in life, is too great happiness to think of; but then, I know that you have a right to expect I should only think of you, and it would not be honest to say that I can do this." She clasped both her hands with the effort these words cost her.

There was a little silence. She had confessed more than he had hoped for, but there was a feeling of disappointment.

"You are so young," he said presently; "your own feelings are scarcely known to you; if you are always happy with me, if you are not conscious of liking any one better, it is quite possible that you do love me without knowing it ——"

Then his feelings broke through the tight rein he had laid on them.

"My darling, I will not ask you to say more now," he said, "you must be my wife. I will soon teach you to love me."

Doris did not feel sure whether she had consented; but when the squire put his arm round her and kissed her blushing cheek, she wished he had not spoken.

"A friend is nicer than a lover," the girl thought.

CHAPTER XV.

AN APPEAL.

JOHN BARUGH came over the morning after Mr. Burneston's visit. Dorothy met him at the door, and in the excess of her joy at what had happened, put both arms round his neck and kissed him heartily. John pushed her away.

"Theer, theer, missus, 'at'll deea — wheear's mah lass — wheear's Doris?" He looked sad and determined, and Dorothy's anger at his repulse melted into fear.

"She's there, dear," she said, and she opened the parlor door.

John took the door handle and pushed her on one side.

"Ah'll speak te thoo presentlys," he said sternly. "Ah mun bide aleean wi' Doris."

He walked up to his daughter, kissed her, and then sat down.

He did not look at her; he kept his eyes away, as if he were debating what to say.

Doris had rarely felt so nervous; ever since Mr. Burneston rode away the day before she had been dreading this interview, although she could have given no more definite cause for her dread than most girls in the same position.

But this silence oppressed her; it was so different to her father's joyful, almost boisterous greetings.

"How's the cow, father?" she said shyly.

"Deng t' coo." Then checking himself, he looked up at his daughter and smiled. "Ah's a rough chap when ah's freeated, and ah's yamost oot 'at yed aat 't news ah's getten about'wards yey, Doris. Waat hev yey seh'd tuv t' squire?"

Doris had grown very rosy while her father spoke; it seeemed to her that he was blaming her for Mr. Burneston's proposal.

"Mr. Burneston came yesterday," she said simply, "and asked me to be his wife."

"Geh on," said John hoarsely. "Ah knaws thaat."

The girl hesitated; she could not say she loved Mr. Burneston, and she could not tell her father that she was willing to marry the squire because she shrank from her home life.

John groaned.

"Yey hev sehd yey wad wed him?"

"I suppose so," she said, for, indeed, under this direct questioning it seemed to Doris that she had given no absolute consent to marry, though both Mr. Burneston and her mother evidently regarded the matter as settled.

It seemed to John Barugh as if his heart must choke him; it was like to burst with the violence of the struggle within. Love and anger and pride, too, were wrenching the strong man this way and that, till he could hardly bear the suspense.

He rose up slowly, and moving across to where the girl sate he laid one hand on her soft, smoothly waving hair.

"Mah lass," he said gently, "ah've nivver telled yee, an' mebbe ah's been wrang, bud ah's nae gleg at speakin' o' mysen." He paused a moment. "Yey's mair te mey, Doris, dhen mah ain life. Mebbe yey've thowt ah waaz a careless faytber to suffer ye te bide sae lang fra t' yam. Ye deeadn't ken, lass, how ah've longed efter mah bairn,— mah heart wur reet sair a' t' tahme. An' noo ah've getten her, ah'd cut off mah reet hand, lass, gin t' wad gi' yey mair joy i' yur life. Noo tell mey, lass, tell yer fayther, wheea hev nae secrets fra yee — diz yon man luov yee mich as thaat?"

Doris had trembled while he spoke; this betrayal of strong feeling stirred her, though at the time it did not touch her deeply.

She moved her head from under his hand and held up her face to be kissed; but John was too overwrought to notice this.

"You are very good to me, father," she said — "very, very kind; but are you vexed about this?"

John turned away.

"That's not the wod, lass; tell mah ye luves t' squire better dhen fayther, ur mother, ur George, an' ah'll gi' yee tiv him; thof yee hev knawd him bud three ur four weeks," he added sadly.

This was the first glimmer that had come to Doris of her father's power to forbid her marriage, and her sense of justice rose against what seemed to her to be tyranny. She forgot her father's sorrow.

"I cannot marry against your wish;

but I think Mr. Burneston will make me very happy," she said quietly, and with a coldness that struck him like a knife; "and if you wish for my happiness, father, you had better let us marry."

He was still turned away from her; she could not see the anguish in his eyes, the rigid pressure of his lips one against another, the clasp of his strong hand, and yet the sympathy that had bound this father and daughter so firmly together had not quite lost its power in Doris's own heart; something warned her that her father's silence was unnatural.

She went up to him and laid her hand on his arm.

"Father," she said gently, "tell me; don't you want me to marry Mr. Burneston?"

He turned round quickly, his deep-set eyes lightened down on her from under the heavy red brows, and the light shining through his hair and beard seemed to circle his head with a glory.

"God help yee, bairn! Yee gaums nowt" — he drew a deep breath — "nowt o' whaat ah's feelin'. An' waat fer sud ye? Deead ah ivver say ye neea, lass? Waat fur sud ah freeat gin yey'se happy? 'At's waat ah's com fer tu mak seear o'. Ah'll gan back to Burneston noo."

Dorothy waited and waited; she did not dare to interrupt the talk between father and daughter. It was a relief when Doris came to find her with the tidings that the farmer had gone back to Church Farm.

"And what does father say, Doris?"

"He's very kind," said Doris; but she turned away and went to her own room to write to her friend Rica.

LETTER FROM DORIS BARUGH TO FREDERICA MASHAM.

"MY DEAR RICA,— When I wrote to you a week ago I did not guess at the news I am now going to give you. I have spoken to you of my brother's kind friend, Mr. Burneston. Only yesterday he came here and asked me to be his wife. This will surprise you; but it surprised me, too, very much. I believe we are to be married in a few weeks. I wanted you to have come and stayed with us first, but now, perhaps, you will be so very kind as to come and be my only bridesmaid. We are to be married at Burneston church, and then Mr. Burneston is going to take me to France and other foreign places. So, dear Rica, if you can come soon I shall be very glad, and then we can have a little time together. Miss Phillimore is to get all my things; but Mr. Burneston does not wish her to be at the wedding; only you and my own people, and his son, perhaps.

"Dear Rica, it is all like a dream, and this is a rambling letter; but I feel so queer and altered that I sometimes doubt if I really am myself, or whether Dame Wrigley has not bewitched me as well as the cows.

"It is not all happiness. It is very sad to see my poor father; I have only seen him once since, and he cannot bear to give me up. I did not guess he was so fond of me, and I fear we shall meet so seldom — I do not like to think of this. He is going to leave Burneston almost directly. I have told you that is the place where we really live. This is merely a temporary house, and I believe my father is looking after a farm somewhere near the sea; but I suppose gain in life must always bring loss of some kind with it, and I am sure of being satisfied with my new life. Do come as soon as you can; I have so much to talk to you about, and believe me

"Your affectionate friend,
"DORIS BARUGH."

In a few days came Miss Masham's answer.

FROM FREDERICA MASHAM TO DORIS BARUGH.

"I AM so glad, but I never was so surprised, to think of Doris, that chilly lily which turned up its lovely nose at 'love nonsense' generally, having actually condescended to tell a man she will marry him! After this, if clouds fall and pigs whistle, I shall be calm and unsurprised. And the squire is the man — that grand Mr. Burneston, of Burneston Hall! Oh, my Doris! hast thou, then, been a princess in disguise, a goose girl, who is now restored to her rightful rights?

"Will I be your only bridesmaid? I should rather think I would. I am in a perfect whirl of excitement, to think of seeing you and that darling of a poor George so soon, and the new husband — oh, I beg pardon, I mean lover. Only I am frightfully angry with you. You never even tell me his Christian name; you never say 'darling Jack,' or Tom or Harry — just 'Mr. Burneston,' quite calmly, as if he were your grandfather. Is he much older than you, Doris, my love? Well, you have such a steady little head, that you will want a husband older than yourself, and I think it must be much nicer.

How wonderfully good and unselfish you are! Now if I loved any one, I should rave about him, because I should be able to think and talk of no one else. Still, you might have given me a glimpse of the creature, just to let me see if I had the least chance of tormenting him. What a stiff, proper letter I am writing! I believe I have a vague fear that darling B. (perhaps his name is Benjamin — only think of my Doris turning into Mrs. B. B.!) looks over your shoulder while you read. Now don't let him see this, and I'll tell you what happened when I read your letter.

"It was breakfast-time, and I went quite off. I jumped up and cried out, 'Hooroor — hooroor — hooroor!' and all the boys followed suit, they always do, you know; they say I waved my cup round my head, and little Jemmy said, 'Is de house on fire?' and papa put on his spectacles and looked at me in a comic way he has sometimes.

"'Anything very special, Frederica?" he said. I sat down: 'Doris is going to be married, papa, and you must excuse everything;' so you see you are responsible for my behavior. I suppose, as the wedding is so quiet, a plain gown, etc., will do best, but mamma will see to all that, she is so good. You can say if you like, how you wish me to be dressed. I am actually bursting till I get to Steersley — how we will talk! George won't mind, I suppose. With fondest wishes for your happiness, your own "RICA."

"Where is George, mother?" Doris looked up from her letter, "I haven't seen him this morning, and I want to tell him Rica is coming."

"He's gone to breakfast with the rector, my dear — he and Mr. Hawnby seems main fond o' one another — he's a nice old gentleman, Doris. I wish he was going to marry you."

"Do you?" said the girl, absently, "is not one clergyman the same as another? We could certainly have been married here, but Mr. Burneston does not wish it."

"Of course not; why, my dear, it would never have done: it would have looked so bad; it would have seemed as if he was ashamed of what he was doing, and of you too." Doris blushed with vexation. "If you had never lived at Church Farm, it would have been different. My word, child, Mrs. Emmett's face will be a sight to see, and Rose, too. I wonder what they're saying about it all. I'd like to know, rarely. Eh! Mr. Burneston 'll have to get a new housekeeper."

Mrs. Barugh checked herself and gave a little frightened look at her daughter's vexed face.

"Please don't talk so, mother, I don't like to see you proud of what is a trouble to me."

"A trouble! what do you mean, child? Your marriage a trouble! My word, you're talking nonsense, Doris."

"No, mother, I'm sure I'm right, and father thinks so too, I know, though he's sorry to lose me. I am glad to marry Mr. Burneston, and proud, too, that he should wish to marry me, and I like him; but I'm troubled. I mean because this marriage will make some people vexed and unhappy, and that is why I wanted less hurry about it."

Mrs. Barugh always got fretted in an argument with her calm, clever daughter. Doris was sure to get the best of it, and was, her mother knew, usually right. But she had some strange crotchets, Dorothy thought, and, with all her loftiness, in some ways a great want of proper pride.

"Gracious me! That's what I call folly, child. Why ever should you and Mr. Burneston dilly-dally over your happiness, just because a strong-willed, selfish boy of fifteen chooses to object? for I'll lay that's what your 'some people' means."

Doris frowned yet more decidedly, and pressed her lips together to control her vexation.

"Please don't say 'I'll lay,' mother, and I don't think you are quite fair to Ralph Burneston. Suppose father were left alone, don't you think George would be vexed if he wanted to marry a girl out of the village?"

Mrs. Barugh had seized a lilac cap-string with each hand while her daughter spoke, and she held them at some distance apart while she answered, —

"My goodness, Doris, you do say the oddest things. Fancy your comparing your brother George with that self-willed, giving-himself-airs young Ralph Burneston, and then to liken yourself to Rose Duncombe or one of these Steersley lasses! You take my breath away, and that's a fact. Mr. Burneston knows what he's about, and he's quite in the right to pay no heed to his son's objections, that's to say if he really does object."

"Well, mother, how about George? Is he self-willed and selfish?"

Doris looked half archly, half sadly at

her mother, and Mrs. Barugh's delicate face puckered and quivered. It was as much as she could do not to cry at the remembrance of what had followed Mr. Burneston's proposal. In the very moment of her triumph, when Mr. Burneston had come into the kitchen after her, and had shaken her by both hands in the fulness of his joy, and thanked her for giving him such a treasure, in that sublimest moment of her life, when everything looked radiant with glory, George had suddenly come to her, as she stood a moment before she sought Doris, looking after the squire as he rode away.

"Mother," the lad spoke in bitter sorrow, "donnut look for joy or blessin' in this matter, gude will not come on it — only sorrow."

"Hush, George," she had said, "oh, fie, for shame!" But the lad had retreated to his own room, and next morning had come her husband's rude, strange behavior: "Not to say one word after he had seen Doris, and to go off again without giving any reason. As sulky and dogged as you please," Dorothy had said pettishly to herself; "bother the men, they're all alike."

It was really too bad that neither husband nor son should wish her joy on this great and triumphant event, which she felt she had helped to produce.

But during the afternoon a hamperful of flowers had come for her from Burneston Hall, with a little parcel for Doris, and the setting out her flowers had filled Mrs. Barugh with a happy, fluttered excitement. She was disappointed to find that the parcel only contained a letter, but somehow a throng of busy thoughts and plans, and the golden future shining out more and more distinctly as a background to her daughter's loveliness, had made her shake off these vexations.

And now Doris herself had recalled them. It was too bad; between them they had managed to trouble all her joy.

"I must give George a talking to," she said, in answer to her daughter's question.

She resented the cold indifference which George had shown, and yet she could not bear to blame him to his sister, come what might. Her boy was more to her than Doris ever could be.

Doris smiled, but she felt proud and bitter.

"You had better leave him alone, mother. He thinks I ought to have said no. He has scarcely spoken to me since; so it is plain you and he do not look at this matter from the same point of view."

It was harder than ever to blame Doris now that she would so soon be a real lady; not only a lady in her mother's eyes, but an unmistakable lady in the eyes of the whole world; for Dorothy even then held the creed so popular nowadays, that a lady is made by her dress and her house, her establishment, etc., far more than by her breeding; but her restless nature could not be content without an attempt to justify George.

"Ah, it's all very well for those who have got all they want to take no account of those that haven't, but, Doris, it wouldn't be natural if the poor lad wasn't sad; he may be nothing to you, but of course you're a great deal to him; and no girl's the same to her brother after she's married."

"No, I suppose not," said Doris, drily. It seemed to her scarcely possible that George could ever feel himself Mr. Burneston's equal. "But, mother, you mistake if you think I have ever been much to George; he thinks far more of Rose than he does of me."

Mrs. Barugh put her hand up to her forehead. "Oh, dear, why do you put that in my head, child? And when you are gone, there'll be no hindrance; that girl'll be always after him."

"I don't know about that," said Doris, quietly; "at present I think the love is all on George's side."

CHAPTER XVI.

HEARTBURNING.

"I CANNOT see it," George was saying. "Ye may be reet, sir, but it goes agin me to think ye are."

The clergyman sat smiling kindly at his young friend. He had just led the way into his library — a favorite haunt of George's, and even now, though at Mr. Hawnby's request the lad sat down, his eyes roved greedily over the brown leather and stone-colored paper backs of the precious books that covered the walls.

"Well, George, put it in this way; suppose, when you are older, you feel an affection for some young woman not quite of your own level; will you think it right if she gives you up because of this? But yours, of course, can hardly be a parallel case, because your parents have to be considered."

George's fiery redness made the vicar hesitate.

"Yes," the lad said thoughtfully, "when a lad has a father and mother like mine is, he's bound to study 'em afore his own

likin's, an' maybe it's feelin' that 'at makes me so hard on Doris. If I saw 'at my marryin' wad gi' father or mother a sore heart, I'd not do't."

"That's well said; but still you forget another point; you say that your sister's affections are not warmly engaged, but you seem to forget Mr. Burneston's feelings. Surely he must love your sister very much indeed."

George struck his fist on the leather-covered table.

"And that's what I cannot make myself believe. He hesn't seen eneaf on her to know if she's fit for him. Maybe he sees 'at this skeëalin's played the mischief wi' her life, and he's taken pity on her; if I were seear o' that" — he stood upright, warming with his subject — "I'd nivver let him within t' door. Ah, ye looks startled, Mr. Hawnby, and maybe ye thinks I'm a soary brother, but I cannut stan' by and see my sister married fer charity."

Mr. Hawnby had sat resting his head on his hand; as George spoke he laid his fingers across his own mouth, it was so difficult not to laugh outright at this suggestion.

"No fear of that, my boy," he said kindly, "you must try and remember that your sister is a very beautiful and gifted young woman, and from the little I have seen of her I should say that in outward manner she is very well fitted for her change of position; but though I cannot do as you wish with regard to your mother, I will tell you, because I see that you wish for my real opinion, that in point of fact, I entirely disapprove of unequal marriages; they must breed strife somewhere, and they tend to disorder in many ways, and strife and disorder in a family" — he smiled — "are, I suppose, great foes to godliness, eh, George?"

"Oh, sir," George's brown eyes were full of beseeching earnestness, "say all that to mother, please do, sir; ye hardly know t' good 't would do her. Yer sermons have stirred her wonderful; they're another sort to our parson's. I don't mean a word o' blame, sir, again Mr. Spencer, but when t' parson's so keen for huntin' and shootin' and ferretin' and the like, ther's nae use in lookin' for work in his sermons, it seems to me they comes last wi' Maister Spencer."

Mr. Hawnby laughed.

"You young people are very severe critics; you'll be telling me next how long a sermon ought to take to write, eh, George?"

"No, sir" — the lad blushed, but he spoke reverently — "I hope I'll not venture to find fault wi' you — it's for mother's sake I axes ye to speak to her; this marriage seems to hev turned her upside down."

"I really cannot interfere," the rector said; "if your father asked me, I should hesitate, because really there seems no ground to go on, but I tell you again that a brother has no authority whatever; you have really no right to give your opinion."

"Well, good-bye, sir," George spoke wearily, "it's the first time I ever found I couldn't see things as you does, an' I cannut — an' if I feels a thing's wrang, well then I feels it a duty to say so."

"Good-bye, my boy; I think you are wrong; remember the old saw, 'Least said, soonest mended.' Now I am due at a parish meeting."

George limped home in a discontented mood. His will asserted itself strongly against this marriage, and he had been so accustomed to see his advice taken by both parents, that he could scarcely believe they would not end by following it in this instance. His mother's submission to his guidance had been so implicit that it seemed to him, as he had said to Mr. Hawnby, as if her daughter's engagement had turned her upside down. It was a great pity that the rector refused to interfere.

As he went slowly home he thought over Mr. Hawnby's words.

"If he'd ha' known all," he said sorrowfully, "he'd say that there warn't t' reet feelin's atween Doris an' me. Maybe I'm at fault too; there mun be two to make a quarrel, and maybe it'd be reeter an' more like a brother's part to speak out tiv her like a man, isted of hodin' my tongue like a sulky cur. If I could gain Doris, mother wad see it t' same way: as to father, he's crazed about her doin' it."

As he reached the cottage, he saw his sister at the gate. She was dressed for walking, and it seemed to the lad that here was his opportunity made for him.

He nodded to her, and then turned and walked beside her without a word. "I have a letter from Rica," she said; "she says she'll come, George." He made no answer, and she went on beside the beck, and through the white swing gate, which George held open for her.

They were quite alone here, the hedge on one side screening them from the road, and the high green sloping meadow on the other securing them from any sudden interruption. Doris was annoyed by her brother's silence.

"What's the matter, George?" she said.

"Doris!" he spoke abruptly; "maybe I've not been quite as ye might ha' thowt I should ha' bin in all this, an' I'll tell ye the reason fer't, lass. I cannot speak again my conscience, an' say I wishes yey joy when I thinks ye'se doing wrang."

"I know you think so, but I cannot help that."

"Yey thinks I say this because of the space atween ye an' Mr. Burneston, but it is nut for that alone. Yey does not love t' squire as a lass sud love afore she weds, Doris, an' I'm feared yer's weddin' for t' sake of bein' a great lady, and that'll nivvers bring a blessin'."

Doris kept silent, she was angry, but she told herself that in this short time of her home life she ought to be kind to her family.

George was surprised when she looked smilingly at him.

"If I say what I think," she laughed, "I should say it is not your business; but I want you to be reasonable, and therefore I will be quite open with you. You are right. I do not love Mr. Burneston" — she blushed till George thought her color was as lovely as Rose's — "as much as I should do if I had known him longer. I was taken by surprise. I should have preferred things to have come more gently and naturally, but I see this would be selfish — at least, Mr. Burneston has made me see it. He says, as father has decided to leave the Church Farm, any delay would be unsettling and unprofitable, and that therefore the sooner we are married the better for father; but, indeed, dear," she said, more warmly, "if you are thinking of my happiness, you need not trouble. I shall be very, very happy."

George was puzzled. Unconsciously, Doris had shielded herself against his arguments, but he had one keen arrow left.

"I do not think of you only; father's main troubled, I'se seear; if not, then what fer dizn't he cum ovver? Yey dizn't ken the store he sets by yey, Doris."

Her eyes glistened, and there were tears on the long dark eyelashes.

"I think I do," she said abruptly, "and that is another reason why I wish it were less hurried; it seems as if father and I had had so little time together."

"Waat fur donnut ye go an' bide wi' 'im at t' farm?" he asked abruptly.

Doris looked troubled.

"One or two things prevent that," she said; "I could not go without mother just now, we have so much to see about together, and it is more convenient in many ways to be here. I hope father will come again soon. I shall write and tell him how much I want him."

"It fair caps mey, it diz," said George emphatically, "I cannot see it plain, ye seys ye loves father best, ye freeats fer his company, and yet ye can leave 'im for t' rest o' his life for a husband whilk is a'most a stranger t' yey."

Doris walked on silently. George's way of putting the question was startling, and carried her on to a side of the future which, in the short time she had had for contemplation, she had not yet seen. As she thought of her father in that brief interview her heart went out after him, and she resolved not only that she would write, but that the warmth of her letter should atone for the coldness which she felt she had shown at their last meeting.

Should she come to love Mr. Burneston as well as the tall, kind-eyed father who loved her so dearly — the only being who had really ever stirred her heart with warm affection? But the question did not touch her as deeply as it would have touched either a different nature, or a mind that had been accustomed to meditate on love.

Doris had never read novels, and love, on the woman's side at least, did not seem the necessity which it is to some minds even in early childhood. Till her engagement the desire of being loved even had not shaped itself. With Doris there had lain dormant the stronger craving which Mr. Burneston's avowal had awakened, though doubtless this had been roused to semi-consciousness by the homage paid her during school-life.

The glimpse she had now got of the poignant lifelong sorrow she was going to cause her father, and also of the wrench the separation — for she was open-eyed to that necessity — must cause her, departed again as if she had shut out a cold wintry sky with a glowing curtain on which a blaze of warm light revealed the marvellous hues, and calm came back to her.

"You must not make any mistake," she said in a firm, decided voice that told George their moment of confidence had ended. "I did not say I should not love Mr. Burneston as a wife should love her husband. I do not like to own, even to you, that at first it is different, but I want to be quite open with you. As to father, it seems to me that the question lies between ourselves. He would wish me to marry some one some day and to be very

happy; so it is chiefly the hurry that really grieves him now, and I must do all I can to make up to him for that. Do not let us quarrel, George." It seemed to her that she should not often again have one of these usually dreaded lectures from her brother, and she resolved to struggle against the hardness his rebukes created. "I learned one thing at school that home life does not teach — people cannot all see things with the same eyes; but it does not follow that those who disagree with us are quite wrong."

George felt worsted and strangely ungracious.

"Well," he said, "I give up, yey must ha' yur will, bud I donnut see that yey's reet, Doris."

CHAPTER XVII.

THE EVENING BEFORE.

PERHAPS if we all knew how our words and actions affect others, we should become changed beings, always supposing that we have feelings tender enough to care for the pain or pleasure felt by any but ourselves, and yet, perhaps, what is called our well-being and well-doing in life might be seriously hindered if this were our standard of action.

Perhaps if Doris had seen her father read her letter — with hungry eyes, over which presently he drew his broad fingers as if some mist obscured them — perhaps, I say, if she could have seen the transport of joy, the healing of sorely wounded love that her few loving sentences gave him, she might have asked herself whether she should not pause and stay a while with this fond father, while she learned to love the man for whom she was sacrificing him.

John did not write her an answer. As I have said, he seldom communed with himself except on farming points; but that night when he went to bed he took down his Bible and read, and then he prayed long and earnestly for strength against himself.

Two days after this he met Mr. Burneston. John was glad that they were beyond the church and out of the view of either the old sexton or Rose; he shrank from both of them, and dreaded the moment when the news should find its way to the village. Both John and the squire were on horseback, the latter was on his way to Steersley.

They had not met since the day of the proposal, and Mr. Burneston was surprised when the farmer reined up his horse and held out his hand.

"Ye mun gi' mah love to Doris, and yey can seh, ah'll bide wi' her fra Saturday till Tuesday, an' we'll hev a rare walk or tweea — she an' mey aleean thegither."

"I'll tell her. Any message to Mrs. Barugh?" The squire was pleased that John had grown reconciled.

John looked stern and shook his head, then nodding to Mr. Burneston, he rode home. Yes, he would go and see Doris now that he could tell her he wished her to be happy in her own way, and he hoped Mr. Burneston would take his hint and leave him alone with his daughter.

The days sped with amazing quickness — days are apt to be winged before a wedding. John Barugh paid more than one visit to Steersley, and each time the squire, prompted by Doris, kept away from the cottage.

But the farmer did not soften towards his wife; indeed, he spoke very little to any one but Doris.

Two days before the wedding he was to take his last leave of her, but, instead, he hurried to the door where George stood looking at his father's horse which a boy had just brought round.

"Wonnut ye bid them farewell?" the lad said.

"Neea, neea." John spoke hoarsely. "Whisht, lad," and he moved quietly along the path lest the sound of his footsteps should bring Doris to the window.

"Ah wadn't bring a tear to her een gin ah cud keep 'em dry," he said as he rode away; he had stifled the longing he felt to hold his darling to his heart, and tell her even then that he could not yield her up.

Doris had had one great disappointment. It had been settled that Rica was to arrive a week beforehand; but on the day she was expected came a letter from Mr. Masham, saying that his wife had been taken suddenly ill, and that his daughter could not be spared at present. "If a favorable change takes place, Rica shall go to you."

Mrs. Barugh had been much discomfited by this. She had engaged a bed for George at the inn, and had spent care and time, which she could ill spare, in the midst of her preparations, in arranging the lad's room for the visitor, and, besides this, what would Doris do for a bridesmaid?

She looked timidly at her daughter, who sat with troubled face re-reading the letter.

"I suppose you wouldn't like me to ask Rose Duncombe?" Dorothy said. "I

could see that she was properly dressed, and I know it would please George."

Doris raised her head haughtily.

"It could not be thought of, mother. I shall have you and my father. It is a pity, of course, but it cannot be helped."

Still it seemed to depress her, and when Mr. Burneston came he reproached her for caring more for Rica than for him. "You have grown quite pale about it," he said laughingly, when he bade her good-bye for the last time before his wedding-day.

He was not to go over to Steersley the actual day before the event; he and John Barugh would have business to transact, both respecting the settlement which Mr. Burneston had made on Doris, and also in regard to Church Farm — also Ralph was to arrive at the Hall.

Only her mother and George saw the sudden surprise in Doris's face when, next morning, a letter came from Rica herself, announcing her arrival for six o'clock that very evening. The letter ended with "I wish I could fly to you."

The excitement and flurry of Dorothy bewildered both her children, and made George, as he expressed it, "fair fractious."

"Sit ye doon, mother," he said, "ye'll worrit Doris past bearin', let alone yursel'; t' room's fettled, an' ye can gi' t' lady summat to her tea, an' what more fuss hev yey need for?"

By tea-time Mrs. Barugh had tired herself out, not only by fussing up and down-stairs, but by a perpetual flow of unmeaning talk, of which Doris took no notice. It seemed to her that her mother was the only member of her family who really rejoiced at her marriage, and yet she could not feel grateful for this sympathy. She shrank so painfully from the undisguised triumph which her mother felt in her coming elevation.

George had driven to the station, some miles distant, to fetch Miss Masham, and the mother and daughter sat expecting the visitor.

Doris was dressed as usual in a soft fawn-colored woollen gown, her large falling collar fastened at her throat by a handsome gold brooch — a gift from Mr. Burneston. She wore her soft thick hair smoothly now, though it rippled into exquisite curves on the creamy temples and above the delicate ears; and as she sat thinking she leaned back in her chair and clasped her hands.

As they lay in her lap, twisting round and round her finger a splended diamond ring, also a gift from her lover, her mother gazed at her admiringly.

"My word, Doris, this white gown will suit you beautifully, and the bonnet's only fit to go under a glass case. Miss Phillimore's got rare good taste."

"I don't know," Doris said languidly; "I think a lace bonnet is rather fine. I should have liked a simpler one. The one I'm to travel in would have done."

"My dear!" — then seeing a frown gathering, she remembered that this being the last evening, she was bound not to thwart her daughter. "Only to think," she went on, "that it's scarcely more than two months since George and I were sitting expecting you and father from London. My gracious! it seems near a year."

Yes, it was little over two months, and yet Doris seemed to have lived more than one new life in the interval. It was a pleasant distraction to go again back to that first arrival, and see how utterly unlooked for had been such a solution of her puzzle about the future. It was a relief from the day's worry to do this, for this day had not been a happy one to Doris.

Her father's abrupt departure had disappointed her. Several words which she had tried to say, and which she had always failed to utter, she felt she could have spoken in a last parting, for she had not fathomed the real reason of his going away.

"Father's like me in some ways," she said; "he hates any nonsense or fuss, and I dare say he felt awkward. It is very nice to see him so reconciled to my marriage." And yet there was a sense of weight and depression at the thought that she should not see him again till he stood beside her in church to give her to her husband.

It had been decided by Doris herself that she should not return to Church Farm. John Barugh had engaged the best fly and the best pair of horses that the Black Eagle boasted to convey the party from the cottage to Burneston church. Mr. Burneston had feared the long drive for Doris, but she had pleaded earnestly for this arrangement. Then Mr. Spencer was to give them lunch at the vicarage, whence the newly-married pair would start for London.

All this had been settled days ago — it was another perplexity that troubled the girl. After the first disappointment about Rica it had been a relief that her friend was not coming. Doris's independence had been far easier to practise at Pelican House, where her own appearance and her

Digitized by CORNELL UNIVERSITY

own manners gave the lie to any surmises about her origin. It would be different at Steersley beside her father and mother, and in the cheaply-fitted little rooms which the nameless attempt to disguise realities with smart rubbish stamped with vulgarity. For a few moments the prospect of seeing her friend, of having some one beside her in this trying time to whom she could speak with a certainty of being understood, was inexpressibly grateful, and her eyes and cheeks glowed with pleasure as she read out the news. But now she shivered as she sat anticipating the first meeting between Rica and her mother. She knew Rica's keen sense of humor, and she seemed to hear beforehand her mother's elaborate greeting and her apologies for all she had tried so hard to make what she considered as it should be. She was angry with herself for the feeling, but it would come.

Like many another proud nature, Doris shrank keenly from ridicule, and she became unjust to her mother's good qualities in her sensitive dread of her absurdities.

"If she had not come now," she repeated to herself, "Rica need never have seen father or mother either."

She had forgotten her visions about George, but the sound of wheels roused her, and there was her brother at the gate laughing and helping out Rica, with whom he seemed already quite at ease.

About the same time the young squire, as Ralph was called, had reached the Hall.

It was nearly a year since he had been at home, for his father had taken him abroad during his summer holidays, and he had shot up so wonderfully that the servants were astonished at his appearance.

"He's a grown man; he's too awd to hev a yung lass set ower him." Benjamin Hazelgrave had kept "a quiet tongue in his head" since the marriage had been announced, but he could not forbear saying this to his wife.

She only shook her head ominously; indeed, so powerful was Mrs. Emmett's influence that you might have thought from the demeanor of the household that its head was going to assist at a funeral next day; only, as Mr. Burneston had been liberal in gifts of gowns and ribbons and other wedding garments, a certain amount of pleasant anticipation pervaded the servants' hall, which did not reach to the housekeeper's room, and caused much speculation as to the chances of a fine day.

Meantime Mr. Burneston was giving his son an affectionate welcome, which that young gentleman received with careless loftiness.

Ralph had told his father in writing that he considered he was going to do a very foolish thing; and it really seemed to the boy that if his father could bring himself to marry a farmer's daughter he must lose caste by doing so.

At first the young fellow had told Gilbert Raine he should not be present at the wedding; but when his father's summons came he did not feel courageous enough to refuse obedience. There was, too, a certain honor and glory in the idea of being the important person of the day, for it seemed to Ralph that, of course, a farmer's daughter would be extremely shy of him, and very desirous of his good opinion.

He was quite as tall as his father now, and singularly like him, only handsomer; his blue eyes were larger and brighter, and his auburn hair clustered round his forehead in crisp waves. He had his mother's delicate features and small chin, but there was about him the graceful dignity and charming frankness of manner which won hearts in his father.

Mr. Burneston's eyes glistened as he looked at his son; he felt proud of him.

"You are growing very fast, Ralph. I suppose you get plenty of exercise with the boats, eh?"

"Oh, yes, as much as I want." Ralph stretched out his legs. "I'm rather a swell oar now, but it was too much fag in hot weather. Where are you going, father," he added in a patronizing tone.

Mr. Burneston winced and was amused both at once; but he felt very much for the boy, and considered that allowance must be made for him.

"To Paris first, I think, and then to the Tyrol, which"—here he hesitated for a name, and then added—"my future wife particularly wishes to see."

"Ah," said Ralph languidly, as if to express, "Pray don't suppose I take the slightest interest in that individual."

Before dinner was well over, Mr. Burneston was wanted for various directions, and soon after Ralph proposed a game at billiards, and there was no more talk of the morrow's business between the father and son that evening.

CHAPTER XVIII.

THE WEDDING-DAY.

ALL the fears and prognostications about colds and all the preparations in the way of wraps had been thrown away.

Original from CORNELL UNIVERSITY

This October morning was as full of genial warmth and of bright sunshine as it could well be, spite of the northern climate.

"It is a capital thing, Doris darling, it's so warm and beautiful," Rica said at breakfast. "Even you would not look an angel with a red nose, and you will look angelic to-day."

Dorothy was delighted with her visitor, and quite forgot her elaborately prepared speeches in the heartiness of Rica's manner.

They dressed Doris between them, and pronounced her perfect, and then arranged themselves.

Mrs. Barugh's costume had been chosen by Miss Phillimore, and she looked so pretty and refined in her soft-colored lavender bonnet and tulle trimmings that Doris felt rejoiced. "How very well you look, mother!" she said affectionately.

The tears were in poor Dorothy's eyes as she returned her daughter's kiss.

"I'm so glad. So long as you're not ashamed of your mother, my dear, it's all right," she said with a simplicity that touched her daughter with remorse.

"Ashamed of you? — oh, mother!" But she flushed deeply as she kissed her again.

She clung to her mother this morning. She felt that she had never loved her so well, and she felt that she had been unjust and exacting. Real feeling had got uppermost with Mrs. Barugh, and she was too simple and quiet when with her daughter to be ridiculous.

Besides this, Dorothy had found a readily amused listener; she got rid of her absurdities on Rica.

"I must go and see after Miss Masham, dear," she said. "Maybe she'll want a finishing touch."

But Rica was quite ready. She wore a dark faded-leaf silk dress and a lemon-colored drawn crape bonnet, which suited her clear, dark skin.

"My word! you do look nice, Miss Masham; I'm sure you do! But if I may put a pin" — careful Dorothy's neat eyes saw at once that the round cape reaching to the waist, which finished the dress, hung a quarter of an inch lower on one side than on the other — "how do you think I look?" turning and arranging herself as she spoke — "and I'm that nervous, Miss Masham, you might blow me over. You see it is *such* an event; and that old goose of a clerk — ah, you don't know him, but it's Joseph Sunley, you'll see him by-and-by — he's been and told my husband the proper thing for the bride's father is a large white flower — and he's going to get him a white dahlia. If you'll believe me, Miss Masham, I made Mr. Barugh a proper favor of white satin ribbon — lovely London ribbon. I feel ready to faint at the notion of seeing John coming up the aisle in a white dahlia. It's well and good for horses' ears; but the bride's father, more especially a fine man like my husband, should not be decorated like a — a quadruped."

She wiped her eyes, for she was really crying with vexation.

"Never mind," said Rica, with a hearty laugh, "I know what Mr. Barugh looks like, and I don't think even a white dahlia can spoil him."

"You're very kind, my dear, but still Mr. Burneston's father-in-law should be very careful of the figure he makes."

But there was no more time for talking. First a cart had to be despatched to the vicarage with Doris's luggage, and then the bride had to be carefully stowed away in the fly from the Black Eagle amid a crowd of gaping Steersley folk. Mrs. Byland was not there; she had prevailed on her husband to drive her over to Burneston an hour ago, and she was now standing amid a throng, consisting of all the population that could leave their houses, awaiting the "weddingers."

In front of the porch, in a new hat, a chocolate-colored coat and brass buttons, and pale salmon-colored trousers, stood Joseph Sunley, an enormous white dahlia fixed on the lappel of his coat.

Many earnest petitions, and many sugared whispered entreaties had been addressed to him, and had been alike refused. "Ah mun steek t' door whiles t' bride hes comed," was his constant answer. No one but himself knew that very early that morning he had let in one pretty though stormy-faced damsel filled with envy and anger and others of the seven deadly sins, and had carefully ensconced the said damsel, yclept Rose Duncombe, in a corner where, if she kept still, she was safe not to be seen.

There was plenty of joking among the expectant crowd, somewhat kept in check by the presence of a group at the churchyard gate — a group headed by Mrs. Emmett and Mr. and Mrs. Hazelgrave, who stood waiting their master's arrival with the intention of following close on his heels down the gravelled path leading to the old gabled porch. At length there was a murmur, first low, then increasing, and then ending in a note of decided disapprobation.

"Zoonds!" "Zookerins!" "Mercy!" "Zolch!" "Dash mey!" from Ephraim Crewe, and other expressive forms of wonder and blame from other bystanders.

"Dhey've ganged thra t' lahtle door!" and a groan succeeded. Then there came a gloomy silence.

It was plainly thought that the squire feared to face his people. But in another minute there rose a loud hurrah, so boisterous and prolonged that it might have been heard at the Hall itself, only that the Hall had been entirely deserted, and left to the charge of Ephraim Crewe's grandmother, a deaf, decrepit old woman.

First a rumor had spread that the vicar, Mr. Burneston, and John Barugh had come into the churchyard by the vicarage gate in the corner of the glebe field, and had gone into church through the little vestry door.

The next moment the tall, stalwart, red-whiskered man and the slenderer squire turned the corner by the tower, and came in full view of the crowded rows on each side of the gravel walk leading from the gate to the old gabled porch. John Barugh's pale grey trousers, buff satin waistcoat, and an enormous white flower in his coat, gave him a bridal appearance.

A passage was cleared for them to pass into the porch while the cheers continued lustily. The squire responded to these welcomes by several smiling bows, while the tall farmer looked on with a grim smile.

"His missis hes rigged him out as fine as a fiddle," Hezekiah Byland whispered to his wife.

"Whisht, Hezekiah!" Peggy, resplendent in a blue bonnet and a scarlet shawl, nudged him with her elbow, and glanced at Mrs. Emmett, who stood in sullen silence beside the gate. There was an ominous frown on the housekeeper's face. This unceremonious arrival of the bridegroom had completely upset her programme; it seemed to her that the first blow had been already struck at her authority.

Murmurs spread along the closely-ranged rows of expectants.

"Sheea taks her ain tahme!"

"Sheea bides ower lang!"

"Woonkers! Sheea's deein' t' laady aforehand!"

Even Joseph Sunley muttered to himself, "Shea'll nivvers keep 'im waitin'."

"Sheea bides ower lang," said Ephraim Crewe, a sworn adherent of the housekeeper's; "bud dhey'll be as proud as owd Soss is o' his tail."

Another burst of cheering brought John Barugh and the squire to the door again; the crowd round the gate swayed, and then opened, and a tall, slim youth walked down the gravel path, bowing to the villagers first on one side, then on the other, with a gracious sweetness which made his striking likeness to his father yet more apparent.

"Hurrah fer t' yung squire!" sounded lustily from the crowd, and then Ralph Burneston also disappeared into the church.

"It's hard on t' poor lad, t' varra marro' o' his fayther." This was said by Mrs. Crewe, senior, also resplendent in a scarlet shawl. She wore on her head a large Tuscan straw bonnet trimmed outside with yellow ribbon and a large pink cambric rose, while her rosy face was set off by an abundance of pink satin bows in a blonde cap underneath.

A thin, sharp-faced woman standing next her looked up at stolid, fleshy Mrs. Crewe.

"Laws, neeaghber," she smiled with some contempt, "wheear's t' use o' makin' mouths at waat's seear an' certain? Ah knawed fower week sin 'at ther war a weddin' toward. Ah's trupped twa tahmes oop steers, an' Sukey hes seed fower craws ivvery tahme sheea's bin i' t' croft."

Mrs. Crewe was stolid, but she was also shrewd, and she eyed her next neighbor with some curiosity. It showed which way the wind blew at the vicarage, she thought, when the parson's housekeeper did not disapprove this marriage.

"Hev yey see t' lass, Missis Riccall?" she asked with some scorn.

"Neea, nut ah! Sheea's bin at t' streeat at Lunnon whiles sin sheea waaz a lahtle lass, afore ah cam to t' parsonage; she mun be bonny noo."

"Sheea'll be faded and set oop lahke her mudher," said Mrs. Crewe; "t' fayther's honest an' plain, an' seea's t' lad, bud ah cannut abide t' missis. She's crammed wiv fads an' fancies. An' noo sheea'll be fair brasted wi' pride."

Mrs. Byland had been listening eagerly to this talk, and she would have joined in at once, but Hezekiah kept her hand tightly tucked under his arm; he did not want his wife to attract the notice of his elderly cousin. But now he turned to speak to Ephraim Crewe, and Peggy got free and pushed herself close to the two talkers.

"Ah's seen t' bride," she said with importance. "Many's t' tahme, an shea's a lady ivvery bit uv her, shea'll mak a reet guid missis fer yur maister, thof he's a bit

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

awd for t' lahkes o' her: gin sheea'd waited a while sheea'd hev suited rarely wi' t' young maister."

Mrs. Crewe raised her head with a look of contemptuous inquiry.

"Eh bud yeh iz a stranger, ah s'pose," she said. "Maister Ralph's nut gane sexteen, an' he'll wed wi' a real lady, neane o' yur maakbelieves."

This time there was no mistaking the sound of wheels, and the squire and John Barugh both appeared at the church door. They went up to the gate, and the farmer handed out his daughter, and as Doris walked slowly, but with easy dignity, beside him the burst of admiration was irrepressible. The effect on Faith Emmett was almost maddening. Her yellow eyes blazed for an instant, and then she resolutely closed them and shut out the vision of exceeding loveliness which she felt must be all powerful before the chorus of admiring wonder met her ears.

Poor Dorothy! she need not have spent so much anxious care and pains on her own adornment. Scarcely any one had time to look at her as she followed on the squire's arm, while George conducted Miss Masham Every eye was strained for a last look at the fair graceful girl with those liquid, far-seeing eyes and a head placed "on her shoolthers," as Benjamin Hazelgrave whispered to his wife, "lahke a queen's."

Faith heard the whisper as she walked into church, and she cursed the marriage with all her heart and soul.

A buzz of admiration went with the crowd as it followed, all but some boys and girls, who took advantage of the general gathering within the building to play hide-and-seek and leap-frog, and various forbidden games within the churchyard.

But these pastimes were soon interrupted; first one and then another of the gazers came out into the porch, anxious to secure a place for a good view of the return procession.

Mrs. Duncombe and Mrs. Crewe found themselves side by side, and the deaf woman's broad, unmeaning face was full of delight.

"Eh, neeaghber; wheea can seh t' squire hesn't made a guid choice. Deead yey ivver see t' lahke o' sik a bonny face? Mah wod! sheea is thaat."

Mrs. Crewe looked down repressively. It behoved the wife of a well-to-do farmer to keep up her dignity with a "puir awd boddy 'at hed jist eneeaf to live by."

"Sheea's weel eneeaf, bud luks is nut ivverything, Missis Duncombe, an' fahne feathers maks fahne bods. Yey mun yaalays mind 'at fooalks is strangers at Burneston. Wer kens nowt aboot 'em wersels. Mah lad Ephraim disn't set mich store by t' farmin 'at gaus on yon."

She nodded her head towards the gabled farmhouse which showed plainly among the scanty-leaved trees, and then she drew her stiff skirts closer, so as to make room for Ephraim, who just then issued from the porch. But Joseph Sunley came out hastily after him, and began to clear a free passage.

"Gae awa, yeh lahtle ragils, ah'll nut hev yey rampin' an reein' whiles t' squire an his lady coms oop t' walk."

As he spoke the congregation poured suddenly out of church, having been taken by surprise by the quick proceedings in the vestry; and before the two rows had again arranged themselves between the porch and the gate, appeared Mr. Burneston and his bride. She looked far more beautiful now, there was a slight flush on her cheeks, and a calm, bright look which spoke of secure peace.

Faith Emmett, Mrs. Crewe, and a few of their cronies sneered inwardly or muttered depreciation, but the village as a whole was taken by a *coup-de-main*, and there rose up a deafening cheer. Even Ephraim forgot his allegiance to the housekeeper as he turned a glowing face to his mother.

"Aay maari! sheea's a beauty, an' sheea moves lahke a queen."

Even Mrs. Barugh's bonnet and general appearance met with favor, and the cheers continued as the procession returned to the gate in the same order, except that Ralph Burneston stepped quietly before George and offered his arm to Rica Masham.

The bells pealed out merrily as the Hall carriage, with Mr. Burneston and Doris, drove rapidly away to the vicarage.

About an hour later the throng had reassembled at the vicarage gates to see the departure of the newly-married pair. On the previous day Mr. Sunley and Will Slater, or Slaater, as he called himself, the gardener at the Hall, had had a consultation, and it had been decided that the path leading to the carriage should be strewn with flowers.

"Wey'll hev yur lahtle lass Mary Anne Slaater," Sunley had said, "an' mah ain grandowter Prudence; they twae sal stan again t' gatepost an' fling t' blossoms efter whiles dhey rides away."

And now Will Slater was diligently strewing the gravel with white dahlias and

chrysanthemums. Joseph Sunley standing over him and pompously advising him now and then.

"Noo gang te t' gate, honies," he said to the two pretty children who stood shyly eager beside him, each with a basket of flowers, "an fling 'em wiv a will."

Another burst of cheering announced that Mr. and Mr. Burneston had appeared at the door, and as the squire, after putting his wife in the carriage, turned round to speak a hearty farewell, the little lasses, true to their instructions, sent a couple of dahlias at him with such determined good-will that if he had not ducked his head they would have hit him hard in the face.

There was a burst of hearty laughter, and the two pretty little maids looked shamefaced and discomfited till Mr. Burneston stooped down, and patting them on the cheek while he picked up the flowers, said he would give them to Mrs. Burneston as a keepsake.

While the rest of the party were still looking after the carriage, Ralph turned to Rica Masham, to whom he had talked exclusively during the wedding breakfast.

"Do you know who that very pretty girl is who stood peeping over the edge of a pew near the vestry? I have been looking at every face in the crowd, but I can't find hers anywhere."

From The Cornhill Magazine.

MASSINGER.

In one of the best of his occasional essays, Kingsley held a brief for the plaintiffs in the old case of Puritans *versus* playwrights. The litigation in which this case represents a minor issue has lasted for a period far exceeding that of the most pertinacious lawsuit, and is not likely to come to an end within any assignable limits of time. When the discussion is pressed home, it is seen to involve fundamentally different conceptions of human life and its purposes; and it can only cease when we have discovered the grounds of a permanent conciliation between the ethical and the æsthetic elements of human nature. The narrower controversy between the stage and the Church has itself a long history. It has left some curious marks upon English literature. The prejudice which uttered itself through the Puritan Prynne was inherited, in a later generation, by the High-Churchmen Collier and William Law. The attack, it is true, may be intentionally directed — as in Kingsley's essay — against the abuse of the stage rather than against the stage itself. Kingsley pays the usual tribute to Shakespeare whilst denouncing the whole literature of which Shakespeare's dramas are the most conspicuous product. But then, everybody always distinguishes in terms between the use and the abuse; and the line of demarcation generally turns out to be singularly fluctuating and uncertain. You can hardly demolish Beaumont and Fletcher without bringing down some of the outlying pinnacles, if not shaking the very foundations of the temple sacred to Shakespeare.

It would be regrettable, could one stop to regret the one-sided and illogical construction of the human mind, that a fair judgment in such matters seems to require incompatible qualities. Your impartial critic or historian is generally a man who leaves out of account nothing but the essential. His impartiality means sympathy with the commonplace and incapacity for understanding heroic faith and overpowering enthusiasm. He fancies that a man or a book can be judged by balancing a list of virtues and vices as if they were separate entities lying side by side in a box, instead of different aspects of a vital force. On the other hand, the vivid imagination which restores dead bones to life makes its possessor a partisan in extinct quarrels, and as short-sighted and unfair a partisan as the original actors. Roundheads and Cavaliers have been dead these two centuries.

> Dumb are those names erewhile in battle loud;
> Dreamfooted as the shadow of a cloud
> They flit across the ear.

Yet few even amongst modern writers are capable of doing justice to both sides without first making both sides colorless. Hallam judges men in the throes of a revolution as though they were parties in a law-suit to be decided by precedents and parchments, and Mr. Carlyle cannot appreciate Cromwell's magnificent force of character without making him all but infallible and impeccable. Critics of the early drama are equally one-sided. The exquisite literary faculty of Charles Lamb revelled in detecting beauties which had been covered with the dust of oblivion during the reign of Pope. His appreciation was intensified by that charm of discovery which finds its typical utterance in Keats's famous sonnet. He was scarcely a more impartial judge of Fletcher or Ford than "stout Cortes" of the new world revealed

by his enterprise. We may willingly defer to his judgment of the relative value of the writers whom he discusses, but we must qualify his judgment of their intrinsic excellence by the recollection that he speaks as a lover. To him and other unqualified admirers of the old drama the Puritanical onslaught upon the stage presented itself as the advent of a gloomy superstition, ruthlessly stamping out all that was beautiful in art and literature. Kingsley, an admirable hater, could perceive only the opposite aspect of the phenomena. To him the Puritan protest appears as the voice of the enlightened conscience; the revolution means the troubling of the turbid waters at the descent of the angel; Pyrnne's "Histriomastix" is the blast of the trumpet at which the rotten and polluted walls of Jericho are to crumble into dust. The stage, which represented the tone of aristocratic society, rightfully perished with the order which it flattered. Courtiers had learned to indulge in a cynical mockery of virtue, or found an unholy attraction in the accumulation of extravagant horrors. The English drama, in short, was one of those evil growths which are fostered by deeply-seated social corruption, and are killed off by the breath of a purer air. That such phenomena occur at times is undeniable. Mr. Symonds has recently shown us in his history of the Renaissance, how the Italian literature, to which our English dramatists owed so many suggestions, was the natural fruit of a society poisoned at the roots. Nor, when we have shaken off that spirit of slavish adulation in which modern antiquarians and critics have regarded the so-called Elizabethan dramatists, can we deny that there are symptoms of a similar mischief in their writings. Some of the most authoritative testimonials have a suspicious element. Praise has been lavished upon the most questionable characteristics of the old drama. Apologists have been found, not merely for its daring portrayal of human passion, but for its wanton delight in the grotesque and the horrible for its own sake; and some critics have revenged themselves for the straitlaced censures of Puritan morality by praising work in which the author strives to atone for imaginative weakness by a choice of revolting motives. Such adulation ought to have disappeared with the first fervor of rehabilitation. Much that has been praised in the old drama is rubbish, and some of it disgusting rubbish.

The question, however, remains, how far we ought to adopt either view of the situation? Are we bound to cast aside the later dramas of the school as simply products of corruption? It may be of interest to consider the light thrown upon this question by the works of Massinger, nearly the last of the writers who can really claim a permanent position in literature. Massinger, born in 1584, died in 1639. His surviving works were composed, with one exception, after 1620. They represent, therefore, the tastes of the play-going classes during the rapid development of the great struggle which culminated in the rebellion. In a literary sense it is the period when the imaginative impulse represented by the great dramatists was running low. It is curious to reflect that, if Shakespeare had lived out his legitimate allowance of threescore years and ten, he might have witnessed the production, not only of the first but nearly all the best works of his school; had his life been prolonged for ten years more, he would have witnessed its final extinction. Within these narrow limits of time the drama had undergone a change corresponding to the change in the national mood. The difference, for example, between Marlowe and Massinger at the opening and the close of the period — though their births were separated by only twenty years — corresponds to the difference between the temper of the generation which repelled the Armada and the temper of the generation which fretted under the rule of the first Stuarts. The misnomer of Elizabethan as applied to the whole school indicates an implicit perception that its greater achievements were due to the same impulse which took for its outward and visible symbol the name of the great queen. But it has led also to writers being too summarily classed together who really represent very different phases in a remarkable evolution. After making all allowances for personal idiosyncrasies, we can still see how profoundly the work of Massinger is colored by the predominant sentiment of the later epoch.

As little is known of Massinger's life as of the lives of most of the contemporary dramatists who had the good or ill fortune to be born before the days of the modern biographical mania. It is known that he, like most of his brethren, suffered grievously from impecuniosity; and he records in one of his dedications his obligations to a patron without whose bounty he would for many years have "but faintly subsisted." His father had been employed by Henry, Earl of Pembroke; but Massinger, though acknowledging a certain debt of

gratitude to the Herbert family, can hardly have received from them any effective patronage. Whatever their relations may have been, it has been pointed out by Mr. Rawson Gardiner* that Massinger probably sympathized with the political views represented by the two sons of his father's patron who were successively Earls of Pembroke during the reigns of the first James and Charles. On two occasions he got into trouble with the licenser for attacks, real or supposed, upon the policy of the government. More than one of his plays contain, according to Mr. Gardiner, references to the politics of the day as distinct as those conveyed by a cartoon in *Punch*. The general result of his argument is to show that Massinger sympathized with the views of an aristocratic party who looked with suspicion upon the despotic tendencies of Charles's government, and thought that they could manage refractory Parliaments by adopting a more spirited foreign policy. Though in reality weak and selfish enough, they affected to protest against the materializing and oppressive policy of the extreme royalists. How far these views represented any genuine conviction, and how far Massinger's adhesion implied a complete sympathy with them, or might indicate that kind of delusion which often leads a mere literary observer to see a lofty intention in the schemes of a selfish politician, are questions which I am incompetent to discuss and which obviously do not admit of a decided answer. They confirm, as far as they go, the general impression as to Massinger's point of view which we should derive from his writings without special interpretation. Shakespeare, says Coleridge, gives "the permanent politics of human nature" (whatever they may be!), "and the only predilection which appears shows itself in his contempt of mobs and the populace. Massinger is a decided Whig; Beaumont and Fletcher high-flying, passive-obedience Tories." The author of "Coriolanus" one would be disposed to say, showed himself a thoroughgoing aristocrat, though in an age when the popular voice had not yet given utterance to systematic political discontent. He was still a stranger to the sentiments symptomatic of an approaching revolution, and has not explicitly pronounced upon issues hardly revealed even to

> the prophetic soul
> Of the wide world dreaming of things to come.

* *Contemporary Review* for August 1876.

The sense of national unity evolved in the great struggle with Spain had not yet been lost in the discord of the rising generation. The other classifications may be accepted with less reserve. The dramatists represented the views of their patrons. The drama reflected in the main the sentiments of an aristocratic class alarmed by the growing vigor of the Puritanical citizens. Fletcher is, as Coleridge says, a thoroughgoing Tory; his sentiments in "Valentinian" are, to follow the same guidance, so "very slavish and reptile" that it is a trial of charity to read them. Nor can we quite share Coleridge's rather odd surprise that they should emanate from the son of a bishop, and that the duty to God should be the supposed basis. A servile bishop in those days was not a contradiction in terms, and still less a servile son of a bishop; and it must surely be admitted that the theory of divine right may lead, however illogically, to reptile sentiments. The difference between Fletcher and Massinger, who were occasional collaborators and apparently close friends (Massinger, it is said, was buried in Fletcher's grave), was probably due to difference of temperament as much as to the character of Massinger's family connection. Massinger's melancholy is as marked as the buoyant gaiety of his friend and ally. He naturally represents the misgivings which must have beset the more thoughtful members of his party, as Fletcher represented the careless vivacity of the Cavalier spirit. Massinger is given to expatiating upon the text that

> subjects' lives
> Are not their prince's tennis-balls, to be bandied
> In sport away.

The high-minded Pulcheria, in "The Emperor of the East," administers a bitter reproof to a slavish "projector" who

> Roars out,
> All is the king's, his will above the laws;

who whispers in his ear that nobody should bring a salad from his garden without paying "gabel" or kill a hen without excise; who suggests that, if a prince wants a sum of money, he may make impossible demands from a city and exact arbitrary fines for its non-performance.

> Is this the way
> To make our emperor happy? Can the groans
> Of his subjects yield him music? Must his thresholds
> Be wash'd with widows' and wrong'd orphans' tears,
> Or his power grow contemptible?

Mr. Gardiner tells us that at the time at which these lines were written they need not have been taken as referring to Charles. But the vein of sentiment which often occurs elsewhere is equally significant of Massinger's view of the political situation of the time. We see what were the topics that were beginning to occupy men's minds.

Dryden made the remark, often quoted for purposes of indignant reprobation by modern critics, that Beaumont and Fletcher "understood and imitated the conversation of gentleman much better" (than Shakespeare); "whose wild debaucheries and quickness of wit in repartees no poet can ever paint as they did." It is, of course, easy enough to reply that in the true sense of the word "gentleman" Shakespeare's heroes are incomparably superior to those of his successors; but then this is just the sense in which Dryden did not use the word. His real meaning indicates a very sound piece of historical criticism. Fletcher describes a new social type; the "king's young courtier," who is deserting the good old ways of his father, the "old courtier of the queen." The change is but one step in that continuous process which has substituted the modern gentleman for the old feudal noble; but the step taken at that period was great and significant. The chivalrous type, represented in Sidney's life and Spenser's poetry, is beginning to be old-fashioned and out of place as the industrial elements of society become more prominent. The aristocrat in the rising generation finds that his occupation is going. He takes to those "wild debaucheries" which Dryden oddly reckons among the attributes of a true gentleman; and learns the art of "quick repartee" in the courtly society which has time enough on its hands to make a business of amusement. The euphuism and allied affectations of the earlier generation had a certain grace, as the external clothing of a serious chivalrous sentiment; but it is rapidly passing into a silly coxcombry to be crushed by Puritanism or snuffed out by the worldly cynicism of the new generation. Shakespeare's Henry or Romeo may indulge in wild freaks or abandon themselves to the intense passions of vigorous youth; but they will settle down into good statesmen and warriors as they grow older. Their love-making is a phase in their development, not the business of their lives. Fletcher's heroes seem to be not only occupied for the moment, but to make a permanent profession of what with their predecessors was a passing phase of youthful ebullience. It is true that we have still a long step to make before we sink to the mere *roué*, the shameless scapegrace and cynical man about town of the restoration. To make a Wycherley you must distil all the poetry out of a Fletcher. Fletcher is a true poet; and the graceful sentiment, though mixed with a coarse alloy, still repels that unmitigated grossness which, according to Burke's famous aphorism, is responsible for half the evil of vice. He is still alive to generous and tender emotions, though it can scarcely be said that his morality has much substance in it. It is a sentiment, not a conviction, and covers without quenching many ugly and brutal emotions.

