Cham, kaam [French for Ham, son of Noah]: assumed name of Amédée de Noé, a French caricaturist; b. in Paris, Jan. 26, 1819, of noble family; studied with Delaroche and Charlet. His first grotesque sketches appeared in 1842, and then followed an uninterrupted series in almanacs and in *Charivari*. The sketches are social rather than political pictorial satires, of which the best collections are *Douze Années Comiques* (1880) and *Les Folies Parisiennes* (1883). D. Sept. 6, 1879.

Chamæ'leon [the older Eng. spelling *camelion* has been in this century readapted to Gr. original χαμαιλέων; χαμαί, on ground + λέων, lion]: a saurian reptile of the genus *Chamæleo*, which constitutes a family (*Chamæleontidæ*), representing a separate tribe (*Dendrosaura*) of lizards. They have a compressed body, with granular scales; the head almost fixed, but the eyes with a wonderful power of motion, each eye being covered by a lid pierced with one small hole; ears beneath the skin; the tail prehensile; the movements extremely slow; the tongue cylindrical and extensile, in appearance resembling a common angle-worm; the toes in two opposible sets, fitted for grasping boughs, etc. About forty species are known, nearly half of which are found in Madagascar. The rest occur in Africa, one species extending into Asia and Southern Europe. Many fables have been related of the chamæleon, such as that it lives upon air,

has the power of changing color at will, or assuming the color of the object upon which it is placed. The food of the chamæleon is insects, which it catches by darting out its long, sticky tongue; but its lungs are large, and it has a habit of enormously dilating itself with air. Its changes of color are not altogether voluntary, and it does not appear to assimilate its color to the object upon which it is placed. But its colors are somewhat changeable. This has been explained (1) by the action of the nervous energy, which, as in blushing, may perhaps affect the circulation of the blood in the skin, and it is certain that fear or other emotions will cause the color to change; (2) by the varied amount of air in the animal's lungs; (3) by the action of light; (4) by the presence of two differently colored layers of pigment-cells in the skin, so arranged as to move upon each other and produce various effects of color. It is probable that all these conditions may contribnte to the result.

Chamæleon.

It is said that that lack of nervous co-ordination between the two sides, which in most animals is only seen in diseased or defective organizations, is either normal to the chamæleon or is very easily produced in it. It is even asserted that one side of the reptile may be awake while the other is asleep. In the Southern U. S. the term is popularly applied to *Anolis principalis*, a small green lizard of the family *Iguanidæ*. See Anolis. Revised by F. A. Lucas.

Chamæleon, of Heraclea on the Pontus: disciple of Aristotle or Theophrastus, and rival of Heraclides Ponticus. He was one of those Peripatetics who had an especial turn for the history of literature, and in his essays on the poets he undertook to idealize their lives as well as to criticise their works. His philosophical writings pertained chiefly to ethics. See Köpke, *De Chamæleonte Heracleota* (1856); Clinton, *Fasti Hellenici* (vol. iii., p. 493).

Chamæ'rops [Gr. χαμαίρωψ, the name of a plant; χαμαί, on the ground, low growing, ῥώψ, shrub or bush, alluding to the low growth of the plants]: a small genus of two or possibly a few species of fan-leaved palms, natives of the region bordering on the Mediterranean Sea. They usually form low trees a few feet high, but in favorable climates they attain a height of 20 or more feet. The edible fruit is globose or ovoid, one-seeded, and resembles an olive in appearance. The leaves yield a valuable fiber (made into carpets, cordage, paper, etc.), and are used also for making hats, brooms, chair-seats, etc. *C. humilis* and *C. macrocarpa* are the two species generally recognised by botanists. C. E. B.

Cham'ba: a native hill-state in the Punjab, British India, adjoining Kashmir; in lat. 33° N. and lon. 76° E. Area, 3,180 sq. miles. Pop. about 120,000. It is very mountainous, has extensive forests, and produces wheat, millet, timber, wax, nuts, honey, lime, and slate. The British sanatorium Dalhousie is within its limits.

Chamber: an apartment of a house; a private apartment; a lodging-room; a hollow or cavity, as the chamber of the ear. In politics the term is often applied to a legislative assembly, as the Chamber of Deputies in France. The room which the U. S. Senate occupies is called the Senate chamber. Chamber of commerce is the title of an association or body of merchants which is commonly formed in each large commercial city for the promotion of the mercantile interests and general prosperity of the place.

Chamber of a muzzle-loading cannon or small firearm is the contracted part of the bore at the breech end. The chamber contains the charge of powder, but it is too small to admit the shot or shell. These cavities are of various forms, spherical, cylindrical, conical, etc.

In breech-loading guns the chamber is cylindrical, and is larger in diameter than the bore to which it is joined by a case, which is made long to prevent erosion from the rush of gas against a sudden contraction in diameter.

Cham'berlain [viâ O. Fr. from Germ.; cf. O. H. Germ. *chamarling*]: an officer attached to the court of a monarch, and who formerly had charge of the private apartments of the palace. He was originally the keeper of the treasure-chamber. The office of chamberlain was one of the grand offices of the crown in France. The lord chamberlain of England is an officer of high rank in the royal household, and has the function of indorsing the king's answer on petitions presented to him, and often communicates his (or her) Majesty's pleasure to Parliament and to the council. He has control over all the officers and servants of the royal chambers except those of the bedchamber, issues invitations to court ceremonials, and regulates presentations to the sovereign. All tradesmen and artificers in the service of the sovereign are appointed by him. He is a member of the privy council, receives £2,000 a year, and goes out of office with his party.

The lord great chamberlain, another officer, is an official of the British court, of noble birth, and holds the title by inheritance. He has charge of the House of Lords during sessions, walks by the right hand of the sovereign in certain processions, and performs many other duties.

Chamberlain: city (founded in 1881); capital of Brulé co., S. Dak. (for location of county, see map of South Dakota, ref. 7–E); on the Missouri river, and Chicago, Milwaukee and St. Paul R. R.; 180 miles N. W. of Sioux City, Ia. It has a first-class steamboat landing, in a fertile country, and has a good river traffic and a wholesale trade with neighboring towns. Pop. (1890) 939; (1900) 874.

Editor of "Register."

Chamberlain, Alexander Francis: See the Appendix.

Chamberlain, Daniel Henry: b. in West Brookfield, Mass., June 23, 1835; graduated at Yale College with high honors 1862, and at the Harvard Law School; entered the army in 1864 as lieutenant in the Fifth Massachusetts Colored Cavalry; promoted to be captain, and served in Maryland, Louisiana, and Texas; went to South Carolina in 1866, and for two years was engaged as a cotton-planter. He was a delegate to the constitutional convention, and subsequently attorney-general of the State for four years: Governor of South Carolina 1875–76; renominated in 1876 and reinaugurated Jan., 1877; but, his election being contested by Wade Hampton, and President Hayes having removed the U. S. troops from the State, he withdrew Apr. 10, 1877. Became engaged in the practice of law in New York city June, 1877.

Chamberlain, Jacob: See the Appendix.

Chamberlain, Joseph, M. P., P. C.: English public man; b. in London, 1836; educated at University College School; became a member of his father's firm of wood-screw makers at Birmingham; retired from the firm in 1874; became noted for his advanced radical opinions and his ability as a speaker; chairman of the Birmingham School Board 1873–76; mayor of Birmingham 1874–76; stood for Parliament 1874, but was unsuccessful; elected to Parliament in June, 1876, from Birmingham; favored disestablishment and compulsory education; re-elected for Birmingham 1880; president of the Board of Trade in Mr. Gladstone's cabinet 1880; prepared and passed the Bankruptcy Act; president of the Local Government Board in Mr. Gladstone's cabinet 1886; resigned by reason of not agreeing with the Prime Minister's Irish Home Rule measures; elected in 1886 to Parliament as a Unionist and withdrew from the Liberal party; commissioner to the conference at Washington for the settlement of the dispute between the U. S. and Canada on the fisheries question, 1887; Secretary of State for the Colonies in Salisbury's cabinet since 1895. In Nov., 1888, he married a daughter of William C. Endicott, Secretary of War in President Cleveland's first administration, 1885–89. C. H. Thurber.

Chamberlain, Joshua Lawrence, LL. D.: general and educator; b. in Bangor, Me., Sept. 8, 1828; graduated at Bowdoin College in 1852, and Bangor Theological Seminary 1855; taught at Bowdoin until he entered the volunteer service of the U. S. in 1862; became a major-general Mar. 29, 1865; received the colors of Lee's army on its surrender in April. He was six times wounded while in the Army of the Potomac, three times severely, and was promoted brigadier-general on the field by Gen. Grant for signal gallantry in the assault on Petersburg, June 18, 1864. He returned to his professorship at Bowdoin College, and while there, from 1867 to 1871 inclusive, was Governor of Maine. He was president of Bowdoin College 1871–83. As major-general of Maine militia, he played an important part in maintaining the peace of the State during the political anarchy of 1880.

Chamberlain, Montague: See the Appendix.

Chamberlain, Thomas Chrowder, Ph. D., LL. D.: an American geologist and educator; b. near Mattoon, Ill.,

Sept. 25, 1843; educated at Beloit College and the University of Michigan; Professor of Natural Sciences in Whitewater Normal School 1869–73; afterward Professor of Geology in Beloit College; president of the University of Wisconsin 1887–92; dean of Scientific Faculty of University of Chicago since 1892. In 1873 he joined the Geological Survey of Wisconsin as an assistant, and in 1876 was made chief geologist. Under his direction the work was pushed to a conclusion and the results published. In the first volume of the final report he gave a general treatise on geology as illustrated by the phenomena of the State, and in other volumes he laid the foundation for the classification and interpretation of the glacial drift of the Northern States by tracing out the "Kettle" moraine and developing the theory of the lobation of the Pleistocene ice-sheet. In 1882 he accepted charge of the glacial division of the U. S. Geological Survey, and extended to a broader field the systematic investigations begun in Wisconsin. Among his later papers are *The Terminal Moraine of the Second Glacial Epoch*; *The Driftless Area of the Upper Mississippi Valley*; *The Rock Scorings of the Great Ice Invasion*; and *The Requisite and Qualifying Conditions of Artesian Wells*—all printed by the U. S. Geological Survey. G. K. G.

Chambers, in law. A judge is said to act at "chambers" when a legal proceeding is carried on before him out of court, either at his office or residence or other convenient place, including the court-room itself. Business done before a judge at chambers, as distinguished from that transacted in court, is increasing in modern times. The codes of procedure in some of the American States expressly provide that certain acts shall be done by the *court*, and others by a *judge*, referring in the last instance to an act done at chambers. Through the same medium a great change has been worked in England in the practice of the court of chancery. Formerly the details of business in that court were transacted by an officer termed "master in chancery," who exercised an almost independent jurisdiction, acting without communicating with the judge until he made report of his conclusions, which was then submitted to the court as a basis for its decree. By the 16 Vict., ch. 80, the office of master was abolished, and the business formerly committed to him was directed to be transacted under the direction and control of the judge, or, in other words, at chambers. Under this system each of the judges has under his control chief clerks and junior clerks, who act in his behalf in taking accounts and making inquiries, and who are more directly responsible to him than were the masters under the earlier practice. Under the law of 1873 (which went into effect Nov. 2, 1874) for the reorganization of the English courts (36 and 37 Vict., ch. 66), the duties of chamber clerks are to be performed by officers of the court in the permanent civil service of the crown. The same law also provides for official and special referees, who may, under the direction of a court or judge, perform acts similar to those formerly intrusted to masters in chancery.

Chambers, Edward T. D.: See the Appendix.

Chambers, Robert, LL. D.: author and publisher; b. at Peebles, Scotland, July 10, 1802; brother of William (*q. v.*); self-educated owing to his father's reverses; apprenticed in the book-trade in Edinburgh; published twenty volumes of his own authorship. He entered into partnership with his brother William in 1832, after which they published many cheap and popular works entited *Information for the People*; *Cyclopædia of English Literature*; *Papers for the People*; *Chambers's Encyclopædia* (1859–68), etc. Of his own books, *Vestiges of Creation* (1844) was a stirring scientific publication, anticipating many of the speculations of Charles Darwin. It appeared anonymously; was assailed by the orthodox; its authorship acknowledged in the twelfth edition (1884), although it had been credited to him since 1854. He also wrote a *History of Rebellions in Scotland* (3 vols., 1829); *Popular Rhymes of Scotland* (1847); *Life and Works of Robert Burns* (1851); *Domestic Annals of Scotland* (3 vols., 1861); and seven volumes of *Select Writings* (1847). See his brother's *Memoir of William and Robert Chambers* (13th ed. 1884). D. at St. Andrews, Scotland, Mar. 17, 1871.

Chambers, Talbot Wilson, LL. D.: b. in Carlisle, Pa., Feb. 25, 1819; graduated at Rutgers College 1834; studied theology at New Brunswick and at Princeton, N. J.; licensed to preach at Clinton, Miss., in 1838, and in Oct., 1839, became pastor of the Second Reformed Dutch church, Somerville, N. J.; in Dec., 1849, was installed as one of the pastors of the Collegiate Dutch church, New York. He published *The Noon Prayer-meeting in Fulton Street* (New York, 1857); *Memoir of Theodore Frelinghuysen*: *The Psalter a Witness for the Divine Origin of the Bible* (1876); *Companion to the Revised Version of the Old Testament* (1885), etc. He was a member of the American Bible Revision Committee. D. in New York, Feb. 3, 1896.

Chambers, Sir William: architect; b. of Scotch parents at Stockholm, Sweden, 1726; taken to England when two years old; after much travel settled in his profession at London 1744; taught the young prince who afterward became George III. the elements of architecture. He is chiefly known for his designs carried out in the Royal Gardens at Kew; for Somerset House, London; and Milton Abbey. Author of a *Treatise on Civil Architecture* (1759), and a *Dissertation on Oriental Gardening* (1772), which brought him much ridicule. D. in London, Mar. 8, 1796.

Chambers, William, LL. D.: author and editor; brother of Robert (*q. v.*); b. at Peebles, Scotland, Apr. 16, 1800. He founded Chambers's *Edinburgh Journal* in 1832, and became a partner with his brother in an extensive publishing-house of Edinburgh. They were distinguished for their enterprise and their successful efforts to supply the people with cheap and instructive literature. They were the founders of *Chambers's Encyclopædia* (1859–68; n. ed. 1888–93). He was the author of several works, among which is *Things as they are in America*. He was chosen lord provost of Edinburgh in 1865; served four years and greatly improved the sanitation of the city. He restored St. Giles's church, Edinburgh, at his own charges. The tender of a baronetcy reached his house on the day of his death, May 20, 1883.

Chambersburg: borough; capital of Franklin co., Pa. (for location of county, see map of Pennsylvania, ref. 6–E); on Cumb. Val., Mont Alto, and West. Ma. R. Rs.; on the Conococheague and Falling Spring creeks. It has manufactories of shoes, stockings, wool, paper, milling machinery, furniture, stationary engines, boilers, and iron; an academy, a female college, and well-conducted public schools. It was settled by the Scotch-Irish. On July 30, 1864, a body of Confederate cavalry under Gen. McCausland entered the town and laid it under tribute of $200,000 in gold or half a million in currency; this demand not being complied with by the inhabitants, McCausland ordered the town to be fired; loss, $1,000,000. About two-thirds of the place was destroyed and 2,500 persons were deprived of their homes. It has been entirely rebuilt. Pop. (1880) 6,877; (1890) 7,863; (1900) 8,864.

Editor of "Franklin Repository."

Chambersburg: Mercer co., N. J. (for location of county, see map of New Jersey, ref. 4–C); on railroad and on Delaware river; was formed in 1872 from part of Hamilton township, but since the census of 1880 has been annexed to Trenton. Pop. (1880) 5,437.

Chambers of Commerce: voluntary associations of merchants and others for the protection and promotion of the commercial interests of the city, district, or country in which such associations are formed. They are, as a rule, incorporated, and may accomplish their ends in various ways; as, for instance, by presenting petitions to legislative bodies or by urging the adoption of measures calculated to benefit the public; by collecting and publishing statistics; by obtaining peculiar advantages through combination with similar associations; or by serving as a court of arbitration to which disputes are referred. A chamber of commerce may exist as a distinct body, may form a department of a board of trade, as is sometimes the case in the U. S., or may correspond so closely with a board of trade as to be called indifferently by either name. France, which established courts for the decision of disputes in trade as early as 1549 (at Toulouse), has the credit of establishing the first chamber of commerce. This was formed at Marseilles, about the end of the fourteenth century or the beginning of the fifteenth, but was not fully organized until 1650. Dunkirk followed in 1700, and in that same year Paris established a council-general of commerce whose officers consisted of six councilors of state and twelve merchants, representing, as delegates, the chief commercial centers of France. Lyons instituted a chamber in 1702: Toulouse in 1703, and soon such organizations became very common in that country and in other parts of Europe. In 1791 the French chambers were suppressed by the National Assembly, but in 1802 were re-established, and have met with no further reverses

except that their organization has been thrice modified and their independence somewhat limited. A close connection exists between them and the general Government, which is kept informed by them as to the industrial as well as the commercial status of their respective districts.

The chamber of commerce at Glasgow, instituted and incorporated in Jan., 1783, is without doubt the oldest in Great Britain. That at Edinburgh was instituted in 1785 and incorporated in 1786. The Manchester chamber, which, like that of Edinburgh, has been prominent in advocating free-trade principles, was established in 1820. The next in order of establishment in England was that of Hull (1837). The chambers of Liverpool, Leeds, and Bradford were established in 1850. The London Chamber of Commerce, the most important in the United Kingdom, was not established until 1882. An association of chambers of commerce of the United Kingdom, established in 1860, has done much to promote the commercial interests of the empire, by bringing together annually delegates from the chambers of all the trading-centers of Great Britain and Ireland and the colonies.

The New York Chamber of Commerce, the oldest in the U. S., was formed in Apr., 1768, by twenty merchants, and received a royal charter in 1770. In Apr., 1784, it was reorganized and received a new charter from the State Legislature, which, in response to its petition, ordered that duties should be levied under a specific instead of an *ad valorem* tariff. It has an arbitrator, nominated by the Governor and appointed with the consent of the State Senate. Its membership is 1,000. The Boston Chamber of Commerce was established not many years after that of New York. Similar organizations exist in many other U. S. cities, as also in those of Canada, which are united in a Dominion Board of Trade. In 1850 a chamber of commerce was established in South Australia, and one may be found in nearly every city throughout the globe which has commerce of any importance.

Chambéry, shăăn'bā'ree' (in Ital. *Ciamberi*): a city of France; capital of Savoy; beautifully situated on the river Laisse, in a rich vine-clad valley; about 60 miles E. S. E. of Lyons (see map of France, ref. 6–H). It is on the railway which connects France with Italy and passes through a tunnel near Mont Cenis. It contains an old castle of the Dukes of Savoy, a cathedral, several convents, and a public library. Here are manufactures of clocks, silk gauze, lace, hats, etc. It was formerly subject to the King of the Sardinian states, but was ceded to France in 1860. Pop. (1891) 20,922; (1896) 21,762.

Chambeze River: one of the most important head-streams of the Congo. It rises on the southern slope of the plateau between Lakes Tanganyika and Nyassa, and flows southwest into Lake Bangweolo. Joseph Thomson discovered (1891) that in the dry season Lake Bangweolo shrinks so greatly that the Chambeze does not enter it at all, but flows directly into the Luapula outlet of the lake. In the wet season Bangweolo resumes nearly the dimensions seen on the maps, and the river again flows into it. The river is shallow, and has little commercial importance. Its name is probably the same as that of the Zambesi, and some geographers formerly thought it was the upper course of that river.

C. C. Adams.

Chambliss, William P.: lawyer and soldier; b. in Bedford co., Va., Mar. 20, 1827; served during the war with Mexico as lieutenant, subsequently captain, Third Tennessee Volunteers. At the close of the war he resumed the practice of his profession at Pulaski, Tenn.; was elected member of the State Legislature 1853–54; Mar., 1855, was commissioned in the army a first lieutenant Second Cavalry, and stationed in Texas, where he was mainly engaged till 1861 against the Comanches and other hostile Indians: promoted captain in April, he was transferred to the Fifth Cavalry in Aug., 1861, and became major Fourth Cavalry 1864. He was engaged in the actions of Manassas and Peninsular campaigns of 1862 up to June 27, when, at the battle of Gaines's Mill, after having been wounded six times, he was taken prisoner while leading a cavalry charge, receiving the brevet of lieutenant-colonel. Served at the U. S. Military Academy as instructor of cavalry tactics 1863–64, until sufficiently recovered to return to the field. Resigned from the army Nov., 1867, and became superintendent of a railway and mining company in Canada. Reinstated major and retired Dec. 21, 1886, by act of Congress. D. Feb. 22, 1887. Revised by J. Mercur.

Cham'bly Basin: a beautiful village of Chambly co., province of Quebec, Canada; at the mouth of the Chambly and St. John's Canal; on Richelieu or Sorel river, and Montreal, Portland and Boston Railway; 12 miles E. of Montreal; has an important trade with Lake Champlain; is the seat of Chambly College. It has a large hospital for the sick and poor, under the care of the Sisters of Charity. Pop. about 2,000.

Chambly Canton: a manufacturing village of Chambly co., province of Quebec, Canada; 2 miles above Chambly Basin and 14 miles from Montreal; on the Montreal, Portland and Boston Railway; at the rapids of the Richelieu, which furnishes water-power for extensive lumber and woolen mills, a foundry, etc. Pop. about 1,000.

Chambly, Capture of Fort: in 1775. The fort at Chambly was situated 12 miles below St. John, at the rapids of the Richelieu or Sorel, which forms the outlet of Lake Champlain. Gen. Carleton thought that the fort was safe and could not be reached by the republicans as long as the British held the post above, and he consequently kept only a small garrison there. Gen. Montgomery, however, who was besieging St. John, was informed of the state of affairs by Canadian scouts, and sent Col. Bedel, of New Hampshire, assisted by Majors Brown and Livingston and provided with a sufficient number of troops, to capture the post. The plan for the attack was laid by Canadians who were familiar with the place and all its surroundings. The artillery, whose conveyance to the point where it was needed presented the greatest difficulties, was placed in bateaux and during a dark night taken past the fort at St. John to the head of Chambly rapids, where the guns were mounted and taken to the place of attack. Only a slight resistance was made, after which the garrison surrendered. A large quantity of provisions and military stores was taken, besides the colors of the Seventh Regiment of British regulars. The colors were sent to the Continental Congress as trophies of victory, and, indeed, the capture of the fort hastened the surrender of St. John.

Chambord, shăăn'bōr': a village and royal château of France; department of Loir-et-Cher; 8 miles E. of Blois (see map of France, ref. 4–E). Here is a magnificent château begun by Francis I. in 1526, and finished by Louis XIV. It stands in the midst of a beautiful park 21 miles in circumference, and is built of black stone. It was the residence of Diana of Poitiers, and afterward of King Stanislas of Poland, the father-in-law of Louis XV. After his death it was given to Marshal Saxe by Louis XV., and was presented to Marshal Berthier by Napoleon I. In 1821 it was purchased by subscription for the Duke of Bordeaux, who was styled Count of Chambord. It is built in the Renaissance style, with a great number of towers, turrets, and gables, and has four large round towers, over 60 feet in diameter. Pop. of village 435.

Chambord, Henri Charles Ferdinand Marie Dieudonné d'Artois, Comte de, and Duc de Bordeaux: the last Bourbon prince of the elder line; b. in Paris, Sept. 29, 1820. His father was the Duke of Berri, son of King Charles X., both of whom abdicated in his favor in Aug., 1830. From that date he was recognized by the French legitimists as the heir to the throne, and they styled him Henry V. He married in 1836 a daughter of the Duke of Módena, but they had no children. He passed many years at the castle of Frohsdorf, near Vienna. He claimed the throne by divine right, and avowed his devotion to the antiquated political ideas of which the white flag is the symbol. After the deposition of Napoleon III. (1870) he issued a proclamation to the French people, which was not approved even by the royalists. Personally he was a man of great probity, and by no means destitute of literary and scientific interests. D. in Frohsdorf Castle, Lower Austria, Aug. 24, 1883.

Chambre ardente, shăăn'brăr'dăănt' [Fr., fiery chamber]: an extraordinary court, chiefly held for the trial of heresies, i. e. followers of the Reformed Church; first convened by Francis I. of France in 1535. Its name was given on account of the unusual severity of its sentences, burning alive being one of its most common punishments. Henry II.'s reign was especially distinguished for the cruelties practiced by this court against the Huguenots. The last victim of the Chambre Ardente was one Voisin, executed in 1680, in the reign of Louis XIV., on a charge of sorcery. In 1682 the court was finally dissolved. For its history between 1540 and 1550, see N. Weiss, *La Chambre ardente* (Paris,

1889); for its later history, see F. Ravaisson, *Archives de la Bastille* (Paris, 1866–84, 16 vols.).

Chambre introuvable, shaañ'brăñ'troo'vaăb'l': a sarcastic name given to the French Chamber of Deputies which was elected after the second restoration of Louis XVIII. in July, 1815. The majority of it were fanatical royalists, were hostile to the ministry, and supported an extremely reactionary policy. They showed no inclination to repress the outrages committed in the south of France by mobs of royalists and fanatics, who massacred many Protestants and liberals. This chamber was dissolved in 1816.

Chaminade, Cecile: See the Appendix.

Chamisso, shaă'meĕ'so', Adelbert, von: poet and naturalist; b. at the château of Boncourt, in Champagne, France, Jan. 27, 1781. He removed with his parents to Berlin in 1790: learned the German language (in which all his works are written); served for some years in the Prussian army. In the capacity of naturalist he accompanied an exploring expedition which sailed from Russia in 1814, and circumnavigated the globe. He wrote several works on natural history, but his reputation rests chiefly on his lyrical poems and ballads, which are very popular, and on the highly original tale of *Peter Schlemihl* (1814), translated by William Howitt (1843). D. in Berlin, Aug. 21, 1838. See J. E. Hitzig, *Leben und Briefe von A. von Chamisso* (2 vols., 1839); also K. Fulda, *Chamisso und seine Zeit* (Leipzig, 1881); E. Du Bois Raymond, *A. v. C. als Naturforscher* (Leipzig, 1889).

Chamois (in Ger. *Gemse*): a goat-like antelope (*Rupicapra tragus*) of the mountains of Central and Southern Europe and Western Asia; found especially in the Alps. It is about the size of a large goat, and is remarkable for its great speed,

Chamois.

for its ability to leap enormous chasms, and for its delicate power of scent. It is highly prized as food, and chamois-hunting is a favorite though perilous amusement in Switzerland and the Tyrol. Its summer haunts are in the high Alps, near the snow-line. Its skin furnishes true chamois leather, but the article generally sold under that name is made of sheepskin. The chamois is gregarious, and in the Caucasus, the Taurus, and the Carpathians, flocks of more than a hundred may be seen; but in the Swiss Alps their number has been much reduced.

Chamomile: plant. See Camomile.

Chamouni, shaă'moo'nee', **Valley of**: in the French department of Haute-Savoie: a wonderful valley in the Alps; 15 miles long and ¾ of a mile broad; traversed by a small stream, the Arve; 3,400 feet above the sea. It is entered on the N. E., from Martigny, by the Col de Tête Noire, and at the other end by diligence from Geneva, 53 miles distant, through the valley of the Arve. It is inclosed by Mont Blanc and the Aiguilles Rouges and Mont Breven. The glaciers Mer de Glace and Argentière are the most remarkable in Switzerland. This beautiful vale, now visited by innumerable travelers each summer, was scarcely known until it was explored and described by the Englishmen Pococke and Wyndham in 1740. Many peculiar plants grow in the valley, and furnish a remarkably rich-flavored honey. In 1099 a Benedictine monastery was established at the village of Chamonix or Prieuré. In early times this region was known as *Les Montagnes Maudites*—a name still retained for the roughest part between the Dome of Mont Blanc and the Mer de Glace.

Champagne: a former province in the N. E. part of France: bounded E. by Lorraine, S. by Burgundy. It is drained by the Marne, Seine, Aube, and other rivers and is now mostly comprised in the departments of Marne, Aube, Ardennes, Haute-Marne, and Yonne. The surface is diversified with plains and hills, on which latter is grown the famous Champagne Wine (*q. v.*). In the twelfth century Champagne was independent or governed by native princes. Thibaud, Count of Champagne and King of Navarre, who died in 1253, was the most powerful feudatory of the French king. By the marriage of Philip IV. of France with Joanna, the heiress of the King of Navarre, Champagne was annexed to France about 1285.

Champagne, Philippe, de: b. in Brussels, 1602; d. 1674; painter of religious subjects and landscapes, in the formal manner of the time, with a distinct emulation of the style of the Renaissance and of N. Poussin. He was painter to the queen, worked also for Richelieu, was professor and rector of the French Academy. His work is timid and cold, but he was a ready and fertile designer.

Champagne Wine: a name applied to wines of various kinds, white or red, still or sparkling, which are produced in Champagne. Of these the sparkling and foaming varieties (*vin mousseux* and *demi-mousseux*) are best known. After the vintage-season this wine stands till December, is then racked off, and fined or purged with isinglass; in the following March it is bottled and corked with care, the bottles being placed with the corks downward, so that the sediment may be drawn off. When this has been removed, some brandy and sugar are introduced, and the bottles are recorked. While this process is going on the breakage of bottles is often very great, and buyers estimate the value of the wines partly by the breakage—the best wines breaking the most bottles.

Even in France, but still more in other countries, a very large part of the so-called champagne wine is factitious, being made of cider, light Rhenish and other cheap wines, and other substances. Happily, in most cases these preparations are quite as harmless, and often quite as palatable, as the genuine product of the Champagne vineyards: for some of the imitations are nearly perfect representatives of the appearance, taste, and bouquet of the original article.

Champagne wine is prized in medicine as a restorative in certain low conditions, especially when the stomach is very irritable and will hardly tolerate any other stimulant, the carbonic acid present acting as a sedative to that organ.

Champagny, shaăm'paăn'yee', Jean Baptiste Vompère, de, Duke of Cadore: b. at Roanne, Aug. 4, 1756; d. in Paris, July 3, 1834. Educated in the Military Academy of Paris: entered the navy in 1780; was present in five battles. Elected a member of the States-General, the National Assembly, and the Constituent Assembly, he did good work whenever the navy was concerned. In 1793 he was imprisoned, and not released until the overthrow of Robespierre. Napoleon was eager to secure his services, and sent him in 1801 as ambassador to Vienna. In 1804 he was Minister of the Interior, and in 1807 Minister of Foreign Affairs, which latter position he resigned in 1811. After the restoration of the Bourbons he lived in retirement.

Champaign: city of Champaign co., Ill. (for location of county, see map of Illinois, ref. 6–F); on Ill. Cent., Clev., Cin., C. and St. L., and Wabash R. Rs.; 128 miles S. S. W. of Chicago and 83 miles N. E. of Springfield. It is favorably situated in the midst of a fertile agricultural district; has an excellent system of water-works, paved and tree-lined streets; is lighted by electricity and gas. An electric street railway threads the city and connects it with Urbana, the county-seat. The University of Illinois is located here. The city is well supplied with fine public and private school-buildings and churches, and contains numerous manufactories, chief among which are hemp, binder-twine, and merchant-twines. A beautiful park of 10 acres lies in the center

of the residence section, and there are large parks in other parts of the city. Pop. (1880) 5,103; (1890) 5,839; (1900) 9,098. W. H. MUNHALL, MANAGER OF "GAZETTE."

Cham'pak, or **Chum'pac** (*Michelia champaca*): an East Indian tree of the magnolia family, remarkable for the beauty of its flowers and foliage. The flowers are of a pale yellow tint, and have a sweet, oppressive perfume, much celebrated in Oriental poetry, and alluded to in the writings of Shelley. This tree is venerated by the Brahmans and Bûddhists.

Champaran': a district in the province of Behar; under the authority of the lieutenant-governor of Bengal: bounded N. by the independent state of Nepaul, E. by the district of Tirkut, S. by the district of Saran, and W. by the Oudh district of Gorakhpur. Area, 3,531 sq. miles: pop. 1,440,815. The surface forms one vast level, with the exception of the northwestern corner, where the ground rises and begins to undulate as it approaches the mountains of Nepaul. The land is excellently cultivated, and produces large crops of rice, corn, barley, sugar, opium, indigo, etc. Gold is found, washed down by the rivers.

Champ de Mars, shaăn'de-maar': a large oblong park or public square in Paris, between the Seine and the Military School; is 3,279 feet long by 1,611 feet in width. It is devoted to military exercises and public gatherings. Its name has a double reference to the *Campus Martius* of ancient Rome and other Italian cities, and to the old Frankish field-meetings, for legislative and other purposes, held annually in March or May, and historically known as *Champs de Mars* or *de Mai*. Furnishing as it does a large open space suitable for great gatherings, it has played no small part in the history of Paris. During the first revolution it was the scene of several important events, among them the celebration of the capture of the Bastile, the festival of the Supreme Being, etc. The buildings of the four great International Expositions of 1867, 1878, 1889, and 1900 were wholly or mainly located here. Revised by C. H. THURBER.

Champeaux, WILLIAM OF: See GUILLAUME DE CHAMPEAUX.

Champe'rico: a port of Guatemala, department of Retalhuleu: on the Pacific Ocean; 25 miles from Retalhuleu, with which it is connected by railroad. It has a good roadstead, but no harbor. Pop. about 2,000. H. H. S.

Cham'perty [deriv. of *champart* = Fr. *champart*, the portion of the produce received by a feudal lord < Lat. *campi pars*, liter., the portion of the field]: an agreement between a party to a suit and a third person that the latter shall carry on the proceeding at his own expense, the subject-matter of the suit to be divided between the parties to the contract in case of a successful result. It is a species of maintenance, and an indictable offense at common law. The offense is not confined to attorneys, but may be committed by laymen. In the U. S., the doctrine of the common law on this subject has not been received with much favor, and in some of the States, where it has been recognized by the courts, it has been abrogated by statutes, making it legal for a party to make such agreement with his attorney as seems to him to be for his interest. No one has been punished criminally for champerty within the memory of men now living. No action could be maintained to recover on a champertous agreement, although it seems to be generally thought that the making of such an agreement is no defense to the original action. HENRY WADE ROGERS.

Champfleury, shaăn'flö'ree' (pseudonym of JULES FRANÇOIS FÉLIX HUSSON FLEURY): a French story-teller and *littérateur*; one of the founders of so-called *realism*: b. at Laon, Sept. 10, 1821. Going early to Paris, he entered literature by the way of journalism, and for many years he continued to produce stories, reviews, bits of literary reminiscence, art criticisms, and all the other baggage of the Parisian writer. His first literary success was *Chien-Caillou* (1847), the story of the life of the aquafortist Rodolphe Bresdin. Among his collections of stories are worth mentioning *Contes vieux et nouveaux* (1853); *Contes d'été* (1853); *Contes d'automne* (1854). Perhaps his most noted book was *Les Bourgeois de Molinchart* (1855), a satirical realistic picture of French provincial life. Among his more or less serious critical studies are *Grandes figures d'hier et d'aujourd'hui* (1861); *Souvenirs et Portraits de jeunesse* (1872); *Documents pour servir à la biographie de Balzac* (1875–78). After 1872 Champfleury had charge of the collections of the porcelain-manufactory at Sèvres, and wrote several books upon the history of pottery. Most important of these was *Bibliographie céramique: nomenclature analytique de toutes les publications faites en Europe et en Orient sur les arts et l'industrie céramique, depuis le XVI^e^ Siècle jusqu'à nos jours* (1881). D. Nov. 6, 1889. A. R. MARSH.

Champigny, shaăn'peĕn'yee': a village near Paris, France; on the Marne: was on Nov. 30 and Dec. 2, 1870, the scene of protracted and bloody encounters between the French troops under Ducrot and the Germans. On Dec. 3 the French recrossed the Marne.

Champion [O. Fr. *champiun*: Span. *campion*: Ital. *campione*, from Germ.; cf. O. H. Germ. *chemphio*, a deriv. of *champf* > Mod. Germ. *Kampf*. Association with *campus*, field, undoubtedly assisted the introduction of these words into Romance]: a person in the Middle Ages, and even in more recent times, who appeared and took part in judicial combats as the hired representative of women, children, feeble persons, and other non-combatants, or acted as an official at a tournament or ceremony. The practice was of very ancient origin, but the occupation of the professional champion came to be looked upon as very disreputable. In the more romantic periods of chivalry, however, knights and gentlemen might contend, especially with those of their own rank, in behalf of injured ladies and children, and were called champions. The crown of England since the time of William the Conqueror has had a champion at coronations—a mounted official fully armed, who, by throwing down his glove, challenges all who refuse to recognize the king as the true sovereign. The championship has been hereditary in the family of Dymoke since the time of Henry IV. This function was carried out for the last time at the coronation of George IV.

Champion Hills: Hinds co., Miss.; about midway between Jackson and Vicksburg: the scene of a desperate struggle, May 16, 1863. The forces under Gen. Grant were marching from Jackson, Miss., toward Vicksburg, when they were met at this point by a Confederate force under Gen. Pemberton. A desperate battle of five hours' duration ensued, the Confederates being forced to retire to the Big Black river. The Confederate loss was heavy in men and artillery. The battle was mainly fought on the side of the U. S. forces by Hovey's division of McClernand's and Logan's and Crocker's division of McPherson's corps, which suffered heavily in killed and wounded. This battle is also known as that of Baker's Creek.

Champlain, shăm-playn': a county and town of Quebec, Canada. The county has a width of about 20 miles on the St. Lawrence river, and extends northwestward in a long strip to the limits of the province. Area, 9,150 sq. miles. Pop. about 30,000. Chief town, Batiscan. The town of Champlain, in the same county, is a station on the Canadian Pacific Ry., 7 miles S. W. of Batiscan and 65 miles S. E. of Montreal. Pop. 2,000.

Champlain: Clinton co., N. Y. (for location of county, see map of New York, ref. 1–J); on Ogdensburg and Lake Champlain (Central Vermont) R. R., and on the Chazy river; about 20 miles N. of Plattsburg. It has manufactures of iron, etc. Pop. (1880) 1,509; (1890) 1,275; (1900) 1,311.

Champlain, SAMUEL, de: geographer and hydrographer; founder of Quebec and governor of New France; b. in Brouage, in France, about 1570; d. in Quebec, Dec. 25, 1635. Having taken an active part in the wars of the League on the side of Henry IV., he received a pension from that monarch, and in 1599 he commanded a vessel in the Spanish fleet sailing for Mexico. On his return to France, Gov. de Chaste, of Dieppe, who had obtained letters-patent from the king for the continuation of the discoveries of Jacques Cartier and the establishment of colonies in New France, offered him an opportunity to take part in the expedition of Pont-Grave. He accepted the offer, left Honfleur Mar. 5, 1603, entered the St. Lawrence in May, and published a description of the voyage, accompanied with maps, after his return to France. He afterward made several expeditions to Canada, of which the third one (1608–10) especially is noteworthy on account of the foundation of Quebec, the defeat of the Iroquois, and the discovery of Lake Champlain. In 1612 he was appointed lieutenant-governor under the Prince of Condé, who bore the title of viceroy, and in 1620 he began the fortification of Quebec. In 1628 the city was, nevertheless, taken by the English, Champlain was captured, taken as prisoner to England, and released when by the treaty of peace in 1632 Canada was re-

stored to France. In the same year he published his *Voyages à la Nouvelle France*. In 1633 he was reinstated as governor, sailed from Dieppe, fortified Richelieu island, founded Three Rivers and a college for Indians in Quebec. A complete edition of his works, with fac-similes of his maps, appeared at Quebec in 1870, edited by Laverdier and Casgrain.

Champlain Epoch: in geology, a term applied to the events which in Northeastern North America closed the Pleistocene period. During this epoch the ice finally retreated from the Northern U. S. and Canada, and the local geography underwent great changes by reason of the elevation and subsidence of the land. At the beginning of the epoch the glaciated district was in general lower than now, the depression being greatest toward the N. and N. E. During the melting of the ice a series of lakes was contained between the ice-front and the upland constituting the southern boundary of the Laurentian basin. As the ice withdrew from the St. Lawrence valley it was replaced by the sea, which extended westward at least to Ogdensburg and southward over the basin of Lake Champlain. The land then rose to a position somewhat higher than the present, and was afterward depressed. The later part of the Champlain epoch is sometimes called the Terrace epoch. See Agassiz, Lake; Geology, Historic; and Pleistocene Period. G. K. G.

Champlain, Lake: forms part of the boundary between New York and Vermont; extends from Whitehall, N. Y., northward to Canada. It is about 125 miles long, and is narrow in proportion to its length. The southern half averages less than 2 miles wide, and in many places is less than a mile. In the northern part, where large islands occur in it, the width is 10 miles or more. The greatest depth is about 280 feet. The water of this lake is discharged by the Sorel or Richelieu river, which issues from its northern extremity. The chief towns on its shores are Burlington and Plattsburg. Occupying a basin between the Adirondack and Green Mountains, this lake is remarkable for its beautiful and picturesque scenery. A naval battle was fought on Lake Champlain between Gen. Arnold and the British Oct. 13, 1776, in which the latter had the advantage. Sept. 11, 1814, Com. McDonough gained an important victory over the British fleet near Plattsburg. This lake is connected with the Hudson river by the Champlain Canal.

Champ'lin, James Tift, D. D.: b. in Colchester, Conn., June 9, 1811: valedictorian of the class of 1834 Brown University, where he was tutor 1835–38. From 1838 to 1841 pastor of Baptist church, Portland, Me.; from 1841 to 1857 Professor of Ancient Languages in Waterville College (now Colby University); from 1857 to 1872 president of that institution. During his connection with the college (which contributed greatly to its prosperity) Dr. Champlin published editions of *Demosthenes on the Crown* (Boston, 1843); *Demosthenes's Select Orations* (1848); *Æschines on the Crown* (Cambridgeport, Mass., 1850); *A Text-book on Intellectual Philosophy* (Boston, 1860); *First Principles of Ethics* (1861); *A Text-book of Political Economy* (New York, 1868); *Constitution of the United States, with Brief Comments* (Boston, 1880); besides other works. D. in Portland, Me., Mar. 15, 1882.

Champlin, John Denison: author; b. in Stonington, Conn., Jan. 29, 1834; graduated at Yale 1856; admitted to the bar 1859; after practicing law for a short time in New York and New Orleans, took up literary work in 1862; became associate editor of the Bridgeport, Conn., *Standard* 1864; published *The Sentinel* in Litchfield 1865–69; edited *Fox's Mission to Russia* (New York, 1873); associate editor of the *American Cyclopædia* 1875. Author of *Young Folks' Cyclopædia of Common Things* (New York, 1879); *Young Folks' Catechism of Common Things* (1880); *Young Folks' Cyclopædia of Persons and Places* (1880); *Young Folks' Astronomy* (1881); *Young Folks' History of the War for the Union* (1881); *Chronicle of the Coach*, a description of a coaching-trip with Andrew Carnegie through Southern England in 1884 (1886); editor of Scribner's *Cyclopædia of Painters and Paintings* (4 vols., 1887), and *Cyclopædia of Music and Musicians* (3 vols., 1890).

Champ'ney, James Wells: genre and portrait painter; b. in Boston, July 16, 1843; pupil of the Antwerp Academy and of Edouard Frère, at Ecouen, France; associate National Academy, New York; member American Water-color Society. He paints portraits in pastel very skillfully, and genre pictures usually depicting scenes of country life in the U. S. Studios in New York and Deerfield, Mass.

William A. Coffin.

Champollion (Fr. pron. shaăn'pol'li-ōn), Jean François: linguist and Egyptologist; b. at Figeac, Lot, France, Dec. 23, 1790. He studied several Oriental languages in Paris; became in 1809 Professor of History in the Academy of Grenoble. In 1814 he published a *Geographical Description of Egypt under the Pharaohs*. From the inscriptions on the Rosetta stone he obtained a key to the mysterious symbols and hieroglyphics of ancient Egypt. His reputation is founded chiefly on this important discovery, which he announced to the Academy of Inscriptions in 1822. In 1824 he published a *Summary of the Hieroglyphic System of the Ancient Egyptians*, in which he proves that the phonetic alphabet is the key to the whole hieroglyphic system. In 1828 he visited Egypt, the monuments of which he explored in company with Rosellini. Having spent sixteen months in Egypt, he returned to France, and was admitted into the Institute in 1830. A chair of Egyptian antiquities was founded for him in the College of France. D. in Paris, Mar. 4, 1832. Among his chief works (published after his death by his brother, Jean Jacques) are an *Egyptian Grammar* (1836–41) and an *Egyptian Dictionary* (1842–44). The results of the researches of Champollion and Rosellini in Egypt appeared in a great work entitled *Monuments of Egypt and Nubia Considered in Relation to History, Religion, etc.* (4 vols., 1835–45). Bunsen expressed the opinion that the greatest discovery of the nineteenth century was that of the key to Egyptian hieroglyphics. See Silvestre de Sacy, *Notice sur Champollion* (1833); Rosellini, *Tributo di Riconoseenza alla Memoria di G. F. Champollion* (1832); and Aimé Champollion-Figeac, *Les deux Champollion, leur vie, leurs œuvres et leur correspondance archéologique relative au Dauphiné et à l'Égypte* (Grenoble, 1888). See Egypt, Ancient, and Egyptology.

Champollion-Figeac, -fee'zhaăk', Jean Jacques: antiquary; brother of the preceding; b. at Figeac, Oct. 5, 1778. He published, besides other works, *Chronicles of the Greek Kings of Egypt* (1819); *Treatise on Archæology* (1843); and, with his son Aimé, *Palæographic Documents Relating to the History of Fine Arts and Belles-Lettres in the Middle Ages* (1868). He became in 1849 librarian at Fontainebleau under Louis Napoleon; edited some posthumous works of his brother. D. May 9, 1867.

Chan'ca, Dr. (probably Dr. Diego Alvarez Chanca, author of a mathematical work): a physician, native of Seville, who accompanied Columbus in his second voyage of 1493, and wrote an account of it in a letter to the Cathedral Chapter of Seville. This letter, first published in Navarrete's collection, is the best historical authority on the voyage and the early days of the Hispaniola colony. H. H. S.

Chancel [O. Fr. *chancel*: Ital. *cancello* < Lat. *cancellus*; in plur. *cancelli*, grating, screen, hence sing., a space behind a grating; *cancelli* is dimin. of *cancer*, crab, in sense crab's claws]: the part of a church which contains the choir and sanctuary, the latter term being used to denote that portion of the chancel where the altar or communion-table is placed. It is the portion of a church occupied by the choristers and clergy, and is usually separated from the nave by a screen of lattice-work. The chancel of Gothic churches corresponds in position to the apsis of the ancient basilicas. In England the term chancel is usually confined to the space occupied by the officiating clergy and the vested choirs in parish churches which have no aisles or chapels around the choir. It is a noteworthy difference between Eastern and Western Churches that in the former the distinction between the bema (or sanctuary) and the choir is much more strongly marked than that between the choir and the nave, while in the latter the distinction between the nave and the choir is much more strongly marked than that between the choir and the sanctuary.

Chancellor [O. Fr. *chancelier*: Ital. *cancelliere* < Lat. *cancellarius*, deriv. of *cancelli*, screen, fence]: a law officer known to the polity of several countries. Originally, under the Roman emperors, he was an usher or official who prevented petitioners from crowding behind the railing or screen which inclosed the judgment-seat, and naturally in course of time he came to act as a "go-between," also serving as scribe. His duties gradually increased in importance until he became the virtual arbiter of suits and the counselor of courts and administrators of power—a conscience-

keeper to magistrates and a director of disputes. In the East he became a powerful officer. In the disruption of the empire and the rise of feudal courts he grew to be the first officer of the suzerain, helped on by the baronial appeals made from fendatories to lords. Yet in the more peaceful conditions of the East the cancellarius rose to the highest influence. The development of the idea in the West is here followed chronologically.

(1) *Ecclesiastical.*—(*a*) As imperial functions failed, the Church, the only permanent organization with precedents and rules, fell heir to the Roman customs. The papacy set up a chancery, and in early days it was soon followed by the bishops. Two auxiliary forms succeeded—monastic and educational, with jurisdictions separate from that of the secular clergy. The great monastic orders, with their independent jurisdictions, came to have chancellors, whose functions were of the highest administrative importance. Ancient universities, generally of monastic origin, followed the same course. In modern English usage, until ecclesiastical courts were abolished, a diocesan or provincial chancellor was a layman learned in the law to whom was referred all litigation left to the canon law. A bishop might be compelled to appoint a chancellor, but there was no appeal from the chancellor to the bishop. The dean of the Court of Arches, a tribunal now extinct, was judge of the appellate court of the province of Canterbury, which formerly reviewed for decisions from the king in chancery. The title is still accorded to the canonical adviser of a bishop, a diocese, or to the seal-keeper and secretary of a cathedral.

(*b*) English university chancellors are of ecclesiastical origin. No one could preach without authorization from the bishop. The early purpose of the university was to train men for the service of the Church. As degrees conferred preaching functions, and as these must come from the diocesan, his notary or chancellor became the medium through which degrees were allowed. From this circumstance grew his general supremacy in the university. In time the office became purely titular, and now at Oxford, Cambridge, Dublin, Edinburgh, Glasgow, and the other universities, the office is held by some eminent peer or statesman. The real duties of the place are discharged by a vice-chancellor in these institutions. In the U. S. many executive chiefs of universities are called chancellors simply by adaptation from precedent. Usually they are both deans of the faculties and presidents of the boards of trustees.

(2) *Political.—Continental Europe.*—The empire of Charlemagne gave precedents to the kingdoms which succeeded it. In France the chancellor became the minister of justice and head of the law administration, and thus charged with the great seal and the duty of presiding over the king's councils. In 1790 this potent office was abolished; Napoleon I. revived it, but in 1848 it was finally given up and its duties merged in the functions of the minister of justice. In Germany the title was revived and given to Bismarck as the chief administrative officer of the new German empire. The German chancellor is president of the imperial secretaries, who convene and act under his direction.

Great Britain.—Originally the chancellor was an adviser of the crown who received his precedents from the canon law and the civilians, and little by little became arbiter between common law and equity cases. Hence the chancery jurisdiction of equity cases grew up.

The Lord High Chancellor is an officer with diversely separable functions. In rank he is the highest civil officer of the crown, and takes precedence after the Archbishop of Canterbury, in sequence to the royal family. He is invariably raised to the peerage. By prescription he is keeper of the great seal, *ex-officio* privy-councilor, member of the cabinet, prolocutor, Speaker or chairman of the House of Lords, and on appeals presides over the court of last resort. The writs for a convocation of Parliament go in his name. He is keeper of the king's conscience, visitor of crown charitable foundations, and president of the chancery division of the High Court of Justice. His patronage is large, his salary £10,000 a year, and he falls with the ministry that appointed him, but then enters the peerage with an annuity of £5,000. His title is "Lord High Chancellor of Great Britain and Ireland." There are lord chancellors of Scotland and Ireland, from the development of whose offices the equity systems of those countries arose.

Chancellor of the Exchequer points to an ancient division between Government revenue cases and law cases. It was his business to adjudicate the revenues of the crown and keep them from detriment. In modern usage he is the head of the treasury department of the United Kingdom, and a cabinet minister. The Premier may take the office if he likes, with its income of £5,000 a year.

Chancellor of the Duchy of Lancaster.—Henry V. made the revenues of the palatine duchy of Lancaster crown perquisites. Formerly this officer was in charge of the Exchequer Court of the duchy, and had jurisdiction between the king and his tenants. It is now a sinecure office which usually carries with it a seat in the cabinet.

United States.—The title chancellor is of post-revolutionary custom. It was originally used to distinguish between control of equity and law jurisdictions, or chancery and law courts. The title has been disused in New York since 1849, when law judges were given equity jurisdiction. The name and courts still exist in Delaware and New Jersey, while there are elective district chancellors in Alabama, Mississippi, and Tennessee.

Miscellaneous.—The title chancellor is further used to designate the foreman of a Scotch jury, the chief officer of a palace, the secretary of an embassy or consulate, the chief administrative officer of an honorable or military order, e. g. Chancellor of the Order of the Garter, or the equivalent of dean in other orders; and it is even applied to Ezra as, in his day, master of decrees.

Chancellor, Charles Williams: physician; b. in Virginia, Feb. 19, 1833; educated at Georgetown College, D. C., and at the University of Virginia; in 1853 graduated at Jefferson Medical College, Philadelphia; he practiced medicine at Alexandria, Va., till 1861. During the civil war he was medical director on Maj.-Gen. Pickett's staff. He then practiced medicine in Memphis, Tenn., till 1868; was then elected Professor of Anatomy in the Washington University of Maryland; in 1869 was made dean of the faculty; in 1870 was transferred to the chair of Surgery; and in 1873 he severed his active connection with the school, retiring from general practice. He was commissioner of public schools in Baltimore two years; a member of the city council five years, two of which he was president of the board of aldermen; in 1876 was elected secretary of the State board of health; and in 1877 president of Maryland Insane Asylum. In 1876 he made an able report on the prisons, reformatories, and charitable institutions of Maryland, which attracted much attention; has published also *Contagious and Infectious Diseases* (Baltimore, 1878); *Mineral Waters and Seaside Resorts* (1883); *Heredity* (1886); *Sewerage of Cities* (1886); and numerous other monographs and papers on medical and sanitary subjects.

Chancellorsville: a small village of Spottsylvania co., Va.; near the Rappahannock river; about 65 miles N. by W. from Richmond (for location of county, see map of Virginia, ref. 5–H).

On assuming command of the Army of the Potomac, Jan., 1863, Gen. Hooker found it in a weakened and despondent condition; its numerical force had been greatly decreased by sickness and desertions, which latter were still frequent. On the contrary, the recent successes of the Confederates had inspired them with boldness and enthusiasm. Hooker devoted the remaining winter months to repairing the demoralized condition of his army, and gathering back those away from duty; his efforts were so far successful that by April he had not only restored confidence, but by additions found himself in command of a well-equipped army of upward of 132,000 men, composed of about 120,000 infantry and artillery, and the remainder cavalry, encamped around Falmouth, Va. The Confederate army under Lee, still encamped on the opposite bank of the Rappahannock, held a line running N. W. to S. E., its right wing extending to Port Royal on the Rappahannock, its left wing resting about 2 miles above Fredericksburg on the same river; thus affording lines of retreat to Richmond and Gordonsville. Its strength was probably upward of 60,000 men.

Everything being in readiness, Hooker decided to move at once upon Lee. The larger portion of the cavalry was placed under Gen. Stoneman, and (Apr. 13) dispatched in advance of the main army for the purpose of destroying the Confederate communications and harassing the retreat which it was deemed must result from the contemplated advance. Owing to frequent rains, which swelled the rivers, Stoneman did not get fairly away until the 29th, the general movement beginning on the 28th.

Gen. Hooker's plan of attack was as follows: His army was divided into seven corps—of these three were to be massed about 2 miles below Fredericksburg, to cross there

and make a bold feint, two of the corps to immediately return and join Hooker; in the meanwhile the remaining four corps were to cross above Fredericksburg.

This plan was successfully executed. The First Corps (Reynolds), Third (Sickles), and Sixth (Sedgwick), all under command of Sedgwick, were moved on the 28th to the position assigned them, and on the 29th one division of the Sixth crossed the river about 2 miles below Fredericksburg, and drove in the pickets, a division of the First crossing about 2 miles lower down, the other divisions with the Third Corps remaining on the north bank in plain view of Lee's army, whose columns were soon seen coming up from Port Royal. On the 30th Sickles silently withdrew his corps and proceeded to join Hooker. In the meanwhile the crossing of the Rappahannock above had been going on: the Eleventh Corps crossed first (28th), followed by the Twelfth, then the Fifth (29th); this column moved along, crossed the Rapidan at Germanna and Ely's Ford; both columns then advancing toward Chancellorsville, at the junction of the Gordonsville turnpike with the Culpeper and Orange C. H. plank road. By the evening of the 30th the Second Corps (two divisions) had crossed and were massed at the same point, and Gen. Hooker had arrived and taken up his headquarters at Chancellorsville. Lee, though thus far outgeneraled, appears to have been undismayed, and, quickly realizing the movement below to be a feint, concentrated his army in front of Hooker, leaving but a small force in his works on the Fredericksburg heights.

Reconnoissances having been made by Hooker on Friday morning (May 1) toward Fredericksburg without opposition, an advance of the Fifth and Twelfth Corps was ordered to be made on two roads leading toward Fredericksburg, which was soon met by the Confederates: a favorable position had been secured, however, when orders were received from Gen. Hooker to fall back to the inferior one of the night before. The right of Hooker's army was held by Howard (Eleventh Corps), then a division of Sickles (Third Corps), who had now arrived from below, then Slocum (Twelfth Corps), Couch (Second Corps), with Meade (Fifth Corps) on the left. The other divisions were held in reserve.

Early in the morning of the 2d a movement of Confederates was observed along Sickles's front and in direction of the Union right, which being continued, Birney (in command first division Third Corps) reported to Sickles, who was ordered to make a reconnoissance in force and ascertain the nature of the movement, which being promptly executed struck the rear of the advancing column, capturing many prisoners, from whom the intelligence was gained that the movement was under command of Stonewall Jackson. Up to this time the movement had been interpreted as a retreat, but in anticipation of its purpose being a flank attack, Howard had been notified of the fact, and ordered to be on the alert. Sickles now obtained permission to move in force upon the flank of the advancing column, and being re-enforced by a brigade from the Twelfth and one from the Eleventh Corps, together with 1,000 cavalry and a horse-battery under Pleasonton, had completed his preparations, when informed that Jackson had struck his blow and was in his rear. Although not entirely unanticipated, it was believed the attack on the right would be resisted; but, being surprised, Devens's division gave way, followed by that of Schurz, and though Buschbeck's brigade gallantly resisted it was finally compelled to fall back, and the woods now swarmed with fugitive corps, closely pursued by the victorious Confederates. The position of Sickles was critical; but fortunately at this moment Pleasonton, returning from the front with about 500 cavalry, met the advancing Confederates; the Eighth Pennsylvania Cavalry charged vigorously into the woods, while Pleasonton got his own battery and such other guns as he could stop, twenty-two in all, into position, double-shotted them, and aiming low was just in time to receive the enemy, who, having overcome the slender opposition of the cavalry, now rushed furiously and repeatedly right up to the guns, but were each time repelled with great loss; and the farther advance in this direction was finally stayed. Meantime, Berry's division (Third Corps), with Hays's brigade (Second Corps), and the artillery under Capt. Best, though unable to check the flying troops of the Eleventh Corps, had, after a severe contest, checked the advance in front. It was during this attack that Stonewall Jackson was mortally wounded—at the hands of his own men, it is said—the greatest loss the South had yet been called upon to bear.

During the day Lee kept up a vigorous attack in front of Hooker, especially along Hancock's line, but was always handsomely repulsed by the troops in the advanced line of rifle-pits. During the night Hooker contracted and reformed his lines. The First Corps (Reynolds) arrived during the evening, and was posted on the right with Meade; the Eleventh Corps, which had been reorganized, was placed in the intrenchments on the left.

At daylight of the 3d the attack was renewed, the Confederates opening a musketry fire along the whole line; but the great effort was in the same direction as the day before, the possession of the plank road to Chancellorsville; and here they met the same troops which had sustained and repelled their assaults of the day before. Berry's and Birney's divisions (Third Corps), supported by Whipple's (Third) and Williams's (Twelfth Corps), supported the artillery of Sickles, against which the Confederates threw themselves again and again, only to be cut down and hurled back, until Sickles, for want of ammunition, was compelled to retire to a second line. Sickles had before retiring sent for assistance to enable him to hold his position; but Hooker, who had been stunned by a ball which struck a pillar against which he was leaning, was in a dazed condition, and his appeal was unanswered. French and Hancock, of the Second Corps, had done gallant work in charging and driving back the Confederate left; but Sickles was not reenforced; yet though his ammunition was exhausted he continued to maintain his position, repelling successive charges at the point of the bayonet till he was again compelled to retire, and the whole line was now withdrawn a mile back from Chancellorsville, which position was strongly fortified.

Sedgwick meanwhile (May 2) had received orders to cross the Rappahannock and advance on Chancellorsville until he should come up with the rear of Lee's army, which he was to attack simultaneously with Hooker's attack on the front. This order was not received by Sedgwick till nearly midnight, but he soon had his corps in motion, and by noon of the 3d had stormed and carried Cemetery and Marye heights, and after reforming his command moved on the road to Chancellorsville; but he was soon met by the force he had driven from the heights, re-enforced by a portion of the army of Lee, who being now disengaged from Hooker turned to check Sedgwick's advance; severe fighting continued till dark, Sedgwick being unable to force the Confederates from the strong position they had taken; the chance of joining Hooker was now small, and the next day made it impossible, for the army of Lee now concentrated against him in large numbers. During the night of the 4th and 5th he crossed the river at Bank's ford, having rescued his corps from its critical position by desperate fighting but with fearful loss.

On the 5th Hooker recrossed his whole army over the Rappahannock without opposition, and the terrible struggle was ended. The losses on the Union side, 18,000; Confederate, 13,000.

Stoneman returned on the 8th, having been nine days in the rear of Lee's army, and having advanced to within 2 miles of Richmond, but his operations conferred no benefit on the Federal army. Revised by JAS. MERCUR.

Chance-medley: in law, the killing of a person in self-defense upon a sudden and unpremeditated encounter or a casual affray.

Chancery, Court of: See COURTS.

Chancre: See SYPHILIS.

Chan'da: a district (and town) of Nagpur, Central Provinces, British India; between the parallels 19° 7′ and 20° 51′ N., and the meridians 78° 51′ and 80° 51′ E. Area, 10,785 sq. miles. It is in part hilly, in part a table-land 2,000 feet above the sea, densely wooded and but little cultivated. Iron and coal are important productions. Pop. about 700,000, chiefly Hindus. The town of Chanda, lat. 20° N. (see map of South India, ref. 3–E), has a population of 17,000, and is connected by a branch line with the Bombay railway system.

Chandeleur (shăn-de-loor′) **Islands**: a range of low islands in the Gulf of Mexico; off the east coast of St. Bernard's parish, La.; separating Chandeleur Sound from the Gulf. The sound has also numerous small islands. At the north end of the northernmost island stands Chandeleur lighthouse, in lat. 30° 3′ 8″ N., lon. 88° 51′ 38″ W. It is built of brick, and is 56 feet high, with a fixed white light.

Chandernagar, shaăn-der-naă-gaar′: a town in India belonging to France; on the river Hugli; about 22 miles above Calcutta (see map of North India, ref. 8–I). It was founded by the French in 1673, and had a considerable trade. It was taken by Lord Clive in 1757, and restored to the French in 1816. Pop. (1895) 24,059.

Chan'dler, Prof. Charles Frederick, M. D., LL. D.: b. in Lancaster, Mass., Dec. 6, 1836; educated at the Lawrence Scientific School of Harvard College, at Göttingen, and Berlin; received the degree of doctor of philosophy in Göttingen in 1856. In 1857 he took charge of the chemical department of Union College at Schenectady, N. Y.; in 1864 was appointed Professor of Analytical and Applied Chemistry in the School of Mines of Columbia College, which position he still holds. In 1858 he was appointed to the chair of Chemistry in the New York College of Pharmacy; in 1872 to a portion of the duties of the chair of Chemistry; and in 1876 to the full chair of Chemistry and Medical Jurisprudence in the College of Physicians and Surgeons. In 1865 he became chemist to the Metropolitan Board of Health, which position he retained till 1873, when he was appointed president of the board. In the same year he received the degrees of M. D. from the University of New York and LL. D. from Union College. In 1869 he was elected a member of the Chemical Society of Berlin; in 1871 of London; in 1872 of Paris; in 1874 of the National Academy of Sciences; has been chairman of the sanitary committee of the New York State Board of Health. In 1870 he established, with his brother, Prof. W. H. Chandler, of Lehigh University of Bethlehem, Pa., the *American Chemist*, a monthly journal devoted to chemical science. Though chiefly employed in instruction, he has published a number of papers on chemical subjects, among which are *The Inaugural Dissertation* (Göttingen, 1856), containing miscellaneous chemical researches: *Report on Waters for Locomotives and Boiler Incrustations* (1865); *Examinations of Various Rocks and Minerals*, published in the geological reports of Iowa and Wisconsin; *Investigations on Numerous Mineral Waters of Saratoga, Ballston, Chittenango*, etc., and of various waters designed for the supply of cities, as well as papers on the purification of coal-gas, on petroleum, milk, sorghum, and glucose. Most of these papers have appeared in the *American Chemist* and in the annual reports of the health department of New York.

Chandler, John: b. in Epping, N. H., in 1760. He was the son of parents in the most humble circumstances, and although apprenticed to learn the trade of a blacksmith he became afterward, by his own industry and perseverance, very wealthy. On the outbreak of war with Great Britain in 1812, he was commissioned a brigadier-general by the President, being at that time a major-general of militia. Settled in Maine; represented his district in Congress (1805–08); was U. S. Senator from Maine (1820–29); U. S. collector of Portland district, Maine (1829–37). D. in Augusta, Me., Sept. 25, 1841.

Chandler, Ralph: rear-admiral U. S. navy; b. in New York, Aug., 23, 1829; entered the navy as a midshipman, Sept. 27, 1845; served on the west coast of Mexico during the Mexican war, and participated in several slight engagements with the enemy near Mazatlan; in sloop of war Vandalia at battle of Port Royal, Nov. 7, 1861; commanded steamer Maumee in both attacks on Fort Fisher; recommended for promotion by Rear-Admiral Porter; commanded U. S. S. Swatara to the southern seas in 1874 to observe the transit of Venus; became rear-admiral in 1886. D. in Hongkong, China, Feb. 11, 1889.

Chandler, Seth C.: astronomer; b. in Boston, Mass., Sept. 16, 1845; as a volunteer at the observatory of Harvard College invented and used the instrument which he called the almucantar; has since devoted himself principally to the subject of the variable stars, of which he has prepared a catalogue, now the standard. In 1891–93 he made a series of investigations, showing the variation of terrestrial latitudes. His investigations on Brooks's comet, 1889, showed that it was probably identical with the celebrated comet of Lexell seen in 1770. Simon Newcomb.

Chandler, William E.: b. in Concord, N. H., Dec. 28, 1835; graduated at Harvard Law School in 1855; member of New Hampshire Legislature 1862–64; was first solicitor and judge-advocate-general of Navy Department 1865; first assistant Secretary of the Treasury 1866–67; chairman of Republican State Committee of New Hampshire 1863–65; secretary National Republican Committee 1868 and 1872; member of Republican National Convention in 1880; Secretary of the Navy Apr. 12, 1882, to Mar. 5, 1885; elected U. S. Senator from New Hampshire June 14, 1887; re-elected 1889 and 1895.

Chandler, Zachariah: b. in Bedford, N. H., Dec. 10, 1813; removed to Detroit, Mich., in 1833; engaged successfully in mercantile business; was elected mayor of Detroit in 1851; U. S. Senator from Michigan (1857–75), and from Feb. 18, 1879, till his death; chairman of committee on commerce, etc. Secretary of the Interior under President Grant 1875–77; chairman of Republican National Committee in 1868 and again in 1876. D. in Chicago, Ill., Nov. 1, 1879.

Chandos: noble English family, descended from a follower of William the Conqueror. The direct male line ended with the death of John Chandos in 1428. Sir John Brydges, a descendant of his sister, was made Baron Chandos in 1554. James Brydges, eighth Lord Chandos, became Duke of Chandos in 1719. Fifty years later this title passed by marriage to the family of Grenville, which at present holds the title in the English peerage of Duke of Buckingham and Chandos.

Chang and Eng: See Eng and Chang.

Changarnier, shaăn′gaăr′niā′, Nicolas Anne Théodule: French general; b. at Autun, Apr. 26, 1793; served with distinction in Algeria 1830–43; May, 1848, appointed governor-general of Algeria; before the end of the year obtained command of the national guard at Paris and of the first military division; became a member of the National Assembly 1849, but continued to command the army or garrison of Paris until 1851. At the *coup d'état* of Dec. 2, 1851, he was arrested and confined for a short time. He afterward passed many years in exile. After the outbreak of the Franco-German war he offered his services to the emperor, and although he did not receive a command he took a leading part in the defense of Metz, and signed, with Bazaine and other generals, the capitulation; returned to Paris in 1871 and reorganized the army under Thiers. D. in Versailles, Feb. 14, 1877.

Chang-Chow-Foo: a city of China; province of Fuh-kien; chief city of department of same name; 35 miles W. from Amoy; on a tributary of the Kian-Long-Kiang (see map of China, ref. 8–J). The city is surrounded by a wall 4½ miles in circumference. The entrance is over a bridge 780 feet in length, with twenty-two water-passages. In the city is a magnificent Buddhist temple built in the eighth century. The streets are broad, and are adorned with fine shops, ornamented arches, and trees. The inhabitants are amiable. There is a considerable manufacture of silk, besides sugar, mirrors, crystal, and quicksilver. The exports are mostly of tea, sugar, porcelain, and paper. Pop. less than 900,000.

Change-of-day Line: See the Appendix.

Change-ringing: See Bell-ringing.

Chang-Sha-Foo: a city of China; capital of the province of Hunan; on the Siang-Kiang; about 360 miles N. of Canton (see map of China, ref. 7–I). It is well built and surrounded with a wall. It is a center of the silk manufacture and also of the silk-trade. Pop. 300,000.

Chank Shell [from the Hindu name *chank* or *changh*]: a name given to various mollusks of the family *Turbinellidæ*, but more particularly to the large, solid, top-shaped shell, technically known as *Turbinella pyrum*, which is abundant about Ceylon, and especially in the Gulf of Manaar. It occurs in shallow water, one or two fathoms deep, and is readily obtained by divers. It is sacred to Vishnu, who is represented with one in his hand, and the shell is in much demand in India, where it is made into bangles, bracelets, anklets, and other ornaments. A left-handed specimen is particularly valuable. F. A. L.

Chanler, Amélie (*Rives*): novelist; b. in Richmond, Va., Aug. 23, 1863; granddaughter of William Cabell Rives, U. S. Senator; married John A. Chanler, of New York, 1888; divorced in 1895, and later married Prince Troubetzkoi. Author of *A Brother to Dragons* (1888); *The Quick or the Dead* (1888); *Herod* (1889), a tragedy in blank verse; *Athelwold* (1893), etc.

Channel: a port of entry in Newfoundland; the most western town of any importance in that island. It has connection by steamers with St. John's, 300 miles distant. It has considerable trade. The cod and halibut fishery is carried on here. Pop. 584.

Channel Islands: a group of islands off the northwest coast of France; belong to Great Britain; governed by their own laws. They are the only parts of the dukedom of Normandy now belonging to the British crown. King John in 1204 lost all the rest. The chief islands of the group are Jersey, Guernsey, Alderney, and Sark (*qq. v.*). The area of the whole is 64½ sq. miles. They are divided into two bailiwicks, viz., Jersey and Guernsey, with the other islands as dependencies. They are not represented in Parliament, but have their own institutions and laws. The legislature of Jersey consists of fourteen deputies, twelve rectors, twelve constables, and twelve jurats, presided over by the bailiff. Guernsey is controlled by the royal court. These are the crown officers, lieutenant-general, attorney-general, solicitor-general, and prévôt. Taxation is light; land holdings are small and mostly of yeoman tenure. The climate is mild and equable; the scenery varied and exceedingly beautiful. The rocks are primary. The chief industries are agriculture and the breeding of cattle. Pop. (1891) 92,272.

Channing, Edward Tyrrel, LL. D.: scholar; b. in Newport, R. I., Dec. 12, 1790. He was brother to William Ellery Channing, and one of the founders of the *North American Review*, to which he contributed many critical and biographical articles. Professor of Rhetoric at Harvard from 1819 to 1851. A volume of his lectures was published in 1856. D. in Cambridge, Mass., Feb. 8, 1856. Revised by H. A. Beers.

Channing, William Ellery, D. D.: the most distinguished of Unitarian preachers and writers in the U. S.; b. in Newport, R. I., Apr. 7, 1780. His maternal grandfather, William Ellery, was a signer of the Declaration of Independence, and his own father entertained at his home the most distinguished Federalists of the time. Graduating at Harvard in 1798 with the highest honors, he soon after went to Richmond, Va., to act as tutor in the family of D. F. Randolph. The ascetic rigors to which he there subjected himself lest he should be effeminate impaired his health so much that it was always delicate. At the same time he acquired a knowledge of slavery as a working institution which contributed largely to his later anti-slavery principles. He studied theology at Cambridge and Newport (1800–1803). At Newport he became intimate with Dr. Hopkins, the famous theologian, whose independent habit of thought and philanthropy he greatly admired. As soon as Channing began to preach he was called by two societies, and, accepting that to the Federal Street Society, Boston, he was ordained June 1, 1803. From the first he made an impression of great spiritual fervor and moral earnestness. He and Buckminster were the first New England preachers who did not disdain to give their sermons literary form. The great merits of Channing's style, both in his sermons and his literary productions, were an absolute lucidity and a remarkable flow of language. His literary reputation was out of all proportion with the amount of his purely literary work, which was limited to a few elaborate essays or discussions, the most remarkable of which was that on the *Life and Character of Napoleon Bonaparte*. It was the moral quality of these essays, even more than their intellectual clearness and their engaging style, that made his reputation. For twelve years after his ordination his life was that of a faithful preacher and pastor. In the meantime the seeds of the Unitarian controversy had been widely scattered, and in 1815 they bore abundant fruit. For many years Calvinism had been undergoing a process of softening and abridgment in some of the New England churches. Since the beginning of the century this process had been much accelerated by some of the most prominent Congregational ministers in and around Boston. The policy of these liberal Christians, as they were called, because they put a liberal construction on Calvinism, was to say very little about the doctrines which they had come to disbelieve. The more conservative could not endure this, and in 1815 charged the liberals with dishonesty and hypocrisy. Channing replied in an elaborate public letter that at once gave him the headship of the liberal party, a position which he held throughout the controversy, though his contributions to it were but few. The most notable were a sermon preached in Baltimore (1819) at the ordination of Jared Sparks, a sermon at the dedication of the Second Unitarian church in New York, a few articles in the *Christian Examiner* and a few public letters. Channing had no liking for controversy and disdained all personalities. The manner of his habitual preaching was the same after the beginning of the controversy as before. His three great affirmations were the Dignity of Human Nature, the Supremacy of Reason as the organ of spiritual knowledge, Religious Liberty without sectarian exclusiveness. He believed that all men are partakers of the Divine Nature, and have in them an infinite element. Accepting Christianity as a reasonable revelation, he said: "I am surer that my rational nature is from God than that any book is the expression of His will"; and again: "The truth is, and it ought not to be disguised, that our ultimate reliance is and must be on our own reason." Denying the deity of Christ, he at first held to his superangelic nature, as did the majority of American Unitarians, while those in England, with Priestley at their head, were generally Socinians holding to the human nature of Jesus. But the moral character of Jesus attracted him more than his special nature, and as he grew older his Arian doctrine became almost or quite humanitarian. He regretted the development of what he called "a Unitarian Orthodoxy" and "a swollen way of talking about Christ." For Theodore Parker and other young radicals of the denomination he always had a willing ear. When Dr. Gannett became his colleague (1824) he had more time for the expression of his philanthropic sympathies. Problems of temperance and social reform interested him deeply, and he spoke and wrote concerning them with impressive seriousness and real illumination. Especially did the anti-slavery conflict excite his interest. Without being himself an abolitionist, he steadily approximated to Garrison's position. Alone among Boston clergymen he invited the agent of the Anti-Slavery Society into his pulpit. When Lovejoy was murdered he was the first to suggest an indignation meeting in Faneuil Hall, and his speech was only less memorable than that of Wendell Phillips made on the same occasion. His last public utterance, Aug. 1, 1842, at Lenox, Mass., was commemorative of emancipation in the West Indies, and he demanded speedy following by the U. S. of that example. D. in Bennington, Vt., Oct. 2, 1842. His works are published by the American Unitarian Association in six 12mo volumes, and his *Life* by his nephew, William Henry Channing (Boston, 1848) in three. The *Works* and *Life* are also published in one volume 8vo. The centennial of his birth was widely celebrated in 1880, and much new biographical matter was published at that time. John W. Chadwick.

Channing, William Ellery: second son of Dr. Walter Channing and nephew of the first William Ellery Channing; b. in Boston, June 10, 1818; was connected with various journals; published several volumes of poems, and wrote in prose, *Thoreau, the Poet-naturalist* (1873), and *Conversations in Rome* (1847). Revised by H. A. Beers.

Channing, William Henry: Unitarian minister; a nephew of William E. Channing; b. in Boston, May 25, 1810. He graduated at Harvard in 1829, and at the divinity school 1833; preached in the cities of New York, Boston, Cincinnati, and Liverpool, England. He was deeply interested in the Brook Farm experiment, and in general in socialism as the religious expression of the brotherhood of man. He was a preacher of great eloquence, but too little self-restraint. His biography by Rev. O. B. Frothingham (1886) is a full and sympathetic account of one of the most interesting representatives of the transcendental movement in New England. His daughter was married to Sir Edwin Arnold (*q. v.*). He contributed to the *North American Review*, and published, besides other works, a *Memoir of William Ellery Channing* (3 vols., 1848). D. in London, Dec. 23, 1884.

Chant [Fr. *chant*: Ital., Span., Portug. *canto* < Lat. *cantus*, song, deriv. of *ca'nere*, sing]: originally plain vocal music, especially such as was used in Christian congregations; now such musical compositions as are sung to words which are not metrical, or if metrical words are used the verbal cadences are not observed in the music. St. Ambrose and Pope Gregory the Great greatly improved the chant, which was, and still is, chiefly used in liturgical worship, though in non-liturgical services passages of Scripture often are chanted in simple harmonies.

The reading of the service in a half-chanting style by the clergyman is called *intonation*, and a somewhat similar method of reading the Scripture in Jewish synagogues is called *cantillation*.

Chantilly, shăn-til'li, or Fr. pron. shăn'tĕe'yee': a town of France; department of Oise; on the railway from Paris to Amiens; 25 miles N. N. E. of Paris (see map of France, ref. 3–F). It has a fine hospital, and celebrated manufactures of blond lace and porcelain, but the lace industry has declined. Annual races are held here. Here is a castle

which was once the residence of the great Prince of Condé, and one of the finest in France. It was destroyed during the Revolution in 1793, but the estate was bought in 1872 by the Duc d'Aumale, who rebuilt the château, filled it with collections of art works, and in 1886 presented it to the French Institute for public uses, at a cost of nearly $10,000,000. The castle park and forest contain 6,500 acres. Pop. (1896) 4,211.

Chantilly: a post-village of Fairfax co., Va.; about 20 miles W. of Washington (for location of county, see map of Virginia, ref. 4–H). On the afternoon of Sept. 1, 1862, the right of Gen. Pope's army was here attacked by the Confederate army under "Stonewall" Jackson. A severe struggle ensued, which was continued till dark in the midst of a terrific thunder-storm. Gen. Isaac I. Stevens, U. S. army, was killed in this action, and Gen. Phil. Kearny after its close.

Chantrey, Sir FRANCIS: sculptor; b. in Jordanthorpe, Derbyshire, England, Apr. 7, 1781; son of a carpenter who died when the lad was only twelve years of age. He learned the trade of carver in Sheffield; bought his freedom with the proceeds of his portrait-painting; removed about 1804 to London, where he devoted himself to sculpture. He was a pupil of Nollekens, and excelled in portraits and monumental sculpture. In 1818 he was chosen a member of the Royal Academy. Among his best works are a statue of Sir Joseph Banks, one in bronze of William Pitt in London, a statue of Canning at Liverpool, and one of Washington in the State-house at Boston, Mass.; *Sleeping Children* in Lichfield Cathedral, erroneously credited to Flaxman; and a *Penelope* at Woburn. He was knighted in 1837. D. Nov. 25, 1841, bequeathing a large sum to the Royal Academy for the extension of its art collection. See John Holland, *Memorials of Chantrey* (1851).

Chantry [O. Fr. *chanterie*, deriv. of *chanter*, sing]: a term signifying (1) an endowment or bequest to provide masses to be sung for the soul of the testator or the souls of others; (2) the office or position held by one who celebrates such masses; (3) a chapel founded with the purpose of insuring the constant chanting of masses either for the good estate of the living or for the repose of the souls of the faithful.

Chanute': city; Neosho co., Kan. (for location of county, see map of Kansas, ref. 7–J); on Atch., Top. and S. Fé and Mo., Kan. and Tex. R. Rs.; 125 miles S. of Kansas City, in an undulating agricultural region; has fine schools. Chanute is the headquarters for the So. Kan. Div. of Atch., Top. and S. Fé R. R. Pop. (1880) 887; (1890) 2,826; (1900) 4,208. EDITOR OF "BLADE."

Chanute, shăă-noot', OCTAVE: civil engineer; b. in Paris, France, Feb. 18, 1832; went to the U. S. in 1838; educated in a private school in New York city; began the practice of his profession in 1849 in the Hudson River Railroad service, and was actively engaged in railway work until 1889, having been chief engineer of the Chicago and Alton Railroad 1863–67, and of the Erie Railway 1873–83. He planned and superintended the construction of the Kansas City bridge across the Missouri river, completed in 1868. He is the author of *The Kansas City Bridge*, published in 1870, and of many papers in engineering journals, among which may be mentioned *The Elements of Cost of Railroad Freight Traffic*; *Rapid Transit and Terminal Freight Facilities*; *The Preservation of Timber*; *Uniformity in Railway Rolling Stock*; *The Sibley Bridge*; and *Progress in Aërial Navigation*. He was a vice-president of the American Society of Civil Engineers 1880–81, president 1891.

Chanzy, shăăń'zee', ANTOINE EUGÈNE ALFRED: French general; b. at Nouart, Mar. 18, 1823; entered the military school of St.-Cyr in 1841; was made a lieutenant of Zouaves in 1843; served chiefly in Algeria, becoming a general of brigade in 1868. In Oct., 1870, he was called to France with the rank of a general of division, and in December was appointed commander-in-chief of the Army of the West, consisting of four corps. In Jan., 1871, in the battles at Le Mans, his army was almost annihilated by three Prussian army-corps of vastly superior numbers. He was elected member of the National Assembly in Feb., 1871; governor-general of Algeria 1873; ambassador at St. Petersburg 1879–81. He wrote *La deuxième armée de la Loire* (9th ed. 1888). D. at Châlons, Jan. 4, 1883.

Chaosien, chow'syen' [Chinese, literally, morning freshness]: the name of a district in the northeast of Korea, applied since the close of the fourteenth century to the whole country. By the Japanese it is pronounced *Cho'sen'*, and by the Koreans *Chosŏn*. See KOREA.

Chapala, shăă-paa'lăă: the largest lake in Mexico; in Jalisco; 40 miles S. of Guadalajara; receives the Rio de Lerma and empties into the Rio Grande de Santiago; area 415 sq. miles. It contains several islands, on one of which are ruins. A small steamer makes the tour of the lake daily. The depth is unknown.

Chapanecs: See INDIANS OF CENTRAL AMERICA.

Chap-books [*chap* is the clip-form of *chapman* < O. Eng. *cēapman*, trader: Germ. *Kaufmann*]: a humble variety of literature which was formerly vended by itinerant chapmen or peddlers. They were small volumes printed on coarse paper, dealing with popular theology or history, the lives of godly or famous personages, fortune-telling and the reading of dreams, and giant, witch, and goblin tales in verse or in prose. The older black-letter chap-books, without dates, are extremely rare. Revised by H. A. BEERS.

Chapel [O. Fr. *chapele*: Ital. *cappella* < Lat. *cappella*, little cloak, place where a piece of the mantle of St. Martin was kept, extended to denote a sanctuary where holy relics were kept, and finally an apartment for worship]: a minor or supplementary place of worship. The term is applied to small edifices for special or occasional services, as cemetery chapels; to structures erected to accommodate parishioners living at a distance from the parish church (chapels of ease); to domestic oratories and places of worship erected by private individuals or attached to public institutions, as hospital-chapels. It also designates a distinct portion or subdivision of a church containing the altar or dedicated to the worship of a particular saint; if of the Virgin Mary, it is called a lady-chapel. In England, places of worship erected by Dissenters are commonly called chapels.

On the introduction of the Church of England into Massachusetts at the close of the seventeenth century, where the Congregationalists were the "standing order" or the "establishment," the first Episcopal church in Boston received the designation of the *King's Chapel*, which it retains today. In the U. S. a chapel is considered as attached to a parochial church, and is under the control of the ecclesiastical corporation of the parent church.

Probably the earliest instance of a chapel having been provided to serve the double purpose of a place of sepulture and of divine worship is that of the *Templum Probi*, a small basilica attached to the exterior of the apse of St. Peter's at Rome, and built by Sixtus Anicius Petronius Probus, who died A. D. 395. Probus and his wife were buried in this building, and the form of the structure attests its purpose for the celebration of the divine offices.

In printing, the workshop is called a chapel, probably because Caxton first set up his press in a chapel of Westminster Abbey; also the body of workmen in a printing-house, when organized, is called a chapel.

Chapelain, shaăp'lăń', JEAN: French poet; b. in Paris, Dec. 4, 1595; d. in Paris, Feb. 22, 1674. He was the chief of the school of pedantic and unnatural poets which Boileau destroyed, and the author of the epic upon Jeanne d'Arc (*La Pucelle*, 1656), which was the object of the great critic's sharpest satire. He produced also odes, now unreadable. His letters (published in part by M. Tamizey de Larroque, 2 vols., Paris, 1880–83) are full of interest, however. See É. de Molènes, *La Pucelle par Jean Chapelain* (2 vols., Paris, 1891). A. R. MARSH.

Chapel Hill: town; Orange co., N. C. (for location of county, see map of North Carolina, ref. 2–G); on Richmond and Danville R. R., and on New Hope river; 28 miles W. N. W. of Raleigh. It is the seat of the University of North Carolina, which was founded in 1789. Pop. (1880) 831; (1890) 1,017; (1900) 1,099.

Cha'pin, AARON LUCIUS, D. D., LL. D.: clergyman; b. in Hartford, Conn., Feb. 6, 1817; graduated at Yale in 1837, and at the Union Theological Seminary in New York in 1842; professor in the New York Institution for the Deaf and Dumb 1838–43; ordained pastor of the First Presbyterian church in Milwaukee, Wis., Jan. 24, 1844; inaugurated as first president of Beloit College, Wis., July 24, 1850, which office he resigned in 1886; was for some years one of the editors of the *Congregational Review*; contributed several articles to that and other like journals, and published occasional sermons. D. July 22, 1892.

Chapin, ALFRED CLARK: U. S. politician; b. in South Hadley, Mass., Mar. 8, 1848; graduated from Williams Col-

lege 1869 and Harvard Law School 1871; removed to New York 1871; member New York Assembly 1882–83, and Speaker 1883: Comptroller of the State 1884–87; mayor of Brooklyn 1888–91; sat as a Democrat in Fifty-second Congress; railroad commissioner for State of New York 1892.

Chapin, Edwin Hubbell, D. D.: b. in Union Village, Washington co., N. Y., Dec. 29, 1814; educated at the seminary in Bennington, Vt.; made D. D. at Harvard University in 1856; commenced preaching in 1837; first settled over a society of Universalists and Unitarians in Richmond, Va.; removed to Charlestown, Mass., in 1840; thence to Boston in 1846, to New York in 1848, where he became pastor of the Fourth Universalist church, corner Fifth Avenue and Forty-fifth Street, one of the wealthiest societies in the city. Dr. Chapin was a powerful and effective pulpit orator, a frequent lecturer before lyceums, etc., and exercised great influence for good. His speech before the Peace Convention at Frankfort-on-the-Main in 1850 commanded great attention. He was the author of *Moral Aspects of City Life* (1853); *True Manliness* (1854); several volumes of sermons and religious lectures, and some occasional discourses. His *Crown of Thorns* had a large circulation. D. in New York city, Dec. 26, 1880. See his *Life* by Sumner Ellis (Boston, 1882).

Chaplain [O. Fr. *chapelain* : Ital. *cappelano* < Late Lat. *cappella'nus*, deriv. of *capel'la*. See Chapel]: a clergyman attached to a chapel without a parish, to the household of any dignitary or nobleman, to a public institution, regiment, or an army post, or ship of war. Army chaplains once carried the relics of a patron saint at the head of the troops. The U. S. army has both post and regimental chaplains. The U. S. Senate and House of Representatives, as well as most State Legislatures, also have chaplains. Many prisons and large almshouses have chaplains attached. The British army and navy have chaplains from the Churches of England and Scotland and the Roman Catholic Church. Forty-eight Anglican and six Scottish ministers are chaplains to the British sovereign.

Chapleau, shăp'lō', Joseph Adolphe, LL. D.: Canadian statesman: b. at Ste. Thérèse de Blainville, Terrebonne, P. Q., Nov. 10, 1840; educated at the colleges of Terrebonne and St. Hyacinthe; admitted to the bar in 1861; was Professor of Criminal Jurisprudence, and afterward Professor of International Law, in Laval University. Meanwhile, he represented Terrebonne in the Quebec Assembly 1867–82, and was then elected to the Dominion Parliament for the same constituency; was re-elected in 1887, and again in 1891. He held in turn the portfolios of Solicitor-General, Provincial Secretary, Premier, and Minister of Railways and of Agriculture and Public Works in the Government of the province of Quebec; was appointed Secretary of State of Canada July 29, 1882, an office which he held till 1892, when he became Minister of Customs, and in December of the same year was appointed Lieutenant-Governor of the province of Quebec. In 1884 he was appointed a commissioner to investigate and report on Chinese immigration into Canada. He was a distinguished orator, a leader of the Conservatives in the province of Quebec, and was the trusted friend and coadjutor of the late Sir John A. Macdonald. In 1881 Mr. Chapleau was created a commander of the Order of St. Gregory the Great (Roman), and in 1882 a commander of the Legion of Honor (France). D. in Montreal, June 13, 1898. Neil Macdonald.

Chaplet [O. Fr. *chapelet*, dimin. of *chape* < Lat. *cappa*, head-covering]: a garland or wreath to be worn on the head; the circle of a crown; a string of beads used by Roman Catholics (see Rosary) by which they enumerate their prayers; in architecture a little molding carved into round beads, pearls, olives, etc.

Chaplin, Charles Joshua: figure and portrait painter; b. of English parents at Les Andelys, France, June 6, 1825; naturalized French citizen; d. in Paris, Jan. 30, 1891; pupil of the École des Beaux-Arts; second-class medal, Salon, 1852; officer Legion of Honor 1877; employed under the Empire in the decoration of the Tuileries and the Elysée; painted ceilings and wall decorations in various public and private buildings in Paris, and numerous portraits, principally of women. His pictures are remarkable for delicate color and clever modeling, and are much appreciated by collectors.

William A. Coffin.

Chaplin, Winfield Scott, M. A.: b. in Glenburn, Me., Aug. 22, 1847; after finishing his course at the high school in Bangor, Me., was appointed in 1866 cadet in the U. S. Military Academy, where he graduated second in the class in 1870; was appointed second lieutenant Fifth U. S. Artillery, where he served until he resigned Apr. 6, 1872. Employed at railroad engineering 1872–74; Professor of Mechanics in the Maine State College 1874–77; Professor of Civil Engineering in the Imperial University of Tokio, Japan, 1877–82. Returning to the U. S. he was for one year employed in railroad engineering; then Professor of Mathematics in Union College, Schenectady, N. Y., 1883–85; Professor of Engineering in Harvard University 1885–91; in 1886 dean of the Lawrence Scientific School; in Sept., 1891, was appointed chancellor of Washington University, St. Louis, Mo.

James Mercur.

Chapman, Alvan Wentworth, M. D.: b. at Southampton, Mass., Sept. 26, 1809; graduated at Amherst College 1830; removed to Appalachicola, Fla., where he attained fame as a botanist. The genus *Chapmannia* was named in his honor. He published *Flora of the Southern United States* (1860). D. Apr. 6, 1899.

Chapman, George: an English poet and translator; b. at Hitchin Hill, Hertfordshire, England, in 1557; became a resident of London and a friend of Shakspeare and Spenser. He produced numerous comedies and tragedies, and was the first translator of Homer into English verse. His version of the *Iliad* was published 1598–1611, and that of the *Odyssey* 1614–15. Of his tragedies, the most noticeable are *Bussy d'Ambois* (1607) and *Cæsar and Pompey*; among his comedies, *All Fools*, *Monsieur d'Olive*, *The Gentleman Usher*, all published in 1607, and *The Widow's Tears*. D. in London, May 12, 1634. A complete edition of his works in three volumes appeared in 1873–75.

Revised by H. A. Beers.

Chapman, John Gadsby, N. A.: b. in Alexandria, Va., in 1808; received his training as a painter in Italy, which was for many years his home. He executed the painting called the *Baptism of Pocahontas*, in the Capitol at Washington, and published a drawing-book. D. Nov. 28, 1889.

Chapman, William: U. S. military officer; b. in St. John's, Md., Jan. 22, 1810; graduated at West Point in 1831; on Feb. 20, 1862, became lieutenant-colonel of Third Infantry. He served chiefly at frontier posts 1831–61; in Black Hawk expedition 1832; at Military Academy as assistant instructor 1832–33; as adjutant Fifth Infantry 1833–38; in military occupation of Texas 1845–46; in the war with Mexico 1846–48; engaged at Palo Alto, Resaca de la Palma, Monterey, Vera Cruz, San Antonio (wounded), Churubuseo (brevet major), Molino del Rey (brevet lieutenant-colonel), Chapultepec, and city of Mexico; in Florida hostilities 1857; on Utah expedition 1857–60. In the civil war he served in the Virginia Peninsula 1862; engaged at Yorktown and Malvern Hill; in North Virginia campaign 1862, engaged at Manassas (brevet colonel). Retired from active service Aug. 26, 1863, and chiefly employed in command of draft rendezvous at Madison, Wis., 1863–65, and in various special duties. D. Dec. 17, 1887.

Chapoo: See Chapu.

Chap'paqua: a post-village and summer resort of New Castle township, Westchester co., N. Y. (for location, see map of New York, ref. 8–J); on the N. Y. C. and H. R. R. R.; 32 miles from New York. It has some manufactures, and an excellent boarding-school under the patronage of the Society of Friends; there is also a saline chalybeate spring near the place. Pop. (1880) 330; (1890) 733; (1900) not returned separately.

Chapparal Cock: See Cuckoo.

Chappe, shăp, Claude: engineer; b. in Rouen, France, 1760; inventor of a telegraph. He produced in 1792 a system of signals and a machine which he called a telegraph, by which a dispatch was transmitted from Paris to Lille, 48 leagues, in thirteen minutes and forty seconds. Numerous lines of his telegraph were soon extended through other parts of France. D. in Brûlon, Jan. 23, 1805.

Chapped Hands are sometimes a sort of chilblain on the hands, and, like chilblain, this disease appears to pass by insensible gradations into a form of eczema, while many cases of chapped hands are simply eczematous, without any recognizable connection with chilblain. Glycerine, borax, benzoated oxide-of-zinc ointment, and various like applications are useful.

Chappell, William, F. S. A.: English musical antiquary; b. Nov. 20, 1809; resided in London, where he belonged for

some time to a music publishing house. Among his works are *Popular Music of the Olden Time*, a most valuable collection of over 400 airs (2 vols., 1855–59); and the first volume of a *History of Music* (1874). D. in London, Aug. 20, 1888.

Chap'ra, or **Chŭp'ra**: a town of British India; capital of Sarun district, Patna division, Bengal; near the Ganges; 34 miles N. W. of Patna city (see map of N. India, ref. 6–H); distinguished for its wealth, its pottery, and brass goods. It has a considerable trade in saltpeter. Pop. (1881) 51,670; (1891) 56,980.

Chapsal, shăăp'săl', Charles Pierre: grammarian; b. in Paris, France, 1788; author of numerous grammatical works: made a fortune from the proceeds of the *Nouvelle Grammaire Française*, written in conjunction with M. François Noel (1st ed. 1823). D. 1858.

Chaptal, shăăp'tăl', Jean Antoine, Comte de Chanteloup: chemist; b. at Nogaret, Lozère, France, June 5, 1756. He graduated as M. D. at Montpelier in 1777; became Professor of Chemistry at that place in 1781; supported the popular cause in the Revolution; introduced the manufacture of certain chemicals for which France had previously been dependent on foreigners. About 1796 he was chosen a member of the Institute. He was Minister of the Interior for five years (1801–05); made a count by Napoleon I.; afterward a senator. His chief works are *Chemistry Applied to the Arts* (1806) and *Elements of Chemistry*. D. in Paris, July 30, 1832. See Flourens, *Éloge historique de Chaptal* (1835).

Chapter [O. Fr. *chapitre* for *chapitle*: Span. *capitulo* < Lat. *capitulum*, little head (*caput*), heading of a column, of a section of a book, etc.]: the body of the clergy of a cathedral united under the bishop, or, where the bishop is not in residence, under the presidency of a dean. The dean, however, was a late addition, dating back no further than the tenth century. W. S. Perry.

Chapter-house: the meeting-hall for the deliberations of the dean, canons, and prebendaries of a cathedral or collegiate church. Many of the splendid chapter-houses of English cathedrals were built for the *chapters* of the monastic orders whose abbeys these cathedrals originally were. Those for the secular clergy were usually polygonal, lofty, and vaulted, with or without a central column, as at Salisbury and York. A. D. F. Hamlin.

Chapu': a town of China; in the province of Cheh-Kiang; port of the important city of Hang-Chow, with which it is connected by a canal (see map of China, ref. 6–K). It was formerly the only Chinese port trading with Japan. The city has a circuit of 5 miles, excluding suburbs.

Chapul'tepec: a strong Mexican fortress; stormed by the forces under Gen. Scott Sept. 13, 1847, during the war between the U. S. and Mexico (1846–47). It is situated about 2 miles S. W. of the city of Mexico, and consists of an isolated eminence about 150 feet high, fortified by a strong citadel which crowns the hill, designed to protect the causeway forming the approach to the city. Its approaches were also strongly guarded by outworks at its base and on its acclivities. The castle contained, besides a strong garrison, the military school of the republic.

In the plan for the capture of the city of Mexico the reduction of Chapultepec was considered indispensable to success. The extraordinary natural strength of this place, and the skill and money which had been expended to make it impregnable, rendered this a hazardous undertaking. To mask the intended attack, Twiggs, with Riley's brigade and Taylor's and Steptoe's batteries, was left at the southern gates of the city, and kept up an effectual fire during Sept. 12, and down to the afternoon of the 13th, compelling the enemy to withdraw within the walls of the city, and thus holding a good part of the Mexican army, under Santa Anna, on the defensive. Heavy batteries at well-selected points were established on the night of the 11th, and a vigorous fire was opened on the castle and outworks on the morning of the 12th, continuing with good effect throughout the day and on the morning of the 13th, while preparations for the attack were being made. Pillow's and Quitman's divisions were to assault, the former on the west and Quitman on the southeast side; Worth's division to support Pillow, and Smith's brigade of Twiggs's division to support Quitman. An assaulting party of 260 men, under Capt. McKenzie, Second Artillery, was furnished Pillow, and Twiggs's division supplied a similar one, under Capt. Casey, Second Infantry, to Quitman. The signal for attack was to be the momentary cessation of firing from the heavy batteries. About 8 A. M. of the 13th notice was sent to Pillow and Quitman that the concerted signal was about to be given, and both columns shortly after moved forward with great vigor, the batteries throwing shot and shell upon the enemy over the heads of the attacking columns.

Pillow's approach on the west side lay through an open grove filled with sharpshooters, who were quickly dislodged; on emerging into an open space at the foot of a rocky hill, Pillow was severely wounded, the immediate command devolving upon Gen. Cadwalader. Clark's brigade of Worth's division was now sent to Pillow's support. A strong redoubt, midway, was to be carried before reaching the heights. The advance was over rocks, chasms, and mines, and in the face of a heavy fire of cannon and musketry. Without wavering the redoubt was carried, and the enemy driven from shelter to shelter, without time to fire a single mine unless endangering the lives of their own men. The ditch and main wall of the work were reached, scaling-ladders were brought in use, and a lodgment soon made, followed by streams of troops.

Simultaneously with Pillow's advance on the west, Quitman approached the southeast of the same works over a causeway strongly fortified and defended. Smith's brigade had been thrown out to the right, to turn the batteries near the foot of Chapultepec and support Quitman's storming party. The contest was desperate for a short time, but the valor of the U. S. troops overcame every obstacle, the batteries and works were carried, and the ascent was continued; the enemy were driven from their stronghold, and the Stars and Stripes floated from the heights of Chapultepec. This victory virtually ended the war, the city of Mexico being entered the next day, the 14th. The U. S. loss in killed and wounded during the 12th, 13th, and 14th, was 863; the Mexican loss was much greater.

At present Chapultepec is the summer palace of the president of Mexico, as it was of the Emperor Maximilian. The military school occupies a portion of it, and the castle is surrounded by a beautiful park.

Cha'ra [from Gr. χαρά, joy, probably in allusion to the beautifully regular habit of branching]: a genus of Stoneworts (*q. v.*) including about sixty-two species, of which twenty-five or thirty occur in North America. C. E. B.

Chara'ceæ [from *Chara*, the principal genus]: an order of aquatic flowerless plants allied to the red seaweeds, and popularly known as Stoneworts (*q. v.*).

Chara'chera: a genus of diffusely shrubby plants including but one species (*C. viburnoides*), native of Arabia. The flowers consist of a five-foliate calyx, gamopetalous, tubular, violet corolla, four stamens, and a four-angled two-celled ovary, each cell two-ovuled. Its affinities are uncertain, but it probably belongs to the family *Acanthaceæ*. C. E. B.

Character [viâ Fr. and Lat. from Gr. χαρακτήρ, stamp, token, distinctive mark, characteristic: deriv. of χαράσσειν, engrave]: a mark or figure engraven on an object; a letter or type used in writing or printing; the peculiar qualities impressed on a person by nature or habit; distinctive qualities of heart, mind, and manners. The term is often used to denote a person or actor in an epic poem or drama. In the arts of painting and sculpture, after the proper representation of form or color, the expression of character is the most important part of the artist's work. In botany and other branches of natural history character is an enumeration or brief description in scientific terms of the essential and distinctive marks of a species, genus, order, etc.

Charade, sha-rād' [Mod. Fr. *charade* < Lat. **caracta*, mystical word, spell; cf. *character*, Gr. χαρακτήρ. A derivation from Span. *charrada*, a country dance, merry-making, has been also suggested]: a social amusement, consisting sometimes of the division of a word into its constituent syllables or letters, and then making some statement as to each syllable and the whole word, the company being required to guess the word. In "acting charades" each syllable is introduced prominently, but not too conspicuously, into the successive scenes of a dialogue, the whole word being brought into the last scene. Sometimes the name *charade* is used to designate any parlor drama.

Charaes, **Jaraes**, or **Xaraes**, shăă-rīz': the name given on old maps of South America to a large lake, represented as the source of the river Paraguay. The report of this lake probably arose from the vast plains which border the

upper Paraguay, and during the annual floods form, in fact, a shallow lake. They are now known as the Charaes marshes. See PARAGUAY RIVER. H. H. S.

Charcas: the name given in colonial times to the region now called BOLIVIA (*q. v.*). The *audiencia* or government of Charcas was at Chuquisaca, and in common parlance that city was often called Charcas. The name is still sometimes used for the province of Chuquisaca. H. H. S.

Cha'rax of Per'gamus: priest and philosopher; supposed to have flourished in the time of Marcus Aurelius. His historical works were prolix, and treated with minute detail the mythical period. Fragments in Müller's *Fragmenta Historicorum Græcorum*, vol. iii., pp. 636–45.

Charcoal [etym. doubtful; perhaps connected with obsol. verb *chare*, turn]: a common name of a variety of carbon; a carbonaceous substance obtained by heating wood and other vegetable matters in close vessels, or by partially burning them. The term is also applied to the solid residuum which results from the destructive distillation of animal matter and peat. (See BONE BLACK and ANIMAL CHARCOAL.) The composition of charcoal depends on the temperature at which it is produced. At high temperatures all the oxygen and hydrogen of the materials are expelled, and the black charcoal consists of carbon and the mineral matter (ashes) originally present. When produced at lower temperatures, the charring is imperfect, and a reddish charcoal results, which contains both hydrogen and oxygen. It burns without flame or smoke, and produces a greater heat than an equal weight of wood. It is used as an ingredient in the composition of gunpowder, as an agent in clarifying liquors, and for other purposes, among which is the smelting of ores. It has an extraordinary capacity for absorbing gases. It is said that it will absorb ninety times its bulk of ammoniacal gas. It is infusible, is not soluble in acids or other liquids, is not liable to decay, and is not altered by any degree of heat if it be not exposed to the air or to oxygen. It is a very bad conductor of heat, and hence powdered charcoal is placed round tubes to prevent the escape of heat. Powdered charcoal is used to preserve flesh, or sweeten it when tainted. Common charcoal intended for fuel is made by burning or heating a pile of wood without free access of air. The sticks of wood, which are not more than 4 feet long, are arranged in a conical pile around a central aperture, and covered with turf, sods, or other material which prevents the free access of air. Charcoal-dust, mixed with earth and moistened, makes a good outer covering. An opening is left at the top for the escape of smoke and vapor. The pile is usually ignited at the top, and continues burning with a slow smoldering fire for a week or more. The charcoal used as an ingredient of gunpowder is made from wood which is free from resin, such as willow or poplar. Charcoal is often prepared by roasting wood in iron cylinders. By this method there is a larger proportion of charcoal saved and the product is of better quality; there is also a larger quantity of pyroligneous acid secured, which is of great value in the arts.

Charbon rouge (i. e. red charcoal) is charcoal obtained by subjecting wood to heated air or steam raised to the temperature of 572° F. By this process from 36 to 42 per cent. of charbon rouge is obtained, whereas not more than 25 per cent. of charcoal is obtained by the ordinary method. It has a dark-red color, and contains 75 per cent. of carbon. It is extensively used in Europe in the manufacture of gunpowder and iron blooms.

Charcoal Blacks: pigments made from any charred material, of which LAMPBLACK (*q. v.*) is the most common instance. The charcoal crayons used for making drawings are another instance. The name charcoal black is given especially to pigments made from charred grapevine twigs.

Charcot, shaar'kō', JEAN MARTIN: French neurologist; b. in Paris, Nov. 29, 1825; M. D. 1853; member of the Academy of Medicine 1873; and of Legion of Honor. He made important investigations in nervous pathology and hypnotism. Author of *Les Maladies des Vieillards et les Maladies Chroniques* (1868); *Les Maladies du Système Nerveux* (4th ed. 1880); *Localisations dans les Maladies du Cerveau et de la Moelle Épinière* (1876–80); *Œuvres complètes* (12 vols., 1886 ff.). D. at Morovan, France, Aug. 18, 1893.

Chard: See BEET.

Chardin, shaar'dăñ, JEAN BAPTISTE SIMEON: painter; b. in Paris, 1698; son of a carpenter; pupil of Cazes and of Noel Coypel; was made member and then treasurer of the Academy; was the friend of Diderot. His works are naturalistic and comprise still-life, flower, and animal subjects, and have passed among the classics in their vein. D. in Paris, 1779. W. J. S.

Chardin, Sir JOHN: celebrated Oriental traveler; b. in Paris, France, Nov. 26, 1643; was educated as a jeweler, but his love for travel led him to make a journey to India and Persia in 1664, to trade in gems. He made two voyages to the East; spent many years in Persia, where he became a favorite with the shah; studied the language, history, and customs of the country. On his return to Europe, in 1681, he settled in London. He was knighted by Charles II., and sent in the following year on a mission to Holland. In 1686 was published the first part of his noble work, *Travels into Persia and the East Indies* (London, 1686), which appeared latter in its complete form, as *Journal du Voyage du Chevalier Chardin en Perse et aux Indes Orientales* (4 vols., Amsterdam, 1711, 1735, and an enlarged edition by Langlès, Paris, 1811). The work is one of much merit, full of interest and very trustworthy, especially in everything relating to Persia. Sir John died in London, Jan. 26, 1713, and is interred in Westminster Abbey.
Revised by A. V. WILLIAMS JACKSON.

Chardon, shaar'don: capital of Geauga co., O. (for location of county, see map of Ohio, ref. 2–I); on Pitts. and West. R. R.; on a ridge 14 miles from Lake Erie, and about 28 miles E. of Cleveland; has four churches, fine courthouse, and school-building. The chief industry is agriculture. Pop. (1880) 1,081; (1890) 1,084; (1900) 1,360.
EDITOR OF "GEAUGA REPUBLICAN."

Charente, shaă'raăṅt': a river of France; rises in Haute-Vienne, and flows in a very tortuous course westward through the departments of Charente and Charente-Inférieure, and enters the Atlantic opposite the isle of Oléron. Total length about 157 miles. It is navigable for steamboats from its mouth to Saintes, and by means of twenty-seven locks is navigable for 102 miles.

Charente: a department in the western part of France; area, 2,294 sq. miles. It is intersected by the rivers Charente and Vienne. The surface is undulating, and in some parts hilly; the soil is mostly calcareous and dry. Several deep limestone caverns occur here. Extensive forests of chestnut-trees grow on the hills. Truffles are found in abundance. A large part of Charente is occupied by vineyards, the product of which is mostly converted into brandy. The chief article of export is Cognac and Jarnac brandy. Here are manufactures of iron, paper, and leather. Capital, Angoulême. Pop. (1896) 356,236.

Charente-Inférieure, -aṅ'fay'rĕc'ör': a department in the western part of France; bounded W. by the Atlantic, and S. W. by the estuary of the Gironde; intersected by the river Charente. Area, 2,635 sq. miles. The surface is nearly level; the soil is very fertile. The staple products are grain, wine (which is mostly converted into brandy), hemp, and flax. The salt-works on the seacoast are the most valuable in France. It has manufactures of glass, earthenware, and leather. Capital, La Rochelle. Pop. (1881) 466,416; (1896) 453,455.

Charenton-le-Pont, shaă'raăṅ'tōṅ'-le-pōṅ': a town of France; department of Seine; on the right bank of the Marne; 5 miles S. E. of Paris (see map of France, ref. 3–F). It has large chemical works. A bridge across the river connects this town with St.-Maurice, where is the large national asylum for lunatics. This bridge has been the scene of several conflicts between armies contending for the possession of Paris. Pop. (1896) 16,811; of St.-Maurice, 6,927.

Cha'res (in Gr. Χάρης): an Athenian general notorious for his corruption and incompetence; was chosen commander-in-chief in the Social war, which began in 357 B. C. This war was provoked by his extortions.

Chares: a Greek statuary; b. at Lindus; was a pupil of Lysippus and the founder of the Rhodian school of sculpture. He lived about 300 B. C. Among his works was the Colossus at Rhodes, regarded as one of the Seven Wonders of the world. It was a bronze statue of Apollo, or rather of the sun-god, about 105 feet high, and was thrown down by an earthquake in 224 B. C.

Chares of Mytilene: Greek historian; his position as master of ceremonies to Alexander the Great enabled him to collect much gossip about that monarch, which he afterward published in a work, quoted by Athenæus and used by Plu-

tarch. Fragments collected in Müller's *Scriptores Rerum Alexandri Magni*, pp. 114–120.

Charge: See Heraldry.

Charge: in law, a burden imposed on a thing; a duty or obligation imposed upon a person; sometimes merely a formal and distinct allegation. More specifically it is used in the following connections: (1) A burden imposed upon land, particularly in a court of equity. It is a common course in a will to "charge" the devisor's estate with the general payment of debts or legacies, or with the payment of a particular debt or legacy. In such a case the land is burdened with the debt, so that it is a lien or incumbrance upon it; and this would follow it into the hands of a purchaser. A charge of this kind may be created by implication. Thus if a testator should provide as follows, "*After* the payment of $1,000 to A, I devise my mansion-house to B," that sum would be charged upon the land as owned by B, and would follow it in case of a sale or other transfer. (2) A charge upon the person. A will or other instrument may be so drawn as to confer a benefit upon a person, and at the same time impose upon him an obligation. Should he accept the benefit, he will by implication take upon himself the burden or obligation, though it may outweigh the benefit. No person is bound to accept such a devise or provision, so that the charge in the case supposed is in truth created by the grantee's or devisee's own act, in conjunction with the grantor's or testator's direction. (3) Directions to a jury. In a jury trial, as the decision of questions of law appertains to a judge, and matters of fact belong to the jury, it is a common practice for the judge to instruct or "charge" the jury upon the questions of law. These instructions the jury are legally bound to follow. The idea lying at the root of the word "charge" in this case would seem to be the obligation or duty of the jury to accept the version of the law propounded by the judge. (4) In equity practice the words "charge and discharge" are found in connection with the taking of accounts in that court of moneys paid and received. The *charge* means the statement of debts due by the party against whom the account is rendered, and *discharge* means the items of credit presented by the latter. These might be so presented as to make counter-statements necessary. This practice, in its details, is disfigured by much technicality, and has been generally abandoned. (5) In equity pleadings there is a statement made by the plaintiff, known as the charging part of the bill (or complaint), in which he sets forth certain facts, anticipatory of a defense which he supposes that the defendant will make. The word charge here means a distinct and formal affirmation, and the pleader sets forth the defendant's claim as a mere pretense on his part, and alleges on his own part the facts in opposition to it. T. W. Dwight.

Chargé d'Affaires, shăär'zhay'dăaf'fār' [Fr.]: a diplomatic agent of the fourth or lowest rank, the others being (1) ambassador; (2) envoy or minister; and (3) resident minister. The first two are accredited to a sovereign. The *chargé d'affaires* is accredited to the Foreign Minister or Secretary of State of the country to which he is sent.

Chariot [O. Fr. *chariot*, deriv. of *char* < Late Lat. *carrum*, wagon, of Celtic origin]: a vehicle used by the ancients in war and in journeys of pleasure. It had two wheels and was drawn by two horses, or sometimes with one or two more. It was closed in front and open behind. War-chariots were used by the ancient Greeks, Romans, Assyrians, Britons, and other nations. The four-horse chariot in which Roman generals rode when they entered Rome in triumph was called a *quadriga*. See Carriages.

Charis'ius: an Attic orator: contemporary of Demochares, the nephew of Demosthenes; imitator of Lysias; mentioned by Cicero and Quintilian. Three passages are translated by Rutilius Lupus in his work *De Figuris* to illustrate certain rhetorical figures. See Blass, *Attische Beredsamkeit*.

Charisius, Aurelius Arcadius: a learned jurist who lived under Constantine and his sons, and filled the office of "magister libellorum." He wrote several works on legal subjects. Extracts from three of his writings are contained in the *Digest*.

Charisius, Flavius Sosipater: probably from Africa; a celebrated grammarian, whose date falls in the latter half of the fourth century. He was a man of some distinction, and is styled "magister urbis" in the inscription of his work, which is a Latin grammar in five books, *Institutionum Grammaticarum libri quinque*, written for the use of his son. Portions of the work have been lost; the remainder is given in the various collections of Latin grammarians, most recently in the first volume of Keil's edition, 1857.

Revised by M. Warren.

Charitable Uses: uses in property, either real or personal, held by a trustee to be devoted by him to charitable purposes. The word "charitable" in this connection is nearly synonymous with public. Trusts for charitable purposes would include funds in the hands of trustees devoted to the repair of highways or streets in cities, the support of paupers, the foundation of colleges, churches, and hospitals, etc. Charitable uses are sometimes loosely called simply charities. They are often sustained by the courts when trusts for the benefit of individuals would be held invalid, especially with respect to the creation of perpetuities. See Trusts (*Charitable Trusts*). Revised by F. Sturges Allen.

Charites, kăr'i-tēēz (in Gr. Χάρις, Χάριτες; in Lat. *Gratiæ*): the Graces of classic mythology; were said to be the daughters of Jupiter. They were patrons of poetry and art, and presided over festivals and social enjoyments. There were three Graces, Aglaia, Euphrosyne, and Thalia.

Char'iton: a river of the U. S.; rises in the south part of Iowa. Having crossed the boundary between Iowa and Missouri, it flows southward through Adair, Macon, and Chariton Counties of the latter State, and enters the Missouri river 3 miles above Glasgow. Total length about 250 miles.

Chariton: city; capital of Lucas co., Ia. (for location of county, see map of Iowa, ref. 7–H); is on the Chicago, Burlington and Quincy R. R. and the Chariton river; 55 miles W. of Ottumwa. It has a large public hall. Pop. (1880) 2,977; (1890) 3,122; (1900) 3,989.

Chariton, kăr'i-ton, of Aphrodisias in Caria: pseudonym of a Greek writer of a late historical romance, *The Story of Chæreas and Callirrhöe*. The scene is laid in the time of the Peloponnesian war; the father of Callirrhöe is the famous Hermocrates, and the author is the secretary of Athenagoras, characters known from Thucydides. It is a poor imitation of romances by Xenophon of Ephesus and by Heliodorus. Edited by D'Orville, with copious notes (rev. ed. 1783). See also Rohde, *Griechischer Roman*, p. 485 fol.

Charities: See Charitable Uses.

Charity Organization: a development of recent times, born of the multiplication of relief agencies in large centers of population, and of the wastes and mischiefs wrought by their independent action. As a specialty it aims at building up voluntary unity of every sort of benevolent endeavor. It is to charity in general what confederations of workmen, exchanges, and clearing-houses are to the industrial and commercial circles: a necessity in the interest of economy and effectiveness. The name is derived from the title of the London Society for Organizing Charitable Relief and Repressing Mendicity, a title so cumbrous that it was popularly abbreviated into Charity Organization Society. As this society began in 1869, that date may be taken for the birth of this reformatory movement. Its principles were the outcome of the experience and experiments of Europe for the previous fifty years. The Rev. Dr. Chalmers made practical trial of kindred principles from 1819 to 1823. The parish of St. John's in Glasgow, embracing 10,000 souls, and in the poorest part of the city, was assigned to him to put his convictions in operation. He required the civic and great voluntary charities of the city not to invade his domain; nor would he turn any applicant for relief over to them. A large corps of friendly visitors was organized until there was one visitor for about every three persons seeking aid. They were not to give alms except in cases of extreme necessity, but were first to elicit the resources of the poor themselves. To carry on his work he relied upon the church-door collections of his evening (which was his poor) congregation, and these amounted to about £40 a year. Forty pauper families disappeared from his lists, and only twenty were added, and the office of his friendly visitors became a sinecure. His poor-collections gave him a surplus with which he endowed two parish schools, and for which he taxed his ingenuity to find a harmless expenditure. In 1823 Chalmers removed to Edinburgh, but his methods of administration went on for fourteen years in St. John's parish, and finally ceased, partly through the encroachment of the poor-laws, and partly owing to dissensions fast growing in the Scotch Kirk.

The London society named was to some extent a sequel to

the large funds raised in England for the relief of the Lancashire sufferers by the cotton famine caused by the blockade of the Southern ports of the U. S. during the civil war. The administration of that and other emergency funds in London was felt to have miscarried, and people had grown ready for surer and better methods.

Effective, too, was the voice of Edward Denison, the son of a bishop and a member of Parliament, who went to live in the East End of London in order to learn by daily contact with the destitute and depraved the secret of their lives, and what they really needed for their redemption from wretched situations. Influential friends, spurred on by Octavia Hill's success with her poor tenants in the same part of London, joined him to create some agency for staying the waste of benevolent money and exertion through disconnected agencies and almoners, and for reaching the roots of pauperism with effective remedies. The society they founded in 1869 has thirty-eight district agencies in as many parishes or unions of London, and has made for itself a world-wide reputation for the exercise of the true art of philanthropy. Its influence has permeated the kingdom to such a degree that there are now (1893) ninety-one analogous societies in as many towns and cities of Great Britain, and seventy-eight corresponding societies on the Continent and in the British possessions.

Its methods were first copied in the U. S. in the Germantown suburb of Philadelphia, under the leadership of Rev. Charles G. Ames (1873). Then came in 1878 the Buffalo Charity Organization Society, virtually founded by Rev. S. H. Gurteen, a clergyman who had been one of the workers in the London society. From Buffalo it spread within two years to Boston, Brooklyn, Cincinnati, Indianapolis, Newport, Philadelphia, Portland, Me., Syracuse, and in 1882 to New York city. Since that time kindred societies have been formed in all of the principal cities and towns of the U. S., and in many other places the principal relief societies have adopted what are called "charity organization" principles. These municipalities include about one-sixth of the total population of the U. S. These societies have taken the diverse names of associated charities, bureau of charities, societies for organizing charity, etc., but all are alike in purpose, principles, and practice. They are allied with each other through representatives sent to the National Conference of Charities and Correction, which meets annually, and are also closely affiliated with each other and with similar organizations all over the world (some 270 in number) by correspondence and interchange of services. This connection is voluntary, but none the less real and practical; and it rests on the inherent unity of the movement and the now general recognition of the fact that the truest welfare of the poor requires intelligent and philosophical research and methods.

What is new about the organization of charities is not its fundamental principles, for these had been elicited bit by bit through years of experiment, but the devising of a plan to apply these principles systematically to the legal, ecclesiastical, and social conditions of English-speaking states. These conditions, at first confronted by the London society, were very complex, but the adaptation of the society to them was ingenious and simple. The scheme was so flexible in operation, so interwoven into the usages and traditions of the people, and yet so distinctly embodying the convictions of humane thinkers, that it was hopefully and loyally approved by those who earnestly desired that benevolence should no longer miscarry but indeed become beneficent.

Among the essential characteristics of "charity organization" are these:

I. Voluntary Principle.—It is purely a voluntary alliance among persons interested or engaged in the administration of civic, congregational, associated, and individual relief. There are three types of relief which pertain to modern life: (*a*) The voluntary, the product of humane or religious sentiment, Italy having, at least until recently, afforded the most striking example of it; (*b*) a state-supervised administration of confiscated endowments and voluntary contributions, which has its best development in France and Belgium; (*c*) and a public charity, officially managed and sustained by taxation, such as obtains in Elberfeld, Prussia, Denmark, and Sweden, where the statutes declare the right of a pauper to state relief. In Great Britain and the U. S. the voluntary and legal methods grew up side by side, and, especially in England, in great prodigality. So lavish had the dual practice grown that Edward Denison, shortly before his death in 1870, wrote: "Certain calculations put the London charities at a total of £7,000,000—enough to give £17 a head to 400,000 souls." This meant that every seventh person in London at that time received relief, and that, if three of these persons (the probable numbers of bread-winners in the average family among the poor) be counted to a household, its income from public charity would be $255 a year, or all that an unskilled workman steadily employed could earn in wages during the same period. The Elberfeld system, most influentially quoted in 1869, is not a voluntary one; but while it is carried out by private citizens of high standing, and serving without pay, their work is practically as compulsory as the enforcement of jury duty in the U. S., and it is bolstered up by taxation.

II. Co-operation.—The next fundamental feature is co-operation or association. When Robert C. Winthrop, about 1859, wrote the report of the Boston Provident Association, in advocating the erection of a building in which the offices of the various civic charities and of the principal voluntary societies of the city might bring their administrations under one roof, he urged as a motive thereto the usefulness of association, and it was partially realized when the Charity Building in Chardon Street in 1869 was authorized and erected. This was an important preliminary step in charity organization in the U. S., and its history has made the term "associated charities" the equivalent in the U. S. of "charity organization." Prior to the invention of an available scheme for concerting the action of charitable agencies, the principle of individualism, or dissociation, ruled public and private benevolence. In the United Kingdom and in most of the U. S., especially in centers of population, legal provisions for relief embraced every form of destitution, and were generally ample except in great emergencies. It was so profuse that it corrupted the poor by its temptations to relax effort, and to depend on temporary relief; it worked harm to wages, to industrial organization, to character, and to tax-payers, some of whom in England saw their property nearly confiscated by the poor-rates. But, notwithstanding this, voluntary charity went on to duplicate the legal provision in every imaginable way. Thus in New York city a *Directory of Charities*, published in 1892, enumerates thirty-nine official agencies of relief sustained by taxation under the city Commissioners of Charities and Correction, and then describes 590 more voluntary associations covering like ground. The latter are sectarian, secular, national, and racial, and devised for all sorts of distress. Each of these agencies, so common in large towns and cities, worked alone; they overlapped; they competed; they fostered indolence; they encouraged deceit; they disappointed the humane; they augmented the evils they professed to cure. Charity organization holds that if all this wasted strength were saved by co-operative action, the generous provision of society would be adequate to overcome every form of misery arising from real misfortune or indigence, and even to abate many caused by vice.

Clearing-house.—A chief appliance provided for this concerted action is a clearing-house or registration bureau, where every private individual, voluntary society, church agency, and civic relief officer can send information regarding the beneficiaries of each. Here that information is classified, tabulated, and exchanged among all who wish to profit by it. Its results are available for the guidance of any one wishing to do an act of charity. There is no dictation by the Charity Organization Society, and there are no restrictions beyond those necessary to protect the reputations of the poor. With the Charity Organization Society of New York city, in Jan., 1893, more than 480 relief agencies and 1,500 private individuals were co-operating through its registration bureau, which contained records, more or less detailed, concerning fully 175,000 families which had been investigated by it or reported to it as applicants for or recipients of charitable relief. This society was appealed to for information 16,244 times during 1892. By the simple expedient of a central registration bureau (often compared to the bankers' "clearing-house" or a "mercantile agency") benevolent activities that formerly counteracted each other now co-operate, the haunts and methods of professional mendicants and impostors are revealed, better adaptations of relief and friendly treatment are brought into view, and rills of service by the score are combined in one effective stream of helpfulness and adequacy.

III. Repression is a third feature of the organization of charity. Organized charity aims not so much to protect givers or workers as to protect the wretched, the tempted, and the fallen, not only from themselves, but from the demoralizing

and degrading effects of sentimentality and its cruel self-indulgence. It believes that to give alms without knowledge of the case is as absurd as to give medicine without a diagnosis, and should incur like censure, and that no one remedy is a panacea for all diseases. It pleads that the strong and prosperous should not damage and degrade the weak; but, not recoiling from any condition, however debased, by an intelligent acquaintance with the state of each, should adapt their help and treatment to the precise case in hand, with the constant aim of restoring each sufferer to true manhood or womanhood, as well as to independence and self-support.

IV. And this RESTORATION may be called the fourth and the most humane feature of charity organization. When human beings lapse into poverty or vice they too often lose their helpful social connections, and exchange them for those with a more degraded class; and their only proper cure is restoration to right social relations. It is this view of charity which finds expression in college and university settlements, Toynbee halls, Andover houses, Hull houses, neighborhood guilds, and all the contrivances for reknitting the social relations between the prosperous and the poor. Edward Denison, as the result of his observations in Stepney, wrote: "I am beginning seriously to believe that all bodily aid to the poor is a mistake; that the real thing is to let things work themselves straight; whereas, by giving alms you keep them permanently crooked. Build schoolhouses, pay teachers, give prizes, frame workmen's clubs, help them to help themselves, lend them your brains; but give no money but what you sink in such undertakings." Thus he, and all likeminded, thoughtful philanthropists, would restore the poor to a useful and honorable place in society.

Friendly Visitors.—The poor fall behind because of their isolation, inferior intelligence, moral weakness, and low ambitions. Bind together aspiration and aimlessness, strength and weakness, culture and ignorance, hopefulness and self-abandonment, and restoration is not only possible but probable; for the disordered class is only one-tenth of the number of the normal. Friendly visitors are charged to go to the poor as neighbors, and to stand by them patiently as friends; to discover and remove the causes of their depression; to give them the sympathy and counsel which they need; to impart the energy, hopefulness, and ambition which wholesome friends alone can give. They also suggest how to improve the health of the family in matters of ventilation, personal and home cleanliness, clothing, diet, care of children and of the sick; how to improve their homes or to remove to sunnier and purer quarters; how to find work; how to practice thrift and foresight; how to overcome debasing habits; how to train the children to become good men and women; and they carry to the impoverished the cheer and encouragement which come only from realizing that they have a living union with the great brotherhood of man. And this is what charity organization means by "restoration."

CHARLES D. KELLOGG.

Charity, Sisters of [in Fr. *sœurs* (or *filles*) *de la charité*, or *sœurs grises*, i. e. Gray Sisters, so called from their dress]: a name applied to several orders of celibate women in the Roman Catholic Church. The first congregation of this name was established at Châtillon, in France, by St. Vincent de Paul in 1629. Confirmed by the see of Rome, this congregation greatly multiplied, and its houses are now found in all parts of the world. This order is devoted to the care of the sick and the protection of foundling or destitute children and aged persons, and hence is popularly regarded with more favor than almost any other order of nuns. It alone, of all religious orders, was able to weather the storm of the Revolution in France. In spite of the edict of 1790, which suppressed all religious orders, the Sisters of Charity continued their activity and were not interfered with. In 1800 Napoleon officially recognized them and gave them public support. Under such circumstances the community developed an extraordinary energy; it became, indeed, the center into which was gathered the whole practical religious energy of the time. Their special name is Sisters of St. Vincent de Paul, and different from them, though having the same rules and the same purposes, is another order of Sisters of Charity, called Daughters of St. Borromeo. It was founded in 1652 by Abbot Epiphanius Louys of Estival, at that time general of the order of the Premonstrants. Its name is derived from the circumstance that its first members served in the hospital of St. Carlo Borromeo at Nancy. It also became very flourishing in France.

Mrs. Eliza Ann Seton, of Maryland, in 1809 founded a congregation of Sisters of Charity under a distinct rule, which is still followed to a considerable extent in the U. S., though many of its houses have united with the French order. Several congregations of Augustinian nuns and of other Roman Catholic orders are called Sisters of Charity and Sisters of Mercy, and have branches in the U. S.

Charkof: See KHARKOF.

Charlemagne, shaar'le-mān: See CHARLES THE GREAT.

Charlemont, shăarl'mōn', EDWARD: portrait and genre painter; b. at Znaim, Moravia, 1848; pupil of Vienna Academy and Makart; honorable mention, Paris Salon, 1878; third-class medal, Paris Salon, 1885. *The Pages* is one of his best works. W. A. C.

Charleroi, shăarl'rwăă': a strongly fortified town of Hainaut, Belgium; on the river Sambre, and on the railway between Brussels and Namur; 33 miles S. of Brussels (see map of Holland and Belgium, ref. 11–D). This place was fortified by Vauban, and was held alternately by the French and Spaniards. It has important manufactures of cutlery, glass, nails, etc. In this vicinity are extensive coal mines, and smelting furnaces which produce cast iron. Railways extending in various directions connect it with Paris and other towns. Pop. (1896) 23,042.

Charles (I.) the Great (in Lat. *Carolus Magnus*, Germ. *Karl der Grosse*, Fr. *Charlemagne*): Frankish king and founder of the Holy Roman empire; b. Apr. 2, 742. He was the eldest son of Pepin the Less, and of Bertha, his wife, daughter of one of the Counts of Laon. The place of his birth has not been positively determined, but it is now regarded as certain that he was German in his origin and belonged to the race of Ripuarian Franks. His father had arisen to the kingship in 751, and thus Charles, in his boyhood, was made familiar with the ceremonies of royalty. Two years later the king was visited by Pope Stephen III., and in 754 a deep ecclesiastical impression was made on the boy's mind by the ceremonies connected with the anointing of Pepin and Bertha, as well as of the two sons, in the cloister chapel of St.-Denis. Though not without mental and moral training, his education, according to the custom of the Franks, was largely devoted to the development of his physical prowess. In 761 he first accompanied his father on a military expedition against several of the strongholds in Aquitaine, and in 762 he witnessed the fall of Bourges. The successes of this difficult expedition testified to the growing power of the ruling family. On the death of Pepin, Sept. 24, 768, Charles succeeded to a large part of the domains of his father; but his rights to a portion of the territory were contested by his brother Carloman. War between the brothers was averted by the fatal illness of Carloman, who died Dec. 4, 771. Charles was immediately hailed and anointed as ruler over the united kingdom of the Franks. The same year he secured a divorce from his first wife, with whom, apparently in opposition to his own inclination, he had been brought into alliance by his mother. Soon after he married Hildegard, a young princess of the house of Alemania. By this alliance the claim of his family over a large part of Southwestern Germany was established. Affairs were complicated, however, by the fact that Desiderius, the father of his divorced wife, raised a revolt in behalf of Gerberga, the widow of Carloman, and her two infant sons. By the ceremony of 754 in St.-Denis, the Frankish kings were brought into peculiar relations with Italy, for the two sons of Pepin, having been specially named as Roman patricians, by receiving this title were made the official protectors of the Church. The responsibilities of this inheritance, whatever they were, were shared by the sons of Carloman as well as by Charles; but when Desiderius applied to Pope Hadrian, the successor of Stephen III., for recognition of royal authority for the sons of Carloman, the pontiff declined the petition. Desiderius enlisted the King of the Lombards in his behalf, and a war ensued. Hadrian appealed to Charles for protection. Assembling his army at Geneva, he sent one division into Italy by the pass of the Great St. Bernard, and the other he led himself across Mont Cenis. Marshaling his forces with great skill at the foot of the Alps, he succeeded in dividing the army of the enemy, driving a portion of it to Verona, and shutting up the rest at Pavia. The widow of Carloman and her sons were obliged to surrender at Verona. While the siege at Pavia was going on Charles paid a visit (774) to Rome, when at the hands of the pope he received confirmation of the pow-

ers granted at St.-Denis twenty years before. Returning to the army, he prosecuted the war with such success that from the year 776 he claimed the title of King of the Lombards as well as King of the Franks. The territory owning his sway reached as far S. as Spoleto. An outbreak in the north called him back, however, and in the winter of 776 he recrossed the Alps with his army and not only defeated the opposing forces, but reduced several cities to ashes. In 781 affairs in Italy once more required his attention, for the pope had been unwilling to abandon his overlordship of Spoleto. The greater part of Italy was soon reorganized in principalities, with the King of the Franks as suzerain. To the pope, however, was granted the exarchate of Ravenna and the territory along the Adriatic as far S. as Ancona, together with a large number of minor cities and estates in Southern Italy. This agreement was the basis of the pope's temporal power during the following centuries. Affairs were not settled, however, until after a long and stubborn campaign ending in 787, but the effects of Charles's policy in Italy were strongly felt in all Italian affairs for more than a thousand years.

While Charles was devoting himself to matters in Italy, affairs in the north were assuming an attitude that required his immediate attention. One of the most turbulent of all the Germanic tribes was the Saxons. Starting from a small beginning about the mouth of the Elbe, they had grown in number and power until they had not only made themselves masters of a large part of Northern Germany, but had made their name dreaded on the sea as well as on the land. With their kindred tribes about the months of the German rivers, the Jutes and the Angles, they had conquered Britain, and now, having overfilled their own territory, they were about to fall with resistless power on the territory of the neighboring Franks. In the absence of national boundaries, collisions along the borders had for years been inevitable. These had become somewhat serious as early as 772. In 774 and 776 they became formidable; but the Saxons were speedily reduced to terms in 777 by Charles himself, who took time enough from his Italian campaigns to march against them. Just after Charles had settled affairs at Paderborn, he received an embassy from Solyman el Arabi, the ruler of Barcelona, who desired to throw off the yoke of the Mohammedan Amiades, inviting the assistance of the powerful King of the Franks. The invitation was welcome, for the Franks and the Mohammedans had been deadly enemies for more than a hundred years. Putting his forces in order, Charles at once turned toward Spain. The campaign began in a most brilliant manner. He took Pamperuna by storm and advanced as far as the Ebro. Saragossa, however, opposed a successful resistance. Obliged at length to return, on Aug. 15, 778, his army was attacked by a horde of Basques and defeated at Roncesvalles. A large number of prisoners were taken, and a large part of the supplies fell into the hands of the enemy. News of this defeat was the signal for another uprising of the Saxons. Against these Charles was obliged to turn at once. He defeated them in 779, and in 780 he began the reorganization of the government of the conquered territory by putting Saxon nobles in power under his suzerainty. As the people were still pagans, he also organized a systematic missionary service for their conversion. The work of reducing the Saxons, however, was one of stupendous difficulties. Campaign after campaign was necessary during the next twenty years. The Avars, occupying the right bank of the Elbe, were not only reduced to subjection, but brought to at least a nominal acceptance of Christianity. In the year 796 Charles was able to report to the pope that the land as far as the Danube had been conquered and brought to acknowledge Christianity. But opposition was by no means broken. In 799 and again in 804 revolts broke out which were repressed with difficulty. But it was now evident that the conquest was substantially complete. It was in the year 804 that government was established in something like a civilized form, and the bishopries were founded which, with unimportant modifications, endured to the time of the Reformation.

By a series of campaigns, in many respects unrivaled in the history of the world, Charles had now extended his power from the Ebro to the Eider, from the Atlantic to the Adriatic, and from the North Sea to the Gulf of Beneventum. He had so conciliated the favor of the pope that he not only received papal sanction but was officially recognized as the protector and defender of the Church. The relations of the Frankish king to the pope, which had been begun in the time of his father, were in many ways elaborated and strengthened by Charles himself; and the seal of ecclesiastical sanction was placed upon these relations when on Christmas Day in the year 800 he was crowned by the pope as Roman emperor.

As a conqueror Charles not only brought the whole of Central Europe into subjection, but he also reduced the turbulent warlike tribes of the time to something like the methods of civilization. Even in those restless days he did much to develop the economic and agricultural resources of his domain. The minor governments which he invested with local responsibility proved an important barrier against the nomadic tendencies of the time, and had not a little influence in promoting peace within the empire. He established schools at various points throughout the empire as well as in the court, and drew about him the greatest scholars of the time. He died at Aix-la-Chapelle, Jan. 28, 814, leaving behind him, as Gibbon has remarked, the only name in all history with which the appellation "The Great" has become permanently incorporated. About his name many mediæval legends gathered which entered into the romances of rising European literatures.

AUTHORITIES.—Einhard, *Vita Caroli Magni*, written by Charles's son-in-law, and of the first importance (best edition Germ. trans. in 2 vols., 1839, by Jaffé, in *Bibliotheca Rerum Germanicarum*; separate volume 1876; Eng. trans. by Glaister, London, 1877); Mullinger, *The Schools of Charles the Great* (1877); Gaston Paris, *Histoire Poétique de Charlemagne* (1865); Guizot, *Charlemagne and the Carlovingians* (2 vols., 1880); Dummler, *Karl I.*, in *Allge. Charles I. (called THE BALD): King of France and second Holy Roman emperor; fourth son of Louis (I.) le Débonnaire and his second wife, Judith of Bavaria; b. in Frankfort-on-the-Main in 823; received a kingdom carved out of a territory assigned to his elder brothers, on account of which wars between them ensued; on the death of his father, 840, he received all of France W. of the Rhône, and in order to obtain the imperial title allied himself with his brother, Louis the German, to wrest it from Lothaire, the eldest brother; the battle of Fontanet ensued in 841, in which Lothaire was defeated in a bloody encounter ruinous to both sides. The next year the allied brothers renewed their treaty, Louis taking the oath in the Romance language and Charles in German. The words of the oath taken by Louis are among the earliest specimens of the Romance language. By treaty of Verdun, 843, Charles received France, Louis Germany, and Lothaire Italy and Lotharingia. This France embraced all territory W. of the Scheldt, Meuse, Saône, and Rhône, and Spain from the Ebro to the Pyrenees. The reign of Charles was passed in efforts to subdue Brittany, Septimania, and Aquitaine, and in feeble attempts to repress the ravages of the Norsemen. On the death of Lothaire the allied brothers fought over the division of Lotharingia, but Charles was weakened by the independence of his feudal barons just coming into power, and resorted to the Church for aid. In 875 Charles was crowned emperor by the pope. To secure the aid of his great barons in his project of wresting the German crown from the children of his brother Louis, he signed for them a capitulary at Quiersy-sur-Oise, which became the Magna Charta of French feudalism. Soon after he died (877), near Mont Cenis, while marching to relieve the pope from incursions of the Saracens.

C. K. ADAMS.

Charles II. (called THE FAT): King of France and third Holy Roman emperor; son of Louis the German; b. 832; on the death of his brother, Carloman of Bavaria, became King of Italy in 880; was crowned emperor 881; gained possession of Germany on the death of his brother Louis of Saxony in 882, and of France on the death of Carloman of France in 885; on account of his great weakness in resisting the invasions of the Norsemen was deposed in 887. D. in the cloister at Tribur, 888.

Charles IV. of the Holy Roman empire: b. in Prague, May 14, 1316; was son of John of Luxembourg, King of Bohemia; viceroy in Italy 1332; King of Bohemia on death of his father 1346, and the same year, through the influence of Pope Clement VI., was elected emperor as the successor of Louis V., whom the pope had deposed. This dignity he maintained at the cost of many humiliating concessions. He was generally submissive to the pope, given to the ag-

grandizement of his own house, and spiritless in repressing disorder. He issued in 1356 the Golden Bull, which for more than four centuries was the fundamental law to regulate the election of German emperors. This bull, by decreeing that the number of electors should be seven, three archbishops and four secular electoral princes, weakened the influence of the pope in the choice of an emperor, and Charles, to conciliate the pontiff, granted him a tithe of all ecclesiastical revenues. D. in Prague, Nov. 29, 1378, and was succeeded in Bohemia and the imperial dignity by his son Wenceslaus.

Charles V. of the Holy Roman empire, or Don Carlos I. of Spain; the eldest son of the Archduke Philip of Austria, and a grandson of the Emperor Maximilian I. His mother was Joanna, the daughter and sole heiress of Ferdinand of Aragon and Isabella of Castile. His vast inheritances, united with his great ability, made him the ablest and the most powerful monarch of the sixteenth century. He was born in Ghent, Feb. 24, 1500, and educated in Flanders, having as his preceptor Adrian of Utrecht. On the death of his father in 1506, Charles inherited the Low Countries and Franche-Comté, and in 1516 he succeeded Ferdinand as King of Spain, whither he removed his court in 1517. In 1519 he was elected Emperor of Germany, defeating Francis I. of France, who was also a competitor for that dignity. He was crowned as emperor at Aix-la-Chapelle Oct. 22, 1520. Charles V. and Francis I. of France were then the most powerful sovereigns on the continent of Europe, and were rivals. Their ambitious designs against Italy led to hostilities, which commenced in 1522. In this war Henry VIII. of England was the ally of Charles V., whose army defeated Francis at the battle of Pavia (1525), and took him prisoner. The war was suspended by the treaty of Madrid in 1526. Charles married in that year Isabella, a daughter of Immanuel, King of Portugal. The war was renewed in 1527 by Francis I. and Pope Clement VII., who had formed an alliance against the emperor. Under the Constable of Bourbon the army of Charles assaulted Rome and took the pope prisoner in 1527. Peace was restored by the treaty of Cambrai in 1529. Charles employed his power to check the progress of the Protestant Reformation, for which purpose he assembled the Diet of Augsburg in 1530. This Diet ordained that severe penalties should be inflicted on the Protestants. In 1531 the German Protestant princes formed for mutual defense the League of Schmalkald, and extorted some concessions from Charles, who, being then engaged in a war against the Turks, thought it expedient to temporize. In 1535 he conducted in person an expedition against Barbarossa, whom he defeated at Tunis. In 1536 his army invaded the south of France, but was not successful, and was soon forced to retreat. A truce of ten years was concluded between Charles and Francis I. in 1538, but it was broken in 1542. The French gained a victory at Ceresole, in Italy, in 1544, soon after which the war was ended by a treaty of peace. Resolving to extirpate heresy among his subjects, Charles published in 1546 the ban of the empire against the Elector of Saxony and the Landgrave of Hesse, who were chiefs of the Protestant party. They took arms in self-defense, but were defeated at Mühlberg in Apr., 1547. Their cause, however, found an able defender in Maurice of Saxony, who, as the head of a league, allied himself with Henry II. of France and took arms against Charles early in 1552. The French king invaded Lorraine; Maurice, South Germany; surprising the emperor at Innsbruck. Charles was compelled to flee into Carinthia; an attempt by him to recover Metz was attended with great loss, and hostilities were ended by the important treaty of Passau, Aug. 22, 1552, which secured religious liberty to the German Protestants. In the autumn of 1555 he formally resigned to his son Philip the sovereignty of the Low Countries, Spain, and his other hereditary dominions. He also abdicated the imperial crown, and was succeeded as emperor by his brother Ferdinand. His motives for abdicating have been matters of much dispute. He retired to the monastery of Yuste, near Plasencia, in Spain, where he died Sept. 21, 1558. His wife, to whom he was devotedly attached, died in 1539. See Robertson, *History of the Reign of Charles V.*; Prescott, *History of Philip II. of Spain*, vol. i.; Luigi Dolce, *Vita di Carolo V.* (1561); A. Pichot, *Charles Quint* (1854); Stirling-Maxwell, *The Cloister Life of the Emperor Charles V.* (1852); Sandoval, *Historia de la Vida de Carlos V.* (1606); Kervyn de Lettenhove, *Commentaires de Charles V.* (Brussels, 1862).

Charles VI. of the Holy Roman empire: second son of the Emperor Leopold I.; b. Oct. 1, 1685. He claimed the throne of Spain as a relative of Charles II., who died without issue in 1700, and who appointed Philip of Anjou as his heir. In 1703 Charles was proclaimed at Vienna under the title of Charles III. of Spain. In the war of the Spanish succession, which ensued, the cause of Charles was supported by Austria, England, and a portion of the Spaniards, and in 1706 was again proclaimed king at Madrid. The allies were defeated at Almanza in 1707 by the army of Philip, who finally obtained the throne by the aid of Louis XIV. of France, and Charles abandoned his chief claims, retaining only the Spanish possessions in the Netherlands and Italy. On the death of his brother, Joseph I., in 1711, Charles was chosen emperor. In 1715 he undertook the defense of the Venetian republic against the Turks, and as a result of victories gained increased the area of his dominions. He was next engaged in repelling an attempt on the part of Spain to recover Sicily, and was aided by England, France, and Holland. Having no son, he wished to secure for his daughter, Maria Theresa, the succession to his hereditary dominions, and appointed her his heir by a pragmatic sanction (1713). In his later years he was involved in wars with France, Spain, and Sardinia, and also with the Turks, and lost large portions of his territory. D. Oct. 20, 1740. See Schirach, *Biographie Kaiser Karl VI.* (1778).

Charles VII. of the Holy Roman empire, Charles Albert: son of Maximilian Emmanuel, Elector of Bavaria; b. in Brussels, Aug. 6, 1697. He married a daughter of the Emperor Joseph I. in 1722, and became Elector of Bavaria on the death of his father in 1726. When Charles VI. died, in 1740, this elector claimed part of the Austrian dominions. To obtain these he and his allies, France and Prussia, waged war against Maria Theresa. He was elected emperor in 1742, but his army was defeated by that of Maria Theresa. D. in Munich, Jan. 20, 1745.

Charles I., Charles Stuart: King of Great Britain and Ireland; b. at Dunfermline, Scotland, Nov. 19, 1600; second son of James I. and Anne of Denmark. He became heir-apparent to the throne on the death of his brother Henry in 1612, and was created Prince of Wales in 1616. His father tried to marry him to the Infanta of Spain, and he went *incognito* with Buckingham to Madrid to obtain her as a bride; the errand was fruitless, as it was obnoxious to the English. He inherited extreme notions in relation to royal prerogatives from his father, whom he succeeded in Mar., 1625. He married Henrietta Maria, a daughter of Henry IV. of France, conceding in the marriage treaty religious freedom to her and her attendants in violation of his parliamentary engagements. In the same year, and in disregard of public opinion, he chose for his Prime Minister and adviser the unpopular Duke of Buckingham, who had been his father's favorite. Parliament, animated by a growing spirit of liberty, was sparing in its grants of supplies, and was soon involved in a contest with the court. Charles dissolved several Parliaments in the first five years of his reign, and had recourse to arbitrary methods of raising money. He governed for eleven years (Mar., 1629, to Apr., 1640) without a Parliament, and after the death of Buckingham employed Laud and the Earl of Strafford as his chief ministers. During this period the Puritans were severely persecuted, and the patriot Hampden was prosecuted because he refused to pay the illegal tax called ship-money. In 1638 the Scottish people, on whom he attempted to impose a liturgy, rose in arms to assert their liberty, and subscribed the National Covenant. Charles, who had not power to enforce his policy in Scotland, summoned a Parliament, which met in Apr., 1640, but, as it was not subservient, it was dissolved in the next month. The Scottish insurgents invaded England in August, and defeated the royal army at Newburn-on-Tyne. This disaster and the want of money induced the king to call a new Parliament, which met in Nov., 1640, and was the famous Long Parliament. Both Houses were resolute in resistance to despotic power. They impeached the Earl of Strafford, who was executed in 1641, and they imprisoned Laud. In Jan., 1642, the king made a rash and abortive attempt to arrest Pym, Hampden, and three other members of the House of Commons. Provoked by this outrage, the Parliament appealed to arms. The royalists at first gained several victories, but they were defeated at Marston Moor in 1644, and again in June, 1645, at the battle of Naseby, where Charles commanded in person and Cromwell led the right wing of the Roundhead army. He was here so completely beaten that he soon gave himself up to the Scottish army, which transferred him in 1647 to the custody

of the English Parliament. Having been tried and convicted in a high court appointed for the occasion, he was beheaded at Whitehall Jan. 30, 1649. Six of his eight children survived him: Charles and James, afterward kings of England; Henry, Duke of Gloucester; Mary, the wife of William, Prince of Orange; Elizabeth; and Henrietta Anna, wife of Philip, Duke of Orleans. He was distinguished for his literary culture and good taste in the fine arts. He was regarded as a martyr by a large portion of his subjects.

AUTHORITIES.—Guizot, *History of the English Revolution*; Forster, *Sir John Eliot*; Chancellor, *Life of Charles I., 1600–25* (1886); especially S. R. Gardiner's *Prince Charles and the Spanish Marriage*, with the subsequent works of the same author.

Charles II.: King of Great Britain and Ireland; son of Charles I.; b. in London, May 29, 1630. He went into exile in 1645, and joined his mother in Paris. In 1649 he assumed the title of king, and was proclaimed king by the Scottish Parliament "on condition of his good behavior." He landed in Scotland in June, 1650, and was crowned at Scone Jan. 1, 1651. The austere Covenanters required him to sign "articles of repentance," and subjected him to restraints which were very irksome to a man who was naturally fond of ease and pleasure. A Scottish army fighting for the king was defeated by Cromwell at Dunbar in Sept., 1650. Charles, having recruited his army, led it into England, hoping that many English royalists would rally to his support. He was pursued by Cromwell, who gained a decisive victory over the royal army at Worcester, Sept. 3, 1651. Charles then became a fugitive, and, after several narrow escapes from capture in the Highlands, took refuge in France. After the death of Cromwell, the royalist party, which was always the most numerous, and was now favored by the law of reaction, easily regained the ascendency. Charles was restored in 1660 to almost unlimited power. He appointed Lord Clarendon Prime Minister, and married in 1662 Catherine, a daughter of the King of Portugal. In 1665, without good reason, he declared war against the Dutch—a war which was contrary alike to the feelings and commercial interests of the English people. The Dutch admiral De Ruyter, by entering the Medway and burning some ships of war at Chatham, induced him to make peace in 1667. Lord Clarendon was removed from power in 1667, and was succeeded by a corrupt ministry called the CABAL (*q. v.*). These ministers abused their power to promote popery and absolute monarchy, and in their foreign policy were subservient to Louis XIV. Charles accepted a pension from the French court, that he might be enabled to reign without the aid or control of parliaments. He also became an ally of France in another war against the Dutch in 1672, but this war, which was unpopular, was ended in 1674. The king showed partiality to the Roman Catholic Church, of which he had secretly become a member. A rumor of a popish plot caused a violent excitement among the people in 1678. Charles dissolved Parliament in that year, and called another, which in 1679 passed the Habeas Corpus Act in opposition to the will of the court. The prevalence of corruption and profligacy in politics and morals, together with the despotic policy of the court, rendered this reign one of the most disgraceful in English history. In 1683 the patriots Algernon Sidney and Lord Russell were put to death for their complicity in the Rye House Plot. Charles died without lawful issue Feb. 6, 1685, and was succeeded by his brother, James II. Charles II. was indolent, unambitious, and depraved in morals. He conferred the highest rank in the peerage upon his many mistresses and their children. See Hume, *History of England*; Macaulay, *History of England*, vol. i.; William Harris, *Life of Charles II.* (1765); Lord Halifax, *Character of Charles II.* (1750)

Charles I. of France: See CHARLES I., THE BALD, Emperor.

Charles II. of France: See CHARLES II., THE FAT, Emperor.

Charles III. of France (called THE SIMPLE): son of Louis le Bègue; b. in 879 A. D. Eudes, Count of Paris, was elected king by the barons in 887. Charles assumed the title of king in 893, and after the death of Eudes in 898 he reigned alone. He was a feeble prince, and failed to defend his kingdom from the Normans, but made a treaty in 911 with them, creating Rollo a duke, giving him his sister in marriage, and creating for him the duchy of Normandy. In 922 his barons revolted, and chose Robert king, who perished at Soissons. The next year the nobles elected Raoul (or Rodolph) of Burgundy to the throne, and Charles was imprisoned by the Count of Vermandois. He was released by Raoul, and died in Peronne in 929, leaving a son, Louis d'Outremer.

Charles IV. of France (called THE FAIR): third son of Philippe le Bel: b. in 1294. He began to reign in 1322 as successor to his brother, Philip V. of France and Navarre. He aided his sister Isabella to dethrone her husband, Edward II. of England. He died without male issue in 1328, and was succeeded by Philip of Valois.

Charles V. (called THE WISE): King of France; b. Jan. 21, 1337; son of John II. He acted as regent during the captivity of John, who was taken prisoner by the English in 1356. His regency was vexed by the States-General, which he convoked, and which refused subsidies, and, led by Stephen Marcel, endeavored to repress the authority of the crown. The murder of Marcel gave Charles control again, but in 1360 his father returned and resumed the government. Charles became king on the death of his father in 1364, at a time when France was invaded by English armies. He acted on the defensive, and avoided a general battle. The French general Du Guesclin expelled the English from Poitou, Saintonge, Brittany, and Guienne, and reduced to submission the King of Navarre. He increased the relative preponderance of the crown over the nobles, and reformed the administration of justice and the procedure of Parliament. Charles founded the Royal Library of Paris. He died at Vincennes, Sept. 16, 1380, leaving the throne to his son, Charles VI. See Roy's *Histoire de Charles V.* (1849).

C. H. T.

Charles VI. (called THE BELOVED): son of Charles V.; b. in Paris, Dec. 3, 1368, and was the first prince who received the title of dauphin. He succeeded to the crown at twelve years of age, and his minority was troubled by the rapacity and turbulence of his uncles of Berry, Burgundy, Anjou, and Bourbon, against whom rebellions broke out in the cities of France and Flanders, where they were directed by Philip van Artevelde, who was overthrown in 1382 at Roosebeke. In 1388 Charles threw off the control of his uncles and assumed the government, but he became insane in 1392, after which the kingdom was distracted by the rivalry between the Dukes of Burgundy and Orleans. In 1407 a civil war broke out between the Burgundians and the Armagnacs (as his party was called) led by the Duke of Orleans, who was assassinated by John the Fearless, of Burgundy, an atrocity which increased the virulence of the civil war. In this disturbed state of the country France was also invaded by Henry V. of England, who gained a great victory at Agincourt Oct. 21, 1415. Charles died in neglect Oct. 22, 1422.

Charles VII. (called THE VICTORIOUS): King of France; b. Feb. 22, 1403; a son of Charles VI., whom he succeeded in 1422. At that time the kingdom was rent by the Burgundian and Armagnac factions during the insanity of his father. The assassination of John the Fearless, of Burgundy, in the presence of the dauphin, was followed by an alliance of the English with the Burgundians, who gained almost a complete mastery of France. In 1420 Henry V., of England, who had married a sister of Charles, had his right of succession confirmed by the treaty of Troyes, but he died in 1422, and the administration of English interests in France was committed to the able DUKE OF BEDFORD (*q. v.*), who carried conquest still further. The court seemed ingulfed in frivolity and dissipation, and the infant King Henry VI. of England was recognized as King of France by a faction which had possession of Paris while France was partially occupied by the English, who besieged Orleans in 1428. From the ruinous state to which the country was reduced by intestine discord and foreign invasion, it was restored by the heroism of JOAN OF ARC (*q. v.*), and the prudent policy of Charles, who had fallen among better advisers. Burgundy withdrew from the English alliance and joined France; the Duke of Bedford died, and Charles became master of Paris in 1436. He waged war with success against the English, reducing their possessions in France to Calais, and recovered Normandy in 1450. The great events of this reign, besides the expulsion of the English and of mercenary soldiers, were the creation of a standing army, the introduction of commoners, as Jacques Cœur, into the royal council, and the Pragmatic Sanction which, by adopting the decrees of the Council of Basel, laid the basis of the liberties of the Gallican Church. Charles's last years were shameless; he embittered his son, and, fear-

ing assassination at his hands, starved himself to death at Melun, July 22, 1461, and was succeeded by his son, Louis XI.

Charles VIII. (called THE AFFABLE): King of France; b. at Amboise, July 30, 1470; a son of Louis XI., whom he succeeded in 1483. His reign began under the regency of his sister, Anne of Beaujeu, who caused the defeat of Count Dunois in Guienne, of the Duke of Orleans at St.-Aubin, and the reform of the States-General, making the peers and bishops representatives of their order and not of personal right, and recognizing the *tiers-état* of the peasantry. In 1490 Charles released the Duke of Orleans, assumed the government with Dunois as his counselor, and married in 1491 Anne, Duchess of Brittany, who had been betrothed to the Emperor Maximilian, and on this account became involved in war with Spain and England. He escaped hostilities by ceding Franche-Comté and Artois to the emperor, Roussillon and Cerdagne to Spain, and by buying off Henry VII. of England. Brittany was thus added to France, and the king turned his attention to foreign conquest. The claims of Anjou to Naples having been purchased, he led an army into Italy in 1494 and conquered that kingdom early in 1495. Alarmed by his victorious progress, the King of Spain, the German emperor, and other powers formed a league against him. As Charles was marching homeward he encountered and repulsed the army of the allies at Fornova, and then returned to France. He died without issue from an accident in his twenty-ninth year, at Amboise, Apr. 7, 1498, and was succeeded by Louis XII.

Charles IX.: King of France; second son of Henry II. and Catherine de' Médici; b. at St.-Germain-en-Laye, June 27, 1550. He succeeded his brother, Francis II., in 1560. During his minority his mother had the chief control of the Government. His reign was disturbed by civil or religious wars, which began in 1562, between the Catholics and Huguenots. The court generally co-operated with the Catholic party, but Catherine was jealous of the Duke of Guise, the leader of the Catholics, and sometimes opposed him by her intrigues. The civil war was several times suspended by treaties, and renewed in consequence of the perfidy of the court. Charles married in 1570 Elizabeth, a daughter of the Emperor Maximilian II. He made overtures of peace to the Huguenots, and negotiated a marriage between his sister Margaret and Henry of Navarre. On the occasion of this wedding he invited Coligny and other Protestant leaders to court, and treated them with a simulated favor which lulled their suspicions. It appears that he and his mother were responsible for the massacre of the Protestants which commenced Aug. 24, 1572 (St. Bartholomew's Day). Charles admitted that he had consented to this crime, which his mother probably suggested. He died in a bloody sweat, full of remorse for the innocent blood he had shed, and without issue, May 30, 1574. A book of his on hunting, *La Chasse Royale*, containing verse of his composition, was published in 1857. See Varillas, *Histoire de Charles IX.* (1683); Sismondi, *History of France.*

Charles X.: King of France; b. at Versailles, Oct. 9, 1757; a younger brother of Louis XVI. He was originally styled the Count of Artois. In 1773 he married Maria Theresa of Savoy; emigrated in 1789; instigated the French royalists to revolt in 1795; remained in exile until 1814; began to reign on the death of Louis XVIII. in Sept., 1824. His policy was reactionary, and his advisers were a conclave of fanatical priests. In Aug., 1829, he formed an ultra-royalist ministry under the absolutist PRINCE POLIGNAC (*q. v.*), which was obnoxious to the people, and on July 25, 1830, the Parisians appealed to arms, barricaded the streets, and after a contest of three days were completely victorious. Charles abdicated in favor of his grandson, the Duke of Bordeaux, or COMTE DE CHAMBORD (*q. v.*), and escaped to Scotland. He died at Göritz, Austria, Nov. 6, 1836, while expiating the follies of his early life by pious austerities. See Lorieux, *Histoire du Règne de Charles X.* (1834); Lamartine, *History of the Restoration.*

Charles I. of Anjou: King of Naples; Count of Anjou and Provence; b. about 1220; the youngest son of Louis VIII. of France, and a brother of St. Louis. He married Beatrice, a daughter of Raimond Berenger, Count of Provence, and became his heir; went on a crusade with his brother, Louis IX., and was captured with him; on his return subdued the republican revolt which had broken out in the cities of Provence; fought for Margaret of Flanders, who was endeavoring to gain Hainault, which Louis forced him to relinquish. At the instigation of Pope Urban IV. he attacked and defeated Manfred, King of Naples, in 1266, usurped his throne and executed the legitimate heir, the little Conradin. He started on a second crusade, but was baffled by a storm. Pope Nicholas, incensed by his haughtiness, deprived him of his offices as senator of Rome and vicar-general of Italy; on this pope's death Charles secured the succession for Martin IV., who restored his Roman offices. Provoked by his tyranny, the Sicilians revolted and massacred a multitude of Frenchmen on Mar. 30, 1282. This event was called "THE SICILIAN VESPERS" (*q. v.*). Charles in retaliation laid siege to Messina, but his fleet was burned and his efforts proved disastrous. D. at Foggia, Jan. 7, 1285.

Charles (or DON CARLOS) **I.** of Spain: See CHARLES V., Emperor.

Charles (or **Carlos**) **II.**: King of Spain; b. Nov. 6, 1661; son of Philip IV., who died in 1665, and Anne of Austria. Anne became regent on the death of her husband, but in 1675 Charles assumed the government and took his natural brother, Don John, as his chief minister, an able man, but he was forced by the treaty of Nimeguen to cede in 1678 Franche-Comté to France. He married in 1678 Louise of Orleans, a niece of Louis XIV. of France. In 1689, having married a sister of Emperor Leopold I., he became an ally of England and Austria in a war against Louis XIV., but the hostilities of Spain were harmless. He was an incapable ruler, and a man of morbid condition of mind and body. As he was childless, he became in the latter part of his life anxious and irresolute about the choice of his successor. By his last will he appointed Philip, Duke of Anjou, as his heir. D. Nov. 1, 1700.

Charles III.: King of Spain; son of Philip V.; b. Jan. 20, 1716. Parma, Piacenza, and Tuscany were formed into a principality for him, and at fifteen he was given an army and sent to take possession of it; at eighteen he subdued Naples and Sicily and was made king thereof; he ascended the throne on the death of his brother, Ferdinand VI., in 1759, and was an ally of France in the war against England which began in 1762. He promoted education and reform, and expelled the Jesuits from Spain in 1767. In 1779, as an ally of France, he declared war against England, joining France in sending aid to the revolted colonies in America, but he reaped little advantage from the alliance. These allies besieged Gibraltar without success. He bartered Florida for Cuba with Great Britain, but received Florida back and gained Minorca at the conclusion of peace. An able sovereign, he was served by able statesmen, who reformed the finances of Spain, banished the Jesuits, and sought to bring the Inquisition under civil control. He died in Madrid, Dec. 14, 1788, and was succeeded by his son, Charles IV.

Charles IV. of Spain: son of Charles III.; b. in Naples, Nov. 12, 1748. He became king in 1788, before which he had married his cousin, Maria Louisa Theresa of Parma, who had great ascendency over him. In 1792, through the evil influence of the queen, her depraved favorite Godoy was appointed Prime Minister. In 1793 war was declared by the French against the Spaniards, who were defeated in many battles. Charles sued for peace, and the war ended in July, 1795. As an ally of France he declared war against England in 1796, but his fleet was ruined by Nelson at Trafalgar (1805). In 1807 he conspired with Napoleon to seize Portugal and divide it into principalities for Godoy and the Queen of Etruria, while Charles was to become Emperor of America by title. The king thereupon sent 16,000 troops to Denmark to aid Napoleon in recovering it from British control. His son conspired against him and plotted his assassination. Charles abdicated in favor of his son Ferdinand in Mar., 1808, but Napoleon in the same year deposed him, and placed his own brother Joseph on the throne. Charles retired to Chambord, and became a pensioner of France with an annuity of $1,200,000. He refused to embroil himself thereafter in Spanish politics. D. in Rome, Jan. 19, 1819.

C. H. T.

Charles IX. of Sweden: fourth son of Gustavus Vasa; b. Oct. 5, 1550; joined his brother John in deposing (1568) their eldest brother, King Eric, who was murdered in 1577; John married Catherine of Poland; turned Roman Catholic; d. in 1592, leaving the throne to his son Sigismund, a Roman Catholic, and King of Poland. Charles took possession of the Government while awaiting Sigismund's arrival, and, assembling a great concourse of magnates at Upsala, pro-

cured a decree in 1593 that the *Augsburg Confession* should be the authoritative standard of the Swedish Church, an event regarded as a new epoch in that country. In 1594 Sigismund was crowned, and began to intrigue for the domination of his own creed. Sigismund returned to Poland, leaving Charles as his viceroy, who then undertook to abridge the pretensions of the nobles and to promote Protestantism, and in 1598 defeated his nephew, who had invaded Sweden, at Stängebro. Sigismund, disregarding the request of the Diet that he should reside in Sweden or send his son to be educated there, was deposed in 1604, and Charles chosen king—an act which increased the hostile feeling between Sweden and Poland. As king, Charles IX. promoted mining and trade; established the University of Gothenburg; secured the burghers and peasantry a larger part in the business of the Diet; reduced the nobles to subordination; and allied himself with the Protestant princes of Germany. He aided Russia against the false Dimitri, whose claims Sigismund upheld, and began the Calmar war with Denmark. D. in Nyköping, Oct. 30, 1611.

C. H. THURBER.

Charles X., or **Charles Gustavus**: King of Sweden: b. at Nyköping, Nov. 8, 1622; son of John Casimir, Elector Palatine of the Rhine. His mother, a daughter of Charles IX. of Sweden, was a sister of King Gustavus Adolphus. He was the heir-apparent in the reign of Christina, and became king when she abdicated in June, 1654. He was an able and a warlike ruler. In 1655 he invaded Poland because the Polish king had not renounced his claim to the throne of Sweden. He took Warsaw, and speedily drove the king out of Poland. During his absence the Danes declared war against him. He defeated them, and compelled them to cede Scania and other territory to Sweden (1658). He died in Gothenburg, Feb. 13, 1660, and left the throne to his son Charles. See Lundblad, *Konung Carl X. Gustaf's Historia* (2 vols., 1823–29).

Charles XI.: King of Sweden; son of Charles X.; b. Dec. 25, 1655, and became king in the fifth year of his age, but the country was governed by a regency under his mother. By a treaty with Poland in 1660, Esthonia and other provinces which Charles X. had conquered were ceded to Sweden. Charles XI. assumed the royal functions in 1672, and formed an alliance with Louis XIV. of France, sending troops to his aid into Germany, which were defeated at Fehrbellin, and a part of Pomerania lost finally to Brandenburg. The Danes now made war upon him in 1677, but he drove them from Scania, and in 1679 signed a treaty of peace and married a sister of the King of Denmark. His reign thenceforth was pacific and prosperous. In 1680 he was invested by the states with absolute power in order to restore the finances. The crown lands had been recklessly given to the nobles, and taxation was oppressive. He recovered ten counties, seventy baronies, and many smaller estates, and rendered the crown independent of the aristocracy and Diet. He founded the University of Lund, promoted parochial schools, reorganized the army and navy, and strengthened the fortresses of Sweden. He died in Stockholm, Apr. 15, 1697, and was succeeded by his son, Charles XII.

Charles XII. of Sweden: b. in Stockholm, June 27, 1682; eldest son of Charles XI. and Ulrica Eleonora of Denmark. He learned Latin, French, and German, and formed in his youth simple and frugal habits of living. He began to reign in Apr., 1697, and chose Count Piper as his chief minister and adviser. In 1700 a league was formed against Sweden by Peter I. of Russia and the Kings of Denmark and Poland, who designed to aggrandize their dominions at his expense. At the head of a well-disciplined army Charles assumed the offensive in May, 1700. He marched first against Copenhagen, and compelled the Danish king to sue for peace, which was concluded Aug., 1700. With prompt and rapid movement he then led about 8,000 men against Peter the Great, who was besieging Narva with nearly 70,000 men. Charles gained a decisive victory at Narva in Nov., 1700, soon after which he invaded Poland. He defeated the Poles in several battles, and deposed Augustus, King of Poland, in 1704. Provoked by recent acts of hostility on the part of the Czar Peter, he advanced toward Moscow in Sept., 1707, with an army of 43,000 men. The Russian army was not able to resist his impetuous progress, and he crossed the Beresina in June, 1708. Having arrived at Smolensko, he was induced by Mazeppa, hetman of the Cossacks, to march southward into the Ukraine. Here many of his men perished from cold and want of provisions, and his army remained inactive during the severe winter of 1708–09. At the beginning of the next campaign he had only 18,000 Swedes in his army. He besieged Poltava, to relieve which Peter advanced with an army of 70,000 men. The decisive battle of Poltava, July 8, 1709, resulted in the defeat of Charles, who lost about 9,000 men killed and 6,000 prisoners. He escaped into Turkey, and was kindly received by the sultan, who gave him a residence at Bender. He induced the sultan to declare war against Russia, but this war was soon ended by a treaty. Charles remained in Turkey several years, and at length was involved in a quarrel with the Turkish rulers, who treated him as a prisoner. He escaped in 1714, and traveling *incognito* through Hungary and Germany, reached Stralsund in November of that year. The Russians, Danes, and Prussians continued to wage war against the King of Sweden, and they took Stralsund in Dec., 1715, after a long siege. The energy and audacity of Charles remained unabated, notwithstanding his reverses, and while the allies threatened to invade Sweden he invaded Norway. He was killed at the siege of Frederikshall Nov. 30, 1718, and left a great reputation as a military genius. The long-current belief that he was treacherously shot by one of his own officers was effectually dissipated in 1859 by an examination of his skull. He was never married, and his sister, Ulrica Eleonora, inherited the throne. See Voltaire, *Life of Charles XII.*; Nordberg, *Karls XII. Historia* (1740); Lundblad, *Konung Carls XII. Historia* (2 vols., 1830); Posselt, *Geschichte Carls XII.* (1804).

Charles XIII.: King of Sweden; b. Oct. 7, 1748; son of King Adolphus Frederick, and nephew of Frederick the Great. Before his accession he was an admiral of the Swedish navy, and gained a naval victory over the Russians in 1788. In 1792 he became regent during the minority of his nephew, Gustavus IV., and retained that office until 1796. The States-General deposed Gustavus in 1809, and elected Charles as his successor. Having no son, Charles, with the consent of the Swedish Diet, adopted Gen. Bernadotte as his son and heir in 1810, and gave the administration almost wholly up to him. D. Feb. 5, 1818.

Charles XIV. of Sweden: See BERNADOTTE.

Charles (or **Carl**) **XV.** (*Louis Eugène*): King of Sweden and Norway; b. May 3, 1826. He succeeded his father, Oscar I., July 8, 1859. He married in 1850 a Princess of Orange. The Storthing, or parliament, was remodeled in this reign and made more representative. The king wrote a book of poems, of which there is a German translation (Berlin, 1866). D. Sept. 18, 1872, leaving a daughter, Louisa, Crown Princess of Denmark. The crown descended to his brother, Oscar II., Frederick, Duke of Östergötland.

Charles I., KARL EITEL FRIEDRICH ZEPHYRIN LUDWIG of Hohenzollern-Sigmaringen: King of Roumania, which until 1861 was the United Danubian Principalities of Moldavia and Wallachia. He was born in Germany, Apr. 20, 1839, and is the second son of Prince Karl of Hohenzollern. He entered the Prussian army at an early age, and was a lieutenant in the Second Regiment of Prussian dragoons when, on May 10, 1866, he was elected *domnul*, or Prince, of Roumania, at the instance of the Prussian ambassador. He arrived in Bucharest May 2, was recognized by the people May 22, and received formal investiture from the sultan, who was his suzerain, July 11, 1866. His administration has been successful as a whole. He declared Roumania independent, and was proclaimed king Mar. 26, 1881. In 1869 he married Princess Elisabeth von Neuwied, known in literature as CARMEN SYLVA (*q. v.*).

Charles, Archduke of Austria: general; b. in Florence, Sept. 5, 1771; son of the German Emperor Leopold II. Having served in several campaigns against the French, he obtained in 1796 the chief command of the Austrian army of the Rhine, and defeated the French general Jourdan at Würzburg in September of that year, and also compelled Moreau to retire across the Rhine. He retired from active service on account of ill-health in 1800, and was appointed governor of Bohemia, but soon returned to the field and in 1805 commanded in Italy, and defeated Masséna at Caldiero. He became general-in-chief of the Austrian armies in 1806. Although he could not prevent Napoleon from entering Vienna, he encountered him with success at the great battle of Aspern in May, 1809. The archduke and Napoleon commanded the armies at Wagram July, 1809, where the French claimed the victory. Charles resigned the command soon

after this event. He wrote an able work called *Principles of Strategy* (1814). D. Apr. 30, 1847, leaving a son, Albert.

Charles Albert: King of Sardinia; b. Oct. 29, 1798. He was a son of Prince Charles Emmanuel of Savoy-Carignan; married in 1817 Maria Theresa, Archduchess of Tuscany; was regent in 1821 on the abdication of Victor Emmanuel; Viceroy of Sardinia in 1829; became king on the death of Charles Felix in 1831, and adopted a liberal policy. Co-operating with the movements of the popular party in the cause of the unity and liberation of Italy, he declared war against Austria in the spring of 1848. Having been defeated at Novara in Mar., 1849, he abdicated in favor of his son, Victor Emmanuel. D. in Oporto, Portugal, July 28, 1849.

Charles Augustus: Grand Duke of Saxe-Weimar; b. Sept. 3, 1757; began to reign in 1775; general in the Prussian army 1792–93; joined the Rhenish Confederacy in Dec., 1806; fought with the allies against Napoleon 1813–15. The congress of Vienna made his principality a grand duchy. He was a patron of the arts and sciences, and an intimate friend of Goethe and other men of letters. Under his reign Weimar, his capital, became the literary center of Germany.

Charles, surnamed **the Bold**, sometimes called **Charles the Rash** (in Fr. *Charles le Téméraire*): Duke of Burgundy; b. in Dijon, Nov. 10, 1433; was a son of Philip the Good. He was styled Count de Charolais until he became duke in 1467. He married Margaret, a sister of Edward IV. of England, in 1468, and became one of the most powerful sovereigns of his time. His dominions included the Netherlands. He waged war against Louis XI. of France, whom he seized at a conference and carried prisoner to Liège, compelling him to witness the terrible punishments inflicted for the revolt the king had instigated; made a truce in 1475, and overran Lorraine. In 1470 he laid siege to Granson and massacred the garrison, but was badly defeated by the Swiss. Three months later he again invaded Switzerland, and was defeated at Morat. He afterward invaded Lorraine to put down the revolting Duke René; was defeated and killed at Nancy, Jan. 5, 1477. He was succeeded by his daughter Mary, who was married to the Emperor Maximilian I. With him ended the resistance of great feudatories to the crown in France. It was the political aim of this prince to restore the kingdom of Burgundy, embracing Provence, Lorraine, Dauphiné, Switzerland, and his own inheritance. See Kirk, *History of Charles the Bold* (1868); Comines, *Mémoires*.

Charles, Cape: See CAPE CHARLES.

Charles City: capital (settled in 1855) of Floyd co., Ia. (for location of county, see map of Iowa, ref. 2–H); on C., M. and St. P. and Ill. Cent. R. Rs., and on Cedar river; 139 miles W. N. W. of Dubuque. Here are 9 churches, 6 schools, a furniture-factory, harrow-factory, roller flouring-mill, 2 foundries, and various other industries. It has the best water-power in Northern Iowa. Pop. (1880) 2,421; (1890) 2,802; (1900) 4,227.

EDITOR OF "INTELLIGENCER."

Charles d'Orléans, shaarl'dōr'lay'ăañ': nobleman and poet; son of Duke Louis of Orleans, and father of Louis XII., King of France; b. May 26, 1391; d. Jan. 4, 1465. His youth was spent at Blois, in the brilliant society of knights and scholars and poets his father liked to have about him. In 1407 his father was assassinated; in 1408 his mother died. He governed his estates till 1415, when he was taken prisoner in the battle of Agincourt and carried to England, to be kept there in captivity for nearly twenty-five years. In his prison he turned for solace to poetry, and composed many *ballades* in praise of *Beauté*, of a *dame*, of a *très belle maîtresse*, the memory of whom afflicts his heart with what must be admitted to be a somewhat monotonous pain. In his *Ballade sur la Paix*, however, and his *Invocation à la France* we have strains that partly justify the inclination of certain scholars to make him, instead of Villon, the first of the band of modern French poets. See Constant Beaufils, *Thèse sur Charles d'Orléans* (1861); Ch. d'Héricault, *Vie de Charles d'Orléans*, and *Poésies de Charles d'Orléans* (1874–75). During his captivity Charles d'Orléans turned some of his poems into English; others were translated under his eye. These translations have been edited by G. W. Taylor for the Roxburghe Club (London, 1827). A. R. MARSH.

Charles Edward, "the Young Pretender," or more fully **Charles Edward Louis Philip Casimir Stuart**: son of James Stuart, the first "Pretender," and of the Polish princess Clementina Sobieski: b. in Rome, Dec. 31, 1720. Unlike his father and his grandfather, James II., he had much native talent and firmness of purpose. He was well educated and skilled in athletic exercises, as well as in music and the fine arts. In early youth he served with much honor in the Spanish army against Austria. War having broken out between France and Great Britain, and his father having abdicated his claim to the British throne, he in 1744 embarked with a powerful fleet and army for England, Marshal Saxe being in command; but the expedition was broken up by a great storm, which destroyed a large part of the fleet. In the following year (July 25) he landed with a few attendants at Moidart. He soon had a large following, mostly of Highlanders. With these he entered Edinburgh Sept. 17, destroyed Sir John Cope's army at Preston Pans Sept. 21, entered England, and could easily have taken London but for the insubordination of the Highland chiefs, who compelled him to retreat to Scotland, repulsing the royal troops at Clifton. On Jan. 17, 1746, he defeated Hawley at Falkirk. The character of his forces soon compelled his retreat to the Highlands, whither he was followed by the Duke of Cumberland. He fought the latter at Culloden Muir (Apr. 16), and was there utterly overthrown: but though his army was inferior in numbers and worn out by exposure and hunger, he would doubtless have won a complete victory but for the jealousy of the clan MacDonald. As it was, the battle was totally lost, and with it the last reasonable hope of the Stuart line. After many months of suffering he escaped from the Western islands by the aid of the famous Flora MacDonald. In Italy he was known under the title of Count of Albany, a title which passed to his natural daughter by Miss Walkenshaw. He was compelled to leave France, though it is suspected that the Government connived at his subsequent secret residence in Paris. He wandered much in Europe, became a confirmed profligate, married in 1772 Louisa of Stolberg, whom he forced to take refuge in a convent through fear of her life. The couple formally separated, partly because she was suspected of an attachment to the poet Alfieri (see ALBANY, LOUISA MARIA CAROLINE), and he remained at Florence. His natural daughter nursed him through his last two years. D. in Rome, Jan. 31, 1788.

Charles, ELIZABETH RUNDLE: an English authoress: b. 1826; was married to Andrew P. Charles, of London, in 1851. Among her works, which are very popular and religious, are *The Draytons and Davenants* (1841); *Chronicles of the Schönberg-Cotta Family* (1863); *Diary of Mrs. Kitty Trevylyan* (1864); *Winifred Bertram* (1866); *Martyrs of Spain* (1870); *The Bertram Family* (1876); *Lapsed, but not Lost* (1881). D. at Hampstead, London, Mar. 28, 1896.

Charles Emmanuel I.: Duke of Savoy (called THE GREAT); b. Jan. 12, 1562. He succeeded his father, Philibert Emmanuel, Aug. 31, 1580, and married Catherine, a daughter of Philip II. of Spain. He was an ambitious prince, and waged war against Henry IV. of France and other sovereigns. D. July 26, 1630.

Charles Friedrich August Wilhelm: Duke of Brunswick; b. Oct. 30, 1804; son of Friedrich Wilhelm who perished at the battle of Quatre-Bras; had for his guardian George IV. of England. Assuming the reins of government in 1823, he ruled so capriciously and arbitrarily that he was deposed by the German Diet. He lived afterward in Paris and London, and died in Aug., 1873, bequeathing his immense fortune to the city of Geneva.

Charles, shaarl, JACQUES ALEXANDER CÉSAR: savant and aëronaut; b. at Beaugency, France, Nov. 12, 1746. He was a popular lecturer on physical science in Paris, and gained distinction by his experiments in electricity. He also made an improvement in the art of ballooning by substituting hydrogen gas for heated air. He and M. Robert were the first persons who ever ascended in a balloon. They ascended in 1783 to the height of 7,000 feet. D. Apr. 7, 1823.

Charles Martel: King of the Franks; b. about 689 A. D.; illegitimate son of Pepin d'Héristal, Duke of Austrasia, who, estranged by the suspicion that Charles had murdered his brother, left the government to his wife and grandson. Deriding the rule of a woman and child, the Austrasians elected Charles their duke. He subdued Neustria, and made himself mayor of the palace, while Chilperic was the nominal king. He made Aquitaine his feudatory, cleared his frontiers of the marauding German tribes, and brought the Frisians to embrace Christianity. His most famous achieve-

ment lay in repelling Asiatic domination from Europe. He gained near Poitiers in 732 a most important victory over a large army of Saracens who had invaded the kingdom. This is known as the battle of Tours, and is regarded as one of the decisive battles of the world's history. For this victory he was surnamed Martel (i. e. the Hammer). When Thierry IV. died, Charles allowed the crown to lie in abeyance, neither changing his titles nor replacing the king, and thus ended the Merovingian dynasty. Charles bequeathed Austrasia to his son Carloman, and Neustria to Pepin, who by the death of Carloman obtained the whole dominion and took the title of king. Charles was detested by the Church because he seized its lands to maintain his wars. D. Oct. 22, 741.

Charles River, Mass.: rises in Worcester County; pursues a very tortuous course through Norfolk and Middlesex Counties; meets the tide-water at Boston, forming part of Boston harbor, and separating that city from Cambridge. Total length about 75 miles.

Charleston: city and railroad junction; capital of Coles co., Ill. (for location of county, see map of Illinois, ref. 7–F); 46 miles W. of Terre Haute, Ind. It is in an agricultural region, and has flouring and woolen mills, a canning-factory, a cigar factory, and a foundry, electric lights, etc. Pop. (1880) 2,867; (1890) 4,135; (1900) 5,488. EDITOR OF "PLAINDEALER."

Charleston: town and railroad junction; capital of Mississippi co., Mo. (for location of county, see map of Missouri, ref. 7–K); 12 miles S. W. of Cairo, Ill. It is in a lumber and agricultural district, and has an academy. Pop. (1880) 1,028; (1890) 1,381; (1900) 1,893.

Charleston: an important railroad and commercial center, the chief city of South Carolina, and capital of Charleston County (for location of county, see map of South Carolina, ref. 7–F); situated in lat. 32° 46′ N., lon. 79° 57′ W.; 100 miles S. S. E. of Columbia, the capital of the State, 82 miles N. E. of Savannah, Ga., and 455 miles S. S. W. of Washington, D. C. The city is built on a peninsula, formed by the confluence of the Ashley and Cooper rivers, having an average elevation of 8 to 10 feet above high water, and is about 3½ miles long, and varies in width from ½ to 2 miles. Northward stretches an extended plain, mostly occupied by fruit, flower, and vegetable farms. The two rivers unite their waters at the south in a spacious and beautiful harbor, which opens to the sea at a point about 6 miles to the S. E. This harbor has a depth of 40 feet at the city, and is one of the safest and most commodious on the Atlantic coast. Formerly the depth of its entrance was insufficient to permit the passage of vessels of great draught, but within recent years jetties have been constructed to create currents of sufficient force to cut a channel through the bar, and the high-water depth on each side of the bar is rapidly increasing. The harbor is defended by Fort Moultrie, situated on Sullivan's island, and by Fort Sumter, which commands the channel. The Ashley river to the westward is spanned by two bridges, the Charleston and Savannah R. R. bridge and another, known as the "New Bridge," and owned by a stock company. Plans have been made to connect the city by a railroad with the suburbs across the Cooper river on the E., including Mt. Pleasant, a growing village, and Sullivan's island, which is a popular summer resort, affording a fine beach for surf-bathing, now reached by ferry. Summerville, 22 miles distant to the N. W., is the home of many of the business men of Charleston, and has a mild climate grateful to consumptives.

The city is laid out in a generally regular way; two wide streets, King and Meeting, running N. and S. and being intersected by streets extending from E. to W. The houses are mostly of brick or wood, and numerous gardens, with a great variety of trees and flowering plants, impart a cheerful aspect. The principal open-air resort is the Battery, a small park at the south end of the city, near the water's edge; another is Colonial Lake, which has park-like surroundings. There is a complete system of tidal drainage, and the sanitary condition of Charleston is excellent, as is shown by the absence now of epidemics. A quarantine station has been established at old Fort Johnson. There are two street railways, operating about 35 miles of road.

Public Buildings and Institutions.—Among noteworthy public buildings are the arsenal and the citadel, market, city-hall, court-house, guard-house, and the new post-office, erected at a cost of about $400,000. There are 40 churches in the city, and 2 synagogues, some of which have edifices remarkable for architecture or historic association. Among these are the Roman Catholic cathedral, St. Michael's and St. Philip's (P. E.) churches, the former built in 1752; the Central Presbyterian church, and the Circular church (Congregational). The benevolent institutions number 15. Prominent among them are the Charleston Orphan Asylum and the Confederate Widows' Home. The public schools, not including a high school for boys, number 6, with an average attendance of 5,000. The private schools for both sexes are excellent, and include two for the higher education of girls. The College of Charleston and the Medical School of South Carolina are the leading educational institutions. The former has a fine museum and the latter a good pathological and anatomical museum. The Charleston Library, established in 1748, contains many books of great value, and the Apprentices' and Minors' Library has a good collection. Six newspapers are published.

Trade and Transportation.—The city has a large wholesale trade with the interior, and is the port through which the large inland cities of the neighboring States draw their supplies of merchandise, with the admission of large vessels to the harbor. The principal exports are cotton, rice, turpentine-casks, rosin, phosphates, fertilizers, lumber, cotton goods, fruits, and vegetables. The total value of exports and imports in 1900 was $8,276,391. The South Carolina, the Charleston and Savannah, and the Northeastern R. Rs. center in Charleston, giving the city direct connection with the large trunk lines. These roads are connected with the water-front by the East Shore Terminal R. R., which runs along the bank of the Cooper river. A similar road, to be called the West Shore Terminal, is now (1900) projected, to run along the bank of the Ashley river. The city is connected by water with New York city and Jacksonville, Fla., by the ships of the Clyde Steamship Company, and with less distant points and the neighboring islands by 12 freight and passenger steamers, owned in the city. The number of vessels arriving at this port in 1892 was 860. The total registered tonnage amounted to 880,673, which did not include vessels under 100 tons, nor steamers plying between points in the State of South Carolina.

The banks of the city are 15 in number, 3 national, 4 state, and 8 savings, with an aggregate capital of about $1,500,000. There are 13 building and loan associations in active existence, with aggregate receipts of $593,320.

Manufactures.—By the census of 1890 Charleston had 566 manufactories with a capital of $7,300,150, employing 5,283 persons; wages paid, $2,203,970; value of materials, $4,800,421, which in the finished product were valued at $8,892,860. The chief industries of the city are the manufacture of men's clothing, capital $86,310; cooperage, capital $306,420; cotton-compressing, capital $1,187,000; manufacturing of fertilizers, capital $724,900; and of flour and grist, capital $218,625.

Charleston was founded in 1680 by an English colony. During the first half century its growth was slow, but it attained commercial importance before the end of the second. It was taken by the British in 1780, after a gallant defense, and evacuated by them in 1782. It was the State capital until 1790, when the seat of government was removed to Columbia. It was the seat of the great Democratic convention of 1860, and later in the same year of the convention which passed the famous ordinance of secession. The reduction of Fort Sumter, its principal harbor defense, was the first conflict of the great civil war, and the first triumph of the Confederate arms. In Dec., 1861, nearly half of the city was destroyed by fire. During the last two years of the war it sustained a protracted siege and bombardment, and was evacuated by the Confederates Feb. 19, 1865. An earthquake destroyed a large part of the city and many lives Aug. 31, 1886, but within a few years the damage was so completely repaired that scarcely a trace of the disaster remained. The assessed valuation of property in 1890 was $21,386,539, and the municipal debt $3,972,113. Pop. (1860) 48,409; (1870) 48,956; (1880) 49,984; (1890) 54,955; (1900) 55,807. C. E. LAWRENCE.

Charleston, or **Kanawha Court-house**: capital of Kanawha County and also of West Virginia (for location of county, see map of West Virginia, ref. 9–E); on Ches. and Ohio and Kan. and Mich. RRs.; on the Kanawha river, at the confluence of the Elk river; 65 miles from its mouth and 150 miles S. S. W. of Wheeling. Steamboats navigate the Kanawha river up to this point. The city has the Kanawha and Ohio machine-shops, marble-works, ice-manufactory, woolen-mills, door, sash and blind, and furniture factories, wagon-shops, iron-fence works, foundries, engine-building works, boat

and barge building yards, dry-docks, a fine new capitol and other public buildings, excellent water-works, gas, electric light, natural gas, etc. A large trade in lumber, salt, and coal is carried on. There are a few salt-furnaces, one of which makes 2,000 bush. of salt per day. The seat of the State government was removed to Charleston in 1869, and to Wheeling in 1875. In May, 1885, Charleston became the permanent capital of the State. Pop. (1880) 4,192; (1890) 6,742; (1900) 11,099. EDITOR OF "GAZETTE."

Charleston, College of: In June, 1770, a meeting of the citizens of Charleston, S. C., was held to petition the General Assembly for the establishment of a college. In Oct., 1775, an act was passed providing for three colleges, one of which was to be located in Charlestown. In Oct., 1794, the first commencement was celebrated. In 1830 the new building (subsequently enlarged by the addition of wings) was erected. The college was nearly destroyed by the great earthquake of Aug., 1886, but academic exercises were not suspended for a day. In the face of most serious obstacles, the institution is making steady advances, maintaining the highest possible standard of scholarship in every department. The Museum of Natural History is one of the most valuable in the U. S. No college in the South is more in accord with the spirit of modern progress. It has (1900) 7 instructors, 47 students, and the library contains 14,000 volumes. HENRY E. SHEPHERD.

Charlestown: a former city of Middlesex co., Mass., but now a part of Boston; situated on a peninsula nearly inclosed by the Mystic and Charles rivers; connected with the old part of Boston and with Chelsea by five bridges. The ground rises into two eminences, Breed's and Bunker Hills, which afford delightful situations for dwellings. The city is well built, with shaded, irregular streets. Three avenues, Main, Bunker Hill, and Medford Streets, traverse the peninsula, and, converging at its neck, make the fine avenue Broadway, passing through Somerville and over Winter Hill. There is an extensive U. S. navy-yard, occupying 70 to 80 acres, extending from the Charles to the Mystic rivers, in which are three large ship-houses, the largest ropewalk in the U. S., and machine-shops for the manufacture of copper-work, machinery, and ordnance, capable of employing 2,000 men. A dry-dock connected with the navy-yard is built of granite, and cost $670,000. Charlestown has manufactures of steam-engines, boilers, and machinery, chemicals, stone-ware, brass-ware, brushes, sugar, soap, leather, mechanics' tools, gas fixtures, whips, drain-pipes, New England rum, tobacco, oils, etc. On the summit of the highest elevation stands the monument to commemorate the battle of BUNKER HILL (*q. v.*). Charlestown is supplied with water from Mystic Lake, 5 miles distant. The water-works were finished in 1864, at a cost of $1,461,259. The water flows from the lake 1 mile by gravitation, is then pumped by three engines to a reservoir on Tuft's Hill, from which it flows 4 miles, and supplies Charlestown and the neighboring towns. Charlestown was permanently settled in 1629, and is memorable from its associations with the Revolution. It was burned by the British on the day of the battle of Bunker Hill. The city was chartered in 1847, and was annexed to Boston Oct. 13, 1873. Pop. (1870) 28,323.

Charles Town: railroad junction; capital of Jefferson co., West Va. (for location of county, see map of West Virginia, ref. 6–N). It has a fine court-house and a jail. In this place John Brown was tried and executed Dec. 2, 1859. On Oct. 18, 1863, a Confederate force of 1,200 or 1,400 men under Gen. Imboden surrounded the place at daylight, and attacked the Union troops stationed there. Being surprised, they were panic-stricken, and, flying in confusion, were nearly all captured. The place was recaptured within an hour by U. S. troops under Col. George D. Wells, and the Confederates driven from the town. Pop. (1880) 2,016; (1890) 2,287; (1900) 2,392.

Charlestown: capital, chief town, and port of Nevis, West Indies; at the southwest extremity of the island (see map of West Indies, ref. 6–L). Pop. (1892) 1,600. It has a small export trade in sugar.

Charlet, shaar'lay', NICOLAS TOUSSAINT: military painter; b. in Paris, Dec. 20, 1792; d. there Dec. 19, 1845; pupil of Baron Gros; visited England in 1836 with Gericault, who was his intimate friend; was one of the first French painters to apply naturalistic treatment to pictures of battles and soldiers' life, and, besides numerous works in oil, executed a great number of lithographs. WILLIAM A. COFFIN.

Charleville, shaar'le-veel': a town of France; department of Ardennes; on the river Meuse, which separates it from Mézières (see map of France, ref. 2–G). It is well built and handsome, and has a college and a large public library; also manufactures of hardware, nails, copper, leather, etc. A suspension bridge crosses the river here. This place was formerly fortified. Pop. (1896) 17,805.

Charlevoix: village: capital of Charlevoix co., Mich. (see map of Michigan, ref. 4–I); on Chicago and West Michigan R. R. and Pine river; about a quarter of a mile from Lake Michigan; is a summer resort, and has trade in lumber and fish. Pop. (1880) 512; (1890) 1,496; (1900) 2,079.

Charlevoix, PIERRE FRANÇOIS XAVIER. de: Jesuit traveler and historian; b. at St.-Quentin, France, Oct. 29, 1682. He went as a missionary to Canada in 1720, and descended the Mississippi to its mouth. He wrote, besides other works, in French, a *History and General Description of Japan* (Paris, 1736); a *History and General Description of New France* (3 vols., 1744; Eng. trans. by John Gilmary Shea, New York, 6 vols., 1865–72); and a *History of Paraguay* (1756, 3 vols.; Eng. trans. London, 1769, 2 vols.). D. Feb. 1, 1761.

Charlotte, shaar'lot: a city and railroad junction; capital of Eaton co., Mich. (for location of county, see map of Michigan, ref. 7–I); 19 miles S. W. of Lansing. It has imposing church and school edifices, fine water-works, electric and gas lights, and several carriage and furniture factories. Pop. (1880) 2,910; (1890) 3,867; (1900) 4,092.
EDITOR OF "REPUBLICAN."

Charlotte: a city and railroad center; capital of Mecklenburg co., N. C. (for location of county, see map of North Carolina, ref. 3–E). It has Biddle University, two large public schools, other institutions of learning, and various manufactories. Gold mines have been opened in the vicinity. There is a branch of the U. S. mint in this city. The city has 4 banks, 4 local building and loan associations, 10 churches, water-works, macadamized streets, a park and library. Average temperature during the year about 60° F. Pop. (1880) 7,094; (1890) 11,557; (1900) 18,091.
SECRETARY OF CHAMBER OF COMMERCE.

Charlotte Amalie, -aa-maa'lee-*e*: a town of the Danish West Indies; capital of the island of St. Thomas (see map of West Indies, ref. 6–K). It stretches a mile along the shore, with white-walled, red-roofed houses, contrasting with the palms on the neighboring hills. It has a good harbor and an extensive trade, being a free port. It is a station for the mail-packets which ply between Southampton and the West Indies. Pop. (1887) 13,000, mostly blacks.

Charlotte Harbor: an inlet on the west coast of Florida; in De Soto County; is nearly 24 miles long, and sheltered from the sea by several islands (see map of Florida, ref. 8–I). It is shallow, its greatest depth being about 10 feet. Good oysters and fish abound here. Cattle are exported to Key West. Pop. of precinct (1890) 182; (1900) 266.

Charlot'tenburg: a town of Prussia; province of Brandenburg; on the river Spree; 3 miles W. of Berlin, at the end of the Thiergarten park (see map of German Empire, ref. 3–G). It has a palace with a fine park and a famous palmery, and a mausoleum in which are statues of Frederick William III. and Queen Louisa, by Rauch. Here are manufactures of cotton and hosiery. Pop. (1880) 30,446; (1890) 76,873; (1895) 132,377.

Char'lottesville: city and railroad junction; capital of Albemarle co., Va. (for location of county, see map of Virginia, ref. 5–G); on the Rivanna river; 97 miles by railroad W. N. W. of Richmond, 61 miles by railroad N. N. E. of Lynchburg, and 115 miles S. W. of Washington, D. C. One mile W. of this town is the University of Virginia, founded in 1819 by Thomas Jefferson, and endowed by the State. Here are cloth, agricultural implements, tobacco, hosiery, underwear, and other factories, and an excellent water-supply. The city has an academy and several schools. Monticello, the former residence of Jefferson, is 3 miles distant. Pop. (1880) 2,676; (1890) 5,591; (1900) 6,449.
EDITOR OF "JEFFERSONIAN REPUBLICAN."

Char'lottetown: capital of Prince Edward Island and of Queen's County; situated on Prince Edward Island Railway and on the north bank of East river, near the south coast (see map of Quebec, etc., ref. 1–B). It has an excellent harbor and a large export trade. The town is well laid out, and has a fine colonial building, post-office, and athenæum, a normal school and lunatic asylum, and is the seat of Prince of Wales College, St. Dunstan's (Roman Catholic) College, and a Methodist college. It has excellent public schools,

and is the see of a Roman Catholic bishop. Pop. (1891) 11,374.

Charmides, kaar'mi-dēēz (in Gr. Χαρμίδης): an Athenian philosopher; b. about 450 B. C.; uncle of Plato and a pupil of Socrates. He was one of the tyrants who obtained power by the aid of Lysander the Spartan, and was killed in battle by the army of Thrasybulus about 404 B. C.

Cha'ron (in Gr. Χάρων): in classic mythology, the ferryman who transported the souls of the dead across the rivers of the infernal regions. An obolus was placed in the mouth of the dead at burial in compensation for this service. The poets feigned that he was the son of Erebus and Nox.

Charon'das (in Gr. Χαρώνδας): an eminent Greek legislator; b. at Catania, in Sicily; flourished about 650 B. C. He composed laws in verse, which were adopted by the Athenians and other nations.

Cha'ron of Lamp'sacus: one of the early writers of history preceding Herodotus, known as LOGOGRAPHERS (*q. v.*); flourished 480–465 B. C. He wrote an *Account of the Persians* (Περσικά) and *Annals of Lampsacus*. The scant fragments are preserved in Müller's *Fragmenta Historicorum Græcorum*, vol. i., pp. 32–35. See Neumann, *De Charone Lampsaceno* (1880).

Charpentier, shaăr'pāăṅ'ti-ay', LOUIS EUGÈNE: military and genre painter; b. in Paris, June 1, 1811; d. there Dec. 16, 1890; pupil of Gérard and Léon Cogniet; third-class medal, Salons 1841 and 1857; an artist of fair ability who was Professor of Design at Versailles for a quarter of a century. One of his works, *Battle of Tchernaia* (1857), is in the Versailles Museum. W. A. C.

Charr: a beautiful fish (*Salvelinus alpinus*) of the salmon family, abounding in cold, clear brooks and ponds in Northern Europe; the same or a very similar species also in Greenland or British America. Compared with the true

The northern charr.

trout (*Salmo*), the charr (*Salvelinus*) differs in the very small scales, the presence of red spots instead of black, and in the structure of its vomer. The charr are in general more beautiful and more retiring than the trout, and more valued as game fish. Several species of charr occur in America, the best known being the so-called "brook trout," or "speckled trout," of the East, *Salvelinus fontinalis*.

D. S. JORDAN.

Charrières, shaăr'ri-ār', Madame SAINT-HYACINTHE, de: French authoress; b. in Holland in 1740; wrote several romances: *Lettres Neuchateloises* (1784) and *Caliste* (1786). She was intimate with Benjamin-Constant, and their correspondence has been published. D. Dec. 20, 1805.

Charron, shaăr'rōṅ', PIERRE: a celebrated French preacher and moralist; b. in Paris in 1541; d. Nov. 16, 1603. A friend and disciple of Montaigne, he had yet found the law intolerable and entered the Church, even desiring to become a monk. His age when this determination was adopted, or perhaps his powers as a preacher, had caused him to be refused permission, however. Curiously enough, the skeptical spirit of his master imposed itself upon him, and when his famous treatise, *De la Sagesse* (On Wisdom), appeared in 1601 (larger edition in 1604; Eng. trans. New York, 1891), it appeared in many ways to substitute natural morality for Christian faith. It was vehemently attacked, but had a great effect in its time. It should be added, however, that his earlier treatises, *Les trois Vérités* (1593) and *Discours chrétiens* (1600), are thoroughly Christian in spirit.

A. R. MARSH.

Chart: a hydrographic map for the use of navigators; the projection of some portion of the sea or coast on a plane surface. Charts are generally constructed on the principle of Mercator's projection. In the English and U. S. services, after coasts have been surveyed by the Government, charts are engraved and sold at prices below their cost in order to encourage their general use. The navigating charts, showing the dangers of the coasts with sufficient clearness to enable mariners to avoid them, are usually on a uniform scale, and the U. S. charts are generally on the polyconic projection. The preparation of charts is a part of the duty of the hydrographical department at the Admiralty in England, and in the U. S. of the coast survey and of the hydrographic office.

Charta Epispastica, kaar'ta-ep-i-spăs'ti-ka [Lat., drawing (or blistering) paper]: the pharmaceutical name for blistering paper. It is prepared by applying to one surface of smooth bibulous paper a mixture of oil, wax, spermaceti, resin, Canada balsam, water, and powdered cantharides. When applied to the skin it adheres, and after a time raises a blister as perfectly as the blistering cerate does, while it is much cleaner and more easily applied.

Various *chartæ emplasticæ*, or adherent medicated papers (*papiers emplastiques*), are employed by many French physicians instead of the less neat and convenient plasters of ordinary pharmacy.

Charte, shaart: the name applied in France (1) to the "Grand Charter" of John II., prepared by the States-General and agreed to by the king; this was the basis upon which the States-General asserted their liberties at the commencement of the Revolution; (2) that by which Louis XVIII. in 1814 acknowledged the rights of the people; (3) that of 1830, which was sworn to by Louis Philippe, recognizing the popular sovereignty. See FRANCE.

Charter [O. Fr. *chartre* < Lat. *chartula*, a small paper, deriv. of *charta*, paper]: a formally written instrument given as evidence of a grant, contract, or other transaction between man and man; an instrument executed with form and solemnity bestowing rights and privileges. In public law the term is applied to those formal deeds or instruments by which sovereigns guarantee the rights and privileges of their subjects, or by which a sovereign state guarantees those of a colony. The founders of several of the British American colonies, now States of the Union, obtained charters from the King of England for the same. In municipal law the word is principally used to designate a grant of franchises, privileges, or estates obtained from the sovereign by letters-patent under the great seal. A leading instance is found in the creation of corporations. In early times corporations were created principally in this manner. It has been doubted whether municipal corporations could at first be created in any other way than by royal charter. The better opinion is that there could be no valid charters other than royal. It is now quite frequent to originate them by act of Parliament. The act of incorporation in that case has the force of a statute. There are certain special rules appertaining to royal charters as distinguished from corporations created by act of Parliament. Thus the king can not limit the perpetuity of a corporation, while Parliament may. Accordingly, when the Bank of England was established by way of experiment, the aid of Parliament was called in to limit its duration. A general statute now confers that power upon the king to limit the time of corporate existence. So the crown can not force a new charter upon an already existing corporation. The king can not derogate from his own grant. Parliament may abolish the institution or modify it at pleasure. Nor can the king remove corporators at discretion, as each corporator is supposed to have a freehold estate. So a charter can not create exclusive right or prohibit trade, or in any way change the established law of the land. These propositions are of but little practical use in the U. S., as since the Revolution corporations are created by act of the legislature. There is a number of municipal and other charters in existence which were granted by the king prior to the Revolution, and which remain in force notwithstanding the change of government. See further under CORPORATION.

T. W. DWIGHT.

Charterhouse [a corruption of *Chartreuse*: see CARTHUSIANS]: a hospital and school in London; founded in 1611 by Sir Thomas Sutton, who endowed it with the revenues of more than twenty manors, lordships, and other estates. It was originally a Carthusian monastery founded in 1371. It is an asylum for poor brethren, the number of whom is limited to eighty, and they must be bachelors, members of the Church of England, and fifty years old. Each brother receives, besides food and lodging, an allowance of £26 a year for his clothing, etc. The school is for the benefit of "the sons of poor gentlemen to whom the

charge of education is too onerous." The number of scholars is limited to forty-four, but in 1889 there were 460 day and boarding pupils who were not charity scholars. In 1892 there were 500 pupils. Among the eminent men educated here were Addison, John Wesley, George Grote, Bishop Thirlwall, and Thackeray. The reputation of the school is high. In 1872 the school was removed to Godalming, where it occupies a large quadrangle, with a gatehouse tower 130 feet high and a chapel rich in stained glass. Headmaster, Rev. W. Haig Brown, LL. D.

Charteris, chaar'tėrz, Archibald Hamilton, D. D.: a Scotch divine; b. at Wamphray, Dumfries, Dec. 13, 1835. He graduated from the University of Edinburgh B. A. 1853, and, after pastorates in St. Quivox, New Abbey, and the Park church, Glasgow, became in 1868 Professor of Biblical Criticism in the University of Edinburgh. In 1868 he founded the Christian Life and Work Committee, of which he still remains convener. He was moderator of the General Assembly of the Church of Scotland in 1892. Besides a biography of Dr. James Robertson (Edinburgh, 1863), he published *Canonicity* (1880); *The New Testament Scriptures* (London, 1883), being the Croall lectures for 1882; and many contributions to periodicals. He was the originator and first editor of the magazine *Life and Work*.

Willis J. Beecher.

Charter Oak: a tree which, famous in colonial history, once stood in Hartford, Conn. The legend runs that when

Charter oak.

Sir Edmund Andros went to Hartford in 1687, by command of King James II., to demand the surrender of the charter of the colony, the charter was concealed by Capt. James Wadsworth in a hollow of this oak. This historic tree was blown down by a gale Aug. 21, 1856, but a sketch had been made of it in 1848.

Charter-party [Fr. *chartre-partie*—so called from such documents being at one time made in duplicate (in Fr. *parti*), and one given to each party concerned, as in the case of an indenture]: a contract in which the owner of a vessel, or (in a foreign port) the master as the agent of the owner, lets the vessel or a portion of her to a second party for the conveyance of goods from one port to another port; hence the vessel is said to be "chartered." A charter-party may be in effect a lease of a vessel, in which case the charterer has the rights and duties of a bailee for hire, furnishing his own crew, provisions, etc., or it may be a contract of affreightment, under which the owner mans and equips the vessel, incurs ordinarily the responsibilities of a Common Carrier (*q. v.*), and has a lien on the cargo for his freight. In a charter-party of affreightment it is customary to describe the ship and her location, and to specify the voyage to be performed and the terms on which the cargo is to be carried. On the part of the ship-owners it is covenanted that she shall be seaworthy and suitably equipped for the voyage; that she shall be ready to receive the cargo on a given day, wait its complete delivery for a certain period, sail for the stipulated port when laden if the weather for the time permits, continue her voyage without unnecessary deviation, and deliver the full cargo on payment of freight. The freighter's portion of the contract obliges him to load and unload at suitable periods under specified penalties, and to pay the freight as agreed. The master must not take on board any contraband goods, or otherwise act so as to render the vessel liable to seizure.

Revised by F. Sturges Allen.

Chartier, shaär'ti-ay', Alain: a French poet and prose-writer of great repute in the fifteenth century; b. at Bayeux, in Normandy, about 1392; d. not later than 1441. He studied in the University of Paris, entered the service of Charles VI., and was clerk, notary, and financial secretary to Charles VII. As a poet he is closely connected with the school of the fourteenth century—Guillaume de Machaut, Eustache Deschamps, Froissart, and Christine de Pisan—writers of *ballades, rondeaux, virelais*, and similar quaint and difficult forms. He delights also in allegorical and controversial love verse, and in moralizing poetical essays. In prose he has much the same characteristics. His style is overloaded with Latinisms, and is at times strangely contorted. At other times, however, it has a gravity and balance that presage the new prose soon to appear in the *Mémoires* of Commines; and when he is touched by the ills of his country he becomes even eloquent. His chief poetical work consists of his lyric poems, his *Bréviaire des Nobles*, his *Livre des quatre Dames*, and his *Belle Dame sans merci*, whose name and fame long endured. In prose, besides several interesting Latin letters and treatises, he wrote *Le Quadrilogue Invectif*, *Le Curial*, *Chronique de Charles VII.*, and one or two other pieces of less moment. His fame is illustrated by the apocryphal story of the kiss given him by Margaret of Scotland, Queen of France, who declared she meant not to kiss the man, "but the mouth whence had issued so many golden words." His influence upon his contemporaries was great, and even foreigners, like the English Lydgate, studied him with ardor. See Delaunay, *Thèse sur Alain Chartier* (1876), which contains full bibliographical information. The only available edition of the works of Alain Chartier is that of André Duchesne, Paris, 1617.

A. R. Marsh.

Chartism: a movement in British politics for the alleviation of the sufferings of the artisan and other laboring classes, and named for the document in which the agitators presented their demands to the world. After the reforms of Lord Grey in 1832, there remained great discontent among the workpeople of Great Britain. In 1838 six members of the House of Commons had a conference with representatives of the Workingmen's Association, and together they formulated what was known as *The People's Charter*. It demanded six specific reforms, viz.: (1) annual parliaments; (2) universal suffrage; (3) the ballot; (4) no property qualification for a seat in the House of Commons; (5) salaries for parliamentary representatives; (6) electoral districts evenly apportioned by population. The methods of agitation were those of O'Connell, who was a Chartist leader, and huge meetings were held, not wanting in intemperance of speech. The *Northern Star*, founded by Fergus O'Connor, became the newspaper organ of the movement and gained a circulation of 50,000, then an extraordinary achievement. In 1839 the National Charter Association was organized in Birmingham on the same platform, and reached a membership of 40,000. But it was not until 1848 that the magnitude and intensity of the movement was disclosed. It was a time of great depression in industry and of revolutionary excitement all over Europe. Men went out to drill in Glasgow and Manchester. Crowds assembled to listen to violent harangues; revolutionary organizations were suspected in the industrial centers of Great Britain; the governing classes were alarmed. In several northern cities the popular gatherings were dispersed by the soldiery and garrisons were maintained in them. It was announced that 500,000 people would assemble on Apr. 10, on Kennington Common, London, to present a petition signed by 6,000,000 to Parliament. The procession was forbidden by the Government, the military was posted by the Duke of Wellington to command the city, 170,000 special constables were enrolled, among whom was Louis Bonaparte (afterward Napoleon III.). The assembly was held and 50,000 attended; the procession was abandoned; the petition was presented to Parliament, scrutinized, and the signatures shrank on enumeration and verification. The Chartist movement rapidly declined, partly owing to the improving condition of labor, and partly owing to the legislative concessions to the People's Charter made in reform bills, such as the extension of suffrage, the redistribution of parliamentary seats, and the adoption of the ballot. Although the People's Charter ceased to be a platform of agitation,

the Chartist disturbances led to a larger recognition of labor interests as a factor in legislation and in British politics. See Carlyle on *Chartism*; McCarthy, *History of our own Times*; *Cooper's Life*.

Chartran, shăr'trăn', Théobald: portrait and figure painter; contemporary; b. at Besançon: pupil of Cabanel; Grand Prix de Rome 1877; second-class medal, Paris Exposition, 1889; Legion of Honor 1890. His small portraits are finely drawn and cleverly painted. At the Salon of 1892 he exhibited a masterly portrait of Pope Leo XIII. Studio in Paris. W. A. C.

Chartres, shaart'r (anc. *Autricum*): a city of France; capital of the department of Eure-et-Loir; on the river Eure, and on the railway which connects Paris with Le Mans; 49 miles S. W. of Paris (see map of France, ref. 4–E). It is built at the base and on the declivity of a steep hill. The streets are narrow and crooked. Here is a Gothic cathedral of the eleventh century, said to be the most perfect in France; it is surmounted by two towers, one of them 382 feet high, with rich ornamentation, and the other exceedingly massive. Chartres has two other remarkable churches, an episcopal palace, and a public library of about 30,700 volumes; also manufactures of hosiery, hats, leather, etc. Here is a large weekly market for grain and flour. During the Middle Ages Chartres was the capital of the district of *Chartrain*, made a duchy by Francis I., and given as an appanage to the Dukes of Orleans. Hence the title Duke of Chartres was given to the eldest son of the Duke of Orleans. More recently the same title was given to Prince Robert of Orleans, grandson of King Louis Philippe, and second son of Duke Ferdinand of Orleans. Pop. (1891) 23,108; (1896) 23,182.

Chartreuse, shăr'tröz', **La Grande**: a large and famous monastery in the French Alps; 12 miles N. N. E. of Grenoble; in the midst of wild and impressive scenery; 3,281 feet above the sea. The convent was founded by St. Bruno in 1084, somewhat higher up the mountain than the present buildings. The name of the order, Carthusians, comes from this convent, and the English Charterhouse is a corruption of its name. The buildings are extensive, but rudely built, and date from 1689. The monastery had been repeatedly burned before the present structure was built. The monks were stripped of their possessions in the French Revolution, and abandoned the convent until 1826. They have never recovered their former wealth and dignity. They manufacture a famous Liqueur (*q. v.*), which takes its name from the monastery. See Charterhouse.

Char'tulary (Late Lat. *chartularia*): literally, a record or register. This term is specially applied to certain rolls or books in which corporations, especially religious and civil corporations, keep a record of their charters and privileges granted them by the statute, and in the case of the early Latin Church a custodian of the charters, records, etc., of the Church was also so called. Some of these chartularies date back in France as far as the tenth century, but it was not until the twelfth or thirteenth century that they were generally kept by corporations. Their value lies in the fact that they frequently contained archæological and genealogical information of great historical value. Many important chartularies have been printed.

Charybdis, kā-rib'dis (in Gr. Χάρυβδις), now called **Galofaro**: an incessant undulation, rather than a whirlpool, on the Sicilian side of the Strait of Messina, opposite the rock of Scylla. It is caused by the meeting of currents, and is seldom dangerous. It was anciently much dreaded by mariners. See Rear-Admiral William Henry Smyth's monograph on the Mediterranean, p. 519, 8vo, 1854.

In Greek mythology Charybdis was a daughter of Poseidon, and was killed by Zeus with a thunderbolt and hurled into the sea, where she henceforth drew the approaching ships into the deep.

Chase, Dudley: b. in Cornish, N. H., Dec. 30, 1771; an uncle of S. P. Chase; graduated at Dartmouth in 1794; chief justice of Vermont (1817–21), and U. S. Senator from 1813 to 1817, and again from 1825 to 1831. D. in Randolph, Vt., Feb. 23, 1846.

Chase, George, LL. B.: b. in Portland, Me., Dec. 29, 1849; graduated at Yale College, Connecticut, 1870, and at Columbia College Law School, New York city, 1873. In 1875 was appointed assistant Professor of Municipal Law in the last-named institution, and in 1878 Professor of Criminal Law, Torts, and Procedure; dean of the New York Law School 1891; published an edition of Blackstone's Commentaries known as the *American Students' Blackstone* (1877), and edited *Johnson's Ready Legal Adviser* (1880); contributed many legal articles to the *Universal Cyclopædia*.

Chase, Irah, D. D.: b. at Stratton, Vt., Oct. 5., 1793; graduated at Middlebury College in 1814 and at Andover Theological Seminary 1817; in the same year was ordained to the Baptist ministry. He labored as missionary in West Virginia, and was in 1818 appointed Professor of Languages and Biblical Literature in the first Baptist Theological School, which was that year started in Philadelphia, but in 1822 removed to Washington, D. C., and incorporated with Columbian College. There he remained till 1825, in which year he became Professor of Biblical Theology, and from 1836 to 1845 of Ecclesiastical History in the Theological Institution (which he was largely instrumental in founding) at Newton Centre, Mass. He published several works, mainly controversial. D. at Newton Centre, Mass., Nov. 1, 1864.

Chase, Philander, D. D.: a Protestant Episcopal bishop; uncle of Salmon P. Chase (*q. v.*); b. in Cornish, N. H., Dec. 14, 1775; graduated at Dartmouth in 1796. He went in 1817 as a missionary to Ohio, where he planted the Episcopal Church. He became Bishop of Ohio in 1819, resigned in 1831, and after a temporary residence in Michigan was made Bishop of Illinois in 1835. He founded Kenyon College (*q. v.*), Gambier, O., and Jubilee College (1838) at Robins' Nest, Ill. Published *Reminiscences* (New York, 1848, 2 vols.). D. at Jubilee College, Robins' Nest, Ill., Sept. 20, 1852. The resignation by Bishop Chase of the see of Ohio, on account of difficulties with the faculty of the Theological School at Gambier, and his subsequent acceptance of the episcopate of Illinois, gave occasion to the enactment of the canon on Episcopal resignations still in force in the Protestant Episcopal Church.

Chase, Pliny Earle: educator; b. in Worcester, Mass., Aug. 18, 1820; graduated at Harvard College in 1839. While engaged for many years as a teacher in Philadelphia, and afterward in mercantile life, he employed his leisure in metaphysical, philological, and physical studies, producing many able and learned papers, published in the *Proceedings of the American Philosophical Society* and in various scientific journals, several of which were copied in the London, Dublin, and Edinburgh *Philosophical Magazines* and other foreign journals. These articles procured him wide distinction as a man of science. In 1871 he was appointed Professor of Physics, and later of Languages, in Haverford College. The Magellanic gold medal of the American Philosophical Society was awarded to him in 1864 for the *Numerical Relations of Gravity and Magnetism*. Among his works is *Elements of Meteorology* (1884). D. in Haverford, Dec. 17, 1886.

Chase, Salmon Portland: statesman and jurist; son of Ithamar Chase, a farmer of New Hampshire; b. in Cornish, N. H., Jan. 13, 1808. He was sixth in descent from Aquila Chase, who emigrated from England to Massachusetts in 1630. His mother was of Scotch descent. The stock to which he belonged was prolific in eminent men. His grandfather, Samuel Chase, had seven sons, five of whom received an education at Dartmouth College. During the war of 1812 Ithamar Chase engaged in the glass manufacture at Keene, N. H., but this business resulted unfortunately on the reintroduction of foreign manufactures. He died in 1817, leaving his family in straitened circumstances. Salmon's education, however, was not neglected. He was first sent to a school at Windsor, Vt., and when twelve years of age went to Ohio to live with his uncle, the bishop, who resided near Columbus. Here he divided his time between hard work on the bishop's farm and hard study in the bishop's academy, which was afterward removed to Cincinnati. In 1823 he returned to New Hampshire, and the next year entered Dartmouth College, from which he graduated in 1826. He then repaired to Washington, and supported himself by teaching a school while studying law under the direction of William Wirt. Here he obtained his license to practice law in 1829, and in the spring of 1830 went to Cincinnati to pursue his profession. During the weary hours of waiting for business he occupied himself in preparing an edition of the *Statutes of Ohio* with notes and an historical introduction. This brought him into notice, and in 1834 he was appointed solicitor for the U. S. Bank in Cincinnati. From this period he never wanted employment.

He early engaged in the controversy respecting slavery and the slave-power in the U. S., and took the then unpopular anti-slavery side. In 1837 he appeared as counsel for Matilda, a colored woman claimed as a fugitive slave, and took the ground that Congress had no right to impose on State officers the duty of assisting to render up fugitive slaves, nor to legislate on the subject at all—that the States were, by the Constitution, solely responsible for the performance of that duty, and had a right to prescribe such proceedings as they saw fit to prevent unjust arrests and detentions. These views were enforced with great eloquence and power, though unsuccessful at that time. In a subsequent case he took the broad ground that slavery was a local institution, dependent upon State laws for its existence and continuance. His great maxim was, "Slavery is sectional, freedom is national." In 1842 he was employed to defend Van Zandt, the original of Van Tromp in *Uncle Tom's Cabin*, who had been a Kentucky farmer, but from a conviction of the wrong of slavery had liberated his slaves and removed to Ohio, near Cincinnati. Here he was indicted, under the Fugitive Slave law of 1793, for harboring fugitive slaves and aiding them to escape. The cause was carried to the Supreme Court of the U. S., where it was ably argued by Mr. Chase and Hon. W. H. Seward in 1846, and became one of the *causes célèbres* of the country.

The subject had now become fully introduced into the politics of the country, and Mr. Chase was virtually the founder and leader of the Liberty party, which resulted in the formation of the Free-soil party, and ultimately of the great Republican party, which became the means of prostrating the slave-power and abolishing slavery in the U. S. A convention of this party under the guidance of Mr. Chase was held at Columbus, O., in Dec., 1841, after it became apparent that no hope was to be expected from President Tyler or the old Whig party in the direction of anti-slavery. Other conventions were held at Buffalo, Cincinnati, and Columbus in 1843, 1845, 1847, and 1848, resulting in the latter year in the nomination of Mr. Van Buren and Charles Francis Adams as the candidates of the Free-soil party for President and Vice-President. Mr. Chase was the moving spirit in these conventions. He presided over the last, and drew up the platform of principles and policy which it adopted. Most absorbing and prominent among these at this time was that of preventing the extension of slavery into the new Territories.

In Feb., 1849, he was elected a U. S. Senator from Ohio, and took his seat in the following March, where he upheld the sectional nature of slavery, opposing the compromises of 1850. In Oct., 1855, he was elected Governor of Ohio, and re-elected in 1857. In 1860 he was a prominent candidate for the presidency before the Republican convention which nominated Mr. Lincoln. In the following session of the Ohio Legislature he was again chosen Senator of the U. S., but had scarcely taken his seat in Mar., 1861, when he was nominated by President Lincoln as Secretary of the Treasury, upon the duties of which position he immediately entered.

He found the treasury empty and the Government credit below par. But he inaugurated measures which met the pressing demands of a gigantic war, amounting to six or seven hundred millions per annum, and stimulated the industrial energies of the country. These measures can not be examined in detail. They belong to the history of that struggle. A cardinal principle kept in view was to issue a sufficient amount of such securities and notes as would furnish a currency that would enable the people to meet their engagements and avoid bankruptcy. This kept them in heart, and every branch of industry in constant activity. It obviated those commercial crises which are the usual consequences of such wars. This financial policy was largely due to the recommendations of Secretary Chase, although able financiers in Congress and out gave him wise and energetic co-operation.

One of the measures resorted to, which should be noticed as exciting a difference of opinion as to the constitutional power of Congress, was the issue by the Government, in Feb., 1862, of currency notes which were made a legal tender in the payment of debts. It is due to Secretary Chase to say that while he recommended the issue of the notes, the making of them a legal tender originated in Congress, though acquiesced in by him. Another measure of permanent importance to the country was the establishment, in Feb., 1863, of a national banking system, by which all notes issued were to be based on funded bonds of the Government of equal or greater amount. This system was entirely original with Secretary Chase, and will probably be regarded as one of his greatest achievements for the benefit of his country. He hoped that it would effectually abolish a resort to State bank issues of paper currency, which it is known he latterly regarded as bills of credit within the meaning and prohibition of the Constitution.

Mr. Chase resigned the secretaryship of the Treasury in the last of June, 1864, and on Dec. 6 following he was appointed chief justice of the Supreme Court of the U. S., in place of Chief Justice Taney. The duties of his new office were no less important to the country than those which he resigned. Many of the momentous questions which arose out of the issues of the war had to be ultimately adjudicated by the high tribunal over which he was called to preside—questions affecting vast private interests and the future stability of the Government. It was the singular fortune of Chief Justice Chase that he bore a conspicuous and leading part not only in the great political movement which brought on the American civil war and abolished slavery, but in the successful conduct of that war and in the final settlement of the constitutional issues and changes to which it gave rise. The status and reconstruction of the Southern States; the rights of their citizens, personal and political; the constitutionality of acts of Congress and of the executive in various matters during the impulses and excitements of the war; the construction of those important amendments to the Constitution which were necessitated by the event of the contest—these were among the subjects upon which the Supreme Court was called to decide. As presiding officer of the court and as a constitutional judge, the chief justice fully met the duties, responsibilities, and the dignity of his high position. But his long service in political life and absence from the bar induced him to lean largely upon the experience of the other members of the bench in matters of technical law. In every case of public consequence depending upon constitutional or fundamental principles he exhibited the same largeness of mind which characterized his entire career. His opinions on some questions have been criticised as exhibiting a leaning against the Federal Government and its authority, in which as an executive officer he had taken so large a part. For example, on the question of the constitutionality of the legal-tender notes he changed his opinion and held them unconstitutional. But it is fairly due to him to accept his own explanation, that he assented to the law as a pressing necessity when passed, but subsequent reflection convinced him that he was mistaken. His opinions are characterized by great clearness and chasteness of style, and may be cited as models of juridical composition. They ever betrayed the fine scholar and the practiced writer.

In 1868 he was called upon, as chief justice, to preside over the Senate pending the impeachment and trial of President Johnson—the only instance of such a trial in the history of the Federal Government.

In June, 1870, he had a stroke of paralysis, from the effects of which he suffered more or less till his death. He attended the regular terms of court commencing in Dec., 1871, and Dec., 1872, and while his mind still remained clear and his logical powers unimpaired, his powerful frame was much enfeebled, and his general appearance indicated that his tenure of life was by a slender thread. He died in the city of New York, May 7, 1873, in the sixty-sixth year of his age. See his *Life and Public Services* by Schuckers (1874).

Chase, Samuel: jurist; b. in Somerset co., Md., Apr. 17, 1741. He was a delegate in Congress from 1774 to 1778, and signed the Declaration of Independence. In 1796 he became an associate justice of the Supreme Court of the U. S. He was impeached in 1804 for misdemeanor in the conduct of several political trials, but was acquitted by the Senate. John Randolph was one of the instigators and managers of this impeachment. D. June 19, 1811.

Chase, Thomas, LL. D.: brother of Pliny Earle Chase, noticed above; b. in Worcester, June 16, 1827; was graduated at Harvard with high honors 1848; was tutor and Latin professor at Harvard for three years; spent two years and a half in Europe; studied at the University of Berlin. On his return he was appointed (in 1855) Professor of Philology and of Classic Literature at Haverford College, and afterward accepted the presidency of that institution. He has published excellent editions of Vergil, Horace, Livy, and Juvenal; a volume entitled *Hellas*, a description of his personal observations in Greece in 1862; and also many oc-

casional addresses and papers. He was one of the company of scholars who prepared the Anglo-American revision of the translation of the New Testament. Removed late in life to Providence, R. I., where he died Oct. 5, 1892.

Chase, William Henry: b. in Massachusetts in 1798; graduated at the U. S. Military Academy in 1815; appointed brevet second lieutenant of engineers; first lieutenant 1819, captain 1825, major 1838. The events of the war of 1812 having shown the vulnerability of the ports of the Gulf coast, and especially of the key to its western territory, New Orleans, Chase was assigned to duty for their defense in 1819. Forts Pike and Macomb were his earliest works. His most important were Forts Pickens, McRee, and Barrancas (*qq. v.*), for the defense of Pensacola, regarded then as the great naval station of the Gulf. But subsequently, as senior engineer officer, all the works of fortification and of river and harbor improvement (e. g. the Mississippi mouths) came under his supervision. There was scarcely a project connected with the development of the region of his adoption in which he did not take an influential part. In 1856 he was appointed by President Pierce superintendent of the Military Academy, but resigned Oct. 31 from the army without entering on its duties. He espoused the Confederate cause, and was prominent in the seizure of the Pensacola navy-yard, but subsequently took no prominent part in the war. D. in Pensacola, Fla., Feb. 8, 1870.

Chase, William Merritt: figure, still-life, and portrait painter; b. Franklin co., Ind., Nov. 1, 1849; pupil of L. E. Wilmarth, New York, and of Wagner and Piloty, Munich; member of the Society of American Artists (1879), and of American Water-color Society; National Academician 1890; second-class medal, Munich Exposition, 1883; second-class medal, Paris Exposition, 1889. His work at first showed the influence of the Munich school, but after his return to New York in 1878 it partook more of the French methods of to-day. It is notable for admirable technical qualities, for truth to nature, and artistic arrangement. His portraits are exceedingly well painted, and often remarkable for effective composition. He is an excellent colorist and good draughtsman. President of the Society of American Artists, and one of the chief instructors in the Art Students League, New York. His *Ready for a Ride* (1879) is in the Union League Club, New York. Studio in New York. Summer studio at Southampton, L. I., where he is the head of the school of art at Shinnecock Hills. William A. Coffin.

Chas'idim [Heb., saints]: a name applied among the ancient Jews to a sect of pietists who originally aimed at strict ceremonial purity under the Mosaic law, warmly espousing the cause of the Maccabees, and opposing the Hellenizing tendencies of some of their fellow Israelites. Some writers believe that the Essenes, Pharisees, and other strict followers of the law all sprang from the Chasidim, but that the name was finally taken by a moderate party, who received the traditions as of equal authority with the law. In recent times the name is applied to a sect of Jews who sprang up in Poland in the eighteenth century, and who aim at a restoration of the ancient piety of their nation. Their ceremonial is extremely formal. Their peculiar mystical and cabalistic doctrines and customs are repudiated by the orthodox Jews. They are now chiefly found in Eastern Europe. See Jewish Sects.

Chasing [Fr. *enchâsser*, enshrine, set; deriv. of *châsse*, shrine, case < Lat. *capsa*, box]: the art of ornamenting metals by means of small steel tools, generally struck with a hammer. By these means the metal is marked with lines, patterns, etc., impressed upon its surface. The art differs from engraving in that the lines, etc., are impressed and not incised; none of the metal is cut away. It is common to ornament silver and other vessels by means of raised patterns produced from the reverse side by the snarling iron (or, as it is now more generally called, the *repoussé* process). When the projections and embossings have been made, roughly, the vessel is filled with pitch, which is allowed to harden, and the chaser works upon the outside, the thin metal being supported by the pitch. The chasing-tools then push back the relief, in parts, sharpen the edges, define and outline the pattern, and complete the design. Russell Sturgis.

Chas'ka: village and railroad junction; capital of Carver co., Minn. (for location of county, see map of Minnesota, ref. 9–E), in a township of its own name, is on the left bank of the Minnesota river, 32 miles W. S. W. of St. Paul and 20 miles S. W. of Minneapolis, and on the Minneapolis and St. Louis R. R. and the C., M. and St. Paul R. R. Chaska was founded in 1855. It has county buildings, four churches, and a weekly newspaper, and is a great brick manufacturing center. The Chicago, St. Paul, Minneapolis and Omaha R. R. passes on the opposite side of the river. Pop. (1880) 1,068; (1890) 2,210; (1900) 2,165.

Editor of "Valley Herald."

Chasles, shaal, Michel: geometer; b. at Épernon, France, Nov. 13, 1793. He became in 1846 Professor of the Higher Geometry in the Faculty of Sciences, Paris. His principal field of study was modern geometry. His most important works are *Aperçu Historique des Méthodes en Géométrie* and *Traité de Géométrie Supérieure*, the latter a very elegant presentation of the subject. D. Dec. 18, 1880.

Chasles, Victor Euphémion Philarète: journalist, author, and Professor of Foreign Literature at the College of France; b. in Mainvilliers, near Chartres, France, Oct. 8, 1798; apprenticed to a printer by his father, a prominent democratic journalist of the Revolution. He went to England, where he assisted Valpy in his editions of the classics, and afterward studied in Germany. He contributed to the *Journal des Débats*, the *Revue des Deux Mondes*, and many other journals, and made admirable translations for the *Revue Britannique*. He published books on *Charles I. and his Court*, Cromwell, Shakspeare, Mary Stuart, eighteenth century in England, the sixteenth century in France, nineteenth-century manners, and on his studies of Spain and Germany. D. in Venice, July 18, 1873. See his *Mémoires* (2 vols., 1876–78).

Chassé, David Hendrik: Dutch soldier; b. at Thiel, Guelders, Mar. 18, 1765; fought in the uprising of 1787; then entered the French service, becoming a general of division in 1813. At Waterloo he commanded the Dutch forces in the army of the allies, and in 1832 made a most heroic three weeks' defense of the citadel of Antwerp against the French and Belgians. D. at Breda, May 2, 1849.

Chassel, shăăs'sel', Charles: b. in Nancy, France, about 1612; distinguished as the first sculptor in wood of his day; was called to Paris to make toys for Louis XIV. in the boyhood of the king, and made an army of soldiers of all arms with all the implements and train of a besieging corps. He left a son devoted to the same branch of art.

Chasseloup-Laubat, shăăs'loo'lō'baa', Justin Napoléon Samuel Prosper, Comte de: a French statesman; b. in Alessandria, Piedmont, May 18, 1805; was *maître de requêtes* during the reign of Charles X.; member of the Chamber of Deputies; councilor of state under Louis Philippe. He became in 1849 member of the Legislature; in 1851 Minister of the Navy; in 1859 Minister of the Colonies; in 1862 senator; and in 1869 president of the ministry which was to carry out the liberal promises of the imperial message of July 12, 1869. D. at Versailles, Mar. 29, 1873.

Chassepot, shăăs'pō': a breech-loading rifle musket; takes its name from its inventor, Antoine Alphonse Chassepot, a French officer and inspector of arms, whose first model was brought out in 1863. Subsequently it was repeatedly improved. This musket attracted much attention in consequence of its use by the French in the war (1870–71) with Germany. It was soon displaced in the French army by the Lebel rifle. The chassepot belongs to the same class with the German needle-gun, having in its cartridge a mass of fulminating material, which is exploded by means of a needle thrust into it along the axis of the bore.

Chasseur, shăăs'sêr': a French word signifying a hunter, a sportsman; the name of certain light troops in the French army who are distinguished as good marksmen. There are chasseurs both among the infantry and cavalry. In the Austrian army are similar troops called *Jägers*. The light troops which fought under Garibaldi in 1859 and 1860 were called *Cacciatori dei Alpi*—i. e. hunters of the Alps.

Chasseurs de Vincennes, -de-văn'sen': is one of the names given to a famous corps in the French army. About the year 1835, when certain improvements had been made in the French rifle, the Duke of Orleans ordered the formation of a company of riflemen armed with the new rifle; they were garrisoned at Vincennes. They proved so efficient that in 1838 a whole battalion was organized, which was called indifferently the *tirailleurs* (sharpshooters) or *chasseurs de Vincennes*.

Chastelard, Pierre de Boscobel, de: French poet; b. in Dauphiné about 1540; as page to Marshal Danville, accompanied Queen Mary to Scotland in 1561. He fell in love with her and was encouraged in his passion; but on repeating the offense of concealing himself in her bedchamber was executed at Burntisland in 1563. See Swinburne's tragedy on this subject.

Chastellain, shaăt'lăn', Georges: a famous French chronicler and poet of the fifteenth century; b. about 1405; d. Mar. 20, 1475, at Valenciennes. Of a noble Flemish family, he became privy counselor, then historiographer, to Philip the Good. His *Chronique des ducs de Bourgogne*, in which he was aided by Molinet, covers the years from 1419 to 1470. He began work upon it in 1460. Many other works by him are in existence, among them one worth mentioning as containing a rarely fine portrait of the perfect gentleman as then conceived. It is the *Chronique du bon Chevalier messire Jacques de Lalaing.* Chastellain was also a poet, one of the *grands rhétoriqueurs*, as they are usually called, employers of a poetic style of the heaviest and most pedantic kind. Still his *Épitaphes d'Hector* furnish an interesting testimony to the passion for antiquity in the early French Renaissance, and his poetical *Récollection des choses merveilleuses arrivées de son temps* is not without value in the history of French literature. His works have been published by Baron Kervyn de Lettenhove (8 vols., Brussels, 1863–66). A. R. Marsh.

Chastellux, shaă'tē'lüks', François Jean, Marquis de: general and writer; b. in Paris in 1734. He wrote an *Essay on Public Happiness* (1772), which was highly commended by Voltaire. He became in 1775 a member of the French Academy. As major-general under Rochambeau he fought for the U. S. (1780–82). He was a friend of Washington and Jefferson. Among his works are *Travels in North America in 1780–82* (2 vols., 1786; Eng. trans. by Grieve, London, 1787) and *Advantages to Europe from the Discovery of America* (1787). D. in Paris, Oct. 28, 1788.

Chasuble [Lat. *casula*, a little house or hut, from *casa*, a house]: an ecclesiastical vestment in the Roman Catholic Church, the last to be put on by the priest before beginning the mass. It is a long sleeveless garment, hanging down in front and behind, reaching about to the knees, and put on through an aperture in the top large enough to allow the garment to fall neatly upon the shoulders. Its color varies according to the directions of the ecclesiastical calendar, but must be always one of the five liturgical colors—white, red, black, green, or violet. In most European countries the chasuble has a large cross figured on its back; in Italy the cross is on the front. It was originally no more than the pænula or outside cloak of the Romans, which in time superseded the toga, and became the usual outside garment of all Romans—rough and coarse among the slaves and the poor, elegant and rich among the nobles. The ancient liturgists loved to find traces of it, or analogies in such scriptural texts as Exodus xxviii. 32–32 and 2 Tim. iv. 13. Its common use as a strictly liturgical garment dates after the end of the sixth century, though there are reasons for believing that all clerics, of whatever rank, wore it at divine service. The chasuble in the Latin Church is hollowed out at the sides, while in the Greek Church the older form of the φελόνιον or πλανητή is yet preserved. The introduction of gold or brocaded stuffs, and the frequency of low masses, caused, it is thought, the modification of the pænula among the Latins, who have also supplanted by the cross the long scarlet strips that once ornamented the pænula, as may yet be seen in the Oranti of the Catacombs. The mass, both of the Latin bishop and priest, preserves yet traces of the time previous to the thirteenth century, when the chasuble fell down on both sides, as it now does to the front and rear. From the fifth century to the eighth this garment was usually known as *planeta*; from the ninth century the term *casula* came into use, with the signification given above (Isid., *Origines*, xix., 24). Illuminated sacramentaries, like that called after St. Gregory, and frescoes of the Catacombs, like those of SS. Cornelius and Cyprian in the crypt of the former in St. Calyxtus, show us the ancient form of the chasuble for the tenth and eighth centuries respectively.

Literature.—Ferrarius, *De re Vestiaria* (1642); Marriott, *Vestiarium Christianum* (1868); Dolby, *Church Vestments, their Use and Origin* (1868); Rock, *Hierurgia, or the Holy Sacrifice of the Mass* (3d ed. 1892); Smith, *Dictionary of Christian Antiquities*; Rensens, *Éléments d'Archæologie Chrétienne* (1890). J. J. Keane.

Chat: a name, generally used with some prefix, for various small warblers. In England it is given to some of the *Saxicolidæ*, as the whinchat, the stonechat, etc. In the

Whinchat.

U. S. the yellow-breasted chat, *Icteria virens*, is one of the *Mniotiltidæ*, a bird a little over 7 inches long, greenish above, white below, with a bright yellow breast. It is common in the Eastern U. S., ranging northward to Massachusetts, being replaced in the west by a dull colored subspecies, *Icteria virens longicauda.* During the mating season it goes through very curious evolutions on the wing, dropping through the air with upraised wings and outstretched legs, singing vigorously all the time. F. A. L.

Chateaubriand, shaă'tō'brē'ăn', Viscount François Auguste, de: author and diplomatist; the most brilliant representative of the reaction against the ideas of the French Revolution, in whose works there is an instructive transition from the classical to the romantic school in French literature; b. of a noble family at St.-Malo, Sept. 14, 1768; d. in Paris, July 4, 1848. He studied the ancient languages at Dol and Rennes, and was destined for the Church, but preferred other pursuits, and a commission in the army was procured for him in 1788. Impelled by a love of adventure, he visited the U. S. in 1791. The purpose with which he set out was to find the northwest passage to India, but, having arrived in America, he completely forgot his aim, traversed the primeval forests of the South, studied the nature and life of the aborigines, and found there the material for a new and romantic literature. He returned in 1792 to France, where he married Mademoiselle de Lavigne. The same year he joined the royalist emigrants who had taken arms to fight against the dominant party; he was wounded at Thionville, and became an exile in England. He passed nearly eight years in England, in extreme poverty, and during this period wrote several works. In 1800 he returned to France, and began to write for the *Mercure de France.* He published in 1801 *Atala*, a romance, the scene of which is laid among the American aborigines. It excited much admiration on account of its marvelous delineations of natural scenery and its great literary finish. It at once established his literary fame, and gave him the most prominent place in the literature of the First Empire. His *Genius of Christianity* followed in 1802, and actually promoted the revival of a religious spirit in French society, then recoiling from the skeptical theories of the Revolution. It appeared just as Napoleon was negotiating the concordat with the pope and laboring for the re-establishment of the Roman Catholic Church in France. The emperor showed the poet his gratitude by appointing him ambassador to Rome, afterward to the Swiss republic. But immediately after the assassination of the Prince d'Enghien, Chateaubriand resigned his office, by no means concealing his indignation. In 1806 and 1807 he traveled in Greece, Asia Minor, and Palestine. He published in 1809 a prose epic entitled *The Martyrs, or the Triumph of the Christian Religion*, and in 1811 his *Itinerary from Paris to Jerusalem.* He was admitted into the French Academy in 1811. In 1814 he expressed his implacable enmity to Napoleon in an eloquent pamphlet entitled *Bonaparte and the Bourbons.* After the restoration of 1815 he acted with the royalists, became a peer of France, and was sent as ambassador to Berlin in 1820. In 1822 he was

transferred to the court of St. James, London. He was appointed Minister of Foreign Affairs in 1823, but was removed by the intrigues of Villèle in June, 1824. He afterward acted with the liberal opposition, and wrote articles against the Villèle ministry, which were inserted in the *Journal des Débats*. In 1828 he was sent as ambassador to Rome by Martignac, but he resigned when Polignac became Prime Minister in 1829. His sympathy for the Bourbons was so strong that he refused to swear allegiance to Louis Philippe in 1830. In the latter part of his life he lived in retirement, consoled by Madame Récamier so far as so vain and egotistic a nature could be consoled. After his death appeared his autobiography, *Mémoires d'Outre-Tombe* (1849–50, 12 vols.), which by its many singular revelations again brought him conspicuously before the public. See Villemain, *Châteaubriand, sa Vie, ses Écrits et son Influence* (1858); Count de Marcellus, *Châteaubriand et son Temps* (1859); Scipion Marin, *Histoire de la Vie et des Ouvrages de Châteaubriand* (1833); Sainte-Beuve, *Châteaubriand et son Groupe Littéraire* (Paris, 1872).

Châteaudun, shăă′tō′dŭn′: a handsome town of France; department of Eure-et Loir; on the river Loir; 28 miles S. S. W. of Chartres (see map of France, ref. 4–E). It has an old castle of the tenth century, a communal college, a public library, and manufactures of blankets. Oct. 18, 1870, the town was stormed and almost entirely destroyed by the Germans. Pop. (1896) 7,460.

Chateaugay: Franklin co., N. Y. (for location of county, see map of New York, ref. 1–I); on railroad, and on the Chateaugay river; 73 miles E. by N. from Ogdensburg; has manufactures of lumber, starch, butter, cheese, etc. Pop. (1880) 680; (1890) 1,172; (1900) 973. EDITOR OF "RECORD."

Château Margaux: See MARGAUX.

Châteauroux, -roo′: a town of France; capital of the department of Indre; in an extensive plain on the river Indre; 62 miles S. E. of Tours (see map of France, ref. 5–E). It has a castle built in the tenth century; a chamber of commeree and a society of arts; also manufactures of wool, cotton, cutlery, paper, hats, and hosiery. Nearly 2,000 persons are employed here in the manufacture of strong woolen fabrics. Good iron is found in the vicinity. Pop. (1891) 23,924: (1896) 23,863.

Châteauroux, MARIE ANNE, Duchesse de: succeeded her three sisters as the mistress of Louis XV. She was grasping and arrogant, and made herself many enemies at the court. In May, 1744, she accompanied the king on his tour of inspection along the frontier. At Metz he fell ill; his life was even in danger, and at the instance of the Bishop of Soissons the Duchess of Châteauroux was sent away. In order to escape ill-treatment and violence by the rural population, she was at last compelled to travel in disguise. But the king recovered, and on his return to Paris the duchess regained her whole power over him, and prepared for revenge, when she suddenly died, Dec. 8, 1744, probably poisoned.

Château-Thierry, -tĕĕ′ăr′ree′: a town of France; department of Aisne; on the river Marne, here crossed by a bridge; about 60 miles by railway E. N. E. of Paris (see map of France, ref. 3–F). It is on the slope of a hill crowned by the ruins of a vast castle built by Charles Martel for Thierry IV. It was the native place of the great poet Lafontaine, to whom a marble monument has been here erected. Pop. (1896) 7,063.

Chatel, shăă′tel′, FERDINAND TOUSSANT FRANÇOIS: a Freneh priest; b. in Gannat, Allier, Jan. 9, 1795; became a priest 1818; left his Church in 1830, and founded in 1831 the "French Unitarian Church," the fundamental principle of which was to recognize nothing but the law of nature. The church of Chatel in Paris was closed by the police in 1842, revived in 1848, and again closed in 1850. Chatel took a position in the postal service. D. in Paris, Feb. 13, 1857.

Châtelet, shăă′tlay′. GABRIELLE EMILIE, Marquise du: b. in Paris, Dec. 17, 1706; d. at Lunéville, Aug. 10, 1749. She was a daughter of Baron de Breteuil, and received a most careful education. She understood Latin, English, and Italian, and began to translate Vergil when sixteen years old. She studied mathematics and physics and philosophy, and was one of the first in France who read and understood Newton, translating his *Principia* into French, with algebraic notes (1756). She published several dissertations on philosophy and physics, and was considered one of the great minds of the age. In 1726 the Marquis du Châtelet married her. She lived with Voltaire at Cirey, 1735–47, and later was engaged in a liaison with Saint-Lambert. See VOLTAIRE.

Châtelguyon, shăă′tel′gĕĕ′ōn′: a town of the department of Puy-de-Dome, France; the source of the celebrated Gubler waters. It is near Riom, with which it is connected by stage (see map of France, ref. 6–F). Pop. (1896) 1,617. There are twenty-seven springs, affording saline, ferruginous, and magnesian waters, with temperatures from 55° to 110 F. The Gubler spring contains the most chloride of magnesium, and is the one from which the waters are exported.

Châtellerault, shăă′tel′rō′: a town of France; department of Vienne; on the river Vienne; 18 miles N. N. E. of Poitiers (see map of France, ref. 5–D). It is near the railway from Tours to Bordeaux. It has a handsome stone bridge, an old castle, a theater, an exchange, and hospital; also important manufactures of cutlery, and a large trade in millstones, wines, etc. Here is a national manufactory of swords and bayonets. The Scottish Dukes of Hamilton derive from this place the title of Duke of Châtellerault, which was given by King Henry II. of France to James Hamilton, Earl of Arran and regent of Scotland, in 1548, and by decree of Napoleon III. was confirmed in 1864 to the Scottish Duke of Hamilton (Duke of Brandon in the English peerage). Pop. (1891) 22,522; (1896) 20,014.

Chat'field: city (incorporated in 1855) of Fillmore and Olmstead cos., Minn. (for location, see map of Minnesota, ref. 11–G); is terminus of Chatfield branch of Ch. and Nor. West. R. R.; on north branch of Root river; 50 miles W. of Winona, 26 miles N. W. of Rochester; has churches of five denominations, high school, and handsome opera-house of brick and iron. Its principal industrial establishments are 3 flouring-mills, woolen-factory, and a saw-mill, all employing water-power; 3 grain elevators and 2 grain-warehouses. The city is in a rich agricultural country, from which it has a large trade. Pop. (1880) 1,166; (1890) 1,335; (1900) 1,426.
EDITOR OF "DEMOCRAT."

Chat'ham: a fortified town, river-port, and naval arsenal of England; in the county of Kent; on the right bank of the Medway; 30 miles E. S. E. of London (see map of England, ref. 12–K). The river here begins to expand into an estuary. Chatham is defended by several forts or castles crowning the adjacent heights, by which it is flanked on the S. and E. It derives its importance from its naval and military establishments, which are separated from the town and the country by a line of fortifications which are considered the best in England, except those of Portsmouth. Here are a military hospital, barracks for infantry, marines, artillery, and engineers, and magazines, storehouses, and dépôts on a large scale. Chatham has also one of the largest royal ship-building establishments in the kingdom. The dockyard is nearly 2 miles long, and contains several building-slips and wet-docks, sufficiently capacious for the largest ships, and inclosing 67 acres. Connected with it are extensive saw-mills, forges, and a metal-mill which produces copper sheets, copper bolts, etc. Numerous brick-yards, lime-kilns, and flour-mills are found in the surrounding district, and the town carries on a large retail trade, partly on account of the presence of the garrison. Here is a large convict establishment, the prisoners being employed on Government constructions. In 1667 the Dutch admiral De Ruyter sailed up the Medway and burned some shipping at Chatham. Pop. (1891) 31,711.

Chatham: a port of entry of Northumberland co., New Brunswick; on the right bank of the Miramichi; 6 miles below Newcastle (see map of Quebec, etc., ref. 4–H); has a heavy trade in lumber and salmon, several steam-mills and foundries, is lighted with gas, and is the seat of a Roman Catholic bishop. Pop. of census sub-district in 1881, 5,762.

Chatham: a post-town of Ontario, Canada; capital of Kent County (for location, see map of Ontario, ref. 6–B); on Can. Pac., Gr. Trunk and Erie and Huron Rys.; on the river Thames; 45 miles E. of Detroit, Mich., and 11 miles N. of Lake Erie (see map of Ontario, ref. 6–B). It has a court-house, an extensive trade in lumber, wood, potash, tobacco, soap, and pork, and has large manufactures of wagons, carriages, iron castings, machinery, and woolen goods. Pop. (1881) 5,907; (1891) 9,052.
EDITOR OF "PLANET."

Chatham: town (founded in 1665, incorporated in 1712); Barnstable co., Mass. (for location of county, see map of Massachusetts, ref. 5–K); on Cape Cod Div. of Old Col. R. R., and on the Atlantic Ocean, at the "Elbow" of Cape

Cod; about 80 miles S. E. of Boston. It has a fair harbor, and is a summer resort. There are four churches, good graded schools, and a high school; its industries are commerce and fishing. It has two lighthouses, lat. 41° 40′ 15″ N., lon. 69° 56′ 30″ W. Pop. of township (1880) 2,250; (1890) 1,954; (1900) 1,749. EDITOR OF "MONITOR."

Chatham: village and railway junction; Columbia co., N. Y. (for location of county, see map of New York, ref. 6–K); 22 miles S. E. of Albany; has five churches, union school, public reading-room, manufactories of barrels, sash, doors and blinds, tissue and straw-board, wagons, thermometers, and shirts; also iron furnace and foundry, car-shops, water-works, and electric lights. There is here a large sanitarium with a very fine building. Pop. (1880) 1,765; (1890) 1,912; (1900) 2,018. EDITOR OF "COURIER."

Chatham, WILLIAM PITT, Earl of: one of the most distinguished of English statesmen; b. at Westminster, Nov. 15, 1708, of a wealthy Cornish family; educated at Eton and Oxford, but, owing to attacks of the gout which afflicted him all his life, he took no degree; was a younger son of Robert Pitt, and grandson of a governor of Madras, whose sale of the Pitt diamond for $675,000 raised his family to influence. After traveling on the Continent, William entered the army as a cornet in the Blues, and soon after, in 1735, was returned to Parliament from Old Sarum, a borough of which the grandfather had purchased the tenures and which a hundred years later became the typical "rotten borough." He had shown remarkable promise in his studies, and in the House of Commons he soon became prominent, engaging in the fierce opposition, headed by the Prince of Wales, to the Walpole government, and embittered by a quarrel between the prince and the king. After the fall of the Walpole administration, whose prosecution Pitt vindictively urged, the Duchess of Marlborough bequeathed (1744) him $50,000 for his hostility to the fallen premier. At the demand of the Pelhams, who threatened otherwise to dissolve the "Broad Bottom" government, the king, notwithstanding a strong personal dislike, saw best to accept Pitt as an officer of the Government, and in 1746 he was made vice-treasurer of Ireland, and then paymaster-general, an office lucrative from the practice of accepting interest on its balances, but a practice which Pitt refused to follow. In the Newcastle ministry Pitt openly assailed his chief and was dismissed, 1751, from office, and then became a rival in the same party of Henry Fox. In 1755, upon the breaking out of the Seven Years' war, after the resignation of Fox, he became leader of the House of Commons under the Duke of Devonshire, with the office of Secretary of State. His measures for the reorganization of the army and navy were opposed by the king, but upon Pitt's resignation in 1757 he was recalled, because the nation demanded it. A coalition was made with Newcastle, who retained the premiership, but Pitt, now known as "The Great Commoner," was virtual head of the Government. He now pursued his plans against the French vigorously, aiding Frederick the Great with subsidies and by relieving him from garrisoning Western Germany; capturing Canada through Wolfe; improving the navy to such an extent that the French were driven from the seas; and upholding with generous praise Clive's conquests in India. The prestige of France in Europe was now impaired by the loss of her colonies in the West and the East, and thus the discontent awoke which culminated in the French Revolution. After the accession of George III. in 1761, Pitt's energetic military measures to resist the Bourbon compact of Spain and France were opposed by Bute, and Pitt resigned in 1761. He accepted from the king a pension of £3,000 for three lives, and a peerage for his wife, Hester Grenville Pitt. He remained in the opposition until 1766. His health had become feeble; he nevertheless combated zealously the more obnoxious acts of the Government, especially an increased excise tax, the persecution of Wilkes, and the American Stamp Tax, the repeal of which he secured. On the fall of the Rockingham ministry (1766), which he had supported, he was desired to form a cabinet, in which he chose for himself the office of Privy Seal, with a seat in the House of Lords, which he entered as Earl of Chatham. The new ministry was weak and inefficient, its measures were taken without consultation with Chatham, who was very ill and denied himself to visitors and even to the king. It went out in 1768. Lord Chatham never again held office. When the war for American independence began, he, though sinking under the infirmities of age, called back all his great powers of eloquence to oppose the cruel and oppressive measures which were put in practice against the American colonies; but when, in 1778, the timid policy of the Duke of Richmond was gaining ground in Parliament, which favored peace with France and a recognition of the American States, Pitt, feeble, pale, and dying, arose in the House of Lords and summoned his fleeting powers to denounce this course of weakness and shame so eloquently that the measure was defeated. He sank back in a swoon at the close of his appeal, and four days afterward, May 11, 1778, died at his country seat at Hayes. He was honored with a public funeral, a monument was erected over his tomb in Westminster Abbey, and an annuity of £4,000 voted to his successors as Earls of Chatham.

Lord Chatham's character was above moral reproach. The effects of his extraordinary eloquence were enhanced by his tall and stately form and dignified bearing. His speeches, which were composed in a vigorous, eloquent, idiomatic English style, have only been partially preserved in the *Chatham Papers* (4 vols. 1838–40). See F. Thackeray, *Life of Chatham* (2 vols., 1827), and Adams's *British Orations*. Revised by C. H. THURBER.

Chatham Islands: a British group in the South Pacific Ocean; discovered by Broughton in 1791; about 400 miles E. of the Middle island of New Zealand. They are about lat. 44° S., and between lon. 177° and 179° W. Chatham island, the largest of the group, is nearly 90 miles in circumference, and contains a large lake. Area, 375 sq. miles. The others are for the greater part mere rocks. The soil and climate are good; besides the natives there are a few British colonists. Pop. 300.

Châtillon-sur-Seine, shaă′tēĕ′yōn′-sür-sayn′: a town of France; in the department of Côte-d'Or; on the Upper Seine; about 40 miles S. W. of Troyes (see map of France, ref 4–G). It stands on both sides of the river, and consisted originally of two distinct portions—Chaumont and Bourg—each with its own fortifications. It has a church, dedicated to St. Vorle and dating from the twelfth century, and a fine château, built by Marshal Marmont, who was born there in 1775. Châtillon was in olden times often the residence of the Dukes of Burgundy, but in modern times it owes its name in history chiefly to the congress which was held there in 1814, from Feb. 5 to Mar. 19, for the purpose of bringing about a peace between Napoleon and the allies. At times it looked as if the negotiations would succeed; but as Napoleon could not be brought to accept the first proposition of the allies—that the frontiers of France should be made equal to those it had before the Revolution—the congress was finally broken up without having arrived at any result. On Mar. 25 the allies marched their troops directly against Paris, and issued from Vitry a proclamation in justification of their proceedings. Pop. (1896) 4,794.

Chatoyant, shaă-toi′*a*nt [Fr., ptc. of *chatoyer*, deriv. of *chat*, cat]: a term used in mineralogy to denote the changeable or floating internal light which is reflected by certain minerals, and resembles the light reflected from the eye of a cat. Among the minerals which are chatoyant are adularia and cat's-eye.

Châtre, shaat'r, **La**: a fine old town of France; department of Indre; on the river Indre; 22 miles S. E. of Châteauroux (see map of France, ref. 5–F). It has a fine church, a ruined castle, a considerable chestnut market, and manufactures of woolen and leather. Pop. (1896) 4,850.

Chats'worth: the mansion of the Duke of Devonshire; one of the most splendid private residences in England; situated in Derbyshire, on the river Derwent, 3 miles N. E. of Bakewell (see map of England, ref. 8–H). It is surrounded by a beautiful park about 10 miles in circumference. This domain was given by William the Conqueror to his natural son, William Peveril. It was purchased by Sir William Cavendish, who built here in 1570 a mansion in which Mary Queen of Scots was confined for thirteen years. The present mansion is a structure by Palladio, begun in 1687 and finished in 1706 by the first Duke of Devonshire. It is nearly a quadrangle with an anterior court, and is ornamented with balustrades and Ionic pillars, the terraces running to 1,200 feet. The façade is 720 feet long. Chatsworth contains rich collections of paintings, statuary, basreliefs, and books. Here is a conservatory which covers nearly an acre, and is 65 feet high. The gardens and parks are 10 miles in circuit.

Chatsworth: town (founded in 1855); Livingston co., Ill. (for location of county, see map of Illinois, ref. 4–F); on

Ill. Cent. and Tol., Peoria and West. R. Rs.; 97 miles S. of Chicago; has six churches, Roman Catholic convent, excellent graded school, water-works, electric lights, and a beautiful park. It is situated in the center of a rich agricultural region. Pop. (1880) 1,054; (1890) 827; (1900) 1,038.
EDITOR OF "PLAINDEALER."

Chattahoo'chee: a river of Georgia; rises in the Blue Ridge in the northeastern part of the State. It flows southwestward, through the gold-region of Georgia, to West Point, below which it flows southward and forms the boundary between Georgia and Alabama. At the southwest extremity of Georgia it unites with the Flint river to form the Appalachicola. Its length is estimated at 550 miles. Small steamboats can ascend it to Columbus, which is about 325 miles from the Gulf of Mexico.

Chattanoo'ga: city; capital of Hamilton co., Tenn. (for location of county, see map of Tennessee, ref. 7–H). Chattanooga is the most important railroad center in the South, being the terminus of nine trunk lines of railroad. It is the leading city within a radius of 100 miles, and is situated on the Tennessee river, near the junction of the States of Alabama, Tennessee, and Georgia, at a point about central between Atlanta, Ga., Birmingham, Ala., Nashville, Tenn., and Knoxville, Tenn. The river is navigable from Chattanooga to the Mississippi. The city had by the census of 1890 a capital of $6,673,515 invested in 283 manufacturing establishments, employing 5,129 persons, and producing merchandise valued at $9,449,384. Of these, iron and steel employed $1,061,656 capital and 543 persons, and produced goods valued at $1,241,262; foundry and machine shops, $894,723 capital, 627 persons, and products $1,094,811; lumber from logs to a finished state, $1,636,884 capital, 680 persons, product $1,426,465; furniture, $396,642 capital, 627 persons, $339,375 product. Besides, it has brick and tile establishments, the only Bessemer-steel mill in the South, rolling-mills, cotton-factories, sewer-pipe works, cast-iron pipe works, car-works, and a larger variety of smaller industries than any city in the South. The city lies at the base of the historic Lookout Mountain, the view from which is very extensive and beautiful; was the scene of three of the bloodiest battles of the civil war, viz., Chickamauga, Missionary Ridge, and Lookout Mountain. The U. S. Government is (1893) laying out the Chickamauga and Chattanooga National Military Park, which, in extent, ranks next to that of Gettysburg. (See CHATTANOOGA, SIEGE AND BATTLE OF.) Pop. (1870) 6,093; (1880) 12,872; (1890) 29,100; (1900) 30,154.
EDITOR OF "TIMES."

Chattanooga, SIEGE AND BATTLE OF: Immediately after the battle of Chickamauga, Sept. 19 and 20, 1863, Gen. Rosecrans withdrew his army and placed it behind the fortifications of Chattanooga. Gen. Bragg moved up and occupied positions upon Missionary Ridge and Lookout Mountain, extending his flanks to the river above and below the city, which was thus surrounded on the south side; and the roads from Bridgeport by which it was supplied were cut. The available roads on the north (right) bank of the river were so rough and the distance so great (60 miles) that the army could not be supplied by them. The Union army was thus blockaded and in danger of starvation. Rations ran very low and many horses died from lack of forage.

In October Gen. Rosecrans was relieved and Gen. Grant took personal command, having under his orders the Army of the Cumberland, under Gen. Thomas, at Chattanooga, the Army of the Tennessee, under Gen. Sherman, between Memphis and Corinth, and the Eleventh and Twelfth Corps, who, under Gen. Hooker, were on their way from the Army of the Potomac. Sherman's army was ordered to Chattanooga.

Grant's first task was to reopen the communications by which the army might be supplied. This he accomplished by carrying out the plan already made by Gen. Rosecrans and his chief of staff, Gen. W. F. Smith, which was as follows, viz.:

Gen. Hooker, who had reached Bridgeport, was ordered to cross the river at that point and move up by Whitesides and Wauhatchie to Brown's Ferry, cutting off Bragg's pickets between Lookout Valley and the river, and uncovering the roads between Brown's and Kelly's Ferries, while Gen. W. F. Smith was to send the necessary pontons down the river to Brown's Ferry, secure the landing on the left bank, and build a bridge there, supporting the movement by two brigades of infantry, which were to march from Chattanooga across the neck of land to Brown's Ferry.

All this was successfully accomplished on Oct. 26, 27, and 28, and the army was immediately and abundantly supplied from the dépôt at Stevenson, viâ Bridgeport, boat to Kelly's Ferry, and wagon train to Brown's Ferry and across Moccasin Point to Chattanooga. This route was kept open until the close of operations at Chattanooga.

Burnside at Knoxville, owing to defective communications, was suffering from lack of supplies, and Bragg, feeling himself strong enough to hold Grant at Chattanooga with less force, detached Longstreet with 20,000 men, on Nov. 4, to capture Burnside's command.

By the night of Nov. 23 Sherman's army had arrived, and was posted on the north (right) bank of the river nearly opposite the mouth of South Chickamauga creek. Hooker was in Lookout Valley, and Thomas, during the 23d, had assaulted the Confederate line directly in front of Chattanooga, driven it back about a mile, and occupied and changed the front of the works which it had previously held. By daylight on the 24th Sherman's infantry had crossed the river, ferried over in pontons and in one steamboat, and had occupied and intrenched a position on the south (left) bank. At a little after noon the bridges across the Tennessee and the South Chickamauga were completed, and all the cavalry and artillery were also on the south side.

The troops were immediately formed for attack, and at one o'clock moved out. By 3.30 they had secured a position on the top of the ridge, which was held against the Confederate attacks and was fortified during the night. (See *Personal Memoirs of U. S. Grant.*) Early in the morning of the 24th Hooker moved out and fought his way up Lookout Mountain, and by evening had secured a position near the summit. During the night the Confederates withdrew from his front.

At daylight on the 25th the battle was opened by Sherman's attack on the left. Hooker, coming over Lookout Mountain on the right, was delayed in crossing Chattanooga creek, and did not strike the enemy until about three o'clock. To relieve Sherman from the forces concentrating upon him, Thomas, in the center, charged up Missionary Ridge before Hooker attacked the Confederate left.

His troops, under Wood and Sheridan, once started, not only drove the enemy from the rifle-trenches, but followed them up the hill, carried the works on the crest of the ridge, and routed their defenders, pursuing them until dark and capturing many prisoners. The troops in front of Sherman, now unsupported on their left, also retreated. During the night of the 25th the pursuit was organized, and measures for the relief of Burnside were taken, which were carried to a successful issue.

Grant's total strength was about 60,000 men, his losses in killed, wounded, and missing nearly 6,000. Bragg's forces were probably about 30,000. His total losses are not exactly known, but the number of prisoners taken exceeded 6,000 men, with 40 guns and 7,000 small arms. JAMES MERCUR.

Chattel [O. Fr. *chatel* < Lat. *capitale*, property]: in law. This is a word of comprehensive meaning, and, with certain exceptions, includes all property of a personal or movable nature. The common law distinguishes between hereditaments on the one hand and chattels on the other. Though this distinction is in the main founded on a difference in the nature of things, the one being in general immovable and the other movable, yet it is in part arbitrary, since there are some things which are in their nature chattels, and yet in law, in a particular case or for some special purposes, within the rules governing interests in land. No one could deny that pigeons are in general movables or chattels, yet they might become so connected with the land by their abode in a pigeon-house as to descend as land to an heir. The same remark might be made of a key of a house, which, though in its owner's pocket, might be regarded in law as part of the house or land. Mr. Austin expresses the same idea in the following words: "Things which are physically movable may be immovable by institution." So in some cases an owner's intention may impress upon a movable thing the legal qualities of an immovable, as where money is directed by a testator to be laid out in land, it is for legal purposes deemed to be land. These same doctrines may be regarded from an opposite point of view, and that which is really land may become in contemplation of law a chattel, as where land is directed by a testator to be sold and converted into money. Certain temporary interests in land are in law treated as chattels of a peculiar nature (chattels real), such as leases for a definite number of years. There is here no completeness of classification, and much time must be spent

by a legal practitioner in acquiring arbitrary distinctions, and particularly in determining when chattels attached to the land are to be deemed a part of it. The addition of machinery, buildings, trees, and shrubs to land, either by the owner or some stranger, has given rise to an important class of questions usually treated under the term "fixtures." See FIXTURES.

Chattels personal are usually subdivided by text-writers into two principal classes: such as are in possession and in action. The first term needs no special explanation. It would include the common case of a movable thing, like a watch or a domestic animal, in the possession or under the control of its owner. A so-called thing in action, or chose in action, is intangible. It is a mere right, and can only be made available or reduced into possession by a legal proceeding. An instance is a note or bond, or, according to some authorities, a right to recover damages for a wrong committed. This classification is imperfect, as it is plain that there are some rights which can not be brought within it; such as patents or copyrights, which, though derived from the state, and in the nature of monopolies, are considered as chattels. Some writers would discard this common-law distinction, and divide property of a movable nature into corporeal and incorporeal. This is not satisfactory, for, though such a distinction is prevalent in the law of real estate, it is well shown by Mr. Austin to be unphilosophical. He advocates a classification which philosophically seems to be correct between those rights which can be affirmed against all persons, and those which can only be asserted against particular persons and those who represent them. The former case is equivalent to complete ownership, such as that of a field or watch; the latter is illustrated by the rights growing out of a contract, or even a wrong, as no one could claim these except a party to the contract or one injured by the wrong. While the comprehension of these distinctions is of service to the student in tending to give him clear conceptions of his subject, the old classification can not be disregarded by the practicing lawyer, who is so bound by precedent that he can not ask a court to dismiss from its view elementary propositions concerning things in possession and things in action. We would adopt the words of Mr. Maine, who says: "The lawyers of all systems have spared no pains in striving to refer these classifications to some intelligible principle, but the reasons of the severance must ever be vainly sought for in the philosophy of law. They belong not to its philosophy, but to its history." They must be accepted as historical facts. They can only be reduced to symmetry, if at all, by legislation. See PROPERTY and TITLE and consult Austin, *On Jurisprudence*; Williams, *On Personal Property*; Schouler, on the same; and Kent's *Commentaries*.

T. W. DWIGHT.

Chattel Mortgage: See MORTGAGES.

Chat'terer: any one of a small group of oscine birds forming the family *Ampelidæ*. (See WAXWING.) The best-known species is the cedar bird (*Ampelis cedrorum*), which is found throughout the greater part of North America. The Bohemian waxwing (*Ampelis garrulus*) is a larger, more richly colored bird, occurring in the northern portions of Europe and North America. It is remarkable for its erratic wanderings, and may be abundant at a given locality one year, and rare, or absent, the next. The term chatterer is a misnomer, as these birds are very quiet, and is probably due to a misinterpretation of the specific name *garrulus* applied to the European species from its resemblance in color to the European jay.

F. A. LUCAS.

Chat'terton, THOMAS: an English poet; b. at Bristol, Nov. 20, 1752. He was a precocious youth, but received only a very meager education in Colson's charity-school in his native city. He was fond of solitude and reverie, devoured books, especially on antiquities, began to write verses at the age of twelve, and was apprenticed to an attorney of Bristol in 1767. Soon after this date he exhibited to his friends manuscript copies of poems which he said were composed by Rowley, a monk of the fifteenth century, and found by him in the archives of St. Mary Redcliffe, where his uncle had been sexton; even Horace Walpole was for a moment taken in. Disgusted with the drudgery of legal studies and business, he removed to London in Apr., 1770, and adopted the profession of author. He produced with great rapidity songs, satiric poems, letters in the style of Junius, and other works, some of which were inserted in the public journals, but brought him little remuneration. He was reduced to extreme destitution, took poison, and was found dead in his lodging-room Aug. 24, 1770; at that time, however, his death attracted very little attention. Among his poems are *The Ballade of Chartie*, *The Tragedy of Ælla*, *The Battle of Hastings*, and the *Tournament*. See W. W. Skeat, *Chatterton's Poetical Works* (2 vols., 1875).

Revised by H. A. BEERS.

Chau'cer, GEOFFREY: English poet; son of John Chaucer, vintner, of London. It is probable that London was the place of his birth, but the date is unknown; 1328, which was long accepted, has no authority, and is even impossible, since John Chaucer was unmarried at that time. In the record of a trial at which the poet gave evidence, in 1386, Geoffrey Chaucer is described as of the age of forty and more, and as having borne arms for twenty-seven years; but it has been shown that the age of several other witnesses is put sixteen or twenty years too low, and consequently this plausible document can not be trusted for Chaucer's. A Geoffrey Chaucer was in the service of the wife of Lionel, third son of Edward III., in 1357. The poet was engaged in Edward III.'s invasion of France in 1359. 1340, which has of late been assumed as an approximate date for his birth, suits fairly well with the known facts of his life, but he may well have been born earlier. It appears from public records that he was a valet of the king's chamber—a place always filled by gentlemen—in 1367, and that in June of the same year the king granted him a salary for life, or till he was otherwise provided for, in consideration of services past and to be rendered. At various times, from 1370 to 1378, or perhaps 1380, Chaucer was employed on royal missions in Italy, Flanders, and France, and for somewhat more than ten years from 1374 he held offices in the customs. He was elected to Parliament for Kent in the year 1386, but toward the end of that year was dismissed, for reasons unknown, from his place in the customs; and although he received other public appointments in 1389, he lost them again, and remained in comparative poverty until the accession of Henry IV., whose favor he immediately received, but lived only a year to enjoy.

A Philippa Chaucer received in 1366 a pension as one of the ladies of the chamber of Queen Philippa. After the queen's death, in 1369, Philippa Chaucer appears to have passed into the service of the second wife of John of Gaunt, Duke of Lancaster; for before 1372 the duke had granted her a pension of £10, "which grant seems to have been commuted in June, 1374, for an annuity of the same amount to her and her husband, for life, in consideration of the good services which they had rendered to the duke, to his duchess, and to the late queen, his mother." Geoffrey Chaucer is named as the husband of this Philippa in the Issue Rolls as early as 1381 (and probably earlier). Philippa Chaucer died in 1387. She has been held (but the evidence is not convincing) to have been the daughter of Sir Payne Roet, and sister to Katherine Swynford, who became the third wife of John of Gaunt. It is not even certain that Chaucer was not her maiden name. She left a son Lewis, for whom, when he was ten years old, possibly in 1391, the father compiled a treatise on the astrolabe. Thomas Chaucer, a person of great wealth and consideration, has been maintained to have been a son of Geoffrey and Philippa, upon the ground that Philippa was of the Roet family.

The chief work of Chaucer, and one which has secured him an immortal and still brightening fame, is *The Canterbury Tales*, a series of about twenty stories narrated by pilgrims to the shrine of St. Thomas. The persons and characters of the pilgrims are sketched with marvelous spirit in an introductory prologue, and both here and in the tales there is displayed a dramatic power of the comic sort second only, and scarcely second, to that of Shakspeare. *Troilus and Cresside*, *The Parliament of Fowls*, and *The Legend of Good Women* are also admirable poems. *The Canterbury Tales* were excellently edited by Thomas Tyrwhitt in 1775, in four volumes, to which a glossary was added in 1778. Of late years Chaucer has received particular attention in England, America, and also in Germany. The Chaucer Society, founded in 1868, has printed seven texts of *The Canterbury Tales*, four of *Troilus*, and all, or nearly all, of the extant texts of the minor poems. The minor poems and *The Legend of Good Women* have for the first time been critically edited (Oxford, 1888–89) by the Rev. W. W. Skeat, preceding an edition of *The Canterbury Tales* and of *Troilus*. The three small volumes of selections from *The Canterbury Tales*, published in the Clarendon Press Series (edited by Skeat and Morris), have given an intelligent introduction to Chau-

cer to many thousands of young people. For biography, *The Life of Chaucer* by Sir Harris Nicolas made great additions to our knowledge. Prof. T. R. Lounsbury's *Studies in Chaucer*, 3 vols. (New York, 1892), embracing papers on Chaucer's life, historical and legendary, his text, the genuine and the spurious works, his learning, genius, etc., is a work of capital importance. F. J. Child.

Chaudes-Aigues, shōd'zayg': an old town of Upper Auvergne, in France; department of Cantal (see map of France, ref. 7–F); celebrated for its hot mineral springs, which were well known to the Romans and are mentioned by Sidonius Apollinaris. The water, whose temperature varies from 135° to 195° F., is slightly alkaline, and is used not only for medical purposes, but also furnishes a cheap means of heating the houses of the town. Pop. about 1,650.

Chaudet, shō'day', Antoine Denis: b. in Paris, Mar. 31, 1763; d. in Paris, Apr. 19, 1810; sculptor and painter; left many works in sculpture of high importance, and portraits of Napoleon I., and many of his contemporaries.

Chaudière, shō'di-ār': a river of the Dominion of Canada; rises in the south part of the province of Quebec, flows northward, and enters the St. Lawrence about 7 miles above Quebec. Length, 120 miles. Two and a half miles from its mouth is a remarkable cataract, called the Falls of the Chaudière, which is about 100 feet high.

Chaudière: a lake of Canada; about 15 miles W. of the city of Ottawa; is an expansion of the Ottawa river.

Chaumonot, shō'mō'nō', Pierre Marie Joseph: a Jesuit and missionary to the North American Indians. He was born in France in 1611, went to Canada in 1639, and after many labors and hardships died near Quebec in 1693. He wrote a grammar of the Huron language, which was published in 1835.

Chaumont, shō'mōñ': a town of France; capital of the department of Haute-Marne; on an eminence near the river Marne; about 141 miles E. S. E. of Paris (see map of France, ref. 4–H). It is connected by railways with Paris, Troyes, and Vesoul. It has a triumphal arch commenced by Napoleon, and a public library of 35,000 volumes; also manufactures of drugget, hosiery, cotton yarn, and gloves. On Mar. 1, 1814, the allied powers here concluded a treaty against Napoleon. Pop. (1896) 13,428.

Chaun'cey, Isaac: a commodore in the U. S. navy; b. at Black Rock, Fairfield co., Conn., Feb. 20, 1772. At an early age he manifested a love for the sea, and entered the merchant service about 1785; obtained command of a ship when he was nineteen years old. On the organization of the navy in 1798, Chauncey was appointed a lieutenant; promoted commandant in 1802; captain in 1806. He served with distinction in the war with Tripoli, and for his services there received the thanks of Congress, which body also voted him a sword, but the resolution was never carried into effect. He was in command of the Navy-yard at Brooklyn, N. Y., from 1808 till the outbreak of the war with Great Britain, when he was placed in the command of the lakes, which position he retained till the close of the war, and won for himself the highest honors for gallantry and skill as a naval commander. He subsequently commanded the Mediterranean squadron (1816–18), was in command of the Navy-yard at Brooklyn, and was president of the navy commission at the time of his death, which occurred in Washington, Jan. 27, 1840.

Chauncey, John S.: commodore U. S. navy; son of Isaac, mentioned above; b. in New York about 1800; entered the U. S. navy as midshipman in Jan., 1812. In 1822 Chauncey commanded the sloop Peacock, and was engaged in the capture of a fleet of armed pirate vessels off Bahia Honda, Cuba; from 1838 to 1843 and from 1843 to 1847 he was assistant inspector of ordnance; in 1861 he commanded the Susquehanna, and was second in command in the engagements of Forts Hatteras and Clark; subsequently in command of blockade on coasts of Virginia and North Carolina. D. in Brooklyn, Apr. 10, 1871.

C. H. Thurber.

Chauncy, Charles: second president of Harvard University; b. in Yardleybury, Hertfordshire, England, in 1592 (baptized Nov. 5); educated at Cambridge, where he was a Professor of Greek and Hebrew. He left the university in 1627, and from then till leaving England was a clergyman in parochial duty in the Church of England. His Puritan principles brought him into trouble, and he emigrated to New England in 1638. He became president of Harvard in 1654, succeeding the first president, Henry Dunster, and d. Feb. 19, 1672.

Chautauqua, sha-taw'kwa: a widely known summer educational center on Chautauqua Lake, Chautauqua co., N. Y. (for location, see map of New York, ref. 6–B). The grounds, formerly known as Fair Point, were purchased, in 1874 by the Chautauqua Assembly, originated jointly by Lewis Miller, of Akron, O., and Dr. (now Bishop) John H. Vincent, of New York. The town, containing more than 500 cottages, a large hotel, and 25 public buildings, lecture-halls, recitation-rooms, a museum, gymnasium, etc., is built upon heavily wooded terraces, sloping gradually to the lake shore. There are complete water and sewerage systems, fire department, electric-light plant, and other municipal features. The average summer population is about 10,000. See Chautauqua System of Education.

Chautauqua Lake: in Chautauqua co., N. Y.; a beautiful sheet of water about 20 miles long, and from 1 to 2 miles wide. It is 726 feet higher than Lake Erie. The surplus water flows through an outlet into Conewango creek. Steamboats ply between Mayville, which is at the N. W. end of the lake, and Jamestown, a flourishing commercial city at the S. E. extremity.

Chautauqua System of Education: The plan of applying scientific principles to Bible study and the training of Sunday-school teachers begun at Chautauqua in 1874 naturally expanded to include classes in literature, language, science, art, etc. In 1878 the establishment of the *Chautauqua Literary and Scientific Circle* paved the way for a system of home reading and study, which has since been widely extended. To Dr. W. R. Harper, now president of the Chicago University, who has been connected with Chautauqua since 1880, much credit is due for the development of the educational work. The combined agencies now employed are known as "The Chautauqua System of Education." Two divisions are made: (1) Summer Work. *The College* offers courses in college studies under instructors from leading institutions. *The Schools of Sacred Literature* and the *S. S. Normal Department* give biblical instruction and pedagogical training. *The Teachers' Retreat* deals with psychology, pedagogics, and practical methods for secular teachers. *The Schools of Music* and *Physical Education* offer exceptional opportunities under teachers of the first rank. There are also classes in art, decoration, oratory, manual training, etc. The number in these schools varies from 1,000 to 1,500 each summer. A schedule of daily lectures, concerts, readings and entertainments, affords instruction and recreation to all. (2) Home Reading and Study. The college conducts correspondence-instruction in all regular college subjects. The instructors are professors in well-known colleges. Each course equals the work expected of a resident student in one subject in a year, and requires about ten hours per week for ten months. Lesson sheets are sent frequently to the student, who returns them for correction. The examinations are conducted by the University of the State of New York. The Chautauqua Literary and Scientific Circle has enrolled over 210,000 readers since 1878. The average number of readers at one time is about 40,000. The essentials of the plan are: A definite four-year course in history, literature, science, etc. Specified books are approved by a council of six. The reading is apportioned by the week. A magazine, *The Chautauquan*, contains additional readings, notes, and general literature. A membership book gives suggestions for reading and review outlines. Isolated readers may have all the privileges. Local circles may be formed by three or more members for mutual aid. The time required is about an hour a day for nine months a year. Certificates are granted to all who complete the course. There are advanced courses for continued reading in special lines, a pedagogical course for secular teachers, and a course to encourage the reading of good literature by the young.

John H. Vincent.

Chauveau, Pierre Joseph Olivier, D. C. L.: Canadian author; b. at Quebec, May 30, 1820; educated at the seminary of Quebec. He was admitted to the bar in 1841; entered Parliament in 1844, and held portfolios of Solicitor-General in 1851, Provincial Secretary in 1853, Premier of province of Quebec in 1867, and Speaker of the Senate in 1873. In 1878 he was appointed Professor of Roman Law in Laval University, and has been president of the Royal Society of

Canada. D. in Quebec, Apr. 4, 1890. In addition to poems, he published *Charles Guérin*, *Roman de Mœurs Canadiennes* (Quebec, 1852); *Voyage de le Prince de Galles* (1861); *Souvenirs et Légendes* (1877); *François Xavier Garneau, sa vie et ses œuvres* (1883). NEIL MACDONALD.

Chauvenet, shō-ve-nay', WILLIAM, LL. D.: mathematician; b. in Milford, Pa., May 24, 1820; graduated at Yale in 1840. He was Professor of Mathematics and Astronomy at the U. S. Naval Academy at Annapolis, Md. (1845–59), an institution he promoted from its beginning. He was chancellor of Washington University 1859–69, and for many years general secretary of the American Association for the Advancement of Science. His mathematical treatises were adopted as text-books in many schools and colleges. D. in St. Paul, Minn., Dec. 13, 1870.

Chauve-souris: the common name in France for the BAT (*q. v.*).

Chauvin, shō'văñ, ÉTIENNE: b. at Nîmes, France, Apr. 18, 1640; d. in Berlin, Apr. 6, 1725. He was a pastor of the Reformed Church in France, but after the revocation of the Ediet of Nantes he fled to Rotterdam, where for several years he officiated in the Walloon Church. In 1695 he was called to Berlin as Professor of Philosophy. He enjoyed great reputation there as a representative of Cartesianism, and he studied physics with great zeal in order to fill up the gaps which the Cartesian system presents in that department. His principal work is his *Lexicon rationale sive thesaurus philosophicus*, which may be considered as a dictionary of Cartesian philosophy. It is very comprehensive.

Chauvinism, shō'vin-izm (in Fr. *chauvinisme*): a term derived from Chauvin, a character in a popular comedy which was performed at the time of the restoration of the Bourbons, 1815. Chauvin was a bragging veteran of Napoleon's army, who talked much of Austerlitz and Jena, and vowed to take revenge for the battle of Waterloo. A Chauvinist may be defined as one who has exaggerated and ridiculous sentiments of patriotism, and is excessively warlike or quarrelsome.

Chaux-de-Fonds, shō'de-fōñ': a town of Switzerland; canton of Neufchâtel; situated in a narrow gorge of the Jura Mountains; 9 miles N. W. of Neufchâtel (see map of Switzerland, ref. 4–C). It is 3,070 feet above the level of the sea. It has extensive manufactures of clocks and watches. Above 160,000 watches are manufactured annually. Pop. (1897) 31,157.

Chay-root, Choya, or **Indian Madder** [*chay* is from Tamil *chaya*]: the *Oldenlandia umbellata*; a herb of the family *Rubiaceæ*, a native both of India and of Mexico. The dye made in India from the outer bark of the roots is well known as the source of the durable red color of Indian chintzes. The leaves are used as an expectorant. Several plants of this genus abound in the U. S.

Chazars: a Tartar people, originally inhabiting the land between the Caucasus and the Caspian Sea. Beginning with the seventh century they spread north between the Dnieper and the Volga, establishing their capital at Astrachan. In 1016 they were subdued by the Russians and Greeks.

Chazy (shăă-zee') **Limestone**: a geological formation occurring on both sides of the Champlain basin and in Canada. It belongs to the Trenton epoch of the Silurian period.

Cheat [M. Eng. *chete*, abbrev. of *eschete* = O. Fr. *eschete* (cf. *escheat*), rent, what falls to one, partic. of *escheoir* < Med. Lat. *excadere* (Lat. *excidere*), fall from; *ex*, from + *cadere*, fall]: in law this topic may be considered under two principal divisions: 1, at common law; 2, by statute, then termed "false pretenses."

1. The common law regarded a "cheat" as a crime when one person defrauded another not by mere words, but by some outward and visible means, such as a false token or sign. A mere lie was not in this sense a cheat, though in a civil sense and as a basis for a civil action it may amount to a fraud. (See FRAUD.) Thus the act of marking false brands upon articles sold, calculated to deceive and defraud persons in general, would come within the scope of the criminal offense. This view led to fine-spun and artificial distinctions. For example, if a man in purchasing goods gave his own check on a bank in which he knew that he had no funds, it would be a mere lie reduced to writing, and thus not a cheat; while if he gave another man's check under the same circumstances the act would be cheating, as the paper was then a token or symbol. Under these rules false personation may be a common-law cheat, particularly where the personator by dress or tokens represents himself to be another person, and thus causes injury to others. Some have even maintained that the defrauder might himself be a symbol or token, as where, knowing that he held a relation (such as apprenticeship) which prevented him from entering into a public engagement (enlisting as a soldier), he professed to be able to, and did in fact, enter into it.

The crime of forgery, though usually, from its magnitude as an offense, discussed separately from the various classes of cheats, is in reality comprised within the same category. The "false token or sign" necessary to constitute cheating at common law must be of such a nature that its tendency in general would be to deceive, though in fact it may be used only to injure particular individuals; as e. g. the use of false dice in games of chance. Moreover, it is essential that any injury sustained be properly attributable to some confidence or belief which the use of the token, etc., inspired. If other considerations than the device influence a person's action, there is merely an attempt to cheat. This is, however, also indictable. Cheating belongs to the lower grade of criminal offenses, termed "misdemeanors."

2. *False Pretenses* constitute a very reprehensible mode of fraudulent deception. The failure of the common law to provide a remedy where no symbol was employed made statutory provisions necessary for wrongs thus occasioned. Reference can here be made only to such regulations as the various States have generally agreed in establishing. False pretenses may be defined as false representations, with intent to defraud, by words or acts concerning past or present facts and events. Statements of a promissory nature in regard to any future transaction, and perhaps all representations as to the future, are insufficient to afford a ground for prosecution. The false representation may be made by acts without words, as if one purports by his peculiar dress to belong to a particular institution of learning, such as Cambridge University. A false sample may also be referred to. Mere expressions of opinion, however, or mere exaggerations of language, by which no reasonable man would be influenced, can not be considered false pretenses within the statutes. It is a further rule that the deception practiced must be the efficient operative cause of the injury sustained. The criterion always is whether, if there had been no such deceit practiced, the transaction between the parties would have been consummated. There has been much discussion upon the point whether the representation must be calculated to deceive a person of ordinary prudence, or whether it will be sufficient, though the party was weak, that he was actually defrauded. The question is still open. The false pretense may be made by an agent in such a way as to make his principal criminally liable.

Property acquired under false pretenses is held by the wrongful possessor under a voidable title as regards the true owner, but if transferred to an honest purchaser, who acts in good faith, without knowledge of the fraud, the latter's claim is indefeasible. On the other hand, when goods are stolen the thief can, with but few exceptions, give no better title than he himself possesses. The reason for the difference is that in the one case the wrong-doer acts with the owner's consent, even though it be procured fraudulently, while in the other his will is in no way exerted. According to general principles this offense would be a misdemeanor, though the statutes of some of the States make it a felony. T. W. DWIGHT.

Cheatham, cheet'am, BENJAMIN FRANKLIN: a general in the Confederate army; b. in Nashville, Oct. 22, 1821; served during the Mexican war as captain of Tennessee volunteers and as colonel Third Tennessee Voltigeurs to July, 1848. During the civil war he espoused the Confederate cause, became major-general, and bore a conspicuous part at Chickamauga, Missionary Ridge, Franklin, Nashville, etc. D. in Nashville, Sept. 4, 1886.

Cheat River: West Virginia; formed by the junction of several branches which rise among the Alleghanies in Randolph County, and unite in Tucker County. It flows nearly northward, and enters the Monongahela in Fayette co., Pa. Its length without the branches is about 75 miles. It takes its name from the extremely variable volume of its waters; for while it is sometimes a large stream, it often becomes in a few hours quite insignificant.

Chebanse: town; Iroquois and Kankakee cos., Ill. (for location of county, see map of Illinois, ref. 4–G); on Ill. Cent. and Tol., Peoria and Western R. Rs.; 65 miles S. S. W. of Chicago. It has a very extensive trade in grain. Pop. (1880) 728; (1890) 616; (1900) 555. EDITOR OF "HERALD."

Cheboygan: city; capital of Cheboygan co., Mich. (for location of county, see map of Michigan, ref. 3–I); on railway and on Lake Huron; has large lumbering and farming industries. Pop. (1880) 2,269; (1890) 6,235; (1900) 6,489.

Check, or **Cheque** [O. Fr. *eschec*: Ital. *scacco*, from Arab. Pers. *shāh*, king, as a term used in game of chess]: a bill of exchange drawn upon a bank or banker, or person holding a position similar to that of a banker. It has some peculiarities which distinguish it from an ordinary bill of exchange, particularly when it is payable without any specific mention of time. It is then, in point of law, payable on demand and without days of grace. If payable a fixed number of days after date, it varies but slightly from a bill of exchange, and will follow the ordinary rules as to days of grace. It is usually said in the lawbooks that a check is not accepted as a bill is. Acceptance, however, as will be seen hereafter, has recently become quite common, and is perfectly lawful. A check may be considered under the following heads: 1. Its form and requisites; 2. The duty of the holder as to demand of payment (*a*) toward the drawer, (*b*) toward the indorser, and herein of crossed checks; 3. The effect of the check upon the banker, and, under this, of acceptance; 4. A check considered as payment of a debt or as cash; 5. The civil and criminal liability of drawers having no funds.

1. A check in its ordinary form is simply an order addressed to the banker to pay a person named or his order or bearer, or the equivalent of a bearer (such as a mere numeral), a sum of money. A check may preserve this form and be post-dated. This class of checks is not used in England, owing to the provisions of the Stamp Acts. It is quite common at the present time to make a check payable to order, as the indorsement of the name of the payee operates as a receipt. In some instances a note may amount to a check. Thus if a customer makes a note payable at his bank, he implicitly requests its payment in the same general manner as if he had drawn his check. In filling up a check care should be taken to so draw it that additional words, which might increase its amount, can not be inserted in blank spaces. Thus if the drawer had written the words "fifty dollars," and had left sufficient space between the word "fifty" and that which preceded it to insert "one hundred and," and such words had been fradulently inserted, and the bank had paid the check in good faith, supposing it to be drawn for $150, the drawer would be the loser. When, on the other hand, due caution has been exercised, the loss from forgeries will fall on the bank, rather than on the drawer, though the former may in some instances recover from the holder. The drawer may simply sign his name to a blank printed form of check, or even to a blank sheet of paper, at the same time authorizing it to be subsequently filled up by some person acting in his behalf. If so filled he will be bound. Even should the agent acting fraudulently fill it up for a larger sum than was directed, the drawer would still be bound to a person who took the check in good faith. This would not be strictly a case of forgery, but that of an agent defrauding his principal, and yet acting within his apparent authority.

2. *The Duty of the Holder as to Demand and Notice*: (*a*) *As to the Drawer.*—The drawer has a right to expect that the holder will demand payment with promptitude, as, if the banker fails to pay, recourse may be had to him. Presentment should be made, in general, as early as the next day, and if payment is not made, due notice given. However, a failure to present is not necessarily fatal to the holder's claim. Whether it is or not depends on the fact whether an injury is caused to the drawer. If, for example, he had no funds in the bank, want of presentment is unimportant, as it is plain that he sustains no harm; so, if after giving the check, he withdraws his funds. If, however, the banker should become insolvent with sufficient funds of the drawer in his possession, want of presentment would be a sufficient defense. (*b*) *Demand as to Indorsers.*—Indorsements upon checks are common. An indorsement is necessary when the instrument is payable to order; it is admissible when payable to bearer. The legal effect of indorsement, as in the case of a bill of exchange, is to make the indorser liable, provided that the steps necessary to charge him are taken. These are substantially the same as in bills of exchange. There are cases in which no presentment is necessary to bind the indorser, as where he indorses and puts in circulation a void or forged check, even though he does this innocently. In some cases custom enlarges the time for presentment. Thus if there be a custom to pay checks through the "clearing-house" (see CLEARING-HOUSE), the time required for them to pass through the system of exchanges there adopted will be allowed. In England a practice of *crossing* checks is resorted to. A check is said to be "crossed" when it is marked by the drawer in such a way that, instead of being presented through an ordinary holder, it must come to the paying bank through a banker. This practice has given rise to a number of perplexing questions recently settled by statute (21 and 22 Vict. ch. 79). The additional time necessary to present the check in this manner must of course be allowed there to the holder. It is believed that crossing checks is not practiced in the U. S. A practice has grown up in some of the large cities to pay drafts drawn on bankers by checks drawn by such bankers, in turn, upon some regularly organized bank, instead of cash. This practice has an important effect upon the subject of demand. Though the check is not payment of the draft, yet it must be presented on the *same day* that it is received, or the drawers of the draft may be discharged. The holder of the draft might have insisted on the money instead of taking the check, and if not paid might have protested the draft.

3. *Effect of the Check on the Banker on whom it is Drawn, and herein of Acceptance.*—According to the better opinion, a check gives no right of action to the holder against the banker. Of course the latter should, in general, pay it, but the holder has no means of enforcing this obligation if the banker refuses to perform it. This rule grows out of the nature of a deposit in a bank, in respect to which there is much popular misconception. This fact is perhaps partly due to the ambiguity lurking in the word "deposit." This is sometimes and properly used to mean the act of intrusting a specific chattel to a person who is bound to return the identical thing delivered to him. That, however, is not the nature of an ordinary bank account against which checks are drawn. The banker is not bound to render the specific money delivered, but only engages to pay an equivalent amount. The relation of *debtor* and *creditor* is created by the transaction. Although the banker is bound to pay checks when he is in funds, it is a duty between him and the depositor or creditor. It can not be enforced by the payee of the check, who is no party to the contract. Nor can the check be treated as an assignment by the depositor of so much money as it represents. These rules have led to a very important practice of certifying checks. An officer of a bank—e. g. a teller or cashier—has by custom acquired an authority to mark such checks as are presented to him as good. This act is treated in law as an acceptance, and the bank becomes liable. The practice is attended with danger, as it practically gives to a teller power to establish without limit fictitious claims against the bank, as he may certify checks for persons who have overdrawn their accounts, or even who have closed their accounts, or have had no dealings with the bank, which will still be binding upon it on general principles of law. (See AGENT, ESTOPPEL, and BILL OF EXCHANGE.) A cashier or teller, however, can not, where he has no funds, validly certify his own check. On the other hand, certification of a check is attended with some hazard to the holder, as he may thereby release the drawer should the bank fail even on the same day and between the time of certification and of presentment for payment. (*National Bank of Jersey City agt. Leach*, New York Court of Appeals, 1873.) In the financial crisis of 1873 in New York, certified bank-checks by general consent played an important part in monetary transactions, and became for a considerable time, through the association of a number of national banks, a substitute for currency. It may be added that banks sometimes pay checks for customers who have no balance due them. These are called "overdrafts." The bank in such a case has a claim upon the dealer for the sum overdrawn.

4. *A Check Considered as Payment or as Cash.*—The general presumption of law is that a check is issued by a drawer to a payee in payment of debt, and not as a means of making a loan. The intention, however, may be shown by affirmative proof. Considered as payment, it is not in general absolute. It is rather a means of obtaining payment, whether it be the debtor's own check or that of a third person. Accordingly, if the check is not paid, the creditor

may resort to his original claim, though if there be an agreement to receive the check as full payment, it must be followed. In other words, a check is not money, but a means of obtaining money, and debts can not be paid in anything but money, unless there be an agreement for some substitute. The gift of one's own check, unless it be certified, is a mere naked promise, and may be countermanded at any time before payment. The death of a drawer in such a case before payment would be a revocation of the authority. It is common for a bank to receive on deposit not only cash, but checks drawn either on itself or on some other bank, payable to the depositor. Such a deposit is not to be treated as cash in case the check is drawn on another bank. It is rather received conditionally, in case it turns out to be good, and the depositor will be liable on his indorsement, which is usually required. Where, however, the check is given by another dealer, the receiving bank is absolutely bound by the credit which it gives the depositor as if it had paid the check.

5. *Civil and Criminal Liability of Drawers of Checks Having no Funds with the Bank*: (*a*) *Civil Liability.*—It is a general rule that a man who draws a check with knowledge that he has no funds commits a fraud toward the payee. If he should purchase goods under such circumstances the seller could rescind the sale as fraudulent. It will not be enough to sustain the sale that he has reasonable grounds to expect funds, but they must be *actually on hand* to pay the check. This view proceeds upon the theory that a check is in the nature of a representation that the money is immediately available; and where a drawer has notice to the contrary he makes a representation known to be false which avoids the contract as between him and the seller, though it would be otherwise should the rights of innocent purchasers intervene. (*b*) *Criminal Liability.*—It was not a crime at common law to give one's own check for goods bought with knowledge that it was worthless, since this was only an affirmation or a base lie reduced to writing, and there was no token or symbol of falsehood on which the common law lays stress. It might accordingly be a criminal cheat (see CHEAT) knowingly to pass off the worthless check of another. Under the statutory offense of false pretenses it is criminal to give one's own check on such a sale, knowing that the drawer had no funds nor any reasonable grounds of expecting them. There might be cases, such as that of *Loughran against Barry*, above cited, where the contract would be rescinded on account of a representation known to be false, and yet the drawer would not be guilty of crime, by reason of the absence of a true criminal intent. See Shaw, *On the Law of Bankers' Checks* (London, 1871); also Parsons, *On Bills and Notes*; and other text-writers on same subject, as Chitty, Byles, Story, etc.

T. W. DWIGHT.

Checkerberry: See PARTRIDGEBERRY.

Checkers, or Draughts: game for two persons played on a square board divided into sixty-four equal squares of alternate colors, each player having twelve like pieces or *men*, distinguished by their color from those of his opponent. Only the thirty-two squares of one color are employed in the game (in America usually the darker ones), and the board is so placed between the players that each has one of them at the corner to his left. The men of each player are placed before him on the first three rows of these squares; the play then alternates between the two players until the end. A play is made by *moving* or *jumping*. A player *moves* by advancing one of his men from the square it occupies diagonally to an adjacent unoccupied square. A man can move or jump only forward until it reaches the last row on the opposite side of the board, when it must be crowned by placing upon it another piece; it then becomes a *king*, and can thereafter move or jump either forward or backward. A player *jumps* one of his opponent's men when it occupies a square adjacent to that occupied by one of his own and there is an unoccupied square next beyond it in the same line. The play is made by the player advancing his man to this unoccupied square, and removing the opponent's piece from the board. Should his man from its new position be able to jump again, it does so in the same play as many times as possible, with the single exception that if it be not a king the play must end on its becoming one. The person to play should jump if possible; if he moves instead, his opponent may at his option either remove from the board the man which should have jumped, and then play, or require the player to take back his move and to jump, or simply proceed as if the play had been correctly made. The first of these three methods is rarely employed. The game is won by a player capturing all his opponent's pieces, or so hemming them in that his opponent can not move or jump when it is his turn to play. The game is drawn when neither player can win; if a player claims to have any advantage, his opponent may require him to win the game or show a decided advantage within forty of his plays, and if he fails, may declare the game drawn.

The game is supposed to have originated before 2000 B. C., and to have preceded chess. It was introduced into Europe from Egypt several centuries ago. Variations from the form described above are quite frequent in the Old World, but are little played in America. The *losing game* is played by the same rules, save that a player wins by losing all his pieces, or by having them so hemmed in by those of his opponent that he can not move or jump when it is his turn to play.

Cheddar Cheese: See CHEESE.

Chedu'ba: an East Indian island in the Bay of Bengal; about 10 miles from Aracan, to which province it belongs. Area about 250 sq. miles. Nearly all of the island has a rich and productive soil, and the interior is much more free from jungle than that of any other island on this coast. The staple productions are cotton, sugar, rice, indigo, and petroleum, which is extensively used in the composition of paint, as it is found to protect wood against the ravages of insects. This island was captured from the Burmese by the British in 1824, and actually ceded to Great Britain in 1826. It afterward proved a valuable possession. Pop. about 20,000.

Cheese (in Lat. *ca'seus*, Ger. *Käse*, Fr. *fromage*): a variety of food prepared by coagulating or solidifying milk, separating the curd from the liquid portion which is called whey, adding some salt, putting it in molds or hoops, and permitting it to undergo a curing or ripening process through slow fermentation.

Cheese is a wholesome and nourishing food. It is comparatively cheap, convenient for use, and, when good, is promotive of digestion rather than antagonistic to it. The chief service of a diet is to furnish those elements or materials which are required for the nutrition of the tissues of the body, and to supply heat or energy for the activities of life. These tissues have the power of appropriating, from food which has been swallowed, the elements which they require, and also of changing them into their own substance. The serviceability of a food depends upon its adaptation to maintain in these tissues an even balance between the processes of waste and reparation. The main substances required have been termed *nitrogenous*, *non-nitrogenous* or *carbo-hydrates* and *salts* or *mineral matter*. The proper proportion in which these can be taken with most advantage in food is 1 part of "nitrogenous" matter to 3½ or 4 parts by weight of "non-nitrogenous" matter. The following table from Letheby shows the relative quantities of these that are to be found in a few articles of diet, and which are cited for comparison with cheese:

SUBSTANCES.	Nitrogenous.	NON-NITROGENOUS.			Salts.
		Starch.	Sugar.	Fat.	
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Lean beef	19·3	....	....	3·6	5·1
Fat beef	14·8	....	....	29·8	4·4
Cheese	34·59	....	4·0	29·75	4·25
Milk	4·1	....	4·4	3·3	0·7
Bread	8·1	47·4	3·6	1·6	2·3
Potatoes	2·1	18·8	3·2	0·2	0·7

It may be calculated that cheese can give at least one and a half times as much nutrition per pound as ordinary beef. The sense of taste has power to stimulate the secretion of digestive fluids; and the pungent, agreeable flavor of well-cured cheese renders it a food easy of digestion, even to the extent of promoting the digestion of other foods that may have been consumed.

COMPOSITION OF CHEESE.—The composition varies according to the process of manufacture and the constitution and condition of the milk from which it is made. Cheese may be made from the milk of any animal, but nearly all the cheeses of commerce are made from that of cows. Milk is a very complex compound, and the milk of cows, as the cheese-maker needs to know it, is composed of substances partly in solution and partly in suspension. It may be described

as a thin emulsion of fat, in a serum of albuminous matter, sugar, and mineral matters. When obtained from a healthy cow in its normal state it has a constant tendency toward acidity. It will change the color of litmus paper before lactic acid has been developed. A small quantity of carbonic acid is generated soon after it is drawn, if left warm; but that can be taken out by agitation and aëration. The true sourness of milk is caused by the development of lactic acid. The specific gravity of milk varies between 1,029 and 1.035 at 60° F.; that is to say, a quantity of milk equal in bulk to as much water as will weigh 1,000 lb. at 60° F. will weigh from 1,029 to 1,035 lb. at the same temperature. The effect of each per cent. of fat is to decrease the specific gravity, because the fat of milk is lighter than its other parts. The effect of each per cent. of solids other than fat is to increase the specific gravity. The total solids of ordinary milk vary between 12 and 16 per cent. In some unusual instances the range of variation has been known to be between 11 per cent. and 20 per cent. of total solids, and between 2 per cent. and 10 per cent. of fat. The solids of milk are its only constituents that have any real or ratable value. The water that is put into the milk by the cow, while the process of elaboration is proceeding in her udder, is worth no more per pound or per gallon than the water that may be put in by a man when it has come into his hands for use or sale. The limits of variation of the solids other than fat are usually within one-half of 1 per cent. in the same cow at different periods in her milking season. Different cows of the same breed rarely show a variation of more than 1 per cent. in the solids other than fat contained in their milk. The greatest difference exists between cows of different breeds; it will sometimes reach as much as 2½ per cent. as between the milk of cows giving extra rich milk and those yielding a very poor quality. The solids other than fat, or the solids in the serum of the milk, also increase slightly during the milking season; the rate is about ·04 per cent. of solids not fat per month.

Composition of Milk.—The average composition of milk from cows may be stated as

COMPONENTS.	Colostrum.	Normal milk.
	Per cent.	Per cent.
Water	75·8	87·2
Fat	2·6	3·60
Casein, Albumen	15·0	3·50
Sugar	3·6	5·0
Ash	3·0	0·70

A great many varieties of cheese are now made. Many of them take their distinctive names from a particular place or locality from which they come. All may be said to belong to one of the classes "soft cheese," "medium or firm cheese" or "hard cheese." Soft cheeses are seldom pressed, and therefore contain a larger per cent. of water than the others. In most cases soft cheeses contain from 60 to 40 per cent. of water, with an average of about 50 per cent. Medium or hard cheeses contain from 40 per cent. to 15 per cent. of water, with an average of about 32 per cent. The following table shows the composition of the varieties of cheeses commonly found in the markets of America and Europe:

MAKE OF CHEESE.	Water.	Fat.	Casein.	Sugar.	Ash.
Stilton, average	30·35	35·39	28·85	....	3·82
Cheddar, six months	31·17	33·68	26·31	4·91	3·93
English, Canadian, and American Cheddar, average	34·38	32·71	26·38	....	3·58
Double Gloucester	35·96	26·83	21·74	....	4·07
New Cheshire	36·96	29·34	24·08	5·17	4·45
Old Cheshire	32·59	26·06	32·51	4·53	4·31
Derby	31·68	35·20	24·50	4·38	4·24
Cream, average	30·65	62·99	4·94	....	1·15
Gouda (flat Dutch)	21·90	24·81	46·95	....	6·32
Edam (round Dutch)	36·28	30·26	24·06	....	4·90
Gorgonzola	24·96	43·46	26·10	0·26	5·22
Parmesan, average	31·34	19·22	41·99	....	6·25
Camembert, average (first prize, dairy show)	40·3	29·9	29·8	....	....
Roquefort, average	31·20	33·16	27·63	...	6·01
Brie, average	50·35	25·12	17·18	....	5·41
Gervais, cream	52·94	29·75	11·80	2·58	2·93
Gruyère, average	34·87	28·91	25·87	....	3·84

CONSTITUENTS OF CHEESE.—The percentage of fat contained in different individual cheeses of the make which is known as Cheddar, and which is practically the cheese of the American continent, may vary from 23 to 44 per cent. The percentage of casein and albumen may vary from 17 to 28 per cent.; the per cent. of ash from 2·5 to 5 per cent.; and the per cent. of water from 22 to 42 per cent.

The milk fat is held to consist of a mixture of several compounds, each of which contains glycerine with some acid. The more prominent and important of these compounds are *olein*, *palmitin*, *stearin*, and *butyrin*. The composition of the milk fat seems to be changed very shortly after the milk is drawn from the cow, and its exact character at any time is therefore quite uncertain. Fresh milk does not appear to contain any butyrin, caprylin, or caproin, while these appear shortly after it is drawn from the cow, and are doubtless the products of a degree of fermentation. The fat in the milk is in a condition of minute globules, which are held in a state of permanent emulsion. Cream has no definite or unvarying composition. It is a word used to define that part of the milk into which a large per cent. of its fat has been gathered by the influence of gravity or by centrifugal force. It is composed of the same constituents as milk, but they are not in the same nor in any constant relative proportion. Cream cheese implies the use of a quantity of cream added to the normal milk.

The Casein.—The casein is the portion of milk which is coagulated by the action of rennet in the process of cheese-making. It appears that the casein does not exist in the milk in a state of complete solution. Some of it appears to be in actual solution, while the greater portion of it is in a state of suspension in the form of minute granules. When milk is filtered through porcelain, the casein, together with the fat, is filtered out, and a clear liquid, which is commonly known as the serum of the milk, is obtained through the filter. Casein and albumen together are known as nitrogenous compounds, and have also been called albuminoids. In composition they closely resemble the albumen or white of an egg. Albumen may be seen as a thin white scum on milk which has been scalded or boiled. The albumen is not coagulated by the action of rennet, and in the process of cheese-making mainly all passes into the whey. To distinguish the casein from the curd, it has been called caseinogen.

Milk-sugar.—Milk-sugar is essentially of the same composition as cane-sugar, but is less soluble and not so sweet as the latter. When it is acted upon by certain micro-organisms or ferments it is changed, yielding as its main product lactic acid. The presence of lactic acid gives the milk or cheese that quality which is termed sour. In the process of cheese-making most of the sugar passes into the whey. A small quantity of it and also of lactic acid is retained in the cheese. These are usually in tables of analyses classed under the head of extractives.

The ash of milk is mainly made up of such elements as calcium, phosphorus, potassium, sodium, magnesium, oxygen, sulphur, chlorine, and iron. It has been demonstrated that the calcium or lime compounds in milk are of particular importance in connection with the process of cheese-making, since the rennet will not coagulate the casein of the milk unless some soluble calcium compound is present. At the present time our knowledge of the changes which occur in these constituents of milk and cheese during the whole process is quite meager.

The quantity of milk required to yield 1 lb. of merchantable Cheddar cheese (which is again taken as typical of the ordinary cheese of commerce) varies according to the source and quality of the milk, and also according to the process and manner of manufacturing adopted. It will range from 9 lb. to 11 lb. of milk per pound of cured cheese.

The proper care and preparation of milk exercises a far-reaching influence on the quality of the cheese which is made from it. Many of the various forms of fermentation which are manifested in milk and cheese are sources of trouble and loss. All the forms of fermentation of milk or its products which have yet been studied and described—from the common souring to the pungent flavor of old cheese—are due to contamination of the milk by some micro-organisms which have reached it from an external source after the milk is drawn from the cow. These organisms of various sorts are so numerous and widespread that no practical method has yet been devised or adopted for keeping them entirely out of milk. Seeing that their presence appears to be inevitable, the dairyman must devote his efforts to preventing undesirable sorts from finding a place in the product which he handles, and toward keeping the action of others within such bounds as to promote the development of flavors which he will find valuable in food products. The best means to attain this end are per-

fect cleanliness and a regulation of the temperature at which the milk or its products are kept. Carelessness or untidiness in the milking of cows will introduce taints into the milk which no degree of subsequent care can eliminate or hide. All the vessels and utensils which are used in the dairy should be scalded with boiling water as frequently as is necessary to keep them perfectly sweet and clean. Filthy floors and proximity to any source of foul air are frequent causes of contamination. Milk should always be strained immediately after it is drawn from the cow, to remove leaves, straws, hairs, or any other impurities which have fallen into it, and some of which might be dissolved to the injury of the whole product.

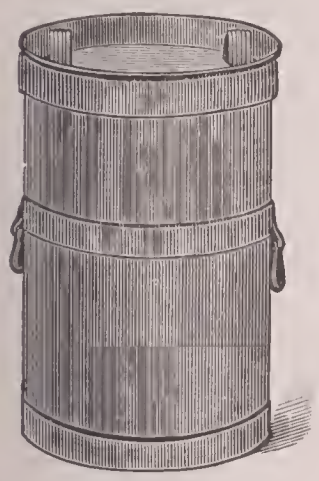

FIG. 1.—Cheese-factory milk-can.

Aëration.—After the straining is attended to, the milk should be aërated. Too often it is poured into one large can and left there just as the cows have given it. That neglect implies three things that are injurious to its quality for cheese-making: (1) The peculiar odor which the cow imparts to the milk will be left in it until it becomes fixed in its flavor. (2) The undesirable germs of fermentation that come in the milk and from the air have the best conditions for growth and action when the milk is left undisturbed. (3) The milk will become in a degree unfit for perfect coagulation by rennet. Hence it is needful and advantageous to aërate it for three reasons:

First, because by pouring, stirring, dipping, or trickling it over an exposed surface, there is eliminated from the milk by evaporation any objectionable volatile element that may be in it. Secondly, because, as has already been stated, the milk contains germs of fermentation. A peculiarity about some of these microbes is that they become active only in the absence of free oxygen. When warm new milk is left undisturbed carbonic acid gas is generated, and that furnishes the best condition for the commencement of action by these almost invisible creatures. After they get started, they can keep up their decomposing work, even in the presence of oxygen. It is impracticable to perfectly coagulate such milk so as to yield a fine quality of keeping cheese. *Neglect of aëration will increase the quantity of milk required to make a pound of fine cheese.* Thirdly, because the airing seems to increase the number and give vigor to the germs of fermentation that will bring about an acid condition of the milk, without producing the acid. So much is this so that *it has been found impracticable to make strictly first-class Cheddar cheese from milk that has not been aërated.*

Cooling.—The subsequent cooling of milk retards the process by which it becomes sour. Certain germs of fermentation exist in milk which in the act of their multiplication split molecules of sugar of milk into molecules of lactic acid. By delaying the operation of these germs the milk is kept sweet for a longer period. The cooling of the milk should never precede the aëration. A temperature of from 60° to 70° F. will be found cold enough for the keeping of milk over night when it has been previously aired.

Taints.—Milk is a liquid of absorbent proclivities. It should be protected against injury that would result from exposure to impure air. Any taints which may be present in the milk from the odor or flavor of feed which has been consumed by the cow will be strongest when the milk is newly drawn from the animal. Taints giving off bad odors and imparting unpleasant flavors from the action of bacteria become stronger the longer the milk is kept. The colostrum, or first portion of milk given by cows after the birth of the calf, is not fit for use in the manufacture of cheese. That condition of the milk usually lasts until after the fourth day.

PROCESS OF MANUFACTURE.—The task of the cheese-maker is to preserve as much as possible of the nourishing constituents of milk in a condition at its best for human food, and conveniently prepared for transportation. The first essential treatment in the process is to reduce the bulk of the milk by the separation of a part of the water which it contains. The degree to which this separation of water is effected very largely accounts for the difference between cheeses which are called "soft," "medium," or "hard." A brief description of the process which is followed in the manufacture of Cheddar cheese will suffice to illustrate the process which is adopted for the manufacture of cheese of the various sorts and which go under different names.

The Cheddar cheese takes its name from a small parish in Somersetshire, in England, where, under the shelter of the Mendip hills, English dairymen have manufactured cheese for some two or three centuries. Their method was first improved and raised into a definite system by Mr. Joseph Harding, of Marksbury.

The process of manufacture may be subdivided into the following operations: The ripening of the milk; the coloring of the milk; the coagulating or solidifying of the curd; the cutting of the curd; the heating, scalding, or cooking of the curd; the separating of the whey; the ripening of the curd; the grinding or cutting of the curd; the salting of the curd; the hooping of the curd, or pressing of the cheese; the bandaging of the cheese; and the curing or ripening of the cheese.

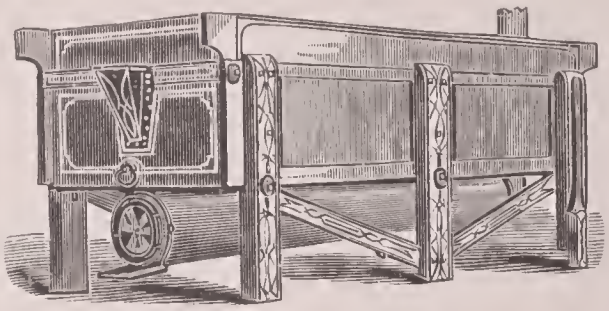

FIG. 2.—Milk vat and heater.

1. *Ripening of the Milk.*—The ripening of the milk is a term used by cheese-makers to express such treatment of the milk as will bring it to that condition when the rennet will coagulate the casein more quickly than when put into fresh or new milk. This is brought about by the action of various ferments in the milk when held at a temperature suitable for their development. A temperature of from 85° to 90° F. seems best adapted to facilitate the change which is desired. The exact degree of ripeness which gives the best result in cheese is difficult to determine. The rennet test (or, as it is commonly called, the cup test) is the most practical test for the average cheese-maker. It is used to ascertain the degree of acidity of the milk or its ripeness for cheese-making. The test may be described as follows: After the vat of milk has been heated to the desired temperature, take 8 oz. of milk from the vat (a teacup is the best vessel to manipulate the test in), add 1 drachm of rennet extract of known strength. Just before adding the rennet take a watch in the left hand and a teaspoon holding the extract of rennet in the right hand. When the seconds hand of the watch touches at some figure, drop the rennet into the milk in the cup and give the milk a sharp stirring for about ten seconds to mix the rennet thoroughly with the milk. If the milk thickens in the cup in twenty-five seconds it is not ripe enough for setting, and should be allowed to mature longer. From twenty seconds down to fifteen seconds by the test indicate the condition of milk most desirable for adding the rennet to the milk in the vat. The most accurate way of telling when the milk in the cup has been coagulated is to put a small piece of burnt match or any small black speck in the cup before the rennet is added. By stirring the black speck is put in motion, and when this stops moving it is a sure sign that the milk is coagulated. After the operator has practiced the test a few times he will be able to manipulate it with accuracy.

Bond's phenol-phthallein acid test is also used in some factories. A small quantity of the phenol-phthallein is put into the milk. While the milk is acidy no change from the white is evident. A standard solution of alkali is prepared for the test. This is added to a small portion of the milk which is being tested, drop by drop, and when a sufficient number of drops have been added to render the milk alkaline, the phenol-phthallein at once changes the whole of the liquid to a magenta color. The number of drops of the alkaline solution which are required to correct the acidity in the milk indicates the acidity or degree of ripeness which the milk has attained.

To the ordinary competent cheese-maker a sense examination seems adequate to give a knowledge of when the milk has reached the proper degree of ripeness.

2. *Coloring of the Milk.*—An extract of annatto, which is

obtained from a plant (bixa orellana), is the common substance which is used for this purpose. It is added to the milk in a liquid form, usually at the rate of from ¾ to 1¼ fluid oz. per 1,000 lb. of milk. The extract of annatto is usually diluted with water to the extent of ½ gal. per 1,000 lb. of milk before it is stirred into it.

3. *Coagulating the Curd.*—The coagulation or solidifying of the curd may be effected by the addition of rennet or the development or use of acids. In most cases rennet is employed. It is a preparation made from the stomach of a calf, which has the power of precipitating the casein of milk. It acts most effectively and rapidly at temperatures from 94° to 98° F. The curdling or coagulation of milk by rennet is the only fermentation of milk which is known to be produced by an unorganized ferment. As far as known, all other fermentations of milk resulting in coagulation are effected by the agency of micro-organisms. Rennet, or *yirning*, is a name also given to the fourth stomach of a young calf. In parts of Central Europe the rennet is prepared by being blown like a bladder until the membranes are distended and very thin, when it is dried. In other places the fresh rennets or *yirnings* are rubbed with salt and left to dry, when they may be kept for an indefinite period. In preparing it for use in cheese-making the dry rennet is soaked in brine, sometimes cut in strips, and always rubbed frequently to cause the mucus to pass into the liquid. The strength of the liquid rennet which is obtained depends upon the quantity of brine which has been used for the soaking of each rennet. Ordinarily each rennet has enough virtue to coagulate from 3,000 to 5,000 lb. of milk into the best condition of curd for the manufacture of cheese. Several brands of commercial extracts of rennet are now prepared by secret processes. A somewhat similar process is described as follows: Wilkins (*Landwirthschaftl. Centralb. f. Deutschland*, 1874) prepares *rennet essence* by rubbing fresh calves' stomachs with salt, treating with water for two days at 100° F. (or a mixture of equal parts of water and Rhine wine), adding to this solution alcohol (90 per cent.) containing a little hydrochloric acid, and allowing the whole to stand eight days. The liquid is then filtered, and will keep for years. His proportions are 6 oz. fresh rennet, 1 oz. salt, 17 oz. water (or wine and water), 2 oz. alcohol, 12 grains acid. One pint of the essence will curdle 250 gal. of milk in thirty to forty minutes. Schatzmann (*Wiener Landschaftl. Zeit.*, 1873) investigated the action of artificial preparations of rennet, and found them to be very permanent, their action to be reliable and accurate to the minute, and the cheese to separate better, with a higher yield. Hansen (*Landwirthschaftl. Centralb. f. Deutschland*) is said to have prepared rennet from hog stomachs after they had been used for making pepsin, using acid, and obtaining rennet in solution and in the solid form.

The action of rennet is not yet well understood or explained. It was Hammersten, a Swedish scientist, who first undertook the study of rennet in such a way as to present clear information on what the substance is.

"His researches lasted several years, and he gave an account of this ferment which has been but little changed up to the present day. In his first paper (1872) he demonstrated at the outset that the action of rennet is entirely independent of the formation of an acid. The reaction does not change during the curdling, although the curd is usually acid from the action of micro-organisms. He proved, secondly, that the action is entirely independent of milk sugar and affects the casein alone. He found that solutions of casein which had been entirely freed from sugar would curdle readily by means of the ferment. Now since, as had already been shown, the action of micro-organisms in souring milk is on the milk sugar rather than the casein, these conclusions proved that the two processes were entirely different, the one acting on the milk sugar and the other on the casein, the one curdling the milk by the formation of an acid and the other not affecting its reaction. Hammersten also succeeded in separating the active principle of rennet from the other ferments associated with it in the gastric secretion."

H. W. Conn gives this explanation, which seems to be the best that has yet appeared, on the action of rennet:

"This caseinogen appears to be kept in the condition of semi-solution by the alkaline condition of the milk, for it is easily precipitated from the solution by the presence of a small quantity of acid. When thus precipitated it seems to be simply thrown from its solution without being altered in its nature. But the active principle of rennet has a very different effect upon it. Under the action of rennet the caseinogen is chemically changed. It is broken into two different proteids, one of which is easily coagulated, while the other is coagulated only with great difficulty. The former is readily thrown from its solution by calcium salts, and, since these are always present in the milk, the result of rennet action is always to throw down the casein. This portion of the original caseinogen is then manufactured into the cheese, while the other portion, being soluble, goes into the whey and is lost to the cheese-maker. The amount of protein thus lost may be still further increased through the action of bacteria, which have the power of digesting even the curdled casein, and this fact teaches the advisability of using rennet in a manner which will produce the coagulation as quickly as possible. The rapidity of the action will depend upon the relative amount of rennet and the temperature, while it is delayed by alkalies and hastened by various salts."

The active principle of rennet is a chemical ferment or enzyme, which is distinct from the other digestive ferments in the stomach juices. It has been variously called rennet, lab, chymosin, and pixine. It seems to be somewhat widely distributed in nature among animals and plants, and it is a common product of bacteria growth. It is killed by a temperature of 70° C. (158° F.), and it acts best at about 35° C. (95° F.). It is undoubtedly to be regarded as one of the digestive ferments.

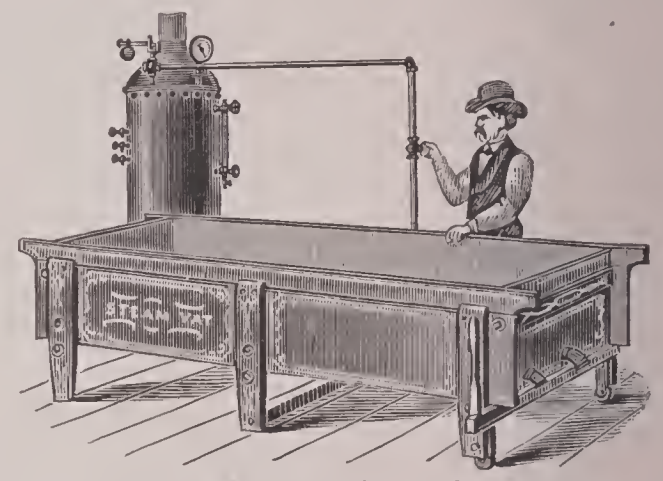

Fig. 3.—Milk vat and steam-heater.

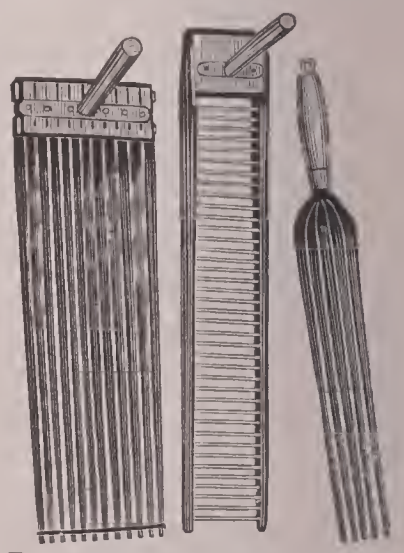
Temperature of Milk.—In the making of cheese the milk is gradually brought to a temperature of about 86° F.; a slightly higher or lower temperature does not appear to make any appreciable difference in the quality or quantity of the cheese which result from the process. In mixing the extract of rennet with the milk it is usually diluted to the extent of at least 1 gal. to every 200 gal. of milk. This permits of a thorough distribution of the fermenting principle of rennet, in order that it may coagulate the caseinogen uniformly throughout the mass. During the coagulation the casein of the milk entangles and encases mechanically most of the fat globules which are held in suspension in the milk. The quantity of rennet which may be used varies very greatly. In milk which is almost sour a larger proportion of rennet should be used than in the coagulation of milk which is comparatively sweet. The quantity of rennet which is employed does not appear to affect the quantity of cheese which can be obtained nor its keeping qualities, except in one respect. The use of a larger quantity of rennet extract in coagulating milk is likely to result in the retention of an abnormally large percentage of water in the cheese. Cheeses containing a large percentage of water cure more rapidly and spoil more quickly than cheeses from which more of the water has been expelled.



Figs. 4, 5, and 6.—Gang-knives for cutting the curd.

4. *Cutting the Curd.*—When the curd has become firm enough to split open before any dull instrument or the

finger of the operator, it is considered as sufficiently firm for the process of cutting to be commenced. The time required to attain this condition after the addition of the rennet may range from ten to sixty minutes, with the milk at a temperature of 86° F. For the cutting of the curd, knives containing several blades from ⅜ of an inch to ½ an inch apart are used. These knives are of two sorts. One cuts the curd into horizontal lines, and the other—the perpendicular knife—cuts these into cubes. In small dairies, and formerly in all dairies, the cutting was effected by means of single knives or machines constructed of wire stretched on a frame which was lowered into and again lifted through the soft curd. The degree of fineness or coarseness to which the curd is cut at this stage of the making has some influence on the quantity of moisture or water which is retained in the cheese. The larger the size of the cubes which are left, the greater is the quantity of water which will be retained. A natural shrinkage of the cubes of curd occurs from the time the cutting is effected. On the surface of each piece of curd a film is formed. This is spoken of as the healing of the curd.

5. *The Heating, Scalding, or Cooking of the Curd.*—The whole mass of whey, with the curd in it, is usually raised to a temperature of from 96° to 100° F. The heating may be effected by the introduction of steam under or around the tin-pan or vat in which the curd is held. In private dairies the common practice is to remove a portion of the whey and scald it to a temperature of 115° or 120°, after which it is poured back on the other portion of the whey which contains the curd. Fig. 3 illustrates the form of a modern cheese-vat.

During the whole process of heating the curd it is kept in a state of gentle agitation by the hands of the cheese-maker or by the use of a rake or some other stirring device. A common test to discern the approach or degree of acidity in the curd is called *the hot-iron test.* A small portion of curd is pressed in the hand until most of the free moisture is expelled. It is then touched lightly against a hot iron. When it is withdrawn from contact with the hot iron, if there be any development of lactic acid, a large number of very slender filaments, like the finest of threads, will be stretched between it and the iron to which it had adhered. The longer these filaments or threads can be stretched before they break, the greater is the degree of the development of acid which is revealed.

6. *The Separating of the Whey.*—The heating and stirring of the curd will cause the particles to shrink to about one-sixth of their first size. When they have become sufficiently firm and dry, they are allowed to settle to the bottom of the pan or vat in which the making is being carried on, when the whey is drawn off. To know precisely the proper stage at which to remove the whey requires care and experience on the part of the cheese-maker. When the threads or filaments by the hot-iron test draw to the length of about ¼ of an inch the curd has usually reached the stage when the whey should be removed immediately. The whey from curd which has been carefully cut and properly handled is bright and clear, with a slightly yellowish-green shade of color. When the curd has been cut roughly or handled violently during any of the stages of the process, considerable quantities of the casein or fat will be lost into the whey. Whey is sometimes drunk as a beverage and is sometimes evaporated for the extraction of milk-sugar. It is usually fed to swine, and is a valuable food for them. There are about 7 lb. of solids in every 100 lb. of whey. Its composition when slightly sour may be given as follows:

	Per cent.
Water	93·00
Nitrogenous substances	1·00
Fat	0·50
Milk-sugar	4·25
Lactic acid	0·50
Ash	0·75
Total	100·00

One hundred pounds of whey fed in the most judicious manner should produce 2 lb. of increase in the live weight in swine.

7. *The Ripening of the Curd.*—After the whey has been drawn from the curd it is usually stirred, in order to keep the particles from packing or matting together until the particles are dry enough to bear pressing together without adhering immediately. After this the curd is allowed to pack or mat into a uniform mass. It is afterward cut into pieces of from 4 to 12 inches square, for convenience in handling. These pieces are turned over from time to time, to facilitate the separation of the remainder of the whey from it. These pieces are doubled and packed on top of each other until the whole forms a compact pile, when the curd is held at a temperature of from 90° to 94° F., until it reaches a condition of ripeness, such as is discerned by the experienced maker. The degree of ripeness or development of acid can be determined by the hot-iron test; but that is

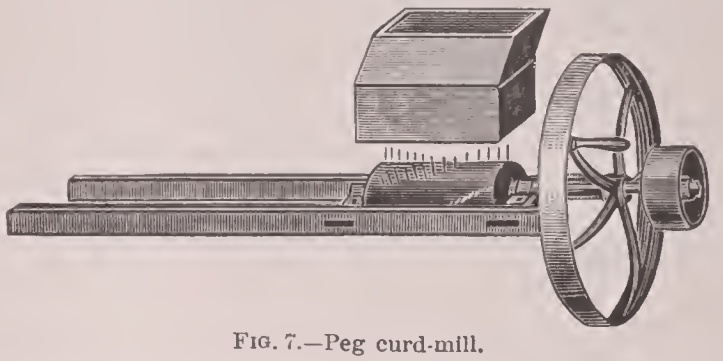


Fig. 7.—Peg curd-mill.

not so sure a guide at this stage as it is for examination of the curd to discover when it is ripe enough for the removal of the whey. The acid development, as revealed by the hot-iron test, will permit the thread-like processes to be drawn to a length of from 1 to 2½ inches from the hot iron. The ap-

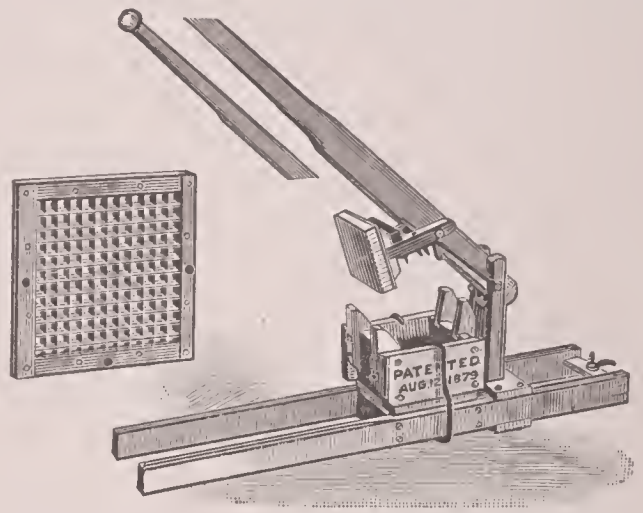

Fig. 8.—Harris curd-cutter. The above cut shows the machine taken apart and the shape of the knife-board.

pearance and texture of the curd also indicate its condition as to ripeness. When it acquires an oily quality and exhibits a fibrous texture when torn, almost similar to the muscles in a piece of boiled beef, it is counted to be ready for cutting and salting.

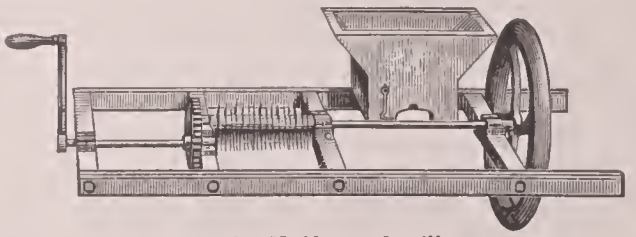

Fig. 9.—Knife curd-mill.