In Fletcher's wild gallants, still adorned by a touch of the chivalrous; reckless, immoral, but scarcely cynical; not sceptical as to the existence of virtue, but only admitting morality by way of parenthesis to the habitual current of their thoughts, we recognize the kind of stuff from which to frame the Cavaliers who will follow Rupert and be crushed by Cromwell. A characteristic sentiment which occurs constantly in the drama of the period represents the soldier out of work. We are incessantly treated to lamentations upon the ingratitude of the comfortable citizens who care nothing for the men to whom they owed their security. The political history of the times explains the popularity of such complaints. Englishmen were fretting under their enforced abstinence from the exciting struggles on the Continent. There was no want of Dugald Dalgettys returning from the wars to afford models for the military braggart or the bluff, honest soldier, both of whom go swaggering through so many of the plays of the time. Clarendon in his "Life" speaks of the temptations which beset him from mixing with the military society of the time. There was a large and increasing class, no longer finding occupation in fighting Spaniards and searching for Eldorado, and consequently, in the Yankee phrase, "spoiling for a fight." When the time comes, they will be ready enough to fight gallantly and to show an utter incapacity for serious discipline. They will meet the citizens, whom they have mocked so merrily, and find that reckless courage and spasmodic chivalry do not exhaust the qualifications for military success.

Massinger represents a different turn of sentiment which would be encouraged in their minds by the same social conditions. Instead of abandoning himself frankly to the stream of youthful sentiment, he feels

that it has a dangerous aspect. The shadow of coming evils was already dark enough to suggest various forebodings. But he is also a moralizer by temperament. Mr. Ward says that his strength is owing in a great degree to his appreciation of the great moral forces; and the remark is only a confirmation of the judgment of most of his critics. It is, of course, not merely that he is fond of adding little moral tags of questionable applicability to the end of his plays. "We are taught," he says in "The Fatal Dowry,"

> By this sad precedent, how just soever
> Our reasons are to remedy our wrongs,
> We are yet to leave them to their will and power
> That to that purpose have authority.

But it is, to say the least, doubtful whether anybody would have that judicious doctrine much impressed upon him by seeing the play itself. Nor can one rely much upon the elaborate and very eloquent defence of his art in "The Roman Actor." Paris, the actor, sets forth very vigorously that the stage tends to lay bare the snares to which youth is exposed and to inflame a noble ambition by example. If the discharge of such a function deserves reward from the commonwealth —

> Actors may put in for as large a share
> As all the sects of the philosophers;
> They with cold precepts — perhaps seldom read —
> Deliver what an honorable thing
> The active virtue is; but does that fire
> The blood, or swell the veins with emulation
> To be both good and great, equal to that
> Which is presented in our theatres?

Massinger goes on to show, after the fashion of Jaques in "As You Like It," that the man who chooses to put on the cap is responsible for the application of the satire. He had good reasons, as we have seen, for feeling sensitive as to misunderstandings — or, rather, too thorough understandings — of this kind.

To some dramatists of the time, who should put forward such a plea, one would be inclined to answer in the sensible words of old Fuller. "Two things," he says, "are set forth to us in stage plays; some grave sentences, prudent counsels, and punishment of vicious examples: and with these desperate oaths, lustful talk, and riotous acts, are so personated to the life, that wantons are tickled with delight, and feed their palates upon them. It seems the goodness is not portrayed with equal accents of liveliness as the wicked things are; otherwise men would be deterred from vicious courses, with seeing the woful success which follows them" — a result scarcely to be claimed by the actors of the day. Massinger, however, shows more moral feeling than is expended in providing sentiments to be tacked on as an external appendage, or satisfied by an obedience to the demands of poetic justice. He is not content with knocking his villains on the head — a practice in which he, like his contemporaries, indulges with only too much complacency. The idea which underlies most of his plays is a struggle of virtue assailed by external or inward temptations. He is interested by the ethical problems introduced in the play of conflicting passions, and never more eloquent than in uttering the emotions of militant or triumphant virtue. His view of life indeed is not only grave, but has a distinct religious coloring. From various indications, it is probable that he was a Roman Catholic. Some of these are grotesque enough. "The Renegado" for example, not only shows that Massinger was, for dramatic purposes at least, an ardent believer in baptismal regeneration, but includes — what one would scarcely have sought in such a place — a discussion as to the validity of lay baptism. The first of his surviving plays, "The Virgin Martyr" (in which he was assisted by Dekker) is simply a dramatic version of an ecclesiastical legend. Though it seems to have been popular at the time, the modern reader will probably think that, in this case at least, the religious element is a little out of place. An angel and a devil take an active part in the performance; miracles are worked on the stage; the unbelievers are so shockingly wicked, and the Christians so obtrusively good, that we — the worldly-minded — are sensible of a little recalcitration, unless we are disarmed by the simplicity of the whole performance. Religious tracts of all ages and in all forms are apt to produce this ambiguous effect. Unless we are quite in harmony with their assumptions, we feel that they deal too much in conventional rose-color. The angelic and diabolic elements are not so clearly discriminated in this world, and should show themselves less unequivocally on the stage, which ought to be its mirror. An audience in the state of mind which generates the true miracle-play might justify such an embodiment of its sentiment. But when forcibly transplanted to the Jacobean stage, we feel that the performance has not the simple earnestness by which alone it can be justified. The sentiment has a certain

unreality, and the *naïveté* suggests affectation. The implied belief is got up for the moment and has a hollow ring. And therefore, the whole work, in spite of some eloquence, is nothing better than a curiosity, as an attempt at the assimilation of a heterogeneous form of art.

A similar vein of sentiment, though not showing itself in so undiluted a form, runs through most of Massinger's plays. He is throughout a sentimentalist and a rhetorician. He is not, like the greatest men, dominated by thoughts and emotions which force him to give them external embodiment in lifelike symbols. He is rather a man of much real feeling and extraordinary facility of utterance, who finds in his stories convenient occasions for indulging in elaborate didactic utterances upon moral topics. It is probably this comparative weakness of the higher imaginative faculty which makes Lamb speak of him rather disparagingly. He is too self-conscious and too anxious to enforce downright moral sentiments to satisfy a critic by whom spontaneous force and direct insight were rightly regarded as the highest poetic qualities. A single touch in Shakespeare, or even in Webster or Ford, often reveals more depth of feeling than a whole scene of Massinger's facile and often deliberately forsenic eloquence. His temperament is indicated by the peculiarities of his style. It is, as Coleridge says, poetry differentiated by the smallest possible degree from prose. The greatest artists of blank verse have so complete a mastery of their language that it is felt as a fibre which runs through and everywhere strengthens the harmony, and is yet in complete subordination to the sentiment. With a writer of the second order, such as Fletcher, the metre becomes more prominent, and at times produces a kind of monotonous sing-song, which begins to remind us unpleasantly of the still more artificial tone characteristic of the rhymed tragedies of the next generation. Massinger diverges in the opposite direction. The metre is felt enough and only just enough to give a more stately step to rather florid prose. It is one of his marks that a line frequently ends by some insignificent "of" or "from," so as to exclude the briefest possible pause in reading. Thus, to take an example pretty much at random, the following instance might be easily read without observing that it was blank verse at all: —

"Your brave achievements in the war, and what you did for me, unspoken, because I would not force the sweetness of your modesty to a blush, are written here; and that there might be nothing wanting to sum up my numerous engagements (never in my hopes to be cancelled), the great duke, our mortal enemy, when my father's country lay open to his fury and the spoil of the victorious army, and I brought into his power, hath shown himself so noble, so full of honor, temperance, and all virtues that can set off a prince; that, though I cannot render him that respect I would, I am bound in thankfulness to admire him."

Such a style is suitable to a man whose moods do not often hurry him into impetuous, or vivacious, or epigrammatic utterance. As the Persian poet says of his country: his warmth is not heat and his coolness is not cold. He flows on in a quiet current, never breaking into foam or fury, but vigorous, and invariably lucid. As a pleader before a law-court — the character in which, as Mr. Ward observes, he has a peculiar fondness for presenting himself — he would carry his audience along with him, but scarcely hold them in spellbound astonishment or hurry them into fits of excitement. Melancholy resignation, or dignified dissatisfaction will find in him a powerful exponent, but scarcely despair, or love, or hatred, or any social phase of pure unqualified passion.

The natural field for the display of such qualities is the romantic drama, which Massinger took from the hands of Beaumont and Fletcher, and endowed with greater dignity and less poetic fervor. For the vigorous comedy of real life, as Jonson understood it, he has simply no capacity; and in his rare attempts at humor, succeeds only in being at once dull and dirty. His stage is generally occupied with dignified lords and ladies, professing the most chivalrous sentiments, which are occasionally too highflown and overstrained to be thoroughly effective, but which are yet uttered with sufficient sincerity. They are not mere hollow pretences, consciously adopted to conceal base motives; but one feels the want of an occasional infusion of the bracing air of common sense. It is the voice of a society still inspired with the traditional sentiments of honor and self-respect, but a little afraid of contact with the rough realities of life. Its chivalry is a survival from a past epoch, not a spontaneous outgrowth of the most vital elements of contemporary development. In another generation, such a tone will be adopted by a conscious and deliberate artifice, and be reflected in mere theatrical rant. In the past, it was the natural expression of a

high-spirited race, full of self-confidence and pride in its own vigorous audacity. In this transitional period it has a certain hectic flush, symptomatic of approaching decay; anxious to give a wide berth to realities, and most at home in the borderland where dreams are only half dispelled by the light of common day. "Don Quixote" had sounded the knell of the old romance, but something of the old spirit still lingers, and can tinge with an interest, not yet wholly artificial, the lives and passions of beings who are thus hovering on the outskirts of the living world. The situations most characteristic of Massinger's tendency are in harmony with this tone of sentiment. They are romances taken from a considerable variety of sources, developed in a clearly connected series of scenes. They are wanting in the imaginative unity of the great plays, which show that a true poet has been profoundly moved by some profound thought embodied in a typical situation. He does not, like Shakespeare, seize his subject by the heart, because it has first fascinated his imagination; nor, on the other hand, have we that bewildering complexity of motives and intricacy of plot which shows at best a lawless and wandering fancy; and which often fairly puzzles us in many English plays, and enforces frequent reference to the list of personages in order to disentangle the crossing threads of the action. The plays are a gradual unravelling of a series of incidents, each following intelligibly from the preceding situation, and suggestive of many eloquent observations, though not developments of one master thought. We often feel that, if external circumstances had been propitious, he would have expressed himself more naturally in the form of a prose romance than in a drama. Nor, again, does he often indulge in those exciting and horrible situations which possessed such charms for his contemporaries. There are occasions, it is true, in which this element is not wanting. In "The Unnatural Combat," for example, we have a father killing his son in a duel, by the end of the second act; and when, after a succession of horrors of the worst kind, we are treated to a ghost, "full of wounds, leading in the shadow of a lady, her face leprous," and the worst criminal is killed by a flash of lightning, we feel that we were fully entitled to such a catastrophe. We can only say, in Massinger's words, —

> May we make use of
> This great example, and learn from it that
> There cannot be a want of power above
> To punish murder and unlawful love!

"The Duke of Milan," again, culminates with a horrible scene, rivalling, though with less power, the grotesque horrors of Webster's "Duchess of Malfi." Other instances might be given of concessions to that blood-and-thunder style of dramatic writing for which our ancestors had a never-failing appetite. But, as a rule, Massinger inclines, as far as contemporary writers will allow him, to the side of mercy. Instead of using slaughter so freely that a new set of actors has to be introduced to bury the old — a misfortune which sometimes occurs in the plays of the time — he generally tends to a happy solution, and is disposed not only to dismiss his virtuous characters to felicity, but even to make his villains virtuous. We have not been excited to that pitch at which our passions can only be harmonized by an effusion of blood, and a mild solution is sufficient for the calmer feelings which have been aroused.

This tendency illustrates Massinger's conception of life in another sense. Nothing is more striking in the early stage than the vigor of character of most of these heroes. Individual character, as it is said, takes the place in the modern of fate in the ancient drama. Every man is run in a mould of iron, and may break, but cannot bend. The fitting prologue to the whole literature is provided by Marlowe's Tamburlaine, with his superhuman audacity, and vast bombastic rants, the incarnation of a towering ambition which scorns all laws but its own devouring passion. Faustus, braving all penalties, human and divine, is another variety of the same type; and when we have to do with a weak character like Edward II., we feel that it is his natural destination to be confined in a loathsome dungeon, with mouldy bread to eat and ditch-water to drink. The world is for the daring; and though daring may be pushed to excess, weakness is the one unpardonable offence. A thoroughgoing villain is better than a trembling saint. If Shakespeare's instinctive taste revealed the absurdity of the bombastic exaggeration of such tendencies, his characters are equally unbending. His villains die, like Macbeth and Iago, with their teeth set, and scorn even a deathbed repentance. Hamlet exhibits the unfitness for a world of action of the man who is foolish enough to see two sides to every question. So again, Chapman, the writer who in fulness and fire of thought approaches most nearly to Shakespeare, is

an ardent worshipper of pure energy of character. His Bussy d'Ambois cannot be turned from his purpose even by the warnings of the ghost of his accomplice, and a mysterious spirit summoned expressly to give advice. An admirably vigorous phrase from one of the many declamations of his hero Byron — another representative of the same haughty strength of will — gives his theory of character: —

Give me a spirit that on this life's rough sea
Loves t' have his sail filled with a lusty wind,
Even till his sailyards tremble, his masts crack,
And his rapt ship run on her side so low
That she drinks water, and her keel plows air.

Pure, undiluted energy, stern force of will, delight in danger for its own sake, contempt for all laws but the self-imposed, those are the cardinal virtues and challenge our sympathy even when they lead their possessor to destruction. The psychology implied n Jonson's treating of "humor" is another phase of the same sentiment. The side by which energetic characters lend themselves to comedy is the exaggeration of some special trait which determines their course as tyrannically as ambition governs the character suited for tragedy.

When we turn to Massinger, this boundless vigor has disappeared. The blood has grown cool. The tyrant no longer forces us to admiration by the fulness of his vitality, and the magnificence of his contempt for law. Whether for good or bad, he is comparatively a poor creature. He has developed an uneasy conscience, and even whilst affecting to defy the law, trembles at the thought of an approaching retribution. His boasts have a shrill, querulous note in them. His creator does not fully sympathize with his passion. Massinger cannot throw himself into the situation; and is anxious to dwell upon the obvious moral considerations which prove such characters to be decidedly inconvenient members of society for their tamer neighbors. He is of course the more in accordance with a correct code of morality, but fails correspondingly in dramatic force and brilliance of color. To exhibit a villain truly, even to enable us to realize the true depth of his villany, one must be able for a moment to share his point of view, and therefore to understand the true law of his being. It is a very sound rule in the conduct of life, that we should not sympathize with scoundrels. But the morality of the poet, as of the scientific psychologist, is founded upon the unflinching veracity which sets forth all motives with absolute impartiality. Some sort of provisional sympathy with the wicked there must be, or they become mere impossible monsters or the conventional scarecrows of improving tracts.

This is Massinger's weakest side. His villains want backbone, and his heroes are deficient in simple overmastering passion, or supplement their motives by some overstrained and unnatural crotchet. Impulsiveness takes the place of vigor, and indicates the want of a vigorous grasp of the situation. Thus, for example, "The Duke of Milan," which is certainly amongst the more impressive of Massinger's plays, may be described as a variation upon the theme of "Othello." To measure the work of any other writer by its relation to that masterpiece is, of course, to apply a test of undue severity. Of comparison, properly speaking, there can be no question. The similarity of the situation, however, may bring out Massinger's characteristics. The duke, who takes the place of Othello, is, like his prototype, a brave soldier. The most spirited and effective passage in the play is the scene in which he is brought as a prisoner before Charles V., and not only extorts the admiration of his conqueror, but wins his liberty by a dignified avowal of his previous hostility, and avoidance of any base compliance. The duke shows himself to be a high-minded gentleman, and we are so far prepared to sympathize with him when exposed to the wiles of Francisco — the Iago of the piece. But unfortunately the scene is not merely a digression in a constructive sense, but involves a psychological inconsistency. The gallant soldier contrives to make himself thoroughly contemptible. He is represented as excessively uxorious, and his passion takes the very disagreeable turn of posthumous jealousy. He has instructed Francisco to murder the wife whom he adores in case of his own death during the war, and thus to make sure that she could not marry anybody else. On his return, the wife, who has been informed by the treachery of Francisco of this pleasant arrangement, is naturally rather cool to him; whereupon he flies into a rage and swears that he will

never think of curs'd Marcelia more.

His affection returns in another scene, but only in order to increase his jealousy, and on hearing Francisco's slander he proceeds to stab his wife out of hand. It is the action of a weak man in a passion,

not of a noble nature tortured to madness. Finding out his mistake, he of course repents again, and expresses himself with a good deal of eloquence which would be more effective if we could forget the overpowering pathos of the parallel scene in "Othello." Much sympathy, however, is impossible for a man whose whole conduct is so flighty, and so obviously determined by the immediate demands of successive situations of the play, and not the varying manifestation of a powerfully conceived character. Francisco is a more coherent villain, and an objection made by Hazlitt to his apparent want of motive is at least equally valid against Iago; but he is of course but a diluted version of that superlative villain, as Marcelia is a rather priggish and infinitely less tender Desdemona. The failure, however, of the central figure to exhibit any fixity of character is the real weakness of the play; and the horrors of the last scene fail to atone for the want of the vivid style which reveals an "intense and gloomy mind."

This kind of versatility and impulsiveness of character is revealed by the curious convertibility — if one may use the word — of his characters. They are the very reverse of the men of iron of the previous generation. They change their state of mind as easily as the characters of his contemporary drama put on disguises. We are often amazed at the simplicity which enables a whole family to accept the brother and father to whom they have been speaking ten minutes before as an entire stranger, because he has changed his coat or talks broken English. The audience must have been easily satisfied in such cases; but it requires almost equal simplicity to accept some of Massinger's transformations. In such a play as "The Virgin Martyr," a religious conversion is a natural part of the scheme. Nor need we be surprised at the amazing facility with which a fair Mahommedan is converted in "The Renegado" by the summary assertion that the "juggling prophet" is a cheat and taught a pigeon to feed in his ear. Can there be strength, it is added, in that religion which allows us to fear death? "This is unanswerable," exclaims the lady, "and there is something tells me I err in my opinion." This is almost as good as the sudden thought of swearing eternal friendship. The hardened villain of the first act in the same play falls into despair in the third, and, with the help of an admirable Jesuit, becomes a most useful and exemplary convert by the fifth. But such catastrophes may be regarded as more or less miraculous. The versatility of character is more singular when religious conversions are not in question. "I am certain," says Philanax in "The Emperor of the East" —

> A prince so soon in his disposition altered
> Was never heard nor read of.

That proves that Philanax was not familiar with Massinger's plays. The disposition of princes and of subjects is there constantly altered with the most satisfactory result. It is not merely that, as often happens elsewhere, the villains are summarily forced to repent at the end of a play, like Angelo in "Measure for Measure," in order to allow the curtain to fall upon a prospect of happiness. Such forced catastrophes are common, if clumsy enough. But there is something malleable in the very constitution of Massinger's characters. They repent half way through the performance, and see the error of their ways with a facility which we could wish to be imitated in common life. The truth seems to be that Massinger is subject to an illusion natural enough to a man who is more of the rhetorician than the seer. He fancies that eloquence must be irresistible. He takes the change of mood produced by an elevated appeal to the feelings for a change of character. Thus, for example, in "The Picture"— a characteristic, though not a very successful play — we have a story founded upon the temptations of a separated husband and wife. The husband carries with him a magical picture, which grows dark or bright according to the behavior of the wife, whom it represents. The husband is tempted to infidelity by a queen, herself spoilt by the flatteries of an uxorious husband; and the wife by a couple of courtiers, who have all the vices of Fletcher's worst heroes without any of their attractions. The interest of the play, such as it is, depends upon the varying moods of the chief actors, who become so eloquet under a sense of wrong or a reflection upon the charms of virtue, that they approach the bounds of vice, and then gravitate back to respectability. Everybody becomes perfectly respectable before the end of the play is reached, and we are to suppose that they will remain respectable ever afterwards. They avoid tragic results by their want of the overmastering passions which lead to great crimes or noble actions. They are really eloquent, but even more moved by their eloquence than the spectators can be. They form the kind of

audience which would be most flattering to an able preacher, but in which a wise preacher would put little confidence. And, therefore, besides the fanciful incident of the picture, they give us an impression of unreality. They have no rich blood in their veins; and are little better than lay figures taking up positions as it may happen, in order to form an effective tableau illustrative of an unexceptionable moral.

There is, it is true, one remarkable exception to the general weakness of Massinger's characters. The vigor with which Sir Giles Overreach is set forth has made him the one well-known figure in Massinger's gallery, and the "New Way to Pay Old Debts" showed in consequence more vitality than any of his other plays. Much praise has been given, and rightly enough, to the originality and force of the conception. The conventional miser is elevated into a great man by a kind of inverse heroism, and made terrible instead of contemptible. But it is equally plain that here, too, Massinger fails to project himself fairly into his villain. His rants are singularly forcible, but they are clearly what other people would think about him, not what he would really think, still less what he would say, of himself. Take, for example, the very fine speech in which he replies to the question of the virtuous nobleman, whether he is not frightened by the imprecations of his victims: —

Yes, as rocks are
When foaming billows split themselves against
Their flinty sides; or as the moon is moved
When wolves, with hunger pined, howl at her brightness.
I am of a solid temper, and, like these,
Steer on a constant course; with mine own sword,
If called into the field, I can make that right
Which fearful enemies murmur at as wrong.
Now, for those other piddling complaints
Breath'd out in bitterness, as when they call me
Extortioner, tyrant, cormorant, or intruder
On my neighbor's rights, or grand incloser
Of what was common to my private use,
Nay when my ears are pierced with widows' cries,
And undone orphans wash with tears my threshold,
I only think what 'tis to have my daughter
Right honorable; and 'tis a powerful charm
Makes me insensible to remorse or pity,
Or the least sting of conscience.

Put this into the third person; read "he" for "I" and "his" for "my," and it is an admirable bit of denunciation of a character probably intended as a copy from life. It is a description of a wicked man from outside; and wickedness seen from outside is generally unreasonable and preposterous. When it is converted, by simple alteration of pronouns, into the villain's own account of himself, the internal logic which serves as a pretext disappears, and he becomes a mere monster. It is for this reason that, as Hazlitt says, Massinger's villains — and he was probably thinking especially of Overreach and Luke in "A City Madam" — appear like drunkards or madmen. His plays are apt to be a continuous declamation, cut up into fragments, and assigned to the different actors; and the essential unfitness of such a method of dramatic requirements needs no elaborate demonstration. The villains will have to denounce themselves, and will be ready to undergo conversion at a moment's notice in order to spout openly on behalf of virtue as vigorously as they have spouted in transparent disguise on behalf of vice.

There is another consequence of Massinger's romantic tendency, which is more pleasing. The chivalrous ideal of morality involves a reverence for women, which may be exaggerated or affected, but which has at least a genuine element in it. The women on the earlier stage have comparatively a bad time of it amongst their energetic companions. Shakespeare's women are undoubtedly most admirable and lovable creatures; but they are content to take a subordinate part, and their highest virtue generally includes entire submission to the will of their lords and masters. Some, indeed, have an abundant share of the masculine temperament, like Cleopatra or Lady Macbeth; but then they are by no means model characters. Iago's description of the model woman is a cynical version of the true Shakespearian theory. Women's true sphere, according to him, or according to the modern slang, is domestic life; and, if circumstances force a Cordelia, an Imogen, a Rosalind, or a Viola, to take a more active share in life, they take good care to let us know that they have a woman's heart under their male dress. The weaker characters in Massinger give a higher place to women, and justify it by a sentiment of chivalrous devotion. The excess, indeed, of such submissiveness is often satirized. In "The Roman Actor," "The Emperor of the East," "The Duke of Milan," "The Picture," and elsewhere, we have various phases of uxorious weakness, which suggest possible application to the court of Charles I. Elsewhere, as in "The Maid of Honor" and "The Bashful Lover," we

Digitized by CORNELL UNIVERSITY

are called upon to sympathize with manifestations of a highflown devotion to feminine excellence. Thus, the bashful lover, who is the hero of one of his characteristic dramatic romances, is a gentleman who thinks himself scarcely worthy to touch his mistress's shoestring; on the sight of her exclaims, —

> As Moors salute
> The rising sun with joyful superstition,
> I could fall down and worship. — O my heart!
> Like Phœbe breaking through an envious cloud,
> Or something which no simile can express,
> She shows to me; a reverent fear, but blended
> With wonder and astonishment, does possess me.

When she condescends to speak to him, the utmost that he dares to ask is liberty to look at her, and he protests that he would never aspire to any higher privilege. It is gratifying to add that he follows her through many startling vicissitudes of fortunes in a spirit worthy of this exordium, and of course is finally persuaded that he may allow himself a nearer approach to his goddess. The maid of honor has two lovers who accept a rather similar position. One of them is unlucky enough to be always making mischief by well-meant efforts to forward her interest. He, poor man, is rather ignominiously paid off in downright cash at the end of the piece. His more favored rival listens to the offers of a rival duchess, and ends by falling between two stools. He resigns himself to the career of a knight of Malta, whilst the maid of honor herself retires into a convent. Mr. Gardiner compares this catastrophe unfavorably with that of "Measure for Measure," and holds that it is better for a lady to marry a duke than to give up the world as, on the whole, a bad business. A discussion of that question would involve some difficult problems. If, however, Isabella is better provided for by Shakespeare than Camiola, "the maid of honor," by Massinger, we must surely agree that the maid of honor has the advantage of poor Mariana, whose reunion with her hypocritical husband certainly strikes one as a questionable advantage. Her fate seems to intimate that marriage with a hypocritical tyrant ought to be regarded as better than no marriage at all. Massinger's solution is at any rate in harmony with the general tone of chivalrous sentiment. A woman who has been placed upon a pinnacle by overstrained devotion cannot, consistently with her dignity, console herself like an ordinary creature of flesh and blood. When her worshippers turn unfaithful she must not look out for others. She may permit herself for once to return the affection of a worthy lover; but, when he fails, she must not condescend again to love. That would be to admit that love was a necessity of her life, not a special act of favor for some exceptional proofs of worthiness. Given the general tone of sentiment, I confess that, to my taste, Massinger's solution has the merit, not only of originality, but of harmony. It may, of course, be held that a jilted lady should, in a perfect healthy state of society, have some other alternative besides a convent or an unworthy marriage. Some people, for example, may hold that she should be able to take to active life as a lawyer or a professor of medicine; or they may hold that love ought not to hold so prominent part even in a woman's life, that disappointed passion should involve, as a necessary consequence, the entire abandonment of the world. But, taking the romantic point of view, of which it is the very essence to set an extravagant value upon love, and remembering that Massinger had not heard of modern doctrines of woman's rights, one must admit, I think, that he really shows, by the best means in his power, a strong sense of the dignity of womanhood, and that his catastrophe is more satisfactory than the violent death or the consignment to an inferior lover which would have commended themselves to most Elizabethan dramatists.

The same vein of chivalrous sentiment gives a fine tone to some of Massinger's other plays; to "The Bondman," for example, and "The Great Duke of Florence," in both of which the treatment of lovers' devotion shows a higher sense of the virtue of feminine dignity and purity than is common in the contemporary stage.

There is, of course, a want of reality, an admission of extravagant motives, and an absence of dramatic concentration, which indicate an absence of high imaginative power. Chivalry, at its best, is not very reconcilable with common sense; and the ideal hero is divided, as Cervantes shows, by very narrow distinctions from the downright madman. What was absurd in the more vigorous manifestations of the spirit does not vanish when its energy is lowered, and the rhetorician takes the place of the poet. But the sentiment is still genuine, and often gives real dignity to Massinger's eloquent speeches. It is true that, in apparent inconsistency with this excellence, passages of Massinger are even more deeply stained than

Digitized by CORNELL UNIVERSITY

usual with revolting impurities. Not only are his bad men and women apt to be offensive beyond all bearable limits, but places might be pointed out in which even his virtuous women indulge in language of the indescribable variety. The inconsistency of course admits of an easy explanation. Chivalrous sentiment by no means involves perfect purity, nor even a lofty conception of the true meaning of purity. Even a strong religious feeling of a certain kind is quite compatible with considerable laxity in this respect. Charles I. was a virtuous monarch, according to the admission of his enemies; but, as Kingsley remarks, he suggested a plot to Shirley which would certainly not be consistent with the most lax modern notions of decency. The court of which he was the centre certainly included a good many persons who might have at once dictated Massinger's most dignified sentiments and enjoyed his worst ribaldry. Such, for example, if Clarendon's character of him be accurate, would have been the supposed "W. H.," the eldest of the two Earls of Pembroke, with whose family Massinger was so closely connected. But it is only right to add that Massinger's errors in this kind are superficial, and might generally be removed without injury to the structure of his plays.

I have said enough to suggest the general nature of the answer which would have to be made to the problem with which I started. Beyond all doubt, it would be simply preposterous to put down Massinger as a simple product of corruption. He does not mock at generous, lofty instincts, or overlook their influence as great social forces. Mr. Ward quotes him as an instance of the connection between poetic and moral excellence. The dramatic effectiveness of his plays is founded upon the dignity of his moral sentiment; and we may recognize in him "a man who firmly believes in the eternal difference between right and wrong," I subscribe most willingly to the truth of Mr. Ward's general principle, and, with a certain reservation, to the correctness of this special illustration. But the reservation is an important one. After all, can anybody say honestly that he is braced and invigorated by reading Massinger's plays? Does he perceive any touch of what we feel when we have been in company, say, with Sir Walter Scott; a sense that our intellectual atmosphere is clearer than usual, and that we recognize more plainly than we are apt to do the surpassing value of manliness, honesty, and pure domestic affection? Is there not rather a sense that we have been all the time in an unnatural region, where, it is true, a sense of honor and other good qualities come in for much eloquent praise, but where, above everything, there is a marked absence of downright, wholesome common sense? Of course the effect is partly due to the region in which the old dramatists generally sought for their tragic situations. We are never quite at home in this fictitious cloudland, where the springs of action are strange, unaccountable, and altogether different from those with which we have to do in the work-a-day world. A great poet, indeed, weaves a magic mirror ont of these dreamlike materials, in which he shows us the great passions, love, and jealousy, and ambition, reflected upon a gigantic scale. But, in weaker hands, the characters become eccentric instead of typical; his vision simply distorts instead of magnifying the fundamental truths of human nature. The liberty which could be used by Shakespeare becomes dangerous for his successors. Instead of a legitimate idealization, we have simply an abandonment of any basis in reality.

The admission that Massinger is moral must therefore be qualified by the statement that he is unnatural; or, in other words, that his morality is morbid. The groundwork of all the virtues, we are sometimes told, is strength and manliness. A strong nature may be wicked, but a weak one cannot attain any high moral level. The correlative doctrine in literature is, that the foundation of all excellence, artistic or moral, is a vivid perception of realities and a masculine grasp of facts. A man who has that essential quality will not blink the truths which we see illustrated every day around us. He will not represent vice as so ugly that it can have no charms, so foolish that it can never be plausible, or so unlucky that it can never be triumphant. The robust moralist admits that vice is often pleasant, and that wicked men flourish like a green bay-tree. He cannot be over-anxious to preach, for he feels that the intrinsic charm of high qualities can dispense with any artificial attempts to bolster them up by sham rhetoric, or to slur over the hard facts of life. He will describe Iago as impartially as Desdemona; and, having given us the facts, leave us to make what we please of them. It is the mark of a more sickly type of morality, that it must always be distorting the plain truth. It becomes sentimental, because it wishes to believe

that what is pleasant must be true. It makes villains condemn themselves, because such a practice would save so much trouble to judges and moralists. Not appreciating the full force of passions, it allows the existence of grotesque and eccentric motives. It fancies that a little rhetoric will change the heart as well as the passing mood, and represents the claims of virtue as perceptible on the most superficial examination. The morality which requires such concessions becomes necessarily effeminate; it is unconsciously giving up its strongest position by implicitly admitting that the world in which virtue is possible is a very different one from our own.

The decline of the great poetic impulse does not yet reveal itself by sheer blindness to moral distinctions, or downright subservience to vice. A lowered vitality does not necessarily imply disease, though it is favorable to the development of vicious germs. The morality which flourishes in an exhausted soil is not a plant of hardy growth and tough fibre, nourished by rough common sense, flourishing amongst the fierce contests of vigorous passions, and delighting in the open air and the broad daylight. It loves the twilight of romance, and creates heroes impulsive, eccentric, extravagant in their resolves, servile in their devotion, and whose very natures are more or less allied to weakness and luxurious self-indulgence. Massinger, indeed, depicts with much sympathy the virtues of the martyr and the penitent; he can illustrate the paradox that strength can be conquered by weakness, and violence by resignation. His good women triumph by softening the hearts of their persecutors. Their purity is more attractive than the passions of their rivals. His deserted king shows himself worthy of more loyalty than his triumphant persecutors. His Roman actor atones for his weakness by voluntarily taking part in his own punishment.

Such passive virtues are undoubtedly most praiseworthy; but they may border upon qualities not quite so praiseworthy. It is a melancholy truth that your martyr is apt to be a little sanctimonious, and that a penitent is sometimes a bit of a sneak. Resignation and self-restraint are admirable qualities, but admirable in proportion to the force of the opposing temptation. The strong man curbing his passions, the weak woman finding strength in patient suffering, are deserving of our deepest admiration; but in Massinger we feel that the triumph of virtue implies rather a want of passion than a power of commanding it, and that resignation is comparatively easy when it connotes an absence of active force. The general lowering of vitality, the want of rigid dramatic coloring, deprive his martyrs of that background of vigorous reality against which their virtues would be forcibly revealed. His pathos is not vivid and penetrating. Truly pathetic power is produced only when we see that it is a sentiment wrung from a powerful intellect by keen sympathy with the wrongs of life. We are affected by the tears of a strong man; but the popular preacher who enjoys weeping produces in us nothing but contempt. Massinger's heroes and heroines have not, we may say, backbone enough in them to make us care very deeply for their sorrows. And they moralize rather too freely. We do not want sermons, but sympathy, when we are in our deepest grief; and we do not feel that any one feels very keenly who can take his sorrows for a text, and preach in his agony upon the vanity of human wishes or the excellence of resignation.

Massinger's remarkable flow of genuine eloquence, his real dignity of sentiment, his sympathy for virtuous motive, entitle him to respect; but we cannot be blind to the defect which keeps his work below the level of his greatest contemporaries. It is, in one word, a want of vital force. His writing is pitched in too low a key. He is not invigorating, stimulating, capable of fascinating us by the intensity of his conceptions. His highest range is a dignified melancholy or a certain chivalrous recognition of the noble side of human nature. The art which he represents is still a genuine and spontaneous growth instead of an artificial manufacture. He is not a mere professor of deportment, or maker of fine phrases. The days of mere affectation have not yet arrived; but, on the other hand, there is an absence of that grand vehemence of soul which breathes in the spontaneous, if too lawless, vigor of the older race. There is something hollow under all this stately rhetoric; there are none of those vivid phases which reveal minds moved by strong passions and excited by new aspects of the world. The sails of his verse are not, in Chapman's phrase, "filled with a lusty wind," but moving at best before a steady breath of romantic sentiment, and sometimes flapping rather ominously for want of true impulse. High thinking may still be there, but it is a little self-conscious, and in need of artificial stimulant. The old strenuous line has disappeared, or gone

elsewhere — perhaps to excite a Puritan imagination, and create another incarnation of the old type of masculine vigor in the hero of "Paradise Lost."

This story ("GREEN PASTURES AND PICCADILLY"), *being written partly in collaboration with an American author, is copyrighted both in this country and in England, and is printed in* THE LIVING AGE *from Harper's Bazar, by arrangement with Harper & Brothers.*

GREEN PASTURES AND PICCADILLY.

BY WILLIAM BLACK,

AUTHOR OF "THE PRINCESS OF THULE," "THE ADVENTURES OF A PHAETON," ETC.,

In conjunction with an American writer.

[Entered according to Act of Congress, in the Year 1877, by HARPER & BROTHERS, in the Office of the Librarian of Congress, at Washington.]

CHAPTER XLIII.

IN ENGLAND.

"I AM not frightened, but stunned — completely stunned," said Balfour, his hands on his knees, his head bent down. The ever faithful Jewsbury had at once gone to him on hearing the news; and now the small man with the blue spectacles stood confronting him, all the joyousness gone out of his resonant voice. "I feel there must be a clean sweep. I will go down to the Lilacs, and send over one or two things belonging to — to my wife — to her father's; then everything must go. At present I feel that I have no right to spend a shilling on a telegram —— "

"Oh," said Mr. Jewsbury, "when the heavens rain mountains, you needn't be afraid of stones." What he exactly meant by this speech he himself probably scarcely knew. He was nervous, and very anxious to appear the reverse. "Nobody will expect you to do anything *outré*. You won't bring down the debts of the firm by giving up the postage-stamps in your pocket-book; and of course there will be an arrangement; and — and there are plenty of poor men in the House —— "

"I have just sent a message down to Englebury," he said, showing but little concern. "I have resigned."

"But why this frantic haste?" remonstrated his friend, in a firmer voice. "What will you do next? Do you imagine you are the only man who has come tumbling down and has had to get up again — slowly enough, perhaps?"

"Oh no; not at all," said Balfour, frankly. "I am in no despairing mood. I only want to get the decks clear for action. I have got to earn a living somehow, and I should only be hampered by a seat in Parliament."

"Why, there are a hundred things you could do, and still retain your seat!" his friend cried. "Go to some of your friends in the late government, get a private secretaryship, write political articles for the papers — why, bless you, there are a hundred ways —— "

"No, no, no," Balfour said, with a laugh, "I don't propose to become a bugbear to the people I used to know — a man to be avoided when you catch sight of him at the end of the street, a button-holer, a perpetual claimant. I am off from London, and from England too. I dare say I shall find some old friend of my father's ready to give me a start — in China or Australia — and as I have got to begin life anew, it is lucky the blow fell before my hair was gray. Come, Jewsbury, will you be my partner? We will make our fortune together in a half-dozen years. Let us go for an expedition into the Bush. Or shall we have a try at Peru? I was always certain that the treasures of the Incas could be discovered."

"But, seriously, Balfour, do you mean to leave England?" the clergyman asked.

"Certainly."

"Lady Sylvia?"

The brief glimpse of gayety left his face instantly.

"Of course she will go to her father's when she returns from America," said he, coldly.

"No she will not," replied his friend, with some little warmth. "I take it, from what you have told me of her, that she is too true a woman for that. It is only now you will discover what a good wife can be to a man. Send for her. Take her advice. And see what she will say if you propose that she should abandon you in your trouble and go back to her father! See what she will say to that!"

Jewsbury spoke with some vehemence, and he did not notice that his companion had become strangely moved. It was not often that Balfour gave way to emotion.

"Why," said he; and then he suddenly rose and took a turn up and down the room, for he could not speak for a moment. "Jewsbury, she left me! She left me!"

"She left you?" the other vaguely repeated, staring at the young man, who stood there with clinched hands.

"Do you think," Balfour continued rapidly, with just a break here and there in

his voice, "that I should be so completely broken down over the loss of that money? I never cared for money much. That would not hurt me, I think. But it is hard, when you are badly hit, to find ——"

He made a desperate effort to regain his composure, and succeeded. He was too proud to complain. Nay, if the story had to be told now, he would take all the blame of the separation on himself, and try to show that his wife had fair grounds for declaring their married life unendurable. Mr. Jewsbury was a little bit bewildered, but he listened patiently.

"You have done wrong in telling me all that," said he at last. "I need never have known, for I see how this will end. But how fortunate you were to have that friend by you in such a crisis, with her happy expedient. No one but a married woman could have thought of it. If you had formally separated — if she had gone back to her father's — that would have been for life."

"How do you know this is not?"

"Because I believe every word of what that lady friend of hers said to you. And if I don't mistake," he added, slowly, "I don't think you will find this loss of money a great misfortune. I think if you were at this moment to appeal to her — to suggest a reconciliation — you would see with what gladness she would accept it."

"No," said the other, with some return to his ordinary reserve and pride of manner. "She left me of her own free-will. If she had come back of her own free-will, well and good. But I can not ask her to come now. I don't choose to make an *ad misericordiam* appeal to any one. And if she found that my Parliamentary duties interfered with her notion of what our married life should be, what would she think of the much harder work I must attack somewhere or other if I am to earn a living? She would not accompany me from Surrey to Piccadilly: do you think she would go to Shanghai or Melbourne?"

"Yes," said his friend.

"I, at least, will not ask her," he said. "Indeed, I should be quite content if I knew that her father could provide her with a quiet and comfortable home; but I fear he won't be able to hold on much longer to the Hall. She was happy there," he added, with his eyes grown thoughtful. "She should never have left it. The interest she tried to take in public affairs — in any thing outside her own park — was only a dream, a fancy; she got to hate every thing connected with the actual business of the world almost directly after she was married ——"

"Why?" cried his friend, who had as much shrewdness as most people. "The cause is clear — simple — obvious. Public life was taking away her husband from her a trifle too much. And if that husband is rather a reserved person, and rather inclined to let people take their own way, instead of humoring them and reasoning with them ——"

"Well, now, I think you are right there," said Balfour with some eagerness. "I should have tried harder to persuade her. I should have had more consideration. I should not have believed in her refusals. "But there," he added, rising, "it is all over now. Will you go out for a stroll, Jewsbury? I sha'n't bore you with another such story when you take a run out to see me at Melbourne."

Now it happened that when they got out into Piccadilly the Kew omnibus was going by, and the same project struck both friends at the one moment — for the wilder part of the gardens had at one time been a favorite haunt of theirs. A second or two afterward they were both on the top of the omnibus, driving through the still, warm air, greatly contented, and not at all afraid of being seen in that conspicuous position. The brisk motion introduced some cheerfulness into their talk.

"After all, Balfour," said Mr. Jewsbury, with philosophic resignation, "there are compensations in life, and you may probably live more happily outside politics altogether. There was always the chance — I may say so now — of your becoming somebody; and then you would have gone on to commit the one unforgivable sin — the sin that the English people never condone. You might have done signal service to your country. You might have given up your days and nights, you might have ruined your health, you might have sacrificed all your personal interests and feelings, in working for the good of your fellow-countrymen; and then you know what your reward would have been. That is the one thing the English people cannot forgive. You would have been jeered at and ridiculed in the clubs; abused in the papers; taunted in Parliament; treated everywhere as if you were at once a self-seeking adventurer, a lunatic, and a fiend bent on the destruction of the State. If you had spent all your fortune on yourself, given up all your time to your own pleasures, paid not the slightest attention to anybody around you except in so far as they ministered to your comfort, then you would

have been regarded as an exemplary person, a good man, and honest Englishman. But if you had given up your whole life to trying to benefit other people through wise legislation, then your reward would be the pillory, for every coward and sneak to have his fling at you."

"My dear Jewsbury," Balfour said with a rueful smile, "it is very kind of you to insist that the grapes are sour."

"Another advantage is that you will have added a new experience to your life," continued the philosopher, who was bent on cheering his friend up a bit, "and will be in so much the completer man. The complete man is he who has gone through all human experiences. Time and the law are against any single person doing it; but you can always be travelling in that direction."

"One ought, for example, to pick a pocket and get sent to prison?"

"Certainly."

"And run away with one's neighbor's wife?"

"Undoubtedly."

"And commit a murder?"

"No," replied this clerical person, "for that might disturb the experiment — might bring it to an end, in fact. But there can be no doubt that Shakespeare committed several diabolical murders, and was guilty of the basest ingratitude, and was devoured with the most fiendish hatred — in imagination. In turns he was a monster of cupidity, of revenge, of bloodthirstiness, of cowardice. Other men, who have not the power to project themselves in this fashion can only learn through action. It therefore follows that the sooner you get yourself sent to the treadmill, the better."

"And indeed I suppose I am nearer it now than I was a week ago," Balfour admitted. "And perhaps I shall soon begin to envy and imitate my esteemed father-in-law in the little tricks by which he earns a few sovereigns now and again. I used to be very severe on the old gentleman, but I may have to take to sham companies myself."

With this and similar discourse the two sages passed the time until they arrived at Kew. It will be observed that as yet it was only a theoretical sort of poverty that had befallen Balfour. It was a sort of poverty that did not prevent the two friends from having a fairly comfortable luncheon at a hotel down there, or from giving up the day to idle sauntering through the wilder and uncultivated portion of the gardens, or from indulging in useless guesses as to what might have been had Balfour been able to remain in Parliament.

"But in any case you will come back," continued Mr. Jewsbury, who was trying to espy a squirrel he had seen run up the trunk of an elm; "and you will be burdened with wealth and rich in knowledge. Then, when you get into Parliament, shall I tell you what you must do? Shall I give you a project that will make your name famous in the political history of your country?"

"It won't be of much use to me," was the answer; "but I know one or two gentlemen down at Westminster who would be glad to hear of it."

"Take my proposal with you now. Brood over it. Collect facts wherever you go. Depend on it ——"

"But what is it?"

"The total abolition of that most pernicious superstition — trial by jury. Why, man, I could give you the heads of a speech that would ring through the land. The incorruptibility of the English bench — the vast learning, the patience, the knowledge of the world, the probity, of our judges. Then you draw a picture of one of these judges laboriously setting out the facts of a case before the jury, and of his astonishment at their returning a verdict directly in the teeth of the evidence. Think of the store of anecdotes you could amass to get the House into a good humor. Then a burst of pathetic indignation. Whose reputation, whose fortune, is safe if either depends on the verdict of twelve crass idiots? A bit of flash oratory on the part of a paid pleader may cost a man a couple of thousand pounds in the face of common sense and justice. Balfour," said Mr. Jewsbury, solemnly, "the day on which the verdict in the Tichborne case was announced was a sad day for me."

"Indeed," said the other. "I have got an uncle-in-law who believes in Tich yet. I will give you a note of introduction to him, and you might mingle your tears."

"I was not thinking of Tich," continued Mr. Jewsbury, carefully plaiting some long grass together; "I was thinking of this great political project which I am willing to put into your hands; it will keep a few years. And I was thinking what a great opportunity was lost when those twelve men brought in a verdict that Arthur Orton was Arthur Orton. I had almost counted on their bringing in a verdict that Arthur Orton was Roger Tichborne; but if that was too much to hope for, then, at least, I took it for granted that they would

disagree. That single fact would have been of more use to you than a hundred arguments. Armed with it, you might have gone forward single-handed to hew down this monstrous institution." And here Mr. Jewsbury aimed a blow at a mighty chestnut-tree with the cord of grass he had plaited. The chestnut-tree did not tremble.

"However, I see you are not interested," the small clergyman continued. "That is another fact you will learn. A man without money pays little heed to the English Constitution, unless he hopes to make something out of it. What is the immediate thing you mean to do?"

"I can do nothing at present," Balfour said, absently. "The lawyers will be let loose, of course. Then I have written to my wife requesting her — at least making the suggestion that she should give up the money paid to her under the marriage settlement ——"

"Stop a bit," said Mr. Jewsbury. "I won't say that you have been quixotic; but don't you think that, before taking such a step, you ought to have got to know what the — the custom is in such things — what commercial people do — what the creditors themselves would expect you to do?"

"I cannot take any one's opinion on the point," Balfour said, simply. "But of course I only made the suggestion in informing her of the facts. She will do what she herself considers right."

"I cannot understand your talking about your wife in that tone," said Jewsbury, looking at the impassive face.

"I think they mean to transfer — to the Lords," said Balfour, abruptly; and so for a time they talked of Parliamentary matters, just as if nothing had happened since Balfour left Oxford. But Jewsbury could see that his companion was thinking neither of Lords nor Commons.

And indeed it was he himself, despite all his resolve, who wandered back to the subject; and he told Jewsbury the whole story over again, more amply and sympathetically than before; and he could not give sufficient expression to the gratitude he bore toward that kind and gracious and generous friend down there in Surrey who had lent him such swift counsel and succor in his great distress.

"And what do you think of it all, Jewsbury?" said he, with all the proud reserve gone from his manner and speech. "What will she do? It was only a sort of probationary tour, you know — she admitted that; there was no definite separation —"

Mr. Jewsbury gave no direct answer.

"Much depends," he said, slowly, "on the sort of letter you wrote to her. From what you say, I should imagine it was very injudicious, a little bit cruel, and likely to make mischief."

From Blackwood's Magazine.

THE IRONY OF LIFE.

In the second volume of the "Philological Museum," published at Cambridge in 1833, there is an article by the late Bishop Thirlwall on "The Irony of Sophocles," which is marked by all that great scholar's subtlety of thought and mastery of classical learning. He distinguishes between *verbal* and *practical* irony, the former of which he defines "as a figure which enables the speaker to convey his meaning with greater force by means of a contrast between the thought and expression — or, to speak more accurately, between the thought which he evidently designs to express, and that which his words properly signify." Practical irony in life is the contrast between the real and apparent state of things which environ the subject of it, whether it be a kingdom, a commonwealth, a society, or an individual. The word seems originally to have been applied to the peculiar mode of disputation adopted by Socrates. This consisted in a playful entanglement of his opponent in admissions, which, while appearing to support and strengthen the argument of that opponent, in reality involved him in an absurd conclusion. He was made to take the bait, all unconscious of the hook by which he was to be captured. There was a perfect antagonism between the appearance and the fact — the appearance being the assurance of victory, the fact the certainty of defeat; and the defeat was brought about by the use of the very weapons on which the disputant relied for success. This the Greeks called Εἰρωνεία. It may be described as the irony of the fallacies, and is different from verbal irony in the modern sense of the word. One reason why verbal irony is so powerful an instrument of speech, is because contrast is a law of the association of ideas. The image of a thing suggests the idea of its opposite. But another reason is, that the very disparity of the language used assists the mind in measuring the contrast, just as the force of a blow is proportionate to the recoil. By seeming to deny to an object its proper attribute, we instantly

conjure up the thought of what that attribute is, and we feel it more strongly in consequence of the incongruity of the term applied. What are some of the most endearing epithets with which we accost the darlings of our hearts — our little ones? What father or mother scruples, or rather in the very gush and effusion of love, is not almost compelled, to address a laughing infant in words which, taken literally, would be strangely and shockingly wrong? "You little rogue!" comes as spontaneously to the lips as "You little darling!" and each expression is but the equivalent of the other. Coleridge has, in his continuation of "Christabel" — alas! only a fragment — tried to give an explanation of this, which is perhaps not very far from the mark, although we think that the one we have already suggested is the true one. But there can be no question about the beauty of the lines.

> A little child, a limber elf,
> Singing, dancing to itself,
> A fairy thing, with red round cheeks,
> That always finds and never seeks,
> Makes such a vision to the sight
> As fills a father's eyes with light;
> And pleasures flew in so thick and fast
> Upon his heart, that he at last
> Must needs express his love's excess
> In words of unmeant bitterness.
> Perhaps 'tis pretty to force together
> Thoughts so all unlike each other;
> To utter and mock a broken charm,
> To dally with wrong that does no harm;
> Perhaps 'tis tender too and pretty,
> At each wild word to feel within
> A sweet recoil of love and pity.

The last explanation is not very different from our own, only we think it is not so much "the sweet recoil of love and pity" which "each wild word" produces in the mind, as the suggestion of thoughts of tenderness and love which the very wildness of the words forces irresistibly on the heart.

In order to appreciate irony there must be some sense of humor. The essays of Elia are full of it; and their chief charm would be lost on the reader who took everything literally, or, to use Charles Lamb's own expression, "on the square." How helplessly he would flounder in the "Sartor Resartus" of Carlyle! There is an essay by De Quincey on "Murder considered as one of the Fine Arts," which is in the finest style of irony; and we once spoke of it in terms of high praise to a person in an official position, and strongly recommended him to read it. We lent him the book for the purpose; but in a few days he returned it to us with a note in which he said that he did not like the article at all, and thoroughly disapproved of it, for it dealt far too lightly with one of the most dreadful of crimes, and seemed almost to encourage it!

There are some excellent examples of verbal irony in the Bible. There must have been something in the tone of Micaiah when, summoned to foretell the issue of the approaching battle at Ramoth-Gilead between the kings of Israel and Judah on the one side, and the king of Syria on the other, he said, "Go ye up and prosper, and they shall be delivered into your hand," — something which betrayed a contradiction between his words and his meaning; for Ahab immediately detected the concealed irony, and asked, "How many times shall I adjure thee that thou say nothing but the truth to me in the name of the Lord?" And then came the truth from the lips of the prophet which predicted the defeat of Israel, and consigned himself to a dungeon, to eat "the bread of affliction" and drink "the water of affliction."

In the apostrophe of Elijah to the priests of Baal on Mount Carmel, when he mocked them, and said, "Cry aloud: for he is a god; either he is talking, or he is pursuing, or he is in a journey, or peradventure he sleepeth and must be awaked;" there is perhaps banter rather than irony. The prophet assumes the truth of the hypothesis that Baal is a god. If so, then surely there must be a good reason why he does not hear the cry of his votaries — he must be otherwise engaged. And we must remember that, according to pagan ideas, there was nothing in the occupations suggested by Elijah incompatible with the dignity of a deity. The mythology of Greece is full of anecdotes which show that its gods might be worse and less rationally employed. The irony consists, we think, in the implied contrast between such an idea of the divinity of Baal and the divinity of Jehovah, the God of Israel. But there is no contradiction between the words and the meaning. Elijah puts himself in the position of the priests themselves. And from their point of view his explanation of the cause why Baal is deaf to their entreaties is reasonable enough. But at the same time he shows how ludicrous it is to suppose that Baal is really a god — "for peradventure he sleepeth, and must be awaked." This is properly banter, or what the French call *badinage;* just as irony with them is *persiflage.* Real irony seems to stand

midway between banter and sarcasm. Banter is the playful, and sarcasm the ferocious form of irony. In the etymology of sarcasm, however, there is nothing to suggest the idea of irony. It literally means a "tearing of the flesh," but in modern usage it generally implies irony in its bitterest form.

We think that the key to many of the passages in the book of Ecclesiastes which seem to inculcate mere selfishness, and a reckless disregard of everything except present and sensual enjoyment, is that they are to be taken in an ironical sense. After a reign of unexampled splendor and magnificence, Solomon had found that all was vanity and vexation of spirit; and the wisest of men must have been a fool if he could seriously propound, as sufficient for happiness, such maxims as that "there is nothing better for a man than that he should eat and drink, and that he should make his soul enjoy good in his labors:" and "Go thy way, eat thy bread with joy, and drink thy wine with a merry heart; for God now accepteth thy works. Let thy garments be always white; and let thy head lack no ointment. Live joyfully with the wife whom thou lovest all the days of the life of thy vanity, which he hath given thee under the sun, all the days of thy vanity; for that is thy portion in this life." Solomon had tried all this, and the apples of Issachar had turned to ashes on his lips. It is not likely, therefore, that he should recommend in earnest to others the fruit which had been so bitter to himself. No; the true meaning and solution of the riddle is to be found in the verse towards the end of the book: "Rejoice, O young man, in thy youth; and let thy heart cheer thee in the days of thy youth; and walk in the ways of thine heart, and in the sight of thine eyes: *but know thou, that for all these things God will bring thee into judgment.*"

But let us now turn to Sophocles. The best example of the practical irony of life which his plays afford is the "Œdipus Tyrannus." A pestilence rages at Thebes, of which Œdipus is king. The gods are appealed to in vain. Altars have blazed with fire and reeked with incense in the temples. The oracle of Delphi is consulted, and the answer of the priestess is, "The land suffers under a curse, owing to a dreadful murder. The crime must be expiated, and the pollution purged away." But what was the murder, and who is the murderer? Tiresias, the blind seer, is sent for; and after refusing to answer, and having been taunted by Œdipus with his blindness, he at last bids the monarch obey the behest of his own proclamation, and, as the perpetrator of the crime, end his own unhallowed life. The chorus asks in all simplicity, "Who is the guilty wretch? Does he hide himself in lonely forest or secluded glen?" Who can believe that he is now sitting on the throne, the husband of Jocasta, and lord of Thebes? But a herdsman comes and unfolds the fatal truth that Œdipus is the murderer, the assassin of his father and now the wedded husband of his own mother. In the agony of remorse the king deprives himself of sight — sinking into the depths of despair under the double weight of his two involuntary crimes of parricide and incest.

Here we see the irony of the situation in all its force. Not only is there the contrast between the apparent glory and happiness of Œdipus, the exalted monarch and beloved husband, and his real wretchedness as an incestuous parricide; but we see that in his proclamation he unconsciously denounces himself, and that the pains he takes to discover the author of the crime are the means by which he brings home that crime to himself.

In the "Trachiniæ" we have another example of the irony of fate. When Nessus, in his attempt to carry off Dejaneira, received his death-wound from the arrow of Hercules, he gave her a subtle poison which he pretended would act as a philtre or love-charm, in case at any time she was in danger of losing the affections of her husband. Hercules, in one of his frequent absences from her while he followed his roving and quixotic life, took a city in Eubœa, and made captive the inhabitants. Amongst them was a royal princess, of whom the inconstant chieftain became enamored, and he brought her in this train, intending to make her his wife. We suppose that bigamy was allowed in those days. The news reaches Dejaneira that Hercules is coming home, accompanied by her rival. She bethinks herself of the gift of Nessus; and dipping a festal robe in the poison, she sends it to Hercules, that he may wear it while he sacrifices to the gods in honor of his victory and as a thanksgiving for his safe return. In all the glory of his triumph, and by the side of his captive bride, he puts on the fatal dress, and dies in horrible torments. Dejaneira, finding that the robe which she had fondly imagined would inspire her husband with his former love for her had been the cause of his death, commits suicide, horror-stricken at the thought of her fatal mistake. Here we have the

bitter contrast between semblance and reality. The moment of joy and triumph to Hercules is the moment of excruciating torture. The gift of a wife's affection is the messenger of death.

We write from memory, amidst the wild mountains of Switzerland, not having access to the article in question, and, indeed, hardly to any books at all; but we believe that Bishop Thirlwall finds in the "Œdipus at Colonus," the "Antigone," and the "Ajax," other instances of the irony of Sophocles. Our impression, however, is, that these illustrations are rather far-fetched, and more ingenious than real.

Let us pass from Sophocles to Shakespeare. It would be easy to quote from his plays many examples of the irony of fate; but we will content ourselves with citing the lines in which Wolsey, in "Henry VIII.," describes the irony of his own life, and, beginning with generalization, ends with a melancholy application to himself: —

This is the state of man: to-day he puts forth
The tender leaves of hope; to-morrow blossoms,
And bears his blushing honors thick upon him;
The third day comes a frost, a killing frost,
And when he thinks — good easy man — full surely
His greatness is a ripening, nips his root,
And then he falls, as I do. I have ventured,
Like little wanton boys that swim on bladders,
These many summers in a sea of glory;
But far beyond my depth: my high-blown pride
At length broke under me, and now has left me,
Weary and old with service, to the mercy
Of a rude stream that must forever hide me.

In fiction we do not know a more terrible example of the irony of situation than that which is given by Victor Hugo in his "*Les Misérables.*" There the convict, Jean Valjean, having escaped from the galleys, succeeds in elevating himself to the position of mayor in a provincial town. He wins the respect and esteem of all the inhabitants, and is distinguished by his benevolence, his probity and his justice. But he had in his flight taken a sum of money from a passenger on the highway, and another is falsely accused of the crime. Jean Valjean hears of this, and rather than that an innocent man should suffer, resolves to appear in the criminal court and avow himself guilty of the theft, with the certainty that his identity as an escaped *forçat* will be discovered, and he will be again consigned to the hulks. We think that the story of his journey to the assize town, and the mental conflict which he has to undergo, is one of the most thrilling narratives in the whole range of fiction; and the moment when he reveals himself in court, not as the upright magistrate but the condemned convict, strains the feelings of the reader to the most painful pitch of intensity. The depth of the fall is measured by the height of the former rise.

But we need not go to the drama and works of imagination to supply examples of the irony of fate. History is full of it, and human life is full of it. Sometimes it shows itself with terrific grandeur in the sudden crash of an empire, as on that fatal night in Babylon when "Belshazzar the king made a great feast to a thousand of his lords, and drank wine before the thousand." Then and there, amidst the blaze of lights and sound of festive music, the mysterious handwriting came forth and proclaimed the doom which the sword of Darius the Median was already accomplishing in the streets of the devoted city. "In that night was Belshazzar the king of the Chaldeans slain, and Darius the Median took the kingdom." Sometimes it assumes the form of slow wasting decay, which eats into the heart of power, while all around seems smiling and secure. Such was the state of the Roman empire when the throne of the Cæsars was undermined by luxury and vice. The apparent prosperity was only the prelude to the ruinous catastrophe. And the peculiar irony of the situation was, that the very strength of the despotism became the weakness and ruin of the State. A conspicuous example of this is seen in the fall of the first Napoleon. His victories were the cause of his overthrow. His never-satisfied ambition made him the enemy of every European kingdom, and at last forced on the coalition that destroyed him. The conqueror of Europe — the ruler over the largest empire which the world had seen since the time of Charlemagne — was at last chained like Prometheus to a rock, and confined to the petty limits of a distant island in the Atlantic, and there condemned to "eat his life away."

There is also an irony of nature. There is something pathetic in the thought that few things are more beautiful than a ruin. Those mouldering walls over whose moss-grown stones the ivy has thrown its mantle of green — those broken casements through which in olden times brave warriors and fair ladies looked, and where the wallflower, the foxglove, and the harebell

shed their wild beauty, are more lovely now than when they were full of the motion of life, and stood in all their pride of feudal strength. For nature is covering decay with bloom and beauty, and adorning the sepulchre of the past with her sweetest flowers and her loveliest colors. And who has not felt in some moment of bitterness and sorrow, when his heart is bursting with grief, how pitiless seems the irony of nature which almost mocks him with her joyousness, and makes him realize the sharpness of the contrast between his own misery and the laughing loveliness of stream and grove and mountain and meadow around him? It was this that inspired Burns with those touching lines, —

> Ye banks and braes o' bonnie Doon,
> How can ye bloom sae fresh and fair?
> How can ye chant, ye little birds,
> And I sae weary fu' o' care?
> Thou'lt break my heart, thou warbling bird,
> That wantons thro' the flowering thorn:
> Thou minds me o' departed joys,
> Departed — never to return!

We have often thought that there is irony in the fact that houses and villages cluster on the slopes and at the feet of Ætna and Vesuvius. The grim mountains rear their bare crests aloft, and in their bosom sleeps the volcanic fire ready at any moment to burst forth and pour the destructive lava over the plain. But vegetation clothes the sides, and a carpet of flowers is spread around like garlands on the neck of a victim. Men and women pursue their rustic labors, and little children play all forgetful of the danger that lurks beneath their feet. It seems impossible to believe that such a scene of beauty and tranquillity may in an instant be changed to a blackened mass of ruin; and so they go on until the curl of dark smoke gives the signal for the earthquake shock and the awful burst of the volcano.

But the irony of human life is everywhere — at home, in society, and in ourselves. The bloom on the cheek of that lovely girl, the delight and pride of the household, is not the bloom of health, but the hectic hue of consumption, which counterfeits its semblance.

Look at that troop of ballet-dancers, with their bright dresses and glittering spangles and joyous movements, and follow one of them, when she has gone through the labors of the night in an applauding theatre, to her poverty-stricken home. The pittance she earns is hardly sufficient to buy food for her mother and sisters, who, in their threadbare apparel and badly-furnished room, have to fight the grim battle of life against want and hunger.

But a still sadder case of irony is that of some poor wanderer of the night who shivers in the cold air beneath her thin dress of gaudy silk, and affects a desperate gayety to attract the notice of those "who force from famine the caress of love." "But the pity of it, Iago; oh, the pity of it!"

That youthful politician whose position in the House of Commons, as the member for a popular constituency, is the envy of his associates, is perhaps devoured by the pangs of dissatisfied ambition, and full of wrath against the minister who has not appreciated his merits. This is irony indeed.

Then there is the irony of married life. We do not speak of an open breach of the marriage vow, although this often falls, like a thunderbolt in a serene sky, upon the unsuspecting wife or husband; nor yet of the false position of him, or her, who, although tortured by jealousy, is unable to discard affection; "who doubts, yet doats; suspects yet strongly loves." But dissimilarity of tastes or incompatibility of temper may make home a misery, while, to society and the world, all there seems to be the sunshine of happiness. Who would suspect that the smiling couple so affable and gracious in mixed company, pass many of their hours when alone together in sulky silence or mutual reproaches? The conventional mask is there thrown off, and the real features are seen, which are anything but pleasant. Sir John and Lady Teasewell lead a cat-and-dog life at home, although they appear like two turtle-doves abroad. We once knew the case of a husband and wife who lived in the same house for years as completely separated as if they had been miles asunder. They had separate apartments and separate meals, and always passed each other on the stairs without speaking. And yet no one who was not in the secret would have imagined that they were not an affectionate pair.

But of all the examples of irony that occur in everyday life, perhaps the most frequent, and at the same time one of the most painful, is the struggle to keep up appearances. We all know how Caleb Balderstone, in "The Bride of Lammermoor," strove to save the credit of the Master of Ravenswood, and to hide the poverty of his purse and home. We respect the motive while we laugh at the

shifts to which the faithful servant has recourse to attain his object. There are many Caleb Balderstones amongst us who act in the same spirit not for others but for themselves. They cannot bear to be thought poor. They must live like their neighbors, although those neighbors may be twice or three times as rich as themselves. They copy the entertainments of the wealthy, and adjust their dinner-parties and evening receptions to the same scale, however much they may pinch and squeeze at the family fireside. We saw lately a statement in one of the London newspapers, that the cost of an evening party at one of the great houses was £386; and of a concert at another house of the ordinary class, £601; while a ball, including £300 for "decorations," came to the startling figure of £615. Perhaps in each case the host was able to afford it, but not the less was the amount reprehensible waste. Each of these sums represented a moderate income on which a family might live respectably for a year. We do not mean that upon it what is called "society" could be kept up in the metropolis; but how many country clergymen are there not who would be glad if their livings amounted to the smallest of these sums? And what is gained by such extravagance? Nobody thinks the better of a host or hostess on account of the profusion of their expenditure. Nobody pretends that there is real enjoyment in being crushed in a crowded room where you can hardly breathe. And too often the lavishness squandered on the dinner-table or the drawing-room seriously cripples the means of the family. The frog cannot try and puff himself out to the dimensions of the ox without danger of bursting. Surely it is the very irony of life when a man struggles to assume or to keep up a position which his means cannot afford. He is running a race in which he is far too heavily handicapped to hope to win; and the show and glitter of a few seasons will perhaps end in insolvency and ruin, or at all events in enforced retirement to some quiet corner where he can economize and repent.

"They manage these things better in France," says Sterne at the beginning of his "Sentimental Journey;" and certainly they do understand the art of entertaining better abroad than in England. They do not consider that people wish to come together to see a parade of ostentatious luxury,—

Where souls are starved and senses gratified,—

but for the purpose of rational conversation, and the gratification of simple tastes. Who would not have preferred an hour with Horace in his Sabine farm, where

> Ille terrarum mihi præter omnes
> Angulus ridet, ubi non Hymetto
> Mella decedunt viridique certat
> Bacca Venafro;

to the suppers of Lucullus in his hall of Apollo, or the costly banquet of Apicius? We know that it is unjust to compare the exigencies of town life with the freedom of the country; but what we mean to assert is, that we sin greatly in our intercourse with society on the side of extravagance; and it is mere irony that can make profuse luxury supply the means of what is intended to be social enjoyment. There is, however, a more respectable form of this contrast between appearance and reality, with which we profoundly sympathize. It may be absolutely necessary, with a view to employment, or for the sake of the interests of sons and daughters, that a man should seem in the eye of the world to be better off than he actually is. He and they must dress respectably and live respectably on a narrow income, and avoid as much as possible falling into the despised class of the shabby-genteel. Provisions may rise, and coals grow dear; but still on the same limited means an outward show of decent comfort has to be maintained at the cost of many a heartache, and by the use of many a trying expedient. We believe that few people know how much distress of this kind there is amongst the clergy of the Established Church. A clergyman is by his profession and his position a gentleman, but too often is a pauper in disguise. His income is probably not larger than that of a banker's clerk,—or including his parsonage, which he holds rent free, amounts, we will say, to £250 or £300. Upon this he has to bring up a family of sons and daughters, and insure his life in order that when he dies he may not leave his family utterly penniless. But what a struggle it is! The cost of clothes, and food, and education is just as dear to a clergyman as to a layman, and he is the person to whom the poor of the parish naturally appeal for help when sickness or other mischance overtakes them. The secret records of the Clergy Aid Society could tell many a piteous tale of dumb and inarticulate suffering of which the world hears nothing, and suspects nothing; for the irony of the situation is, that the snug rectory or pretty vicarage seems to be the abode of ease and com-

fort, while the inmates are obliged to practise the most rigid and self-denying economy.

To hoist an engineer with his own petard has almost passed into a proverb, so frequent have been the instances in which the author of some invention of cruelty has perished by his own device. The oldest on record is that of the man who was roasted alive in his brazen bull by Phalaris. And one of the latest would be that of the inventor of the guillotine, if, as according to the current tradition, he had fallen under its knife. But we believe it is satisfactorily established that Dr. Guillotine never looked through "the little window," but died peaceably in his bed.

The annals of crime are full of the irony of destiny. The means by which the criminal has sought to evade detection have been the means by which his guilt has been discovered. One of the most recent of these is the case of the murderer Wainwright, who was tried and executed two years ago. In the first place, he poured chloride of lime instead of quicklime over the body of his victim, forgetful or ignorant that the substance is antiseptic, and tends rather to preserve the dead body than destroy it. Again, although the corpse had been buried out of sight for more than a year, and there was little likelihood that it would be discovered, he disinterred it, and gave some of the fragments in a packet to a boy to hold, whose curiosity induced him to look into the parcel, and thus led to the discovery and conviction of the murderer. It would be easy to multiply examples of this kind, showing how unconsciously guilt weaves the web in the meshes of which it is itself caught, and that what seems prudence and safety is in reality folly and destruction.

But after all, the irony of life is best shown when we consider time with reference to eternity. It must seem almost inconceivable to celestial beings, if they have any consciousness of what takes place on earth, that we, the little insects of an hour, who profess to believe in immortality and a future state, should live as if our existence on earth were our all in all. The disproportion between the interests at stake is so infinite, that comparison is impossible. And yet practically the great majority of Christian men do live as if this world were everything, and throw themselves with as much eagerness into the trifles of the present as if they were to last forever. What a tremendous irony there is in the parable of our Saviour! —

The ground of a certain rich man brought forth plentifully: and he thought within himself, saying, What shall I do, because I have no room where to bestow my fruits? And he said, This will I do: I will pull down my barns, and build greater; and there will I bestow all my fruits and my goods. And I will say to my soul, Soul, thou hast much goods laid up for many years; take thine ease, eat, drink, and be merry. But God said unto him, Thou fool, this night thy soul shall be required of thee: then whose shall those things be, which thou hast provided?

This is the sum of the whole matter. If we live in the full consciousness that we are but shadows here, and pursue only shadows upon earth, — that we are but children who await a glorious inheritance, and that nothing is of any real value which does not fit and prepare us for our future destiny, — there will be no irony in our lives as regards our aims and our employments, for we shall subordinate everything to the thought of the hereafter. We shall know how to proportion our interests, and avoid all extravagance, either of sorrow or of joy, thankfully making use of the blessings which the favor of the Almighty may bestow upon us, but always in our life-voyage keeping steadily in view the haven for which we are bound.

From Macmillan's Magazine.

LA GRANDE DAME DE L'ANCIEN REGIME.

THE beginning of this century witnessed the gradual extinction of a great social power. It has died out, and its place knows it no more.

"*La grande dame s'en va*," wrote a French author about the year 1830; "*le milieu respirable pour elle n' existant plus; elle n'a pas faire école*. He was right; *la grande dame* is extinct. And not only in France, but in English society almost simultaneously she disappeared. Whether from the same cause — that the elements necessary to her existence are wanting here also — or whether, according to the inflexible laws of supply and demand, she ceased to exist when the restlessness of modern life no longer required her calm, obstructive influence, I leave to wiser heads to determine. Enough to note the fact that she has departed, and left no successors. I trust that I shall not be misunderstood to imply that our society has not still, notwithstanding the debasing influences of slang and fastness, numerous specimens of the high-bred lady "*of the*

best class, and better than her class," who has ever been the boast of our aristocracy, and remains to bear her own witness to her own days. Those who are now gone, but in my youth were still living and retained in their manners the traditions of the old school, were so numerous and wellknown that to name some would be invidious, to omit none impossible, without trenching on the sacredness of private life. Still, there was *one* whom I may be forgiven for naming, because her political existence and *rôle* have marked her place in the history of her times; one who will ever be to me the type of the perfect lady, everywhere recognized, whatever her outward symbols, by that inward grace of good breeding, which in Horace Walpole's famous words *is good feeling*. Who that ever knew her does not remember the graceful hostesss, whose house the most insignificant never left without feeling he had received an individual welcome, while the familiar word or jest distinguished the friend or *habitué?* She who had for all the kind word, the happy phrase, yet whose gentle dignity kept aloof any risk of the forwardness which might have been feared in a society as mixed as that which the interests of the Liberal party obliged her to receive. She who to her latest day reigned over society by her exquisite tact even more than by her position; and gained all hearts by that irresistible charm which sprang from the well of kindness in her own. But the exigencies of the society in which she played so prominent a part had effaced in her the traditions of her youthful days. Between the type she represented and that of the *grande dame de l'ancien régime* there is a great gulf fixed by national habits and character. Lady Palmerston, under fostering circumstances, might live again; but the *grande dame* was an anomaly: she is gone forever.

To attempt to trace out this dissimilarity and its causes would require an abler pen than mine, a profound knowledge of the social history of the past century in both countries, and, above all, the risk of entering on a subject treated by master minds of the past generation, and in this by De Tocqueville, Prévost Paradol, Henri Taine, and many other celebrated writers. I wish carefully to avoid any national comparisons, and simply try to fix the recollections of my earliest youth, passed entirely in Paris in close intimacy with many of the families representing the greatest names in French history. Thus I became better acquainted with their domestic life, with the tone of their very restricted intimate circle, than was perhaps the case with any English in the days succeeding the restoration, when the soreness of recent defeat had just succeeded the privations of the Continental *blocus*, and the name of England was with few exceptions odious to all French ears. It happened in our case that amongst the noble *émigrés* returned from England my parents had some personal friends, and a family connection in the Faubourg St. Germain, and thus saw them in their own homes, a favor seldom accorded to strangers. We children continued playmates of our still older friends, the children of the Orleans family, which gave us a foot in both camps — for opposite camps they were. The Duc d'Orleans — tolerated from his position as *premier prince du sang*, and until the birth of the Duc de Bordeaux, heir to the crown — was looked upon with distrust by the court and the noble faubourg as the son of Egalité, the pupil of Madame de Genlis, the Swiss schoolmaster, the American democratic wanderer, the bold advocate of the political offender. The well-known ambition and influence of his sister Madame Adelaide added to this unjust distrust, which not even respect for his angelic wife could conquer. A king's daughter, a Bourbon aunt of the young Duchesse de Berri, who was tenderly attached to her, — such claims as these could not be wholly ignored by the court and its followers; but the gloomy Duchesse d'Angoulême, who had never forgiven the murder of her parents, naturally kept aloof from the Duc d'Orleans, and only the necessary intercourse took place between the court and the Palais Royal. The liberal education which Louis Philippe gave his sons, sending them to walk daily, satchel on back, to the Collége de France, to pursue their studies in common with boys of all classes, went counter to all their ideas. The brilliant society of the Palais Royal and Neuilly, where everything distinguished in arts, literature, and even finance was entertained with the most princely hospitality, was, by its very contrast, equally distasteful to the gloomy, ascetic court. The Duchesse d'Orleans, adored by all who approached her, lived but for her husband and her beautiful young family, in whom her somewhat southern piety counteracted the liberal tendencies of their education. She cultivated in them religious feelings. She animated them with enthusiatic loyalty to the throne. I remember hearing that when the guns were firing for the birth of

the first child of the Duchesse de Berri, the young Duc d'Chartres, then between eight and nine years old, sat intently listening for the eventful twenty-first gun (which indicated the birth of a prince), saying, "*Silence ! j'écoute si c'est mon roi, ou ma femme*," unconscious of anxiety for the throne which hung on the balance. Such was the state of parties in 1823, when I first recollect the families of whom I shall now speak.

It is very remarkable how little, although only separated by that narrow Channel passed daily by thousands, how imperfectly we know *good* French society. We have our preconceived notions, our judgments formed on the writings of a certain class of French novelists, who because they write about comtesses and duchesses, we fancy must know them.* We in England may safely trust to the novels of the late Lord Lytton, Lord Beaconsfield, Mr. Whyte Melville, George Eliot, Mrs. Oliphant, Thackeray, Lady G. Fullerton, and a few others, to give a foreigner a sufficiently accurate idea of life on the higher rungs of the ladder to which they mostly belong. But it is not so in the France of modern days, where writers do not belong to the upper classes, or do not write novels. Some memoirs written by themselves, but printed for private circulation only, could alone give an idea of a class to which in our appreciation of their home life and domestic virtues I fear we do but scant justice. I, who have seen them in the bosom of their families, who have received from these, the last of their social type, constant kindness and cordial reception, should indeed feel proud and happy, could my simple but faithful witness serve to dispel one erroneous impression, or conquer one unjust prejudice against those I early learnt to love and respect.

There were other reasons besides the natural distaste for the English to account for so few of them having been admitted into the intimacy of French families. All foreigners, *accueillant* as they are to strangers in society, are far more chary than we are of admitting them into domestic life, partly because owing to the spoliations of the Revolution, and the new laws of division of property, many of the great families were poor, partly that "hugger mugger" is the only term to express the life of a French family, even many of the greatest, in those days when it was the custom for all the different *ménages* composing it to live under one roof. These ancestral houses, *hôtels* as they were called, were mostly situated in the Faubourg St. Germain, where some of them are still to be seen spared by the Revolution — although more have perished in the suicidal fires of the Commune. Some streets as the Rue de Lille, Rue de l'Université, Rue St. Dominique, were entirely composed of these lordly elevations, with their grand old trees towering over the high wall which separated them from the quiet street they overshadowed, to which no shops brought traffic or noise. It was difficult to realize that this was the bustling Paris whose deafening roar and whirl of excitement you had left on the Boulevard but a few minutes before. In this wall the entrance gate, called the *porte cochère*, so gigantic that you wondered how easily the porter swung it on its circular hinges, admitted carriages; the foot-passengers entering by a small door cut in the large one, as in some of our own old houses. These hotels were immense; none of our largest houses in London, except Burlington House before its alteration, give an idea of them. You drove into a large court, round which the house was built, a peristyle in the centre. The garden front on the ground and first floors was devoted to the heads of families and to reception; the second floor, and the two sides of the court, were divided into innumerable apartments with *entresols;* these although low-pitched were roomy, and in the clear sky and light air of Paris had none of the stuffy darkness which would be their lot in London. That they are pleasant abodes enough any one who has enjoyed the *entresol* apartment at the Hotel Bristol will testify. In these were lodged the younger branches of the family, the tutor, *M. l'abbé*, the *secrétaire*, and the hangers-on — their name was legion. As the sons and daughters grew up and married, each young couple took an apartment in the caravanserai of one or other paternal abode. There could not be a separate kitchen to each, therefore from mingled motives of economy and a wish to keep a due watch and hold over the young couple, all had their meals in common in the apartment of the head of the house, excepting the morning *café*, which was taken by each person when and where they liked. There is still in some French houses of my acquaintance a sort of buttery, where, between the hours of eight and nine, are an unrestricted supply of coffee, milk, and bread in the rough, but excellent in its kind, can be had; served on white marble

* See this well stated in "French Novels and French Life," by H. de Lagardie; *Macmillan* for March, 1877.

slabs, cleaner and less expensive than tablecloths. This arrangement saves time, as each servant comes at the hour most convenient.

Between eleven and twelve came the *déjeuner*, which we should call luncheon. Often have I assisted with my young companions at these repasts, where with an eye as keen as any at the table, the great-grandmother presided over four generations, beginning with her own already aged sons or daughters, and ending with the baby in its high chair attended by its Normande nurse, in her fly-cap, feeding it with broth out of a glass — a very nasty-looking proceeding, by-the-by. At the top of the table near the lady sat the old friend, who, according to invariable custom, came on a certain day of the week — his other days being similarly filled up at other hospitable houses. Then some relation who had in poverty found an asylum with the head of the house. The *lectrice*, or companion of the old lady, *M. l'abbé* the friend and counsellor of the family; interspersed with them the married sons and daughters; the boys with their tutor; rarely the men of the family, at least the young ones, but all the children. The *déjeuner* was good, but plain; soup, cutlets (without sauce), filets of beef with fried potatoes, omelettes and cheese, of which an immense variety is eaten in France, and fruit. The dinner, at six o'clock, was a repetition of the *déjeuner* minus the baby and its broth, and plus fish, *entrées*, and sweets, as well as the men of the family, who were often out in the morning, receiving in friendly houses the same *sans façon* hospitality they left in their own. Still it would have been difficult and inconvenient to invite strangers to such unceremonious meals, and there being no schoolroom table (because there were no schoolrooms), it was impossible to break up the heterogeneous assemblage except on great gala occasions. The result was that in those days no, or at least, very few, French families gave dinners.

After the *déjeuner* and a visit to *bonne-maman*, as the grandmother is prettily called in French, when we were duly presented and given the freedom of the house in torrents of *mon bijou*, *charmante*, *délicieuse*, duly distributed to us all with laudable impartiality, and accompanied by *pastilles de chocolat*, which I appreciated much more, we were dismissed to the garden — not the miserable strip of modern Paris (when it has one), but shade in summer, sunny walks in winter, and space enough in those airy quarters of the town to dispense with going out of its walls for daily exercise. In those days there were few open carriages, fewer still with one horse; and the coachman and pair of fat old horses were kept chiefly for evening, or for the necessary work of the day. The young women drove *au bois* with their husbands in cabriolets or curricles, which came from England, and were beginning to be a fashion. French women, as a rule, walk less, but live more in the open air than we do. In fine weather they sat almost entirely in their gardens, reading, writing, working, many days never going out of it, except *à la messe* in the morning to some small church close by, which was the almost universal custom of the higher classes. French servants, shopkeepers, in general all women of the lower classes, both town and country, sit outside their doors at their work whenever the weather allows of it. They are to be seen at the door of the palace as of the cottage, or under the *porte cochère* in the shade, carding mattresses, shelling peas, dressing their children, working, or spinning; not a moment will they be indoors that they can help. Sometimes we children were all taken to the Tuileries by the *bonne* of the family. There, in a sunny corner, sheltered by the terraces overlooking the Place de la Concorde, and named from its warmth *la petite Provence*, we exercised ourselves at the skipping-rope with a proficiency I look back to with admiration, double twirls in one leap being highly applauded by the critical audience of fly-caps — each with a fusty-looking baby in her arms — and wooden-legged Invalides, its usual frequenters, whose appreciation we much coveted. There were also some *gaufres*, a sort of pancake, thin and crisp, made instantaneously in an iron shovel on a little charcoal stove, which, by permission of the authorities, was allowed in one corner for the delectation of the fly-caps and their charges; also a honey wafer, called *plaisirs*, and fresh milk were to be had here, as in all public promenades at Paris. These were provided for by a few sous put into our tiny pockets with a lump of bread, for the *goûter*, a sort of nondescript meal, of any trash obtainable, which French children have as a stop-gap between *déjeuner* and dinner. Alas! I have since seen my poor *petite Provence* filled with savage Turcos and Zouaves instead of kind old Invalides, and camp-fires replacing the little *gaufre* stove of my childish days.

The old custom of bringing up girls in convents was fast dying out. Many of

our young friends were educated at home, or, at all events, only went to a convent the year preceding and following their first communion, a time always with them spent in retirement. If at home, they did not come down when there was company, that their minds should not be distracted from the solemnity of the act. There are, or at least there were, no governesses in these families. If the daughters were brought up at home, they, and indeed the sons also, were so much with their mothers, that no assistance but that of masters and the old *bonne* who had nursed them, was required.

French women are in general devoted mothers, seldom leaving their children, and expending upon them what the poet calls "the strong necessity of loving," to which many of their marriages formerly gave little aliment. Amongst them is many a mute inglorious Sévigné, who lacked not Sévigné's feelings for her daughter, exaggerated as they may seem to us, but only the power of expressing them. Their time is much more their own in the day than with us, because morning visiting does not exist, none but a sister or an intimate is admitted before the evening, which is considered the time for society; they were therefore free to attend to their favorite pursuits and studies, or to their children's education. They did not formerly, as we do, and they do now, go to the seaside, travel, pay country visits. The great families had magnificent châteaux, but these had mostly been *saccagé* at the Revolution, and there were no means to refurnish them; some were very far off, and a journey to Touraine or Provence, before the days of railways, was too heavy an expense. They often preferred leaving them unoccupied, and, if rich enough, had villas on the beautiful hills of St. Germain, or Meudon, or even nearer Paris, where within a walk from the Champs Elysées were some charming country houses, with farms and green fields, now covered with streets and shops. In one of these beautiful residences, Le Val, in the Forêt de St. Germain, belonging to the old Princesse de Poix, I passed many never-to-be-forgotten days. The family consisted of the blind grandmother, looking like a Rembrandt stepped out of its frame, and her two sons, the eldest a widower with an only child; she herself a widow after a year's marriage, her young husband buried under the snows of the Russian retreat. Celebrated over Europe for her wit and charm, she refused the most brilliant offers of marriage to devote herself to her father and her only child, a daughter. The second son, one of those rare characters of unostentatious piety, living but for the good he could do in this world of suffering, entirely occupied with social questions on the improvement of the lower classes, to which he devoted his life, the best of sons, of fathers, of husbands. His wife, a Talleyrand, holding by her birth not more than by her kindness and virtues, a position which led even the great emperor to press her acceptance of the post of *grande maîtresse* to Marie Louise; and caused her to take the same post with the young Duchesse de Berri at the Restoration, which she retained in society as long as she lived. Their mantle descended on the four bright handsome children, with whom we roamed the beautiful forest. The eldest son took a prominent part in political and utilitarian life in his own province. The second was well known as a diplomate in England. To name the daughter, Mrs. S. Standish, is but to recall virtues, charms, and talents, celebrated in the literary and social world of her own and her adopted country. A family of perfect affection, of unpretending goodness; whom to know was to love. It is of such as these (and they were not so unique in that society) that we loftily shrug our insular shoulders, and thank Heaven we are not as these foreigners are.

We often pronounce French women frivolous in their pursuits, reading, and lives; this I think an unjust judgment. What I saw of French women in former days has led me to the contrary conclusion; I do not speak of the present generation, but let us see what is the witness of French history as far back as the reign of *le Grand Monarque*. In that most charming of books, Mme. de Sévigné's "Letters," we find that ladies read and understood Descartes' philosophy, the theological disputes of the Jansenists and the Port Royal, Laplace's astronomy, the writings of Pascal, Latin and even Greek authors, history in its dryest forms, algebra, etc. See the list she sends her daughter of the books she provides herself, and *le bien bon*, l' Abbé de Coulanges, for a rainy week *aux Rochers*. It is like the *menu* of a first-class competitive examination. It includes St. Augustine, Bourdaloue, and Massillon as pious reading; as light reading *pour nous délasser*, Dante and Tasso in Italian, and Delisle's translation of Virgil; as fiction, "*Le Grand Cyrus*," and some works by the *bel esprits* of the Hôtel de Rambouillet, whom Molière was already flagellating in "*Les Pré-*

cieuses Ridicules," but whose influence even Mme. de Sévigné's sound sense had not shaken off.

Absurd as was the use women in those days made of their learning, the education must have been of a high order which enabled them to hold such dialogues as those satirized by Molière in the "*Femmes Savantes*."

Trissotin. Je m'attache pour l'ordre au péripatétisme.
Philaminte. Pour les abstractions j'aime le platonisme.
Armande. Epicure me plaît, et ses dogmes sont forts.
Bélise. Je m'accommode assez, pour moi, des petits corps ;
Mais le vuide à souffrir me semble difficile,
Et je goûte bien mieux la matière subtile.
Trissotin. Descartes, pour l'aimant, donne fort dans mon sens.
Armande. J'aime ses tourbillons.
Philaminte. Moi, ses mondes tombants.

The husband of the *femme savante*, Chrysale, that incarnation of good sense, tells her to —

Oter, pour faire bien, du grenier de céans
Cette longue lunette à faire peur aux gens,
Ne point aller chercher ce qu'on fait dans la lune,
Et vous mêler un peu de ce qu'on fait chez vous,
Où nous voyons aller tout sens-dessus-dessous.
. . . .
Et l'on sait tout chez moi, hors ce qu'il faut savoir ;
Mes gens à la science aspirent pour vous plaire.
Et tous ne font rien moins que ce qu'ils ont à faire.

From this, and from the perfect scene in which the bluestocking dismisses her cook, because her language is not that of Vaugelas (the great grammarian of the period), as well as from the plot of "*Les Précieuses Ridicules*," where the valets personate their masters and talk the pedantic jargon of the period, it is evident that the servants of these *femmes savantes* participated in the studies and pretensions of the house. This epoch of bad taste passed away; but all French memoirs, down to the Revolution of '92, prove that the education of women of the highest rank embraced even abstruse studies. History tells us that the Duchesse du Maine, one of the most beautiful and dissipated women of the court of Louis Quinze, herself collated, in secret from the Bibliothèque du Roi, the arguments and legal precedents to establish her husband's right to the regency. In the correspondence of the Comtesse de Sabran, a beautiful young widow in the days of Louis Seize, with the Chevalier de Boufflers, to whom she was engaged, and afterwards married, we find her reproaching him for not writing to her in Latin, telling him that he is so severe a critic she dare not send him her translation of Pythagoras and of the ode of Claudius on "Old Age." She is reading the letters of Abelard and Eloisa in Latin, with such pleasure, that she is translating some of them. She explains to him an effect of light which puzzled him, adding that she had gone through three courses of lectures on chemistry and physics in her life, and retained them. In the journal of her daily life, she says: "I get up at seven, I write and study till eleven, then after *déjeuner* I paint until dinner time at a full-length portrait of La Comtesse Auguste de la Marck" — the Princesse d'Arenberg (her intimate friend), who shared these studies. She is also painting a large historical picture. All this is intermixed with accounts of the *fêtes* she went to, and in the most womanly and tender letters. I saw this lady at an advanced age; she died as late as 1833.

In the last century, the *grande dame* was invariably educated at a convent. It is a mistake to suppose her education was neglected. The nuns, it is true, taught little besides the fairy needlework, in which they excelled, and the reverential, if somewhat narrow and childish, religion, of which the reverence at least remained with their pupils through life. No woman, at least in noble society, was outwardly negligent of the observances of the Church, and to speak of them even slightingly would have been esteemed the acme of bad taste. True, some women of the great families during the few years preceding the Revolution, led away by the genius of Voltaire and his school, and by the influence of the times, abjured in great measure their early religious beliefs ; but these were exceptions, and in most cases they returned in their old age to the faith instilled into their youthful hearts. Beside this training from the nuns, they received from professors of almost every branch of literature (too often neglected with us) a solid education *des études sérieuses*, continued when they left the convent by *M. l'abbé*, their brother's tutor, and far different from the light reading and showy accomplishments of these days. This lasted even beyond their early marriage, which was not considered as emancipating them from study.

The Revolution, with its horrors, or a life

of exile and wandering, must have interrupted the studies of the *grande dame* as I knew her in my childish days. I was not of an age to judge of her in that respect, except from what I have since heard from her grandchildren. Those that I recollect up to 1830, when we finally left Paris, a few months before the second revolution, were some of them between seventy and eighty, the survivors of '93. Some had passed through the prisons waiting daily for death, and saved only by Robespierre's fall; others had seen parents and husbands torn from them to the scaffold. Others, mere children at that fearful time, had been rescued by devoted nurses, or with their parents had found timely refuge in England or Germany. One there was, who, when but ten years old, had watched from the window of her home the *fête* for the marriage of the dauphin and Marie Antoinette (May 1770), and had witnessed the fearful disaster by which so many perished on that day, almost on the spot where the guillotine was to stand twenty years later. She had episodes of her court life after marriage to relate to us, of her hairbreadth escapes, of her flight to exile. There was the old Princesse de V——x, who passed through the *Terreur* shut up in one room in her Paris home (whence she had refused to emigrate), watched by two *gardes nationaux*, her life only saved by an unknown protector in the revolutionary tribunal. Many returned when the danger was passed, to resume, though impoverished, their former existence, amid the wreck of families and fortunes which they had refused to retrieve by adherence to the empire. Others returned only at the Restoration, having lived in the narrow circle of the *émigrés* unaltered in ideas, *n'ayant rien appris, et rien oublié*, and bringing with them the traditions and manners of bygone days. Some would still call Napoleon M. Bonaparte, and would date in 1814 "*20ème année du règne de Louis XVIII.*" It is said that they even altered history. I have been told that a printed history exists which states that S. M. Louis XVIII. gave the command of his armies and the government of his kingdom to M. Bonaparte, not liking after his brother's death to return to France for some years.

There is wonderful vitality in aged French women, particularly of the noble class — not only are they as a rule long-lived, but the vigor of their mind and faculties remains intact to advanced age, and strengthens the tenacity of habits and ideas which was a characteristic of the *grande dame*. She came from exile, after ten or fifteen years passed, perhaps in England, amongst a race different in all things from her own, and with many of whom she was on even affectionate terms. But not one thought, not one prejudice was modified; as a drop of oil cast on a stream will be tossed about, surrounded, pressed upon, but never mingle with the water, she remained in the midst of a world of progress, her own unaltered self.

They were noble old women; I remember still the sort of awe with which I looked on those venerable relics of a past already become history. Differing in character, as all human beings differ, and some of them twenty years younger than the others, there were still amongst them some general features of resemblance, a certain strange assemblage of contrasts. What struck you first about her (and which still distinguishes French ladies) was her *ton* and language — always strictly grammatical, and pure French, but startling you by its almost brusque *bonhomie*, its utter absence of all affectation or self-consciousness, homely in expression, but never trivial; above all things she eschewed fine words, and stilted phrases. *L'épicier dit mon épouse, le roi dit ma femme*, was the principle on which she spoke; but no vulgarisms, no slang or cant ever sullied her lips; she spoke well, and pithily, not unfrequently with short, sharp sentences, *qui emportaient la pièce*, if she happened to be offended. She spoke with decision, with the authority of one who knows that she is respectfully listened to. Her manner was generally perfect in its ease and adaptation to the person addressed; in its natural unstudied felicity of expression; illustrating the axiom that to conceal art is the acme of art. French women are fond of talking; it is no effort to them; the shyness which in us English so often destroys the grace and power of speaking is, if it exists, so combated in their earliest years that it is unknown to them. With her simple *grandes manières*, perfectly civil and well-bred, she knew how to draw the line — elaborately, ceremoniously civil to those whom she did not wish to admit within her circle, or encourage to return; while with her own intimates she gladly relapsed into the familiar snuff-taking, the not over particular talk her soul rejoiced in (for she called a spade a spade if she had occasion to mention it), or topics of conversation perhaps not in general use with us; such she considered it affectation to avoid. But it was all said

in such grand simplicity, so evidently without any idea of shocking her hearers — or indeed any idea that it *could* or *ought* to shock them — that you could not feel annoyed. She had mostly mother wit, and those equable spirits and cheerful temperament which alone could have carried her through the fearful scenes of her childhood, or the poverty and privation of her youth and middle age. The courage which had supported her mother on the scaffold had not deserted her, she had gone through what would have killed women of another stamp. Reverses and dangers found her undaunted, ready as ever to risk life and fortune for her sovereign or her "idea," and rearing her children to the same devoted loyalty.

The second Vendée proved that they were the equals of the Lescures and La Rochejaquelins of the first. To their children these women were tenderly and even passionately attached; but the tone of maternal authority — whatever the age — of decision in all family matters, and of undisputed sovereignty at home, never ceased but with life. A prominent feature in them was the strength and constancy of their friendship, and this has been a trait in French character in all times. Their time, their house, their fortune if required, is devoted to their friends: they will leave all to nurse them in illness, to console them in sorrow. Mme. de Staël, in "*L'Influence des Passions*," places friendship in the rank of a passion, and devotes to it one of her most eloquent chapters. These friendships used to be carried on without interruption from the convent days. One of them told me that for sixty years she and her friend had never failed to meet on the same anniversary and spend a month or two together, although dwelling a long distance apart. Proud of birth rather than of rank or social position — which, as she never went out of her house, she only valued for the court it brought her — she loved to recall the *hauts faits* of her ancestors, and the history of her family. But she equally valued that of others; she held that *noblesse oblige* — she might commit many sins, but never a meanness; and would sacrifice any interests to the honor and glorification of her name! Haughty she was undeniably, sometimes cruelly, insolently so; but it was the *naïf* haughtiness of one who never has had her superiority questioned, and it was always to her equals, never to her inferiors. She passed for being fond of money, but it was to accumulate for her children — she had no other interests. Life is singularly simplified in these existences, bounded by their own room, absolutely despotic as head of the family, and as completely independent as to fortune, with the power of absolute disposal of it at will. With her inferiors, her dependants, above all, with her personal servants — the *valet de chambre*, a sort of Caleb Balderstone, who often filled the place of five or six of our servants, and her lady's maid, an old woman, like herself — she spoke with a familiarity which made my young eyes open wide at its contrast with our English home ways. She said *vous* to her husband if she still had one, but would *tutoyer* her servants. The distance in her own mind was too immeasurable to fear any possible advantage being taken of this freedom. The devoted attachment of these servants through the perils of the Revolution, through exile and privation, justified the system. Ill-paid, ill-fed on the remains of their master's table, snatched behind a screen in the ante-room, harder worked than our servants could conceive possible, lodged anyhow, anywhere, they still preserved the old feudal feeling of clanship and reverential devotion to the family they and their forefathers had served time out of mind.

It must be said that to them the family were affectionately kind, nursed them in illness, took a part in all their concerns, danced at their weddings, were godparents to their children, and showed them that lively interest, that human sympathy, worth far more than the gold they perhaps had not to give, although the old age of these retainers was never left without provision. Many of the great families being poor, the number of their domestics were small, although the dependants and members might be numerous; but the one whose convenience was never neglected, who was honored with personal intercourse and long conversations with his noble mistress, was the cook — always a man, for the *cuisinière* only belonged to the *bourgeoisie*.

My *grande dame* was invariably fond of her dinner, rather boasted of being *gourmande*. The Princesse de Poix used to hold as an axiom, *que le signe distinctif d'une femme bien née, c'est de se connaître en cuisine*. French ladies mostly satisfy this requirement. They drink very little wine, generally *de l'eau rougie*, no tea or coffee after dinner, but they are not afraid of a tiny glass of the delicious liquors that are served round in such numbers at a French house.

Whatever the variety of character between them, there is one point in which

all agree, love of conversation. The *grande dame's* real enjoyment in life was her *salon*. By this term is meant a reception held every evening, where the guests never expect food, or invitation after their first introduction. The *salons* I speak of were, I imagine, rather restricted to their own circle. I was too young at the time to go into society, so it is only from what I heard from my young friends, and from those I have since seen, that I can trace the difference which seems to have existed between the past and the present society. The halo of veneration which surrounded the aged grandmother, the heroine, the victim of catastrophes and misfortunes, of which perhaps history offers no other example, made *her* and her tastes and amusement the one object of the family reception; but they were not so amusing to others, with the exception of the Hôtel Beauvau, and one or two isolated cases. Still they were very agreeable ways of passing the evening, judging from the few which survived the reverses of 1830. The old lady sat enthroned in her comfortable armchair, the only one in the room — people did not loll as they do now. A *fauteuil*, that is one of those little stiff-backed articles with straight, short arms, which we see ranged round the old state rooms in French palaces, was placed near her, to which came the first guest, yielding the place in turns to each arrival. The other elderly ladies had their work at a table apart, where the visitors came to pay their *devoirs;* and — again apart — the young women and girls of the family, perhaps at a tea-table, a novelty then beginning to come in, although not much understood, for a girl friend said to me one day, "*Comment va ta maman?*" "*Mais bien; pourquoi?*" "*Ah! c'est qu'elle prenait du thé hier.*" They still considered it as a *tisane* and medicinal. Politics were not talked at these houses, for the simple reason that the *grande dame* had none but loyalty. To her there was but one party — monarchy; but one danger — democracy. *La charte* was something Louis XVIII. had kindly given to his people, but was never to interfere with his good pleasure of sending away one set of ministers for another, or passing any laws or enactments. Her code was neither liberal nor conservative, but *les gentilhommes et la canaille*. Strange as it may seem to us, such was her world of ideas from 1804 to 1830. There were in Paris at that time, as later, many *salons*, all differing in their society, literary, political, artistic, diplomatic, scientific, even theatrical; some receiving the young and brilliant world, some devoted to the graver questions of the day, some combining on one day in the week all parties, all specialities — except *les ennuyeux*. It would be far beyond my scope to enter into details of them. There is a charming volume called "*Les Salons de Paris*," written, I believe, by M. E. de Girardin, which may enlighten English people as to a form of society which does not exist and never can flourish in England.

During the last ten years of the restoration these *salons* constituted the chief *société* of the *noblesse*. Louis Dix-huit, infirm and selfish, did little towards restoring the brilliancy of former days. Few courtiers survived the emigration. My *grande dame's* husband, if still alive, was a *chambellan*, but probably too old to attend court, certainly too old to give life to it. They led a very dull existence. Too poor to give *fêtes* themselves, and avoiding the new nobility, they only went to the court or embassies, and occasionally to the Rothschilds' and Delmars', as neutral houses.

The gloom of Charles Dix's court, after the assassination of the Duc de Berri, closed the door to all but the friends and adherents of the old order of things. The young generation began to horrify their parents by their indifference to such dull amusements and wearisome favors. The young widowed Duchesse de Berri, after a few years of seclusion, attempted to give again some animation to the Tuileries, but she failed, and who can wonder that, unheeding the royal frowns, she collected around her the rebellious youth of the noble faubourg, and with them sought, in the brilliant circle of the Palais Royal, the pleasures denied them in the stern and solemn Tuileries? With her young cousins — the Duc de Chartres, growing into manhood with the promise he so well kept of being the handsomest and most charming man of his day; with the Duc d'Aumale, and the rest of the gay young *troupe*, they rode, they drove ponies, they read books *à l'index*, they went to masked balls; it was said that, worst of all, they learnt English, and that, ignoring Waterloo, some of them actually visited London in the season, bringing back English fashions in horses and carriages, and even the taste for clubs, which before then were mere political *réunions*. The parents wisely felt that the next generation must progress with their times; they had too much sense to attempt to stem the torrent. The grandmother in her *salon*, though

shorn of the pomp of her former stately existence, impoverished, but surrounded by her children's love and care, attended as dutifully as ever by the young reformers themselves, glided away her last days, scarcely realizing the changes around her. She was growing very old, she had no longer vigor to use her restraining influence, had she retained it. To her darkening sight the cloud which was lowering over the monarchy bore no threat. Few of them lived to see the Bourbons a third time dethroned, driven to exile or death. Before the revolution of 1830 most of them died away, and with the accession of the *régime bourgeois* ended the *grande dame de l'ancien régime*.

AUGUSTA L. CADOGAN.

From The Globe.

GREAT MEN AT PLAY.

WHEN Macaulay observed that nothing delights the vulgar so much as seeing great men unbending and reducing themselves for a moment to the level of ordinary mortality, he made a remark which has been time out of mind amusingly illustrated. Probably at no period in the world's history has the private life of public characters, whether belonging to the walks of literature or to the walks of politics, been so obtruded on the notice of their contemporaries as at the present. Mr. Gladstone's recreations in Hawarden Park are as fully recorded and have been as amply commented on as his more serious recreations in the House of Commons. It would seem, indeed, that he is as anxious to leave trophies of his prowess as a woodsman as he has been to assert his title to a conspicuous place among Homeric commentators and English statesmen. The illustrious author of the "Evidences of Christianity" and the "*Horæ Paulinæ*" refused, as every one knows, to leave his portrait to his countrymen unless the artist would paint him with his favorite fishing-rod in his hand; Boxhorne insisted on being represented with his pipe in his mouth; and Sir Walter Scott's favorite dog testifies the tastes and shares the honorable pedestal of his master. The woodsman's axe and the ratskin suit of the disestablisher of the Irish Church bid fair to win the same immortality. We have lately been regaled with accounts of the other amusements of our public characters; how one toils from morning till night, a laborious amateur in his laboratory; how another delights in fishing; another in spinning over the country on a bicycle, to the imminent peril of his own life and the lives of all he meets; another, we are told, finds his chief pleasure in romping on all fours with children, quoting as precedents Goldsmith, Shelley, and Macaulay. "Futile pursuits," said Ovid, "delight futile minds." He might have added less cynically, and quite as truly, great minds too. In truth, a very pretty apology for these trifles might be written, and such an "*Encomium Moriæ*," if the shade of Erasmus will permit us to steal the title of his charming *brochure*, would find some singular illustrations in the bypaths of biography. Swift relieved his tense and tragic moods by harnessing his servants with cords and driving them up and down the stairs and through the rooms of the deanery. Peter the Great sought to unbend himself by being wheeled over the flowerbeds and neat *parterres* of his host's gardens in a wheelbarrow, as poor Sir William Temple found to his cost. That accomplished diplomatist appears to have felt his chagrin at the failure of the triple alliance mere child's play to his feelings at beholding the Russian monarch riding roughshod over the priceless tulips of Moor Park. Glover, the once famous author of "Leonidas," and the "Atheniad," had the same disagreeable weakness, though not being safe in the divinity "which doth hedge a king," his plebeian back received on more than one occasion infuriated cudgellings at the hands of insulted horticulturists. Walton, George Herbert, Wotton, and Paley were, like Mr. Bright, devotees of the rod and line, and Dryden's piscatory parties with honest Mr. Jones, of Ramsbury, were long remembered. His contempt for the angling powers of one of his literary rivals has been amusingly recorded by Fenton: —

> By long experience, D'Urfey may, no doubt,
> Ensnare a gudgeon or sometimes a trout;
> Yet Dryden once exclaim'd, in partial spite,
> *He fish!* because the man attempts to write.

Cardinal Mazarin is said to have been fond of shutting himself up in a room and jumping over the chairs arranged in positions varying the difficulty of clearing them. On one occasion he forgot to lock the door. A young courtier inadvertently entered the room, and surprised the cardinal in his undignified pursuit. It was

an embarrassing position, for Mazarin, he knew, was as haughty as he was eccentric. The young man was equal to the crisis. Assuming the intensest interest in the proceeding, he said with well-feigned earnestness, "I will bet your Eminence two gold pieces I can beat that jump." He had struck the right chord, and in two minutes he was measuring his leaping powers with the prime minister, whom he took care not to beat; he lost his two gold pieces, but he gained before long a mitre. Samuel Clarke relieved his theological pursuits in the same way, and on seeing a pedantic fellow approaching said to the pupil who was sharing his amusement, "Now we must stop, for a fool is coming in." Old Burton, the author of the "Anatomie of Melancholy," the only book which got Dr. Johnson out of his bed two hours before he intended to rise, found his chief recreation in going down to Folly-bridge at Oxford and listening to the ribaldry of the barges. It was well for him that he could not read the stinging reproach which Dante represents himself as receiving from Virgil for a similar weakness. Byron's great delight was shooting with a pistol at a coin in a cleft stick, and that he practised more methodically than any other thing in his decidedly unmethodical life. Henry V. was devoted to tennis, and Philip, the great duke of Burgundy, spent much of his leisure time, and we may add, enormous sums of money also, in contriving houses full of diableries, such as hidden trap-doors, spring snares, and the like. He would then invite some stranger inside, and the miseries of this unfortunate being — who would find himself at one time falling through space, at another time soused in water, or banged with sacks which came tumbling charged with flour on his bewildered head — afforded infinite amusement to his eccentric torturer. From William the Conqueror downwards, the chief delight of our sovereigns has been in the hunting-field, though some have varied it with other more peaceful pursuits. Charles II., for instance, spent a good deal of his time in a chemical laboratory. Prince Rupert was devoted to mechanical pursuits, and in the discovery of mezzotinto conferred a solid benefit on mankind. Godolphin's life was divided between the council chamber and the cock-pit. It is curious to observe how men who have been noted for their polish and culture as writers or conversationalists have, in their leisure moments, found a strange pleasure in associating themselves with sordid vulgarity. Prior, one of the most elegant of our minor poets, constantly passed whole evenings in chatting with a soldier and his slattern wife in a low public-house in Long-acre. Thomas Warton, the historian of English poetry and a singularly refined writer, was often to be found, like Porson, in low public-houses, joking and being joked. Turner, the painter, had similar tastes. Leonardo de Vinci felt intense pleasure, or perhaps an inexplicable fascination, in contemplating filth and garbage. He would gaze for hours on the slow, slimy streams which crawl out of the slums of Florence. But to turn to less reprehensible amusements. The lord chief justice saunders, whose character has been so admirably sketched by Roger North, devoted his leisure time to practising on an old virginal. Milton selected the more dignified companionship of an organ. Innocent III., probably the greatest man who ever sat on the throne of St. Peter, relieved his graver amusement of playing at nine-pins with the potentates of Europe by gossiping familiarly with an old monk on a seat at a fountain in the Vatican. He would listen for hours to the stories and pointless anecdotes with which his humble companion, who had travelled a good deal, regaled him. Petavius, one of the most learned of the Jesuits, when engaged on one of his principal works, used, at the end of every two hours, to rise and rapidly twirl his chair about for five minutes. Bacon, Cowley, Sir William Temple, Evelyn, Buffon, and Addison were accustomed to interrupt their literary studies by seeking the stimulation of a walk round their garden, and have all of them recorded their delight in Adam's principal pursuit.

POETRY.

THE SONG OF PATIENCE, ... 322 | SWEET LOVE AND I, ... 322

MISCELLANY, ... 384

PUBLISHED EVERY SATURDAY BY

LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

THE SONG OF PATIENCE.

THERE was a song I tried in vain to sing!
It seemed as though I ne'er should learn the ring
Of the sweet melody; though oft again
I sought, with tears, to sing that sweet refrain.
I longed to strike the chords in harmony,
And pour a song which should fall soothingly
On lonely, troubled hearts, and lull their fears
To rest. But all in vain! Hot, burning tears
Fell from my weary eyes, as, sorely vexed,
My disappointed heart at last confessed
My voice might never breathe that song of rest.

I heard of other voices, raising high
The same sweet song, that I so wearily
Had striven to learn for many a long, long year;
I listened eagerly, that on mine ear
Might fall the gracious echoes, sweet and low,
And fondly dreamed that I could quickly know
And imitate their tone; and gazed upon
The words till blinding tears did hide them one
By one from view: and yet, when I essayed
To strike the measure, oh! how soon I laid
My harp, in sad despair, upon the ground,
And felt that never, from its slumbering sound,
The song of patience I might sweetly wake!
To earthly masters I my harp did take,
Imploring them to teach me, but in vain;
Others might raise the full melodious strain,
Till angels bent with listening ears again;
My yearning voice forever hushed must be,
That blessed song might ne'er be sung by me.

O weary soul! didst thou not see One near?
Did not his footsteps fall upon thine ear?
Did not his shadow, gently passing o'er,
In silent tenderness, thy tear-stained floor,
Raise thee from that dull, sorrowful despair?
He lowly bends, and takes thy harp from where
In sad impatience it was often flung,
And, tuning it with skilful fingers, sung
The song I craved to learn. Oh! dear, dear soul,
Did e'er such melody across thee roll?
It was a tone that never had its birth
In this poor, troubled, sin-marred, weary earth.
I turned to him, with streaming, earnest eyes,
Imploring him to bid my voice arise
In that rich harmony. He gently smiled,
And whispered softly, "Follow me, my child,
And thou shalt learn to sing the song below,
Which angels in my mansions ne'er may know."

I followed him, wiping my tears away,
Clasping my silent harp, but lo! the way
Straight in a flaming, angry fire he led,
Where red-forked tongues shot high above my head,
Devouring far and wide. Deep anguish filled
My soul. I would have fled, but through me thrilled
His loving voice,—"Sing on, my child, and raise
Thy harp's full melody, e'en in the blaze;
Those stubborn fingers will with soft power wake
Chords which this scorching glow can only make;
The blessed words will sink with deep-graved power,
And thy best teacher be this fiery hour!"

I raised my voice, though heartstrings nearly broke,
With scorched and trembling fingers, slowly woke
The song I longed to learn! and, 'midst the pain,
I felt I could, though feebly, raise the strain.

And now I pass along the world's highway,
Where restless, woe-worn hearts in darkness stray:
Oh that I might, though poor and weak my tone,
Comfort some lost one, wandering alone,
And sing my song of patience, till the light
Breaks on his darkly clouded, heavy night.

The day grows late, the shadows longer fall,
Soon will the voice from Zion's palace call,
And songs and harps will soon their echoes swell
Around the glassy sea, where God doth dwell,
And songs of patience, which we sang below,
In tones of deep, glad love away shall flow!

Golden Hours. M.

SWEET LOVE AND I.

SWEET Love and I have strangers been
These many years,
So many years.
He came to me when life was green
And free from fears,
These present fears.

He came, and for a little space
My life was gladdened by his grace;
But soon he fled, and joy gave place
To grief and tears.

"O Love, come to me once again!"
My lone heart sighs,
So sadly sighs.
"Recall thy fearless nature, then,"
Sweet Love replies,
Softly replies.

"Thou canst not? Then I cannot be
The same that once I was to thee.
There's no room in the heart for me,
Where fears arise."

From The Nineteenth Century.

THE COLOR-SENSE.

TWENTY years ago, an examination of the Homeric text led me to what I then thought a very startling conclusion. It was this: that, although Homer had used light in its various forms for his purposes with perhaps greater splendor and effect than any other poet, yet the color-adjectives and color-descriptions of the poems were not only imperfect, but highly ambiguous and confused. It was only after submitting the facts to some very competent judges that I published in 1858 a section of my Homeric studies,* "On Homer's Perceptions and Use of Color;" for the case appeared to open up questions of great interest, with respect to the general structure of the human organs, and to the laws of hereditary growth. My propositions were: † —

1. That Homer's perceptions of the prismatic colors, or colors of the rainbow (which depend on the decomposition of light by refraction), and *a fortiori* of their compounds, were, as a general rule, vague and indeterminate.

2. That we must therefore seek another basis for his system of color.

I rejected the supposition, that this was due to any defect in his individual organization: and found that his system of color, or rather his "system in lieu of color," was "founded upon light, and upon darkness, its opposite or negative;" and that "the organ of color" was "but partially developed among the Greeks of his age." ‡ My meaning was substantially this: that he operated, in the main, upon a quantitative scale, with white and black, or light and dark, for its opposite extremities, instead of the qualitative scale opened by the diversities of color.

The curious phenomena of color-blindness had then been very recently set forth by Dr. George Wilson.§ He considered it in three forms: 1, as inability to discern color at all; 2, to distinguish the nicer shades of the more composite colors, such as browns, greys, and neutral tints; 3. to distinguish between the primary colors, red, blue, and yellow, or between these and the secondary or tertiary colors, under which head he names green, purple, orange, and brown. The first form, he says, is rare, and perhaps not absolutely ascertained.* Color-blindness does not depend upon weakness in the organ: for he mentions the case of a woman, who could distinguish no colors, yet "could often read for nearly a quarter of an hour in the greatest darkness." In one family, three persons called all bright tints white, and all dull ones black.† A house-painter in Australia could not distinguish colors, but had a good eye for form, and was excellent in designing and drawing. Once, however, he mixed his own colors, and thought he had got a stone tint, but it was found that he was painting the building blue.‡ Painters, says Dr. Wilson, "know how long it is before the most susceptible eye acquires its maximum sensibility to color." But the commonest form of color-blindness appears to be that which confounds red and green. Now these are not neighboring colors in the spectrum. Were it a question only of imperfect devolopment of a sense, it would be shown first and most in inability to distinguish a color from that next to it. But red is separated from green by the intervening spaces of orange and yellow. Color-blindness proper, then, appears to partake of the nature of organic defect. But, as Dr. Wilson has pointed out (and I have had an opportunity of verifying the remark), painters know that there is an education of the eye for color in the individual. The proposition, which I desire to suggest, is that this education subsists also for the race.

Within the last few years, this subject has been freely discussed both in Germany among philologists and physiologists, and likewise among Oriental scholars. I understand the general tendency of the discussions to be in favor of the doctrine that color was little known to the ancients,

and that the sense of it has been gradually developed, until it has now become a familiar and unquestioned part of our inheritance. Perhaps one of the most significant relics of the older state of things is to be found in the preference, known to the manufacturing world, of the uncivilized races for strong, and what is called in the spontaneous poetry of trading phrases loud, color.

I shall endeavor to give a view of the subject from Dr. Hugo Magnus, a German inquirer who has recently written on it with great care and ability. He is a physiologist as well as a scholar, and teaches, as *Privatdocent* in the University of Breslau, on the care and treatment of the eye. He gives some indications of a conflict of opinion which has been manifested in his country. But my principal object, after presenting a sketch of his labors, will be to make a contribution to the stores of material, upon which the questions at issue will ultimately be determined, from the quarter where I feel myself most competent, or least incompetent, to search for it.

I understand from an able Hebraist that the Old Testament offers much evidence of the imperfect conception of color in early times. But I take it that by far the most important magazine of information on this subject is to be found in the Homeric poems: the most important on account of its mass, of its unity, and of that high organization which belongs in a degree to genius in general, and which the text of Homer indisputably proves him to have possessed with regard to the two kindred subjects of motion and form. Treading, therefore, with a bolder and firmer step, than when I had no one within view to lean on, I shall now endeavor to present the results, which are to be obtained from Homer, in a more positive and decided shape: and shall suggest a method of meeting, at least in part, the principal and not inconsiderable difficulties which they bring into view.

Dr. Magnus has published (I.) "*Die geschichtliche Entwickelung des Farbensinnes*" (Leipzig, 1877), and (II.) a tract which partially covers the same ground, and is entitled "*Die Entwickelung des Farbensinnes*" (Jena, 1877). I shall refer to these tracts as I. and II. respectively.