8. *The Grinding or Cutting the Curd.*—There are several different mechanical devices for the grinding or cutting of the curd. Some of these effect a division of the curd into pieces from ½-inch cubes to a larger size by means of cutting-knives. Others tear the curd apart by means of pegs attached to a roller. In both cases the curd is fed into a hopper-like receptacle.

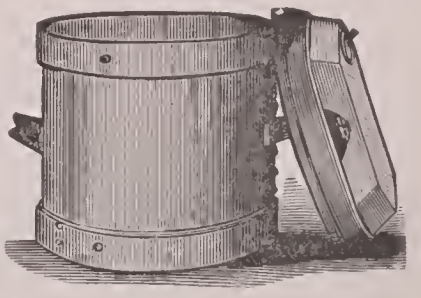

Fig. 10.—Cheese hoop and follower.

9. *The Salting of the Curd.*—Pure salt is added to the curd at the rate of from 1½ lb. to 3 lb. per 1,000 lb. of milk. Salt acts on the particles of curd in such a way as to expel a part of the remaining moisture. It gives an agreeable fla-

vor to the curd and cheese, and also acts as a preservative. Consequently the larger the quantity of salt which is used the drier will be the body of the cheese and the longer it will keep without deterioration. The process of ripening is also retarded in proportion to the quantity of salt which is used.

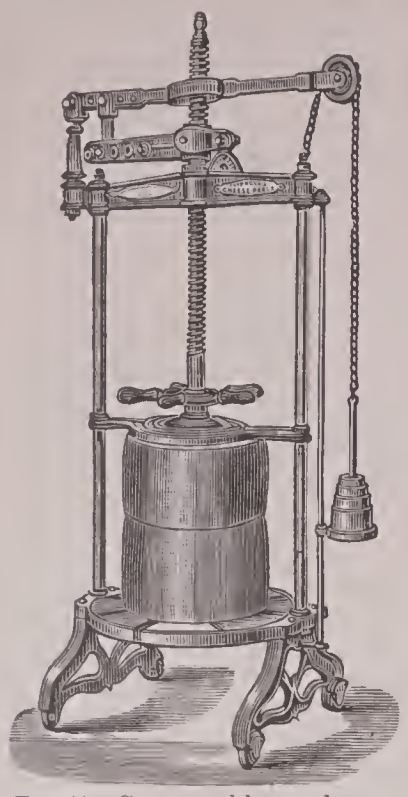

Fig. 11.—Compound-lever cheese-press.

10. *The Hooping or Pressing of the Curd.*—The pressing of the curd is effected not only to get rid of the superfluous whey, but to give to the mass a desirable shape and sufficient consistency to render it suitable for handling and transportation. The hoops are usually cylindrical, from 12 to 16 inches high, and from 7 to 16 inches in diameter. They are made of heavy tin or galvanized iron, or of wooden staves held in place by iron hoops. In some presses the hoops stand on tables. Over each one is an upright screw, which is used to exert sufficient pressure on the cheese. In other cases gang-presses are used, in which the hoops lie in a horizontal row. The pressure is exerted from one end of the row by means of a screw, and presses all the cheese in the several hoops at the same time.

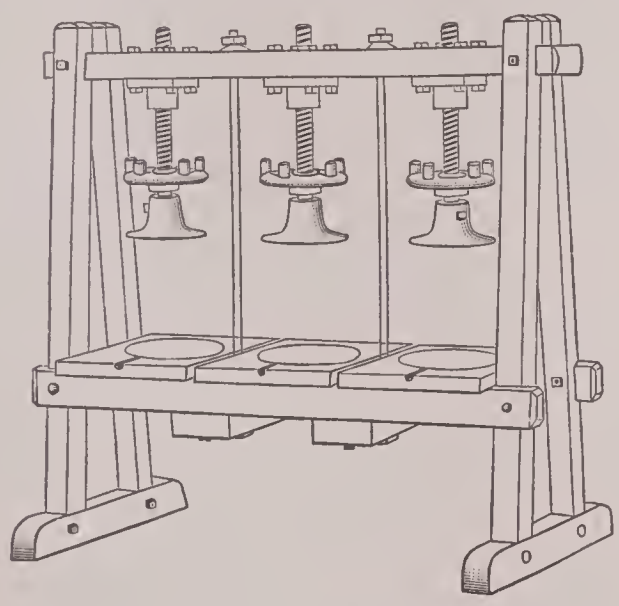

Fig. 12.—Upright screw cheese-press.

Devices have recently been applied whereby a coil spring at one end, or the action of a small water-wheel at the other, causes a continuous pressure to be kept up, even after the cheeses yield to the pressure of the screw and shrink somewhat in size.

11. *Bandaging the Cheese.*—The bandaging of the cheese consists in putting a covering of fine cheese-cloth in position in the hoop before the curd is filled into it. After the mass has been pressed to give it sufficient consistency to permit of the new cheese being handled, the hoop is removed and the bandage of cloth carefully adjusted, so as to cover the sides and turn over the edges of the ends of the cheese. The cheeses are also turned upside down in the hoops during the process of pressing. The usual time given to pressing cheese in cheese-factories is from eighteen to twenty hours. Cloths are sometimes left on the ends of the cheese, to prevent a cracking of the rind. In other cases when the cheese is taken from the hoop the end-cloths are removed, after which the rinds are rubbed with hot butter or whey oil.

12. *The Curing or Ripening.*—When the cheeses are taken from the presses they are only compressed quantities of curd. The curd is quite insipid, not palatable to most people, and rather indigestible. To give it the true characteristics of cheese it must be kept for a length of time varying from a few weeks to several months, to undergo a process of fermentation, which is commonly called curing. The proper flavor is thus developed, which grows stronger the longer

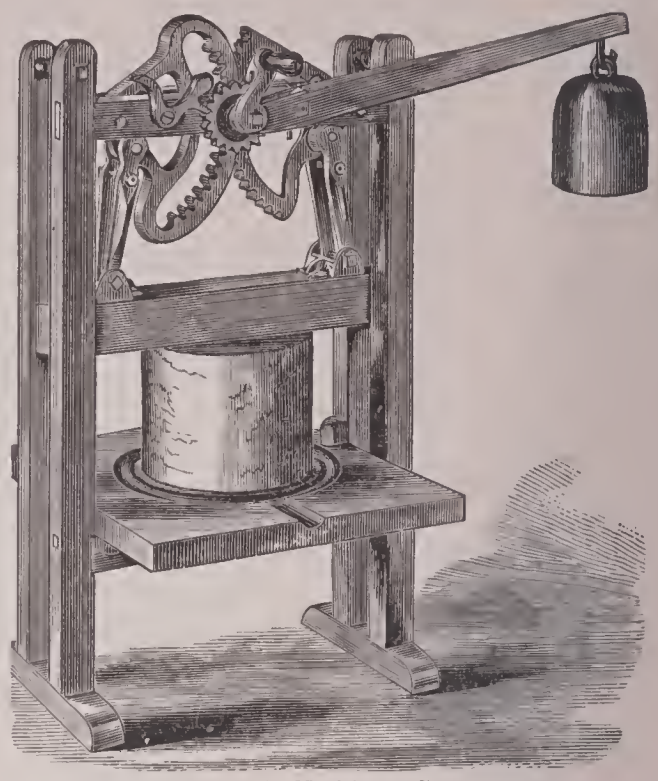

Fig. 13.—Oyston's Herkimer County press.

the cheeses are kept. During that process the casein again becomes soluble, and the various fermentations, which proceed simultaneously in the cheese, give rise to the distinctive flavors which often give different cheeses their names. The acidity of the curd diminishes as the cheese becomes older and riper, and in most cases entirely disappears. There is

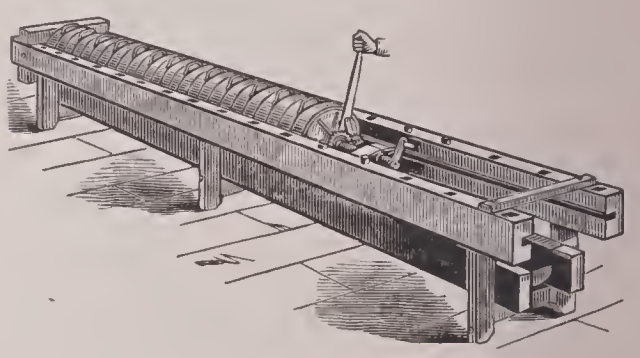

Fig. 14.—Gang-press and hoops.

also considerable loss of weight in the curing process. That may be from 1½ to 3 per cent. during the first seven days up to 5 or 6 per cent. during the following seventy days. The shrinkage in weight depends in some measure upon the quantity of water retained in the curd and the degree of moisture in and the temperature of the atmosphere where the curing goes on. In some cases the shrinkage has been known to reach 10 per cent. within five weeks after the cheeses have been made.

The following extracts from Experimental Station Bulletin No. 9, of the U. S. Department of Agriculture (H. W. Conn), present the most reliable scientific information which is available at this date on the ripening of cheese:

"The ripening of cheese has been conclusively proved to be a matter of the action of micro-organisms. Cohn (1875) first found bacteria in cheese, stating that *Bacterium lactis* was especially abundant. But it was Duclaux who first connected the ripening with the growth of these organisms. His first paper (1877) gave the results of a chemical study of the ripening process, and showed that it consisted chiefly in the transformation of insoluble casein into soluble albuminoids and that the process was associated with the production of several ferments. Three years later (1880) he made a study of the bacteria in such cheese, and determined that they were very numerous and comprised several species. Some of them were aërobic, while others were anaërobic. During the ripening there were produced several gases—carbonic acid, hydrogen, and sulphuretted hydrogen, and a large number of decomposition products, such as alcohol, oxalic acid, carbonate of ammonium, leucin, tyrosin, etc. In

general the process was quite similar to the digestion by the digestive fluids of the stomach and alimentary canal. At this time Duclaux first suggested that certain of the bacteria produced as the result of their growth ferments similar in their characters to the digestive ferments, a discovery which we have seen to be so well established by later work.

"The ripening of cheese was now studied by others, Schaffer, Bondzynski, and Benecke all confirming Duclaux. Schaffer prevented the growth of bacteria by subjecting the cheese to a stream of carbonic acid, and found that under these conditions the cheese would not ripen. Benecke (1887) concluded that the species *Bacillus subtilis* was the chief organism concerned in the ripening process, although others were found with it. In a later work Duclaux (1887) applied modern methods of bacteriological study to the subject, and found seven species of aërobic organisms and three species of anaërobic organisms present in the cheese. He regarded them all as concerned in the process. The ripening, he said, concerned chiefly the casein, and was due to the combined effect of all of the bacteria present, each aiding the others, and each having a share in the decomposition of the casein. The aërobic organisms acted at the surface and the anaërobic organisms acted in the interior, and thus the whole cheese becomes thoroughly ripened.

"The most systematic work was done, however, by Adametz (1889). This observer proved that the ripening was due to bacteria growth by treating fresh cheese with a disinfecting agent, which would prevent bacteria growth without affecting the chemical condition of the cheese. Under these conditions the cheese did not ripen. He also made quantitative estimates of the number of organisms present, finding from 850,000 to 5,600,000 per gramme, and this number was found to increase slowly during the ripening process. He also tried to determine whether the ripening was due to the combined action of many species of organisms or to a single species. For this purpose he studied many specimens, and studied the cheese at intervals during the ripening. He found many species of bacteria present, but as the ripening went on one species was found to increase at the expense of the others, and was much more abundant at the close of the ripening than any of the others. This species he always found, while the others were more variable, and hence he concluded that this species was the cause of the ripening. The organism in question was not *Bacillus subtilis*, as had been supposed by Benecke, but a species to which no name has been given.

"Shortly after this Freudenreich (1890) carried on a set of experiments of a similar import to those of Adametz, confirming his results. He obtained rather large numbers of organisms in his cheese, but agreed with Adametz that the ripening was due to a single species of organism rather than to the combined action of a large number.

"At this point the knowledge of the normal ripening of cheese rests at the present time. But few observations have been made in regard to abnormal ripening. The greatest difficulty that the cheese manufacturer has to contend with lies in this direction. He can not be sure of a uniform product. In spite of all precautions his cheese will sometimes undergo abnormal troubles and become worthless by changes taking place during the ripening process. These troubles have been attributed to every sort of difficulty, including health and condition of the cow, the condition of the barn, the food of the cow, etc. In some cases they have actually been traced to filth connected with the management of the cows. Recent experiments have indicated that the direct result is in all cases to be attributed to the action of abnormal species of micro-organisms which get into the milk, and hence have a share in the ripening of the cheese. Certain it is that black cheese, bitter cheese, and cheese flecked with red spots are all thus caused, and several other troublesome infections have with certainty been traced to micro-organisms. Freudenreich (1890) has experimentally shown that if milk is inoculated with certain species of bacteria which should not be present, and the milk is then made into cheese, the cheese will ripen in an abnormal manner and become worthless, while the control cheese is perfectly good. According to Adametz (1891), either bacteria, yeasts, or moulds may be the cause of the abnormal ripening of cheese under different conditions. But while abnormal ripening is undoubtedly due to growth of improper species of organisms, we can not at present determine how far the variations in the ripening are due to different species of organisms planted in the curd and how far to different conditions of the ripening. Each doubtless has its effect, and much further study is needed in this direction.

"It is evident that the presence of bacteria in cheese is inevitable. The milk from which it was made always contains them, and when made into cheese part of the bacteria at least will be inclosed in the cheese. Here they find proper conditions for growth. The conditions are not very favorable, it is true, for the density of the cheese prevents ready access of air, and the aërobic organisms suffer in consequence, except at the surface. The lack of moisture is also doubtless a disadvantage. But in spite of these disadvantages the bacteria grow slowly, and soon produce profound chemical changes. They give rise to the peptonizing ferment, which acts upon the casein, rendering it partly soluble. Besides this, they induce numerous other decomposition changes, the total result of which is the production of the rich, delicately flavored cheese for the market. The cheese-maker thus forces the bacteria to give him products for which he obtains a high price. Of course, so far as the food value of cheese is concerned, it is the casein and the fat which render cheese valuable, but its market price depends not upon the quantity of casein, but upon the flavor, and this flavor is supplied by micro-organisms. To a certain extent also it is true that the different flavors of different cheeses are due to the action of different species of organisms in the ripening, although we know little in regard to this matter at the present time."

The terms which are used in the trade, and some of the qualities of cheese which have particular commercial value, may be defined as: (1) rich, clean, creamy *flavor*; (2) solid, firm, buttery *body*; (3) fine, close, flaky *texture*; (4) bright, uniform *color*; (5) attractive, neat, symmetrical appearance.

For the judging of cheese at competitions, and for the making of records for comparison, the following scale of points has been devised and is serviceable:

POINTS.	Perfection.	Points awarded.
Flavor	35	..
Body	25	..
Texture	15	..
Color	15	..
Finish	10	..

Some experiments have been made recently—mostly in the experimental dairy stations of Canada and New York—to discover the relation which exists between the percentage of fat in the milk and the quantity and quality of cheese which may be obtained from it. The results of the investigations indicate that, from milk containing between 3 and 4 per cent. of fat, for every two-tenths of 1 per cent. of fat contained in the milk, three-tenths of 1 per cent. of cheese may be obtained, additional to the quantity obtained from normal milk containing 3 per cent. of fat.

Co-operative Factories.—On the continent of North America the great bulk of the cheese which is produced is made in co-operative factories. Probably 95 per cent. of it is manufactured in cheese-factories and not, as in Great Britain and other parts of Europe, in private dairies. The first cheese-factory in the U. S. was erected and operated by Mr. Jesse Williams, near Rome, N. Y., in 1851. Mr. James Burnett, of Dunham, Que., and Mr. Harvey Farrington, of Norwich, Ont., divide the honor of introducing the cheese-factory system into Canada.

The bases upon which a cheese-factory may be established and the business carried on are usually:

I. A private enterprise, whereby some individual or firm undertakes to provide buildings and to conduct the business; or

II. The formation of a joint-stock company or co-operative association.

In the case of private enterprise one of four plans may be followed:

(1) The individual or business firm, called the "manufacturer," may charge such a rate per pound of cheese as may be agreed upon with the patrons who furnish the milk, in consideration of which the manufacturer will undertake and agree to manufacture cheese of first-class merchantable quality, and to provide all furnishings required in the manufacture and boxing or packing of the same.

The collecting of the milk is sometimes done at the expense of the manufacturer and sometimes it is delivered at the factory by the patrons. A different rate is charged by the manufacturer in the two cases.

Where the milk is collected by the manufacturer for

cheese-making, the usual charge ranges from 2 cents to 2¾ cents per pound of cheese, according to the quantity of the output, the distances to be traveled collecting the milk, and other local and particular circumstances.

(2) The manufacturer may carry on the business and meet all expenses incident thereto, in the providing of furnishings, etc., for a stated per cent. of the product.

The disposal of the whey is a matter for mutual agreement between the manufacturer and patrons.

(3) The manufacturer may purchase the milk from the patrons at such a price as may be agreed upon. The price may be uniform per 100 lb. of milk for the whole season, or it may vary for different months.

(4) A price for milk may be fixed on a sliding scale, according to some recognized market quotation for milk or cheese from time to time during the season.

In the case of co-operative companies and associations each may be formed to conduct business as a manufacturer, in a similar capacity and on similar lines to those mentioned under the heading of "private enterprise"; or it may conduct business in a special way for the benefit of its shareholders who furnish milk to the factory which it controls. In the latter case one or other of the subjoined sets of arrangements may be followed.

(5) A certain rate per pound of product may be charged by the company, or association, called hereafter the manufacturer, similar to the plan mentioned in (1). The balance between the receipts and the expenditures of the company or association, in its manufacturing capacity, may be distributed as a dividend among the shareholders according to the amounts of stock which they hold, or it may be disposed of otherwise as they may direct.

(6) Each shareholder may be entitled to furnish to the factory a stated quantity of milk for every share which he holds in the company or association. The product from such quantities of milk may be manufactured at a fixed rate per pound, sufficient to cover the actual running expenses of the concern; and a slight additional charge (say ¼ cent per pound for cheese) may be made for all the quantities of milk furnished in excess.

A rate equal to or higher than the shareholder's excess-rate may be charged for manufacturing the product of the milk supplied by all non-shareholders.

According to this arrangement $12 of shares in cheese-factory stock might entitle the holder to furnish 9,000 lb. of milk annually at the lowest rate for manufacturing.

(7) Under the arrangements set forth in (1), (2), (5), and (6), a general meeting of the patrons, called for that purpose, designates some individual as salesman for the disposal of the products of the factory. The plan of appointing one salesman has been found more satisfactory than the appointment of two or three with equal powers. The salesman may have an advisory committee associated with him.

Statistics.—No accurate statistics are available showing the quantities of cheese which are manufactured in different countries. An English authority (Henry F. Moore) estimates that the total quantity of cheese made in Great Britain reaches 300,000,000 lb. per annum. It has been calculated by a U. S. statistician (J. R. Dodge) that the net requirements of Great Britain in cheese to be imported amount to about 200,000,000 lb. annually. France imports about 25,000,000 lb. per year and Italy imports about 20,000,000 lb. The U. S. export about 104,000,000 lb. annually; the yearly exportation from Canada, which is steadily increasing, has reached 106,000,000 lb.; Holland exports about 60,000,000 lb., and Switzerland about 50,000,000 lb. annually. All other European countries have as great imports as exports.

Varieties of Cheese.—The varieties of cheeses which go under different names are well-nigh innumerable. Most of them take their distinctive designation from the place or locality where they were first made. Counties, districts, towns, villages, and parishes have all lent their names to different varieties. The cheeses themselves often differ: (1) according to the source of the milk from which they are made; (2) as they are made from cream, whole milk, skimmed milk, or mixtures of these; (3) according to the agent used to effect coagulation of the milk; (4) according to the method of manipulating the curd and the temperatures to which it is raised; (5) according to the shape and size of the cheese; (6) according to the manner of the curing or ripening; (7) and according to the results which come from the milk, curd, or cheese being inoculated by certain ferments or forms of micro-organisms which appear to prevail in different places.

Some of the cheeses are pressed and others are left to drain dry for periods of several days or even weeks. The *Cheddar* cheese may be taken as typical of *hard* or *firm cheeses*; the *Gruyère* or *Stilton* as types of *medium cheeses*; and cream cheese, as *Neufchâtel* or *Brie*, as representative of *soft cheeses*.

The following list of the cheeses which are best known is taken almost entirely from Prof. James Long's pamphlet on *Trade in Dairy Produce*:

British Cheese.—Pressed: Cheddar, Cheshire, Gloucester, Leicester, Dunlop, Derby, Wiltshire Loaf, Blue Dorset, Liberton, Caerphilly. Unpressed: Stilton, Wensleydale, Cotherstone, Colwick, Slipcote, York (curd), New Forest.

French Cheese.—Pressed: Cantal, Port-du-Salut, Septmoncel, Gex, Sassenage, Gruyère. Unpressed: Gérome, Void, Olivet, Rollot, Brie, Camembert, Coulommiers, Livarot, Neufchâtel, Mont d'Or, Troyes, Gournay, Gervais, Bondon, Mignot, Pont l'Évêque.

Swiss Cheese.—Pressed: Gruyère, Emmenthaler, Backstein, Spalen, Gessanay, Vacherin, Jura. Unpressed: Bellelay.

Italian Cheese.—Pressed: Parmesan, Gorgonzola, Cacio Cavallo, Pecorino, Bellunese, Rubiole.

German Cheese.—Pressed: Hartz. Unpressed: Münster, Limburg.

Holland Cheese.—Pressed: Edam, Gouda.

Swedish Cheese.—Pressed: Herrgaardsost.

United States Cheese.—Pressed: Cheddar, Brick, Young Americas, Ohio Flats, Skim.

Canadian Cheese.—Pressed: Cheddar, Loaf or Truckle, Stilton, Cream, prepared cheese in stone and glass pots. Unpressed: Stilton.

Emmenthal cheeses are the variety which are produced most plentifully in Switzerland. Each cheese is round, 80 to 100 cm. in diameter, 10 to 15 cm. thick, and weighing from 50 to 100 kilog. or more. Like all the rich cheeses (*fromage gras*), which retain nearly all the elements of the milk, its nutritive value is high. It was first made in the valley of the Emme in the canton of Berne, whence it followed the Bernese emigration into the neighboring cantons, where it is now made in large quantities, and into Bavaria, Russia, North Germany, and North and South America. The exportation began in the seventeenth century to Germany and Italy, and now it is sent everywhere, the principal markets being Germany, Russia, Italy, and the U. S., where it is known as *Schweizer Kase*. In winter a good deal of Emmenthal *mi-gras* is made, mostly for France, where it takes the place of butter.

Next in importance is the *Gruyère*, called after the village of that name in Fribourg, another round cheese 60 to 70 cm. in diameter, 9 to 12 cm. thick, and weighing 30 to 45 kilog. It has come into great repute since the formation of a wealthy society for its manufacture in Fribourg. It is also made in large quantities in Vaud and Neufchâtel, and the French provinces of the Jura and the Doubs, where, according to some writers, it originated about 1750. It is manufactured in much the same way as the Emmenthal, except that a third or more of the cream is removed, whence it is classed as *mi-gras*. The exportation is mostly to France and Italy, and recently to South America.

Still more remarkable is the *Schabzieger*, or green cheese (*fromage vert*), known in the U. S. under the corrupt name of sago or sapsago, and which some writers hesitate to class as a cheese. Its manufacture dates back to the ninth or tenth century, and it is still the most famous product of the canton of Glaris, which turns out a great many other varieties, mostly *mi-gras* and *maigre*. The peculiarity of the *Schabzieger* is due partly to the method of coagulation by azi instead of rennet, and partly to treatment by the *zigerlee* (melilotus cœrulea), a plant grown for the purpose in Schwyz. In 1869 the exportation amounted to 1,250,000 kilog., valued at 750,000 francs. It is sent all over the world.

The *Gorgonzola* cheeses are made mostly in Italy. *Stracchino*, of Gorgonzola, is made of milk containing the buttery parts. When the mountain pasture is exhausted the Bergamese herdsmen drive, for wintering, their herds to the plains. Gorgonzola is their favorite halting-spot, for there they first find the luxuriant vegetation of the Lombardian plateau. These herds, reveling on the rich grasses of Gorgonzola, are, from the middle of September to the end of October, very lactiferous.

Cheese is made during these months in small rooms devoted to it in the homes of the Gorgonzolese, who buy the milk of the herdsmen. The autumn temperature, being

moderate, is best for cheese-making, as too much heat, by hastening the separation of the whey, makes it too dry and friable, while excessive cold produces a wheyey acid and easily spoiled cheese. The milk while warm from the cow is curdled with well preserved and prepared calf rennet. The quality of the cheese depends much upon that of the rennet, and experience guides as to the quantity required. In fifteen or twenty minutes, when the milk is coagulated and the whey separated, the curd is hung in hemp-cloth bags to drain. As cows are milked twice daily the foregoing is twice done, viz., mornings and evenings.

The morning-drained curd, inclosed in light, flexible, wooden bands, covered on their inside surface with hemp-cloth, is placed on an inclined board strewn with rye chaff. Being of two milkings the curd is partly warm, partly cold, and, though mixed, care is taken to form the upper and lower strata of the warm, because it is cementitious. As hot and cold curd never perfectly unite, minute interstices remain in the cheese, in which, while maturing, green mould, known as "parsley," forms and gives the *stracchino* the delicious taste for which it is famous. The curd is further drained during the first day of the process by two or three turnings. On the following morning, when of some consistency, the cloth being removed, its value is determined by weighing. After three or four days fermentation begins, and the wooden bands are removed. It is then, once daily for eight or ten days, alternately salted on its upper and lower side, 4 oz. of pulverized salt being, on an average, used per form of 33 lb. The Gorgonzolese adopted some years ago the process of quickly turning and pressing the cheese against a salt-covered surface, thus insuring more uniformity and a better crust. The color changes in a month to pinkish white if good, to black if bad. When black, the crust is soft and the cheeses perishable in summer. If the crust is sufficiently hard, the shade is improved by one or two dippings in salt water.

French Cream Cheese.—This variety of cheese is similar to most of the soft cheeses which must be eaten fresh. In making it, enough rennet is added to the morning mess of milk to coagulate it in two or three hours at a temperature of 70° F. It is then left for twenty or twenty-four hours. After the whey which has collected on top of the curd is poured off, the curd is cut in slices and laid on a sieve to drain. After this is done, cream from as much milk as was first coagulated is added and mixed with the curd by means of a wooden pestle until it is uniform in consistency. The whole is placed in wicker molds—generally heart-shaped—and is ready for use. It can be kept good for several days if placed in a refrigerator or on ice.

Limburg is a soft cheese formed at a low temperature and slightly pressed. The curing process is usually allowed to proceed to the putrefactive stage before it is eaten. Its odor is extremely offensive to persons with an acute sense of smell, who have not acquired a taste for it.

Parmesan cheese is used extensively for soups in Italy, and is to be found upon the dinner-tables commonly grated into a powder.

The Roquefort cheese was originally, and it is at the present time to some extent, made from ewe's milk; but in some instances cow's milk is added. It is highly flavored, blue-moulded, and is ripened in curing-cellars in mountain caves in that part of France where it is produced. The caves are constantly cool at a temperature of 41° or 42° F.

Stilton cheese takes its name from the village or parish of Stilton in England. It is popularly believed to be made from milk with cream added. The milk is coagulated at a low temperature, the curd is dipped out by bowls on a strainer usually made of cloth, it is moved gently to facilitate the separation of the whey, and while still in a moist and comparatively soft and plastic condition is filled into hoops or molds of cylindrical shape and about 7 inches in diameter. These molds or hoops are turned upside down frequently for several days. Sometimes the curd is inoculated with the mould and flavor which are characteristic of Stiltons, by grating a small quantity of an old Stilton cheese between the layers as it is filled into the hoops. Sometimes the cheeses are inoculated by the insertion into their sides of wooden skewers which have been stuck into an old Stilton cheese for a few days.

Full-cream cheese is a term now used to designate cheese made from whole milk, from which no cream has been removed, and from which strippings have not been kept back.

Skim-milk cheese is also extensively manufactured in many countries, and sold often under the name of whole-milk cheese. It is generally harder and more translucent than other cheese. Sometimes the milk is skimmed three times, and yields a cheese which becomes so hard in a short time that a pickaxe must be used to break it. By allowing the curd of skim-milk to ferment somewhat, and by leaving considerable whey in it, softer cheese is obtained. Such is the offensive German hand-cheese.

Oleomargarine, or *filled cheese*, devised by H. O. Freeman, of Sherburne, N. Y., is made by replacing the fat removed in the cream with oleomargarine made from beef suet. The oleomargarine is melted and added to the skim-milk, which has been previously heated to 94° F., and colored with annatto. Rennet enough is then added to curdle in eight or ten minutes. About 1½ lb. of oleomargarine are retained by 100 lb. of milk. When skillfully made this cheese appears rich and well-flavored, and passes for fair whole-milk cheese, but spoils very quickly and badly.

Lard cheese has recently been manufactured in New York and other States. It is somewhat similar to oleomargarine cheese, being made from skimmed milk and lard.

Butter-filled cheese is also made from skim-milk and rancid or other cheap butter, which is partly purified by melting before it is mixed into the milk.

The mould on and in old cheese consists of a few common species of green, blue, and red fungi, such as *Penicillium glaucum*, *P. globulosum*, *Torula viridis*, *T. auriantiaca*, etc. See articles Fungi, Mildew, and Mould.

Cheese-mites, which appear on some kinds of old cheese as a light buff dust, are known as *Acarus domesticus* or *A. siro*. They are of the same genus of the *Arachnidæ* as the sugar-mites. They are harmless.

Skippers, called also *hoppers* and *jumpers*, are the larvæ or maggots of the cheese-fly, *Piophila casei*, which lays its eggs in the cracks or on the surface of the cheese. This fly is about half as large as the ordinary house-fly. Care and cleanliness are the only means for preventing its inroads; frequent turning, rubbing, brushing, etc.

Tyrotoxicon.—Dr. Victor C. Vaughan has separated from long-kept acid milk, from cheese which caused poisonous symptoms, and from an ice-cream which similarly had caused illness, a very poisonous substance, of the nature of a ptomaine, which he has named tyrotoxicon. The method of separation is exceedingly simple; the acid-coagulated milk is filtered, and the filtrate, thus freed from fat and casein, is shaken up with ether after being first faintly alkalized with potash. On filtering and evaporating the ether, a crystalline substance is left, extremely small doses of which cause vomiting and diarrhœa in man, and kill small animals with cholera-like symptoms. There has been recently adduced evidence that this crystalline substance is probably diazobenzine.

Cheese-maggot: See CHEESE.

Chee'tah, or **Hunting Leopard**: the *Guepardа jubata* or *Cynælurus jubatus*, a carnivorous mammal of the cat family, distinguished by its slender build, long legs, and non-retractile claws. The general color is pale yellow, marked with numerous small black spots, which, unlike those of the leopard, are not arranged in rosettes. The hair on the neck and shoulders is long, the fur coarser and crisper than that of most cats. It is found throughout Africa, and in Asia nearly as far N. as Siberia. Its intelligence, docility, and fidelity are so great that in India and Persia it is trained for the chase of antelopes and deer. The cheetah is kept leashed and hooded until the game is found near, when it is let loose and, drawing stealthily near its victim, it rushes suddenly upon it, and can with difficulty be made to let go its hold. This animal is readily domesticated. Little is known of its habits while in a state of nature. In Ceylon the true leopard is called *cheetah*.

Cheetham, HENRY, D. D.: b. in Nottingham, England, Apr. 27, 1827; educated at Christ's College, Cambridge; ordained in 1856 to the curacy of Saffron Walden, Essex; held the vicarage of Quarndon, Derbyshire, from 1858 to Sept., 1870. He was then nominated to the bishopric of Sierra Leone, and was consecrated Nov. 30, 1870, in St. Paul's Cathedral. He resigned his see in 1882, and became vicar of Rotherham. He is the author of *Ministerial Fruit Proportionate to Ministerial Faith*; *Sermons*, etc.

Cheetham, SAMUEL, D. D.: Archdeacon of Rochester since 1882; b. in Hambleton, Rutland, Mar. 3, 1827; educated at Cambridge, where he graduated in the first class both in classics and mathematics in 1850; was Professor of Pastoral Theology in King's College, London, 1863–82. He edited with Dr. William Smith the *Dictionary of Christian Antiquities* (London, 1875–80, 2 vols.).

Chee'ver, EZEKIEL: a New England school-teacher; b. in London, England, Jan. 25, 1615 (N. S.). He received an excellent classical education, and emigrated to America in June, 1637, to enjoy Christian worship in its purity. He was one of the founders of the colony of New Haven, where he taught school for twelve years; was chosen deacon soon after the organization of a church there, and occasionally served as a preacher. He represented the town in the General Assembly in 1646: was afterward master of the grammar school at Ipswich, Mass., for eleven years, and subsequently taught school in Charlestown, Mass., nine years; removed to Boston Jan. 6, 1671, and had charge of the Boston Latin School for many years. During the time he was teaching at New Haven he prepared the *Accidence, a Short Introduction to the Latin Tongue*, of which in 1785 twenty editions had been published, and it was in use for over 100 years by the Latin teachers of New England. He also wrote *Scripture Prophecies Explained, in Three Short Essays*. D. in Boston, Mass., Aug. 21, 1708.

Cheever, GEORGE BARRELL, D. D.: Congregational divine; b. at Hallowell, Me., Apr. 17, 1807; graduated at Bowdoin College in 1825, and at Andover Theological Seminary in 1830. In 1833 he became minister of a Congregational church in Salem, Mass. He published, in 1835, a satirical allegory called *Deacon Giles's Distillery*, for which he was prosecuted by a certain distiller, and was condemned to imprisonment for thirty days. He was distinguished as a zealous advocate of temperance and as an opponent of slavery. He resigned his pastorate 1836, went to Europe, and contributed letters to the New York *Observer*, and in 1839, on his return, took charge of the Allen Street Presbyterian church, New York city, and held it till 1844; he was corresponding editor of the New York *Evangelist* in 1844 while in Europe, and was its principal editor for a year after his return in 1845. His contributions to the New York *Independent* and the *Bibliotheca Sacra* were numerous and extensive. From 1846 to 1870 he was pastor of the Church of the Puritans in New York city. Among his works are *Studies in Poetry* (1830); *Lectures on Pilgrim's Progress* (1843); *Wanderings of a Pilgrim in the Shadow of Mont Blanc* (1846); *Journal of the Pilgrims at Plymouth in 1620* (1848); and *God against Slavery* (1857). D. at Englewood, N. J., Oct. 1, 1890.

Cheever, HENRY THEODORE: See the Appendix.

Cheffontaines, shef'fŏn'tān', CHRISTOPHE, de: a French theologian; b. about 1532 in Brittany; became Archbishop of Cæsarea about 1586, and exercised episcopal functions in the diocese of Sens in the absence of Cardinal Pellevé. Cheffontaines wrote, among other works, a *Defense of the Faith of our Ancestors* (1570) and a *Treatise against Certain Dogmas of Scholastic Theology* (1586). D. May 26, 1595.

Chefoo, or **Chifu**: a seaport of China, called by the natives *Yen-t'ai* (Smoke Terrace); in the hien or district of Foo-shan, the foo or department of Tŭng-chow, and the province of Shantung. It is situated in lat. 37° 35′ 56″ N., and lon. 124° 22′ 33″ E., on the north shore of the promontory of Shantung, in the southeast angle of a small bay formed by the peninsula of Chefoo, the sandy spit which connects this peninsula with the mainland, and the hill Yen-t'ai, from which the town takes its name (see map of China, ref. 4–K). Chefoo is one of the ports opened to foreign residence and trade by the treaty of 1858, taking the place of Tŭng-Chow-foo (55 miles to the W. N. W.), the city designated in the treaty, but which possessed no suitable harbor. Steamers plying between Shanghai and Tientsin touch here, and there is considerable trade by sailing ships with the other ports of China. The chief imports are woolens, cotton goods, opium, and sugar. The chief exports are pulse, bean oil, bean-cake, medicines, and strawbraid. In 1891 the total imports amounted to $10,234,720, and the exports to $5,125,848. In the same year 1,217 vessels, with a tonnage of 982,759 tons, entered the port, and 1,215, with a tonnage of 981,805 tons, cleared. The climate of Chifu is the most salubrious of all the treaty-ports of China, and the place is consequently much resorted to by foreigners from other parts of China in the summer months. Pop. (1890) 32,500.

R. LILLEY.

Chehab-Eddin, better **Shehâb-Eddin**, ABDEL RAHMAN: b. at Damascus in 1203; d. there in 1267. He wrote *Kitâb-ar-raudhatain*, or *The Book of the Two Gardens*, which means the history of Nureddin and Saladin. This work appeared also in an abridged form as *Azhar-ar-raudhatain*, or *The Flowers of the Two Gardens*.

Cheha'lis: a river of the State of Washington; rises in Lewis County, on the east side of the Coast Range; flows in a W. N. W. direction through Chehalis County; enters Gray's Harbor, and is about a quarter of a mile wide at its mouth. It is navigable for steamboats, and its valley is extensive and fertile, producing oats, wheat, and potatoes. The inclosing hills are covered with dense forests of fir, cedar, spruce, maple, and ash. Total length about 125 miles.

Chehalis: city; capital of Lewis co., Wash. (for location of county, see map of Washington, ref. 6–C); on Northern Pacific R. R. and Chehalis and South Bend R. R., and at the confluence of the Chehalis and Newaukum rivers; 54 miles S. of Tacoma. It has five churches and excellent graded schools; its industries are manufacturing and agriculture. It was founded in 1881. Pop. (1890) 1,309; (1900) 1,775.

EDITOR "BEE."

Cheh-kiang, or **Che-kiang**, chā-kyaang' (i. e. Crooked River, from the old name of the river which waters the province, called the Ts'ien-T'ang river since the eleventh century): the smallest of the eighteen provinces of China; bounded S. by Fuh-kien, W. by Kiang-si and Ngan-hwei, N. by Kiang-su, and E. by the Yellow Sea; 11,588,692 inhabitants in 1882; area, 39,150 sq. miles. The southwestern part of the province is hilly, and produces great quantities of excellent tea; the northern and eastern parts belong to the great delta plain, and produce silks. The principal towns are the capital, Hang-Chow-Foo, and the treaty-port of Ning-po. The Chusan islands, lying opposite Ning-po at a distance of about 50 miles, belong to this province.

Cheirolepis, kī-rol'ĕe-pis [Gr. χειρ, a hand + λεπίς, scale, in allusion to the scale-covered pectoral fins]: a genus of fossil fishes belonging to the family *Palæoniscidæ*, found in the Devonian of Europe and Canada. The vertebral column was cartilaginous although the neural arches were ossified, head large, teeth small, pointed, or cylindrical, body slender, and covered with small rhomboid scales. The fins, particularly the pectorals, are large, and the first ray of each is developed as a spine.

F. A. L.

Cheiromancy [from Gr. χειρόμαντις, diviner by palmistry; χείρ, hand + μάντις, diviner]: divination by inspection of the

lines in the palm of the hand; also called *palmistry*. Cheiromaney comes from India, and is of great antiquity. It was practiced at Rome and much in vogue at the time of Juvenal. It was cultivated by philosophers and celebrated schoolmen like Plato, Aristotle, Galien, Albertus Magnus, and Ptolemy. Aristotle having found on an altar dedicated to Apollo a book on cheiromancy, written in letters of gold, sent it to Alexander as a work worthy of the attention of an investigating and lofty spirit. Cheiromancy played a very important part among the Chaldeans, Assyrians, and Egyptians. The Jewish people possessed thousands of cheiromancers. Solomon speaks of the art as having been perfected among the Hebrews. The Emperor Augustus was considered a distinguished practitioner. Cardanus, the author of a work on cheiromancy which is considered one of the best, declares and proves that there are from the point of view of this art 170 kinds of hands. Tricassus recognizes only 80; Kenker will allow but 70, and Belot puts the number at 40. This art was in great repute in Europe in the Middle Ages. The basis of the so-called science is the three large, principal lines which are at once recognized in the palm of the hand. The first, the one nearest the fingers, is called the line of the heart; the second, in the middle of the hand, the line of the head; and the third, at the base of the thumb, the line of life. These represent the trinity of human existence: the heart, sensation; the head, intelligence; life, action. There exist outside of these three main lines other important lines, all of which have a particular significance. Moreover, the palm of the hand is divided into different quarters, and the slight elevations beneath the base of each finger are called mountains, each one having its particular name. The line of the heart when it is very well defined signifies strong and happy affection; if the line is broken, it denotes inconstancy. The line of the head in the same way denotes strong or weak mental faculties. The line of life, the most important of all, determines by its distinctness and clearness the length of life and liability to diseases, etc. Each one of the mountains mentioned above is named after the various planets, from which they receive, according to their greater or less development, favorable or unfavorable influences. It need hardly be added that the whole subject is placed in the realm of charlatanism or of innocent amusement, according to the way in which it is practiced.

C. H. Thurber.

Cheiron, kī'ron (in Gr. Χείρων): one of the Centaurs; the noblest specimen of a combination of the human and animal forms created by the Greek imagination. Generally the centaur expresses the sensual and savage features of a man combined with the strength and swiftness of a horse; but to these qualities Cheiron added justness, wisdom, and kindness. Having been instructed by Artemis and Apollo in hunting, gymnastics, music, and medicine, he in his turn became the instructor of many heroes—Achilles, Heracles, and others—in these arts. Together with the other Centaurs, he was expelled by the Lapithæ from Mt. Pelion, but sacrifices continued to be offered to him even after his expulsion by the Magnesians; and the family of the Cheironidæ, living in that neighborhood and distinguished for knowledge in medicine, was said to descend from him.

Cheironectes, kī-rō-nek'tēez [Gr. χειρ, hand + νήχειν swim]: the yapock, or water-opossum (*Cheironectes variegatus*), a small marsupial of the family *Didelphyidæ*, found from Guatemala to Southern Brazil. It is about 2 feet in total length, clothed in soft, dense, woolly fur, white below, gray above, marked with large patches of sooty black, ears large and bare, tail long and naked, except at the base where it is covered with fur. The hind feet are large and webbed, and the animal, which is aquatic in its habits, frequenting small streams, feeds on crustacea, insects, and fishes. Owing to its peculiar appearance and mode of life it was for a long time placed with the otters. F. A. L.

Cheironectes.

Cheiroptera, kī-rop'te-ra [from Gr. χείρ, hand + πτερόν, wing]: an order of mammals consisting of the Bats (*q. v.*).

Cheke, Sir John: scholar and Hellenist; b. in Cambridge, June 14, 1514. He became in 1540 first Professor of Greek in the university of that place, and distinguished himself as a reviver of classical learning. In 1544 he was appointed Latin tutor to Prince Edward. He was Secretary of State in 1553, but on the accession of Queen Mary he was deprived of his office because he was a Protestant, and he went into exile. He was seized in Flanders in 1556 by the agents of Philip II. of Spain, and taken to England. Compelled to choose between death by fire and a profession of the Catholic religion, he accepted the latter. D. Sept. 13, 1557. Of his numerous writings, *The Hurt of Sedition* (1549) and the translation of the *Gospel of Matthew* are especially noteworthy. See Strype, *Life of Cheke* (1705).

Che-Kiang: See Cheh-kiang.

Chelidonium: See Celandine.

Chelido'nius: See Schwalber.

Chelifer, kel'i-fer [from Gr. χηλή, claw + Lat. *fer're*, bear]: a genus of small arachnids belonging to the order *Pseudoscorpii*, and commonly called false scorpions. They have two large pincers in front, like the true scorpions, but they lack the long abdomen and the poison sting of the latter. They live in moss, under the bark of trees and the wall-paper in houses. They feed on small mites and insects.

Chelmon'ski, Joseph: figure and landscape painter; b. in Varsovia, Russia; contemporary; pupil of Gerson, Paris; honorable mention, Paris Salon, 1882; medal of honor, Paris Exposition, 1889. He paints horses well, and his pictures of life in Russia and Poland are spirited. W. A. C.

Chelmsford, chemz'fŭrd: a town of England; capital of the county of Essex; at the confluence of the Chelmer and Cann rivers; on the Eastern Union Railway; 29 miles N. E. of London (see map of England, ref. 11–K). Two fine bridges cross the river here. The town is well built, has an old church, a handsome county-hall, a theater, and assembly-rooms. Pop. (1891) 11,008.

Chelmsford, Lord Frederic Augustus Thesiger: British general; b. May 31, 1827. Educated at Eton; served in the Crimean war; commanded the British troops in the Zulu war of 1879; made general 1888; lieutenant of the Tower of London 1884–89.

Chelmsford, Sir Frederick Thesiger, Baron, Lord Chancellor: b. in London in 1794. He became solicitor-general in 1844 and attorney-general in 1845, but he resigned in 1846. He was reappointed in 1852. On the formation of a Conservative ministry in 1858 he was appointed Lord Chancellor, and received the title of Lord Chelmsford. He resigned with his colleagues in June, 1859, and was again Lord Chancellor from July, 1866, to Feb., 1868. D. Oct. 5, 1878.

Chelonia, kĕe-lō'ni-a [from Gr. χελώνη, tortoise]: that order of reptiles which contains the turtles and tortoises. In this sense the term is antedated by Testudinata (*q. v.*). *Chelonia* is also the name of the genus of sea-turtles containing the Green Turtle (*q. v.*).

Chel'sea: a populous southwestern suburb of London; in Middlesex; on the left (north) bank of the Thames; 4½ miles W. S. W. of St. Paul's (see map of England, ref. 12–J). The Thames is here crossed by three fine bridges, the Chelsea, Albert, and Battersea. Among the principal edifices are the great Chelsea Hospital for pensioners from the British army, the Royal Military Asylum, founded by Frederick, Duke of York, for the maintenance and education of soldiers' children, and a training-college for schoolmasters for the army. A noted place of public amusement formerly was Cremorne Gardens, now built upon. A fine embankment skirts the river-front. The original name was not Chelsea, but Cealscythe, and in the *Doomsday-book* it appears as Cercehede or Chelched. The present form first appeared in the sixteenth century. The manor of Chelsea was presented

by Henry VIII. to Catharine Parr, afterward passing into the hands of the Duke of Northumberland, Lord Cheyne, and Sir Hans Sloane. The names Cheyne and Sloane are still perpetuated in the borough, as it was in Cheyne Walk that Carlyle lived for many years. During the eighteenth century many famous men resided here, among them Arbuthnot, Atterbury, Guy, Swift, Smollett, Steele, and Count Zinzendorf. Chelsea was the first place in England in which the Italian style of gardening was introduced by Sir John Danvers. The borough returns one member to Parliament. Pop. (1891) 96,272; (1901) 73,856.

Chelsea: a city of Suffolk co., Mass. (for location of county, see map of Massachusetts, ref. 2-I); is a northeastern suburb of Boston; is 3 or 4 miles N. E. of Boston Common. It is separated from Charlestown by the Mystic river, which is here crossed by the Chelsea bridge. It is bounded on the S. and S. E. by an inlet of the sea called Chelsea creek, which separates it from East Boston. Chelsea has a U. S. marine hospital and a U. S. naval powder-magazine, an academy, and large factories for making elastic rubber, sewing-machines, brass-ware, linseed-oil, iron safes, woolens, brushes, machinery, tools, etc. The U. S. census of 1890 shows 334 manufacturing establishments, with a capital of $7,068,111, employing 3,421 persons at the aggregate annual wages of $1,879,663. The cost of materials consumed yearly is given as $4,655,432, and the value of the product $8,072,048. Chelsea is connected with Boston by the Eastern R. R. and by a ferry 1½ miles across. Pop. (1880) 21,782; (1890) 27,909; (1900) 34,072.

EDITOR OF "RECORD."

Chelsea: village (incorporated 1869), Washtenaw co., Mich. (for location of county, see map of Michigan, ref. 8-J); on Michigan Central R. R.; 22 miles E. by N. of Jackson; has excellent graded school and five churches; is the best produce-market in Southern Michigan. Pop. (1880) 1,160; (1890) 1,356; (1900) 1,635.

EDITOR OF "HERALD."

Chelsea: shire town, Orange co., Vt. (for location of county, see map of Vermont, ref. 5-C); 22 miles S. E. from Montpelier. Chelsea has an academy, 2 churches, and county buildings; has manufactories of shoes, lumber, and milk products. There are here excellent water privileges, and valuable granite formations (as yet unquarried). Manufacturing industries which locate here are exempted from taxation for a period of ten years. Pop. (1880) 1,462; (1890) 1,230; (1900) 1,070.

EDITOR OF "HERALD."

Chelsea Hospital: an asylum at Chelsea, England, for disabled or superannuated soldiers. The College for Religious Controversy, founded by James I. in 1610, was torn down to make room for this hospital in 1682. It has accommodations for about 660 persons, and is governed by a board of commissioners, comprising, *ex-officio*, the Lord President of the Council and the First Lord of the Treasury. It supports about 500 in-pensioners, who receive board, lodging, and clothing. All pensions granted to soldiers by the British Government are awarded by the commissioners of Chelsea Hospital, who are appointed by the crown. Out-pensioners may become inmates when there are vacancies, by surrendering their out-allowances, and inmates may become out-pensioners at will. The institution is supported by Parliamentary appropriations. In 1892 the expenditures for the hospital were £26,633, and for out-pensioners £1,821,700. In 1892 there were 84,011 out-pensioners paid at the hospital.

Cheltenham, chelt'nŭm: a parliamentary borough and fashionable watering-place of Gloucestershire, England; on the Bristol and Birmingham Railway; 96 miles by the road or 121 by railway W. N. W. of London (see map of England, ref. 11-G). It is pleasantly situated in a picturesque valley on the Chelt, a small tributary of the Severn, and is sheltered on the E. and S. E. by a semicircle of the Cotswold Hills. It derives its prosperity and importance from its mineral springs, which contain sulphates of soda and magnesia, with iodine, iron, and carbonic acid. It has elegant squares, terraces, and crescents, and numerous villas, interspersed with gardens and shrubberies. The public promenades are among the finest in England. It has ten or more churches, besides chapels of Dissenters, a general hospital, a theater, a zoölogical garden, and a well-endowed grammar school founded in 1574. Cheltenham is famous for its colleges and schools, among which is the proprietary college for the sons of gentlemen. The borough returns one member to the House of Commons. Pop. (1891) 42,914.

Chemical Nomenclature and **Notation**: See CHEMISTRY.

Chemistry, kem'is-tri [Eng. deriv. (seventeenth century) of *chemist*, Fr. *chimiste*, Mod. Lat. *chimista* for earlier *alchimista* with omission of the Arab. article *al*. The mediæv. name of the science was Span. *alquimia*, Ital. *alchimia*, O. Fr. *alquimie*, Lat. *alchimia*, all forms of Arab. *al-kīmīa* = *al*, the + *kīmīa*, prob. representing Late Gr. χημεία, Egyptian art, from *Khem*, an old name of Egypt. The word may be merely a folk-etymological modification of Gr. χυμεία, pouring, infusion, adapting it to a supposed connection with *Khem*. It was, at any rate, a supposed connection with χυμεία, etc., which in the Renaissance produced the spellings *alchymia*, *chymistry*, *chymist*, etc.]: the science which deals with the composition of the various forms of matter of which the universe is made up, and with the changes in composition which these forms of matter undergo. The name applied about the fourth century of the Christian era to the art which had for its object the transformation of the baser metals into the noble ones, as, for example, of silver into gold, was *chemia* (χημεία). This, in turn, is said to be derived either from the Egyptian word Khem, or chêmi, the name of Egypt (see the etymology), or from a word meaning black. Whether, therefore, *chemia* first signified the Egyptian art, or the occupation with a black substance of importance to the alchemists, is uncertain. Certain it is that the earliest chemical work recorded is that done by the alchemists (see ALCHEMY), and for a long period the principal chemical work was done by them. Gradually other objects were sought for, and a body of workers came to be engaged in earnest efforts to learn more of the composition of the things of the earth, and then the science of chemistry as we know it to-day took shape and grew rapidly. Looking at anything, the chemist first asks, "What does this consist of?" An example will illustrate the kind of answer he will get. Suppose the thing is a piece of granite. He can see with the naked eye that the granite is made up of at least three different things, and by breaking it up and working carefully the three things can be separated from one another. He will discover that they are the three minerals quartz, feldspar, and mica. By treating each of these substances in turn in the proper way, each one can be shown to be made of simple things. Thus the quartz consists of silicon and oxygen; the feldspar, of silicon, oxygen, aluminium, and either potassium or sodium; and the mica, of silicon, oxygen, aluminium, and potassium or sodium, with one or two other substances. Now the question presents itself, Can the substances just named, i. e. silicon, oxygen, aluminium, potassium, and sodium, be further decomposed? And the answer is that although chemists have been working with these things since their discovery, and have subjected them to all the influences at their command, they have not been able to get any simpler things from them. Hence these simple substances are called *chemical elements*. By work similar to that above referred to in connection with granite, all things within reach of the chemist have been found to be made up of not more than seventy elements. Most of these elements are, however, quite rare, most things with which we have to deal being made up of about a dozen elements; and most of the chemical changes that are taking place around us involving only this small number of elements. It has been calculated that the solid crust of the earth is made up approximately as represented in the subjoined table:

	Per cent.		Per cent.
Oxygen	44·0 to 48·7	Calcium	6·6 to 0·9
Silicon	22·8 " 36·2	Magnesium	2·7 " 0·1
Aluminium	9·9 " 6·1	Sodium	2·4 " 2·5
Iron	9·9 " 2·4	Potassium	1·7 " 3·1

While oxygen forms a large proportion of the solid crust of the earth, it forms a still larger proportion (eight-ninths) of water by weight, and about one-fifth of the bulk of the air. Carbon is the principal element entering into the structure of living things; while hydrogen, oxygen, and nitrogen, also are essential constituents of animals and plants. Nitrogen forms four-fifths of the bulk of the air.

The first object of chemistry is to determine what elements enter into the composition of things. But, starting with this object in view, the chemist soon finds that many substances

that occur in nature contain the same elements. Thus there are many compounds known that contain only the elements carbon, hydrogen, and oxygen. Gradually he recognizes the importance of determining not only what elements are in the substance under examination, but *in what proportions by weight they are present*. Work of the first kind is called *qualitative analysis*, while work of the second kind is called *quantitative analysis*. By means of these two kinds of work much of the knowledge included in the science of chemistry has been gained.

There is a third kind of work which has also contributed very largely to the development of chemistry. This is the opposite of analysis. It is *synthesis*. Finding that by various methods they were able to tear things apart or to decompose them, chemists naturally tried to make more complex from simpler things. In this way they succeeded in making artificially in the chemical laboratory not only many of the things that occur in nature, but many more that do not occur in nature, and for years past chemists have been working with things of their own making much more than with things furnished by nature.

Valuable as is a knowledge of the composition of things, both qualitative and quantitative, whether this knowledge be gained by analysis or synthesis, chemistry would never have been what it now is without the aid of guiding thoughts that stimulate to work. In dealing with the problems of analysis and synthesis the chemist has impressed upon his mind the great fact that two or more elements combine with each other and form new things, and that the act of combination is a very wonderful and interesting one. He brings together the elements oxygen and hydrogen, and finds that they can be left in contact with each other for any length of time in a closed vessel without change, but that if the smallest spark be applied to the mixture, a fearful explosion ensues, the gases disappear for the most part, and a few drops of water are formed. He will naturally ask what has happened. He will be interested in the phenomenon for its own sake, but he will not be satisfied when he has learned that the explosion accompanied the act of combination between the elements hydrogen and oxygen; and that the water is the product of the combination of the two elements; and that the elements combine in the proportion of one part by weight of hydrogen to eight parts by weight of oxygen. Can he not learn anything more concerning the act? He can learn that when the gases combine there is a great elevation of temperature; that there is a simple relation between the volumes of the combining gases; that when the act of combination is started in any part of a mixture of the two gases it proceeds with enormous rapidity throughout the mass; that the volume of the water, in the form of gas or vapor, bears a simple relation to the volumes of the combining gases; and, indeed, he can learn much more. In such an investigation he would constantly be brought face to face with the great question: What is the cause of the combination? What holds the hydrogen and oxygen together in the compound, water? What is the condition of things in the mass of the gas hydrogen, and in that of the gas oxygen? What change in the condition takes place when the two combine? In this stage of his inquiry he will necessarily call in his imagination. He has learned certain facts in regard to which there can be no question. He has found that a fact to-day is a fact to-morrow. He gains confidence in facts, and recognizes that in his speculations as to causes he must always be guided by the facts. He strives to imagine a condition of things that would lead to the results he is familiar with. If he succeeds, he proposes his *hypothesis*, which is a guess as to the cause, and if the hypothesis be a good one it sets others to thinking, and from thinking they go to work to see whether their thoughts are or are not well founded. Thus a study of facts leads to hypotheses, and hypotheses in turn lead to further study of the facts, and chemistry grows.

A systematic study of chemical phenomena has been carried on for centuries, and the science of chemistry now includes (1) a knowledge of an enormous number of *facts*; (2) *laws* governing these facts; (3) *hypotheses* as to the causes of the regularities which we call laws; and (4) *theories*, which are hypotheses that have been thoroughly tested and found to hold good. When a subject is spoken of as a science it may be inferred that it has been developed to such an extent as to include all the parts mentioned. Facts alone do not constitute a science, nor do facts and laws alone; there must be hypotheses, and some of these must have become theories before the subject they deal with is entitled to rank as a science.

Hand in hand with the development of a science the application of the truths of the science advances. Mankind is ever ready to make use of new discoveries for its own improvement, and much of the progress of the world from barbarism to civilization is intimately connected with the applications of the treasures of science. Chemistry has been particularly helpful in this respect. It has furnished the world with innumerable substances which are of fundamental importance, and without which it is difficult to see how the world could get along. Take, for example, the substance sulphuric acid. This is not furnished by nature, but is manufactured in all civilized countries by a process devised by chemists. This substance is used in the manufacture of the important compound, soda, which is needed in the manufacture of glass and soap; it is used further in the refining of petroleum, and in the preparation of valuable fertilizers. Its importance can not be overestimated. And so with many other substances. It is clear from what has been said then that we might have the science of chemistry in all its fullness without applying it directly to the material welfare of man. On the other hand, it would be possible to have many of the great chemical industries without the aid of the science, but, as a matter of fact, the growth of chemical industries does to a very large extent to-day depend upon the growth of the science, while science also often profits by the growth of the industries.

In this cyclopædia some of the principal facts of chemistry and the principal chemical industries are presented in independent articles arranged alphabetically; but in order that an idea of the connection between the facts may be more clearly discerned and some conception of the science gained, a brief account of the history of the subject is given, together with a general account of the present condition and object of the science.

Historical.—The old philosophers were much given to speculation and but little to experiment. Indeed, the time is not far distant when working with the hands was considered beneath learned men. In the early ages there was much thinking without a sufficient basis of facts. Many theories were put forward that have since been found to be at variance with the facts. Among the first chemical theories was that of Aristotle regarding the composition of all forms of matter. According to this theory all things are made up of four elements, called earth, air, fire, and water, and the properties of a thing depend upon the proportion in which these elements enter into it. This theory is profound, and is evidently the result of a contemplation of the facts of nature. It would be interesting to discuss it, but this would lead too far, and it must suffice to note that the theory suggests the possibility of converting one substance into another by varying the proportion of the constituent elements. The alchemists were engaged in chemical work with this object in view. Their highest object was the conversion of base metals like lead, copper, and mercury into the noble metals silver and gold. For fifteen hundred years this object was pursued with great industry by many earnest men. What was the result? They found that what they were striving to accomplish could not be accomplished. They found that the metals can not be converted one into the other; that they can enter into combination with other things and form new compounds, and that they can be recovered from these compounds without loss. This work laid the foundation of our present conception of *chemical elements*, which is plainly entirely different from that first held by the alchemists. Now, we consider that substance a chemical element which can not be decomposed by us into simpler substances, and we hold that, so far as our powers go, these elements are quite independent of one another. Further, while engaged upon their chief problem, the alchemists became acquainted with a host of chemical facts, and laid the foundations of the science of chemistry.

In the first half of the sixteenth century, through the influence of Paracelsus, some of those who were engaged in work on chemical substances were seeking another object. The value of some chemical substances as remedies for disease had long been recognized. Now, the importance of the chemical processes constantly taking place in the human body was also recognized, and it appeared that by the introduction of the proper substances into the diseased body the normal chemical condition could probably be restored. The study of chemistry took therefore a medical direction. This period is known as that of *iatro-chemistry*. It was

fruitful in the discovery of new substances, especially such as produced changes in the condition of the human body. Paracelsus, the father of iatro-chemistry, said: "The true object of chemistry is not to make gold, but to prepare medicines."

Toward the end of the seventeenth century much attention began to be given to the phenomena of combustion, and for a period of over a hundred years the leading chemists were engaged in work in this line, guided by a theory that was put forward by Stahl. Before him Boyle and others had added much to the knowledge of the chemistry of combustion, but it remained for Stahl to gather all the knowledge upon the subject together and propose the theory that was destined to exert such a powerful influence on the thoughts of chemists. This is the phlogiston theory. According to this all combustible substances contain a common ingredient called *phlogiston*, which escapes in the process of combustion. The act of combustion consists in the escape of this ingredient. Some substances contain much phlogiston, and therefore burn easily; others contain little and burn with difficulty. Combustion being one of the most common chemical phenomena, it is not surprising that this simple and comprehensive theory at once attracted attention and directed the thoughts of chemists. It held sway until the end of the eighteenth century, when Lavoisier succeeded in furnishing the true explanation of combustion, and, by so doing, in giving chemistry the direction which it has been following ever since. The phlogiston theory was the controlling theory for about 120 years. During most of that time the question as to the weight of substances was not regarded as an important one. True, balances came into use, but their use did not lead to valuable results for some time. It was pointed out from time to time that some things increase in weight by burning, as, for example, tin, lead, zinc, etc., and that this is plainly not in accordance with the phlogiston theory. If something escapes in the act of burning, then that which is left should always weigh less than the original substance. By way of reply it was said by the upholders of the theory that the phlogiston might weigh less than nothing, and thus make the substance in which it was lighter by its presence. It was not, however, until Lavoisier took up the subject that the theory was found to be incompetent to explain the facts, and that a much simpler and much more satisfactory explanation of combustion was presented.

Lavoisier began his studies a believer in the theory of phlogiston, but the facts established by him, taken together with the discovery of oxygen made by Priestley at the same time, showed clearly that the cause of combustion is oxygen. Briefly stated, Lavoisier proved that when a certain weight of a substance is burned in the air, a certain weight of the air disappears as such, and the substance increases in weight just as much as the air loses. He also showed that the part of the air that is used up is identical with the oxygen discovered by Priestley and by Scheele, which they had made by heating red oxide of mercury. His results are summed up thus: When a substance burns it combines with oxygen, and the weight of the product formed is equal to the sum of the weights of the substance burned and of the oxygen used up. There was no room for phlogiston. Nothing escapes when combustion takes place. Combustion is an act of combination with oxygen. The explanation thus given is the one we give to-day.

As Lavoisier reached his great results by the aid of the balance, this instrument came at once to be the chief instrument of chemistry. The quantitative period of chemistry was thus introduced, and very soon new results of fundamental importance were achieved. Before speaking of these, however, one generalization should be noted, as it lies at the basis of all chemistry. This is the law of *the indestructibility of matter*, or the law of *the conservation of mass*, which may be stated thus:

Whenever a change in the composition of substances takes place the amount of matter after the change is the same as before the change.

Assuming that this law has always held good, it follows that the amount of matter in the universe is the same to-day as it was at the beginning. Transformations are constantly taking place, but these involve no increase nor decrease in the total amount of matter. The evidence upon which this law rests is furnished by the innumerable quantitative analyses that have been made since the balance came into general use. Every fact known points to its truth. It is the first great law of chemistry. In the early part of the nineteenth century Dalton discovered two other important laws the truth of which has been verified by all subsequent work. These are (1) *the law of definite proportions*, and (2) *the law of multiple proportions*. The former is thus expressed:

Any given chemical compound always contains the same elements in exactly the same proportion by weight.

The second thus:

If two elements form several compounds with each other, the different weights of one that combine with a fixed weight of the other bear a simple ratio to each other.

The three laws mentioned are simply expressions of what has been found to hold true in all cases thus far examined. As the number of these is very great, it is fair to assume that the laws hold good also in cases not actually examined. These laws bear the same relation to the facts that every other law of nature does. They go beyond the facts and are an expression of facts known. It is, however, one thing to know a general fact or to know a law, and quite another thing to know the reason why the law holds good. We know that all bodies are attracted by the earth, and that they fall when thrown in the air. This is a very remarkable fact, and one of immense importance. We know that it is true, as we have evidence of its truth every day. But yet we do not know why it is so. We say that the earth attracts other bodies by virtue of gravitation, but this does not tell us anything whatever about the cause of the phenomenon. We might verify the law of universal attraction over and over again without getting any nearer to the explanation. So, too, we might verify the important laws of definite and multiple proportions over and over again without being able to give an answer to the question why do substances combine according to these laws. Here comes in the hypothesis.

Dalton not only discovered the laws, but he proposed an hypothesis which has since developed into a theory, the most important and most fruitful theory of chemistry. This is the *atomic theory*. If we consider any simple form of matter or element, such as iron, it is clear that there are two views which we may hold regarding the way the substance is made up. We know we can subdivide every piece of iron we can see, no matter how small it may be; and though after a time the particles would become so small that we could no longer subdivide them, still we can imagine that by more refined methods the process of subdivision might be continued forever. If we believe that such infinite subdivision is possible, we hold the hypothesis that matter is infinitely divisible. We can not prove this—we can only speculate in regard to it. But we may also conceive that after the process of subdivision has been carried on for a time until extremely minute particles have been reached, a limit will be found beyond which the process of subdivision can not be carried. If we believe this, we hold the hypothesis that matter is not infinitely divisible, and this carries with it the belief that matter consists of *indivisible particles*, that is, of particles that can not be made smaller by any means known to us. These particles may be called *atoms* (from the Greek ἄτομος, indivisible). Both of these hypotheses have been held for ages. But the discussion in regard to the relative merits of the two was not profitable, because the facts known did not make either hypothesis necessary.

When, however, the laws of definite and multiple proportion were discovered, Dalton saw that the conception of atoms might furnish an explanation of the laws. If each element is made up of atoms, the most probable view is that every atom of a particular element is like every other atom of that element. Among the properties possessed by these atoms must be weight. It is probable that the atoms of different elements have different weights. Let us suppose now that when two elements combine chemically the action takes place between the atoms, so that one atom of the one element combines with one of the other, and so on throughout the mass. If in the mass of the one element there were exactly as many atoms as in the mass of the other element, both substances would enter into combination completely. But if there were a larger number of atoms of one element than of the other, then of the element of which the larger number of atoms is present some would be left uncombined. Suppose, further, that the weights of the atoms of the two elements are to each other as one to ten. Then if when these two elements are brought together they combine in the proportion of one atom of one to one atom of the other, the resulting compound will contain the elements in the propor-

tion of one part by weight of one to ten parts by weight of the other. Or if on analyzing a compound of two elements we find that it contains one part by weight of one to ten parts by weight of the other, we should conclude that the weights of the atoms of the two elements bear to each other the ratio one to ten. The atomic theory thus furnishes an explanation of the facts summed up in the law of definite proportions. As the atoms are indivisible, if two elements combine in more than one proportion they must do so in the proportion of one atom of one to two atoms of the other, or one to three, or two to three, or in some other way that does not involve a breaking down of single atoms. If, for example, two elements, the weights of whose atoms are as one to ten, combine in the proportion of one atom of one to one atom of the other, the resulting compound will contain the elements in the proportion of one part by weight of one to ten parts by weight of the other element. If the same elements combine in the proportion of one atom of the first to two of the second, then the resulting compound will contain the elements in the proportion of one part by weight of one to twenty parts by weight of the other, and so on. It will thus be seen that the law of multiple proportions, as well as that of definite proportions, finds a satisfactory explanation in the atomic theory. All experience in the field of chemistry tends to show that the atomic theory is well founded. It has been the guide of chemists for nearly a hundred years, and it has led them into most interesting fields where they have made important discoveries.

The atomic theory being accepted, the determination of atomic weights becomes one of the principal problems of chemistry. So many difficulties have been encountered in this that some of the leaders have entirely abandoned the use of the word atom, and speak of *equivalents*. An equivalent of an element was that relative weight of the element that combined with one part by weight of hydrogen. Thus 8 parts of oxygen, 35·4 parts of chlorine, 80 parts of bromine, and 16 parts of sulphur combine respectively with 1 part by weight of hydrogen, and therefore 8, 35·4, 80, and 16 are said to be the equivalents of these elements. But, unfortunately, there are many elements that do not combine with hydrogen, and some combine with it in more than one proportion, so that the difficulty of determining equivalents is as great as that of determining atomic weights. Then it was proposed to call these important weights *combining numbers* and *combining weights*, but the old difficulties remained in spite of the new names. Meantime, through the aid of a large number of observations, chemists gradually came to recognize the truth of a generalization that was made by Avogadro in Italy at about the same time that Dalton proposed the atomic theory. This same generalization was also made a little later by Ampère, of France. Avogadro's law, as it is commonly called, is this: *Under the same conditions of pressure and temperature, equal volumes of all gaseous substances, whether elementary or compound, contain the same number of molecules.*

Although this law was distinctly stated in 1811, it did not exert much influence on chemistry for nearly half a century. Then it came to be recognized as a firm foundation for speculations on the subject of atomic weights, and its truth is now generally acknowledged by chemists and physicists. According to this law it is an easy matter to determine the relative weights of the molecules of all gaseous substances. But the molecule is not the atom. It is, however, not difficult, knowing the molecular weights of a number of compounds of an element, to determine the atomic weight from these. As regards the distinction between atoms and molecules, an example or two will make this clear. Common salt or sodium chloride is a compound of the elements sodium and chlorine. According to the theory, the smallest particle of sodium chloride is a molecule. But each molecule must be made up of at least one atom of sodium and one atom of chlorine. So, too, with an element such as hydrogen. The gas as we know it—that is, free hydrogen—is conceived as made up of molecules, and these molecules in turn of atoms. It may be, however, that the molecule of an element is identical with its atom, or the molecule may consist of two, three, or more atoms. In the latter case the atoms are believed to be held in combination in the same way as in the molecule of a compound. The molecule of a compound is therefore made up of atoms of different kinds, while that of an element is made up of atoms of the same kind. These conceptions of molecules and atoms based upon the law of Avogadro form the foundation of what is frequently called "modern chemistry." With the adoption of these conceptions came a definite and consistent system of atomic weights, upon which the great majority of chemists were agreed. These are the atomic weights at present in use, and they are based not only upon Avogadro's law, but upon a large mass of other evidence.

Another law that is of value in connection with the problem of the determination of atomic weights is the law of Dulong and Petit, discovered in 1819. This is expressed as follows: *The specific heat of an element multiplied by its atomic weight is a constant* (*about 6·25*).

According to this, it is only necessary to determine the specific heat of an element, and divide this into the constant 6·25 to get the atomic weight. What is meant by specific heat will appear from the following: It is known that when equal weights of different substances are exposed to heat from the same source, they have different temperatures at the end of the same period of time. From this it is clear that to raise equal weights of different substances the same number of degrees different quantities of heat are necessary. Given exactly the same heating-power, it takes about thirty-two times as long to raise the temperature of a pound of water 10, 20, or 30 degrees as it takes to raise the temperature of a pound of mercury the same number of degrees; or it takes thirty-two *times as much heat* to raise the temperature of a pound of water 10, 20, or 30 degrees as it takes to raise the temperature of a pound of mercury the same number of degrees. The quantity of heat required to raise the temperature of a given weight of any substance a given number of degrees, as compared with the quantity of heat required to raise the temperature of the same weight of water the same number of degrees, is called the specific heat of the substance. The specific heat of water being taken as the standard, that of mercury is $\frac{1}{32}$ or 0·03332; that of gold is 0·03244, etc.

While the adoption of the system of atomic weights now in use has led to clearer views in regard to many chemical phenomena, and has been of great service to chemistry in many other ways, there is one special result that demands attention even in this brief account. It has been shown by Mendeléeff, Lothar Meyer, and previously in a less satisfactory way by Newlands, that the properties of the elements are most remarkably connected with their atomic weights. Hydrogen, the lightest element, with lowest atomic weight, does not fit into the system. Beginning with that one which comes next in the order of increasing atomic weights, and arranging it with the following thirteen elements simply with reference to the increasing atomic weights, we have this table:

Lithium, 7; Glucinum, 9; Boron, 11; Carbon, 12;
Sodium, 23; Magnesium, 24; Aluminium, 27; Silicon, 28;

Nitrogen, 14; Oxygen, 16; Fluorine, 19;
Phosphorus, 31; Sulphur, 32; Chlorine, 35·5.

In these two series elements which we recognize as similar come to stand in the same vertical line, as lithium and sodium, glucinum and magnesium, carbon and silicon, fluorine and chlorine, etc. But this is only the beginning. Further examination showed that all the elements can be arranged in series similar to the above, and thus a very intimate connection between the atomic weights and the properties of the elements is known to exist. It will be noticed that the changes in the properties of the elements are *periodic*. Hence the law governing the relations between the atomic weights and properties of the elements is known as *the periodic law*. The relations can be expressed in different ways. The subjoined table, proposed by Mendeléeff, is the one most commonly used. In order to aid in its interpretation a list of all the elements, with their symbols and atomic weights, is given first. In this list the names of the most common elements are printed in SMALL CAPITALS and those of the rarest elements in *italics*.

LIST OF THE ELEMENTS, THEIR SYMBOLS AND ATOMIC WEIGHTS.

ALUMINIUM	Al	27·04	Columbium	Cb	93·7
Antimony	Sb	119·6	Copper	Cu	63·18
Arsenic	As	74·9	*Didymium*	Di	142·1
Barium	Ba	136·9	*Erbium*	E	166
Bismuth	Bi	207·3	Fluorine	F	19·06
Boron	B	10·9	*Gallium*	Ga	69·9
Bromine	Br	79·76	*Germanium*	Ge	73·32
Cadmium	Cd	111·7	Glucinum	Gl	9·08
Cæsium	Cs	132·7	Gold	Au	196·7
CALCIUM	Ca	39·91	HYDROGEN	H	1

Selenium	Se	78·87			

In this table the atomic weights are given as in the original. Many of them differ slightly from the figures determined by the most accurate work.

family; its properties are the result of that particular weight. Further, it seems to follow that the elements are not entirely independent forms of matter, but that they are in all probability compounds of a small number of simple elements at present unknown to us. Of this, however, we have no evidence, and until some one succeeds in isolating one or more of these ultimate elements it is almost useless to speculate in regard to them. See Argon and Spectrum (*Helium*).

From the earliest times chemists have speculated upon the constitution of matter, and some of the most prominent views that have been held have been briefly referred to in the foregoing. The general acceptance of the atomic theory and of the notions of chemical combination presented by Lavoisier led to new ideas in regard to chemical constitution. In Lavoisier's system oxygen was the controlling element. Oxygen formed acids and oxygen formed bases, and acids and bases formed salts with one another. Then early in this century the idea that electricity was the cause of chemical combination was held by many, and was earnestly advo-

It will be seen that in Group I. are the metals of the alkalies; in Group II. calcium, strontium, and barium, magnesium, zinc, and cadmium; in Group III. boron, aluminium, scandium, etc.; in Group IV. carbon, silicon, tin, lead; in Group V. nitrogen, phosphorus, arsenic, etc.; in Group VI. sulphur, selenium, tellurium; in Group VII. fluorine, chlorine, bromine, and iodine. Between the fourth series, ending with manganese, and the next one, beginning with copper, there are three similar elements, iron, cobalt, and nickel. So, too, a similar group of three elements—ruthenium, rhodium, and palladium—comes between the sixth and seventh series; and another, consisting of osmium, iridium, and platinum, between the eleventh and twelfth. If we know the atomic weight of an element, we can tell approximately where it belongs in the table, and from its position we can determine its properties with considerable accuracy. When the table was first constructed three elements now included in it were not known. These are scandium, gallium, and germanium. It was seen, however, that the gaps existed, and it was predicted by Mendeléeff that elements would be found with atomic weights approximately 44, 69, and 72, and that these elements would have certain properties which were clearly stated at the time. The predictions were confirmed by the subsequent discovery of all three of these elements, and their properties were found to agree very closely with the descriptions given long before the elements were known. Unquestionably the properties of the elements are determined by their atomic weights. An element whose atom weighs one hundred times as much as that of hydrogen must have certain properties. It must combine with hydrogen and with oxygen in certain proportions; it must be allied to the members of the chlorine

cated by Sir Humphry Davy and by Berzelius. According to the electro-chemical theories, every compound, however complex it may be, consists of two parts, one of which is electro-positive and the other electro-negative. In order that we may know the constitution of a compound according to this theory, we must know what elements enter into it, the relative weights of the elements contained in the compound. This is expressed in the terms of the atomic theory by saying that it contains certain atoms. Thus sodium sulphate is said to consist of two atoms of sodium, four atoms of oxygen, and one atom of sulphur, and this is expressed by the formula Na_2SO_4. But now, according to the electro-chemical theory, this is made up of an electro-positive and an electro-negative part, and it ought to be possible to determine what these are by passing an electric current through the compound in solution, and noting what part goes to the positive pole and what to the negative. It is found that the part containing the sodium goes to the negative pole, and is itself, therefore, positive, while the part containing the sulphur goes to the positive pole, and is therefore negative. This was expressed thus, $\overset{+}{Na_2}O.\overset{-}{SO_3}$. All formulas then came to be written in a similar way. But the electro-chemical theory was found to lead to inconsistencies, and was finally abandoned. The so-called *binary theory* was an outgrowth of the electro-chemical theory. It was not of broad application, having to deal mainly with salts. According to it every salt consists of two parts. At one time these two parts were held to be an acid and a base. Later they were a metal and an acid radical.

After the electro-chemical was given up, it was recognized that while the number of compounds is enormous they fall

into a comparatively few classes, the members of each of which resemble some simple compound which is the type of the class. The four *types* to which compounds were referred are hydrochloric acid, ClH, water, H_2O, ammonia, NH_3, and marsh gas CH_4. Or the formulas of these typical compounds may be written thus:

$$ClH \qquad O\begin{cases} H \\ H \end{cases} \qquad N\begin{cases} H \\ H \\ H \end{cases} \qquad C\begin{cases} H \\ H \\ H \\ H \end{cases}$$

By substituting other elements or groups of elements for the hydrogen, the composition of each type may be changed in a great variety of ways, but the general plan of the compound will be the same as that of the simple type. This so-called type theory served a valuable purpose, and led gradually to the views at present held regarding the constitution of chemical compounds. These views resulted from the efforts of many, among whom may be mentioned Frankland, Würtz, Hofmann, Williamson, and Kekulé. It was, however, largely due to Kekulé's clear and comprehensive treatment of the subject of constitution that chemists came to accept the views now generally held. In an important article published in 1858 he said: "I consider it necessary, and in the present state of our knowledge I consider it possible, in many cases to go back to the elements themselves which make up the compound." At the present time the expression constitution of a compound means the arrangement of the atoms composing the molecule of the compound. It is believed that these atoms are connected or linked together in definite ways, and that by studying the decompositions and syntheses of a compound it is possible to draw conclusions as to the order in which the atoms are linked together. It is easily seen that different kinds of atoms have different linking powers. Thus hydrogen and chlorine have this power in its simplest form. An atom of hydrogen can hold in combination but a single atom of chlorine, and an atom of chlorine can hold but a single atom of hydrogen. An atom of oxygen can, however, hold two atoms of hydrogen, an atom of nitrogen can hold three atoms of hydrogen, and an atom of carbon can hold four atoms of hydrogen. This power of an atom to hold a certain number of other atoms in combination is called *valence*, and sometimes *atomicity*; and, according to differences like those referred to, the elements are divided into *univalent*, *bivalent*, *trivalent*, *quadrivalent*, according as they are like chlorine, oxygen, nitrogen, or carbon. The determination of the constitution of a chemical compound involves then the following steps:

(1) The analysis, qualitative and quantitative;

(2) The determination of the molecular weight by the aid of Avogadro's law or some similar law;

(3) The determination of the molecular formula from the results obtained in steps 1 and 2;

(3) The determination of the way in which the atoms are linked together by a study of the decompositions and syntheses of the compound.

The formula $H-\overset{H}{\underset{H}{C}}-\overset{O}{\overset{\|}{C}}-O-H$ represents the constitution of ordinary acetic acid as determined by the methods referred to. It is a condensed statement of a great many facts that have been established by much work, and the facts are expressed in the terms of the theory of atoms, the theory of molecules, the hypothesis of the linking of atoms, and the hypothesis of valence. Constitution, in the sense in which that word has been used, has no reference to the arrangement of atoms in space. It refers simply to connections, not to directions. Quite recently, however, the study of certain phenomena has led to a conception of constitution which does involve the consideration of space-relations, and a new branch of chemistry has sprung up, known as STEREO-CHEMISTRY (*q. v.*). It would lead too far to discuss this subject here. Suffice it to say that most chemists at present believe that there are good grounds for believing that conclusions can be drawn in many cases as to the shape of the molecules, and more particularly as to the space-relations of the atoms in certain molecules, and this fascinating subject is now under active investigation in a number of the leading laboratories of the world. The results already obtained are such as to give promise of brilliant successes in the future.

Up to the present most chemists have been engaged in the study of questions pertaining directly to composition and constitution, and work of this kind promises to yield rich rewards for years to come. Most of the work is of such a kind as to be practically incomprehensible, except to one who has a thorough knowledge of chemistry, and so the world at large hears very little of it. It is only when the results are of such a character that they can be utilized by mankind that they come to be known at all. Let a chemist discover a dyestuff or a medicine or a very sweet, or a very pleasant-smelling substance, and the world feels that he has done something. The discovery of the aniline dyes, of the artificial preparation of alizarin or Turkey red, of the sweet substance known as saccharin, of antipyrine, of sulphonal, of choral, of nitroglycerin, etc., of these the world hears. But of the countless thousands of long-named substances which are constantly being described in the chemical journals, the world hears nothing and cares nothing. It does not follow from this, however, that these things are of no importance. They may be of the very highest importance, and yet absolutely incomprehensible to the world. Anything that advances the science of chemistry, even to a very slight extent, is of importance, for, leaving all other thoughts out of consideration, it is only through advancement of the science that further applications of the science become possible. But there is a higher argument. Anything that gives a clearer insight into the secrets of nature is of value to man, whether it be capable of direct application to his material wants or not.

There is another side of chemistry of which no mention has been made thus far, and this side has been coming into greater prominence within the last few years. A complete study of chemistry involves not only the subject of constitution, but that of the nature of chemical action. Some chemists are no longer satisfied with studying chemical elements and chemical compounds as such, but they have sought to make observations during the progress of chemical action, and thus to get an insight into the nature of the act. For various reasons there are serious difficulties in the way of such observations, but, notwithstanding these, some progress has been made in this kind of study. This branch of chemistry is generally called *physical* or *general chemistry*. It has been shown that the extent to which two or more substances act upon one another is determined by the mass of the substances as well as by something which is called the affinity, and methods have been devised for determining the affinity of certain classes of substances. The amount of heat evolved or absorbed in chemical reactions has been carefully measured in a large number of cases, and some conclusions of general application have been reached. This special branch of physical chemistry is called *thermo-chemistry*. Finally, the study of solutions has led to some very curious results. Prominent among these is the conception that many substances, particularly the common acids, bases, and salts, are broken down when dissolved in water, and that in the solutions these decomposition products or *ions* are present. Thus when sodium chloride or common salt is dissolved in water, it is believed by many that it is broken down into the ions chlorine and sodium, and that these exist as such in the solution. It is not meant by this that the substances we know as chlorine and sodium are present as such, but the atoms of these elements highly charged with electricity. In the article on SOLUTION (*q. v.*) this subject will be presented somewhat more fully, though it should be said that this hypothesis has not yet taken its final place in chemistry.

Chemistry is taught very generally in schools, colleges, and universities. It touches a good many subjects, and it is taught, further, for the most part for the purpose of giving some insight into the methods of natural science. Chemical laboratories were the first into which students were admitted for instruction. The first chemical laboratory built for instruction and investigation was that of Liebig at the University of Giessen. Now hundreds of better equipped laboratories are found in every civilized country, though there is hardly a laboratory that can point to richer results than those obtained in the old laboratory at Giessen. There are now not only chemical laboratories, but physical, biological, pathological, psychological, and other laboratories in which the scientific work of the world is carried on. It would be difficult to overestimate the value of the work done in them year by year.

After this general account, it will be easier to give a definition of chemistry than it was at the outset. It was then stated that "chemistry is that science which has to deal with the composition of the various forms of matter of which the universe is made up, and with the changes in

composition which these forms of matter undergo." If rightly understood, this definition is satisfactory; but from what has been said, it is clear that the chemist's task is not done when he has determined the composition of substances. He must go further, and determine the constitution, and further still and strive to learn what the chemical reactions are that give rise to the compounds he deals with. He must investigate everything that is likely to help him in his effort to discover what takes place when substances act upon one another chemically. His field is boundless, and new visions are appearing to him at every advance.

Chemmis, kem'mis (in Gr. Χέμμις): a city of ancient Egypt; the modern Ekhmim. See Egypt, Ancient; Panopolis.

Chemnitz, chem'nits: a town of the kingdom of Saxony, Germany; in the circle of Zwiekau; on the Chemnitz river; 44 miles W. S. W. of Dresden (see map of German Empire, ref. 5–G). Chemnitz is the most important manufacturing town in the kingdom, but ranks next to Leipzig and Dresden in population. It produces largely cheap cotton goods for the European and American markets. It is also engaged in the manufacture of silks and woolens, and in calico-printing, and the construction of machinery, steam-engines, etc. It has several handsome buildings, a gymnasium, an industrial school of great repute, technical schools, etc. It was formerly fortified, but its walls have been converted into promenades. Chemnitz was an imperial city from the thirteenth century to the seventeenth. Its prosperity was originally due to the linen-weaving of the Wends. Cotton-weaving was introduced in 1799, and developed greatly after 1834 when the kingdom joined the customs union. Pop. (1895) 161,017.

Chemnitz (Lat. *Chemnitius*), Martin: Lutheran theologian; b. at Treuenbrietzen, in Brandenburg, Nov. 9, 1522. Owing to straitened means his university course at Wittenberg was brief, and was confined mainly to the study of mathematics. Under the advice of Melanchthon his theological studies were pursued privately, especially from 1550–52, while librarian of the Duke of Prussia. He became lecturer on Melanchthon's *Loci* at Wittenberg in 1552. From 1554 to 1567 he was preacher in Brunswick, and delivered weekly theological lectures. He became superintendent in 1567, and showed great organizing ability. His chief works were *Examen Concilii Tridentini* (1565–73), one of the ablest defenses of Protestantism; *De Duabus Naturis*, an epoch-making treatise on the Incarnation; and the posthumous *Loci Theologici* (1591), being a commentary on Melanchthon's system. He also began a *Harmony of the Gospels*, and was one of the authors of the *Formula of Concord*. D. Apr. 8, 1586. Bossuet said that Luther, Chemnitz, and Gerhard were three in a series of Lutheran theologians in which there was no fourth. Henry E. Jacobs.

Chemosh: the national deity of the Moabites (*q. v.*); essentially the same as the Moloch of the Ammonites or the Canaanitic Baal. His worship was introduced into Jerusalem by Solomon.

Chemsian: See Chimmesyan Indians.

Che'mulpo': an open or treaty port on the west coast of Korea; 27 miles from Seoul, the capital, with which it is connected by a good road; lat. 37° 10′ N., lon. 126° 40′ E. (see map of China, ref. 4–L). There were only three foreign firms there in 1892, and the trade is mostly in the hands of Japanese. The chief exports are hides and beans, valued in 1887 at $260,000: the imports were mostly cotton and woolen goods, and were valued at $1,200,000.

Chemung, shĕĕ-mŭng': a river of New York; formed in Steuben County by the union of the Conhocton and Tioga rivers. It flows in an E. S. E. direction through Chemung County, and enters the North Branch of the Susquehanna about a mile below Athens, in Bradford co., Pa.

Chemung Group: in U. S. geology, a prominent division of the Devonian system of rocks, characterized by the upper marine fauna of the Devonian. The rocks are typically irregular alternations of shaly sandstones, coarse shales, and flaggy sandstones, characteristically brownish gray in color, named for Chemung County, river, or town in Southern New York, and outcropping over the southern half of the western counties of New York State, as well as in the Appalachian region. Other rocks in Iowa in the Western States, and in Maine, are referred to the Chemung group. Palæontologically the Chemung group is equivalent to the Upper Devonian of the British and European classifications. See Geology and Palæontology. H. S. Williams.

Chenango River: rises in Oneida co., N. Y.; flows S. S. W. through Madison and Chenango Counties; enters the Susquehanna at Binghamton. Length, 90 miles.

Cheney, Charles Edward, D. D.: clergyman; b. at Canandaigua, Ontario co., N. Y., Feb. 12, 1836. He graduated at Hobart College, Geneva, N. Y., in 1857, and studied at the Theological Seminary of Virginia. Nov. 21, 1858, he was ordained deacon and became assistant rector of St. Luke's church, Rochester, N. Y. Subsequently he took charge of St. Paul's church at Havana, N. Y. (1859), and in Mar., 1860, he was ordained a presbyter, and took charge of Christ church mission in Chicago. In consequence of his refusal to use the word "regenerate" in the baptismal offices, he incurred the displeasure of his diocesan, Bishop Whitehouse, and his trial for this offense has become historic. During this trial by an ecclesiastical court an injunction from the Superior Court was obtained by Melville W. Fuller (now Chief Justice of the U. S.), Mr. Cheney's counsel, on the ground that his client could not have justice at the hands of the ecclesiastical tribunal as constituted. On a hearing the injunction was dissolved, and the trial proceeded. Mr. Cheney was found guilty and was suspended from the exercise of his sacerdotal functions for a stated time. Refusing to obey the decision of the court, a new trial for contumacy followed, and on this ground—that of contumacy—he was finally deposed from the priesthood of the Protestant Episcopal Church. He received consecration as a bishop (Dec. 14, 1873), from the hands of the Rt. Rev. Dr. Cummins, late assistant Bishop of Kentucky, who had left the church of which he was a bishop with the view of founding an organization more in sympathy with the evangelical bodies who have not the episcopate. Dr. Cheney still remains in charge of Christ church, Chicago, the parishioners of which followed him into the Reformed Episcopal Church.

Cheney, John Vance: poet; b. at Groveland, N. Y., Dec. 29, 1848; practiced law in New York till 1876, when he removed to San Francisco; librarian of the public library there 1887–94, and of the Newberry Library, Chicago, since 1894. Among his poems are *Thistle Drift* (1887) and *Wood Blooms* (1888).

Chénier, shā'ni-ā', André Marie, de: poet; b. in Constantinople, Oct. 30, 1762, his father being consul-general of France, his mother a beautiful and cultivated Greek named Santi-l'Homaka before her marriage. He was educated in Paris, and early conceived a profound enthusiasm for Greek poetry and art. At sixteen he proposed to translate Sappho. He was, however, a serious student and, on the whole, had the intellectual sympathies of the eighteenth century rather than the romantic passions of the nineteenth, of which he has so often been called an early representative. In 1787 he went as secretary of legation to London, where he lived somewhat gloomily for a time, deriving little from England except an admiration for the English Constitution, which subsequently led him to oppose and denounce the tendencies toward anarchy which appeared in the French Revolutionary movement. At the first outbreak of the Revolution, however, he hailed it with gladness. He returned to France and threw himself into the political whirl. But before long he found himself vehemently opposing the men into whose hands the direction of things had fallen. He was arrested and after a time in prison guillotined July 25, 1794.

The enduring portion of Chénier's poetry is that which conveys his love of beauty, his passion for antique art, his reflection upon the universe, rather than that which conveys his political loves and hates. His early death, however, left his work in a very unfinished and even fragmentary condition. Of his three longer poems, *l'Invention*, *Hermes*, and *Susanne*, only the first is completed. The *Hermes*, in which the poet attempts a new version of the theme of Lucretius, *De Rerum Natura*, is the most interesting. Of his shorter poems, idyllic in form, several are among the masterpieces of the French tongue: *l'Aveugle*, *la Liberté*, *le Mendiant*, *le Jeune Malade*. His ode to Charlotte Corday and that to *la Jeune Captive* are equally famous. See H. de Latouche, *Notice sur André Chénier* (1826); Sainte-Beuve, *Critiques et Portraits* (t. ii.), and his *Causeries de Lundi* (t iv.): B. de Fouquières, *Poésies d'André Chénier, avec une étude* (1872);

id., *Œuvres en prose d'A. C.* (1872); id., *Documents nouveaux sur A. C.* (1875); *Œuvres de A. Chénier*, ed. by L. Moland (1882). A. R. Marsh.

Chénier, Marie Joseph Blaise, de: French poet and dramatist; younger brother of André Chénier; b. Feb. 11, 1764, at Constantinople. After several discouraging failures he produeed at the Théâtre Français, Nov. 4, 1789, his tragedy *Charles IX.*, which proved to be a politieal event of the first importance. From this moment the poet was famous as the representative on the stage of the impulses which led to the Freneh Revolution. Danton said of *Charles IX.*: "Si *Figaro* a tué la noblesse, *Charles IX.* tuera la royauté." The poet's next great success was his *Caius Gracchus* (1792), full of lofty republican sentiment and patriotie pride. The famous phrase, *Des lois, et non du sang*, however, brought it and the poet into suspicion during the dark days of the Terror. In 1794 *Timoléon*, a play full of protests against violenee and tyranny, was not allowed to be played, and indeed would have been destroyed completely had not Mme. Vestris secretly kept a copy of the MS. These three plays constitute Marie Joseph Chénier's main literary achievement. They had great political signifieanee, and they also did much to prepare the way for the romantie drama of our century. The poet wrote besides many patriotic songs and odes, among them the famous *Chant du départ* whieh was almost as popular among the Freneh soldiers as the *Marseillaise*. Chénier had also for a time an important political *rôle* as a moderate republiean. His last years were embittered by a baseless ealumny to the effect that he had a hand in the death of his brother André. D. Jan. 10, 1811. See *Œuvres de Marie-Joseph de Chénier* (ed. Arnault, 8 vols., 1823–26); Ch. Labitte, *Marie-Joseph Chénier*, in his *Études littéraires* (t. ii.). A. R. Marsh.

Chenoa: town (settled 1856, incorporated 1872); McLean co., Ill. (for loeation of eounty, see map of Illinois, ref. 5–E); at junetion of Chieago and Alton and Toledo, Peoria and Western R. Rs.; 102 miles S. of Chicago, 48 miles E. of Peoria. It has a graded sehool, seven ehureh organizations, tile-works, kiln-factory, canning-faetory, ereamery, and coal mines. Agrieulture is an important industry. Pop. (1880) 1,063; (1890) 1,226; (1900) 1,512.

Editor of "Chenoa Gazette."

Chenopodium, kĕ-nō-pō'di-ŭm [from Gr. χηνόπους, goose-foot: χήν, goose + πούς, ποδός, foot]: a genus of herbaeeous plants of the family *Chenopodiaceæ*; natives of America, Europe, and Asia. They are weeds, growing in gardens and waste plaees, and often covered with a white mealiness. Several speeies are naturalized in the U. S., and are known by the names of goosefoot, pigweed, and lamb's quarter. The *Chenopodium anthelminticum* (wormseed) is a native of the U. S. An oil whieh is obtained from the seeds of this plant is administered as a remedy for worms. Among the more important plants of this genus is Quinoa (*q. v.*).

Chenopods, ken'o-podz (see Chenopodium): a family of dieotyledonous plants (*Chenopodiaceæ*) with small, greenish, apetalous flowers, each with a one-eelled and one-seeded ovary; seed with a long, curved embryo in eopious endosperm. The beet (*Beta vulgaris*), spinach (*Spinacia oleracea*), and many weed plants belonging to many genera (e. g. *Cycloloma*, *Chenopodium*, *Atriplex*, *Corispermum*, *Salsoli*, etc.), are well-known ehenopods. There are 520 species known, of which a few in the tropics are small trees.

Charles E. Bessey.

Cheops, kee'ops (in Gr. Χέοψ): the name given by Herodotus to the despotic builder of the great pyramid in Egypt, now identified with Suphis I. (or Shufu) of the monuments. He was the second king of the fourth dynasty, whieh was established at Memphis about 2500 B. C., aeeording to the more sober Egyptologists. See Suphis.

Cheper: See Kheper.

Chep'stow: a town and river-port of England; county of Monmouth; on the river Wye; 2½ miles from its entranee into the estuary of the Severn, and 141 miles by rail W. of London (see map of England, ref. 12–F). At Chepstow occurs the highest tidal bore in Europe, rising suddenly often 50 feet and sometimes more than 65. Pop. (1891) 3,378.

Cher, shăr: a river of Central France; rising in the department of Creuse. It flows in a general N. W. direetion through the departments of Allier, Cher, and Loir-et-Cher, and enters the Loire immediately below Tours. Total length 207 miles. It becomes navigable when it receives the rivers Arnon and Yévre.

Cher: a central department of France; area, 2,780 sq. miles. It is bounded E. by the river Loire, and is intersected by the Cher. The surface is nearly level, and extensively covered with forests; the soil is variable; the staple products are wine, hemp, flax, and wool. It has mines of eoal and iron, and manufaetures of woolen fabrics. Capital, Bourges. Pop. (1891) 359,276; (1896) 347,725.

Cheraw': railroad junetion: Chesterfield co., S. C. (for loeation of county, see map of South Carolina, ref. 5–F); on Pedee river, at the head of navigation; 140 miles N. of Charleston. It has two academies, several other sehools, and a public library. During the civil war this plaee, whieh was a dépôt of supplies for the Confederates, was eaptured Mar. 3, 1865, by the Federal forees under Gen. Sherman. Pop. (1880) 918; (1890) 976; (1900) 1,151.

Cherbourg, sher'bŭrg, or (Fr. pron.) shăr'boor' (in Lat. *Caroburgus*): a fortified seaport-town and important naval station of Franee; department of Manche; on the English Channel; and at the N. end of the peninsula of Cotentin; 229¾ miles by rail W. N. W. of Paris; lat. 49° 38′ N., lon. 1° 37′ W. (see map of Franee, ref. 2–C). Its climate is mild. The streets are narrow, and there are but a few public buildings of any importanee. Among these are the ancient tower and the Church of La Trinité, in front of whieh is a colossal statue of Napoleon I. It eontains a eommunal eollege, a public library, a museum, and a theater; also manufaetures of hosiery, ehemieals, laee, and leather, but the industry of the inhabitants is ehiefly employed in the arsenal and dockyards. Vast sums of money have been expended here in fortifications, and in public works for the improvement of the harbor. The latter is sheltered by land on three sides, but is open to heavy seas and storms on the N. To proteet it from these the eonstruction of a breakwater, or *digue*, was eommeneed in the reign of Louis XVI. and eompleted under Napoleon III. Cherbourg breakwater is the most gigantic work eonstructed for such a purpose in ancient or modern times, and is a noble monument of the skill and perseveranee of the Freneh engineers. (See the article Breakwater.) At the meeting of the two branches of the breakwater there is an important eentral fort. The town is also defended by a number of other batteries faeing the sea, besides two important forts on the land side. The naval port eonsists of a harbor 776 feet long by 663 feet wide, whieh eommunicates with two large wet doeks. The eommereial harbor at the mouth of the Divette, half a mile distant, is conneeted with the sea by a eanal 650 feet long and 54 feet in width. Outside these harbors is the bay, whieh is of a triangular shape. William the Conqueror founded a hospital and a ehureh here. Cherbourg was besieged by the English in 1378, 1418, 1450, and 1758. Pop. (1881) 35,691; (1891) 38,554; (1896) 40,783.

Cherbuliez, shăr'bü'li-ay', Victor: novelist; nephew of Antoine Elysée, and son of André Cherbuliez. Professor of Hebrew at Geneva; b. July 19, 1829. His *À propos d'un Cheval*, a reverie on ancient art, appeared in 1860, and was followed by the romances *Comte Kostia* (1863); *Paule Meré*; *Le Roman d'une honnête femme* (1866); *Le grand œuvre* (1867); *Ladislas Bolski* (1869); *Samuel Brohl et Cie.* (1877), *La vocation du Comte Ghislain* (1888); a work on *Men and Things of the Present Time* (1883); *Le secret du Précepteur* (1893), etc. He was elected to the French Aeademy in 1882. D. in Paris, July 1, 1899.

Cherea, or **Chærea**, Cassius: the murderer of Caligula; first mentioned during the revolt of the German legions after the death of Augustus, when he eseaped the general massacre of the eenturions by his brilliant valor and intrepidity. As tribune of the prætorian guard he afterward beeame one of the prineipal members of the eonspiraey against Caligula, and when the emperor, on Jan. 24, 41 A. D., returned from the theater, where he had been present at the games eelebrated in honor of Augustus, it was Cherea who in the long gallery of the palaee gave Caligula the first blow. He supported the senate in its attempt to establish the republie, but meanwhile the prætorian guard had declared Claudius emperor, and next day Cherea was exeeuted.

Cheres: See Egypt, Ancient.

Cheribon, sher'i-bon, or **Sheribon**: a seaport town on the north coast of Java; capital of the resideney of Cheribon; at the head of a bay: 128 miles E. S. E. of Batavia. It was formerly of importanee, but suffered severely from a plague in the earlier part of the nineteenth century. It exports eoffee, indigo, pepper, etc. Pop. 11,000.

Cherimoy'er, or **Chirimoy'a**: the fruit of a species of Anona (*q. v.*), of the Custard Apple family (*Anonaceæ*). It grows upon a spreading tree (*A. cherimolia*), 20 to 25 feet high, which is native of tropical America including the West Indies. It is related to the pawpaw of the U. S. (*Asimina triloba*), and bears ovate-lanceolate leaves which are silky underneath, solitary, brown, fragrant flowers, and globose or oblong, greenish or purplish fruits which are from 2 to 5 or 6 inches in diameter. These fruits have a white flesh containing a few dark-colored seeds, and are regarded as among the finest in the world. This and some related species have been long in cultivation as ornamental plants in conservatories. C. E. B.

Chernigoff': a government (and city) of Little Russia. The government is on the east bank of the Upper Dnieper, S. of Smolensk, and between Orel and Kursk on the E. and Poltava on the W. Area, 20,233 sq. miles. It is an undulating plain, deeply grooved with ravines, wooded and marshy in the north, dry and steppe-like in the south. The Disna river passes through the province, and is navigable. Corn, timber, linseed, brandy, and hemp are produced. Sugar is also extensively grown and manufactured. Pop. (1883) 1,996,250; (1897) 2,322,007. The people are mostly (86 per cent.) of Little Russian stock. Jews are numerous, and there are a few Germans and Greeks. Chief towns, Nyezhin (50,000), Starodub (25,000), Chernigoff (20,000) (see map of Russia, ref. 8-C). The last is the capital, and is situated on the right bank of the Desna, 476 miles S. W. of Moscow. It is an ancient city, and was formerly of much greater importance than now. M. W. Harrington.

Cherokee': town; capital of Cherokee co., Ia. (for location of county, see map of Iowa, ref. 3-D); on Ill. Cent. R. R., and on the Little Sioux river; 59 miles E. N. E. of Sioux City. Cherokee has a number of flourishing industries, electric lights, water-works, and mineral springs. Pop. (1880) 1,523; (1890) 3,441; (1900) 3,865.
Editor of "Times."

Cherokee: city; Crawford co., Kan. (for location of county, see map of Kansas, ref. 8-K); on Mo., Pac. and Kan. City, F. S. and M. R. Rs.; 136 miles S. of Kansas City; has a high school, churches, large hay-press manufactory, mills, round-house, machine-shop, coal-shafts, etc. Pop. (1880) 556; (1890) 1,087; (1900) 1,326.
Editors of "Sentinel."

Cherokees: See Iroquoian Indians.

Chéron, shăy' rōn', Élise Sophie, also known as **M. Le Hay**: painter; b. 1648; pupil of her father, Henri Chéron; she painted in various mediums, oil, water-color, enamel, etc., and was made member of the academies of Paris and Padua. D. 1711. W. J. S.

Cherry: a name applied to various species of the genus *Prunus* (family *Rosaceæ*), which are characterized by small, smooth fruits with a smooth stone, which is globular or approximately so. There are numerous species of cherries in various parts of the world, falling into two groups designated by the inflorescence. In one group, to which garden cherries belong, the flowers are borne in umbel-like, nearly sessile clusters; and in the other, to which belong the choke cherry and wild black cherry, they are disposed in true racemes. The natural history of the common cherries is not well understood, but most botanists agree in referring them to two species—*Prunus cerasus*, comprising the Morello type, and *Prunus avium*, comprising all the sweet cherries and the class known as Dukes. Pomologists divide the offspring of *Prunus avium* into several classes, but most American writers make but three divisions—the "hearts," characterized by heart-shaped fruit with sweet, tender flesh; the "bigarreaus," with a firmer or more meaty flesh; and the Dukes, with acid, juicy fruit. The Dukes are sometimes classed with the Morellos, and some writers regard them as a distinct species; among the heart cherries, leading varieties are Black Eagle, Black Tartarian, Downer, Elton, Governor Wood, Ohio Beauty; among the bigarreaus, Napoleon Bigarreau, Yellow Spanish (known also as Bigarreau), Windsor, Roekport Bigarreau; among Dukes, May Duke, Late Duke, Royal Duke, Reine Hortense, Belle de Choisy, Belle Magnifique; among Morellos, English Morello, Montmoreney, Early Richmond, Ostheim, Louis Philippe. Cherries require a dry and moderately strong soil. The Mazzard is a half-wild type of *Prunus avium*, which is used for stocks upon which to bud and graft all the common cherries. The Mahaleb stock (*Prunus mahaleb*) is used as a stock when dwarf trees are required. The Sand or Dwarf cherry (*Prunus pumila*), native to the U. S., is now coming into cultivation as a fruit-plant. In Japan cherries are popular as ornamental plants, the common species there being *Prunus pseudocerasus*. L. H. Bailey.

Cherry-bird: See Cedar-bird.

Cherry Laurel: a name given to the evergreen cherry-trees, such as the bay laurel, *Prunus laurocerasus*, a native of Asia; the Portugal laurel, *Prunus lusitanica*, a native of Southern Europe; and the "mock orange" of the Southern U. S., *Prunus caroliniana*. They are all prized as ornamental shrubs or trees, and all abound in poisonous hydrocyanic acid, especially in the kernels and leaves. They have also an essential oil, resembling that of bitter almonds. The leaves of the first-mentioned species are used in flavoring sauces, etc., and in preparing cherry-laurel water; sometimes employed in medicine as a sedative, but its strength is variable, and it should not be used.

Cherryvale: city (founded in 1870); Montgomery co., Kan. (for location of county, see map of Kansas, ref. 8-I); on Atch., Top. and S. Fé, Kan. City, Fort S. and M., and St. L. and San. F. R. Rs.; 156 miles S. W. of Kansas City; has 2 fine schools, 6 churches, and natural gas, which supplies light and heat to the entire city. The city is situated in a farming district. Pop. (1880) 690; (1890) 2,104; (1900) 3,472.
Editor of "Republic."

Cherry Valley: village; Otsego co., N. Y. (for location of county, see map of New York, ref. 5-H); 68 miles W. of Albany. It has an academy. Cherry Valley was the scene of a massacre by the Tories and Indians in the British service Oct. 11, 1778. Thirty-two inhabitants, nearly all women and children, were murdered, besides sixteen soldiers of the Continental army. The rest of the citizens were made prisoners and taken away, and all the buildings were burned. The village is 6 miles from Sharon Springs, and is a place of summer resort. Pop. (1880) 856; (1890) 685; (1900) 772.
Editor of "Gazette."

Chersiphron, kĕr'si-fron (in Gr. Χερσίφρων): an eminent Cretan architect who flourished about 600 B. C. He designed the temple of Diana at Ephesus, one of the Seven Wonders of the world, but he died before it was finished. It was adorned with 127 Ionic columns of marble 60 feet high, and was 425 Roman feet in length.

Chersou: See Kherson.

Chersonesus, kĕr-sō-nee'sŭs (in Gr. Χερσόνησος): the ancient name of several peninsulas of Europe and Asia, as Chersonesus Aurea (Malacca), Chersonesus Cimbrica (Jutland), Chersonesus Thracia (Gallipoli), and Chersonesus Taurica (Crimea).

Chert, or **Hornstone**: a siliceous mineral; a variety of quartz with many of the characters of flint, but differing from it in being of a tougher nature, and breaking with a splintery instead of a conchoidal fracture. It is always massive, and is of various colors—white, red, yellow, gray, and brown. It is common in the mountain limestone, oölite, and greensand formations; it sometimes forms rocks, and often contains petrifactions. The term chert is often applied to the siliceous concretions which occur as nodules in limestone rocks. The limestone is said to be "cherty" when it contains so much of these concretions as to render it unfit for building and conversion into lime.

Cherub (plu. **Cherubim** or **Cherubs**): a kind of winged being mentioned in the Scriptures. Cherubim guarded Paradise (Gen. iii. 24) and prevented the return of fallen man, and cherubim were placed over the mercy-seat in the Holy of Holies (Ex. xxxvii. 8), and were wrought into the hangings of the temple (Ex. xxvi. 1, 31; xxxvi. 8, 35); so in Solomon's temple (1 Kings vi. 23, *sqq.*) they overshadowed the ark, and carved upon the doors and elsewhere were used as ornaments (1 Kings vii. 29, 36). They symbolized the nearness and at the same time the inaccessibility of God. They appear as four-winged beings of a generally human form in Christian art. Most writers regard them as angels, but many critics believe that they are symbols rather than real existences. According to the simple, primitive angelology, cherubim carried God when he appeared in his glory on the earth (Ps. xviii. 10); cf. Ezekiel's visions (Ezek. i. 19; x. 16; xi. 22). So also they are called "the wings of the wind," bearing God to the world (Ps. civ. 3; Is. xix. 1).

Cherubini, kăy-roo-bee'nĕe, Maria Luigi Carlo Zenobio Salvador: musician; b. in Florence, Italy, Sept. 14, 1760;

d. in Paris, May 15, 1842. Most of his life was spent in France. First taught by his father, an orchestral player in the Pergola theater of his native city, he early attracted the attention of the Grand Duke of Tuscany. Through his liberality he was enabled to study at Bologna under Sarti for four years. Here he gained the wonderful proficiency in the polyphonic style which ever distinguished him.

Both his earlier and latest works were in the line of church music, as masses, motetts, and offertories, mostly of large dimensions, with full orchestral accompaniments. A middle period of his art-life made him also famous as an operatic composer. Among his numerous operas *Lodoiska* (1791), *Medée* (1797), and *Les deux Journées* (1800) were the most renowned of their time. The latter is still occasionally given in Germany under the title of *Der Wasserträger* (The Water-carrier). The overtures to many of his operas are still found upon many European concert programmes. Among his sacred compositions his requiem in C minor is considered his greatest work. Beethoven is known to have esteemed Cherubini very highly, ranking him above all the then living writers for the stage. Napoleon I., though personally disliking him, made him chevalier of the Legion of Honor.

DUDLEY BUCK.

Cherusci, kĕĕ-rŭs'si: an ancient and celebrated German tribe mentioned by Cæsar; inhabited a country on the north side of the Silva Bacenis (Hartz Forest). The famous Hermann (Arminius) was a chief of the Cherusci. Having formed a league with other German tribes, he defeated the Roman general Varus near the Lippe in 9 A. D. According to Tacitus, the Cherusci were conquered by the Catti or Chatti after the death of Arminius.

Cher'vil [Fr. *cerfeuil*, from the Lat. *caerefolium* = Gr. *χαιρέφυλλον*]: a garden plant, *Anthriscus cerefolium*, of the order *Umbelliferæ*, used as a pot-herb and in soups. The leaves have a peculiar, somewhat sweetish and aromatic smell and taste. It is a native of Europe.

Chesaning: village; Saginaw co., Mich. (for location of county, see map of Michigan, ref. 6–J); on Mich. Cent. R. R. and on Shiawassee river; 20 miles S. of Saginaw; has seven churches, fine union school, stave and lumber mills, grain elevator, grist-mill, and fair-grounds and race-course. The village is situated in a fine agricultural region, and derives water-power from the river. Pop. (1880) 889; (1890) 1,056; (1900) 1,244.

EDITOR OF "ARGUS."

Chesapeake Bay [*Chesapeake* is from an Indian word meaning mother of waters]: a large inlet of the Atlantic coast of the U. S.; extends from Capes Charles and Henry northward along Virginia and two parts of Maryland to the mouth of the Susquehanna river. It is about 200 miles long, and varies in width from 4 to 40 miles. The distance from Cape Charles to Cape Henry is nearly 12 miles. The coasts on each side are deeply indented by numerous inlets and estuaries, which are navigable. The Chesapeake is so deep that the largest ships can ascend from the ocean nearly to the northern extremity. It contains numerous islands. The largest rivers which flow into it are the Susquehanna, the Potomac, and the James.

Ches'brough, ELLIS SYLVESTER: civil engineer; b. in Baltimore, Md., July 6, 1813, and at the age of thirteen began the work of his profession as a chainman on the Baltimore and Ohio Railroad. From 1846 to 1855 he was engineer of the Boston water-works, having also charge of streets and harbor improvements. He planned the sewerage system for Chicago and also the water tunnels, and he was engaged as consulting engineer on sewerage work in many cities. During 1878 he was president of the American Society of Civil Engineers. D. Aug. 18, 1886.

Ches'elden, WILLIAM, F. R. S.: anatomist and surgeon; b. near Melton Mowbray, Leicestershire, England, in 1688. He began to lecture on anatomy in London about 1711, and published in 1713 *The Anatomy of the Human Body*, which was long used as a text-book. He was afterward chief surgeon of St. Thomas's and Westminster Hospitals, and acquired a high reputation as an operator. Among his works is *The Anatomy of the Bones* (1733). D. in Bath, Apr. 10, 1752.

Cheshire, England: See CHESTER.

Chesh'ire, JOSEPH BLOUNT, Jr., D. D.: b. in Tarborough, N. C., Mar. 27, 1850; son of a clergyman of the same name; educated at Trinity College, Hartford, Conn.; is the official historiographer of the diocese of North Carolina; author of *The Early Conventions of the Episcopal Church in North Carolina, with Introduction and Notes* (1882). In 1892 he edited *Sketches of Church History in North Carolina*, one-third of which was his contribution. Before his ordination in 1878 Dr. Cheshire was admitted to the bar Jan. 1, 1872, and practiced law for six years.

W. S. PERRY.

Ches'ney, CHARLES CORNWALLIS: b. in England, Sept. 29, 1826; entered the British army as second lieutenant in the corps of royal engineers; became lieutenant-colonel in 1868 and brevet colonel 1873. Although he bore an excellent reputation as an officer of engineers, it is by his contributions to military literature that his name is best known. He was for many years Professor of Military Art and History at the Staff College, Sandhurst. In 1863 he published his *Campaigns in Virginia*; in 1868 his *Waterloo Lectures*. In 1870 his *Military Biographies*, contributed mainly to the *Edinburgh Review*, including essays on Gens. Grant, Lee, and others, were published in 1 vol. D. Mar. 19, 1876.

Chesney, FRANCIS RAWDON: an officer noted as an explorer; b. in County Down, Ireland, in 1789. Aided by the British Government, he explored a route from Europe to India by way of the Red Sea, and in 1836 descended the Euphrates in a steamer from Beer (Bîr) to its mouth. He published *The Expedition for the Survey of the Euphrates and Tigris* (4 vols., 1850). In 1855 he obtained the rank of major-general. D. at Mourne, Jan. 30, 1872.

Chess, or **Cheat**: common names in the U. S. of several species of *Bromus*, of the Grass family, especially *Bromus secalinus*. It resembles oats in appearance, and commonly occurs in wheat-fields as a troublesome weed.

Chess [O. Fr. *eschès*, *eschecs*, plur. of *eschec*, whence Engl. *check*; Ital. *scacco*, Lat. *scaccus*, ultim. from Pers. *shāh*, king. Adopted into Germ. as *Schach*]: a scientific pastime of a most entertaining character, which concentrates and exercises the logical faculties and affords a test of mental skill free from the elements of chance. It has been called "the art of human reason." The influence of the cultivation of this game on the highest qualities of mind bears essential resemblance to the effect of gymnastics on the growth, increase and conservation of the physical powers. The players begin with exactly even forces and the different pieces on either side correspondingly possess equal properties. The results are obtained by purely logical processes of reasoning, which engage to an enormous extent simultaneously the memory, creative imagination, and concrete calculation. Among general amateurs who only enjoy the pleasures of the game as a recreation the average duration of life has been computed to be higher than that of men devoted to other pursuits, and of the comparatively few chess experts who have attained eminence as practical masters or authors an exceptionally large proportion have remained in the fullest possession of their mental faculties up to a very old age.

A great number of the most famous men in history have been attracted by the beauties of the game, and greatly favored it as a pastime. Sir Walter Raleigh said that he would not care to survive for one day the loss of his capacity for playing chess. Benjamin Franklin paid it the highest encomium as an intellectual exercise. Goethe, in an adaptation from Diderot, described it as the "touchstone of the human brain." Prince Bismarck once taunted an eloquent opponent in the Reichstag with the remark that "great orators can play neither chess nor whist well," which evidently showed that this eminent statesman had a higher opinion of the logical requirements of intellectual games of skill than of the faculty of oratory. Prince Eugène of Savoy, Frederick the Great, Napoleon I., Emperor William I., von Moltke, Leibnitz, Lessing, Mendelssohn, Voltaire, Rousseau, Alfred de Musset, the two Lyttons, Buckle, Tennyson, Ruskin, and other great celebrities are known to have been warm devotees of chess.

Early History of the Game.—Little is known of the early history of the game and of the time of its introduction into Europe, but all authorities agree that it is of ancient Oriental origin. The Egyptians played two or more games on chequered boards with pieces of different powers, but they were not strictly chess. In the funeral pageants of Queen Isy em Kheb (a contemporary of Solomon) and of Queen Taiti (consort of Amanoph, 1430 B. C.), the squares of the ornamentation are alternately pink and green. Similar relics that might be brought into connection with the invention of the game are referred to in Wilkinson's *Ancient Egyptians*, and in H. Villiers Stewart's *The Tent of an*

Egyptian Queen (London, 1882). Dr. Forbes is of opinion that the Byzantines received the game of chess from the Persians about the beginning of the seventh century of the Christian era, and that it was communicated to some central parts of Europe from Constantinople and from Spain in the next century.

The First Printed Book.—The development and progress of chess has been closely connected with the earliest budding of literature in different languages. A short treatise by Jacobus de Cessolis, entitled *Liber de moribus hominum et officiis nobilium super ludo Scacorum*, written about the year 1300 A. D., was translated into English from a French version of Jehan de Vignay by William Caxton, and brought out in type in 1479 at Cologne, under the title *The Game and Playe of the Chesse*. A second edition was printed by the translator in 1479 in London, and this is undoubtedly one of the first books issued in metal type in England, some writers indeed claiming it to be absolutely the first.

Chess Libraries.—The literary elucidation of the game, with the branches that have developed in different countries, fills, in special chess libraries which have been collected by many amateurs and public institutions, several thousands of volumes, consisting of theoretical works, collections of actually played games, books on endings and problems, chess periodicals, etc. The largest of the well-known chess libraries are those of J. G. White, of Cleveland, O.; Baron von Heydebrand und der Lasa, Wiesbaden, Germany; Charles A. Gilberg, Brooklyn, N. Y.; and Eugene B. Cook, Hoboken, N. J.

Theoretical Works.—Of the most prominent theoretical chess works that have appeared within about forty-five years may be mentioned Bilguer's *Handbuch des Schachspiels*, by Baron von Heydebrand und der Lasa (Leipzig, 1843); *The Chessplayer's Handbook*, by Howard Staunton (London, 1847); *Das grosse Schachhandbuch*, by Zukertort and Dufresne (Berlin, 1871); *Teoria e Pratica del Giuoco degli Schacchi*, by C. Salvioli (Venice, 1885); and *The Modern Chess Instructor*, part i., by W. Steinitz (New York, 1889).

Collections of Games.—Separate collections of games played by masters, with reliable annotations, are most instructive and entertaining to amateurs, and since the inauguration of great public matches between two selected players, or tournaments consisting of short encounters between a large number of competitors, the publication of the games thus played forms a large portion of current chess literature. The most noteworthy books of that description are *Chess Studies, comprising 1,000 Games* (without annotations), edited by George Walker (London, 1844); *Staunton's Chess Tournament* (London, 1852); *Book of the First American Chess Congress*, by G. W. Fiske (New York, 1859), which is especially remarkable as it records the first public exploits of the American chess genius, Paul Morphy; *Morphy's Game of Chess*, by Lowenthal (London, 1860); *The Chess Congress of 1862*, by Lowenthal and Medley (London, 1864); *Transactions of the British Chess Association*, by Lowenthal and Medley (London, 1868); *Congrès International des Échecs*, by Alphonse Féry d'Esclands, with notes by G. R. Neumann and J. A. de Rivière (Paris, 1868); *Der erste Wiener Internationale Schachkongress*, by H. Lehner and C. Schwede (Leipzig, 1874); *London International Chess Tournament*, by J. I. Minchin (London, 1883), with notes by Zukertort, Steinitz, Mason, and Bird; *Sixth American Chess Congress*, by W. Steinitz (New York, 1891); and various books of German chess congresses, by E. Schallopp and other authors (Leipzig).

Chess Problems.—Compositions of problems, which are imaginary end positions leading to mate in a required number of moves, are almost dissociated from the practical game to the formation of a separate art, which has been called the poetry of chess. Philip Stamma, a native of Aleppo, Syria, who was interpreter of Oriental languages to the King of England, is regarded as the father of this modern branch of chess science, which he inaugurated with a collection of 100 artificial end positions, published in 1737, and the same author is the inventor of an ingenious chess notation which has since been adopted all through Germany, and also by writers in other languages, notably by the Italian C. Salvioli. It consists in marking the horizontal squares of the board from left to right with letters from a to h, and the vertical ones, starting from the white side, with figures from 1 to 8. The combination of a letter and figure thus denotes each square precisely.

Problem Tournaments and Composers.—Shortly after the institution of tournaments for players, public competitions, mostly of an international character, were also organized for problem composers in connection with chess congresses or by journals which publish a regular chess column. There are now so many problem composers in different countries, who are recognized to be of the first rank, that it is too difficult to class and enumerate them. But it will perhaps be only fair to distinguish by name problem authors who have won high prizes in international competitions, and who at the same time have been the leaders of problem taste in their published works. They are Ph. Klett and Kohtz and Kockelkorn (joint authors) in Germany; J. Berger, Austria; F. Healy and B. G. Laws, England; S. Loyd, America; E. Pradignat, France; and B. G. Valle, Italy.

Chess Masters, Champions, and Blindfold Players.—For the purposes of comparison between mental operations and physical exercises, it is very remarkable that in chess as well as in sports the relative difference of strength between the highest experts is extremely difficult to determine, and is generally almost imperceptible. The established tests of skill have often produced close results, and it is specially notable that in team matches of players selected by rival clubs or associations, which sometimes number as many as one hundred a side, occasional ties, i. e. equalities in the score of each party, have occurred.

Up to the early part of the nineteenth century chess celebrity was generally assigned only to authors on the game, and of the very few previous public trials of strength between reputed experts which are on record that of the Italian Leonardo, called "El Puttino," who defeated the Spanish chess author, Ruy Lopez, at the court of Philip II., is noteworthy. The distinguished French musical composer, Danican, better known under the name of Philidor, was the greatest chess player and writer on the game of the last century, and he added to his fame, after having frequently played single games from memory without sight of board or men, by successfully conducting in that manner two games a short time before his death in 1795. This has been held to have been the first achievement of the kind until recently, when Prince Dadian of Mingrelia, a distinguished Russian amateur, discovered in the *Histoire Universelle*, by G. Villani, 1559, an earlier record of a blindfold exhibition by a Saracen of the name of Buccca, who about that time played two games without board or men, and one game over the board simultaneously. But this performance, which was at the time considered quite astounding, has been since greatly excelled by various masters. Zukertort played in that way the greatest number of games, i. e. 16, Louis Paulsen 14, Blackburne 12, Tschigorin 10, Morphy and others 8.

Philidor's successor in holding the chess supremacy was De la Bourdonnais, also a Frenchman, whose match games with the best English player of the time, Alexander Macdonnell, were the first to be preserved in a collected form. De la Bourdonnais died in London in 1840, and three years later a great match was organized at Paris between his pupil Saint-Amant and Howard Staunton, of England, which was regarded as of an international character, and involving at least the European championship. The winner of that match, Staunton, after having defeated some players of considerable strength, among them the rising master Harrwitz, at large odds, became the chief promoter of the first international tournament, which was held in connection with the first World's Exhibition of 1851 in London, and was ostensibly intended to settle the championship of the world. But in that tournament, as well as in the numerous subsequent ones which have since been organized, it was found impossible to frame satisfactory rules for the purpose of establishing an undisputed superiority, and such general contests are regarded by the best judges merely as excellent training for aspiring champions, and a personal encounter in a large number of games between two selected players is held to be the superior test. In the first international tournament Prof. Anderssen, of Breslau, was the chief victor, and Staunton took only the fourth prize. The latter had also been defeated by the former in the personal round, but nevertheless Staunton was still distinctly termed in 1858 the "*acknowledged European champion*" in a challenge from Paul Morphy, of New Orleans, the most precocious genius that has ever appeared in the chess arena.

Morphy's famous tour to Europe took place in the same year, at the end of which he had defeated Lowenthal, Harrwitz, and Anderssen in matches, as well as other foremost players in off-hand games, so decisively that the title of champion of the world was assigned to him, though his

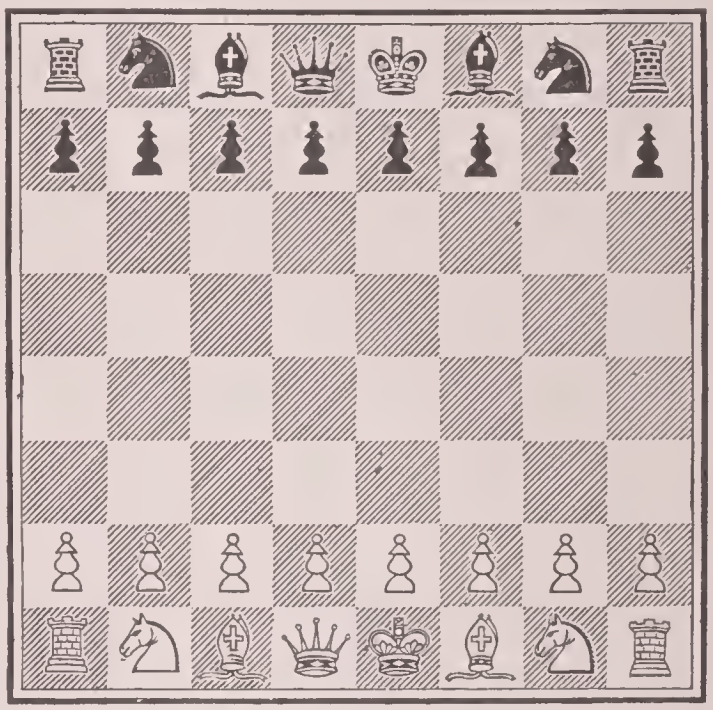
desired match with Staunton did not come off, owing to the latter's unwillingness to play. After his return to his native city the young master retired from chess practice, chiefly on account of a nervous disorder which was due to private misfortunes, and perhaps in some measure to mental overwork at an early age. He died in July, 1884. Staunton also retired in 1858, and he died in 1874.

In 1866 Steinitz, an Austrian born, but resident in the U. S. since 1883, won the championship of the world in a match in London against Prof. Anderssen, and successfully defended the title until 1894 in various great matches, of which the most notable were those against Zukertort in London, 1872; Blackburne in London, 1876; Zukertort again in New York, St. Louis, and New Orleans, 1886; Tschigorin in Havana, 1889; Gunsberg in New York, 1891; and Tschigorin again in Havana, 1892. In 1894 he was beaten by Lasker. Though he has not competed in any tournament since 1883, Steinitz held the best average record in tournaments according to the last computation published in 1891 by W. Sonneborn, the inventor of an ingenious and recognized mathematical system for the purpose. Steinitz has also won the greatest number of consecutive games in any single tournament.

The chief rivals of these champions, besides their respective opponents already named, who either had no opportunity of showing their fullest force or else fell short of the highest success, were, in chronological order, Baron von Heydebrand und der Lasa, Buckle, Hamppe, Neumann, Winawer, Englisch, Burn, Mackenzie, and Weiss. At the present time two most remarkable young players are in the field, both natives of Germany—Dr. Tarrasch, of Nuremburg, and E. Lasker, formerly of Berlin, but now resident in England. The former won in succession the three tournaments of Breslau in 1889, Manchester in 1890, and Dresden in 1892. Each of those tournaments consisted only of one round, and they were also inferior as public tests to the double-round tournaments of London, 1883, and New York, 1889, in reference to strength of competitors. But the succession of victories on the part of the German master is an astounding one, and is much enhanced by the fact that he only lost one single game in the last tournament, but otherwise won or drew all other games in the three competitions. He has, however, never played a match against any first-class player. Lasker has made a record which ranks him among the greatest masters of the day. He has beaten such players as Mieses, Englisch, and von Bardeleben, has won two tournaments in England without losing more than one game, and has defeated Blackburne and Bird in matches without a single game being scored against him. In 1894 he defeated Steinitz in a match for the championship of the world.

Inexhaustibility of Chess.—The infinite variety of possible combinations in playing the game affords opportunities for the exercise of the highest ingenuity. Starting on the basis that the first player has twenty different moves at his disposal, for which, however, only the pawns and the two knights are available, while the other pieces are blocked according to the laws of the game, and that the opponent has twenty different replies, under the same restrictions for each one, it is clear that the first move on each side, without going any farther, can be made in 400 different ways! This number is therefore the unit in the arithmetical progression for calculating the total of possible combinations that may arise in playing the game. Mathematicians have been unable to arrive at an exact figure, but Edwyn Anthony, of Hereford, in an article published in the *Chess Players' Chronicle*, 1878, has computed approximately that the number of ways of playing only the first ten moves on each side is 169,518,829,100,544,000,000,000,000,000,000.

Hints for Learners.—From such an appalling product of reckoning, which after all only applies to the opening portion of the game, the difficulties in mastering its intricacies would seem to be insurmountable. But experience has proved that this practically illimitable number of combinations presents no more serious general difficulty to the acquirement of proficiency in the game of chess than it does in the art of music, which theoretically is also of infinite variety. By adopting a reasonable method of training, it requires in reality no greater effort of mind or expenditure of time to learn the game sufficiently for the purpose of thorough enjoyment and appreciation of its attractions as a foundation for further improvement than a similar qualification for other accomplishments. Our advice on the subject must of necessity be very brief, and we shall confine ourselves to the most important points. After having obtained the necessary elementary knowledge in reference to the movements of the pieces and the laws of the game, the learner should alternate practice and study with the greatest regularity. Tuition under competent instructors and actual play with superiors will be of the greatest assistance. The study should consist chiefly in learning the openings and in playing over attentively selected games of first-class masters, with analytical comments by annotators of the highest repute. But the solving of real or artificial game endings and problems will also be found of great service. In practicing over the board the learner should very early begin to play on even terms against the strongest opponents available, without in the least minding even the certainty of defeat for a long time. The play with full forces is of an entirely different character, most notably in the openings on both sides, to that at odds, and a much better training is afforded to the student in competing on equal terms than by habituating himself to start with an exceptional advantage. By adopting these methods systematically a player will soon acquire knowledge and judgment of position that will fit him to attain a high stage of excellence.



Elementary Description of the Game.—The above diagram shows the board and men arranged for starting play between two parties. It should be specially noticed that each side has a white square on his right hand corner, and that the white queen is placed on a white square and the black queen on a black square.

Notation.—The abbreviated signs for the pieces and pawns in recording the scores of games or in print are K for king, Q for queen, R for rook, B for bishop, Kt for knight, and P for pawn. In the opening of the game and sometimes throughout it is necessary to distinguish specially the pieces on each side, thus, KR for king's rook, QR for queen's rook, KKt for king's knight, etc. In designating the pawns the letter P is added to the name of the piece which he fronts. For instance, QRP for queen's rook's pawn, KKtP for king's knight's pawn, KP for king's pawn.

The squares are described by adding sq to the initial letters of the piece placed at starting on the front row, the figure 2 for the second row, the figure 3 for the third row, and so on up to the figure 8, each party counting from his own first or front row to the top. Thus, for instance, the square on which the king's bishop stands would be marked KB sq if white places any man on that square, and KB8 when black plays a man to that square. (The figure 1 is also sometimes used instead of sq, or either is left out altogether when a square on the first or front row is alluded to.) The fourth square on white's fifth row, counting from left to right, would be called K4.

The object of the game is to "checkmate" the adverse king, which means to attack him in such a manner that he can not effect his escape. If the king and all other pieces are blocked in a position in which the said king is not attacked or "in check," it is a "stalemate," and the game is drawn.

Movements of Men and Captures.—The men move to vacant squares, and, with the exception of the knight, can pass

over only unoccupied squares. A capture is effected by removing the adversary's man and replacing it with the capturing man. All captures are optional, excepting when checkmate can not otherwise be avoided. The king is of paramount importance, but his powers in play are limited, and he is weaker for the purposes of co-operation than queen or rook, but stronger than bishop or knight. He is the only piece that is not allowed to "place himself in check," which means to expose himself to capture. The king moves to any adjoining square only, and captures in the same way unprotected pieces. Once during the game the king may "castle." This is effected with either rook when no piece intervenes, the king not being in check, nor moving into check, nor passing any square commanded (attacked) by an adverse piece, by placing the rook on the square next to the king, and then crossing over with the king to the square next to the rook. Either the king first or simultaneously king and rook should be touched in carrying out that process. Castling with the queen's rook is described in the notation by 0–0–0 (adopted from the German), or "Castles QR" or "Castles Q side"; the sign for castling with the KR is 0–0, "Castles KR" or "Castles K side."

The queen is the most powerful piece on the board. She moves straight in all directions, horizontally, vertically, and diagonally, as long as she passes on unoccupied squares, or until she replaces an adverse man by capturing it.

The rooks move and capture horizontally and vertically, but not diagonally.

The bishops, which are slightly superior to the knights, move or capture diagonally in any direction, and in consequence a bishop always remains on squares of his original color.

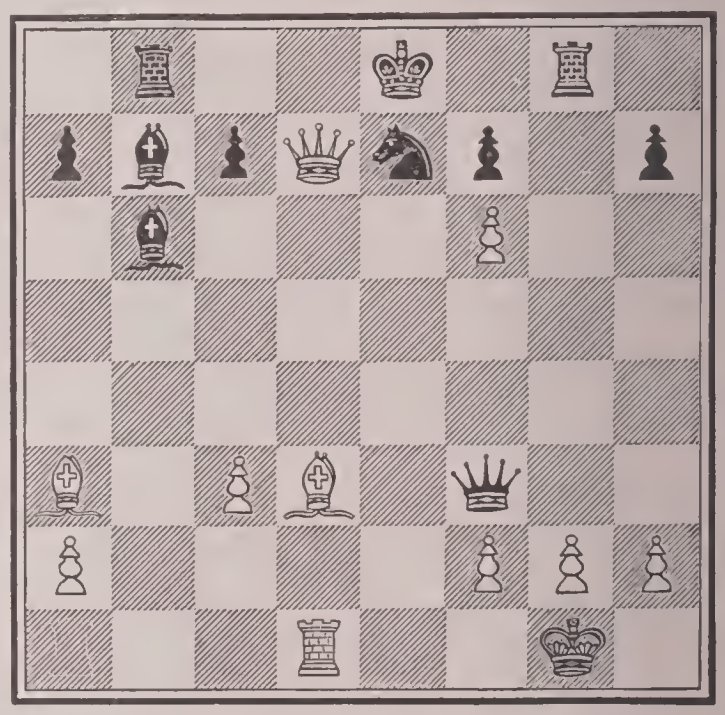
The movement of the knight, or its method of capturing, combines one move square and one oblique, landing the piece on any third square of opposite color from the starting-point, with power of overleaping men of either side. In the position in the above diagram either knight may move to B3 or R3 on the corresponding side; in the middle of a free board a knight has eight moves.

The pawn moves, if for the first time, one or two squares forward at the option of the player, but afterward only one square at a time forward. He captures, however, only on one of the two diagonal squares in front. Exceptionally, when a pawn stands on a fifth square, and the opponent, in accordance with his option, plays one of the adjoining pawns two squares, the former *may* capture the same as if the hostile man had only been moved one square. This is called "taking a pawn in passing," or "*en passant*," for which the abbreviation is e. p. The privilege of capturing *en passant* and the respective liability to being captured in that way is absolutely confined to pawns. A pawn on reaching the eighth square, counting from the front row of the same color, may be promoted into any piece of the same color, excepting the king. A player may therefore have two or more queens, three or more rooks, knights, or bishops, simultaneously on the board in the course of the game. . According to the code of laws of the British Chess Association of 1862 a player has the option of allowing such a pawn to remain unmovable, but liable to capture. The practical utility of such a case is hardly likely to arise in actual play, and this law is only of importance in reference to construction of problems.

Modern Style and an Old Masterpiece.—It is now established beyond any doubt, chiefly through the best practical examples of modern masters and the more recent researches of theorists, that scientifically correct play must be based on steady development and circumspection with the view of holding the balance of position at all points without sacrificing any material, and that the first move or the attack is only sufficient to secure a draw, which by best play on both sides should be the legitimate result. It is also now generally accepted that the king is a strong piece both for attack and defense, and early aggressions in his direction are mostly premature. Yet the slightest strategical fault will often justify brilliant sacrifices of heavy material that will result in the recovery of more valuable force, or even in checkmating the opponent. Theoretical analyses and practical expositions of masters have often produced charming complications of that description, which will always prove most entertaining to the student. One of the finest specimens of that character is the subjoined game, which was played between Prof. Anderssen, one of the world's champions about forty years ago, and Herr Dufresne, one of the strongest players of that time and a distinguished chess author. The opening, an "Evans gambit," is named after its inventor, Capt. Evans, the word gambit meaning the early sacrifice of a pawn for the attack.

(– represents the word "to," ch "check," dbl ch "double check," dis ch "discovered check," and × "takes.")

A. Anderssen.	J. Dufresne.
WHITE.	BLACK.
1. P–K4	1. P–K4
2. KKt–B3	2. QKt–B3
3. B–B4	3. B–B4
4. P–QKt4 (*a*)	4. B × KtP (*b*)
5. P–B3	5. B–R4
6. P–Q4 (*c*)	6. P × P
7. Castles	7. P–Q6 (*d*)
8. Q–Kt3	8. Q–B3
9. P–K5	9. Q–Kt3 (*e*)
10. R–K sq	10. KKt–K2
11. B–R3	11. P–Kt4 (*f*)
12. Q × P	12. QR–Kt sq
13. Q–R4	13. B–Kt3 (*g*)
14. QKt–Q2	14. B–Kt2
15. Kt–K4	15. Q–B4 (*h*)
16. B × QP	16. Q–R4 (*i*)
17. Kt–B6 ch (*j*)	17. P × Kt
18. P × P	18. R–Kt sq
19. QR–Q sq (*k*)	19. Q × Kt
20. R × Kt ch	20. Kt × R (*l*)
21. Q × QP ch	21. K × Q
22. B–B5 dbl ch	22. K–K sq
23. B–Q7 ch	
and mates next move (*m*).	



NOTES.

(*a*) This move constitutes the gambit named above, and it leads to a variety of most interesting combinations in theory and in practice.

(*b*) Some authorities hold that the gambit ought to be refused by B–Kt3, and no doubt black obtains at least an equal game by that retreat.

(*c*) The Russian master, Tschigorin, prefers castling at this juncture to the present more hazardous attacking line, which gives up another pawn. The latter was, however, in general favor among experts at the time this game was played.

(*d*) Herr Dufresne's favorite defense, but P × P has been since established as superior, though it still leaves white with a very strong attack.

(*e*) 9 . . . Kt × P would at least lose a piece by 10 R–K sq, 10 P–Q3; 11 Kt × Kt (the attack might also be continued with 11 B–KKt5); 11 . . . P × Kt; 12 Q–R4 ch and wins.

(*f*) Castling was undoubtedly preferable. The counter-attack is premature.

(*g*) He could not castle now on account of the reply B × Kt, winning a piece.

(*h*) Loss of time, which was of great importance in this precarious position; 15 . . . Kt–Q5; 16 KKt–Kt5, 16 Kt–K3; 17 B × P, 17 Q–R4 was probably his best resource.

(*i*) The queen was now in danger by Kt–B6 ch.

(*j*) The initiation of a most elegant and profound combination.

(*k*) The key-move to one of the most beautiful problems that has ever been constructed in actual play.

(*l*) Even if he had divined white's magnificent plan, which more clearly reveals itself on the next move, he could not have saved the game, for if 20 . . . K–Q sq, 21 R × QP ch, 21 K–B sq (best, or if 21 . . . K × R white soon forces mate by B–B5 dbl ch), 22 R–Q8 ch, and if

22 . . , Kt × R ; 23 Q–Q7 ch and mates in two more moves, while if 22 . . . K × R ; 23 B–B5 dis ch and wins.

(*m*) Wherever the king moves to the reply B × Kt effects mate.

W. Steinitz.

Chest, or **Tho'rax**: the part of the body between the neck and the abdomen. It is a conical casement formed of bones and cartilages joined together by muscles and other soft tissues. It contains the heart and the great blood-vessels, the lungs, œsophagus, various nerves, and other less important structures. The windpipe and the venous trunks of the head, neck, and arms enter the upper portion, which is bounded by the top of the sternum in front, by the first rib at the sides, and by the first thoracic vertebra behind. In the expanded part of the chest are the lungs, one to either side, and in the space between the lungs, more toward the front than the back, is the heart and the great vessels leading to and leaving it. This portion of the chest is bounded by the sternum and costal cartilages and the ribs in front, by the ribs at the side, and by the thoracic portion of the spine behind. The lower opening of the thorax is closed by the diaphragm, a musculo-membranous structure attached to the end of the sternum in front, the ribs at the sides, and the spine behind. The diaphragm arches upward into the thorax, but moves up and down with the respirations.

The thorax, as a whole, is broader from side to side than from before backward. It changes its shape with the breathing, becoming expanded by the elevation of the sternum and ribs during inspiration, and contracted and depressed during expiration. In pure abdominal breathing the external shape of the thorax changes but little, while internally the capacity is increased and decreased by the descent and ascent of the arching diaphragm.

Deformities of the thorax are very common, and usually result from disease affecting the bones in early childhood, such as rickets. A marked form of rachitic or rickety deformity is that known as "chicken-breast," in which the chest is compressed laterally, and the sternum and anterior margins of the ribs may be made to protrude. With persons who suffer with very long abdominal disease during childhood, the lower part of the chest is frequently much expanded; in individuals of phthisical tendency the chest is prone to be flattened and elongated. The potent cause of deformity of the chest, which has frequently been overlooked, is the "mouth-breathing," resulting from chronic nasal disease in childhood. The insufficient chest expansion leads to gradual deformity of the chest, resembling "chicken-breast." In spinal disease, particularly in kyphosis or hunchback, marked deformities occur. Emphysema and asthma lead to a barrel-like deformation of the chest. Chest deformities while they are found resulting from disease may also contribute to the occurrence of disease by interfering with proper breathing and circulation. Such effects may be obviated, and the deformities themselves may be removed by systemic exercise and by general care of the health.

William Pepper.

Ches'ter, or **Chesh'ire**: a maritime county of England; bounded N. by Lancashire, from which it is separated by the Mersey, N. E. by Yorkshire, E. by Derbyshire and Staffordshire, S. by Shropshire and Denbighshire, W. by Flintshire, and N. W. by the Irish Sea. It has a coast on the Irish Sea and the estuaries of the Dee and Mersey. Area, 1,027 sq. miles. The surface is mostly level and well wooded; the soil is a fertile clayey or sandy loam adapted to grazing and dairy farming. The surface-rock is new red sandstone. The chief rivers besides the Mersey are the Dee and Weaver. Coal, copper, and lead are found in the county. Salt is mined in large quantities. Here are many extensive dairies; the quantity of cheese made annually is estimated at about 15,000 tons. Chester has a good system of canals and is traversed by several railways. Capital, Chester. The other chief towns are Macclesfield, Stockport, and Birkenhead. In 828 A. D. Egbert annexed Chester to his kingdom. William the Conqueror erected it into a county palatine. Pop. (1891) 535,944; (1901) 601,042.

Chester: an episcopal city of England; capital of the county of Cheshire; on the right bank of the Dee; 22 miles from the sea and 16 miles S. S. E. of Liverpool (see map of England, ref. 8–F). It has a large railway station at which several lines of railways converge. The town is built on a rocky sandstone elevation, and is entirely inclosed within ancient and massive walls, nearly 2 miles in length. In the four principal streets are to be seen the most striking feature of the town. The space in front of the second stories of the houses, which are used for shops, forms a covered way for foot-passengers called the "rows." Chester has an old and massive sandstone cathedral 375 feet long, with a tower 127 feet high. Among its other edifices are a castle and St. John's church, the latter supposed to have been founded in 698 A. D., and now partially in ruins. Here is a stone bridge across the Dee with a single arch 200 feet in span. Chester has a public library, a museum, and a theater. It returns a member to Parliament. There are lead and iron works, and shoes are manufactured. Cheese, coal, copper, and cast iron are exported from this point by the river, which is navigable for small vessels. Chester occupies the site of an important Roman station called *Deva* (or *Devana*) *Castra*. Pop. (1891) 37,105; (1901) 36,281.

Chester: a port of entry; post-village and township of Lunenburg co., Nova Scotia; 45 miles W. by S. of Halifax; on Chester Basin, which is studded with numerous islands (see map of Quebec, etc., ref. 3–B). Its manufactures and fisheries are important. The village of Chester Basin, 5 miles distant, is also celebrated for its beauty. Pop. 3,000.

Chester: city; capital of Randolph co., Ill. (for location of county, see map of Illinois, ref. 10–D); on Wab., Chest. and West. R. R., and on the Mississippi river; 76 miles below St. Louis. It is the shipping-point for the Chester coal-fields. It has rolling-mills, foundries, flour-mills, and an elevator. Pop. (1880) 2,580; (1890) 2,708; (1900) 2,832.

Chester: a city (incorporated in 1866); Delaware co., Pa. (for location of county, see map of Pennsylvania, ref. 6–J); on B. and O., Phil. and Read., and Phil., W. and B. R. Rs., and on the Delaware river; 15 miles W. S. W. of Philadelphia. It was settled by the Swedes in 1643, and is the oldest town in the State. In Chester are fine schools, 16 churches, large ship-yards, and manufactures of woolen and cotton goods, metals, etc. The Pennsylvania Military Academy is in the city, Crozer Theological Seminary (Baptist) in Upland, and Swarthmore College (Friends) a short distance outside the city. Adjacent are the boroughs of Upland and South Chester, which have considerable manufactories. Pop. (1880) 14,997; (1890) 20,226; (1900) 33,988. Editor of "Times."

Chester: town; capital of Chester co., S. C. (for location of county, see map of South Carolina, ref. 4–E); 65 miles N. N. W. of Columbia, the State capital; is in a cotton-raising region. Pop. (1880) 1,899; (1890) 2,703; (1900) 4,075.

Chester: town; Windsor co., Vt.; on the Williams river, and the Rutland Division of the Central Vermont Railway; 39 miles S. E. of Rutland (see map of Vermont, ref. 7–C). Here are manufactures of chair stock, lumber, soapstone finish, and a fine soapstone quarry. Pop. of township (1880) 1,901; (1890) 1,787; (1900) 1,775; village, 950.

Chester, Colby M.: captain U. S. navy; b. in Connecticut in 1845; graduated at the Naval Academy as ensign in 1863. He served in the steamer Richmond at the battle of Mobile Bay Aug. 5, 1864, and was commended "for coolness and courage" by the commanding officer of that vessel, Capt. Thornton A. Jenkins, in his official report to Rear-Admiral Farragut of the part taken by the Richmond in the battle. Was hydrographic inspector of the coast survey 1881–85; captain June 12, 1896.

Chester, Joseph Lemuel: antiquary; b. in Norwich, Conn., Apr. 30, 1821. He has published *Greenwood Cemetery, and other Poems* (1843); a treatise on *The Law of Repulsion* (1853); *Educational Laws of Virginia*, etc. (1854), and other works. He was afterward engaged in the publication of all the marriage, burial, and baptismal registers of Westminster Abbey, with annotations. D. in London, May 28, 1882.

Chester Court-house, S. C.: See Chester.

Ches'terfield: a town of Derbyshire, England; 24 miles by railway N. N. E. of Derby (see map of England, ref. 8–H). It has a church built in the thirteenth century, with a remarkable twisted spire 230 feet high. Here are manufactures of silk and cotton stuffs, laces, hosiery, earthenware, and machinery. Mines of coal, lead, and iron are worked in the vicinity. Pop. (1891) 13,242.

Chesterfield Inlet: a long and narrow inlet of British America; extends westward from the northern part of Hudson's Bay. It is about 250 miles long, and 25 miles wide at the broadest part. It incloses many islands.

Chesterfield, Philip Dormer Stanhope, Fourth Earl of: an English author and courtier distinguished for his wit and politeness; b. in London, Sept. 22, 1694. He was the eldest son of Philip the third earl and Elizabeth Saville, who was a daughter of the Marquis of Halifax. He studied

at Cambridge, made a tour on the Continent in 1714, and was elected a member of Parliament in 1715. In 1726 he inherited the earldom and passed into the House of Lords. He became an eloquent debater, and gained distinction by his graceful manners and fine taste. In 1733 he married Melusina Schulemburg, Countess of Walsingham. He was a strenuous opponent of Sir Robert Walpole about 1734–40, was appointed Lord-Lieutenant of Ireland in 1745, and one of the principal Secretaries of State in 1746. He resigned office in 1748. He was intimate with Pope, Swift, Voltaire, and Bolingbroke. His reputation as a writer is founded chiefly on his *Letters to his Son* (1774), the style of which is much admired. "Take out the immorality," said Dr. Johnson, "and it should be put into the hands of every gentleman." D. Mar. 24, 1773.

Chestertown: seaport; capital of Kent co., Md. (for location of county, see map of Maryland, ref. 2–G); on Balt. and Del. Bay, and on the right (west) bank of Chester river; about 30 miles E. of Baltimore. It is the seat of Washington College. Pop. (1880) 2,359; (1890) 2,632; (1900) 3,008.

Chestnut, ches'nŭt (in Lat. *castanea*; Fr. *châtaigne*): a forest-tree of the family *Cupuliferæ*. The genus *Castanea* is distinguished by having sterile flowers interruptedly clustered in long and naked cylindrical catkins, and coriaceous and farinaceous ovoid nuts inclosed in a hard and prickly four-valved involucre. The *Castanea sativa* is a large tree growing wild in Europe, while its variety *americana* grows in the U. S. from Maine to Michigan and Alabama. It prefers a dry, light soil, and usually grows in hilly districts. It has oblong-lanceolate and pointed leaves, serrate with coarse pointed teeth, and smooth and green on both sides. Each involucre (called the bur) contains from one to three edible nuts, often compressed and flattened on one or both sides. The wood is light and coarse-grained, but durable, is a valuable material for fences, and is much prized for finishing rooms. The chestnut is an ornamental and stately tree, and in Europe attains a great age. A chestnut-tree on Mt. Etna was celebrated for its longevity, and is said to have measured 200 feet in circumference. The fruit of the Spanish chestnut is larger than that which grows in the U. S. Chestnuts form an important article of food in France and other countries of Southern Europe, where they are cultivated and used either roasted or boiled. The best variety of French chestnuts is called *marron*. The chinquapin (*Castanea pumila*) is a small tree indigenous in the Southern U. S. from Pennsylvania to Florida, Indian Territory, and Texas. The nuts are good to eat, but are not so large as chestnuts. The genus *castanopsis* includes fourteen species of chestnut-like Asiatic and West American trees, of which *C. chrysophylla*, an evergreen Californian species, and *C. argentea* of Java are good representatives.

Chetimach'es Lake, or **Grand Lake**: in the southern part of Louisiana, between the parishes of St. Mary's and St. Martin's. It is about 40 miles long; too shallow for navigation. It is an expansion of the Atchafalaya Bayou.

Cheto'pa: a city; Labette co., Kan. (for location of county, see map of Kansas, ref. 8–J); $2\frac{1}{4}$ miles N. of the Indian Territory line; on Mo., Kan. and Tex. and Mo. and Pac. R. Rs., and on the Neosho river. It has flour-mills, a foundry, 2 fine school-buildings, 4 churches, and electric lights, etc. A fine building-stone is found immediately S. of the city. Pop. (1880) 1,305; (1890) 2,265; (1900) 2,019.

EDITOR OF "ADVANCE."

Chevalier, she-vă'li-ay', MICHEL: political economist; b. at Limoges, France, Jan. 13, 1806. He was sent to the U. S. in 1832 to examine the American railroads, and published in 1836 *Letters on North America*. Among his important works is one entitled *On the Material Interests of France* (1838). He became an advocate of free trade. In 1840 he was appointed Professor of Political Economy in the College of France, and in 1841 chief engineer of mines. He was deprived of these places by the republicans in 1848, but was reinstated by Napoleon in 1852; wrote on the organization of labor against socialism. In 1851 he was admitted into the Institute. He was the author of *History and Description of the Ways of Communication in the United States* (2 vols., 1840–42); *Mexico, Ancient and Modern* (1863), and other works. D. in Montpellier, Nov. 28, 1879.

Chevaux-de-Frise, she-vō'de-frēz': a French military term used also in English; applied to large and strong pieces of timber, from which wooden or iron spikes project in various directions. They are employed to impede the advance of cavalry or of a storming-party in a fortified place. Sometimes the cheval-de-frise consists of an iron tube, 6 feet long, in which there are twelve holes. The same number of spears are kept in the tube, and when required for use are inserted in the holes.

Chevaux-legers, -lā'zhā' (i. e. light horse): a company of light cavalry created by Henry IV., and used by him as a kind of household troops. The company consisted originally only of 240 men, all noblemen, and ranked next the *garde du corps*. Afterward several other companies were added, and the name became very celebrated until, in 1779, it disappeared from the French army-rolls, the companies having been incorporated with the regular regiments of dragoons. Meanwhile the name had crossed the Rhine, and not only the minor princes of Germany but even Austria created companies of chevaux-legers. The name is frequently met with in accounts of the Napoleonic wars, and was much used in Germany, but has now disappeared there too.

Cheverus, shev'*e*-rŭs, or (Fr. pron.) shev'rüs', JEAN LOUIS ANNE MADELEINE LEFEBVRE, D. D.: a French cardinal and philanthropist; b. at Mayenne, Jan. 28, 1768. Imprisoned by the revolutionists, he fled to England on his release in 1792; surrendered his fortune to his relatives and migrated to Boston in 1796 as a missionary. Here he endeared himself to the people by his kindly relations to Protestants, who aided him in building churches, by his humane work among the poor and those stricken by pestilence, by his self-impoverishing generosity, and by his support of educational institutions. He was one of the founders of the Boston Athenæum; was appointed Bishop of Boston, Mass., in 1808; returned to France in 1823 on account of his health; was made Bishop of Montauban; Archbishop of Bordeaux in 1826, and a cardinal in 1835. D. in Bordeaux, July 19, 1836. See his *Life* by J. Huen-Dubourg (Paris, 1837; 3d ed. 1842; Eng. trans. Boston, 1839).

Cheves, cheevz, LANGDON, LL. D.: statesman and lawyer; b. in Abbeville district, S. C., Sept. 17, 1776. He was a member of Congress from 1811 to 1816, and was Speaker of the House of Representatives during one session (1814–15). In this position he voted against the bill to recharter the U. S. Bank in 1815, but he was afterward president of that bank (1819–22); also a supporter of nullification in South Carolina. D. in Columbia, June 25, 1857.

Chev'iot Hills: a mountain-range extending along the border between England and Scotland. The range is about 35 miles long. Its direction is nearly N. E. and S. W. The highest point is Cheviot Peak, which rises 2,676 feet above the level of the sea. The rocks of which the range is formed are porphyry, trap, and mountain limestone. Grouse abound on these hills, which afford good pasture, and are grazed by sheep, called Cheviots, which are famed for their wool. Their name is connected with the ballad of Chevy Chase and many incidents of border warfare.

Chevreul, she-vröl', MICHEL EUGÈNE, LL. D.: chemist; b. at Angers, France, Aug. 31, 1786; published in 1823 *Chemical Researches on Fat Substances of Animal Origin*, which did much to promote industries, and became director of the dyeworks at Gobelin in 1824. He succeeded Vauquelin as Professor of Applied Chemistry in the Museum of Natural History in 1829. He published in 1839 an important work *On the Law of the Simultaneous Contrast of Colors and the Distribution of Colored Objects*. Among his other works is *Lectures on Chemistry Applied to the Art of Dyeing* (1831). D. Apr. 10, 1889.

Chevron, shev'rŭn [Fr., rafter, from a deriv. of Lat. *caper*, goat, i. e. leap of a goat]: an ornament and badge of rank of gold or silver lace, or of braid, worn on the sleeve, deriving its name from its resemblance in form to a pair of rafters. It is of French origin, and has been used to denote periods of service in the ranks (*chevrons d'ancienneté*) or the rank of non-commissioned officers. The corporals and the various grades of sergeant have from one to four chevrons, of different colors in different branches of the service.

CHEVRON, in heraldry, an ordinary representing the rafters of a house, and generally denoting the foundation of his own family by the bearer. The chevron is formed of two lines, joined at the top, and descending to the extremity of the field in the form of a pair of rafters.

CHEVRON, or ZIGZAG MOLDING, in architecture, a molding in the form of a succession of chevrons. In general it

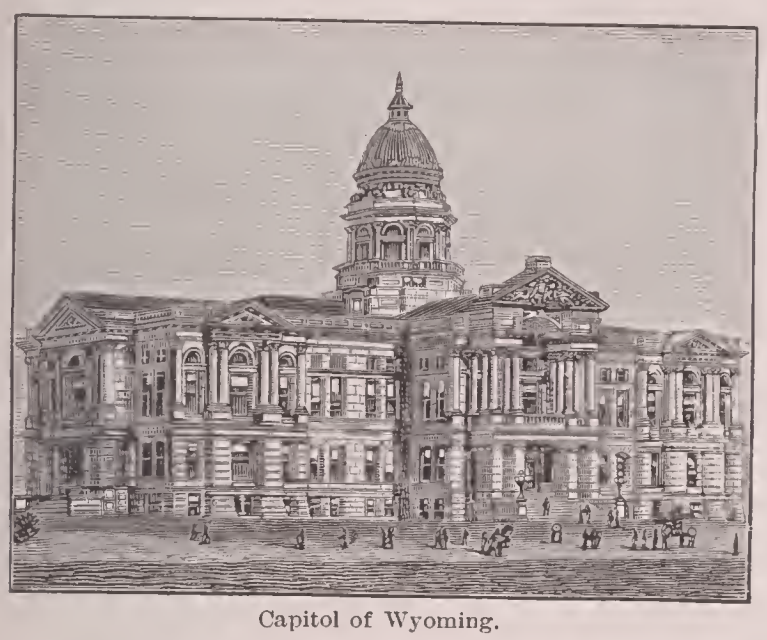
is characteristic of Norman architecture, but is also found during the transition period from Norman to Early English.

Chev'y Chase: one of the most famous of British ballads, recounting an affray between the Douglas and the Percy on the Scottish border. In its present form the piece does not seem to be older than the beginning of the seventeenth century. But a much earlier version exists under the title *The Hunting of the Cheviot*. See Skeat, *Specimens of Early English Literature*, part iii.

Revised by H. A. Beers.

Chewink', Ground Finch, or **Tow'hee Bun'ting** (*Pipilo erythropthalmus*): a very common passerine bird of the U. S. and Canada; glossy black, with breast and abdomen white, and with the sides and lower tail-coverts rufous. It nests on the ground, and flies with a peculiar jerking motion.

Cheyenne, shī-en': city and railroad center; capital of State of Wyoming and of Laramie County (for location of county, see map of Wyoming, ref. 12–L); situated 106 miles N. of Denver and 516 miles W. of Omaha. Elevation,



Capitol of Wyoming.

6,075 feet. It has the main railroad-shops of the Union Pac. R. R. system (employing 600 mechanics), a fine capitol building, water-works, a beautiful park, three artificial lakes, a public library, and a $40,000 high-school building. This is the great beef-growing center, the shipping-point for beef-cattle to Eastern markets, and the supply dépôt for the trade of the Rocky Mountain region. Pop. (1880) 3,456; (1890) 11,690; (1900) 14,087. Editor of "Sun."

Cheyennes: See Algonquian Indians.

Cheyne, Thomas Kelly, D. D.: exegetical scholar and author; b. in London, Sept. 18, 1841; educated at Merchant Taylors' School and at Worcester College, Oxford; Kennicott Hebrew scholarship 1863; Pusey and Ellerton Hebrew scholarship 1864; member of the Old Testament Revision Committee; ordained 1864; Oriel Professor of Interpretation at Oxford, with canonry of Rochester attached, 1886; fellow of Balliol College 1868; Bampton lecturer 1889. Author of *Notes and Criticisms on the Hebrew Text of Isaiah* (1868); *The Book of Isaiah Chronologically Arranged* (1870); joint editor of *The Holy Bible* (Authorized Version) *with various Renderings and Readings from the Best Authorities* (1876); *The Prophecies of Isaiah, a new Translation with Commentaries and Appendices* (1880–81; 3d ed. 1884); *Micah and Hosea*, in *The Cambridge Bible for Schools* (1882–84); *Exposition of Jeremiah in Pulpit Commentary* (1883–84); *The Book of Psalms*, translated in *The Parchment Library* (1884); *Job and Solomon* (1887); *The Book of Psalms*, a new translation with commentary (1888); *The Hallowing of Criticism* (1888); *Jeremiah, his Life and Times* (1888); *Aids to the Devout Study of Criticism* (1892). Prof. Cheyne has contributed numerous articles to the *Encyctopædia Britannica*, and has been prominently known as one of the English representatives of Ewald's school of criticism and exegesis. In 1889 he delivered the Bampton Lectures on *The Historical Origin and Religious Ideas of the Psalter*, which were published in 1890. W. S. Perry.

Chézy, shăy'zee', Antoine Léonard, de: b. at Neuilly, France, Jan. 15, 1773; educated in the Polytechnic School of Paris; studied Arabic, Persian, and other Oriental languages under de Sacy and Langlès; was appointed to accompany Napoleon to Egypt in 1799, but fell sick in Toulon, and was compelled to return home; became conservator of the Oriental manuscripts in the National Library in 1799, and Professor of Sanskrit in the Collège de France in 1814. He made a translation of *Medschnun and Leila* in 1807, and an edition and translation of *Sacuntala* in 1830. D. in Paris, Aug. 31, 1832. C. R. Lanman.

Chhatisgarh': the easternmost of the four districts of the Central Provinces, British India; between lats. 17° 50′ and 23° 10′ N., and lons. 83° 30′ and 85° E. Area, 25,013 sq. miles. It consists of three districts, Raipur, Bilaspur, and Sambalpur, and thirteen feudatory states, the latter comprising about one-third of the area. Pop. (1891) 3,537,350, of whom about 62 per cent. are Hindus.

Chhindwa'ra: a district of Nerbudda, Central Provinces, British India; between 21° 25′ and 22° 50′ N. lat., and 78° and 79° 30′ E. lon.; on the southern slopes of the Salpura Mountains. Area, 3,915 sq. miles. There are very extensive forests in the district, and coal has been discovered in great abundance. The climate of the upper part is temperate and healthy, and ice frequently forms in the tanks. The average annual rainfall is about 36 inches. Pop. about 400,000, of whom two-thirds are Hindus. The principal town and administrative center is Chhindwara, situated in the wooded district and among the hills at an elevation of 2,200 feet. It is a favorite European health resort. Pop. 10,000.

Chiabrera, kĕĕ-ăă-brā'răă, Gabriello: an Italian lyric poet; b. at Savona, June 8, 1552. Reaching maturity at a time when the creative force in Italian literature had nearly spent itself, he endeavored to find new inspiration in the Greek lyric poets, especially Pindar and Anacreon. He strove to imitate the grandeur of the one, the grace of the other. His contemporaries thought him to have succeeded, and esteemed him the discoverer of new poetic worlds. In fact, however, his verse is mainly rhetoric, and one may read far in it without finding a single touch of true imagination. His greatest success was in his numerous odes and canzoni, above all in his *canzonette*. His attempts at epic poetry, in imitation of Vergil and Homer, *La Gotiade*, *La Firenze*, *l'Amadeide*, *Il Ruggiero*, had comparatively little effect even in his own time, and are now almost unreadable. His twenty-two *poemetti* on profane subjects and fourteen on sacred subjects are equally impossible. D. Oct. 14, 1637. See *Vita de G. Chiabrera*, by himself (Milan, 1821). His works are to be found in the series *Ctassici Itatiani* (Milan, 3 vols., 1807–08). A. R. Marsh.

Chiapanecs: See Indians of Central America.

Chiapas, chĕĕ-aa'păăs: a state in the southeast part of the Mexican confederation. Area, 27,222 sq. miles. It is bounded N. by Tabasco, E. by Guatemala, and W. by Tehuantepec. It exports cocoa and vanilla. Extensive and remarkable ruins of an ancient city are visible at Palenque in this state. Pop. (1895) 315,120. Capital, San Cristóbal.

Chiari, kĕĕ-aa'rĕĕ: a town of Italy; province of Brescia; on the railway from Milan to Brescia; 11 miles W. of the latter; was formerly fortified (see map of Italy, ref. 2–C). It has several churches and manufactures of silk fabrics. Pop. 10,507.

Chiari, Giuseppe: painter; b. in Rome in 1654; pupil of Galliani and M. Maratta; worked in the church of Montesanto, Marcaioni chapel, S. Maria del Suffragio, where his *Adoration of the Magi* is, and in S. John Lateran. D. 1727.

Chiarini, kĕĕ-ăă-ree'nĕĕ, Bartolomeo: Italian sculptor who lived about 1560. In company with Benvenuto Torelli he carved the wood bas-reliefs in the choir of S. Severino at Naples.

Chiarini, Marc Antonio: Bolognese painter; b. 1652; pupil of Fra Quaino and Domenico Santi. Painted at Modena, Milan, Lucca, and Vienna, with a great reputation for perspectives, architectural subjects, arabesques, and ceilings. D. 1730.

Chiaroscuro, kĕĕ-aa'rō-skoo'rō [Ital., from a union of the two words meaning *light* and *dark*]: a combination of light and dark in a painting; a drawing; a print from wood-cut or metal, and the like. The term is especially used for the design in light and dark of a painting, as distinguished from its color-design and from its merit as a piece of accurate drawing. Thus a picture may be said to be poor

and cold in color, but valuable as a piece of *chiaroscuro*—that is to say, the combination of light and dark parts and of different degrees of light and dark is praised. It is sometimes said that the chiaroscuro is not truthful or not accurate, meaning that the system of light and dark in the picture is not that of nature; but probably this is an erroneous use of the term, as chiaroscuro is an exclusively artistical expression. It might be better to say that the chiaroscuro is fine, but not taken from the light and shade of nature.

RUSSELL STURGIS.

Chiaroscuro Prints: prints in two or more colors made from wood-cuts by the use of two or more blocks, each with a different-colored ink. These were common in Italy in the sixteenth century, and the use of them was revived in the eighteenth century in England.

Chiasma: See DECUSSATION.

Chiavari, kĕĕ-aa′vaă-rĕĕ: a town of Italy; province of Genoa; on the Gulf of Rapallo, at the mouth of the Sturla; 24 miles E. S. E. of Genoa (see map of Italy, ref. 4–C). The streets are bordered with arcades and well-built houses. The town is inclosed by cultivated hills, and has many handsome villas in the environs. Here are several palaces and three churches; also manufactures of silk, lace, furniture. Fishing is carried on and marble is quarried in the neighborhood. Pop. 12,066.

Chiavistelli, kĕĕ-aă-vĕĕs-tel′lĕĕ, JACOPO: b. 1621; d. 1698; Florentine painter; pupil Fab. Boschi and Baccio del Bianco; work of his is in the prefecture and in various churches in Florence.

Chibchas and **Chibchan Antiquities**: The ancient nation of the Chibchas occupied the territory about the headwaters of the Magdalena river in New Granada (see INDIANS OF SOUTH AMERICA); but more or less remote branches of the stock occupied a large part of the present republic of Colombia, and remains attributable to them are found scattered over a great part of this area.

Buildings.—Both the domestic and public edifices of the Chibchas were usually of perishable materials, as wood and plaster, so that in their territory remnants of stone structures are rare. A few sites, however, are mentioned where such have been found. Perhaps the most characteristic is in the valley of San Augustin. Here the ruins of various small temples or *adoratorios* have been discovered. They are constructed partly underground, walls and roof being of large slabs of a compact ferruginous sandstone, carefully dressed, and bearing figures carved in relief. The interior chamber is rectangular, about 7 feet in height, and 12 feet by 10 in area. In the vicinity many large and curious stone images have been met with, carved with considerable expression and with a marked and varied individuality. They have a family likeness, being short and thick, about 4 feet high, and with an expression of countenance apparently intended to strike terror into the observer.

Sepulchers.—In most of the fertile valleys of the upper Magdalena and its branches burial-mounds from 5 to 30 feet in height were numerous. They attracted the attention of the European settlers at an early date, as they were found to contain an abundance of precious metal—gold and silver—which had been buried with the dead. Gold was especially frequent, the forms into which it had been worked being figurines, cups and vases, personal ornaments, and utensils. There have been instances reported where $50,000 worth of this metal have been extracted from a single tumulus. The consequence is that but few of them have escaped the attention of the treasure-seekers, who cared for nothing but the objects in metal, and for those only for their money value.

Rock Inscriptions.—Although it is not positively known that the Chibchas possessed a method of writing, there is some evidence to that effect, and the paintings and carvings on rocks still to be seen in their territory prove that at least they understood a developed form of symbolic script. A number of such have been mentioned in various parts of their territory, the two best known being the "painted rock" at Saboya and a pyramidal inscribed rock at Gameza, on the river Chicamocha. Both of these contain figures of men and of animals, especially the frog, which seems to have played an important part in Chibchan mythology as the symbol of the god of the waters. The monolithic pyramid of Gameza is believed to have been artificially carved into its present shape to serve as a memorial of some important event in tribal history. Unfortunately, an accurate copy of the inscription has not been published.

Calendar Stones.—Another and peculiar class of Chibchan antiquities includes what have perhaps erroneously been called "calendar stones." These are small, hard stones, 6 or 7 inches in length, or less, carved into curious shapes, with flat surfaces, on which are chiseled in low relief figures of various objects. The local archæologist Duquesne, and following him Alexander von Humboldt, explained these as calendars, and the figures upon them as day and month signs. This explanation has been rejected by later antiquaries, who prefer to regard them as molds on which thin plates of gold were hammered so as to present in the metal the figure in relief on the stone. To this it may be objected that the figures are always in series of fives on the stones, and that they are not varied, but are repetitions of the same, a frog, a fish, a drum, a quiver, etc., which would scarcely be the case were they simply molds for gold-beating. Their real purpose has therefore not been decided.

Metal-work.—The Chibchas were not acquainted with copper or bronze, and their tools and weapons were of stone or wood. The rivers of their country are, however, rich in gold, and this they acquired unusual skill in working. They had learned the art of smelting and chasing, and of decoration in both low and high relief. Their eye for symmetry of form was excellent, and the gold vases probably showing the most correct form and finest workmanship of any on the American continent have been disinterred from their ancient sepulchers. They were one of the few American tribes who had a metallic currency, for which they used flat pieces of gold valued by measure and not weight.

Pottery.—The ceramic art had been cultivated by the Chibchas to almost as great an extent as by the Peruvians. The jars and vases taken from the ancient mounds are usually in a grayish clay, finely tempered, symmetrical in contour, and of varied designs, all, however, presenting an easily recognizable family likeness. They rarely imitate animal forms, and in this respect these products differ from the ware brought from Peru.

AUTHORITIES.—J. Acosta, *Compendio Historico de Nueva Granada*; P. Perez, *Geografía de Bogotá*; E. Uricoechea, *Antiguedades Neo-grenadinas.* D. G. BRINTON.

Chica, chee′ka: a resinous dyestuff used to give an orange-red color to cotton. It is obtained by boiling the leaves of the *Bignonia chica*, a plant which grows on the banks of the Orinoco. This plant is a climber with bipinnate leaves, heart-shaped leaflets, and flowers in drooping clusters.

Chica, or **Pito**: a fermented liquor made from Indian corn in some parts of South America, and similar to ordinary beer; but the Indians sometimes prepare it by chewing the grains, and that which is so prepared is most highly esteemed. To make this liquor particularly strong and well flavored, they pour it into an earthen jar which contains beef; and having made the jar air-tight, they bury it in the ground, where it is left for years. On the birth of a child it is their custom thus to bury a jar of chica, to be drunk at the same child's wedding. Chica has an agreeable flavor, and is very intoxicating.

Chicago: city; capital of Cook co., Ill. (for location, see map of Illinois, ref. 2–G); the largest city on the Great Lakes, also the second city in size and the largest interior city in the U. S.; on Lake Michigan and both sides of the Chicago river; lat. 41° 53′ 6″ N., lon. 87° 36′ W. from Greenwich; 911 miles from New York, 811 from Washington, 915 from New Orleans, and 2,450 from San Francisco. The area of the original town in 1830 was 2·55 sq. miles; in 1847, it was 14·03 sq. miles; in 1864, 35·76 sq. miles; in Dec., 1887, 43·91 sq. miles; in 1900, 190·66 sq. miles.

Site and Plan.—Its original site was a narrow sand ridge extending along the lake, and a low flat prairie, many miles in extent, adjoining it on the W. only 3 feet higher than the river. The prairie has since been raised to a uniform grade of 10 feet above the lake, an elevation ample for perfect sewerage. The highest part of the city is in the neighborhood of Humboldt Park. Within the city limits the west shore of Lake Michigan extends nearly N. and S. The city stretches along the lake for a distance of 26 miles, touching the State line of Indiana on the S. E. It varies in width from E. to W. from 6 to 14 miles. The river and its branches divide the city into what are called the north, west, and south sides, of which the west division contains 762,219 inhabitants, the south 645,318, and the north 291,048 (school census of 1900). That part of the city touching the Indiana State line is drained by Calumet river. The principal branch of this stream flows northward and empties into Lake Michi-

gan. Here also are found the only large bodies of water within the city limits—Calumet Lake, a little more than 3 miles in length, and Hyde Lake. Both are connected with Calumet river, and Hyde Lake is connected with Wolf Lake, which lies partly in Chicago and partly in Indiana.

The streets of the city, averaging in width 66 feet, are, with but few exceptions, laid out at right angles, running with the four points of the compass. Of these streets 1,248 miles are paved and 1,412 partly improved, making in all 2,660 miles of streets. The streets are lined with 5,890 miles of sidewalk (including parks) averaging 17 feet in width, of which 4,490½ are of wood, 286 stone, and 1,076 concrete. There are 1,481 miles of sewers, 53,490 catch-basins, and 154,951 manholes, which, with the cost of repairing and cleaning, have cost the city $20,059,389.

The business center is comparatively small, occupying an area less than a mile square, bounded on the E. by the lake and N. and W. by Chicago river. Here are situated most of the great railway dépôts, the post-office, the court-house, the board of trade building and custom-house, the Art Institute, the principal stores, banks, theaters, and hotels, the lofty structures that are the chief architectural features of the city. The chief business thoroughfares within this area are Michigan, Wabash, and Fifth Avenues, State, Dearborn, Clark, La Salle, Franklin, and Market Streets, all running N. and S., and Lake, Randolph, Washington, Madison, Monroe, Adams, and Jackson Streets, extending E. and W. The shipping business is transacted along the river and the canal, the former having a frontage, including docks, of 41 miles. Many of the manufactories are situated on Canal and Clinton Streets W. of the river, also in the angle formed by the Chicago river and its northern branch, and in the south-western part of the city. The live-stock and meat industry is carried on at the Union stock-yards, extending from Thirty-ninth Street to Forty-seventh Street, in the geographical center of the city.

Grand, Michigan, Drexel, and Washington Boulevards, Wabash, Calumet, and Prairie Avenues, La Salle, Rush, Pine, and Cass Streets, and the lake shore drive contain many of the most attractive and costly residences. There is great variety in the architecture and in the building material; brick and sandstone are used extensively, but large houses constructed entirely of wood are found, and those of all descriptions in the strictly residence quarters are detached, as a rule. The great boulevards, stretching as far as the eye can reach, are admirably planned to meet the needs of the future as well as the present, and, with their roadways separated by stretches of turf and brilliant flower-beds, and their palatial dwellings surrounded by well-kept lawns, present a strong contrast to the business streets, which are overcrowded, and show the effects of the almost universal use of soft coal for manufacturing and other purposes. The fact that the city is modern is everywhere apparent; a large part of it retains its suburban character, and in the more recently annexed districts there are farms, groves, and even bits of unbroken prairie, but in the older parts enterprise, good taste, and a lavish outlay of money have combined to produce effects that almost compensate for the lack of picturesqueness obtained only by age.

Parks and Boulevards.—The park system, including boulevards, covers an area of 2,605 acres. The principal parks are under the management of three distinct boards of commissioners, those for Lincoln Park, on the north side, for the west parks, and for the south parks. Lincoln Park, on Lake Michigan, including boulevards, contains 308 acres. The ground is undulating and beautifully laid out in drives, lawns, and avenues, bordered by trees, shrubs, and flowers. It has two artificial lakes and a lagoon for boating. It contains many fine specimens of the sculptor's art, among which the most striking is the statue by St. Gaudens of Abraham Lincoln, which cost $50,000. There are also an equestrian statue of Gen. Grant, bronze statues of Franklin, Hans Christian Andersen, Schiller, Linné, and La Salle, a reclining statue of Shakespeare, and a group of Indians. The west parks are separately distinguished as follows: Douglas, 180 acres; Garfield, 186 acres; and Humboldt, 200 acres; there are also the lesser parks of Union, Vernon, Wickes, and Jefferson. The south park system includes the famous Jackson Park, where the World's Columbian Exposition was held, containing 533 acres; Washington Park, 371 acres; Gage Park, 20 acres; and the celebrated Midway Plaisance, 80 acres. Only one of the buildings in Jackson Park erected for the World's Fair remains permanently, the Art Building, which has become the Field Columbian Museum. The above system of parks is connected with a chain of boulevards, from 100 to 200 feet in width, which with the lake shore drive circles the entire city with one of the most beautiful driveways in the world, over 65 miles in length. Besides the parks under the management of the boards, the following small parks, containing from 1 to 5 acres, scattered through the city, are controlled by the commissioner of public works; Irving, Oak, Ellis, Green Bay, Shedd's, Jefferson (town), Holstein, East End, and Congress parks; and Douglas Monument, Aldine, Biekerdike, and Washington squares. The Lake Front Park, 20 acres, is also controlled by the city.

Drainage Channel and Waterway.—The Illinois and Michigan Canal was deepened in 1868–71 at the cost of $3,300,000 for drainage purposes, the Chicago river having become greatly contaminated by the city sewage; but the canal was not made sufficiently large to carry off the water, and resort was had to pumping, which has only partly answered the purpose. After several years' agitation and discussion a plan for the construction of a new waterway, 160 feet wide and at least 16 feet deep, from the Chicago river to the Desplaines, and so on to Joliet, was adopted, and the work was begun in 1891. On Jan. 2, 1900, this great canal was opened, the cost to that date having been $33,525,700.

Water-works.—The city is supplied with water from Lake Michigan. Pure water is obtained at "cribs" located from 2 to 4 miles from the shore, and is conveyed thence to the city through five tunnels under the lake. It is distributed by ten pumping works capable of supplying the city with 532,000,000 gals. daily. The cost of the system to Jan. 1, 1901, including lands, buildings, water-pipe, tunnels, cribs, and machinery, was more than $30,000,000.

Bridges and Track Elevation.—The Chicago river is spanned by fifty-four swinging bridges, of from 200 to 250 feet in length, operated by steam. By the elevation of 260 miles of railway tracks and the construction of 254 subways, dangerous grade crossings have been eliminated. Three brick tunnels under the river connect the north and south and south and west divisions of the city, and are used by cable-cars and pedestrians.

Lighting.—The city has 29,500 street lamps, of which 25,000 are gas and 4,500 gasoline. It has also an electric plant with four power stations, supplying 4,300 lights. The cost of lighting is nearly $913,000 per year.

Public Buildings.—The U. S. Government building, occupying an entire block, and erected in 1880–84 at the cost of nearly $6,000,000, was so badly constructed that it had to be torn down and a new one is being erected in its place. The Board of Trade building, at the foot of La Salle Street, covers an area of 200 by 174 feet, and is built of gray granite. The great Exchange Hall, the largest in the country, is 174 by 155 feet, and is elegantly embellished with decorations. The court-house and city-hall combined was erected in 1879–81 at a cost of over $4,000,000. It is a handsome and imposing structure 340 by 210 feet, three stories in height, with basement and attic, in the Romanesque and Venetian style of architecture. The interior is finely decorated and finished, the floors being tiled with black and white marble. The east half is used as a county building, with court and office rooms, and the west half as a city-hall.

The high-building period began in 1883–84, the first one being the Home Insurance building, ten stories high. It is called the "Chicago construction," and consists of a skeleton construction of metal, fire-proofed by masonry, all loads being carried story by story on the columns. They are claimed to be fire-proof, wind-proof, and earthquake-proof. Among the "sky-scrapers" the Masonic Temple is the highest, being twenty stories in height, and cost over $2,000,000. It contains 800 offices and desk-room for 5,000 people. Other tall buildings are the W. C. T. U. Temple, which cost $1,100,000, thirteen stories high, the new Chamber of Commerce building, the Unity, Monadnock, Fisher, and Old Colony buildings, and the Leiter building, 404 by 140 feet. The Auditorium building includes an opera-house, with a seating capacity for 4,000 people, which can be extended to accommodate 7,000, a recital hall, stores, 136 offices, a tower observatory, and a hotel with accommodations for 400 guests. It has a total frontage on Wabash and Michigan Avenues and Congress Street of 710 feet, and the main building is ten stories in height.

Means of Communication.—Chicago, being the terminus of all the great trunk lines of railway of the U. S., Canada, and Mexico, is practically the greatest railway center in the world. The number of these lines, controlled by thirty-five

different corporations, is twenty-one, and they bring into the city the products, merchandise, and passengers from 111,000 miles of contributing lines. These lines have a trackage of 1,439 miles in the city; the six principal dépôts are the Union, Grand Central, Rock Island, Illinois Central (costing over $1,000,000), Dearborn or Polk Street, and the Northwestern. From these stations 275 through trains, 750 local, suburban, or accommodation trains, and over 500 freight trains arrive and depart daily.

Besides the railways, the carrying trade of Chicago is largely shared by the merchant marine service, the average number of vessels arriving and departing each year being a little over 16,000, with a tonnage of 12,600,000. These include many passenger steamers, which connect the city through Lake Michigan with Lakes Huron, Superior, and Erie; through the Erie and Welland Canals with the ocean; and through the Illinois and Michigan Canal with the Mississippi river. There are 432 miles of street-railways, 40 of which are operated by cable, 5 by horses, and 347 by electricity, while 40 are elevated.

Churches.—There are 852 churches, divided denominationally as follows: Methodist Episcopal, 148; Lutheran, 149; Roman Catholic, 121; Congregational, 96; Baptist, 76; Presbyterian, 62; Protestant Episcopal, 47; Jewish, 20; Reformed Episcopal, 7; and all others, 126.

Educational Institutions.—The common schools are supported by taxation, and are free to all. The expenditures for 1900 were $7,273,787. The system is under the management of a board of education and city superintendent, appointed by the mayor. In 1900 there were 252 school houses, 5,350 teachers, to whom were paid salaries amounting to $4,847,192, and an enrollment of 211,897 pupils. There are primary, grammar, and high-school departments, and English high and manual-training school, and evening schools. A compulsory education law is in force. There is also a normal school for the education of public-school graduates desirous of becoming teachers, and in addition to the public or free schools there are numerous kindergartens, parochial schools, and private and sectarian schools. The oldest college is the NORTHWESTERN UNIVERSITY (*q. v.*) The Armour Institute, a training school for the promotion of industrial education, was established in 1891 by Philip D. Armour and his family, who endowed it with $1,700,000. A spacious and substantial building has been erected, 175 by 65 feet, five stories in height, with rooms for library, chemical and physical laboratories, lectures, and recitations. The Chicago Athenæum, called "The People's College," was established in 1873. It is opened daily and five evenings each week for nine months each year, and has a corps of thirty-three teachers. Young men and women are entered at any time without examination.

The oldest of the theological colleges is the Chicago Theological Seminary (Congregational), which was established in 1854. The McCormick Theological Seminary is a Presbyterian institution which was organized and the first buildings erected in 1863. The Western Theological Seminary is a new institution, established under the control of the Protestant Episcopal Church. The Baptist Union Theological Seminary is now a part of the University of Chicago (see CHICAGO, UNIVERSITY OF). St. Ignatius College is a Roman Catholic institution, established in 1869. It is conducted by the Fathers of the Society of Jesus. St. Xavier's Academy is a Catholic institution for the education of females. It was established in 1846, and is conducted by the Sisters of Mercy. The leading medical colleges are the Bennet Homœopathic, College of Physicians and Surgeons, Hahnemann, and Rush. There are also several colleges of dental surgery.

Art has found a home in the Art Institute, a magnificent structure located on Michigan Avenue and costing $500,000. It contains a splendid collection of pictures, casts, and works of art, together valued at $500,000.

The Academy of Sciences was founded in 1869. In 1890 Matthew Laflin made it a donation of $75,000, which, with other aid, enabled it to erect a fine building in Lincoln Park.

Libraries.—The Chicago Historical Society possesses the oldest public library in the city, begun when the society was organized in 1857. It is not large, containing only 65,000 volumes, bound and unbound, but is rich in Americana, original documents, records, and manuscripts. The Public Library is the largest in the Northwest, containing over 260,000 volumes. It was established in 1873, and is supported by city taxation. It is housed in a magnificent fireproof building on Michigan Avenue. It is a free circulating library, with reading and reference rooms. The Newberry Library is named after its founder, Walter L. Newberry, who left in his will for its establishment property from which has been realized over $2,500,000. It occupies a handsome building facing Washington Place, on the north side. The library is for reference only, and over 200,000 volumes, many of them rare and costly, have been collected. The Chicago Law Institute has a fine law library in the county building. The Crerar Library, with an endowment of over $2,000,000 from John Crerar, is to be located on the south side, and, in accordance with the founder's will, must be kept free from sensational and skeptical works.

Charitable Institutions.—These comprise 11 asylums for children, 2 diet kitchens, 6 homes for the aged, 6 homes for women, 7 industrial schools, 7 day nurseries, 12 relief societies, 4 reformatories, 7 dispensaries, 8 training-schools for nurses, County and City Infirmary, and Insane Hospital. Besides these there are the following hospitals: Alexian Brothers, Augustana, Baptist, Emergency, German, Marine, Porter Memorial, Mercy, Michael Reece, Presbyterian, Provident, St. Elizabeth, St. Joseph, St. Luke's, Temperance, Wesley, Woman's, and the Women's and Children's.

Government.—The city is governed by a mayor, elected biennially, who receives a salary of $7,000; and a common council, composed (1900) of sixty-eight aldermen, whose terms are also two years, each of the thirty-four wards into which the city is divided electing one each year. The other elective officers are a city clerk, treasurer, and attorney. The following are the officers appointed by the mayor and confirmed by the council: City comptroller, commissioner of public works, corporation counsel, city collector, prosecuting attorney, engineer, superintendents of the police department, public buildings, water office, streets, and schools, fire marshal and other subordinate officers. The receipts of the city for 1900 were $33,341,720, and the expenditures $30,141,134. The bonded debt in 1900 was $16,000,000.

Police and Fire Departments.—The police force of the city, including a superintendent and assistant, secretary, chief inspector and 5 division inspectors, 15 captains, 60 lieutenants, 104 patrol sergeants, and 104 desk sergeants, numbers 2,475; with 42 police stations, 39 patrol barns, 42 patrol wagons, 8 ambulances, and 245 horses in use. Connected with the department is a bureau of identification, with the portraits of over 12,000 criminals and measurements and descriptions of over 4,000. It has also a detective department, 30 matrons to look after women and children arrested, and an efficient patrol-wagon system. The cost of maintaining the force in 1900 was $3,383,092.

The fire department consists of 1,150 officers and men, 101 steam engines, 27 chemical engines, 33 hook and ladder trucks, 5 fire-boats and 503 horses. The organization is directed by a fire marshal, a first and second assistant, secretary, a fire inspector, and 13 chiefs of battalions. Connected with the department is an insurance patrol, established in 1871. Firemen are retired on half pay after a continuous service of twenty years. The cost to the city of the department in 1900 was $1,678,410.

Banks.—There are 15 national banks with an aggregate capital of $17,450,000, and 17 State banks with an aggregate capital of $11,622,000. The total bank clearances for 1900 were $6,799,535,598, as against $6,612,313,611 in 1899.

Manufactures.—The manufacturing industries of Chicago are second in magnitude only to those of New York city and are growing rapidly. The total value of manufactures for 1900 was $741,097,000, as against $673,725,000 for 1899. Slaughtering and meat packing and closely allied industries lead in value of products, aggregating $154,000,000. Smelting and refining come next with $42,000,000. Then follow wagons and implements, $40,000,000; clothing, $35,000,000; printing and publishing, $31,000,000; rolling mills, $30,000,000; foundries, $27,000,000; furniture, $26,000,000; machinery, $21,000,000; cars, bridges, and elevators, $21,000,000; boots and shoes, $16,250,000; breweries, $15,000,000; cloaks and furs, $15,000,000; tobacco, snuff, and cigars, $12,000,000; tanneries, $11,000,000; coffee and spice mills, $11,000,000; electric supplies, $10,500,000; bakeries, $10,500,000; soap, $10,500,000; sash, door, and box manufacture, $10,500,000; jewelry and optical goods, $10,000,000; pianos and organs, $10,000,000; millinery, $10,000,000.

Trade and Commerce.—The receipts of grain, and flour in its grain equivalent, in 1900 aggregated 349,631,000 bush., more than in any previous year; the shipments for the year aggregated 265,546,000 bush. Corn showed receipts of 134,663,456 bush.; shipments, 111,099,653. Oats, receipts, 105,226,761 bush.; shipments, 77,554,695. There are 27 grain

elevators, with a combined capacity of 32,800,000 bush. The volume of the speculative grain trade of Chicago for 1900, as indicated by the board of trade clearing-house, amounted to $62,227,165. The live-stock receipts during 1900 were 8,698,478 hogs, 2,728,134 cattle, 3,540,643 sheep, 136,370 calves, 91,756 horses, valued in all at $271,217,000. The number of hogs packed in that year was 7,241,881; of cattle, 1,794,397. During the year Chicago received 216,455,042 lb. of dressed beef, and shipped 1,178,950,898 lb. Of meats other than barreled pork there were received during the year 197,203,914 lb., and shipped 791,021,932 lb. Of lard, 60,632,245 lb. were received, and 479,773,491 lb. shipped.

The great pine forests of Michigan, Wisconsin, and Western Canada, easily accessible by lake vessels, and the vast region tributary to Chicago and dependent upon this market for lumber, have made the figures in this department of trade almost fabulous. Chicago is the largest lumber-market in the world, the receipts for 1900 aggregating 1,671,563,000 feet. Of shingles, 345,000,000 feet were received. The coal receipts were 2,125,063 tons of anthracite and 4,627,167 tons of bituminous, which, with the coke received, amounted in value to about $20,470,885. The value of foreign merchandise imported into Chicago in 1893 was $15,441,320, paying a duty of $8,177,735.

Hotels and Theaters.—The demands of the World's Fair stimulated the erection of more hotels than can be well sustained. The principal hotels in the heart of the city are the Auditorium and its Annex, the Great Northern, the Palmer House, the Grand Pacific, the Wellington, the Leland, Victoria, Sherman, and the Tremont House, and farther out the Virginia, the Metropole, and the Lexington. The "downtown" theaters, with the Auditorium and Central Music Hall, are McVicker's, the Illinois, Chicago Opera-house, the Grand Opera-house, Powers's, the Dearborn, the Great Northern, the Studebaker, the Olympic, and Hopkins's.

The Press.—The first newspaper, the *Weekly Chicago Democrat*, was founded in 1833, and began with 145 subscribers. The second, *The American*, now called *The Evening Journal*, was founded in 1835. In 1894 the number of publications of all kinds was a little over 500. Of this number, 24 were dailies, 195 weeklies, and 280 monthlies; 53 were devoted to religion, 11 to music and the drama, 16 to commerce and finance; 25 were printed in German, 2 in French, 24 in Scandinavian (chiefly Swedish), 5 in Bohemian, and 7 in Polish.

History.—The territory included within the limits of Chicago belonged to France by right of discovery, as claimed by La Salle in 1682; to Great Britain, by conquest and treaty with France in 1761; to Virginia, by right of conquest under Col. George Rogers Clark in 1778, under whose jurisdiction it remained until 1784; and to the U. S., by deeds of cession from Virginia and New York, which claimed the territory under a treaty with the Six Nations of Indians. It became a part of "the Northwest Territory," but there being no white inhabitants it was not included in any county until 1796, when it was embraced within the county of Wayne, the third one organized in the Territory, in which Detroit also was situated. When the Indiana Territory was created, in 1802, it was included within its boundary until the Territory of Illinois was separated therefrom and organized in 1809. It thereafter was included in Illinois counties as follows: Madison in 1812, Edwards in 1814, Crawford in 1816, in Clark after the Territory of Illinois was admitted as a State in 1819, Pike in 1821, Fulton in 1823, Peoria 1825, under whose jurisdiction it remained until the formation of Cook County in 1831.

The site of the city was a place of resort and rendezvous for the Indians ever since it was first discovered by the whites; and for many years before any civilized settlements were made it was the favorite rallying-point for hundreds of voyagers and fur-traders. So important was this spot regarded by the Government that in the treaty of Greenville (Aug. 3, 1795)—the first made with the aborigines for Western lands—"six miles square at the mouth of the Chikago river," covering the present site of the city, was ceded to the U. S. Fort Dearborn was established in 1803–04, around which slowly grew the white settlement which formed the village of Chicago. This was plotted and laid out Aug. 4, 1830; it was incorporated as a town in 1833, and as a city May 4, 1837.

The building of the Illinois and Michigan Canal, which did much to promote the growth of the city, was begun in 1836 and completed in 1848. The first appropriation for the improvement of the harbor of Chicago by Congress, $25,000, was made Mar. 2, 1833. The first drawbridge across the Chicago river was constructed in 1834. The first fire company was organized in 1835. The first vessel, the *Clarissa*, was built and launched May 4, 1836. Chicago became a port of entry July 16, 1846.

The first railway constructed was a ten-mile stretch of the Chicago and Galena Union Railroad, and the first train of cars was run thereon Dec. 15, 1848. It required nearly four years to complete the line to Freeport, a distance of 120 miles. The first roads leading to the East, the Michigan Southern and the Michigan Central, did not enter the city until 1852.

Chicago, having neither barriers of hills nor forests, is exposed to sweeping winds on every side. Under conditions most favorable for a disastrous fire, one broke out in the evening of Oct. 8, 1871, in a barn on De Koven Street. The wind was blowing strong from the S., and soon veering to the S. W. assumed the proportions of a fierce and unrelenting gale. In two hours and a half the entire heart of the city was burned out. On the morning of the 9th the north side was attacked; at 3.20 the water-works were destroyed, and thenceforth there was no help. The fire raged on the south side until 10 o'clock, A. M., and on the north side all day. On the west side, where the fire began, 194 acres were burned over, destroying 500 buildings. On the south side the area was 460 acres, and the number of buildings burned 3,650, including 1,600 stores, 28 hotels, 60 manufactories, and all the public buildings, banks, and offices. The area of destruction on the north side comprised 1,470 acres, and the number of buildings destroyed was 13,300, including 600 stores and warehouses, 100 manufactories, and all the finest residences in the city. Out of a population of 77,000, only 7,000 were left with a roof to cover their heads. The loss of property, according to the best revised estimates, was: Buildings and improvements, $50,000,000; produce, lumber, and provisions, $5,000,000; dry goods and manufactures, $75,000,000; household property, libraries, etc., $57,000,000—total, $187,000,000. The loss of the city in public buildings, bridges, pavements, etc., was $2,500,000.

The hard times of 1876–77 culminated in rioting on July 23, 1877, and continued three days, the militia being called out, and many of the rioters killed and wounded.

In May, 1886, labor difficulties led to the Haymarket riots, which, by the hurling of a bomb during an anarchists' meeting into the ranks of the police, resulted in the death or severe wounding of twenty persons. The leaders were arrested, tried, and four of them, Spies, Parsons, Fischer, and Engel, executed for their crime.

The strike of 1894 was the most extensive that has occurred in Chicago, requiring the calling out not only of the State militia, but of U. S. troops as well. Property to the amount of over a million dollars was destroyed, and many lives were lost.

For an account of the World's Fair of 1893, see COLUMBIAN EXPOSITION, WORLD'S.

Population.—(1837) 4,180; (1845) 12,088; (1850) 29,963; (1860) 109,206; (1870) 298,977; (1880) 503,185; (1890) 1,099,850; (1900) 1,698,575. The foreign-born population in 1890 was 809,850. The nationalities of the population at the school census of 1894 were as follows: American-born, 949,092; of foreign birth, 618,565. Of those of foreign birth, 216,324 were from Germany, 111,037 from Ireland, 90,922 from Scandinavia, 34,960 from Bohemia, 47,881 from Poland, 36,895 from Great Britain, 7,413 from France, and 14,194 from Italy. Of the voters in 1892, the native born numbered 131,335, those naturalized or of foreign birth, 128,812.

See Moses and Kirkland, *History of Chicago* (2 vols., 1894); Andreas, *The History of Chicago* (3 vols., Chicago, 1885); Schick, *Chicago and its Environs* (Chicago, 1891).

JOHN MOSES.

Chicago, University of: The first University of Chicago was chartered by the Legislature of Illinois in 1857, and began the work of instruction in 1858; but in 1886, when its last class was graduated, it succumbed to the financial difficulties which had attended the greater part of its history. In May, 1888, the American Baptist Education Society was formed in Washington, and the Rev. F. T. Gates elected corresponding secretary. He decided that the first great work of the society should be the founding of a strong institution in Chicago. In Dec., 1888, the board of the society instructed its secretary to use every means in his power to originate and encourage such a movement. In 1889 Drs. William R. Harper, E. Benjamin Andrews, Alvah Hovey,

Henry G. Weston, J. F. Elder, Samuel W. Duncan, Henry L. Morehouse, James M. Taylor, and Hon. Charles L. Colby were appointed a committee to report on the scope, location, funds, etc., of the institution. In May, 1889, the board took financial action in a series of resolutions, immediately after the adoption of which Mr. Gates announced a subscription of $600,000 by Mr. John D. Rockefeller, of New York, providing $400,000 more should be pledged on or before June 1, 1890. Not only was the $400,000 secured, but also books, apparatus, and a site for the institution valued at $125,000. The site lies between Washington and Jackson Parks, and fronts south on the Midway Plaisance. Mr. Marshall Field contributed a block and a half of land and two and a half blocks more were purchased for $282,500, thus providing a tract of four blocks, or some 25 acres. The university was incorporated in June, 1890, the corporate name being "The University of Chicago." Two-thirds of the members of the board of trustees and the president of the university must belong to the Baptist denomination. At the first meeting of the board of trustees after its incorporation, Prof. William Rainey Harper, of Yale University, was elected president. He entered upon the duties of his office July 1, 1891. Before he accepted the presidency, the scope of the institution had been greatly enlarged. At first the establishment of a college only had been contemplated. President Harper felt that the institution should be a university from the outset. Mr. Rockefeller, agreeing with this view, in Sept., 1890, added $1,000,000 to his former subscription, of which $800,000 was designated for non-professional graduate instruction. Mr. Rockefeller further increased his endowment Feb. 23, 1892, by $1,000,000, and Dec. 27, 1892, by $1,000,000 more, making the total of his endowment $3,600,000. The general plan of the entire group of buildings was prepared before the work of construction was commenced. The central features of the plan are a university hall, scientific laboratories, museum, library, chapel, science hall, and gymnasium. Dormitories intended to accommodate over 2,000 students are arranged in quadrangles on the four corners of the site. The erection of buildings was begun Nov. 26, 1891. The first buildings to be erected were the recitation building and a group of dormitories for the divinity school and university. In 1892 S. A. Kent, of Chicago, contributed $150,000 for the erection and equipment of a chemical laboratory. The entire group of buildings will be of blue Bedford stone. The university begins its work with a great and valuable library, comprising numerous private libraries, but mainly consisting of a large collection purchased in Berlin, popularly known as the Calvary Library, which includes many rare manuscripts and the most complete collection of dissertations from the universities of Europe in existence. The library now contains over 300,000 volumes. In 1891 the executors and trustees of the estate of William B. Ogden, the first mayor of Chicago, assigned to the university 70 per cent. of that portion of the estate devoted by the will of Mr. Ogden to benevolent purposes, to establish "The Ogden Scientific School of the University of Chicago." It is expected that at least $300,000 will be realized by the university from this source. The entire property of the university was valued in 1900 at more than $8,000,000. The university academy occupies the buildings formerly used by the Theological Seminary at Morgan Park, and also those occupied by the Illinois Military Academy. The Baptist Union Theological Seminary, in accordance with Mr. Rockefeller's wishes, became the divinity school of the university, and now occupies quarters on the university site. The organization of the university embraces many novel features. The university work is divided into the university proper and the department of university extension. The university proper includes (1) academies which may be either directly under the control of the university or affiliated with it; (2) colleges either in Chicago or at other points, the latter being also affiliated with the university upon certain definite terms; (3) graduate schools, either non-professional or professional. The college year is divided into four quarters, beginning respectively on the first day of October, January, April, and July, and continuing twelve weeks. The university is thus in session the entire year. Students and professors may take as their vacation any one of the four quarters: the students may take two vacations of six weeks each at two periods of the year as best suits their needs and convenience. The courses of instruction are classified as majors and minors; majors calling for ten hours and the minors five hours each per week. Courses continue six weeks. Candidates for a degree must have finished satisfactorily 24 majors and 24 minors, or the equivalent of 36 majors, and each student is required to take 1 major and 1 minor during each term of the quarter. Students may be graduated at any time when they have completed the required work. Non-resident work is accepted under certain specific regulations. Instruction in the university began Oct., 1892, with 111 instructors in its various faculties, and an attendance of 589 students. It had at the close of 1900 240 instructors and 3,183 students. C. H. THURBER.

Chicasaw Confederacy: See NATCHESAN INDIANS; also MUSKHOGEAN INDIANS.

Chiccory, or **Succory**: an herb of the family *Compositæ*, sub-family *Ligulifloræ*. The common chiccory or succory (*Cichorium intybus*) is a perennial plant found wild in most parts of Europe and naturalized in the U. S., growing in waysides, borders of fields, etc. It has a long carrot-like root of a brownish-yellow color, and white within. The stem rises 2 to 5 feet, the leaves resembling those of the dandelion; the flowers rather large, beautiful, and generally blue. Chiccory is extensively cultivated in Europe for its roots and for feeding cattle with its leaves; and its cultivation has attracted some attention in America. The blanched leaves are sometimes used as a salad. To this genus belongs also the endive. The dried and powdered roots of chiccory are much used as a substitute for coffee; also in the adulteration of that article.

Chichen', or **Chichen Itza**: a town of Mexico, in Yucatan; 18 miles S. W. of Valladolid (see map of Mexico, ref. 7–L). Here are the remains of an ancient town, comprising a vast ruined building 450 feet long, a pyramid, the base of which is 550 feet square, and a remarkable domed edifice.

Chich'ester (anc. *Regnum*): an episcopal city of England; capital of Sussex; on the London, Brighton, and South Coast Railway; 17 miles E. N. E. of Portsmouth (see map of England, ref. 14–I). It stands on a plain between an arm of the sea and the South Downs. It is well built, and has clean wide streets. Here is a cathedral built in 1199, which is 410 feet long by 227 wide. The town is connected by a canal with the sea, which is 2 miles distant. It was formerly the capital of the kingdom of Sussex. Chichester district sends a member to Parliament. Pop. (1891) 7,842.

Chickadee [a name derived from its note]: the popular name of the black cap titmouse (*Parus atricapillus*) and other American passerine birds of the same genus and of

Chickadee.

nearly related genera. The common chickadee is frequent all the year round throughout a great part of Eastern North America, and is one of the bravest and most cheerful of winter birds. It shares with several others the name snow-bird, and its familiar cry and sprightly manners render it a great favorite with children. It nests in a hollow tree, and feeds on insects in their season and on seeds in winter.

Chickahom'iny: a river in the east part of Virginia; rises about 20 miles N. W. of Richmond; flows southeastward, and after a course of about 75 miles enters the James river. It forms the boundary between Henrico and Charles City Counties on the right, and Hanover, New Kent, and James City on the left. The margins of the Chickahominy were the theater of the operations of Gen. McClellan operating against Richmond during May and June, 1862. In close proximity to this river occurred the battles of Seven Pines and Fair Oaks, May 31–June 1, 1862; Mechanicsville, June 26; Gaines's Mill, June 27; Savage's Station, June 29;

White Oak Swamp, June 30, 1862; and Cold Harbor, June 3, 1864. See CONFEDERATE STATES.

Chickamau'ga: a creek which rises in Walker co., Ga.; flows northeastward and northward, and enters the Tennessee river about 6 miles above Chattanooga.

Chickamauga, Battle of: battle fought near Chickamauga creek, about 12 miles E. of Chattanooga, between the forces of the U. S., under command of Gen. W. S. Rosecrans, and those of the Confederates, under Gen. Braxton Bragg; commenced on the morning of Sept. 19, 1863, at nine o'clock. Of Rosecrans's army Gen. McCook commanded the right wing, Thomas the left, and Crittenden the center, while Gen. Polk held chief command of the Confederate right and Hood of the left. The Confederates first attacked the extreme left of the U. S. army with heavy masses, the endeavor being to turn it, and thus gain possession of the roads to Chattanooga. A desperate conflict was continued during the day, but Thomas maintained his position. On the right the conflict had been severe at times, but, on the whole, the day closed with the advantage on the Union side. During the night Thomas was re-enforced from the other wings of the army, and had strengthened his position by hastily thrown up breastworks. The attack was renewed by the Confederates on the morning of the 20th against the left and center, and the tide of battle here ebbed and flowed throughout the day with heavy losses on both sides, but without material advantage to either; but Bragg was unable to turn Thomas's flank and occupy the coveted passage to Chattanooga. The fight along the left center had been equally desperate, bloody, and indecisive. But on the right a fearful disaster had fallen. In answer to Thomas's call for aid, Rosecrans had dispatched Negley's and Van Cleve's divisions from the right and center. Wood was directed to close up on Reynolds on the right center, and Davis to close up on Wood. According to Rosecrans's report, Wood overlooked this direction, but supposed that he was to *support* Reynolds, and attempted to do so by withdrawing from the line and passing in the rear of Brannan, thus opening a gap in the line of battle, which being quickly perceived by Longstreet, a decisive charge was made, striking Davis in flank and rear, and throwing the whole division into confusion. Pouring in through this gap, the Confederates cut off the Federal right and center, and attacking Sheridan's division, which was advancing to the support of the left, compelled it, after a gallant struggle, to give way. It was afterward rallied, however, and by a circuitous route joined Thomas, who was now left to breast the tide of battle against the whole army of Bragg. The right and part of the center had been broken and sent flying in disorder toward Chattanooga with terrible loss. Rosecrans, McCook, and numerous subordinate commanders were carried along in the whirl. Sheridan and Davis rallied and reformed their decimated and scattered commands on the way, and halted at Rossville. Rosecrans, being unable to join Thomas, hastened to Chattanooga to prepare that place for defense in case of a total rout of his army, which now seemed imminent. But Gen. Thomas still remained immovable in his position. His line had now assumed a crescent shape, with its flank supported by the lower spurs of the mountain; and here he repulsed the furious onsets of the Confederates. About 3.30 P. M. the Confederates discovered a gap in the hills in rear of his right flank, through which Longstreet poured his massive columns. At this critical moment Gen. Gordon Granger, who had been posted with his reserves to cover the left and rear, arrived in the field. He had heard the sound of the cannon and marched his force there without orders. Gen. Thomas pointed out to him the gap through which the Confederates were debouching, and he at once threw in Steedman's brigade of cavalry. The conflict was terrible, but the gap was taken. Two divisions of Longstreet's corps repeatedly assaulted the position, but a battery of six guns placed in the gorge repelled them with fearful slaughter. About sunset they made their last charge, when they were met and driven back at the point of the bayonet, and returned no more. In the meantime Thomas had repulsed the repeated attacks on his left and front, and at nightfall the Confederate army retired beyond range of his artillery, leaving Thomas in possession of his hard-fought field. Considering the extreme labor of his troops, the scarcity of ammunition, food, and water, Gen. Thomas determined to retire on Rossville, where they arrived and took post before morning of the 21st, receiving supplies from Chattanooga, and offering battle during the day, but the attack was not seriously renewed. On the night of the 21st he withdrew within the defenses of Chattanooga.

The result of the battle was a nominal victory to the Confederates on the field, though Chattanooga and the possession of East Tennessee, the prize for which the battle was fought, still remained in the possession of the Union forces. The Union loss was reported at 16,000, killed, wounded, and missing; the Confederate loss, 18,000; they captured 36 guns, 8,500 small-arms, and large quantities of accoutrements.

Chickamauga and Chattanooga National Park: By an act of Congress approved Aug. 19, 1890, the establishment of a park embracing the battle-fields of Chickamauga and of the actions about Chattanooga was authorized. Under it and subsequent legislation a national commission was appointed to carry out this intention. Georgia ceded to the U. S. jurisdiction over the field purchased by the commission and over the roads approaching it, and Tennessee over the roads from Hooker's position on Lookout Creek to Rossville and thence along the summit of Missionary Ridge to Sherman's works at the northern end. Nearly all the ground occupied in the Chickamauga battle has been acquired, and negotiations are carried on to embrace the scenes of the actions at Brown's Ferry, Wauhatchie, Orchard Knob, Lookout Mountain, and Missionary Ridge. The roads, buildings, and conditions as existing at each engagement are to be restored. A new road runs for 20 miles along the crest of Missionary Ridge, on which are threaded the scenes of the heaviest actions. The Government marks with tablets suitably inscribed the headquarters of general officers, the position of organizations down to batteries, regiments and detached forces for both armies, while monuments commemorative of the lesser organizations are left to the States and the voluntary efforts of veterans' societies. The park was dedicated in the presence of a large concourse of spectators, Sept. 19, 1895.

Chickaree Indians: See SIOUAN INDIANS.

Chickasaw Bluffs, Battle of: before Vicksburg, Miss. The U. S. forces under Gen. W. T. Sherman assaulted this strongly fortified position Dec. 29, 1862, but, though the head of the assaulting column reached the works, the severe fire from the rifle-pits and batteries caused them to fall back to the point of starting, leaving many dead, wounded, and prisoners on the field. The Confederate loss in killed and wounded was but light.

Chickasaws, or **Chicasaws**: See MUSKHOGEAN INDIANS.

Chicken-pox: a contagious febrile disease, chiefly of children: bearing some resemblance to a very mild form of smallpox. Chicken-pox is distinguished by an eruption of vesicles or blebs, which rarely become pustular or yellow, and leave only a very slight incrustation, which falls off in a few days, without any such permanent mark or pit as in smallpox. It is a disease of little or no danger, the fever being often hardly perceptible, and never lasting long. It usually occurs but once in any one patient.

Chick's Springs: Greenville co., S. C. (for location of county, see map of South Carolina, ref. 4–C); about 9 miles N. E. of Greenville. Here are two mineral springs—one alterative and slightly sulphurous, the other a tonic iron spring. Pop. of township (1890) 2,595; (1900) 3,136.

Chick-pea: a plant of the genus *Cicer* and family *Leguminosæ*; having pinnate leaves and two-seeded pods, inflated like bladders. The common chick-pea (*Cicer arietinum*) grows wild in the countries around the Mediterranean. It is an annual, of a stiff upright habit. The seeds abound in farina, and have a slightly bitterish taste. They are about the size of common peas, and curiously wrinkled. They are used as food, either boiled or roasted; are the common pulse of the East; are an important article in French and Spanish cookery; have been in general use from the earliest times; and the plant is now extensively cultivated in Egypt, Syria, India, Europe, Mexico, etc. The herbage affords nutritious food for cattle. Drops exude from this plant, which, on drying, leave crystals of almost pure oxalic acid. In France, in India, and in Mexico the free use of the chick-pea as food is said sometimes to lead to paralysis.

Chicla'na: a town of Spain; province of Cadiz; 12 miles S. E. of Cadiz (see map of Spain, ref. 20–C). The houses are built of white stone. It has a fine hospital, and manufactures of linen, earthenware, and brandy. Here are mineral springs which are much frequented. Pop. 11,627.

Chicla'yo: a city of Peru; capital of the department of Lambayeque; 10 miles N. E. of the port of Pimentel and 18 miles N. of that of Eten, with both of which it is connected by rail (see map of South America, ref. 4–B). Pop. 14,000.

Chico, chee'cō: city; former capital of Butte co., Cal. (for location of county, see map of California, ref. 5–C): on railroad and on Chico creek; 96 miles N. of Sacramento and 6 miles E. of the Sacramento river; has 7 churches, State normal school, 2 public schools, flour-mills, lumber and planing mills, marble-works, a foundry, and machine-shops. Pop. (1880) 3,300; (1890) 2,894; (1900) 2,640.

EDITOR OF "ENTERPRISE."

Chic'opee: a river of Massachusetts: rises in Worcester County: flows nearly westward, and enters the Connecticut 4 miles above Springfield. It affords abundant water-power.

Chicopee: city; Hampden co., Mass. (for location of county, see map of Massachusetts, ref. 3–D); on Conn. Riv. Div. of Boston and Maine R. R., and on Connecticut river at the mouth of the Chicopee river, 4 miles N. of Springfield, of which it was formerly a part. It was incorporated as a town in 1848 and as a city in 1890, and contains the villages of Chicopee, Chicopee Falls, Fairview, and Willimansett. There are here 15 public schools, 4 parochial schools, 15 churches, and a free public library of 20,000 volumes. The taxable valuation of Chicopee has increased from $3,301,000 in 1848 to $9,250,830 in 1900. It has a system of sewers, an electric-lighting plant, and a public water-supply owned by the city. Water-power for manufacturing purposes is furnished by the Chicopee river, which is crossed by five dams within the city limits. At Chicopee Centre are located extensive cotton-mills, manufactures of machine-tools and bicycles, an extensive foundry for casting bronze statuary, and the largest manufactory of swords in the U. S. The village of Chicopee Falls is on the Chicopee river, 1½ miles E. of Chicopee Centre, with which it is connected by a branch railroad and an electric street-car line. Here are mills with 70,000 spindles producing cotton flannel, dress-goods, and blankets; extensive manufactures of agricultural tools, knitting-machines, knit goods, rifles, shotguns, pistols, and mechanics' tools; also a bleachery. Pop. of city (1890) 14,050; (1900) 19,167—including Chicopee, Chicopee Falls, Willimansett, etc.

JOHN D. WHITE, CITY CLERK OF CHICOPEE.

Chicoutimi, shĕĕ'koo'tĕĕ'mee': a post-village; capital of Chicoutimi co., Quebec, Canada, on the south side of the river Saguenay; 75 miles from its mouth (see map of Quebec, ref. 2–D). It has a court-house, jail, a convent of the Good Shepherd, and an important trade in lumber, which is shipped direct to Great Britain and other regions. Pop. about 2,000.

Chief Justice: the title of the highest in rank of the judges of a court. The chief justice of the U. S. is an officer who presides over the Supreme Court, controlling its docket, regulating the order of business, and assigning to the associate justices the cases in which they are to prepare opinions. He reads decisions in practice cases; administers the oath to the President and Vice-President at their inauguration; presides when the President is on trial upon articles of impeachment; and nominates persons to be appointed registers in bankruptcy by the district judges. Like his associates, he is required to attend at least one term of the circuit court in his circuit during each period of two years. He ranks next to the President in official dignity. His salary is $10,500.

Chiem-See, chēem'say': a lake of Bavaria; 42 miles S. E. of Munich; is at an elevation of 1,726 feet above the sea. It is 12 miles long, about 7 miles wide, and a little over 500 feet deep. It contains many fish. Its outlet is by the Alz and then the Inn into the Danube.

Chieri, kĕĕ-ay'rĕĕ (anc. *Carrea Potentia*): a town of Italy; province of Turin; on the slope of a hill 8 miles S. E. of Turin (see map of Italy, ref. 3–B). It had manufactures of fustians, etc., in 1422. Here is the Church of St. Domenico, built in 1260, and the Church of Santa Maria della Scala, which was founded in 1405, the largest Gothic structure in Piedmont. Chieri has manufactures of silk, cotton, and linen fabrics. Pop. 13,260.

Chieti, -ay'tĕĕ, formerly **Abruzzo Citeriore**: a province of Central Italy; a mountainous region. The chief products are corn, oil, fruits, rice, and wine. Area, 1,105 sq. miles. Pop. (1881) 339,986; (1890) 348,318.

Chieti (anc. *Teate*): an episcopal city of Italy; capital of the province of Chieti or Abruzzo Citeriore; on a hill near the Pescara; 40 miles E. of Aquila, 115 miles N. of Naples, and 6 miles from the Adriatic (see map of Italy, ref. 5–F). It is the see of an archbishop, and has a cathedral, a college, and a fine theater. Here are some manufactures of silk and woolen goods. Chieti occupies the site of the ancient *Teate*, a large and important city, the remains of which are still visible. Among these are the ruins of a theater and several temples. Pop. 22,432.

Chignecto (shig-nek'tō) **Bay**: an inlet in British North America; is the northern part of the Bay of Fundy, and extends between New Brunswick and Nova Scotia. It is about 30 miles long.

Chigoe, chig'ō, or **Jigger**: a small species of flea (*Sarcopsylla penetrans*) occurring in tropical and semitropical America. In length it is but a twenty-fifth of an inch. It lives a free life, especially in the sand. The fertilized female bores into the skin of the foot of man and of other animals. At first there is but a slight irritation and scarcely noticeable itching, but soon the eggs begin to grow and these distend the abdomen of the mother to the size of a pea. As a result, inflammation and ulceration follows, which should be attended to at once, for if the young jiggers be set free from the parent they can continue the trouble, and death has resulted from neglect. They are usually extracted with the knife, but care must be taken to remove all the eggs. In the Southern States the term jigger and chigoe are often given to certain of the TICKS (*q. v.*) which attack man and other animals, but which belong to another zoölogical group. J. S. K.

Chi- (or **Shi-**) **Hwang-Ti** (i. e. First August Ruler): a ruler of China, who at the age of thirteen succeeded his father, Prince Chwang Siang, 246 B. C., and who, having completed the subjugation of the feudatory kingdoms of the Chow Dynasty, begun by his ancestors of the house of Ts'in, proclaimed himself First Universal Emperor (221 B. C.). He divided his empire into thirty-six provinces, and displayed great ability in consolidating it, constructing roads and canals and many fine public buildings. Among other things he drove out the Hiung Nû, or Huns, and other northern barbarians who threatened to overrun his empire, and built the great wall to prevent their return. (See GREAT WALL OF CHINA.) His name and memory, however, have for ever been rendered infamous by his destruction by fire of all the records of the past, and of all writings except those on medicine, divination, and husbandry, in order, first, that he might appear to succeeding ages as the first great emperor, and, second, that he might not be confronted by the literati with the ethical teachings of such philosophers as Confucius and Mencius in carrying out his ambitious schemes and despotic measures. Nearly 500 of the literati were also put to death. (See CHINESE LITERATURE.) In the twenty-eighth year of his reign he made a grand progress through his dominions, visiting all the famous mountains in the kingdom. Arrived at the shore of the Eastern Sea (the promontory of Shanting), he with great pomp and ceremony offered solemn sacrifices to the Lords of Heaven and Earth, of the YIN and YANG (*q. v.*), the sun, moon, the four seasons, etc. The name of Chi-Hwang-Ti is also intimately associated with the vagaries and superstitions of the Taoists (see TAOISM), and especially with the search for the elixir of immortality. He died in 210 B. C., and was succeeded by his son, a weakling, who reigned for seven years, when the Ts'in dynasty came to an end. ROBERT LILLEY.

Chihli, chĕĕ'lĕĕ (i. e. Direct Rule, referring to the fact that this is the metropolitan province), or **Pechihli** (i. e. Northern Chihli): the northeasternmost province of China, extending from 35° to 43° N. lat., and from 114° 30′ to 122° E. lon., and containing Peking, the capital of the empire. Area, 58,949 sq. miles. The northern part is mountainous, the southern a plain with somewhat alkaline soil near the coast. The principal rivers are the Peiho and Lanho, both emptying into the Gulf of Pechihli. Agriculture is extensively practiced, but often requires irrigation, and large tracts of land have been abandoned or were originally sterile. The climate is healthful, and the rainfall small and mostly confined to June and July. Coal is found in many places, and is being extensively mined, under the superintendence of foreign engineers, especially in the regions to the N. and E. of Tientsin, with which the coal-fields are connected by rail. Iron is also abundant, and silver has been found near Ching-Shui and elsewhere throughout the province. The Great

Wall passes through this province, and the Grand Canal enters it from the S. For administrative purposes the province is divided into eleven foo or departments. The department of Shun-Tien Foo, in which Peking is situated, does not fall within the jurisdiction of the viceroy of Chihli. Principal cities, besides Peking, are Tientsin, Paoting (the capital), Chingting, Yungping, Tûngchow. Pop. (official for 1879) 17,937,000.

Chihuahua, chĕe-waa'wăă: a state of Mexico, bordering on Texas; area, 83,746 sq. miles. It is bounded N. E. by the Rio Grande del Norte, and is drained by the Conchos. The west part is occupied by a long mountain-chain called Sierra Madre. The surface E. of this chain is mostly a high tableland; the soil is generally arid and sterile. The state is rich in minerals, including gold, silver, copper, lead, tin, and cinnabar. The silver mines, which are in the Sierra Madre, were formerly very productive. The chief wealth of the inhabitants consists in herds of cattle, horses, and mules. This state is infested by Apaches, who greatly retard its prosperity. Capital, Chihuahua. Pop. of the state (1895) 266,831.

Chihuahua: a town of Mexico; capital of the state of same name; about 310 miles N. N. W. of Durango; lat. 28° 50′ N., lon. 105° 33′ W. (see map of Mexico, ref. 3–E). It has a fine stone cathedral which cost about $800,000, a state prison, a state-house, and a mint. It is supplied with water by a good stone aqueduct 3 miles long. Silver mines have been opened in the vicinity. Chihuahua is on the Mexican Central Railway. Pop. 12,000.

Chilblain: one of the secondary effects of cold and moisture upon the human system, principally affecting the feet, hands, nose, ears, etc.; after a first attack chilblains are likely to recur on the slightest exposure. Mild cases are marked by swelling and redness of the affected part, accompanied by intolerable itching. The more severe forms assume an ulcerated, and sometimes even a gangrenous, character. Those troubled with chilblains should carefully protect the feet and hands from cold, should wash the feet frequently, and dry them very thoroughly, and avoid going near a fire when they are very cold. An attack is treated by rubbing the part with cold water or snow, and later applying various stimulant applications, as citrine ointment, tincture of iodine, solution of nitrate of silver, or the like. Surgical treatment may become necessary.

Revised by WILLIAM PEPPER.

Child, FRANCIS JAMES, Ph. D., LL. D., L. H. D.: scholar; b. in Boston, Mass., Feb. 1, 1825; graduated at Harvard College in 1846, and then was tutor there until 1849, when he went to Europe, and studied for a semester at Göttingen. In Aug., 1851, he returned to Cambridge to become Boylston Professor of Rhetoric and Oratory. In 1876 he exchanged this chair for a simple professorship of English. Though his earlier appointments had to do rather with the rhetorical, or formal, than with the historical and linguistic aspects of English, he early became the chief representative in America of the scientific method of treating both. Before going to Europe he had edited *Four Old Plays, with Introduction and Notes* (Cambridge, 1848). After his return he became the chief editor of a series of British poets, published in Boston. Many of the volumes he edited in detail—notably, the works of Spenser (5 vols., 1855). In the same series he issued his first collection of *English and Scottish Ballads* (8 vols., 1857–58). In 1863 appeared the first scientific examination of the language of Chaucer, his *Observations on the Language of Chaucer* (*Mem. Amer. Acad. of Arts and Sciences*, vol. viii.), and in 1873 his *Observations on the Language of Gower's Confessio Amantis* (*Mem. Amer. Acad.*, vol. ix.). He assisted J. W. Hales and F. J. Furnivall in the publication of *Bishop Percy's Folio Manuscript* (3 vols., London, 1867–68); and then he began the publication of *The English and Scottish Popular Ballads* (1882, *seq.*, 8 parts to 1892), upon which his reputation mainly rests. He prepared also two anthologies: *War Songs for Freemen* (1862) and *Poems of Religious Sorrow, Comfort, Counsel, and Aspiration* (new ed. 1886). D. Sept. 11, 1896. A. R. M.

Child, LYDIA MARIA: See the Appendix.

Child-birth: See OBSTETRICS.

Chil'dermas, or **Holy Innocents' Day** [*childermas is* from O. E. *cildra*, of infants + *mæsse*, mass]: the day (Dec. 28th, or in the East the 29th) observed by the Roman, Anglican, Greek, and various Eastern Churches as a festival in commemoration of the children killed by Herod. It was formerly considered unlucky to marry or undertake any work of importance on this day. In the Middle Ages it was a widely spread custom to whip children on the morning of the Innocents' Day. This was called giving them the "innocents."

Chil'ders, HUGH CULLING EARDLEY, M. P., F. R. S.: statesman; b. in London, England, June 25, 1827; graduated at Trinity College, Cambridge, 1850; went to Australia, and was prominent in the Government of Victoria; returned to England and became agent-general for the colony of Victoria 1857; entered Parliament 1860; Financial Secretary of the Treasury, Aug., 1855; First Lord of the Admiralty in Mr. Gladstone's cabinet 1868–71; Chancellor of the Duchy of Lancaster 1872–73; Secretary of State for War in the Liberal cabinet of 1880; succeeded Mr. Gladstone as Chancellor of the Exchequer Dec. 16, 1882; Home Secretary in the Gladstone administration 1886. D. Jan. 29, 1896.

Childs, GEORGE WILLIAM, LL. D.: publisher and journalist; b. in Baltimore, Md., May 12, 1829; removed to Philadelphia in his youth; became a partner in a publishing-house in 1849; and in 1864 became editor and proprietor of the *Public Ledger*. Besides other gifts to the public, he erected a Shakespeare memorial fountain at Stratford-on-Avon, a memorial window in Westminster Abbey to Cowper and Herbert, and aided in founding a home for printers at Colorado Springs. D. in Philadelphia, Feb. 3, 1894. Author of *Recollections of General Grant* (1885) and *Personal Recollections* (1889).

Childs, THOMAS: soldier; b. in Pittsfield, Mass., in 1796; graduated at West Point in 1814; served with distinction in the war of 1812–15 at the battle of Niagara, and at Fort Erie in 1814; was engaged in the Florida war 1836–42, and in the Mexican war, at Palo Alto, Resaca de la Palma, Monterey, Vera Cruz, and Cerro Gordo; was breveted brigadier-general. D. at Fort Brooke, Fla., Oct. 8, 1853.

Child-study: See the Appendix.

Chile, or **Chi'li** (Sp. pron. chee'lăy): a South American republic, stretching from lat. 56° S. to lat. 16° 30′ S., and from the Pacific Ocean to the summits of the Andes, having a breadth varying from 50 to 200 miles. It has an area of 293,970 sq. miles, and a population (1885) of 2,527,350. In 1895 the population was officially estimated at 3,414,000, of whom about 50,000 were Indians. Two-thirds of the population are rural and about one-third urban. The language and conventionalities are Spanish, except in ARAUCANIA (*q. v.*), which retains a quasi-independence. SANTIAGO (*q. v.*) is the capital.

Physical Features, Productions, etc.—The Andes form the eastern boundary, an unbroken wall from 6,000 feet in average height southward to 15,000 feet northward, and with peaks rising above 22,000 feet. North of Chiloé there is a secondary and lower coast range, in parts divided into two, and broken at intervals to allow the passage of rivers. The space between the Andes and the coast range, S. of lat. 33°, consists of plains and rolling lands, with isolated hills. This is the so-called valley of Chile, the richest part of the republic and containing the bulk of the population. From lat. 33° to 37° the land was originally open prairie; farther S. it is more or less varied with woods of evergreens, oaks, and myrtles, and there are numerous lakes. All this region is well watered and fertile, adapted for grazing and the cultivation of grains, and with a delightful and very healthful climate. S. of lat. 42° the whole country is mountainous and covered with heavy forests. N. of lat. 33° the space between the mountains is much broken by spurs and cross-chains, and the intermediate plains are high, rainless, and barren; these are the deserts of Atacama and Tarapaca. There are several active and quiescent volcanoes, and the whole country is subject to earthquakes. One of these in 1822 not only destroyed several towns, but raised a portion of the coast line 3 to 4 feet. The most important mineral product is nitrate of soda, which occurs in large beds in the northern deserts; 1,028,000 tons in 1890 and 794,000 tons in 1891 were exported for fertilizing purposes, and the export tax pays one-third of the expenses of the state.

Excellent bituminous coal is extensively worked; there are important mines of copper and silver; gold, quicksilver, lead, iron, antimony, and bismuth have been found. The staple agricultural products are wheat (about 21,000,000 bush. a year) and wine (24,000,000 gal.); abundant crops are also grown of barley, maize, hemp, potatoes, and beans. Apples, pears, peaches, and oranges are largely cultivated. The value of exports of all kinds amounted in 1893 to 72,245,114

silver dollars; imports for the same year were valued at $68,235,874. In 1893, 1,782 miles of railway were in operation, of which 686 belonged to the state, and 11,465 miles of telegraph lines, of which about 6,900 belonged to the state.

Religion.—The official religion of the state is Roman Catholic, but the public worship of other denominations is protected by the constitution. There are, however, but very few Protestant congregations. The estates of the church were seized by the Government at the time of the revolt and separation from Spain. The president invests with their temporalities the bishops, and the state pays all ecclesiastics, but the salaries of the curates are small.

For the literature of Chile, see SPANISH-AMERICAN LITERATURE.

Government.—The constitution of the republic was framed, with certain important variations, on the model of the constitution of the U. S. The executive power is vested in a president, who is elected for five years by electors chosen by popular vote; is not eligible for re-election for the term immediately following; and is liable to impeachment for a year after the end of his term, during which time he can not leave the country without permission. He is assisted by a cabinet of six ministers, who are in charge of the seven departments of government. The president also is advised and held in check by a council of state of eleven members, five of whom are nominated by him, and six by Congress. The legislature consists of a Senate and a Chamber of Deputies, the former of whom are elected for six years, the latter for three. The senators, one for each three deputies, are chosen by direct vote of the people. The deputies, one for each 30,000 or fraction in excess of 15,000 of the population, are also chosen by popular vote. In Jan., 1890, the total debt of the country, external and internal, issued and authorized, including the amount of paper money, was $124,667,512 in silver.

History.—Northern Chile to lat. 37° was a part of the dominions of the Incas of Peru. The Spaniards under Almagro invaded it in 1535, but soon returned to Peru. The final conquest was commenced by Valdivia in 1541 and by 1550 was complete to lat. 37°; S. of that the Araucanians kept up the struggle for two centuries and were never entirely subdued. In 1810 Chile, in common with many other Spanish provinces, revolted against Spain; defeated at first, the revolutionists finally succeeded with the aid of Gen. San Martin, who marched over the Andes from Buenos Ayres. The independence of Chile was formally proclaimed on Jan. 1, 1818, although the last stronghold of the Spaniards was not taken until 1826. The constitution which had been adopted in 1824 was remodeled in 1828, in 1833, and a few subsequent amendments have been made. The country was reorganized by law in 1887. In 1844 the independence of Chile was formally recognized by treaty with the mother country. Between 1851 and 1861, during the presidency of Manuel Montt, the country was greatly advanced in agriculture, mining, and commerce. In 1865 Chile and Peru were engaged in a war with Spain, which continued with many vicissitudes until 1869, when the dispute was ended through the mediation of the Government of the U. S. After a successful war with Peru and Bolivia, extending over a period of three years (1879–83), the northern frontier of Chile was advanced from 24° to 16° 30′.

The turbulent condition of the country between 1886 and 1892 is of peculiar interest because of the difficulties in which the U. S. Government was involved. The social organization of the country was feudal in its character, and it is not singular, therefore, that for many years after the adoption of the republican form of government it was strongly conservative. The owners of the soil and the mines, often descendants of the Spanish conquerors, constituted an oligarchy which found it not difficult to control political affairs. As time passed on, however, modern ideas and liberal views came to be entertained. The clash between these ideas and those of the old conservative party led to revolutionary outbreaks, which ended (in 1874) in the triumph of liberalism and the adoption of some important amendments to the constitution. As time passed on the spirit of modern liberalism became more and more prevalent. The conservative party finally withdrew from electoral contests and contented itself with exercising simply a restraining influence. As the liberal party grew in power it experienced the common fate of being split into factions and divided by struggles for leadership and office. The president has generally been compelled to act in harmony with the majority in Congress, for the reason that the members of his cabinet have been representatives of the dominant element in Congress, and have been dismissed whenever a vote of censure has been passed. With this limitation the power of the Chilian president is very great, embracing as it does the general civil service and all local officials, excepting those of the cities, and all appointments in the army and navy as well as the telegraph and railroad service. Through the exercise of this power the president has uniformly been able to control the choice of his successor.

At the beginning of the recent revolution the most radical section of the liberal party had its nucleus in a reform club in Santiago, which was composed for the most part of young men of university education, of whom BALMACEDA (*q. v.*) was the most conspicuous. Having entered Congress in 1868 he had risen to great distinction as a congressional leader and debater. As one of the founders of the liberal party that had demanded important changes in the constitution, he acquired great popularity and strength, and a little later added to his reputation by his service as minister to the Argentine Republic during the Peruvian war. In 1885 his popularity carried him into the presidency by an overwhelming majority. The early part of his administration was characterized by great liberality and success. He caused to be adopted a thorough system of popular education, the complete separation of Church and state, a system of normal schools, and extensive school-houses. He secularized the cemeteries, caused a civil marriage law to be adopted, and banished sectarian teaching from the schools and colleges. He also entered upon an elaborate system of internal improvements, building railroads, constructing harbors, providing dry-docks, wharves, and piers. This remarkable prosperity, however, was but the antecedent of great dissension and disorder. A part of the liberal members, thinking the president was going too far, united with the old conservative leaders, and the new union succeeded in overthrowing his cabinet in 1888. Congress was soon broken up into five separate factions. What were thought to be the arbitrary characteristics of the president led to hostility and revolt. A war ensued. The president issued a manifesto virtually assuming a dictatorship, although disclaiming to be a dictator, and defending his acts on constitutional grounds. Before many months the contest took the form of a war between Balmaceda on the one hand, and the representatives of Congress, known as the Junta, on the other. Balmaceda, after numerous engagements, was overwhelmed with defeat. Attempting to escape from Santiago, he remained for a time concealed in the Argentine legation, where, in a fit of desperation on Dec. 19, 1891, he took his life with his own hand.

During the whole of this struggle the partisans of the Junta were hostile to the Government of the U. S., believing that Patrick Egan, their minister, had conducted himself in a manner unfriendly to their cause. It was claimed that Egan's dispatches to his Government had belittled the importance of the rebellion, and had magnified Balmaceda's strength. Exception was also taken to the fact that the U. S. minister had afforded an asylum in the legation to fugitives from Balmaceda's army. While this state of feeling was active, two boats' crews from the U. S. war-vessel Baltimore, while on shore, got into an altercation in a drinking-saloon with some Chilian sailors. The testimony subsequently taken proved that sailors from the Baltimore knocked down one of the Chilians, whereupon knives and other weapons were drawn, and finally the affair grew into a riot. The difficulty was not limited to the saloon but was taken into the street, and several U. S. sailors received dangerous wounds. Minister Egan at once reported the indignity to the Government at Washington. The attack on sailors wearing the uniform of the U. S. was regarded in Washington as a national insult, and redress was firmly but courteously demanded. The provisional authorities in Chile not only refused satisfaction, but also to grant safe conduct to the men who had been assaulted, and demanded their surrender on the ground that they were criminals. The Government of the U. S. in reply took vigorous measures by sending the Yorktown and Boston to Chile to back up the demand for satisfaction. The reply of the Chilian Government had been couched in language so offensive that no answer was returned. On the appearance of the men-of-war, however, President Montt, who had now been inducted into office, directed the Minister of Foreign Affairs to withdraw the offensive note, and to tender apologies, while compensation was made to the injured men and the families of the killed. Thus the demands of the U. S. were satisfactorily complied with.

C. K. Adams.

Chiliad, kil'i-ăd [from Gr. χιλιάς, -άδος, a group of a thousand; cf. *triad*, *myriad*, etc.]: an assemblage of things grouped or ranged by thousands. The word is chiefly used by the early computers of logarithmic tables, who expressed the extent of the table by saying it contained the logarithms of so many *chiliads* of absolute numbers.

Chiliasm: See Millennium.

Chiliasts: See Millenarians.

Chill: the subjective sensation of cold, accompanied by general shaking of the body, chattering of the teeth, etc., and induced by exposure to moisture or cold, by fevers and inflammatory diseases, and various nervous conditions. The sensation of cold produced by exposure is so well known as to require no extended discussion. (See Cold, Effects of.) Chills as indications of disease are of the greatest importance. Their association with malarial fever is so intimate as to have given rise to the term "chills and fever" or "fever and ague," synonymous with malarial fever. In malaria the chills appear with the most striking regularity and periodicity, and according as they appear every day, every third or every fourth day, the terms quotidian, tertian, and quartan have been assigned. Malarial chills are apt to appear in the forenoon, and set in with most extreme sense of cold, great chattering, etc. The surface of the body feels somewhat cool to the hand, but the real interior temperature of the body is greatly elevated. The explanation of these phenomena is found in the fact that the vessels of the skin are contracted, with production of the exterior fall of temperature, and the blood is driven to the interior with production of great internal heat. Following the chill, which may last from a few minutes to an hour or longer, comes the stage of fever and sweating, the blood now reverting to the exterior, with a resultant sense of high fever and production of great sweating. The true bodily temperature is now lower than during the stage of chill. A peculiar form of intense malarial infection is that producing the so-called "congestive chill," a most fatal form of the disease, which simulates to a certain extent the last or algid stage of cholera. There is not the same periodicity in these cases as is seen in ordinary cases of malaria, and in general they present features not seen in other forms of the disease. Aside from malarial infection, chills are of very great importance as indicating the onset of a variety of diseases, and especially in children must the occurrence of a chill without or with previous indisposition be looked upon as a danger-signal of great moment. Scarlet fever, diphtheria, meningitis, and other severe infectious diseases may all be ushered in with more or less pronounced rigor or chill, and therefore this symptom is one rightfully viewed with apprehension. In adults chills are symptoms of lesser gravity, though here also the greatest affections, such as pneumonia and specific diseases, are so initiated. In all forms of violent septic disease chills play a prominent *rôle*, either at the onset or during the course of the malady, and occasionally may present sufficient periodicity to lead to the mistaken diagnosis of malaria. Thus in cases of consumption, when there are cavities in the lungs, there is apt to be absorption of septic matters from the pus contained in the cavities, and therefore repeated chills, and in not a few cases mistakes of diagnosis have been made on this account. After child-birth the occurrence in the puerperal woman of a chill is regarded with the greatest apprehension, as usually indicating the much dreaded childbed fever, a virulent form of septic infection.

Besides these grave diseases, chills may indicate a variety of more trivial conditions, such as slight cold with bodily depression, nervous excitement, and the like; but the frequent gravity of their occurrence renders it necessary to examine with great care every case in which they arise.

William Pepper.

Chillan, chēēl-yaan': the capital of Nuble, Chile; situated in a depression in a fertile plain, between the rivers Nuble and Chillan; lat. 35° 56′ S., lon. 71° 37′ W.; about 120 miles N. E. of Concepcion; and a railway station (see map of South America, ref. 8–C). The town is the center of a rich agricultural district, and is celebrated for its hand-made lace and its mineral baths. It was originally founded in 1594 by Ruiz de Gamboa, was laid waste by Indians in 1601, was destroyed by Indians and an earthquake in 1657, by an earthquake in 1751, by an overflow of the river Nuble in 1797, and by an earthquake in 1835. In recent times, however, the town has been prosperous. Pop. (1885) 21,000; (1895) 28,738.

Chillicoth'e: city of Peoria co., Ill. (for location of county, see map of Illinois, ref. 4–D); on C., Rk. I. and P. and A., Y. and S. F. R. Rs.; on the Illinois river; 18 miles N. N. E. of Peoria. It has five churches, canning-factory, flouring-mill, pottery, electric lights, and street cars, and is a dépôt for large quantities of grain. Chillicothe is a popular summer resort. Two packet-boats run daily to Peoria. Pop. (1880) 936; (1890) 1,632; (1900) 1,699.

Publisher of "Bulletin."

Chillicothe: city; capital of Livingston co., Mo. (for location of county, see map of Missouri, ref. 2–F); on Han. and St. Jo., Wabash, and Ch., M. and St. P. R. Rs.; 76 miles E. of St. Joseph. It is the principal city in Grand river valley, and contains eight churches, normal, high, and graded schools, manufactories of ax-handles and stoves, street railways, electric lights, gas and water-works. There is an abundance of timber near Grand river. Pop. (1880) 4,078; (1890) 5,717; (1900) 6,905.

Editor of "Tribune."

Chillicothe, or **Chilicothe**: a beautiful city and railroad center; the capital of Ross co., O. (for location of county, see map of Ohio, ref. 7–E); finely situated on the Scioto river, and in a plain inclosed on several sides by verdant hills nearly 500 feet high. It is on the Ohio and Erie Canal, about 48 miles S. of Columbus, and 99 miles E. by N. from Cincinnati. The streets are wide, straight, and lighted with electricity. It has a stone-front court-house which cost about $100,000, five commodious brick union school-houses, electric street railroad, water-works; also manufactures of steam-engines and farming implements, flour-mills, furniture, buggies, wagons, boots and shoes, and other manufactories, and the B. and O. S. W. R. R. shops. Chillicothe was the capital of Ohio from 1800–10. Pop. (1880) 10,938; (1890) 11,288; (1900) 12,976.

Editor of "News."

Chil'lingham Cattle: a herd of cattle preserved at Chillingham Park, Northumberland, England. These cattle are of peculiar interest, from the fact that they are the descendants of the wild cattle which formerly inhabited Scotland. They are cream white, the insides and tips of the ears reddish, the hoofs and tips of horns black. They feed at night, sleep during the day, and hide their calves. "Once the bulls in the herd were reduced to three; two fought and killed each other, and the third proved impotent, so that the preservation of the herd depended on the accident of a cow producing a bull-calf."

F. A. Lucas.

Chil'lingworth, William: divine and controversialist; b. in Oxford, England, Oct., 1602. In 1618 he became a scholar, and in 1628 a fellow of Trinity College, Oxford. In 1630, through the influence of John Fisher, the famous Jesuit, he became a Roman Catholic, and entered the Jesuit College in Douay, France. In 1631 he was persuaded by his godfather, Laud, then Bishop of London, to reconsider the question and return to Oxford. In 1637 he put forth his great work, *The Religion of Protestants a Safe Way to Salvation*, a work of singular acuteness and ability. He became chancellor of Salisbury and prebendary of Brixworth (1638), and soon after master of Wigstan's Hospital, Leicestershire. In theology he was a latitudinarian, and in politics a royalist. D. at Chichester, Jan. 30, 1644. His collected works appeared in London (10th ed. 1742), with *Life* by Rev. Thomas Birch. See Des Maizeaux, *Life of Chillingworth* (1725); August Neander, *Erinnerung an den evangelischen Gottesgelehrten W. Chillingworth* (1832); and the Oxford edition of his works (3 vols., 1838).

Chillon, shil'lŏn (Fr. pron. shĕĕ'yōñ'): a castle and fortress of Switzerland; in the canton of Vaud; 6 miles S. E. of Vevay. It is at the east end of the Lake of Geneva, on an isolated rock, standing out from the edge of the lake. It consists of a number of towers grouped about a higher central tower. Bonnivard was confined here from 1530 to 1536 for his efforts to liberate the Genevese. His imprisonment is commemorated in Byron's *The Prisoner of Chillon*.

Chilo, kī'lō, or **Chilon** (Gr. Χίλων or Χείλων): a Spartan who is enumerated among the Seven Wise Men of Greece.

He became one of the ephori of Sparta in 556 B. C. Among the maxims ascribed to him is "Know thyself." He is said to have died of joy when his son gained a victory at the Olympic games.

Chiloé, chĕĕ-lō-ay′: an island off the coast of Chili, between lat. 41° 40′ and 43° 43′ S., with an average width of 35 or 40 miles. The mainland at this point suddenly recedes, forming the Gulfs of Ancud and Corcovado, with the island in front of them. It may be regarded as a continuation of the land north of it, from which it is separated by a winding channel less than 2 miles broad. The western coast of Chiloé is high, precipitous, and forest-covered; one of the peaks at the southern end is more than 3,000 feet above the sea. The eastern side is lower, and some portions are very fertile, producing wheat, barley, potatoes, etc. The climate is very damp. Chiloé, with about 120 neighboring islets, forms a province of Chili, sometimes called Ancud, the total area being 3,995 sq. miles, and the population (1895) 77,750. Capital, San Carlos de Ancud, at the northern end of the island, with a population of about 4,000.

HERBERT H. SMITH.

Chilopoda, kī-lop′ō-da: See MYRIAPODA.

Chil′tern Hundreds, The Stewardship of: in England, a nominal office which a member of Parliament, desiring to withdraw from the House of Commons, receives and immediately resigns. A member can not surrender his representative seat unless disqualified, and an appointment by the crown works such disqualification. In old times the steward's duties were to protect from the robbers who lurked in the forests of the Chiltern Hills, in Buckinghamshire. When this office is occupied the stewardship of the manors of East Hendred, Northshead, and Hempholme is made to serve the same purpose. The Chancellor of the Exchequer controls this patronage, which began to be used for this purpose in the middle of the eighteenth century.

Chil′ton: city; capital of Calumet co., Wis. (for location of county, see map of Wisconsin, ref. 5–F); on railroad and the Manitowoc river; 24 miles S. of Appleton; has 1 public school, 2 parochial schools, and 5 churches. Its chief industry is agriculture. Pop. (1880) 1,132; (1890) 1,424; (1900) 1,460.

EDITOR OF "TIMES."

Chilula Indians: See WEITSPEKAN INDIANS.

Chimæra, kī-mee′ra (in Gr. Χίμαιρα): a monster of classic mythology, having the fore part that of a lion, the middle that of a goat, and the hind part that of a dragon. It was supposed to exhale flames of fire. In Hesiod's account Chimæra was a daughter of Typhaon and Echidna, and wasted Lycia until Bellerophon slew her. In modern languages the term chimera is applied to any wild or incongruous fancy.

Chimæridæ: the sole family of the order *Holocephali*, a group of cartilaginous marine fishes related to the sharks and rays. The chimæras have a naked body which tapers gradually into the long, filamentous tail. There are two

Chimæra, or sea cat.

dorsal fins, the first high, pointed, and armed with a spine; the second long and low; anal variable; pectorals large. There are four cutting teeth in each jaw. The males are provided with "claspers" and the head bears a pointed, erectile appendage which fits into a groove when depressed. The eggs have a horny case. The species of the family are few and found in deep water. The best known is *Chimæra monstrosa* of European seas. *C. affinis* is found on the eastern coast of the U. S. and *C. colliei* on the western. The genus *Callorhynchus* has the nose terminated by a cartilaginous prominence ending in a flap.

F. A. L.

Chimakuan Indians: a linguistic family represented by two small tribes, the Chimakum and the Quileute. The original territory of the former, or eastern, division embraced Port Townsend, Port Ludlow, and Port Gamble, on Puget Sound, Washington. While probably never a large tribe, the Chimakum were noted among their neighbors, the Clallam, Makau, and others, for their unusually warlike habits, which seemed early to have diminished their numbers. In 1853 they numbered ninety souls; in 1884 about twenty-four survived—four on the Skokomish reservation and the remainder near Port Townsend.

The Quileute, or western, division of the family inhabited the banks of the Quileute river and the seacoast above and below, between the Makau on the N. and their kindred, the Hoh, on the S. The Quileute appear to be the remnant of a more powerful body, and the isolation and position of this and the Chimakum division suggest that the Chimakuan family once occupied the coast of Puget Sound and Straits of Fuca from Port Townsend to the Quileute country. The Makau and Clallam, of the Wakashan and Salishan families respectively, who have held this area since historic times, appear to be intruders from Vancouver island, and it seems by no means improbable that the tribes they dispossessed were Chimakuan. There is traditionary evidence that the Chimakum came from the Quileute. This latter tribe also owes its diminution in number to a pugnacious tendency toward the neighboring and more populous Salishan tribes. In 1891 there were 245 living on the Pacific coast S. of Cape Flattery. The Hoh, a sub-tribe of the Quileute, are under the Puyallup agency, and number about seventy.

F. W. HODGE.

Chimalpopo′ca: the third war-chief or so-called "Emperor" of the Aztecs of Mexico; ruled from 1417 to 1428, according to some chronologies, but according to others from 1410 to 1422. He was elected by the chiefs to succeed his brother, Huitzilihuitl, Maxtla having usurped the chieftainship of the Tepanecs. Chimalpopoca tried to aid the legitimate ruler; Maxtla seized and imprisoned him, and he hung himself in the cage in which he was confined. Lineal descendants of Chimalpopoca are still living in Mexico.

H. H. S.

Chimaltenan′go: the name of a department and city of Guatemala. The department lies on the northern slope of the main Sierra in about the middle of the state; is well watered and fertile; gold is found in the streams. The inhabitants are Christianized Indians, devoted to the rearing of cattle and cultivation of soil. Area, 800 sq. miles. Pop. 57,000. The town is in the department, 25 miles W. of the city of Guatemala (see map of Central America, ref. 4–D). It has a considerable trade. Pop. 14,000.

Chimariкan Indians: a linguistic family comprising the Chimariko and Chimálakwe tribes, formerly of Trinity co., Cal., the former inhabiting Trinity river from Burnt Ranch northward to the junction of the north and south forks, the latter residing on New river, a tributary of the Trinity.

Of the general characteristics of these two tribes very little is known. From the friendly Wintu tribes, their eastern and southern neighbors, they borrowed their mortuary customs and in part their medical practices. In lieu of tobacco they smoked the mistletoe. Their hunters were accustomed to smear their bows and arrows with "medicine" to prevent the deer from detecting the human odor.

By an early pioneer it is stated that the Chimarikan Indians were once as numerous as the Hupâ, an Athapascan tribe adjoining them on the W. and S. W., who, through constant aggression particularly toward the Chimálakwe, from whom they exacted an annual tribute, finally succeeded in overpowering the latter and in compelling them to adopt much of the Hupâ tongue. Thus it was that about 1850 the Chimálakwe numbered but two families, aggregating twenty-five persons, who spoke their own language.

Salmon had formed the chief article of subsistence of the two Chimarikan tribes up to the advent of the whites into their territory, when the pollution of the streams from mining operations rendered the fisheries of the Indians useless, and continued warfare ensued. In 1876 but half a dozen Chimariko survived; a year before only three members of the Chimálakwe were known to exist. In 1889, in Hupâ valley, a Chimariko man, seventy or more years of age, was found, who was then believed to be one of two survivors of the tribe.

F. W. Hodge.

Chimbora'zo: a province of Ecuador; in the highlands S. of the volcano of the same name; area, 5,544 sq. miles. Pop. estimated (1885) 122,300. Capital, Riobamba.

Chimborazo: the highest mountain of Ecuador, and one of the highest in America; in the Western Cordillera; about 100 miles S. of Quito and 80 N. E. of Guayaquil. It is a magnificent dome, its snowy summit towering far above the surrounding peaks, and visible at times from the ocean, 150 miles distant. Several glaciers extend far down the sides. The mountain is of volcanic formation, but no crater has been discovered, and there is no record of an eruption. The ascent is extremely difficult, owing not only to the height and the rarefied air, but to the deep powdery snow of the summit through which the explorer must force his way. It was vainly attempted by Humboldt, Boussingault, and others. Jules Rémy reached what he believed was the top in 1856, but could not recognize the surroundings owing to a blinding snowstorm. The feat was finally accomplished by Whymper in 1879, and again in 1880. His careful measurements show that the height is 20,496 feet. He had the fortune of viewing from the summit an eruption of Cotopaxi, 60 miles distant. See Whymper, *Travels among the Great Andes of the Equator*; Wolf, *Geografía y Geología del Ecuador*.

Herbert H. Smith.

Chime [M. Eng. *chimbe, chymbe, chim*; abbrev. of * *chimbel* < O. Eng. *cimbal*, from Lat. *cym'balum*, a cymbal]: the consonant or harmonic sounds of several instruments; correspondence of sound; music performed on a set of bells in a church tower. The term is sometimes used to denote a set of bells which chime or ring in harmony. The carillon differs from the chime in that its bells are more in number and are stationary. See Bell-ringing.

Chimere [O. Fr. *chamarre*, fur cloak; Span. *chamarra, zamarra*, sheepskin; Ital. *zimarra*, long cloak; origin obscure; that from Basque *echamarra* improbable]: the upper robe worn by a bishop, to which the lawn sleeves are now generally attached. Since the time of Queen Elizabeth it has been of black satin, but previously it was of a scarlet color, like that now worn by bishops assembled in convocation or when the sovereign of Great Britain attends Parliament.

Chimmesyan Indians [from the Chimsian terms *ts'em*, on, and *kcian*, main river (Bois); literally on the main (Skeena) river; according to Tolmie and Dawson the name signifies people or our people]: a linguistic family comprising the Chimsian and Nasqá tribes of British Columbia, with their various divisions. The Chimsian occupy the territory drained by the lower Skeena and the coast of Chatham Sound, Grenville channel, and the adjacent islands, except Hawkesbury island, southward to Milbank Sound in latitude 52° 15′. The Nasqá (also called Nass and Naas) inhabit the banks of Nass and upper Skeena rivers.

The Chimmesyan people are said to be strong and finely formed, and to compare well physically with the best specimens of the Indian race. They do not have the habit of deforming the heads of their children, like the neighboring tribes, but the custom prevails of perforating the lower lip of the females for the insertion of labrets. They also perforate the septum of the nose as well as the helix and lobe of the ear to admit of ornamentation, and tattoo arms and feet.

The tribes of this family can not be said to be hunters, though in the interior the chase is more or less resorted to, chiefly to procure skins for clothing. Bows and arrows until recently were used. The Chimmesyan tribes, particularly those of the coast, are expert fishermen, and large quantities of fish are dried for winter use. Sea-grass and various berries are also eaten.

Their principal article of clothing is the blanket, made of tanned skins, or more frequently woven of mountain-sheep wool and dog-hair, or both, and even of cedar bark. Their heads are covered with water-tight hats made of roots, and in rainy weather and in the canoe a water-tight cap of cedar bark is worn. The legs are left bare.

Baskets are made for various purposes, dried seaweed, cedar bark, roots, wood, etc., being employed in their manufacture. Cedar bark, reed, and rush mats are used for many purposes. Canoes were made principally of cedar, being hollowed out by means of wedges, adzes, and axes, aided by fire. The art of pottery is unknown, but for cooking purposes large water-tight baskets and hot stones were employed.

The houses, which are of wood, with gable roofs supported on beams, are built to face the sea. A platform about 2 feet high and 4 feet wide is built around the interior walls, and very large houses have two or three such platforms upon which small sleeping apartments are constructed. Four families usually occupy a single house, a family living in each corner and having its own fireplace.

Three social classes are found among the Chimmesyan. Common people are those who have not been initiated into one of the four secret societies. By the initiation they become middle-class people, but can never become chiefs, who form a distinct class and who are hereditary. Chiefs, however, have little influence upon the members of the tribe. The Chimmesyan have four gentes—the raven, the eagle, the wolf, and the bear—and in each village the houses of members of each gens are grouped together. One of their institutions is the "potlatch"—the custom of paying debts and of acquiring distinction by means of giving a great feast and making presents to all guests. Curious natal rites are observed and interesting maturity and mortuary ceremonies performed. Slavery is said to be common to both the tribes.

In 1888 the population of the entire family was estimated at 5,000. In 1887 about 1,000 of these, in charge of William Duncan, removed to Annette island, about 60 miles N. of the southern boundary of Alaska, near Port Chester, where they founded the settlement of Metlakahtla. Here houses have been erected, schools and churches established, and the natives are said to be making remarkable progress in civilization.

Authorities.—Tolmie and Dawson, *Comp. Vocabs. Ind. Tribes Brit. Columbia*, with map (Montreal, 1884); Franz Boas, in the British Association for Advancement of Science *Proceedings*, Newcastle-upon-Tyne meeting (London, 1889). See Indians of North America.

F. W. Hodge.

Chimney: a structure of masonry or of iron, usually of considerable altitude, containing a flue or flues for conveying the gases from a furnace to the outer air. It produces, in whole or in part, also the draught required to give the needed rate of combustion. Its main purpose is sometimes simply the discharge of noxious gases at great altitudes, as, for example, in chemical works. Such chimneys are sometimes built up to heights of 400 and 500 feet, and produce a draught sufficient to burn 30 to 50 lb. of coal on each square foot of grate. The intensity of draught thus measured varies as the square root of the altitude, and with good proportions and proper adjustment to their work the weight thus burned in pounds on the square foot of grate will be not far from twice that numerical quantity taken in feet. Every pound of fuel produces 15 to 25 lb. of gas, sometimes more, and the flue is commonly made about one-fifth or one-sixth the area of the grate.

Where, as on shipboard or the locomotive, an exceedingly strong draught is demanded, a "forced draught" is resorted to, the current being produced by the action of a revolving fan, a steam-jet, or the impulses of the exhaust steam from the engine. By such expedients more than 100 lb. of coal are sometimes burned on a square foot of grate. Such intensity of combustion by natural draught would require a chimney exceeding half a mile in height. These figures are given for the usual marketable qualities and sizes of fuel. Fuels of poor quality or of small size require greater intensity of draught than those of good quality or of large size. Anthracites demand higher chimneys than bituminous coals.

House-chimneys were probably introduced into the better class of houses in Europe about the twelfth century. The first in the city of Rome was erected in 1368, and they only came into general use in England and on the continent of Europe in the seventeenth century. Previously the fires were built on the stone or earthen floors and in the middle of the room, the gases and smoke emerging through a hole in the middle of the ceiling, as still practiced by semi-civilized and barbarous nations.

R. H. Thurston.

Chimney-swallow: in the U. S. the common name for the chimney-swift (*Chætura pelagica*); a bird which outwardly bears some resemblance to the swallows, but is not related to them. (See Swift.) It is very abundant during summer in the Eastern U. S., and seems perpetually on the wing, gathering while in full flight the little twigs of which

its nest is made. In Europe the name is given to a true swallow (*Hirundo rustica*) very much resembling our barn-swallow. Both chimney-swift and chimney-swallow are so called from their habit of nesting in chimneys.

F. A. Lucas.

Chimpan'zee (*Troglodytes niger*): an anthropoid or tailless ape inhabiting the dense forests of the Congo region of Africa, from near the coast eastward to the great lakes. When fully grown it is 4 feet or a little more in height, blackish, with pale hands and feet. It more nearly resembles man in general appearance than does any other of the great apes, and assumes an upright attitude with greater ease than its relatives. The gorilla is, however, anatomically more closely related to man. The chimpanzee is largely terrestrial in its habits and runs on all fours, the knuckles of the hands being applied to the ground. It builds nests in trees, and is usually found in small bands of from five to ten. When young the chimpanzee can be readily tamed and taught various tricks. Many have been taken to Europe and several have from time to time been brought to the U. S., but sooner or later they die from diseases of the lungs. See R. Hartmann, *Anthropoid Apes* (International Science Series, 1885).

Chimpanzee.

F. A. Lucas.

Chimsian: See Chimmesyan Indians.

Chi'mu, or **Grand Chi'mu**: the name given by archæologists to an ancient city of Northwestern Peru; on the seashore; 4 miles N. of the present city of Truxillo. It was the chief town and probably the capital of the people called Chimu or Yuncas, whose civilization was entirely distinct from that of the Incas until the fifteenth century. The ruins of this city are the most extensive in America, covering a space 12 to 15 miles long and 5 to 6 broad. They comprise vast buildings, palaces, and temples, some of the walls being ornamented with arabesques and paintings; immense reservoirs, which were filled by an aqueduct 14 miles long; a great truncated pyramid, used as a burial-mound; and other interesting structures. One of the buildings is supposed to have been a prison. Excavations among these ruins have yielded many ornaments of gold and silver, remains of rich cloths, pottery, and other objects. See Squier, *Peru* (1877); Charles Wiener, *Perou et Bolivie* (1880).

Herbert H. Smith.

China: a large, compact, and populous country of Eastern Asia, which, excluding its dependencies, has an area of nearly 1,300,000 sq. miles, and extends through twenty-five degrees of E. lon. (98° to 123°) and about twenty-three degrees of N. lat. (18° W. to 41°). It is bounded on the N. by Mongolia, one of its largest dependencies; on the E. by a part of Manchuria and those western extensions of the Pacific Ocean which are known as the Gulfs of Liao-tung and Peh-Chih-li, the Hwang-Hai, or Yellow Sea, the Tûng-Hai, or Eastern Sea, and the China Sea; on the S. by the Nan-Hai, or Southern Sea, and by Tong-king (Tonquin) and Burma: and on the W. by Tibet and Eastern Turkestan.

Name.—The name *China* is entirely unknown to the people of the country. It is probably derived from *Ts'in*, the name of the most powerful of the feudal states of ancient China, which finally became paramount, overturned the dynasty of Chow (1121 to 284 B. C.), and established under Chi-Hwang-Ti (*q. v.*) the short-lived dynasty of Ts'in, about 255 B. C. As Ts'in guarded the northwest part of the empire, occupying most of the present province of Shensi and the regions beyond, it would naturally be the one with which travelers from Western and Central Asia would become first and best acquainted. From this arose perhaps the many variations of the name which we find applied in ancient times to this region, e. g. *Sin* (the *Sinæ* of Ptolemy and the *Sinim* of the Bible being the people of *Sin*), *Chin*, *Thin*, Tsin-is-*tan* (the *-tan* or country of the Ts'in), and lastly Chin-a or Chin-tan (compare *-tan* in Baluchis*tan*, Afghanis*tan*, Hindus*tan*, etc.), the forms most commonly used by Chinese Buddhist writers. Among the Chinese themselves the country is most commonly known as *Chung-Kwoh*, or "Middle Kingdom," a name which takes us back to the feudal times of the Chow dynasty, when the imperial domain was called the "Central Kingdom or State," as distinguished from the surrounding feudal kingdoms and the territories of the outlying "barbarians." Many other names are in use among the people, such as *T'ien Chao*, or "Celestial Dynasty" (from which probably comes our phrase "Celestial Empire"), in allusion perhaps to the claim of each succeeding dynasty that it has been commissioned by Heaven to rule. The name of the reigning dynasty is also much used, generally preceded by Ta-, great, as *Ta Ming Kwoh*, the "Great Illustrious Kingdom," from *Ming*, "illustrious," the dynasty which began in 1368 and lasted until 1643, when the present *Ta Ts'ing* or Great "Pure" Dynasty "received the appointment of Heaven" and displaced it, and China became *Ta Tsing Kwoh*, the "Great Pure Country." In ancient classical writings we also find mention of *Serica* (Seriee in Ptolemy), the land of the *Seres*, and it is now well understood that the reference is to China as the land of the silkworm and of silk, from the Chinese word *sze*, for "silk as it comes from the cocoons."

In the Middle Ages the country was most commonly known as Cathay, a corruption of *Khitai*, the Persian form of *Khitan*, the name of a Tartar tribe which first comes into notice in the fifth century of our era, and which was in possession of Northern China during the tenth and eleventh centuries. Marco Polo speaks of China as Khitai, and by that name the country is still known among the Russians. See Cathay.

Physical Features.—China may be described as a series of basins sloping eastward to the Pacific from the great mountain masses of Central Asia which bound it on the W., and which extend as far E. as the 112th or 113th meridian. East of that line the country may be roughly divided into two parts: (1) a hilly region S. of the Yang-tse, and (2) a great plain stretching northward from the latitude of Hang-chow Bay some distance S. of the Yang-tse, almost to the latitude of Peking, where it meets the foot-hills of the eastern extensions and outliers of the great mountain-chains of the northwestern provinces.

Mountains.—In the mountainous belt of provinces which lies W. of the 112th meridian we find two distinct systems—the Kwŭn-lŭn and the Himalayan. The former consists (1) of several nearly parallel ridges of great height, reaching far above the snow-line at some points, which break off from the Kulkun or Kwŭn-lŭn range N. of Tibet, and take a generally S. E. or S. S. E. direction through Sze-chuen and part of Hupeh, separating the Ya-lung, the Min, the Kia-ling, and other considerable affluents of the Great River from one another and from the Kin-sha-kiang or uppermost courses of the Yang-tse after it enters China proper. (2) An eastern extension of the Kwŭn-lŭn chain, in two parallel ridges of 6,000 to 8,000 feet, through Kansuh, Shensi, and Shansi into Honan. These are known as the Tsing-ling (or "Azure Mountains") and the Fû-niu Shan, and divide the Wei and other tributaries of the Yellow river from the Han and its affluents, which join the Yang-tse at Hankow. (3) The Pa-ling, or Kiu-tiao (or "Nine Branch Mountains"), thrown off by the Sinch-ling, with a S. E. trend, and forming the watershed between the Han and the Kia-ling, which joins the Yang-tse at Ch'ung-K'ing-Foo in Sze-chuen. The peaks of this range are not as lofty as those of the Tsing-

ling, which in turn are inferior in height to the Sze-chuen peaks.

The Himalayan system of Yunnan and Kwei-chow is but an eastern extension of the mountains which bound Tibet on the S., and consists of several ranges collectively called Nan Shan, or the "Southern Mountains." These spread eastward, separating the Yang-tse and its southern feeders from the Si-kiang, cover the province of Kwang-tung, and on the borders of Fuh-kien merge into what Pumpelly calls the "coast range" of his "Sinian system of parallel ridges" which cross the empire from N. E. to S. W., and "determine the outlines and nearly all the physical features of the continent, just as the Appalachians have determined those of the eastern part of North America."

Rivers.—The Chinese have several words for "river." *Chuen* is a book-word found in such names as Sze-chuen, "Four Rivers," the name of the largest province of the country. The most common words, however, are *kiang* and *ho*. The former is used in the formation of river-names from the Yang-tse southward, while *ho* is used N. of the Yang-tse. The only exceptions to this use of these syllables are the Ya-lu-kiang, which flows westward between Manchuria and Korea, and Heh-lûng-kiang, or "Black Dragon river," the Chinese name of the Amur, and both of these lie outside of China proper.

The great river-basins of China proper are three in number—(1) the Yang-tse in the center, (2) the Hwang-ho, or "Yellow River," in the north, and (3) the Si-kiang (which enters the sea partly along the channel of the Chu-kiang, or "Pearl River") in the south, and partly in a channel of its own parallel to the Chu-kiang. These, like almost all the rivers of China, flow S. E. through the greater part of their courses. The chief exceptions are the Woo and the Yuen in Kwei-chow (already mentioned), the Siang in Hunan, and the Kan in Kiangsi, which find their way to the Yang-tse through the Tung-ting and Poyang lakes respectively.

The Hwang-ho and the Yang-tse rise beyond the western boundary of the country at no great distance apart. The former has its origin in some little lakes situated in lat. 35° N. and lon. 96° E. in a plain of Kokonor, called by the Chinese Sing-suh-Hai, or "Constellation Sea." For the first 700 miles its course is very crooked, winding its way through gorges in the Kulkun range. It then bends to the N. E. and N. through Kansuh and the Great Wall for 450 miles more, when it is deflected eastward by the In-Shan. About the 110th meridian it is again forced S., and flows for 500 miles in that direction between the provinces of Shensi and Shansi as far as the fortress of Tung-Kwan at the foot of the Tsing-ling, where it receives the Wei from the W. Here it is again deflected to the E., and flows in that direction through the Great Plain, carrying immense quantities of the *loess*, or "terrace deposit," which is so characteristic of this region of China, and which, as it settles in the more level parts of the river's course, forms banks and shoals, and has gradually raised the bottom of the river itself above the surrounding country. A short distance beyond Kai-fŭng-foo, near the borders of Shantung, it takes a northward course, flowing past Tsao-chow Foo on the Grand Canal. Here it joins the Ta-tsing-ho, and through its channel pours its waters into the Gulf of Peh-chih-li. At the point where it turns northward it has changed its course several times, having taken its present course in 1853. Up to that time it had made its way to the sea in a S. E. direction, using the channel of the Hwai in Kiangsu. In 1853, when it changed its course, again in 1867, and on several occasions since, the bursting of its banks has resulted in widespread disaster and immense loss of life. It receives its name from the yellow *loess* which tinges its waters, has a course of about 2,600, and drains an area of 475,000, sq. miles.

The most important river of China, and one of the longest and greatest in the world, is that which is known to foreigners as the Yang-tse-Kiang, a name, however, which is applicable only to that portion of the river which flows through the ancient province of Yang—that is, through Ngan-hwuy, and the region stretching thence to the sea. In that part of its course which lies beyond China proper it is fittingly called the *Murui Ussu*, or "Tortuous River." Thence to where it is joined by the Min it is called the *Kin-sha-kiang*, or "River of Golden Sand." From its junction with the Min as far as Foo-chow in Sze-chuen, where it receives the Woo from Kwei-chow, it takes the name of *Min*, while lower down to Ngan-hwuy and beyond it is known indifferently as the *Ta-kiang*, or "Great River," the *Ch'ang-kiang*, or "Long River," or simply as the *Kiang*. It is sometimes incorrectly spoken of, especially in French books, as the "Blue River," and the name Yang-tse is also sometimes incorrectly translated "Son of the Ocean." In its uppermost courses in Tibet its bed is 10,000 feet above the level of the sea, and in China proper its fall is very great. For the first thousand miles of its course in China it flows in a S. E. direction to the borders of Yunnan (26° N. lat.), where the Yun-ling merges into the Nan-ling. It then makes a great bend to the N. E., as far as 30° N. lat., thence in a generally S. E. direction, falling into the sea at the islet of Sha-wei-shan in about lat. 31° 25′ N. and lon. 122° 14′ E., having drained an area of 548,000 sq. miles. In its course it receives the waters of several important affluents, the Ya-lung, the Min, the Loh, the Kialing, and the Han from the N., and from the S. the Woo in Sze-chuen, the Yuen from Kwei-chow, the Siang from Hunan, and the Kan from Kiangsi. At Chin-kiang, 150½ geographical miles from the sea, it connects with the Grand Canal, which reaches N. as far as Tien-tsin (less than 80 miles from Peking) and S. as far as Hang-chow. The river is now open to foreign trade as far as CH'UNG-K'ING (*q. v.*), about 1,700 miles from the sea. For 600 miles of this distance—as far as Hankow—it is navigable by the largest ocean-going steamers, and for 500 miles more—to Ichang—by steamboats. Above Ichang the river is a succession of gorges and formidable rapids, up which native junks, specially built for this traffic, are towed by large crews of trackers at the rate of a few miles a day. Toward the end of summer, when swollen by the melted snows of the great mountains of the west, the river rises 50 feet or more, flooding the fields and the towns on its banks.

The third great basin of China is that of the Si-kiang, or West river, which drains a region of 130,000 sq. miles lying E. of the Yun-ling and S. of the Nanshan. It rises in Yunnan, flows eastward through Kwangsi and Kwang-tung for 5,000 *li* (about 1,650 English miles), and joins the CHU-KIANG (*q. v.*) at Samshui, through which part of its waters find their way to the sea, but the greater part soon branches off through a separate channel parallel to the Chu-kiang and enters the sea at Macao.

Lakes.—There are three considerable lakes in China, and several smaller ones, mostly south of and connected with the Yang-tse. The Tung-ting Lake, in Hunan, is about 200 miles in circumference, and connects with the Great river at Yo-chow-foo, 150 geographical miles W. of Hankow. It is apparently a part of a much larger lake which extended northward as far as the Han, but which has become silted up N. of the Great river, and is rapidly silting up S. of it. The second lake in size is the Poyang, in Kiangsi. It is about 90 miles in length and 20 in breadth, and connects with the Yang-tse at Hu-kow, about 430 miles from the sea. It is studded with numerous picturesque and populous islands. The third is the Ta- or Tai- hu, i. e. "Great Lake," near Su-chow, a shallow sheet of water 60 miles in length and 30 in width, and connected with the Yang-tse and with the ocean. In Northern Kiang-su and Southwestern Shantung there are other lakes that played an important part in the construction of the Grand Canal.

Islands.—Besides the two great islands, Hainan and Taiwan, or Formosa (ceded to Japan in 1895), lying off the coasts of Kwangtung and Fuh-kien respectively, there are several groups of smaller islands much nearer the coast. Among these are the Lintin group (to which Hongkong may be said to belong), in the estuary of the Chu-kiang; the group near the mouth of the Lung-kiang, to which AMOY (*q. v.*) belongs; the Pescadores, 20 miles W. of Formosa; the Chusan Archipelago, off the coast of Cheh-kiang (see CHUSAN); and the Miao-tao group, in the Gulf of Peh-chih-li, off the coast of Shantung.

The Great Plain is an irregularly shaped alluvial tract, slightly undulating in some parts, with occasional isolated hills and groups of low mountains. It is about 700 miles in length, and varies in breadth from 150 to 500 miles; area, 210,000 sq. miles. It is thickly studded with towns and villages, mostly walled, and supports an immense population. It is traversed from north to south by the Yun-ho, or "Transit River," known among foreigners as the GRAND CANAL (*q. v.*), a great public work designed by Kublai Khan, the founder of the Yuen or Mongol dynasty (1272–1368), and carried out by his successors. Its total length is about 650 miles. See CANAL and YUN-HO.

GEOLOGY.—Little is known of the geology of China, though something has been accomplished by the investigations and studies of Kingsmill, Pumpelly, and von Richthofen. Coal,

both bituminous and anthracite, is found in almost every province, most of it in proximity to iron, and all readily accessible. The province of Honan alone has 21,000 sq. miles of anthracite, declared by von Richthofen to compare favorably with the best anywhere. The total coal area of the country has been estimated at 419,000 sq. miles. Until recent times this coal has never been worked to any depth or to any extent by the Chinese, (1) because it was illegal, all minerals being claimed by the emperor; (2) because of the Fung-shui superstition (see FUNG-SHUI), which deprecates all tampering with the earth, lest the equilibrium of the elements be disturbed and calamity result; and (3) because of the lack of engineering skill, and such Western appliances as the pump (a thing unknown in China), which are essential in deep mining. Since the establishment of native-owned steamship lines, however, a supply of steam-coal has become necessary, and now mining is in active operation under Government auspices and foreign superintendence, both in Chih-li (about 50 miles from Peking) and in Northern Formosa. Gold, silver, lead, and tin are also abundant, and Yunnan has long been known for its rich supplies of copper. Petroleum and natural gas are found in Sze-chuen, the gas being utilized to some extent in the great salt-making industry for which that province is noted.

Loess.—This remarkable formation, called "lake loam" by Pumpelly and terrace deposit by some, covers the provinces of Chih-li (except the alluvial part), Shansi, Shensi N. of the Tsing-ling range, Kansu, and Northern Honan, and stretches eastward into Liao-tung. It also covers large portions of Shantung and Southern Honan, and big patches of it are found in the neighborhood of the Tung-ting and Poyang Lakes. It is a brownish-yellow, unstratified, friable earth, with a highly porous tubular structure and a tendency to vertical cleavage, which has a most marked effect on the scenery. The depth varies from a few inches to a thousand feet or more, and it is found at all altitudes, rounding the hillsides and filling the valleys. It is exceedingly fertile, but owing to its very porous nature it demands a rainfall that would be excessive elsewhere. It is in this region that the famines of China occur, in seasons when the rain is too scant to fill the tubes and pores of the loess to bring up to the growing grain the chemical substances it needs.

Geologists are not agreed as to the mode of the origin of this peculiar formation. Pumpelly and others hold that it is a marine or lacustrine deposit, while Baron von Richthofen claims that it is of "subaërial" origin—that is, that it was carried by the wind from some region farther west and deposited in its present position. In proof of this he points to the fact that it is full of fossil land-shells, and contains bones of land quadrupeds, but no remains of either marine or fresh-water shells. See LOESS.

PRODUCTS.—Agriculture is the chief industry, and the most honorable. Every acre of cultivable land is cultivated with care; even the hillsides are terraced and turned to account. The principal cereal in the southern, central, and western provinces is rice, which grows in standing water. In the north, owing chiefly to the porous nature of the soil, rice is not much grown. Here wheat, barley, millet, and maize are the chief cereals. Pulse is also extensively grown, as well as tobacco, cotton, hemp, opium, and sugar-cane. Tea is grown on the hillsides (not in gardens), especially in the south, center, and west. The chief tea-exporting ports are Fuh-chow, Hankow, Amoy, and Canton. The tea of Formosa resembles that of Japan, but is superior in quality. (See TEA.) Silk both for domestic use and for export is also produced extensively. Among other products are cotton, camphor, vegetable or insect wax (see PEH-LA), and medicines. Fruits of many kinds, including grapes, peaches, apricots, oranges, loquats, kumquats, lichees, persimmons, etc., are grown. The native cotton is woven into a very substantial narrow-width fabric on the hand looms of the country.

CLIMATE.—In a region so large as China there must naturally be much diversity of climate. In general it may be said that it resembles that of the U. S. in its range of temperature, except that while in North China the temperature is higher in summer and lower in winter than in the corresponding portions of the U. S., there is less humidity. The rainy season of North China lasts for about six weeks, and the dry season for the rest of the year. In the south the heat is greater, and so is the humidity. In the north the rivers are frozen over during winter, and all navigation ceases. In Sze-chuen dense fogs prevail all winter, and the sun is seldom seen.

POLITICAL DIVISIONS.—The number of provinces has varied at different periods. During the Ming dynasty (1368–1643) there were thirteen provinces. In the period K'ang-hi—that of the second emperor of the present dynasty—it was cut up into eighteen provinces, and ever since *Shih-pah Sung*, or "the eighteen provinces," has been a common colloquial name for the country. In 1886, shortly after the French difficulty, the island of Taiwan, called Formosa by foreigners, was detached from Fuh-kien, and made into a separate province. In 1895 it was ceded to Japan.

TABLE SHOWING THE AREA, POPULATION, AND CAPITALS OF THE EIGHTEEN PROVINCES.*

PROVINCES.	Area in sq. miles.	Population.	Year of census or of estimate.	Population per sq. mile.	CAPITALS.

* To these might very properly be added Shingking, the most southerly of the "Three Eastern Provinces," commonly known as Manchuria, as since 1876 it has been administered by a civil governor.
† Estimated.

PEOPLE.—History shows that the people of China entered the country at a very early period as a band of immigrants from some place in Central Asia, and recent researches seem to point to Babylonia as their original home. It is said that they followed the course of the Yellow river and settled in Shensi, Shansi, and Honan. The aboriginal tribes they found in possession were gradually overcome and absorbed, though remnants of some of them are still found in wild independence in the southwestern provinces (see MIAO-TSE) and on the islands of Hainan and Formosa. These immigrants brought with them a considerable degree of civilization, and their descendants have continued to be the great civilizers of Eastern Asia. Korea, Japan, Loochoo, etc., have all received their culture and arts from China.

Education.—Education is widespread and highly prized. It is the only passport to social and official position; each village has at least one school, and at least one male member of each family can read, write, and cipher—the ciphering being done with the swan-pan, or ABACUS (*q. v.*). Competitive examination for literary degrees dates, in its present form, from about the beginning of the eighth century. The scholars or literati form the highest of the four social grades, farmers coming next, then the artisans, and lastly merchants. In point of intellect, as in business and diplomacy, the Chinese are the equals of the ablest and most civilized nations of Christendom.

Social Life.—The Chinese are a gregarious people living in cities and villages (most of them defended by high walls and fortified gates which are closed every night at sunset). Scattered dwellings are as a rule unknown, yet agriculture is one of their chief occupations. There are no grass-fields and no grazing herds; beef is not used, except by the Mohammedans, and milk, butter, and cheese are entirely unknown. Pork, chickens, eggs, and fish, with vegetables and rice (in the southern and central provinces), and wheat, barley, maize, and millet, etc. (in the northern provinces), form the chief articles of food.

Dwellings.—To a European, Chinese homes seem very comfortless, with their paper windows, their lack of outlook to the street, their earthen or tiled floors, their straight-backed chairs, the absence of fireplaces and stoves, and of a second story, except for purposes of amusement. The better class of buildings are of slate-colored brick (red bricks and tiles are practically unknown), the under courses probably of limestone, with tiled or thatched roof, and heavy, ornamented, overhanging eaves. The less wealthy use sun-dried bricks covered by a thin coating of plaster or cement, or

faced with a single thickness of burnt brick. The poorest use *adobe*, or else a wooden framework filled up with wattled bamboos, or stalks of millet or maize thickly daubed with mud and mortar. Timber is scarce, the principal supply for the best buildings coming from Manchuria in the north or from Annam or Burma in the south. The framework of the roof is first set up on posts (about 9 feet apart) which are afterward built into the walls.

There are few notable buildings in China except pagodas and temples, the gate-towers of the cities, a few palaces and government offices, and, owing to the perishable nature of the materials employed and the havoc wrought by frequent rebellions, few can boast of any great antiquity. There can be no doubt that the tent is the real model of all Chinese buildings. This is proved chiefly by the shape of the roof, which shows the curves of an easy-hanging tent-cloth over a tent-frame.

Marriage is universal, and is contracted in childhood, though from sixteen to eighteen is the usual age for marrying. Persons of the same surname can not intermarry. The son takes his wife to his father's home and not to one of his own. Few women can read; some, however, have attained distinction as scholars. The women never eat with the men, even of their own family, and are seldom seen abroad. The cramping of the feet of girls is a custom of long standing, the origin of which is unknown. For social reasons it can not well be changed until the court ladies give it up.

Religion.—In religion the Chinese are easy going, and draw on three different systems. From primitive times they got the notion of a supreme Being (still worshiped twice a year by the emperor on behalf of the people), a host of spirits, and the worship of ancestors. On this have been grafted the Confucian morality and many superstitious notions and practices from BUDDHISM and TAOISM (*qq. v.*). The former was introduced into China in the period Ming-ti (A. D. 67) and at once took root. Monasteries, usually styled temples, abound, and the system has so spread over the empire that people forget its foreign origin. There are about thirty millions of Mohammedans in the country, and until recent times a Jewish community, with a synagogue and copies of the Pentateuch in Hebrew, existed at Kai-fŭng-foo, the capital of Honan. Christian missions are now found everywhere throughout the eighteen provinces and beyond.

GOVERNMENT.—The government of China is a despotism constituted on the model of the family. The Hwang-ti or emperor is the "son and minister of Heaven," but he is also the "father and mother" of the people, and what he is to the people at large each district official is to those under his jurisdiction. Under the emperor, the supreme direction of affairs is intrusted to a grand council or cabinet composed of four high officials, the highest in the empire, of whom two are Chinese and two are Manchus. Under the orders of this grand council are the seven boards or executive departments, each with two presidents, a Chinese and a Manchu. These are (1) the board of civil office, which superintends the appointments, salaries, and movements of officials; (2) of rites; (3) of revenue and population; (4) of war, which until 1885 included both the army and navy; (5) the board of punishments; (6) the board of works; and (7) the admiralty or navy department. Besides these there are many other important bureaus and offices, such as the Tu-Cha-yuen, or board of censors, "the eyes and ears of the emperor" (whose business is to expose corruption and misgovernment, and who are privileged to rebuke the emperor himself); the Li-Fan-yuen, which has charge of the "colonies" and dependencies; the Tsung-li-Yamen, or foreign office, etc.

For administrative purposes each of the eighteen provinces is divided into *departments* called fu (or foo), and *districts* called chow or hien. The official at the head of each of these is called a *chih-fu*, a *chih-chow*, or a *chih-hien*—that is, "the one who knows" the fu, the chow, or the hien. The district mandarin has charge of everything connected with his district, and is at once sheriff, coroner, judge, tax-collector, superintendent of education, etc. Several districts make a fu or department, and two or more departments a *tao* or circuit, at the head of which is a tao-tai, or intendant of circuit. The district magistrates report to the chih-fu, and the chih-fu to the provincial authorities. Each district has at least one walled town, that in which the chih-hien has his yamŭn or office. That in which the chih-fu has his headquarters is called a fu or departmental city, hence the frequency of the syllable fu as a final in Chinese place-names—e. g. Chin-kiang-fu. There are in China proper 182 departments, 79 minor departments called *ting* and *chow*; 1,280 districts called hien, 140 called chow (the standing of which is somewhat higher than that of the hien), and about 50 called ting. At the head of each province is a *Tsung-tuh*, or governor-general, as in Chih-li and Sze-chuen, or a fu-tai, or governor, as in Shansi, Shantung, and Honan. The remaining fourteen provinces are grouped in twos and threes, with a governor for each, but subordinate to the governor-general at the head of the group. These governors communicate directly with the throne, or with the grand council at Peking. Associated with the governor of each province are the fantai, or provincial treasurer; the ngan-cha-sze, or criminal judge; the hioh-tai, or literary chancellor (a sort of commissioner of education), a kien-tuh, or commissioner of excise, and a ti-tuh, or commander of the forces. All these officials, from the tsung-tuh down to the chih-hien, are appointed by the emperor, but are as a rule chosen from among the graduates. Of the 144 officials who now form the supreme government only 13 obtained their first appointment by purchase. All officials are ranged in nine ranks, the distinguishing mark of each being the button or knob worn on the official hat or cap. (See BUTTON.) No one can hold office in his native province. Each province is practically self-governing, raises its own taxes, makes a fixed contribution to the central government, and has its own army and navy.

Army and Navy.—Besides these provincial forces there is the national army, which consists (1) of about 320,000 Manchu bannermen, and (2) of 656,459 officers and men who compose the *Ying Ping*, "camp troops" or regular army. Irregular levies called yung or "braves," a kind of militia, may be called out and disbanded as occasion demands. As a rule, the regular army is drilled after Western methods, and armed with modern arms, but bows and arrows and pikes are still much used, especially among the Manchus and the yung. The Chinese fight well when properly led, but as yet they are poorly officered. The navy, which in 1894 was considerable, included (1) two squadrons comprising 4 barbette ironclads, 1 turret ship, 18 cruisers, 27 torpedo-boats, 14 gunboats, and several dispatch-boats, etc.; and (2) two flotillas comprising an armored frigate, 14 gunboats, 6 floating batteries, 3 transports, etc.

There are arsenals at Tientsin, Tsi-nan-foo (in Shantung), Shanghai, Nanking, Hanyang-foo, Fuh-chow, and Canton, and dockyards at Wei-hai-wei, Shanghai, and Fuh-chow.

Revenue.—The normal revenue amounts to about 75,000,000 hai-kwan taels, or about $78,750,000 U. S. gold. It consists (1) of land tax, payable part in silver (about 20,000,000 taels) and part in rice (= taels 2,750,000); (2) the profits of the salt monopoly (about 9,600,000 taels); (3) customs dues (native 6,000,000, foreign (in 1892) 23,200,000 taels); (4) likin and transit dues (about 11,000,000 taels; and (5) licenses (about 2,000,000 taels.)

Trade and Commerce.—The native trade is very extensive. Foreign trade is carried on at certain ports which have been opened from time to time by treaty with European nations, chiefly Great Britain. These are given in the following table, together with the amount of imports and exports for each in 1894, stated in taels:

PORT.	Where situated.	Population.	When opened.	Imports.	Exports.
Tientsin.....	Chih-li	950,000	May, 1861.	4,551,175	6,605,997

* Niu-chwang lies outside of China proper, but was one of the ports opened by the treaty of 1860. † Now Japanese ports.

This trade is chiefly with Great Britain and her colonies, Japan, the U. S. and the continent of Europe coming next in the order here given. In 1891 the total foreign imports amounted to over 134,000,000 taels (cotton goods, 53,290,200; opium, 28,353,156; metals, 7,254,448; woolens, 4,695,256; and sundries, 40,329,599 taels). The exports for the same year were valued at 100,947,849 taels, mostly tea and silk.

Means of Communication.—The country is unfenced, and tracks (they can not be called roads) run everywhere. In the plain, wagons form the chief means of conveyance, though pack-animals and wheelbarrows are also used. In the hilly parts pack-animals and mule-litters are resorted to, while in the mountainous parts porters and sedan chairs are employed. In the central and southern provinces connected by the Yang-tse, the lakes, and the canals, the means of travel are convenient and cheap, though slow. A railway is in operation in Chih-li, from the coal mines at Kai-ping to Hokow on the Peh-tang, thence viâ Taku to Tientsin; thence to Shan-hai-kwan, at the E. end of the Great Wall and a little beyond. In 1876 a line from Shanghai to Woosŭng, 12 miles in length, was begun by some foreigners, and operated along half that distance for nearly a year, when it was purchased by the Chinese authorities and torn up. A trunk line from Peking to Hankow has been sanctioned. Telegraphs now connect Peking with the principal cities of the country and with foreign countries.

Money, Weights and Measures.—The only coin used is the CASH (*q. v.*). Payments of small sums are made in cash; payments of larger sums are usually made in silver by weight. The unit is the *liang* (called tael by foreigners), which is equal to $1\frac{1}{3}$ oz. avoirdupois. The tael is divided into tenths called *tsien* or mace, and these again into tenths, called *fŭn* or candareen. Sixteen *liang*, or ounces, make a *kin*, or pound (equal $1\frac{1}{3}$ lb. avoir.), called catty by foreigners. One hundred kin make one picul, equal to $133\frac{1}{3}$ lb. avoir. Ten *tsun*, or inches, make a foot, which according to treaty stipulation is equal to $14\frac{1}{10}$ English inches. A *li*, or native mile, equals about one-third of an English mile.

History.—The Chinese claim for themselves a hoary antiquity, the more extravagant of their writers going back several millions of years to Pân-Kû, the first man, who chiseled himself out of chaos. Others begin with a great chieftain named Foh-hi, 2852 B. C., the first of the "Five Rulers." The *Book of History*, edited by Confucius, begins with Yao, 2357 B. C., who, however, appears with a well-developed governmental system. He was succeeded by Shun, 2255 B. C., and he in turn by Yu, who had labored so successfully in remedying the great flood of the time of Yao that he was chosen first as the associate and then as the successor of Shun. These three (with Wŭn Wang of the twelfth century B. C.) are the "ancient kings" lauded by Confucius for their virtue. (See CONFUCIANISM.) From Yu to CHI-HWANG-TI (*q. v.*) there were three dynasties, the Hia (2208–1766 B. C.), Shang (1766–1122), and Chow (1122 to 249 B. C.). From the abolition of the feudal system and the consolidation of the empire under Chi-Hwang-ti down to the present dynasty twenty-one dynasties have ruled over the country, sometimes only in part. The most illustrious of these are the Han (202 B. C. to 220 A. D.), the T'ang (618–907), the Sung (960–1280), the Yuen or Mongol dynasty (1280–1368), and the Ming (1368–1643). The Han, the T'ang, and the Sung are the periods of greatest literary activity. The rulers of the present or Ta-Tsing dynasty are Manchus, but they rule China on Chinese lines of polity, and have practically lost their own nationality. The only really distinctive custom which the Manchus have compelled the Chinese to adopt is the wearing of the queue, or "pigtail"; and of the 144 officials who now form the supreme government of the empire only 32 are Manchus.

Originally called in to assist in suppressing the internal troubles which threatened the overthrow of the Ming dynasty, they refused to withdraw when the object of their mission had been accomplished, but proceeded to conquer the country for themselves. In 1643 they proclaimed the ninth son of their own ruler Tien-ming as the first emperor of the Ta-tsing dynasty, the name chosen for his reign-period being *Shun-chi*. In the following period, K'ang-hi, the empire was fully consolidated, and an era of great prosperity as well as of literary activity inaugurated. The ninth emperor of this dynasty now reigns, his reign-period being called *Kwang-sü*. He came to the throne in 1875. The great events of this dynasty have been the opening of the country to foreign trade, residence, and travel, the introduction of steam machinery, steamboats, railways, and telegraphs, the establishment of diplomatic relations with Western nations, and the protection accorded to those who profess, as well as to those who teach, Christianity.

In connection with Korean internal troubles in 1894, China became involved in a war with Japan, which resulted in the loss of most of her fleet, of the island of FORMOSA (*q. v.*), and, for a time at least, of the seaboard of Liao-tung, and the great fortified ports of PORT ARTHUR and WEI-HAI-WEI (*qq. v.*), besides the payment of a large money indemnity. (See KOREA.) See CHINA in the Appendix.

ROBERT LILLEY.

China, or **Chinaware**: See the article POTTERY AND PORCELAIN.

China Clay: See KAOLIN.

China Grass, or **Chinese Grass**: a vegetable fiber which the Chinese manufacture into a beautiful fabric called by themselves *hia-poo*, or summer cloth, and by foreigners "grass cloth." It is also manufactured in Europe to some extent. It is obtained mostly from the *Bœhmeria nivea*, a plant of the order *Urticaceæ*. (See RAMIE.) Grass cloth has a glossy appearance and a silky luster. The plant flourishes in the Southern U. S. under proper cultivation.

China, Great Wall of: a remarkable fortification constructed by order of the celebrated Emperor Shi-Hwang-Ti, the first universal Emperor of China, for the purpose of protecting the northern and northwestern frontier of his empire from the hordes of barbarians who then swarmed in that part of Asia. To accomplish this great object, he united the several defenses which had been erected for the same purpose by the feudal princes. Several millions of men, it is said, were occupied for the space of ten years, during which time half a million of those employed on the work perished. It was completed in 211 B. C. The entire length of the wall is about 1,255 miles, the height being from 20 to 25 feet, with towers about 100 yards apart and 40 feet high. The wall is thick enough at the summit to admit of six horsemen riding abreast. Each face of the wall was built of hewn stone or brick, with earth filled in between. The Chinese name for the wall is Wan li Ch'ang Ching, or "Ten Thousand Mile Rampart."

Chinam'pa: the Aztec name for a floating garden, whether natural or artificial. The shallow lakes around ancient Mexico were often partly covered with floating masses of grass and weeds, such as are often seen in similar bodies of water; these held portions of soil entangled in their roots. Some families of the Nahua or Aztec race took advantage of them to make floating homes, strengthening the unsteady mass with poles and brush, on which earth was piled, and eventually, it would appear, constructing rafts covered with soil. On these their homes were built, and gardens of considerable extent were planted. The Indians living in this manner were called Chinampenecs, and for a time they ranked as an independent tribe. They became tributary to the Mexicans about 1425. At the time of the conquest these gardens were very numerous and supplied the markets of Mexico with vegetables. HERBERT H. SMITH.

Chinande'ga: a department and town of Nicaragua, Central America. The town is in a fertile plain about 13 miles from the Pacific Ocean and 20 miles N. W. of Leon (see map of Central America, ref. 6–G). The houses are built of *adobe*, and are only one story high. Cotton and sugar are produced in the vicinity. Pop. of department (1888) 23,719; of town, 8,000.

China-root: a drug, consisting of the dried roots of a woody, climbing, thorny shrub, *Smilax china*, native of

Eastern and Southeastern Asia. The plant is closely related to the common greenbrier (*S. hispida*) of the U. S., and also to *S. officinalis*, from which the drug sarsaparilla is obtained; in fact, the China-root is sometimes substituted for the true sarsaparilla. It was formerly held in high repute as a remedy for rheumatic and syphilitic complaints.

Chinard, shĕc'naar', Joseph: b. 1756; d. 1813; a sculptor of Lyons; studied in Rome, and based his style on the antique; he executed many public works for Lyons, and some for Marseilles, and left many portrait busts.

China Sea: that portion of the Pacific Ocean which extends from Japan, Korea, and the S. of the Yellow Sea to Borneo, with the Philippine islands on the E., with China, Tonquin, Siam, and the Malay Peninsula on the W. It includes the East Sea (*Tung-hai*), stretching from Korea to Formosa, and the South Sea (*Nan-hai*), stretching from Formosa to Borneo. These two seas are connected by the Straits of Formosa, while the southern sea makes the great Gulfs of Tonquin and Siam. Navigation is hazardous on account of the typhoons that visit these waters. Some geographers restrict the name China Sea to the second of these divisions.

China-tree: See China, Pride of.

China Wax: See Pela or Peh-la.

Chin'cha Islands: three small islands in the Pacific Ocean; situated about 14 miles from the coast of Peru; near lat. 39° 4′ S.; total area, 4,000 acres. They are mere rocks, with perpendicular cliffs 200 feet high and numerous surf-caves. Multitudes of sea birds frequent them, and the islands had large deposits of guano, now practically exhausted. See Guano.

Chinch-bug: the *Rhyparochromus leucopterus* of Say; a hemipterous insect of the family *Lygæidæ*, which is a subdivision of Latreille's great family *Corisiæ*. The chinch is a great pest to the wheat crops of the U. S., attacking also Indian corn, grass, and the various kinds of grain and garden vegetables, destroying in some years much property. The female lays her eggs, some 500 in number, in the ground, and there are often two broods of larvæ in a single year—the first attacking the wheat sometimes as early as the middle of June, and not always disappearing until the middle of August. The next brood comes in autumn. The bug is $\frac{3}{16}$ of an inch long, and has white fore wings, each having a black spot on the middle of its edge; the body is mainly black, but the wingless young are at first red, with a white band on the back. The chinch-bug attacks the tender parts of plants, sucking the juices, and apparently poisoning the part which is bitten. The insect is not uncommon in the E. and N. E. of the U. S., but there its ravages are not conspicuous, and little attention is paid to it. The valley of the Mississippi has in some years suffered terribly from this cause. Thus in 1864 one-half the corn (maize) and three-fourths of the wheat were destroyed by this pest throughout large districts, and the total damage to crops was estimated at $100,000,000 in U. S. currency. In 1865 a seemingly providential epidemic attacked the larvæ of the chinch-bug, and most effectually checked the destructive process, so that for some years it was not easy for entomologists to find specimens; but since that time the species has so multiplied that in some districts great destruction of grain has ensued. There are several germ diseases infesting the chinch-bug which are now well known; one of them is a fungus belonging to the genus *Sporotrichum*. As this fungus can be artificially cultivated, it has been found practicable to use it as a means of destroying this pest. The fungus is cultivated during the winter in artificial media, and during the summer months bugs are infected with it and distributed to localities where there are serious outbreaks. Much use of this method has been made, especially in Kansas. See *Report* by Prof. F. H. Snow, director of the experiment station, University of Kansas (1891).

Chinchil'la (Sp. pron. chin-cheel'yăă): a small South American rodent, the best-known member of the family *Chinchillidæ*. It is about 10 inches long, exclusive of the bushy tail; clothed with soft, dense fur, gray above and dusky white beneath. The ears are large, and the hind legs much longer than the fore. It dwells in colonies along the eastern slopes of the Andes, from Northern Peru to Southern Chili, at elevations of from 8,000 to 12,000 feet. The chinchilla is a burrowing animal, and comes out in the morning and evening to feed on roots and grass. It is docile and mild in temper, and may be easily tamed as a pet. Its fur was much valued by the ancient Peruvians, and is still in demand for cloak linings, trimmings, and similar purposes.

Chinchilla.

Many thousands are annually taken by the Indians, who capture them by the aid of a trained weasel (*Galictis vittata*). F. A. Lucas.

Chinchilla (anc. *Salaria*): a city of Spain; province of Albacete; on a hill 12 miles S. E. of the city of Albacete. It has a fine church, and manufactures of cloth, linen, glass, earthenware, etc., and marble is quarried in the neighborhood. Pop. (1887) 6,096.

Chinchil'lidæ: a family of medium-sized rodents characterized by short incisors, molars divided by continuous folds into transverse plates, perfect clavicles, and long hind limbs. The fur is soft, the tail bushy. They dwell in burrows, and are limited to the pampas of La Plata and the highlands of the Andes. There are, according to Flower, but three species, each representing a separate genus readily distinguished by the number of toes on the fore and hind feet: *Chinchilla* has five toes on each of its front feet and four on each of those behind; *Lagidium* has four on each foot; and *Lagostomus* has four and three respectively. See Chinchilla and Lagotis. F. A. Lucas.

Chinchon', Ana, Countess of: Vice-Queen of Mexico and Peru; b. in Astorga, Castile, 1576. Her father was the eighth Marquis of Astorga. In 1593 she married the Marquis of Salinas, who was successively Viceroy of Mexico (1594–96), Viceroy of Peru (1596–1604), and again Viceroy of Mexico (1604–11). After his death she married (1621) the fourth Count of Chinchon, and when he was made Viceroy of Peru she accompanied him to Lima (1629), thus being a second time vice-queen in that city. While there in 1638 she was ill of a tertian ague, and was cured by some powdered quinquina bark which had been sent to her physician by the Corregidor of Loxa, Don Juan Lopez de Canizares. She died, while returning to Spain, at Cartagena, Dec., 1639. A package of the bark which she had brought with her was taken to Spain, and she was thus the means of first introducing this important remedy into Europe. Linnæus named the genus of quinquina-bearing plants, in her honor, *Cinchona*, or, as it should have been written, *Chinchona*.

Herbert H. Smith.

Chindwara: See Chhindwara.

Chinese Architecture: See China.

Chinese Empire: the immense region of Eastern and Central Asia which is subject to the Emperor of China. It may be divided into four parts:

I. Chung-Kwoh, the "Middle Kingdom," or China Proper, which borders on the Pacific Ocean, and has an area of about 1,322,841 sq. miles, with a population of 383,000,000, or more. See China.

II. The "Three Eastern Provinces" lying to the N. of Korea, and commonly called Manchuria (*q. v.*). It has an area of 362,310 sq. miles, and a population of about 18,000,000.

III. The regions subject to the Li Fan Yuen or "Colonial Office," viz.: (1) Mongolia (between China proper and Siberia) and Kokonor (between Tibet and the province of Kansuh); area, 1,288,000 sq. miles; pop. 2,000,000; (2) Ili, or Kulja, stretching westward into Central Asia, and marching with the Russian possessions there. It includes Sungaria and Eastern Turkestan, and is officially called *Sin-tsiang*, "the New Frontier (province)"; area, 579,750 sq. miles; pop. 1,180,000; (3) Tibet; area, 651,500 sq. miles; pop. 6,000,000.

IV. Tributary states. These formerly included Burma, Annam, Loochoo, Korea, etc. (see all these titles); but one by one they have slipped from China's grasp.

Chinese Language: the leading member of the group of monosyllabic languages which occupy Southeastern Asia, and constitute, with a possible exception or two, the whole of the monosyllabic class. This monosyllabism is not, as a few scholars have held, a state to which they have been reduced by a process of phonetic decay, but manifestly a primitive condition. It represents a stage out of which all other languages, whether of the agglutinative or inflective type, have passed, while these, from arrested development, have remained behind. Chinese words are not only altogether destitute of inflection, but they are hardly parts of speech in the sense which we attach to the term, being to a great extent still in the root state. The same word may, according to its position in the sentence, be noun, adjective, adverb, or verb; e. g. *sin* must be variously translated "fidelity," "faithful," "faithfully," "believe." This indefiniteness, however, attaches to the words only when taken separately, and disappears in the sentence. Chiefly by the value given to position, but partly also (especially in the spoken language) by the use of certain words as signs of grammatical relation, logical precision of statement is attained. Being cut off from the resources of derivation for the multiplication of forms, while the development of signification has gone on as in other languages, the number of homophonous words is very great. The phonetic combinations of which the language admits are comparatively few and simple. The number of distinct vocables differs considerably in the various dialects, the highest limit being not far from 1,000 and the lowest 500. By the aid of tones, similar to those which we use for the purpose of emphasis and expression, this number is increased two or three fold, being raised in the Kwan-hwa to about 1,600. The same phonetic combination pronounced in different tones constitutes so many different words, and so essential a part of the pronunciation is the tone that a wrong tone will sooner occasion misunderstanding of a word than will the substitution of a wrong consonant. In the modern dialects the number of tones varies from four to eight, the smaller number being found in some of the districts of Central China; in the Kwan-hwa there are five, in the Fuchow and Amoy dialects seven, in the Canton eight. The number of words which coincide both in sound and tone being, however, still very large, other means are necessary to remove the ambiguity, and in the spoken language phrases composed of two or more words are largely used in the place of simple terms. Two synonyms are frequently thus joined; e. g. *shu-muh*, "tree." *Shu* and *muh* have each various significations besides that of "tree," but there is no other in which they agree, and the combination thus becomes definite. Other phrases are taken in a collective sense; e. g. *hiung-ti*, "older brother, younger brother," for "brother" or "brothers"; or in a derived sense; e. g. *tung-si*, "east-west," for "thing." These phrases, which often extend to four or five words, make a near approach to proper compounds, one of the words uniformly receiving a stronger accent, supported in the case of the longer phrases by a secondary accent.

Spoken by a population variously estimated at from three to four hundred millions, the Chinese not unnaturally is divided into strongly marked dialects. Of these the Kwan-hwa, commonly called by Europeans the mandarin or court dialect, has the widest currency, being spoken with minor differences over the whole north and west of the empire, and on the east reaching as far south as the Yang-tse-Kiang. It is, further, the language of official communication throughout the empire, and the only one of the popular dialects which has received any considerable literary cultivation. Phonetically, it is the poorest of the dialects. The only consonant finals of which it admits are the nasals *n* and *ng*, and the sonant initials *b*, *d*, *g*, *v*, *z*, found in some of the other dialects, are wanting here. The southeastern dialects, in the provinces of Canton and Fukien, on the other hand, are the most archaic, having preserved the final mutes *p*, *k*, *t*. Differing largely in vocabulary, as well as in the form and tone of the words common to them, these several dialects are not generally understood (except the Kwan-hwa) beyond the limits of a single province. There are in addition many local dialects, less marked in character and of a more limited currency. This diversity does not, however, extend to the written language, which is uniform throughout the empire, and, to a degree unapproached in any other literature, uniform also throughout the whole course of its history. Its development has been to some extent independent of the spoken language, and forms one of the most interesting chapters in the history of writing.

The date of the invention of the present characters, commonly ascribed to Tsang-kié, about 2600 B. C., can not be fixed even approximately, but the history of the successive stages of the development of the system is written in the characters themselves. The first signs were purely ideographic, being rude representations of the objects named. A circle with a point in the center stood for the sun, a crescent for the moon, a three-pointed peak for a mountain. The changes of form which they have undergone, arising in part from the different materials used in writing, have left in the present characters little resemblance to the objects pictured. The limits of this method of direct representation were soon reached. A few words denoting position and number were represented by points and strokes; thus a point above or below a horizontal line signified "above" or "below"; a stroke through the center of a circle, "middle." The combining of two or more signs to express a single idea, either by direct or symbolical representation, was another easy step; thus "water" and "eye" make up the sign for "tear"; "sun" and "moon" for "bright."

By far the greater number of characters, however, are formed on a new principle, the combination of an ideographic and phonetic element in one sign. The number of homophonous words is, as we have seen, very large, and a sign having been found for one of these, it is used phonetically to represent the sound of the others, being differentiated in each case by an additional sign, which indicates in a general way the meaning. In this combination one of the parts, termed the *phonetic* or *primitive*, gives up its meaning and retains only its sound; the other, the *radical*, gives up its sound and retains only the meaning. For example, the syllable *tao* has among other significations the following: "sword," "anxious," "appetite," "heart of a tree," "long narrow boat," "a species of fish of a slender form." The first of these, "sword," being represented ideographically, the others are written phonetically by the same sign, further defined by the radicals for "heart," "eat," "tree," "boat," "fish."

The number of different phonetics employed in writing a single vocable is in some cases twenty or more, and the aggregate number of characters thus formed may exceed a hundred. Some characters are used both as phonetics and radicals; and a character composed of a radical and phonetic may itself be employed as a phonetic in forming new characters. The number of phonetics in common use is about 1,000. These phonetics represent the sound of the word as a whole, without analyzing it into its elements.

There is, however, a kind of syllabic spelling called Fan-ts'ieh, introduced from India by Buddhist priests, and first currently used in dictionaries of the fifth and sixth centuries to mark the sound of characters with more precision. One series of characters is chosen to represent the initial sounds, another the final sounds, together with the tone, the number of both varying according to the dialect. Thus *king*, "classic," in the dictionary of K'ang-hi is spelled with the characters *k-ien l-ing*, the first being simply the sign of the initial *k*, the second of the final *ing*.

In the arrangement of the characters Chinese dictionaries follow three different methods. By the first the characters are distributed according to their meaning under a certain number of categories, such as heaven, earth, body, etc. The second principle of arrangement is according to the radical part of the character. This appears first in the *Shuoh-wén* published A. D. 100, in which 10,000 characters are arranged under 540 radicals, a number slightly increased in subsequent dictionaries, but in the *Tzŭ-Hwui*, published during the Ming dynasty, reduced to 214. This last number is retained in the two principal dictionaries of the present dynasty, the *Ching-tzŭ-t'ung* and the *K'ang-hi-tzŭ-tien*. In the last-mentioned work, with a total of about 44,000 characters, the number found under the different radicals varies from 5 to 1,300, or, counting duplicate forms, 1,900, the following radicals having each 1,000 and upward: *mouth*, *heart*, *hand*, *tree*, *water*, *plant*. Under each radical the characters are arranged in the order of the number of strokes contained in the phonetic. The third and last method of arrangement is according to the sound of the characters. The usual order in works of this class is the following: the characters are divided into four great classes, according to the tone; each tone divided into smaller classes, according to the final sound,

and these sometimes further subdivided, according to the initials. To this class belongs the *Pei-wén-yun-fu*, one of the most extensive lexicographical works in any language. It gives by numerous citations the fullest illustration of the usage of the language, and was published in 1711 in 130 thick volumes. Of the total number of characters in the language extravagant statements have often been made. The more complete dictionaries contain from 40,000 to 60,000, of which obsolete and duplicate forms and proper names make up perhaps one-half. The number of really different characters which have the sanction of good usage is not far from 25,000. Even in the number last given a large proportion of the characters are of rare occurrence, and a knowledge of from 5,000 to 10,000 is sufficient for almost all the needs of the scholar.

In no language are the differences between the literary and colloquial idioms so great as in Chinese. Words alike in sound but distinct in meaning being written with different characters, the precautions against ambiguity required in the spoken language are to some extent unnecessary. In the classical style conciseness is carried to the extremest limit. It is in general true of the classical books that, while to the eye they are definite, to the ear they convey no meaning. In this ancient style, termed Ku-wên, all historical, philosophical, and critical works are still written, and no accomplishment is so highly valued among scholars as the mastery of it. Novels and dramatic compositions, which are regarded as quite inferior classes of literature, are written in the Kwan-hwa, in a style but little elevated above the colloquial, and, like it, abounding in compound phrases. The Wên-chang, the style of the literary essays, which is also much cultivated, is of a more artificial character than the Ku-wên, and less esteemed.

The relation of the Ku-wên to the ancient spoken language, whether and how far it represents it, and how far it is the product of a merely literary development, are points upon which scholars are not agreed. Doubtless the Chinese written characters would long ago have given place to an alphabetic system had they not been peculiarly suited to the genius of the language, which, being monosyllabic, abounds in homophonous words. Still there are serious drawbacks, not the least of which is this, that the labor involved in learning and holding in the memory so many arbitrary characters absorbs no small portion of the intellectual energy of the people. Attempts have been made, not without success, to romanize some of the popular idioms, the tones being marked by diacritic signs. Books have been published by missionaries in this character in the Shanghai, Ningpo, Fu-chow, and Amoy dialects. To the concise classical style, however, this method is quite inapplicable.

The Chinese characters have undergone in the course of their history great changes of form, and six varieties are now in use. These are the *Chuen-shu*, or seal character, used in seals and ornamental inscriptions; the *Li-shu*, and, closely related to it, the *Kiai-shu*, a pattern style employed in careful writing; the *Sung-shu*, the common book character; the *Hing-shu*, or running hand; and the still more abbreviated "grass-character," *Ts'au-tzŭ*. In no country is the art of calligraphy so highly esteemed or so sedulously cultivated as in China, and no written character is so well adapted to the display of it.

Of the Chinese language in general we may say, in conclusion, that, notwithstanding its poverty of forms, it has been made, solely by the genius of those who use it, superior as an instrument of thought to many, perhaps to most, inflected languages. ADDISON VAN NAME.

Chinese Literature: In the history of literature there is hardly to be found another example of so high an antiquity, and none of so great a longevity, as the Chinese—an age which at least reaches, and perhaps exceeds, 3,000 years. Neither in language, literature, nor institutions is the modern period in China separated from the ancient by so wide an interval as elsewhere; an unbroken tradition holds together all. In few countries has the cultivation of letters been so general. In theory, at least, all offices beneath the throne are not only open to the scholar, but official promotion is made to depend directly on scholarship. The entrance to the various grades is guarded by public competitive examinations, which at each successive step become more rigorous. This system, introduced under the Han dynasty near the commencement of the Christian era, has been adhered to with more or less fidelity under the succeeding dynasties. Under such conditions, with the long history and vast population of China, a literature of immense extent is a natural result. Nor is any great literature so purely national, so little affected by foreign influences, as the Chinese. Buddhism, brought from India in the first century of the Christian era, has created for itself a literature apart, without much disturbing the general course of development. During the past three centuries of intercourse with Western nations their influence upon the literature, except in the department of mathematics, has been hardly felt. The exaggerated reverence paid to the classical models has so strengthened the conservative tendency as to check the growth of originality.

There is, however, more of variety both in the history and the literature of China than the commonly received opinion gives to them. The first period of marked activity is that commencing with Confucius (d. B. C. 478) and Lao-tsĕ, and covering a period of about three centuries. Mencius and many other less celebrated writers belong to this period, which was rudely brought to a close by Shi Hwang-Ti, the founder of the Ts'in dynasty. This ruler, famous also as the builder of the Great Wall, having consolidated into an empire the petty states into which China had been divided, and fearing that the study of the literature would lead to an attempt to restore the old order of things, ordered (B. C. 212) the destruction of all books except those on medicine, divination, and husbandry, and the records of his own dynasty. This edict remained in force only twenty-two years, the Ts'in dynasty having been soon succeeded by the Han, under which strenuous efforts were made to recover the lost books. The catalogue of the library thus formed, which is found in the history of the Han dynasty, enumerates more than 13,000 volumes by 600 different authors. This collection perished in the burning of the imperial palace at the close of the dynasty, and similar collections made under succeeding dynasties met a like fate. Including the burning of the books by Shi Hwang-Ti, five great catastrophes of this kind are enumerated by Chinese historians, the last in the sixth century.

The period of the T'ang dynasty (A. D. 618–905) was the golden age of Chinese poetry; that of the Sung (960–1279) was the era of philosophical speculation and of criticism; the Yuen (Mongol) dynasty (1280–1367) was the most flourishing period of the drama, and produced also some of the best novels; the Ming and the reigning Manchu dynasties have been less distinguished for the originality of their productions than for works of an encyclopædic character, digests of the older literature. Printing from wooden blocks was invented before the close of the sixth century, but did not come into general use until the tenth. Movable types were employed as early as A. D. 1040, four centuries before the invention was known in Europe, without, however, displacing wooden blocks, which have remained in general use. Chinese literature is abundantly supplied with works in bibliography and literary history, which for many centuries have been favorite subjects of study. In the several dynastic histories also an important section is devoted to the literature of the period. An index of works prohibited on account of their moral or political tendency has been published by the present dynasty. It contains many thousand volumes, mostly written about the close of the Ming dynasty.

The term *king* or "classic" is used in a narrower and a wider sense. It belongs *par excellence* to the *Five King*, but very commonly includes also the *Four Books*, and is not unfrequently used in a still wider sense. Among the *Five King* the first place is accorded to the *Yih*, partly for its antiquity and partly for its enigmatical character. The proper text consists of eight trigrams, made up of horizontal lines, whole and broken, afterward increased by combination to sixty-four hexagrams. With these are incorporated commentaries by Wên-Wang, the ancestor of the Chow dynasty, by his son, Chow-Kung, and by Confucius, which constitute the only intelligible part of the work. These mystical figures, ascribed to the ancient sage Fuh-Hi, are much used in divination, and on this account the work is said to have been excepted from the general destruction of books under Shi Hwang-Ti. Next in rank is the *Shu King*, a collection of historical documents relating to the Yu, Hia, Shang, and Chow dynasties, and covering the period, according to the received chronology, from the middle of the twenty-fourth century down to B. C. 721. The *Shu* is largely occupied with discourses on government put in the mouths of ancient sovereigns, the historical matter being quite subordinate. The third classic is the *Shi King*, or *Book of Odes*, which contains 305 pieces (origi-

nally 311, but of six only the titles are preserved), selected by Confucius as the most worthy of preservation out of nearly 4,000. The poetical merit of these pieces is very unequal, but is in general superior to that of later productions. They belong, with few exceptions, to the Chow dynasty, and for the light which they throw on the history and customs of the time are of great value. The fourth place among the classics is occupied by the Rituals, three in number. The *Li-ki*, which is designated by imperial authority as one of the *Five Classics*, is a compilation made in the first century B. C. out of the older Rituals. The last of the *Five Classics* is the *Ch'un Ts'iu* (Spring and Autumn Annals), the only one of which the authorship can be properly ascribed to Confucius, his labors upon the others being merely those of an editor. It is a chronicle of events from 720 to 480 B. C., written in continuation of the *Shu King*. In it are recorded thirty-seven eclipses of the sun (the earliest 720 B. C.), which, with few exceptions, have been proved by calculation correct. The *Four Books* are next in rank. Two of them, the *Ta Hioh* and the *Chung Yung*, formed parts of the *Li-ki* (Book of Rites), but were detached and arranged in the present order by Chu Hi, the great critic of the twelfth century. The *Ta Hioh* (Great Learning) is a discourse on the principles of government, in eleven chapters, the first containing the words of Confucius, and the remaining ten a commentary on them, commonly ascribed to his disciple, Tsŭng Ts'an. The *Chung Yung* (Invariable Mean) is a philosophical treatise, attributed to K'ung Keih, the grandson of Confucius, in which the observance of the right mean is set forth as the highest wisdom and virtue. The *Lun Yu* (Miscellaneous Conversations) of Confucius and his disciples is a collection of mostly disconnected sayings, embodying the substance of his teaching, which was altogether of a practical character, on ethics, government, ceremonies, and the like. The last and most extensive of the *Four Books* contains the works of Mencius, who now ranks second only to Confucius in the general esteem, though not until the twelfth century were his writings definitely admitted to a place among the classics. All of these are now accessible to the English reader in Dr. Legge's excellent translation. His edition of the Chinese classics, published at Hongkong, 1861–72, in the original text, with translation, elaborate introductions and notes, included the *Four Books*, *Shu King*, *Shi King*, and *Ch'un Ts'iu*. The translations have also for the most part been separately published, and the series has since been completed in the *Sacred Books of the East*, where his translation of the *Yih King* forms the sixteenth volume, and the *Li-ki* the twenty-seventh and twenty-eighth volumes. Many other works bear the title of *king* (classic); nor is it confined to the orthodox school, but applied also to the canonical books of the Taoist and Buddhist faiths, and even to works of a more miscellaneous character, such as important technical writings. Thus we have the *Ch'a King* (Tea Classic), on the culture of the tea-plant, and the *Shan-hai King* (Hill and River Classic), an ancient geographical work from which many poetical allusions are borrowed.

The historical works, which are very voluminous, fall mostly into three classes. First in importance are the histories of the several dynasties, the work of official historiographers, and constructed mostly on a uniform plan. The variety of subjects treated of, each in a distinct section, gives them an encyclopædic character. The order, varying somewhat in the separate works, is in general the following: First, the personal history of the successive emperors of the dynasty, followed by a series of memoirs on chronology, rites, music, jurisprudence, political economy, state sacrifices, astronomy, influence of the five elements, geography, and literature, closing with biographies of the eminent men of the dynasty, and historical and geographical notices of foreign nations. The series as at present established consists of twenty-four histories, comprising 3,264 books. They are of very unequal merit; some of them the work of single authors, others prepared by a board of scholars. The second class of histories follows a chronological order. The most celebrated general history on this plan is the *Tzŭ-chih-t'ung-kien* of Szŭ-ma-Kwang, a writer of the eleventh century. It was revised in the next century under the direction of Chu Hi, and published with the title *Tung-kien-kang-muh*. Continuations were added in the following dynasties. De Mailla translated it into French (Paris, 1777–83, 12 vols., 4to). The abridgment of the above work, entitled *Kang-kien-i-chi-luh* (History Made Easy), is one of the most useful compendiums. Another class of works, called *Complete Records*, follows neither the one nor the other of the above methods, but gives with more freedom of arrangement a general survey of the subject treated.

In biographies the literature is unusually rich. Besides the space accorded to them in the dynastic histories and in statistical works, separate biographies, many of them of a collective character, abound.

The geographical works are hardly surpassed in extent by those of any country. There are works on the geography of the whole empire, such as the *Ta-ts'ing-yih-t'ung-chi*, published under the present dynasty, which give under each province the topography, population, taxes, etc.; under each prefecture and department, the antiquities, public works, eminent and notorious characters born there, productions of the soil, and a variety of other details. In addition, every province, every prefecture, every department, nearly every district, and frequently a town or famous locality within a district, has its separate description, amounting in all to thousands of volumes. Some of these works are of considerable antiquity, and in successive editions have been gradually enlarged. Of the history and geography of Eastern Asia, beyond the limits of the empire, Chinese literature contains many valuable notices. The accounts of the journeys of Buddhist pilgrims to India between the fourth and the tenth centuries are the most important sources of information for the history of Buddhism in India during that period that we possess.

The three principal philosophical and religious sects, the Confucianists, Taoists, and Buddhists, have each an extensive literature. Of the orthodox school the most celebrated among the near successors of Confucius and Mencius was Sun-tzŭ, who held, in opposition to Mencius, to the original depravity of human nature. In the eleventh and twelfth centuries, under the Sung dynasty, Chow-tzŭ, and especially Chu Hi, gave a new impulse, and in some particulars a new direction, to philosophical speculation. The authority of Chu Hi, who was equally eminent as a commentator of the classics and in other departments of literature, has remained paramount to the present day, though under the present dynasty there is some disposition to rebel against it. Laotzŭ, the founder of the Taoist school, was a contemporary of Confucius. The principal texts of Taoism, translated by Dr. Legge, are contained in *The Sacred Books of the East*, vols. xxxix., xl., Oxford, 1891. Taoism has long since degenerated into superstitious practices, its followers being devoted to magic, alchemy, and the like. Buddhism was introduced from India in the first century of our era. The earliest translation from the Sanskrit, the *Sutra of Forty-two Sections*, was made A. D. 67, and for several centuries there was constant activity in this work. The catalogue of Chi-Shing, published in 730, gives a list of 2,278 separate works which had been translated up to that date. These constitute the more important part of the literature of Chinese Buddhism, though in the fifth and sixth centuries original works began to appear, and have since greatly multiplied.

In the history of Chinese poetry there are two distinctly marked periods. In the earlier, previous to the T'ang dynasty, the structure was less artificial and the rhythm freer. In the *Shi King* the verses are mostly of four syllables; the rhyme is often imperfect, and sometimes altogether wanting. In the T'ang period a more rigid consecution of tones was introduced, and verses of five and seven syllables became the favorites. The tones for rhythmical purposes are divided into two classes—the *p'ing* or "even" tone constituting one, while the other three tones are considered "uneven." In every verse the first, third, and fifth syllables are indifferent with respect to tone; the second, fourth, and sixth must alternate, so that the order is either "even," "uneven," "even"; or "uneven," "even," "uneven."

The weakest side of Chinese literature is the scientific. It has a tolerably complete system of arithmetic, older than the Christian era, a system of algebra which dates from the thirteenth century, but no theoretical astronomy worthy of the name, except what is borrowed from the West. For the regulation of the calendar, and for astrological purposes, observations of a simple character were very early made, and numerous eclipses recorded. During the Ming dynasty mathematical knowledge had greatly declined, and the first Jesuit missionaries recommended themselves to the imperial favor chiefly by their acquirements in this science. The mathematical works since published are mainly based on European methods. Medical writers are numerous, and some of them very ancient, but the science, notwithstand-

ing its long history, has made little progress. The chief work on materia medica is the *Pun-Ts'au*, in fifty-two books, compiled by Li Shi-chin of the Ming dynasty. He made extracts from more than 800 earlier writers, and gives 1,892 medicaments, selected and original. ADDISON VAN NAME.

Chinese Wall: See CHINA, GREAT WALL OF.

Chinese White: a name sometimes given to the white oxide of zinc. It is much used as a pigment instead of white lead in painting woodwork, since it is not liable to be much changed by atmospheric action. It was experimentally made as early as 1780, but has been manufactured commercially only since 1844.

Chinghis' Khan: same as GENGHIS KHAN (*q. v.*).

Ching-kiang-foo: a common mis-spelling of CHINKIANG (*q. v.*).

Chingleput', **Chingalpat**, or **The Jaghire**: a maritime district of India; province of Madras; area, 2,842 sq. miles. It is bounded on the E. by the Indian Ocean, and adjoins Madras on the N. The chief river is the Palaur. The soil is poor. Capital, Chingleput. Pop. about 1,000,000.

Chingleput, or **Chingalpat**: (anc. *Singalapetta*): a town of India, in the above district; 36 miles S. W. of Madras (see map of S. India, ref. 6–F); has a large citadel or fort. It is accessible to an enemy only on the S., being protected on the other side by a large tank. It was captured in 1752 by Clive. Pop. 7,500.

Chingú: See XINGÚ.

Chin-Hai: seaport-town of China; in the province of Che-Kiang; at the mouth of the Takia river; 20 miles E. of Ning-po (see map of China, ref. 6–K). It has a strong citadel on a high and steep rock, and is 3 miles in circumference. The British defeated the Chinese here in Oct., 1841.

Ching-tu: a foo or departmental city of China; capital of the province of Sze-chuen, and the residence of the viceroy. It is situated on a branch of the Min (a tributary of the Yang-tse), in the midst of a very fertile plain with an area of 2,400 sq. miles; 1,700 feet above the level of the sea; lat. 28° 21′ N., lon. 104° 33′ E. (see map of China, ref. 6–G). It is a walled city with a circuit of 12 miles; has extensive suburbs, especially on the north side. The streets are straight, well paved, and clean. The houses are well built, the shops and stores well stocked, and the people civil and prosperous. There is a greater demand here for foreign goods, articles of luxury, such as carpets, rugs, clocks, watches, etc., than in any other inland city of China. Pop. 800,000.

Chiniquy, CHARLES P. T.: See the Appendix.

Chinkiang, or **Ching-kiang-foo**: a fortified departmental city and river-port of China; province of Kiang-Su; on the right bank of the Yang-tse-Kiang, near its junction with the Grand canal; 43½ miles E. of Nanking and 150½ geographical miles from Shanghai (see map of China, ref. 6–K). Its walls are about 4 miles in circuit, and are about half a mile from the river. It was a populous and important commercial city before it was taken by the Taipings in 1859. It was captured by the British in July, 1842, and was opened to foreign trade by the treaty concluded at Tientsin June 26, 1858. Pop. (1890) 135,000.

Chinnery-Haldane, JAMES ROBERT ALEXANDER: Bishop of Argyle and the Isles, Scotland; only son of the late Alexander Haldane, barrister-at-law, heir-male of the family of Haldane of Gleneagles; b. 1842; educated at Trinity College, Cambridge, 1864. Ordained deacon 1866 and priest 1867; on his marriage with the daughter of Rev. Sir Nicholas Chinnery, Bart., he assumed the additional name of Chinnery; consecrated bishop 1883. Author of *Charges on the Holy Eucharist and Kindred Subjects* (1883–87).

W. S. PERRY.

Chinon, shĕĕ'nōṅ' (anc. *Castrum Caino*): a town of France; department of Indre-et-Loire; on the river Vienne; 25 miles S. W. of Tours (see map of France, ref. 5–E). It has remains of a large castle, which was the residence of several kings of England. Here Henry II. of England died, and here Rabelais was born. Charles VII. of France resided here when Joan of Arc disclosed her mission to him. Pop. (1896) 6,187.

Chinook': a warm, dry westerly wind of winter; occurring on the eastern slopes of the mountains from Colorado to Oregon and northward to the Peace river. It brings a vernal mildness of temperature, and is so dry that the snow and ice disappear without the visible production of water. It occurs several times each winter, and usually lasts two or three days. It is due to the drawing of the wind over the mountains, and is paralleled by the *Föhn* in Switzerland and similar winds in Greenland, New Zealand, and other parts of the world.

Chinookan Indians: This linguistic family of Indians includes a number of tribes whose former homes extended along the Columbia river, chiefly upon the northern bank, from its mouth to the Dalles, about 200 miles. Their villages also extended along the Pacific coast from and including Long Island, in Shoalwater Bay, on the N., to about Tillamook Head, some 20 miles S. of the mouth of the Columbia. Following are the most important Chinookan tribes: *Lower Chinuk*, Chinuk and Clatsop; *Upper Chinuk*, Cathlamet, Cathlapotle, Chilluckquittequaw, Clakama, Kuniak, Echeloot, Multnoma, Wahkiakum, Wasco.

The Chinookan may be regarded as typical representatives of the fishing tribes of the northwest coast, deriving their subsistence from the salmon-fisheries, and, to a very slight extent, from berries and roots. The remaining necessities and luxuries of savage life, above those obtainable by their own efforts, such as skins for clothing, ornaments, etc., they formerly procured by barter chiefly for dried salmon and roots. Their trade was extensive, not only among tribes of their own language, but also with inland Indians of the Shahaptian, Kalapooian, Salishan, and other stocks, and evidence is not wanting to show that this early intertribal trade had received much impetus from the presence of white traders at the mouth of the Columbia. From their proximity to Astoria, the Chinuk proper early became well known, and their language formed the basis of the widely spread trade jargon which is still used as a medium of communication between the whites and the various Indian tribes of this region.

One band of the Chinuk only was found by Lewis and Clarke in possession of horses, the Weocksockwillacum above the Cascades, and most of the dozen or more owned by them had recently been taken from the neighboring Shoshonean tribes. As remarked by Lewis and Clarke, most of the Chinuk country was so densely wooded as to forbid the use of horses.

Though hardly to be called warlike, the Chinuk were quarrelsome, and maintained a petty warfare among themselves and with the Shoshoni and other tribes.

Though conforming in appearance and in their general habits, the Chinookan tribes presented to the early observer many minor points of difference. Thus it is stated by Lewis and Clarke that on the lower part of the Columbia the practice of head-flattening was universal, while on the upper part the practice was limited to a few of the women.

Slavery largely prevailed among the Chinuk. They obtained slaves by capture or by purchase.

Little is known of their tribal laws or of their social and political usages. There appears to have been no such thing as a political union of the Chinookan tribes as a whole, or indeed of any considerable part of them. They seem to have lived generally in small communities, the size and location of which were determined by the season and by the nature and extent of the fishing-stations, which for obvious reasons were always situated at falls or rapids. They were generally regarded as indolent, thievish, and treacherous.

Every village had a chief who, in some cases, either from personal popularity or other cause, seems to have been able to extend at least a nominal authority over contiguous villages speaking closely allied dialects.

The Chinuk were in the main a sedentary people, though frequent changes of residence from one fishing-point to another were common, as from a summer to a winter location. Their houses were built on the communal principle, and were occupied by three or four families, aggregating from fifteen to twenty individuals to each house.

Population.—As a rule, the figures given by Lewis and Clarke for the Indian population were estimates made with all the care possible under the circumstances. They passed through the greater part of the Chinookan territory twice, probably visited a great many of their settlements, and in many cases counted the houses and based their estimates of the proper occupants upon actual observation. Hence their statement of the Chinookan population is probably to be accepted as a near approach to truth. The number given for the several divisions is about 1,800, a population by no means

excessive when the extent of country inhabited and the abundant food-supply are considered. Evidence is given by Lewis and Clarke that some four years previous to their visit, or about 1800, a reduction which had occurred in the number of the Clatsop tribe at the mouth of the Columbia was attributed to smallpox. Practically, however, the Indian tribes along the river were found by the travelers in their pristine condition.

There are 256 Waseo on the Warm Springs reservation, Oregon, and 150 on the Yakama reservation, Washington. On the Grande Ronde reservation, Oregon, there are 59 Clakama. It is learned that there still remain three or four families, probably belonging to one of the down-river tribes, about 6 miles above the mouth of the Columbia. Two of these speak the Chinuk proper, and three have an imperfect command of Clatsop. There are eight or ten families, probably also of one of the lower river tribes, living near Freeport, Wash.