He observes in his preface on the extreme paucity of materials supplied by previous labor; and proceeds to anticipate the counter-argument, which some might be disposed to draw from the admitted sharpness of sense in the savage. This sharpness of sense, which may be observed also in the inferior animals, is wholly distinct from a high development of special aptitudes contained within the bounds of each domain. There appears, I would remark, to be a sort of analogy in the relation of the two to the relation between muscular strength and muscular pliability. Homer himself illustrates the argument of Magnus. I have observed that hardly any poet has made such free and effective use of light in general for poetical purposes. Nowhere has he been more bold than in his figure of black pains (Il. iv. 117, 191; xv. 394), of the soul purpling in painful apprehension (Il. xxi. 551, *et al.*), of blazing rumor, or battle (Il. ii. 93, *et al.*), and the like. We must presume that his retina was especially sensitive to light and dark; and yet it is in him, too, that we lack the developed sense of color. And we may find an independent analogy in the case of mental gifts; where it will sometimes be found that those who are clearest and strongest in their perception of broad outline are endowed with the narrowest capacity for apprehending even essential distinctions. Dr. Magnus quotes Geiger, who published in 1871 on the historical development of man, as pointing out that the dog with his wonderful faculty of scent, had no power of distinction between smells which are agreeable and smells which are offensive. He can deal with quantity only, not with kind, in smell. And so a keen perception of sound is entirely distinct from a good ear for music. As to the sense of smell, I may observe that it would be difficult to find in Homer an instance of its pleasurable exercise except once in relation to the *aroma* or bouquet of wine (Od. ix. 210); unless we allow that another instance is supplied by the rather carnal idea of the κνίσση, or savor which ascends to heaven from the sacrifices, and which apparently is more

related to taste than smell. He calls a store-room fragrant (Il. iii. 382), and he calls the growing cypress and oil, oddly enough to our apprehension, by the same name (Od. ii 339, v. 64). He was not, however, insensible to a strong stench, and he mentions with a vigorous and hearty detestation the seals of Proteus: —

φωκάων ἁλιοτρεφέων ὀλοώτατος ὀδμη.—Od. iv. 442.

He speaks of flowers as tender (Od. ix. 449), white (Il. xvii. 56), and hyacinthine, but nowhere as sweet-smelling. And Magnus observes that the fragrance of flowers is nowhere noticed in the Old Testament until we reach the Song of Solomon.

So much for the principle involved. Having drawn the distinction between the elementary activity of one organ, and its higher exhibitions of function, we may now proceed to a brief outline of the facts. And I shall best introduce the general view of Dr. Magnus by quoting Sir Isaac Newton on the scale of colors: "The lights of colors are more refrangible one than another in this order: red, orange, yellow, green, blue, indigo, deep violet." *

Dr. Magnus considers that, in the progressive education of the human organ, three colors have been successively disclosed to it, and have by degrees come to be part of its regular perceptions, in the order here given: the order of their greater or less refrangibility, of their wealth or poverty in light. The increase of susceptibility acquired by the retina has become hereditary, and has grown with a long series of generations.

We will now pass to the stages of the historical development. The starting-point is, an absolute blindness to color in the primitive man. Anaxagoras, it seems, believed that in the earliest times there was no sense of color at all. The first stage attained is that at which the eye becomes able to distinguish between red and black. Red comes first into our perceptions, because it is the most luminous of the colors; but, says Geiger, in the "*Rig-veda*" white and red are hardly severed.† Greek philosophers, Aristotle in particular, lean to treating colors chiefly as degrees of the luminous and non-luminous, or as mixtures, atomistic or otherwise, of black and white.

In the next stage of the development, the sense of color becomes completely distinct from the sense of light. Both red and yellow, with their shades, that is to say, the red, orange, and yellow of the Newtonian scale, are now clearly discerned. To this stage Magnus * refers the Homeric poems, in which red and yellow colors are set forth, but there is no mention of green or blue; for example of green for trees and plants, or of blue for the heavens. I may intimate in passing, that in my opinion it is hardly possible to pass more than an approximative judgment on the sense of color in Homer, but I think the estimate of it given by Magnus is liberal rather than the reverse.

With this comparatively early acquisition of the sense of redness, Magnus connects the prominence which that color acquired both in the initial stages of the painter's art, and in the costumes of high personages. It had as it were got a start, and had the first possession of the ground which, in costume particularly, it has retained. But we must remember that, in public exhibition and ceremonial, it is, from its luminous character, highly satisfactory to the eye.

The characteristic of the third stage is the recognition of colors which in point of luminousness belong to neither extreme, but are in a mean: he refers to green with its varieties. The clear and bright green he regards as a next onward step from yellow; but the dark green is classed as belonging to the dark family in general. At this point we are reminded of what seems to be the greatest difficulty of the entire subject. We find its lines traverse one another; the light and dark, within the limits of each particular color, giving us one scale of comparison, while the colors as such present another, and the two scales having no common measure. Nay, it may even seem that each color is capable of being deepened into black, by a road of its own,

without passing through the other colors. But, making these remarks as I pass, I proceed with the historical outline.

In the fourth stage of the development, we find an acquaintance with blue begin to emerge. This is a stage not even now reached universally. "Bastian relates * that in Burmah a striking confusion between blue and green is a perfectly common phenomenon, which in fact attracts the attention of strangers arriving there, in a manner thoroughly surprising." † A like confusion is sometimes observable among ourselves as to these two colors when seen by candle-light, in the case of persons who have not, in any degree, the specific defect of color-blindness.

Our author next gives his adhesion to the Newtonian doctrine, and finds the law of that progression, which has now been traced, in the wealth or poverty of living force possessed by the respective colors, which determines their early or late admission to the list of things perceived by the average man. Thus red begins, blue and violet close, the scale; and the retina, gradually trained to a higher susceptibility, grasps at length with ease what formerly and long eluded it.

By way of illustration, he considers the manner in which the ancients have treated the rainbow. Homer deals with it, he thinks,‡ as one-colored, red or purple (πορφυρέη, Il. xvii. 547): so does the Arabic, which describes it as *nadathon*, red, and applies the same phrase to the sunset and sunrise. Also as *castalanijjathon*, with the same meaning and applications. The reader will observe how we again strike upon the "stone of stumbling." How were men led to equate the color-impression from the rainbow with that from the morning and evening glow? So, about 600 B.C., we find Ezekiel (i. 27–8) in a similarly backward state. I quote the English version: "I saw as it were the appearance of fire, and it had brightness round about. As the appearance of the bow that is in the cloud in the day of rain, so was the appearance of the brightness round about." Which cannot be explained but by supposing that, for the eye of the prophet, red was the fundamental, and exclusively prevailing color of the rainbow. But I shall have to show that this was a point which Homer, living, as I think, many centuries earlier, had by no means reached. Magnus, now passing beyond it, brings us to Xenophanes, who sees in the rainbow the several hues of red (*phoinikeon*), purple (*porphureon*), and yellow-green (*chloron*). In Aristotle it is still tricolor; but, with red and green, blue is now set forth as a substantive color. Ovid (Met. vi. 65–7) treats it as of a thousand colors, with shades hardly distinguishable each from its next neighbor, but with extremes very remote from one another. Him Seneca seems to follow. But the Aristotelian triad of colors is reproduced by Suidas and Galen; is found in the Edda and in Varâhamihira; in the Arabian literature, and in the West down to the opening of modern times,* notwithstanding the struggle of the improving sense to assert itself, at least by recognizing minor shades as innumerable. Finally Newton appears on the scene, and establishes the scientific (yet not undisputed) doctrine of color. Throwing back one glance as far as the Augustan age, we see Virgil (Æn. iii. 63–4) using *cæruleus*, blue, in a sense interpreted by Servius as equivalent to *niger*, and not capable of being rendered more mildly than by the word "dark." † Statius, Juvenal, and Valerius Flaccus may be quoted to the same effect. The details concerning the rainbow are treated by Magnus as a verifying formula for the general doctrine.

I now come to consider and present the Homeric materials.

It has been said above that there is difficulty in determining with any precision the true bounds of Homer's perception of color. Prolonged examination moves me rather to reduce than to extend former estimates. I find that the more we treat, as a general rule, what are apparently his words of color as quantitative expressions of light or its opposite, the nearer do we come to the establishment of harmony and coherence in his terminology. With regret, but in deference to truth, I find it safe to lean to this canon of interpretation. Perhaps, in thus exhibiting the narrow range of his ὕλη or material, I am doing a special homage to his transcendent genius. If without the aids of lengthened history, of wide survey of the earth and man, of long hereditary development of the organs, he has achieved his present results, what would he have accomplished had he been possessed of the vast and varied apparatus of all kinds which we enjoy! And what have natural selection, and the survival of the fittest, with their free play through three thousand years,

done for us, who at an immeasurable distance are limping after him, amidst the laughter, I sometimes fear, of the immortal gods?

To pass at once *in medias res*. The epithets which are even apparently true epithets of color in Homer are but few, although they are apparently multiplied by the fact that some of them have a large progeny. For example, we have *phoinix* (Il. xxiii. 454), *phoineeis* (Il. xii. 202), *phoinos* (Il. xvi. 159), *phoinios* (Od. xviii. 96), *phoinikoeis* (Il. x. 133, *et al.*), *phoinikopareōs* (Od. xi. 124, xxiii. 271), and finally *daphoinos* (Il. ii. 308), with its verb *daphoineō* (Il. xviii. 538).

In speaking of true color, I here strike out of view the extremes of white, with brightness, on the one side, and of black, with darkness, on the other.

When we proceed to examine these words of color, we find that the poet's sense of color was not only narrow, but also vague, and wanting in discrimination.

Take first the word *phoinix*. We are introduced to it as a substantive, describing a material which was used as a dye for ivory; and it is made the subject of a comparison with the blood of Menelaos flowing forth upon his flesh (Il. iv. 141). So far so good. With this some other passages agree. But in the games the word describes the color of a horse (xxiii. 454), who was *phoinix* all over, but had a white spot, like the moon, on the forehead. The same epithet sits very ill upon blood and the bay color of a horse; nor would it mend the matter if we were to render the word chestnut. It is a new difficulty to connect these senses of the word with Od. vi. 163, where it means the palm.

Passing to the other members of the family, we find applied to blood *phoineeis* (Il. xii. 202, 220), *phoinios* (Od. xviii. 96), *phoinos* (Il. xvi. 159), *phonikoeis* (xxiii. 716), *daphoineō* (Il. xviii. 538).

Of these words the three first named are used in no other connection. But *daphoinos*, the adjective, is used in Il. ii. 308 for the back of a serpent; and thus we are thrown back at once from the color red, the near neighbor of light, and from blood associated with it, upon blackness or darkness, at the other end of the scale. If more evidence on this word be desired, we find it applied in Il. xi. 474 to jackals, and in Il. x. 23 to the skin of a lion, which could hardly be either black or red, except upon a sign-post.

So, again, *phoinikoeis* is principally used for a cloak or mantle (Il. x. 133, *et al.*). Now it is pretty certain that these were not red; because Homer never once applies to them the word ἐρυθρός, or any other word directly connected with that color.

Further, we have *phoinikopareōs* applied to the painted bows of a ship (Od. xi. 123, xxiii. 272). It is commonly supposed that this means red, and agrees with the word μιλτοπάρηος (Il. ii. 627), which is rendered vermilion. Now, whatever this word meant, it seems to have been descriptive not only of the twelve ships of Odusseus, as in this place, but of ships in general; for in Od. ix. 125 we are told that νέες μιλτοπάρηοι are not found among the Kuklopes. But, proceeding a step further, we find not only that the favorite phrase of Homer for ships is "black ships," but that he has another epithet for the prows much more distinctive than the two compound words already quoted, namely, *kuanoproros*, with bronzed or dark prows, which he uses no less than thirteen times, against twice for each of the other two. Consequently the strongest presumption arises that *phoinikopareōs* and *miltopareōs* mean for him the same thing as *kuanoproros*. And to set the matter at rest we find that, while all the twelve ships of Odusseus are called *miltopareoi* in Il. ii., we have *kuanoproros* applied to his ship in Od. ix. 432, 539, x. 127, and elsewhere.

From these difficulties we are of course tempted to escape by generalizing the sense, and interpreting the words as only having the force of dark at large. But this way is in some degree stopped against us; for (*a*) we are thus travelling at once from red, the strongest light color, down to the opposite of light; and (*b*) brightness is directly and strongly associated with the present root in Il. vi. 219, vii. 305, Od. xxiii. 201, where it is distinctly applied to a girdle or a stripe of leather, φοίνικι φαεινόν, bright with the dye called *phoinix*.

If we pass on to the important word *porphureos*, we shall find it not less embarrassing. Of all the color-words this, with its verb πορφύρω, has the largest and most varied application in Homer. They are used, in all, thirty-two times. The verb πορφύρειν, like the adjective μέλας, is employed to describe mental operations, and πορφύρεος is also applied to immaterial subjects. We find it placed in connection with —

Original from CORNELL UNIVERSITY

1. Clothing:
   - τάπητες, carpets (Il. ix. 200, Od. xx. 278).
   - ῥήγεα, blankets (Il. xxiv. 643).
   - χλαῖνα, the mantle (Od. xix. 225).
   - φᾶρος, the cloak (Il. viii. 221, Od. viii. 85).
   - πέπλος, female robe (Il. xxiv. 796).
   - ἱστός, a web (Il. iii. 125, xxii. 441).
2. The rainbow (Il. xvii. 547).
3. Blood (Il. xvii. 361).
4. A cloud (Il. xvii. 552).
5. The sea (Il. xvi. 391). The wave (Il. i. 482, xxi. 326; Od. ii. 428, sea or river). The sea darkening (πορφύρειν, Il. xiv. 16).
6. The ball for play in Scheria (Od. viii. 373).
7. Death (Il. v. 83, xx. 477, xvi. 334).
8. The mind in painful apprehension (Il. xxi. 551), or perplexity (Od. iv. 427, 572, x. 309): (πορφύρειν).
9. Lastly, the wool on Kalupso's distaff is of the *porphurean* of the sea, ἠλάκατα ἁλιπόρφυρα (Od. vi. 53); also on Aretē's distaff (*ibid.* 306); and garments made of it (Od. xiii. 108) are the same.

Upon examining this remarkable phrase in its several applications, I think it is clear —

a. That in many cases the idea to be conveyed is undeniably that of darkness.

b. That in no one case can we positively affirm it to be a color-epithet, as contradistinguished from a light-epithet.

In proof of the first I cite the figurative application like μέλας to death, and as it seems only to bloody death; and to painful rumination, in which it recalls the φρένες ἀμφιμέλαιναι: and to a dark cloud.

Again, the light robes cast over the body of Hector in Il. xxiv. are *porphureoi.* Now we know, from the case of Thetis (Il. xxiv. 93) after the death of Patroclos, that dark vestments were even thus early used in connection with death, and evidently by way of mourning. Such then were, in all likelihood, these *peploi.*

Again, the rainbow is *porphureē.* But, it may be asked, did Homer, like the Arabians, mean brightness by this phrase? Evidently not. For, firstly, we may remark that to his personal Iris he never attaches an epithet either of color or of light. The nearest to it is *aellopous*, storm-footed. He might have said, if he had liked, ray-footed. But more; he mentions the physical phenomenon in one other passage, Il. xi. 23, where the three serpents on the breastplate of Agamemnon are compared to rainbows, but are also called κυάνεοι, bronzed, or of bronze; an expression which I think settles the question, and shows that the bow for Homer's eye was dark; the indigo and violet were more, for his perception, than the red, orange, and yellow.

Further, I cannot doubt that, when the poet applies *porphureon* to the sea, he so applies it as an image of darkness. It is (Il. xiv. 16) the sea darkening for a storm: again, we have the roaring water of Scamandros when angry and in flood (Il. xxi. 386); and the sea swollen by furious rivers (Il. xvi. 391).

Besides all this, we have to consider that, if he did not mean the dark lowering color of the sea, be it green or brown, and intended to convey brightness, this would be a blue brightness. But blue is a color weak in light; and of a blue brightness Homer nowhere shows the smallest idea. The negative proof becomes overwhelming, when we consider that, living under a Mediterranean sky, he never calls that sky by the name blue.

This argument covers the wool on the distaff and the garments made of it; and presumably the other objects named, such as vestments. I doubt, indeed, if in any one case Homer gives us a vestment bright by color. In Od. xxiv. 147 we have the web of Penelopē, bright, not with color, but with light, "as the sun or the moon is bright." It is, however, when she has just washed it, and when it carries some gloss of light. And hence it is that in the mourning-time of Laertes he does not, we are told, use bright coverlids or blankets. The meaning appears to be that, being in sadness, he did not use fresh, bright, glossy, well-kept garments; and this appears to be in exact conformity with the force of the epithet *sigaloenta* (Od. xi. 189), here used to denote brightness.

I will pass now to what I take to be in itself the best approach to a true, genuine color-epithet in Homer, namely the word ἐρυθρός. No garment in Homer is *eruthros*, or red. Of purple as a color, the weakest of all as it is in luminosity, Homer could plainly have no idea. But what is strange is that even his idea of red does not seem to be wholly distinct, as we shall find in considering that family of epithets, of which *eruthros* is the head.

Here the poet is so far on the right road, that he takes hold of a word which is meant to signify color in itself, and not merely as residing in some object which is taken for the standard. He deals with redness; and not with rosiness or rose-like-ness. I doubt whether so much can

be said of any other word in the poems except *xanthos*.

Eruthros is applied to —

1. Copper (Il. ix. 365).
2. Nectar (Il. xix. 38; Od. v. 93).
3. Wine (Od. v. 165, ix. 163, 208, xii. 19, 327, xiii. 69, xvi. 444).
4. Blood, in ἐρυθαίνω (Il. x. 484, xxi. 21).

The favorite use of the word, it will now be seen, is for wine: including nectar, we have it thus applied in nine cases out of a total of only twelve. This is very remarkable; because wine is not of a redness proper, but only approximative, and with a decided infusion of the idea of darkness. Accordingly, we find that Homer has but one other epithet of color for wine, namely αἴθοψ, and this belongs to a family in which (*infra*) the notion of darkness predominates.

Again, we may observe of the application of *eruthros* to copper, that this metal is rather freely associated with color-phrases. It is called —

aithops eleven times	. . Dark epithet;
ēnops three times, *nōrops* eight times	. . . Bright epithets;

and he has splendid descriptions of the effulgence of the copper-wrought arms; as in

αἴγλη δ' οὐρανὸν ἷκε, γέλασσε δὲ πᾶσα περὶ χθὼν
χαλκοῦ ὑπὸ στεραπῆς. — Il. xix. 362.

Now one of Homer's best color-associations is with χαλκός, as he calls the red blazing heaven the copper heaven (Il. v. 504, xvii. 425); but this very word helps to show us the determined predominance of the light-perception over the color-perception, when he so many times uses for it both epithets of brightness and epithets of darkness, which have their only possible meeting-point in the notion of light affused or withdrawn.

Again we have, as might be expected, the notion of red twice applied to blood, which he also once calls *phoinion* and once *porphureon*. But his favorite epithets of color for blood are all epithets of blackness; κελαινεφές, Il. iv. 140, and in six other places; κέλαινον, Il. i. 303, and in nine other places; most of all μέλαν, Il. iv. 149, and in eleven other places.

We have also, as place-names in the catalogue, *Eruthrai* and *Eruthinai*, probably with reference to the brown red of sandstone soil or rock (Il. ii. 499, 855).

Thus even the red of Homer, represented by ἐρυθρός, is in the great majority of instances associated with dark rather than with bright.

Passing now to the rose, we find it supply the staple epithet for morning; *rhododactulos*, rose-fingered. There is no direct point of contact between Homer's expressions taken from the rose, and *eruthros*; as they are never applied to the same objects. A very pale reddish pink, far removed from ruddiness, seems to be indicated in this epithet; and its application, we should remember, is to the dawn, not the day. It is doubtful whether the whiteness, or the redness, which are here combined, contributed most to fashion the poet's perception. Probably the whiteness, as I judge from the only other indication he has afforded as to his notion of the rose. It is in the curious phrase rosy oil, *rhodoen elaion*, which was used to anoint the body of Hector, Il. xxiii. 186. Here we can trace no greater resemblance to the rose than the glossy shine of oil: again an instance of the dominance of the light-sense, of the rudeness and feebleness of the color-sense.

Upon the whole, perhaps the best and truest acknowledgment of pure color in the poems is conveyed, though indirectly, in a reference to the human form, by the epithet *kallipareōs*, fair-cheeked. This rather favorite word is applied by Homer to the following persons, all certainly or presumably beautiful: —

1. Chruseïs (Il. i. 143).
2. Brisēis (Il. i. 134).
3. Theano, the priestess of Athenē (Il. xi. 224).
4. Diomedē, the war-concubine of Achilles (Il. ix. 665).
5. Helen (Od. xv. 23).
6. The goddess Themis (Il. xv. 87).
7. The goddess Leto (Il. xxiv. 607).
8. The saucy Melantho (Od. xviii. 320).
9. Penelopē, in καλὰ παρήϊα (Od. xix. 81, 208).

We have here to consider what are the distinct hues of Homer's men and his women. We find him apply the name Melas to a Greek of rank (Il. xiv. 117). Odusseus, on his restoration to beauty by Athenē, becomes *melanchroiēs* (Od. xvi. 171). The *melanochroös* of his herald, in Od xix. 246, does not seem to bear any different sense. Homer's *melas* means dark rather than black, and is itself but indefinite; we are obliged to take these words as referring to an olive complexion. But, in his women, whiteness is commended. Penelope (xviii. 195) is whiter than ivory. Like Herē and Andromachē in the Iliad, and even like Helen herself, the attendant maidens, in Od. xviii. 197, are λευκώλενοι, white-armed. To the beauty of

Original from CORNELL UNIVERSITY

this white skin, color in the cheek is the proper supplement; nor is it easy to see on what other marked ground the cheek should be selected as a part so characteristic. This, then, is rosy or red color, and it is perhaps the best example in the poems of a normal relation between the perception, the expression, and the object.

I take now the difficult word αἴθοψ with its cognates *aithōn*, *aithē*, *Aithiopes* and *aithaloeis:* also with οἴνοψ, wine-dark according to Liddell and Scott, which, in this rare case unable wholly to follow them, I take to be kindred in sense to *aithops*. I begin with *oinops*, wine-colored.

Oinops is applied to no more than two objects; and only to one of these two with any frequency. It is used twice of oxen, in Il. xiii. 703, and Od. xiii. 32. But of the sea it may be called a stock epithet, being so employed eighteen times. Now we have already found, in arguing the case of *porphureos*, that the sea-epithets of tint are dark, though without positive color. Such, therefore, is the probable sense of *oinops* with the sea. This sense is supported by its special associations: as with the mental sadness of Achilles gazing over it, Il. i. 350 and xxiii. 143; with the word ἠεροειδές in Il. v. 770–1; and with the state of the sea under a rattling breeze at night, Od. ii. 421.

Again, it is plain that we cannot associate *oinops* with any one leading color specifically. The only question, in reference to wine, would be whether it meant the brightness of sparkling wine. But this kind of brightness is totally inapplicable to the βόε οἴνοπε. As they cannot be white, and are not sparkling, they must be dark. *Oinops*, then, means dark in this case also.

Having thus found the color of Homer's wine as it presented itself to his eye, we are in a better condition to judge of any epithets of color which he applies to it. There are only two, *eruthros* and *aithops*. It has already been found that *eruthros*, with wine, carries the notion of darkness rather than of light; it is therefore unlikely that the other staple epithet should not greatly correspond with it. Yet there is an element of doubt in the case. *Aithops* seems to be applied to dark objects, but commonly to such dark or dull objects as are capable of brightness by reflecting light. Thus it is a favorite epithet of *chalkos*, to which it is applied eleven times, and *chalkos* is one of the few Homeric words which decidedly lean to epithets of brightness, such as *ēnops* and *nōrops*. I do not therefore identify *aithops*, as applied to wine, with *oinops*. It includes the element of light; but it includes also the element of darkness, for we have it applied to yet the third subject, namely, smoke (Od. x. 152).

When we look to kindred words, we find them bearing witness on both sides, and thus illustrating the dualism of idea; the brightness of lights which impinge upon a dark subject.

The adjective αἴθων, for example, is applied to —

Iron (Il. iv. 485, *et al.*),
Eagle (Il. xv. 690),
Oxen, bull (Il. xvi. 488; Od. xviii. 371),

where the sense of darkness, subsisting in various degrees, appears obvious. But an opposite idea, that of brightness produced by rays of light falling on a dead surface, is presented by its application to —

1. The lion (Il. x. 23, *et al.*),

and more especially to —

2. The copper cauldron (Il. ix. 123); also the tripod (Il. xxiv. 233).

But again: the dark element prevails in Aithiopes, for the Ethiopian nation, with whom is associated Poseidon the dark-haired god (Od. i 22); probably in the horse Aithon (Il. viii. 184) and the mare Aithē (Il. xxiii. 295), for the horses could hardly sparkle, though the horse Lampos (Il. viii. 185) might shine in the sense of Virgil, —

> Quæ cura nitentes
> Pascere equos. — Æn. vi.

Again in *aithaloeis* applied to dark or sooty beams of a roof, Il. ii. 415, and Od. xxii. 239; and to *tephrē*, ash, in Il. xviii. 23, which in v. 25 is at once called *melaina*. But in the word *aithēr* for the atmosphere, in *aithein*, used for the lighting of a fire, and in *aithousa*, the open portico or colonnade of a mansion, the element of light prevails; not, however, an element of color. So it is, that we are buffeted about in the attempt to deal with this the most difficult and unmanageable group of all the color or light-words of Homer.

It is not necessary to dwell long upon *kuaneos*. I conceive it to mean (1) made of, (2) in hue like to, bronze. In the latter sense it is applied —

1. To the eyebrows of Zeus and Herē (Il. i. 528, xv. 102, xvii. 209).
2. To a dark cloud (Il. v. 345, xx. 418, xxiii. 188).
3. To the hair of Hector (Il. xxii. 402); to the beard of Odusseus restored to beauty (Od.

xvi. 176); agreeing apparently with his hyacinthine hair (Od. vi. 231).

4. To the serried mass of the Greek and Trojan armies as they move (Il. iv. 281, xvi. 66).

5. To the mourning garments of Thetis. Her veil is *kuaneon;* and the poet adds, τοῦ δ' οὔτι μελάντερον ἔπλετο ἔσθος (Il. xxiv. 94). Nothing could be more black than this garment; and yet, in Il. iv. 277, we have a cloud as black as pitch.

6. To the sea-sand just left bare by the water (Od. xii. 243).

Further, in compounds —

1. To hair, of Poseidon (Il. xiii. 563, xv. 174, *et al.*); to a mare (Il. xx. 224).
2. Amphitritē, as the sea (Od. xii. 60).
3. To a ship's prow (Il. xv. 693, *et al.*).

There are also various cases in which a question may be raised whether Homer intends to signify the metal, or merely the color belonging to the metal.

1. The breastplate of Agamemnon, which has ten layers of black *kuanos* (μέλανος κυάνοιο), together with twelve of gold and twenty of tin, carries likewise on each side three serpents called *kuaneoi* (Il. xi. 26). The change of form from the genitive to the adjective will be observed; it might possibly indicate the transition from the metal to the mere color without the metal. It should be remembered that the *chruseos* of Homer for the most part means not golden but gilded, and his *argureos* in like manner silver-plated.

2. On the belt of Agamemnon (*ibid.* 38, 39,) which is *argureos*, there is another serpent which is *kuaneos*.

3. On the shield of Achilles, round the golden vineyard and the silver stakes, is a trench called *kuaneē* (Il. xviii. 564).

4. The foot of a finely-wrought table is signified by the epithet *kuanopeza* (Il. xi. 628).

Upon the whole it may be most likely that in all these four places the metal is indicated, and not the color only. But this does not affect the argument, for it is clear that the poet has the contrast of light and dark in his eye, and that *kuanos* supplies the dark tint as against silver, gold, and tin, and also against copper in Od. vii. 87. I think it almost certain that *kuanos* is bronze, which is normally dark and not bright. But whatever it be, it is clearly assigned, in respect of color, to the dark family by its association with the hair of Poseidon, the mourning garment, the bared sea-sand, the sea itself, and the cloud. It is clear, indeed, that the word when applied to the ship's prow means something separate, as to hue, from the ship itself, which is always *melas.* But the word wholly refuses to lend itself to anything but what is more or less dark, and of degrees in dark and light there is no doubt that Homer had a substantive, if not a very minute, conception.

This last proposition is illustrated by the fact that the violet did not escape the notice of Homer, and that, like the hyacinth named but once, it is clearly associated by him with the dark tribe. Thrice we have the sea declared to be violet-colored, *ioeides*, in Il. ix. 298, Od. v. 55, xi. 106. But it is quite plain from what we have already seen that this means the dark sea, not the bright; therefore the brown or dark-green sea, not the blue. Then we have *ioeis*, violet-like, used as an epithet (Il. xxiii. 850) for iron. This is manifestly dark, but not with a deep darkness. We have the iron heaven (*sidereos*, Od. xv. 328), in contrast undoubtedly with the burnished copper heaven, but meaning what we should call grey. Finally, we have the kindred word *iodnephes* applied to wool in Od. iv. 135. There can be little question that this is dark wool: first, from the sense forced upon us by *ioeides;* secondly, from the fact that the distaff and the wool are presents made to Helen in Egypt (*ibid.* v. 130), and all our southern associations of color are ineradicably dark; as the hair of Poseidon, the wool on the distaffs of Kalūpso and Aretē, the bulls offered to Poseidon (Od. iii. 6), and the ram promised for a sacrifice to Teiresias (Od. xi. 33).* It is plainly the wool of a dark-brown ram that the poet has in view, or else a wool dyed to a deep purple, which is not an unlikely interpretation.

The word *xanthos* in Homer I think resembles *eruthros* in being a thoroughly true word of color, though imperfectly conceived. I conceive it principally to represent orange in the scale of the spectrum, and so far probably to agree with *phoinix*. He found that color represented for his eye in chestnut or auburn, and in bay. It is remarkable that Homer is so limited in his applications of this word; and they are more consistent in proportion. He uses it principally for hair, male and female, as of Menelaos, *passim;* for the coat of horses (Il. ix. 407) generally; and also as represented in the horse Xanthos;

* The learned Archimandrite Myriantheus, in his work on ancient Cyprus (with which the Greeks were in close communication), observes of a Cypriote river: ἔτι καὶ σήμερον διαμφισβητεῖ τὰ πρωτεῖα πρὸς τὸν Αἰγύπτιον Νεῖλον, κατὰ τὴν προαγωγὴν τοῦ φοίνικος. (Περὶ τῶν ἀρχαίων Κυπρίων, p. 6. Athens, 1868.)

and finally in the name of the river Xanthos, a strong and often turbid stream, though likewise called by him silver-eddying, *argurodines* (Il. xxi. 8, 130).

I conceive that we have now done with the Homeric adjectives and phrases of color, as contradistinguished from those of light. In *Argos*, *marmareos*, *marmairōn*, there is plainly no idea conveyed except that of light. On one or two exceptional cases I shall remark further on. But I must notice here two words, which might at first sight be set down as epithets of colour, namely, *polios* and *chloros*. I take first the case of *chloros*, which has the stronger pretensions of the two.

The derivation of the word is from *chloē*, herbage. But it is plain, from the applications of it, that green was not on the list of Homer's colors. If I am to choose an English equivalent for the phrase, it will be pale: and pale is not properly an epithet of color so much as of light, although there may perhaps be detected in it a very faint inkling, so to speak, of yellow.

Including two derivatives, namely, Chloris, the wife of Neleus (Od. xi. 281), and *chloreïs*, which is applied to the nightingale, the word is used nineteen times in Homer. Ten times metaphorically, as an epithet of fear. Twice for the paleness derived from fear (Il. x. 376 and xv. 4); uses which give us the basis of the metaphor just named. Twice for honey (Il. xi. 630, Od. x 234); twice for the olive-wood club of Poluphemos (Od. ix. 320, 379); once for the twigs used by Eumaios to make a "shakedown" bed for Odusseus (Od. xvi. 47). In these five cases, freshness and not color seems to be the idea. If we strive to give the sense of color, we find there is none that will cover them in common; yellow suiting in some cases, green in others, neither of the two in all.

The word *chloreïs* has been the subject of much dispute. There is a temptation to give it the very poetical sense of green-wood-loving; an epithet peculiarly suitable to the nightingale, which delights in copses, the greenest of all greenwoods. But the balance of authority * attaches the phrase to the hue or aspect of the bird; and when so attached it loses all definite idea of color. Bolton finds the color of the nightingale require a long description. "The head and back of a plain tawny, dashed with olive; the tail is of a deep tawny red; the throat, breast, and upper part of the belly are of a light glossy ash color; the lower part nearly white; the exterior parts of the quill-feathers are of a dull reddish brown; the interior of brownish ash-color." * Evidently enough, Homer's idea in this matter could not but be most vague and dim.

Chloros then, so far as it has a visual meaning, is a light-epithet rather than a color-epithet.

The word *polios* is a stock adjective for the sea, Il. i. 350, and in twenty-three other places. Foam is the mere accident of the sea: and we must, I think, consider the epithet as drawn from its general and standing character. I should render it grey; and I take this word to indicate not a color proper, though we may now apply it to various mixtures of colors, but a quantitative composition, midway, so to speak, between white and black.

The word is also applied —

1. To the human hair in old age (Il. xxii. 74, xxiv. 516).

2. To iron (Il. ix. 366, xx. 261; Od. xxi. 381, xxiv. 167).

3. To the hide of a wolf, which Dolon (Il. x. 334) put on for his nocturnal expedition. Treating Dolon as a simpleton, the poet may have meant that he put on a white hide, which would make him visible; but perhaps this idea is far-fetched, and we must take grey, I suppose, as the dominant color of the wolf. "His color is a mixture of black, brown, and grey;" but there are also white wolves.†

The idea of whiteness is totally inapplicable to iron. But in any case it seems plain, that the conception exhibited by the *polios* of Homer is simply a mode of light.

By way of completion of this survey, it may be interesting to examine in exact detail the statistics of color, so to speak, taken from some sufficiently extended portions of the poems.

I select for this purpose the last ten books of the Odyssey, which contain 4,924 lines, and the last eight of the Iliad, which contain rather more, namely 5,131 lines. I begin with the Odyssey.

In the ten books, I count 133 epithets or phrases, which relate either to color, or to light and its opposite, or its modifications.

I. I first deduct the epithets and phrases of brightness and darkness, and show the proportion which they form of the whole.

* Liddell and Scott, *in voc.* Buchholz *Homerische Realien*, I. ii. 122.

* Bolton's "British Songbirds," ii. 22.
† Goldsmith, ii. 258, 268.

ἀστὴρ ὡς ἀπέλαμπε, a robe (xv. 108)	1
Γλαυκῶπις, bright or flashing eyed Athenē	18
ἠελίῳ ἐναλίγκιον ἠὲ σελήνῃ, a mantle (xxiv. 148)	1
νώροψ χαλκός, dazzling (xxiv. 466, 499)	2
πῦρ ὀφθάλμοισι δεδορκώς, wild boar (xix. 446)	1
σιγαλόεις, bright — tunic, apartment, rug; in xix. 242 likened to the skin of a dried onion	9
στεροπὴ χαλκοῦ, flash of copper (xvii. 437)	1
φαέθων, used of the sun (xxii. 388)	1
φαεινός, bright — used for a bowl, a brooch, a quiver, polished leather	7
χρυσέη, Aphroditē (xvii. 37, xix. 53)	2
χρυσόθρονος, Eōs	6
Total	49

Of Darkness.

	times
αἰθαλόεις, smutty — roof-beam (xxii. 239)	1
δνοφερός, dark — of night (xv. 50)	1
ἐρεμνός, Erebus-like — the earth (xxiv. 106	1
ἠερόεις, dark — ways to the under-world (xx. 65)	1
Total	4

II. I next deduct the epithets of whiteness and blackness, as neither properly designates color. *Argos* and *argennos*, though originally referable to motion and the light resulting from it, seem to have acquired in these cases the sense of white.

Whiteness.

	times
ἀργός, white — a goose (xv. 161)	1
αργεννός, white — sheep (xv. 472)	1
Λευκάς, white — Leucadian rock (xxiv. 11)	1
λευκός, white — sails, bones of the dead, wild boar's tusk, sails, arms, Penelopē whiter than polished ivory (xviii. 196)	10
Total	13

Blackness.

	times
κέλαινος, black — blood (xvi. 441, xix. 447)	2
μελανόχροος, dark-skinned — Eurubates the herald (xix. 246)	1
μέλας, black — ship, fate, death, earth, (xix. 111); blood, βρότος (xxiv. 188); mainland (xxi. 109); evening (xviii. 305)	20
Total	23

Next I shall deduct the words which indicate the shade of grey, halfway, so to speak, between white and black, but without decomposition, or refraction, and therefore not properly a color. The epithets used for it in these ten books are three.

	times
1. πόλιος is here applied to iron (xxi. 3, 81, xxiv. 167); to the sea (xxii. 385, xxiii. 236); to the old (xxiv. 316, 498)	7
2. σιδήρεος, like χάλκεος, πολύχαλκος is applied to the heaven, and *if* an adjective of color, which is doubtful, means grey (Od. xv. 329)	1
3. χλωρός, of fresh twigs of brushwood (Od. xvi. 43); metaphorically of (δεός) fear (Od. xxiv. 449, 532); and χλώρηις ἀήδων (xxix. 518): see *supra*. In all the passages are	4

Thus we have

	times
Epithets of light and dark	55
" white and black	36
" grey	12
Total	103

Thus there remain some thirty-one cases in nearly five thousand lines, where Homer can be said to introduce the element or idea of color; or about once in one hundred and sixty lines.

The epithets used are:

ἐρυθρός, καλλιπάρῃος, ῥοδοδάκτυλος, καλὰ παρῄια, for redness.

ξανθός, for auburn or chestnut.

αἴθοψ, αἴθων, οἴνοψ, πορφύρεος, φοινικόεις, φοινικοπάρῃος, ὑακίνθινος: all these words expressing vaguely and confusedly an idea of color based upon red, purple, or brown verging into black.

It will be interesting in connection with the discussion on the identity of authorship for the two poems, and on the theory that the Iliad was produced earlier, the Odyssey later in life, to observe the relative uses of color in the one and the other.

In the last eight books of the Iliad, I find, as nearly as I can reckon, about 208 light and color phrases, as against 133 in the last ten books of the Odyssey. Allowing for an excess of about two hundred lines in the books of the Iliad, we may take the number of light and color phrases in an equal number of lines at two hundred, to be compared with 133 in the Odyssey; or, in other words, the Iliad seems to have, in the same space, three color phrases for two in the Odys-

sey. I do not think the difference can be wholly accounted for by the domesticity of the subject of the Odyssey. Indeed it should be remembered that in three of the books from the Iliad (xviii., xxiii., xxiv.), containing more than four-ninths of the whole, there are no field operations whatever. This remarkable difference in light and color phrases seems to be in accord with the hypothesis (of course it is nothing more) that the Iliad is the work of the poet's early maturity and more fiery mind and imagination, the Odyssey the production of his later age and less susceptible temperament.

Pursuing the same process as with the Odyssean books, I first set out and deduct the phrases which relate only to light and darkness.

LIGHT PHRASES.	times
φαεινός	13
σιγαλόεις	3
Glaukōpis	9
κροκόπεπλος	3
λαμπρός	1
Phainops (proper name)	1
μαρμαίρων	2
παμφανόων	4
χρύσεος	5
ἀστερόεις	1
γλαυκιόων	1
Lampos (proper name)	1
ἀργυροδίνης	1
φαεσίμβροτος	1
φλογὶ εἴκελος Ἡφαίστοιο (xvii. 88)	1
Ἔρισ δέδηεν (xvii. 253)	1
φάος ἦλθεν (xvii. 615, xviii. 103)	2
Kine of gold and tin (xviii. 574)	1
Tunics oil-glistening (xviii. 596)	1
ὄσσε ὡσεὶ σέλας (xix. 16, 365)	2
παμφαίνων ὡς ἀστήρ (xxii. 26)	1
αἴγλη οὐρανὸν ἶκε (xix. 362)	1
σέλας ἠΰτε μήνης (xix. 374)	1
ἀστὴρ ὥς, helmet (xix. 380)	1
ὥστ' ἠλέκτωρ ὑπερίων (xix. 398)	1
τιθέναι, τεύχειν τινὶ φάος (xx. 95, xxi. 538)	2
λάμπειν χαλκῷ (xx. 156, xxii. 134)	2
Total	63

PHRASES OF DARKNESS.	times
κυάνεος	6
αἰθαλόεις	1
δαφοίνεος	1
κελαινεφής	4
αἱματόεις	1
ἐρεμνός	1
ἐρεβεννός	1
εὐρώεις	1
Κυανοχαίτης	2
κυανοπρῶρος	1
ἠεροειδής	1
ζόφος ἠερόεις	2
πολέμοιο νέφος (xvii. 243)	1
Total	23

WHITENESS.	times
λευκός	9
λευκώλενος	7

Ἀργικέραυνος	2
ἀργιόδων	2
Total	26

BLACKNESS.	times
μέλας	23
νεῖον μελαίνετο (xviii. 547)	1
μελανυδρος κρήνη (xxi. 257)	1
ἀκροκελαινιόων	1
Total	26

The classification of the word *ἀογός* is disputable. As applied to dogs, I take it to mean swiftness, for this is a general characteristic. As applied to oxen, where it cannot mean swift, I render it white, as the occasion (xxiii. 30) is that of a solemn funeral celebration, and Homer has oxen of tin as well as gold (*supra*) on the shield, and probably drew no broad distinction between the two hues. As, however, the whiteness signified by *ἀργός* seems to have applied originally to rapid motion, it might be classed as an epithet of light. There is another question, namely, whether *βόες ἀργοί* means strenuous oxen.

Again, Homer's idea of darkness passes into that of blackness by such vague shading that the classification on this side is merely one of approximation. But I proceed:

Lastly, I have to deduct what signifies the merely intermediate stage between white and black, namely grey. For this we have —

	times
πόλιος	9
χλωρός (xvii. 67)	1
	10

		times
Thus we have the total of light and color phrases		208
From which we deduct for		
light and dark	63 + 23 = 86	
white and black	26 + 26 = 52	
grey	10	
		148
Leaving epithets of color proper		60

Among these, however, there stand (xix. 400, 404) two of a doubtful character: *balios*, meaning dappled or perhaps piebald, and the phrase *πόδας αἴολος* applied to the horse Xanthos, which, as I contend, means the white foot on a chestnut animal, or, as it is familiarly called, the white stocking. These two are hardly to be presented in any of the classes, but they evidently belong rather to light than to color in this inquiry. The color phrases, then, may be thus classified: —

Redness is represented by ἐρυθρός (xix. 38), ἐρυθαίνειν conveying the same idea (xxi. 21), καλλιπάρῃος (xxiv. 647, 676), ῥοδόεις (xxiii. 186), and ῥοδοδάκτυλος (xxiii. 109.)

For auburn and chestnut we again have *xanthos:* applied to the horse of Achilles, the river Scamandros, the hair of Achilles, and especially of Menelaos.

And we have αἴθων (4 times), αἴθοψ (6), οἴνοψ (2), φοινικόεις (1), πορφύρεος (9), and the verb πορφύρω (used in xxi. 551 to describe troubled and fearful meditation) as the exponents of that particular idea of color in Homer which was based upon red; and also on purple or brown verging into black.

Let us deviate for a few moments from the subject of color in order to consider the bearing of these facts upon the question whether the Iliad and the Odyssey were produced by the same or by different minds.

It has long been clear to me that a thorough settlement of this question, which is not free from what I may call surface difficulties, could only be had by the most minute analysis, and comparison of particulars, especially of such particulars as are undesigned. It is too wide to be settled except on a comprehensive basis, and a very diversified scrutiny is required. I do not rely then on a single result; but surely the result before us is not unworthy of notice.

We find in the first place, upon the basis of this examination, that the light and color phrases of the Odyssey, as compared with those of the Iliad, diminish in a ratio proportioned to what we might expect from the subjects of the two poems, and the spirit in which they are composed.

Next, on examining the proportion between light-phrases and color-phrases, we find it nearly the same. In the Odyssey, we have 31 color-phrases to 103 light-phrases, somewhat under a third: in the Iliad we have 58 color-phrases to 150 light-phrases, somewhat under a third.

The leading light-phrases are the same in both: φαεινός, σίγαλοεις, Γγαυκῶπις, λευκός, and ἀργς, with their respective compounds. The phrases for darkness are much more varied in the Iliad; but every word expressing it in the one selected portion is also found in the other except δνοφερός. And here we see how much more stringent is the present mode of comparison, than would be a comparison of the entire poems; for δνοφερός is twice used in other parts of the Iliad (ix. 15, xvi. 4). At the grey or intermediate stage, we have in each poem the same epithets, πολιός and χλωρός.

Still more remarkable is the uniformity of material, or mental stock, with which the poet worked, when we come to the epithets of color proper. The fifty-eight phrases of the Iliad are furnished from precisely the same sources as the thirty-one of the Odyssey: the word ἐρυθρός (still represented in our *ruddy*), the rose, the beauty of the cheek, φοίνιξ and its derivatives, πορφύρεος, and the well-known family of αἴθων, αἴθοψ, and οἴνοψ.

It seems to me manifest that this unity in the expression of light and color raises a presumption in favor of unity of authorship. But only because of the fundamental fact, which in the whole of this paper I wish to exhibit, namely that colors were for Homer not facts but images: his words describing them are figurative words, borrowed from natural objects; in truth, colors are things illustrated rather than described. The word *eruthros* is in truth a rarity in Homer, from its describing color in the abstract and not as embodied in a particular object. The same may be said of *xanthos:* but the more common use in Homer by far is to speak of rose-color, wine-color, fire-color, bronze-color, and the like. How would it have been possible, at a time when color was only dealt with by this illustrative method, that two independent poets should light so exactly on the same family of illustrations to supply them with material? There was no fixed terminology of color; and it lay with the genius of each true poet to choose a vocabulary for himself.

The solution of all our difficulties, as far as a solution can be attained, is in the main, perhaps, one and the same. It is in subordinating, case by case, the question of this or that color to the question of much or little light. The sleek garment freshly washed reflects the light, and is called bright; the same garment used and tumbled ceases to reflect, and is dark. Wine in motion sparkles; held up to the light it glows; withdraw these conditions, and what we call red wine is simply dark, darker indeed than the smoke. The copper arms flash back the sun; their splendor reaches to the heaven and makes the earth to laugh; place the sun behind a cloud, the rutilant effect disappears, the dull, dead face of the metal assumes the tone of the rest of the accoutrements, and we have the Homeric phalanxes of bronze. Once more: thus it is that water in Homer commonly has the epithet of *black*, even the fountain being black-watered; and yet we have the four fountains of Kalūpso flowing with white water (Od. v.

70) and the white or pure water (Il. xxiii. 282) in which Patroclos used to wash the immortal horses of Achilles. Thus we have to adopt the idea of light and dark as our umpire in all difficulties, our universal solvent. But even in the use of these instruments the poet was elastic, and also ill-defined. The word *melas* covered many shades of deep red, dark blue, brown, no less than black, even as each one of his winds covered a large arc of the horizon. And his sense of light, however keen, was not critical, or very determinate: a favorite illustration with him as to something brilliant is that it resembles the sun or moon —

ἠελίῳ ἐναλίγκιον ἠὲ σελήνῃ.

But sun-brightness and moon-brightness are so different, that no modern poet could use this simile without giving himself over to be torn by the beaks of critics. I suppose that Quintus Smyrnæus was sensible of this incongruity in his model, when he substituted for it that "fond thing," his awkward formula * —

ἠελίῳ ἐναλίγκιον, ἢ Διὸς αἴγλῃ.

For what is the *aiglē* of Zeus except the sun from which it is here parted?

And here, in illustration of the great wealth of Homer in the region we have traversed, I may say that this most sedulous and close but inadequate and inanimate imitator does not, I think, use above one light or color phrase for ten that we find in Homer.

I am not competent to enter into the philosophy of color itself, and the controversy in which Goethe has taken, with his great name, the side opposed to Newton. He has indeed, in his "*Farbenlehre*," much disparaged our great countryman, whom he seems to consider a great mathematician, but in the dark as a naturalist.† He, too, establishes a scale between light and non-light: "Next to light a color appears which we call yellow; another appears next to the non-light, which we call blue. When these in their purest state are so mixed that they are exactly equal, they produce a third color, called green." ‡ Condensed and blackened, blue and yellow may become red respectively; blue passing into a blue-red, yellow into a yellow-red. Also red may be produced by mixing; and thus Goethe completes his scale of six colors. Eastlake himself § does not admit the division into seven; and quotes Professor Leslie of Edinburgh, who thinks that "in the choice of that number Newton was apparently influenced by some lurking disposition towards mysticism," but that four or five principal colors may be named. One observation only I will hazard. It seems as if there were something in Goethe's ideas, how and what I cannot presume to say, which has a point of contact with the phenomena of color as they are represented in Homer. He appears to find a certain affinity between what lies next to light, and what lies next, at the other end of the scale, to not-light. The archaic man, we are to suppose, sets out equipped with one positive perception, namely light, and one negative, namely not-light or darkness. As his organ begins to be trained, it trespasses on the intermediate space, and Homer has already got, after a fashion, his red and orange, his *eruthros* and his *xanthos*. But may not the advance in the organ operate in some way at the other end of the scale also? May not the *porphureos* and the *phoinikoeis* be the indications of the invasion of the new region from that side; and may not this in some manner account for the curious travelling backwards and forwards, so to speak, of so many of Homer's color-epithets, between a real red at the upper end of the scale and some very deep purple at the other? I cannot describe clearly what I admit that I have not conceived clearly, but I am struck with an impression that, at a certain point, the observations of Goethe appear to touch upon the Homeric facts. I do not suggest this as a substitute for the main explanation which I have already suggested, and which views Homer as often using the same phrase for bright-colored and dark-colored objects according to the greater or lesser quantity of light that falls on the surfaces. This he does in regard to his epithets of color and light generally, though less in the case of *xanthos* than in others. And this he could not have done, but for the fact that the organ was given to him only in its infancy, which is now full-grown in us. So full-grown is it, that a child of three years in our nurseries knows, that is to say sees more of color, than the man who founded for the race the sublime office of the poet, and who built upon his own foundations an edifice so lofty and so firm that it still towers unapproachably above the handiwork not only of common, but even of many uncommon men.

W. E. Gladstone.

* Quint. Smyrn., *Posthomerika*.

From Good Words.

DORIS BARUGH.

A YORKSHIRE STORY.

BY THE AUTHOR OF "PATTY."

BOOK III. — MARRIAGE.

CHAPTER XIX.

COMING HOME.

THE church bells had been ringing ever since early morning, except when the ringers assembled round Joseph Sunley's door for the bowls of crowdy he was wont to provide on such occasions. And judging by the red fingers that held the brown bowls, and the purple cheeks, and noses, and screwed-up eyes that bent over them steaming crowdy was not a bad sort of refreshment on this keen, crisp January morning.

"Timothy's whiskers hev friz t' mornin'," said Jeremiah Howden with a grin.

The old sexton shivered, but he waved his hand in a superior fashion; he could not condescend to feel chilly before his satellites. Two of them, Reuben Crofts and Timothy Tyzack, were older than Sunley was, while Jeremiah Howden was much younger, and Lot Groves was a lad, Mr. Sunley's own deputy in the churchyard.

"Ah's thinkin', lads, 'at yey can clear off for an hour or twae. Lot an' me 'as bizniss 'at cannut be set asahde; gin yey's ringin' by fower or sae, 'twill be reet eneeaf." He shook his head dolorously. "Eh, eh! it's sair 'at it sud happen sae, mebbe it's a warnin'; bud it's nae faut bud t' squire's ain fer comin' yam a day ower sune."

Timothy laughed, and spat, and moved his head uneasily.

"Weel, Maister Sunley," he said in a feeble, flute-like voice, "yey hes t' orderin' o't, sae it rests on yur shouthers, bud ah minds when t' squire's mudher waaz brout yam t' bells nivvers stopped fra morn till e'en. Eh thaat wur a bonny yam-comin'. Three wur a bonfire an' a cask o' yell outsahde t' gates."

"Ay, marry, theer's chaang in ivverythin', neaghbur. Roonz, lad, t' warld winnut stan' still whiles yey leeaks at yursel'; gang yur ways, an' wen mey an' Lot hes dean wark yey sal hev yur will wi' t' bells; 'twad be ill wark diggin' t' awd witch's pit-hole jist as t' squire an' 'is missis gaanged ridin' by."

"Ah minds," — began Timothy with his withered old face on one side, and a twinkle in his watery grey eyes; but Joseph Sunley spread out his hand imperatively.

"Whisht, whisht, lad! we've nae tahme fer cracks tu-day," he said, "Lot an' mey hes a stiff bit o' wark tu ha' gitten deean."

Reuben and Jeremiah set down their bowls within the cottage and departed more quickly than might have been expected from their slouching figures and slow movements; but Timothy lingered, and then he set down his bowl on the end of Joseph's bench, and fumbled in his grey smock for something which eventually revealed itself in the shape of a horseshoe.

Leaning on his stick, he bent stiffly towards the sexton and held out the rusty treasure.

"Yey's getten a crazzler oop dhis taam, neaghber," then his treble sunk into a whisper, to the offence of Lot Groves, who, being eighteen or so, considered himself old enough to be taken into confidence on anything, especially anything respecting his work, which he conceived the term "crazzler" referred to.

Timothy went on impressively, "Gin ah wint diggin t' hole fer t' awd divvul dam lahke yon, an' bided sae negh t' kirk-geates," he looked over each shoulder fearfully, "ah'd neal 'im oop o' t' dure sill. Ah seed 'im liggin i' t' rooad, an' ah sez, 'Ah'll gi' 'im tu Maister Sunley, ah wilz;' an' ah picks 'im oop, an' ah's brout 'im. Ah seayd ah waad, an' ah deed." He held out the horseshoe and shook his head warningly.

Joseph Sunley's queer, twisted mouth curled into a sneer; he smiled pityingly at the old man's outstretched hand, and put both his own hands in his pockets.

"Theer, theer, Timothy! Dhoo means weel, ah knaws, bud dhoo gaums nowt, — gang awa', bairn," he said, as the half-offended, half-frightened old man turned away, and began feebly to hobble down hill. "Noo, Lot," Sunley said sharply, "let's be gangin'; t' awd hoit's geean aof i' a hunch; noo yey git to wark, yey munnut loaf onny mair."

Lot departed to fetch his mattock and spade, while Joseph carefully washed and put away the bowls. Then he crossed over to the churchyard, and stood beside the spot which he had chosen for poor old Prudence Wrigley's grave. It was an eerie dark corner in an angle of the ground beneath a withered brown fir-tree; no other grave was near it, and Joseph congratulated himself on his choice.

"Noo, then," he called out as Lot came in sight with his implements, "dhoo mun dig wiv a will, lad, an' we'll pit her far

doon, an' yey mun be seear to lig t' eearth heavy on her tu morn. Woonkers! we'll keep her quiet atween us," he added vindictively; "gin t' parson wad hev bin guided sheea'd nut ha' bin liggin' i' t' kirk geeates, bud at t' cross rooads."

Lot made no answer; he was digging fast, but there was a sour, discontented look on his face.

"Gin ah'd a knawed t' wark yey waaz set on, Maister Sunley," he said when he left off for a moment to scratch his curly red head, "ah'd nut hev stayed i' Burneston tu-day. Gin ye knawed sae mich on yon awd lass 'at ah knaws, yey'd nut hev ligged her sae negh yursel, ye'd titter tak a teead by t' feeace."

Joseph's chin was jerked up at this insinuation.

"Mind thoo thy diggin', lad," he said compassionately, "it's mair thy ain wark dhen skeealin' thy betters is."

Lot looked yet more sullen, but he dug on with stubborn strength that promised soon to complete the trench, flinging up the shovelfuls of rich brown earth with wonderful rapidity.

Joseph pottered about giving directions to the digger from time to time. He turned away at the click of the churchyard gate, and peering under his crooked fingers he saw Rose Duncombe coming up towards the porch.

Sunley moved stiffly towards her, and Rose, seeing him, left the path and came down to meet him between the graves with their green sods and mouldering mossed headstones. She had been away ever since the wedding, minding the younger brothers and sisters of one of her rich schoolfellows, while their governess was absent in ill health. The change of air and scene had made her, Joseph thought, "bonnier" than ever, and yet she looked cross and discontented this morning.

"Weel, lass," he said, "an' how's yey sped wi' t' skeealin'?"

"I hate it," she said pettishly, "an' I won't do no more on't; to be found fault wi' and lectured, and spied on. My word, Mr. Sunley, I might as well have been one o' them American niggers." Sunley shook his head, and she went on more blithely. "But, Mr. Sunley, I want to know if the young squire's coming home wi' t' others. Gran'mother 's deaf as the door, an' she says she knows nowt."

"Shea's varra reet, varra reet, lass. Maist on ye wimin knaws nowt, bud hardlys yan mang yey'll awn till 't. Iz t' yung squire comin' yam, seys yey — neea, t' yungun bides at skeeal;" then looking sharply at her clouded face, "bud what fur diz yey ax, lass? Yey'll all ha' plenty o' talk aboot t' missis's gowns an' bonnets; zouns! theer's nut bin sik a wonder i' Burneston sin ah wur born."

Rose shook her shoulder backwards and forwards like a pettish child.

"My word, Maister Sunley, ye're growing old, an' no mistake; d'ye s'pose I haven't seen plenty o' gowns, and bonnets too, as fine as Doris's will be?"

Joseph shook his head with marked disapproval.

"Whisht, lass!" he waved his hand with authority. "Yey mun think waat yey pleease, bud ye mun speak o' t' squire's missis as ye wad o' onny other body o' t' quality; yey munnut talk o' Doris. Sheea's Mrs. Burneston noo."

"T' quality!" Rose's little impertinent nose turned up with her scorn, and she grew red with anger. "Eh, Maister Sunley, ye make a body laugh, ye do. I s'pose ye're glamoured too. I came" — she sank her voice to a whisper, for she saw that the red head appearing above the edge of the newly-dug grave was turned in a listening attitude — "to give you a warning."

The sexton laughed; he looked sideways at Rose.

"Coom, coom, lass, yey wants tu skeeal mey, di' yu?"

"Yes, I do," she said, gravely; "gran'-mother an me's both of one mind about this. Ye've no right to lay that wretched old woman so near us; an' if half's true that's said, I wonder you're not afraid yourself. I don't believe such stupid tales but I s'pose you do, Mr. Sunley."

He looked at her full of stern rebuke.

"Ye're fond, lass; ye sud read yur Bible. Deead yey nivvers hear tell o' t' witch o' Endor? Bud t' liggin her in t' kirk-geate's naane o' mah wark; 'twaaz t' parson's sel."

Lot Groves had an unbounded though sheepish admiration for Rose, and the present was such an opportunity for taking his fill of gazing unseen, that he stood still in the grave, spade in hand, eyes and mouth opened roundly.

"Well," said Rose carelessly, "after all, you may be right, but I don't see why a woman is to be called a witch —— "

"Whisht, bairn, whisht!" from Sunley, but she went on as if he had not spoken.

"Just because she's old and ugly; it seems to me young and good-looking ones may be witches. Maybe the squire's as much 'witched as Mr. Barugh's cows

were. Ye needn't glower at me, gaffer, I means what I says."

"Dhen ye mun keep a quiet tongue i' yur head, ye dotteril," he said angrily, catching her by the arm; "gin ah wur tu seay tu t' squire hawf waat yey've bin sayin', he'd hev yey an' yur gran'mother sent awa adrift afore t' morn. Zouns! ye've putten mey i' sik a stuffle ah can hardlys speeak."

He stood trembling with the excitement of his anger at Rose's insinuation. In these three months his first righteous indignation against the squire's marriage had softened, and to-day, in the preparation for the welcome home, he had almost forgotten that Mrs. Burneston had been Doris Barugh. Rose's insolence, as he considered it, was just enough to confirm his growing toleration of the squire's choice.