Some of the Watlala, or Upper Chinuk, live near the Cascades, about 55 miles below the Dalles. There thus remain probably between 500 and 600 of the Indians of this family.

(Philadelphia, 1814); Lee and Frost, *Ten Years in Oregon* (New York, 1844); Alexander Ross, *Fur Hunters of the Far West*, vols. i.–ii. (London, 1855); James G. Swan, *The Northwest Coast* (New York, 1857); see also *Seventh Annual Report*, Bureau of Ethnology, pp. 65–66 (Washington, 1891), and works cited therein. See INDIANS OF NORTH AMERICA.

H. W. HENSHAW.

Chinquapin: See CHESTNUT.

Chintreuil, shăn'trö-ĕĕl', ANTOINE: landscape-painter; b. in Pont-de-Vaux, Ain, France, May 15, 1816; d. at Septeuil, Seine-et-Oise, Aug. 13, 1873; pupil of Corot; medal, Paris Exposition, 1867; Legion of Honor 1870. His pictures are mostly effects of sunlight on meadows and trees in summer foliage, and are truthful and pleasing. His *Thicket with Deer* (1873) is in the Luxembourg Gallery, Paris.

WILLIAM A. COFFIN.

Chintz: originally, an Oriental cotton fabric printed in patterns with bright colors, the ground being usually of the natural color of the stuff. In Europe and America a highly glazed printed cotton stuff is used for furniture and curtains. The exact character of the fabric called chintz varies with the fashion.

Chinuk, or **Chinook**: See CHINOOKAN INDIANS.

Chio, or **Chios**: See SCIO.

Chioggia, kĕe-od'jăa, or **Chiozza** (anc. *Fossa Clodia*): seaport-town of Italy; province of Udine; on an island of the Adriatic; 15 miles S. of Venice (see map of Italy, ref. 3–E). It is built on piles like Venice; is joined to a fort on the mainland by a stone bridge of forty-three arches; has a fine main street lined with portieoes, a cathedral, several schools, a theater, and a harbor protected by two forts. Here are ship-building yards, salt-works, and fisheries. Pop. 25,084.

Chionides, kī-on'i-dēez: a Greek comic poet, who began to exhibit, according to Suidas, in B. C. 487. Aristotle puts him somewhat later than this. Though not the first in time, yet from the more careful and artistic preparation of his pieces he was regarded as the leader of the Old Attic comedy. The fragments are brought together in Meineke's and Koek's collections.

Chionid'idæ: See SHEATHBILL.

Chion (kī'on) **of Heracle'a** on the Pontus: a pupil of Plato: sought to free his native city by slaying the tyrant Clearchus (B. C. 353), but was himself slain. Seventeen letters, late productions, under the name of Chion, are edited by Coberus (1765), and by Orelli in his *Memnon* (1816).

Chipman, DANIEL, LL. D: b. in Salisbury, Conn., Nov. 15, 1765; graduated at Dartmouth in 1788; became distinguished as a lawyer and an author. He was a member of Congress from Vermont (1815–17), and prominent in the politics of that State. He published a valuable work on the *Law of Contracts* (1822); *Reports of Cases in the Supreme Court of Vermont* (1824); and other works. D. in Ripton, Vt., Apr. 23, 1850.

Chipman, NATHANIEL, LL. D.: soldier and jurist; brother of Daniel Chipman; b. in Salisbury, Conn., Nov. 15, 1752; graduated at Yale in 1777. He was an officer of the Revolutionary army; was admitted to the bar in 1779; chief justice of Vermont for several years; judge of the U. S. district court for Vermont (1791–93); and U. S. Senator 1797–1803. His work on the laws of Vermont are highly commended. He published *Principles of Government* (1793) and other works. D. in Tinmouth, Vt., Feb. 15, 1843. See his *Life* by his brother Daniel (1846).

Chipman, WARD, LL. D.: a jurist of New Brunswick; son of a Tory refugee from Massachusetts to that province; b. in St. John, July 10, 1787; graduated at Harvard in 1804. He succeeded his father as judge in 1824, and as boundary commissioner; became chief justice of the Supreme Court of the province in 1834, and was prominent in its legislature. D. in St. John, Dec. 26, 1851.

Chipmunk: a popular name in the U. S. for various small ground squirrels of the genus *Tamias*, more particularly for the common *Tamias striatus*. This little striped

Chipmunk.

squirrel is about 10 inches in total length, reddish brown above, white below, marked with two white and five black longitudinal stripes. It is abundant throughout the Eastern U. S., N. of the lowlands of the Southern States. It feeds on nuts, seeds, and grain, laying up a store for winter's use; as much as two pecks of provision have been taken from a single burrow. See also SCIURIDÆ. F. A. LUCAS.

Chip'pawa: a post-village and port of entry of Ontario, Dominion of Canada, Welland County; on the Niagara river; about 3 miles above Niagara Falls (for location, see map of Ontario, ref. 5–E). This village is memorable as the scene of an important victory of a portion of the U. S. army under Maj.-Gen. Joseph Brown (but see SCOTT, WINFIELD) over a superior British force under Maj.-Gen. Rial, July 5, 1814. The number actually engaged on the U. S. side was 1,900; the British force numbered 2,100. The U. S. loss in killed and wounded was 328; the British loss was reported at 505.

Chippewa [native, *Ojibway* or *Ojibbewa*]: a river of Wisconsin: rises in Ashland County, flows nearly southwestward through Chippewa and other counties; enters the Mississippi river at the foot of Lake Pepin; length about 220 miles. It traverses extensive forests of pine.

Chippewa Falls: city and railroad junction; capital of Chippewa co., Wis. (for location of county, see map of Wisconsin, ref. 3–C); on Chippewa river. It has gas and electric light, complete system of water-works, graded schools, ample water-power, several mills, and extensive manufactures of lumber. Pop. (1880) 3,982; (1890) 8,670; (1900) 8,094.

EDITOR OF "INDEPENDENT."

Chippewas: See ALGONQUIAN INDIANS.

Chipping Barnet: town, England. See BARNET.

Chipping Bird, or **Chipping Sparrow**: a common little North American bird (*Spizella socialis*, Bonap.). It is between 5 and 6 inches long, whitish underneath, crown chestnut, back and sides ashen, with streaks of white and black. Its song consists of six or seven notes rapidly repeated.

Chiquichi'qui Palm, or **Piassa'ba Palm**: the *Leopoldina piassaba*; a tree of the Palm family, found in the tropical portions of South America, from which much of the piassaba fiber of commerce is derived. It bears large pinnate leaves, which, after dying, remain hanging from the trunks until they finally split up into tangled masses of fibers, giving them an unsightly appearance. The fiber is

collected and sent to Europe and America, where it is made into brooms, cordage, etc. This tree is nearly related to the *Attalea funifera* of the same region, and known also by the name of piassaba palm, since it yields a similar fiber.

Chiquimu'la: the easternmost department of Guatemala, Central America; bordering on the Caribbean Sea; between the Bay of Honduras on the north and the state of San Salvador on the south. It is hot and unhealthful. Area, 4,000 sq. miles. Pop. 62,878. Capital, Chiquimula de la Sierra, with 9,000 inhabitants.

Chiquinquirá, chĕĕ-kēēn-kē-raa': a city in the western part of the department of Boyacá, Colombia; about 70 miles N. of Bogotá, and 8,576 feet above the sea. It is the center of a grazing region and has a considerable trade, but is principally known for an image of the Virgin, reputed to be miraculous. The chapel devoted to this image is probably the finest church in Colombia, and it is said that over 60,000 pilgrims have visited it in a single year. The lake of Fúquene, near the city, was a sacred place of the Chibchas Indians, and was surrounded by their villages. Chiquinquirá, though its name is Indian, is a Spanish town, founded soon after the conquest. Pop. of the city (1893) about 12,000; of the district, 19,000. HERBERT H. SMITH.

Chiquitos: a province of the department of Santa Cruz de la Sierra, Bolivia, occupying the plains of the eastern part to the frontiers of Brazil; area unknown, but probably not less than 40,000 sq. miles. Pop. about 35,000, mostly Indians. It is continuous with the Chaco region, and is a vast area of low, flat land, with a few isolated hills; much of it is occupied by grass-lands, but there are extensive forests near the mountains and toward the river Paraguay; portions are flooded every year. The climate is hot and unhealthful. The Chiquitos region is very imperfectly known, and has no important towns. A road from Santa Cruz de la Sierra crosses it to the Paraguay near Corumbá, Brazil. See Castelnau, *Expédition dans les parties centrales de l'Amérique du Sud*, tom. iii., p. 205, 1851. HERBERT H. SMITH.

Chiricahua: See ATHAPASCAN INDIANS.

Chiriqui': name of a volcano, lagoon or bay, and river; at the extreme north of the department of Panama, Colombia; hence given to the district in which they lie. The Chiriqui lagoon is a large and almost completely inclosed bay opening into the Caribbean Sea. The river empties into the sea a short distance to the E. of the lagoon. The volcano lies about 40 miles S. W. of the lagoon, in the main cordillera, and is 11,260 feet high. The district, which is claimed by Costa Rica, is fertile, devoted to agriculture and cattle-raising, and contains considerable coal. Capital, the beautiful town of David, 10 miles from the sea; pop. 9,000. The isthmus is here very narrow, with a good harbor on each side. M. W. H.

Chiriqui Ornaments: See CENTRAL AMERICAN ANTIQUITIES.

Chiriquis: See INDIANS OF CENTRAL AMERICA.

Chirisophus, kī-ris'ō-fŭs: a Lacedæmonian officer who joined Cyrus the Younger in his expedition against Artaxerxes (B. C. 401) at Issus, with 700 heavy-armed men. He first appeared prominently after the death of Clearchus, when he was, at the suggestion of Xenophon, appointed to lead the van of the retreating Greeks. After reaching Trapezus, Chirisophus attempted to secure vessels for the Greeks, but was unsuccessful. At Sinope, through Xenophon's refusal of the office, he was chosen commander of the Greek forces, but six or seven days after, while at Heraclea, the army was broken up into three parts, which set out separately. Chirisophus died soon after at Calpe.

Chiromancy: same as CHEIROMANCY (*q. v.*).

Chiron: same as CHEIRON (*q. v.*).

Chironectes, kī-rō-nek'tēēz [from Gr. χείρ, hand + νήχειν, swim]: a term used by Cuvier for a genus of fishes belonging to the family *Antennariidæ* and order *Pediculati* (*q. v.*); antedated by *Antennarius*.

Chis'elhurst: a parish of England, in Kent; 11 miles S. E. of London (see map of England, ref. 12–J). The Emperor Napoleon III. fixed his residence at Chiselhurst early in 1871, after he was released from captivity by the Emperor of Germany, and here, Jan. 9, 1873, he died.

Chis'wick: a suburb of London; county of Middlesex; on the Thames; about 7 miles nearly W. from the Bank of England, in London (see map of England, ref. 12–J). It contains the gardens of the London Horticultural Society. In Chiswick House, a villa belonging to the Duke of Devonshire, Fox died in 1806, and Canning in 1827. Hogarth lies buried in the churchyard. Pop. (1891) 21,964.

Chitaldrug' (anc. *Sitala Durga*, the spotted castle): a town and fortress of Nagar, Mysore, British India; 128 miles N. N. W. of Seringapatam (see map of S. India, ref. 5–D). Here is a rock-fortress which is one of the strongest and most remarkable in India. It is occupied by a British garrison. The town is in a thinly populated district of the same name, which in 1876–78 was decimated by famine. It has an area of 4,871 sq. miles. Pop. of district about 400,000; of town 4,300.

Chitimachan Indians: a linguistic family of North American Indians, whose name is derived from the Choctaw language, in which *tchuti* means cooking-pot or vessel, and *imasha*, they possess. Only one tribe is known to exist; its habitat is at Clarenton, St. Mary's parish, Louisiana, and another settlement is on Bayou Plaquemine, N. E. from Grand Lake, around which fifteen of the Chitimachan villages were built in the eighteenth century. Some of these Indians lived farther E. At present the tribe consists of mixed-blood Indians only. They have no remembrance of early migrations. They do not figure prominently in colonial history, for they lived inland, far from the high roads of travel and commerce; but they had many encounters with lawless bands of the Choctaw people. In 1881 their population amounted to fifty-five people, who gained subsistence as farm-hands, lumbermen, makers of basketry, etc. At the death of their chief, A. Dardin, in April, 1879, the tribal government was abandoned, and no Indian has since held the chieftainship. The Chitimachan language is now spoken in one dialect only.

See INDIANS OF NORTH AMERICA.

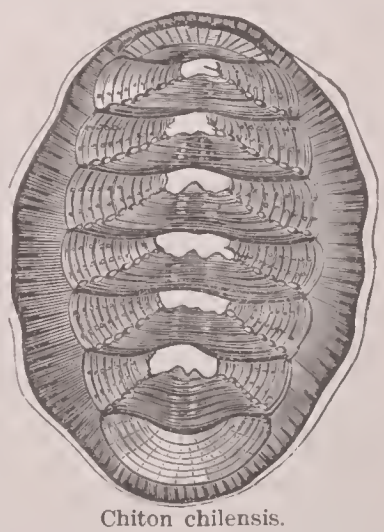
A. S. GATSCHET.

Chitin, kī'tin, a substance that forms the principal part of the covering of insects and crustacea. It is also found in the bones of cuttle-fish. The best method for its preparation consists in treating lobster-shells and carapaces successively with dilute acid, caustic potash, alcohol, and ether. It is a colorless, amorphous mass which is insoluble in water, alcohol, ether, alkalies, and dilute acids. When boiled with concentrated hydrochloric acid, it is decomposed, forming glycosamine and acetic acid. As glycosamine appears to be closely related to the sugars, chitin is regarded as a GLUCOSIDE (*q. v.*). Further, it is stated that, when chitin is dissolved in concentrated sulphuric acid acetic acid, ammonia, and a carbohydrate are formed. In a way, chitin serves a purpose similar to that which CELLULOSE (*q. v.*) serves in the vegetable world, namely, to protect the more active and vital parts of the beings or plants of which they form a part. I. R.

Chiton, kī'ton [from Gr. χιτών, tunic]: a Linnæan genus of mollusks now divided into many genera. They are characterized by having a flattened body covered above with an eight-jointed shell. Several hundred species, all marine, are known. To the naturalist the chitons are extremely interesting, as they retain the primitive bilateral symmetry of the body, there being a terminal vent and paired genital, excretory, and circulatory organs, while the numerous gills are arranged on either side of the body, and the nervous system is not twisted as in all gasteropods. The chitons were long regarded as blind, but Prof. Henry N. Moseley pointed out that in many species the whole back was covered with hundreds of minute eye-like organs. The chitons form the class *Polyplacophora*, a pri-



Chiton chilensis.

mary division of the mollusca. The species on the Atlantic coast of North Ameriea are small, but on the Pacific coast species 4 inches in length occur. J. S. KINGSLEY.

Chiton: in ancient Greeee was the undermost garment, and was worn by both sexes. In early times it was a long tunic worn by men. Subsequently two forms arose: the Ionian, made of linen, reaching to the feet, with sleeves, appropriated exclusively by women from the time of Pericles; and the Dorian, a square garment of wool, with short sleeves or mere armholes, peculiarly the garment of men, though common to Spartan women.

Chitore: a town and fortress of India; province of Rajputana; 64 miles E. N. E. from Udaipur (see map of N. India, ref. 7–C). The fortress consists of a rock smoothly scarped to a height of from 80 to 190 feet by nature, surmounted by a rude bastioned wall 12 miles in its entire circuit. The inclosure is narrow and irregular, and contains temples and palaces.

Chitral: See KASHKAR.

Chittagong': a district (and city) of British India; on the Bay of Bengal; in the presidency of Bengal, at its S. E. extremity. Area of district, 2,567 sq. miles. A great part of the country is mountainous; covered with forests; penetrated by canals or streams used for traffic, but a source of malaria. Cholera is endemic. The soil is fertile, but little cultivated. Towns are only found on the seacoast. The population is more than half Mohammedan. Pop. of district, 1,200,000. Chittagong port, or Islamabad, is on the right bank of the Karnaphuli river, 6 or 8 miles from its mouth (see map of N. India, ref. 8–K). It is a straggling, hilly city of 21,000 inhabitants, with a considerable maritime trade. Under the Portuguese it was one of the chief commercial ports of India. It was captured in 1665 by Moguls, who gave it its Mohammedan name, meaning the city of the faithful.

Chittagong Hill Tracts is a wild region of dense vegetation on the west border of Burma. Area, 6,882 sq. miles. Tigers and elephants are numerous in the jungles; population about 70,000, barbarous tribes ruled by chiefs feudatory to the Bengal presidency.

Chittagong Wood, so called because produced extensively E. of Bengal, is a cabinet wood, finely grained or marked, called in India a *cedar*. It is from a tree of the order *Cedrelaceæ*.

Chitteldroog: same as CHITALDRUG (*q. v.*).

Chittenan'go Springs, or **White Sulphur Springs**: in Sullivan township, Madison co., N. Y.; 15 miles E. from Syracuse; a saline and sulphur spring, surrounded with accommodations for receiving visitors, and highly recommended for many cases of disease. Chittenango village, 2 miles N., on a creek of the same name, has an academy and textile factories. Pop. (1890) 792; (1900) 787.

Chittenden, RUSSELL HENRY, Ph. D.: physiological chemist; b. in New Haven, Conn., Feb. 18, 1856; was graduated Ph. B. at Yale University 1875; studied also in Heidelberg; instructor in physiological chemistry, Sheffield Scientific School of Yale University 1875–82; professor of same branch since 1882; author of several volumes of *Studies* in physiological chemistry based on laboratory investigations; member of National Academy of Sciences; contributor to scientific periodicals.

Chitty, JOSEPH: English lawyer and legal writer; b. in 1776; studied law and practiced under the bar till June 28, 1816, when he was called to the bar at the Middle Temple; was a man of remarkable memory and of great legal erudition, and an assiduous worker. He had a very large practice as a barrister (he never became a queen's counsel), trained in the law many men who were afterward eminent in their profession, and wrote in rapid succession a large number of legal works, many of which have passed through numerous editions. They are still standards for the practitioner, and have done as much perhaps to facilitate the study of the law as the work of any man of his time. Among his best-known works (with the dates of the first editions) are *Treatise on Bill of Exchange, Checks on Bankers, Promissory Notes*, etc. (1799); *Precedents in Pleading* (1808); *Treatise on Criminal Law* (1816); an edition of *Blackstone's Commentaries* (1832); *The Practice in the Courts of King's Bench, Common Pleas, and Exchequer* (1831–32); *Treatise on Medical Jurisprudence* (1834); *Practice Respecting Amendments of Variances Pending a Trial* (1835); *Collection of the Statutes of Practical Utility* (1829–37); *Practice of the Law in all its Departments* (1833–38). D. in London, Feb. 17, 1843. His sons adopted the legal profession, and of them Joseph Chitty, Jr. (d. Apr. 10, 1838), was a special pleader, and wrote, among other works, a *Treatise on the Law of Contracts*; and Thomas Chitty (b. in 1802; d. Feb. 13, 1878) also was a special pleader, who wrote, among other works, *Forms of Practical Proceedings* (1834), and had many pupils in the law who afterward attained eminence.

Revised by F. STURGES ALLEN.

Chiusi, kē-oo'sē: a town of Italy; province of Siena; in the Val di Chiana (see map of Italy, ref. 4–B); the residence of a bishop; has a large cathedral. It was the *Clusium* of the ancients, one of the twelve cities of the Etruscan confederation, and the headquarters of Porsena. Its museum contains a very interesting collection of Etruscan bronzes, mirrors, vases, funeral urns, etc., found in the vicinity. In Dante's time the district was a "pestilential pool," but the drainage of the Chiana in 1816 has brought fertility to the valley and prosperity to the town. Pop. 5,005.

Chivalry [from O. Fr. *chevalerie*: Ital. *cavalleria* (whence Fr. *cavalerie*, Eng. *cavalry*), from deriv. of Lat. *caballarius*, horseman, hostler]: the system or dignity of knighthood; originally a body or assembly of knights or horsemen. The word has the same etymology as *cavalry*, and in the Italian and Spanish languages the same term is used for both. Chivalry was an institution originating in the Middle Ages. Its origin is to be traced to the customs and sentiments of Teutonic nations, especially remarkable for the respect which they evinced for the female sex, and for their development of the feudal system. It was essentially aristocratic, and included military accomplishments, the relation of vassal to his lord, the defense of women and devotion to their honor and persons. The moral and social standards of the institution were high, and the manners inculcated heroic and elevated. The ceremonial relation assumed by the Church to KNIGHTHOOD (*q. v.*) enhanced these ideals, and tended to make them the common rule of life for persons of gentle birth, although in conduct individuals frequently fell far below them. Without chivalry the crusades could not have taken the form or proportions which they did. The appearance of chivalry marks the transition of feudalism from violence to culture. It gave rise to the literature of chroniclers, like Villehardouin and Froissart, of troubadours and *trouvères* and other mediæval singers. Its extravagances were ridiculed by Cervantes, but it created traditions of manners, poetry, and art which still have force in society. In English law chivalry denotes a land-tenure conditioned on the performance of knight-service. It was a service due the crown, and was ordinarily of a military nature for forty days annually, but by commutations it was made to disappear.

The Court of Chivalry was instituted by Edward III., regulated by Richard II. in 1390, and of it the earl marshal and the lord high constable were joint judges. When both were present the court had summary jurisdiction in criminal cases; the earl-marshal sitting alone constituted a court of honor. It is represented now only by the earl marshal of the Heralds' College, a sinecure hereditary in the dukedom of Norfolk.

Chivasso, kē̆-vaas'sō: a town of Italy; province of Turin; on the left bank of the Po, near the influx of the Oreo (see map of Italy, ref. 3–B). It was at one time considered the key to Piedmont, but its fortifications were destroyed in 1804 by the French, and it now has no military importance. It carries on some trade in grain and wool. Pop. 4,375.

Chiverny, PHILIPPE HURAULT, Comte de: memoir-writer; b. at Chiverny, in Brittany, Mar. 25, 1528. He received a Government office in 1562 through the influence of Marie de Médicis. He fell into disgrace in 1582, but in 1594, on the accession of Henry IV., he was received into favor with that monarch, which lasted until his death at Chiverny, July 29, 1599. His work, *Mémoires d'Estat de Messire Philippe Hurault, etc.*, was first printed in Paris in 1636.

Chives, or **Cives**: a garden name for *Allium schœnoprasum*, a small onion-like plant, which is wild in Europe and the northern parts of North Ameriea. It is grown in gardens for the slender hollow leaves, which are used for flavoring in soups or stews. It is a perennial plant, growing in tough clumps, and bearing rose-purple flowers in dense erect umbels or heads. The plant grows to a height of 6 to 10 inches. It is propagated by dividing the clumps. Chives is little grown in the U. S.

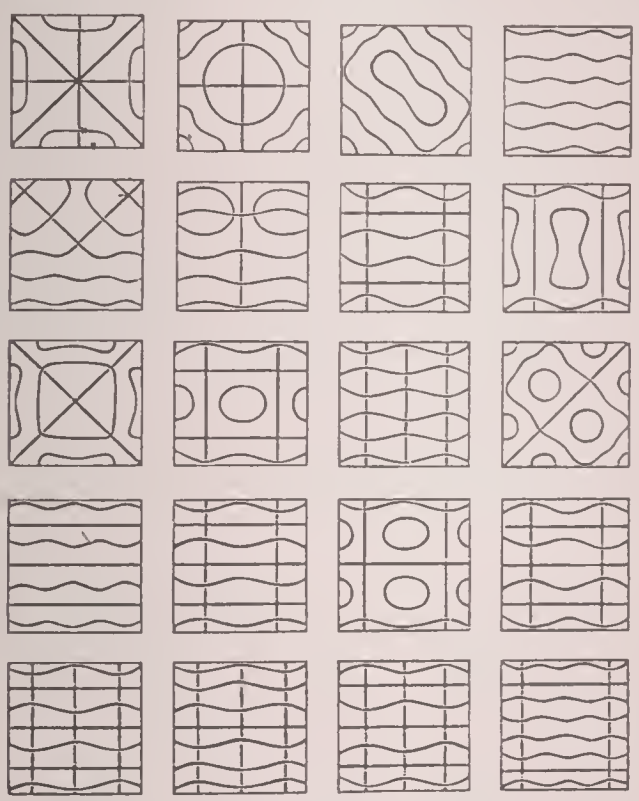
Chivilcoy, shĕĕ-vĕĕl-kō'ĕĕ: a city of the Argentine Republic: in the province of Buenos Ayres, and about 100 miles west of the city of Buenos Ayres, with which it is connected by rail. It is situated in the center of a rich grazing region, settled principally by Italian, Basque, and German immigrants. The town is well built, with wide streets, excellent shops, a theater, free library, club-house, etc. Pop. (1880) 11,000, and rapidly growing.

HERBERT H. SMITH.

Chivot, MARIE ANTOINE FRANÇOIS: classical scholar; b. at Roye, in the old province of Picardy, France, in 1752. After a brilliant course of studies in the University of Paris, he was made Professor of Humanities there. He gave several years to his great work, *De l'esprit ou de la filiation des langues*. D. at Roye in 1786.

Chladni, khlaad'nĕĕ, ERNST FLORENS FRIEDRICH: b. in Wittenberg, Germany, Nov. 30, 1756: educated at Leipzig; the founder of the science of acoustics. He devoted much time to the perfecting of the theory of sound, and published, besides other works, *Discoveries on the Theory of Sound* (1787); a *Treatise on Acoustics* (1802); and a *Treatise on Fiery Meteors* (1819). D. in Breslau, Apr. 3, 1827. See his *Life* (1866) by Melde.

Chladni's Figures [so named from the acoustician E. F. F. Chladni]: sand figures by means of which the vibrations of plates may be studied. When a metal plate of any

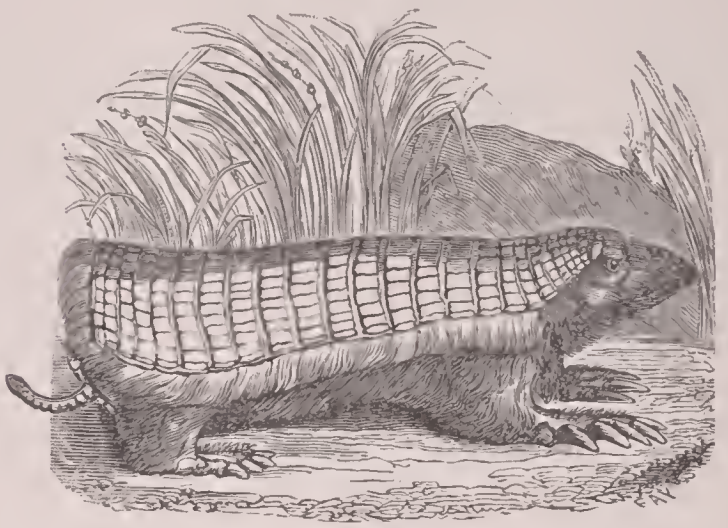


Chladni's figures.

regular geometrical form is clamped at the center and thrown into vibration by the application of a bow upon one of its edges, it gives out a more or less complex musical note. If dry sand be strewn upon the surface of the plate it will arrange itself along certain well-defined lines (nodal lines), producing a symmetrical pattern, by means of which the number and shape of the vibrating segments into which the plate is broken up are indicated.

The illustration is a reduced fac-simile (omitting the reference letters) of one of the pages of Chladni's classical work, *Entdeckungen über die Theorie des Klanges* (Leipzig, 1787). In that and in later volumes hundreds of such sand figures have been depicted by him. E. L. NICHOLS.

Chlamydoph'orus [from Gr. χλαμύς, -ύδος, cape + φέρειν, carry]: a genus of armadillos (see DASYPODIDÆ), distinguished by the abrupt truncation of the hinder portion of the body, which looks as though cut off with a hatchet. Two species are known, both extremely rare, only about thirty specimens of the commonest species, *Chlamydophorus truncatus*, the pichiciago, being preserved in museums. This little animal, the smallest of the armadillos, is about 5 inches long, clothed with soft, silky hair, and with the upper and the hinder part of the body protected by a shield of four-sided, horny plates. The dorsal portion of this shield is almost free, being attached to the body only along the middle line of the back. The tail, which is also covered with plates, projects downward through a notch in the hinder shield. It is inflexible, turned up toward the end, and terminates in a little trowel-shaped point. The pichiciago is only known to occur in the vicinity of Mendoza, Argentine Republic, and



Chlamydophorus.

is seldom taken, except by the Indians, who find it nestling in their blankets. It is nocturnal in habit, and burrows with incredible rapidity in the light, sandy soil. F. A. LUCAS.

Chlamydosau'rus [from Gr. χλαμύς, -ύδος, cape + σαῦρος, σαύρα, lizard]: a genus of reptiles often called the "frilled lizards" (from the large, plaited frill on the neck), of which

Chlamydosaurus.

the best-known species is the *Chlamydosaurus kingii*, a native of Australia. The general color of the chlamydosaurus is yellow brown, mottled with black, and it is remarkable that the tongue and the inside of the mouth are also yellow. The frill forming so conspicuous an ornament to this creature is covered with scales, and toothed on the edge. During the early stage of the animal's life this appendage does not reach even the base of the forelegs, but when the animal has attained maturity it extends considerably beyond them. The chlamydosaurus is very courageous, and when provoked it erects the frill, and by showing its teeth presents a formidable aspect. When at rest its frill lies back in plaits upon the body. This lizard measures at full growth nearly a yard in total length. Revised by F. A. LUCAS.

Chla'mys (in Gr. χλαμύς): a woolen outer garment of the Greeks, differing from the usual *amictus*, the ἱμάτιον of the men, in being finer, gayer in color, and oblong instead of square. It was fastened round the neck by a brooch (fibula), and hung down the back to the calf, or over the left shoulder, covering the left arm.

Chlopicki, JOSEPH: Polish soldier; b. 1771; fought in the Polish army 1794–95, in the French 1797–1813, and in the Russian, as general of division, 1814–18. At the second insurrection of the Poles he acted as dictator for six weeks, resigning in Jan., 1831; while fighting as a private was badly wounded Feb. 25. D. at Cracow, Sept. 30, 1854.

C. H. T.

Chlo'ral [from first syllable of *chlorine* and the first syllable of *alcohol*]: a liquid composed of chlorine, carbon, hydrogen, and oxygen, obtained by the action of chlorine on absolute alcohol. Its formula is $CCl_3.CHO$. Chemically considered, chloral is acetic aldehyde in which the H_3 is replaced by Cl_3. Bromine acts similarly on alcohol, producing bromal, $CBr_3.CHO$. When kept for a time it becomes solid, but is not changed in composition, and may be restored to its original form by heat. With water it forms a solid hydrate known as chloral hydrate or hydrate of chlo-

ral, which is now much used in medicine as a hypnotic. Liebreich introduced chloral as a hypnotic, thinking that it would be broken up into chloroform and formic acid in the animal body. This is, however, not the case. Chloral acts as chloral and is eliminated from the body as urochloralic acid. The dose is from 10 to 20 grains to an adult. Much larger doses have been given with no bad results, but well-authenticated fatal cases of chloral poisoning indicate the necessity of caution in its use. The sleep produced by hydrate of chloral is wonderfully sweet and refreshing to most patients. Hydrate of chloral sometimes increases hysterical symptoms, and unless well diluted is irritant to the stomach. It is peculiarly valuable in tetanus. Given in large doses, it powerfully diminishes reflex action, and is a physiological antidote in poisoning by strychnia. Croton chloral is a by-product in the manufacture of chloral. It possesses similar properties in less degree, unites with water to form a hydrate, and is used in medicine as a hypnotic. It is chiefly used as a remedy for neuralgia, in which chloral itself is not as efficacious.

Revised by H. A. HARE.

Chlo'rate: a compound formed by the replacement of the hydrogen of chloric acid by a metallic element. The best known of these salts is potassium chlorate ($KClO_3$), which, mixed with combustibles, such as sulphur and charcoal, forms highly explosive compounds, which ignite by a blow or friction. It is also a useful medicine. See CHLORIC ACID.

Chlorhydric Acid: See HYDROCHLORIC ACID.

Chlo'ric Acid ($HClO_3$): forms with potash the white crystalline salt called potassium chlorate, or chlorate of potash. (See CHLORATE.) This acid is a sirupy liquid, setting fire to dry organic substances with which it comes in contact.

Chlo'rine [from Gr. *χλωρός*, green + suffix *-ine*]: one of the seventy chemical elements. It occurs in nature in very large quantities, but always in combination. The most widely distributed and abundant compound containing it is common salt, or sodium chloride. It was early found that when this compound is treated with sulphuric acid an acid is formed. This is now called hydrochloric acid, but it was once called muriatic acid. In 1774 Scheele, in the course of an investigation on black oxide of manganese, or pyrolusite, treated this compound with muriatic acid and obtained chlorine, which he studied very thoroughly. It was supposed to contain oxygen. It forms an acid without the addition of oxygen, but at that time it was regarded as necessary that all acids should contain oxygen. It has been proved, however, beyond a doubt that nothing simpler can be obtained from chlorine than chlorine itself, and so it is regarded as an element. It belongs to the family of the halogens, of which fluorine, bromine, and iodine are the other members. It is formed most easily by the method used by Scheele—that is, by treating black oxide of manganese with hydrochloric acid. It is made also by passing hydrochloric acid gas mixed with air over clay balls saturated with a solution of blue vitriol and heated to a rather high temperature. Chlorine is a greenish-yellow gas of extremely disagreeable odor. It acts with great energy upon most substances, disintegrating them and forming new compounds, among which are chlorides, by a process analogous to ordinary COMBUSTION (*q. v.*). When inhaled it causes most uncomfortable sensations in the throat, and in large quantities it is very dangerous. Its chief use is for bleaching. It is passed into lime, and thus a compound of lime and chlorine, known as bleaching-powder or "chloride of lime" is formed. When this is dissolved in water in contact with the air, the solution is an excellent bleacher. The chemical symbol of chlorine is Cl, its atomic weight 35·4. Binary compounds of chloric acid and an element or radical are chlorides.

IRA REMSEN.

Chlo'rite [from Gr. *χλωρός*, green, with suffix *-ite*]: the name of a group of minerals composed of various proportions of hydrous silicates of aluminium, magnesium, and ferrous iron. They are generally of various shades of green in color, and in structure resemble mica, but some are granular. They are soft and yield easily to the knife. A chlorite in chemistry is a salt formed by chlorous acid.

Chlo'roform [from the first syllable of *chlorine* + the first syllable of *formyl*, of which it was considered to be a trichloride]: a heavy, colorless, and very volatile liquid, which is not inflammable, and possesses a sweet taste and a neutral reaction. It is soluble in about 200 parts of water and in all proportions in alcohol and ether. Because of its power as a solvent it is sometimes used by chemists and pharmacists for other than medicinal purposes. The only chloroform which should be used in medicine is known as *Chloroformum purificatum*. It has a formula of $CHCl_3$ and a molecular weight of 119·08, and should contain, according to the U. S. Pharmacopœia, 99 per cent. by weight of pure chloroform and only 1 per cent. of alcohol. It should be kept in a dark-glass stoppered bottle and in a cool dark place. Locally applied to the skin chloroform is capable of producing very considerable irritation and even blisters if evaporation is prevented. When inhaled it very speedily produces a condition of anæsthesia and unconsciousness during which any major surgical operation may be performed without pain to the patient. It was first introduced into medicine as a general anæsthetic by Simpson, of Edinburgh. The substance itself was originally discovered by Guthrie, of Sackett's Harbor, N. Y., and also almost simultaneously by Soubeiran, of France. Guthrie, however, failed to recognize it as chloroform, and called it chloric ether.

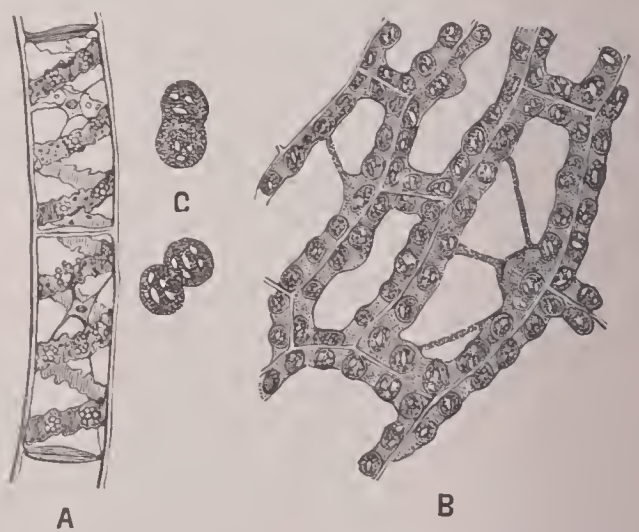
Much discussion has arisen in the medical profession as to the safety of this anæsthetic. The enormous amount of statistics that has been collected proves that the death-rate all over the world from the administration of chloroform is about 1 to 3,000 administrations, while that of ether varies from 1 in 6,000 to 1 in 13,000 administrations. It is evident, therefore, that chloroform is much the more dangerous drug. The advantages which it possesses are its rapidity of action, the fact that only a small quantity is required to anæsthetize the patient, and again that its inhalation, to most patients, is not very disagreeable. On the other hand, there is no doubt that it possesses very powerful depressing influences which are chiefly exercised upon the two vital functions of respiration and the heart.

Chloroform is sometimes used internally, generally in the form of the "spirit of chloroform," in the dose of 1 to 5 drops for the relief of abdominal pain and for the removal of tapeworm, when used by inhalation. In such cases it should always be diluted with water.

H. A. HARE.

Chlo'rophane [from Gr. *χλωρός*, green + *-φανης* (*φαίνεσθαι*), appearing]: a name given to those varieties of fluor spar which when heated shine with a beautiful emerald-green, phosphorescent light.

Chlo'rophyll [from Gr. *χλωρός*, green + *φύλλον*, leaf]: the green coloring-matter of plants. It is a product of



A, a pond-scum (*Spirogyra*) with spiral chloroplasts; B, cells from a moss leaf (*Funaria*) with spherical chloroplasts; C, chloroplasts dividing.

protoplasm, and is usually secreted by definite portions (plastids) known as chloroplasts or chloroplastids. In some of the lower plants (e. g. *Schizophyceæ*), and apparently in the *Mesocarpeæ*, the whole mass of protoplasm in the cell is colored, but in the great majority of cases the chloroplasts constitute but a small part of the protoplasm of the cell.

Chloroplasts are mostly minute, rounded bodies, occupying the peripheral portions of the cell; in a few cases they are ribbon-shaped, as in *Spirogyra*, or star-shaped, as in *Zygnema*. Chlorophyll is developed in the chloroplasts only in the light (with a few remarkable exceptions), and in prolonged darkness it almost invariably disappears, as in the blanching (etiolation) of celery. It may be removed artificially by alcohol, ether, chloroform, and many other

reagents, leaving the chloroplasts colorless, and by proper treatment of the green solution the chlorophyll itself may be obtained, although mixed with other extracts. Chemical analyses of chlorophyll solutions indicate that it is composed of carbon, hydrogen, oxygen, and nitrogen, with a small quantity of ash.

In sunlight (or other strong light) the chloroplasts form starch, or, rarely, some related hydrocarbon, and this appears to be the proper function of the chlorophyll. Plants which obtain their carbon compounds already made, as is done by parasites and saprophytes, develop little or no chlorophyll; hence those organs which normally contain chlorophyll (as leaves, stems, thallomes, etc.) are themselves but poorly developed. The non-development of chlorophyll results in the atrophy and degeneration of the vegetative organs of the plant-body. CHARLES E. BESSEY.

Chlo'roplasts, or **Chlo'roplastids**: See CHLOROPHYLL.

Chloro'sis, or **Green Sickness** [from Gr. χλωρός, green + suffix *-osis*; cf. Gr. χρύσωσις, act of making golden, χήρωσις, act of making lonely, κένωσις, act of making empty]: a disease almost peculiar to young women and girls, and usually associated with other troubles peculiar to that time of life. It takes its name from a greenish-yellow tint of the skin which some patients exhibit. There is also great pallor and debility, often disturbance of the heart's action, breathlessness, and a variously perverted and capricious appetite. The disease is characterized by a peculiar impoverishment of the blood. Most cases are readily curable by the use of rest and, later, moderate exercise, good air, proper food and clothing, and, above all, by the administration of iron, which is almost a specific in this disease. See BLOOD. Revised by WILLIAM PEPPER.

Chlorosis is also the name of the "yellows," a disease which attacks plants and trees, especially the peach-tree. A deficiency of chlorophyll causes a blanched and yellow appearance. Damp soil, wet weather, and insufficient culture and manuring are assigned as causes, but widespread climatic influences of a character which is little understood appear to be the principal cause of this destructive malady. No treatment except underground drainage and good culture promises any benefit.

Chlorox'ylon [from Gr. χλωρός, green + ξύλον, wood]: a genus of plants of the order *Cedrelaceæ*, its fruit having only three cells and splitting into three parts. *Chloroxylon swietenia* is the SATIN-WOOD (*q. v.*) of India. Its wood is exported, and is used by cabinet-makers and brushmakers.

Chmunu: See HIEROPOLIS.

Chnum, or **Khnum**: a deity. See EGYPT, ANCIENT.

Choate, JOSEPH HODGES: See the Appendix.

Choate, RUFUS, LL. D.: eminent advocate and orator; b. in Essex, Mass., Oct. 1, 1799. Both his parents were distinguished for quickness of intellect, as well as weight of character. He entered Dartmouth in 1815. After taking his degrees he remained in the college as tutor for one year. He commenced the study of law at Cambridge, and subsequently studied under the distinguished orator and lawyer, Mr. Wirt, then U. S. Attorney-General at Washington. He began the practice of law in his native State at Danvers, whence he removed to Salem and afterward to Boston. While at Salem he was elected to Congress (1832), and later (1841) he was chosen Senator as successor to Mr. Webster, who had been appointed Secretary of State under President Harrison. In political life he acted with the Conservative or Websterian wing of the Whigs. After Webster's death Mr. Choate was the acknowledged leader of the Massachusetts bar, and was regarded by the younger members of the profession with a love equal to their reverence. As an orator, Mr. Choate's powers were of the rarest order. He was not merely eloquent when he spoke on themes that were calculated of themselves to touch the feelings or stir the passions of his audience, but his genius enabled him to interest and fascinate his hearers even while discussing the driest and most unpromising subjects. His health having failed, in 1858 he retired from business, and, a sea-voyage having been recommended by his physicians, he embarked for Europe in 1859, but he was unable to proceed farther than Halifax, where he died on July 13. See *Works of Rufus Choate, with a Memoir of his Life*, by S. G. Brown (1862); Neilson, *Memoirs of Rufus Choate* (Boston, 1884); *Addresses and Orations* (5th ed. Boston, 1885).

Choco', a region of Western Colombia, embracing the Atrato valley and nearly the whole Pacific slope, from the Isthmus of Panama southward. It was formerly a province of the Spanish viceroyalty of New Granada, and now constitutes the northwestern and most populous portion of the department of CAUCA (*q. v.*). H. H. S.

Chocolate [viâ Fr. and Span. from Mexican *chocolatl*, prob. unconnected with *cacao*]: a dried paste made from the kernel of cacao or chocolate nuts, which, after being roasted, are deprived of their shell and reduced by grinding between heated stones. To this paste are frequently added rice flour or other starch powders, and lard or butter, for the purpose of improving its taste and nutritive properties. In other instances certain flavoring substances are employed, such as cinnamon or vanilla. Chocolate is generally used in the form of a drink made by the addition of hot water or hot milk to the powdered nut, which has been flavored and sweetened. In other instances, after proper treatment, it is eaten in the form of confections or in plain chocolate cakes. It possesses a high nutritive value, both on account of the starch it contains and the very considerable amount of oily material which is present in it. It is to be distinctly understood that chocolate is derived from cacao or cocoa, which has been technically called theobroma, and not from coca, from which is derived the anæsthetic alkaloid cocaine.

Choctaws: See MUSKHOGEAN INDIANS.

Chodowiecki, DANIEL NICHOLAS: b. in Dantzic, Oct. 16, 1726; an engraver and designer of great originality, whose illustrations were almost the necessary aids to popularity in Prussia in his day, and have since been the object of the quest of collectors. He was a pupil of Kaufmann. He left over 3,000 engravings, most of them of small proportions, and they have been noted as the most remarkable as well as the earliest of that manner of illustration. He was rector of the Berlin Academy of Fine Arts and Mechanical Sciences in 1764, and director in 1793. Many of his prints were illustrations of Shakspeare. He also produced a *History of the Life of Christ*, which consisted of a series of painted miniatures which brought him great renown; was called the Hogarth of Germany, but had no tendency to caricature or satire. D. in Berlin, Feb. 7, 1801. W. J. S.

Chœrilus of Iasus: an attendant of Alexander on his march to the East, who sought to flatter him by his verses. According to the scholiast on Horace, Alexander said "he would rather be the Thersites of Homer than the Alexander of Chœrilus." The scholiast adds that Alexander agreed with him to give him a gold piece for every good verse, but a blow for every bad one, and that Chœrilus received only seven gold pieces in all, but was killed by the blows for his numerous bad verses. See Näke's *Chœrilus of Samos*. HENRY DRISLER.

Chœrilus of Samos: Greek epic poet: contemporary of Herodotus. His poem on the Persian war (Περσηίς) was popular at Athens because of the praise he lavished on the conduct of the Athenians during the conflict with Persia. The few fragments extant, which are not uninteresting, may be found in Kinkel's *Epicorum Græcorum Fragmenta* (1878, vol. i., pp. 265–277).

Chogset: See CONNOR.

Choir (Lat. *chorus*; Fr. *chœur*): a company of singers or choristers in a church; the part of a church occupied by the singers. Although in some of the basilicas, and generally in Spain, the choir is placed in an inclosure at the crossing of nave and transepts, the term signifies architecturally that portion of the church between the transepts and the apse, and which in parish churches, having no side aisles or chapels around it, is called the chancel. The choir in many large churches is furnished with stalls or *sedilia* for the choristers and clergy, and is separated from the nave by an elaborate screen, either of stone or of metal open-work, called the *rood-screen*. See CHORUS. A. D. F. HAMLIN.

Choiseul, shwää'zöl', ÉTIENNE FRANÇOIS, de, Duc de Choiseul et d'Amboise: a French statesman; b. June 28, 1719. He entered the army, gained the rank of lieutenant-general, and was sent as ambassador to Vienna in 1756 to secure coalition against Frederick the Great, and he was author of the Bourbon Family Compact, and of the policy of securing the liberties of the Gallican Church, the East Indian trade, and the commercial development of France. Favored by Madame de Pompadour, he became prime minister and favorite of Louis XV. He was an able diplomatist, popular with the nation, but he was removed from power by the influence of Madame du Barry in 1770. Retired to his estate of Chanteloup, returned to Paris four years later, and be-

came an unofficial adviser of Louis XVI. D. May 7, 1785. See *Mémoires de M. le Duc de Choiseul, écrites par luiméme* (2 vols., 1790).

Choke-cherry: the common name of *Prunus virginiana* and its fruit; a species of bird-cherry; a native of North America; the fruit is very astringent.

Choke-damp: See Carbonic Acid.

Chok'ing: the obstruction of the pharynx or œsophagus, or more rarely of the larynx or trachea, by masses of food or other foreign bodies. Choking by obstruction of the pharynx or œsophagus is sometimes relieved by the operation of an emetic, sometimes by the use of gullet-forceps, of which there are many varieties, or by other appropriate instruments. Œsophagotomy, or cutting, has been resorted to, but this is one of the most formidable operations of surgery, and is not often necessary. When foreign bodies lodge in the larynx, aphonia, or loss of voice, is one of the symptoms. If the substance is in the windpipe or bronchi, the surgeon may often detect its presence by auscultation. The symptoms caused by foreign bodies in the œsophagus are often surprisingly like those which occur when similar bodies lodge in the air-passages. These symptoms are various; there may be spasmodic coughing, redness of the face, ineffectual attempts to swallow, unusual discharge of saliva, and generally great difficulty of breathing. There is also a great tendency on the part of the patient to bend the head back, and thus to increase the difficulty in breathing by pressing the foreign body against the trachea.

Revised by William Pepper.

Cholera, kol'e-ra [Gr. χολέρα, used by Hippocrates as name for cholera nostras, from χολή, bile]: an acute infectious disease in which purging and vomiting are prominent symptoms. The home of genuine Asiatic cholera is in India, whence all its great epidemics have taken origin. The first outbreak of which we have accurate record occurred in 1817, and the disease first appeared in Europe in notable degree in 1830–32, since which time a number of epidemics have occurred, the one in 1866 being noteworthy, that of 1892 in Russia, France, Italy, and Hamburg also being severe. The disease has appeared in epidemic proportions in America a number of times, the outbreaks of 1832, 1849, 1854, and 1866 being notable examples. The nature and history of the disease had long made it clear to the minds of the medical profession that an infectious agency is operative in the production of cholera; but the actual demonstration of the specific germ remained for the genius of Koch, who discovered the "bacillus of cholera" in Egypt in 1883, a year after communication of his still more important discovery of the cause of tuberculosis. The bacillus of cholera is a short rod-shaped organism generally presenting a slight curve, whence the name by which it is often known, "comma bacillus"; but under certain circumstances it is seen as long spiral threads, and is therefore, strictly speaking, a *spirillum*. This organism occurs only in the intestinal canal and contents, never in the blood or distant organs. There is no longer much question as to the method of infection. Pure contagiousness, that is, infection by association with a patient by emanations, or the like, probably never occurs. The dejecta being cast out are preserved in the soil, the germs enter water which is afterward drank, and the disease so produced. Other methods may occur, but this is doubtless the most common. The bacilli have been actually discovered in water supplied for drinking in cisterns. The nature of the soil has some part in the propagation of the disease, but this is certainly of less importance than was formerly believed. The fact that the poison does not become disseminated by the air and wind is well proved by the observation that cholera proceeds from place to place along the beaten lines of travel, and no more rapidly than the means of human intercommunication render it possible.

Epidemics of cholera are apt to occur during the summer months, like *cholera morbus*, a similar but entirely distinct disease. In the early part of an epidemic, and to an extent during its course, cases of cholera, presenting no symptoms beyond a mild diarrhœa, are apt to occur. These cases, called *cholerine*, are as infectious as the severe attacks, though the person affected is more likely to recover. The worst forms are also ushered in with slight diarrhœa, attended with malaise and general depression. Later the dejections grow more and more frequent and copious, at last consisting of large quantities of watery fluid containing loosened epithelium from the bowel-wall ("rice-water discharges"). At the same time vomiting begins and grows in intensity, and the patient's general condition grows more and more profoundly depressed, until in the last or "algid stage" he lies collapsed, with cold exterior, pinched features, whispering or absent voice, and finally death. There is rarely much abdominal pain, but there is commonly much cramp-like pain and tenderness in the limbs. It is at times difficult to distinguish violent cases of *cholera morbus* from true *Asiatic cholera*; but the presence of the comma bacillus, which is not difficult to demonstrate, is an infallible test. *Cholera infantum*, also similar in its clinical manifestations, is an entirely distinct disease, and distinguished by the absence of Koch's bacillus.

The treatment of the disease is of little importance compared with the prevention. The dejections of each case must be rigidly guarded, being received at once into strong solutions of carbolic acid. The patient should, as far as possible, be isolated in a healthful locality. Every person in the affected locality must exercise the most scrupulous personal cleanliness and attention to his general health. Especially must any tendency to diarrhœa or disturbance of the stomach be righted at once. Sanitary cordons have been found of much less value than was expected, and are looked upon by many as useless and unjustifiable. Water, milk, and foods in general should be boiled or heated before being used. The treatment of the disease consists largely in palliation of the symptoms, with supporting measures. During the early stage of diarrhœa it is necessary to check this, to which end some advise opium, others more simple remedies, as bismuth. During the stage of collapse it is necessary to supply the fluids wasted by the enormous discharges, and this is best done by injecting large quantities of weak salt solution under the skin or into the rectum. Further, it will be necessary in this stage to supply external heat, stimulants, and supporting measures, but generally they prove of little avail. The mortality is sometimes frightfully high (50 to 70 per cent.), but generally is considerably less than this.

William Pepper.

Cholera Infan'tum, or **Acute Intestinal Catarrh**: a severe and dangerous form of infantile diarrhœa, seen principally during the first two years of life, and more commonly among the poor, but not confined to them. It is most frequently observed in hot climates, and during the hot season in more temperate zones, not alone in the U. S. but in Europe as well, occurring just as frequently during the first as the second summer. It has no direct relation to dentition, which is illogically accused of being the cause of many infantile diseases; it also is but rarely due to exposure, or to mental emotions of infant, mother, or wet-nurse. Usually the cause is found in improper feeding, especially during hot weather; the former does direct injury, and the latter, by debilitating the nervous system and lowering the functions of all the digestive organs, diminishes the general strength and power of endurance. Thus nurslings are but seldom affected, and many infants will recover from an attack by being returned to the mother's breast. It may be noted, however, that an improper condition of the breast-milk—i. e. undue proportion of water, fat, or casein, admixture of medicinal agents taken by mother or nurse, or a change produced by mental emotions in the latter—are known to be injurious. Artificially fed babies and those already weaned are mostly attacked. Artificial food is seldom identical in nutritive value with mother's milk; cow's milk contains more butter and casein than the former, and requires boiling, skimming, and subsequent dilution with water, preferably barley water. Vegetable food is dangerous, unless carefully selected and prepared.

Onset of the disease is characterized by vomiting, oftentimes incessant, and frequent profuse diarrhœal passages, very offensive, both containing varieties of undigested food, particularly large curds of milk; later, the stools are more watery, with an acid or fetid odor, and more or less vomiting continues. These passages contain many bacteria, none of which is considered characteristic of the affection; they encourage the formation of poisonous products of decomposition, which act on the system. Moaning, crying, and restlessness are soon replaced by debility; the body, being rapidly deprived of a large portion of the water contained in it, emaciates; the eyes lie deep in the orbits; sutures and fontanelles of the skull sink; the skin becomes dry and ashy; the face looks shrunken and senile; hands and feet are cold, while the body temperature rises; the pulse becomes rapid and weak; the voice is feeble, and the expression listless. This described condition often results in convulsions or

coma, with subsequent collapse and a fatal termination. A most alarming mortality is found among the poor in large cities. Preventive measures consist in supplying infants with proper artificial food when breast-milk is unavailable, at regular intervals, and in attention to general health and hygienic surroundings. When developed, the principal means of checking the disease are the following: During the first three to eight hours no food or drink should be given, in order to secure rest for the irritated stomach, and vomiting will cease on this condition only. Then give teaspoonful doses of iced water with a few drops of brandy every ten minutes as long as the tendency to vomiting persists.

When feeding can be recommenced, avoid milk in any form, excepting breast-milk. Strained barley water with white of egg and a little whisky, a teaspoonful at short intervals, is well borne and easily digested. Many cases will get well with this dietetical treatment. The air should also be kept as fresh and cool as possible, at night as well as day. Medicinal treatment, which is under all circumstances the domain of a physician, varies according to the nature of the case. Frequently calomel will be of service to remove irritating material from the intestinal tract, to be followed by such antacids and antifermentatives as subnitrate of bismuth, resorcin, etc., to which opium or Dover's powder can be added. Whisky and camphor are advised as stimulants. The extremities should be kept warm. Enemas of salt water to fill vessels by absorption are of value. Astringents are useful in cases which threaten to become chronic.

A. Jacobi and F. E. Sondern.

Cholesterin, kō-les'ter-in [from Gr. *χολή*, bile + *στέαρ*, contr. *στῆρ*, fat]: the principal constituent of gall-stones, in which it was discovered in 1775. It is also found in the bile, in human blood, in the brain, in the excrement of crocodiles, in wool-oil, in milk, and in other animal products. It can be prepared by treating powdered gall-stones, first with boiling water and then with boiling alcohol, in which latter the material dissolves. It can also be prepared from the brain substance, but the process is somewhat more complicated than that employed in the case of gall-stones. One pound of brain yields 2 grammes of cholesterin. It crystallizes from chloroform in needles, from alcohol or ether in plates. It is insoluble in water, soluble in 9 parts boiling alcohol. It is easily soluble in ether and in carbon disulphide. That made from wool-oil is sold under the name *lanolin*, and is used in medicine instead of vaselin and other similar substances. I. R.

Cholet, shō'lay': a town of France: department of Maine-et-Loire: on the river Maine; 32 miles S. S. W. of Angers (see map of France, ref. 5–D). It is well built, and has manufactures of cotton and woolen stuffs and leather. Pop. (1891) 14,987; (1896) 17,844.

Choliam'bus (in Gr. *χωλίαμβος*. Lame Iambus); also called **Scazon** (Limper): an iambic verse in which a spondee or trochee is substituted for the final iambus, and the rhythm reversed. This "halting" measure is used in satirical, mocking, querulous poems, notably in the fables of Babrius and the recently discovered mimes of Herondas.

Cholmondeley, chŭm'lĕe, Marquesses of: Earls Rocksavage (United Kingdom, 1815), Earls Cholmondeley (1706), Viscounts Malpas (1706), Barons Cholmondeley (England, 1689), Barons Newburgh (Great Britain, 1716), Viscounts Cholmondeley (1661), Barons Newburgh (Ireland, 1714), and baronets (1611).—William Henry Hugh Cholmondeley, third marquess, joint hereditary lord grand chamberlain of England, b. Aug. 31, 1800, was member of Parliament for South Hants 1852–57, and succeeded his brother, George Horatio Cholmondeley, May 8, 1870. D. in 1884.—Fourth marquess, George Henry Hugh Cholmondeley, b. in 1858; succeeded in 1884.

Chols: See Indians of Central America.

Cholu'la: a town of Mexico, in the state of Puebla, 7 miles W. of Puebla city; in a plain 6,906 feet above the sea (see map of Mexico, ref. 8–H). It was an Indian settlement of great antiquity and unknown origin. At the time of the conquest it was occupied by a tribe of the Nahuatl race, and formed, with the neighboring villages, a semi-independent state, with only a nominal allegiance to Montezuma. The government was democratic. Cortés estimated that the town contained 20,000 houses and the outskirts as many more; but this is evidently a great exaggeration. The Cholulans were noted traders, holding regular fairs and exchanging their manufactures of pottery and fine cloths for the produce of neighboring tribes. In the outskirts of the town there was an immense, irregular brick pyramid or mound, covering over 20 acres and 170 feet high. This pyramid, which still exists, is much more ancient than the Nahuatl occupation, and is connected with the legends of the hero-god Quetzalcohuatl. There are remains of several smaller mounds. These and the pyramid were occupied by Indian temples, the resort, it is said, of numerous pilgrims. Cortés, on his way to Mexico in 1519, stopped at Cholula for some weeks. At first he was entertained hospitably, but, hearing of or suspecting a plot against the Spaniards, he surprised and massacred a great number of the people in the public square. The present population of Cholula is about 6,000. There are considerable manufactures of fireworks and hand-woven cotton cloths. The park and the pyramid, now surmounted by a chapel, are the principal objects of interest. See Bandelier, *Report of an Archæological Tour in Mexico* (1884). See Mexican Antiquities. Herbert H. Smith.

Cholute'ca: a town of Southern Honduras; on the navigable Choluteca river, 35 miles from its mouth in the bay of Fonseca (see map of Central America, ref. 6–G). Pop. about 5,000 (1890). It is the capital and principal town of a department of the same name, which has an area of 2,000 sq. miles, and a population of 50,000 (1884). H. H. S.

Chondrostes [Gr. *χόνδρος*, cartilage; *ὀστέον*, bone]: a group of fossil ganoids (see Fishes) closely allied to the sturgeons.

Chondropterygii [Gr. *χόνδρος*, cartilage; *πτέρον*, wing or fin]: a name sometimes used for the group containing the sharks and skates, otherwise known as Elasmobranchiates (*q. v.*), in allusion to the cartilaginous character of the fin skeleton.

Chonós Archipelago: a group of high islands and islets along the west coast of Patagonia, between the island of Chiloé and the peninsula of Taytas. They number more than 1,000, including rocks, and are separated from the mainland and from each other by intricate channels. The larger ones are covered with forest, and all are very picturesque. These islands belong to Chili. They were formerly the homes of the Chonós Indians, now extinct. At present they are uninhabited, or nearly so. Herbert H. Smith.

Chonsu: a deity. See Egypt, Ancient, and Khonsu.

Chontáles: a department of Nicaragua; bordering the northeastern side of Lake Nicaragua and the San Juan river, with a short coast on the Caribbean Sea; area about 3,000 sq. miles. Pop. 30,000. Capital, Acoyapa. The southern part is mountainous, except near the coast; the northern part, comprising the valley of the Bluefields river, is imperfectly known, and inhabited mainly by uncivilized Indians. Herbert H. Smith.

Chopin, shō'păn'. Frédéric François: pianist and composer; b. near Warsaw, Poland, Mar. 1, 1809; son of a French father; studied under Elsner in Warsaw; published first at sixteen years of age; at eighteen began to give concerts in Vienna; traveled in Eastern Germany; removed to Paris about 1832, where there gathered about him a select society, for which he delighted to play. He was seldom heard in public. George Sand, with whom he formed an intimacy, is said by Liszt to have added him to her "collection of heroes" in *Lucrezia Floriani* (see her *Histoire de ma Vie*). He twice visited Great Britain (1837 and 1848). He composed concertos, waltzes, nocturnes, preludes, and mazurkas, which display a poetic fancy and abound in subtle ideas, with graceful harmonic effects. His compositions are strikingly peculiar in melody, rhythm, and harmony, and possess a delicate though powerful charm. He was one of the first of pianists, and his playing, like his music, was marked by a strange and ravishing grace. He was the great interpreter of the music of his native country, and to his passionate patriotism must be referred the exuberance, subtle refinements, and tone of strange romance in his piano music. He wrote nothing of consequence for the orchestra. He suffered long from the inroads of pulmonary disease, and died in Paris, Oct. 17, 1849. In 1869 a monument was erected to him at Warsaw. See his *Life* (Dresden, 1877; Eng. trans. 1879) by M. Karasowski; also that by Niecks.

Chopine, chō-peen', also **Chiopine** [from Span. *chapin*, shoe with cork sole]: a shoe, sandal, or clog, having a sole and heel of such thickness as to add several inches to the height of the wearer. Those worn in Venice in the sixteenth century had a single pillar replacing sole and heel, and were 6 or 7 inches high. Vecellio (1590) gives a plate

showing a lady wearing chopines at least 8 inches high. The gown usually reached the ground, however, and concealed them. Chopines were also used on the stage.

Chop'tank: a river which rises in Kent co., Del., and flows southwestward into Maryland. It expands into an estuary, forming the boundary between Talbot and Dorchester Counties, and communicates with Chesapeake Bay. Length nearly 100 miles. Sloops can ascend it about 50 miles.

Chopunnish Indians: See Shahaptian Indians.

Choragus, kō-ray'gŭs, or **Choregus** (in Attic Gr. *χορηγός*): originally an Athenian citizen appointed by the state to be the leader and trainer of a chorus in dramatic contests in Athens. Later the functions of the choragus was to supply the money necessary for living and feeding the coach and the choreutæ, for the purchase of costumes, and the rent of training quarters. His prize consisted of a crown and tripod; he might build a monument and on it expose his tripod.

Cho'ral, or **Chora'le** [Fr. *choral*, Med. Lat. *chorālis*; deriv. of *chorus*]: a tune written or arranged for a hymn or psalm to be sung by a congregation in public worship. This style of music has its origin in the *Enchiridion* of Luther and Walther (1524), and the Lutheran Church produced many subsequent collections. The melody was given in them to the tenor, and there were at times even five and six parts. The greatest composer of such music was Johann Crüger (1598–1662), whose *Praxis Pietatis Melica* (1649) preserves much of his work. Sebastian Bach, a hundred years later, applied counterpoint to many of these themes, and from his time the old chorales have had great influence on the development of Protestant church music in Great Britain and on the European continent. In Germany they are still sung in unison, and slowly and strongly with organ accompaniment; but much English choral music is in parts. It involves a development of harmony, is stately, devout, and excellently adapted to congregational singing. In the Roman Catholic Church a choral is any part of the service which is sung by the whole choir.

Chord [a spelling of *cord* to adapt it to etymol.; Lat. *chorda*, Gr. *χορδή*, a string of gut]: in geometry, the straight line which joins the two extremities of the arc of a curve; so called because while the arc resembles the bow (*arcus*), the chord may be likened to the bowstring. The chord of a circular arc may be found by multiplying the radius by twice the sine of half the angle which the arc subtends. The use of chords in trigonometry is mostly superseded by the use of sines.

Since two circles can cut each other in only two points, they can have only one common chord. But by Poncelet's "principle of continuity," to which modern geometry owes so much, the circle may be considered as a curve of the second order, and as such two circles may be said to have four points of intersection, two of which are, however, always imaginary. These imaginary points are called "circular points at infinity." This view also gives the two circles six common chords instead of one. Four of these chords are imaginary, and the fifth is infinitely distant; while the sixth (and most obvious) chord may or may not cut the two circles in real points. This last chord is often called the radical axis, and has many remarkable properties. See Geometry.

Chord, in music: See Consonance.

Chor'da dorsa'lis: See Notochord.

Chorda'ta [from Lat. *chorda*, a cord]: Since the term vertebrata implies the existence of a back bone made up of separate vertebræ, it has been found necessary to make a new term to include not only the true vertebrates but several other forms closely allied to them, yet which lack the separate vertebral elements. All of these forms agree in having the nervous system unperforated by the alimentary canal, in the possession in either embryo or adult of gill slits connecting the throat with the exterior, and in the possession of a cartilaginous axis, the notochord, produced from the intestinal wall and lying between the alimentary canal and the nervous system. The body is made up of a series of similar joints or metameres, and the principal circulatory organ consists of a tube, often twisted, lying upon the side of the body opposite to the nervous system. The chordata are divided into (1) the *Urochorda*, or Tunicata; (2) the *Hemichordia*, or Enteropneusti; (3) the *Cephalochordia*, or Leptocardii (with the single genus Amphioxus, *q. v.*); and (4) the Vertebrata. J. S. Kingsley.

Chore'a (in Gr. *χορεία*, a dance), or **St. Vitus's Dance**: a disease characterized by irregular, involuntary, and often grotesque muscular action, without appreciable organic change in any tissue, and generally without pain or any known derangement of mental action or of sensation. It is most common in children after the second dentition and before puberty; much more common in girls than in boys; sometimes attacks pregnant women and other adults, though some cases once called adult chorea would now be recognized as locomotor ataxia, a very different disease. Chorea is sometimes hereditary, sometimes epidemic. Many writers have classed the dancing mania (the original "St. Vitus's dance"), tarantism, and the strange excesses of certain religionists (dervishes, French prophets, "jumpers," and "convulsionists") all as varieties of chorea. Stammering has been called a chorea of the vocal organs. The disease is sometimes associated with rheumatism and generally with anæmia. Such complications should receive special treatment. The metallic tonics are generally useful, and so are systematic gymnastics, life in the open air, and a kind and unobtrusive discipline, which shall teach the young patient the power of the will over the movements of the body.

Chorepis'copus (in Late Gr. *χωρεπίσκοπος*): country bishop, *vicarius episcopi*, or *villanus episcopus*, as opposed to the *cathedralis episcopus*; to be distinguished, as being stationary, from the *visitator*, who itinerated; a class of bishops called into existence in the latter part of the third century, and first in Asia Minor, in order to meet the want of episcopal supervision in the country parts of the then enlarged dioceses, and to avoid the necessity for the subdivision of these sees of vast territorial extent. The functions of the *chorepiscopi* were episcopal, though the exercise of their powers was limited to minor offices. They gave a measure of supervision to the country of which they were assigned the charge. *In loco episcopi* they ordained readers, exorcists, subdeacons, but, as a rule, not priests or deacons (and of course not bishops), unless by express permission of their diocesan. They administered confirmation in their own districts, and (in Gaul) consecrated churches. They were held therefore to have "mission," that is, the power of ordination, but to lack jurisdiction save subordinately and as expressly assigned. Among the Eastern sects the *chorepiscopi* were presbyters, and, in at least one ritual, their setting apart for their office is prescribed to be without the laying on of hands. English writers, such as Beveridge, Hammond, Cave, Bingham, and Routh, assert the true episcopal character and consecration of the *chorepiscopi*. Van Espen takes the same view. Morinus and Du Cange, with others, allege them to have been presbyters only. The weight of evidence would prove that at first they were duly consecrated to the episcopal office, but that in later years they became simple presbyters with no claim to "mission" and possessing such "jurisdiction" only as might be exercised by an archdeacon. W. S. Perry.

Choriam'bus (in Gr. *χοριαμβος*); a classic measure compounded of a choree (trochee) and iambus, thus: *dimoveas*. But the choriambi that occur most frequently are now measured as irrational dactyls. See Metres.

Chor'ley: a town of England, in Lancashire; on a hill and on the river Chor; 20 miles N. W. of Manchester, 8 miles S. E. of Preston (see map of England, ref. 7–F). It has an ancient parish church in the Norman style, and a handsome Gothic church. The place owes its prosperity to various manufactures of cotton yarn, muslin, jaconet, calico, gingham, and railway cars. Mines of coal and lead and quarries of slate are worked, and bleaching is carried on in the vicinity. Pop. (1891) 23,082.

Chorley, Henry Fothergill: journalist, author, and music critic; b. in Blackley Hurst, Lancashire, England, Dec. 15, 1808; educated in local schools, but mostly self-taught; began to write for the London *Athenæum* in 1830, and continued till his death, Feb. 16, 1872. He wrote reviews of literature, art and music, obituary notices, etc., but his most enduring work was his volumes on *Modern German Music* (1854); *Thirty Years' Musical Recollections* (1862); and *National Music of the World*, published posthumously. He wrote the librettos of many operas and cantatas, words for many songs, and translated many foreign librettos into English. He also wrote novels, dramas, and poems. He was honest and conscientious as a critic, but very stubborn and self-willed. D. E. Hervey.

Cho'rogi: the Japanese name of a mint-like plant which bears short, white, and crisp subterranean tubers. It was in-

troduced into Europe from China in 1882, was exhibited in England in 1887, and appeared in the U. S. in 1888. Its proper name is *Stachys sieboldi*, but it is commonly known as *S. tuberifera* and *S. affinis*. It is perennial, and is an important secondary vegetable. L. H. Bailey.

Cho'roid (kō'roid) **Coat** [*choroid* is from Gr. *χόριον* (Lat. *corium*), the afterbirth, any intestinal membrane + *εἶδος*, appearance]: the second of the tunics of the eye, covering the posterior five-sixths of the eyeball, and coming as far forward as the edge of the cornea. In front it is continued by the ciliary processes and the iris. It joins the sclerotic by means of the ciliary ligament and muscle. It is highly vascular, and is pigmentary, being of a kind of chocolate color. It is in three layers. The outermost is connected to the sclerotic by the *membrana fusca*. This coat consists principally of the vorticose veins, with pigment-cells. The middle layer (*tunica Ruyschiana*) consists of capillaries. The inner layer consists of tessellated epithelium, charged with pigment. This layer is lined by the retina. The choroid coat is liable to an inflammatory disease known as choroiditis.

Chorrillos: city on the Peruvian coast; about 30 miles S. E. of Lima, with which it is connected by a railroad (see map of South America, ref. 5–B). It is the residence of many wealthy Peruvians, and is a noted resort for bathing and recreation during the warm months. The town is irregularly built and covers a large space. Pop. (1891) 3,000. On Jan. 13, 1881, the Peruvians under Iglesias and Caceres were defeated before Chorrillos by the Chilians, Iglesias surrendering with 5,000 men. Herbert H. Smith.

Chorus (Lat. *chorus*; Gr. *χορός*): the union of musicians for the performance of a musical work. In modern music a combination of voices is called a chorus. It is mixed or complete where it consists of all or part of the four principal voices. There are also choruses for male and female voices. The word *chorus* is not applied to instrumental combinations, but the word *choir* sometimes is when speaking of subdivisions of the orchestra, thus, the "wood-wind choir," "the brass choir," but never the string choir.

The chorus of the ancient drama is not, as is often insinuated, an element of special æsthetic excellence, but a mark of its historical origin from the worship of Dionysus, which it never succeeded in getting rid of. In the olden times solemn narratives of the exploits of the god were recited between the hymns sung in his honor, and this character of being a recital of an epic interspersed with the singing of lyrical poems the ancient drama never fully outgrew. The hymns were sung by the chorus; the epic was recited by the actors. The chorus never—or at least very seldom—entered the stage. Its place was in the orchestra, in the center of which stood the altar of Dionysus, on which a sacrifice was offered before the representation began. Around that altar the chorus was dancing to the flute while singing its songs. Its connection with that which took place on the stage was often very loose—a kind of running commentary; it very seldom took an active part in the dramatic development of the plot. Its members were citizens of good reputation. The expenses of their training and outfit were defrayed by some rich man, the *choragus*. Their leader bore the name of *coryphæus*. When the chorus did its part well, not only the *coryphæus*, but also the *choragus*, was crowned and applauded. Revised by Dudley Buck.

Chose, shōz: in law, a thing; an article of personal property. A *chose in action* is a phrase used to express all rights enforceable by action in a court of justice. Blackstone in his *Commentaries* confines it to rights growing out of contracts. Modern usage extends it to claims arising from torts. Formerly, at common law, choses in action, except bills of exchange, checks, and other negotiable paper, could not be assigned so as to give to the assignee the right to sue upon it in his own name. *Choses in possession* are commonly called Chattels (*q. v.*). See Assignment, Contracts, and Tort. Revised by F. Sturges Allen.

Chōsen and **Chosön**: See Chaosien.

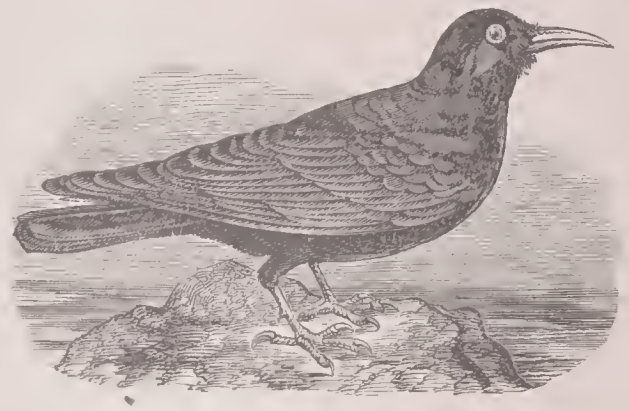
Chota Nagpur: See Chutia Nagpur.

Chotin: See Khotin.

Chouans, shoo'anz (Fr. pron. shoo'ăn'): the French royalists of Maine and Brittany who revolted against the French Convention in 1792. Chouan, which signifies an "owl," was perhaps the nickname of Jean Cottereau, who was the leader of the insurgents, or an imitation of a signal cry that summoned men to their rendezvous. This insurrection was called *La Chouannerie*. Cottereau, who had been pardoned for smuggling by Louis XVI. and never forgot the favor, began peasant reprisals in Maine, whence the insurrection spread to Brittany. He gained some success in guerrilla warfare, and in 1793, under the name "La petite Vendée," united his troops with the Vendeans. They were defeated at Le Mans in Dec., 1793. Cottereau was killed in an ambuscade in July, 1794. A succession of leaders now arose, Cormatin, Georges Cadondal, and Charette; the army increased to 10,000 men: but they were overthrown by La Hoche at Quiberon in 1795, and he stamped out the remnants of the revolt. New movements of the Chouans took place in 1799; again in 1814 and 1815; and finally in 1830 an insurrection known as Chouan broke out on behalf of the Duchess of Berri and her son, subsequently known as the Duc de Chambord, but these all were easily suppressed. See Seguin, *Histoire de la Chouannerie*.

Revised by C. H. Thurber.

Chough, chŭf (sometimes *Cornish chough*): the *Fregilus graculus*, a bird of the crow family inhabiting Europe and Northern Africa. It is about 15 inches long, of a purplish black color, with a rather long, slender, curved beak, which,



Chough.

as well as the feet, is vermilion red. It was formerly abundant along the cliffs of the southern coasts of England and Wales, as well as parts of Ireland and Scotland, but has been greatly reduced in numbers, largely on account of the fact that it has been crowded out of its favorite haunts by the jackdaw, *Corvus monedula*. Possibly, too, it is a case of a species naturally on the decline, for its remains have been found in caverns associated with those of the reindeer. A somewhat larger form, distinguished as a separate species, *F. himalayanus*, occurs in Central Asia. The chough lives in communities and feeds on insects, grain, and berries. The alpine chough, *Pyrrhocorax pyrrhocorax*, which dwells in the mountains of Central Europe, is similar, with the exception of the bill, which is orange yellow. F. A. L.

Chowles, chōlz, John Overton, D. D.: b. in Bristol, England, Feb. 5, 1801; studied theology at Bristol College, England. He arrived in America in 1824, and engaged immediately in teaching, for which he seems to have had unusual adaptation, and to which he devoted himself to some extent, throughout his life. He was pastor of Baptist churches in New Bedford, Mass., Buffalo, N. Y., Jamaica Plain, Mass., and Newport, R. I., and edited several works, the most important of which was Neal's *History of the Puritans*, and published *The Young Americans Abroad* and completed Thomas Smith's *History of Christian Missions* (2 vols., New York, 1832; 8th ed. 1837). D. in New York, Jan. 5, 1856.

Chowan, chō-waan': a river of North Carolina; formed by the Meherrin and Nottoway rivers, which unite about 5 miles above Winton. It flows southeastward, and then southward; forms the boundary between Chowan and Bertie Counties; enters Albemarle Sound at its western end. It is about 50 miles long, and is navigable for sloops.

Choya: See Chay-root.

Chrestien or **Chrétien de Troyes**, krā'ti-ăn'de-trwăă': mediæval French poet; flourished in the second half of the twelfth century, dying toward 1195. He was regarded by his contemporaries as the greatest of French poets, and his works were known and admired all over Europe. Little is known of his life. He seems to have been a native of Troyes, and to have passed most of his productive period in the society which gathered at the court of the brilliant Countess Marie of Champagne in that place. He was also familiar, probably, with the courts of Flanders, Hainault,

and Alsace. He was the chief poetic exponent of the ideals of courtesy, chivalric love, and mystical devotion, which, coming perhaps originally from Provence with the famous Eleanor of Poitiers, Queen of France and then of England, were taken up by her daughter, Marie of Champagne, and made the tests of virtue at her court. To Chrestien is due in particular the identification of the legends of Celtic origin, just then becoming popular in Europe, with these ideals. Geoffroy of Monmouth had indeed plainly allowed chivalric elements to intrude themselves in his Latin version of the legends; but Chrestien first made the identification complete, and after his time the Arthurian and other Celtic heroes and heroines were everywhere thought of as peculiarly representative of the dreams and aspirations of chivalric society. Chrestien's Arthurian poems and their approximate dates are the following: *Tristan* (1160; now lost); *Érec et Énide* (1165); *Le Conte de la Charrette*, or *Lancelot* (1170); *Le chevalier au lion*, or *Ivain* (1172); *Perceval*, or *Le Conte de Graal* (1175). Besides these poems Chrestien imitated at least two episodes in Ovid's *Metamorphoses*, that of Philomela being preserved to us; and he translated into French Ovid's *Ars amatoria*, and perhaps his *Remedia amoris*. He also composed one of the earliest *romans d'aventures*, his *Cligès* (1165), based upon an Oriental legend of a wife of Solomon stolen by a ruse in which she has a part herself. For analyses of the French romances of Celtic origin, with full bibliographical information, see *l'Histoire littéraire de la France*, t. xxx. (Paris, 1888). For Chrétien, see G. Paris, *Le Conte de la Charrette*, in *Romania*, vol. xii., p. 459 (1883); W. Förster, *Christian von Troyes sammtliche erhaltene Werke* (Halle, 1884, *seq.*). A. R. Marsh.

Chrestom'athy [from Gr. χρηστομάθεια, a collection of choice passages from authors, as of things worthy to be learned]: χρηστός, useful + μαθεῖν, learn]: literally, that which is useful to learn. The Greeks frequently formed commonplace books by collecting the various passages to which in the course of reading they had affixed the mark χ (χρηστός). Hence books of extracts chosen with a view to utility have received this name.

Chres'tus of Byzan'tium: one of the most distinguished pupils of Herodes Atticus, a contemporary of the Emperor Aurelius. He was celebrated for his eloquence, and taught rhetoric with great success, having many distinguished men among his hearers. Of his writings nothing is preserved. Philostratus has given notices of him in his lives of the Sophists.

Chrism, krizm, or **Chrisom**, kriz'ŭm [from Gr. χρῖσμα, an anointing; deriv. of χρίειν, anoint. Doublet of *cream*]: an ointment or oil, consecrated by a bishop, and used in the Roman Catholic, Greek, and Oriental Churches in the consecration of chalices, altar-stones, and churches, in the blessing of the water for baptism, and in the ceremonies of baptism, confirmation, ordination, and extreme unction. In the R. C. Church it is a mixture of oil and balsam, but in the Eastern it contains over forty ingredients.

Christ [O. Eng. *crist*, from Lat. *Christus*, Gr. χριστός, anointed; deriv. of χρίειν, anoint; a translation of Heb. *māshīax*, messiah]: a word which was at first a title of our Saviour, now in general use as part of his name. As kings were anointed on being called to their offices, so the Saviour was anointed (Acts x. 38) "with the Holy Ghost and with power." This anointing signifies a consecration or setting apart for a peculiar work. For the historical account of Christ, see Jesus; for an account of the doctrines held with regard to Christ's nature, see Christology.

Christ, krist, Wilhelm, von: Greek scholar; b. in Geissenheim, Germany, Aug. 2, 1831; professor in the University of Munich since 1861. Among his best-known works are *Metrik der Griechen und Römer* (1879, 2d edit.); text editions of Aristotle's *Poetics* and *Metaphysics*; Homer's *Iliad*, with prolegomena (2 vols., Leipzig, 1884); *History of Greek Literature* (vol. vii. of I. Müller's *Handbuch der classischen Alterthumswissenschaft*, 2d edit. 1891). Author of a great number of valuable articles in the publications of the Munich Academy. Alfred Gudeman.

Christadel'phians (liter., brothers of Christ): a religious body originating in the U. S. about 1855, with John Thomas, M. D., a man of English birth, after whom the sect is sometimes called Thomasites. They attach equal importance to the Old and New Testaments, and believe that the intention of the Creator is to recall to immortal life all who love him in this life, and with them to people this world. All who have not caught the immortal principle perish in death. They reject the doctrine of a personal devil. Christ, they believe, is the Son of God, deriving from the Deity moral perfection, but from his mother the common nature of Adam. They ascribe to him the threefold character of prophet, priest, and king. The first office he fulfilled by his life and death on earth; as priest he now mediates before the Deity; and as king he will return to earth and reign from the throne of David over the glorified world. This denomination is small in numbers; its monthly organ, *The Christadelphian*, is published in Birmingham, England; the exposition of its views may be found in the publications of Thomas and of Robert Roberts.

Christchurch: a borough and seaport of Hampshire, England; on the English Channel and at the head of the estuary formed by the rivers Avon and Stour; 33 miles by rail S. W. of Southampton (see map of England, ref. 14–H). Here is a priory church, founded as an Augustinian priory by Flanbard, dean of Christchurch, early in the twelfth century. It is over 300 feet long by 100 across the transept. Christchurch has several breweries, but the former noted manufacture of fusee-chains for watches is no longer carried on. The borough, which includes Bournemouth (*q. v.*), returns one member to Parliament. Pop. of parliamentary borough (1891), 53,300; of municipality, 3,994.

Christchurch: a town of New Zealand; capital of the province of Canterbury; on the banks of the river Avon, 7 miles from the sea. It is connected by railway with Lyttelton, which is its port, and by telegraph with nearly all the leading towns. It is the seat of an Anglican bishop, and has a college. Pop. (1881) 15,213; with Sydenham and suburbs, 30,970; (1896) with suburbs, 51,330.

Christ, Pictures of: The New Testament contains no hint at the personal appearance of Christ, and the double tradition which soon began to form was evidently based, not on actual knowledge, but on the prophetic descriptions of the Old Testament, the persecuted Church imagining Christ as the suffering Messiah, in accordance with Ps. xxii. and Isa. liii.; the victorious Church as the glorified Messiah, in accordance with Ps. xlv. and the Song of Songs. Of formal descriptions three have come down to us, but none of them has any real value. The first is found in a Latin letter which pretends to have been written by Publius Lentulus, "president of the people of Jerusalem" and a contemporary of Pilate. It was first discovered in a manuscript copy of the works of Anselm, and is certainly not older than the fourth century. A second description is found in the works of John of Damascus (*Ep. ad. Theoph. Imp. de venerandis imaginibus*) from the eighth century, and a third in the ecclesiastical history of Nicephorus (i. 40) from the fourteenth century. All those descriptions agree in depicting Christ as having florid or reddish hair parted down the middle of the crown, blue eyes, and forked beard. Finally, two portraits of Christ are spoken of. Eusebius tells us (*Hist. Eccl.* i. 13) of a correspondence between Christ and King Abgarus of Osroëne, and when repeating this story Moses Choronensis adds (*Hist. Arm.* ii. 30–33) that Christ sent his portrait to Abgarus. Both Rome and Genoa claim to be in possession of the genuine portrait. Another portrait of Christ became imprinted on the silken handkerchief of Veronica when she wiped the sweat from his face while he was carrying his cross to Golgotha. That portrait, too, has multiplied, and several cities claim to have the genuine one. See Mrs. Jameson and Lady Eastlake, *The History of our Lord in Works of Art* (London, 1865).

Christian II.: King of Denmark; b. in Nyborg, Fünen, July 2, 1481. He began to reign in 1513, and married Isabella, a sister of the Emperor Charles V., in 1515. In 1520 he invaded Sweden, which he partially conquered. He usurped the throne of Sweden, and abused his power with cruelty, but he was expelled by Gustavus Vasa in 1522. His Danish subjects also revolted, deposed him, and elected his uncle, Frederick I., king in 1523. Christian retired to Flanders, and returned with an army in 1531, but was defeated and kept in prison until his death, Jan. 25, 1559. See Behrmann, *Kong Christiern II., Historie* (1815).

Christian IV.: King of Denmark; b. in Frederiksborg, Zeeland, Apr. 12, 1577; the son and successor of Frederick II., who died in 1588. He became in 1625 the commander of the Protestant armies in the Thirty Years' war against the Emperor of Austria, but his campaigns were unfortunate

and he gave up the leadership to Gustavus Adolphus, after having been defeated in 1626 by the imperialist Gen. Tilly at Lutter. He waged war against Sweden from 1611 to 1613, and again from 1643 to 1645. He was an able ruler, and promoted the trade of the Hanse towns with Denmark, and the literary and scientific growth of his country. He became eventually an heroic figure in Denmark, and several cities of Norway perpetuate his name. D. in Copenhagen, Feb. 28, 1648. See Rasmus Nyerup, *Charakteristik af Kong Christian IV.*, 1816.

Christian VII.: King of Denmark; b. Jan. 29, 1749; son of Frederick V. His mother was Louisa, a daughter of George II. of England. He began to reign in Jan., 1766, and married his cousin Caroline Matilda, a sister of George III. of England, in the same year. His physician, Struensee, obtained the chief power in 1770, and was supported by the favor of the queen, but he was unpopular with the nation. Christian VII. was so feeble and morbid that he was incapable of reigning. D. Mar. 13, 1808, and was succeeded by his son, Frederick VI., who had been regent since 1784.

Christian VIII.: King of Denmark; b. Sept. 18, 1786; cousin of Frederick VI. He was chosen King of Norway in 1814, but being unable to defend it against Bernadotte, who invaded Norway, he abdicated in Oct., 1814. He succeeded Frederick VI. in Denmark in 1839, and d. Jan. 20, 1848, leaving the throne to his son, Frederick VII.

Christian IX.: King of Denmark; b. Apr. 8, 1818; ascended the throne on the death of Frederick VII. in 1863 by virtue of a London protocol of 1852, which conferred the right of succession after the extinction of the house of Oldenburg upon the house of Glücksburg. The Schleswig-Holstein difficulty culminated soon after his accession, and he found himself involved in war with Prussia and Austria, those two powers having resolved on a joint occupation of the disputed territory. Denmark was completely defeated, and Christian was forced to renounce all claims to Schleswig, Holstein, and Lauenburg.

Christian and Missionary Alliance: See the Appendix.

Christian Commission, or, more fully, **The United States Christian Commission**: a great organization in the Northern U. S. during the civil war. It was organized Nov. 14, 1861, at New York. Its work was designed to supplement that of the great Sanitary Commission, for while the object of the latter was more especially the care of the sanitary condition of the national armies, the relief of the wounded and sick, etc., the Christian Commission also gave especial attention to the religious needs of the troops, co-operating with the chaplains, while the Sanitary Commission more especially co-operated with the medical officers of the army. The Christian Commission was first proposed by Mr. Vincent Collyer, of New York, and originated by a call of the Young Men's Christian Association of New York (Sept. 23, 1861) upon all similar associations in the North to unite in this great undertaking. George H. Stuart, of Philadelphia, was its president until its affairs were wound up at the close of the war. Its disbursements were valued at about $5,000,000. See Moss, *Annals of the Christian Commission.*

Christian Connection: See CHRISTIANS.

Christiancy, ISAAC P.: b. at Jamestown, Montgomery co., N. Y., Mar. 12, 1812; went to Monroe, Mich., in 1836, and was admitted to the bar in that place in 1838; was a delegate to the Free-soil convention which nominated Martin Van Buren to the presidency, and was one of the founders of the Republican party in Michigan; served two terms in the Michigan Senate; was editor for a year of the Monroe *Commercial*, and in 1857 was elected a judge of the Supreme Court of the State; was re-elected in 1865 and again in 1873. In Jan., 1875, he was elected U. S. Senator from Michigan. Resigned Feb. 10, 1879, and was U. S. minister to Peru 1879–81. D. Sept. 8, 1890.

Christian Endeavor, YOUNG PEOPLE'S SOCIETY OF: an organized religious movement, which numbers within its ranks three and a half million young people of both sexes. The first society was started in the Williston Congregational church of Portland, Me., on Feb. 2, 1881. After a period of special religious interest, the pastor of the church, Rev. F. E. Clark, called his young people together and presented to them the constitution of a society called the *Young People's Society of Christian Endeavor*, which is substantially the same as the one used now by 60,000 societies in all parts of the world. The Society of Christian Endeavor is a purely religious organization, though there may be social features, literary features, and musical features connected with it. In fact, the society is meant to do anything that the church wishes to have it do. The scope of its energies is almost limitless. It may relieve the destitute, visit the sick, furnish flowers for the pulpit, replenish the missionary treasuries, build up the Sunday-school, awaken an interest in the temperance cause, preach a White-Cross crusade. The inspiration for all these manifold forms of service comes from the weekly prayer-meeting, which is always a vital matter in a Christian Endeavor society. The prayer-meeting pledge, while no uniformity of language is insisted upon, binds the young disciple to daily private devotions, to loyal support of his own church, and to attendance upon and participation in the weekly prayer-meeting, "unless prevented by a reason which he can conscientiously give to his Master." This perhaps is the most vital and important thing in the society. It has rejuvenated and revived the young people's prayer-meeting in all parts of the world, and has poured new life into the other services of the church. The monthly consecration meeting, at which the roll is called and the members answer to their names, is also a very serious and important meeting, and shows who are faithful to their covenant vows. There is no central authority or board of control. The United Society of Christian Endeavor, with trustees from the various evangelical denominations, is simply a bureau of information. Every local society is entirely controlled by its own church and denomination. The interdenominational features of the movement are also most important, since the conventions bring the young people together from every State and province in North America, and from at least thirty evangelical denominations. Students of Church history have declared that more than anything else this movement has promoted practical Christian fraternity and co-operation in all the denominations, though it does not strive for organic unity. The annual international conventions of this organization have been remarkable gatherings, surpassing in size any religious conventions that have ever been held, bringing together more than fifty thousand young people, and inspiring them with unlimited enthusiasm for future work. The Presbyterian denomination leads in the number of societies, but is closely followed by the Congregational, Baptist, Methodist, and Disciples, while in many other denominations there are quite as many societies in proportion to their size as in those enumerated. THE EPWORTH LEAGUE (*q. v.*) is a similar organization, confined to the Methodist Episcopal Church.

FRANCIS E. CLARK.

Christian Era: the great era from which all Christian nations compute their time; once supposed to correspond to the date of the birth of Christ. But, according to some of the best authorities, Christ was born on Apr. 5, four years before the commencement of our era (others say on Dec. 25, four or five years before that time). The practice of reckoning time from the (supposed) birth of Christ appears not to have been introduced into the Christian Church until the sixth century, when Dionysius, surnamed the Little (Exiguus), a monk of Syria, first made use of it, about 527 A. D. It was soon after introduced into Italy, and into France in the following century. The first instance recorded of its being employed in England was in 680. But the practice did not become universal throughout Christendom until about the middle of the fifteenth century.

Christia'nia, or **Kristiania** (Norw. pron. kris-tēĕ-aa'-nēĕ-a): the capital of Norway and of the stift of the same name; picturesquely situated in a valley and at the head of the navigable Christiania Fiord, about 55 miles from the sea; lat. of observatory, 59° 55′ N., lon. 10° 43′ E. (see map of Norway and Sweden, ref. 10–C). The environs of the city are beautiful, and visitors who approach it by the fiord pass through magnificent scenery. It contains a cathedral, a citadel, a royal palace, a great arsenal, a town-hall, two theaters, an exchange, an asylum for lunatics, and a university founded in 1811, which has a library of 250,000 volumes. The number of students in 1890 was 1,537. Connected with the university is an astronomical observatory. Here are manufactures of cotton, paper, glass, soap, etc. The commerce is considerable. In 1889 2,120 vessels entered the port, and 1,407 cleared. It is the port of the Thingvalla line to the U. S. The chief articles of export are timber, ice, and fish. The harbor and fiord are closed by ice for three or four months in the year. It is a bishop's see, and was founded in 1624 by Christian IV. on the site of the burned royal city of Oslo. Pop. (1891) 150,444.

Christianity: the religion of those who accept Jesus of Nazareth as the Messiah, that is the Christ, promised of old to Israel. It is now the dominant religion in Europe (Turkey excepted), in North and South America, and in Australia, Southern Africa, and many islands, and is making steady progress in the other parts of the earth. It exists in the form of a large number of particular churches, sects, denominations, which may be classified in three large groups: the Roman Catholic Church; the Oriental Churches, including the Greek Church; and other Churches, mainly those grouped under the name Protestant. The aggregate nominally Christian population of the earth exceeds 400,000,000. Of these, somewhat more than half are Roman Catholics, more than one-fourth Protestants, and less than one-fourth connected with the Oriental Churches. There is no room in this article to discuss the characteristics of those Christian bodies or opinions that may be regarded as exceptional, nor even to discuss the differential characteristics of the various churches. For these, see EASTERN CHURCHES, GREEK CHURCH, ROMAN CATHOLIC CHURCH, PROTESTANTISM, REFORMATION, and the names of the various denominations and movements. There are certain things which most Christians of different names have in common, and to these we must now confine our attention.

Its Relation to other Religions.—Christianity is monotheistic, in distinction from all polytheistic, pantheistic, nature-worshiping, or agnostic religions. It claims to be of divine origin, and that not merely in the sense of its having come into existence through the providential guiding of the ordinary forces of nature and the human spirit, but also in the sense of its being the product of divine spiritual operations that transcend what we commonly call nature. In other words, it claims to be a supernatural religion. Professing thus to be no product of the human intellect, and acknowledging no author but the Being whom it sets before us as the object of worship, it claims to be the only true religion, and is consequently exclusive; that is to say, it admits of no compromise with any other religious system. But it does not claim that there is nothing true or good in other systems, or that no adherents of other systems are true worshipers of the one true God.

To the ancient religion of Israel it stands in peculiar relations, claiming for its own the Old Testament as well as the New. The only logical position for Christianity to take here, though not all Christians take it, is that Christianity is itself the ancient religion of Israel, in a changed dispensation, adapting it to new conditions; and that the present religion of the Jews is a less correct branch of the same ancient religion. Historically, Mohammedanism is a shoot—from the Christian point of view a corrupt shoot—from the same root.

Christianity as a Revealed Religion.—Christians hold that God, in addition to his providential manifestation of himself in nature and in human history, makes a spiritual revelation of himself to men in three different forms: in the Scriptures of the Old and New Testaments, in the spiritual illumination and guidance of individuals, and in spiritual supervision of the acts and traditions of the Church in its organic character. Protestants regard the first of these three as supreme; the hierarchical churches exalt the third; among men of certain types of thinking, or among very different men of certain types of feeling, the second is made prominent.

Salvation in the Christian System.—For the various doctrines of the Christian religion, see such articles as those on GOD, INCARNATION, CHRISTOLOGY, JESUS CHRIST, HOLY GHOST, GRACE, ATONEMENT, JUSTIFICATION, IMPUTATION, SANCTIFICATION, etc. So far as men are concerned, its central idea is that men are lost, and need to be saved.

Man is represented as involved in misery, incapacitated for the service of God, and liable to punishment for sin in a future state. In its teachings concerning a remedy for this state of things the doctrine of the atonement claims special attention—a doctrine taught in all the sacrifices of the patriarchal and Jewish dispensations, as well as by the words of the Bible. Man being utterly incapable of effecting his own deliverance, God sent his Son to save sinners, to make them holy and partakers of eternal life. By Unitarians and others who do not accept the above view, atonement or reconciliation with God is made to depend on repentance, while the life and death of Christ are represented as an example to us of obedience, virtue, goodness, and beneficence, under most trying circumstances; in which view the doctrines of a propitiatory sacrifice and imputed righteousness fall to the ground. These doctrines, however, are held by most of those who receive the doctrine of the Trinity and the generally received doctrine as to the incarnation of the Son of God.

The doctrine of divine grace is a part of the system of Christianity on which very important differences of opinion subsist, especially as to the relation of grace to individual men. Such are the differences concerning election, and concerning man's ability or inability to exercise saving faith of himself. But by Christians generally the relation of the believer to Christ and his faith in Christ are ascribed to the Holy Ghost or Spirit of God, the third person of the Godhead. See CALVINISM and ARMINIANISM.

Salvation is viewed as beginning in regeneration, and as carried on in sanctification, and all its joys as connected with the progress of sanctification in this life or in that which is to come. Faith in Christ can not be unaccompanied with repentance; though believers are holy in contrast to what they once were, yet there is none in this life free from sin, the tempter of our first parents being still the active enemy of men. Responsibility belongs to human nature; and the doctrine of a judgment to come may be considered as to a certain extent a doctrine of natural religion, as may also that of the immortality of the soul; but the clear and distinct enunciation of these doctrines belongs to the Christian religion.

Of the moral element of Christianity it is sufficient here to state that it is harmonious with the doctrinal part and inseparable from it; that it is founded upon the teachings of the Bible with regard to the moral attributes of God, and is exemplified in the character of Jesus Christ; and that it is divisible into two great parts—one of the love of God, and the other of the love of man.

Among what are termed the means of grace, which form so important a part of the system, the doctrine contained in the Bible first claims attention as the means of conversion and of edification, the instrument by which salvation is begun and carried on. The ordinances of worship, prayer, and sacraments are means of grace, concerning the relative importance of which, as compared with the other means, considerable difference of opinion prevails. The same remark applies also to the combination of Christians into an organized body with its own system of Church government and discipline.

The truth of Christianity is supported by many different evidences, independent, but mutually corroborative. It appeals to reason, and demands to have its claims examined. Nor is there any faith where there is not a mental conviction arrived at by reasoning, direct or indirect. See APOLOGETICS and EVIDENCES OF CHRISTIANITY.

Revised by W. J. BEECHER.

Christian Reformed Churches: See PRESBYTERIAN CHURCH.

Christians, or **Christian Connection**: the resultant of several distinct and independent movements. 1. In North Carolina and Virginia, in 1792, James O'Kelly and twenty or thirty ministers and above 1,000 members withdrew from the recently formed Methodist Episcopal Church, in opposition to what they considered the unwarranted assumption of the episcopate by Coke and Asbury. At their first conference, Dec. 25, 1793, they informally discussed the principles since characteristic of their movement. At the second conference, Aug. 4, 1794, they all agreed that they should "be known only as Christians, and should acknowledge no head over the Church but Christ, and should have no creed or discipline but the Bible." 2. In New England, Abner Jones, M. D., left the Baptists and earnestly advocated similar principles. He organized the first churches in New England to assume no name but Christian at Lyndon, Vt., in Sept., 1800, at Bradford, Vt., in 1802, and at Piermont, N. H., and Haverhill, Mass., in 1803. 3. In Apr., 1801, a peculiar manifestation of religious excitement, known as "the falling exercise," appeared in Southern Kentucky, and it and the accompanying revival spirit spread in all directions. In May it reached 100 miles northward into the Presbyterian churches at Cane ridge and Concord in Bourbon and Nicholas Counties, then under the pastoral care of Barton W. Stone. His usual "May meeting," lasting several days, was attended by 2,500 people, many from distant States, and hundreds were converted. This famous Cane ridge revival continued several years and spread over several States, and is considered the historical beginning of a half dozen different denominations. The religious enthu-

siasm and Christian fellowship broke over the usual denominational limits of those days, and Christians of the most diverse creeds were freely fellowshiped by the young ministers who led in the work. This resulted in "heresy" trials and the formation of a new presbytery. But, soon finding that they had ceased to be Presbyterians, they disbanded on June 28, 1804, and published a unique document called *The Last Will and Testament of the Springfield Presbytery*, in which they discarded denominational names and doctrinal standards.

As a basis of universal Christian fellowship for the reunion of the divided Church they make "Christian character the only test of membership" and "individual interpretation of the Scriptures the right of all." At first they did not think of a separate ecclesiastical organization, but worked like Wesley and Moody within existing churches, seeking to destroy sectarianism by destroying its fruits. In the South their conferences at first had neither presidents nor secretaries; but after a time "a scribe was appointed for the convenience of the meeting," but at the adjournment he destroyed his minutes lest they become laws for the Church. They began everywhere to erect "meeting-houses free for all ministers of the gospel," but finally, being excluded from these as well as other church houses, they were compelled to organize. In 1893 they had more than 1,500 ministers, 1,600 churches, and 150,000 adult and active members. They are strongest in Ohio, New York, and Indiana, which include about one-half their membership. Their churches are mainly in rich farming communities and not many in cities. They have ten institutions of learning under their general patronage, and a mission work in Japan since 1887.

In 1802 Elias Smith, a Baptist pastor at Portsmouth, N. H., met Abner Jones and accepted his views, and afterward led his church over to the new name and movement. In 1805 Smith began the publication of the *Christian's Magazine Reviewer and Religious Intelligencer*, which continued two years. On Sept. 1, 1808, at Portsmouth, N. H., he issued the first number of the *Herald of Gospel Liberty*, which after several changes of location is now published at Dayton, O., and is therefore the oldest regular religious newspaper in the U. S., if not in the world. The Christian Publishing Association, at Dayton, O., also issues Sunday-school and other publications. They elsewhere publish several papers. They have no uniform system of doctrine or ritual, ordain women to the ministry, and have steadily refused to accept any doctrinal basis or statement either *for or against* the Trinity, etc. In the practice of the ordinances there is the same liberty and diversity, modified of course by local influences. In government their churches are purely independent, but usually are associated in conferences. Several of these in one or more States combine to form State conferences or associations or conventions; and these, all in the U. S. and Canada, are represented in the American Christian Convention, which meets quadrennially.

At the session of the body in Cincinnati in 1854 resolutions pertaining to the slavery question offended the Southern delegates, most of whom withdrew and formed "The General Christian Convention," under the leadership of W. B. Wellons; but soon after the war friendly relations were resumed and fraternal visits were exchanged. Commissioners from the general convention were present at the session of the A. C. C. at Marion, Ind., in 1890; and, as no law of either body hindered, they were received to seats with the delegates from other sections, but for prudential reasons chose to vote only on those questions likely to be approved by their own people. Their general convention will be preserved co-ordinate with that of New England Christian Convention and various State associations, while the churches and ministers are co-operating more and more fully in missionary, educational, and evangelistic work.

In 1890 delegates from the Christian Union were welcomed to seats, and hopes are yet entertained of a full amalgamation of these people with such similar principles.

According to the census of 1890, the Christian Connection had in the U. S. 1,424 churches, with 103,722 communicants, and church property valued at $1,774,202. See CHRISTIAN UNION CHURCHES and DISCIPLES OF CHRIST.

E. A. DE VORE.

Chris'tiansand, or **Kristiansand** (Norw. pron. kris'tĕeăan-săand): a fortified seaport-town of Norway; near its southern extremity and on the Skager-Rack; about 160 miles S. W. of Christiania (see map of Norway and Sweden, ref. 12–B). It has a good harbor, at the entrance of which is the beautiful island Odderö. Ship-building and fishing are the principal industries. It is a bishop's see and the capital of a stift of the same name. Timber, salmon, etc., are exported hence. Pop. (1891) of town, 12,541; of stift, 359,416.

Christiansborg: a fortified town on the Gold Coast, West Africa; occupied by Great Britain since 1850.

Christiansburg: capital of Montgomery co., Va. (for location of county, see map of Virginia, ref. 7–D); on Norf. and West. R. R.; 86 miles W. of Lynchburg; 2,200 feet above the sea-level. It has a female college, an academy, tobacco and shoe factories. Pop. of district of this name (1880) 4,772; (1890) 5,215; (1900) 4,888; of town, 659.

Christian Science: See SCIENCE, CHRISTIAN.

Christians of St. John: a name mistakenly applied to the MANDÆANS or MENDAITES (*q. v.*).

Christians of St. Thomas: a body of Christians found in the southern part of the Malabar coast of India. It is claimed that these Christians are the descendants of the converts of the apostle Thomas, who is supposed to have visited India, but it is probable that this sect originated from a Nestorian colony, and was in the sixth century in regular communication with the Nestorian Church of Western Asia. When the Portuguese landed in India the Church of St. Thomas numbered about 16,000 families, but was in a very poor condition. In 1599 the Jesuits attempted the conversion of this people to the Roman obedience. A connection with the papal see was established, but in 1653 most of the converts broke loose from the Roman Church. There was anciently, it would seem, more than one sect among the Christians of St. Thomas. According to Mr. Ludlow, they are at present both socially and morally much debased, though they were once the dominant class in Malabar. They are now found principally in Travancore. Attention was first called in modern times to this interesting people by Dr. Claudius Buchanan, a missionary of the Church of England in India, whose *Star in the East* was a popular work on missions at the close of the last century and the beginning of the present. See James Hough's *History of Christianity in India* (4 vols., 1839–45), *passim*.

Revised by W. S. PERRY.

Christianstad, or **Kristianstad**: a town of Sweden; capital of a laen of its own name; on the river Helge, about 9 miles from its entrance to the Baltic and 267 miles S. W. of Stockholm (see map of Norway and Sweden, ref. 14–E). It has broad streets and wooden houses. In the vicinity are the immense alum-works at Andrarum (5,000 tons annually). It has an arsenal, barracks, and a fine church; also manufactures of linen and woolen fabrics and gloves. Pop. 10,700; of laen (1891) 221,697.

Christiansted, or **Bassin**: the chief town of the island of St. Croix, in the West Indies; on the northeast coast (see map of West Indies, ref. 6–K). It has a good harbor, which is defended by a fort. The headquarters of the Danish West Indies were removed hence to St. Thomas in 1871. Pop. 5,127.

Christiansund, or **Kristiansund**: a seaport-town of Norway; on three islands, which inclose its harbor. It is in the district of Romsdal, and 85 miles W. S. W. of Trondhjem (see map of Norway and Sweden, ref. 7–B). The trade is good, and fishing is largely pursued. Pop. (1891) 10,130.

Christian Union Churches is the name adopted by a denomination which first came together in convention at Columbus, O., in 1863, though the organization was not completed until 1865. Their principles, as stated by themselves, are—(1) the oneness of the Church; (2) Christ the only Head; (3) the Bible the only rule of faith and practice; (4) good fruits the only condition of fellowship; (5) the repudiation of controversy; (6) each local church governs itself; (7) no preaching of partisan politics. Their motto is, "In things essential, *unity*; in non-essentials, *liberty*; and in all things, *charity*." They practice baptism as a condition of membership, but are practically unrestricted in their communion. They have about 30,000 members and an adherent population of about 150,000, principally in Ohio, Indiana, Michigan, Iowa, Illinois, Missouri, Arkansas, Texas, Nebraska, and Kansas. They have one newspaper, *The Christian Witness*, published at McArthur, O., and have issued several books and tracts. They are active in revival and missionary work. In Oct., 1890, they became affiliated with the Christian Connection.

Christie, WILLIAM H. M., F. R. S.: b. in Woolwich, England, Oct. 1, 1845; educated at King's College School, Lon-

don, and at Trinity College, Cambridge. In 1870 he became chief assistant at the Royal Observatory, Greenwich. He introduced several valuable improvements in the scientific apparatus used there, and became secretary of the Royal Astronomical Society in 1880. In Sept., 1881, on the retirement of Sir G. B. Airy, he succeeded him as astronomer royal. He has contributed a number of valuable papers to the proceedings of the Royal Society and of the Royal Astronomical Society; he is also the editor of *The Observatory, a Monthly Review of Astronomy*, and the author of *Manual of Elementary Astronomy*, published in 1875.

Christina, Queen of Spain: See MARIA CHRISTINA.

Christina, Queen of Sweden; b. Dec. 6, 1626; was the only surviving child of Gustavus Adolphus. She received a solid and masculine education, and learned Latin, Greek, Hebrew, politics, etc. When her father died in 1632 she was recognized as his successor under the regency of Oxenstiern. In 1644 she assumed royal power, and in 1648 concluded the treaty of Westphalia, by which Pomerania was annexed to Sweden. Her mind was strong and her character eccentric. Her subjects wished that she should choose a husband, but she manifested a constant aversion to marriage. Her eccentricity was also exhibited in an extravagant patronage of authors, pedants, artists, and buffoons. In 1650 her cousin, Charles Gustavus, was designated as heir to the throne by the states of Sweden, with the assent of the queen. Impatient of the personal restraint which the etiquette of court imposed on her, she abdicated the throne in June, 1654, while still in the bloom of youth. This act has been variously attributed to levity and magnanimity. She reserved supreme power over her suite and household, embraced the Roman Catholic religion, and became a resident of Rome. She patronized artists, founded an academy at Rome, and meddled with astrology and other chimerical pursuits. In 1657 she caused her grand equerry, Monaldeschi, to be put to death for treason. It is said she wished to recover the crown of Sweden when the king died in 1660, but she did not succeed. D. Apr. 19, 1689. See Lacombe, *Histoire de Christine* (1762); Archenholz, *Memoirs of the Life of Christina* (Stockholm, 4 vols., 1751, in French); H. Woodhead, *Memoirs of Christina of Sweden* (1863).

Christinos, kris-tee'nōs: the name of a political party in Spain during the regency of Queen Maria Christina, the mother of Isabella II., embracing the adherents of the queen. They were opposed by the CARLISTS (*q. v.*).

Chris'tison, Sir ROBERT: a Scotch physician; Professor of Materia Medica in the University of Edinburgh; b. in Edinburgh, July 18, 1797, studied in Paris with Orfila. He wrote, among other works, a *Treatise on Poisons* (1829), a standard authority; also *On Granular Degeneration of the Kidneys*, and *The Dispensatory, or Pharmacopœias of Great Britain* (1842). He was made a baronet in Nov., 1871. D. Jan. 23, 1882. See his *Life* by his sons (1886).

Christlieb, krist'lēp, THEODOR, D. D.: b. in Birkenfeld, Würtemberg, Mar. 7, 1833; studied at Tübingen; taught in France, and became a preacher in London, where he published his famous lectures on *Modern Doubt and Christian Belief*. He returned to Germany in 1865, and in 1868 became university preacher and Professor of Theology at Bonn. In 1873 he visited the U. S. as a delegate of the Evangelical Alliance. Here he delivered a fine address upon the rationalism of the present day. He published *Leben und Lehre des Johannes Scotus Erigena* (1860) and *Modern Doubt and Christian Belief* (transl., 1874). D. at Bonn, Aug. 15, 1889.

Christmas, FESTIVAL OF [so called because an especial mass, the "mass of Christ," was celebrated on that day; Fr. *Noël*; Ger. *Weihnachtsfest* (from the solemn vigils which preceded the feast itself): Ital. *Natale*, i. e. birthday]: the day on which the birth of Jesus Christ is celebrated throughout the Christian world. This event was, in the East during the third century, set on the same day of the year with his baptism and the two commemorated on Jan. 6, which in the West is the feast of Epiphany. The Romans had, like other pagan nations, a nature festival, called by them Saturnalia, and the northern peoples had Yule; both celebrated the turn of the year from the death of winter to the life of spring—the winter solstice. As this was an auspicious change the festival was a very joyous one. It began with the Romans on Dec. 17 and lasted seven days. The giving of presents and the burning of candles characterized it. Among the northern people the lighting of a huge log in the houses of the great and with appropriate ceremonies was a feature. The Roman Church, finding this festival deeply intrenched in popular esteem, wisely adopted it, and at the same time altered it in intention and observance. It was no longer natural delight at the prospect of spring, the conquest of the sun over cold and barrenness, but peculiarly Christian joy in the rise of the Sun of Righteousness with universal life and warmth which the feast set forth. The day was put just at the close of the heathen festival, and the presents and the ceremonies were meant to symbolize the unspeakable gift of God—the Saviour. Like many other popular usages the exact course of Christmas can not be traced. The authority and example of the Roman Church, and perhaps the inconvenience of celebrating two such different events as the birth and the manifestation of Christ upon the same day, caused the Eastern Church as early as the latter part of the fourth century to separate the events and keep the birth of Christ on Dec. 25.

Christmas has always been the most popular of festivals. It is in Christendom the time of gift-giving and merry-making. Even the Jews keep it in this way, and multitudes of Christians as little think of or care for its special significance. The ceremonies of the day are a mixture of pagan and Christian elements, and formerly were conducive to disorder and immorality. Thus in England there was a Lord of Misrule, and in Scotland an Abbot of Unreason, appointed to superintend and concoct the Christmas revels. The sports were boisterous and coarse, and extended from All-Hallow eve (Nov. 1) to Candlemas (Feb. 2). The favorite dish for breakfast and supper during this period was a boar's head with an apple stuck in its mouth; and by way of pastry there were plum-puddings and mince-pies. Evergreens and the sacred mistletoe decorated house and church—plainly a borrowing from the Druidic worship. In Germany and France and in other countries during the Middle Ages, from the eleventh century on, there were sacred plays at Christmas in which the scenes attendant upon the birth of Christ were enacted. At first they were in Latin, and followed the scriptural story as amplified by legend; later a comic element was introduced, and this part was in the vernacular; later, the entire play was in the vernacular. The earliest performers were the clergy and the place was the church or churchyard. But as a vernacular play it was more under purely secular control, if not entirely in lay hands, and given in a public square.

The Christmas mass, celebrated by the pope in person, is very elaborate. Formerly he said three masses—one in the Liberian basilica at midnight Christmas eve, one in the Church of St. Anastasia at dawn Christmas day, and the third in the Vatican church in the course of the day. Ordinary priests are allowed to celebrate three masses that day, because in a sense there were three births of Christ—first, the eternal generation; second, the earthly birth from a woman; and third, the birth in the believer's heart. The pope was in the habit of calling upon any sovereign who might be present in the papal chapel on Christmas night to read the fifth lesson in the office, sword in hand, and the pope would bless a ducal cap and sword, which he presented in person or sent to some prince.

Christmas has always had its appropriate songs, commonly called carols: many are most beautiful. (See next article.) It has been the theme of innumerable eloquent sermons. It is the great Sunday-school festival of the year. In liturgical churches it has its special services. But Puritanism took offense at its association with what is called "popery" and refused to observe the day. S. M. J.

Christmas Carols [*carol*, from O. Fr. *carole*: Provenç. *corolla*, ring-dance < Lat. *corol'la*, dimin. of *coro'na*, crown]: songs or hymns sung, generally in the open air, in celebration of Christmas. These were not always of a sacred character, and those of a jovial kind were sometimes sung at the Christmas board. The custom of singing Christmas carols dates from a very early period, and in the Middle Ages became very popular, when the clergy and people often joined in the singing, which was accompanied with dances and the music of various instruments. Those with which the dawn of Christmas is now ushered in in Great Britain and the U. S. are generally religious; they are sometimes sung in churches. A collection of early English carols was printed by Wynkyn de Worde in 1521. The most complete collection is by Sandys (London, 1833). There is a collection of German carols by Karl Weinhold (Gratz, 1855; new ed. Vienna, 1875),

and among the many editions of French carols, called *noëls*, there was one published at Poitiers in 1824.

Christmas Islands: See the Appendix.

Christology [from Gr. *Χριστός*, Christ + *λόγος*, word, reason]: may include everything relating to the work as well as to the person of Christ, but as the work of Christ is discussed under ATONEMENT (*q. v.*), it is better to confine Christology to the person of Christ. See also SOTERIOLOGY.

The incarnation of one of the persons of the Trinity results in a peculiar kind of self-consciousness, which is neither divine alone nor human alone, but Divine-human. Jesus Christ is not merely God, for in this case he would not differ as a person from the unincarnate Logos in the bosom of the Father. (John i. 18.) Neither is he merely man, for in this case he would not differ in respect to species of personality from any other human being. But he is God and man united—the God-man—a unique species of person.

The early Church was not forced, by false theories respecting the nature of Christ, to make nice distinctions and definitions, and consequently made none. It was content with worshiping Jesus Christ; and worship is a more direct and impressive affirmation of his divinity than even a dogmatic assertion of it. In course of time, however, several errors arose which compelled the Church to make a careful and guarded statement of the peculiarity of Christ's complex person. The first of these errors was Arianism, which denied the existence of a truly and properly divine nature in Jesus Christ. The Arians allowed that he had in the composition of his wonderful personality a very exalted nature, which is higher than that of any creature whatever, but which is not literally and metaphysically divine. This highly exalted and superhuman nature, united with a human soul and body, constituted the Arian Christ. The second error was Patripassianism. The Patripassians asserted the real and strict Deity in Christ's person, but denied his humanity. According to them, the one solitary person of God (for they also denied a real distinction of persons in the Godhead) united itself with a human body, but not with a human soul. This single person of God, whom they denominated the Father, thus united with a material body, was the Patripassian Son of God, or Christ. Anterior to this union there was no Son of God. The third error was the Nestorian. This pertained to the relations of the two natures to each other, and not to the natures themselves, both of which were conceded. The Nestorian Christ is two persons, one divine and one human, in union. The important distinction between a nature and a person is not recognized. Nestorianism overlooked the fact that the second person in the Trinity did not assume into union with himself a human individual, but a portion of human nature not yet individualized. The Logos, in the words of Hooker, "did not assume a man's person into his own person, but a man's nature to his own person; he took *semen*, the seed of Abraham (Heb. ii. 16), the very first original element of our nature, before it was come to have any personal subsistence." The union is embryonic, and thus yields only a single personality. But instead of thus blending the divinity and the humanity into one self, the Nestorian scheme places two distinct selves, one divine and one human, side by side, and allows only a moral and sympathetic union between them. There is a God and there is a man, but there is no God-man. The fourth of the ancient errors in Christology is the Eutychian or Monophysite. This is the opposite error to Nestorianism. It asserts the unity of self-consciousness in the person of Christ, but loses the duality of the natures. In and by the incarnation the human nature is transmuted into the divine, so that after the incarnation there remains only one nature. For this reason the Monophysites held that it is correct to say that "God suffered," meaning thereby that Jesus Christ suffered in the divine nature.

The Council of Ephesus in 431 made some beginning toward the settlement of the questions involved, but it was reserved for the Council of Chalcedon in 451 to make the final statement. The Chalcedon symbol defines Christ's person as follows: "We teach that Jesus Christ is perfect as respects Godhood and perfect as respects manhood—that he is truly God, and truly a man consisting of a rational soul and body. He was begotten of the Father before creation as to his deity, but in these last days he was born of Mary, the mother of God, as to his humanity. He is one Christ existing in two natures, without mixture, without change, without division, without separation—the diversity of the two natures not being at all destroyed by their union in the person, but the peculiar properties of each nature being preserved, and concurring to one person and one subsistence."

This statement asserts the continued and everlasting existence of two natures in Christ's complex person, and adjusts their relations to each other. In the first place, the union of the two natures does not confuse or mix them in such a manner as to destroy their distinctive properties or transmute one into the other. The deity of Christ is just as pure and simple deity after the incarnation as before it; and the humanity of Christ is just as pure and simple human nature as that of Mary his mother or any other human individual, sin being excluded. In the second place, the Chalcedon statement prohibits the division of Christ into two selves or persons. The incarnating act, while it makes no changes in the properties of the two united natures, gives as a resultant a person that is a *tertium quid*—a resultant that is neither a human person nor a divine person, but a *theanthropic* person. Contemplating Jesus Christ as the result of the union of God and man, he is not to be denominated simply God, and he is not to be denominated simply man, but he is to be denominated God-man.

This union of two natures in one self-conscious ego may be illustrated by reference to man's personal constitution. An individual man is one person, but this person consists of two natures—a material nature and an immaterial nature. The personality, the self-consciousness, is the result of the *union* of the two. Neither one taken by itself would yield the person. Both body and soul are requisite in order to a complete individuality. The two natures do not make two individuals in union and alliance. The material nature, taken by itself, is not the man, and the mental part, taken by itself, is not the man; only the union of both is. Yet in this intimate union of two such diverse substances as matter and mind, body and soul, there is not the slightest alteration of the properties of each substance or nature.

It follows from this statement of the Council of Chalcedon that while the properties of one nature can not be attributed to the other nature, the properties of both natures may be attributed to the person resulting from their union. While it is not proper to say that the Divine nature suffered, it is proper to say that the God-man suffered. The first statement attributes to one nature the properties and acts of the other, and is therefore not allowable. The second statement asserts that Jesus Christ, the self-conscious Ego resulting from the incarnation, endured a passion, the seat and medium of which was the human nature in this Ego. Here, again, the analogies of finite existence furnish an illustration. A man suffers the sensation of heat from a coal of fire. In this instance it would not be correct to say that the man's immaterial nature suffers in the sense of being itself burned by the fire. The immaterial soul is not the sensorium in this instance. It is not the seat of the physical sensation. To say that it is would be to attribute to an immaterial nature the properties of a material nature. Yet, at the same time, the self-conscious person, the Ego resulting from the union of body and soul, feels the sensation of physical pain, but it feels it in and through the material part, and not the immaterial. In like manner, the entire humanity of Christ, the true body and reasonable soul, sustained the same relation to his divinity that the fleshy part of a man does to his rational part. It was the sensorium, the passible medium, by and through which it was possible for the self-conscious Ego, the God-man, to suffer. Hence while it is proper to say that Jesus Christ, the God-man, existed before Abraham, and was born in the reign of Augustus Cæsar, that he was David's son and David's Lord, it would not be proper to say that the divine nature of Jesus Christ was born in B. C. 4, or that it died upon the cross in A. D. 30.

The positions taken at Chalcedon have been reaffirmed both in the mediæval and the modern Church. The doctrine of Christ's person is in some of its aspects even more mysterious and baffling to finite comprehension than the doctrine of the Trinity, and Christian science has not been inclined to go beyond the general outlines and distinctions made in 451. The Lutheran Church, in connection with the doctrine peculiar to it of the ubiquity of Christ's person, has made some attempts to explain that peculiarity of Christ's self-consciousness by which it is sometimes that of finite weakness and sorrow, and at other times that of infinite majesty and power. But the endeavor runs too near the brink of the confusion of natures, and their transmuta-

tion into each other, to be regarded as a real advance upon the Chalcedon Christology. Upon the subject of Christology, see Athanasius, *Against the Arians*, iii.; Augustine, *Letter to Volusianus*; Anselm, *Cur Deus Homo*, ii., vii.–ix.; Aquinas, *Summa*, iii., i.–xxxv.; Petavius, *De Incarnatione*; Calvin, *Institutes*, ii., xii.–xiv.; Ursinus, *Christian Religion*, Q. 35; Turrettin, *Institutio*, xiii., iv.–xiv.; Usher, *The Incarnation*; Hooker, *Polity*, v., li., lii.; Pearson, *Creed*, art. iii.; Owen, *Person of Christ*, xviii.; Dorner, *Person of Christ*; Hagenbach, *History of Doctrine*, §§ 64–67, 95–105, 179, 266, 267, 299; Neander, *Church History*, ii., 478–616; Hengstenberg, *Christology of Old Testament*; Schaff, *Church History*, iii., 705–772, article *Christology*, in *Schaff-Herzog Encyclopädie*; Shedd, *History of Doctrine*, i., 392–408; *Dogmatic Theology*, ii., 261–349; Delitzsch, *Messianic Prophecies*; Riehm, *Messianic Prophecy*; Bruce, *Humiliation of Christ* (Kenotic Theories).

Christology, Heretical and Unaccepted Theories of.—The orthodox doctrine of the person of Christ set forth in the preceding article is the resultant of many forces. It will be convenient to state in chronological sequence the various "heresies" which conditioned its development.

A. From the Apostolic Age to the Fourth Century.—1. *Ebionism* in the second century, which affirmed the humanity to the exclusion of the divinity of Christ.

2. *Gnosticism*, which came up about the same time, and resolved Christ's humanity into a delusive appearance.

3. *Rationalistic Unitarianism*, second and third centuries, which denied his divinity or claimed that it was a mere power, while generally admitting his supernatural birth.

4. *Patripassianism*, third century, which affirmed that the distinctions of Father, Son, and Holy Spirit were only verbal.

5. *Sabellianism*, third century, which affirmed that the Father, Son, and Holy Spirit were only three relations in which the one God stood toward the world. Over against such more or less prevalent opinions the Church taught the full divinity of Christ, his full humanity, and his independent personality.

B. From the Council of Nicæa, 325 to 381.—*Arius*, a presbyter of Alexandria (*q. v.*), taught that Christ was not co-equal with the Father, but was a subordinate divinity, different in essence from God, not eternal, though existent before the world, a creature of God, although the creator of the world and its incarnate Saviour. As a variant from his views the *Semi-Arians* taught that Christ was similar in his essence to God. Hence came the two terms, the orthodox *homo-ουσια*, oneness of essence between Christ and God, and the heterodox *homoi-ousia*, similarity of essence. . . . The great opponent of Arius was Athanasius. The first œcumenical council, that of Nicæa, 325, settled the controversy on the orthodox side, and the second œcumenical council, that of Constantinople, 381, reaffirmed its decision, and since then the Church has never receded from its belief in the essential oneness of the Son with the Father, which carries with it his eternal deity. Arianism was not killed by these councils. It continued to flourish for centuries among the barbarians. Ulfilas, the apostle of the Goths, was an Arian, and so were the conquerors of the Roman empire in the fifth century.

C. Having settled the question of Christ's deity, the Church was agitated by questions as to the proper constitution of his theanthropic person. There were three principal heresies:

1. *Apollinarianism*, i. e. the doctrine of Apollinaris the Younger of Laodicea (d. 390), which was that Christ had a human body and a human soul, but not a human spirit or reason. In place of the latter, he taught, was the Logos, which was therefore organically united with the man Jesus.

2. *Nestorianism*, i. e. the doctrine attributed to Nestorius, Patriarch of Constantinople (428–435), who died in exile. This was that the two natures, although subsisting in unity, so that Christ is both divine and human, are not so united as to make it admissible to call the Virgin Mary the "Mother of God," as she was often called. Christ was man and God, a twofold person.

3. *Eutychianism*, i. e. the doctrine attributed to Eutyches, abbot of a monastery near Constantinople, excommunicated by the Council of Constantinople, 448. He taught the directly opposite view to Nestorius, viz., that in the incarnation there is an absorption of the human nature by the divine. Human nature, even the human body, is deified. Hence the Eutychians considered it allowable to say "God is born," "God was crucified," "God died."

The third œcumenical council, that of Ephesus, 431, and the fourth, that of Chalcedon, 451, condemned the opinions just cited, and affirmed that the one and the same Christ is "to be acknowledged in two natures, inconfusedly, unchangeably, indivisibly, inseparably." Symbol of Chalcedon; cf. Schaff's *Creeds*, ii., 62.

D. But Greek speculation was not yet exhausted and new heresies sprang up.

1. *Monophysitism*, or the doctrine that Christ had but one composite nature; hence his humanity is a mere accident of the immutable divine substance.

2. *Monothelitism*, or the doctrine that since Christ had only one person he had only one will.

These theories met their death-blow at the sixth œcumenical council, that of Constantinople, 680, which thus defined the relation between the two wills: "We likewise preach two natural wills [in Christ] and two natural operations undivided, inconvertible, inseparable, unmixed, . . . and the two natural wills [are] not contrary, . . . but his human will follows the divine will, and is not resisting or reluctant, but rather subject to his divine and omnipotent will." See Schaff's *Creeds*, ii., 72, 73.

3. Another heresy was *Adoptionism*, or the doctrine that Christ as man was the Son of God by adoption, not by nature. This was a Western theory, and condemned at the synod of Frankfort-on-the-Main, 794.

E. Down to the Reformation the Chalcedonian Christology reigned undisputed in the Church, East and West, and passed over practically unchanged into the Lutheran and Reformed Churches. There has been discussion, however, as to (1) the *communicatio idiomatum*, in the interest of the Lutheran theory of the ubiquity (see Lutheran Church) of Christ's body, which doctrine indeed is essential to their view of the Eucharist; (2) in relation to the twofold state of Christ, viz., of humiliation and exaltation; and (3) in relation to the threefold office of Christ, viz., of prophet, priest, and king. In regard to (1) the Lutherans claimed that the human nature of Christ was in such a sense clothed with the attributes of the divine nature that the body of Christ was ubiquitous. The Reformed Churches, while willing to grant the phrase, denied that there was any transformation of the human nature into the divine, or *vice versa*, affirming that the two natures remain separate and distinct. Hence there is no ubiquity. In regard to (2) the Lutherans deny and the Reformed Churches affirm that the states refer to both natures. Upon (3) the Confessions do not materially differ.

F. Modern Christologies.—The only one which has denominational importance is the Unitarian, which is held by that body in all forms, from the old Socinian theory, which attributes semi-divinity to Christ, to the extreme humanitarian which sees in Christ merely a man. The only recent discussion in orthodox circles which has attracted attention is in relation to the Kenosis, the "emptying" of the divine attributes of Christ spoken of in Phil. ii. 7. There was such a discussion in Germany in the early part of the seventeenth century between the Lutheran divines of Giessen and Tübingen, the former holding that Christ entirely abstained during his earthly life from the use of his divine attributes, while the Tübingen divines maintained that he used them secretly. The Kenotic theory is a revival and modification of the Giessen view. It asserts that our Lord from his incarnation to his resurrection "literally emptied himself not only of his divine glory but also of his divine mode of existence, and assumed the human mode of existence, subject to the limits of space and time and the laws of development and growth" (Schaff).

Literature.—In addition to the books named by Dr. Shedd, see on the general subject Schaff's *Creeds of Christendom*, vol. i.; Hefele, *Conciliengeschichte*; A. Harnack, *Dogmengeschichte* (Freiburg in Br., 2d ed. 1888, 3 vols.). For the Lutheran view, see C. P. Krauth, *The Conservative Reformation and its Theology* (Philadelphia, 1872, p. 456, *sqq.*); H. Schmidt, *Doctrinal Theology of the Evangelical Lutheran Church* (trans. by H. E. Jacobs and C. A. Hay, Philadelphia, 1875). For the Reformed view, see the systems of Hodge (New York, 1871–73, 3 vols.); Van Oosterzee (2d ed. 1878); Shedd (1889, 2 vols.); and Strong (3d ed. 1890).

Samuel Macauley Jackson.

Christophe, krees-tof', Henri: a Negro, one of the chiefs of the insurrection of Haiti; b. of slave parents in the island of Grenada, Oct. 6, 1767. He was emancipated in his youth; went to Haiti, joined the insurrection of 1793, and

was one of the most active lieutenants of Toussaint Louverture. On the arrival of the French expedition at Cap Français (Feb., 1802), he burned the town and retired into the interior, but submitted in April. Later in the year he joined in a new insurrection; was generalissimo under Dessalines, and succeeded him in Oct., 1806, in command of the north; was made president for life Feb., 1807, and crowned king as Henri I. Mar. 28, 1811. Meanwhile he was bitterly opposed by Pétion, who had proclaimed a republic, and was followed by the southern and western districts; an almost continual war was carried on, each striving to acquire the whole island. Christophe's cause was weakened by his despotic acts and extravagance; an insurrection broke out, he was attacked in his palace of Sans Souci, and shot himself to avoid capture, Oct. 24, 1820. Christophe's body of laws was published as the *Code Henri*. HERBERT H. SMITH.

Christophe, JOSEPH: painter; b. in Utrecht about the middle of the fifteenth century. He was a pupil or imitator of Bellini and Perugino, and painted many pictures at Lisbon, to which he was called by the king, and where he passed the later years of his life. He was a master of perspective. D. in Lisbon about 1550. W. J. S.

Christopher, SAINT: a native of Syria or Palestine; supposed to have suffered martyrdom about 250 A. D. The Roman Catholic Church celebrates his festival July 25, and the Greek Church on May 9. In art he is represented as carrying the child Christ on his shoulders, and leaning heavily on his staff to support the great weight. Many wonderful legends cluster about the name which have nothing to do with the martyr. See *Legenda Aurea* (Leipzig, 1850).

Christ's Hospital, or the **Bluecoat School**: in London, was founded by Edward VI. in 1553 as a hospital for orphans and foundlings. The dress worn by the boys at present consists of a blue woolen gown, with a red leather girdle, yellow breeches and stockings, a clergyman's bands, and a blue worsted cap, which, however, they seldom wear, generally going about bareheaded. The color of the dress was formerly russet. No child is admitted before eight or after ten years of age, and none can remain after fifteen, except "king's boys" (who attend the mathematical school founded by Charles II. in 1672) and "Grecians" (the highest class), of whom five are sent on scholarships to the universities. About 1,100 boys can be admitted. Latin and Greek are the basis of instruction, but the modern languages, drawing, etc., are taught. In 1683 the governors built a preparatory school at Hertford, where the children are instructed till they are old enough to enter the hospital. By a new scheme, which came into effect in 1891, the hospital is to be transferred to the country, and this, together with the girls' school and the preparatory school, will constitute "the hospital schools." Two day-schools will subsequently be started, and the whole number of children accommodated will be 2,170, instead of about 1,200 as at present.

Christy, EDWIN P.: minstrel; b. in 1815; was manager and organizer of the original "Christy's Minstrels" in Buffalo, N. Y., in 1842; met with great success with his troupe in New York and London, and retired with a fortune in 1854. D. in New York, May 21, 1862, from injuries received by throwing himself from a window while temporarily insane. B. B. VALLENTINE.

Chromate of Lead: See CHROMIUM.

Chromatic [from Gr. *χρωματικός*, deriv. of *χρῶμα*, color; applied as a name to one of the scales in Greek music]: the name given to a succession of notes which are raised or lowered by accidentals—that is, sharps, flats, and naturals, the key being preserved throughout the passage. In the chromatic scale the differences of the notes are all by semitones. The series is formed by dividing the intervals between the whole tones of the natural diatonic scale by means of semitones. These are twelve in number and are all made equal to each other in modern music. The name chromatic is also applied to chords composed of such notes.

Chromatics: See COLOR.

Chrome, **Chrome Green**, and **Chrome Yellow**: See CHROMIUM.

Chromic Acid: See CHROMIUM.

Chromic Iron, or **Chromite**: the most abundant ore of chromium; found near Brusa, Asia Minor, in the Ural Mountains, Siberia, Norway, New Caledonia, in Maryland, and in Del Norte, San Luis Obispo, Shasta, and Placer cos., Cal., the production of the U. S. in 1888 having been 1,500 gross tons, while the imports during the fiscal year 1888 were 4,440 gross tons. It is composed chiefly of the oxides of chromium and iron. It sometimes occurs crystallized in octahedrons, but commonly massive. Chromite is used chiefly for the manufacture of potassium and sodium bichromates. It has been employed also as a neutral lining for open-hearth steel furnaces. C. KIRCHHOFF.

Chromium [from Gr. *χρῶμα*, color]: one of the elementary substances. It is found in nature for the most part in the form of the mineral *chrome-ironstone*, or *chromite*, which has essentially the composition represented by the formula $FeCr_2O_4$. It was discovered in 1797 by Vauquelin, who gave it its name on account of the number of colored compounds which it forms. Several of these have come into use on account of their color, as will be pointed out below. From chrome-ironstone, *bichromate of potash*, or potassium bichromate, is first made, and from this most other chromium compounds. The conversion of the chrome-ironstone into the bichromate is accomplished by finely powdering, mixing with lime and caustic potash, and heating to bright redness in contact with the air. This treatment gives rise to the formation of the yellow chromate of potash, or potassium chromate, K_2CrO_4. By dissolving this in water and treating with sulphuric acid, it is converted into the bichromate, $K_2Cr_2O_7$. The element chromium (symbol Cr; atomatic weight 52·45) is not made in quantity. It has been described as a grayish-white powder, not easily changed in the air. It is used to some extent as an addition to steel for the purpose of hardening the latter. The presence in steel of 2 to 4 per cent. of chromium and 1·2 to 1·4 per cent. of carbon renders it so hard that it is bored with difficulty by good steel drills. Among the most important compounds of chromium are the following: *Chromic oxide*, Cr_2O_3. This is used under the names *chrome green* and *ultramarine green* to color glass and porcelain green, and as a pigment in oil and water colors. *Guignet's green* and *Amandon's green* are chromic oxide prepared by special methods. *Chrome alum*, $KCr(SO_4)_2 \cdot 12H_2O$. This resembles ordinary alum very closely, differing from it in composition in that it contains chromium instead of aluminium. It is used in dyeing, calico-printing, and tanning. *Chromates.—Potassium chromate*, K_2CrO_4, is not largely used. *Potassium bichromate*, $K_2Cr_2O_7$, is used extensively in the preparation of chrome pigments, in the manufacture of safety matches, etc. When a mixture of gelatin and potassium bichromate is exposed to light, the gelatin is rendered insoluble. This fact is utilized in the "carbon" process of photography. *Lead chromate*, $PbCrO_4$, is formed by treating a solution of a chromate with a solution of lead acetate. It is of a lemon-yellow color. It is used as a pigment under the names *chrome yellow* and *Paris yellow*. A basic chromate is known as *chrome red*. By mixing chrome yellow and chrome red in different proportions, pigments varying in shade between vermilion and lemon yellow are made. A substance made by mixing chrome yellow with Prussian blue is used under the name *green cinnabar*.

IRA REMSEN.

Chromo: See LITHOGRAPHY.

Chromoplasm: See *Cell*, in BIOLOGY.

Chromosphere [Gr. *χρῶμα*, color + Eng. *sphere*]: a layer of gases and vapors which covers the surface of the sun, resting upon the photosphere. It is entirely invisible to direct vision, except at the very moment of the beginning or ending of a solar eclipse. See SUN.

Chronicle [M. Eng. *cronikle*, from Angl. Fr. *cronicle*, modified from O. Fr. *cronique* (cf. Engl. *chronique*) < Lat. *chronica* = Gr. *τὰ χρονικά*, annals, deriv. of *χρόνος*, time. The modification of suffix in Engl. is an adaptation to the commoner type of *particle*, *article*, *miracle*, *oracle*, etc., and is parallel to *syllable* for Fr. *sillabe*, *principle* for Fr. *principe*, *manciple* for Fr. *mancipe*, *participe*, etc.]: an historical register of facts and events arranged in the order of time; a history in which the events are related in the order of time. The histories written in the Middle Ages were chronicles. Among the most celebrated writers of chronicles were Froissart, Eginhard, Monstrelet, Holinshed, and Geoffrey of Monmouth.

Chronicles: the name of two canonical books of the Old Testament. They are counted as one book in the reckoning which reduces the number of the Old Testament books to twenty-four. The first nine chapters are genealogical, and cover a period from the creation to the middle of the Persian times. The remaining chapters consist of selections or

abridgments of the matters contained in Samuel and Kings, with a large amount of supplementary matter. Hence the Septuagint named it Παραλειπόμενα (Paraleipomena, Supplements), and the Vulgate borrowed this name. The last two verses repeat the first verses of Ezra, the author apparently regarding his task as complete when he had brought the earlier history up to the times treated of in Ezra. The book was composed at or soon after the time of Nehemiah. Its peculiar characteristic is that it is written from the standpoint of interest in the Levitical and ritualistic institutions. Its authority was assailed during the first half of the nineteenth century by the rationalists, but no one doubts that it contains valuable contributions to our knowledge of the history of the Israelites. Beyond this the views of men differ much according to their different views of the inspiration of the Scriptures. Revised by W. J. Beecher.

Chronogram [from Gr. χρόνος, time + γράμμα, writing, deriv. of γράφειν, write]: an inscription in which a certain date is indicated by printing some of the letters in larger type than the others, and taking them as Roman numerals. The date 1632 is thus expressed in the inscription of a medal of Gustavus Adolphus: ChrIstVs DVX ergo trIVMphVs. If it is a verse, it is called chronostichon.

Chronograph [from Gr. χρονογράφος, recording time; χρόνος, time + γράφειν, write]: an instrument used (chiefly in astronomy) for recording the exact instant of the occurrence of an event, such as the transit of a star over the spider-lines of a telescope. The record is made by electro-magnetism. A point or pen, governed by the clock, marks uniformly the seconds. It can also be brought into action at any desired instant by an electric key under the finger of the observer. The first chronograph was simply Morse's telegraphic instrument slightly modified. The method was originally suggested by Prof. Locke, of Cincinnati, about 1850. The chronographs now in use usually employ a rotating cylinder covered with paper, and turning on a helical axis, each revolution occupying one minute. See Chronoscope, Velocimeter, and Ordnance. Revised by E. L. Nichols.

Chronology [from Gr. χρόνος, time + λόγος (-λογία), word, reason]: the science that treats of the succession of events in time. As an essential part of the sciences of astronomy and geology in determining the order of natural events and the duration of periods, it is discussed in those articles. The present article deals with the subject in its more limited sense as applying only to human events. Before the art of writing was known the dates of events were matters of mere oral tradition, and even after the invention of letters a period was described as lasting so many "generations," and an event as occurring in the reign or archonship of some king or magistrate. Before the eighth century B. C. dates of events are largely conjectural. The attempts to assign a precise date to the creation of the world occasioned much fruitless labor and led to the most diverse results, of which Archbishop Ussher's estimate is the most familiar to English readers. From the time of Adam to the birth of Christ he reckons 4,004 years, a conclusion wholly at variance with modern science. Of early chronological systems the most definite is the Babylonian. Sir Henry Rawlinson's discovery of the Assyrian canon, published in 1862, determines the chronology of Assyria from 1330 B. C. for the next 700 years. (See the articles Babylonia, Babylon, and Assyria.) The point of time, however, from which Babylonian history is reckoned is 747 B. C. This is the so-called era of Nabonassar, and curiously enough both the Roman and the Greek eras date from nearly the same point, the former beginning with the year 776 B. C., when Coræbus was victor at the Olympic games, and the latter from 753 B. C., the supposed date of the founding of Rome. The unit of time in the Greek chronology was the Olympiad (*q. v.*), a period of four years, while the Romans designated an event by naming the consuls in whose term it occurred. After 312 A. D., however, the authorized system throughout the Roman empire was by the Indiction (*q. v.*) a period of fifteen years, and its use can be traced in the West as late as the fifteenth century, though the Olympiads were followed in the East till 440 A. D. The simple plan of counting by years was first adopted in 150 B. C. by Eratosthenes, whose works have perished. Dionysius Exiguus in the sixth century A. D. was the first to employ the Christian era, beginning with the birth of Christ, which, however, probably occurred from two to four years earlier than the point from which Dionysius reckoned. Down to the middle of the eighteenth century A. D. historical records are often confused by the fact that at different periods and among different nations various dates were selected for the beginning of the year, e. g. March 25, Christmas Day, Easter, and January 1. (See Calendar.) The Christian era is attended by this inconvenience, that we must count backward for the dates of events prior to the birth of Christ, a difficulty obviated by the Julian system, proposed by Joseph Scaliger in the sixteenth century, which selects the date 471 B. C. as a starting-point. Other important eras are the era of Constantinople, which began with 5509 B. C.; that of the Seleucidæ, dating from the capture of Babylon by Seleucus in 311 B. C.; the Mohammedan era from the Hegira (*q. v.*), 622 A. D.; and the Persian era of Yezdegerd, 632 A. D. For the ancient chronologies, see Persia, India, China, Egypt, etc. See also Year, Month, Day, Cycle, Period, and Week. The most laborious work on chronology is *L'Art de Vérifier les Dates* (1818–31). There are manuals by Ideler (1831; n. ed. Berlin, 1883); Blair (1851); Brinckmeier (1882); Woodward and Cates (1872); Brockmann (Berlin, 1883); Haydn (New York, 1883). F. M. Colby.

Chronometer [from Gr. χρόνος, time + μέτρον, measure]: a watch of peculiar construction and great perfection of workmanship, used where time must be measured with extreme accuracy, as in the determination of geographical longitudes by measuring the difference of time. The chronometer differs from the ordinary watch in the principle of its escapement, which is so constructed that the balance is entirely free from the wheels during the greater part of its vibration; and also in having the balance compensated for variations of temperature. Marine chronometers generally beat half-seconds, and are hung in gimbals in boxes about 6 or 8 inches square. The pocket chronometer does not differ in appearance from the ordinary watch, excepting that it is generally a little larger. Chronometers are of immense utility in navigation, and ships going on distant voyages are usually furnished with several, for the purpose of checking one another, and also to guard against the effects of accidental derangement in any single one. The accuracy of chronometers is truly astonishing, the departures from perfect uniformity of running amounting only to small fractions of a second from day to day for long periods of time.

Chronophotography: See the Appendix.

Chronoscope [from Gr. χρόνος, time + σκοπός, watching, watchman; deriv. of σκοπεῖν, observe]: a kind of chronograph invented in 1835 by Wheatstone for measuring the duration of the electric spark. It consisted essentially of a plane mirror revolving with a high but known velocity, the elongation of the image of the spark as seen in this mirror furnishing the measure of the duration. In 1858 Feddersen substituted a concave for the plane mirror, with better results. In 1867 Rood replaced the concave mirror by a set of achromatic lenses and a plane mirror, and succeeded in measuring intervals of time as small as 40 one-billionths of a second. A chronoscopic apparatus was constructed by Fizeau for measuring the velocity of light. In this there was employed a rotating circular disk with sectors alternately open and closed. A ray from a luminous source transmitted through one of the open sectors, and reflected back from a distant mirror, is, with a certain velocity of rotation, intercepted by a closed sector, and with a higher velocity is transmitted through the next following open sector. The distance traversed in Fizeau's experiment was 8,633 meters (about 5⅜ miles). With this and the known velocity of rotation the velocity of light per second is computed. Foucault, and later Michelson, and also Newcomb, used for the same determination a chronoscope with a concave revolving mirror. Chronoscopes for measuring the time of flight of projectiles have been invented by Wheatstone, Hipp, Henry, Navez, Benton, De Brettes, Gloesener, Schultz, Bashforth, and others. In these the beginning and end of the interval measured are marked by the passage of the induction spark, or mechanically by electro-magnetism, generally upon a revolving cylinder, but in some upon a fixed arc before which a pendulum swings. For marking *equal* minute intervals steel tuning-forks are used in various ways.

Revised by E. L. Nichols.

Chrudim, *k*hroo'dim: a town of Bohemia; on the Chrudimka, a small river; 62 miles S. E. of Prague (see map of Austria-Hungary, ref. 3–E). It has several churches, a convent, and a gymnasium; also manufactures of cloth, beer, and sugar, and a large market for horses. Pop. (1890) 12,128.

Chrysalis [Lat. from Gr. χρῡσαλλίς, the gold-colored sheath of butterflies, deriv. of χρυσός, gold]: originally, the pupal stage of certain butterflies, as, for instance, the thistle but-

terfly, on account of their golden spots; but the term has been extended to the pupal condition of all *Lepidoptera* (butterflies and moths), and even of all insects. While at a first glance a chrysalis bears but little resemblance to the perfect insect, a little examination will reveal all the parts. The wings are folded around the body, while between them can be seen the legs and antennæ, and behind the rings of the abdomen, all inclosed in a hard, horny skin. In some cases the chrysalis is without other protection, but in others the larva, before passing into this stage, spins a silken cocoon, inside of which the transformation is undergone.

Chrysamine: See BENZIDENE DYES.

Chrysanthemum [Gr. χρυσάνθεμον, the corn-marigold; χρυσός, gold + ἄνθεμον, flower]: a composite Japanese flower which has become popular in Europe and America. There is much confusion respecting the original species or form of the chrysanthemum, but recent authorities hold that it is derived from *Chrysanthemum sinense*, and that *C. indicum*, which was formerly supposed to be the original form, has given comparatively few garden types. The genus *Chrysanthemum*, as now accepted by English botanists, comprises a great variety of plants, including the pyrethrums or feverfews and the ox-eyed daisy. The chrysanthemum has been grown from the earliest times in Japan, and an open 16-rayed chrysanthemum is one of the imperial emblems. The greatest diversity of forms has arisen in recent years, largely because of the free introduction of the loose and odd forms from Japan, which are much unlike the older, stiff, and bell-form (or "incurved") types which are known as Chinese chrysanthemums. In the U. S. the tendency is to breed the Japanese types to the exclusion of the formal kinds, while the opposite is still true in parts of Europe.

Chryselephantine Statues [*chryselephantine* is from Gr. χρυσαλεφάντινος, of gold and ivory; χρυσός, gold + ἐλέφας, -αντος, elephant, ivory]: statues whose surface was of gold and ivory. These statues were made by the Greeks of Pericles's time and later, and were of great celebrity in antiquity, the most important being the statue of Zeus in the temple of that god at Olympia and that of Athena Parthenos in the Parthenon at Athens. The first named of these statues is stated to have been seated and 43 feet in height, with a pedestal about 20 by 30 feet in horizontal dimensions, so that the whole composition must have filled up the western end of the naos or inclosed room of the temple, occupying all the space between the inner rows of columns. In later times chryselephantine statues were made as portraits of kings and princes.

Chrysip'pus (in Gr. Χρύσιππος): an eminent Stoic philosopher; b. at Soli, in Cilicia, 280 B. C.; son of Apollonius of Tarsus. He was a pupil of Cleanthes, and was distinguished for his skill in dialectics and his subtlety as a disputant. He once said to Cleanthes, "Teach me only your doctrines, and I will find the arguments to defend them." The Sorites is said to have been invented by Chrysippus. He wrote a great number of works, none of which is extant. He was considered to be the greatest Stoic philosopher except Zeno. D. in 207 B. C. See Ritter, *History of Philosophy*; J. F. Richter, *Dissertatio de Chrysippo Stoico* (1738); E. Zeller, *History of Greek Philosophy* (4th ed. 1876).

Chrysoberyl [from Gr. χρυσοβήρυλλος, χρυσός, gold + βήρυλλος, beryl]: a mineral sometimes yielding fine gems, an aluminate of glucina. It has a hardness of 8·5, next to that of sapphire, and is usually some shade of yellow, yellowish green, sage green, greenish brown, etc. It crystallizes in rhombic prisms, generally twinned or compounded into hexagonal forms. The transparent, light-colored stones which come chiefly from Ceylon are called by jewelers *Oriental chrysolite* (not the true CHRYSOLITE, *q. v.*). *Opalescent chrysoberyl*, or those that have an opalescent play of light, are properly called *cymophane* (Gr. κῦμα, a wave of the sea, and φαίνεσθαι, appear). The finest variety of cat's-eye, called *Oriental cat's-eye*, is a chrysoberyl, in which the peculiar chatoyant line of light is due to the twinned structure of the crystal, or to included impurities. (See also under CAT'S-EYE for other varieties of cat's-eye.) The line of light appears when the stone is cut across the prism and polished *en cabochon*. This variety, which is highly valued, is found with the others in Ceylon and Brazil. *Alexandrite* is a chrysoberyl containing some oxide of chromium, which gives it a fine rich green color by day, but by artificial light the green changes to a raspberry or columbine red. It was named by Nordenskiold for the Emperor Alexander II. of Russia, on whose birthday it was identified. It was found at Takowaja, in the Urals. Gems of this variety have been found in Kandy, Ceylon, up to 65 carats in weight, and valued at $2,000 each. Chrysoberyl occurs at several places in the U. S., notably at Haddam, Conn., Greenfield, N. Y., and Stow, Me., but not of a quality suitable for gems.

GEORGE F. KUNZ.

Chrysocol'la [Lat., from Gr. χρυσόκολλα, gold-solder; χρυσός, gold + κόλλα, glue]: a hydrated silicate of copper; sometimes called copper-green; used as a pigment by the ancient Greeks. The color is verdigris or emerald green, passing into sky blue, with a shining or dull resinous luster. It is found native in considerable abundance in Missouri and Wisconsin.

Chrys'olite [from O. Fr. *crisolite* < Lat. *chryso'lithus*, from Gr. χρυσόλιθος, a bright yellow stone, prob. the topaz; χρυσός, gold + λίθος, stone]: a mineral (also called *olivine*, and, by jewelers, peridot) consisting of a simple silicate of magnesia and protoxide of iron. It occurs in igneous rocks, such as lava and basalt, and also in meteoric stones, either as grains or in crystals of rather complicated form, having a vitreous luster and conchoidal fracture, transparent and doubly refracting, of an olive-green color, and a hardness somewhat less than quartz. The finer varieties make beautiful and valuable gems, of a rich olive to golden green. Many fine specimens may be seen in the chapel of the Three Magi in the Cologne Cathedral. Recently small transparent gems have been cut from olivine crystals found in meteorites. It was formerly confounded with emerald, but the tint is entirely different; the *chrysolithus* of the ancients would seem to have been our topaz. Fine specimens are found in Egypt and other parts of the East, and in New Mexico.

GEORGE F. KUNZ.

Chrysolo'ras, MANUEL, or EMMANUEL: a Byzantine Greek scholar; b. in Constantinople about 1355; noted as being the first teacher of the Greek tongue of importance in the modern world. His fame as a scholar reached Italy in the end of the fourteenth century, and Guarino da Verona went to Constantinople to study under him. But in the early part of the last decade of the century (1393?), Chrysoloras, with a fellow Greek, Kydonius, went to Venice on a mission from the Greek emperor. The former was at once besieged by would-be learners, and did in fact give lessons in Greek during his stay. He returned soon to Constantinople, and only in 1396, on invitation from the Florentine Republic, did he come to occupy the chair of Greek created originally for Leontius Pilatus, but given up by him in 1363. During the three or four years of his teaching, Chrysoloras had among his pupils several of the leaders in the revival of classical learning—Niccolò Niccoli, Leonardo Bruni, Manetti, Marsuppini, Traversari. Others obtained, at least indirectly, inspiration from him. He composed a Greek grammar (*Erotemata*), which served for generations as the basis of Italian instruction in Greek. In 1400, however, he left Florence to join the emperor, Manuel Palæologus. In 1402 we find him teaching in Pavia. Here he translated Plato's *Republic* into Latin, thus inaugurating the long series of translations which within a century made ancient Greece known to the Western world. In 1404 his presence in both Rome and Venice has been proved. After another visit to Constantinople we find him again in Venice. In the years 1408–10 he seems to have journeyed in France, England, and Spain. From 1410 to 1412 he was in Florence, Bologna, and Rome, probably occupied as before with teaching Greek. At the same time he becomes involved in larger concerns, and we find him engaged in the preliminaries of the Council of Constance, which, among other things, was to unite the Eastern and Western Churches. At Constance, however, before the council had come together, he died Apr. 15, 1415. Besides the works mentioned above, we have from him a comparison of new with ancient Rome (Σύγκρισις παλαιᾶς καὶ νέας Ρώμης) and a number of familiar letters. See G. Voigt, *Die Wiederbelebung des classischen Alterthums* (2d. ed. Berlin, 1880); T. Klette, *Beiträge zur Geschichte und Literatur der Ital. Gelehrtenrenaissance* (Greifswald, 1888).

A. R. MARSH.

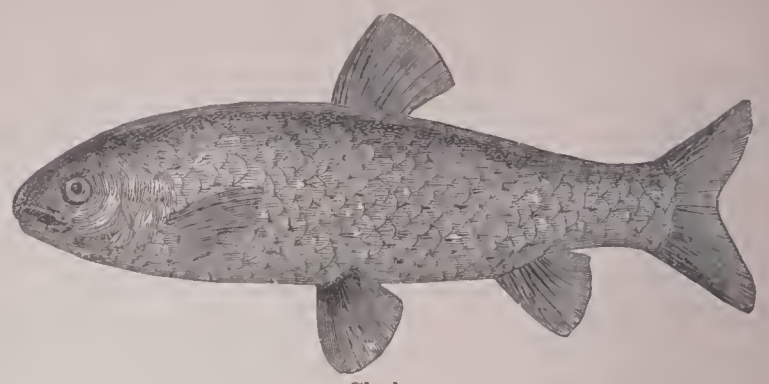
Chrysoprase [older *crisopace*, from O. Fr. *crisopace*, but now adapted in form to its original, Gr. χρυσόπρασος, a golden-green gem; χρυσός, gold + πράσον, leek]: a rare variety of chalcedony, the coloring-matter of which is oxide of nickel; it is a beautiful translucent ornamental stone, specimens of which realized a high figure a century ago, when it was most esteemed. Through age it frequently loses its greenish cast

to some extent, and becomes a dirty yellow green. Dampness, or perhaps darkness, is believed to be favorable to its preservation. The wall of the chapel of St. Wenzel at Prague is covered with slabs of this beautiful material. It is found at Rabenstein, in Silesia; and in the U. S. at Visalia, California, and Riddles, in Oregon. The chrysoprase of the ancients has not been positively identified. It is mentioned once in the Bible (Rev. xxi. 20). G. F. K.

Chrys'ostom [Gr. *χρυσόστομος*, liter., golden-mouthed; *χρυσός*, gold + *στόμα*, mouth], John: the most accomplished orator of the ancient Greek Church; b. in Antioch, Syria, 347. He was brought up by his widowed mother, Anthusa, his father, Secundus, a distinguished military officer, having died soon after his birth. He had an older sister. He studied rhetoric under Libanius, the famous Sophist, and philosophy under Andragathius. Quitting the legal profession, upon which he had entered, he was ordained reader, 370, in Antioch, by Bishop Meletius. While not leaving home, he led a monastic life. In 374 his mother died, and he then retired to a monastic community in the mountains S. of Antioch. But his health being affected by his austerities, he returned to Antioch in 381, and was promptly ordained deacon by Bishop Meletius, whose successor, Flavian, raised him to the priesthood in 386. He quickly was recognized as a great preacher, and his fame spread throughout Christendom. On Feb. 26, 398, he was consecrated Archbishop of Constantinople, having, by a mixture of force and fraud, been carried thither against his will. His boldness as a reformer brought him into trouble. Both among the clergy and at the imperial court enemies rose up against him. They were headed by the empress and by Theophilus, Patriarch of Alexandria. The latter called a council at Chalcedon, and deposed and banished Chrysostom on trumped-up charges in 403. But the sentence was scarcely carried out ere it was revoked, and he returned in triumph. On June 5, 404, he was again banished. Under the scorching heat he was conveyed to Cucusus, a mountain village in the Taurie range between Cilicia and the Lesser Armenia. Thence he carried out an extensive correspondence, so that his influence was really wider than when on his throne. On learning of this, the empress had him transferred, first to Arabissus, then to Pityus in the Caucasus, on the eastern shore of the Black Sea, the most inhospitable spots in the empire. He could not stand the journey, but on Sept. 14, 407, died at Comana, in Pontus. He was little of stature, with a large, bald head, hollow cheeks, and deep sunken eyes. His eloquence was of the highly ornate Asiatic type, but also very incisive and practical. In rebuke he was terrible, calling things by their right names. He had great reverence for the Scriptures, lived abstemiously, defied danger, promoted missions, and died exclaiming, "Glory be to God for all things! Amen." He was the most voluminous of the Greek Fathers. His most important and permanently useful writings are his homilies and commentaries. As a preacher he has no superior in the history of the Church. As a foremost representative of the Antiochian school, which sought to give the Scriptures their grammatical and historical sense, he seldom uses allegory, but speaks plainly and practically. He laid great stress upon the freedom of the human will and its co-operation in the work of conversion. He magnified the grace of God which extends salvation to all who will accept it. His laudation of saints promoted hagiolatry, but it is remarkable that he furnished no support to mariolatry. He considered the Bishop of Rome as the successor of Peter, and appealed to him in his first banishment; but this was conceding to him "a primacy of honor, not a supremacy of jurisdiction." (Schaff.) The best edition of his works is the Benedictine (13 vols. folio, Paris, 1718–38; reprinted by Migne, 1859–63, 13 vols.). His most important works have been translated into English (edited by Dr. Schaff) by the Christian Literature Company (New York, 1889–90, 6 vols.). The best biography of Chrysostom is by W. R. W. Stephens (London, 1872; 3d ed. 1883). Cf. the sketches by R. W. Bush (1885) and Philip Schaff (New York, 1891).

Samuel Macauley Jackson.

Chub: a name given in Great Britain to *Leuciscus cephalus*, a fresh-water fish of the carp family, having a stout, round body and broad head. It attains a weight of 5 lb., and is taken by anglers, although of little account for food. In the U. S. the term chub is applied to various fishes bearing more or less resemblance to their European namesake. In California the chub is *Leuciscus atrarius*; in the Middle and Southern States it is *Semotilus corporalis*, well known as the horned dace: E. of the Alleghanies it is *S. bullaris*, also called fall-fish. These are mostly of small size, rarely



Chub.

reaching a length of 12 inches, and inhabit clear, running streams, where they afford sport to young anglers.

F. A. L.

Chubut': a territory of Argentina, comprising that portion of Patagonia between the rivers Chubut and Negro. Area over 15,000 sq. miles. Civilized population, a few thousand. The interior is in great part arid, and is occupied by roving Indians. Chubut was first settled in 1865 by Welsh immigrants, who established a colony at the mouth of the Chubut river, now known as Rawson. H. H. S.

Chuck-will's-widow: *Antrostomus carolinensis*; a bird of the family *Caprimulgidæ*, so called from its peculiar loud cry. It is the largest member of the group found in the U. S., being about twice the size of its near relative the whippoorwill, which it much resembles in plumage, being mottled with black and brown. It ranges from the South Atlantic States to Central America. F. A. L.

Chu-en-Aten: See Egypt (*Ancient*).

Chufu: king. See Egypt (*Ancient*) and Supms.

Chu-hi, choo'hee, or **Chu-fu-tsĕ** (that is, *Chu* the philosopher): a distinguished Chinese scholar and philosopher whose influence on Chinese learning and thought is second only to that of Confucius; b. in 1130; d. in 1200. As a commentator on the Chinese classics, he successfully introduced interpretations and principles of interpretation almost entirely at variance with those of the scholars who had preceded him. He was also one of the founders and the chief ornament of the speculative school of philosophy in China. A collected edition of his philosophical works was first published in 1415 by the third Emperor of the Ming dynasty. A still more complete edition in sixty-six books was prepared under imperial supervision, and published by imperial authority in 1713. His disciples were numerous, and many voluminous collections of "notes" of his lectures and conversations were compiled and issued by them. A history of China in fifty-nine books was prepared by them under his superintendence. This forms the basis of de Mailla's *Histoire de la Chine* (3 vols., Paris, 1777–85). His most popular work, the *Siao Hioh*, or Juvenile Instructor, is still in use all over China as a text-book. See Wylie's *Notes on Chinese Literature* (London and Shanghai, 1867), and McClatchie's *Confucian Cosmogony* (London, 1874).

Robert Lilley.

Chu-kiang, or **Pearl River**: a river of Southern China, and that on which the city of Canton, in the province of Kwangtung, is situated. It is formed by the union of the "North" and "West" rivers, which unite at a place called Samshui, or "Three Waters," about 30 miles N. W. of Canton, to form the Chu-kiang. From that point it flows eastward past the city of Fat Shan, expanding at Canton into a broad tidal river which, lower down, becomes subdivided into an intricate network of waterways around and between numberless flat alluvial islands. Twelve miles below Canton is the anchorage of Whampoa (or Hwang-pu). Ten miles farther down still the Chu-kiang receives from the left the waters of the East river. Some miles below this the river narrows into what is called the *Hu-mun* or Tiger Gate by the Chinese, the Boca Tigris of the Portuguese, where the famous Bogue forts are situated. (See Boca Tigris.) From this the river widens out into a great estuary, having a breadth of about 70 geographical miles. Total length, 110 miles. For the Si-kiang or "West River," see China. R. L.

Chulpas: See Incan Antiquities.

Chumashan Indians [from *Chumash*, the name of the Santa Rosa islanders. By most authors they have been

mentioned as Santa Barbara Indians, from the name of the town and mission best known]. The tribes comprising this linguistic family were formerly located on the coast of California between 34° 20′ and 36° lat. There are known to have been seven distinct dialects of the family, viz., those spoken around San Luis Obispo, Purissima, Santa Inez, Santa Barbara, and San Buenaventura missions, and the dialects of Santa Rosa and Santa Cruz islands. If, as is probable, the language spoken on other islands of the Santa Barbara group was distinct, the number would be increased by several more. These dialects, with the exception of the first, constitute an unusually homogeneous language. They are so much alike that their close relationship appears from the most cursory examination of vocabularies, and while apparently each dialect contained a greater or less number of words more or less different from the kindred tongues, they were so sufficiently alike as to be in great part mutually intelligible. The tongue spoken by the San Luis Obispo Indians, as appears from a vocabulary collected by the writer in 1884, differs markedly from any of the others, and it has been relegated to the present family with some doubt. Its decided differences from the other dialects are to be accounted for, perhaps, by the greater isolation of the Indians speaking it, they being the most northern of the family, and the probable greater extent to which it borrowed material from its neighbors of other stocks. On the south the Indians of this family were bordered by tribes of the widespread Shoshonean stock, which, occupying an enormous domain in the interior of the country, found their way through the passes of the southern Sierras, overcame the tribes in possession, and gained the coast, to be in turn overcome by the climate and surroundings, and reduced in character and disposition to a position little if any above those of the people they dispossessed. Who the latter were is, of course, only a matter of surmise, but it is highly probable that in part, at least, they were Indians of the present family. Recent linguistic investigations seem to show, indeed, a connection between the language of the present family and that of the Yuman family to the S., the two being separated geographically by the wedge of Shoshonean invasion. Whether the thread of linguistic connection results from a borrowing of material, or the two ultimately will be found to have a common parentage, remains to be seen, but in any case doubtless both the families mentioned were pressed N. and S. respectively by their more warlike Shoshonean neighbors.

Peculiar interest attaches to the Indians of this family, as they were the first of the California tribes to be visited and reported upon by Europeans. Cabrillo sailed along the California coast in 1542, and though the accounts of his voyage contain but meager details of the aborigines, they are yet sufficient to show that little change had taken place between the time of his visit and the subsequent occupation by the Franciscans, more than two centuries later. The mission of San Luis Obispo on the northern confines of the country occupied by this family was established in 1772. San Buenaventura, on the southern extremity, was founded in 1782; the establishment of Santa Barbara, Purissima, and Santa Inez followed successively in 1786, 1787, and 1804.

Though by no means physically weak, the Indians of this family appear to have been of a singularly peaceable and sluggish disposition. Living in a mild and equable climate, and surrounded by a bountiful food supply, their mental faculties were never sharpened by the struggle for existence so necessary for high development. When entered by the Spaniards, the region was found occupied by a large population established in numerous villages, chiefly on the coast and the contiguous islands; for these Indians, though claiming part of their subsistence from the land, especially from seeds, roots, acorns, and the like, were not hunters, but fishermen.

Their political organization consisted of a series of petty confederacies, if so large a term be permissible, united to some extent by the common bond of language and habits, but disconnected in every other way, and often indeed on unfriendly terms. Warlike these Indians never were, and hostilities growing out of trespass disputes or the capture of women never rose to the dignity of wars.

To their peaceable disposition, sluggish habits, and disconnected political state, which prevented all possibility of acting in concert, are due their easy enslavement under the mission system.

It is not necessary to conclude that the names given by Cabrillo in 1542 were allotted to the same village sites in the nineteenth century, though it is probable enough that in some instances such was the case. Recent examinations of some of the village sites near Santa Barbara have shown that they have been occupied for a long term of years, probably for centuries, and as Indian village names often have their origin in geographic peculiarities, it is likely enough that the names were perpetuated. On the other hand, it appears from the duplication of names in the archives of the different missions either that the same village is claimed by two missions, or, as is probable, that not infrequently two or more villages received the same or nearly the same name, the latter supposition being likely enough when the similarity of the dialects spoken is considered.

Of the fifty odd villages named in the Cabrillo narrative, about 11 per cent. appear to be identifiable with the later lists. Considerably more than two hundred years had elapsed between the date of Cabrillo's list and the founding of the missions, and nearly three centuries and a half from the date of that voyage and the taking of the writer's list. Hence any attempt to identify the old names with others recently in use must necessarily be largely conjectural.

In 1884 the writer visited the several counties formerly inhabited by the populous tribes of this family, and discovered that about forty men, women, and children survived. The adults still speak their old language when conversing with each other, though on other occasions they use Spanish. The largest settlement is at San Buenaventura, where perhaps twenty individuals live near the outskirts of the town.

AUTHORITIES.—S. Powers, *Indians of California, Cont. to N. A. Eth.*, iii. (Washington, 1877); H. H. Bancroft's *History of California*, i.–vii. (San Francisco, 1884–90); H. W. Henshaw, *Missions and Mission Indians of California*, in *Popular Science Monthly* (New York, Aug., 1890). See INDIANS OF NORTH AMERICA.

H. W. HENSHAW.

Chumbul′: a river of India; rises in the Vindhyan Mountains; flows nearly northeastward, and enters the Jumna 85 miles S. E. of Agra. Length, 500 miles.

Chumpac: See CHAMPAC.

Chunam′: a mixture of lime with sand and other ingredients, used in India from time immemorial for plastering walls and for the manufacture of many small articles, some of them decorative. Milk, buttermilk, eggs, GHEE (*q. v.*), powdered chick-peas, hemp, sugar, gum, and different dried fruits are among the materials sometimes mixed with the lime and sand. Different makers have their own different secrets for making chunam. The work done with it is often very delicate and beautiful, as it is hard and durable and takes a high polish.

Chunaten: See KHUNATEN.

Ch'ung-k'ing: a foo or departmental city and important riverine port of China, in the province of Sze-chuen, on the left bank of the Yang-tse, and the confluence with it of the Kia-ling river from the north; about 1,700 miles from the sea; lat. 29° 33′ 50″ N., and lon. 107° 2′ E. (see map of China, ref. 6–G). It stands on a rocky promontory, 200 feet above the level of the Yang-tse (here called the Min), and about 840 above the level of the sea. It is a walled city, built in its present form by the first emperor of the Ming dynasty (1368–98), and has seventeen gates, of which only nine are made to open, and eight are permanently closed. Since 1876 it has been the seat of a British consul, though no trading was permitted. On Mar. 2, 1891, it was opened to foreign trade in accordance with a convention signed there Mar. 31, 1890, and a custom-house established. Ch'ung-k'ing is about 600 miles above the port of Ichang, the highest point of steam navigation. From Ch'ung-k'ing to Ichang the river is a succession of formidable rapids and eddies, and requires for its navigation both great skill and native boats specially built for the traffic. Chief exports, silk, salt, *pelah* or insect wax, tobacco, etc. Pop. 250,000.

R. L.

Chunhuhn: See CENTRAL AMERICAN ANTIQUITIES.

Chupra: See CHAPRA.

Chuquisa′ca, or **Char′cas**: a southeastern department of Bolivia; bounded N. by Cochabamba and Santa Cruz, E. by Brazil, S. by Tarija, and W. by Potosí and Oruro; area (including a large tract formerly pertaining to Santa Cruz), 72,700 sq. miles. Pop. (1888) estimated at 123,347, besides wild Indians. Capital, Sucre. The western part is more or less mountainous, with a temperate climate in the high valleys, where most of the civilized population is congregated.

There are extensive forests, and fertile open lands adapted to grazing and agriculture. Some of the richest silver mines of Bolivia are in this region. The eastern and more extensive portion of Chuquisaca is a plain, forming part of the GRAN CHACO (*q. v.*), and it is inhabited only by roving Indians, except near the base of the highlands, where there are a few stock-farms. The principal products are silver and wheat in the highlands, coffee, cacao, and sugar-cane (used principally for making rum) in the lower valleys, and horses on the plains. The exports are limited, owing to the difficulty of transport. HERBERT H. SMITH.

Chuquisaca: city of Bolivia. See SUCRE.

Chur, *khoor* (Fr. *Coire*): the capital of the Swiss canton of Grisons; in a valley and on or near the river Rhine; 60 miles S. E. of Zurich, with which it is connected by railway (see map of Switzerland, ref. 5–I). It has an ancient cathedral of the eighth century and a bishop's palace; also manufactures of cutting tools and zincware. It is a well-known climatic station; elevation, 1,936 feet. Pop. (1888) 9,381.

Church [O. Eng. *circe* (*cirice*) : Northern Eng. *kirke* (whence *kirk*) : O. Sax. *kirika* (Dutch *kerk*) : O. H. Germ. *chirihhe* (Mod. Germ. *kirche*), borrowed probably by way of Constantinople from Christian Greek κυριακόν (or plur. κυριακά), of the Lord (se. δῶμα), Lord's house (Lat. *dominicum*), deriv. of κύριος, master, lord]: primarily, a place of Christian worship; hence the assemblage there worshiping; hence also the whole body of Christians, as in the phrase, "Christ, the Head of the Church." In this sense the word corresponds to the Greek ἐκκλησία as used in the New Testament (Lat. *ecclesia*, Span. *iglesia*, Fr. *église*, Ital. *chiesa*), though somewhat differently used by different communions. Thus Roman Catholics regard the Church as composed of those only who participate in the traditional ordinances administered by the hierarchy in regular succession from the apostles down, and often restrict the term still further to the Roman Catholic hierarchy itself, whose official action is regarded as divinely inspired and infallible. Protestants, on the other hand, consider the "Church Catholic" (or universal) to include all true believers in Christ, who constitute the *invisible* Church; while the collective body of members of Christian communions is designated the *visible* Church, which thus includes the Roman Catholic, the Greek, and the Armenian communions, as well as the Protestant. In theological language, the "Church militant" is the collective body on earth of believers engaged in the battle against sin and error; the "Church triumphant" is the general assembly of the redeemed in Heaven.*

Besides these broad applications of the term, it is also used to designate (*a*) the collective body of members of a given communion or believers in a given creed of Christianity, as the Episcopal Church, the Roman Catholic Church, the Greek Church, the Church of England; (*b*) a sect or denomination, as the Methodist Church, the Moravian Church; (*c*) a single parish or the body of worshipers at a particular church, as "the Central church," "the Church of St. Agnes."

Church: as an architectural term, any edifice consecrated to Christian worship; but it has become especially associated with certain types of religious architecture which have grown up with the development of Christian ritual. The earliest form adopted was that of the Roman basilica, a purely civic structure serving as a public hall, market-place, and court-room. It comprised an apse, within which was the tribune for the magistrate, a broad, open space before this for the public, and a long nave flanked by side aisles, separated from each other by columns bearing walls pierced with windows above the side-aisle roofs. These arrangements were admirably suited to the development of early Christian worship, and the fact that the basilica was not like the temples associated with pagan worship made it the more acceptable to the Christians when, in the fourth century, they were permitted throughout the Roman empire to worship in public and to build new or occupy old structures. From this ground plan, changed slightly by enlarging the central space laterally into *transepts*, and thus securing a symbolic cruciform outline, was developed the plan of the mediæval cathedral and of the great abbey churches of Europe. A fundamental structural change was effected by substituting vaulting in stone for the timber ceiling of the original type. This led to the use of flying-buttresses, pinnacles, and clustered shafts. The *narthex*, or long transverse porch at the front, was exchanged for triple doors; the side aisles were continued around the eastern portion of the building, with its *apse*, or polygonal or semicircular termination, which was assigned to the clergy and singers and called the CHOIR (*q. v.*, also CHANCEL); and in England a second or minor pair of transept-arms was sometimes added. Vestries for the clergy, a baptistery, a campanile for the bells, or else one or two towers with spires at the western end, and chapels with altars for particular saints, were added to the original plan.

In the Eastern Church the circular and domical types of church were developed, the latter employing four short and equal arms like those of the Greek cross, with a dome on their intersection and sometimes one over each of the arms also. The Renaissance architects combined the two ideas in such structures as St. Peter's at Rome, St. Paul's at London, and St. Geneviève at Paris. Parish churches vary more widely in type than the cathedral and abbey churches on account of more widely varying requirements, and a similar reason accounts for the diversity of type or absence of type among modern Protestant denominations.

A. D. F. HAMLIN.

* Roman Catholics acknowledge a distinction between the *body* of the Church, which is the visible organization, and the *soul*, which is the aggregate of all the just known to God alone and united in the Holy Ghost through grace; so that there may be those in the body who are not in the soul, and *vice versa*. They acknowledge also a distinction in the body of the Church, viz., the hierarchy, or the *Ecclesia docens*, the teaching Church, and the faithful, or the *Ecclesia discens*, the Church taught, or the hearing Church. JOHN J. KEANE.

Church, ALBERT E., LL. D.: U. S. military officer and mathematician; b. in Salisbury, Conn., in 1807; graduated at West Point in 1828. He served, while lieutenant of artillery, at the Military Academy as assistant professor 1831 and 1833–37, and as acting Professor of Mathematics 1837–38, and in garrison at Newport and Boston harbors 1832–33. He resigned Mar. 13, 1838, and was appointed Professor of Mathematics in the U. S. Military Academy. He was member of several scientific associations and author of valuable mathematical works especially prepared for the use of his cadet pupils, viz.: *Elements of Differential and Integral Calculus* (1842), and of an *Improved Edition Containing the Elements of the Calculus of Variations* (1851); *Elements of Analytical Geometry* (1851); *Elements of Analytical Trigonometry* (1857); and *Elements of Descriptive Geometry, with its Application to Spherical Projections, Shades, and Shadows, Perspective and Isometric Projections* (1865). D. at West Point, N. Y., Mar. 30, 1878.

Revised by JAMES MERCUR.

Church, ALFRED JOHN: professor, translator, commentator, and author; b. in London, Jan. 29, 1829; educated at King's College, London, and at Lincoln College, Oxford, where he took the degree of B. A. in 1851; ordained priest in 1853; Professor of Latin in University College, London, 1880–89. Author (in connection with Rev. W. T. Brodribb) of translations of *Tacitus* (3 vols., 1862–77) and *Livy*, books xxi.–xxv. (1883); editor of *Tacitus, Agricola, and Germania* (1869); Tacitus, *Annals*, vi. (1878); Pliny, *Select Letters* (1869). The works by which Prof. Church is best known are a series of volumes which aim at popularizing the more famous Greek and Latin classics. *Stories from Homer* appeared in 1877, and have been followed by *Stories from Virgil* (1878); *Stories from the Greek Tragedians* (1879); *Stories from the East* (1880); *The Story of the Persian War* (1881); *Stories from Livy* (1882); *Roman Life in the Days of Cicero* (1883); *The Chantry Priest of Barnet* (1884); *With the King at Oxford* (1885); *A Traveler's True Tale, after Lucian* (1879); *The Story of Jerusalem* (1880); *Two Thousand Years Ago; or, The Adventures of a Roman Boy* (1885); *Isis and Thamesis* (1886); *Carthage*, in Putnam's Series of Stories of the Nations (1886); *Stories of the Magicians* (1887); *The Legend of St. Vitalis and other Poems* (1887); *The Count of the Saxon Shore* (1887); *Three Greek Children* (1888); *To the Lions* (1889); *Burning of Rome* (1891); *Pictures of Roman Life and Story* (1892). W. S. PERRY.

Church, FREDERIC EDWIN: landscape-painter; b. in Hartford, Conn., May 4, 1826; pupil of Thomas Cole; National Academician 1849; painted tropical scenery in South America 1853 and 1857; second-class medal, Paris Exposition, 1867. His *The Great Fall—Niagara* (1857) is in the Corcoran Gallery, Washington. D. Apr. 7, 1900. W. A. C.

Church, FREDERICK STUART: genre and animal painter; b. in Grand Rapids, Mich., 1841; pupil of the National Academy and Art Students League, New York; member of the Society of American Artists (1890); National Academician 1885; member American Water-color Society. His

works are generally fantasies representing animals and human figures, original in conception, and notable chiefly for agreeable color schemes; well known as an illustrator. Studio in New York. W. A. C.

Church, Irving Porter: civil engineer; b. at Ansonia, Conn., July 22, 1851; graduated at Cornell University in 1873. From 1876 to 1892 he was assistant and associate Professor of Civil Engineering in Cornell University; in 1892 was appointed Professor of Applied Mechanics in the same institution. He is the author of *Statics and Dynamics for Engineering Students* (1886); *Mechanics of Materials* (1887); *Hydraulics and Pneumatics* (1889), which were issued later in one volume as *Mechanics of Engineering*; and *Notes and Examples in Mechanics* (1892).

Church, John Adams, E. M.: b. in Rochester, N. Y., Apr. 5, 1843; graduated in 1867 at the School of Mines in New York city. After three years of professional travel in Europe, he published in 1871 a pamphlet on *Mining Schools in the United States*, in 1873 *Notes on a Metallurgical Journey in Europe*, and in 1880 *The Comstock Lode*, the material for which was obtained during an examination made for one of the Government surveys. Mr. Church has contributed largely to recent technical literature, and was for two years associate editor of the *Engineering and Mining Journal of New York*. From 1872 to 1874 he filled the chair of mineralogy and metallurgy in the School of Mines, and is now engaged in the active practice of his profession.

Church, Pharcellus, D. D.: b. in Seneca, Ontario co., N. Y., Sept. 11, 1801; educated at Hamilton, N. Y.; pastor of Baptist churches in Poultney, Vt., Providence, R. I., Rochester, N. Y., Boston, Mass.; was for ten years editor of the *Chronicle* (Baptist), New York city, a frequent contributor to other journals, and author of *Philosophy of Benevolence* (New York, 1836); *Religious Dissensions: Their Cause and Cure* (1838); *Antioch, or Increase of Moral Power in the Church* (Boston, 1843); *Memoir of Theodosia Dean* (1850); *Mapleton, or more Work for the Maine Law*, a tale (Montreal, 1853); *Seed Truths, or Bible Views of Mind, Morals, and Religion* (New York, 1870). D. in Tarrytown, N. Y., June 5, 1886.

Church, Sir Richard: a Greek general; b. in Cork, Ireland, in 1784; entered the British army. In the Greek war for independence he commanded the land forces. Afterward he was made a general in the Greek army (1854), and continued to live in Athens a retired but honored life, and there he died Mar. 30, 1873.

Church, Richard William, D. C. L.: dean of St. Paul's, London; b. in Lisbon, Apr. 25, 1815. After a distinguished career at the University of Oxford, proceeded B. A. with first classical honors in 1836, and shortly afterward became fellow of Oriel College. He was appointed dean of St. Paul's, London, Sept. 6, 1871. Of delicate physique and uncertain health, his prospects of preferment were slight, and yet it is understood that he declined the archiepiscopal seat. His administration of St. Paul's brought the great cathedral of London in touch with the people. The ornamentation of St. Paul's was specially furthered through his intelligent taste and judgment. In 1854 he published a volume of essays, two of which on *St. Anselm* were afterward expanded into a *Life of Anselm* (1871). In 1869 he published a volume of *University Sermons on the Relations between Christianity and Civilization*. His other works are as follows: *The Catechetical Lectures of St. Cyril*, translated with notes in the Library of the Fathers; *Essays and Reviews* (1854); *Essays of Montaigne*, in *Oxford Essays* (1855); *Civilization and Religion* (1860); *University Sermons* (1868); *Civilization before and after Christianity* (1872); *On Some Influences of Christianity upon National Character* (1873); *On the Sacred Poetry of Early Religions* (1874); *The Beginning of the Middle Ages* (1877); *Human Life and its Conditions* (1878); *Dante* (1878); *Spenser* and *Bacon* in English Men of Letters (1879). D. in London, Dec. 9, 1890. His posthumous work on *The Oxford Movement* (1891) is of great interest and value. W. S. Perry.

Church, Sanford Elias, LL. D.: jurist; b. in Milford, Otsego co., N. Y., Apr. 18, 1815; studied law and rose to prominence in his profession. He was chosen Lieutenant-Governor of the State of New York in 1850, and again in 1852. In 1857 he was elected comptroller. In May, 1870, he was elected chief judge of the court of appeals of the State of New York, which position he accepted and held till his death. In politics he was a steadfast Democrat. D. in Albion, N. Y., May 14, 1880.

Church-ale: in mediæval England, a merry-making for the purpose of raising church funds; generally held at Whitsuntide and in the churchyard. Large quantities of ale were sold by the churchwardens, and the people indulged in the popular amusements of the time.

Church Calendar: See Calendar, Easter, and Epact.

Church Congress: the title assumed by a voluntary organization of the Church of England associated for the free discussion of great questions pertaining to both Church and state. The first English Church Congress was held Nov. 27–29, 1861, in the hall of King's College, Cambridge. The preface to its *Report of Proceedings*, issued the following year (1862), refers to "the restless attacks, the systematic organization, and the avowed purposes of the opponents of the Church of England, encouraged by the indifference of the apathetic and backed by the support of the irreligious," as awakening churchmen to make an effort for "the preservation of their constitutional rights and privileges." The formation of church defense associations throughout England in 1859, with a central church institution in London, gave rise to a call for "a congress of churchmen." The meeting at Cambridge was the beginning of a series of annual gatherings, which speedily assumed a most important part in the Church revival of the times. The sessions of the Church congresses are now attended by thousands. The leading ecclesiastics and laymen are found among their promoters, and their published reports are a *thesaurus* of Church literature and arguments.

In Oct., 1875, the first congress of the Protestant Episcopal Church in the U. S. was convened in New York. This congress meets only in the years when the General Convention does not convene. Its discussions have been able and full of interest, and its proceedings as reported and issued in volumes have been widely circulated. W. S. Perry.

Church Discipline: the means employed by the Church to maintain her standard of piety and obedience. From her origin to 312 she was constantly exposed to inroads from pretended friends, who really desired to secure her confidence and then betray her to the civil authority, and from enthusiasts and false teachers who honestly tried to adapt her to their strange beliefs. Her membership, being recruited from the lower classes predominantly, were the victims of low tastes and vitiated appetites. To keep herself pure she was obliged to excommunicate grave offenders, and to enjoin more or less prolonged exclusion from her services, especially from the sacrament of the Lord's Supper, upon those who sinned less grievously. But when the parties repented they were generally restored, and the blessing of the Church was seldom refused those who on their death-bed declared their sorrow. The sins most commonly punished were then and are to-day sexual and other irregularities, heresy and schism, sedition and irreverence, denial of Christ and of Christianity. After 313, when the Church was united to the Roman state, discipline relaxed, and wherever Church and state are united there the difficulty of maintaining a high standard in the Church is greatly increased. The advantage of the union was that notorious offenders could be handed over by the Church to the state for punishment. In a later period the Roman Church in this way used the secular authority in the punishment of heresy, thereby securing its cruel extermination in many quarters.

Church Government: See Baptists, Congregationalism, Episcopal Church, Methodism, Presbyterians, etc.

Church History, or **Historical Theology**: one of the four divisions of theological science—viz., exegetical (or biblical), historical, systematic (or philosophical), and practical (homiletical and pastoral) theology. Of these divisions the historical is the most extensive in bulk, and furnishes material to all the rest. In importance it yields only to exegetical theology, which has to do with the interpretation of the Holy Scriptures. Historical theology begins with the creation of man in the image, and for the glory of God, and comes down to the present as its relative goal, but will go on till the general judgment or the final settlement of all the affairs of men. It embraces within these limits all that belongs to the religious development of the race within the line of revelation—the origin, progress, and fortunes of the kingdom of God, and its relations to the kingdoms of this world. Since the fall of man it has assumed the character

of a history of redemption (and is so represented, for instance, by Jonathan Edwards in his well-known popular book). In a narrower sense, Church history is the history of Christianity from the birth of Christ, or, according to others, from the day of Pentecost (A. D. 30), when Christianity first assumed an organized form distinct from Judaism, down to the present time.

CHURCH HISTORY AND SECULAR HISTORY.—These differ as Church and state, as Christianity and humanity, as the order of grace and the order of nature differ. Yet they are inseparably connected and interwoven, and the one can not be understood without the other. Among the Jews the spiritual and secular history together form one history of a theocracy. Both currents intermingle in the old Byzantine empire, in the European states and the Latin Church during the Middle Ages, in the period of the Reformation, during the colonial period of America, and in all countries where Church and state are united. Gibbon's *History of the Decline and Fall of the Roman Empire* is in great part also a history of the rise and progress of Christianity, which survived the fall of Old and New Rome, and went forth to conquer the barbarian conquerors by Christianizing and civilizing them. A history of the papacy is also a history of the Holy Roman empire, and *vice versa*. No history of the sixteenth century can be written without constant reference to the Protestant Reformation and the Roman Catholic reaction. (Compare e. g. Hume, Macaulay, and Burnet for England; Ranke and Janssen for Germany; Motley for Holland.) The Puritan settlements of New England are the beginning alike of the ecclesiastical and secular history of North America. In modern times the tendency is more and more toward separation of the spiritual and temporal, the ecclesiastical and civil powers; nevertheless, the Church will always be more or less influenced by the surrounding state of civil society, and must adapt itself to the wants of the age and progress of events; while, on the other hand, the world will always feel the moral influence, the restraining, ennobling, stimulating, purifying, and sanctifying power of Christianity, which works like a leaven from within upon all ramifications of society.

PERIODS AND EPOCHS.—These represent the different stages in the religious development of the race, and must not be arbitrarily made according to a mechanical scheme (such as the centurial division adhered to by Mosheim), but taken from the actual stops or starting-points (ἐποχή), and circuits (περίοδος) of the history itself. The following are the natural divisions:

A. *Sacred* or *Biblical History*, the history of the Divine revelation from the creation to the close of the apostolic age, running parallel with the Scriptures from Genesis to Revelation. Here we must distinguish the dispensation of the Law and the dispensation of the Gospel, or the history of the Old Testament religion and of that of the New Testament religion.

(*a*) Under the *Old Dispensation*, from the creation down to John the Baptist. Subdivisions: The antediluvian period; the patriarchal period; the Mosaic period (the establishment of the Jewish theocracy); the period of the Jewish monarchy and prophecy; the period of the Babylonian exile; the period of the restoration, the Maccabees, the Roman rule till Herod the Great and down to the destruction of Jerusalem.

(*b*) Under the *New Dispensation*, A. D. 1–100, Christ and the apostles, or primitive and normative Christianity in its divine-human founder and inspired organs. Subdivisions: The preparatory mission of John the Baptist; the life of Christ; the founding of the Church by the apostles; the labors of Peter, Paul, and John. This period connects biblical history with ecclesiastical history and belongs as much to the latter as to the former.

B. *Christian History*, or *Church History* proper, from the close of the apostolic age to modern times. Subdivisions:

(*a*) History of *Ancient* Christianity, embracing the first six centuries to Gregory I. (590): Græco-Latin, patristic, Catholic, the common stock from which the Greek, the Roman, and the Protestant Churches have sprung. Subdivisions: (1) The life of Christ and the apostolic age (1–100; see A *b*); (2) the Ante-Nicene age, or the age of persecution, to Constantine the Great and the Council of Nicæa (325); (3) the Post-Nicene age, or the age of patriarchs, Christian emperors, and œcumenical councils (to 590). Some historians carry the age of ancient Christianity down to Charlemagne, A. D. 800 (so as to include John of Damascus, the last of the Greek Fathers), and the beginning of the German Roman empire and the temporal power of the papacy. In this case we have a fourth subdivision, from Gregory I. to Charlemagne (A. D. 590 to 800). The ancient Church history has its theater in the old Roman empire, around the Mediterranean, among Jews, Greeks, and Romans to the borders of the barbarians.

(*b*) History of *Mediæval* Christianity, from the close of the sixth to the beginning of the sixteenth century, or from Gregory I. (A. D. 590), the first mediæval pope, to Luther, the leader of the Reformation (A. D. 1517). Character: The Greek and Roman Churches, divided, pursue their independent course: the Latin Church extending west among the Celtic and Germanic races, the Greek northeast among the Slavonians (in Russia): conversion of the barbarians of Northern and Western Europe; conflicts with Mohammedanism; the crusades; rise and progress of the papacy in conflict with the holy Roman empire; church architecture; scholastic philosophy and theology; mysticism; the reformatory councils of Pisa, Constance, and Basel; revival of letters; invention of printing; discovery of America; biblical theology; forerunners of Protestantism (Wycliffe in England, Hus in Bohemia, Savonarola in Italy, Wessel in Holland, etc.). Subdivisions: (1) The missionary period of the Middle Ages, from Gregory I. to Hildebrand or Gregory VII. (590 to 1073); (2) the palmy period of the papacy, from Gregory VII. to Boniface VIII. (1073 to 1294); (3) the decay of the mediæval papacy and scholasticism, and the preparation for the Reformation, from Boniface VIII. to Leo X. and Martin Luther (1294–1517).

(*c*) History of *Modern* Christianity, from the Reformation of the sixteenth century to the present time. Protestantism and Romanism; founding of the various evangelical churches, the Lutheran, Calvinistic, Anglican, etc.; progress of Protestantism among the Teutonic races; restoration of Romanism; Jesuitism; Jansenism: Puritanism and Methodism in England; Pietism and the Moravians in Germany; settlements in North America; growth of the Greek Church in Russia, and of the Protestant in the United States; revival and triumph of ultramontane Romanism; conflict of faith with modern rationalism and infidelity; immense activity in theology, literature, missions, and all forms of Christian philanthropy. Subdivisions: (1) The age of the Protestant Reformation and the Roman Catholic counter-reformation or reaction (from 1517 to the Peace of Westphalia, 1648); (2) the age of scholastic and polemic confessionalism in conflict with nonconformity and subjective piety (from the middle of the seventeenth to the French Revolution, 1789); (3) the age of revolution and revival: conflict between Christianity and various forms of skepticism and secularism; progress of missions in all heathen lands; separation of Church and state; development of the voluntary principle; growth of Christian philanthropy; movements toward the reunion of Christendom on the basis of freedom.

SOURCES.—They are mostly written, in part unwritten. The *written* sources include (*a*) the official documents of ecclesiastical and civil authorities, such as acts of councils, creeds, liturgies, hymn-books, church laws, papal bulls and encyclicals; (*b*) the writings of the personal actors in the history, and contemporary observers and reporters, such as the Fathers for ancient Christianity, the Schoolmen for mediæval, the Reformers and their opponents for the Reformation period; (*c*) inscriptions on walls, pictures, churches, tombstones, and other monuments.

The *unwritten* sources are works of Christian art, as churches, chapels, pictures, sculptures, crosses, crucifixes, relics, and other remains which symbolize and embody the spirit of Christianity in different epochs and phases. Thus the Roman catacombs, with their vast extent, their solemn darkness, their labyrinthine mystery, their rude epitaphs and sculptures, their symbols of faith, and their relics of martyrdom, give us a lifelike idea of the Church in the period of persecution, its trials and sufferings, its faith and hope, its simple worship and devoted piety. "He who is thoroughly steeped in the imagery of the catacombs will be nearer to the thoughts of the early Church than he who has learned by heart the most elaborate treatises of Tertullian or Origen." The basilicas are characteristic of the Nicene, the Byzantine churches, of the Byzantine age, the Gothic cathedrals, of the palmy days of the Middle Ages, the Renaissance style, of the revival of letters. Even now most churches and sects can be best appreciated in the localities and in view of the monuments and the people where they originated or have their center of life and action.

Duty of the Historian.—He must (1) master the sources in the original languages in which they were written (Greek, Latin, and the modern languages of Europe); separating the genuine from the spurious, the original from corruptions and interpolations; sifting the truth from falsehood, the facts from fiction and partisan judgment; comparing the accounts of all actors, friend and foe, narrator, eulogist, advocate, and antagonist, whether orthodox or heretic, whether Christian, Jew, or Gentile; aiming in all this laborious investigation at "the truth, the whole truth, and nothing but the truth." (2) He must then reproduce the clearly ascertained facts and results of his investigation in a faithful and lifelike narrative, so as to present the objective course of history itself as it were in a miniature photograph. The genuine writer of history differs as much from the dry chronicler of isolated facts and dates as from the novelist; history has a body and a living soul, and its facts are animated by thoughts and principles. The historian must exhibit both; he must be able to particularize and to generalize, to descend into minute details, and to take a comprehensive bird's-eye view of whole ages and periods. He must have a judicial mind, which deals impartially with all persons and events coming before his tribunal, and is swayed by no consideration but that of strict justice. This aim should be constantly kept in view, although in the limited and imperfect state of our information, and the inability to emancipate one's self from all the influences of education and prevailing opinions and prejudices, we can expect no more than an approximate solution of the difficult task. It is the exclusive privilege of the Divine Mind to view all things *sub specie eternitatis*, to see the end from the beginning. We can only know things consecutively and in fragments. But history is its own best interpreter, and the farther it advances the more we are able to understand and appreciate the past.

Value.—The study of history enables us to understand the present, which is the fruit of the past and the germ of the future. It is the richest storehouse of wisdom and experience. It is the best commentary of Christianity. It is full of comfort and encouragement. It verifies on every page the promise of the Saviour to be with his people always, and to build his Church on the rock against which the gates of hell can not prevail. It exhibits the life and power of Christ in all its forms and phases, and the triumphant march of his kingdom from land to land and generation to generation. Earthly empires, systems of philosophy have their day, human institutions decay, all things of this world bloom and fade away like the grass of the field; but the Christian religion has the dew of perennial youth, survives all changes, makes steady progress from age to age, overcomes all persecution from without and corruption from within, is now stronger and more widely spread than ever before, directs the course of civilization, and bears the hopes of the human race. The history of the world is governed in the interest and for the ultimate triumph of Christian truth and righteousness. The experience of the past is a sure guarantee of the future.

Literature.—(1) Works on *General Church History*; Eusebius (d. 340), *Church History*, from the birth of Christ to Constantine the Great (324). His successors in the Greek Church: Socrates, Sozomen, Theodoret. The *Magdeburg Centuries*, by Matthias Flacius (d. 1575), and other Lutheran divines of Germany (Basel, 1559–74), covering thirteen Christian centuries in as many volumes; the first history from a Protestant point of view in opposition to the claims of Romanism. The *Ecclesiastical Annals* of Cæsar Baronius (d. 1607), in 12 folio volumes, published at Rome, 1588, *sqq.*, to which were added the continuations of Raynaldus, Spondanus, and others—a work of immense learning and industry, but altogether in the interest of the papacy. Tillemont (d. 1698), in his invaluable *Mémoires* (Paris, 1693–1712, 16 vols.), wrote the history of the first six centuries from the sources, in biographical style and in the spirit of the more liberal Gallican Catholicism. Gottfried Arnold (d. 1714), of the Pietistic school of Spener, in his *Impartial History of the Church and of Heretics to A. D. 1688* (Frankfort, 1699, *sqq.*, 4 vols. fol.), advocated the interests of practical piety and the claims of heretics and schismatics and all who suffered persecution from an intolerant hierarchy and orthodoxy. J. L. Mosheim (d. 1755) wrote his *Institutes of Ecclesiastical History* (in Latin, Helmstädt, 1755, and often since in several translations) in the spirit of a moderate Lutheran orthodoxy, with solid learning and impartiality, in clear style, after the centurial arrangement of Flacius, and furnished a convenient text-book which (in Murdock's and Stubbs's editions) has continued in use in England and America even to this day. Schroeckh's *Christian Church History* (Leipzig, 1768–1810, in 45 vols.) is a far more extensive and far less readable work, but invaluable for reference, full of reliable information from the sources; it forsakes the mechanical centurial division, and substitutes for it the periodic arrangement. Henke (d. 1809) followed with a thoroughly rationalistic work in nine volumes (1788–1810). Neander (Professor of Church History in Berlin, d. 1850) marks an epoch in this branch of theological literature, and by his truly Christian, conscientious, impartial, truth-loving, just, liberal, and withal thoroughly learned and profound spirit and method, he earned the title of "father of Church history." His *General History of the Christian Religion and Church* (Hamburg, 1825–52, 11 vols.), though incomplete (it stops with the Council of Basel, 1430) and somewhat diffuse and monotonous in style, is an immortal monument of genius and learning; it pays special attention to the development of Christian life and doctrine, and is edifying as well as instructive. It has been naturalized in England and America by the translation of Prof. Torrey (Boston, 1847–52, 5 vols.; 12th ed. 1872), and will long be studied with profit, although the first volume is superseded by recent discoveries. Equally valuable, though of an altogether different plan and spirit, is the *Church History* of Gieseler (Bonn, 1824–56), translated from the German first by Cunningham in Philadelphia (1846), then by Davidson and Hull in England, and revised and completed by H. B. Smith, of New York (1857–80, 5 vols.). The text is a meager skeleton of facts and dates, except in the last volume, but the body of the work consists of carefully selected extracts and proof-texts from the sources, which furnish the data for independent judgment. Baur's *Church History* (partly published after his death, Tübingen, 1861, in 5 vols.; Eng. trans. of the history of the first three centuries, London, 1878–79, 2 vols.; the original goes down to 1848) is distinguished for philosophic grasp, critical combinations, and bold conjectures, especially in the treatment of the ancient heresies and systems of doctrine. Hagenbach's *Church History*, down to the nineteenth century (Leipzig, 1869–72, 7 vols.; revised ed. by Nippold, vols. i.–iii., 1885–87), is a clear digest of the vast material for the lay reader. Hase's *Lectures on Church History* (Leipzig, 1885–92, in 3 parts, the last edited by Dr. G. Krüger) are an expansion of his admirable manual, and bring the history down to the *Culturkampf* and the settlement between Bismarck and Leo XIII. in a liberal spirit, and clear and elegant style.

Of English Church historians, Waddington represents the general history in six volumes to the Reformation, inclusive (1835, *sqq.*); Robertson in four (1854–73) to the close of the Middle Ages (new ed. in 8 vols., 1873–75). The older work of Milner (d. 1797) is written in popular style for edification.

Schaff's *History of the Christian Church* (New York, 5th ed. revised and enlarged, 1890–92, 7 vols.) is the first general Church history prepared on American soil, but not yet completed (a volume is in course of preparation).

Of the numerous compends of Church history in one or more volumes, we mention those of Döllinger, Möhler, Ritter, Alzog, Hergenröther, Funk, among Roman Catholics; Hase, Niedner, Guericke, Kurtz (12th ed.), Herzog, Möller, Karl Müller, George P. Fisher (1888, the best summary for English readers), and J. F. Hurst (1893), among Protestants.

(2) Works on *special departments* of Church history. On Old Testament history: Milman (*History of the Jews*), Ewald (*History of Israel*, 7 vols., translated by Russell Martineau), Stanley (*History of the Jewish Church*). Life of Christ: Neander (German and English), Lange (German and English, 6 vols.), Pressensé (French and English), Ellicott, Andrews, Ewald, Strauss (mythical theory), Renan (legendary theory), Keim, Weiss, Beyschlag, Farrar, Geikie, Edersheim. History of the Apostolic Church from A. D. 30 to 100: Neander, Thiersch, Lechler, Weizsäcker, Schaff, Conybeare and Howson, Lewin, and Farrar (on St. Paul). History of Christian Doctrines, or Dogmatic History: Petavius (R. C.), Münscher, Baumgarten Crusius (2 vols.), Hagenbach (translated by Buch, revised by H. B. Smith, New York, 1861, 2 vols.; 6th German ed. revised by Benrath), Neander (1 vol., posthumous), Baur (Leipzig, 1867, posthumous, 3 vols.; also a compend in 1 vol.), Shedd (New York, 1863, 2 vols.), Beck, Schwane, Bach (R. C.). The most recent work which makes an epoch is Harnack's *Dogmengeschichte* (2d ed. Freiburg im Br., 1890) in three volumes (also a compendium, 1891; 2d

ed. 1893; Eng. trans. by E. K. Mitchell, *Outlines of the History of Dogma*, New York, 1893). Loofs, *Leitfaden der Dogmengeschichte* (Leipzig, 2d ed. 1890; a third in press, 1893). *History of Protestant Theology*, by Dorner (Munich, 1867; also in English, Edinburgh, 1871, 2 vols.); *History of Roman Catholic Theology since the Council of Trent*, by Werner (Munich, 1866). History of special doctrines: Baur on the *Trinity and Incarnation* (3 vols.), on the *Atonement* (1 vol.); Dorner on *Christology* (2 vols.; also in English, Edinburgh, 1861–63, 5 vols.); Ebrard on the *Lord's Supper*; Ritschl on *Justification and the Atonement* (Bonn, 3d ed. 1870–74; 3 vols., the first is historical). History of Councils: Mansi, Hardouin, Walch, Fuchs, Hefele. Hefele's *History of the Councils*, continued by Hergenröther and others, is a complete Church history down to the Council of Trent from the Roman Catholic standpoint. History of Church Polity: Planck, Ritschl, Sugenheim, Greenwood. History of Missions: Blumhardt, Wiggers, and numerous monographs. Patrology and Patristics: the Benedictine editions, and large collections of the works of the Fathers by Gallandi, Migne, etc. English translations in the Ante-Nicene, Nicene, and Post-Nicene Libraries, ed. the first by Bishop Coxe, the second by Dr. Schaff, the third by Schaff and Wace, and published by the Christian Literature Company (New York, 1888, *sqq.*), making in all when completed thirty-five volumes. The biographical and literary works on the Fathers, by Tillemont, Du Pin, Ceillier, Cave, Lumper, Möhler, Fessler, Alzog, Böhringer, Farrar, Smith and Wace (*Dictionary of Christian Biography of the First Eight Centuries*, 4 vols., invaluable). Separate biographies of Tertullian and Chrysostom, by Neander; Justin Martyr, by Semisch and Engelhard; Origen, by Redepennig and Thomasius; Augustine, by Bindemann and Reuter; Jerome, by Zöckler. Ecclesiastical Antiquities, by Bingham, Augusti, Siegel, Smith and Cheetham (*Dictionary of Christian Antiquities*). On Ancient Christianity: Mosheim, Milman, Schaff, Pressensé. *History of the Greek* (*Eastern*) *Church*, by Dean Stanley (London and New York, 1862); *History of Latin Christianity*, by Dean Milman (to the pontificate of Nicholas V., London and New York, 1860, *sqq.*); *History of the Crusades*, by Michaud, Wilkin, Spittler, Kugler. The Papacy: Walch, Planck, Spittler, Greenwood (*Cathedra Petri*), Riddle, Bauer, Wylie; also many monographs on single popes, as Voight on Gregory VII., Hurter on Innocent III. (4 vols.), Reuter on Alexander III. (3 vols.). On the papacy of the Reformation period: Creighton, Pastor. Scholasticism and Mysticism of the Middle Ages: Stöckl (*History of the Philosophy of the Middle Ages*, Mayence, 1864, *sqq.*, 3 vols.); Görres (*History of Christian Mysticism*, 1836–42, 4 vols.); and the monographs of Hasse, Dean Church, and Rule on Anselm of Canterbury, Werner and Vaughan on Thomas Aquinas, Neander, Morison, and Storrs on St. Bernard, Christlieb on Scotus Erigena, Liebner on Hugo of St. Victor. History of Monasticism: Spittler, Münch, Döring, Montalembert, and especially the colossal biographical work of the Jesuits, *Acta Sanctorum* (for every day in the year). Forerunners of the Reformation: Ullmann on the *Reformers before the Reformation* (2 vols., Hamburg, 1841); Vaughan on John Wycliffe (London, 1854); Lechler on Wycliffe (Leipzig, 1873, 2 vols.; Eng. trans. of vol. i., the life of Wycliffe by Lorimer, n. ed. London, 1884); Helfert and Gillett on Hus and Jerome of Prague; Meier, Rudelbach, Perrens, Madden, especially Villari, on Savonarola; Müller and Drummond on Erasmus; Strauss on Ulrich von Hutten; Seebohm on *The Oxford Reformers, John Colet, Erasmus, and Thomas More* (London, 1869); Voight, Burkhardt, Symonds, Geiger, Schaff, on the *Renaissance. History of the Reformation*, by Marheineke, Neudecker, Ranke, Merle d'Aubigné, Döllinger (R. C.), Fisher (New York, 1873), Kahnis (1873), Bezold (1890); not to mention the numerous monographs on the Reformers and the Luther and Zwingli literature of 1883. On the English Reformation in particular: Strype (*Ecclesiastical Memorials and Annals of the Reformation*; also his *Memorials of Cranmer, Parker, Grindal, Whitgift*, etc.), Burnet, Collier (non-juror), Dodd (R. C.), Cardwell, Fuller, Soames, Froude (from the fall of Wolsey to the death of Elizabeth), Perry, Geikie, etc. On the Reformation in Scotland: Buchanan (*Rerum Scoticarum Historia*), J. Knox (till 1567), Calderwood, Robertson, M'Crie (*Life of John Knox*), Hetherington, Rudloff, Stanley, Cunningham. American Church history will be written in denominations by a number of scholars under the auspices of the American Society of Church History, according to a uniform plan adopted at its fourth annual session in Washington, 1891, and will be published in ten or more volumes as they are ready (beginning in 1893).

PHILIP SCHAFF.

Churchill, or **Missiunip'pi**: a river of the Dominion of Canada; rises in a lake near lon. 109° W. It flows nearly northeastward, passes through Nelson's Lake, and enters Hudson's Bay in lat. 59° N. Length estimated at 800 miles.

Churchill, CHARLES: poet and satirist; b. in Westminster, London, in Feb., 1731. He was a fellow-student and friend of the poet Cowper. Although he had a strong aversion to the clerical profession, he was ordained as a priest in 1756. In 1758 he succeeded his father as curate at St. John's, Westminster. His parishioners were scandalized by his dissipated and licentious habits, and by his negligence of his duties. He produced in 1761 *The Rosciad*, a witty satire on theatrical managers and performers, which was very successful. About this time he resigned his curacy and quitted the profession of clergyman. He defended himself against certain critics by a poem entitled *The Apology*. He was an intimate friend of John Wilkes, whom he assisted in the *North Briton*. In 1763 he published *The Prophecy of Famine*, a satire on the Scotch. Among his other works are *The Conference*, *Gotham*, and *The Author*. D. in Boulogne, France, during a visit, Nov. 4, 1764. See Tooke, *Life of Churchill*, and Macaulay's essay entitled *Charles Churchill* (1845). Revised by H. A. BEERS.

Churchill, JOHN WESLEY, A. M.: instructor in elocution and author; b. in Fairlee, Vt., May 26, 1839; educated at Phillips Academy, Andover, Mass., at Harvard College, graduating in 1865, and at Andover Theological Seminary, graduating in 1868 and being ordained to the ministry. In 1869 he was inaugurated Jones Professor of Pulpit Delivery in Andover Theological Seminary; was instructor in Elocution in Phillips Academy, Andover, from 1867 till his death; in Abbot Academy, Andover, 1867–92; in Wellesley College three years; in Smith College five years; in Mt. Holyoke Seminary five years; in Harvard University divinity school since 1890. He was a trustee of Abbot Academy and an associate editor of the *Andover Review*; contributed to periodical literature articles chiefly of a biographical nature. He received the degree of A. M. from Harvard University. D. at Andover, Mass., Apr. 13, 1900.

Churchill, Lord RANDOLPH HENRY SPENCER, M. P.: English statesman; b. Feb. 13, 1849; the son of the Duke of Marlborough and his wife, Lady Frances Anne Emily, daughter of the Marquis of Londonderry; educated at Merton College, Oxford; represented Woodstock in Parliament Feb., 1874, to Nov., 1885; after 1880 he became conspicuous in the House of Commons by his attacks on the Liberal party, and was the leader of the so-called Fourth party; Secretary of State for India in Lord Salisbury's government 1885; Chancellor of the Exchequer and leader of the House of Commons in Lord Salisbury's second administration 1886, but resigned in December, and was returned to Parliament from Paddington. He was regarded at one time as the coming Tory leader and successor to Lord Beaconsfield. In 1892 he traveled in Southeast Africa as correspondent of a London newspaper. Lord Churchill married in 1874 Miss Jennie Jerome, of New York. D. Jan. 24, 1895.

Churching of Women: the public thanksgiving in church by young mothers, both for their motherhood and their recovery from the perils of childbirth. In former days the practice was usual, if not obligatory, although no formularies for the service have come down to us from ancient times. It imitated doubtless the Mosaic regulation (Lev. xii.): and, as child-bearing defiled, the woman was not to be churched till forty days after her parturition.

Church Jurisdiction: established by Constantine the Great in 331. This, such as it was, did not simply mean that the Church should exercise jurisdiction in all ecclesiastical affairs, but actually meant an absorption by the Church of the jurisdiction of the state also in civil affairs. St. Paul had admonished the Christians not to bring their cases before unbelieving judges, and thus arose a practice which was legalized by Constantine. When, however, the court and the judges had become Christian, there was no reason for so extensive a Church jurisdiction, and the state immediately began to conquer back its old rights, confining the Church jurisdiction to purely spiritual affairs. But the contest was long and fierce, and is by no means ended as yet in certain countries of Europe. A striking exposition of the

extensive claims which the pope made, and of the opposition he met with already in the times of the Council of Constance, may be found in Gerson's *De potestate ecclesiastica*, written during the sessions of the council. (See KULTURKAMPF, *Falk Laws*, *Ferry Laws*). In the U. S. the jurisdiction of a religious body is confined to those who voluntarily submit to it. Ecclesiastical penalties, when they are simply of a spiritual nature, can be enforced without interference of the civil power. If, however, one is injured either pecuniarily or by loss of standing in the community, the civil courts will require that the Church laws obtaining in the case be enforced to the letter and not beyond. Revised by W. S. PERRY.

Church Methodists, or **Primitive Wesleyans**: See METHODISM.

Church of England: See ENGLAND, CHURCH OF.

Church of God: a body of Christians first organized at Harrisburg, Pa., in 1830, by the converts and followers of John Winebrenner, formerly a minister of the German Reformed Church. Its doctrines are a belief in the Bible as the authoritative revelation of God; also in the Trinity, in human depravity, the vicarious atonement, and the freedom of the will (rejecting the Calvinistic doctrine of election). It recognizes adult immersion as the only baptism, and administers the Lord's Supper to all Christians who desire it. Literal washing of the feet is practiced as one of the ordinances of the Church. It holds that the Lord's Supper should be administered in a sitting posture and always in the evening. In all other respects the Church of God agrees with other evangelical Christian Churches. The congregations of this denomination are in part independent in Church government, but are united into "elderships," which are again joined into one "general eldership," which owns the church property. The ministry is itinerant, and under the appointment of the elders. The Church has several newspapers, and a college at Findlay, O. According to the census of 1890, they comprise 479 societies with 22,511 members, and hold church property valued at $643,185. They are strongest in Pennsylvania and the Ohio valley.

Church of Scotland: See the article SCOTLAND, CHURCH OF.

Church of Scotland, Free: See FREE CHURCH OF SCOTLAND.

Church Rates: a tax, as the name implies, formerly levied upon the occupiers of houses or lands, or both, in an English or Irish parish for the incidental expenses of service in the parish church, apart from the priest's salary, but including repairs of the building. The rate was resolved upon at a regularly called vestry meeting. By 31 and 32 Victoria, c. 109, passed in 1868, its payment was made voluntary in England, and when the Church of Ireland was disestablished, rates also ceased in that country. When rates began to be exacted is not known. There is nothing improbable in the supposition that the repair of the parish church and other similar expenses were at first voluntarily assumed by the well-to-do or devoted members of the parish, but after a time when zeal declined the churches were in great danger of decay. So their maintenance and repair became a matter of obligation. The manifest injustice of compelling persons who not only did not attend the parish church, but belonged to rival or hostile communions, to pay perhaps large amounts for the adornment or repair of the parish church gradually impressed the conscience of the English people, who in overwhelming numbers belong to the established church. The legislation alluded to has decreased the amount of money at the disposal of the CHURCHWARDENS (*q. v.*), and correspondingly decreased the importance and perhaps attractiveness of that office. The incidental advantage probably is that the money raised by voluntary contributions is more wisely and economically expended. Doubtless many ardent churchmen considered the abolition of compulsory rates as an entering wedge to the disestablishment of the Church of England. But the two events may not really be so closely connected. S. M. J.

Church Temperance Society: See the Appendix.

Churchwardens: in the Anglican and the Protestant Episcopal Churches, officers whose duty is to protect the church edifice, to superintend the performance of public worship, and maintain order during service. There are generally two in each parish. In some dioceses they are appointed by the clergymen, and in others are chosen by the parishioners. Their assistants are sometimes called questmen. They appear to be the representatives in modern times of the *seniores ecclesiastici* of whom mention is made by St. Augustine and others. These *seniores ecclesiæ* formed a lay council of the bishops, giving advice and assistance in the weighty matters of church discipline or order. The *seniores ecclesiastici* seem to have had charge of the utensils, treasure, and outward affairs of the church, and their office and duties corresponded closely with those of churchwardens. In the U. S. in most dioceses the rector, churchwardens, and vestrymen form the legal corporation of a parish. W. S. P.

Churchyard, THOMAS: b. in Shrewsbury, England, in 1520; was a prolific author of prose and verse in the early part of Queen Elizabeth's reign. He was at first a servant of the Earl of Surrey, and afterward a soldier. Some of his works have been from time to time reprinted, more for the pleasure of bibliophiles than on account of any great merit. His *Worthiness of Wales* (1587), *Chips Concerning Scotland*, and *Legende of Jane Shore* are the best known of his works. D. in 1604. Revised by H. A. BEERS.

Churn: an apparatus for agitating cream so as to make the fat-globules unite to form butter. There is a great variety in the forms of churns. The plunge churn is one of the oldest and simplest forms. In the box churn the agitation of the cream is brought about by dashers revolving on a spindle, which passes through the center of the box. In revolving churns the barrel containing the cream is supported at both ends, and made to rotate by means of a handle; or it may hang from two points on the sides and be made to turn over and over. In churns constructed and used in this way the action may be greatly increased by the use of internal dashers. In the swinging churn a long box is hung by four chains and swung back and forth. Horse-power is often used in the working of churns in large dairies. See BUTTER.

Churubus'co: a village or hamlet of Mexico; on the Rio de Churubusco; about 6 miles S. of the city of Mexico (see map of Mexico, ref. 7–G); the scene of a battle, Aug. 20, 1847, between the U. S. forces under Gen. Winfield Scott, marching on the city of Mexico, and the Mexicans, defending the approaches to their capital, under President Santa Anna. The battle of Contreras was fought on the same day, and in both instances victory remained with the U. S. troops. Three thousand prisoners were taken; 4,000 were killed or wounded, and 37 pieces of ordnance were captured, while the U. S. loss was only 1,053 in killed and wounded.

Chusan' (i. e. Boat Island): an island near the east coast of China; province of Cheh-kiang; about 45 miles N. E. of Ningpo. It is the principal one of a group of islands known as the Chusan Archipelago (see map of China, ref. 6–L). It is nearly 50 miles in circumference, and is mountainous, but mostly fertile and well cultivated. Population estimated at over 200,000. The products of the soil are tea, rice, cotton, tobacco, etc. The camphor-tree and bamboo flourish here. The climate is pleasant and healthful. Tinghai, the capital, was taken by the British in July, 1840, and again in Oct., 1841, but it was restored to the Chinese at the end of the war. It has a secure harbor, and is famous for its carved and silver work. A mile to the E. of Chusan lies the island of Pu-to, a sacred resort occupied by Buddhist temples and monasteries of great wealth and magnificence. Kwan-yin, the Chinese Goddess of Mercy, is said to have resided here for nine years. No woman is allowed to set foot on Pu-to, and no living thing is permitted to be killed on it. R. L.

Chu'tia (or *Cho'ta*) **Nag'pur**: a division of Bengal, British India; comprising 4 districts and 7 tributary states, and occupying the southwestern quarter of Bengal. The British district has an area of 26,941 sq. miles, and a population of 4,645,590 (1891). A large part of this district occupies a plateau averaging 2,000 feet in elevation, containing much forest and jungle. Coal exists in large quantities, and considerable placer gold has been found. Two-thirds of the population are Hindu, the remainder largely aboriginal tribes. The tributary states have an area of 16,054 sq. miles, and a population of about 700,000. They form what is called the Southwest Frontier Agency. These states are mountainous, little cultivated, and inhabited for the most part by wild aboriginal tribes. They contain no towns and only three villages of more than 1,000 inhabitants. M. W. H.

Chutney, or **Chutny**: a stimulating condiment used to a great extent in India, and to a considerable extent in Great Britain and the U. S. Chutney is a mixture composed of capsicum, tamarinds, raisins, mangoes, ginger-root, garlic, lime-juice or vinegar, etc.

Chwalynsk', or **Khvalynsk**: a town of Russia; government of Saratof; a river-port on the Volga (see map of Russia, ref. 8–G). It has various manufactures and large fruit gardens. Pop. 18,000.

Chyle, kīl [from Gr. *χυλός*, juice]: the liquid product of digestion, found in the upper part of the small intestines, and absorbed by the lacteals and the veins and conveyed by the circulation to the various tissues and organs. The food after its complete digestion in the stomach is converted into a yellowish more or less liquid mass known as the chyme. This passes into the duodenum, and is there acted upon by the pancreatic secretion and bile which complete the digestion of the starches and proteids and emulsify the fatty foods. An opaque yellowish-white liquid known as chyle is the result. The chyle is found in the thoracic duct as an oily liquid of greater or less turbidity, which under the microscope shows oil droplets and a small proportion of white blood-corpuscles. From the thoracic duct the chyle passes into the veins, and is thus carried to the tissues, mingled with the blood. Occasionally dilatation of the lacteal vessels leads to rupture, and chyle escapes into the peritoneal cavity (chylous ascites). W. P.

Chyme, kīm [from Gr. *χυμός*, juice. The differentiation in meaning between *χυλός* and *χυμός* appears first in Galen; *χυμός*, juice in raw or natural state, *χυλός*, juice produced by decoction]: the food after the process of stomach-digestion, and before the action of the intestinal juice, bile, and pancreatic fluids has taken place upon it. The name is now not much used, but it is a convenient term, and as such deserves to be retained. Chyme consists of the peptones and the starchy, saccharine, and fatty elements of food, mingled with certain residual matters which are not useful as food, but which, with other waste products, are ultimately expelled directly from the alimentary canal. See DIGESTION.

Chyträus, *chĕĕ-tray'oos*, or **Chytræus**, DAVID KOCHHAFF: one of the most influential Lutheran theologians of the second half of the sixteenth century; b. at Ingelfingen, Swabia, Feb. 26, 1530; Professor of Theology at Rostock, and a participant in various religious conferences. He was one of the framers of the *Formula Concordiæ* from 1550, and the chief author of the classical Austrian Lutheran Liturgy of 1571. D. in Rostock, June 25, 1600. See his biography by T. Pressel (Elberfeld, 1863) and by O. Krabbe (Rostock, 1870).
Revised by HENRY E. JACOBS.

Cialdini, *chĕĕ-ăăl-dee'nĕĕ*, ENRICO: general; b. in Modena, Italy, Aug. 10, 1811. Having engaged in the insurrection of 1831, he fled to France; entered the Spanish army in 1835; fought in several campaigns against the Carlists. In 1848 he returned to Italy, and joined the Italian patriots in the war against Austria. He served Victor Emmanuel as a general of a division in the Crimean war (1854–55). In June, 1859, he commanded with success against the Austrians at Palestro. He defeated the papal Gen. Lamoricière at Castelfidardo in 1860, and besieged Gaeta, which he took in Feb., 1861; was created Duke of Gaeta; governor of Naples, where in 1862 he resisted Garibaldi's second military expedition to Sicily. He became a senator of Italy in 1864, commanded one of the armies operating against Austria in 1866, and was appointed chief of the royal staff in the same year. In Oct., 1867, he was requested by the king to form a cabinet after the resignation of Ratazzi, but without success. He withdrew from the army, and opposed the ministry of Lanzi. He accompanied Amadeo as ambassador extraordinary to Madrid. He was ambassador to France from 1876 to 1881; received appointment as one of the two generals in the Italian army. D. Sept. 9, 1892.

Ciampelli, *chĕĕ-ăăm-pel'lĕĕ*, AGOSTINO: b. 1578; d. 1640; a Florentine painter; pupil of Santo Tito; worked for Clement VIII. in the Vatican, S. John Lateran, and the Church of the Gesú: was made superintendent of the works at St. Peter's.

Cianca, *see-ăăn'-zăă*, ANDRES, de: Spanish judge; b. at Peñaficl, diocese of Palencia, about 1500. In 1546 he went with Gasca to Peru, and soon after took a seat in the royal audience, of which he became president. He was one of the judges who condemned Gonzalo Pizarro and Francisco Carvajal to death in Apr., 1548. After the departure of Gasca (1550), Cianca governed Peru as president of the audience until the arrival of Mendoza, Sept., 1551. Nothing is known of his subsequent career. H. H. S.

Cib'ber, COLLEY: dramatist and actor of Danish extraction; b. in London, England, Nov. 6, 1671. His father was a sculptor of merit. He began to act comedies in 1689, and married a Miss Shore in 1693. In 1695 he produced a play called *Love's Last Shift, or the Fool in Fashion*, which was successful. He also wrote *The Careless Husband* (1704); *The Non-juror* (1717); and *An Apology for the Life of Colley Cibber*, an amusing work, of which an edition was published in 1888. Most of his theatrical life was passed in connection with Drury Lane theater, of which he was one of the managers. In 1730 he was appointed poet laureate. D. Dec. 11, 1757. Notwithstanding the reputation for stupidity which Pope's *Dunciad* has conferred upon Cibber, there is no doubt that he was in reality one of the most brilliant writers of that brilliant age. His morals, however, were not of the purest.—His son THEOPHILUS (1705–58) was an actor, an author, and a writer of repute, and husband of Susanna Maria Cibber, a celebrated actress.

Cib'ol: a plant of the onion or garlic genus; the *Allium fistulosum*; an Asiatic plant, much cultivated in parts of Europe for its tops, which are tubular, somewhat like those of the onion. It stands in the ground all winter, growing from year to year without replanting. The name is also sometimes given to the SHALLOT (*q. v.*).

Cibola: See ZUÑIAN INDIANS.

Ci'bolo: a river of Texas; rises in Kendal County, flows southeastward, and enters the San Antonio near Helena. Entire length about 110 miles.

Ciborium [from Gr. *κιβώριον*, a cup-shaped seed-vessel, a drinking cup. False association with Latin *cibus*, food, probably directed the eccles. use of the term]: in the Roman Catholic Church a variety of the pyx, or vessel used to contain the consecrated host. The ciborium is of gold or silver, and its cover is frequently surmounted by a cross. The name is also given to a canopy over the altar, sustained by four columns, to which the pyx, in the form of a dove, was suspended by chains.

Cibrario, *chĕĕ-braa'rĕĕ-ō*, LUIGI: historian; b. in Turin, Italy, Feb. 23, 1802. He published, besides other works, *Economia Politica del Medio Evo* (1839); a *History of the Monarchy of Savoy* (1840); and a *History of Turin* (1847), besides numismatic and antiquarian treatises. He was made a senator of Sardinia in 1848. Became Minister of Public Instruction in 1852, and Minister of Foreign Affairs in 1855. D. Oct. 1, 1870.

Cica'da: the Latin name of a well-known European insect, called also **Cica'la**, which gives its name to a genus of *Hemiptera* noted for the shrill noise which they make. The cicada of the ancient classic poets, admired for its shrill song, is the common species (*Cicada orni*) of Southern Europe. Their organ of sound is situated on each side of the under and anterior part of the abdomen. Cicadas abound in tropical and sub-tropical regions. They mostly have transparent and veined wing-covers. There are several species of cicada in the U. S., commonly termed locusts or harvest-flies. The most remarkable is the "seventeen-year locust" (*Cicada septemdecim*), a species abundant at times in portions of the U. S. to the E. of the great plains. There are two races, one essentially northern in its distribution and appearing at intervals of seventeen years, the other practically southern, and with a period of thirteen years. There are several broods of each, so that while the periodical cicadas are at no time found continuously over the entire area which they inhabit, yet, with rare exceptions, each year is somewhere a cicada year. The eggs of the cicada are deposited in little grooves cut by the ovipositor in the outermost twigs of various trees, and hatch in about six weeks. Almost immediately after liberation the active young leap from the boughs, and, falling to the ground, burrow into the earth, where the greater part of their lives is to be passed. Here they live for nearly thirteen or seventeen years, as the case may be, at depths of from 2 to 20 feet, feeding upon the roots of trees or herbaceous plants. They extract the sap by means of the long, sharp-pointed beak; also, it is said, obtaining nourishment from the moist earth by means of certain capillary hairs at the tip of the proboscis. Having passed through the long period of underground existence, during which the growing larvæ shed their skins many

times, the cicadas tunnel upward, issue from the ground by countless thousands, climb the nearest tree, shed their skin for the last time, and emerge as perfectly formed insects. The freshly formed cicadas are at first soft and creamy white, but a few hours exposure to the air suffices for them to harden and assume the colors of the adult. The ascent takes place about the last of May, a little earlier or later according to locality, and between sunset and midnight.

F. A. Lucas.

Cicatrization [from Lat. *cica'trix*, scar]: the process by which wounds or other destructive processes are repaired. A dense, fibrous tissue takes the place of the lost tissues, and has a great tendency to contract and produce puckering. Scars of the skin are found to lack the glands and other structures of normal skin, and frequently present a white, shining appearance from their density. The cicatrix of burns and scalds has often a remarkable tendency to contract and distort the neighboring surface.

William Pepper.

Ciccione, chit-chi-ō'nāy, Andrea: d. 1445; sculptor and architect of Naples; pupil of the younger Masuccio. His best work is the mausoleum of King Ladislas at Carbonara.

Cic'ely: originally and properly the *Myrrhis odorata*, a sweet-scented plant of the family *Umbelliferæ*, native of Europe and Western Asia. It is also known as myrrh, but it is not the true Myrrh (*q. v.*). It bears small white flowers in terminal compound umbels. It was formerly used as a pot-herb, and is still used in Italy in making salads. In the U. S. species of *Osmorrhiza* are called sweet cicely.

Cic'er: a genus of plants of the Bean family (*Papilionaceæ*) related to the peas and vetches, from which it differs in having toothed leaflets, and in having a terminal leaflet instead of a tendril. *C. arietinum*, the chick-pea or coffee-pea, is grown for its seeds.

C. E. B.

Cicero, sis'e-rō, Mar'cus Tul'lius: Roman orator, author, and statesman; b. at Arpinum (now Arpino), about 70 miles E. S. E. of Rome, on Jan. 3, 106 B. C. He is often called Tully by English writers. The significance of the surname *Cicero* is unknown. He was liberally educated by his father, an opulent *eques* of the same name; was a pupil of Archias, the Greek poet, and learned to speak Greek fluently. He also became deeply versed in Greek literature and philosophy. His disposition was genial and amiable, his habits temperate and exemplary. In the year 90 B. C. he assumed the manly gown (*toga virilis*), and began to study law under Mucius Scævola the Augur, who was a jurist of great eminence. In his early youth he wrote *Pontios Glaukos* and other poems, among them a translation of the *Phainomena* of Aratus, of which fragments are extant. According to Plutarch, "he was regarded as the best poet, as well as the greatest orator, in Rome." He passed through a course of discipline in rhetoric and elocution, studied logic under Diodotus the Stoic, rhetoric under Molo of Rhodes, attended the lectures of the Greek philosopher Philo, and neglected no mental exercise, however arduous. At the age of twenty-five he began to plead in the Forum, and, according to the custom of Roman advocates, his services were always gratuitous. About the year 80 he defended Roscius Amerinus with courage and success when he was prosecuted for a capital crime by an agent or favorite of Sulla, then dictator, the fear of whose enmity deterred the other advocates from pleading for the defendant.

His constitution was naturally delicate, and his physical condition was such that his friends advised him to abandon the bar or to improve his health by travel. In 79 B. C. he departed from Rome and went to Athens, where he passed about six months, and studied philosophy with Antiochus of Ascalon and Zeno the Epicurean, and rhetoric with Demetrius Syrus. He there formed an intimate friendship with the celebrated Titus Pomponius Atticus. He afterward extended his travels through Asia Minor, and returned to Rome in 77 with a great improvement in his lungs, voice, and constitution. About this time, perhaps as early as 79, he married an heiress named Terentia.

In 75 B. C. he obtained the office of quæstor, the first step in the gradation of public honors, and it was decided by lot that he should perform the duties of quæstor in Sicily. The integrity, moderation, and humanity of his official conduct excited general admiration among the people of Sicily. He returned to Rome in the year 74, and soon rose to the foremost rank in his profession. His chief forensic rival was Hortensius. Cicero excelled in sarcasm and witticisms, with which he often seasoned and enlivened his orations and arguments. No advocate had greater power over the feelings and sympathies of his auditors. It was his habitual practice to act as counsel for the defense in criminal trials, but he deviated from this rule in the case of Gaius Verres, who was prosecuted by the Sicilians in 70 B. C. for nefarious acts of cruelty and rapine. Only two of his admirable orations against Verres (the *Divinatio* and *Actio Prima*) were actually spoken in court, for the evidence against the accused was so convincing that his counsel declined to plead, and Verres went into exile before the decision of the cause. Cicero was elected ædile in 69 B. C. by a majority of the voters of every tribe, and in that capacity had the charge of the temples and public edifices. Having offered himself in 67 as a candidate for the office of prætor, which was the next in the ascending scale of public honor, he was elected first *prætor urbanus* by the suffrages of all the centuries. In this magistracy he had to preside as judge over the highest civil court. According to Plutarch, "he acted with great integrity and honor as president in the courts of justice." During his term of office, in 66 B. C., as prætor he made an important political oration for the Manilian Law (*De Imperii Cn. Pompei*), the object of which was to appoint Pompey commander-in-chief in the war against Mithridates the Great.

After the expiration of his term of office (which was one year) he prepared to compete for the consulship, and offered himself as a candidate in 64 B. C. Catiline was one of the defeated candidates in this election, which resulted in the choice of Cicero and C. Antonius. Cicero entered upon the office on Jan. 1, 63, at a time when the republic was in a critical condition in consequence of the prevalence of corruption, sedition, and treasonable designs. He succeeded in forming a political alliance between the senate and the *equites* or knights, and by this wise policy promoted the cause of liberty and order. "He was," says Middleton, "the only man in the city capable of effecting such a coalition, being now at the head of the senate, yet the darling of the knights." He acquired great celebrity by the courage and energy with which he defeated the conspiracy of Catiline, whom he denounced in four eloquent orations. Catiline, who was the leader of a large number of desperate men, had formed a plot to burn the city and massacre many of the senators. Cicero, who was notified of this plot by a woman named Fulvia, pronounced before the senate on Nov. 8 his first oration against Catiline, who was present and rose to reply, but his voice was drowned by cries of "Traitor!" and "Parricide!" (See Catiline.) The versatility and elasticity of Cicero's mind were signally exemplified by the fact that during the crisis of this conspiracy, before Catiline was defeated in battle, he defended Murena against a charge of bribery in an oration which abounds in witty and good-humored raillery.

For the defeat of this great conspiracy, Cicero received unbounded honor and applause. Men of all ranks and all parties hailed him as the saviour of the republic and father of his country. In the language of Juvenal,

Roma Patrem Patriæ Ciceronem libera dixit.

"Cicero could boast," says William Ramsay, "of having accomplished an exploit for which no precedent could be found in the history of Rome. In the garb of peace he had gained a victory of which the greatest among his predecessors would have been proud, and had received tributes of applause of which few triumphant generals could boast." He incurred, however, the enmity of many persons by the capital punishment of Lentulus, Cethegus, and other accomplices of Catiline. He was censured for violation of the constitution and laws by the execution of these conspirators, although they had been condemned to death by the senate. At the expiration of his consulship, having refused to accept the government of a province, he returned to the senate as a private individual (62 B. C.), and purchased an elegant mansion on the Palatine Hill. He also owned villas or country-seats at Tusculum, Arpinum, Formiæ, and other places. He opposed the triumvirs Cæsar, Crassus, and Pompey, whose coalition he considered to be dangerous to the peace and liberty of the state, and he endeavored, without success, to detach from that coalition Pompey, who was his personal friend. In 59 B. C. his malignant enemy Clodius obtained power as tribune of the people, and proposed a law "that whoever has put to death a Roman citizen without due trial shall be interdicted from fire and water." Many thousands of Roman citizens now expressed sympathy

for Cicero, but as the consuls were hostile to him, he yielded to the storm and went into exile in Apr., 58 B. C. A law was then speedily enacted to interdict Cicero from earth and water, and his house on the Palatine Hill was burned by Clodius. The lack of fortitude which he exhibited in his exile (which was passed in Greece) is severely criticised by several writers. In a letter to his wife Terentia he wrote, "It is not my crimes, but my virtue that has crushed me." The excessive violence of his enemies tended to produce a speedy and strong reaction. The new consuls and tribunes elected for the year 57 were friendly to Cicero, whose recall was also advocated by Pompey and a majority of the senate. In Aug., 57, a bill for his restoration was adopted by an overwhelming majority of the voters, who had come from various parts of Italy to the *comitia centuriata* at Rome. "There had never been known," says Middleton, "so numerous and solemn an assembly of the Roman people as this." On his return to Rome he was greeted with abundant demonstrations of popular favor and enthusiasm. Between 57 and 52 he pleaded several causes in the courts, and found leisure to write two important works, entitled *De Republicâ* (On the Republic, or the Principles of Government) and *De Oratore*. The *De Legibus*, a philosophical treatise on the origin, nature, and perfection of law, was probably begun in 52.

For a term of one year (beginning July 31, 51 B. C.) he acted as proconsul or governor of Cilicia and Pisidia, where his administration was a model of moderation, purity, and probity. He returned to Italy in the year 50, and found that a civil war was imminent between Cæsar and the senate. He hesitated whether he should take an active part in the coming contest, and wished to act as a mediator, but eventually he joined the army of Pompey, who fought for the senate. "He fluctuated greatly," says Plutarch, and was in the utmost anxiety; for he says in his letters, "Whither shall I turn? Pompey has the more honorable cause, but Cæsar manages his affairs with the greatest address. In short, I know whom to avoid, but not whom to follow." His wit, however, did not fail even in this gloomy crisis. When Pompey asked him, "Where is your son-in-law?" (Dolabella), Cicero replied, "He is with your father-in-law." After the battle of Pharsalus (Aug., 48 B. C.), Cato offered the command of the army to Cicero, but he declined it, and, returning to Italy, submitted to the power of Cæsar, who treated him with clemency. He afterward devoted himself to literary labors in retirement, and found consolation in the calm enjoyments of speculative philosophy. In the ensuing period of three or four years (47–44) he produced numerous works on philosophy and rhetoric, which are admirable monuments of his profound and varied learning as well as of his immense mental activity. As a philosopher he preferred the principles of the New Academy. In the year 45 he lost his accomplished daughter Tullia, whom he regarded with the fondest affection. He approved the assassination of Cæsar, and denounced the conduct of Mark Antony in a series of orations called *Philippics*, the first of which was spoken in the senate in Sept., 44. The second *Philippic* is a masterpiece of eloquent invective. For a few months in the year 43, while Octavius co-operated with the senate against Antony, Cicero was the most prominent statesman in Rome. Between Dec., 44, and May, 43 B. C., he uttered his last twelve *Philippics*, which were received with general applause, but the republican cause was soon ruined by the coalition of Octavius with Antony and Lepidus. Cicero was proscribed by them, and was killed by the soldiers of Antony near his Formian villa Dec. 7, 43 B. C. He left one son, named Marcus Tullius. The moral character of Cicero is admitted to be excellent even by those who censure his public conduct. His worst foible was vanity, exhibited in a habit of self-laudation. According to Niebuhr, "the predominant and most brilliant faculty of his mind was his wit. In what the French call *esprit*—light, unexpected, inexhaustible wit—he is not excelled by any of the ancients." As an orator he surpassed all the ancients except Demosthenes. Modern critics concur in unanimous admiration of the consummate grace and beauty of diction which enchant successive generations in the periods of Cicero. He amplifies everything. His words seem to gush forth without effort in an ample stream; and the sustained dignity of his oration is preserved from pompous stiffness by the lively sallies of a ready wit and a vivid imagination. His periods are sonorous, but present a great variety of cadences. His *Letters*, of which nearly 800 are extant, are models of exquisite Latinity, and are highly prized for the light which they throw on the history and antiquities of the Roman republic. Among his works which remain entire are fifty-seven orations; also treatises, entitled *De Finibus*, libri v. (an Inquiry into the Supreme Good); *Brutus seu de Claris Oratoribus* (a critical notice of Roman orators); *De Amicitiâ* (a dialogue on friendship); *De Senectute* (a dialogue on old age); *Tusculanæ Disputationes* (disputations on various questions of philosophy); *De Naturâ Deorum*, libri iii. (On the Nature of the Gods); *Orator, seu de Optimo Genere Dicendi* (The Orator, or On the Best Manner of Speaking); and *De Officiis*, libri iii. (an excellent treatise on ethics). One of his greatest works, *De Republicâ*, is lost, except a large fragment. He also wrote treatises, *De Gloriâ* (On Glory) and *De Virtutibus* (On the Virtues), which are not extant. Mutilated copies have been preserved of his works entitled *De Legibus* and *Academicorum*, libri iv. Among the best editions of his complete works are those of Ernesti (Halle, 5 vols. 8vo, 1774–77); Orelli (Zurich, 9 vols. 8vo, 1826–38); Baiter and Kayser (Leipzig, 11 vols. 8vo, 1860–69); and C. F. W. Müller (Leipzig, 1878, still in course of publication). The correspondence, chronologically arranged, is being edited by R. Y. Tyrrell; 3 volumes have already appeared (Dublin and London). See Plutarch, *Life of Cicero*; Conyers Middleton, *History of the Life of Cicero* (1741); Abeken, *Cicero in Seinen Briefen* (1835), and an English version of the same (1854); W. Forsyth, *Life of M. T. Cicero* (2 vols., 1865); Lamartine, *Cicéron* (1852); Orelli, *Onomasticum Tullianum*; Drumann, *Geschichte Roms*, vols. v. and vi.; G. Boissier, *Cicéron et ses amis* (Paris, 1884). The most vivid and popular *Life of Cicero* is by Anthony Trollope (1880, 2 vols.). Revised by M. Warren.

Cicero, Marcus Tullius: the only son of the preceding; b. in 65 B. C. He is said to have been dissipated, indolent, and intemperate. In the year 49 he joined the army of Pompey, and received the command of a squadron of cavalry. Soon after the battle of Pharsalia (48 B. C.) he went to Athens, and studied philosophy under Cratippus. Having been appointed a military tribune by Brutus in 44 B. C., he defeated C. Antonius, and did good service in the Macedonian campaign. By the favor of Octavius (Augustus) he became consul in the year 30, and was governor of Asia (Syria) in 29–28. The year of his death is unknown.

Cicero, Quintus Tullius: a brother of Cicero the orator; b. about 102 B. C. He was elected prætor for the year 62, after which he officiated as governor of Asia for three years, and returned to Rome in 58 B. C. In Asia, however, he gave great offense to both the Greeks and the Romans by the violence of his temper and the corruption and licentiousness of his favorites. He was appointed in the year 55 legate (*legatus*) to Cæsar, whom he attended in an expedition to Britain, and in 54 he commanded a legion in Gaul. In the civil war he took arms against Cæsar, but he made his peace with him in 57 B. C. He was proscribed by the triumvirs, and killed in 43 B. C.

Cicognara, chĕe-kōn-yaa'răă, Leopoldo, Count da: an Italian antiquary and writer on art; b. in Ferrara, Nov. 17, 1767. He was for many years president of the Academy of Fine Arts in Venice, and was a friend of Canova. His chief work is a *History of Sculpture from the Renaissance of that Art to the present Century* (3 vols., 1813–18), which is highly esteemed. He wrote a *Life of Canova* (1823). D. Mar. 5, 1834.

Cicu'ta: the Latin name of the *Conium maculatum* (hemlock); a poisonous plant which was used at Athens as means of capital punishment. This is the plant which is popularly called cicuta in the U. S. and Europe. (See Conium.) Cicuta is also the name of a genus of umbelliferous plants which are poisonous. The *Cicuta maculata* (spotted cowbane) grows in swamps in the U. S. Its root is a very deadly poison. Other equally poisonous species grow in the U. S. and in Europe.

Cid, more originally **Mio Cid**: a surname of the celebrated national hero of the Spaniards, Ruy (Rodrigo) Diaz de Bivar, most likely bestowed upon him by the Moorish population of Valencia (derived from the Arabic *Sid-y*, My Lord). A descendant of one of the noblest Castilian families, the Cid was born at Bivar, near Burgos, about 1040. From 1063–73 he served as captain of King Sancho II. in his wars with Aragon, Galicia, and Navarre. In 1074 he married Ximena, daughter of Diego, Count of Oviedo. Being

banished by his sovereign, Alfonso VI., in 1080, he became a bold guerrillero, serving Christian or Moor as seemed most profitable to himself, and being equally dreaded by both. During this border warfare he received the surname of *Campeador*, the champion. It was in the service of a Moorish sovereign, King Mostain of Saragossa, that the Cid, about the year 1087, began those invasions of the territory of Valencia which led to his conquest of that city in 1094. He maintained himself as master of Valencia until his death in July, 1099. The Cid is the central figure of the earliest epic poetry of Spain that we possess. The oldest and most important epic poem celebrating his triumphs is the *Poema del Cid*, composed about the middle of the twelfth century in the Spanish epic verse of fourteen syllables, and telling in its first part the exploits of the hero after his banishment by Alfonso VI.; in the second the taking of Valencia and the (unhistorical) marriage of his daughters with the infantes of Carrion; and in the third the treason of the infantes, the Cid's triumph over them, and the second marriage of his daughters with the princes of Navarre and Aragon. While in this poem the Cid is represented to us as a mediæval vassal loyal to his sovereign, he appears as the leader of the rebellions nobles in the *Cronica rimada*, composed about half a century later, and is entirely unlike the historical character in the part he plays in the ballad and the drama, such as e. g. Guillen de Castro's play, *Las mocedades del Cid* and in Corneille's *Le Cid*. The best treatise on the Cid is Dozy's work *Le Cid, d'après de nouveaux Documents* (Leyden, 1860). A critical edition of the *Poema*, such as is required by the condition of the text, is still wanting; the text is published in vol. xv. of Rivadeneyra's *Biblioteca de Autores Españoles*, and by Vollmöller (Halle, 1879). A good French translation, with notes and a vocabulary to the Spanish text, is that by Damas Hinard, *Poème du Cid* (Paris, 1858), and an English rendering, with an able introduction, that of John Ormsby, *The Poem of the Cid* (London, 1879). The *Cronica rimada* was published by Francisque Michel at Paris in 1846, republished by F. Wolf at Vienna in 1847, and by Duran in his *Romancero General* (2d ed. 1882), vol. ii., appendix iv. Critical editions of the ballads of the Cid are by Duran in the *Romancero General*, vol. ii., and especially by Carolina Michaëlis de Vasconcellos, *Romancero del Cid* (Leipzig, 1871). HENRY R. LANG.

Cider [from O. Fr. *sidre*: Ital. *sidro*: Span. *sidra* < Lat. *sicera* = Gr. σίκερα, from Heb. *shēkār*, strong drink]: a beverage made in several countries from the juice of apples. After gathering, the apples should be kept under cover until they are thoroughly ripe. If left in the air rain will wash from them certain organisms which are of importance for the purpose of causing fermentation of the juice after it is expressed. Various devices are employed for the purpose of expressing the juice, the most common being a large wooden roller running by horse-power in a sort of trough. The juice first formed (sweet cider) is turbid. This is placed in casks and allowed to ferment at a temperature not exceeding 40° F. The sugar contained in the juice is thus converted into alcohol and carbonic-acid gas. After the liquid begins to clear up on account of the interference with the fermentation due to the accumulation of alcohol, it is drawn off and kept at a lower temperature, when a further fermentation takes place. Good cider contains from 8 to 10 per cent. of alcohol, and from 2 to 3 per cent. of sugar. It may be mentioned that the presence of malic acid in cider distinguishes it from wine. I. R.

Ciene'ga [Sp. *cienaga*, a quagmire, deriv. of *cieno* < Lat. *caenum*, mud]: a marshy tract situated on a slope otherwise arid. The term is widely used in California, Arizona, New Mexico, and Mexico. The occurrence of a cienega depends on the existence, not far below the surface of the ground, of a stratum impervious to water, by which an underground current is brought near the surface. It is thus closely analogous to a spring, and the two phenomena grade into one another. A well dug in a cienega will always find a supply of water, and cienegas have proved serviceable in directing exploration for artesian water. See E. W. Hilgard, *Cienegas of Southern California*, Bulletin Geological Society of America, vol. iii., 1891. G. K. G.

Cienfuegos: a town of Cuba. See the Appendix.

Cieza, thēē-ā'tha: a town of Spain; in the province of Murcia, near the river Segura, on a railway, 26 miles N. W. of Murcia. It has manufactures of coarse linen cloth. On the opposite side of the river are remains of an ancient Roman town. Pop. about 11,000.

Cie'za de Leon', PEDRO, de: Spanish soldier and historian; b. at Llerana, Estremadura, 1518. He went to America, probably in 1534, and served in Panama and New Granada until 1547, when he went with Gasca to Peru. He traveled extensively in that country and Charcas, with the special object of collecting material for his history, which he had commenced in 1541. Much important information was obtained from the Inca Cayu Tupac of Cuzco, a descendant of Huayna Ccapac. He returned to Spain about 1552, and died at Seville in 1560. His *Crónica del Peru* consisted of four parts, the first giving a description of the country, the second embracing the history of the Incas, and the remainder the conquest and civil wars. Of these, part i. was published at Seville 1553, part ii. in 1873, and the third book of part iii. in 1877. Other portions are known in MS., but some is lost. There are English translations of parts i. and ii. Cieza de Leon is by general consent one of the best and most reliable authorities on early Peruvian history.

HERBERT H. SMITH.

Cigar, or **Segar** [*segar* is the older Eng. spelling, *cigar* that of this century; Fr. *cigare*, Span. *cigarro*, Ital. *sigaro*, with change of gender from Lat. *cica'da*, locust, probably so named from resemblance in color and form between the roll of tobacco and the body of the cicada]: a small roll of tobacco-leaves for smoking. The cigars of Havana are the most highly prized, but those from Manila, usually called cheroots, are also excellent. The manufacture of cigars in the U. S. is an important industry. For the outer part or wrapper of a cigar the tobacco raised in the Connecticut valley is considered the best, from its fine elastic quality. See TOBACCO.

Cignani, chēēn-yaa'nee, Count Cavalier CARLO: painter; b. in Bologna, Italy, May 15, 1628; pupil of Albani, under whom he worked. He was director of the Painters' Academy of Bologna; knighted by the Duke of Parma; was considered one of the best painters of his day and school, and has left frescoes and other works in the palaces and churches of Piacenza, Parma, and Forli, where he decorated the cupola of the duomo. D. in Bologna, Sept. 6, 1719.

W. J. STILLMAN.

Cigoli, chēē-gō'lēē, FRA LUDOVICO CARDI, da: painter and architect; b. in Cigoli, near Florence, in 1559; pupil of Allessandro Allori, Sante Tite, and Buontalenti. He worked after A. del Sarto, Correggio, and Baroccio. His best painting is a *Martyrdom of S. Stephen*, in the Uffizi Gallery in Florence. He designed a façade for S. Maria del Fiore, which was probably the classical one, which was destroyed by the Medici. D. in Rome, 1613. W. J. STILLMAN.

Cil'ia [Lat. plur. of *cilium*, eyelid, eyelash]: the hairs which grow from the margin of the eyelids. The term is more usually applied to microscopic filaments which project from animal membranes, and which are endowed with quick, vibratile motion. Cilia are distinguished from pseudopodia by their permanence, and from flagella by their smaller size and association in groups; although practically a flagellum is a large, single cilium. In vertebrates cilia occur upon the epithelium of the mucous membrane of various organs; their movements are apparently independent of the nervous system, and will continue long after the animal is dead. Among minute invertebrates, such as the ROTIFERA and INFUSORIA (*q. v.*), cilia are present in definite tracts, and serve by the rapid vibration as organs of locomotion, or to create currents by which particles of food are brought within reach. The embryos of many of the lower animals are also frequently provided with cilia by means of which they move about.

In BOTANY cilia are long hairs situated on the margins of vegetable bodies.

In ENTOMOLOGY fringes of hairs, such as are found on the legs of some beetles, are termed cilia. F. A. LUCAS.

Cilia'ta: an order of INFUSORIA (*q. v.*).

Cilic'ia (in Gr. Κιλικία): an ancient division of Asia Minor; bounded N. by Mt. Taurus, E. by Mt. Amanus, S. by the Mediterranean, and W. by Pamphylia. The surface is partly mountainous, and partly occupied by fertile plains adjacent to the sea. The chief river was the Cydnus. The principal towns were Tarsus, Soli, Seleucia, Mallus, and Aphrodisias. The ancient Cilicians were distinguished for maritime enterprise and also for piratical habits. In early ages Cilicia was an independent kingdom. It was afterward a part of the Persian empire, and was reduced to a Roman province in the time of Pompey. It coincides nearly with the Turkish division of Adana. Among the eminent natives of Cilicia

were St. Paul, Chrysippus the Stoic philosopher, and Aratus the poet.

Cima, chee'mă. Giovanni Battista da Conegliano: b. 1460; one of the most charming and earnest of the early Venetian painters; a native of the town of Conegliano, at the edge of the Venetian Alpine country, the landscape of which had a strong and delightful influence on his art. His early manner of painting had, according to Cavalcaselle, a tendency to the Lombard art, and showed also the influence of Antonello da Messina. Like the other Venetians, he passed from tempera to oil soon after coming to Venice, where he fell under the teaching of Bellini, from whom, however, he differs not only in the general feeling for subject, but also in that for color. He devoted himself to the saints, and reaches a high degree of expression of that serenity which we are in the habit of considering the characteristic of the purely religious schools. He carried the elaboration of the details of his figures and landscape to a height remarkable even then, and a portion of one of his landscape backgrounds has been made famous by Ruskin, who spent many days in copying it. He was not, however, naturalistic, the details of his landscape being always invented in the studio. Most of his work is to be found at Venice. The picture named by Ruskin is *St. John the Baptist*, in the Church of the Madonna del Orto, Venice. (See *Modern Painters*, vol. i. and vol. iii.) This picture was at one time in the Venice Academy. Other celebrated pictures are a *Baptism of Christ*, in the Church of St. John in Bragola, Venice, and a *St. Helena with the Cross*, in the same church; a *Virgin and Child*, in the National Gallery in London; a *Virgin and Child*, in the Louvre. D. about 1520. W. J. Stillman.

Cimabue, chĕe-mă-boo'ă, Giovanni: b. in Florence about 1240; d. about 1302. Cimabue is noted as the restorer of painting, and, as his contemporaries were thrown into the shade by the want of the contemporary recognition he enjoyed, he retains that position in popular tradition. The famous mention of him by Dante has had perhaps more effect on the reputation he has maintained to our day than he merited. He did not redeem art from a state of barbarous rudeness, as is generally supposed, but took the Byzantine art of his predecessors and teachers and carried it a little further; but he was only one of a great number of painters who were all affected by the same awakening which was the result of the new political and intellectual life of Italy, partly due to the influx of learned men and letters from Constantinople. Sienna was not in the least behind Florence at the time, but as most of the Siennese school has perished, and the glory of Giotto, Cimabue's pupil, came up before the world through the literary activity of Florence with advantages that Sienna never enjoyed, and also partly because the greater wealth of Florence and her domination of the other Tuscan cities gave her almost the monopoly of the best art, Sienna never felt permanently the effect of the Renaissance as her greater rival did. Cimabue probably only innovated by the adoption of a gayer, more natural, and more attractive scheme of color than the Byzantine, and perhaps by a somewhat more minute and faithful painting of his accessories. The Byzantine painters had certain conventional tones for all things, and prescribed attitudes for their subjects, and they seem to have regarded the effects of age on the older work as necessary to the reverence required for religious painting. These Cimabue probably abandoned, and he at the same time, as we see at Assisi, tried new ways of painting, not always fortunate, and he certainly did not always follow the prescriptions of Byzantine art. But the idea that he ever attempted to revert to nature in the modern sense of the word is unfounded. He followed the archaic treatment, working without nature and following the archaic types. The comparison with the nearly or quite contemporary work at Sienna shows that the growth of art had not been confined to one part of Italy, and Cimabue's work is often very difficult to distinguish from the earlier Byzantine and from that of his contemporaries. Madonnas of his may be seen in the galleries of Florence, the Louvre in Paris, and the National Gallery of London. His *Virgin and Child*, which had great celebrity, is an altar-piece in the Pucellai chapel of the S. Maria Novella church of Florence. His work may also be seen in Assisi, and a mosaic in the cathedral of Pisa. W. J. Stillman.

Cimarosa, chĕe-mă-rō'să, Domenico: musical composer; b. in Aversa, kingdom of Naples, Italy, Dec. 17, 1749; studied eleven years at the musical institute of Naples; in 1772 produced in Naples two comic operas, the renown of which led to an invitation to Rome, where, in 1774, he put on the stage the humorous *Italian in London*. He pursued his art in Naples, Rome, Florence, and other Italian cities, composing cantatas, sacred and comic operas, and church music, but little of his work of this period has survived. In 1787 he went to St. Petersburg as a court musician, and four years later to Vienna, where he produced his masterpiece, *Il Matrimonio Segreto* (The Secret Marriage). Returning in 1793 to Naples, he placed on the stage his *Le Astuzie Feminili* and *L'Olimpiade*; engaged in the republican agitation while the French troops were in Naples; was condemned to death on the return of the Bourbons; escaped to Venice, where he died Jan. 11, 1801. His works are remarkable for originality and spirit.

Cim'bri (in Gr. Κίμβροι): a warlike people of ancient Europe whose origin is involved in obscurity. They were regarded as Germans by Cæsar and Tacitus, whose opinion has been adopted by most moderns. H. Müller and other writers suppose that they were Celtic, and that Cimbri is another form of *Kymri*, which is the native name of the Welsh. In 113 B. C. the Cimbri and the Teutones issued from the north part of Germany, crossed the Eastern Alps, and invaded the territory of the Romans, whom they defeated in battle. They afterward moved across the Rhine, and pillaged part of Gaul. The Cimbri and Teutones gained another victory over the Romans in the year 109. Within a period of six years they defeated four consuls and routed five Roman armies, so that great consternation prevailed at Rome. They invaded Spain in 104 B. C. In 102 B. C. Marius defeated the Teutones at Aquæ Sextiæ (Aix), in Gaul. The army of the Cimbri at the same time invaded the north of Italy by a different route, and gained a victory over the Roman consul Catulus near the Adige. The infantry of the Cimbri had shields fastened together with chains. The two Roman armies were then united under the joint command of Catulus and Marius, who gained a great victory over the Cimbri near Verona, or, as some place it, near Vercellæ (Vercelli), in July, 101 B. C. It is said that more than 100,000 Cimbri were killed in this battle. The Cimbri in the time of Tacitus lived near the North Sea, and in Jutland, which was called the Cimbric Chersonese. See Pullmann's *Die Cimbern* (1870).

Cimme'rians (in Gr. Κιμμέριοι): originally a mythical people living on the confines of the world, where they were shrouded in mist and cloud, untouched by the rays of the sun; hence the proverbial expression "Cimmerian darkness." There were the groves of Persephone, the entrance to the dank house of Hades, and there is a rock (Mt. Taurus), "and the meeting of two roaring waters" (between the Sea of Azof and the Euxine Sea). The historical Cimmerians inhabited the Tauric Chersonesos (Crimea) and the country E. of the Straits of Kertch ("Cimmerian Bosporos"). They gave place to the Scythians, who in turn were banished by the Greek colonists. J. R. S. Sterrett.

Cimo'lian Earth (in Gr. γῆ Κιμωλία): a kind of earth which the ancients used to obtain from the islands Cimolus and Siphnus in the Cyclades. It was sometimes used in medicine, but was especially employed instead of soap in washing clothes. It appears to have been a variety of steatite or soapstone.

Ci'mon, or **Ki'mon** (in Gr. Κίμων): an Athenian commander and statesman; b. about 502 B. C.; a son of Miltiades who commanded at Marathon. He served with distinction at the great battle of Salamis, 480 B. C. Cimon and Aristides commanded the Athenians, who, co-operating with the other Greek armies, prosecuted the war against Persia in 476 B. C. Soon after this date he became commander-in-chief of the allies, who preferred him to the Spartan Pausanias. He defeated the Persians on the Strymon, and in 466 gained a great naval victory at the mouth of the Eurymedon. He was for some time the most prominent statesman of Athens, and a rival of Pericles. Cimon improved Athens by planting trees and building walls to the Piræus. In 461 B. C. he was banished by ostracism, but he was permitted to return in 456. He obtained command of a fleet in 449, and besieged Citium, in Cyprus, where he died in the same year. He was a conservative in politics. See Plutarch, *Life of Cimon*; Cornelius Nepos, *Cimon*; Grote, *History of Greece*; Thirlwall, *History of Greece*.

Cinaloa: same as Sinaloa (*q. v.*).

Cinchona, sin-kō'na: a genus of trees of the family *Rubiaceæ*, from many of the species of which is derived the bark

(sometimes popularly called Peruvian bark), from which are obtained the alkaloids quinine and cinchonia. Cinchona-trees are indigenous to South America from 10° N. lat., to 19° or 20° S. lat. They are found chiefly on the eastern slope of the central chain of the Andes in Bolivia and Peru, and it is stated that the climate which is most favorable to their growth is characterized by a rainy season lasting for nearly nine months, the mean annual temperature being pretty low—about 55° F. The tree is distinctly a mountain tree, and does not grow in the valleys. It is an evergreen, from 40 to 80 feet in height, with laurel-like opposite leaves and fragrant flowers. The *Cinchona calisaya* is an exceedingly handsome tree generally found at an altitude of 5,000 to 6,000 feet. Any cinchona bark which will yield a quantity of alkaloid amounting to 5 per cent. can be used for medicinal purposes, but half of this quantity of alkaloid should be quinine. No less than thirty-six species of cinchona bark are known, but comparatively few of them (about six) yield the required amount of alkaloid. From the barks of these six species may be derived not only the alkaloid quinine but five other alkaloids, two of which are artificial. These alkaloids are divided into two series, known as the quinine and cinchonine series. In the quinine series we have quinine, quinidine, and quinicine. In the cinchonine series we have cinchonine, cinchonidine, and cinchonicine. It is the quinicine and cinchonicine which are artificial alkaloids. Cinchona bark also contains kinic and kinovic acids. At the present time most of the cinchona bark is derived from cultivated trees, since it has been found that by the cultivation of the trees and the careful collection of the bark a greater percentage of quinine can be obtained. The largest amount of cultivated cinchona bark comes from Bolivia. The cinchona-tree is also grown for its bark in Java and in India, and cinchona plantations have been started in Western Africa, in Mexico, Central America, and in the Straits Settlements. The chief use of cinchona and its alkaloids is in the treatment of malarial infection. Originally introduced to the world at large for this purpose as an anti-malarial by the Countess of Chinchon, it was afterward taken up by the Jesuits and for a certain length of time was called "Jesuits' bark." Up to within a few years the employment of this drug in malarial fever was purely empirical, but owing to the studies of Laveran, a French army surgeon, and of Marchiafava and Celli in Italy, Osler, Councilman, and others in the U. S., it has now been determined, first, that malarial fever is always due to the presence of what is known as the malarial germ in the blood, and, second, that quinine cures malarial fever by destroying these micro-organisms. Owing to its exceedingly bitter taste it is best administered in pill form, but this very bitter property makes it also a valuable bitter tonic in cases where the mucous membranes and nervous system of the human body are below par. In addition to being employed for malarial fever it has also been found to be a destroyer of the amœba coli, a micro-organism producing certain forms of dysentery, and it is therefore employed as a specific remedy in amœbic dysentery. It is also used for the purpose of breaking up colds in their early stages. With the object of increasing the power of the uterine contractions during parturition it is usually given in the dose of 20 or 30 grains dissolved in water. In pneumonia in children it is particularly useful, seeming to possess some specific influence, and it has also been found of value in certain cases of whooping-cough. Quinine itself is rarely employed, being nearly always in the form of a salt, such as the sulphate of quinine, the hydrochlorate, the bisulphate, the hydrobromate of quinine, or some similar combination of an acid with the alkaloid. Of these, the best combination is the hydrochlorate and the bisulphate, owing to their solubility, but the sulphate of quinine is the preparation which is most widely employed, purely as the result of custom. Similarly, the other alkaloids of quinine are rarely employed except as salts, and of these only the cinchonine and cinchonidine are used in medicine, as a rule generally in the form of the sulphate. They are only about quarter as strong as is the alkaloid quinine in combating malarial fever. When taken in large quantity the symptoms which are produced are known as "cinchonism." These symptoms consist chiefly in ringing in the ears, dizziness, perversions of taste and smell, a sense of fullness in the head, sometimes frontal headache, and in rare cases even complete blindness, which fortunately is usually only temporary. Deafness is also quite common from full doses, and in persons who are already partially deaf permanent deafness may be produced by this drug. Cinchona bark or any of its alkaloids should not be taken by patients suffering from inflammation of the stomach, or of the bladder, or the meninges of the brain, or by epileptics.

H. A. Hare.

Cincinnati: chief city of the Ohio valley; situated on the northern bank of the Ohio river in Hamilton co., O., the extreme southwestern county of the State of Ohio. It is midway between Pittsburg and Cairo, in lat. 39° 6′ 30″ N. and lon. 84° 24′ W.; 764 miles from New York, 610 miles from Washington, and about 300 miles from Chicago and St. Louis. It stands in the geographical center of a region, 200 miles in diameter, the most fertile in the world. It is from 500 to 900 feet above the sea-level. Low-water mark in the Ohio river is 432 feet above the sea, and the highest hills in the city are 475 feet higher. It is chiefly built upon two plateaus nearly surrounded by hills, but it now extends over the neighboring highlands where most of the fine residences are located. The first plateau is about 65 feet above low-water mark, the second rises from 50 to 100 feet higher. The neighboring hills, pierced by ravines, rise from 150 to 300 feet above the upper plateau. The semicircle of hills comes close to the river above and below the plain, the distance between the ends of the semicircle being about 2½ miles. Access to this inclosed plain is chiefly by the narrow river-valley and by the spacious valley of Mill creek, which extends northward by gentle elevations, with a width of more than ½ mile in the narrowest part. This open gateway through the hills decided the location and growth of the city. It was from the first an easy approach for highways, canals, and railroads, and in later years affords room for the overflow of the city's population and business. If the encircling hills had been closed at that point there could have been no city where Cincinnati now stands.

Area, Plan, Divisions, and Streets.—Cincinnati has an area of about 36 sq. miles, and was regularly laid out upon the plan of Philadelphia. This regularity, however, disappears beyond the original site, and the streets conform largely to the course of the ravines and the contour of the hills. The streets are generally 66 feet wide, and the principal ones are paved with granite or asphalt, others with bowlders or macadam. The city on the hills is singularly picturesque and beautiful—perhaps beyond any other on the continent. A population of 75,000 in that region gives room for lawns and spaces, and the effect is heightened by hills and ravines, so that it has every appearance of a well-kept park, and from many points the view of country and forest and river adds greatly to the interest and beauty. The front of the city extends about 14 miles along the river, while northward from the river the average width is about 3 miles, but it extends up the Mill creek valley about 5½ miles. It is nearly surrounded on all sides by cities and villages. Opposite in Kentucky are the cities of Covington and Newport, and the villages of Ludlow, Bellevue, and Dayton. To the northward in Ohio are the villages of Oakley, Norwood, Reading, St. Bernard, Winton Place, and College Hill. These nearly inclose the city, and in some places form extensive angles and projections within her territory. It has two extensive parks, namely, Eden and Burnet Woods, upon the hills, and seven smaller ones among the denser population in the plain below. The great cemetery is Spring Grove, lying on the western slopes of the Mill creek valley, 6 miles from the river, and containing about 600 acres. It is famous among great cemeteries for beauty of situations and elegance of landscape gardening.

Buildings, Monuments, etc.—The most notable public buildings are the U. S. building for post-office, courts, etc., constructed entirely of brick, iron, and granite, at a cost of $5,000,000; the city hall, completed in 1893, a substantial, spacious, and elegant structure, costing $1,500,000; the Music Hall, mainly a gift from Reuben Springer, with a seating capacity of 5,000; the Chamber of Commerce building, one of Richardson's last designs; the County Court-house, the Cincinnati College, the Ohio and Miami Medical Colleges, the Public Library, the Central Union R. R. Dépôt, the Masonic Temple, the new Odd Fellows' building, the Scottish Rite Cathedral, the City Hospital, and the noble Art Museum in Eden Park. Among theatres, the Pike, Grand Opera-house, and Walnut Street are very creditable. Elegant private residences are numerous. The general character of the buildings from the first was plain and substantial. During the most rapid growth of the city, from 1840 to 1860, many miles of plain brick structures were erected. In later years these have given an unfavorable impression of the city architecture. No Chicago fire came to remove them, and later

growth did not demand their demolition. They are now giving way to stately and permanent buildings, of the most substantial construction. Conspicuous examples of this renaissance may be seen in the United Bank building, the buildings of the First and Second National Banks, the Neave building, the New Odd Fellows' Temple, the Chamber of Commerce, the Union Trust building, and many others.

One railway bridge, two bridges for railway and highway purposes combined, and two used exclusively for highways, none less than ½ mile in length, span the Ohio river.

The Tyler-Davidson fountain, the gift of Henry Probasco, erected on Fifth Street, surrounded by an esplanade, is the most striking and elaborate monument in the city. The statue of Garfield delivering his inaugural address and the equestrian statue of Gen. William Henry Harrison are notable works of art. In Spring Grove Cemetery there is an impressive monument erected to the memory of the Ohio volunteers who died during the civil war. St. Peter's Cathedral contains a beautiful altar of Carrara marble, and an altarpiece, *St. Peter Delivered*, by Murillo.

Institutions, etc.—Cincinnati contains 260 churches, representing every phase of Christian belief and custom. The most notable buildings are St. Peter's Cathedral, St. Francis Xavier's church, the Second Presbyterian, St. Paul's Episcopal, St. Paul's Methodist, and the First Presbyterian, which has the distinction of the loftiest spire in the West, 285 feet high. There are 17 hospitals, namely, 1 extensive City Hospital, 1 U. S. Marine Hospital: 4 are private enterprises for profit, and 11 are supported by private charity.

There are 370 building and loan associations organized under the laws of the State, which take the place of savings-banks. There are about 1,000 societies and associations, social, benevolent, and commemorative.

There are 3 public high schools, 49 district schools, and 4 intermediate schools, with 151 male and 828 female teachers, and 44,423 pupils enrolled. The cost of the public free schools in 1833 was $10,073.83; in 1842 the cost was $26,878.22; in 1852 it was $103,712.92; in 1862 it was $212,294.46; in 1872 it was $764,027.03; in 1882 it was $859,397.12; in 1892 it was $814,333.42; and in 1900 it was $897,110.41.

In addition, there are now forty parochial schools, with instructors and pupils numbering about 15,000.

There are five Roman Catholic colleges and six academies. The McMicken University, which originated in a bequest of Charles McMicken now amounting to $600,000, has been further endowed from the annual revenues of the city, and is rapidly growing into an important institution of learning. New buildings have been erected in Burnet Woods Park, where the city has set apart 30 acres for a site. The aim is to crown the free-school system with a completely equipped university. The College of Music is very largely attended, and has a large number of instructors.

The Ohio Mechanics' Institute has long been a great educational force in the city. It owns an ample building, with library, lecture-hall, and school-rooms. It maintains courses of lectures specially devoted to the mechanic arts, and a night-school with 700 pupils, where instruction is given in the rudiments of science, mathematics, architecture, and kindred subjects.

The Art School, in connection with the museum, which contains many fine paintings, statues, and other works of art, is attended by hundreds of students. It is perhaps the most liberally endowed of all the private institutions of the city, due to Joseph Longworth, Charles West, David Sinton, and Reuben Springer.

The Zoölogical Garden is situated near the northern boundary of the city. It covers 60 acres of picturesque hills and ravines, and is well stocked with wild animals, birds, etc. It originated with the public spirit of Andrew Erkenbrecher.

The principal libraries are the Public Library, with 212,262 books and 33,867 pamphlets; the Young Men's Mercantile, with 50,000 volumes; the Law Library, with 8,000 volumes; the library of the Historical Society, with a large number of rare books, pamphlets, manuscripts, etc.; and the library of the Mechanics' Institute.

Among municipal, benevolent, and penal institutions are the city infirmary, the workhouse for punishment of misdemeanors and violations of city ordinances, the House of Refuge for incorrigible or homeless boys and girls, and an extensive hospital. Besides these, there are supported by private charity many orphan asylums, protectories, and homes for boys and girls, for fallen women, for widows, and for old men.

The city has one police court with a single judge for the trial of minor offenses, and five justices of the peace. There is also a superior court with three judges, which has jurisdiction only of civil causes arising within the city. It is intended to expedite the hearing of causes arising in commercial business.

The court of common pleas, with seven judges, has jurisdiction in county and city, in cases both civil and criminal. A circuit court, with three judges, hears appeals, second trials, etc.

Government, Finance, etc.—The city is divided into thirty wards, each of which is a civil division for choosing officials.

The government of the city has much of the so-called "federal" plan. The mayor is elected every three years, and is not eligible for re-election. He appoints a board of review, six members, with authority to examine and supervise city officers and fix rates of taxation; and a board of elections, four members, which appoints all election officers, and conducts the elections and canvasses returns. He also appoints the prosecutor of the police court. He is the chief of police, with powers similar to those belonging to an officer of the army—to discipline and command, but not to appoint or discharge. There is a board of four police commissioners, appointed by the Governor of the State. The mayor nominates all officers of the police force, and with the approval of the board appoints them. Police officers hold during "good behavior," and can only be removed or punished upon charges and a hearing by the board. They must pass a medical and a literary examination before appointment. A board of service, chosen by popular vote, consisting of five members, has charge of the streets, waterworks, city infirmary, and parks.

The judge of the police court and auditor of the city are elected by the people. The board of legislation consists of one member from each ward, one half elected each year, who serve for two years. There is no other legislative body.

Commerce, etc.—By the Ohio river the city is in convenient commercial relations with the entire Mississippi valley. The river navigation is of the first importance, because it brings the vast coal, iron, and timber regions of the Alleghany hills to the city's wharf. These materials of manufacture float to Cincinnati at trifling expense. The Government has expended large sums wisely and skillfully in deepening and clearing the river's channel, and now maintains throughout its entire length a system of lights which serve as a safe guide for navigation.

The vigorous growth of railway facilities has apparently reduced the importance of river transportation. But the figures show an enormous tonnage by river each year. During the year ending Aug., 1900, Cincinnati alone received by river about 3,000,000 tons of coal, nearly 200,000 tons of manufactured iron and steel, more than 500,000 tons of pig iron, 20,000 barrels of salt, 31,000,000 square feet of lumber, and 31,000 tons of other crude merchandise. The general use of barges has reduced the cost of river carriage, and enables the steamboats which traffic with Cincinnati to handle this great volume of business.

The city is also a railway center, every important railway system having lines passing through it. Its inland situation precludes it from foreign commerce, but its location in the most productive portion of the U. S., with its ample means of communication, must always make it a most important center of domestic trade.

The traffic in 1900, which included almost every article of trade, made an aggregate in receipts of $350,000,000, and in shipments of $375,000,000.

There are 13 banks, with an aggregate capital of $9,918,000, and clearings in 1900 amounting to $795,593,750.

It is, however, chiefly a manufacturing city. Its industries ran in this direction at an early date. The distance from any source of supply and the convenience of all sorts of materials made manufacturing profitable, and there was a steady and increasing demand from the growing regions lying south and west.

According to the census of 1900 it had 175 manufacturing industries, with 5,200 establishments, engaging $89,886,796 capital, employing 90,000 hands, paying out $45,000,000 annually in wages, using materials to the value of $90,000,000, and producing merchandise to the value of $200,000,000. The total population was 326,000, so that the preponderance of manufacturing is readily seen.

The municipal debt by the census of 1890 was $24,737,611. Of this amount $18,000,000 is the cost of the Cincinnati

Southern R. R., built wholly by the city and now yielding an annual rental of nearly a million dollars. The remainder of the debt is mainly for parks, public buildings, and street improvements. The assets of the city are largely in excess of the debts.

History.—Cincinnati was settled in Dec., 1788 (probably the 28th), on land bought from the U. S. Government by John Cleves Symmes. The land had been looked over by its proprietors on Sept. 22, 1788, and a decision reached to call the place Losantiville, a pedantic name signifying the town opposite the mouth of the Licking. Judge Symmes laid out another city at the junction of the Ohio and Great Miami rivers, but a great flood in the spring of 1798 made unavailable the sites of several great cities, and the decision of the military authorities to build Fort Washington at the mouth of Mill creek aided in making Losantiville the center of settlement. In 1790 Hamilton County was organized by Gen. St. Clair, who was a member of the Society of the Cincinnati, and who changed the name of the settlement, also making it the county-seat. For ten years or more it was a village of log cabins, peopled by idlers and dissolute frontiersmen, and in 1800, when the village was organized, the population numbered only 750. In 1802 a "young ladies' school" was opened and in 1814 the Lancaster Academy, which later became Cincinnati College. An energetic population, first from New Jersey, and later from Pennsylvania, Virginia, Maryland, and Kentucky, laid sound foundations; in 1815 the first steamboat from New Orleans reached Cincinnati, and in a few years a wide commerce was made possible. In 1819 a city charter was received; the city became a manufacturing center and an important distributing-point, and its growth continued steadily until 1860. At that date the area of the city was 7 sq. miles. From 1845 to 1860 there was a large German immigration, and six or seven wards are still known as German, though the great majority of the "Germans" now living in the city are native-born. The civil war (1861–65) seriously interfered with the development of the city, chiefly by the destruction of its trade with the Southern States. In 1870 the area of the city was increased by the addition of adjoining villages, embracing an area of 17 sq. miles. In 1895 another addition of 11 sq. miles was made, including the villages of Riverside, Westwood, Clifton, Avondale, and Linwood. The period since 1865 has been distinguished by advance in art, architecture, music, and educational institutions, and under these influences a very composite population is slowly becoming homogeneous.

Population, etc.—In 1795, 500; (1810) 2,300; (1820) 9,603; (1830) 24,831; (1840) 46,338; (1850) 115,436; (1860) 161,044; (1870) 216,239; (1880) 298,000. By the census of 1890 the resident population within the city limits was 296,908, and in 1900, 325,902. The surrounding villages and cities contain about 100,000 people. Like New York, Cincinnati will always have her census population reduced by the overflow into an adjoining State. D. W. McClung.

Cincinnati Group: in geology, one of the formations representing the Silurian period in Southwestern Ohio, Southeastern Indiana, and Northern Kentucky. It consists chiefly of calcareous shale with intercalated layers of limestone, and these have yielded a large fossil fauna. The celebrated Blue Grass region of Kentucky acquires its peculiar soil from the disintegration of these rocks. G. K. G.

Cincinnati, Society of the (named from the old Roman Cincinnatus, who returned from victory to his farm): a patriotic order founded in the Verplanck House, near Fishkill, N. Y., on May 13, 1783, by officers of the Revolutionary army. It was organized to perpetuate the remembrance of the war and "the mutual friendships formed under the pressure of common danger." Membership included only officers who had served for three years and the eldest male descendants of officers who had been killed. The society has been perpetuated by the election of the eldest male posterity of a deceased member to the vacancy caused by his death. During 1783 societies were organized in each of the thirteen States, and representatives from these convened in a congress in Philadelphia in 1784. Washington was asked to hold the office of president-general until that convention. He did so, and was then chosen to the office and held it until his death. The hereditary clause in the original constitution caused much adverse criticism for its aristocratic tendencies, and at the congress in 1784 a revised constitution with that feature left out was adopted. This failed to receive a majority ratification from the State societies, and the original constitution is still in force. Meanwhile a society of French officers who had served in the American army was organized in France. One by one the State societies disbanded or became dormant until 1881, when only those of Massachusetts, New York, New Jersey, Pennsylvania, Maryland, and South Carolina remained, and an original membership of over 1,500 had fallen to 315. Since then State societies in Rhode Island, Connecticut, and France have been revived. The general society meets every three years, and in 1893 met in Boston. The present membership is now (1896) over 500. The French society was dispersed by the revolution of 1792.

Cincinnato, chĕen-chĕe-naa'tō. Romolo: a Florentine painter; b. 1502; pupil of Salviati, who was the pupil of Andrea del Sarto. He went to Spain in the service of Philip II., and died there (1502). He left a son there named Diego Romolo, also a painter, who died in 1626.

Cincinna'tus, Lucius Quintius [so called because he wore his hair in long curling locks, Lat. *cincinni*]: an eminent Roman patriot and dictator; b. about 519 B. C.; belonged to the patrician order. He cultivated a small farm with his own hands, and was regarded as a model of pristine virtue and simplicity of habits. About 458 B. C. he became consul. According to Smith's *Dictionary*, he was illegally appointed consul suffectus in 460 B. C. He was appointed dictator two years later, and gained a victory over the Æqui; resigned the dictatorship in sixteen days, and returned to his farm on the Tiber bank. In the year 450 he was an unsuccessful candidate for the office of decemvir. He was chosen dictator in 439 B. C., to oppose the machinations of Spurius Melius, accused of treason. Much of what is related of him by Livy is now thought to be legendary.

Cin'eas (in Gr. Κινέας): Thessalian orator and negotiator. He became a confidential minister of Pyrrhus, King of Epirus, who, in 280 B. C., sent Cineas to Rome to negotiate a treaty of peace or alliance. His artful and plausible speeches were frustrated by Appius Claudius, and his mission was a failure. D. about 270 B. C.

Cinematograph: See Vitascope.

Cinerary Urn [*cinerary* is from Lat. *cinera'rius*, pertaining to ashes (*ci'nis, ci'neris*)]: a jar or other receptacle of a durable kind used to contain the ashes of a dead body which had been burned. Among the Etruscans these urns were frequently of terra-cotta modeled in the form of a small house, and some information concerning the architecture of the periods has been obtained from these; others were boxes decorated with external reliefs of great richness. The Romans adopted this custom, but began before the fall of the republic to use cinerary urns of stone, sometimes in the form of square boxes and sometimes like covered vases. Urns containing ashes of the poor were placed in niches in large public structures provided for the purpose. See Columbarium.

Cin'na, C. Helvius: a Roman poet and a friend of Catullus; perhaps the same as the Cinna whom Vergil compliments in his ninth eclogue. He wrote an epic poem in the Alexandrine manner, called *Smyrna*, of which only a few lines are extant. He was killed in 44 B. C. by a mob of Cæsar's adherents, who mistook him for another Cinna, an accomplice of Brutus.

Cinna, Lucius Cornelius: Roman patrician; partisan of Marius in the civil war between Marius and Sulla. He became consul in 87 B. C., while Marius was in exile and Sulla was conducting a campaign in Asia. By an effort to reinstate Marius he provoked a violent conflict, and was driven out of Rome, but he and Marius soon returned with an army and obtained the mastery in that capital. They massacred many friends of Sulla. Cinna was re-elected consul as a colleague of Marius, who died in 86 B. C. Afterward he usurped the consulship for himself and his creatures; raised an army and marched to oppose Sulla, who was returning from Asia, but was killed by his own mutinous soldiers in 84 B. C. His daughter Cornelia was married to Julius Cæsar.

Cin'nabar [from Gr. κιννάβαρι, a word of Persian origin, *zingafr*]: the mercuric sulphide, composed, when pure, of 86·2 per cent. of mercury and 13·8 per cent. of sulphur. It occurs in rhombohedral crystals and also in the granular and massive states. Cinnabar is the principal ore of mercury, and while it is found in many localities the deposits have commercial value only in a few countries. Conspicuous among these are Spain, whose Almaden mines are controlled by the Rothschild family; Austria, with the ancient Idria mines; and California, with the New Almaden, the

New Idria, and other mines. The maximum production of the California mines, 79,395 flasks at 76½ lb., was reached in 1877. In 1893 the world's production of quicksilver was estimated at 105,644 flasks. Vermilion is a pigment, made in the dry way by mixing 8 parts of sulphur and 42 parts of mercury and distilling the product thus obtained. The sublimate is ground, treated with caustic soda, washed, and dried. C. K.

Cinnamon: a drug and flavoring mixture derived from the inner bark of shoots of *Cinnamomum zeylanicum*, a tree some 20 to 30 feet in height, with branches mostly horizontal or drooping. Most of the cinnamon of commerce is obtained from Ceylon, although other sources are largely drawn upon. Chief among these is China, from which immense amounts of cinnamon are annually exported. Cinnamon bark has also been artificially cultivated in Java, in the Cape de Verde Island, in Brazil, in a number of the West India islands, and in Egypt. As with many other drugs, the quantity of its volatile oil depends very largely, indeed, upon the character of the soil in which the tree grows, the climate, and the mode of culture to which it is exposed. The presence of sunlight and shade also influence the development of the oil in the bark. The bark was collected at one time from trees which were growing wild, but the Dutch, recognizing its value, first introduced the practice of cultivating the tree. In commerce the Chinese cinnamon bark is called cassia. Ceylon cinnamon occurs in long cylindrical pieces looking like quills, the smaller quills being placed inside the larger ones. Sometimes these are as long as 3 feet. Chinese cinnamon is of a darker color than the best Ceylon cinnamon, and is more rough and dense. Besides these and the other forms of cinnamon which we have mentioned, there is a variety called Saigon cinnamon, which has now become official in the U. S. Pharmacopœia. Little is known concerning the trees from which this bark is derived. Its introduction into commerce is comparatively recent, but it seems to be increasing in quantity from year to year. It appears in commerce in the shape of unscraped quills about 6 inches long and ½ inch in diameter. Their thickness varies from $\frac{1}{12}$th to $\frac{1}{8}$th inch. The inner surface is quite dark brown in color, somewhat striated, and granular. The taste is sweet, decidedly aromatic, slightly astringent, and when the bark is ground into a powder it yields a darker-colored mass than does the Chinese cinnamon. The odor which is given off by all of these barks depends upon the presence of a volatile oil known as the *oil of cinnamon*, which is a warm aromatic liquid possessing a taste which is very peculiar. Besides this volatile oil, cinnamon bark contains tannic acid as its chief ingredient. It is one of the best of the various aromatic oils employed in medicine, and seems to possess certain antihæmorrhagic powers when administered internally in cases where there is a tendency to an oozing hæmorrhage. The dose varies from 1 to 5 drops. Upon the nervous system it acts as a feeble sedative. In the gastro-intestinal tract it tends to stop fermentation and decrease flatulence. The oil of cinnamon is also largely employed in the preparation of what is known as cinnamon water, which is used as a pleasantly flavored vehicle to carry more powerful drugs. H. A. H.

Cinnamon Bear: a reddish-brown or yellowish-brown variety of the black bear (*Ursus americanus*). The name is occasionally applied to small varieties of the grizzly bear.

Cinnamon-stone, or **Essonite**: See GARNET.

Cino da Pistoia, chee'nō-dăă-pĕĕs-tō'yăă: an Italian poet; b. in Pistoia, 1270 or earlier; d. in 1336 or 1337. He belonged to the noble family of the Sinibuldi, and was educated for the career of jurisprudence. He studied at Bologna, and here, in 1314, he completed his commentary on the first nine books of the *Codex Justinianus* (*Lectura in Codicem*), receiving soon after (Dec. 9, 1314) the degree of doctor. He had already before this (1307) received the honor of an appointment as judge in Pistoia, but had been obliged to go into exile, owing to the defeat of the party (the Bianchi) to which his family belonged. He taught jurisprudence with extraordinary success at several universities (Treviso, 1318–21; Siena, 1321–26; Perugia, 1326–33; Florence, 1334). He is chiefly known to us, however, as a poet. Dante (*De Vulg. Elog.* xiii) called him one of four persons excellent in the vulgar tongue; and elsewhere we have evidences of the admiration and friendship felt for him by the great Florentine. To him, among others, was sent a copy of Dante's first finished sonnet (*Vita Nuova*, son. i.), and he answered it with a sonnet of his own. He belonged, therefore to the poets of the "*dolce stil nuovo*," as Dante called it; and he has a certain importance as having continued this style somewhat further into the fourteenth century than did his fellows. Some have essayed to find in him the precursor of Petrarch. The latter did, indeed, upon Cino's death write a sonnet to his memory, and he several times speaks of him with admiration; but it is difficult to trace any spiritual relationship between the two. The name of the lady most celebrated by Cino is by him given as Selvaggia, and she had in the fourteenth century almost the fame of Beatrice and Laura. Who she was has never been satisfactorily made out, though a certain Selvagia dei Vergiolesi, whose father was leader of the Bianchi in Pistoia, has since the seventeenth century at least been mentioned in this connection.

BIBLIOGRAPHY.—Luigi Chiappelli, *Vita e opere giuridiche di Cino da Pistoia* (Pistoia, 1881); Bindi e Fanfani, *Le Rime di Cino da Pistoia ridotte a miglior lezione* (Pistoia, 1878); A. Bartoli, *Storia della Litteratura italiana*, vol. iv.
A. R. MARSH.

Cinq-Mars, săńk'maars', HENRI COIFFIER DE RUZÉ, Marquis de: son of Marquis d'Effiat, marshal of France; b. in 1620; came to the court in 1639 as a *protégé* of Richelieu, who intended to make him the favorite of the king, in order to use him as a spy. The cardinal, however, mistook the young man. Cinq-Mars, proud, noble, and brilliantly gifted, had an ambition of his own, and a deadly hatred soon sprang up between the favorite and the minister. Cinq-Mars joined the Orleans party, a conspiracy was formed for the overthrow of Richelieu, and an alliance was concluded with Spain. Meanwhile the cardinal had watched the movement from the very beginning, and just as the conspiracy was ripe to enter into action he laid all its traitorous documents before the king, and had Cinq-Mars and his friend De Thou arrested at Narbonne June 13, 1642. In order to save himself, the Duke of Orleans confessed all, and Cinq-Mars was executed at Lyons Sept. 12, 1642. Alfred de Vigny has given a very interesting description of his life and character in his romance, *Cinq-Mars, ou une Conjuration sous Louis XIII.*

Cinque Cento, chĕĕn'kwăy-chen'tō [Ital., five hundred]: a term used by the Italians to designate the sixteenth century—that is, the years whose dates are one thousand five hundred and something. The same term is also applied in English to the literature and architecture of that period, either adjectively, as "the cinque cento-sculpture," or substantively, as "the arts of the cinque cento." By careful writers it is distinguished from the Renaissance, which is taken to have closed in Italy with the beginning of the cinque cento. R. S.

Cinquefoil, singk'foil [from an O. Fr. form of Lat. *quinquefolium*, five-leaved; *quinque*, five + *folium*, leaf: cf. Mod. Fr. *quintefeuille*]: a plant of the genus POTENTILLA (*q. v.*) and of the family *Rosaceæ*. Some of the species are shrubby, as in *Potentilla fruticosa*, but nearly all are perennial herbs, as *P. canadensis*, *P. argentea*, *P. palustris*, etc. Many of the species are quite ornamental, especially the exotic *P. nepalensis* and *P. atrosanguinea* from the Himalaya region, the first with rose-red and the second with brown-purple or crimson flowers. C. E. B.

Cinque Ports [M. Eng. *sink pors*, O. Fr. *cink porz* < Lat. *quinque portus*, five ports]: the English seaport-towns of Dover, Sandwich, Hastings, Romney, and Hythe, to which William the Conqueror granted important privileges. Winchelsea, Rye, and several minor towns with the name of Limb or Member were subsequently added to the original five ports. They are under the government of a lord warden. The Cinque Ports in early times were required to furnish at their own expense such shipping as the sovereign required for the public service. Up to the time of Henry VII. they supplied nearly all the ships and sailors that the state was in need of, and for a long period afterward they afforded considerable assistance to the permanent navy. The lord warden's civil jurisdiction ceased in 1835, but he still presides in the ancient court of Shepway, and appoints justices of the peace for the Cinque Ports. The official residence is Walmer Castle, Deal, and there the Duke of Wellington died, having been lord warden for twenty-three years. In 1891 the Marquis of Dufferin succeeded the late Right Hon. W. H. Smith, who had himself succeeded Earl Granville but a few months before. In 1895 the Marquis of Salisbury succeeded the Marquis of Dufferin.

Cin'tra, or **Sintra**: a town of Portugal, in Estremadura; on the slope of the Serra de Cintra; 14 miles N. W. of Lisbon (see map of Spain, ref. 17–A). It is remarkable for the picturesque beauty of its situation and its delightful climate. It has an ancient castle, originally occupied by Moorish kings and afterward by Christian sovereigns. On two hills are the Penha convent, now a royal residence, and a Moorish castle, and within the town is a palace. It is surrounded by summer residences. The Cintra convention of 1808, which aroused indignation in Great Britain, was a capitulation under which the French army in Portugal was landed in France with its arms and effects and without conditions as prisoners of war. Pop. 5,000.

Cinu'ra [from Gr. *κινεῖν*, move + *οὐρά*, tail]: a sub-order of insects. See THYSANURA.

Cione di Andrea: See ORCAGNA.

Ciparîu, TIMOTEO: a Roumanian writer; b. Feb. 21, 1805. He did much for the study of his native language and literature. Besides works on Poetics (1860) and Philosophy (1863), he published *Elemente de limba românâ* (Elements of the Roumanian Language, 2d ed. 1866); *Grammatica de limba românâ* (1870–77); *Crestomatia seu analecte litterarie* (1858). He edited also the Roumanian *Archives for Philology and History* (4 vols., 1870). D. Sept. 14, 1887. A. R. MARSH.

Cipher, or **Monogram**: an intermixture of letters, as the initials of a name; an arrangement of the initial letters of a person's name, used as a private mark by artists and others. In strictness, *monogram* is the character in which all the letters of one word are combined. The term is also applied to certain characters or arbitrary signs used in writing dispatches, etc., in cases where secrecy is desirable. See CRYPTOGRAPHY.

Circæ'a: a genus of herbaceous plants of the family *Onagraceæ*, having a corolla of two petals and two stamens. The *Circæa lutetiana* (enchanter's nightshade) is a native of Europe and the U. S., growing in damp woods. It bears small whitish flowers in racemes.

Circars, Northern: an obsolete subdivision of Madras presidency, British India, from the native word *circar*, a subdivision of a province. It was a coast district on the Bay of Bengal, granted to the French in 1757 by the ruler of the Deccan, overrun by Clive, ceded in 1766 to the East India Company, and permanently British since 1823.

Circas'sia: a geographical name applied to the northwestern part of the Caucasus region N. of the mountains; now in large part the Kuban territory of the Russian Government. The soil is fertile, and the climate cool and healthful. The forests are of luxuriant growth. Coal and iron abound. Area about 33,000 sq. miles.

The name Circassians has been widely applied to the mountaineers of the whole northwestern part of the Caucasus, of which the Russian form of name is Tcherkesses. In this large sense it included the Adighè, or Circassians proper, and the inferior but related tribes of Abkhasians who dwell in the S. E. as far as Mingrelia, and of Kabardans living on the north slopes of the mountains, in the valleys of the Kuban and Terek, and beyond. The Adighè, living on the northwestern end of the mountains and along the northeastern coast of the Black Sea under a half-patriarchal government, attracted the attention of mankind by their spirited defense of their independence against Russia. For fifty years they maintained resistance, and when in 1864 the Russians gained complete military occupation of their territory, 400,000 Circassians, including some of the Abkhasians (some say 500,000), forsook their old homes and migrated to Asia Minor, or to Bulgaria, where they added terrors to the massacres of 1877. The country they forsook was left almost a desert for 200 miles along the Black Sea coast from Sukhum Kaleh to Anapa. Those who remained seem completely pacified, have taken to farming, cattle-breeding, and fishing, are exempt from poll-tax, are strict Mohammedans, have abandoned predatory habits, are prosperous, and have considerable self-government, while serfdom is practically extinct. Originally there were fifteen Circassian tribes, with an estimated number of 600,000.

The language of the Circassians, like that of nearly all the races of the Caucasus, is apparently unconnected with that belonging to any other people. It is mainly agglutinative in structure. Among the Circassians previous to the Russian conquest there were three distinct ranks of the free people—namely, the princes, the nobles, and the peasants. Besides these there were the slaves, of whom many were prisoners taken in battle. They were the domestics of the princes and nobles, or were employed in cultivating the soil. The Circassians are handsome, strong, active, and temperate, and are characterized by self-dependence, courage, and prudence. They are also known for their custom of selling their daughters to the Turks and Persians.

Cir'ce (in Gr. *Κίρκη*): a sorceress of classic mythology; daughter of the Sun and Perseis, sister of Æetes, King of Colchis and Pasiphaë, wife of Minos; married and slew a Samaritan prince; fled to the island of Ææa, on the Italian coast. Ulysses stopped here on his way home from Troy, and his companions were transformed for their gluttony into swine, and placed among other victims of Circe's enchantments. He, guided by Mercury and fortified by an herb against her wiles, compelled Circe to restore his men; but he lingered a year in the island and had offspring by her. It is further told that she changed her rival, Scylla, into a repulsive shape to alienate Glaucus from her. The metamorphoses by Circe of Scylla and of Picus are celebrated by Ovid.

Circen'sian Games: See CIRCUS.

Circignani, cheĕr-cheĕn-yaa'neĕ, NICOLA: b. 1516; a Tuscan painter; pupil of Sante Tite. He painted at Orvieto and in the Vatican. His chief work is the cupola of S. Pudenziana. He has many remarkable works at Città di Castello, Umbria. D. in 1598. W. J. S.

Circle [from Lat. *cir'culus*, dimin. of *circus*, ring]: in geometry, a plane figure bounded by a curved line which is everywhere equally distant from a point within called the center. The curved line which bounds the circle is called the circumference. The distance from the center to the circumference is called the radius, and any two radii which together form a straight line constitute the diameter.

In the mechanic arts the ratio of the diameter to the circumference is assumed to be as 7 to 22, which is exact enough for many purposes, though the real ratio can never be exactly expressed by numbers. In ordinary mathematical work it is assumed to be as 1 to 3·14159265. William Shanks, a British mathematician, has carried out the decimal to 607 places. The diameter and circumference are in fact incommensurable, and it is conclusively demonstrated that the famous problem of "squaring the circle" can never be solved. See QUADRATURE OF THE CIRCLE.

The circle is one of the conic sections, as it can be formed by cutting a right cone by a plane parallel to its base. It may be regarded as an ellipse whose foci coincide with each other.

In astronomy, the term "great circle" is applied to those circles which divide the celestial sphere into two equal parts, as the equator and the meridian.

NINE-POINT CIRCLE, the circle which passes through nine points connected with a triangle, viz., the middle points of the sides of the triangle, the feet of the three perpendiculars let fall from the angles upon the opposite sides, and the middle points of the three lines joining the vertices of the triangle to the intersection of the three perpendiculars. Among its curious properties is that it touches the inscribed and the three escribed circles of the triangle.

The term "circle" is also applied to several astronomical instruments, of which a circle for measuring angles forms the most important part. Among these are the MURAL CIRCLE, MERIDIAN or TRANSIT Circle, REFLECTING CIRCLE, and REPEATING CIRCLE (*qq. v.*). Revised by S. NEWCOMB.

Circle, Mural: See MURAL CIRCLE.

Circle of Perpetual Apparition: a lesser circle of the celestial sphere; parallel to the equator; increases with the latitude of the place where the observer is stationed. All stars included in it are always above the horizon. These are called circumpolar stars.

Circleville: a city; capital of Pickaway co., O. (for location of county, see map of Ohio, ref. 6–E); on Cin. and Musk. Val. and Norf. and West. R. Rs., and on the Scioto river and the Ohio Canal; 104 miles E. N. E. of Cincinnati and 25 miles S. of Columbus. It has large pork-packing establishments, very large straw-board works, furniture, shoe, and agricultural-implement factories, and other industries. The streets are lighted by electricity, and there is an electric street railway. The city occupies the site of highly interesting ancient works, consisting of a circle and square, perfect in form, fully described in Howe's *History of Ohio*. The lands in the vicinity of Circleville are largely devoted to broom-corn culture, thus making it a leading

market for that article. Camp Charlotte, where Lord Dunmore encamped in 1774 and made a treaty of peace with Indians, is 7 miles S. E. of Circleville. Pop. (1880) 6,046; (1890) 6,556; (1900) 6,991. Editor of "Daily Herald."

Circuit [from. Lat. *circu'itus*, a going around; *circum*, around + *ire*, go]: in electricity, the path of the current; in magnetism, the path of the lines of force which constitute the magnetic field to which the lines in question belong. An electrical circle is "closed" when no portion of it offers an infinite resistance to the flow of electricity. It is an open circuit when any portion possesses so high a resistance as to prevent the passage of an appreciable current. The electrical circuit may be said to be made up of the lines of flow, each of which is a closed curve. No two lines come into contact at any point, and all of them are everywhere perpendicular to the equipotential surfaces. The total number of lines of flow in any circuit is at every part of it the same; but their distribution depends upon the specific conductivity of the material of which the circuit is composed.

The simplest case is that of a battery or dynamo sending a current through an external circuit composed of a uniform wire of a single metal. The circuit may be divided in two parts, that within the battery or within the armature of the dynamo (internal circuit), and the wire, which constitutes the external circuit. In such a wire the lines of flow will be parallel and evenly distributed throughout the metal. The current density, measured by the number of lines per unit of cross section, will be everywhere the same throughout the external circuit.

Circuits are, however, frequently of a much more complicated character. The current may be made to traverse the ground through a portion of its course, as in telegraphic circuits, etc., in which case the lines of flow will disseminate themselves through all neighboring portions of the earth's crust, following watercourses and whatever other paths offer themselves. The existence of currents flowing within the earth at great distances from the direct line between the terminals inserted in the ground has been repeatedly noted, but the principle already stated, that every line of flow is a closed curve, is a rigorous one; and every such line issuing from the positive terminal into the earth will be found to enter the negative terminal, however devious or indirect its path may have been. Where several distinct paths between two points are offered, the current will use them all, each one in direct proportion to its conductivity, or in inverse ratio to its resistance. E. L. Nichols.

Circuit: a division or district of a country or state at various places in which court is successively held by a judge or judges appointed for that purpose. Originally in England the judges of the courts at Westminster held their sittings only at that place, or wherever the king might be, but as early as the reign of Henry II. the kingdom was divided into districts or circuits which were visited, commonly twice in each year, for the trial of issues of fact, the issues of law being reserved for decision by the full court sitting in banc at Westminster. (See Banc and Nisi Prius.) The judges while traveling circuit were anciently called "justices in eyre" (deriv. of Lat. *iter*, *itineris*, journey). Essentially the same system is still preserved, and England and Wales are now divided into eight circuits, and Scotland and Ireland are divided in a similar way. In the U. S. the term is applied to a judicial district over which a Circuit Court (*q. v.*) has jurisdiction. Revised by F. Sturges Allen.

Circuit Court: the name of the principal inferior courts of the U. S. which, until the establishment of the circuit court of appeals in 1891, were next inferior to the Supreme Court. The U. S. are divided into circuits, and in the judicial districts of each circuit one of these courts holds its sittings. The court may be held by the chief justice of the U. S., one of his associates, a special circuit justice, or a district judge, or any two of them, sitting together. In general the circuit courts have original jurisdiction, both in law and equity, in civil cases involving sums of $500 or over, and in all criminal cases. They no longer have any appellate jurisdiction. The term circuit court is also applied in several of the States to certain courts of record having a general original jurisdiction, from whose decisions on questions of law an appeal lies to a superior court. See Courts.

Revised by F. Sturges Allen.

Circuit Court of Appeals: an appellate court of record of the U. S., established by act of Congress in 1891 (26 Stat. at Large, § 517) to relieve the Supreme Court of a share of its burdens. It consists of three judges, two of whom constitute a quorum, and is presided over by the chief justice or one of his associates, or by a circuit judge. One or more judges of the district courts may sit when necessary to make a full court. By this act the appeal which formerly lay from the district courts to the circuit courts is taken away, and all appeals must be taken to the Circuit Court of Appeals, except that in any case in which the jurisdiction of the court is in issue the question of jurisdiction may be certified to the Supreme Court, and an appeal may be taken directly to the Supreme Court, from final sentences and decrees in prize cases, in cases of conviction of a capital or otherwise infamous crime, in cases involving the construction or application of the U. S. Constitution, in any case in which the constitutionality of any law of the U. S. or the validity or construction of any treaty is involved, and in any case in which the constitution or a law of a State is claimed to be in contravention to a law of the U. S. The Circuit Court of Appeals has final jurisdiction in cases where the jurisdiction depends entirely upon the parties being aliens and citizens, or citizens of different States, and in cases arising under the patent laws, the revenue laws, the criminal laws, and in admiralty cases. It may, however, certify to the Supreme Court any questions or propositions of law concerning which it desires the instruction of that court, and the Supreme Court may require by *certiorari* or otherwise any case to be certified to itself for its review and determination. F. Sturges Allen.

Circular (Lat. *circularis*; Fr. *circulaire*): round, like a circle, circumscribed by a circle; ending in itself, as a paralogism in which the second proposition proves the first, and is proved by it. "Circular sailing" is the method of sailing by the arc of a great circle. (See Great-circle Sailing.) As a noun circular sometimes signifies a document addressed to a circle of persons or to persons having a common interest, as a circular letter.

Circular Functions: the inverse of the trigonometrical functions.

Circular Notes: See Letters of Credit.

Circular Numbers: numbers whose powers have their last digits the same as their own; such are numbers ending in 0, 1, 5, 6.

Circular Points at Infinity: the two imaginary points in which any circle intersects the infinitely distant right line in its plane.

Circulating (or **Recurring**) **Decimal**: a decimal in which certain digits are continually repeated. Thus, ·15723723 . . . . , *ad infinitum*, is a circulating decimal of which the figures 723 constitute the *recurring period*, called also the *repetend*.

Circulating Library: See Libraries.

Circulation of the Blood: In all animals, even the simplest and lowest, there is a movement, more or less regular, of blood, or of a fluid equivalent to it, furnishing material for the growth, repair, and sustenance of the body. Sponges, while living, have no closed *internal* circulation, but their nutrition and aëration are sustained by the incessant flow of the water in which they exist through their numerous pores. Other Protozoa (as the lowest group of animals is designated), as Rhizopoda, have, within their soft, jelly-like substance, cavities (vacuoles) which alternately contract and dilate, serving the purpose of circulation within their bodies and redistribution of their material. Animals a grade higher, as the Actinia (sea-anemone), have a free communication between the stomach and the general cavity of the body, from which, through fine ramifications to certain parts, the nutritious fluid is circulated, though never separated as true blood. In worms no distinct circulation of blood has been proven to exist. Cavities (*lacunæ*) there are, and in some, as the leech, vessels called *pseudo-hæmal* vessels, ramifying through the body and containing a fluid, generally red, but these always have a tubular communication with the exterior. In insects there is a dorsal segmented vessel, with valves between the segments, which conveys the blood forward by its rhythmical contractions. The blood, which is often colored, and contains corpuscles (though never colored, as in vertebrates, by the corpuscles), then flows into lacunæ, or spaces through the body, coming in contact with the air introduced by the tracheal tubes. Crustaceans, as the lobster, have a muscular heart, with six arterial branches, going to the head, stomach, liver, and posterior parts. Thence the blood passes through a number of lacunæ, and returns by a number of veins, which expose it.

in the *gills*, to the air before reconveying it to the heart. Thus the heart of the crustacean is *systemic*, not respiratory, in its mode of distribution of the blood. The oyster has a heart, not far from the muscle which closes its shell; its vascular system, however, is incompletely closed. In the cuttle-fish there is a strong systemic heart, with valves; it sends blood to all the organs except the gills. The blood returns into a contractile venous enlargement (*sinus*), which conveys it to the gills through from two to four branches or veins. Other sinuses then receive it, and these, being contractile, send it back to the heart. All invertebrates (animals without an internal skeleton) have, if any, a *systemic* heart, and only few of them have *colored* corpuscles in their blood.

Vertebrated animals always (except the anomalous *Amphioxus*) have blood containing both red and colorless corpuscles, the former of which give to it its color. In fishes the heart is branchial or respiratory. Consisting of an auricle and a ventricle, it receives venous blood from the body, and propels it, by four or five arched vessels, through the gills, whence it circulates, to be returned by veins to the auricle. In the eel, torpedo, and one or two other fishes, contractile venous sinuses assist this return.

In fishes generally it is supposed that the impulse of the heart suffices for the whole round of the circulation. More probably, however, this is supplemented by arterial, if not venous, propulsion, and by a power acting in the (intermediate) capillary region. All vertebrated animals have a closed circulatory system, consisting of a heart, arteries, capillaries, and veins. In all vertebrates there is, also, a portal system, composed of veins going from the digestive, and sometimes other, organs to the liver—in fishes to the kidney also—whence veins again convey the blood to the heart.

Reptiles and amphibia have a heart with three cavities—two auricles and one ventricle. Of the auricles, one receives blood from the lungs (except in the early stage of life of the frog and some other amphibia; and from the lungs and gills *both* in the perennibranchiate amphibia, as Proteus); and the other receives the blood from the body generally. These two kinds of blood (aërated, or arterial, and non-aërated, or venous) mingle in the single ventricle, whence they are redistributed to the lungs and all over the body by arteries. In the crocodile, however, a partition almost separates the two halves of the ventricle, thus approaching the arrangement in the higher animals.

Birds have four cavities—two auricles and two ventricles—making a completely double heart, always situated in the middle of the thorax or chest. One auricle receives the blood by large veins coming from the body generally. This auricle passes the blood into the connected ventricle, which sends it, by pulmonary arteries, to the lungs. Thence it returns, by pulmonary veins, to the other auricle, and this conveys it into its attached ventricle. That cavity then propels it through the aorta, or main arterial trunk, for general distribution over the body. In birds the portal venous system mainly connects the liver with the digestive organs; but a few of its veins communicate with the kidneys, posterior internal organs, and lower extremities.

All mammals (viviparous vertebrated animals which suckle their young) have a double heart, consisting of two auricles and two ventricles—a respiratory and a systemic heart conjoined. In man, for instance, the right auricle and ventricle constitute the respiratory or pulmonary heart—the left, the systemic; and after birth, although closely adherent together, no direct communication exists between them. In the dugong the two ventricles are partly separated by a deep notch. In the ox and many other ruminants a bony deposit strengthens the inter-ventricular wall. Only in man and some of the anthropoid (man-like) apes does the heart incline to the left side; in other animals it is usually median. This promotes the symmetry which is so especially important in swift-running animals, as the hound and deer, and in birds for flight.

The arrangement of the branches of the aorta differs in the several classes of vertebrated animals. Fishes have four or five aortic arches going to the gills. The lower reptiles have three aortic arches on each side; the higher reptiles, one on each side, descending over the roots of the two lungs to form together the abdominal aorta. Birds have only one—the right aortic arch, passing over the root of the right lung. In mammals, including man, there is only a single aortic arch, over the root of the left lung: this, giving off branches above, becomes in its descent the abdominal aorta. The manner of origin of the ascending branches (subclavian and carotid) of the aorta differs also, even among the Mammalia. In man it is least symmetrical, two arterial trunks passing upward from the aorta on the left side (left carotid and subclavian), while there is one (*arteria innominata*) only on the right, soon subdividing into two. The horse and ruminants have but a single aortic principal branch, which gives off all four of the carotid and subclavian arteries. The portal circulation in mammals is never connected with the kidneys.

A *rete mirabile* is a network of closely interjoining (anastomosing) arteries, which finally unite into a single trunk. Whales and other Cetacea (aquatic, fish-like mammals) have *retia mirabilia* connected with their intercostal arteries within the chest, evidently serving the purpose of reservoirs to retain and distribute aërated blood while the animal is submerged for a long time. There are also in the same animals venous plexuses or *retia*, for the detention, under like circumstances, of impure, non-aërated blood. Protective arrangements of the arteries exist in certain special instances, as the passage through the pelvic bones of the main artery of the hind part of the tail in the whale; of the great artery of the anterior extremity through the humerus or arm-bone of the lion; and of the corresponding artery through the coffin-bone (hoof-bone) of the horse. In all these cases vigorous action of the muscles in locomotion or prehension might unduly obstruct, at times, the flow of arterial blood but for such a provision, by which muscular or tendinous pressure upon the artery is prevented by its inclosure within body walls.

The circulation of the blood in man corresponds altogether (except in the unsymmetrical location of the heart and of some of the arterial trunks) with the mammalian type above described. In connection with the human circulation, however, some additional particulars may be here given.

Action of the Heart.—Being composed of peculiarly arranged muscular fibers, the heart, by its rhythmical contractions and relaxations, alternately empties itself and becomes filled with blood, in an adult man or woman, between seventy and eighty times a minute while at rest in health. From the right ventricle the venous blood (poured into it from the right auricle, which receives it from the great *venæ cavæ*) is sent through the pulmonary artery and its branches to the capillaries which ramify minutely throughout the lungs. These combine to form small veins whose union into larger trunks finally constitutes the four pulmonary veins, which empty the (now aërated or arterialized) blood into the left auricle. This conveys it into the left ventricle, whence it is impelled through the aorta, by the branches of which it becomes distributed all over the body in capillary networks, to return to the heart by means of the veins; all of which empty at last into the ascending and descending *venæ cavæ*. See HEART, ARTERY, CAPILLARY, and VEIN.

For the maintenance of this round of the circulation the *valves* of the heart are indispensable. Membranous and muscular valves (tricuspid and mitral) intervene between each auricle and its corresponding ventricle. Pocket-like (three-folded, semilunar) valves also exist at the mouths of the two great arteries which convey blood from the heart; namely, the pulmonary artery from the right ventricle and the aorta from the left ventricle. When the auricles are contracting, the (tricuspid and mitral) valves between them and the ventricles are open, allowing the blood to flow through. The auricles being emptied and the ventricles filled, the latter then contract, and at the same time, and in the same act, close the auriculo-ventricular valves; so that the blood is forced onward through the two arteries above named (pulmonary artery and aorta). While the ventricles are contracting (this being called the *systole*), the heart is spirally twisted, shortened, changed in form from a flattened to a round cone, and thrust slightly forward against the space between the fifth and sixth ribs, below the left nipple. This quite perceptible movement is the impulse of the heart. No power other than that of elasticity has been proved to exist in the dilatation (*diastole*) of the cavities of the heart. The immediate cause of the systolic contraction is most probably the irritability resident in the heart's muscular and nervous tissues, acting under the stimulus of the blood. It is also placed under the modifying influence of the nervous apparatus connected with the brain and spinal cord by branches of the pneumogastric nerves and fibers running through the sympathetic nerves. Why the action of the heart should be so regularly rhythmical is not known. With

some (especially cold-blooded) animals the heart has been found to contract for some minutes, or even hours and days, after its removal from the body, and sometimes when entirely deprived of blood.

Of the *sounds* of the heart, audible when the ear is placed over it against the chest, the first (longest and loudest) is explained principally by the closing, with vibration, of the auriculo-ventricular valves during the systole of the ventricles and the sound produced by the contraction of the muscular fibers. Other minor causes are the impulse of the heart, the rush of blood into the great arteries. The second sound has been shown experimentally to be caused by the closure, *after* the systole, of the pocket-like (semilunar) valves at the mouths of the aorta and pulmonary artery.

Arterial Circulation.—Since the arteries contain, in their middle coat, a portion of (smooth, pale, involuntary) muscular as well as elastic tissue, this must have an important influence upon the blood-movement. The fact that the relative amount of muscular tissue is greatest in the smallest arteries, which are farthest from the heart, suggests their adaptation to the purpose of supplementing the action of the heart in propelling the blood through the capillaries, as well as to act by dilating or contracting in modifying the blood-supply to the various parts. After death the arteries are always found to have emptied themselves, by their last contraction, into the veins. The value of the muscular fibers in propelling the blood is also supported by the apparent need of such an arterial power to complete the circulation commenced by the merely branchial (not systemic) heart in fishes, and by the fact that in acephalous (born without a head) children the heart is found to be absent, so that the circulation in them must have been arterial and capillary only; as well as by the proof that during early embryonic life every human being is likewise without a heart, the blood-movement then depending on the blood-vessels alone. Notwithstanding these and many other obvious reasons in favor of such a view (which was accepted by the distinguished John Hunter and Sir Charles Bell), the more common opinion among physiologists has been, for many years, that the office of the muscularity of the arteries is of a "stop-cock" or "flood-gate" nature, opposing a graduated resistance to the impulse given to the flow of blood by the heart. Certainly these vessels, by their change in caliber brought about by the muscular element, have to do with the regulation of the changing supply or determination of blood to various parts of the body at different times. This variation we see in blushing; in the erectile tissues and organs; in the effect of friction or mustard, etc., upon the skin; in the increased flow of blood to the jaws during the time of dentition in infants, to the ovaries during ovulation, the uterus in gestation, the male reproductive organs of some animals at certain periods, and the antlers of the deer during their annual new growth. In all these variations the vaso-motor nerves and centers have an important influence.

Capillaries.—Having but a single elastic coat, without muscularity, these very (microscopically) minute vessels simply adapt themselves to the blood that passes through them. Yet besides the transudation of lymph or modified blood-plasma *from* them for the nutrition of the tissues, and the absorption *into* them of waste materials, a force is probably added to the forward movement of the blood in the capillary region. This may occur in two ways, both of which are common to animals and plants. One is capillary attraction—i. e. the attraction of fine tubes for liquids in which they are immersed, such as is observed in inanimate (metallic or glass) tubes or porous bodies, as well as in living plants and animals. The other is the "vital affinity," or attraction of nutrition, exercised by the tissues toward materials present in the blood, and withdrawing them constantly from the current, thus making room, by diminution of resistance, for its onward flow. The volume of the capillary system in man is about 300 times that of the arteries.

Venous Circulation.—On account of the distance traversed by the blood (passing as it does through the capillary ramifications) before it reaches the veins, and their greater aggregate volume (three times that of the arterial system), as well as the obtuseness of the angles made generally by their branches with the main trunks, and the various other factors which offer resistance to the blood-current in the arteries and capillaries, the flow of the blood is much slower through the veins than through the arteries. Veins have, as the arteries have not, valves along their course, opening only toward the heart. By these the propulsive power is economized, and, on account of their influence also, the effect of movement during exercise upon the veins always favors the blood-movement toward the heart. Inspiration, by causing a condition of negative pressure within the thoracic cavity, tends to promote the return of venous blood to the heart. Forced expiration has an effect the reverse of this, but by increase of pressure upon the heart and aorta it favors the expulsion of the blood through the arteries.

The velocity of the movement of the blood through the arteries averages from 12 to 20 feet in a second; in the capillaries, about 2 inches in a minute; in the veins, from 6 to 12 feet in a second. Experiments prove that the whole round of the circulation is accomplished in a little less than half a minute during rest and health.

The discovery of the circulation of the blood, as now understood, was made by Dr. William Harvey in 1619, first published by him, however, in 1628. He was *partially* anticipated by Servetus, Realdus Columbus, and Cæsalpinus; almost entirely so by Paolo Sarpi, whose claim in this respect has been generally overlooked. The discovery was completed by the demonstration (with the aid of the microscope) of the blood corpuscles and the capillaries, between 1658 and 1687, by Swammerdam, Malpighi, and Leeuwenhoek. See, on the circulation, Foster's or Landois's *Treatises on Physiology.* Revised by EDWARD T. REICHERT.

Circulating Medium: See MONEY.

Circulation of Sap in plants: It was formerly supposed by botanists, and is yet popularly believed, that higher plants possess a nutrient fluid, the sap, which ascends and descends by regular paths, after the fashion of the blood in higher animals. This is now known to be erroneous. See BOTANY, *Physiology of Larger Plants*, and PHYSIOLOGY, VEGETABLE.

Circumcision [from Lat. *circumcī'sio*, a cutting round: *circum*, around + *cæ'dere*, cut]: the removal of the foreskin of males. This practice comes down from the earliest times. It is depicted upon a temple of Karnak, in Egypt, and was certainly known to Abraham (Gen. xvii. 7–14). It was practiced by the Indians and native tribes of North and South America, among the Kaffir and other Negro tribes of Africa, in Australia, and in the South Sea islands. It is to-day universally observed by the Jews, by the Mohammedans, and by the Coptic and Abyssinian Christians. It can not be traced back to any one land as originating it, nor is there any satisfactory explanation of its origin; perhaps it should be referred to the general connection between expiation of offenses and shedding blood. But however or where the practice originated, it certainly must have quickly recommended itself, and is to-day advocated by some physicians on the score of health, for it promotes personal cleanliness, and also renders less the likelihood of venereal poisoning. It was formerly considered to increase the fruitfulness of the male. With the Jews circumcision was performed on the eighth day of the child's life, but Mohammedans usually circumcise between the eighth and twelfth year. Both make quite an occasion of the act, inviting company and giving an entertainment proportional to their means. The operation is painful and in the case of non-infants even dangerous. The operators are not surgeons, nor necessarily priests. The parts are commonly healed up in a few days. In the reign of Antiochus Epiphanes the attempt of circumcised Jews to undo their circumcision was made (1 Macc. i. 15; Josephus *Antiq.*, xii. 5, 1); so later the attempt is alluded to by Paul (1 Cor. vii. 18) and by the Roman poet Martial, and described by Celsus (book vii., chap. xxv.). It does not seem to have been very successful. In the Bible the word "circumcision" is used figuratively to express a change of heart. The earliest Christians being Jews, naturally considered it necessary that the Gentile converts should enter the Christian Church by the rite of circumcision. But Paul saw clearly how detrimental such a requisition was, and the Council of Jerusalem (A. D. 50) formally absolved the Gentiles from it. In the Mohammedan world, female circumcision is practiced, which consists in the removal of the clitoris. In Arabia there are female professional circumcisers. See P. C. Remondino, *History of Circumcision* (Philadelphia, 1891).

Circumference [from Lat. *circumferen'tia*, circuit; *circum*, around + *ferre*, carry]: a curved line which incloses a plane area, and is synonymous with periphery. It is applied especially to the curved line formed by a circle, and its length bears a certain constant ratio to the diameter. (See CIRCLE.) The term perimeter is used to designate the length of the bounding lines of a plane area inclosed by several straight lines, as a square or polygon.

Circumflex [from Lat. *circumflexus*, bent about; *circum*, around + *flec'tere*, bend; a translation of the Gr. περισπώμενος (σπάω), drawn around]: in grammar, a character or accent originally denoting a rise and fall of the voice on the same long syllable, marked in Greek ~, or ^, and in Latin ^.

Circumnavigation [from Lat. *circumnaviga're*, sail around; *circum*, around + *naviga're*, sail]: literally, a sailing round: usually, the act of sailing round the globe. The first person who circumnavigated the earth was Sebastian del Cano, a lieutenant of Magellan, in 1519. (See MAGALHÃES, FERNÃO, de.) Sir Francis Drake sailed round the globe in 1577. Among the other celebrated navigators who performed this voyage was Capt. James Cook (1768–71).

Circumpolar Stars [*circumpolar* is from Lat. *circum*, around + *polus*, from Gr. πόλος, axis]: stars which revolve within the circle of perpetual apparition, and appear to move around the pole, and complete their diurnal circles without setting. The number of stars so circumstanced increases with the latitude of the place, or, in other words, with the elevation of the pole above the horizon of the observer.

Circumstantial Evidence: See EVIDENCE.

Circumvalla'tion [from Lat. *circumvalla're*, surround with a rampart; *circum*, around + *vallum*, rampart]: in fortification, an intrenchment or series of defensive works erected by a besieging army, facing outward from the place invested or besieged, is called a line of circumvallation. It consists of a line of field-works, sometimes connected by a parapet or a rampart. It is designed to defend the besieging army against an attack from a hostile army operating in the rear.

Circus [Lat., *a circle*, a building for races, public spectacles, etc.; cf. Gr. κρίκος, κίρκος, ring]: in Roman archæology, an open space for the display of physical contests and sports, especially chariot-racing. Originally a circus was the open space with a level area and hillsides, or rude buildings affording the only means of accommodating spectators, but wooden seats were used from early times. It is stated that no stone seats were used even in the famous Circus Maximus, S. of the Palatine Hill, before the time of Julius Cæsar. The perfected plan of the circus was probably settled about this era. The general shape was long with parallel sides and from four to five times as long as wide, with one end rounded to a half circle. The other extremity, which was that from which the chariots started in the race, was shaped into a segmental curve, the center of which was taken arbitrarily within the arena. The chariots were supposed to have an equal chance at starting because all were equidistant from this point. The arena was divided by a low wall running lengthwise, but not parallel to either side. This arrangement was to allow the race-course to be wider at the start than at the finish. The seats were arranged in steplike rows, rising one above the other, a great circus having perhaps fifteen or eighteen such rows. The emperor's or state box was placed near the point of finish of the races, that is to say, on the left hand of a spectator looking from the starting-place. The low wall which divided the arena was called the *spina*, and this was early made into a platform 10 or 12 feet broad and adorned with obelisks and pieces of sculpture. The chariots had each a chamber called *carcer*, in which chambers they remained till the moment of starting, when a rope was dropped from before them, or the doors suddenly opened at a signal. Under the empire the circuses of Rome were adorned in the richest manner with stately architectural screens and arcades, sculpture, flagstaffs and trophies, and abundant use of colors and gold. The Circus Maximus remained the largest, but that of Caligula and Nero, which stood on the Vatican Hill where is now the sacristy of St. Peter, that of Hadrian, the Circus Flaminius and others, were perhaps as rich in their architecture and appointments as the first named. The circus of Maxentius, situated outside the walls of Rome on the southeast, still remains partly erect, but all those within the walls have entirely disappeared. The Circus Maximus is stated to have accommodated 350,000 spectators. The Circus Maxentius, though very much smaller, is nearly 1,600 feet long and 260 feet wide; while the spina, which can be perfectly traced from end to end and which of course determines the length of the race-track, is 890 feet. According to this measurement each lap of a chariot near the middle line of the track would be as nearly as possible half a mile long. A similar lap in the Circus Maximus must have been much greater, perhaps 4,000 feet. R. S.

Cirencester, sis'e-tér (anc. *Corinium*): a town of England, in Gloucestershire; on the river Churn, and on a branch of the Great Western Railway; 89 miles by rail W. N. W. from London (see map of England, ref. 12–G). It has an agricultural college, several hospitals, and manufactures of carpets, woolen cloths, and cutlery. Canute held a council here in 1020. Cirencester partly occupies the site of *Corinium*, an ancient Roman town 2 miles in circuit. Pop. (1891) 7,441.

Cirillo, cheē-reēl'lō, DOMINICO: b. at Grugno, in the kingdom of Naples, 1734; d. at Naples, 1799; studied medicine; visited Great Britain and France; was appointed Professor first of Botany, afterward of Medicine, in Naples; wrote a number of books and treatises which enjoyed a great reputation in their time. When, in 1799, the French under Championnet entered Naples and the Parthenopean republic was established, Cirillo was elected a member of the legislative assembly, and acted as its president. As soon, however, as the French left Naples, King Ferdinand returned, and by the aid of the British he compelled the republicans to surrender. Cirillo was sentenced to death, and, as he refused to ask for mercy, was hanged, Aug., 1799.

Cirrhop'oda: the CIRRIPEDIA (*q. v.*).

Cirripe'dia [Lat. *cirrus*, curl + *pes*, *pedis*, foot]: an order of *Crustacea*, sub-class *Entomostraca*, known by the common name barnacles. They are incapable of locomotion, as they are fastened by their head-ends to some foreign body. They have usually a multivalve calcareous shell, six (more rarely four) pairs of curled bifid feet, no heart, sexes united in the same individual, and in their development they pass through nauplius and cypris stages. (See CRUSTACEA and ENTOMOSTRACA.) As they can not go in search of their food, they create currents in the water by their feathery feet which bring small organic particles to the mouth. In some there are present complementary males, the object of which is to prevent close fertilization. All barnacles are marine; the large parrot barnacle (*Balanus psittacus*) of Peru is used as food, but most forms acquire their economic importance from the fact that they become attached to ships, and there act as a drag upon their progress.

The goose barnacles (*Lepadidæ*) are attached by an elongate stalk, while the body hangs down in the water. These forms derive their common name from the old myth of the Middle Ages that they gave birth to the barnacle goose. Frequently in the goose barnacles calcareous shells are absent, the body being enveloped in a leathery tunic.

The acorn barnacles (*Balanidæ*: see BALANUS) are always provided with calcareous valves, which are directly attached to some foreign object without the intervention of a stalk. The valves on the free surface can be opened and the feet protruded to obtain the food. Some forms have strange habitats: thus *Tubicinella* occurs in the skin of sharks, *Coronula* on whales, and *Chelonobia* on the tortoise-shell turtle. The more common forms encrust rocks, piles, etc., between and below tide marks.

The root barnacles (*Rhizocephala*) afford wonderful instances of DEGENERATION (*q. v.*). Thus in their young stages they are free-swimming, and much like the young of other *Entomostraca*. They soon become attached to the abdomen of crabs, and then gradually lose their eyes, legs, abdomen, and alimentary canal and degenerate into a double-walled sac. From one side grows out a root-like process which penetrates the body of the crab, branching between the viscera and muscles. Through this the fluids of the host are absorbed and used as food by the parasite. The body becomes converted into a mere sac of eggs, the space between its two walls serving as a brood-chamber. J. S. KINGSLEY.

Cir'rus (plu. **Cirri**) [Lat., curl, lock, fringe]: in botany, a tendril, a spiral and filiform appendage of climbing plants. It twines around such objects as occur in the vicinity, and thus obtains support for the stem, which is too weak to support itself in an erect position. The cirrus is a modified leaf, or in some cases is an elongation of the midrib of a pinnate leaf.

In a meteorological classification of clouds, a thin fleecy cloud floating in the sky at a great elevation, and called mare's tail, or curl-cloud. See CLOUDS.

Cis: a Latin preposition meaning "on this side": is often prefixed to the names of rivers or mountains to form adjectives; as Cisalpine, "on this side of the Alps"; Cispadane, "on this side of the Po." These terms are used with reference to Rome.

Cisal'pine Republic: an Italian state, founded by Napoleon Bonaparte in 1797, and recognized by Austria in the Treaty of Campo Formio. It included Lombardy, the Venetian territory W. of the Adige, the legations of Bologna, Ferrara and Romagna, the duchy of Modena, Mantua, Rovigo, etc., covering an area of over 16,000 sq. miles, with a population of 3,500,000. It was taken by the allies in 1799, but regained by Bonaparte in 1800. It received the name of Italian Republic in Jan., 1802, and chose Bonaparte as president. In Mar., 1805, it became the kingdom of Italy, with Napoleon as king and Eugene Beauharnais as viceroy, and it continued as such till 1814, when its territories were divided.

Ciscauca'sia: one of the two general divisions of Caucasia. Area, 86,030 sq. miles. It contains the government of Stavropol and territories of Kuban and Terek. Pop. 2,673,601.

Cisco: town (founded in 1881); Eastland co., Tex. (for location of county, see map of Texas, ref. 3–G); on Tex. Cent. and Tex. and Pac. R. Rs.; 155 miles from Waco. Cisco is situated near the center of the great undeveloped coal and iron belt of Texas, in a fine farming and stock-raising region. Here is a large nursery for Southern shrubs, flowers, and fruits, ice-factory, roller-mills, cotton-gins, and water-works. Fine building-stone is found in the vicinity. Pop. (1890) 1,063; (1900) 1,514.

EDITOR OF "ROUND-UP."

Cisleitha'nia: since 1867 the usual, though not official, collective name of that part of the Austro-Hungarian monarchy which is situated this side (as viewed from Vienna) of the river Leitha. It embraces all the German crown lands, Istria, Dalmatia, Galicia, and the Bukovina; in general, all the provinces not appertaining to the Hungarian crown. See TRANSLEITHANIA.

Cis'padane Republic: a former state of Italy; was organized by the French after the battle of Lodi in 1796. It was bounded on the N. by the river Po (anc. *Padus*), and comprised Módena, Reggia, Bologna, and Ferrara. In 1797 it was merged in the Cisalpine Republic.

Cis'platine Republic and **Province**: See URUGUAY.

Cis'rhenane Republic: a name selected in 1797 for the projected confederation of the German towns situated W. of the Rhine. The project was not carried into execution, because the peace of Campo Formio transferred the entire left bank of the Rhine to France.

Cissam'pelos [Gr. κισσάμπελος, a plant which climbs like the ivy (κισσός), and has fruit like the vine (ἄμπελος)]: a genus of woody climbing plants of the Moonseed family (*Menispermaceæ*), natives of tropical regions in both hemispheres. It is of importance on account of the species *C. pareira*, a native of Brazil, which is one of the sources of a common adulterant of the drug known as PAREIRA BRAVA (*q. v.*).

Cissey, sĕ'say', ERNEST LOUIS OCTAVE, de: general and senator; b. in Paris, Dec. 23, 1810; educated at school of St.-Cyr 1830; distinguished himself in Algiers and the Crimea; became a general of division 1863; shared in the events attending the investiture and capitulation of Metz; served against the Commune in the siege of Paris in Mar. and Apr., 1871; was Minister of War from July, 1871, to Aug., 1876. D. in Paris, June 15, 1882.