Rose was also in a towering rage. "Old Sunley," as she called him, had always been considered by her as her especial ally, and while the Barughs lived at Church Farm he had always been ready to find fault with one or another of them, above all with the folly of John Barugh in sending his daughter to a London school. It was not to be endured, she thought, that the old fool should turn round upon her in this way, and she went towards the grave and Lot Groves.

"How d'ye find yerself, Lot?" she said condescendingly, at which Lot nodded loutishly and muttered an unintelligible answer. "I wonder at you, Lot Groves," Rose went on; "I wouldn't be mixed up in such a job. That poor old Prudence won't thank those who help to put her underground; she'd liefer be left above."

"Eh, lass, maybe yey're reet!" Lot scratched his head by way of brightening his ideas. "Ah deant cotton tu t' job. Gin ye nobbut knawed waat ah knaws!" As Joseph turned round and came towards them, Lot fell to vigorous digging.

"Coom, coom, lass," the old man said, "dunnut ye get clavering wi' t' lad to set him aweays landering his tahme."

Rose tossed her head.

"I'm going," she said; "though it's barely civil to turn me out o' t' graveyard. But, Maister Sunley, I want to know what Lot knows about Dame Wrigley. As she's to lie so near us, I have a right to know what she really did. Tell it out, Lot, directly, there's a good lad."

She placed herself between him and the sexton, smiling down at the awkward rustic with such winning sweetness that for the minute Lot forgot the risk of one of Joe Sunley's lectures in such a glimpse of Paradise.

Lot peered behind her at the sexton. "Ye mun coom negher, lass," he whispered. "Ah cannut tell 't to mair nor yan at yance — it's a fearsome tellin'."

Rose went close to the edge of the grave, but Sunley followed and took her arm. "Ah's shamed on yey," he said, "mellin' wiv t' lad. What hes come tiv ye, lass? Gan yam tu yur gran'mother, yey trash," he muttered between his teeth.

Rose still lingered. She smiled brightly at Lot, and made signs for him to speak; but when she saw him return to his digging, she left with a look of disgust.

"What a poor, mean-spirited hulk the fellow is!" she said. "He should stand by me against that old fool."

She strolled out of the churchyard as lazily as she had come in. She could not enter into the general rejoicings; even for the pleasure of seeing the squire. Her childish worship had been checked by the news of Mr. Burneston's love for Doris; Doris who despised her, and who would set her husband against her.

There was plenty of amusement to be found in Burneston this afternoon. The great gates down at the Hall had stood open all day, and the few small children of the village had slipped in through the stable yard and indulged themselves with a survey through the inner gates, also wide open. Some of the more adventurous spirits longed to mount the time-worn steps and penetrate into what might lie within the glass door in the quaint Elizabethan doorway, or adventure themselves among the flower-beds of the garden beyond the side of the house farthest from the gates; but Mrs. Emmett had managed to inspire these youngsters with as much awe as was felt by their seniors for Prudence Wrigley herself, and not a child dared trespass within forbidden limits.

But Rose did not trouble herself to go so far as the Hall. There was plenty of preparation to see going on nearer home. The Church Farm really belonged to the vicar, but had been let on a long lease years ago to the squire of Burneston, and now, as the term had nearly expired, Mr. Spencer had announced his intention of farming the property himself, and had offered the large barn beside the rick-yard for the welcome-home supper to be given in.

Rose went in through the white gate; but she did not turn aside to the farmhouse. A laboring man named Shadrach Swaddles and his wife inhabited it now,

and it had lost all the trim aspect which Mrs. Barugh's fresh muslin curtains used to give to its windows. But when the girl reached the rickyard, she stopped. Mr. Spencer and his housekeeper stood beside the barn in earnest talk, and Rose, in her present mood, shrank from all the "Doris-ites," as she irreverently called them. Mrs. Riccall, who had been always kind and friendly to her, had so praised the bride on her wedding-day that she was henceforward numbered among Rose's enemies, while Mrs. Emmett, who had snubbed and blamed her for her forward ways in childhood, was now high in the pettish girl's favor, simply because she had looked so sourly at the ceremony.

"I wonder she stays to be at the beck and call of such a mistress; she's got a rare sperrit too. I can't make it out."

Faith had been saying almost the same words to herself all day. Now that the trial drew so near, she wondered why she had stopped to face it. She had written to Ralph and said she must leave Burneston even before the wedding — she could not stay to see such a person as Doris Barugh put in his dead mother's place; but Ralph's answer had been peremptory. He bid her not be selfish. "Who," he asked, "would there be to see after me and my comforts if you went away? If I were to be ill, I should like to know who could nurse me. No, Faith; don't you say the least word about leaving, or give any cause of offence to my father's wife, or you'll get the sack at once, you may be sure. She'll be only too glad to have the excuse of packing you off."

And at the time this letter had pacified Faith, and she had reproached herself for thinking of her own feelings and what was due to her when her darling was going to be so ill used. Yes, she would stay for the sake of her darling boy — for Mrs. Emmett held the opinion that there never had been at Burneston such a housekeeper as she had made. "If I geeas," she said, "that fond dotteril Martha Haselgrave taks mah pleeace, an' ivverything gans to rewin."

Now that she had seen that all through the house was at its best and brighest, and she had dressed herself so as to look her best in a black silk gown (Master Ralph's gift), and a cap trimmed with pink bows, she sat down in her own little snuggery to think. In those few moments it seemed to Faith that she had made a great mistake. All the little details of her office — the infinity of little ways in which, if Mrs. Burneston chose, she could mortify and humble the housekeeper — rose up before her with glaring distinctness. She told herself she was a fool, — and her rage and scorn against the upstart wife coming home to reign in her dead lady's place, burst out in a fierce storm of abuse.

"I can do this," she said, her yellow eyes bright with anger: "t' first tahme she gies mey a lofty look or word, I gangs to t' squire an' ah seays I'se bin used to t' quality, an' I cannut bide wiv sik as mey-sel'. Ralph cannut expect the like fra mey."

She frowned till her dark brows met, and her closely-set teeth and compressed lips made her face even shorter than usual. Gradually the woman's strong will curbed the wild beast within, and she smiled in pity at her own folly. Her eyelids drooped till the fierce, malicious eyes showed only like two dark curves of lashes, and the thin lips relaxed. What a fool she was to shrink from this raw, untaught girl, instead of resolving to be Doris's mistress! "Looks wunnut deea ivverything. She'll hev to larn t' ways o' t' quality, an' I knaws 'em; an' he'll see I knaws her mistaks. I'se an awd feeal. Me 'ats been wiv t' quality years an' years, to be feeared on a lass fra a boardin'-skeeal! I mun show her how to guide herself. I munnit let her skeeal mey in nowt."

She acted out her purpose. As the carriage drove up to the door Faith stood ready in the midst of the hall, and greeted her new mistress with a reverent curtsy and a gracious countenance. Doris looked round timidly, but with a bright smile, and Mr. Burneston hurried after her and gave her his arm.

Faith followed them silently up-stairs and along the lighted gallery till the squire paused before the door of the rooms which had been furnished and decorated for Doris. He led the way through a small sitting-room into the dressing-room beyond.

Then Mrs. Emmett stepped forward and threw open the red baize doors, and then those within, showing a large chamber with a glowing wood fire, and tall wax candles blazing on the dressing-table, in huge candle-sticks shaped like a fluted column mounted on a square of silver steps.

Faith went forward, drew the candles in front of the toilet-glass, and then lighted another pair fixed to a tall swing-glass close by; then she came up to Mr. Burneston, who had led Doris to the cosy armchair beside the fire.

"Shall I wait on Mrs. Burneston, sir,

whiles t' maid has sorted t' boxes? Mebbe Mrs. Burneston's tired."

The squire was pleased. He had been rather anxious about Faith's behavior, and he had been surprised that after her hostile looks and ways she had shown no inclination to leave the Hall. He nodded pleasantly.

"How are you, Emmett?" he said: Then going close up to his wife, "Doris, this is Mrs. Emmett, your housekeeper, a very old servant of the house. Can she wait on you till Burnett comes?"

Doris had thought, too, about the formidable Mrs. Emmett, and had resolved to see her as little as should be possible. She glanced up at the dark, expressive face, but it baffled her scrutiny. Faith's eyes were bent on the ground.

"Thank you, Mrs. Emmett," the girl said, "but I am so chilled that I believe I shall be glad to sit still and warm myself till the maid is ready."

CHAPTER XX.

THE NEW MISTRESS AT THE HALL.

Doris felt that her plans for the improvement of the village girls — those plans so prominent once in her dreams of the future — must of necessity be postponed. Her husband carefully avoided any allusion to her former state, and this very avoidance taught Doris that he wished her also to bury it in silence. It was therefore imperative that at first she should keep aloof as much as possible from the villagers.

The first Sunday at church was rather a trial. As she walked up the aisle she felt that every eye was fixed on her. It was comforting to find herself completely screened by the wooden walls of the huge square pew at which she had gazed so reverently in former days. She remembered now, with a smile, how she had wondered if the carving on the upper panels of the pew had any hidden meaning in its masks and flowers, and whether the cross-legged figure of a man in armor against the wall on the right was an image of one of Mr. Burneston's forefathers. Now that she knew a little more about cross-legged knights, her heart swelled proudly at the thought that she might reckon this unknown warrior among her husband's ancestors, for the Burnestons had been esquires of that ilk from the days of the Conqueror, therefore the cross-legged man in chain-armor must be one of them.

Dreams of the future distracted Doris throughout the service, and she read the tablets with a flush of pride as she thought that a record on the old walls would place her name among the ladies of Burneston.

Going out of church, they went through the small door, and then into the glebe-field by Mr. Spencer's little gate, and thus escaped a second ordeal.

Mr. Burneston wished to take Doris through the rickyard, and to the gate where he had first seen her swinging and singing the prophetic jingle; but there were too many spectators just now, and he noticed that she walked on quickly and silently, as if she wanted to avoid notice.

Mr. Spencer had soon overtaken them, panting with haste.

"Good day, good day; very glad to see you home, Mrs. Burneston," he said. "I should have called yesterday, but I thought you would be too busy for visitors. "Well, my dear young lady," he added more familiarly, "I hope you find everything all right. I assure you Mrs. Emmett has been indefatigable. I've no doubt you'll get on very well with her."

He was walking beside Doris. Mr. Burneston had dropped behind, as the path across the field was narrow. She raised her head stiffly, and looked at the vicar gravely.

"Yes, I fancy Mrs. Emmett is a very good servant," she said.

Mr. Spencer winced. He felt somehow humbled by this fair young creature; but Doris went on courteously,—

"I hope you will come and see us soon. Mr. Burneston has bought several pictures in Italy — I know he wants to show them to you; and we have some fine cameos, and other things worth seeing."

Mr. Burneston came forward, and walked on the grass beside them.

"Yes, come in now, Spencer," he said; "if you wait till after afternoon service there will be no light to look at pictures by. How does Shadrach manage the farm?"

"Well enough; but his wife is a nuisance. She's a pretty, fresh-faced, golden-haired sloven — she's from the south, you know. I believe it would make poor Mrs. Barugh's hair stand on end to — to" — here the vicar became conscious and purple-faced; he ended his sentence in a faltering gasp — "I mean the house is so untidy in comparison with what it used to be."

They had just reached the vicarage, separated from the glebe-field by a narrow holly-hedged road.

"Won't you come on to the Hall?" said the squire.

"No, thank you, Philip," the vicar said, carefully avoiding to look at Doris; "I can't to-day, but I'll look in soon."

This was the first ruffle that had come into Mrs. Burneston's married life.

In travelling they had met with many pleasant strangers, and also with some of her husband's London friends, who knew nothing about the story of his marriage. All these persons had greatly admired Mrs. Burneston, and had plainly received her as an equal. She liked her husband more and more as his good qualities revealed themselves, and as she saw his unfailing kindness and ready courtesy, even amid the trials of temper and patience attendant on travelling in days when foreign railways were only beginning, and her own manners had gained much in outward sweetness and gentleness from daily association with him.

It seemed to her now, as she walked on silently beside her husband to the Hall, that she had received a sudden awakening to the reality of her position, and at the same time she felt a strong dislike to the man who had shown her this reality.

"He is just like that country clergyman we met in Venice," she thought; "class and good looks are all he thinks necessary for a woman. My education has done nothing for me in his eyes; he would say, if he told the truth, 'It may have made her fit to teach others, it could never make her fit to marry Philip Burneston.'" Her vexation sank deeper because she kept it entirely to herself, and though her husband noticed her unusual silence, he did not attempt to disturb it. He thought it a fresh charm.

"She is feeling the responsibilities she has undertaken," the happy man said to himself. "The service has doubtless impressed her, such a mind as hers must digest weighty thoughts seriously."

Next morning it seemed to Doris that she must begin her life in earnest. The arrangements of her rooms were completed, and Mr. Burneston had taken her all over the house himself. The only part of her little kingdom of which she had not taken formal possession was the garden, and at breakfast she said this to her husband.

"I want to have the garden very pretty," she went on. "Mrs. Maynard told me at Florence that the most successful gardens are those for which the lady plans the arrangement of her own flower-beds."

Mr. Burneston laughed.

"Well," he said, "I suppose you will have your own way with Slater, as you have it with us all. But I can tell you, I'm a good deal afraid of him, and I expect you will discover that he has privately a great contempt for the 'maister's nooations.' I have a way of gathering flowers when I want them that seems to annoy him immensely. I got into great trouble about the flowers I used to send to you, darling."

Doris laughed.

"I won't gather flowers then," she said. "I'm very glad to be guided about Mr. Slater, but I shall try to have my own way with those flower-beds below my side windows. I have an idea about them that I think will be pretty."

She found Slater in the vinery, which, with the other greenhouses, were at some distance from the house, near the fruit garden. His hands were stuffed in his rusty brown pockets, his hat was pushed to the back of his head, and his freckled face and thick red eyebrows were puckered into a highly discontented expression as he surveyed the grapes.

He just nodded in answer to Doris's greeting, but he looked as troubled as before, and his eyes went up again to the black bunches overhead.

"You have a good show of grapes still," said Doris, meaning to be propitiatory.

He grunted, and then glanced at her sideways out of his sly blue eye.

"Ah'd be mazed if theear waaz a bad show, ov owt 'at ahs getten tu deea wiv," he said, raising his chin still higher; "bud ah recknons t' graapes 'll be needed noo. Tahme waaz dhay'd hing o' ther stalks fra yah year's ind tiv anither an' thin t' squire 'd seh, 'Gi 'em tu t' bairns, Slaater,' hed seay, 'Gi 'em tu t' bairns.'"

Doris thought the man presuming, but she took no notice.

"I am very fond of flowers," she said with dignity, "and I think those side flower-beds may be made very pretty in summer-time."

Slater's mouth twisted, one corner going up towards his eye, and the other downwards, till it seemed as if it would not come straight again; but he bestowed a bland smile on his new mistress.

"Weel, yey see," he said, "ah nivvers waits fer summer, missis; mah fleuers begins 'arly, at' t' weather letz 'em bloa. Wat fur sud ah wait? Theers nemonies, an' saxifrages, an' sedums, an' semperwivums, an' wall-fleuers, an' daffydowndillies, an' white alyssum, an' as monny mair tu mak t' gardin wiv. Yey can hev mignonette an' stocks teeah agin yey wants chaange," he added condescendingly.

Doris shook her head. There had been a far more modern and experienced gardener than Slater at Pelican House. Miss Phillimore had taken great pride in her flowers, and Doris meant at least to rival Miss Phillimore.

"They are all common spring flowers. I want something choice in the summer. I suppose you have some young plant cuttings from last year, have you not?" she said, as if she knew all about it.

Slater had picked up a bit of straw, and was twisting it slowly between his fingers.

"Neea, neea, missis; deeant yey hamper yursel wi' neah-fangled nooations; dhey yaalus fashous. T' fleuers yaalus deeaz reet weel, an' ah's a plenty. Noos an' thans ah chaanges wiv a neeghber's gardiner, Maister Boothroyd's ur Lord Moorside's, but t' plaant 'at ah handles iz seear tu thraave, sae dunnut feel parlous about t' fleuers, yey 'v nowt tu deea bud tu gether 'em."

"I don't want to interfere with your gardening" — Mrs. Burneston felt her face flushing — "but I wish to choose the colors for these beds. We can use the plants you have," she said gently, "and, Mr. Slater, I am very fond of creeping plants; will you plant some against the house? If you will follow me, I will show you where I want them."

The gardener followed her, pushing out his under lip.

"There," said Doris, "I wish something pretty against that bare wall."

"Weel, weel, missus, ah'll think it ower, and ah'll see whither it can be deean; mebbe it can, an' sae 'at it is sae, ah'll mak a better job on't dhen anither wad. D'ye seea 'at tree, missis?" He pointed to one of the cedars on the lawn. "Weel, t' squire cums yam, an' seays, seays he, 'Slaater, leetnin's struck t' cedar, an' it'll dee reet aweay,' an' ah just leeaks an' ah sehs, 'Deeant yeh fash yersel', leeave t' cedar-tree to mey,' an' 'e sehs, 'Tak it tu yursel', Slaater,' 'e sehs. An' ah jist splices t' tree oop, an' ah fills oop tay hole wi' yeth, an' ah nusses t' tree; an' when t' squire cooms yam 'e sehs, 'Wheea, Slaater,' 'e sehs, 'wheear's 't sick tree?' an' ah laffed o' mey inside, ah deead, fer 'e cudn't makit oot. Ee waaz fair capt, t' squire waaz, tu think o' t' tree comin' round. 'Theer s naebody cud ha' din it bud yey, Slaater,' 'e ses, an' 'e wah reet."

Doris smiled.

"It's a fine tree," she said; then, for once unbending from her hatred of vanity, "you were very clever to save it. You'll remember that wall, then. Good morning."

Slater had been looking at her almost for the first time fully, and her smile did more in her favor than her words.

"Sheea's bud a lass," he said to himself as his mistress moved slowly and gracefully towards the house; "bud ah thinks sheea knaws 'er pleace — sheea's a bonny feeace, an' sheea moves lahke a duchis. 'Gin sheea disn't mell on 'em sheea mey cheease t' fleuers noos an' thans, thof them new-fangled nooations plays awd Soss wi' t' gardins; bud it's t' saame wiv ivverything, t' lasses ur yallus mellin'."

CHAPTER XXI.

VISITORS AT THE HALL.

At luncheon her husband said to Doris, "I want to get your father and George over for a few days to see you, my dear. D'ye think your mother will come too if you ask her?"

Doris blushed. She was alone with her husband; but there were feelings in her heart which she could not share with him.

"You are very kind," she said, then with hesitation, "I will ask father and George, but I know my mother dislikes to leave home."

This was true, and yet Doris felt as if she had glossed the truth, for of all the three she thought that her mother would be the most willing to accept such an invitation, and she knew that it would disturb her to have her mother as a visitor at the Hall.

Mr. Burneston felt secretly relieved.

"Very well," he said kindly, "then ask Mr. Barugh and George, and tell them to come soon. I shall be glad of your father's advice on several points, and you must be longing to show my old friend George all the treasures you picked up abroad."

For a moment this speech grated on Doris. Really she shrank from having any of her family at the Hall, but if her husband loved her as dearly as she quite believed he did, why could he not look on her kindred as parts of herself instead of finding reasons for their coming to Burneston? She was too just, however, to cherish such a thought. She had chosen him, and she was happy with him. Moreover, she owed him a debt for having chosen her, and she could pay this debt, which often burdened her pride, pay it fully by sacrificing all she loved to her husband.

She looked up at him with her sweet, gracious smile.

"Thank you, dear. I will write to fa-

Original from CORNELL UNIVERSITY

ther and ask him and George to come for a few days."

It is sometimes a curious study to watch the effect produced by two persons of different temperament on the same mind under parallel circumstances.

Years ago, in the early days of his married life, Philip Burneston had sometimes wearied of the petty duties in the way of personal attention which his wife exacted; now he lavished these on Doris; he seemed to anticipate her slightest wish; he loved her with far more strength and fervor than he had ever loved; but much of the cause of of this change lay in Doris. She was not self-helpful. A kind of indolence, fostered by her love of reverie and self-contemplation, made her like to be waited on, although she did not care for being petted; but, spite of this, she was too proud ever to ask for help or to seem to exact it. She rarely offered it to others, and therefore she could not ask for it for herself. But as her husband followed her up-stairs into her pretty little sitting-room, and she stood quietly while he drew her chair and her Davenport close to the fire, then opened her writing-case and placed everything ready for her use,—

"You spoil me, dear," she said, but she smiled gratefully and bent down and kissed him as he stooped over the writing-table. The kiss gave rapture to the lover-like husband, and he thought that no happiness could equal his.

He lingered while she sat down to write. Her regular, punctual habits amused him. School-life still clung to Doris. She had no light occupations, none of the ease in getting rid of time without seeming to waste it, which society would have taught her. Already she had planned out the order of her days, and meant to carry into execution her rule of life steadily.

The house bell and the loud chorus of barking announced an arrival before the sound of wheels came crunching over the gravel before the entrance door.

"Visitors for you, I fancy," her husband smiled rather mischievously. "Where will you see these people, my pet? Hazelgrave will be coming directly to ask you."

Doris did not look frightened or puzzled. She thought a moment, and then she said simply, "I should like to do whatever your mother did, Philip, and I think she would have received her friends in the drawing-room."

She had never once alluded to his first wife. The portrait of her dead mother-in-law hung in her room, a sweet-faced, fair-skinned, timid-looking woman in a large cap. Doris felt a kind of protecting fondness for the original she had created for this portrait.

"Do as you like, darling," her husband said, and then having waited while Doris gave the order to the butler, Mr. Burneston took her down-stairs to her visitors, a Mr. and Mrs. Boothroyd.

The husband was ordinary-looking, with a waxen complexion and round dark eyes; he evidently considered these eyes expressive, although they failed to convey to others any idea beyond that of complete self-satisfaction. Mrs. Boothroyd had no doubt been pretty in her youth. She was a blonde with thin lips, round which a chronic sarcasm hovered, while her small blue eyes travelled over Doris's dress, taking note of everything.

She talked in a stately way, ending each sentence with a glance at Doris, as if she were teaching; but when her spouse spoke, or rather seemed about to speak, she subsided into silence.

Mr. Boothroyd delivered his sentences with effect, his words rolling as it were round his tongue, his chest expanded before he propelled them into utterance.

"You have really been such runaways we began to give you up." There was a patronizing sweetness in Mrs. Boothroyd's smile that annoyed Doris. "We thought you never were coming home."

Doris checked the stiffness she felt rising within her, for she saw that her husband was watching her.

"We always meant to stay away three months," she said carelessly. "We thought ourselves rather good to come home so soon. We wanted to be in Rome at Easter."

"Ah, just so, people do——" Mr. Boothroyd puffed and looked with benignant condescension at Mrs. Burneston; "but really one gets so tired of that sort of thing, aw—you perhaps have never done it; but it's really—aw—always the same, and aw—I find the music and the services, and so on, a great bore."

If Mr. Boothroyd had worn moustaches he would certainly have twirled them at the end of his sentence. Not having moustaches to twirl, he stood on the hearth-rug with his legs wider apart than usual.

Doris smiled. "Everything is new to me, so everything amuses me," she said.

Mr. Boothroyd was charmed with her, he liked women to be beautiful, that was a part of their vocation, and perhaps the best part, as in this special quality a woman could really equal a man, and see-

ing the rare excellence of Mrs. Burneston's beauty, he was far more inclined to excuse his friend's foolish marriage than Mrs. Boothroyd was.

"You are going to town after Easter, I suppose," the lady said, wondering to herself, meantime, whether Doris had had her gown made in Paris, and feeling that her own handsome clothes were old-fashioned and clumsy in comparison.

"Oh, no, we shall stay here. I should not care to go away just as the flowers are coming out."

Mrs. Boothroyd's eyebrows rose, and her thin lips pinched into a pitying smile.

"My dear Mrs. Burneston, there are plenty of flowers to be had in London, and besides, you can have them in the autumn. At your age you are courageous to give up balls, and the opera, and the park. Why, Mr. Burneston," she appealed to the squire, who was talking politics with her husband, "surely you mean to have Mrs. Burneston presented on her marriage — it is quite the right thing to do, you know," she looked at him inquiringly, and a tinge of color came into the squire's face.

"I had not thought of it," he said; "but if my wife wishes it, we can easily go to town. At present she has so much to make acquaintance with here that she is quite content to stay at Burneston."

"Yes, yes, I understand, that is a matter of course; but you know duties must have precedence over likings;" this, though spoken in a lower tone, was audible to Doris, who grew pale with annoyance; "it is naturally all so new to Mrs. Burneston, such a delightful change; but you and I can judge better what she should do than she can." Then she turned quickly to Doris, before Mr. Burneston was ready with an answer. "I shall be glad to be of use to you, my dear," she said with a lofty smile; "if you want advice about housekeeping, or little matters of etiquette, and so on — as no doubt you will — I shall really take pleasure in being of use; do not hesitate to consult me," she said this heartily.

Mr. Burneston's anger gathered slowly; he bit his lip, but he was silent.

Doris felt and looked angry; but this was lost on Mrs. Boothroyd, bent on fulfilling her self-chosen duty of trying to fit her neighbor's wife for the position to which she had been raised. "I can recommend you an excellent maid," she went on, "just the sort of person you want, who will think for you, choose your dresses, and so on."

The immovable silence of her listener here attracted her attention, and she stopped. Mr. Burneston was talking to Mr. Boothroyd, but the stiff tone of Doris's "thank you" reached her husband's ears through Mr. Boothroyd's puffed-out platitudes.

"We seem to have a good housekeeper, and I am satisfied with my maid," Doris said; and then she stopped abruptly.

"Yes, all the servants remain," said Mr. Burneston.

Mrs. Boothroyd felt snubbed.

"Poor thing!" she said to herself, "what a terrible want of manner! This must be improved."

"Are you fond of needlework?" she said with a kind smile, that for the moment made Doris feel that she had been uncourteous.

"No, I like books much better."

"Ah, yes; books, my dear, are all very well on a wet day, or when one is ill, and so on; but society could not go on if every one liked reading. Just imagine your house full of visitors and every one reading books, what would become of conversation? Depend upon it, in your position a love of reading is just the thing you are called on to sacrifice. Berlin work is far more sociable, and better in every way — besides, it is a thing that is done. I assure you I have some damask roses worked on silk canvas, which you will take for real when you see them." She spoke pityingly, as if she were humoring a spoilt child.

Mr. Boothroyd had been hovering over the two ladies like an amiable vulture, and he now pounced on the opening his wife's pause gave, and seized the conversation.

"Yes, yes, indeed those roses simply lack perfume — that is all — my wife is a wonderful worker — actually she brings her wool-work down to breakfast, and I hear her counting the threads of her canvas while she makes tea. Aw — a charming song might be written on it. It's a sweetly feminine art, strictly feminine and charming," he looked expressively at Doris. "A woman never seems so much a woman as when she has her needle in her fingers; you — aw — I presume, are gifted in this art."

Doris laughed, she was not sure whether Mr. Boothroyd was quite in earnest.

"No, I am not, and it seems to me that women who give themselves up entirely to fancy-work lose time that might be better given to reading and learning."

This retort was too much for Mr. Booth-

royd; he puffed, and spluttered, and laughed as if it was an excellent joke.

"Aw — ha — ha — very good; but, my dear Mrs. Burneston, you have left school now, and have done with lesson books. Aw — of what use can learning, or reading either, be to a woman when she marries? Eh, Burneston?"

Doris felt that her face was flushing, she looked appealingly at her husband.

"You don't agree with this, I'm sure," she said.

Mr. Burneston laughed. He thought Mr. Boothroyd a bore, and he mentally called him "conceited ass," and he was annoyed with Mrs. Boothroyd, but he felt obliged to answer his wife's question.

"Well," he said, "I agree partly with Boothroyd, and partly with you. I think if a lady can amuse herself with a book, so much the better for her; but fancy needle-work is, no doubt, a sort of safety-valve against too much learning;" and then, as he really felt no interest in the subject, he proposed to show his friends the pictures and objects of curiosity he had brought from Italy, quite unconscious how much his words had upset Doris.

"A conceited, assumptive young person," Mrs. Boothroyd said sternly as the carriage drove through the gates.

"My dear, she's lovely enough to excuse anything; and, Barbara, you made a mistake in interfering about dress. Why, Mrs. Burneston is perfect altogether, no alteration could improve her elegance."

"Pray don't be foolish, Reginald;" his wife had reddened considerably. "You've always got some new beauty to admire, that nothing could improve. I'm tired of such nonsense."

Mr. Burneston did not go back to his wife's room when the visitors had departed, and Doris stood still where they had left her — musing sadly.

"Are they all right in what they say?" she thought. "If they are, my mother and Rose are right, and a woman's life can only be right when it is given up to petty aims and petty occupations." She pressed her hand tightly against her forehead and stood thinking; the ghosts of her past visions rose up before her with the plans of usefulness she had created. She tapped the floor impatiently with her foot. No, her peculiar position at Burneston crippled these plans; years must pass before she could shake off the memory that attached to her there.

"That patronizing, disagreeable woman is right," she said. "I will go to London, and try to learn how a woman can gain such power and influence that all the world looks up to her."

CHAPTER XXII.

AT THE CAIRN.

THE new home of the Barughs was far away from Burneston.

John Barugh had found it impossible to get what he wanted near the sea; indeed, he had been too dispirited and sore-hearted to take much interest in this new venture, except so far as regarded the quality of the land; and when he was suddenly offered a small but fertile farm lying chiefly in a valley beside a river, he went to see it, and was satisfied; he made his bargain at once, without any reference to Dorothy, or her comforts and tastes, though the farmhouse belonging was not built beside the river, but on the wild moor above the crags, which shut in the valley from a grand range of surrounding hills.

When first Dorothy heard that the Cairn, as the new farm was called, stood about a thousand feet above the sea, she rejoiced. Next to having sea breezes, she said, it was the best possible thing that could happen for George to live in such pure, invigorating air. But when she reached her new home, and saw a long, low range of stone buildings, newly slated, with scarcely any tree or garden ground, and all round, as far as her eyes could reach, a desolate expanse of moor, she burst into sudden tears, and turned angrily on her husband, who was helping her out of the dog-cart.

"O Lor', what a dreadful place! It's too bad, John, I declare it is," she said vehemently. "Why, I shall be buried alive. I might as well be in the churchyard."

John's heavy eyebrows were frowning, but he looked more grieved than angry.

"It's yur ain wark," he said. "Yee've made yur bed, an' yey mun lig on 't. Yee've ta'en t' joy fra uz, noo ivvery pleace iz t' same wivoot t' lass."

This was the first spoken reproach he had addressed to her, and it so soothed Dorothy with a comforting sense of her own superior judgment, that she walked silently into her new home. After all, it did not much matter that the situation was lonely; the mother of Mrs. Burneston of Burneston Hall could not have visited the wives of other farmers, supposing that there had been a neighbor or two within reach.

"Gentlefolks' houses is always far apart," said Mrs. Barugh, and she soon

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

settled herself in the new home. "Doris has become a real lady, and her family must rise with her," Dorothy argued; "and, sure enough, she gets all her pretty, taking ways from me," said the poor woman, as she looked at herself in the glass. "If a gentleman had come in my way when I was young, who's to say what might have happened?" Here her conscience smote her. "God forgive me!" she said; "my man has been a good husband to me — none better."

On the whole, however, she had a timid shrinking from grand folks, as she called them; she had keenly felt, spite of all, the difference between her daughter's ways and her own.

Doris had written several letters from abroad, but they had not heard tidings of her return home till her letter of invitation arrived.

John read the letter, and then passed it on to his wife; he rested his elbow on the table, and shaded his face with his hand. Dorothy looked vexed, but she passed the letter on to George without remark; she felt vexed to be left out, but in her heart she was relieved, and thankful that her old-fashioned clothes would not be exposed to the prying eyes of Mrs. Emmett; but she did not intend this thankfulness to be known to her husband and her son.

George read the letter, frowned over it, and then looked at his father.

"Well, father," he said.

"Waats dhoo think, lad?" John kept his face shaded by his hand.

"I'se fain Doris has axed yey," George said. "She's not forgotten that she's the same as oursels."

George had not come to the Cairn with his father and mother, he had stayed some time with Mr. Hawnby, who took a warm interest in the lad, and the change had been of service to him; it seemed as if the stormy cloud of conflicting feelings and opinions which during those two months had brought bitterness and unrest into his peaceful life had cleared away, and left no trace of its visitation except that the depth of George's heart owned a self-knowledge of failings hitherto unexplored, because no temptation had drawn them forth from where they lay coiled like sleeping serpents; he was humbler and gentler than he had been when Doris first arrived at Steersley.

But Dorothy did not understand his meaning. She thought his words presumptuous.

"And that she's not, you foolish lad," she said, with a smile of superior wisdom. "A woman takes the rank of her husband when she marries. Doris is not the same as us now, she's every bit the same as Mr. Burneston now she's his wife." She nodded round triumphantly, for her husband had raised his head, and was looking at her from under his thick red brows.

George sat waiting his father's answer, but John first addressed Dorothy.

"Sheea's mah lass, bliss her, an' ah's fain tu see sheea thinks on uz; bud sheea mun coom an' see mey, ah wunnot bide at t' Hall wiv her."

Dorothy's face flamed with sudden vexation.

"Ah, John, was there ever such a folly! A chance that mayn't come twice in your life, and I've planned out what you're to take and all, and you'll scarcely want a new thing! Why, it's the top stone on the family. George, lad, can't you speak? Tell your father not to be such a simpleton. I sha'n't get over it if he doesn't go, and Doris will be so dreadful disappointed."

A wistful look crossed John's face at the last words, but it did not dwell there; he laid one broad, brown hand on the table, and gave his wife a sad smile.

"Neeah, neeah, Doll. Ah'll not gang to Burneston."

"Oh, John, you ——"

"Whisht, whisht! mah mahnd's sattled, an' yee knaws 'at waat ah's seyd ah means."

George put his hand on his mother's shoulder.

"Father's in t' right," he said earnestly; "he's thinkin' o' Doris, mother; we'll do well to keep away from the Hall."

Mrs. Barugh was completely upset, it seemed to her that her cherished projects and schemes were annihilated. Of what use to say that her daughter was Mrs. Burneston of Burneston Hall, if it became known that none of Doris's family visited her? She broke down in pettish tears, and put her handkerchief to her eyes.

"It's too bad," she said, "but it's what I might have looked for. O John! one would think you hadn't got a soul in your body, let alone natural feelings; it's hard enough for me, what neither of you seem to take in, that Doris don't ask her own mother to come and see how she's gettin' on; but it's makin' it worse for me, John, much worse. You know what a come-down I made in marryin' you, and that now you've got a chance of risin' in the world you won't stir a step upwards, I call it downright cruel." A fresh burst of tears followed.

John gave an impatient groan, and pushed his chair back from the table.

No one spoke for some minutes, and Dorothy sobbed her anger into quietness.

"Mother," George said lovingly, "it's nat'ral you should wish to know how Doris seems in her new life, and if father's willing, mebbe he and I'll go over to Burneston and just see how she does, and bring you word. We'll not bide at t' Hall, father."

John raised his head, but there was no sign of yielding in his face.

"Dhoo can gang if dhoo wilz, lad, bud ah'll nivver set feeat i' Burneston Hall. God knaws, ah'd lahke to sey mah lass, mah wee darlin'," his voice trembled a little; he rose up, a sterner tone came into his voice — "Ah've coom here reet aweay, an' what fur sud ah be sik a feeal as to gan back tu yal 'at ah meeans tu furgit?"

He passed George on his way to the door, but the lad grasped his arm.

"Bide a bit, father. I wants," he cleared his throat, "I wants to say a word or two to you and mother together: wad ye mind if I was to speak to Rose Duncombe an ax her if some day she'll wed with me?"

He grew deathly pale while he spoke, for he felt intensely anxious as to the result of his question; he kept his large, pleading, brown eyes fixed on his father, it was his mother's opposition he dreaded.

John gave him back a long, steadfast gaze, and then he sighed and looked puzzled.

"Mah lad," he said, "ah dizzint seea hoo thoo yams tu keep a wife when thoo's gitten her; Rose is a bonny lass, an' sheeas bin kahnd ti dhu, an' ——"

But Dorothy broke in here.

"Oh, hush, John! how can George marry Rose? It was different before Doris came home; but don't you see now that it would never do? Fancy a lass like Rose being Mr. Burneston's sister-in-law."

George's pale face flushed deeply red.

"Let father speak, mother; he's none so set-up with having Mr. Burneston for a son-in-law that he would put aside my happiness because of him."

His son's words seemed to give the farmer the clue he wanted, the puzzled look left his eyes, and he looked down gravely, but not unkindly, at Dorothy.

"T' lasses iz aye fond," he said; "big and lahtle's t' same. Dhoo seays 'at ah's nut gude eneeaf fer thoo, an' yit thoo winnut hev t' lad wed wiv a lass 'at can nivvers fling at 'im 'at he's nut so gude as sheea is; gin t' lad mun wed, let 'im hev a wife 'at cannut cock her neb at 'im, an' mak 'im feel sair at heart." Then to George he said, "Gin Rose can mak dhoo happy, lad, dhoo may win her. Ye'll hev nae needs tu wark, thank God, but dhoo's ower yung to wed."

He left the long, low room so abruptly that both Dorothy and George stood still a minute listening to the meaning of his words; then the conscience-stricken woman sank into a chair and put her apron up to her face — she shrank even from her son's eyes.

George waited, but she sat still and silent; her husband's words had torn away the curtain of reserve that had lain between his heart and hers, and she saw the wounds her silly, only half-meant discontent had made. Absorbed in this new thought, she had forgotten all about Rose and George when her son took her hand and spoke.

"You see father is willing. Mother, say you're willing too. Rose has a loving heart, though she hesn't been as well taught as you hev; but, mother, if you'll only love her, she'll do anything to please you, I know she will."

Mrs. Barugh looked up hastily. All her love for her darling came back in full tide, and she saw with a mother's instinct the danger that lay before him. Her heart was so full just then that she flung her arms round her boy's neck and cried on his shoulder.

"I won't speak against Rose, dear. I don't want to vex you, my boy — I couldn't; but, oh! do be sure she loves you, George; don't take her just because she says yes for the sake of a home and smart clothes."

George held up his head and drew himself away.

"Mother, I'm a poor limping lad, but I believe this trouble has been good for me in some ways; it has taught me not to set much store by myself. Maybe Rose 'll say nay to me, an' if she does, ye may rest sure I'll not try to make her say yes. I want her love as much as I wants hersel; but, mother, if I thinks she'll say me nay I'll not ask her — 'twad only make soreness atween us."

Dorothy's pride rose at the notion that any Burneston girl could venture to refuse her George, but she did not express it in words. There was just a hope that Rose's manner might be discouraging, and so the evil might be staved off for a time. She listened patiently, even complaisantly, while George explained to her his plan of

visiting Doris, and then of seeing Rose and learning his fate.

"I shall go to Steersley and get a lift next morning over to t' old place," he said. "Mr. Hawnby will always put me up for t' night. Ah, mother, I wish you knew him better; he is so good an' he is so kind to me."

CHAPTER XXIII.

A REBUFF.

MORE than one week passed before George Barugh reached Burneston, for on the day succeeding their conversation a violent snow-storm swept over the moor, and even after its first vehemence had subsided the soft flakes fell thickly and noiselessly till night; and when the farmer looked out of doors in the early morning the broad moor was a trackless plain under the lowering leaden sky.

John would not listen to his son's argument that the horse would surely find its way, and spite of George's impatience he had to wait till the thaw came and the snow melted.

He was very impatient, not to see Doris — he had a half-defined feeling at his heart that he and his sister had better now keep apart from any real communion — but he longed to see Rose Duncombe.

On the wedding-day he had felt strangely stirred to make an appeal to her, but he had resolved not to do this unknown to his parents; he was, however, so strongly moved that it was perhaps well for his resolution that Rose remained invisible till he and his mother and Rica went back to Steersley.

Now, as he drove over from the rectory in the early morning with the postman to Burneston, he wondered how he could have waited so long and have thus risked the chance of losing Rose.

Doris had not expected him so early, and she and her husband were out riding when he reached the Hall. He had promised Mr. Hawnby that he would go back to sleep at Steersley, so that he had not many hours to spend in Burneston.

"I'll go up the village," he said to Benjamin Hazelgrave, "but I'll be back soon."

Benjamin looked after him, shrugging his shoulders and wondering how it could have come about that such a one as George Barugh should be kin to the lady of Burneston.

The morning was bitterly cold, spite of the recent thaw; but the sun shone overhead, and the birds were chirping as with a consciousness of coming spring, though the trees were black and leafless, and a keen wind made the bare walnut branches rattle as George passed by Ephraim Crewe's farm.

Scarcely any one came out of doors as the lad passed up the wet, muddy road, and when he reached the two cottages opposite Church Farm, even Joseph Sunley was not in his accustomed place; he had a severe rheumatic twinge in his right arm, and sat indoors crouched over his fire.

George was glad to be able to go without interruption to Mrs. Duncombe's cottage. He knocked and knocked for some time, till at last Rose opened the door herself.

She started at the sight of George, and a flush spread over her face.

He thought she looked prettier than ever; and she certainly did make a bright picture in the doorway. George grasped her hand eagerly.

"Good gracious, lad" — Rose tossed her head and put up her hand to smooth her hair — "how ye frighted me! Where ye come from?"

George laughed. "I thought ye'd be surprised, lass. May'nt I come in?" he asked, for she filled up the doorway with her plump figure and full skirts. "Ye're looking bonnier than ever," he said as she stood aside to let him pass.

"Then it's a wonder, I'm sure it is. Gran'-mother's ill an' as deaf as the door-post, an' I'm run off my legs with this an' that. I'm real tired out, lad, wiv so much work."

"When yer gran'mother's better ye mun come up to t' Cairn an' see mother." He looked at her shyly, but she remained quite unmoved. "T' air's lovely up at t' moor, an' ye can see miles an' miles one hill topping over t' others."

"My word!" Rose's eyes opened widely, but next minute she said, "It must be main dull, I'm thinking, at the Cairn; ye've nothing but cows and sheep to see, George."

"Gin ye were there, honey, 't wad be as bright as summer-time. I miss ye sorely, Rose."

She saw the look of pleading love in his eyes, but she resolved to seem unconscious.

"George, lad," she said eagerly, "I hevn't seen ye since the weddin'-day. My word, that was a grand day for ye all, specially for Doris. I suppose her head's turned above a bit wiv such an uplifting. How does she take it, lad?"

George felt vexed; he was not disposed to find fault with Doris, and it seemed to him that Rose spoke unkindly.

"I have not seen her yet," he said, "she and Mr. Burneston were both out when I called just now."

Rose's full lip curled.

"And do ye really think it? Nay, George, I think ye were hasty to go where mebbe ye're not wanted. Bless yur heart, lad, the squire won't see ye; he desn't mean to take up with such as you."

George had grown scarlet; he felt angry with Rose.

"Ye are quite mistook, lass," he said hastily; "it may be a lesson t' ye not to speak ill o' Doris. She writ father a kind letter, axin' us to go see her, an' that's one reason why I'm come now."

"D'ye mean to say," — Rose was staring at him with wide-opened eyes, — "that ye're bidin' at t' Hall along with Doris an' t' squire? My mercy, lad, ye mun feel like a fish in a croft."

George laughed — his anger against his darling was gone already.

"Ye're in the right, lass. I shouldn't be mysel' at t' Hall. I'll go see Doris, an' tell father an' mother how she looks, an' so on, but I'll not bide long wi' her: our ways lie apart now."

Rose scarcely heard him; she sat thinking, one finger pressed against her red lips; suddenly she roused.

"George, lad, wad ye find out from Doris when t' young squire's coming home? Mr. Sunley says he believes Master Ralph's said he won't bide wiv a stepmother."

"Sunley's an old gossip. What does he know?" said George angrily. "Why, Doris will make the young lad's home brighter an' more pleasant like than he's ever known it; he'll be glad enough to come."

"Young lad — I like that!" Rose laughed scornfully. "Why, he's nigh as old as I am, an' he's a man every bit. Did ye ever see such a face? He's as like t' squire as two peas, except that he's twice as handsome. My gracious, George! did ye ever see t' like of him? I made sure he'd come home for Kessamus, an' I think 'twar a real shame o' Doris to stop away, an' leave him to go among his friends. No wonder if he's huffed. But tell me, George, will ye find out, an' write to me when Ralph Burneston comes home? I'm just curious to know."

George laughed uneasily.

"What can it matter to ye, Rose, an' what for sud he come? There's nowt fer a lad to do now," he said; "t' shootin's past, an' it's a bad season for sport. A young lad's better at school, than in sinter-saunterin' wiv nowt to do. Burneston's not a good place for t' lad; there's no mates for t' like o' him here."

Rose tossed her head.

"Ye say that because ye've gone now. Suppose he likes lasses instead o' lads; suppose he wur to come an' see me? I warrant ye I'd make it lively for him, that wad I." She giggled.

George frowned.

"Ye're talking like a giglot; I'm shamed on ye, Rose." he said hotly. "Ye mun mind yersel'; ye'se no one to mind ye now, an' I's said afore, ye sudn't garb yerself so mich as a lass diz waat hes her own mother to guide her."

Rose jumped from her chair, and curtsied to the ground.

"Well done, parson!" she clapped her hands in mockery; "why don't ye ask yur grand lady sister to get ye made into a parson right out, t' wad suit ye rarely, lad, an' then ye'd hev a lawful way o' gettin' rid o' yur wisdom, instead o' plaguin' folk's lives out wi' lectures. My word, *I'm* shamed on *yee*, to think harm o' me for wantin' to talk to Ralph Burneston, a lad not so old as mysel'; ye've got a lot o' Puritan stuff out o' that old Pilgrim, ye hev. I'll tell Maister Sunley how rude ye've been, that I will." She wiped away some sudden tears with her fingers.

George sat confounded by her outburst; then sudden remorse seized on him. What a fool he had been to put such an idea into Rose's innocent mind!

"There, there, honey!" he tried to take her hand, but she flounced away and stood with her back towards him, trembling with passion. "I *am* sham'd o' mesel', but it's my luv for ye makes me foolish. I came wi' a full heart to tell ye about mysel'; an' ye begins about t' young maister. Forgive me, lass. Winnut ye gi' me just a look, Rose, darlin'?"

"No; go away, an' don't carney me." She shook her shoulders waywardly. "It's not likely I'm going to blow hot an' cold all in a minute. I won't forgive ye, so there."

But George was doggedly resolute.

"Yes, ye will, honey." He took her by the shoulders, and turned round her scarlet, angry face to face his own. "Ye'll make friends, Rose, dear. Ye were always a sweet, forgivin' lass, an' ye'll tell me if ——"

She put one hand over his mouth.

"Stop there, lad. If I forgive ye, it'll be to pay ye for holding yur peace. You an' me's long frien's, an' will keep so, an' if ye wants me for a frien', dunnut speak o' yursel' to me. Now I mun gae to gran'mother: she's called twice whiles ye've been talking. Ye can giv' my luv to yur fooaks."

She ended abruptly, kissed her hand, and ran away, as if she doubted her own power of escape from George's grasp.

He stood, looking puzzled and foolish, at the door which she had closed behind her.

"I's a fool, a doited idiot," he said; "I sud hev won her fost, an' then I might ha' said waat I pleased. I mun try again; sae long as there's no ither lad, I'll win my Rose yet."

But his face was downcast as he went back to the Hall: all joyful anticipation had gone out of it.

This time he was more successful.

The squire met him at the entrance door and gave him a hearty welcome; and when Doris came to him, in her own sitting-room, she was very cordial and pleasant. George was impressed by the change in her manner; he felt far more at ease with her than he had felt at Steersley.

"It is too tiring for you, George, to go back again to Steersley to-day," she said; "you had better sleep here."

But George remained firm to his purpose. So long as the squire stayed in the room he felt at ease, but when Mr. Burneston left him alone with Doris his shyness came again. He kept silence.

"I wish father had come with you," she said; "I want so much to see him."

George shook his head. He was vexed with himself for feeling shy, and it seemed to him that, spite of all Mr. Hawnby's advice, he was disposed to judge his sister harshly.

"No, he'll not come here," he said coldly; "ye mun come to t' Cairn if ye want to see father."

Doris looked thoughtful for a minute.

"I see no reason why I should not go to see you all," she said; "only I could not travel alone, — either you or my father must come and fetch me," she added, with a bright smile; "but not just yet."

"It's a fine country about t' Cairn," George said, "steep hills as ye never saw the like on, one above t' other."

Doris smiled; she thought Yorkshire hills after Swiss mountains would look like pigmies, but she only said, —

"Yes, I shall like to go to the Cairn some day — just now we have so many engagements."

George sighed. He had nearly said that no engagement ought to keep a daughter from her father, but he checked himself.

"How's t' young lad — Maister Ralph I mean?" he said.

For the first time Doris looked uneasy and confused. She bent over a camellia-tree on her little flower-table.

"He is at school," she said. "He is not coming home just yet."

George felt greatly relieved.

"I'm fain to hear that, Doris. A village is an idle place for a young lad to loaf about in."

But Doris was thinking of something else.

"Do you think," she said, "that mother could make room for Miss Masham as well as for me at the Cairn? She is coming to stay with us in the summer, and I am sure she would like to go with me."

George looked dissatisfied. He thought Doris ought to want to be with her parents without needing any companion.

"We'd be fain to see Miss Masham," he said abruptly; "but we'd liefer ye didn't wait for her company, Doris. Father's wearyin' to set eyes on ye again."

"Well, I hope it will not be long before I go," she said, "but I cannot fix the time. We may go to town this spring; but nothing is settled, and I can make no arrangement without consulting my husband."

Again George sighed. He felt disappointed even in his own idea of Doris; he thought that she possessed too much mind to care for anything, as it seemed to him, so frivolous and fashionable as going to town in spring-time.

"I'd ha' thought," he said, "t' squire'd ha' found plenty to see after t' long whiles he's bin away, without running off again so soon."

Doris held her head very stiffly; she did not want to disagree with George, still she thought him extremely presumptuous to find fault with her husband. But as she looked at him, there was a yearning earnestness in his tender brown eyes that stirred her heart with a feeling that had grown to be unusual — the strange tie of blood — and again she spoke more frankly than she could have thought it possible to speak to any one.

"George," she said in a warmer tone, "you see I have much to learn so as to be quite fit for my position, and I think I am more likely to learn among those with whom my life has to be passed than —

than by keeping away from what is called society."

George sat listening, trying to take in the full sense of her words, which seemed to him to hold some hidden meaning.

"I'm not sure if I've gaumed ye rightly," he said at last. "D'ye mean, Doris, 'at ye mun keep away from the Cairn for the sake o' keeping yurself a lady? If ye thinks that" — he rose, looking very tall and proud as he faced his sister — "why, then, you an' I are best to keep apart, I'm thinkin'."

Doris was stung and deeply hurt. She had, so it seemed to her, conceded very much in making this revelation to her brother of the scheme she was forming with regard to her future, and, instead of seeing that by this very frankness she had acted like a sister towards him, George chose to be offended by what was, she knew, true wisdom.

"You are quite mistaken," she spoke in the icy voice which had always ended their childish disputes. "I meant — but it seems useless to explain to you." She broke off and paused; then she smiled up in her brother's face with that winning smile that never failed to conquer. "You cannot quite understand me, dear," she said, "and I do not blame you for it — we must see everything from such different points; only you can trust me, and believe that my love for you all has not changed, or if it has, it is stronger and warmer than it was before I married. Will you say this to our father, George? — with my dearest love."

Her voice trembled, and her firm lips quivered, but her eyes were tearless. She was not carried away by her feelings, but she wished George to do her justice. And he was greatly touched; also he felt remorse for his own outburst.

"That I will, lass." He kissed her and shook her hand heartily. "An' I'm grieved I misdoubted ye. My thought was that wi' yur bonny face ye'd maybe get spoiled among t' fine London fooalk. They're not o' much account, I've heard; but ye'll not stay there long, maybe?"

Doris was saved an answer by Benjamin, who came to announce luncheon in his portly fashion.

Soon after luncheon George took leave, spite of Mr. Burneston's cordial invitation to stay. As he rode along, on a horse lent him by the squire, he pondered his sister's words.

"Society?" he said slowly, "that's t'other name for t' world; Vanity Fair, old Bunyan rightly calls it. Must Doris go into it? Couldn't she stay quiet at t' Hall with her husband an' her books, an' all the fine things she's got to amuse her, instead o' goin' to London, which is real Vanity Fair, I's sure? I misdoubt her plan sorely. I'll not fret father wi' her doings; but I fear Doris'll not come back from Vanity Fair t' same as she goes doon there."

From Macmillan's Magazine.

THE COLORS OF ANIMALS AND PLANTS.*

II. — THE COLORS OF PLANTS.

THE coloring of plants is neither so varied nor so complex as that of animals, and its explanation accordingly offers fewer difficulties. The colors of foliage are, comparatively, little varied, and can be traced in almost all cases to a special pigment termed chlorophyll, to which is due the general green color of leaves; but the recent investigations of Mr. Sorby and others have shown that chlorophyll is not a simple green pigment, but that it really consists of at least seven distinct substances, varying in color from blue to yellow and orange. These differ in their proportions in the chlorophyll of different plants; they have different chemical reactions; they are differently affected by light; and they give distinct spectra. Mr. Sorby further states that scores of different coloring matters are found in the leaves and flowers of plants, to some of which appropriate names have been given, as erythrophyll which is red, and phaiophyll which is brown; and many of these differ greatly from each other in their chemical composition. These inquiries are at present in their infancy, but as the original term chlorophyll seems scarcely applicable under the present aspect of the subject, it would perhaps be better to introduce the analogous word chromophyll as a general term for the coloring matters of the vegetable kingdom.

Light has a much more decided action on plants than on animals. The green

* In the first part of this paper I used the term "voluntary sexual selection" to indicate the theory that many of the ornaments of male animals have been produced by the choice of the females, and to distinguish it from that form of sexual selection which explains the acquisition of weapons peculiar to male animals as due to the selective influence of their combats and struggles for the possession of the females. I find that Mr. Darwin thinks the term "voluntary" not strictly applicable, and I therefore propose to alter it to "conscious" or "perceptive," which seem free from any ambiguity and make not the least difference to my argument.

color of leaves is almost wholly dependent on it; and although some flowers will become fully colored in the dark, others are decidedly affected by the absence of light, even when the foliage is fully exposed to it. Looking therefore at the numerous colored substances which are developed in the tissue of plants; the sensitiveness of these pigments to light; the changes they undergo during growth and development; and the facility with which new chemical combinations are effected by the physiological processes of plants as shown by the endless variety in the chemical constitution of vegetable products, we have no difficulty in comprehending the general causes which aid in producing the colors of the vegetable world, or the extreme variability of those colors. We may therefore here confine ourselves to an inquiry into the various uses of color in the economy of plants; and this will generally enable us to understand how it has become fixed and specialized in the several genera and species of the vegetable kingdom.

In animals, as we have seen, color is greatly influenced by the need of protection from or of warning to their numerous enemies, and to the necessity for identification and easy recognition. Plants rarely need to be concealed, and obtain protection either by their spines, their hardness, their hairy covering, or their poisonous secretions. A very few cases of what seem to be true protective coloring do, however, exist, the most remarkable being that of the "stone mesembryanthemum," of the Cape of Good Hope, which in form and color closely resembles the stones among which it grows; and Dr. Burchell, who first discovered it, believes that the juicy little plant thus generally escapes the notice of cattle and wild herbivorous animals. Mr. J. P. Mansel Weale also noticed that many plants growing in the stony Karoo have their tuberous roots above the soil, and these so perfectly resemble the stones among which they grow that, when not in leaf, it is almost impossible to distinguish them (*Nature*, vol. iii. p. 507). A few cases of what seem to be protective mimicry have also been noted, the most curious being that of three very rare British fungi, found by Mr. Worthington Smith, each in company with common species, which they so closely resembled that only a minute examination could detect the difference. One of the common species is stated in botanical works to be "bitter and nauseous," so that it is not improbable that the rare kind may escape being eaten by being mistaken for an uneatable species, though itself palatable. Mr. Mansel Weale also mentions a labiate plant, the *Ajuga ophrydis*, of South Africa, as strikingly resembling an orchid. This may be a means of attracting insects to fertilize the flower in the absence of sufficient nectar or other attraction in the flower itself; and the supposition is rendered more probable by this being the only species of the genus *Ajuga* in South Africa. Many other cases of resemblances between very distinct plants have been noticed — as that of some euphorbias to cacti; but these very rarely inhabit the same country or locality, and it has not been proved that there is in any of these cases the amount of inter-relation between the species which is the essential feature of the protective "mimicry" that occurs in the animal world.

The different colors exhibited by the foliage of plants, and the changes it undergoes during growth and decay, appear to be due to the general laws already sketched out, and to have little if any relation to the special requirements of each species. But flowers and fruits exhibit definite and well-pronounced tints, often varying from species to species, and more or less clearly related to the habits and functions of the plant. With the few exceptions already pointed out, these may be generally classed as *attractive* colors. The seeds of plants require to be dispersed so as to reach places favorable for germination and growth. Some are very minute, and are carried abroad by the wind, or they are violently expelled and scattered by the bursting of the containing capsules. Others are downy or winged, and are carried long distances by the gentlest breeze. But there is a large class of seeds which cannot be dispersed in either of these ways, and are mostly contained in eatable fruits. These fruits are devoured by birds or beasts, and the hard seeds pass through their stomachs undigested, and, owing probably to the gentle heat and moisture to which they have been subjected, in a condition highly favorable for germination. The dry fruits or capsules containing the first two classes of seeds are rarely, if ever, conspicuously colored, whereas the eatable fruits almost invariably acquire a bright color as they ripen, while at the same time they become soft and often full of agreeable juices. Our *red* haws and nips, our *black* elderberries, our *blue* sloes and whortleberries, our *white* mistletoe and snowberry, and our *orange* sea-buckthorn, are examples of the color-sign of edibility; and in every part

of the world the same phenomenon is found. The fruits of large forest trees, such as pines, oaks, and beeches, are not colored, perhaps because their size and abundance render them sufficiently conspicuous, and also because they provide such a quantity of food to such a number of different animals that there is no danger of their being unnoticed.

The colors of flowers serve to render them visible and recognizable by insects which are attracted by secretions of nectar or pollen. During their visits for the purpose of obtaining these products, insects involuntarily carry the pollen of one flower to the stigma of another, and thus effect cross-fertilization, which, as Mr. Darwin was the first to demonstrate, immensely increases the vigor and fertility of the next generation of plants. This discovery has led to the careful examination of great numbers of flowers, and the result has been that the most wonderful and complex arrangements have been found to exist, all having for their object to secure that flowers shall not be self-fertilized perpetually, but that pollen shall be carried, either constantly or occasionally, from the flowers of one plant to those of another. Mr. Darwin himself first worked out the details in orchids, primulas, and some other groups; and hardly less curious phenomena have since been found to occur, even among some of the most regularly-formed flowers. The arrangement, length, and position of all the parts of the flower is now found to have a purpose, and not the least remarkable portion of the phenomenon is the great variety of ways in which the same result is obtained. After the discoveries with regard to orchids, it was to be expected that the irregular, tubular, and spurred flowers should present various curious adaptations for fertilization by insect agency. But even among the open, cup-shaped, and quite regular flowers, in which it seemed inevitable that the pollen must fall on the stigma, and produce constant self-fertilization, it has been found that this is often prevented by a physiological variation — the anthers constantly emitting their pollen either a little earlier or a little later than the stigma of the same flower, or of other flowers on the same plant, were in the best state to receive it; and as individual plants in different stations, soils, and aspects, differ somewhat in the time of flowering, the pollen of one plant would often be conveyed by insects to the stigmas of some other plant in a condition to be fertilized by it. This mode of securing cross-fertilization seems so simple and easy, that we can hardly help wondering why it did not always come into action, and so obviate the necessity for those elaborate, varied, and highly complex contrivances found in perhaps the majority of colored flowers. The answer to this of course is, that *variation* sometimes occurred most freely in one part of a plant's organization, and sometimes in another, and that the benefit of cross-fertilization was so great that *any* variation that favored it was preserved, and then formed the starting-point of a whole series of further variations, resulting in those marvellous adaptations for insect fertilization, which have given much of their variety, elegance, and beauty to the floral world. For details of these adaptations we must refer the reader to the works of Darwin, Lubbock, Herman Müller, and others. We have here only to deal with the part played by color, and by those floral structures in which color is most displayed.