Cis'soid of Di'ocles [*cissoid* is from Gr. κισσοειδής, ivy-like; κισσός, ivy + εἶδος, appearance]: a curve invented by the Alexandrian mathematician Diocles, with a view to the solution of the problem of the duplication of the cube, or the insertion of two mean proportionals between two given straight lines. It may be regarded as the pedal of a parabola with respect to the vertex; in other words, it is the locus of the vertex of a parabola which rolls upon an equal parabola, so that corresponding points of the curves always coincide with their point of contact. It is also the inverse of a parabola with respect to its vertex.

Cistercians, or **Bernardines** [Cistercian is from *Cistercium*, the modern Cîteaux, formerly Cisteaux, in Côte-d'Or, France, 160 miles S. E. of Paris, the site of their first abbey]: an order of monks and nuns, established in 1098 by Robert of Champagne, who had been abbot of the Benedictine monastery in the forest of Molesme, but who, desiring a stricter rule, induced twenty of his monks to accompany him, and they chose a desert spot given over to wild beasts and overgrown with brambles for their site. The next year Robert returned to Molesme, and the remaining monks became discouraged, for, notwithstanding the vigorous administration of Stephen Harding, who is esteemed the second founder of the order, it did not flourish. Its austerities repelled and many considered them too severe. But they were the attraction which in 1113 induced BERNARD (*q. v.*), son of a Burgundian nobleman, and thirty companions to join it. The rank and size of the company and the enthusiasm of Bernard soon gave the order fame. It was necessary in two years to send Bernard forth to found a new monastery, which was established at Clairveaux. Inside of forty years there were 500 abbeys of the order, in the thirteenth century 1,800. The Cistercians originally wore a brown habit, but Stephen Harding adopted a white one, at the alleged suggestion of the Virgin Mary, to whom he solemnly dedicated the order. They were addicted to contemplation, and so chose "lonely valleys and sequestered nooks" for their sites. They slept little and worked hard; fasted from Sept. 14 to Easter; never ate meat, fish, eggs or grease, and rarely used milk. Their churches were noticeably bare. They had seventy-five monasteries and twenty-five nunneries in England when Henry VIII. dissolved the monasteries. The ruins of their abbeys at Furness, Tintern, and Woburn in England, and the still more famous ruins at Melrose in Scotland, attest their greatness. But the order is now practically dead. S. M. J.

Cistern [from Lat. *cisterna*, subterranean reservoir, deriv. of *cista*, box]: a tank constructed for holding water. Where the supply of water is uncertain, or where rain-water is used, every house requires a cistern. A cistern in the top of the house is usually constructed of wood, and generally holds less than 1,000 gallons, which is sufficient to supply a family only two or three days. Larger cisterns are excavated in the earth, and have masonry walls which are cemented. The cylindrical form is the best, as the earth excavation and the amount of masonry are then the least for a given capacity. Cistern water collected from the rainfall is usually good if the roof be thoroughly clean before the water is allowed to be admitted and if the cistern itself be emptied and scrubbed once a year. A cistern should not be placed within 20 feet of a cesspool, and it is better if the distance between them is greater yet. Charcoal is often thrown into cisterns under the idea that the water will be rendered purer, but its utility is doubtful unless applied in the shape of a mechanical filter connected with the pump.

MANSFIELD MERRIMAN.

Cistus: the rock-roses; a genus of plants, the type of the family *Cistaceæ*; comprises several species which are natives of the Levant and Southern Europe, and are cultivated for the beauty of their flowers. The *Cistus creticus* and a few others yield the resinous balsamic substance called gum labdanum. The cistus of the English poets is the rock-cist (*Helianthemum*), a genus of which there are four British and several American species.

Citadel: an especially strong part of a fortress, as in a fortified town; a separately inclosed and defended place, which may be held after the surrender of the rest of the place. Thus when William III. of England besieged Namur in 1695, the town surrendered Aug. 4, after a month's siege, but the citadel had to be besieged separately, and did not surrender until Sept. 1, and after an assault had been repulsed with great slaughter.

Citation, in law: 1. A summons issued by a court of competent jurisdiction directing a person to appear before it. The service of the citation gives the court jurisdiction over the parties cited or summoned. The citation is chiefly used in England in the ecclesiastical courts, and in the U. S. in surrogate or probate courts, whose jurisdiction corresponds in part to that formerly exercised by the English ecclesiastical courts, and in the U. S. Supreme Court in practice on writs of error. 2. A reference to precedents or authorities in support of a proposition of law. F. S. A.

Cîteaux, formerly **Cisteaux**, sĕe'tō' (anc. *Cistercium*): a hamlet of France, in Côte-d'Or; about 10 miles S. S. E. of Dijon (see map of France, ref. 5–H). Here was a celebrated monastery of the Cistercian order founded in 1098. Remains of the magnificent buildings of this monastery are still visible. See CISTERCIANS.

Cithæ'ron (in Gr. Κιθαιρών), **Mount**, now **Elatea**: a famous mountain-range of Greece; on the boundary between Attica and Bœotia; was covered with forests. The highest summit rises 4,620 feet above the level of the sea. It is often mentioned by ancient classical poets.

Cith'ara (in Gr. κιθάρα): a stringed musical instrument of the ancient Grecks and Romans; resembled a guitar or harp. Derived from this word, or cognate with it, are the English *guitar*, *cithern*, and *zither*.

Cities of Refuge: the six of the forty-eight Levitical cities to which the involuntary homicide might flee, and might live safe from the avenger of blood till the death of the high priest released him from this quasi-captivity (Num. xxxv. 6, 13, 34; Deut. xix. 1–10; Josh. xx.). There were three on each side of Jordan, as nearly as possible opposite each other. On the east side: 1, Bezer, not yet identified; 2, Ramoth-Gilead, probably Remiun; 3, Golan, now Jaulan. On the west side: 1, Kedesh, now Kedes; 2, Shechem, now Nabulus; 3, Hebron. The road to them was plainly marked and kept open. There is no biblical instance of their use.

Citizen [Anglo-Fr. *citeseyn*, modified form of Old Fr. *citeain* (Mod. Fr. *citoyen*) : Ital. *cittadino* : Span. *ciudadano* < Lat. **civitata'nus*, a deriv. of *civitas*, replacing *civis*]: a resident in a city; in free states one who has the elective franchise and may take part in legislative or judicial deliberations. In the Greek city-states and in early Rome citizenship was restricted at the outset to members of certain old houses (*phylæ*, *gentes*), which seem to represent the earlier clans that founded the state, perhaps by invasion and conquest. These houses gradually lost their predominance. The other free inhabitants of the city were first admitted to the same private rights as the ruling class, and finally to full political and religious equality. The household, not the clan, became the basis of the state. All free members of a citizen family were citizens; not only the wife and the children born in wedlock, but the adopted child and the enfranchised slave, since the latter as "client" was still a member of the family.

With the extension of Roman power the area of Roman citizenship was gradually widened. It was conferred upon the leading families in friendly cities, and later upon whole communities. Before the end of the republic nearly all the Italians were citizens, not merely of their own municipalities but of Rome. Roman citizenship, however, was still regarded as urban, not imperial. Each new citizen family was enrolled in one of the Roman wards (*tribus*), and the citizen's political rights could be exercised only at Rome.

The chief value of citizenship in the ancient world lay in the fact that all private rights were "civil" rights; that the non-citizen had no rights. He enjoyed legal protection only through the mediation of a citizen or through treaty. In the development of the Roman world-state this principle was modified: at first, by granting to favored allies a limited, non-political citizenship; and, finally, by working out for all the subjects of Rome a new body of law (*jus gentium*), which gave ample protection to person and property. (See Roman Law.) At the end of the republic the chief value of Roman citizenship lay in the privileges accorded to citizens in criminal procedure. Under the empire, when citizens were stripped, first, of all political rights, and afterward of all special privileges, citizenship lost all value. Its extension by Caracalla to all the free inhabitants of the Roman world had only the effect of making certain special taxes general.

Municipal citizenship remained of importance because of the burdens it imposed. It was acquired by birth, by naturalization, and by residence. He who was by birth a citizen of one town and by residence a citizen of another had to bear the burdens of both.

Citizen: in modern law, a person who owes an indefeasible allegiance to a state or nation, and who is entitled to certain rights and privileges which appertain to freemen. This view prevailed at a date as early as the time of Bodin (A. D. 1576), who defines a citizen to be "a free subject holding of the sovereignty of another man." (Knolles's translation, A. D. 1606.) Citizenship, in this sense, is not to be confounded with the elective franchise or the holding of offices of government. Children, the insane, and the non-voting classes in general are citizens. The same writer says: "They are to be called citizens that enjoy the rights and privileges of the state. This is to be understood according to the condition and quality of every one; the nobles as nobles, the commons as commons, the women and children in like case according unto the age, sex, and condition, and deserts of every one of them. . . . It may be well said that special privileges make not a man a citizen, but the mutual obligation of the sovereign to the subject, to whom, for the faith and obeisance he receiveth, he oweth justice, counsel, aid, and protection which is not due unto strangers."

The subject may be further considered under the following general divisions: I. The mode of becoming a citizen; II. The obligations, rights, and privileges of a citizen with special reference to the Constitution of the U. S.

I.—1. The leading mode of acquiring citizenship is by birth in the country or under a state of allegiance. Birth in the country confers citizenship without reference to the citizenship of the parent, who at the moment of birth owes at least a local allegiance, and, though an alien, is temporarily a subject, except in the case of foreign ambassadors and ministers. This rule would apply in the U. S. to the case of persons, though in a foreign country, who were in the U. S. army, as their allegiance would be due to the U. S. On this same principle the children of U. S. ambassadors and ministers born abroad are citizens.

2. A more difficult question is as to the citizenship in the U. S. of children born abroad of U. S. parentage. It should be noted in the discussion of this question that allegiance is twofold—perpetual and local. When a citizen of the U. S. goes to a foreign country, he can not by his own act put off his citizenship. He is still subject to laws of his own, and can, according to modern views, still be governed by its criminal legislation. "The power to tie and bind the subject can not be tied down to places." It would seem on principle that as the mutual obligation from which citizenship springs still exists, his child would still be a citizen, though not born within the territory of the state to which allegiance is due. Lord Bacon, who would naturally look upon this subject with the eye of a philosopher, plainly took this view. In his famous argument concerning the *post nati* in the time of King James I., he said: "If a man look narrowly into the law on this point, he shall find a consequence that may seem at the first strange, but yet can not be well avoided; which is, that if divers families of English men and women plant themselves at Rouen or at Lisbon, and have issue, and their descendants do intermarry among themselves, without any intermixture of foreign blood, such descendants are naturalized to all generations, for *every generation is still of liege parents*, and therefore naturalized; so as you may have whole tribes and lineages of English in foreign countries." (Harg., *State Trials*, 81.) If this broad proposition should be attended with any evil consequences, they could be corrected by suitable legislation. The strictly legal authorities are, however, hopelessly in conflict. The proposition that the foreign-born children of citizens are aliens is argued with great force and power by Mr. Horace Binney in his well-known article on the *Alienigenæ of the United States* (2 *Am. Law Register*, 193, A. D. 1854). An outline of his argument is that there are no early legal decisions affirming the citizenship of such persons, but that, on the other hand, the preamble to an early statute on this subject (25 Ed. III., stat. 2) of the year 1350, the language of text-writers, such as Lord Coke, Jenkins, and Blackstone, the expressions of authors of digests, such as Comyns and Mr. Bacon, all point to the fact that the persons in question are aliens. The argument is legal and based upon authorities, and does not enter into the philosophy of the subject as depending on the doctrines of allegiance. Opposed to this view of Mr. Binney is a carefully considered case in the New York court of appeals (*Ludlam* vs. *Ludlam*, 26 New York R., 356). This case maintains that the statute of 25 Ed. III., ch. 2, above referred to, was simply an affirmation of already existing law, and that the common law proceeds solely upon the doctrine of allegiance, which does not depend upon locality and place, and can not be confined within boundaries. It holds that the true test of the allegiance of the child is parentage, that it is transmitted from the father to the child, and that, accordingly, the state may claim allegiance from the children of its citizens wherever born. These doctrines are supported by a reference to *Calvin's Case*, 7 Coke R., 1, in the sixth year of James I., and other authorities. The doctrine of this case appears to be based on sound principles of political philosophy, whatever view may be taken of the result of the legal decisions. The discussions of this subject by various writers led to the following important enactment by Congress in Feb., 1855: "Persons heretofore born, or hereafter to be born, out of the limits and jurisdiction of the U. S. whose fathers were or shall be at the time of their birth citizens of the U. S., shall be deemed and considered, and are hereby declared to be, citizens of the U. S.: Provided, however, that the rights of citizenship shall not descend to persons whose fathers never resided in the U. S." If the theory of Mr. Binney be

correct, this statute conferred citizenship where it did not before exist; if that of *Ludlam* vs. *Ludlam* be sound, then it restricted the rights of the foreign-born descendants of citizens, perhaps unnecessarily.

3. *Citizenship by Naturalization.*—An alien may be made a citizen by the act of a state or a nation co-operating with his own act. Sometimes this citizenship is complimentary or honorary; usually it is attended with true, or intended, renunciation of foreign citizenship. The question thus recurs whether a person can by his own act put off his citizenship. The doctrine of the common law was that natural-born subjects can not be absolved from allegiance to their sovereign without his consent. At one time the courts of the U. S. asserted the same doctrine. But Congress has enacted that expatriation is a natural right of all persons. England no longer insists on the doctrine of indelible allegiance. The theory formerly held was this: the tie of allegiance creates reciprocal rights and duties; the state can not rightfully discard the citizen without just cause of forfeiture, nor can the citizen repudiate his obligations to the state without its consent. Assuming that mutual agreement is necessary to dissolve the relation of sovereign and citizen, the more difficult question is whether the agreement of dissolution can be *inferred* from the prolonged absence of the citizen, coupled with foreign naturalization, and the failure of the state, after notice, to reclaim him. The better opinion would seem to be that there must be some affirmative act of renunciation on the part of the state to which the allegiance is due, though there are weighty opinions to the contrary. For the purpose of settling perplexing and irritating questions that frequently arise, the U. S. have entered into treaties of naturalization with a number of foreign powers. (For details, see NATURALIZATION.) Naturalization may take place either by a mere law of a general nature, such as that which provides that every alien woman who marries a citizen of the U. S. shall be deemed and taken to be a citizen, or it may occur in special instances affirmative on the part of the individual to be naturalized. In the U. S. the power to naturalize is exclusively vested in Congress by a provision in the U. S. Constitution. There is an important provision concerning citizenship in the fourteenth amendment to the U. S. Constitution as follows: "All persons born or naturalized in the U. S., and subject to the jurisdiction thereof, are citizens of the U. S. and of the State wherein they reside." The precise effect of this provision has not yet been settled by judicial decision. It would seem, however, that it should not be construed by implication to deprive any person of citizenship who would possess it by common law, such as the children of ambassadors or other citizens born abroad. The ninth amendment would lead to this conclusion: "The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people." Citizenship at present, as will be shown hereafter, leads to important rights and privileges, of which it would be unjust to deprive any one entitled to them. The words "subject to the jurisdiction of the U. S." would exclude from citizenship the children of foreign public ministers and members of the Indian tribes, though Indians born out of the tribal organizations would seem to be citizens. Alien Chinese can not become naturalized citizens of the U. S., but a child born of Chinese parents within the limits and jurisdiction of the U. S. is a citizen.

Interesting questions concerning citizenship arise in case of the union of two separate nations, or of the division of a single nation into two separate states. The first of these cases was discussed with much acuteness and learning when Scotland and England were united under James I.; the second has been extensively considered by the courts, both in Great Britain and in the U. S., in connection with the latter's independence. *Calvin's case* (7 Coke's Reports), the leading English authority upon the whole subject, declared that the *post nati* (persons born after the union) of Scotland were natural-born subjects, and could inherit lands in England. In respect to the result of the revolt of the colonies opinions differ as to the time when the separation between Great Britain and the U. S. became complete, though they substantially agree as to the effect of the division. The U. S. view is, that the separation took place at the Declaration of Independence, July 4, 1776; the British, that it was consummated at the treaty of peace in 1783. Accordingly, a person born in Great Britain before July 4, 1776, who did not reside in the U. S. after that date, became, as to the U. S., an alien, as well as all his descendants. The effect of this rule is not to work a forfeiture of vested rights, and the real estate owned by a former citizen continued to be vested in him, though he could not, after the day named, acquire an indefeasible title to land.

II.—The provisions of the U. S. Constitution concerning citizenship have assumed great importance, growing out of the controversies concerning the legal condition or *status* of persons of African descent. The Constitution as originally adopted made no provision concerning citizens of the U. S., except an incidental direction that Senators, Representatives, and the Executive should be such citizens. There were, however, distinct clauses concerning the rights and privileges of the citizens of the several States, such as that the judicial power of the U. S. shall extend to controversies between a State and a citizen of another State, and between citizens of different States, and that the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States. This last clause has led to much judicial discussion, some points of which will be noticed hereafter. Under the clause which provided that the judicial power should extend to controversies between citizens of different States, the question arose in the now famous case of *Scott* vs. *Sandford* (19 Howard's Reports, 39), whether an emancipated Negro could be considered as a "citizen of a State"; and it was decided that he could not be so regarded, and accordingly that he could not maintain an action on that basis in the Federal courts. It would seem to follow that he could not claim the benefit of the other constitutional provision respecting privileges and immunities. The division of public opinion occasioned by this decision, and the desire to settle by a positive rule the condition of the slaves emancipated by the thirteenth amendment to the Constitution, as well as that of the colored race in general, led to the fourteenth and fifteenth amendments, the provisions of which are now to be considered, as far as they affect citizenship. All persons born or naturalized in the U. S. are declared to be citizens of the U. S. and of the State in which they reside; and it is provided that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the U. S."; and also that the "right of citizens of the U. S. to vote shall not be denied or abridged by the U. S. or by any State on account of race, color, or previous condition of servitude." Though the condition of the colored race led to these amendments, their construction is not to be confined to it. It will be observed that the same words are here used as in the body of the Constitution—"privileges and immunities"—except that they are here declared to belong to "citizens of the U. S.," while there they appertain to "citizens of each State" in reference to the "several States." The meaning of the words "privileges and immunities" in the body of the Constitution has been, as already stated, much considered. They have been held to mean such privileges, etc., as are of a general nature, such as security to life and liberty, the right to acquire property, to have access to courts of justice, and freedom to pursue and obtain happiness and safety, with such restrictions as are necessary to the public good. Whatever guarantees upon these points a State accords to its own citizens, it must extend to citizens of other States. But the Constitution before the amendments gave no directions as to the mode in which a State should treat its own citizens, except in a few specially marked instances, such as the prohibition to pass bills of attainder and *ex-post facto* laws. In other respects the State was left to its own action toward its people. Under the amendments there is provision made for the privileges and immunities of citizens of the U. S. A momentous question now arises: Does this provision trench on the great power which has all along been vested in each State to regulate the conduct of its own citizens? Does Congress under it have the right to enter upon the once exclusive field of State legislation and the domain of State constitutions, and to override all its action as to privileges and immunities of citizens? This question came up for careful consideration before the Supreme Court of the U. S. in the very important case of the *Butchers' Benevolent Association* vs. *The Crescent City Live Stock Company* (A. D. 1872). The State of Louisiana had granted an exclusive right to the latter company to engage in the business of slaughtering cattle within a certain district, including the city of New Orleans. It was claimed by the plaintiffs, who had been engaged in the same business, and who were by the act prohibited from following it, that the law created a

monopoly, that its exclusiveness was contrary to the spirit of free institutions, and that it was opposed to this provision of the U. S. Constitution. It was, however, considered by the court that there is now a clear distinction between citizens of the U. S. and citizens of a State—that there may be persons of the former class who are not members of the latter, and that the constitutional amendment is solely applicable to privileges and immunities of citizens of the U. S., *as such*; and that accordingly the clause does not refer to such regulations as the State may make for *its own* citizens, though they may also fill the character of citizens of the U. S. If it be asked what scope there is in this construction for the amendment, the answer is that the court does not seek to lay down any abstract rule on the subject, and will decide questions as they arise. Some instances of its application may be suggested, such as the right to visit the seat of government to assert a claim or to seek its protection; to freely approach its seaports, sub-treasuries, land-offices, and courts of justice; to be protected on the high seas; to assemble and petition for the redress of grievances; to invoke the privilege of the writ of *habeas corpus*; and freely to change the residence from one State to another. These appertain to citizens of the U. S. in general. It was decided by the same court that a claim to practice law in a State by one of its citizens (Mrs. Bradwell) did not come within the phrase "privileges and immunities" of a citizen of the U. S. It is a matter of congratulation to all who desire to see the equilibrium of forces between the general government and the States properly preserved that the court was able to see its way clear to a somewhat rigorous construction of the clauses of this amendment. The effect of the fifteenth amendment has not been settled by the courts, but its object is well known. It of course abrogates all State law or constitutional provisions creating distinctions among citizens of the U. S. as to the exercise of the right of suffrage based upon race and color, and for ever prevents the introduction of them either through the action of the States or the general Government. The right of citizenship under the U. S. Government is different from that under the State. (*Slaughter-house cases, 16 Wallace, 36.*) The U. S. and State Governments being distinct from each other, each has citizens of its own whose rights within its jurisdiction it is bound to protect. The right to vote is not a necessary incident of citizenship.

Revised by Henry Wade Rogers.

Citlahua, or **Citlahuatzin**: See Cuitlahua.

Citric Acid [*citric* is from Lat. *citrus*, citron; Gr. *κίτρον*]: an acid which occurs very widely distributed in nature in many kinds of fruit, as well as in the roots and leaves of some plants. It is found alone or with little malic acid, as the uncombined acid, in lemons and cranberries. Together with malic acid it is found in gooseberries and huckleberries. Further, it occurs in sugar beets, in tobacco, in acorns, and in the spring sap of grape-vines. It is prepared on a large scale from lemon juice. This is allowed to ferment, then neutralized with lime, the solution filtered, and the calcium citrate decomposed with sulphuric acid. One hundred pounds of lemons yield 5 lb. of citric acid.

Citrine: See Quartz.

Citrine Ointment: See Mercury, Medicinal Uses of.

Citron [viâ Fr. from L. *citrus* = Gr. *κίτρον*]: fruit of *Citrus medica*, one of the orange tribe, and now held by most botanists to belong to the same natural species as the lemon and the sour lime. The species was named *medica* by Linnæus upon the supposition that it came from Media, but its origin is now traced much farther east. The fruit is like an exaggerated lemon and covered with prominent humps. It sometimes weighs several pounds. The rind is very aromatic, and is used for the making of conserves. The mildly acid juice is employed in the flavoring of liquors. The citron makes a handsome small tree, with oblong or oval, acute, and short-petioled leaves, the petiole being either winged or wingless. The name citron is also used for a variety of watermelon, the rind of which is used, like that of the true citron, for preserves. This watermelon is characterized by a medium-sized, very hard, inedible fruit, which has a small and firm white core. This fruit thrives throughout the U. S.

Citronel'la (Fr. *citronelle*): a perfume prepared from the *Melissa officinalis*, or common Balm (*q. v.*); also a liquid prepared in Barbados from the rind of the citron, and used in France for flavoring the best brandies. The name *citronelle* is also given in France to the common southernwood (*Artemisia abrotanum*). The term citronella is, however, chiefly applied by perfumers at present to an oil exported from Ceylon. It is the product of *Andropogon schœnanthus*, a kind of grass.

Citron-melon: See Watermelon.

Citrus, kit'roos, but more commonly sit'rŭs [Lat., from Gr. *κίτρον*, citron, *κιτρέα*, citron tree]: a genus of evergreen trees and shrubs of the family *Rutaceæ*, natives of tropical India, but long cultivated in all warm climates. Few species are now recognized by most botanists, but these have given rise to many strongly marked varieties, which by some are regarded as species. The orange, *C. aurantium*, the lemon, *C. limonum*, lime, *C. limetta*, shaddock or grapefruit, *C. decumana*, kumquat, *C. japonica*, and the Seville or bitter orange, *C. vulgaris*, are the commonly recognized species. The leaves of all these species, while apparently simple, are really compound, as shown by their jointed petioles. All species abound in a volatile oil, which is used in medicine and the manufacture of perfumery. C. E. B.

Cittadella, chit-tăă-del'lăă, Alfonso: portrait-painter; b. 1487; pupil of Nicolo di Puglia at Bologna. He is said to have introduced a new and improved style of portrait-medallion, modeling from nature. He made the portraits of the contemporary Medici and of Charles V. He worked in clay and wax as well as in color. D. in 1536. W. J. S.

Città-della-Pieve, -pĕĕ-ay'văy: a town of Italy; province of Perugia; 23 miles W. S. W. of city of Perugia (see map of Italy, ref. 5–E), the native place of the eminent painter Perugino. Pop. 8,000.

Città di Castel'lo (anc. *Tiberinum*): a town of Italy; province of Perugia; on the Tiber, about 28 miles N. W. of Perugia (see map of Italy, ref. 5–E). It has a cathedral, several palatial mansions, and Gothic structures. Pop. 25,000.

Città Vecchia, -vek'kĕĕ-ăă (i. e. Old City): a city of Malta; 6 miles W. of Valetta; on a limestone hill in which extensive catacombs were excavated at a remote period (see map of Italy, ref. 11–F). It has a large and handsome cathedral. It was called *Medina* by the Saracens, who occupied it for some time. Pop. 7,000.

City [from O. Fr. *cité*: Prov. *ciutatz*: Ital. *città*: Span. *ciudad*: Portug. *cidade* < Lat. *ci'vitas* (*civtas*), *-ta'tem*]: a large town, especially one incorporated with special privileges. As early as the thirteenth century the word city was applied in England to important boroughs such as London and Leeds. Under the Norman kings the episcopal sees began to be removed to the chief borough or "city" of the diocese, as in France, and the term city came to be used specifically to designate a borough which was the seat of an episcopal see, and in the reign of Henry VIII. the boroughs in which new bishopries were established were created "cities." This title has been generally conferred on nearly all the places to which new bishopries have been assigned in the nineteenth century; but a number of boroughs which are not episcopal sees have had it conferred upon them by royal authority. In Scotland and Ireland the word has had a somewhat parallel usage. In Canada a city is a municipality of the highest class, and is separated from the jurisdiction of the county council. In the U. S. the term is specifically applied to municipalities which are governed by a mayor and board of aldermen, or other similar body, and in which there is no general deliberative assembly of the citizens, or "town council." In some of the U. S. cities are classified according to their population for purposes of legislation. See Municipal Government.

Revised by F. Sturges Allen.

City Island: an island and village situated in Long Island Sound, a few miles E. of New York city, to which it was annexed in 1895 (see map of New York, ref. 7–B). It has a number of the public institutions of New York, and shipbuilding and oystering industries. Pop. (1880) 989; (1890) 1,206; (1900) not returned separately.

City Point: port of entry of Prince George co., Va. (for location of county, see map of Virginia, ref. 6–H); on the James river, at the mouth of the Appomattox, 10 miles by railroad E. N. E. of Petersburg. This point, being a good landing, was seized by the troops under Gen. Butler in his movement up the James, May, 1864, and later, June, 1864, became the headquarters of Gen. Grant after his passage of this river; and during his subsequent operations against

Petersburg and Richmond was the principal dépôt of supplies for his army. Pop. (1880) 484; (1890) 409; not returned separately in 1900.

Ciudad Bolivar: See Bolivar.

Ciudad de Cura: See Cura.

Ciudad de las Casas: See San Cristobal.

Ciudad de los Reyes: See Lima.

Ciudad Guzman, or **Zapotlan el Grande**: a city in the south part of the state of Jalisco, Mexico; 4,300 feet above the sea (see map of Mexico, ref. 7–F). Pop. (1891) 23,205. The place is growing rapidly. At present it is reached by diligence from Guadalajara. H. H. S.

Ciudad Porfirio Diaz: See Porfirio Diaz.

Ciudad Real, thĕe-ōō-dăad'răy-aal': a province of Spain; intersected by the river Guadiana, and bounded S. by Sierra de Morena. Area, 7,840 sq. miles. Capital, Ciudad Real. Pop. (1887) 292,291.

Ciudad Real (city of the king): a town of Spain; capital of the province of same name; situated on a plain about 5 miles S. of the Guadiana and 105 S. of Madrid by rail (see map of Spain, ref. 17–F). It has several fine churches, monasteries, and a large hospital founded by Cardinal Lorenzand. The nave of the parish church is a magnificent Gothic structure. Here are manufactures of linen and coarse woolen fabrics and an annual mule-fair. This town was the headquarters of the Hermandad, or Holy Brotherhood, founded in 1249 for the suppression of robbery. Pop. 13,365.

Ciudad Rodrigo, -rod-ree'gō: a fortified town of Spain; on the river Agueda, here crossed by a fine bridge; about 90 miles S. W. of Salamanca (see map of Spain, ref. 14–D). It has a Gothic cathedral founded in the twelfth century, and a citadel. During the Peninsular war it was considered an important point as a key of Spain on the west. It was invested and taken by the French general Massena in July, 1810. The army of the Duke of Wellington assaulted and took this place, with 150 guns, Jan., 1812. For this achievement the Spanish Government gave him the title of Duke of Ciudad Rodrigo. Pop. (1887) 8,330.

Ciudad Victoria: a Mexican city; capital of Tamaulipas; in the southwestern part of the state (see map of Mexico, ref. 5–H). It is beautifully situated, at the base of high mountains in a rich and well-watered valley. Sugar-cane is largely grown in the vicinity. Pop. (1889) 8,000.

Civet [from Fr. *civette*: Ital. *zibetto*, from Arab. *zabād*]: a name applied to a pale-yellow or brownish substance, about the consistency of honey, secreted by the anal glands of several carnivorous mammals of the genus *Viverra* and family Viverridæ (*q. v.*). Upon exposure to air the civet thickens, acquiring the consistency of lard, and becomes darker. When pure it has a strong, unpleasant musky odor, but when diluted, say 1 part of civet to 1,000 of alcohol, the unpleasant quality disappears. It is still in great vogue as a perfume in the East, but in Europe it is used not so much on account of its own odor, but because when combined with other perfumes it has the property of increasing and preserving their quality. The civet of commerce comes mostly from Northern Africa and Southern Asia and the adjoining islands. It is prepared for market by removing the hairs, washing, and drying. When pure it is worth from $10 to $12 per ounce, but, on account of its value, it is frequently adulterated with lard or butter. The animals which furnish civet are also known as civets, or civet-cats. They are kept in confinement and the secretion removed with a small spoon once or twice a week. The most common species, and most important commercially, is the African civet, *Viverra civetta*, which is found from North Africa southward to the latitude of Fernando Po. It is from 3 to 4 feet in length, including the tail, and 10 or 12 inches high. The fur is rather harsh, and along the center of the back is quite long, and can be erected to form a crest. The general color is a brownish gray; there is a dark line down the center of the back, and the upper parts of the body are marked with numerous rows of black spots. The legs and greater portion of the tail are black, there is a black patch about each eye, and two or three black stripes run obliquely downward and backward from near the ear. The upper lip and sides of neck are whitish. The pupil of the eye is round even in a strong light, the toes are short, and the claws partially retractile. The Indian civets *Viverra zibetha* and *V. tangalunga* are somewhat smaller and lack the dorsal crest. They are found in India, China, and the large islands of the coast of Southern Asia. The rasse (*Viverricula malaccensis*) is a much smaller animal, likewise inhabiting Southern Asia and the adjoining islands, whose civet is used by the Javanese. While kept in confinement these animals can scarcely be called domesticated, for, with the exception of the zibeth, *V. zibetha*, they are cross and treacherous. As a recompense for this, the secretion of the glands is greatest when the animals are irritated. Care is taken in removing the civet to have the creature in a cage so narrow that it can not turn around. The civet-cat of Mexico and the Southwestern U. S. is the cacomixl. See Bassaris. F. A. Lucas.

Civetta, chĕe-vet'tăa, otherwise **Heinrich von Bles**: b. in Bovines, near Namur, Belgium, 1480; d. probably in Liége, 1550. A Dutch painter who lived in Venice, where he painted a strange inferno in the ducal palace. His most noted picture is one of a peddler asleep while monkeys rifle his pack. He was known as Civetta from the habit of painting an owl in his pictures. W. J. S.

Civil Action: an action which is instituted for the recovery of private or civil rights, or of compensation for their infraction.

Civil Damage Acts: laws giving to husbands, wives, children, parents, guardians, and others who have sustained injury in person, or property, or means of support by any intoxicated person, or in consequence of the intoxication of such person, a right of action against any person who has by selling or giving away intoxicating liquors caused the intoxication in whole or in part. In some of the States this right of action is also given against the owners of the premises on which the intoxicating liquors are sold. The right of action is not restricted to cases where the dealer made the sale himself, but it extends to cases of sales made by his agent even against his explicit instructions. The liquor-dealer's license to sell is not a defense to the action, as liability under the acts does not depend on whether the sale was lawful or unlawful, or on any question of negligence.
Henry Wade Rogers.

Civil Death: in law, the cessation or loss of one's civil rights and capacities so that he becomes, as it were, dead in law while the physical life remains; or the state of a person who is separated from civil society and has lost his civil rights. Civil death may arise from various causes, such as abjuring the realm, entering into a monastery, banishment, etc. In Great Britain it arose where a man by act of Parliament was attainted of treason or felony. Formerly in the case of one entering a monastery and becoming a monk his next heir succeeded to his estate. In some States of the U. S., as in New York, the sentence of a criminal to imprisonment for life causes civil death and nullifies an existing marriage. F. Sturges Allen.

Civil Engineer: a term originally used in contradistinction to military engineer, meaning a person whose profession was the planning and construction of roads, bridges, machinery, river improvements, etc., for the uses of the general public and not for the special purposes of warfare. The term is still sometimes used in this sense in Europe, but civil engineering is often held to include all branches of engineering, even those purely military and naval. In the U. S. this latter use of the term is not obsolete; for instance, the constitution of the American Society of Civil Engineers provides that "a member shall be a civil, military, naval, mining, mechanical, electrical, or other professional engineer, an architect, or a marine architect." There is also a tendency, which is seen especially in some schemes for classifying books, to omit the word "civil" entirely, and subdivide the various branches of engineering into mechanical, hydraulic, sanitary, bridge engineering, etc. See Engineering.

According to the usage most prevalent in the U. S., a civil engineer is a person whose profession is the planning or construction of works which promote inland transportation for the public benefit. The word transportation is here used in a very broad sense, and includes the moving of water in pipes, and of sewage in sewers, as well as of freight and passengers on roads and railroads. Under this definition civil engineering includes surveying, or the measurements necessary for making the plans, the construction of vessels, street railways, railroads, canals, sewers, and methods of water-supplies, as also the improvement of rivers and harbors. The word works, used in the above definition, does not include prime motors, machines, or machinery, although such must be necessarily used by the civil engineer in his

operations, and it does not include mining, metallurgical, or electrical plants. MANSFIELD MERRIMAN.

Civilian: in popular usage, a person whose pursuits and employment are civil—i. e. one neither in the army nor in the navy. As a legal term, it denotes a man learned in the civil or Roman law. In England the term is applied particularly to a member of the college of doctors of law practicing in the ecclesiastical and admiralty courts, in which the civil law is recognized. Revised by F. STURGES ALLEN.

Civi'lis, CLAUDIUS: an heroic chief of the Batavi who served for many years in the Roman army. When Vespasian and Vitellius were contending in civil war for the imperial throne, the adherents of the former induced Civilis to make a feigned demonstration of hostility to the Romans, in order to detain in Gaul the Roman army, which was inclined to fight for Vitellius. Having raised a large army, Civilis revolted in earnest in 69 A. D., was joined by many Germans, and defeated the Romans in several battles. In 70 A. D. he was defeated by Cerealis, a general of Vespasian. Tacitus states that negotiations ensued between Cerealis and Civilis, but his history here ends abruptly.

Civilization [deriv. of *civilize*, from Fr. *civiliser*, from a deriv. of Lat. *civi'lis*, civic, civil, polite]: In popular use the meaning of this word is twofold; it is sometimes employed to describe a process and sometimes a condition. As a process it means the act of elevating or developing from a savage or semi-barbarous state to a state of intelligence, order, and refinement. As a condition it means the state of a people with whom intelligence is cultivated, manners are refined, the industries are active, and the arts are prosperous. In the first sense it aims at, and in the second it consists of, a highly and harmoniously developed condition of the individual man and of a state of society that is conducive to the most favorable relations of the individual man with his fellow-man. As a condition it is the sum of intelligence and well-being in the various gradations of society. Formerly the doctrine was not unfrequently held that mankind has degenerated from a loftier and happier condition to the present state of moral and physical degradation. Recently, however, this theory has been almost universally abandoned, and in its place the belief has come to prevail that the civilization of the present day is the result of a long and tedious process of evolution from barbarism. Various theories of the methods by which this result has been accomplished are entertained. The most elaborate attempt that has ever been made to discover the principles which govern the development of civilization is that of Henry Thomas Buckle, whose *History of Civilization in England*, though left incomplete, formulated certain laws and principles which it was the object of the work to establish. These principles, as given in the first volume of the work, may be presented in an abbreviated form, as follows: 1. The metaphysical dogma of free will rests on an erroneous belief in the infallibility of consciousness. 2. It is proved by history, and especially by statistics, that human actions are governed by laws as fixed and regular as those which rule in the physical world. 3. Climate, soil, food, and the aspects of nature are the principal causes of intellectual progress. 4. The great distinction between European and non-European history and civilization is the fact that in Europe man is stronger than nature, while elsewhere nature has been stronger than man. 5. Human progress has been due not to moral agencies, which are stationary, and which balance one another in such a way that their influence over any long period is neutralized, but to intellectual activity, which has been constantly varying and advancing. 6. Religion, literature, and government are, at the best, but the products, and not the cause, of civilization. 7. Civilization progresses with the advance of skepticism—that is to say, the disposition to doubt and investigate—and with the opposition of credulity, or the protective spirit—that is to say, a disposition to maintain without examination established beliefs and practices. These positions have been critically examined by several historical writers, the most cogent being the examination of Johann Gustav Droysen, in the first chapter of his *Grundriss der Historik*. Droysen holds the positions of Buckle to be untenable. Another very important work on the history of civilization is Laurent's *Études sur l'Histoire de l'Humanité*, in the eighteenth and last volume of which the author sums up his beliefs. He holds that there is a plan which extends through and directs human affairs, and which has accomplished its ends through physical and moral forces; that this plan did not originate with matter; that it was not the work of chance; that it is not merely a cause without an effect; and that it must therefore be the work of a Supreme and Infinite Intelligence. The author reviews Bossuet's theory of the miraculous government of Providence: the antique fatalism of Vico; the fatalism of chance by Voltaire and Frederick II.; the fatalism of climate in Montesquieu; the fatalism of nature in Herder; of race in Renan; of revolution in Thiers; of pantheism in Hegel; and of positivism in Comte and Buckle. But the best-known analysis of civilization is that of Guizot, in his *History of Civilization in Europe*. In this work the author has explained and commented upon the facts that have influenced civilization from the fall of the Roman empire to the French Revolution with a penetration and a clearness that have never been surpassed. He does not recount facts, but contents himself with making their significance known. The advance of civilization, in his belief, consists of the development of the individual and the development of the social condition. Its essential feature, therefore, is progress. He does not attempt to trace the development of the individual, but limits himself to the work of making known the great laws which dominate the evolution of society. The church, the crusades, the feudal system, the free cities, monarchy, in short all the prominent institutions of the Middle Ages, pass under his review. But he nowhere discloses his personal beliefs. Throughout the work there reigns a severity and serenity of method which conciliate all sympathy and respect. Especially noteworthy is his treatment of the crusades and the Reformation. Another French writer, M. de Gobeneau, in his *Essai sur l'inégalité des races humaines*, has also attempted to analyze the forces which have tended to the development of civilization. On many points he takes issue with Guizot. Civilization he regards as a chain of facts and ideas; and the characteristic difference between civilization and barbarism he declares to be in the fact that the one estimates at its true value the difference between the material need and the moral needs of man, while the other does not. With barbarism the physical needs dominate; but with civilization the multitude forces itself to seek by specific means the preponderance of moral considerations. In this way intelligence is promoted and manners are refined. The author thinks that climate and soil have much less to do with the development of civilization than has commonly been supposed; and he cites in proof of his belief the fact that for centuries the natives of America had the most magnificent opportunities presented to them without result. The most essential factor is the aptitude of race to avail itself of the opportunities afforded by its environment. Besides the writers who have occupied themselves mainly with what may be regarded as the philosophical evolution of civilization, a still larger number have endeavored to trace the development of it as a record of facts. In this kind of writing the Germans, in the works which they call *Kulturgeschichte* (i.e. culture history) have been especially pre-eminent. There is scarcely a period in the history of the human race on which, by the thoroughness of their investigations, they have not thrown important light. As it is impossible here to analyze even the most important of the numerous works on this subject, a list of the most noteworthy books is all that can be given.

C. K. ADAMS.

Civil Law: See LAW, THE CIVIL.

Civil List: the sum allotted for the annual expenses of the crown in countries having monarchical governments. The term is of English origin, going back to the reign of Charles II., who was assigned a revenue of £1,200,000 by

Parliament. An absolute sovereign needs no civil list, since he disposes of the entire revenues of the state at will; but in constitutional monarchies a fixed sum is assigned by Parliament, usually at the beginning of the reign, to be paid annually for the support of the royal family in proper dignity. It may be voted year by year, but this is mere formality. The impression sometimes prevailing that the sums paid on account of the civil list are raised directly from taxation is erroneous. The ruling families have always possessed large hereditary estates, the incomes from which were as rightfully their own as those of any other landed proprietor. They have turned the revenues from these hereditary domains into the public treasury in return for a fixed annual allowance. The civil list of the Queen of England amounts to less than the incomes of previous sovereigns. By 1 and 2 Vict., c. 2, it is established that during her Majesty's reign all the revenues of the crown shall become part of the Consolidated Fund. The Queen is allowed an annual allowance of £385,000, of which the Lords of the Treasury are directed to pay yearly £60,000 into her Majesty's privy purse; to set aside £231,260 for the salaries of the royal household; £44,240 for retiring allowances and pensions to servants; and £13,200 for royal bounty, alms, and special services. The Queen has also the revenues of the duchy of Lancaster, from which she received £50,000 in 1890. The heir-apparent to the crown has an annuity of £40,000, and receives in addition the revenues from the duchy of Cornwall. Under George I. the crown revenues amounted at times to £1,000,000. The civil list of Napoleon III. was 25,000,000 francs. In the German states the expenses of the sovereign and their families are chiefly met by the income from hereditary estates. The Emperor of Austria has a civil list of 9,300,000 florins (about $3,800,000). Up to within a recent period the Kings of Prussia enjoyed the whole income of the state domains, amounting to about $5,000,000 a year. In 1820 and again in 1850 this was reduced, but in 1859 was increased 500,000 thalers, in 1868 1,000,000 thalers, and Feb. 20, 1889, 3,500,000 marks. The total income now is something like $4,000,000, but it is dependent on the revenue derived from the domains and forests. The King of Saxony has a civil list of 2,940,000 marks (about $750,000 a year). The former royal domains, consisting chiefly in extensive forests, became the property of the state in 1830. The civil lists of some other monarchies are: Belgium, 3,300,000 francs; Greece, about $250,000; Italy, 14,250,000 lire (about $2,800,000, the greater part of the private domains of the king having been given up to the state in 1848); Japan, 3,000,000 yen (the yen being equivalent to the silver dollar of the U. S.); the Netherlands, 600,000 guilders (about $2,500,000); Portugal, 571,000 milreis (a milreis equals about $1); Spain, about $2,000,000; Sweden and Norway, about 2,000,000 kronor (nearly $600,000); Denmark, 500,000 rigsdalers (about $300,000). The president of France has 600,000 francs, with an additional allowance of 600,000 francs for expenses. The Emperor of Russia has an enormous revenue from the crown domains, which consist of more than 1,000,000 sq. miles of cultivated land and forests, but the amount is not made known, as the crown domains are considered the private property of the imperial family. C. H. THURBER.

Civil Service and **Civil Service Reform**: In its comprehensive sense, the civil service of a nation, state, or city embraces the whole body of officers who manage the civil affairs of its government. It could hardly include a person employed only as a laborer for the government, but it is very difficult in some cases to decide whether a person employed and paid by the government is an officer or simply a laborer. The whole public service of civilized states is in three great divisions—the civil, the military, and the naval. Yet it is not easy in every instance to decide whether an officer should be classed in the military or in the naval service, as he may serve in both. So various officers have both civil and military functions. The President of the U. S. is the head of one of the great branches of the civil service, but he is also commander-in-chief of the army and navy, and of the militia of the several States while in the actual service of the nation. The position of governors is analogous. The functions of the Secretary of War and those of the Secretary of the Navy are in part, but not wholly, civil. Office in every part of the public service is a trust the authority and functions of which should be executed at all times under a sense of both moral and legal obligation, solely for the public good, and therefore not in the interest of any party, faction, family, or individual. The duty to be faithful, efficient, and economical in every public office is as absolute as it is in any private station.

The civil service, under enlightened forms of government, is separated into three branches—the legislative, the judicial, and the executive.

1. We need not stop to notice the lower grades of officers in towns and villages, where legislative, executive, and in some degree judicial, functions are united in the same officer. The legislative branch is essentially representative. Everywhere—in theory, at least—it represents opinions, and, in greater or less degree, interests and property also. In republics it is also especially representative of numbers and localities; and in monarchies, of classes, of the state Church or religion, and of hereditary privileges. This representative function of legislators and the duty of adapting the laws of a people to their varied and changing interest and opinions make the views, interests, and, to some extent, the residence of candidates for legislative offices an important part of the proper tests of fitness for the places they seek. Such considerations also point to popular elections as the best means of selecting such officers. But in the U. S. different considerations should prevail in the selection of the clerks and other subordinates of the houses of Congress and of State legislatures. The functions of these subordinates, from the secretaries and chief clerks down to the copyist and the messengers, are in no sense representative. They owe no duty to members of one party that they do not as much owe to members of the other party. To make them partisan workers for the dominant party is to mistake their functions and to practice despotism. That knowledge of form and of details which such subordinates have learned by long practice is particularly valuable to new members, and greatly facilitates the business of legislative bodies; yet nearly all State legislatures and both houses of Congress, as well as almost every municipal council, are in the habit of treating these subordinate places as so much party patronage, to be grasped at the cost of long, angry, sometimes ignominious, controversies. It is plain that their selection should depend solely on their capacity for advancing the business portion of that work. There are various officers—of which presidents, governors, and in a degree mayors, are examples—whose functions are in their nature both legislative and executive. Their duty of approving or vetoing bills is in kind wholly legislative. It is for this reason, and for the further reason that they are to carry out in their executive sphere the general policy approved by the people in their selection, that these offices also are properly made elective. It is plain that representative officers would soon cease to be such if their terms were made long, and officers whose functions are both legislative and executive should also be given a fixed term, though it should be longer than that of officers who are solely representative. In close analogy to presidents and governors, in some of their duties, are the heads of departments (generally members of the cabinet) and councils of appointment. Being the confidential advisers of the chief executive, they need to have his confidence and to share his views in regard to the execution of the policy to which he is pledged. Their political opinions therefore are important tests of their fitness, and their terms of office should not be longer than that of the chief.

2. The judicial branch of the government is in no proper sense representative. A despot may make it such to intrench his despotism; an aristocracy may make it such to add strength to class privileges; a party in a republic may make it such to perpetuate its power and reward its adherents. In each case it is a prostitution of judicial functions and a calamity to the state. It is too much to expect that judges who feel the need of conciliating voters for re-election at the end of a short term will carry the scales evenly between a humble citizen who can control no vote but his own and a great corporation, or a great politician, who can control many hundreds. In the U. S it has been but the natural fruit of a short-term elective judiciary that clerks and other court officers have become a part of the spoils of party victories in many of the States and cities. And this is the view which has been causing so many of the States to retrace—in part, at least—their disastrous advances in the direction of a short-term partisan judiciary.

3. In the executive department is found the vast majority of those civil officers by whom the Government is carried on. There are more than 150,000 in the civil service of the U. S. without including those of the grade of mere laborers. Aside

from the few of the higher grade already referred to, these officials are in no sense representative of either localities or opinions. There were 67,668 postmasters in 1892, with tens of thousands of clerks and carriers under them, engaged in receiving, forwarding, and delivering the public mails, and in the collection, care, and transmission of postage-money and postal orders. In the whole country there is not a branch of private business to which, upon a true view of its nature and interests, party politics are more foreign or in which business-methods are more essential than they are to the proper discharge of the functions of the post-office department. In the other six executive departments of the Federal Government, as in this, official life is graded from the central authority down to the porters and the doorkeepers. An organization quite analogous exists in the executive department of the States, and, in some degree, of the cities. None of these latter officials is representative. In every grade it is their duty to obey the legal instructions of their superiors, and to do their work in the same manner whichever party is in power. With rare exceptions, they are doing work the success and the utility of which depend upon its being done wholly upon business principles. The bias of proscriptive party views and of active affiliation with the managers of politics is almost inevitably a hindrance to the well-doing of the public business. Men thus placed in office are apt to feel it a duty, and are sure to feel it a matter of personal safety, to work for their benefactors. From such a view of the matter the step was but a short one to the practice of collecting an annual rent from such subordinate—under the name of political assessments upon salaries—for the purpose of paying the expenses of parties and great politicians. From that stage the next step to the making of salaries excessive that they might bear heavy assessments was easy and natural. The system which thus made offices perquisites, tens of thousands official servile partisans, and their salaries the source of a vast corruption fund for carrying elections, has long been known as the "spoils system." But little developed before Jackson's time, that system first found a distinguished apologist in Senator Marcy, of New York, who, commenting on patronage in a speech in the Senate in 1832, said, especially of New York politicians, who had enforced the system most extensively, "*They see nothing wrong in the rule that to the victor belong the spoils of the enemy.*" In that State a spoils system began to appear early in the nineteenth century. It was developed in the vindictive war waged by Tammany Hall on the Clintons, and it was spread over the State by the "Albany Regency," established in 1818 by Martin Van Buren. Thence it spread to the Federal Government during Jackson's administration. During the first forty years of constitutional Government in the U. S. the general feeling was that to remove from office, except for cause, was a tyrannic outrage, and the whole number of instances of such removal amounted to only about 1,700.

In England, when Parliament became the greater power in the Government, its members demanded their share of the spoils of the offices. A patronage secretary was created for its apportionment, and regular accounts were kept with members of the places they had filled. Political assessments were not exacted, because the offices were sold for a full price at the outset.

The practice, where it has prevailed, has absorbed the time needed for legislation, has weakened the sense of responsibility on the part of the executive, has impaired confidence in legislative bodies, has foisted incompetent supernumeraries upon the public treasury, has prevented the investigation of abuses, and has tended in many other ways to corruption alike in party politics and in official life. It has been in the great departments and offices and in the populous cities that the evils of this system have been most developed. In the Treasury Department at Washington, for example, there are about 3,500 officials. In the post-office at New York city there are nearly 3,000, and in the customs service there the number is more than 1,600. The head of a small office can easily learn the character and capacity of all who seek places, and of all who serve under him; but it is quite otherwise in the great offices and departments. He can not there know the qualifications of one in ten of those who are pushed for places.

More than fifty years ago it was found necessary in Great Britain to aid the appointing power by requiring an examination as to the capacity and the attainments of the applicant before his appointment was decided upon. These first examinations—known as *pass*-examinations—defeated the most incompetent. They were upon subjects which those in the offices needed to understand. But such examinations allowed the monopoly of access to them to remain with the dominant party. Only one person was examined at a time, and the recommendation of persons of influence in that party was a condition of being examined at all. That British precedent was the basis of the acts of Congress of 1853 and 1855 (see U. S. Rev. Stat., § 164), by which such examinations were made the condition of an appointment to any place in the four great classes of clerkships at Washington. These examinations were the first practical steps toward what is now designated *civil service reform*.

These pass-examinations in Great Britain led to a general system of competitive examinations, or, in other words, to examinations open to all apparently qualified irrespective of recommendations and of political opinions. Thus the Government was able to ascertain and select the best for its service. Competitive examinations did more than this. By allowing every one so qualified to present himself, and by giving the appointments to those who showed the highest excellence, the applicant acted independently, and practically *put himself into the public service*. Arbitrary and partisan patronage in that service was thus in great measure extinguished. This was the second great step in civil service reform.

Great Britain has for more than a generation enforced competitive examinations for the selection of her administrative officials in British India. In 1870 she made these examinations general for the home offices; so that very few mere pass-examinations are left. Her larger post-offices, her customs-offices, and nearly the whole of her executive service, with no small part of her military and naval service, have by these means been taken out of party politics and official favoritism, and placed on a basis of personal merit. See Eaton's *Civil Service in Great Britain*.

Between 1872 and 1874 President Grant, aided by a clause in an appropriation bill (now section 1,753 of the Revised Statutes of the U. S.), enforced a system of competitive examinations in the departments at Washington. He appointed a civil-service commission to take charge of them. They brought superior persons into the public service, and were rapidly suppressing the evils of patronage. For this reason they encountered the hostility of many members of Congress, who saw they could no longer effectively promise places for votes or foist their dependents upon the public treasury. A special message of President Grant in Apr., 1874, setting forth the beneficial results of these examinations, requested an appropriation for continuing them—a request repeated in his next annual message. Congress in 1874 and 1875 refused all appropriations. Competitive examinations, as a consequence, were suspended. The old pass-examinations were renewed; congressional patronage again flourished. But there was a large class of citizens who condemned this action of Congress, and an agitation of the subject began.

Competitive examinations were, however, established by President Hayes at the post-office and the custom-house at New York city, and they were continued there by Presidents Garfield and Arthur. The beneficial results there obtained and the growth of the reform sentiment of the country led to the passage of the Civil Service Act by Congress on Jan. 16, 1883. This act contains stringent provisions for the suppression of political assessments, and provides for a system of competitive examinations. The act has already arrested the grosser abuses connected with political assessments. Under it President Arthur appointed a civil-service commission, and approved and promulgated a series of civil-service rules. Since July 16, 1883, these rules have been enforced, and all places in that part of the civil service to which the act (at first) and the rules extend have been filled by those who have stood highest in the competitive examinations. These places were at first in number a little more than 14,000, of which 5,652 were in the departments at Washington, 2,573 were in the 25 custom-offices, and the residue were in the 23 post-offices to which the act and the rules applied. The parts of the service thus brought within the act are designated *the classified civil service*. The customs districts therein embraced are those in which there are as many as fifty clerks, but the President has the authority to extend the rules to smaller offices. The service classified under the act, and to which it and the rules apply, now embraces the executive departments at Washington, the department of labor, the fish commission, and the civil-service commission, all customs districts, all free delivery post-offices,

the railway mail service, and the Indian school service, including altogether about 80,000 classified and 102,000 unclassified places. Most of the unclassified positions are held by fourth-class postmasters, of whom there are more than 71,000.

The State of New York enacted a civil-service law similar to that of Congress, May 4, 1883, under which a State commission has been appointed. A like law and commission were established a year later in Massachusetts. The system in New York has not given complete satisfaction, owing to its not being thoroughly carried out, save in one or two places, notably Buffalo, where it has worked admirably. Competitive examinations are now enforced as qualifications for admission to the civil service of those States and their large cities. DORMAN B. EATON.

Revised by THEODORE ROOSEVELT.

Civil War of the United States: See CONFEDERATE STATES.

Civitali, chĕe-vĕe-taa'lĕe, MATTEO: b. in Lucca, Italy, in 1435; a barber of Lucca who studied in Florence and became a sculptor in his thirtieth year. His master is not known. He made the monument of Pietro da Noceto, the statue of St. Sebastian, the fine pulpit, the altar-piece of S. Regulus, two kneeling angels of the Chapel of the Sacrament, and especially the "Tempietto" or eight-sided marble shrine for the famous "Volto Santo," a cedar-wood crucifix said to have been brought miraculously to Lucca in the year 780. All these works of sculpture and decorative architecture are in the Cathedral of Lucca. He was called to Genoa, where he executed six fine statues for the cathedral. His figure of *Faith* is in the Uffizi Gallery at Florence. He was also an architect, and did much to improve the buildings of his native city. D. in 1501. W. J. STILLMAN.

Civita Vecchia, chee'vĕe-taa-vek'kĕe-aa (i. e. Old City; anc. *Centum Cellæ* and *Trajani Portus*): a city and fortified seaport of Italy; province of Rome; 36 miles W. N. W. of Rome by railway (see map of Italy, ref. 6–D). It is inclosed by walls and well built, has a large church, an arsenal, a theater, a lighthouse, and a castle founded in the reign of Julius II. The harbor was constructed by the Emperor Trajan, and is formed by two large moles, and a breakwater which protects shipping from a heavy sea. It was destroyed by the Saracens in 812, and rebuilt under Pope Leo IV. on the return of its former inhabitants. Pop. about 13,000.

Civoli, chee'vō-lĕe, LUDOVICO: Italian painter; b. in Cigoli, Tuscany, in 1559; d. in 1613; a pupil of Alessandro Allori, though he seems to have formed his style on studies of Michael Angelo, Correggio, and Andrea del Sarto. He became insane either on account of the persecutions of his enemies or because he was poisoned by a corpse after which he modeled. His mental alienation lasted for three years. After a prolonged visit to Lombardy he settled in Florence, and there he spent most of the remainder of his life. His masterpiece is an *Ecce Homo*, which was taken by Napoleon to France and placed in the Louvre, but after 1815 was returned to the Grand Duke of Tuscany. In Rome are *The Holy Apostle Curing the Lame*, in the Church of St. Peter; *The Conversion of St. Paul*, in the Church of St. Paul; *The History of Psyche*, painted *al fresco* in the villa Borghese, etc. He also painted the cupola of the chapel of St. Paul in the Church of Santa Maria Maggiore, but an ill-chosen disposition of the perspective spoiled the picture, and the painter died from chagrin.

Clackman'nan: the smallest county of Scotland; area, 48 sq. miles. It is bounded S. by the river Forth and N. by the Ochil Hills. It consists chiefly of the romantic valley of the North Devon. The soil is partly fertile. Coal, ironstone, copper, sandstone, and greenstone are found here. The chief articles of export are coal and iron. Clackmannan and Kinross together return one member to Parliament. Capital, Clackmannan. Pop. (1891) 28,433; (1901) 31,991.

Clackmannan: capital of the county of same name; on the river Devon, near its entrance into the Forth; 9 miles E. of Stirling (see map of Scotland, ref. 11–G). This town is noted for its ale. King David Bruce, whose ruined tower still stands near by, resided here in 1330. Pop. 3,600.

Cladocera, kla-dos'e-ra [from Gr. κλάδος, sprout + κέρας, horn]: small entomostraca with few segments; the second antennæ used for swimming, and the body inclosed in a bivalve shell. Most of the species live in fresh water. *Daphnia* is the best-known genus.

Claf'lin, LEE: a distinguished philanthropist of Boston, Mass.; b. in Hopkinton, Mass., Nov. 19, 1791. He acquired wealth in the manufacture of shoes, and bestowed munificent gifts of money upon the Wesleyan academy at Wilbraham, Mass., the Methodist university at Middletown, Conn., and the Boston Theological Seminary. D. in Boston, as the result of an accident, Feb. 23, 1871.

Claggett, THOMAS JOHN, D. D.: first Bishop of Maryland; b. in Prince George's co., Md., Oct. 2, 1742; graduated at the College of New Jersey (Princeton) 1762, and studied theology with his uncle, the Rev. John Eversfield, D. D.; ordained deacon Sept. 20, 1767, and advanced to the priesthood Oct. 11 in the same year, by the Bishop of London. His whole ministry was spent in his native State. He was consecrated bishop in Trinity church, New York city, Sept. 17, 1792 by Provoost of New York, assisted by Seabury of Connecticut, White of Louisiana, and Madison of Virginia. This was the first consecration of a bishop in the U. S., and the lines of succession of the English and Scottish Churches united in it. Bishop Claggett was a chaplain of the U. S. Senate in 1800. D. at Croom, Md., Aug. 2, 1816. Every bishop of the Protestant Episcopal Church traces his succession to Bishop Claggett. W. S. PERRY.

Clai'borne, Clayborne, or **Cleborne**, WILLIAM: b. in Westmoreland, England, about 1589; was the second son of Sir Edmund Cleburne, of Cleburne Hall, Westmoreland; was appointed by Charles I. his secretary of state for the dominion of Virginia Mar. 4, 1626, and treasurer of Virginia for life Apr. 6, 1642. He discovered, purchased, and planted Kent island in 1631, under a Scotch signet commission granting trading privileges with the Indians, and owned a large portion of the land upon which Annapolis now stands, as well as great estates in Virginia. He battled for his rights against Lord Baltimore, who claimed jurisdiction under his charter, and twice reduced the island of Kent by arms. Claiborne had secured the representation of Kent in the Virginia House of Burgesses, but, failing to maintain his claims, he purchased other islands in the Chesapeake which proved to be within Maryland bounds, and he contended in support of his ventures with varying success until 1651, when he withdrew into Virginia, and was appointed by Parliament a commissioner for the reduction of the colonies. He subdued Virginia, overturned the Calvert government, and restored religious tests, which excluded Roman Catholics from franchise. Cromwell did not sustain his operations and restored the Calverts. After the restoration the court neglected his petitions, and he sank into retirement upon his Virginia estates. Recent investigations into colonial history prove him to have been the victim of court favoritism, injustice, and misrepresentation. He has been styled "the champion of Virginia" and the "evil genius of Maryland." D. in Virginia about 1676.

Claim [from O. Fr. *claime*, connected with *clamer*, claim < Lat. *clama're*, call out, cry]: a demand of a right; the act of demanding from another person something due; a right to claim or demand; a title to any debt or privilege. The term is sometimes applied to the thing claimed, as land or other property. In law, claim is a challenge of interest in anything that is in possession of another, or at least out of the possession of the person who claims it.

Claims, Court of: a court of the U. S. for the relief of those persons who have claims against the Government. Before the year 1855, when this court was established, such claims could be settled only by act of Congress, as a sovereign power can be sued only by its own consent. It is a court of law, without equity powers, and consists of five judges (appointed by the President by and with the advice and consent of the Senate), two of whom constitute a quorum for the transaction of business, but three of whom must concur to render a judgment. It has a single annual session, beginning on the first Monday in December, held in Washington, D. C. Its decisions are not final as against the Government, for Congress may refuse to make appropriations to meet the claims allowed. In practice this seldom happens, and the effect of the court is to remove a vast number of private bills from the congressional calendar, and to subject claims to legal proof. (See COURT.) The COURT OF PRIVATE LAND CLAIMS (*q. v.*) was established in 1891. Revised by F. STURGES ALLEN.

Clairaut, clā'rō', ALEXIS CLAUDE: geometer; b. in Paris, France, May 7, 1713; d. there May 17, 1765. When only twelve years old he read a paper on curves of double cur-

vature before the Academy of Sciences, and in his eighteenth year he was admitted as a member of that institution. He accompanied Maupertuis to Lapland in order to measure a degree of the meridian, and on his return he published his celebrated treatise on the figure of the earth (1743). That, however, which made him most famous was his prediction of the return of Halley's comet in 1759.

Clairin, clā′răñ′, GEORGE JULES VICTOR: figure and portrait painter; b. in Paris, Sept. 11, 1843; pupil of Picot and Pils; second-class medal, Salon, 1885; second-class medal, Paris Exposition, 1889; Legion of Honor 1888. His pictures of incidents in Spanish history are brilliant in color, and he has painted some very good portraits. He painted a series of decorative panels in the buffet of the Grand Opera-house, Paris. Studio in Paris. W. A. C.

Clairon, clā′rōñ′, CLAIRE JOSEPHE LEGRIS DE LA TUDE: French actress; b. at Saint-Wanon de Conde, in Flanders, in 1723; d. in Paris, Jan. 18, 1803. She was educated in Paris, and so precocious were her passion and her talent for the stage that in her thirteenth year she made a brilliant *début* as soubrette in the Théâtre Italienne. In 1743 she made her *début* as Phèdre in the Théâtre Français, and from that period down to 1765 she represented all the tragic characters of Du Belloy, Saurin, Marmontel, Voltaire, and the other dramatists of the time. She was put in prison for some insignificant insubordination, and she declared that she would never tread the stage again unless she received due satisfaction; but no satisfaction was ever offered, and she remained in retirement. During the Revolution she lost her fortune, and died in very straitened circumstances. Her *Memoirs* appeared in 1799.

Clairvaux, clār′vō′: a village in the department of Aube, France; about 10 miles above Bar-sur-Aube; stands on the left bank of the river Aube, and is noteworthy as the site of the famous Cistercian abbey of Clara Vallis (see map of France, ref. 4–G). This was founded in 1115 by St. Bernard, who was its abbot till his death in 1153, and who threw such a glory over the place that in 1143 the kingdom of Portugal extravagantly declared itself a fief of the abbey of Clairvaux. It afterward became famous for the architectural merits of its church. During the Revolution the convent was closed, and the vast buildings are now turned into a prison. See Ruskin's *Præterita*.

Clairvoy'ance [Fr., deriv. of *clairvoyant*, clear-sighted; *clair*, clear + *voyant*, seeing]: The power by which persons in a mesmeric state are supposed to be able to see concealed things or to see what is happening at a distance. Hitherto the nature of spirit has been discussed theologically and metaphysically. Its scientific investigation has been considered either impracticable or undesirable. In this borderland between the known and unknown ignorance and charlatanism have held high carnival. Science, purely material, is entirely occupied with matter and its inherent force, and beyond the retort and crucible has no place for spirit. Belief in spiritual being outside of physical existence is superstition. The mention of a fact bearing in that direction provokes a smile of scornful pity. When the oil is exhausted the flame no longer burns; when the fuel is spent the fire goes out; when the instrument is destroyed the music is not heard; when the complex co-ordination of conditions called a living being is subverted, life, intelligence, spirit, are no more. Such are the illustrations of material science. The spiritual realm has remained unknown, or rather its existence has been denied.

These reflections are rendered pertinent by the consideration that whatever else of pretense and folly be blown away, the central fact of clairvoyance remains undisturbed; and clairvoyance is a supersensuous perception depending on the spiritual nature of man, without which it would be impossible. In the present state of psychological knowledge the facts are ill-observed, loosely recorded, and theories out of place. The world of spirit, to which "foree" furnishes the key, perhaps may at some future time broaden into as wide a field as the physical world now presents. Superstition will then have no place for concealment. Ghosts, witchcraft, visions, trances, ecstasy, and the innumerable phases of spiritual phenomena will be co-ordinated, the chaff blown away, the vital facts preserved, and a true science of the soul, based on accurate observation and discriminating research, founded.

The existence of a somnambulic or sleep-walking state, induced by unknown causes and accompanied by peculiar phenomena, is generally admitted. It is also admitted that a state similar to, if not identical with, these can be induced by artificial means, usually by fixing the attention, in gazing intently into a "magic mirror" or "crystal," repeating formulæ, by incantations, fasting, drugs, or by an operator making what are termed magnetic passes. The interference of a second person is not essential, and perhaps without exception distorts the result. This admission by no means indorses the theories which have sprung fungus-like therefrom, of mesmerists, biologists, magnetists in an endless array, best known by their barbarous terminologies.

The trance or clairvoyant state has been observed in all ages and among all races of mankind—Chinese, Hindus, Turks, as well as Christians. It has in seasons of great religious excitement become epidemic, the devotee falling in convulsions, becoming cataleptic, and after hours, days, or even months of apparent death, awakening with mind overwrought with visions of the strange world in which it had dwelt during its apparent unconsciousness. The records of clairvoyance are as old as history. If prophecy, the "clear-seeing" of the future, be its fruit, the prophets and sages of the past were all more or less endowed with this gift. Socrates and Apollonius predicted and were conscious of events transpiring at remote distances. Cicero mentions that when the revelations are being given some one must be present to record them, as "these sleepers do not retain any recollection of them." Pliny, speaking of the celebrated Hermotinus of Clazomenæ, remarks that his soul separated itself from the body and wandered in various parts of the earth, relating events occurring in distant places. During the periods of inspiration his body was insensible. The day of the battle of Pharsalia, Cornelius, a priest of renowned piety, described, while in Padua, as though present, every particular of the fight. Nicephorus says that when the unfortunate Valens, taking refuge in a barn, was burned by the Goths, a hermit named Paul in a fit of ecstasy cried out to those who were with him, "It is now that Valens burns!" Tertullian describes two women celebrated for their piety and ecstasy; that they entered that state in the midst of the congregation, revealed celestial secrets, and knew the innermost hearts of persons. St. Justin affirms that the sibyls foretold events correctly, and quotes Plato as coinciding with him in that view. St. Athenagoras says of the faculty of prescience that "it is proper to the soul." Volumes might be readily filled with quotations like the foregoing, showing that clairvoyance has been manifested and received as a truth by profound thinkers in every age. Swedenborg, Zschokke, and Davis are not peculiarities of modern times, but are repetitions of Socrates, Apollonius, and countless other sages who deeply impressed their personality on their times.

Perhaps for purposes of investigation the artificially induced mesmeric state has advantages over the spontaneous, which presents itself at undeterminate times, although its spontaneous exhibition is more reliable in its results. Its natural manifestation requires a finely developed nervous system. It is not always, though at times it may appear to be, the result of disease. The more perfect the health the more reliable the results. The visions produced by disease, like those by drugs, bear to true clairvoyance the same relations that the dreams of indigestion do to those of refreshing sleep.

Clairvoyance must be regarded as a peculiar state of the mind, in which it is in a greater or lesser degree independent of the physical body. It presents many gradations from semi-consciousness to profound and death-like trance. However induced, the attending phenomena are similar. The condition of the physical body is that of deepest sleep. A flame may be applied to it without producing a quiver of the nerves; the most pungent substances have no effect on the nostrils; pins or needles thrust into the most sensitive parts give no pain; surgical operations can be made without sensation. Hearing, tasting, smelling, feeling, as well as seeing, are seemingly independent of the physical organs. The muscular system is either relaxed or rigid; the circulation impeded in cases until the pulse becomes imperceptible; and respiration leaves no stain on a mirror held over the nostrils.

In passing into the clairvoyant state the extremities become cold, the brain congested, the vital powers sink, a dreamy unconsciousness steals over the faculties. There is a sensation of sinking or floating. After a time the perceptions become intensified. We can not say the senses, for they are of the body, which for the time is insensible. The mind sees without physical organs of vision, hears without

organs of hearing, and feeling becomes a refined consciousness which brings it *en rapport* with the intelligence of the world. The more death-like the condition of the body the more lucid the perceptions of the spirit or mind, which for the time owes it no fealty. If, as there is every reason to believe, clairvoyance depends on the unfolding of the spirit's perceptions, then the extent of that unfolding marks its perfection. However great or small this may be, the state itself is the same, differing only in degree, whether observed in the Pythia of Delphic oracles, the vision of St. John, the trance of Mohammed, the epidemic catalepsy of religious revivals, or the illumination of Swedenborg or Davis. The disclosures made have also a general resemblance, but they are so colored with surrounding circumstances that they are extremely fallible. The tendency of the clairvoyant is to make objective the subjective ideas he has acquired by education—if a Christian, to see visions of Christ; if a Moslem, of Mohammed—somewhat as dreams reflect the ideas of wakefulness. Yet there is a profound condition which sets all these aside, and the mind appears divested of all physical trammels, and to come in direct contact with the thought-atmosphere of the world. Time and space have no existence, and matter becomes transparent.

If there is an independent spiritual existence after the death of the physical body, the clairvoyant in this independent stage closely approximates to that existence. It may be an open question whether the spirit leaves the body and actually visits the remote places it describes, or gains such knowledge by intensity of perception that annuls space, as it does time, in its retrospection and prevision. The many authentic instances of "double presence" which have been observed lead to the former conclusion.

Baron Reichenbach, in his *Dynamics*, has investigated the sensitiveness of the clairvoyant to refined emanations of force, and Denton, in his *Soul of Things*, has carried the investigation still further, though in a somewhat similar direction. The field is broad as the spirit of man, and its threshold has been scarcely crossed. Clairvoyance is no miraculous power, but an inherent faculty, a foregleam in this life of the next spiritual life. For if man exists as a spirit after the dissolution of the physical body, his present life is that of a spirit clad in flesh, and should manifest some of the characteristics of the next untrammeled condition.

HUDSON TUTTLE.

Clakama: See CHINOOKAN INDIANS.

Clam: a name variously applied, according to locality, to many bivalve mollusks of different genera. The common clam of the New England coast is *Mya arenaria*, a species ranging from South Carolina to the Arctic Ocean, and found on the northern coasts of Europe and Asia, as well as on the shores of Japan and Alaska. In the U. S. it is of considerable importance as an article of food, and it is extensively used for bait, while vast shell heaps along the New England coast testify to the extent to which it was for centuries eaten by the Indians. Very curiously it is not used for bait in Europe. The Little Neck clam of New York is *Venus mercenaria*, known in New England as the quahaug or hard clam. It derives its specific name from the fact that the Indians of the Eastern U. S. used the purple margin of the shell for making the dark wampum. The great clam of the northwest coast of America, *Lutraria maxima*, is a staple article of food for the coast tribes of Indians, who dry large numbers for winter's use, a practice pursued in earlier times by Eastern tribes with *Mya arenaria*. *Glycimeris generosa*, the giant clam of the U. S. Pacific coast, attains a weight of 5 or 6 lb., and resembles a *Mya* which has so outgrown its shell that the soft portion is not wholly covered. This species lives in moderately deep water, rarely occurring above extreme low-water mark. The term giant clam is also applied to *Tridacna gigas*, the largest of bivalves, whose shells attain a weight of 250 lb. each, and are sometimes used in Roman Catholic churches to contain the holy water. This huge mollusk is a native of East Indian seas. Its flesh is edible, and the natives of the Caroline islands use pieces of the shell for axes. The various species of fresh-water mussels, or *Unios*, are popularly termed fresh-water clams in the U. S.

F. A. LUCAS.

Clamato'res [plur., from Lat. *clama'tor*, one who cries out]: a division of *Insessores*, or perching birds, distinguished by the arrangement of the muscles of the lower larynx or syrinx. There is usually but one pair of intrinsic muscles, never so many as four pairs, and these are attached to the middle of the half rings of the bronchi, an arrangement termed mesomyodian. The group is named in contrast to the *Oscines*, or singing birds, which have a more complicated singing apparatus.

F. A. LUCAS.

Clan [Gaelic, *clann*, offspring, family, stock]: a body of kindred larger than a household and smaller than a tribe, and recognizing relationship in only one line of descent—i. e. either through the mother or through the father, but never through both. In English usage the word "clan" specifically means the kinship organization of the Scottish Highlanders. Corresponding terms in other languages are the Roman *gens*, the Greek *γένος*, the Arabic *hayy*, the Irish *sept*, and the North American Indian *otem* (*totem*). In ethnology it has become necessary to have a general name for the gentile organization wherever found, and by common consent the word "clan" has been adopted for this purpose.

The earliest type of the clan is the totem-kin, the best examples of which are found among the North American Indians. The group of kindred takes its name from some class of natural objects, usually a species of plant or of animal—e. g. the hawk, the turtle, or the bear—which is superstitiously regarded, and from which the group is supposed to be descended. Relationship is metronymic—i. e. it is traced only through mothers. A woman's sons and daughters and the sons and daughters of her daughters belong to her clan, but the children of her sons belong to the clans of their mothers. A later form of the clan is patronymic—i. e. relationship is traced only through fathers. Hebrew, Arabian, Grecian, Roman, German, and Celtic clans were patronymic in the earliest historical period, but there is much evidence to prove that originally they were metronymic.

A clan is essentially a juristic organization. Its members are under obligation to avenge one another's injuries. They have common rights and duties, among which marital rights and obligations are of the first importance. A man may not marry his clanswoman. Therefore no clan is self-perpetuating, and a tribe accordingly comprises two or more clans whose members intermarry. A clan usually has a judicial officer and a chief or military officer. See SOCIOLOGY, TOTEMISM, and TRIBE.

FRANKLIN H. GIDDINGS.

Clanric'arde, MARQUESSES OF (1825): Barons Dunkellin (1543), Viscounts Burke (1629, Ireland), Barons Somerhill (United Kingdom, 1826).—ULICK JOHN DE BURGH, first marquess, K. P., P. C.; b. Dec. 28, 1802; ambassador to St. Petersburg 1835–40; Postmaster-General 1846–52; Lord Privy Seal 1857–58; succeeded his father, John Thomas, thirteenth earl, as Earl of Clanricarde July 27, 1808; d. 1874; succeeded by HUBERT DE BURGH CANNING, b. in 1832.

Clap, THOMAS, A. M.: Congregational divine; b. at Scituate, Mass., June 26, 1703; graduated at Harvard in 1722; pastor in Windham, Conn., 1725–40. He was installed president of Yale College in 1740 and held the office until 1766. His administration was disturbed by his controversies over the preaching of Whitfield and Edwards, but the college was improved in its charter, library, and buildings, through his exertions. He was an eminent natural philosopher and astronomer, and constructed the first planetarium made in America. He published *The Nature and Foundation of Moral Virtue and Obligation* (New Haven, Conn., 1765); a *History of Yale College* (1766); *Nature and Motion of Meteors* (1781); and other works. D. in New Haven, Conn., Jan. 7, 1767.

Clap'perton, HUGH: captain; traveler and explorer of Africa; b. at Annan, Dumfriesshire, Scotland, in 1788; entered the British navy as a lad and rose to be a lieutenant. In 1823 he accompanied Dr. Oudney and Denham in an expedition to Lake Chad. Having returned to England in 1825, he soon renewed the enterprise, with the naval rank of commander, in company with Richard Lander and others. His chief object was to discover the course of the Niger. He entered Africa at the Bight of Benin and penetrated to Sokoto, where he was detained nearly a year by the sultan. He died near that place Apr. 13, 1827. See R. Lander, *Records of Captain Clapperton's Last Expedition* (1830).

Claque [Fr., clap of the hand; also the body of *claqueurs*]: in French theatrical language, an organized body of men posted among the audience to applaud the actors. At all times such hired applause has been used; it is on record as having existed under the Roman empire, but the modern institution in Paris dates from the beginning of the nineteenth century, and was completely organized before 1830. The leader of the band (*chef de claque*) is paid either by the director of the theater or by an actor, or both, and his business

is to select those parts of the play which will best allow of warm applause, and to start it at the right moment. The use of the *claque* is defended by some persons of good reputation as a means of supporting and encouraging the performers at difficult times and so helping them to do their best.

Clarac, Charles Othon Frédéric Jean Baptiste, de French antiquary and artist; b. in Paris in 1777: in 1808 became tutor of the children of Murat, King of Naples, and had charge of the excavations at Pompeii. After visiting Brazil, where he made some fine sketches of tropical vegetation, he was in 1818 made curator of the Museum of Antiquities in the Louvre. Author of *Fouilles faites à Pompéi* (1818): *Musée de Sculpture* (6 vols., 1826–55). D. in 1847.

Clare: a maritime county of Ireland, in Munster; bounded N. W. by Galway Bay, E. and S. by the Shannon river, and W. by the Atlantic Ocean. Area, 1,294 sq. miles. The surface is mostly hilly; the soil of the valleys is fertile. This county contains many small lakes. The principal rock is carboniferous limestone. Coal, copper, lead, and marble are found here. The staple products of the soil are oats, potatoes, wheat, and barley. There are many cromlechs, abbey ruins, and round towers in the county. Capital, Ennis. Pop. (1891) 123,859.

Clare, John: "The Lincolnshire Plowman"; a self-educated English poet: b. at Helpstone, near Peterborough, July 19, 1793. He was a common laborer; was discharged for scribbling; inspired by Thomson's *Seasons*, wrote and published in 1821 two volumes of pastoral verse, which attracted much praise—*Poems Descriptive of Rural Life* and *The Village Minstrel*. His *Rural Muse* (1835), praised by Christopher North, is perhaps his best work. Died in great poverty in the lunatic asylum of Northampton, May 20, 1864. See J. L. Cherry, *Life and Remains of John Clare* (1873).

Clare, or **Clara**, Saint: a noble maiden of Assisi; b. in 1193; d. Aug. 11, 1253; canonized in 1255; festival Aug. 12. Enamored with "the sweetness of Christ," she fled to St. Francis and took refuge near his Portiuncula, refusing to return. Her three sisters followed her with other gentlewomen, and in 1212 the Nuns of St. Clare were organized as the first order of Franciscan nuns. It spread rapidly through Italy, and into France, Spain, Germany, and Bohemia. In 1220 a rule of strictest sort was given them by Cardinal Hugolin; in 1224 St. Francis wrote them a relaxed rule; Urban IV. about 1263 gave them a still milder observance. The convents separated on these rules, some adhering to the severe Hugolin requirements, others to those of St. Francis, but the most of them following the rule of Urban. The Capuchin reformation in the Franciscan order led many of the sisters, under the guidance of Peter of Alcantara, to establish the "Poor Clares of the Strictest Observance," who vow perpetual silence. The order is known also as "The Poor Clares," and their convents are for the most part occupied with the education of girls.

C. H. Thurber.

Claremont: town, on railroad; Sullivan co., N. H. (for location of county, see map of New Hampshire, ref. 8–D); about 48 miles W. by N. from Concord. It has manufactures of cotton and wool. Claremont junction is 2 miles farther W. Claremont township is bounded on the W. by the Connecticut river. It has paper-mills, a furnace, a water-wheel manufactory, a high school, and a library of 4,000 volumes. Pop. of township (1880) 4,704; (1890) 5,565; (1900) 6,498.

Clarence, Duke of: a name sometimes given to the younger princes of the royal house of England. The title was derived from Clare or Clarence (Lat. *Clarentia*) in Suffolk. Some authorities, however, say it was derived from Clarenza in the Morea, of which an English knight was duke during the crusades. The title was last conferred on Albert Victor, eldest son of Albert Edward, Prince of Wales. He was b. Jan. 8, 1864: educated at Trinity College, Cambridge, and Heidelberg: was engaged to Princess Victoria Mary of Teck, a remote cousin. Died at Sandringham, Jan. 14, 1892, on the eve of his marriage.

Clarencieux, or **Clarenceux**: one of the kings of arms in the English heraldic college. (See Heraldry.) The jurisdiction of this king of arms includes England S. of the river Trent. The title or name *Clarencieux* is supposed to be derived from the dukedom of Clarence during the reign of Edward IV., being a French form derived from the Latin Clarentius. *The arms of Clarencieux are Argent, the Cross of St. George, on a chief gules, a lion of England crowned, or*: that is to say, an escutcheon, of which the top part is red and the rest is silver, with the gold lion of England on the red and a red cross on the silver. The official residence of Clarencieux, as of the other kings of arms, is the Herald College in Queen Victoria Street, in the City of London.

Clarendon: town: capital of Monroe co., Ark. (for location of county, see map of Arkansas, ref. 3–E); on Ark. Mid. and St. Louis S. W. R. Rs., and on White river: 60 miles E. of Little Rock: has mills, cotton-gin, and wagon-factory. Pop. (1880) 400; (1890) 1,060; (1900) 1,840.

Clarendon: Rutland co., Vt. (for location of county, see map of Vermont, ref. 7–B); on Benn. and Rut. R. R.; 6 miles S. of Rutland. Clarendon has mineral springs, which are visited for the cure of kidney and skin diseases, etc. Pop. of township (1880) 1,105; (1890) 928; (1900) 915.

Clarendon, Edward Hyde, First Earl of: statesman and historian; b. at Dinton, Wiltshire, England, Feb. 18, 1609 (N. S.). He was educated at Oxford, but coming into the family estates he did not proceed to a degree, but studied law at the Middle Temple, London, under his uncle, Nicholas Hyde, who became chief justice. He was a member of the Long Parliament, which met in 1640, and he acted at first with the popular party, but the next year he became an adviser of the king, writing his ablest appeals to the country: but Charles I. concealed facts from him, and arrested members of Parliament without his knowledge. When the civil war broke out in 1642 he followed the wanderings of the court. In 1643 he was appointed Chancellor of the Exchequer and privy councilor. He accompanied Charles, Prince of Wales, to Scilly and Jersey in 1645–46, and then commenced his history. He represented Charles II. at Madrid for sixteen months from Nov., 1649, but could obtain no assistance. Then, in extreme poverty, he formed one of the petty, impotent court of Charles II. in exile, bearing the lofty title of High Chancellor. It was during this period that his daughter contracted a marriage engagement with the Duke of York which was fulfilled in Aug., 1660, the father seeming to be ignorant of it, and very indignant on learning of it. The marriage brought great suspicion of interested motives and obloquy on Clarendon, contributing not a little to his downfall. On the Restoration in 1660 Hyde became Prime Minister and Lord Chancellor of England, and in 1661 he was created Earl of Clarendon. He opposed popery, and was more moderate than many of the royalists, his policy being simply a reaction toward the legal conditions existing before the civil war. In Aug., 1667, he was removed from office and impeached by the House of Commons, and at the request of the king he took refuge in Montpellier, France. In 1673 he removed to Rouen, and abjectly begged permission to die in England; but his suit was denied, and there he died Dec. 9, 1674. He left a *History of the Rebellion in England* (1707); a *History of the Civil War in Ireland* (1721); an autobiography and other works. These have the merit of stately style, but are prejudiced and unreliable as history. A complete edition, with annotations by Bishop Warburton, was published at Oxford in 1826, but the latest edition is from the Clarendon Press (6 vols., Oxford, 1889). See *Life of Edward, Earl of Clarendon*, by himself (1759); T. H. Lister, *Life of Lord Clarendon* (3 vols., 1838).

Revised by C. K. Adams.

Clarendon, George William Frederick Villiers, Fourth Earl (of the Villiers family): b. Jan. 12, 1800; was the eldest son of the Hon. George Villiers, who was a son of the Hon. Thomas, Earl of Clarendon, and also a descendant of the first earl through the female line. He was sent as ambassador to Madrid in 1833, and succeeded to the earldom, in 1838, on the death of his uncle, John Charles, the third earl. In Spain he was influential in upholding Espartero's policy of constitutional government. In 1840 he became Lord Privy Seal in the Whig ministry, which he resigned in 1841. He was president of the Board of Trade in the new ministry formed by Lord John Russell in 1846, and was appointed Lord-Lieutenant of Ireland in 1847. He exhibited moderation, tact, and energy in the government of that island, which was then much agitated. Having been recalled in 1852, he entered the ministry of Lord Aberdeen in Jan., 1853, as Secretary of Foreign Affairs. He retained this office in the cabinet of Lord Palmerston, who became Premier early in 1855, and acquired a high reputation as a diplomatist. The French alliance and the success

of the Crimean war were indeed the results of his diplomatic skill. The Emperor Nicholas I. calculated that the alliance between France and England would not last three months, but it lasted three years; and at the Congress of Paris, 1856, Lord Clarendon's ideas succeeded. He resigned with his colleagues in 1858, but again became Secretary of Foreign Affairs in Nov., 1865. The Liberal ministers resigned in consequence of the defeat of the Reform bill in June, 1866. Lord Clarendon was appointed Secretary of Foreign Affairs by Mr. Gladstone in Dec., 1868. D. June 27, 1870.

Clarendon, Constitutions of: certain laws made by a general council (or parliament) of the English barons and prelates at Clarendon, in Wiltshire, in 1164, whereby King Henry II. checked the power of the Church, and narrowed the exemption which the clergy had claimed from secular jurisdiction. These ordinances, sixteen in number, defined the limits of the patronage and jurisdiction of the pope, and provided that the crown should be entitled to the election to vacant dignities in the Church. But the most characteristic of all the stipulations—that one which most pointedly indicated the new idea of the relation between State and Church which was dawning upon men's minds—was that concerning the exemption of the clergy from the secular jurisdiction. It was agreed that in criminal cases the clergy should be amenable to the common courts. Heretofore the clergy were judged and punished by ecclesiastical tribunals even for crimes in civil life. As those tribunals could not inflict death, the result was unpunished and therefore increased crime among the clergy. The Constitutions were unanimously adopted, and Becket, the primate, reluctantly signed them. But they were at once rejected by Pope Alexander III. when sent to him for ratification, not so much that they sought to bring guilty clerics to deserved chastisement, as that they infringed on acknowledged rights of the Church in the collation of benefices and dignities, and Becket thereupon retracted his consent, and imposed upon himself the severest penances. This, and the other measures adopted by the archbishop to vindicate the independence of the clergy, led to disputes between him and the monarch. (See Becket.) Notwithstanding the humiliation to which the king submitted after Becket's death, most of the provisions of the Constitutions of Clarendon continued permanent. See Stubbs's *Constitutional History*, and for text his *Select Charters*; cf. Schaff, *St. Thomas of Canterbury* in *Papers of American Society Church History* for 1892, pp. 16, *sqq.* Revised by J. J. Keane.

Clarendon Press: a celebrated printing and publishing establishment connected with Oxford University, England. It was founded in 1672, and took its name from the fact that the printing-house erected in 1711 was built from the profits arising from the sale of Clarendon's *History of the Rebellion*, of which work the university has a perpetual copyright.

Claret [O. Fr. *claret*, dimin. *clair*, clear, bright < Lat. *clarus*]: a name given in Great Britain and the U. S. to red French wines produced near Bordeaux (Fr. *vin de Bordeaux*). The French *clairet* signifies "pale wine."

Claretie, klăăr'tee', Arsène Arnaud, called Jules: French *littérateur*; b. in Limoges, Dec. 3, 1840. He has written an enormous quantity of books—novels, plays, criticisms, historical essays, etc. His *Pierrille* (1863) obtained the praise of George Sand, and his *Mlle. Cachemire* (1865) and *Un Assassin* (1866) raised for him favorable expectations in the public mind. His *Derniers Montagnards: histoire de l'insurrection de prairial, an III.* [1795] obtained Michelet's approval in 1867. A longer historical work is *Histoire de la Révolution de 1870–71* (2d ed., 5 vols., 1875–76). He has contributed biographies of Victor Hugo, Émile Augier, A. Dumas fils, Alphonse Daudet, Victorien Sardou, François Coppée, and several others to the series entitled *Célébrités contemporaines*. Since Oct. 20, 1885, he has been general administrator of the Comédie-Française.

A. R. Marsh.

Clarification: See Fining.

Clarinda: city; capital of Page co., Ia. (for location of county, see map of Iowa, ref. 7–E); on the Nodaway river; 62 miles S. E. of Council Bluffs. It has an asylum for the insane, and stock-raising and agricultural industries. Pop. (1880) 2,011; (1890) 3,262; (1900) 3,276.

Clarinet, or **Clarionet** (Fr. *clarinette*): a musical instrument, said to have been invented by Johann Denner, of Nuremberg, in 1690. It consists of a cylindrical tube, terminating in a bell, with eighteen holes in the side, half capable of being closed by the fingers and half by keys. The mouthpiece, which is provided with a single reed, is a conical stopper flattened on one side to form a table for the reed. The sounds of the instrument depend upon the vibration of the reed against the table. The fundamental scale consists of nineteen semitones, of which eighteen are produced by removing the fingers from the holes and lifting the keys, the lowest note being emitted through the bell. As one clarinet can not be played in more than one key, it is usual for the performer to have in reserve two other instruments in different keys.

Clarion, or **Clarin**: a small high-pitched trumpet, chiefly referred to in poetry; also the name of an organ-stop of the reed species, usually sounding *an octave higher* than the trumpet. It was formerly used as a bearing in heraldry.

Clarion: borough (incorporated Apr. 6, 1841); capital of Clarion co., Pa. (for location of county, see map of Pennsylvania, ref. 3–C); on Pittsb. and West. R. R., and on Clarion river; about 75 miles N. N. E. of Pittsburg. Here are churches of six denominations, large and excellent public schools, and the Clarion State Normal School. The borough is situated in a farming, lumbering, mining, and oil-producing region. Pop. (1880) 1,169; (1890) 2,164; (1900) 2,004.

Editor of "Democrat."

Clarion River: of Pennsylvania; rises in McKean County; flows nearly S. W. through Elk and Clarion Counties, and enters Alleghany river. Entire length about 130 miles.

Clark, Abraham: signer of the Declaration of Independence; b. at Elizabethtown, N. J., Feb. 15, 1726; became an attorney and surveyor; high sheriff of Essex County; member of the New Jersey committee of public safety; was chosen a delegate to the Continental Congress of 1776, and signed the declaration. He was re-elected six times to the Continental and twice to the Constitutional Congresses; member of the constitutional convention of 1787; very dominant in the New Jersey Legislature 1782–87. D. from sunstroke in Rahway, N. J., Sept. 15, 1794.

Clark, Alexander, D. D.: b. in Jefferson co., O., Mar. 10, 1834; educated in the common schools and by his father, a classical scholar. At the age of seventeen he became a teacher, and while so occupied started the *Schoolday Visitor*, which was afterward consolidated with *St. Nicholas*. In 1861 he was ordained a minister in the Protestant Methodist Church. He preached in Philadelphia and Cincinnati, and went to Pittsburg as pastor of the First Protestant Methodist church in 1866. In 1870 he was elected editor of the official papers of his denomination—the *Methodist Recorder* and *Our Morning Guide*—which position he held at the time of his death. He had a high reputation as an author, editor, and poet. Among his works are the *Old Log Schoolhouse* and *Workaday Christianity*. D. in Georgia, July 7, 1879.

Clark, Alonzo, M. D., LL. D.: physician; b. in Chester, Mass., Mar. 1, 1807; graduated A. B. at Williams College 1828; took degree of M. D. in College of Physicians and Surgeons of New York in 1835; was for a time Professor of Pathology and Materia Medica in the Vermont Medical College at Burlington; Professor of Physiology and Pathology in the New York College of Physicians and Surgeons from 1848 to 1855; chair changed to pathology and practical medicine in the same institution 1855–85; and dean of the faculty 1875–85. He was appointed physician to Bellevue and St. Luke's Hospitals, New York. In 1853 he was elected president of the New York State Medical Society. He published valuable professional papers. D. in New York city, Sept. 13, 1887.

Clark, Alvan, A. M.: b. in Ashfield, Mass., Mar. 8, 1804; an ingenious farmer's boy; became in youth an engraver for calico print-works at Lowell, Mass. He possessed native skill in portrait-painting, an art which he practiced with great success, but when over forty years his son George made a small reflecting telescope in which he became interested, and soon after he gave up his studio and engaged in the manufacture of astronomical instruments with his sons at Cambridgeport. He was the first American who successfully made large achromatic lenses. In this department and in the field of astronomical observation he won great fame at home and abroad. He invented a valuable double eyepiece for measuring small arcs, and made discoveries with

instruments of his own manufacture. D. in Cambridge, Mass., Aug. 19, 1887. See TELESCOPE.

Clark, ALVAN GRAHAM: astronomer; son of Alvan; b. in Fall River, Mass., July 10, 1832: partner with his father; received a Russian medal for the 30-inch refractor in the St. Petersburg Observatory; went with the solar eclipse expeditions of 1870 to Spain and of 1878 to Wyoming; resolved difficult double stars, receiving from the French Academy of Sciences the Lalande gold medal in 1862 for resolving the companion star of Sirius. D. June 9, 1897.

Clark, Sir ANDREW, M. D., F. R. S., LL. D.: physician; b. in Aberdeen, Scotland, Oct. 28, 1826; educated at Aberdeen and Edinburgh; settled as a physician in London; member of the Royal College of Physicians 1858, of which he became president 1888–90; created baronet 1883. D. in London, Nov. 6, 1893. He was the author of *On the Anatomy of the Lungs*; *On Tubercular Sputum*; *The Theory of Asthma*; *Renal Inadequacy*, etc.

Clark, CHARLES EDGAR: See the Appendix.

Clark, DANIEL: Canadian physician; b. at Granton, Inverness-shire, Scotland, Aug. 29, 1836; in 1841 arrived in Canada with his parents. He graduated M. D. at Victoria College in 1858; afterward took a course at Edinburgh University, and in 1864 became attached to the surgeon-general's department U. S. army. In 1875 he became superintendent of the Asylum for the Insane at Toronto, an office which he now holds; in 1891, at Washington, D. C., was elected president of the Association of Medical Superintendents of the American Institutions for the Insane; and is Professor of Psychology and Mental Diseases in Toronto University. He has published *Pen Photographs* (Toronto, 1873), and *John Garth*, a novel. NEIL MACDONALD.

Clark, DAVIS WASGATT, D. D.: bishop of the Methodist Episcopal Church; b. on the island of Mt. Desert, Me., Feb. 12, 1812; graduated at Wesleyan University in 1836; became distinguished as a preacher, editor, and author; was elected editor of the *Ladies' Repository* in 1852, which position he held twelve years. Became a bishop in 1864. He published an *Algebra* (New York, 1843); *Mental Discipline* (1848); *Man all Immortal* (Cincinnati, O., 1864); and other works. D. in Cincinnati, O., May 23, 1871.

Clark, EDWIN CHARLES: See the Appendix.

Clark, FRANCIS EDWARD, D. D.: founder of the Christian Endeavor Society; b. at Aylmer, Quebec, Sept. 12, 1851; studied at Kimball Union Academy; graduated from Dartmouth 1873; took the course of theology at Andover Theological Seminary; installed as pastor of the Williston Congregational church, Portland, Me., Oct. 19, 1876. Here he organized the first society of Christian Endeavor among the young people of his church Feb. 2, 1881 (see CHRISTIAN ENDEAVOR); accepted a call to the Phillips Congregational church of South Boston 1883; resigned the pastorate 1887 to accept the presidency of the United Society of Christian Endeavor and editorship of the *Golden Rule*, the official organ of the society. Dr. Clark resides at Auburndale, Mass. His wife, HARRIET E. ABBOTT, is also well known for her writings and efforts in the Christian Endeavor movement. C. H. THURBER.

Clark, GEORGE ROGERS: frontiersman; b. near Monticello, Albemarle co., Va., Nov. 19, 1752; d. near Louisville, Ky., Feb. 18, 1818; learned surveying, and at twenty years of age removed to the upper Ohio valley; in 1774 served against the Shawnees; in 1775 settled in Kentucky, then beginning to be disturbed by Indian raids instigated by the British. In 1776 he procured the organization of Kentucky as a county of Virginia, was appointed major of militia, and conveyed ammunition to Harrodsburg just in time to repel an Indian foray upon that post. In 1777 he projected a scheme for the conquest of Illinois, established a post at Corn island, opposite Louisville, surprised and took Kaskaskia and the neighboring French villages; marched on Vincennes and compelled the British commander, Hamilton, to capitulate in 1779; built Fort Jefferson, near the mouth of the Ohio; relieved Cahokia from an attack of British and Indians in 1780; invaded the Shawnee country and burned their villages; went to Virginia to arrange a campaign against Detroit, and while there ambuscaded a detachment of Benedict Arnold's invading army; defended the settlements around Louisville against Brant and his allies; in 1782 destroyed the Indian villages in the Big Miami valley. His operations were influential in preserving the country N. of the Ohio to the U. S. in the peace of 1783. Afterward Clark maintained the cause of the French against the Spanish in the Mississippi valley, but his fighting days were over. Neglected by his country, he passed his latter years in penury on Corn island. Died at the home of his sister. (See *Campaign in the Illinois, 1778–79*, Cincinnati, 1869.)—WILLIAM CLARK, his brother, the military commander of the Lewis and Clark expedition to Oregon, was b. in Virginia, Aug. 1, 1770; d. in St. Louis, Mo., Sept. 1, 1838. At fourteen he settled near Louisville; entered the army; removed in 1804 to St. Louis; commissioned by President Jefferson to join Lewis on his expedition to the mouth of the Columbia river; was Indian agent and brigadier-general for Upper Louisiana; Governor of Missouri 1813–21; superintendent of Indian affairs at St. Louis until his death.
C. H. THURBER.

Clark, GEORGE WHITEFIELD, D. D.: Baptist clergyman; b. at South Orange, N. J., Feb. 15, 1831; graduated at Amherst College in 1853, and at Rochester Theological Seminary in 1855; ordained Oct. 31, 1855, and became pastor of the Baptist church at New Market, N. J. In 1859 he accepted the pastorate of the First Baptist church at Elizabeth, N. J.; about 1868 became pastor at Ballston Spa, N. Y.; in 1873 at Somerville, N. J.; retired on account of health 1877; since 1880 has been doing literary work for the American Baptist Publication Society. In 1870, in New York, he published his *New Harmony of the Four Gospels*, and his *Notes on Matthew* in 1872; *Notes on Mark* (1876); *Notes on the Gospels of Luke and John* (1879); *Harmonic Arrangement of the Acts* (1884).

Clark, HENRY JAMES: naturalist; b. in Easton, Mass., June 22, 1826; graduated at the University of New York 1848; became a pupil of Asa Gray at the Cambridge botanical garden; graduated at the Lawrence Scientific School at Harvard 1854; assistant to Louis Agassiz till 1863, and also for three years adjunct Professor of Zoölogy at the Lawrence Scientific School; Professor of Natural Sciences in Pennsylvania State College, near Bellefonte, 1866–69; Professor of Natural History in University of Kentucky, Lexington, 1869–72; Professor of Veterinary Science in Massachusetts Agricultural College, Amherst, from 1872 until his death there July 1, 1873. He contributed to the Smithsonian publications, to the *Proceedings* of the American Academy of Sciences and Arts, and to other learned periodicals. Author of *Mind in Nature* (Cambridge, 1863) and of the *Mode of Development of Animals* (New York, 1865). See A. S. Packard, Jr.'s *Memoir* in *Biographical Memoirs of the National Academy of Sciences* (Washington, 1877).

Clark, Sir JAMES, Bart., K. C. B., F. R. S.: physician; b. at Cullen, Scotland, Dec. 14, 1788; studied medicine at Edinburgh. About 1826, after six years of practice in Rome, he settled in London, where he attained eminence as a physician. In 1829 he published an able work *On the Sanative Influence of Climate*. He was appointed physician in ordinary to Queen Victoria in 1837, and the next year made a baronet. His *Treatise on Pulmonary Consumption* (1835) is highly esteemed. D. June 29, 1870.

Clark, LABAN, D. D.: Methodist Episcopal minister; b. at Haverhill, N. H., July 19, 1778; began to preach in 1800. He was one of the founders of the Methodist Missionary Society and of the Wesleyan University at Middletown, Conn. (1831), and was for many years an able and influential preacher. D. in Middletown, Conn., Nov. 28, 1868.

Clark, LATIMER, C. E., F. R. S.: electrical engineer; b. at Great Marlow, Bucks, England, Mar. 10, 1822; commenced railway surveying 1847, and published a *Description of the Britannia and Conway Tubular Bridges*, on which he was engaged under his brother Edwin; entered the service of the Electric Telegraph Company 1850; undertook a long series of researches on the subject of underground telegraph wires 1853; announced the disturbance of the magnetic needles during the display of the aurora borealis 1857; became engineer to the Atlantic Cable Telegraph Company 1859; member of the Government committee to investigate the subject of submarine telegraph cables 1860; wrote on *Standards of Electric Measurements*, suggesting the now current names for electric units in 1861, and again in 1868 a work translated into French, Italian, and Spanish; superintended the submergence of some 50,000 miles of cable in all parts of the globe; originated "Clark's Standard Cell" as a standard of electro-motive force in 1873.
C. H. THURBER.

Clark, Lewis Gaylord: writer: b. at Otisco, Onondaga co., N. Y., in 1810. He was for many years editor of the *Knickerbocker Magazine*, about which gathered Irving, Bryant, Longfellow, and all the prominent literary men of the time. It was the precursor of the modern popular magazine. In 1859 this periodical ceased, and Clark found employment in the custom-house. His friends bought a residence for him at Piermont-on-the-Hudson, and there he died, Nov. 3, 1873. His only publications were the *Knickerbocker Skelch-book* (1850) and *Knick-Knacks* (1852). He was twin brother to Willis Gaylord Clark (*q. v.*).

Revised by C. H. Thurber.

Clark, Nathaniel George, D. D., LL. D.: Congregationalist; b. at Calais, Vt., Jan. 18, 1825; graduated at the University of Vermont 1845, and at Auburn Theological Seminary 1852; became a professor in the latter institution in 1853, and in Union College, New York, in 1863; and one of the secretaries of the American Board of Commissioners for Foreign Missions from 1865 to Oct., 1894. D. at West Roxbury, Mass., Jan. 3, 1896. His writings consisted chiefly of articles and reports relating to missionary subjects.

Clark, Thomas March, D. D., LL. D.: Protestant Episcopal Bishop of Rhode Island; b. at Newburyport, Mass., July 4, 1812; graduated at Yale in 1831, and at Princeton Seminary in 1835; received holy orders in 1836; held rectorships in Boston, Philadelphia, and Hartford; consecrated bishop in 1854. He was an efficient member of the Sanitary Commission, and a frequent contributor to popular literary periodicals. He was long the Episcopal leader of the Broad Church school in his Church. Besides his *Formation of Character* (1852) and *Primary Truths of Religion* (1869), he has published devotional books. Three of his brothers, Rufus Wheelwright (1813–86), George Henry (b. 1819), and Samuel Adams (1822–75), became prominent clergymen, and Rufus wrote many religious books.

Clark, Rev. William: See the Appendix.

Clark, William George: English man of letters; b. in Mar., 1821; educated at Trinity College, Cambridge; ordained in 1853, but resigned his orders in 1869, giving his reasons in the pamphlet, *The Present Dangers of the Church of England*; edited the first series of *Cambridge Essays* (1855); George Brinley's *Essays* (1858); and, in collaboration with others, the *Cambridge Shakespeare* (9 vols., 1863–66). In 1872 he published *Lectures on the Middle Ages and the Revival of Learning*. D. at York, Nov. 6, 1878.

C. H. Thurber.

Clark, Willis Gaylord: poet; b. at Otisco, N. Y., in 1810; was twin-brother of Lewis Gaylord Clark (*q. v.*). He wrote for the *Knickerbocker Magazine* a series of amusing articles called *Ollapodiana*. Among his poems is *The Spirit of Life* (1833). In the latter part of his life he was the chief editor of the *Philadelphia Gazette*. D. in Philadelphia, Pa., June 12, 1841. His *Literary Remains* were published in 1844, and a reissue of his collected poems in 1847.

Revised by H. A. Beers.

Clarke, Adam, LL. D.: Wesleyan divine and commentator; b. at Moybeg, Londonderry, Ireland, about 1762. He was educated at Wesley's Kingswood School, near Bristol; sent out by Wesley as an itinerant preacher in 1782; was president of the Wesleyan Conference in 1806, 1814, 1822; became eminent for his Oriental and biblical learning; held Arian views of Christ; published a *Bibliographical Dictionary* (6 vols. 12mo, 1802); *Bibliographical Miscellany* (2 vols., 1806); *Succession of Sacred Literature* (1807); *Commentary on the Bible* (1810–25, 8 vols; several later editions and reprints, e. g. New York, 1837, 6 vols.; New Testament portion condensed by Daniel Curry, 1883–84, 2 vols.; 2d vol. 1832); *Rymer's Fœdera* (1819); *Wesley Family*; sermons and miscellaneous works (13 vols. 8vo., 1836–37). Died of cholera at Bayswater, Middlesex, Aug. 26, 1832. See his autobiography and memoir (1833, 3 vols.); and *Life* by J. W. Etheridge (London, 1858; New York, 1859).

Revised by S. M. Jackson.

Clarke, Andrew, Sir: lieutenant-general in British army; b. at Southsea, England, in 1824; educated at Woolwich Military Academy; entered the corps of Royal Engineers June 19, 1844, in which he became a captain in 1854, lieutenant-colonel in 1867, full colonel in 1872, major-general in 1883, lieutenant-general in 1886; was acting secretary of the British Government in Van Diemen's Land 1851–52, and surveyor-general and chief commissioner of crown lands in Victoria 1853–58. In 1856 he became an executive councilor and member of the first cabinet in the latter colony. For his services in inaugurating the new governments in the young colonies, and for his sagacious administration during the excitement which followed the discovery of gold, he was created a Knight Commander of St. Michael and St. George. In 1863 he made an inspection of the African west coast colonies. In 1864 he was appointed director of the works of the navy under the Admiralty, and as such designed and executed the great docks at Malta and Bermuda, also the extensive new works at Portsmouth and the extension of the principal dockyards. For these services he was created a C. B. in 1869. In 1873 he was appointed governor of the Straits Settlements, including Penang, Singapore, and Malacca. In 1875 he relinquished this office, and became Minister of Public Works and member of the council of the governor-general in India. He was commandant of the Chatham School of Military Engineering 1881–82. In the latter year he went to Cairo to reconstruct its sanitary arrangements.

Clarke, Charles Cowden: author: the husband of Mary Cowden Clarke (*q. v.*); b. at Enfield, Middlesex, Dec. 15, 1787; became a bookseller in London in 1820; delivered lectures on dramatists and poets 1834–54. Among those published are *Shakespeare Characters* (1863) and *Molière Characters* (1865). Husband and wife jointly produced an annotated edition of Shakespeare's works (1869), now known as *Cassell's Illustrated Shakespeare*; the *Shakespeare Key* (1879); and *Recollections of Writers* (1878). D. at Genoa, Mar. 13, 1877. See his *Biography* by his wife (1887).

Clarke, Sir Edward George: See the Appendix.

Clarke, Frank Wigglesworth: chemist; b. in Boston, Mass., Mar. 19, 1847; graduated at the Lawrence Scientific School of Harvard in 1867, and was assistant in Chemistry at Cornell for a year. In 1873–74 he was Professor of Chemistry and Physics at Howard University, Washington, D. C., and in 1874 was called to the University of Cincinnati, where he remained until 1883. He then resigned to become chief chemist to the U. S. Geological Survey. He has published many articles on chemistry and allied subjects. His most important work is the *Constants of Nature*, in five 8vo pamphlets. Of late he has been engaged in work on the constitution of the natural silicates, and has contributed to the journals a number of valuable articles on this subject.

I. R.

Clarke, Hugh Archibald: Professor of Music in the University of Pennsylvania: b. in Toronto, Canada, Aug. 15, 1839; studied first under his father there and in the Canada University. In 1875 was appointed Professor of Music in the University of Pennsylvania, from which, in 1866, he had received the degree of Mus. Doc. Has been organist of several churches and leader of some societies in Philadelphia. His compositions include *Jerusalem*, an oratorio; overture and choruses to Aristophanes's *Acharnians*; a treatise on *Harmony*, instruction books for the pianoforte and organ, and songs and pianoforte pieces.

D. E. Hervey.

Clarke, Hyde: See the Appendix.

Clarke, James Freeman, D. D.: Unitarian preacher, editor, and author; b. in Hanover, N. H., Apr. 4, 1810; was settled in Louisville, Ky., 1833–40; was pastor of the Church of the Disciples in Boston, Mass. (organized especially for him), from 1841 until his death. Besides other works, he published *Service-book and Hymn-book for the Church of the Disciples* (Boston, 1844–56); *Christian Doctrine of Prayer* (1854); *The Hour which Cometh* (1864); *Orthodoxy: its Truths and Errors* (1866); *Steps of Belief* (1870); *Ten Great Religions* (1871; vol. ii. 1883); *Self-culture* (1880); *Events and Epochs in Religious History* (1881); *Anti-Slavery Days* (1884); *The Ideas of the Apostle Paul* (1884). D. in Boston, June 8, 1888. His *Autobiography* (which extends only to 1840), *Diary, and Correspondence*, edited by Dr. Edward Everett Hale, appeared in Boston (1891).

J. W. Chadwick.

Clarke, John: physician and preacher and one of the founders of Rhode Island; b. in Suffolk, England, Oct. 8, 1609. He was educated as a physician and practiced in London; joined the Puritans and emigrated to Massachusetts, landing at Boston Nov., 1637, but was driven to Rhode Island in 1638, and in the same year founded the first Baptist church at Newport. This church claims to be older than the first church at Providence, and therefore the first of that faith in the New World. Clarke visited England in company with Roger Williams (1651), and in 1663 ob-

tained from Charles II. the charter which secured civil and religious liberty to Rhode Island. He did not return till 1664, as he acted as agent of the colony in England. Callender, in his history of that State, classes Clarke with the ablest projectors and legislators of that commonwealth. While he was pastor at Newport he preached once at Lynn, Mass., for which he was imprisoned and fined £20, under the act of Nov. 15, 1644. D. in Newport, R. I., Apr. 26, 1676. Cf. Callender, *Historical Discourse*, in vol. iv. *Collections of Rhode Island Historical Society*.

Clarke, John Sleeper: comedian; b. in Baltimore, Md., in 1835. He first appeared as Frank Hardy in *Paul Pry*, at the Howard Athenæum in Boston in 1851, played at the Chestnut Street theater, Philadelphia, Aug. 28, 1852; became leading comedian and in 1858 joint lessee of the Arch Street theater. In 1865 he purchased, with his brother-in-law, Edwin Booth, the Walnut Street theater, Philadelphia. He went to London in 1867, and at the St. James theater made a hit as Major Wellington de Boots, which character he had played more than a thousand times in the U. S.; reappeared in New York in 1870 and in 1872; became proprietor of the Charing Cross theater, London. D. in London, Sept. 24, 1899. B. B. Vallentine.

Clarke, Mary Cowden: author; a daughter of Vincent Novello, the composer; b. in London, England, June 22, 1809. She was married in 1828 to Charles Cowden Clarke (*q. v.*). Among her works are *The Complete Concordance of Shakespeare* (1845), a work remarkable for completeness and accuracy, and *World-noted Women* (1857). She annotated an edition of Shakspeare in 1869. She also published novels, tales for children, *Shakespeariana* (1885), and a *Centennial Biographic Sketch of Charles Cowden Clarke* (1887). D. at Genoa, Jan. 12, 1898.

Clarke, Samuel, D. D.: philosopher and theologian; b. in Norwich, England, Oct. 11, 1675; educated at Cambridge. His Boyle lectures in 1704 and 1705 on the *Being and Attributes of God*, *The Obligations of Natural Religion*, and the *Truth and Certainty of the Christian Religion* (6th ed. 1725), brought him great fame. They were in answer to Spinoza, Hobbes, and other freethinkers. He was the successor of Locke among English metaphysicians. He became in 1706 chaplain to Queen Anne and rector of St. James, Westminster, London, 1709. In 1712 he published *The Scripture Doctrine of the Trinity*, on which point his opinions were Semi-Arian. He defended the Newtonian philosophy against Leibnitz, with whom he corresponded. The correspondence was published in 1717. His edition of Homer, with a Latin version and notes (1729, 12 books, completed by his son, 1732) was extensively used by students. D. May 17, 1729. See his *Life* by B. Hoadley, prefixed to his *Sermons* (10 vols., 1731) and his *Works*; and one by William Whiston (1730; 3d ed. 1748). Revised by S. M. Jackson.

Clarke, Samuel Fessenden: naturalist; b. in Geneva, Ill., June 4, 1851; graduated at the Sheffield Scientific School (Yale), 1878; assistant to U. S. Fish Commission 1874–75; biological assistant at Johns Hopkins University 1879–81; Professor of Natural Science at Williams College 1882; has written monographs on hydroids and amblystoma, and *The Development of a Double-headed Vertebrate* (1880).

Clarke, William Horatio: See the Appendix.

Clarke River, or **Flathead River**: rises in the Rocky Mountains, in the west part of Montana. It flows northwestward, traverses the northern part of Idaho, and enters Washington. Near the northern boundary of Washington it enters the Columbia. Length about 650 miles. Gold is found near this river in Montana.

Clarksburg: town; capital of Harrison co., West Va. (for location of county, see map of West Virginia, ref. 6–H); on Balt. and Ohio and other R. Rs., and on the Monongahela, at the confluence of the West Fork river and Elk creek. It is in a coke and coal region, and has fine U. S. and county buildings, two academies, water-works, gas-works, electric light, steam flouring-mills, large woolen-factory, extensive sawmills, etc. Pop. (1880) 2,307; (1890) 3,008; (1900) 4,050.

Editor of "Telegram."

Clarkson, Robert Harper: Protestant Episcopal bishop; b. in Gettysburg, Pa., Nov. 19, 1826; graduated from Pennsylvania College, Gettysburg, 1844, and went to the theological school of St. James College, Hagerstown, Md., from which he received a diploma in 1848; was soon after appointed rector of St. James Episcopal church, Chicago, and held that position until 1865, when he removed to Omaha as missionary bishop of Nebraska and Dakota; in 1870 was chosen diocesan of Nebraska. He was instrumental in establishing about fifty Episcopal churches in his diocese, and was for about twenty-five years trustee of the Racine and Neosho colleges, in Wisconsin. D. in Omaha, Neb., Mar. 10, 1884.

Clarkson, Thomas: philanthropist; b. at Wisbeach, in Cambridgeshire, Mar. 28, 1760. He was educated in St. John's College, Cambridge, where he wrote in 1786 a Latin prize essay on the question, *Is Involuntary Servitude Justifiable*. He was so deeply interested in that subject that he resolved to devote his life chiefly to the abolition of the slave-trade and the relief of the oppressed. He became an associate of William Dillwyn, George Harrison, and other members of the Society of Friends, who had previously formed themselves into an anti-slavery committee. Mr. Wilberforce cooperated, and was the chief advocate of the cause in Parliament. Clarkson diligently collected and diffused information about the slave-trade. Their efforts excited violent opposition, and were several times defeated in Parliament, but finally an act to abolish the slave-trade was passed in Mar. 25, 1807. He published in 1808 *The History of the Abolition of the Slave-trade*. In 1823 he was chosen president of the Anti-Slavery Society, and devoted himself to the extirpation of slavery in the West Indies, which was accomplished in 1833. D. in Playford Hall, near Ipswich, Sept. 26, 1846. See his *Life* by T. Taylor (London, 1839).

Clarksville: city (founded in 1780); capital of Montgomery co., Tenn. (for location of county, see map of Tennessee, ref. 5–E); on Louisville and Nashville R. R.; 100 miles N. E. of Memphis and 50 miles N. W. of Nashville. The city is built upon a peninsula formed by the Cumberland and Red rivers, which unite their waters N. W. of the city. It has elegant churches, fine public schools, water-works, gas-works, electric lights, and street cars. It is the seat of Southwestern Presbyterian University, and of an academy for girls. It is situated in the center of the large "dark-tobacco" growing district of Tennessee and Kentucky, and is one of the largest tobacco-markets in the U. S., the tobacco-trade being its chief source of prosperity. Here are also large bending-works, flouring-mills, and lumber-mills. There are in the surrounding region large lumber-forests, and in the immediate vicinity rich and accessible iron-ore deposits, once mined. Preparations for working the disused mines have now (1893) been made. Steamboats navigating the Cumberland river touch at Clarksville daily. Pop. (1880) 3,880; (1890) 7,924; (1900) 9,431.

Editor of "Progress Democrat."

Clarksville: town; capital of Red River co., Tex. (for location of county, see map of Texas, ref. 2–J); on Texas and Pacific R. R.; 20 miles from Red River. The town is situated in a rich farming region, and is one of the leading cotton-markets of Northern Texas, 27,000 bales of cotton having been marketed in 1891–92. Here are good schools and numerous churches. Pop. (1890) 1,588; (1900) 2,069.

Editor of "Times."

Clark University: an institution of learning situated at Worcester, Mass.: chartered in Jan., 1887; opened in Oct., 1889. It is devoted exclusively to post-graduate work. It not only does not receive undergraduates, but does not do undergraduate work. This gives it a unique position in the country. Great prominence is given to original investigation which creates the material of culture distributed by colleges and lower schools. It thus occupies a position intermediate between most universities and special institutes for the most advanced work. It does not cover the whole field of human knowledge, but confines all its efforts to a few related branches, which it strives to make as perfect as possible. These are mathematics, physics, chemistry, morphology, anatomy, physiology, neurology, psychology, anthropology, and pedagogy. Each of these subjects is represented by a chief instructor, who conducts a systematic course and instigates and guides research.

Mr. Jonas G. Clark, the founder, and his wife, have provided a system of fellowships and scholarships for thirty meritorious students, ranging in value from $200 to $600. A system of docentship has been established for young men who have done work which marks a distinct advance beyond the doctorate, and who wish to engage in research. They are not assistants, are expected to do some teaching, are entirely independent, and their relations are directly with the president.

The buildings are, so far, three in number: the central

building is 204 feet by 114, is four and a half stories high, and has 90 rooms; another, a chemical building, contains 68 rooms. The grounds consist of an 8-acre lot and three smaller lots, all located about 1½ miles W. of the railway station.

It is the desire of the founder that the highest academic standards be here forever maintained; that special opportunities be offered for independent research; that to this end the instructors be not overburdened with teaching or examinations; that all available experience, both of the U. S. and of older countries, be freely utilized; and that new measures and even innovations, if really helpful to the highest needs of science and culture, be no less freely adopted. He chose Worcester as the seat of the new foundation because its location is central among the best colleges of the East, the work of which he desires to supplement by an institution devoted to the training of professors.

L. N. Wilson.

Clary: a gray hairy annual plant (*Salvia sclarea*), of the *Labiatæ* or Mint family, native of Southern Europe, now somewhat cultivated in the U. S. for its leaves, which are used for seasoning. It grows to the height of 2 feet or so, and bears oblong obtuse leaves and spikes of small red flowers, whose broad bracts are red and very showy. The foliage has also been used in domestic medicine. C. E. B.

Class [from Fr. *classe* < Lat. *classis*, a division or class of the Roman people, what is called together or proclaimed, deriv. of *cala're*, proclaim; cf. *calen'dae*, *intercala'ris*. Some regard *classis* as loan-word from Greek (Dor.) κλᾶσις, deriv. of καλέω, summon]: in natural history, a large group of plants or animals formed by the union or association of several orders. Classes, orders, families, genera, and species are common to all methods of classification. The term *class* is also used to denote a portion of society separated from other portions by some distinction of rank, fortune, or more intrinsic qualities.

Classic, or **Classical** [from Lat. *classicus*, of the highest rank or order: deriv. of *classis*; see Class]: pure, refined; conformed to the best and most perfect standard; also pertaining to the ancient Greek or Latin authors, or rendered famous by association with ancient writers, as "classic ground." The ancient Roman people were divided into six classes, and the persons of the first or highest class were called *classici*. Hence the term came to signify the highest and purest class of writers in any language, though formerly it was applied only to the most esteemed Greek and Latin authors. The epithet "classical," as applied to ancient writers, is determined less by the purity of their style than by the period at which they wrote. The classical age of Greek literature begins with Homer, the earliest Greek writer whose works are extant, and extends perhaps to the time of the Roman emperor Antonine, but signs of decadence appeared about 300 B. C. The Latin classical period is shorter; its earliest writer is Plautus, and it ended about 200 A. D. Some critics, however, include Claudian, who was born about 365 A. D., among the classics.

Classical Learning: See Humanism.

Classis [Lat., a class]: in the Reformed Churches in America and in Holland, a church court corresponding to the presbytery in Presbyterian churches. It is composed of the elders delegated by the consistories (the governing body of each church), one from each, of the pastors and all the ministers in a certain district. The classis hears appeals from the consistories, and appeal from the classis is to a particular synod. The classis also confirms and dissolves pastoral connections, ordains and deposes ministers, sends 2 ministers and 2 delegates to the synod and 3 ministers and 3 delegates to the general synod.

Clatsop: See Chinookan Indians.

Claude d'Abbeville: French Capuchin missionary and author; b. at Abbeville. His secular name was Fermin Foullon, and he took the name Claude when he entered the Capuchin order in 1601. In 1612 he went with other Capuchins to establish a mission at Maranhão, Brazil, then a French colony. Returning in 1614, he published his *Histoire de la Mission des Pères Capvcins en l'Isle de Maragnan* (Paris, 1614; Portuguese translation, Maranhão, 1874), a work of the highest value, not only as a history, but for the minute account given of the Tupinambas Indians. The narrative of Yves d'Evreux (*q. v.*) is properly a continuation of it. D. at Rnen, 1616. Herbert H. Smith.

Claude, klōd, Jean: Protestant theologian; b. in La Sauvetat, Southern France, in 1619: became pastor at Nîmes 1654, and of the Protestant church at Charenton, near Paris, 1666. When the Edict of Nantes was revoked (1685) he removed to The Hague, where he died, Jan. 13, 1687. He was distinguished as a disputant. Among his works are *A Defense of the Reformation*, against Nicole (Quevilly, 1673; 4th ed. Paris, 1844; Eng. trans. London, 1815); *A Short Account of the Complaints and Cruel Persecutions of the Protestants in France* (n. e. Cologne, 1713; Eng. trans. 1686; n. e. 1708); and, best known of all, *Essay on the Composition of a Sermon* (Eng. trans. n. e. 1853). See his *Life* in French by De La Devèze (Amsterdam, 1687). Revised by S. M. Jackson.

Claude, Jean Maxime: genre and landscape painter; b. in Paris, June 24, 1824; pupil of Galland; second-class medal, Paris Exposition, 1889; Legion of Honor 1884. His pictures of hunting-parties and equestrians in the Paris and London parks are distinguished by their good taste and fine qualities of color. Studio in Paris. W. A. C.

Claude Lorrain: See Gelée, Claude.

Claudia'nus, Claudius: a Latin epic poet, whose birthplace is unknown, who went to Rome from Alexandria in 395 A. D., and gained the favor of Stilicho. His poems were so popular that a statue was erected to him in Rome by the senate and the emperor. Among his works are *The Rape of Proserpine*, *The Battle of the Giants*, and a *Eulogy of Stilicho* (De Consulatu Stilichonis). He probably did not survive the death of his patron Stilicho in 408 A. D. He had a fertile imagination, and is regarded as the last of the classical Latin poets. The best editions of his works are those by Jeep (2 vols., Leipzig, 1876–79) and T. Birt (Berlin, 1893). There is an English translation by Abraham Hawkins (London, 1817), but it is of slight merit.

Clau'dius, or, more fully, **Tiberius Claudius Drusus Nero**: the fourth Emperor of Rome; b. at Lugdunum (Lyons) in 10 B. C. He was a son of Drusus Nero and a nephew of the Emperor Tiberius. He was naturally infirm in body, and his education was neglected. He was lame and paralyzed, and by nature so diffident and timid that he was generally considered half imbecile, and by his family he was treated as an object of scorn. On the death of Caligula (who was his nephew) he was proclaimed emperor by the army in 41 A. D., and was unwillingly recognized by the senate, who preferred a republic. He began his reign with a show of clemency, but his wife, the infamous Messalina, acquired great power, which she abused by acts of cruelty. When she finally pushed her recklessness so far as to marry one of her lovers, Claudius had her put to death; but her successor, his niece Agrippina, was even worse. Claudius wrote several historical works, but they have all perished. He built a great aqueduct called Aqua Claudia, and successfully invaded Britain in person. He was poisoned in 54 A. D. by his wife Agrippina. See Suetonius, *Claudius*; Tacitus, *Annales*.

Claudius, Appius, surnamed Crassus: Roman patrician; decemvir in 451 B. C. He rendered himself infamous by an attempt to enslave and dishonor Virginia, whom he claimed the right to retain as the slave of one of his clients. Her father, unable to obtain redress from the courts, slew her and appealed to the army. A popular revolt expelled the decemviri, and Claudius was seized and imprisoned. According to Livy, he committed suicide. The story is rehearsed in Macaulay's *Lays of Ancient Rome*. See Arnold, *History of Rome*.

Claudius, Appius Cæcus: a Roman patrician who was censor about 312 B. C., and consul 306 and 295 B. C. He constructed the great road called Via Appia from Rome to Capua, and built the first great aqueduct which brought water from Tusculum to the city. In his second consulship he defeated the Samnites and Etrurians, and about 280 secured the rejection of the terms of peace offered by Pyrrhus. He became blind (hence his name Cæcus). He wrote a legal work and a poem. His daughter Claudia, a vestal virgin, is said to have proved her suspected chastity by drawing to land the stranded ship which brought an image of Vesta to Rome, although the men had not been able to release it.

Claudius, Marcus Aurelius, surnamed Gothicus: Emperor of Rome; b. in Illyricum in 214 A. D.; proclaimed emperor by the army on the death of Gallienus, 268 A. D., and their choice was ratified by the senate. He defeated the rebel Aureolus in the same year, and gained a victory over the Goths or Scythians in Servia in 269. D. at Sirmium, 270 A. D., and was succeeded by Aurelian.

Claudius, Matthias: b. in Rhinefeld, near Lübeck, Aug. 15, 1740; d. in Hamburg, Jan. 21, 1815; spent most of his life at Wandsbeck in a banking-office. He published the *Wandsbecker Bote*, a periodical, and afterward a collected edition of his works, verse and treatises (Hamburg, 8 vols., 1775–1812; 12th ed., 2 vols., Gotha, 1882); partial translation, *Claudius, or the Messenger of Wandsbeck and his Message* (London, 1859). Though not a theologian, he exercised great influence on the religious life of Germany by his quaint writings, half humorous and half sentimental. He attacked both the old barren orthodoxy and the new fashionable rationalism, and produced a deep impression. His *Life* was written by W. Herbst (Gotha, 1857; 4th ed. 1878; K. Gerok, Darmstadt, 1881).

Claughton, Thomas Legh, D. D.: Bishop of St. Albans; b. Nov. 6, 1808, at Haydock Lodge, Lancashire, England; educated at Rugby and at Trinity College, Oxford, becoming successively scholar, fellow, and tutor of the latter; graduated in 1831 as first in classics, having previously gained the chancellor's prize for Latin verse and the Newdigate prize for English verse. In 1836 he was appointed public examiner; married a sister of the Earl of Dudley; Professor of Poetry at Oxford 1852–57; consecrated Bishop of Rochester 1867, and translated to the newly constituted see of St. Albans 1877; he resigned in 1890. D. July 25, 1892. A son of the same name is canon of Worcester Cathedral. W. S. Perry.

Claus, klō, Émile: landscape and figure painter; b. in Vive-St.-Éloi, Belgium; contemporary; pupil Antwerp Academy; first-class medal, Paris Exposition, 1889. His pictures are cleverly painted and show much truth to nature. Studio at Astène, Belgium. W. A. C.

Clau'sen, George: figure and landscape painter; b. in England; contemporary; studied in France; associate member of Royal Water-color Society; second-class medal, Paris Exposition, for both oil and water colors, 1889. Studio at Cookham Dean, Berks, England. W. A. C.

Clausen, Henrik Nicolai: Danish theologian and liberal statesman; b. in the island of Laaland, Apr. 22, 1793. He became in 1820 Professor of Theology in the University of Copenhagen, and wrote, besides other works, *Romanism and Protestantism* (1825); *Popular Discourses on the Reformation* (1836); a commentary on the synoptical Gospels, and *Christian Dogmatics* (1867). In 1840 he was chosen a deputy to the States, and near the end of 1848 was appointed a member of the Cabinet. D. Mar. 28, 1877.

Clausewitz, klow'*se-vits*, Karl, von: a Prussian general and writer on war; b. in Burg, June 1, 1780. He served on the staff of the Russian army in 1813, and wrote an *Account of the Campaign of 1813* (1814); became a corps commander, director of the army-school, and then inspector of artillery. D. in Breslau, Nov. 16, 1831. His posthumous works were published in 10 vols. (1832–37; 3d ed. 1869). Of these the principal are *On War* (n. ed. Berlin, 1880) and the *Life and Character of von Scharnhorst*. See his *Life* by Schwartz (Berlin, 1877).

Clausius, klow'sĕĕ-oos, Rudolf Julius Emanuel: physicist, mathematician, and "thermodynamist"; one of the founders of the modern science of thermodynamics; b. in Köslin, Prussia, Jan. 1, 1822. He was educated in Berlin schools and in the university; was made privat-docent on graduation from the latter, and occupied the position in the Royal School of Artillery of instructor in Natural Philosophy. He at once became known as a mathematician by the publication of a number of papers on mathematical physics, a department in which he continued active throughout his life. He was called to the professorship in Natural Philosophy at Zurich in 1857, at the age of thirty-five. He went to the University of Bonn in the same capacity in 1869, and there remained until he died in 1888. His most remarkable work was done at Berlin from 1845 to 1850, in the construction of the science of thermodynamics upon the modern basis, the then recently admitted doctrine of the equivalence of heat and work as forms of energy-effect. Clausius in Germany and Rankine in Great Britain contemporaneously developed the fundamental "general equation of thermodynamics," which expresses the mathematical relations of heat and mechanical energy, and upon which they both proceeded to construct the whole theory of heat-engines, and to apply it to the "ideal case," in which only thermodynamic phenomena are considered. The partial condensation of steam at usual temperatures and pressures by thermodynamic action was discovered by both simultaneously in 1860, and the constancy of the two specific heats of gases predicted by Carnot and others was proved by them at about the same time. This work was all practically done before the close of the decade 1850–60, and in substantially the same manner by both. After going to Zurich, Clausius gave much time to the study of electrical and molecular physics. His greatest work, however, was that for which he shared honors with Rankine. Clausius was a member of many learned societies, was often decorated by the European Governments, and was an honorary member of the American Society of Mechanical Engineers. R. H. Thurston.

Clausson, klow'sōn, Peder: Norwegian author; b. Apr. 1, 1545; d. Oct. 15, 1614. By his translations of the old sagas he rendered great service to the history of Norway, indeed, one saga is extant only in his translation. In his *Description of Norway and Adjacent Islands* is to be found historical material of value. His language is remarkably pure and his style is vigorous and artless. R. B. Anderson.

Clausthal, klows'tăăl: a town of Germany; province of Hanover; on a hill 1,740 feet above the level of the sea, and about 56 miles S. S. W. of Hanover (see map of German Empire, ref. 4–E). It is the chief mining town of the Hartz, and has a mint, a mining academy, a gymnasium, and a valuable museum: also manufactures of camlet and other fabrics. Silver and lead are mined in the vicinity. Pop. (1890) 8,736.

Clavecin: See Bell-ringing.

Clavicle, or **Collar-bone**: a bone which, with the scapula and the head of the humerus, forms the shoulder. In man it is horizontal and immediately above the first rib, and articulates internally with the sternum or breast-bone, and externally with the acromion process of the scapula. Its office is to keep the shoulders apart, and to afford a fulcrum by which the muscles give lateral movement to the arm. Clavicles are absent in those mammals in which the fore limbs are used only for walking or swimming, such as the horse and seal; they are commonly present in mammals which use the fore limbs for climbing, digging, or flying, as monkeys, rats, and bats. Among carnivores the clavicles are absent or rudimentary, being largest in the cat family. In birds the clavicles are usually united with a third bone, the interclavicle, to form the furcula, or wish-bone; but even in this class of animals they may be separate, as in toucans and some parrots, rudimentary, as in the ostrich, or absent, as in the apteryx. Among birds of prey the clavicles are well developed, and serve to counteract the tendency of the pull of the pectoral muscles to draw the shoulders nearer together; but in a large proportion of birds the furcula is of little functional importance, and in some of the best flyers, swifts and humming-birds, the coracoid is practically the sole support of the wing. Among reptiles clavicles may be absent, as in serpents; in lizards they are firmly attached to the front of the breast bone, and aid in keeping the shoulders apart; in turtles they are so modified as to form the front part of the plastron or under "shell." Clavicles are present in the *Anura*, or tailless batrachia, absent in the *Urodela*, or tailed batrachia; they are apparently absent in fishes, or at least the parts so named very doubtfully correspond to the clavicles of other groups.

In man the ossification of the clavicle takes place sooner than that of any other bone, commencing the thirtieth day after conception; and at birth it is ossified in nearly its whole extent; but the sternal end is not complete till the eighteenth or nineteenth year. The clavicle in transcendental anatomy is considered to be the hæmapophysis of the atlas. F. A. Lucas.

Clavicor'nia, or **Clavicorns** [*clavicornia* is plur. of Mod. Lat. *clavicor'nis*, from Lat. *clava*, club + *cornu*, horn]: a group of beetles, so named from their club-shaped (clavate) antennæ. It comprises some water beetles and many land species, including most of the burying beetles (*Necrophaga*). F. A. L.

Clavigero, Francisco Xavier: Mexican historian; b. at Vera Cruz, 1731. He early entered the Jesuit order and taught rhetoric and philosophy in their schools, but devoted much of his time to the study of Aztec history and manuscripts. After the expulsion of his order from America (1767) he lived at Bologna, Italy, where he established an academy. His history of Mexico was written in Spanish, but translated into Italian and first published as *Storia Antica del Messico*

(Cesena, 1780). It treats of the Aztec period and conquest, and attained a wide and deserved popularity, being translated into English, German, and Spanish. The Abbé Clavigero also wrote a *Storia della California*, published after his death, which occurred at Bologna, 1787.

HERBERT H. SMITH.

Clavijo, klaă-vee'*khō*, RUY GONZALES, de: a Spanish traveler: d. in 1412; a native of Madrid; was sent by Henry III. as ambassador to Timur. He started from Seville in 1403, reached Samarcand viâ Constantinople, Trebizond, Tabreez, and Teheran, and returned in 1406. His itinerary was published at Seville in 1582, *Historia del gran Tamerlan e itinerario*, etc., and again in 1782. There is an English translation of the work by Clements Markham, published by the Hakluyt Society in 1860.

Clay: any fine-grained earth which is sticky when wet and coherent when dry. Clays differ widely in composition, but silica is usually the chief ingredient and alumina stands second. Minor components are water, iron oxide, lime, magnesia, and the alkalis. Classed as to origin, clays are (1) *sedimentary*, the finest sediments deposited by water; (2) *residual*, the material left after the removal by percolating water of the soluble parts of rocks, especially limestones; (3) *glacial*, the fine rock-flour ground up by glaciers and deposited in till. They are also variously named, according to their uses, as pottery, slip, porcelain, terra-cotta, brick and fire clay. Fire-clays, made into fire-bricks, crucibles, and other objects that must endure great heat, are composed almost wholly of silica, alumina, and water; slip clays, used in glazing pottery, are characterized by large percentages of lime and the alkalis.

Clays occur in every State of the Union, and in nearly every county, being so abundant that their immense importance is rarely appreciated. In 1894 the value of building-brick was $35,200,000; vitrified paving-brick, $3,700,000; drain-tile, $5,800,000; sewer-pipe, $6,300,000; and roofing-tile, terra-cotta work, etc., $8,200,000. See also SOILS.

Clay, CASSIUS MARCELLUS: statesman; b. in Madison co., Ky., Oct. 19, 1810. He graduated at Yale in 1832; opposed the annexation of Texas to the Union; advocated the abolition of slavery; made speeches in the Northern States in 1844 in support of Henry Clay as a candidate for the presidency. In 1845 he became the editor of the *True American*, an anti-slavery paper issued at Lexington, Ky. He was attacked by mobs, against which he defended himself bravely in several bloody conflicts. He served as a captain in the Mexican war (1846–47); supported J. C. Fremont in 1856, and Abraham Lincoln in 1860; became a major-general of volunteers in Apr., 1862; resigned Mar. 11, 1863; was minister to Russia 1862–69; subsequently he became a Democrat, although he advocated Blaine's election in 1884. In 1877 he was tried for killing a Negro servant who had threatened his life, and was acquitted of the crime charged. See Horace Greeley, *The Life, Memoirs, Writings, and Speeches of Cassius M. Clay* (2 vols., Cincinnati, ed. of 1886).

Clay, CLEMENT CLAIBORNE: b. in Huntsville, Ala., in 1819; son of a U. S. Senator, C. C. Clay (1789–1866), who was for many years a prominent official of the U. S. and of Alabama. The younger Clay became a lawyer in 1840, a judge in 1844; was U. S. Senator from Alabama from 1854 to 1861, where he advocated extreme States-rights views. In the latter year he entered the Confederate Senate; was also a secret agent of the Confederacy in Canada 1864. After the war he fled to Canada, but surrendered himself to the U. S. on being accused of complicity in the murder of President Lincoln. After a short imprisonment he was released in Apr., 1866, and returned to the practice of his profession. D. in Huntsville, Jan. 3, 1882.

Clay, FREDERICK: musician; b. in Paris, Aug. 3, 1840, of English parents temporarily residing there; educated in Paris and Leipzig. With few exceptions his compositions were entirely for the stage, and include a number of operettas and musical dramas. He wrote two cantatas, *The Knights of the Cross* (1866) and *Lalla Rookh*, for the Brighton festival of 1877. Among his songs the one entitled *She Wandered Down the Mountain Side* was exceedingly popular. D. in London in Nov., 1889. D. E. HERVEY.

Clay, HENRY: lawyer, orator, legislator, and statesman; thrice a candidate for President, and once very nearly elected; b. near The Slashes, in Hanover County, not far from Richmond, Va., Apr. 12, 1777. His father was a poor Baptist preacher, who died in 1782; his mother—a woman of noble character and fervid piety—married again ten years afterward, and migrated to Kentucky, leaving this son (the fifth of seven children) a clerk in a retail store in Richmond, which he soon left for employment as a copyist in the office of Peter Tinsley, clerk of the high court of chancery, whom he served four years, passing thence to the office of Robert Brooke, then attorney-general, afterward Governor. Licensed as a lawyer in 1797, though not yet of age, he followed his mother to Kentucky, opened a law-office at Lexington, and soon achieved a lucrative practice. Kentucky, separating from her parent, Virginia, soon called a convention to frame a State constitution, and young Clay publicly besought her to provide therein for a gradual abolition of slavery, but was sternly overruled, as he was half a century later, when, in the fullness of his fame, he renewed this counsel on the revision of the State constitution in 1849–50.

Kentucky strongly sympathized with her mother State in its opposition to John Adams's administration and its Alien and Sedition Acts, and idolized Jefferson, Virginia's oracle, for whom she cast her first presidential vote in 1800. Young Clay was one of her favorite orators in that excited canvass, and was first chosen to represent his county (Fayette) in the Legislature of 1803–04. Late in 1806, when scarcely eligible, he was chosen by the Legislature of his State to fill a vacancy in the U. S. Senate caused by the resignation of Gen. John Adair. His term expired with his first session, but he had already made his mark as a champion of the policy of internal improvement by the construction of roads, bridges, etc. He was again chosen to the Legislature in 1807, and elected Speaker of the House. He now proposed that each member should clothe himself wholly in fabrics manufactured in the U. S., which was stigmatized by Humphrey Marshall as the project of a demagogue—language which led to a duel wherein both parties were slightly wounded. At the session of 1809 Clay was again chosen to fill a vacancy in the U. S. Senate—this time for two years. In Aug., 1811, he was elected to the House, and on the first day of his service was chosen its Speaker—an extraordinary proof of his ability and popularity. This Congress, in June, 1812, declared war against Great Britain, Clay being one of its foremost advocates, as he remained throughout the struggle, until dispatched to Europe by President Madison as one of the negotiators of peace—a service which he rendered at Ghent with eminent ability. Returning to his country in Sept., 1815, he was received as a victor, and, having been re-elected to the House in his absence, he was rechosen Speaker without opposition. He had been conspicuous in defeating the recharter of the first Bank of the U. S. in 1811; he was equally active and influential in promoting the charter of the second in 1816. He was now, as he had been, a champion of protection to home industry, and of national internal improvements; and he was foremost in effecting the compromise whereby Missouri was admitted as a slave State, on condition that all Federal territory north of lat. 36° 30′ should be consecrated to free labor. Having favored in 1816 an increase of the pay of members of Congress from $8 per day to $1,500 per annum, Clay was formidably opposed in his next canvass by John Pope, afterward Jackson's Governor of Arkansas Territory, but saved his seat by a vigorous effort.

In 1824 five candidates were started for President—William H. Crawford, of Georgia, who had the caucus nomination; John Quincy Adams, of Massachusetts, then President Monroe's Secretary of State; Gen. Andrew Jackson, of Tennessee, then a U. S. Senator; John C. Calhoun, of South Carolina, then Secretary of War; and Henry Clay, of Kentucky, then Speaker of the House. Calhoun soon withdrew, and was made Vice-President by pretty general consent, while Jackson, Adams, and Crawford (no one having a majority) were the three highest on the electoral vote, which compelled the House to choose between them. Clay, having received the votes of Kentucky, Ohio, and Missouri only, with four of those cast from New York, was four votes behind Crawford, and so could not be voted for in the House. He and his friends cast their votes for Adams, electing him by the vote of thirteen States, to seven for Jackson and four for Crawford. Adams made Clay his Secretary of State; whereupon a cry of "Bargain!" was raised, and Gen. Jackson was at once proposed for next President. He was elected over Adams, and Calhoun was again chosen Vice-President. At the next choice of President (1832) Clay was run against Gen. Jackson, and was badly defeated by him. He had just been returned to the U. S. Senate, in which he played a lead-

ing part for many years ensuing, especially in the tariff compromise of 1833, whereby a conflict with South Carolina was averted, and in resistance to the new financial policy propounded by Van Buren in 1837, whereby the treasury was to be divorced from all connection with banks and their notes. Clay was again a candidate for President, before the first Whig national convention, held at Harrisburg in Dec., 1839, but Gen. Harrison was nominated and triumphantly chosen. His death and Tyler's course brought Clay forward as the unanimous choice of his party in 1844, when a desperate effort was made to elect him, but without success, James K. Polk, of Tennessee, carrying both the great States of New York and Pennsylvania by a handful of votes, when the vote of New York alone would have elected Clay. The annexation of Texas and the resulting war with Mexico were fruits of this election.

Mr. Clay's name was once more, and for the last time, presented to the Whig national convention of 1848, but Gen. Taylor was nominated over him and elected. Clay had in 1842 bidden farewell to the Senate, but was persuaded to return to it after 1844, and bore a leading part in effecting the slavery compromise of 1850. He returned to Washington from Kentucky for the last time near the close of 1851, and was soon prostrated by disease, under which he gradually sank until his death, June 29, 1852.

Mr. Clay will be permanently remembered as the leader in promoting what was then considered a high protective tariff. In 1824, in one of the most elaborate and effective speeches of his life, he presented a brilliant array of arguments which still pass current among advocates of high protection. He succeeded in having his doctrine denominated the "American System" in distinction from the "Foreign System," though Daniel Webster pointed out that the views advocated by Clay were an abandonment of American methods, and an adoption of the methods that generally prevailed in Europe. But the phrase succeeded as a party cry, and the bill was carried. In the course of this discussion, and in those that followed, Clay showed on the one hand a masterful grouping of facts and principles, a plausibility of reasoning, a fervor of imagination, and a brilliancy of diction; while on the other he showed superficial research, a disinclination or inability to reason out his propositions to their ultimate conclusions, and a willingness to satisfy himself with half knowledge. Again, in 1832, Clay appeared as the champion of a tariff bill designed to sweep away the "tariff of abominations" of 1828. For the purpose of expounding his policy and bringing his party into line, he called together a caucus of the Whig members of the Senate and the House. Here he laid down the law in a manner which John Quincy Adams, in his *Memoirs*, describes as "courteous, but exceedingly peremptory and dogmatical." The object of the proposed revision was primarily to get rid of the great surplus brought into the treasury by the law of 1828. Clay proposed to sweep away the duties on articles not coming into competition with U. S. products, and preserving the duties on all others. One of his speeches in the Senate on the subject ranks among his greatest successes. Though the bill was carried, it failed to accomplish the desired result. The surplus was not materially reduced, and one year later Clay proposed and carried a bill for the gradual reduction of duties to a maximum of 20 per cent.

Though not successful as an aspirant to the presidency, he was a gallant party chief, an admirable orator, a skillful legislator, wielding unequaled influence, not only over his friends, but even over those of his political antagonists who were subjected to the magic of his conversation and manners. See *The Life and Speeches of Henry Clay*, compiled and edited by Daniel Mallory (New York, 1844; 5th ed. 1857); *Life and Times of Henry Clay*, containing his speeches and correspondence, edited by Calvin Cotton (6 vols., New York; rev. ed. 1865): *Life of Henry Clay*, by Carl Schurz (American Statesman Series, 1887).

Revised by C. K. Adams.

Clay, Henry, Jr.: son of the orator and statesman of the same name; a military officer and lawyer; b. Apr. 10, 1811, in Ashland, Ky.; graduated at West Point 1831; resigned Nov. 1, 1831; counselor-at-law 1833–46; member of the Kentucky House of Representatives 1835–37; and lieutenant-colonel Second Kentucky Volunteers in the war with Mexico 1846–47; engaged at Buena Vista, where, while gallantly leading a charge of his regiment, he was mortally wounded, and in that condition lanced to death Feb. 23, 1847.

Clay, James B.: brother of Henry Clay, Jr.; b. in Washington, D. C., Nov. 9, 1817; *chargé d'affaires* to Lisbon 1849; elected to represent his father's district in Congress 1857; espoused the Confederate cause. D. in Montreal, Canada, Jan. 26, 1864.

Clay Center: city; capital of Clay co., Kan. (for location of county, see map of Kansas, ref. 4–G); on Union Pac. and Ch., Rk. I. and Pac. R. Rs., and on the Republican river; about 125 miles W. of Leavenworth. The city has large plow-works, and other smaller factories. Abundant water-power is furnished by the Republican river. Pop. (1880) 1,753; (1890) 2,802; (1900) 3,069. Editor of "Times."

Claymore, sometimes spelled **Glaymore** [from Gaelic *claidheamhmor*, a broadsword]: a heavy two-handed sword used by the Highlanders of Scotland. It had a crossguard with curved guillons. The name was also given in the eighteenth century to a basket-hilted broadsword.

Clay Slate: See Slate.

Clays, Paul Jean: marine-painter; b. in Bruges, 1819; pupil of Gudin, Paris; second-class medals, Paris Expositions, 1867 and 1878; officer of Legion of Honor 1881; order of Leopold of Belgium. He is a prolific painter, and his pictures are agreeable in color. Studio in Brussels.

W. A. C.

Clayton: capital of Barbour co., Ala. (for location of county, see map of Alabama, ref. 6–E); on Cent. R. R. of Ga.; 75 miles S. E. of Montgomery; in a fruit and grain growing district. Pop. (1880) 761; (1890) 997; (1900) 998.

Clayton, John: botanist; b. in Fulham, Middlesex, England, in 1686; emigrated to Virginia in 1705, where for over fifty years he was clerk of Gloucester County. He wrote on the natural history of Virginia. Linnæus and Gronovius published in 1739 a *Flora of Virginia, Exhibiting Plants which J. Clayton has Collected*. D. Dec. 15, 1773.

Clayton, John Middleton, LL. D.: statesman; b. in Sussex co., Del., July 24, 1796; graduated at Yale in 1815; studied law, which he practiced in Delaware, and gained a high reputation. He was elected a Senator of the U. S. in 1829, joined the Whig party, and was re-elected to the Senate in 1835, but resigned two years later to become chief justice of his native State. In 1845 he was again chosen to represent Delaware in the national Senate, and in Mar., 1849, he became Secretary of State in the cabinet of President Taylor. He negotiated with the British Government the Clayton-Bulwer Treaty in 1850. Having resigned on the death of President Taylor in July, 1850, he was chosen a U. S. Senator for six years (1851–57). D. in Dover, Del., Nov. 9, 1856.

Clayton, Powell: U. S. Senator; b. in Bethel, Delaware co., Pa., Aug. 4, 1833; was before the civil war a lawyer of Leavenworth, Kan. In 1861 he became lieutenant-colonel of the Fifth Kansas Cavalry, and afterward a brigadier-general, serving with ability, chiefly in Arkansas; honorably mustered out Aug., 1865. He was Governor of Arkansas 1866–71, and in the latter year was chosen U. S. Senator for six years. Appointed U. S. minister to Mexico 1897.

Clayton-Bulwer Treaty: a treaty concluded between Great Britain and the U. S., and signed in Washington Apr. 19, 1850. It related to the establishment of a communication between the Atlantic and Pacific Oceans by means of a ship-canal across the Isthmus of Panama, and consisted of nine articles, the contracting parties declaring that they would not erect fortifications on the banks or in the vicinity of the proposed canal; that they would not assume dominion over Nicaragua, Costa Rica, the Mosquito coast, or any part of Central America. Opposite and contradictory constructions having been placed upon this treaty by both Governments, another, called the Dallas-Clarendon treaty, was signed in London Oct. 17, 1856. But, as objections to it were raised on both sides of the Atlantic, it was ultimately rejected. The commencement of the Panama and the Nicaragua ship-canals again brought the Clayton-Bulwer treaty into discussion. The Government of President Arthur contended that the first seven articles of the treaty related solely to a concession for opening the Tehuantepec interoceanic route, obtained from Mexico; that they were applicable to no other route; that, for the sake of inviting British capital to the work, the U. S. at the time were willing to concede some of the rights they had acquired under the Mexican grant; but that this condition had not been realized, and that the changed condition of the U. S. since 1850

had diminished, if it had not entirely removed from consideration any advantage to be derived from that source; and that the British occupation of Balize constituted a violation of the treaty stipulations. It further contended that the eighth article provided only for future negotiations in case new interoceanic routes were opened, and that the earlier articles, now grown obsolete, could not apply to these new conditions. These contentions failed to receive the acquiescence of the British Government, and the dispute is in an unsettled and unsatisfactory state.

Clayto'nia [named in honor of John Clayton, the botanist], or **Spring-beauty**: a genus of American and Asiatic flowers of the family *Portulacaceæ*. These beautiful flowers open in early spring, and are common in most of the U. S., one species being found in Alaska. The tubers of the *Claytonia tuberosa* are eaten in Siberia. Some of the species are naturalized in Europe.

Clazom'enæ (in Gr. Κλαζομεναί): a Greek city of Ionia; situated on a bay of the Ægean Sea, near Smyrna; was the birth-place of Anaxagoras.

Clean'thes (in Gr. Κλεάνθης): Stoic philosopher; native of Assos, in Asia Minor; a disciple of Zeno, whom he succeeded as head of the Stoic school (260 B. C.). He is the author of a much-admired hymn to Zeus preserved in Stobæus, *Eclogæ*, lib. i., 2, 12.

Clearfield: borough; capital of Clearfield co., Pa. (for location of county, see map of Pennsylvania, ref. 4–D); on Pa. and Beach Creek R. Rs., and on the West Branch of the Susquehanna river. It has a public park, an academy, a machine-shop, foundry, fire-brick, and lumber manufactories, etc. It is an agricultural and coal-mining district. Pop. (1880) 1,809; (1890) 2,248; (1900) 5,081.

Clearing-house: an institution set up by persons or corporations engaged in some particular department of trade or finance for convenience in settling accounts and effecting exchanges.

The New York Clearing-house.—The clearing-house system was first established in London about the beginning of the nineteenth century. The three great clearing-houses of London are the Bankers' Clearing-house, the Stock Exchange Clearing-house, and the Railway Clearing-house. The system was introduced into the U. S. by the banks of the city of New York, which established the New York Clearing-house by organizing an association and commencing operations on Oct. 11, 1853. Clearing-houses have since been established in the cities of Boston, Philadelphia, Chicago, St. Louis, Hartford, Providence, Baltimore, Cincinnati, San Francisco, Pittsburg, New Orleans, Louisville, Milwaukee, Detroit, Memphis, Richmond, Cleveland, Indianapolis, Kansas City, New Haven, Columbus, Peoria, Lowell, Worcester, Springfield (Mass.), Syracuse, St. Joseph, Norfolk, St. Paul, Portland (Me.), Minneapolis, Buffalo, Galveston, Houston, Denver, Omaha, Nashville, Dallas, Portland (Ore.), Fort Worth, Duluth, Washington, D. C., Lexington, Salt Lake, Rochester, Tacoma, Topeka, Grand Rapids, Sioux City, Seattle, Los Angeles, Wilmington, Lincoln, Des Moines, Waco, Birmingham, Chattanooga, Wichita, New Bedford, Fall River, Charleston, Spokane, Helena, and a few other places.

There were, May 1, 1892, in the city of New York ninety-five banks, with an aggregate capital of $67,322,700 and a surplus of $69,972,500, many of them situated at remote distances from others. Each in its daily dealings receives large amounts of bills of, and checks on, other banks, so that at the close of the day's business every bank has in its drawers various sums thus due it by other banks. It is in like manner itself the debtor of other banks, which have during the day received its bills and checks drawn upon it. Before the establishment of the clearing-house it was necessary for each bank every morning to make up its account with every other bank, and to send its porter to present the bills and checks so received to the debtor banks for payment. The balances of their indebtedness were adjusted by payments in gold, which became so laborious, dangerous, and complicated that the balances were settled only weekly, on Friday, instead of daily—a course that induced much evil. This was obviated by the clearing-house system, through which the settlements are so simultaneously and almost instantly effected that the transactions adjusted through it have amounted in one day to the enormous sum of $295,821,422.37, in adjusting which the exchanges were settled in the space of an hour. The establishment of the clearing-house system closed 2,500 bank ledger accounts, with numerous daily entries in each: enabled the banks to settle every day with each other without delay or loss through the clearing-house, they now having no direct business with each other except through that medium; and with comparatively little trouble brought each officer into intimate and friendly relations with the others, thus enabling them by united action to aid and strengthen each other in times of excitement and financial danger, and to exert by their combined power a salutary influence upon the banking business of the country at large.

It is doubtful if without the aid of the banks of the city of New York the U. S., upon the breaking out of the civil war in 1861, could have raised the loans necessary to carry on the war in time to prevent the success of the enemies of the Union. It is certain that without the Clearing-house Association the banks could not have furnished the funds which at once established the credit of the Government, and enabled it, by the restoration of confidence, to negotiate its bonds to the enormous amount of over $2,000,000,000. During those exciting times the machinery of the clearing-house worked with regularity and exactness; the banks, united as one, daily equalized their resources, and presented to the world a most important as well as practical proof that in "union is strength."

The panic of 1873 was only checked by similar action, as also in May, 1884, the experience of the war enabling the banks to act with such promptness in combining their entire resources by the use of over $25,000,000 loan certificates as to sustain themselves against a panic, the serious results of which were greatly modified by their action.

From Oct. 11, 1853, to May 1, 1892, a period of thirty-eight years and seven months, the total transactions of the N. Y. clearing-house amounted to the sum of $1,015,343,101,754.53, an average of $85,791,559.08 per day for the entire period. The largest average daily transaction for any one year was for that ending Oct. 1, 1899, amounting to $189,961,029. The present daily average is about $175,000,000. Of this vast business so exact and complete is the system that no difference of any kind exists in any of its books or accounts; neither has a loss occurred from its organization to the present time.

During the war the Government issued "certificates of indebtedness" bearing interest, which were found to be desirable as a reserve for the banks. Accordingly, an arrangement was made for the issue of special certificates bearing interest, and available only to banks being members of the Clearing-house Association, and which were recognized in the National Banking Act of 1864 as part of the lawful reserve for a national bank. The principal of these certificates was made payable on demand in legal-tender notes at the office of the assistant treasurer of the U. S. in New York, and the interest to the manager of the clearing-house and chairman of the clearing-house committee jointly. This interest was payable semi-annually. The certificates were made available by a vote of the association for the settlement of balances at the clearing-house, and were so used, thus changing daily the amounts held by each bank, and frequently (by the presentation of them by individual banks to the U. S. treasury for payment) changing the aggregate amount issued. The interest was collected and disbursed to the several banks by the clearing-house regularly every six months, and each bank received the exact amount of interest due it, notwithstanding the amounts held by it for the whole period had changed daily.

The apparent intricacy of the calculations necessary to arrive at such results troubled some of the banks in other cities, which were desirous of availing themselves of the privileges offered by the use of these certificates; and in one or two instances committees were sent to New York to ascertain the process of computation in use, the simplicity of which, when explained, not only astonished them, but confirmed them in the opinion of the usefulness of an institution capable of adjusting with so much ease calculations which, at first sight, appeared so difficult. The largest amount of clearing-house certificates in use in the city of New York at any one time was $36,000,000.

The clearing-house is located at No. 14 Pine Street, the building being owned by the association. The clearing-room is provided with a continuous line of desks, sixty-four in number, one for each bank, each desk bearing the name and number of the bank by which it is occupied; the banks being numbered according to the date of their organization, the oldest (the Bank of New York) being No. 1. Each bank

is represented every morning by two clerks—one a messenger, who brings with him the checks, drafts, etc., that his bank has received the day previous upon the other banks, which are called the "exchanges," and are assorted for each bank and placed in envelopes. On the outside of each envelope is a slip on which are listed the amounts of the various items which it contains. These envelopes are arranged in the same order as the desks for the several banks. The messengers, sixty-five in number, take their places in a line outside of the line of desks, each opposite the desk assigned to his bank, while on the other side of the desk is a clerk with a sheet containing the names of all the banks arranged in the same order, with the aggregate amounts his messenger has against each bank.

The hour for making the exchanges or general delivery is 10 A. M. Just previous to that time the manager takes his position at an elevated desk and calls the house to order. At a signal from a bell struck precisely at ten o'clock, each messenger moves forward to the desk next his own, and delivers the envelopes containing the checks, etc., for the bank represented by that desk to the clerk on the inside, together with a printed list of the banks in the same order, with the amount opposite each bank. The clerk receiving it signs and returns it to the messenger, who immediately passes to the next desk, delivering the exchange for the bank represented by that desk, and so on until he has made the circuit of the room and reached his own desk, the starting-point, having delivered to each bank the exchanges he had for it, and consequently delivering his entire exchanges for all the banks. Every other messenger does the like, the whole moving on at the same time. In other words, each messenger has visited every bank and delivered to each everything his bank has received the day previous from it, taking a receipt for the same, consequently the entire exchanges are delivered; while each clerk upon the inside has of course received from every other bank the amounts each had against his bank. This operation occupies exactly ten minutes, and accomplishes what could not otherwise be done in less than six or eight hours.

Besides the saving of time gained by this method, each bank is enabled to know the exact balance for or against it at once, as the clerks, after receiving the envelopes containing the checks, etc., immediately enter from the slips, upon their own sheets, the aggregate amount from each bank; the difference between the total amount they have received and the total amount brought by them being the balance either due to or from the clearing-house to each bank.

The messengers then receive from their several clerks the various envelopes containing the exchanges, and return to their banks, reporting their condition, debtor or creditor as the case may be. The clerks then report to the assistant manager the amount they have received, they having reported the amount each brought upon first entering the room. These amounts are entered in separate columns on what is termed a "proof-sheet," and if no errors have been made the manager, finding that both columns agree, announces that the "proof is made," and the clerks return to their respective banks. If, however, any error has been made by any of the sixty-four clerks, it is indicated on the proof-sheet, and the clerks are then required to revise and examine their work; and not until every error has been discovered and corrected are the clerks allowed to leave.

The clerks are allowed thirty-five minutes after the delivery of the exchanges to enter, report, and prove their work. If any errors are discovered after that time, fines are imposed for each error, which are collected monthly by drafts on the banks fined.

Various and ingenious methods are resorted to for discovering errors, and the manager, from long experience, generally is enabled to anticipate the nature of the error, whether in entry, footing, or transposition, and thereby facilitate its discovery by applying at once the best method of examination. When it is remembered that there are sixty-five sheets, each containing 130 entries, in all 8,450 entries, the difficulty in discovering where the error is in the shortest possible time is apparent.

The entire business of the morning is usually accomplished in one hour. The debit banks are required to pay to the manager in legal-tender notes or coin, previous to half-past one o'clock the same day, and the credit banks receive immediately after that hour the amounts due by or to them respectively, thus by one process settling exactly the entire transactions of all the banks of the day previous.

A record is kept of the daily transactions of each bank, and a statement of the loans, specie, legal tenders, deposits, and circulation made weekly to the manager of the clearing-house, so that the movement of each bank can be determined and its condition pretty accurately estimated. Its other records and statistics are most complete and valuable for reference by bank officers. No other clearing-house in the U. S. approaches that of New York in importance; but almost every large city has an institution of the same kind. The figures for the leading clearing-houses of the U. S. for the year ending Dec. 31, 1900, were as follows:

	Millions of dollars.		Millions of dollars.
New York	52,634	Omaha	579
Chicago	6,799	Cleveland	565
Boston	6,180	New Orleans	556
Philadelphia	4,677	Detroit	427
St. Louis	1,688	Louisville	424
Pittsburg	1,615	Providence	326
Baltimore	1,084	Milwaukee	298
San Francisco	1,029	Buffalo	259
Cincinnati	795	Washington	259
Kansas City	775	St. Paul	247
Minneapolis	579	Denver	216

Returns from these and a number of others of less importance show a total for the whole country of $86,160,587,352. To a great extent New York acts as a general clearing-house for the whole country, drafts of one section on another being liquidated through New York; while each of the other clearing-houses simply does a local business of greater or less importance.

Even more commanding than the position of New York in the U. S. is that of London in England. The London clearing-house was established in 1775. The Bank of England did not join it till 1864. The clearings have of late years not averaged quite as large as those of New York. For the details of its management, see Bagehot's *Lombard Street*. In France and Germany the system of payment by check is not so well developed as in England and the U. S., and clearing-houses have not made much progress.

Railway Clearing-house.—In the sale of through tickets, or in payments for through freight, one road will often receive money from the public for work performed by another; and a system of mutual liabilities is created, not unlike those which arise when one bank handles drafts on another. The British Railway Clearing-house was devised to settle accounts of this kind. First established in 1842, it was incorporated in 1850, and now regulates the through traffic accounts of practically the whole railway system of the United Kingdom. There have been similar attempts in the U. S., but none quite so successful. By far the best is that of the Southern Railway and Steamship Association, which was organized in 1873, and established a clearing-house in 1875, under the able suggestions of Albert Fink. This clearing-house, located at Atlanta, now settles the through traffic accounts of all the lines S. of the Potomac and Ohio, and E. of the Mississippi, as well as those of the connecting steamship lines.

A similar extension of the principle of clearings resulted in the establishment of a *Stock Exchange Clearing-house* in New York, in May, 1892, to prevent the necessity of numerous transfers of stock from hand to hand. Matters are settled by a combination of stock balances and cash balances, both being very small in proportion to the aggregate of business done.

A. T. Hadley.

Clearing Nut: the seed of a small tree (*Strychnos potatorum*) of the *Loganiaceæ* or Nux Vomica family, and native of India. It has ovate, pointed leaves, black edible fruits about as large as a cherry, each containing a single seed. The popular name refers to its reputed remarkable property of clearing muddy water. It is said that when the seeds are rubbed on the inside of a vessel the muddy water afterward put into it soon becomes cleared.

C. E. B.

Clear Lake: in Lake co., Cal.; is 112 miles N. of San Francisco, and is nearly 24 miles long. The width varies from 2 to 6 miles. It is surrounded by a picturesque region which is frequented by tourists and hunters. Deer, bears, panthers, and foxes abound here. Fish of various kinds are found in this lake.

Cleaveland: See Cleveland.

Cleaveland, Moses: founder of Cleveland, O.; second cousin of Parker Cleaveland; b. in Canterbury, Wind-

ham co., Conn., Jan. 29, 1754; became a lawyer, but was also a captain of sappers and miners during the closing years of the Revolutionary war. He was one of a company which purchased for $1,200,000 from Connecticut the land in Ohio reserved to the State by Congress and known as the Western Reserve. In 1796 he led a party of surveyors and pioneers to the present site of Cleveland, laid it out in building lots, and his companions named it for him. The name of the city was abbreviated to its present form in 1830 by the publisher of the first newspaper there, who needed room in his headline. The founder died in his native town, Nov. 16, 1806.

Cleaveland, Parker, LL. D.: mineralogist and chemist; b. in Rowley, Mass., Jan. 15, 1780; graduated at Harvard, 1799; studied law; tutor in mathematics at Harvard 1803–05. In 1805 he was chosen professor in Bowdoin College, and in all the fifty-three years of his connection with the institution missed on his own account only three recitations. His admirable work on *Mineralogy and Geology*, which earned for him the title of "father of American mineralogy," was published in two volumes in 1816, and passed to a second edition in 1822. He was dean and Professor of Chemistry of the medical school organized at Bowdoin in 1821. D. in Brunswick, Me., Oct. 15, 1858.

Cleburne: town; capital of Johnson co., Tex. (for location of county, see map of Texas, ref. 3–H); on Tex., Gulf, Col., and Santa Fé R. R.; 4 miles from Nolan river and 15 miles from the Brazos river; 28 miles from Fort Worth and 56 miles from Dallas. The town has nine churches, good public schools, college for girls, handsome public buildings, an ice-factory, mills, and other industries, and water-works. The chief industry is agriculture. Pop. (1880) 1,855; (1890) 3,278; (1900) 7,493.

Editors of "Enterprise."

Cleburne, Patrick Ronayne: a Confederate general; b. in County Cork, Ireland, Mar. 17, 1828; ran away from college and enlisted in the British army; served three years and then removed to Arkansas, where he was a lawyer before the civil war. He enlisted as a private in the Confederate army, and rose to the command of a corps; commanded a division of the Confederate army at the battle of Stone River, which ended Jan. 2, 1863, and at Chickamauga in September of that year distinguished himself by his defense of Ringgold Gap. He was killed at the battle of Franklin, Tenn., Nov. 30, 1864. He was a daring and popular officer, and he instituted the Order of the Southern Cross.

Cledo'nius: a grammarian of the fifth century, who taught at Constantinople. His grammatical treatise, which is in reality a commentary on the celebrated work of Donatus, is printed in vol. v. of Keil's ed. of the *Grammatici Latini*.

Cleef, Johann. van: Flemish painter; b. in Vanloo in 1646: a pupil of Gaspar de Crayer, after whose death he was commissioned to finish the cartoons for the tapestries of Louis XIV. His paintings are numerous in Brabant and Flanders. D. in Ghent, 1716.

Clef [from Fr. *clef*, key < Lat. *clā'vis*, key: Gr. κλείς]: a character placed on the musical staff, by which the names of the notes are fixed. There are three clefs—viz.: the G or *treble* clef (on the second line); the F or *bass* clef (on the fourth line); and the C clef, which is placed on the fourth line for the *tenor*, and on the third line for the *alto*. The C clef was also formerly used for the soprano voice. It was written on the first line of the staff. The G and F clefs are now in most general use, both in vocal and instrumental music. And though a tenor part with the G clef is really an octave out of place, yet this is understood by the singer.

Cleisthenes: See Clisthenes.

Cleitus: See Clitus.

Clem'atis [from Gr. κληματίς, deriv. of κλῆμα, branch of a vine]: a genus of about 100 species of herbaceous or soft-wooded, mostly climbing plants, of the family *Ranuncutaceæ*, mostly confined to the temperate regions. They have opposite leaves, valvate sepals, minute petals or none, and hairy or feathery styles. There are many species native to North America, among which are *C. virginiana* E. of the Rocky Mountains, and *C. tigusticifolia*, from the Great Plains westward, both high climbers with profuse foliage and very numerous, large clusters of white flowers. These are admirably adapted for covering arbors, trellises, screens, etc., for which purpose they are much used under the name of virgin's bower. Two similar European species, *C. flammuta* and *C. vitalba*, are also much grown, the latter bearing in England the name old-man's-beard and traveler's-joy. The single flowered species have been greatly modified under cultivation, the flowers being greatly enlarged and much changed in shape. This is especially the case with *C. florida* from Japan, *C. lanuginosa* from China, etc. C. E. B.

Clémenceau, klā'maăn'sō', Eugène: b. at Mouilleron-en-Pared, in the Vendée, Sept. 28, 1841; studied medicine at Nantes and Paris, and began to practice as a physician in the eighteenth arrondissement (Montmartre) of Paris in 1865. His popularity soon became unbounded. On Sept. 4, 1870, he was elected mayor of the arrondissement, and Feb. 8, 1871, he was elected member of the National Assembly. Unable to prevent the execution of the generals Lecomte and Clement Thomas, Mar. 18, 1871, and to bring about a reconciliation between the Commune and the Versailles government, he resigned his position as mayor. In the National Assembly he voted for the continuation of the war. Elected a member of the Chamber of Deputies, Feb. 20, 1876, he took his seat on the extreme left, and was the acknowledged leader of the radical republican party. He pronounced in favor of full and general amnesty; was one of the 363 deputies belonging to the united Left who refused to give the cabinet of Broglie a vote of confidence; was also a member of the committee of eighteen charged by the republican majority with watching the proceedings of the anti-parliamentary cabinet, and with directing the resistance against them. He was defeated in the general election of Sept., 1893, and has not since sat in the chamber. Editor of *La Justice*, a radical journal.

Clem'ens: Bishop of the Frisians. See Wilibrord.

Clemens, Hon. Jeremiah: politician; b. in Huntsville, Ala., Dec. 28, 1814; became a lawyer in 1834; distinguished himself in State politics and in the affairs of Texas in 1842. He served with distinction in the Mexican war, was rapidly promoted in the army, and became colonel in 1848. He was U. S. Senator from Alabama 1849–53. He held office under the Confederacy, though not a warm friend of the Southern cause. D. in his native town, May 21, 1865.

Clemens, Samuel Langhorne, A. M. (better known as *Mark Twain*): a humorist; b. at Florida, Mo., Nov. 30, 1835. "Mark Twain" was the *nom de ptume* of Capt. Isaiah Sellers, who furnished river news for the New Orleans *Picayune*. He died in 1863, and Clemens took up his *nom de ptume*. He became a journalist in Virginia, Nev., in 1862, and subsequently followed the same profession in San Francisco and in Buffalo, N. Y. Since 1867 he has resided mainly at Hartford, Conn. Author of *The Jumping Frog* (1867); *The Innocents Abroad* (1869); *Roughing It* (1872); *Adventures of Tom Sawyer* (1876); *A Tramp Abroad* (1880); *The Stolen White Elephant* (1882); *The Prince and the Pauper* (1882); *Life on the Mississippi* (1883); *Huckleberry Finn* (1885); *A Yankee at King Arthur's Court* (1890); *Joan of Arc* (1896); and, with C. D. Warner, a story, subsequently dramatized, called *The Gilded Age* (1874). Revised by H. A. Beers.

Clemens Romanus: See Clement I.

Clem'ent of Alexandria (Lat. *Titus Flavius Clemens*, or *Clemens Alexandrinus*): an eminent Father of the Christian Church; supposed to have been a native of Athens, and originally a pagan. B. about 150, he passed the greater part of his life at Alexandria, where he became a disciple of Pantænus, a Christian philosopher, and his successor as head of the famous catechetical school, and acquired a high reputation for wisdom and virtue. Origen was one of his pupils. He was ordained a presbyter, and in 202 A. D. retired to Palestine to escape persecution. Clement was more addicted to speculative philosophy than most of the Fathers of the Church. Among his extant works (written in Greek) are *Pædagogus* and *Stromata* (Gr. Στρωματεῖς), which is a medley of religious thoughts, anecdotes, and maxims of philosophy. Time and place of his death are unknown. His works are translated in *Ante-Nicene Fathers* (New York, Christian Literature Company, vol. ii.). See the special treatises upon him by J. Kaye (London, 1835; n. e. 1890); J. H. Reinkens (Breslau, 1851); C. E. Freppel (Paris, 1866).

Clement I. (or **Cle'mens Roma'nus**): the earliest of the Apostolic Fathers; a bishop, accounted by Roman Catholic writers as fourth in the order of succession at Rome. Origen (254) identifies him with the Clement of Phil. iv. 3, but this may be only a conjecture. Irenæus (202) makes

him the third after the apostles Peter and Paul, Linus being the first, and Cletus (or Anacletus) the second. Eusebius says he died in the third year of Trajan, "having for nine years superintended the preaching of the Divine word." Accordingly, he presided over the Church from 91 or 92 to 100 or 101 A. D. His Epistle to the Corinthians (Eng. trans., New York, Christian Literature Company, ed. *Ante-Nicene Fathers*, vol. i.), written about 95 A. D., consists of sixty-five short chapters, and in bulk is about one-half larger than St. Paul's First Epistle to the Corinthians. It used to be read in many ancient churches, but was not included in any of the ancient lists of authoritative books. Other writings ascribed to Clement are not his. (See CLEMENTINES.)—CLEMENT II.; a native of Saxony; elected pope in 1046 on the abdication of Gregory VI., through the influence of Emperor Henry III. He crowned the Emperor Henry III., and died in 1047. He was the first of the six German popes.—CLEMENT III.; a native of Rome; was elected pope in 1187. He pacified the citizens of Rome by allowing them to elect their own magistrates, while retaining the appointment of the governor of the city, and promoted the third crusade against the Saracens. D. in 1191. There was also an anti-pope of this title, who died in 1100. —CLEMENT IV. (GUY FOULQUES) was born in France. He succeeded Pope Urban IV. in 1265 through the patronage of Louis IX. of France; befriended the cause of Charles of Anjou in Naples; was a protector of Roger Bacon; kept the papal residence at Viterbo; d. in 1268.—CLEMENT V., POPE, was a Frenchman named BERTRAND DE GÔT. He was chosen pope in 1305, as successor to Benedict XI. To gratify Philippe IV., King of France, to whom he was subservient, he resided at Avignon, which became the capital of the popedom. This innovation gave much offense and caused a long schism in the Church. He suppressed in 1311 the order of Templars, promulgated the Clementine Constitution in 1313, and was the first pope to assume the threefold crown. D. in 1314, and was succeeded by John XXII.—CLEMENT VI. (PIERRE ROGER); b. at Limousin, in France; succeeded Benedict XII. as pope in 1342. He reigned at Avignon, the sovereignty of which he purchased from Joanna of Naples. The principal events of his reign were a dispute with Edward III. over ecclesiastical prerogatives in England, the excommunication of the Emperor Louis IV., and his attempt to reunite the Eastern and Latin Churches. D. in 1352, and was succeeded by Innocent VI.—CLEMENT VII. (ROBERT, COUNT OF GENEVA), ANTI-POPE; was Bishop of Cambray when in 1378 he was elected anti-pope in the time of Urban VI. With him began the great Western schism. D. in 1394.—CLEMENT VII. (GIULIO DE' MEDICI), a cousin of Leo X., whose principal minister and counselor he was. Unable to procure his own election on the death of his uncle, he secured that of Adrian VI. of Utrecht, in 1522, and on Nov. 14, 1523, succeeded him. At first he adhered to the Emperor Charles V., but after the battle of Pavia, alarmed at the imperial preponderance, he joined the Italian princes in a league with France. Tumults in Rome led him to invoke the protection of Charles, but as soon as he was relieved from peril at home he went back to the French alliance, which brought upon him the mercenary army of the Constable Bourbon, who sacked the city and held the pope in captivity for six months, 1527. Confronting the Reformation, he wished the emperor to proceed with vigor against the Lutherans, but at the same time evaded his demands for the assembling of a general council. The same embarrassments attended his procrastination in the case of Henry VIII.'s divorce from Catharine of Aragon. He feared to offend the emperor or to alienate the king, and by his vacillation allowed the breach between the English crown and the papacy to take effect, although he issued in 1534 a bull against Henry. His administration, irresolute and diplomatic, was disastrous to the papacy, and witnessed the withdrawal from its jurisdiction of Great Britain and Northern Germany. He died in 1534.—CLEMENT VIII. (IPPOLITO ALDOBRANDINI), POPE; a native of Fano, in Italy; was chosen in place of Innocent IX. in 1592. He annexed the duchy of Ferrara to the papal states; reconciled Henry IV. of France to the Church; resisted the influence of Spain upon the papacy; authorized the execution of GIORDANO BRUNO (*q. v.*) in 1600; had a reputation for prudence and ability. D. in 1605, and was succeeded by Leo XI.—CLEMENT VIII. (EGIDIO MUÑOZ), ANTIPOPE; canon at Barcelona; was in 1424, after the death of Benedict XIII., elected pope by three cardinals. His resignation in 1429 ended the great schism of the West.—CLEMENT IX. was born at Pistoja in 1600, and was chosen pope in June, 1667, as the successor of Alexander VII. D. in Dec., 1669, and was succeeded by Clement X.—CLEMENT X. (EMILIO ALTIERI) was a native of Italy. He was nearly eighty years old when he became pope in 1670. He died in 1676, and was succeeded by Innocent XI.—CLEMENT XI. (GIOVANNI FRANCESCO ALBANI) was born at Pesaro, in Italy, in 1649. He succeeded Innocent XII. in 1700, and in 1713 issued the famous bull *Unigenitus*, which condemned 101 propositions of Quesnel's work on Grace and Predestination. This bull was approved by the Jesuits and opposed by the Jansenists. Clement aided the Pretender in his effort to seize the British crown in 1715. D. in 1721. Innocent XIII. was his successor. (See Lafitau, *Vie de Clément XI.*, 1752.)—CLEMENT XII. (LORENZO CORSINI) was born at Florence in 1652. He became pope in 1730, as the successor of Benedict XIII.; was reputed by some writers to have become blind; was the first pope to condemn Freemasonry. He died in 1740, and was succeeded by Benedict XIV.—CLEMENT XIII. (CARLO REZZONICO) was born in Venice in 1693, and succeeded Benedict XIV. as pope in 1758. He offended the French and Spanish monarchs by impolitic attempts to assert his prerogative. He issued a bull in favor of the Jesuits, who had been expelled in 1767 from France and Spain. D. in 1769, and was succeeded by Clement XIV.—CLEMENT XIV. (GIOVANNI VINCENZO ANTONIO GANGANELLI), an eminent and learned pope; b. near Rimini in 1705. He succeeded Clement XIII., May 19, 1769. His election was accomplished after an exciting contest, influenced by the purpose of the European sovereigns to exclude from the papacy any friend of the Jesuits. His administration aimed at the reconciliation of ecclesiastical and secular interests, and, though he pursued this object with acknowledged purity and ability, his memory became in a large part of the Church the most obnoxious in the papal list. He issued the papal bull *Dominus ac Redemptor noster*, July 21, 1773, dissolving the whole order of the Jesuits, because of its lapse from its primitive purpose and its evil influence. He founded the Clementine Museum in Rome. D. Sept. 22, 1774, not without the suspicion of poison, detested by the Ultramontanes and deplored by his secular subjects. See Caraccioli, *Vie de Clément XIV.*, 1775; Theiner, *Geschichte des Pontificats Clements XIV.* (3 vols., 1853), which is very friendly, and charges that Clement's enemies have apparently caused the disappearance of important documents.

Clement, ARTHUR GALETTE, A. M.: educator of the blind; b. at West Bethany, N. Y., Dec. 31, 1854; educated at University of Rochester; appointed superintendent of New York State Institution for the Blind at Batavia, N. Y., 1883; author of *The Home Education of the Blind*, and other articles read before the American Association of Instructors for the Blind.

Clementi, klā-men'tēē, MUZIO: Italian pianist and composer; b. in Rome in 1752. He was patronized by Mr. Beckford, who took him to England about 1765. At the age of eighteen he composed his Opus 2, which is regarded as the basis on which the whole fabric of modern sonatas for the piano has been founded. He composed numerous sonatas and wrote the *Gradus ad Parnassum*, a series of 100 piano studies, a master-work which may be regarded as the foundation upon which the modern piano technique has been built up. D. at Evesham, Mar. 10, 1832.

Clem'entines, or **Pseudo-Clementines**: a name given to two writings, the *Homilies* and the *Recognitions*, falsely ascribed to Clement of Rome. They originated in Rome about the middle of the second century.

The name Clementines is also applied to that part of the canon law which was collected and published by Pope Clement V. (1305–14).

Cleom'brotus (in Gr. Κλεόμβροτος): a Spartan general; brother of Leonidas, who fell at Thermopylæ. He commanded the army in 480 B. C., after the death of Leonidas. He was the father of Pausanias, who defeated the Persians at Platæa.

Cleombrotus I.: King of Sparta; grandson of the preceding; began to reign in 380 B. C. He commanded the Spartans at Leuctra, where he was defeated by Epaminondas and killed in 371 B. C. He left two sons, Agesipolis II. and Cleomenes II.

Cleome'des (in Gr. Κλεομήδης): an ancient Greek astronomer whose native place and period are unknown. He

wrote a remarkable treatise on astronomy entitled *The Circular Theories of the Heavenly Bodies*, which is extant and has been printed. This contains several scientific truths, as the spherical figure of the earth and the revolution of the moon about the earth.

Cleom'enes, or **Kleomenes** (in Gr. Κλεομένης) **I.**: King of Sparta; succeeded his father, Anaxandrides, about 518 B. C. He liberated Athens from the domination of the Pisistratidæ in 510, but he afterward attempted to restore Hippias. He procured the dethronement of Demaratus, who had reigned jointly with himself. He died in 489 B. C., and was succeeded by his half-brother, the heroic Leonidas.

Cleomenes III.: King of Sparta, of the Agidæ line; a son of Leonidas II. He began to reign in 236 B. C., and resolved to restore the ancient Spartan virtue and discipline. He declared war against the Achæan League, and defeated Aratus at Megalopolis in 226 B. C. He put to death all the ephori except Agesilaus (who escaped), made a new division of land, and restored the old social system. Antigonus, King of Macedon, who was an ally of the Achæans, defeated Cleomenes at Sellasia in 222 B. C. Cleomenes fled to Egypt, and killed himself in 220 B. C. See Plutarch, *Cleomenes* and *Aratus*.

Cle'on, or **Kleon** (in Gr. Κλέων): an Athenian demagogue distinguished for his insolence and venality; was a tanner in his youth. He is first mentioned in history about 428 B. C. He was a leader of the democracy or lower classes. In 425 B. C. Cleon and Demosthenes conducted a successful expedition against Sphacteria. He commanded an army which was sent against the Spartan general Brasidas in 422 B. C. Cleon and Brasidas were both killed in the battle of Amphipolis, where the Athenians were defeated. His character is depicted with great exaggeration in Aristophanes's *The Knights*, and even the narrative of Thucydides is hardly just in this point.

Cleopa'tra (in Gr. Κλεοπάτρα): Queen of Egypt; a daughter of Ptolemy Auletes; b. in 69 B. C. She was distinguished for her personal charms, was richly endowed with mental gifts, and was mistress of the Greek and other languages. Her father dying in the year 51, left the throne to her in partnership with her brother Ptolemy. The latter deprived her of royal power, but Julius Cæsar interposed in 48 B. C., and restored her to the throne after her brother Ptolemy had been killed in battle. She captivated the affection of Cæsar, and accompanied him to Rome in the year 46, and bore him a son known as Cæsarion. After he had been killed in 44 B. C., she returned to Egypt. Soon after the battle of Philippi (42 B. C) she was summoned by Antony to appear before him in Cilicia, and sailed up the Cydnus. He was fascinated by her charms, and spent much time with her in Alexandria. Her fleet fought against Augustus at Actium, she being present, 31 B. C. She was the first to order a retreat on this occasion, and was eventually taken prisoner by Augustus, who intended to exhibit her in a triumphant procession in Rome. She died in 30 B. C. That she killed herself by the poison of an asp is now considered improbable. See Egypt, Ancient.

Cleopatra's Needles: two obelisks of red granite which formerly stood in front of the temple of Cæsar at Alexandria in Egypt. One of them now stands on the Thames Embankment in London, having been erected there in 1878. The other, which stands in Central Park, New York, was first erected, about 1600 B. C., at Heliopolis, a city of Egypt near the delta of the Nile, by Thothmes III., a famous Egyptian monarch, to commemorate his power. The obelisk is covered with hieroglyphics, each side having three perpendicular lines of them, the central one on each side referring to Thothmes, and the others to Rameses II., the supposed Sesostris; it was dedicated to the god Ra, or the Sun, and stood before the temple of Tun in Heliopolis till removed to Alexandria in Egypt, and set up there 23 B. C., where it remained till it was transported to New York in 1880, having been presented to the U. S. by Ismail Pasha, a former Khedive of Egypt. These obelisks bear their popular name, "Cleopatra's Needles," on account of a false tradition that they were brought to Alexandria in the time of Cleopatra. The one in New York is 69½ feet high, exclusive of the pedestal, 7 ft. 9 in. square at the base, and has a sharply pointed pyramidal top; weighs 196 tons, and is all in one piece. See Obelisk; also Gorringe, *Egyptian Obelisks* (New York, 1882).

Clep'sydra, or **Clepsy'dra** [from Gr. κλεψύδρα < κλέπτειν, steal, conceal + ὕδωρ, water]: an instrument formerly used by the Greeks and Romans for measuring time by the gradual flow of water through one or more orifices. In its simplest form it was a vessel of known capacity, from which the water escaped through several holes in the bottom. To remedy the defect of the gradually decreasing rate of flow, another kind was used, in which the water was maintained at a constant level, the time being measured by the amount of water that was discharged. See Clocks.

Clerc, Jean le: See Leclerc, Jean.

Clerc, Laurent: a celebrated deaf-mute; b. in La Balme, near Lyons, France, Dec. 26, 1785. When one year of age he lost his hearing as the result of an attack of scarlet fever. At the age of twelve he became a pupil of Abbé Sicard at Paris, and in 1805 was a teacher of deaf-mutes under that eminent instructor. He removed to the U. S. in 1816 with Gallaudet, and was one of the founders of the Hartford asylum for the deaf and dumb, which was opened in 1817. He was a laborious and successful teacher of deaf-mutes. D. in Hartford, Conn., July 18, 1869.

Clergy: the ministers of the Christian Church as distinguished from the laity. In Scripture the Greek word *Klēros*, from which our word clergy is derived, is frequently used in its literal sense for "lot." Jerome says the word was applied to the clergy either because the Lord is their lot or because they were chosen by lot, as Matthias was. As early as the second century the word was used to mean not only a lot, but also an office, and the person to whom it was allotted. The clergy are divided into many classes, as deacons, priests, and bishops. To these, which are of divine origin, were added, in time, other classes, such as cardinals, patriarchs, primates, and archbishops, all dignities of ecclesiastical institution. In churches which have monastic orders the clergy of all ranks who serve Christ in the world, and are not bound by any other vows or rule of life but such as the general laws of the Church impose on all the clergy, are called *secular* or *diocesan* clergy. Those who bind themselves to observance of the special rules of some monastic order or religious congregation are called *regulars*. In the Protestant churches generally the distinction between the clergy and laity is less marked than in the Roman Catholic Church.

Two important privileges have generally belonged to the entire body of the clergy: first, they were exempted from the jurisdiction of secular courts in criminal and civil causes; second, excommunication was incurred by any one who should strike cleric or monk. John J. Keane.

Clerk, John: a Scottish naval tactician; b. at Eldin about 1730. He is said to have been the inventor of the manœuver in naval tactics called "breaking the line." This plan was first tried by Lord Rodney in Apr., 1782, when he gained a victory over the French admiral de Grasse. Clerk published in 1782 an *Essay on Naval Tactics*. D. May 10, 1812.

Clerk to the Signet: See Writer to the Signet.

Clermont, or **Clermont-Ferrand**, kler'mōṅ' fer'raṅ': a city of France; capital of the department of Puy-de-Dôme; finely situated on an eminence 208 miles S. by E. from Paris, with which it is connected by a railway (see map of France, ref. 6–F). It is near a range of extinct volcanoes, and is surrounded by remarkable scenery. It has some manufactures, and a considerable trade with Paris in the products of the surrounding country. It has a Gothic cathedral of the thirteenth century, a college, a public library of 1,600 volumes, a theater, a normal school, and a botanic garden. Clermont occupies the site of the ancient capital of the Arverni, which was originally called *Nemosus*, and afterward *Augustonementum*. It became a bishop's see about 250 A. D. The great council in which the crusades originated was held here by Pope Urban II. in 1095. Clermont was the capital of Auvergne for several centuries. Pop. (1891) 45,083; (1896) 50,870.

Clésinger, Jean Baptiste Auguste: French sculptor; b. in Besançon, Oct. 22, 1814; best known for his *Woman Bitten by a Serpent* (1847), *The Gypsy Girl*, and his many busts and statues. D. in Paris, Jan. 7, 1883.

APPENDIX.

Bhamo, b'-mō', or **Bhanmo**: a decayed city of Burma; on the Irawadi; in lat. 24° 16′ N., 300 miles above Mandalay (see map of N. India, ref. 7–M). It is still a local capital and the seat of a considerable trade. Large caravans laden with silk and other goods arrive here from October to May. Large quantities of raw cotton are also exported from this place. It was formerly the chief town of a Shan principality. Pop. 2,500. See Anderson's *Expedition to Western Yunnan* (1871).

Biddle, George W.: lawyer; b. in Philadelphia, Jan. 11, 1818; graduated at Mt. St. Mary's College, Maryland; studied law and was admitted to the bar of Pennsylvania in 1839, and took up his practice in Philadelphia; besides holding many minor offices in Philadelphia, he was a member of the constitutional convention of Pennsylvania in 1873; he became the leader of the bar of the State, and was retained in most cases of importance in the Supreme Court of the State; represented the U. S. in the fishery disputes with Canada in the first administration of President Cleveland; member of American Bar Association; and for a term was chancellor of the Law Association of Philadelphia. Besides numerous legal papers, including *Contribution among Terre-tenants* (1863), *Lien of the Debts of a Decedent upon his Real Estate in Pennsylvania* (1864), *Retrospective Legislation* (1880), and others, he wrote translations of the *Greek Orations of Demosthenes and Æschines on the Crown* (1881). D. Apr. 29, 1897. F. Sturges Allen.

Bielshöh'le: a curious cave situated in one of the Hartz Mountains, called Bielstein, on the right bank of the river Bode, in the duchy of Brunswick, Germany. It was discovered in 1762, and in 1768 a passage was found by which it could easily be entered. The entrance is over 100 feet above the bed of the stream, and the cave is about 600 feet deep, with eleven main compartments, besides an upper cave. These contain a great many curious arrangements of stalactites and stalagmites. In the eighth division the stalactites have a singular resemblance to a great organ, and in the ninth the stalagmites look like the waves of a sea.

Bird, Arthur: pianist and composer; b. in Cambridge, Mass., July 23, 1856; studied in Berlin, Weimar, etc., under Haupt, Loeschhorn, and Liszt, 1882–85; conducted the Milwaukee Musical Festival in 1886. His compositions are mainly for the piano, but he has also written some works for orchestra and a number of songs. D. E. Hervey.

Birrell, Augustine: English public man and author; b. 1856: educated at Amersham Hall School and Trinity Hall, Cambridge; B. A. 1872; called to the bar, Inner Temple, 1875; became a member of Parliament in 1889; author of *Obiter Dicta*.

Blair, Andrew George: statesman; b. in Fredericton, N. B., Mar. 7, 1844; educated at the collegiate school, Fredericton, studied law, and was admitted to the bar in 1866; elected to the New Brunswick Assembly in 1878, 1879, and 1882; defeated the Hannington ministry in 1883 and was called upon to form a new cabinet, and retained the premiership until July, 1896, when he became Minister of Railways and Canals. He is president of the Royal Victoria Hospital, Fredericton, and a fellow of the Royal Colonial Institute.

Blair, John Insley: b. in Warren co., N. J., Aug. 22, 1802. At the age of eleven he began work in the store of a relative in Hope, N. J., and remained there until 1819, when he settled in Blairstown, N. J., in partnership in a country store until 1821, and afterward continued the business independently for forty years, establishing various branch stores in partnership with his brothers and brothers-in-law. Mr. Blair's business interests rapidly extended so as to include flour-mills, cotton manufacture, the marketing of country produce, the development of iron mines, and the building of railroads, in connection with his coal interests. Having carried through the building of the Delaware, Lackawanna and Western R. R. system, between 1860 and 1870 he extended his operations westward, building the first railroad across the State of Iowa, laying the foundations of the great Chicago and Northwestern system. In connection with his large railroad interests in the West Mr. Blair was always the friend of liberal education, giving freely lands for church and school purposes. Besides founding and liberally endowing Blair Presbyterial Academy, at Blairstown, N. J., he contributed largely to Princeton and Lafayette, besides other colleges, and was one of the trustees of Princeton since 1866. Descending from Scotch ancestry, Mr. Blair was always a stanch Presbyterian, and in politics an ardent Republican, and was in 1868 the candidate of that party for Governor of New Jersey. D. in Blairstown, N. J., Dec. 2, 1899.

Blanchard, Albert Gallatin: soldier; b. in Charlestown, Mass., Sept., 1810; graduated at the U. S. Military Academy; served on the frontier until 1840, when, as a first lieutenant, he resigned; was a merchant in New Orleans, La., 1840–46, and director of public schools there 1843–45. He served during the war with Mexico as a captain of Louisiana volunteers, re-entered the regular army as a major, and again resigned July 25, 1848, afterward teaching for a time in the public schools of New Orleans, then becoming a surveyor, and being connected with several railroad companies. He entered the Confederate army as a brigadier-general in 1861, and in 1862 he was accused of issuing an order urging the people to fire at the Union troops from behind trees, and to obstruct their progress in every possible way. After the war he was a civil engineer and surveyor in New Orleans. D. in New Orleans, June 21, 1891.

Bliss, Cornelius Newton: merchant and politician; b. in Fall River, Mass., Jan. 26, 1833; educated in public schools and an academy in Fall River and a high school in New Orleans; member of a commission firm in Boston, afterward in New York; chairman of Republican State committee of New York 1887–88; treasurer of national Republican committee 1892–96; appointed Secretary of the Interior Mar. 5, 1897; resigned Dec. 21, 1898.

Bliss, George: b. in Springfield, Mass., May 3, 1830; graduated at Harvard College in 1851; was associated with David A. Wells in the publication of the *Annual Scientific Dictionary*, after which he studied and traveled two years in Europe; returned to the U. S. and was admitted to practice law in Massachusetts and New York; in 1862 was paymaster-general of the State of New York; in 1862–63, as a representative of the Union League Club of New York, he organized the 20th, 26th, and 31st Regiments of the U. S. colored troops. Resumed the practice of law in 1866; in 1873 was appointed U. S. District Attorney for the Southern District of New York; in 1881–82 was the active counsel for the U. S. Government in the trial of the "Star Route cases." He has written or edited a number of legal works, including *Law of Insurance* and the *Code of Civil Procedure*, which have run through many editions, and has been an active contributor to magazines and newspapers, chiefly on political subjects. He drew the charter of 1873 of the State of New York, and has been active in drawing up and procuring the passage of many other papers affecting the laws of that State, including *Special and Local Acts Relating to the City of New York* and the *New York City Consolidation Act*. D. in Wakefield, R. I., Sept. 2, 1897. F. Sturges Allen.

Bloomfield-Zeisler, Fanny: pianist; b. in Bielitz, Austrian Silesia, July, 1866, but came to the U. S. when an infant; received her first musical instruction in Chicago, then studied five years under Leschetiszky in Vienna; made her

first public appearance in Chicago in 1876, when ten years old. Her real professional *début* was in Jan., 1884, in Chicago.

D. E. Hervey.

Bolton, Henry Carrington, Ph. D.: chemist; b. in New York city, Jan. 28, 1843; graduated at Columbia in 1862, and then studied chemistry in Paris under Wurtz and Dumas, in Heidelberg under Bunsen, in Göttingen under Wohler, and in Berlin under Hofmann. He received the degree of Ph. D. from the University of Göttingen in 1866. He was assistant in quantitative analysis in the Columbia School of Mines 1872–77, and during part of this time (1874–77) Professor of Chemistry in the Woman's Medical College of the New York Infirmary; Professor of Chemistry and Natural Science in Trinity College, Hartford, Conn., since 1877. Dr. Bolton was active in arranging for the celebration of the centennial of chemistry in Northumberland, Pa., the last home of Joseph Priestley, who discovered oxygen in 1774. Most of his important work has been literary. He is a member of the American Association for the Advancement of Science, and was its general secretary in 1878 and 1879, and vice-president of the chemical section in 1882. He was for several years corresponding secretary of the New York Academy of Sciences. He has contributed largely to scientific periodicals; has compiled several chemical works, including *Literature of Uranium* (1870; revised ed. 1886), *Literature of Manganese* (1877), and a *Catalogue of Scientific and Technical Periodicals, 1665–1882* (Smithsonian Institution, Washington, 1885); and is the author of *Student's Guide in Quantitative Analysis* (New York, 1879) and editor of several chemical text-books.

Book-plates: printed or engraved labels pasted within the front covers of books to denote ownership. The use of the book-plate dates back certainly to the last quarter of the fifteenth century. The earliest specimens known were made and used in Germany. They are rude woodcuts of the archaic type familiar to the student of engraving. About the year 1480 Friar Hildebrand Brandenburg and Younker Wilhelm von Zell gave books and manuscripts to the Carthusian monastery at Buxheim, and upon some of these they pasted heraldic devices recording the gifts. These are the earliest attested book-plates known to-day. The claim has been made, but not established, that book-plates were in use in Japan in the tenth century. Early in the sixteenth century the art of the book-plate received great impetus from Albert Dürer, who drew, if he did not actually cut in the wood, a number of undoubted book-plates. The first of these bearing a date was made for Hieronymus Ebner. It is dated 1516, and by its inscription, *Liber Hieronimi Ebner*, is clearly identified as a book-plate. Credit may properly be given to Dürer for making the book-plate what it is, for he transformed the crude drawing and rough woodcutting of his predecessors into an artistic design, ingeniously devised and skillfully engraved on wood or copper. Bilibald Pirckheimer, the Nuremberg jurist, and Dr. Hector Pomer, Provost of the Church of St. Laurence in the same city, had book-plates made by Dürer. In the Imperial Library at Vienna may be seen the original wood block of an armorial design for John Stabius, which was probably a book-plate. Bartsch ascribes it to Dürer. This measures 11 by 7½ inches. It is easy to be misled in looking over the armorial designs of Dürer and other German artists into believing that all of them were intended for use as book-plates; but there were other uses for heraldic prints, and there is need of investigation before accepting them as genuine book-plates. Coats-of-arms of many of the leading families of Nuremberg, as the Kress, Scheurl, Rieter, Haller, and Kurtz, continually come up among the early prints to torment and puzzle the collector. Among the celebrated German artists who made book-plates may be named Lucas Cranach, Hans Holbein, Hans Sebald Beham, Jost Amman, Hans Siebmacher, Hans Troschel, Wolffgang Kilian, Virgil Solis, Giles Sadeler. All along through the sixteenth and seventeenth centuries book-plates are numerous and of considerable merit as works of art. In the eighteenth century the most eminent engraver whose name appears on these small engravings is Daniel Nicolas Chodowiecki. The plates made under the supervision of Dürer seem to have been the first embellished with non-essential but highly artistic and desirable ornamentation. Ever since his day the ornamentation of the book-plate has been considered an important feature, and as this ornamentation conforms to the changing conditions, views, and tastes of the different nations, the student of book-plate art finds certain natural classifications ready to his hand. The early German book-plates as a rule are larger, bolder, and rougher than their successors in neighboring countries. Heraldry is seldom omitted, and allegorical features are common.

The earliest dated plate yet found in France was made in 1574, and was in the books of Charles d'Ailleboust, Bishop of Autun. It is a simple typographical label. The earliest dated armorial plate was engraved by Leonard Gaultier in 1611, and was for the library of Alexander Bouchart, Viscomte de Blosseville. French book-plates are not so numerous as the German, and the anonymous plates of the seventeenth and eighteenth centuries are difficult to identify. French heraldry is perplexing, as the early engravers did not conform to established rules with the regularity the collector deems commendable. There is considerable similarity between the early plates of Germany and France, but they are distinguishable by the marked differences in the heraldic devices of the two countries and by the manner of engraving. The French cut into the wood, while the German often cut in relief. The prints from these differently cut blocks are readily separated. French plates, as time went on, became more ornate than the German, resulting in a loss of dignity. Jacques Pieart, Isaac Briot, and Sebastien Le Clere in the seventeenth century, and J. Andran, Cochin *fils*, Collin *père*, Durand, Charles Eisen, Charles-Étienne Gaucher, Gravelot, Lonise Le Daulceur, B. Pieart, and Claude Roy in the eighteenth century, are among the most widely known French engravers who made book-plates. Probably the chief interest in the book-plates of France, among English-speaking collectors at least, centers in those used by the celebrities of the country. Men and women famous in state and court, in letters and art, used book-plates that are highly prized to-day.

Book-plates are found in all the continental countries, but the number is not large beyond the limits of Germany and France. Sweden began their use some years after Germany. Switzerland and Italy have plates dating very early in the seventeenth century, and Spain, Denmark, Russia and Austria, the Netherlands, and Norway contribute but few early examples.

It is in England that the book-plate has been most widely used, and the plates of that country furnish a most interesting field for investigation. England took the fashion from France, and was many years behind Germany. The early plates of England show an unmistakable French influence. It seems rather singular that the book-plate was so slow in getting into England. The sixteenth century is not known to have produced more than three examples, and none of an earlier period have been found. These three are the plate for the gift of books made by Sir Nicholas Bacon to the University of Cambridge (dated 1574), the one for Sir Thomas Treshame (1585), and one said to be in the Bodleian Library, dated 1518. In the seventeenth century, however, plates multiplied rapidly in England. Heraldry was the prominent feature of the design; and as English heraldry is governed by fixed rules, the student-collector is able to identify anonymous English plates with considerable precision. In the eighteenth century the number of plates is legion. The many changes in the ornamentation of the armorial device are called "styles." The first English plates with the full, elaborate mantling nearly surrounding the shield were called *Early Armorial* by Warren, whose nomenclature is universally accepted. Castle's subdivisions, *Tudoresque*, *Carolian*, and *Restoration*, serve to place these sixteenth and seventeenth century plates in closer chronological sequence. The *Early Armorial* style was prevalent up to about 1700, when the *Jacobean* came in. Plates in this style are rather stiff and formal in design, strongly resembling wood-carving in many ways. The arrangement is such that the two sides coincide in all details of outline and decoration. Columns, shells, fruit in inartistic, heavy clusters, flowers of a most unlifelike appearance, and mouldings and frames that seem to be copied from the furniture of the age, are used by way of ornament. This style gave way to the *Chippendale* about the year 1745. This is named after the famous London upholsterer and cabinet-maker, who about this time did so much for the artistic treatment of household furniture. Even so small a bit of property as the book-plate was influenced, and began to throw off the heaviness of its previous form, and to assume a lightness and grace that are most acceptable. The flowers on Chippendale plates look natural, the fruit bears more resemblance to the gift of Nature than to carved wood, the stiffness of the old frame gives place to an airy, light design, and the whole appearance of the plate

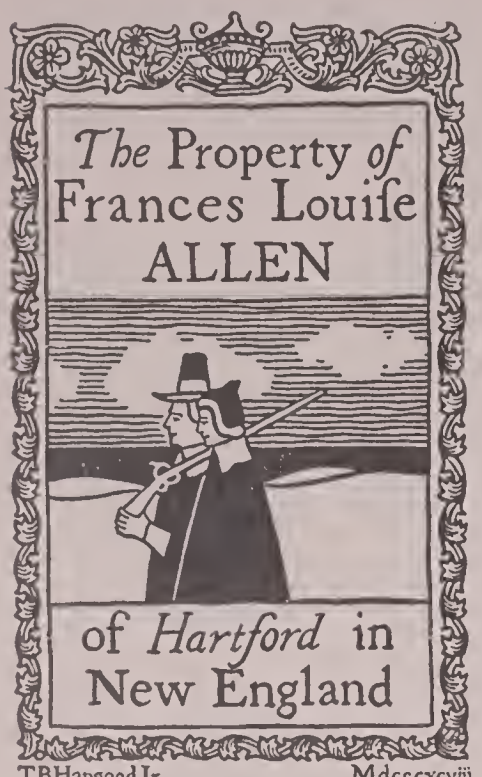
is altered. It is progressive, cheery, attractive. But the ornamentation of the Chippendale plate was overdone at length, and the style was succeeded about the year 1770 by the simple, severe designs known as the *Ribbon and Wreath*. This title quite clearly describes the style: it was merely the shield of arms inclosed in branches of palm tied with a bit of ribbon, something in the manner of the conventional victor's wreath. During the progression of all these styles the perfectly plain armorial plates were also in use. Gradually, too, the various styles known as the *Trophy*, *Library Interior*, *Book-pile*, and *Pictorial* were developed to suit the tastes of owner and designer. England has a great profusion of signed plates, Mr. Fincham's list (which includes a small proportion of Americans) giving over 1,500 different engravers and designers whose names appear on book-plates. Cole, Hogarth, Kirk, Marshall, Mountaine, Pine, Skinner, Strange, Vertue, Allen, Bartolozzi, Bewick, Cipriani, Lambert, Pye, Scott, Sherwin, and Yates are among the most widely known.

America took its book-plate styles from England. Undoubtedly the first plates in the U. S. came over already pasted into the books of some colonist bound for either the Southern or New England settlements. For some years the few that were used were made by British engravers. Early records show that orders were sent over to the London tradesmen by the wealthier colonists. The plates of William Penn, founder of the colony, and of Francis Page, of Virginia, are dated 1703, and are the earliest dated armorial book-plates used in the American possessions. Both of these were made in England. Page was a student at the Inner Temple when his was engraved; but Penn is described on his plate as *Proprietor of Pennsylvania*. There are several armorial plates used by colonists which bear dates previous to 1750, all of which are of English workmanship. The first American engraver to date a book-plate was Nathaniel Hurd, of Boston, whose charming plate for Thomas Dering is dated 1749. Dawkins made a plate for John Burnet in 1754, and Hurd engraved one for Benjamin Greene in 1757. The little group of native engravers on copper, self-taught in the art, are a most interesting subject of research. Nathaniel Hurd was the most prolific as well as the most artistic of them all. He made plates in the Jacobean, Chippendale, and Ribbon and Wreath styles. His patrons were from the first families of New England. Some thirty plates signed by Hurd are known and nearly a score more can safely be attributed to him. Joseph Callender, Amos Doolittle, Samuel Hill, Oliver Pelton, Paul Revere, and James Turner were New England engravers whose book-plates are rare and valuable. Very few plates by Paul Revere are known, and a print of the one he engraved for Epes Sargent (of which but three or four are known) sold at auction in Boston in 1895 for seventy-five dollars, the highest price, up to that time, ever paid for a single American book-plate. The plate of George Washington is naturally of peculiar interest, and not many copies are in the hands of collectors. The plate was engraved in England, and is not extraordinary in any way in itself. A very high value, however, is set upon the plate when pasted into a book once owned by Washington and having his well-known signature in its usual place on the title-page. This plate was once counterfeited, the fraudulent prints being used in an unsuccessful attempt to sell certain books as coming from Washington's library. The spurious prints are not so well executed as the genuine, and will not deceive if comparison is made. Probably the rarest American book-plate is the John Franklin, by James Turner. The New York and Southern group of engravers is headed by Peter Rushton Maverick, who came to this country from England about 1774. Nearly fourscore plates signed by Maverick are known, and about twenty more, though not signed, are considered his work. Other engravers in this group are Alexander Anderson (America's first wood-engraver), Henry Dawkins, Edwin Gallaudet, Abraham Godwin, Francis Kearney, William Rollinson, J. Smithers, James Trenchard, and John Vallance. Nearly all the American plates of the eighteenth century are armorial. Some few pictorial and a great number of typographical labels are known also. These printed labels were very common because inexpensive, and in the hands of an ingenious craftsman became quite ambitious, flowerets, ornaments, and various "sorts" being used in the composition. After the war of 1812 some American book-plates had guns, flags, trumpets, and other warlike emblems in their decoration. Although the use of the book-plate has never been entirely discontinued, it fell into general disuse toward the end of the first quarter of this century, and the plates from 1825 up to 1890 are few and of little merit, broadly speaking. Some individual book-collectors and some public libraries made use of engraved plates, but most of them are poor in design and in execution.

No general interest was taken in book-plates until the publication of Warren's *Guide*, in 1880, brought them sharply to the attention of bibliophiles. In the libraries and in many private collections numbers of book-plates were preserved in the old books they originally came in, and among a very limited number some notice was taken of them. When Warren was preparing his admirable book, he had the co-operation of such sterling book-lovers as the late Rev. T. W. Carson, of Dublin, and the late Sir Augustus Wollaston Franks, of the British Museum. Mr. Carson was, indeed, the ardent coadjutor of this pioneer, and without his continual encouragement and substantial aid the book probably would not have been written. One or two others, notably Henry Peckett, the Hon. Gerald Ponsonby, and Dr. Joseph Jackson Howard, were the only persons known to take a genuine interest in book-plates. Warren, who had no small poetic gift, and who was a thorough and painstaking student, made his book exceedingly interesting. Some years previous to this publication, namely in 1822 and 1823, *The Gentleman's Magazine* printed two articles on book-plates, and in 1837 the Rev. Daniel Parsons wrote at some length on the subject in the third *Annual Report* of the Oxford University Archæological and Heraldic Society. Following these, *Notes and Queries* had for a number of years references to book-plates. The paper by the Rev. Daniel Parsons showed considerable study and patient research. The first known collector of book-plates as such (for many examples found their way into the big collections of prints) was a Miss Jenkins, of Bath, who began collecting in 1820. Dr. J. J. Howard acquired her collection in 1837 and has been adding to it ever since. Probably the largest collection and one of the finest that have been gathered was owned by the late Sir A. W. Franks, who bequeathed it to the British Museum. It numbered well over 100,000 specimens. The collection Mr. Carson left numbered 32,000, and was sold in 1895 for £1,150. In January, 1897, Messrs. Puttick and Simpson held the first auction sale devoted to book-plates only, in their rooms, Leicester Square, London. The first volume of the *Western Antiquary*, edited by Mr. W. H. K. Wright, and published in 1881, contained an illustrated article on the book-plates of Francis Drake. In each annual volume of this magazine thereafter articles on the spreading hobby of book-plate collecting may be found. In 1890 the *Book-Plate Collector's Miscellany* was started as a supplement to the *Western Antiquary*, but within a year it was merged with the *Journal of the Ex Libris Society*, the official organ of the newly founded association of book-plate collectors. With the foundation of this society the present renascence of the book-plate may be said to have begun. When Warren's book found at length a good circulation among bookmen, a wonderful interest in book-plates sprang up, not only in England, but on the Continent and in the U. S.

In 1886 Mr. Laurence Hutton wrote articles for the *Book Buyer* on early American book-plates, and in the same year Mr. Richard C. Lichtenstein contributed a list of early New England and New York plates to the *New England Historical and Genealogical Register*. In 1881 the Rev. Joseph Henry Dubbs had reviewed Warren's book in the pages of Boston's *Literary World*. The late James Eddy Mauran, of Newport, R. I., and the late Henry F. Sewall, of New York, were the earliest collectors of book-plates on this side of the Atlantic. Mr. Mauran's collection numbered about 3,500 at his death in 1888. This collection had a most interesting history. A large part of it is now owned by Mr. H. E. Deats, of Flemington, N. J. The Sewall collection was sold at auction in 1896–97 along with the library Mr. Sewall left when he died. The first public exhibition of book-plates in the U. S. was made by the Grolier Club of New York in November, 1894. Since then the Rowfant Club of Cleveland (1895), the Caxton Club of Chicago (1898), and the Club of Odd Volumes of Boston (1896 and 1898), besides many smaller societies, together with booksellers and artists, have held exhibitions in many cities. In 1896 the Washington Book-Plate Society was founded. In 1897 it was made national and the name was changed to the American Book-Plate Society. Four numbers of an excellent quarterly were published in 1896–97. The publica-

tion was then discontinued and the society is now dormant. The first auction sale in this country devoted to book-plates alone was held by Messrs. C. F. Libbie & Co., in Boston, in February, 1897. From being an almost unconsidered trifle, the book-plate has come to exert a strong influence upon the price of books offered at auction, and the sale catalogues usually refer to the good plates in the books offered. The dealers in old books regularly mention the plates their stock contains in their periodical catalogues. In consequence of the recent revival of the book-plate, the collector now classes as "old" all plates made previous to 1880, and those dating before the present century are "early." The interest in the study of the plates of bygone years that Warren's book incited led naturally to the widespread adoption of the book-plate among the bookmen of today. Many fine plates have been made in the last decade, and the languishing arts of engraving and etching found in the new hobby unexpected encouragement. In England the best-known engraver is Mr. Charles W. Sherborn; the leading etcher is Mr. G. W. Eve. In the U. S. Mr. Edwin Davis French is the foremost engraver, Mr. W. F. Hopson leads as cutter in wood, and Mr. J. W. Spenceley is the best-known etcher.



American—present day.

The modern cheap methods of photographic reproduction may be held responsible for the great flood of book-plates the last few years have seen. The designs of greatest merit in this line have come from the studios of Mr. Edwin A. Abbey, Mr. R. Anning Bell, and Mr. Walter Crane in England, Mr. George Wharton Edwards and Mr. Thomas Brown Hapgood, Jr., in the U. S., and Herr Joseph Sattler in Germany. Hundreds of inferior designs are issued today which plainly show the debasing influence of so-called poster-art.

In addition to the Ex Libris Society, founded in London in 1891, which is thoroughly cosmopolitan in its membership, limited strictly to 500, there are two other societies of international importance. *Des Ex-Libris-Vereins zu Berlin* was established in 1891 and issues to members an illustrated quarterly magazine. The *Société Française des Collectionneurs d'Ex Libris* was organized in 1893. Its *Archives* are published monthly. The English society also issues a monthly journal.

The literature of the subject has grown very fast during the last eight years. Many privately issued monographs, now rare, and many articles in periodical literature would find mention in a complete bibliography. The works named below furnish, however, a fairly complete list of the authorities accepted by collectors. A. Ponlet-Malassis, *Les Ex Libris Français* (Paris, 1875); the Hon. J. Leicester Warren (the late Lord de Tabley), *A Guide to the Study of Book-Plates* (London, 1880); C. M. Carlander, *Svenska Bibliotek och Ex Libris anteckningar* (Stockholm, 1889); F. Warnecke, *Die Deutschen Bucherzeichen* (Berlin, 1890); Joannis Guigard, *Nouvelle Armorial de Bibliophile* (Paris, 1890); Henri Bouchot, *Les Ex Libris et Les Marques de Possession du Livre* (Paris, 1891); Egerton Castle, M. A., F. S. A., *English Book-Plates* (London, 1892); Walter Hamilton, *French Book-Plates* (London, 1892); W. J. Hardy, F. S. A., *Book-Plates* (London, 1893); Charles Dexter Allen, *American Book-Plates* (New York and London, 1894); Miss Norna Labouchere, *Ladies' Book-Plates* (London and New York, 1895); Walter Hamilton, *Dated Book-Plates* (London, 1896); Henry W. Fincham, *The Artists and Engravers of British and American Book-Plates* (London, 1897).

CHARLES DEXTER ALLEN.

Borodin, ALEXANDER PORPHYRJEVITCH: musician; b. in St. Petersburg, Russia, Nov. 12, 1834. He was Professor of Medicine and Chemistry in the Academy, and only an amateur musician and composer. He was president of the Society of Music-Lovers in St. Petersburg. His compositions include *Middle Asia*, a symphonic poem, two symphonies, several string quartets, some piano music, an opera, *Prince Igor* (MS.), and some church music. D. Feb. 28, 1887. D. E. HERVEY.

Borthwick, Rev. JOHN DOUGLAS, LL. D.: b. in Glencourse, near Edinburgh, Scotland, June 7, 1832; after a year's study in Edinburgh University became a teacher in Eastern Academy, Glasgow, and, beginning in 1850, taught in various Canadian high schools and academies; ordained a priest of the Church of England in 1866; was incumbent of St. Mary's, Hochelaga, twenty-five years; chaplain of the Montreal jail, and of the British troops in Canada until their withdrawal. He has written many books, including *A Cyclopædia of History and Geography* (1859); *The British-American Reader* (1860); *The Harp of Canaan* (1866); *The Battles of the World* (1866); *Every Man's Mine of Useful Knowledge* (1869); *The Dominion Geography* (1871); *The History of Scottish Song* (1874); *History of Montreal* (1875); *Borthwick Castle; or, Scenes from Scottish History* (1880); *Commercial Gazetteer of Montreal* (1885); *History of the Montreal Prison* (1886).

Bottome, MARGARET: b. in New York city, Dec. 29, 1828. She is president of the International Order of the King's Daughters and Sons, and of the women's branch of International Medical Missions; is associate editor of the *Ladies' Home Journal*, and contributes to religious magazines and papers on subjects affecting the lives of women; for about twenty-five years has given Bible readings in New York city homes. She has published *Crumbs from the King's Table*, *Seven Questions after Easter*, and *A Sunshine Trip to the Orient*.

Bourke, JOHN GREGORY: soldier and author; b. in Philadelphia, Pa., June 23, 1846; served as a volunteer private 1862–65; graduated at West Point and commissioned second lieutenant 1869; promoted first lieutenant May 17, 1876, and captain June 26, 1882; while engaged in campaigns against Indians wrote several ethnological treatises; was detailed for special duty in Washington, where he was connected with the Bureau of Ethnology; in 1892 rejoined his regiment, and was active in suppressing violations of neutrality laws on the Mexican border; did special service in the Latin-American Department of the Columbian Exposition in 1893; was president of the American Folk-lore Society in 1896. He wrote *The Snake Dance of the Moquis* (1884); *On the Border with Crook* (1886); *The Medicine Men of the Apaches* (1893); *The Folk Food of the Rio Grande Valley and of Northern Mexico* (1895). D. in Philadelphia, June 8, 1896.

Bovey, HENRY TAYLOR, D. C. L., LL. D.: b. in Devonshire, England, Mar. 7, 1852; educated at Cambridge; practiced as a civil engineer in England until 1877, when he became Professor of Civil Engineering and Applied Mechanics in McGill University, Montreal, Canada; afterward dean of the department of applied science. He was the founder of the Montreal Sanitary Association, and is a member of various societies of engineers. He is the author of *Applied Mechanics* (1883); *The Theory of Structures and Strength of Materials* (1892); *The Strength of Canadian Douglas Fir, Red Pine, and Spruce* (1895); *A Treatise on Hydraulics* (1895).

Boyle, DAVID: ethnologist; b. in Greenock, Scotland, May 1, 1842; went to Canada in 1856, and was apprenticed to a blacksmith, but became a teacher, and was for ten years principal of the public school at Elora, Ontario; formed a museum there which is one of the most important in the province; was instrumental in founding the Elora Mechanical Institute Library; discovered several important fossils; became a leading authority on the archæology of Ontario. He presented a valuable collection of Indian relics to the Canadian Institute of the Archæological Museum, of which he became curator in 1883. He had charge of the mineral exhibits from Ontario at the Cincinnati Centennial Exposition in 1888 and at the Imperial Institute, London, in 1892, and prepared the mineral and archæological exhibits of the province for the Columbian Exposition in 1893. He has done much educational literary work. Among his productions are *Notes on the Life of Dr. Joseph Workman* (1894);

Notes on Primitive Man in Ontario (1895); *The History of Scarboro', 1796–1896* (1896). Under the *nom-de-plume* of "Andrew McSparkle," he has for many years written in Scottish dialect for the *Scottish American*.

Boyton, Paul: nautical adventurer; b. in Dublin, Ireland, June 29, 1848. He served in the U. S. navy during the civil war, after which he was employed at submarine diving; served under Gen. Pedro Martinez in the revolution in Sonora, Mexico; was employed in the U. S. life-saving service on the Atlantic coast 1867–69; served with the French in the Franco-Prussian war 1870–71, after which he went to the diamond-fields in South Africa: re-entered the U. S. life-saving service, and remained until 1874, when he began his series of unique adventures of swimming and paddling long distances in the water. Dressed in a rubber suit of his own invention, he leaped from a vessel 40 miles off the coast of Ireland, during a furious gale, and reached the land after being nearly seven hours in the water. On May 25, 1875, he crossed the English channel in twenty-four hours. In Oct., 1875, he paddled on the Rhine from Basel, Switzerland, to Cologne, Germany—430 miles. Early in 1876 he went from Alton, Ill., to St. Louis, Mo., on the Mississippi, and from Bayou Goula to New Orleans, 100 miles, in twenty-four hours. In May, 1876, he went down the Danube from Lintz, Austria, to Budapest, Hungary, 460 miles, in six days. One of his longest trips was from Oil City, Pa., to the Gulf of Mexico, 2,342 miles, made in eighty days, suffering in the beginning from extreme cold, and toward the end from great heat. In 1880–81 he commanded the torpedo service of Peru, was captured by the Chilians and his execution ordered, but he escaped. His longest trip covered 3,580 miles, from the mouth of Cedar Creek, Montana, to St. Louis, Mo., and lasted from Sept. 17, 1881, to Nov. 20. His adventures have been described in a book entitled *Roughing it in Rubber* (1886).

Brandeis, Frederick: musician; b. in Vienna, July 5, 1835; studied music there under the best masters, including Carl Czerny; went to New York in 1849 and has since resided and practiced his profession there. He is a pianist and organist and has held many church positions, principally in Roman Catholic churches. He has composed much church music, many songs, part songs, and choruses, a great number of pieces for the piano, and some orchestral works, the most important of this last variety being his *Mary Stuart* overture. One of his most popular songs is *My Love is like a Red, Red Rose.* D. E. Hervey.

Brewer, John Hyatt: musician; b. in Brooklyn, N. Y., in 1856, and has always lived there; as a boy sang in several boy choirs in Episcopal churches; studied piano, organ, and theory under local teachers. His first organ position was in the Clinton Avenue Congregational church, Brooklyn; in 1881 he became organist of the Lafayette Avenue Presbyterian church, which position he still retains. He conducted the Cæcilia Ladies' Vocal Society. His compositions include church music, vocal music in various forms, and works for piano, organ, and orchestra. D. E. Hervey.

Brockway, Howard: musician; b. in Brooklyn, N. Y., Nov. 22, 1870. His first studies were with H. O. C. Kortheuer. In 1889 he went to Berlin, where he remained five years, studying composition and harmony with Otis B. Boise (*q. v.*) and Heinrich Barth. On Feb. 23, 1895, he gave a concert at the Berlin Sing Akademie with the Philharmonic Orchestra, Heinrich Barth, pianist, and Emmanuel Werth, violinist, at which his symphony in D major, ballade in G minor for orchestra, and sonata and cavatina for violin and piano were produced with great success. In addition to these his compositions include *Variations on an Original Theme*, ballade for piano, several piano pieces, and some others. D. E. Hervey.

Brodsky, Adolph: violinist; b. in Taganrog, South Russia, Feb. 21, 1851; began to play in public when nine years old in Odessa. A rich citizen sent him to Vienna, where he studied under Helmsburger, Laub, and Heimaly. In 1879 he became director of the symphony concerts in Kieff, and later appeared as a soloist in Paris, London, Moscow, and Vienna. Mr. Walter Damrosch engaged him as concert-master for the Symphony orchestra, but he remained only a short time. He went to Leipzig and later to England. Mr. Brodsky is also a fine chess-player. D. E. Hervey.

Bronx, Borough of the: one of the boroughs of the city of New York as constituted under the charter of Jan. 1, 1898. It consists of all that portion of the new city lying northerly or easterly of the borough of Manhattan, between the Hudson river and the East river or Long Island Sound, with the several islands not included in the borough of Manhattan. Pop. (1900) 200,507. For the new government, see New York, City of, in the Appendix.

Brooke, John Rutter: soldier; b. in Pottsville, Pa., July 21, 1838: entered the U. S. volunteer service as captain in the Fourth Pennsylvania in April, 1861, became colonel of the Fifty-third Pennsylvania Nov. 7, 1861, and was commissioned brigadier-general in 1864, "for distinguished services during the recent battles of the Old Wilderness and Spottsylvania Court-house." His brevet of major-general of volunteers dated from Aug. 1, 1864, and in 1867 he received the brevet of brigadier-general in the regular army. When the army was reorganized after the war he became colonel of the Thirty-seventh Infantry, was transferred to the Third in 1869, and was made colonel of the Thirteenth in 1879. He was again transferred to the Third Infantry, of which he was in command at Fort Shaw, Montana, till in 1888 he was made brigadier-general and assigned to the department of the Platte. Later he was for two years at St. Paul, in the department of the Dakotas. In 1898, when appointed major-general, his headquarters were at Chicago and his command was known as the old department of the Missouri. During the war with Spain he served in Puerto Rico, and at the close of the war was appointed Governor-General of Cuba.

Brotherhood of Andrew and Philip: an organization founded at Reading, Pa., in 1888, by Rev. Rufus W. Miller, pastor of the Second Reformed church, and based on the rules of the Brotherhood of St. Andrew. It is interdenominational, nineteen denominations now contributing to its membership, which amounts to about 14,000, spread over 32 States. The denominations represented are: the Presbyterian (North, South, and Canadian), Reformed (Dutch and German), Congregational, Methodist Episcopal, Baptist, United Brethren, Church of Christ, Methodist Protestant, United Presbyterian, Federal, Lutheran, Reformed Episcopal, Free Baptist, Progressive Brethren, Friends, and United Evangelical. The chapters in the U. S. number 462. The badge is a black silk button with a red and orange star woven on its face, and the letters B. of A. and P.; the colors are the tricolor of the continental churches during the Reformation. Any man can join the brotherhood by promising "to pray daily for the spread of the kingdom of Christ among young men, and to make an earnest effort, each week, to bring at least one young man within the hearing of the Gospel."

Brotherhood of St. Andrew: an organization exclusively of men in the Protestant Episcopal Church. "The sole object of the brotherhood is," in the words of the constitution of the society, "the spread of Christ's kingdom among young men, and to this end every man desiring to become a member thereof must pledge himself to obey the rules of the brotherhood so long as he shall be a member. These rules are two: the rule of prayer and the rule of service. The rule of prayer is to pray daily for the spread of Christ's kingdom among young men and for God's blessing upon the labors of the brotherhood. The rule of service is to make an earnest effort each week to bring at least one young man within hearing of the Gospel of Jesus Christ, as set forth in the services of the Church and in young men's Bible classes." Any body of young men in any parish, mission, or educational institution of the Protestant Episcopal Church united under the name of the Brotherhood of St. Andrew, with the approval of the rector or minister in charge, and whose members pledge themselves to the objects of the order, is entitled to become a chapter of the brotherhood, and as such to representation in its conventions, which are held annually. The convention appoints a council, which is charged with the executive direction of the general organization. The parent brotherhood was organized out of a young men's Bible class in St. James's church, Chicago, on Nov. 30, 1883, and the work was attended with such encouraging results that other parishes formed similar societies. There are now more than 1,200 active chapters in the U. S., with a membership of nearly 14,000 men. The brotherhood has extended to other lands, having in Canada 230 chapters and about 2,000 members; in Scotland, 10 chapters and 150 members; in Australia, 40 chapters and about 500 members; it has been established also in England, the West Indies, and South America. There is a junior department of the brotherhood.

Brotherhood of the Kingdom: an interdenominational organization of both sexes, composed of those who "believe in the kingdom of God on earth, and have united to establish that idea in the thought of the Church and to assist in its practical realization in the world." The qualifications for membership are: "Comprehension of the aims of the brotherhood, harmony with its spirit, expressed desire to cooperate with it."

Brounoff, Platon: musician; b. in Elizabethgrad, South Russia, in May, 1863. At the age of fifteen he entered the Musical Institute in Warsaw. In 1883 he received a scholarship at the Imperial Conservatory of St. Petersburg. Anton Rubinstein was one of his teachers. He came to the U. S. in July, 1891, and went first to La Porte, Ind., where he gave his first concert, but soon settled permanently in New York city, where he has since been a teacher, conductor, and pianist. He brought out his overture *Russia* at a public concert of the New York Manuscript Society in Chickering Hall, Dec. 15, 1897. This work was first performed some six years before, conducted by Rubinstein before the Czar of Russia. Mr. Brounoff has composed other music.
D. E. Hervey.

Brown, Thomas Edward: clergyman and educator; b. in Douglas, Isle of Man, in 1830; educated at King William's College, Isle of Man, and held a fellowship at Oriel College, Oxford; second master at Clifton College 1863-92. He contributed to reviews and other periodicals, and wrote many poems, chiefly in the Manx dialect. His published works are *Betsey Lee* (1873); *Fo'c's'le Yarns* (1881); *The Doctor and other Poems* (1887); *The Manx Witch and other Poems* (1889); *Old John and other Poems* (1893). D. in Clifton, England, Oct. 30, 1897.

Bucknill, Sir John Charles: alienist; b. in Market Bosworth, Leicestershire, England, in 1817; educated at Rugby, and studied medicine in University College, London, graduating in 1840. He was medical superintendent of the county lunatic asylum of Devon 1844–62, and then for four years was the Lord Chancellor's medical visitor of lunatics. He founded the *Journal of Mental Science* in 1853, and was one of the original editors of *Brain*. He was knighted in 1894 for his services in the volunteer movement started in 1852. He lectured and wrote on subjects of psychology and mental pathology, his works including *Unsoundness of Mind in Relation to Criminal Acts* (1857); *The Mad Folk of Shakespeare* (1859); *The Medical Knowledge of Shakespeare* (1860); *Notes on American Asylums* (1876); *Habitual Drunkards and Insane Drunkards* (1878); *Care of the Insane and their Legal Control* (1880). D. in Bournemouth, July 20, 1897.

Buisson, Ferdinand Édouard: publicist and educator; b. in Paris, Dec. 20, 1841; studied at Argentan and Saint-Étienne, completing his course in Paris. From 1866 to 1870 he taught in the academy in Neuchâtel, Switzerland. He returned to France in 1870, and in 1871 was made primary inspector by Jules Simon, a step which aroused great opposition on account of the stand taken by M. Buisson against teaching sacred history in the schools. Unable to retain his place, he retired to become secretary of the commission on the statistics of primary education. In 1873 he was sent as a delegate from the Ministry of Public Instruction to the Universal Exposition at Vienna; in 1876 he went to Philadelphia in the same capacity; and in 1878 he had charge of the pedagogical section in the Paris Exposition. Jan. 15, 1875, he was decorated with the cross of the Legion of Honor. In 1879 he was called by Jules Ferry, then Minister of Public Instruction, to the direction of primary instruction, a position that he has filled for many years in a notable way. In the important and far-reaching reforms in its educational system that have taken place in France since 1870, no one has borne a more worthy and laborious part than M. Buisson. His chief publication is a large *Dictionnaire de Pédagogie*, a monumental work, in addition to which he has written many official reports and valuable contributions to current educational discussions. His firm and manly stand in the Dreyfus agitation (1898–99) has won him international honor. C. H. Thurber.

Bull, John: soldier; b. in Providence township, Montgomery co., Pa., June 1, 1731. In 1758 he became captain in the provincial service, serving with the Pennsylvania and other troops under Gen. Forbes, and was at the taking of Fort Duquesne, also serving in the campaigns of 1759. During the war of the Revolution he was conspicuous as a member of the committee of inspection of his county in 1774, and as a member of the second provincial convention in 1775. During 1775 and 1776 he was colonel of the First Pennsylvania battalion of the continental troops. He was a member of the third provincial convention which framed the Pennsylvania constitution in 1776. Later he was chairman of the committee of inspection of Philadelphia County, and also a member of the Council of Safety of the State of Pennsylvania. Meanwhile he held various commands, and with the rank of colonel commandant had charge of the construction of the defenses at Billingsport. Subsequently he was colonel of the Pennsylvania State Regiment of Foot, and became adjutant-general of Pennsylvania in 1777. During 1777 and 1778 he was in command of the Second Brigade of the Pennsylvania militia, and held other offices of military or judicial character until the close of the war of the Revolution. Between 1780 and 1784 he settled on Opequan creek, Berkeley co., Va., where he remained until 1795, when he returned to his home in Northumberland. He was elected to the State Assembly of Pennsylvania from Northumberland in 1803, and in 1808 he was an unsuccessful candidate of the Federal party for Congress. D. in Northumberland, Aug. 9, 1824. Marcus Benjamin.

Bullions, Peter: clergyman and educator; b. in Moss Side, Perthshire, Scotland, in December, 1791; in 1810 entered the University of Edinburgh, and supported himself by teaching during the three years' course; studied theology, and came to the U. S. in 1817; in March, 1818, was ordained pastor at Argyle, N. Y., and resigned in 1824 because of ill health; became Professor of Languages in the Albany Academy, continuing until 1848; was pastor of the United Presbyterian congregation in Troy, N. Y., 1832–52, and again from 1853 until his death, in Troy, Feb. 13, 1864. He published many text-books, some of which were largely used in schools, passing through numerous editions. Among them are: *Principles of English Grammar* (1834); *Principles of Greek Grammar* (1840); *Analytical and Practical English Grammar* (1850); *Cicero's Select Orations* (1851); *Principles of Latin Grammar* (1853); *Latin Exercises* (1855); *Latin and English Dictionary* (1862). He also published a *Life of Alexander Bullions*.

Burck'hardt, Jakob: historian; b. in Basel, Switzerland, May 25, 1818; studied theology in Basel, and afterward studied in Berlin under Ranke and Franz Kugler; was Professor of the History of Art in the University of Basel for more than forty years. He published several works on the Italian Renaissance, among them being *Cicerone zu den Kunstwerken Italiens* and *Geschichte der Renaissance in Italien*. D. in Basel, Aug. 8, 1897.

Burmeister, Richard: pianist and composer; b. in Homburg, Germany, Dec. 7, 1860; studied under several teachers and finally under Liszt, becoming a pianist of the first rank. After making successful tours in his native country he went to New York, and settled there as pianist and teacher, appearing in many important concerts. He has composed much for the piano, including a concerto in D and a symphonic fantasia for orchestra, *Jagd nach dem Glueck* (the Hunt for Happiness), but he is chiefly notable for his rewritten versions of Chopin's F minor concerto and Liszt's *Concerto Pathetique*, which Liszt originally wrote as a pianoforte solo in 1850, and in 1867 rewrote for two pianos. Mr. Burmeister arranged the second piano part for orchestra. D. E. Hervey.

Burmeister, Willy: violinist; b. in Homburg, Germany, in 1869; studied first under his father and later for three years with Joachim in Berlin. Playing at concerts throughout Germany, he won a reputation for technical skill. He visited the U. S. for the first time in the autumn of 1898, and made his first appearance in a concert of the Boston Symphony Orchestra in Brooklyn on Dec. 14. D. E. Hervey.

Burnett, Peter Hardeman: jurist; b. in Nashville, Tenn., Nov. 15, 1807; was engaged in trading and the practice of law in Tennessee and Missouri for some time before 1843, when he went to Oregon. He was prominent in the organization of the Territorial government, was a member of the Legislature in 1844 and 1848, and became a judge of the Supreme Court, but soon resigned and went to California. Here he worked for a short time at mining, and then became agent for the Sutter family and estate at Helvetia. In 1849 he was active in the agitation for a State government, advocating its formation without waiting for congressional authorization, and openly opposed the U. S. military

government of the Territory. He became the first Governor, assuming the office before the admission of the State by Congress, in September, 1850. He resigned in 1851, resumed the practice of law, and in 1857–58 was a judge of the Supreme Court. He was president of the Pacific Bank of San Francisco 1863–80. He published *The Path which Led a Protestant Lawyer to the Catholic Church* (New York, 1860); *The American Theory of Government, Considered with Reference to the Present Crisis* (1861); *Recollections of an Old Pioneer* (1878); and *Reasons Why we should Believe in God, Love God, and Obey God* (1884). D. in San Francisco, Cal., May 16, 1895.

Burnham, Sherburne Wesley, M. A.: astronomer; b. in Thetford, Vt., Dec. 12, 1838; educated in Thetford Academy. He took up stenography as his profession, and during the civil war was a shorthand reporter at the army headquarters in New Orleans. While thus engaged he bought Burritt's *Geography of the Heavens* at an auction, and soon became so interested in the subject that he procured a small telescope. A few years later he went to Chicago, where he continued his shorthand reporting, while giving all his spare time to the study of microscopy and of astronomy. In 1869 Mr. Burnham ordered an $800 telescope with a 6-inch object glass, "as good as could be made." This he mounted himself in his back yard, and with it made the first of his many important discoveries of double stars. In the course of his discoveries he entered into correspondence with leading astronomers of foreign countries and soon became famous abroad, while at home his work was almost unknown. Gradually his work became recognized at home, and in 1876 he was appointed acting director of the Dearborn Observatory, Chicago. He assisted in the establishment of the Lick Observatory and made numerous important observations by means of its famous telescope. Several years later he was appointed to his present position as Professor of Astronomy in the Yerkes Observatory of the University of Chicago. Prof. Burnham has discovered and catalogued more double stars than were ever before discovered by any one observer. He is a fellow of the Royal Astronomical Society of England, and a member of the German Astronomical Society, and holds an honorary degree of M. A. from Yale. He has been for more than twenty years a contributor to English and European astronomical journals.

Burnham, William Henry, Ph. D.: educator; b. in Dunbarton, N. H., Dec. 3, 1855; graduated from Harvard University 1882; taught in Wittenberg College 1882–83, and Potsdam (N. Y.) Normal School 1883–85; was fellow, Johns Hopkins University, 1885–86; Ph. D., Johns Hopkins University, 1888; instructor in psychology, Johns Hopkins University, 1888–89; docent in pedagogy, Clark University, 1890–92; and instructor in pedagogy there since 1892. He has contributed numerous articles to the *Pedagogical Seminary*, *American Journal of Pedagogy*, *School Review*, and other educational journals. C. H. Thurber.

Butler, Charles, LL. D.: lawyer; b. at Kinderhook Landing, Columbia co., N. Y., Feb. 15, 1802; educated in the academy at Greenville, N. Y.; studied law with his brother, Benjamin Franklin Butler, and Martin Van Buren; was admitted to the bar in 1824, and opened a practice in Lyons, N. Y., but soon moved to Geneva, N. Y., and became assistant district attorney of Genesee County. In 1833 he went to Chicago, then called Fort Dearborn, and invested largely in land there, as he afterward did in the present city of Toledo, Ohio. In 1835 he settled in New York, where he successfully engaged in the adjustment of the State debts of Michigan, Indiana, and Illinois. He became very wealthy. He was one of the founders of Union Theological Seminary in New York, and from 1836 was a member of the council of the University of the City of New York. He was also a founder and officer of the Protestant Half-orphan Asylum of New York, and of the Westchester Temporary Home for Friendless Children. He received the degree of LL. D. from Wabash University and the University of the City of New York. D. in New York, Dec. 13, 1897.

Butler, Thaddeus J.: clergyman; b. in Limerick, Ireland, in 1833; ordained to the priesthood in Rome with his three brothers, came with them as missionaries to the U. S., and settled in Chicago. He was Professor of Theology in the seminary of St. Mary of the Lake, and secretary to the bishop and chancellor of the diocese. During the civil war, while serving as chaplain, he was captured by the Confederates and sentenced to be shot, but was discharged on parole, and returned to Chicago. Early in 1897 he was appointed bishop of Concordia, Kan., but died on July 16, the day before the one set for his consecration.

Cailletet, kāā'ye-tā', Louis Paul: engineer and physicist; b. in Chatillon-sur-Seine, France, Sept. 21, 1832; received his training as an engineer in the School of Mines in Paris, after which he practiced his profession in the extensive ironworks of his native province (Côte-d'Or). Cailletet has made extensive studies of the physical and chemical properties of iron, and it is upon this work and upon his investigations of the influence of high pressures upon gases that his reputation chiefly rests. During the winter 1877–78 he succeeded in liquefying nitrogen and oxygen, of which achievement he shares the credit with the Swiss engineer Pictet, who reported his results to the French Academy at the same meeting. The priority was given to Cailletet, because he had previously made a demonstration of his method privately before certain members of the academy. A sealed caveat fixed the date of his first successful experiment on Dec. 2. For an account of these experiments see articles Liquefaction of Gases and Liquid Air, the latter in Appendix to Vol. VII. Cailletet was elected a member of the French Academy of Sciences in 1884. E. L. Nichols.

Caldicott, Alfred James: musician; b. in Worcester, England, in 1842; pupil at the Leipzig Conservatory; organist of St. Stephen's church, Worcester, 1864; won prize for glees, Worcester Glee Club, 1878, and Huddersfield, 1879; received Mus. Bac. degree from Cambridge 1878; appointed professor in Royal Academy of Music, London, 1882. Among his well-known compositions are the *Widow of Nain*, oratorio (1881); *Rhine Legend*, cantata for female voices (1883); *Queen of May*, cantata, several operettas, many songs, glees, and other smaller pieces. D. Oct. 24, 1897. D. E. H.

Campana, Fabio: composer; b. in Bologna, Italy, in 1815, and received his musical education there; produced his first opera, *Caterina di Guisa*, in Leghorn, 1838, following with *Jannina d'Ornano* (Florence, 1842), *Luisa di Francia* (Rome, 1844), and *Giulio d'Este* (Milan, about 1850, or, according to another authority, Rome, 1841). After this he went to London and settled there, composing and teaching. He produced two operas during this period, *Almina* in 1860, and *Esmeralda*, performed first in St. Petersburg, Dec. 20, 1869, and in London, with Patti in the title *rôle*, June 14, 1870, and again at Homburg, 1872. He composed many successful drawing-room songs. D. in London, Feb. 2, 1882. D. E. Hervey.

Campbell, Bartley: dramatist; b. in Allegheny, Pa., Aug. 12, 1843; entered a law office in 1856, but left the study of law in 1858 and became a reporter for the Pittsburg *Leader*. In 1863 and 1864 he made Democratic political speeches. He founded the Pittsburg *Evening Mail* in 1868, and the *Southern Magazine* in New Orleans in 1869, and was official reporter of the Louisiana House of Representatives in 1870. In 1871 he wrote his first play, *Through Fire*, which was played for four weeks, and his second, *Peril*, a comedy of Long Branch, was produced in 1872, and soon followed by *Fate*, *Risks*, and *The Virginian*, the last being bought by Frank Mayo, who changed its name to *Van the Virginian*. In 1874 he wrote *Gran Uale*, in 1875 *On the Rhine*, and an adaptation of the German comedy *Ultimo*, which he called *The Big Bonanza*. Among his other plays were *Heroine in Rags* and *How Women Love* (the latter reconstructed as *The Vigilantes*), written in England in 1876; *Clio*; *Fairfax, or Life in the Sunny South*; *My Partner*, the first of his plays that was successful in New York; *The Galley Slave*; *Matrimony*; *The White Slave*; *My Geraldine*; *Siberia*; *Paquita*. D. in Middletown, N. Y., July 30, 1888.

Campbell, Charles: historian; b. in Petersburg, Va., May 1, 1807; graduated at Princeton in 1825; kept a select classical school in Petersburg 1842–55, and afterward was principal of the Anderson Seminary there. He was a member of the Virginia Historical Society. He contributed to the *Historical Register* and the *Southern Literary Messenger*, and edited the *Order-Book of Gen. Andrew Lewis in 1776* (Richmond, 1860). He published *The Bland Papers* (1840–43); *An Introduction to the History of the Colony* and *Ancient Dominion of Virginia* (Richmond, 1849; Philadelphia, 1859); *Some Materials for a Memoir of John Daly Burk* (Albany, 1868); and *Genealogy of the Spotswood Family*. D. in Staunton, Va., July 11, 1876.

Campbell, William Wilfred: poet; b. in Berlin, Ontario, June 1, 1861; educated at the University of Toronto and

in Cambridge, Mass.; ordained to the ministry of the Church of England in 1885; became rector of St. Stephen, New Brunswick, in 1888; retired from the ministry in 1891, and entered the civil service in Ottawa. He began at an early age to write short poems, at first for a village paper, afterward for the *Atlantic Monthly*, the *Century*, and *Harper's Magazine*. After his ordination he wrote poems on the lake region, from which he became known as the "Poet of the Lakes." His first volume was *Lake Lyrics and other Poems* (1889); others are *The Dread Voyage* (1893) and *Mordred* and *Hildebrand*, two tragedies (1895).

Canniff, William, M. D.: physician and author; b. in Thurlow, Ontario, in 1830; after graduation from Victoria University, Cobourg, Ontario, studied medicine at the Toronto School of Medicine, at the University of New York, and in England, where he served in the army medical department during the Crimean war; was Professor of Pathology and afterward of Surgery in Victoria University; during the civil war in the U. S. visited the hospitals in Washington, and was with the Army of the Potomac; then practiced in Toronto. In 1867 he read a paper on the British North American Indians before the International Medical Congress in Paris. He has been president of the Medical Society of the Canadian Institute, and of the Northwestern Emigration Society. Besides writing for the medical and the general press, he has published *A Manual of the Principles of Surgery* (1866); *A History of the Early Settlement of Upper Canada* (1869); *Canadian Nationality* (1875); *The Medical Profession in Upper Canada* (1894).

Cappa, Carlo Alberto: conductor; b. in Alessandria, Sardinia, Dec. 10, 1836, and came to the U. S. about 1860; joined the Seventh Regiment band of New York and became its leader in 1881, succeeding C. S. Grafulla. Under his direction the band gained great fame and was esteemed one of the best regimental bands in existence. He composed and arranged much for the band, and was continuously connected with it for thirty years. D. in New York, Jan. 6, 1893. D. E. Hervey.

Car'denas: a city in the province of Matanzas, on the northern coast of Cuba, 30 miles E. of the city of Matanzas. Founded in 1828. It lies at the head of a very spacious bay, and is sheltered from the northwest winds by the long and narrow promontory of Cape Hicacos. Steamers connect it with the other coast cities, and a branch railroad joins it with the central railroad system of the island. The chief center of the sugar industry lies in the fertile plains to the S. E., and Cardenas has long been largely engaged in the export of sugar and molasses. Manufactures of liquors, soaps, and cigars are carried on. Pop. (1899) 21,940. C. C. A.

Carhart, Henry Smith: physicist; b. in Coeymans, N. Y., Mar. 27, 1844; graduated at Wesleyan University, Middletown, Conn., in 1869. From 1873 to 1886 he was Professor of Physics in Northwestern University. Since 1886 he has been director of the laboratories of physics and electrical engineering and Professor of Physics in the University of Michigan. In 1889 he was one of the delegates from the U. S. to the Electrical Congress held in Paris, and in 1893 was a member of the Chamber of Delegates of the International Electrical Congress at Chicago. Prof. Carhart has paid much attention to electrical research, to the literature of which he has made numerous important contributions. His best-known work is on the electromotive force of standard voltaic cells. He is the author of the following books: *Primary Batteries* (Boston, 1891); *Physics for University Students* (2 vols., Boston, 1894–96); *Elements of Physics*, with H. N. Chute (Boston, 1895); *A Laboratory Manual of Physics*, with G. W. Patterson (Boston, 1898).

E. L. Nichols.

Carman, Bliss: poet and journalist; b. in Fredericton, Canada, Apr. 15, 1861. He was educated at the Fredericton Collegiate School, at the University of New Brunswick, at the University of Edinburgh, Scotland, and at Harvard; was office editor of *The Independent*, New York, 1890–92; was the first editor of the *Chap-Book* 1894; on the staff of the *Cosmopolitan* 1894; on the staff of the *Atlantic Monthly* 1895; studied law in Fredericton 1884–86, and was for a time engaged in civil engineering in Maine. His principal published works are *Low Tide on Grand Pré* (1893); *Songs from Vagabondia*, with Richard Hovey (1894); *Behind the Arras* (1895); *A Seamark* (1895); *More Songs from Vagabondia*, with Richard Hovey (1896); *Ballads of Lost Haven* (1897); *By the Aurelian Wall* (1898).

Carr, Frank Osmond: composer; b. near Bradford, England, Apr. 23, 1858; educated at Cambridge University, taking his B. A. in 1881, and receiving the degree of doctor of music in 1891. In 1887 he composed the music of a light opera, *Faddimir*, to a libretto by Mr. Arthur Reed Ropes, better known as Adrian Ross. In 1891 the same authors produced *Joan of Arc*, and in Oct., 1892, *In Town*. Dr. Carr also composed *Morocco Bound* and *Black-eyed Susan*. These were of the lightest kind of music-hall operettas. In 1894 he composed the music for W. S. Gilbert's libretto *His Excellency*, after the long partnership of Gilbert with Arthur Sullivan was dissolved. D. E. Hervey.

Carter, James Coolidge: lawyer; b. in Massachusetts, Oct. 14, 1827; fitted for college at Derby Academy, Hingham, Mass.; graduated at Harvard in 1850 with high honors, and at the Harvard College law school in 1853, in which year he was admitted to the bar in New York city, where he has been in active practice since. As a leader of the bar of New York State he is one of the most prominent men in its political and legal affairs; was counsel for the city of New York in the case of the people of the State of New York against William M. Tweed for the recovery of the moneys fraudulently taken under "the six-million-dollar credit"; was advocate for the U. S. Government in the Bering Sea arbitration at Paris. He is one of the most active and distinguished of the lawyers who have been foremost in movements looking to municipal reforms; was appointed in 1875 by Gov. Tilden a member of the commission to devise a form of municipal government for the cities of the State of New York. He is author of *The Proposed Codification of our Common Law* (1884), in which he opposes the codification of the laws of the State; of *The Provinces of the Written and the Unwritten Law* (1889); and *The Ideal and Actual Law* (1890), addresses noted for their learning and acumen. F. Sturges Allen.

Chabrier, shaă'bri-ā', Alexis Emmanuel: composer; b. in Ambert, department of Puy-de-Dôme, France, Jan. 18, 1841. He studied law, but finally devoted himself to music. His opera *Gwendoline* was produced in Brussels, Apr. 10, 1886, and *Le Roi malgre lui* in Paris, May 18, 1887. Among his other compositions are *Dix Pieces Pittoresques*, for piano, and *España*, an orchestral rhapsody on original Spanish airs. D. in Paris, Sept. 13, 1894. D. E. Hervey.

Chaffee, Adna Romanza: soldier; b. in Ohio, Apr. 14, 1842; enlisted when nineteen years old in the Sixth U. S. Cavalry. He served through the civil war, rising through the grades till he became lieutenant. He was wounded at Gettysburg and Chickamauga. He was with Gen. Crooke in Mexico in the campaign which resulted in the surrender of the Apache chief Geronimo and his band in 1885, and took part in most of the important Indian wars. For four years he was inspector-general on Gen. McCook's staff, with stations at Los Angeles and Denver. In the years 1894–96 he was instructor of cavalry tactics in the Fort Leavenworth school for officers, and June 1, 1897, became lieutenant-colonel of the Third Cavalry, and was made commandant of the cavalry school of instruction at Fort Riley, Kan. At the outbreak of the war with Spain he was commissioned brigadier-general of volunteers, and on May 8, 1898, was appointed colonel of the Eighth Cavalry. His brigade participated in the battle of El Caney, July 1, 1898, and for gallant conduct in that battle he was breveted major-general of volunteers, and was honorably discharged from that grade in Apr., 1899. On June 27, 1900, he was ordered to the command of the American forces in China, and on July 19 was appointed major-general of volunteers.

Chalmers, Mackenzie Dalzell, M. A.: lawyer; b. in Worcester, England, Feb. 7, 1847; educated at King's College and Trinity College, Oxford University, and became a barrister in 1867, and the same year entered the Indian civil service, in which he remained until 1872; was made revising barrister in 1881; a judge of the county courts in 1884; was appointed acting chief justice of Gibraltar in 1893, and a commissioner of assize in 1895; is a member of the statute law committee, and of the board of faculty of law of Oxford University, and also a law member of the viceroy's council in India. He has published *Local Government*; *Digest of the Law of Bills of Exchange*; *Digest of the Law of Sale*, and other works on legal topics. F. Sturges Allen.

Chamberlain, Alexander Francis, Ph. D.: b. in Kenninghall, England, Jan. 12, 1865; educated at Toronto University, Canada, and Clark University, Worcester, Mass.,

securing the degree of Ph. D. from the latter in 1892, and then becoming lecturer on anthropology therein. He has contributed many articles on anthropology and philology to the scientific press, and has published *Modern Languages and Classics* (1891); *Report on the Kootenay Indians* (1892); *Language of the Mississaga Indians* (1892); *The Mythology of the Columbian Discovery* (1893); *The Child and Childhood in Folk-thought* (1896).

Chamberlain, Jacob, M. D., D. D.: Reformed (Dutch) missionary; b. in Sharon, Litchfield co., Conn., Apr. 13, 1835; graduated at Western Reserve College, Hudson, Ohio, 1856, and at the theological seminary of the Reformed Dutch Church in New Brunswick, N. J., 1859, and the same year at the College of Physicians and Surgeons, New York city. In Dec., 1859, he went as a medical missionary to Southern India, and has resided in that country ever since, except during his three vacations in America, taken mainly in consequence of broken health. He was stationed first at Palamanair, but since 1863 at Madanapalli, both in the Madras Presidency. In each he has erected a hospital and dispensary. He enjoys great repute as a surgeon, but still more as a scholarly and devoted missionary. The language of his locality is Telugu, and into it he has translated the liturgy and hymns of his denomination. He also was chief collaborator on the Telugu translation of the Bible. He has written some widely circulated tracts in English.

S. M. J.

Chamberlain, Montague: ornithologist; b. in St. John, N. B., Apr. 5, 1844; in 1856 he began work in the office of a merchant, and afterward became a journalist; appointed assistant secretary in the office of Harvard University in 1889, recorder of Harvard College in 1890, and secretary of Harvard Scientific School in 1893. He contributed papers on ornithological subjects to various periodicals, including the *Auk*, of which paper he was for a time associate editor, and while acting as editor for the Nuttall Ornithological Club, Cambridge, edited *Nuttall's Handbook of the Birds of Eastern North America* (1892). Among his works are *Catalogue of Birds of New Brunswick*; *Catalogue of Mammals of New Brunswick*; *Catalogue of Birds of Canada*; *Systematic Table of Birds of Canada*; *Birds of Field and Grove*; and a revised and annotated edition of Hagerup's *Birds of Greenland*.

Chambers, Edward Thomas Davies: journalist and author; b. in Saffron Walden, Sussex, England, in 1852; went to Canada in 1870; after teaching for a few years established a newspaper called the *Progress* at St. Andrews, and later adopted journalism exclusively as his occupation, becoming chief editor of the Quebec *Daily Chronicle* in May, 1897. He has written many articles, chiefly relating to early Canadian history, the scenery and resources of Northern Quebec, and Canadian hunting and fishing. He was a war correspondent in the Northwest Territories in 1885. He is a prominent Freemason. Among his published works are *The Port of Quebec: its Facilities and Prospects* (1890); *The Haunts of the Ouananiche* (1891); *Quebec, Ancient and Modern* (1892); *Quebec, Lake St. John, and the Saguenay* (1893); *Chambers's Guide to Quebec* (1895); *The Book of the Ouananiche and its Canadian Environment* (1896).

Chaminade, shaă'mē'nad', Cecile: musician; b. in Paris, Aug. 8, 1861; studied entirely in that city. Being of a well-to-do family, she followed a musical career solely from the love of it. She lives in a beautiful country mansion a few miles outside of Paris, where she has a fine music-room fitted with every convenience and luxury, and where she receives her musical friends. She is a splendid pianist, and has won much fame as a composer. Her works are chiefly for the piano, but she has also written many songs and some small cantatas, which have been sung by choral societies with considerable success. D. E. Hervey.

Change-of-day Line: an imaginary line through the Pacific to indicate where it is convenient for the nations that the change in the calendar day shall be made; also known as the "change-of-date line," the "date-boundary," the "date-line," etc. As most navigators use the meridian of Greenwich as the initial meridian, it is convenient for them, sailing E. or W., to regard the meridian that is exactly opposite Greenwich on the other side of the world, the 180th, as the line on which the necessary change in day and date shall be made. But the line does not entirely coincide with the meridian, being drawn to the W. of it in order to give the Aleutian chain, a part of the U. S. territory, the same day as the U. S.; and again it swerves to the E. of the meridian, so as to give islands in the neighborhood of the Fiji group the same calendar day as Australia and New Zealand, with which they chiefly have business relations.

The meridians of longitude lying E. of a place have more advanced time in the day than that place, for the sun rises earlier there; the meridians lying W. have a less advanced time in the day, for the sun rises later there. If a person travels to the W. around the world, which is the direction opposite to that of the earth's revolution, he nullifies, as far as he is concerned, one complete revolution of the earth. In other words, he loses a day. If he travels E. around the world he has added one revolution to those the earth has made during its revolution. In other words, he has gained a day. He must add or subtract a day in order to make his reckoning agree with the calendar. The whole theory of the change-of-day line is to have this addition or subtraction performed in midocean, where sailors and travelers may record the change with the least embarrassment to themselves or others.

A difference of four minutes in time between two places corresponds to a difference of 1° in the longitudes of those places. A longitude difference of 15° between two places corresponds to a difference of one hour in time. If a person travels from any point in America exactly 180° of longitude, or half around the world to the E. or the W., he will find the time-difference between the place from which he started and the one he has reached to be twelve hours. The convenience of fixing a line where the calendar day shall change may thus be illustrated: Suppose it is Jan. 1, 8 A. M., at New York city, and that a man can instantly transfer himself E. to a place on the 180th meridian. He will find the date and time there to be Jan. 1, 8 P. M. Suppose a man starting W. from New York at the same instant reaches the place on the 180th meridian simultaneously, he will find the time there to be Dec. 31, 8 P. M. There are thus two determinations of time for the same place differing in day, month, and year, and yet both scientifically correct. The apparent discrepancy arises simply from the fact that the men reached their destination from opposite directions. Which of these dates should be assigned to the meridian? Convenience must dictate the answer, and it is easy to see which date should be used. The place lies in Asian or Australian lands or waters, and it is most convenient, therefore, that it should have the Asian date and time, which is Jan. 1, 8 P. M. Some maps show Samoa to the W. of the line, but on others this group is placed to the E. of it, with good reason. Samoa's business relations with Australia are insignificant. She has to do chiefly with the U. S., Germany, and England, and should have the calendar day of those countries.

The experience of the Spanish in the Philippine islands illustrates the inconvenience of ignoring the line. Their explorers reached the Philippines from Spanish America and took there their own calendar day. The Spanish settlers in the Philippines, therefore, had the calendar day of Spain and her American possessions. But in the Dutch and Portuguese possessions in the same waters the calendar time corresponded with the Asian day. As long as the Philippines traded only with Spanish America no embarrassment arose from the fact that their calendar differed from that of the surrounding regions of Asia. When, however, in the early part of this century, Spain lost all her possessions on the American mainland, the Philippines sought trade with their neighbors in Asia. Business relations with the Dutch and Portuguese showed that it was confusing to have a calendar day which differed from theirs. When it was Sunday at Manila it was a working day at Canton, Macao, and other regions all around the Philippines. Spain at last ended this source of confusion by dropping Dec. 31, 1844, out of the calendar. In the Philippines and the Ladrones the day after Dec. 30 was Jan. 1, 1845.

This is the method of changing the time when a ship crosses the line. If the vessel crosses from W. to E. the day is reckoned twice—that is, if it is April 6 when the line is crossed the following day is also counted as April 6. If the vessel crosses from E. to W. a day is dropped out; for example, if the crossing occurs on April 1 the following day is April 3. C. C. Adams.

Cheever, Henry Theodore: clergyman and author; b. in Hallowell, Me., Apr. 17, 1807; brother of George Barrell Cheever; graduated at Bowdoin College in 1834 and at

the Bangor (Me.) Theological Seminary in 1839. He visited the South Sea islands in the interest of the New York *Evangelist*, of which he was for several years associate editor, was pastor in various places, and secretary and agent for the Church Anti-slavery Society 1859–64. He published the following books of travel and biography: *The Whale and his Captors* (1849); *A Reel in a Bottle for Jack in the Doldrums* (1851); *The Island World of the Pacific* (1852); *Memoirs of Nathaniel Cheever, M. D.*, his father (1853); *Life and Religion in the Sandwich Islands* (1854); *Autobiography and Memorials of Capt. Obadiah Congat* (1855); *The Sea and the Sailor* (1855); *Short Yarns for Long Voyages* (1855); *Life and Writings of the Rev. Walter Colton, U. S. N.* (1856); *The Pulpit and the Pew* (1858); *Waymarks in the Moral War with Slavery* (1862); *Autobiography and Memorials of Ichabod Washburn* (1878); *Correspondences of Faith and Views of Madame Guyon* (1886). D. in Worcester, Mass., Feb. 13, 1897.

Child, Lydia Maria: author; b. in Medford, Mass., Feb. 11, 1802; daughter of a baker named David Francis; educated in the common schools and by her brother, Rev. Convers Francis, D.D. She began to write a novel when she was seventeen years old, which was published in 1821, entitled *Hobomok*. Soon after this she wrote another novel, *The Rebels, a Tale of the Revolution*. In 1826 she founded *The Juvenile Miscellany*, the first juvenile periodical in the U. S., which she managed for eight years. She was married to David Lee Child, a Boston lawyer, in Oct., 1828. Mrs. Child became active in the anti-slavery movement which started about this time, and wrote one of the first anti-slavery books, entitled *Appeal in Behalf of that Class of Americans Called Africans*, advocating immediate emancipation. In 1841 she and her husband became editors of the *National Anti-slavery Standard* in New York, continuing until 1844. She wrote a letter of sympathy to John Brown in 1859, and the correspondence arising from it with Gov. Wise and Mrs. Mason, of Virginia, was published in a pamphlet, of which 300,000 copies were circulated. Among Mrs. Child's other works are: *The First Settlers of New England* (1829); *The American Frugal Housewife* (1829; 33d ed. 1855); *The Mother's Book*, *The Girl's Own Book*, and the *Coronal*, a collection of verses (1831); *The Ladies' Family Library* (5 vols., 1832–35); *Philothea*, a romance of Greece in the days of Pericles (1835); *Flowers for Children* (3 vols., 1844–46); *Fact and Fiction* (1846); *The Power of Kindness* (1851); *Isaac T. Hopper, a True Life* (1853); *The Progress of Religious Ideas Through Successive Ages* (3 vols., 1855); *Autumnal Leaves* (1856); *Looking Toward Sunset* (1864); *The Freedman's Book* (1865); *Miria, a Romance of the Republic* (1867); and *Aspirations of the World* (1878). D. in Wayland, Mass., Oct. 20, 1880.

Child-study: the scientific study of children. The universal naïve observation of children, contributing as it does to our "knowledge of human nature," and leading as it does in the best cases to invaluable artistic insights, not only prepares the way for all more systematic child-study, but is likely to remain a principal source of our practical knowledge of child-life. Indeed, one important object of the child-study movement of the present day is to arouse and intensify interest in the natural history of childhood among mothers, teachers, and other persons who lack scientific training. Such observers are advised to keep notes of the spontaneous sayings and doings of children, generally with reference to some question or system of questions proposed by a psychologist.

Child-study in the more strictly scientific sense is historically an outgrowth of older biological sciences. The earliest and the best researches in this field are the work of men trained in anthropology, physiology, neurology, psychiatry, psychology, or other related science. The general aims, special problems, methods, and results of scientific child-study have developed in close connection with the development of these sciences, and they can not be rightly judged nor properly utilized if taken from the whole body of science of which they form an organic part.

The outline of subordinate topics here given follows the main lines which research has actually taken. Purely medical studies, anthropological studies of the primitive child, and, in general, studies whose interest is mainly theoretical rather than educational, are omitted.

The fact that in general the more fundamental functions develop early in life, and the consideration that the early life of the individual is possibly, in a measure, an epitome of the race-life, give special importance to the study of infants. Very careful and extended studies have been made of the first three years after birth. They cover almost every phase of physical and mental development, including the development of the senses, memory, imagination, and intellect (and in particular the development of language), of the emotions, and of impulsive, reflex, instinctive, imitative, and voluntary motions. See Genetic Psychology.

Study of School-children.—(*a*) *Anthropometrical.*—The task of anthropometry is primarily to determine the weight, size, and form of the human body, together with the causes of these characteristics; secondarily, to explain the functional characteristics associated with the foregoing. This task requires the weighing and measuring of many individuals varying in race, sex, age, and in social and geographical environment, and a statistical study of the results for the several classes to determine with precision the influence of varying conditions upon structural and functional development.

The fundamental importance of such an exhibition of human growth in connection with the causes affecting it, for all social and educational interests, is manifest. Among specific results of the large and classical researches in this field are the following: The rate of growth is not uniform, but varies with the season of the year and with age; and is characteristically different for different parts of the body, for boys and girls, for children of different race, conditions of life, etc. Along with these physical periodicities go fluctuations of mental vigor. If now we take into account the fact that the period of maximum growth is the period of maximum ability to resist disease, and also of greatest aptitude in the acquirement of skill, the importance of these results for physical and mental education must be apparent. Of quite particular importance in this connection are the curves of growth, of motor ability, and of disease during the period of adolescence.

(*b*) *The Senses.*—The extensive modern researches on the physiology and psychology of the senses have been for the most part confined to adult subjects. Of the studies made upon children most are chiefly of hygienic interest.

An examination of about 30,000 school-children has shown an alarming increase of myopia from grade to grade. Extensive studies on the lighting and seating of school-houses, on the paper and printing of text-books, and on the attitude in writing, all bear upon the correction of this evil. The hearing of about 20,000 school-children has been tested in various cities of Europe and America. One of twelve investigators reports about 2 per cent. of defectives; the others report from 13 per cent. to about 30 per cent. It is held by the best authorities that the frequency of partial deafness among school-children renders advisable expert examination of all school-children and special instruction for defectives. It has also been shown that nasal diseases which lead to a stoppage of nose-breathing seriously affect memory, power of attention, and so in general mental ability; that if such stoppage of nose-breathing continues, the child's mind is likely to be permanently stunted; that the removal of the obstructions is often followed by remarkable intellectual improvement; finally, that a considerable per cent. of children suffer in this way. Bresgen reports from his own practice 300 cases of cures of head-pressure, headache, migraine, asthma, hay fever, etc., through treatment of nasal diseases, and "demands that all children appearing to be of weak mind be examined by a specialist as regards nose, ear, and throat."

(*c*) *Motor Ability.*—The maximum rate and precision of voluntary movement and the general motor ability as shown in the performance of common movements have been studied with great detail. Sixty thousand school-children in Boston and many more in Europe have been observed with reference to stuttering. A chief practical outcome of these studies is to confirm and define the principle that the small muscles of the hand, eye, and vocal organs must not be overused early in life or in periods of special nervous excitability, under penalty of failing to secure proper training of these muscles, and under penalty of inducing nervous disease. It seems evident that rational physical training, manual training, art education, as piano-playing, drawing and the like, hand-work in the kindergarten, penmanship, especially in primary grades, and oral reading, should take account of these facts. It can not be claimed that teaching in these lines does so except in occasional cases, and there is evidence that this ignorance and neglect result in an increase of nervous diseases among school-children.

(*d*) *Central Processes.*—All the more intelligent current pedagogy emphasizes the importance of knowing the child's capacities, attainments, interests, aptitudes, and the development of these under existing conditions. Each of these fundamental points has been approached by studies upon children. The following is a bare statement of the more important studies: (1) *Endurance and Fatigue.*—Recent studies from several sciences emphasize the importance of well-conserved nervous capital for all the interests of life. Among the facts of practical importance are the following: The close relation between physical and mental endurance, the fluctuation of endurance with the time of day, season, age, nutrition, blood-supply, rate of growth, adjustment of tasks to individual capacity, and the fact that "continuously incomplete restoration" from fatigue leads to chronic fatigue and so to many forms of nervous and mental disease. Specific school studies in this field are Galton's statistics on signs of fatigue in school-children (as headache, loss of memory, thought-wandering, slowing reaction time); Burgerstein's test of the curve of mental fatigue in one hour's work, indicating that not more than forty-five minutes' work out of an hour should be required; and the statistics of school diseases, especially those of Hertel in Denmark and Key in Sweden, indicating dangerous overpressure in some schools. The most recent investigations of Kräpelin and Friedrich indicate that short periods of intense work are better for health and for the quality of work than long periods of less intense work. (2) *Memory Span.*—The memory span has been determined for each age from five to eighteen together with the range of individual variation. (3) *Apperceptive Capital.*—Many collections of children's vocabularies have been made, including one study of the color vocabulary of school-children. Tests have been made to determine the contents of children's minds on entering school. It is urged that primary instruction should be based upon knowledge gained by such studies. Studies exist upon children's ideas of sex and upon their religious and moral ideas which can not be summarized here. (4) *Practice.*—The rate of improvement with practice is not uniform, but it is first rapid and then gradually slower. Recent investigations indicate that in the acquisition of a certain skill, for example, in the learning of a language, there are occasional brief periods of rapid improvement preceded and followed by long periods of slight improvement. As the periods of rapid improvement differ for different functions, the teacher should know the practice-curve of the function sought to be developed. (5) *Aptitudes and Interests.*—Many authors have shown that minds are to be distinguished according to the sense whose impressions are apperceived, remembered, and employed with most aptitude and frequency. Visual, auditory, tactile, and motor types are distinguished. The important bearing of these special aptitudes upon the development of the mind and even upon one's philosophy has been shown. Most children are not exclusively or extremely of any one type, but there are many extreme individual cases, and these at least should be known as such by the teacher. Children's interests have been studied in a variety of ways. A study of the predicates chosen by children to describe familiar things indicates that young children are interested mainly in the motions and uses of things, only much later acquiring an interest in classifying things into larger groups. Children's drawings, their preferences among stories, their choice of future occupations, their collections, their plans for spending money, their æsthetic preferences, their imaginative creations, their plays, their lies, their secret languages, their rudimentary society, and the like have been studied both statistically on large numbers and by personal acquaintance, all of which help to sound the character and range of their mental and moral tendencies and the trend of change in these as they grow older.

In summing up the applications of child-study to education, it must be affirmed, in the first place, that many scientific studies of children have no immediate educational application whatever. Most of them were made, not by educators nor for educational purposes, but by scientists interested in the facts and laws of human development. To the scientists who believe that such work must lead to far more profound and just views of man's life than any one now has every such study is precious, as it is to the individual who has learned that the discovery of truth must often long precede any practical application thereof. To the unscientific teacher many of these studies must look like so many useless scraps. A recognition of these separate points of view should prevent much misunderstanding.

In the second place, it must be remembered that no sort of truth, whether philosophy, poetry, or science, is of much educational value except through persons who have thoroughly assimilated that truth. No sort of truth can get to the pupil in sealed packages. While, therefore, one thoroughly trained in scientific child-study would find what knowledge we now possess a valuable help in the decision of almost every question in the school, one without such training can be given comparatively few educational prescriptions. The most valuable practical suggestion that can be given teachers desiring help from child-study is accordingly to become students of children. The common-school teacher can be directed in doing this so far as to bring immediate advantages to the school, and the advanced student of pedagogy may secure training in scientific child-study. As regards the study of children's minds, it is almost impossible to give any other advice of importance. We already have from educational philosophies the maxim that we must know the apperception ability and tendency of children. But such maxims are only empty truisms unless, along such lines as above suggested, teachers actually study the children they have in charge.

Lastly, some of the hygienic outcomes of child-study may be put in the form of specific educational suggestions:

1. There should be expert medical examination of school-houses, grounds, equipments, programmes of required work, and methods of teaching in so far as these may affect the health of school-children.

2. All schools for the training of teachers should afford competent instruction and training on school hygiene.

3. School boards should cause the present teaching force to receive such instruction from resident physicians as will lead them to observe the more obvious symptoms of sensory, motor, or mental defect. Reliable diagnosis can not of course be made by untrained teachers. But careful attention, directed by such suggestions as a physician could give, would lead the teachers to discover in many cases the *fact* of defect, as defective eyesight or hearing, special liability to take cold, stoppage of nose-breathing; motor irregularities, such as the twitching of any muscles; useless habitual rhythms, such as tooth-grinding, stuttering, inability to perform common tasks, incoördination of movements when the eyes are closed, absence of iris light reflex, general muscular restlessness; signs of overfatigue in addition to the foregoing, such as unusual flightiness of attention, emotional depression, weakness of memory, slowness and difficulty in reasoning about common things, insistent ideas, unusual indecision, and the like. When such or any defects are known (*a*) the defectives of course will not be blamed or punished, as may possibly now in ignorance be done, for their inabilities; (*b*) they will receive special consideration in the assignment of seats and in the requirement of school tasks; (*c*) the attention of parents will be called to the defect, and the child may receive competent medical treatment.

4. Those who have authority to arrange school programmes should reconsider many exercises and requirements in the light of the fact adduced above touching fatigue. Eye-strain, due to bad light, bad print, faulty desks, faulty attitude in writing, or long-continued or precise use, accelerates the development of hereditary optical defects, as myopia, hypermetropia, astigmatism, etc., if it does not also cause such defects. Further, eye-strain, involving as it does long-continued contraction of the delicate muscles of the eye, is specially fatiguing to the corresponding nerve-centers and is proved to induce nervous disease. The literature of this subject is extensive, and includes quite specific directions from the highest authorities on school-lighting, books, desks, and programmes of work. These directions are much too extensive to be given here, but they are easily accessible. (See especially Cohn's *Hygiene of the Eye.*) Overfatigue of the nerve-centers controlling the hand may be induced by too long-continued or too precise work in writing, drawing, hand-work in the kindergarten, tool-work in the manual-training school, piano practice, or the like. This effect can be prevented by shortening such exercises, by not demanding a higher degree of precision in such work than can be attained by moderate effort, and by encouraging the use of the larger muscles wherever possible instead of the smaller. Finally, it is important to note that the acquirement of skill is not hindered, but facilitated, by having regard to these hygienic conditions.

WILLIAM L. BRYAN.

China: Seven new treaty-ports were added to the list between Dec., 1893, and Apr., 1898, making 32 in all. Shahshih, Suchow, and Hangchow were opened in 1896, under the stipulations of the treaty of peace with Japan; Yatung in 1894; Szemao in 1896, by treaty with France; Samshui and Wuchow in 1897, by treaties with Great Britain. Shahshih, on the Yang-tse river, 90 miles below Ichang, is a port for all the steamers plying between Hankow and Ichang, and has ten times the trade of the latter town. The junk trade between Shah-shih and many towns on the Yang-tse and its affluents is very large. Suchow is on the Imperial canal, province of Kiangsu, 50 miles W. of Shanghai, with which it has water communication. It is a center of a rich flat country where vast quantities of cotton, silk, rice, and other productions are raised, and is at the focus of canals extending in all directions. The chief product is silk. Hangchow, the capital of the Cheh-kiang province, stands at the head of the deep inlet S. of Shanghai. The poppy is extensively cultivated in the region around the city, which is also a center of silk-raising and manufactures. Wuchow (pop. 60,000) is at the eastern border of Kwangsi province, 200 miles W. of Canton, at the junction of the Kassia and West or Si-Kiang rivers. Wuchow is the limit of steamer traffic at present, and the rapids and rocks above may prevent steam-navigation farther up the stream. Samshui is 40 miles W. of Canton, at the junction of the West and North rivers. The West river, second only to the Yang-tse as an artery of trade, was opened to foreign commerce as far as Wuchow by the Chinese Government on June 3, 1897.

By imperial proclamation Yochow, Santuao, Chinwangtao, and Wusung were ordered open early in 1898. Yochow is a large trade center on the Yang-tse above Hankow. Santuao, Fukien province, is better known to foreigners as Simlah inlet. The entrance, 10 miles W. of Spider island, is 1¾ miles wide. An extensive junk trade along the coast is carried on. Chinwangtao is a coast town in the same neighborhood, and will serve as an outlet for the coal country behind it.

The harbor of Port Arthur and the adjoining bay of Talienwan, by agreement with the Chinese Government, were occupied by the Russians in the fall of 1897, and on Mar. 28, 1898, Russia secured a lease of these ports for twenty-five years with power of extension. A part of the harbor of Talienwan is to be open to the merchant marine of all nations, with the customs tariff of the Chinese treaty-ports administered and collected by Russian officials. China agreed later, on the demand of Great Britain, that no provinces tributary to the Yang-tse should be alienated. Great Britain thus secured a lease of the islands and waters of Weihai-wei for the same number of years and on the same terms as those of Russia at Port Arthur.

The Germans, by treaty with China, in Dec., 1897, secured a ninety-nine-year lease of the harbor and town of Kiao-Chau and the surrounding district on the southern coast of Shantung peninsula. The bay had been previously occupied (Nov. 14, 1897) by a German squadron. The area of the leased territory is 360 sq. miles, of which 215 sq. miles are embraced by the waters of the bay. The land area of the German sphere of interest, lying outside of and around the leased territory, is 2,790 sq. miles. The leased territory is entirely subject to the political and legal control of Germany. Within the sphere of interest Germany is at liberty to carry out any enterprises for the commercial and industrial development of the district, including the building of railroads. Now that the value of all the ports of the Gulf of Pechili has been impaired by sedimentation, the importance of Kiao-Chau Bay as a gateway to the interior is increased. It affords the best harbor on the coast of Northern China, and offers an excellent means for communication with the larger part of Shantung, one of the most densely peopled and richest regions of China, by means of minor river routes fit for a considerable junk traffic, and by the railroads yet to be constructed.

The Chinese Government on June 9, 1898, leased to Great Britain, for ninety years, territories on the mainland, opposite Hongkong, which were needed to assure the proper protection of the colony and also to provide for commercial expansion. The island of Hongkong had proved too cramped an area for the requirements of its immense and growing trade. The concession includes the whole of the peninsula opposite Hongkong as far as a line joining Deep Bay and Mirs Bay, and also the island of Lan-tao. The waters of both bays are included in the lease, but their northern shores are retained by China. The total area is about 200 sq. miles, all of which will be under British jurisdiction, except within the native city of Kau-lung, N. of Hongkong. China reserves the right to use the leased waters for her own ships, whether belligerent or neutral. Fifty years ago the place where Victoria stands on the island of Hongkong was a fishing village containing a few score of squalid huts. A city of 250,000 inhabitants now stands on this site, and its prosperity has grown out of the fact that Hongkong is the great commercial clearing-house of the Far East.

A demand by the French Government for the cession of a port at Kwang-chau-wan, on Lei-chau peninsula, N. of Hainan island, was conceded Apr. 5, 1898, and China gave to France the formal assurance that no part of the provinces of Kwang-tung, Kwang-si, and Yunnan would be ceded to any other power.

In Sept., 1898, the emperor issued a number of edicts proclaiming various far-reaching reforms in the financial management and the general administration of the central and provincial governments. These sweeping innovations, which were based upon European methods, did not meet the approval of the empress dowager and her powerful supporters. The emperor's new policy was wholly blocked by the empress dowager, who assumed charge of the Government and restored the regency which she had previously held. She immediately reverted to the old methods of government, banishing or beheading many of the more progressive statesmen, ordering a return to the ancient methods of study for examination for official rank, and issuing secret orders, late in 1899, to the governors of the maritime and Yang-tse provinces to resist with arms, without first looking to Peking for instructions, any occupation of territory on the part of the foreigners.

In Sept., 1899, U. S. Secretary of State Hay instructed the American representatives in England, France, Germany, Russia, Italy, and Japan to intimate to the governments to which they were accredited the apprehensions felt by the U. S. Government of the danger of complications arising between the treaty powers that might imperil the rights assured to the U. S. by treaty. The representations were made with the express reservation that the Government of the U. S. did not commit itself to any recognition of exclusive rights of any power within or control over any portion of the Chinese Empire under the agreements recently made by which Great Britain, Germany, and Russia claimed and conceded to each other the possession of spheres of influence or interest, particularly in respect to railroads and mining enterprises. Hoping to retain China as an open market for the world's commerce, with the object of remov-

ing dangerous sources of international irritation and thereby hastening united action by the powers at Peking to promote administrative reforms so greatly needed for strengthening the Imperial Government, in which it was believed that the whole western world was alike concerned, the U. S. Government requested the powers claiming spheres in China to declare their intentions with regard to the treatment of foreign trade in those spheres, and invited from each a declaration to the effect that it will in no wise interfere with any treaty port or any vested interest within any so-called sphere of interest or leased territory that it may have in China; that the Chinese treaty tariff of the time being shall apply to all merchandise landed at or shipped to all such ports as are within such spheres, unless they be free ports, no matter to what nationality they may belong, and that duties so leviable shall be collected by the Chinese Government; that the power approached will levy no higher harbor dues on vessels of another nationality frequenting any port in such sphere than shall be levied on vessels of its own nationality, nor any higher railroad charges over lines built, controlled, or operated in its sphere on merchandise belonging to citizens or subjects of other nationalities than are levied on similar merchandise belonging to its own citizens. On Nov. 30 Lord Salisbury wrote that Great Britain was prepared to make a declaration in the sense desired. Germany and Russia followed with similar replies. France responded Dec. 16; Italy Jan. 7; and the Japanese Government soon afterward. On Mar. 20 Mr. Hay sent a circular letter to the American representatives abroad, saying that all the powers concerned had accepted the proposals of the U. S., and that he would therefore consider their consent as final and irrevocable.

Meanwhile a greater force than even the government could control—urged on by the national sentiment against the occupation of Chinese territory by foreign nations, and the ignorance and superstitious hatred of the missionaries among the lower classes, who looked upon the "foreign devils" as bringing ill luck—was springing up in all parts of China. Two ancient secret societies—the I-Ho-Chuan, the League of United Patriots, and the Ta-Tao-Hwei, or Great Sword Society of Shantung, afterward united under the popular name of Boxers (Chuan also meaning fists, and athletic contests being practiced by its members)—under Prince Tuan, the father of the heir apparent, a favorite of the Empress Dowager and a radical anti-foreigner, secretly supported and encouraged by the court, were gaining recruits everywhere. The members took as their watchword the support of the Heavenly Dynasty and death to all foreigners, clothed their doings with mysterious and spiritualistic rites, and claimed and believed themselves to be invulnerable to bullet and sword. They exacted tribute from the native Christians, massacred those that refused to pay, and forced the local governors to stamp their edicts and proclamations. Their acts and depredations became so overt in the latter part of 1899 and the early part of 1900 that they called forth strong protests on the part of the foreign ministers in Peking, long before warned of the impending crisis by the missionaries in the interior. Following the murder of the Rev. Mr. Brooks, Dec. 31, 1899, a joint note was addressed to the Tsung-li-Yamen, the Chinese foreign office, calling for the abolition of the Boxer organization, with whom the imperial troops were already in secret co-operation; this was feebly replied to on Feb. 25 by the usual decree, openly condemning the excesses of the Boxers, but secretly praising them for their courage and patriotism. By the middle of May the situation had become so desperate that the ministers demanded an extra legation guard, and 450 marines from the battle-ships assembling at Taku were sent by way of Tientsin and arrived in Peking June 1. The same day the English missionaries Norman and Robinson were murdered 40 miles S. of Peking. The Boxers continued to pour into Peking, fraternizing with the regular soldiery, and destroying foreign property wherever found, and massacring hundreds of native Christians. On June 11 the Japanese Secretary of Legation, while setting out for Tientsin to inform his government of the situation, was killed by Chinese soldiers outside the city gates. The following day all communication with the outside world was cut off.

On June 9 came a call for more guards, and after a conference of the officers of the allied fleets the British Admiral Seymour with 1,486 men (915 British, 350 Germans, 104 Americans, 300 Russians, 158 French, 54 Japanese, 40 Italians, and 25 Austrians) left Tientsin on four trains for the relief of Peking. They succeeded in getting within 25 miles of the capital, but were there surrounded by Boxers and Chinese troops, the railroad torn up, and their communications with Tientsin destroyed. On June 17 they began their retreat down the Peiho, fighting for every inch of the way. June 22 they drove the garrison from the great Hsiku arsenal, and fortified themselves within rocket communication of Tientsin. They were relieved on June 25 by a column of Russian troops, and on the following day marched into Tientsin after destroying guns and war stores to the value of 40,000,000 taels. The expedition had lost 374 in killed and wounded.

On the night of June 17 the Taku forts opened fire on the allied fleets. The fire was returned, the American Admiral Kempff refusing to take part in the action, and after a hard fight the forts were captured and reduced. Steps were immediately taken to relieve the civilians and the small body of troops now shut up in the foreign quarter of Tientsin and exposed to the fire of the Chinese in the native city. On June 20 the expedition started, and on June 23 the combined force occupied the foreign city. On July 9 the attack on the native city began, and operations continued till the 14th, the hardest fighting occurring on the 13th, when the Americans and Japanese met with heavy losses, Col. Emerson H. Liscum, of the Ninth American Regiment, being killed at the head of his troops.

July 3 Secretary Hay had announced the attitude of the U. S. to be that of disinterested protection of its citizens and treaty rights, the promotion of permanent safety and peace in China, and the preservation of the Chinese Empire in its entirety. On the same day the Emperor of China appealed to the Mikado for intervention. July 17 a similar note was addressed to President McKinley, expressing in addition especial confidence in the U. S. The President replied on June 23, urging upon the Chinese Government to give a public assurance whether the foreign ministers were alive, and, if so, in what condition; to put them in immediate and free communication with their respective governments, and to remove all danger to their lives and liberty, and to place the imperial authorities in communition with the relief expedition, so that co-operation could be secured between them for the liberation of the legations, the protection of foreigners, and the restoration of order. If these objects were secured the Government of the U. S. believed that no obstacle would be found to exist on the part of the powers to an amicable settlement of all questions arising out of the recent trouble, and it proffered its friendly offices, with the assent of the other powers, to secure such a settlement on the fulfillment of these conditions. At the same time China addressed a note to the President of France, which was similarly replied to.

On the afternoon of Aug. 4 a relief column, 22,000 strong, left Tientsin for Peking. Of these, 12,000 were Japanese; 2,800 British; 2,400, under Gen. Chaffee, American; and over 3,000 Russians. They met with sharp skirmishing at Peitang, Yangtun, and Tungchau, but in most instances the Chinese offered very little resistance, and on Aug. 14–15 the allies entered Peking and relieved the legations. The Emperor, Empress-Dowager, and the Court escaped under escort to Taiyuen-fu, and finally to Singan-fu, Sept. 14, where the provisional government was established. Aug. 15 the Americans forced the Imperial City, and on Aug. 17 the allies marched through it in force. The subsequent military operations, with the exception of the Russian demonstration on the border of Manchuria, were chiefly punitive expeditions to the affected parts of the interior.

The relief of the legations was most timely. From June 12, when communications were cut off, the ministers and their families, the legation guards, missionaries, and many native Christians had been in a state of siege in the compound of the British legation. Provisions and ammunition were almost exhausted, and the besieging force growing more formidable every day. Baron von Ketteler, the German minister, while on his way to the Tsung-li-Yamen, was killed by a troop of Chinese soldiers on June 20, and after June 23 it was necessary to repel attacks upon the legation almost daily. The number of the defenders killed during the siege was 67, of wounded 160. Several attempts were made on the part of the Chinese to persuade the ministers to start for Tientsin under promise of armed escort, but the ministers, realizing the futility of such escort, even if the government were sincere in its offer, in each instance promptly refused. The first tidings of the besieged was Mr. Conger's cipher telegram of July 18, saying that they

were under shot and shell, and that only quick relief would save them from massacre.

Of the missionaries scattered through the northern provinces of China some few made their way to Peking or the more friendly southern provinces, but by far the greater number perished at their posts, many suffering degrading deaths, and torture and mutilation by the fanatical Boxers, abetted in some instances by the local authorities.

As soon as the allies were in full possession of the capital negotiations for peace began. Count von Waldersee, field-marshal in the German army, who had been unanimously chosen as commander-in-chief of the allies, arrived in Peking and took command of the forces. Li-Hung-Chang and Prince Ching were the peace commissioners on behalf of the Chinese Court. The terms as finally agreed upon and signed by the ministers Dec. 22, 1900, were as follows:

"During the months of May, June, July, and August of the current year serious disturbances broke out in the northern provinces of China, in which atrocious crimes unparalleled in history and outrages against the law of nations, against the laws of humanity, and against civilization, were committed under particularly odious circumstances. The principal of these crimes were the following:

"1. On the 20th of June, his Excellency Baron von Ketteler, while on his way to the Tsung-li-Yamen, in the performance of his official functions, was murdered by soldiers of the regular army, acting under orders of their chiefs.

"2. On the same day the foreign legations were attacked and besieged. The attacks continued without intermission until the 14th of August, on which date the arrival of the foreign forces put an end to them. These attacks were made by the regular troops, who joined the Boxers, and who obeyed the orders of the court emanating from the imperial palace. At the same time the Chinese Government officially declared, by its representatives abroad, that it guaranteed the security of the legations.

"3. On the 11th of June Mr. Sujyama, chancellor of the legation of Japan, while in the discharge of an official mission, was killed by regulars at the gates of the city. In Peking and in several provinces foreigners were murdered, tortured, or attacked by the Boxers and the regular troops, and such as escaped death owed their salvation solely to their own determined resistance. Their establishments were looted and destroyed.

"4. Foreign cemeteries, at Peking especially, were desecrated, the graves opened and the remains scattered abroad.

"These occurrences necessarily led the foreign powers to dispatch their troops to China to the end of protecting the lives of their representatives and nationals and restoring order. During their march to Peking the allied forces met with resistance from the Chinese army and had to overcome it by force.

"Inasmuch as China has recognized her responsibility, expressed regret, and evinced a desire to see an end put to the situation created by the aforesaid disturbances, the powers have determined to accede to her request upon the irrevocable conditions enumerated below, which they deem indispensable to expiate the crimes committed and to prevent their recurrence:

"I. (*a*) The dispatch to Berlin of an extraordinary mission headed by an imperial prince, in order to express the regrets of his Majesty the Emperor of China and of the Chinese Government for the assassination of his Excellency, the late Baron von Ketteler, minister of Germany. (*b*) The erection on the spot of the assassination of a commemorative monument, befitting the rank of the deceased, bearing an inscription in the Latin, German, and Chinese languages expressing the regrets of the Emperor of China for the murder.

"II. (*a*) The severest punishment for the persons designated in the imperial decree of Sept. 25, 1900, and for those whom the representatives of the powers shall subsequently designate. (*b*) The suspension for five years of all official examinations in all the cities where foreigners have been massacred or have been subjected to cruel treatment.

"III. Honorable reparation to be made by the Chinese Government to the Japanese Government for the murder of Mr. Sujyama.

"IV. An expiatory monument to be erected by the Imperial Chinese Government in every foreign or international cemetery which has been desecrated or in which the graves have been destroyed.

"V. The maintenance, under conditions to be determined by the powers, of the interdiction against the importation of arms as well as of materials employed exclusively for the manufacture of arms and ammunition.

"VI. Equitable indemnities for the governments, societies, companies, and individuals, as well as for Chinese who during the late occurrences have suffered in person or in property in consequence of their being in the service of foreigners. China to adopt financial measures acceptable to the powers for the purpose of guaranteeing the payment of said indemnities and the interest and amortization of the loans.

"VII. The right for each power to maintain a permanent guard for its legation, and to put the diplomatic quarter in a defensible condition, the Chinese having no right to reside in that quarter.

"VIII. The destruction of the forts which might obstruct free communication between Peking and the sea.

"IX. The right to the military occupation of certain points, to be determined by an understanding among the powers, in order to maintain open communication between the capital and the sea.

"X. The Chinese Government to cause to be published during two years in all the subprefectures an imperial decree: (*a*) Embodying a perpetual prohibition, under penalty of death, of membership in any anti-foreign society; (*b*) enumerating the punishments that shall have been inflicted on the guilty, together with the suspension of all official examinations in the cities where foreigners have been murdered or have been subjected to cruel treatment; and (*c*) furthermore, an imperial decree to be issued and published throughout the empire, ordering that the governors-general (viceroys), governors, and all provincial or local officials shall be held responsible for the maintenance of order within their respective jurisdictions, and that in the event of renewed anti-foreign disturbances or any other infractions of treaty occurring and which shall not forthwith be suppressed and the guilty persons punished, they, the said officials, shall be immediately removed and forever disqualified from holding any office or honors.

"XI. The Chinese Government to undertake to negotiate amendments to the treaties of commerce and navigation considered useful by the foreign powers, and upon other matters pertaining to their commercial relations, with the object of facilitating them.

"XII. The Chinese Government to determine in what manner to reform the Department of Foreign Affairs and to modify the court ceremonials concerning the reception of foreign representatives, in the manner to be indicated by the powers.

"Until the Chinese Government has complied with the above conditions to the satisfaction of the powers, the undersigned can hold out no expectation that the occupation of Peking and the province of Chih-li by the general forces can be brought to a conclusion."

On Jan. 13, 1901, the Chinese envoys were authorized to sign the joint note, and the carrying out of its provisions was at once begun. The question of indemnity was the longest debated, the powers deeming it impolicy to make an impossible demand. The amount finally determined upon, May 29, 1901, was 450,000,000 taels (about $315,000,000). Shortly afterward the withdrawal of the troops, with the exception of the guard provided for in the agreement, was carried out, and the Court announced its return to the capital in the early autumn.

In Mar., 1898, Mr. Archibald J. Little, a British merchant, conducted a large steam-launch from Shanghai to Chungking, the first steam-vessel to ascend the Yang-tse above Ichang. As there are rapids above that treaty-port, steamers to make headway must have sufficient power to propel them 15 knots an hour. Steamers may run to Chungking ten months of the year; the low stage of water during two months may render navigation then impracticable.

The present means of transport in China are wholly inadequate to opening up its enormous resources. The hostility of the Chinese Government long prevented the introduction of railroads, but less opposition is now offered, and about 401 miles of railroad were in operation in 1899. The line 80 miles long from Tientsin to Peking, opened in 1897, and destroyed by the Boxers in 1900, was one of the most profitable short railroads in the world. The road from Tientsin, the port of Peking, extended from Taku, at the mouth of the Peiho, N. E. to Shan-hai-kwan, where it crossed the Great Wall of China, and penetrated 30 miles farther

N.; about 210 miles were in operation at the beginning of the disturbances in 1900, most of which was destroyed. It is being extended N. to meet the eastern Chinese railroad which the Russians have secured permission to build through Northeast Mongolia, between the Trans-Siberian railroad and Vladivostok, for which the route is now being surveyed by Russian engineers. The first section of the important railroad that is to extend from Peking to Hankow was completed from the capital as far as Paoting-fu, about 80 miles. Concessions have been obtained by American and European contractors for building other railroads.

As the eastern part of China is largely denuded of trees, the native supply of lumber is very limited. The rapid growth of Shanghai, and particularly the building of large cotton-mills and silk filatures there and in other cities, have largely increased the import of timber during the past two years. Lumber is increasing in importance as an article of import from America, particularly the fine lumber from Oregon and Washington and red wood from California.

The most important building enterprise recently carried out in China is the vast rolling-mills and arsenals in the city of Hanyan, opposite Hankow. The plant covers about 70 acres, and is connected with the Yang-tse river by a railroad 1½ miles in length. The buildings are of brick with stone foundations, two of them covering an area of about 4 acres. The plant was erected under the auspices of the Viceroys of Hupeh and Hunan, and the intention is to manufacture ordnance, rails, machinery, small-arms, etc. Native artisans are being instructed by skilled workmen from Europe. The iron-mines from which metal for the manufacture of rails is to be obtained are near the Yang-tse, about 75 miles below this manufacturing plant.

Chiniquy, shĕ'nĕ'kee', Charles Paschal Telesphore, D. D.: b. in Kamouraska, Quebec, July 30, 1809; educated at the Quebec Seminary, and ordained a Roman Catholic priest in 1833. He established the first temperance society in the province of Quebec, and traveled through the province in the interest of temperance. In 1851 he went to Chicago for the purpose of inducing immigration into Illinois, and soon founded a Roman Catholic colony at Ste. Anne, Kankakee co. In 1858 he left the Catholic Church, and took his congregation with him into the Presbyterian Church. Among his published works are *Fifty Years in the Church of Rome*; *The Priest, the Woman, and the Confessional*: *Papal Idolatry*; *The Church of Rome the Enemy of the Virgin Mary and of Jesus Christ*; *The Perversion of Dr. Newman in the Light of History, the Scriptures, Common Sense, and of His Own Declarations.* D. in Montreal, Canada, Jan. 16, 1898.

Choate, Joseph Hodges, LL. D.: lawyer; b. in Salem, Mass., Jan. 24, 1832; related to Rufus Choate, the orator; was educated at Salem, Mass.; entered Harvard and graduated in 1852; graduated at the Dane Law School in 1854; admitted to the bar of Massachusetts in 1855, and in 1856 removed to New York city, was there admitted to the bar, and has practiced there continuously since, having acquired a national reputation as an orator and pleader at the bar; was one of the Committee of Seventy which organized the combine against the Tweed ring, and was associated with Charles O'Conor in the trial and conviction of Tweed; was counsel for Gen. Fitz John Porter, who was restored to his military rank after several years of litigation; conducted the successful defense of Gen. di Cesnola in the libel suit arising out of the question as to the authenticity of the Cypriote antiquities presented by him to the Metropolitan Museum of Art. He conducted the litigation in which the U. S. income tax was declared unconstitutional. He is a member of the Union Club and the New England Society, and is a noted after-dinner speaker. He is an active Republican, and a leader in reform movements. He was appointed U. S. ambassador to Great Britain Jan. 19, 1899.

F. Sturges Allen.

Christian and Missionary Alliance: an organization whose objects are stated in its constitution to be "to bear witness to the Lord Jesus Christ in his fullness, to emphasize the baptism of the Holy Ghost, and to work for the evangelization of the neglected classes at home and abroad." It is "a fraternal union of Christians of all evangelical denominations, and in cordial sympathy with all branches of the Church of Christ." Founded in 1887, it was merged with the International Missionary Alliance in 1897, when the present name was adopted. Besides the older auxiliaries established in Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Ohio, California, Washington, and Georgia, new branches have been formed in Maine, New Hampshire, Vermont, Ohio, Maryland, Delaware, District of Columbia, North Carolina, South Carolina, Indiana, Michigan, Kentucky, Illinois, Minnesota, and Colorado, and the order has for some time been in operation in Canada; besides there are workers in England, Scotland, Ireland, Switzerland, Spain, Sweden, Norway, Germany, Russia, Turkey, Italy, Egypt, Palestine, India, China, Africa, and South America. Active members sign the following declaration of principles: "I believe in God the Father, Son, and Holy Ghost; in the verbal inspiration of the Holy Scriptures as originally given; in the vicarious atonement of the Lord Jesus Christ, in the eternal salvation of all who believe in him, and the everlasting punishment of all who reject him. I believe in the Lord Jesus Christ as my Saviour, Sanctifier, Healer, and coming Lord." The Missionary Institute, situated at Nyack, N. Y., is unsectarian, and is open "to all men and women called of God to engage in Christian work at home or abroad." Special attention is given, however, to the equipment of foreign missionaries and to securing their adaptability to the various fields of labor.

Christmas Island: a lonely islet of the Indian Ocean; 190 miles S. W. of Java, in S. lat. 10° 25′, E. lon. 105° 42′. The surrounding seas are of enormous depth, and soundings of over 6,000 feet are within 2 miles of its coasts. It was visited by a number of vessels from 1688 to 1890, but good anchorages were not found, and the island, which is only 12 miles long and 3 to 9 miles wide, was reported to be of little value. Later, however, valuable deposits of phosphate of lime were discovered, and about forty persons were living there in 1898, preparing to work the deposits. Substantial houses had been built, wells sunk, and fruit-trees and cocoanut-palms planted. The island is of limestone and coral formation, most of it densely covered with forest, with only five species of mammals (two rats, a shrew-mouse, and two bats), and the land-birds, except birds of passage and a small rail, are all peculiar to it. This isolated spot is of special interest as a place that has been uninhabited till now, and has therefore developed its flora and fauna without the interference of man. The fullest account of it is given by C. W. Andrews, in the *Geographical Journal*, Jan., 1896.

C. C. Adams.

Chronophotography: the art of recording photographically successive phases of a motion or the changes in an animated scene. The first step in the development of chronophotography was reached when the sensitiveness of photographic plates had been brought to the stage which permitted of exposures so brief that during the interval the body which is being photographed shall not perceptibly

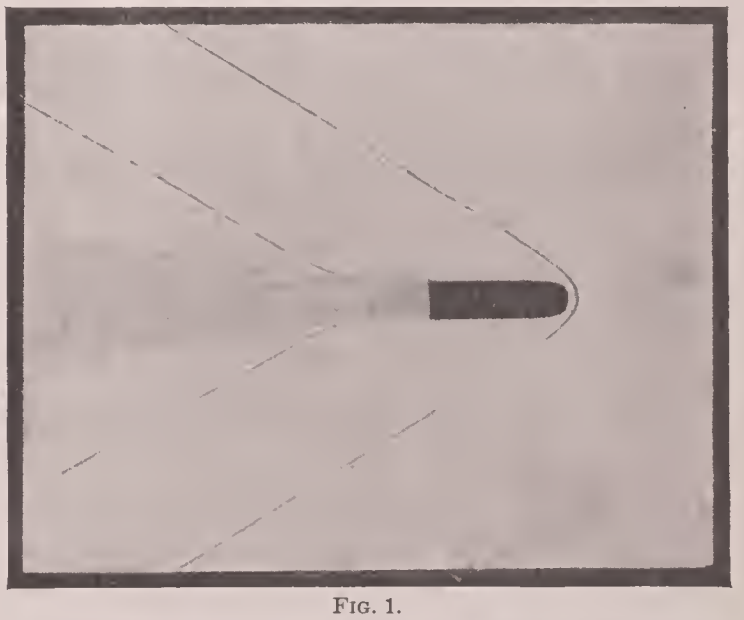

Fig. 1.

have changed its position. In the case of comparatively slow motions it is possible to construct shutters the action of which is prompt enough to fulfill this condition. In other cases, as in the photography of bullets in full flight from the muzzle of the gun, the exceeding brevity of exposure is obtained by the use of the electric spark, the duration of which can be reduced at will almost indefinitely.

The supplementing of ordinary vision by means of such instantaneous photographic records brings out many features that would otherwise long remain unsuspected. Fig. 1, which is reproduced from a drawing after a photograph taken by Boys, and is a view of a projectile from a modern rifle that has just left the gun, will serve to illustrate this fact. The picture shows the existence of waves sent off from a projectile that was traveling at a speed greater than that of sound-waves in air, and which are very much like the waves from the bow and stern of a vessel moving rapidly through water. It likewise shows the highly perturbed state of the atmosphere behind the projectile, like the wake of such a vessel. The exposure was obtained by means of an electric spark, the duration of which was about one-millionth of a second. Such photographs, instructive as they are, serve to record one instantaneous aspect only of the motion under investigation. Chronophotography consists in the production of a series of such views which follow one another at such intervals as will best serve to record all the important phases of the motion. To this end a number of different methods have been employed, each of which is especially adapted to the subject under investigation.

Continuous Exposure on a Fixed Plate.—The earliest example of this type, and probably of any kind of chronophotography, is due to Feddersen,* who in 1862 flashed the image of an electric spark across the face of a sensitized

Fig. 2.

plate by means of a lens and revolving mirror. He succeeded thus in securing photographs which showed the complex character of the discharge and its oscillatory nature. The achievement was the more remarkable when we consider the comparatively undeveloped state of the photographic art at that time, and the fact that it was necessary to use the old-fashioned wet plates. Fig. 2, which is a reproduction of one of the most remarkable of Feddersen's photographs, shows the oscillatory discharge from a battery of Leyden jars between tin spheres. The entire phenomenon recorded in this figure is completed within a few thousandths of a second. In many cases it is possible to obtain a trace representing the motion under investigation by simply attaching a small mirror to the moving body, and by reflecting a beam of light directly to the face of the plate. Merritt† has made in this way many interesting chronophotographs of the motion of a gyroscopic pendulum. One of these is reproduced in Fig. 3.

Fig. 3.

Continued Exposures on a Moving Plate or Film.—For many purposes, particularly in scientific work, chronophotography can be most easily reached by throwing the image of the moving body upon a plate which travels more or less rapidly through the field of view of the camera. The photographic image of a point at rest obtained in this way is a line drawn across the plate in the direction of its motion. All displacements of the points at right angles to the line of motion of the plate produce corresponding transverse displacements of the line that forms its image.

The scientific applications of this form of chronophotography are of two kinds: (*a*) The automatic registry of changes which occur so slowly that the direct observation of them becomes laborious. The continuous daily records of the fluctuations of thermometers and barometers are of this description. In such cases the image or shadow of the moving point is thrown upon a slowly moving strip of photographic paper of small sensitiveness. (*b*) The tracing of fluctuations too rapid to permit of direct observation with the eye. In such cases the plate or film is moved at a high velocity through the field of the camera, and motions the duration of which may amount to only a small fraction of a second are thus recorded in detail.

The motion of the plate through the field in this type of chronophotography is sometimes produced by mounting it in the form of a disk, and giving it a motion of rotation about an axis perpendicular to the face of the plate through its center. This is the method pursued by Crehore and Squier* in their *photochronograph*, an instrument for the study of the velocity of modern projectiles. In this interesting apparatus the projectile is made to break a succession of electrical circuits by penetrating screens placed in its path at given distances. A polarized ray of light on its way to the photographic plate passes through carbon bisulphide contained within the core of a coil traversed by the current. By an ingenious application of the rotatory power of this field upon the plane of polarization of the light-ray, the latter is prevented from reaching the plate whenever the circuit is interrupted. The form of record obtained is shown in Fig. 4, which shows the appearance of one of the plates after development. The broad undulatory circle is the trace of a spot of light passed through an aperture carried on the prongs of a vibrating tuning-fork. This serves as a time-marker. The tracing near the edge of the circle is produced by the polarized ray. The circuit is closed automatically just as the shot is fired. It remains closed until the first screen is reached, at which instant the passage of the light is instantaneously checked by the destruction of the magnetic field. This happens at each screen, and the angular distance between successive interruptions measured in terms of the time, as indicated by the tuning-fork tracing, makes it possible to compute the velocity of the projectile with great accuracy. See Photochronograph.

The number of problems in physics to which chronophotography by continuous exposure on a moving plate is applicable is very large. The slow movements of a magnetometer-needle, which records fluctuations of the earth's magnetism from day to day, may thus register by means of a spot of light thrown from a mirror on a moving strip of sensitized paper; or, on the other hand, the exceedingly rapid electrical oscillations occurring in the charge or discharge of a condenser may be recorded on a plate shot through the field of the camera at high speed. Fig. 5 shows such a tracing made by Millis† with the Hotchkiss‡ galvanometer, an instrument the tiny needle of which, suspended in the magnetic field by means of a quartz fiber so small as to be scarcely visible to the naked eye, oscillates many thousands of times a second. This needle carries a minute mirror cut from the thin cover-glass used in micros-

Fig. 4.

copy, and it is a spot of light reflected from it which makes the tracing shown in the figure. The undulating curve at the top of the figure is due to the motions of a tuning-fork which is used as a time-marker. The curve of greater am-

plitude below is that which shows the rapid electrical surges in the circuit of the condenser.

The entire period during which the plate in such experiments is in the field is only a few hundredths of a second, and where it is desirable for any reason to extend the record for a longer time it is necessary to resort to the use of a moving film. A convenient form of camera for such purposes is shown in Fig. 6. It consists of the usual lens and camera-box, behind which, in place of the ordinary plate-holder, is a box containing a drum (D) on the periphery of which the sensitive film is mounted. This film is driven at whatever speed may be desired by means of an electric motor. A slit in the side of the box nearest the camera admits rays of light from the lens. This slit may be opened at the instant when the chronophotograph is to be begun, and it closes automatically after one revolution of the disk has been completed. The image of each point of light which falls on the film thus traverses a path the entire length of the latter.

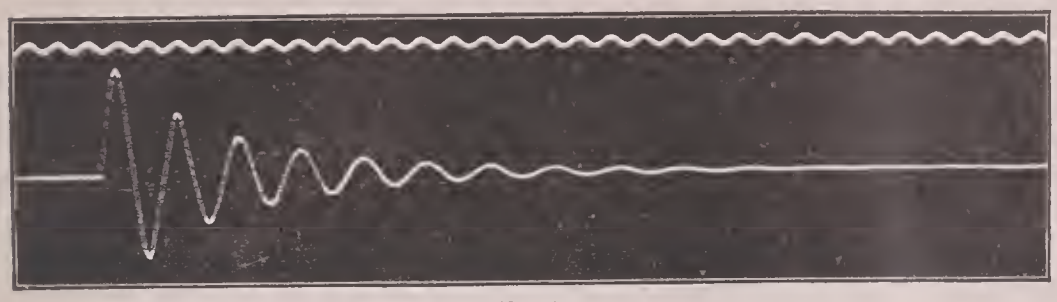

FIG. 5.

This instrument, which can be applied to a great variety of experiments, was used by Nichols and Merritt* in the photography of the manometric flame. The manometric flame, a gas-flame which is made to dance to the rapid vibrations of sound-waves, was devised by Koenig and used by him in a variety of important acoustical experiments. For many years the images of this flame were observed by gazing into a revolving mirror. Merritt,† in 1893, found it possible so to increase the brilliancy of the flame as to make chronophotographs of it practicable. Fig. 7 shows a portion of such a photograph cut from a film, the total length of which was 120 cm. The upper image is that of a flame thrown into vibration by the human voice which utters the rolling sound of the letter *r* (as we hear it when German is spoken). The film was moving with a velocity of 500 cm. per second, so that the time-interval comprised in the portion selected for illustration is about three-hundredths of a second. The brief interruption of the vibration of the flame shown near the center of the picture marks the instant when the tongue touches the roof of the mouth. It lasts about 0·006 second and is repeated about fifty times a second. It is this motion of the tongue which gives the rolling character to the sound. The lower image in Fig. 7 is that belonging to the vowel-sound *a* (flat), as in *slam*.

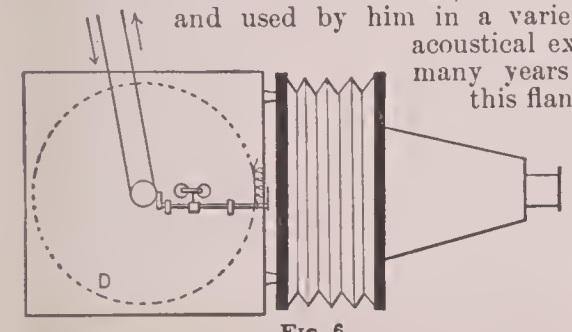

FIG. 6.

By means of this apparatus it is possible to take on a single film records of the movements of the flame during the utterance of a spoken word of three or four syllables or even of a short phrase. The flame records faithfully the thousands of complex undulations which the air undergoes in such a case.*

The apparatus just described has likewise been applied to the study of the movement of a vibrating string. If we look at such a string through a transverse slit so that only a single point or element of it can be seen, this point will be found to move up and down too rapidly to be followed by the unaided eye. If the image of this point be thrown on a photographic plate moving at right angles to the slit, or on the film mounted in the camera just described, that image will trace a curve which indicates precisely the character of the oscillation which the string is undergoing.

In this way Menzel and Raps† in Berlin made chronophotographs of numerous vibrating strings. On the plates used in their experiments it was, however, possible to get the record of only a few successive vibrations. By the use of the long film just described the entire history of the vibrating string, from the moment it is plucked or bowed until the undulation has died away, can be obtained. Such records show beautifully how the overtones which give the vibration its complicated character disappear before the fundamental tone, so that the clang varies continually as the sound fades away. Fig. 8, cut from two parts of the same film, shows these changes.

Still another interesting application of chronophotography on a moving plate is shown in Fig. 9. The subject is the extinction and rekindling of an electric arc. The arc having been properly focused, the plate was shot horizontally through the field of the camera at high speed. Its direction as seen in the figure is from left to right.

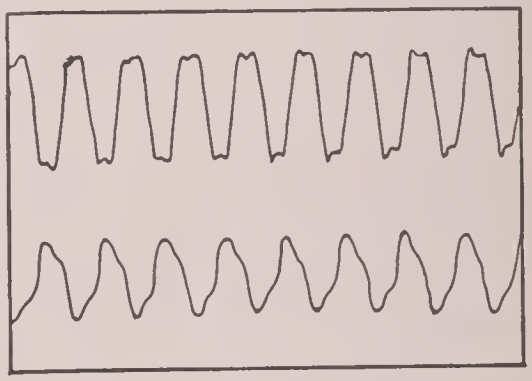

FIG. 8.

In the upper photograph the arc was fed by an alternating current and the exposure was made just as the current changed direction. The light fades away gradually, disappearing last in a region nearly midway between the two carbons, and reappears gradually as the current in the reversed direction is re-established. The horizontal trace of light running across the dark space at the bottom of the picture, but gradually fading out, is due to the tip of the previously positive and consequently hotter carbon.

The lower photograph shows the momentary interruption of a direct-current arc. The light of the arc remains longest in the immediate neighborhood of the positive (upper) carbon. When the circuit is closed again, at the extreme left of the picture, the restoration of the arc is very prompt. Chronophotographic studies of the arc-light have been made by Blondel,‡ McMynn,§ Crew and Basquin,‖ N. H. Brown,¶ and others. The illustrations given here are from the work

of the last-named observer. See, further, the article ELECTRIC ARC, in which is shown (Fig 2) an earlier chronophotograph of the alternating arc.

Successive Instantaneous Exposures on a Fixed Plate.—This method was developed by Marey in Paris and extensively applied by him to the study of movement, particularly to the motions of men and of the lower animals. Fig. 10, which is a reproduction taken at a very early period in the development of chronophotography by Eakins,* will serve

FIG. 9.

to illustrate the application of this method to human motion. It shows successive figures of a jumping boy taken on the same plate. It is, however, to the study of the movements of a single point or of a group consisting at most of three or four points that this method is especially adapted. Marey made numerous studies by this method of the motion of bodies falling freely through space or thrown into the air. He likewise greatly simplified the study of the movements of the human body by attaching bright objects at the wrist, elbow, ankle, knee, etc., of the subject, who was clad in black, illuminating these so that their successive positions would be clearly brought out on the photographic plate. Strips of bright material on the dark clothing served to mark out the line of the limbs (see Fig. 11). The analysis of chronophotographs in which only these groups of points or of lines are shown is much simpler than where the entire body appears. For the numerous instructive and interesting results thus obtained the reader is referred to Marey's well-known work *Le Movement*,† in which his method is fully described and reproductions of a large number of chronophotographs are given. Fig. 12 will serve to illustrate one of the numerous applications of this method. It is from a study of the motion of the right arm of a man suffering from tremor of the hand. Metallic buttons were placed at the shoulder, at the elbow, and on the hand, and were connected by bright stripes. The subject was seated on a chair and told to rise at a given signal. The tremor is clearly brought out by the double row of dots along the path followed by his hand as he arose. It ceases altogether by the time he has reached

FIG. 10.

an upright position. For further details concerning this interesting application of chronophotography to pathology, see the volume on Muybridge's work, cited in a subsequent paragraph of this article.

Muybridge, who was one of the first to turn his attention to this method of chronophotography, made photographs on the Leland Stanford farm in California (1878) for the purpose of illustrating the various gaits of trotting horses. These photographs attracted universal admiration, and the investigation was taken up on a much more elaborate scale under the auspices of the University of Pennsylvania.

* See Marks, *The Mechanism of Instantaneous Photography; Animal Locomotion*, p. 9, Philadelphia, 1888.

† Translated by Pritchard under the title *Movement* (International Science Series, N. Y., 1895).

Successive Instantaneous Views on Separate Plates.—The overlapping of the successive images taken on a single fixed plate led naturally to the development of apparatus in which each exposure should have a free surface to itself. Muybridge, in his Philadelphia experiments, constructed a very extensive and intricate apparatus for this purpose. He used several batteries of cameras for fixed plates, with quick-moving shutters that could be operated electrically by the experimenter. One such battery consisted of twenty-four cameras for 4 × 5 plates. Two smaller batteries of twelve each were subsequently constructed, taking pictures 3 inches square. To describe the ingenious and elaborate electromagnetic devices by which these exposures could be made at the proper instant of time lies beyond the scope of the present article. Readers are referred to the report published by the University of Pennsylvania under the title *Animal Locomotion*.* The results of this work were published in a series of 781 folio plates, each consisting of a group of instantaneous photographs dealing with nearly every type of animal locomotion.

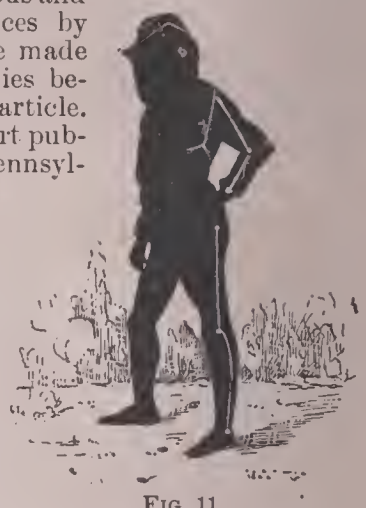

FIG. 11.

Marey, in France, has likewise devised many instruments for this sort of chronophotography, among them an ingenious form of camera known as the "photographic gun." This apparatus (see Fig. 13) was designed particularly for taking chronophotographs of birds in flight and of other rapidly moving objects. The lens is in the barrel of the gun, the breach of which contains the sensitive plate, cut into the form of a disk or octagon and mounted so as to revolve rapidly under the action of a spring when released by the trigger. Twelve exposures are made in one second with this instrument by means of a disk shutter, the opening in which gives an exposure of $\frac{1}{720}$ of a second. Another disk with twelve windows carries the sensitized plate with a properly interrupted motion, so that the plate is at rest during each exposure and is moving forward to a new position between times. The photographs taken with the gun were very small, but they sufficed for the study of the successive positions of the wings of flying birds and for a variety of other similar subjects.

Successive Instantaneous Exposures on a Moving Film.—It is to this type of chronophotography that the greatest amount of attention has been paid in recent years, and which in consequence has been most highly developed. It owes its present perfection to the demand for subjects for the various forms of the *animated-picture machine*, a device

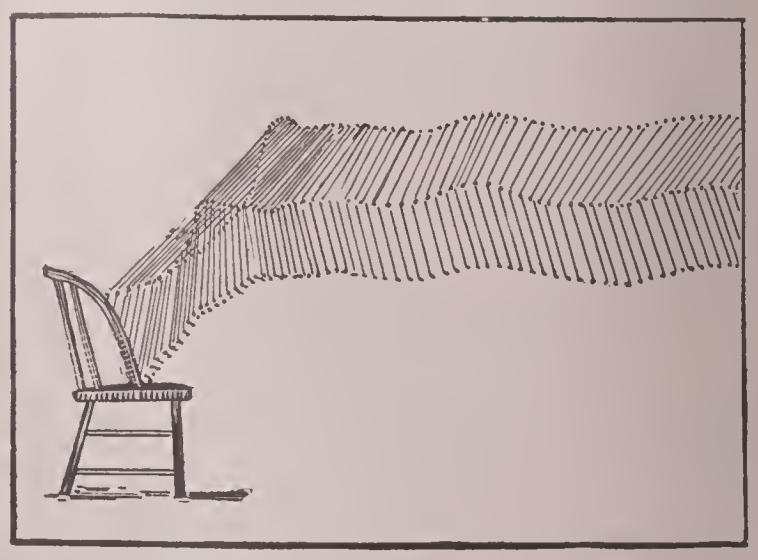

FIG. 12.

by means of which chronophotographs, projected upon a screen, may be viewed by many observers simultaneously.

Such machines are capable of many applications. Demeny, a pupil of Marey, for example, took chronophotographs of the moving lips of a speaker, and, making positives from these, projected them by means of an attachment to the lantern which he called the *photoscope*, for the instruction of

* See *Muybridge's Work at the University of Pennsylvania*, J. B. Lippincott & Co., 1878.

deaf-mutes in the reading of speech. Mach used the method to exhibit the growth of vegetation, for which purpose he photographed a plant daily throughout its life and then projected the pictures with sufficient rapidity to blend the effect by persistence of vision. The plant was thus made to appear to go through all the phases of growth and decline within the interval of a few minutes. The animated-picture machine has received a multitude of names. Jenkins,* in his recent volume on this subject, gives a list of more than one hundred.

All of these machines may be described simply as a form of magic lantern for the projection of chronophotographs on a screen. The successive pictures follow one another in the field at the rate of about twenty in a second. In most

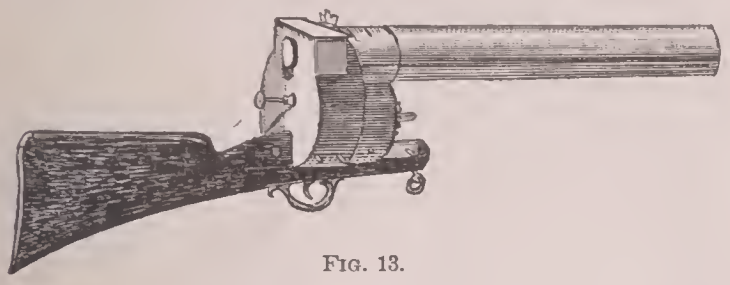

Fig. 13.

machines the film, or picture-ribbon, as it is called, is moved stepwise, the film remaining at rest during the passage of an open sector in a revolving disk which admits the light to the screen, and being shifted the proper distance to bring the next picture into the field during the intervening period of darkness. The usual size of the photographs on these picture-ribbons is about 2·5 cm. by 2 cm. This gives about twenty pictures to each foot of ribbon, and requires 1 foot of film for each second of time that the exhibition is to last. Picture-ribbons are usually made in lengths of 50 feet, but in certain instances where a prolonged scene has to be recorded the lengths run into thousands or even tens of thousands of feet.

Of instruments for the production and exhibition of picture-ribbons there are, in spite of the many names, only two types—that in which the motion of the film is stepwise and that in which it is continuous. The device most frequently employed to secure the rapid stepwise motion, by which the film is brought to rest for a very brief interval of time during which the exposure takes place and is then moved the precise distance necessary for taking the next picture without overlapping or loss of space, consists of a series of equidistant perforations, running along each edge of the film.

Fig. 14 shows a characteristic method of producing the step-by-step movement of the film, both in the camera and in the projecting apparatus. The film, which is perforated as described above, passes from one sprocketed drum (*a*), the teeth of which fit the perforations, downward behind a vertical clip, which holds it in place with slight pressure, and which contains a diaphragm through which the exposure is made. Thence it passes under a similarly constructed drum (*b*) which moves stepwise through the required angle and pulls the film with each motion in such a way as to bring the successive portions rightly centered into the field. There are numerous mechanisms for the purpose of producing with precision this rapidly interrupted movement which has to be repeated without hitch or failure at least twenty times a second.

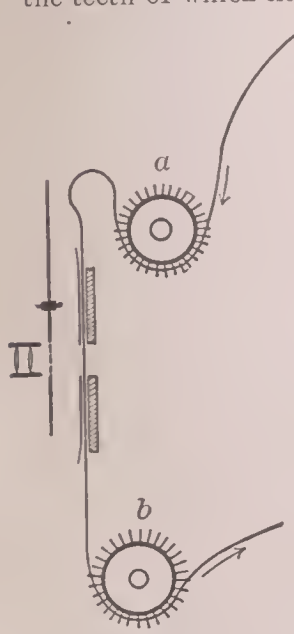

Fig. 14.

To take sharply defined pictures on a constantly moving film, which is necessary in the second type of machine, the exposure must either be of negligible length as compared with the velocity of the film, which with the rapid motions given in animated-picture machines is impracticable, or some device must be employed to prevent the blurring of the picture. The most successful device of this kind consists in moving the lens with a motion parallel to that of the film. The light from the object to the film then travels downward with the same speed as the latter, and there is no relative shifting of the image on the sensitive surface. In this way it is possible to obtain sharp pictures, the exposure of which is properly timed by the interposition of an adjustable slit. The camera for accomplishing this contains several lenses mounted on a disk and traveling with the same linear velocity as the film itself. Jenkins, who was one of the pioneers in the development of the art of producing chronophotographs for purposes of projection, constructed one form of camera in which there were fifteen such lenses. For further details see the article Vitascope; also the various authors cited in the foot-notes to the present article, especially the volumes *Animal Locomotion*, *Le Mouvement*, and *Animated Pictures*; also Woodbury's *Dictionary of Photography* and Jenkins's article on *Muybridge's Work*, *Photographic Times*, July, 1898, p. 292.

E. L. Nichols.

Church Temperance Society: an American society organized in 1881 in the Protestant Episcopal Church, and having for its main purpose the promotion of temperance in the use of intoxicating drinks. Those who totally abstain from and those who temperately use liquors as beverages constitute its adult membership. Moral suasion is employed as an adjunct to legal restriction, and the objects of the society are stated to be the training of the young in habits of temperance; the rescue of drunkards; restriction of the saloon by legislation; and the employment of counteractive agencies, such as coffee-houses, workingmen's clubs, reading-rooms, and other resorts. The Church Temperance Legion, an auxiliary under the management of men and women, and comprising the Knights of Temperance, the Young Crusaders, and the Veteran Knights, is chiefly devoted to the welfare of boys, endeavoring to induce them to lead sober lives and to keep morally pure, and to strengthen and perpetuate such habits in men.

Cienfuegos, sē̆e-en-fwā'gōs: a city of Santa Clara province, Cuba; named in honor of a former Cuban governor; situated on Jagua Bay, south coast; 111 miles S. E. of Havana (see map of West Indies, ref. 4–C). The harbor has an area of 26 sq. miles, and is the best, though not the largest, in Cuba. Herrara spoke of it as "unrivaled in the world." The situation, however, was not utilized till Cienfuegos was founded, in 1819. The town became the center of trade for south central Cuba, and the fourth commercial port of the island, ranking after Havana, Matanzas, and Santiago de Cuba. It is connected by rail with Santa Clara, Matanzas, and Havana. Pop. including suburbs, 41,000. C. C. A.

Clark, Charles Edgar: naval officer; b. in Vermont, Aug. 10, 1843; entered the Naval Academy, Annapolis, in 1860 and remained until Oct. 1, 1863, when he was promoted ensign and assigned to duty on the steam-sloop Ossipee of the Western Gulf blockading squadron. Here he remained two years, being engaged in the battle of Mobile Bay, Aug. 5, 1864, and in the bombardment of Fort Morgan, Aug. 23 of the same year. He was commissioned master May 10, 1866, while serving on the Vanderbilt of the Pacific station; became lieutenant Feb. 21, 1867; lieutenant-commander Mar. 12, 1868, and was assigned to the Suwanee, which was wrecked July 7 of the same year. He was attached to the receiving-ship Vandalia at Portsmouth, N. H., 1868–69, and the next year was transferred to the steamer Seminole and later to the ironclad Dictator of the North Atlantic station. During the years 1870 to 1873 he was assigned to the Naval Academy, and then to the Mahopac of the North Atlantic station. He served on the steamers Hartford, Monocacy, and Kearsarge of the Asiatic station 1874–77, and then at the Boston navy-yard for three years. In 1881 he was transferred to the training-ship New Hampshire; was commissioned commander Nov. 15, 1881, and was assigned to the torpedo-station at Newport in 1883. For the next three years he served on the Ranger, engaged in the survey of the North Pacific, and then was lighthouse inspector for four years. In May, 1891, he was assigned to the Mare island navy-yard, San Francisco, where he remained until Sept., 1893, when he was put in command of the Mohican. In Jan., 1895, he was assigned to special duty, and in November was put in command of the receiving-ship Independence for a year. He was promoted captain June 21, 1896, and in the following September was assigned to the Monterey, holding command until Jan., 1898, when he was put in command of the battle-ship Oregon at Mare island navy-yard. On the outbreak of the war with Spain he was ordered to join the North Atlantic squadron, and made a notable voyage around Cape Horn, successfully evading the Spanish war-ships reported to be lying in wait for him off the coast of Brazil, reaching Key West May 27,

1898. He took part in the blockade of the Cuban ports and was engaged in the battle of July 3 off Santiago.

Clark, Edwin Charles, LL. D.: b. in Yorkshire, England, Nov. 5, 1835; was educated at Shrewsbury School and Trinity College, Cambridge University, taking high honors; was formerly scholar and fellow of Trinity College, now (1899) professorial fellow of St. John's College, and Regius Professor of Civil Law in Cambridge University; practiced as a conveyancer in London for a time. He has published *Early Roman Law: Regal Period* (1872); *Analysis of Criminal Liability* (1880); *Practical Jurisprudence* (1883); *Cambridge Legal Studies* (1888). He is a well-known student of archæology and architecture. F. Sturges Allen.

Clark, Rev. William, LL. D., D. C. L.: b. at Inverurie, Aberdeenshire, Scotland, Mar. 26, 1829; educated at the University of Aberdeen and at Oxford; ordained deacon in the Church of England 1857 and priest 1858. He went to Canada in 1882, and became Professor of Mental and Moral Philosophy in Trinity University, Toronto, in 1883. He has delivered public lectures on various literary and biographical subjects; was appointed in 1887 Baldwin lecturer at the University of Michigan, and in 1888 was chosen orator at Hobart College, Geneva, N. Y., and made a member of the college staff. He was a delegate to various synods of the Church of England, and to the Pan-American Congress of Religion and Education at Toronto in 1895. In 1896 he became a member of the Educational Council of Ontario. His writings include *The Redeemer*, sermons (1863); *The Comforter*, sermons (1864); *The Four Temperaments*, sermons (1874); *The Sin of Man and the Love of God*, sermons (1880); *Hefele's History of the Councils*, translated and edited (1886); *Witnesses to Christ* (1888); *Savonarola* (1892); Hagenbach's *History of Christian Doctrine*, translated and edited.

Clarke, Sir Edward George: b. in London, England, Feb. 15, 1841; educated at College House, Edmonton, City of London College, and King's College evening classes; was a writer in the India Office 1859–60; took up the study of law in 1861; became a barrister at Lincoln's Inn in 1864; practiced in the common-law courts with great success, and has been retained in a number of famous cases, including the Bartlett case in 1886, the Baccarat case in 1891, and the Jameson case in 1896; is a fellow of King's College in London, and has been a member of Parliament for Plymouth since 1880; has published a *Treatise on the Law of Extradition* (3d ed. 1888), and several series of public speeches. He was knighted in 1886, when he was made solicitor-general. F. Sturges Allen.

Clarke, Hyde: philologist; b. in London in 1815; became an engineer, and in 1836 was engaged in planning and surveying the Glasgow and Southwestern Railway; went to India in 1849 to aid in establishing a telegraph system, and was afterward active in establishing settlements and building railroads there. He was the founder of the London and County Bank and of the Council of Foreign Bondholders. He wrote a *Military Life of Wellington*, many pamphlets on philosophical subjects, political economy, banking, statistics, railways, international law, foreign loans, and public works, besides philological and ethnological books, among the last-named classes being *Pre-Hellenic Inhabitants of Asia Minor*; *The Connection of the Languages of India and Africa*; *Prehistoric Comparative Philology*; *The Khita and Khita-Peruvian Epoch*; *Serpent and Siva Worship and Mythology*; *The Earliest English*; and *Early History of the Mediterranean Populations*. D. in London, Mar. 1, 1895.

Clarke, William Horatio: organist; b. in Newton, Mass., 1840, and learned to play at a very early age; played the organ in church and the violin at local concerts while still a youth. He has been a church organist continuously since 1856. He settled in Boston as organist and teacher, where he has since remained with the exception of a short period about 1871, when he was superintendent of music in the public schools of Dayton, Ohio. His compositions are chiefly for the organ, and include several theoretical and practical instruction-books. D. E. Hervey.

END OF VOLUME TWO.