The sweet odors of flowers, like their colors, seem often to have been developed as an attraction or guide to insect fertilizers, and the two phenomena are often complementary to each other. Thus, many inconspicuous flowers, like the mignonette and the sweet-violet, can be distinguished by their odors before they attract the eye, and this may often prevent their being passed unnoticed; while very showy flowers, and especially those with variegated or spotted petals, are seldom sweet. White, or very pale flowers, on the other hand, are often excessively sweet, as exemplified by the jasmine and clematis; and many of these are only scented at night, as is strikingly the case with the night-smelling stock, our butterfly orchis (*Habenaria chlorantha*), the greenish-yellow *Daphne pontica*, and many others. These white flowers are mostly fertilized by night-flying moths, and those which reserve their odors for the evening probably escape the visits of diurnal insects which would consume their nectar without effecting fertilization. The absence of odor in showy flowers and its preponderance among those that are white, may be shown to be a fact by an examination of the lists in Mr. Mongredien's work on hardy trees and shrubs.* He gives a list of about one hundred and sixty species with showy flowers, and another list of sixty species with fragrant flowers; but only twenty of these latter are included

among the showy species, and these are almost all white-flowered. Of the sixty species with fragrant flowers, more than forty are white, and a number of others have greenish, yellowish, or dusky and inconspicuous flowers. The relation of white flowers to nocturnal insects is also well shown by those which, like the evening primroses, only open their large white blossoms after sunset. The red Martagon lily has been observed by Mr. Herman Müller to be fertilized by the humming-bird hawk moth, which flies in the morning and afternoon when the colors of this flower, exposed to the nearly horizontal rays of the sun, glow with brilliancy, and when it also becomes very sweet-scented.

To the same need of conspicuousness the combination of so many individually small flowers into heads and bunches is probably due, producing such broad masses as those of the elder, the gueldre-rose, and most of the umbelliferæ, or such elegant bunches as those of the lilac, laburnum, horse-chestnut, and wistaria. In other cases minute flowers are gathered into dense heads, as with *Globularia*, *Jasione*, clover, and all the compositæ; and among the latter the outer flowers are often developed into a ray, as in the sunflowers, the daisies, and the asters, forming a starlike compound flower, which is itself often produced in immense profusion.

The beauty of alpine flowers is almost proverbial. It consists either in the increased size of the individual flowers as compared with the whole plant, in increased intensity of color, or in the massing of small flowers into dense cushions of bright color; and it is only in the higher Alps, above the limit of forests and upwards towards the perpetual snow-line that these characteristics are fully exhibited. This effort at conspicuousness under adverse circumstances may be traced to the comparative scarcity of winged insects in the higher regions, and to the necessity for attracting them from a distance. Amid the vast slopes of debris and the huge masses of rock so prevalent in higher mountain regions, patches of intense color can alone make themselves visible and serve to attract the wandering butterfly from the valleys. Mr. Herman Müller's careful observations have shown, that in the higher Alps bees and most other groups of winged insects are almost wanting, while butterflies are tolerably abundant; and he has discovered, that in a number of cases where a lowland flower is adapted to be fertilized by bees, its alpine ally has had its structure so modified as to be adapted for fertilization only by butterflies.* But bees are always (in the temperate zone) far more abundant than butterflies, and this will be another reason why flowers specially adapted to be fertilized by the latter should be rendered unusually conspicuous. We find, accordingly, the yellow primrose of the plains replaced by pink and magenta-colored alpine species; the straggling wild pinks of the lowlands by the masses of large flowers in such mountain species as *Dianthus alpinus* and *D. glacialis;* the saxifrages of the high Alps with bunches of flowers a foot long, as in *Saxifraga longifolia* and *S. cotyledon*, or forming spreading masses of flowers, as in *S. oppositifolia;* while the soapworts, silenes, and louseworts are equally superior to the allied species of the plains.

Again, Dr. Müller has discovered that when there are showy and inconspicuous species in the same genus of plants, there is often a corresponding difference of structure, those with large and showy flowers being quite incapable of self-fertilization, and thus depending for their very existence on the visits of insects; while the others are able to fertilize themselves should insects fail to visit them. We have examples of this difference in *Malva sylvestris*, *Epilobium angustifolium*, *Polygonum bistorta*, and *Geranium pratense*,—which have all large or showy flowers and must be fertilized by insects,—as compared with *Malva rotundifolia*, *Epilobium parviflorum*, *Polygonum aviculare*, and *Geranium pusillum*, which have small or inconspicuous flowers, and are so constructed that if insects should not visit them they are able to fertilize themselves.†

As supplementing these curious facts showing the relation of color in flowers to the need of the visits of insects to fertilize them, we have the remarkable, and on any other theory utterly inexplicable circumstance, that in all the numerous cases in which plants are fertilized by the agency of the wind they never have specially colored floral envelopes. Such are our pines, oaks, poplars, willows, beeches, and hazel; our nettles, grasses, sedges, and many others. In some of these the male flowers are, it is true, conspicuous, as in the catkins of the willows and the hazel, but this arises incidentally from the masses of pollen necessary to secure fertilization, as shown by the entire absence of a corolla

or of those colored bracts which so often add to the beauty and conspicuousness of true flowers.

The adaptation of flowers to be fertilized by insects — often to such an extent that the very existence of the species depends upon it — has had widespread influence on the distribution of plants and the general aspects of vegetation. The seeds of a particular species may be carried to another country, may find there a suitable soil and climate, may grow and produce flowers, but if the insect which alone can fertilize it should not inhabit that country, the plant cannot maintain itself, however frequently it may be introduced or however vigorously it may grow. Thus may probably be explained the poverty in flowering plants and the great preponderance of ferns that distinguishes many oceanic islands, as well as the deficiency of gaily-colored flowers in others. This branch of the subject is discussed at some length in my address to the Biological Section of the British Association,* but I may here just allude to two of the most striking cases. New Zealand is, in proportion to its total number of flowering plants, exceedingly poor in handsome flowers, and it is correspondingly poor in insects, especially in bees and butterflies, the two groups which so greatly aid in fertilization. In both these aspects it contrasts strongly with southern Australia and Tasmania in the same latitudes, where there is a profusion of gaily-colored flowers and an exceedingly rich insect fauna. The other case is presented by the Galapagos Islands, which, though situated on the equator off the west coast of South America, and with a tolerably luxuriant vegetation in the damp mountain zone, yet produce hardly a single conspicuously-colored flower; and this is correlated with, and no doubt dependent on, an extreme poverty of insect life, not one bee and only a single butterfly having been found there.

Again, there is reason to believe that some portion of the large size and corresponding showiness of tropical flowers is due to their being fertilized by very large insects and even by birds. Tropical sphinx moths often have their probosces nine or ten inches long, and we find flowers whose tubes or spurs reach about the same length; while the giant bees, and the numerous flower-sucking birds, aid in the fertilization of flowers whose corollas or stamens are proportionately large.

* See *Nature*, September 6th, 1876.

I have now concluded this sketch of the general phenomena of color in the organic world. I have shown reasons for believing that its presence, in some of its infinitely varied hues, is more probable than its absence, and that variation of color is an almost necessary concomitant of variation of structure, of development, and of growth. It has also been shown how color has been appropriated and modified both in the animal and vegetable world, for the advantage of the species in a great variety of ways, and that there is no need to call in the aid of any other laws than those of organic development and "natural selection" to explain its countless modifications. From the point of view here taken it seems at once improbable and unnecessary that the lower animals should have the same delicate appreciation of the infinite variety and beauty — of the delicate contrasts and subtle harmonies of color — which are possessed by the more intellectual races of mankind, since even the lower human races do not possess it. All that seems required in the case of animals, is a perception of *distinctness* or *contrast* of colors; and the dislike of so many creatures to scarlet may perhaps be due to the rarity of that color in nature, and to the glaring contrast it offers to the sober greens and browns which form the general clothing of the earth's surface.

The general view of the subject now given must convince us that, so far from color being — as it has sometimes been thought to be — unimportant, it is intimately connected with the very existence of a large proportion of the species of the animal and vegetable worlds. The gay colors of the butterfly and of the alpine flower which it unconsciously fertilizes while seeking for its secreted honey, are each beneficial to its possessor, and have been shown to be dependent on the same class of general laws as those which have determined the form, the structure, and the habits of every living thing. The complex laws and unexpected relations which we have seen to be involved in the production of the special colors of flower, bird, and insect, must give them an additional interest for every thoughtful mind; while the knowledge that, in all probability, each style of coloration, and sometimes the smallest details, have a meaning and a use, must add a new charm to the study of nature.

Throughout the preceding discussion we have accepted the subjective phenomena of color — that is, our perception of varied

hues, and the mental emotions excited by them — as ultimate facts needing no explanation. Yet they present certain features well worthy of attention, a brief consideration of which will form a fitting sequel to the present essay.

The perception of color seems, to the present writer, the most wonderful and the most mysterious of our sensations. Its extreme diversities and exquisite beauties seem out of proportion to the causes that are supposed to have produced them, or the physical needs to which they minister. If we look at pure tints of red, green, blue, and yellow, they appear so absolutely contrasted and unlike each other, that it is almost impossible to believe (what we nevertheless know to be the fact) that the rays of light producing these very distinct sensations differ only in wave-length and rate of vibration; and that there is from one to the other a continuous series and gradation of such vibrating waves. The positive diversity we see in them must then depend upon special adaptations in ourselves; and the question arises — for what purpose have our visual organs and mental perceptions become so highly specialized in this respect? When the sense of sight was first developed in the animal kingdom, we can hardly doubt that what was perceived was light only, and its more or less complete withdrawal. As the sense became perfected, more delicate gradations of light and shade would be perceived; and there seems no reason why a visual capacity might not have been developed as perfect as our own, or even more so, in respect of light and shade, but entirely insensible to differences of color, except in so far as these implied a difference in the quantity of light. The world would in that case appear somewhat as we see it in good stereoscopic photographs; and we all know how exquisitely beautiful such pictures are, and how completely they give us all requisite information as to form, surface-texture, solidity, and distance, and even to some extent as to color; for almost all colors are distinguishable in a photograph by some differences of tint, and it is quite conceivable that visual organs might exist which would differentiate what we term color by delicate gradations of some one characteristic neutral tint. Now such a capacity of vision would be simple as compared with that which we actually possess; which, besides distinguishing infinite gradations of the *quantity* of light, distinguishes also, by a totally distinct set of sensations, gradations of *quality*, as determined by differences of wave-lengths or rate of vibration. At what grade in animal development this new and more complex sense first began to appear we have no means of determining. The fact that the higher vertebrates, and even some insects, distinguish what are to us diversities of color, by no means proves that their *sensations* of color bear any resemblance whatever to ours. An insect's capacity to distinguish red from blue or yellow may be (and probably is) due to perceptions of a totally distinct nature, and quite unaccompanied by any of that sense of enjoyment or even of radical distinctness which pure colors excite in us. Mammalia and birds, whose structure and emotions are so similar to our own, do probably receive somewhat similar impressions of color; but we have no evidence to show that they experience pleasurable emotions from color itself when not associated with the satisfaction of their wants or the gratification of their passions.

The primary necessity which led to the development of the sense of color, was probably the need of distinguishing objects much alike in form and size, but differing in important properties; such as ripe and unripe, or eatable and poisonous fruits; flowers with honey or without; the sexes of the same or of closely allied species. In most cases the strongest contrast would be the most useful, especially as the colors of the objects to be distinguished would form but minute spots or points when compared with the broad masses of tint of sky, earth, or foliage against which they would be set. Throughout the long epochs in which the sense of sight was being gradually developed in the higher animals, their visual organs would be mainly subjected to two groups of rays — the green from vegetation, and the blue from the sky. The immense preponderance of these over all other groups of rays would naturally lead the eye to become specially adapted for their perception; and it is quite possible that at first these were the only kinds of light-vibrations which could be perceived at all. When the need for differentiation of color arose, rays of greater and of smaller wave-lengths would necessarily be made use of to excite the new sensations required; and we can thus understand why green and blue form the central portion of the visible spectrum, and are the colors which are most agreeable to us in large surfaces; while at its two extremities we find yellow, red, and violet, colors which we best appreciate in smaller masses, and when contrasted with the other two or with light neutral tints.

We have here probably the foundations of a natural theory of harmonious coloring, derived from the order in which our color-sensations have arisen, and the nature of the emotions with which the several tints have been always associated.* The agreeable and soothing influence of green light may be in part due to the green rays having little heating power; but this can hardly be the chief cause, for the blue and violet, though they contain less heat, are not generally felt to be so cool and sedative. But when we consider how dependent are all the higher animals on vegetation, and that man himself has been developed in the closest relation to it, we shall find, probably, a sufficient explanation. The green mantle with which the earth is overspread caused this one color to predominate over all others that meet our sight, and to be almost always associated with the satisfaction of human wants. Where the grass is greenest, and vegetation most abundant and varied, there has man always found his most suitable dwelling-place. In such spots hunger and thirst are unknown, and the choicest productions of nature gratify the appetite and please the eye. In the greatest heats of summer, coolness, shade, and moisture are found in the green forest glades; and we can thus understand how our visual apparatus has became especially adapted to receive pleasurable and soothing sensations from this class of rays.

* There is reason to believe that our capacity of distinguishing colors has increased even in historical times. The subject has attracted the attention of German philologists, and I have been furnished by a friend with some notes from a work of the late Lazarus Geiger, entitled, "*Zur Entwickelungsgeschichte der Menschheit*" (Stuttgart, 1871). According to this writer it appears that the *color* of grass and foliage is never alluded to as a beauty in the Vedas or the Zendavesta, though these productions are continually extolled for other properties. Blue is described by terms denoting sometimes green, sometimes black, showing that it was hardly recognized as a distinct color. The *color* of the sky is never mentioned in the Bible, the Vedas, the Homeric poems, or even in the Koran. The first distinct allusion to it known to Geiger is in an Arabic work of the ninth century. "Hyacinthine locks" are black locks, and Homer calls iron "violet-colored." Yellow was often confounded with green, but, along with red, it was one of the earliest colors to receive a distinct name. Aristotle names three colors in the rainbow — red, yellow, and green. Two centuries earlier Xenophanes had described the rainbow as purple, reddish, and yellow. The Pythagoreans admitted four primary colors — white, black, red, and yellow; the Chinese the same, with the addition of green. If these statements fairly represent the early condition of color-sensation they well accord with the view here maintained, that green and blue were first alone perceived, and that the other colors were successively separated from them. These latter would be the first to receive names; hence we find purple, reddish, and yellow first noticed in the rainbow as the tints to be separated from the widespread blue and green of the visible world which required no distinctive color-appellation. If the capacity of distinguishing colors has increased in historic times, we may perhaps look upon color-blindness as a survival of a condition once almost universal; while the fact that it is still so prevalent is in harmony with the view that our present high perception and appreciation of color is a comparatively recent acquisition, and may be correlated with a general advance in mental activity.

The preceding considerations enable us to comprehend, both why a perception of difference of color has become developed in the higher animals, and also why colors require to be presented or combined in varying proportions in order to be agreeable to us. But they hardly seem to afford a sufficient explanation, either of the wonderful contrasts and total unlikeness of the sensations produced in us by the chief primary colors, or of the exquisite charm and pleasure we derive from color itself, as distinguished from variously-colored objects, in the case of which association of ideas comes into play. It is hardly conceivable that the material *uses* of color to animals and to ourselves required such very distinct and powerfully contrasted sensations; and it is still less conceivable that a sense of delight in color *per se* should have been necessary for our utilization of it.

The emotions excited by color and by music, alike, seem to rise above the level of a world developed on purely utilitarian principles. ALFRED R. WALLACE.

GREEN PASTURES AND PICCADILLY.

BY WILLIAM BLACK,

AUTHOR OF "THE PRINCESS OF THULE," "THE ADVENTURES OF A PHAETON," ETC.,

In conjunction with an American writer.

[Entered according to Act of Congress, in the Year 1877, by HARPER & BROTHERS, in the Office of the Librarian of Congress, at Washington.]

CHAPTER XLIV.

THE DISCLOSURE.

"LADY SYLVIA," said Queen T., going up to her friend, whom she found seated alone in her room in this Omaha hotel, "I am going to surprise you."

"Indeed," said the other, with a pleasant smile; for she did not notice the slightly trembling hands; and most of Queen T.'s surprises for her friends were merely presents.

"I — hope I shall not frighten you,"

she continued, with some hesitation; "you must prepare yourself for — for rather bad news —— "

She caught sight of the newspaper. She sprung to her feet.

"My husband!" she cried, with a suddenly white face. But her friend caught her hands.

"He is quite well; don't be alarmed; it is only a — a — misfortune."

And therewith she put the paper into her hand, with an indication as to where she should look, while she herself turned aside somewhat. There was silence for a second or two. Then she fancied she heard a low murmur — a moan of infinite tenderness and pity and longing — "*My husband! my husband!*" and then there was a slight touch on her arm. When she turned, Lady Sylvia was standing quite calmly there, with her eyes cast down. Her face was a little pale, that was all.

"I think I will go back to England now," said she, gently.

And with that, of course, her friend began to cry a bit; and it was with a great deal of difficulty and of resolute will that she proceeded to speak at all. And then she bravely declared that if Lady Sylvia insisted on setting out at once, she would accompany her; and it needed equal bravery to admit what she had done — that she had written to Mr. Balfour, begging him to let us know what his plans were, and that she had told him where he might telegraph ——

"The telegraph!" cried Lady Sylvia, with a quick light of joy leaping to her eyes. "I can send him a message now! He will have it this very day! I will go at once!"

"Yes, there is the telegraph," stammered her friend, "and there is an office below in the hall of the hotel. But — don't you think — it might be awkward — sending a message that the clerks will read — "

Lady Sylvia seized her friend's hands, and kissed her on both cheeks, and hurried out of the room and down-stairs. The elder woman was rather taken aback. Why should she be so warmly thanked for the existence of the telegraph, and for the fact that Mr. Balfour, M.P., was ruined?

Lady Sylvia went down-stairs, and in the hall she found the telegraphic office. She was not afraid of any clerk of woman born. She got a pencil and the proper form; and clearly and firmly, after she had put in the address, she wrote beneath, "*My darling husband, may I come to you?*" She handed the paper to the clerk, and calmly waited until he had read it through, and told her what to pay. Then she gave him the necessary dollars, and turned and walked through the hall, and came up the stairs, proud and erect — as proud, indeed, as if she had just won the battle of Waterloo.

And she was quite frank and fearless in speaking about this failure, and treated it as if it were an ordinary and trivial matter that could be put right in a few minutes. Her husband, she informed Mr. Von Rosen — who was greatly distressed by the news, and was condoling with her very sincerely — was quite capable of holding his own in the world without any help from his father's business. No doubt it would alter their plans of living, but Mr. Balfour was not at all the sort of man likely to let circumstances overpower him. And would it please us to set out at once on our inspection of Omaha? for she would like to get a glimpse of the Missouri, and there was the possibility that she might have to start off for England that night.

"*Nein!*" cried the lieutenant, in indignant protest. "It is impossible. Now that you have only the few days more to go on — and then your friends to go back —— "

Here one of the party intimated her wish — or rather her fixed intention — of accompanying Lady Sylvia.

"Oh no!" our guest said, with quite a cheerful smile. "I am not at all afraid of travelling alone — not in the least. I have seen a great deal of how people have to help themselves since I left England. And that is not much hardship. I believe one can go right through from here to New York; and then I can go to the Brevoort House, which seemed the quietest of the hotels, and wait for the first steamer leaving for Liverpool. I am not in the least afraid."

Our Bell looked at her husband. That look was enough; he knew his fate was sealed. If Lady Sylvia should set out that evening, he knew he would have to accompany her as far as New York anyhow.

I think she quite charmed the hearts of the kind friends who had come to show us about the place. The truth was that the recent heavy rains had changed Omaha into a Slough of Despond, and the huge holes of mud in the unmade streets were bridged over by planks of wood that were of the most uncertain character; but she seemed rather to like this way of laying out streets. Then we climbed up to the heights above the town on which is built the high school — a handsome building of

red brick; and she betrayed the greatest interest in the system of education followed here, and listened to the catechising of the children by the smartly-dressed and self-composed young ladies who were their teachers, just as if she understood all about co-sines and angles of reflection. And when we clambered up to the tower of this building, she was quite delighted with the spacious panorama spread out all around. Far over there was a mighty valley — a broad plain between two long lines of bluffs — which was, no doubt, in former times worn down by the Missouri; and now this plain, we could see, was scored along by various channels, one of them, a little darker in hue than the neighboring sand, being the yellow Missouri itself. We were rather disappointed with the mighty Missouri, which we expected to find rolling down in grandeur to the sea — or rather to the Mississippi, if the poet will allow us to make the correction. We considered that even the name they give it out here, the Big Muddy, was misapplied, for it did not seem broader than the Thames at Richmond, while the mud banks and sand banks on both sides of it were of the dreariest sort. But she would not hear a word said against the noble river. No doubt at other times of the year it had sufficient volume; and even now, was there not something mysterious in this almost indistinguishable river rolling down through that vast, lonely, and apparently uninhabited plain? As for Omaha, it looked as bright as blue skies and sunshine could make it. All around us were the wooden shanties and the occasional houses of stone dotted about in promiscuous fashion; out there on the green undulations where the prairie began; on the sides of the bluffs where the trees were; and along the level mud-bed of the river, where the railway works and smelting-works were sending up a cloud of smoke into the still, clear air. We visited these works. She listened with great interest to the explanations of the courteous officials, and struck up a warm friendship with a civil engineer at the railway works, doubtless because he spoke with a Scotch accent. But, after all, we could see she was becoming anxious and nervous, and rather before midday we proposed to return to the hotel for luncheon.

Four hours had elapsed.

"But you must not make sure of finding an answer awaiting you, my dear Lady Sylvia," said her ever-thoughtful friend. "There may be delays. And Mr. Balfour may be out of town."

All the same she did make sure of an answer; and when, on arriving at the hotel, she was informed that no telegram had come for her, she suddenly went away to her own room, and we did not see her for some little time. When she did make her appearance at lunch, we did not look at her eyes.

She would not go out with us for our further explorations. She had a headache. She would lie down. And so she went away to her own room.

But the curious thing was that Queen T. would not accompany us either. It was only afterward that we learned that she had kept fluttering about the hall, bothering the patient clerks with inquiries as to the time that a telegram took to reach London. At last it came, and it was given to her. We may suppose that she carried it up-stairs quickly enough, and with a beating heart. What happened in the room she only revealed subsequently, bit by bit, for her voice was never quite steady about it.

She went into the room gently. Lady Sylvia was seated at a table, her hands on the table, her head resting on them, and she was sobbing bitterly. She was deserted, insulted, forsaken. He would not even acknowledge the appeal she had made to him. But she started up when she heard some one behind her, and would have pretended to conceal her tears but that she saw the telegram. With trembling fingers she opened it, threw a hasty glance at it, and then, with a strange, proud look, gave it back to her friend, who was so anxious and excited that she could scarcely read the words — "*No. I am coming to you.*" And at the same moment all Lady Sylvia's fortitude broke down, and she gave way to a passion of hysterical joy, throwing her arms round her friend's neck, and crying over her, and murmuring close to her, "Oh, my angel! my angel! my angel! you have saved to me all that was worth living for!" So much can imaginative people make out of a brief telegram.

The two women seemed quite mad when we returned.

"He is coming out! Mr. Balfour is coming to join us!" says Queen T., with a wild fire of exultation in her face, as if the millennium were at hand; and Lady Sylvia was sitting there, proud enough too, but rosy-red in the face, and with averted eyes.

And here occurred a thing which has always been a memorable puzzle to us.

"Ha!" cried the lieutenant, in the

midst of an excitement which the women in vain endeavored to conceal, "that rifle! Does he remember that wonderful small rifle of his? It will be of such use to him in the Rocky Mountains. I think — yes, I think it is worth a telegram."

And he went down-stairs to squander his money in that fashion. But, we asked ourselves afterward, did he know? Had he and his wife suspected? Had they discussed the affairs of Lady Sylvia and her husband in those quiet conjugal talks of which the outsider can never guess the purport? And had this young man, with all his bluntness and good-natured common sense and happy matter-of-factness, suddenly seized the dramatic situation, and called aloud about this twopenny-halfpenny business of a pea-shooter all to convince Lady Sylvia of the general ignorance, and put her at her ease? He came up a few moments afterward, whistling.

"There is antelope," said he, seriously, "and the mountain sheep, and the black-tailed deer and the bear. Oh, he will have much amusement with us when he comes to Idaho."

"You forget," says Lady Sylvia, smiling, though her eyes were quite wet, "that he will be thinking of other things. He has got to find out how he has got to live first."

"How he has got to live?" said the lieutenant, with a shrug of his shoulders. "That is simple. That is easy. Any man can settle that. He has got to live — happy, and let things take their chance. What harm in a holiday, if he comes with me to shoot one or two bears?"

"Indeed you will do nothing of the kind," said his wife, severely: she had too much regard for her babes to let the father of them go off endangering his life in that fashion.

That was a pleasant evening. Our friends came to dine with us, and we settled all our plans for our expedition to the Indian reservations lying far up the Missouri Valley. And who was first down in the morning? and who was most delighted with the clear coolness of the air and the blue skies? and who was most cheerful and philosophical when we discovered, at the station, and when it was too late, that the carpet-bag we had stuffed with wine, beer, and brandy for our stay in these temperate climes had been left behind at the hotel?

The small branch line of railway took us only about forty miles on our way. We went up the immensely broad valley of the river, which was at this time only a rivulet. The valley was a plain of rich vegetation — long water-color washes of yellow and russet and olive green. The further side of it was bounded by a distant line of bluffs, bright blue in color. Close by us were the corresponding bluffs, broken with ravines which were filled with cotton-trees, and which opened out into a thick underwood of sunflowers ten feet high and of deep-hued sumac. Overhead a pale blue sky and some white clouds. Then, as we are looking up into the light, we see an immense flock of wild geese making up the stream, divided into two lines, representing the letter V placed horizontally, but more resembling a handful of dust flung high into the air.

About midday we reached the terminus of the line, Tekamah, a collection of wooden shanties and houses, with a few cotton-trees about. We had luncheon in a curious little inn which had originally been a block-house against the Indians, that is to say, it had been composed of sawn trees driven into the earth, with no windows on the ground-floor. By the time we had finished luncheon, our two carriages were ready — high springed vehicles with an awning, and each with a moderately good pair of horses. We set out for our halting-place, Decatur, sixteen miles off.

That drive up the bed of the Missouri we shall not soon forget. There was no made road at all, but only a worn track through the dense vegetation of this swampy plain, while ever and anon this track was barred across by ravines of rich, deep, black, succulent mud. It was no unusual thing for us to see first one horse and then its companion almost disappear into a hole, we looking down on them; then there would be a fierce struggle, a plunge on our part, and then we were looking up at the horses pawing the bank above us. How the springs held out we could not understand. But occasionally, to avoid these ruts, we made long detours through the adjacent prairie-land lying over the bluffs; and certainly this was much pleasanter. We went through a wilderness of flowers, and the scent of the trampled May-weed filled all the air around us. How English horses would have behaved in this wilderness was a problem. The sunflowers were higher than our animals' heads; they could not possibly see where they were going; but, all the same, they slowly ploughed their way through the forest of crackling stems. But before we reached Decatur we had to return to the mud swamp, which was here worse than ever; for now it appeared as

if there were a series of rivers running at right angles to the broad black track, and our two vehicles kept plunging through the water and mud as if we were momentarily to be sucked down into a morass. The air was thick with insect life, and vast clouds of reed-birds rose, as we passed, from the sunflowers. There was a red fire all over the west as we finally drove into the valley of the Decatur.

It was a strange-looking place. The finest objects that met our eyes were some Indian boys riding away home to the reservations on their ponies, and looking picturesque enough with their ragged and scarlet pantaloons, their open-breasted shirt, their swarthy face and shining black hair, and their arms swinging with the galloping of the ponies, though they stuck to the saddle like a leech. And these were strange-looking gentlemen, too, whom we met in the inn of Decatur — tall, swanking fellows, with big riding-boots and loose jackets, broad-shouldered, spare-built, unwashed, unshaven, but civil enough, though they set their broad-brimmed hats with a devil-may-care air on the side of their head. We had dinner with these gentlemen in the parlor of the inn. There were two dishes — from which each helped himself with his fingers — of some sort of dried flesh, which the lieutenant declared to be pelican of the wilderness, and there were prunes and tea. We feared our friends were shy, for they did not speak at all before our women-folk. In a few minutes they disposed of their meal, and went out to a bench in front of the house to smoke. Then the lieutenant — so as not to shock these temperate people — produced one of several bottles of Catawba which he had procured at some way-side station before we left the railway. In appearance, when poured out, it was rather like tea, though not at all so clear; and, in fact, the taste was so unlike any thing we had ever met before that we unanimously pronounced in favor of the tea. But the lieutenant would try another bottle; and that being a trifle more palatable, we had much pleasure in drinking a toast. And the toast we drank was the safety of the gallant ship that was soon to carry Lady Sylvia's husband across the Atlantic.

From The Fortnightly Review.

THE SCHOOL OF GIORGIONE.

To regard all products of art as various forms of poetry is the mistake of much popular criticism. For this criticism, poetry, music, and painting are but translations into different languages of one and the same fixed quantity of imaginative thought, supplemented by certain technical qualities of color in painting, of sound in music, of rhythmical words in poetry. In this way, the sensuous element in art, and with it almost everything in art that is essentially artistic, is made a matter of indifference: and a clear apprehension of the opposite principle, that the sensuous material of each art brings with it a special phase or quality of beauty, untranslatable into the forms of any other, an order of impressions distinct in kind, is the beginning of all true æsthetic criticism. For, as art addresses not the pure sense, still less the pure intellect, but the imaginative reason through the senses, there are differences of kind in æsthetic beauty corresponding to the differences in kind of the gifts of sense themselves. Each art, therefore, having its own peculiar and incommunicable sensuous charm, has its own special mode of reaching the imagination, its own special responsibilities to its material. One of the functions of æsthetic criticism is to define these limitations, to estimate the degree in which a given work of art fulfils its responsibilities to its special material: to note in a picture that true pictorial charm which is neither a mere poetical thought or sentiment on the one hand, nor a mere result of communicable technical skill in color or design on the other; to define in a poem that true poetical quality which is neither descriptive nor meditative merely, but comes of an inventive handling of rhythmical language, the element of song in the singing; to note in music the musical charm, that essential music which presents no words, no definable matter of sentiment or thought, separable from the special form in which it is conveyed to us.

To such a philosophy of the variations of the beautiful, Lessing's analysis of the spheres of sculpture and poetry in the "Laocoon" was a rememberable contribution. But a true appreciation of these things is possible only in the light of a whole system of such art-casuistries. And it is in the criticism of painting that this truth most needs enforcing, for it is in popular judgments on pictures that that false generalization of all art into forms of poetry is most prevalent. To suppose that all is mere technical acquirement in delineation or touch, working through and addressing itself to the intelligence on the one side, or a merely poetical

or what may be called literary interest, addressed also to the pure intelligence, on the other — this is the way of most spectators, and many critics, who have never caught sight all the time of that true pictorial quality which lies between, the pledge of the pictorial gift, the inventive or creative handling of line and color only, which, as almost always in Dutch painting, as often also in the works of Titian or Veronese, is quite independent of anything definitely poetical in the subject it accompanies. It is the *drawing* — the design projected from that peculiar pictorial temperament or constitution in which, while it may possibly be ignorant of true anatomical proportions, all things whatever, all poetry, every idea however abstract or obscure, floats up as a visible scene or image; it is the *coloring* — that weaving of imperceptible gold threads of light through the dress, the flesh, the atmosphere, in Titian's "Lace-girl," the staining of the whole fabric of the thing with a new, delightful physical quality. This *drawing*, then — the arabesque traced in the air by Tintoret's flying figures, by Titian's forest branches; this coloring — the magic conditions of light and hue in the atmosphere of Titian's "Lace-girl," or Rubens's "Descent from the Cross" — these essential pictorial qualities, must first of all delight the sense, delight it as directly and sensuously as a fragment of Venetian glass, and by this delight only be the medium of whatever poetry or science may lie beyond it in the intention of the composer. In its primary aspect, a great picture has no more definite message for us than an accidental play of sunlight and shadow for a moment, on one's wall or floor, is itself indeed a space of such falling light, caught as the colors are caught in an Eastern carpet, but refined upon and dealt with more subtly and exquisitely than by nature itself. And this primary and essential condition fulfilled, we may trace the coming of poetry into painting by fine gradations upwards; from Japanese fan-painting, for instance; where we get, first, only abstract color; then just a little interfused sense of the poetry of flowers; then, sometimes, consummate flower-painting; and so onwards, until in Titian we have, as his poetry in the "Ariadne," so actually a touch of true childlike humor in the diminutive, quaint figure with its silk gown, which ascends the temple stairs, in his picture of the "Presentation of the Virgin," at Venice.

But although each art has thus its own specific order of impressions, and an untranslatable charm, and a just apprehension of the ultimate differences of the arts is the beginning of æsthetic criticism; yet it is noticeable that, in its special mode of handling its given material, each art may be observed to pass into the condition of some other art, by what German critics term an *Anders-streben*, a partial alienation from its own limitations, by which the arts are able, not indeed to supply the place of each other, but reciprocally to lend each other new forces.

Thus, some of the most delightful music seems to be always approaching to figure, to pictorial definition. Architecture, again, though it has its own laws — laws esoteric enough, as the true architect knows only too well — yet sometimes aims at fulfilling the conditions of a picture, as in the Arena chapel; or of sculpture, as in the flawless, ringing unity of Giotto's tower at Florence; and often finds a true poetry, as in those strangely twisted staircases of the châteaux of the country of the Loire, as if it were intended that among their odd turnings the actors in a wild life might pass each other unseen; there being a poetry also of memory and mere effect of time, by which it often profits much. Thus, again, sculpture aspires out of the hard limitation of pure form towards color, or its equivalent; poetry also in many ways finding guidance from the other arts, the analogy between a Greek tragedy and a work of Greek sculpture, between a sonnet and a relief, of French poetry generally with the art of engraving, being more than mere figures of speech; and all the arts in common aspiring towards the principle of music, music being the typical, or ideally consummate art, the object of the great *Anders-streben* of all art, of all that is artistic, or partakes of artistic qualities.

All art constantly aspires towards the condition of music. For while in all other works of art it is possible to distinguish the matter from the form, and the understanding can always make this distinction, yet it is the constant effort of art to obliterate it. That the mere matter of a poem, for instance, its subject, its given incidents or situation; that the mere matter of a picture, the actual circumstances of an event, the actual topography of a landscape, should be nothing without the form, the spirit of the handling; that this form, this mode of handling, should become an end in itself, should penetrate every part of the matter; this is what all art constantly strives after, and achieves in different degrees.

This abstract language becomes clear

enough if we think of actual examples. In an actual landscape we see a long white road lost suddenly on the hill-verge. That is the matter of one of M. Legros' etchings; but in this etching it is informed by an indwelling solemnity of expression, seen upon it or half-seen, within the limits of an exceptional moment, or caught from his own mood perhaps; but which he maintains as the very essence of the thing throughout his work. Sometimes a momentary tint of stormy light may invest a homely or too familiar scene with a character which might well have been drawn from the deep places of the imagination. Then we say, This particular effect of light, this sudden inweaving of gold thread through the texture of the hay-stack, and the poplars, and the grass, gives the scene artistic qualities; it is like a picture. And such tricks of circumstance are commonest in landscape which has little salient character of its own, because in such scenery the whole material detail is so easily absorbed, or saturated by that informing expression of passing light, and elevated throughout its whole extent to a new delightful effect by it. And hence the superiority for most conditions of the picturesque of a river-side in France to a Swiss valley, because on the French river-side mere topography, the simple material, counts for so little, and, all being so pure, untouched, and tranquil in itself, nature has such easy work in tuning and playing music upon it. The Venetian landscape, on the other hand, has in its material conditions much which is hard and definite; but the masters of the Venetian school have shown themselves little burdened by them. Of its Alpine background they retain certain abstracted elements only of cool color and tranquillizing line; and they use its actual details, the brown windy turrets, the straw-colored fields, the forest arabesques, but as the notes of a music which duly accompanies the presence of their men and women, presenting us with the spirit or essence only of a certain sort of landscape, a country of the pure reason or half-imaginative memory.

Poetry, again, works with words addressed in the first instance to the mere intelligence; and it deals most often with a definite subject or situation. Sometimes it may find a noble and quite legitimate function in the expression of moral or political aspiration, as often in the poetry of Victor Hugo. In such instances it is easy enough for the understanding to distinguish between the matter and the form, however much the matter, the subject, the element which is addressed to the mere intelligence, has been penetrated by the informing, artistic spirit. But the ideal types of poetry are those in which this distinction is reduced to its minimum; so that lyrical poetry, just because in it you are least able to detach the matter from the form without a deduction of something from that matter itself, is, at least artistically, the highest and most complete form of poetry. And the very perfection of such poetry often seems to depend in part on a certain suppression or vagueness of mere subject, so that the definite meaning almost expires, or reaches us through ways not distinctly traceable by the understanding, as in some of the most imaginative compositions of William Blake, and often in Shakespeare's songs, as pre-eminently in that song of Mariana's page in "Measure for Measure," in which the kindling power and poetry of the whole play seems to pass for a moment into an actual strain of music.

And this principle holds good of all things that partake in any degree of artistic qualities, of the furniture of our houses and of dress, for instance, of life itself, of gesture and speech, and the details of daily intercourse; these also, for the wise, being susceptible of a suavity and charm caught from the way in which they are done, which gives them a value in themselves; wherein, indeed, lies what is valuable and justly attractive in what is called the fashion of a time, which elevates the trivialities of speech, and manner, and dress into an end in themselves, and gives them a mysterious grace and attractiveness in the doing of them.

Art, then, is thus always striving to be independent of the mere intelligence, to become a matter of pure perception, to get rid of its responsibilities to its subject or material; the ideal examples of poetry and painting being those in which the constituent elements of the composition are so welded together that the material or subject no longer strikes the intellect only; nor the form, the eye or ear only; but form and matter, in their union or identity, present one single effect to the imaginative reason, that complex faculty for which every thought and feeling is twin-born with its sensible analogue or symbol.

It is the art of music which most completely realizes this artistic ideal, this perfect identification of form and matter, this strange chemistry, uniting, in the integrity of pure light, contrasted elements. In its ideal, consummate moments, the end is not distinct from the means, the form from

the matter, the subject from the expression; they inhere in and completely saturate each other; and to it, therefore, to the condition of its perfect moments, all the arts may be supposed constantly to tend and aspire. Music, then, not poetry, as is so often supposed, is the true type or measure of consummate art. Therefore, although each art has its incommunicable element, its untranslatable order of impressions, its unique mode of reaching the imaginative reason, yet the arts may be represented as continually struggling after the law or principle of music, to a condition which music alone completely realizes; and one of the chief functions of æsthetic criticism, dealing with the concrete products of art, new or old, is to estimate the degree in which each of those products approaches in this sense to musical law.

By no school of painters have the necessary limitations of the art of painting been so unerringly though instinctively apprehended, and the essence of what is pictorial in a picture so justly conceived, as by the school of Venice; and the train of thought suggested in what has been now said is, perhaps, a not unfitting introduction to a few pages about Giorgione, who, though much has been taken by recent criticism from what was reputed his, still, more entirely than any other, sums up, in what we know of himself and his work, the spirit of that school.

The beginnings of Venetian painting link themselves to the last, stiff, half-barbaric splendors of Byzantine decoration, and are but the introduction into the crust of marble and gold on the walls of Murano or Saint Mark's of a little more of human expression. And throughout the course of its later development, always subordinate to architectural effect, the work of the Venetian school never escaped from the influence of its beginnings. Unassisted, and therefore unperplexed, by naturalism, religious mysticism, philosophical theories, it had no Giotto, no Angelico, no Botticelli. Exempt from the stress of thought and sentiment which taxed so severely the resources of the generations of Florentine artists, those earlier Venetian painters, down to Carpaccio and the Bellini, seem never for a moment to have been even tempted to lose sight of the scope of their art in its strictness, or to forget that painting must be before all things decorative, a thing for the eye, a space of color on the wall, only more dexterously blent than the marking of its precious stone or the chance interchange of sun and shade upon it — this, to begin and end with — whatever higher matter of thought, or poetry, or religious reverie might play its part therein between. At last, with final mastery of all the technical secrets of his art, and with somewhat more than a spark of the divine fire to his share, comes Giorgione. He is the inventor of *genre*, of those easily movable pictures which serve for uses neither of devotion nor of allegorical or historical teaching; little groups of real men and women amid congruous furniture or landscape; morsels of actual life, conversation or music or play, refined upon and idealized till they come to seem like glimpses of life from afar. Those spaces of more cunningly blent color, obediently filling their places hitherto in a mere architectural scheme, Giorgione detaches from the wall; he frames them by the hands of some skilful carver, so that people may move them readily and take with them where they go, like a poem in manuscript, or a musical instrument, to be used at will for all subtle purposes of culture, stimulus, or solace, coming like an animated presence, into one's cabinet, as we say, to enrich the air as with a personal aroma, and, like persons, live with us, for a day or a lifetime. Of all art like this, art which has played so large a part in men's culture since that time, Giorgione is the initiator. Yet in him, too, that old Venetian clearness or justice in the apprehension of the essential limitations of the pictorial art is still undisturbed; and while he interfuses his painted work with a high-strung sort of poetry, caught directly from a singularly rich and high-strung sort of life, yet in his selection of subject or phase of subject, in the subordination of mere subject to pictorial design, to the main purpose of a picture, he is typical of that aspiration of all the arts towards music which I have endeavored to explain, towards the perfect identification of matter and form.

Born so close to Titian, though a little before him, that these two companion pupils of the aged Giovanni Bellini may almost be called contemporaries, Giorgione stands to Titian in something like the relationship of Sordello to Dante, in Mr. Browning's poem. Titian, when he leaves Bellini, becomes in turn the pupil of Giorgione; he lives in constant labor more than sixty years after Giorgione is in his grave, and with such fruit that hardly one of the greater towns of Europe is without some fragment of it. But the slightly older man, with his so limited actual prod-

uct (what remains to us of it seeming when narrowly examined to reduce itself to almost one picture, like Sordello's one fragment of lovely verse) yet expresses quintessentially, in elementary suggestion and effect, that spirit, itself the final acquisition of all the long endeavors of Venetian art, which Titian spreads over his whole life's activity.

And, as we might expect, something fabulous and illusive has always mingled itself in the brillance of Giorgione's fame. The exact relationship to him of many works — drawings, portraits, painted idylls — often fascinating enough, which in various collections went by his name was from the first uncertain. Still, six or eight famous pictures at Dresden, Florence, and the Louvre, were undoubtingly attributed to him, and in these, if anywhere, something of the splendor of the old Venetian humanity seemed to have been preserved. But of those six or eight famous pictures it is now known that only one is certainly from Giorgione's hand. The accomplished science of the subject has come at last, and, as in other instances, has not made the past more real for us, but assured us that we possess of it less than we seemed to have. Much of the work on which Giorgione's immediate fame rested, work done for instantaneous effect, in all probability passed away almost within his own age, like the frescoes on the façade of the *fondaco dei Tedeschi* at Venice, some crimson traces of which, however, still give a strange additional touch of splendor to the scene of the Rialto. And then there is a barrier, or borderland, a period about the middle of the sixteenth century, in passing through which the tradition miscarries, and the true outline of Giorgione's work and person obscure themselves. It became fashionable for wealthy lovers of art, with no critical standard of authenticity, to collect so-called works of Giorgione, and a multitude of imitations came into circulation. And now, in the "new Vasari," * the great traditional reputation, woven with so profuse demand on men's admiration, has been scrutinized thread by thread; and what remains of the most vivid and stimulating of Venetian masters, a live flame, as it seemed, in those old shadowy times, has been reduced almost to a name by his most recent critics.

Yet enough remains to explain why the legend grew up above the name, why the name attached itself, in many instances, to the bravest work of other men. The "Concert" in the Pitti Palace, in which a monk with cowl and tonsure touches the keys of a harpsichord, while a clerk placed behind him grasps the handle of a viol, and a third with cap and plume seems to wait upon the true interval for beginning to sing, is undoubtedly Giorgione's. The outline of the lifted finger, the trace of the plume, the very threads of the fine linen, which fasten themselves on the memory in the moment before they are lost altogether in that calm, unearthly glow, the skill which has caught the waves of wandering sound, and fixed them on the lips and hands forever — these are indeed the master's own; and the criticism which, while dismissing so much hitherto believed to be Giorgione's, has established the claims of this one picture, has left it among the most precious things in the world.

It is noticeable that the "distinction" of this "Concert," its sustained evenness of perfection, alike in design, in execution and in choice of personal type, becomes for the "new Vasari" the standard of Giorgione's genuine work. Finding here enough to explain his influence, and the true seal of mastery, it assigns to Pellegrino da San Daniele the "Holy Family" in the Louvre, for certain points in which it comes short of that standard, but which will hardly diminish the spectator's enjoyment of a singular charm of liquid air with which the whole picture seems instinct, filling the eyes and lips, the very garments of its sacred personages with some wind-searched energy of physical and spiritual being, and of which the blue peak clearly defined in the distance is, as it were, the material pledge. Similarly, another beloved picture in the Louvre, the subject of a sonnet by a poet whose own painted work comes often to mind as one ponders over these precious things, the "*Fête Champêtre*," is assigned to but an imitator of Sebastian del Piombo; and the "Tempest" in the Academy at Venice — less of a loss, perhaps, though not without its sweet effect of clearing weather towards the left, its one untouched morsel — to Paris Bordone, or perhaps to "some advanced craftsmen of the sixteenth century." From the gallery at Dresden, the "Knight embracing a Lady," where the knight's noticeably worn gauntlets seem to mark some well-known pause in a story we would willingly hear the rest of, is conceded to "a Brescian hand," and "Jacob meeting Rachel" to a pupil of Palma; and,

whatever their charm, we are called on to give up the "Ordeal," and the "Finding of Moses," with its jewel-like pools of water, perhaps to Bellini.

Nor has the criticism which thus so freely diminishes the number of his authentic works added anything important to the well-known outline of the life and personality of the man; only, it has fixed one or two dates, one or two circumstances, a little more exactly. Giorgione was born before the year 1477, and spent his childhood at Castelfranco, where the last crags of the Venetian Alps break down romantically, with something of park-like grace, to the plain. A natural child of the family of the Barbarelli by a peasant-girl of Vedelago, he finds his way early into the circle of notable persons, people of courtesy; and becomes initiated into those differences of personal type, manner, dress even, which are best understood there, that "distinction" of the "Concert" of the Pitti Palace. Hard by his home lives Catherine of Cornara, formerly queen of Cyprus; and up in the towers, which still remain, Tuzio Costanzo, the famous *condottiere* — strange, picturesque remnant of mediæval manners in a civilization rapidly changing. Giorgione paints their portraits; and when Tuzio's son, Matteo, dies in early youth, adorns in his memory a chapel in the church of Castelfranco, painting on this occasion, perhaps the altarpiece, foremost among his authentic works, still to be seen there, with the figure of the warrior saint, Liberale, for which the original little study in oil, with the delicately gleaming silver-grey armor, is one of the greatest treasures of the National Gallery, and in which, as in some other knightly personages attributed to him, people have supposed the likeness of his own presumably gracious presence. Thither, at last, he is himself brought home from Venice, early dead but celebrated. It happened, about his thirty-fourth year, that in one of those parties at which he entertained his friends with music, he met a certain lady, of whom he became greatly enamoured, and "they rejoiced greatly, the one and the other, in their loves." And two quite different legends concerning it agree in this, that it was through this lady he came by his death; Ridolfi relating that being robbed of her by one of his pupils he died of grief at the double treason; Vasari, that she being secretly stricken of the plague, and he making his visits to her as usual, he took the sickness from her mortally with his kisses, and thus briefly departed.

But although the number of Giorgione's extant works has been thus limited by recent criticism, all has not been done when the real and the traditional elements in what concerns him have been discriminated; for in what is connected with a great name much that is not real is often very stimulating, and for the æsthetic philosopher, over and above the real Giorgione and his authentic extant works, there remains *the Giorgionesque* also, an influence, a spirit or type in art, active in men so different as those to whom those supposed works of his are really assignable — a veritable school, indeed, which grew, as a supplementary product, out of all those fascinating works rightly or wrongly attributed to him; out of many copies from, or variations on, him by unknown or uncertain workmen, whose drawings and designs were, for reasons, prized as his; out of the immediate impression he made upon his contemporaries, and with which he continued in men's minds; out of many traditions of subject and treatment which really descend from him to our own time, and by retracing which we fill out the original image; Giorgione thus becoming a sort of impersonation of Venice itself, its projected reflex or ideal, all that was intense or desirable in it thus crystallizing about the memory of this wonderful young man.

And now, finally, let me illustrate some of the characteristics of this *school of Giorgione*, as we may say, which for most of us, notwithstanding all that negative criticism of the "new Vasari," will still identify itself with those famous pictures at Florence, Dresden, and Paris; and in which there defines itself for us a certain artistic ideal, the conception of a peculiar aim and procedure in art, which we may understand as the *Giorgionesque*, wherever we find it — in Venetian work generally, or in work of our own time, and of which the "Concert," that undoubted work of Giorgione in the Pitti Palace, is the typical instance, and a pledge which authenticates the connection of the school with the master.

I have spoken of a certain interpenetration of the matter or subject of a work of art with the form of it, a condition realized absolutely only in music, as the condition to which every form of art is perpetually aspiring. In the art of painting, the attainment of this ideal condition, this perfect interpenetration of the subject with color and design, depends, of course,

in great measure, on dexterous choice of that subject, or phase of subject; and such choice is one of the secrets of Giorgione's school. It is the school of *genre*, and employs itself mainly with "painted idylls," but, in the production of this pictorial poetry, exercises a wonderful *finesse* in the selecting of such matter as lends itself most readily and entirely to pictorial form, to entire expression by drawing and color, to what I may call again the musical treatment. For although its productions are painted poems they belong to a sort of poetry which tells itself without an articulated story. The master is pre-eminent for the resolution, the ease, and quickness with which he reproduces instantaneous motion — the lacing on of armor, with the head bent back so stately; the fainting lady; the embrace rapid as the kiss caught with death itself from dying lips; the momentary conjunction of mirrors and polished armor and still water, by which all the sides of a solid image are presented together, solving that casuistical question whether painting can present an object as completely as sculpture. The sudden act, the rapid transition of thought, the passing expression — this he arrests with that vivacity which Vasari has attributed to him, the *fuoco Giorgionesco*, as he terms it. Now it is part of the ideality of the highest sort of poetry that it presents us with a kind of profoundly significant and animated instants, a mere gesture, a look, a smile, perhaps, a brief and entirely concrete moment, into which, however, all the abstract motives, all the interest and efficacy of a long history, have condensed themselves, and which seem to absorb past and future in an intense consciousness of the present. Such ideal instants the school of Giorgione selects with admirable *finesse* from that feverish, tumultuously colored existence of the old citizens of Venice; phases of subject in themselves already volatilized almost to the vanishing point, exquisite pauses in time, in which, arrested thus, we seem to be spectators of all the fulness of things forever, and which are like an extract, or elixir, or consummate fifth part of life.

Who, in some such perfect moment, when the harmony of things inward and outward beat itself out so truly, and with a sense of receptivity, as if in that deep accord, with entire inaction on our part, some messenger from the real soul of things must be on his way to one, has not felt the desire to perpetuate all that, just so, to suspend it in every particular circumstance, with the portrait of just that one spray of leaves lifted just so high against the sky, above the well, forever? — a desire how bewildering with the question whether there be indeed any place wherein these desirable moments take permanent refuge. Well! in the school of Giorgione you drink water, perfume, music, lie in receptive humor thus forever, and the satisfying moment is assured.

It is to the law or condition of music, as I said, that all art like this is really aspiring; and in the school of Giorgione those perfect moments of music, the making or hearing of it, song or the accompaniment of song, are themselves prominent as subjects. On that background of the silence of Venice, which the visitor there finds so impressive, the world of Italian music was then forming itself. In choice of subject, as in all besides, the "Concert" of the Pitti Palace is typical of all that Giorgione, himself an admirable musician, touched with his influence; and in sketch, or finished picture, in various collections, we may follow it through many intricate variations — men fainting at music, music heard at the poolside while people fish, or mingled with the sound of the pitcher in the well, or heard across running water, or among the flocks; the tuning of instruments; people with intent faces as if listening, like those in Plato, to detect the smallest interval of musical sound, the smallest undulation in the air, as it is said gifted ears may catch the note of the bat; feeling for music in thought, on a stringless instrument, ear and finger refining themselves infinitely in the appetite for sweet sound; a momentary touch of an instrument in the twilight, as one passes through some unfamiliar room, in a chance company.

In such favorite incidents, then, of Giorgione's school, music or music-like intervals in our existence, life itself is conceived as a sort of listening — listening to music, to the reading of Bandello's novels, to the sound of water, to time as it flies. Often such moments are really our moments of play, and we are surprised at the unexpected blessedness of what may seem our least important part of time; not merely because play is in many instances that to which people really apply their own best powers, but also because at such times the stress of our servile, every-day attentiveness being relaxed, the happier powers in things without us are permitted free passage, and have their way with us. And so, from music, the school of Giorgione passes often to play which is like music; to those masques in which men avowedly do but play at real life, like children

"dressing-up," disguised in the strange old Italian dresses, parti-colored, or fantastic with purfling and furs, of which the master was so curious a designer, and which, above all the spotless white linen at wrist and throat, he painted so dexterously.

And when people are happy in this thirsty land, water will not be far off; and in the school of Giorgione the presence of water — the well or marble-rimmed pool, the drawing or pouring of water, as the woman pours it from a pitcher with her jewelled hand in the "*Fête Champêtre*," listening, perhaps, to the cool sound as it falls, blent with the music of the pipes — is as characteristic, and almost as suggestive, as that of music itself. And the landscape feels and is glad of it also — a landscape full of clearness, of the effects of water, of fresh rain newly passed through the air, and collected into its grassy channels; the air, too, in the school of Giorgione, being as vivid as the souls which breathe it, and literally empyrean, its impurities burnt out of it, no taint, no trace or floating particle of aught but its own clear element, allowed to subsist within it.

Its scenery is such as in England we call "park scenery," with some undefined refinement felt about the rustic buildings, the choice grass, the grouped trees, the undulations deftly economised for graceful effect. Only, in Italy all natural things are woven through and through with gold thread, even the cypress revealing it among the folds of its blackness. And it is with gold dust or gold thread that these Venetian painters seem to work, spinning its fine filaments through the solemn human flesh, out away into the white plastered walls of the thatched huts. The harsher details of the mountains recede to a harmonious distance, the one peak of rich blue above the horizon remaining but as the visible warrant of that due coolness which is all we need ask here of the Alps, with their dark soul of rains and streams. Yet what real, airy distance, as the eye passes from level to level, through the long-drawn valley in which Jacob embraces Rachel, the fiery point of passion, to which all the rest turns up, opening and closing about them, yearningly. Nowhere is there a truer instance of that balance, that modulated unison of landscape and persons — the earth being here but a "second body," a garment as exactly conformed to and spiritually expressive of the human presence on it, of the "first body," as that "first body" is of the soul — a unison of the human image and its accessories, already noted as characteristic of the Venetian school, so that in it neither personage nor scenery is ever a mere pretext for the other.

Something like this seems to me to be the *vraie vérité* about Giorgione, to adopt a serviceable expression by which the French recognize those more liberal and durable impressions which, in respect of any really considerable person or subject, anything that has at all intricately occupied men's attention, lie beyond and must supplement the narrower range of the strictly ascertained and numerable facts about it. In this, Giorgione is but an illustration of a valuable general caution we may abide by in all criticism. As regards Giorgione himself, we have indeed to take note of all those negations and exceptions by which, at first sight, a new Vasari seems merely to have confused our apprehension of a delightful object, to have explained out of our inheritance from past time what seemed of high value there. Yet it is not with a full understanding even of those exceptions that one can leave off just there. Set in their true perspective such negations become but a salt of genuineness in our knowledge; for, beyond all those strictly deducible facts, we must take note of that indirect influence by which one like Giorgione, for instance, enlarges his permanent efficacy, and really makes himself felt in our culture; and in a just impression of that is the essential truth, the *vraie vérité*, concerning him.

WALTER H. PATER.

From The Westminster Review.

THE SUPERNATURAL ELEMENT IN SHAKESPEARE.

"POETRY," says Lord Bacon in his "Advancement of Learning," "is nothing else but feigned history, the use of which hath been to give some shadow of satisfaction to the mind of man in those points wherein the nature of things doth deny it, the world being in proportion inferior to the soul; by reason whereof there is, agreeable to the spirit of man, a more ample greatness, a more exact goodness, and a more absolute variety, than can be found in the nature of things." In thus setting forth, by means of the imagination, actions more heroical, a retribution more just, and events more novel and surprising, than belong to true history, "poesy

serveth and conferreth to magnanimity, morality, and delectation."

This *ideal* character of poetry, which is singled out by the great natural philosopher as its proper "note," is also a favorite theme with his famous contemporary Sir Philip Sidney in his "Apology for Poetry." "Nature never set forth the earth in so rich tapestry as divers poets have done, neither with pleasant rivers, fruitful trees, sweet-smelling flowers, nor whatsoever else may make the too-much-loved earth more lovely. Her world is brazen; the poets only deliver a golden!" exclaims the courtly and eloquent pleader, half-jesting at his own enthusiasm on behalf of his "unelected vocation." Yet while he thus presses the claim of the poet to the name given to him in Greece and England of a *maker* or inventor, Sidney does not forget the necessity of that foundation of truth upon which fancy is to raise her airy structures. He cites with approval Aristotle's definition of poetry as an "art of imitation," though "the right poets," he says, imitate nothing that is, or was, or shall be, but "that unspeakable and everlasting beauty which is only to be seen with the eyes of the mind."

The harmony of these two opposite yet mutually indispensable principles, imitation and invention, the real and the ideal, is that which constitutes a work of art; and it is the end and aim of the supernatural element in Shakespeare.

Supernatural agencies,* that is to say, intelligent and rational beings who are either not human, or, if human, are conceived as existing under conditions which are not those of our natural life, appear in four of the plays of Shakespeare — plays which are generally held to display the full perfection of his genius — the comedies of "A Midsummer Night's Dream" and "The Tempest," and the tragedies of "Hamlet" and "Macbeth." It becomes, therefore, a matter of some interest to discuss the significance of this feature which they possess in common, and to ascertain the poetic end which it may serve. If the explanation already hazarded be correct, it will not be difficult to show that this introduction of the supernatural, whether in the form of the fairies of "A Midsummer Night's Dream," the witches and demons of "Macbeth," the ghost in "Hamlet," or the airy spirit and half-human monster of the "Tempest," has the twofold effect of *adding a new element of reality to the work, while at the same time it heightens its ideal character.*

* The ghost in "Julius Cæsar," and the dream-apparitions in "Richard III.," are not introduced as characters of the drama, nor have they any positive influence over its action.

In the first place, *it adds to its reality.* Poetic truth is subjective, not objective; and these fictions, however they may be glorified by a poet's fancy, are founded on fact — a fact all-important in art, though not in science — the fact of *being believed.* No one can write a fairy-tale now, because no one believes in the fairies, consequently a modern fairy-tale is either a veiled satire, a scientific lecture in disguise, or a moral allegory, where we cannot settle down comfortably with a good old-fashioned dragon or enchanter without finding that he "means" some depressing abstraction in *ism* or *ation*, or some equally dreary principle in chemistry or mechanics. To be entrapped into learning when we expected amusement is a thing to be resented by every well-regulated mind; and most readers of the elder generation can remember the disappointment of their youthful days occasioned by a certain tale of magic in Madame de Genlis' "*Veillées du Château*," in which all the delightful marvels turn out in the end to be "facts explainable by natural causes!"

But the fairies were still believed in by the simple country folks in the days of Shakespeare, as they were forty years afterwards in the days of Milton, when it was one of the amusements of a village festival to tell at summer eve "how Fairy Mab the junkets eat" — as they were, up to the close of the last century, in Devonshire, where a shady cavern is still shown on the wooded bank of the River Otter, dedicated, under the name of the Pixies' Parlor, to those

> Whom the untaught shepherds call
> Pixies in their madrigal.

The word *fairy* is derived through Italian and French from the Latin *fata*, the fates or goddesses of destiny — Clotho, who spins the thread of life; Atropos, who cuts it; and Lachesis or Fortune, who disposes of human lots. These awful personages bear but little resemblance to Oberon and Titania with their jocund train, which is not really surprising; for the fairies of rustic England, though bearing a classic name, are the direct descendants of the elves of Teutonic and Scandinavian mythology, a race of beings inhabiting the woods and meadows, of diminutive stature, but formidable powers, sometimes hostile and sometimes friendly to man. This belief was brought over to our island by the Saxon and Danish invaders as a

part of their religion, and continued after their conversion to flourish as a popular tradition, side by side with the creed of Christendom, unreconciled and uncontradicted.

The idea of Ariel in "The Tempest" will best be understood by a reference to the elemental spirits or intelligences presiding over the realms of earth, air, water, and fire, whose existence and attributes formed a favorite speculation with Greek philosophers and mediæval sages. Milton's "Penseroso," when in his midnight studies he unspheres the spirit of Plato, reads, —

> Of those demons that are found
> In fire, air, flood, or under ground;
> Whose power hath a true consent
> With planet or with element.

The Ariel of Shakespeare, however, is never a mere impersonation of the powers of nature; for as, on the one hand, he rises in the service of man into the higher character of a minister of destiny, so, on the other, he descends, when his task is ended, into the familiar fairy of our northern folklore, who lurks in the cowslip and flies on the bat's back

> After sunset, merrily.

An extreme credulity and curiosity about extraordinary sights and strange physical phenomena has often been noticed as a foible of the English people. This disposition, which was naturally much increased by the wonderful geographical discoveries of the fifteenth and sixteenth centuries, is good-humoredly satirized by Shakespeare in "The Tempest," a play produced during a season of public excitement occasioned by the shipwreck of Sir George Somers in 1609 on the stormy and desolate coast of Bermuda, "the still-vext Bermoothes." "Were I in England now, as once I was, and had but this fish painted," says Stephano the Neapolitan, when he finds Caliban on the seashore, "not a holiday fool there but would give a piece of silver; when they will not give a doit to relieve a lame beggar, they will lay out ten to see a dead Indian."

Ignorant wonder, or the habit of caring for things not because they are beautiful or because they are useful, but because they are odd, has ever seemed a mark of barbarism to men of an artistic race. Ben Jonson, though full of admiration for the "Sweet Swan of Avon," could not resist a sly hit at his brother playwright for what he was pleased to consider his encouragement of a foolish taste. "If there be never a *servant-monster* in the fair, who can help it?" he asks in the introduction to "Bartholomew Fair." The author of "The Tempest," had he cared to defend his invention, might have answered in the words of the philosophical prince of Denmark, that such representations, whatever else might be thought of them, were certainly not "from the purpose of playing, which is to show virtue her own feature, scorn his own image, and the very age and body of the time his form and pressure."

Those portentous figures which meet us in the tragedies of "Hamlet" and "Macbeth," and cast their lurid light over the scene, wear an aspect, in some points, more like a grave reality. Sorcery and divination — unhallowed communications with the unseen world — the return of the spirits of the dead to the abodes of the living, with messages of warning or revenge, — these are ideas not national and local, but human and universal, deriving their authority, if not their origin, from the fact of conscience, the faith in immortality, and the conviction of a judgment to come. Perverted as they are in their developments, and pernicious in their effects, these superstitions, and the tales connected with them, do yet come "in such a questionable shape," that many even nowadays would rather speak of them as unproved and unprovable, than as groundless and false. Be that as it may, it will be sufficient to point out that the nearer approach (though but apparent) which they make to the character of authentic history, is well suited to the dignity of the tragic muse. And thus it has been shown that the marvellous incidents and mysterious beings (whether light and joyous or sombre and terrible) introduced into the Shakespearian drama, are in strict accordance with the realistic principle or principle of imitation, since they are *imitations of superstitious narratives sometime received as true.*

In the second place, *the supernatural element in the plays of Shakespeare heightens their ideal charaeter.* The idea of "A Midsummer Night's Dream" is mutability, the changeableness and unstable character of human hopes, feelings, and desires. In Demetrius we have the portrait of an inconstant man, and one which is none the less true and natural because the figure is placed in remote scenery and in a mythical age. Betrothed with the consent of her friends to "old Nedar's daughter Helena," he secretly wearies of her submissive and confiding affection; his course

Digitized by CORNELL UNIVERSITY

of love is running *too* smooth, and his restless temperament requires the stimulus of opposition and the excitement of a chase. While thus ready for change, his fancy is caught by the more brilliant beauty and livelier manners of Hermia, Helena's school friend and companion, who, however, is attached to the young Lysander, and receives his addresses with indifference, if not with disdain. Undeterred by this repulse, Demetrius seeks opportunities of ingratiating himself with Egeus, Hermia's imperious and hot-tempered father, who favors the suit of the more politic (and perhaps more wealthy) admirer, and endeavors to force his daughter into an unwelcome alliance.

This is the state of affairs at the opening of the play. May we venture for a moment to fancy the story finished as if it were a novel of the nineteenth century, instead of a romantic drama of the sixteenth, and something in this fashion?

The pair of true lovers, Lysander and Hermia, finding that matters have reached a desperate crisis, resolve to seek their happiness in flight and a stolen marriage. Hermia confides the project to her friend, who, blinded by an idolizing affection which no unkindness can destroy, betrays the secret to her former lover. Demetrius is about to take measures to hinder the success of the scheme, but at this juncture a fresh complication occurs. A youthful wooer is suddenly seen in the train of the desponding and forsaken Helena, who declares himself forever hers, and whose tender declarations might well tempt her to forget her old love. Demetrius hears of it, of course, with strange new sensations of surprise, displeasure, and alarm. Jealousy awakens a love which was not dead, but sleeping, and is unconsciously aided by that deference to public opinion which leads most men to think more highly of the merits that are esteemed by others. Casting his recent fancy to the winds, he seeks, somewhat too boldly, to resume his old allegiance, but is received at first with becoming coolness and distrust. His probation, however, does not last long, for the gentle and generous Helena is only too ready to forgive his error, and to believe him when he tells her that his love to Hermia —

> Melted as doth the snow, seems to him now
> As the remembrance of an idle gawd
> Which in his childhood he did dote upon;
> And all the faith and virtue of his heart,
> The object and the pleasure of his eye,
> Is only Helena.

Now it will, of course, be obvious, that this is, after all, no imaginary conclusion, but contains the very incidents of that portion of the play that concerns the loves of Demetrius and Helena, only under a prosaic disguise. The sudden revival of his early affection in the fickle heart of Demetrius, following hard upon the appearance of a rival, and treated as "mockery" by the indignant maid, are alike in both versions; here are the palpable facts, the solid foundation of truth and nature, without which no tale of human life (even though it be a fairy-tale) can command our interest and attention.

But let us see how this plain looking-glass of prose, in which we view the goings on of the workaday world, changes in the poet's hand into an enchanted mirror, where the single object is reflected, with many a dazzling gleam of mirthful fancy, with many a bewildering yet delightful repetition.

Shakespeare transports his lovers into "fairyland;" where the ebb and flow of youthful feeling (which on our dull earth would need weeks, or at least days, to develop) can run its fleeting course in a midsummer night, the shortest of the year; and where the new influences by which the characters are moved and affected, instead of being separate and unconnected, as they would be in real life, are all interwoven in mutual reaction, so as to increase the comic perplexities of the scene. Thus the fairy machinery serves to the "delectation" of the spectator, by giving rise to a "more absolute variety" than would be attainable without it; for he sees even the faithful Lysander compelled by the witchery of the charmed flower to exhibit a fantastic repetition of Demetrius's wilful inconstancy, and play the part of lover to Helena; while the fascinating Hermia is for a while deserted by both her swains for the sake of the once solitary Helen. The confusion and delusion spread even among the higher powers of the magic realm! The fairy king, who aspired to act as a mimic providence over the affairs of mortals, finds that he has only succeeded in setting things wrong that were right enough before. The fairy queen, whom we are to imagine as the very flower of grace and loveliness, the sparkling embodiment of wit and wisdom, astonishes her loyal subjects by a vagary which is of course quite unheard of out of fairyland, — Titania falls in love with an ass!

This arch spirit of satire, which animates the poetic imagery of "A Midsum-

mer Night's Dream," is not, however, its most prominent characteristic. The rod in the poet's hand is so wreathed in flowers, that its stroke cannot be very formidable; and should any more sensitive members of the audience suspect that their faults or follies have been laughingly hinted at, there is an apt and ample apology to be offered by Robin Goodfellow at the close, —

> If we shadows have offended,
> Think but this (and all is mended),
> That you have but slumbered here
> While these visions did appear;
> And this weak and idle theme,
> No more yielding but a dream.
> Gentles, do not reprehend;
> If you pardon, we will mend.

In "The Tempest," on the other hand, which is composed in a more serious mood than "A Midsummer Night's Dream," the moral element is conspicuous. The idea of "The Tempest" is retribution, an outward and visible correspondence between the law and the sentence, "that writing on the wall" which, as Bacon finely says, "is often so obscure as to be scarce legible even to those that behold it from the sanctuary, but sometimes is written in such text and capital letters that he that runs may read it." This more exact apportionment of temporal rewards and punishments, which we call poetic justice, is the proper theme of comedy. Tragedy, taking a deeper and truer view of the destiny of man, can bear without dismay, though not without sorrow —

> To see wretchedness o'ercharged,
> And duty in his service perishing.

The fairies of "A Midsummer Night's Dream" are merely traditional; we are interested in them for the sake of the poor foolish mortals whom they help or hinder, but in themselves they are light and unsubstantial, "as the gay motes that people the sunbeam."

It is otherwise with the supernatural or preternatural characters of "The Tempest" (a work produced sixteen years later, in Shakespeare's most intellectual period), which bear traces of moral and philosophical speculation that will repay an attentive scrutiny.

Man, it has been said, is a microcosm, a little world, whose features have their counterparts in the macrocosmos or great world of nature. Ariel, the spirit of the air, symbolizes whatever in nature is musical and etherial, forceful and vivid, the wave, the breeze, and the flame. Caliban typifies that which, both in nature and in man, is the sluggish and the deathly, the foul and the fierce, the creeping miasma, the poisonous reptile, as well as that worser half of human nature which, if looked at alone, without the "better things that accompany salvation," has turned thoughtful minds in every age into self-haters or man-haters, ascetics or misanthropists. These evil qualities have been held up to our abhorrence by Swift in his detestable Yahoo. But Swift's bitter invective provokes an indignant protest on behalf of the humanity which he traduced, while Shakespeare, by showing their hateful likeness in a creature possessed of speech and understanding, yet in other respects more than half beast, conveys more effectively the solemn warning —

> To let the *man* be more and more,
> And let the ape and tiger die.

To what does the "delicate spirit" Ariel correspond in the intellectual world of man? We answer, to the "shaping spirit of imagination," which is in itself neither good nor evil, and which claims, as the prime necessity of its being, the *right to be free as air*. But when yielding, though half-reluctant, to the dominion of the will of man, like Ariel submitting to the control of Prospero, it does him worthy service. As the minister of reason, armed with the wand of experiment and the magic book of science, it leads the way to that knowledge which is power — power to employ the forces of nature through a knowledge of her laws. As minister of the conscience and the affections, this mysterious faculty plays a part which, though outwardly less friendly, is not really less useful to man.

The terrors of imagination resemble those of adversity —

> Whose iron scourge and torturing hour
> The bad affright, afflict the best.

Ferdinand, the type of knightly honor, *sans peur et sans reproche*, is "afflicted" by the mysterious and dirge-like music that greets him in the lonely isle.

"This ditty does remember my drowned father!" he mournfully exclaims, while imagination deludes him with sounds that are but the echo of his own apprehensions. We know, however, that the "torturing hour" of fancied sorrow will soon be past, and that the invisible singer is really his guide into the presence of love and joy.

But the "men of sin," the tyrant, the usurper, and the conspirator, whom Providence has brought across the seas to meet

their doom, to them imagination comes in the awful form of an avenger.

"I have made you mad," says the stern angel of destiny to the guilty three. And when, in impotent rage, they draw their swords, he addresses them in a tone of lofty scorn, not unmingled with pity: —

You fools! I and my fellows
Are ministers of fate: the elements,
Of whom your swords are tempered, may as well
Wound the loud winds, or with bemocked-at stabs
Kill the still-closing waters, as diminish
One dowle that's in my plume: my fellow ministers
Are like invulnerable. If you could hurt,
Your swords are now too massy for your strengths,
And will not be uplifted. But remember,
(For that's my business to you) that you three
From Milan did supplant good Prospero;
Exposed unto the sea (which hath requit it)
Him and his innocent child; for which foul deed
The powers, delaying, not forgetting, have
Incensed the seas and shores, yea, all the creatures,
Against your peace. Thee, of thy son, Alonso,
They have bereft; and do pronounce, by me,
Lingering perdition (worse than any death
Can be at once) shall step by step attend
You and your ways; whose wraths to guard you from
(Which here, in this most desolate isle, else falls
Upon your heads) is nothing but heart's sorrow
And a clear life ensuing.

The threats and promises are alike to all, but of this "heart's sorrow," which is required as the condition of pardon, only one proves capable.

O it is monstrous!

cried the unhappy king.

Methought the billows spoke and told me of it;
The winds did sing it to me; and the thunder,
That deep and dreadful organ-pipe, pronounced
The name of Prosper: it did bass my trespass.
Therefore my son i' the ooze is bedded.

Nature and grief alike bring the saving knowledge of truth to one who, though deeply stained with crime, is yet a living soul. No such hope of repentance is possible to the wicked Antonio and the weak Sebastian, who treat the merciful warning of destiny as the challenge of "a fiend," to be accepted with the valor of a suicide.

It seems almost presumptuous to attempt thus peremptorily to define the end and aim of works like "Macbeth" and "Hamlet," works of manifold and complicated interest, which have long engaged the attention of the most acute and profound thinkers. Without venturing to point a moral where the poet may have left it intentionally obscure, we cannot surely do amiss to consider, in the first place, what is the main impression left on our minds by the play as a whole, and then to inquire whether that impression corresponds with the thought that recurs most frequently and emphatically in the speeches of the principal character.

To be weak is miserable,
Doing or suffering,

says the fallen cherub in "Paradise Lost." The sense of being "overcharged," bound to carry a weight too heavy for us, called by duty to a task for which we feel ourselves unfit, this is what fills many an outwardly prosperous existence with silent and unsuspected misery. And this fact of human life rests upon a truth in human nature, a truth expressed with French point and neatness in the well-known line —

Le ciel nous vend toujours les biens qu'il nous prodigue.

Great gifts are sold, not given; the excess in one direction is balanced by a corresponding deficiency in another. More especially does this law hold good of the opposite poles of the intellect and the will. The practical and speculative faculties are unequally yoked together in most persons; and this inevitable disproportion leads to many an inconsistency, which would be more mercifully judged were its cause perceived more clearly. *Knowing* a thing is very different from *doing* it. Critics of poetry are seldom good poets; moralists are not always virtuous, nor are theologians always devout.

The legendary Hamlet of Saxo Grammaticus, whose father's brother succeeds to the throne of Denmark under the suspicious circumstances of the king in Shakespeare, learns through some *ordinary* channel of information that there has been foul play in the matter. He escapes to England, returns with an English army at his back, slays his uncle, makes an oration to the Danes, and is elected king. This is precisely the course adopted by the young Prince Malcolm in Macbeth after the murder of Duncan; and it is plain that these or similar incidents would afford materials for a spirited drama. But it

would be literally "the play of 'Hamlet' with the part of Hamlet left out."

There is another thing left out in the chronicle which we find in the tragedy — *the spirit of the royal Dane.* What can we imagine more likely to prolong the agony of indecision, to paralyze the will, and render the act of righteous vengeance (which is to Hamlet both an acknowledged duty and a passionate desire) well-nigh impossible, than this which actually happens to him,— his receiving the dark secret through an experience which, while deeply agitating to the feelings, is inconceivable to the reason, and which therefore only raises "obstinate questioning" to which it supplies no answer? —

That undiscovered country, from whose bourne
No traveller returns.

Could Hamlet ever for an instant have *forgotten* that form "so majestical," that haunted the platform of Elsinore? When he spoke these words, it was not in forgetfulness, but in doubt. Thus conscience (or consciousness, as the word meant then) does make cowards of us all —

And thus the native hue of resolution
Is sicklied o'er with the pale cast of thought,
And enterprises of great pith and moment,
With this regard, their currents turn aside,
And lose the name of action.

According to one theory, though not the latest, "Macbeth" and "The Tempest" were written within a few months of each other, in the spring and autumn of the year 1610; and, if that be true, it may possibly account for a certain resemblance between the two, though it is but the resemblance of a landscape seen under the gleam and showers of a breezy April morning to a similar scene amidst the alternate gloom and glare of a thunder-storm.

The force of imagination is alike conspicuous in the comedy and in the tragedy. But in the former it is a beneficent genius, bringing transgressors to repentance by salutary terrors, and charming the young and innocent with "masque and antique pageantry," where Juno and Ceres are seen conferring blessings of the heaven above and the earth beneath upon the happy bridal pair. In the latter, imagination, in bondage to an evil power, is the tempter who entices man to sin, and the fury who avenges it.

The tragedy of "Macbeth" is no mere tale of guilty ambition, or picture of the torments of remorse; these things form indeed the material substance of the play, but they are not its most characteristic feature.

And be these juggling fiends no more believed,
That palter with us in a double sense,
That keep the word of promise to our ear,
And break it to our hope.

This is the lesson which Macbeth himself teaches us as the moral of his fall; and it is a warning against that perversion of the imaginative part of our nature which is the very essence of superstition.

The abuse of imagination in religion is idolatry or image-worship, the craving to represent that which eye hath not seen under images derived from the senses — a craving which was obeyed without misgiving in heathen worship, and which led directly, by an obvious connection of cause and effect, to the most frightful moral corruption. And closely akin to idolatry was "the sin of witchcraft," in its outward form a delusion, but in its inward principle an evidence of spiritual infidelity.

"Seek ye unto them that have familiar spirits, unto wizards that peep and that mutter? Should not a people seek unto their God?" So spake Isaiah of old to backsliding Judah. It is this longing to lift the veil of futurity, to walk by sight and not by faith — that faith which means trust in a Creator's wisdom and a Father's love — which led God's chosen people to forsake their Redeemer for the dark spells of the heathen around them. And it was this same temptation that beset the victorious Scottish general on the lonely heath of Forres.

"When shall we three meet again?" Who are these three, "so withered and so wild in their attire," "like creatures of an elder world"? No mere mortals, we know, though they wear the garb and speak the language of the witches of popular superstition, and that with such accuracy of imitation, that much of the strange dialogue cannot be understood without an acquaintance with the mediæval notions about witchcraft. These are the weird sisters, the fates or goddesses of destiny, answering to the three divisions of time, the past, the present, and the future.

All hail, Macbeth! hail to thee, thane of Glamis!
All hail, Macbeth! hail to thee, thane of Cawdor!
All hail, Macbeth! that shalt be king hereafter.

The virtuous Banquo has his prophetic message as well as the brave Macbeth.

Mac. *Your* children shall be kings!
Ban. *You* shall be king!

the two men exclaim to each other in equal

wonderment. But the knowledge of the "hereafter," dropped like an evil seed by the hand of fate, lies dormant and therefore harmless in the memory of the upright Banquo. He does not suffer it to possess his imagination and harden his heart.

Both these results are attained with fearful rapidity when the evil seed falls in a congenial soil. How quickly does the high-souled warrior sink, under temptation, into the midnight murderer, the bloodthirsty tyrant, and the treacherous friend!

And now as he wades deeper and deeper in blood, and sees the shades of the prison-house closing around his soul, he seeks the weird sisters in their dark cavern, to gain more of that knowledge which has been his bane.

More shall they speak, for I am bent to know,
By the worst means, the worst.

To see, to hear, with his own eyes and ears, and thus, "to be satisfied," this is his demand, and it is granted. The infernal powers, whom he has served so well, permit him, in answer to his imperious entreaty, to see what he cannot perceive, and to hear what he cannot understand.

He sees the apparitions of an "armed head" (as of one slain in battle), of a "bloody child," of a "child crowned, with a tree in his hand." And he knows not that these strange visions, which hover over the cauldron in the witches' cavern, are the three actors in the final scene of his own history — Macbeth the usurper, Macduff the avenger, and Malcolm the king.

He hears mysterious "bodements," which lead him in blind and frantic confidence to

Spurn fate, scorn death, and bear
His hopes 'bove wisdom, grace, and fear;

till, in his dying day, he learns too late that these are but the equivocation of the fiend "that lies like truth."

Thus the supernatural element interprets the idea of tragedy, by rendering it "greater and more heroical," and enabling the poet to display the form of humanity on a grander scale, surrounded by an "ampler ether, a diviner air." In comedy of the more serious type, which appeals to the moral sense, it aids in a "retribution more exact;" while it enhances the charm of purely romantic fiction by imparting to it, in a higher degree, the incidents of chance and change. And thus it subserves the main purpose and end of poesy, by "conferring to magnanimity, morality, and delectation."

From The Spectator.

MR. RUSKIN'S UNIQUE DOGMATISM.

As we have often had occasion, if not exactly to remark, yet to imply, in what we have said of him, Mr. Ruskin is a very curious study. For simplicity, quaintness, and candor, his confidences to "the workmen and laborers of Great Britain" in "*Fors Clavigera*" are quite without example. For delicate irony of style, when he gets a subject that he fully understands, and intends to expose the ignorance, or what is much worse, the affectation of knowledge which is not knowledge, of others, no man is his equal. But then as curious as anything else, in that strange medley of sparkling jewels, delicate spider-webs, and tangles of exquisite fronds which make up Mr. Ruskin's mind, is the high-handed arrogance which is so strangely blended with his imperious modesty, and that, too, often when it is most grotesque. It is not, indeed, his arrogance, but his modest self-knowledge which speaks when he says in this new number of the "*Fors*," that though there are thousands of men in England able to conduct the business affairs of his society better than he can, "I do not believe there is another man in England able to organize our elementary lessons in natural history and art. And I am therefore wholly occupied in examining the growth of *Anagallis tenella*, and completing some notes on St. George's Chapel at Venice." And so no doubt he is quite right. Probably no one could watch the growth of *Anagallis tenella* to equal purpose, and no one else could complete his notes on St. George's Chapel without spoiling them. We are equally sure that he is wise, when he tells his readers that he must entirely decline any manner of political action which might hinder him "from drawing leaves and flowers." But what does astonish us is the supreme confidence,— or say, rather, hurricane of dictatorial passion,— though we do not use the word "passion" in the sense of anger or irritation, but in the higher sense of mental white-heat, which has no vexation in it,— with which this humble student of leaves and flowers, of the *Anagallis tenella* and the beauties of St. George's Chapel at Venice, passes judgment on the whole structure of human society, from its earliest to its latest convolutions, and not only judgment, but the sweeping judgment of one who knows all its laws of structure and all its misshapen growths with a sort of assurance which Mr. Ruskin would cer-

tainly never feel in relation to the true form or the distortions of the true form of the most minute fibre of one of his favorite leaves or flowers. Curiously enough, the humble learner of nature speaking through plants and trees, is the most absolute scorner of nature speaking through the organization of great societies and centuries of social experience. We know well what Mr. Ruskin would say,—that the difference is great between the growth that is without moral freedom, and the growth which has been for century after century distorted by the reckless abuse of moral freedom. And we quite admit the radical difference. But what strikes us as so strange is that this central difficulty of all,—how much is really due to the structural growth of a great society, and quite independent of any voluntary abuse which might be amended by voluntary effort, and how much is due to the false direction of individual wills, never strikes Mr. Ruskin as a difficulty at all. On the contrary, he generalizes in his sweeping way on social tendencies which appear to be far more deeply ingrained in the very structure of human life than the veins of a leaf in the structure of a plant, with a confidence with which he would never for a moment dream of generalizing as to the true and normal growth of a favorite plant. Thus he tells us in the last number of "*Fors*" that "'*Fors Clavigera*' is not in any way intended as counsel adapted to the present state of the public mind, but it is the assertor of the code of eternal laws which the public mind *must* eventually submit itself to, or die; and I have really no more to do with the manners, customs, feelings, or modified conditions of piety in the modern England, which I have to warn of the accelerated approach either of revolution or destruction, than poor Jonah had with the qualifying amiabilities which might have been found in the Nineveh whose overthrow he was ordered to foretell in forty days." But the curious part of the matter is that Mr. Ruskin, far from keeping to simple moral laws, denounces in the most vehement manner social arrangements which seem to most men as little connected with them, as they would have seemed to "poor Jonah." We are not aware, for instance, that Jonah denounced the use of machinery in Nineveh. Indeed, he seems to have availed himself of a ship, which is a great complication of machines, and to have "paid his fare" from Joppa to Tyre, without supposing himself to have been accessory to anything evil in so doing. We are not aware, too, that Jonah held it to be wrong, as Mr. Ruskin holds it to be wrong, to charge for the use of a thing when you do not want to part with it altogether. These are practices which are so essentially interwoven alike with the most fundamental, as also with the most superficial principles of social growth, that any one who assumes that they are rooted in moral evil is bound to be very careful to discriminate where the evil begins, and show that it can be avoided,—just as a naturalist who should reproach the trees on a hillside for sloping away from the blast they have to meet, should certainly first ask himself how the trees are to avoid the blast, or how, if they cannot avoid it, they are to help so altering their growth as to accommodate themselves to it. But Mr. Ruskin, though in relation to nature he is a true naturalist, in relation to human nature has in him nothing at all of the human naturalist. It never occurs to him, apparently, that here, too, are innumerable principles of growth which are quite independent of the will of man, and that it becomes the highest moralist to study humbly where the influence of the human will begins and where it ends, instead of rashly and sweepingly condemning, as due to a perverted morality, what is in innumerable cases a mere inevitable result of social structure.

Consider only how curiously different in spirit is the humility with which the great student of the laws of beauty watches the growth of the *Anagallis tenella* and that with which he watches the growth of the formation of human opinion. A correspondent had objected to him that he speaks so contemptuously of some of the most trusted leaders of English workmen, of Goldwin Smith, for instance, and of John Stuart Mill. Disciples of such leaders, the writer had said, "are hurt and made angry, when names which they do not like are used of their leaders." Mr. Ruskin's reply is quite a study in its way:—

Well, my dear sir, I solemnly believe that the less they like it, the better my work has been done. For you will find, if you think deeply of it, that the chief of all the curses of this unhappy age is the universal gabble of its fools, and of the flocks that follow them, rendering the quiet voices of the wise men of all past time inaudible. This is, first, the result of the invention of printing, and of the easy power and extreme pleasure to vain persons of seeing themselves in print. When it took a twelvemonth's hard work to make a single volume legible, men considered a little the difference between one book and another; but now, when not only anybody can get them-

selves made legible through any quantity of volumes, in a week, but the doing so becomes a means of living to them, and they can fill their stomachs with the foolish foam of their lips, the universal pestilence of falsehood fills the mind of the world as cicadas do olive-leaves, and the first necessity for our mental government is to extricate, from among the insectile noise, the few books and words that are divine. And this has been my main work from my youth up, — not caring to speak my own words, but to discern, whether in painting or scripture, what is eternally good and vital, and to strike away from it pitilessly what is worthless and venomous. So that now, being old, and thoroughly practised in this trade, I know either of a picture, a book, or a speech quite securely whether it is good or not, as a cheesemonger knows cheese; and I have not the least mind to try to make wise men out of fools, or silk purses out of sows' ears; but my one swift business is to brand them of base quality, and get them out of the way, and I do not care a cobweb's weight whether I hurt the followers of these men or not, — totally ignoring them, and caring only to get the facts concerning the men themselves fairly and roundly stated, for the people whom I have real power to teach. And for qualification of statement, there is neither time nor need. Of course there are few writers capable of obtaining any public attention who have not some day or other said something rational; and many of the foolishest of them are the amiablest, and have all sorts of minor qualities of a most recommendable character, — propriety of diction, suavity of temper, benevolence of disposition, wide acquaintance with literature, and what not. But the one thing I have to assert concerning them is that they are men of eternally worthless intellectual quality, who never ought to have spoken a word in this world, or to have been heard in it, out of their family circles; and whose books are merely so much floating fog-bank, which the first breath of sound public health and sense will blow back into its native ditches forever.

Now observe that here Mr. Ruskin, who would follow the lines of a gossamer-thread sparkling in the morning dew with reverent wonder and conscientious accuracy, arraigns, first the tendency of man to express immature and tentative views of passing events, as if that were wholly due, not to a law of human nature, but to those voluntary abuses of human freedom which might as effectually be arrested as murder or theft could be arrested by moral effort; next arraigns, if not the discovery of the printing-press (of which any one would suppose that he entertained a stern disapprobation), at least the inevitable results of that discovery, precisely as he would arraign a general prevalence of positive vice; and last of all, that he actually claims the power, as an old *littérateur*, to discern at sight "what is eternally good and vital, and to strike away from it pitilessly what is worthless and venomous." On the first two heads, as it seems to us, Mr. Ruskin arraigns laws of nature as practically unchangeable as any by which the sap rises in the tree and the blossom forms upon the flower. On the last head, he assumes a tremendous power in relation to subjects very far removed from those which he has made his own, and one indefinitely greater, of course, than any which he would dream of assuming in relation to the subjects which he had made his own, for on the latter he would know far better the strict limitations of his own insight. The man who humbly follows nature on the small scale, violently reprimands and inveighs against her on the large scale, without waiting for a moment to inquire whether he is right in supposing that all he objects to is a mere product of crime and sin, or rather of the very tissue of social growth, whether at its lowest or its highest level. What a singular paradox is this,— that the same man should sit at God's feet while he is busy with the leaf and the insect, and then storm at his most absolute laws, when he is making the great city, the brain of the nineteenth century, and the mechanism of human civilization; that the same man should be so humble and modest in dealing with the subjects he knows intimately, and so peremptory and rash in dealing with the great mass of subjects of which he knows little! We will admit that so far as our knowledge goes, the majority of books, journals, printed papers, etc., are of trivial value, and that their number has in some respects very injurious effects. But the same thing exactly is true of the majority of other results of human labor. And we should certainly question profoundly Mr. Ruskin's power to discriminate good from bad amongst books, as much as we should his power to discriminate the good from the bad amongst the results of the work of the "laboring poor," whom, for some mysterious reason, he calls "the producers of *all* wealth." Yet what Mr. Ruskin vituperates so roundly in the nature of human society is not any equivalent for the manly human reticence, and wisdom, and thoughtful, silent obediences of past ages, but rather an equivalent — if history may be trusted — for vacancy of mind, for the riot of the senses, for cares much ignobler, and selfishness much more rampant and energetic, than any even which we now

have to complain of. The fatiguing abundance of shallow noise of which Mr. Ruskin complains has not really drowned the voices of the wise of old, but rather the still more unmeaning chatter of the ignorant of old. With fewer books men did not appreciate what they had better, but less. Most of our books may be eternally worthless, but at least we learn, either from them, or in spite of them, to appreciate those which are "eternally" worthy, more than they were ever appreciated before.

In truth, though Mr. Ruskin can note and admire the strange alchemy by which the earth transforms vulgar particles of flint and dust and moisture into the beauty of the stalk and leaf and blossom, he has no eyes for the similar process by which she transforms the vulgar interests of the millions of yesterday into the somewhat less vulgar interests of the millions of to-day, and by which these, again, will be sifted, till they would, perhaps a few thousand years hence, satisfy the relatively crude taste of the Mr. Ruskin of a past which would then be so far behind it as that of our own generation. How is it that the thoughtful and modest naturalist, studying laws in the minutest lines and colors of the actual world, ceases altogether to be modest, though not perhaps to be thoughtful, when he is watching the laws of evolution of the moral world? We cannot explain it, but this we can say, — that Mr. Ruskin wastes an immense proportion of his fine moral gifts in this childish invective against principles which are quite as deeply ingrained in the providential rule of the social universe, as is the principle of harmony in the development of the leaf, the principle of grandeur in the uprearing of the mountains, or the principles of simplicity, candor, and moral arrogance in the character of Mr. Ruskin himself.

From Chambers' Journal.

LOST IN MAGELLAN'S STRAITS.

ONE might look all the world over without finding a coast more bleak, desolate, and inhospitable than that of Tierra del Fuego and the southern part of Patagonia. Owing to certain meteorological causes, the cold is comparatively greater in the southern than in the northern latitudes; icebergs are found ten degrees nearer to the equator. In the Straits of Magellan, which are about the same distance from the equator as central England, the cold in winter is so intense as to be almost unbearable. Here icebergs are found floating, and glaciers larger in extent than any Switzerland can boast of; the land is entirely covered with snow down to the very water's edge, while bitter piercing winds rush down the clefts in the mountains, carrying everything before them, and even tearing up huge trees in their passage. Not a pleasant coast this on which to be cast away; and yet such, in 1867, was the fate of two unfortunate men who formed part of the crew of her Majesty's ship "Chanticleer," then on the Pacific station; and an account of whose sufferings we propose to lay before our readers.

One day early in September a sailing-party had been sent off with the hope of increasing the ship's stock of provisions by the addition of fresh fish, which is here very abundant. The nets soon became so heavy that extra hands were required to haul them; and as there appeared even then little chance of the work being over before sunset, the fishing-party obtained permission to spend the night on shore. Tents were pitched, huge fires were lighted, with the double object of affording warmth and cooking some of the produce of their successful expedition; blankets were distributed, grog was served out, and altogether the party seemed prepared to defy the cold, showing a disposition to be "jolly" in spite of it that would have gladdened the soul of the immortal Mark Tapley. However, after all these preparations to keep off the effects of the biting frost, they were compelled about nine o'clock in the evening to send off to the ship for more blankets and provisions.

Two sailors, Henty and Riddles, volunteered to go on this errand in the "dingy" (a small two-oared boat), and having obtained the desired things, they started to return; but when about midway between the ship and the shore, the wind began to rise, carrying the boat to some extent out of her course; shortly after which she struck on a sandbank, and in trying to get her off one of the oars was lost. Soon they were drifted out into the strong current. It was now dark as pitch; the wind continued to rise; and although all through the night they made every possible effort to reach the shore, when morning dawned to their alarm they found themselves miles away from the ship, and powerless to contend any longer with their one oar against the force of both wind and tide. They were finally driven on to the

beach in a bay opposite Port Famine, a spot not less dreary than its name.

The sea was so rough, that here for a day and a night our two men were obliged to remain; and when on the second day they ventured to launch the boat, it was upset; nearly all their things were lost, and they were left to endure the intense cold without the means of making a fire, with no clothes but those they wore, and scarcely any food. For a while they walked about, trying, not very successfully, to keep up circulation; and by-and-by the feet of both began to swell and grow so painful that it was no longer possible to keep on their shoes. Still, although suffering both from hunger and cold (Henty's toes being already frostbitten), they kept up their spirits in true British fashion, not for a minute doubting that sooner or later they would be picked up; and true enough, on the fourth day the "Chanticleer" was seen in the distance under weigh, and standing over towards them. Taking the most prominent position that could be found, they made signs and tried in every possible way to attract attention, but in vain. If they had only possessed some means of kindling a fire they might have succeeded; but although those on board were at the moment on the lookout for their lost messmates, no one saw them; and the hope with which the two poor fellows had buoyed themselves up faded away as the ship changed her course, grew smaller and smaller, and by-and-by, late in the afternoon, while they still watched, altogether disappeared.

Although now their only chance of rescue was apparently gone, and the last scrap of food was consumed, yet the brave fellows did not despair. Their boat was very leaky; but on the 5th of September, having repaired her as far as possible, they took advantage of finer weather to endeavor to reach some spot where there would be more probability of getting rescued by a passing ship; but they had scarcely got half-way across the straits before there was a terrific snow-storm; it blew a gale; the boat began to fill rapidly; and finally they were blown back again into the bay, upset in the surf and nearly drowned, being unable to swim through having lost the use of their legs from sitting so long in water. However, they were thrown up by the waves high, though by no means dry, and in this miserable plight and under a pitiless snow-storm, they were forced to remain all through the night. The next day they managed to erect something in the form of a hut, in which they might lie down and be to some extent protected from the weather, which was so boisterous as to render it useless to attempt to launch the boat. For some days, owing to exposure and want of food, they were both very ill; but still hoping for better weather. They kept themselves alive by eating seaweed and such shellfish as could be found, until the 12th of September, when the weather suddenly clearing, they again launched their small boat; and this time, after a day's hard toil, succeeded in reaching the opposite side of the straits, where they had left the ship, which it is needless to say was by this time far away.

When first the men were missed, rockets had been fired, and blue-lights burned; and on the following day the cutter was sent to the westward, while the "Chanticleer" coasted along the opposite side; look-out men were constantly aloft; but nothing was to be seen of the missing men. The next day the ship had remained at Port Famine, and exploring parties were sent in all directions. On the third day they again weighed anchor, and examined a fresh piece of coast, but all to no purpose; and finally it was decided, with much regret, to give up the search, for every one concluded that the poor men must by this time have perished, even if they had survived the first night's cold, which no one on board thought possible. Both men were generally popular, and great grief was felt for their loss. Immediately a subscription was started by the whole ship's company for the widow of the one man and the mother of the other. Strangely enough, when the sad news reached England, the former, in spite of what seemed conclusive evidence, firmly refused to believe the assurance of her husband's death. Whether the wife's intuition or the more logical inferences of every one else proved correct, events will shew.

By the time Henty and Riddles reached, as we have seen, the opposite side of the straits it was quite dark; but on the following day they found that the current had drifted them fourteen miles from Port Famine, towards which they had steered, and for which place they now started on foot. Here they saw in the distance a ship under steam going towards the Pacific; but again all efforts to attract attention failed. They knew of no settlement that they could hope to reach, and at this rough season there was not the slightest chance of falling in with any wandering tribes of natives. The only course left them was to endure the cold, wait as

patiently as might be, in the hope of some ship passing within hail, and to keep up what little life remained in them by chewing seaweed, and seeking and devouring the mussels, which fortunately were to be found in great abundance on the rocks. After a time, however, they grew so weak as to be only just able to crawl out of the place they had made to lie down in, and every day the effort to gather their scanty nourishment grew harder. Once more, on the 4th of October, they saw a vessel pass through the straits, but were unable to make any signals; on the 7th, both men had grown too weak to stir, and nothing was left for them but to confront death. The 8th day passed, the 9th, the 10th, and they were still sinking slowly from starvation. On the 11th, when they could not possibly have lived more than a few hours longer, and had become little short of living skeletons, they were picked up by the officers of the "Shearwater," and at once taken on board, where, after receiving the most careful attention, both, although still suffering greatly, began after a time to recover. Being conveyed by the "Shearwater" to Rio, they remained some time in the hospital there, and finally were sent home invalided; and yet both men lived to regain their full strength, and to serve as striking examples of what tough human nature can endure in the shape of physical hardships and mental anxiety. They had contrived, by a patience and energy almost unprecedented, to lengthen out existence for a space considerably over a month, with no other food than seaweed and shellfish; the last four days indeed eating absolutely nothing; while the whole time exposed to intense cold, the roughest weather, and more hardships than it is possible for those who have never seen that barren and desolate region even to imagine.

From The Spectator.

THE SCENERY AND THE PEOPLE OF LEWIS.

[From a Correspondent.]

Sir, — Why don't more people go to the Lews? The island has a peculiar charm of its own, and is a much better resting-place, after the fierce wear-and-tear of a London season, than the Trossachs, the Caledonian Canal, and the other well-known places in the Highlands where tourists most do congregate. For years it had been a sort of "Yarrow unvisited" to me. Again and again, in yearly wanderings amongst the dark-blue lakes and purple hills of Scotland, I had cast wistful glances towards the land of Sheila Mackenzie; but year after year I had returned to London leaving the restless waters of the Minch uncrossed. You can tell therefore how great was my delight when last month I whirled away from smoky, noisy, bustling London in the night express, with luggage labelled, "Stornoway, per steamer 'Clansman.'" By ten o'clock next morning we were in Glasgow, and had taken possession of our small deck cabin. Small though it was, it was all our own, and from its windows we could watch the shores as they glided by. At that dismal and busy place Greenock we stayed some weary hours, taking on board every conceivable thing — timber, flour, whiskey, sugar, glass, china, and furniture, enough to stock, I should think, every island home in existence. Worst of all, we took on board a large number of passengers. It is very wicked and unsympathetic, I know, but I cannot endure travelling with a great assortment of fellow-beings, and it was, therefore, with very unchristian feelings that I watched every fresh batch come on board. We stayed so long at Greenock, that the light had faded before we reached the beautiful shores of Bute and Arran, and we were in our berths as the vessel plunged and rolled and tumbled through the rough waters that wash the rugged Mull of Cantire. Early next morning, when we went on deck, we found ourselves in the lovely bay of Oban. All through the sunny day we glided past the purple hills of Mull, and in the evening we watched the glories of the setting sun spread over the Atlantic, whilst the purple heights of Rum, and Eig, and Muck seemed to float in a sea of silver and gold. Then the brilliant colors deepened into a soft glow behind the misty hills of Skye, and the quiet night came down as the "Clansman" pushed her way through the almost land-locked waters that divide Skye from the mainland. In the morning, we found the bright sun shining on the red cliffs that guard the entrance to the harbor of Portree. Here, to my great delight, nearly all that was left of our tourist companions went ashore, and my husband and I, with but two or three more, were left in possession of the white and shining deck. Here we walked about with a sort of triumphant "monarch of all I survey" feeling, and watched the broken cliff-line of Skye growing faint, and lonely little islands

on the horizon appear and disappear. Then to the north-west across the green waters we saw at last the dim line of the Lewis coast. Presently we were sailing past the white lighthouse that guards the entrance to Stornoway Harbor, and before us lay the little town. A semicircular line of white houses skirts the bay; behind stretches the brown and treeless moorland, dotted here and there with white farmhouses. To the left, on the hillside overhanging the town, is the castle, with its beautiful wooded gardens and grounds.

After securing rooms and the promise of some dinner in a somewhat uninviting-looking hotel, we marched off to inspect the town, which we found to consist of rather narrow streets of thick-walled houses built of grey stone. About every other house was a shop. Such marvellous shops! — narrow and small, but containing everything, and filled with a curious compound smell, suggesting soap, candles, boots and shoes, cheese, blankets, furniture, and hair-oil! In the streets near the harbor "an ancient fish-like smell" prevailed; and no wonder, for in our walk we discovered numbers of barrels of herrings lying on the little wharf waiting to be shipped, and just outside the town we found the sea-beach covered with hundreds of codfish drying in the sun. I suppose people exist who enjoy a meal of dried codfish. Indeed, we were told that the Russian peasant consumes enormous quantities of this dainty, but to my mind, as delicious a fish could be produced from a stewed herring-barrel. The fisher-folk in Lewis, however, pay great respect to the cod, for it yields them a good income. We were told that the fish-curers pay the fishers from ninepence to a shilling for every dried cod.

The first thing that struck us, when we extended our walks into the island, was the absence of men. Everywhere we saw troops of women and girls busy about the houses, working in the fields, driving cattle, or trudging along the road, bearing on their broad shoulders wicker creels filled with peats, or fish, or potatoes. "Are there no men in Lewis?" we naturally asked. "Oh, aye! plenty," was the answer, "but the lads are a' awa' just noo at the east coast feshing." The women did not look at all miserable, however, in their deserted condition. They are broad-shouldered, stalwart creatures, and look fully competent to carry on alone the work of the island. I was delighted with their costume. They wear a short dark-blue woollen skirt, which comes but little below the knees, a red tartan shawl over their shoulders, and a white, full-bordered cap. The married women, at least, wear caps; the unmarried go bare-headed. Most of them have nothing on their legs or feet, and none wear shoes, but a few indulge themselves with long dark-blue woollen stockings without soles. The large brown wicker creel is almost a part of their costume, for they are rarely seen without it. They always work in company. As we passed them, they would stop talking and cast a hurried and critical look at me and my companion, and then resume their conversation, in soft low Gaelic, with some remark, doubtless, on the absurdity of long skirts and balmoral boots. Most of them were busy knitting long blue stockings, as they trudged along with shoulders bent beneath a weight that would make a London porter grumble. The women do nearly all the work on the land, the men considering that after the summer and autumn fishing is done they are entitled to rest all the winter and spring. We were told that in the winter it is quite a common sight to see a row of men leaning all the morning against a house-side, whilst their wives and daughters are busy digging and manuring their small fields, or carrying peats. Before Sir James Matheson built the stone bridges that cross the numberless little rivers, it was a common practice for the women to carry the men across the water on their backs! The authorities, however, have set their faces against such abominable doings, and occasionally it is suppressed by merited chastisement. This scene really happened one evening not very far from Stornoway; would that I had been by to see it! A person of position in the island was passing a ford in his gig, when he saw a woman wading through the water, with her stalwart fisher husband perched on her back. Pursuing the delinquent, and giving him a heavy stroke across the back with his whip, he induced the goodwife to drop her burden in mid-stream!

We soon noticed that there were two distinct types in the island, the Celtic and the Scandinavian. Some of the men might seem to have come direct from Denmark. The red-brown curly hair, the blue eyes, and the bright-colored faces of the Norse race form a curious contrast to the olive skin and jet-black hair of the Celt. You meet with faces of a decided Spanish type. This is due, we were told, to the fact that one of the ships of the Spanish Armada was wrecked on the

coast of Lewis. Many of the sailors did not return to Spain, but settled down in the island. I met a girl of this type on board the "Clansman." She was a domestic servant in Rothesay, and was going home for a few weeks' holiday. She was very pretty, with an oval face, olive skin, and soft dark eyes. Her manners were dignified and graceful. As she sat and talked to me, and told me of her home on the Atlantic shore, I might have fancied she had come straight from Granada.

The island has a strange charm of color and outline. I felt this charm most forcibly the first time we drove across to Garrynahine. For fourteen or fifteen miles the road runs up and down over the wide-stretching moor. Sometimes the ground is nothing but a stretch of brown moss, broken here and there by the cuttings of jet-black peat, tufts of purple heather, and the waving heads of the cotton-weed. Then the road turns round a shoulder of the hill, and you come upon the blue and glittering water of a little lake, and by the side of it a cluster of huts. The little strips of oats, and barley, and potatoes which surround them seem marvellously green, set as they are amongst the prevailing brown, whilst far away in the south are the blue and purple mountains of Harris. There was something very touching about these clusters of little huts, with their small patches of cultivated land. Everything about them tells of the hard struggle for existence. The ground is very damp, the climate is moist, and, though there is not much snow or frost, there is also very little sunshine. Stone is abundant, but it is not good for building-purposes. Wood there is none except in the castle grounds. Most of the houses are little better than hovels, formed of a rude wall of uncemented stones about six feet high, covered by a roof of thatch, which is tied down with ropes made of twisted heather-stalks. One morning we made an excuse for entering one of these small homes. The gudewife welcomed us, and bade us sit down. The house consisted of one room, about twelve feet wide and twenty feet long. A peat fire burnt in a hole in the middle of the clay floor, some of the smoke finding its way out through a hole in the roof, while the rest escaped through the door and countless thin places in the thatch. Over the fire hung an iron pot that evidently played the part of oven, frying-pan, and boiler to the establishment. On either side of the door was a small window about two feet square. At one end of the room reposed the cow; at the other, behind a partition of boards, was the sleeping-room. A little child about three years of age pattered about the hard floor with bare feet, whilst a baby lay near the fire asleep in a high wooden cradle. In the gentle, hesitating manner of Highlanders who have only learnt English in school, the woman talked to us about her husband, who was away at Wick, fishing, about her children, and about the cow. Then she rose and offered me, with much graciousness, a cup of sweet fresh milk. I thought to myself, as I sat there, that in spite of the apparent squalor and discomfort of such a home, it was a hundred times better than the life of a London back street, and that if I had to choose, I would infinitely prefer my children to grow up amidst such surroundings than amongst the poor of one of our great cities. Their fare would be wholesome, — milk, oat-cake, fish, and potatoes. They would go to church every Sunday, and be sent regularly to school, and their early ambitions would be to drive home the cows, help to cut peat, and be allowed to go out on the loch and fish, — healthier occupations for body and soul than following a Punch and Judy show, or playing pitch-and-toss on a crowded pavement. From all we saw and heard, we were convinced that Sir James and Lady Matheson spare no pains to make the people's lives more healthy and orderly. The regulations of the estate distinctly provide that the abode of each family shall be cut off from the place in which the cow is kept; but the truth is that the prohibition of it will for a long time be baffled by the despotism of physical conditions. The poor people defend themselves by saying that, in the first place, they lodge the cow under their own roof for the sake of warmth. They say that the cow, if kept warm, requires less food, and gives more milk than she otherwise would. They cannot afford to feed it better, nor can they afford a second fire. They give a similar answer when asked why they leave the manure of the cow-house untouched from one month to another. If they were to remove it every day a great quantity of the fertilizing properties would be lost. For the same reason they dislike to build chimneys, for they have found that their thatch, when thoroughly saturated with smoke, makes excellent manure.

Ignorant of all the difficulties of the poor crofters, I asked a highly intelligent islander why the all-powerful Free Church ministers did not boldly preach the gospel of pure air and separate cow-houses. My

intelligent islander said the people would be greatly shocked by such a proceeding. The Highland Free-Churchman does not approve of purely practical sermons. This is forcibly brought out in the story of a Highlander, who came out of church one day in a violent state of indignation, because the minister had so far forgotten his duty as to preach a whole sermon against Sandy Bean, for ill-treating his white horse: "As if that wass the Cospel! He said we wass to do unto others as we would they should do to us, — as if horses wass others whatever!"

In another letter, I should like to tell you something of the charm of the coast and sea lochs of Lewis, and the ways and doings of the fisher-folk. I am, Sir, etc.,

ANNIE H. MACDONELL.

From The Popular Science Review.

THE ELECTRIC CONDUCTIVITY OF WATER.

It seems at first sight curious that in the case of so common a substance as water there should be any doubt among physicists as to the power which the liquid possesses of conducting electricity. Not that the subject has by any means been neglected, as the labors of Magnus, Pouillet, Becquerel, Oberbeck, Rossetti, and Quincke abundantly testify. But the results obtained by these several investigators differ so widely among themselves that it is not easy to know which are to be accepted. The figures brought out by Pouillet, for example, are sixty times greater than those deduced by Magnus. Professor Kohlrausch has, therefore, thought it high time that the subject was settled; and after a most carefully conducted investigation, he has published the results of his inquiry in Poggendorf's "*Annalen*" (*Ergänzungsb.* iii. 1877, p. 1). Many substances have their electric conductivity affected to a remarkable extent by the presence of impurities, even when these are present in only minute proportion. Matthiessen showed that copper, for instance, has its conductivity lowered forty per cent., by presence of a mere trace of arsenic. In like manner Kohlrausch has found it necessary to pay scrupulous attention to the purity of the water which he examined, and indeed the discrepancies among the results of previous inquirers may probably be explained by inattention to this point. Having prepared the liquid in as pure a state as the resources of the laboratory can permit, Kohlrausch tested the conductivity by examining a shell of this water enclosed between two hemispherical vessels of platinum nearly fitting one into the other, and serving as electrodes. On passing a current of electricity through this arrangement, it was found that the pure water offered remarkable resistance; in fact its conductivity was only one one-hundred-and-twentieth of that assigned to it by Pouillet. Rain, which is, of course, the purest natural form of water, conducted electricity twenty-five times better than the artificially purified liquid which served as a standard.

A SWEDISH paper just received publishes an interesting article under the heading, "Why is the Climate of Europe growing Colder?" The article states that in the Bay of Komenok, near Koma, in Greenland, fossil and very characteristic remains of palm and other trees have been discovered lately, which tend to show that in these parts formerly a rich vegetation must have existed. But the ice period of geologists arrived, and, as a consequence of the decreasing temperature, this fine vegetation was covered with ice and snow. This sinking in the temperature, which moved in a southerly direction, as can be proved by geological data, *i.e.*, the discovery of fossil plants of certain species, seems to be going on in our days also. During the last few years the ice has increased far towards the south; thus between Greenland and the Arctic Sea colossal masses of ice have accumulated. On European coasts navigators now frequently find ice in latitudes where it never existed before during the summer months, and the cold reigning upon the Scandinavian peninsula this summer results from the masses of ice which are floating in the region where the Gulf Stream bends towards our coasts. This is a repetition of the observations made in the cold summer of 1865. The unaccustomed vicinity of these masses of ice has rendered the climate of Iceland so cold that corn no longer ripens there, and the Icelanders, in fear of a coming famine and icy climate, begin to found a new home in North America.

POETRY.

THE DESERTED GARDEN, ... 386

PUBLISHED EVERY SATURDAY BY

LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

THE DESERTED GARDEN.

BEYOND the woods, yet half by woods inclosed,
A tangled wilderness of fair growth lay;
A spot where dreaming poet might have dozed
Into the dawning of a fairy day;
For in its desolation wild reposed
Something that pointed to a past more gay,
Since here and there one found the lingering trace
Of caresome hands in the neglected place.

The once trim walks were coated thick with moss;
Dwarfed were the garden roses, and their glow
From vivid crimson paled to fainter gloss
Nigh broken sun-dial; and the water's flow
Had ceased to murmur in the ancient foss,
Whose slopes were now with purple thyme a-blow;
And on the fragments of the crumbled wall
The golden wall-flower stood like seneschal.

The nut-trees made an archway overgrown,
And midst the boughs the timid squirrel leapt;
At eve the nightingale with mellow tone
Sang with the mourning wind a dirge that crept
Into all hearts — until one heart more lone
Than others, gathered up the strain and wept;
Nor knew if 'twere half joy or wholly grief
That in the sympathetic chord had found relief.

The clouds sent flickering shadows o'er the grass,
As though some spectral life were there upstirred;
And as the fitful breezes onward pass,
A murmur of strange voices might be heard,
As though some unseen quire were chanting mass,
Echoed throughout the grove by plaintive bird;
And still the wanderer listening, asks for whom
The wild amen; For whom the flowers did bloom.

The ancient summer-house with broken vane,
And rotting pillars where the woodbines twine;
And on a cobwebbed solitary pane
In casement, that with colors once did shine,
And shewed the seasons through each differing stain,
Was writ in jaggèd-wise a Latin line,
"*Sic transit gloria mundi;*" and below,
"My Ursula! the world is full of woe."

It read as epitaph above the grave
Of human hopes, all blighted as the space
Around, whose wreck no hand was stretched to save;
Yet that with tender, melancholy grace,
A sermon in that blooming desert gave
To him whose soul had power enough to trace
In the lone scene, so desolate, so lone,
Though man upbuilds, God shapes the crowning stone.

I spake the name a score of times aloud,
"Sweet Ursula," a source of joy and woe!
The glory of a life, the light allowed
To make all nature flush with deeper glow.
Then light put out — then darkness — then a cloud
And agony that nought but love can know —
The bitter memory of a sweetness past,
A gleam of sunshine all too bright to last.

The lazy lilies gleamed with petals white
Upon the pool o'errun with weeds and sedges,
That once shone clear and fair as mirror bright,
With blue forget-me-nots on shelving ledges,
Where water-flags upreared their banners light,
And the marsh-mallow crept along its edges —
But in the water face to face no more
Smiled back as in the happier days of yore.

Ah! could the olden stones a story tell,
How sweet a love-tale might they not reveal
Of mystic Ursula, and what befell
In the fond hopes and doubts that lovers feel,
Till blighted by that sorrowful farewell
That all the beauty of the world did steal;
Shattered the rainbow in fresh-gathered cloud,
And changed the bridal robe to funeral shroud.

Perchance her monument this wildered spot,
Tended by Nature's pitying hand alone,
For one by generations now forgot,
To whom *he* reared no proud sepulchral stone;
But with love's jealousy he willed that not
Another o'er her grave should make his moan,
But he alone through hieroglyphic bloom,
Should haunt the precincts of the loved one's tomb.

Ay, who can tell! For time his seal hath set
On life and all its secrets gone before;
The hearts are dead that never could forget;
The hearts that live, but know the tale no more.
Each hath its bitterness o'er which to fret,
Each hath its joys eclipsing those of yore;
To each its own small world the real seems,
Outside of which is but a land of dreams.

Yet still one loves to linger here and muse,
And conjure up vague theories of the past;
And here a hand to trace; and there to lose
The touch of human life upon it cast;
And still for idle loitering make excuse,
And weave a tale of mystery to the last;
And in the old deserted garden bowers
Find fairer blossoms than 'mongst tended flowers.

Chambers' Journal. JULIA GODDARD.

From The Fortnightly Review.

WALTER BAGEHOT.

It is inevitable, I suppose, that the world should judge of a man chiefly by what it has gained in him, and lost by his death, even though a very little reflection might sometimes show that the special qualities which made him so useful to the world implied others of a yet higher order, in which, to those who knew him well, these more conspicuous characteristics must have been well-nigh merged. And while of course it has given me great pleasure, as it must have given pleasure to all Bagehot's friends, to hear the chancellor of the exchequer's evidently genuine tribute to his financial sagacity in the budget speech, and Lord Granville's eloquent acknowledgments of the value of Bagehot's political counsels as editor of the *Economist*, in the speech delivered at the London University on the 9th May, I have sometimes felt somewhat unreasonably vexed that those who appreciated so well what I might almost call the smallest part of him, appeared to know so little of the essence of him,— of the high-spirited, buoyant, subtle, speculative nature in which the imaginative qualities were even more remarkable than the judgment, and were indeed at the root of all that was strongest in the judgment,— of the gay and dashing humor which was the life of every conversation in which he joined,— and of the visionary nature to which the commonest things often seemed the most marvellous, and the marvellous things the most intrinsically probable. To those who hear of Bagehot only as an original political economist and a lucid political thinker, a curiously false image of him must be suggested. Certainly if they are among the multitude misled by Carlyle, who regard all political economists as "the dreary professors of a dismal science," they will probably conjure up an arid disquisitionist on value and cost of production; and even if assured of Bagehot's imaginative power, they may perhaps only understand by the expression that capacity for feverish preoccupation which makes the mention of "Peel's Act" summon up to the faces of certain fanatics a hectic glow, or the rumor of paper currencies blanch others with the pallor of true passion. The truth, however, is, that the best qualities which Bagehot had, both as economist and as politician, were of a kind which the majority of economists and politicians do not specially possess. I do not mean that it was in any way an accident that he was an original thinker in either sphere; far from it. But I do think that what he brought to political and economical science, he brought in some sense from *outside* their normal range,— that the man of business and the financier in him fell within such sharp and well-defined limits that he knew better than most of his class where their special weakness lay, and where their special functions ended. This, at all events, I am quite sure of, that so far as his judgment was sounder than other men's — and on many subjects it was much sounder — it was so not in spite of, but in consequence of, the excursive imagination and vivid humor which are so often accused of betraying otherwise sober minds into dangerous aberrations. In him both lucidity and caution were directly traceable to the force of his imagination.

I first met Bagehot at University College, London, when we were neither of us over seventeen. I was struck by the questions put by a lad with large dark eyes and florid complexion to the late Professor De Morgan, who was lecturing to us, as his custom was, on the great difficulties involved in what we thought we all understood perfectly, such, for example as the meaning of 0, of negative quantities, or the grounds of probable expectation. Bagehot's questions showed that he had both read and thought more on these subjects than most of us, and I was eager to make his acquaintance, which soon ripened into an intimate friendship, in which there has been no intermission from that time to this. Some will regret that Bagehot did not go to Oxford, the reason being that his father, who was a Unitarian, objected on principle to all doctrinal tests, and would never have permitted a son of his to go to either of the older universities while those tests were required of the undergraduates. And I am not at all sure that University College,

London, was not at that time a much more awakening place of education for young men than almost any Oxford college. Bagehot himself, I suspect, thought so. Fifteen years later he wrote, in his essay on Shelley, "A distinguished pupil of the University of Oxford once observed to us, 'The use of the University of Oxford is that no one can overread themselves there. The appetite for knowledge is repressed.'" And whatever may have been defective in University College, London — and no doubt much was defective — nothing of the kind could have been said of it when we were students there. Indeed in those years London was a place with plenty of intellectual stimulus in it for young men, while in University College itself there was quite enough vivacious and original teaching to make that stimulus available to the full. It is sometimes said that it needs the quiet of a country town remote from the capital to foster the love of genuine study in young men. But of this, at least, I am sure, that Gower Street and Oxford Street, and the New Road, and the dreary chain of squares from Euston to Bloomsbury, were the scenes of discussions as eager and as abstract as ever were the sedate cloisters or the flowery river-meadows of Cambridge or Oxford. Once, I remember, in the vehemence of our argument as to whether the so-called logical principle of identity (A is A) were entitled to rank as a "law of thought," or only as a postulate of language, Bagehot and I wandered up and down Regent Street for something like two hours in the vain attempt to find Oxford Street;

And yet what days were those, Parmenides,
When we were young, when we could number friends
In all the Italian cities like ourselves,
When with elated hearts we joined your train,
Ye sun-born virgins, on the road of truth.
Then we could still enjoy, then neither thought
Nor outward things were closed and dead to us,
But we received the shock of mighty thoughts
On single minds with a pure natural joy;
And if the sacred load oppressed our brain
We had the power to feel the pressure eased,
The brow unbound, the thoughts flow free again
In the delightful commerce of the world.

Bagehot has himself described, evidently from his own experience, the kind of life we lived in those days, in one of his articles on Oxford reform. "So too, in youth, the real plastic energy is not in tutors or lecturers or in books 'got up,' but in Wordsworth and Shelley, in the books that all read because all like, in what all talk of because all are interested, in the argumentative walk or disputatious lounge, in the impact of young thought upon young thought, of fresh thought on fresh thought, of hot thought on hot thought, in mirth and refutation, in ridicule and laughter — for these are the free play of the natural mind, and these cannot be got without a college."

The late Professor Sewell, when asked to give his pupils some clear conception of the old Greek sophists, is said to have replied that he could not do this better than by referring them to the professors of University College, London. I do not think there was much force in the sarcasm; for, though Professor T. Hewitt Key, whose restless and ingenious mind led him many a wild dance after etymological will-of-the-wisps — I remember, for instance, his cheerfully accepting the suggestion that "better" and "bad" (*melior* and *malus*) came from the same root, and accounting for it by the probable disposition of hostile tribes to call everything bad which their enemies called good, and everything good which their enemies called bad — may have had in him much of the brilliance and something also perhaps of the flightiness of the old sophist, it would be hard to imagine men more severe in exposing pretentious conceits and dispelling dreams of theoretic omniscience, than Professors De Morgan, Malden, and Long. De Morgan, who at that time was in the midst of his controversy on formal logic with Sir William Hamilton, was, indeed, characterized by the great Edinburgh metaphysician as "profound in mathematics, curious in logic, but wholly deficient in architectonic power;" yet, for all that, his lectures on the theory of limits were a far better logical discipline for young men than Sir William Hamilton's on the law of the unconditioned or the quantification of the predicate. Professor

Malden contrived to imbue us with a love of that fastidious taste and that exquisite nicety in treating questions of scholarship, which has, perhaps, been more needed and less cultivated in Gower Street than any other of the higher elements of a college education; while Professor Long's caustic irony, accurate and almost ostentatiously dry learning, and profoundly stoical temperament, were as antithetic to the temper of the sophist as human qualities could possibly be.

The time of our college life was pretty nearly contemporaneous with the life of the Anti-Corn-Law League, and the great agitation in favor of free trade. To us this was useful rather from the general impulse it gave to political discussion, and the literary curiosity it excited in us as to the secret of true eloquence, than because it anticipated in any considerable degree the later-acquired taste for economical science. Bagehot and I seldom missed an opportunity of hearing together the matchless practical disquisitions of Mr. Cobden,— lucid and homely, yet glowing with intense conviction,— the profound passion and careless, though artistic, scorn of Mr. Bright, and the artificial and elaborately ornate periods, and witty, though somewhat *ad captandum* epigrams of Mr. W. J. Fox (afterwards M.P. for Oldham). Indeed, we scoured London together to hear any kind of oratory that had gained a reputation of its own, and compared all we heard with the declamation of Burke and the rhetoric of Macaulay, many of whose later essays came out and were eagerly discussed by us while we were together at college. In our conversations on these essays, I remember that I always bitterly attacked, while Bagehot moderately defended, the glorification of compromise which marks all Macaulay's writings. Even in early youth Bagehot had much of that "animated moderation" which he praises so highly in his latest work. He was a voracious reader, especially of history, and had a far truer appreciation of historical conditions than most young thinkers; indeed, the broad historical sense which characterized him from first to last made him more alive than ordinary students to the urgency of circumstance, and far less disposed to indulge in abstract moral criticism from a modern point of view. On theology, as on all other subjects, Bagehot was at this time more conservative than myself, he sharing his mother's orthodoxy, and I at that time accepting heartily the Unitarianism of my own people. Theology was, however, I think, the only subject on which in later life we, to some degree at least, exchanged places, though he never at any time, however doubtful he may have become on some of the cardinal issues of historical Christianity, accepted the Unitarian position. Indeed, within the last two or three years of his life, he spoke on one occasion of the Trinitarian doctrine as probably the best account which human reason could render of the mystery of the self-existent mind.

In those early days Bagehot's manner was often supercilious. We used to attack him for his intellectual arrogance — his ὕβρις we called it in our college slang — a quality which I believe was not really in him at all, though he had then much of its external appearance. Nevertheless his genuine contempt for what was intellectually feeble was not accompanied by an even adequate appreciation of his own powers. At college, however, his satirical "hear, hear," was a formidable sound in the debating society, and one which took the heart out of many a younger speaker, and the contemptuous "How much?" with which in conversation he would meet an over-eloquent expression, was always of a nature to reduce a man, as the mathematical phrase goes, to his "lowest terms." In maturer life he became much gentler and mellower, and often even delicately considerate for others; but his inner scorn for ineffectual thought remained in some degree natural to him, though very reticently expressed, to the last. For instance, I remember his attacking me for my mildness in criticising a book which, though it professed to rest on a basis of clear thought, really missed all its points. "There is a pale whitey-brown substance," he wrote to me, "in the man's books, which people who don't think, take for thought, but it isn't;" and he upbraided me much for not saying

plainly that the man was a muff. In his youth this scorn for anything like the vain beating of the wings in the attempt to think clearly, was at its maximum. It was increased, I think, by that which was one of his greatest qualities, his remarkable "detachment" of mind — in other words, his comparative inaccessibility to the contagion of blind sympathy. Most men, more or less unconsciously, shrink from even *thinking* what they feel to be out of sympathy with the feelings of their neighbors, unless under some strong incentive to do so; and in this way the sources of much true and important criticism are dried up through the mere diffusion and ascendancy of conventional but sincere habits of social judgment. And no doubt for the greater number of us this is much the best. We are worth more for the purpose of constituting and strengthening the cohesive power of the social bond, than we should ever be worth for the purpose of criticising feebly — and with little effect, perhaps, except the disorganizing effect of seeming ill-nature — the various incompetences and miscarriages of our neighbor's intelligence. But Bagehot's intellect was always far too powerful and original to render him available for the function of mere social cement, and full as he was of genuine kindness and hearty personal affections, he certainly had not in any high degree that sensitive instinct as to what others would feel, which so often shapes even the thoughts of men, and still oftener their speech, into mild and complaisant, but unmeaning and unfruitful, forms.

Thus it has been said that in his very amusing article on Crabb Robinson, published in this review upwards of eight years ago,* he was more than a little rough in his delineation of that quaint old friend of our earlier life. And, certainly, there is something of the naturalist's realistic manner of describing the habits of a new species, in the paper, though there is not a grain of malice or even depreciatory bias in it, and though there is a very sincere regard manifested throughout. But that essay will illustrate admirably what I mean by saying that Bagehot's detachment of mind, and the deficiency in him of any aptitude for playing the part of mere social cement, tended to give the impression of an intellectual arrogance which — certainly in the sense of self-esteem or self-assertion — did not in the least belong to him. In the essay I have just mentioned, he describes how Crabb Robinson, when he gave his somewhat famous breakfast-parties, used to forget to make the tea, then lost his keys, then told a long story about a bust of Wieland during the extreme agony of his guests' appetites, and finally, perhaps, withheld the cup of tea he had at last poured out, while he regaled them with a poem of Wordsworth's or a diatribe against Hazlitt. And Bagehot adds, "The more astute of his guests used to breakfast before they came, and then there was much interest in seeing a steady literary man, who did not undertand the region, in agonies at having to hear three stories before he got his tea, one again between his milk and his sugar, another between his butter and his toast, and additional zest in making a stealthy inquiry that was sure to intercept the coming delicacies by bringing on Schiller and Goethe." The only "astute" person referred to was, I imagine, Bagehot himself, who confessed to me, much to my amusement, that this was always his own precaution before one of Crabb Robinson's breakfasts. I doubt if anybody else ever thought of it. It was very characteristic in him that he should have not only noticed — for that of course any one might do — this weak element in Crabb Robinson's breakfasts, but should have kept it so distinctly before his mind as to make it the centre, as it were, of a policy, and the opportunity of a mischievous stratagem to try the patience of others. It showed how much of the social naturalist there was in him. If any race of animals could understand a naturalist's account of their ways and habits, and of the devices he adopted to get those ways and habits more amusingly or instructively displayed before him, no doubt they would think that he was a cynic; and it was this intellectual detachment, as of a social naturalist, from the society in which he moved, which made Bagehot's remarks often seem somewhat harsh, when, in fact, they were animated not only by no suspicion of malice, but by the most cordial and earnest friendliness. Owing to this separateness of mind, he described more strongly and distinctly traits which, when delineated by a friend, we expect to find painted in the softened manner of one who is half disposed to imitate or adopt them.

Yet though I have used the word "naturalist" to denote the keen and solitary observation with which Bagehot watched society, no word describes him worse if we attribute to it any of that coldness and stillness of curiosity which we are apt to associate with scientific vigilance. Espec-

ially in his youth, buoyancy, vivacity, velocity of thought, were of the essence of the impression which he made. He had high spirits and great capacities for enjoyment, great sympathies indeed with the old English cavalier. In his essay on Macaulay he paints that character with profound sympathy: —

What historian, indeed [he says], has ever estimated the Cavalier character? There is Clarendon, the grave, rhetorical, decorous lawyer — piling words, congealing arguments — very stately, a little grim. There is Hume, the Scotch metaphysician, who has made out the best case for such people as never were, for a Charles who never died, for a Strafford who could never have been attainted, a saving, calculating North-countryman, fat, impassive, who lived on eightpence a day. What have these people to do with an enjoying English gentleman? Talk of the ways of spreading a wholesome Conservatism throughout the country . . . as far as communicating and establishing your creed is concerned, try a little pleasure. The way to keep up old customs is to enjoy old customs; the way to be satisfied with the present state of things, is to enjoy that state of things. Over the "Cavalier" mind, this world passes with a thrill of delight; there is an exultation in a daily event, zest in the "regular thing," joy at an old feast.

And that aptly represents himself. Such arrogance as he seemed to have in early life was the arrogance as much of enjoyment as of detachment of mind, — the *insouciance* of the old Cavalier as much at least as the calm of a mind not accessible to the contagion of social feelings. He always talked, in youth, of his spirits as inconveniently high; and once wrote to me that he did not think they were quite as "boisterous" as they had been, and that his fellow-creatures were not sorry for the abatement; nevertheless, he added, "I am quite fat, gross, and ruddy." He was, indeed, excessively fond of hunting, vaulting, and almost all muscular effort, so that his life would be wholly misconceived by any one who, hearing of his "detachment" of thought, should picture his mind as a vigilantly observant, far-away intelligence, such as Hawthorne's for example. He liked to be in the thick of the *mêlée* when talk grew warm, though he was never so absorbed in it as not to keep his mind cool.

Bagehot was a Somersetshire man, with all the richness of nature and love for the external glow of life which the most characteristic counties of the south-west of England contrive to give to their most characteristic sons.

This northwest corner of Spain, [he wrote once to a newspaper from the Pyrenees] is the only place out of England where I should like to live. It is a sort of better Devonshire; the coast is of the same kind, the sun is more brilliant, the sea is more brilliant, and there are mountains in the background. I have seen some more beautiful places and many grander, but I should not like to live in them. As Mr. Emerson puts it, "I do not want to go to Heaven before my time." My English nature by early use and long habit is tied to a certain kind of scenery, soon feels the want of it, and is apt to be alarmed as well as pleased at perpetual snow and all sorts of similar beauties. But here about San Sebastian, you have the best England can give you (at least if you hold as I do that Devonshire is the finest of our counties), and the charm, the ineffable, indescribable charm, of the south too. Probably the sun has some secret effect on the nervous system that makes one inclined to be pleased, but the golden light lies upon everything, and one fancies that one is charmed only by the outward loveliness.

The vivacity and warm coloring of the landscapes of the south of England certainly had their full share in moulding his tastes, and possibly even his style.

Bagehot took the mathematical scholarship with his bachelor's degree in the University of London in 1846, and the gold medal in intellectual and moral philosophy with his master's degree in 1848, in reading for which he mastered for the first time those principles of political economy, which were to receive so much illustration from his genius in later years. But at this time philosophy, poetry, and theology had, I think, a much greater share of his attention than any narrow and more sharply defined science. Shakespeare, Keats, Shelley, and Wordsworth, Coleridge, Martineau, and John Henry Newman, all in their way exerted a great influence over his mind, and divided, not unequally, with the authors whom he was bound to study — that is, the Greek philosophers, together with Hume, Kant, J. S. Mill, and Sir William Hamilton — the time at his disposal. I have no doubt that for seven or eight years of his life the Roman Catholic Church had a great fascination for his imagination, though I do not think that he was ever at all near conversion. He was intimate with all Dr. Newman's writings. And of these, the Oxford sermons, and the poems in the "*Lyra Apostolica*" afterwards separately published — partly, I believe, on account of the high estimate of them which Bagehot himself had given — were always his special favorites. The little poetry he wrote — and it is evident that he never had the kind of instinct for,

or command of, language which is the first condition of genuine poetic genius — seems to me to have been obviously written under the spell which Dr. Newman's own few but finely chiselled poems had cast upon him. If I give one specimen of these poems, it is not that I think it in any way an adequate expression of Bagehot's powers, but for a very different reason, because it will show those who have inferred from his other writings that his mind never deeply concerned itself with religion, how great is their mistake. Nor is there any real poverty of resource in these lines, except perhaps in the awkward mechanism of some of them. They were probably written when he was twenty-three or twenty-four.

To the Roman Catholic Church.

"Casta inceste." — *Lucretius.*

Thy lamp of faith is brightly trimmed,
Thy eager eye is not yet dimmed,
Thy stalwart step is yet unstayed,
Thy words are well obeyed.

Thy proud voice vaunts of strength from heaven,
Thy proud foes carp, "By hell's art given:"
No Titan thou of earth-born bands,
Strange Church of hundred hands.

Nursed without knowledge, born of night,
With hand of power and thoughts of light,
As Britain seas, far-reachingly
O'er-rul'st thou history.

Wild as La Pucelle in her hour,
O'er prostrate realms with awe-girt power
Thou marchest steadfast on thy path
Through wonder, love, and wrath.

And will thy end be such as hers,
O'erpowered by earthly mail-clad powers,
Condemned for cruel, magic art,
Though awful, bold of heart?

Through thorn-clad time's unending waste
With ardent step alone thou strayest,
As Jewish scape-goats tracked the wild,
Unholy, consecrate, defiled.

Use not thy truth in manner rude
To rule for gain the multitude,
Or thou wilt see that truth depart,
To seek some holier heart;

Then thou wilt watch thy errors lorn,
O'erspread by shame, o'erswept by scorn,
In lonely want without hope's smile,
As Tyre her weed-clad isle.

Like once thy chief, thou bear'st Christ's name;
Like him thou hast denied his shame,
Bold, eager, skilful, confident,
Oh, now like him repent!

That has certainly no sign of the hand of the master in it, for the language is not moulded and vivified by the thought, but the thought itself is fine. There is still better evidence than these lines would afford of the fascination which the Roman Catholic Church had for Bagehot. A year or two later, in the letters on the *coup d'état* to which I shall soon have to refer, there occurs the following passage. (He is trying to explain how the cleverness, the moral restlessness, and intellectual impatience of the French, all tend to unfit them for a genuine parliamentary government.)

I do not know that I can exhibit the way these qualities of the French character operate on their opinions better than by telling you how the Roman Catholic Church deals with them. I have rather attended to it since I came here. It gives sermons almost an interest, their being in French, and to those curious in intellectual matters, it is worth observing. In other times, and even now in out-of-the-way Spain, I suppose it may be true that the Catholic Church was opposed to inquiry and reasoning. But it is not so now and here. Loudly from the pens of a hundred writers, from the tongues of a thousand pulpits, in every note of thrilling scorn and exulting derision, she proclaims the contrary. Be she Christ's workman or Antichrist's, she knows her work too well. "Reason, reason, reason!" exclaims she to the philosophers of this world. "Put in practice what you teach, if you would have others believe it. Be consistent. Do not prate to us of private judgment, when you are but yourselves repeating what you heard in the nursery, ill-mumbled remnants of a Catholic tradition. No; exemplify what you command; inquire and make search. Seek and we warn you that ye will never find, yet do as ye will. Shut yourselves up in a room, make your mind a blank, go down (as you speak) into the depth of your consciousness, scrutinize the mental structure, inquire for the elements of belief, — spend years, your best years, in the occupation, — and at length, when your eyes are dim and your brain hot, and your hands unsteady, then reckon what you have gained. See if you cannot count on your fingers the certainties you have reached; reflect which of them you doubted yesterday, which you may disbelieve to-morrow, or rather make haste, assume at random some essential *credenda*, — write down your inevitable postulates, enumerate your necessary axioms, toil on, toil on, spin your spider's web, adore your own soul, or if ye prefer it, choose some German nostrum; try an intellectual intuition, or the pure reason, or the intelligible ideas, or the mesmeric clairvoyance, and when so, or somehow, you have attained your results, try them on mankind. Don't go out into the byways and hedges; it is unnecessary. Ring a bell, call in the ser-

vants, give them a course of lectures, cite Aristotle, review Descartes, panegyrize Plato, and see if the *bonne* will understand you. It is you that say *Vox populi, vox Dei.* You see the people reject you. Or suppose you succeed, — what you call succeeding. Your books are read; for three weeks or even a season you are the idol of the *salons.* Your hard words are on the lips of women; then a change comes, a new actress appears at the Théâtre Français or the opera; her charms eclipse your theories; or a great catastrophe occurs; political liberty, it is said, is annihilated. *Il faut se faire mouchard*, is the observation of scoffers. Anyhow you are forgotten. Fifty years may be the gestation of a philosophy, not three its life. Before long, before you go to your grave, your six disciples leave you for some newer master, or to set up for themselves. The poorest priest in the remotest region of the Basses Alpes has more power over men's souls than human cultivation. His ill-mouthed masses move women's souls — can you? Ye scoff at Jupiter, yet he at least was believed in, you never have been. Idol for idol, the *de*throned is better than the *un*throned. No, if you would reason, if you would teach, if you would speculate, — come to us. We have our premises ready; years upon years before you were born, intellects whom the best of you delight to magnify, toiled to systematize the creed of ages. Years upon years after you are dead, better heads than yours will find new matter there to define, to divide, to arrange. Consider the hundred volumes of Aquinas. Which of you desire a higher life than that; to deduce, to subtilize, discriminate, systematize, and decide the highest truth, and to be believed. Yet such was his luck, his enjoyment. He was what you would be. No, no, *credite, credite.* Ours is the life of speculation. The cloister is the home for the student. Philosophy is stationary, Catholicism progressive. *You* call. *We* are heard, etc." So speaks each preacher according to his ability. And when the dust and noise of present controversies have passed away, and, in the interior of the night, some grave historian writes out the tale of half-forgotten times, let him not forget to observe that, profoundly as the mediæval Church subdued the superstitious cravings of a painful and barbarous age, in after years she dealt more discerningly still with the feverish excitement, the feeble vanities, and the dogmatic impatience of an over-intellectual generation.

It is obvious, I think, both from the poem, and from these reflections, that what attracted Bagehot in the Church of Rome was the historical prestige and social authority she had accumulated in believing and uncritical ages for use in the unbelieving and critical age in which we live, — while what he condemned and dreaded in her was her tendency to use her power over the multitude for purposes of a low ambition.

And as I am on this subject, this will be, I think, the best opportunity I shall have to say what I have got to say of Bagehot's later religious belief, without returning to it when I have to deal with a period in which the greatest part of his spare intellectual energy was given to other subjects. I do not think that the religious affections were very strong in Bagehot's mind, but the primitive religious instincts certainly were. From childhood he was what he certainly remained to the last, in spite of the rather antagonistic influence of the able scientific group of men from whom he learned so much, — a thorough transcendentalist, by which I mean one who could never doubt that there was a real foundation of the universe distinct from the outward show of its superficial qualities, and that the substance is never exhaustively expressed in these qualities. He often repeats in his essays Shelley's fine line, " Lift not the painted veil which those who live call life," and the essence at least of the idea in it haunted him from his very childhood. In the essay on " Hartley Coleridge," — perhaps the most perfect in style of any of his writings, — he describes most powerfully, and evidently in great measure from his own experience, the mysterious confusion between appearances and realities which so bewildered little Hartley, — the difficulty that he complained of in distinguishing between the various Hartleys, — " picture Hartley," " shadow Hartley," and between Hartley the subject and Hartley the object, the enigmatic blending of which last two Hartleys the child expressed by catching hold of his own arm, and then calling himself the " catch-me-fast Hartley." And in dilating on this bewildering experience of the child's, Bagehot borrows from his own recollections : —

All children have a world of their own, as distinct from that of the grown people who gravitate around them, as the dreams of girlhood from our prosaic life, or the ideas of the kitten that plays with the falling leaves, from those of her carnivorous mother that catches mice and is sedulous in her domestic duties. But generally about this interior existence children are dumb. You have warlike ideas, but you cannot say to a sinewy relative, " My dear aunt, I wonder when the big bush in the garden will begin to walk about; I'm sure it's a crusader, and I was cutting it all the day with my steel sword. But what do you think, aunt? for I'm puzzled about its legs, because you see, aunt, it has only *one* stalk — and besides, aunt, the leaves." You cannot remark this in secular life, but you hack at the infelicitous bush till you do not wholly reject the idea

that your small garden is Palestine, and yourself the most adventurous of knights.

They have a tradition in the family that this is but a fragment from Bagehot's own imaginative childhood, and certainly this visionary element in him was very vivid to the last. However, the transcendental or intellectual basis of religious belief was soon strengthened in him, as readers of his remarkable paper on Bishop Butler will easily see, by those moral and retributive instincts which warn us of the meaning and consequences of guilt.

> The moral principle [he wrote in that essay], whatever may be said to the contrary by complacent thinkers, is really and to most men a principle of fear. . . . Conscience is the condemnation of ourselves; we expect a penalty. As the Greek proverb teachest Where there is shame, there is fear. . . . How to be free from this is the question. How to get loose from this — how to be rid of the secret tie which binds the strong man and cramps his pride and makes him angry at the beauty of the universe, which will not let him go forth like a great animal, like the king of the forest, in the glory of his might, but which restrains him with an inner fear and a secret foreboding that if he do but exalt himself he shall be abased, if he do but set forth his own dignity he will offend ONE who will deprive him of it. This, as has often been pointed out, is the source of the bloody rites of heathendom.

And then, after a powerful passage in which he describes the sacrificial superstitions of men like Achilles, he returns, with a flash of his own peculiar humor, to Bishop Butler, thus: —

> Of course it is not this kind of fanaticism that we impute to a prelate of the English Church; human sacrifices are not respectable, and Achilles was not rector of Stanhope. But though the costume and circumstances of life change, the human heart does not; its feelings remain. The same anxiety, the same consciousness of personal sin, which lead, in barbarous times, to what has been described, show themselves in civilized life as well. In this quieter period, their great manifestation is scrupulosity;

which he goes on to describe as a sort of inexhaustible anxiety for perfect compliance with the minutest positive commands which may be made the condition of forgiveness for the innumerable lapses of moral obligation. I am not criticising the paper, or I should point out that Bagehot failed in it to draw out the distinction between the primitive moral instinct and the corrupt superstition into which it runs, but I believe that he recognized the weight of this moral testimony of the conscience to a divine Judge, as well as the transcendental testimony of the intellect to an eternal substance of things, to the end of his life. And certainly the reality of human free-will as the condition of all genuine moral life, he firmly believed. In his "Physics and Politics," — the subtle and original essay upon which, in conjunction with the essay on the British Constitution, Bagehot's reputation as a European thinker chiefly rests, — he repeatedly guards himself (for instance, pp. 9, 10) against being supposed to think that in accepting the principle of evolution, he has accepted anything inconsistent either with spiritual creation, or with the free-will of man. On the latter point he adds, "No doubt the modern doctrine of the 'conservation of force,' if applied to decision, is inconsistent with free-will; if you hold that force is 'never lost or gained,' you cannot hold that there is a real gain, a sort of new creation of it in free volition. But I have nothing to do here with the universal 'conservation of force.' The conception of the nervous organs as stores of will-made power, does not raise or need so vast a discussion." And in the same book he repeatedly uses the expression "Providence," evidently in its natural meaning, to express the ultimate force at work behind the march of "evolution." Indeed in conversation with me on this subject he often said how much higher a conception of the creative mind the new Darwinian ideas seemed to him to have introduced, as compared with those contained in what is called the argument from contrivance and design. On the subject of personal immortality too, I do not think that Bagehot ever wavered. He often spoke, and even wrote, of "that vague sense of eternal continuity which is always about the mind, and which no one could bear to lose," and described it as being much more important to us than it even appears to be, important as that is; for he said, "When we think we are thinking of the past, we are only thinking of a future that is to be like it." But with the exception of these cardinal points, I could hardly say how much Bagehot's mind was or was not affected by the great speculative controversies of later years. Certainly he became much more doubtful concerning the force of the historical evidence of Christianity than I ever was, and rejected I think entirely, though on what amount of personal study he had founded his opinion I do not know, the apostolic origin of the fourth Gospel. Possibly his mind may have been latterly in suspense

as to miracle altogether, though I am pretty sure that he had not come to a negative conclusion. He belonged, in common with myself, during the last years of his life, to a society in which these fundamental questions were often discussed, but he seldom spoke in it, and told me very recently that he shrank from such discussions on religious points, feeling that, in debates of this kind, they were not and could not be treated with anything like thoroughness. On the whole, I think, the cardinal article of his faith would be adequately represented even in the latest period of his life by the following passage in his essay on Bishop Butler: —

In every step of religious argument we require the assumption, the belief, the faith, if the word is better, in an absolutely *perfect* Being; in and by whom we are, who is omnipotent as well as most holy; who moves on the face of the whole world, and ruleth all things by the word of his power. If we grant this, the difficulty of the opposition between what is here called the natural and the supernatural religion is removed; and without granting it, that difficulty is perhaps insuperable. It follows from the very idea and definition of an infinitely perfect Being, that he is within us, as well as without us, — ruling the clouds of the air and the fishes of the sea, as well as the fears and thoughts of men; smiling through the smile of nature as well as warning with the pain of conscience, — "sine qualitate bonum; sine quantitate magnum; sine indigentiâ, creatorem; sine situ præsidentem; sine habitu omnia continentem; sine loco ubique totum; sine tempore sempiternum; sine ullâ sui mutatione mutabilia facientem, nihilque patientem." If we assume this, life is simple; without this, all is dark.

After Bagehot had taken his master's degree, and while he was still reading law in London, and hesitating between the bar and the family bank, there came as principal to University Hall (which is a hall of residence in connection with University College, London, established by the Presbyterians and Unitarians after the passing of the Dissenters' Chapel Act) the man who had, I think, a greater intellectual fascination for Bagehot than any of his contemporaries, — Arthur Hugh Clough, fellow of Oriel College, Oxford, and author of various poems of great genius, more or less familiar to the public, though Clough is perhaps better known as the subject of the exquisite poem written on his death in 1861, by his friend Matthew Arnold, — the poem to which he gave the name of "Thyrsis," — than by even the most popular of his own. Bagehot had subscribed for the erection of University Hall, and took an active part at one time on its council. Thus he saw a good deal of Clough, and did what he could to mediate between that enigma to Presbyterian parents, a college-head who held himself serenely neutral on almost all moral and educational subjects interesting to parents and pupils, except the observance of disciplinary rules, and the managing body who bewildered him, and were by him bewildered. I don't think Bagehot and Clough's other friends were very successful in their mediation, but he at least gained in Clough a cordial friend and a theme of profound intellectual and moral interest to himself which lasted him his life, and never failed to draw him into animated discussion long after Clough's own premature death; and I think I can trace the effect which some of Clough's writings had on Bagehot's mind to the very end of his career. There were some points of likeness between Bagehot and Clough, but many more of difference. Both had the capacity for boyish spirits in them, and the florid color which usually accompanies a good deal of animal vigor; both were reserved men with a great dislike of anything like the appearance of false sentiment, and both were passionate admirers of Wordsworth's poetry; but Clough was slightly lymphatic, with a great tendency to unexpressed and unacknowledged discouragement, and to the paralysis of silent embarrassment when suffering from such feelings, while Bagehot was keen, and very quickly evacuated embarrassing positions, and never returned to them. When, however, Clough was happy and at ease, there was a calm and silent radiance in his face, and his head was set with a kind of stateliness on his shoulders, that gave him almost an Olympian air; but this would sometimes vanish in a moment into an embarrassed taciturnity that was quite uncouth. One of his friends declares that the man who was said to be "a cross between a schoolboy and a bishop," must have been like Clough. There was in him, too, a large Chaucerian simplicity and a flavor of homeliness, so that now and then, when the sun shone into his eyes, there was something, in spite of the air of fine scholarship and culture, which reminded one of the best likenesses of Burns. It was of Clough, I believe, that Emerson was thinking (though knowing Clough intimately as he did, he was of course speaking mainly in joke) when he described the Oxford of that day thus: "Ah, says my languid Oxford gentleman, — nothing new, and nothing true, and no

matter." No saying could misrepresent Clough's really buoyant and simple character more completely than that; but doubtless many of his sayings and writings, treating, as they did, most of the greater problems of life as insoluble, and enjoining a self-possessed composure under the discovery of their insolubility, conveyed an impression very much like this to men who came only occasionally in contact with him. Bagehot, in his article on Crabb Robinson, says that the latter, who in those days seldom remembered names, always described Clough as "that admirable and accomplished man,—you know whom I mean,—the one who never says anything." And certainly Clough was often taciturn to the last degree, or if he opened his lips, delighted to open them only to scatter confusion by discouraging, in words at least, all that was then called earnestness,—as, for example, by asking, "Was it ordained that twice two should make four, simply for the intent that boys and girls should be cut to the heart that they do not make five? Be content, when the veil is raised perhaps they will make five! Who knows?" *

Clough's chief fascination for Bagehot was, I think, that he had as a poet in some measure rediscovered, at all events realized as few had ever realized before, the enormous difficulty of finding truth,—a difficulty which he somewhat paradoxically held to be enhanced rather than diminished by the intensity of the truest modern passion for it. The stronger the desire, he teaches, the greater the danger of illegitimately satisfying that desire by persuading ourselves that what we *wish* to believe is true, and the greater the danger of ignoring the actual confusions of human things.

> Rules baffle instincts, instincts rules,
> Wise men are bad, and good are fools,
> Facts evil, wishes vain appear,
> We cannot go, why are we here?
>
> Oh, may we, for assurance' sake,
> Some arbitrary judgment take,
> And wilfully pronounce it clear,
> For this or that 'tis we are here?
>
> Or is it right, and will it do
> To pace the sad confusion through,
> And say, it does not yet appear
> What we shall be—what we are here?

This warning to withhold judgment and not cheat ourselves into beliefs which our own imperious desire to believe had alone engendered, is given with every variety of tone and modulation, and couched in all sorts of different forms of fancy and apologue, throughout Clough's poems. He insists on "the *ruinous* force of the will" to persuade us of illusions which please us; of the tendency of practical life to give us beliefs which suit that practical life, but are none the truer for that; and is never weary of warning us that a firm belief in a falsity can be easily generated:—

> *Action will furnish belief*,—but will that belief be the true one?
> This is the point, you know. However it doesn't much matter.
> What one wants, I suppose, is to predetermine the action,
> So as to make it entail, not a chance belief, but the true one.

This practical preaching, which Clough urges in season and out of season, met an answering chord in Bagehot's mind not so much in relation to religious belief, as in relation to the over-haste and over-eagerness of human conduct, and I can trace the effect of it in all his writings, political and otherwise, to the end of his life. Indeed, it affected him much more in later days than in the years immediately following his first friendship with Clough. With all his boyish dash, there was something in Bagehot even in youth which dreaded precipitancy, and not only precipitancy itself, but those moral situations tending to precipitancy which men who have no minds of their own to make up, so often court. In later life he pleased himself by insisting that, on Darwin's principle, civilized men, with all the complex problems of modern life to puzzle them, suspend their judgment so little, and are so eager as they are for action, only because they have inherited from the earlier, simpler, and more violent ages an excessive predisposition to action unsuited to our epoch and dangerous to our future development. But it was Clough, I think, who first stirred in his mind this great dread of "the ruinous force of the will," a phrase he was never weary of quoting, and which might almost be taken as the motto of his physics and politics, the great conclusion of which is that in the "age of discussion," grand policies, and high-handed diplomacy, and sensational legislation of all kinds will become rarer and rarer, because discussion will point out all the difficulties of such policies in relation to a state of existence so complex as our own, and will in this way tend to repress the

excess of practical energy handed down to us by ancestors to whom life was a sharper, simpler, and more perilous affair.

But the time for Bagehot's full adoption of the suspensive principle in public affairs was not yet. In 1851 he went to Paris, shortly before the *coup d'état*. And while all England was assailing Louis Napoleon (justly enough, as I think) for his perfidy, and his impatience of the self-willed Assembly he could not control, Bagehot was preparing a deliberate and very masterly defence of that bloody and high-handed act. Even Bagehot would, I think, if pressed judiciously in later life, have admitted — though I can't say he ever *did* — that the *coup d'état* was one of the best illustrations of "the ruinous force of the will" in engendering, or at least crystallizing, a false intellectual conclusion as to the political possibilities of the future, which recent history could produce. Certainly he always spoke somewhat apologetically of these early letters, though I never heard him expressly retract their doctrine. In 1851 a knot of young Unitarians, of whom I was then one, headed by the late Mr. J. Langton Sanford — afterwards the historian of the great Rebellion, who survived Bagehot barely four months — had engaged to help for a time in conducting the *Inquirer*, which then was and still is the chief literary and theological organ of the Unitarian body. Our *régime* was, I imagine, a time of great desolation for the very tolerant and thoughtful constituency for whom we wrote; and many of them, I am confident, yearned, and were fully justified in yearning, for those better days when this tyranny of ours should be overpast. Sanford and Osler did a good deal to throw cold water on the rather optimist and philanthropic politics of the most sanguine, because the most benevolent and open-hearted, of Dissenters. Roscoe criticised their literary work from the point of view of a devotee of the Elizabethan poets; and I attempted to prove to them in distinct heads, first that their laity ought to have the protection afforded by a liturgy against the arbitrary prayers of their ministers; and next, that at least the great majority of their sermons ought to be suppressed, and the habit of delivering them discontinued almost altogether. Only a denomination of "just men" trained in tolerance for generations, and in that respect at least made all but "perfect," would have endured it at all; but I doubt if any of us caused the Unitarian body so much grief as Bagehot, who never was a Unitarian, but who contributed a series of brilliant letters on the *coup d'état* in which he trod just as heavily on the toes of his colleagues as he did on those of the public by whom the *Inquirer* was taken. In those letters he not only, as I have already shown, eulogized the Catholic Church, but he supported the prince president's military violence, attacked the freedom of the press in France, maintained that the country was wholly unfit for true parliamentary government, and worst of all, perhaps, insinuated a panegyric on Louis Napoleon himself, and declared that he had been far better prepared for the duties of a statesman in gambling on the turf, than he would have been by poring over the historical and political dissertations of the wise and the good. This was Bagehot's day of cynicism. The seven letters which he wrote on the *coup d'état* were certainly very exasperating, and yet they were not caricatures of his real thought, for his private letters at the time were more cynical still. Crabb Robinson in speaking of him used ever afterwards to describe him to me as "that friend of yours — you know whom I mean, you rascal — who wrote those abominable, those most disgraceful letters on the *coup d'état*, I did not forgive him for years after." Nor do I wonder even now that a sincere friend of constitutional freedom and intellectual liberty, like Crabb Robinson, found them difficult to forgive. They were light and airy and even flippant on a very grave subject. They made nothing of the prince's perjury; and they took impertinent liberties with all the dearest prepossessions of the readers of the *Inquirer*, and assumed their sympathy just where Bagehot knew that they would be most revolted by his opinions. Nevertheless, they had a vast deal of truth in them, and no end of ability. I confess even that I should much like to see them republished. There is a good deal of the raw material of history in them, and certainly I doubt if Bagehot ever again hit the satiric vein of argument so well. Here is a passage that will bear taking out of its context, and therefore not so full of the shrewd malice of these letters as many others, but which will illustrate their ability. It is one in which Bagehot maintained for the first time the view (which I believe he subsequently almost persuaded English politicians to accept, though in 1852 it was a mere flippant novelty, a paradox, and a heresy) that free institutions are apt to succeed with a stupid people, and to founder with a ready-witted and

vivacious one. After broaching this, he goes on: —

I see you are surprised. You are going to say to me, as Socrates did to Polus, "My young friend, *of course* you are right, but will you explain what you mean, as you are not yet intelligible?" I will do so as well as I can, and endeavor to make good what I say, not from a prior demonstration of my own, but from the details of the present and the facts of history. Not to begin by wounding any present susceptibilities, let me take the Roman character, for, with one great exception — I need not say to whom I allude — they are the great political people of history. Now is not a certain dulness their most visible characteristic? What is the history of their speculative mind? A blank. What their literature? A copy. They have left not a single discovery in any abstract science; not a single perfect or well-formed work of high imagination. The Greeks, the perfection of human and accomplished genius, bequeathed to mankind the ideal forms of self-idolizing art; the Romans imitated and admired. The Greeks explained the laws of nature; the Romans wondered and despised. The Greeks invented a system of numerals second only to that now in use; the Romans counted to the end of their days with the clumsy apparatus which we still call by their name. The Greeks made a capital and scientific calendar; the Romans began their month when the *pontifex maximus* happened to spy out the new moon. Throughout Latin literature this is the perpetual puzzle — Why are we free and they slaves? We prætors and they barbers? Why do the stupid people always win and the clever people always lose? I need not say that in real sound stupidity the English people are unrivalled. You'll have more wit, and better wit, in an Irish street-row than would keep Westminster Hall in humor for five weeks. . . . These valuable truths are no discoveries of mine. They are familiar enough to people whose business it is to know them. Hear what a douce and aged attorney says of your peculiarly promising barrister. "Sharp? Oh! yes, yes; he's too sharp by half. He isn't *safe*, not a minute, isn't that young man." "What style, sir," asked of an East India director some youthful aspirant for literary renown, "is most to be preferred in the composition of official despatches?" "My good fellow," responded the ruler of Hindostan, "the style *as we* like, is the Humdrum."

The permanent value of these papers is due to the freshness of their impressions of the French capital, and their true criticisms of Parisian journalism and society; their perverseness consists in this, that Bagehot steadily ignores the distinction between the duty of resisting anarchy, and the assumption of the prince president that this could only be done by establishing his own dynasty and deferring *sine die* that great constitutional experiment which is now once more, no thanks to him or his government, on its trial; an experiment which, for anything we see, had at least as good a chance then as now, and under a firm and popular chief of the executive like Prince Louis, would probably have had a better chance then than it has now under MacMahon.

During that residence in Paris, Bagehot, though, as I have said, in a somewhat cynical frame of mind, was full of life and courage, and was beginning to feel his own genius, which, perhaps, accounts for the air of recklessness so foreign to him, and which he never adopted either before or since. During the riots he was a good deal in the streets, and, from a mere love of art, helped the Parisians to construct three of their barricades "with as much keenness," he wrote, "as though I had been clerk of the works," notwithstanding the fact that his own sympathy was with those who shot down the barricades, not with those who manned them. He was very much struck by the ferocious look of the Montagnards. "If you want a Satan," he wrote, "any odd time, they'll do; only I hope that *he* don't believe in human brotherhood. It is not possible to respect any one who does, and I should be loth to confound the notion of *our* friend's solitary grandeur by supposing him to fraternize, etc." "I think M. Buonaparte is entitled to great praise. He has very good heels to his boots, and the French just want treading down, and nothing else, calm, cruel, business-like oppression to take the dogmatic conceit out of their heads. The spirit of generalization which John Mill tells us honorably distinguishes the French mind, has come to this, that every Parisian wants his head *tapped* in order to get the formulæ and nonsense out of it. And it would pay to perform the operation, for they are very clever on what is within the limit of their experience and all that can be 'expanded' in terms of it, but beyond, it is all generalization and folly. . . . So I am for any carnivorous government."

Of course that is a gross caricature not only of his maturer mind but even of the judgment of the published letters, and I quote it only to show that at the time when he composed these letters on the *coup d'état*, Bagehot's mood was that transient mood of reckless youthful cynicism through which so many men of genius pass. I do not think he had at any time any keen sympathy with the multitude, *i.e.* with masses of unknown men. And that he ever felt what has since then been

termed "the enthusiasm of humanity," the sympathy with "the toiling millions of men sunk in labor and pain," he himself would strenuously have denied. Such sympathy, even when really yearned for, is, indeed, very much oftener coveted than really felt by men as a living motive; and I am not quite sure that Bagehot would have even wished to feel it. Nevertheless he had not the faintest trace of real hardness about him towards people whom he knew and understood. He could not bear to give pain; and when, in rare cases by youthful inadvertence, he gave it needlessly, I have seen how much and what lasting vexation it caused him. Indeed, he was capable of great sacrifices to spare his friends but a little suffering.

It was, I think, during his stay in Paris that Bagehot finally decided to give up the notion of practising at the Bar and to join his father in the Somersetshire bank and in his other business. He thoroughly liked the law; in his friend the late Mr. Justice Quain's chambers, and in those of the present vice-chancellor Sir Charles Hall, he had learnt a good deal that was of great use to him in later life. And in spite of his really large capacity for finance and commerce, there were difficulties in Bagehot's way as a banker and merchant which he felt somewhat keenly. He was always absent-minded about minutiæ. For instance, to the last, he could not correct a proof well, and was sure to leave a number of small inaccuracies, harshnesses, and slipshodnesses in style, uncorrected. He declared at one time that he was wholly unable to "add up," and in his mathematical exercises in college he had habitually been inaccurate in trifles. I remember Professor Malden, in returning one of his Greek exercises, saying to him with that curiously precise and emphatic articulation which made every remark of his go so much farther than that of our other lecturers, "Mr. Bagehot, you wage an internecine war with your aspirates," — not meaning, of course, that he ever left them out in pronunciation, but that he neglected to put them in in his written Greek. And to the last, even in his printed Greek quotations, the slips of this kind were always numerous. This habitual difficulty, due, I believe, to a preoccupied imagination, in attending to small details, made a banker's duties look irksome and formidable to him at first; and even to the last, in his most effective financial papers, he would generally get some one else to look after the precise figures for him. But in spite of all this, and in spite of a real attraction for the study of law, he was sure that his head would not stand the hot courts and heavy wigs which make the hot courts hotter, or the night-work of a thriving barrister in case of success; and he was certainly quite right. Indeed, had he chosen the bar he would have had no leisure for the two or three remarkable books which have made his reputation, which have been already translated into all the literary and some of the unliterary languages of Europe, and two of which are, I believe, used as text-books in some of the American colleges. Moreover, in all probability his life would have been much shorter into the bargain. Soon after his return from Paris he devoted himself in earnest to banking and commerce, and also began that series of articles, first for the *Prospective* and then for the *National Review* (which latter periodical he edited in conjunction with me for several years), the most striking of which he republished in 1858, under the awkward and almost forbidding title of "Estimates of some Englishmen and Scotchmen," — a book which never attracted the attention it deserved, and which has now been long out of print.

I confess I have never understood the failure of that brilliant book. No doubt there are many faults of workmanship in it. Now and then the banter is forced. Often enough the style is embarrassed. Occasionally, perhaps, the criticism misses its mark, or is over-refined. But taken as a whole I hardly know any book that is such good reading, that has so much lucid vision in it, so much shrewd and curious knowledge of the world, so sober a judgment and so dashing a humor combined. Take this, for instance, out of the paper on "The First Edinburgh Reviewers" concerning the judgment passed by Lord Jeffrey on the poetry of Bagehot's favorite poet, Wordsworth: —

> The world has given judgment. Both Mr. Wordsworth and Lord Jeffrey have received their rewards. The one had his own generation, the laughter of men, the applause of drawing-rooms, the concurrence of the crowd; the other a succeeding age, the fond enthusiasm of secret students, the lonely rapture of lonely minds. And each has received according to his kind. If all cultivated men speak differently because of the existence of Wordsworth and Coleridge; if not a thoughtful English book has appeared for years without some trace for good or for evil of their influence; if sermon-writers subsist upon their thoughts; if "sacred" poets thrive by translating their weaker portions into the speech of women; if, when all this is over, some suffi-

cient part of their writing will ever be fitting food for wild musing and solitary meditation, surely this is because they possessed the inner nature, — an "intense and glowing mind," — "the vision and the faculty divine." But if perchance in their weaker moments the great authors of the "Lyrical Ballads" did ever imagine that the world was to pause because of their verses, that "Peter Bell" would be popular in drawing-rooms, that "Christabel" would be perused in the city, that people of fashion would make a hand-book of the "Excursion," it was well for them to be told at once that it was not so. Nature ingeniously prepared a shrill, artificial voice, which spoke in season and out of season, enough and more than enough, what will ever be the idea of the cities of the plain concerning those who live alone among the mountains; of the frivolous concerning the grave; of the gregarious concerning the recluse; of those who laugh concerning those who laugh not; of the common concerning the uncommon; of those who lend on usury concerning those who lend not; the notions of the world of those whom it will not reckon among the righteous. It said, "This won't do." And so in all times will the lovers of polished Liberalism speak concerning the intense and lonely "prophet."

I choose that passage because it illustrates so perfectly Bagehot's double vein, his sympathy with the works of high imagination, and his clear insight into that busy life which does not and cannot take note of works of high imagination, and which would not do the work it does, if it could. And this is the characteristic of the whole book. How admirably, for instance, in his paper on Shakespeare, does he draw out the individuality of a poet who is generally supposed to be so completely hidden in his plays; and with how keen a satisfaction does he discern and display the prosperous and practical man in Shakespeare,— the qualities which made him a man of substance and a conservative politician, as well as the qualities which made him a great dramatist and a great dreamer. No doubt Bagehot had a great personal sympathy with the double life. Somersetshire probably never believed that the imaginative student, the omnivorous reader, could prosper as a banker and a man of business, and it was a satisfaction to him to show that he understood the world far better than the world had ever understood him. Again how delicate is his delineation of Hartley Coleridge; how firm and clear his study of Sir Robert Peel; and how graphically he paints the literary pageant of Gibbon's tame but splendid genius. Certainly the literary taste of England never made a greater blunder than when it passed by this remarkable volume of essays almost without notice.

In 1858 Bagehot married the eldest daughter of the Right Honorable James Wilson, who died two years later in India, whither he had gone as the financial member of the Indian Council, to reduce to some extent the financial anarchy which then prevailed there. This marriage gave Bagehot nineteen years of undisturbed happiness, and certainly led to the production of his most popular and original, if not in every respect his most brilliant books. It connected him with the higher world of politics, without which he would hardly have studied and written as he did on the British Constitution; and by making him the editor of the *Economist*, it compelled him to give his whole mind as much to the theoretic side of commerce and finance, as his own duties had already compelled him to give it to the practical side. But when I speak of his marriage as the last impulse which determined his chief work in life, I do not forget that he had long been prepared, both for political and for financial speculation, by his early education. His father, a man of firm and deliberate political convictions, had taken a very keen interest in the agitation for the great Reform Bill of 1832, and probably no one in all England knew the political history of the country since the peace more accurately. Bagehot often said that when he wanted any detail concerning the English political history of the last half-century, he had only to ask his father, to obtain it. His uncle, Mr. Vincent Stuckey, too, was a man of the world, and his house in Langport a focus of many interests during Bagehot's boyhood. Mr. Stuckey had begun life at the Treasury, and was at one time private secretary to Mr. Huskisson; and when he gave up that career to take a leading share in the Somersetshire bank, he kept up for a long time his house in London and his relations with political society there. He was fond of his nephew, as was Bagehot of him; and there was always a large field of interests, and often there were men of great eminence, to be found in his house. Thus Bagehot had been early prepared for the wider field of political and financial thought to which he gave up so much of his time after his marriage.

I need not say nearly so much on this later aspect of Bagehot's life as I have done on its early and more purely literary aspects, because his services in this direction are already well appreciated by the public; and the readers of the *Fort-*

nightly Review in particular have had unusual opportunities of estimating his powers, both as a student of political phenomena, special and general, and also as an economic thinker. But this I should like to point out, that he could never have written as he did on the British Constitution, without having acutely studied living men and their ways of acting on each other; that his book was essentially the book of a most realistic, because a most vividly imaginative observer of the actual world of politics,— the book of a man who was not blinded by habit and use to the enormous difficulties in the way of "government by public meeting," and to the secret of the various means by which in practice those difficulties had been attenuated or surmounted. It is the book of a meditative man who had mused much on the strange workings of human instincts, no less than of a quick observer who had seen much of external life. Had he not studied the men before he studied the institutions, had he not concerned himself with individual statesmen before he turned his attention to the mechanism of our parliamentary system, he could never have written the book on the British Constitution.

I think the same may be said of the book on "Physics and Politics," a book in which I find new force and depth every time I take it up afresh. It is true that Bagehot had a keen sympathy with natural science, that he devoured all Mr. Darwin's and Mr. Wallace's books, and many of a much more technical kind, as, for example, Professor Huxley's on the principles of physiology, and grasped the great ideas contained in them with a firmness and precision that left nothing to be desired. But after all, "Physics and Politics" could never have been written without that sort of living insight into man which was the life of all his earlier essays. The notion that a "cake of custom" of rigid, inviolable law, was the first requisite for a strong human society, and that the very cause which was thus essential for the *first* step of progress,— the step toward unity,— was the great danger of the second step,— the step out of uniformity, — and was the secret of all arrested and petrified civilizations, like the Chinese, is an idea which first germinated in Bagehot's mind at the time he was writing his cynical letters from Paris about stupidity being the first requisite of a political people; though I admit, of course, that it could not have borne the fruit it did without Mr. Darwin's conception of a natural selection through conflict, to help it on. Such passages as the following could evidently never have been written by a mere student of Darwinian literature, nor without the trained imagination exercised in Bagehot's literary essays: —

> No one will ever comprehend the arrested civilizations unless he sees the strict dilemma of early society. Either men had no law at all and lived in confused tribes, hardly hanging together, or they had to obtain a fixed law by processes of incredible difficulty. Those who surmounted that difficulty, soon destroyed all those that lay in their way who did not. And then they themselves were caught in their own yoke. The customary discipline which could only be imposed on any early men by terrible sanctions, continued with those sanctions, and killed out of the whole society the propensities to variation which are the principles of progress. Experience shows how incredibly difficult it is to get men really to encourage the principle of originality,

and, as Bagehot held, for a very good reason, namely, that without a long accumulated and inherited tendency to *discourage* originality, society would never have gained the cohesion requisite for effective common action against its external foes. No one, I think, who had not studied as Bagehot had in actual life, first, the vast and unreasoning conservatism of politically strong societies, like that of rural England, and next the perilous mobility and impressibility of politically weak societies, like that of Paris, would ever have seen as he did the close connection of these ideas with Mr. Darwin's principle of natural selection by conflict. And here I may mention, by way of illustrating this point, that Bagehot delighted in observing and expounding the bovine slowness of rural England in acquiring a new idea. Somersetshire, he used to boast, would not subscribe £1,000 "to be represented by an archangel," and in one letter which I received from him during the Crimean War, he narrated with great gusto an instance of the tenacity with which a Somersetshire rustic stuck to his own notion of what was involved in conquering an enemy. "The Somersetshire view," he wrote, "of the chance of bringing the war to a successful conclusion, is as follows: — Countryman: 'How old, zir, be the zar?' — *Myself:* 'About 63.' — Countryman: 'Well, now, I can't think however they be to take he. They do tell I that Rooshia is a very big place, and if he doo goo right into the middle of 'n, you could not take he, not nohow.' I talked till the train came (it was at a station), and

endeavored to show how the war might be finished without capturing the czar, but I fear without effect. At last he said, 'Well, zir, I hope, *as you do say*, *zir*, we shall take he,' as I got into the carriage." It is clear that the humorous delight which Bagehot took in this tenacity and density of rural conceptions, was partly the cause of the attention which he paid to the subject. No doubt there was in him a vein of purely instinctive sympathy with this density, for intellectually he could not even have understood it. Writing on the intolerable and fatiguing cleverness of French journals, he describes in one of his Paris letters the true enjoyment he felt in reading a thoroughly stupid article in the *Herald* (a Tory paper now no more), and I believe he was quite sincere. It was, I imagine, a real pleasure to him to be able to preach in his last general work that a "cake of custom," just sufficiently stiff to make innovation of any kind very difficult, but not quite stiff enough to make it impossible, is the true condition of durable progress.

I do not myself rate Bagehot's sagacity as a practical politician nearly so highly as I rate his wise analysis of the growth and *rationale* of political institutions. Everything he wrote on the politics of the day was instructive, but, to my mind at least, seldom decisive, and, as I thought, often not true. He did not feel, and avowed that he did not feel, much sympathy with the masses, and he attached far too much relative importance to the refinement of the governing classes. That, no doubt, is most desirable, if you can combine it with a genuine consideration for the interests of "the toiling millions of men sunk in labor and pain." But experience, I think, sufficiently shows that they are often, perhaps even generally, incompatible; and that democratic governments of very low tone may consult more adequately the leading interests of the "dim, common populations" than aristocratic governments of very high calibre. Bagehot hardly admitted this, and always seemed to me to think far more of the intellectual and moral tone of governments than he did of the intellectual and moral interests of the people governed.

Again, those who felt most profoundly Bagehot's influence as a political thinker, would probably agree with me that it was his leading idea in politics to discourage anything like too much action of any kind, legislative or administrative, and most of all anything like an ambitious colonial or foreign policy. This was not owing to any *doctrinaire* adhesion to the principle of *laissez-faire*. He supported, hesitatingly no doubt, but in the end decidedly, the Irish Land Bill, and never belonged to that straitest sect of the economists who decry, as contrary to the laws of economy, and little short of a crime, the intervention of government in matters which the conflict of individual self-interests might fairly be trusted to determine. It was from a very different point of view that he was so anxious to deprecate ambitious policies, and curb the practical energies of the most energetic of peoples. Next to Clough, I think that Sir George Cornewall Lewis had the most powerful influence over him in relation to political principles. There has been no statesman in our time whom he liked so much or regretted so deeply; and he followed him most of all in deprecating the greater part of what is called political *energy*. Bagehot held with Sir George Lewis that men in modern days do a great deal too much; that half the public actions, and a great many of the private actions of men, had better never have been done; that modern statesmen and modern peoples are far too willing to burden themselves with responsibilities. He held, too, that men have not yet sufficiently verified the principles on which action ought to proceed, and that till they have done so, it would be better far to act less. Lord Melbourne's habitual query, "Can't you let it alone?" seemed to him, as regarded all new responsibilities, the wisest of hints for our time. He would have been glad to find a fair excuse for giving up India, for throwing the colonies on their own resources, and for persuading the English people to accept deliberately the place of a fourth or fifth rate European power — which was not in his estimation a cynical or unpatriotic wish, but quite the reverse, for he thought that such a course would result in generally raising the calibre of the national mind, conscience, and taste. In his "Physics and Politics" he urges generally, as I have before pointed out, that the practical energy of existing peoples in the West is far in advance of the knowledge that would alone enable them to turn that energy to good account. He wanted to see the English a more leisurely race, taking more time to consider all their actions, and suspending their decisions on all great policies and enterprises till either these were well matured, or, as he expected it to be in the great majority of cases, the opportunity for sensational action was gone by. He quotes from Clough what

really might have been taken as the motto of his political creed : —

> Old things need not be therefore true,
> O brother men, nor yet the new ;
> Ah, still awhile th' old thought retain,
> And yet consider it again.

And in all this, if it were advanced rather as a principle of education than as a principle of political practice, there would be great force. But when he applied this teaching, not to the individual but to the State, not to encourage the gradual formation of a new type of character, but to warn the nation back from a multitude of practical duties of a simple though arduous kind, such as those, for example, which we have undertaken in India, — duties, the value of which, performed even as they are, could hardly be overrated, if only because they involve so few debatable and doubtful assumptions, and are only the elementary tasks of the hewers of wood and drawers of water for the civilization of the future, — I think Bagehot made the mistake of attaching far too little value to the moral instincts of a sagacious people, and too much to the refined deductions of a singularly subtle intellect. I suspect that the real effect of suddenly stopping the various safety-valves by which the spare energy of our nation is diverted to the useful work of roughly civilizing other lands, would be, not to stimulate the deliberative understanding of the English people, but to stunt its thinking as well as its acting powers, and render it more frivolous and more vacant-minded than it is.
